

~~X. 205. d.~~

ENCYCLOPÆDIA BRITANNICA;
OR, A
DICTIONARY
OF
ARTS, SCIENCES, &c.
On a PLAN entirely NEW:

By WHICH,
THE DIFFERENT SCIENCES AND ARTS
Are digested into the FORM of Distinct
TREATISES OR SYSTEMS,

COMPREHENDING
The HISTORY, THEORY, and PRACTICE, of each,
according to the Latest Discoveries and Improvements;

AND FULL EXPLANATIONS GIVEN OF THE
VARIOUS DETACHED PARTS OF KNOWLEDGE,
WHETHER
Relating to NATURAL and ARTIFICIAL Objects, or to Matters ECCLESIASTICAL,
CIVIL, MILITARY, COMMERCIAL, &c.

TOGETHER WITH
A DESCRIPTION of all the COUNTRIES, || A GENERAL HISTORY, *Ancient and Modern*,
CITIES, Principal MOUNTAINS, SEAS, || of the different EMPIRES, KINGDOMS, and
RIVERS, &c. throughout the WORLD; AND STATES;

AN ACCOUNT of the LIVES of the most EMINENT PERSONS in every Nation,
from the earliest ages down to the present times.

THE WHOLE COMPILED FROM THE WRITINGS OF THE BEST AUTHORS, IN SEVERAL LANGUAGES; THE MOST APPROVED DICTIONARIES,
AS WELL OF GENERAL SCIENCE AS OF PARTICULAR BRANCHES; THE TRANSACTIONS, JOURNALS, AND MEMOIRS, OF LEARNED
SOCIETIES, BOTH AT HOME AND ABROAD; THE MS. LECTURES OF EMINENT PROFESSORS ON DIFFERENT SCIENCES;
AND A VARIETY OF ORIGINAL MATERIALS, FURNISHED BY AN EXTENSIVE CORRESPONDENCE.

The SECOND EDITION; greatly Improved and Enlarged.

ILLUSTRATED WITH ABOVE TWO HUNDRED COPPERPLATES.

VOL. I.

INDOCTI DISCANT, ET AMENŒ MEMINISSE PERITI.

EDINBURGH:

Printed for J. BALFOUR and Co. W. GORDON, J. BELL, J. DICKSON, C. ELLIOT, W. CREECH,
J. MCCLESISH, A. BELL, J. HUTTON, and C. MACFARQUHAR.

MDCCLXXVIII.

P R E F A C E.

THE mind of man has been by some authors called a *tabula rasa*, and compared to a sheet of clean paper. But this principle, however generally received, may perhaps admit of some hesitation; especially if it should be found less salutary in its consequences than could be wished. One should imagine, that the human intellect, by its original constitution, easily admits and retains some impressions, as congenial to its nature, and faithful to their objects; whilst it repels others with aversion or disdain, as subversive of its happiness, and false to the things which they represent. Hence our frame, from its very origin, seems marked by the hand of nature with indubitable signatures of pre-eminence and distinction. Hence man assumes the important characters of a rational being and a moral agent. Hence his desires of happiness and truth are insatiable, and his capacities of enjoying them indefinite.

From the feeblest efforts of infancy to the last convulsive struggles of departing life, these grand objects, these irresistible attractions, actuate all his powers, and animate all his enterprises, through every gradation of his progressive being. It must, however, be acknowledged, that, in these sublime pursuits, the mind is obnoxious to error and deception: but still the ends which she proposes are the same, though she may err in selecting the proper means by which alone they can be attained. We may further observe, that though truth and happiness originally appear to the mind in different forms; yet, in nature, they are inseparable: for nothing that is false can be a source of endless and universal happiness; nor can any truth, as truth, be productive of unmixed and permanent misery.

Whether the superior desires and capacities with which our nature is invested necessarily result from the inherent excellence of its powers, or from the advantages of its structure and organization, or from both, we cannot at present stay to inquire. These questions will more properly find their solution in other departments of science. It is sufficient for the purpose which we have now in view, to observe this important fact established, That the original powers of man are susceptible of culture and refinement to a very high degree; and that the proper exertion and application of these faculties are not only conducive, but essential, to his happiness, whether considered as an individual, or a social being. Every attempt, therefore, to enlarge his views, to improve his talents, to direct his efforts, and to form his nature for its sublime destiny, should certainly command the public regard and attention; and the only apology which can be offered for the cold reception too generally given to such laudable endeavours, arises either from their multiplicity, or from their want of merit and consequently of success. It would be at the same time an endless and a fastidious task, to enumerate the various methods by which men of leisure and speculation have essayed to cultivate the public understanding and taste, or to trace literature through all the various forms in which it has tried to gain the general attention.

Abstract truths have, as it were, been clothed with a body, that, by the drapery of narrative and allegory, they might be more effectually recommended to our notice, and more agreeably inculcated. The various topics of art and science have

have been ranged in a systematic order, and volumes professedly written upon each. But the taste for novelty still demanded various gratification. Hence unconnected miscellanies, and detached essays, appeared. But these periodical effusions of genius and learning, that they might be obvious to all capacities, were generally too flimsy and superficial either to attract or deserve the attention of a cultivated mind. To exhibit art and science in all their extent and lustre, it was at last thought necessary to reunite the detached parts in one work, that their proportions, their relations one to another, and to the general system of which they are constituents, might be more clearly and obviously perceived. With this intention, Dictionaries of Arts and Sciences have been compiled; and it is certain, that such a plan, regularly and successfully prosecuted, may be productive of numberless utilities and advantages. But when topics, far from being digested into a system, or disposed in their natural order, are violently dilacerated, and, without any regard to their proper positions, huddled together as the order of the letters which constitute their technical terms determine, such a work should rather be called a book of shreds and patches, than a Dictionary of Arts and Sciences. We do not deny, that every article, as an article, may have considerable merit: but, as it stands connected in nature with what ought to precede or to follow it, we affirm, that it cannot have the same influence upon the mind without its antecedents and consequences; and that an understanding formed upon such models, is rather a chaos of detached and heterogeneous ideas, than a regular intellect. It is only by thinking in method, by reducing our ideas to a proper and natural order, by observing what they possess in common, and what are their relations or differences, that our reasoning faculties are capable of making any progress at all. Without these assistances, we might be ranked amidst sensitive or conscious beings, but could never attain the human or rational character. At the same time, it must be confessed, that there is some inconvenience in being reduced to the necessity of perusing a whole system when we only want to consult a particular topic. To avoid these disagreeable extremes, the compilers of the *Encyclopædia Britannica* have endeavoured to give a compendious, yet clear and satisfactory, account of each particular science or art, under its proper denomination; whilst the subordinate articles in each are likewise explained under their technical terms. Thus the systematic reader will be fully and regularly informed by turning to the general name of the science which he wishes to explore; whilst the person who, already acquainted with the whole, wishes only to consult particular topics, or others who are willing to content themselves with partial and detached views of things, will find them illustrated under the articles by which they are denominated. To be more explicit upon this head: Detached articles may be divided into three kinds. The first consists of such as, independent of particular systems, admit of a full and complete illustration as they stand; the second, of such as require partly to be discussed under the systems to which they belong, and partly under their own proper denominations; the third, of such as are sufficiently elucidated in the systems to which they appertain. Those of the first kind need no references. Those of the second, being only partially explained under their particular denominations, demand references to the systems where the illustrations are completed. For those of the last, as no explication is found necessary under the terms, we refer to the systems of which they

they are constituents, where the subjects are fully discussed. These our readers may consult as emergencies require or their own dispositions impel them.

To accomplish a task so arduous and important, neither labour nor expence has been spared. The best authors on each particular science have been collected, and compared. Such as could be abridged without disadvantage, have been epitomized with all possible care: others who were more concise and tenacious of their subjects, have been more closely pursued, and more faithfully retained. When topics have been obscurely or imperfectly treated, the utmost endeavours have been used to supply these defects; and upon such parts of science as the compilers have not found properly illustrated by other authors, original essays are inserted. Nor do these amount to an inconsiderable number. To each particular art or science, a history of its origin, progress, and revolutions, is prefixed, so far as these can be collected or deduced from historians, or from other authors by whom the subjects are occasionally treated. But where these are defective, careless, or inconsistent, in their narrations; neither can absolute certainty, nor circumstantial accuracy, be expected from us. This task, therefore, demands no small degree of industry and perspicacity, because the various events relative to the discovery or improvement of literature have often been either entirely neglected, or only obscurely hinted, by their contemporary authors. A few instances will show how inauspicious to learning these omissions have proved, and of what importance the discovery of such events must be, not only as they gratify mere unmeaning curiosity, but as they elucidate the particular sciences in which they are found. Every one who has the least acquaintance with navigation, must observe the inestimable utility of the mariners compass; which, by rendering voyages more safe and expeditious, gives a facility and success to the business of commerce, which it could not have attained by any other means. Yet the name of its inventor, the æra and occasion of its discovery, are extremely uncertain: for though, in the year 1260, it was produced as his own invention by Paulus Venetus, it was not applied to the purposes of navigation for a long time afterwards, when it was again exhibited by Gioya of Amalphi, who likewise claimed the discovery as his own. Nothing has more effectually contributed to render knowledge accessible and diffusive than the art of printing: yet the same culpable inattention of authors had left its origin, and the gradations of its improvement, difficult to be investigated. The wonderful powers of magnetism and electricity long remained undiscovered, and longer still unapplied to the purposes of utility. Nor have we, perhaps, at this enlightened period, derived from them all the advantages of which they may be found productive: a consideration which ought incessantly to stimulate our industry in acquiring such improvements as have been already made, or to actuate our inventive powers for enlarging the sphere of discovery.

In the theories of arts we may reasonably hope to find a higher degree of satisfaction. Particular care has therefore been taken to deduce them, with all possible accuracy, in a series of conclusions drawn from intuitive truths, or from principles previously discovered. But wherever such a series has been left interrupted by others, and where it appears impossible from the state of learning to supply that deficiency, we must be forgiven for only exhibiting, as certain, such as have been made; without imposing on the public conjectural for real improve-

ments, which from the former state of learning have seemed, and from its present may still seem, unattainable. Yet, through the whole of this department, wherein such regions of hesitation and conjecture occur, we have not remained silent and supine. A number of probable solutions not commonly met with have been offered to the public attention. In disputed points, arguments and objections have been displayed in their full force; a method which is so far from leading to scepticism, that it not only appears the most efficacious but the only real means of discovering and establishing truth. Thus every reader will see his favourite system attacked and defended in such a manner that his own judgment may determine the victory; and thus, by comparing it with other systems, he may either see the merit of his own, or rectify its errors, or adopt any other which may appear preferable. Thus likewise the compilers will preserve their essential character, which, by assuming the spirit or tenets of any party as their own, would be entirely destroyed.

To make the perusal of this comprehensive work as easy and successful as possible, marginal references are made from general systems to particular articles, and reciprocally from the latter to the former. Thus the diligent inquirer after truth will no longer find himself under a necessity of hunting the letters of the alphabet through all their arbitrary forms and positions, nor tantalized at last by the unsatisfactory glance of an object which the whole art or industry of man could not possibly explain in such a solitary and insulated situation. The utility of this expedient will sufficiently appear from the following instance; and from hence we may likewise see how abortive and impotent the attempts of some authors have proved who by references have tried to direct us how we may form a full system from independent topics. From the preface of Chamber's Dictionary the subsequent may be quoted as an example. "AGRICULTURE, or the *Tillage* and improvement of *Soils, Clay, Sand, Earth, &c.* by the operations of *Ploughing, Fallowing, Burning, Sembradore, Semination, Manuring, &c.* to produce *Corn, Hemp, Flax, Liquorice, Saffron, &c.* for *Malt, Farina, &c.* *Granary, Threshing, &c.* The culture of *Trees, Timber, &c.* by *Planting, Shrowding, Barking, &c.* for *Coppice, Park, Paddock, Hedge, Pasture, &c.* But how extremely difficult it would be to follow a subject through such a multitude of references, as well as new ones which spring up at every one of them, any person may easily conceive.

Whilst, however, we prove the expediency of references from sciences to articles, and from articles to sciences, we regret, that unavoidable contingencies in the progress of the work have sometimes put it out of our power to observe this rule with all the fidelity which we could have wished. For in several articles relating to the sciences of Optics and Medicine, instead of marginal notes, an index at the end of these articles is referred to. This, it must be owned, is attended with some little inconvenience; but it was inevitable on account of a variety of communications received after the work was begun, so that proper references could not be made to the numbers originally placed on the margin, the plan of these dissertations being somewhat altered. Besides, when the nature of a work so extensive and multiform is duly considered, it will immediately occur to every reader of candour and indulgence, how easy it is for the utmost care and assiduity to fail in some instances. These, however, it is hoped,

hoped, will be found few and of little importance; the work, during its whole progress, having been superintended with unremitting vigilance and assiduity.

After surveying any particular science, it will be found equally useful and entertaining to acquire some notion of the private history of such eminent persons as have either invented, cultivated, or improved, the particular art or science in which our attention has been recently engaged. This has induced the compilers to enrich the *Encyclopædia Britannica* with a new department, which is not to be found in any other collection of the same kind, except in the French *Encyclopedie*. Of all historical pursuits, Biography is perhaps the most delightful and instructive. Its tendency to illustrate particular passages in general history, and to diffuse new light through the arts and sciences in which the persons whose lives are related were employed, is too obvious to require explication. Besides, it exhibits the human character in all possible forms and situations. It not only attends its hero through all the bustle of public life, but pursues him to his most sequestered retirements. It shows, how distinguished characters have been involved in misfortunes and difficulties; by what means they were extricated; or with what degree of fortitude and dignity they have discharged the various functions, or sustained the different vicissitudes, of a chequered and fluctuating life. For these reasons it is, that every man of learning and genius has esteemed the biographical labours of Plutarch among the most precious and valuable remains of antiquity. The lives and characters, therefore, of such personages as have either excelled in the arts of war or peace, of such as have either distinguished themselves in the theatre of action or in the recess of contemplation, will be found under their proper names alphabetically disposed.

When we read of the persons by whom, and the occasions on which, any particular branch of human knowledge has been cultivated, we naturally wish to know something of the places where those transactions have passed. This curiosity, so natural and laudable, has frequently been felt by the compilers of this work. And, in order to gratify a desire so useful and congenial to the human mind; besides the general system of Geography, they have subjoined to the name of each particular place, an account of its situation, its climate, its soil, its peculiarities, its inhabitants, its revolutions, laws, and government, with whatever else appeared necessary for the reader's information, and comprehensible in a work of such variety and extent.

In treating of such matters as are peculiar to certain authors, the obligation is generally acknowledged by the compilers of this Dictionary; but, in such subjects as were common to many writers, they did not imagine those acknowledgements required either by their own gratitude or the curiosity of their readers. Yet, that all possible means of improvement may be put in the power of such as wish to cultivate their taste or genius, a list of those authors who have been most distinguished and successful in the various departments of art or science will be added. It will easily occur to the reader, that these are the authors chiefly used in this compilation; and by this he will be enabled to consult each particular author in his own province. But so much pains have been taken to select and extract from each whatever is valuable, that it is hoped the necessity of this research will be in a great measure superseded. From the catalogue proposed to be given, it must appear what a considerable and extensive library would be required

to afford so much knowledge as this work contains, and what an immense disparity there is between the expense of purchasing it, and that of procuring the books from whence it was derived.

We have already hinted the almost insuperable difficulty attending the execution of a plan so various in its nature, and so considerable in its extent. To redress, therefore, as far as possible, the inconveniences arising from casual omissions, an Appendix may be thought indispensably necessary. But though the plan proposed should be accomplished in a manner equal to our own or our readers most sanguine expectations, such an Appendix would still be found a most important addition. For even though the work should be as perfect as possible according to the state of arts and sciences at the time of its exhibition, still revolutions may happen, and improvements may be made, in various branches both of theoretical and practical knowledge, which an Appendix will give the compilers a proper opportunity of inserting. This accession, therefore, to the original plan, our readers will be pleased to find.

In a collection so large and multifarious as that which is now recommended to the public attention, the critic must be severe, and the genius minute, who could stop to animadvert upon every trivial inaccuracy of style. We think it indeed indispensable incumbent on every author who would be read with intelligence and pleasure, after sufficiently attending to the nature and importance of what he submits to the public observation, that he should, in the next degree, regard the vehicle by which it is conveyed. But where the subjects are so indefinitely varied, and where propriety requires that each should be expressed in a manner suitable to its nature; it can scarcely be imagined, that the same exactness and uniformity should equally prevail in this as in compositions of a nature less extensive and complex.

After all, though the compilers are conscious of having done their utmost to render this work as extensively and generally useful as it could possibly be; yet, since no human production, even from the origin of literature to the present period, has ever been found perfect in its kind, it would be cruel, if not unjust, to expect absolute perfection in the present attempt. From every candid and benevolent inquirer after truth, therefore, they hope, that the merit of their intention and the utility of their plan will in a great measure atone for such trivial or unavoidable faults as may be found in its execution. Such was the spirit in which one of the noblest and wisest of ancient critics perused his contemporary poets:

*Verum ubi plura nitent in carmine, non ego paucis
Offendar maculis, quas aut incuria fudit,
Aut humana parum cavit natura. —*

HOR.

But where the beauties more in number shine,
I am not angry, when a casual line
(That with some trivial faults unequal flows)
A careless hand, or human frailty, shows.

FRANCIS.

A NEW D I C T I O N A R Y O F A R T S, S C I E N C E S, & C.

A,
abbreviat.

A, THE character of the first letter of the alphabet in Latin, English, French, and most of the present languages of Europe. The first character in the Hebrew alphabet is called *aleph*, in the Greek *alpha*, in the Arabic *aleph*, and in the Syriac *aleph*.

A has deservedly the first place in the alphabet on account of its simplicity, very little more being necessary to its pronunciation than opening the mouth.

A, an article. See ARTICLE.

A, among the ancients, was a numeral letter, and signified 500; and when a dash was added on the top, *A*, 5000.

A, in the Julian calendar, is the first of the seven dominical letters*. It had been in use among the Romans long before the establishment of Christianity, as the first of the eight *nundinales* † *litteræ*; in imitation whereof it was that the dominical letters were first introduced.

A is also an abbreviation, used with different intentions. Hence,

A, among logicians, is used to denote an universal affirmative proposition; according to the verse,

Afferit A, negat E, verum generaliter ambe.

Thus, in the first figure, a syllogism consisting of three universal affirmative propositions, is said to be in *Bār-bārā*; the *A* thrice repeated, denoting so many of the propositions to be universal, &c. See BARBARA.

A, among the Romans, was used in the giving of votes or suffrages.—When a new law was proposed, each voter had two wooden ballots put in his hand; the one marked with a capital *A*, signifying *antiquus*, q. d. *antiquum volo*; and the other with *V. R.* for *uti rogas*. Such as were against the law, cast the first into the urn: as who should say, I refuse it, I antiquate it; or, I like the ancient law, and desire no innovation.

A, in the trials of criminal causes, also denoted absolution: whence Cicero, *pro Milone*, calls *A, littera salutaris*, a saving letter.—Three ballots were distributed to each judge, marked with the letters, *A* for *absolve*, I acquit; *C* for *condemno*, I condemn; and *N. L.* for *non liquet*, It is not clear. From the number of each cast into the urn, the prætor pronounced the prisoner's fate. If they were equal in number, he was absolved.

A, in the ancient inscriptions of marbles, &c. occasionally stands for *Augustus*, *ager*, *aiunt*, &c. When double, it denotes *Augusti*; and when triple, *aurum, argentum, æ*; and sometimes its meaning can only be

Vol. I.

A A R

known by the rest of the inscription. Ifidore adds, that when it occurs after the word *miles* (soldier), it denotes him young. On the reverse of ancient medals, it denotes them struck by the city of Argos, sometimes by that of Athens; but on coins of modern date, it is the mark of Paris.

A, as an abbreviation, is also often found in modern writers: as, *A. D.* for *anno domini*; *A. M.* *artium magister*, master of arts, &c.

Ā, the letter a, with a line above it thus, ā, is used in medical prescriptions for *ana*, of each; sometimes it is written thus, āā: e. g. & Mel. Sacchar. & Mann. ā, vel āā, ʒj. i. e. Take of honey, sugar, and manna, of each one ounce.

A.A.A. The chemical abbreviation for Amalgama, or Amalgamation.

AA, the name of several rivers in Germany and Switzerland.

AACH, a little town in Germany, in the circle of Suabia, near the source of the river Aach, and almost equally distant from the Danube and the lake Constance. It belongs to the house of Austria; and is twelve miles north-east of Schaffhausen, and twenty-five north-west of Constance. E. Long. 9. o. Lat. 47. 55.

AAHUS, a little town in Germany, in the circle of Westphalia, and bishoprick of Munster. It is the capital of Aahus, a small district; has a good castle; and lies north-east of Coesfeldt. E. Long. 7. 1. Lat. 52. 10.

AAM, a Dutch measure of capacity for liquids, containing about 63 pounds avoirdupois weight.

AAR, the name of two rivers, the one in Switzerland, the other in Westphalia. Also the name of a small island in the Baltic.

AARON, high-priest of the Jews, and brother to Moses, was by the father's side great-grandson, and by the mother's grandson, of Levi. By God's command he met Moses at the foot of mount Horeb, and they went together into Egypt to deliver the children of Israel: he had a great share in all that Moses did for their deliverance; the scriptures call him the prophet of Moses, and he acted in that capacity after the Israelites had passed over the Red Sea. He ascended mount Sinai with two of his sons, Nadab and Abihu, and seventy elders of the people; but neither he nor they went higher than half way, from whence they saw the glory of God; only Moses and Joshua went to the top, where they staid forty days. During their absence, Aaron, overcome by the people's eager intreaties, set up the golden calf, which the Israelites worshipped by

A

Aaron
||
Ab.

his consent. This calf has given rise to various conjectures. Some rabbis maintain that he did not make the golden calf; but only threw the gold into the fire, to get rid of the importunities of the people; and that certain magicians, who mingled with the Israelites at their departure from Egypt, cast this gold into the figure of a calf. According to some authors, the fear of falling a sacrifice to the resentment of the people by giving a refusal, made Aaron comply with their desire: and they alleged also, that he hoped to elude their request, by demanding of the women to contribute their ear-rings, imagining they would rather choose to remain without a visible deity, than be deprived of their personal ornaments. This affair of the golden calf happened in the third month after the Israelites came out of Egypt. In the first month of the following year, Aaron was appointed high-priest by God, which office he executed during the time that the children of Israel continued in the wilderness. He died in the fortieth year after their departure from Egypt, upon mount Hor, being then an 123 years old; A. M. 2522, of the Julian period 3262, before the Christian era 1452. With regard to the attempts of the Egyptian magicians to imitate the miracles performed by his rod, see some remarks under the article Magic.

AARON Ben Afer, a celebrated rabbi, who, in the fifth century, had a share in the invention of the Hebrew points and accents.

AARON of Alexandria, a Christian priest and physician, who flourished in Egypt about the year 621. He is the most ancient author who has treated of the small-pox.

AARON Harifcheon, a learned rabbi and carait * in the 13th century, wrote an Hebrew grammar, printed at Constantinople 1581; probably the same with Aaron the carait, who wrote a commentary on the five books of Moses, which is in MS. in the French king's library.

AARSSENS (Peter), a painter, called in Italy Pietro Longo, because of his stature, was born at Amsterdam 1519. He was eminent for all kinds of subjects; but was particularly famous for altar-pieces, and for representing a kitchen with its furniture: he had the pain to see a fine altar-piece of his destroyed by the rabble in the insurrection 1566, though a lady of Alcaer offered 200 crowns for its redemption.

AB, the eleventh month of the civil year of the Hebrews, and the fifth of their ecclesiastical year, which begins with the month Nisan. It answers to the moon of July; that is, to part of our month of the same name, and to the beginning of August: it consists of thirty days. The Jews fast on the first of this month, in memory of Aaron's death; and on the ninth, because on that day both the temple of Solomon, and that erected after the captivity, were burnt; the former by the Chaldeans, and the latter by the Romans. The same day is also remarkable among that people for the publication of Adrian's edict, wherein they were forbidden to continue in Judea, or even to look back when at a distance from Jerusalem in order to lament the desolation of that city. The 18th of the same month is also a fast among the Jews; because the lamp in the sanctuary was that night extinguished, in the time of Ahaz.

AB, in the Syriac calendar, is the name of the last summer-month. The first day of this month they call-

Aba
||
Abactors.

ed *Saum Miriam*, the fast of the virgin, because the eastern Christians fasted from that day to the fifteenth, which was therefore called *Faster-Miriam*, the cessation of the fast of the virgin.

ABA (or rather ABAB) HANIFAH, surnamed Al-Nooman, was the son of Thabet, and born at Coufah in the 80th year of the Hegira; this is the most celebrated doctor of the orthodox Mussulmans, and his sect holds the principal esteem among the four which they indifferently follow. Notwithstanding this *, he was not very well esteemed during his life, inasmuch that the khaliff Almanzor caused him to be imprisoned at Bagdat, for having refused to subscribe to the opinion of absolute predestination, which the Mussulmans call *Cadha*. But afterwards Abou Joseph, who was the sovereign judge or chancellor of the empire under the khaliff Hadi, brought his doctrine into such credit, that it became a prevailing opinion. That to be a good Mussulman was to be a Hanafite. He died in the 150th year of the hegira, in the prison of Bagdat aforesaid. And it was not till 335 years after his death, that Melick Schah, a sultan of the Selgiucidan race, built for him a magnificent monument in the same city, whereto he adjoined a college peculiarly appropriated to such as made a profession of this sect. This was in the 485th year of the hegira, and Anno Christi 1092. The most eminent successors of this doctor were Ahmed Benali, Al Giaslas, and Al Razi who was the master of Nassari; and there is a mosque particularly appropriated to them in the temple of Mecca.

ABACATUAIA, in ichthyology, a barbarous name of the zeus vomer. See ZEUS.

ABACH, a market-town of Germany, in Lower Bavaria, seated on the Danube, six miles south-west of Ratibon, and twenty-nine north of Landshut. It is remarkable for Roman antiquities, and for springs of mineral waters which are said to be good for various distempers. E. Long. 11. 56. Lat. 48. 53.

ABACK (a sea-term), the situation of the sails when their surfaces are flatted against the masts by the force of the wind. The sails are laid to be *taken aback*, when they are brought into this situation, either by a sudden change of the wind, or by an alteration in the ship's course. They are *laid aback*, to effect an immediate retreat, without turning to the right or left; or, in the seaphrase, to give the ship *stern-way*, in order to avoid some danger discovered before her in a narrow channel, or when she has advanced beyond her station in the line of battle, or otherwise. The sails are placed in this position by slackening their lee-braces, and hauling in the weather ones; so that the whole effort of the wind is exerted on the forepart of their surface, which readily pushes the ship astern, unless she is restrained by some counteracting force. See BACKING, and BRACING. It is also usual to spread some sail aback near the stern, as the mizzen-top-sail, when a ship rides with a single anchor in a road, in order to prevent her from approaching it so as to entangle the flukes of it with her slackened cable, and thereby loosen it from the ground.

ABACOT, the name of an ancient cap of state worn by the kings of England, the upper part whereof was in the form of a double crown.

ABACTORS, or ABACTORES, a name given to those who drive away, or rather steal, cattle by herds,

* Herbelot.
Bibl. Orient.
p. 21.

* See Car-
rait.

Abaci,
various.

or great numbers at once; and are therefore very properly distinguished from *fures*, or thieves.

ABACUS, among the ancients, was a kind of cupboard, or buffet. Livy, describing the luxury into which the Romans degenerated after the conquest of Asia, says, They had their *abaci*, beds, &c. plated over with gold. (Dec. IV. Lib. ix.)

ABACUS, among the ancient mathematicians, signified a table covered with dust, on which they drew their diagrams; the word in this sense being derived from the Phenician *abak*, dust.

ABACUS, in architecture, signifies the superior part or member of the capital of a column, and serves as a kind of crowning to both. Vitruvius tells us the abacus was originally intended to represent a square tile laid over an urn, or rather over a basket.—An Athenian old woman happening to place a basket, thus covered, over the roof of an acanthus; that plant shooting up the following spring, encompassed the basket all round, till meeting with the tile, it curled back in a kind of scroll. An ingenious sculptor passing by, took the hint, and immediately executed a capital on this plan; representing the brick by the abacus, the leaves by the volutes, and the basket by the vase, or body of the capital. Such was the rise of the first regular order.—The form of the abacus is not the same in all orders: in the Tuscan, Doric, and Ionic, it is generally square; but in the Corinthian and Composite, its four sides are arched inwards, and embellished in the middle with some ornament, as a rose or other flower. Scamozzi uses *abacus* for a concave moulding on the capital of the Tuscan pedestal; and Palladio calls the plinth above the echinus, or boustrophedon, in the Tuscan and Doric orders, by the same name.*

* See Pl. I.
fig. 11.

ABACUS is also the name of an ancient instrument for facilitating operations in arithmetic. It is variously contrived. That chiefly used in Europe is made by drawing any number of parallel lines at the distance of two diameters of one of the counters used in the calculation. A counter placed on the lowest line, signifies 1; on the 2d, 10; on the 3d, 100; on the 4th, 1000, &c. In the intermediate spaces, the same counters are estimated at one half of the value of the line immediately superior, viz. between the 1st and 2d, 5; between the 2d and 3d, 50, &c. See Plate I. fig. 2. A B, where the same number, 1777 for example, is represented under both by different dispositions of the counters:

Chinese ABACUS. See CHINESE-SWANPAN.

ABACUS *Pythagoricus*, the common multiplication-table; so called from its being invented by Pythagoras.

ABACUS is also used by modern writers for a table of numbers ready cast up, to expedite the operations of arithmetic. In this sense we have *Abaci* of addition, of multiplication, of division; an *Abacus logarithmicus*; *Abacus* of squares, of cubes, &c.

ABACUS *Logisticus* is a rectangled triangle, whose sides, forming the right angle, contain the numbers from 1 to 60; and its area, the facta of each two of the numbers perpendicularly opposite. This is also called a *canon of sexagimalis*.

ABACUS & *Palmule*, in the ancient music, denote the machinery, whereby the strings of polyplectra, or instruments of many strings, were struck with a plectrum made of quills.

ABACUS *Harmonicus*, is used by Kircher for the

structure and disposition of the keys of a musical instrument, whether to be touched with the hands or the feet.

ABACUS *Major*, in metallurgic operations, the name of a trough used in the mines, wherein the ore is washed.

ABADDON, is the name which St John in the Revelations gives to the king of the locust, the angel of the bottomless pit. The inspired writer says, this word is Hebrew, and in Greek signifies *Ἀβaddon*, i. e. a *destroyer*. That angel-king is thought to be Satan or the devil: but Mr le Clerc thinks*, with Dr Hammond, that by the locust which came out of the abyss, may be understood the zealots and robbers, who miserably afflicted the land of Judea, and laid it in a manner waste, before Jerusalem was taken by the Romans; and that Abaddon, the king of the locust, may be John of Gischala, who, having treacherously left that town a little before it was surrendered to Titus, came to Jerusalem, where he soon headed part of the zealots, who acknowledged him as their king; whilst the rest would not submit to him. This subdivision of the zealot-party brought a thousand calamities on the Jews.

ABADIR, a title which the Carthaginians gave to gods of the first order. In the Roman mythology, it is the name of a stone which Saturn swallowed, by the contrivance of his wife Ops, believing it to be his new-born son Jupiter: hence it ridiculously became the object of religious worship.

ABÆ, or ABÆA, a town of Phocis in Greece, near Helicon; famous for an oracle of Apollo older than that at Delphi, and for a rich temple plundered and burnt by the Persians. (Strabo.)

ABAST, a sea-term, signifying the hinder part of a ship, or all those parts both within and without which lie towards the stern, in opposition to *AFORE*; which see.—*Abast*, is also used as a preposition, and signifies *further ast*, or *nearer the stern*; as, the barricade stands *abast* the main-mast, i. e. behind it, or nearer the stern.

ABAISED, *Abaisse*, in heraldry, an epithet applied to the wings of eagles, &c. when the tip looks downwards to the point of the shield, or when the wings are flut, the natural way of bearing them being extended.

ABALAK, a town in Siberia, two miles from Tobolskoi, where there is a famous picture of the Virgin Mary, that is constantly visited by a great number of pilgrims: the clergy carry this image every year in procession to Tobolskoi, where it is kept for a fortnight. E. Long. 64. 10. Lat. 57. 1.

ABALIENATION, in law, the act of transferring one man's property to another.

ABALIENATUS, among physicians, means corrupted. When applied to the body, it signifies that a part is so destroyed as to require extirpation. When applied to the senses, it expresses their total destruction.

ABALLABA, now *Appleby*, a town in Westmoreland, remarkable only for its antiquity, having been a Roman station. (Notitia Imperii.) See APPLEBY.

ABANA, (Bible,) otherwise *Amana*, a river of Phœnicia, which, rising from mount Hermon, washes the south and west sides of Damascus, and falls into the Phœnician sea, to the north of Tripolis, called *Chrysorrhœos* by the Greeks.

ABANGA, the name of the fruit of the palm-tree, in the island of St Thomas. The tree is the *Palma Ad Infule*

Abaddon

Abano
||
Abaris.

* See *Ady.*

Infula S. Thome, C. B. The fruit is like a lemon externally; and the inhabitants give three or four of the kernels two or three times a-day as a restorative *.

ABANO, a town of the Paduano, in the republic of Venice, famous among the ancients for its hot baths. It is five miles south-west of Padua, and fifteen south-east of Vicentia. E. Long. 10. 7. Lat. 45. 20.

ABANTES, a people who came originally from Thrace, and settled in Phocæa, a country of Greece, where they built a town which they called Aba, after the name of Abas their leader; and, if we may credit some ancient authors, the Abantes went afterwards into the island Eubæa, now called Negropont: others say the Abantes of Eubæa came from Athens. The Abantes were a very warlike people, closing with their enemies, and fighting hand to hand. See next article.

ABANTIAS, or ABANTIS, a name of the island Eubæa, in the Egean sea, extending along the coast of Greece, from the promontory Sunium of Attica to Theffaly; and separated from Bœotia by a narrow strait, called Euripus. From its length the island was formerly called *Macris*: afterwards *Abantias*, or *Abantis*, from the Abantes, a people originally of Thrace, called by Homer *ἄντιος ἑσπέρων*, from wearing their hair long behind, having in a battle experienced the inconvenience of wearing it long before; and from cutting their forelocks, they were called *Curetes*. (*Abanteus*, the epithet; Ovid.) See ABANTES.

ABAPTISTON, in furgery, the perforating part of the instrument called a trepan. The word is from the negative α, and *βαπτο* to sink under. This instrument hath had various contrivances to prevent its sinking suddenly upon the membranes of the brain when the operator was fawing the skull: whence its name. But the present practice proves all precautions needless, unless the operator is attentive and careful when he uses this instrument.

ABARA, a town in the Greater Armenia, under the dominion of the Turks: it is often the residence of the archbishop of Nakhivan, from which place it is twenty miles north. Long. 46. 25. Lat. 39. 45.

ABARANER, a town of Asia, in Grand Armenia, belonging to the Turks. It is seated on the river Alin-gena, twenty miles north of Nakhivan. Long. 46. 30. Lat. 39. 50.

ABARIM, high mountains of steep ascent, separating the country of the Ammonites and Moabites from the land of Canaan, where Moses died. According to Josephus, they stood opposite to the territory of Jericho, and were the last station but one of the Israelites coming from Egypt. Nebah and Pisgah were parts of these mountains.

ABARIS, the Hyperborean; a celebrated sage of antiquity, whose history and travels have been the subject of much learned discussion. Such a number of fabulous stories* were told of him, that Herodotus himself seems to scruple to relate them. He tells us only†, that this Barbarian was said to have travelled with an arrow, and took no sustenance; but this does not acquaint us with the marvellous properties which were attributed to that arrow; nor that it had been given him by the Hyperborean Apollo. With regard to the occasion of his leaving his native country, Harporation‡ tells us, that the whole earth being infected with a deadly plague, Apollo, upon being consulted, gave no other

answer, than that the Athenians should offer up prayers in behalf of all other nations: upon which, several countries deputed ambassadors to Athens, among whom was Abaris the Hyperborean. In this journey, he renewed the alliance between his countrymen and the inhabitants of the island of Delos. It appears that he also went to Lacedæmon; since, according to some writers||, he there built a temple consecrated to Proserpine the Salutary. It is asserted, that he was capable of foretelling earthquakes, driving away plagues, laying storms †, &c. He wrote several books, as Suidas† informs us, viz. Apollo's arrival into the country of the Hyperboreans; The nuptials of the river Hebrus; *Θεγονια*, or the Generation of the Gods; A collection of oracles; &c. Himerius* the sophist applauds him for speaking pure Greek; which attainment will be no matter of wonder to such as consider the ancient intercourse there was between the Greeks and Hyperboreans.—If the Hebrides, or Western Islands of Scotland, (says Mr Toland†), were the Hyperboreans of Diodorus‡, then the celebrated Abaris was of that country; and likewise a druid, having been the priest of Apollo. Suidas, who knew not the distinction of the insular Hyperboreans, makes him a Scythian; as do some others, misled by the same vulgar error; though Diodorus has truly fixed his country in an island, and not on the continent. And indeed the fictions and mistakes concerning our Abaris are infinite: however, it is by all agreed that he travelled quite over Greece, and from thence into Italy, where he conversed familiarly with Pythagoras, who favoured him beyond all his disciples, by instructing him in his doctrines (especially his thoughts of nature) in a plainer and more compendious method than he did any other. This distinction could not but be very advantageous to Abaris. The Hyperborean, in return, presented the Samian, as though he equalled Apollo himself in wisdom, with the sacred arrow, on which the Greeks have fabulously related* that he sat astride, and flew upon it, through the air, over rivers and lakes, forests and mountains; in like manner as our vulgar still believe, particularly those of the Hebrides, that wizards and witches fly whithersoever they please on their broomsticks. The orator Himerius above mentioned, tho' one of those who, from the equivocal sense of the word Hyperborean, seem to have mistaken Abaris for a Scythian, yet describes his person accurately, and gives him a very noble character. "They relate (says he) that Abaris the sage was by nation an Hyperborean, appeared a Grecian in speech, and resembled a Scythian in his habit and appearance. He came to Athens, holding a bow in his hand, having a quiver hanging on his shoulders, his body wrapt up in a plad, girt about the loins with a gilded belt, and wearing trowsers reaching from his waste downward." By this it is evident (continues Mr Toland) that he was not habited like a Scythian, who were always covered with skins; but appeared in the native garb of an Aboriginal Scot. As to what relates to his abilities, Himerius informs us, that "he was affable and pleasant in conversation, in dispatching great affairs secret and industrious, quick-sighted in present exigencies, in preventing future dangers circumspicacious, a searcher after wisdom, desirous of friendship, trusting indeed little to fortune, and having every thing

“ thing trusted to him for his prudence.” Neither the Academy nor the Lyceum could have furnished a man with fitter qualities to travel so far abroad, and to such wife nations, about affairs no less arduous than important. And if we further attentively consider his moderation in eating, drinking, and the use of all those things which our natural appetites incessantly crave; joining the candour and simplicity of his manners with the solidity and wisdom of his answers, all which we find sufficiently attested; it must be owned, that the world at that time had few to compare with Abaris.

ABARTICULATIO, in anatomy, a species of articulation admitting of a manifest motion; called also *Diarthrosis*, and *Dearticulation*, to distinguish it from that sort of articulation which admits of a very obscure motion, and is called *Synarthrosis*. See **ARTICULATIO**.

ABAS, a weight used in Persia for weighing pearls. It is 1-8th less than the European carat.

ABAS, in the heathen mythology, was the son of Hypothoon and Meganira, who entertained Ceres, and offered a sacrifice to that goddess; but Abas ridiculing the ceremony, and giving her opprobrious language, she sprinkled him with a certain mixture the held in her cup, on which he became a newt or water-lizard.

ABAS (Schah) the Great, was third son of Codabendi, 7th king of Persia, of the race of the Sophis. Succeeding to his father at 18, in 1585, he found the affairs of Persia at a low ebb, occasioned by the conquests of the Turks and Tartars. He regained several of the provinces they had seized; but death put a stop to his victories in 1629, after a reign of 44 years. He was the greatest prince that had reigned in Persia for many ages; and it was he who made Ispahan the metropolis of Persia: his memory is held in the highest veneration among the Persians.

ABAS (Schah) his grandson, 9th king of Persia, of the race of the Sophis, succeeded his father Sefi at 13 years of age: he was but 18 when he made himself master of the city Candahar, which had surrendered in his father's reign to the Great Mogul, and all the province about it; and he preserved it afterwards against this Indian emperor, though he besieged it more than once with an army of 300,000 men. He was a very merciful prince, and openly protected the Christians: he had formed a design of extending the limits of his kingdom toward the north, and had for that effect levied a powerful army; but death put a stop to all his great designs, at 37 years of age, in 1666.

ABASCIA, or **ABCAS**, a country in Asia, tributary to the Turks, situated on the coast of the Black Sea. The people are poor, thievish, and treacherous, insomuch that there is no trading with them without the utmost caution. Their commodities are furs, buck and tyger skins, linen yarn, boxwood, and bees-wax; but their greatest traffic is in selling their own children, and even one another, to the Turks; insomuch that they live in perpetual distrust. They are destitute of many necessities of life, and have nothing among them that can be called a town; though we find Anacopia, Dandar, and Czekorni, mentioned in the maps. They have the name of Christians; but have nothing left but the name, any more than the Mingrelians their northern neighbours. The men are robust and active, and the women are fair and beautiful; on which account the Turks have a great value for the female slaves which they

purchase from among them. Their customs are much the same as those of the **MINGRELIANS**; which see. E. Long. from 39 to 43. Lat. from 43 to 45.

ABASSI, or **ABASSIS**, a silver coin current in Persia, equivalent in value to a French livre, or tenpence halfpenny Sterling. It took its name from Schah Abas II. king of Persia, under whom it was struck.

ABATAMENTUM, in law, is an entry to lands by interposition, *i. e.* when a person dies seized, and another who has no right enters before the heir.

To ABATE, (from the French *abatre*, to pull down, overthrow, demolish, batter down, or destroy), a term used by the writers of the English common-law both in an active and neutral sense; as, To abate a castle, is to beat it down. To abate a writ, is, by some exception, to defeat or overthrow it. A stranger abateth; that is, entereth upon a house or land void by the death of him that last possessed it, before the heir takes possession, and so keepeth him out: wherefore, as he that putteth out him in possession is said to disfeize, so he that steppeth in between the former possessor and his heir is said to abate. In the neuter signification thus: The writ of the demandant shall abate; that is, shall be disabated, frustrated, or overthrown. The appeal abateth by covin; that is, the accusation is defeated by deceit.

ABATE, in the manege, implies the performing any downward motion properly. Thus a horse is said to abate or take down his curvets, when he puts both his hind legs to the ground at once, and observes the same exactness in all the times.

ABATEMENT, in heraldry, an accidental figure supposed to have been added to coats-of-arms, in order to denote some dishonourable demeanour or stain, whereby the dignity of the coat-armour was rendered of less esteem. See **HERALDRY**, n^o 12, l.

ABATEMENT, in law. See **To ABATE**.

ABATEMENT, in the customs, an allowance made upon the duty of goods, when the quantum damaged is determined by the judgment of two merchants upon oath, and ascertained by a certificate from the surveyor and land-waiter.

ABATIS, an ancient term for an officer of the stables.

ABATOR, in law, a term applied to a person who enters to a house or lands, void by the death of the last possessor, before the true heir.

ABATOS, an island in the lake Mœris, formerly famous for its flax and papyrus. It was the burial-place of Osiris, (Lucan.)

ABAVO, in botany, a synonyme of the *adanfonia* *. * See *Adanfonia*.

ABB, a term, among clothiers, applied to the yarn of a weaver's warp. They also say *Abb-wool* in the same sense.

ABBA, in the Syriac and Chaldee languages, literally signifies a father *, and figuratively, a superior, reputed as a father in respect of age, dignity, or affection. * See *Abbot*. It is also a Jewish title of honour given to some of the class called Tanaites.

ABBADIE (James) an eminent Protestant divine, born at Nay in Bern, in 1654; first educated there under the famous John la Placette, and afterward at the university of Sedan. From thence he went into Holland and Germany, and was minister in the French church of Berlin. He left that place in 1690; came into England; was sometime minister in the French church in the Savoy, London; and was made dean of Killaloe in Ireland. He died at St Mary le Bonne near London, in 1727, aged

Abbas
||
Abbe.

aged 73. He was strongly attached to the cause of king William, as appears in his elaborate defence of the revolution, and his history of the assassination-plot. He had great natural abilities, which he improved by true and useful learning. He was a most zealous defender of the primitive doctrine of the Protestants, as appears by his writings; and that strong nervous eloquence, for which he was so remarkable, enabled him to enforce the doctrines of his profession from the pulpit with great spirit and energy. He published several works in French that were much esteemed; the principal of which are, *A Treatise on the Truth of the Christian Religion*; *The art of Knowing one's Self*; *A Defence of the British Nation*; and, *The History of the last Conspiracy in England*, written by order of king William III.

ABBAS, son of Abdalmothleb, and Mahomet's uncle, opposed his nephew with all his power, esteeming him an impostor and infidel; but in the second year of the hejira, being overcome and made a prisoner at the battle of Bendir in 623, a great ransom being demanded for him, he represented to Mahomet, that his paying it would reduce him to poverty, which would redound to the dishonour of the family. But Mahomet having been informed of Abbas's having secreted large sums of money, asked him after the purses of gold he had left in his mother's custody at Mecca. Abbas, upon this, conceiving him to be really a prophet, embraced his new religion; became one of his principal captains; and saved his life when in imminent danger at the battle of Henain, against the Thakéites, soon after the reduction of Mecca. But besides being a great commander, Abbas was a famous doctor of the Mussulman law, inasmuch that he read lectures upon every chapter of the Koran, as his nephew pretended to receive them one by one from heaven. He died in 652, and his memory is held in the highest veneration among the Mussulmans to this day.

Abul ABBAS, surnamed *Sassah*, was proclaimed khalif; and in him began the Dynasty of the

ABBASSIDES, who possessed the khalifate for 524 years; and there were 37 khalifs of this race who succeeded one another without interruption.

* See *Abbot*. ABBE, in a monastic sense, the same with Abbot *.

ABBE, in a modern sense, is the name of a curious popular character in France, very much mentioned, but very little known, in Britain. The term is not to be rendered in our language, as the existence of the being which it denominates is posterior to the reformation, and no such character was known among the Romanists till about a century and a half ago.

Abbes, according to the strictest definition, are persons who have not yet obtained any precise or fixed settlement in church or state, but most heartily wish for, and would accept of, either, just as it may happen. In the mean while, their privileges are many. They are admissible in all companies, and no degradation to the best, notwithstanding they are sometimes found in the worst. Their dress is rather that of an academic, or of a professed scholar, than of an ecclesiastic; and, never varying in colour, is no incumbrance on the pocket.

These abbes are very numerous, and no less useful. They are, in colleges, the instructors of youth; in private families, the tutors of young gentlemen; and many procure a decent livelihood by their literary and witty compositions of all kinds, from the profoundest philo-

sophy to the most airy romances. They are, in short, a body of men who possess a fund of universal talents and learning, and are incessantly employed in the cultivation of every various branch of literature and ingenuity. No subject whatever escapes them; serious or gay, solid or ludicrous, sacred or profane, all pay tribute to their researches; and as they are conversant in the lowest as well as the highest topics, their fame is equally great in the learned and in the scribbling world.—A distinguishing part of their character, too, though we shall but slightly touch it, is their devotion to the fair sex: whose favourites, in return, they have the honour of being in the most enviable degree; the wit and smartness for which they are usually remarkable, being just the very things that suit the French ladies.—In fine, these abbes are sought after by most people, on various accounts; as they are equally men of business and pleasure, not less expert in the most serious transactions, than fond of enjoying their share of whatever occupies the gay world. Hence they diligently frequent all public spectacles, which are thought incomplete without them; as they compose the most intelligent part of the company, and are the most weighty approvers or condemners of what passes in almost all places.

ABBESE, the superior of an abbey or convent of nuns *. The abbess has the same rights and authority over her nuns, that the abbots regular have over their monks. The sex indeed does not allow her to perform the spiritual functions annexed to the priesthood, where-with the abbot is usually invested; but there are instances of some abbesses who have a right, or rather a privilege, to commission a priest to act for them. They have even a kind of episcopal jurisdiction, as well as some abbots who are exempted from the visitation of their diocessans.

ABBEVILLE, a considerable city of France in Picardy, and the capital of Ponthieu; the river Somme runs through the middle of it, and divides it into two parts. It has a collegiate church and twelve parish-churches, the most considerable of which are St George's and St Giles's, besides a great number of monasteries and nunneries, a bailiwick, and a presidial court. It is a fortified town; the walls are flanked with bastions, and surrounded by large ditches; and it was never yet taken. The country about it is low, marshy, and dirty. It is pretty well peopled, and is famous for its woollen manufactory. It is about fifteen miles east of the British channel, and thips may come from thence by the river Somme to the middle of the town. It is ninety miles almost directly north of Paris. E. Long. 2. 6. Lat. 50. 7.

ABBEY, a monastery, or religious house, governed by a superior under the title of abbot or abbess *.

Abbeys differ from *priories*, in that the former are under the direction of an abbot, and the others of a prior †; but abbot and prior (we mean a prior conventual) are much the same thing, differing in little but the name.

Fauchet observes, that, in the early days of the French monarchy, dukes and counts were called *abbots*, and duchies and counties *abbeyes*. Even some of their kings are mentioned in history under the title of abbots. Philip I. Louis VI. and afterwards the dukes of Orleans, are called abbots of the monastery of St Aignan. The dukes of Aquitaine were called abbots of the monastery of St Hilary, at Poitiers; and the earls of Anjou of St. Aubin, &c.

* See Monk
and Archi-
mandrite.

Monasteries were at first nothing more than religious houses, whither persons retired from the bustle of the world to spend their time in solitude and devotion. But they soon degenerated from their original institution; and procured large privileges, exemptions, and riches. They prevailed greatly in Britain before the reformation; particularly in England: and as they increased in riches, so the state became poor; for the lands, which these regulars possessed, were *in mortua manu*, i. e. could never revert to the lords who gave them. This inconvenience gave rise to the statutes against gifts in *mortmain*, which prohibited donations to these religious houses; and Lord Coke tells us, that several lords, at their creation, had a clause in their grant, that the Donor might give or sell his land to whom he would (*exceptis viris Religiosis & Judais*) excepting Monks and Jews.

These places were wholly abolished in England at the time of the Reformation; Henry VIII. having first appointed visitors to inspect into the lives of the monks and nuns, which were found very disorderly: upon which, the abbots, perceiving their dissolution unavoidable, were induced to resign their houses to the king, who by that means became invested with the abbey-lands: these were afterwards granted to different persons, whose descendants enjoy them at this day: they were then valued at 2,853,000 *l.* per annum, an immense sum in those days.

ABBEY-BOYLE, a town of Ireland, in the county of Roscommon and province of Connaught, twenty-three miles north of Roscommon. W. Long. 8. 32. Lat. 56. 54. It is remarkable for an old abbey.

ABBEY-HOLM, a town in Cumberland, so called from an abbey built there by David king of Scots. It stands on an arm of the sea, and had a market on Saturdays; it has now a fair on October 29, for horses and horned cattle: it is sixteen miles south-west of Carlisle. W. Long. 2. 38. Lat. 54. 45.

ABBOT, or ABBAT, the superior of a monastery of monks erected into an abbey or prelacy *.

* See Abbey
and Abbot.

The name *Abbot* is originally Hebrew, where it signifies father. The Jews call *father*, in their language, *Ab*; whence the Chaldeans and Syrians formed *Abba*; thence the Greeks *αββας*, which the Latins retained, *Abbas*; and hence our *Abbot*, the French *Abbé*, &c. —St Mark and St Paul use the Syriac *Abba* in their Greek, by reason it was then commonly known in the synagogues and the primitive assemblies of the Christians; adding to it, by way of interpretation, the word *father*, *αββα ο πατερ*, “*Abba, father*,” *q. d.* *Abba*, that is to say, Father.—But the name *Ab*, and *Abba*, which at first was a term of tenderness and affection in the Hebrew and Chaldee, became at length a title of dignity and honour: The Jewish doctors affected it; and one of their most ancient books, containing the sayings or apophthegms of divers of them, is entitled *Pirke Abbot*, or *Avoth*; i. e. Chapters of the Fathers. It was in allusion to this affection, that Jesus Christ forbade his disciples to call any man their father on earth; which word St Jerome turns against the superiors of the monasteries of his time, for assuming the title of *Abbots*, or Fathers.

The name *Abbot*, then, appears as old as the institution of monks itself.—The governors of the primitive monasteries assumed indifferently the titles *Abbots*,

and *Archimandrites* *. They were really distinguished from the clergy; though frequently confounded with them, because a degree above laymen.

In those early days, the abbots were subject to the bishops and the ordinary pastors. Their monasteries being remote from cities, built in the farthest solitudes, they had no share in ecclesiastical affairs. They went on Sundays to the parish-church with the rest of the people; or, if they were too remote, a priest was sent them to administer the sacraments; till at length they were allowed to have priests of their own body. The abbot or archimandrite himself was usually the priest: but his function extended no farther than to the spiritual assistance of his monastery; and he remained still in obedience to the bishop. There being among the abbots several persons of learning, they made a vigorous opposition to the rising heresies of those times; which first occasioned the bishops to call them out of their deserts, and fix them about the suburbs of cities, and at length in the cities themselves: from which era their degeneracy is to be dated. The abbots, now, soon wore off their former plainness and simplicity, and began to be looked on as a sort of little prelates. They aspired at being independent of the bishops; and became so insupportable, that some severe laws were made against them at the council of Chalcedon: this notwithstanding, in time many of them carried the point of independency; and got the appellation of *lord*, with other badges of the episcopate, particularly the mitre.

Hence arose new species of distinctions between the abbots. Those were termed *mitred* abbots, who were privileged to wear the mitre, and exercise episcopal authority within their respective precincts, being exempted from the jurisdiction of the bishop. Others were called *croziered* abbots, from their bearing the crozier or pastoral staff. Others were styled *ecumenical* or universal abbots, in imitation of the patriarch of Constantinople: while others were termed *cardinal* abbots, from their superiority over all other abbots.—Among us, the mitred abbots were lords of parliament; and called abbots-foreign, and abbots-general, to distinguish them from the other abbots. And as there were lords abbots, so there were also lords priors, who had exempt jurisdiction, and were likewise lords of Parliament. Some reckon 26 of these lords abbots and priors, that sat in parliament. Sir Edward Coke says, that there were 27 parliamentary abbots, and two priors. In the parliament 20 Rich. II. there were but 25 abbots, and two priors: but in the summons to parliament, anno 4 Ed. III. more are named.

At present, in the Roman-catholic countries, the principal distinctions observed between abbots, are those of *regular* and *commendatory*. The former take the vow and wear the habit of their order; whereas the latter are seculars, though they are obliged by their bulls to take orders when of proper age.

Antiently the ceremony of creating an abbot consisted in cloathing him with the habit called *cuculla*, or cowl; putting the pastoral staff into his hand, and the shoes called *pedales* on his feet; but at present, it is only a simple benediction, improperly called, by some, consecration.

ABBOT is also a title given to others beside the superiors of monasteries: thus bishops, whose sees were formerly abbeyes, are called abbots; as are the superiors of some congregations of regular canons, particularly

Archbishop
Abbot.

cularly that of St Geneviève at Paris; and among the Genoëse, the chief magistrate of their republic formerly bore the title of abbot of the people. It was likewise usual, about the time of Charlemagne, for several lords to assume the title of *count-abbot*, *abba-comites*; and that for no other reason, but because the superintendency of certain abbeyes was committed to them.

ABBOT (George), archbishop of Canterbury, was born October 29, 1562, at Guildford in Surrey. He went through his studies at Oxford, and in 1597 was chosen principal of Univerſity College. In 1599, he was installed dean of Winchester: the year following, he was chosen vice-chancellor of the university of Oxford, and a second time in 1603. In 1604, that translation of the bible now in use was begun by the direction of king James; and Dr Abbot was the second of eight divines of Oxford, to whom the care of translating the whole New Testament (excepting the epistles) was committed. The year following, he was a third time vice-chancellor. In 1608, he went to Scotland with George Hume earl of Dunbar, to assist in establishing an union betwixt the kirk of Scotland and the church of England; and in this affair he behaved* with so much address and moderation, that it laid the foundation of all his future preferment. For king James ever after paid great deference to his advice and counsel; and upon the death of Dr Overton bishop of Litchfield and Coventry, he named Dr Abbot for his successor, who was accordingly consecrated bishop of those two united sees in December 1609. About a month afterwards he was translated to the see of London, and on the second of November thereafter was raised to the archiepiscopal see. His great zeal for the Protestant religion made him a strenuous promoter of the match between the Elector Palatine and the princess Elizabeth; which was accordingly concluded and solemnized the 14th of February 1612, the archbishop performing the ceremony on a stage erected in the royal chapel. In the following year happened the famous case of divorce betwixt the lady Francis Howard, daughter of the earl of Suffolk, and Robert earl of Essex: an affair which has been by many considered as one of the greatest blemishes of king James's reign; but the part acted therein by the archbishop added much to the reputation he had already acquired for incorruptible integrity. The matter was by the king referred to a court of delegates. The archbishop saw plainly, that his Majesty was very desirous the lady should be divorced; but he was, in his own judgment, directly against the divorce. He laboured all he could to extricate himself from this difficulty, by having an end put to the cause by some other way than by sentence: but it was to no purpose; for those who drove on this affair, had got too great power to be restrained from bringing it to the conclusion the king desired. The archbishop prepared a speech, which he intended to have spoken against the nullity of the marriage, in the court at Lambeth; but he did not make use of it, because the king ordered the opinions to be given in few words. He continued, however, inflexible in his opinion against the divorce; and drew up his reasons, which the king thought fit to answer himself. It need scarce be added, that sentence was given in the lady's favour.—In 1618, the king published a declaration, which he ordered to be read in all churches, permitting sports and pastimes on the Lord's

* Heylin's
hist. of Pres-
byterians,
p. 83.

day: this gave great uneasiness to the archbishop; who, happening to be at Croydon when it came thither, had the courage to forbid its being read.—Being now in a declining state of health, the archbishop used in the summer to go to Hampshire for the sake of recreation; and being invited by lord Zouch to hunt in his park at Bramzill, he met there with the greatest misfortune that ever befell him; for he accidentally killed the game-keeper, by an arrow from a cross-bow which he shot at one of the deer. This accident threw him into a deep melancholy; and he ever afterwards kept a monthly fast on Tuesday, the day on which this fatal mischance happened, and he settled an annuity of 20*l*. on the widow*. There were several persons who took an advantage of this misfortune, to lessen him in the king's favour; but his Majesty said, "An angel might have miscarried in this sort." His enemies alledged that he had incurred an irregularity, and was thereby incapacitated for performing the offices of a primate; the king directed a commission to ten persons to inquire into this matter. The result, however, was not satisfactory to his Grace's enemies; it being declared, that, as the murder was involuntary, he had not forfeited his archiepiscopal character. The archbishop thenceforward seldom assisted at the council, being chiefly hindered by his infirmities; but in the king's last illness he was sent for, and attended with great constancy till his Majesty expired on the 27th of March 1625. He performed the ceremony of the coronation of king Charles I. though very infirm and much troubled with the gout. He was never greatly in this king's favour; and the duke of Buckingham being his declared enemy, watched an opportunity of making him feel the weight of his displeasure. This he at last accomplished, upon the archbishop's refusing to license a sermon, preached by Dr Sibthorpe to justify a loan which the king had demanded, and pregnant with principles which tended to overthrow the constitution. The archbishop was immediately after suspended from all his functions as primate; and they were exercised by certain bishops commissioned by the king, of whom Laud, the archb^p's enemy, and afterwards his successor, was one: while the only cause assigned for this procedure was, That the archbishop could not at that time personally attend those services which were otherwise proper for his cognisance and direction. He did not, however, remain long in this situation; for a parliament being absolutely necessary, his Grace was sent for, and restored to his authority and jurisdiction. But not proving friendly to certain rigorous measures adopted by the prevailing church-party, headed by Laud, whose power and interest at court was now very considerable, his presence became unwelcome there; so that upon the birth of the prince of Wales, afterwards Charles II. Laud had the honour to baptize him, as dean of the chapel. The archbishop being worn out with cares and infirmities, died at Croydon, the 5th of August 1633, aged seventy-one years; and was buried at Guildford, the place of his nativity, and where he had endowed an hospital with lands to the amount of 300*l*. per annum. A stately monument was erected over the grave, with the effigy of the archbishop in his robes. He shewed himself, in most circumstances of his life, a man of great moderation to all parties; and was desirous that the clergy should attract the esteem of the laity by the sanctity

Abbot
(Robert)

sanctity of their manners, rather than claim it as due to their function. His notions and principles, however, not suiting the humour of some writers, have drawn upon him many severe reflections; particularly, which is to be regretted, from the earl of Clarendon. But Dr Welwood has done more justice to his merit and abilities *. He wrote several tracts upon various subjects; and, as already mentioned, translated part of the New Testament, with the rest of the Oxford divines, 1611.

* Memoirs,
8vo. 1700.
p. 38.

ABBOT (Robert,) elder brother to the former, and born at Guilford in 1560, went through his studies in Baliol college, Oxford. In 1582, he took his degree of master of arts, and soon became a celebrated preacher; and to this talent he chiefly owed his preferment. Upon his first sermon at Worcester, he was chosen lecturer in that city, and soon after rector of All-saints in the same place. John Stanhope, esq; happening to hear him preach at Paul's-croft, was so pleased with him, that he immediately presented him to the rich living of Bingham in Nottinghamshire. In 1597, he took his degree of doctor in divinity; and, in the beginning of king James's reign, was appointed chaplain in ordinary to his Majesty; who had such an opinion of him as a writer, that he ordered the doctor's book *De Antichristo* to be printed with his own commentary upon part of the Apocalypse. In 1609, he was elected master of Baliol college; which trust he discharged with the utmost care and assiduity, by his frequent lectures to the scholars, by his continual presence at public exercises, and by promoting temperance in the society. In November 1610, he was made prebendary of Normanton in the church of Southwell; and, in 1612, his Majesty appointed him regius professor of divinity at Oxford. The fame of his lectures became very great; and those which he gave upon the supreme power of kings against Bellarmine and Suarez, so much pleased his Majesty, that, when the see of Salisbury became vacant, he named him to that bishoprick, and he was consecrated by his own brother at Lambeth, December 3, 1615. When he came to Salisbury, he found the cathedral running to decay, through the negligence and covetousness of the clergy belonging to it; however, he found means to draw five hundred pounds from the prebendaries, which he applied to the reparation of this church. He then gave himself up to the duties of his function with great diligence and assiduity, visiting his whole diocese in person, and preaching every Sunday whilst health would permit. But this was not long: for his sedentary life, and close application to study, brought upon him the gravel and stone; of which he died on the 2d of March 1618, in the fifty-eighth year of his age; having not filled the see quite two years and three months, and being one of the five bishops which Salisbury had in six years. He was buried opposite to the bishop's seat in the cathedral. Dr Fuller *, speaking of the two brothers, says, "that George was the more plausible preacher, Robert the greatest scholar; George the abler statesman, Robert the deeper divine; gravity did frown in George, and smile in Robert." He published several pieces; and also left behind him sundry manuscripts, which Dr Corbet made a present of to the Bodleian library.

ABBOTS BROMLEY, a town in Staffordshire, with a market on Tuesday. After the dissolution of

the monasteries, it was given to the Lord Paget; and has since been called Paget's Bromley, and is so denominated in the county map. But it retains its old name in the king's books, and is a discharged vicarage of 30*l.* clear yearly value. It likewise retains the old name with regard to the fairs; which are three, and all for horses and horned cattle. They are on the Thursday before Mid-lent Sunday, the 22^d of May, and 24th of August. It is six miles east of Stafford, seven north of Litchfield, and 128 north-west of London. W. Long. 1. 2. Lat. 52. 45.

ABBOTSBURY, a small town in Dorsetshire, with a market on Thursday; seven miles west of Weymouth, seven fourth-west of Dorchester, and a hundred and thirty-three west-by-south of London. The fair is on July the tenth, for sheep and toys. W. Long. 1. 17. Lat. 50. 40. The abbey near this town was founded by a Norman lady, about the year 1026; and Edward the Confessor and William the Conqueror were considerable benefactors to it.

ABBREVIATE of *Adjudications*, in Scots law, an abstract or abridgment of a decret of adjudication, which is recorded in a register kept for that purpose *.

* See *Law*,
Part III.
n^o clixii. 5.

ABBREVIATION. See ABBREVIATURE.

ABBREVIATOR, in a general sense, a person who abridges any large book into a narrower compass.

ABBREVIATORS, a college of 72 persons in the chancery of Rome, who draw up the pope's briefs, and reduce petitions, when granted by him, into proper form for being converted into bulls.

ABBREVIATURE, or ABBREVIATION, properly signifies the substitution of a syllable or letter for a whole word: thus, M. stands for *municipalis*, a handful; and Cong. for *congius*, a gallon.

ABBREVIATURE, in a less proper sense, is used for any mark or character. See CHARACTER.

ABBUTALS, signify the buttings or boundings of land towards any point. Limits were anciently distinguished by artificial hillocks, which were called *butelines*; and hence *butting*. In a description of the site of land, the sides on the breadth are more properly *adjacentes*, and those terminating the length are *abbutantes*; which, in old surveys, were sometimes expressed by *capitare*, to head, whence abbutals are now called *head-lands*.

ABCDARY, or ABCEDARIAN, an epithet given to compositions, the parts of which are disposed in the order of the letters of the alphabet: thus we say, Abecedarian psalms, lamentations, hymns, &c.

ABDALA, the son of Abdalmotheb, was the father of the prophet Mahomet.

ABDALMALEK, the son of Mirvan, and the 5th khalif of the race of the Omniads, surnamed *Rasch al Hegiarat*, i. e. the skinner of a stone, because of his extreme avarice; as also *Aboulzebab*, because his breath was said to be so poisonous as to kill all the flies which rested on his face. Yet he surpassed all his predecessors in power and dominion; for in his reign the Indies were conquered in the east, and his armies penetrated Spain in the west: he likewise extended his empire toward the south, by making himself master of Medina and Mecca. He began his reign in the 65 of the hegira, A. D. 648; reigned 15 years; and four of his sons enjoyed the khalifate one after another.

ABDALMELEK (Ben Zohar), an eminent physician, commonly called by the Europeans *Avenzoor* *.

ABDALMOTHEB, or ABDAL MATEEB, the son of Halmeh, the father of Abdalla, and grandfather of Mahomet the prophet of the Mussulmans, was, it is said, of such wonderful comeliness and beauty, that all women who saw him became enamoured: which may have given occasion to that prophetic light, which, according to the Arabians, shone on the foreheads of him, his ancestors, and descendants; it being certain that they were very handsome and graceful men. He died when Mahomet, of whom he had taken peculiar care, was only 8 or 9 years old; aged, according to some, 110, and according to other writers 120.

ABDALONYMUS, or ABDOLONYMUS, (in classical history), of the royal family of Sidon, and descended from king Cinyras, was contented to live in obscurity, and get his subsistence by cultivating a garden, while Strato was in possession of the crown of Sidon. Alexander the Great having deposed Strato, inquired whether any of the race of Cinyras was living, that he might set him on the throne. It was generally thought that the whole race was extinct: but at last Abdalonymus was thought of, and mentioned to Alexander; who immediately ordered some of his soldiers to fetch him. They found the good man at work, happy in his poverty, and entirely a stranger to the noise of arms, with which all Asia was at that time disturbed; and they could scarcely persuade him that they were in earnest. Alexander was convinced of his high descent, by the dignity that appeared in his person; but was desirous of learning from him in what manner he bore his poverty. "I wish (said Abdalonymus) I may bear my new condition as well: These hands have supplied my necessities: I have had nothing, and I have wanted nothing." This answer pleased Alexander so much, that, besides giving him all that was Strato's, he augmented his dominions, and gave him a large present out of the Persian spoils.

ABDALS, in the Eastern countries, a kind of saints supposed to be inspired to a degree of madness. The word comes, perhaps, from the Arabic, *Abdallah*, the servant of God. The Persians call them *devanah khoda*, similar to the Latins way of speaking of their prophets and sibyls, *q. d. furentes deo*, raging with the god. They are often carried by excess of zeal, especially in the Indies, to run about the streets, and kill all they meet of a different religion; of which travellers furnish many instances. The English call this, *running a mad*, from the name of the instrument, a sort of pignard, which they employ on those desperate occasions. If they are killed, as it commonly happens, before they have done much mischief, they reckon it highly meritorious; and are esteemed, by the vulgar, martyrs for their faith.

ABDERA, a maritime town of Thrace, not far from the mouth of the river Nessus, on the east side; (Strabo.) The foundation thereof, according to Herodotus, was attempted to be laid by Timachus the Clazomenian; but he was forced by the Thracians to quit the design. The Teians undertook it, and succeeded; settling there, in order to avoid the insults of the Persians. —Several singularities are told of Abdera *. The grass of the country round it was so strong, that such horses as eat of it ran mad. In the reign of Cassander king of

Macedon, this city was so pestered with frogs and rats, that the inhabitants were forced to quit it for a time. —The Abderites, or Abderitani, were very much derided for their want of wit and judgment: yet their city has given birth to several eminent persons; as, Protagoras, Democritus, Anaxarchus, Hecateus the historian, Nicænetus the poet, and many others, who were mentioned among the illustrious men. —In the reign of Lyfimaachus, Abdera was afflicted for some months with a most extraordinary disease †: this was a burning fever, whose crisis was always on the seventh day, and then it left them; but it so distracted their imaginations, that they fancied themselves players. After this, they were ever repeating verses from some tragedy, and particularly out of the *Andromeda* of Euripides, as if they had been upon the stage; so that many of these pale, meager actors were pouring forth their tragic exclamations in every street. This delirium continued till the winter following; which was a very cold one, and therefore fitter to remove it. Lucian, who has described this disease, endeavours to account for it this manner: Archelaus, an excellent player, acted the *Andromeda* of Euripides before the Abderites, in the height of a very hot summer. Several had a fever at their coming out of the theatre; and as their imaginations were full of the tragedy, the delirium which the fever raised represented perpetually *Andromeda*, *Perseus*, *Medusa*, &c. and the several dramatic incidents, and called up the ideas of those objects, and the pleasure of the representation, so strongly, that they could not forbear imitating Archelaus's action and declamation: And from thence the fever spread to others by infection.

ABDEST, a Persian word, properly signifying the water placed in a basin for washing the hands; but is used to imply the legal purifications practised by the Mahometans before they enter on their religious ceremonies.

ABDIAS of Babylon, one of the boldest legend-writers, who boasted he had seen our Saviour, was one of the 72 disciples, had been eye-witness of the actions and prayers at the deaths of several of the apostles, and had followed into Persia. St Simon and St Jude, who, he said, made him the first bishop of Babylon. His book entitled *Historia certaminis apostolici*, was published by Wolfgang Lazius, at Basil, 1551; and it as since borne several impressions in different places.

ABDICATION, the action whereby a magistrate, or person in office, renounces and gives up the same before the term of service is expired.

This word is frequently confounded with *resignation*; but differs from it, in that abdication is done purely and simply, whereas resignation is in favour of some third person. It is said to be a renunciation, quitting, and relinquishing, so as to have nothing further to do with a thing; or the doing of such actions as are inconsistent with the holding of it. On king James's leaving the kingdom, and abdicating the government, the lords would have had the word *desertion* made use of; but the commons thought it was not comprehensive enough, for that the king might then have liberty of returning.

ABDOMEN, in anatomy, is that part of the trunk of the body which lies between the thorax and the bottom of the pelvis. See *ANATOMY*, n° 349, &c.

ABDON, one of the Levitical cities in the south of the tribe of Aser. (Joshua.)

ABDON, the son of Hillel, a Pirathonite, succeeded Elon, and judged Israel eight years.

ABDUCTION, a form of reasoning among logicians, which consists in drawing conclusions from certain and undeniable propositions.

ABDUCTION, in surgery, a species of fracture wherein the broken parts of the bone recede from each other.

ABDUCTOR, or ABDUCENT, in anatomy, a name given to several of the muscles on account of their serving to withdraw, open, or pull back, the parts to which they are fixed.

ABEL, second son of Adam and Eve, was a shepherd. He offered to God some of the firstlings of his flock, at the same time that his brother Cain offered fruits of the earth. God was pleased with Abel's oblation, but dissatisfied with Cain's; which so exasperated the latter, that he rose up against his brother and killed him. These are the only circumstances Moses relates of him; though, were we to take notice of the several particulars which curiosity has given birth to on this occasion, they would run to a very great length. But this will not be expected.—It is remarkable, that the Greek churches, who celebrate the feasts of every patriarch and prophet, have not done the same honour to Abel; his name is not to be found in any catalogue of saints or martyrs till the 10th century, nor even in the new Roman martyrology. However, he is prayed to with some other saints in several Roman litanies said for persons who lie at the point of death.

ABELARD (Peter), one of the most famous doctors of the twelfth century, was born at Palais near Nantz, in Britany; he was well learned in divinity, philosophy, and the languages; but was particularly distinguished by his skill in logic, and his fondness for disquisitions, which led him to travel into several provinces in order to give public proof of his acuteness in that science. After having baffled many antagonists, he read lectures in divinity with great applause at Paris; where he boarded with a canon whose name was Fulbert, and who had a very beautiful niece named Heloise. The canon ardently wished to see this young lady make a figure among the learned, and Abelard was made her preceptor: but instead of instructing her in the sciences, he taught her to love. Abelard now performed his public functions very coldly, and wrote nothing but amorous verses. Heloise proving with child, Abelard sent her to a sister of his in Britany, where she was delivered of a son. To soften the canon's anger, he offered to marry Heloise privately; and he was better pleased with the proposal than the piece; who, from a singular excess of passion, chose to be his mistress rather than his wife. She married, however; but was often to protest upon oath that she was single, which provoked the canon to use her ill. Upon this, Abelard sent her to the monastery of Argenteuil; where she put on a religious habit, but did not take the veil. Heloise's relations considering this as a second treachery, hired ruffians, who, forcing into his chamber in the dead of the night, emasculated him. This infamous treatment made him fly to the gloom of a cloister. He assumed the monastic habit in the abbey of St Dennis; but the dis-

orders of that house soon drove him from thence. He was afterwards charged with heresy; but after several persecutions for his religious sentiments, he settled in a solitude in the diocese of Troies, where he built an oratory, to which he gave the name of the Paraclet. He was afterwards chosen superior of the abbey of Ruis in the diocese of Vannes: when the nuns being expelled from the nunnery in which Heloise had been placed, he gave her his oratory; where she settled with some of her sister nuns, and became their prioress. Abelard mixed the philosophy of Aristotle with his divinity, and in 1140 was condemned by the council of Rheims and Sens. Pope Innocent II. ordered him to be imprisoned, his books to be burnt, and forbid him ever teaching again. However, he was soon after pardoned, at the solicitation of Peter the Venerable, who received him into his abbey of Clugny, where he led an exemplary life. He died in the priory of Marcellus at Chalons, April 21, 1142, aged sixty three. His corpse was sent to Heloise, who buried it in the Paraclet. He left several works: the most celebrated of which are those tender letters that passed between him and Heloise, with the account of their misfortunes prefixed; which have been translated into English, and one of them immortalized by the harmony of Mr Pope's numbers.

ABEL-TREE, or ABEL-*TREE*, an obsolete name for a species of the poplar. See *POPULUS*.

ABEL-BETH-MAACHA, called also *Abel-maim*, a town in the tribe of Naphthali, in the north of Canaan, towards Syria, where was a district called Maacha*.

ABELIANS, ABELOITES, or ABELONIANS, in church-history, a sect of heretics mentioned by St Austin †, which arose in the diocese of Hippo in Africa, and is supposed to have begun in the reign of Arcadius, and ended in that of Theodosius. Indeed it was not calculated for being of any long continuance. Those of this sect regulated marriage after the example of Abel; who, they pretended, was married, but died without ever having known his wife. They therefore allowed each man to marry one woman, but enjoined them to live in continence: and, to keep up the sect, when a man and woman entered into this society, they adopted a boy and a girl, who were to inherit their goods, and to marry upon the same terms of not begetting children, but of adopting two of different sexes.

ABELLA, anciently a town of Campania, near the river Clanus. The inhabitants were called Abellani, and said to have been a colony of Chalcidians. The nux Avellana, called also Prænestina, or the hazelnut, takes its name from this town, according to Macrobius. Now *Avella*.

ABELLINUM, anciently a town of the Hirpini, a people of Apulia; distant about a mile from the rivulet Sabbato, between Beneventum and Salernum. Pliny calls the inhabitants Abellinates, with the epithet Propoti, to distinguish them from the Abellinates Mariti. Now *Avellino*. E. Long. 15. 20. Lat. 21.

ABEL-MEHOLA, the country of the prophet Elisha, situate in Manafich, on this side Jordan, between the valley of Jezreel and the village Bethmaela in the plains of Jordan, where the Midianites were defeated by Gideon. Judges, vii. 22.

ABEL-MIZRAIM, called also the Threshing-floor of *Atad*; signifying the lamentation of the Egyptians; in allusion to the mourning for Jacob, Gen.

ABELMOSCH, or ABELMUSCH, in botany, the trivial name of a species of the hibiscus. See HIBISCUS.
ABEL-SATTIM, or SITTIM, a town in the plains of Moab, to the N. E. of the Dead Sea, not far from Jordan, where the Israelites committed fornication with the daughters of Moab: So called, probably, from the great number of fitim-trees there.

ABEN EZRA (Abraham) a celebrated rabbi, born at Toledo in Spain, called by the Jews, The wife, great, and admirable Doctor, was a very able interpreter of the Holy Scriptures; and was well skilled in grammar, poetry, philosophy, astronomy, and medicine. He was also a perfect master of the Arabic. His principal work is, Commentaries on the Old Testament, which is much esteemed: there are printed in Bomberg's and Buxtorf's Hebrew Bibles. His style is clear, elegant, concise, and much like that of the Holy Scriptures: he almost always adheres to the literal sense, and every where gives proofs of his genius and good sense: he, however, advances some erroneous sentiments. The scarcest of all his books is entitled, *Iesud Mora*; which is a theological work, intended as an exhortation to the study of the Talmud. He died in 1174, aged 75.

ABEN MELLER, a learned rabbin, who wrote a commentary on the Old Testament in Hebrew, intitled *The Perfection of Beauty*. This rabbin generally follows the grammatical sense and the opinions of Kimchi. The best edition is that of Holland.

ABENAS, a town of France, in Languedoc and in the lower Vivarais, seated on the river Ardèche, at the foot of the Cevennes, 15 miles north-west of Viviers. E. Long. 4. 43. Lat. 44. 40.

ABENSPERG, a small town of Germany, in the circle and duchy of Bavaria, and in the government of Munich. It is seated on the river Abentz, near the Danube, 13 miles south-west of Ratibon, and 20 east of Ingolstadt. E. Long. 11. 38. Lat. 48. 45.

ABERAVON, a borough-town of Glamorganshire in Wales, governed by a portreeve. It had a market, which is now discontinued: the vicarage is discharged, and is worth 45 l. clear yearly value. It is seated at the mouth of the river Avon, 19 miles south-west of Cowbridge, 75 east of St David's, and 194 west of London. W. Long. 3. 21. Lat. 51. 40.

ABERBROTHICK, or ABERBROTH, one of the royal boroughs of Scotland, situated in the county of Angus, about forty miles N. N. E. of Edinburgh; its W. Long. being 2. 29. and N. Lat. 56. 36. It is seated on the discharge of the little river Brothie into the sea, as the name imports, *Aber* in the British implying such a situation. It is a small but flourishing place, well built, and still increasing. The town has been in an improving state for the thirty last years, and the number of inhabitants greatly augmented; which is owing to the introduction of manufactures. The number, at this time, is said to be about three thousand five hundred: these principally consist of weavers of coarse brown linens, and some sail-cloth; others are employed in making white and coloured threads: the remainder are either engaged in the shipping of the place, or in the necessary and common mechanic trades. The brown linens, or Onaburghs, were manufactured here before any encouragement was given by Government, or the linen company erected at Edin-

burgh. It appears from the books of the stamp-office in this town, that seven or eight hundred thousand yards are annually made in the place, and a small district round. Besides this export and that of thread, much barley and some wheat is sent abroad. The foreign imports are flax, flax-seed, and timber, from the Baltic. The coasting trade consists of coals from Borrowtownells, and lime from Lord Elgin's kilns in Fife.—At this place, in default of a natural harbour, a tolerable artificial one of piers has been formed, where, at spring-tides, which rise here fifteen feet, ships of two hundred tons can come, and of eighty at neap-tides; but they must lie dry at low water. This port is of great antiquity: there is an agreement yet extant between the abbot and the burghers of Aberbrothick, in the year 1194, concerning the making of the harbour. Both parties were bound to contribute their proportions; but the largest fell to the share of the former, for which he was to receive an annual tax payable out of every rood of land lying within the borough.—The glory of this place was the abbey, whose very ruins give some idea of its former magnificence. It was founded by William the Lion in 1178, and dedicated to our celebrated primate Thomas à Becket. The founder was buried here; but there are no remains of his tomb, or of any other, excepting that of a monk, of the name of Alexander Nicol. The monks were of the Tyronensian order; and were first brought from Kells, whose abbot declared those of this place on the first institution to be free from his jurisdiction. The last abbot was the famous Cardinal Beaton, at the same time archbishop of St Andrews, and, before his death, as great and absolute here as Wolsey was in England. King John, the English monarch, granted this monastery most uncommon privileges; for by charter, under his great seal, he exempted it a *totius et consuetudine* in every part of England, except London.

ABERCONWAY, or CONWAY, Caernarvonshire, North-wales; so called from its situation at the mouth of the river Conway. It is a large well-built town; but its castle is now in ruins. It is governed by a mayor and two bailiffs, and has a market on Fridays. It is 229 measured miles from London. W. Lon. 3. 47. Lat. 53. 20.

ABERDEEN, the name of two cities in Scotland, called the *Old* and *New Towns*, situated on the German Ocean, in W. Long. 1. 40. and N. lat. 57. 19.

The Old Town lies about a mile to the north of the Old Town. new, at the mouth of the river Don, over which is a fine bridge, of a single arch, which rests at both sides on two rocks. The old town was formerly the seat of the bishop, and had a large cathedral commonly called *St Machers*. This two very antique spires, and one aisle, which is used as a church, are now the only remains of it. The bishoprick was founded in the time of David I. who translated it from Mortlich in Banffshire to this place. The cathedral had anciently two rows of stone pillars across the church, and three turrets; the steeple, which was the largest of these turrets, rested upon an arch, supported by four pillars. In this cathedral there was a fine library; but, about the year 1560, it was almost totally destroyed. But the capital building is the King's college, on the south side of the town, which is a large and stately fabric.

Aberbro-
thick
||
Aberdeen.

Aberdeen.

fabric. It is built round a square, with cloisters on the south side. The chapel is very ruinous within; but there still remains some wood-work of exquisite workmanship. This was preferred by the spirit of the principal at the time of the reformation, who armed his people and checked the blind zeal of the barons of the Mcarns, who after stripping the cathedral of its roof, and robbing it of the bells, were going to violate this seat of learning. They shipped their sacrilegious booty, with an intention of exposing it to sale in Holland; but the vessel had scarcely gone out of port, but it perished in a storm with all its ill-gained lading. The steeple is vaulted with a double cross arch; above which is an imperial crown, supported by eight stone-pillars, and closed with a globe and two gilded crockets. In the year 1631 this steeple was thrown down by a storm, but was soon after rebuilt in a more stately form. This college was founded in 1494, by William Elphinstone bishop of this place, Lord Chancellor of Scotland in the reign of James III. and Lord Privy Seal in that of James IV. But James IV. claimed the patronage of it, and it has since been called the *King's College*. This college, and the Marishal-college in the New Town, form one university, called the *University of King Charles*. The library is large, but not remarkable for many curiosities. Hector Boethius was the first principal of the college; and sent for from Paris for that purpose, on an annual salary of forty marks Scots, at thirteen pence each. The square tower on the side of the college was built, by contributions from general Monk and the officers under him then quartered at Aberdeen, for the reception of students; of which there are about a hundred belonging to the college, who lie in it.

New Town.

The New Town is the capital of the shire of Aberdeen. For largeness, trade, and beauty, it greatly exceeds any town in the north of Scotland. It is built on a hill or rising ground, and lies on a small bay formed by the Dee, deep enough for a ship of 200 tons. It is about two miles in circumference, and contains 13000 souls, and about 3000 in the suburbs; but the whole number of inhabitants between the bridges Dee and Don, which includes both the Aberdeens, and the interjacent houses or hamlets, is estimated at 20,000. The buildings (which are of granite from the neighbouring quarries) are generally four stories high; and have, for the most part, gardens behind them, which gives it a beautiful appearance. On the high street is a large church, which formerly belonged to the Franciscans. This church was begun by Bp William Elphinstone; and finished by Gavinus Dunbar, Bishop of Aberdeen, about the 1500. Bp Dunbar is said likewise to have built the bridge over the Dee, which consists of seven arches. In the middle of Castle-street is an octagon building, with neat bas-reliefs of the kings of Scotland from James I. to James VII. The town-house makes a good figure, and has a handsome spire in the center. The grammar-school is a low but neat building. Gordon's hospital is handsome; in front is a good statue of the founder: it maintains fortyboys, who are apprenticed at proper ages. The infirmary is a large plain building, and sends out between eight and nine hundred cured patients annually. But the chief public building in the new town is the Marishal-college, founded by George Keith earl of

Marshall, in the year 1593; but since greatly augmented with additional buildings. There are about 140 students belonging to it. In both the Marishal and King's-college the languages, mathematics, natural philosophy, divinity, &c. are taught by very able professors. The convents in Aberdeen were: One of Mathurines, or of the order of the Trinity, founded by William the Lion, who died in 1214; another of Dominicans, by Alexander II.; a third of Observantines, a building of great length in the middle of the city, founded by the citizens and Mr Richard Vais, &c.; and a fourth of Carmelites, or White Friars, founded by Philip de Arbutnot in 1350.

Aberdeen once enjoyed a good share of the tobacco trade; but was at length forced to resign it to Glasgow, which was so much more conveniently situated for it. At present, its imports are from the Baltic, and a few merchants trade to the West Indies and North America. Its exports are stockings, thread, salmon, and oatmeal. The first is a most important article, as appears by the following state of it. For this manufacture, 20,800 pounds worth of wool is annually imported, and 1600 pounds worth of oil. Of this wool is annually made 69,333 dozen pairs of stockings; worth, at an average, 1 *l.* 10 *s.* per dozen. These are made by the country-people, in almost all parts of this great county, who get 4 *s.* per dozen for spinning, and 14 *s.* per dozen for knitting; so that there is annually paid them 62,329 *l.* 14 *s.* There is, besides, about 2000 *l.* value of stockings manufactured from the wool of the county. The thread manufacture is another considerable article, though trifling in comparison of the woollen. The salmon-fisheries on the Dee and the Don are a good branch of trade. About 46 boats, and 130 men, are employed on the fish; and, in some years, 167,000 lb. of fish have been sent pickled to London, and about 930 barrels of salted fish exported to France, Italy, &c. The fishery on the Don is far less considerable.—Aberdeen, with Aberbrothick, Brechin, Montrose, and Inverbarvie, returns one member to Parliament.

ABERDOUR, a small town in Fifeshire, Scotland, on the frith of Forth, about ten miles N. W. of Edinburgh. In old times it belonged to the Viponts; in 1126 was transferred to the Mortimers by marriage, and afterwards to the Douglasses. William, Lord of Liddesdale, furnished the *Flower of chivalry*, in the reign of David II. by charter conveyed it to James Douglas, ancestor of the present noble owner the Earl of Morton. The monks of Incheolm had a grant for a burial-place here from Allan de Mortimer, in the reign of Alexander III. The nuns, usually styled the poor *Clares*, had a convent at this place.

ABERFORD, a market-town in the west riding of Yorkshire, stands in a bottom; and is about a mile long, and indifferently well built. It is near a Roman highway, which is raised very high, and not far from the river Cock; between which and the town there is the foundation of an old castle still visible. The market-day is Wednesday, and it is 181 miles north-by-west from London. W. Long. 2. 45. Lat. 55. 52.

ABERGAVENNY, a large, populous, and flourishing town in Monmouthshire, seated at the confluence of the rivers Uffk and Gavenny. It has a fine bridge.

Aberdeen

bridge over the Uik, consisting of fifteen arches; and being a great thoroughfare from the west part of Wales to Bath, Bristol, Gloucester, and other places, is well furnished with accommodations for travellers. It is surrounded with a wall, and had once a castle. It is governed by a bailiff, a recorder, and twenty-seven burgesses; has two markets, one on Wednesdays, and the other on Fridays; and carries on a considerable trade in flannels, which are brought hither for sale from the other parts of the county. Its fairs are on May 14, for lean horned cattle and sheep; on the first Tuesday after Trinity Sunday, for linen and woollen cloth; and on the 25th of September, for flannels, hogs, and horses. It is 142 miles distant from London. W. Long. 2. 45. Lat. 51. 50.

ABERNETHY (John), an eminent dissenting minister, was the son of Mr John Abernethy a dissenting minister in Colrairie, and was born on the 19th of October 1680. When about nine years of age, he was separated from his parents, his father being obliged to attend some public affairs in London; and his mother, to shelter herself from the mad fury of the Irish rebels, retiring to Derry, a relation who had him under his care, having no opportunity of conveying him to her, took him with him to Scotland; by which means he escaped the hardships he must have suffered at the siege of Derry, where Mrs Abernethy lost all her other children. He afterwards studied at the university of Glasgow, till he took the degree of master of arts; and, in 1708, he was chosen minister of a dissenting congregation at Antrim, where he continued above twenty years. About the time of the Bangorian controversy (for which, see HOADLY), a dissension arose among his brethren in the ministry at Belfast, on the subject of subscription to the Westminster confession; in which he became a leader on the negative side, and incurred the censure of a general synod. Being in consequence deserted by the greatest part of his congregation, he accepted an invitation to settle in Dublin, where his preaching was much admired. He was distinguished by his candid, free, and generous sentiments; and died of the gout in Dec. 1746, in the sixtieth year of his age. He published a volume of sermons on the Divine Attributes; after his death a second volume was published by his friends; and these were succeeded by two other volumes on different subjects: all of which have been greatly admired.

ABERNETHY, a town in Strathern, a district of Perthshire, in Scotland. It is seated on the river Tay, a little above the mouth of the Erne. It is said to have been the seat of the Pictish kings; and was afterwards the see of an archbishop, since transferred to St Andrews. It is now greatly decayed.

ABERRATION, in astronomy, a small apparent motion of the fixed stars discovered by the late Dr Bradley. The discovery was made by accident in the year 1725, when Mr Molyneux and Dr Bradley began to observe the bright star in the head of *Draco*, marked γ by Bayer, as it passed near the zenith, with an instrument made by Mr Graham, in order to discover the parallax of the earth's annual orbit; and, after repeated observations, they found this star, about the beginning of March 1726, to be 20' more southerly than at the time of the first observation. It now indeed seemed to have arrived at its utmost limit southward; because, in

several trials made about this time, no sensible difference was observed in its situation. By the middle of April, it appeared to be returning back again toward the north; and, about the beginning of June, it passed at the same distance from the zenith as it had done in December, when it was first observed: in September following it appeared 39" more northerly than it was in March, just the contrary way to what it ought to appear by the annual parallax of the stars. This unexpected phenomenon perplexed the observers very much; and Mr Molyneux died before the true cause of it was discovered. After this, Dr Bradley, with another instrument more exact and accurately adapted to this purpose, observed the same appearances not only in that but many other stars; and, by the great regularity that appeared in a series of observations made in all parts of the year, the doctor was fully satisfied with regard to the general laws of the phenomena; and therefore endeavoured to find out the cause of them. He was already convinced, that the apparent motion of the stars was not owing to a nutation of the earth's axis. The next thing that offered itself, was an alteration in the direction of the plumb line, with which the instrument was constantly rectified; but this, upon trial, proved insufficient. Then he had recourse to what refraction might do; but here also nothing satisfactory occurred. At last this acute astronomer found, that the phenomena in question proceeded from the progressive motion of light, and the earth's annual motion in its orbit: for he perceived, that if light was propagated in time, the apparent place of a fixed object would not be the same when the eye is at rest, as when it is moving in any other direction, than that of the line passing through the eye and object; and that, when the eye is moving in different directions, the apparent place of the object would be different *.

ABERRATION, in optics, is used to denote that error or deviation of the rays of light, when reflected by a lens or speculum, whereby they are hindered from meeting or uniting in the same point. There are two species of the aberrations of rays, distinguished by their different causes; one arising from the figure of the glass or speculum, the other from the unequal refrangibility of the rays of light. This last species is sometimes called the Newtonian, from the name of its inventor *.

ABERYSTWITH, a market-town of Cardiganshire, in Wales, seated on the Ridal, near its confluence with the Ithwith, where it falls into the sea. It was formerly a walled town; and fortified with a castle, which is now in ruins; and the town itself is gone to decay, for there is scarce a hundred houses remaining. However, it is governed by a mayor and recorder; and sends one member to parliament. It is noted for its fishing trade, and has a good market on Mondays for corn and wool. Its distance from London is 199 miles west-fourth-west. W. Long. 4. 15. Lat. 52. 30.

ABESTA, the name of one of the sacred books of the Persian magi, which they ascribe to their great founder Zoroaster. The abesta is a commentary on two others of their religious books called *Zend* and *Pazend*; the three together including the whole system of the Ignicld, or worshippers of fire.

ABETTOR, a law-term, implying one who encourages another to the performance of some criminal action, or who is art and part in the performance itself.

Aberration

self. Treason is the only crime in which abettors are excluded by law, every individual concerned being considered as a principal. It is the same with *Art-and-part* in the Scots law.

ABEX, a country in High Ethiopia, in Africa, bordering on the Red Sea, by which it is bounded on the east. It has Nubia or Sennar on the north; Sennar and Abyfinia on the west; and Abyssinia on the south. Its principal towns are Suaquem and Arkeko. It is subject to the Turks, and has the name of the Beglerbeg of Habeleth. It is about five hundred miles in length and one hundred in breadth, and is a wretched country; for the heat here is almost insupportable, and the air is so unhealthy, that an European cannot stay long there without the utmost hazard of his life. It is very mountainous, inasmuch that there are many more wild beasts than men. There are forests, in which grow a great number of ebony trees.

ABEYANCE, in law, the expectancy of an estate. Thus if lands be leased to one person for life, with reversion to another for years, the remainder for years is an abeyance till the death of the lessee.

ABGAR, or **ABGARUS**, a name given to several of the kings of Edessa in Syria. The most celebrated of them is one who, it is said, was cotemporary with Jesus Christ; and who having a distemper in his feet, and hearing of Jesus's miraculous cures, requested him, by letter, to come and cure him. Eusebius*, who believed that this letter was genuine, and also an answer our Saviour is said to have returned to it, has translated them both from the Syriac, and asserts that they were taken out of the archives of the city of Edessa. The first is as follows: "Abgarus, prince of Edessa, to Jesus the holy Saviour, who hath appeared in the flesh in the confines of Jerusalem, greeting. I have heard of thee, and of the cures thou hast wrought without medicines or herbs. For it is reported thou makest the blind to see, the lame to walk, lepers to be clean, devils and unclean spirits to be expelled, such as have been long diseased to be healed, and the dead to be raised; all which when I heard concerning thee, I concluded with myself, That either thou wast a God come down from heaven, or the Son of God sent to do these things. I have therefore written to thee, beseeching thee to vouchsafe to come unto me, and cure my disease. For I have also heard that the Jews use thee ill, and lay snares to destroy thee. I have here a little city, pleasantly situated, and sufficient for us both. **ABGARUS.**" To this letter, Jesus, it is said, returned an answer by Ananias, Abgarus's courier, which was as follows: "Blessed art thou, O Abgarus! who hast believed in me whom thou hast not seen; for the scriptures say of me, They who have seen me have not believed in me, that they who have not seen me, by believing, have life. But whereas thou writest to have me come to thee, it is of necessity that I fulfil all things here for which I am sent; and having finished them, to return to him that sent me: but when I am returned to him, I will then send one of my disciples to thee, who shall cure thy malady, and give life to thee and thine. **JESUS.**" After Jesus's ascension, Judas, who is also named Thomas, sent Thaddæus one of the seventy to Abgarus; who preached the gospel to him and his people, cured him of his disorder, and

wrought many other miracles: which was done, says Eusebius, A. D. 43.—Though the above letters are acknowledged to be spurious by the candid writers of the church of Rome; several Protestant authors, as Dr Parker †, Dr Cave §, and Dr Grabe §, have maintained that they are genuine, and ought not to be rejected.

ABGILLUS (John), surnamed Prester John, was son to a king of the Frisii; and, from the austerly of his life, obtained the name of *Prester* or *Priest*. He attended Charlemagne in his expedition to the Holy Land; but instead of returning with that monarch to Europe, it is pretended that he gained mighty conquests, and founded the empire of the Abyssines, called, from his name, the empire of Prester John. He is said to have written the history of Charlemagne's journey into the Holy Land, and of his own into the Indies; but they are more probably trifling romances, written in the ages of ignorance.

ABIANS, anciently a people of Thrace, or (according to some authors) of Scythia. They had no fixed habitations; they led a wandering life. Their houses were waggons, which carried all their possessions. They lived on the flesh of their herds and flocks, on milk, and cheese, chiefly on that of mare's milk. They were unacquainted with commerce. They only exchanged commodities with their neighbours. They possessed lands; but they did not cultivate them. They assigned their agriculture to any who would undertake it, reserving only to themselves a tribute; which they exacted, not with a view to live in affluence, but merely to enjoy the necessaries of life. They never took arms but to oblige those to make good a promise to them by whom it had been broken. They paid tribute to none of the neighbouring states. They deemed themselves exempt from such an imposition; for they relied on their strength and courage, and consequently thought themselves able to repel any invasion. The Abians, we are told, were a people of great integrity. This honourable eulogium is given them by Homer. (Strabo.)

ABIATHAR, high-priest of the Jews, son to Abimelech, who had borne the same office and received David into his house. This so enraged Saul, who hated David, that he put Abimelech to death, and 81 priests; Abiathar alone escaped the massacre. He afterwards was high-priest; and often gave King David testimonies of his fidelity, particularly during Abalom's conspiracy, at which time Abiathar followed David, and bore away the ark. But after this, conspiring with Adonijah, in order to raise him to the throne of king David his father; this so exasperated Solomon against him, that he dethroned him of the priesthood, and banished him, A. M. 3021, before Christ 1014.

ABIB, signifying an ear of corn, a name given by the Jews to the first month of their ecclesiastical year, afterwards called *Nisan*. It commenced at the vernal equinox; and according to the course of the moon, by which their months were regulated, answered to the latter part of our March and beginning of April.

ABIDING by writings, in Scots law: When a person founds upon a writing alleged to be false, he may be obliged to declare judicially, whether he will stand or abide by it as a true deed. As to the consequence of abiding by, or passing from, a false deed, see *LAW*, Part III. N^o clxxvi. 32.

Abies,
the Fir-tree.

characters of which are, There are male and female flowers on the same tree; the male flowers have em-palements of four leaves without petals, many stamens, and naked summits. The female flowers are collected in a scaly cone, each scale covering two flowers having neither petals or stamens, with one pointal, and are each succeeded by a winged nut. The distinguishing character of this genus, is the leaves arising singly from their base; whereas the Pines have two or more arising from the same point.

The Fir has always been separated from the Pines by all writers on botany before Dr Linnæus; and were generally distinguished therefrom, by their leaves being produced singly on the branches; the leaves of the Pines being produced by pairs, threes, or fives, out of sheaths which surround their base. And as this distinction is now well known among the nursery-gardeners, it is much better to keep them separate, than to join them, with the cedar of Libanus and larch-tree, to the Pine, as the doctor has done, making them of one genus; especially as the culture of them is very different. See PINUS.

Species de-
scribed.

The following species are now in the British gardens.

1. *Picea*, or the silver or yew-leaved fir, grows naturally in many parts of Germany, but the finest trees of this sort are growing upon mount Olympus. The Strasburgh turpentine is drawn from this tree. The wood is white and soft, and therefore not greatly esteemed. 2. *Alba*, or the spruce or Norway fir, sometimes called the pitch-tree, grows naturally on the low lands of Sweden, Norway, and Denmark, or the mountains of Scotland; as also in many other parts of Europe. The wood is very light, white, rots in the air, and crackles in the fire. It is used for making musical instruments, packing-boxes, &c. The Laplanders make ropes of the roots, and employ them for fastening together the thin planks of their portable canoes. The inhabitants of Canada prepare a pleasant and wholesome liquor from the leaves. 3. *Balsamea*, or the balm-of-Gilead fir, so nearly resembles the picea, as scarcely to be distinguished from it after it is grown to a large size. 4. *Canadensis*, or the small-coned American spruce fir, grows naturally in many parts of North America, from whence the cones have been brought to England. The leaves are shorter than those of the spruce fir, but like them in shape; the cones are loose, and about an inch in length. 5. The Newfoundland spruce, is a native of Newfoundland and several other parts of North America; where the inhabitants make three sorts of it, by the titles of Black, White, and Red Spruce. 6. *Americana*, or the American hemlock fir, is also a native of the same country; and in the northern parts grows to be a very large tree: but in Britain the branches spread wide every way, so that there is no appearance of the trees ever arriving to any considerable height. The leaves are short, and shaped very like those of the yew-tree: they are ranged on two sides of the branches only; so they appear flat, like those of the silver fir; but are of a pale green on both sides. The cones are small, loose, and roundish. From most of these fir, the inhabitants of North America collect a clear fragrant turpentine, which they use for curing green wounds; and the physicians there make great use of it internally.

Culture. All the sorts of fir are propagated by seeds. The

Abies,
the Fir-tree.

time for sowing them is about the middle of March, when the season is mild; otherwise it had better be deferred till the end of that month, or the beginning of April. The seeds which are preserved in their cones, will keep good much longer than those which are taken out: but the cones of the silver and balm-of-Gilead firs generally fall to pieces in the autumn, soon after the seeds are ripe; so that if they are not carefully watched, and gathered at that time, the seeds will be lost. The cones of all the sorts of fir open with more ease than those of the pines, and require but little trouble to get out their seeds. If they are spread on a cloth before a fire for a few hours, their scales will open and emit the seeds. They may be sown in pots or boxes filled with light fresh earth, and covered over about half an inch thick with the same earth: these should be placed to an east aspect, where they may have the sun till eleven in the morning. Or if the seeds are sown in a bed of earth, it should be shaded with mats in the middle of the day: for when they are too much exposed to the sun, the surface of the ground will dry so fast (especially in dry seasons) as to hinder the seeds from vegetating; and when the plants begin to appear, if they are not screened from the sun, many of them will be soon destroyed. The seeds must be carefully guarded against mice and birds, who are very fond of them, but particularly when the plants begin to appear; for as they thrust up the cover of the seeds on their top, the birds, in pecking off these covers, destroy the young plants: therefore the surest method is to cover them with nets until the plants have thrown off their husks and expanded their seed-leaves, soon after which they will be out of danger. After the plants have remained in the seed-bed one year, they may be transplanted into beds in rows at five or six inches distance, and the plants in the rows four inches asunder. They must be carefully weeded; and, if the season proves very dry, it will be of service gently to sprinkle them over with water once or twice a week during the hot time of the year. When they have grown two years in these beds, they may then be transplanted into the nursery, placing them in rows at three feet distance, and in the rows a foot asunder. The best season for removing them is in April, just before they begin to shoot. The smaller these trees are planted out where they are to remain, the greater will be their progress, and they will grow to a much larger size than those that are removed at a much greater age.—The wood of all the sorts of fir yet known, being much inferior to that of the Pine*, it is not common to make plantations of them for their timber, but to cultivate them in pleasure-grounds for ornament. With this view, they should be placed so far asunder as to admit the free air between them; otherwise the lower branches will decay, and render the trees unsightly. The great beauty of these trees is their pyramidal form, and their being furnished with lateral branches from about seven feet above the surface of the ground to the top. These branches should be well garnished with leaves: to obtain which, the trees should not be planted nearer than 18 or 20 feet; for when they are closer planted, the under branches soon drop their leaves, and totally decay. The unskilful disposition of these trees has brought them into disrepute with many persons; whereas, if properly placed, they may be made

* See PINUS.

Abigean
||
Abingdon.

made very ornamental to fine feats.—In pruning off the under branches to the designed height, there must be care taken not to cut off too many at the same time; one tier being enough to be displaced in a year. The best time for this operation is in the beginning of September.—The American spruce-firs, planted in light moist ground, grow to a large size, and make a beautiful appearance; and if they are allowed room for their lower branches to spread and extend, they will be garnished with them almost to the ground, forming themselves in a pyramidal figure.—For the medical uses of certain species of the Abies, see MATERIA MEDICA, n° 61.

ABIGEAT, an old law-term, denoting the crime of stealing cattle by droves or herds. This crime was more severely punished than *furtum*, the delinquent being often condemned to the mines, banishment, and sometimes capitally.

ABIHU, brother to Nadab, and son to Aaron. The two former had the happiness to ascend mount Sinai with their father, and there to behold the glory of God: but afterward putting strange fire into their censers, instead of the sacred fire commanded by God, fire rushing upon them killed them. Though all the people bewailed this terrible catastrophe, Moses forbade Aaron and his two sons Eleazar and Ithamar to join in the lamentation.

ABILITY, a term in law, denoting a power of doing certain actions in the acquisition or transferring of property.

ABIMELECH, king of Gerar, a country of the Philistines, cotemporary with Abraham. This patriarch and his family being there, his wife Sarah, though 90 years of age, was not safe in it; for Abimelech carried her off, and was so enamoured of her, that he resolved to marry her. Abraham did not declare himself Sarah's husband; but gave out she was his sister. But the king being warned in a dream, that she was married to a prophet, and that he should die if he did not restore her to Abraham, the king obeyed: at the same time reproving Abraham for his dissimulation; who thereupon, among other excuses, said she was really his sister, being born of the same father, tho' of a different mother. Abimelech afterwards gave considerable presents to Abraham; and a covenant, that of Beerseba, was entered into between them.—After the death of Abraham, there being a famine in the neighbouring countries, Isaac his son also withdrew into Gerar, which was then likewise governed by a king called

ABIMELECH, probably the successor of the former. Here Rebekah's beauty forced her husband to employ Abraham's artifice. Abimelech discovering that they were nearer related, chid Isaac for calling his wife his sister; and, at the same time, forbid all his subjects, upon pain of death, to do the least injury to Isaac or Rebekah.—Isaac's prosperity lost him the king's friendship, and he was desired to go from among them. He obeyed; but Abimelech afterward entered into a covenant with him.

ABIMELECH, the natural son of Gideon, by Druma his concubine. His violent acts and death are recorded in Judges, chap. ix.

ABINGDON, a market-town in Berkshire, seated on a branch of the Thames, received its name from an abbey anciently built there. The streets, which are well paved, centre in a spacious area, in which the

Vol. I.

Abingdon
||
Abblactation.

market is held; and in the centre of this area is the market-house, which is supported on lofty pillars, with a large hall of free-stone above, in which the summer-azizes for the county are held, and other public business done, the Lent azizes being held at Reading. It has two churches; one dedicated to St Nicholas, and the other to St Helena: the latter is adorned with a spire, and both are said to have been erected by the abbots of Abingdon. Here are also two hospitals, one for six, and the other for thirteen poor men, and as many poor women; a free school; and a charity-school. The town was incorporated by queen Mary; and is governed by a mayor, two bailiffs, and nine aldermen: it sends two members to parliament, who are chosen by the inhabitants at large not receiving alms. Its great manufacture is malt, large quantities of which are sent by water to London. The market-days are on Monday and Friday; and it hath four fairs for horses and other cattle, on the first Monday in Lent, on June 20, on September 19, and on December 11. It is six miles and a half south of Oxford, forty-seven east of Gloucester, and fifty-five west of London. Long. 1. 20. Lat. 51.

AB-INTESTATE, in the civil law, is applied to a person who inherits the right of one who died intestate or without making a will. See INTESTATE.

ABIRAM, a seditious Levite, who, in concert with Korah and Dathan, rebelled against Moses and Aaron, in order to share with them in the government of the people; when Moses ordering them to come with their censers before the altar of the Lord, the earth suddenly opened under their feet, and swallowed up them and their tents; and at the same instant fire came from heaven, and consumed two hundred and fifty of their followers. Numb. xvi.

ABISHAI, son of Zeruiah, and brother to Joab, was one of the celebrated warriors who flourished in the reign of David: he killed with his own hand three hundred men, with no other weapon but his lance; and slew a Philistine giant, the iron of whose spear weighed three hundred shekels. 1 Sam. xxvi. 2 Sam. xxiii.

ABJURATION, in our ancient customs, implied an oath, taken by a person guilty of felony, and who had fled to a place of sanctuary, whereby he solemnly engaged to leave the kingdom for ever.

ABJURATION, is now used to signify the renouncing, disclaiming, and denying upon oath, the Pretender to have any kind of right to the crown of these kingdoms.

ABJURATION *of heresy*, the solemn recantation of any doctrine as false and wicked.

ABLACTATION, or weaning a child from the breast. If the mother or nurse has enough of milk, a child will need little or no other food before the second or third month of its age; when it will be proper to give it, once or twice a-day, a little water-pap; and as it grows older, it may be fed oftener, and have its panada sometimes mixed with milk. This will accustom the child by degrees to take food, and will render the weaning both less difficult and less dangerous. Weaning, unless when silemments, weakness, or such like circumstances, forbid, ought generally to take place about the sixth or seventh month, at farthest by the ninth or tenth. The child ought then to be fed four or five times a-day; but should never be accustomed to eat in the night. The food should be simple

C

and

Ablactation
||
Abblution.

and light; not spoiled with sugar, wine, and such like additions, for they produce the diseases that children are most troubled with. Unfermented flour makes a viscid food that turns four before it digests, and well fermented bread soon turns four; but if the panada made of this latter be given new, the inconvenience of souring is prevented. To prevent acidity in the child's stomach by a daily use of vegetable food, give now and then a little fresh broth, made from either veal, mutton, or beef. Rice is not so apt to turn four as wheat bread is; it therefore would be a more convenient food for children, and deserves to be attended to. Toasted bread boiled in water till it is almost dry, then mixed with fresh milk not boiled, is an agreeable change. As the teeth advance, the diet may increase in its solidity. As to the quantity, let the appetite be the measure of it; observing to satisfy hunger, but no more; which may be thus managed, Feed the child no longer than he eats with a degree of eagerness: but children may at all times be allowed good light bread to chew as much as they please. Butter ought by all means to be denied them; as it both relaxes the stomach, and produces gross humours. In place of this, let them be used as early as possible with honey; which is cooling, cleansing, tends to sweeten the humours, prevents or destroys worms, and renders children less subject to scabbed head and other cutaneous disorders. In feeding, let the child be held in a sitting posture, and that until the stomach has nearly digested its contents; the too common practice of violently dancing and shaking the child should be avoided. Divert it during the day as much as possible, which will make it sleep soundly all the night. Never awaken a child when it is asleep, for thus fickleness and peevishness are often produced.

* See Grafting.

ABLACTATION, among the ancient gardeners, the same with what is called *grafting by approach* *.

ABLAÏ, a country of Great Tartary, the inhabitants of which, called Buchars or Buchares, are subject to Russia, but that only for protection. It lies eastward of the river Irty, and extends five hundred leagues along the southern frontiers of Siberia.

ABLAQUEATION, an old term in gardening, signifies the operations of removing the earth and baring the roots of trees in winter, to expose them more freely to the air, rain, snows, &c.

ABLATIVE, is the 6th case in Latin grammar, and peculiar to that language. It is opposed to the dative, which expresses the action of *giving*, the ablative expressing that of *taking away*.

ABLECTI, in Roman antiquity, a select body of soldiers chosen from among those called *Extraordinarii* *.

* Which see.

ABLEGMINA, in Roman antiquity, those choice parts of the entrails of victims, which were offered in sacrifice to the gods. They were sprinkled with flour, and burnt upon the altar; the priests pouring some wine on them.

ABLUMENTS, in medicine, the same with diluters. **ABLUTION**, in a general sense, signifies the washing or purifying something with water.

ABLUTION, in a religious sense, a ceremony in use among the ancients, and still practised in several parts of the world: it consisted in washing the body, which was always done before sacrificing, or even entering their houses.—Ablutions appear to be as old as any ceremonies, and external worship itself. Moses enjoined them;

the heathens adopted them; and Mahomet and his followers have continued them: thus they have got footing among most nations, and make a considerable part of most established religions. The Egyptian priests had their diurnal and nocturnal ablutions; the Grecians their sprinklings; the Romans their lustrations and lavations; the Jews their washing of hands and feet, beside their baptisms. The ancient Christians had their ablutions before communion; which the Romish church still retain before their mass, sometimes after the Syrians, Copts, &c. have their solemn washings on Good-Friday: the Turks their greater and lesser ablutions; their Ghast and Wodou, their Aman, Taharat, &c.

ABNER, the son of Ner, father-in-law to Saul, and general of all his forces, who served him on all occasions with fidelity and courage. After the death of that prince, Abner set Ishbosheth, Saul's son, on the throne. A war breaking out between the tribe of Judah who had elected David king, and Israel, Abner marched against that prince with the flower of his troops, but was defeated. Abner afterward, being disaffected, went over to David, and disposed the chiefs of the army and the elders of Israel to declare for him; and was received by David with such testimonies of affection, as gave umbrage to Joab, who killed him traitorously.

ABNOBA, now **ABENOW**, a long range of mountains in Germany, taking different names according to the different countries they run through. As about the river Maine, called the *Oden* or *Otterwald*; between Hesse and Franconia, the *Spessart*; and about the duchy of Wirtenberg, where the Danube takes its rise, called the *Boar*.

ABO, a maritime town in Sweden: it is the capital of the province of Finland, and is seated in the gulph of that name, at the mouth of the river Aurajoki. It is a good port; and is the see of a bishop, suffragan of Upsal. It has also an university, founded by queen Christina in 1640. It lies 120 miles north-east from Stockholm. E. Long. 21. 28. Lat. 60. 50.

ABOARD, the inside of a ship. Hence any person who enters a ship is said to *go aboard*: but when an enemy enters in the time of battle, he is said to *board*; a phrase which always implies hostility.—To *fall aboard* of, is to strike or encounter another ship when one or both are in motion, or to be driven upon a ship by the force of the wind or current.—*Aboard-main-tack*, the order to draw the main-tack, i.e. the lower corner of the main-sail, down to the chefs-tree. See **CHEFS-TREE**.

ABOLITION, implies the act of annulling, destroying, making void, or reducing to nothing. In law, it signifies the repealing any law or statute.

ABOLLA, a warm kind of garment, lined or doubled, worn by the Greeks and Romans, chiefly out of the city, in following the camp.—Critics and antiquaries are greatly divided as to the form, use, kinds, &c. of this garment. Papias makes it a species of the toga, or gown; but Nonius, and the generality, a species of the pallium, or cloak. The *abolla* seems rather to have stood opposed to the *toga*, which was a garment of peace, as the *abolla* was of war; at least Varro and Martial place them in this opposite light. There seem to have been different kinds of *abollas*, fitted to different occasions. Even kings appear to have used the *abolla*: Caligula was affronted at king Ptolemy for appearing

parative A-
natomy, pp.
88, 89,
90.

ABOMASUS, ABOMASUM, or ABOMASIVS, names of the fourth stomach of ruminating animals*.

ABOMINATION, a term used in scripture with regard to the Hebrews, who, being shepherds, are said to have been an abomination to the Egyptians, because they sacrificed the sacred animals of that people, as oxen, goats, sheep, &c. which the Egyptians esteemed as abominations, or things unlawful. The term is also applied in the sacred writings to idolatry and idols, because the worship of idols is in itself an abominable thing, and at the same time ceremonies observed by idolaters were always attended with licentiousness and other odious and abominable actions. The *abomination of desolation*, foretold by the prophet Daniel, is supposed to imply the statue of Jupiter Olympius, which Antiochus Epiphanes caused to be placed in the temple of Jerusalem. And the *abomination of desolation*, mentioned by the Evangelists, signifies the ensigns of the Romans, during the last siege of Jerusalem by Titus, on whom the figures of their gods and emperors were embroidered, and placed upon the temple after it was taken.

ABON, ABONA, or ABONIS, (Antonie;) a town and river of Albion. The town, according to Camden, is Abington; and the river Abhon or Avon. But by Antonine's Itinerary, the distance is nine miles from the Venta Silurum, or Caer-Went: others, therefore, take the town to be Porflut, at the mouth of the river Avon, over against Bristol. Abhon or Avon, in the Celtic language, denotes a river.

ABOR, CHABOR, or HABOR, a district in Assyria, on the river Gozan, bounding on Media, 2 Kings xvii.

ABORIGINES, (Dionysius of Halicarnassus, Livy, Virgil;) originally a proper name, given to a certain people in Italy, who inhabited the ancient Latium, or country now called *Campagna di Roma*. In this sense the Aborigines are distinguished from the Janigenæ, who, according to the false Berofus, inhabited the country before them; from the Siculi, whom they expelled; from the Grecians, from whom they descended; from the Latins, whose name they assumed after their union with Æneæ and the Trojans; lastly, from the Ausonii, Volsci, Oenotrii, &c. neighbouring nations in other parts of the country.—Whence this people came by the appellation, is much disputed. St Jerom says, they were so called as being, *absque origine*, the primitive planters of the country after the flood: Dion. of Halicarnassus accounts for the name, as denoting them the founders of the race of inhabitants of that country: others think them so called, as being originally Arcadians, who claimed to be earth-born, and not descended from any people. Aurelius Victor suggests another opinion, viz. that they were called *Aborigines*, q. d. *Aberrigines*, from *ab*, from, and *errare*, to wander; as having been before a wandering people. Pausanias rather thinks they were thus called *απο γης*, from *mountains*; which opinion seems confirmed by Virgil, who, speaking of Saturn, the legislator of this people, says,

*Is genus indocile ac dispersum montibus altis
Composuit, legesque dedit.*—

The Aborigines were either the original inhabitants of the country, settled there by Janus, as some imagine; or by Saturn, or Cham, as others; not long after the dispersion, or even, as some think, before it: or they were a colony sent from some other nation; who expelling the ancient inhabitants the Siculi, settled in their place.—About this mother-nation there is great dispute. Some maintain it to be the Arcadians, parties of whom were brought into Italy at different times; the first under the conduct of Oenotrius, son of Lyacon, 450 years before the Trojan war; a second from Theffaly; a third under Evander, 60 years before the Trojan war: besides another under Hercules; and another of Lacedæmonians, who fled from the severe discipline of Lycurgus: all these uniting, are said to have formed the nation or kingdom of the Aborigines. Others will have them of barbarian rather than Grecian origin, and to have come from Scythia; others from Gaul. Lastly, others will have them to be Canaanites, expelled by Joshua.

ABORTION, in midwifery, the birth of a fœtus before it has acquired a sufficient degree of perfection to enable it to perform respiration and the other vital functions*.

The practice of procuring abortions was prohibited by the ancient Greek legislators Solon and Lycurgus. Whether or not it was permitted among the Romans, has been much disputed. It is certain the practice, which was by them called *visceribus vim inferre*, was frequent enough: but whether there was any penalty on it, before the emperors Severus and Antonine, is the question. Noodt maintains the negative; and further, that those princes only made it criminal in one particular case, viz. of a married woman's practising it out of resentment against her husband, in order to defraud him of the comfort of children: this was ordered to be punished by a temporary exile. The foundation on which the practice is said to have been allowed, was, that the fœtus, while *in utero*, was reputed as a part of the mother, ranked as one of her own viscera, over which she had the same power as over the rest: besides, that it was not reputed as a man, *homo*; nor to be alive, otherwise than as a vegetable: consequently, that the crime amounted to little more than that of plucking unripe fruit from the tree. Seneca represents it as a peculiar glory of Helvia, that she had never, like other women, whose chief study is their beauty and shape, destroyed the fœtus in her womb. The primitive fathers, Athenagoras, Tertullian, Minutius Felix, Augustin, &c. declaimed loudly against the practice as virtual murder. Several councils have condemned it. Yet we are told that the modern Romish ecclesiastical laws allow of dispensations for it. Egan mentions the rates at which a dispensation for it may be had.—In some countries, the procuring of abortions is still said not only to be allowed, but even enjoined by law; as among the Formosans, if Mr Psalmanazar had been to be believed, who relates, that the women there, tho' married, are not allowed to breed before 35 years of age. When with child before that time, they are obliged to make themselves abortive by force: to this end the priestesses (for in that country, according to him, the priestly office belongs to women) tramples on the patient's belly, till the bring forth. But the extraordinary fabrications of this author are now well known*.

manazar.
The

Abortion
||
Abraca-
dabra.

The practice of artificial abortion is chiefly in the hands of women and nurses, rarely in that of physicians; who, in some countries, are not admitted to the profession without abjuring it. Hippocrates, in the oath he would have enjoined on all physicians, includes their not giving the *passus abortivus*: though elsewhere he gives the formal process whereby he himself procured in a young woman a miscarriage. In the Supplement to Chambers's Dictionary, a detail is given of the various methods by which abortions may be procured. But we were unwilling to bestow room upon information which it seemed equally useless and improper to propagate. It may, however, be observed, that often all the powers of art prove ineffectual, and no less often do the attempts prove the means of punishment by the fatal consequences which they produce.

ABORTION, among gardeners, signifies such fruits as are produced too early, and never arrive at maturity.

ABORTIVE, is, in general, applied to whatever comes before its legitimate time, or to a design which miscarries.

ABOU-NAVAS, an Arabian poet of the first class, was born at Balfora; and flourished at the court of Aaron al Rafchid, at the end of the 7th century.

ABOUT, the situation of a ship immediately after she has *tacked*, or changed her course by going about and standing on the other tack*.—*About-ship!* the order to the ship's crew to prepare for tacking.

* See Tack-
ing.

ABOUTIGE, a town in Upper Egypt, in Africa, near the Nile, where they make the best opium in all the Levant. It was formerly a large, but now is a mean place. N. lat. 26. 50.

ABRA, a silver coin struck in Poland, and worth about one shilling Sterling. It is current in several parts of Germany, Constantinople, Africain, Smyrna, and Grand Cairo.

ABRABANEL, ABRABANEL, or AVRAVANEL, (Isaac) a celebrated rabbi, descended from king David, and born at Lisbon A. D. 1437. He became counsellor to Alphonso V. king of Portugal, and afterwards to Ferdinand the Catholic; but in 1492 was obliged to leave Spain with the other Jews. In short, after residing at Naples, Corsica, and several other cities, he died at Venice in 1508, aged 71. Abrabanel passed for one of the most learned of the rabbis; and the Jews gave him the names of the Sage, the Prince, and the Great Politician. We have a Commentary of his on all the Old Testament, which is pretty scarce: he there principally adheres to the literal sense; and his style is clear, but a little diffuse. His other works are, A Treatise on the Creation of the World; in which he refutes Aristotle, who imagined that the world was eternal: A Treatise on the explication of the prophecies relating to the Messiah, against the Christians: A book concerning articles of Faith; and some others less sought after. Though Abrabanel discovers his aversion to Christianity, yet in all his writings he treats the Christians with politeness and good-manners.

ABRACADABRA, a magical word, recommended by Serenus Samonicus as an antidote against agues and several other diseases. It was to be written upon a piece of paper as many times as the word contains letters, omitting the last letter of the former every time, as in the margin†, and repeated in the same order; and then suspended about the neck by a linen thread. *Abracada-*

bra was the name of a god worshipped by the Syrians; Abraham, who wearing his name was a sort of invocation of his aid: a practice which, though not more useful, yet was less irrational, than is the equally heathenish practice among those who call themselves Christians, of wearing various things, in expectation of their operating by a Sympathy, whose parents were Ignorance and Superstition.

ABRAHAM, the father and stock whence the faithful sprung, was the son of Terah. He was descended from Noah by Shem, from whom he was nine degrees removed. Some fix his birth in the 130th year of Terah's age, but others place it in his father's 70th year. It is highly probable he was born in the city of Ur, in Chaldea, which he and his father left when they went to Canaan, where they remained till the death of Terah; after which, Abraham resumed his first design of going to Palestine. The Scriptures mention the several places he stopped at in Canaan; his journey into Egypt, where his wife was carried off from him; his going into Gerar, where Sarah was again taken from him, but restored as before; the victory he obtained over the four kings who had plundered Sodom; his compliance with his wife, who insisted that he should make use of their maid Hagar in order to raise up children; the covenant God made with him, sealed with the ceremony of circumcision; his obedience to the command of God, who ordered him to offer up his only son as a sacrifice, and how this bloody act was prevented; his marriage with Keturah; his death at the age of 175 years; and his interment at the cave of Macpelah, near the body of Sarah his first wife. It would be of little use to dwell long upon these particulars, since they are so well known. But tradition has supplied numberless others, the mention of one or two of which may not be unacceptable.

Many extraordinary particulars have been told relating to his conversion from idolatry. It is a pretty general opinion, that he sucked in the poison with his milk; that his father made statues, and taught that they were to be worshipped as gods*. Some Jewish authors relate†, that Abraham followed the same trade with Terah for a considerable time. Maimonides‡ says, that he was bred up in the religion of the Sabaeans, who acknowledged no deity but the stars; that his reflections on the nature of the planets, his admiration of their motions, beauty, and order, made him conclude there must be a being superior to the machine of the universe, a being who created and governed it: however, according to an old tradition, he did not renounce paganism till the 50th year of his age. It is related||, that his father, being gone a journey, left him to sell the statues in his absence; and that a man, who pretended to be a purchaser, asked him how old he was. Abraham answered, "Fifty."—"Wretch that thou art, (said the other,) for adoring, at such an age, a being which is but a day old!" These words greatly confounded Abraham. Some time afterwards, a woman brought him some flour, that he might give it as an offering to the idols; but Abraham, instead of doing so, took up a hatchet and broke them all to pieces, excepting the largest, into the hand of which he put the weapon. Terah, at his return, asked whence came all this havoc? Abraham made answer, that the statues had had a great contest which should eat first of the oblation; "Upon which, (said he),

Abraham.

ites.

he), the god you see there, being the stoutest, hewed the others to pieces with that hatchet." Terah told him this was bantering; for those idols had not the sense to act in this manner. Abraham retorted these words upon his father against the worshipping of such gods. Terah, stung with this railery, delivered up his son to the cognizance of Nimrod, the sovereign of the country: who exhorted Abraham to worship the fire; and, upon his refusal, commanded him to be thrown into the midst of the flames: "Now let your God (said he) come and deliver you." But (adds the tradition), Abraham came safe and sound out of the flames.—This tradition is not of modern date, since it is told by St Jerom *; who seems to credit it in general, but disbelieves that part of it which makes Terah so cruel as to be the informer against his own son. Perhaps the antiquity of the word *Ur* § might have given rise to the fiction altogether. Such as lay stress on the following words which God says to Abraham, (Gen. xv. 7.), *I am the Lord that brought thee out of Ur of the Chaldees*, imagine that he saved him from a great persecution, since he employed the very same words in the beginning of the decalogue to denote the deliverance from Egypt.

Abraham is said to have been well skilled in many sciences, and to have wrote several books. Josephus * tells us that he taught the Egyptians arithmetic and geometry; and, according to Eupolemus and Artapan, he instructed the Phenicians, as well as the Egyptians, in astronomy. A work which treats of the creation has been long ascribed to him; it is mentioned in the Talmud †, and the Rabbis Chanina and Hofchaia used to read it on the eve before the sabbath. In the first ages of Christianity, according to St Epiphanius ‡, a heretical sect, called Sethinians, dispersed a piece which had the title of *Abraham's Revelation*. Origen mentions also a treatise supposed to be wrote by this patriarch. All the several works which Abraham composed in the plains of Mamre, are said to be contained in the library of the monastery of the Holy cross on Mount Amaria, in Ethiopia §. The book on the creation was printed at Paris 1552, and translated into Latin by Postel: Rittangel, a converted Jew, and professor at Konigsberg, gave also a Latin translation of it, with remarks, in 1642.

ABRAHAM BEN MEIR, or ABEN EZRA. See ABEN EZRA.

ABRAHAM USQUE, a Portuguese Jew, who translated the Bible out of Hebrew into Spanish. It was printed at Ferrara in 1553, and re-printed in Holland in 1630. This Bible, especially the first edition, which is most valuable, is marked with stars at certain words, which are designed to shew that these words are difficult to be understood in the Hebrew, and that they may be used in a different sense.

ABRAHAM (Nicholas), a learned Jesuit born in the diocese of Toul, in Lorrain, in 1589. He obtained the rank of divinity professor in the university of Pont-a-Mousson, which he enjoyed 17 years, and died September 7, 1655. He wrote Notes on Virgil and on Nonnius; A Commentary on some of Cicero's Orations, in 2 vols folio; An excellent collection of theological pieces, in folio, entitled *Pharus Veteris Testamenti*; and some other works.

ABRAHAMITES, an order of monks extermina-

ted for idolatry by Theophilus in the ninth century. Also the name of another sect of heretics who had adopted the errors of Paulus. See PAULICIANS.

ABRANTES, a town of Portugal, in Estremadura, seated on the river Tajo, belongs to a marquis of the same name. It stands high, is surrounded with gardens and olive-trees, and contains thirty-five thousand inhabitants. It has four convents, an alms-house, and an hospital. W. Long. 7. 18. Lat. 39. 13.

ABRASAX, or ABRAXAS, the supreme god of the Basilidian heretics. It is a mystical word, composed of the Greek numerals α, β, γ, δ, ε, ζ, η, θ, which together make up the number CCCLXV. For Basilides taught, that there were 365 heavens between the earth and the empyrean; each of which heavens had its angel or intelligence, which created it; each of which angels likewise was created by the angel next above it; thus ascending by a scale to the supreme Being, or first Creator. The Basilidians used the word *Abraxas* by way of charm or amulet.

ABRASION, in medicine, the corroding of any part by acrid humours or medicines.

ABRAX, an antique stone with the word *abraxas* engraven on it. They are of various sizes, and most of them as old as the third century.

ABREAST, (a sea-term) side by side, or opposite to; a situation in which two or more ships lie, with their sides parallel to each other, and their heads equally advanced. This term more particularly regards the line of battle at sea, where, on the different occasions of attack, retreat, or pursuit, the several squadrons or divisions of a fleet are obliged to vary their dispositions, and yet maintain a proper regularity by sailing in right or curved lines. When the line is formed *abreast*, the whole squadron advances uniformly, the ships being equally distant from and parallel to each other, so that the length of each ship forms a right angle with the extent of the squadron or line abreast. The commander in chief is always stationed in the center, and the second and third in command in the centers of their respective squadrons. --- *Abreast*, within the ship, implies on a line with the beam, or by the side of any object aboard; as, the frigate sprung a leak *abreast* of the main hatch-way, i. e. on the same line with the main hatch-way, crossing the ship's length at right angles, in opposition to *astore* or *abaft* the hatch-way *---We discovered a fleet *abreast* of Beachy-head; i. e. off, or directly opposite to it.

ABRETTENE, (Strabo;) AERETTINE, (Stephanus;) a district of Mysia, in Asia. Hence the epithet *Abrettenuus* given Jupiter, (Strabo); whose priest was Cleon, formerly at the head of a gang of robbers, and who received many and great favours at the hand of Antony, but afterwards went over to Augustus. The people were called *Abrettini*; inhabiting the country between Ancyra of Phrygia, and the river Rhyndacus.

ABRIDGEMENT, in literature, a term signifying the reduction of a book into a smaller compass.

The art of conveying much sentiment in few words, is the happiest talent an author can be possessed of. This talent is peculiarly necessary in the present state of literature; for many writers have acquired the dexterity of spreading a few trivial thoughts over several hundred pages. When an author hits upon a thought that pleases him, he is apt to dwell upon it, to view it in different lights, to force it in improperly, or upon the

ment.

the slightest relations. Though this may be pleasant to the writers, it tires and vexes the reader. There is another great source of diffusion in composition. It is a capital object with an author, whatever be the subject, to give vent to all his best thoughts. When he finds a proper place for any of them, he is peculiarly happy. But, rather than sacrifice a thought he is fond of, he forces it in by way of digression, or superfluous illustration. If none of these expedients answer his purpose, he has recourse to the margin, a very convenient apartment for all manner of pedantry and impertinence. There is not an author, however correct, but is more or less faulty in this respect. An abridger, however, is not subject to these temptations. The thoughts are not his own; he views them in a cooler and less affectionate manner; he discovers an impropriety in some, a vanity in others, and a want of utility in many. His business, therefore, is to retrench superfluities, digressions, quotations, pedantry, &c. and to lay before the public only what is really useful. This is by no means an easy employment: To abridge some books, requires talents equal, if not superior, to those of the author. The facts, manner, spirit, and reasoning, must be preserved; nothing essential, either in argument or illustration, ought to be omitted. The difficulty of the task is the principal reason why we have so few good abridgements: Wynne's abridgement of Locke's Essay on the Human understanding, is, perhaps, the only unexceptionable one in our language.

These observations relate solely to such abridgements as are designed for the public. But,

When a person wants to set down the substance of any book, a shorter and less laborious method may be followed. It would be foreign to our plan to give examples of abridgements for the public: But as it may be useful, especially to young people, to know how to abridge books for their own use, after giving a few directions, we shall exhibit an example or two, to shew with what ease it may be done.

Read the book carefully; endeavour to learn the principal view of the author; attend to the arguments employed: When you have done so, you will generally find, that what the author uses as new or additional arguments, are in reality only collateral ones, or extensions of the principal argument. Take a piece of paper or a common-place book, put down what the author wants to prove, subjoin the argument or arguments, and you have the substance of the book in a few lines. For example,

In the Essay on Miracles, Mr Hume's design is to prove, That miracles which have not been the immediate objects of our senses, cannot reasonably be believed upon the testimony of others.

Now, his argument (for there happens to be but one) is,

"That experience, which in some things is variable, is in others uniform, is our *only* guide in reasoning concerning matters of fact. A variable experience gives rise to probability only; an uniform experience amounts to a proof. Our belief of any fact from the testimony of eye-witnesses, is derived from no other principle than our experience in the veracity of human testimony. If the fact attested be miraculous, here arises a contest of two opposite experiences, or proof against proof. Now, a miracle is

Abridge-
ment.

"a violation of the laws of nature; and as a firm and unalterable experience has established these laws, the proof against a miracle, from the very nature of the fact, is as complete as any argument from experience can possibly be imagined; and if so, it is an undeniable consequence, that it cannot be surmounted by any proof whatever derived from human testimony."

In Dr Campbell's Dissertation on Miracles, the author's principal aim is to shew the fallacy of Mr Hume's argument; which he has done most successfully by another single argument, as follows:

"The evidence arising from human testimony is not solely derived from experience: on the contrary, testimony hath a natural influence on belief antecedent to experience. The early and unlimited assent given to testimony by children gradually contracts as they advance in life: it is, therefore, more consonant to truth, to say, that our *diffidence* in testimony is the result of experience, than that our *faith* in it has this foundation. Besides, the uniformity of experience, in favour of any fact, is not a proof against its being reversed in a particular instance. The evidence arising from the single testimony of a man of known veracity will go farther to establish a belief in its being actually reversed: If his testimony be confirmed by a few others of the same character, we cannot withhold our assent to the truth of it. Now, though the operations of nature are governed by uniform laws, and though we have not the testimony of our senses in favour of any violation of them; still, if in particular instances we have the testimony of *thousands* of our fellow-creatures, and those too men of strict integrity, swayed by no motives of ambition or interest, and governed by the principles of common sense, That they were actually eye-witnesses of these violations, the constitution of our nature obliges us to believe them."

These two examples contain the substance of about 400 pages.—Making private abridgements of this kind has many advantages; it engages us to read with accuracy and attention; it fixes the subject in our minds; and, if we should happen to forget, instead of reading the books again, by glancing a few lines we are not only in possession of the chief arguments, but recall in a good measure the author's method and manner.

Abridging is peculiarly useful in taking the substance of what is delivered by Professors, &c. It is impossible, even with the assistance of short-hand, to take down, *verbatim*, what is said by a public speaker. Besides, although it were practicable, such a talent would be of little use. Every public speaker has circumlocutions, redundancies, lumber, which deserve not to be copied. All that is really useful may be comprehended in a short compass. If the plan of the discourse, and arguments employed in support of the different branches, be taken down, you have the whole. These you may afterwards extend in the form of a discourse dressed in your own language. This would not only be a more rational employment, but would likewise be an excellent method of improving young men in composition, an object too little attended to in all our universities.

ABRIDGEMENT, in law, signifies the making a declaration or plaint shorter by leaving out something.

ABRO-

Abrodietical
|
Absolute

ABRODIETICAL; delicate or nice in diet.
ABROTATION, signifies annulling, making void, or repealing a law.

ABROLKOS, the name of certain shelves, or banks of sand, about 20 leagues from the coast of Brazil.

ABROTANUM, in botany, a fynonime of several plants. See **ARTEMISIA**, **FILAGO**, **SANTOLINA**; and **MATERIA MEDICA**, n° 62, 63.

ABROTUNUM, a town and harbour on the Mediterranean, in the district of Syrtis Parva, in Africa, (Strabo, Pliny :) one of the three cities that went to form Tripoly.

* See Glycine.

ABRUSS, in botany, the trivial name of the glycine *.
ABRUZZO, a province in Naples. The river Pescara divides it into two parts; one of which is called Ulterior, whereof Aquila is the capital; and the other Citerior, whose capital is Solomona. Besides the Apennines, there are two considerable mountains, the one called Monte Cavallo, and the other Monte Maiello. The top of this last is always covered with snow. AbruZZo is a cold but fruitful country; and abounds with corn, rice, several good fruits, and fallow.

ABSAALOM, the son of David by Maacah, was brother to Thamar David's daughter, who was ravished by Amnon his eldest brother by another mother. He waited two years for an opportunity of revenging the injury done to his sister, and at last procured the assassination of Amnon at a feast which he had prepared for the king's sons. He took refuge with Talmai king of Gethur; and was no sooner restored to favour, but he engaged the Israelites to revolt from his father. Absalom was defeated in the wood of Ephraim: as he was flying, his hair caught hold of an oak, where he hung till Joab came and thrust him through with three darts: David had expressly ordered his life to be spared, and extremely lamented him.

ABSCEDENTIA, in surgery, a term applied to decayed parts of the body, which, in a morbid state, are separated from the sound, or lose that union which was preferred in a natural state.

ABSCISS, in surgery, from *abscido*, to depart. A cavity containing pus; or, a gathering of matter in a part: So called, because the parts which were joined are now separated; one part recedes from another, to make way for the collected matter. See **SURGERY**, n° 8.

ABSCISSION, a figure in rhetoric, whereby the speaker stops short in the middle of his discourse, leaving the audience to make the inference.

ABSCISSION, in surgery, the fame with amputation.
ABSCONSA, a dark lantern used by the monks at the ceremony of burying their dead.

ABSENCE, in Scots law: When a person cited before a court does not appear, and judgment is pronounced, that judgment is said to be *in absence*. No person can be tried criminally in absence *.

* See Law, Part III., No cxxxv. 2, 4.

ABSINTHIATED Medicines, such as are impregnated with absinthium or wormwood.

ABSINTHIUM, in botany, the trivial name of the common wormwood or artemisia. It is also a fynonime of the tanacetum incanum, the fenecio incanum, the anthemion montana, the achillaea aegyptiaca, and of the parthenium hysterophorus. See **ARTEMISIA**, &c. and **MATERIA MEDICA**, n° 64, 65, 66.

ABSIS, in astronomy, the fame with **APSID**.

ABSOLUTE, in a general sense, denotes a thing's

being independent of, or unconnected with, any other; it is also used to express freedom from all limitation.

ABSOLUTE Gravity, in physics, is the whole force by which a body is urged downwards.

ABSOLUTE Government, is that wherein the prince, unlimited by the laws, is left solely to his own will *. * See Government.

ABSOLUTE Equation, in astronomy, is the aggregate of the optic and eccentric equations. The apparent inequality of a planet's motion arising from its not being equally distant from the earth at all times, is called its optic equation, and would subsist even if the planet's real motion were uniform. The eccentric inequality is caused by the planet's motion being uniform. To illustrate which, conceive the sun to move, or to appear to move, in the circumference of a circle, in whose centre the earth is placed. It is manifest, that if the sun moves uniformly in this circle, it must appear to move uniformly to a spectator on the earth, and in this case there will be no optic nor eccentric equation: but suppose the earth to be placed out of the centre of the circle, and then, though the sun's motion should be really uniform, it would not appear to be so, being seen from the earth: and in this case there would be an optic equation, without an eccentric one. Imagine farther, the sun's orbit to be not circular, but elliptic, and the earth in its focus; it will be as evident that the sun cannot appear to have an uniform motion in such ellipse: so that his motion will then be subject to two equations, the optic and the eccentric. See **EQUATION**.

ABSOLUTE Motion } (MOTION.

ABSOLUTE Space } See (SPACE.

ABSOLUTE Time } (TIME.

ABSOLUTE, in metaphysics, denotes a being that possesses independent existence.

ABSOLUTION, in general, is the pardoning or forgiving a guilty person.

ABSOLUTION, in civil law, is a sentence whereby the party accused is declared innocent of the crime laid to his charge.

ABSOLUTION, in the canon law, is a juridical act, whereby the priest declares the sins of such as are penitent remitted.

ABSOLUTION is chiefly used among Protestants for a sentence whereby a person who stands excommunicated is released or freed from that punishment.

ABSORBENT Medicines, testaceous powders, as chalk, crab-eyes, &c. which are taken inwardly for drying up or absorbing any acid or redundant humours in the stomach or intestines. They are likewise applied outwardly to ulcers or sores with the same intention *. * See Materia Medica, n° 14, &c. & Medicines, n° 373, &c.

ABSORBENT Vessels, a name given promiscuously to the lacteal vessels, lymphatics, and inhalant arteries. Naturalists speak of the like absorbents in plants, the fibrous or hairy roots of which are as a kind of vast absorbentia, which attract and imbibe the nutritious juices from the earth. See **PLANTS**, n° 21, 50. * See Medicines, Part I., n° 11, &c. & Anatomy, n° 369, &c.

ABSORBING, the swallowing up, sucking up, or imbibing, any thing: thus black bodies are said to absorb the rays of light; luxuriant branches, to absorb or waste the nutritious juices which should feed the fruit of trees, &c.

ABSORPTION, the effects of absorbing. In the animal economy, it is the act whereby the absorbent vessels imbibe the juices &c.

ABSORUS, **APSORUS**, **ABSYRTIS**, **ABSYRTIDES**, **APSYRTIDES** 370. * See Anatomy, n° 369, &c.

Absolute
||
Absorbus.

Abdētious APSYRTIDES, APSYRTIS, and ABSYRTIUM, (Strabo, Mela, Ptolemy;) islands in the Adriatic, in the gulf of Carnero; so called from Apsyrtus, Medea's brother, there slain. They are either one island, or two, separated by a narrow channel, and joined by a bridge; and are now called *Cherso* and *Osero*.

Abstinence

ABSTEMIOUS, **ABSTEMI**, in church-history, a name given to such persons as could not partake of the cup of the eucharist, on account of their natural aversion to wine. Calvinists allow these to communicate in the species of bread only, touching the cup with their lip; which, on the other hand, is by the Lutherans deemed a profanation.

ABSTEMIUS (Laurentius) a native of Macerata, professor of belles lettres in Urbino, and librarian of duke Guido Ubaldo, under the pontificate of Alexander VI. He wrote, 1. Notes on most difficult passages of ancient authors. 2. Hecatomythium, *i. e.* A collection of an 100 fables, &c. which have been often printed with those of Æsop, Phædrus, Gælius, Avianus, &c.

ABSTERGENT Medicines, those employed for resolving obstructions, concretions, &c. such as soap, &c.

ABSTINENCE, in a general sense, the act or habit of refraining from something which we have a propensity to or find pleasure in.—Among the Jews, various kinds of abstinence were ordained by their law. Among the primitive Christians, some denied themselves the use of such meats as were prohibited by that law, others looked upon this abstinence with contempt; as to which, St Paul gives his opinion, Rom. xiv. 1—3. The council of Jerusalem, which was held by the Apostles, enjoined the Christian converts to abstain from meats strangled, from blood, from fornication, and from idolatry. Abstinence, as prescribed by the gospel, is intended to mortify and restrain the passions, to humble our vicious natures, and by that means raise our minds to a due sense of devotion. But there is another sort of abstinence, which may be called *ritual*, and consists in abstaining from particular meats at certain times and seasons. It was the spiritual monarchy of the western world, which first introduced this ritual abstinence; the rules of which were called *rogations*; but grossly abused from the true nature and design of fasting.—In England, abstinence from flesh has been enjoined by statute even since the reformation, particularly on Fridays, and Saturdays, on vigils, and on all commonly called *fast-days*. The like injunctions were renewed under Q. Elizabeth: but at the same time it was declared, that this was done not out of motives of religion, as if there were any difference in meats; but in favour of the consumption of fish, and to multiply the number of fishermen and mariners, as well as spare the flock of sheep. The great saint, says St Augustin, is to abstain from sin.

ABSTINENCE is more particularly used for a spare diet, or a slender parsimonious use of food, below the ordinary standard of nature. The physicians relate wonders of the effects of abstinence in the cure of many disorders, and protracting the term of life. The noble Venetian, Comaro, after all imaginable means had proved vain, so that his life was despaired of at forty, recovered, and lived to near an hundred, by mere dint of abstinence; as he himself gives the account. It is indeed surprising to what a great age the primitive

Christians of the East, who retired from the persecutions into the deserts of Arabia and Egypt, lived, healthful and cheerful, on a very little food. Cassian assures us, that the common rate for 24 hours was 12 ounces of bread, and mere water: with this St Anthony lived 105 years; James the hermit, 104; Arsenius, tutor of the Emperor Arcadius, 120; S. Epiphanius, 115; Simeon the Stylite, 112; and Romauld, 120. Indeed, we can match these instances of longevity at home. Buchanan writes, that one Laurence preserved himself to 140 by force of temperance and labour; and Spotwood mentions one Kentigern, afterwards called S. Mongah or Mungo, who lived to 185 by the same means. Other instances see under the article **LONGEVITY**.—Abstinence, however, is to be recommended only as it means a proper regimen; for in general it must have bad consequences when observed without a due regard to constitution, age, strength, &c. According to Dr Cheyne, most of the chronic diseases, the infirmities of old age, and the short lives of Englishmen, are owing to repletion; and may be either cured, prevented, or remedied by abstinence: but then the kinds of abstinence which ought to obtain, either in sickness or health, are to be deduced from the laws of diet and regimen*.

Among the brute creation, we see extraordinary instances of long abstinence. The serpent-kind, in particular, bear abstinence to a wonderful degree. We have seen rattle-snakes that had subsisted many months without any food, yet still retained their vigour and fierceness. Dr Shaw speaks of a couple of cerastes, (a sort of Egyptian serpents), which had been kept five years in a bottle close corked, without any sort of food, unless a small quantity of sand wherein they coiled themselves up in the bottom of the vessel may be reckoned as such: yet when he saw them, they had newly cast their skins, and were as brisk and lively as if just taken. But it is even natural for divers species to pass four, five, or six months every year, without either eating or drinking. Accordingly, the tortoise, bear, dormouse, serpent, &c. are observed regularly to retire, at those seasons, to their respective cells, and hide themselves, some in the caverns of rocks or ruins; others dig holes under ground; others get into woods, and lay themselves up in the clefts of trees; others bury themselves under water, &c. And these animals are found as fat and fleshy after some months abstinence as before.—Sir G. Ent* weighed his tortoise several years successively, at its going to earth in October, and coming out again in March; and found, that, of four pounds four ounces, it only used to lose about one ounce.

—Indeed, we have instances of men passing several months as strictly abstinent as other creatures. In particular, the records of the Tower mention a Scotchman imprisoned for felony, and strictly watched in that fortress for six weeks: in all which time he took not the least sustenance; for which he had his pardon. Numberless instances of extraordinary abstinence, particularly from morbid causes, are to be found in the different periodical Memoirs, Transactions, Ephemerides, &c.—It is to be added, that, in most instances of extraordinary human abstinence related by naturalists, there were said to have been apparent marks of a texture of blood and humours, much like that of the animals above mentioned. Though it is no improbable opinion, that the air itself may

Abstinence

* See *Abstinence*, *Diet*, *Regimen*; & *Medicine*, Part VI. n^o 318, &c.

* Phil. Trans. n^o 194.

Abstruse
+
Abstraction

may furnish something for nutrition. It is certain, there are substances of all kinds, animal, vegetable, &c. floating in the atmosphere, which must be continually taken in by respiration. And that an animal body may be nourished thereby, is evident in the instance of vipers; which if taken when first brought forth, and kept from every thing but air, will yet grow very considerably in a few days. So the eggs of lizards are observed to increase in bulk, after they are produced, though there be nothing to furnish the increment but air alone; in like manner as the eggs or spawn of fishes grow and are nourished with the water. And hence, say some, it is that cooks, turnspit-dogs, &c. though they eat but little, yet are usually fat.

ABSTINENTS, or ABSTINENTES, a set of heretics that appeared in France and Spain about the end of the third century. They are supposed to have borrowed part of their opinions from the Gnostics and Manicheans, because they opposed marriage, condemned the use of meats, and placed the Holy Ghost in the clafs of created beings.

ABSTRACT *Idea*, in metaphysics, is a partial idea of a complex object, limited to one or more of the component parts or properties, laying aside or abstracting from the rest. Thus, in viewing an object with the eye, or recollecting it in the mind, we can easily abstract from some of its parts or properties, and attach ourselves to others: we can attend to the redness of a cherry, without regard to its figure, taste, or confidence. See ABSTRACTION.

ABSTRACT *Terms*, words that are used to express abstract ideas. Thus beauty, ugliness, whiteness, roundness, life, death, are abstract terms.

ABSTRACT *Numbers*, are assemblages of units, considered in themselves, without denoting any particular and determined particulars. Thus 6 is an abstract number, when not applied to any thing; but, if we say 6 feet, 6 becomes a concrete number. See the article NUMBER.

ABSTRACT *Mathematics*, otherwise called Pure Mathematics, is that which treats of magnitude or quantity, absolutely and generally considered, without restriction to any species of particular magnitude; such are Arithmetic and Geometry. In this sense, abstract mathematics is opposed to mixed mathematics, wherein simple and abstract properties, and the relations of quantities primitively considered in pure mathematics, are applied to sensible objects, and by that means become intermixed with physical considerations; such are Hydrostatics, Optics, Navigation, &c.

ABSTRACTION, the operation of the mind when occupied by abstract ideas. A large oak fixes our attention, and abstracts us from the shrubs that surround it. In the same manner, a beautiful woman in a crowd, abstracts our thoughts, and engrosses our attention solely to herself. These are examples of real abstraction: when these, or any others of a similar kind, are recalled to the mind after the objects themselves are removed from our sight, they form what is called *abstract ideas*, or the mind is said to be employed in abstract ideas. But the power of abstraction is not confined to objects that are separable in reality as well as mentally: the size, the figure, the colour of a tree are inseparably connected, and cannot exist independent of each other; and yet we can mentally confine our

observations to any one of these properties, neglecting or abstracting from the rest.

ABSTRUSE, something deep, hidden, concealed, or far removed from common apprehensions, and therefore not easily understood; in opposition to what is obvious and palpable. Thus metaphysics is an abstruse science; and the doctrine of fluxions, and the method de maximis et minimis, are abstruse points of knowledge.

ABSDUR, an epithet applied to any thing that opposes the human apprehension, and contradicts a manifest truth. Thus, it would be absurd to say that six and six make only 10, or to deny that twice six make 12. When the term *absurd* is applied to actions, it has the same import as *ridiculous*.

ABSDURDITY, an impropriety, or something that opposes an evident truth or principle. The contradiction is the greatest of all absurdities.

ABSYNTIUM. See ABSINTHIUM.

ABSYRTUS, in the heathen mythology, the son of Æta and Hypsæa, and the brother of Medæa. The latter running away with Jason, after her having assisted him in carrying off the golden fleece, was pursued by her father; when, to stop his progress, he tore Absyrtus in pieces, and scattered his limbs in his way.

ABTHANES, a title of honour used by the ancient inhabitants of Scotland, who called their nobles *thanes*, which in the old Saxon signifies *king's ministers*; and of these the higher rank were styled *abthanes*, and those of the lower *underthanes*.

ABUCARAS (Theodorus), metropolitan of Caria in the ninth century, was remarkable for his zeal in defending what he believed to be the truth, and was the author of above forty controversial treatises against the Saracens, Jews, and reputed heretics. This metropolitan at first embraced the doctrines of Photius; for which, begging pardon of the council of Constantinople in 869, he was restored to the communion of the church, and obtained a seat in the council. His works are inserted in the Supplement of the *Bibliothèque des Peres*, the Paris edition.

ABUKESO, in commerce, the same with AŞLAN *. *Which see.

ABULFARAGIUS (Gregory), son to Aaron a physician, born in 1226, in the city of Malatia, near the source of the Euphrates in Armenia. He followed the profession of his father; and practised with great success, numbers of people coming from the most remote parts to ask his advice. However, he would hardly have been known at this time, had his knowledge been confined to physic: but he applied himself to the study of the Greek, Syriac, and Arabic languages, as well as philosophy and divinity; and he wrote a history which does honour to his memory. It is written in Arabic, and divided into dynasties. It consists of ten parts, being an epitome of universal history from the creation of the world to his own time. Dr Pocock published it with a Latin translation in 1663; and added, by way of supplement, a short continuation relating to the history of the eastern princes.

ABUNA, the title given to the archbishop or metropolitan of Abyssinia. See ABYSSINIAN.

ABUNDANT *Number*, in arithmetic, is a number, the sum of whose aliquot parts is greater than the number itself. Thus the aliquot parts of 12, being 1, 2, 3, 4, and 6, they make, when added together, 16.

Abstruse
+
Abundant.

Abundantia

Abyſs.

An abundant number is oppoſed to a *deficient* number, or that which is greater than all its aliquot parts taken together; as 14, whose aliquot parts are 1, 2, and 7, which make no more than 10: and to a *perfect* number, or one to which its aliquot parts are equal, as 6, whose aliquot parts are 1, 2, and 3.

ABUNDANTIA, a heathen divinity, represented in ancient monuments under the figure of a woman with a pleasing aspect, crowned with garlands of flowers, pouring all sorts of fruit out of a horn which she holds in her right hand, and scattering grain with her left, taken promiscuously from a heap of corn. On a medal of Trajan, she is represented with two cornucopias.

ABUS, (Tacitus); a river of Britain, formed by the confluence of the Ure, the Derwent, Trent, &c. falling into the German sea, between Yorkshire and Lincolnshire, and forming the mouth of the Humber.

ABUSE, in a general sense, implies the perverting something from its genuine or original intention. Thus an abuse of words is the using them without any clear and distinct ideas.

ABUTILON, in botany, the trival name of several species of the fida. See SIDA. Abutilon is also a synonyme of the melochia tomentosa and melochia depressa, two American plants of the monadelphia pentandria class. It is likewise a synonyme of the lavatera, malva, and hibiscus.

ABYDOS, anciently a town built by the Milesians in Asia, on the Hellespont, where it is scarce a mile over, opposite to Scios on the European side, (Dionysius Periegetes.) Now both called the *Dardanelles*. Abydos lay midway between Lampsaes and Ilium, famous for Xerxes's bridge, (Herodotus, Virgil); and for the loves of Leander and Hero, (Musiens, Ovid); celebrated also for its oysters, (Ennius, Virgil.) The inhabitants were a soft, effeminate people, given much to dissipation; hence the proverb, *Ne temere Abydum*, when we would caution against danger, (Stephanus.)

ABYDOS, (Strabo, Pliny); anciently an inland town of Egypt, between Ptolemais and Diofolis Parva, towards Syene; famous for the palace of Memnon, and the temple of Osiris. A colony of Milesians; (Stephanus.)

ABYLA, (Ptolemy, Mela); one of Hercules's pillars, on the African side, called by the Spaniards *Sierra de las Monas*, over against Calpe in Spain, the other pillar; supposed to have been formerly joined, but separated by Hercules, and thus to have given entrance to the sea now called the *Mediterranean*: the limits of the labours of Hercules, (Pliny.)

ABYSS, in a general sense, denotes something profound, and, as it were, bottomless. The word is originally Greek, *αβυσσος*; compounded of the privative *α*, and *βυσσο*, bottom; *q. d.* without a bottom.

ABYSS, in a more particular sense, denotes a deep mass or fund of waters. In this sense, the word is particularly used, in the Septuagint, for the water which God created at the beginning with the earth, which encompassed it round, and which our translators render by *deep*. Thus it is that darkness is said to have been on the face of the abyss.

ABYSS is also used for an immense cavern in the earth, where God collected all those waters on the third day; which, in our version, is rendered the *seas*, and elsewhere the *great deep*. Dr Woodward, in his

Natural History of the Earth, asserts, That there is a mighty collection of waters inclosed in the bowels of the earth; constituting a huge orb in the interior or central parts of it; and over the surface of this water he supposes the terrestrial strata to be expanded. This, according to him, is what Moses calls the *great deep*, and what most authors render the *great Abyss*. The water of this vast Abyss, he asserts, does communicate with that of the ocean, by means of certain hiatus's or chasms passing betwixt it and the bottom of the ocean: and this and the Abyss he supposes to have one common centre, around which the water of both is placed; but so, that the ordinary surface of the Abyss is not level with that of the ocean, nor at so great a distance from the centre as the other, it being for the most part restrained and depressed by the strata of earth lying upon it: but where-ever those strata are broken, or so lax and porous that water can pervade them, there the water of the Abyss ascends; fills up all the clefts and fissures into which it can get admittance; and saturates all the interstices and pores of the earth, stone, or other matter, all around the globe, quite up to the level of the ocean.—The existence of an abyss, or receptacle of subterraneous waters, is controverted by Camerarius*; and defended by Dr Woodward, chiefly by two arguments: the first drawn from the vast quantity of water which covered the earth in the time of the deluge; the second, from the consideration of earthquakes, which he endeavours to shew are occasioned by the violence of the waters in this abyss. A great part of the terrestrial globe has been frequently shaken at the same moment; which argues, according to him, that the waters, which were the occasion thereof, were coextended with that part of the globe. There are even instances of universal earthquakes; which (says he) shew, that the whole abyss must have been agitated: for so general an effect must have been produced by as general a cause, and that cause can be nothing but the subterraneous Abyss†.—To this abyss also has been attributed the origin of springs and rivers; the level maintained in the surfaces of different seas; and their not overflowing their banks. To the effluvia emitted from it, some even attribute all the diversities of weather and changes in our atmosphere‡. Ray§, and other authors, ancient as well as modern, suppose a communication between the Caspian sea and the ocean by means of a subterranean abyss: and to this they attribute it, that the Caspian does not overflow, notwithstanding the great number of large rivers it receives, of which Kemper reckons above 50 in the compass of 60 miles; tho', as to this, others suppose that the daily evaporation may suffice to keep the level.—After all, however, that has been advanced by naturalists concerning this Abyss, its existence remains as yet unestablished by any solid proofs.

ABYSS is also used to denote hell. In which sense the word is synonymous with what is otherwise called *Barathrum*, *Erebus*, and *Tartarus*; in the English bible, the *bottomless pit*. The unclean spirits expelled by Christ, begged, *ne imperaret ut in abyssum irent*, according to the vulgate; *ut abussos*, according to the Greek. Luke viii. 31. Rev. ix. 1.

ABYSS is more particularly used, in antiquity, to denote the temple of Proserpine. It was thus called on account

account of the immense fund of gold and riches deposited there; some say, hid under ground.

ABYSS is also used, in heraldry, to denote the centre of an escutcheon. In which sense, a thing is said to be bore in abyss, *en abyssme*, when placed in the middle of the shield, clear from any other bearing: He bears azure, a flower de lis, in abyss.

ABYSSINIA, by some called *Higher Ethiopia*, and by the Arabians *Al Habash*, is bounded on the north by Nubia; on the east, by the Arabic gulph or Red Sea, and the kingdom of Adél; on the south, by the kingdoms of Ajan, Alaba, and Gingiro; and on the west, by the kingdom of Goram and part of Gingiro; and is divided into a great number of provinces. The principal river is the Nile, which has its source in this country; and the most considerable lake, that of Dambea, which discharges itself into the Nile, is about 700 miles in length, and 90 in breadth. The air is pretty temperate in the mountains, and therefore their towns and strong-holds are generally placed on them; but in the valleys it is hot and suffocating. The soil and face of the country is various. In some places there are nothing but rocks and profound caverns; in others, especially where there are rivers, the land is exceeding fruitful; and the banks of these streams are bordered with flowers of various kinds, many of which are unknown in Europe. The torrents in the rainy season wash a great deal of gold from the mountains. This season begins in May, when the sun is vertical, or directly over their heads; and ends in September. To these torrents is attributed the overflowing of the Nile, the cause of which so much puzzled the ancients. It was commonly attributed to the melting of the snow upon the hills in these parts: but experience has since undeceived the world; for there is no snow, even on the highest hills in this country.—The country produces a great variety of animals, both tame and wild, such as lions, tigers, rhinoceroses, leopards, elephants, monkeys, stags, deer; horses, camels, dromedaries, goats, cows, sheep; likewise ostriches, with a vast variety of other birds. In the rivers are crocodiles and the hippopotamus. Travelers mention also a peculiar kind of bees, small, black, and without a sting, which hive in the earth, and make honey and wax that are extremely white. The country is greatly infested with locusts, which devour every thing that is green wherever they come.—Besides the large towns, there are a great number of villages, which in some places are so thick sown, that they look like one continued town: the houses are very mean, being but one story high; and built of straw, earth, and lime. In most of the towns the houses are separated by hedges, which are always green, and mixed with flowers and fruit-trees at a certain distance from each other, which affords an agreeable prospect.—The government is monarchical. The sovereign has the title of Negus, and is an absolute prince. When he is in camp, the tents are so regularly disposed as to have the appearance of a city; and there is a captain over every division, to prevent disorders and to execute justice.—The Abyssines in general are of an olive complexion, tall, graceful, and well featured. Those who are neither mechanics or tradesmen (which few of them are), nor tillers of the ground, are inured to bear arms, which are a head-piece, a buckler, a coat of mail, bows and arrows, darts, pikes capped with iron at both ends, a

fling, and a sword: they have very few fire-arms, and those were introduced by the Portuguese. The habit of persons of quality is a silken vest, or fine cotton, with a kind of scarf. The citizens have the same habit, only coarser. The common people have nothing but a pair of cotton drawers, and a scarf which covers the rest of their body. The women are of a healthy constitution, active, and moderately handsome, having neither flat noses nor thick lips like the negroes; and nature is so friendly, that they stand in little need of midwives, which is indeed the case of most countries in the torrid zone. They appear in public as in Europe, without being forbid the conversation of the men as among the Mahometans. Princesses of the royal blood are not permitted to marry foreigners; and when they take the air, they go in great state, with 400 or 500 women attendants. Their language is the Ethiopic, which bears a great affinity with the Arabic; but particular provinces have a different dialect. As to their religion, see the next article.

Manufactures are almost wholly wanting in this country; and the few trades which they have amongst them are always conveyed from the father to the children. They seem indeed by their churches, and other ruined places, to have had a knowledge of architecture. But the workmen were sent for from other countries, and were forced to do all themselves; so that when these fabrics were reared, especially the imperial palace built by Peter Pais, a Portuguese architect, the people flocked from all parts of Ethiopia to view it, and admired it as a new wonder of the world.—Gold, silver, copper, and iron, are the principal ores with which their mines abound in this extensive part of Africa; but not above one third part is made use of by way of merchandize, or converted into money; of which they have little or no use in Abyssinia. They cut their gold indeed into small pieces for the pay of their troops, and for expenses of the court, which is but a modern custom among them; the king's gold, before the end of the 17th century, being laid up in his treasury in ingots, with intent to be never carried out, nor ever used in any thing but vessels and trinkets for the service of the palace. In the lieu of small money, they make use of rock-salt as white as snow and as hard as stone. This is taken out of the mountain of Lafta, and put into the king's warehouses; where it is reduced into tablets of a foot long, and three inches broad, ten of which are worth about a French crown. When they are circulated in trade, they are reduced into still smaller pieces, as occasion requires. This salt is also applied to the same purpose as common sea-salt. With this mineral salt they purchase pepper, spices, and silk stuffs, which are brought to them by the Indians, in their ports in the Red Sea. Cardamums, ginger, aloes, myrrh, cassia, civet, ebony-wood, ivory, wax, honey, cotton and linens of various sorts and colours, are merchandizes which may be had from Abyssinia; to which may be added sugar, hemp, flax, and excellent wines, if these people had the art of preparing them. It is affirmed there are in this country the finest emeralds that are any where to be found; and, though they are found but in one place, they are there in great quantities, and some so large and so perfect as to be of almost incalculable value. The greatest part of the merchandizes above mentioned, are more for foreign than in-

Abyssinia,
Abyssinian.

land trade. Their domestic commerce consists chiefly in salt, honey, buck-wheat, grey pease, citrons, oranges, lemons, and other provisions, with fruits and herbage necessary for the support of life. Those places that the Abyssinian merchants frequent the most, who dare venture to carry their commodities by sea themselves, are Arabia Felix, and the Indies, particularly Goa, Cambaye, Bengal, and Sumatra. With regard to their ports on the Red Sea, to which foreign merchants commonly resort, the most considerable are those of Mette, Azum, Zajalla, Maga, Dazo, Patea, and Brava. The trade of the Abyssinians by land is inconsiderable. There are, however, bands of them who arrive yearly at Egypt, particularly at Cairo, laden with gold dust, which they bring to barter for the merchandizes of that country, or of Europe, for which they have occasion. These caravans, if we may be allowed thus to call a body of 40 or 50 poor wretches who unite together for their mutual assistance in their journey, are commonly three or four months on their route, traversing forests and mountains almost impassable, in order to exchange their gold for necessaries for their families, and return immediately with the greatest part of the merchandize on their backs. Frequently the Jews or Egyptians give them large credit; which may seem surprising, as they are beyond recourse if they should fail of payment. But experience has shewn, that they have never abused the confidence reposed in them; and even in the event of death, their fellow-travellers take care of the effects of the deceased for the benefit of their families, but in the first place for the discharge of those debts contracted at Cairo.—It remains only to be observed, that one of the principal branches of trade of the Abyssines is that of slaves; who are greatly esteemed in the Indies and Arabia for the best, and most faithful, of all that the other kingdoms of Africa furnish. The Indian and Arabian merchants frequently substitute them as their factors; and, on account of their good services and integrity, not only often give them their liberty, but liberally reward them.

ABYSSINIAN, in ecclesiastical history, is used as the name of a sect, or heresy, in the Christian church, established in the empire of Abyssinia. The Abyssinians are a branch of the Copts or Jacobites; with whom they agree in admitting but one nature in Jesus Christ, and rejecting the council of Chalcedon: whence they are also called Eutychians, and stand opposed to the Melchites. They are only distinguished from the Copts, and other sects of Jacobites, by some peculiar national usages.—The Abyssinian sect or church is governed by a bishop or metropolitan styled *Abuna*, sent them by the Coptic patriarch of Alexandria residing at Cairo, who is the only person that ordains priests. The next dignity is that of Komos, or Hegumenas, who is a kind of arch-prefbyter. They have canons also, and monks: the former of whom marry; the latter, at their admission, vow celibacy, but with a reservation: these, it is said, make a promise aloud, before their superior, to keep chastity; but add, in a low voice, *as you keep it*. The emperor has a kind of supremacy in ecclesiastical matters. He alone takes cognizance of all ecclesiastical causes, except some smaller ones referred to the judges; and confers all benefices, except that of *Abuna*.—The Abyssinians have at different times expressed an inclination to be

reconciled to the see of Rome; but rather out of interest of state, than any other motive. The emperor David, or the queen regent on his behalf, wrote a letter on this head to pope Clement VII. full of submission, and demanding a patriarch from Rome to be instructed by: which being complied with, he publicly abjured the doctrine of Eutychius and Dioscorus in 1626, and allowed the supremacy of the pope. Under the emperor Seltan Seghed all was undone again; the Romish missionaries settled there had their churches taken from them, and their new converts banished or put to death. The congregation of *propaganda* have made several attempts to revive the mission, but to little purpose.—The doctrines and ritual of this sectary form a strange compound of Judaism, Christianity, and superstition. They practise circumcision; and are said to extend the practice to the females as well as males: they observe both Saturday and Sunday fasts: they eat no meats prohibited by the law of Moses: women are obliged to the legal purifications; and brothers marry their brothers wives, &c. On the other hand, they celebrate the epiphany with peculiar festivity, in memory of Christ's baptism; when they plunge and sport in ponds and rivers, which has occasioned some to affirm that they were baptized anew every year. Among the saints-days is one consecrated to Pilate and his wife; by reason Pilate washed his hands before he pronounced sentence on Christ, and his wife desired him to have nothing to do with the blood of that just person. They have four lent: the great one commences ten days earlier than ours, and is observed with much severity, many abstinence therein even from fish, because St Paul says there is one kind of flesh of men, and another of fishes. They allow of divorce, which is easily granted among them, and by the civil judge; nor do their civil laws prohibit polygamy itself. They have at least as many miracles and legends of saints, as the Romish church: which proved no small embarrassment to the Jesuit missionaries, to whom they produced so many miracles, wrought by their saints, in proof of their religion, and those so well circumstantiated and attested, that the Jesuits were obliged to deny miracles to be any proof of a true religion; and in proof hereof to allege the same arguments against the Abyssinians, which Protestants in Europe allege against the Papists. They pray for the dead, and invoke saints and angels; have so great a veneration for the virgin, that they charged the Jesuits with not rendering her honour enough. Images in painting they venerate; but abhor all those in relieve, except the crosses. They hold that the soul of man is not created; because, say they, God finished all his work on the sixth day. They admit the apocryphal books, and the canons of the apostles, as well as the apostolical constitutions, for genuine. Their liturgy is given by Alvarez, and in English by Pagit.

ACA, ACE, or ACON, a town of Phœnicia, on the Mediterranean; afterwards called *Ptolemais*; now *Acre*.

ACACALOTL, the Brazilian name of a bird called by some *corvus aquaticus*, or the water-raven: properly, the pelicanus carbo, or corvora. See PELICANUS.

ACACIA, EGYPTIAN THORN, or BINDING BEAN-TREE, in botany, a species of *Mimosa**, according to Linneus; tho' other botanists make it a distinct genus.

False ACACIA. See ROBINIA.

Abyssinia
|
Acacia.

* See *Mimosa*.

Acacia
||
Academus.

Three-thorned ACACIA, or Honey-Locust. See GLE-
DITSIA.

ACACIA, in the *Materia Medica*. See there, n^o 67. ACACIA, among antiquaries, something resembling a roll or bag, seen on medals, as in the hands of several consuls and emperors. Some take it to represent a handkerchief rolled up, wherewith they made signals at the games; others, a roll of petitions or memorials; and some, a purple bag full of earth, to remind them of their mortality.

ACACIANS, in ecclesiastical history, the name of several sects of heretics; some of which maintained, that the Son was only a similar, not the same, substance with the Father; and others, that he was not only a distinct, but a dissimilar, substance. Two of these sects had their denomination from Acacius bishop of Cæsarea, who lived in the fourth century, and changed his opinions, so as, at different times, to be head of both. Another was named from Acacius patriarch of Constantinople, who lived in the close of the fifth century.

ACACIUS, surnamed LUSCUS, because he was blind of one eye, was bishop of Cæsarea in Palestine, and succeeded the famous Eusebius: he had a great share in the banishment of pope Liberius, and bringing Felix to the see of Rome. He gave name to a sect*, and died about the year 355. He wrote the life of Eusebius, and several other works.

ACACIUS (St.), bishop of Amida, in Mesopotamia, in 420, was distinguished by his piety and charity. He sold the plate belonging to his church, to purchase seven thousand Persian slaves who were ready to die with want and misery; and giving each of them some money, sent them home. Veranius, their king, was so affected with this noble instance of benevolence, that he desired to see the bishop; and this interview procured a peace between that prince and Theodosius I.

There have been several other eminent persons of the same name; particularly, A martyr under the emperor Decius: A patriarch of Antioch, who succeeded Basil in 458, and died in 459: A bishop of Miletum in the fifth century: A famous rhetorician in the reign of the emperor Julian; and, A patriarch of Constantinople in the fifth century; who was ambitious to draw the whole power and authority of Rome by degrees to Constantinople, for which he was delivered over irretrievably to the devil by pope Felix III.

ACADEMICIAN, or ACADEMIST, a member of an academy. See ACADEMY in the modern sense.

ACADEMICS, or ACADEMISTS, a denomination given to the cultivators of a species of philosophy originally derived from Socrates, and afterwards illustrated and enforced by Plato, who taught in a grove near Athens, consecrated to the memory of Academus an Athenian hero; from which circumstance this philosophy received the name of *academical*. Before the days of Plato, philosophy had, in a great measure, fallen into contempt. The contradictory systems and hypotheses which had successively been urged upon the world were become so numerous, that, from a view of this inconsistency and uncertainty of human opinions, many were led to conclude, that truth lay beyond the reach of our comprehension. Absolute and universal scepticism was the natural consequence of this conclusion. In order to remedy this abuse of philosophy and of the human faculties, Plato laid hold of the

principles of the academical philosophy; and, in his *Phædo*, reasons in the following manner. "If we are unable to discover truth, (says he), it must be owing to two circumstances: either there is no truth in the nature of things; or the mind, from a defect in its powers, is not able to apprehend it. Upon the latter supposition, all the uncertainty and fluctuation in the opinions and judgments of mankind admit of an easy solution: Let us therefore be modest, and ascribe our errors to the real weakness of our own minds, and not to the nature of things themselves. Truth is often difficult of access: in order to come at it, we must proceed with caution and diffidence, carefully examining every step; and, after all our labour, we will frequently find our greatest efforts disappointed, and be obliged to confess our ignorance and weakness."

Labour and caution in our researches, in opposition to rash and hasty decisions, were the distinguishing characteristics of the disciples of the ancient academy. A philosopher possessed of these principles, will be slow in his progress; but will seldom fall into errors, or have occasion to alter his opinion after it is once formed. Vanity and precipitance are the great sources of scepticism: hurried on by these, instead of attending to the cool and deliberate principles recommended by the academy, several of our modern philosophers have plunged themselves into an absurd and ridiculous kind of scepticism. They pretend to discredit things that are plain, simple, and easily comprehended; but give peremptory and decisive judgments upon subjects that evidently exceed the limits of our capacity. Of these, Berkeley and Hume are the most considerable. Berkeley denied the existence of every thing, excepting his own ideas. Mr Hume has gone a step further, and questioned even the existence of ideas; but at the same time has not hesitated to give determined opinions with regard to eternity, providence, and a future state, miraculous interpositions of the Deity, &c. subjects far above the reach of our faculties. In his essay on the academical or sceptical philosophy, he has confounded two very opposite species of philosophy. After the days of Plato, indeed, the principles of the first academy were grossly corrupted by Arcesilas, Carneades, &c. This might lead Mr Hume into the notion that the *academical* and *sceptical* philosophy were synonymous terms. But no principles can be of a more opposite nature than those which were inculcated by the old academy of Socrates and Plato, and the sceptical notions which were propagated by Arcesilas, Carneades, and the other disciples of the succeeding academics.

ACADEMY, in antiquity, a garden or villa, situated within a mile of Athens, where Plato and his followers held their philosophical conferences. It took its name from one Academus, or Ecademus, a citizen of Athens, who was the original owner of it, and made it a kind of gymnasium: he lived in the time of Theseus. Cimon embellished it with fountains, trees, and walks; but Sylla, during the siege of Athens, employed these very trees in making battering engines against the city. Cicero too had his villa, or place of retirement, near Puzzuoli, which he also named an academy, where he composed his *Academical questions*, and his book *De natura deorum*.

ACADEMY, among the moderns, is most commonly used

Academics,
Academy.

* See the
preceding
article.

Academies. used to signify a society of learned men, established for the improvement of any art or science.

The first Academy we read of, was established by Charlemagne, at the instigation of Alcuin. It was composed of the chief wits of the court, the emperor himself being a member. In their academical conferences, every person was to give an account of what ancient authors he had read; and each even assumed the name of some ancient author who pleased him most, or some celebrated person of antiquity. Alcuin, from whose letters we learn these particulars, took that of Flaccus, the surname of Horace: a young lord, named Angilbert, took that of Homer: Adelard, bishop of Corbie, was called Augustin: Riculf, bishop of Mentz, was Dametas; and the king himself, David *. This shews the mistake of some modern writers, who relate, that it was in conformity with the genius of the learned men of those times, who were great admirers of Roman names, that Alcuin took the name of Flaccus Albinus.

Most nations have now their Academies; but Italy has by far the greatest number.—The French have many flourishing academies, most of which were established by Lewis XIV.—We have but few in Britain; and those of chiefest note go by a different name *. There are, however, in London, the *Academy of Painting*, and that of Music; established by letters-patent, and governed by their respective directors.

In giving an account of the principal Academies, it seems most proper to arrange them according to their subjects.

I. *MEDICAL Academies*; as that of the *Naturæ Curiosius* in Germany; that founded at Palermo in 1645; another at Venice in 1701, which meets weekly in a hall near the grand hospital; another at Geneva in 1715, in the house of M. Le Clerc. The colleges of physicians at London and Edinburgh are also, by some, ranked in the number of *Academies* *.

The *Academy of Naturæ Curiosius*, called also the *Leopoldine Academy*, was founded in 1652 by Jo. Laur. Baufchius, a physician; who, in imitation of the English, published an invitation to all physicians to communicate their extraordinary cases; and, meeting with success, was elected president. Their works were at first published separately; but in 1670 a new scheme was laid for publishing a volume of observations every year. The first volume appeared in 1684, under the title of *Ephemerides*, and the work has been continued with some interruptions and variations of the title, &c. In 1687, the emperor Leopold took the society under his protection, granting the members several privileges, particularly that their presidents should be counts palatine of the holy Roman empire. This academy has no fixed residence or regular assemblies: instead of these, there is a kind of bureau, or office, first established at Breslau, and afterwards removed to Nuremberg, where letters, observations, &c. from correspondents or members are taken in. The academy consists of a president, two adjuncts or secretaries, and colleagues or members without restriction. The colleagues, at their admission, obligeth themselves to two things: first, to chuse some subject out of the animal, vegetable, or mineral kingdom, to handle, provided it had not been treated of by any colleague before; the second, to apply themselves to furnish materials for the Annual *Ephemerides*. Each member to bear a symbol of the academy; viz. a gold

ring, whereon, instead of a stone, is a book open, and, on the face thereof, an eye; on the other side the motto of the academy, *Nunquam otiosus*.

II. *CHIRURGICAL Academies*; as that instituted some years ago, by public authority, at Paris: the members of which were not only to publish their own and correspondents observations and improvements; but to give an account of all that is published on surgery, and to compose a complete history of the art, by their extracts from all the authors ancient and modern who have wrote on it. A question in surgery is annually propoed by the academy, and a gold medal of two hundred livres value given to him who furnishes the most satisfactory answer.

III. *ECCLESIASTICAL Academies*; as that at Bologna in Italy, instituted in 1687, employed in the examination of the doctrine, discipline, and history, of each age of the church.

IV. *COSMOGRAPHICAL Academies*; as that at Venice, called the *Argonauts*. This was instituted at the solicitation of F. Coronelli, for the improvement of geographical knowledge. Its design was to publish exact maps, both celestial and terrestrial, as well particular as general, together with geographical, historical, and astronomical descriptions. Each member, in order to defray the expence of such a publication, was to subscribe a proportional sum, for which they were to receive one or more copies of each piece published. For this end, three societies are settled; one under F. Moro, provincial of the Minorites in Hungary; another under the abbot Laurence au Rue Payenne au Marais; the third under F. Baldigiani, Jesuit, professor of mathematics in the Roman college. The device of this academy is the terraqueous globe, with the motto *Plus ultra*; and at its expence all the globes, maps, and geographical writings, of F. Coronelli have been published.

V. *Academies of SCIENCES*.—These comprehend such as are erected for improving natural and mathematical knowledge. They are otherwise called *Philosophical* and *Physical Academies*.

The first of these was instituted at Naples, about the year 1560, in the house of Baptista Porta. It was called the *Academy Secretorum Naturæ*; and was succeeded by the *Academy of Lyncei*, founded at Rome by Prince Frederic Cesi, towards the end of that century. Several of the members of this academy rendered it famous by their discoveries; among these was the celebrated Galileo. Several other academies were instituted about that time, which contributed greatly to the advancement of the sciences; but none of them comparable to that of the *Lyncei*.

Some years after the death of Toricelli, the *Academy del Cimento* made its appearance, under the protection of Prince Leopold, afterwards Cardinal de Medicis. Redi was one of its chief members; and the studies pursued by the rest may be collected from those curious experiments published in 1667, by their secretary Count Laurence Magulotti, under the title of *Saggi di Naturali Esperienze*; a copy of which was presented to the Royal Society, translated into English by Mr Waller, and published at London in 4^{to}.

The *Academy degli Inquieti*, afterwards incorporated into that of Della Traccia in the same city, followed the example of that of Del Cimento. Some excellent discourses.

* See School.

* See Society, the general term with us for establishments of this kind.

* See College.

Academies. courses on physical and mathematical subjects, by Geminiano Montenari, one of the chief members, were published in 1667, under the title of *Pensieri Fisico Matematici*.

The *Academy of Rossano*, in the kingdom of Naples, was originally an Academy of Belles Lettres, founded in 1540, and transformed into an Academy of Sciences in 1695 at the solicitation of the learned abbot Don Giacinto Gimma; who being made president, under the title of Promoter General thereof, gave them a new set of regulations. He divided the academists into the following classes: Grammarians, Rhetoricians, Poets, Historians, Philosophers, Physicians, Mathematicians, Lawyers, and Divines, with a class apart for Cardinals and persons of quality. To be admitted a member, a man must have some degrees in the faculty. The members are not allowed to take the title of *Academists* in the beginning of their books, without a written permission from their president, which is not granted till the work has been examined by the censors of the Academy; and the permission is the greatest honour the Academy can confer, as they thereby adopt the work, and are answerable for it against all criticisms that may be made upon it. To this law the president or promoter himself is subject; and no academist is allowed to publish any thing against the writings of another, without leave from the society.

Several other Academies of *Sciences* have been founded in Italy; but, for want of being supported by princes did not continue long. The loss of them, however, was abundantly repaired by the institution of others still subsisting; such as, the *Academy of Filarmenici* at Verona; of *Ricovetri* at Padua, where a learned discourse on the origin of springs was delivered by Sig. Vallisneri, first professor of physic in the university of that city, and which was afterwards printed. To the Academy of the *Muti de Reggio*, at Modena, the same Sig. Vallisneri presented an excellent discourse on the scale of created beings, since inserted in his history of the generation of man and animals printed at Venice in the year 1721.

F. Merfenne is said to have given the first idea of a philosophical Academy in France, towards the beginning of the 17th century, by the conferences of naturalists and mathematicians occasionally held at his lodgings; at which Gassendi, Des Cartes, Hobbes, Roberval, Pascal, Blondel, and others assisted. F. Merfenne proposed to each certain problems to examine, or certain experiments to be made. These private assemblies were succeeded by more public ones, formed by Mr. Montmort, and Mr. Thevenot the celebrated traveller. The French example animated several Englishmen of distinction and learning to erect a kind of philosophical academy at Oxford, towards the close of Oliver Cromwell's administration; which, after the Restoration, was erected into a Royal Society*. The English example, in its turn, animated the French. Lewis XIV. in 1666, assisted by the counsels of Mr. Colbert, founded an Academy of Sciences at Paris, with a sufficient revenue to defray the charge of experiments, and salaries to the members.

Royal Academy of Sciences. After the peace of the Pyrenees, Lewis XIV. being desirous of establishing the arts, sciences, and literature, upon a solid foundation, directed M. Colbert to form a society of men of

known abilities and experience in the different branches, who should meet together under the king's protection, and communicate their respective discoveries. Accordingly Mr. Colbert, having conferred with those who were at that time most celebrated for their learning, resolved to form a society of such persons as were conversant in natural philosophy and mathematics, to join to them other persons skilled in history and other branches of erudition, along with those who were entirely engaged in what are called the *Belles Lettres*, grammar, eloquence, and poetry. The geometers and natural philosophers were ordered to meet on Tuesdays and Saturdays, in a great hall of the king's library, where the books of mathematics and natural philosophy were contained; the learned in history to assemble on Mondays and Thursdays, in the hall where the books of history were contained; and the class of Belles Lettres to assemble on Wednesdays and Fridays. All the different classes were likewise ordered to meet together upon the first Thursday of every month; and, by their respective secretaries, make a report of the proceedings of the foregoing month.

In a short time, however, the classes of History, Belles Lettres, &c. were united to the *French Academy*, which was originally instituted for the improvement and refining the French language, so that the royal Academy contained only two classes, *viz.* that of natural philosophy and mathematics.

In year 1696, the king, by a proclamation dated the 26th of January, gave this Academy a new form, and put it upon a more respectable footing.—It was now to be composed of four kinds of members, *viz.* *honorary, pensionary associates, and elects*. These last were a kind of pupils, or scholars, each of whom was attached to one of the pensionaries. The first class to contain ten persons, and each of the rest twenty. The honorary academists to be all inhabitants of France; the pensionaries all to reside at Paris; eight of the associates allowed to be foreigners; and the elects all to live at Paris. The officers to be, a president named by the king, out of the class of honorary academists; and a secretary and treasurer to be perpetual. Of the pensionaries, three to be geometers, three astronomers, three mechanics, three anatomists, three chemists, three botanists, and the remaining two to be secretary and treasurer. Of the twelve associates, two to apply themselves to geometry, two to botany, and two to chemistry. The elects to apply themselves to the same kind of science with the pensionaries they were attached to; and not to speak, except when called by the president. No regular or religious to be admitted, except into the class of honorary academists; nor any person to be admitted either for associate or pensionary, unless known by some considerable printed work, some machine, or other discovery. The assemblies were held on Wednesdays and Saturdays, unless either of them happened to be a holiday, and then the assembly was held on the preceding day.—To encourage the members to pursue their labours, the king engaged not only to pay the ordinary pensions, but even to give extraordinary gratifications, according to the merit of their respective performances; furnishing withal the expence of the experiments and other inquiries necessary to be made. If any member gave in a bill of charges of experiments he had made, or desired the printing of any book, and brought

Academies.

* See Society.

brought in the charges of graving, the money was immediately paid by the king, upon the president's allowing and signing the bill. So, if an anatomist required live tortoises, for instance, for making experiments about the heart, &c. as many as he pleased were brought him at the king's charge. Their motto was, *Invenit et perfect.*

In the year 1716, the duke of Orleans, then regent, made an alteration in their constitution; augmenting the number of honoraries, and of associates capable of being foreigners, to 12; admitting regulars among such associates; and suppressing the class of elves, as it appeared to be attended with some inconveniences, particularly that of making too great an inequality among the Academists, and being productive of some misunderstandings and animosities among the members. At the same time he created other two classes; one consisting of 12 adjutants, who, as well as the associates, were allowed a deliberative voice in matters relative to science; and the other six free associates, who were not attached to any particular science, nor obliged to pursue any particular work.

Since its re-establishment in 1699, this Academy has been very exact in publishing, every year, a volume containing either the works of its own members, or such memoirs as have been composed and read to the Academy during the course of that year. To each volume is prefixed the history of the Academy, or an extract of the memoirs, and, in general, of whatever has been read or said in the Academy; at the end of the history, are the eulogiums on such Academists as have died that year.—M. Rouille de Meslay, counsellor to the parliament of Paris, founded two prizes, one of 2500, and the other of 2000 livres, which are alternately distributed by the parliament every year; the subject for the first must relate to physical astronomy, and those for the latter to navigation and commerce.

Notwithstanding the advantages which the members of this Academy enjoy over others, in having their expences defrayed, and even being paid for their time and attendance, they have fallen under some imputations, particularly that of plagiarism, or borrowing their neighbours inventions; but with what justice we do not say.

The *Royal Society at Berlin* was founded in 1700, by Frederic II. king of Prussia, on the model of that of England; excepting that, besides natural knowledge, it likewise comprehends the Belles Lettres. In 1710, it was ordained that the president shall be one of the counsellors of state, and nominated by the king. The members were divided into four classes; the first for prosecuting physics, medicine, and chemistry; the second for mathematics, astronomy, and mechanics; the third for the German language and the history of the country; the fourth for oriental learning, particularly as it may concern the propagation of the gospel among infidels. Each class to elect a director for themselves, who shall hold his post for life. The members of any of the classes have free admission into the assemblies of any of the rest.

The great promoter of this institution was the celebrated Mr Leibnitz, who accordingly was made the first director. The first volume of their transactions was published in 1710, under the title of *Miscellanea Berolinensia*; and though they received but few marks

of the royal favour for some time, they continued to publish new volumes in 1723, 1727, 1734, and 1740. At last, however, Frederic III. the present king of Prussia, gave new vigour to this Academy, by inviting to Berlin such foreigners as were most distinguished for their merit in literature, and encouraged his subjects to prosecute the study and cultivation of the sciences by giving ample rewards; and thinking that the Academy, which till that time had had some minister or opulent nobleman for its president, would find an advantage in having a man of letters at its head, he conferred that honour on M. Maupertuis. At the same time, he gave a new regulation to the academy, and took upon himself the title of its protector.

The academists hold two public assemblies annually; one in January, on the present king's birth-day; and the other in May, on the day of his accession to the throne. At the latter of these is given, as a prize, a gold medal of 50 ducats value: the subject for this prize is successively, natural philosophy, mathematics, metaphysics, and erudition.

The *Imperial Academy at Petersburg* was projected by Czar Peter the Great, who had taken the necessary measures for its establishment, when he was prevented by death from putting them into execution. His successor, the Czarina Catherine, laboured on the same plan; and in a short time formed one of the most celebrated academies in Europe, composed of the most considerable foreigners, some of them settled at Petersburg. The memoirs of this academy, which are published in Latin, are highly valuable, particularly for the mathematical part. The Academy, however, was in a very languishing condition, when the empress Czarina Elisabeth ascended the throne; but that princess, happily, naming count Rasumowski president, he gave it a new body of statutes, and quickly restored it to its ancient splendor.

The building and apparatus of this academy are extraordinary, there being a fine library, observatory, &c. It partakes much of what we call an *University*; having regular professors in the several faculties, who read lectures as in our schools.—The ordinary assemblies are held twice a-week, and public or solemn ones thrice a-year. In the public assemblies an account is given of what has been done in the private ones. The Academy has this model motto, *Paulatin.*

The *Academy of Sciences*, called the *Institute of Bologna*, was founded by count Marigli in 1712, for the cultivating of physics, mathematics, medicine, chemistry, and natural history. Its history is written by M. de Limiers, from memoirs furnished by the founder himself.

VI. *Academies of LAW*; as that famous one at Beryta, and that of the Sitientes at Bologna.

VII. *Academies of HISTORY*; as the *Royal Academy of Portuguese History* at Lisbon. This Academy was instituted by King John V. in 1720. It consists of a director, four censors, a secretary, and 50 members; to each of which is assigned some part of the ecclesiastical or civil history of the nation, which he is to treat either in Latin or Portuguese. In the church-history of each diocese, the prelates, synods, councils, churches, monasteries, academies, persons illustrious for sanctity or learning, places famous for miracles or relics, must be distinctly related in twelve chapters. The civil histo-

Academies. ry comprises the transactions of the kingdom from the government of the Romans down to the present time. The members who reside in the country are obliged to make collections and extracts out of all the registers, &c. where they live. Their meetings to be once in fifteen days.

A medal was struck by this Academy, in honour of their prince: the front of which was his effigy, with the inscription *Johannes V. Lusitanorum Rex*; and on the reverse, the same prince is represented standing, and raising History almost prostrate before him, with the legend *Historia Resurgens*. Underneath are the following words in abbreviation: REGIA ACADemia HISTORIE LUSITANÆ, INSTITuta VI. Idus Decembris MDCCXX.

VIII. *Academies of ANTIQUITIES*; as that at Cortona in Italy, and at Upsal in Sweden. The first is dignified for the study of Heturian antiquities; the other for illustrating the northern languages, and the antiquities of Sweden, in which notable discoveries have been made by it. The head of the Heturian Academy is called *Lucemon*, by which the ancient governors of the country were distinguished. One of their laws is to give audience to poets only one day in the year; another is to fix their sittings, and impose a tax of a dissertation on each member in his turn.

The *Academy of Medals and Inscriptions* at Paris was set on foot by M. Colbert, under the patronage of Lewis XIV. in 1663, for the study and explanation of ancient monuments, and perpetuating great and memorable events, especially those of the French monarchy, by coins, reliefs, inscriptions, &c. The number of members at first was confined to four or five, chosen out of those of the French Academy; who met in the library of Mr Colbert, from whom they received his majesty's orders. The days of their meetings were not determined; but generally they met on Wednesdays, especially in the winter season: but, in 1691, the king having given the inspection of this academy to M. de Pontchartrain comptroller general, &c. he fixed their meetings on Tuesdays and Saturdays.

By a new regulation, dated the 16th of July 1701, the Academy was composed of ten *honorary* members; ten *associates*, each of whom had two declarative voices; ten *personaries*; and ten *elèves*, or pupils. They then met every Tuesday and Wednesday, in one of the halls of the Louvre; and had two public meetings yearly, one the day after Martinmas and the other the 16th after Easter. The class of *elèves* has been suppressed, and united to the associates. The king nominates their president and vice-president yearly; but their secretary and treasurer are perpetual. The rest are chosen by the members themselves, agreeably to the constitutions on that behalf given them.

One of the first undertakings of this Academy, was to compose, by means of medals, a connected history of the principal events of Lewis XIV.'s reign: but in this design they met with great difficulties, and of consequence it was interrupted for many years; but at length it was completed down to the advancement of the duke of Anjou to the crown of Spain.

In this celebrated work, the establishment of the Academy itself was not forgot. The medal on this subject represents Mercury sitting, and writing with an

antique stylus on a table of brass; he leans with his left hand upon an urn full of medals, and at his feet are several others placed upon a card: the legend, *Rerum gestarum fides*; and on the exergue, *Academia regia inscriptionum et numismatum, instituta M.DC.LXIII.* signifying that the Royal Academy of Medals and Inscriptions, founded in 1663, ought to give to future ages a faithful testimony of all great actions. Besides this work, we have several volumes of their memoirs; and their history, written and continued by their secretaries.

IX. *Academies of BELLES LETTERS*, are those wherein eloquence and poetry are chiefly cultivated. There are very numerous in Italy, and not uncommon in France.

The *Academy of Umidi* at Florence has contributed greatly to the progress of the sciences by the excellent Italian translations given, by some of its members, of the ancient Greek and Latin historians. Their chief attention is to the Italian poetry, at the same time that they have applied themselves to the polishing of their language, which produced the *Academy La Crusca*.

The *Academy of Humorists*, *Umoristi*, had its origin at Rome from the marriage of Lorenzo Marcin, a Roman gentleman; at which several persons of rank were guests; and, it being carnival time, to give the ladies some diversion, they took themselves to the reciting of verses, sonnets, speeches, *first ex tempore*, and afterwards premeditated; which gave them the denomination of *Belli Humori*. After some experience, coming more and more into the taste of these exercises, they resolved to form an Academy of Belles Lettres; and changed the title of *Belli Humori* for that of *Humoristi*: chusing for their device a cloud, which, after being formed of exhalations from the salt waters of the ocean, returns in a gentle sweet shower; with this motto from Lucretius, *Reddit agmine dulci*.

In 1690, the *Academy of Arcadi* was established at Rome, for reviving the study of Poetry and of the Belles Lettres. Besides most of the politer wits of both sexes in Italy, this academy comprehends many princes, cardinals, and other ecclesiastics; and, to avoid disputes about pre-eminence, all appear masked after the manner of Arcadian shepherds. Within ten years from its first establishment, the number of *Academists* amounted to six hundred. They hold assemblies seven times a year in a mead or grove, or in the gardens of some nobleman of distinction. Six of these meetings are employed in the recitation of poems and verses of the Arcadi residing at Rome; who read their own compositions; except ladies and cardinals, who are allowed to employ others. The seventh meeting is set apart for the compositions of foreign or absent members.

This academy is governed by a Custos, who represents the whole society, and is chosen every four years, with a power of electing 12 others yearly for his assistance. Under these are two sub-custodes, one vicar or pro-custos, and four deputies or superintendants, annually chosen. The laws of the society are immutable, and bear a near resemblance to the ancient model.

There are five manners of electing members. The first is by *acclamation*. This is used when sovereign princes, cardinals, and ambassadors of kings, desire to be

Academies.

be admitted; and the votes are then given *viva voce*. The second is called *annumeration*. This was introduced in favour of ladies and academical colonies, where the votes are taken privately. The third, *representation*, was established in favour of colonies and universities, where the young gentry are bred; who have each a privilege of recommending one or two members privately to be balloted for. The fourth, *surrogation*, whereby new members are substituted in the room of those dead or expelled. The last, *destination*; whereby, when there is no vacancy of members, persons of poetical merit have the title of Arcadi conferred upon them, till such time as a vacancy shall happen. All the members of this body, at their admission, assume new pastoral names, in imitation of the shepherds of Arcadia. The academy has several colonies of Arcadi in different cities of Italy, who are all regulated after the same manner.

X. ACADEMIES of Languages; called, by some, *Grammatical Academies*; as,

The *Academy della Crusca* at Florence, famous for its vocabulary of the Italian tongue, was formed in 1582, but scarce heard of before the year 1584, when it became noted for a dispute between Tasso and several of its members. Many authors confound this with the Florentine academy. The discourses which Toricelli, the celebrated disciple of Galileo, delivered in the assemblies, concerning levity, the wind, the power of percussion, mathematics, and military architecture, are a proof that these academists applied themselves to things as well as words.

The *Academy of Frustifri* had its rise in 1617, at an assembly of several princes and nobility of the country, who met with a design to refine and perfect the German tongue. It flourished long under the direction of princes of the empire, who were always chosen presidents. In 1668, the number of members arose to upwards of 900. It was prior in time to the French academy, which only appeared in 1629, and was not established into an academy before the year 1635. Its history is written in the German tongue, by George Neumark.

The *French Academy*, which had its rise from a meeting of men of letters in the house of M. Conrart, in 1629. In 1635, it was erected into an academy, by Cardinal Richlieu, for refining and ascertaining the French language and style.—The number of its members are limited to 40; out of whom a director, chancellor, and secretary, are to be chosen: the two former hold their post for two months, the latter is perpetual. The members of this academy enjoy several privileges and immunities, among which is that of not being obliged to answer before any court but that of the king's household. They meet three times a-week in the Louvre; at breaking up, forty silver medals are distributed among them, having on one side the king of France's head, and on the reverse, *Protecteur de l'Academie*, with laurel, and this motto, *A l'Immortalité*. By this distribution, the attendance of the *Academists* is secured, those who are present receiving the surplus otherwise intended for the absent. To elect or expel a member, at least eighteen are required; nor can any be chosen unless he petition for it: by this expedient, the affront of refusals from persons elected is avoided. Religious are not admitted; nor can any nobleman, or person of distinction,

Academies.

be admitted on another footing than as a man of letters. None are to be expelled, except for bafe and dishonest practices; and there are but two instances of such expulsions, the first of M. Granier for refusing to return a deposit the other of the Abbe Furetiere for plagiarism.—The design of this academy was to give not only rules, but examples, of good writing. They began with making speeches on subjects taken at pleasure, about twenty of which were printed. They met with great opposition from the parliament at their first institution; it being two years before the patents granted by the king would be registered. They have been severely satyriized, and their style has been ridiculed as enervating instead of refining the French language. They are also charged with having surreitied the world by flattery, and having exhausted all the topics of panegyric in praise of their founder; it being a duty incumbent on every member, at his admission, to make a speech in praise of the king, the cardinal, the chancellor Seguier, and the person in whose place he is elected. The most remarkable work of this academy is a dictionary of the French tongue; which, after 50 years spent in settling the words and phrases to be used in writing, was at last published in 1694.

The *Royal Spanish Academy* at Madrid held its first meeting in July 1713, in the palace of its founder, the duke d'Escalona. It consisted at first of eight Academists, including the duke; to which number 14 others were afterwards added, the founder being chosen president or director. In 1714, the king granted them his confirmation and protection. Their device is a crucible in the middle of the fire, with this motto, *Limpia, Fy, y da Esplendor*; "it purifies, fixes, and gives brightness." The number of members is limited to 24; the duke d'Escalona to be director for life, but his successors chosen yearly, and the secretary to be perpetual. Their object, as marked out by the royal declaration, was to cultivate and improve the national language: they were to begin with chusing carefully such words and phrases as have been used by the best Spanish writers; noting the low, barbarous, or obsolete ones; and composing a dictionary wherein these may be distinguished from the former.

XI. ACADEMIES of Dancing; as that erected by Lewis XIV. with privileges above all the rest.

XII. ACADEMIES of Painting; as the *Academy of Painting and Sculpture* at Paris. This took its rise from the disputes that happened between the master painters and sculptors in that capital; in consequence of which, M. Le Brun, Sarazin, Comelle, and others of the king's painters, formed a design of instituting a particular academy; and, having presented a petition to the king, obtained an arret dated Jan. 20. 1648. In the beginning of 1655, they obtained from cardinal Mazarin a brevet, and letters patent, which were registered in parliament; in gratitude for which favour, they chose the cardinal for their protector, and the chancellor for their vice-protector. In 1663, by means of M. Colbert, they obtained a pension of 4000 livres. The academy consists of a protector; a vice-protector; a director; a chancellor; four rectors; adjuncts to the rectors; a treasurer; four professors, one of which is professor of anatomy, and another of geometry; several adjuncts and counsellors, an historiographer, a secretary, and two others.

The

Academies.

Acalandrus.

The Academy of Painting holds a public assembly every day for two hours in the afternoon, to which the painters resort either to design or to paint, and where the sculptors model after a naked person. There are 12 professors, each of whom keeps the school for a month; and there are 12 adjuncts to supply them in case of need. The professor upon duty places the naked man as he thinks proper, and sets him in two different attitudes every week. This is what they call *setting the model*. In one week of the month he sets two models together, which is called *setting the group*. The paintings and models made after this model, are called *academies*, or *academy-figures*. They have likewise a woman who stands for a model in the public school. Every three months, three prizes for design are distributed among the *elevés* or disciples; two others for painting, and two for sculpture, every year.

There is also an Academy of Painting, Sculpture, &c. at Rome, established by Lewis XIV. wherein those who have gained the annual prize at Paris are entitled to be three years entertained at the king's expense, for their further improvement.

XIII. *Academies of ARCHITECTURE*; as that established by M. Colbert in 1671, consisting of a company of skilful architects, under the direction of the superintendent of the buildings.

XIV. *Academies of POLITICS*; as that at Paris, consisting of six persons, who met at the Louvre, in the chamber where the papers relating to foreign affairs were lodged. But this Academy proved of little service, as the kings of France were unwilling to trust any but their ministers with the inspection of foreign affairs.

ACADEMY is also a term for schools and other seminaries of learning among the Jews, where their rabbins and doctors instructed their youth in the Hebrew language, and explained to them the Talmud and the secrets of the Cabbala: Those of Tiberias and Babylon have been the most noted.

ACADEMY is often used with us to denote a kind of collegiate school, where youth are instructed in arts and sciences. There is one at Portsmouth for teaching navigation, drawing, &c.; another at Woolwich, for fortification, gunnery, &c.—Besides these, there are numerous academies, especially in London, for teaching mathematics, languages, writing, accounts, drawing, and other branches of learning.

ACADEMY is likewise a name given to a riding-school, where young gentlemen are taught to ride the great horse, &c. and the ground allotted is usually called the *Menage*.

ACADEMY *Figure*, a drawing of a naked man or woman, taken from the life, which is usually done on paper with red or black chalk, and sometimes with pencils or crayons*. See ACADEMY, N^o XII. par. 2. *supra*.

ACADIE, or ACADY, in geography, a name formerly given to Nova Scotia, or New Scotland, one of our American colonies. See NOVA SCOTIA.

ACENA, in antiquity, a Grecian measure of length, being a ten feet-rod, used in measuring their lands.

ACAJOU, or CASHEW-NUT-TREE. See ANACARDIUM.

ACALANDRA, a town of Lucania, on the other side the Apennine, (Strabo); now *Salandra*, in the Basilicata, on the river Acalandrus.

ACALANDRUS, a river falling into the bay of Ta-

rentum, not far from the Metapontum, (Pliny, Strabo); now *Fiume de Roseto*.

ACALEPTIC, in ancient prosody, a complete verse.

ACALYPHA, the Three-headed Mercury, in botany, a genus of plants belonging to the monœcia monadelphica class. There are only four species of this plant; the acalypha virginica, which is a native of Ceylon; the virgata, indica, and australis, all natives of America. Sir Hans Sloan ranks this plant with the nettle, under the name of *urtica minor iners spicata*. As these plants have no beauty to recommend them, and at the same time are too tender to thrive easily in this climate, a particular description of the species or their culture seems unnecessary.

ACAMANTIS, the ancient name of the island Cyprus, taken from one of its promontories, situate to the west.

ACAMAS, son of Theseus, followed the rest of the Grecian princes to the siege of Troy; and was deputed, with Diomedes, to the Trojans, in order to get Helen restored. Laodice, Priam's daughter, fell in love with him, stole a night with him, and had a son by him called Munitus. He was one of the heroes who concealed themselves in the wooden horse. One of the tribes of Athens was called *Acamantides* from him, by the appointment of the oracle. He founded a city in Phrygia Major, called *Acamantium*; and made war against the Solymus.

ACAMBOU, a kingdom of Africa, on the coast of Guinea.

ACANACEOUS PLANTS, such as are armed with prickles.

ACANGIS, that is, *Ravagers* or *Adventurers*; a name which the Turks give their hussars or light-troops, who are generally sent out in detachments to procure intelligence, harass the enemy, or ravage the country.

ACANTHA, in botany, the prickly of any plant; in zoology, a term for the spine or prickly fins of fishes.

ACANTHABOLUS, in surgery, an instrument for pulling thorns, or the like, out of the skin.

ACANTHINE, any thing resembling or belonging to the herb acanthus. Acanthine garments, among the ancients, are said to be made of the down of thistles; others think they were garments embroidered in imitation of the acanthus.

ACANTHOPTERYGIOUS FISHES, a term used by Linnæus and others for those fishes whose back-fins are hard, scissous, and prickly.

ACANTHOS, a town of Egypt, near Memphis, (Pliny); now *Bisalta*. Also a maritime town of Macedonia, to the west of mount Athos, a colony of Andrians, (Thucydides, Ptolemy); now *Erisso*; near which was shewn Xerxes's ditch, of seven fadoms, in order to separate mount Athos from the continent, and convey his ships, without doubling Athos, into the Singitic Bay. *Acanthos*, is also a town of Epirus.

ACANTHUS, bear-breech, or brank-ursine, in botany; a genus of plants of the angiospermia order belonging to the didynamia class. For the figure of this plant, which is extremely beautiful, see Plate I. fig. 3. There are five.

Species. 1. The mollis, or common bear's-breech, a native of Italy, is the sort that is used in medicine*, via Medica, and is supposed to be the *mollis acanthus* of Virgil: *no* 68.

* See Grayson's painting.

Acaleptic

the leaves of this species are famous for having given rise to the capital of the Corinthian pillars †. 2. The spinosus, or prickly bear's-breech; the leaves of which are deeply jagged in very regular order, and each segment is terminated with a sharp spine, as are also the footstalks of the leaves and the empalement of the flower, which renders it troublesome to handle them. 3. Hicifolius, or shrubby bear's-breech, grows naturally in both the Indies. It is an evergreen shrub, which rises about four feet high; and is divided into many branches, garnished with leaves like those of the common holly, and armed with spines in the same manner: the flowers are white, and shaped like those of the common *acanthus*, but smaller. 4. The nigra, or Portugal bear's-breech, with smooth sinuated leaves of a livid green colour, was discovered in Portugal by Dr Jussieu of the royal garden at Paris. 5. The middle bear's-breech, with entire leaves, having spines on their border, is supposed to be the *acanthus* of Dioscorides.

Culture. They are all perennial plants. The first and second species may be propagated either by seeds, or by off-sets from the roots. The best way is to raise them from the seeds; which should be sown about the end of March, in a light soil. They are best dropped at distances into shallow drills, and covered three quarters of an inch with mould. When the plants are come up, the strongest should be marked, and the rest should be pulled up, that these may stand at a yard distance one from another. They require no other culture, but to keep them clear from weeds. The third, fourth and fifth sorts, are propagated only by seeds; which, as they do not ripen in Europe, must be obtained from the places in which they grow naturally: the plants are so tender, that they cannot be preserved out of the stove in this country.

ACANTHUS is likewise used by Theophrastus as a synonyme of the *acacia*.

ACANTHUS, in architecture, an ornament representing the leaves of the *acanthus*, used in the capitals of the Corinthian and Composite orders.

ACANUS, in botany, a synonyme of *carduus* castaneus of Linnaeus. See *CARDUS*.

ACAPULCO, a considerable town and port in Mexico, on the South Sea. It has a fine harbour, from whence a ship annually sails to Manila in the Philippine islands, near the coast of China in Asia: and another returns annually from thence with all the treasures of the East Indies, such as diamonds, rubies, sapphires, and other precious stones; the rich carpets of Persia; the camphire of Borneo; the benjamin and ivory of Pegu and Cambodia; the silks, muslins, and calicoes, of the Mogul's country; the gold-dust, tea, china-ware, silk, and cabinets, of China and Japan; besides cinnamon, cloves, mace, nutmegs, and pepper; inasmuch that this single ship contains more riches than many whole fleets. The goods brought to Acapulco are carried to the city of Mexico by mules and pack-horses; and from thence to Vera Cruz on the North Sea, in order to be shipped for Europe. Acapulco itself is a small place, consisting of about 2 or 300 thatched houses. Ships arrive at the port by two inlets, separated from each other by a small island; the entrance into them in the day-time is by means of a sea-breeze, as the falling out in the night-time is effected by a land-breeze. A wretched fort, 42 pieces of cannon, and a garrison of 60 men,

defend it. It is equally extensive, safe, and commodious. The bason which constitutes this harbour is surrounded by lofty mountains, which are so dry, that they are even destitute of water. The air here is hot, heavy, and unwholesome; to which none can habituate themselves, except certain negroes that are born under a similar climate, or some mulattoes. This feeble and miserable colony is crowded with a vast accession to its numbers upon the arrival of the galleons; traders flocking here from all the provinces of Mexico, who come to exchange European toys, their own cochineal, and about ten millions † of silver for spices, muslins, printed linens, silk, perfumes, and the gold works of Asia. W. Long. 102. 29. N. Lat. 17. 30.

ACARAI, a town of Paraguay in South America, built by the Jesuits in 1624. Long. 116. 40. S. lat. 26°.

ACARAUNA, a small American fish, called by our sailors the old-wife. See *LABRUS*.

ACARNANIA, the first country of Free Greece, or Greece Proper, bounded on the west by the Sinus Ambracius, and separated from *Ætolia* by the river *Achelous* on the east, and by the Sinus Ambracius from *Epirus*. The people were called *Acarnanians*, denoting persons unborn; or other *Ætolians*, to the east of the *Achelous*, being called *Curetes*, (Homer,) from being shorn. According to *Lucian*, they were noted for effeminacy and incontinence; hence the proverb, *Porcellus Acarnanius*. This country was famous for an excellent breed of horses; so that *Acarnanicus* is used, is a proverbial saying for a thing excellent in its kind. It is now called *la Carnia* and *il Despotato*.

ACARON, or *ACCARON*, a town of Palestine, called *Etron* in scripture. It was the boundary of the Philistines to the north; stood at some distance from the sea, near *Bethshemesh*; and was famous for the idol of *Baalzebub*.

ACARUS, a genus of insects belonging to the order of aptera, or such as have no wings. The *acarus* has eight legs, two eyes, one on each side of the head, and two jointed tentacula. Most of the species of this genus have been also arranged among the microscopic animalcules, but with no reason; they are all sufficiently visible to the naked eye. The term *Acarus* is not to be understood, in this sense, as restrained to the insect commonly understood by it, the Mite: that animal is possessed of characters in common with a great number of other insects, which have been called by other names, but which are all connected by nature, and are therefore of the same genus; some of them have been called spiders, others lice, and others by other names, referring them to genera to which they have as little alliance in nature as to these. The genus, on bringing them back to it, appears a very numerous one †, and consists of some which are inhabitants of the earth, some of waters; some which live on trees, others among stones, and others on the bodies of other animals, and even under their skin. The description of a few of the most remarkable will here suffice.

1. The fire, or cheese-mite, is a very minute species. To the naked eye, these mites appear like moving particles of dust. But the microscope discovers them to be perfect animals, having as regular a figure, and performing all the functions of life as perfectly, as creatures that exceed them many times in bulk. The principal parts of them are the head, the neck, and the body.

* Linnaeus
enumerates
35 species.

The Cheese-
mite, &c.

The

Acarus.

The head is small in proportion to the body; and has a sharp snout, and a mouth that opens and shuts like a mole's. They have two small eyes, and are extremely quicksighted; and when they have been once touched with a pin, you will easily perceive how cunningly they avoid a second touch. Their legs are each furnished at the extremity with two little claws, with which the animal very nicely takes hold of any thing. The hinder part of the body is plump and bulky; and ends in an oval form, from which there issue out a few exceeding long hairs. Other parts of the body are also beset with thin and long hairs. The males and females are easily distinguished in these little animals. The females are oviparous, as the louse and spider; and from their eggs the young ones are hatched in their proper form, without having any change to undergo afterwards. They are however, when first hatched, extremely minute; and, in their growing to their full size, they cast their skins several times. These little creatures may be kept alive many months between two concave glasses, and applied to the microscope at pleasure. They are thus often seen *in situ*, conjoined tail to tail; and this is performed by an incredibly swift motion. Their eggs, in warm weather, hatch in twelve or fourteen days; but, in winter, they are much longer. These eggs are so small, that a regular computation shews, that 90 millions of them are

* Baker's Microscope, p. 187.

not so large as a common pigeon's egg *. They are very voracious animals, and have often been seen to eat one another. Their manner of eating is by thrusting alternately one jaw forward and the other backward, and in this manner grinding their food; and after they have done feeding, they seem to chew the cud. There are several varieties of this species found in different substances besides cheese; as in malt-dust, flour, oat-meal, &c. Those in malt-dust and oat-meal are much number than the cheese-mites, and have more and longer hairs. There are also a sort of wandering mites, which range wherever there is any thing they can feed on: They are often seen in the form of a white dust, and are not suspected to be living creatures.—The mite is called by authors, simply, *Acarus*. It is an animal very tenacious of life, and will live months without food.

* Arcan. Nat. tom. iv. p. 308.

Mr Lewenhock * had one which lived eleven weeks on the point of a pin, on which he had fixed it for examining by his microscope.—2. The sanguifugus. The hinder part of the abdomen is cruciated, the scutellum is oval and yellowish, and the beak is trifid. It is a native of America, and sticks so fast on the legs of travellers, sucking their blood, that they can hardly be extracted. 3. The telarius is of a greenish yellow colour. It has a small sting or weapon, with which it wounds the leaves of plants, and occasions them to fold backward. They are very frequently to be met with in the autumn, inclosed in the folded leaves of the lime-tree. 4. The exulcerans, or itch-acarus, is a very small species; its body is of a figure approaching to oval, and lobated; the head is small and pointed; its colour is whitish, but it has two dusky femicircular lines on the back. It has long setaceous legs, but the two first are short. It is found in the pustules of the itch: authors in general have supposed that it causes that disease; but, if this were so, it would be found more universally in those pustules. It is more probable that these only make a proper nidus for it. 5. The

The Itch-animal.

batatas, is of a blood-colour, and a little rough; the fore pair of legs are as long as the body. It inhabits the potatoes of Surinam. 6. The ovinus, or sheep-tick, has a flat body, of a roundish figure, but somewhat approaching to oval, and of a yellowish white colour, and has a single large round spot on the back: the anus is visible in the lower part of the body; the thorax is scarce conspicuous; the head is very small and black; the mouth is bifid: the antennæ are of a clavated figure, and of the length of the snout; the legs are short and black. It is common on sheep, and its excrements stain the wool green: it will live in the wool many months after it is shorn from the animal. 7. The coleopratorum, or acarus of insects, is extremely minute: its body is round, reddish, and covered with a firm and hard skin; the head is very small, the neck scarce visible; the legs are moderately long, the anterior pair longer than the others; it has a whiteness about the anus. It is frequent on the bodies of many insects, which it infests, as the louse does others; it runs very swiftly: the humble-bee, and many other of the larger insects, are continually infested with it; but none so much as the common black beetle, which has thence been called the lousy beetle. 7. The baccharum, or scarlet tremite, is a small species: its body is roundish, and the back not at all flattened, as it is in many others; the skin is smooth, shining, and glossy; and the whole animal seems distended, and ready to burst; the colour is a bright red, but a little dusker on the sides than elsewhere: the head is very small, and the legs short; there is on each side a small dusky spot near the thorax, and a few hairs grow from different parts of the body. It is very common on trees, particularly on the currant, on the fruit of which we frequently see it running. 9. The longicornis, or red stone-acarus, is very small, and of a bright red colour; the body is round, and distended; the head is very small, and pointed; the legs are moderately long, and of a paler red than the body: the antennæ are much longer than in any other species. It is frequent about old stone-walls and on rocks, and runs very nimbly. 10. The aquaticus is a small species: the body is of a figure approaching to an oval, and the back appears depressed; it is of a bright and strong scarlet colour. The head is small; the legs are moderately long and firm, and are of a paler red than the body. It is common in shallow waters, where it runs very swiftly along the bottom. 11. The holosericus is a small species: its body is roundish, but a little approaching to oval; the back somewhat depressed: it is of a fine scarlet colour, and covered with a velvety down. The head is very small; the eyes are two, and very small; the legs are short and of a paler red, and there is a small black spot near the insertion of the anterior ones. It is very common under the surface of the earth, and sometimes on herbs and among hay. It is supposed to be poisonous, if swallowed; but we do not seem to have any certain account of such an effect. 12. The longipes is the largest of the acarus kind: its body is roundish, of a dusky brown on the back, with a dusker spot of a rhomboidal figure near the middle of it; the belly is whitish; the legs are extremely long and slender. On the back part of the head there stands a little eminence, which has on it a kind of double crest, formed as it were of a number of minute spines: the eyes are small and black, and are

Acarus.

Acarus of insects.

Long-leg'd Acarus. Pl. I. fig. 4.

Acclius
Accele-
ration.

two in number. It is very common in our pastures, towards the end of summer. Ray and Lister call it *araneus crustatus longipes*; Mouffet, *araneus longipes*; and, notwithstanding its having but two eyes, it has been almost universally ranked among the spiders.

ACASTUS, in classic history, the son of Pelias king of Thessaly, and one of the most famous hunters of his time, married Hippolyta, who falling desperately in love with Peleus her son-in-law, and he refusing to gratify her wishes, she accused him to her husband of a rape; on which he slew them both.

ACATALECTIC, a term, in the ancient poetry, for such verses as have all their feet or syllables, in contradistinction to those that have a syllable too few.

ACATALEPSY, signifies the impossibility of comprehending something.—The distinguishing tenet of the Pyrrhonists was their asserting an absolute acatalepsy in regard to every thing.

ACATERY, or ACCATRY, an officer of the king's household, designed for a check betwixt the clerks of the kitchen and the purveyors.

ACATHARSIA, an impurity of the blood or humours.

ACATHISTUS, the name of a solemn hymn anciently sung in the Greek church, on the Saturday of the fifth week of Lent, in honour of the Virgin, for having thrice delivered Constantinople from the invasions of the barbarous nations.

ACCA (St), bishop of Hagafult, or Hexham, in Northumberland, succeeded Wilfrid in that see in 709. He ornamented his cathedral in a most magnificent manner: he furnished it also with plate and holy vestments; and erected a noble library, confiding chiefly of ecclesiastical learning, and a large collection of the lives of the saints, which he was at great pains to procure.—He was accounted a very able divine, and was famous for his skill in church-music. He wrote several pieces: particularly, *Passiones Sanctorum*, the Sufferings of the Saints: *Pro illustrandis scripturis, ad Bedam*; For explaining the scriptures, addressed to Bede. He died in 740, having enjoyed the see of Hexham 31 years, under Egbert king of the Northumbrians.

ACCALIA, in Roman antiquity, solemn festivals held in honour of Acca Laurentia, Romulus's nurse: they were otherwise called *Laurentalia*.

ACCAPITARE, in law, the act of becoming vassal of a lord, or of yielding him homage and obedience. Hence,

ACCAPITUM, signifies the money paid by a vassal upon his admission to a fief.

ACCAPITUM, in our ancient law, was used also to express the relief due to the chief lord. See RELIEF.

ACCEDAS *ad curiam*, in the English law, a writ lying, where a man has received, or fears, false judgment in an inferior court. It lies also for justice delayed, and is a species of the writ *recordare*.

ACCEDONES. See ACCENDONES.

ACCELERATED, implies, in a general sense, quickened, continually increasing. Thus, *accelerated motion* is a motion continually increasing. See MOTION.

ACCELERATION, an increase of velocity in the motion of a body; it is opposed to *retardation*, which is a diminution of motion.

ACCELERATION, is also a term used by ancient astronomers, with whom it signified the difference between

the revolution of the primum mobile and that of the sun, computed to be three minutes and fifty-five seconds.

ACCELERATOR, in anatomy, the name of two muscles of the penis, which serve for ejecting the urine or semen. See ANATOMY, n° 176.

ACCENDENTES, a lower order of ministers in the Romish church, whose office is to light and trim the candles.

ACCENDONES, or ACCEDONES, in Roman antiquity, a kind of gladiators, whose office was to excite and animate the combatants during the engagement *. The orthography of the word is contested: the first edition of Tertullian, by Rhenanus, has it *accedones*; an ancient manuscript, *accendones*. Aquinas adheres to the former, Pitiscus to the latter. The origin of the word, supposing it *accendones*, is from *accendo*, I kindle; supposing it *accedones*, from *accedo*, I accede, am added to. The former places their distinguishing character in enlivening the combat by their exhortations and suggestions; the latter supposes them to be much the same with what among us are called *seconds*, among the Italians *patroni*: excepting that these latter only stand by to see the laws of the sword duly observed, without intermeddling to give advice or instruction.

ACCENSI, in the Roman armies, certain supernumerary soldiers, designed to supply the places of those who should be killed or anywise disabled. They were thus denominated, *quia accensebantur*, or *ad censum adiciebantur*. Vegetius calls them *supernumerarii legionum*. Cato calls them *serentarii*, in regard they furnished those engaged in battle with weapons, drink, &c. Though Nonnius suggests another reason of that appellation, *viz.* because they fought with stones, slings, and weapons *que ferruntur*, such as are thrown, not carried in the hand. They were sometimes also called *velites*, and *velati*, because they fought clothed, but not in armour; sometimes *adscripticii*, and *adscriptivi*; sometimes *rorarii*. The *accensi*, Livy observes, were placed at the rear of the army, because no great matter was expected from them: they were taken out of the fifth class of citizens.

ACCENSI, in antiquity, denotes an inferior order of officers, appointed to attend the Roman magistrates, somewhat in the manner of ushers, serjeants, or tipstaves among us. They were thus called from *accire*, to tend for; one part of their office being to call assemblies of the people, summon parties to appear and answer before the judges, &c.

ACCENSI, was also an appellation given to a kind of adjutants, appointed by the tribune to assist each centurion and decurion. In which sense, *accensus* is synonymous with *optio*.—In an ancient inscription, given by a Torre, we meet ACCENSUS EQUITUM ROMANORUM; an office no where else heard of. That author suspects it for a corruption; and instead thereof reads, A CENSIBUS.

ACCENSION, the action of setting a body on fire: thus the accension of tinder is effected by striking fire with flint and steel.

ACCENT, in reading or speaking, an inflection of the voice, which gives to each syllable of a word its due pitch in respect of height or lowness. See the article READING, N° IV.—The word is originally Latin, *accentus*: a compound of *ad*, to; and *canto*, to sing. *Accentus*, *quasi* *adcantus*, or *juxta cantum*. In this sense,

Accelerator
Accent.

* See Gladi-
ator.

Accent.

Accent.

senſe, accent is ſynonymous with the Greek *ῥωσ*; the Latin *tenor*, or *tonor*; and the Hebrew *נָוֶה*, *gufus*, taſte.—For the doctrine of *Accents* in *Compoſition*, ſee *POETRY*, Part II. n° 53, 62, 70, 90,—98.

ACCENT, among grammarians, is a certain mark or character placed over a ſyllable, to direct the ſtreſs of its pronunciation. We generally reckon three grammatical accents in ordinary uſe, all borrowed from the Greeks, *viz.* the *acute accent* (´), which ſhews when the tone of the voice is to be raiſed. The *grave accent* (`), when the note or tone of the voice is to be depreſſed. The *circumflex accent* (^ or ^), is compoſed of both the acute and the grave, and points out a kind of undulation of the voice. The Latins have made the ſame uſe of theſe three accents.

The Hebrews have a grammatical, a rhetorical, and muſical accent: though the firſt and laſt ſeem, in effect, to be the ſame; both being comprized under the general name of *tonic accents*, becauſe they give the proper tone to ſyllables; as the rhetorical accents are ſaid to be euphonic, inasmuch as they tend to make the pronunciation more ſweet and agreeable. There are four euphonic accents, and 25 tonic; of which ſome are placed above, and others below the ſyllables; the Hebrew accents ſerving not only to regulate the riſings and fallings of the voice, but alſo to diſtinguiſh the ſections, periods, and members of periods, in a diſcourſe; and to anſwer the ſame purpoſes with the points in other languages.—Their accents are divided into *emphatics*, *kings*, *dukes*, &c. each bearing a title anſwerable to the importance of the diſtinction it makes. Their emperor rules over a whole phraſe, and terminates the ſenſe completely; anſwering to our point. Their king anſwers to our colon; and their duke to our comma. The king, however, occasionally becomes a duke, and the duke a king, as the phraſes are more or leſs ſhort. It muſt be noted, by the way, that the management and combination of theſe accents diſſer in Hebrew poetry from what they are in proſe. The uſe of the tonic or grammatical accents has been much controverted: ſome holding that they diſtinguiſh the ſenſe; while others maintain that they are only intended to regulate the muſic, or fingiſg; alledging that the Jews ſing, rather than read, the ſcriptures in their ſynagogues*. Be this, however, as it will, it is certain the ancient Hebrews were not acquainted with theſe accents. The opinion which prevails amongſt the learned, is, that they were invented about the ſixth century, by the Jewiſh doctōrs of the ſchool of Tiberias, called the *Maſoretes*.

As to the Greek accents, now ſeen both in manuſcripts and printed books, there has been no leſs diſpute about their antiquity and uſe than about thoſe of the Hebrews. Iſaac Voſſius endeavours to prove them of modern invention; aſſerting, that anciently they had nothing of this kind, but only a few notes in their poetry, which were invented by Ariſtophanes the grammarian, about the time of Ptolemy Philopater; and that theſe were of muſical, rather than grammatical uſe, ſerving as aids in the ſinging of their poems, and very different from thoſe introduced afterwards. He alſo ſhews from ſeveral ancient grammarians, that the manner of writing the Greek accents in theſe days was quite different from that which appears in our books. The author of *La Methode Greque*, p. 546, obſerves, that the right

pronunciation of the Greek language being natural to the Greeks, it was needleſs for them to mark it by accents in their writings: ſo that, according to its appearance, they only began to make uſe of them ſo low as the time in which the Romans, being curious to learn the Greek tongue, ſent their children to ſtudy at Athens, thinking thereby to fix the pronunciation, and to facilitate it to ſtrangers; which happened, as the ſame author obſerves, a little before Cicero's time. Weſtein, Greek profeſſor at Baſil, in a learned diſſertation endeavours to prove the Greek accents of an older ſtanding. He owns that they were not always formed in the ſame manner by the ancients; but thinks that difference owing to the different pronunciation which obtained in the different parts of Greece. He brings ſeveral reaſons, *a priori*, for the uſe of accents, even in the earlieſt days: as that they then wrote all in capital letters equidistant from each other, without any diſtinction either of words or phraſes, which without accents could ſcarce be intelligible; and that accents were neceſſary to diſtinguiſh ambiguous words, and to point out their proper meaning; which he confirms from a diſpute on a paſſage in Homer, mentioned by Ariſtotele in his *Poetics*, chap. v. Accordingly, he obſerves, that the Syrians, who have tonic, but no diſtinctive accents, have yet invented certain points, placed either below or above the words, to ſhew their mood, tenſe, perſon, or ſenſe.

The uſe of accents, to prevent ambiguities, is moſt remarkably perceived in ſome eaſtern languages, particularly the Siameſe and Chineſe. Among the people of China, every word, or (which is the ſame thing) ſyllable, admits of five accents, as ſpoken more acutely or remiſely; and thus ſtands for many different things. The ſame ſound *ya*, according to the accent affixed to it, ſignifies *God*, a *wall*, *excellent*, *ſtupidity*, and a *gooſe*.—The Chineſe have but 330 ſpoken words in their language; but theſe being multiplied by the different accents or tones, which affect the vowels, furniſh a language tolerably copious. By means hereof, their 330 ſimple ſounds come to denote 1650 things; but this being hardly ſufficient, they are increaſed further by *aspirates* added to each word, to double the number. The Chineſe only reckon four accents: for which the miſſionaries uſe the following marks, *ā, á, â, ã*; to which they have added a fifth, *ũ*. They make a kind of modulation; wherein, prolonging the duration of the ſound of the vowel, they vary the tone, raiſing and ſinking it by a certain pitch of voice: ſo that their talking is a ſort of muſic or ſingiſg. Attempts have been made to determine the quantity of the riſe or fall in each accent by means of muſical notes; but this is hard to effect, as being different in different perſons. Hence the great difficulty of the language to foreigners; they are forced to ſing moſt ſcrupuloſly: if they deviate ever ſo little from the accent, they ſay quite a different thing from what was intended. Thus, meaning to compliment the perſon you are talking to with the title *Sir*, you call him a beaſt, with the ſame word, only a little varied in the tone. Magalhon makes the language the eaſier to learn on this account.—The Siameſe are alſo obſerved to ſing rather than talk. Their alphabet begins with ſix characters, all only equivalent to a K, but differently accented. For tho' in the pronunciation the accents are naturally on the vowels, yet they have ſome to diverſify ſuch of their conſonants

* Cooper, Dom. Moſaic. Clav. p. 31.

Accent conforants as are in other respects the same.

Acciaioli. ACCENT, in music, is a certain modulation of sounds to express a passion, whether by the voice or instruments.

* *See* Trio. ACCENTER, in music, one of the three fingers in a trio, viz. the person who sings the highest part *.

ACCEPTANCE, in law, a person's agreeing to offers made in bargaining, by which the bargain is concluded.

ACCEPTANCE, in the church of Rome, is put for receiving the pope's constitutions.

ACCEPTANCE, in commerce, is the subscribing, signing, and making one's self debtor for the sum contained in a bill of exchange or other obligation. See BILLS.

ACCEPTATION, in grammar, the sense or meaning wherein any word is taken.

ACCEPTER, or ACCEPTOR, the person who accepts a bill of exchange, &c.

ACCEPTILATION, among civilians, an acquittance or discharge given by the creditor to the debtor without the payment of any value.

ACCESSIBLE, something that may be approached, or that access may be had to. Thus we say, Such a place is accessible on one side, &c.

ACCESSION, in law, is a method of acquiring property, by which, in things that have a close connexion or dependence upon one another, the property of the principal thing draws after it the property of the accessory. Thus, the owner of a cow becomes likewise the owner of the calf. See LAW, Part III. n^o clxii. 6. It sometimes likewise signifies consent or acquiescence.

ACCESSION, among physicians, is used for a paroxysm of a disease; among politicians, it signifies a prince's succeeding to the government upon the death of his predecessor.

ACCESSORY, in law, is the subject acquired by accession: Or, in crimes, it signifies the person by whose assistance, advice, or command, the crime was committed; in which sense, it is the same with accomplice, aft and part, &c. See LAW, Part III. n^o clxxxiv. 4, 45, 50.

ACCI, a town of Tarraconensis, (Pliny, Ptolemy;) formerly called *Atti*, supposed to be Guadix, to the east of the city of Granada, at the foot of a mountain, near the source of the rivulet Guadalatin. Now greatly decayed. It is the Colonia Accitana Gemella, (coins); and was of some repute among the Roman colonies. The people were called Gemellenes, because the colony consisted of colonists from the third and sixth legions.

ACCIAIOLI (Donato), a man famous for his learning and the honourable employments he possessed in Florence his native country, in the 15th century. He wrote, A Latin translation of some of Plutarch's Lives; Commentaries on Aristotle's Ethics and Politics; and the Life of Charlemagne. He was sent to France by the Florentines, to sue for succour from Lewis XI. against Pope Sixtus IV. but died on his journey at Milan; his body was carried to Florence, and buried in the church of the Carthusians. The small fortune he left his children is a proof of his probity and disinterestedness. His daughters, like those of Aricides, were married at the public expense, as an acknowledgment of his services. His funeral elogium was spoken by Christopher Landini; and an elegant epitaph, by Politian, was inscribed on his tomb.

ACCIDENT, in a general sense, denotes any casual event.

ACCIDENT, among logicians, is used in a threefold sense. 1. Whatever does not essentially belong to a thing; as the clothes a man wears, or the money in his pocket. 2. Such properties in any subject as are not essential to it; thus whiteness in paper is an accidental quality. 3. In opposition to substance, all qualities whatever are called accidents; as sweetness, softness, &c.

ACCIDENT, in grammar, implies a property attached to a word, without entering into its essential definition; for every word, notwithstanding its signification, will be either primitive, derivative, simple, or compound, which are the accidents of words. A word is said to be primitive, when it is taken from no other word in the language in which it is used: thus *heaven, king, god*, are primitive words. It is said to be derivative, when it is taken from some other word: thus *heavenly, kingdom, goodness*, &c. are derivatives. A simple word is easily distinguished from a compound: thus *just, justice*, are simple words; *unjust, injustice*, are compound: *res* is a simple word, as well as *publica*; but *respublica* is a compound. Besides these accidents, which are common to all sorts of words, each particular species has its accidents: thus the accidents of the noun substantive are the gender, declension, and number; and the adjective has another accident, namely, the comparison. See GRAMMAR, n^o 14, &c. and the article LANGUAGE.

ACCIDENT, in heraldry, an additional point or mark in a coat of arms, which may be either omitted or retained without altering the essence of the armour; such as, abatement, difference, and tincture.

ACCIDENTAL, in a general sense, implies something that happens by accident, or that is not essential to its subject.

ACCIDENTAL, in philosophy, is applied to that effect which flows from some cause intervening by accident, without being subject, or at least without any appearance of being subject, to general laws or regular returns. In this sense, *accident* is opposed to *constant* and *principal*. Thus the sun's place is, with respect to the earth, the constant and principal cause of the heat in summer, and the cold in winter; whereas winds, snows, and rains, are the accidental causes which often alter and modify the action of the principal cause.

ACCIDENTAL Point, in perspective, is that point in the horizontal line where the projections of two lines parallel to each other meet the perspective plane.

ACCIPENSER, in ichthyology, a genus of fishes belonging to the Amphibia Nantes of Linnæus. The accipenser has a single linear nostril: the mouth is in the under part of the head, and contains no teeth; the cirri are below the snout, and before the mouth. There are three species of this genus, viz.

1. The huso has 4 cirri; the body is naked, i. e. has no prickles or protuberances. The skin of the huso is so tough and strong, that it is employed for ropes in carts and other wheel-carriages; and the ichthyocolla *, or singlass of the shops, famous as an agglutinant, and used also for the lining of wines, is made from its sound or scales. The ancients were acquainted with the fish that afforded this drug. Pliny mentions it under the name of ichthyocolla; and says, that

Acipenser. the glue that was produced from it had the same title; and afterwards adds, that it was made out of the belly of the fish. The hufe is the largest of the genus, and grows to 24 feet in length. It inhabits the Danube and the rivers of Russia.

2. The sturio, or sturgeon, with 4 cirri and 11 squamous protuberances on the back. That this is the *Ovianus* of Dorian, as quoted by Athenæus, is very probable, as well from the account he gives of its form as of its nature. He says its mouth is always open, with which it agrees with the sturgeon; and that it conceals itself in the hot months: this shews it to be a fish of a cold nature; which is confirmed by the history of the European fish of this species given by Mr Forster †, in his Essay on the *Volga*; who relates, that they are scarce ever found in that river in spring or summer, but in vast quantities in autumn and winter, when they crowd from the sea under the ice, and are then taken in great numbers. Whether the *acipenser* is the sturgeon of the moderns, may be doubted; otherwise Ovid never had spoken of it as a foreign fish:

† Phil. Tran.
lviij. 352.

Tuque peregrinis, Acipenser, nobilis undis.

And thou, a fish in foreign seas renown'd—

it being well known that it is not uncommon in the Mediterranean, and even in the mouth of the Tiber, at certain seasons. But this passage leaves us as much in the dark as to the particular species intended by the word *acipenser*, as the description Pliny has given us: for that philosopher relates, that its scales are placed in a contrary direction to those of other fish, being turned towards the mouth; which disagrees with the character of all that are known at present. Whatever fish it might be, it was certainly the same with the *elops*, or *helops*; as appears from Pliny, who makes it synonymous with the *acipenser* †; and from another line of the poet beforementioned:

Et pretiosus Helops, nostris incognitus undis.

The precious Helops, stranger to our seas.

The sturgeon annually ascends our rivers, but in no great numbers, and is taken by accident in the salmon-nets. It seems a spiritless fish, making no manner of resistance when entangled, but is drawn out of the water like a lifeless lump. It is a fish that is seldom taken far out at sea, but frequents such parts as are not remote from the estuaries of great rivers. It is admired for the delicacy and firmness of its flesh, which is white as veal, and extremely good when roasted. It is generally pickled. The most we receive comes either from the Baltic rivers, or North America: those cured at Pillau have been, till of late, in the greatest repute; but through the encouragement given by the society instituted for promoting trade and manufactures, the sturgeon from our colonies begins to rival those of the Baltic. Great numbers are taken during summer in the lakes Frischehoff, and Curisch-haff near Pillau, in large nets made of small cord. The adjacent shores are formed into districts, and farmed out to companies of fishermen, some of which are rented for six thousand guilders, or near three hundred pounds, *per annum*. They are found in vast abundance in the American rivers in May, June, and July; at which time they leap some yards out of the water, and, falling on their sides, make a noise to be heard in still weather at some miles distance. Caviare is made of the roes of this, and also

VOL. I.

of all the other-forts of sturgeons, dried, salted, and packed up close. Ichthyocolla, or ising-glass, is also made of the sound of our fish, as well as that of the others; but in very small quantity. The sturgeon grows to a great size, to the length of 18 feet, and to the weight of 500 pounds, but it is seldom taken in our rivers of that bulk. The largest we have known caught in those of Great Britain, weighed 460 pounds; which was taken about three years ago in the Esk, where they are more frequently found than in our southern waters. In the manner of breeding, this fish is an exception among the cartilaginous kind; being, like the bony fish, oviparous, spawning in water.

3. The ruthenus has 4 cirri, and 15 squamous protuberances. It is a native of Russia.

ACCIPITER, the name of Linnæus's first order of Birds. See ZOOLOGY, n° 8, a.

Among the Romans, the term *accipiter* signified a hawk; and which, from its being very carnivorous, they considered as a bird of bad omen:

Odium accipitrem, quia semper vivit in armis. OVID.

Pliny, however, tells us, that in some cases, particularly in marriage, it was esteemed a bird of good omen, because it never eats the hearts of other birds; intimating thereby, that no differences in a married state ought to reach the heart. The accipiter was worshipped as a divinity by the inhabitants of Tentyra, an island in the Nile, being considered by them as the image of the sun; and hence we find that luminary represented, in hieroglyphics, under the figure of a hawk.

ACCISMUS, denotes a feigned refusal of something which a person earnestly desires. The word is Latin; or rather Greek, *ακκιςμος* supposed to be formed from *Acco*, the name of a foolish old woman noted in antiquity for an affectation of this kind.

Accismus is sometimes considered as a virtue; sometimes as a vice, which Augustus and Tiberius practised with great success. Cromwell's refusal of the crown of England, may be brought as an instance of an *Accismus*.

Accismus is more particularly used, in rhetoric, as a species of irony.

ACCIIUS (Lucius), a Latin tragic poet, the son of a freedman, and, according to St Jerom, born in the consulship of Hostilius Mancinus and Attilius Serranus, in the year of Rome 583; but there appears somewhat of confusion and perplexity in this chronology. He made himself known before the death of Pacuvius, a dramatic piece of his being exhibited the same year that Pacuvius brought one upon the stage, the latter being then eighty years of age, and Accius only thirty. We do not know the name of this piece of Accius's, but the titles of several of his tragedies are mentioned by various authors. He wrote on the most celebrated stories which had been represented on the Athenian stage; as Andromache, Andromeda, Atreus, Clytemnestra, Medea, Meleager, Philoctetes, the civil wars of Thebes, Tereus, the Troades, &c. He did not always, however, take his subjects from the Grecian story; for he composed one dramatic piece wholly Roman: it was entitled *Brutus*, and related to the expulsion of the Tarquins. It is affirmed by some, that he wrote also comedies; which is not unlikely, if he was the author of two pieces, the *Wedding*, and the *Merchant*, which have been ascribed to him. He

Acclama-
tion.Acclama-
tion.

did not confine himself to dramatic writing; for he left other productions, particularly his annals, mentioned by Macrobius, Priscian, Festus, and Nonius Marcellus. He has been censured for writing in too harsh a style, but in all other respects has been esteemed a very great poet. He was so much esteemed by the public, that a comedian was punished for only mentioning his name on the stage. Cicero speaks with great derision of one Accius who had written a history; and, as our author had wrote annals, some insist that he is the person censured: but as Cicero himself, Horace, Quintilian, Ovid, and Paterculus, have spoken of our author with so much applause, we cannot think it is him whom the Roman orator censures with so much severity.

There was also in this age a pretty good orator of the same name, against whom Cicero defended Cluentius. He was born in Pisaurum, and perhaps was a relation of our poet.

ACCIUS, a poet of the 16th century, to whom is attributed *A Paraphrase on Esop's Fables*, on which Julius Scaliger bestows great encomiums.

ACCLAMATION, a confused noise or shout of joy, by which the public express their applause, esteem, or approbation.

ACCLAMATION, in a more proper sense, denotes a certain form of words, uttered with extraordinary vehemence, and in a peculiar tone somewhat resembling a song, frequent in the ancient assemblies. Acclamations were usually accompanied by applauses, with which they are sometimes confounded: though they ought to be distinguished; as acclamation was given by the voice, applause by the hands; add, that acclamation was also bestowed on persons absent, applause only on those present. Acclamation was also given by women, whereas applause seems to have been confined to men.

Acclamations are of various kinds; ecclesiastical, military, nuptial, senatorial, synodical, scholastic, theatrical, &c. We meet with loud acclamations, musical and rhythmical acclamations; acclamations of joy and respect, and even of reproach and contumely. The former, wherein words of happy omen were used, were also called, *Laudationes, et bona vota*, or good wishes; the latter, *Execrationes et convicia*. Suetonius furnishes an instance of this last kind in the Roman senate, on occasion of the decree for demolishing the statues of Domitian, when the fathers, as the historian represents it, could not refrain from contumelious acclamations of the deceased. The like were shown after the death of Commodus, where the acclamations ran in the following strain: *Hosti patria honores detrahantur, parricidae honores detrahantur; hostis status undique, parricidae status undique, gladiatoris status undique, &c.*—The formula, in acclamations, was repeated sometimes a greater, sometimes a lesser, number of times. Hence we find in Roman writers, *acclamatum est quinquies, et vicies*; five times, and twenty times: sometimes also *sexagesies*, and even *octuagesies*; sixty and eighty times.

Acclamations were not unknown on the theatres in the earliest ages of the Roman commonwealth; but they were artless then, and little other than confused shouts. Afterwards they became a sort of regular concerts. That mentioned by Phædrus, *letare incolunt Roma salvo principe*, which was made for Augustus, and proved the occasion of a pleasant mistake of a flute-

player called *Princeps*, shews that musical acclamations were in use in that emperor's reign. *Revertentem ex Provincia modulatis carminibus profœquebantur*, says Suetonius, who gives another instance in the time of Tiberius: a false report of Germanicus's recovery being spread through Rome, the people ran in crowds to the capitol with torches and victims, singing, *Salva Roma, Salva Patria, Salvus est Germanicus*.—Nero, passionately fond of music, took special care to improve and perfect the music of acclamations. Charmed with the harmony wherewith the Alexandrians, who came to the games celebrated at Naples, had sung his praises, he brought several over to instruct a number of youth, chosen from among the knights and people, in the different kinds of acclamations practised at Alexandria. These continued in use as low as the reign of Theodoric. But the people did not always make a single chorus; sometimes there were two, who answered each other alternately: thus, when Nero played on the theatre, Burrhus and Seneca, who were on either hand, giving the signal by clapping, 5000 soldiers called Augustals, began to chant his praise, which the spectators were obliged to repeat. The whole was conducted by a music-master called *Mesochorus* or *Pausanius*.—The honour of acclamations was chiefly rendered to emperors, their children, and favourites; and to the magistrates who presided at the games. Persons of distinguished merit also sometimes received them, of which Quintilian gives us instances in Cato and Virgil. The most usual forms were, *Feliciter, Longiorem vitam, Anxius felices*. The actors themselves, and they who gained the prizes in the games of the circus, were not excluded the honour of acclamations.

To theatrical acclamations may be added those of the soldiery and the people in time of triumph. The victorious army accompanied their general to the capitol; and, among the verses they sung in his praises, frequently repeated, *IO TRIUMPHES*, which the people answered in the same strain. It was also in the way of acclamation, that the soldiers gave their general the title of *Imperator*, after some notable victory: a title which he only kept till the time of his triumph.

The acclamations of the senate were somewhat more serious than the popular ones; but arose from the same principle, *viz.* a desire of pleasing the prince or his favourites; and aimed likewise at the same end, either to express the general approbation and zeal of the company, or to congratulate him on his victories, or to make him new protestations of fidelity. These acclamations were usually given after a report made by some senator, to which the rest all expressed their consent by crying *OMNES, OMNES*; or else, *ÆQUUM EST, JUSTUM EST*. Sometimes they began with acclamations, and sometimes ended with them without other debates. It was after this manner that all the elections and proclamations of emperors, made by the senate, were conducted; something of which practice is still retained at modern elections of kings and emperors, where *Vivat Rex, Vive le Roy*, and *Long live the King*, are customary forms.

The Greeks borrowed the custom of receiving their emperors in the public places from the Romans. Luitprand relates, that at a procession where he was present, they sung to the emperor Nicephorus, *ΒΑΣΙΛΕΥΣ*; that is, Many years: which Codin expresses thus, by

Acclamation.

το δαδαιον το πολυχρονον, or by το πολυχρονον; and the wish or salutation by πολυχρονος εστω. And at dinner, the Greeks then present wishing with a loud voice to the emperor and Bardas, *Ut Deus annos multiplicet*; as he translates the Greek. Plutarch mentions an acclamation so loud, upon occasion of Flaminius's restoring liberty to Greece, that the very birds fell from heaven with the shout. The Turks practise something like this on the fight of their emperors and grand viziers, to this day.

For the acclamations wherewith authors, poets, &c. were received, who recited their works in public; it is to be observed, the assemblies for this purpose were held with great parade in the most solemn places, as the capitol, temples, the Athæneum, and the houses of great men. Invitations were sent every where, in order to get the greater appearance. The chief care was that the acclamations might be given with all the order and pomp possible. Men of fortune who pretended to wit, kept able applauders in their service, and lent them to their friends. Others endeavoured to gain them by presents and treats. Philostratus mentions a young man named Vavus, who lent money to the men of letters, and forgave the interest to such as applauded his exercises. These acclamations were conducted much after the same manner as those on the theatre, both as to the music and the accompaniments: they were to be suited both to the subject and to the person. There were particular ones for the philosophers, for orators, for historians, and for poets. It would be difficult to rehearse all the forms of them; one of the most usual was *Sophos*, which was to be repeated three times. Martial comprehends several other usual forms in this verse:

Grauior, Cito, Nequiter, Euge, Beate.

Neither the Greeks nor Romans were barren on this head. The names of gods and heroes were given those whom they would extol. It was not enough to do it after each head of discourse, chiefly after the exordium; but the acclamations were renewed at every fine passage, frequently at every period.

The acclamations wherewith the spectators honoured the victories of the athletes, were a natural consequence of the impetuous motions which attended the gymnastic games. The cries and acclamations of the people, sometimes expressing their compassion and joy, sometimes their horror and disgust, are strongly painted by different poets and orators.

Acclamations made also a part of the ceremony of marriage. They were used for the omen's sake; being the *Leta Omina*, sometimes spoken of before marriage in Roman writers.

Acclamations, at first practised in the theatre, and passing thence to the senate, &c. was in process of time received into the acts of councils, and the ordinary assemblies of the church. The people expressed their approbation of the preacher variously; the more usual forms were, *Orthodox! Third Apostle, &c.* These acclamations being sometimes carried to excess, and often misplaced, were frequently prohibited by the ancient doctors, and at length abrogated; though they appear to have been in some use as low as the time of St Bernard.

ACCLAMATION *Medals*, among antiquaries, such as represent the people expressing their joy in the posture of acclamation.

ACCLIVITY, the rise or ascent of a hill, in opposition to the declivity or descent of it. Some writers in fortification use it for the talus of a rampart.

ACCOLA, among the Romans, signified a person who lived near home place; in which sense, it differed from *incola*, the inhabitant of such a place.

ACCOLADE, a ceremony anciently used in the conferring of knighthood.

Antiquaries are not agreed wherein the accolade properly consisted. The generality suppose it to be the embrace, or kiss, which princes anciently gave the new knight, as a token of their affection: whence the word *accolade*; *q. d.* a clapping, or taking round the neck. Others will rather have it to be a blow on the chine of the neck, given on the same occasion. The Accolade is of some antiquity, in whichsoever of the two senses it be taken. Greg. de Tours writes, that the kings of France, even of the first race, in conferring the gilt shoulder-belt, kissed the knights on the left cheek. For the *accolée*, or blow, John of Salisbury assures us, it was in use among the ancient Normans: by this it was that William the Conqueror conferred the honour of knighthood on his son Henry. At first, it was given with the naked fist; but was afterwards changed into a blow with the flat of the sword on the shoulder of the knight.

ACCOLEE, sometimes synonymous with ACCOLADE, which see.—It is also used in various senses in heraldry: sometimes it is applied to two things joined; at other times, to animals with crowns, or collars about their necks, as the lion in the Ogilvy's arms; and, lastly, to kews, battons, maces, swords, &c. placed saltierwise behind the field.

ACCOLTI (Bernardo), secretary to the republic of Florence, was surnamed L'unico, or the Non-Such, probably from the great extent of his understanding, the variety of sciences he had acquired, and the excellency of his poetic vein; which not only gained him a seat among the academicians of the court of Urbino, but made that great Mæcenas, pope Leo X. in 1520, create him prince of the state of Nepi. He wrote many pieces; among others, a collection of beautiful poems, printed at Venice in 1519 and 1553.

ACCOMMODATION, the application of one thing, by analogy, to another; or the making two more things agree with one another.

To know a thing by accommodation, is to know it by the idea of a similar thing referred thereto.

A prophecy of scripture is said to be fulfilled various ways; properly, as when a thing foretold comes to pass; and improperly, or by way of accommodation, when an event happens to any place or people, like to what fell out some time before to another.—Thus, the words of Isaiah, spoken to those of his own time, are said to be fulfilled in those who lived in our Saviour's; and are accommodated to them: "Ye hypocrites, well did Isaiah prophecy of you," &c. which same words, St Paul afterwards accommodates to the Jews of his time.

The primitive church accommodated multitudes of Jewish, and even heathen ceremonies and practices, to Christian purposes; but the Jews had before done the same by the Gentiles: some will even have circumcision, the tabernacle, brazen serpent, &c. to have been originally of Egyptian use, and only accommodated by

l. 3. p. 32.

Moses to the purposes of Judaism*. Spencer maintains, that most of the rites of the old law, were an imitation of those of the Gentiles, and particularly of the Egyptians; that God, in order to divert the children of Israel from the worship they paid to the false deities, consecrated the greatest part of the ceremonies performed by those idolaters, and had formed out of them a body of the ceremonial law; that he had indeed made some alterations therein, as barriers against idolatry; and that he thus accommodated his worship to the genius and occasions of his ancient people. To this concession of God, according to Spencer †, is owing the origin of the tabernacle, and particularly that of the ark.

ACCOMPANIMENT, something attending or added as a circumstance to another, either by way of ornament, or for the sake of symmetry.

ACCOMPANIMENT, in music, denotes the instruments which accompany a voice to sustain it, as well as to make the music more full. The accompaniment is used in recitative, as well as in song; on the flute, &c. as well as in the choir, &c. The ancients had likewise their accompaniments on the theatre; they had even different kinds of instruments to accompany the chorus, from those which accompanied the actors in the recitation.—The accompaniment, among the moderns, is frequently a different part or melody from the song it accompanies. It is disputed whether it was so among the ancients. It is generally alleged, that their accompaniments went no farther than the playing in octave, or in antiphony to the voice. The Abbe Frauguier, from a passage in Plato, pretends to prove, that they had actual symphony, or music in parts: but his arguments seem far from being conclusive.

ACCOMPANIMENT, in painting, denotes such objects as are added, either by way of ornament, or probability; as dogs, guns, game, &c. in a hunting-piece.

ACCOMPANIMENT, in heraldry, any thing added to a shield by way of ornament; as the belt, mantling, supporters, &c. It is also applied to several bearings about a principal one: as a saltire, bend, fess, chevron, &c.

ACCOMPLICE. See **ACCESSARY**.

ACCOMPLISHMENT, the entire execution or fulfilling of any thing.

ACCOMPLISHMENT, is principally used in speaking of events foretold by the Jewish prophets in the Old Testament, and fulfilled under the New. We say a literal accomplishment, a mystical or spiritual accomplishment, a single accomplishment, a double accomplishment, a Jewish accomplishment, a Christian, a heathen accomplishment. The same prophecy is sometimes accomplished in all, or several of those different ways. Thus, of some of the prophecies of the Old Testament, the Jews find a literal accomplishment in their own history, about the time when the prophecy was given: the Christians find another in Christ, or the earliest days of the church; the heathens another, in some of their emperors; the Mahometans, another in their legislator; &c. There are two principal ways of accomplishing a prophecy; *directly*, and by *accommodation*. See **ACCOMMODATION**, and **PROPHECY**.

ACCOMPLISHMENT, is also used for any mental or personal endowment.

ACCORD, in music. See **CONCORD**.

ACCORD, in painting, is the harmony that reigns among the lights and shades of a picture.

ACCOUNT, or **ACCOMPT**, in a general sense, a computation or reckoning of any thing by numbers.—Collectively, it is used to express the books which merchants, traders, bankers, &c. use for recording their transactions in business. See **BOOK-KEEPING**.

Chamber of Accounts, in the French polity, is a sovereign court of great antiquity, which takes cognizance of and regulates the accounts of the king's revenue. It is nearly the same with the English *Court of Exchequer*.

ACCOUNT is taken sometimes, in a particular sense, for the computation of time: thus we say, The Julian Account, the Gregorian Account, &c. in which sense it is equivalent to *style*.

ACCOUNTANT, or **ACCOMPTANT**, in the most general sense, is a person skilled in accounts. In a more restricted sense, it is applied to a person, or officer, appointed to keep the accounts of a public company or office; as the South-sea, the India-company, the Bank, the Excise, &c.

ACCOUNTANTSHIP, the art of keeping and balancing accounts. See **BOOK-KEEPING**.

ACCOUNTANT-GENERAL, a new officer in the court of Chancery appointed by act of parliament to receive all moneys lodged in court instead of the masters, and convey the same to the bank of England for security.

ACCOUNTING-HOUSE, **COUNTING-HOUSE**, or **COMPTING-HOUSE**, is a house, or office, set apart by a merchant, or trading-company, for transacting their business, as well as keeping their books, accounts, vouchers, &c.

ACCOUTREMENT, an old term, applied to the furniture of a soldier, knight, or gentleman.

ACCRETION, in physics, the increase, or growth, of an organical body, by the accession of new parts*.

ACCRETION, among civilians, the property acquired in a vague or unoccupied thing, by its adhering to or following another already occupied: thus, if a legacy be left to two persons, one of whom dies before the testator, the legacy devolves to the survivor by right of accretion.

ACCROCHE, in heraldry, denotes a thing's being hooked with another.

ACCUBATION, a posture of the body, between sitting and lying. The word comes from the Latin *accubare*, compounded of *ad*, to, and *cubo*, I lie down. *Accubation*, or *Accubitur*, was the table-posture of the Greeks and Romans; whence we find the words particularly used for the lying, or rather (as we call it) sitting, down to meat. The Greeks introduced this posture. The Romans, during the frugal ages of the republic, were strangers to it. But as luxury got footing, this posture came to be adopted, at least by the men; for as to women, it was reputed an indecency in them to lie down among the men: though, afterwards, this too was got over. But children did not lie down; nor servants, nor soldiers, nor persons of meaner condition; but took their meals sitting, as a posture less indulgent. The Roman manner of disposing themselves at table was this: A low round table was placed in the *cœnaculum*, or dining-room; and, about this, usually three, sometimes only two, beds or couches; according to the number

Account

Accubitor
Accusation.

ber of which, it was called *biclinium* or *triclinium*. These were covered with a sort of bed-clothes, richer or plainer according to the quality of the person, and furnished with quilts and pillows, that the guests might lie the more commodiously. There were usually three persons on each bed; to crowd more, was esteemed fordid. In eating, they lay down on their left sides, with their heads resting on the pillows, or rather on their right elbows. The first lay at the head of the bed, with his feet extended behind the back of the second; the second lay with the back of his head towards the navel of the first, only separated by a pillow, his feet behind the back of the third; and so of the third, or fourth. The middle place was esteemed the most honourable. Before they came to table, they changed their clothes, putting on what they called *canatoria vestis*, the dining-garment; and pulled off their shoes, to prevent fouling the couch.

ACCUBITOR, an ancient officer of the emperors of Constantine, whose business was to lie near the emperor. He was the head of the youths of the bed-chamber, and had the *cubicularius* and *procurator* under him.

ACCUMULATION, in a general sense, the act of heaping or amassing things together. Among lawyers, it is used in speaking of the concurrence of several titles to the same thing, or of several circumstances to the same proof.

ACCUMULATION of Degrees, in an university, is the taking several of them together, or at smaller intervals than usual, or than is allowed by the rules of the university.

ACCURSED, denotes something that lies under a curse, or is detestable. It is likewise used for an communicated person.

ACCURSIUS, a law-professor in the 13th century, born in Florence. His authority was for some time so great, that he was called the Idol of the Lawyers.

ACCUSARIUS (Mariangelus), a famous critic of the 16th century, born at Aquilo in the kingdom of Naples. His Diatribes, printed at Rome in folio, in 1524, on Ovid and Solinus, are a proof of his abilities in that kind of erudition. In his edition of Ammianus Marcellinus there are five books more than in any of the preceding ones; and he affirms he had corrected 5000 errors in that historian. His predominant passion was the searching for and collecting of old manuscripts: yet he made Latin and Italian verses; was complete master of the French, German, and Spanish tongues; and understood optics and music. He purged himself by oath, being charged for being a plagiarist with regard to his Aulonius; it being reported, that he had appropriated to himself the labours of Fabricio Varana, bishop of Camerino.

ACCUSATION, the charging any person with a criminal action, either in one's own name, or in that of the public. The word is compounded of *ad*, to; and *causari*, to plead.

Writers on politics treat of the benefit and the inconveniences of public accusations. Various arguments are alleged, both for the encouragement and discouragement of accusations against great men. Nothing, according to Machiavel, tends more to the preservation of a state, than frequent accusations of persons trusted with the administration of public affairs.

This, accordingly, was strictly observed by the Romans, in the instances of Camillus, accused of corruption by Manlius Capitolinus, &c. Accusations, however, in the judgment of the same author, are not more beneficial than calumnies are pernicious; which is also confirmed by the practice of the Romans. Manlius not being able to make good his charge against Camillus, was cast into prison.

Accusation?
Accusative.

By the Roman law, there was no public accuser for public crimes; every private person, whether interested in the crime or not, might accuse, and prosecute the accused to punishment, or abolition. Cato, the most innocent person of his age, had been accused 42 times, and as often absolved. But the accusation of private crimes was never received but from the mouths of those who were immediately interested in them: None (*s. g.*) but the husband could accuse his wife of adultery.

The ancient Roman lawyers distinguished between *postulatio*, *delatio*, and *accusatio*. For, first, leave was desired to bring a charge against one, which was called *postulare*: then he against whom the charge was laid, was brought before the judge; which was called *deferre*, or *nomini delatio*: lastly, the charge was drawn up and presented, which was properly the *accusatio*. The accusation properly commenced, according to Pædianus, when the *reus* or party charged, being interrogated, denied he was guilty of the crime, and subscribed his name to the *delatio* made by his opponent.

In the French law, none but the Procureur general, or his deputies, can form an accusation, except for high-treason and coining, where accusation is open to every body. In other crimes, private persons can only act the part of denouncers, and demand reparation for the offence, with damages.

In Britain, by Magna Charta, no man shall be imprisoned or condemned on any accusation, without trial by his peers, or the law: none shall be vexed with any accusation, but according to the law of the land: and no man may be molested by petition to the king, &c. unless it be by indictment or presentment of lawful men, or by process at common law. Promoters of suggestions, are to find surety to pursue them; and if they do not make them good, shall pay damages to the party accused, and also a fine to the king. No person is obliged to answer upon oath to a question whereby he may accuse himself of any crime.

ACCUSATIVE, in the Latin grammar, is the fourth case of nouns*, and signifies the relation of the noun on which the action implied in the verb terminates; and hence, in such languages as have cases, these nouns have a particular termination, called *accusative*: as, *Augustus vicit Antonium*, Augustus vanquished Antony. Here *Antonium* is the noun, on which the action implied in the verb *vicit* terminates; and, therefore, must have the accusative termination. Ovid, speaking of the palace of the sun, says, *Materiem superabat opus*, The work surpassed the materials. Here *materiem* has the accusative termination; because it determines the action of the verb *superabat*.—In the English language there are no cases, except the genitive; the relation of the noun being shewn by the assistance of prepositions, as *of*, *to*, *from*, &c.

* See Grammar, no 17, and Latin Grammar, no 23, &c.

ACCUSIURUM COLONIA, (Ptolemy;) an inland town in the Cavares, in Gallia Narbonensis: now *Grenoble*, in Dauphiné. See GRENABLE.

ACE,

Are
Accephalus.

ACE, among gamesters, a card or die marked only with one point.

ACEPHALI, or ACEPHALITÆ, a term applied to several sects who refused to follow some noted leader. Thus the persons who refused to follow either John of Antioch, or St Cyril, in a dispute that happened in the council of Ephesus, were termed *Accephali*, without a head or leader. Such bishops, also, as were exempt from the jurisdiction and discipline of their patriarch, were styled *Accephali*.

ACEPHALI, the levellers in the reign of king Henry I. who acknowledged no head or superior. They were reckoned so poor, that they had not a tenement by which they might acknowledge a superior lord.

ACEPHALOUS, or ACEPHALUS, in a general sense; without a head.

The term is more particularly used in speaking of certain nations, or people, represented by ancient naturalists and cosmographers, as well as by some modern travellers, as formed without heads; their eyes, mouths, &c. being placed in other parts.

Such are the Blemmyes, a nation of Africa near the head of the Niger, represented to be by Pliny and Solinus; *Blemmyes traduntur capita abesse, ore & oculis pectore affixis*. Ctesias and Solinus mention others in India near the Ganges, *sine cervice, oculus in humeris habentes*. Mela also speaks of people, *quibus capita et vultus in pectore sunt*. And Suidas, Stephanus Byzantinus, Vopiscus, and others after them, relate the like. Some modern travellers still pretend to find accephalous people in America.

Several opinions have been framed as to the origin of the fable of the Accephali. The first is that of Thomas Bartholin, who turns the whole into a metaphor; being convinced, that the name Accephali was anciently given to such as had less brain, or conducted themselves less by the rules of prudence, than others. Olearius rather apprehends, that the ancient voyagers, viewing certain barbarous people from the coasts, had been imposed on by their uncouth dress; for that the Samogitians, being short of stature, and going in the severity of winter with their heads covered in hoods, seem at a distance as if they were headless. F. Lastau says, that by Accephali are only meant, people whose heads are sunk below their shoulders. In effect, Hullius, in his epitome of Sir Walter Raleigh's voyage to Guiana, also speaks of a people which that traveller found in the province of Iripipana, between the lakes of Panama and Cassipa, who had no head or neck; and Hondius, in his map, marks the place with the figures of these monsters. Yet De Laet rejects the story; being informed by other hands, that the inhabitants of the banks of the Caora, a river that flows out of the lake of Cassipa, have their head so far sunk between their shoulders, that many believed they had their eyes in their shoulders and their mouths in their breasts.

|| In Eph. But though the existence of a nation of *Accephali* be ill warranted, naturalists furnish several instances of individuals born without heads, by some lush or aberration of nature. Wepfer gives || a catalogue of such accephalous births, from Schenckius, Licetus, Paræus, p. 258. Wolfius, Mauriceau, &c.

* See Tania. ACEPHALUS, an obsolete term for the *tænia* * or tape-worm, which was long supposed to be accephalous. The first who gave it a head, was Tulpus; and after him,

Fehr: The former even makes it *biceps*, or two-headed.

ACEPHALUS, is also used to express a verse defective in the beginning.

ACER, the maple-tree; a genus of plants, of the monœcia order, belonging to the polygama class. Of this genus there are ten

Species. 1. The pseudo *platanus*, improperly called the *sycomore*, is a very large and beautiful tree, with broad leaves divided into five lobes, serrated in their edges; of a dark-green colour on the upper side, but paler and somewhat hoary underneath; the flowers are very small, and of a greenish white colour. The fruit is large, and beautifully variegated with green and purple. This species is a native of Germany; but thrives very well in Britain, where it is frequent in plantations. It is very proper for making plantations near the sea, or sheltering such as are already too near it, because the *sycomore*-tree resists the spray of the ocean much better than most other trees. It has however this inconvenience, that its leaves are devoured by insects, so as to become full of holes and very unsightly, which has caused the planting of it to be much neglected of late. 2. The *campestre*, or common maple, is too well known to need any particular account; it growing very frequently, in hedge-rows, in most parts of Britain. The timber of the common maple is far superior to beech for all uses of the turner; particularly for dishes, cups, trenchers, &c. When it abounds with knots, as it frequently does, it is highly esteemed by joiners for inlayings. It is also often employed in making musical instruments, on account of its lightness; and for the whiteness of its wood was formerly esteemed for making tables, &c. 3. The *negundo*, or Virginian ash-leaved maple, is a very strong shooting tree; and in Virginia, where it is a native, is one of the largest trees of this kind. It must be planted in places not too much exposed to violent winds, being subject to split thereby. 4. The *platanoides*, or Norway maple, grows naturally in Norway, Sweden, and other Northern countries in Europe: it rises to a good height; and is well furnished with branches, with smooth leaves, of a shining green colour, divided in the form of an hand. These have an acrid milky juice, which prevents them from being preyed upon by insects as the *sycomore* is; and as this species resists the spray of the sea equally with the first, it is preferred in plantations situated near the sea. 5. The *rubrum*, or Virginian scarlet flowering maple, is a native of that country, and never grows to a large size in Britain. It is, however, cultivated in gardens for the beauty of its flowers, which appear in the beginning of April, in roundish bunches, at the bottom of the rootstalks of the leaves. The seeds are ripe in five or six weeks after; and ought to be immediately sown, being otherwise very apt to perish. The tree ought to be sheltered, especially whilst young, from the north-east winds; it delights in a moist light soil, where it will thrive much better, as well as produce many more flowers and much better seeds, than in a dry ground. A variety of this tree is known in England by the name of *Sir Charles Wager's Flowering Maple*, from its being first sent from America to Sir Charles Wager. The flowers of this kind come out in larger clusters than the other, and surround the small branches, so that the tree appears entirely covered with them, and makes a much more beautiful appearance than the former,

Acer,
the
Maple-tree.

|| In Eph. But though the existence of a nation of *Accephali* be ill warranted, naturalists furnish several instances of individuals born without heads, by some lush or aberration of nature. Wepfer gives || a catalogue of such accephalous births, from Schenckius, Licetus, Paræus, p. 258. Wolfius, Mauriceau, &c.

* See Tania. ACEPHALUS, an obsolete term for the *tænia* * or tape-worm, which was long supposed to be accephalous. The first who gave it a head, was Tulpus; and after him,

Acerr,
the
Maple tree.
• See Sugar.

mer, which now is not so much esteemed. 6. The fugarinum, or American fugar-maple, so called from a coarse kind of fugar being obtained from its juice by the inhabitants of North America *, grows to a large size. When young, it very much resembles the Norway maple; but as it grows up, the leaves become more deeply divided, and their surfaces less smooth; they are, besides, preyed upon by insects, like the sycamore; by which circumstances the two species are easily distinguished. 7. The Penſylvanicum, or American mountain-maple, very much resembles the fugar-maple, only its leaves are more pointed. 8. The opalus, or Italian maple, is very common in most parts of Italy, particularly about Rome; but in Britain is very rarely to be met with, though hardy enough to bear the open air. It is one of the largest species of trees in Italy, and affords a great shade by its numerous and large leaves. On this account it is planted on the road-sides, and near habitations. 9. The montepulianum, or Montpellier maple, is common in the south of France, and in Italy; but is hardly met with in Britain. The leaves resemble those of the common maple; but are of a much thicker substance, a shining green colour, and not so large. They continue in verdure very late in the autumn, which renders the trees more valuable. 10. The creticum, or Cretan maple, grows naturally in the Levant; it somewhat resembles the last species; but its leaves are of a much thinner texture, and their footstalks covered with a soft hairy down; whereas those of the other are smooth and soft.

Culture. All these species are propagated either by seeds or cuttings. If the first method is chosen, the seeds should be sown in autumn, soon after they are ripe, in a bed of common earth, covering them about half an inch thick with light mould. If they cannot be sown in autumn, they must be put into sand to preserve their growing quality; for if kept dry till the spring, the seeds often fail, or at least lie a whole year in the ground before they vegetate. The seeds ought also to be sown in a sheltered situation; because most sorts of maple, especially those which come from America, are very impatient of heat while young; and if the young plants are exposed to the sun but one day, few of them will survive; being instantly attacked by insects, which in that short time devour their seed-leaves, after which the plants drop to the ground. This is most especially remarkable in the American fugar-maple. When the plants come up, they must be kept free from weeds, and in the following autumn transplanted into the nursery, where they may grow two or three years, and then be planted where they are to remain. If maple-trees are to be propagated by cuttings, they should be planted in autumn, if the ground is dry; but where the soil is cold and moist, the spring season is preferable. If cut from the trees before the buds begin to swell, and the ground is not then fit to receive them, they may be wrapped in moss, and put in a cool place, where they will keep a month or five weeks without injury; but the trees propagated from cuttings are not so valuable as those from seeds, because they seldom grow so large or so upright. Most, if not all the species of maples, take well by inoculation, or ingrafting on each other. Some of them are plain, and others variegated or striped with different colours, which by the means just now mentioned may be easily intermixed.

ACERB, a sour rough astringency of taste, such as that of unripe fruit.

ACERENZA. See CIRENZIA.

ACERNO, a town of Italy, in the citior principal city of Naples, with a bishop's see. It is 17 miles S. W. of Conza, and 12 N. E. of Salerno. E. long. 15. 46. N. lat. 40. 50.

ACERNUM, a town of the Picentini, (Pliny;) now ACERNO.

ACERRA, in antiquity, an altar erected, among the Romans, near the gate of a person deceased, on which his friends daily offered incense till his burial.—The Chinese have still a custom like this: they erect an altar to the deceased in a room hung with mourning; and place an image of the dead person on the altar, to which every one that approaches it bows four times, and offers oblations and perfumes.

The *Acerra* also signified a little pot wherein were put the incense and perfumes to be burnt on the altars of the gods and before the dead. It appears to have been the same with what was otherwise called *thuribulum*, and *pyxia*.

We find mention of *Acerra* in the ancient church. The Jews had also their *Acerra*, in our version rendered *cenfers*; and the Romanists still retain them under the name of *incense-pots*. In Roman writers, we frequently meet with *plena acerra*, a full *acerra*: to understand which, it is to be observed, that people were obliged to offer incense in proportion to their estate and condition; the rich in larger quantities, the poor only a few grains; the former poured out *acerras* full on the altar, the latter took out two or three bits with their fingers.

ACCERA, a town of Italy, in the kingdom of Naples, and in the Terra di Lavoro; seated on the river Agno, 7 miles N. E. of Naples, and 20 S. W. of Benevento. E. Lon. 15. 10. N. lat. 40. 55.

ACCERRÆ, the ancient name of a town on the Clanus, in Campania, not far from Naples, (Virgil;) now ACCERRA.—The name also of another town, (Plutarch, Polybius,) now called *la Gioia*, in the territory and to the south-east of Lodi, where the rivulet Serio falls into the Adda, to the west of Cremona and north of Placentia.

ACETABULUM, in antiquity, a measure used by the ancients, equal to one-eighth of our pint. It seems to have acquired its name from a vessel in which acetum or vinegar was brought to their tables, and probably contained about this quantity.

ACETABULUM, in anatomy, a cavity in any bone for receiving the protuberant head of another, and thereby forming that species of articulation called *enarthrosis*. See ANATOMY, n° 2, c.

ACETABULUM, in botany, the trivial name of a species of the *peizia*, or cup-peizia, a genus belonging to the cryptogamia fungi of Linnaeus. It has got the name of *acetabulum*, from the resemblance its leaves bear to a cup. See PEZIZA.

ACETARY. Nehemiah Grew, in his anatomy of plants, applies this term to a pulpy substance in certain fruits, *e. g.* the pear, which is inclosed in a congeries of small calculeous bodies towards the base of the fruit, and is always of an acid taste.

ACETIFICATION, a term used by chemists for the making of vinegar.

Acerrb
||
Acetary.

Acetosa,
or
Sorrel.

ACETOSA, Sorrel; by Linnaeus joined to the genus of Dock, under the title of *Rumex*: but as the plants have long been used in the kitchen, and sometimes in the shops, under the title of *Sorrel*, we chuse to preserve it; especially as, according to his method, they seem more properly ranked in his 224 class, intituled *Diacia*.—Of this genus there are reckoned eight

Species. 1. The pratensis, or common sorrel, grows naturally in pasture-grounds in most places of England and Scotland, & requires no description. It is also cultivated in gardens for culinary uses, where it produces large leaves, though it is generally small when growing in the fields. It is a perennial plant, and with proper management will continue many years. Its acidity gives it a considerable medicinal virtue in all putrid diseases*; and formerly an essential salt was extracted from it by evaporating the juice of the fresh plant. This was, however, very difficult to procure, and yielded only in small quantity; twenty pounds of the plant affording little more than two ounces of salt. What was worse, the salt when thus procured was inferior in virtue to the plant itself; so that this preparation is now entirely disused. This plant is fit for use all the year round. 2. The acetosella, or sheep's sorrel, grows naturally on dry banks, and on gravelly ground, where by its creeping roots it proves a very troublesome weed, so is not admitted into gardens. It possesses the same medicinal virtues with the former. 3. The scutata, round-leaved garden or French sorrel, is a more grateful acid than either of the former; so is preferably cultivated for culinary uses. About Paris it is cultivated in almost as great quantity as any other esculent plant. It has also been much cultivated in England since the introduction of French cookery; being an ingredient in many of their sauces and soups. 4. The digyna, or low creeping sorrel, grows naturally in the northern counties of England, Wales, and Scotland. The leaves have very short footstalks, are indented at both ends, and thick in proportion to their size. They grow near the ground, and seldom rise above six inches high. The roots creep in the ground, whereby it multiplies exceedingly in a proper situation. It is sometimes preserved in gardens for the sake of variety, but is not used in the kitchen, though it is applicable to the same purposes with the other species. 5. The alpina, or alpine sorrel, is full as hardy as the common, and fitter for the use of the kitchen, as having larger and more succulent leaves, of an equally grateful acid taste. 6. The vesicaria, or American annual sorrel, is kept in some gardens for variety, but is not of any use. It is a native of America and Egypt. 7. The rosea, or Egyptian sorrel, grows naturally only in that country; it has its name from the bladders of the seeds being of a fine rose colour. 8. The clunaria, or sorrel-tree, is a native of the Canary Islands, and rises with a strong woody stalk to the height of 10 or 12 feet. It is frequently kept in Britain in gardens. 9. The sterilis, or northern barren sorrel, is used for culinary purposes; and is preferable to the common kind, very rarely running to seed, and being fit for use all the year round.

Culture. Most species of sorrel may be propagated either by seeds, sown early in the spring on a moist shady border; or by parting the roots, either in spring

or autumn. The plants raised from the seeds, however, are more vigorous than those propagated from cuttings. They ought to be placed at a good distance from one another, so as to allow of digging the ground about each plant. French sorrel, particularly, spreads its roots so much, that the plants ought not to be placed at less than two feet distance from one another. It agrees better with an open situation than such as are natives of Britain. As the seed neither of French sorrel nor of the sorrel-tree ripens well in England, they can only be propagated from cuttings. The French sorrel thrives best on stony land, as it grows naturally on rocks. The sorrel-tree requires to be housed in winter, being unable to live in hard frost. If the cuttings are planted in a shady border any time in summer, and duly supplied with water, they will soon put out roots: upon which they must be immediately taken up, and planted in pots; for if permitted to remain in the border, they will soon grow so vigorous as to render their transplanting hazardous. When planted in pots, they should be placed in the shade, until they are again rooted; then they may enjoy the open air till October, when the frosts begin to be sharp; at which time they should be carried into the green-house, and treated in the same way as myrtles or other hardy green-house plants.

ACETOSELLA. See OXALIS.

ACETOUS, an epithet applied to such substances as are four or partake of the nature of vinegar.

ACETUM, vinegar, the vegetable acid of the chemists. See VINEGAR; and MATERIA MEDICA, n° 71. with the references *ib*.

ACETUM *Diffillatum*, distilled vinegar, or spirit of vinegar. See PHARMACY, n° 682.

ACETUM *Efurians*, a distilled vinegar, rectified by the help of verdigrease. It has obtained this name, because concentrated vinegar creates an appetite.

ACETUM *Radicatum*, is likewise used to denote concentrated vinegar; but Boerhaave thinks the *tartarus regeneratus* is the *acetum radicum* of the old chemists.

ACGLAH-SARAI, a town on the north shore of the Caspian sea.

ACH, or ACHE, in medicine, a term used for any severe pain; as Head-ach, Tooth-ach, &c.

ACHEANS, the inhabitants of Achaia Propria†, a Peloponnesian state. This republic was not considerable in early times, for the number of its troops, nor for its wealth, nor for the extent of its territories; but it was famed for its probity, its justice, and its love of liberty. Its high reputation for these virtues was very ancient. The Crotonians and Sybarites, to re-establish order in their towns, adopted the laws and customs of the Achæans. After the famous battle of Leuctra, a difference arose betwixt the Lacedæmonians and Thebans, who held the virtue of this people in such veneration, that they terminated the dispute by their decision. The government of the Achæans was democratical. They preserved their liberty till the time of Philip and Alexander. But in the reign of those princes, and afterwards, they were either subject to the Macedonians, who had made themselves masters of Greece, or oppressed by cruel tyrants. The Achæan commonwealth consisted of twelve inconsiderable towns in Peloponnesus. Its first annals are not marked by any great action, for they are not graced with one eminent character.

Acetosa

Achaia
||
Achæous.

character. After the death of Alexander, this little republic was a prey to all the evils which flow from political discord. A zeal for the good of the community was now extinguished. Each town was only attentive to its private interest. There was no longer any stability in the state; for it changed its masters with every revolution in Macedonia. Towards the 124th Olympiad, about the time when Ptolemy Soter died, and when Pyrrhus invaded Italy, the republic of the Achæans recovered its old institutions and unanimity. The inhabitants of Patra and of Dyme were the first assertors of ancient liberty. The tyrants were banished, and the towns again made one commonwealth. A public council was instituted, in which affairs of importance were discussed and determined. A register was appointed to record the transactions of the council. This assembly had two presidents, who were nominated alternately by the different towns. But instead of two presidents, they soon elected but one. Many neighbouring towns which admired the constitution of this republic, founded on equality, liberty, the love of justice, and of the public good, were incorporated with the Achæans, and admitted to the full enjoyment of their laws and privileges.—The arms which the Achæans chiefly used, were slings. They were trained to the art from their infancy, by slinging from a great distance, at a circular mark of a moderate circumference. By long practice they took so nice an aim, that they were sure, not only to hit their enemies on the head, but on any part of the face they chose. Their slings were of a different kind from those of the Bæliarians, whom they far surpassed in dexterity.

ACHÆL, (Achæans); the inhabitants of Achaia Propria. In Livy, the people of Greece; for the most part called *Achæi*, by the Roman poets. In Homer, the general name for Grecians.

ACHÆMENES, according to Herodotus, was father of Cambyses, and grandfather of Cyrus the first, king of Persia. Most of the commentators of Horace are of opinion, that the Achæmenes whom that poet mentions, ode xii. of his 2^d book, was one of the Persian monarchs: but, if that were true, he must have reigned before the Medes subdued the Persians; for we do not hear of any king of that name from the time that the Persians founded that great monarchy, which is looked upon as the second universal one. However this be, the epithet *Achæmenius* is frequently given to the Persians, in the old Latin poets.

ACHÆMENES, son of Darius I. king of Persia, and brother of Xerxes, had the government of Egypt bestowed on him, after Xerxes had forced the Egyptians to return to their allegiance. He some time after commanded the Egyptian fleet in the celebrated expedition which proved so fatal to all Greece. The Egyptians having again taken up arms after the death of Xerxes, Achæmenes was sent into Egypt to suppress the rebellion; but was vanquished by Inarus, chief of the rebels, succoured by the Athenians.

ACHEUS, cousin-german to Seleucus Ceraunus and Antiochus the Great, kings of Syria, became a very powerful monarch, and enjoyed the dominions he had usurped for many years; but at last he was punished for his usurpations in a dreadful manner, in the

which Ptolemy calls *Hellas*; the younger Pliny, *Græcia*; now called *Livadia*: bounded on the north by Thessaly, the river Sperchius, the Sinus Maliacus, and mount Oeta; on the west by the river Achelous; on the east, turning a little to the north, it is washed by the Archipelago, down to the promontory of Sunium; on the south, joined to the Peloponnesus, or Morea, by the isthmus of Corinth, five miles broad. See LIVADIA.

ACHAIA PROPRIA, anciently a small district in the north of Peloponnesus, running westward along the bay of Corinth, and bounded on the west by the Ionian Sea, on the south by Elis and Arcadia, on the east by Sicyonia: inhabitants, the *Achæani**, properly so called; its metropolis, *Patra*. It is now called *Romania Alia*, *Achæans*. * See

Achaia was also taken for all those countries that joined in the Achæan league, reduced by the Romans to a province. Likewise for Peloponnesus.

ACHAÏE PRESBYTERI, or the Presbyters of Achaia, were those who were present at the martyrdom of St Andrew the apostle, A. D. 59; and are said to have written an epistle in relation to it. Bellarmine, and several other eminent writers in the church of Rome, allow it to be genuine; while Du Pin, and some others, expressly reject it.

ACHAÏUS, son of Ethwin, was raised to the crown of Scotland after the death of Soluati, A. D. 788. The emperor Charlemagne sent an embassy to desire an alliance with him against the English, whose pirates so infested the seas, that the merchants could not carry on their trade. This alliance was concluded in France upon conditions so advantageous to the Scots, that Achaïus, to perpetuate the memory of it, added to the arms of Scotland a double field fowed with lilies. He died in 819.

ACHAN, the son of Carmi, of the tribe of Judah, at the taking of Jericho concealed two hundred shekels of silver, a Babylonish garment, and a wedge of gold, contrary to the express command of God. This sin proved fatal to the Israelites, who were repulsed at the siege of Ai. In this dreadful exigence, Joshua prostrated himself before the Lord, and begged that he would have mercy upon his people. Achan was discovered by casting lots, and he and his children were stoned to death. This expiation being made, Ai was taken by stratagem. Josh. vii. 8, 9.

ACHARACA, anciently a town of Lydia, situate between Tralles and Nyfa; in which were the temple of Pluto, and the cave Charonium, where patients slept in order to obtain a cure.

ACHAT, in law, implies a purchase or bargain. And hence probably purveyors were called *Achaters*, from their making bargains.

ACHATES, the companion of Eneas, and his most faithful friend, celebrated in Virgil.

ACHATES, (Sil. Italicus); a river of Sicily, now the *Drillo*, (Cluverius); which runs from north to south, almost parallel with, and at no great distance from, the Gela; and rises in the north of the territory of Noto. It gave name to the Achates, or Agate, said to be first found there.

ACHAZIB, or ACHIZIB, a town of Galilee, in the tribe of Asher, nine miles from Ptolemais.—Also a town in the more northern parts of the tribe of Judah.

ACHELOUS, in fabulous history, wrestled with Hercules,

* Lib. viii. 140th year of Rome, as related by Polybius.

cap. 5, 6. ACHAIA, a name taken for that part of Greece

Achelous
||
Acheron.

Hercules, for no less a prize than Deianira, daughter to king Oeneas; but as Achelous had the power of assuming all shapes, the contest was long dubious: at last, as he took that of a bull, Hercules tore off one of his horns; so that he was forced to submit, and to redeem it by giving the conqueror the horn of Amalthea, the fame with the Cornucopia or horn of plenty; which Hercules having filled with a variety of fruits, consecrated to Jupiter. Some explain this fable, by saying, That Achelous is a winding river of Greece, whose stream was so rapid, that it roared like a bull, and overflowed its banks; but Hercules, by bringing it into two channels, broke off one of the horns, and so restored plenty to the country. See the next article.

ACHELOUS, a river of Acarnania; which rises in mount Pindus, and, dividing Ætolia from Acarnania, falls from north to south into the Sinus Corinthiacus. It was formerly called *Thoa*, from its impetuosity, and *king of rivers*, (Homer.) The epithet *Achelous* is used for *Aqueus*, (Virgil); the ancients calling all water *Achelous*, especially in oaths, vows, and sacrifices, according to Ephorus: Now called *Aspro Potamo*. Rivers are by the ancient poets called *Tauriformes*, either from the bellowing of their waters, or from their ploughing the earth in their course: Hercules, restraining by dykes and mounds the inundations of the *Achelous*, is said to have broken off one of his horns, and to have brought back plenty to the country. See the preceding article.

ACHELOUS, a rivulet of Thessaly, running by the city Lamia, (Strabo, Pausanias.) Also a river of Peloponnesus, running by Dymæ, in Achaia, (Strabo); and by mount Lycæus in Arcadia, (Pausanias.)

ACHERI (LUKE p.) a learned Benedictine of the congregation of St Maur, was born at St Quintin, in Picardy, in 1609; and made himself famous by printing several works, which till then were only in manuscript; particularly, The epistle attributed to St Barnabas; The works of Lanfrank, archbishop of Canterbury; A collection of scarce and curious pieces, under the title of *Spicilegium*, i. e. Gleanings, in thirteen volumes, quarto. The prefaces and notes, which he annexed to many of these pieces, shew him to be a man of genius and abilities. He had also some share in the pieces inserted in the first volumes of The acts of the saints of the order of St Bennet, the title whereof acquaints us that they were collected and published by him and father Mabillon. After a very retired life, till the age of 73, he died at Paris the 29th of April 1685; in the abbey of St Germain in the fields, where he had been librarian.

ACHERON, a river of Epirus. The poets feigned it to have been the son of Ceres, whom she hid in hell for fear of the Titans, and turned into a river, over which souls departed were ferried in their way to Elysium.

ACHERON, a river of Thesprotia, in Epirus; which, after forming the lake Acherusia, at no great distance from, falls into the sea near, the promontory of Chimerium, to the west of the Sinus Ambracius, in a course from north to south.

ACHERON, or ACHEROES, a river of the Bruttii in Italy, running from east to west; where Alexander king of Epirus was slain by the Lucani, being deceived by the oracle of Dodona, which bid him beware of Acheron.

Acheræe
||
Achillæa.

ACHERNER, in astronomy, a star of the first magnitude in the southern extremity of the constellation Eridanus. Its longitude is 11°. 48'. 20". of Pisceæ, and its latitude 32°. 46'. 3'. S.

ACHERUSIA PALUS, a lake between Cumæ and the promontory Misenum, now *il Lago della Colucia*, (Cluverius.) Some confound it with the *Lacus Lucrinus*, and others with the *Lacus Averni*. But Strabo and Pliny distinguish them. The former takes it to be an effusion, exundation, or washes of the sea, and therefore called by Lycophron, *Ἀχέρουσα θάλασσα*.—Also a lake of Epirus, through which the Acheron runs.—There is also an *Acherusia*, a peninsula of Bithynia on the Euxine, near Heraclea; and a cave there of the same name, through which Hercules is fabled to have defended to hell to drag forth Cerberus.

ACHIA, a kind of cane that grows in the East Indies, which is pickled green in the country, with strong vinegar, pepper, and some other spice and ingredients. This pickle comes to Europe in a sort of earthen jars, about a foot high, and the same in breadth, growing narrower at the mouth. The bits of cane are an inch and a half in diameter, and a little above two inches long, almost of the same consistency with pickled cucumbers. They are of a pale yellow colour; and, instead of pulps, their inside is a close, fibrous substance, like that of the common canes when the outside coat is off. The Dutch bring home great quantities of this pickle, which their cold climate makes them think wholesome. They generally eat it towards the end of their meals, judging it very good to quicken the appetite, and strengthen the stomach.

ACHIAK, is a Malayan word, which signifies all sorts of fruits and roots pickled with vinegar and spice. The Dutch import from Batavia all sorts of achia, which the Chinese make after the manner of the Malaysians; but particularly that of bamboo, a kind of cane, extremely thick, which grows in the East-Indies, and is preserved there, whilst it is still green, with very strong vinegar and spice. This is called *Bambocachia*. The name changes according to the fruit with which the achia is made.

ACHILLÆA, YARROW, MILFOIL, or NOSEBLEED; a genus of the order of the polygamia superflua, belonging to the fyngenesis class of plants. The following are the principal

Species. 1. The millefolium, or common yarrow, is found naturally on banks, and by the sides of foot-paths, in moist parts of England. It most commonly bears white flowers, though a variety of it is found which bears purple ones. These, however, do not long continue to bear flowers of this colour, if transplanted into gardens. It was formerly used in medicine; but though it may still have a place in some dispensatories, no physician of any note expects any virtue from it, or ever prescribes it. It creeps greatly by its roots, and also multiplies by the seeds, so that it becomes a troublesome weed where it is once allowed to get a footing. The cultivation of it is recommended by Mr Anderson, in his Essays on Agriculture, as a proper food for cattle. 2. The fantolina, or eastern sneezewort, is sometimes cultivated in gardens; it has large yellow flowers, which stand upon pretty long footstalks placed singly, not in bunches as in the common kind. It has leaves like lavender-cotton, which,

Achillea,
or
Yarrow, &c.

which, when rubbed, emit a strong oily odour. The flowers appear in June and July. 3. The tomentosa, or woolly yarrow, is a native of the south of France and Spain, but lives in the open air in England. The flowers are of a bright yellow, and continue long in beauty, growing in clusters at the top of the stalks, which seldom rise above a foot high. The leaves are finely cut, and very hoary. 4. The *abrotanifolia*, or tall castran yarrow, is a native of the islands in the Archipelago: it grows to the height of two feet and a half, with large umbels of yellow flowers on the top; the leaves resemble those of the common wormwood, and are cut into long narrow segments. 5. The *clavenna*, or Alpine umbelliferous wormwood, takes its name from the mountains of which it is a native. It seldom grows above six or seven inches in height; it supports umbels of white flowers, like those of the common sneezwort, which appear in April and May. The leaves are silvery, and shaped like those of wormwood, which often decay in the autumn and winter. 6. The *tanacetifolia*, or eastern sneezwort, with tansy leaves, is a very humble plant, seldom rising above six inches in height. The flowers are nearly as large as those of the common sneezwort, white, and growing in flat umbels. They appear in June and July. The leaves of the plant have some likeness to those of the common wormwood, are very hoary, grow close to the ground, and decay in autumn so as to make little appearance in winter. Like the last species, this is a native of the Alps. 7. The *ageratum*, or sweet maudlin, was formerly much used in medicine and for culinary purposes; but has now fallen so much into neglect as to be totally unknown in the markets; so that when it is demanded, the white maudlin is substituted in its stead. The reason of this substitution was, that the latter is more hardy and easily propagated than the sweet maudlin, which is apt to rot in wet winters. The common maudlin flowers in June and July, and the seeds are ripe in September. 8. The *Egyptiaca*, or hoary sneezwort, is a native of the Archipelago. It hath very hoary leaves, which remain all the year; and the plants growing close and low, make a pretty appearance at all seasons. The flowers are yellow, and are produced in umbels on the top of the stalks; they appear in June, and continue till the end of Sep. ember. 9. The *ptarmica*, or common sneezwort, grows wild in the woods, and other shady places, in many parts of England; so is not admitted into gardens. There is a variety, however, with double flowers, which is preserved in gardens, and is commonly known by the name of double maudlin. This species creeps greatly by the roots, so as soon to overspread a large spot of ground. If planted in pots, so as to confine its roots from creeping, the stalks grow close together, and make a tolerable appearance when in flower; but when at a distance, so that the roots have full liberty to run, the flowers appear but indifferently. 10. The *macrophylla*, or Alpine sneezwort, with feverfew leaves, is a native of the Alps. It produces many stalks rising near three feet high; having loose branching umbels of white flowers on their top, resembling those of the common sneezwort, but larger. 11. The *nana*, or hoary Alpine milfoil, is likewise a native of the Alps; the leaves are hoary, and the umbels of its flowers are more compact than the former; the stalks do not rise more than a foot high.

12. The *nobilis*, or sweet milfoil, approaches to the nature of the common milfoil; but its leaves are of a paler green, and are neither so long nor so much cut off as those of the common milfoil are: they have a strong sweet scent when bruised. 13. The *alpina*, or white maudlin, bears some resemblance to the common sneezwort; but the leaves are longer, of a deeper green colour, and deeply indented in their edges; the flowers are white, and the roots creep far under ground. The plant will rise, in good land, to the height of four feet.

Culture. All the sorts of yarrow are easily propagated by seeds, which may be sown either in the spring or autumn, upon a bed of common earth. When the plants come up, and are strong enough for transplanting, they should be planted in beds in the nursery, where they may continue till autumn, when they should be transplanted to the places where they are to remain. The Archipelago kinds, however, are often destroyed by severe frost; so they ought to be sheltered during the winter. These kinds also rarely bring their seeds to perfection in England; they are therefore to be propagated by slips, which may be taken off and planted in a shady border any time in summer, when they will take root in about six weeks, and then may be transplanted where they are to remain.

ACHILLEA, a name frequently given by the ancients to the gum called dragons-blood. See DRAGONS-BLOOD.

ACHILLEID, *ACHILLEIS*, a celebrated poem of Statius, in which that author proposed to deliver the whole life and exploits of Achilles; but being prevented by death, he has only treated of the infancy and education of his hero. See *STATIUS*.

ACHILLES, in fabulous history, one of the greatest heroes of ancient Greece, was the son of Peleus and Thetis. He was a native of Phthia, in Thessaly; and, according to the poets, his mother fed him by day with ambrosia, and by night covered him with celestial fire. She dipped him also in the waters of the river Styx, by which his whole body became invulnerable, except that part of his heel by which he held him; and afterwards intrusted him to the care of the centaur Chiron, who, to give him the strength necessary for martial toil, fed him with honey, and the marrow of lions and wild boars, &c. To prevent his going to the siege of Troy, the disguised him in female apparel, and hid him among the maidens at the court of king Lycomedes: but Ulysses discovering him, persuaded him to follow the Greeks. Achilles distinguished himself by a number of heroic actions at the siege. Being disgusted, however, with Agamemnon for the loss of Briseis, he retired from the camp. But returning to avenge the death of his friend Patroclus, he slew Hector, fastened his corpse to his chariot, and dragged it round the walls of Troy. At last Paris, the brother of Hector, wounded him in the heel with an arrow, while he was in the temple treating about his marriage with Philoxena, daughter to king Priam. Of this wound he died, and was interred on the promontory of Sigeum; and after Troy was taken, the Greeks sacrificed Philoxena on his tomb. It is said, that Alexander, seeing this tomb, honoured it by placing a crown upon it; at the same time crying out, that "Achilles was happy in having, during his life, such a friend as Patroclus; and, after his death, a

my*, n^o 65, b.

Tendo ACHILLIS, in anatomy is a strong tendinous cord formed by the tendons of several muscles, and inserted into the os calcis *. It has its name from the fatal wound Achilles is said to have received in that part from Paris the son of Priam.

ACHILLINI (Alexander), born at Bologna, and doctor of philosophy in that university. He flourished in the 15th and 16th centuries, and by way of eminence was styled the Great Philosopher. He was a steadfast follower and accurate interpreter of Averroes upon Aristotle, but most admired for his acuteness and strength of arguing in private and public disputations. He made a surprising quick progress in his studies, and was very early promoted to a professorship in the university, in which he acquitted himself with so much applause that his name became famous throughout all Italy. He continued at Bologna till the year 1506; when the university of Padua made choice of him to succeed Antonio Francatiano in the first chair of philosophy, and his fame brought vast numbers of students to his lectures at Padua: but the war, wherein the republic of Venice was engaged against the league of Cambray, putting a stop to the lectures of that university, he withdrew to his native country, where he was received with the same marks of honour and distinction as before, and again appointed professor of philosophy in Bologna. He spent the remainder of his life in this city, where he died, and was interred with great pomp in the church of St Martin the Great, which belongs to the Carmelite friars. Jovius, who knew Achillini, and heard his lectures, says, that he was a man of such exceeding simplicity, and so unacquainted with address and flattery, that he was a laughing-stock to the pert and faucy young scholars, although esteemed on account of his learning. He wrote several pieces on philosophical subjects, which he published, and dedicated to John Bentivogli.

ACHILLINI (Claudius), grandson of the former, read lectures at Bologna, Ferrara, and Parma; where he was reputed a great philosopher, a learned divine, an excellent lawyer, an eloquent orator, a good mathematician, and an elegant poet. He accompanied Cardinal Ludovino, who went as legate into Piedmont; but being afterward neglected by this cardinal, when he became pope under the name of Gregory XV. he left Rome in disgust, and retired to Parma; where the duke appointed him professor of law, with a good salary. He published a volume of Latin Letters, and another of Italian Poems, which gained him great reputation: he died in 1640, aged 66.

ACHIOTTE, or ACHIOTL, a foreign drug, used in dying, and in the preparation of chocolate. It is the same with what the French commonly call *Rocou*, and the Dutch *Orleanse*. It has been commonly esteemed a kind of argilla, or earth; but later observers find it a flower, or seed of a tree*, which grows chiefly in very hot countries, as Yucatan, or Campechy, and Guatimala. It is about the size of a plumb-tree, but more tufted; its branches being longer than the trunk. The fruit is inclosed in a rind like a chestnut, except that it is of an oval figure. It begins to open crosswise from the middle to the top; and subdivides

into four parts, having in the middle a beautiful carnation-coloured flower. The tree has no leaves; but instead thereof shoots out filaments like those of faffron, only bigger and longer. Between these grow little soft vermilion-coloured grains, about the size of pepper-corns; which the Indians, separating from the filaments, bake in cakes of about half a pound each; in which form the drug is brought into Europe. The poor people use Achiotte instead of faffron: others mix it as an ingredient in chocolate, during the grinding of the cacao, the quantity of two drams to a pound, to give it a reddish colour, &c. though this practice was formerly more frequent than at present, the opinion of its being an earth, which even Mr Ray fell into, having discredited its use. Some also use it to dye wax of a vermilion colour. Physicians hold it a good cordial, and preservative against suppression of urine. F. Labat describes the achiotte somewhat differently; especially the preparation of it for dying. The tree, according to him, produces yearly its crops of flowers, of a carnation colour; not unlike wild roses. These are succeeded by a kind of rough pods, or fruit resembling chestnuts, full of small grains; which being fermented in water, and this water afterwards passed through a carriage sieve, it contracts a red colour. It is then boiled, cummed, set on the fire again, and stirred; till at length it thickens, and will fall loose from the spatula; which is the Achiotte or Rocou in perfection; though to make it more beautiful, they have two further processes, which are described by F. Labat *. According to Savary, to procure the Achiotte, they shake out the grains in an earthen vessel, soak and then wash them in several repeated warm waters, till they have discharged all their vermilion colour: after which, letting the water stand to settle, the fecula at the bottom is taken and formed into little cakes and balls; which when pure, and not adulterated either with red earth, or fine brick-dust, are highly valued. Some also use fire to boil the Achiotte, and give it a farther consistance.

ACHISH, king of Gath, to whom David retired; and who gained a complete victory over Saul, which was fatal both to that prince and his son Jonathan.

AHITOPHEL, a counsellor, who, revolting from David king of Israel, sided with his rebellious son Absalom; to whom he gave crafty advice, which not being complied with, he hanged himself.

ACHLAR, a river of the greater Armenia, otherwise called *Araç*, *Caiaç*, and by the ancients *Araxis*.

ACHMETSCHET, a town of the peninsula of the Crimea, the residence of the sultan Galga, who is eldest son of the Khan of Tartary. Long, 51. 20. Lat. 45. 0.

ACHMET, son of Sarim, has left a book concerning the interpretation of dreams according to the doctrine of the Indians, Persians, and Egyptians, which was transcribed out of Greek into Latin by Leo Tuscus in 1160. He lived in the 9th century.

ACHMET GEDUC, a famous general under Mahomet II. and Bajazet II. in the 15th century. When Mahomet II. died, Bajazet and Zezan both claimed the throne: Achmet sided with the former, and by his bravery and conduct fixed the crown on his head. But Bajazet took away his life; thinking virtue being always an unpardonable crime in the eyes of a tyrant.

Achor
Achryan-
thes.

vince of Connaught and county of Sligo, seated on the river Shannon.

ACHOR, a valley of Jericho, lying along the river Jordan, not far from Gilgal; so called from Achan, the troubler of Israel, being there stoned to death.

ACHOR, in medicine. Trallian says it is a sore on the outside of the head, full of little perforations, which discharge a humour like ichor, whence its name. He further says, that the cerion resembles an achor; but that the mouths of the perforations are larger, resembling the cells of a honey-comb, whence the name; the matter is also nearly of the consistence of thin honey. When these diseases spread, the serum which oozes out dries, and forms a scab.—The achor differs from the favus and tinca only in the degree of virulence. It is called *favus* when the perforations are large, and *tinea* when they are like those which are made by moths in cloth. But generally by tinea is understood a dry scab on the hairy scalp of children, with thick scales and an offensive smell. When this disorder affects the face, it is called *crusta lactea*; which, when it happens to children, if in other respects they are healthy, the best treatment, besides keeping the belly moderately lax, is cleanliness and a moderate diet; an issue may be made, and continued till the disorder is cleared and the strength of the constitution is established, keeping the hair short and washing the head with soap fuds.—Some instances of this sort are very difficult of cure, and attended with violent itching, a pale countenance, &c. but still the same method generally succeeds in all the species and degrees of virulence. Small doses of calomel † may be given as an alterative, rather than as a laxative; and the vin. antim. ‡ in such doses, at proper intervals, as the stomach will easily retain. Externally, the unguent *è pice* † may be used two or three times in a week, or cream mixed with falt in fine powder. If the humour is repelled, give warm sudorifics until it return.—Writers of medical observations afford divers anomalous instances of achores, *viz.* Some found even in aged people; some not on the head, but the feet; others resembling the venereal disease; others which disappeared upon cutting the hair, and returned on its growing anew; others followed by a thickness of hearing, others by panniculi, and others by a gutta serena. Their drying up has sometimes been followed by a fever, their repulsion inwards by an epilepsy.

ACHRADINA, (Plutarch, Cicero, Livy); one of the four cities or divisions of Syracuse, and the strongest, largest, and most beautiful part of it; separated by a very strong wall from the outer town, *Tycha* and *Neapolis*. It was adorned with a very large forum, with beautiful porticoes, a most elegant prytæneum, a spacious senate-house, and a superb temple of Jupiter Olympius. (Plutarch.)

ACHRAS. See SAPOTA.

ACHROMATIC an epithet expressing want of colour. The word is Greek, being compounded of *a* privative, and *χρῶμα* colour.

ACHROMATIC Telescop. See OPTICS, n° 20.

ACHYR, a strong town and castle of the Ukurin, subject to the Russians since 1667. It stands on the river Uorklo near the frontiers of Russia, 127 miles W. of Kiow, Long. 36. o. Lat. 49. 32.

ACHRYANTHES, in botany, a genus of the pentandria order, belonging to monogynia class of plants.

Achill
Acidalius.

There are seven species, all natives of the Indies. Only one of them, the amaranthus, is commonly cultivated in botanical gardens, and that more for the sake of variety than beauty. This species grows to the height of three feet, with oblong pointed leaves. The flowers come out in long spikes from the extremities of the branches, and appear in July, the seeds ripening in September. Plants of this kind must be reared in a hot-bed, and may be transplanted when they have acquired sufficient strength. If kept in pots, and sheltered during the winter in a warm green-house, they will live two or three years.

ACHZIB. See ACHAZIB.

ACHULÆ, the small pikes or prickles of the hedge-hog, echinus marinus, &c.

ACIDALUS, a fountain in Orchomenus a city of Boeotia, in which the Graces, who are sacred to Venus, bathed. Hence the epithet *Acidalia*, given to Venus, (Virgil.)

ACIDS, substances which give a sour, sharp, or tart taste. Among the chemists, the acid salts are distinguished into the nitrous, vitriolic, muriatic, and vegetable. See CHEMISTRY, n° 22, 76, 103.

ACIDS, in the Materia Medica, are such medicines as possess an acid quality. See MAT. MED. n° 10.

ACIDALIUS (Valens,) would, in all probability, have been one of the greatest critics in these latter ages, had he lived longer to perfect those talents which nature had given him. He was born at Wittstock, in Brandenburg; and having visited several academies in Germany, Italy, and other countries, where he was greatly esteemed, he afterwards took up his residence at Breslaw, the metropolis of Silesia. Here he remained a considerable time, in expectation of some employment; but nothing offering, he turned Roman-catholic, and was chosen rector of a school at Niella. It is related, that about four months after, as he was following a procession of the host, he was seized with a sudden phrenzy; and being carried home, expired in a very short time. But Thuanus tells us, that his excessive application to study was the occasion of his untimely death; and that his sitting up a-nights in composing his Conjectures on Plautus, brought upon him a distemper which carried him off in three days, on the 25th of May 1595, being just turned of 28. He wrote a Commentary on Quintus Curtius; also, Notes on Tacitus, on the Twelve Panegyrics; besides speeches, letters, and poems. His poetical pieces are inserted in the *Deliciae* of the German poets, and consist of epic verses, odes, and epigrams. A little piece, printed in 1595, under the title of *Mulieres non esse homines*, "That women were not of the human species," was falsely ascribed to him. But the fact was, that Acidalius happening to meet with the manuscript, and thinking it very whimsical, transcribed it, and gave it to the bookseller, who printed it. The performance was highly exclaimed against, inasmuch that the bookseller being seized, he discovered the person who gave him the manuscript, and a terrible outcry was made against Acidalius. A story goes, that being one day to dine at a friend's house, there happened to be several ladies at table, who supposing him to be the author, were moved with so much indignation, that they threatened to throw their plates at his head. Acidalius, however, ingeniously diverted their wrath. In his opinion, he said, the

Acme.

the author was a judicious person, the ladies being certainly more of the species of *angels* than of *men*.—Mr Baillet has given him a place among his *Enfants Celebres*; and says, that he wrote a comment upon Plautus when he was but 17 or 18 years old, and that he composed several Latin poems at the same age.

ACIDITY, that quality which renders bodies acid.

ACIDULÆ. Mineral waters that contain a brisk spirit, when unaccompanied with heat, are thus named; but if they are hot also, they are called *thermae* *.

* See *Water*.

ACIDULATED, a name given to medicines that have an acid in their composition.

ACILA, (Strabo;) **OCILA**, (Pliny;) and **OCELIS**, (Ptolemy;) a staple or mart town in Arabia Felix, on the Arabic gulf, from which, according to Pliny, they set sail for India. Now *Ziden*.

ACILIUS GLABRIO (Marcus), consul in the year of Rome 562, and 211 years before the Christian era, distinguished himself by his bravery and conduct in gaining a complete victory over Antiochus the Great, king of Syria, at the Streights of Thermopylae in Thessaly, and on several other occasions. He built the Temple of Piety at Rome, in consequence of a vow he made before the above-mentioned battle; and the reason of his giving it that name, is very remarkable. The story is mentioned by Pliny, Valerius Maximus, and others †.

† See the article *Piety*.

ACINIPPO, a town of Batica, (Pliny;) its ruins, called *Ronda la Viega*, are to be seen near Arunda, in the kingdom of Granada.

ACINUS, or **ACINI**, the small protuberances of mulberries, strawberries, &c. and by some applied to grapes. Generally it is used for those small grains growing in bunches, after the manner of grapes, as *Legustrum*, &c.

ACIS, in fabulous history, the son of Faunus and Simethis, was a beautiful shepherd of Sicily, who being beloved by Galatea, Polyphemus the giant was so enraged, that he dashed out his brains against a rock; after which Galatea turned him into a river, which was called by his name.

Acis, (Ovid, Theocritus;) a river of Sicily, running from a very cold spring, in the woody and shady foot of mount *Etna*, eastward into, and not much above a mile from, the sea, along green and pleasant banks, with the speed of an arrow, from which it takes its name. It is now called *Aci Iaci*, or *Chiaci*, according to the different Sicilian dialects: Antonine calls it *Acis*. Also the name of a hamlet at the mouth of the *Acis*.

ACKNOWLEDGMENT, in a general sense, is a person's owning or confessing a thing; but, more particularly, is the expression of gratitude for a favour.

ACKNOWLEDGMENT-Money, a certain sum paid by tenants, in several parts of England, on the death of their landlords, as an acknowledgment of their new lords.

ACLIDES, in Roman antiquity, a kind of missive weapon, with a thong affixed to it, whereby to draw it back. Most authors describe it as a sort of dart or javelin; but Scaliger makes it roundish or globular, with a slender wooden stem to poise it by.

ACLOWA, in botany, a barbarous name of a species of colutea; see **COLUTEA**. It is used by the natives of Guinea to cure the itch: They rub it on the body, as we do unguents.

ACME, the top or height of any thing. It is usually applied to the maturity of an animal just before

it begins to decline; and physicians have used it to express the utmost violence or crisis of a disease.

ACMONIA, and **ACMONIA**, in Peutinger's map, a town of Phrygia Major, now in ruins. The inhabitants are called *Acmonenses* by Cicero, and the city *Civitas Acmonensis*. Also a city of Dacia, (Ptolemy,) on the Danube, near the ruins of Trajan's bridge, built by Severus, and called *Severicum*; distant 12 German miles from Temeswar, to the south-east.

ACNIDA, **VIRGINIAN HEMP**, in botany, a genus of the diœcia order, belonging to the pentandria class of plants. There is only one species of it, *viz.* the acnida canadica. It is a native of Virginia; but rarely cultivated in Europe, except for the sake of variety. It has little beauty, and at present is applied to no useful purpose.

ACNUA, in Roman antiquity, signified a certain measure of land, near about the English rood, or fourth part of an acre.

ACOMETÆ, or **ACOMETI**, in church-history; or, Men who lived without sleep; a set of monks who chaunted the divine service night and day in their places of worship. They divided themselves into three bodies, who alternately succeeded one another, so that their churches were never silent. This practice they founded upon the precept, *Pray without ceasing*. They flourished in the east about the middle of the 5th century. There are a kind of acometi still subsisting in the Roman church, *viz.* the religious of the holy sacrament, who keep up a perpetual adoration, some one or other of them praying before the holy sacrament day and night.

ACOLUTHI, or **ACOLUTHISTS**, in antiquity, was an appellation given to those persons who were steady and immovable in their resolutions: and hence the stoics, because they would not forsake their principles, nor alter their resolutions, acquired the title of Acoluthi. The word is Greek, and compounded of *α*, priv. and *κλῡσις*, way; as never turning from the original course.

ACOLUTHI, among the ancient Christians, implied a peculiar order of the inferior clergy in the Latin church; for they were unknown to the Greeks for above 400 years. They were next to the sub-deacon; and we learn from the fourth council of Carthage, that the archdeacon, at their ordination, put into their hands a candlestick with a taper, giving them thereby to understand that they were appointed to light the candles of the church; as also an empty pitcher, to imply that they were to furnish wine for the eucharist. Some think they had another office, that of attending the bishop wherever he went. The word is Greek, and compounded of *α*, priv. and *κλῡσις*, to hinder or disturb.

ACOLYTHIA, in the Greek church, denotes the office or order of divine service; or the prayers, ceremonies, hymns, &c. whereof the Greek service is composed.

ACOMA, a town of North America, in New Mexico, seated on a hill, with a good castle. To go into the town, you must walk up 50 steps cut out of the rock. It is the capital of that province, and was taken by the Spaniards in 1599. W. Long. 104. 15. Lat. 35. 0.

ACOMAC, the name of a county in Virginia. It is on the eastern side of Chesapeake bay, on a slip of land, by the Virginians called the *eastern shore*. It is

Acominatus,
Aconitum.

Aconitum
||
Acorus.

a large county, and yet contains but one parish, the inhabitants being but thin at present, and scattered up and down in distinct settlements.

ACOMINATUS (Nicetas), was secretary to Alexius Comnenus and to Isaacus Angelus successively: he wrote an history from the death of Alexius Comnenus in 1118, where Zonaras ended his, to the year 1203, which has undergone many impressions, and is much applauded by the best critics.

ACONITUM, ACONITE, WOLFSBANE, or MONKSHOOD; a genus of the trigynia order, belonging to the polyandria class of plants. There are 10

Species. 1. The lycoctonum, or yellow wolfsbane, grows upwards of three feet high, flowers about the middle of June, and if the season is not warm will continue in flower till August. 2. The alissimum, or greatest yellow wolfsbane, grows upwards of four feet high, and the spikes of its flower are much longer in this sort than the former. 3. The variegatum, or lesser wolfsbane, seldom grows more than two feet high; it carries blue flowers, and the spikes of them are much shorter than either of the two last. 4. The anthora, or wholesome wolfsbane, flowers in the middle of August, and often continues in beauty till the middle of September; its flowers are not large, but are of a beautiful sulphur-yellow colour. 5. The napellus, bears large blue flowers, which appear in August, and make a pretty appearance. There are two or three varieties of this kind; one with white, another with rose-coloured, and a third with variegated flowers; but these are only varieties which often change. 6. The pyramidalis, or common blue monkhood, bears a long spike of blue flowers, which appear sooner than any of the other sorts, being so early as June, or sometimes even May. The spikes of flowers are upwards of two feet long, so that it makes a pretty appearance; the seeds are ripe in September. 7. The alpinum, or large-flowered monkhood, flowers in August, and will grow to the height of five feet in good ground; the flowers are very large, of a deep blue colour, but not many upon each spike. 8. The pyrenaicum, or Pyrenean monkhood, flowers in July. It grows about four feet high, and carries a long spike of yellow flowers. 9. The cammarum, grows about four feet high, and flowers in the beginning of July. 10. The orientale, or eastern monkhood, grows sometimes more than six feet high, and bears a white flower.

Culture. All these species, except the last, are natives of the Alps, the mountains of Germany, Austria, and Tartary; so require a cool shady situation, except the wholesome wolfsbane, which must have an open exposure. They thrive better in a moist than dry soil; but the ground must not be so wet as to have the water standing near their roots in the winter-time. They may be propagated by sowing their seeds in autumn, upon a north border, where they are screened from the sun. The plants will come up in the spring, when they must be kept clean from weeds during the summer-months; and, in very dry seasons, if they are frequently refreshed with water, their growth will be greatly promoted. The following autumn they should be transplanted into shady borders, in rows a foot asunder, and the plants six inches distant from one another. In this situation they may remain two years, when they will carry flowers, and so may be transplanted to those

places where they are to remain. The eastern monkhood is a native of the Levant, from whence the seeds of it were first sent by Dr Tournefort to the royal garden at Paris, from whence some other gardens have been furnished with the seeds. It is very rare in Europe at present.

Qualities. All these species of plants are poisonous, except the anthora, which has been said to be an antidote to the rest. This, however, rests on the single authority of Matthioli; from whom others have implicitly and confidently copied this particular: but till the efficacy of this antidote is established by repeated trials, made by experienced physicians, we apprehend it ought not to be mentioned; as the mentioning an antidote of this kind may occasion the neglect of other more powerful remedies. Of the effects of this, however, and other vegetable poisons, medical writers give but a confused account. In general, those which are not of the narcotic kind, nor excite violent vomitings and purgings, produce their pernicious effects by irritating the nervous coats of the stomach and intestines, so as to occasion violent convulsions, not only in them, but through the whole body. The proper cure is evacuation by vomit: but this is not to be obtained without some difficulty; because there is usually such a contraction about the upper orifice of the stomach, that nothing can either be swallowed or thrown up. In this case, an infusion of tobacco has been recommended, and may probably be of service: for being itself of a very stimulating nature, it may for a moment take off the violent spasms occasioned by the poison; in which case, a violent vomiting will immediately ensue.—The stomach being thoroughly emptied, and deglutition rendered easy, the cure may be completed by oily and mucilaginous medicines. On account of the poisonous qualities of monkhood, no species of it should be planted where children have access, lest they should suffer by putting the leaves or flowers in their mouths, or rubbing them about their eyes; for the juice of the leaves will occasion great disorder by being only rubbed upon very tender flesh; and the farina of the flowers, when blown into the eyes, causes them to swell greatly.

ACONITUM *Hyemale*. See HELLEBORUS.

ACONTIAS, in zoology, an obsolete name of the anguis jaculus, or dart-snake, belonging to the order of amphibia serpentes. See ANGUIS.

ACONTIUM, *axosifloris*, in Grecian antiquity, a kind of dart or javelin, resembling the Roman pilum.

ACONTIUS (James), a philosopher, civilian, and divine, born at Trent in the 16th century: he embraced the reformed religion; and, coming into England in the reign of queen Elizabeth, was much honoured by her, which he acknowledges in a book dedicated to that queen. This work is his celebrated Collection of the Stratagems of Satan, which has been so often translated, and borne so many editions.

ACORN, the fruit of the oak-tree. See QUERCUS.

ACORN, (in sea-language,) a little ornamental piece of wood, fashioned like a cone, and fixed on the uppermost point of the spindle, above the vane, on the mast-head. It is used to keep the vane from being blown off from the spindle in a whirlwind, or when the ship leans much to one side under sail.

ACORUS, CALAMUS AROMATICUS, SWEET FLAG, or SWEET RUSH; a genus of the monogynia order, belonging

¹ Acorus,
or
Sweet Flag

longing to the hexandria class of plants, of which only one species is known. It grows naturally in shallow standing waters, and is found wild in some parts of Britain. The leaves are sometimes two feet long, narrow, compressed, smooth, and of a bright green, terminating in a point; the root is pretty long, of a whitish, reddish, and partly greenish colour. Among the leaves there arises a single one, thicker and more robust than the rest, furrowed on the surface, and of a paler green. On this grow frequently two spikes of flowers, by many writers called *juli*. These are of a brown colour, having a chequered surface. The root of this plant has a very agreeable flavour, which is greatly improved by drying. It is reckoned carminative and stomachic, having a warm, pungent, bitterish taste; so is frequently used as an ingredient in bitters*. It has been complained of, however, as communicating a nauseous flavour to those bitters in which it was infused; and Neumann observes, that its agreeable flavour, as well as its distinguishing taste, reside entirely in a volatile essential oil; the residuum after distillation having a nauseous flavour, not at all resembling that of the calamus.—The Turks candy the roots, and imagine them a preservative against contagion. They are usually imported from the Levant into Britain; though those of our own country might answer equally well. Neither horses, cows, goats, sheep, or swine, will eat the herb, or its roots.

* See *Materia Medica*,
nº 194.

Culture. The acorus being a perennial plant, may be transplanted into a garden, where it will thrive very well if the ground is moist; but never flowers unless it grows in water. It loves an open situation, and will not thrive well under the shade of trees. The flowers appear the latter end of June, and continue till August.

ACORUS, in the materia medica, a name sometimes given to the great galinjal*.

ACOUSMATICI, sometimes also called *Acoustici*, in Grecian antiquity, such of the disciples of Pythagoras as had not completed their five years probation.

ACOUSTIC, in general, denotes any thing that relates to the ear, the sense of hearing, or the doctrine of sounds.

ACOUSTIC Duct, in anatomy, the same with meatus auditorius, or the external passage of the ear*.

ACOUSTIC Instrument, or auricular tube. See ACOUSTICS, nº 26.

ACOUSTIC Vessels, in the ancient theatres, were a kind of vessels, made of brass, shaped in the bell fashion, which being of all tones within the pitch of the voice, or even of instruments, rendered the sounds more audible, so that the actors could be heard through all parts of theatres, which were even 400 feet in diameter.

ACOUSTIC Disciples, among the ancient Pythagoreans, those more commonly called *Acousmatici*.

¹ Diacoustics.

INSTRUCTS us in the nature of sound. It is divided by some writers into *Diacoustics*, which explains the properties of those sounds that come directly from the sonorous body to the ear; and *Catacoustics*, which treats of reflected sounds: but such distinction does not appear to be of any real utility.

² Catacoustics

³ Of the vehicles of sound

CHAP. I. Different Theories of Sound.

Most sounds, we all know, are conveyed to us on the bosom of the air. In whatever manner they either float upon it, or are propelled forward in it, certain it is, that, without the vehicle of this or some other fluid, we should have no sounds at all. Let the air be exhausted from a receiver, and a bell shall emit no sound when rung in the void; for, as the air continues to grow less dense, the sound dies away in proportion, so that at last its strongest vibrations are almost totally silent.

⁴ Air not the only one.

Thus air is a vehicle for sound. However, we must not, with some philosophers, assert, that it is the only vehicle; that, if there were no air, we should have no sounds whatsoever: for it is found by trial, that sounds are conveyed through water almost with the same facility with which they move through air. A bell rung in water returns a tone as distinct as if rung in our aerial atmosphere. This was observed by Derham, who also remarked that the tone came a quarter deeper. Some naturalists assure us also, that fishes have a strong perception of sounds, even at the bottom of deep rivers (A). From hence, it would seem not to be very material in the propagation of sounds, whether the

fluid which conveys them be elastic or otherwise. Water, which, of all substances that we know, has the least elasticity, yet serves to carry them forward; and if we make allowance for the difference of its density, perhaps the sounds move in it with a proportional rapidity to what they are found to do in the elastic fluid of air.

One thing however is certain, that whether the fluid which conveys the note be elastic or non-elastic, whatever sound we hear is produced by a stroke, which the sounding body makes against the fluid, whether air or water. The fluid being struck upon, carries the impression forward to the ear, and there produces its sensation. Philosophers are so far agreed, that they all allow that sound is nothing more than the impression made by an elastic body upon the air or water, and this impression carried along by either fluid to the organ of hearing. But the manner in which this conveyance is made, is still disputed: Whether the sound is diffused into the air, in circle beyond circle, like the waves of water when we disturb the smoothness of its surface by dropping in a stone; or whether it travels along, like rays diffused from a center, somewhat in the swift manner that electricity runs along a rod of iron; these are the questions which at present divide the learned.

Newton was of the first opinion. He has explained the progression of sound by an undulatory, or rather a vermicular, motion in the parts of the air. If we have an exact idea of the crawling of some insects, we shall have a tolerable notion of the progression of sound upon this hypothesis. The insect, for instance, in its motion, first carries its contractions from the hinder part, in order

⁵ What sound is, and how propagated.

⁶ Newton's theory.

(A) Others, however, deny this; asserting, that fishes are totally deaf. Nor have anatomists, from examining their organs of hearing, been able to pronounce with certainty upon the matter. See FISH; and COMPARATIVE Anatomy, nº 175.

Different

* See *Elasticity*.

der to throw its fore part to the proper distance, then it carries its contractions from the fore part to the hinder to bring that forward. Something similar to this is the motion of the air when struck upon by a sounding body. To be a little more precise, suppose ABC, the string of an harpsichord screwed to a proper pitch, and drawn out of the right line by the finger at B. We have elsewhere observed*, that such a string would, if let go, vibrate to E; and from E to D, and back again. We observed, that it would continue thus to vibrate like a pendulum for ever, if not externally resisted, and, like a pendulum, all its little vibrations would be performed in equal times, the last and the first being equally long in performing. We shewed also, that, like a pendulum, its greatest swiftness would always be when it arrived at E, the middle part of its motion. Now then, if this string be supposed to fly from the finger at B, it is obvious, that whatever be its own motion, such also will be the motion of the parts of air that fly before it. Its motion, as is obvious, is first uniformly accelerated forward from B to E, then retarded as it goes from E to D, accelerated back again as it returns from D to E, and retarded from E to B. This motion being therefore sent in succession through a range of elastic air, it must happen, that the parts of one range of air must be sent forward with accelerated motion, and then with a retarded motion. This accelerated motion reaching the remotest end of the first range will be communicated to a second range, while the nearest parts of the first range being retarded in their motion, and falling back with the recession of the string, retire first with an accelerated, then with a retarded motion, and the remotest parts will soon follow. In the mean time, while the parts of the first range are thus falling back, the parts of the second range are going forward with an accelerated motion. Thus there will be an alternate condensation and relaxation of the air, during the time of one vibration; and as the air going forward strikes any opposing body with greater force than upon retiring, so each of these accelerated progressions have been called by Newton a *pulse* of sound.

Thus will the air be driven forward in the direction of the string. But now we must observe, that these pulses will move every way; for all motion impressed upon fluids in any direction whatsoever, operates all around in a sphere: so that sounds will be driven in all directions.

Vol. I.

NOTE on Noth. preceding page.] Though air and water are both vehicles of sound, yet neither of them seem to be so by themselves, but only as they contain an exceedingly subtle fluid capable of penetrating the most solid bodies. Hence, by the medium of that fluid, sounds can be propagated through wood, or metals, even more readily than through the open air. By the same means, deaf people may be made sensible of sounds, if they hold a piece of metal in their mouth, one end of which is applied to the sounding body. As it is certain, therefore, that air cannot penetrate metals, we must acknowledge the medium of sound to be of a more subtle nature; and thus the electrical fluid will naturally occur as the proper one. But why then is sound no longer heard in an exhausted receiver, if the air is not the fluid by which it is conveyed, seeing the electrical matter cannot be excluded? The reply to this is obvious: The electrical fluid is so exceedingly subtle, and pervades solid bodies with so much ease, that any motion of a solid body in a quantity of electric matter by itself, can never excite a degree of agitation in it sufficient for producing a sound; but if the electric fluid is entangled among the particles of air, water, wood, metal, &c. whatever affects their particles will also affect this fluid, and produce an audible noise. In the experiment of the air-pump, however, there may be an ambiguity, as the gradual exhausting of the air creates an increasing difference of pressure on the outside, and may occasion in the glass a difficulty of vibrating, so as to render it less fit to communicate to the air without the vibrations that strike it from within. From this cause the diminution of sound in an exhausted receiver may be supposed to proceed, as well as from the diminution of the air. But if any internal agitation of its parts should happen to the electrical fluid, exceeding loud noises might be propagated through it, as has been the case when large meteors have kindled at a great distance from the earth. Of this an instance is recorded in the Philosophical Transactions by Dr Halley. (See FIRE.) It is also difficult to account for the exceeding great swiftness of sound, upon the supposition that it is propagated by means of air alone; for nothing is more certain, than that the strongest and most violent gale is, in its course, inert and sluggish, compared with the motion of sound.

tions, backwards, forwards, upwards, downwards, and on every side. They will go on succeeding each other, one on the outside of the other, like circles in disturbed water; or rather, they will lie one without the other, in concentric shells, shell above shell, as we see in the coats of an onion.

All who have remarked the tone of a bell, while its sounds are decaying away, must have an idea of the pulses of sound, which, according to Newton, are formed by the air's alternate progression and recession. And it must be observed, that as each of these pulses are formed by a single vibration of the string, they must be equal to each other; for the vibrations of the string are known to be so.

Again, as to the velocity with which sounds travel, this Newton determines, by the most difficult calculation that can be imagined, to be in proportion to the thickness of the parts of the air, and the distance of these parts from each other. From hence he goes on to prove, that each little part moves backward and forward like a pendulum; and from thence he proceeds to demonstrate, that if the atmosphere were of the same density every where as at the surface of the earth, in such a case, a pendulum, that reached from its highest surface down to the surface of the earth, would by its vibrations discover to us the proportion of the velocity with which sounds travel. The velocity with which each pulse would move, he shews, would be as much greater than the velocity of such a pendulum swinging with one complete vibration, as the circumference of a circle is greater than the diameter. From hence he calculates, that the motion of sound would be 979 feet in one second. But this not being consonant to experience, he takes in another consideration, which destroys entirely the rigour of his former demonstration, namely, vapours in the air; and then finds the motion of sound to be 1142 feet in one second, or near 13 miles in a minute: a proportion which experience had established nearly before.

Thus much will serve to give an obscure idea of a most obscure theory; a theory which has met with numbers of opposers. Even John Bernoulli, Newton's greatest disciple, modestly owns that he did not pretend to understand this part of the *Principia*. He attempted therefore to give a more perspicuous demonstration of his own, that might confirm and illustrate the

Theory, op-
posed.

Different
Theories of
Sound.

Different
Theories of
Sounds.

the Newtonian theory. The subject seemed to reject elucidation: his theory is obviously wrong, as D'Alembert has proved in his Theory of Fluids. Euler, therefore, rejecting the Newtonian doctrine entirely, has attempted to establish another; but as he has hitherto only given the result of his calculations, without the progressive proofs that confirm his opinion, the learned continue in suspense as to the merit of his work.

The objec-
tions.

Various have been the objections that have been made to the Newtonian system of sounds. First, it is urged, that if the first pulse of sound be driven by that which immediately follows, and that by the succeeding, and so on, it must then happen, that the more numerous the pulses, the farther will the sound be driven; so that a string which vibrates the longest will be heard at the greatest distance, which is contrary to known experience. Again, it is urged, that this theory can only agree with the motion of sound in an elastic fluid, whereas sounds are known to move forward through water that is not elastic. To explain their progress therefore through water, a second theory must be formed: so that two theories must be made to explain a similar effect; which is contrary to the simplicity of true philosophy, for it is contrary to the simplicity of nature. It is still farther urged, that this slow vermicular motion but ill represents the velocity with which sounds travel, as we know by experience that it is almost 13 miles in a minute. In short, it is urged, that such undulations as have been described, when coming from several sonorous bodies at once, would cross, obstruct, and confound each other; so that, if they were conveyed to the ear by this means, we should hear nothing but a medley of discord and broken articulations. But this is equally with the rest contradictory to experience, since we hear the fullest concert, not only without confusion, but with the highest pleasure. These objections, whether well founded or not, have given rise to another theory: which we shall likewise lay before the reader; though it too appears liable to objections, which shall be afterwards mentioned.

Another
Theory.

Every sound may be considered as driven off from the founding body in straight lines, and impressed upon the air in one direction only; but whatever impression is made upon a fluid in one direction, is diffused upon its surface into all directions: so that the sound first driven directly forward soon fills up a wide sphere, and is heard on every side. Thus, as it is impressed, it instantaneously travels forward with a very swift motion, resembling the velocity with which we know electricity flies from one end of a line to another.

Now, as to the pulses, or open shakes as the musicians express it, which a founding body is known to make, each pulse (say the supporters of this theory) is itself a distinct and perfect sound, and the interval between every two pulses is profoundly silent. Continuity of sound from the same body is only a deception of the hearing; for as each distinct sound succeeds at very small intervals, the organ has no time to transmit its images with equal swiftness to the mind, and the interval is thus lost to sense: just as in seeing a flaming torch, if flared round in a circle, it appears as a ring of fire. In this manner a beaten drum, at some small distance, presents us with the idea of continuing sound. When children run with their sticks along a rail, a continuing sound is thus represented,

though it need scarce be observed, that the stroke against each rail is perfectly distinct and insulated.

According to this theory, therefore, the pulses are nothing more than distinct sounds repeated by the same body, the first stroke or vibration being ever the loudest, and travelling farther than those that follow; while each succeeding vibration gives a new sound, but with diminished force, till at last the pulses decay away totally, as the force decays that gives them existence.

All bodies whatsoever that are struck, return more or less a sound: but some, wanting elasticity, give back no repetition of the sound; the noise is at once begotten and dies: while other bodies, however, there are, which being more elastic, and whose parts are capable of vibration, give back a sound, and repeat the same several times successively. These last are said to have a tone; the others are not allowed to have any.

This tone of the elastic string, or bell, is notwithstanding nothing more than a similar sound of what the former bodies produced, but with the difference of being many times repeated, while their note is but single. So that, if we would give the former bodies a tone, it will be necessary to make them repeat their sound, by repeating our blows swiftly upon them. This will effectually give them a tone, and even an unmusical instrument has often had a fine effect by its tone in our concerts.

Let us now go on then to suppose, that by swift and equally continued strokes we give any non-elastic body its tone, it is very obvious, that no alterations will be made in this tone by the quickness of the strokes, though repeated ever so fast. These will only render the tone more equal and continuous, but make no alteration in the tone it gives. On the contrary, if we make an alteration in the force of each blow, a different tone will then undoubtedly be excited. The difference will be small, it must be confessed; for the tones of these inflexible bodies are capable but of small variation; however, there will certainly be a difference. The table on which we write, for instance, will return a different sound when struck with a club, from what it did when struck only with a switch. Thus non-elastic bodies return a difference of tone, not in proportion to the swiftness with which their sound is repeated, but in proportion to the greatness of the blow which produced it; for in two equal non-elastic bodies, that body produced the deepest tone that was struck by the greatest blow.

We now then come to a critical question, What is it that produces the difference of tone in two elastic founding bells or strings? Or what makes one deep and the other shrill? This question has always been hitherto answered by saying, that the depth or height of the tone proceeded from the slowness and swiftness of the times of the vibrations. The slowest vibrations, it has been said, are qualified for producing the deepest tones, while the swiftest vibrations produce the highest tones. In this case, an effect has been given for a cause. It is in fact the force with which the founding string strikes the air when struck upon, that makes the true distinction in the tones of sounds. It is this force, with greater or less impressions, resembling the greater or less force of the blows upon a non-elastic body, which produces correspondent affections of sound. The greatest forces produce the deepest sounds: the high notes are the effect of small efforts. In the same manner a bell, wide

at

Different
Theories of
Sound.

at the mouth, gives a grave sound; but if it be very maffy withal, that will render it still graver; but if maffy, wide, and long or high, that will make the tone deepeft of all.

Thus, then, will elastic bodies give the deepeft found, in proportion to the force with which they strike the air: but if we should attempt to increafe their force by giving them a stronger blow, this will be in vain; they will still return the fame tone; for fuch is their formation, that they are fonorous only becaufe they are elastic, and the force of this elasticity is not increafed by our strength, as the greatnefs of a pendulum's vibration will not be increafed by falling from a greater height.

Thus far of the lengths of cords. Now as to the frequency with which they vibrate the deepeft tones, it has been found, from the nature of elastic strings, that the longeft strings have the wideft vibrations, and confequently go backward and forward floweft; while, on the contrary, the fhorteft strings vibrate the quickeft, or come and go in the fhorteft intervals. From hence thofe who have treated of founds, have afferted, as was faid before, that the tone of the ftring depended upon the length or the fhortnefs of the vibrations. This, however, is not the cafe. One and the fame ftring, when ftruck, muft always, like the fame pendulum, return precifely fimilar vibrations; but it is well known, that one and the fame ftring, when ftruck upon, does not always return precifely the fame tone: fo that in this cafe the vibrations follow one rule, and the tone another. The vibrations muft be invariably the fame in the fame ftring, which does not return the fame tone invariably, as is well known to muficians in general. In the violin, for instance, they can eafily alter the tone of the ftring an octave or eight notes higher, by a fofter method of drawing the bow; and fome are known thus to bring out the moft charming airs imaginable. Thefe peculiar tones are by the Englifh fiddlers called *Autenotes*. The only reafon that can be affigned for the fame ftring thus returning different tones, muft certainly be the different force of its ftrokes upon the air. In one cafe, it has double the tone of the other; becaufe upon the foft touches of the bow, only half its elasticity is put into vibration.

This being underftood (continue the authors of this theory) we fhall be able clearly to account for many things relating to founds that have hitherto been inexplicable. Thus, for instance, if it be asked, When two ftrings are ftretched together of equal lengths, tenfion, and thicknefs, how does it happen, that one of them being ftruck, and made to vibrate throughout, the other fhall vibrate throughout alfo? the answer is obvious: The force that the ftring ftruck receives is communicated to the air, and the air communicates the fame to the fimilar ftring; which therefore receives all the force of the former; and the force being equal, the vibrations muft be fo too. Again, put the queftion, If one ftring be but half the length of the other, and be ftruck, how will the vibrations be? The answer is, The longeft ftring will receive all the force of the ftring half as long as itfelf, and therefore it will vibrate in proportion, that is, through half its length. In the fame manner, if the longeft ftring were three times as long as the

Different
Theories of
Sound.

other, it would only vibrate in a third of its length; or if four times, in a fourth of its length. In fhort, whatever force the fmaller ftring imprefles upon the air, the air will imprefs a fimilar force upon the longer ftring, and partially excite its vibrations.

From hence alfo we may account for the caufe of thofe charming, melancholy gradations of found in the Eolian lyre; an inftrument (fays Sir John Hawkins) lately obtruded upon the public as a new invention, tho' defcribed above a century ago by Kircher. * This inftrument is eafily made, being nothing more than a long narrow box of thin deal, about 30 inches long, 5 inches broad, and 1½ inches deep, with a circle in the middle of the upper fide or belly about 1½ inch diameter, pierced with fmall holes. On this fide are feven, ten, or (according to Kircher) fifteen or more ftrings of very fine gut, ftretched over bridges at each end, like the bridge of a fiddle, and fcrewed up or relaxed with fcrew-pins (s). The ftrings are all tuned to one and the fame note; and the inftrument is placed in fome current of air, where the wind can bruft over its ftrings with freedom. A window with the fafh juft raifed to give the air admiffion, will anfwer this purpofe exactly. Now when the entering air blows upon thefe ftrings with different degrees of force, there will be excited different tones of found; fometimes the blaft brings out all the tones in full concert; fometimes it finks them to the foftelt murmurs; it feels for every tone, and by its gradations of ftrengh folicits thofe gradations of found which art has taken different methods to produce.

We come now, in the laft place, to confider (by this theory) the loudnefs and lownefs, or, as the muficians fpeak, the ftrengh and foftnefs, of founds. In vibrating elastic ftrings, the loudnefs of the tone is in proportion to the deepefs of the note; that is, in two ftrings, all things in other circumftances alike, the deepeft tone will be loudeft. In mufical inftruments upon a different principle, as in the violin, it is otherwife; the tones are made in fuch inftruments, by a number of fmall vibrations crowded into one ftroke. The rofined bow, for instance, being drawn along a ftring, its roughnefs catches the ftring at very fmall intervals, and excites its vibrations. In this inftrument, therefore, to excite loud tones, the bow muft be drawn quick, and this will produce the greateft number of vibrations. But it muft be obferved, that the more quick the bow paffes over the ftring, the lefs apt will the roughnefs of its furface be to touch the ftring at every inftant; to remedy this, therefore, the bow muft be preffed the harder as it is drawn quicker, and thus its fulleft found will be brought from the inftrument. If the fwiftnefs of the vibrations in an inftrument thus rubbed upon, exceed the force of the deeper found in another, then the fwift vibrations will be heard at a greater diftance, and as much farther off as the fwiftnefs in them exceeds the force in the other.

By the fame theory (it is alleged) may all the phenomena of mufical founds be eafily explained.—The fables of the ancients pretend, that mufic was firft found out by the beating of different hammers upon the fmith's anvil. Without purfuing the fable, let us endeavour to explain the nature of mufical founds by a fimilar me-

The nature of Mufical Sounds illuftrated according to the fame theory.

H 2

thod.

(s) The figure represents the inftrument with ten chords; of which fome direct only eight to be tuned unifons, and the two outermoft octaves below them. But this feems not to be material.

Of Musical
Sounds.

thod. Let us suppose an anvil, or several similar anvils, to be struck upon by several hammers of different weights or forces. The hammer, which is double that of another, upon striking the anvil will produce a sound double that of the other: this double sound musicians have agreed to call an Octave. The ear can judge of the difference or resemblance of these sounds with great ease, the numbers being as one and two, and therefore very readily compared. Suppose that an hammer three times less than the first, strikes the anvil, the sound produced by this will be three times less than the first: so that the ear, in judging the similitude of these sounds, will find somewhat more difficulty; because it is not so easy to tell how often one is contained in three, as it is to tell how often it is contained in two. Again, suppose that an hammer four times less than the first strikes the anvil, the ear will find greater difficulty still in judging precisely the difference of the sounds; for the difference of the numbers four and one cannot so soon be determined with precision as three and one. If the hammer be five times less, the difficulty of judging will be still greater. If the hammer be six times less, the difficulty still increases, and so also of the seventh, inasmuch that the ear cannot always readily and at once determine the precise gradation. Now, of all comparisons, those which the mind makes most easily, and with least labour, are the most pleasing. There is a certain regularity in the human soul, by which it finds happiness in exact and striking and easily-made comparisons. As the ear is but an instrument of the mind, it is therefore most pleased with the combination of any two sounds, the differences of which it can most readily distinguish. It is more pleased with the concord of two sounds which are to each other as one and two, than of two sounds which are as one and three, or one and four, or one and five, or one and six or seven. Upon this pleasure, which the mind takes in comparison, all harmony depends. The variety of sounds is infinite; but because the ear cannot compare two sounds so readily to distinguish their discriminations when they exceed the proportion of one and seven, musicians have been content to confine all harmony within that compass, and allowed but seven notes in musical composition.

Let us now then suppose a stringed instrument fitted up in the order mentioned above. For instance: Let the first string be twice as long as the second; let the third string be three times shorter than the first, let the fourth be four times, the fifth string five times, and the sixth six times as short as the first. Such an instrument would probably give us a representation of the lyre as it came first from the hand of the inventor. This instrument will give us all the seven notes following each other, in the order in which any two of them will accord together most pleasingly; but yet it will be a very inconvenient and a very disagreeable instrument: inconvenient, for in a compass of seven strings only, the first must be seven times as long as the last; and disagreeable, because this first string will be seven times as loud also; so that when the tones are

Of Musical
Sounds.

to be played in a different order, loud and soft sounds would be intermixed with most disgusting alternations. In order to improve the first instrument, therefore, succeeding musicians very judiciously threw in all the other strings between the two first, or, in other words, between the two Octaves, giving to each, however, the same proportion to what it would have had in the first natural instrument. This made the instrument more portable, and the sounds more even and pleasing. They therefore disposed the sounds between the Octave in their natural order, and gave each its own proportional dimensions. Of these sounds, where the proportion between any two of them is most obvious, the concord between them will be most pleasing. Thus Octaves, which are as two to one, have a most harmonious effect; the fourth and fifth also sound sweetly together, and they will be found, upon calculation, to bear the same proportion to each other that Octaves do. "Let it not be supposed," (says Mr. Saverus) that the musical scale is merely an arbitrary combination of sounds: "it is made up from the consonance and differences of the parts which compose it. Those who have often heard a fourth and a fifth accord together, will be naturally led to discover their difference at once; and the mind unites itself to their beauties." Let us then cease to assign the coincidences of vibrations as the cause of harmony, since these coincidences in two strings vibrating at different intervals, must at best be but fortuitous; whereas concord is always pleasing. The true cause why concord is pleasing, must arise from our power, in such a case, of measuring more easily the differences of the tones. In proportion as the note can be measured with its fundamental tone by large and obvious distinctions, then the concord is most pleasing; on the contrary, when the ear measures the discriminations of two tones by very small parts, or cannot measure them at all, it loses the beauty of their resemblance: the whole is discord and pain (c).

But there is another property in the vibration of a musical string not yet taken notice of, and which is alleged to confirm the foregoing theory. If we strike the string of an harpsichord, or any other elastic sounding chord whatever, it returns a continuing sound. This till of late was considered as one simple uniform tone; but all musicians now confess, that instead of one tone it actually returns four tones, and that constantly. The notes are, beside the fundamental tone, an octave above, a twelfth above, and a seventeenth. One of the bass-notes of an harpsichord has been dissected in this manner by Rameau, and the actual existence of these tones proved beyond a possibility of being controverted. In fact, the experiment is easily tried; for if we smartly strike one of the lower keys of an harpsichord, and then take the finger briskly away, a tolerable ear will be able to distinguish, that, after the fundamental tone has ceased, three other shriller tones will be distinctly heard; first the octave above, then the twelfth, and lastly the seventeenth: the octave above is in general almost mixed with the fundamental tone, so as not to be easily perceived, except by an ear long habituated to the minute discrimi-

(c) It is certain, that in proportion to the simplicity of relations in sound, the ear is pleased with its combinations; but this is not to be admitted as the cause why musicians have confined all harmony to an octave. Discriminated sounds, whose vibrations either never coincide, or at least very rarely, do not only cease to please, but violently grate, the ear. Harmony and discord, therefore, are neither discriminated by the judgment of hearers, nor the institution of musicians, but by their own essential and immutable nature.

differiminations of sounds. So that we may observe, that the smallest tone is heard last, and the deepest and largest one first: the two others in order.

In the whole theory of sounds, nothing has given greater room for speculation, conjecture, and disappointment, than this amazing property in elastic strings. The whole string is universally acknowledged to be in vibration in all its parts, yet this single vibration returns no less than four different sounds. They who account for the tones of strings by the number of their vibrations are here at the greatest loss. Daniel Bernouilli supposes, that a vibrating string divides itself into a number of curves, each of which has a peculiar vibration; and though they all swing together in the common vibration, yet each vibrates within itself. This opinion, which was supported, as most geometrical speculations are, with the parade of demonstration, was only born soon after to die. Others have ascribed this to an elastic difference in the parts of the air, each of which, at different intervals, thus received different impressions from the string, in proportion to their elasticity. This is absurd. If we allow the difference of tone to proceed from the force, and not the frequency, of the vibrations, this difficulty will admit of an easy solution. These sounds, though they seem to exist together in the string, actually follow each other in succession: while the vibration has greatest force, the fundamental tone is brought forward: the force of the vibration decaying, the octave is produced, but almost only instantaneously; to this succeeds, with diminished force, the twelfth; and, lastly, the seventeenth is heard to vibrate with great distinctness, while the three other tones are always silent. These sounds, thus excited, are all of them the harmonic tones, whose differences from the fundamental tone are, as was said, strong and distinct. On the other hand, the discordant tones cannot be heard. Their differences being but very small, they are overpowered, and in a manner drowned in the tones of superior difference: yet not always neither; for Daniel Bernouilli has been able, from the same stroke, to make the same string bring out its harmonic and its discordant tones also (p.). So that from hence we may justly infer, that every note whatsoever is only a succession of tones; and that those are most distinctly heard, whose differences are most easily perceivable.

32
objections
to the preceding
theory.

To this theory, however, though it has a plausible appearance, there are strong and indeed insuperable objections. The very fundamental principle of it is false. No body whatever, whether elastic or non elastic, yields a graver sound by being struck with a larger instrument, unless either the sounding body, or that part of it which emits the sound, is enlarged. In this case, the largest bodies always return the gravest sounds.

In speaking of elastic and non-elastic bodies in a musical sense, we are not to push the distinction so far as when we speak of them philosophically. A body is *musically* elastic, all of whose parts are thrown into vibrations so as to emit a sound when only part of their surface is struck. Of this kind are bells, musical strings, and all bodies whatever that are considerably hollow.—Musical non-elastics are such bodies as emit a sound only from that particular place which is struck: thus, a table, a plate of iron nailed on wood, a bell hung

in the earth, are all of them non-elastics in a musical sense, though not philosophically so. When a solid body, such as a log of wood, is struck with a switch, only that part of it emits a sound which comes in contact with the switch; the note is acute and loud, but would be noise if the adjacent parts of the log were removed. If, instead of the switch, a heavier or larger instrument is made use of, a larger portion of its surface then returns a sound, and the note is consequently more grave; but it would not be so, if the large instrument struck with a sharp edge, or a surface only equal to that of the small one.

In sounds of this kind, where there is only a single thwack, without any repetition, the immediate cause of the gravity or acuteness seems to be the quantity of air displaced by the sounding body; a large quantity of air displaced produces a grave sound, and a smaller quantity a more acute one, the force wherewith the air is displaced signifying very little.—What we here advance is confirmed by some experiments made by Dr Priestley, concerning the *musical tone* of electrical discharges. The passage being curious, and not very long, we shall here transcribe it:

“As the course of my experiments has required a great variety of electrical explosions, I could not help observing a great variety in the musical tone made by the reports. This excited my curiosity to attempt to reduce this variation to some measure. Accordingly, by the help of a couple of spinets, and two persons who had good ears for music, I endeavoured to ascertain the tone of some electrical discharges; and observed, that every discharge made several strings, particularly those that were chords to one another, to vibrate: but one note was always predominant, and sounded after the rest. As every explosion was repeated several times, and three of us separately took the same note, there remained no doubt but that the tone we fixed upon was at least very near the true one. The result was as follows.

“A jar containing half a square foot of coated glass sounded F sharp, concert pitch. Another jar of a different form, but equal surface, sounded the same.

“A jar of three square feet sounded C below F sharp. A battery consisting of sixty-four jars, each containing half a square foot, sounded F below the C.

“The same battery, in conjunction with another of thirty-one jars, sounded C sharp. So that a greater quantity of coated glass always gave a deeper note.

“Differences in the degree of a charge in the same jar made little or no difference in the tone of the explosion: if any, a higher charge gave rather a deeper note.

These experiments shew us how much the gravity or acuteness of sounds depend on the quantity of air put in agitation by the sounding body. We know that the noise of the electric explosion arises from the return of the air into the vacuum produced by the electric flash. The larger the vacuum, the deeper was the note: for the same reason, the discharge of a musket produces a more acute note than that of a cannon; and thunder is deeper than either.

Besides this, however, other circumstances concur to produce different degrees of gravity or acuteness in sounds. The sound of a table struck upon with a piece

of

Musical
Sounds.

of wood, will not be the same with that produced from a plate of iron struck by the same piece of wood, even if the blows should be exactly equal, and the iron perfectly kept from vibrating.—Here the sounds are generally said to differ in their degrees of acuteness, according to the specific gravities or densities of the substances which emit them. Thus gold, which is the most dense of all metals, returns a much graver sound than silver; and metaline wires, which are more dense than therms, return a proportionably graver sound.—But neither does this appear to be a general rule in which we can put confidence. Bell-metal is denser than copper, but it by no means appears to yield a graver sound; on the contrary, it seems very probable, that copper will give a graver sound than bell-metal, if both are struck upon in their non-elastic state; and we can by no means think that a bell of pure tin, the least dense of all the metals, will give a more acute sound than one of bell-metal, which is greatly more dense.—In some bodies hardness seems to have a considerable effect. Glass, which is considerably harder than any metal, gives a more acute sound; bell-metal is harder than gold, lead, or tin, and therefore sounds much more acutely; though how far this holds with regard to different substances, there are not a sufficient number of experiments for us to judge.

In bodies musically elastic, the whole substance vibrates with the slightest stroke, and therefore they always give the same note whether they are struck with a large or with a small instrument; so that striking a part of the surface of any body musically elastic is equivalent, in it, to striking the whole surface of a non-elastic one. If the whole surface of a table was struck with another table, the note produced would be neither more nor less acute whatever force was employed; because the whole surface would then yield a sound, and no force could increase the surface; the sound would indeed be louder in proportion to the force employed, but the gravity would remain the same. In like manner, when a bell, or musical string, is struck, the whole substance vibrates, and a greater stroke cannot increase the substance.—Hence we see the fallacy of what is said concerning the Pythagorean anvils. An anvil is a body musically elastic, and no difference in the tone can be perceived whether it is struck with a large, or with a small hammer; because either of them are sufficient to make the whole substance vibrate, provided nothing but the anvil is struck upon: smiths, however, do not strike their anvils, but red-hot iron laid upon their anvils; and thus the vibrations of the anvil are stopped, so that it becomes a non-elastic body, and the differences of tone in the strokes of different hammers proceed only from the surface of the large hammers covering the whole surface of the iron, or at least a greater part of it than the small ones. If the small hammer is sufficient to cover the whole surface of the iron as well as the large one, the note produced will be the same, whether the large or the small hammer is used.

Lastly, The argument for the preceding theory, grounded on the production of what are called *flute-notes* on the violin, is built on a false foundation; for these notes are not produced by drawing the bow softly on the string, but by lightly touching the string with the finger. In this, case the same sounds are produced as if the vibrations were transferred to the space between

the end of the finger-board and the finger, instead of that between the finger and the bridge. Why this small part of the string should vibrate in such a case, and not that which is under the immediate action of the bow, we must own ourselves ignorant: nor dare we affirm that the vibrations really are transferred in this manner, only the same sounds are produced as if they were.

Though these objections seem sufficiently to overturn the foregoing theory, with regard to acute sounds being the effects of weak strokes, and grave ones of stronger impulses, we can by no means admit that longer or shorter vibrations are the occasion of gravity or acuteness in sounds. A musical sound, however lengthened, either by string or bell, is only a repetition of a single one, whose duration by itself is but for a moment, and is therefore termed *inappreciable*, like the smack of a whip, or the explosion of an electrical battery. The continuation of the sound is nothing more than a repetition of this instantaneous inappreciable noise after the manner of an echo, and it is only this echo that makes the sound agreeable. For this reason, music is much more agreeable when played in a large hall where the sound is reverberated, than in a small room where there is no such reverberation. For the same reason, the sound of a string is more agreeable when put on a hollow violin than when fastened to a plain board, &c.—In the sound of a bell, we cannot avoid observing this echo very distinctly. The sound appears to be made up of distinct pulses, or repetitions of the same note produced by the stroke of the hammer. It can by no means be allowed, that the note would be more acute though these pulses were to succeed one another more rapidly; the sound would indeed become more simple, but would still preserve the same tone.—In musical strings the reverberations are vastly more quick than in bells; and therefore their sound is more uniform or simple, and consequently more agreeable than that of bells. In musical glasses *, the vibrations must be inconceivably quicker than in any bell, or stringed instrument; and hence they are of all others the most simple and the most agreeable, though neither the most acute nor the loudest.—As far as we can judge, quickness of vibration contributes to the uniformity, or simplicity, but not to the acuteness, nor to the loudness, of a musical note.

It may here be objected, that each of the different pulses, of which we observe the sound of a bell to be composed, is of a very perceptible length, and far from being instantaneous; so that it is not fair to infer what we have done, namely, that the sound of a bell is only a repetition of a single instantaneous stroke, seeing it is evidently the repetition of a lengthened note.—To this we reply, that the inappreciable sound which is produced by striking a bell in a non-elastic state, is the very same which, being first propagated round the bell, forms one of these short pulses that is afterwards re-echoed as long as the vibrations of the metal continue, and it is impossible that the quickness of repetition of any sound can either increase or diminish its gravity.

With regard to the production of the different tones from the bass-string of an harpsichord, we can only offer a conjecture, which is, that as the strings of musical instruments are fastened at both ends, and very tense, the vibrations of the middle parts must be performed much more easily than those towards the extre-

Musical
Sounds.* See
Harmoise.

remities; .

Reverberated Sounds.

tremities; consequently, as vibration must have a certain degree of strength before a sound is produced, the middle parts of the string may vibrate so as to produce a sound, while the extremities have lost that power. This will be equivalent to shortening the string, and consequently the tone must gradually grow more acute.

CHAP. II. Of the Velocity, &c. of Sound. Axioms.

velocity of ind.

HOWEVER it may be with regard to the theories of sound, (which we leave to the judgment of our readers), experience has taught us, that it travels at about the rate of 1142 feet in a second, or near 13 miles in a minute; nor do any obstacles hinder its progress, a contrary wind only a small matter diminishing its velocity.

progress calculated.

The method of calculating its progress is easily made known. When a gun is discharged at a distance, we see the fire long before we hear the sound. If then we know the distance of the place, and know the time of the interval between our first seeing the fire and then hearing the report, this will shew us exactly the time the sound has been travelling to us. For instance, if the gun is discharged a mile off, the moment the flash is seen, you take a watch and count the seconds till you hear the sound; the number of seconds is the time the sound has been travelling a mile.—Again, by the above axiom, we are enabled to find the distance between objects that would be otherwise immeasurable. For example, suppose you see the flash of a gun in the night at sea, and tell seven seconds before you hear the report, it follows therefore, that the distance is seven times 1142 feet, that is, 24 yards more than a mile and a half. In like manner, if you observe the number of seconds between the lightning and the report of the thunder, you know the distance of the cloud from whence it proceeds.

stances calculated means of ind.

16 sounds travel at the rate.

Derham has proved by experience, that all sounds whatever travel at the same rate. The sound of a gun, and the striking of a hammer, are equally swift in their motions; the softest whisper flies as swiftly, as far as it goes, as the loudest thunder.

To these axioms we may add the following.

Smooth and clear sounds proceed from bodies that are homogeneous, and of a uniform figure; and harsh or obtuse sounds, from such as are of a mixed matter and irregular figure.

The velocity of sound is to that of a brisk wind as fifty to one.

The strength of sounds is greatest in cold and dense air, and least in that which is warm and rarefied.

In all sounds, the angle of incidence is equal to that of reflection; that is, if a line be drawn perpendicular to the reflecting surface, the point from which the sound issues, and that to which it is reflected, will be equally distant from the perpendicular line.

CHAP. III. Of Reverberated Sounds.

SOUND, like light, after it has been reflected from several places, may be collected in one point, as into a focus; and it will be there more audible than in any other part, even than at the place from whence it proceeded. On this principle it is that a whispering gallery is constructed.

The form of this gallery must be that of a concave hemisphere (E), as ABC; and if a low sound or whisper be uttered at A, the vibrations expanding themselves

every way will impinge on the points DDD, &c. and from thence be reflected to EEE, and from thence to the points F and G, till at last they all meet in C, where, as we have said, the sound will the most distinctly heard.

Reverberated Sounds.

Upon this principle also it is that the speaking trumpet is formed. For the sound, in passing through the long and narrow part of the tube, is continually reflected from its curved side into the axis, and by that means is prevented from spreading till at its exit from the tube, whereby the strength of the sound is greatly increased. To the augmentation of the sound, the condensation of the air in the tube (by n^o 19.) likewise contributes.

26 Speaking-trumpet.

But to illustrate this more particularly: Let ABC be the tube, BD the axis, and B the mouth-piece for conveying the voice to the tube. Then it is evident, when a person speaks at B in the trumpet, the whole force of his voice is spent upon the air contained in the tube, which will be agitated through the whole length of the tube; and, by various reflections from the side of the tube to the axis, the air along the middle part of the tube will be greatly condensed, and its *momentum* proportionably increased, so that when it comes to agitate the air at the orifice of the tube AC, its force will be as much greater than what it would have been without the tube, as the surface of a sphere, whose radius is equal to the length of the tube, is greater than the surface of the segment of such a sphere whose base is the orifice of the tube. For a person speaking at B, without the tube, will have the force of his voice spent in exciting concentric superficies of air all around the point B; and when those superficies or pulses of air are diffused as far as D every way, it is plain the force of the voice will there be diffused through the whole superficies of a sphere whose radius is BD; but in the trumpet it will be so confined, that at its exit it will be diffused through so much of that spherical surface of air as corresponds to the orifice of the tube. But since the force is given, its intensity will be always inversely as the number of particles it has to move; and therefore in the tube it will be to that without, as the superficies of such a sphere to the area of the large end of the tube nearly.—To make this matter yet plainer by calculation: Let BD = 5 feet, then will the diameter of the sphere DE = 10 feet, the square of which is 100, which multiplied by 0,7854, gives 78,54 square feet for the area of a great circle BHEFC; and therefore four times that area, viz. 4X78,

Fig. 4.

54 = 314,16 = square feet in the superficies of the aerial sphere. If now the diameter AC of the end of a trumpet be one foot, its area will be 0,7854; but, 7855 : 314,16 :: 1 : 400; therefore the air at the distance of BD will be agitated, by means of the trumpet, with a force 400 times greater than by the voice alone.—It must, however, be observed, that the more sonorous and audible the voice is made by this means, the less articulate or distinct it is: just as light, to which sound bears in many things a pretty near resemblance, the more it is diffused, the less will it distinguish the objects whereon it falls; and the more it is condensed, the brighter and more distinct will the objects it is thrown on always appear.

For

(E) A cylindric or elliptic arch will answer still better than one that is circular.

Reverberated
Sounds.

2d 26
Auricular
Tube.

For a contrary reason, the auricular tube, here represented, affords such as are hard of hearing, when not occasioned by the humours becoming inspissated by cold, &c. and the obstructions consequent thereon: in which case, this machine can be of little service; washing out the wax does much better. But when the organ itself is by age enfeebled and decayed, that is, when the acoustic as well as other nerves have lost their delicacy, this tube may be of real use and service in rendering sounds more distinct and audible.—This machine then seems to be just the reverse of the stentoraphonic tube, or the speaking-trumpet just mentioned; as the use of that is to dissipate, this is intended to collect, the rays of sound. With regard to the structure of it, the base is best made in form of the parabolic curve, finishing at top with a small bent tube, that it may more conveniently be applied to the ear. It does thus in some measure resemble the auditory duct, or the inner ear itself, which is also something conical, having the base outward, and the apex next the head; that so a larger quantity of the moved air may be collected, received, and thereby transmitted to the point of the auditory nerve, which must be shaken to produce hearing and give this kind of perception. So that this contrivance is in effect no more than the base of the ear enlarged, and therefore capable of intercepting more of the rays of sound than the ear alone, and that in proportion to its base; and these being gradually contracted into the smaller end, are thence thrown upon the tympanum, and affect the inner ear according to the force and quantity of the impression received. The smoothness of these machines is no small advantage to the conveyance of sounds through them; for by experiment we know, that these always glide with most ease, and move the farthest, over smooth surfaces, where there is nothing to obstruct and divert their progress, or to occasion a rebound.

27
Echoes. An echo is a reflection of sound striking against some object, as an image is reflected in a glass: but it has been disputed what are the proper qualities in a body for thus reflecting sounds. It is in general known, that caverns, grottoes, mountains, and ruined buildings, return this image of sound. Image we may call it, for in every respect it resembles the image of a visible object reflected from a polished surface. Our figures are often represented in a mirror, without seeing them ourselves, while those standing on one side are alone sensible of the reflection. To be capable of seeing the reflected image of ourselves, we must be directly in a line with the image. Just so it is in an echo; we must stand in the line in which the sound is reflected, or the repetition will be lost to us, while it may, at the same time, be distinctly heard by others who stand at a small distance to one side of us. We have heard of a very extraordinary echo, at a ruined fortress near Louvain, in

Flanders. If a person sung, he only heard his own voice, without any repetition: on the contrary, those who stood at some distance, heard the echo but not the voice; but then they heard it with surprising variations, sometimes louder, sometimes softer, now more near, then more distant. There is an account in the memoirs of the French academy, of a similar echo near Rouen.

As (by n° 20) the angle of reflected sound is equal to that of its incidence, if we know the point from which any sound proceeds, and the place from which it is reflected, we may easily find the point in which its echo will be heard. To hear the echo of one syllable, we must be at the distance of 120 feet from the reflecting surface; for two syllables, 240 feet; for three syllables, 360 feet, &c. For when we speak distinctly, we scarce pronounce more than three syllables, or three and a half, in a second; and as (by n° 13,) sound goes 1142 feet in a second, if the distance between the speaker and the reflecting surface were less than 360 feet, the first syllable would be returned before the last was pronounced (P), and therefore the echo could not be distinctly heard. The echo in Woodstock Park is said to return 17 syllables in the day, and 20 in the night; for then the air being colder and denser, (by n° 19) the strength of the sound must be greater. From hence we may determine, nearly, the distance of an object that is inaccessible; for if an echo of 10 syllables be reflected from the side of a church or tower, it follows, from what has been said, that the object must be 1200 feet distant.

The same sound may have several echoes, if there be several reflecting surfaces so disposed as to make it reverberate to the same point. Thus a violin, or other instrument, when sounded in a room where there are several arches of the same form, will sound like a number of violins of the same size playing in concert: or if the arches be of different forms, there will seem to be different instruments playing the same tune.

We shall dismiss this article with a few inventions founded on some of the preceding principles, which may amuse a number of our readers.

Entertaining Experiments and Contrivances.

PLACE a concave mirror of about two feet diameter, as A B (c), in a perpendicular direction. The focus of this mirror may be at 15 or 18 inches distance from its surface. At the distance of about five or six feet let there be a partition, in which there is an opening E F, equal to the size of the mirror; against this opening must be placed a picture, painted in water-colours, on a thin cloth, that the sound may easily pass through it (h).

Behind the partition, at the distance of two or three feet, place another mirror G H, of the same size as the former,

(P) According to n° 13, the distance should be 380 feet; for the first syllable must go as far as is equal to the time the two last syllables are pronouncing, that is, two-thirds of a second; therefore the distance should be equal to two-thirds of 1142 feet, or 760, that is, 380, going and coming. But as some time must be allowed for the reflecting surface to be made to vibrate by the impinging sound, the first distance, 360 feet, will be very near the truth.

(G) Both the mirrors here used may be of tin or gilt pasteboard, this experiment not requiring such as are very accurate.

(H) The more effectually to conceal the cause of this illusion, the mirror A B may be fixed in the wainscot, and a gauze or any other thin covering thrown over it, as that will not in the least prevent the sound from being reflected. An experiment of this kind may be performed in a field or garden, between two hedges, in one of which the mirror A B may be placed, and in the other an opening artfully contrived.

Entertaining
Experiments,
&c.

28
I. The Con-
servative Sta-
tion. III.
fig. 5.

Entertain-
ing Experi-
ments, &c.

former, and let it be diametrically opposite to it.

At the point C let there be placed the figure of a man seated on a pedestal, and let his ear be placed exactly in the focus of the first mirror: his lower jaw must be made to open by a wire, and shut by a spring; and there may be another wire to move the eyes: these wires must pass through the figure, go under the floor, and come up behind the partition.

Let a person, properly instructed, be placed behind the partition near the mirror. You then propose to any one to speak softly to the statue, by putting his mouth to the ear of it, assuring him that it will answer instantly. You then give the signal to the person behind the partition, who, by placing his ear to the focus I, of the mirror G H, will hear distinctly what the other said; and, moving the jaw and eyes of the statue by the wires, will return an answer directly, which will in like manner be distinctly heard by the first speaker.

Remark. This experiment appears to be taken from the Century of Inventions of the Marquis of Worcester; whose designs, at the time they were published, were treated with ridicule and neglect as being impracticable, but are now known to be generally, if not universally, practicable. The words of the Marquis are these: "How to make a brazen or stone head in the midst of a great field or garden, so artificial and natural, that though a man speak ever so softly, and even whisper into the ear thereof, it will presently open its mouth, and resolve the question in French, Latin, Welsh, Irish or English, in good terms, uttering it out of its mouth, and then shut it until the next question be asked."—The two following, of a similar nature, appear to have been inventions of Kircher, by means of which (as he informs us *) he used to "utter feigned and ludicrous consultations, with a view to shew the fallacy and imposture of ancient oracles."

II. LET there be two heads of plaster of Paris, placed on pedestals, on the opposite sides of a room. There must be a tin tub of a inch diameter, that must pass from the ear of one head, through the pedestal, under the floor, and go up to the mouth of the other. Observe, that the end of the tube which is next the ear of the one head, should be considerably larger than that end which comes to the mouth of the other. Let the whole be so disposed that there may not be the least suspicion of a communication.

Now, when a person speaks, quite low, into the ear of one bust, the sound is reverberated thro' the length of the tube, and will be distinctly heard by any one who shall place his ear to the mouth of the other. It is not necessary that the tube should come to the lips of the bust.—If there be two tubes, one going to the ear, and the other to the mouth, of each head, two persons may converse together, by applying their mouth and ear reciprocally to the mouth and ear of the busts; and at the same time other persons that stand in the middle of the chamber, between the heads, will not hear any part of their conversation.

III. PLACE a bust on a pedestal in the corner of a room, and let there be two tubes, as in the foregoing amusement, one of which must go from the mouth and the other from the ear of the bust, through the pedestal, and the floor, to an under apartment. There may be likewise wires that go from the under jaw and the eyes

of the bust, by which they may be easily moved.

A person being placed in the under room, and at a signal given applying his ear to one of the tubes, will hear any question that is asked, and immediately reply; moving at the same time, by means of the wires, the mouth and the eyes of the bust, as if the reply came from it.

IV. In a large cave, such as is used for dials and spring-clocks, the front of which, or at least the lower part of it, must be of glass, covered on the inside with gauze, let there be placed a barrel-organ, which, when wound up, is prevented from playing, by a catch that takes a toothed wheel at the end of the barrel. To one end of this catch there must be joined a wire, at the end of which there is a flat circle of cork, of the same dimension with the inside of a glass tube, in which it is to rise and fall. This tube must communicate with a reservoir that goes across the front part of the bottom of the cave, which is to be filled with spirits, such as is used in thermometers, but not coloured, that it may be the better concealed by the gauze.

This cave being placed in the sun, the spirits will be rarefied by the heat; and, rising in the tube, will lift up the catch or trigger, and let the organ in play: which it will continue to do as long as it is kept in the sun; for the spirits cannot run out of the tube, that part of the catch to which the circle is fixed being prevented from rising beyond a certain point by a check placed over it.

When the machine is placed against the side of a room on which the sun shines strong, it may constantly remain in the same place, if you inclose it in a second cave, made of thick wood, and placed at a little distance from the other. When you want it to perform, it will be only necessary to throw open the door of the outer cave, and expose it to the sun.

But if the machine be moveable, it will perform in all seasons by being placed before the fire; and in the winter it will more readily stop when removed into the cold.

A machine of this sort is said to have been invented by Cornelius Dreble, in the last century. What the construction of that was, we know not; it might very likely be more complex, but could scarce answer the intention more readily.

V. UNDER the keys of a common harpsichord let there be fixed a barrel, something like that in a chamber organ, with stops or pins corresponding to the tunes you would have it play. These stops must be moveable, so that the tunes may be varied at pleasure. From each of the keys let there go a wire perpendicular down: the ends of these wires must be turned up for about one-fourth of an inch. Behind these wires let there be an iron bar, to prevent them from going too far back. Now, as the barrel turns round, its pins take the ends of the wires, which pull down the keys, and play the harpsichord. The barrel and wires are to be all inclosed in a case.

In the chimney of the same room where the harpsichord stands, or at least in one adjacent, there must be a smoke jack *, from whence comes down a wire, or cord, that, passing behind the waincoat adjoining the chimney, goes under the floor, and up one of the legs of the harpsichord, into the case, and round a small wheel fixed on the axis of that first mentioned. There should be pulleys at different distances, behind the wain-

foot and under the floor, to facilitate the motion of the chord.

This machinery may be applied to any other keyed instrument, as well as to chimes, and to many other purposes where a regular continued motion is required.

An instrument of this sort may be considered as a perpetual motion, according to the vulgar acceptance of the term; for it will never cease going till the fire be extinguished, or some parts of the machinery be worn out.

33
A Ventofal
Symphony.
Plate III.
fig. 6.

VI. At the top of a summer-house, or other building, let there be fixed a vane AB, on which is the pinion C, that takes the toothed wheel D, fixed on the axis EF, which at its other end carries the wheel G, that takes the pinion H. All these wheels and pinions are to be between the roof and the ceiling of the building. The pinion H is fixed to the perpendicular axis IK, which goes down very near the wall of the room, and may be covered after the same manner as are bell-wires. At the lower end of the axis IK there is a small pinion L,

that takes the wheel M, fixed on the axis of the great wheel NO. In this wheel there must be placed a number of stops, corresponding to the tunes it is to play. These stops are to be moveable, that the tunes may be altered at pleasure. Against this wheel there must hang twelve small bells, answering to the notes of the gamut. Therefore, as the wheel turns round, the stops striking against the bells, play the several tunes. There should be a fly to the great wheel, to regulate its motion when the wind is strong. The wheel NO, and the bells, are to be inclosed in a case.

Entertain-
ing Experi-
ments, &c.

There may be several sets of bells, one of which may answer to the tenor, another to the treble, and a third to the bass; or they may play different tunes, according to the size of the wheel. As the bells are small, if they are of silver, their tone will be the more pleasing.

Instead of bells, glasses may be here used, so disposed as to move freely at the stroke of the stops. This machinery may likewise be applied to a barrel-organ; and to many other uses.

Acqs
||
Acquittance

A C Q. ACQS, a town at the foot of the Pyrenean mountains, in the government of Foix in France. It takes its name from the hot waters in these parts. E. long. 1. 40. lat. 43. 0.

ACQUA-CHE-TAVELLA, a celebrated fountain of Italy, in Calabria Citerior, a province of Naples. It is near the mouth of the river Crata, and the ruins commonly called *Sihari Rovinata*. It has been said to beautify those who washed in it.

AQUAPENDENTE, a pretty large town of Italy, in the territory of the church, and patrimony of St Peter, with a bishop's see. It is situated on a mountain, near the river Paglia, ten miles W. of Orvieto, and 57 N. by W. of Rome. E. long. 11. 53. lat. 42. 43.

ACQUARIA, a small town of Italy, in Frigiana, a district of Modena, which is remarkable for its medicinal waters. It is twelve miles south of the city of Modena. E. long. 11. 17. lat. 44. 24.

ACQUEST, or ACQUIST, in law, signifies goods got by purchase or donation. See CONQUEST.

ACQUI, a town of Italy, in the duchy of Montserrat, with a bishop's see, and commodious baths. It was taken by the Spaniards in 1745, and retaken by the Piedmontese in 1746; but after this, it was taken again and dismantled by the French, who afterwards forsook it. It is situated on the river Bormio, 25 miles N. W. of Genoa, and 30 S. of Casal. E. long. 8. 30. lat. 44. 40.

ACQUISITION, in general, denotes the obtaining, or procuring something. Among lawyers, it is used for the right or title to an estate got by purchase or donation.

ACQUITTAL, a discharge, deliverance, or setting of a person free from the guilt or suspicion of an offence.

ACQUITTANCE, a release or discharge in writing for a sum of money, witnessing that the party has paid the said sum.—No man is obliged to pay a sum of money if the demandant refuses to give an acquittance, which is a full discharge, and bars all actions, &c. An acquittance given by a servant for a sum of money received for the use of his master, shall be a good dis-

A C R

charge for that sum, provided the servant used to receive his master's rents, debts, &c.

ACRA, a town of Africa, on the coast of Guinea, where the English, Dutch, and Danes, have strong forts, and each fort its particular village. W. long. 0. 2. lat. 5. 0.

ACRA, (Josephus); one of the hills of Jerusalem, on which stood the lower town, which was the Old Jerusalem; to which was afterwards added Zion, or the city of David. Probably called *Aera*, from the fortrefs which Antiochus built there, in order to annoy the temple, and which Simon Maccabeus took and razed to the ground.

ACRA JAPYGIA, (Pliny); *Salentina*, (Ptolemy); now *Capo di San Maria di Leuca*; a promontory in the kingdom of Naples, to the south-east of Otranto, where formerly was a town, now lying in ruins, on the Ionian sea, over against the Montes Acroceranii of Epirus.

ACRÆ, in the ancient geography, a town of Sicily, whose inhabitants were called *Acerenses*. It stood to the south of Syracuse at the distance of 24 miles, near the place now called the monastery of *Santa Maria d'Arcia*, on an eminence, as appears from Silius Italicus. The Syracusans were the founders of it, according to Thucydides, 70 years after the building of Syracuse, or 665 before Christ. Hence the epithet *Acræus*.

ACRAGAS, or AGRAGAS, (anc. geogr.) so called by the Greeks, and sometimes by the Romans (Virgil); but more generally *Agrigentum* by the latter; a town of Sicily. In Greek medals the inhabitants are called *AKPIFANTINOI*, and *Agrigentini* by Cicero. The town stood upon a mountain, at the confluence of the Acragas and Hypsæ, near the port called *Eutopov* by Ptolemy, but *Erivov*, or the Dock, by Strabo; and in the time of the latter, scarce a trace of all that side remained. In the year before Christ 584, the people of Gela built Acragas, 108 years after building their own city. It took its name from the river running by it; and being but two miles from, enjoyed all the conveniences that could come by, the sea. It was a place of great strength, standing on the top of a very steep rock, and washed

washed on the fourth side by the river Acragas, now called *Fiume di Gergenti*, and on the fourth-west by the Hypia, with a citadel to the fourth-east, externally surrounded by a deep gulf, which made it inaccessible but on the side next the town. It was famous for the tyrant Phalaris and his brazen bull. They were a people luxurious in their tables, and magnificent in their dwellings; of whom Empedocles, in Diogenes Laertius, says, that they lived to-day as if they were to die to-morrow, and built as if they were to live for ever. The country round the city was laid out in vine and olive yards, in the produce of which they carried on a great and profitable commerce with Carthage. E. long. 13. 30. lat. 37. 20.

ACRASIA, among physicians, implies the predominancy of one quality above another, either with regard to artificial mixtures, or the humours of the human body. The word is Greek, and compounded of α , priv. and $\kappa\rho\alpha\sigma\iota\varsigma$ to mix; q. d. not mixed in a just proportion.

ACRATH, (anc. geog.) a place in Mauritania Tingitana, (Ptolemy;) now supposed to be *Velez de Gomarra*; a fortified town in the kingdom of Fez, with a citadel and commodious harbour on the Mediterranean, scarce a mile distant from Penon de Velez, a Spanish fort. W. long. 5. lat. 34. 45.

ACRE, or ACRA, a sea-port town in Syria. It was formerly called *Ptolemais*, and is a bishop's see. It was very famous in the time of the crusades, and underwent several sieges both by the Christians and Saracens. It is now an inconsiderable town, being entirely supported by its harbour, which is frequented by ships of several nations. It is 20 miles S. of Tyre, and 37 N. of Jerusalem. E. long. 39. 25. lat. 32. 40.

ACRE, in the Mogul's dominions, the same with lack, and signifies the sum of 100,000 rupees; the rupee is of the value of the French crown of 3 livres, or 30 sols of Holland; an 100 lacks of rupees make a courou in Indostan, or 10,000,000 rupees: the pound Sterling is about eight rupees; according to which proportion, a lack of rupees amounts to 12,500 pounds Sterling.

ACRE, a measure of land used in several provinces of France, particularly Normandy. It is larger or less according to the different places; but commonly contains 160 perches.

The *ACRE of woods in France*, consists of four roods, called *vergues*; the rood is 40 perches, the perch 24 feet, the foot 12 inches, the inch 12 lines.

ACRE, the universal measure of land in Britain. An acre in England contains four square roods, a rood 40 perches or poles of 16½ feet each by statute. Yet this measure does not prevail in all parts of England, as the length of the pole varies in different counties, and is called *customary measure*, the difference running from the 16½ feet to 28. The acre is also divided into 10 square chains, of 22 yards each, that is 4840 square yards. An acre in Scotland contains 4 square roods; one square rood is 40 square fells; one square fell, 36 square ells; one square ell, nine square feet and 73 square inches; one square foot, 144 square inches. The Scots acre is also divided into 10 square chains; the measuring chain should be 24 ells in length, divided into 100 links, each link 8 $\frac{1}{2}$ inches; and so one square chain will contain 10,000 square links. The English statute-acre is about three roods and six fells

standard measure of Scotland.

The word (formed from the Saxon *acher*, or the German *aker*, a field), did not originally signify a determined quantity of land, but any open ground, especially a wide champaign; and, in this antique sense, it seems to be preserved in the names of places, as Castle-acre, Weit-acre, &c.

ACRIBEIA, a term purely Greek, literally denoting an exquisite or delicate accuracy; sometimes used in our language for want of a word of equal signification.

ACRID, a name for any thing that is of a sharp or pungent taste.

ACRIDS, in the Materia Medica. See there, n° 25, &c.

ACRIDOPHAGI, in the ancient geography; an Ethiopian people, represented as inhabiting near the deserts, and to have fed on locusts. This latter circumstance their name imports; the word being compounded of the Greek $\alpha\kappa\rho\iota\varsigma$ locusts, and $\phi\alpha\gamma\epsilon\iota$ to eat. We have the following account of them by Diodorus Siculus*. Their stature was lower than that of other men; they were meagre, and extremely black. In the spring, high west winds drove from the desert to their quarter locusts of an extraordinary size, and remarkable for the squalid colour of their wings. So great was the number of these insects, that they were the only sustenance of the barbarians, who took them in the following manner: At the distance of some stadia from their habitations there was a wide and deep valley. They filled this valley with wood and wild herbs, with which their country abounded. When the cloud of locusts appeared, which were driven on by the wind, they set fire to the fuel which they had collected. The smoke which arose from this immense fire was so thick, that the locusts, in crossing the valley, were stifled by it, and fell in heaps on the ground. The passage of the locusts being thus intercepted for many days, they made a large provision of those insects. As their country produced great quantities of salt, they salted them, to render them more palatable, and to make them keep till the next season. This peculiar supply was their sole food; they had neither herds nor flocks. They were unacquainted with fishing; for they lived at a distance from the sea. They were very active, and ran with great swiftness. But their life was not of long duration; it exceeded not forty years. The close of their life was extremely miserable; for in their old-age, winged lice of different, but all of ugly forms, bred in their bodies. This malady, which began in the breast and belly, soon spread through the whole frame. The patient at first felt an itching; and the agreeable sensation produced by his scratching of himself, preceded a most deplorable calamity. For when those lice, which had bred in his body, forced their way out, they caused effusions of corrupt blood, with excruciating pains in the skin. The unhappy man, with lamentable cries, was industrious himself to make passages for them with his nails. In short, these lice issued forth successively from the wounds made by the hands of the patient, as from a vessel full of holes, and in such numbers that it was impossible to exterminate them.—Whether this extraordinary and dreadful distemper was occasioned by the food of the inhabitants of this country, or by a pestilential quality of their climate, it is difficult to determine. Indeed, as to the

* Lib. iii.
& xxxix.
Also Strabo,
lib. xvi.

Acridophagi
||
Acroamati-
ci.

credibility of the whole account, we must leave the reader to judge.—But though the circumstances of these people should be deemed fabulous, yet may the *acridophagia* be true. It is well known, that to this day the inhabitants of Ethiopia, Arabia, &c. frequently use locusts as food. The reader will not be displeased if we lay before him the result of Dr Haffelquist's inquiries as to this particular, who travelled in Syria and Egypt so late as the year 1752. This ingenious gentleman, who travelled with a view to improve natural history, informs us, that he asked Franks, and many other people who had lived long in these countries, whether they had ever heard that the inhabitants of Arabia and Ethiopia, &c. used locusts as food. They answered that they had. He likewise asked the same question of Armenians, Coptes, and Syrians, who lived in Arabia, and had travelled in Syria and near the Red-sea; some of whom said they heard of such a practice, and others that they had often seen the people eat these insects. He at last obtained complete satisfaction on this head from a learned sheik at Cairo, who had lived six years in Mecca. This gentleman told him, in presence of M. le Grand the principal French interpreter at Cairo, and others, that a famine frequently rages at Mecca when there is a scarcity of corn in Egypt, which obliges the inhabitants to live upon coarser food than ordinary: That when corn is scarce, the Arabians grind the locusts in hand-mills, or stone-morts, and bake them into cakes, and use these cakes in place of bread: That he has frequently seen locusts used by the Arabians, even when there was no scarcity of corn; but then they boil them, stew them with butter, and make them into a kind of fricassée, which he says is not disagreeably tasted, for he had sometimes tasted these locust-fricassées out of curiosity. From this account, we may see the folly of that dispute among divines about the nature of St John's food in the wilderness: some maintaining the original word to signify the fruits of certain trees; others, a kind of birds, &c.: but those who adhered to the literal meaning of the text were at least the most orthodox, although their arguments were perhaps not so strong as they might have been, had they had an opportunity of quoting such an author as Haffelquist.

ACRIMONY, that quality in bodies which renders them acrid to the taste.

Morbific ACRIMONY. See **MEDICINE**, n° 127,—132, and 263.

ACRISIUS, king of Argos, (fab. hist.) being told by the oracle he that should be killed by his grandchild, shut up his only daughter Danaë in a brazen tower: but Jupiter coming down in a golden shower, begot Perseus upon her: after Perseus had slain the Gorgons, he carried Medusa's head to Argos; which Acrisius seeing, was turned into a statue.

ACRITAS, (anc. geogr.) a promontory of Messenia, near Methone, (Ptolemy); running into the sea, and forming the beginning of the bay of Messene. Now called *Capo di Gallo*, between Methone to the west, and Corone to the east, where the Sinus Coronæus begins.

ACRIVIOLA. See **TROPOEOLUM**.

ACROAMATIC, or **ACROATIC**, in general, denotes a thing sublime, profound, or abstruse.

ACROAMATICI, a denomination given the disci-

Acroatic
||
Acron.

ples or followers of Aristotle, &c. who were admitted into the secrets of the inner or acroamatic philosophy.

ACROATIC. Aristotle's lectures to his disciples were of two kinds, *exoteric* and *acroatic*. The acroatic were those, to which only his own disciples and intimate friends were admitted; whereas the exoteric were public and open to all. But there are other differences. The acroatic were set apart for the higher and more abstruse subjects; the exoteric were employed in rhetorical and civil speculations. Again, the acroatics were more subtle and exact, evidence and demonstration being here aimed at; the exoterics chiefly aimed at the probable and plausible. The former were the subject of the mornings exercises in the Lyceum, the latter of the evenings. Add, that the exoterics were published: whereas the acroatics were kept secret; being either entirely concealed; or if they were published, it was in such obscure terms, that few but his own disciples would be the wiser for them. Hence, when Alexander complained of his preceptor for publishing his acroatics, and thus revealing what should have been reserved to his disciples, Aristotle answered, that they were made public and not public; for that none who had not heard them explained by the author *viva voce*, would understand them.

ACROATHOUM, or **ACROTHOUM**, (anc. geogr.) a town situated on the top of mount Athos, where the inhabitants, according to Mela, were longer lived by half than in any other country: called by the modern Greeks, *Αγίου ορος*; by the Italians, *La Cima di Monte Santo*.

ACROCERAUNIA, or **MONTES CERAUNI**, (anc. geogr.) mountains running out into the sea, (so called from their being often thunder-struck); separating the Ionian sea from the Adriatic; where Illyria ends and Epirus begins, (Horace): now called *Monti della Ghibera*.

ACROCORINTHUS, (anc. geogr.) a high and steep hill, hanging over the city of Corinth, which was taken within the walls, as an acropolis, or citadel. On its top stood a temple of Venus; and lower down issued the fountain Pyrene, yielding not a plentiful, but a clear stream of water, (Pliny.)

ACROMION, in anatomy, the upper part of the scapula. See **ANATOMY**, n° 45, 46.

ACROMONOGRAMMATICUM, in poetry, a kind of poem, wherein every subsequent verse begins with the letter wherewith the immediately preceding one terminated.

ACRON, a celebrated physician of Agrigentum, who first thought of lighting large fires, and purifying the air with perfumes, to put a stop to the pestilence that ravaged Athens, and which was attended with success. He lived about four hundred and seventy three years before the Christian æra.

ACRON, a territory on the gold-coast of Guinea, in Africa, bordering on the Fantynen country. The Dutch have a fort here, called Fort Patience; and under it is a village, inhabited only by fishermen. The other inhabitants are addicted to husbandry, and sell their corn to other countries. There is plenty of game, which is very commodious for the Dutch factory. The people are very ignorant, and go naked like the rest of the negroes. This is called Little Acron; for Great Acron

Acronical
Acroflilum.

Acroflilum
Adis.

Acron is farther inland, and is a kind of a republic.

ACRONICAL, **ACHRONICAL**, or **ACHRONICAL**, in astronomy, is a term applied to the rising of a star, when the sun is set in the evening; but has been promiscuously used to express a star's rising at sunset, or setting at sunrise.

ACROPOLIS, (anc. geogr.) the citadel, and one of the divisions, of Athens; called *Polis*, because constituting the first and original city; and the *Upper Polis*, to distinguish it from the Lower, which was afterwards built round it in a large open plain, the Acropolis standing on a rock or eminence in the heart of this plain; and hence its name: (Pausanias). To the north it had a wall, built by the Pelasgi, and therefore called *Pelasgic*; and to the south a wall, by Cymon the son of Miltiades, out of the Persian spoils, many ages after the building of the north wall, (Plutarch). It had nine gates, and was therefore called *Enneapylon*; yet but one principal gate or entrance, the access to which was by a flight of steps of white marble, built by Pericles with great magnificence, (Plutarch).

ACRÓPOLITA (George), one of the writers of the Byzantine history, was born at Constantinople, in the year 1220, and brought up at the court of the emperor John Ducas at Nice. He was employed in the most important affairs of the empire; being sent ambassador to Larissa, to establish a peace with Michael of Epirus; and was constituted judge to try Michael Comnenus, suspected of engaging in a conspiracy. Theodorus Lascaris, the son of John, whom he had taught logic, appointed him governor of all the western provinces in his empire. In 1255, he was taken prisoner in a war with Michael Angelus; but gaining his liberty in 1260, by means of the emperor Palæologus, he was sent by him ambassador to Constantine prince of Bulgaria; and was employed in several other negotiations. He wrote, *A Continuation of the Greek History*, from the taking of Constantinople by the Latins, till it was recovered by Michael Palæologus in 1261, which makes part of the Byzantine history; *A Treatise concerning Faith, Virtue, and the Soul*; *An Exposition upon the Sermons of St Gregory Nazianzen*; and other pieces. Gregory Cyprian, patriarch of Constantinople, in his encomium upon him, prefixed to *Acropolita's* history, is perhaps somewhat extravagant in his praise, when he says he was equal to Aristotle in philosophy, and to Plato in the knowledge of divine things and Attic eloquence.

ACROSPIRE, a vulgar term for what botanists call the *plume*. See *PLANTS*, n° 5.

ACROSPIRED, in malt-making, is the grain's shooting both at the root and blade end.

ACROSTIC, in poetry, a kind of poetical composition disposed in such a manner, that the initial letters of the verses form the name of some person, kingdom, place, motto, &c. The word is compounded of the Greek *akros* extremity, and *stichos* verse. The acrostic is considered by the critics as a species of false wit, and is therefore very little regarded by the moderns.

ACROSTICUM, or **RUSTYBACK**, in botany, a genus of the cryptogamia filices, of which there are 30 species, but only three of them natives of Britain, viz. the septentrionale, or horned fern, which grows on walls or cliffs of rocks; the ilvense, or hairy fern, grow-

ing in cliffs of rocks; and the thelypteris, or marsh-fern, in turfey bogs.

ACROSTOLIUM, in ancient naval architecture, the extreme part of the ornament used on the prows of their ships, which was sometimes in the shape of a buckler, helmet, animal, &c.; but more frequently circular, or spiral. It was usual to tear them from the prows of vanquished vessels, and fix them to the conquerors, as a signal of victory.

ACROTELEUTIC, among ecclesiastical writers, an appellation given to any thing added to the end of a psalm; as the *Gloria Patri*, or *Doxology*.

ACROTHERIA, in architecture, small pedestals, usually without bases, anciently placed at the middle or two extremes of pediments or frontispieces, serving to support the statues, &c. It also signifies the figures placed as ornaments on the tops of churches, and the sharp pinnacles that stand in ranges about flat buildings with rails and ballusters.

Among ancient physicians, it signified the larger extremities of the body, as the head, hands, and feet. It has also been used for the tips of the fingers, and sometimes for the eminences or processes of bones.

ACROTHYMION, from *akros* extreme, and *thymos* thyme. A sort of wart described by Celsus, as hard, rough, with a narrow basis, and broad top; the top is of the colour of thyme, it easily splits and bleeds. This tumour is also called *thymus*.

ACSOR, a town in the river Nile in Egypt, famed for its earthen ware.

ACT, in general, denotes the exertion of power; and differs from power, as the effect from the cause.

Act, in logic, is particularly understood of an operation of the human mind. Thus to discern and examine, are acts of the understanding; to judge and affirm, are acts of the will. There are voluntary and spontaneous acts; the former are produced by the operation of the soul, the latter without its privity or participation.

Act, in the universities, signifies a thesis maintained in public by a candidate for a degree, or to shew the capacity and proficiency of a student. The candidates for a degree of bachelor and master of arts are to hold philosophical Acts; and those for bachelor of divinity, theological Acts, &c. At Oxford, the time when masters or doctors complete their degrees is also called the *act*; which is held with great solemnity. At Cambridge, they call it the *commencement*.

Act, among lawyers, is an instrument in writing for declaring or justifying the truth of any thing. In which sense, records, decrees, sentences, reports, certificates, &c. are called *acts*.

Acts, also denote the deliberations and resolutions of an assembly, senate, or convention; as acts of parliament, &c. Likewise matters of fact transmitted to posterity in certain authentic books and memoirs.

Acts of the senate, (*Acta Senatus*), among the Romans, were minutes of what passed and was debated in the senate-house. These were also called *Commentarii*, and by a Greek name *νεμεσιπαια*. They had their origin in the consulship of Julius Cæsar, who ordered them both to be kept and published. The keeping them was continued under Augustus, but the publication was abrogated. Afterwards all writings, relating to the decrees or sentences of the judges, or what passed

AAs.

and was done before them, or by their authority, in any cause, were also called by the name *Acta*: In which sense we read of civil acts, criminal acts, intervention acts; *acta civilia, criminalia, interventoria, &c.*

Acts of the people, (*Acta Populi*), among the Romans, were journals or registers of the daily occurrences; as assemblies, trials, executions, buildings, births, marriages, deaths, &c. of illustrious persons, and the like. These were otherwise called *Acta Publica*, and *Acta Diurna*, or simply *Acta*. The *Acta* differed from Annals, in that only the greater and more important matters were in the latter, and those of less note were in the former. Their origin is attributed to Julius Cæsar, who first ordered the keeping and making public the acts of the people. Some trace them higher, to Servius Tullius; who, to discover the number of persons born, dead, and alive, ordered that the next of kin, upon a birth, should put a certain piece of money into the treasury of Juno Lucina; upon a death, into that of Venus Libitina: the like was also to be done upon assuming the toga virilis, &c. Under Marcus Antoninus, this was carried further: persons were obliged to notify the births of their children, with their names, and surnames, the day, consul, and whether legitimate or spurious, to the prefects of the *Ærarium Saturni*, to be entered in the public acts; though before this time the births of persons of quality appear to have thus been registered.

* See
Diplomatics.

Public Acts. The knowledge of public acts forms part of a peculiar science, called the *diplomatic**, of great importance to an historian, statesman, chronologer, and even critic. The preservation of them was the first occasion of erecting libraries. The style of acts is generally barbarous Latin. Authors are divided as to the rules of judging of their genuineness, and even whether there be any certain rules at all. F. Germon will have the greater part of the acts of former ages to be spurious. Pontanini asserts, that the number of forged acts now extant is very small. It is certain there were severe punishments inflicted on the forgers and falsifiers of acts.—The chief of the English acts, or public records, are published by Rymer, under the title of *Fœdera*, and continued by Saunderson; an extract whereof has been given in French by Rapin, and translated into English under the title of *Acta Regia*. Great commendations have been given this work: also some exceptions made to it; as that there are many spurious acts, as well as errors, in it; some have even charged it with falsifications.—The public acts of France fell into the hands of the English after the battle of Poitiers, and are commonly said to have been carried by them out of the country. But the tradition is not supported by any sufficient testimony.

Acts of the Apostles, one of the sacred books of the New Testament, containing the history of the infant-church, during the space of 29 or 30 years, from the ascension of our Lord to the year of Christ 63.—It was wrote by St Luke; and addressed to Theophilus, the person to whom the evangelist had before dedicated his gospel. We here find the accomplishment of several of the promises made by our Saviour; his ascension; the descent of the Holy Ghost; the first preaching of the apostles, and the miracles whereby their doctrines were confirmed; an admirable picture of the manners of the primitive Christians; and, in short, every thing that

AAs.

passed in the church till the dispersion of the apostles, who separated themselves in order to propagate the gospel throughout the world. From the period of that separation, St Luke quits the history of the other apostles, who were then at too great a distance from him, and confines himself more particularly to that of St Paul, who had chosen him for the companion of his labours. He follows that apostle in all his missions, and even to Rome itself; for it appears that the Acts were published in the second year of St Paul's residence in that city, or the 36th year of the Christian æra, and in the 9th or 10th year of Nero's reign. The style of this work, which was originally composed in Greek, is much purer than that of the other canonical writers; and it is observable, that St Luke, who was much better acquainted with the Greek than with the Hebrew language, always, in his quotations from the Old Testament, makes use of the Septuagint version. The council of Laodicea places the Acts of the Apostles among the canonical books, and all the churches have acknowledged it as such without any controversy.

* See *Abdias*.

There were several *Spurious Acts of the Apostles*; particularly, I. *Acts*, supposed to be written by Abdias*, the pretended bishop of Babylon, who gave out that he was ordained bishop by the apostles themselves when they were upon their journey into Persia. II. *The Acts of St Peter*: this book came originally from the school of the Ebionites. III. *The Acts of St Paul*, which is entirely lost. Eusebius, who had seen it, pronounces it of no authority. IV. *The Acts of St John the Evangelist*; a book made use of by the Encratites, Manichæans, and Priscillianists. V. *The Acts of St Andrew*; received by the Manichæans, Encratites, and Apotactics. VI. *The Acts of St Thomas the apostle*; received particularly by the Manichæans. VII. *The Acts of St Philip*. This book the Gnostics made use of. VIII. *The Acts of St Matthias*. Some have imagined, that the Jews for a long time had concealed the original acts of the life and death of St Matthias, written in Hebrew; and that a monk of the abbey of St Matthias at Treves, having got them out of their hands, procured them to be translated into Latin, and published them. But the critics will not allow them to be authentic. See *CANON*.

Acts of Pilate; a relation sent by Pilate to the emperor Tiberius, concerning Jesus Christ, his death, resurrection, ascension, and the crimes of which he was convicted before him*. It was a custom among the Romans, that the proconsuls and governors of provinces should draw up acts, or memoirs, of what happened in the course of their government, and send them to the emperor and senate. The heretics corrupted these acts, at least forged others in imitation of them; and, in the reign of the emperor Maximin, the Gentiles, to throw an odium on the Christian name, spread about spurious Acts of Pilate; which the emperor, by a solemn edict, ordered to be sent into all the provinces of the empire, and enjoined the school-masters to teach and explain them to their scholars, and make them learn them by heart. These acts, both the genuine and the spurious, are lost. There is indeed extant, in the Pseudo-Hegeippus, a letter from Pilate to the emperor Claudius, concerning Jesus Christ†. But it discovers itself at first sight not to be authentic.

Act of Faith, Auto da Fe, in the Romish church,

* Eusebii
Hist. Eccl.
lib. ii. cap. 2.
and ix. 5.

† Cave Hist.
Literar. Sac.
Apostol.

Act
of faith.
See Inqui-
sition.

is a solemn day held by the inquisition, for the punishment of heretics, and the absolution of the innocent accused *. They usually contrive the *Auto* to fall on some great festival, that the execution may pass with the more awe and regard; at least it is always on a Sunday.

The *Auto da Fe* may be called the last act of the inquisitorial tragedy; it is a kind of goal-delivery, appointed as oft as a competent number of prisoners in the inquisition are convicted of heresy, either by their own voluntary, or extorted confession, or on the evidence of certain witnesses. The process is thus: in the morning, they are brought into a great hall, where they have certain habits put on, which they are to wear in the procession. The procession is led up by dominican friars; after which come the penitents, some with fan-benitoes, and some without, according to the nature of their crimes; being all in black coats without sleeves, and bare-footed, with a wax candle in their hands. These are followed by the penitents who have narrowly escaped being burnt, who over their black coats have flames painted with their points turned downwards, *Peugo revolto*. Next come the negative, and relapsed, who are to be burnt, having flames on their habits pointing upwards. After these come such as profess doctrines contrary to the faith of Rome, who, besides flames pointing upwards, have their picture painted on their breasts, with dogs, serpents, and devils, all open-mouthed, about it. Each prisoner is attended with a familiar of the inquisition; and those to be burnt have also a Jesuit on each hand, who are continually preaching to them to abjure. After the prisoners, comes a troop of familiars on horseback; and after them the inquisitors, and other officers of the court, on mules; last of all, the inquisitor-general on a white horse, led by two men with black hats and green hat-bands. A scaffold is erected in the *Terreiro de Paio*, big enough for two or three thousand people; at one end of which are the prisoners, at the other the inquisitors. After a sermon made up of encomiums of the inquisition, and invectives against heretics, a priest ascends a desk near the middle of the scaffold, and having taken the abjuration of the penitents, recites the final sentence of those who are to be put to death; and delivers them to the secular arm, earnestly beseeching at the same time the secular power not to touch their blood or put their lives in danger. The prisoners being thus in the hands of the civil magistrate, are presently loaded with chains, and carried first to the secular goal, and from thence in an hour or two brought before the civil judge, who, after asking in what religion they intend to die, pronounces sentence, on such as declare they die in the communion of the church of Rome, that they shall be first strangled, and then burnt to ashes; on such as die in any other faith, that they be burnt alive. Both are immediately carried to the Ribera, the place of execution; where there are as many stakes set up as there are prisoners to be burnt, with a quantity of dry furz about them. The stakes of the professed, that is, such as persist in their heresy, are about four yards high, having a small board towards the top for the prisoner to be seated on. The negative and relapsed being first strangled and burnt, the professed mount their stakes by a ladder; and the Jesuits, after several repeated exhortations to be reconciled to the church, part with them, telling them they leave them to the devil, who

is standing at their elbow to receive their souls, and carry them with him into the flames of hell. On this a great shout is raised; and the cry is, Let the dogs beards be made; which is done by thrussing flaming furzes fastened to long poles against their faces, till their faces are burnt to a coal, which is accompanied with the loudest acclamations of joy. At last, fire is set to the furz at the bottom of the stake, over which the professed are chained so high, that the top of the flame seldom reaches higher than the seat they sit on, so that they rather seem roasted than burnt. There cannot be a more lamentable spectacle; the sufferers continually cry out, while they are able, *Misericordia per amor de Dios*: yet it is beheld by all sexes, and ages, with transports of joy and satisfaction.

ACT, in dramatic poetry, signifies a certain division, or part, of a play, designed to give some respite both to the actors and spectators. The Romans were the first who divided their theatrical pieces into acts; for no such divisions appear in the works of the first dramatic poets. Their pieces indeed consisted of several parts or divisions, which they called *protasis*, *epitasis*, *catastasis*, and *catastrophe*; but these divisions were not marked by any real interruptions on the theatre. Nor does Aristotle mention any thing of acts in his Art of Poetry. But, in the time of Horace, all regular and finished pieces were divided into five acts.

Neuve minor, neu sit quinto productior actu Fabula, que posci vult & spectata reponi.

The first act, according to some critics, besides introducing upon the stage the principal characters of the play, ought to propose the argument or subject of the piece; the second, to exhibit this to the audience, by carrying the fable into execution; the third, to raise obstacles and difficulties: the fourth to remove these, or raise new ones in the attempt; and the fifth, to conclude the piece, by introducing some accident that may unravel the whole affair. This division, however, is not essentially necessary; but may be varied according to the humour of the author, or the nature of the subject. See POETRY, Part I. chap. ii.

ACT of grace. See GRACE.

ACT of Parliament is a positive law, consisting of two parts, the words of the act, and its true sense and meaning; which being joined, make the law. The words of acts of parliament should be taken in a lawful sense. Cases of the same nature are within the intention, though without the letter, of the act; and some acts extend by equity to things not mentioned therein.

ACTÆA, ACONITUM RACEMOSUM, HERB CRISTOPHER, or BANE-BERRIES; a genus of the monogynia order, belonging to the polyandria class of plants, of which there are four

Species. 1. The spicata, or common herb-christopher, is a native in several parts of Britain. It grows to the height of about two feet and an half; the foot-stalks of the leaves arise from the root; these divide into three smaller foot-stalks, each of which are again divided into three, and these have each three lobes; so that each leaf is composed of 27 lobes or smaller leaves. The flowers grow in ramous spikes, and are of a pure white; they grow upon a slender, jointed, and furrowed stem; appear in May; and are succeeded by black, shining, pulpy berries, about the size of peas, which ripen in the autumn. This plant is a powerful repellent.

Act
Actus.

Actea,
Actæon.

lent, and the root has been used internally in some nervous cases, but must be administered with caution. The berries are highly poisonous. It is said toads resort to this plant, on account of its fetid smell. Sheep and goats eat it; cows, horses, and swine, refuse it. 2. The alba, or American herb-christopher, is a native of North America. The leaves of this species are somewhat like the former, but not so deeply indented in the edges. The flowers grow in a more compact spike, and the berries are very white and transparent when ripe; the roots are composed of thick knobs. This species has been used as an emetic, and sometimes called *ipécacuanha*. 3. The racemosa, or American black or wild snake-root, is likewise a native of North America. It has large compound leaves, rising immediately from the root, and branched after the same manner as the first, which grow more than two feet high. The flower-stem rises to the height of four or five feet; and carries a long spike of white flowers reflexed at the top. These appear in June or the beginning of July, but the seeds do not come to maturity in Britain.—The root of this plant is greatly used by physicians in North America, in many disorders; and is supposed to be an antidote against poison, or the biting of a rattle-snake. 4. The cimicifuga, is a native of Siberia; the leaves resemble those of the feathered columbine; the stalks rise little more than a foot high, supporting panicles of white flowers, which appear in May. This species is rare in Britain.

Culture. The first species hath a perennial root, but the stalks annually decay. It may be propagated either by seeds, or parting the roots, which should be transplanted in autumn. The seeds should be sown soon after they are ripe, or they will lie a whole year in the ground before they vegetate. They should be sown in a shady border; and as all the plants do not come up at the same time, the border should not be disturbed till the following autumn, when they should be transplanted into a shady border, where they may be allowed to remain and flower.—The second species may be propagated in the same manner; only the plants should be allowed three feet every way, an account of their wide-spreading leaves. This species delights in a light moist soil, and a shady situation.—The third is usually propagated by seeds sent annually from North America: it thrives in the same kind of soil as the former; and is very hardy, requiring no other culture than the common flowering shrubs. The plants should not be often removed, for that will prevent their flowering strong.—The fourth requires a moist loamy soil, and shady situation. It may be propagated in the same manner as the others.

ACTÆON, in fabulous history, the son of Aristæus and Autonoe; a great hunter. He was turned by Diana into a stag, for looking on her while bathing; and died by his own dogs.

ACTE, **ACTEA**, or **ATTIS**, ancient names of Attica. Pliny extends it to the isthmus of Corinth, so as to include Megaris. Others make this last a distinct district, because Megara was always the rival and enemy of the Athenians. If so, then Attica was bounded on the west by Megara; on the north by Boeotia, separated from it by high mountains, thro' which there was a difficult passage; on the south by the Saronic bay, with the Egean sea on the east. It was called

Acte from its maritime situation; hence *Actica* and *Attica*, and the epithets *Actæus* and *Atticus*, &c. Hence also *Actias* for *Atheniensis*, Virgil.

ACTIAN GAMES, in Roman antiquity, were solemn games instituted by Augustus, in memory of his victory over Marc Anthony at Actium, held every fifth year, and celebrated in honour of Apollo, since called *Actius*. Hence *Actian Years*, an era commencing from the battle of Actium, called the *Æra of Augustus*.

ACTION, in a general sense, implies nearly the same thing with *act* *.—Grammarians, however, observe some distinction between *action* and *act*; the former being generally restricted to the common or ordinary transactions, whereas the latter is used to express those which are remarkable. Thus, we say it is a good *action* to comfort the unhappy; it is a generous *act* to deprive ourselves of what is necessary, for their sake. The wife man proposes to himself an honest end in all his *actions*; a prince ought to mark every day of his life with some *act* of greatness. The abbé Girard makes a further distinction between the words *action* and *act*. The former, according to him, has more relation to the power that acts than the latter; whereas the latter has more relation to the effect produced than the former; and hence the one is properly the attribute of the other. Thus we may properly say, "Be sure to preserve a "preference of mind in all your actions; and take care that they are all acts of equity."

ACTION, in mechanics, implies either the effort which a body or power makes against another body or power, or the effect itself of that effort.

As it is necessary in works of this kind to have a particular regard to the common language of mechanics and philosophers, we have given this double definition: but the proper signification of the term is the motion which a body really produces, or tends to produce, in another; that is, such is the motion it would have produced, had nothing hindered its effect.

All power is nothing more than a body actually in motion, or which tends to move itself; that is, a body which would move itself if nothing opposed it. The action therefore of a body is rendered evident to us by its motion only; and consequently we must not fix any other idea to the word action, than that of actual motion, or a simple tendency to motion. The famous question relating to *vis viva*, and *vis mortua*, owes, in all probability, its existence to an inadequate idea of the word action; for had Leibnitz and his followers observed, that the only precise and distinct idea we can give to the word force or action, reduces it to its effect, that is, to the motion it actually produces or tends to produce, they would never have made that curious distinction.

Quantity of ACTION, a name given by M. de Maupertuis, in the Memoirs of the Parisian Academy of Sciences for 1744, and those of Berlin for 1746, to the product of the mass of a body by the space which it runs through, and by its celerity. He lays it down as a general law, "that, in the changes made in the state "of a body, the quantity of action necessary to produce such change is the least possible." This principle he applies to the investigation of the laws of refraction, of equilibrium, &c. and even to the ways of acting employed by the Supreme Being. In this manner M. de Maupertuis attempts to connect the metaphysics,

Actiōn,
Actiōn!

* See *Act*.

Action.

physics of final causes with the fundamental truths of mechanics, to shew the dependence of the collision of both elastic and hard bodies upon one and the same law, which before had always been referred to separate laws; and to reduce the laws of motion, and those of equilibrium, to one and the same principle.

ACTION, in ethics, denotes the external signs or expressions of the sentiments of a moral agent *.

ACTION, in poetry, the fame with subject or fable. Critics generally distinguish two kinds, the principal and the incidental. The principal action is what is generally called the *fable*; and the incidental an *episode* *.

ACTION, in oratory, is the outward deportment of the orator, or the accommodation of his countenance, voice, and gesture, to the subject of which he is treating. See **ORATORY**, Part IV.

ACTION, in a theatrical sense. See **DECLAMATION**, Art. IV.

ACTION for the Pulpit. See **DECLAMATION**, Art. I.

ACTION, in painting and sculpture, is the attitude or position of the several parts of the face, body, and limbs of such figures as are represented, and whereby they seem to be really actuated by passions. Thus we say, the action of such a figure finely expresses the passions with which it is agitated: we also use the same expression with regard to animals.

ACTION, among physicians, is applied to the functions of the body, whether vital, animal, or natural.

The *vital* functions, or actions, are those which are absolutely necessary to life, and without which there is no life, as the action of the heart, lungs, and arteries. On the action and reaction of the solids and fluids on each other, depend the vital functions. The pulse and respiration are the external signs of life. Vital diseases are all those which hinder the influx of the venous blood into the cavities of the heart, and the expulsion of the arterial blood from the same.—The *natural* functions are those which are instrumental in repairing the several losses which the body sustains; for life is destructive of itself, its very offices occasioning a perpetual waste. The mastication of food, the deglutition and digestion thereof, also the separation and distribution of the chyle and excrementitious parts, &c. are under the head of natural functions, as by these our aliment is converted into our nature. They are necessary to the continuance of our bodies.—The *animal* functions are those which we perform at will, as muscular motion, and all the voluntary actions of the body: they are those which constitute the senses of touch, taste, smell, sight, hearing; perception, reasoning, imagination, memory, judgment, affections of the mind. Without any, or all of them, a man may live, but not so comfortably as with them *.

ACTION, in commerce, is a term used abroad for a certain part or share of a public company's capital stock. Thus, if a company has 400,000 livres capital stock, this may be divided into 400 actions, each consisting of 1000 livres. Hence a man is said to have two, four, &c. actions, according as he has the property of two, four, &c. 1000 livres capital stock. The transferring of actions abroad is performed much in the same manner as stocks are with us. See **STOCKS**.

ACTION, in law, is a demand made before a judge for obtaining what we are legally entitled to demand, and is more commonly known by the name of law-suit, or process †.

Vol. I.

ACTIONARY, or **ACTIONIST**, a proprietor of stock in a trading company.

ACTIONS, among merchants, sometimes signify moveable effects; and we say the merchant's creditors have seized on all his actions, when we mean that they have taken possession of all his active debts.

ACTIVE, denotes something that communicates action or motion to another; in which acceptation it stands opposed to passive.

ACTIVE, in grammar, is applied to such words as express action; and is therefore opposed to passive. The active performs the action, as the passive receives it *.

Active Principles, in chemistry, such as are supposed to act without any assistance from others; as mercury, sulphur, &c.

ACTIVITY, in general, denotes the power of acting, or the active faculty. See **ACTIVE**.

Sphere of ACTIVITY, the whole space in which the virtue, power, or influence, of any object, is exerted.

ACTIUM, (anc. geogr.) a town situated on the coast of Acarnania, in itself inconsiderable, but famous for a temple of Apollo, a safe harbour, and an adjoining promontory of the same name, in the mouth of the Sinus Ambracius, over against Nicopolis, on the other side of the bay: it afterwards became more famous on account of Augustus's victory over Antony and Cleopatra; and for quinquennial games instituted there, called *Actia*, or *Ludi Actiaci*. Hence the epithet *Actius*, given to Apollo, (Virgil.) *Actiaca ara*, a computation of time from the battle of Actium. The promontory is now called *Capo di Figale*.

ACTIUS, in mythology, a surname of Apollo, from Actium, where he was worshipped.

ACTON, a town near London, where is a well that affords a purging water, which is noted for the pungency of its salt. This water is whitish, to the taste it is sweetish, with a mixture of the same bitter which is in the Epfom water. The salt of this water is not quite so soft as that of Epfom, and is more calcareous than it, being more of the nature of the salt of lime: for a quantity of the Acton water being boiled high, on being mixed with a solution of sublimated in pure water, threw down a yellow sediment. The salt of the Acton water is more nitrous than that of Epfom; it strikes a deep red, or purple, with the tincture of logwood in brandy, as is usual with nitrous salts; it does not precipitate silver out of the spirit of nitre, as common salt does: 1b of this water yields 48 grains of salt.

ACTOR, in general, signifies a person who acts or performs something.

Actor, in the drama, is a person who represents some part or character upon the theatre: The drama consisted originally of nothing more than a simple chorus, who sung hymns in honour of Bacchus; so that the primitive actors were only singers and musicians. Thespis was the first that, in order to ease this unformed chorus, introduced a declaimer, who repeated some heroic or comic adventure. Æschylus, finding a single person tirefome, attempted to introduce a second, and changed the ancient recitals into dialogues. He also dressed his actors in a more majestic manner, and introduced the conthurnus or buskin *. Sophocles added a third, in order to represent the various incidents in a more natural manner; and here the Greeks stopped, at least we do not find in any of their tragedies above

three persons in the same scene: perhaps they looked upon it as a rule of the dramatic poem never to admit more than three speakers at a time on the stage; a rule which Horace has expressed in the following verse:

Nec quarta loqui persona laboret.

This however did not prevent their increasing the number of actors in comedy. Before the opening of a play, they named their actors in full theatre, together with the parts they were to perform. The ancient actors were masked, and obliged to raise their voice extremely, in order to make themselves heard by the innumerable crowd of people who filled the amphitheatres: they were accompanied with a player on the flute, who played a prelude, gave them the tone, and played while they declaimed. Actors were highly honoured at Athens; and despised at Rome, where they were not only denied all rank among the citizens, but even when any citizen appeared upon the stage, he was expelled his tribe, and deprived of the right of suffrage by censors. Cicero, indeed, esteems the talents of Roscius; but he values his virtues still more: virtues which distinguished him so remarkably above all others of his profession, that they seemed to have excluded him from the theatre. The French have, in this respect, adopted the ideas of the Romans; and the English those of the Greeks.

ACTOR, the name of several persons in fabulous history. One Actor among the Aurruci is described by Virgil, as an hero of the first rank. *Æn.* xii.

ACTORUM TABULÆ, in antiquity, were tables instituted by Servius Tullius, in which the births of children were registered. They were kept in the treasury of Saturnus.

ACTRESS, a woman who performs a part upon the stage. Women actors were unknown to the ancients, among whom men always performed the female character; and hence one reason for the use of masks among them.

ACTUAL, something that is real and effective, or that exists truly and absolutely. Thus philosophers use the terms *actual* heat, *actual* cold, &c. in opposition to *virtual* or *potential*. Hence, among physicians, a red-hot iron, or fire, is called an *actual* cautery; in distinction from cauteries, or caustics, that have the power of producing the same effect upon the animal solids as actual fire; these last are called *potential* cauteries. Boiling water is actually hot; brandy, producing heat in the body, is potentially hot, though of itself cold.

ACTUAL SIN, that which is committed by the person himself, in opposition to original sin, or that which he contracted from being a child of Adam.

ACTUARIE NAVES, a kind of ships among the Romans, chiefly designed for swift sailing.

ACTUARIUS, a celebrated Greek physician, of the 13th century, and the first Greek author who has treated of mild purgatives, such as cassia, manna, fena, &c. His works were printed in one volume folio, by Henry Stephens, in 1567.

ACTUARIUS, or ACTARIUS, a notary or officer appointed to write the acts or proceedings of a court, or the like. In the Eastern Empire, the actuarii were properly officers who kept the military accounts, received the corn from the *susceptores* or store-keepers, and delivered it to the soldiers.

ACTUATE, to bring into act, to put a thing in motion, or to stir up a person to action.

ACTUS, in ancient architecture, a measure in length equal to 120 Roman feet. In ancient agriculture, the word signified the length of one furrow, or the distance a plough goes before it turns.

Actus *Minimus*, was a quantity of land 120 feet in length, and four in breadth.

Actus *Major*, or Actus *Quadratus*, a piece of ground in a square form, whose side was equal to 120 feet, equal to half the jugerum.

Actus *Intervicinalis*, a space of ground four feet in breadth, left between the lands as a path or way.

ACULEATE, or ACULEATI, a term applied to any plant or animal armed with prickles.

ACULEI, the prickles of animals or of plants.

ACULER, in the menage, is used for the motion of a horse, when, in working upon voltes, he does not go far enough forward at every time or motion, so that his shoulders embrace or take in too little ground, and his croupe comes too near the center of the volt. Horses are naturally inclined to this fault in making demi-voltes.

ACUMINA, in antiquity, a kind of military omen, most generally supposed to have been taken from the points or edges of darts, swords, or other weapons.

ACUPUNCTURE, the name of a surgical operation among the Chinese and Japanese, which is performed by pricking the part affected with a silver needle. They employ this operation in head-achs, lethargies, convulsions, colics, &c.

ACUNA (Christophoro de), a Spanish Jesuit, born at Burgos. He was admitted into the society in 1612, being then but 15 years of age. After having devoted some years to study, he went to America, where he assisted in making converts in Chili and Peru. In 1640, he returned to Spain, and gave the king an account how far he had succeeded in the commission he had received to make discoveries on the river of the Amazons; and the year following he published a description of this river, at Madrid. Acuna was sent to Rome, as procurator of his province. He returned to Spain with the title of Qualificator of the Inquisition; but soon after embarked again for the West Indies, and was at Lima in 1675, when father Southwell published at Rome the Bibliothéque of the Jesuit writers. Acuna's work is intitled, *Nuevo descubrimiento del gran rio de las Amazonas; i. e.* "A new discovery of the great river of the Amazons." He was ten months together upon this river, having had instructions to inquire into every thing with the greatest exactness, that his majesty might thereby be enabled to render the navigation more easy and commodious. He went aboard a ship at Quito with Peter Texeira, who had already been so far up the river, and was therefore thought a proper person to accompany him in this expedition. They embarked in February 1639, but did not arrive at Para till the December following. It is thought that the revolutions of Portugal, by which the Spaniards lost all Brasil, and the colony of Para at the mouth of the river of the Amazons, were the cause that the relation of this Jesuit was suppressed; for as it could not be of any advantage to the Spaniards, they were afraid it might prove of great service to the Portuguese. The copies of this work became extremely scarce, so that the publishers of the French translation at Paris asserted, that there was not one copy of the original extant, excepting one in the

the possession of the translator, and, perhaps, that in the Vatican library. M. de Gomberville was the author of this translation: it was published after his death, with a long dissertation. An account of the original may be seen in the *Paris Journal*, in that of *Leipfic*, and in *Chevreau's History of the World*.

ACUS, in ichthyology, the trivial name of a species of *syngnathus*. See *SYNGNATHUS*.

ACUTE, an epithet applied to such things as terminate in a sharp point or edge. And in this sense it stands opposed to obtuse.

ACUTE *Angle*, in geometry, is that which is less than a right angle.

ACUTE-ANGLED *Triangle*, is a triangle whose three angles are all acute.

ACUTE-ANGLED *Cone* is, according to the ancients, a right cone, whose axis makes an acute angle with its side.

ACUTE, in music, is applied to a sound or tone that is sharp or high, in comparison of some other tone. In this sense, *acute* stands opposed to *grave*.

ACUTE *Accent*. See *ACCENT*.

ACUTE *Diseases*, such as come suddenly to a crisis. This term is used for all diseases which do not fall under the head of chronic diseases.

AD, a Latin preposition, originally signifying *to*, and frequently used in composition both with and without the *d*, to express the relation of one thing to another.

AD *Bestias*, in antiquity, is the punishment of criminals condemned to be thrown to wild beasts.

AD *Hominem*, in logic, a kind of argument drawn from the principles or prejudices of those with whom we argue.

AD *Ludos*, in antiquity, a sentence upon criminals among the Romans, whereby they were condemned to entertain the people by fighting either with wild beasts, or with one another, and thus executing justice upon themselves.

AD *Metalla*, in antiquity, the punishment of such criminals as were condemned to the mines, among the Romans; and therefore called *Metallici*.

AD *Valorem*, a term chiefly used in speaking of the duties or customs paid for certain goods: The duties on some articles are paid by the number, weight, measure, tale, &c. and others are paid *ad valorem*, that is, according to their value.

ADAGE, a proverb, or short sentence, containing some wise observation or popular saying. Erasmus has made a very large and valuable collection of the Greek and Roman adages; and Mr Ray has done the same with regard to the English. We have also Kelly's collection of Scotch Proverbs.

ADAGIO, in music, an Italian adverb, signifying *slowly, leisurely*; and is used to denote the slowest of all times, except the grave.

ADAM, the first of the human race, was formed by the Almighty on the sixth day of the creation. His body was made of the dust of the earth; after which, God animated or gave it life, and Adam then became a rational creature.—His heavenly Parent did not leave his offspring in a destitute state to shift for himself; but planted a garden, in which he caused to grow not only every tree that was proper for producing food, but likewise such as were agreeable to the eye, or merely ornamental. In this garden were assembled all the brute creation; and, by

their Maker, caused to pass before Adam, who gave all of them names, which were judged proper by the Deity himself.—In this review, Adam found none for a companion to himself. This solitary state was seen by the Deity to be attended with some degree of unhappiness; and therefore he threw Adam into a deep sleep, in which state he took a rib from his side, and healing up the wound, formed a woman of the rib he had taken out. On Adam's awaking, the woman was brought to him; and he immediately knew her to be one of his own species, called her his bone and his flesh, giving her the name of *woman* because she was taken out of man.

The first pair being thus created, God gave them authority over the inferior creation, commanding them to subdue the earth, also to increase and multiply, and fill it. They were informed of the proper food for the beasts and for them; the grass, or green herbs, being appointed for beasts; and fruits, or seeds, for man. Their proper employment also was assigned them; namely, *to dress the garden, and to keep it*.

Though Adam was thus highly favoured and instructed by his Maker, there was a single tree, which grew in the middle of the garden, of the fruit of which they were not allowed to eat; being told, that they should surely die in the day they eat of it. This tree was named, The tree of the knowledge of good and evil. This prohibition, however, they soon broke through. The woman having entered into conversation with the *serpent*, was by him persuaded, that by eating of the tree she should become as wise as God himself; and accordingly, being invited by the beauty of the fruit, and its desirable property of imparting wisdom, she plucked the fruit, and eat it; giving her husband of it at the same time, who did likewise eat.

Before this transgression of the divine command, Adam and his wife had no occasion for clothes, neither had they any sense of shame; but immediately on eating the forbidden fruit, they were ashamed of being naked, and made aprons of fig-leaves for themselves. On hearing the voice of God in the garden, they were terrified, and hid themselves: but being questioned by the Deity, they confessed what they had done, and received sentence accordingly; the man being condemned to labour; the woman to subjection to her husband, and to pain in childbearing. They were now driven out of the garden, and their access to it prevented by a terrible apparition. They had clothes given them by the Deity made of the skins of beasts. In this state Adam had several children; the names of only three of whom we are acquainted with, *viz.* Cain, Abel, and Seth. He died at the age of 930 years.

These are all the particulars concerning Adam's life, that we have on divine authority: but a vast multitude of others are added by the Jews, Mahometans, and Papists; all of which must be at best conjectural; most of them, indeed, appear downright falsehoods or absurdities. Mr Bayle, however, and the authors of the *General Dictionary*, have been at great pains in collecting them, and the account spreads over many folio pages; but our readers curiosity, it is presumed, will be sufficiently gratified by the few which are here subjoined.

According to the Talmudists, when Adam was created,

Adam.

Adam.

created, his body was of immense magnitude. When he sinned, his stature was reduced to an hundred ells, according to fume; to nine hundred cubits, according to others; who think this was done at the request of the angels, who were afraid of so gigantic a creature. In the island of Ceylon is a mountain, called the *Peak* or mountain of Adam, from its being, according to the tradition of the country, the residence of our first parent. Here the print of his footsteps, above two palms in length, are still pointed out.

Many reveries have been formed concerning the personal beauty of Adam. That he was a handsome well-shaped man, is probable; but some writers, not content with this, affirm, that God, intending to create man, clothed Himself with a perfectly beautiful human body, making this his model in the formation of the body of Adam.

Nor has the imagination been less indulged concerning the formation of the human species male and female.—It would be endless to recount all the whimsies that have been wrote on this subject; but as Mrs Bourignon has made a considerable figure in the *religieuse*, or rather *superstitious* world, we cannot help inserting some of her opinions concerning the first man, which are peculiarly marvellous. According to the *revelations* of this lady, Adam before his fall possessed in himself the principles of both sexes, and the virtue or power of producing his like, without the concurrent assistance of woman. The division into two sexes, the imagined †, was a consequence of man's sin; and now, the observes, mankind are become so many *monsters in nature*, being much less perfect in this respect than plants or trees, who are capable of producing their like alone, and without pain or misery. She even imagined ‡, that, being in an ecstasy, she saw the figure of Adam before he fell, with the manner how, by himself, he was capable of procreating other men. "God," says she, "repented to my mind the beauty of the first world, and the manner how he had drawn it from the chaos: every thing was bright, transparent, and darted forth light and ineffable glory. The body of Adam was purer and more transparent than crystal, and vastly fleet; through this body were seen vessels and rivulets of light, which penetrated from the inward to the outward parts, through all his pores. In some vessels ran fluids of all kinds and colours, vastly bright, and quite diaphanous. The most ravishing harmony arose from every motion; and nothing resisted, or could annoy, him. His stature was taller than the present race of men; his hair was short, curled, and of a colour inclining to black; his upper lip covered with short hair: and instead of the bectial parts which modesty will not allow us to name, he was fashioned as our bodies shall be in the life eternal, which I know not whether I dare reveal. In that *region* * his nose was formed after the manner of a *face*, which diffused the most delicious fragrancy and perfumes; whence also men were to issue, all whose principles were inherent in him; there being in his belly a vessel, where little eggs were formed; and a second vessel filled with a fluid, which impregnated those eggs: and when man heated himself in the love of God, the desire he had that other creatures should exist besides himself, to praise and love God, caused the fluid abovementioned (by means of the fire of the love of God) to drop on one or more of these

eggs, with inexpressible delight; which being thus impregnated, issued, some time after, out of man, by this canal †, in the shape of an egg, whence a perfect man was hatched by insensible degrees. Woman was formed by taking out of Adam's sides the vessels that contained the eggs; which she still possesses, as is discovered by anatomists."

Many others have believed, that Adam at his first creation was both male and female: others, that he had two bodies joining together at the shoulders, and their faces looking opposite ways like those of Janus. Hence, say these, when God created Eve, he had no more to do than to separate the two bodies from one another*. Of all others, however, the opinion of Paracelsus seems the most ridiculous †. *Negabat primos parentes ante lapsum habuisse partes generationi hominis necessarias; credebatur posse accessisse, ut strumam gutturi.*

Extravagant things are asserted concerning Adam's knowledge. It is very probable that he was instructed by the Deity how to accomplish the work appointed him, viz. to dress the garden, and keep it from being destroyed by the brute creatures; and it is also probable that he had likewise every piece of knowledge communicated to him that was either necessary or pleasing: but that he was acquainted with geometry, mathematics, rhetoric, poetry, painting, sculpture, &c. is too ridiculous to be credited by any sober person. Some rabbies, indeed, have contented themselves with equaling Adam's knowledge to that of Moses and Solomon; while others, again, have maintained that he excelled the angels themselves. Several Christians seem to be little behind these Jews in the degree of knowledge they ascribe to Adam; nothing being hid from him, according to them, except contingent events relating to futurity. One writer indeed (Pinedo) excepts politics; but a Carthusian friar, having exulted, in favour of Aristotle, every image and comparison he could think of, at last asserted that Aristotle's knowledge was as extensive as that of Adam.—In consequence of this surprising knowledge with which Adam was endued, he is supposed to have been a considerable author. The Jews pretend that he wrote a book on the creation, and another on the Deity. Some rabbies ascribe the 92^d psalm to Adam; and in some manuscripts the Chaldee title of this psalm expressly declares that this is the song of David which the first man repeated for the sabbath-day.

Various conjectures have been formed concerning the place where man was first created, and where the garden of Eden was situated; but none of these have any solid foundation. The Jews tell us, that Eden was separated from the rest of the world by the ocean; and that Adam, being banished therefrom, walked across the sea, which he found every way fordable, by reason of his enormous stature*. The Arabians imagined paradise to have been in the air, and that our first parents were thrown down from it on their transgression; as Vulcan is said to have been thrown down headlong from heaven by Jupiter.

Strange stories are told concerning Adam's children. That he had none in the state of innocence, is certain from scripture; that his marriage with Eve was not consummated till after the fall, cannot be proved from thence. Some imagine, that, for many years after the fall, Adam denied himself the connubial joys by way penance; others, that he cohabited with another woman.

Adam
Melchior)
Adam.

man. The Mahometans tell us, that our first parents having been thrown headlong from the celestial paradise, Adam fell upon the isle of Serendib, or Ceylon, in the East Indies; and Eve on Iodda, a port of the Red Sea, not far from Mecca. After a separation of upwards of 200 years, they met in Ceylon, where they multiplied: according to some Eve had twenty, according to others only eight, deliveries; bringing forth at each time twins, a male and a female, who afterwards married. The Rabbins, imagine that Eve brought forth Cain and Abel at a birth; that Adam wept for Abel an hundred years in the valley of tears near Hebron, during which time he did not cohabit with his wife; and that this separation would probably have continued longer, had it not been forbid by the angel Gabriel. The inhabitants of Ceylon affirm, that the salt lake on the mountain of Colombo consists wholly of the tears which Eve for one hundred years together shed because of Abel's death.

Some of the Arabians tell us, that Adam was buried near Mecca on mount Abukobeis; others, that Noah, having laid his body in the ark, caused it to be carried after the deluge to Jerusalem by Melchisedek the son of Shem: of this opinion are the Eastern Christians; but the Persians affirm that he was interred in the isle of Serendib, where his corps was guarded by lions at the time the giants warred upon one another.—St Jerom imagined that Adam was buried at Hebron; others, on mount Calvary. Some are of opinion that he died on the very spot where Jerusalem was afterwards built; and was buried on the place where Christ suffered, that so his bones might be sprinkled with the Saviour's blood!!!

ADAM (Melchior) lived in the 17th century. He was born in the territory of Grotkwa in Silesia, and educated in the college of Brieg, where the dukes of that name, to the utmost of their power, encouraged learning and the reformed religion as professed by Calvin. Here he became a firm Protestant, and was enabled to pursue his studies by the liberality of a person of quality, who had left several exhibitions for young students. He was appointed rector of a college at Heidelberg, where he published his first volume of illustrious men in the year 1615. This volume, which consisted of philosophers, poets, writers on polite literature, and historians, &c. was followed by three others; that which treated of divines was printed in 1619; that of the lawyers came next; and, finally, that of the physicians: the two last were published in 1620. All the learned men, whose lives are contained in these four volumes, lived in the 16th, or beginning of the 17th century, and are either Germans or Flemings; but he published in 1618 the lives of twenty divines of other countries in a separate volume. All his divines are Protestants. The Lutherans were not pleased with him, for they thought him partial; nor will they allow his work to be a proper standard, whereby to judge of the learning of Germany. He wrote other works besides his lives, and died in 1622.

ADAM'S Apple. See AURANTUM.

ADAM'S Needle. See YUCCA.

ADAM'S Peak, a high mountain of the East Indies, in the island of Ceylon, on the top of which they believe the first man was created. See ADAM.

ADAM or ADOM, a town in the Peræa, or on the o-

ther side the Jordan, over-against Jericho, where the Jordan began to be dried up on the passage of the Israelites; (Joshua.)

ADAMA, or ADMAH, one of the towns that were involved in the destruction of Sodom; (Moses).

ADAMANT, a name sometimes given to the diamond*. It is likewise applied to the scoria of gold, the magnet, &c.

ADAMIC EARTH, a name given to common red clay, alluding to that species of earth of which the first man is supposed to have been made.

ADAMITES, in ecclesiastical history, the name of a sect of ancient heretics, supposed to have been a branch of the Basilidians and Carpocratians.

Epiphanius tells us, that they were called Adamites from their pretending to be re-established in the state of innocence, and to be such as Adam was at the moment of his creation, whence they ought to imitate him in his nakedness. They detested marriage; maintaining, that the conjugal union would never have taken place upon earth had sin been unknown; and that the privilege of enjoying women in common, was one of the rights which flowed from their establishment in original purity.

This obscure and detestable sect did not at first last long; but it was revived in the twelfth century by one Tandamus, since known by the name of *Tanchelin*, who propagated his errors at Antwerp, in the reign of the emperor Henry V. He maintained, that there ought to be no distinction between priests and laymen, and that fornication and adultery were meritorious actions. Tanchelin had a great number of followers, and was constantly attended by 3000 of these profligates in arms. His sect did not however continue long after his death: but another appeared under the name of *Turlupins*, in Savoy and Dauphiny, where they committed the most brutal actions in open day.

About the beginning of the fifteenth century, one Picard, a native of Flanders, spread these errors in Germany and Bohemia, particularly in the army of the famous Zisca, notwithstanding the severe discipline he maintained. Picard pretended that he was sent into the world as a new Adam, to re-establish the law of nature; and which, according to him, consisted in exposing every part of the body, and having all the women in common. This sect found also some partizans in Poland, Holland, and England: they assembled in the night; and it is asserted, that one of the fundamental maxims of their society was contained in the following verse:

Jura, perjury, secretum prodere noli.

ADAMSHIDE, a district of the circle of Rastenburg, belonging to the king of Prussia, which, with Dombroken, was bought, in 1737, for 42,000 dollars.

ADAMSON (Patrick), a Scottish prelate, archbishop of St Andrews. He was born in the year 1536, in the town of Perth, where he received the rudiments of his education; and afterwards studied Philosophy, and took his degree of master of arts at the university of St Andrews. In the year 1566, he set out for Paris, as tutor to a young gentleman. In the month of June of the same year, Mary queen of Scots being delivered of a son, afterwards James VI. of Scotland, and First of England, Mr Adamson wrote a Latin poem on the occasion. This proof of his loyalty involved him.

Adamson
(Patrick.)

him in some difficulties, having been confined in France for six months; nor would he have got off easily, had not queen Mary, and some of the principal nobility, interceded themselves in his behalf. As soon as he recovered his liberty, he retired with his pupil to Bourges. He was in this city during the massacre at Paris; and the same bloody persecuting spirit prevailing among the catholics at Bourges, as at the metropolis, he lived concealed for seven months in a public house, the master of which, upwards of seventy years of age, was thrown from the top thereof, and had his brains dashed out, for his charity to heretics. Whilst Mr Adamson lay thus in his sepulchre, as he called it, he wrote his Latin poetical version of the Book of Job, and his Tragedy of Herod in the same language. In the year 1573, he returned to Scotland; and, having entered into holy orders, became minister of Paisley. In the year 1575, he was appointed one of the commissioners, by the general assembly, to settle the jurisdiction and policy of the church; and the following year he was named, with Mr David Lindsay, to report their proceedings to the earl of Mortoun, then regent. About this time, the earl made him one of his chaplains; and, on the death of bishop Douglas, promoted him to the archiepiscopal see of St Andrews, a dignity which brought upon him great trouble and uneasiness: for now the clamour of the Presbyterian party rose very high against him, and many inconsistent absurd stories were propagated concerning him. Soon after his promotion, he published his catechism in Latin verse, a work highly approved even by his enemies; but, nevertheless, they still continued to persecute him with great violence. In 1578, he submitted himself to the general assembly, which procured him peace but for a very little time; for, the year following, they brought fresh accusations against him. In the year 1582, being attacked with a grievous disease, in which the physicians could give him no relief, he happened to take a simple medicine from an old woman, which did him service. The woman, whose name was Alison Pearson, was thereupon charged with witchcraft, and committed to prison, but escaped out of her confinement; however, about four years afterwards, she was again found and burnt for a witch. In 1583, king James came to St Andrews; and the archbishop, being much recovered, preached before him, and disputed with Mr Andrew Melvil, in presence of his majesty, with great reputation, which drew upon him fresh calumny and persecution. The king, however, was so well pleased with him, that he sent him ambassador to queen Elizabeth, at whose court he resided for some years. His conduct, during his embassy, has been variously reported by different authors. Two things he principally laboured, *viz.* the recommending the king his master to the nobility and gentry of England, and the procuring some support for the episcopal party in Scotland. By his eloquent preaching, he drew after him such crowds of people, and raised in their minds such a high idea of the young king his master, that queen Elizabeth forbade him to enter the pulpit during his stay in her dominions. In 1584, he was recalled, and sat in the parliament held in August at Edinburgh. The Presbyterian party was still very violent against the archbishop. A provincial synod was held at St Andrews in April 1586: the archbishop was here accused and

excommunicated: he appealed to the king and the States, but this availed him little; for the mob being excited against him, he durst scarce appear in public. At the next general assembly, a paper being produced, containing the archbishop's submission, he was absolved from the excommunication. In 1588, fresh accusations were brought against him. The year following, he published the Lamentations of the prophet Jeremiah in Latin verse; which he dedicated to the king, complaining of his hard usage. In the latter end of the same year, he published a translation of the Apocalypse, in Latin verse; and a copy of Latin verses, addressed also to his majesty, when he was in great distress. The king, however, was so far from giving him assistance, that he granted the revenue of his see to the duke of Lennox; so that the remaining part of this prelate's life was very wretched, he having hardly subsistence for his family. He died in 1591.

ADANA, a town of Asia, in Natolia, and in the province of Carmania. It is seated on the river Choquen; on the banks of which stands a strong little castle built on a rock. It has great numbers of beautiful fountains brought from the river by means of water-works. Over the river there is a stately bridge of fifteen arches, which leads to the water-works. The climate is very pleasant and healthy, and the winter mild and serene: but the summer is so hot as to oblige the principal inhabitants to retire into the neighbouring mountains, where they spend six months among shady trees and grottos, in a most delicious manner. The adjacent country is rich and fertile, and produces melons, cucumbers, pomegranates, pulse, and herbs of all sorts, all the year round; besides corn, wine, and fruits in their proper season. It is thirty miles east of Tarsus, on the road to Aleppo. E. long. 35. 42. N. lat. 38. 10.

ADANSONIA, ETHIOPIAN SOUR-GOURD, or MONKIES-BREAD; a genus of the monodelphia order, belonging to the polyandria class of plants. It has its name from one Mr Adanson, a French surgeon, who brought a curious collection of plants and seeds from Senegal in Africa.

Species. We know but of one species belonging to this genus at present. It is a native of Africa and South America. The leaves of the young plants are entire, of an oblong form, about four or five inches long, and almost three broad towards the top, having several veins running from the middle rib; they are of a lucid green colour. As the plants advance in height, the leaves alter, and are divided into three parts, and afterwards into five lobes, which spread out in the shape of an hand. The fruit is almost as large as a man's head, the shell woody and close, having a greenish downy coat; it is divided into 10, 12, or 14 cells within, which contain a good number of kidney-shaped seeds, as large as the tip of a man's little finger; these are closely surrounded with a mealy pulp of an acid taste.

—According to Mr Adanson's account, these trees grow in plains of barren moveable sand, which being continually shifted by the wind, admit of no tracts whereby the traveller can be guided over them. The size of the trunks, roots, and branches, is very surprising, their circumference being sometimes 65 or 70 feet, but their height only from 8 to 12. These trunks were divided into many horizontal branches, which touched the ground at their extremities; these

Adamson
Adanson.

were

Adanfon
Adda.

were from 45 to 55 feet long, and so large in circumference that each branch was equal to a monitrous tree in Europe; and where the water of a neighbouring river had washed away the earth so as to leave the roots of one of these trees bare and open to sight, they measured 110 feet in length, without including those parts which remained covered with sand.

Culture. This tree is propagated from seeds, which are brought from the countries where they grow naturally. Being natives only of hot climates, the plants will not thrive in the open air in Britain, even in summer. The seeds are therefore to be sown in pots, and plunged into a hot-bed, where the plants will appear in about six weeks, and in a short time after be fit to transplant. They must then be planted each in a separate pot, in light sandy earth, and plunged into a hot-bed, shading them until they have taken root: after which they should have fresh air admitted every day in warm weather; but must be sparingly watered, as being apt to rot. They grow quickly for two or three years, but afterwards make little progress; the lower part of the stem then begins to swell, and put out lateral branches, inclining to a horizontal position, and covered with a light grey bark.—Some of this kind of plants were raised from seeds obtained from Grand Cairo by Dr William Sherard, in 1724, and were grown to the height of 18 feet; but were all destroyed by the severe frost in 1740; after which they were unknown in Britain till the return of Mr Adanfon to Paris in 1754.

ADAPTERS, or ADOPTERS. See **CHEMISTRY**, n° 80.

ADAR, the name of a Hebrew month, answering to the end of February and beginning of March, the 12th of their sacred, and 6th of their civil year. On the 7th day of it, the Jews keep a feast for the death of Moses; on the 13th, they have the feast of Easter; and on the 14th, they celebrate the feast of Purim, for their deliverance from Haman's conspiracy.—As the lunar year, which the Jews followed in their calculations, is shorter than the solar, by about 11 days, which at the end of three years make a month, they then intercalate a 13th month, which they call *Veader*, or the *second Adar*.

ADARCE, a kind of concreted salts found on reeds and other vegetables, and applied by the ancients as a remedy in several cutaneous diseases.

ADARCON, in Jewish antiquity, a gold coin mentioned in scripture, worth about 15 s. sterling.

ADARME, in commerce, a small weight in Spain, which is also used at Buenos-Aires, and in all Spanish America. It is the 16th part of an ounce, which at Paris is called the *semi-gror*. But the Spanish ounce is *seven per cent.* lighter than that of Paris. Stephens renders it in English by a *dram*.

ADATAIS, ADATS, or ADATYS, in commerce, a muslin or cotton-cloth, very fine and clear, of which the piece is ten French ells long, and three quarters broad. It comes from the East-Indies; and the finest is made at Bengal.

ADCRESCENTES, among the Romans, denoted a kind of soldiery, entered in the army, but not yet put on duty; from these the standing forces were recruited. See **ACCENSII**.

ADDA, in geography, a river of Switzerland and Italy, which rises in mount Braulio, in the country of the Grisons, and, passing through the Valteline, tra-

verses the lake Como and the Milanese, and falls into the Po, near Cremona.

ADDEPHAGIA, in medicine, a term used by some physicians, for gluttony, or a voracious appetite.

ADDER, in zoology, a vulgar name for the *Viper*; which see.

ADDESS-TONGUE. See **OPHIOGLOSSUM**; and **MATERIA MEDICA**, n° 504.

ADDER-WORM, or **SNAKEWEED.** See **BISTORTA**; and **MATERIA MEDICA**, n° 170.

ADDEXTRATOIRES, in the court of Rome, the pope's mitre-bearers, so called, according to Ducange, because they walk at the pope's right-hand when he rides to visit the churches.

ADDICE, or ADZE, a kind of crooked ax used by ship-wrights, carpenters, coopers, &c.

ADDICTI, in antiquity, a kind of slaves, among the Romans, adjudged to serve some creditor whom they could not otherwise satisfy, and whose slaves they became till they could pay or work out the debt.

ADDICTION, among the Romans, was the making over goods to another, either by sale, or by legal sentence; the goods so delivered were called *bona addicta*. Debtors were sometimes delivered over in the same manner; and thence called *servi additi*.

ADDICTIO IN DIEM, among the Romans, the adjudging a thing to a person for a certain price, unless by such a day the owner, or some other, give more for it.

ADDISON (Lancelot), son of Lancelot Addison a clergyman, was born at Mouldisemaburn, in the parish of Crosby Ravensworth in Westmoreland, in the year 1632. He was educated at Queen's College, Oxford; and at the Restoration of king Charles II. accepted of the chaplainship of the garrison of Daulkirk; but that fortress being delivered up to the French in 1662, he returned to England, and was soon after made chaplain to the garrison of Tangier; where he continued seven years, and was greatly esteemed. In 1670, he returned to England, and was made chaplain in ordinary to the king; but his chaplainship of Tangier being taken from him on account of his absence, he found himself straitened in his circumstances, when he seasonably obtained the rectory of Milston, in Wiltshire, worth about 120 l. per annum. He afterwards became a prebendary of Sarum; took his degree of doctor of divinity at Oxford; and in 1683 was made dean of Litchfield, and the next year archdeacon of Coventry. His life was exemplary; his conversation pleasing, and greatly instructive; and his behaviour as a gentleman, a clergyman, and a neighbour, did honour to the place of his residence. He wrote, 1. *A Short Narrative of the Revolutions of the Kingdoms of Fez and Morocco*: 2. *The present History of the Jews*: 3. *A Discourse on Catechising*: 4. *A Model of the Sacrament for the Clergy*: 5. *An Introduction to the Sacrament*: 6. *The first State of Mahometism*: and several other pieces. This worthy divine died on the 20th of April 1703 and left three sons: Joseph, the subject of the next article; Gullston, who died while governor of Fort St George; Lancelot, master of arts, and fellow of Magdalen College in Oxford; and one daughter, first married to Dr Sartre prebendary of Westminster, and afterwards to Daniel Combes, Esq.

ADDISON (Joseph), one of the brightest geniuses that this or any other country has produced, was the son.

Addephagia
Addition.

Addison.

fon of dean Addison, the subject of the last article. He was born at Milston, near Ambresbury, in Wiltshire, on the 11th of May 1672; and not being thought likely to live, was baptized the same day. He received the first rudiments of his education at the place of his nativity, under the reverend Mr Naish; but was soon removed to Salisbury, under the care of Mr Taylor; and from thence to the charter-house, where he commenced his acquaintance with Sir Richard Steele. About fifteen, he was entered at Queen's College, Oxford, where he applied very closely to the study of classical learning, in which he made a surprising proficiency. In the year 1687, Dr Lancelot, dean of Magdalen College, having, by chance, seen a Latin poem of Mr Addison's, was so pleased with it, that he immediately got him elected into that house, where he took up his degrees of bachelor and master of arts. His Latin pieces, in the course of a few years, were exceedingly admired in both universities; nor were they less esteemed abroad, particularly by the celebrated Boileau, who is reported to have said, that he would not have written against Perrault, had he before seen such excellent pieces by a modern hand. He published nothing in English before the twenty-second year of his age; when there appeared a short copy of verses written by him, and addressed to Mr Dryden, which procured him great reputation from the best judges. This was soon followed by a translation of the Fourth Georgic of Virgil, (omitting the story of Aristeus), much commended by Mr Dryden. He wrote also the Essay on the Georgics, prefixed to Mr Dryden's translation. There are several other pieces written by him about this time; amongst the rest, one dated the 3^d of April 1694, addressed to H. S. that is, Dr Sacheverel, who became afterwards so famous, and with whom Mr Addison lived once in the greatest friendship; but their intimacy was some time after broken off by their disagreement in political principles. In the year 1695, he wrote a poem to king William on one of his campaigns, addressed to Sir John Somers, lord keeper of the great seal. This gentleman received it with great pleasure, took the author into the number of his friends, and bestowed on him many marks of his favour. Mr Addison had been closely pressed, while at the university, to enter into holy orders; and had once resolved upon it: but his great modesty, his natural diffidence, and an uncommonly delicate sense of the importance of the sacred function, made him afterwards alter his resolution; and having expressed an inclination to travel, he was encouraged thereto by his patron above-mentioned, who, by his interest, procured him from the crown a pension of £. 300 *per annum* to support him in his travels. He accordingly made a tour to Italy in the year 1699; and, in 1701, he wrote a poetical epistle from Italy to the earl of Halifax, which has been universally esteemed as a most excellent performance. It was translated into Italian verse by the abbot Antonio Maria Salvini, Greek professor at Florence. In the year 1705, he published an account of his travels, dedicated to lord Somers; which, though at first but indifferently received, yet in a little time met with its deserved applause. In the year 1702, he was about to return to England, when he received advice of his being appointed to attend prince Eugene, who then commanded for the emperor in Italy: but the

death of king William happening soon after, put an end to this affair as well as his pension; and he remained for a considerable time unemployed. But an unexpected incident at once raised him, and gave him an opportunity of exerting his fine talents to advantage: for in the year 1704, the lord-treasurer Godolphin happened to complain to lord Halifax, that the duke of Marlborough's victory at Blenheim had not been celebrated in verse in the manner it deserved; and intimated, that he would take it kindly, if his lordship, who was the known patron of the poets, would name a gentleman capable of doing justice to so elevated a subject. Lord Halifax replied, somewhat hastily, that he did know such a person, but would not mention him; adding, that long had he seen, with indignation, men of no merit maintained in luxury at the public expence, whilst those of real worth and modesty were suffered to languish in obscurity. The treasurer answered very coolly, that he was sorry there should be occasion for such an observation, but that he would do his endeavour to wipe off such reproaches for the future; and he engaged his honour, that whoever his lordship named, as a person capable of celebrating this victory, should meet with a suitable recompence. Lord Halifax thereupon named Mr Addison; insisting, however, that the treasurer himself should send to him; which he promised. Accordingly he prevailed on Mr Boyle (afterwards lord Carlton) then chancellor of the exchequer, to make the proposal to Mr Addison; which he did in so polite a manner, that our author readily undertook the task. The lord-treasurer had a fight of the piece, when it was carried no farther than the celebrated simile of the angel; and was so pleased with it, that he immediately appointed Mr Addison a commissioner of appeals, vacant by the promotion of Mr Locke, chosen one of the lords commissioners for trade. The Campaign is addressed to the duke of Marlborough; it gives a short view of the military transactions in 1704, and contains a noble description of the two great actions at Schelleberg and Blenheim. The poem will be admired as long as the victory is remembered. In 1705, he attended lord Halifax to Hanover; and the ensuing year was appointed under-secretary to Sir Charles Hedges secretary of state; in which office he acquitted himself so well, that the earl of Sunderland, who succeeded Sir Charles in December, continued Mr Addison in his employment. A taste for operas beginning at this time to prevail in England, and many persons having solicited Mr Addison to write one, he complied with their request, and composed his Rosamond. This however, whether from the defect of the music, for which our language is said by some to be very improper, or from the prejudices in favour of the Italian taste, did not succeed upon the stage; but the poetry of it has, and always will be, justly admired. About this time, Sir Richard Steele composed his comedy of the Tender Husband, to which Mr Addison wrote a prologue. Sir Richard surprised him with a dedication of this play, and acquainted the public, that he was indebted to him for some of the most excellent strokes in the performance. The marquis of Wharton, being appointed lord lieutenant of Ireland in 1709, took Mr Addison with him as his secretary. Her majesty also made him keeper of the records of Ireland, and, as a farther mark of

Addison.

her

Addition. her favour, considerably augmented the salary annexed to that place. Whilst he was in this kingdom, the Tatler was first published; and he discovered his friend Sir Richard Steele to be the author, by an observation on Virgil, which he had communicated to him. He afterwards assisted considerably in carrying on this paper, which the author acknowledges. The Tatler being laid down, the Spectator was set on foot, and Mr Addison furnished great part of the most admired papers; those which he wrote are distinguished by one of the letters of the muse, C, L, I, O. The Spectator made its first appearance in March 1711, and was brought to a conclusion in September 1712. He had likewise a considerable share in the Guardian, another paper in the same taste, which entertained the town in 1713 and 1714. His celebrated Cato appeared in 1713. He formed the design of a tragedy upon this subject when he was very young, and wrote it when on his travels: he retouched it in England, without any intention of bringing it on the stage; but his friends being persuaded it would serve the cause of liberty, he was prevailed on by their solicitations, and it was accordingly exhibited on the theatre with a prologue by Mr Pope, and an epilogue by Dr Garth. It was received with the most uncommon applause, having run thirty-five nights without interruption; and all parties, however divided, agreed in giving this play the commendation it deserved. It was no less esteemed abroad, having been translated into French, Italian, and German; and it was acted at Leghorn, and several other places, with vast applause. The Jesuits at St Omers made a Latin version of it, and the students acted it with great magnificence. Her majesty queen Anne signified an inclination of having the play dedicated to her; but the author having proposed to dedicate it elsewhere, to avoid giving offence, published it without a dedication. He had formed a design of writing another tragedy upon the death of Socrates; but this he never carried into execution. He intended also to have composed an English dictionary upon the plan of the Italian (Della Crusca); but, upon the death of the queen, being appointed secretary to the lords justices, he had not leisure to carry on such a work. When the earl of Sunderland was appointed lord lieutenant of Ireland, Mr Addison was again made secretary for the affairs of that kingdom; and, upon the earl's being removed from the lieutenancy, he was chosen one of the lords of trade. In 1715, he began the Freeholder, a political paper, which was much admired, and proved of great use at that juncture. He published also, about this time, verses to Sir Godfrey Kneller upon the king's picture, and some to the prince of Wales with the tragedy of Cato. In April 1717, his majesty king George appointed our author one of his principal secretaries of state; but the fatigue of his employment having brought upon him an asthmatic disorder, with which he had been before afflicted, he resigned his office, and retired from business. In his retirement, he applied himself to a religious work*, which he had begun long before; part of which, scarce finished, has been printed in his works. He intended also to have given an English paraphrase of some of David's psalms; but a long and painful relapse cut short all his designs, and carried off this great man on the 17th of June 1719, in the 54th year of

* Evidences of the Xian religion.

his age. He died at Holland-house, near Kensington, leaving behind him one daughter by the countess of Warwick, to whom he was married in 1716. After his decease, Mr Tickel, by the author's instructions, published his works in four volumes in 4^{to}. In this edition, there are several pieces hitherto unmentioned, viz. The Dissertation on Medals; which, though not published till after his death, yet he had collected the materials, and began to put them in order, at Vienna, in 1702. A pamphlet, entitled, The present State of the War, and the Necessity of an Augmentation, considered. The late Trial and Conviction of Count Tariff. The Whig Examiner came out on the 14th of September 1716: there were five of these papers attributed to Mr Addison, and they are the severest pieces he ever wrote. The Drummer, or the Haunted Horse, a comedy not taken notice of in this edition, was published afterwards as Mr Addison's, by Sir Richard Steele. He is said also to have been the author of a performance entitled *Dissertatio de insignioribus Romanorum Poetis*, and of a Discourse on Ancient and Modern Learning.

ADDITAMENT, something added to another. Thus physicians call the ingredients added to a medicine already compounded, *additamenta*.

ADDITION, is the joining together or uniting two or more things, or augmenting a thing by the accession of others thereto.

ADDITION, in ARITHMETIC, ALGEBRA, &c. see these articles.

ADDITION, in music, a dot marked on the right side of a note, signifying, that it is to be sounded or lengthened half as much more as it would have been without such mark.

ADDITIONS, in heraldry, some things added to a coat of arms, as marks of honour; and therefore directly opposite to abatements. Among additions we reckon **BORDURE**, **QUARTER**, **CANTON**, **GYRON**, **PILE**, &c. See these articles.

ADDRESS, a term often used to express the skill and propriety with which an affair is conducted.

Games of ADDRESS. See **GAMES**.

An ADDRESS, in a particular acceptance, is a congratulation, petition, or remonstrance, presented to a superior, especially to the king.

ADDUCENT MUSCLES, or **ADDUCTORS**, in anatomy, those muscles which pull one part of the body towards another.

ADEL, a kingdom on the eastern coast of Africa, which reaches as far as the straits of Babelmandel, which unites the Red Sea to the sea of Arabia. This country produces corn, and feeds a great number of cattle. The inhabitants drive a trade in gold, silver, ivory, oil, frankincense, a sort of pepper, and other merchandizes of Arabia and the Indies. The king was formerly a vassal to the grand negus of Abyssinia: but being Mahometans, and the Abyssinians a sort of Christians, they could not agree; and in 1535 came to an open rupture, when the Adelites threw off the yoke, seeking protection from the Grand Signior. The principal places are, Adela, seated in the centre of the country, and is the town where the king resides; Zeila, near the Arabian Sea, is a rich town, and has a good trade: Barbora, near the sea-coast, is an ancient trading town. It rains very seldom in this country.

ADELA,

Addition
Adel.

Adelia
|
Adequate.

ADELIA, a genus of the monadelphia order, belonging to the dioecia class of plants. Of this genus there are three species; the *bernardia*, the *ricinella*, and *acideton*, for which we have no proper names in English. They are natives of Jamaica, and are akin to the ricinus or croton, and may be propagated in hot-beds from seeds procured from Jamaica; but they have little beauty, and are therefore seldom cultivated.

ADELME, or **ALDHELM**, son to Kenred, nephew to Ina, king of the West-Saxons; after having been educated abroad, was abbot of Malmbury 30 years. He was the first Englishman who wrote in Latin, the first who brought poetry into England, and the first bishop of Sherburn. He lived in great esteem till his death, which happened in 709. He was canonized, and many miracles were told of him. He is mentioned with great honour by Camden and Bayle, and his life was written by William of Malmbury.

ADELPHIANI, in church-history, a sect of ancient heretics, who fasted always on Sundays.

ADEMPION, in the civil law, implies the revocation of a grant, donation, or the like.

ADEN, formerly a rich and considerable town of Arabia the Happy. It is seated by the sea-side, a little eastward of the straits of Babelmandel.

ADENANTHERA, BASTARD FLOWER-FENCE, a genus of the monogynia order, belonging to the decandria class of plants. Only one species of this plant is known in Britain: but there is a variety, with scarlet seeds; which, however, is rare, and grows very slowly. It is a native of India, and rises to a considerable height. It is as large as the tamarind tree; spreads its branches wide on every side, and makes a fine shade; for which reason, it is frequently planted by the inhabitants in their gardens or near their habitations. The leaves of this tree are doubly winged, the flowers of a yellow colour, and disposed in a long bunch. These are succeeded by long twisted membranaceous pods, inclosing several hard compressed seeds, of a beautiful scarlet, or shining black, colour. This plant must be raised in a hot-bed, and kept during winter in a stove.

ADENBURG, or **ALDENBURG**, a town of Westphalia, and in the duchy of Burg, subject to the Elector Palatine. It is 12 miles N. E. of Cologne, and 17 W. of Bonn; E. long. 7.25. lat. 51. 2.

ADENOGRAPHY, that part of anatomy which treats of the glandular parts *.

ADENOIDES, glandulous, or of a glandular form; an epithet applied to the prostate †.

ADENOLOGY, the same with Adenography.

ADENOS, a kind of cotton, otherwise called *marine cotton*. It comes from Aleppo by the way of Mar-seilles, where it pays 20 per cent. duty.

ADEONA, in mythology, the name of a goddess invoked by the Romans when they set out upon a journey.

ADEPHAGIA, in mythology, the goddess of glutony, to whom the Sicilians paid religious worship.

ADEPS, in anatomy, the fat found in the abdomen. It also signifies animal fat of any kind *.

ADEPTS, a term among alchemists for those who pretended to have found the panacea or philosophers' stone. See **CHEMISTRY**, n° 5, 6.

ADEQUATE, something equal to or exactly corresponding with another.

ADEQUATE Idea, signifies a distinct or perfect conception of all the equalities of any object.

ABERBIJAN, a province of Persia, bounded on the N. by Armenia Proper, on the S. by Irac-Agemi, on the E. by Ghilan, and on the W. by Curdistan. The principal town is Tauris; from 42. to 48. long. from 36. to 39. lat.

ADERNO, a small place in the Val di Demona in the kingdom of Sicily: E. long. 15. 25. lat. 28. 5. The ancient Adranum: See **ADRANUM**.

ADESSENIANS, **ADESSENIARI**, in church-history, a sect of Christians, who hold the real presence of Christ's body in the eucharist, though not by way of transubstantiation. They differ considerably as to this presence; some holding that the body of Christ is in the bread; others, that it is about the bread; and others that it is under the bread.

ADFILATION, a Gothic custom, whereby the children of a former marriage are put upon the same footing with those of the second. This is also called *unio prolium*, and still retained in some parts of Germany.

AD FINES, (Antonie), a town of Switzerland, supposed to be the modern *Pfin*, in the north of the district of Turgow, on the rivulet Thur, not far from the borders of Suabia, about half-way between Constance and Frauenfeld. So called, because when Cecinna, general of the emperor Vitellius, with the auxiliary Rhetians, defeated the Helvetii, the former extended their borders thus far, their territory ending here; and, in time of the Romans, it was the last town in this quarter, and of some repute.

ADHA, (*Arab.*) A festival, which the Mahometans celebrate on the tenth day of the month *Dhoulhagiat*, which is the twelfth and last of their year. This month being particularly destined for the ceremonies which the Pilgrims observe at Mecca, it takes its name from thence, for the word signifies the *month of Pilgrimage*. On that day they sacrifice with great solemnity, at Mecca, and nowhere else, a sheep, which is called by the same name as the festival itself. The Turks commonly call this festival the *Great Beiram*, to distinguish it from the lesser, which ends their fast, and which the Christians of the Levant call the *Easter of the Turks*. The Mahometans celebrate this festival, out of the city of Mecca, in a neighbouring valley; and sometimes they sacrifice there a camel. See **BEIRAM**.

ADHATODA, in botany. See **JUSTICIA**.

ACTION or **ADHERENCE**, in Scots law; an action competent to a husband or wife, to compel either party to adhere, in case of desertion *.

ADHESION, in a general sense, implies the sticking or adhering of two bodies together.

ADHESION, in philosophy. See **ATTRACTION** of Cohesion.

ADHESION, in anatomy, a term for one part sticking to another, which in a natural state are separate. For the most part, if any of those parts in the thorax or belly lie in contact, and inflame, they grow together. The lungs very frequently adhere to the pleura.

ADJACENT, an appellation given to such things as are situated near, or adjoining to, each other.

ADIANTHUM, MAIDEN-HAIR; a genus of the order of silices, belonging to the cryptogamia class of plants.

Species. Of this genus botanical writers nume-rate

Adjunct.

rate fifteen species; the most remarkable are the following. 1. The capillus veneris, or true maiden-hair, is a native of the southern parts of France, from whence it is brought to Britain; though it is likewise said to grow plentifully in Cornwall, and the Trichomanes has been almost universally substituted for it. 2. The pedatum, or American maiden-hair, is a native of Canada; and grows in such quantities, that the French send it from thence in package for other goods, and the apothecaries at Paris use it for maiden-hair in the compositions wherein that is ordered. 3. The trapeziforme, or black American maiden-hair, is a native of Jamaica; and has shining black stalks, and leaves of an odd shape, which make an agreeable variety among other plants, so is sometimes cultivated in gardens.

Culture. The first species grows naturally out of the joints of walls, and fissures of rocks. It ought therefore to be planted in pots filled with gravel and lime-rubbish; where it will thrive much better than in good earth. It must also be sheltered under a frame during the winter.—The second is to be treated in the same manner; but the third will not thrive in Britain, unless kept in a stove during the winter*.

ADIAPHORISTS, in church-history, a name importing lukewarmness, given, in the 16th century, to the moderate Lutherans, who embraced the opinions of Melancthon, whose disposition was vastly more pacific than that of Luther.

ADJAZZO, ADRAZZO, or AJACCIO, in geography, a handsome town and castle of Corsica in the Mediterranean, with a bishop's see, and a good harbour. It is populous, and fertile in wine. It is 27 miles S. W. of Corte. E. long. 41. 54. lat. 38. 5.

ADJECTIVE. See GRAMMAR, n° 50, 51.

ADIGE, a river in Italy, which taking its rise south of the lake Glacc among the Alps, runs south by Trent, then east by Verona in the territory of Venice, and falls into the gulph of Venice, north of the mouth of the Po.

ADJOURNMENT, the putting off a court, or other meeting, till another day. There is a difference between the adjournment and the prorogation of the parliament; the former not only being for a shorter time, but also done by the house itself; whereas the latter is an act of royal authority.

ADIPOSE, a term used by anatomists for any cell, membrane, &c. that is remarkable for its fatness.

ADIRBEITSAN, in geogr. a province of Persia, in Asia, and part of the ancient Media. It is bounded on the N. by the province of Shirvan, on the S. by Irac-Agemi and Curditan, on the E. by Gilan and the Caspian sea, and on the W. by Turcomania.

ADIT, the passage to, or entrance of, any thing; as the adit of a mine, &c.

ADJUDICATION, implies the act of adjudging, or determining, a cause in favour of some person.

ADJUDICATION, in Scots law, the name of that action by which a creditor attaches the heritable estate of his debtor, or his debtor's heir, in order to appropriate it to himself, either in payment or security of his debt; or, that action by which the holder of an heritable right, labouring under any defect in point of form, may supply that defect*.

ADJUNCT, among philosophers, signifies something added to another, without being any necessary part of

it. Thus water absorbed by cloth or a sponge, is an adjunct, but no necessary part of either of these substances.

ADJUNCT, in metaphysics, some quality belonging to either the body or mind, whether natural or acquired. Thus thinking is an adjunct of the mind, and growth an adjunct of the body.

ADJUNCT, in music; a word which is employed to denominate the connection or relation between the principal mode and the modes of its two-fifths, which, from the intervals that constitute the relation between them and it, are called its *adjuncts*.

ADJUNCT is also used to signify a colleague, or some person associated with another as an assistant.

ADJUNCT *Gods*, or ADJUNCTS *of the Gods*, among the Romans, were a kind of inferior deities, added as assistants to the principal ones, to ease them in their functions. Thus, to Mars was adjoined Bellona and Nemesis; to Neptune, Salacia; to Vulcan, the Cabiri; to the Good Genius, the Lares; to the Evil, the Lemures, &c.

ADJUNCTS, in rhetoric and grammar, signify certain words or things added to others, to amplify or augment the force of the discourse.

ADJUNCTS, or ADJOINTS, in the royal academy of sciences at Paris, denote a class of members, attached to the pursuit of particular sciences. The class of *Adjuncts* was created in 1716, in lieu of the *Elèves*; they are twelve in number; two for geometry, two for mechanics, two for astronomy, two for anatomy, two for chemistry, and two for botany. The *Elèves* not taken into this establishment were admitted on the foot of supernumerary *Adjuncts**.

ADJUTANT, in the military art, is an officer whose business it is to assist the major. Each battalion of foot and regiment of horse has an adjutant, who receives the orders every night from the brigade-major; which, after carrying them to the colonel, he delivers out to the serjeants. When detachments are to be made, he gives the number to be furnished by each company or troop, and assigns the hour and place of rendezvous. He also places the guards; receives, and distributes the ammunition to the companies, &c.; and, by the major's orders, regulates the prices of bread, beer, and other provisions. The word is sometimes used by the French for an *aid-du-camp*.

ADJUTANTS-general, among the Jesuits, a select number of fathers, residing with the general of the order, each of whom has a province or country assigned him, as England, Holland, &c. and their business is to inform the father-general of state-occurrences in such countries. To this end they have their correspondents delegated, emissaries, visitors, regents, provincials, &c.

ADJUTORIUM, a term used by physicians for any medicine in a prescription but the capital one.

ADLE-EGGS, such as have not received an impregnation from the semen of the cock.

ADLOCUTION, ADLOCUTIO, in antiquity, is chiefly understood of speeches made by Roman generals to their armies, to encourage them before a battle. We frequently find these adlocutions expressed on medals by the abbreviation ADLOCUT. COH.—The general is sometimes represented as seated on a tribunal, often on a bank or mount of turf, with the cohorts

Admiral

Admiral

ranged orderly round him, in *manipuli* and *turmae*. The usual formula in adlocutions was, *Fortis est ac fidus*.

ADMICULE, a term used, chiefly in old law-books, to imply an aid, help, assistance, or support. The word is Latin, *admiculum*; and derived from *admiculor*, to prop, or support.

ADMICULES, in Scots law, signifies any writing or deed referred to by a party, in an action of law, for proving his allegations.

ADMICULATOR, an ancient officer of the church, whose business it was to attend to and defend the cause of the widows, orphans, and others destitute of help.

ADMINISTRATION, in general, the government, direction, or management of affairs, and particularly the exercise of distributive justice; among ecclesiastics, it is often used to express the giving or dispensing the sacraments, &c.

ADMINISTRATION, is also the name given by the Spaniards in Peru to the staple magazine, or warehouse, established at Callao, a small town on the S. Sea, which is the port of Lima, the capital of that part of South America, and particularly of Peru. The foreign ships, which have leave to trade along that coast, are obliged to unload here, paying 13 per cent. of the price they sell for, if the cargo be entire, and even 16 per cent. if otherwise; besides which, they pay 3 per 1000, duty, for consularship and some other small royal rights and claims.

ADMINISTRATOR, in law. See there, N^o xiv. 3, 7, 8. and clxi. 6.

ADMINISTRATOR, is sometimes used for the president of a province; for a person appointed to receive, manage, and distribute, the revenues of an hospital or religious house; for a prince who enjoys the revenues of a secularized bishopric; and for the regent of a kingdom, during a minority of the prince, or a vacancy of the throne.

ADMIRABILIS SAL, the same with Glauber's salt. See CHEMISTRY, n^o 124.

ADMIRAL, a great officer, or magistrate, who has the government of a navy, and the hearing of all maritime causes.

Authors are divided with regard to the origin and denomination of this important officer, whom we find established in most kingdoms that border on the sea. But the most probable opinion is that of Sir Henry Spelman, who thinks, that both the name and dignity were derived from the Saracens, and, by reason of the holy wars, brought amongst us; for *admiral*, in the Arabian language, signifies a prince, or chief ruler, and was the ordinary title of the governors of cities, provinces, &c. and therefore they called the commander of the navy by that name, as a name of dignity and honour. And indeed there are no instances of admirals in this part of Europe before the year 1284, when Philip of France, who had attended St Lewis in the wars against the Saracens, created an admiral. Du Cange assures us, that the Sicilians were the first, and the Genoese the next, who gave the denomination of Admiral to the commanders of their naval armaments; and that they took it from the Saracens or Arabic *E-mir*, a general name for every commanding officer. As for the exact time when the word was introduced among us, it is uncertain; some think it was in the reign of

Edward I. Sir Henry Spelman is of opinion that it was first used in the reign of Henry III. because neither the laws of Oleron made in 1266, nor Bracton, who wrote about that time, make any mention of it; and that the term *admiral* was not used in a charter in the eighth of Henry III. wherein he granted this office to Richard de Lacey, by these words *Maritimanus Anglie*; but in the 56th year of the same reign, not only the historians, but the charters themselves, very frequently use the word *admiral*.

Anciently there were generally three or four admirals appointed in the English seas, all of them holding the office *durante bene placito*; and each of them having particular limits under their charge and government; as admirals of the fleet of ships, from the mouth of the Thames northward, southward, or westward. Besides these, there were admirals of the Cinque Ports, as in the reign of Edward III. when one William Latimer was styled *admiralis quinque portuum*; and we sometimes find that one person has been admiral of the fleets to the southward, northward, and westward: but the title of *admiralis Anglie* was not frequent till the reign of Henry IV. when the king's brother had that title given him, which in all commissions afterwards was granted to the succeeding admirals. It may be observed, that there was a title above that of admiral of England, which was, *locum-tenens regis super mare*, the king's lieutenant-general of the sea; this title we find mentioned in the reign of Richard II.—Before the use of the word *admiral* was known, the title of *custos maris* was made use of.

Lord High ADMIRAL of England, in some ancient records called *capitaneus maritimarum*, an officer of great antiquity and trust, as appears by the laws of Oleron, so denominated from the place they were made at by Richard I. The first title of Admiral of England, expressly conferred upon a subject, was given by patent of Richard II. to Richard Fitz-Allen, jun^r, earl of Arundel and Surrey; for those who before enjoyed this office were simply termed admirals, though their jurisdiction seems as large, especially in the reign of Edward III. when the court of admiralty was first erected.

This great officer has the management of all maritime affairs, and the government of the royal navy, with power of decision in all maritime cases, both civil and criminal: he judges of all things done upon or beyond the sea, in any part of the world: upon the sea-coasts, in all ports and havens, and upon all rivers below the first bridge from the sea. By him, vice-admirals, rear-admirals, and all sea-captains, are commissioned; all deputies for particular coasts, and coroners to view dead bodies found on the sea-coasts, or at sea: he also appoints the judges for his court of admiralty, and may imprison, release, &c. All ports and havens are *infra corpus comitatus*, and the admiral hath no jurisdiction of any thing done in them. Between high and low water-mark, the common-law and the high-admiral have jurisdiction by turns, one upon the water, and the other upon the land.

The lord-admiral has power, not only over the seamen serving in his ships of war, but over all other seamen, to arrest them for the service of the state; and, if any of them run away, without leave of the admiral, he hath power to make a record thereof, and certify the same to the sheriffs, mayors, bailiffs, &c. who shall

shall cause them to be apprehended and imprisoned. To the lord high-admiral belong all penalties and amercements of all transgressions at sea, on the sea-shore, in ports and havens, and all rivers below the first bridge from the sea; the goods of pirates and felons condemned or enslaved, sea-wrecks, goods floating on the sea, or cast on the shore (not granted to lords of manors adjoining to the sea), and a share of royal prizes; also all great fishes, commonly called royal fishes, except whales and sturgeons: to which add, a salary of 7000*l.* a-year.

In short, this is so great an office, in point of trust, honour, and profit, that it has been usually given to princes of the blood, or the most eminent persons among the nobility. We have had no high admiral for some years; the office being put in commission, or under the administration of the lords commissioners of the admiralty, who by statute have the same power and authority as the lord high admiral.

High Admiral in Scotland, a judge invested with supreme jurisdiction in all maritime cases within that part of Britain.

ADMIRAL, also implies the commander in chief of any single fleet or squadron; or, in general, any flag-officer whatever. The commander of a fleet carries his flag at the main-top-mast head.

Vice Admiral, is the commander of the second squadron, and carries his flag at the fore-top-mast head.

Rear Admiral, is the commander of the third squadron, and carries his flag at the mizzen-top-mast head.

Vice Admiral, is also an officer appointed by the lords commissioners of the admiralty. There are several of these officers established in different parts of Great Britain, with judges and marshals under them, for executing jurisdiction within their respective limits. Their decrees, however, are not final, an appeal lying to the court of admiralty in London.

ADMIRAL is also an appellation given to the most considerable ship of a fleet of merchant-men, or of the vessels employed in the cod-fishery of Newfoundland. This last has the privilege of choosing what place he pleases on the shore to dry his fish; gives proper orders, and appoints the fishing-places to those who come after him; and as long as the fishing-season continues, he carries a flag on his main-mast.

ADMIRAL, in zoology, the English name of a species of the voluta, a shell-fish belonging to the order of vermes testacea. See *VOLUTA*.

ADMIRALTY properly signifies the office of lord high-admiral, whether discharged by one single person, or by joint commissioners called lords of the admiralty.

Court of Admiralty, is a sovereign court, held by the lord high-admiral, or lords of the admiralty, where cognizance is taken in all maritime affairs, whether civil or criminal.—All crimes committed on the high-seas, or on great rivers below the first bridge next the sea, are cognizable in this court only, and before which they must be tried by judge and jury. But in civil cases the mode is different, the decisions being all made according to the civil law. From the sentences of the admiralty-judge an appeal always lay, in ordinary course, to the king in chancery, as may be collected from statute 25 Hen. VIII. c. 19. which directs the appeal from the archbishop's courts to be determined by persons named in the king's commission, "like as in

"case of appeal from the admiral-court." But this is also expressly declared by statute 8 Eliz. c. 5. which enacts, that upon an appeal made to the chancery, the sentence definitive of the delegates appointed by commission shall be final.

Appeals from the vice-admiralty courts in America, and our other plantations and settlements, may be brought before the courts of admiralty in England, as being a branch of the admiral's jurisdiction, tho' they may also be brought before the king in council. But in case of prize-vessels, taken in time of war, in any part of the world, and condemned in any courts of admiralty or vice-admiralty as lawful prize, the appeal lies to certain *commissioners of appeals* consisting chiefly of the privy council, and not to judges delegates. And this by virtue of divers treaties with foreign nations, by which particular courts are established in all the maritime countries of Europe for the decision of this question, Whether lawful prize or not: for this being a question between subjects of different states, it belongs entirely to the law of nations, and not to the municipal laws of either country, to determine it.

Court of Admiralty in Scotland. See *LAW*, Part III. N^o clvii. 15.

ADMIRATION, in general, denotes surprize, wonder, or astonishment, at any extraordinary event. Sometimes also it signifies the expression of wonder. The point of admiration, in grammar, is marked, thus [!].

ADMONITION, in ecclesiastical affairs, a part of discipline much used in the ancient church. It was the first act, or step, towards the punishment or expulsion of delinquents. In case of private offences, it was performed according to the evangelical rule, privately: in case of public offence, openly, before the church. If either of those sufficed for the recovery of the fallen person, all further proceedings in the way of censure ceased: if they did not, recourse was had to excommunication.

ADMONITIO Fustium, among the Romans, a military punishment, not unlike our whipping, only it was performed with vine-branches.

ADMORTIZATION, in the feudal customs, the reduction of the property of lands or tenements to mortmain. See *MORTMAIN*.

ADNATA, in anatomy, one of the coats of the eye, which is also called *conjunctiva* and *albuginea* *.

ADNATA, is also used for any hair, wool, or the like, which grows upon animals or vegetables.

ADNOUN, is used by some grammarians to express what we more usually call an Adjective. The word is formed by way of analogy, to adverb; in regard adjectives have much the same office and relation to nouns, that adverbs have to verbs. Bishop Wilkins uses the word *adname* in another sense, *viz.* for what we otherwise call a preposition.

ADOLESCENCE, the state of growing youth; or that period of a person's age commencing from his infancy, and terminating at his full stature or manhood. The word is formed of the Latin *adolescere*, to grow.—The state of adolescence lasts so long as the fibres continue to grow, either in magnitude or firmness. The fibres being arrived at the degree of firmness and tension sufficient to sustain the parts, no longer yield and give way to the efforts of the nutritious matter to extend them; so that their farther accretion

Adon
Adonis.

cretion is stopped, from the very law of their nutrition. ADOLLAM, or ODOLLAM, (anc. geogr.) a town in the tribe of Judah, to the east of Eleutheropolis. David is said to have hid himself in a cave near this town, (Bible.)

ADON, a populous village in the province of Stuhl-Weissenberg, belonging to Hungary. It lies in a fruitful country, towards the river Danube. Long. 19. 20. Lat. 47. 30.

ADONAI, one of the names of the Supreme Being in the scriptures. The proper meaning of the word is *my lord*, in the plural number; as *Adoni* is *my lord*, in the singular.

ADONIA, in antiquity, solemn feasts in honour of Venus, and in memory of her beloved Adonis. The Adonia were observed with great solemnity by most nations; Greeks, Phœnicians, Lycians, Syrians, Egyptians, &c. From Syria, they are supposed to have passed into India. The prophet Ezekiel* is understood to speak of them. They were still observed at Alexandria, in the time of St Cyril; and at Antioch in that of Julian the apostate, who happened to enter that city during the solemnity, which was taken for an ill omen. The Adonia lasted two days: on the first of which certain images of Venus and Adonis were carried, with all the pomp and ceremonies practised at funerals; the women wept, tore their hair, beat their breasts, &c. imitating the cries and lamentations of Venus for the death of her paramour. This lamentation they called *Adoniae pos*. The Syrians were not contented with weeping, but gave themselves discipline, shaved their heads, &c. Among the Egyptians, the queen herself used to carry the image of Adonis in procession. St Cyril mentions an extraordinary ceremony practised by the Alexandrians: A letter was written to the women of Byblus, to inform them that Adonis was found again: this letter was thrown into the sea, which (it was pretended) did not fail punctually to convey it to Byblus in seven days; upon the receipt of which, the Byblian women ceased their mourning, sung his praises, and made rejoicings as if he were raised to life again: Or rather, according to Meursius, the two offices of mourning and rejoicing made two distinct feasts, which were held at different times of the year, the one six months after the other; Adonis being supposed to pass half the year with Proserpine, and half with Venus.—The Egyptian Adonia are said to have been held in memory of the death of Osiris; by others, of his sickness and recovery. Bishop Patrick dates their origin from the slaughter of the first-born under Moses.

ADONIDES, in botany, a name given to botanists who described or made catalogues of plants cultivated in any particular place.

ADONIS, son to Cinyras king of Cyprus, the darling of the goddess Venus: being killed by a wild boar in the Idalian woods, he was turned into a flower of a blood-colour, supposed to be the Anemone. Venus was inconsolable; and no grief was ever more celebrated than this, most nations having perpetuated the memory of it by a train of anniversary ceremonies*. Among Shakspeare's poems, is a long one on the subject of Venus's affection for Adonis. See MYRRHA.

ADONIS, in zoology. See EXCOEETUS.

ADONIS, or BIRDS-EYE, or PHEASANTS-EYE; a genus of the polyandria order, belonging to the polygynia class of plants.

Adonis
Adoption

Species. Of this genus there are four different species enumerated; the most remarkable are the following. 1. The annua, or common adonis, is a native of Kent, where it is found in great plenty in the fields sown with wheat. Its flowers are of a beautiful scarlet colour, and appear in the beginning of June; the seeds ripening in August and September. Great quantities of these flowers are sold in London, under the name of Red Morocco. 2. The æstivalis, or annual adonis, with yellow flowers, grows much taller than the first, has its leaves thinner set, and of a lighter colour. 3. The vernalis, or perennial adonis, grows naturally on the mountains of Bohemia, Prussia, and other parts of Germany. It flowers the latter end of March, or beginning of April; the stalks rise about a foot and a half high; and when the roots are large, and have stood unremoved for some years, they will put out a great number of stalks from each root; on the top of each of these grows one large yellow flower. 4. The apennina, represented on Plate III. fig. 1. is a native of Siberia and the Appennines.

Culture. The first two species, being annual, must be propagated from seeds, which ought to be sown in autumn, soon after they are ripe, or they will be in danger of not growing up that year. They thrive best in a light soil. The third and fourth species are likewise to be propagated from seeds, which must be sown in autumn, or they seldom succeed. When the plants come up, they must be carefully kept clear from weeds; and in very dry weather their growth will be promoted by being now and then watered. They should remain in the place where they are sown till the second year; and be transplanted thence in autumn, to the place where they are to remain.

ADOPTIANI, in church-history, a sect of ancient heretics, followers of Felix of Urgel, and Elipand of Toledo, who, towards the end of the eighth century, advanced the notion, that Jesus Christ, in his human nature, is the son of God, not by nature, but by adoption.

ADOPTION, an act by which any one takes another into his family, owns him for his son, and appoints him for his heir.—The custom of adoption was very common among the ancient Romans; yet it was not practised, but for certain causes expressed in the laws, and with certain formalities usual in such cases: they first learnt it from the Greeks, among whom it was called *τὸν υἱὸν*. This adoption was a sort of imitation of nature, intended for the comfort of those who had no children: wherefore he that was to adopt was to have no children of his own, and to be past the age of getting any; nor were eunuchs allowed to adopt, as being under an actual impotency of begetting children; neither was it lawful for a young man to adopt an elder, because that would have been contrary to the order of nature; nay, it was even required that the person who adopted should be eighteen years older than his adopted son, that there might at least appear a probability of his being the natural father.—Among the Turks, the ceremony of adoption is performed by obliging the person adopted to pass thro' the shirt of the adopter. Hence, among that people, to adopt, is expressed by the phrase, *to draw another through my shirt*. It is said, that something like this has also been observed among the Hebrews; where the prophet Elijah adopted Elisha for his son and successor, and communicated

*Ch.viii. 14.

See Adonia. of it by a train of anniversary ceremonies. Among Shakspeare's poems, is a long one on the subject of Venus's affection for Adonis. See MYRRHA.

ated to him the gift of prophecy, by letting fall his cloak or mantle on him. But *adoption*, properly so called, does not appear to have been practised among the ancient Jews: Moses says nothing of it in his laws; and Jacob's adoption of his two grandsons, Ephraim and Manasseh, is not so properly an adoption, as a kind of substitution, whereby those two sons of Joseph were allotted an equal portion in Israel with his own sons.

ADOPTION is also used, in theology, for a federal act of God's free grace; whereby those who are regenerated by faith, are admitted into his household, and entitled to a share in the inheritance of the kingdom of heaven.

ADORATION, the act of rendering divine honours; or of addressing a being, as supposing it a god. The word is compounded of *ad*, to; and *or*, *oris*, mouth; and literally signifies, to apply the hand to the mouth; *Manum ad os admoveo*, *q. d.* to kiss the hand; this being, in the eastern countries, one of the great marks of respect and submission.—The Romans practised adoration at sacrifices, and other solemnities; in passing by temples, altars, groves, &c.; at the sight of statues, images, or the like, whether of stone or wood, wherein any thing of divinity was supposed to reside. Usually there were images of the gods placed at the gates of cities, for those who went in or out, to pay their respects to.—The ceremony of adoration among the ancient Romans was thus: The devotee having his head *covered*, applied his right hand to his lips, the fore-finger resting on his thumb, which was erect, and thus bowing his head, turned himself round from left to right. The kiss thus given was called *osculum labratum*; for ordinarily they were afraid to touch the images of their gods themselves with their profane lips. Sometimes, however, they would kiss their feet, or even knees, it being held an incivility to touch their mouths; so that the affair passed at some distance. Saturn, however, and Hercules, were adored with the head *bare*; whence the worship of the last was called *institutum peregrinum*, and *ritus Græcivicius*, as departing from the customary Roman method, which was to sacrifice and adore with the face veiled, and the cloths drawn up to the ears, to prevent any interruption in the ceremony by the sight of unlucky objects.—The Jewish manner of adoration was by prostration, bowing, and kneeling.—The Christians adopted the Grecian rather than the Roman method, and adored always *uncovered*. The ordinary posture of the ancient Christians was kneeling, but on Sundays standing; and they had a peculiar regard to the East, to which point they ordinarily directed their prayers.

ADORATION is more particularly used for the act of praying, or preferring our requests or thanksgivings to Almighty God.

ADORATION is also used for certain extraordinary civil honours or respects which resemble those paid to the Deity, yet are given to men.

The Persian manner of *Adoration*, introduced by Cyrus, was by bending the knee, and falling on the face at the prince's feet, striking the earth with the forehead, and kissing the ground. This ceremony, which the Greeks called *προσκύνησις*, Conon refused to perform to Artaxerxes, and Calisthenes to Alexander the Great, as repugnant to impiety and unlawful.

The *Adoration* performed to the Roman and Grecian

emperors consisted in bowing or kneeling at the prince's feet, laying hold of his purple robe, and presently withdrawing the hand and clapping it to the lips. Some attribute the origin of this practice to Constantine. It was only persons of some rank or dignity that were entitled to the honour. Bare kneeling before the emperor to deliver a petition, was also called *adoration*.

The practice of *adoration* may be said to be still subsisting in England, in the ceremony of kissing the king's or queen's hand, and in serving them at table, both being performed kneeling.

ADORATION is more particularly used for kissing one's hand in presence of another, as a token of reverence.—The Jews adored by kissing their hands and bowing down their heads; whence, in their language, *kissing* is properly used for *adoration*.

ADORATION is also used among Roman writers for a high species of applause given to persons, who had spoken or performed well in public*. We meet with adoration paid to orators, actors, musicians, &c. The method of expressing it was, by rising, putting both hands to their mouth, and then returning them towards the person intended to be honoured.

ADORATION is also used, in the court of Rome, for the ceremony of kissing the pope's feet.—The introduction of adoration among the Romans is ascribed to the low flattery of Vitellius, who, upon the return of C. Cæsar from Syria, would not approach him otherwise than with his head covered, turning himself round, and then falling on his face. Heliogabalus restored the practice, and Alexander Severus again prohibited it. Dioclesian redemanded it; and it was, in some measure, continued under the succeeding princes, even after the establishment of Christianity, as Constantine, Constantius, &c. It is particularly said of Dioclesian, that he had gems fastened to his shoes, that divine honours might be more willingly paid him, by kissing his feet. The like usage was afterwards adopted by the popes, and is observed to this day. These prelates finding a vehement disposition in the people to fall down before them and kiss their feet, procured crucifixes to be fastened on their slippers; by which stratagem, the adoration intended for the pope's person is supposed to be transferred to Christ. Divers acts of this adoration we find offered even by princes to the pope.

ADORATION is also used for a method of electing a pope. The election of popes is performed two ways; by *adorations*, and by *scrutiny*. In election by adoration, the cardinals rush hastily, as if agitated by some spirit, to the adoration of some one among them, to proclaim him pope. When the election is carried by scrutiny, they do not adore the new pope till he is placed on the altar.

Barbarous ADORATION is a term used, in the laws of king Canute, for that performed after the manner of the heathens who adored idols. The Romish church is charged with the adoration of saints, martyrs, images, crucifixes, relics, the virgin, and the host; all which by Protestants are generally aggravated into idolatry, on a supposition, that the honour thus paid to them is absolute and supreme, called by way of distinction *Latria*, which is due only to God. Roman-catholics, on the contrary, explain them, as only a relative or subordinate worship, called *Dulia* and *Hyperdulia*, which terminates ultimately in God alone. But may not the same

fame be said of the idol-worship of the heathens? The Phœnicians adored the winds, on account of the terrible effects produced by them; the fame was adopted by most of the other nations, Persians, Greeks, Romans, &c. The Persians chiefly paid their adorations to the sun and fire; some say also to rivers, the wind, &c. The motive of adoring the sun was the benefits they received from that glorious luminary, which of all creatures has doubtless the best pretensions to such homage.

ADOSCULATION, a term used by Dr Grew, to imply a kind of impregnation, without intromission; and in this manner he supposes the impregnation of plants is effected by the falling of the farina fecundans on the pistil.

ADOSEE, in heraldry, signifies two figures or bearings being placed back to back.

ADOUR, the name of a river of France, which rises in the mountains of Bigorre, and running N. by Tarbes through Gascony, afterwards turns E. and, passing by Dax, falls into the bay of Biscay, below Bayonne.

ADOXA, **TUBEROUS MOSCHATEL**, or **HOLLOW-ROOT**; a genus of the tetragynia order, belonging to the octandria class of plants. This is a native of the woods in Britain, and several parts of Europe: it is a very low plant, seldom rising more than four or five inches high; the leaves resemble those of bulbous fumitory; the flower-stalk arises immediately from the root, on the top of which grow four or five small flowers of an herbaceous white colour, which appear in the beginning of April, and the berries ripen in May; soon after which, the leaves decay. The herb may be procured by transplanting the roots any time after the leaves decay, till winter. They must be planted in the shade, under shrubs; for they will not thrive if exposed to the sun. The leaves and flowers smell like musk, from whence it has by some been called *musk-crowfoot*.

AD Pondus Omnium, among physicians, an abbreviation in their prescriptions, signifying that the last mentioned ingredient is to weigh as much as all the rest together.

AD Quod Damnum, in the English law, a writ directed to the sheriff, commanding him to inquire into the damage which may befall from granting certain privileges to a place, as a fair, market, or the like.

ADRAMMELECH, one of the gods of the inhabitants of Sepharvaim, who were settled in the country of Samaria, in the room of those Israelites who were carried beyond the Euphrates. The Sepharvaimes made their children pass through the fire, in honour of this idol and another called Anamelech. It is supposed, that Adrammelech meant the sun, and Anamelech the moon: the first signifies the *magnificent king*; the second the *gentle king*. See **ANAMELECH**.

ADRAMYTTIUM, (anc. geogr.) now *Andramiti*; a town of Mysia Major, at the foot of mount Ida, an Athenian colony, with a harbour and dock near the Caicus. *Adramyttenus* the epithet; as, *Adramyttenus Sinus*, a part of the Egean Sea, on the coast of Mysia; *Adramyttenus Conventus*, sessions or assizes. The eighth in order of the nine *Conventus Juridici* of the province of Asia.

ADRANUM, or **HADRANUM**, (anc. geogr.) now *Aderno*, a town of Sicily, built by the elder Dionysius, at the foot of mount Ætna, (Diodorus Siculus), four

hundred years before Christ. So called from the temple of Adranus, or Hadranus, a god much worshipped by the Sicilians; with a river of the same name, (Stephanus,) now *Fiume d' Aderno*. The inhabitants, *Hadrantani*, and *Adranita*.

ADRASTIA, in antiquity, an epithet given to the goddess Nemesis, or Revenge. It was taken from king Adrastus, who first erected a temple to that deity.

ADRASTIA Certamina, in antiquity, a kind of Pythian games, instituted by Adrastus king of Argos, in the year of the world 2700, in honour of Apollo, at Sicyon. These are to be distinguished from the Pythian games celebrated at Delphi.

ADRASTUS, king of Argos, son of Talaus and Lysianissa, daughter of Polybius king of Sicyon, acquired great honour in the famous war of Thebes, in support of Polyneices his son-in-law, who had been excluded the sovereignty of Thebes by Eteocles his brother, notwithstanding their reciprocal agreement. Adrastus, followed by Polyneices and Tydeus his other son-in-law, by Capaneus and Hippomedon his sister's sons, by Amphiarus his brother-in-law, and by Parthenopæus, marched against the city of Thebes; and this is the expedition of the Seven Worthies, which the poets have so often sung. They all lost their lives in this war, except Adrastus, who was saved by his horse called Arion. This war was revived ten years after by the sons of those deceased warriors, which was called the war of the Epigones, and ended with the taking of Thebes. None of them lost their lives, except Ægialeus son of Adrastus; which afflicted him so much, that he died of grief in Megara, as he was leading back his victorious army.

ADRAZZO, or **AJACCIO**. The same with **ADJAZZO**.

ADRIA, or **HADRIA**, (anc. geogr.) the name of two towns in Italy. One in the country of the Veneti, on the river Tartarus, between the Padus and the Athetis, called *Atria* by Pliny and Ptolemy, but *Adrias* by Strabo. Another on the river Vomanus, in the territory of the Piceni, (to which Antonine's Itinerary from Rome is directed,) the country of the ancestors of the emperor Adrian. From which of these the Adriatic sea is denominated, is matter of doubt. A third opinion is, that it is so called from Adrias the son of Ioan, of Italian origin; (Eustathius in Dionysium.)

ADRIANUM (or **ADRIATICUM**) **MARE**, (anc. geogr.) now the Gulf of Venice, a large bay in the Mediterranean, between Dalmatia, Slavonia, Greece, and Italy. It is called by the Greeks, *Ἀδριακὸν Πέλαγος*; and *Adria* by the Romans, as *Arbiter Adria Notus*, Hor. Cicero calls it *Hadrianum Mare*; Virgil has *Hadriaticæ Undæ*. It is commonly called *Mare Adriaticum*, without an aspiration; but whether it ought to have one, is a dispute: if the appellation is from *Hadria*, the town of the Piceni, it must be written *Hadriaticum*, because the emperor's name, who thence derives his origin, is on coins and stones *Hadrianus*; but if from the town in the territory of Venice, as the more ancient, and of which that of the Piceni is a colony, this will justify the common appellation *Adriaticum*.

ADRIAN, or **HADRIAN**, (Publius Ælius), the Roman emperor. He was born at Rome the 24th of January, in the 76th year of Christ. His father left him

Adrastrus
||
Adrian.

Adrian.

an orphan, at ten years of age, under the guardianship of Trajan, and Cælius Tatianus a Roman knight. He began to serve very early in the armies, having been tribune of a legion before the death of Domitian. He was the person chosen by the army of Lower Mœsia, to carry the news of Nerva's death to Trajan, successor to the empire. He accompanied Trajan in most of his expeditions, and particularly distinguished himself in the second war against the Daci; and having before been quæstor, as well as tribune of the people, he was now successively prætor, governor of Pannonia, and consul. After the siege of Atræ in Arabia was raised, Trajan, who had already given him the government of Syria, left him the command of the army: and at length, when he found death approaching, it is said he adopted him. Adrian, who was then in Antiochia, as soon as he received the news thereof, and of Trajan's death, declared himself emperor, on the 11th of August, 117. No sooner had he arrived at the imperial dignity, than he made peace with the Persians, to whom he yielded up great part of the conquests of his predecessors; and from generosity, or policy, he remitted the debts of the Roman people, which, according to the calculation of those who have reduced them to modern money, amounted to 22,500,000 golden crowns; and he burnt all the bonds and obligations relating to those debts, that the people might be under no apprehension of being called to an account for them afterwards. There are medals in commemoration of this fact, in which he is represented holding a flambeau in his hand, to set fire to all those bonds which he had made void. He went to visit all the provinces; and did not return to Rome till the year 118, when the senate decreed him a triumph, and honoured him with the title of Father of his country; but he refused both, and desired that Trajan's image might triumph. No prince travelled more than Adrian; there being hardly one province in the empire which he did not visit. In 120 he went into Gaul; from thence he went over to Britain, in order to subdue the Caledonians, who were making continual inroads into the provinces. Upon his arrival, they retired towards the north: he advanced however as far as York, where he was diverted from his intended con-

VOL. I.

Adrian.

quest by the description some old soldiers he found there, who had served under Agricola, gave him of the country. In hopes, therefore, of keeping them quiet by enlarging their bounds, he delivered up to the Caledonians all the lands lying between the two Friths and the Tyne; and at the same time, to secure the Roman province from their future incursions, built the famous wall which still bears his name (A). Having thus settled matters in Britain, he returned to Rome, where he was honoured with the title of Restorer of Britain, as appears by some medals. He soon after went into Spain, to Mauritania, and at length into the East, where he quieted the commotions raised by the Parthians. After having visited all the provinces of Asia, he returned to Athens in 125, where he passed the winter, and was initiated in the mysteries of Eleusinian Ceres. He went from thence to Sicily, chiefly to view mount Ætna, contemplate its phenomena, and enjoy the beautiful and extensive prospect afforded from its top. He returned to Rome the beginning of the year 129; and, according to some, he went again, the same year, to Africa; and, after his return from thence, to the east. He was in Egypt in the year 132, revisited Syria the year following, returned to Athens in 134, and to Rome in 135. The persecution against the Christians was very violent under his reign; but it was at length suspended, in consequence of the remonstrances of Quadrat bishop of Athens, and Aristides, two Christian philosophers, who presented the emperor with some books in favour of the Christian religion. He conquered the Jews; and, by way of insult, erected a temple to Jupiter on Calvary, and placed a statue of Adonis in the manger of Bethlehem; he caused also the images of swine to be engraven on the gates of Jerusalem. At last he was seized with a drop-sy, which vexed him to such a degree, that he became almost raving mad. A great number of physicians were sent for, and to the multitude of them he ascribed his death. He died at Baize in the 63^d year of his age, having reigned 21 years. The Latin verses (B) he addressed to his soul have been much criticised and variously interpreted. There are some fragments of his Latin poems extant, and there are Greek verses of his in the Anthology. He also wrote the history of

M

his

(A) This work, though called by the Roman historians *murus*, which signifies a wall of stone, was only composed of earth covered with green turf. It was carried on from the Solway Frith, a little west of the village of Burgh on the Sands, in as direct a line as possible, to the river Tyne on the east, at the place where the town of Newcastle now stands; so that it must have been above 60 English, and near 70 Roman miles in length. It consisted of four parts: 1. The principal *agger*, mound of earth, or rampart, on the brink of the ditch. 2. The ditch on the north side of the rampart. 3. Another rampart on the south side of the principal one, about five paces distant from it. 4. A large rampart on the north side of the ditch.—This last was probably the military way to the line of forts on this work: it was so to those formerly built by Agricola; and if it did not serve the same purpose in this, there must have been no military way attending it.—The fourth rampart might serve for an inner defence in case the enemy should beat them from any part of the principal rampart, or it might be designed to protect the soldiers from any sudden attack of the provincial Britons.—For many ages, this work hath been in so ruinous a condition, that it is impossible to discover its original dimensions with certainty. From their appearance its seems probable that the principal rampart was at least 10 or 12 feet high, and the fourth one not much less; but the north one was considerably lower. From the dimensions of the ditch taken as it passes through a lime-stone quarry near Harlow hill, it appears to have been 9 feet deep, and 11 wide at the top, but somewhat narrower at the bottom. The north rampart was about 20 feet distant from the ditch.

(B) The verses are these:

Animula vagula, blandula,
Hospes, comeseque corporis,
Quæ nunc abhis in loca
Pallidula, rigida, nudula,
Nec, ut soles, dabis jocos?

Thus translated by Mr Pope:

Ah! fleeing spirit! wand'ring fire,
That long hast warm'd my tender breast,
Must thou no more this frame inspire?
No more a pleasing cheerful guest?
Whither, ah whither art thou flying?
To what dark undiscover'd shore?
Thou seem'st all trembling, shiv'ring, dying,
And wit and humour are no more!

Adrian.

his own life : to which, however, he did not chuse to put his name ; but that of Phlegon, one of his freedmen, a very learned person, was prefixed to it *. He had great wit, and an extensive memory. He understood the sciences perfectly well ; but was very jealous of others who excelled in them. He was also cruel, envious, and lascivious. Antoninus his successor obtained his apotheosis ; and prevented the rescission of his acts, which the senate once intended.

ADRIAN IV. (Pope), the only Englishman who ever had the honour of sitting in the papal chair. His name was Nicholas Brekepere ; and he was born at Langley, near St Alban's, in Hertfordshire. His father having left his family, and taken the habit of the monastery of St Alban's, Nicholas was obliged to submit to the lowest offices in that house, for daily support. After some time, he desired to take the habit in that monastery, but was rejected by the abbot Richard. Upon this, he resolved to try his fortune in another country, and accordingly went to Paris ; where, though in very poor circumstances, he applied himself to his studies with great assiduity, and made a wonderful proficiency. But having still a strong inclination to a religious life, he left Paris, and removed to Provence, where he became a regular clerk in the monastery of St Rufus. He was not immediately allowed to take the habit ; but passed some time, by way of trial, in recommending himself to the monks by a strict attention to all their commands. This behaviour, together with the beauty of his person, and prudent conversation, rendered him so acceptable to those religious, that after some time they intreated him to take the habit of the canonical order. Here he distinguished himself so much by his learning and strict observance of the monastic discipline, that, upon the death of the abbot, he was chosen superior of that house ; and we are told that he rebuilt that convent. Pope Eugenius III. being apprised of the great merit of Nicholas, and thinking he might be serviceable to the church in a higher station, created him cardinal-bishop of Alba in 1146. In 1148, his Holiness sent him legate to Denmark and Norway ; where, by his fervent preaching and diligent instructions, he converted those barbarous nations to the Christian faith ; and erected Upsal into an archiepiscopal see. When he returned to Rome, he was received by the pope and cardinals with great marks of honour : and Pope Anastasius, who succeeded Eugenius, happening to die at this time, Nicholas was unanimously chosen to the holy see, in November 1154, and he took the name of *Adrian*. When the news of his promotion reached England, king Henry II. sent Robert abbot of St Alban's, and three bishops, to Rome, to congratulate him on his election ; upon which occasion Adrian granted very considerable privileges to the monastery of St Alban's, particularly an exemption from all episcopal jurisdiction, excepting to the see of Rome. Adrian, in the beginning of his pontificate, boldly withstood the attempts of the Roman people to recover their ancient liberty under the consuls, and obliged those magistrates to abdicate their authority, and leave the government of the city to the pope. In 1155, he drove the heretic Arnaut * of Breffe, and his followers, out of Rome. The same year he excommunicated William king of Sicily, who ravaged the territories of the church,

and absolved that prince's subjects from their allegiance. About the same time, Frederic king of the Romans, having entered Italy with a powerful army, Adrian met him near Sutrium, and concluded a peace with him. At this interview, Frederic consented to hold the pope's stirrup whilst he mounted on horseback. After which, his holiness conducted that prince to Rome, and in St Peter's church placed the imperial crown on his head, to the great mortification of the Roman people, who assembled in a tumultuous manner, and killed several of the Imperialists. The next year a reconciliation was brought about between the pope and the Sicilian king, that prince taking an oath to do nothing farther to the prejudice of the church, and Adrian granting him the title of *king of the two Sicilies*. He built and fortified several castles, and left the papal dominions in a more flourishing condition than he found them. But notwithstanding all his success, he was extremely sensible of the disquietudes attending so high a station ; and declared to his countryman John of Salisbury, that all the former hardships of his life were more amusements to the misfortunes of the popedom ; that he looked upon St Peter's chair to be the most uneasy seat in the world ; and that his crown seemed to be clapped burning on his head †. He died September 1. 1159, in the fourth year and tenth month of his pontificate ; and was buried in St Peter's church, near the tomb of his predecessor Eugenius.—There are extant several letters, and some homilies, written by Pope Adrian.

ADRIAN, cardinal priest, of the title of St Chrysogonus, was a native of Cornetto in Tuscany. Innocent VIII. sent him nuncio into Scotland and into France ; and after he had been clerk and treasurer of the apostolic chamber, pope Alexander VI. whose secretary he had been, honoured him with the cardinal's hat. His life was a continued scene of odd alterations. He narrowly escaped death the day Alexander VI. poisoned himself by mistake. Afterward he drew upon himself the hatred of Julius II. so that he was obliged to go and hide himself in the mountains of Trent. Having been recalled by Leo X. he was so ungrateful, that he engaged in a conspiracy against him. The pope pardoned his fault : but the cardinal, not caring to trust to this, made his escape, and it could never be known exactly what was become of him. He was one of the first that effectually reformed the Latin style. He studied Cicero with great success, and made many excellent observations on the propriety of the Latin tongue. The treatise he composed *De Sermone Latino*, is a proof of this. He had begun a Latin translation of the Old Testament. He wrote *De Vera Philosophia* : This treatise was printed at Cologne 1548.

ADRIAN VI. (Pope), was born at Utrecht in 1459. His father was not able to maintain him at school, but he got a place at Louvain in a college in which a certain number of scholars were maintained *gratis*. It is reported that he used to read in the night-time by the light of the lamps in the churches or streets. He made a considerable progress in all the sciences ; led an exemplary life ; and there never was a man less intriguing and forward than he was. He took his degree of doctor of divinity at Louvain ; was soon after made canon of St Peter's, and professor of divinity at Utrecht, and then dean of St Peter's and vice-chancellor of the university.

Adrianople

verfity. He was obliged to leave an academical life, to be tutor to the archduke Charles. This young prince made no great progreſs under him: however, never was a tutor more conſiderably rewarded; for it was by Charles V.'s credit he was raiſed to the papal throne. Leo X. had given him the Cardinal's hat in 1517. After this pope's death, ſeveral cabals in the conclave ended in the election of Adrian, with which the people of Rome were very much diſpleaſed. He would not change his name, and in every thing he ſhewed a great diſlike for all ottentation and ſenſual pleaſures, though ſuch an averſion had been long ago out of date. He was very partial to Charles V. and did not enjoy much tranquillity under the triple crown. He lamented much the wicked morals of the clergy, and wiſhed to eſtabliſh a reformation of manners among them. He died Sept. 14. 1523.

ADRIANI (Joanni Battista) was born of a patrician family at Florence, in 1511. He wrote a Hiſtory of his own Times, in Italian; which is a continuation of Guicciardini, beginning at the year 1536; to which Thuaſius acknowledges himſelf greatly indebted: beſide which, he compoſed ſix funeral orations, on the emperor Charles V. and other noble perſonages; and is thought to have been the author of a long letter on ancient painters and ſculptors, prefixed to the third volume of Vaſari. He died at Florence in 1579.

ADRIANISTS, in eccleſiaſtical hiſtory, a ſect of heretics divided into two branches; the firſt were diſciples of Simon Magus, and flouriſhed about the year 34. Theodoret is the only perſon who has preferred their name and memory; but he gives us no account of their origin. Probably this ſect, and the fix others which ſprung from the Simonians, took their name from the particular diſciples of Simon. The ſecond were the followers of Adrian Hamſtead, the anabaptiſt; and held ſome particular errors concerning Chriſt.

ADRIANOPLE, a city of Turkey in Europe, in the province of Romania, and the ſec of an archbiſhop under the patriarch of Conſtantinople. It is about ſeven or eight miles in circumference, including the old city and ſome gardens. The houſes are low, moſtly built of mud and clay, and ſome of brick; and the ſtreets are exceeding dirty. The walls and towers are in a great meaſure fallen to decay. However, there is a beautiful bazar, or market, half a mile long, called Ali Baſſa. It is a vaſt arched building, with fix gates, and three hundred and ſixty-five well-furniſhed ſhops, kept by Turks, Armenians, and Jews, who pay five crowns a-month for each ſhop. The number of inhabitants of all nations and religions may be about a hundred thouſand: but it is dear living here, becauſe the proviſions are brought from diſtant places. The air is wholeſome, and the country very pleaſant in the ſummer time, on account of the river and ſtreams that run near and about the city; the chief of which is the Mariza. Theſe promote and preſerve the verdure of the gardens, meadows, and fields, for a conſiderable part of the year. In the winter there is plenty of game. Near the principal bazar there is another, about a mile in length, covered with boards, with holes on each ſide to let in the light. It is full of good ſhops, which contain all kinds of commodities. Sultan Selim's moſque ſtands on the ſide of a hill, in the midſt of the city; and hence this magnificent ſtructure may be ſeen on all

Adſidella
||
Ad Ventrem.

fides. Every thing made of gold and ſilver, jewels, piſtols, ſcimitars, &c. are ſold in another part of the city, called by travellers the *bizeſtein*, though it differs little from a bazar. This contains about two hundred ſhops, and is covered like the former: but the covering is ſupported by two rows of large pillars. The grand viſier's palace is nothing more than a convenient houſe, after the Turkiſh manner of building. The emperor's ſeraglio is a regular ſtructure, in a plain near the river Tungia. It is two miles in compaſs, and has ſeven gates, beſides thoſe of the gardens, which are ſeveral miles in circumference. The city is governed by a mulah cadi, who has an abſolute authority both in civil and criminal matters. In the time of the plague, or war, the grand ſignior ſometimes reſides here. The Turks took this city from the Greeks in 1362, and made it the capital of the empire, till Mahomet II. took Conſtantinople in 1453. E. Long. 26. 27. Lat. 41. 45.

ADSIDELLA, in antiquity, the table at which the flammens ſat during the ſacrifices.

ADSTRICION, among phyſicians, a term uſed to denote the rigidity of any part.

ADUACA, (Antoine;) or ATUACA, contracted from *Atuacua*, (Cæſar;) anciently a large and famous city of the Tungri; now a ſmall and inconfiderable village, called *Tongeren*, in the biſhoprick of Liege, to the north-weſt of the city of Liege, in the territory of Haſpengow, on the rivulet Jecker, that ſoon after falls into the Maefe. E. Long. 5. 22. Lat. 50. 54.

ADVANCE, in the mercantile ſtile, denotes money paid before goods are delivered, work done, or buſineſs performed.

ADVANCED, in a general ſenſe, denotes ſomething poſted or ſituated before another. Thus,

ADVANCED *Ditch*, in fortification, is that which ſurrounds the glacis or eſplanade of a place.

ADVANCED *Guard*, or *Vanguard*, in the art of war, the firſt line or diviſion of an army, ranged or marching in order of battle; or, it is that part which is next the enemy, and marches firſt towards them.

ADVANCED *Guard*, is more particularly uſed for a ſmall party of horſe ſtationed before the main-guard.

ADVANCER, among ſportſmen, one of the ſtarts, or branches of a buck's attire, between the back antler and the palm.

ADUAR, in the Arabian and Moorish cuſtoms, a kind of ambulatory village, conſiſting of tents, which theſe people remove from one place to another, as ſuits their conveniency.

ADVENT, in the calendar, properly ſignifies the approach of the feaſt of the Nativity. It includes four ſundays, which begin on St Andrew's day, or on the Sunday before or after it. During advent, and to the end of the Octaves of Epiphany, the ſolemnizing of marriage is forbid without a ſpecial licence. It is appointed to employ the thoughts of Chriſtians on the firſt advent or coming of Chriſt in the fleſh, and his ſecond advent or coming to judge the world. The primitive Chriſtians praſticed great aſterity during this ſeaſon.

ADVENTITIOUS, an epithet applied to any thing that is accidental or fortuitous.

AD VENTREM *Inſpicendum*, in law, a writ by which a woman is to be ſearched whether ſhe be with child

Adventure
Adultery.

Adultery.

child by a former husband, on her with-holding of lands from the next, failing issue of her own body.

ADVENTURE, in a general sense, some extraordinary or accidental event. It also denotes a hazardous or difficult undertaking.

Bill of ADVENTURE, among merchants, a writing signed by a merchant, testifying the goods mentioned in it to be shipped on board a certain vessel belonging to another person, who is to run all hazards; the merchant only obliging himself to account to him for the produce.

ADVENTURER, in a general sense, denotes one who hazards something.

ADVENTURERS, is particularly used for an ancient company of merchants and traders, erected for the discovery of lands, territories, trades, &c. unknown. The society of adventurers had its rise in Burgundy, and its first establishment from John duke of Brabant in 1248, being known by the name of the *The Brotherhood of St Thomas à Becket*. It was afterwards translated into England, and successively confirmed by Edward III. and IV. Richard III. Henry IV. V. VI. and VII. who gave it the appellation of *Merchant Adventurers*.

ADVERB, in grammar. See there, n° 52.

ADVERSARIA, among the ancients, a book of accounts, not unlike our journals or day-books. It is more particularly used for a kind of common-place-book. See *COMMON-PLACE-BOOK*.

ADVERSARY, a person who is an enemy to or opposes another.

ADVERSATIVE, in grammar, a word expressing some difference between what goes before and what follows it. Thus, in the phrase, *he is an honest man, but a great enthusiast*, the word *but* is an adverbative conjunction.

ADVERSATOR, in antiquity, a servant who attended the rich in returning from supper, to give them notice of any obstacles in the way, at which they might be apt to stumble.

ADVERTISEMENT, in a general sense, denotes any information given to persons interested in an affair; and is more particularly used for a brief account of an affair inserted in the public papers, for the information of all concerned.

ADULE, or **ADULIS**, (anc. geogr.) a town of Egypt built by fugitive slaves, distant from its port on the Red Sea twenty stadia. Pliny calls the inhabitants *Adulatae*. The epithet is either *Adulatanus*; as, *Monumentum Adulatanum*, or the pompous inscription of the statue of Ptolemy Euergetes, published by Leo Alatus at Rome in 1631, and to be found in Spon and Theronot: *Or, Adulicus*; as *Adulicus Sinus*, a part of the Red Sea.

ADULT, an appellation given to any thing that is arrived at maturity: Thus we say, an adult person, an adult plant, &c. Among civilians, it denotes a youth between 14 and 25 years of age.

ADULTERATION, the act of debasing, by an improper mixture, something that was pure and genuine.

ADULTERY, an unlawful commerce between one married person and another, or between a married and unmarried person.

Punishments have been annexed to adultery in most ages and nations, though of different degrees of severity.

In many it has been capital; in others venial, and attended only with slight pecuniary mulcts. Some of the penalties are serious, and even cruel; others of a jocose and humorous kind. Even contrary things have been enacted as punishments for adultery. By some laws, the criminals are forbid marrying together, in case they became single; by others, they are forbid to marry any besides each other; by some, they are incapacitated from ever committing the like crime again; by others, they are glutted with it till it becomes downright nauseous.

Among the rich Greeks, adulterers were allowed to redeem themselves by a pecuniary fine; the woman's father, in such cases, returned the dower he had received from her husband, which some think was refunded by the adulterer. Another punishment among those people was, putting out the eyes of adulterers.

The Athenians had an extraordinary way of punishing adulterers, called *παρελαβὴ ἀπορροσίδου*, practised at least on the poorer sort who were not able to pay the fines. This was an awkward sort of empalement, performed by thrusting one of the largest radishes up the anus of the adulterer, or, in defect thereof, a fish with a large head, called *mugil*, mullet. Alceus is said to have died this way, though it was doubted whether the punishment was reputed mortal. Juvenal and Catullus speak of this custom, as received also among the Romans, though not authorized by an express law, as it was among the Greeks.

There are various conjectures concerning the ancient punishment of Adultery among the Romans. Some will have it to have been made capital by a law of Romulus, and again by the twelve tables. Others, that it was first made capital by Augustus; and others, not before the emperor Constantine. The truth is, the punishment in the early days was very various, much being left to the discretion of the husband and parents of the adulterous wife, who exercised it differently, rather with the silence and countenance of the magistrate, than any formal authority from him. Thus we are told, the wife's father was allowed to kill both parties, when caught in the fact, provided he did it immediately, killed both together, and as it were with one blow. The same power ordinarily was not indulged the husband, except the crime were committed with some mean or infamous person; tho', in other cases, if his rage carried him to put them to death, he was not punished as a murderer. On many occasions, however, revenge was not carried so far; but mutilating, castrating, cutting off the ears, noses, &c. served the turn. The punishment allotted by the *lex Julia*, was not, as many have imagined, death; but rather banishment, or deportation, being interdicted fire and water: though Octavius appears, in several instances, to have gone beyond his own law, and to have put adulterers to death. Under Macrinus, many were burnt at a stake. Constantine first by law made the crime capital. Under Constantine and Constant, adulterers were burnt, or sewed in sacks and thrown into the sea. Under Leo and Marcian, the penalty was abated to perpetual banishment, or cutting off the nose. Under Justinian, a further mitigation was granted; at least in favour of the wife, who was only to be scourged, lose her dower, and be shut up in a monastery: after two years, the husband was at liberty to take her back again; if he refused, she was shaven,

Adultery,
Advocate.

ven, and made a nun for life: But it still remained death in the husband. The reason alleged for this difference is, that the woman is the weaker vessel. Mattheus declaims against the empress Theodora, who is supposed to have been the cause of this law, as well as of others procured in favour of the sex from that emperor.

Under Theodosius, women convicted of this crime were punished after a very singular manner, *viz.* by a public confutation; being locked up in a narrow cell, and forced to admit to their embraces all the men that would offer themselves. To this end, the gallants were to dress themselves on purpose, having several little bells fastened to their clothes, the tinkling of which gave notice to those without of every motion. This custom was again abolished by the same prince.

In Britain, adultery is reckoned a spiritual offence, that is, cognizable by the spiritual courts. The common law takes no farther notice of it, than to allow the party grieved an action and damages. This practice is often censured by foreigners, as making too light of a crime, the bad consequences of which, public as well as private, are so great. But perhaps this penalty, by civil action, is more wisely calculated to prevent the frequency of the offence, which ought to be the end of all laws, than a severer punishment. He that by a judgment of law is, according to circumstances, stripped of great part of his fortune, thrown into prison till he can pay it, or forced to fly his country, will, no doubt, in most cases, own, that he pays dearly for his amusement*.

ADVOCATE, among the Romans, a person who undertook the defence of causes. The term is still kept up in all countries where the civil law obtains.

KING'S ADVOCATE, is the principal crown-lawyer in Scotland. His business is to act as a public prosecutor, and to plead in all causes that concern the crown; but particularly in such as are of a criminal nature. The office of king's advocate is not very ancient: It seems to have been established about the beginning of the 16th century. Originally he had no power to prosecute crimes without the concurrence of a private party; but, in the year 1597, he was empowered to prosecute crimes at his own instance.

FACULTY OF ADVOCATES, in Scotland, a respectable body of lawyers, who plead in all causes before the Courts of Session, Judiciary, and Exchequer. They are also intitled to plead in the house of peers, and other supreme courts in England.

In the year 1660, the faculty founded a library upon a very extensive plan, suggested by that learned and eminent lawyer Sir George McKenzie of Rosehaugh, advocate to King Charles II. and King James VII. who enriched it with many valuable books. It has been daily increasing since that time, and now contains not only the best collection of law-books in Europe, but a very large and select collection of books on all subjects. Besides, this library contains a great number of original manuscripts, and a vast variety of Jewish, Grecian, Roman, Scots, and English coins and medals.

A candidate for the office of an advocate undergoes three several trials: The first is in Latin, upon the civil law and Greek and Roman antiquities; the second, in English, upon the municipal law of Scotland; and, in the third, he is obliged to defend a Latin thesis, which is impugned by three members of the faculty.

Immediately before putting on the gown, the candidate makes a short Latin speech to the lords, and then takes the oaths to the government and *de fide*.

The faculty at present consists of above 200 members. As an advocate or lawyer is esteemed the gentlest profession in Scotland, many gentlemen of fortune take the degree of advocate, without having any intention of practising at the bar. This circumstance greatly increases their number, gives dignity to the profession, and enriches their library and public fund. It is from this respectable body, that all vacancies on the bench are generally supplied.

FISCAL ADVOCATE, *fisci advocatus*, in Roman antiquity; an officer of state under the Roman emperors, who pleaded in all causes wherein the *fiscus*, or private treasury, was concerned.

CONGREGATIONAL ADVOCATES; officers of the consistory at Rome, who plead in all oppositions to the disposal of benefices in that court: they are ten in number.

ADVOCATE of a City, in the German polity, a magistrate appointed in the Emperor's name to administer justice.

BILL of ADVOCATION, in Scots law, a writing drawn up in the form of a petition, whereby a party, in an action before an inferior court, applies to the supreme court, or court of Session, for calling the action from the inferior court before itself*.

LETTERS of ADVOCATION, in Scots law, the decree or warrant of the court of Session upon cognisance of the facts set forth in the bill, drawn up in the form of a summons, and passing under the signet, discharging the inferior judge and all others from further procedure in the cause, and advocating it to itself*.

ADVOW, in law, signifies the patron of a church, or he who has a right to present to a benefice.

PARAMOUNT ADVOWEE, is used for the king, as being the highest patron.

ADVOWZON, in law, is the right of patronage, or presenting to a vacant benefice.

ADUST, among physicians, a term applied to the blood, &c. when too hot and fiery.

ADY, in natural history, a name given to the palm-tree of the island of St Thomas. It is a tall tree, with a thick, bare, upright stem, growing single on its root, of a thin light timber, and full of juice. The head of this tree shoots into a vast number of branches, which being cut off, or an incision being made therein, afford a great quantity of sweet juice, which fermenting supplies the place of wine among the Indians. The fruit of this tree is called by the Portuguese *Caryoceros* and *Carissos*; and by the black natives, *Avanga*. This fruit is of the size and shape of a lemon, and contains a kernel, which is good to eat. The fruit itself is eat roasted, and the raw kernels are often mixed with mandioc meal. These kernels are supposed very cordial. An oil is also prepared from this fruit, which answers the purpose of oil or butter. This oil is also used for anointing stiff and contracted parts of the body.

ADYTUM, in pagan antiquity, the most retired and sacred place of their temples, into which none but the priests were allowed to enter.

ADZE, or **ADDOCE**, a cutting tool of the ax kind, chiefly used by coopers.

ÆACEA, in Grecian antiquity, solemn festivals and games celebrated at Ægina, in honour of Æacus.

ÆACUS.

Æacus
Æge.

ÆACUS, the son of Jupiter by Ægina. When the ile of Ægina was depopulated by a plague, his father, in compassion to his grief, changed all the ants upon it into men and women, who were called *Myrmidons*, from *μυρμήκ*, an ant. The foundation of the fable is said to be, that when the country had been depopulated by pirates, who forced the few that remained to take shelter in caves, Æacus encouraged them to come out, and by commerce and industry recover what they had lost. His character for justice was such, that, in a time of universal drought, he was nominated by the Delphic oracle to intercede for Greece, and his prayer was answered. The Pagans also imagined that Æacus, on account of his impartial justice, was chosen by Pluto one of the three judges of the dead; and that it was his province to judge the Europeans.

ÆCHMALOTARCHA, in Jewish antiquity, a title given to the principal leader or governor of the Hebrew captives residing in Chaldea, Assyria, and the neighbouring countries. This magistrature was called by the Jews *rosch-galath*, i. e. the chief of the captivity.

ÆDES, in Roman antiquity, besides its more ordinary signification of a house, likewise signified an inferior kind of temple, consecrated to some deity.

ÆDICULA, a term used to denote the inner part of the temple, where the altar and statue of the deity stood.

ÆDILATE, the office of ædile, sometimes called *Ædilitas*. See the next article.

ÆDILE, *edilis*, in Roman antiquity, a magistrate whose chief business was to superintend buildings of all kinds, but more especially public ones, as temples, aqueducts, bridges, &c. To the ædiles likewise belonged the care of the highways, public places, weights and measures, &c. They also fixed the prices of provisions, took cognizance of debauches, punished lewd women, and such persons as frequented gaming houses. The custody of the plebs, or orders of the people, was likewise committed to them. They had the inspection of comedies and other pieces of wit; and were obliged to exhibit magnificent games to the people, at their own expence, whereby many of them were ruined. At first the ædiles were only two in number, and chosen from among the common people; but these being unable to support the expence of the public shews, two more were created out of the patrician order: these last took upon themselves all the charges of the games, and were called *Ædiles Curules*; or *Maiores*, as the two plebeians were denominated *Minores*. Julius Cæsar, in order to ease these four, created two others, who were called *Ædiles Cereales*, as having the inspection of all manner of grain committed to their care. There were also ædiles in the municipal cities, who had much the same authority as those in Rome.

ÆDITUUS, in Roman antiquity, an officer belonging to the temple, who had the charge of the offerings, treasure, and sacred utensils. The female deities had a woman officer of this kind called *Æditua*.

ÆGAGROPILA, a ball composed of a substance resembling hair, generated in the stomach of the chamois-goat. This ball is of the same nature with those found in cows, hogs, &c.

ÆGÆ, or **ÆGÆA**, (anc. geogr.) the name of *Ædesa*, so called from the following adventure: Cara-

Ægean Sea
Ægimurus.

nus, the first king of Macedonia, being ordered by the oracle to seek out a settlement in Macedonia, under the conduct of a flock of goats, surprised the town of *Ædesa*, during a thick fog and rainy weather, in following the goats, that fled from the rain; which goats ever after, in all his military expeditions, he caused always to precede his standard; and in memory of this he called *Ædesa Ægæa*, and his people *Ægææ*. And hence probably, in the prophet Daniel, the he-goat is the symbol of the king of Macedon.

ÆGEAN SEA, (anc. geogr.) now the *Archipelago*, a part of the Mediterranean, separating Europe from Asia and Africa; washing, on the one hand, Greece and Macedonia; on the other, Caria and Ionia. The origin of the name is greatly disputed. Festus advances three opinions: one, that it is so called from the many islands therein, at a distance appearing like so many goats; another, because *Ægæa* queen of the Amazons perished in it: a third opinion is, because *Ægeus*, the father of Theseus threw himself headlong into it.

ÆGEUS, in fabulous history, was king of Athens, and the father of Theseus. The Athenians having basely killed the son of Minos, king of Crete, for carrying away the prize from them, Minos made war upon the Athenians; and being victorious, imposed this severe condition on *Ægeus*, that he should annually send into Crete, seven of the noblest of the Athenian youths, chosen by lot, to be devoured by the Minotaur. On the fourth year of this tribute, the choice fell on Theseus; or, as others say, he himself intreated to be sent. The king, at his son's departure, gave orders, that as the ship sailed with black sails, it should return with the same in case he perished; but, if he became victorious, he should change them into white. When Theseus returned to Crete, after killing the Minotaur, and forgot to change the sails in token of his victory, according to the agreement with his father; the latter, who watched the return of the vessel, supposing by the black sails that his son was dead, cast himself headlong into the sea, which afterwards obtained the name of the *Ægean Sea*. The Athenians decreed *Ægeus* divine honours; and sacrificed to him as a marine deity, the adopted son of Neptune.

ÆGIAS, among physicians, a white speck on the pupil of the eye, which occasions a dimness of sight.

ÆGIDA, (Pliny); now *Capo d'Isiria*, the principal town in the north of the territory of Isiria, situated in a little island, joined to the land by a bridge. In an inscription, (Gruter,) it is called *Ægidis Insula*. E. Long. 14. 20. Lat. 45. 50. It was afterwards called *Justinopolis*, after the emperor Justinus.

ÆGILOPS; the name of a tumour in the eye, which frequently degenerates into a fistula lacrymalis.

ÆGILOS, **WILD FESTUC**, a genus of the monocæcia order, belonging to the polygamia class of plants, is a native of Italy and some other parts of Europe. The root is composed of a few short white fibres: the plant grows to about a foot high: the stalk is round, hollow, jointed, and has two or three long, narrow, grassy leaves on it, hairy at the edges: at the top of the stalk grows a short spike consisting of two or three little rigid clusters of flowers: the seeds are large; and somewhat like barley, but flatter.

ÆGIMURUS, (anc. geogr.) an island on the bay of

Ægina
Ægiuchus.

of Carthage, about thirty miles distant from that city, (Livy;) now the *Galecta*: This island being afterwards sunk in the sea, two of its rocks remained above water, which were called *Aræ*, and mentioned by Virgil, because the Romans and Carthaginians entered into an agreement or league to settle their mutual boundaries at these rocks.

ÆGINA, in fabulous history, the daughter of Ætopus, king of Bœotia, was beloved by Jupiter, who debauched her in the similitude of a lambent flame, and then carried her from Epidaurus to a desert island called Oenope, which afterwards obtained her own name.

ÆGINA, (anc. geogr.) now *Engia*, an island on the Saronic Bay, or Bay of Engia, twenty miles distant from the Piræus, formerly vying with Athens for naval power, and at the sea-fight of Salamin disputing the palm of victory with the Athenians. It was the country and kingdom of Æacus, who called it *Ægina* from his mother's name, it being before called *Oenopia*, (Ovid.) The inhabitants were called *Æginetæ*, and *Æginensîs*. The Greeks had a common temple in Ægina. The soil was gleby underneath, but rocky on the surface; yet yielding plenty of barley. The *Æginetæ* applied to commerce; and were the first who coined money, called *Ναυπηγία Ἀργυρίων*; hence *Ægineticum æs*, formerly in great repute. The inhabitants were called *Myrmidones*, or a nation of ants, from their great application to agriculture. See *ÆACUS*.

ÆGINETA (Paulus), a celebrated surgeon of the island of Ægina, from whence he derived his name. According to Mr Le Clerc's calculation, he lived in the fourth century; but Abulpharagius the Arabian, who is allowed to give the best account of those times, places him with more probability in the seventh. His knowledge in surgery was very great, and his works are deservedly famous. Fabricius ab Aquapendente has thought fit to transcribe him in a great variety of places. Indeed the doctrine of Paulus Ægineta, together with that of Celsus, and Albucasis, make up the whole text of this author. He is the first writer who takes notice of the cathartic quality of rhubarb; and, according to Dr Milward, is the first in all antiquity who deserves the title of a man-midwife.

ÆGIPAN, in heathen mythology, a denomination given to the god Pan, because he was represented with the horns, legs, feet, &c. of a goat.

ÆGIS, in heathen mythology, the shield which Jupiter presented to Minerva, after his having covered it with the skin of Amalthea, the goat who suckled him. Afterwards Minerva fixed Medusa's head in the middle of the ægis, which by this means obtained the power of turning all who saw it into stone.

ÆGISTHUS, son of Thyestes by his own daughter Pilopeia, who, to conceal her shame, exposed him in the woods: some say he was taken up by a shepherd, and suckled by a goat, whence he was called *Ægisthus*. He corrupted Clytemnestra the wife of Agamemnon; and with her assistance slew her husband, and reigned seven years in Mycenæ. He was, together with Clytemnestra, slain by Orestes. Pompey used to call Julius Cæsar *Ægisthus*, on account of his having corrupted his wife Mutia, whom he afterward put away, though he had three children by her.

ÆGIUCHUS, in heathen mythology, a surname of

Jupiter, given him on account of his having been suckled by a goat.

ÆGIUM, (anc. geogr.) a town of Achaia Propria, five miles from the place where Helice stood, and famous for the council of the Achæans, which usually met there, on account either of the dignity, or commodious situation of the place. It was also famous for the worship of *Θαλασπιος Ζευς*, *Conventional Jupiter*, and of *Panachean Ceres*. The territory of Ægium was watered by two rivers, viz. the Phoenix and Meganitis. The epithet is *Æginensis*. There is a coin in the cabinet of the king of Prussia, with the inscription *ΑΓΓΙ*, and the figure of a tortoise, which is the symbol of Peloponnesus, and leaves no doubt as to the place where it was struck.

ÆGLEFINUS, or HADDOCK, in ichthyology, a species of the gadus. See *GADUS*.

ÆGOPODIUM, SMALL WILD ANGELICA, or GOUTWORT, a genus of the digynia order, belonging to the pentandria class of plants, is very common under hedges, and about gardens; the leaves resemble those of Angelica, and it carries small white flowers. Its roots run so fast, as to render it a very troublesome weed.

ÆGOS POTAMOS, (anc. geogr.) a river in the Thracian Chersonesus, falling with a south-east course into the Hellespont, to the north of Sestos; also a town, station, or road for ships, at its mouth. Here the Athenians, under Conon, through the fault of his colleague Isocrates, received so fatal a blow from the Lacedæmonians under Lysander, in a sea-engagement, as to cost them their liberty and their all.

ÆGYPT. See *EGYPT*.

ÆGYPTIACUM, in pharmacy, the name of several detergent ointments. See *PHARMACY*, n° 992, 993. ÆGYPTILLA, in natural history, the name of a stone described by the ancients, and said, by some authors, to have the remarkable quality of giving water the colour and taste of wine. This seems a very imaginary virtue, as are indeed too many of those in former ages attributed to stones. The descriptions left us of this remarkable fossil tell us, that it was variegated with, or composed of, veins of black and white, or black and blueish, with sometimes a plate or vein of whitish red. The authors of these accounts seem to have understood by this name the several stones of the onyx, sardonius, and camæa kind, all which we have at present common among us, but none of which possess any such strange properties.

ÆGYPTUS, (fab. hist.) was the son of Beleus, and brother of Danaus. See *BELIDES*.

ÆINATTÆ, in antiquity, a denomination given to the senators of Miletus, because they held their deliberations on board a ship, and never returned to land till matters had been agreed on.

ÆLIAN (Claudius), born at Præneste in Italy. He taught rhetoric at Rome, according to Perizonius, under the emperor Alexander Severus. He was surnamed *Μελιχλωπος*, Honey-mouth, on account of the sweetness of his style. He was likewise honoured with the title of Sophist, an appellation in his days given only to men of learning and wisdom. He loved retirement, and devoted himself to study. He greatly admired and studied Plato, Aristotle, Isocrates, Plutarch, Homer, Anacreon, Archilochus, &c. and, though a Roman, gives

Ægium
Ælian.

ÆLI PONS gives the preference to the writers of the Greek nation. His two most celebrated works are, his Various History, and History of Animals. He composed likewise a book on Providence, mentioned by Eustathius; and another on Divine Appearances, or The Declarations of Providence. There have been several editions of his Various History.

ÆLI PONS, (anc. geogr.) one of the fortresses near the wall or rampart, or, in the words of the Notitia, through the line of the hither wall; built, as is thought, by Adrian*. Now Porteland, (Camden), in Northumberland, between Newcastle and Morpeth.

ÆLIUS PONS, now *il Ponte S. Angelo*, a stone-bridge at Rome, over the Tyber, which leads to the Burgo and Vatican from the city, along Adrian's mole, built by the emperor Adrian.

ÆLFRED. See **ALFRED**.

ÆLURUS, in Egyptian mythology, the deity or god of cats; represented sometimes like a cat, and sometimes like a man with a cat's head. The Egyptians had so superstitious a regard for this animal, that the killing it, whether by accident or design, was punished with death: and Diodorus relates, that, in the time of extreme famine, they chose rather to eat one another, than touch these sacred animals.

ÆMILIUS (Paulus), the son of Lucius Paulus, who was killed at the battle of Cannæ, was twice consul. In his first consulate he triumphed over the Ligurians; and in the second subdued Perseus king of Macedonia, and reduced that country to a Roman province, on which he obtained the surname of Macedonicus. He returned to Rome loaded with glory, and triumphed for three days. He died 168 years before Christ.

ÆMILIUS (Paulus), a celebrated historian, born at Verona, who obtained such reputation in Italy, that he was invited into France by the cardinal of Bourbon, in the reign of Lewis XII. in order to write the history of the kings of France in Latin, and was given a canonry in the cathedral of Paris. He was near 30 years in writing that history, which has been greatly admired; and died at Paris on the 5th of May 1529.

ÆNARIA, (anc. geogr.) an island on the bay of Cumæ, or over-against Cumæ in Italy, (Pliny.) It is also called *Inarime*, (Virgil); and now *Ischia*: scarce three miles distant from the coast, and the promontory Misenus to the west; 20 miles in compass; called *Pithecia* by the Greeks. It is one of the Oenotrides, and fenced round by very high rocks, so as to be inaccessible but on one side; it was formerly famous for its earthen ware. See **ISCHIA**.

ÆNEAS, (fab. hist.) a famous Trojan prince, the son of Anchises and Venus. At the destruction of Troy, he bore his aged father on his back, and saved him from the Greeks; but being too solicitous about his son and household-gods, lost his wife Creusa in the escape. Landing in Africa, he was kindly received by queen Dido: but quitting her coast, he arrived in Italy, where he married Lavinia the daughter of king Latinus, and defeated Turnus, to whom he had been contracted. After the death of his father-in-law, he was made king of the Latins, over whom he reigned three years: but joining with the Aborigines, he was slain in a battle against the Tuscans. Virgil has rendered

the name of this prince immortal, by making him the hero of his poem.

ÆNEAS SYLVIVS, (Pope). See **PIUS II.**

ÆNEATORES, in antiquity, the musicians in an army, including those who played trumpets, horns, &c. The word is formed from *æneus*, on account of the brazen instruments used by them.

ÆNGINA, one of the islands of the Archipelago. It lies in the bay of Engia, and the town of that name contains about 800 houses and a castle; and near it are the ruins of a magnificent structure, which was probably a temple.

ÆNIGMA, denotes any dark saying, wherein some well-known thing is concealed under obscure language. The word is Greek, *Αἰνigma*, formed of *αἰνέω*, *obscure innuere*, to hint a thing darkly, and of *αἶνος*, an obscure speech or discourse. The popular name is *riddle*; from the Belgic *raeden*, or the Saxon *araethan*, to interpret. Fa. Bouhours, in the memoirs of Trevoux, defines an *ænigma*, A discourse, or painting, including some hidden meaning, which is proposed to be guessed.

Painted ÆNIGMAS, are representations of the works of nature, or art, concealed under human figures, drawn from history, or fable.

A Verbal ÆNIGMA, is a witty, artful, and abstruse description of any thing.—In a general sense, every dark saying, every difficult question, every parable, may pass for an *ænigma*. Hence obscure laws are called *Ænigmata Juris*. The alchemists are great dealers in the *ænigmatic* language, their processes for the philosophers stone being generally wrapped up in riddles: e. g. *Fac ex mare et semina circum, inde quadrangulum, hinc triangulum, fac circulum, et habebis lapidem philosophorum*—F. Menckner has attempted to reduce the composition and resolution of *ænigmas* to a kind of art, with fixed rules and principles, which he calls the philosophy of *ænigmatic* images.

The Subject of an ÆNIGMA, or the thing to be concealed and made a mystery of, he justly observes, ought not to be such in itself; but, on the contrary, common, obvious, and easy to be conceived. It is to be taken, either from nature, as the heavens, or stars; or from art, as painting, the compass, a mirror, or the like.

The Form of ÆNIGMAS consists in the words, which, whether they be in prose or verse, contain either some description, a question, or a prosopopeia. The last kind are the most pleasing, inasmuch as they give life and action to things which otherwise have them not. To make an *ænigma*, therefore, two things are to be pitched on, which bear some resemblance to each other; as the sun, and a monarch; or a ship, and a house: and on this resemblance it is to be raised a superstructure of contrarieties to amuse and perplex. It is easier to find great subjects for *ænigmas* in figures than in words, inasmuch as painting attracts the eyes and excites the attention to discover the sense. The subjects of *ænigmas* in painting, are to be taken either from history or fable: the composition here is a kind of metamorphosis, wherein, e. g. human figures are changed into trees, and rivers into metals. It is essential to *ænigmas*, that the history or fable, under which they are presented, be known to every body; otherwise it will be two *ænigmas* instead of one; the first of the history or fable, the second of the sense in which

it is to be taken. Another essential rule of the ænigma is, that it only admit of one sense. Every ænigma which is susceptible of different interpretations, all equally natural, is so far imperfect. What gives a kind of erudition to an ænigma, is the invention of figures in situations, gestures, colours, &c. authorized by passages of the poets, the customs of artists in statues, basso relievos, inscriptions, and medals.—In foreign colleges,

The explication of *ÆNIGMAS* makes a considerable exercise; and that one of the most difficult and amusing, where wit and penetration have the largest field.—By explaining an ænigma, is meant the finding a motto corresponding to the action and persons represented in a picture, taken either from history or mythology. The great art of this exercise consists in the choice of a motto, which either by itself, or the circumstances of time, place, person who speaks, or those before whom he is speaking, may divert the spectators, and furnish occasion for strokes of wit; also in shewing to advantage the conformities between the figure and thing figured, giving ingenious turns to the reasons employed to support what is advanced, and in artfully introducing pieces of poetry to illustrate the subject and awaken the attention of the audience.

As to the solution of ænigmas, it may be observed, that those expressed by figures are more difficult to explain than those consisting of words, by reason images may signify more things than words can; so that to fix them to a particular sense, we must apply every situation, symbol, &c. and without omitting a circumstance.—As there are few persons in history, or mythology, but have some particular character of vice or virtue, we are, before all things, to attend to this character, in order to divine what the figure of a person represented in a painting signifies, and to find what agreement this may have with the subject whereof we would explain it. Thus, if Proteus be represented in a picture, it may be taken to denote *inconstancy*, and applied either to a physical or moral subject, whose character is to be changeable; *e. g.* an almanack, which expresses the weather, the seasons, heat, cold, storms, and the like. The colours of figures may also help to unriddle what they mean: *white*, for instance, is a mark of innocence, *red* of modesty, *green* of hope, *black* of sorrow, &c. When figures are accompanied with *symbols*, they are less precarious; these being, as it were, the soul of ænigmas, and the key that opens the mystery of them. Of all the kinds of symbols which may be met with in those who have treated professedly on the subject, the only truly enigmatical are those of Pythagoras, which, under dark proverbs, hold forth lessons of morality; as when he says, *Statuam ne transjillas*, to signify, Do no injustice.

But it must be added, that we meet with some ænigmas in history, complicated to a degree which much transcends all rules, and has given great perplexity to the interpreters of them. Such is that celebrated ancient one, *Ælia Lælia Crispis*, about which many of the learned have puzzled their heads. There are two exemplars of it: one found 140 years ago, on a marble near Bologna; the other in an ancient MS. written in Gothic letters, at Milan. It is controverted between the two cities, which is to be reputed the more authentic.

The Bononian *Ænigma*.

D. M.

Ælia Lælia Crispis,
Nec vir, nec mulier,
Nec androgyna;
Nec puella, nec juvenis,
Nec anus;
Nec casta, nec meretrix,
Nec pudica;
Sed omnia:
Sublata
Neque fame, neque ferro,
Neque veneno;
Sed omnibus:
Nec celo, nec terris,
Nec aquis,
Sed ubique jacet.
Lucius Agatho Priscius,
Nec maritus, nec amator,
Nec necessarius;
Neque mærens, neque gaudens,
Neque stens;
Hanc,
Nec molem, nec pyramidem,
Nec sepulchrum,
Sed omnia,
Scit et nescit, cui posuerit.

That is to say, *To the gods maner, Ælia Lælia Crispis, neither man, nor woman, nor hermaphrodite; neither girl, nor young woman, nor old; neither chaste, nor a whore; but all these: killed neither by hunger, nor steel, nor poison; but by all these: rests neither in heaven, nor on earth, nor in the waters; but every where. Lucius Agatho Priscius, neither her husband, nor lover, nor friend; neither sorrowful, nor joyful, nor weeping, certain, or uncertain, to whom he rears this monument, neither erects her a temple, nor a pyramid, nor a tomb, but all these. In the MS. at Milan, instead of D. M. we find A. M. P. P. D. and at the end the following addition:*

Hoc est sepulchrum intus cadaver non habens,
Hoc est cadaver sepulchrum extra non habens,
Sed cadaver idem est sepulchrum.

We find near 50 several solutions of this ænigma advanced by learned men. Marius Michael Angelus maintains *Ælia Lælia Crispis* to signify rain-water falling into the sea. Ri. Vitus first explained it of Niobe turned to a stone, afterwards of the rational soul, and afterwards of the Platonic idea; Jo. Turrius, of the *materia prima*; Fr. Schottus, of an eunuch; Nic. Bernardus, of the philosophers-stone, in which he is followed by Borrichius; Zach. Pontinus, of three human bodies in the same situation, and buried by three different men at the same time; Nelsmondus, of a law-suit; Jo. Gaf. Gerartius, of love; Zu. Boxhornius, of a shadow; P. Terronus, of music; Fort Licetius, of generation, friendship, and privation; M. Ov. Montalbanus, of hemp; Car. Cæf. Malvasia, of an abortive girl promised in marriage; Pet. Mengulus, of the rule of chastity, prescribed by the founder of the military religion of St Mary; M. de Ciconia, of pope Joan; Heumannus, of Lot's wife; and lastly, J. C. S. an anonymous writer in the Leipzig Acts, of the Christian church.

Ænigma-
tography
||
Æolus.

ÆNIGMATOGRAPHY, or ÆNIGMATHOLOGY, the art of resolving or making ænigmas.

ÆOLIE INSULÆ, now *Isle di Lipari*, (anc. geogr.) seven islands, situated between Sicily and Italy, (Strabo, Diodorus Siculus, Mela); so called from Æolus, who reigned there about the time of the Trojan war. The Greeks call them *Hephestiades*; and the Romans, *Vulcaniæ*, from their fiery eruptions. They are also called *Liparaeum Insule*, from the principal island Lipara. Dionysius Periegetes calls them *Πλαγίαι*, because circumnavigable.

ÆOLIC, in a general sense, denotes something belonging to Æolis.

ÆOLIC *Dialect*, among grammarians, one of the five dialects of the Greek tongue, agreeing in most things with the Doric dialect. See DORIC.

ÆOLIC *Verse*, in prosody, a verse consisting of an iambus, or spondee; then of two anapests, separated by a long syllable; and, lastly, of another syllable. Such as, *ὦ σιελίφρι conditor orbis*.

ÆOLIPILE, in hydraulics, is a hollow ball of metal, generally used in courses of experimental philosophy, in order to demonstrate the possibility of converting water into an elastic steam or vapour by heat. The instrument, therefore, consists of a slender neck, or pipe, having a narrow orifice inserted into the ball by means of a shouldered screw. This pipe being taken out, the ball is filled almost full of water, and the pipe being again screwed in, the ball is placed on a pan of kindled charcoal, where it is well heated, and there issues from the orifice a vapour, with prodigious violence and great noise, which continues till all the included water is discharged. The stronger the fire is, the more elastic and violent will be the steam; but care must be taken that the small orifice of the pipe be not, by any accident, stopped up; because the instrument would in that case infallibly burst in pieces, with such violence as may greatly endanger the lives of the persons near it. Another way of introducing the water is to heat the ball red-hot when empty, which will drive out almost all the air; and then by suddenly immersing it in water, the pressure of the atmosphere will force in the fluid, till it is nearly full. Des Cartes and others have used this instrument to account for the natural cause and generation of the wind: and hence it was called *Æolopila*; q. d. *pila Æoli*, the ball of Æolus or of the god of the winds.

ÆOLIS, or ÆOLIA, (anc. geogr.) a country of the Hither Asia, settled by colonies of Æolian Greeks. Taken at large, it comprehends all Troas, and the coast of the Hellespont to the Propontis, because in those parts there were several Æolian colonies: more strictly, it is situated between Troas to the north, and Ionia to the south. The people are called *Æoles*, or *Æoli*.

ÆOLIUM MARE, (anc. geogr.) a part of the Egean sea, washing Æolis; called also *Myſium*, from Myſia. Now called, *Golfo di Smyrna*.

ÆOLUS, in heathen mythology, the god of the winds, is said to be the son of Jupiter by Æcasta, or Sigeia, the daughter of Hippotus; or, according to others, the son of Hippotus by Meneclea, daughter of Hyllus king of Lipara. He dwelt in the island Strongyle, now called *Stromboli*, one of the seven islands called *Æolian* from their being under the dominion of Æolus. Others say, that his residence was

at Regium, in Italy; and others again place him in the island Lipara. He is represented as having authority over the winds, which he held enclained in a vast cavern, to prevent their continuing the devastations they had been guilty of before they were put under his direction. Mythologists explain the original of these fables, by saying, that he was a wife and good prince; and, being skilled in astronomy, was able, by the flux and reflux of the tides, and the nature of the volcano in the island Strongyle, to foretell storms and tempests.

Harp of Æolus, or the Æolian Lyre *.

ÆON, a Greek word, properly signifying the age or duration of any thing.

Æon, among the followers of Plato, was used to signify any virtue, attribute, or perfection: hence they represented the Deity as an assemblage of all possible æons; and called him *pleroma*, a Greek term signifying *fulness*. The Valentinians, who, in the first ages of the church, blended the conceits of the Jewish cabalists, the Platonists, and the Chaldean philosophers, with the simplicity of the Christian doctrine, invented a kind of Theogony, or Genealogy of Gods (not unlike that of Hesiod), whom they called by several glorious names, and all by the general appellation of *Æons*: among which they reckoned *Zen, Life, Noſos, Word, Monogenes, Only-begotten, Παλιγκμα, Fullness*; and many other divine powers and emanations, amounting in number to thirty: which they fancied to be successively derived from one another; and all from one self-originated deity, named *Bythus*, i. e. *profound or unsathomable*; whom they called likewise, *The most high and ineffable Father*. See VALENTINIANS.

ÆQUIMELIUM, in antiquity, a place in Rome, where stood the house of Spurius Melius, who, by largesses corrupting the people, affected the supreme power: refusing to appear before the dictator Cincinnatus, he was slain by Servilius Ahala, master of the horse; his house was razed to the ground; and the spot on which it stood was called *Ara Equimelii*. (Livy).

ÆRA. The point of time from whence any number of years is begun to be counted, is called a *period, æra, or epoch*. The word æra comes from the Latin *æs*, because the Romans marked their years with a kind of small brass nails. The difference between the terms *era* and *epoch* is, that the æras are certain points fixed by some people, or nation; and the epochs are points fixed by chronologists and historians. The idea of an æra comprehends also a certain succession of years proceeding from a fixed point of time, and the epoch is that point itself. Thus the Christian æra began at the epoch of the birth of Jesus Christ *.

AERIAL, in a general sense, denotes something partaking of the nature of air; thus, aerial substance, aerial particles, &c.

AERIANS, in church-history, a branch of Arians, who, to the doctrines of that sect, added some peculiar dogmas of their own; as, that there is no difference between bishops and priests; a doctrine maintained by many modern divines, particularly of the presbyterian and reformed churches.

FLOS ÆRIS, among alchemists, small scales procured from copper melted by a strong heat; it is sometimes used for arguro or verdigris.

AEROGRAPHY, signifies a description of the air.

AEROLOGY,

Æon
||
Ærography

* See *Astronomy*, n^o 10.

Aerology

Æschines.

* See Pneumatics.

* See Materia Medica, p. 74.

AEROLOGY, an account of the nature and properties of the air.

AEROMANCY, a species of divination performed by means of air, wind, &c. See **DIVINATION**, n° 5.

AEROMETRY, the science of measuring the air. It comprehends not only the doctrine of the air itself, considered as a fluid body; but also its pressure, elasticity, rarefaction, and condensation. But the term is at present not much in use, this branch of natural philosophy being more frequently called **Pneumatics** *.

AEROPHYLACEA, a term used by naturalists for caverns or reservoirs of air, supposed to exist in the bowels of the earth.

AERSHOT, a town in the Netherlands, in the duchy of Brabant, and capital of the duchy of Aershot. It is seated on the river Demur, ten miles east of Malines or Mechlin, and eight north of Louvain. E. Lon. 5. 4. N. lat. 51. 15.

ÆRUGINOUS, in ornithology, the trivial name of a species of falco. See **FALCO**.

ÆRUGINOUS, an epithet given to such things as resemble or partake of the nature of the rust of copper.

ÆRUGO, in natural history, properly signifies the rust of copper, whether natural or artificial. The former is found about copper mines, and the latter made by corroding copper plates with acids †.

ÆRUSCATORES, in antiquity, a kind of strolling beggars, not unlike gypsies, who drew money from the credulous by fortune-telling, &c. It was also a denomination given to griping exactors, or collectors of the revenue. The Galli, or priests of Cybele, were called *æruscatores magnæ matris*, and *μυροφύγιοι*, on account of their begging or collecting alms in the streets; to which end they had little bells whereby to draw peoples attention to them, much like some orders of mendicants abroad.

ÆERY, or **AIRY**, among sportsmen. See **AIRY**.

ÆS, properly signifies copper, or money coined of that metal. See **COPPER**.

Æs Flavum, yellow copper, among the Romans, an appellation given to the coarser kinds of brass.

Æs Caldarium, a term used by the German mineralists, for a substance which sometimes occurs to those who work upon cobalt, and is used for the making the fine blue colour called *smalt*.

Æs Usum, a chemical preparation, made of thin leaves of copper, sulphur, and nitre, placed *stratum super stratum* in a crucible, and set in a charcoal fire, till all the sulphur is consumed; after which, the copper is taken out of the crucible, and reduced to powder. Some quench the leaves of copper in vinegar, and repeat the calcination.—Its principal use is in colouring glass, to which it gives a beautiful tincture. The surgeons use it as a deservive, and some have given it internally; but it is certainly a very dangerous medicine, and should be avoided.

ÆSCHINES, a Socratic philosopher, the son of Charinus a sausage-maker. He was continually with Socrates; which occasioned this philosopher to say, that the sausage-maker's son was the only person who knew how to pay a due regard to him. It is said that poverty obliged him to go Sicily, to Dionysius the Tyrant; and that he met with great contempt from Plato, but was extremely well received by Aristippus; to whom he shewed some of his dialogues, and received from him

a handsome reward. He would not venture to profess philosophy at Athens, Plato and Aristippus being in such high esteem; but he set up a school to maintain himself. He afterwards wrote orations for the Forum. Phrynicius, in Photius, ranks him amongst the best orators, and mentions his orations as the standard of the pure Attic style. Hermogenes has also spoken very highly of him.—He also wrote several dialogues, of which there are only three extant: 1. Concerning Virtue, whether it can be taught. 2. Eryxias, or Erasistratus; concerning riches, whether they are good. 3. Axiochus; concerning death, whether it is to be feared. Mr Le Clerc has given a Latin translation of them, with notes, and several dissertations, intitled *Sylva Philologica*.

ÆSCHYLUS, the tragic poet, was born at Athens. Authors differ in regard to the time of his birth, some placing it in the 65th, others in the 70th Olympiad; but according to Stanley, who relies on the Arundelian marbles, he was born in the 63^d Olympiad. He was the son of Euphoriion, and brother to Cynegirus and Aminias, who distinguished themselves in the battle of Marathon, and the sea-fight of Salamis, at which engagements Æschylus was likewise present. In this last action, according to Diodorus Siculus, Aminias, the younger of the three brothers, commanded a squadron of ships, and behaved with so much conduct and bravery, that he sunk the admiral of the Persian fleet, and signalized himself above all the Athenians. To this brother our poet was, upon a particular occasion, obliged for saving his life: Ælian relates, that Æschylus being charged by the Athenians with certain blasphemous expressions in some of his pieces, was accused of impiety, and condemned to be stoned to death: they were just going to put the sentence in execution, when Aminias, with a happy presence of mind, throwing aside his cloak, shewed his arm without a hand, which he had lost at the battle of Salamis, in defence of his country. This sight made such an impression on the judges, that, touched with the remembrance of his valour, and with the friendship he shewed for his brother, they pardoned Æschylus. Our poet, however, resented the indignity of this prosecution, and resolved to leave a place where his life had been in danger. He became more determined in this resolution when he found his pieces less pleasing to the Athenians than those of Sophocles, tho' a much younger writer. Some affirm, that Æschylus never sat down to compose but when he had drank liberally. He wrote a great number of tragedies, of which there are but seven remaining: and notwithstanding the sharp censures of some critics, he must be allowed to have been the father of the tragic art. In the time of Theſpis, there was no public theatre to act upon; the strollers driving about from place to place in a cart. Æschylus furnished his actors with masks, and dressed them suitably to their characters. He likewise introduced the bulkin, to make them appear more like heroes.—The ancients give Æschylus also the praise of having been the first who removed murders and shocking sights from the eyes of the spectators. He is said likewise to have lessened the number of the chorus. M. Le Fevre has observed, that Æschylus never represented women in love, in his tragedies; which, he says, was not suited to his genius; but, in representing a woman transported with fury, he was incomparable. Longinus says, that Æschylus has a noble boldness of expression; and that

Æchylus,

Æsculapius.

his imagination is lofty and heroic. It must be owned, however, that he affected pompous words, and that his sense is too often obscured by figures: this gave Salmastius occasion to say, that he was more difficult to be understood than the scripture itself. But notwithstanding these imperfections, this poet was held in great veneration by the Athenians, who made a public decree that his tragedies should be played after his death. He was killed in the 69th year of his age, by an eagle letting fall a tortoise upon his head as he was walking in the fields. He had the honour of a pompous funeral from the Sicilians, who buried him near the river Gela; and the tragedians of the country performed plays and theatrical exercises at his tomb.—The best edition of his plays is that of London, 1663, fol. with a Latin translation and a learned commentary by Tho. Stanley.

ÆSCHYNOMENE, **BASTARD SENSITIVE-PLANT**; a genus of the decandria order, belonging to the diadelphia class of plants. Of this genus they are reckoned fix

Species. 1. The aspera (as well as the rest of this genus) is a native of warm countries. It rises to the height of four or five feet, having a single herbaceous stalk, which is rough in some parts. The leaves come out on every side towards the top, forming a sort of head; the flowers come out between the leaves, two or three together upon long footstalks; they are yellow, and shaped like those of pease: after the flower is past, the germen becomes a flat jointed pod, which, when ripe, parts at the joints, and in each division is lodged a single kidney-shaped seed. 2. The Americana, seldom rises more than two feet in height. The flowers come out from the leaves on branching footstalks, five or six together; these are much less than the former, and of a paler yellow colour. The seed is lodged in pods like the other. 3. The arborea, grows to the height of six or seven feet, with a single stem; the flowers come out two or three together, of a copper colour, and as large as those of the aspera. 4. The sesban hath woody stems, and branches garnished with smooth leaves. The flowers are small, of a deep yellow colour, and come out in long spikes hanging downward. The seed is contained in a smooth pod, not jointed. 5. The pumila, rises to the height of about three feet; has flowers of a pale yellow colour, which come out sometimes single, at other times two or three upon each foot stalk. The seeds are contained in a long falcated pod having 13 or 14 divisions, each of which lodges a single seed. 6. The grandiflora, rises six or eight feet high, with a woody stem, sending out branches towards the top, garnished with obtuse leaves. The flowers are large, yellow, and succeeded by large pods containing kidney-shaped seeds.

Culture. These plants are propagated by seeds, which should be sown early in the spring, on a hot-bed; and when the plants have strength enough to be removed, they should each be put into a separate pot filled with light earth, and plunged into a hot-bed. As they increase in size, they must be removed into larger pots; but if these are too large, the plants will not thrive. They must be brought forward early in the year, otherwise the second kind will not perfect its seed.

ÆSCULANUS, or **ÆRES**, in mythology, a deity who presided over the coinage of copper-money.

ÆSCULAPIUS, in the heathen mythology, the god of physic, was the son of Apollo and the nymph Coronis. He was educated by the centaur Chiron,

who taught him physic; by which means Æsculapius cured the most desperate diseases. But Jupiter, enraged at his restoring to life Hippolitus who had been torn in pieces by his own horses, killed him with a thunder-bolt. According to Cicero, there were three deities of this name: the first, the son of Apollo, worshipped in Acadia, who invented the probe, and bandages for wounds; the second, the brother of Mercury, killed by lightning; and the third, the son of Arisippus and Arsinoe, who first taught the art of tooth-drawing and purging. At Epidaurus, Æsculapius's statue was of gold and ivory, with a long beard, his head surrounded with rays, holding in one hand a knotty stick, and the other entwined with a serpent; he was seated on a throne of the same materials as his statue, and had a dog lying at his feet. The Romans crowned him with laurel, to represent his descent from Apollo; and the Phalians represented him as beardless. The cock, the raven, and the goat, were sacred to this deity. His chief temples were at Pergamus, Smyrna, Trica a city in Ionia, and the Isle of Cos; in all which, votive tablets were hung up, shewing the diseases cured by his assistance. But his most famous shrine was at Epidaurus; where, every five years, games were instituted to him, nine days after the Isthmian games at Corinth.

ÆSCULAPIUS'S Serpent, or **COLUBER ÆSCULAPII**. See **COLUBER**.

ÆSCULUS, the **HORSE-CHESTNUT**; a genus of the monogynia order, belonging to the heptandria class of plants. Of this genus there is but one known species, viz. the hippocastanum, or common horse-chestnut. It was brought from the northern parts of Asia about the year 1550, and sent to Vienna about 1588. It had the name of castanea from the shape of its fruit; and the title of *equini* was added on account of its being a proper food, when ground, for horses. This tree makes a noble appearance all the month of May, the extremities of the branches being terminated by fine spikes of flowers spotted with rose-colours, so that the whole tree seems covered with them. It is quick in its growth; so that in a few years it arrives at a size large enough to afford a good shade in summer, as also to produce plenty of flowers. They have however this great inconvenience, that their wood is of no use, being unfit even for burning; and their leaves beginning to fall in July, soon deprive the trees of their beauty. There is something very singular in the growth of these trees, which is, that the whole shoot is performed in less than three weeks after the buds are opened.—The nuts are reckoned good food for horses. In Turkey, they are ground, and mixed with the provender of these animals, especially those which are troubled with coughs or broken-winded. Deer are also very fond of the fruit; and at the time of their ripening keep much about the trees, but especially in strong winds, when the nuts are blown down, which they carefully watch, and greedily devour as they fall. A variety of this species grows naturally in North America, where it rises to the height of 20 feet, but does not spread its branches to any great extent. The flowers are wholly red, whence it is called the *scarlet horse-chestnut*: they are tubulated, and smaller than those of the other kind; but, for want of brims to expand, make an indifferent appearance.

Culture.

Æsculapius,
Æsculus.

Æsculus,
Æſop.

Æſop.

Culture. These trees are propagated by sowing the nuts, which ought to be done early in the spring; but the nuts should be preserved in sand during the winter, otherwise they are apt to grow mouldy and rot.—The tree will thrive in moist soils and situations, but best in a sandy loam; and, if it inclines to moisture, the leaves will continue in verdure much longer than in a very dry ground. When the nuts succeed, and have a proper soil, the plants will shoot near a foot the first summer; so that where they grow pretty thick together, it will be proper to transplant them the following autumn. They ought then to be planted in rows three feet asunder, and one foot distance from one another in the rows. In this nursery they may continue two years, and then be transplanted where they are designed to remain. In transplanting them, the roots ought to be preserved as entire as possible, and none of the branches broken on any account. When such an accident happens, the branch is to be cut over close by the stem, that the wound may heal over. Another particularity with respect to this tree, besides its quickness of growth, is, that as soon as the old leaves fall off, the new bud for the next year is formed, which continues swelling till autumn, at which time the folding leaves are covered with a tenacious juice, which serves as a pigment to defend the tender bud from the winter-frosts; but, upon the first return of warmth in the spring, this melts and runs off, leaving the bud at full liberty to expand. The scarlet horse-chestnut must be propagated from nuts procured from America, for they do not come to perfection in this country. They should be planted in pots early in the spring, and the pots plunged in a moderate hot-bed to forward their growth; towards the end of May, the pots should be put into the earth, in a south-east border, and duly watered in dry weather. They must be screened from the frost during the first winter or two, being impatient of cold whilst young; though when they have attained strength, it seldom hurts them: the following spring they should be carefully separated, and planted a foot distance from each other in a sheltered situation.

ÆSOP, the Phrygian, lived in the time of Solon, about the 50th Olympiad, under the reign of Cræsus the last king of Lydia. As to genius and abilities, he was greatly indebted to nature; but in other respects not so fortunate, being born a slave and extremely deformed. St Jerom, speaking of him, says he was unfortunate in his birth, condition in life, and death; hinting thereby at his deformity, servile state, and tragical end. His great genius however enabled him to support his misfortunes; and in order to alleviate the hardships of servitude, he composed those entertaining and instructive fables which have acquired him so much reputation. He is generally supposed to have been the inventor of that kind of writing; but this is contested by several, particularly Quintilian, who seems to think that Hesiod was the first author of fables. Æſop, however, certainly improved this art to a very great degree; and hence it is that he has been accounted the author of this sort of productions:

Æſopus auctor quam materiam reperit,
Hanc ego polivi verbis fœnaris.

Phœd. Proel. ad lib. i.
If any thoughts in these iambs shine,
Th' invention's Æſop's, and the verse is mine."

The first master whom Æſop served, was one Cara-

cus Demarchus, an inhabitant of Athens; and there in all probability he acquired his purity in the Greek tongue. After him he had several masters; and at length came under a philosopher named Idmon or Iadmon, who enfranchised him. After he had recovered his liberty, he soon acquired a great reputation amongst the Greeks; so that, according to Meziriac, the report of his wisdom having reached Cræsus, he sent to inquire after him, and engaged him in his service. He travelled through Greece, according to the same author; whether for his own pleasure, or upon the affairs of Cræsus, is uncertain; and passing by Athens soon after Pisistratus had usurped the sovereign power, and finding that the Athenians bore the yoke very impatiently, he told them the fable of the frogs who petitioned Jupiter for a king. The images made use of by Æſop are certainly very happy inventions to instruct mankind; they possess all that is necessary to perfect a precept, having a mixture of the useful with the agreeable. "Æſop the fabulist (says Aulus Gellius) was deservedly esteemed wise, since he did not, after the manner of the philosophers, rigidly and imperiously dictate such things as were proper to be advised and persuaded; but, framing entertaining and agreeable apologies, he thereby charms and captivates the human mind."—Æſop was put to death at Delphi. Plutarch tells us, that he came there with a great quantity of gold and silver, being ordered by Cræsus to offer a sacrifice to Apollo, and to give a considerable sum to each inhabitant: but a quarrel arising betwixt him and the Delphians, he sent back the money to Cræsus; for he thought those for whom the prince designed it, had rendered themselves unworthy of it. The inhabitants of Delphi contrived an accusation of sacrilege against him; and pretending they had convicted him, threw him headlong from a rock. For this cruelty and injustice, we are told, they were visited with famine and pestilence; and consulting the oracle, they received for answer, that the god designed this as a punishment for their treatment of Æſop: they endeavoured to make an atonement, by raising a pyramid to his honour.

ÆSOP (Clodius), a celebrated actor, who flourished about the 670th year of Rome. He and Roscius were cotemporaries, and the best performers who ever appeared upon the Roman stage, the former excelling in tragedy, the latter in comedy. Cicero put himself under their direction to perfect his action. Æſop lived in a most expensive manner, and at one entertainment is said to have had a dish which cost above eight hundred pounds; this dish, we are told, was filled with singing and speaking birds, some of which cost near 50*l*. The delight which Æſop took in this sort of birds proceeded, as Mr Bayle observes, from the expense. He did not make a dish of them because they could speak, this motive being only by accident, but because of their extraordinary price. If there had been any birds that could not speak, and yet more scarce and dear than these, he would have procured such for his table. Æſop's son was no less luxurious than his father, for he dissolved pearls for his guests to swallow. Some speak of this as a common practice of his; but others mention his falling into this excess only on a particular day, when he was treating his friends. Horace * speaks only of one pearl of great value, which he dissolved in vinegar, and drank. Æſop, notwithstanding his expen-

Actius.

ces, is said to have died worth above 160,000*l*. When he was upon the stage, he entered into his part to such a degree, as sometimes to be seized with a perfect ecstacy: Plutarch mentions it as reported of him, that whilst he was representing Atreus deliberating how he should revenge himself on Thyestes, he was so transported beyond himself in the heat of action, that with his truncheon he smote one of the servants crossing the stage, and laid him dead on the spot.

ÆSTIMATIO CAPITIS, a term met with in old law-books for a fine anciently ordained to be paid for offences committed against persons of quality, according to their several degrees.

ÆSTIVAL, in a general sense, denotes something connected with, or belonging to, summer. Hence æstival sign, æstival solstice, &c.

ÆSTUARIA, in geography, denotes an arm of the sea, which runs a good way within land. Such is the Bristol channel, and many of the friths of Scotland.

ÆSTUARIES, in ancient baths, were secret passages from the hypocaustum into the chambers*.

ÆSTUARY, among physicians, a vapour-bath, or any other instrument for conveying heat to the body.

ÆSYMNIUM, in antiquity, a monument erected to the memory of the heroes, by Æsymnus the Megarean. He consulting the oracle in what manner the Megareans might be most happily governed, was answered, *If they held consultation with the more numerous*: whom he taking for the dead, built the said monument, and a senate-house that took within its compass the monument; imagining, that thus the dead would assist at their consultations. (Pausanias.)

ÆTH, or ARH, a strong little town in the Austrian Netherlands and province of Hainault, situated on the river Dender, about twenty miles S. W. of Brussels.

ÆTHER, in natural philosophy. See ETHER.

ÆTHER, in chemistry. See CHEMISTRY, n^o 167, 218, 261, 290, 305.

ÆTHERIAL. See ETHERIAL.

ÆTHIOPIA. See ETHIOPIA.

ÆTHIOPS, Mineral and Antimonial. See PHARMACY, n^o 752, 804.

ÆTHUSA, in botany, a genus of the pentandria digynia class. The volucrum is dimidiated, triphyllous, and pendulous. There is but one species, viz. the æthusa synapium, fools-parley, or lesser hemlock, (a native of Britain,) which grows in corn-fields and gardens. This plant, from its resemblance to common parley, hath sometimes been mistaken for it; and when eaten, it occasions sickness. If the curled-leaved parley only was cultivated in our gardens, no such mistakes would happen in future. Cows, horses, sheep, goats, and swine, eat it. It is noxious to geese.

ÆTIANUS, in church-history, a branch of Arians who maintained, that the Son and Holy Ghost are in all things dissimilar to the Father. See ÆTIUS.

ÆTIOLOGY, is that part of Pathology which is employed in exploring the causes of diseases*.

ÆTIUS, one of the most zealous defenders of Arianism, was born in Syria, and flourished about the year 336. After being servant to a grammarian, of whom he learned grammar and logic, he was ordained deacon, and at length bishop, by Eudoxus patriarch of Constantinople. St Epiphanius has preserved 47 of his propositions against the Trinity. His followers

followers were called ÆTIANUS.

ÆTIUS, a famous physician, born at Amida in Mesopotamia, and the author of a work intitled *Tetrabiblos*, which is a collection from the writings of those physicians who went before him. He lived, according to Dr Freind, at the end of the 5th or the beginning of the 6th century.

ÆTIUS, governor of Gallia Narbonensis in the reign of Valentinian III. forced the Franks who were passing into Gaul to repass the Rhine. He defeated the Goths; and routed Attila king of the Huns, who invaded Gaul with an army of 700,000 men. But the emperor, jealous of the merit of this great man, killed him in 454 with his own hand, under the pretence that he had permitted the invasion of the Huns, after Attila's defeat.

ÆTNA, (in the Itineraries *Æthna*, supposed from *aitis*, to burn; according to Bochart, from *Athuna*, a furnace, or *Ætuna*, darkness), now *Monte Gibello*; a volcano or burning mountain of Sicily, situated in lat. 38°. N. long. 15°. E.

This mountain, famous from the remotest antiquity, both for its bulk and terrible eruptions, stands in the eastern part of the island, in a very extensive plain, called *Val Demoni*, from the notion of its being inhabited by devils, who torment the spirits of the damned in the bowels of this volcano.

Concerning the dimensions of mount Ætina, we can scarce extract any thing consistent, even from the accounts of the latest and most ingenious travellers. Pindar, who lived about 435 years before Christ, calls it the *Pillar of heaven*, on account of its great height. All modern writers likewise agree, that this mountain is very high, and very large; but differ exceedingly both as to its height and magnitude: some making it no less than twelve miles high, others eight, others six, some four, while Mr Brydone, and Sir William Hamilton, who lately ascended to its highest fummit, reduce its height to little more than two miles; nay, by some, it is reduced to 10,036 feet, somewhat less than two miles. No less remarkable are the differences concerning its circumference: some making it only 60 miles round, others 100; and Signior Recupero, from whom Mr Brydone had his information in this respect, affirms it to be no less than 183 miles in circuit.

We are sorry to detract from the merit of Mr Brydone, or to involve in obscurity what he hath been at so much pains to elucidate; but every person who compares the account of mount Ætina's circumference, given by Signior Recupero, and to which Mr Brydone seems to have assented, with its apparent circumference on the map prefixed to that gentleman's tour through Sicily and Malta, must at once be struck with the prodigious disparity. Indeed, it is plain, that, in the map, the geographer hath not left room for any such mountain; nor can we help thinking, that, by comparing the distances of some of the Sicilian towns from one another, Signior Recupero's dimensions will be found enormously exaggerated.—Certain it is, that there the geographer hath placed Catania, which stands at the foot of mount Ætina, on one side, no more than 28 miles from the most distant point of the river Alcantara, which forms the boundary on the opposite side; so that a circle, whose radius is 14 or 15 miles, must encompass as much space as we can possibly think is occupied by

Inconsistent accounts concerning the magnitude of Ætina.

Ætna.

by the basis of mount Ætna. Thus we will reduce the circumference of this famous mountain to between 80 and 90 miles; and even when we do so, it must still be acknowledged to be very great.

But if we are embarrassed with the circumference of Ætna, we are much more so with the accounts relating to its height; and one circumstance, particularly, creates almost insurmountable difficulties. It is agreed upon by all travellers, and among the rest by Sir William Hamilton, that from Catania, where the ascent first begins, to the summit, is not less than 30 miles. The descent on the other side we have no account of; but, whatever supposition we make, the height of the mountain must be prodigious. If we suppose it likewise to be 30 miles, and that mount Ætna can be represented by an equilateral triangle, each of whose sides is 30 miles, we will have an amazing elevation indeed, no less than 26 miles perpendicular!—Such a height being beyond all credibility, we must contract the sides of our triangle, in proportion to its basis. We shall begin with allowing 10 miles for the difference between a straight line from Catania to the summit, and the length of the road, occasioned by the inequalities of the mountain; and supposing the descent on the other side to be somewhat shorter, we may call it 15 miles. Mount Ætna will now be represented by a scalene triangle, whose base is 30 miles, its longest side 20, and its shortest 15; from which proportions we will still find its height to be betwixt eight and nine miles.—This is still incredible; and when all the various relations concerning the height of Ætna are compared, we hope it will not be thought presumptuous in us to give it as our opinion, that the true dimensions of this mountain are as yet unknown.

Dimensions
uncertain.General ap-
pearance,
&c.

Concerning the products and general appearance of this volcano, authors are much better agreed.—The journey from Catania to its summit has been lately described by three travellers, M. D'Orville, Mr Brydone, and Sir William Hamilton. All these agree, that this single mountain affords an epitome of the different climates throughout the whole world: towards the foot, it is very hot; farther up, more temperate; and grows gradually more and more cold the higher we ascend. At the very top, it is perpetually covered with snow; from thence the whole island is supplied with that article, so necessary in a hot climate, and without which the natives say Sicily could not be inhabited. So great is the demand for this commodity, that the bishop's revenues, which are considerable, arise from the sale of mount Ætna's snow; and he is said to draw 1000*l.* a-year from one small portion lying on the north side of the mountain. Great quantities of snow and ice are likewise exported to Malta and Italy, making a considerable branch of commerce. On the north side of this snowy region, Mr Brydone was assured, that there are several small lakes which never thaw; and that the snow mixed with the ashes and salts of the mountain are accumulated to a vast depth. The quantity of salts contained in this mountain, he, with great probability, conjectures to be one reason of the preservation of its snows; for salt increases the coldness of snow to a surprising degree*.

* See Cold,
and Congela-
tion.

In the middle of the snowy region stands the great crater, or mouth of Ætna; from which, though contrary to the usual method of travellers, we shall begin our particular account of this mountain. Sir William

Hamilton describes the crater as a little mountain, about a quarter of a mile perpendicular, and very steep, situated in the middle of a gently inclining plain, of about nine miles in circumference. It is entirely formed of stones and ashes; and, as Mr Hamilton was informed by several people of Catania, had been thrown up about 25 or 30 years before the time (1769) he visited mount Ætna. Before this mountain was thrown up, there was only a prodigious large chafin, or gulph, in the middle of the above-mentioned plain; and it has been remarked, that about once in 100 years the top of Ætna falls in; which undoubtedly must be the case at certain periods, or the mountain behaved continually to increase in height. As this little mountain, though emitting smoke from every pore, appeared solid and firm, Mr Hamilton and his companions went up to the very top. In the middle is a hollow, about two miles and a half in circumference, according to Mr Hamilton; three miles and a half, according to Mr Brydone; and three or four, according to Mr D'Orville. The inside is crufted over with salts and sulphur of different colours. It goes shelving down, from the top, like an inverted cone; the depth, in Mr Hamilton's opinion, nearly corresponding to the height of the little mountain. From many places of this space issue volumes of sulphureous smoke, which being much heavier than the circumambient air, instead of ascending in it, roll down the side of the mountain, till, coming to a more dense atmosphere, it shoots off horizontally, and forms a large tract in the air, according to the direction of the wind; which, happily for our travellers, carried it exactly to the side opposite to which they were placed. In the middle of this funnel is the tremendous and unfathomable gulph, so much celebrated in all ages, both as the terror of this life, and the place of punishment in the next. From this gulph continually issue terrible and confused noises, which in eruptions are increased to such a degree as to be heard at a prodigious distance. Its diameter is probably very different at different times: for Mr Hamilton observed, by the wind clearing away the smoke from time to time, that the inverted hollow cone was contracted almost to a point; while Mr D'Orville and Mr Brydone found the opening very large. Both Mr Brydone and Mr Hamilton found the crater too hot to descend into it; but Mr D'Orville was bolder: and accordingly he and his fellow-traveller, fastened to ropes which two or three men held at a distance for fear of accidents, descended as near as possible to the brink of the gulph; but the small flames and smoke which issued from it on every side, and a greenish sulphur and pumice-stones, quite black, which covered the margin, would not permit them to come so near as to have a full view. They only saw distinctly in the middle, a mass of matter which rose, in the shape of a cone, to the height of above 60 feet, and which towards the base, as far as their sight could reach, might be 600 or 800. While they were observing this substance, some motion was perceived on the north side, opposite to that whereon they stood; and immediately the mountain began to send forth smoke and ashes. This eruption was preceded by a sensible increase of its internal roarings; which, however, did not continue; but after a moment's dilatation, as if to give it vent, the volcano resumed its former tranquillity; but

Crater de-
scribed.

Ætna.

as it was by no means proper to make a long stay in such a place, our travellers immediately returned to their attendants.

On the summit of mount Ætna, Mr Hamilton observes that he was sensible of a difficulty in respiration from the too great subtilty of the air, independent of what arose from the sulphureous smoke of the mountain. Mr Brydome takes no notice of this; which probably arose from the air being in a more rarefied state at the time of Mr Hamilton's observation, than of Mr Brydome's; the barometer, as observed by the former, standing at 18 inches and 10 lines, by the latter at 19 inches 6½ lines.

In these high regions there is generally a very violent wind, which, as all our travellers found it constantly blowing from the south, may possibly be commonly directed from that point. Here Mr Brydome's thermometer fell to 27°.

Splendor of
the stars seen
from the top
of Ætna.

The top of Ætna being above the common region of vapours, the heavens appear with exceeding great splendor.—Mr Brydome and his company observed, as they ascended in the night, that the number of stars seemed to be infinitely increased, and the light of each of them appeared brighter than usual; the whiteness of the milky way was like a pure flame which shot across the heavens; and, with the naked eye, they could observe clusters of stars that were invisible from below. Had Jupiter been visible, he is of opinion that some of his satellites might have been discovered with the naked eye, or at least with a very small pocket-glass. He likewise took notice of several of those meteors called *falling stars*; which appeared as much elevated as when viewed from the plain: a proof, according to Mr Brydome, that “these bodies move in regions much beyond the bounds that some philosophers have assigned to our atmosphere.”

Extensive
prospect.

To have a full and clear prospect from the summit of mount Ætna, it is necessary to be there before sunrise; as the vapours raised by the sun, in the day-time, will obscure every object: accordingly, our travellers took care to arrive there early enough; and all agree, that the beauty of the prospect from thence cannot be expressed.—Here Mr Brydome and Mr Hamilton had a view of Calabria in Italy, with the sea beyond it; the Lipari islands, and Stromboli a vulcano at about 70 miles distance, appeared just under their feet; the whole island of Sicily, with its rivers, towns, harbours, &c. appeared distinct, as if seen on a map. Massa, a Sicilian author, affirms, that the African coast as well that of Naples, with many of its islands, have been discovered from the top of Ætna. The visible horizon here, is not less than 8 or 900 miles in diameter. The pyramidal shadow of the mountain reaches across the whole island, and far into the sea on the other side, forming a visible tract in the air, which, as the sun rises above the horizon, is shortened, and at last confined to the neighbourhood of Ætna. The most beautiful part of the scene, however, in Mr Brydome's opinion, is the mountain itself, the island of Sicily, and the numerous islands lying round it. These last seem to be close to the skirts of Ætna; the distances appearing reduced to nothing.

Division in-
to three
zones.

This mountain is divided into three zones, which might properly enough be distinguished by the names of *torrid*, *temperate*, and *frigid*; they are, however,

known by the names of the *Piedmontese*, or *Regione culta*, the cultivated, or fertile region; the *Sylvosa*, woody, or temperate zone; and the *Regione deserta*, the frigid, or desert zone, or region. All these are plainly distinguished from the summit. The *Regione deserta* is marked out by a circle of snow and ice, which extends on all sides to the distance of about eight miles, beginning at the foot of the crater. Greatest part of this region is smooth and even. This is immediately succeeded by the *Sylvosa*, or woody region; which forms a circle of the most beautiful green, surrounding the mountain on all sides. This region is variegated with a vast number of mountains of a conical form, thrown up by Ætna in those eruptions which burst out from its sides. Mr Hamilton counted 44 on the Catania side, each having its crater, many with large trees flourishing both within and without the crater. All these, except a few of late date, have acquired a wonderful degree of fertility. The circumference of this zone, or great circle, according to Recupero, is not less than 70 or 80 miles. It is everywhere succeeded by the *Regione culta*; which is much broader than the rest, and extends on all sides to the foot of the mountain. Here terrible devastations are sometimes committed by the eruptions; and the whole region is likewise full of conical mountains thrown up by them. The circumference of this region, is, by Recupero, reckoned 183 miles; but we have already given our reasons for rejecting these dimensions.—This region is bounded by the sea to the south and south-east; and on all other sides, by the rivers Semetus and Alcantara, which form the boundaries of mount Ætna.

About a mile below the foot of the great crater, are found the ruins of an ancient structure, called *Il Torre del Filosofo*, by some supposed to have been built by the philosopher Empedocles, who took up his habitation here, the better to study the nature of mount Ætna. By others they are supposed to be ruins of a temple of Vulcan. They are of brick, and seem to have been ornamented with marble. Somewhere in this region also, Mr D'Orville found a great oblong block of polished marble, eight or ten feet high, and three or four thick; though how it came there, was quite unaccountable to him. From Mr D'Orville's and Mr Brydome's accounts, we must reckon this part of the mountain pretty steep: but Mr Hamilton says, that the ascent was so gradual, as not to be in the least fatiguing; and had it not been for the snows, they might have rode on their mules to the very foot of the crater.

The woody region descends eight or nine miles below the *Regione deserta*, but differs greatly in the temperature of its climate. Mr Hamilton observed a gradual decrease of the vegetation as he advanced; the under part being covered with large timber trees, which grew gradually less as he approached the third region, at last they degenerated into the small plants of the northern climates. He also observed quantities of juniper and tansey; and was informed by his guide, that later in the season (he visited Ætna in June 1769) there are a great many curious plants, and in some places rhubarb and saffron in great plenty. In Carrera's history of Catania, there is a list of all the plants and herbs of Ætna, in alphabetical order.

This region is extolled by Mr Brydome as one of the most delightful spots on earth. He lodged for a night in a large cave near the middle, formed by one of the
moist

Ætna.

Sylvosa.

Ætna.

Ætna.

most ancient lavas. It is called *La Spelonca del Capriolo*, or the goats cavern; because it is frequented by those animals, which take refuge there in bad weather. Here his rest was disturbed by a mountain thrown up in the eruption 1766. It discharged great quantities of smoke, and made several explosions like heavy cannon fired at a distance; but they could observe no appearance of fire.

This gentleman likewise visited the eastern side of the *Regione sflosa*, intending to have ascended that way to the summit, and defended again on the south side to Catania; but found it impracticable; though what the insurmountable difficulties were, he does not mention. On this side, part of the woody region was destroyed, in 1755, by an immense torrent of boiling water, which issued from the great crater. Its traces were still very visible, about a mile and an half broad, and in some places more. The soil was then only beginning to recover its vegetative power, which it seems this torrent had destroyed for 14 years.—Near this place are some beautiful woods of cork, and evergreen oak, growing absolutely out of the lava, the soil having hardly filled the crevices; and not far off, our traveller observed seven little mountains that seemed to have been formed by a late eruption. Each of these had a regular cup, or crater, on the top; and, in some, the middle gulph, or *Voragine*, as the Sicilians call it, was still open. Into these gulphs Mr Brydone tumbled down stones, and heard the noise for a long time after. All the fields round, to a considerable distance, were covered with large burnt stones discharged from these little volcanoes.

Eruption of boiling water.

Overgrown chestnut-trees.

The woody region, especially the east side, called *Carpinetto*, abounds with very large chestnut-trees; the most remarkable of which has been called, from its size, *Castagno de Cento Cavalli*, or chestnut-tree of an hundred horse. Mr Brydone was greatly disappointed at the sight of this tree, as it is only a bush of five large ones growing together: but his guides assured him, that all these five were once united into one stem; and Signior Recupero told him, that he himself had been at the expence of carrying up peasants with tools to dig round this bush of trees, and found all the stems united below ground in one root. The circumference, as measured by Messrs Brydone and Glover who accompanied him, amounted to 204 feet. Another of these, about a mile and a half higher on the mountain, is called *Castagna del Galea*: it rises from one solid item to a considerable height; after which it branches out, and is a much finer object than the other: this was measured two feet above the ground, and found to be 76 feet in circumference. A third, called *Castagno del Nave*, is pretty nearly of the same size; and Massa, one of the most esteemed Sicilian authors, affirms that he has seen solid oaks there upwards of 40 feet round. All these grow on a thick rich soil, which seems originally to have been formed of ashes thrown out by the mountain. Here the barometer stood at 26 inches 5 lines and an half, indicating an elevation of near 4000 feet.

Regione Calta.

The Piedmontese district is covered with towns, villages, monasteries, &c. and is well peopled, notwithstanding the danger of such a situation: but the fertility of the soil tempts people to inhabit that country; and their superstitious confidence in their fairs, with the propensity mankind have to despise danger which they do not see, render them as secure there as in any o-

Vol. I.

ther place. Here, Sir W^m Hamilton observes, they keep their vines low, contrary to the custom of those who inhabit mount Vesuvius; and they produce a stronger wine, but not in such abundance: here also many terrible eruptions have burst forth; particularly one in 1669. At the foot of the mountain raised by that eruption, is a hole, through which Sir W^m Hamilton descended, by means of a rope, into several subterranean caverns, branching out, and extending much farther than he chose to venture, the cold there being excessive, and a violent wind extinguishing some of the torches. Many other caverns are known in this and the other regions of Ætna; particularly one near this place called *La Spelonca della Palomba*, (from the wild pigeons building their nests there.) Here Mr Brydone was told that some people had lost their senses, from having advanced too far, imagining they saw devils and damned spirits.—Some of these caverns are made use of as magazines for snow; which they are well adapted for, on account of their extreme cold. These are with great probability supposed by Sir W^m Hamilton to be the hollows made by the issuing of the lava in eruptions.

Subterraneous caverns.

In this region the river *Acis*, so much celebrated by River Acis. the poets, in the fable of Acis and Galatea, takes its rise. It bursts out of the earth at once in a large stream, runs with great rapidity, and about a mile from its source throws itself into the sea. Its water is remarkably clear; and so extremely cold, that it is reckoned dangerous to drink it: it is said, however, to have a poisonous quality, from being impregnated with vitriol; in consequence of which, cattle have been killed by it. It never freezes, but is said often to contract a greater degree of cold than ice.

Having thus given an account of this mountain in its quiet and peaceable state, we must now describe the appearance it puts on during the time of an eruption, when it spreads destruction for many miles round, and is capable of striking the boldest with terror.—Here we are surprised to find ourselves at a loss; for though there are many particular accounts of the eruptions of Vesuvius, we cannot, after the most diligent search, find that any writer hath accurately described the phenomena attending an eruption of Ætna.—Borelli, indeed, an Italian writer, published a natural history of this mountain for the year 1669, when a very terrible eruption happened; but as this treatise is not now to be found, in this part of the world at least, we must supply the deficiency in the best manner we can, by such hints as can be obtained from the writing of Sir W^m Hamilton and Mr Brydone, together with a very imperfect account given by some English merchants who happened to be in Catania at that time, and recorded in the Philosophical Transactions N^o 51.

Appearances during an eruption.

Sir W^m Hamilton, who has examined both Vesuvius and Ætna in a very accurate manner, never had an opportunity of seeing an eruption of the latter; but as he is of opinion that the two volcanoes agree perfectly in all respects, only that the latter is on a much larger scale than the former, we hope it will not be unacceptable to our readers to give an account of some of the general appearances of Vesuvius when in a state of eruption, the better to help their ideas concerning Ætna.

It has been already observed, that a smoke constantly issues from the top of Ætna, and that its inter-

O

nal

Ætna.

nal noises never cease. The cafe is the fame with Vefuvius: and Sir W^m Hamilton obferved, that in bad weather the fmoke was more confiderable, as well as the noises much louder, than when it was fair; fo that in bad weather he had frequently heard the inward explofions of the mountain at Naples, fix miles diftant from Vefuvius. He alfo obferved the fmoke that iffued from the mountain in bad weather to be very white, moift, and not near fo offenfive as the fulphureous fteam from various cracks in the fide of the mountain.

Signs of an approaching eruption

Hamilton's Observations, p. 4.

The firft fymptom of an approaching eruption is an increafe of the fmoke in fair weather: after fome time, a puff of black fmoke is frequently feen to fhoot up in the midft of the white, to a confiderable height. Thefe puffs are attended with confiderable explofions: for while Vefuvius was in this ftate, Sir W^m Hamilton went up to its top, which was covered with fnow; and perceiving a little hillock of fulphur, about fix feet high, which had been lately thrown up, and burnt with a blue flame at the top, he was examining this phenomenon, when fuddenly a violent report was heard, a column of black fmoke fhut up with violence, and was followed by a reddifh flame. Immediately a fhower of ftones fell; upon which he thought proper to retire. Phenomena of this kind, in all probability, precede the eruptions of Ætna, in a much greater degree.—The fmoke at length appears wholly black in the day-time, and in the night has the appearance of flame; fhowers of afhes are fent forth, earthquakes are produced, the mountain difcharges volleys of red-hot ftones to a great height in the air. The force by which thefe ftones are projected, as well as their magnitude, feems to be in proportion to the bulk of the mountain. Signior Recupero affured Mr Brydone, that he had feen immenfe large ones thrown perpendicularly upwards to the height of 7000 feet, as he calculated from the time they took to arrive at the earth after beginning to defend from their greateft elevation. The largeft ftone, or rather rock, that was ever known to be emitted by Vefuvius, was 12 feet long, and 45 in circumference. This was thrown a quarter of a mile; but much larger ones have been thrown out by mount Ætna, almoft in the proportion in which the latter exceeds Vefuvius in bulk. Along with thefe terrible fymptoms, the fmoke that iffues from the crater is fometimes in a highly electrified ftate. In this cafe, the fmall afhes which are continually emitted from the crater, are attracted by the fmoke, and rife with it to a great height, forming a vaft black, and to appearance denfe, column; from this column continual fafhies of forked or zig-zag lightning iffue, fometimes attended with thunder; and fometimes not, but equally powerful with ordinary lightning. This phenomenon was obferved by Sir W^m Hamilton in the fmoke of Vefuvius, and has alfo been taken notice of in that of Ætna; and where this electrified fmoke hath fpread over a tract of land, much mischief hath been done by the lightning proceeding from it.

Thunder & lightning from the fmoke.

When thefe dreadful appearances have continued fometimes four or five months, the lava begins to make its appearance. This is a fream of melted mineral matters, which in Vefuvius commonly boils over the top; but very feldom does fo in Ætna; owing to the great weight of the lava, which, long before it can be raifed to the vaft height of mount Ætna, burfts out

through fome weak place in its fide. Upon the appearance of the lava, the violent eruptions of the mountain generally, though not always, ceafe; for if this burning matter gets not fufficient vent, the commotions increafe to a prodigious degree.—In the night-time the lava appears like a fream of fire, accompanied with flame: but in the day-time it has no fuch appearance; its progrefs is marked by a white fmoke, which by the reflection of the red-hot matter in the night afumes the appearance of flame.

Ætna.

All the abovementioned fymptoms preceded the great eruption of Ætna in 1669. For feveral months before 1669. the lava broke forth, the *old mouth*, or great crater on the fummit, was obferved to fend forth great quantities of fmoke and flame; the top had fallen in, fo that the mountain was much lowered; the iflands alfo of Volcan and Stromboli, two vulcanoes to the weltward of Sicily, were obferved to rage more than ufual.—Eighteen days before the eruption, the fky was very thick and dark, with thunder, lightning, frequent confufions of the earth, and dreadful fubterraneous bellowsings. On the 11th of March, fome time before the lava got vent, a rent was opened in the mountain twelve miles in length, into which, when ftones were thrown down, they could not be heard to ftrike the bottom. Burning rocks, 60 palms (15 of our feet) in length, were thrown to the diftance of a mile; others of a leffer fize were carried three miles off; the internal noises of the mountain were exceedingly dreadful, and the thunder and lightning from the fmoke fearee lefs terrible than they. When the lava at laft got vent, it burft out of a vineyard, 20 miles below the great crater, and fprung up into the air to a confiderable height. Here it formed a mountain of ftones and afhes, not lefs, as Sir W^m Hamilton conjectures, than half a mile perpendicular in height, and three miles in circumference. For 54 days, neither fun nor ftars had appeared; but foon after the lava got vent, the mountain became very quiet. The terrible effects of this fiery fream may be imagined from its amazing extent; being, as Sir W^m Hamilton obferves, no lefs than 14 miles long, and in many places fix in breadth. In its courfe, it deftroyed the habitations of near 30,000 perfons; and meeting with a lake four miles in compafs, it not only filled it up, though feveral fathom deep, but made a mountain in the place of it. Having reached Catania, it deftroyed part of its walls, and ran for a confiderable length into the fea, forming a safe and beautiful harbour; which, however, was foon filled up by a frefh torrent of the fame inflamed matter.

It is not eafy for thofe who have never been prefent at thofe terrible operations of nature, to reprelent to their minds the horror which muft attend the breaking forth of a lava; for though the giving vent to this burning matter generally produces a ceflation of the violent efforts of the internal fire, yet at the very inflant of its explofion fearee any thing can be conceived fo dreadful.—As we cannot find a particular account of what happened at the breaking forth of the lava in mount Ætna in 1669, we muft content ourfelves with giving the reader fome idea of it from Sir W^m Hamilton's account of the breaking forth of a lava in Vefuvius, no more than a quarter of a mile's diftance from the place where he flood. "I was making my obfervations," fays he, "on the lava, which had already, from the

Phenomena at the breaking forth of the lava.

Hamilton's Observations, p. 264.

"fpot

Ætna.

"spot where it first broke out, reached the valley; when, on a sudden, about noon, I heard a violent noise within the mountain, and about a quarter of a mile off the place where I stood, the mountain split, and with much noise, from this new mouth, a fountain of liquid fire shot up many feet high, and then, like a torrent, rolled on directly towards us. The earth shook, at the same time that a volley of pumice-stones fell thick upon us; in an instant, clouds of black smoke and ashes caused almost a total darkness; the explosions from the top of the mountain were much louder than any thunder I ever heard, and the smell of sulphur was likewise very offensive. My guide, alarmed, took to his heels; and I must confess I was not at my ease. I followed close, and we ran near three miles without stopping; as the earth continued to shake under our feet, I was apprehensive of the opening of a fresh mouth, which might have cut off our retreat. I also feared that the violent explosions would detach some of the rocks off the mountain of Somma, under which we were obliged to pass; besides, the pumice-stones, falling upon us like hail, were of such a size as to cause a disagreeable sensation upon the part where they fell. After having taken breath, as the earth still trembled greatly, I thought it most prudent to leave the mountain and return to my villa; where I found my family in a great alarm at the continual and violent explosions of the vulcano, which shook our house to its very foundation, the doors and windows swinging upon their hinges.—The noise and smell of sulphur increasing, we removed from our villa to Naples: and I thought proper, as I passed by Portici, to inform the court of what I had seen; and humbly offered it as my opinion, that his Sicilian Majesty should leave the neighbourhood of the threatening mountain.—I observed, in my way to Naples, which was in less than two hours after I had left the mountain, that the lava had actually covered three miles of the very road through which we had retreated. It is astonishing that it should have run so fast; as I have since seen, that the river of lava in the *Atrio di Cavallo* was 60 and 70 feet deep, and in some places near two miles broad. When his Sicilian Majesty quitted Portici, the noise was greatly increased; and the concussion of the air from the explosions was so violent, that, in the king's palace, doors and windows were forced open, and even one door there, which was locked, was nevertheless burst open. At Naples, the same night, many windows and doors flew open: (the windows at Naples open like-folding doors.) In my house, which is not on the side of the town next *Vesuvius*, I tried the experiment of unbolting my windows, when they flew wide open upon every explosion of the mountain. Besides these explosions, which were very frequent, there was a continued subterraneous and violent rumbling noise; which lasted this night about five hours."

No doubt the same terrible appearances are put on by *Ætna* at the time its lavas break forth; but in a much greater degree, in proportion to the superior size of the mountain.—The appearance, and indeed the effects, of the lava itself, are very dreadful. When it first issues, the lava appears very fluid, and runs with the ra-

pidity of a swift river: but even then it surprisingly resists the impression of solid bodies; for Sir *Wm Hamilton* could not pierce that of *Vesuvius* with a sick driven against it with all his force; nor did the largest stone he was able to throw upon it sink, but made a slight impression, and then floated along. This happened almost at the very mouth, when the lava appeared liquid as water, and when he saw it running with a rapidity equal to the river *Severn* at the passage near *Bristol*.—A description of the lava issuing from mount *Ætna* in 1669 was sent to the court of England by Lord *Winchelsea*, who at that time happened to be at *Catania* in his way home from an embassy at *Constantinople*. His account is not now to be procured; but Mr *Hamilton* found a copy in *Sicily*, and hath given an extract, part of which follows. "When it was night, I went upon two towers in divers places; and I could plainly see, at ten miles distance, as we judged, the fire begin to run from the mountain in a direct line, the flame to ascend as high and as big as one of the greatest steeples in your Majesty's kingdoms, and to throw up great stones into the air; I could discern the river of fire to descend the mountain of a terrible fiery or red colour, and stones of a paler red to swim thereon, and to be some as big as an ordinary table. We could see this fire to move in several other places, and all the country covered with fire, ascending with great flames in many places, smoking like to a violent furnace of iron melted, making a noise with the great pieces that fell, especially those that fell into the sea. A cavalier of Malta, who lives there, and attended me, told me, that the river was as liquid, where it issues out of the mountain, as water, and came out like a torrent with great violence, and is five or six fathom deep, and as broad, and that no stones sink therein."

The account given in the *Philosophical Transactions* is to the same purpose. We are there told, that the lava is "nothing else than diverse kinds of metals and minerals, rendered liquid by the fierceness of the fire in the bowels of the earth, boiling up and gushing forth as the water doth at the head of some great river; and having run in a full body for a stone's-cast or more, began to crust or curdle, becoming, when cold, those hard porous stones which the people call *Sciari*." Those, though cold in comparison of what first issues from the mountain, yet retained so much heat as to resemble huge cakes of sea-coal strongly ignited, and came tumbling over one another, bearing down or burning whatever was in their way.—In this manner the lava proceeded slowly on till it came to the sea, when a most extraordinary conflict ensued betwixt the two adverse elements. The noise was vastly more dreadful than the loudest thunder, being heard thro' the whole country to an immense distance; the water seemed to retire and diminish before the lava, while clouds of vapour darkened the sun. The whole fish on the coast were destroyed, the colour of the sea itself was changed, and the transparency of its waters lost for many months.

While this lava was issuing in such prodigious quantity, the merchants, whose account is recorded in the *Philosophical Transactions*, attempted to go up to the mouth itself; but durst not come nearer than a furlong, lest they should have been overwhelmed by a vast pillar

of the eruptions.

lar of ashes, which to their apprehension exceeded twice the bigness of St Paul's steeple in London, and went up into the air to a far greater height; at the mouth itself was a continual noise, like the beating of great waves of the sea against rocks, or like distant thunder, which sometimes was so violent as to be heard 60, or even 100 miles off, to which distance also part of the ashes were carried.—Some time after, having gone up, they found the mouth from whence this terrible deluge issued to be only a hole about 10 feet diameter. This is also confirmed by Mr Brydone; and is probably the same through which Sir W^m Hamilton descended into the subterranean caverns already mentioned.

Mount Ætna, as we have already remarked, has been a celebrated Vulcano from the remotest antiquity. Diodorus Siculus mentions eruptions of it as happening 500 years before the Trojan war, or 1693 years before the Christian æra. Many others are recorded by historians in different ages, but none are particularly described. The mountain seems sometimes to lie dormant for many years, or even centuries; when it breaks out again with great fury, and will sometimes burn for years together. Since 1669 there have been several eruptions, but none of them comparable to that one. The last happened in 1766. The lava sprung up into the air to a considerable height, twelve miles below the summit; but formed a stream only six miles in length, and one mile in breadth.

These are the most remarkable circumstances we have been able to collect, that might serve to give an adequate idea of this famous mountain.—Many things, however, concerning the extent, antiquity, &c. of the lavas, remain to be discussed, as well as the opinions of philosophers concerning the origin of the internal fire which produces so much mischief: but the consideration of these belongs to the general article VULCANO, to which the reader is referred.—The fate of *Catania* and *Hybla*, which have often been destroyed by eruptions, falls to be mentioned under these two words.

ÆTOLARCHA, in Grecian antiquity, the principal magistrate or governor of the Ætolians.

AFER (Domitius), born at Nîmes, a famous orator under Tiberius and the three succeeding emperors. Quintilian makes frequent mention of him, and commends his pleadings. But he disgraced his talents, by turning informer against some of the most distinguished personages in Rome. He died A. D. 59.

AFFECTION, in a general sense, implies an attribute inseparable from its subject. This magnitude, figure, weight, &c. are affections of all bodies; and love, fear, hatred, &c. are affections of the mind*.

* See Moral
Philosophy,
Part I. sec. i.
iv.

AFFECTION, signifying a *settled bent of mind toward a particular being or thing*, occupies a middle space between *disposition* on the one hand, and *passion* on the other †. It is distinguishable from *Disposition*, which being a branch of one's nature, originally, must exist before there can be an opportunity to exert it upon any particular object; whereas *Affection* can never be original, because, having a special relation to a particular object, it cannot exist till the object have once at least been presented. It is also distinguishable from *Passion*, which, depending on the real or ideal presence of its object, vanishes with its object; whereas *Affection* is a lasting connection; and, like other connections, subsists even when we do not think of the person. A familiar

Affection
||
Affirmation

example will illustrate this. There may be in one person's mind a disposition to gratitude, which, through want of an object, happens never to be exerted; and which therefore is never discovered even by the person himself. Another, who has the same disposition, meets with a kindly office that makes him grateful to his benefactor: An intimate connection is formed between them, termed *affection*; which, like other connections, has a permanent existence, though not always in view. The affection, for the most part, lies dormant, till an opportunity offer for exerting it: in that circumstance, it is converted into passion of gratitude; and the opportunity is eagerly seized of testifying gratitude in the warmest manner.

AFFECTION, among physicians, signifies the same as disease. Thus the hysterical *affection* is the same with the hysterical disease.

AFFECTIONS and *Passions*, (non-naturals.) See MEDICINE, n^o 153.

AFFEERERS, or AFFEERORS, in law, persons appointed in court-leets, courts-baron, &c. to settle, upon oath, the fines to be imposed upon those who have been guilty of faults arbitrarily punishable.

AFFETUOSO, or *Con Affetto*, in the Italian music, intimates that the part to which it is added ought to be played in a tender moving way, and consequently rather slow than fast.

AFFIANCE, in law, denotes the mutual plighting of troth between a man and woman to marry each other.

AFFIDAVIT, signifies an oath in writing, sworn before some person who is authorized to take the same.

AFFINITY, among civilians, implies a relation contracted by marriage; in contradistinction to consanguinity, or relation by blood.—Affinity does not found any real kinship; it is no more than a kind of fiction, introduced on account of the close relation between husband and wife. It is even said to cease, when the cause of it ceases: hence a woman who is not capable of being a witness for her husband's brother during his lifetime, is allowed for a witness when a widow, by reason the affinity is dissolved. Yet with regard to the contracting marriage, affinity is not dissolved by death, though it be in every thing else.

AFFINITY, is also used to denote conformity or agreement: Thus we say, the affinity of languages, the affinity of words, the affinity of sounds, &c.

AFFINITY, in chemistry, implies that natural impulse or attraction which various bodies exert towards each other. See CHEMISTRY, n^o 15, 27, 64.

AFFIRMATION, in logic, the asserting the truth of any proposition.

AFFIRMATION, in law, denotes an indulgence allowed to the people called Quakers; who, in cases where an oath is required from others, may make a solemn affirmation that what they say is true; and if they make a false affirmation, they are subject to the penalties of perjury. But this relates only to oaths taken to the government, and on civil occasions; for Quakers are not permitted to give their testimony in any criminal case, &c.

AFFIRMATION, is also used for the ratifying or confirming the sentence or decree of some inferior court: thus we say, the House of Lords affirmed the decree of the lord chancellor, or the decree of the lords of session,

AFFLATUS,

AFFLATUS, literally denotes a blast of wind, breath, or vapour, striking with force against another body. The word is Latin, formed from *ad* to, and *flare* to blow. Naturalists sometimes speak of the afflatus of serpents. Tully uses the word, figuratively, for a divine inspiration; in which sense, he ascribes all great and eminent accomplishments to a divine afflatus. The Pythian priestesses being placed on a tripod or perforated stool, over a hollow cave, received the divine afflatus, as a late author expresses it, in her belly; and being thus inspired, fell into agitations, like a phrenetic; during which, the pronounced, in hollow groans and broken sentences, the will of the deity. This afflatus is supposed, by some, to have been a subterraneous fume, or exhalation, wherewith the priestesses was literally inspired. Accordingly, it had the effects of a real physical disease; the paroxysm of which was so vehement, that Plutarch observes it sometimes proved mortal. Van Dale supposes the pretended enthusiasm of the Pythia to have arisen from the fumes of aromatics.

AFFRAY, or **AFFRAYMENT**, in law, formerly signified the crime of affrighting other persons, by appearing in unusual armour, brandishing a weapon, &c. but, at present, *affray* denotes a skirmish or fight between two or more.

AFFRONTÉE, in heraldry, an appellation given to animals facing one another on a escutcheon; a kind of bearing which is otherwise called *confrontée*, and stands opposed to *adefse*.

AFRANIUS, a Latin poet, who wrote comedies in imitation of Menander, commended by Tully and Quintilian: he lived in the 170th olympiad.

AFRICA (according to Bochart, from a Punic word, signifying *Ears of Corn*) one of the four great divisions, by the moderns called *quarters*, of the world, and one of the three called by the Greeks *ἡμέραι*, or *continents*. By them it was also called *Libya*.

Africa lies south of Europe, and west of Asia. It is bounded on the north by the Mediterranean, which separates it from the former; on the north-east, by the Red-sea which divides it from Asia, and to which it is attached by a neck of land called the *Isthmus of Suez*, about 60 miles over, separating the Mediterranean from the Red-sea. On the west, south, and east, it is bounded by the main ocean: so that it is properly a vast peninsula, bearing some faint resemblance of a pyramid, the base of which is the northern part, running along the shores of the Mediterranean; and the top of the pyramid is the most southerly point, called the *Cape of Good Hope*. Its greatest length from north to south is 4300 miles, and its greatest breadth from east to west is 3500 miles; reaching from Lat. 37° N. to 35° S. and from Long. 17° W. to 50° E.

Though the greatest part of this continent hath been in all ages unknown both to the Europeans and Asiatics, its situation is more favourable than either Europe or Asia for maintaining an intercourse with other nations. It stands, as it were, in the centre of the three other quarters of the globe; and has thereby a much nearer communication with Europe, Asia, and America, than any one of these has with another. For, (1.) It is opposite to Europe in the Mediterranean, for almost 1000 miles in a line from east to west; the distance seldom 100 miles, never 100 leagues, and sometimes not above 20 leagues. (2.) It is opposite to

Asia for all the length of the Red-sea, the distance sometimes not exceeding five leagues, seldom fifty (3.) Its coast for the length of about 2000 miles lies opposite to America at the distance of, from 500 to 700 leagues, including the islands: whereas America, unless where it may be a *terra incognita*, is no where nearer Europe than 1000 leagues; and Asia, than 2500.

As the equator divides this continent almost in the middle, the far greatest part of it is within the tropics; and of consequence the heat in some places is almost insupportable by Europeans, it being there greatly increased by vast deserts of burning sand.—It cannot be doubted, however, that, were the country well cultivated, it would be extremely fertile; and would produce in great abundance not only the necessities, but also the luxuries, of life. It has been asserted, that the sugars of Barbadoes and Jamaica, as also the ginger, cotton, rice, pepper, pimento, cocoa, indigo, &c. of these islands, would thrive in Africa to as much perfection as where they are now produced. Nor can it be doubted, that the East-Indian spices, the tea of China and Japan, the coffee of Mocha, &c. would all thrive in some parts of the African coast; as this continent has the advantage of feeling no cold, the climate being either very warm or very temperate.

Whatever may be the case with the internal parts of Africa, it is certain that its coasts are well watered with many very considerable rivers. The Nile and the Niger may be reckoned among the largest in any part of the world, America excepted. The first discharges itself into the Mediterranean, after a prodigious course from its source in Abyssinia. The origin neither of the Nile, nor of the Niger, is certainly known; but that of the latter is supposed to run through a tract of land little less than 3000 miles. Both these rivers annually overflow their banks, fertilizing by that means the countries through which they pass. The Gambia and Senegal rivers are only branches of the Niger. Many vast ridges of mountains also run through different parts of this continent; but their extent is very little known. Some of the most remarkable are, (1.) Those called *Atlas*, lying between the 20th and 25th degree of north latitude, and supposed almost to divide the continent from east to west. (2.) The *mountains of the moon*, so called on account of their great height; supposed to be the boundaries between Abyssinia and some of the interior kingdoms. (3.) The *mountains of Sierra Leona*, so called on account of their abounding with lions, and likewise supposed to be the boundaries of some of the nations. (4.) Those called by the ancients the *mountains of God*, on account of their being subject to perpetual thunder and lightning. Of all these, however, little more is known than their names.

To what we have already said concerning the produce of Africa, we may add, that no part of the world abounds with gold and silver in a greater degree. Here also are a prodigious number of elephants; and it is surprising, that neither the ancient nor modern Europeans, notwithstanding their extravagant and insatiable thirst after gold and silver, should have endeavoured to establish themselves effectually in a country much nearer to them than either America or the East Indies; and where the objects of their desire are found in equal, if not greater, plenty.

Next to gold and silver, copper is the most valuable metal,

Africa.

metal; and on this continent is found in great plenty, inasmuch that the mountains of Atlas above mentioned are said all to be composed of copper ore. In short, Africa, though a full quarter of the globe, stored with an inexhaustible treasure, and capable of producing almost every necessary, conveniency, and luxury of life, within itself, seems to be utterly neglected both by its own inhabitants and all other nations: the former, being in a savage state, are incapable of enjoying the blessings offered them by nature; and the latter taking no farther notice of the inhabitants, or their land, than to obtain at the easiest rate what they procure with as little trouble as possible, or to carry them off for slaves to their plantations in America.

Only a small part of this continent was known to the ancients, *viz.* the kingdom of Egypt, and the northern coast, comprehending little more than what is now known by the name of *Barbary*. It was divided into *Africa Propria*, and *Africa Interior*. *Africa Propria* comprehended only the Carthaginian territories. *Africa Interior* comprehended all other nations to the southward of these territories, or those at a greater distance from Rome. The only kingdoms, however, with which the Romans had any connection, were the Numidians, the Mauritians, and the Gætuli. All these, as well as Egypt, were swallowed up by that enormous power, and reduced to the condition of Roman provinces. But the Romans never seem to have penetrated beyond the tropic of cancer. There appears, indeed, to have been some intercourse between them and the Ethiopians; but the latter always preserved their liberty; and we find their queen Candace mentioned in the times of the apostles, when the Roman power was at its highest pitch.

Between the tropic of cancer and the equinoctial line, a multitude of savage nations were supposed to have their residence, known by the names of Melanogætuli, Nigritæ, Blemmyes, Dolopes, Aflacuri, Lotophagi, Ichthyophagi, Elephantophagi, &c. (which are taken notice of, as well as the others already mentioned, under their proper names); but that Africa was a peninsula, seems to have been totally unknown both to the Europeans and Asiatics for many ages.—It is probable indeed, that some of the Phenicians, and their offspring the Carthaginians, were not so ignorant; as they carried navigation to a much greater height than either the Greeks or Romans: but their discoveries were all concealed with the greatest care, lest other nations should reap the benefit of them; and accordingly we can now find no authentic accounts concerning them. The navigation round Africa, in particular, is recorded by the Greek and Roman writers rather as a strange amusing tale than as a real transaction; and as neither the progress of the Phenician and Carthaginian discoveries, nor the extent of their navigation, were communicated to the rest of mankind, all memorials of their extraordinary skill in naval affairs seem in a great measure to have perished, when the maritime power of the former was annihilated by Alexander's conquest of Tyre, and the empire of the latter was overturned by the Romans.

That the peninsula of Africa, however, was in reality sailed round by the Phenicians, we have on indisputable authority; for some of that nation undertook the voyage, at the command of Necho king

of Egypt, about 604 years before the Christian æra. They sailed from a port in the Red-sea, and after three years returned by the Mediterranean: and the very objections that were made to the veracity of their accounts at that time, are unanswerable proofs to us that this voyage was really accomplished. They pretended, that, having sailed for some time, the sun became more and more vertical, after which he appeared in the north, and seemed to recede from them: that as they returned, the sun gradually seemed to move southwards; and, after becoming vertical once more, appeared then in the fourth side of them as before they set out. This, which we know must certainly have been the case, was deemed incredible at that time, and universal ignorance concerning the extent of this continent prevailed till the 15th century. The first attempts towards attaining a knowledge of Africa was made by the Portuguese in 1412. Notwithstanding their vicinity, they had never ventured beyond Cape Non, situated in about N. lat. 27°. it had received its name from a supposed impossibility of passing it. This year they proceeded 160 miles farther, to Cape Bojador; which stretching a considerable way into the Atlantic ocean, with rocky cliffs, appeared so dreadful to the navigators, that they returned without any attempt to pass it. In an attempt to double this formidable cape, they discovered the Madeira islands in 1419; but Cape Bojador continued to be the boundary of their continental discoveries till 1433; when they penetrated within the tropics, and in a few years discovered the river Senegal, Cape de Verd, and the islands which lie off that promontory. In 1449, the western islands, called the *Azores*, were discovered: and in 1471, they first penetrated beyond the line; and were surprised to find, that the torrid zone, contrary to the opinion of the ancients, who imagined it to be burnt up with heat, was not only habitable, but fertile and populous. In 1484, they proceeded 1500 miles beyond the line; so that they began to entertain hopes of finding that way a passage to the East Indies: and two years afterwards, the Cape of Good Hope was discovered by Bartholomew de Diaz; but it was not till the year 1497, that the Portuguese, under Vasquez de Gama, actually doubled this cape, and discovered the true shape of the continent. Thus the coasts of Africa were made perfectly known; and probably the knowledge concerning its interior parts would have been much greater than it is, had not the general attention been called off from this continent by the discovery of America in 1492.

The Romans for a long time maintained their power in Africa: but in the year 426, Bonifacius, supreme governor of all the Roman dominions in this quarter, being compelled to revolt by the treachery of another general called *Aetius*, and finding himself unable to contend with the whole strength of the Roman empire, called in Genserik king of the Vandals to his aid; who thereupon abandoned the provinces he had seized in Europe, and passed over into Africa. Bonifacius, however, being soon after reconciled to his empress Placidia, endeavoured in vain to persuade the Vandals to retire. Hereupon a war ensued, in which the barbarians proved victorious, and quickly over-ran all the Roman provinces in Africa. In the year 435, a peace was concluded; when Numidia and some other countries were ceded to the Vandals, who soon after seized

Africa.

Africa.

all the rest. These barbarians did not long enjoy their ill-gotten possessions: for, about the year 533, Belisarius drove them out, annexing the provinces to the eastern empire; and in 647, the Saracens, having conquered Mesopotamia, Egypt (which anciently was not included in the meaning of the word *Africa*), Phœnicia, Arabia, and Palestine, broke like a torrent into Africa, which they quickly subdued. Their vast empire being in 936 divided into seven kingdoms, the African states retained their independency long after the others were subdued by the Turks: but in the beginning of the 16th century, being afraid of falling under the yoke of Spain, they invited the Turks to their assistance; who first protected, and then enslaved, them. They still continue in a kind of dependence on the Ottoman empire. They are not, however, properly speaking, the *subjects* of the grand Signior, but call him their *protector*, paying him an annual tribute. On the coasts, the natives are almost all addicted to piracy; and with such success have they carried on their employment, that the greatest powers in Europe are become their tributaries, in order to procure liberty to trade on the Mediterranean.

Concerning even these states, which are nearest to Europe, very little is known; but the interior nations are scarce known by name; nor do almost any two of the most learned moderns agree in their division of Africa into kingdoms; and the reason is, that no traveller hath ever penetrated into these inhospitable regions. In the year 1774, indeed, an account appeared in our newspapers and magazines, of a Mr Bruce, who had entered Abyssinia, probably the ancient Ethiopia, where he remained upwards of two years; after which he found means to return, bringing along with him many great curiosities: but this gentleman, contrary to the general disposition of travellers, could never be prevailed upon to make his discoveries public, and disclaimed what was published by others concerning his travels; and indeed none of those vague accounts contained anything very singular, except the horrible custom ascribed to the Abyssinians of eating living animals; which, however problematical, we subjoin in the note †. According to the best accounts we have been able to procure concerning those regions of Africa lying beyond Egypt and Barbary, they are divided in the following manner. On the western coast, to the south of Barbary, lie the kingdoms of Bildulgerid, Zaara, Negroland, Loango, Congo, Angola, Benguela, and Terra de Natal. On the eastern coast beyond Egypt, are those of Nubia, Adel, Ajan, Zanguebar, (between these two a huge desert is interposed), Monomatapa, and Sofala. In the interior parts, the kingdoms of Lower Ethiopia, Abex, Monemuge, and Matanan, are made mention of. The southernmost part, called Cafrairia, is well known for the habitation of the Hottentots, the most degenerate of all the human species.

The chief trade carried on by the Europeans with

the more savage African nations, is the purchasing, or carrying off by force when it is in their power, slaves for their colonies in other countries; and because they have been remarkably successful in this iniquitous trade, it hath been gravely asserted, that these barbarous nations are descended from Canaan the son of Ham, whom Noah cursed, and prophesied that he should be a servant of servants to his brethren: but, not to insist on the absurdity of supposing the villany of any nation a punishment *sent from God*, it may justly be questioned whether the term "servant of servants" will not apply to ourselves rather than to them. Certain it is, that the interior parts of Africa have never been conquered by any nation. A set of lawless banditti, pretending to be defended from other vagabonds driven out of Troy by the Greeks, enslaved the greatest part of the known world, and this island among the rest. After a number of ages, the Romans were driven out by other banditti, and these again by others; so that for a space of time much longer than the slave-trade hath yet existed, the European and most Asiatic nations were servants to those who had themselves been accounted the most contemptible of the human race; but during all this time the Africans enjoyed liberty, and do still enjoy it, notwithstanding the wicked advantages the Europeans take of the barbarism of the negroes to make them sell one another. No European nation hath ever made a nation of negroes yield up their country to them, or pay them an annual tribute; nor have they even been able to introduce their customs among them; so that, on the whole, instead of being the greatest slaves, we cannot help thinking the barbarous nations in Africa are the only people on earth that have never yet been enslaved by others.—The most probable conjectures concerning the peopling, &c. of those kingdoms of Africa concerning which we have any credible accounts, are mentioned under their proper names, as they occur in the order of the alphabet.

AFRICAN COMPANY, a society of merchants, established by King Charles II. for trading to Africa; which trade is now laid open to all his majesty's subjects, paying 10 *per cent.* for maintaining the forts.

AFRICANUS (Julius), an excellent historian of the third century, the author of a chronicle which was greatly esteemed, and in which he reckons 5500 years from the creation of the world to Julius Cæsar. This work, of which we have now no more than what is to be found in Eusebius, ended at the 221st year of the vulgar era. Africanus also wrote a letter to Origen on the history of Sufanna, which he reckoned supposititious; and we have still a letter of his to Aristides, in which he reconciles the seeming contradictions in the two genealogies of Christ recorded by St Matthew and St Luke.

AFT, in the sea-language, the same with ABAFT.

AFTER-BIRTH, in midwifery, signifies the membranes

Africa
||
After-
birth.

† "Not satisfied (say these accounts) with devouring raw flesh, their custom is to cut collops from live animals, which they tear to pieces with their teeth while warm and palpitating with vital motion. The flesh of an animal after it is dead they account quite unfavourable. The most expert butcher among them is he who can cut most flesh from a beast before it is deprived of its life; for doing which the utmost attention is necessary to avoid the great arteries, or those parts the destruction of which will soon bring on death. A company of Abyssinians at dinner is a horrible spectacle: they are seated, each with a cake of flour in his hand; live cattle are brought to the door, and the inhuman butcher cuts morsels off them, which are instantly carried in to the company, who lay them upon their cakes, and eat them directly, all bathed in the tepid blood of the miserable animals, whose lowings and groanings, through violence of anguish, serve for a dinner-bell, or music, to the flocking barbarians."

After-
math
||
Agamen-
non.

branches which surround the infant in the womb, generally called the secundines.

AFTER-MATH, in husbandry, signifies the grass which springs or grows up after mowing.

AFTER-NOON, the latter half of the artificial day, or that space between noon and night.

AFTER-PAINS, in midwifery, excessive pains felt in the groin, loins, &c. after the woman is delivered.

AFTER-SWARMS, in the management of bees, are those which leave the hive some time after the first has swarmed. See *Apis*.

AFWESTAD, a large copper-work belonging to the crown of Sweden, which lies on the Dala, in the province of Dalecarlia, in Sweden. It looks like a town, and has its own church. Here they make copper plates; and have a mint for small silver coin, as well as a royal post-house. W. Long. 14. 10. N. Lat. 58. 10.

AGA, in the Turkish language, signifies a great lord or commander. Hence the Aga of the Janissaries is the commander in chief of that corps; as the general of horse is denominated *spahialar aga*. The aga of the janissaries is an officer of great importance. He is the only person who is allowed to appear before the Grand Signior without his arms across his breast in the posture of a slave. Eunuchs at Constantinople are in possession of most of the principal posts of the seraglio: The title *aga* is given to them all, whether in employment or out. We find also *agas* in other countries. The chief officers under the Khan of Tartary are called by this name. And among the Algerines, we read of *agas* chosen from among the *boluk bashis* (the first rank of military officers), and sent to govern in chief the towns and garrisons of that state. The *aga* of Algiers is the president of the divan, or senate. For some years, the *aga* was the supreme officer; and governed the state in the place of bawhaw, whose power dwindled to a shadow. But the soldiery rising against the *boluk bashis*, or *agas*, massacred most of them, and transferred the sovereign power to the calif, with the title of *Dey*, or King.

AGADES, a kingdom and city of Negroland in Africa. It lies nearly under the tropic of Cancer, between Gubur and Cano. The town stands on a river that falls into the Niger; it is walled, and the king's palace is in the midst of it. The king has a retinue, who serve as a guard. The inhabitants are not so black as other Negroes, and consist of merchants and artificers. Those that inhabit the fields are shepherds or herdsmen, whose cottages are made of boughs, and are carried about from place to place on the back of oxen. They are fixed on the spot of ground where they intend to feed their cattle. The houses in the city are stately, and built after the Barbary fashion. This kingdom was, and be may still, tributary to the king of Tombut. It is well watered; and there is great plenty of grass, cattle, fenna, and manna. The prevailing religion is the Mahometan, but very loosely professed. N. Lat. 26. 10. E. Long. 9. 10.

AGALOCHEM. See *MATERIA MEDICA*, n° 75. AGALMATA, in antiquity, a term originally used to signify any kind of ornaments in a temple; but afterwards for the statues only, as being most conspicuous.

AGAMEMNON, the son of Atreus by Hecuba, was captain-general of the Trojan expedition. It was foretold to him by Cassandra, that his wife Clytemnestra

would be his death: yet he returned to her; and accordingly was slain by Ægisthus, who had gained upon his wife in his absence, and by her means got the government into his own hands.

AGANIPPIDES, in ancient poetry, a designation given to the mules, from a fountain of mount Helicon called *Aganippe*.

AGANIPPE, in antiquity, a fountain of Boeotia at mount Helicon, on the borders between Phœcia and Boeotia, sacred to the mules, and running into the river Permessus; (Pliny, Paufanias.) Ovid seems to make *Aganippe* and *Hippocrene* the same. Solinus more truly distinguishes them, and ascribes the blending them to poetical licence.

AGAPE, in ecclesiastical history, the love-feast, or feast of charity, in use among the primitive Christians; when a liberal contribution was made by the rich to feed the poor. The word is Greek, and signifies *love*.—St Chrysostom gives the following account of this feast, which he derives from the apostolical practice. He says, “the first Christians had all things in common, as we read in the Acts of the Apostles; but when that equality of possessions ceased, as it did even in the Apostles time, the agape, or love-feast, was substituted in the room of it. Upon certain days, after partaking of the Lord's supper, they met at a common feast; the rich bringing provisions, and the poor who had nothing being invited.” It was always attended with receiving the holy sacrament; but there is some difference between the ancient and modern interpreters as to the circumstance of time, viz. Whether this feast was held before or after the communion. St Chrysostom is of the latter opinion; the learned Dr Cave of the former.—These love-feasts, during the three first centuries, were held in the church; but at length such abuses were committed at them, that the councils of Laodicea and Carthage prohibited the practice for the future.

AGAPETÆ, in church-history, a name given to those young maidens who frequented the company of ecclesiastics out of a motive of piety and charity. This practice afterwards degenerated into an occasion of libertinism, inasmuch that *agapetæ* became a term of reproach.

AGARD (Arthur), a learned English antiquarian, born at Tolton in Derbyshire in the year 1540. His fondness for English antiquities induced him to make many large collections; and his office as deputy chamberlain of the exchequer, which he held 45 years, gave him great opportunities of acquiring skill in that study. Similarity of taste brought him acquainted with Sir Robert Cotton, and other learned men, who associated themselves under the name of *The Society of Antiquarians*, of which society Mr Agard was a conspicuous member. He made the doomday-book his peculiar study; and composed a work purposely to explain it, under the title of *Tractatus de usu et obscurioribus verbis libri de Domesday*: he also compiled a book for the service of his successors in office, which he deposited with the officers of the king's receipt, as a proper index for succeeding officers. All the rest of his collections, containing at least twenty volumes, he bequeathed to Sir Robert Cotton; and died in 1615.

AGARICUS, or MUSHROOM, a genus of the order of fungi, belonging to the cryptogamia class of plants. *Species*. Botanical writers enumerate 55 species belonging

Aganip-
pides
||
Agaricus.

Agaricus,
or
Mushroom.

longing to this genus; of which the most remarkable are the following. 1. The *chantarellus*, or *champignon* mushroom, has a turban-shaped hat, rather flat; with branched yellow gills running down the pillar; the pillar short and naked, mostly of a pale yellow, but sometimes of a deep and even saffron colour. They are excellent food, and have a fine flavour. Of this species there are two varieties; one called the *common*, and the other the *cup*, *mushroom*: these have the border of the hat not circular, but running into angles; reflected upwards, in form of an inverted cone, or drinking-glass; yellow, and when full grown with a tinge of red; the stalk very short and thick. They are found in the meadows and pastures, and in woods. The French and Italians eat them.—2. The *variegatus*, or variegated mushroom, has a very long variegated stalk and broad hat. It is of a finer flavour than the common mushroom.—3. The *muscaria*, or reddish mushroom, has a large hat almost flat, either white, red, or crimson, sometimes beset with angular red warts; the gills white, flat, and inversely spear-shaped; the pillar hollow, the cap fixed to the middle of the pillar, limber, and hanging down. This species grows in pastures, and is said to destroy bugs effectually if the juice is rubbed upon the walls and bed-posts. The inhabitants of the north of Europe, whose houses are greatly infested with flies at the decline of summer, infuse it in milk, and fit it in their windows, and the flies upon tasting the least drop are instantly poisoned. An infusion of common pepper in milk answers the same purpose, but the flies through time become wise enough not to taste it; and though vast numbers are at first destroyed, it is impossible to clear a house of these insects by this means.—4. The *campetris*, or common mushroom, has a scaly, whitish, and convex hat; the gills of a brownish red; the pillar cylindrical, above the cap smooth and white, below it ash-coloured. The degree of convexity and colour of the gills of this mushroom depend upon its age. At its first appearance it is smooth, and almost globular; the edges of the hat press upon the pillar; and the gills, which are then almost white, are covered with a white membrane extending from the edge of the hat to the summit of the pillar. In this state it is called a *button*: by degrees it expands, the membrane bursts, the edges of the hat remove from the pillar, and the gills are exposed to view, of a bright flesh colour; this, however, soon fades, and sinks at length into a dark brown or chocolate. The hat now loses its convexity, and becomes almost flat, rough, and scaly. Of this species there are several varieties; particularly one with a broad hat, white above; the gills very numerous, and of a pale red or flesh colour; the stalk short, and pretty thick. It is found in parks and lands that have been long unploughed, commons and poor lands, in pastures, and in woods. This species constitutes one of the corner-stones of modern luxury; either dressed in substance, or boiled up with wine and spices under the name of *catchup*. The seeds are contained in the substance of the gills; each of which is composed of two layers, and betwixt these layers are the seeds, which fall to the ground when ripe. Some of them in their fall are caught upon the cup, and detained on its woolly surface, where, by the assistance of a microscope, they may be easily found.—5. The *viridis*, or green mushroom, is large, and of a whitish green; the flesh is of a fine flavour. It grows in woods.

VOL. I.

—6. The *seruginosus* or *verdigrise* mushroom, is of a moderate size, and covered with a mucus of a verdigrise colour. It is only to be found in the garden belonging to the company of apothecaries at London, and in St James's park. It has also been observed in a gravel-pit in the middle of September.—7. The *clypeatus*, or long-stalked mushroom, has an hemispherical hat tapering to a point, and clammy; the pillar long, cylindrical, and white; the gills white, and not concave; dusted with a fine powdery substance on each side; the root bulbous, long, and hooked at the end. It is found in September, in woodlands and pastures. This species is thought to be poisonous; and we have the following account of the symptoms produced by eating it, in Dr Percival's *Essays*. "Robert Usherwood, of Middleton, near Manchester, a strong healthy man, aged 50 years, early in the morning gathered and eat what he supposed to be a mushroom. He felt no symptoms of indisposition, till five o'clock in the evening; when, being very thirsty, he drank near a quart of table-beer. Soon afterwards he became universally swollen, was sick, and in great agonies. A severe vomiting and purging succeeded, with violent cramps in his legs and thighs. He discharged several pieces of the fungus, but with little or no relief. His pains and evacuations continued, almost without intermission, till the next night; when he fell into a sound sleep, and awaked in the morning perfectly easy, and free from complaint."—Many of the different species of this genus grow on cows or horses dung, on dunghills, on rotten wood, in cellars, or on the trunks of trees; of which the most remarkable is, 8. The *quercinus*, or *agaric* of the oak. This is of various sizes, sometimes not exceeding the bigness of the fist, sometimes as large as a man's head. It takes at least an year or two to grow to its full size. There are two kinds of it, called by the ancients *mas* and *femina*: the male is dark coloured, hard, heavy, and woody; it is sometimes used by the dyers, as an ingredient in the black dye. The female, or official *agaric*, is covered with a hard blackish rind like the other; but when the cortical part is pared off, the internal substance appears quite white; by age it changes a little yellowish. It should be very light, porous, easy to break, and free from any hard pieces or compact veins. It tastes at first sweetish in the mouth, but presently becomes very bitter and nauseous. It is an article in the *Materia Medica**; but deserves the name of a poison, rather than of a medicine.

Culture. Only the esculent kinds of mushrooms are cultivated; and the following method is used by the gardeners who raise them for sale.—If the young mushrooms cannot be procured from gardens, they must be looked for in rich pastures during the months of August and September: the ground must be opened about their roots, where it is frequently found full of small white knots; which are the off-sets, or young mushrooms. These must be carefully gathered in lumps, with the earth about them: but as this spawn cannot be found in the pasture, except at that season when the mushrooms are naturally produced, it may be searched for at any time in old dung-hills, especially where there has been much litter, and it hath not been penetrated by wet so as to rot: it may also be found very often in old hot-beds; or it may be procured by mixing some long dung from the stable, which has not been

P

thrown

Agaricus,
or
Mushroom.

thrown on a heap to ferment, with strong earth, and put under cover to prevent wet getting to it. The spawn commonly appears in about two months after the mixture is made; but proportionably sooner the more effectually the air is excluded, provided the mixture is not kept so close as to heat. Old thatch, or litter which has lain long abroad so as not to ferment, is the best covering. The spawn has the appearance of white mould shooting out into long strings, by which it may be easily known wherever it is met with.—The beds for receiving the spawn are now to be prepared. These should be made of dung in which there is plenty of litter, but which should not be thrown on a heap to ferment: that dung which has lain spread abroad for a month or longer, is best. The beds should be made on dry ground, and the dung laid on the surface; the width at the bottom should be two and a half or three feet, the length in proportion to the quantity of mushrooms desired; then lay the dung about a foot thick, covering it with strong earth about four inches deep. Upon this lay more dung, about 10 inches thick; then another layer of earth, still drawing in the sides of the bed, so as to form it like the roof of a house; which may be done by three layers of dung, and as many of earth. When the bed is finished, it must be covered with litter or old thatch, both to prevent its drying too fast, and to keep out wet. In this situation it ought to remain eight or ten days, when it will be in a proper temperature to receive the spawn; for this is destroyed by too much heat; though, before planting, it may be kept very dry, not only without detriment, but with considerable advantage.—The bed being in a proper temperature for the spawn, the covering of litter should be taken off, and the sides of the bed smoothed; then a covering of light rich earth, about an inch thick, should be laid all over the bed; but this should not be wet. Upon this the spawn must be thrust, laying the lumps two or three inches asunder: then gently cover this with the same light earth, above half an inch thick; and put the covering of litter over the bed, laying it so thick as to keep out wet, and prevent the bed from drying. In spring or autumn the mushrooms will begin to appear, perhaps in a month after making; but when the beds are made in summer or winter, they are much longer before they produce. In any season, however, they ought not to be hastily destroyed; since mushroom-beds have been known to produce very plentifully, even after the spawn has lain in them five or six months. When the beds are destroyed, the spawn should be carefully preserved, and laid up in a dry place, at least five or six weeks before it is again planted.—The difficulty of managing mushroom-beds is, to keep them always in a proper degree of moisture. In the summer season they may be uncovered to receive gentle showers of rain at proper times; and in long dry seasons the beds should now and then be watered, but much wet ought by no means to be suffered to come to them. During the winter season they must be kept as dry as possible, and so closely covered as to keep out cold. In frosty, or very cold weather, if some warm litter, shaken out of a dung-heap, is laid on, the growth of the mushrooms will be promoted: but betwixt this and the bed, a covering of dry litter must be interposed; which should be renewed as it decays; and, as the cold increases, the covering must be

thickened. By attending to these directions, plenty of mushrooms may be produced all the year round. One bed will continue good for many months.

In the Ephemerides of the Curious we find mention made of a stone, called by Dr John George Wolcramer, who saw one in Italy, *Lapis Lycuarius*, which never ceases to produce in a few days mushrooms of an excellent flavour by the most simple and easy process imaginable. “It is (says he) of the bigness of an ox’s head, rough and uneven on its surface, and on which also are perceived some clefts and crevices. It is black in some parts, and in others of a lighter and greyish colour. Internally it is porous, and nearly of the nature of the pumice-stone, but much heavier; and it contains a small piece of flint, which is so incorporated with it as to appear to have been formed at the same time the stone itself received its form. This gives room to judge, that those stones have been produced by a fat and viscid juice, which has the property of indurating whatever matter it filtrates into. The stone here spoken of, when it has been lightly covered with earth, and sprinkled with warm water, produces mushrooms of an exquisite flavour, which are usually round, sometimes oval, and whose borders, by their inflexions and different curvities, represent in some measure human ears. The principal colour of these mushrooms is sometimes yellowish, and sometimes of a bright purple; but they are always disseminated with different spots, of a deep orange colour, or red brown; and when these spots are recent, and still in full bloom, they produce a very agreeable effect to the sight. But what appears admirable is, that the part of the stalk which remains adhering to the stone, when the mushroom has been separated from it, grows gradually hard, and petrifies in time, so that it seems that this fungus restores to the stone the nutritive juice it received from it, and that it thus contributes to its increase.” John Baptist Porta pretends, that this stone is found in several parts of Italy; and that it is not only to be met with at Naples, taken out of mount Veluvius; but also on mount Pantherico, in the principality of Arellino; on mount Garganus, in Apulia; and on the summit of some other very high mountains. He adds, that the mushrooms which grow on those sorts of stones, and are usually called *fungi lycuarii*, have the property of dissolving and breaking the stone of the kidneys and bladder; and that, for this purpose, nothing more is required than to dry them in the shade, and being reduced to powder, to make the patient, fasting, take a sufficient quantity of this powder, in a glass of white-wine, which will so cleanse the excretory ducts of the urine, that no stones will ever after be collected in them. As to the form of those mushrooms, their root is stony, uneven, divided according to its longitudinal direction, and composed of fibres as fine as hairs, interwoven one with another. Their form on first shooting out resembles a small bladder scarce then larger than the bud of a vine; and, if in this state they are squeezed between the fingers, an aqueous subacid liquor issues out. When they are at their full growth, their pedicle is of a finger’s length, larger at top than at bottom, and becomes insensibly slender in proportion as it is nearer the earth. These mushrooms are also formed in an umbella, and variegated with an infinity of little specks situate very near one another. They are smooth and even on the upper part,

but

Agaric, but underneath leafy like the common mushrooms. Their taste is likewise very agreeable, and the sick are not debarred eating of them when they have been dressed in a proper manner. Curiosity having prompted some naturalists and physicians to submit these stones to a chemical analysis, in order to be more competent judges of the uses they might be put to in medicine, there first came forth, by distillation, an insipid water, and afterwards a spirituous liquor. The retort having been heated to a certain point, there arose an oil, which had nearly the smell and taste of that of guaiacum; and a very acrid salt was extracted from the ashes.

Mineral AGARIC, a marley earth resembling the vegetable of that name in colour and texture. It is found in the fissures of rocks, and on the roofs of caverns; and is sometimes used as an astringent in fluxes, hæmorrhages, &c.

AGATE, or **ACHAT**, (among the Greeks and Latins, *Αχατης*, and *Achat*, from a river in Sicily, on the banks of which it was first found), a very extensive genus of the semipellucid gems.

These stones are variegated with veins and clouds, but have no zones like those of the onyx. They are composed of crystal debased by a large quantity of earth, and not formed, either by repeated incrustations round a central nucleus, or made up of plates laid evenly on one another; but are merely the effect of one simple concretion, and variegated only by the disposition given, by the fluid they were formed in, to their differently coloured veins or matters.

Agates are arranged according to the different colours of their ground. Of those with a *white* ground there are three species. (1.) The *dendrachates**, *mocca* stone, or *arborescent agat*. This seems to be the same with what some authors call the *achates* with rosemary in the middle, and others *achates* with little branches of black leaves. (2.) The *dull milky-looking agate*. This, though greatly inferior to the former, is yet a very beautiful stone. It is common on the shores of rivers in the East Indies, and also in Germany and some other parts of Europe. Our lapidaries cut it into counters for card-playing, and other toys of small value. (3.) The *lead-coloured agate*, called the *phassachates*† by the ancients.

Of the agates with a *reddish* ground there are four species. (1.) An impure one of a flesh-coloured white, which is but of little beauty in comparison with other agates. The admixture of flesh-colour is but very slight; and it is often found without any clouds, veins, or other variegations; but sometimes it is prettily veined or variegated with spots of irregular figures, having fimbriated edges. It is found in Germany, Italy, and some other parts of Europe; and is wrought into toys of small value, and often into the German gunflints. It has been sometimes found with evident specimens of the perfect mosses bedded deep in it. (2.) That of a pure blood colour, called *hæmachates*‡, or the *bloody agate*, by the ancients. (3.) The clouded and spotted agate, of a pale flesh colour, called by the ancients the *carnelian agate*, or *sardachates*§. (4.) The red-lead-coloured one, variegated with yellow, called the *coral agate*, or *corallo-achates*§, by the ancients.

Of the agates with a *yellowish* ground there are only two known species: the one of the colour of yellow

wax, called *cerachates* by the ancients; the other a very elegant stone, of a yellow ground, variegated with white, black, and green, called the *leonina*, and *leontesferes*†, by the ancients.

Lastly, Of the agates with a *greenish* ground, there is only one known species, called by the ancients *jaspachates*†.

Of all these species there are a great many varieties; some of them having upon them natural representations of men and different kinds of animals, &c. These representations are not confined to the agates whose ground is of any particular colour, but are occasionally found on all the different species. Velfchius had in his custody a flesh-coloured agate, on one side of which appeared a half-moon in great perfection, represented by a milky semicircle; on the other side, the phases of *vesper*, or the evening-star; whence he denominated it an *aphrodisian agate*. An agate is mentioned by Kircher*, on which was the representation of a heroine armed; and one in the church of St Mark in Venice has the representation of a king's head adorned with a diadem. On another, in the museum of the prince of Gonzaga, was represented the body of a man with all his clothes in a running posture. A still more curious one is mentioned by de Boot†, wherein appears a circle struck in brown, as exactly as if done with a pair of compasses, and in the middle of the circle the exact figure of a bishop with a mitre on: but inverting the stone a little, another figure appears; and if it is turned yet further, two others appear, the one of a man, and the other of a woman. But the most celebrated agate of this kind is that of Pyrrhus, wherein were represented the nine muses, each with their proper attributes, and Apollo in the middle playing on the harp||. In the emperor's cabinet is an oriental agate of a surprising bigness, being fashioned into a cup, whose diameter is an ell, abating two inches. In the cavity is found delineated in black specks, *Β. ΧΡΙΣΤΟΣ. S. XXX.* Other agates have also been found, representing the numbers 4191, 191; whence they were called *arithmetical* agates, as those representing men or women have obtained the name of *anthropomorphic*.

Great medicinal virtues were formerly attributed to the agate, such as resisting poisons, especially those of the viper, scorpion, and spider; but they are now very justly rejected from medicinal practice. The oriental ones are all said to be brought from the river Gambay. A mine of agates was some time ago discovered in Transylvania, of divers colours; and some of a large size, weighing several pounds.

Agates may be stained artificially with solution of silver in spirit of nitre, and afterwards exposing the place to the sun‡; and though these artificial colours disappear on laying the stone for a night in aquafortis, yet a knowledge of the practicability of thus staining agates, must render those curious figures above-mentioned strongly suspected of being the work not of nature, but of art. Some account for these phenomena from natural causes. Thus, Kircher, who had seen a stone of this kind in which were depicted the four letters usually inscribed on crucifixes, *I. N. R. I.* apprehends that some real crucifix had been buried underground, among stones and other rubbish, where the inscription happening to be parted from the cross, and to be received among a soft mould or clay susceptible

Agate.

of the impression of the letters, came afterwards to be petrified. In the same manner he supposes the agate of Pyrrhus to have been formed. Others resolve much of the wonder into fancy, and suppose those stones formed in the same manner with the *cameaux* * or Florentine stones.

The agate is used for making cups, rings, seals, handles for knives and forks, hilts for swords and hangers, beads to pray with, smelling-boxes, patch-boxes, &c. being cut or fawed with no great difficulty. At Paris, none have a right to deal in this commodity except the wholesale mercers and goldsmiths. The sword-cutlers are allowed to sell it, but only when made into handles for *contaux de classe*, and ready set in. The cutlers have the same privilege for their knives and forks.

Considerable quantities of these stones are still found near the river Achates in Sicily. There are found in some of these the surprising representations above-mentioned, or others similar to them. By a dextrous management of these natural stains, medals have been produced, which seem master-pieces of nature: for this stone bears the graver well; and as pieces of all magnitudes are found of it, they make all sorts of work it. The high altar of the cathedral of Messina is all over encrusted with it. The lapidaries pretend that the Indian agates are finer than the Sicilian; but father Labat * informs us, that in the same quarries, and even in the same block, there are found pieces much finer than others, and these fine pieces are sold for Indian agates in order to enhance their price.

AGATE, among antiquaries, denotes a stone of this kind engraven by art. In this sense, agates make a species of antique gems, in the workmanship whereof we find eminent proofs of the great skill and dexterity of the sculptors. Several agates of exquisite beauty are preserved in the cabinets of the curious; but the facts or histories represented on these antique agates, however well executed, are now become so obscure, and their explanations so difficult, that several diverting mistakes and disputes have arisen among those who undertook to give their true meaning.

The great agate of the apotheosis of Augustus, in the treasury of the holy chapel, when sent from Constantinople to St Lewis, passed for a triumph of Joseph. An agate now in the French king's cabinet, had been kept 700 years with great devotion, in the Benedictine abbey of St Evre at Toul, where it passed for St John the evangelist carried away by an eagle, and crowned by an angel; but the heathenism of it having been lately detected, the religious would no longer give it a place among their relics, but presented it in 1684 to the king. The antiquaries found it to be the apotheosis of Germanicus. In like manner the triumph of Joseph was found to be a representation of Germanicus and Agrippina, under the figures of Ceres and Triptolemus. Another was preserved, from time immemorial, in one of the most ancient churches of France, where it had passed for a representation of paradise and the fall of man; there being found on it two figures representing Adam and Eve, with a tree, a serpent, and an Hebrew inscription round it, taken from the third chapter of Genesis, "The woman saw that the tree was good, &c." The French academists, instead of our first parents, found Jupiter and Minerva represented by the two figures: the inscription was of

a modern date, written in a Rabbinical character, very incorrect, and poorly engraven. The prevailing opinion was, that this agate represented simply the worship of Jupiter and Minerva at Athens.

AGATE, is also a name of an instrument used by gold-wire-drawers; so called from the agate in the middle of it, which forms its principal part.

AGATHIAS, or, as he calls himself in his epigrams, AGATHIUS, distinguished by the title of *Scholeasticus*, a Greek historian in the 6th century under Justinian. He was born at Myrina, a colony of the ancient Æolians, in Asia the less, at the mouth of the river Phrythicus. He was an advocate at Smyrna. Tho' he had a taste for poetry, he was yet more famous for his history, which begins with the 26th year of Justinian's reign, where Procopius ends. It was printed in Greek and Latin, with Bonaventura Vulcanius's, at Leyden, 1594, in 4to; and in Paris at the king's printing-house, 1660, in folio.

AGATHO, a tragic and comic poet, disciple to Prodicus and Socrates, applauded in Plato's dialogues for his virtue and beauty. His first tragedy obtained the prize; and he was crowned in the presence of upwards of 30,000 men, the 4th year of the 90th Olympiad. There is nothing now extant of his, except a few quotations in Aristotle, Athenæus, and others.

AGATHOCLES, the famous tyrant of Sicily, son of a potter at Reggio. He was a thief, common soldier, centurion, general, and a pirate, all in a regular succession. He defeated the Carthaginians several times in Sicily, and was once defeated himself. He first made himself tyrant of Syracuse, and then of all Sicily; after which, he vanquished the Carthaginians again both in Sicily and Africa. But at length having ill success, and being in arrears with his soldiers, they mutinied, forced him to fly his camp, and cut the throats of his children, whom he left behind. Recovering himself again, he relieved Corfu, besieged by Cassander; burnt the Macedonian fleet; returned to Sicily, murdered the wives and children of those who had murdered him; afterwards meeting with the soldiers themselves, he put them all to the sword; and ravaging the sea-coast of Italy, took the city of Hipponium. He was at length poisoned by his grandson Archagathus, in the 72^d year of his age, 290 years before Christ, having reigned 28 years.

AGATHYRNA, or AGATHYRNUM, AGATHYRSA, (Polybius.) AGATHYRSUM, (Strabo;) a town of Sicily; now *S. Marco*; as old as the city of Troy, being built by Agathyrnus, son of Æolus, on an eminence. The gentililium name is *Agathyrneus*; or, according to the Roman idiom, *Agathyrnesis*.

AGAVE, the common American aloë; a genus of the monogynia order belonging to the hexandria class of plants. Of this genus, botanical writers enumerate eight

Species. 1. The Americana, or great American aloë. The stems of this, when the plants are vigorous, generally rise upwards of 20 feet high, and branch out on every side towards the top, so as to form a kind of pyramid: the slender shoots being garnished with greenish yellow flowers, which stand erect, and come out in thick clusters at every joint: these make a fine appearance, and continue long in beauty; a succession of new flowers being produced for near three months in favourable seasons, if the plant is protected from the autumnal colds.

Agate
Agave.* See *Cameaux*.

* Voyage d'Ital. tom. v. p. 156.

Hist. Acad. R. Inscript. tom. i. p. 337. — 344.

colds. The seeds do not ripen in England. It has been generally thought, that these plants do not flower till they are 100 years old: but this is a mistake; for the time of their flowering depends on their growth: so that in hot countries where they grow fast, and expand many leaves every season, they will flower in a few years; but in colder climates, where their growth is slow, it will be much longer before they shoot up their stem. There is a variety of this species with striped leaves, which are pretty common in the English gardens. 2. The Virginia, or American aloe, with a simple stalk. This so much resembles the last, as to be distinguishable only by good judges. The principal difference is, that the leaves of this are narrower toward their extremity, and of a paler colour: the stems of this sort do not rise so high as the first, nor do they branch in the same manner, but the flowers are collected into a close head at the top; they are, however, of the same shape and colour. 3. The fetida, or piet, hath long, narrow, stiff leaves, of a pale green colour: the plants rarely grow above three feet in height, but the flower-stem rises to near 20, and branches out much like that of the first, but more horizontally: the flowers are of the same shape, but smaller, and of a greener colour. After the flowers are past, instead of seed-vessels, young plants succeed them; which, falling off, are to be received in pots, where they soon take root, and become perfect. This sort never sends out off-sets from the roots; so that it can only be multiplied when it flowers; and presently after the young plants have dropped off, the old one dies. 4. The tuberosa, or American aloe with a tuberous root, agrees with the last in its general characters; only that the leaves are indented, and each of them terminates in a strong thorn. 5. The vivipara, so called from its producing young plants after the flowers are fallen off, never grows to a large size; the flower-stem rises to about 12 feet in height, and branches out in the same manner as the third sort, with which it agrees in most of its other properties. 6. The karratto is as yet so little known in Britain, that no particular description of it can be given. 7. The Vera Cruz so greatly resembles the first as to be scarce distinguishable. 8. The rigida hath long narrow stiff leaves, which are entire, and terminated by a stiff black spine. It is very little known.

Culture. The third, fourth, fifth, sixth, and eighth sorts are so tender, that they cannot be preserved thro' the winter in England unless they are placed in a warm stove; nor will they thrive when set abroad in summer, and therefore must constantly remain in the stove, observing to let them enjoy a large share of free air in warm weather. They require a light sandy earth, and should have little wet in winter; but, in warm weather, may be gently watered twice a-week. They should be shifted every summer into fresh pots: but these must not be too large; for if their roots are not confined, they will not thrive. Such as send out off-sets from their roots may be propagated by them; the others, from seeds obtained from the countries where they grow, or the young plants produced at flowering time.

AGDE, a city of France, in Lower Languedoc, in the territory of Agadez, with a bishop's see. The diocese is small, but it is one of the richest countries in

the kingdom. It produces fine wool, wine, oil, corn, and silk. It is seated on the river Eraut, a mile and a quarter from its mouth, where it falls into the gulph of Lyons, and where there is a fort built to guard its entrance. It is well peopled; the houses are built of black stone, and there is an entrance into the city by four gates. The greatest part of the inhabitants are merchants or seamen. The public buildings are but mean: the cathedral is small, and not very handsome: the bishop's palace is an old building, but convenient enough. The city is extended along the river, where it forms a little port, wherein small craft may enter. There is a great concourse of pilgrims and other devout people to the chapel of Notre Dame de Grace. It is a little without the city, between which and the chapel there are about 13 or 14 oratories, which they visit with naked feet. The convent of the Capuchins is well built, and on the outside are lodgings and apartments for the pilgrims who come to perform their *neuvaine* or nine days devotion. The chapel, which contains the image of the Virgin Mary, is distinct from the convent. E. Long. 3. 20. Lat. 43. 10.

AGE, in the most general sense of the word, signifies the duration of any being, from its first coming into existence to the time of its peaking of it, if it still continues; or to its destruction, if it has ceased to exist some time before we happen to mention it.

Among the ancient poets, this word was used for the space of thirty years; in which sense, *age* amounts to much the same with *generation*. Thus, Nestor is said to have lived *three ages*, when he was 90 years old.—By ancient Greek historians, the time elapsed since the beginning of the world is divided into three periods, which they called *ages*. The first reaches from the creation to the deluge which happened in Greece during the reign of Ogyges; this they called the *obscure* or *uncertain* age, because the history of mankind is altogether uncertain during that period. The second they call the *fabulous* or *heroic* age, because it is the period in which the fabulous exploits of their gods and heroes are said to have been performed. It began with the Ogygian deluge, and continued to the first Olympiad; where the third, or *historical*, age commenced.—This division, however, it must be observed, holds good only with regard to the Greeks and Romans, who had no histories earlier than the first Olympiad; the Jews, Egyptians, Phenicians, and Chaldees, not to mention the Indians and Chinese who pretend to much higher antiquity, are not included in it.

The interval since the first formation of man has been divided by the poets into four *ages*, distinguished by the epithets of *golden*, *silver*, *brazen*, and *iron*. During the *golden* age, Saturn reigned in heaven, and justice and innocence in this lower world. The earth then yielded her productions without culture; men held all things in common, and lived in perfect friendship. This period is supposed to have lasted till the expulsion of Saturn from his kingdom. The *silver* age commenced when men began to deviate from the paths of virtue; and in consequence of this deviation, their lives became less happy. The *brazen* age commenced on a farther deviation, and the *iron* age took place in consequence of one still greater.—A late author, however, reflecting on the barbarism of the first ages, will have the order which the poets assign to the four ages inverted;

ed; the first being a time of rudeness and ignorance, more properly denominated an *iron*, than a *golden* age. When cities and states were founded, the *silver* age commenced; and, since arts and sciences, navigation and commerce, have been cultivated, the *golden* age has taken place.

In some ancient northern monuments, the *rocky* or *flony* age corresponds to the *brazen* age of the Greeks. It is called *rocky*, on account of Noah's ark, which rested on mount Ararat; whence men were said to be defended or sprung from mountains: or from Deucalion and Pyrrha, restoring the race of mankind, by throwing stones over their heads. The northern poets also style the fourth age of the world the *ashen* age, from a Gothic king Madenis, or Mannus, who on account of his great strength was said to be made of ash, or because in his time people began to make use of weapons made of that wood.

Among the Jews, the duration of the world is also divided into three *ages*. (1.) The *seculum inane*, or *void age*, was the space of time from the creation to Moses; (2.) The *present age*, denotes all the space of time from Moses to the coming of the Messiah; and, (3.) The *age to come*, denotes the time from the coming of the Messiah to the end of the world.

Various other divisions of the duration of the world into *ages* have been made by historians.—The Sibylline oracles, wrote, according to some, by Jews acquainted with the prophecies of the Old Testament, divide the duration of the world into ten *ages*; and according to Josephus, each age contained six hundred years. It appears, by Virgil's fourth eclogue, and other testimonies, that the age of Augustus was reputed the end of these ten *ages*, consequently as the period the world's duration.

By some, the space of time commencing from Constantine, and ending with the taking of Constantinople by the Turks, in the 15th century, is called the *middle age*; but others chuse rather to date the middle age from the division of the empire made by Theodosius at the close of the 4th century, and extend it to the time of the emperor Maximilian I. in the beginning of the 16th century, when the empire was first divided into circles.—The middle is by some denoted the *barbarous age*, and the latter part of it the *lowest age*. Some divide it into the *non-academical* and *academical ages*. The first includes the space of time from the 6th to the 9th centuries, during which schools or academies were lost in Europe. The second from the 9th century, when schools were restored, and universities established, chiefly by the care of Charlemagne.

AGE is also frequently used in the same sense with *century*, to denominate a duration of 100 years.

AGE likewise signifies a certain period of the duration of human life: by some divided into four stages, namely, infancy, youth, manhood, and old age; the first extending to the 14th year, the second to the 25th, the third to the 50th, and the fourth to the end of life: by others divided into infancy, childhood, youth, manhood, and old age*.

AGE, in law, signifies a certain period of life, when persons of both sexes are enabled to do certain acts. Thus, one at twelve years of age ought to take the oath of allegiance to the king in a lect; at fourteen he may marry, chuse his guardian, and claim his lands

held in focage. Twenty-one is called *full age*, a man or woman being then capable of acting for themselves, of managing their affairs, making contracts, disposing of their estates, and the like.

AGE-PRIER, in law, is when an action being brought against a person under age, for lands defended to him, he, by motion or petition, shews the matter to the court, praying the action may be staid till his full age; which the court generally agrees to.

AGEMA, in Macedonian antiquity, was a body of soldiery, not unlike the Roman legion.

AGEMOGLANS, AGIAMOGLANS, or AZAMOGGLANS, in the Turkish polity, are children purchased from the Tartars, or raised every third year, by way of tribute, from the Christians tolerated in the Turkish empire. These, after being circumcised and instructed in the religion and language of their tyrannical masters are learnt the exercises of war, till they are of a proper age for carrying arms; and from this corps the Janissaries are recruited. With regard to those who are thought unfit for the army, they are employed in the lowest offices of the seraglio. Their appointments also are very small, not exceeding seven aspers and a half per day, which amount to about threepence-halfpenny of our money.

AGEN, a city of France, on the river Garonne, the capital of Agenois in Guienne, and the see of a bishop. The gates and old walls, which are yet remaining, shew that this city is very ancient, and that its former circuit was not so great as the present; but there is no trace remaining of the castle so famous in history. The palace, wherein the prefidial holds his sessions at this day, was heretofore called the castle of Montravel; and is seated without the walls of the old city, and on the side of the fosse. There are likewise the ruins of another castle called *La Sagne*, which was without the walls close by a brook. Though the situation of Agen is very convenient for trade and commerce, the inhabitants are so very indolent that there is very little, of which the neighbouring cities take the advantage. It is seated on the bank of the river Garonne, in a pleasant country. E. Long. o. 30. N. Lat. 44. 12.

AGENDA, among philosophers and divines, signifies the duties which a man lies under an obligation to perform: thus, we meet with the *agenda* of a Christian, or the duties he ought to perform; in opposition to the *credenda*, or things he is to believe.

AGENDA, among merchants, a term sometimes used for a memorandum-book, in which is set down all the business to be transacted during the day, either at home or abroad.

AGENORIA, in mythology, the goddess of courage and industry, as *Vacuna* was of indolence.

AGENT, in a general sense, denotes any active power or cause. Agents are either natural or moral. Natural agents are such inanimate bodies as have a power to act upon other bodies in a certain and determinate manner; as, gravity, fire, &c. Moral agents, on the contrary, are rational creatures, capable of regulating their actions by a certain rule.

AGENT, is also used to denote a person intrusted with the management of an affair, whether belonging to a society, company, or private person.

AGER, in Roman antiquity, a certain portion of land allowed to each citizen. See AGRARIAN LAW.

AGER

* See the article *Man*; and *Moral Philosophy*, Sect. I. n^o 242.

Ager
Piceus
||
Agelæus.

Agelæus.

AGER PICEUS, (Cicero, Sallust, Livy;) and sometimes *Picenus*, (Cæsar, Pliny;) a territory of Italy to the south-east of Umbria, reaching from the Apennine to the Adriatic. The people are called *Picentes*, (Cicero, Livy,) distinct from the Picentini on the Tuscany sea, though called by Greek writers *Πικεντινός*. This name is said to be from the bird *Picus*, under whose conduct they removed from the Sabines, of whom they were a colony.

AGERATUM, **BASTARD HEMP-AGRIMONY**; a genus of the polygamia æqualis order, belonging to the syngenesia class of plants. Of this genus there are three

Species; the conyzoides, the houstonianum, and the altissimum. All these are natives of warm climates. The first grows to a foot high; the stalks are round and firm; the leaves two inches long, broadest at the base, and serrated round the edges; the flowers are white, and stand on the extremities of the branches. They appear in July, and continue flowering till the frosts destroy them. The third sort is a native of Carolina, has a perennial root, and an annual stalk, which grows to the height of five or six feet, putting out side-branches at the top; the leaves are shaped like an heart. At the end of the shoots the flowers are produced in large tufts, are of a pure white, and appear in October.

Culture. The two first are annual plants, and consequently can be propagated only by seeds; which, however, come to perfection in this country. They must be sown in a hot-bed in the spring; and when the plants are come up, and strong enough to remove, they must be transplanted to another moderate hot-bed, observing to water and shade them until they have taken root; after which time they must have a good share of air in warm weather, otherwise they will grow up very weak. In summer, the plants will thrive in the open air. The seeds ripen in September and October.—The third species will bear the severest cold in this climate, but its seeds do not ripen in this country. It puts out off-sets, however, from its roots, by which it may be propagated, as well as by seeds, which are very frequently brought from America. The plants spread their roots very much, and cannot bear a cramped situation; for which reason, they must be allowed three feet every way. They delight in a rich moist soil and open situation, where they will produce so many stalks from each root as to form a considerable bush.

AGERATUM, or **MAUDLIN**. See **ACHILLÆA**.

AGERATUM PURPUREUM. See **ERINUS**.

AGGA, or **AGGONNA**, a British settlement on the gold-coast of Guiney. It is situated under the meridian of London, in 6 degrees of N. lat.

AGGER, in the ancient military art, a bank or rampart, composed of various materials, as earth, boughs of trees, &c.—The agger of the ancients was of the same nature with what the moderns call *lines*.

AGGERHUYS, a city of Norway, capital of the province of the same name. It is subject to Denmark, and situated in E. long. 28. 35. and N. lat. 59. 30.

AGGERS-HERRED, a district of Christianland and a diocese of Norway. It consists of three judicial places; namely, Acher, West Barum, and Ager.

AGESILAUS, king of the Lacedæmonians, the son of Archidamus, was raised to the throne notwithstanding the superior claim of Leotychides. As soon

as he came to the throne, he advised the Lacedæmonians to be beforehand with the king of Persia, who was making great preparations for war, and to attack him in his own dominions. He was himself chosen for this expedition; and gained so many advantages over the enemy, that if the league which the Athenians and the Thebans formed against the Lacedæmonians had not obliged him to return home, he would have carried his victorious arms into the very heart of the Persian empire. He gave up, however, all these triumphs readily, to come to the succour of his country, which he happily relieved by his victory over the allies in Bœotia. He obtained another near Corinth; but to his great mortification, the Thebans afterward gained several over the Lacedæmonians. These misfortunes at first raised somewhat of a clamour against him. He had been sick during the first advantages which the enemy gained; but as soon as he was able to act in person, by his valour and prudence he prevented the Thebans from reaping the advantages of their victories; inasmuch that it was generally believed, had he been in health at the beginning, the Lacedæmonians would have sustained no losses, and that all would have been lost had it not been for his assistance. It cannot be denied but he loved war more than the interest of his country required; for if he could have lived in peace, he had saved the Lacedæmonians several losses, and they would not have been engaged in many enterprises which in the end contributed much to weaken their power. He died in the third year of the 104th Olympiad, being the 84th year of his age, and 41st year of his reign. Agelæus would never suffer any picture or sculpture to be made of him, and prohibited it also by his will: this he is supposed to have done from a consciousness of his own deformity; for he was of a short stature, and lame of one foot, so that strangers used to despise him at the first sight. His fame went before him into Egypt, and there they had formed the highest idea of Agelæus; when he landed in that country, the people ran in crowds to see him: but great was their surprise when they saw an ill-dressed, slovenly, mean-looking little fellow lying upon the grass; they could not forbear laughing, and applied to him the fable of the mountain in labour. He was, however, the first to jest upon his own person; and such was the gaiety of his temper, and the strength with which he bore the roughest exercises, that these qualities made amends for his corporal defects. He was extremely remarkable for plainness and frugality in his dress and way of living. "This (says Cornelius Nepos) is especially to be admired in Agelæus: when very great presents were sent him by kings, governors, and states, he never brought any of them to his own house; he changed nothing of the diet, nothing of the apparel of the Lacedæmonians. He was contented with the same house in which Euristhenes, the founder of his family, had lived: and whoever entered there, could see no sign of debauchery, none of luxury; but, on the contrary, many of moderation and abstinence; for it was furnished in such a manner, that it differed in nothing from that of any poor or private person." Upon his arrival into Egypt, all kind of provisions were sent to him; but he chose only the most common, leaving the perfumes, the confections, and all that was esteemed most delicious, to his servants. Agelæus was extremely fond of his children, and would often amuse himself by joining

Agēipolis

Agio.

joining in their diversions: one day when he was surprized riding upon a stick with them, he said to the person who had seen him in this posture, "Forbear talking of it till you are a father."

AGESIPOLIS I. king of Lacedæmon, succeeded his father Paufanias, colleague of Agēfilas II. He ravaged the country of Mantinea, subdued that city, and pillaged Olynthia. He died about 380 years before Jesus Christ, and was embalmed in honey, according to the custom of the Lacedæmonians. He died without issue, and was succeeded by Cleombrotus his brother, the father of Agēipolis II. who was more remarkable for his apophthegms than his actions.

AGGLUTINANTS, in pharmacy, a general name for all medicines of a glutinous or viscid nature; which, by adhering to the solids, contribute greatly to repair their lofs.

AGGLUTINATION, in a general sense, denotes the joining two or more things together, by means of a proper glue or cement.

AGGLUTINATION, among physicians, implies the action of reuniting the parts of a body, separated by a wound, cut, &c. It is also applied to the action of such internal medicines as are of an agglutinating quality, and which, by giving a glutinous consistence to the animal-fluids, render them more proper for nourishing the body.

AGGRAVATION, a term used to denote whatever heightens a crime, or renders it more black.

AGGREGATE, in a general sense, denotes the sum of several things added together, or the collection of them into one whole. Thus, a house is an aggregate of stones, wood, mortar, &c. It differs from a mixed or compound, inasmuch as the union in these last is more intimate than between the parts of an aggregate.

AGGRESSOR, among lawyers, denotes the person who began a quarrel, or made the first assault.

AGHER, a town of Ireland, which sends two members to parliament. It is situated in the southern part of Ulster, not far from Clogher.

AGHRIM, a town of Ireland, in the county of Wicklow, and province of Leinster, situated about thirteen miles south-west of Wicklow.

AGIADES, in the Turkish armies, a kind of pioneers employed in fortifying camps, smoothing of roads, and the like offices.

AGILITY, an aptitude of the several parts of the body to motion; or it may be defined, The art or talent of making the best use of our strength.—The improving of agility was one of the chief objects of the institution of games and exercises. The athlete made particular profession of the science of cultivating and improving agility. Agility of body is often supposed peculiar to some people; yet it seems not owing to any thing in their frame and structure different from others, but entirely to practice.

AGINCOURT, a village of the French Netherlands; famous on account of the victory obtained by Henry V. of England over the French, in 1415. E. long. 2. 10. N. lat. 50. 35.

AGIO, in commerce, is a term chiefly used in Holland, and at Venice, to signify the difference between the value of bank-stock and the current coin. The agio in Holland is generally three or four per cent. and at Rome it is from 15 to 25 per cent. but at Venice

the agio is fixed at 20 per cent.

AGIOSYMANDRUM, a wooden instrument used by the Greek and other churches under the dominion of the Turks, to call together assemblies of the people. The *agiosymandrum* was introduced in the place of bells, which the Turks prohibited their Christian subjects the use of, lest they should make them subservient to sedition.

AGISTMENT, **AGISTAGE**, or **AGISTATION**, in law, the taking in other people's cattle to graze at so much per week. The term is peculiarly used for the taking cattle to feed in the king's forests, as well as for the profits arising from that practice.—It is also used, in a metaphorical sense, for any tax, burden, or charge; thus, the tax levied for repairing the banks of Romney-marsh was called *agistmentum*.

AGISTOR, or **AGISTATOR**, an officer belonging to forests, who has the care of cattle taken in to be grazed, and levies the moneys due on that account. They are generally called *quest-takers* or *gift-takers*, and are created by letters-patent. Each royal forest has four agistors.

AGISYMBIA, (anc. geogr.) a district of Libya Interior, according to Agathemerus, situated to the south-east of the *Æthiopes Anthrophagi*; the parallel passing through which, at 16° to the south of the equator, was the utmost extent of the knowledge of the ancients to the south, (Ptolemy.)

AGITATION, the act of shaking a body, or tossing it backwards and forwards.

AGITATION, in physics, is often used for an intestine commotion of the parts of a natural body. Fermentation and effervescence are attended with a brisk agitation of the particles.

AGITATION is one of the chief causes or instruments of mixture: by the agitation of the parts of the blood and chyle, in their continual circulation, sanguification is in a good measure effected. Butter is made out of milk by the same means: in which operation, a separation is made of the oleous parts from the serous, and a conjunction of the oleous together. Digestion itself is only supposed to be an insensible kind of agitation.

AGITATION is reputed one of the symptoms of inspiration. Petit informs us †, that, in the last century, there arose in a church in Italy, for the space of a year, a vapour of an extraordinary kind, which put all the people into trembling and agitations, and unless they got away betimes, lest them a dancing, with strange contortions and gesticulations. This seems to verify what has been related of the temple of Delphi.

AGITATION is also used in medicine, for a species of exercise popularly called *swinging*. Maurice prince of Orange found this method a relief against the severe pains of the gout and stone. Bartholin mentions fits of the tooth-ach, deafness, &c. removed by vehement agitations of the body.

AGITATOR, in antiquity, a term sometimes used for a charioteer, especially those who drove in the circus at the curule games.

AGITATORS, in the English history, certain officers set up by the army in 1647, to take care of its interests.—Cromwell joined the agitators, only with a view to serve his own ends; which being once accomplished, he found means to get them abolished.

in ordinary to king James I. a man of universal learning, who had a very considerable hand in the translation of the New Testament appointed by king James I. in 1604.

AGMEN, in antiquity, properly denotes a Roman army in march: in which sense, it stands contradistinguished from *acies*, which denoted the army in battle array; though, on some occasions, we find the two words used indifferently for each other. The Roman armies, in their marches, were divided into *primum agmen*, answering to our vanguard; *medium agmen*, our main-battle; and *postremum agmen*, the rear-guard. The order of their march was thus: After the first signal with the trumpets, &c. the tents were taken down, and the baggage packed up; at the second signal, the baggage was to be laden on the horses and carriages; and at the third signal, they were to begin their march. First came the *extraordinarii*; then the auxiliaries of the first wing, with their baggage; these were followed by the legions. The cavalry marched either on each side, or behind.

AGNATE, in law, any male relation by the father's side.

AGNO, a river of Naples, which, taking its rise in the mountainous parts of Terra di Lavoro, washes the town of Acerra; and, passing between Capua and Aversa, falls into the Mediterranean, about seven miles north of Puzzuoli.

AGNOETÆ, (from *αἰσῆς*, to be ignorant of), in church-history, a sect of ancient heretics, who maintained that Christ, considered as to his human nature, was ignorant of certain things, and particularly of the time of the day of judgment. Eulogius, patriarch of Alexandria, ascribes this heresy to certain solitaries in the neighbourhood of Jerusalem, who built their opinion upon the text Mark xiii. 32. "Of that day and hour knoweth no man, no not the angels who are in heaven, neither the Son, but the Father only."—The same passage was made use of by the Arians; and hence the orthodox divines of those days were induced to give various explanations thereof. Some allege, that our Saviour here had no regard to his divine nature, but only spoke of his human. Others understand it thus, That the knowledge of the day of judgment does not concern our Saviour considered in his quality of Messiah, but God only: which is the most natural solution.

AGNOMEN, in Roman antiquity, a kind of fourth or honorary name, given to a person on account of some extraordinary action, virtue, or other accomplishment. Thus, the agnomen *Africanus* was bestowed upon Publius Cornelius Scipio, on account of his great achievements in Africa.—The agnomen was the third in order of the three Roman names: thus, in Marcus Tullius Cicero, Marcus is the prænomen, Tullius the nomen, and Cicero the agnomen.

AGNON, a small river of Bourgogne in France, otherwise called *Ignon*.

AGNONE, a city of the kingdom of Naples, in the province of the Hither Abruzzo, called by some *Anclone*.

AGNUS, or LAMB, in zoology, the young of the ovivora or sheep. See Ovis.

AGNUS Castus, in botany, the trival name of a species of the vitex *. The Greeks call it *αἰσῆς*, chaste; to which has since been added the reduplicative *castus*, *q. d.* chaste chaste. It was famous among the ancients

as a specific for the preservation of chastity. The Athenian ladies, who made profession of chastity, lay upon leaves of *agnus castus* during the feasts of Ceres.—Being reputed a cooler, and particularly of the genital parts, it was anciently used in physic to allay those inordinate motions arising from femal turgecences: but it is out of the present practice.

AGNUS Dei, in the church of Rome, a cake of wax stamped with the figure of a lamb supporting a cross. These being consecrated by the pope with great solemnity, and distributed among the people, are supposed to have great virtues; as, to preserve those who carry them worthily, and with faith, from all manner of accidents; to expel evil spirits, &c.—It is also a popular name for that part of the mass, where the priest strikes his breast thrice, and says the prayer beginning with the words *Agnus Dei*.

AGNUS Strychius. See Strythian LAMB.

AGOGE, among ancient musicians, a species of modulation, wherein the notes proceed by contiguous degrees.

AGON, among the ancients, implied any dispute or contest, whether it had regard to bodily exercises, or the accomplishments of the mind; and therefore poets, musicians, painters, &c. had their agones, as well as the athletes. Games of this kind were celebrated at most of the heathen festivals, with great solemnity, either annually, or at certain periods of years. Among the latter were celebrated at Athens, the *agon gymnicus*, the *agon nemeus* instituted by the Argives in the 53^d Olympiad, and the *agon Olympius* instituted by Hercules 430 years before the first Olympiad. The Romans also, in imitation of the Greeks, instituted contests of this kind. The emperor Aurelian established one under the name of *agon solis*, the contest of the sun; Dioclesian another, which he called *agon capitolinus*, which was celebrated every fourth year, after the manner of the Olympic games. Hence the years, instead of *lustris*, are sometimes numbered by *agones*.

AGON also signified one of the ministers employed in the heathen sacrifices, and whose business it was to strike the victim. The name is supposed to have been derived from hence, that standing ready to give the stroke he asked *Agon?* or *Agone?* shall I strike?

AGONALES, an epithet given to the SALII.

AGONALIA, in Roman antiquity, festivals celebrated in honour of Janus; or of the god Agonius, whom the Romans invoked before undertaking any affair of importance.

AGONISMA, in antiquity, denotes the prize given to the victor in any combat or dispute.

AGONISTICI, in church-history, a name given by Donatus to such of his disciples as he sent to fairs, markets, and other public places, to propagate his doctrine; for which reason they were also called *Circuitoires*, *Circelliones*, *Catropite*, *Coropite*, and at Rome *Montenses*. They were called *Agonistici*, from the Greek *αἰσῆς*, combat; in regard they were sent, as it were, to fight, and subdue the people to their opinions.

AGONISTICON, a term used by physicians for cold water, as being supposed to combat the febrile heat.

AGONIUM, in Roman antiquity, was used for the day on which the *rex sacrorum* sacrificed a victim, as well as for the place where the games were celebrated otherwise called *agon*.

AGONOTHETA, or AGONOTHETES, in Grecian antiquity,

Agnus
||
Agonotheta.

* See Vitex.

Agony
Agricola.

antiquity, was the president or superintendent of the sacred games; who not only defrayed the expences attending them, but inspected the manners and discipline of the athletes, and adjudged the prizes to the victors.

AGONY, any extreme pain. It is also used for the pangs of death. Much of the terror of death consists in the pangs and convulsions wherewith the agony seems attended; tho' we have reason to believe, that the pain in such cases is ordinarily not extremely acute; a course of pain and sickness having usually stupified and indisposed the nerves for any quick sensations. However, various means have been thought of for mitigating the agony of death. Lord Bacon considers this as part of the province of a physician; and that not only when such a mitigation may tend to a recovery, but also when, there being no further hopes of a recovery, it can only tend to make the passage out of life more calm and easy. Complacency in death, which Augustus so much desired, is certainly no small part of happiness. Accordingly the author last cited ranks *enthafia*, or the art of dying easily, among the desiderata of science; and does not even seem to disapprove of the course Epicurus took for that end,

—*Hinc pignus ebrius hausit aquas.*

Opium has been applied for this purpose, with the applause of some, but the condemnation of more.

AGONYCLITE, or **AGONYCLITES**, in church-history, a sect of Christians, in the 7th century, who prayed always standing, as thinking it unlawful to kneel.

AGORÆUS, in heathen antiquity, an appellation given to such deities as had statues in the market-places; particularly Mercury, whose statue was to be seen in almost every public place.

AGORANOMUS, in Grecian antiquity, a magistrate of Athens, who had the regulation of weights and measures, the prices of provisions, &c.

AGOUTI, or **AGUTI**. See **MUS**.

AGRA, the capital town of a province of the same name, in Indostan, and in the dominions of the Great Mogul. It is looked upon as the largest city in these parts, and is in the form of a half-moon. A man on horseback can hardly ride round it in a day. It is surrounded with a wall of red stone, and with a ditch 100 feet wide. The Great Mogul sometimes resides here: his palace is prodigiously large, and the seraglio commonly contains above 1000 women. There are upwards of 800 baths in this town; but that which travellers most admire, is the mausoleum of one of the Mogul's wives, which was 20 years in building. The indigo of Agra is the most valuable of all that comes from the East-Indies. It is seated on the river Jemna, about 50 miles above its confluence with the Tehemel, and is 300 miles N. E. of Surat. E. Long. 79. 12. N. Lat. 26. 29.

AGRARIAN LAWS, among the Romans, those relating to the division and distribution of lands; of which there were a great number; but that called the *Agrian Law*, by way of eminence, was published by Spurius Cassius, about the year of Rome 268, for dividing the conquered lands equally among all the citizens, and limiting the number of acres which each citizen might enjoy.

AGREDA, a town of Spain, in Old Castile, near the frontiers of Arragon, and about three leagues south-west of Tarazon.

AGREEMENT, in law, signifies the consent of Agreement
several persons to any thing done or to be done.

AGRESTÆ, among physicians, denotes unripe grapes, said to be of a cooling nature.

AGRI, or **ACRI**, a river of the kingdom of Naples, which arising in the Apennine mountains, not far from Marisco Nuovo, falls into the gulph of Tarento.

AGRIA, called by the Germans *Eger*, is a small but strong town in Upper Hungary, and is a bishop's see. It is situated on a river of the same name, and has a citadel called Erlaw. It was besieged by the Turks in 1552, with 70,000 men: but they lost 8000 in one day; and were obliged to raise the siege, though the garrison consisted only of 2000 Hungarians, assisted by the women, who performed wonders on this occasion. However, it was afterwards taken by Mahomet III. in 1596; but was re-taken by the emperor in 1687, since which time it has continued under the dominion of the house of Austria. It is 47 miles north-east of Buda, and 55 south-west of Cassovia. E. Long. 20. 10. N. Lat. 48. 10.

AGRICOLA (Cneus Junius), born at Frejus in Provence, was made lieutenant in Vespasian's time to Vettius Bolanus in Britain; and, upon his return, was ranked by that emperor among the patricians, and made governor of Aquitania. This post he held three years; and upon his return was chosen consul, and afterward appointed governor of Britain, where he greatly distinguished himself. He reformed many abuses occasioned by the avarice or negligence of former governors; put a stop to extortion; and caused justice to be impartially administered. Vespasian dying about this time, his son Titus, knowing the great merit of Agricola, continued him in the government. In the spring, he marched towards the north, where he made some new conquests, and ordered forts to be built for the Romans to winter in. He spent the following winter in concerting schemes to bring the Britons to conform to the Roman customs: he thought the best way of diverting them from rising and taking arms, was to soften their rough manners, by proposing to them new kinds of pleasure, and inspiring them with a desire of imitating the Roman manners. Soon after this, the country was adorned with magnificent temples, porticos, baths, and many other fine buildings. The British nobles had at length their sons educated in learning; and they who before had the utmost aversion to the Roman language, now began to study it with great assiduity: they wore likewise the Roman habit; and, as Tacitus observes, they were brought to consider those things as marks of politeness, which were only so many badges of slavery. Agricola, in his third campaign, advanced as far as the Tweed; and in his fourth, he subdued the nations betwixt the Tweed and the friths of Edinburgh and Dumblinton, into which the rivers Glotta and Bodotria discharge themselves; and here he built fortresses to shut up the nations yet unconquered. In his fifth, he marched beyond the friths; where he made some new acquisitions, and fixed garrisons along the western coasts, over against Ireland. In his sixth campaign he passed the river Bodotria, ordering his fleet, the first which the Romans ever had in those parts, to row along the coasts, and take a view of the northern parts. In the following spring, the Britons raised an army of 30,000 men; and the command was

given

Agricola.

given to Galgacus, who, according to Tacitus, made an excellent speech to his countrymen on this occasion. Agricola likewise addressed his men in very strong and eloquent terms. The Romans gained the victory, and 10,000 of the Britons are said to have been killed. This happened in the reign of the emperor Domitian; who, growing jealous of the glory of Agricola, recalled him, under pretence of making him governor of Syria. Agricola died soon after, and his death is suspected to have been occasioned by poison given him by that emperor. Tacitus the historian married his daughter, wrote his life, and laments his death in the most pathetic manner.

AGRICOLA (George), a German physician, famous for his skill in metals. He was born at Glaucha, in Misnia, the 24th of March 1494. The discoveries which he made in the mountains of Bohemia gave him so great a desire of examining accurately into every thing relating to metals, that though he had engaged in the practice of physic at Joachimsthal by advice of his friends, he still prosecuted his study of fossils with great assiduity; and at length removed to Chemnitz, where he entirely devoted himself to this study. He spent in pursuit of it the pension he had of Maurice duke of Saxony, and part of his own estate; so that he reaped more reputation than profit from his labours. He wrote several pieces upon this and other subjects; and died at Chemnitz the 21st of November, 1555, a very firm Papist. In his younger years he seemed not averse to the Protestant doctrine; and he highly disapproved of the scandalous traffic of indulgences, and several other things in the church of Rome. The following lines of his were posted up in

the streets of Zwickaw, in the year 1519:

*Si nos infecto salvabit cistula nummo,
Hec nimium infelix tu mihi, pauper, eris!
Si nos, Christe, tua servatos morte beasti,
Tam mihi infelix tu mihi, pauper, eris.
If wealth alone salvation can procure,
How sad a fate for ever waits the poor!
But if thou, Christ, our only saviour be,
Thy merits still may bless ev'n poverty!*

In the latter part of his life, however, he had attacked the Protestant religion; which rendered him so odious to the Lutherans, that they suffered his body to remain unburied for five days together; so that it was obliged to be removed from Chemnitz to Zeitz, where it was interred in the principal church.

AGRICOLA (John), a Saxon divine born at Islebe in 1492. He went as chaplain to count Mansfield, when that nobleman attended the Elector of Saxony to the diet of Spire in 1526, and that of Augsburg in 1530. He was of a restless ambitious temper, rivalled and wrote against Melancthon, and gave count Mansfield occasion to reproach him severely. He obtained a professorship at Wittenberg, where he taught particular doctrines, and became founder of the sect of Antinomians; which occasioned warm disputes between him and Luther, who had before been his very good friend. But though he was never able to recover the favour either of the elector of Saxony, or of Luther, he received some consolation from the fame he acquired at Berlin: where he became preacher at court; and was chosen in 1548, in conjunction with Julius Plügel, and Michael Heldingus, to compose the famous *Interim*, which made so much noise in the world.* He died at Berlin in 1566.

A G R I C U L T U R E

Definition. MAY be defined, The art of disposing the earth in such a manner as to produce whatever vegetables we desire, in large quantity, and in the greatest perfection of which their natures are capable.—But though, by this definition, agriculture, strictly speaking, includes in it the cultivation of every species of vegetable whatever, and consequently comprehends all that is understood of gardening and planting, we mean here to confine ourselves to the cultivation of those species of grain, grass, &c. which, in this country, are generally necessary as food for men and beasts.

HISTORY. THAT the antiquity of this art is beyond all others, cannot well be doubted; seeing we are informed by Scripture, that Adam was sent from the garden of Eden to till the ground; and, this being the case, he certainly must have known how to do so.—It would be ridiculous, from this, to imagine that he was acquainted with all the methods of ploughing, harrowing, fallowing, &c. which are now made use of; and it would be equally foolish to imagine, that he used such clumsy and unartful instruments as wooden hooks, horns of oxen, &c. to dig the ground, which were afterwards employed for this purpose by certain savages: but as we know nothing of the particular circumstances in which he was situated, we can know as little concerning his method of agriculture.

The prodigious length of life which the antedilu-

vians enjoyed, must have been very favourable to the advancement of arts and sciences, especially agriculture, to which they behaved to apply themselves in a particular manner, in order to procure their subsistence. It is probable, therefore, that, even in the antediluvian world, arts and sciences had made great progress, nay, might be farther advanced in some things than they are at present. Of this, however, we can form no judgment, as there are no histories of those times, and the scripture gives us but very slight hints concerning these matters.

No doubt, by the terrible catastrophe of the flood, which overwhelmed the whole world, many sciences would be entirely lost, and agriculture would suffer; as it was impossible that Noah or his children could put in practice, or perhaps, know, all the different methods of cultivating the ground that were formerly used. The common methods, however, we cannot but suppose to have been known to him and his children, and by them transmitted to their posterity; so that as long as mankind continued in one body without being dispersed into different nations, the arts, agriculture especially, behaved to advance; and that they did so is evident from the undertaking of the tower of Babel. It is from the dispersion of mankind consequent upon the confusion of tongues, that we must date the origin of savage nations. In all societies where different arts are cultivated, there are some persons who have a kind of general

Agricola.

ral knowledge of most of those practised through the whole society, while others are in a manner ignorant of every one of them. If we suppose a few people of understanding to separate from the rest, and become the founders of a nation, it will probably be a civilized one, and the arts will begin to flourish from its very origin; but, if a nation is founded by others whose intellects are in a manner callous to every human science, (and of this kind there are many in the most learned countries), the little knowledge or memory of arts that were among the original founders will be lost, and such nations will for many ages be a savage and degenerate race, till at last they will either begin to improve of themselves, or the arts will be brought to them from other nations.

From this, or similar causes, all nations of equal antiquity have not been equally savage, nor is there any solid reason for concluding that all nations were originally unskilled in agriculture; though as we know not the original instruments of husbandry used by mankind when living in one society, we cannot fix the date of the improvements in this art. Different nations have always been in a different state of civilization; and agriculture, as well as other arts, has always been in different degrees of improvement among different nations at the same time.

From the earliest accounts of the eastern nations, we have reason to think, that agriculture has at all times been understood by them in considerable perfection; seeing they were always supplied not only with the necessities, but the greatest luxuries, of life. The Egyptians never appear to have been destitute of it, seeing they were capable of supplying other nations with corn upwards of 2400 years before the Christian era. The accounts of Herodotus, concerning the judicious conduct of this nation in the disposition of their country with respect to the inundations of the Nile, likewise evince their knowledge of agriculture to have been very considerable.

The Greeks, who were at first a set of barbarous savages, appear to have received their knowledge of agriculture from the eastern nations. Some few fragments of theirs are the most ancient rudiments of husbandry upon record. The elder Cato is the most ancient Latin author whose writings upon this subject have reached the present time. An improved treatise on agriculture was written by Varro, who has embellished his subject with elegant language: soon after him, Virgil published his justly admired Georgics, by far the most laboured and highly finished of any of his works. Columella afterwards collected with great judgment whatever was valuable in the writings of his predecessors, and enriched them with his own observations on the subject. His work is one of the choicest remains of antiquity, and has scarcely been equalled by any author since his time.—Valuable treatises on agriculture were also published by Attalus, king of Pergamus; Archelaus, king of Cappadocia; Valerius Asiaticus, who was judged worthy of the empire after Caligula; and by the emperor Albinus.

The irruptions of the barbarous nations of the north soon abolished any improved agriculture. These innumerable and enterprising barbarians, who over-ran all Europe, were originally shepherds or hunters, like the present Tartars and the savages of America. They con-

tented themselves with possessing those vast deserts made by their own ravages, without labour or trouble, cultivating only a very small spot near their habitations; and in this trifling husbandry, only the meanest slaves were employed: so that the art itself, which formerly was thought worthy of the study of kings, was now looked upon as mean and ignoble; a prejudice which is scarcely effaced at present, or at least but very lately.

At what time agriculture was introduced into Britain, is uncertain. When Julius Cæsar first invaded this island, it was not wholly unknown. That conqueror was of opinion, that agriculture was first introduced by some of those colonies from Gaul which had settled in the southern parts of Britain, about 100 years before the Roman invasion*.

It is not to be expected that we can now be acquainted with many of the practices of these ancient husbandmen. It appears, however, that they were not unacquainted with the use of manures, particularly marle. This we have on the authority of Pliny†, who tells us, that it was peculiar to the people of Gaul and of Britain; that its effects continued 80 years; and that no man was ever known to marle his field twice, &c.—It is highly probable, too, that lime was at this time also used as a manure in Britain, it being certainly made use of in Gaul for this purpose at the time of Julius Cæsar's invasion.

The establishment of the Romans in Britain produced great improvements in agriculture, inasmuch that prodigious quantities of corn were annually exported from the island; but when the Roman power began to decline, this, like all the other arts, declined also, and was almost totally destroyed by the depredation of that people. The unhappy Britons were now exposed to frequent incursions of the Scots and Picts, who destroyed the fruits of their labours, and interrupted them in the exercise of their art. After the arrival of the Saxons in the year 449, they were involved in such long wars, and underwent so many calamities, that the husbandmen gradually lost much of their skill, and were at last driven from those parts of their country which were most proper for cultivation.

After the Britons retired into Wales, though it appears from the laws made relative to this art, that agriculture was thought worthy of the attention of the legislature, yet their instruments appear to have been very unartful. It was enacted that no man should undertake to guide a plough who could not make one; and that the driver should make the ropes of twisted willows, with which it was drawn. It was usual for six or eight persons to form themselves into a society for fitting out one of these ploughs, providing it with oxen and every thing necessary for ploughing; and many minute and curious laws were made for the regulation of such societies. If any person laid dung on a field with the consent of the proprietor, he was by law allowed the use of that land for one year. If the dung was carried out in a cart in great abundance, he was to have the use of the land for three years. Whoever cut down a wood, and converted the ground into arable, with the consent of the owner, was to have the use of it for five years. If any one folded his cattle, for one year, upon a piece of ground belonging to another, with the owner's consent, he was allowed the use of that field for four years.

* Cæsar de
Bell. Gal.
lib. 5. c. 12.

† Plin. Nat.
Hist. lib. 19.
cap. 6.

Thus, though the Britons had in a great measure lost the knowledge of agriculture, they appear to have been very assiduous in giving encouragement to such as would attempt a revival of it; but, among the Anglo-Saxons, things were not at present in so good a state. These restless and haughty warriors, having contracted a distaste and contempt for agriculture, were at pains to enact laws to prevent its being followed by any other than women and slaves. When they first arrived in Britain, they had no occasion for this art, being supplied by the natives with all the necessities of life. After the commencement of hostilities, the Saxons subsisted chiefly by plunder; but having driven out or extirpated most of the ancient Britons, and divided their lands among themselves, they found themselves in danger of starving, there being now no enemy to plunder; and therefore they were obliged to apply to agriculture.

The Saxon princes and great men, who, in the division of the lands, had received the greatest shares, are said to have subdivided their estates into two parts, which were called the *in-lands* and the *out-lands*. The in-lands were those which lay most contiguous to the mansion-house of their owner, which he kept in his own possession, and cultivated by his slaves, under the direction of a bailiff, for the purpose of raising provisions for the family. The out-lands were those at a greater distance from the house, and were let to the *eorls*, or farmers of those times, at very moderate rents. By the laws of Ina king of the west Saxons, who reigned in the end of the seventh and beginning of the eighth century, a farm, consisting of ten hides, or plough-lands, was to pay the following rent: "Ten calks of honey; three hundred loaves of bread; twelve calks of strong ale; thirty calks of small ale; two oxen; ten wedders; ten geese; twenty hens; ten cheefes; one cask of butter; five salmon; twenty pounds of forage; and one hundred eels." From this low rent the imperfection of agriculture at that time is easily discoverable; but it is still more so from the low prices at which land was then sold. In the ancient history of the church of Ely, published by Dr Gale, there are accounts of many purchases of lands by *Ædelwold* the founder of that church, and by other benefactors, in the reign of *Edgar the Peaceable*, in the tenth century. By a comparison of these accounts it appears, that the ordinary price of an acre of the best land in that part of England, in those times, was no more than 16 Saxon pennies, or about four shillings of our money; a very trifling price, even in comparison of that of other commodities at the same time: for, by comparing other accounts, it appears, that four sheep were then equal in value to an acre of the best land, and one horse of the same value with three acres. The frequent and deplorable famines which afflicted England about this time, are further instances of the wretched state of agriculture. In 1043, a quarter of wheat sold for 60 Saxon pennies, (15 of our shillings) and at that time equal in value to seven or eight pounds of our money now.

The invasion of the Normans, in 1066, contributed very much to the improvement of agriculture; for, by that event, many thousands of husbandmen from Flanders, France, and Normandy, settled in Britain, ob-

tained estates or farms, and cultivated them after the manner of their country. The implements of husbandry, used at this time, were of the same kind with those employed at present; but some of them were less perfect in their construction. The plough, for example, had but one stilt, or handle, which the ploughman guided with one hand, leaving in his other hand an instrument which served both for cleaning and mending the plough, as well as for breaking the clods. The Norman plough had two wheels; and in the light soil of Normandy was commonly drawn by one or two oxen; but, in England, a greater number was often necessary. In Wales, the person who conducted the oxen in the plough walked backwards. Their carts, harrows, scythes, sickles, and flails, from the figures of them still remaining, appear to have been nearly of the same construction with those that are now used. In Wales, they did not use a sickle for reaping their corns, but an instrument like the blade of a knife, with a wooden handle at each end.—Their chief manure, next to dung, seems still to have been marle. Summer fallowing of lands designed for wheat, and ploughing them several times, appear to have been frequent practices of the English farmers in this period.

All this time, agriculture seems to have been in a very imperfect state in Scotland. Though we are certain that the knowledge of it in this country proceeded originally from England, we know not when it was introduced. In 1214, the legislature seem to have directed their attention towards the improvement of this art; for by an act of Alexander II. dated this year, all farmers that had four oxen or cows, or upwards, were commanded to till their land by *ploughing*, and to begin to till fifteen days before Candlemas; that such farmers as had not so many oxen, should delve with hand and foot as much land as would produce a sufficient quantity of corn to support themselves and their families. It is probable, however, that this law was designed for the Highlands, and most uncultivated parts of the kingdom; for, in the same parliament, a very severe law was made against those farmers who did not extirpate a pernicious weed called *guilde* out of their lands, which seems to indicate a more advanced state of cultivation.

The most considerable improvements in agriculture, however, have taken place in Britain since the reign of Queen Elizabeth. The reformation was no less favourable to the arts than to religion. Improvements were first begun by some natives of Switzerland who settled in England; and the liberal spirit of inquiry succeeding this remarkable period, hath in a manner entirely put an end to that slavish attachment to the customs of preceding ages, which, under the dominion of popery, proved an unsurmountable bar to the progress of every science. Societies for the improvement of this most useful art have been instituted both in England and Scotland; and though the agriculture of Scotland hath hitherto scarcely equalled that of England, yet the improvements that are daily making in the former, and the universal increase of the knowledge of the art among her inhabitants, leave no room to doubt, that in a few years she will show every mark of equality that soil, climate, and other natural differences, will allow.

PART I. THEORY OF AGRICULTURE.

IN an art so extensively useful to mankind, and which has been so universally practised since the creation of the world, it is natural to expect the most exact and perfect theory; but in this we are not only totally disappointed, but likewise find the greatest disagreement among those who practise it, new schemes starting up and receiving the highest applause to day, and sinking into total neglect and oblivion to-morrow.

¹ Ignorance of the food of vegetables, the reason of imperfection in the theory of agriculture.

One reason of this want of a distinct theory of agriculture is, the ignorance of what is properly the food of vegetables; for as the whole art of agriculture consists only in supplying them with a proper quantity of food, in the most favourable circumstances, it is evident, we could proceed upon a much more sure foundation if we could ascertain what their proper nourishment is, than we can do without this knowledge. —The reason of the great differences regarding the practice, probably, is the difficulty of making experiments in agriculture. It is not in this art as in Mechanics, Chemistry, &c. where an experiment can be made in an hour, or a day or two at farthest: an experiment in agriculture cannot be properly made in less than several years. Some favourable unobserved circumstances, quite foreign to the experiment itself, may concur to produce plentiful crops for a year or two; and thus the farmer may be induced to publish his fancied improvements, which failing in the hands of others, or perhaps even in his own on a repetition of the experiment, the new improvements are totally neglected, and things continue in their old way. Was he, however, capable of seeing and handling the food of vegetables, as well as he can do that of a horse or an ox, and procuring it in any imaginable quantity, it is plain, that he would be able to cause vegetables grow in their utmost luxuriance, or, if we may be allowed the expression, *fatten* them, with as great certainty as he can fatten a horse or an ox, when he hath plenty of proper food to give them. —To ascertain what this food is, therefore, must be a step towards the perfection of agriculture; and to this we shall contribute our endeavour.

SECT. I. Of the proper Food of Plants.

² Various suppositions concerning the food of plants.

We shall not here spend time in refuting the theories of those who imagined the vegetable food to consist of oily and saline substances. These will be considered when speaking of the different kinds of manures. The theory which seems to gain most credit at present is, that Water and Air are the proper vegetable food, to which alone they owe their increase in bulk and weight. —That plants cannot be supported without both these, is very certain: but we know, that air is a compound fluid; and water is never without some impurities, so may also be considered as a compound. —Dr Priestley hath shewn, that our atmosphere is composed of earth, of phlogiston, and the nitrous acid *. To these we may add water; for whether that is an ingredient in the Doctor's pure dephlogisticated air or not, we are very sure that it is so in that air which has access to all vegetables, and contributes so much to their growth. Is it then the aqueous, the earthy, the acid, or the phlogistic part of the air, which nourishes plants? In like manner, is it

the pure elementary part of water, which nourishes them? or does it contribute to their growth only by the heterogeneous substances which it contains?

From Dr Priestley's experiments on different kinds of air, it appears that the purest kind of that fluid is not the fittest for the purposes of vegetation. On the contrary, vegetables flourished in a surprising degree when confined in a small quantity of air made perfectly noxious by the putrid effluvia of animal bodies. In these circumstances, a sprig of mint extended itself, in seven days, three inches in length, and put forth several new shoots; the putrid air, in the mean time, being deprived of its noxious quality, and becoming so wholesome that animals might breathe it with safety. This property of absorbing such noxious effluvia, he found to belong not only to mint, but indiscriminately to every vegetable substance; and hence he concludes, that one use of the vegetable creation is to purify the air from that immense quantity of putrid effluvia which is continually absorbed by it from the breath of living creatures, and the putrefaction of animal and vegetable bodies. By the absorption of these effluvia from the air we find that vegetables are remarkably increased in bulk. We are assured, therefore, that they constitute at least one species of vegetable food; and when vegetables are put into such circumstances that the steams of putrefying bodies can have access to them, we are sure they will thrive the better.

Besides this method of restoring the salubrity of putrid air by growing vegetables, the Doctor found another; namely, by agitating it in water, part of which was exposed to the atmosphere. In this case, the water acquired a very putrid noxious smell; which shews, that water, as well as air, is capable of absorbing those effluvia which are found proper food for vegetables. We cannot help concluding, therefore, that in the continual ascent of water in vapour, and its descent again in rain, which is a much more effectual agitation than could be made by Dr Priestley, the water must be very intimately combined with the phlogistic or putrid effluvia which are contained in the air. To this union we are led strongly to suspect that rain-water owes its fertilizing qualities; for the purest spring waters, though most wholesome for animals, are not found to be fittest for promoting the growth of vegetables. —As, therefore, vegetables evidently receive nourishment both by their leaves and roots, and increase remarkably in bulk by absorbing the putrid effluvia from the air; and as they likewise increase in bulk by admitting water to their roots, and more so when the water contains much of that kind of effluvia, than when it contains less; we must necessarily conclude, that the nourishment received by the roots of plants is of the same kind with that received by their leaves; and that this food may be given them in greater plenty, than they naturally receive it, by impregnating the air which surrounds them, or the water which moistens them, with a greater quantity of putrid matter than what they contain in a natural state.

Some will perhaps laugh at this scanty provision we are making for the immense quantity of vegetables with which the whole surface of the earth is covered; for

the food we have just now assigned them is naturally invisible, and consequently will be looked upon by many as a kind of non-entity. Its invisibility, however, is no argument for its existing only in a small quantity; for the subtle matter which increases the weight of calcined metals is equally invisible with what we have just now assigned for the support of the vegetable creation; nevertheless, it is so far from being in small quantity, that any imaginable weight of it may be absorbed from the air in a short time. It is said by some, that lead, by being converted into the substance called *minium* or *red lead*, gains one fourth, by others only one tenth, in weight from the air*: as a medium, we shall suppose that it gains $\frac{1}{4}$ th. If seven tons of lead, then, were converted into minium at once, it would gain one ton, or 2000lb. from the air, in three or four days at most, for that is the longest time required for the calcination. We should be surprised at finding a vegetable increase so much in such a short time, though it receives food both from the air and earth; but if the air contains such a quantity of mineral food, if we please to call it so, why should it not contain an equal quantity of matter for the support of vegetables also, even supposing them to have no other source of nourishment?

SECT. II. *The foregoing Theory confirmed from considerations on the nature of vegetable Mould, and the different kinds of Manure found proper for fertilizing the Soil.*

7
All kinds of
earth not
equally pro-
per for nour-
ishing ve-
getables.

THOUGH plants will grow on any kind of earth, and flourish vigorously, if plentifully supplied with water; yet some kinds of soils are found much more proper for supplying them with nourishment than others.—We cannot, indeed, allow the inferences to be quite fair which some would draw from experiments on plants set in mere sand, &c.; viz. that the earth is of no other use to vegetation than to afford a proper support to the plant, that it be not easily moved out of its place; because the experiments made on single vegetables are always performed in or very near houses, where the air is by no means so pure as in the open fields, and consequently where they have an opportunity of receiving as much nourishment from the air as may compensate the want of what they would have derived from the earth if planted in a rich soil. Lord Kaimes, in the Gentleman Farmer, mentions an experiment wherein a pea was planted on some cotton spread on water, in a vial. It sprang, and pushed roots through the cotton into the water. The plant grew vigorously, and, at the time of his writing the experiment, carried large pods full of ripe seed.—From this experiment, or others of a similar kind, however, a farmer would not be thought to act very judiciously, who should conclude that nothing more was requisite to produce a plentiful crop, than to keep his fields constantly soaking with water, and apply his labour only for that purpose, without regarding either tillage, manure, or the difference of soils. Experience has abundantly shewn, that by certain operations performed on the earth itself, it is rendered much more capable of supplying vegetables with plenty of nourishment than if such operations were omitted; and that some kinds of soils cannot without certain additions be rendered so fit for this purpose as others; and this is what constitutes the difference between a *rich* and a *poor* soil.

Chemists have distinguished the different kinds of earths into particular classes*, from whence we might expect some insight into the nature of different soils; but so far from this, that species of earth, which alone is capable of supplying the vegetable kingdom with nourishment in the greatest plenty, seems entirely overlooked, and is scarce ever mentioned. This kind of earth is the most common of any, and is found in its greatest perfection in well cultivated gardens. It is not however, even in these, found in perfect purity; being constantly mixed with greater or less proportions of sand, small stones, &c. It can be had by itself, and entirely separated from all other substances, only by suffering vegetable or animal bodies to putrify. By undergoing this operation, they are at last resolved into a kind of earth, which appears perfectly the same, from whatever substance it is produced. Of this earth Dr Lewis gives us the following characters. It is indissoluble in acids, somewhat tenacious when moistened with water, friable when dry, and acquires no additional hardness in the fire.—The chemistry of nature, and of art, however, are so very dissimilar, that an account of the chemical properties of this earth can be but of very little service to the practice of agriculture; however, to those above mentioned we may add, that when it is distilled with a violent fire, a volatile alkaline spirit, and fetid oil, similar to those of hartshorn or other animal substances, are obtained.

As the volatile alkali is known to be produced in great plenty by distilling putrid substances either animal or vegetable, the obtaining an alkaline spirit from this kind of earth is a strong argument of its being much impregnated with the putrid effluvia, which we have already mentioned as the proper vegetable food contained in the air and water. Indeed, considering that this kind of earth is produced by putrefaction, it is next to an impossibility that it should not be impregnated with putrid steams, as much as earth can be; and if the earth which is most impregnated with these steams is found to afford the greatest quantity of nourishment to vegetables, we have from thence an additional proof that they live on the putrid matter emitted from dead animals and vegetables like themselves.

That we may be the more ascertained of this, it must be considered, that the earth, which undoubtedly is the great source of nourishment to vegetables, is capable of absorbing putrid effluvia more powerfully, or at least in much greater quantity, before it is saturated, than either the air or water. The practice of burying dead bodies is an undeniable proof of this. They are laid but a small depth under ground; yet the abominable stench emitted by the dead carcase is retained in the earth, so that it never penetrates in such a manner as to be offensive. That earth may be saturated with this putrid matter, as well as air or water, is very certain; and, in case of such a saturation, no doubt either of these will take up the superfluous quantity, and become noxious: but unless the earth is fully saturated, both of them will deposit part of what they themselves contain in the earth, and by that means become more salutary than they were before.

That earth is capable of attracting putrid effluvia from the air, perhaps, may not be so readily granted; and indeed we know of no experiment whereby it can be shewn that putrid air is made salutary by having any kind

THEORY.

kind of earth agitated in it: but if we consider the exceeding great salubrity of the air in the country, and the healthiness of those who follow the plough or are employed in digging the ground, we must at least allow, that when the ground is turned up, it communicates no kind of noxious quality to the air; which it most certainly would do, if it emitted a putrid effluvia. So far from this, the smell of moist earth is always agreeable and wholesome; and here we have the satisfaction to find our theory somewhat confirmed by the celebrated Baron van Swieten, late physician to the emperors of Hungary.

"Physicians" says he "usually advise their patients to rustication, not only that they may enjoy a pure and freely circulating air, but that, as their strength increases, they may, disengaged from all care, exercise their body by the lighter labours of agriculture, and other country amusements.

"There may perhaps be another cause why rustication will be of benefit in consumptions. It is well known, that, after some days drought, on the falling of rain that moistens the earth, there arises a grateful smell, which we all are sensible of; and this is commonly attributed to the vegetables, which before sapless, but now refreshed by rain, perspire more copiously. But Reaumur observed, that a like fragrant is also perceptible after rain when the corn has been cut down in the fields, where there only remains dry stubble; and examining the matter more particularly, he found that dry earth is without smell, but as soon as it is moistened to the degree of having the confidence of softish pap, it then diffuses a strong smell; but if more water is added, the smell is diminished, nay even quite dissipated. Neither does it seem an easy matter to exhaust that power of producing smells which the earth is possessed of. Every day, during a fortnight, he made cakes of moistened earth; and having dried and wetted them over again, he could not perceive that the earth was less fragrant after all these repeated experiments, if it was again wetted. He further observed, that this fragrant does not diffuse itself to any thing at a great distance, without being much diminished, and soon entirely gone.—It has been observed, that this expiration of the earth ceases if thunder and storms soon follow: while they continue, it begins to return; and when over, the same fragrant of the earth for some hours affects the smell of a man as he walks along over a considerable tract of ground. There is no one, I believe, but has sometimes made this observation; and hence the earth, when moistened to a certain degree, seems to exhale fragrant odours, and indeed various in various places, as we are sensible of from their diversity. They are for the most part of a salubrious quality; as some persons quite faint and languid in the summer-heat perceive themselves wonderfully refreshed, whilst, after rain, they snuff up the fragrant odour. In some places those effluvia are perhaps bad, and may be the causes of diseases."

This property of emitting a fragrant smell is likewise taken notice of by Dr Home in his Principles of Agriculture and Vegetation. Some physicians have prescribed a bath of earth for the cure of consumptive patients; and Dr Solano de Luque was of opinion, that the earth had the property of absorbing contagious miasmata into it: and we are certain, that whether it can absorb these miasmata from living bodies

or not, it certainly can absorb them from dead ones; for a piece of putrid meat will be much sweetened by lying for a short time in the ground.

From all this we cannot indeed infer, that putrid air is sweetened by mere earth; but we discover what is perhaps more important, namely, that though earth is the common receptacle of all putrid matters both animal and vegetable, there is a change made on them when in it, which cannot be made either by air or water. Thus, if the carcase of a small animal is left to putrefy in the air, it becomes exceedingly offensive, and continues so from first to last. The same thing happens if it is left to putrefy in water. But, in earth, the case is quite different. After the carcase is consumed, the earth which has imbibed all the putrid steams, instead of exhaling an offensive odour, diffuses an agreeable one; and thus we may see that it is endowed with a power no less remarkable than that of attraction or repulsion, and which we may distinguish by the name of *transmutation*. With regard to water, the case is more evident; for the most putrid water will be sweetened by percolation through earth, or even running in a channel for some time on its surface; but if it contains any impurities of the saline kind, they will not be separated, or at least in very small quantity.

The existence of such a power as that of transmutation we will be obliged to own, whatever we imagine the vegetable food to consist of; for it is impossible to solve the phenomena of vegetation by attractions and repulsions. If we suppose the vegetable food to be salt, let us attract and repel salt as we will, it remains salt from first to last. Let us suppose it water, the case is the same; and, by mere attraction, nothing but masses of salt, or pools of water, could be produced. The case is the same on our own hypothesis; for, supposing plants composed of the putrid effluvia of others, and of dead animals, if nature was endowed with no other power than attraction or repulsion, the vegetable behaved to be a corrupted mass like that of which it was composed.—This power, as we have already seen, resides only in the earth, and in the vegetables themselves; air and water can indeed act as powerful solvents, but cannot transform or compound.

We must next consider the nature of those different operations, which, from time immemorial, have been performed on the earth, in order to cause it produce the greatest crops of vegetables. If all of these shall be found conspiring to one general purpose, then the shortest and most easy method of attaining that purpose is undoubtedly the most proper to be practised in agriculture, whether it hath been as yet put in execution or not. These are,

1. *Frequent ploughing, or fallowing.* The immediate consequences of this is to expose different quantities of the soil to the action of the air and sun, which will not fail to exert their solvent powers upon it. In consequence of this action, the earth is partly reduced to powder; many of the roots of vegetables, with which it always abounds, are dissolved and putrified; and the earth produced from them mixes with the rest, as well as the effluvia they emit during their dissolution. The earth soon begins again to exert its prolific quality, and a crop of vegetables is produced. By a repetition of the ploughing, these are turned with their roots upwards,

15
Fallowing.

THEORY. wards, are exposed to the solvent powers of the air and light, in consequence of which they die, are putrefied, and more of the native soil is reduced to powder, and mixed with them. By a frequent repetition of this process, the soil becomes vastly more tender, and approaches to the nature of garden-mould, and its fertility is considerably increased.

16 The capacity of a soil to retain water not increased by fallowing. Lord Kaimes is of opinion, that the reason of the fertility of any soil being increased by fallowing, is, that its capacity of retaining water is increased. But this we absolutely deny; for so far from being more disposed to retain water by its pulverisation, the soil is evidently more disposed to part with it, either by evaporation, or by suffering the moisture to percolate thro' it. In this respect it is far inferior to clay; for tho' dry garden-mould absorbs water much more quickly than clay, it also dries much sooner, and thus all the advantage is lost.

17 Oils and salts not the true vegetable food. To those who reckon the food of vegetables to consist of oils or salts, the operation of fallowing ground must appear an useless one, as it can tend neither to produce oils nor salts, but to destroy them. As its utility, however, cannot be denied, the favourers of this theory imagine, that the ground, by repeated operations of this kind, is fitted for attracting the nitrous salts from the air: but it is found, that these salts cannot be attracted by earth, or any other substance, even when exposed for a great length of time to the air with a view to produce salt-petre; which gives a strong suspicion against their existence*; and even if nitre is mixed with the soil, it is found to be detrimental, and will kill or poison plants instead of nourishing them.

* See Chemistry, no 177.

18 Overflowing the soil with water. 2. *Overflowing the ground with water.*—This is found prodigiously to increase the fertility of any soil. It is well known how much Egypt owes to the annual overflowing of the Nile; and even in this country the overflowing of any ground is found to be attended with great advantage. This is practised by Mr Bakewell of Leicestershire, famous for his improvements in the breed of cattle; and he finds it fully to answer an annual manuring of any other sort. It is also recommended by Mr Anderson of Monkhill, in his essays on agriculture.

19 Reasons of the increase of fertility by the overflowing. The fertilizing quality of water will easily be accounted for on the same principles. When grown vegetables are covered with water, their growth, however vigorous before, is immediately stopped, unless they be of the aquatic kind; they die, are dissolved, and putrefied; in which case, their finer parts are undoubtedly absorbed by the earth: and thus the *floating*, as it is called, of fields with water, answers the purpose of fallowing, with very little trouble. This is not all: for stagnating water always deposits a sediment, which, mixing with the dissolved parts of the vegetables all over the field, forms an excellent manure; and when the water is allowed to run off, the heat of the sun soon brings the highest degree of putrefaction on the dead vegetables, the effluvia of which, mixing with the mud deposited from the water, makes it exceedingly rich.

20 Oils & salts cannot be the vegetable food. Upon the supposition of oily and saline food for vegetables, this operation must certainly be prejudicial; for nothing can so effectually deprive any substance of salt, as steeping it in water. Neither will water either deposit oil from itself, or suffer it to mix with the ground if accidentally brought to it; nay, though a field were

previously impregnated with oil, upon overflowing it with water, great part of the oil would be separated, and rise to the top: so that, in either case, this operation behaved to impoverish land, rather than enrich it; and as vegetables are found to be supplied with food in plenty, by an operation which must undoubtedly tend to take away both oils and salts from them, we cannot help thinking this a demonstration that their food is composed neither of oil nor salt.

3. *Manuring*, or mixing the soil with different substances.—We shall here confine ourselves to those which are of undoubted efficacy, and have their credit established by long experience. These are, 1. lime, chalk, marle, shells, or other earths called by the chemists *calcareous earths*; 2. foot; 3. ashes; 4. dung of different kinds.—(1.) The lime, chalk, marle, and shells, are all found to be of the same nature. The marle differs from the rest, only in having a mixture of clay along with its calcareous part. These contain neither salt nor oil of any kind; they readily imbibe water, and as readily part with it. Quicklime, indeed, retains water very obstinately; but such lime as is laid upon the ground soon returns to the same state in which it originally was, and powdered limestone is found to answer as well for the purposes of manure as that which has been burnt; so that here we may consider them all as substances of the same class.—If any of these substances are mixed with dead animal or vegetable bodies, they remarkably quicken their dissolution and corruption, as appears from Sir John Pringle's experiments on putrefaction. When mixed with the soil, therefore, they must undoubtedly exert their powers on such substances as they find there, in the same manner as they do on others; that is, they must hasten their dissolution and putrefaction, and give the pure vegetable mould an opportunity of absorbing their putrid steams, and consequently of being fertilized by it in the same manner as by putrid substances of any kind. (2.) Those who contend for oily and saline principles in the vegetable food, avail themselves of the usefulness of foot as a manure; which is not only oily of itself, but affords a great quantity of volatile salt, along with some neutral sal-ammoniac. It must be remembered, however, that not an atom either of volatile salt or sal-ammoniac can be extracted from foot without a considerable heat, which no soil can give, nor could any vegetable bear. Neither doth its oil appear without a great degree of heat: and though it feels somewhat unctuous to the touch, this is but a mere deception; for no true oil, capable of floating on water, can be obtained from foot without distillation. It is impossible, therefore, that foot can act upon the soil either as an oily or a saline substance; how far it is capable of dissolution by putrefaction, or being otherwise converted into an earth, hath not yet been determined by experiments; but as it yields, on distillation, the same principles which are obtained from animal or putrefied vegetable substances, it is probable that foot enriches the ground in the same manner that they do. (3.) The use of ashes in manure is likewise urged as an argument for the food of vegetables being of a saline nature; as it is known, that the common alkaline salts are procured by lixiviating the ashes of wood and other vegetables. Experience, however, shews us, that ashes are no less fit for manure after the salt is extracted from them than before.

21 Of manures, and their operation.

THEORY.

before. Indeed, if there is any difference, it is in favour of the washed ashes. The alkali itself, though in Sir John Pringle's experiments it was found to be *antiseptic*, or a refister of putrefaction, is nevertheless a powerful dissolvent; and as it must soon lose its alkaline properties when mixed with the earth, in consequence of the universal existence of the vitriolic acid *, those substances which it has dissolved will be more disposed to putrefaction than before, and consequently tend to fertilize the ground in the manner we have already described. The washed ashes are *septic*, or promoters of putrefaction, and consequently act in the same manner as chalk or limestone. (4.) All kinds of dung are so much disposed to putrefaction, that it is difficult to imagine any other way in which they can be serviceable to vegetation than by their putrid effluvia.—People indeed may dream of imaginary salts in dung; but if they considered, or even knew the difficulty of procuring salt of any kind from dung, they would probably alter their sentiments. The volatile salts procured from this as well as other animal-matters are mere creatures of the fire: putrid urine produces them indeed without heat, but scarce any other animal-substance *. Nevertheless other putrid substances will fertilize the ground as well as urine, and therefore must act in some other way than by their salts. Tho' Dr Priestley's experiments had never been made, we could have formed no other rational supposition concerning the manner in which putrid substances fertilize the earth than what we have already done; but as he has shewn that vegetables are prodigiously increased in bulk by the mere contact of these putrid steams, where no saline substance could have access to them, we cannot help thinking this a decisive experiment concerning the manner in which the ground is fertilized by manuring with dung or other putrid substances.

22
Effects of saline substances on growing vegetables.

We shall conclude this part of the subject with an account of some experiments concerning the effects of saline substances on the growth of vegetables. The following are related by Lord Kaimes, in his Gentleman Farmer.—“A number of Jerusalem artichokes were set in pots filled with pure sand. One plant was kept as a standard, being nourished with water only. Other plants of the same kind were nourished with water in which salt of tartar, a fixed alkali, was dissolved. These grew more vigorously than the standard plant; but, by reiterated waterings, there came to be such an accumulation of the fixed alkali among the sand, as to make the plants decay, and at last to die. Some plants were nourished with water in which sal-ammoniac, a volatile alkali, was dissolved. These grew also well for some time; but, like the former, were destroyed by frequent reiterations of it. Weak lime-water promoted the growth of its plants more than common water. But water, completely saturated with quicklime, proved more noxious than that which contained a fixed alkali; though less than that which contained a solution of volatile alkali.—Urine promoted, for a long time, the growth of its plants; and the most putrid appeared to have the strongest effect; but at last it totally destroyed them. Water impregnated with putrid animal and vegetable substances did more effectually promote the growth of its plants than any other solution; and in every stage of the process appeared to be salutary.”

With regard to other saline substances there are not

many experiments which can be depended upon concerning their qualities as a manure. Mr Anderson relates an experiment made with common salt, the success of which, we apprehend, may justly enough be taken as a specimen of what is to be expected from manures of a similar kind.—He marked out a circle of six feet diameter in the middle of a grass-field, which he distinguished by driving a stake in its centre. All over this circle he strewed common salt, which, about the stake, lay near an inch thick on the ground. In this state he left it to the operations of nature. The grass sprung up as usual, neither better nor worse about the stake than in the rest of the field, and the place where the circle was could be distinguished only by the stake, which was left there for some years.

Upon these experiments we need make very few observations. They are so much in favour of our theory, that they seem made on purpose to confirm it. The fixed alkali employed in Lord Kaimes's experiments would first exert its solvent powers on such heterogeneous substances as it met with among the sand; for no sand can be supposed to be perfectly free of these. As long as it exerted its strength on these only, the plant would thrive, for the reasons we have already mentioned; but, having exhausted the small quantity of substances contained in the sand, it would next attack the plant itself, which consequently would decay and die. The same effects behoved to follow in a greater degree from strong lime-water which contains lime in its caustic state; for this is a more powerful solvent than fixed alkali itself, and would not fail to destroy every thing it touched; nor is it at all improbable that the plant would seem to grow vigorously by the dissolution of part of its own roots, more nourishment being by this means given to those which remained sound.—Volatile alkali is likewise a powerful solvent; but, by reason of its volatility, would exert its caustic power on the plant sooner than either lime, or fixed alkali; and accordingly it seems to have been the most destructive of any thing that was tried. It seems owing to this, that putrid urine at last destroyed the plants whose growth it so long promoted; while water impregnated with other putrid matters which yield no volatile alkali without heat, proved always salutary.

From all this we may draw the following general conclusion, *viz.* That the principal end which a farmer ought to keep in view, is to impregnate his ground as much as possible, with substances which either actually contain putrid matter, or which are in their own nature *septic*, or promoters of putrefaction. To impregnate the air with putrid effluvia is impossible; and though it could be done, would be highly dangerous; for however salutary such effluvia may be to vegetables, nothing can be more fatal to mankind. The putrid substances therefore can only be used by mixing them with the earth; and in whatever manner they can be most perfectly, and in the greatest quantity, mixed with the soil, there the best crops may be expected.

SECT. III. Of the different Soils, and the Manures most proper for each.

ACCORDING to the theory we have just now laid down, the richest soil must be that which contains the least greatest quantity of putrid matter, either animal or vegetable; and such is the earth into which animal and

THEORY.

23
Common salt inefficient as a manure.

24
End to be kept in view by a farmer.

25
Richest soils must at last be improved.

vegeta-

THEORY.

vegetable substances resolve themselves. Was this earth to be had in perfection, it is evident it could not stand in need of manure of any kind, or be in the least enriched by it; for containing an immense quantity of putrid matter, it would freely communicate it to the vegetables planted in it, which would grow in the most luxuriant manner, without requiring any other care than that of keeping them constantly supplied with water. If we suppose the crop left upon the ground to putrefy and mix with the earth as before, the soil will contain the same quantity of putrid matter the second year that it did the first, and be equally prolific: but if the crop is removed to another place, and nothing is brought back to enrich the ground in its stead, it is evident that it will contain less of the true vegetable food the second year than it did the first, and consequently be less prolific. For some time, however, the difference will not be perceptible, and people who are in possession of such ground may imagine that they enjoy a soil which will be perpetually fertile; but long experience has taught us, that the richest soils will at last be exhausted by repeated cropping without manure, as according to our theory they ought to be.

Where the ground has been suffered to remain uncultivated for many ages, producing all that time succulent plants which are easily putrefied, and trees, the leaves of which likewise contribute to enrich the ground by their falling off and mixing with it, the soil will in a manner be totally made up of pure vegetable earth, and be the richest, when cultivated, that can be imagined. This was the case with the lands of America. They had remained uncultivated perhaps since the creation, and were endowed with an extraordinary degree of fertility; nevertheless we are assured by one who went to America in order to purchase lands there, that such grounds as had been long cultivated were so much exhausted, as to be much worse than the generality of cultivated grounds in this country. Here, then, we have

26
One species of poor soil destroyed by lime.

an example of one species of poor soil, namely, one that has been formerly very rich, but has been deprived, by repeated cropping, of the greatest part of the vegetable food it contained. The farmer who is in possession of such ground would no doubt willingly restore it to its former state; the present question is, What must be done in order to obtain this end? We have mentioned several kinds of manures which long practice has recommended as serviceable for improving ground: we shall suppose the farmer tries lime, or chalk; for, as we have already seen, their operations upon the soil must be precisely the same. This substance, being of a septic nature, will act upon such parts of the soil as are not putrified, or but imperfectly so; in consequence of which, the farmer will reap a better crop than formerly. The septic nature of the lime is not altered by any length of time. In ploughing the ground, the lime is more and more perfectly mixed with it, and gradually exerts its power on every putrescible matter it touches. As long as any matter of this kind remains, the farmer will reap good crops: but when the putrescible matter is all exhausted, the ground then becomes perfectly barren; and the caustic qualities of the lime are most unjustly blamed for *burning* the ground, and reducing it to a *caput mortuum*; while it is plain, the lime has only done its office, and made the soil yield all that it was capable of yielding.

THEORY.

27

A species of poor soil meliorated by lime.

When ground has been long uncultivated, producing all the time plants, not succulent, but such as are very difficultly dissolved, and in a manner incapable of putrefaction; there the soil will be excessively barren, and yield very scanty crops, though cultivated with the greatest care. Of this kind are those lands covered with heath, which are found to be the most barren of any, and the most difficultly brought to yield good crops. In this case, lime will be as serviceable as it was detrimental in the other: for, by its septic qualities, it will continually reduce more and more of the soil to a putrid state; and thus there will be a constant succession of better and better crops, by the continued use of lime, when the quantity first laid on has exerted all its force. By a continued use of this manure, the ground will be gradually brought nearer and nearer the nature of garden-mould; and, no doubt, by proper care might be made as good as any; but it will be as great a mistake to imagine, that, by the use of lime, this kind of soil may be rendered perpetually fertile, as to think that the other was naturally so; for though lime enriches this soil, it does so, not by adding vegetable food to it, but by preparing what it already contains; and when all is properly prepared, it must as certainly be exhausted as in the other case.

28
Poor soils how restored.

Here then we have examples of two kinds of *poor* soils, the one of which is totally destroyed, the other greatly improved, by lime, and which therefore require very different manures; lime being more proper for the last than dung; and dung, being more proper to restore an exhausted soil than lime, ought only to be used for the first. Besides dunging land which has been exhausted by long cropping, it is of great service to let it lie fallow for some time; for to this it owed its original fertility, and what gave the fertility originally cannot fail to restore it in some degree.

By attending to the distinction between the reasons for the poverty of the two soils just now mentioned, we will always be able to judge with certainty in what cases lime is to be used, and when dung is proper. The mere poverty of a soil is not a criterion whereby we can judge; we must consider what hath made it poor. If it is naturally so, we may almost infallibly conclude that it will become better by being manured with lime. If it is *artificially* poor, or exhausted by continual cropping, we may be as certain that lime will entirely destroy it.—We apprehend that it is this *natural* kind of poverty only which Mr Anderson says, in his *Essays on Agriculture*, may be remedied by lime; for we can scarce think that experience would direct any person to put lime upon land already exhausted. His words are,

“Calcareous matters act as powerfully upon land that is naturally poor, as upon land that is more richly impregnated with those substances that tend to produce a luxuriant vegetation.”

29
Mr Anderson's opinion concerning lime.

“Writers on agriculture have long been in the custom of dividing manures into two classes, *viz.* *Enriching* manures, or those that tended directly to render the soil more prolific, however sterile it may be; among the foremost of which was dung: *Exciting* manures, or those that were supposed to have a tendency to render the soil more prolific, merely by acting upon those enriching manures that had been formerly in the soil, and giving them a new stimulus, so as to enable them to operate anew upon that soil which they had formerly fertilized.

R 2

fertilized. In which class of stimulating manures, *lime* was always allowed to hold the foremost place."

"In consequence of this theory, it would follow, that lime could only be of use as a manure when applied to rich soils,—and, when applied to poor soils, would produce hardly any, or even perhaps hurtful, effects."

"I will frankly acknowledge that I myself was so far imposed upon by the beauty of this theory, as to be hurried along with the general current of mankind, in the firm persuasion of the truth of this observation, and for many years did not sufficiently advert to those facts that were daily occurring to contradict this theory.—I am now, however, firmly convinced, from repeated observations, that lime, and other calcareous manures, produce a much greater *proportional* improvement upon poor soils, than on such as are richer.—And that lime alone, upon a poor soil, will, in many cases, produce a much greater and more lasting degree of fertility than dung alone."

Thus far Mr Anderson's experience is exactly conformable to the theory we have laid down, and what ought to happen according to our principles. He mentions, however, some facts which seem very strongly to militate against it; and indeed he himself seems to proceed upon a theory altogether different.

30
Query concerning the nature of a proper foil.

"Calcareous matter alone" (says he) "is not capable of rearing plants to perfection;—mould is necessary to be mixed with it in certain proportions, before it can form a proper foil. It remains, however, to be determined what is the due proportion of these ingredients for forming a proper foil."

"We know that neither chalk, nor marle, nor lime, can be made to nourish plants alone; and soils are sometimes found that abound with the two first of these to a faulty degree. But the proportion of calcareous matter in these is so much larger than could ever be produced by art, where the soil was naturally destitute of these substances, that there seems to be no danger of erring on that side. Probably it would be much easier to correct the defects of those soils in which calcareous matters super-abound, by driving earth upon them as a manure, than is generally imagined; as a very small proportion of it sometimes affords a very perfect foil. I shall illustrate my meaning by a few examples."

31
Examples of soil perpetually fertile.

"Near Sandhede, in the county of Caithness, there is a pretty extensive plain on the sea-coast, endowed with a most luxuriant degree of fertility. In all seasons it produces a most luxuriant herbage, altho' it never got any manure since the creation; and has been, for time immemorial, subjected to the following course of crops."

"1. Bear, after once ploughing from grafs, usually a good crop."

"2. Bear, after once ploughing, a better crop than the first."

"3. Bear, after once ploughing, a crop equal to the first."

"4. 5. and 6. Natural-grafs, as clove and rich as could be imagined, might be cut, if the possessor so inclined, and would yield an extraordinary crop of hay each year."

"After this the same course of cropping is renewed. The soil that admits of this singular mode of farming, appears to be a pure incoherent sand, destitute of the smallest particle of vegetable mould; but, upon examination, it is found to consist almost entirely of broken

shells: the fine mould here bears such a small proportion to the calcareous matter, as to be scarce perceptible, and yet it forms the most fertile foil that ever I yet met with."

"I have seen many other links (downs) upon the sea-shore, which produced the most luxuriant herbage, and the closest and sweetest pile of grafs, where they consisted of shelly sand, which, without doubt, derive their extraordinary fertility from that cause."

"A very remarkable plain is found in the island of *Jir-ey*, one of the Hebrides. It has been long employed as a common; so that it has never been disturbed by the plough, and affords annually the most luxuriant crop of herbage, consisting of white clover, and other valuable pasture-grasses, that can be met with any where. The soil consists of a very pure shelly sand."

"From these examples I think it is evident, that a very small proportion of vegetable mould is sufficient to render calcareous matter a very rich foil. Perhaps, however, a larger proportion may be necessary when it is mixed with clay than with sand; as poor chalky soils seem to be of the nature of that composition."

To these examples brought by Mr Anderson, we may add some of the same kind mentioned by Lord Kaimes. His Lordship having endeavoured to establish the theory of water being the only food of plants, tho' he himself frequently deviates from that theory, yet thinks it possible, upon such a principle, to make a foil perpetually fertile.

"To recruit," (says he,) "with vegetable food, a foil impoverished by cropping, has hitherto been held the only object of agriculture. But here opens a grander object, worthy to employ our keenest industry, that of making a foil perpetually fertile. Such soils actually exist; and why should it be thought, that imitation here is above the reach of art? Many are the instances of nature being imitated with success. Let us not despair, while any hope remains; for invention never was exercised upon a subject of greater utility. The attempt may suggest proper experiments: it may open new views: and if we fail in equalling nature, may we not, however, hope to approach it? A foil perpetually fertile must be endowed with a power to retain moisture sufficient for its plants; and at the same time must be of a nature that does not harden by moisture. Calcareous earth promises to answer both ends: it prevents a foil from being hardened by water; and it may probably also invigorate its retentive quality. A field that got a sufficient dose of clay-marle, carried above 30 successive rich crops, without either dung or fallow. Doth not a foil so meliorated draw near to one perpetually fertile? Near the east side of Fife, the coast for a mile inward is covered with sea-fand, a foot deep or so; which is extremely fertile, by a mixture of sea-shells reduced to powder by attrition. The powdered shells, being the same with shell-marle, make the sand retentive of moisture; and yet no quantity of moisture will unite the sand into a solid body. A foil so mixed, seems to be not far distant from one perpetually fertile. These, it is true, are but faint essays; but what will not perseverance accomplish in a good cause?"

Having thus, in a manner, positively determined, with Mr Anderson, that no dose of calcareous matter can possibly be too great, we cannot help owning ourselves

THEORY.

THEORY.

³²
Inconsistency in Lord Kaimes's theory.

selfes surpris'd on finding his Lordship expressing himself as follows.

"An over-dose of shell-marle, laid perhaps an inch, and an inch and a half, or two inches thick, produces, for a time, large crops: but, at last, it renders the soil a *caput mortuum*, capable of neither corn nor grass; of which there are too many instances in Scotland: the same probably would follow from an over-dose of clay-marle, stone-marle, or pounded lime-stone."—To account for this, he is obliged to make a supposition directly contrary to his former one; namely, that calcareous matter renders the soil *incapable* of retaining water. This phenomenon, however, we think is solved upon the principles above laid down, in a satisfactory manner, and without the least inconsistency.

³³
Perpetual fertility of soils chimerical.

As to rendering soils perpetually fertile, we cannot help thinking the attempt altogether chimerical and vain. There is not one example in nature of a soil perpetually fertile, where it has no supply but from the air, and the rain which falls upon it. The above recited examples can by no means be admitted as proofs of perpetual fertility. We know, that the grass on the banks of a river is much more luxuriant than what grows at a distance: the reason is, that the water is attracted by the earth, and communicates its fertilizing qualities to it; but was the river to be dried up, the grass would soon become like the rest. Why should not the ocean have the same power of fertilizing plains near its shores, that rivers have of fertilizing small spots near their banks? We see, however, that it hath not; for the sea-shores are generally sandy and barren. The reason of this is, that the waters of the ocean contain a quantity of loose acid;* and this acid is poisonous to plants; but, abstracting this acid part, we hesitate not to affirm, that sea-water is more fertilizing than river-water. It is impossible to know how far the waters of the ocean penetrate under ground, through a sandy soil. Where they meet with nothing to absorb their acid, there the ground is quite barren: but, in passing through an immense quantity of broken shells, the calcareous matter, we are very certain, will absorb all the acid; and thus the soil will be continually benefited by its vicinity to the ocean. All the above fields, therefore, are evidently supplied with nourishment from the ocean: for, if the salt-water has sufficient efficacy to render fields which are in its neighbourhood barren, why should it not render them fertile when the cause of barrenness is removed from its waters?

After all, the field in Caithness, mentioned by Mr Anderson, seems to have been perpetually fertile only in grass: for though, the second year, it carried a better crop of bear than it did the first; yet, the third year, the crop was worse than the second, and only equal to the first. Had it been ploughed a fourth time, the crop would probably have been worse than the first. Ground is not near so much exhausted by grass as corn, even though the crop be cut, and carried off; and still less, if it only feeds cattle, and is manured by their dung; which appears to have been the case with this field. Lord Kaimes, indeed, mentions fields in Scotland, that, past memory, have carried successive crops of wheat, pease, barley, oats, without a fallow, and without a manure; and particularizes one on the river Carron, of nine or ten acres, which had carried 103 crops of oats without intermission, and without manure: but as we

are not acquainted with any such fields, nor know any thing about their particular situation, we can form no judgment concerning them.

Besides the two kinds of soils abovementioned, there are others, the principal ingredient of which is clay, or sand. The first of these is apt to be hardened by the heat of the sun, so that the vegetables can scarce penetrate it in such a manner as to receive proper nourishment. The second, if it is not situated so as to receive a great deal of moisture, is very apt to be parched up in summer, and the crop destroyed; nor has it sufficient adhesion to support plants that have few roots and grow high. From these opposite qualities, it is evident, that these two soils would be a proper manure for one another; the clay would give a sufficient degree of firmness to the sand, and the sand would break the too great tenacity of the clay. According to Dr Home's experiments, however, sand is the worst manure for clay that can be used. He recommends marle most. To reduce clay-ground as near as possible to the form of pure vegetable mould, it must first be pulverized. This is most effectually performed by ploughing and harrowing; but care must be taken not to plough it whilst too wet, otherwise it will concrete into hard clots, which can scarcely be broken. After it is pulverized, however, some means must be taken to keep it from concreting again into the same hard masses as before. According to Lord Kaimes, though clay, after pulverization, will concrete into as hard a mass as before, if mixed with water; yet if moistened with dung-hill juice, it will not concrete any more. Lime also breaks its tenacity, and is very useful as a manure for this kind of soil.

The conclusion we wish the practical farmer to draw from our theory is, That there is a certain limit to the fertility of the earth, both as to duration, and to degree, at any particular time: that the nearer any soil approaches to the nature of pure garden-mould, the nearer it is to the most perfect degree of fertility; but that there are no hopes of keeping it perpetually in such a state, or in any degree of approximation to it, but by constant and regular manuring with dung. Lime, chalk, marle, &c. may be proper to bring it near to this state, but are absolutely unfit to keep it continually so. They may indeed for several years produce large crops; but the more they increase the fertility for some years, the sooner will they bring on an absolute barrenness; while regular manuring with plenty of dung, will always ensure the keeping up the soil in good condition, without any occasion for fallow. What we have said concerning the use of lime, &c. applies likewise to the practice of frequent ploughing, though in a less degree. This tends to meliorate ground that is naturally poor, by giving an opportunity to the vegetable parts to putrefy; but, when that is done, it tends to exhaust, though not so much as lime. A judicious farmer will constantly strive to keep his lands always in good condition, rather than to make them suddenly much better; lest a few years should convince him that he was in reality doing almost irreparable mischief, while he fancied himself making improvements. As for the ridiculous notions of stimulating the ground by saline manures, we hope they will never enter the brain of any rational practitioner of agriculture.

Fertility of the earth limited.

SECT. IV. *Of the different kinds of Vegetables proper to be raised with a view to the Melioration of Soil.*

³⁶
Soil pulverized by certain vegetables.

THE methods of meliorating soils, which we have mentioned above, consisting of tedious and laborious operations that yield no return at first, it is natural for a farmer to wish for some method of meliorating his ground, and reaping crops at the same time. One very considerable step towards the melioration of ground, is its pulverisation. This is accomplished by repeated ploughings, as already mentioned; especially if performed in autumn, that the ground may be exposed to the winter's frost; but these ploughings yield no crop, as long as the field is not sown. By planting in the field, however, those vegetables whose roots swell to a considerable bulk, the ground must constantly be acted upon by the swelling of their roots in all directions; and thus the growing of the crop itself, may be equal, or superior, in efficacy to several ploughings, at the same time that the farmer enjoys the benefit of it. The plant most remarkable for the swelling of its roots, is the potatoe; and by none is the ground meliorated more, or even so much. They are not, however, equally proper for all soils. In clay they do not thrive, nor are palatable; but in hard gravelly or sandy soils, they grow to a large size, and are of an excellent quality. Turneps likewise contribute to meliorate the ground, by the swelling of their roots, though not so much as potatoes. They have this advantage, however, that they will thrive in almost any soil. In clay ground, pease and beans thrive exceedingly well, and therefore are proper in this kind of soil as a preparatory for other kinds of grain. These push their roots deep into the ground, and cover it with their leaves more than other crops; so that the sun has not so much access, as when it is covered with other kinds of grain. Where-ever any of these kinds of vegetables are raised, it is observable that more or less blackness is communicated to the soil: an evident sign of its melioration; this being the colour of the true vegetable mould, or *lumpy soil*, as it is called.

Besides the above-mentioned plants, carrots, parsnips, cabbages, and all those vegetables which sink their roots deep in the ground, answer the same purpose of loosening and pulverizing the earth; but as they will not thrive but on ground already well cultivated, they cannot be raised to any advantage for the purpose of meliorating a poor soil.

It hath been customary in many places, particularly in England, to sow turnip, pease, buck-wheat, &c. and then to plough them down for manuring the land.— This, being similar to that operation of nature by which she renders the uncultivated soils so exceedingly fertile, cannot fail of being attended with singular advantages; and might be looked upon as preferable even to driving dung on the land to fatten it, was it not attended with the entire loss of a crop for that year.

SECT. V. *Of destroying Weeds.*

WHAT we have already said regarding the cultivation of the soil, respects only the fitting it for producing all kinds of vegetables indiscriminately. Experience, however, shews, that the ground is naturally much more disposed to produce and nourish some kinds of vegetables than others; and those which the earth

seems most to delight in, are commonly such as are of very little use to man; but if neglected, will increase to such a degree as entirely to destroy the plants intended to be raised, or at least hinder them from coming to perfection, by depriving them of nourishment. The clearing the ground of weeds, therefore, is an article no less necessary in agriculture, than the disposing it to produce vegetables of any kind in plenty.

The weeds may be divided, according to the time of their duration, into *annual*, or such as spring from a seed, and die the same year; and *perennial*, that is, such as are propagated by the roots, and last for a number of years. The first kind are the least noxious, and most easily destroyed. For this purpose it will be sufficient to let them spring up till near the time of ripening their seed, and then plough them down before it comes to maturity. It is also of service to destroy such weeds as grow in borders, or neglected corners, and frequently scatter their seeds to a great distance; such as the thistle, dandelion, rag-weed, &c. for these are sufficient to propagate their species through a deal of ground; as their seeds are carried about with the wind to very considerable distances. A farmer ought also to take care, that the small seeds of weeds, separated from corn in winnowing, be not sown again upon the ground; for this certainly happens, when they are thrown upon a dunghill; because, being the natural offspring of the earth, they are not easily destroyed. The best method of preventing any mischief from this cause, would be to burn them.

Perennial weeds cannot be effectually destroyed, but by removing the roots from the ground, which is often a matter of some difficulty. Many of these roots strike so deep in the ground, that they can scarcely be got out. The only method that can be depended upon in this case, is frequent ploughing, to render the ground as tender as possible; and harrowing with a particular kind of harrow which shall hereafter be described, in order to collect these pernicious roots. When collected, they ought to be dried and burnt, as the only effectual method of insuring their doing no further mischief.

There is a particular species of weed, peculiar only to grass-lands, of a soft spongy nature, called *fog*, which it is found very difficult to exterminate. Where the land can be conveniently tilled, this weed may be destroyed by covering it with a crop of pease, potatoes, &c.: or, passing a heavy roller over the ground will be of great service; for fog owes its origin to too great a laxity of the soil, and will not grow upon firm ground.

Besides these kinds of weeds which are of an herbaceous nature, there are others which are woody, and grow to a very considerable size; such as broom, furze, or whins, and thorns. *Broom* is an evergreen shrub, that thrives best in sandy soil; and there it grows so vigorously, as scarce to admit any grass under it. It propagates by seed which grows in pods; and these, when fully ripe, break with violence, scattering the seeds all around. Thus, a field which is overgrown with broom, besides the old plants, always contains an infinite number of young ones; so that though the old plants die when cut over, a fresh crop constantly springs up. It may, however, be destroyed by frequent ploughing and harrowing, in the same manner as other perennial weeds are; for it does not for some time carry any

³⁷
Weeds divided into annual and perennial.

³⁸
Perennial weeds how destroyed.

³⁹
Broom, furze, &c. how destroyed.

seed,

The *whin* is a fine evergreen shrub, carrying a sweet-smelling flower all the year round. It propagates both by seed, and by its roots, which spread sometimes to the distance of ten or twelve feet; and hence, when once established, it is very difficultly extirpated. The best method is to set fire to the whins in frosty weather; for frost has the effect to wither whins, and make them burn readily. The stumps must then be cut over with a hatchet; and when the ground is well softened by rain, it may be ploughed up, and the roots taken out by a harrow adapted to that purpose.—If the field is soon laid down to grass, the whins will again spring up in great abundance, from the seeds, and small parts of the roots left in the ground. In this case, pasturing with sheep is an effectual remedy; as they are no less fond of young whins than of young broom; and if there are a sufficient number, they will not leave a single plant above ground. But if grass is not immediately wanted, the most effectual method of clearing a field of whins, is by reiterated ploughings.

The *thorn*, or *bramble*, spreads its roots very wide, and at the same time sinks them deep in the earth. Though cut in the winter, it rises, and comes to such perfection as to carry fruit in summer. It can only be extirpated by ploughing up the ground, and collecting the roots.

SECT. VI. Of the most proper kinds of Vegetables to be raised for the purposes of feeding Cattle.

THOUGH this must be an article of the utmost consequence to every farmer, we do not find that it has been much considered. Mr Anderson seems to have been the first writer on agriculture who hath properly attended to this subject; and what he hath wrote upon it is: rather a catalogue of desiderata, than any thing else: and indeed the desiderata on this subject are so many and so great, that we must acknowledge ourselves very unable to fill them up.—To attain to a competent knowledge in this respect, the following things must be taken into consideration. (1.) The wholesomeness of the food for cattle, with regard to health and strength, or fatness. (2.) The quantity that any extent of ground is capable of yielding. (3.) The quantity necessary to feed the different kinds of cattle. (4.) The labour of cultivation; and, (5.) The soil they require to bring them to perfection, and the effect they have upon it.

With regard to the wholesomeness, it is plain, that as the natural food of wild cattle is the green succulent plants they meet with all the year round, food of this kind, could it be had, must be preferable to hay; and accordingly we find that cattle will always prefer succulent vegetables where they can get them. To find plants of this kind, and having proper qualities in other respects, we must search among those which continue green all the year round, or come to their greatest perfection in the winter-time.—Of these, cabbages bid fair for holding the first place; both as being very succulent, and a very large quantity of them growing upon a small space of ground. In Mr Young's Six Months Tour, we have an account of the produce of cabbages in many different places, and on a variety of soils. The produce by Mr Crow at Keplin, on a clay soil, was, on an average of six years, 35 tons per acre; by Mr Smelt at the Leases, on a sandy gravel, 18 tons per acre; by Mr Scroop at Danby, on an average of six years, 37 tons per acre: and the general average of all the accounts giving by Mr Young, is 36 tons per acre.

Cabbages, however, have the great inconvenience of sometimes imparting a disagreeable flavour to the milk of cows fed with them, and even to the flesh of other cattle. This, it is said, may be prevented by carefully picking off the decayed and withered leaves: and very probably this is the case; for no vegetable inclines more to putrefaction than this; and therefore particular care ought to be taken to pull off all the leaves that have any symptoms of decay. Dr Priestley found that air was rendered noxious by a cabbage-leaf remaining in it for one night, though the leaf did not shew any symptom of putrefaction.—For milk-cows, probably the cabbages might be rendered more proper food by boiling them.

Turnips likewise produce very bulky crops, though far inferior to those of cabbages. According to Mr Young's calculation, the finest soil does not produce up above five tons of turnips per acre; which is indeed a very great disproportion: but possibly such a quantity of turnips may not be consumed by cattle as of cabbages; an ox, of 80 stone weight, eat 210 lb of cabbages in 24 hours, besides seven lb. of hay.

Carrots are found to be an excellent food for cattle of all kinds, and are greatly relished by them. In a rich sand, according to Mr Young's account, the produce of this root was 200 bushels per acre. In a finer soil, it was 640 bushels per acre. A lean hog was fattened by carrots in ten days time: he eat 196 lb; and his fat was very fine, white, firm, and did not boil away in the dressing. They were preferred to turnips by the cattle; which having tasted the carrots, soon became so fond of them as difficultly to be made to eat the turnips at all. It is probable, indeed, that carrots will make a more wholesome food for cattle than either cabbages or turnips, as they are strongly antiseptic; inasmuch as to be used in poultices for correcting the fumes of cancers. It is probably owing to this, that the milk of cows fed on carrots is never found to have any bad taste. Six horses kept on them thro' the winter without oats, performed their work as usual, and looked equally well. This may be looked upon as a proof of their salubrity as a food; and it certainly can be no detriment to a farmer to be so much versant in medical matters as to know the impropriety of giving

THEORY.

THEORY.

giving putrescent food to his cattle. It is well known, what a prodigious difference there is in the health of the human species when fed on putrid meats, in comparison of what they enjoy when supplied with food of a contrary nature; and why may there not be a difference in the health of beasts, as well as of men, when in similar circumstances?—It is also very probable, that as carrots are more solid than cabbages or turnips, they will go much farther in feeding cattle than either of them. The above-mentioned example of the hog, seems some kind of confirmation of this; he being fed, for ten days together, with 21 lb lbs weight of carrots, than what an ox devoured of cabbages and hay in one day. There is a great disproportion, it must be owned, between the bulk of an ox, and that of a hog; but we can scarce think that an ox will eat as much at a time as ten hogs. At Parlington in Yorkshire, 20 work horses, four bullocks, and six milk-cows, were fed on the carrots that grew in three acres, from the end of September till the beginning of May; and the animals never tasted any other food but a little hay. The milk was excellent, and thirty hogs were fattened upon what was left by the other cattle.

45
Potatoes.

Potatoes likewise appear to be a very palatable food for all kinds of cattle; and not only oxen, hogs, &c. are easily fed by them, but even poultry. The channels of potatoes compared with other kinds of food for cattle, cannot well be known, as, besides the advantage of the crop, they improve the ground more than any other known vegetable. The quantities of this root required to feed different kinds of cattle are not known, nor how far the food itself is salutary; though it is probable, that as the human species find no detriment from the use of potatoes, neither will cattle of any kind.

The above-mentioned vegetables have all of them the property of meliorating, rather than exhausting the soil; and this is certainly a very valuable qualification: but carrots and cabbages will not thrive except in soils that are already well cultivated; while potatoes and turnips may be used as the first crops of a soil with great advantage. In this respect, they are greatly superior to the others; as it may be disagreeable to take up the best grounds of a farm with plants designed only for food to cattle.

46
Whins an
excellent
food for
horses.

Whins have lately been recommended as a very proper food for cattle, especially horses; and are recommended by Mr Anderson, in a particular manner. They have this advantage, that they require no culture, and grow on the very worst soil; but they are troublesome to cut, and require to be bruised in a mill constructed for this purpose; neither is the ground at all meliorated by letting whins grow upon it for any length of time. Notwithstanding these disadvantages, however, as whins continue green all the year round, and when bruised will afford an excellent succulent food, which seems possessed of strongly invigorating qualities, they may be looked upon as the cheapest winter-food that can possibly be given to cattle.—According to the calculations of Mr Eddison of Gateford, a single acre, well cropped with whins, will winter six horses: at three or four years growth, the whole crop should be taken, cut close to the ground, and carried to the mill; in which the whins are to be bruised, and then given to the horses. Four acres ought to be planted, that one may be used each year, at the proper age to

be cut; and he reckons the labour of one man sufficient for providing food to this number of horses. He says they all prefer the whins to hay, or even to corn.

The herb called *burnet* hath likewise been recommended as proper food for cattle, on account of its being an evergreen, and further recommended, by growing almost as fast in winter as in summer. Of this herb, however, we have very various accounts. In a letter addressed by Sir James Caldwell F. R. S. to the Dublin Society, the culture of this plant is strongly recommended on the authority of one Bartholomew Rocque, farmer at Walham-Green, a village about three miles south-west of London.

What gave occasion to the recommendation of this plant, was, that, about the year 1760, Mr Wych, chairman of the Committee of Agriculture of the London Society, for the encouragement of arts, manufactures, and commerce, came to Rocque (who was become very eminent by the premiums he had received from the society), and told him, he had been thinking, that as there are many animals which subsist wholly upon the fruits of the earth, there must certainly be some plant or herb fit for them, that naturally vegetates in winter; otherwise we must believe the Creator, infinitely wise and good, to have made creatures without providing for their subsistence; and that if there had been no such plants or herbs, many species of animals would have perished before we took them out of the hands of nature, and provided for them dry meat at a season, when, indigenous plants having been indiscriminately excluded, under the name of weeds, from cultivated fields and places set apart for natural grass, green or fresh meat was no longer to be found.

Rocque allowed the force of this reasoning; but said, the knowledge of a grass, or artificial pasture, that would vegetate in winter, and produce green fodder for cattle, was lost; at least, that he knew of no such plant.—Mr Wych, however, knowing how very great the advantage would be of discovering a green fodder for winter, and early in the spring, wrote to Bern, and also to some considerable places in Sweden, stating the same argument, and asking the same question. His answers to these letters were the same that had been given by Rocque. They owned there must be such a plant, but declared they did not know it.

Mr Wych then applied again to Rocque; and desired him to search for the plant so much desired, and so certainly existing. Rocque set about this search with great assiduity, and finding that a pimpernel, called *burnet*, was of very speedy growth, and grew near as fast in winter as in summer, he took a handful of it and carried it into his stable, where there were five horses, every one of which eat of it with the greatest eagerness; snatching it even without first smelling it. Upon the success of this experiment he went to London, and bought all the burnet-feed he could get, amounting to no more than eight pounds, it having been only used in fallads; and he paid for it at the rate of 4 s. a pound. Six of the eight pounds of feed he sowed upon half an acre of ground, in March, in the year 1761, with a quarter of a peck of spring-wheat, both by hand. The feed being very bad, it came up but thin. However, he sowed the other two pounds in the beginning of June, upon about six rood of ground: this he mowed in the beginning of August; and at Michaelmas he planted

47
Burnet.49
Recom-
mended
by
Sir James
Caldwell.

THEORY. off the plants on about 20 rood of ground, giving each plant a foot every way, and taking care not to bury the heart. These plants bore two crops of feed the year following; the first about the middle of June, the second about the middle of September; but the June crop was the best. The year after, it grew very rank, and produced two crops of feed, both very good. As it ought not to be cut after September, he let it stand till the next year; when it sheltered itself, and grew very well during all the winter, except when there was a hard frost; and even during the frost it continued green, though it was not perceived to grow. In the March following it covered the ground very well, and was fit to receive cattle.

If the winter is not remarkably severe, the burnet, though cut in September, will be 18 inches long in March; and it may be fed from the beginning of February till May: if the cattle are taken off in May, there will be a good crop of feed in the beginning of July. Five weeks after the cattle are taken off, it may be removed, if that is preferred to its standing for feed; it grows at the rate of an inch a-day, and is made into hay like other grass. It may be mown three times in one summer, and should be cut just before it begins to flower. Six rood of ground has produced 1150 pounds at the first cutting of the third year after it was sowed; and, in autumn 1763, Rocque sold no less than 300 bushels of the feed.

According to Rocque, the soil in which burnet flourishes best is a dry gravel; the longest drought never hurts it: and Sir James Caldwell asserts, that he saw a very vigorous and exuberant plant of this kind, growing from between two bricks in a wall in Rocque's ground, without any communication with the soil; for he had cut away all the fibres of the root that had stretched downward, and penetrated the earth, long before.

Burnet was found equally fit for feeding cows, sheep, and horses; but the sheep must not be suffered to crop it too close. Though no feed was left among the hay, yet it proved nourishing food; and Rocque kept a horse upon nothing else, who, at the time of writing the account, was in good heart, and looked well. He affirmed also, that it cured horses of the distemper called the *grease*, and that by its means he cured one which was thought incurable; but says it is only the first crop which has this effect.

This is the substance of Sir James Caldwell's letter to the Dublin society, at least as to what regards the culture of burnet; and it might reasonably be expected, that a plant, whose use was recommended to the public with so much parade, would soon have come into universal esteem. We were surprised, therefore, on looking into Mr Miller's Dictionary, to find the following words, under the article *Pterium*:—"This plant has of late been recommended by *persons of little skill*, to be sown as a winter pabulum for cattle: but whoever will give themselves the trouble to examine the grounds where it naturally grows, will find the plants left uneaten by the cattle, when the grass about them has been cropped to the roots; besides, in wet winters, and in strong land, the plants are of short duration, and therefore very unfit for that purpose: nor is the produce sufficient to tempt any person of skill to engage in its culture; therefore I wish those persons to make trial of it in small quantities, before they embark largely in

Vol. I.

these new schemes."—Mr Anderson, too, in his *Essays on Agriculture*, mentions the produce of burnet being so small, as not to be worth cultivating.

Upon the authority of Mr Rocque, likewise, the white beet is recommended as a most excellent food for cows; that it vegetates during the whole winter, consequently is very forward in the spring; and that the most profitable way of feeding cows is, to mow this herb, and give it to them green all the summer. It grew in Rocque's garden, during a very great drought, no less than four feet high, from the 30th of May to the 3^d of July; which is no more than one month and four days. In summer it grows more than an inch a-day, and is best sown in March: a bushel is enough for an acre, and will not cost more than 10 shillings. It thrives best in a rich, deep, light soil: the stalks are very thick and succulent; the cows should therefore eat them green.

In Mr Anderson's essays, we find it recommended to make trial of some kinds of grasses, which probably would not only answer for fresh fodder during the winter, but might also be cut for hay in summer. This is particularly the case with that species called *sheep's fescue-grass*. "I had," (says he) "a small patch of this grass in winter 1773; which, having been cut in the month of August or September preceding, was saved from that period, and had advanced before winter to the length of five or six inches; forming the closest pile that could be imagined. And although we had about six weeks of very intense frost, with snow; and about other six weeks, immediately succeeding that, of exceeding keen frost every night, with frequent thaws in the day-time without any snow, during which time almost every green thing was destroyed; yet this little patch continued all along to retain as fine a verdure as any meadow in the month of May; hardly a point of a leaf having been withered by the uncommon severity of the weather. And as this grass begins to vegetate very early in the spring, I leave the reader to judge what might be the value of a field of grass of this kind in these circumstances."

Of another kind of grass, called *purple fescue*, Mr Anderson gives the following character. "It retained its verdure much better than rye-grass during the winter-season; but it had more of its points killed by the weather than the former. It likewise rises in the spring, at least as early as rye-grass."

This ingenious farmer has also made experiments on the culture of these and several other kinds of grasses; which being very well worthy of attention, we shall here insert.

1. *Purple fescue-grass*. "Although this grass is very often found in old pastures, yet as it has but few flower-stalks, and as it is greedily eat by all domestic animals, these are seldom suffered to appear; so that it usually remains there unperceived. But it seems to be better able to endure the peculiar acrimony of the dung of dogs than almost any other plant; and is therefore often to be met with in *dog-hills*, as I call the little hills by road-sides where dogs usually piss and dung: and as it is allowed to grow there undisturbed, the farmer may have an opportunity of examining the plant, and becoming acquainted with its appearance.

"The leaves are long and small, and appear to be roundish, something like a wire; but, upon examination,

49

52
Purple fescue.

THEORY. tion, they are found not to be tubulated like a reed or rush; the sides of the leaf being only folded together from the middle rib, exactly like the strong bent-grafs on the sea-shore. The flower-stalk is small, and branches out in the head, a little resembling the wild-oat; only the grains are much smaller, and the ear does not spread full open, but lies bending a little to one side. The stalks are often spotted with reddish freckles, and the tops of the roots are usually tinged with the same colour; from whence it has probably obtained its distinctive name of *festuca rubra*, or red (purple) *festuca*.

"It is often to be met with in old garden-walks; and, as its leaves advance very quickly after cuttings, it may usually be discovered above the other grasses, about a week or fortnight after the walks are cut. Nor do they seem to advance only at one season, and then stop and decay, like the rye-grafs; but continue to advance during the whole of the summer, even where they are not cut; so that they sometimes attain a very great length. Last season, (1774,) I measured a leaf of this grass, that sprung up in a neglected corner, which was four feet and four inches in length, although not thicker than a small wire. It is unnecessary to add, that these leaves naturally trail upon the ground, unless where they meet with some accidental support; and that if any quantity of it is suffered to grow for a whole season, without being cut down or cut, the roots of the leaves are almost rotted, by the overshadowing of the tops of the other leaves, before the end of the season.

53
Appearance
in its culti-
vated state.

"This is the appearance and condition of the plant in its native situation: as it is seldom that it is discovered but in pretty old pastures, and as in that state it carries only a very few feed-stalks, it was with some difficulty that I could collect a small handful of the seed, which I carefully sowed in a small patch of garden-mould, to try if it could be easily cultivated. It came up as quickly as any other kind of grass, but was at first as small as hairs: the leaves, however, advanced apace; and were, before autumn, when the grain with which they had been sowed was cut down, about 16 or 18 inches in length: but having been sown very thin, it was necessary to pick out some other kinds of grass that came up amongst it, lest it might have been choked by them. Early next spring it advanced with prodigious vigour, and the tufts that were formed from every seed became exceeding large; so that it quickly filled the whole ground. But now the leaves were almost as broad as those of common rye-grass, and the two sides only inclined a little towards one another from the mid-rib, without any appearance of roundness. In due time a great many feed-stalks sprung out, which attained very nearly to the height of four feet, and produced feeds in abundance; which may be as easily sowed as those of common rye-grass.

"The prodigious difference between this plant in its native and cultivated state amazed me; but it was with a good deal of satisfaction that I found there would be no difficulty of procuring feeds from it, which I had much doubted of at first. It would seem, that nature hath endowed this plant with a strong generative power during its youth, which it gradually loses as it advances in age, (for the difference perceived in this case could not be attributed to the richness of the soil); and that, on the contrary, when it was old, the leaves advanced with an additional vigour, in proportion to

the declining strength of the flower-stalks: for the leaves of the young plant seldom exceed two feet, whereas numbers of the old leaves were near four feet in length.

"From these peculiarities in the growth of this plant, it would seem to promise to be of great use to the farmer; as he could reap from a field of it, for the first two or three years, as great a weight of hay as he could obtain from any of the culmiferous grasses, (those bearing a long jointed stalk); and, if he meant afterwards to pasture it, he would suffer no inconveniences from the flower-stalks; and the succulent leaves that continue to vegetate during the whole summer, would at all times furnish his cattle with abundance of wholesome food. It has also been remarked, that this grass rises as early in the spring as rye-grass; and continues green for the greatest part of winter, which the other does not. It is moreover an abiding plant, as it seems never to wear out of the ground where it has once been established. On all which accounts, it appears to me highly to merit the attention of the farmer; and well deserves to have its several qualities, and the culture that best agrees with it, ascertained by accurate experiments.

2. "*Sheeps festuca-grass*, or *festuca ovina*, is much praised by the Swedish naturalists for its singular value as a pasture-grass for sheep; this animal being represented as fonder of it than of any other grass, and fattening upon it more quickly than on any other kind of food whatever. And indeed, the general appearance of the plant, and its peculiar manner of growth, seems very much to favour the accounts that have been given of it.

54
Sheeps festuca described.

"This plant is of the same family with the former, and agrees with it in several respects; although they may be easily distinguished from one another. Its leaves, like the former, in its natural state, are always rounded, but much smaller; being little bigger than large horse-hairs, or swines-bristles, and seldom exceed six or seven inches in length. But these spring out of the root in tufts, so close upon one another, that they resemble, in this respect, a close hair-brush more than any thing else I know: so that it would seem naturally adapted to form that thick short pile of grass in which sheep are known chiefly to delight. Its flower-stalks are numerous, and sometimes attain the height of two feet; but are more usually about 12 or 15 inches high.

"Upon gathering the seeds of this plant, and sowing them as the former, it was found that they sprung up as quickly as any other kind of grass; but the leaves are at first no bigger than a human hair. From each side springs up one or two of these hair-like filaments, that in a short time send out new off-sets, so as quickly to form a sort of tuft, which grows larger and larger, till it at length attains a very large size, or till all the intervals are closed up, and then it forms the closest pile of grass that it is possible to imagine. In April and May it pushed forth an innumerable quantity of flower-stalks, that afforded an immense quantity of hay; it being so close throughout, that the scythe could scarcely penetrate it. This was allowed to stand till the seeds ripened; but the bottom of the stalks were quite blanched, and almost rotted for want of air before that time.

55
Its appearance when cultivated.

"This was the appearance that it made the first year after

THEORY.

after it was sowed: but I have reason to think, that, after a few years, it likewise produces fewer seed-stalks, and a greater quantity of leaves than at first. But however that may be, it is certain, that if these are eat down in the spring, it does not, like rye-grass, persist in a continued tendency to run to seed; but is at once determined to push forth a quantity of leaves without almost any stalks at all: and as all domestic animals, but more especially sheep, are extremely fond of this grass, if they have liberty to pasture where it grows, they bite it so close as never to suffer almost a single seed-stalk to escape them; so that the botanist will often search in vain for it, when he is treading upon it with his feet. The best way to discover it in any pasture, is to search for it in winter, when the tufts of it may be easily distinguished from every other kind of grass, by their extraordinary closeness, and the deep green colour of the leaves.

56
What soil
most proper

“It seems to grow in almost any soil; altho’ it is imagined that it would flourish best in a light sandy soil, as it can evidently live with less moisture than almost any other kind of grass; being often seen to remain in the fods that have been employed in coping for stone-dykes, after all the other grasses that grew in them have disappeared. It is likewise found in poor barren soils, where hardly any other plant can be made to grow at all; and on the surface of dry worn-out peat-moss, where no moisture remains sufficient to support any other plant whatever: but in neither of these situations does it thrive; as it is there only a weak and unfightly plant, very unlike what it is when it has the good fortune to be established upon a good soil; although it is seldom met with in this last state than in the former.

“I will not here repeat what has been already said about the particular property that this plant possesses of continuing all winter; nor point out the benefits that the farmer may reap from this valuable quality.—He need not, however, expect to find any verdure in winter on such plants as grow upon the loose mossy soil above-mentioned; for, as the frost in winter always hoves up the surface of this soil, the roots of the plants are so lacerated thereby, as to make it, for some time in the spring, to all appearance dead. Nor will he often perceive much verdure in winter upon those plants that grow upon poor hungry soils, which cannot afford abundant nourishment to keep them in a proper state of vegetation at all times: but such plants as grow on earthen dykes, which usually begin to vegetate with vigour when the autumnal rains come on, for the most part retain their verdure at that season almost as well as if they were in good garden-mould.

“I have been very particular in regard to this plant; because, in as far as my observations have yet gone, it promises on many accounts to make a most valuable acquisition to the farmer, and therefore justly demands a very particular share of his attention.”

57
Holcus lanatus.

3. The *holcus lanatus*, or creeping soft-grass of Hudson.—This is considered by our author as one of the most valuable kinds of meadow-grasses; its pile being exceedingly close, soft, and succulent. It delights much in moisture, and is seldom found on dry ground, unless the soil is exceeding rich. It is often found on those patches near springs, over which the water frequently flows; and may be known by the uncommon softness and succulence of the blade, the lively light

green colour of the leaves, and the matted intertexture of its roots. But, notwithstanding the softness of its first leaves, when the seed-stalks advance, they are rough to the touch, so that the plant then assumes a very different appearance from what we would have expected. The ear is branched out into a great number of fine ramifications somewhat like the oat, but much smaller.—This kind of grass, however, would not be easily cultivated, on account of a kind of soft membrane that makes the seeds adhere to the stalk, and to one another, after they are separated from it, as if they were intermixed with cobweb, so that it is difficult to get them separated from the stalk, or to spread readily in sowing. It spreads, however, so fast by its running roots, that a small quantity sowed very thin, would be sufficient to stock a large field in a short time.

These are the kinds of grasses, properly so called, which have not as yet been cultivated, that Mr Anderson thinks the most likely to be of value; but, besides these, he recommends the following, of the pea-tribe.

1. *Milk-vetch, liquorice-vetch, or milkwort.* This plant, in some respects, very much resembles the common white clover; from the top of the root a great number of shoots come out in the spring, spreading along the surface of the ground every way around it; from which arise a great many clusters of bright yellow flowers, exactly resembling those of the common broom. These are succeeded by hard round pods, filled with small kidney-shaped seeds. From a supposed resemblance of a cluster of these pods to the fingers of an open hand, the plant has been sometimes called *ladies-fingers*. By others it is called *crow-toes*, from a fancied resemblance of the pods to the toes of a bird. Others, from the appearance of the blossom, and the part where the plant is found, have called it *seal*, improperly *fell-broom*. It is found plentifully almost every where in old grass-fields; but as every species of domestic animal eats it, almost in preference to any other plant, it is seldom allowed to come to the flower in pasture-grounds, unless where they have been accidentally saved from the cattle for some time; so that it is only about the borders of corn-fields, or the sides of inclosures to which cattle have not access, that we have an opportunity of observing it. As it has been imagined that the cows which feed on these pastures, where this plant abounds, yield a quantity of rich milk, the plant has, from that circumstance, obtained its most proper English name of *milk-vetch*.

One of the greatest recommendations of this plant is, that it grows in poor barren ground, where almost no other plant can live. It has been observed in ground so poor, that even heath, or ling, (*Erica Communis*) would scarcely grow; and upon bare obdurate clays, where no other plant could be made to vegetate; inasmuch that the surface remained entirely uncovered, unless where a plant of this kind chanced to be established; yet even in these unfavourable circumstances, it flourished with an uncommon degree of luxuriance, and yielded as tender and succulent, though not such abundant shoots, as if reared in the richest manured fields. In dry, barren sands also, where almost no other plant could be made to live, it has been found to send out such a number of healthy shoots all round, as to cover the earth with the closest and most beautiful

58
Milk-vetch.

59

carpet

THEORY. carpet that can be desired.

The stalks of the milk-vetch are weak and slender, so that they spread upon the surface of the ground, unless they are supported by some other vegetable. In ordinary soils they do not grow to a great length, nor produce many flowers; but in richer fields the stalks grow to a much greater length, branch out a good deal, but carry few or no flowers or seeds. From these qualities our author did not attempt at first to cultivate it with any other view than that of pasture; and, with this intention, sowed it with his ordinary hay-seeds, expecting no material benefit from it till he desisted from cutting his field. In this, however, he was agreeably disappointed; the milk-vetch growing, the first season, as tall as his great clover, and forming exceeding fine hay; being scarce distinguishable from lucerne, but by the slenderness of the stalk, and proportional smallness of the leaf.

Another recommendation to this plant is, that it is perennial. It is several years after it is sowed before it attains to its full perfection; but, when once established, it probably remains for a great number of years in full vigour, and produces annually a great quantity of fodder. In autumn 1773, Mr Anderson cut the stalk from an old plant that grew on a very indifferent soil; and after having thoroughly dried it, he found that it weighed 14 ounces and an half.

The stalks of this plant die down entirely in winter, and do not come up in the spring till the same time that clover begins to advance; nor does it advance very fast, even in summer, when once cut down or cut over: so that it seems much inferior to the above-mentioned grasses; but might be of use to cover the worst parts of a farm, on which no other vegetable could thrive.

⁶²
Yellow
vetchling.

2. The common yellow vetchling, *latyrus pratensis*, or *everlasting tare*, grows with great luxuriance in stiff clay soils, and continues to yield annually a great weight of fodder, of the very best quality, for any length of time. This is equally fit for pasture, or hay; and grows with equal vigour in the end of summer, as in the beginning of it; so would admit being pastured upon in the spring, till the middle, or even the end of May, without endangering the loss of the crop of hay. This is an advantage which no other plant except clover possesses; but clover is equally unfit for early pasture, or for hay. Sain-foin is the only plant whose qualities approach to it in this respect, and the yellow vetchling will grow in such soils as are utterly unfit for producing sain-foin.—It is also a perennial plant; and increases so fast by its running roots, that a small quantity of the seed would produce a sufficient number of plants to fill a whole field in a very short time. If a small patch of good ground is sowed with the seeds of this plant in rows, about a foot distance from one another, and the intervals kept clear of weeds for that season, the roots will spread so much as to fill up the whole patch next year; when the stalks may be cut for green fodder or hay. And if that patch were dug over in the spring following, and the roots taken out, it would furnish a great quantity of plants, which might be planted at two or three feet distance from one another, where they would probably overpread the whole field in a short time.

⁶³
Blue tare.

3. The common blue tare, seems more likely than

the former to produce a more nourishing kind of hay, as it abounds much more in feeds; but as the stalks come up more thickly from the root, and branch more above, it does not appear to be so well adapted for a pasture-grass as the other. The leaves of this plant are much smaller, and more divided, than those of the other; the stalks are likewise smaller, and grow to a much greater length. Though it produces a great quantity of feeds, yet the small birds are so fond of them, that, unless the field was carefully guarded, few of them would be allowed to ripen.

4. The *vicia sepium*, purple *everlasting*, or *buff-vetch*. Our author gives the preference to this plant beyond all others of the same tribe for pasture. The roots of it spread on every side a little below the surface of the ground, from which, in the spring, many stems arise quite close by one another; and as these have a broad tufted top covered with many leaves, it forms as close a pile as could be desired. It grows very quickly after being cut or cropt, but does not arrive at any great height; so that it seems more proper for pasture than making hay; altho', upon a good soil, it will grow sufficiently high for that purpose; but the stalks grow so close upon one another, that there is great danger of having it rotted at the root, if the season should prove damp. It seems to thrive best in a clay soil.

Besides these, there are a variety of others of the same class, which he thinks might be useful to the farmer. The common garden *everlasting* pea, cultivated as a flowering plant, he conjectures, would yield a prodigious weight of hay upon an acre; as it grows to the height of ten or twelve feet, having very strong stalks, that could support themselves without rotting, till they attained a great height.

One other plant, hitherto unnoticed, is recommended by our author to the attention of the farmer; it is the common *yarrow*, *achillea millefolium*, or hundred-leaved grass. Concerning this plant, he remarks, that, in almost every fine old pasture, a great proportion of the growing vegetables with which the field is covered, consists of it; but the animals which feed there are so fond of the yarrow, as never to allow one feed-stalk of it to come to perfection. Hence these feed-stalks are never found but in neglected corners, or by the sides of roads; and are so disagreeable to cattle, that they are never tasted; and thus it has been erroneously thought that the whole plant was refused by them.—The leaves of this plant have a great tendency to grow very thick upon one another, and are therefore peculiarly adapted for pasture. It arrives at its greatest perfection in rich fields that are naturally fit for producing a large and succulent crop of grass. It grows also upon clays; and is among the first plants that strike root in any barren clay, that has been lately dug from any considerable depth; so that this plant, and thistles, are usually the first that appear on the banks of deep ditches formed in a clayey soil. All animals delight to eat it; but, from the dry aromatic taste it possesses, it would seem peculiarly favourable to the constitution of sheep. It seems altogether unfit for hay.

Besides these plants, which are natives of our own country, there are others, which, though natives of a foreign climate, are found to thrive very well in Britain; and have been raised with such success by individuals, as highly to merit the attention of every farmer.

⁶²
Buff-vetch.

⁶³
Everlasting
pea.

⁶⁴
Achillea
millefolium.

⁶⁵
Lucerne.

THEORY. mer. Among these the first place is claimed by lucerne.

This plant hath a perennial root, and annual stalks, which, in good soil, rise to three feet; or sometimes more in height; but for a particular description of the whole plant, see the article *MEDICA*. All sorts of domestic cattle are fond of this plant, especially when allowed to eat it green, and black cattle may be fed very well with the hay made from it; but an excess of this food is said to be very dangerous.

Lucerne has the property of growing very quickly after it is cut down, inasmuch that Mr Rocque has mowed it five times in a season, and Mr Anderson affirms he has cut it no less than six times. It is, however, not very easily cultivated; in consequence of which it sometimes does not succeed; and as it dies entirely in the winter, it is perhaps inferior to the fescue grasses already mentioned, which, tho' despised and neglected, might probably yield as rich a crop as lucerne, without any danger of a miscarriage.

66
Timothy-
grass.

Another grass was brought from Virginia, where it is a native, and sown by Rocque in 1763. This grass is called *Timothy*, from its being brought from New-York to Carolina by one Timothy Hanfon. It grows best in a wet soil; but will thrive in almost any. If it is sown in August, it will be fit for cutting in the latter end of May or beginning of June. Horses are very fond of it, and will leave lucerne to eat it. It is also preferred by black cattle and sheep; for a square piece of land having been divided into four equal parts, and one part sowed with lucerne, another with fain-foin, a third with clover, and the fourth with timothy, some horses, black cattle, and sheep, were turned into it, when the plants were all in a condition for pasturage; and the timothy was eaten quite bare, before the clover, lucerne, or fain-foin, was touched.

One valuable property of this grass is, that its roots are so strong and interwoven with one another, that they render the wettest and softest land, on which a horse could not find footing, firm enough to bear the heaviest cart. With the view of improving boggy lands, therefore, so as to prevent their being poached with the feet of cattle, Mr Anderson recommends the cultivation of this kind of grass, from which he has little expectation in other respects.

SECT. VII. Of the Diseases of Plants.

THESE are divided by Tournefort into the following classes. 1. Those which arise from too great an abundance of juice; 2. from having too little; 3. From its bad qualities; 4. From its unequal distribution; and 5. From external accidents.

Too great an abundance of juices causes at first a prodigious luxuriant growth of the vegetable; so that it does not come to the requisite perfection in a due time. Wheat is subject, in some climates, to a disease of this kind; it vegetates excessively, without ever carrying ripe grain; and the same disease may be artificially produced in any grain, by planting it in too rich a soil. Too much rain is apt likewise to do the same. When a vegetable is supplied too abundantly with juices, it is very apt to rot; one part of it overshadowing another in such a manner as to prevent the access of fresh air; upon which, putrefaction soon ensues, as has been already observed with regard to the fescue grasses.

In grass, or any herbaceous plant, where the leaves

are only wanted, this over-luxuriancy cannot be called a disease, but is a very defensible property; but in any kind of grain, it is quite otherwise. Dr Home, in his *Principles of Agriculture and Vegetation*, classeth the *smut* in grain among the diseases arising from this cause. He is of opinion, that too great an abundance of juices in a vegetable will produce diseases similar to those occasioned by repletion in animal-bodies; viz. stagnations, corruptions, varices, carioities, &c. along with the too great luxuriancy we have just now mentioned, which he expresses by "too great an abundance of water-shoots." Hence he is induced to class the *smut* among diseases arising from this cause; it being a corruption happening most in rainy seasons, and to weak grain.—Like other contagious diseases, he tells us, the *smut* may be communicated from the infected to healthy grain. As a preventative, he recommends steeping the grain in a strong pickle of sea-salt. Besides the effect which this has upon the grain itself, it is useful for separating the good from the bad; the best seed falling to the bottom, and the faulty swimming on the top of the liquor.—For the same purpose, a ley of wood-ashes and quicklime is recommended by some; and, by others, a solution of salt-petre or copperas; after which the grain is to be dried with slacked lime, or dry turpashes. This solution, however, we can by no means recommend, as it seems most likely to kill the grain entirely.

According to Dr Home, dung is a preventative of diseases arising from too great moisture; in confirmation of which, he relates the following experiment. "Two acres of poor ground, which had never got any manure, were fallowed with a design to be sown with wheat; but the scheme being altered, some dung was laid on a small part of it, and the whole sowed, after it had got five furrows, with barley. A great quantity of rain fell. The barley on that part which was dunged, was very good; but what was on the rest of the field turned yellow after the rains, and, when ripe, was not worth the reaping."

The want of nourishment in plants may be easily known by their decay; in which case, the only remedy is, to supply them with food, according to the methods we have already directed; or to remove from their neighbourhood such other plants as may draw off the nourishment from those we wish to cultivate.—In the *Memoirs of the Academy of Sciences for 1728*, Mr Du Hamel mentions a disease, which he calls *le mort*, that attacks saffron in the spring. It is owing to another plant, a species of trefoil, fixing some violet-coloured threads, which are its roots, to the roots of the saffron, and sucking out its juice. This disease is prevented by digging a trench, which saves all the unaffected.

The bad qualities, or unequal distributions, of the juices of plants, are the occasion of so few of the diseases to which vegetables in this country are subject, that we forbear to mention them at present. Most of the diseases of our plants are owing to external accidents, particularly to the depredations of insects.—The insects by which the greatest devastations are committed in this country are, snails, caterpillars, grubs, and flies. The snails and caterpillars feed on the leaves and young shoots; by which means they often totally destroy the vegetable. Where the plants are of easy access, these vermin may be destroyed by sprinkling the vegetable with lime-water, for quick-lime is a mortal poison to crea-

tures of this kind, and throws them into the greatest agonies the moment they are touched with it. On trees, however, where this method cannot so well be followed, fumigation is the most proper; and, for this purpose, nothing is better than the smoke of vegetables not perfectly dry. In some cases the eggs of these destroying creatures may be observed, and ought without doubt immediately to be taken away. On the fruit-trees, as apples, pears, medlars, on some forest-trees, the oak and dwarf-maple especially, and the white and black thorn in hedges, a kind of little tufts are to be observed, resembling, at first sight, withered leaves twisted, by a cobweb, about the uppermost twigs or branches. These contain a vast number of little black eggs, that in the spring produce swarms of caterpillars which devour every thing. To prevent this, all the twigs on which these cobwebs appear should be taken off and burnt as soon as possible. This ought to be done before the end of March, that none of the eggs be allowed sufficient time for hatching.

74
Grubs.

The grubs are a kind of worms which destroy the corn by feeding upon its roots; they are transformed every fourth year into the beetles called *cock-chafers*, *may-bugs*, &c. they are very destructive when in their vermicular state, and cannot then be destroyed because they go deep in the ground. When become beetles, they conceal themselves under the leaves of trees, where they seem asleep till near sunset, when they take their flight. It is only now that they can be destroyed, and that by a very laborious method; namely, by spreading pack-sheets below the trees in the day-time when the beetles are in their torpid state, then shaking them off and burning them. Some time ago, they made such devastations in the county of Norfolk, that several farmers were entirely ruined by them; one gathered 80 bushels of these insects from the trees which grew on

his farm. It is said that, in 1574 there fell such a multitude of these insects into the river Severn, that they stopped and clogged the wheels of the water-mills.

Turnips, when young, are apt to be totally destroyed by a multitude of little black flies, from thence called the *turnip-fly*. As a preventative of these, some advise the seed to be mixed with brimstone; but this is improper, as brimstone is found to be poisonous to vegetables. The best method seems to be the fumigation of the fields with smoke of half-dried vegetables. For this purpose weeds will answer as well as any. This fumigation must no doubt be often repeated, in order to drive away the innumerable multitudes of these insects which are capable of destroying a large field of turnip.

75
Turnip-fly.

Some time ago an insect, called the *corn-butterfly*, committed such ravages while in its vermicular state, in France, that upwards of 200 parishes were ruined by it; and the ministry offered a reward to the discoverer of an effectual remedy against this destroying worm. The cure which was at last discovered, was to heat the corn, in an oven, so much as not to destroy its vegetative power, but sufficiently to destroy the small worms, which made their nest in the substance of the grain, and at last eat out the substance so completely that nothing could be got from the husk, even by boiling it in water. It is certain, that though insects can bear a great deal of cold, they are easily destroyed by a slight degree of heat; nor is the vegetative power of corn easily destroyed, even when kept for a long time in a pretty strong heat. This method must therefore be very effectual for destroying all kinds of insects with which grain is apt to be infected; but care must be taken not to apply too great a heat; and the adjusting of the precise degree necessary to destroy the insect, without hurting the corn, will be attended with some difficulty.

76
Corn butterfly.

PART II. PRACTICE OF AGRICULTURE.

SECT. I. Instruments of Husbandry.

THE instruments employed in agriculture are various; as the plough, the harrow, the roller, &c. which are again greatly diversified by differences arising from their construction, and particular uses.

I. OF PLOUGHS.

THE plough constructed in the following manner is still the most common and the most generally understood in Scotland; and, if properly made, is the best for answering all purposes, when only one is used; though others are, perhaps, more proper on some particular occasions.

78
Description of the Scotch plough.

The parts of which this plough is composed, are the head, the beam, the sheath, the wrest, the mould-board, the two handles, the two rungs, the sock, and the coulter; the two last are made of iron, and all the rest of wood.

Plate IV.
fig. 1.

The HEAD, is designed for opening the ground below. The length of the head from A to B is about 20 inches, and the breadth from A to D about five inches; C is the point upon which the sock is driven, and the length from B to C is about six inches; *a* is the mortoise into which the larger handle is fixed, and *b* is the mortoise into which the sheath is fixed.

The head is that part of the plough which goes in

the ground; therefore the shorter and narrower it is, the friction will be the less, and the plough more easily drawn; but the longer the head is, the plough goes more steadily, and is not so easily put out of its direction by any obstructions that occur. Twenty inches is considered as a mean length; and five inches as the most convenient breadth.

The SHEATH, E, is driven into the mortoise *b*, and Fig. 2. thus fixed to the head A B. It is not perpendicular to the head, but placed obliquely, so as to make the angle formed by the lines A B and E B about 60 degrees. The sheath is about 13 inches long, besides what is driven into the mortoise *b*; about three inches broad, and Fig. 1. one inch thick.

The sheath is fixed to the mould-board, as in fig. 11. E, in the same manner as the wrest is fixed to the head in fig. 7.

The MOULD-BOARD, is designed to turn over the earth of the furrow made by the plough; and it is obvious, that, according to the position of the sheath, the mould-board will turn over the earth of the furrow more or less suddenly. Besides, when it forms a less angle with the head than 60 degrees, the plough is in great danger of being choked, as the farmers term it.

The LARGER HANDLE, F A, is fixed to the head, by Fig. 3. driving it into the mortoise *a*. It is placed in the same Fig. 1. plane

PRACTICE

PRACTICE

Fig. 3.

plane with the head; and its length from A F is about five feet four inches, and its diameter at the place where it is fixed to the beam is about two inches and an half, and tapers a little to the top F. About ten inches from A, there is a curve in the handle, which, when F is raised to its proper height, makes the lower part of it nearly parallel to the sheath E B. This curve is designed to strengthen the handle. The proper position of the handle is, when the top F is about three feet two inches higher than the bottom of the head A B.

The longer the handles, the plough is the more easily managed, because the levers are more distant from the centre of motion. The higher the top of the handles, the plough is more easily raised out of the ground, provided they be no higher than the lower part of a man's breast.

Fig. 4.

The BEAM, is fixed to the larger handle and the sheath, all of which are placed in the same plane with the head. The length of it, from H to I, is about six feet; its diameter is about four inches. When the plough is in the ground, the beam should be just high enough not to be incommoded by any thing on the surface.

The position of the beam depends on the number of cattle in the plough. When two horses are yoked, the beam should be placed in such a manner as to make the perpendicular distance betwixt the bolt-hole of the beam and the plane of the head about 21 inches; when four horses are yoked, two a-breast, this distance should only be about 18 inches.

Fig. 5.

The SOCK, B P, is fixed to the end of the head, and is about two feet long. In fitting the sock to the head, the point ought to be turned a little to the land or left side; because otherwise it is apt to come out of the land altogether. When turned to the left, it likewise takes off more land; when turned upwards, the plough goes shallow; and when downwards, it goes deeper.

Fig. 6.

The COULTER, is fixed to the beam, and is about two feet ten inches long, two inches and a half broad, sharp at the point and before, and thick on the back, like a knife. It is fixed and directed by wedges, so as to make the point of it equal to, or rather a little before the point of the sock, and upon a line with the left side of the head. This oblique position enables it to throw roots, &c. out of the land, which requires less force than cutting or pushing them forward.

Fig. 7.

The WREST, B D, is fixed to the head, and is about 26 inches long, two broad, and one thick. It is fixed to the head at B, in such a manner as to make the angle contained between the lines A B and B D about 25 degrees. The wrest is seldom or never placed in the same plane with the head, but gradually raised from the place where it is fixed to it; that is, from B to K, as in fig. 8. The position of the wrest determines the nature of the furrow. When the wrest is wide and low set, the furrow is wide; and when it is narrow and high set, the furrow is narrow.

Fig. 9. represents the two HANDLES, fixed together by the two rungs. The larger handle has already been described; the lesser one is a few inches shorter, and does not require to be quite so strong. The distance of the handles at the little rung depends on the position of the wrest. Their distance at M and P is about two feet six inches. The lesser handle is fixed to the mould-board at M, fig 10. and to the wrest K B, at L.

Fig 11. represents the plough complete, by joining together figures 6. and 10. in the sheath E B. The wrest B K is supposed to make an angle with the head A B as in fig. 7. and the handles joined together as in fig. 9.

After having given such a particular description of all the parts and proportions of the Scots plough, it will easily appear how it separates, raises, and turns over the earth of the furrow. If it had no coulter, the earth would open above the middle of the sock, and in a line before the sheath; but as the coulter opens the earth in a line with the left side of the head, if the soil has any cohesion, the earth of the furrow will be wholly raised from the left side, and, as the sock moves forward, will be thrown on the right side of the sheath, and by the casting out of the mould-board, or the raising of the wrest, will be turned over.

The BRIDLE, or MUZZLE, is another article belonging to the plough. It is fixed to the end of the beam, and the cattle are yoked by it. The muzzle commonly used is a curved piece of iron, fixed to the beam by a bolt through it. A B C is the muzzle, A C the bolt by which it is fixed to the beam; D is the fswingle-tree or cross-tree, to which the traces are fixed; and B is a hook, or cleek, as it is commonly called, which joins the muzzle and fswingle-tree.

Fig. 12.

Some use another kind of muzzle, A B C D. It is fixed to the beam by two bolts, and has notches by which the cleek of the fswingle-tree may be fixed either to the right or the left of the beam. There are also different holes for the hind-bolt to pass thro', by which the draught may be fixed either above or below the beam. A D is the fore-bolt upon which the muzzle turns; or B C are four notches, betwixt any two of which the cleek of the fswingle-tree may be fixed. When the cleek is fixed at B, the plough is turned towards the firm land, and takes off a broader furrow; and when fixed at C, it is turned towards the ploughed land, and takes of a narrower furrow. E and F are the holes on each side thro' which the hindmost bolt passes. When the bolt is put thro' the highest two, these holes being thereby brought to the middle of the beam, the fore-part of the muzzle is raised above the beam, and the plough is made to go deeper; and when put through the lowest two, the fore-part of the muzzle is sunk below the beam, and the plough is made to go shallower. This muzzle may be so constructed as to have the same play with the common one. A is the end of the beam; B a plate of iron sunk into it, and with a similar one in the other side, is rivetted into it by bolts; C is the muzzle fixed to these plates of iron by the bolt D, which bolt may be put through any of the holes E E. From the construction of this muzzle it is plain, that it has the same play with the common one, and that by it the land of the plough may be altered at pleasure.

Fig. 16.

Of all forms, that of the Scotch plough is the fittest for breaking up stiff and rough land, especially where stones abound; and no less fit for strong clays hardened by drought. The length of its head gives it a firm hold of the ground; its weight prevents it from being thrown out by stones; the length of the handles gives the ploughman great command to direct its motion; and by the length of its head, and of its mould-board, it lays the furrow-slice cleverly over. This plough

plough.

PRACTICE

PRACTICE

80
In what soil
improper.

plough was contrived during the infancy of agriculture, and was well contrived: in the soils above described, it has not an equal.

But in tender soil it is improper, because it adds greatly to the expence of ploughing, without any counterbalancing benefit. The length of the head and mould-board increases the friction, and consequently it requires a greater number of oxen or horses than are necessary in a shorter plough. There is another particular in its form, that refits the draught: the mould-board makes an angle with the sock, instead of making a line with it gently curving backward. There is an objection against it no less solid, that it does not stir the ground perfectly: the hinder part of the wreathe rises a foot above the sole of the head; and the earth that lies immediately below that hinder part, is left unstirred. This is ribbing land below the surface, similar to what is done by ignorant farmers on the surface.

These defects must be submitted to in a soil that requires a strong heavy plough; but may be avoided in a cultivated soil by a plough differently constructed. Of all the ploughs fitted for a cultivated soil free of stones, that introduced into Scotland about 12 years ago, by James Small in Blackadder Mount, Berwickshire, is the best. It is now in great request; and with reason, as it avoids all the defects of the Scotch plough. The shortness of its head and of its mouldboard lessen the friction greatly: from the point of the sock to the back part of the head it is only 30 inches; and the whole length, from the point of the beam to the end of the handles, between eight and nine feet. The sock and mouldboard make one line gently curving; and consequently gather no earth. Instead of a wreathe, the under edge of the mouldboard is in one plain with the sole of the head; which makes a wide furrow, without leaving any part unstirred. It is termed the *chain-plough*, because it is drawn by an iron chain fixed to the back part of the beam immediately before the coulter. This has two advantages: first, by means of a muzzle, it makes the plough go deep, or shallow; and, next, it stresses the beam less than if fixed to the point, and therefore a slenderer beam is sufficient.

This plough may well be considered as a capital improvement; not only by saving expence, but by making better work. It is proper for loams; for carle-clays; and, in general, for every sort of tender soil free of stones. It is even proper for opening up pasture-ground, where the soil has been formerly well cultivated.

A spiked sock is used in the Scotch plough. The difference between it and the feathered sock will be best understood by comparing their figures. Fig. 14. is the common sock, and fig. 15. the feathered one.

From the construction of the feathered sock, it is obvious, that it must meet with greater resistance than the common sock. However, when the plough takes off the earth of the furrow broader than that part of the sock which goes upon the head, it is more easily drawn than the plough with the common sock; for the earth which the common sock leaves to be opened by the wreathe, is more easily opened by the feather of the other sock. In lea, the feathered sock makes the plough go more easily, because the roots of the grass, which go beyond the reach of the plough, are more easily cut by the feather, than they can be torn asunder

by the common sock. The feathered sock is also of great use in cutting and destroying root-weeds. The common sock, however, answers much better in strong land.

It is proper here to add, that in fitting the feathered sock to the head, the point of it should be turned a little from the land, or a little to the right hand.

Some ploughs are made with two small wheels running in the furrow, in order to take off the friction of the head; and this plough is recommended in a book, intitled, *The complete Farmer*. But all complicated ploughs are bables; and this as much as any. The pivots of such wheels are always going wrong; and, besides, they are choked so with earth, as to increase the friction instead of diminishing it.

If we look back 30 years, ploughs of different constructions did not enter even into a dream. The Scotch plough was universally used; and no other was known. There was no less ignorance as to the number of cattle necessary for this plough. In the south of Scotland, six oxen and two horses were universal; and in the north, 10 oxen, sometimes 12. The first attempt to lessen the number of oxen, was in Berwickshire. The low part of that county abounds with stone, clay, and marl, the most substantial of all manures, which had been long used by one or two gentlemen. About 25 years ago it acquired reputation, and spread rapidly. As two horses and two oxen were employed in every marl-cart; the farmer, in summer-fallowing, and in preparing land for marl, was confined to four oxen and two horses. And as that manure afforded plenty of succulent straw for oxen, the farmer was surprised to find that four oxen did better now than six formerly. Marling, however, a laborious work, proceeded slowly, till people were taught by a noted farmer in that country, what industry can perform by means of power properly applied. It was reckoned a mighty task to marl five or six acres in a year. That gentleman, by plenty of red clover for his working-cattle, accomplished the marling 50 acres in a summer, once 54. Having so much occasion for oxen, he tried with success two oxen and two horses in a plough; and that practice became general in Berwickshire.

Now here appears with lustre the advantage of the chain-plough. The great friction occasioned in the Scotch plough by a long head, and by the angle it makes with the mould-board, necessarily requires two oxen and two horses, whatever the soil be. The friction is so much less in the chain-plough, that two good horses are found sufficient in every soil that is proper for it. Besides, the reducing the draught to a couple of horses has another advantage, that of rendering a driver unnecessary. This saving on every plough, where two horses and two oxen were formerly used, will, by the strictest computation, be £ 15 sterling yearly; and where four horses were used, no less than £ 20 sterl. There is now scarce to be seen in the low country of Berwickshire a plough with more than two horses; which undoubtedly in time will become general. We know but of one further improvement, that of using two oxen instead of two horses. That draught has been employed with success in several places; and the saving is so great, that it must force its way every where. It may be confidently affirmed, no soil stirred in a proper season, can ever require more than two

horse

plough parti-
cularly illu-
strated.

horses and two oxen, in a plough, even supposing the stiffest clay. In all other soils, two good horses, or two good oxen abreast, may be relied on for every operation of the chain-plough.

A chain-plough of a smaller size than ordinary, drawn by a single horse, is of all the most proper for horse-hoeing, supposing the land to be mellow, which it ought to be for that operation. It is sufficient for making furrows to receive the dung, for ploughing the drills after dunging, and for hoeing the crop.

86
A small
single-horse
plough re-
commended
for various
purposes.

A still smaller plough of the same kind may be recommended for a kitchen-garden. It can be reduced to the smallest size, by being made of iron; and where the land is properly dressed for a kitchen-garden, an iron plough drawn by a horse of the smallest size will save much spade-work.—In Scotland, thirty years ago, a kitchen-garden was an article of luxury merely, because at that time there could be no cheaper food than oat-meal. At present, the farmer maintains his servants at double expence, as the price of oat-meal is doubled; and yet he has no notion of a kitchen-garden, more than he had thirty years ago. He never thinks, that living partly on cabbage, kail, turnip, carrot, would save much oat-meal: nor does he ever think, that change of food is more wholesome, than vegetables alone, or oat-meal alone. We need not recommend potatoes, which in scanty crops of corn have proved a great blessing: without them, the labouring poor would frequently have been reduced to a starving condition. Would the farmer but cultivate his kitchen-garden with as much industry as he bestows on his potatoe-crop, he needed never fear want; and he can cultivate it with the iron plough at a very small expence. It may be held by a boy of 12 or 13; and would be a proper education for a ploughman. But it is the landlord who ought to give a beginning to the improvement. A very small expence would inclose an acre for a kitchen-garden to each of his tenants; and it would excite their industry, to bestow an iron plough on those who do best.

Nor is this the only case where a single-horse plough may be profitably employed. It is sufficient for seed-furrowing barley, where the land is light and well-dressed. It may be used in the second or third ploughing of fallow, to encourage annual weeds, which are destroyed in subsequent ploughings.

2. The BRAKE.

The brake is a large and weighty harrow, the purpose of which is to reduce a stubborn soil, where an ordinary harrow makes little impression. It consists of four square bulls, each side five inches, and six feet and a half in length. The teeth are 17 inches long, bending forward like a coulter. Four of them are inserted into each bull, fixed above with a screw-nut, having 12 inches free below, with a heel close to the under part of the bull, to prevent it from being pushed back by stones. The nut above makes it easy to be taken out for sharpening. This brake requires four horses or four oxen. One of a lesser size will not fully answer the purpose: one of a larger size will require six oxen; in which case the work may be performed at less expence by the plough.

This instrument may be applied to great advantage

Vol. I.

in the following circumstances. In the following strong clay that requires frequent ploughings, a bracking between every ploughing will pulverize the soil, and render the subsequent ploughings more easy. In the month of March or April, when strong ground is ploughed for barley, especially if bound with couch-grass, a cross bracking is preferable to a cross-ploughing, and is done at half the expence. When ground is ploughed from the state of nature, and after a competent time is cross-ploughed, the brake is applied with great success, immediately after the cross-ploughing, to reduce the whole to proper tilth.

Let it be observed, that a brake with a greater number of teeth than above-mentioned, is improper for ground that is bound together by the roots of plants, which is always the case of ground new broken up from its natural state. The brake is soon choked, and can do no execution till freed from the earth it holds. A less number of teeth would be deficient in pulverizing the soil.

3. The HARROW.

HARROWS are commonly considered as of no use but to cover the seed. But they have another use scarce less essential, which is to prepare land for the seed. This is an article of importance for producing a good crop. But how imperfectly either of these purposes is performed by the common harrow, will appear from the following account of it.

The harrow commonly used is of different forms. The first we shall mention has two bulls, four feet long and 18 inches asunder, with four wooden teeth in each. A second has three bulls and 12 wooden teeth. A third has four bulls, and 20 teeth, of wood or iron, 10, 11, or 12 inches asunder. Now, in fine mould, the last may be sufficient for covering the seed; but none of them are sufficient to prepare for the seed any ground that requires subduing. The only tolerable form is that with iron teeth; and the bare description of its imperfections will shew the necessity of a more perfect form. In the first place, this harrow is by far too light for ground new taken up from the state of nature, for clays hardened with spring-drought, or for other stubborn soils: it floats on the surface; and after frequent returns in the same tract, nothing is done effectually. In the next place, the teeth are too thick set, by which the harrow is apt to be choked, especially where the earth is bound with roots, which is commonly the case. At the same time, the lightness and number of teeth keep the harrow upon the surface, and prevent one of its capital purposes, that of dividing the soil. Nor will fewer teeth answer for covering the seed properly. In the third place, the teeth are too short for reducing a coarse soil to proper tilth; and yet it would be in vain to make them longer, because the harrow is too light for going deep into the ground. Further, the common harrows are so ill constructed, as to ride at every turn one upon another. Much time is lost in disengaging them. Lastly, it is equally unfit for extirpating weeds. The ground is frequently so bound with couch-grass, as to make the furrow-lice stand upright, as when old lea is ploughed: notwithstanding much labour, the grass-roots keep the field, and gain the victory.

A little reflection, even without experience, will make

PRACTICE

90
Improved
harrow.Plate V.
fig. 3.

make it evident, that the same harrows, whatever be the form, can never answer all the different purposes of harrowing, nor can operate equally in all different soils, rough or smooth, firm or loose. The following, therefore, have been recommended; which are of three different forms, adapted for different purposes. They are all of the same weight, drawn each by two horses. Birch is the best wood for them, because it is cheap, and not apt to split. The first is composed of four bulls, each four feet ten inches long, three and a quarter inches broad, and three and a half deep; the interval between the bulls 11 and three-fourths inches; so that the breadth of the whole harrow is four feet. The bulls are connected by four sheths, which go thro' each bull, and are fixed by timber-nails driven through both. In each bull five teeth are inserted, ten inches free under the bull, and ten inches asunder. They are of the same form with those of the brake, and inserted into the wood in the same manner. Each of these teeth is three pounds weight; and where the harrow is made of birch, the weight of the whole is six stone 14 pounds Dutch. An erect bridle is fixed at a corner of the harrow, three inches high, with four notches for drawing higher or lower. To this bridle a double tree is fixed for two horses drawing abreast, as in a plough. And to strengthen the harrow, a flat rod of iron is nailed upon the harrow from corner to corner in the line of the draught.

Fig. 4.

The second harrow consists of two parts, connected together by a crank or hinge in the middle, and two chains of equal length, one at each end, which keep the two parts always parallel, and at the same distance from each other. The crank is so contrived, as to allow the two parts to ply to the ground like two unconnected harrows; but neither of them to rise above the other, more than if they were a single harrow without a joint. In a word, they may form an angle downward, but not upward. Thus they have the effect of two harrows in curved ground, and of one weighty harrow in a plain. This harrow is composed of six bulls, each four feet long, three inches broad, and three and a half deep. The interval between the bulls nine and a half inches; which makes the breadth of the whole harrow, including the length of the crank, to be five feet five inches. Each bull has five teeth, nine inches free under the wood, and ten inches asunder. The weight of each tooth is two pounds; the rest as in the former.

Fig. 5.

The third consists also of two parts, connected together like that last mentioned. It has eight bulls, each four feet long, two and a half inches broad, and three deep. The interval between the bulls is eight inches; and the breadth of the whole harrow, including the length of the crank, is six feet four inches. In each bull are inserted five teeth, seven inches free under the wood, and ten and a half inches asunder, each tooth weighing one pound. The rest as in the two former harrows.

91
Properties
of these har-
rows.

These harrows are a considerable improvement. They ply to curved ground like two unconnected harrows; and when drawn in one plain, they are in effect one harrow of double weight, which makes the teeth pierce deep into the ground. The imperfection of common harrows, mentioned above, will suggest the advantages of the set of harrows here recommended. The first is pro-

per for harrowing land that has lain long after plough-^{PRACTICE} ing, as where oats are sown on a winter-furrow, and in general for harrowing stiff land: it pierces deep into the soil by its long teeth, and divides it minutely. The second is intended for covering the seed: its long teeth lays the seed deeper than the common harrow can do; which is no slight advantage. By placing the seed considerably under the surface, the young plants are, on the one hand, protected from too much heat, and, on the other, have sufficiency of moisture. At the same time, the seed is so well covered that none of it is lost. Seed slightly covered by the common harrows, wants moisture, and is burnt up by the sun; beside, that a proportion of it is left upon the surface uncovered. The third harrow supplies what may be deficient in the second, by smoothing the surface, and covering the seed more accurately. The three harrows make the ground finer and finer, as heckles do lint; or, to use a different comparison, the first harrow makes the bed, the second lays the seed in it, the third smooths the cloaths. They have another advantage not inferior to any mentioned: they mix manure with the soil more intimately than can be done by common harrows; and upon such intimate mixture depends greatly the effect of manure, as has already been explained. To conclude, these harrows are contrived to answer an established principle in agriculture, That fertility depends greatly on pulverizing the soil, and on an intimate mixture of manure with it, whether dung, lime, marl, or any other.

4. The ROLLER.

The roller is an instrument of capital use in husbandry, tho' scarcely known in ordinary practice; and, where introduced, it is commonly so slight as to have very little effect. ⁹² The roller.

Rollers are of different kinds; stone, yetling, wood. Each of these has its advantages. We would recommend the last, constructed in the following manner. Take the body of a tree, six feet ten inches long, the larger the better, made as near a perfect cylinder as possible. Surround this cylinder with three rows of fillices, one row in the middle, and one at each end. Line these fillices with planks of wood equally long with the roller, and so narrow as to ply into a circle. Bind them fast together with iron rings. Beech-wood is the best, being hard and tough. The roller thus mounted, ought to have a diameter of three feet ten inches. It has a double pair of shafts for two horses abreast. These are sufficient in level ground: in ground not level, four horses may be necessary. The roller without the shafts ought to weigh two hundred stone Dutch; and the large diameter makes this great weight easy to be drawn.

Rolling wheat in the month of April, is an important article in loose soil; as the winter-rains preling down the soil leave many roots in the air. Barley ought to be rolled immediately after the seed is sown; especially where grass-seeds are sown with it. The best time for rolling a gravelly soil, is as soon as the mould is so dry as to bear the roller without clinging to it. A clay soil ought neither to be tilled, harrowed, nor rolled, till the field be perfectly dry. And as rolling a clay soil is chiefly intended for smoothing the surface, a dry season may be patiently waited for, even

till

till the crop be three inches high. There is the greater reason for this precaution, because much rain immediately after rolling is apt to cake the surface when drought follows. Oats in a light soil may be rolled immediately after the seed is sown, unless the ground be so wet as to cling to the roller. In a clay soil, delay rolling till the grain be above ground. The proper time for sowing grafs-seeds in an oat-field, is when the grain is three inches high; and rolling should immediately succeed, whatever the soil be. Flax ought to be rolled immediately after sowing. This should never be neglected; for it makes the seed push equally, and prevents after-growth, the bad effect of which is visible in every step of the process for dressing flax. The first year's crop of sown grasses ought to be rolled as early the next spring as the ground will bear the horses. It fixes all the roots precisely as in the case of wheat. Rolling the second and third crops in loose soil is an useful work; though not so essential as rolling the first crop.

94
Effects of
rolling.

In the first place, rolling renders a loose soil more compact and solid; which encourages the growth of plants, by making the earth clasp close to every part of every root. Nor need we be afraid of rendering the soil too compact; for no roller that can be drawn by two or four horses will have that effect. In the next place, rolling keeps in the moisture, and hinders drought to penetrate. This effect is of great moment. In a dry season, it may make the difference of a good crop, or no crop, especially where the soil is light. In the third place, the rolling grafs-seeds, beside the foregoing advantages, facilitates the moving for hay; and it is to be hoped, that the advantage of this practice will lead farmers to mow their corn also, which will increase the quantity of straw, both for food and for the dunghill.

There is a small roller for breaking clods in land intended for barley. The common way is, to break clods with a mell; which requires many hands, and is a laborious work. This roller performs the work more effectually, and at much less expense: let a harrowing precede, which will break the clods a little; and after lying a day, or a day and a half to dry, this roller will dissolve them into powder. This however does not superfluous the use of the great roller after all the other articles are finished, in order to make the soil compact, and to keep out the summer-drought. A stone roller four feet long, and fifteen inches diameter, drawn by one horse, is sufficient to break clods that are easily dissolved by pressure. The use of this roller in preparing land for barley is gaining ground daily, even among ordinary tenants, who have become sensible both of the expense and toil of using wooden mells. But in a clay soil, the clods are sometimes too firm, or too tough, to be subdued by so light a machine. In that case, a roller of the same size, but of a different construction, is necessary. It ought to be surrounded with circles of iron, six inches asunder, and seven inches deep; which will cut even the most stubborn clods, and reduce them to powder. Let not this instrument be considered as a finical refinement. In a stiff clay, it may make the difference of a plentiful or scanty crop.

5. The FANNER.

This instrument for winnowing corn was introduced into Scotland not many years ago. Formerly wind being our only resource, the winnowing of corn was no less precarious than the grinding it at a wind-mill: people often were reduced to famine in the midst of plenty. There was another bad effect: it was necessary to place a barn open to the west wind, however irregular or inconvenient the situation might be with regard to the other buildings. But it is needless to be particular upon that useful instrument; because every farmer considers it now as no less essential than a plough or a harrow.

95
The fanner.

SECT. II. *Preparing Land for Cropping.*

I. OBSTRUCTIONS TO CROPPING.

In preparing land for cropping, the first thing that occurs, is to consider the obstructions to regular ploughing. The most formidable of these, are *stones* lying above or below the surface, which are an impediment to a plough, as rocks are to a ship. Stones above the surface may be avoided by the ploughman, though not without loss of ground; but stones below the surface are commonly not discovered till the plough be flattered to pieces, and perhaps a day's work lost. The clearing land of stones is therefore necessary to prevent mischief. And to encourage the operation, it is attended with much actual profit. In the first place, the stones are useful for fences: when large they must be blown, and commonly fall into parts proper for building. And as the blowing, when gunpowder is furnished, does not exceed a halfpenny for each inch that is bored, these stones come generally cheaper than to dig as many out of the quarry. In the next place, as the soil round a large stone is commonly the best in the field, it is purchased at a low rate by taking out the stone. Nor is this a trifle; for not only is the ground lost that is occupied by a large stone, but also a considerable space round it, to which the plough has not access without danger. A third advantage is greater than all the rest; which is, that the ploughing can be carried on with much expedition, when there is no apprehension of stones: in stony land, the plough must proceed so slow, as not to perform half of its work.

96
Obstructions, viz.
97
Stones.

To clear land of stones, is in many instances an undertaking too expensive for a tenant who has not a very long lease. As it is profitable both to him and to his landlord, it appears reasonable that the work should be divided, where the lease exceeds not nineteen years. It falls naturally upon the landlord to be at the expense of blowing the stones, and upon the tenant to carry them off the field.

Another obstruction is *wet ground*. Water may improve gravelly or sandy soils; but it fours (A) a clay soil, and converts low ground into a morass, unfit for any purpose that can interest the husbandman.

98
Wetness.

A great deal has been written upon different methods of draining land, mostly so expensive as to be scarce fit for the landlord, not to mention the tenant.

T 2

One

(A) By this expression it is not meant that the ground really becomes acid, but only that it becomes unfit for the purposes of vegetation. The natural products of such a soil are rushes, and *four grafts*: which last appears in the furrows, but seldom in the crown of the ridge; is dry, and tasteless, like a chip of wood; and feels rough when stroked backwards.

One way of draining without expence when land is to be inclosed with hedge and ditch, is to direct the ditches so as to carry off the water. But this method is not always practicable, even where the divisions lie convenient for it. If the run of water be considerable, it will destroy the ditches, and lay open the fences, especially where the soil is loose or sandy.

If ditches will not answer, hollow drains are sometimes made, and sometimes open drains, which must be made so deep as to command the water. The former is filled up with loose stones, with brush-wood, or with any other porous matter that permits the water to pass. The latter is left open, and not filled up. To make the former effectual, the ground must have such a slope as to give the water a brisk course. To execute them in level ground is a gross error: the passages are soon stopped up with sand and sediment, and the work is rendered useless. This inconvenience takes not place in open drains; but they are subject to other inconveniences: They are always filling up, to make a yearly reparation necessary; and they obstruct both ploughing and pasturing.

The following is the best in all views. It is an open drain made with the plough, cleaving the space intended for the drain over and over, till the furrow be made of a sufficient depth for carrying off the water. The slope on either side may, by repeated ploughings, be made so gentle as to give no obstruction either to the plough or to the harrow. There is no occasion for a spade, unless to smooth the sides of the drain, and to remove accidental obstructions in the bottom. The advantages of this drain are manifold. It is executed at much less expence than either of the former; and it is perpetual, as it never can be obstructed. In level ground, it is true, grass may grow at the bottom of the drain; but to clear off the grass once in four or five years, will restore it to its original perfection. A hollow drain may be proper between the spring-head and the main drain, where the distance is not great; but in every other case the drain recommended is the best.

Where a level field is infested with water from higher ground, the water ought to be intercepted by a ditch carried along the foot of the high ground, and terminating in some capital drain.

The only way to clear a field of water that is hollow in the middle, is to carry it off by some drain still lower. This is commonly the case of a morass fed with water from higher ground, and kept on the surface by a clay bottom.

A clay soil of any thickness is never pestered with springs; but it is pestered with rain, which settles on the surface as in a cup. The only remedy is high narrow ridges, well rounded. And to clear the furrows, the furrow of the foot-ridge ought to be considerably lower, in order to carry off the water cleverly. It cannot be made too low, as nothing hurts clay soil more than the stagnation of water on it; witness the hollows at the end of crooked ridges, which are absolutely barren. Some gravelly soils have a clay bottom; which is a substantial benefit to a field when in grass, as it retains moisture. But when in tillage, ridges are necessary to prevent rain from settling at the bottom; and this is the only case where a gravelly soil ought to be ridged.

Clay soils that have little or no level, have sometimes

a gravelly bottom. For discharging the water, the best method is, at the end of every ridge to pierce down to the gravel, which will absorb the water. But if the furrow of the foot-ridge be low enough to receive all the water, it will be more expeditious to make a few holes in that furrow. In some cases, a field may be drained, by filling up the hollows with earth taken from higher ground. But as this method is expensive, it will only be taken where no other method answers. Where a field happens to be partly wet, partly dry, there ought to be a separation by a middle ridge, if it can be done conveniently. And the dry part may be ploughed, while the other is drying.

The low part of Berwickshire is generally a brick clay extremely wet and poachy during winter. This in a good measure may be prevented by proper inclosing, as there is not a field but can be drained into lower ground, all the way down to the river Tweed. But as this would lessen the quantity of rain in a dry climate, such as is all the east-side of Britain, it may admit of some doubt whether the remedy would not be as bad as the disease. (*See the article DRAINING.*)

2. Bringing into CULTURE, LAND from the STATE OF NATURE.

To improve a moor, let it be opened in winter when it is wet; which has one convenience, that the plough cannot be employed at any other work. In spring, after frost is over, a slight harrowing will fill up the seams with mould, to keep out the air, and rot the sod. In that state let it lie the following summer and winter, which will rot the sod more than if laid open to the air by ploughing. Next April, let it be cross-ploughed, braked, and harrowed, till it be sufficiently pulverized. Let the manure laid upon it, whether lime or dung, be intimately mixed with the soil by repeated harrowings. This will make a fine bed for turnip-seed if sown broad-cast. But if drills be intended, the method must be followed that is directed afterward in treating more directly of the culture of turnip.

A successful turnip-crop, fed on the ground with sheep, is a fine preparation for laying down a field with grass-seeds. It is an improvement upon this method, to take two or three successive crops of turnip, which will require no dung for the second and following crops. This will thicken the soil, and enrich it greatly.

The best way of improving swampy ground after draining, is paring and burning. But where the ground is dry, and the soil so thin as that the surface cannot be pared, the best way of bringing it into tillth from the state of nature, as mentioned above, is to plough it with a feathered sock, laying the grassy surface under. After the new surface is mellowed with frost, fill up all the seams by harrowing cross the field, which by excluding the air will effectually rot the sod. In this state let it lie summer and winter. In the beginning of May after, a cross-ploughing will reduce all to small square pieces, which must be pulverized with the brake, and make it ready for a May or June crop. If these square pieces be allowed to lie long in the sap without breaking, they will become tough and not be easily reduced.

3. FORMING RIDGES.

THE first thing that occurs on this head, is to consider

99
Moorish ground.

100
Swampy ground.

101
Of ridges.

PRACTICE sider what grounds ought to be formed into ridges, and what ought to be tilled with a flat surface. Dry soils, which suffer by lack of moisture, ought to be tilled flat, which tends to retain moisture. And the method for such tillings, is to go round and round from the circumference to the centre, or from the centre to the circumference. This method is advantageous in point of expedition, as the whole is finished without once turning the plough. At the same time, every inch of the soil is moved, instead of leaving either the crown or the furrow unmoved, as is commonly done in tilling ridges. Clay soil, which suffers by water standing on it, ought to be laid as dry as possible by proper ridges. A loamy soil is the middle between the two mentioned. It ought to be tilled flat in a dry country, especially if it incline to the soil first mentioned. In a moist country, it ought to be formed into ridges, high or low according to the degree of moisture and tendency to clay.

In grounds that require ridging, an error prevails, that ridges cannot be raised too high. High ridges labour under several disadvantages. The soil is heaped upon the crown, leaving the furrows bare: the crown is too dry, and the furrows too wet: the crop, which is always best on the crown, is more readily shaken with the wind, than where the whole crop is of an equal height: the half of the ridge is always covered from the sun, a disadvantage which is far from being slight in a cold climate. High ridges labour under another disadvantage in ground that has no more level than barely sufficient to carry off water: they sink the furrows below the level of the ground; and consequently retain water at the end of every ridge. The furrows ought never to be sunk below the level of the ground. Water will more effectually be carried off, by lessening the ridges both in height and breadth: a narrow ridge, the crown of which is but 18 inches higher than the furrow, has a greater slope than a very broad ridge where the difference is three or four feet.

Next, of forming ridges where the ground hangs considerably. Ridges may be too steep as well as too horizontal; and if to the ridges be given all the steepness of a field, a heavy shower may do irreparable mischief. To prevent such mischief, the ridges ought to be so directed cross the field, as to have a gentle slope for carrying off water slowly, and no more. In that respect, a hanging field has greatly the advantage of one that is nearly horizontal; because in the latter, there is no opportunity of a choice in forming the ridges. A hill is of all the best adapted for directing the ridges properly. If the soil be gravelly, it may be ploughed round and round, beginning at the bottom and ascending gradually to the top in a spiral line. This method of ploughing a hill, requires no more force than ploughing on a level; and at the same time removes the great inconvenience of a gravelly hill, that rains go off too quickly; for the rain is retained in every furrow. If the soil be such as to require ridges, they may be directed to any slope that is proper.

In order to form a field into ridges, that has not been formerly cultivated, the rules mentioned are easily put in execution. But what if ridges be already formed, that are either crooked or too high? After seeing the advantage of forming a field into ridges, people were naturally led into an error, that the higher the better.

But what could tempt them to make their ridges crooked? Certainly this method did not originate from design; but from the laziness of the driver suffering the cattle to turn too hastily, instead of making them finish the ridge without turning. There is more than one disadvantage in this slovenly practice. First, the water is kept in by the curve at the end of every ridge, and sours the ground. Next, as a plough has the least friction possible in a straight line, the friction must be increased in a curve, the back part of the mouldboard pressing hard on the one hand, and the coulter pressing hard on the other. In the third place, the plough moving in a straight line, has the greatest command in laying the earth over. But where the straight line of the plough is applied to the curvature of a ridge in order to heighten it by gathering, the earth moved by the plough is continually falling back, in spite of the most skilful ploughman.

The inconveniences of ridges high and crooked are so many, that one would be tempted to apply a remedy at any risk. And yet, if the soil be clay, it would not be advisable for a tenant to apply the remedy upon a lease shorter than two nineteen years. In a dry gravelly soil, the work is not difficult, nor hazardous. When the ridges are cleaved two or three years successively in the course of cropping, the operation ought to be concluded in one summer. The earth, by reiterated ploughings, should be accumulated upon the furrows, so as to raise them higher than the crowns: they cannot be raised too high, for the accumulated earth will subside by its own weight. Cross-ploughing once or twice, will reduce the ground to a flat surface, and give opportunity to form ridges at will. The same method brings down ridges in clay soil: only let care be taken to carry on the work with expedition; because a hearty shower, before the new ridges are formed, would soak the ground in water, and make the farmer suspend his work for the remainder of that year at least. In a strong clay, we would not venture to alter the ridges, unless it can be done to perfection in one season.—On this subject Mr Anderson has the following observations*.

“The difficulty of performing this operation properly with the common implements of husbandry, and the obvious benefit that accrues to the farmer from having his fields level, has produced many new inventions of ploughs, harrows, drags, &c. calculated for speedily reducing the fields to that state; none of which have as yet been found fully to answer the purpose for which they were intended, as they all indiscriminately carry the earth that was on the high places into those that were lower; which, although it may, in some cases, render the surface of the ground tolerably smooth and level, is usually attended with inconveniences far greater, for a considerable length of time, than that which it was intended to remove.

“For experience sufficiently shows, that even the best vegetable mould, if buried for any length of time so far beneath the surface as to be deprived of the benign influences of the atmosphere, loses its *vis viva*, if I may be allowed that expression; becomes an inert, lifeless mass, little fitted for nourishing vegetables; and constitutes a soil very improper for the purposes of the farmer. It therefore behoves him, as much as in him lies, to preserve, on every part of his fields, an equal covering

* *Essays on Agriculture*, Vol. I. p. 146.

103
Inconveniences in the common methods of levelling.

103
Vegetable mould becomes inert by being long buried.

PRACTICE

covering of that vegetable mould that has long been uppermost, and rendered fertile by the meliorating influence of the atmosphere. But, if he suddenly levels his high ridges by any of these mechanical contrivances, he of necessity buries all the good mould that was on the top of the ridges, in the old furrows; by which he greatly impoverishes one part of his field, while he too much enriches another; inasmuch that it is a matter of great difficulty, for many years thereafter, to get the field brought to an equal degree of fertility in different places; which makes it impossible for the farmer to get an equal crop over the whole of his field by any management whatever: and he has the mortification frequently, by this means, to see the one half of his crop rotted by an over-luxuriance, while other parts of it are weak and sickly, or one part ripe and ready for reaping, while the other is not properly filled; so that it were, on many occasions, better for him to have his whole field reduced at once to the same degree of poorness as the poorest of it, than have it in this state. An almost impracticable degree of attention in spreading the manures may indeed in some measure get the better of this; but it is so difficult to perform this properly, that I have frequently seen fields that had been thus levelled, in which, after thirty years of continued culture and repeated dressings, the marks of the old ridges could be distinctly traced when the corn was growing, altho' the surface was so level that no traces of them could be perceived when the corn was off the ground.

"But this is a degree of perfection in levelling that cannot be usually attained, by following this mode of practice; and, therefore, is but seldom seen. For all that can be expected to be done by any levelling machine, is to render the surface perfectly smooth and even in every part, at the time that the operation is performed: but as, in this case, the old hollows are suddenly filled up with loose mould to a great depth, while the earth below the surface upon the heights of the old ridges remain firm and compact, the new-raised earth after a short time subsides very much, while the other parts of the field do not sink at all; so that, in a short time, the old furrows come to be again below the level of the other parts of the field, and the water of course is suffered in some degree to stagnate upon them; in so much that, in a few years, it becomes necessary once more to repeat the same levelling process, and thus renew the damage that the farmer sustains by this pernicious operation.

"On these accounts, if the farmer has not a long lease, it will be found in general to be much his interest to leave the ridges as he found them, rather than to attempt to alter their direction: and, if he attends with due caution to moderate the height of these old ridges, he may reap very good crops, although perhaps at a somewhat greater expense of labour than he would have been put to upon the same field, if it had been reduced to a proper level surface, and divided into straight and parallel ridges.

"But, where a man is secure of possessing his ground for any considerable length of time, the advantages that he will reap from having level and well laid-out fields, are so considerable as to be worth purchasing, if it should even be at a considerable expense. But the loss that is sustained at the beginning, by this mecha-

nical mode of levelling ridges, if they are of considerable height, is so very great, that it is perhaps doubtful if any future advantages can ever fully compensate it. I would therefore advise, that all this levelling apparatus should be laid aside; and the following more efficacious practice be substituted in its stead: A practice that I have long followed with success, and can safely recommend as the very best that has yet come to my knowledge.

"If the ridges have been raised to a very great height, as a preparation for the ensuing operations, they may be first *cloven*, or *scaled* out, as it is called in different places; that is, ploughed so as to lay the earth on each ridge from the middle towards the furrows. But, if they are only of a moderate degree of height, this operation may be omitted. When you mean to proceed to level the ground, let a number of men be collected, with spades, more or fewer as the nature of the ground requires, and then set a plough to draw a furrow directly across the ridges of the whole field intended to be levelled. Divide this line into as many parts as you have labourers, allotting to each one ridge or two, or more or less, according to their number, height, and other circumstances. Let each of the labourers have orders, as soon as the plough has passed that part assigned him, to begin to dig in the bottom of the furrow that the plough has just made, about the middle of the side of the old ridge, keeping his face towards the old furrow, working backwards till he comes to the height of the ridge, and then turn towards the other furrow, and repeat the same on the other side of the ridge, always throwing the earth that he digs up into the deep old furrow between the ridges, that is directly before him; taking care not to dig deep where he first begins, but to go deeper and deeper as he advances to the height of the ridge, so as to leave the bottom of the trench he thus makes across the ridge entirely level, or as nearly so as possible. And when he has finished that part of the furrow allotted to him that the plough has made in going, let him then go and finish in the same manner his own portion of the furrow that the plough makes in returning. In this manner, each man performs his own task through the whole field, gradually raising the old furrows as the old heights are depressed. And, if an attentive overseer is at hand, to see that the whole is equally well done, and that each furrow is raised to a greater height than the middle of the old ridges, so as to allow for the subsiding of that loose earth, the operation will be entirely finished at once, and never again need to be repeated.

"In performing this operation, it will always be proper to make the ridges, formed for the purpose of levelling, which go across the old ridges, as broad as possible; because the deep trench that is thus made in each of the furrows are an impediment in the future operations, as well as the height that is accumulated in the middle of each of these ridges; so that the fewer there are of these, the better it is. The farmer, therefore, will do well to advert to this in time, and begin by forming a ridge by always turning the plough to the right hand, till it becomes of such a breadth as makes it very inconvenient to turn longer in that manner; and then, at the distance of twice the breadth of this new-formed ridge from the middle of it, mark off

104
Levelling
sometimes
not to be
attempted.

PRACTICE a furrow for the middle of another ridge, turning round it to the right hand, in the same manner as was done in the former, till it becomes of the same breadth with it; and then, turning to the left hand, plough out the interval that was left between the two new-formed ridges. By this mode of ploughing, each ridge may be made of 40, or 50 or 60 yards in breadth, without any great inconvenience; for, although some time will be lost in turning at the ends of these broad ridges, yet, as this operation is only to be once performed in this manner, the advantage that is reaped by having few open furrows, is more than sufficient to counterbalance it. And, in order to moderate the height that would be formed in the middle of each of these great ridges, it will always be proper to mark out the ridges, and draw the furrow that is to be the middle of each, some days before you collect your labourers to level the field; that you may, without any hurry or loss of labour, clear out a good trench through the middle of each of the old ridges; as the plough at this time going and returning nearly in the same track, prevents the labourers from working properly without this precaution.

"If these rules are attended to, your field will be at once reduced to a proper level, and the rich earth that formed the surface of the old ridges be still kept upon the surface of your field; so that the only loss that the possessor of such ground can sustain by this operation, is merely the expence of performing it."

He afterwards makes a calculation of the different expences of levelling by the plough and by the spade, in which he finds the latter by far the cheapest method.

Let it be a rule, to direct the ridges north and south, if the ground will permit. In this direction, the east and west sides of the ridges, dividing the sun equally between them, will ripen at the same time.

It is a great advantage in agriculture, to form ridges so narrow, and so low, as to admit the crowns and furrows to be changed alternately every crop. The soil nearest the surface is the best; and by such ploughing, it is always kept near the surface, and never buried. In high ridges, the soil is accumulated at the crown and the furrows left bare. Such alteration of crown and furrow, is easy where the ridges are no more but seven or eight feet broad. This mode of ploughing answers perfectly well in sandy and gravelly soils, and even in loam. But it is not safe in clay soil. In that soil, the ridges ought to be 12 feet wide, and 20 inches high; to be preserved always in the same form by casting, that is, by ploughing two ridges together, beginning at the furrow that separates them, and ploughing round and round till the two ridges be finished. By this method, the separating furrow is raised a little higher than the furrows that bound the two ridges. But at the next ploughing, that inequality is corrected, by beginning at the bounding furrows, and going round and round till the ploughing of the two ridges be completed at the separating furrow.

4. CLEARING GROUND OF WEEDS.

For this purpose a new instrument, termed a *cleaning harrow*, has been introduced by Lord Kaimes, and is strongly recommended (B.) It is one entire piece like the first of those mentioned above, consisting of

seven bulls, four feet long each, two and one-fourth inches broad, two and three-fourths deep. The bulls are united together by sheths, similar to what are mentioned above. The intervals between the bulls being three and three-fourths inches, the breadth of the whole harrow is three feet five inches. In each bull are inserted eight teeth, each nine inches free below the wood, and distant from each other six inches. The weight of each tooth is a pound, or near it. The whole is firmly bound by an iron plate from corner to corner in the line of the draught. The rest as in the harrows mentioned above. The size, however, is not invariable. The cleaning harrow ought to be larger or less according as the soil is stiff or free.

To give this instrument its full effect, stones of such a size as not to pass freely between the teeth ought to be carried off, and clods of that size ought to be broken. The ground ought to be dry, which it commonly is in the month of May.

In preparing for barley, turnip, or other summer-crop, begin with ploughing and cross-ploughing. If the ground be not sufficiently pulverized, let the great brake be applied, to be followed successively with the 1st and 2^d harrows*. In stiff soil, rolling may be proper, * Plate V. or twice between the acts. These operations will loosen fig. 3, 4.

every root, and bring some of them to the surface. This is the time for the 3^d harrow†, conducted by a † Fig. 5.

boy mounted on one of the horses, who trots smartly along the field, and brings all the roots to the surface: there they are to lie for a day or two, till perfectly dry. If any stones or clods remain, they must be carried off in a cart. And now succeeds the operation of the cleaning harrow. It is drawn by a single horse, directed by reins, which the man at the opposite corner puts over his head, in order to have both hands free.

In this corner is fixed a rope, with which the man from time to time raises the harrow from the ground, to let the weeds drop. For the sake of expedition, the weeds ought to be dropped in a straight line cross the field, whether the harrow be full or not; and seldom is a field so dirty but that the harrow may go 30 yards before the teeth are filled. The weeds will be thus laid in parallel rows, like those of hay raked together for drying. A harrow may be drawn swiftly along the rows, in order to shake out all the dust; and then the weeds may be carried clean off the field in carts. But we are not yet done with these weeds: instead of burning, which is the ordinary practice, they may be converted into useful manure, by laying them in a heap with a mixture of hot dung to begin fermentation.

At first view, this way of cleaning land will appear operose; but upon trial, neither the labour nor expence will be found immoderate. At any rate, the labour and expence ought not to be grudged; for if a field be once thoroughly cleaned, the seasons must be very cross, or the farmer very indolent, to make it necessary to renew the operation in less than 20 years. In the worst seasons, a few years pasture is always under command; which effectually destroys triennial plants, such as thistles and couch-grass.

SECT. III. Culture of particular Plants.

The articles hitherto insisted on, are all of them preparatory to the capital object of a farm, that of raising

(B) In his *Gentleman Farmer*; to which performance the practical part of this article is materially indebted.

PRACTICE

110
Culmiferous plants.111
Leguminous plants.

raising plants for the nourishment of man, and of other animals. These are of two kinds; culmiferous, and leguminous; differing widely from each other. Wheat, rye, barley, oats, rye-grass, are of the first kind: of the other kind are peas, beans, clover, cabbage, and many others.

Culmiferous plants, says Bonnet, have three sets of roots. The first issue from the feed, and push to the surface an upright stem; another set issue from a knot in that stem; and a third, from another knot, nearer the surface. Hence the advantage of laying seed so deep in the ground as to afford space for all the sets.

Leguminous plants form their roots differently. Peas, beans, cabbage, have store of small roots, all issuing from the feed, like the undermost set of culmiferous roots; and they have no other roots. A potatoe and a turnip have bulbous roots. Red clover has a strong tap-root. The difference between culmiferous and leguminous plants with respect to the effects they produce in the soil, will be insisted on afterward, in the section concerning rotation of crops. As the present section is confined to the propagation of plants, it falls naturally to be divided into three articles: first, Plants cultivated for fruit; second, Plants cultivated for roots; third, Plants cultivated for leaves.

I. Plants Cultivated for Fruit.

1. WHEAT and RYE.

112
Following for wheat.

ANY time from the middle of April to the middle of May, the following for wheat may commence. The moment should be chosen, when the ground, beginning to dry, has yet some remaining softness: in that condition, the soil divides easily by the plough, and falls into small parts. This is an essential article, deserving the strictest attention of the farmer. Ground ploughed too wet, rises, as we say, *whale-fur*, as when pasture-ground is ploughed: where ploughed too dry, it rises in great lumps, which are not reduced by subsequent ploughings; not to mention, that it requires double force to plough ground too dry, and that the plough is often broken to pieces. When the ground is in proper order, the farmer can have no excuse for delaying a single minute. This first course of fallow must, it is true, yield to the barley-feed; but as the barley-feed is commonly over the first week of May, or sooner, the season must be unfavourable if the fallow cannot be reached by the middle of May.

As clay soil requires high ridges, these ought to be cleaved at the first ploughing, beginning at the furrow, and ending at the crown. This ploughing ought to be as deep as the soil will admit: and water-furrowing ought instantly to follow; for if rain happen before water-furrowing, it stagnates in the furrow, necessarily delays the second ploughing till that part of the ridge be dry, and prevents the furrow from being mellowed and roasted by the sun. If this first ploughing be well executed, annual weeds will rise in plenty.

About the first week of June, the great brake will loosen and reduce the soil, encourage a second crop of annuals, and raise to the surface the roots of weeds moved by the plough. Give the weeds time to spring, which may be in two or three weeks. Then proceed to the second ploughing about the beginning of July; which must be cross the ridges, in order to reach all

the slips of the former ploughing. By cross-ploughing the furrows will be filled up, and water-furrowing be still more necessary than before. Employ the brake again about the 10th of August, to destroy the annuals that have sprung since the last stirring. The destruction of weeds is a capital article in following: yet so blind are people to their interest, that nothing is more common than a fallow field covered with charlock and wild mustard, all in flower, and ten or twelve inches high. The field having now received two harrowings and two breakings, is prepared for manure, whether lime or dung, which without delay ought to be incorporated with the soil, by a repeated harrowing and a gathering furrow. This ought to be about the beginning of September, and as soon after as you please the feed may be sown.

As in ploughing a clay soil it is of importance to prevent poaching, the hinting furrows ought to be done with two horses in a line. If four ploughs be employed in the same field, to one of them may be allotted the care of finishing the hinting furrows.

Loam, being a medium between land and clay, is of all soils the fittest for culture, and the least subject to chances. It does not hold water like clay; and when wet, it dries sooner. At the same time, it is more retentive than sand of that degree of moisture which promotes vegetation. On the other hand, it is more subject to couch-grass than clay, and to other weeds; to destroy which, fallowing is still more necessary than in clay.

Beginning the fallow about the first of May, or as soon as barley-feed is over, take as deep a furrow as the soil will admit. Where the ridges are so low and narrow as that the crown and furrow can be changed alternately, there is little or no occasion for water-furrowing. Where the ridges are so high as to make it proper to cleave them, water-furrowing is proper. The second ploughing may be at the distance of five weeks. Two crops of annuals may be got in the interim, the first by the brake, and the next by the harrow; and by the same means eight crops may be got in the season. The ground must be cleared of couch-grass and knot-grass roots, by the cleaning harrow described above. The time for this operation is immediately before the manure is laid on. The ground, at that time being in its loosest state, parts with its grass-roots more freely than at any other time. After the manure is spread, and incorporated with the soil by braking or harrowing, the seed may be sown under furrow, if the ground hang so as easily to carry off the moisture. To leave it rough without harrowing, has two advantages: it is not apt to cake with moisture; and the inequalities make a sort of shelter to the young plants against frost. But if it lie flat, it ought to be smoothed with a slight harrow after the seed is sown, which will facilitate the course of the rain from the crown to the furrow.

A sandy soil is too loose for wheat. The only chance for a crop is after red clover, the roots of which bind the soil; and the instructions above given for loam are applicable here. Rye is a crop much fitter for sandy soil than wheat; and like wheat it is generally sown after a summer-fallow.

Lastly, Sow wheat as soon in the month of October as the ground is ready. When sown a month more early, it

PRACTICE

Dressing loam for wheat.114
Dressing a sandy soil.115
Time for sowing.

PRACTICE is too forward in the spring, and apt to be hurt by frost: when sown a month later, it has not time to root before frost comes on, and frost spews it out of the ground.

2. OATS.

116
Effect of
frost upon
tilled land.

As winter-ploughing enters into the culture of oats, we must remind the reader of the effect of frost upon tilled land. Providence has neglected no region intended for the habitation of man. If in warm climates the soil be meliorated by the sun, it is no less meliorated by frost in cold climates. Frost acts upon water, by expanding it into a larger space. Frost has no effect upon dry earth; witness sand, upon which it it makes no impression. But upon wet earth it acts most vigorously: it expands the moisture, which requiring more space puts every particle of the earth out of its place, and separates them from each other. In that view, frost may be considered as a plough superior to any that is made, or can be made, by the hand of man: its action reaches the minutest particles; and, by dividing and separating them, it renders the soil loose and friable. This operation is the most remarkable in tilled land, which gives free access to frost. With respect to clay-soil in particular, there is no rule in husbandry more essential than to open it before winter in hopes of frost. It is even advisable in a clay-soil to leave the stubble rank, which, when ploughed in before winter, keeps the clay loose, and admits the frost into every cranny.

To apply this doctrine, it is dangerous to plough clay-foil when wet; because water is a cement for clay, and binds it so as to render it unfit for vegetation. It is, however, less dangerous to plough wet clay before winter, than after. A succeeding frost corrects the bad effects of such ploughing; a succeeding drought increases them.

117
Culture of
oats.

The common method is, to sow oats on new-ploughed land in the month of March, as soon as the ground is tolerably dry. If it continue wet all the month of March, it is too late to venture them after. It is much better to summer-fallow, and to sow wheat in the autumn. But the preferable method, especially in clay-foil, is to turn over the field after harvest, and to lay it open to the influences of frost and air, which lessen the tenacity of clay, and reduce it to a free mould. The surface-foil by this means is finely mellowed for reception of the seed; and it would be a pity to bury it by a second ploughing before sowing. In general, the bulk of clay-foils are rich; and skilful ploughing without dung, will probably give a better crop, than unskilful ploughing with dung.

Hitherto of natural clays. We must add a word of earse-clays which are artificial, whether left by the sea, or swept down from higher grounds by rain. The method commonly used of dressing earse-clay for oats, is, not to stir it till the ground be dry in the spring, which seldom happens before the first of March, and the seed is sown as soon after as the ground is sufficiently dry for its reception. Frost has a stronger effect on such clays than on natural clay. And if the field be laid open before winter, it is rendered so loose by frost as to be sown drenched in water. The particles at the same time are so small, as that the first drought in spring makes the surface cake or crust. The difficulty of reducing this crust into mould for covering the oat-

VOL. I.

seed, has led farmers to delay ploughing till the month of March. But we are taught by experience, that this soil ploughed before winter, is sooner dry than when the ploughing is delayed till spring; and as early sowing is a great advantage, the objection of the superficial crust is easily removed by the first harrow above described, which will produce abundance of mould for covering the seed. The ploughing before winter not only procures early sowing, but has another advantage: the surface-foil that had been mellowed during winter by the sun, frost, and wind, is kept above.

The dressing a loamy soil for oats differs little from dressing a clay soil, except in the following particular, that being less hurt by rain, it requires not high ridges, and therefore ought to be ploughed crown and furrow alternately.

Where there is both clay and loam in a farm, it is obvious from what is said above, that the ploughing of the clay after harvest ought first to be dispatched. If both cannot be overtaken that season, the loam may be delayed till the spring with less hurt.

Next of a gravelly soil; which is the reverse of clay, as it never suffers but from want of moisture. Such a soil ought to have no ridges; but be ploughed circularly from the centre to the circumference, or from the circumference to the centre. It ought to be tilled after harvest: and the first dry weather in spring ought to be laid hold of to sow, harrow, and roll; which will preserve it in sap.

The culture of oats is the simplest of all. That grain is probably a native of Britain: it will grow on the worst soil with very little preparation. For that reason, before turnip was introduced, it was always the first crop upon land broken up from the state of nature.

Upon such land, may it not be a good method, to build upon the crown of every ridge, in the form of a wall, all the surface-earth, one foot above another, as in a fold for sheep? After standing in this form all the summer and winter, let the walls be thrown down, and the ground prepared for oats. This will secure one or two good crops; after which the land may be dunged for a crop of barley and grass-seeds. This method may answer in a farm where manure is scanty.

3. BARLEY.

This is a culmiferous plant that requires a mellow soil. Upon that account, extraordinary care is requisite where it is to be sown in clay. The land ought to be stirred immediately after the foregoing crop is removed, which lays it open to be mellowed with the frost and air. In that view, a peculiar sort of ploughing has been introduced, termed *ribbing*; by which the greatest quantity of surface possible is exposed to the air and frost. The obvious objection to this method is, that half of the ridge is left unmoved. And to obviate that objection, the following method is offered, which moves the whole soil, and at the same time exposes the same quantity of surface to the frost and air. As soon as the former crop is off the field, let the ridges be gathered with as deep a furrow as the soil will admit, beginning at the crown and ending at the furrows. This ploughing loosens the whole soil, giving free access to the air and frost. Soon after, begin a second ploughing in the following manner. Let the

118

barley.

119
Ribbing.

120
A better
method.

U

field

field be divided by parallel lines cros the ridges, with intervals of 30 feet or so. Plough once round an interval, beginning at the edges, and turning the earth toward the middle of the interval; which covers a foot or so of the ground formerly ploughed. Within that foot plough another round similar to the former; and after that, other rounds, till the whole interval be finished, ending at the middle. Instead of beginning at the edges, and ploughing toward the middle, it will have the same effect to begin at the middle and to plough toward the edges. Plough the other intervals in the same manner. As by this operation the furrows of the ridges will be pretty much filled up, let them be cleared and water-furrowed without delay. By this method, the field will be left waving like a plot in a kitchen-garden, ridged up for winter. In this form, the field is kept perfectly dry; for beside the capital furrows that separate the ridges, every ridge has a number of cros furrows that carry the rain instantly to the capital furrows. In hanging grounds retentive of moisture, the parallel lines above mentioned ought not to be perpendicular to the furrows of the ridges, but to be directed a little downward, in order to carry rain-water the more hastily to these furrows. If the ground be clean, it may lie in that state winter and spring, till the time of seed-furrowing. If weeds happen to rise, they must be destroyed by ploughing, or braking, or both; for there cannot be worse husbandry, than to put seed into dirty ground.

121
Advantages
of this method.

This method resembles common ribbing in appearance, but is very different in reality. As the common ribbing is not preceded by a gathering furrow, the half of the field is left untilled, compact as when the former crop was removed, impervious in a great measure to air or frost. The common ribbing at the same time lodges the rain-water on every ridge, preventing it from descending to the furrows; which is hurtful in all soils, and poisonous in a clay soil. The *stitching* here described, or *ribbing* if you please to call it so, prevents these noxious effects. By the two ploughings the whole soil is opened, admitting freely air and frost; and the multitude of furrows lays the surface perfectly dry, giving an early opportunity for the barley-seed.—But further, as to the advantage of this method: When it is proper to sow the seed, all is laid flat with the brake, which is an easy operation upon soil that is dry and pulverized; and the seed-furrow which succeeds, is so shallow as to bury little or none of the surface-earth: whereas the stirring for barley is commonly done with the deepest furrow; and consequently buries all the surface-soil that was mellowed by the frost and air. Nor is this method more expensive; because the common ribbing must always be followed with a stirring furrow, which is saved in the method recommended. Nay, it is less expensive; for after common ribbing, which keeps in the rain-water, the ground is commonly so fouled, as to make the stirring a laborious work.

122
Time of
sowing.

Where the land is in good order, and free of weeds, April is the month for sowing barley. Every day is proper, from the first to the last.

The dressing loamy soil and light soil for barley, is the same with that described; only that to plough dry is not altogether so essential as in dressing clay-foil. Loam or sand may be stirred a little moist: better,

however, delay a week or two, than to stir a loam when moist. Clay must never be ploughed moist, even though the season should escape altogether. But this will seldom be necessary; for not in one year of 20 will it happen, but that clay is dry enough for ploughing some time in May. Frost may correct clay ploughed wet after harvest; but ploughed wet in the spring, it unites into a hard mass, not to be diffused but by very hard labour.

The foregoing culmiferous plants are what are ordinarily propagated for food in this country. What follow are leguminous plants.

4. BEANS.

123
Culture of
beans.

THE properest soil for beans is a deep and moist clay. There was lately introduced into Scotland a method of sowing beans with a drill-plough, and horse-hoeing the intervals; which, beside affording a good crop, is a dressing to the ground. But as that method is far from being general, we keep in the common track.

As this grain is early sown, the ground intended for it should be ploughed before winter, to give access to the frost and air; beneficial in all soils, and necessary in a clay-soil. Take the first opportunity after January when the ground is dry, to loosen the soil with the harrow first described, till a mould be brought upon it. Sow the seed, and cover it with the second harrow. The third will smooth the surface, and cover the seed equally. These harrows make the very best figure in sowing beans; which ought to be laid deep in the ground, not less than six inches. In clay soil, the common harrows are altogether insufficient. The soil, which has rested long after ploughing, is rendered compact and solid: the common harrows skim the surface: the seed is not covered; and the first hearty shower of rain lays it above ground. Where the farmer overtakes not the ploughing after harvest, and is reduced to plough immediately before sowing, the plough answers the purpose of the first harrow; and the other two will complete the work. But the labour of the first harrow is ill saved; as the ploughing before winter is a fine preparation, not only for beans, but for grain of every kind. If the ground ploughed before winter happen by superfluity of moisture to cake, the first harrow going along the ridges, and crossing them, will loosen the surface, and give access to the air for drying. As soon as the ground is dry, slow without delaying a moment. If rain happen in the interim, there is no remedy but patience till a dry day or two come.

Carse-clay, ploughed before winter, seldom fails to cake. Upon that account, a second ploughing is necessary before sowing; which ought to be performed with an ebb furrow, in order to keep the frost-mould as near the surface as possible. To cover the seed with the plough is expressed by the phrase *to sow under furrow*. The clouds raised in this ploughing, are a sort of shelter to the young plants in the chilly spring-months.

The foregoing method will answer for loam. And as for a sandy or gravelly soil, it is altogether improper for beans.

Though we cannot approve the horse-hoeing of beans, with the intervals that are commonly allotted for turnip, yet we would strongly recommend the drilling

ling them at the distance of 10 or 12 inches, and keeping the intervals clear of weeds. This may be done by hand-hoeing, taking opportunity at the same time to lay fresh soil to the roots of the plants. But as this is an expensive operation, and hands are not always to be got, a narrow plough, drawn by a single horse, might be used, with a mould-board on each side to scatter the earth upon the roots of the plants. This is a cheap and expeditious method: it keeps the ground clean; and nourishes the plants with fresh soil.

As beans delight in a moist soil, and have no end of growing in a moist season, they cover the ground totally when sown broadcast, keep in the dew, and exclude the sun and air: the plants grow to a great height; but carry little seed, and that little not well ripened. This displays the advantage of drilling; which gives free access to the sun and air, dries the ground, and affords plenty of ripe seed.

5. PEASE.

PEASE are of two kinds; the white, and the gray. The cultivation of the latter only belongs to this place.

There are two species of the gray kind, distinguished by their time of ripening. One ripens soon, and for that reason is termed *hot feed*: the other, which is slower in ripening, is termed *cold feed*.

Pease, a leguminous crop, is proper to intervene between two culmiferous crops; less for the profit of a pease-crop, than for meliorating the ground. Pease however, in a dry season, will produce six or seven bolls each acre; but, in an ordinary season, they seldom reach above two, or two and a half. Hence, in a moist climate, which all the west of Britain is, red clover seems a more beneficial crop than pease; as it makes as good winter-food as pease, and can be cut green thrice during summer.

A field, intended for cold seed, ought to be ploughed in October or November; and in February, as soon as the ground is dry, the seed ought to be sown on the winter-furrow. A field intended for hot feed, ought to be ploughed in March or April, immediately before sowing. But if infested with weeds, it ought to be also ploughed in October or November.

Pease laid a foot below the surface will vegetate; but the most approved depth is six inches in light soil, and four inches in clay soil; for which reason, they ought to be sown under furrow when the ploughing is delayed till spring. Of all grain, beans excepted, they are the least in danger of being buried.

Pease differ from beans, in loving a dry soil and a dry season. Horse-hoeing would be a great benefit, could it be performed to any advantage; but pease grow expeditiously, and soon fall over and cover the ground, which bars ploughing. Horse-hoeing has little effect when the plants are new sprung; and when they are advanced to be benefited by that culture, their length prevents it. Fast growing at the same time is the cause of their carrying so little seed: the seed is buried among the leaves; and the sun cannot penetrate to make it grow and ripen. The only practicable remedy to obtain grain, is thin sowing; but thick sowing produces more straw, and mellows the ground more. Half a boll for an English acre may be reckoned thin sowing; three firlots, thick sowing.

Notwithstanding what is said above, Mr Hunter, a

noted farmer in Berwickshire, began some time ago to sow all his pease in drills; and never failed to have great crops of corn as well as of straw. He sowed double rows at a foot interval, and two feet and an half between the double rows, which admit horse-hoeing. By that method, he had also good crops of beans on light land.

Pease and beans mixed are often sown together, in order to catch different seasons. In a moist season, the beans make a good crop; in a dry season, the pease.

The growth of plants is commonly checked by drought in the month of July; but promoted by rain in August. In July, grass is parched; in August, it recovers verdure. Where pease are so far advanced in the dry season as that the seed begins to form, their growth is indeed checked, but the seed continues to fill. If only in the blossom at that season, their growth is checked a little; but they become vigorous again in August, and continue growing without filling till stopped by frost. Hence it is, that cold feed, which is early sown, has the best chance to produce corn: hot feed, which is late sown, has the best chance to produce straw.

The following method is practised in Norfolk, for sowing pease upon a dry light soil, immediately opened from pasture. The ground is pared with a plough extremely thin, and every sod is laid exactly on its back. In every sod a double row of holes is made. A pea dropt in every hole lodges in the flay'd ground immediately below the sod, thrusts its roots horizontally, and has sufficient moisture. This method enabled Norfolk farmers, in the barren year 1740, to furnish white pease at 12 s. per boll.

II. Plants cultivated for Roots.

1. TURNIP.

TURNIP delights in a gravelly soil; and there it can be raised to the greatest perfection, and with the least hazard of miscarriage. At the same time, there is no soil but will bear turnip when well prepared.

No person ever deserved better of a country, than he who first cultivated turnip in the field. No plant is better fitted for the climate of Britain, no plant prospers better in the coldest part of it, and no plant contributes more to fertility. In a word, there has not for two centuries been introduced into Britain a more valuable improvement.

Of all roots, turnip requires the finest mould; and to that end, of all harrows frost is the best. In order to give access to frost, the land ought to be prepared by ribbing after harvest, as above directed in preparing land for barley. If the field be not subject to annuals, it may lie in that state till the end of May; or otherwise the weeds must be destroyed by a braking about the middle of April; and again in May, if weeds rise. The first week of June, plough the field with a shallow furrow. Lime it if requisite, and harrow the lime into the soil. Draw single furrows with intervals of three feet, and lay dung in the furrows. Cover the dung sufficiently, by going round it with the plough, and forming the three-feet spaces into ridges. The dung comes thus to lie below the crown of every ridge.

The season of sowing must be regulated by the time intended for feeding. Where intended for feeding in November, sowing.

November, December, January, and February, the seed ought to be sown from the 1st to the 20th of June. Where the feeding is intended to be carried on to March, April, and May, the seed must not be sown till the end of July. Turnip sown earlier than above directed, flowers that very summer, and runs fast to seed; which renders it in a good measure unfit for food. If sown much later, it does not apple, and there is no food but from the leaves.

Though by a drill-plough the feed may be sown of any thickness, the safest way is to sow thick. Thin sowing is liable to many accidents, which are far from being counterbalanced by the expense that is saved in thinning. Thick-sowing can bear the ravage of the black fly, and leave a sufficient crop behind. It is a protection against drought, gives the plants a rapid progress, and establishes them in the ground before it is necessary to thin them.

The sowing turnip broadcast is universal in England, and common in Scotland, though a barbarous practice. The eminent advantage of turnip is, that beside a profitable crop, it makes a most complete fallow; and the latter cannot be obtained but by horse-hoeing. Upon that account, the sowing turnip in rows at three feet distance is recommended. Wider rows answer no profitable end, frailer rows afford not room for a horse to walk in. When the turnip is about four inches high, annual weeds will appear. Go round every interval with the slightest furrow possible, at the distance of two inches from each row, moving the earth from the rows toward the middle of the interval. A thin plate of iron must be fixed on the left side of the plough, to prevent the earth from falling back, and burying the turnip. Next, let women be employed to weed the rows with their fingers; which is better, and cheaper done, than with the hand-hoe. The hand-hoe, beside, is apt to disturb the roots of the turnip that are to stand, and to leave them open to drought by removing the earth from them. The standing turnip are to be at the distance of twelve inches from each other: a greater distance makes them swell too much; a less distance affords them not sufficient room. A woman soon comes to be expert in finger-weeding. The following hint may be necessary to a learner. To secure the turnip that is to stand, let her cover it with the left hand; and with the right pull up the turnip on both sides. After thus freeing the standing turnip, she may safely use both hands. Let the field remain in this state, till the appearance of new annuals make a second ploughing necessary; which must be in the same furrow with the former, but a little deeper. As in this ploughing the iron plate is to be removed, part of the loose earth will fall back on the roots of the plants: the rest will fill the middle of the interval, and bury every weed. When weeds begin again to appear, then is the time for a third ploughing in an opposite direction, which lays the earth to the roots of the plants. This ploughing may be about the middle of August; after which, weeds rise very faintly. If they do rise, another ploughing will clear the ground of them.

Weeds that at this time rise in the row, may be cleared with a hand-hoe, which can do little mischief among plants distant twelve inches from each other. It is certain however, that it may be done cheaper with the hand (c). And after the leaves of turnips in a row meet together, the hand is the only instrument that can be applied for weeding.

In swampy ground, the surface of which is best reduced by paring and burning, the feed may be sown in rows with intervals of a foot. To save time, a drill-plough may be used that sows three or four rows at once. Hand-hoeing is proper for such ground; because the soil under the burnt *stratum* is commonly full of roots, which digest and rot better under ground than when brought to the surface by the plough. In the mean time, while these are digesting, the ashes will secure a good crop.

2. POTATOES.

THE choice of soil is not of greater importance in any other plant than in a potato. This plant in clay soil, or in rank black loam lying low without ventilation, never makes palatable food. In a gravelly or sandy soil, exposed to the sun and to free air, it thrives to perfection, and has a good relish. But a rank black loam, though improper to raise potatoes for the table, produces them in great plenty; and the product is, as already observed, a palatable food for horned cattle, hogs, and poultry.

The spade is a proper instrument for raising a small quantity, or for preparing corners or other places inaccessible to the plough; but for raising potatoes in quantities, the plough is the only instrument.

As two great advantages of a drilled crop, are, to destroy weeds, and to have a fallow at the same time with the crop, no judicious farmer will think of raising potatoes in any other way. In September or October, as soon as that year's crop is removed, let the field have a rousing furrow, a cross-braking next, and then be cleared of weeds by the cleaning harrow. Form it into three-foot ridges, in that state to lie till April, which is the proper time for planting potatoes. Cross-bake it, to raise the furrows a little. Then lay well-digested horse-dung along the furrows, upon which lay the roots at eight inches distance. Cover up these roots with the plough, going once round every row. This makes a warm bed for the potatoes; hot dung below, and a loose covering above, that admits every ray of the sun. As soon as the plants appear above ground, go round every row a second time with the plough, which will lay upon the plants an additional inch or two of mould, and at the same time bury all the annuals; and this will complete the ploughing of the ridges. When the potatoes are six inches high, the plough, with the deepest furrow, must go twice along the middle of each interval in opposite directions, laying earth first to one row, and next to the other. And to perform this work, a plough with a double mould-board will be more expeditious. But as the earth cannot be laid close to the roots by the plough, the spade must succeed, with

(c) Children under thirteen may be employed to weed turnip with the fingers. We have seen them go on in that work with alacrity; and a small premium will have a good effect. For boys and girls above thirteen, a hand-hoe adapted to their size is an excellent instrument: it strengthens the arms amazingly. In driving the plough, the legs only are exercised; but as the arms are chiefly employed in husbandry, they ought to be prepared beforehand by gentle exercise.

PRACTICE which four inches of the plants must be covered, leaving little more but the tops above ground; and this operation will at the same time bury all the weeds that have sprung since the former ploughing. What weeds arise after, must be pulled up with the hand. A hoe is never to be used here: it cannot go so deep as to destroy the weeds without cutting the fibres of the plants; and if it skim the surface, it only cuts off the heads of the weeds, and does not prevent their pulling again.

¹¹⁸
Best method
of taking
them up.

The shortest and most perfect method of taking up potatoes, is to plough once round every row at the distance of four inches, removing the earth from the plants, and gathering up with the hand all the potatoes that appear. The distance is made four inches, to prevent cutting the roots, which are seldom found above that distance from the row on each side. When the ground is thus cleared by the plough, raise the potatoes with a fork having three broad toes or claws; which is better than a spade, as it does not cut the potatoes. The potatoes thus laid above ground, must be gathered with the hand. By this method scarce a potatoe will be left.

¹²⁹
Of prefer-
ring them.

As potatoes are a comfortable food for the low people, it is of importance to have them all the year round. For a long time, potatoes in Scotland were confined to the kitchen-garden; and after they were planted in the field, it was not imagined at first that they could be used after the month of December. Of late years, they have been found to answer even till April; which has proved a great support to many a poor family, as they are easily cooked, and require neither kiln nor mill. But there is no cause for stopping there. It is easy to preserve them till the next crop: When taken out of the ground, lay in the corner of a barn a quantity that may serve till April, covered from frost with dry straw pressed down: bury the remainder in a hole dug in dry ground, mixed with the husks of dried oats, sand, or the dry leaves of trees, over which build a stack of hay or corn. When the pit is opened for taking out the potatoes, the eyes of what have a tendency to push, must be cut out; and this cargo will serve all the month of June. To be still more certain of making the old crop meet the new, the setting of a small quantity may be delayed till June, to be taken up at the ordinary time before frost. This cargo, having not arrived to full growth, will not be so ready to push as what are set in April.

If the old crop happen to be exhausted before the new crop is ready, the interval may be supplied by the potatoes of the new crop that lie next the surface, to be picked up with the hand; which, far from hurting the crop, will rather improve it.

3. CARROT AND PARSNIP.

¹³⁰
Culture of
carrot.

Of all roots, a carrot requires the deepest soil. It ought at least to be a foot deep, all equally good from top to bottom. If such a soil be not in the farm, it may be made artificially by trench-ploughing, which brings to the surface what never had any communication with the sun or air. When this new soil is sufficiently improved by a crop or two with dung, it is fit for bearing carrots. Beware of dunging the year when the carrots are sown; for with fresh dung they seldom escape rotten scabs.

The only soils proper for that root, are a loam and a **PRACTICE** sandy soil.

The ground must be prepared by the deepest furrow that can be taken, the sooner after harvest the better; immediately upon the back of which, a ribbing ought to succeed, as directed for barley. At the end of March, or beginning of April, which is the time of sowing the seed, the ground must be smoothed with a rake. Sow the seed in drills, with intervals of a foot for hand-hoeing; which is no expensive operation where the crop is confined to an acre or two: but if the quantity of ground be greater, the intervals ought to be three feet, in order for horse-hoeing.

In flat ground without ridges, it may be proper to make parallel furrows with the plough, ten feet from each other, in order to carry off any redundant moisture.

At Parlington in Yorkshire, from the end of September to the first of May, 20 work-horses, four bullocks, and six milk-cows, were fed on the carrots that grew on three acres; and these animals never tasted any other food but a little hay. The milk was excellent: and, over and above, 30 hogs were fattened upon what was left by the other beasts. We have this fact from undoubted authority.

The culture of parsnips is the same with that of ¹³¹Parsnips, carrots.

III. Plants Cultivated for Leaves.

THERE are many garden-plants of this kind. The plants proper for the field are cabbage red and white, colewort plain and curled. As there is very little difference in the cultivation of these plants, we shall confine ourselves to cabbage. The reader will easily apply to the other plants the directions to be given concerning cabbage.

Cabbage is an interesting article in husbandry. It is easily raised, is subject to few diseases, resists frost more than turnip, is palatable to cattle, and sooner fills them than turnip, carrot, or potatoes. ¹³² Culture of cabbage.

The season for setting cabbage, depends on the use it is intended for. If intended for feeding in November, December, and January, plants procured from seed sown the end of July the preceding year, must be set in March or April. If intended for feeding in March, April, and May, the plants must be set the first week of the preceding July, from seed sown in the end of February or beginning of March the same year. The late setting of the plants retards their growth; by which means they have a vigorous growth the following spring. And this crop makes an important link in the chain that connects winter and summer green food. Where cabbage for spring-food happens to be neglected, a few acres of rye, sown at Michaelmas, will supply the want. After the rye is consumed, there is time sufficient to prepare the ground for turnip.

And now to prepare a field for cabbage. Where the plants are to be set in March, the field must be made up after harvest, in ridges three feet wide. In that form let it lie all winter, to be mellowed with air and frost. In March, take the first opportunity, between wet and dry, to lay dung in the furrows. Cover the dung with a plough, which will convert the furrow into a crown, and consequently the crown into a furrow. Set the plants upon the dung, distant from each other

PRACTICE

other three feet. Plant them so as to make a straight line cros the ridges, as well as along the furrows, to which a gardener's line directed perpendicularly cros the furrows will be requisite. This will set each plant at the distance precisely of three feet from the plants that surround it. The purpose of this accuracy, is to give opportunity for ploughing, not only along the ridges, but cros them. This mode is attended with three signal advantages: it saves hand-hoeing, it is a more complete dressing to the soil, and it lays earth neatly round every plant.

If the soil be deep and composed of good earth, a trench-ploughing after the preceding crop will not be amiss; in which case, the time for dividing the field into three-foot ridges as above, ought to be immediately before the dunging for the plants.

If weeds happen to rise so close to the plants as not to be reached by the plough, it will require very little labour to destroy them with a hand-hoe.

Unless the soil be much infested with annuals, twice ploughing after the plants are set will be a sufficient dressing. The first removes the earth from the plants; the next, at the distance of a month or so, lays it back.

Where the plants are to be set in July, the field must be ribbed as directed for barley. It ought to have a slight ploughing in June before the planting, in order to loosen the soil, but not so as to bury the surface-earth; after which the three-foot ridges must be formed, and the other particulars carried on as directed above with respect to plants that are to be set in March.

SECT. IV. Culture of Grass.

THE grasses commonly sown for pasture, for hay, or to cut green for cattle, are red clover, white clover, yellow clover, ryegrass, narrow-leaved plantain commonly called *ribwort*, fainfoin, and lucerne.

Red clover is of all the most proper to be cut green for summer-food. It is a biennial plant when suffered to perfect its seed; but when cut green, it will last three years, and in a dry soil longer. At the same time the safest course is to let it stand but a single year: if the second year's crop happen to be scanty, it proves, like a bad crop of pease, a great encourager of weeds by the shelter it affords them.

Here, as in all other crops, the goodness of seed is of importance. Chuse plump seed of a purple colour, because it takes on that colour when ripe. It is red when hurt in the drying, and of a faint colour when unripe.

¹³³
Of red clo-
ver.

Red clover is luxuriant upon a rich soil, whether clay, loam, or gravel: it will grow even upon a moor, when properly cultivated. A wet soil is its only bane; for there it does not thrive.

To have red clover in perfection, weeds must be extirpated, and stones taken off. The mould ought to be made as fine as harrowing can make it; and the surface be smoothed with a light roller, if not sufficiently smooth without it. This gives opportunity for distributing the seed evenly: which must be covered by a small harrow with teeth no larger than of a garden-rake, three inches long, and six inches asunder*. In harrowing, the man should walk behind with a rope in his hand fixed to the back part of the harrow, ready to disentangle it from stones, clods, turnip or cab-

* Plate V.
fig. 7.

PRACTICE

bage roots, which would trail the seed, and displace it.

Nature has not determined any precise depth for the seed of red clover more than of other feed. It will grow vigorously from two inches deep, and it will grow when barely covered. Half an inch may be reckoned the most advantageous position in clay soil, a whole inch in what is light or loose. It is a vulgar error, that small seed ought to be sparingly covered. Miled by that error, farmers commonly cover their clover-feed with a bushy branch of thorn; which not only covers it unequally, but leaves part on the surface to wither in the air.

The proper season for sowing red-clover, is from the middle of April to the middle of May. It will spring from the first of March to the end of August; but such liberty ought not to be taken except from necessity.

There cannot be a greater blunder in husbandry, than to be sparing of feed. Ideal writers talk of sowing an acre with four pounds. That quantity of seed, say they, will fill an acre with plants as thick as they ought to stand. This rule may be admitted where grain is the object; but it will not answer with respect to grass. Grass-feed cannot be sown too thick: the plants shelter one another: they retain all the dew: and they must push upward, having no room laterally. Observe the place where a sack of pease, or of other grain, has been set down for sowing: the feed dropt there accidentally grows more quickly than in the rest of the field sown thin out of hand. A young plant of clover, or of fainfoin, according to Tull, may be raised to a great size where it has room; but the field will not produce half the quantity. When red clover is sown for cutting green, there ought not to be less than 24 pounds to an acre. A field of clover is seldom too thick: the smaller a stem be, the more acceptable it is to cattle. It is often too thin; and when so, the stems tend to wood.

Red clover is commonly sown with grain; and the most proper grain has been found by experience to be flax. The soil must be highly cultivated for flax as well as for red clover. The proper season of sowing is the same for both: the leaves of flax being very small, admit of free circulation of air; and flax being an early crop, is removed so early as to give the clover time for growing. In a rich soil it has grown so fast, as to afford a good cutting that very year. Next to flax, barley is the best companion to clover. The soil must be loose and free for barley; and so it ought to be for clover: the season of sowing is the same; and the clover is well established in the ground, before it is over-topped by the barley. At the same time, barley commonly is sooner cut than either oats or wheat. In a word, barley is rather a nurse than a stepmother to clover during its infancy. When clover is sown in spring upon wheat, the soil, which has lain five or six months without being stirred, is an improper bed for it; and the wheat, being in the vigour of growth, overtops it from the beginning. It cannot be sown along with oats, because of the hazard of frost; and when sown as usual among the oats three inches high, it is over-topped, and never enjoys free air till the oats be cut. Add, that where oats are sown upon the winter-furrow, the soil is rendered as hard as when under wheat.—Red clover is sometimes sown by itself, with-

out other grain : but this method, beside losing a crop, is not salutary ; because clover in its infant state requires shelter.

As to the quantity of grain proper to be sown with clover : In a rich soil well pulverized, a peck of barley on an English acre is all that ought to be ventured ; but there is not much soil in Scotland so rich. Two Linlithgow firloths make the proper quantity for an acre that produces commonly six bolls of barley ; half a firloth for what produces nine bolls. To those who are governed by custom, so small a quantity will be thought ridiculous. Let them only consider, that a rich soil in perfect good order, will from a single seed of barley produce 20 or 30 vigorous stems. People may flatter themselves with the remedy of cutting barley green for food, if it happen to oppress the clover. This is an excellent remedy in a field of an acre or two ; but the cutting an extensive field for food must be slow ; and while one part is cutting, the clover is smothered in other parts.

135
White and
yellow clo-
ver, rib-
wort, & rye-
grafs.

The culture of white clover, of yellow clover, of ribwort, of ryegrass, is the same in general with that of red clover. We proceed to their peculiarities. Yellow clover, ribwort, ryegrass, are all of them early plants, blooming in the end of April or beginning of May. The two latter are evergreens, and therefore excellent for winter-pasture. Ryegrass is less hurt by frost than any of the clovers, and will thrive in a moister soil : nor in that soil is it much affected by drought. In a rich soil, it grows four feet high : even in the dry summer 1775, it rose to three feet eight inches ; but it had gained that height before the drought came on. These grasses are generally sown with red clover for producing a plentiful crop. The proportion of seed is arbitrary ; and there is little danger of too much. When ryegrass is sown for procuring seed, five firloths wheat-measure may be sown on an acre ; and for procuring seed of ribwort, 40 pounds may be sown. The roots of ryegrass spread horizontally : they bind the soil by their number ; and tho' small, are yet so vigorous as to thrive in hard soil. Red clover has a large tap-root, which cannot penetrate any soil but what is open and free ; and the largeness of the root makes the soil still more open and free. Ryegrass, once a great favourite, appears to be discarded in most parts of Britain. The common practice has been, to sow it with red clover, and to cut them promiscuously the beginning of June for green food, and a little later for hay. This indeed is the proper season for cutting red clover, because at that time it begins to flower ; but as at that time the seed of the ryegrass is approaching to maturity, its growth is stopped for that year, as much as of oats or barley cut after the seed is ripe. Oats or barley cut green before the seed forms, will afford two other cuttings ; which is the case of ryegrass, of yellow clover, and of ribwort. By such management, all the profit will be drawn that these plants can afford.

When red clover is intended for seed, the ground ought to be cleared of weeds, were it for no other purpose than that the seed cannot otherwise be preserved pure : what weeds escape the plough, ought to be taken out by the hand. In England, when a crop of seed is intended, the clover is always first cut for hay. This appears to be done, as in fruit-trees, to check the growth of the wood, in order to encourage the fruit.

This practice will not answer in Scotland, as the seed would often be too late for ripening. It would do better to eat the clover with sheep till the middle of May, which would allow the seed to ripen. The seed is ripe when, upon rubbing it between the hands, it parts readily from the hulk. Then apply the scythe, spread the crop thin, and turn it carefully. When perfectly dry, take the first opportunity of a hot day for threshing it on boards covered with a coarse sheet. Another way less subject to risk, is to stack the dry hay, and to thresh it the end of April. After the first threshing, expose the hulks to the sun, and thresh them over and over till no seed remain. Nothing is more efficacious than a hot sun to make the hulk part with its seed ; in which view it may be exposed to the sun by parcels, an hour or two before the flail is applied.

White clover, intended for seed, is managed in the same manner. No plant ought to be mixed with ryegrass that is intended for seed. In Scotland, much ryegrass seed is hurt by transgressing that rule. The seed is ripe when it parts easily from the hulk. The yellowness of the stem is another indication of its ripeness ; in which particular it resembles oats, barley, and other culmiferous plants. The best manner to manage a crop of rye-grass for seed, is to bind it loosely in small sheaves, widening them at the bottom to make them stand erect ; as is done with oats in moist weather. In that state they may stand till sufficiently dry for threshing. By this method they dry more quickly, and are less hurt by rain, than by close binding and putting the sheaves in shocks like corn. The worst way of all is to spread the rye-grass on the moist-ground, for it makes the seed malten. The sheaves, when sufficiently dry, are carried into clove carts to where they are to be threshed on a board, as mentioned above for clover. Put the straw in a rick when a hundred stone or so are threshed. Carry the threshing-board to the place where another rick is intended ; and so on till the whole seed be threshed, and the straw ricked. There is necessity for clove carts to save the seed, which is apt to drop out in a hot sun ; and, as observed above, a hot sun ought always to be chosen for threshing. Carry the seed in sacks to the granary or barn, there to be separated from the hulks by a fan. Spread the seed thin upon a timber-floor, and turn it once or twice a day till perfectly dry. If suffered to take a heat, it is useless for seed.

The writers on agriculture reckon saintfoin preferable to clover in many respects : They say, that it produces a larger crop ; that it does not hurt cattle when eaten green ; that it makes better hay ; that it continues four times longer in the ground ; and that it will grow on land that will bear no other crop. These are great advantages : But, as we have so little of that kind of grass in Scotland, it cannot be expected that any directions can be given concerning the manner of cultivating it, founded upon experience. We must therefore confine ourselves to such facts as are mentioned by authors of the best credit.

Saintfoin has a very long tap-root, which is able to pierce very hard earth. The roots grow very large ; and the larger they are, they penetrate to the greater depth ; and hence it may be concluded, that this grass, when it thrives well, receives a great part of its nourishment from below the staple of the soil : of course, a deep dry

136
Culture of
saintfoin.

soil

PRACTICE

soil is best for the culture of fainfoin. When plants draw their nourishment from that part of the soil that is near the surface, it is not of much consequence whether their number be great or small. But the case is very different when the plants receive their food, not only near, but also deep below, the surface. Besides, plants that shoot their roots deep are often supplied with moisture, when those near the surface are parched with drought.

To render the plants of fainfoin vigorous, it is necessary that they be sown thin. The best method of doing this is by a drill; because, when sown in this manner, not only the weeds, but also the supernumerary plants, can easily be removed. It is several years before fainfoin comes to its full strength; and the number of plants sufficient to stock a field, while in this imperfect state, will make but a poor crop for the first year or two. It is therefore necessary that it be sown in such a manner as to make it easy to take up plants in such numbers, and in such order, as always to leave in the field the proper number in their proper places. This can only be done, with propriety, by sowing the plants in rows by a drill. Supposing a field to be drilled in rows at ten inches distance, the partitions may be hand-hoed, and the rows dressed in such a manner as to leave a proper number of plants. In this situation the field may remain two years; then one fourth of the rows may be taken out in pairs, in such a manner as to make the beds of fifty inches, with six rows in each, and intervals of thirty inches, which may be ploughed. Next year, another fourth of the rows may be taken out in the same manner, so as to leave double rows with partitions of ten inches, and intervals of thirty: All of which may be hoed at once or alternately, as it may be found most convenient.

The great quantity of this grass which the writers on this subject assure us may be raised upon an acre, and the excellency and great value of the hay made of it, should induce farmers to make a complete trial of it, and even to use the spade in place of the hoe, or hoe-plough, if necessary.

The plants taken up from a field of fainfoin may be set in another field; and if the transplanting of this grass succeeds as well as the transplanting of lucerne has done with Mr Lunin de Chateauxvieux, the trouble and expence will be sufficiently recompensed by the largeness of the crops. In transplanting, it is necessary to cut off great part of the long tap-root: this will prevent it from striking very deep into the soil, and make it push out large roots in a sloping direction from the cut end of the tap-root. Saintfoin managed in this manner, will thrive even on shallow land that has a wet bottom, provided it be not overstocked with plants.

Whoever inclines to try the culture of this grass in Scotland, should take great pains in preparing the land, and making it as free from weeds as possible.

The writers on agriculture, ancient as well as modern, bestow the highest encomiums upon lucerne as affording excellent hay, and producing very large crops. Lucerne remains at least 10 or 12 years in the ground, and produces about eight tons of hay upon the Scots acre. There is but little of it cultivated in Scotland. However, it has been tried in several parts of that country; and it is found, that, when the seed

is good, it comes up very well, and stands the winter-frost. But the chief thing which prevents this grass from being more used in Scotland, is the difficulty of keeping the soil open, and free from weeds. In a few years the surface becomes so hard, and the turf so strong, that it destroys the lucerne before the plants have arrived at their greatest perfection: so that lucerne can scarce be cultivated with success there, unless some method be fallen upon of destroying the natural grass, and prevent the surface from becoming hard and impenetrable. This cannot be done effectually by any other means than horre-hoeing. This method was first proposed by Mr Tull, and afterwards practised successfully by M. de Chateauxvieux near Geneva. It may be of use therefore to give a view of that gentleman's method of cultivating lucerne.

He does not mention any thing particular as to the manner of preparing the land; but only observes in general, that no pains should be spared in preparing it. He tried the sowing of lucerne both in rows upon the beds where it was intended to stand, and likewise the sowing it in a nursery, and afterwards transplanting it into the beds prepared for it. He prefers transplanting; because, when transplanted, part of the tap-root is cut off, and the plant shoots out a number of lateral branches from the cut part of the root, which makes it spread its roots nearer the surface, and consequently renders it more easily cultivated: besides, this circumstance adapts it to a shallow soil, in which, if left in its natural state, it would not grow.

The transplanting of lucerne is attended with many advantages. The land may be prepared in the summer for receiving the plants from the nursery in autumn; by which means the field must be in a much better situation than if the seed had been sown upon it in the spring. By transplanting, the rows can be made more regular, and the intended distances more exactly observed; and consequently the hoeing can be performed more perfectly, and with less expence. Mr Chateauxvieux likewise tried the lucerne in single beds three feet wide, with single rows; in beds three feet nine inches wide, with double rows; and in beds four feet three inches wide, with triple rows. The plants in the single rows were six inches asunder, and those in the double and triple rows were about eight or nine inches. In a course of three years he found, that a single row produced more than a triple row of the same length. The plants of lucerne, when cultivated by transplantation, should be at least six inches asunder, to allow them room for extending their crowns.

He further observes, that the beds or ridges ought to be raised in the middle; that a small trench, two or three inches deep, should be drawn in the middle; and that the plants ought to be set in this trench, covered with earth up to the neck. He says, that if the lucerne be sown in spring, and in a warm soil, it will be ready for transplanting in September; that, if the weather be too hot and dry, the transplanting should be delayed till October; and that, if the weather be unfavourable during both these months, this operation must be delayed till spring. He further directs, that the plants should be carefully taken out of the nursery, so as not to damage the roots; that the roots be left only about six or seven inches long; that the green crops be cut off within about two inches of the crown; that

PRACTICE

PRACTICE that they be put into water as soon as taken up, there to remain till they are planted; and that they should be planted with a planting-stick, in the same manner as cabbages.

He does not give particular directions as to the times of horse-hoeing; but only says in general, that the intervals should be stirred once in the month during the whole time that the lucerne is in a growing state. He likewise observes, that great care ought to be taken not to suffer any weeds to grow among the plants, at least for the first two or three years; and for this purpose, that the rows, as well as the edges of the intervals where the plough cannot go, should be weeded by the hand.

SECT. V. *Rotation of Crops.*

¹³⁸
Rotation of crops. No branch of husbandry requires more skill and sagacity than a proper rotation of crops, so as to keep the ground always in heart, and yet to draw out of it the greatest profit possible. Some plants rob the soil, others are gentle to it: some bind, others loosen. The nice point is, to intermix crops, so as to make the greatest profit consistently with keeping the ground in trim. In that view, the nature of the plants employed in a rotation, must be accurately examined.

¹³⁹
Culmiferous and leguminous plants.
* No 110, 111. The difference between culmiferous and leguminous plants, is occasionally mentioned above *. With respect to the present subject, a closer inspection is necessary. Culmiferous plants, having small leaves and few in number, depend mostly on the soil for nourishment, and little on the air. During the ripening of the seed, they draw probably their whole nourishment from the soil; as the leaves by this time, being dry and withered, must have lost their power of drawing nourishment from the air. Now, as culmiferous plants are chiefly cultivated for their feed, and are not cut down till the seed be fully ripe, they may be pronounced all of them to be robbers, some more, some less. But such plants, while young, are all leaves; and in that state draw most of their nourishment from the air. Hence it is, that where cut green for food to cattle, a culmiferous crop is far from being a robber. A hay-crop accordingly, even where it consists mostly of ryegrass, is not a robber, provided it be cut before the seed is formed; which at any rate it ought to be, if one would have hay in perfection. And the foggage, excluding the frost by covering the ground, keeps the roots warm. A leguminous plant, by its broad leaves, draws much of its nourishment from the air. A cabbage, which has very broad leaves, and a multitude of them, owes its growth more to the air than to the soil. One fact is certain, that a cabbage cut and hung up in a damp place, preserves its verdure longer than other plants. At the same time, a seed is that part of a plant which requires the most nourishment; and for that nourishment a culmiferous plant must be indebted entirely to the soil. A leguminous crop, on the contrary, when cut green for food, must be very gentle to the ground. Pease and beans are leguminous plants; but being cultivated for feed, they seem to occupy a middle station: their feed makes them more severe than other leguminous crops cut green; their leaves, which grow till reaping, make them less severe than a culmiferous plant left to ripen.

These plants are distinguished no less remarkably by
Vol. I.

PRACTICE the following circumstance. All the seeds of a culmiferous plant ripen at the same time. As soon as they begin to form, the plant becomes stationary, the leaves wither, the roots cease to pull, and the plant when cut down is blanched and sapless. The seeds of a leguminous plant are formed successively: flowers and fruit appear at the same time in different parts of the plant. This plant accordingly is continually growing, and pushing its roots. Hence the value of bean or pease straw above that of wheat or oats: the latter is withered and dry when the crop is cut; the former, green and succulent. The difference therefore, with respect to the soil, between a culmiferous and leguminous crop, is great. The latter, growing till cut down, keeps the ground in constant motion, and leaves it to the plough loose and mellow. The former gives over growing long before reaping; and the ground, by want of motion, turns compact and hard. Nor is this all. Dew falling on a culmiferous crop after the ground begins to harden, rests on the surface, and is sucked up by the next sun. Dew that falls on a leguminous crop, is shaded from the sun by the broad leaves, and sinks at leisure into the ground. The ground accordingly, after a culmiferous crop, is not only hard, but dry: after a leguminous crop, it is not only loose, but soft and unctuous.

Of all culmiferous plants, wheat is the most severe, by the long time it occupies the ground without admitting a plough. And as the grain is heavier than that of barley or oats, it probably requires more nourishment than either. It is observed above, that as pease and beans draw part of their nourishment from the air by their green leaves while allowed to stand, they draw the less from the ground; and by their constant growing they leave it in good condition for subsequent crops. In both respects they are preferable to any culmiferous crop.

Culmiferous crops, as observed above, are not robbers when cut green: the soil, far from hardening, is kept in constant motion by the pushing of the roots, and is left more tender than if it had been left at rest without any bearing crop.

Bulbous-rooted plants are above all successful in dividing and pulverising the soil. Potatoe-roots grow six, eight, or ten, inches under the surface; and, by their size and number, they divide and pulverise the soil better than can be done by the plough; consequently, whatever be the natural colour of the soil, it is black when a potatoe-crop is taken up. The potatoe, however, with respect to its quality of dividing the soil, must yield to a carrot or parsnip; which are large roots, and pierce often to the depth of 18 inches. The turnip, by its tap-root, divides the soil more than can be done by a fibrous-rooted plant; but as its bulbous root grows mostly above ground, it divides the soil less than the potatoe, the carrot, or the parsnip. Red clover, in that respect, may be put in the same class with potatoe.

Whether potatoes or turnip be the more gentle crop, appears a puzzling question. The former bears feed, and probably draws more nourishment from the soil than the latter, when cut green. On the other hand, potatoes divide the soil more than turnip, and leave it more loose and friable. It appears no less puzzling, to determine between cabbage and turnip: the former draws

PRACTICE draws more of its nourishment from the air, the latter leaves the soil more free and open.

The result of the whole is what follows : Culmiferous plants are robbers ; some more, some less : they at the same time bind the soil ; some more, some less. Leguminous plants in both respects are opposite : if any of them rob the soil, it is in a very slight degree ; and all of them without exception loosen the soil. A culmiferous crop, however, is generally the more profitable : but few soils can long bear the burden of such crops, unless relieved by interjected leguminous crops. These, on the other hand, without a mixture of culmiferous crops, would soon render the soil too loose.

These preliminaries will carry the farmer some length in directing a proper rotation of crops. Where dung, lime, or other manure, can be procured in plenty to recruit the soil after severe cropping, no rotation is more proper or profitable in a strong soil, than wheat, pease or beans, barley, oats, fallow. The whole farm may be brought under this rotation, except so far as hay is wanted. But as such command of manure is rare, it is of more importance to determine what should be the rotation when no manure can be procured but the dung collected in the farm. Considering that culmiferous crops are the more profitable in rich land, it would be proper to make them more frequent than the other kind. But as there are few soils in Scotland that will admit such frequent culmiferous crops without suffering, it may be laid down as a general rule, that alternate crops, culmiferous and leguminous, ought to form the rotation. Nor are there many soils that will stand good, even with this favourable rotation, unless relieved from time to time by pasturing a few years. If such extended rotation be artfully carried on, crops without end may be obtained in a tolerable good soil, without any manure but what is produced in the farm.

¹⁴⁰
The nature of soil considered with regard to the rotation of crops.

It is scarce necessary to be mentioned, being known to every farmer, that clay answers best for wheat, moist clay for beans, loam for barley and pease, light soil for turnip, sandy soil for rye and buck-wheat ; and that oats thrive better in coarse soil than any other grain. Now, in directing a rotation, it is not sufficient that a culmiferous crop be always succeeded by a leguminous : attention must be also given, that no crop be introduced that is unfit for the soil. Wheat, being a great binder, requires more than any other crop a leguminous crop to follow. But every such crop is not proper : potatoes are the greatest openers of soil ; but they are improper in a wheat-soil. Neither will turnip answer, because it requires a light soil. A very loose soil, after a crop of rye, requires ryegrass to bind it, or the treading of cattle in pasturing : but to bind the soil, wheat must not be ventured ; for it succeeds ill in loose soil.

Another consideration of moment in directing the rotation, is to avoid crops that encourage weeds. Pease is the fittest of all crops for succeeding to wheat, because it renders the ground loose and mellow, and the same soil agrees with both. But beware of pease, unless the soil be left by the wheat perfectly free of weeds ; because pease, if not an extraordinary crop, fosters weeds. Barley may be ventured after wheat, if the farmer be unwilling to lose a crop. It is indeed a robber ; better, however, any crop, than run the hazard of

poisoning the soil with weeds. But to prevent the necessity of barley after wheat, the land ought to be fallowed before the wheat : it cleans the ground thoroughly, and makes pease a secure crop after wheat. And after a good crop of pease, barley never fails. A horse-hoed crop of turnip is equal to a fallow for rooting out weeds ; but turnip does not suit land that is proper for wheat. Cabbage does well in wheat-soil ; and a horse-hoed crop of cabbage, which eradicates weeds, is a good preparation for wheat to be succeeded by pease ; and a crop of beans diligently hand-hoed, is in that view little inferior. As red clover requires the ground to be perfectly clean, a good crop of it ensures wheat, and next pease. In loam, a drilled crop of turnip or potatoes prepares the ground, equal to a fallow, for the same succession.

Another rule is, to avoid a frequent repetition of the same species ; for to produce good crops, change of species is no less necessary than change of feed. The same species returning every second or third year, will infallibly degenerate, and be a scanty crop. This is remarkably the case of red clover. Nor will our fields bear pleasantly perpetual crops of wheat after fallow, which is the practice of some English farmers.

Hitherto of rotation in the same field. We add one rule concerning rotation in different fields ; which is, to avoid crowding crops one after another in point of time ; but to chuse such as admit intervals sufficient for leisurely dressing, which gives opportunity to manage all with the same hands, and with the same cattle ; for example, beans in January or February, pease and oats in March, barley and potatoes in April, turnip in June or July, wheat and rye in October.

For illustrating the foregoing rules, a few instances of exceptionable rotations will not be thought amiss. The following is an usual rotation in Norfolk. First, wheat after red clover. Second, barley. Third, turnip. Fourth, barley with red clover. Fifth, clover cut for hay. Sixth, a second year's crop of clover commonly pastured. Dung is given to the wheat and turnip.—Against this rotation several objections lie. Barley after wheat is improper. The two crops of barley are too near together. The second crop of clover must be very bad, if pasturing be the best way of consuming it ; and if bad, it is a great encourager of weeds. But the strongest objection is, that red clover repeated so frequently in the same field cannot fail to degenerate ; and of this the Norfolk farmers begin to be sensible.—Salton in East Lothian is a clay soil, and the rotation there is, Wheat after fallow and dung. Second, barley after two ploughings ; the one before winter, the other immediately before the seed is sown. Third, oats. Fourth, pease. Fifth, barley. Sixth, oats : and then fallow. This rotation consists chiefly of robbing crops. Pease are the only leguminous crop, which even with the fallow is not sufficient to loosen a stiff soil. But the soil is good, which in some measure hides the badness of the rotation.—About Seaton, and all the way from Preston to Gosford, the ground is still more severely handled : wheat after fallow and dung, barley, oats, pease, wheat, barley, oats, and then another fallow. The soil is excellent ; and it ought indeed to be so, to support many rounds of such cropping.

In the parishes of Tranent, Aberlady, Dirleton, North-

¹⁴¹
Exceptionable rotations.

PRACTICE

North-Berwick, and Athelstonefoord, the following rotations were formerly universal, and to this day are much more frequent than any other mode.

1. After fallow with dung, wheat, barley, oats, pease and beans, barley, oats, wheat.

2. After fallow and dung, barley, oats, pease and beans, wheat, barley, oats, pease, wheat.

3. After fallow and dung, wheat, oats, pease, barley, oats, wheat.

4. After fallow and dung, barley, oats, beans, wheat, pease, barley, oats.

In the several Tours of Young the itinerant farmer, are found, in the best counties of England, examples without end, of rotations no less exceptionable than many of those mentioned.

142
Fields not
to be kept
too long in
pasture.

Where a field is laid down for pasture in order to be recruited, it is commonly left in that state many years; for it is the universal opinion, that the longer it lies, the richer it becomes for bearing corn. This may be true; but in order to determine the mode of cropping, the important point is, what upon the whole is the most profitable rotation; not what may produce luxuriant crops at a distant period. Upon that point, it may be affirmed, that the farmer who keeps a field in pasture beyond a certain time, loses every year considerably; and that a few luxuriant crops of corn, after twenty years of pasture, and still more after thirty, will not make up the loss.

Pasture-grafs, while young, maintains many animals; and the field is greatly recruited by what they drop; it is even recruited by hay-crops, provided the grafs be cut before feeding. But as old grafs yields little profit, the field ought to be taken up for corn when the pasture begins to fail; and after a few crops, it ought to be laid down again with grafs-seeds. Seduced by a chimerical notion, that a field, by frequent corn-crops, is fatigued and requires rest like a labouring man or animal, careful farmers give long rest to their fields by pasture, never adverting that it affords little profit. It ought to be their study, to improve their soil, by making it free, and also retentive of moisture; if they accomplish these ends, they need not be afraid of exhausting the soil by cropping.

143
Examples
of rotations.

Where a farmer has access to no manure but what is his own production, the case under consideration, there are various rotations of crops, all of them good though perhaps not equally so. We shall begin with two examples, one in clay, and one in free soil, each of the farms ninety acres. Six acres are to be inclosed for a kitchen-garden, in which there must be annually a crop of red clover, for summer-food to the working cattle. As there are annually twelve acres in hay, and twelve in pasture, a single plough with good cattle will be sufficient to command the remaining sixty acres.

Rotation in a clay soil.

Inclos.	1775.	1776.	1777.	1778.	1779.	1780.
1.	Fallow.	Wheat.	Pease.	Barley.	Hay.	Oats.
2.	Wheat.	Pease.	Barley.	Hay.	Oats.	Fallow.
3.	Pease.	Barley.	Hay.	Oats.	Fallow.	Wheat.
4.	Barley.	Hay.	Oats.	Fallow.	Wheat.	Pease.
5.	Hay.	Oats.	Fallow.	Wheat.	Pease.	Barley.
6.	Oats.	Fallow.	Wheat.	Pease.	Barley.	Hay.
7.	Pasture.	Pasture.	Pasture.	Pasture.	Pasture.	Pasture.

When the rotation is completed, the seventh inclosure having been six years in pasture, is ready to be taken up for a rotation of crops which begins with oats in the year 1781, and proceeds as in the sixth inclosure. In the same year 1781, the fifth inclosure is made pasture, for which it is prepared by sowing pasture grafs seeds with the barley of the year 1780. And in this manner may the rotation be carried on without end. Here the labour is equally distributed; and there is no hurry nor confusion. But the chief property of this rotation is, that two culmiferous or white-corn crops are never found together; by a due mixture of crops, the soil is preserved in good heart without any adventitious manure. At the same time, the land is always producing plentiful crops: neither hay nor pasture get time to degenerate. The whole dung is laid upon the fallow.

Every farm that takes a grafs-crop into the rotation must be inclosed, which is peculiarly necessary in a clay soil, as nothing is more hurtful to clay than poaching.

Rotation in a free soil.

Inclos.	1775.	1776.	1777.	1778.	1779.	1780.
1.	Turnip.	Barley.	Hay.	Oats.	Fallow.	Wheat.
2.	Barley.	Hay.	Oats.	Fallow.	Wheat.	Turnip.
3.	Hay.	Oats.	Fallow.	Wheat.	Turnip.	Barley.
4.	Oats.	Fallow.	Wheat.	Turnip.	Barley.	Hay.
5.	Fallow.	Wheat.	Turnip.	Barley.	Hay.	Oats.
6.	Wheat.	Turnip.	Barley.	Hay.	Oats.	Fallow.
7.	Pasture.	Pasture.	Pasture.	Pasture.	Pasture.	Pasture.

For the next rotation, the seventh inclosure is taken up for corn, beginning with an oat-crop, and proceeding in the order of the fourth inclosure; in place of which, the third inclosure is laid down for pasture by sowing pasture-grasses with the last crop in that inclosure, being barley. This rotation has all the advantages of the former. Here the dung is employed on the turnip-crop.

We proceed to consider what rotation is proper for carle clay. The farm we propose consists of seventy-three acres. Nine are to be inclosed for a kitchen garden, affording plenty of red clover to be cut green for the farm-cattle. The remaining sixty-four acres are divided into four inclosures, sixteen acres each, to be cropped as in the following table,

Inclos.	1775.	1776.	1777.	1778.
1.	Beans.	Barley.	Hay.	Oats.
2.	Barley.	Hay.	Oats.	Beans.
3.	Hay.	Oats.	Beans.	Barley.
4.	Oats.	Beans.	Barley.	Hay.

Here the dung ought to be applied to the barley.

Many other rotations may be contrived, keeping to the rules above laid down. Fallow, for example, wheat, pease and beans, barley, cabbage, oats, for clay. Here dung must be given both to the wheat and cabbage. For free soil, drilled turnip, barley, red clover, wheat upon a single furrow, drilled potatoes, oats. Both the turnip and potatoes must have dung. Another for free soil: turnip drilled and dunged, red clover, wheat on a single furrow with dung, pease, barley, potatoes, oats.

PRACTICE

oats. The following rotation has proved successful in a soil proper for wheat. 1. Oats with red clover, after fallow, without dung. 2. Hay. The clover-stubble dunged, and wheat sown the end of October with a single furrow. 3. Wheat. 4. Pease. 5. Barley. Fallow again. Oats are taken the first crop, to save the dung for the wheat. Oats always thrive on a fallow, though without dung, which is not the case of barley. But barley seldom fails after pease. In strong clay soil, the following rotation answers. 1. Wheat after fallow and dung. 2. Beans sown under furrow as early as possible. Above the beans, few pease end of March, half a boll per acre, and harrow them in. The two grains will ripen at the same time. 3. Oats or barley on a winter-furrow with grafs-seeds. 4. Hay for one year or two; the second growth pastured. Lay what dung can be spared on the hay-stubble, and sow wheat with a single furrow. 5. Wheat. 6. Beans or pease. 7. Oats. Fallow again.

SECT. VI. Of Reaping Corn and Hay Crops, and Storing them up for use.

¹⁴⁴
Of ripeness.

CULMIFEROUS plants are ripe when the stem is totally white: they are not fully ripe if any green streaks remain. Some farmers are of opinion, that wheat ought to be cut before it is fully ripe. Their reasons are, first, that ripe wheat is apt to shake; and next, that the flour is not so good. With respect to the last, it is contrary to nature, that any seed can be better in an unripe state, than when brought to perfection: nor will it be found so upon trial. With respect to the first, wheat, at the point of perfection, is not more apt to shake than for some days before: the husk begins not to open till after the seed is fully ripe; and then the suffering the crop to stand becomes ticklish: after the minute of ripening, it should be cut down in an instant, if possible.

¹⁴⁵
Of reapers.

This leads to the hands that are commonly engaged to cut down corn. In Scotland, the universal practice was, to provide a number of hands, in proportion to the extent of the crop, without regard to the time of ripening. By this method, the reapers were often idle for want of work; and what is much worse, they had often more work than they could overtake, and ripe fields were laid open to shaking winds. The Lothians have long enjoyed weekly markets for reapers, where a farmer can provide himself with the number he wants; and this practice is creeping into neighbouring shires. Where there is no opportunity of such markets, neighbouring farmers ought to agree in borrowing and lending their reapers.

One should imagine, that a caution against cutting corn when wet, is unnecessary; yet from the impatience of farmers to prevent shaking, no caveat is more so. Why do they not consider, that corn standing dries in half a day; when, in a close sheaf, the weather must be favourable if it dry in a month? in moist weather it will never dry.

¹⁴⁶
Manner of cutting.

With respect to the manner of cutting, we must premise, that barley is of all the most difficult grain to be dried for keeping. Having no husk, rain has easy access; and it has a tendency to malten when wet. Where the ground is properly smoothed by rolling, it seems best to cut it down with the fythe. This manner being more expeditious than the sickle, removes it

sooner from danger of wind; and gives a third more straw, which is a capital article for dung, where a farm is at a distance from other manure. We except only corn that has lodged; for there the sickle is more convenient than the fythe. As it ought to be dry when cut, bind it up directly: if allowed to lie any time in the swath, it is apt to be discoloured.—Barley sown with grafs-seeds, red clover especially, requires a different management. Where the grafs is cut along with it, the difficulty is great of getting it so dry as to be ventured in a stack. The best way is, to cut the barley with a sickle above the clover, so as that nothing but clean barley is bound up. Cut with a fythe the stubble and grafs: they make excellent winter-food. The same method is applicable to oats; with this only difference, that when the field is exposed to the south-west wind, it is less necessary to bind immediately after mowing. As wheat commonly grows higher than any other grain, it is difficult to manage it with the fythe; for which reason the sickle is preferred in England. Pease and beans grow so irregularly, as to make the sickle necessary.

¹⁴⁷
Drying of Pease.

The best way for drying pease, is to keep separate the handfuls that are cut: though in this way they wet easily, they dry as soon. In the common way of heaping pease together for composing a sheaf, they wet as easily, and dry not near so soon. With respect to beans, the top of the handful last cut, ought to be laid on the bottom of the former; which gives ready access to the wind. By this method pease and beans are ready for the stack in half the ordinary time.

¹⁴⁸
Size of sheaves.

A sheaf commonly is made as large as can be contained in two lengths of the corn made into a rope. To save frequent tying, the binder presses it down with his knee, and binds it so hard as totally to exclude the air. If there be any moisture in the crop, which seldom fails, a process of fermentation and putrefaction commences in the sheaf; which is perfected in the stack, to the destruction both of corn and straw. How stupid is it, to make the size of a sheaf depend on the height of the plants! By that rule, a wheat-sheaf is commonly so weighty, as to be unmanageable by ordinary arms: it requires an effort to move it, that frequently bursts the knot, and occasions loss of grain, beside the trouble of a second tying. Sheaves ought never to be larger than can be contained in one length of the plant, cut close to the ground; without admitting any exception, if the plants be above eighteen inches high. The binder's arm can then compress the sheaf sufficiently, without need of his knee. The additional hands that this way of binding may require, are not to be regarded, compared with the advantage of drying soon. Corn thus managed may be ready for the stack in a week; it seldom in the ordinary way requires less than a fortnight, and frequently longer. Of a small sheaf compressed by the arm only, the air pervades every part; nor is it so apt to be unloosed as a large sheaf, however firmly bound. We omit the gathering of sheaves into shocks, because the common method is good, which is to place the shocks directed to the south-west, in order to resist the force of the wind. Five sheaves on each side make a sufficient stay; and a greater number cannot be covered with two head-sheaves.

¹⁴⁹
Carrying off the victual harvest.

Every article is of importance that hastens the operation in a country, like Scotland, subjected to unequal harvest.

PRACTICE harvest-weather; for which reason, the most expeditious method should be chosen for carrying corn from the field to the stack-yard. Our carriages are generally too small or too large. A sledge is a very awkward machine; many hands are required, and little progress made. Waggon and large carts are little less dilatory, as they must stand in the yard till unloaded *sheaf* by *sheaf*. The best way is, to use long carts moveable upon the axle, so as at once to throw the whole load on the ground; which is forked up to the stack by a hand appointed for that purpose. By this method, two carts will do the work of four or five.

150 Building round stacks in the yard is undoubtedly preferable to housing corn. There it is shut up from the air; and it must be exceedingly dry, if it contract not a multitudes, which is the first step to putrefaction. Add to this, that in the yard, a stack is preserved from rats and mice by being set on a pedestal; whereas no method has hitherto been invented for preserving corn in a house from such destructive vermin. The proper manner of building, is to make every sheaf incline downward from its top to its bottom. Where the sheaves are laid horizontally, the stack will take in rain both above and below. The best form of a stack is that of a cone placed on a cylinder; and the top of the cone should be formed with three sheaves drawn to a point. If the upper part of the cylinder be a little wider than the under, so much the better.

151 The delaying to cover a stack for two or three weeks, though common, is, however, exceedingly absurd; for if much rain fall in the interim, it is beyond the power of wind to dry the stack. Vegetation begun in the external parts, shuts out the air from the internal; and to prevent a total putrefaction, the stack must be thrown down, and exposed to the air, every sheaf. In order to have a stack covered the moment it is finished, straw and ropes ought to be ready; and the covering ought to be so thick as to be proof against rain.

Scotland is subject not only to floods of rain, but to high winds. Good covering guards against the former, and ropes artfully applied guards against the latter. The following is a good mode. Take a hay-ropes well twisted, and surround the stack with it, two feet or so below the top. Surround the stack with another such rope immediately below the easing. Connect these two with ropes in an up-and-down position, distant from each other at the easing about five or six feet. Then surround the stack with other circular ropes parallel to the two first mentioned, giving them a twist round every one of those that lie up-and-down, by which the whole will be connected together in a sort of net-work. What remains is, to finish the two feet at the top of the stack. Let it be covered with bunches of straw laid regularly up and down; the under part to be put under the circular rope first mentioned, which will keep it fast, and the upper part be bound by a small rope artfully twisted, commonly called the *crown of the stack*. This method is preferable to the common way of laying long ropes over the top of the stack, and tying them to the belting-rope; which flattens the top, and makes it take in rain. A stack covered in the way here described, will stand two years secure both against wind and rain; a notable advantage in this variable climate.

The great aim in making hay is, to preserve as much of the sap as possible. All agree in this; and yet differ widely in the means of making that aim effectual. To describe all the different means would be equally tedious and unprofitable. We shall confine ourselves to two, which appear preferable to all others. A crop of rye-grass and yellow clover ought to be spread as cut. A day or two after, when the dew is evaporated, rake it into a number of parallel rows along the field, termed *wind-rows*, for the convenience of putting it up into small cocks. After turning the rows once and again, make small cocks weighing a stone or two. At the distance of two days or so, put two cocks into one, observing always to mix the tops and bottoms together, and to take a new place for each cock, that the least damage possible may be done to the grass. Proceed in putting two cocks into one, till sufficiently dry for tramp-ricks of 100 stone each. The easiest way of erecting tramp-ricks, is to found a rick in the middle of the row of cocks that are to compose it. The cocks may be carried to the rick by two persons joining arms together. When all the cocks are thus carried to the rick within the distance of forty yards or so, the rest of the cocks will be more expeditiously carried to the rick, by a rope wound about them and dragged by a horse. Two ropes are sufficient to secure the ricks from wind, the short time they are to stand in the field. In the year 1775, 10,000 stone were put into tramp-ricks the fourth day after cutting. In a country so wet as many parts of Scotland are, expedition is of mighty consequence in the drying both of hay and corn. With respect to hay intended for horned cattle, it is by the generality held an improvement, that it be heated a little in the stack. But we violently suspect this doctrine to have been invented for excusing indolent management. An ox, it is true, will eat such hay; but it will always be found that he prefers sweet hay; and it cannot well be doubted, but that such hay is the most salutary and the most nourishing.

153 The making hay consisting chiefly of red clover, requires more care. The season of cutting is the last week of June, when it is in full bloom: earlier it may be cut, but never later. To cut it later, would indeed produce a weightier crop; but a late first cutting makes the second also late, perhaps too late for drying. At the same time, the want of weight in an early first cutting, is amply compensated by the weight of the second.

When the season is too variable for making hay of the second growth, mix straw with that growth, which will be a substantial food for cattle during winter. This is commonly done by laying strata of the straw and clover alternately in the stack. But by this method, the strata of clover, if they do not heat, turn mouldy at least, and unpalatable. The better way is, to mix them carefully with the hand before they be put into the stack. The dry straw imbibes moisture from the clover and prevents heating.

But the best method of hay-making seems to be that recommended by Mr Anderion *. "Instead," says he, "of allowing the hay to lie, as usual in most places, for some days in the swathe after it is cut, and afterwards alternately putting it up into cocks and spreading it out, and treading it in the sun, which tends greatly to bleach the hay, exhales its natural juices, and subjects

PRACTICE

subjects it very much to the danger of getting rain, and thus runs a great risk of being good for little, I make it a general rule, if possible, never to cut hay but when the grafs is quite dry; and then make the gatherers follow close upon the cutters,—putting it up immediately into small cocks about three feet high each when new put up, and of as small a diameter as they can be made to stand with; always giving each of them a slight kind of thatching, by drawing a few handfuls of the hay from the bottom of the cock all around, and laying it lightly upon the top with one of the ends hanging downwards. This is done with the utmost ease and expedition; and when it is once in that state, I consider my hay as in a great measure out of danger: for unless a violent wind should arise immediately after the cocks are put up, so as to overturn them, nothing else can hurt the hay; as I have often experienced, that no rain, however violent, ever penetrates into these cocks but for a very little way. And, if they are dry put up, they never fit together so closely as to heat; although they acquire, in a day or two, such a degree of firmness, as to be in no danger of being overturned by wind after that time, unless it blows a hurricane.

“In these cocks, I allow the hay to remain, until, upon inspection, I judge that it will keep in pretty large tramp-cocks, (which is usually in one or two weeks, according as the weather is more or less favourable, when two men, each with a long pronged pitchfork, lift up one of these small cocks between them with the greatest ease, and carry them one after another to the place where the tramp-cock is to be built (n); and in this manner, they proceed over the field till the whole is finished.

155
Advantages of this method.

“The advantages that attend this method of making hay, are, That it greatly abridges the labour; as it does not require above the one half of the work that is necessary in the old method of turning and tedding it: That it allows the hay to continue almost as green as when it is cut, and preserves its natural juices in the greatest perfection; for, unless it be the little that is exposed to the sun and air upon the surface of the cocks, which is no more bleached than every straw of hay faved in the ordinary way, the whole is dried in the most slow and equal manner that could be desired: and, lastly, That it is thus in a great measure secured from almost the possibility of being damaged by rain. This last circumstance deserves to be much more attended to by the farmer than it usually is at present; as I have seen few who are sufficiently aware of the loss that the quality of their hay sustains by receiving a slight shower after it is cut, and before it is gathered; the generality of farmers seeming to be very well satisfied if they get in their hay without being absolutely rotted; never paying the least attention to its having been several times wetted while the hay was making. But, if these gentlemen will take the trouble at any time to compare any parcel of hay that has been made perfectly dry, with another parcel from the same field

that has received a shower while in the swathe, or even a copious dew, they will soon be sensible of a very manifest difference between them; nor will their horses or cattle ever commit a mistake in chusing between the two.

“Let it be particularly remarked, that in this manner of making hay, great care must be taken that it be dry when first put into the cocks; for, if it is in the least degree wet at that time, it will turn instantly mouldy, and fit together so as to become totally impervious to the air, and will never afterwards become dry till it is spread out to the sun. For this reason, if at any time during a course of good settled weather you should begin to cut in the morning before the dew is off the grafs, keep back the gatherers till the dew is evaporated; allowing that which was first cut to lie till it is dry before it is cocked. In this case, you will almost always find that the uncut grafs will dry sooner than that which has been cut when wet; and, therefore, the gatherers may always begin to put up that which is fresh cut before the other; which will usually require two or three hours to dry after the new-cut hay may be cocked. And if, at any time, in case of necessity, you should be obliged to cut your hay before it is dry, the same rule must be observed, always to allow it to remain in the swathe till it is quite dry; but, as there is always a great risk of being long in getting it up, and as it never in this case *wins* (E) so kindly as if it had been dry cut, the farmer ought to endeavour, if possible, in all cases, to cut his hay only when dry; even if it should cost him some additional expence to the cutters, by keeping them employed at any other work, or even allowing them to remain idle, if the weather should be variable or rainy.

156
Particular caution requisite in this method.

“But if there is a great proportion of clover, and the weather should chance be close and calm at the time, it may, on some occasions, be necessary to open up these cocks a little, to admit some fresh air into them; in which case, after they have stood a day or two, it may be of great use to turn these cocks and open them up a little, which ought to be done in the driest time of the day; the operator taking that part of each cock which was the top, and with it forming the base of a new one, so that the part which was most exposed to the air becomes excluded from it, and that which was undermost comes to be placed upon the top, so as to make it all dry as equally as possible.

“If the hay has not been damp when it was first put up, the cock may be immediately finished out at once; but if it is at all wet, it will be of great use to turn over only a little of the top of the cock at first, and leaving it in that state to dry a little, proceed to another, and a third, and fourth, &c. treating each in the same way; going on in that manner till you find that the inside of the first opened cock is sufficiently dried, when it will be proper to return to it, turning over a little more of it till you come to what is still damp, when you leave it and proceed to another, and so

(n) If the hay is to be carried to any considerable distance, this part of the labour may be greatly abridged, by causing the carriers take two long sticks of a sufficient strength, and having laid them down by the small cocks parallel to one another, at the distance of one and a half, or two feet asunder, let them lift three or four cocks, one after another, and place them carefully above the sticks, and then carry them all together, as if upon a hand-barrow, to the place where the large rick is to be built.

(E) By *winning* hay, is meant the operation by which it is brought from the succulent state of grafs to that of a dry fodder.

PRACTICE 157
 to on round the whole; always returning afresh till the cocks are entirely finished. This is the best way of faving your hay, if you have been under the necessity of cutting it while damp; but, it is always best to guard against this inconvenience, if possible."

In the yard, a stack of hay ought to be an oblong square, if the quantity be greater than to be easily flowed in a round stack; because a smaller surface is exposed to the air, than in a number of round stacks. For the same reason, a stack of peas ought to have the same form, the straw being more valuable than that of oats, wheat, or barley. The moment a stack is finished, it ought to be covered; because the surface-hay is much damaged by withering in dry weather, and moistening in wet weather. Let it have a pavilion-roof; for more of it can be covered with straw in that shape, than when built perpendicular at the ends. Let it be roped as directed above for corn-stacks; with this difference only, that in an oblong square the ropes must be thrown over the top, and tied to the belt-rope below. This belt-rope ought to be fixed with pins to the stack: the reason is, that the ropes thrown over the stack will bag by the sinking of the stack, and may be drawn tight by lowering the belt-rope, and fixing it in its new position with the same pins.

The stems of hopes, being long and tough, make excellent ropes; and it will be a faving article, to propagate a few plants of that kind for that very end.

A stack of ryegrass hay, a year old, and of a moderate size, will weigh, each cubic yard, 11 Dutch tone. A stack of clover-hay in the same circumstances weighs somewhat less.

SECT. VII. Manures.

The manures commonly used are dung, lime, shell-marl, clay-marl, and stone-marl. Many other substances are used; shavings of horn, for example, refuse of malt, and even old rags: but as the quantity that can be procured is inconsiderable, and as their application is simple, we shall consume no time upon them.

Dung is the chief of all manures; because a quantity of it may be collected in every farm, and because it makes the quickest return. A field sufficiently dunged, will produce good crops four or five years.

Dung of animals that chew the cud, being more thoroughly putrefied than that of others, is fit to be mixed with the soil without needing to be collected into a dunghill. A horse does not chew the cud; and in horse-dung may be perceived straw or ryegrass broken into small parts, but not dissolved: it is proper therefore that the putrefaction be completed in a dunghill. It ought to be mixed there with cool materials: so hot it is, that, in a dunghill by itself, it fumes and burns instead of putrefying. The difference between the dung of a horse and of a horned animal, is visible in a pasture-field: the grass round the former is withered; round the latter, it is ranker and more verdant than in the rest of the field. A mixture of dry and moist stuff, ought to be studied: the former attracting moisture from the latter, they become equally moist.

To prevent sap from running out of a dunghill, its situation should be a little below the surface; and to prevent rain from running into it, it should be surrounded with a ring of sod. If the soil on which the

dunghill stands be porous, let it be paved, to prevent the sap from sinking into the ground. If moisture happen to superabound, it may be led off by a small gutter to impregnate a quantity of rich mould laid down to receive it, which will make it equal to good dung.

Straw should be prepared for the dunghill, by being laid under cattle, and sufficiently moistened. When laid dry into a dunghill, it keeps it open, admits too much air, and prevents putrefaction.

Dung from the stable ought to be carefully spread on the dunghill, and mixed with the former dung. When left in heaps upon the dunghill, fermentation and putrefaction go on unequally.

Complete putrefaction is of importance with regard to the seed of weeds that are in the dunghill: if they remain found, they are carried out with the dung, and infest the ground. Complete putrefaction is of still greater importance by pulverising the dung; in which condition it mixes intimately with the soil, and operates the most powerfully. In land intended for barley, undigested dung has a very bad effect: it keeps the ground open, admits drought, and prevents the seed from springing. On the other hand, when thoroughly rotted, it mixes with the soil, and enables it to retain moisture. It follows, that the properest time for dunging a field, is in its highest pulverisation; at which time the earth mixes intimately with the dung. Immediately before setting cabbage, sowing turnip, or wheat, is a good time. Dung divides and spreads the most accurately when moist. Its intimate mixture with the soil is of such importance, that hands should be employed to divide and spread any lumps that may be in it.

Dung should be spread, and ploughed into the ground, without delay. When a heap lies two or three weeks, some of the moisture is imbibed into the ground, which will produce tufts of corn more vigorous than in the rest of the field. There cannot be a worse practice than to lead out dung before winter, leaving it exposed to frost and snow. The whole spirit of the dung is extracted by rain, and carried off with it. The dung divested of its sap becomes dry in spring, and incapable of being mixed with the mould. It is turned over whole by the plough, and buried in the furrow.

As dung is an article of the utmost importance in Of husbandry, one should imagine, that the collecting it would be a capital article with an industrious farmer. Yet an ingenious writer, observing that the Jamaicans are in this particular much more indolent than the British, ascribes the difference to the difficulty of procuring dung in Jamaica. "In England, where the long winter enables a farmer to raise what quantity he pleases, it is not collected with any degree of industry. But in Jamaica, where there is no winter, and where the heat of the sun is a great obstruction, the farmer must be indefatigable, or he will never raise any dung." Cool interest is not alone a sufficient motive with the indolent, to be active. As dung is of great importance in husbandry, a farmer cannot be too assiduous in collecting animal and vegetable substances that will rot. One article of that kind there is, to collect which there is a double motive, and yet is neglected almost every where. A farm full of weeds is a nuisance to the neighbourhood: it poisons the fields around; and the possessor ought to be disgraced

PRACTICE

PRACTICE

graced as a pest to society. Now the cutting down every weed before the seed is formed, answers two excellent purposes. First, it encourages good crops, by keeping the ground clean. Next, these weeds mixed with other materials in a dunghill, may add considerably to the quantity of dung.

163
Of lime.

Next of lime, which is a profitable manure, and greatly so when it can be got in plenty within a moderate distance. The benefit of lime is so visible, that the use of it has become general, where the price and carriage are in any degree moderate.

164
Its operation.

However people may differ in other particulars, all agree, that the operation of lime depends on its intimate mixture with the soil; and therefore that the proper time of applying it, is when it is perfectly powdered and the soil at the same time in the highest degree of pulverification. Lime of itself is absolutely barren; and yet it enriches a barren soil. Neither of the two produces any good effect without the other; and consequently, the more intimately they are mixed, the effect must be the greater.

Hence it follows, that lime ought always to be slaked with a proper quantity of water, because by that means it is reduced the most effectually into powder. Lime left to be slaked by a moist air, or accidental rain, is seldom or never thoroughly reduced into powder; and therefore can never be intimately mixed with the soil. Sometimes an opportunity offers to bring home shell-lime before the ground is ready for it; and it is commonly thrown into a heap without cover, trusting to rain for slaking. The proper way is, to lay the shell-lime in different heaps on the ground where it is to be spread, to reduce these heaps into powder by slaking with water, and to cover the slaked lime with sod so as to defend it from rain. One however would avoid as much as possible the bringing home lime before the ground be ready for it. Where allowed to lie long in a heap, there are two bad consequences: first, lime attracts moisture, even though well covered, and runs into clots, which prevents an intimate mixture; and next, we know, that burnt limestone, whether in shells or in powder, returns gradually into its original state of limestone; and upon that account also, is less capable of being mixt with the soil. And this is verified by a fact, that, after lying long, it is so hard bound together as to require a pick to separate the parts.

For the same reason, it is a bad practice, though common, to let spread lime lie on the surface all winter. The bad effects abovementioned take place here in part: and there is another; that rain washes the lime down to the furrows, and in a hanging field carries the whole away.

As the particles of powdered lime are both small and heavy, they quickly sink to the bottom of the furrow, if care be not taken to prevent it. In that view, it is a rule, that lime be spread, and mixed with the soil, immediately before sowing, or along with the seed. In this manner of application, there being no occasion to move it till the ground be stirred for a new crop, it has time to incorporate with the soil, and does not readily separate from it. Thus, if turnip-seed is to be sown broadcast, the lime ought to be laid on immediately before sowing, and harrowed in with the seed. If a crop of drilled turnip or cabbage be intended, the lime ought to be spread immediately before forming in

165
Time of liming.

drills. With respect to wheat, the lime ought to be spread immediately before seed-furrowing. If spread more early, before the ground be sufficiently broken, it sinks to the bottom. If a light soil be prepared for barley, the lime ought to be spread after seed-furrowing, and harrowed in with the seed. In a strong soil, it sinks not so readily to the bottom; and therefore, before sowing the barley, the lime ought to be mixed with the soil by a brake. Where moor is summer-fallowed for a crop of oats next year, the lime ought to be laid on immediately before the last ploughing, and braked in as before. It has sufficient time to incorporate with the soil before the land be stirred again.

166
Quantity.

The quantity to be laid on, depends on the nature of the soil. Upon a strong soil, seventy or eighty bolls of shells are not more than sufficient, reckoning four small firlots to the boll, termed *wheat-measure*; nor will it be an overdose to lay on an hundred bolls. Between fifty and sixty may suffice upon medium soils; and upon the thin or gravelly, between thirty and forty. It is not safe to lay a much greater quantity on such soils.

167
Liming pasture-fields.

It is common to lime a pasture-field immediately before ploughing. This is an unsafe practice; it is thrown to the bottom of the furrow, from which it is never fully gathered up. The proper time for liming a pasture field, intended to be taken up for corn, is a year at least, or two, before ploughing. It is washed in by rain among the roots of plants, and has time to incorporate with the soil.

Limestone beat small, makes an excellent manure; and supplies the want of powdered lime, where there is no fuel to burn the limestone. Limestone beat small has not hitherto been much used as a manure; and the proportion between it and powdered lime has not been ascertained. What follows may give some light. Three pounds of raw lime is by burning reduced to two pounds of shell-lime. Yet nothing is expelled by the fire but the air that was in the limestone: the calcareous earth remains entire. Ergo, two pounds of shell-lime contain as much calcareous earth as three pounds of raw limestone. Shell-lime of the best quality, when slaked with water, will measure out to thrice the quantity. But as limestone loses none of its bulk by being burnt into shells, it follows, that three bushels of raw limestone contain as much calcareous earth as six bushels of powdered lime; and consequently, if powdered lime possesses not some virtue above raw limestone, three bushels of the latter beat small should equal as a manure six bushels of the former.

168
Beat lime-ft. ac.

Shell-marl, as a manure, is managed in every respect like powdered lime; with this only difference, that a fifth or a fourth part more in measure ought to be given. The reason is, that shell-marl is less weighty than lime; and that a boll of it contains less calcareous earth, which is the fructifying part of both.

169
Of shell-marl.

Clay and stone marls, with respect to husbandry, are the same, though in appearance different.

The goodness of marl depends on the quantity of calcareous earth in it: which has been known to amount to a half or more. It is too expensive if the quantity be less than a third or a fourth part. Good marl is the most substantial of all manures; because it improves the weakest ground to equal the best borough-acres. The low part of Berwickshire termed *the Merse*, abounds every

170
Of clay and stone-marls.

PRACTICE every where with this marl; and is the only county in Scotland where it is in plenty.

Land ought to be cleared of weeds before marling; and it ought to be smoothed with the brake and harrow, in order that the marl may be equally spread. Marl is a soil on which no vegetable will grow; its efficacy depends, like that of lime, on its pulverisation, and intimate mixture with the soil. Toward the former, alternate drought and moisture contribute greatly, as also frost. Therefore, after being evenly spread, it ought to lie on the surface all winter. In the month of October, it may be roused with a brake; which will bring to the surface, and expose to the air and frost, all the hard parts, and mix with the soil all that is powdered. In that respect it differs widely from dung and lime, which ought to be ploughed into the ground without delay. Oats is a hardy grain, which will answer for being the first crop after marling, better than any other; and it will succeed though the marl be not thoroughly mixed with the soil. In that case, the marl ought to be ploughed in with an ebb furrow immediately before sowing, and braked thoroughly. It is ticklish to make wheat the first crop: if sown before winter, frost swells the marl, and is apt to throw the seed out of the ground; if sown in spring, it will suffer more than oats by want of due mixture.

Summer is the proper season for marling; because in that season the marl, being dry, is not only lighter, but is easily reduced to powder. Frost however is not improper for marling; especially as in frost there is little opportunity for any other work.

Marl is a heavy body, and sinks to the bottom of the furrow, if indifferently ploughed. Therefore the first crop should always have an ebb furrow. During the growing of that crop, the marl has time to incorporate with the soil, and to become a part of it; after which it does not readily separate.

SECT. VIII. Principles and Operations of the New or Horse-hoeing Husbandry.

THE general properties attributed to the new husbandry may be reduced to two, *viz.* the promoting the growth of plants by hoeing, and the saving of seed; both of which are equally profitable to the farmer.

The advantages of tillage before sowing have already been pointed out. In this place we must confine ourselves to the utility of tillage after sowing. This kind of tillage is most generally known by the name of *horse-hoeing*.

Land sowed with wheat, however well it may be cultivated in autumn, sinks in the winter; the particles get nearer together, and the weeds rise; so that in spring, the land is nearly in the same situation as if it never had been ploughed. This, however, is the season when it should branch and grow with most vigour; and consequently stands most in need of ploughing or hoeing, to destroy the weeds, to supply the roots with fresh earth, and, by dividing anew the particles of the soil, to allow the roots to extend and collect nourishment.

It is well known, that, in gardens, plants grow with double vigour after being hoed or transplanted. If plants growing in arable land could be managed with care and safety in this manner, it is natural to expect, that their growth would be promoted accordingly. Experience shows, that this is not only practicable, but attended with many advantages.

VOL. I.

In the operation of hoeing wheat, though some of the roots be moved or broken, the plants receive no injury; for this very circumstance makes them send forth a greater number of roots than formerly, which enlarge their pasture, and consequently augment their growth.

Sickly wheat has often recovered its vigour after a good hoeing, especially when performed in weather not very hot or dry.

Wheat, and such grain as is sown before winter, requires hoeing more than oats, barley, or other grain sown in the spring; for, if the land has been well ploughed before the sowing of spring-corn, it neither has time to harden, nor to produce many weeds, not having been exposed to the winter's snow and rain.

OF SOWING.

As, in the practice of the new husbandry, plants grow with greater vigour than by the old method, the land should be sowed thinner. It is this principle of the new husbandry that has been chiefly objected to; for, upon observing the land occupied by a small number of plants, people are apt to look upon all the vacant space as lost. But this prejudice will soon be removed, when it is considered, that, in the best land cultivated in the common method, and sown very thick, each seed produces but one or two ears; that, in the same land sown thinner, every seed produces two or three ears; and that a single seed sometimes produces 18 or 21 ears.

In the common method, as there are many more plants than can find sufficient nourishment, and as it is impossible to assist them by hoeing, numbers die before they attain maturity, the greatest part remain sickly and drooping; and thus part of the seed is lost. On the contrary, in the new method, all the plants have as much food as they require; and as they are, from time to time, assisted by hoeing, they become so vigorous as to equal in their production the numerous but sickly plants cultivated in the common method.

OF HOEING.

THE new husbandry is absolutely impracticable in lands that are not easily ploughed. Attempting to cultivate land according to this husbandry, without attending to this circumstance, that it is practicable in no land excepting such as have already been brought into good tilth by the old method, has gone far to make it contemptible in many places.

When a field is in good tilth, it should be sown so thin as to leave sufficient room for the plants to extend their roots. After being well ploughed and harrowed, it must be divided into rows, at the distance of thirty inches from one another. On the sides of each of these rows, two rows of wheat must be sowed six inches distant from each other. By this means there will be an interval of two feet wide betwixt the rows, and every plant will have room enough to extend its roots, and to supply it with food. The intervals will likewise be sufficient for allowing the earth to be hoed or tilled without injuring the plants in the rows.

The first hoeing, which should be given before the winter, is intended to drain away the wet, and to dispose the earth to be mellowed by the frosts. These two ends will be answered by drawing two small furrows at a little distance from the rows, and throwing

172

sowing in
the New
Husbandry.

171
Advantages
ascribed to
horse-hoe-
ing.

173
The differ-
ent hoe-
ings.

the earth taken from the furrows into the middle of the intervals. This first hoeing should be given when the wheat is in leaf.

The second hoeing, which is intended to make the plants branch, should be given after the hard frosts are over. To do this with advantage, after stirring the earth a little, near the rows, the earth which was thrown in the middle of the intervals should be turned back into the furrows. This earth, having been mellowed by the winter, supplies the plants with excellent food, and makes the roots extend.

The third hoeing, which is intended to invigorate the stalk, should be given when the ears of the corn begin to shew themselves. This hoeing may, however, be very slight.

But the last hoeing is of the greatest importance, as it enlarges the grain, and makes the ears fill at their extremities. This hoeing should be given when the wheat is in bloom; a furrow must be drawn in the middle of the interval, and the earth thrown to the right and left on the foot of the plants. This supports the plants, prevents them from being laid, and prepares the ground for the next sowing, as the seed is then to be put in the middle of the ground that formed the intervals.

By this successive tillage, or hoeing, good crops will be obtained, provided the weather is not very unfavourable.

But as strong, vigorous plants are longer before they arrive at maturity, corn raised in the new way is later in ripening than any other, and must therefore be sown earlier.

In order to prepare the intervals for sowing again, some well-rotted dung may be laid in the deep furrows made in the middle of the intervals; and this dung must be covered with the earth that was before thrown towards the rows of wheat. But, if the land does not require mending, the deep furrow is filled without any dung. This operation should be performed immediately after harvest, that there may be time to give the land a slight stirring before the rows are sowed; which should occupy the middle of the space which formed the intervals during the last crop. The intervals of the second year take up the space occupied by the stubble of the first.

Supposing dung to be necessary, which is denied by many, a very small quantity is sufficient; a single layer, put in the bottom of each furrow, will be enough.

DESCRIPTION of the INSTRUMENTS commonly used in the NEW HUSBANDRY.

174
Instruments
described.
Plate VI.

Fig. 1. is a marking-plough. The principal use of this plough is to straighten and regulate the ridges. The first line is traced by the eye, by means of three poles, placed in a straight line. The plough draws the first furrow in the direction of this line; and, at the same time, with the tooth A, fixed in the block of wood near the end of the cross-poll or slider B B, marks the breadth of the ridge at the distance intended. The ploughman next traces the second line or rutt made by the tooth, and draws a small furrow along it; and continues in this manner till the whole field is laid out in straight and equidistant ridges.

Fig. 2. is a plough for breaking up lee, or turning up the bottom of land when greatly exhausted. By its construction, the width and depth of the furrows can

be regulated to a greater certainty than by any other hitherto known in this country. Its appearance is heavy; but two horses are sufficient to plough with it in ordinary free land; and only four are necessary in the stiffest clay-foils. This plough is likewise easily held and tempered. A, is the sword fixed in the fizers B, which runs thro' a mortoise E, at the end of the beam C, and regulates the depth of the furrow by raising or depressing the beam; it is fixed by putting the pin D thro' the beam and sword, and is moveable at E.

Fig. 3. is a jointed-brake-harrow with 24 teeth, shaped like coulters, and standing at about an angle of 80 degrees. By this instrument the land is finely pulverised, and prepared for receiving the seed from the drill. It requires four horses in stiff, and two in open, land. This harrow is likewise used for levelling the ridges; which is done by prefling it down by the handles where the ridge is high, and raising it up when low.

Fig. 4. is an angular weeding-harrow, which may follow the brake when necessary. The seven hindmoist teeth should stand at a more acute angle than the rest, in order to collect the weeds, which the holder can drop at pleasure, by raising the hinder part, which is fixed to the body of the harrow by two joints.

Fig. 5. is a pair of harrows with shafts. This harrow is used for covering the seed in the drills, the horse going in the furrow.

Fig. 6. is a drill-plough, constructed in such a manner as to sow at once two rows of beans, peas, or wheat. This machine is easily wrought by two horses. A, is the happer for containing the seed; B, circular boxes for receiving the seed from the happer; C C, two square boxes which receive the seed from small holes in the circular boxes, as they turn round; and last of all, the seed is dropped into the drills through holes in the square boxes, behind the coulters D. The cylinder E follows, which, together with the wheel F, regulates the depth of the coulters, and covers the feed; the harrow G comes behind all, and covers the feed more completely. H H, two sliders, which, when drawn out, prevent the seed from falling into the boxes; and, I, is a ketch which holds the rungs, and prevents the boxes from turning, and losing seed at the ends of the ridges.

Fig. 7. is a single hoe-plough of a very simple construction, by which the earth in the intervals is stirred and laid up on both sides to the roots of the plants, and at the same time the weeds are destroyed. A A the mould-boards, which may be raised or depressed at pleasure, according as the farmer wants to throw the earth higher or lower upon the roots.

SUMMARY of the OPERATIONS necessary in executing the NEW HUSBANDRY with the PLOUGH.

1. It is indispensably necessary that the farmer be provided with a drill and hoe-plough.
2. The new husbandry may be begun either with the winter or spring corn.
3. The land must be prepared by four good ploughings, given at different times, from the beginning of April to the middle of September.
4. These ploughings must be done in dry weather, to prevent the earth from kneading.
5. The land must be harrowed in the same manner as if it were sowed in the common way.
6. The rows of wheat should be sowed very straight.

7. When

175
Summary of
the opera-
tions.

Plate VI.

7. When the field is not very large, a line must be strained across it, by which a rill may be traced with a hoe for the horse that draws the drill to go in; and when the rows are sown, 50 inches must be left betwixt each rill. But, when the field is large, stakes at five feet distance from each other must be placed at the two ends. The workman must then trace a small furrow with a plough that has no mold-board, for the horse to go in that draws the drill, directing himself with his eye by the stakes.

8. The fowing should be finished at the end of September, or beginning of October.

9. The furrows must be traced the long way of the land, that as little ground as possible may be lost in head-lands.

10. The rows, if it can be done, should run down the slope of the land, that the water may get the easier off.

11. The seed-wheat must be plunged into a tub of lime-water, and stirred, that the light corn may come to the surface and be skimmed off.

12. The seed must be next spread on a floor, and frequently stirred, till it is dry enough to run through the valves of the happer of the drill.

13. To prevent smut, the seed may be put into a ley of ashes and lime.

14. After the hoppers of the drill are filled, the horse must go slowly along the furrow that was traced. That a proper quantity of seed may be sown, the aperture of the happer must be suited to the size of the grain.

15. As the drill is seldom well managed at first, the field should be examined after the corn has come up, and the deficiencies be supplied.

16. Stiff lands, that retain the wet, must be stirred or hoed in October. This should be done by opening a furrow in the middle of the intervals, and afterwards filling it up by a furrow drawn on each side, which will raise the earth in the middle of the intervals, and leave two small furrows next the rows, for draining off the water, which is very hurtful to wheat in winter.

17. The next stirring must be given about the end

of March, with a light plough. In this stirring the furrows made to drain the rows must be filled up by earth from the middle of the intervals.

18. Some time in May, the rows must be evened; which, though troublesome at first, soon becomes easy, as the weeds are soon kept under by tillage.

19. In June, just before the wheat is in bloom, another stirring must be given with the plough. A deep furrow must be made in the middle of the intervals, and the earth thrown upon the sides of the rows.

20. When the wheat is ripe, particular care must be taken, in reaping it, to trample as little as possible on the ploughed land.

21. Soon after the wheat is carried off the field, the intervals must be turned up with the plough, to prepare them for the feed. The great furrow in the middle must not only be filled, but the earth raised as much as possible in the middle of the intervals.

22. In September, the land must be again sowed with a drill, as above directed.

23. In October, the stubble must be turned in for forming the new intervals; and the same management must be observed as directed in the first year.

We pretend not to determine whether the old or new husbandry be preferable in every country.

With regard to this point, the climate, the situation of particular land, skill and dexterity in managing the machinery, the comparative expence in raising crops, and many other circumstances, must be accurately attended to before a determination can be given. One observation, however, may be made in favour of the new husbandry:—Though the particular modes of cultivating land by it are perhaps too limited to be universally adopted; yet it has been of great use in raising suspicions concerning the old method, and in turning the views of philosophers and farmers towards improving in general. Many real improvements in agriculture have been the consequences of these suspicions; and as this spirit of inquiry remains in full vigour, particularly in our own country, a solid foundation is laid for expecting still further improvements in this useful art.

A G R

A G R

AGRIFOLIUM, or AQUIFOLIUM. See ILEX.

AGRIMONIA, AGRIMONY; a genus of the digynia order, belonging to the dodecandria class of plants. Of this genus there are five species enumerated by botanical writers; but none of them have any remarkable properties except the two following.—

(1.) The eupatori, or common agrimony. It grows naturally in several parts of Britain by the sides of hedges and of woods.—This species is eat by sheep and goats, but refused by horses and swine. The Canadians are said to use an infusion of the root in burning fevers, with great success. An infusion of six ounces of the crown of the root in a quart of boiling water, sweetened with honey, and half a pint of it drank three times a-day, is an effectual cure for the jaundice, according to Doctor Hill. He advises to begin with a vomit, afterwards to keep the belly soluble, and to continue the medicine as long as any symptoms of the disease remain.—It is said to be an aperient, detergent, and strengthener of the viscera. Hence it is recommended in scorbutic disorders, in debility and laxity of

the intestines, &c. Digested in whey, it affords an useful diet-drink for the spring-season, not ungrateful to the palate or stomach. Doctor Alston says, that the best mode of administering this herb is in powder, when the intention is to corroborate; and that if thus taken in a large quantity, we may expect many of the effects of the bark from it in agues.—(2.) The odorata, or sweet-scented agrimony. This grows near four feet high; the leaves have more pinnæ than the former; the serratures of the leaves are also sharper, and, when handled, they emit an agreeable odour. The leaves of this species make an agreeable cooling tea, which is sometimes prescribed by physicians as a drink for people in fevers.

Culture. Both these species may be propagated either by seed, or by parting the roots in autumn when the leaves begin to decay. The seeds ought also to be sown in this season; for if kept out of the ground till spring, they seldom come up that year.—Agrimony is a hardy perennial plant, and will thrive in almost any soil or situation; but the plants should not be placed

Agri-
monoides
||
Agrippa.

nearer one another than two feet, that the roots may have room to spread.

AGRIMONOIDES, the trivial name of a species of the agrimonia.

AGRIMONY. See AGRIMONIA.

Hemp AGRIMONY. See EUPATORIUM.

Water-hemp AGRIMONY. See BIDENT.

AGRIONIA, in Grecian antiquity, festivals annually celebrated, by the Bœotians, in honour of Bacchus. At these festivals, the women pretended to search after Bacchus as a fugitive; and, after some time, gave over their inquiry, saying, that he was fled to the Muses, and was concealed among them.

AGRIOPHAGI, in antiquity, a name given to those who fed on wild beasts. The word is Greek, compounded of *αγρος*, wild, savage, and *φαγε*, I eat. The name is given, by ancient writers, to certain people, real or fabulous, said to have fed altogether on lions and panthers. Pliny and Solinus speak of *Agriophagi* in Ethiopia, and Ptolemy of others in India on this side the Ganges.

AGRIPPA, in midwifery, a term applied to children, brought forth with their feet foremost.

AGRIPPA (Herod) son of Aristobulus by Berenice, and the grandson of Herod the Great. He was cast into prison by Tiberius for wishing Caius emperor, who gave him a chain of gold, equal in weight to those which he had wore in prison, and afterward made him king of Judea. He put St James to death, imprisoned St Peter, and, for allowing the deifying shouts of the people, was eaten up with worms.

AGRIPPA II. son of the preceding Herod, was made king of Chalcide; but three or four years after, he was deprived of that kingdom by Claudius, who gave him in the place of it other provinces. In the war Vespasian carried on against the Jews, Herod sent him a succour of 2000 men; by which it appears, that, tho' a Jew by religion, he was yet entirely devoted to the Romans, whose assistance indeed he wanted, to secure the peace of his own kingdom. He lived to the third year of Trajan, and died at Rome A. C. 100. He was the seventh and last king of the family of Herod the Great. It was before him and Berenice his sister, that St Paul pleaded his cause at Cæsarea.

AGRIPPA (Marcus Vipsanius), son-in-law to Augustus, of mean birth, but one of the most considerable generals among the Romans. Augustus's victory over Pompey and Mark Anthony was owing to his counsel: he adorned the city with the pantheon, baths, aqueducts, &c.

AGRIPPA (Cornelius), born at Cologne in 1486, a man of considerable learning, and by common report a great magician; for the monks at that time suspected every thing of heresy or sorcery which they did not understand. He composed his *Treatise of the Excellence of Women*, to insinuate himself into the favour of Margaret of Austria, governess of the Low-Countries. He accepted of the charge of historiographer to the emperor, which that prince gave him. The treatise of the *Vanity of the Sciences*, which he published in 1530, enraged his enemies extremely; as did that of *Occult Philosophy*, which he printed soon after at Antwerp. He was imprisoned in France for something he had written against Francis I.'s mother; but was enlarged, and went to Grenoble, where he died in 1534. His works are

printed in two volumes octavo.

AGRIPPINA, daughter of Germanicus, sister of Caligula, and mother of Nero; a woman of wit, but excessively lewd: she was thrice married, the last time to Claudius her own uncle, whom she poisoned to make way for Nero her son. Nero afterward caused her to be murdered in her chamber, when he bid the executioner stab her first in the belly, that had brought forth such a monster.

AGRIPPINA COLONIA UBIORUM, (Pliny, Suetonius); now *Cologne*: so called from Agrippina, the daughter of Germanicus, and mother of Nero, who had a colony sent thither at her request by the emperor Claudius, to honour the place of her birth. See *COLOGNE*.

AGRIPPINIANS, in church-history, the followers of Agrippinus bishop of Carthage, in the third century, who first introduced and defended the practice of rebaptization.

AGROM, a disease frequent in Bengal, and other parts of the Indies, wherein the tongue chaps and cleaves in several places, being extremely rough withal, and sometimes covered with white spots. The Indians are very fearful of this disease, which they attribute to extreme heat of the stomach. Their remedy is, to chew the black-seeded basilica, drink some chalybeated liquor, or the juice of large mint.

AGROSTEMMA, WILD LYCHNIS, or CAMPION; a genus of the pentagynia order, belonging to the decandria class of plants.

Species. The most remarkable are, 1. The githago, hairy wild lychnis, or common campion, which grows naturally in corn-fields in most parts of Britain. The flowers appear in June, are generally purple, sometimes white, and by cultivation yellow. 2. The coronaria, or single rose-campion. Of this species there are four varieties; one with deep red, another with flesh-coloured, a third with white, flowers; and a fourth with double flowers, which has turned most of the others out of the gardens. 3. The *flos jovis*, or umbelliferous mountain-campion, grows naturally upon the Helvetic mountains: it is a low plant with woolly leaves: the flower-stem rises near a foot high; the flowers grow in umbels on the top of the stalk, and are of a bright red colour. They appear in July, and the seeds ripen in September.

Culture. The first and third species are annual plants, so must be propagated by seeds; but as the first is found naturally in corn-fields, it is very seldom cultivated in gardens; the third sort should have a shady situation, and thrives best in a strong soil. The second species is perennial, but only those varieties which have single flowers produce any seeds; the double kind, therefore, as it produces no seeds, must be propagated by parting the roots in autumn, after the flowers are past. In doing this, every head which can be slipped off with roots should be parted: these should be planted in a border of fresh undug earth, at the distance of six inches one from the other, observing to water them gently until they have taken root; after which they will require no more; for much wet is very injurious to them, as is also dung. In this border they may remain till spring, when they should be planted in the borders of the flower-garden, where they will be very ornamental during the time of their flowering, which is in July and August.—This plant is eat by horses,

Agrippina
||
Agrostem-
ma.

Agrostis

Aguilonius

horses, goats, and sheep.

AGROSTIS, *BENT-GRASS*, in botany, a genus of the triandria order, belonging to the digynia class of plants. The calix has two valves, terminated by a beard or awn. There are fifteen species; eight of them natives of Britain. See *GRASS*.

AGROSTOGRAPHIA, signifies the history or description of grasses.

AGROUND, the situation of a ship whose bottom, or any part of it, hangs or rests upon the ground, so as to render her immovable, till a greater quantity of water floats her off, or till she is drawn out into the stream by the application of mechanical powers.

AGRYPNIA, among physicians, implies an inaptitude to sleep; a troublesome symptom of feverish and other disorders.

AGRYPNIA, in the Greek church, implies the vigil of any of the greater festivals.

AGUE, a general name for all periodical fevers, which, according to the different times of the returns of the feverish paroxysm, are denominated tertian, quartan, and quotidian. See *MEDICINE*, n° 424—426.

AGUE-TREE, a name given to the salisfras, on account of its febrifuge qualities.

AGUEPERSE, a town of France, situated on the Lyonnois, about fifteen miles north of Clermont.

AGUILLANEUF, or **AGUILLANEUF**, a form of rejoicing used among the ancient Franks on the first day of the year. The word is compounded of the French *A* to, *gui* mistletoe, and *l'an neuf* the new year. Its origin is traced from a druid-ceremony: the priests used to go yearly in December, which with them was reputed a sacred month, to gather mistletoe of the oak in great solemnity. The prophets marched in the front, singing hymns in honour of their deities; after them came a herald with a caduceus in his hand; these were followed by three druids a-breast, bearing the things necessary for sacrifice; last of all came the chief, or arch-druid, accompanied with the train of people. The chief druid climbing the oak, cut off the mistletoe with a golden sickle, and the other druids received it in a white cloth; on the first day of the year, it was distributed among the people, after having blessed and consecrated it by crying *Au gui l'an neuf*, to proclaim the new year. This cry is still continued in Picardy, with the addition of *Plantez, Plantez*, to wish a plentiful year. In Burgundy and some other parts, the children use the same word to beg a new-year's gift. Of later times the name *Aguillaneuf* was also given to a sort of begging, practised in some dioceses, for church-tapers, on new-year's day, by a troop of young people of both sexes, having a chief, &c. It was attended with various ridiculous ceremonies, as dancing in the church, &c. which occasioned the synods to suppress it.

AGUILLAR, a town of Spain, in the province of Navarre, about twenty-four miles west of Estella.

AGUILLAR Del Campo, a town of Old Castile, with the title of marquitate, about 15 leagues north of the city of Burgos.

AGUILLONIUS (Francis), a Jesuit, born at Brussels: he was rector of the Jesuits college at Antwerp, and eminent for his skill in mathematics. He was the first who introduced that science among the Jesuits in the low countries: he wrote a book of Optics, and was employed in finishing his Catoptrics and Dioptrics,

when death prevented him in 1617.

AGUIRRA (Joseph Sænz de), a Benedictine, and one of the most learned men of the 17th century, was born March 24, 1630. He was censor and secretary of the supreme council of the inquisition in Spain, and interpreter of the scriptures in the university of Salamanca. He printed three volumes in folio upon Philosophy, a Comentary upon Aristotle's ten books of Ethics, and other pieces. He died at Rome, August 19, 1699.

AGUL, in botany, a synonyme of the hedyсарum, See *HEDYSARUM*.

AGURAH, in Jewish antiquity, the name of a silver coin, otherwise called *gerah* and *kesbitha*.

AGURIUM, or **AGYRIUM**, (anc. geogr.) a town of Sicily in the Val di Demona, near the river Semeus. The people were called *Populus Agrynensis*, by Cicero; *Agrinus*, by Pliny. It was the birth-place of Diodorus Siculus, as he himself testifies; but he calls it *Agrium*, as it is now called *S. Philippo d'Argirone*, which modern name seems to confirm that *Argyrium* is the true reading.

AGUSADURA, in ancient customs, a fee due from vassals to their lord for the sharpening their ploughing tackle. Anciently the tenants in some manors were not allowed to have their rural implements sharpened by any but whom the lord appointed; for which an acknowledgment was to be paid, called *Agusadura*, in some places *Agusage*: which some take to be the same with what was otherwise called *Reillage*, from the ancient French *Reille*, a plough-share.

AGUTI, in zoology, the trivial name of a species of the mouse, belonging to the mammalia gires of Linnæus. See *MUS*.

AGUTI-GUEFA, in botany. See *SAGITTARIUM*.

AGYEI, in antiquity, a kind of obelisks, sacred to Apollo, erected in the vestibles of houses, by way of security.

AGYNIANI, in church-history, a sect who condemned all use of flesh, and marriage, as not instituted by God, but introduced at the instigation of the devil. The word is compounded of the privative *a* and *γυν* woman. They are sometimes also called *Agyntenses*, and *Agyntii*; and are said to have appeared about the year 694. It is no wonder they were of no long continuance. Their tenets coincide in a great measure with those of the Abelians, Gnostics, Cerdonians, and other preachers of chastity and abstinence.

AGYRTÆ, in antiquity, a kind of strolling impostors running about the country, to pick up money by telling fortunes at rich mens doors, pretending to cure diseases by charms, sacrifices, and other religious mysteries; also to expiate the crimes of their deceased ancestors, by virtue of certain odours and fumigations; to torment their enemies, by the use of magical verses and the like. The word is Greek *Αγυρται*, formed of the verb *αγυρ*, I congregate; alluding to the practice of Charlatans, who gather a crowd about them.

AGYRTÆ, among the Greeks, amount to the same with *Erufatores* among the Latins, and differ not much from gypsies among us.

AHAB, son of Omri king of Israel, succeeded his father A. M. 3086, and surpassed all his predecessors in impiety and wickedness.

Aguil

Ahab.

Ahæstulla

|| Ajax.

AHETULA, the trivial name of a species of the coluber. See COLUBER.

AHALOTH. See XYLO-ALOES.

AHEAD, a sea-term, signifying further onward than the ship, or at any distance before her, lying immediately on that point of the compass to which her stem is directed. It is used in opposition to *astern*, which expresses the situation of any object behind the ship. See ASTERN.

AHICCYATLI, in zoology, the Indian name of a serpent resembling the rattle-snake, only it wants the rattles. It is as fatal in the effect of its poison as any known species of serpent.

AHMELLA, in botany. See BIDENT.

AHOUI, in botany, a synonyme, and also the trivial name of a species of the cerbera. See CERBERA.

A-HULL, in the sea-language, the situation of a ship when all her sails are furled on account of the violence of the storm, and when having lashed her helm on the lee-side, she lies nearly with her side to the wind and sea, her head being somewhat inclined to the direction of the wind.

AHUN, a town in France, in the Upper Marche and generality of Moulins, and is a royal jurisdiction. It is seated on the river Creuse, near a Benedictine abbey of the same name, eight miles south-east of Gueret, 30 north-east of Lomages, and 55 south-east of Moulins. E. Long. 2. 8. N. Lat. 49. 5.

AHUYS, a town of Sweden. It is small, but very strong by its situation, and has a good port. It is in the principality of Gothland, in the territory of Blecking, near the Baltic sea, about 18 miles from Christianstad. E. Long. 14. 10. N. Lat. 56. 20.

AI, (anc. geogr.) a town in Judea, to the north of Jericho, called *Aia* by Josephus, and the inhabitants *Ainai*.

AICUROUS, a species of parrot. See PSITTACUS.

AJALON, (anc. geogr.) a town of the tribe of Dan, one of the Levitical. Another in the tribe of Benjamin, in whose valley Joshua commanded the moon to stand still, being then in her decrease, and consequently to be seen at the same time with the sun.

AJAN, a coast and country of Africa, has the river Quilmanci on the south; the mountains from which that river springs, on the west; Abyssinia, or Ethiopia, and the strait of Babelmandel, on the north; and the eastern, or Indian ocean, on the east. The coast abounds with all necessaries of life, and has plenty of very good horses. The kings of Ajan are often at war with the emperor of the Abyssins; and all the prisoners they take they sell to the merchants of Cambaya, those of Aden, and other Arabs, who come to trade in their harbours, and give them in exchange, coloured cloths, glass-beads, raffins, and dates; for which they also take back, besides slaves, gold and ivory. The whole sea-coast, from Zanguebar to the strait of Babelmandel, is called the coast of Ajan; and a considerable part of it is styled the Desert-coast.

AJAX, the son of Oileus, was one of the principal generals that went to the siege of Troy: he ravished Cassandra the daughter of Priam, even in the temple of Minerva, where she thought to have found sanctuary. It is said, he made a serpent of fifteen feet long so familiar with him, that it eat at his table, and followed him like a dog. The Locrians had

a singular veneration for his memory.

AJAX, the son of Telamon, was, next to Achilles, the most valiant general among the Greeks at the siege of Troy: he commanded the troops of Salamis, and performed many great actions, of which we have an account in the Iliad, in *Didys Cretenfis*, and in the 23^d book of Ovid's *Metamorphoses*. He was so enraged that the arms of Achilles were adjudged to Ulysses, that he immediately became mad. The Greeks paid great honours to him after his death, and erected a magnificent monument to his memory upon the promontory of Rheum.

AJAZ, in antiquity, a furious kind of dance, in use among the Grecians; intended to represent the madness of that hero, after his defeat by Ulysses, to whom the Greeks had given the preference in his contest for Achilles's arms. Lucian, in his treatise of Dancing, speaks of dancing the *Ajax*.—There was also an annual feast called *Ajantia*, *Aiantia*, consecrated to that prince, and observed with great solemnity in the island of Salamis, as well as in Attica; where, in memory of the valour of Ajax, a bier was exposed, set out with a complete set of armour.

AJAZZO, a sea-port town of the island of Corsica, in the Mediterranean, with a bishop's see. Long. 26. 35. Lat. 41. 40.

AJAZZO, a sea-port town of Natolia, in the province of Caramania, anciently Silefia, seated on the coast of the Mediterranean, 30 miles north of Antioch, and 50 west of Aleppo, where the city of Ilius anciently stood, and near which Alexander fought his second battle with Darius. Long. 33. 10. Lat. 37. 0.

AICHSTAT, a town of Germany, in Franconia, and capital of a bishoprick of the same name. It is remarkable for a curious piece of workmanship, called the Sun of the Holy Sacrament, which is in the church: it is of massy gold, of great weight, and is enriched with 350 diamonds, 1400 pearls, 250 rubies, and other precious stones. This place is moderately large, and seated in a valley on the river Altmul, 10 miles N. of Newburgh, and 37 S. of Neurenberg. E. Lon. 11. 10. N. Lat. 49. 0. The bishoprick is 45 miles in length, and 17 in breadth; and the bishop is chancellor of the church of Mayence or Mentz.

AID, in a general sense, denotes any kind of assistance given by one person to another.

AID, in law, denotes a petition made in court to call in help from another person who has interest in land, or any other thing contested.

AID-de-camp, in military affairs, an officer employed to receive and carry the orders of a general.

AID, *Auxilium*, in ancient customs, a subsidy paid by vassals to their lord on certain occasions. Such were the aid of relief, paid upon the death of the Lord Mesne to his heir; the *aid cheval*, or capital aid, due to the chief lord on several occasions, as, to make his eldest son a knight, to make up a portion for marrying his daughter, &c.

AIDS, in the French customs, certain duties paid on all goods exported or imported into that kingdom.

Court of Aids, in France, a sovereign court established in several cities, which has cognizance of all causes relating to the taxes, gabelles, and aids, imposed on several sorts of commodities, especially wine.

AIDS, in the menage, are the same with what some writers

Ajax

|| Aids.

Aidan
||
Ailcbery.

writers call *cherishings*, and used to avoid the necessity of corrections.—The inner heel, inner leg, inner rein, &c. are called *inner aids*; as the outer heel, outer leg, outer rein, &c. are called *outer aids*.

AIDAN, a famous Scottish bishop of Lindisfarne, or Holy Island, in the 7th century, was employed by Oswald king of Northumberland in the conversion of the English, in which he was very successful. He died in 651.

AIGHENDALE, the name of a liquid measure used in Lancashire, containing seven quarts.

AIGLE, a bailiwick, in the territory of Romand, in Switzerland, consists of mountains and valleys, the principal of which are the Aigle and Bex. Through these is the great road from Vallais into Italy. When you pass by Villeneuve, which is at the head of the lake of Geneva, you enter into a deep valley three miles wide, bordered on one side with the Alps of Switzerland, and on the other with those of Savoy, and crossed by the river Rhone. Six miles from thence you meet with Aigle, a large town, seated in a wide part of the valley, where there are vineyards, fields, and meadows. The governor's castle is on an eminence that overlooks the town, and has a lofty marble tower. This government has nine large parishes; and is divided into four parts, Aigle, Bex, Olon, and Ormont. This last is among the mountains, and joins to Rougement. It is a double valley, abounding in pasture-lands. Ivorna, in the district of Aigle, was in part buried by the fall of a mountain, occasioned by an earthquake in 1584.

AIGLE a small town, in France, in Upper Normandy, twenty-three miles from D'Evereux, and thirty-eight from Rouen. It is surrounded with walls and ditches, has six gates, three suburbs, and three parishes. It trades in corn, toys, and more particularly in needles and pins. E. Long. 1. 5. N. Lat. 48. 35.

AIGUILLON, a small town of France in the province of Guienne, situated at the conflux of the rivers Garonne and Lot.

AIGUISCE, in heraldry, denotes a cross with its four ends sharpened, but so as to terminate in obtuse angles.—In differs from the cross fitchee, in as much as the latter tapers by degrees to a point, and the former only at the ends.

AILANA, **AILATH**, or **AHELOTH**, anciently a town of Arabia Petrea, situated near the Sinus Elanites of the Red Sea. It was also called *Blath*, and *Eloth*, (Stephanus, Strabo, Moses.) The same with *Elena*.

AILE, in law, a writ which lies where a person's grandfather, or great-grandfather, being seized of lands, &c. in fee-simple, the day that he died, and a stranger abates or enters the same day, and dispossesses the heir of his inheritance.

AILESBUURY, **AYLESBUURY**, or **ALESBUURY**, a borough town in Buckinghamshire, consisting of about 400 houses. It consists of several streets, though the houses are not very contiguous: these lie round about the market place, in the middle of which is a convenient hall, where the sessions are held, and sometimes the assizes for the county. It sends two members to parliament; has a market on Saturdays; and three fairs for cattle, viz. on the Saturday before Palm-funday, June 14th, and September 25th. It is sixty miles south-east of Bucingham and forty-four north-west

of London. W. Long. o. 40. N. Eat. 51. 40.

AILRED, or **EALRED**, abbot of Revelby in Lincolnshire, in the reigns of Stephen and Henry II. He was born in 1109, of a noble family, and educated in Scotland with Henry the son of king David. On his return to England, he became a monk of the Cistercian order, in the monastery of Revelby, of which he afterwards was made abbot. He died on the 12th of January, 1166, aged 57, and was buried in his monastery. "He was (says Leland) in great esteem during his life; celebrated for the miracles wrought after his death; and admitted into the catalogue of saints." He was author of several works; most of which were published by Gilbo the Jesuit at Douay, 1631; part of them may be also found in the *Bibliotheca Cisterciensis*, and *Bibliotheca Patrum*. His principal work is the *Speculum charitatis*. Leland, Bale, and Pits, mention several manuscripts which never were published.

AINSWORTH (Dr Henry), an eminent nonconformist divine, who, about the year 1590, distinguished himself among the Brownists; which drew upon him such troubles, that he was obliged to retire to Holland, and became minister of a church at Amsterdam. His skill in the Hebrew language, and his excellent Annotations on the Holy Scriptures, which are still highly esteemed, gained him great reputation. He also wrote several pieces in defence of the Brownists, and several other works.

AINSWORTH (Robert), born at Woodyale in Lancashire in 1660, was master of a boarding-school at Bethnal-green, from whence he removed to Hackney, and to other places in the neighbourhood of London. After acquiring a moderate fortune, he retired, and lived privately till the time of his death, which happened in 1743. We are indebted to him for the best Latin and English Dictionary extant: he published it in quarto 1736; and in 1752, the fourth edition, under the care of Doctor Ward of Gresham College, and the Rev. William Younge, was enlarged to two vols folio.

AIR is that invisible fluid which every where surrounds the globe; and on which depends the life not only of every kind of animals, but of vegetables also; and which seems, in short, to be one of the great agents employed by nature in carrying on her operations throughout the whole world.

For many ages the air was considered as an absolutely simple fluid, the component parts of which were beyond the reach of man's wisdom to discover. Its common operations were thought to be performed, either by its heat or cold, its moisture or dryness; and if any effects were discovered which could not be explained by these, (such as the appearance of pestilential diseases), they were reckoned to be entirely supernatural, and the immediate effect of Divine power.

In the beginning of the last century, Lord Bacon and Galileo discovered some of what may be called the *mechanical* powers of the air. The former, from experiments, ascertained its elasticity; and the latter, its weight. The pressure of the atmosphere, however, was more fully discovered by Toricelli, the disciple of Galileo, and inventor of the barometer, as Lord Bacon had been of the thermometer. Pascal observed, that this pressure was not always the same; but diminished according to the height to which the barometer was carried. Otto de Guericke soon after invented the air-pump.

Discovery of its mechanical powers.

Air.

pnmp; which was much improved by Mr Boyle and Doctor Hooek, two members of the Royal Society. The complete knowledge of the mechanical properties of the air, however, must be ascribed to the labours of Doctor Halley and Sir Isaac Newton; who have, by mathematical demonstration, established its rarefaction, and the proportion in which it is rarefied, according to its distance from the earth, &c.

While these discoveries were making concerning the mechanical properties of the air, little notice seems to have been taken of the different kinds of fluid which go under that name. It was known, indeed, that air was separable from terrestrial bodies by means of fire, fermentation, &c.; but this was commonly reckoned to be the fame with the air we breathe. Van Helmont, a disciple of Paracelsus, was the first who undertook to make inquiries concerning this species of air. He gave it the name of *gas sylvestre*, from the Dutch word *ghaef*, signifying spirit; and observes, that some bodies resolve themselves almost entirely into it. "Not," (says he), that it had been actually contained in that form in the bodies from which it was separated; but it was contained under a concrete form, as if fixed, or coagulated." According to this author, the gas sylvestre is the same with what is separated from all substances by fermentation; from vegetables by the action of fire; from gun-powder when it explodes; and from charcoal when burning. On this occasion he asserts, that sixty-two pounds of charcoal contain sixty-one pounds of gas, and only one pound of earth. To the effluvia of gas, he also attributes the fatal effects of the grotto del Cani in Italy, and the suffocation of workmen in mines. He asserts, that it is to the corruption of the aliment, and the gas discharged from it, that we are to attribute wind, and the discharges of it from the bowels. Upon the same principles he accounts for the swelling of dead bodies, which have remained some time under water; and for the tumours which arise on some parts of the body in certain diseases. He also determines, that this gas is different from the air we breathe; that it has a greater affinity with water: and he imagined it might consist of water reduced to vapours, or a very subtil acid combined with volatile alkali.

Mr Boyle repeated all Van Helmont's experiments to more advantage than he himself had performed them; but seems not to have proceeded further in his discoveries than Van Helmont did: only he found, that there are some bodies, such as sulphur, amber, camphor, &c. which diminish the volume of air in which they burn.

Doctor Hales was the first person who attempted to determine the quantity of air produced from different bodies: and, for this purpose, he made experiments on almost every known substance in nature, examining them by distillation, fermentation, combustion, combinations, &c. Of the vegetable substances which he examined, crude tartar seems to have yielded the greatest quantity of air, and essential oils the least. From a cubic-inch of the former he obtained 504 cubic-inches of air; and from a like quantity of oil of aniseeds, only 22. Of the animal-substances, the greatest quantity of air was obtained from the human calculus, or stone extracted from the bladder: three quarters of a cubic-inch of this substance yielding, on distillation, no

less than 516 cubic-inches of air; while a cubic-inch of tallow yielded only 18 inches. In the mineral kingdom, pit-coal gave out the greatest quantity of this fluid, 360 inches of air being obtained from one inch of it, or nearly one-third of its whole weight. From the same quantity of antimony, only 28 inches were obtained. By fermentation, 639 cubic inches of air were obtained from 42 inches of small-beer in seven days; and from 26 inches of bruised apples, 98 inches of air were obtained in thirteen days.

In examining the quantities of air produced from combinations of different bodies, very strange phenomena appeared; the very combinations which produced air one day, would absorb all they had produced, and sometimes much more, the next. Half a cubic inch of sal-ammoniac, with one cubic-inch of oil of vitriol, produced five or six cubic inches of air the first day; and the next, absorbed 15. In a few hours, six inches of oyster-shells, and as much vinegar, produced 29 inches of air; but, in nine days, 21 inches were absorbed, and the remainder disappeared upon pouring water into the vessel. A quarter of an inch of iron-filings, and one cubic inch of sulphur, instead of producing, absorbed 19 inches of air. A cubic inch of aquafortis, with an equal quantity of marcasite, absorbed 85 inches; but the same quantity of aquafortis and sea-coal, absorbed 18 inches in three days; after which, instead of absorbing, they generated 12 inches. Two cubic inches of lime, with four of vinegar, absorbed 22 inches of air: but two inches of lime, with an equal quantity of sal-ammoniac, absorbed 115 inches.

By examining flaming substances, it appeared that all of them, nitre alone excepted, absorbed or consumed air. A lighted candle, three-fifths of an English inch in diameter, consumed 78 inches of air: linens, dipped in melted brimstone, and burnt in a large vessel, consumed 198 inches; in a smaller one, 150. Two grains of Kunkel's phosphorus absorbed 28 inches of air; after which it had only lost half a grain in weight, and in a short time gained a whole grain. A rat, confined in a large receiver, consumed 78 inches before it died; and 73 inches of air breathed by a man till he was almost suffocated, were reduced to 20.

Doctor Hales also first suspected, that the briskness and sparkling of the waters, improperly called *acidulous*, were owing to the air they contained. But notwithstanding all his discoveries concerning the quantity of elastic fluid obtained from different bodies, he did not imagine there was any essential difference between this fluid and the air we breathe, only that it was loaded with noxious vapours, foreign to its nature. He therefore endeavoured to restore air which had been depraved by the respiration of animals, or by burning bodies, to its original purity. This he attempted, by filtering it through flannel which had been steeped in a solution of salt of tartar; and by this means the air was perfectly restored. A candle, likewise placed under a receiver, lined with flannel dipped in a solution of this salt, burned considerably longer than it would otherwise have done. The flannels, however, through which the air was filtered, were sensibly increased in weight.

What doctor Hales only suspected, concerning the impregnation of some kinds of waters with air, was confirmed by M. Venel, professor of chemistry at Montpellier,

Air.

pelier, in a memoir read before the Royal Academy of Sciences in 1750. This gentleman proceeded so far as to disengage the air from the Seltzer waters, and to measure its quantity; which he constantly found to amount to about one-fifth of its bulk. When the water was deprived of this air, it became flat, and ceased to sparkle; the only difference then between the Seltzer water, deprived of its air, and common water, was, that the former contained a small quantity of sea-salt. Upon these principles he attempted to recompose Seltzer water, by dissolving in a pint of common water two drachms of fossil alkali, and then adding an equal quantity of marine acid. The quantity of sea-salt produced by the union of these two, he knew would prove equal to that contained in a pint of Seltzer water; and the effervescence produced by the action of the acid and alkali upon each other, he imagined, would produce air sufficient for the impregnation of the water. In this he was not deceived; the water thus produced was not only analogous to Seltzer, but much more strongly impregnated with air.

10
Discoveries
by Dr Black.

Dr Black professor of chemistry at Glasgow, now at Edinburgh, first discovered, that magnesia alba, chalk, and all the earths in general which are reduced to quicklime by calcination, consist of an alkaline earth, by itself soluble in water, but which, combined with a large quantity of fixed air, becomes insoluble; losing the properties of quicklime, and assuming the natural appearance we observe those earths to have when not reduced into lime. The same thing he discovered in alkalies, both fixed and volatile. On the fixed air contained in these bodies, he found their property of effervescing with acids to depend, as likewise their mildness; both the alkalies and calcareous earth being highly caustic when deprived of their fixed air. He also found, that this fluid which he called *fixed-air*, had different degrees of affinity with different substances; that it was stronger with calcareous earth, than with fixed alkali; with fixed alkali, than magnesia; and with magnesia, than volatile alkali. He also suspected, that the fixed air of alkaline salts unites itself with the precipitates of metals, when thrown down from acids; and that the increase of weight observable in these precipitates, was owing to this cause. But he was of opinion, that the fluid which he called *fixed air* was very different from the common air we breathe; and therefore adopted the name of air, merely as one already established, whatever impropriety there might be in the term.

11
By the Count de
Saluces.

In the mean time, the count de Saluces, at Turin, was employing himself in making experiments on the elastic fluid discharged from gun-powder.—He found, that, when at liberty, this species of air occupied two hundred times the space of that taken up by the gun-powder itself. He was able to reduce it to the same state with common air, by filtering through alkaline solutions, or by exposing it for twelve hours to the degree of cold in which water freezes. The air detached from pulvis fulminans he found to be much less in quantity than that from gun-powder, notwithstanding the explosion of the former is much greater. He also observed, that air disengaged from effervescing bodies extinguishes flame; but that what was separated from volatile alkali and vinegar, was an exception to this rule. He was, however, of opinion, that all these

Vol. I.

different fluids were only common air loaded with heterogeneous particles.

Mr Haller first inferred, from Doctor Hales's experiments, that air is the real cement of bodies; which, fixing itself in the solids and fluids, unites them to each other, and serves as a bond by which they are kept from dissolution. In 1764, Dr Macbride of Dublin published a number of experiments in support of this doctrine. From his work it appears, that fixed air is separated, not only from all substances in fermentation, but also from all animal substances as they begin to putrefy; and that this air is capable of uniting itself to all calcareous earths, as well as alkalies both fixed and volatile, and restoring to them the property of effervescing with acids when they have by any means been deprived of it.—The conclusions drawn by him from his numerous experiments were, that fixed air is an elastic fluid, very different from the common air we breathe: that it is possessed of a strong antiseptic quality, and may be introduced with safety into the intestinal canal, and other parts of the animal economy, where common air would have fatal effects; but is mortal if breathed into the lungs, &c.

In 1766 and 1767, Mr Cavendish communicated some new experiments to the Royal Society at London, wherein he determines the quantity of air contained in fixed alkali, when fully saturated with it, to be five-twelfths of its weight, and seven-twelfths in volatile alkali: that water is capable of absorbing more than its own bulk of this air; that it has then an agreeable, spirituous, and acidulous taste; and that it has the property of dissolving calcareous earths and magnesia, as well as almost all the metals, especially iron and zinc: that the vapour of burning charcoal occasions a remarkable diminution of common air, at the same time that a considerable quantity of fixed air is produced in the operation. He also found, that solution of copper in spirit of salt, instead of producing inflammable air, like that of iron or zinc, afforded a species of air which lost its elasticity as soon as it came into contact with water.

About the same time that Dr Macbride published his experiments, a treatise appeared, written in German by Mr Meyer, apothecary at Onabruck, wherein he opposes Doctor Black's theory concerning fixed air being the cause of effervescence in calcareous earths and alkaline salts. The loss of weight these substances suffer by calcination, he attributes to the quantity of water expelled by the vehement heat; and their not effervescing afterwards, he attributes to their having been neutralized, while in the fire, by a peculiar kind of acid, which he calls *acidum pingue*. The existence of such an acid in lime he proves from the precipitation of lime-water by alkaline solutions. From this he concludes, that the acidum pingue forsakes the earth, which it before kept in a dissolved state, to unite with the alkali. This acid he also affirms to be what escapes from charcoal in burning; what unites with metals in their calcination; and what gives the causticity to volatile and fixed alkalies, as being the very acid, *caustic*, or power of fire itself.

A strong objection lies against this theory, from a fact discovered by Doctor Black; namely, that pure calcareous earth dissolved in the nitrous acid, may be precipitated either in the form of lime, or of chalk, according as we make use of the caustic or the mild alca-

Air.

lies. The reason given by Dr Black for this phenomenon is, that, in the dissolution of the earth by the acid, all its fixed air is expelled. In the precipitation, if a mild fixed alkali is made use of, the fixed air is expelled from it by its union with the acid, and the calcareous earth has liberty again to combine with the fixed air expelled from the alkali; in which case, the earth appears in its natural mild state: but if an alkali is made use of, which contains no fixed air, the calcareous earth has none to combine with, and therefore appears in the state of lime.

This formidable objection Mr Meyer easily solves by his new hypothesis of the acidum pingue. "When we mix (says he) a solution of calcareous earth in the nitrous acid with a caustic fixed alkali in a fluid state, we mix solutions of two neutral salts together; the one of calcareous nitre, the other of alkali saturated with acidum pingue. In this case, according to the known laws of affinities, a double decomposition ought to take place; and we see it actually does so. The weaker acidum pingue is expelled from its basis by the nitrous acid, which forsakes the earth to unite with the alkali. The acidum pingue, having now nothing else to combine with, unites with the earth which the nitrous acid hath left, neutralizes, and forms it into lime. The case is different when the mild alkali is employed: for this having no acidum pingue joined with it, can communicate none; and therefore the precipitate falls as a calcareous earth."

18
Answered
by Mr Jac-
quin.

To this new system of Mr Meyer's, Mr Jacquin, botanical professor at Vienna, published an answer in 1769.—He first attempts to prove, that calcareous earth is not converted into quicklime merely by the loss of its humidity. To ascertain this, he distilled 38 ounces of limestone in a stone-retort, fitted with a large tubulated receiver, with a fire gradually increased to the highest degree; and obtained only two ounces of water, which had some slight traces of volatile alkali. This came over with a moderate fire; and after the aqueous vapours ceased, an elastic vapour began to separate very plentifully, and continued for an hour and an half to fly off through the tube of the receiver with an hissing noise. The lime which was left in the retort weighed only 17 ounces.—Here was therefore a deficiency of 19 ounces, which Mr Jacquin attributed to the air; and, according to him, limestone contains six or seven hundred times its bulk of air.

Mr Jacquin afterwards examines the action of water upon lime; and finds, that it is by no means the absence or presence of moisture in any degree, which constitutes lime; seeing it can be preserved under water for any length of time as lime, provided we keep the surface of the water from contact with the air.

19
Mr Crans's
reply.

About the time that Mr Jacquin's performance made its appearance, Mr Meyer died; but Mr Crans, physician to his Prussian majesty, published a reply to Mr Jacquin at Leipzig. He eludes the force of Mr Jacquin's experiment with limestone distilled in a retort, by attributing to water, reduced to a state of vapour, or in a great degree of expansion, the elastic separation during the continuance of the distillation. But of this assertion he hath not brought any decisive proof.

Mr Crans denies that lime is deprived of the power of effervescing with acids; and corroborates his assertion, both from experiments made by himself, and

Air.

by the united testimonies of Messrs Duhamel, Geoffroy, Homberg, and Pott.—On this occasion he objects, that if lime differs from calcareous earth only in being deprived of its air, it ought, by a short exposure to the open air, to imbibe all that it has lost; but so far from this, he affirms, that, after being exposed a considerable time, it even acquires greater causticity. In favour of Mr Meyer's hypothesis, he likewise observes, that the sudden swelling and heat, observed in the slaking of lime, is a natural consequence of his system, whereas it is absolutely inexplicable on Dr Black's hypothesis; which also can give no reason why calcareous earth dissolves with very little heat in the nitrous acid, while the dissolution of lime in the same acid produces a degree of heat superior to that of boiling water; and asserts the partisans of fixed air to be utterly unable to explain many phenomena, which upon Mr Meyer's plan are perfectly intelligible.

This author further observes, that lime-water dissolves sulphur, camphor, and resins, nearly in the same manner that spirit of wine does. If Dr Black's disciples then reason consistently, they ought to say that it renders those substances soluble by attracting their air from them; but thus they will be obliged to affirm the same of spirit of wine, which, he says, would lead them into a labyrinth of difficulties, if not of absurdities.

With regard to effervescence, Mr Crans observes, that, in the dissolution of a calcareous earth, we may have an effervescence or not, just as we please, by employing a strong or a weak acid; whereas, on Dr Black's plan, there ought to be an effervescence whether the acid employed is strong or weak.—He afterwards shews, that a brisk effervescence may be obtained by a mixture of caustic lixivium with an acid, though, according to Dr Black and Mr Jacquin, neither of these substances contain any air. Mr Crans's method is to pour some caustic lixivium into a solution of calcareous earth. The alkali trickles down the sides of the bottle, and reaches the bottom. If the two liquors are afterwards suddenly agitated, a brisk effervescence ensues, and the precipitation is formed in an instant.

The experiments adduced by Dr Black and Mr Jacquin for the support of their system, from the precipitation of calcareous earths in the form of lime by caustic alkalies, are absolutely denied by Mr Crans; who affirms, that, with whatever alkali he precipitated the earth, the precipitate always effervesced with acids. The only difference he could perceive, was, that it had some degree of solubility in water, and turned syrup of violets green.

A strong argument in Dr Black's favour is, that calcareous earths, when dissolved in acids, suffer a loss of weight equal to what they would have done, had they been reduced by calcination into quicklime.—Here Mr Crans opposes experiments made by solutions of calcareous stones in the nitrous acid, compared with solutions of lime. In these processes, he always observed a considerable diminution of weight, but without any rule; sometimes the lime appeared more diminished than the calcareous earth, at other times the calcareous earth appeared to receive an augmentation in weight during its dissolution. These experiments, however, do not appear to have been made with sufficient accuracy, both as Mr Crans employed too shallow vessels, and likewise operated upon such small quantities, that

20

to Dr Black's
experiments.

Air.

an error in the scales might occasion most of the inequalities he has remarked.

21
His answer
to Dr Mac-
bride.

Lastly, Mr Crans proceeds to Dr M'Bride's experiments concerning the restoration of the effervescing power to alcalies by means of fixed air. To this trial he submitted the caustic lixivium made after Mr Meyer's method. The air detached from an effervescing mixture precipitated from the lixivium a white sediment, which collected at the bottom of the bottle. The liquor also acquired, after some time, the property of effervescing with acids; but he observed, that it did so, nearly, in as short a time when exposed to the open air. He also remarked, that this property was much sooner recovered if the lixivium was placed over a moderate fire; and that it was recovered at the instant when the fumes began to arise. Hence Mr Crans concludes, that it acquires the effervescing power only in proportion to the evaporation of the caustic principle, or acidum pingue, to which the alcali was united.

The same thing was observed with respect to the caustic volatile alcali obtained from sal ammoniac. Mr Crans placed one portion of it in a stove; another on hot cinders; and exposed the third to the vapours of an effervescing mixture. At the end of eight hours all the three effervescd. The reason he gives, is, the evaporation of the acidum pingue; so that, according to him, the fixed air had no other effect than what might have naturally taken place in the open air.

Upon the whole, Mr Crans agrees that fixed air combines with alkaline liquors; but he affirms that these liquors are impregnated in the same manner with common water, and denies that there is any real combination, or that to such a combination is owing the mild state of alkaline salts. This he constantly ascribes to the evaporation of the acidum pingue.

22
Dr Black's
theory at-
tacked by
Mr de
Smeth.

While Mr de Crans thus attacked Dr Black's doctrine at Leipzig, Mr de Smeth did the same at Utrecht. This gentleman begins with asserting that we have no knowledge of common air, except by some of its physical effects; of its internal nature and composition we know nothing; and therefore we ought not to call any substance *air*, merely because it has elasticity, and gravity, while it wants the other essential properties of air. He affirms, that elasticity is a very equivocal characteristic of air; and that we may at this rate affirm water reduced into vapours to be atmospherical fluid. He is of opinion, that the elastic vapours which arise either from fermenting or effervescing liquors, are very different from atmospherical air; and he particularly observes, that the vapour of fermentation is much more subtle than common air, as passing through bodies which would be an unsurmountable obstacle to the latter. This vapour he found incapable of being retained by lutes; a moistened bladder, tied over the mouth of the vessel, was not at all inflated, though he was certain, from other experiments, that a great quantity of this vapour had escaped. Nay, so far is he from thinking it a particular element, or *simple*, in the sense which chemists give to that word, that he is very positive it did not originally exist in the bodies from which it is extracted by art, but is only a *misfina* formed by the collision of solid and fluid parts; that it is therefore never produced, but in cases where the bodies suffer violent intestine motion, in consequence of which their parts are altered, broken, and attenuated,

so as to exhibit the phenomena of fixed air.

Air.

The antiseptic virtue of astringents, according to Dr M'Bride, consists in the power they have of contracting the pores of animal substances, and thus preventing the escape of their fixed air. This argument Mr de Smeth pays no regard to; and affirms that we know too little of the manner in which astringents act, to be able to form the least induction from thence. Indeed, from the following experiments mentioned by Mr Henry, F. R. S. it would seem that the sweetening properties of fixed air may possibly depend on an affinity between this fluid and the septic particles arising from putrid bodies.—“A piece of putrid beef, fastened by a string to a cork, was confined in three pints of fixed air for 13 hours, during which time it was considerably, though not entirely, sweetened; but the air in the bottle seemed to have acquired all the putrid smell of which the flesh had been deprived; so that the septic effluvium did not seem to be destroyed, but only to change its place. Slips of linen cloth also, dipped in very rancid oil, were much sweetened by being exposed to a stream of fixed air from an effervescing mixture; but a pint-bottle of the same oil, though it absorbed much of this air, so as to become entirely saturated with it, was not sweetened in the least.”

23
Mr Henry's
experiments
concerning
the antiseptic
power of
fixed air.

Mr de Smeth endeavours to overthrow Dr Black's theory by a number of experiments, most of which are evidently inconclusive. The principal, indeed the only one, which deserves attention, is the following:—Having observed that Homburg's pyrophorus gained weight considerably by being exposed to the air, he was induced to make the same experiment with regard to quicklime. Twelve ounces of this substance, being exposed to the air in a balance, augmented almost visibly in weight during the first month. After this period, its attractive power diminished considerably; and at the end of a year, or thirteen months, was absolutely lost. In this time it had acquired an augmentation in weight of four ounces, three drachms, and forty grains; was reduced to a fine powder, and no longer separated the volatile alcali but in a concrete form. After a space of thirteen months, then, the whole weight of this lime was sixteen ounces, three drachms, and forty grains. Mr de Smeth weighed, separately, twelve ounces, three drachms, and forty grains; which, by calculation, he found ought to contain three ounces, two drachms, fifty-four grains and an half, of matter attracted from the atmosphere. This matter he thought would be easily dissipated by fire; and to ascertain himself of this, he put the abovementioned quantity into an earthen retort, and exposed it to a very strong fire for two hours. During the operation, there passed into the receiver, one ounce, four drachms, and forty grains of pure phlegm, in which no saline matter could be discovered. Theridum, weighing ten ounces five drachms, proved a quicklime, notwithstanding there was only two drachms of weight lost upon the whole. If there had been a separation of air then, during the operation, it could by no means have been so considerable, as according to Dr Black's theory it ought to have been.—From this experiment it also appears, that quicklime, by being exposed to the air, gains something from it which cannot afterwards be separated by fire. He afterwards repeated the same operation in open vessels, with the same success. Having put the

24
A remark-
able experi-
ment by Mr
de Smeth.

Air.

remaining four ounces of lime in a wind furnace, and urged it with a very strong fire, it retained one drachm eleven grains of matter, attracted from the atmosphere. Being again exposed to the air, it regained in weight, 4 drachms, 28 grains. The same thing has been observed by Mr du Hamel; who relates, that lime, flaked in the air, retained an increase of weight, amounting to about four and a half drachms *per pound*, and which could not be driven off by the strongest fire he could employ.

During this controversy among the learned, concerning the existence or non-existence of fixed air, as such, in terrestrial bodies, none of the contending parties seem to have apprehended, that this fluid might possibly be one of the component parts of our atmosphere; and, tho' pernicious when separated from the others, might nevertheless be absolutely necessary, in a certain degree, to preserve that life which its suffocating properties, when collected by itself, would seem calculated rather than to destroy.—To decompose the subtle invisible fluid we daily breathe; to be able to recompose it again, and produce air either salutary or noxious as we please; seems to be one of the highest discoveries ever made by man.—This, however, hath been accomplished by Dr Priestley, whose discoveries we now begin to relate.

25
Dr Priestley first discovered the true composition of the atmosphere.

The Doctor began his experiments nought about the same time with Mr de Smeth. He begins with observing, that the term *fixed air* may be equally applied to every species of air hitherto discovered; being inflammable, and other kinds of air, are fixed in terrestrial bodies as well as this. As the term, however, has come into such general use, he chuses to retain it, and distinguishes by that name the fluid which issues from fermenting liquors, and from the effervescence of acids with calcareous earths. It may be obtained in its greatest purity from a mixture of oil of vitriol and chalk. From fermenting liquors also, if the quantity is considerable, it may be obtained tolerably pure; and in this way Dr Priestley himself used frequently to procure it, when living in the neighbourhood of a large brewery.

26
His account of fixed air.

One general property of this air is to be imbibed by water with great avidity. By agitation, the water may be impregnated very quickly with a great quantity of it; but as agitation will also make water part with its fixed air, so great a quantity cannot be imbibed by this means as when the water is left to take up the air leisurely by being at rest.—The air thus taken up is discharged by boiling, or by freezing, the water which contains it.

Dr Priestley agrees with Dr Black, that the concrete form of volatile alkaline salts, as well as the effervescing power of both kinds of alkalies, and calcareous earths, depends upon the presence of fixed air. He also owns it to be of an acid nature, though weak, and of a peculiar kind. This was demonstrated by Mr Bewly, in some letters to Dr Priestley, wherein he gives an account of his having both changed the blue juices of vegetables red with this acid, and likewise formed perfectly neutral salts, both from fixed and volatile alkali, by means of it; and in the last volume of his observations, Doctor Priestley hath given very strong reasons for thinking that fixed air is a modification of the nitrous acid. He found also, that it possessed an inebriating quality; and, when combined with fixed alkali in such quantity as to neutralize it, could not be

27
Fixed air a modification of the nitrous acid.

expelled by a boiling heat, unless the liquor was exposed to the open air; in which case it was impossible to retain it. The Doctor hath also observed, that water held long in fixed air discharged from fermenting liquor, acquires a very disagreeable taste: once he observed it like tar-water; but could not satisfy himself whence this arose, for fear of hurting the liquor; having once injured a large quantity of beer, by holding over it a quantity of ether in a glass.

By agitating pure fixed air in a glass, with water, a part of it always remained, which the water could not imbibe; and in this residuum the Doctor found that animals could live, though flame was extinguished. By a mixture of iron-filings and brimstone, about one fifth of the air was imbibed, and the remainder was not so noxious as before.

In making experiments on common air made noxious by the burning of candles, brimstone, &c. he found, that lime-water became turbid by being placed in the vessel where the candle was burning. This made him suspect, that the manner in which this change happens to the air, is by its depositing its heaviest part, or that which commonly goes by the name of *fixed air*. This he was afterwards assured of, by finding air considerably diminished by the electric spark; and that, in consequence of this, blue juices of vegetables were turned red, and lime-water was precipitated exactly as by fixed air.—The Count de Saluces, at Turin, had imagined, that air which had been rendered incapable of supporting flame, could be restored merely by being exposed to a considerable degree of cold, and also by being compressed in bladders. Dr Priestley repeated his experiments; but found them not to succeed, unless the air was compressed in bladders only, which he attributes to the porosity of the bladders; and with great reason, having constantly found, that however he compressed it, or to whatever degree of cold he exposed it, in glass-vessels, the air underwent no change. Vegetation alone he found effectual for this purpose; which was generally accomplished in five or six days: after which time candles would burn in it perfectly well; while another portion of the same air, after being kept for many months, without any vegetation, would extinguish candles equally as at first.

28
Mistake of the Count de Saluces detected.

29
Noxious air rendered wholesome by vegetation.

The restoration of the air depended entirely upon the vegetation of the plant made use of; for a great number of fresh leaves of mint were unsuccessfully used for a long time, in endeavouring to restore a small quantity of air in which candles had burnt out. Though mint was the first plant made use of by the doctor in this experiment, he found all others to answer equally well, as well aromatics, as those which had no smell; and even poisonous plants, as well as others. The plant he found most efficacious for this purpose was spinach.

One caution the doctor gives in making experiments of this kind, *viz.* that it is absolutely necessary to remove all the dead or rotten leaves of the plant; for they will deprave air in such a manner as to render it incapable of supporting flame. A fresh cabbage-leaf, put under a glass vessel for one night, so affected the air in it, that it extinguished a candle next morning; and this without any appearance of putrefaction in the leaf.

After candles cease to burn, animals feel little or no inconvenience

Air.

³⁰ Putrid air favourable to vegetation.

Air. inconvenience from breathing the same air. It is impossible, however, for them to breathe air of this or any other kind for any length of time without suffocation. The reason of their death, according to Dr Priestley, is not the want of the *pabulum-vitæ*, supposed to be contained in the air; but the air being impregnated with something stimulating to the lungs. The noxious effluvia with which the air, in this case, is loaded, cannot be absorbed by standing, without agitation, in fresh or salt water. Growing vegetables, however, restored air depraved by animal respiration, as perfectly as that in which candles had burned out. The same effect was produced by agitating this air with water; and in some degree, also, by a mixture of fixed air.

Notwithstanding that this kind of air, (which the Doctor distinguishes by the name of *putrid air*), proves so very noxious to most animals; yet vegetables thrive in it to a surprising degree. It is also impossible for them to be kept clean from swarms of insects; which Dr Priestley was frequently obliged to brush off the sprigs of mint on which he made his experiments.

³¹ In inflammable air.

Inflammable air was first observed by Mr Cavendish. He obtained it from a solution of iron, zinc, or tin, in the marine acid. Doctor Priestley hath found, that this air may be procured from every inflammable substance, either animal, mineral, or vegetable, by combustion alone. From these substances he extracted it, by heating them in a gun-barrel, to the orifice of which a glass-tube or tobacco-pipe was luted, and to this was tied a flaccid bladder, in order to catch the generated air: but, in order to get a great quantity of air, it was necessary to apply the heat as suddenly, and as vehemently, as possible. By this treatment, a bit of dry oak, weighing twelve grains, will yield a sheep's bladder full of air, while only two or three ounces measures of it can be obtained if the heat is slowly applied.

Inflammable air, when made by a quick process, has a strong offensive smell, from whatever substance it is extracted. It differs, however, according to the substance from which it is obtained; and is most fetid when procured from animal bodies. If a quantity of this kind of air is contained in a glass vessel standing inverted in water, it will even smell through the water; which will soon become covered with a thin film, assuming all the different colours. If the air has been generated from iron, the film will be a red ochre; if from zinc, it is a whitish substance, probably the calx of that metal; it likewise settles to the bottom; and, when the water is stirred, has very much the appearance of wool. When water is once impregnated in this manner, it continues to yield this scum for a considerable time after the air is removed.

This kind of air is no less noxious to animals than the fixed or putrid kinds. It was generally thought to be immiscible with water: but Dr Priestley hath observed four instances of its entirely losing the inflammable property, and being reduced to half its bulk, by long standing in a bottle inverted in water. In this state it extinguished candles much more speedily than that air in which they had formerly burnt out, and instantly killed animals that were put into it.

³² Explodes on the approach of flame.

If inflammable air, contained in a vial, be mixed with an equal quantity of common air, it will instantly explode on the approach of flame. If less than an e-

qual quantity of common air is introduced, a number of explosions may be produced from the same quantity of inflammable air; only taking care to stop the mouth of the vial immediately after every explosion, otherwise the inflammable air will continue burning, though invisibly in the day-time, till the whole is consumed. A small mixture of the fumes of smoking spirit of nitre, makes it go off at once, as if mixed with an equal quantity of common air. This kind of air Dr Priestley could not kindle without bringing it into contact with a substance actually flaming; but Mr Volta, inventor of the *electrophorus* or perpetual electrifying machine, hath succeeded in firing it by the simple electric spark, even when the electricity is very moderate, by a well lighted coal without any flame, by a red hot iron, and even by a flint and steel.

Upon trial, with fixed air, the inflammable kind seemed incapable of mixing with it. Even after equal quantities of the two had been confined together in a vial for three years, they did not seem to have at all united, or affected one another; the fixed air being absorbed by water, and the inflammable air exploding as usual.

Vegetables continued to grow in this kind of air, but without making it lose its inflammability, or become fit for respiration. This could be accomplished only by agitation in water. By agitating a large quantity of inflammable air in water, one fourth of it disappeared in ten minutes, and a mouse lived 20 minutes in 24 ounce measures of the remainder; which is as long as that creature can live in the same quantity of common air. The air was yet, however, inflammable, though very weakly so. By a continuance of the agitation, this air admitted a candle to burn in it; and at last came to extinguish it like that in which a candle had burned out. The degree of diminution suffered by this kind of air when it lost its inflammability, was about one half. Distilled water imbibed about one fourteenth of its bulk of inflammable air; but the taste was not sensibly altered.

A mixture of iron-filings and brimstone, made into a paste with water, diminished the air in which it stood, between one fourth and one fifth of its whole quantity; which then became rather lighter than common air. In this state it is highly noxious; has a very pungent and offensive smell; nor is it meliorated by standing in water.—The diminution in this, as well as in other cases, Dr Priestley concludes to arise from a deposition of the fixed air, owing to a superabundant quantity of phlogiston being introduced.

³⁶ Nitrous air.

All the acids have been reduced by Dr Priestley into the form of air. He begins with the nitrous, which is obtained from a solution of any kind of metallic substance in that acid. From gold, and the regulus of antimony, it is obtained by means of aqua regia. He hath even found that it may be obtained in great plenty from common water. See WATER.

³⁶ Diminished common air.

One of the most conspicuous properties of this air is the great diminution of any quantity of common air with which it is mixed, attended with a turbid red or deep orange colour, exactly like that which appears on untopping a bottle containing smoking spirit of nitre, which the air itself very much resembles in smell. This diminution is attended with a considerable degree of heat.

Air.

If one ounce measure of nitrous, be put to double the quantity of common air, in a few minutes the mixture will want one ninth of the original quantity; and if both kinds of air be very pure, the diminution will fill go on very slowly, till the whole, in a day or two, is reduced to one fifth less than the original quantity of common air. After this saturation of common with nitrous air, a fresh quantity of the latter makes an addition equal to its own bulk, without producing the least redness, or other visible effect.—The diminution in this mixture, was found to arise from a precipitation of the fixed part of the common air, and the condensation of the nitrous air into the acid, called spirit of nitre. The precipitation of fixed air appeared, when the process was conducted in lime-water, by its becoming turbid, though a small quantity of this water put into the vessel was not affected by it. The condensation was evident by the acid taste communicated to water in which this process had been conducted; and Mr Beveley has observed, that, without a mixture of common air, the condensation of nitrous air will not take place.

37
Nitrous air
a test of the
goodness of
common air

It is also very remarkable, that the effervescence with nitrous air is peculiar to common air, or that fit for respiration; and this exactly in proportion to its goodness; that is, the more pure, or fit for respiration, any quantity of air is, the greater degree of redness will be communicated to it on the admixture of nitrous air, and vice versa. Thus the Doctor was furnished with a most accurate method of measuring the degree of goodness of any kind of air he had occasion to try.—This test is equally applicable to air, on whatever account it is rendered unfit for respiration; not the least effervescence being made between the nitrous and fixed, inflammable, putrid, or any species of noxious air. By this test he was able to discover, that air in which candles had burned out, was thereby rendered about one third worse than common air.

Inflammable air, mixed with nitrous, burns with a green flame. Equal proportions of oil of vitriol and spirit of nitre produced nitrous air; but with a less proportion of the nitrous acid, an inflammable kind, burning with a green flame, was produced.

38
Nitrous air
diminished
by a mixture
of iron filings
and brimstone.

By a mixture of iron filings and brimstone, made into a paste with water, nitrous air is remarkably diminished; no more than one fourth of the original quantity being left in one hour after the effervescence of the iron and brimstone has begun; which generally takes place in about five or six hours after the mixture has been made. The glass in which this mixture was made, usually acquired such a degree of heat, that it could not be touched.

Nitrous air, thus diminished, has not so strong a smell as at first, but smells exactly like common air diminished by the same mixture. It is not then capable of being further diminished by a fresh mixture of iron and brimstone. Nor is common air, saturated with nitrous, any farther diminished by a mixture of iron and brimstone; though the mixture ferments with great heat, and swells very much in it.

This kind of air, as well as common air saturated with nitrous, proves fatal both to vegetable and animal life. Neither of these differ in specific gravity from the common atmospheric air.

Distilled water absorbs nitrous air with great avidi-

ty, and acquires from it a remarkably acid and astringent taste, with a peculiarly pungent smell. A filmy kind of substance is also precipitated by the union of this kind of air with water. The Doctor supposes it to be a calx of the metal employed in producing the nitrous air.

The most remarkable, and, as Dr Priestley observes, probably the most useful, property of this kind of air, is its power of preserving animal substances from putrefaction, and restoring those that are already putrid; which it possesses in a degree far superior to fixed air. In the months of July and August, 1772, the Doctor put two mice, one of them just killed, the other soft and putrid, into the same jar of nitrous air; and after 25 days, having observed little or no change in the quantity of the air, he took them out; when both were found perfectly sweet: that which had been put into the jar when just dead, was quite firm; the other continued soft, but perfectly sweet.—A mouse inclosed for a month in fixed air, became insufferably offensive.

Though this kind of air may be obtained from all metallic substances, yet it is got with difficulty from some metals, and the proportion yielded by them is very different. Iron yields the greatest quantity, sixteen ounce measures of air being obtained from 20 grains of this metal; next to iron, copper, or brass, yield the most; after them silver, quicksilver, &c. In attempting to get nitrous air from zinc, the following phenomena occurred.

Four penny-weights, and seventeen grains of zinc being dissolved in spirit of nitre diluted with an equal quantity of water, yielded twelve ounce measures of air, which was in some degree nitrous. The solution being boiled in a sand heat, some air came from it, which appeared to be the same with nitrous air diminished about $\frac{1}{2}$, or $\frac{3}{4}$, by washing in water. Upon the evaporation of the fluid, there remained a brown fixed substance, which, on an increase of heat, gave out very dense red fumes; and the air was considerably diminished within the receiver. This substance, therefore, the Doctor concludes, must have contained the principle on which the properties of nitrous air depend.

Although the air, however, within the receiver was diminished $\frac{1}{2}$ by this process, it was as much affected by nitrous air, as common air itself is, and a candle burned in it perfectly well.

The Doctor next proceeds to an investigation of the air produced from the fumes of burning charcoal; and he finds, that in this case, as well as in others, a considerable diminution of air is occasioned, and, by the precipitation of lime-water contained in the vessel, there appeared to be a deposition of fixed air. At first he concluded, that the fixed air in this case came from the charcoal; but, considering the intense heat requisite for making charcoal, he thought it more probable it came from the air, as the great heat requisite to calcine the charcoal would have expelled all the air out of it. This, however, was determined in the following manner.

Having suspected, from the experiments with charcoal, that the diminution of air in all cases was owing to the deposition of its fixed part, in consequence of its having more than the usual quantity of phlogiston; the calcination of metals, which are supposed to contain nothing else than a particular kind of earth united to phlogiston,

39
Prodigious
antiseptic
power of ni-
trous air.

40
Phenomena
observed in
the calcina-
tion of met-
als.

Air.

phlogiston, appeared to be the most certain method of determining this point. Pieces of lead and tin were accordingly suspended in given quantities of air, and had the focus of a burning mirror thrown upon them, so as to make them fume copiously. A great diminution of the air immediately took place; it became in the highest degree noxious, made no effervescence with nitrous air, nor was farther diminished by a mixture of iron-filings and brimstone.

The water over which metals have been calcined, acquires a yellowish tinge, and an exceedingly pungent smell and taste, much like that over which brimstone has been frequently burned. A thin whitish pellicle, also, covered the surface of the water, and the sides of the vial in which the calcination was made. Mr La Voisier has proved, by some experiments, that the calcination of metals depends entirely on the absorption of fixed air; that, exactly in proportion to the increase of their weight, the air in the receiver which contains them is diminished; and that when all the fixed part of the air has been deposited, the calcination cannot proceed farther, until fresh air is admitted. Dr Priestley also has observed, that lime-water is not precipitated by having metals calcined over it; but it always acquires the peculiar smell and taste above-mentioned. The reason why none of the lime is precipitated in this case, is, that the metallic calx has a greater affinity with fixed air than lime has, and consequently absorbs it preferably to the lime.

47
Calcination of metals depends on the absorption of fixed air.

43
Diminution of air accounted for in all cases.

From all these experiments, and many more than what can be mentioned here, the Doctor concludes, that in all cases the diminution of the air is owing to the deposition of its fixed part; which happens in consequence of a saturation with phlogiston: that the inflammable principle, having a greater affinity with some of the constituent parts of the air than its fixed part, unites with them in preference to the other; which immediately joins itself to whatever has a tendency to absorb it. When an animal or vegetable putrefies, the phlogistic matter, together with all its other constituent parts, is let loose, which he supposes to be the cause of the diminution of the air in that case. When iron ferments with brimstone and water, there is an evident escape of phlogiston, by the metal's being reduced to calx. The same must necessarily happen upon the ignition of charcoal; and as spirit of nitre has a very strong affinity with phlogiston, it is highly probable that nitrous air diminishes common air, by imparting phlogiston to it, while the acid of the nitrous air, uniting with the aqueous part of the atmosphere, condenses into a liquor.

43
True composition of air suspected

44
Discovered.

As for the Doctor's experiments on the other kinds of acid and alkaline air, as they come more properly under CHEMISTRY, we shall here only mention, that from the fume of the marine acid he always obtained inflammable air, by putting to it spirit of wine, oil of olives, oil of turpentine, charcoal, phosphorus, bees wax, and even sulphur. This made him suspect, that the common air we breathe, was no other than some kind of acid united with phlogiston; and that it really was so, he discovered by the following experiments.

Having exposed *mercurius calcinatus per se* to the focus of a burning glass twelve inches diameter, he obtained air from it very plentifully. This air, he found, was not absorbed by water; a candle burned with a very

vigorous and greatly enlarged flame; a piece of red-hot wood sparkled in it like paper dipped in a solution of nitre, and consumed very fast.—The same properties he observed in air drawn from red precipitate. From minium, he extracted air of the very same kind. One third of this air, indeed, was readily absorbed by water; but in the remainder, a candle burned very strongly, and with a crackling noise.

After some time, it occurred to him to apply the test of nitrous air to that which he had newly procured; and, upon so doing, he found that it was fully as much diminished as common air. From hence he concluded, that this air was respirable. Accordingly, he put a mouse into two ounce measures of air, obtained from *mercurius calcinatus per se*. Had it been common air, he knew that this creature would have lived a quarter of an hour in such a quantity. In the dephlogisticated air, however, as Dr Priestley calls it, the mouse lived a full half hour; nor did it, when taken out, shew signs of being injured any otherwise than by cold, as it presently revived upon being held to the fire. The remainder of the air which had been so long breathed by the mouse, and which, had it been common air, would have been in the highest degree noxious, was still found to be much better than common air, being reduced by nitrous air to almost one half of its original quantity.

From this quality of taking more phlogiston from nitrous air, than common air was capable of doing, he concluded, that it must originally contain less of that principle than common air. In his experiments to know why this kind of air comes to be so much dephlogisticated, he at last hit upon a method of producing very pure air readily, and in considerable quantity. Having moistened half an ounce of red lead with spirit of nitre, and then dried the mass, he obtained from it not quite a pint of dephlogisticated air, exceedingly pure, in which a candle burned very briskly; and which seemed to be about five times as pure as common air. From this experiment, the Doctor concluded, that the nitrous acid was that which gave the minium power to emit this dephlogisticated air. The vitriolic and marine acids were tried without effect. No air of any kind was produced by treating them in the same manner. The minium effervesced violently with all the acids.

For the same purpose, the Doctor tried, with success, flowers of zinc, chalk, quicklime, slaked lime, tobacco-pipe-clay, flint, Muscovy talcs, and even glass itself; from all which he draws the general conclusion, "That the air we breathe consists of the nitrous acid and earth, with as much phlogiston as is necessary to its elasticity; and likewise as much more as is necessary to bring it from its state of perfect purity, to the mean condition in which we find it." The residuum of his distillation, he found equally fit with fresh earth for the production of more air, upon being again moistened with the spirit of nitre. In his third volume, published in 1777, the Doctor acquaints us, that very pure dephlogisticated air is produced by simply distilling a solution of any metal in the nitrous acid: and Mr Bewley found even that trouble unnecessary; nothing more being requisite, than to moisten red lead with the spirit of nitre, and then pour upon it oil of vitriol; when the dephlogisticated air would immediately be expelled without any more heat being required than what was generated by the mixture. The Doctor hath also endeavoured to determine the proportions

Air.

Air. tions of earth and nitrous acid, required to produce this kind of air; but hitherto without success. Air, he finds, will take up a great deal of earth when hot, which it deposits when cold. See EARTH.

45 The use of blood in animals. We shall conclude this subject with some observations which the Doctor has made on the use of the blood in animals, and on respiration. They are to be found at length in the Philosophical Transactions for the year 1776, and in his third volume on air published in 1777.

46 Respiration a phlogistic process. In his treatise on putrid air, or that infected by animal respiration, he had shewn, that respiration was a phlogistic process; and that by means of it a putrid effluvia was carried off from the body, without which he imagined that a living body might perhaps putrefy as soon as a dead one. In this paper he proves, that the blood is the principal agent in carrying off the superabundant phlogiston; that when the whole mass of blood is successively brought almost into contact with the air in the lungs, it discharges phlogiston into it; and that the blood receives its red florid colour from the air, he proves by the following experiments.

47 Black coloured blood becomes florid by being exposed to the air. Pieces of the nearly black-coloured crassamentum of a sheep's blood, inclosed in nets of open gauze, or wire, having been introduced thro' water or quicksilver into inverted receivers containing common air, received from it a florid red colour, at the same time that the air was considerably depraved.—The brightest red blood became black in phlogisticated or any otherwise depraved air; and resumed its colour again upon being exposed to the fresh air, parting, in this last situation, with the phlogiston it had acquired in the preceding.

That pure air is depraved by the presence of blood, while the colour of it is changed from black to red, the Doctor proved by his very pure dephlogisticated air being considerably vitiated by successively introducing fresh pieces of crassamentum to the same portion of it; and this without any tendency to putrefaction in the blood employed.

48 Remarkable discovery concerning the nature of serum. In the course of his experiments on blood, he made the following remarkable discovery concerning the nature of serum, viz. that a covering of serum several inches deep was no impediment to the action of the air upon the crassamentum of the blood, as it acquired the red colour as easily on being exposed to pure air with this thick coat of serum, as without it; whereas the slightest covering of water, or saliva, effectually prevented any change of colour. On reversing the experiment, he found that phlogisticated air would act upon crassamentum, so as to turn it black, through a covering of serum two inches deep.—From these experiments he concluded, that the ferous part of the blood was particularly organized for the purpose of transmitting air through it.

49 Apparatus for making experiments on air. It now remains that we give some account of the apparatus requisite for making experiments on air: and for this purpose it will be sufficient to give an idea of that made use of by Dr Priestley; both as being most easily understood, and likewise, if we may judge from the discoveries he hath made by the use of it, as being the most efficacious of any that hath hitherto been invented.

Plate VII. For experiments in which air will bear to be confined in water, he made use of an oblong wooden trough, *fig. 1.* two feet long, 11 inches deep, and 18 inches

wide; with a shelf, *bb*, about an inch lower than the top, for the convenience of placing the jars upon it. The several kinds of air are kept in cylindric jars *cccc*, about about 10 inches long, and $2\frac{1}{2}$ wide; though it is necessary, for particular experiments, to have vessels of different forms and sizes. When he has occasion to transfer air from one jar to another in quicksilver, a small oblong trough is absolutely necessary; but, on other occasions, a basin is more convenient for holding the quicksilver.

When vessels of air are to be removed from the large trough, they are placed in pots or dishes *ggg*, of different sizes, to hold more or less water as there is occasion. For the purpose of merely removing a jar of air from one place to another, where it is to stand only a few days, common tea-dishes may be used; unless the air be in a state of diminution, when vessels of a larger size must be made use of.

When an experiment is to be tried how long a small animal, a mouse for instance, will live in a certain species of air, a tall beer-glass, such as is represented by *d*, which contains between two and three ounce measures of air, will answer the purpose. In this quantity of common air a mouse will live 20 minutes, or half an hour.—On this occasion the Doctor observes, that mice must be kept in a pretty exact temperature, as they are unable to bear either much heat or much cold. He was also surprized to find that they lived entirely without water; and he had an instance of one mouse tearing another almost in pieces, though there was plenty of provisions at the time for both. The method of putting these creatures into the quantity of air designed for the experiment, is to pass them through the water into the cavity of the glass, into which something must be put for them to fit conveniently out of the reach of the water.—The same method may be used when a plant is to be conveyed into any given quantity of air. If the plant is of such a nature that it will grow in water only, there will be no occasion to set it in a pot of earth, which otherwise will be necessary.

For opening the mouth of a vial, in any quantity of air, without admitting the water into the vial, it is necessary to have a cork cut tapering, with a strong wire thrust through it, (*b*, *fig. 1.*) by which means it may be introduced into the mouth of an inverted jar, and the cork withdrawn by means of the wire, which afterwards can be replaced by the same means, if there is occasion.—For supporting a gallipot at a considerable height within a jar, it is convenient to have such wire-stands as are represented *fig. 2.* They answer better than any other, as they take up but little room, and easily bend to any form.

When air is to be poured from a wide-necked, into a very narrow-necked vessel, a glass funnel *e* must be used, by which means the operation is rendered exceedingly easy; first filling the vessel into which the air is to be conveyed with water, and untopping the other containing the air under the funnel, which is inserted into the mouth of the narrow vessel, and immersed in water. The air immediately ascends through the neck of the funnel, makes the water descend, and take its place.

To expel air from solid substances by means of heat, a gun-barrel may be sometimes used, which is filled up with dry sand that has been well burned, *fig. 11.*

Fig. 2.

A. Bell's design

Air.

so that no air can come from it. To the open end is luted the stem of a tobacco-pipe, or a small glass-tube. Having put the closed end of the barrel containing the materials, into the fire, the generated air, issuing through the tube, may be received in a vessel of quicksilver having its mouth inverted into a basin of the flame, suspended all together by wires, in the manner represented in the figure.

But the most accurate method of extracting air from several substances, by means of heat, is to put them, if they will bear it, into vials full of quicksilver, with the mouths immersed in the flame; and then throwing the focus of a burning mirror, or convex lens, upon them. The vials used for this purpose should have their bottoms round and very thin, that they may not break with a sudden application of heat; for which Florence flasks seem very proper.

If air is to be expelled from any liquid, a vial is nearly filled with it. To the vial is fitted a perforated cork, having a glass tube inserted in it, bent as in *fig. 1*, and secured with cement. The vial is then to be put in a kettle of boiling water, in order to expell the air; or it may be heated by means of a candle, or red-hot poker. But where the air is readily imbibed by water, quicksilver ought always to be used; or if a sufficient quantity of it cannot be procured, oil will in some measure answer the purpose.

Plate VII.

When air is to be transferred from a jar standing in the trough of water to any other vessel, the contrivance *fig. 12*, is made use of. It consists of a bladder furnished at one end with a small tube of glass bent, having at the other a cork perforated, so as just to admit the small end of a funnel. When the common air is pressed out of this bladder, and the funnel thrust tightly into the cork, it may be filled with any kind of air as easily as a glass jar. A string being then tied above the cork in which the funnel is inserted, and the orifice in the other cork closed by pressing the bladder against it, it may be carried to any place; and if the tube be carefully wiped, the air may be conveyed quite free from moisture through a body of quicksilver, or any thing else.

Plate VIII.

To impregnate fluids with air of any kind, as water with fixed air, a vial is filled with the fluid, as *a*, *fig. 5*. It is then inverted in a bowl *b*, containing a quantity of the same fluid; and the bladder *c* being filled with the air, as much of it as is thought proper may be thrown into the vial; and, to accelerate the impregnation, the vial may be shaken as much as possible. The same apparatus serves very conveniently for conveying air immediately as it is generated from an effervescing mixture, into any other species of fluid; and that the vial may be more conveniently shaken, in order to make the effervescence occasionally more brisk, a flexible leather pipe may be sometimes used, instead of the inflexible glass one.

Plate VII.

When any kind of air is to be tried with regard to its capacity for sustaining flame, a cylindrical glass vessel (*fig. 4*.) is made use of, with a bit of wax candle, fastened to the end of a wire, and turned up in such a manner as to be let down into the vessel with the flame upwards. The vessel should be kept carefully covered, till the moment the candle is admitted; and by this means the Doctor has extinguished a candle more than 20 times successively; although it is im-

Vol. I.

possible to dip the candle in it without giving the external air an opportunity of mixing more or less with that in the vessel. The candle at the other end of the wire is very convenient for being held under a jar standing in water, in order to burn as long as the inclosed air can supply it; for, the moment it is extinguished, it may be drawn through the water, before any smoke can have mixed with the air.

Air.

In order to draw air out of a vessel which has its mouth immersed in water, and thereby to raise the water to any height, it is convenient to use a glass syphon, *fig. 6*. putting one of the legs up into the vessel, and drawing the air out of the other by the mouth. If the air is of a noxious quality, it may be necessary to have a syringe fastened to the syphon; or if a very small hole is made in the upper part of a glass-vessel, it may be filled to any height, by holding it under water, while the air is discharged at the hole, which may be afterwards closed with cement.

Plate VIII.

When a particular kind of air is to be admitted to any thing that will not bear wetting, especially if it is a powder, and must be placed on a stand, as in those experiments in which the focus of a burning mirror is to be thrown upon it, a receiver is first exhausted, in which it is previously placed; and having a glass tube bended for the purpose, as in *fig. 7*, it is to be screwed to the stem of a transfer of the air-pump on which the receiver had been exhausted; and introducing it into a jar of that kind of air with which the receiver is desired to be filled, the purpose is gained, by only turning the cock.

To take the electric spark in any kind of air, the quantity of which must be very small, to produce a sensible effect upon it in a short time, a piece of wire is put into the end of a small tube, and fastened with hot cement, as in *fig. 8*. and having got the air desired into the tube, by means of the apparatus already described, it is placed inverted in a basin containing quicksilver or any other fluid substance. By the help of the air-pump, then, as much of the air is driven out as is thought proper; and putting a brass ball on the end of the wire, the sparks, or shocks, are communicated by its means, thro' the air contained in the tube, to the fluid.—If air is generated very fast by this process, a glass is used, *fig. 10*. which is narrow above, and grows wider below, that the quicksilver may not too soon recede beyond the striking distance.

Besides this general apparatus, which hitherto may be considered as merely experimental, and a matter of curiosity only, it will be proper to mention that for impregnating water with fixed air; as water impregnated with this kind of air hath been found exceedingly salutary in putrid distempers, particularly in the sea-scurvy. For this reason, a method of impregnating large quantities of water with fixed air has become an object worthy of public attention. A proposal for doing so was laid before the board of Admiralty, and was accepted of; and the captains of two ships that were just failing for the south seas, had orders to make trial of the impregnated water; for which purpose Dr Priestley drew out his directions in writing, and sent a drawing of his apparatus.

50
Apparatus
for impreg-
nating water
with fixed
air.

The apparatus recommended by Dr Priestley for By Dr Priestley, impregnating water, is not in the least different from that represented *fig. 5*, where *a* represents a glass-vessel,
A a vessel,

51

Air.

veffel, with a pretty narrow neck, but so formed that it will stand upright with its mouth downwards. Having filled it with water, lay a slip of clean paper, or thin palleboard, upon the mouth: then, if they be pressed close together, the vefsel may be turned upfide down, without danger of admitting common air into it; and when thus inverted, it muft be placed into another vefsel, in the form of a bowl or bafon, *b*, with a little water in it, so much as to permit the slip of paper or palleboard to be withdrawn, and the end of the crooked pipe to be introduced. One end of this pipe is inferted into a bladder, which is tied round it; and the other communicates, by means of a perforated cork, with a vial which contains the effervescing mixture, from whence the fixed air is to be detached. On some occasions it may be convenient to have this pipe flexible; when it will be best made of leather sewed with a waxed thread, in the manner used by shoe-makers. When this pipe is flexible, a piece of quill muft be thrust into each end of it, to keep them open, while one of them is introduced into the vefsel of water, and the other into the bladder *c*, the opposite end of which muft be tied round a cork perforated, and the hole kept open by a quill. The cork muft fit the vial containing the effervescing mixture, two-thirds of which muft be filled with chalk, juft covered with oil of vitriol. The Doctor, however, finds it most convenient to use a glass tube; and, for the advantage of agitating the vial, to have two bladders, communicating by a perforated cork, to which they are both tied.

Things being thus prepared, and the vial containing the chalk and water being detached from the bladder, and the pipe from the vefsel of water, pour a little oil of vitriol upon the chalk and water; and having carefully pressed all the common air out of the bladder, put the cork into the bottle presently after the effervescence has begun. Also, press the bladder once more, after a little of the newly generated air has got into it, in order the more effectually to clear it of all remains of common air; and then introduce the end of the pipe into the mouth of the vefsel of water, as in the drawing, and begin to agitate the chalk and water briskly. This will presently produce a considerable quantity of fixed air, which will distend the bladder; and this being pressed, the air will force its way through the pipe, and ascend into the vefsel of water, the water at the same time descending and coming into the bafon.

When about one half of the water is forced out, let the operator lay his hand upon the uppermost part of the vefsel *a*, and shake it as briskly as he can, not to throw the water out of the bafon; and, in a few minutes, the water will absorb the air; and, taking its place, will nearly fill the vefsel as at first. Then shake the vial containing the chalk and water again, and force more air into the vefsel, till upon the whole an equal bulk of air has been thrown into it. Also shake the water as before, till no more of the air can be imbibed. As soon as this is perceived to be the case, the water is ready for use; and if it is not to be used immediately, should be put, as soon as possible, into a bottle well corked and cemented. It will, however, keep very well, if the bottle be only well corked, and kept with the mouth downwards. A little more than a tea-spoonful of oil of vitriol will be sufficient to impregnate three pints of water with fixed air.

Air.

By this process may fixed air be given to wine, beer, and almost any liquor whatever: and when beer is become flat or dead, it will be revived by this means; but the delicate agreeable flavour, or acidulous taste, communicated by the fixed air, and which is manifest in water, will hardly be perceived in wine, or other liquors, which have much taste of their own.

By the same means also may be prepared water having all the medicinal virtues of Pyrmont water, or any other mineral water similar to it; especially if a few iron-silings be added, to render it a chalybeate like genuine Pyrmont water; which it may be made to resemble exactly, by putting eight or ten drops of *tinctura martis cum spiritu salis* to every pint.

52
Artificial
Pyrmont
water.

The first hint of the uses to which fixed air may be applied, was given by Sir John Pringle; who discovered that putrefaction was checked by fermentation. Doctor Macbride found this to be an effect of the fixed air produced in the process; upon which principle he recommended the use of wort to sailors, as a substitute to fresh vegetables, by supplying a quantity of fixed air from its fermentation in the stomach; which conjecture is now confirmed by experience. Dr Black discovered the existence of fixed air in calcareous substances; Dr Brownrigg claims the discovery of it in Pyrmont, and other mineral waters; and Dr Priestley, that of an easy method of impregnating water with it in large quantities. He also conjectured, that, if applied by way of clyster, it might be of service in putrid fevers; which is likewise verified by experience. The fixed air may be injected into the intestinal canal, by the same apparatus employed for injecting the smoke of tobacco.

The use of bladders in this apparatus was objected to by Dr Nooth; who asserted, that they were apt to communicate an urinous flavour to the water. This he attributed to the action of the solvent power of the air upon the bladder; and he gave a particular kind of apparatus of his own invention, in which, the vessels being entirely made of glass, no inconvenience of this sort could be apprehended.—To Dr Nooth's objections Dr Priestley replied, that he had been conversant with bladders, and fixed air contained in bladders, as much as any man, and never found any such flavour arising from the use of them as Dr Nooth had experienced. He suspected, therefore, that the taste complained of had arisen from the carelessness of the servant, and that urine had really been mixed with the water made use of. He owned, however, that the apparatus recommended by Dr Nooth, and improved by Mr Parker, had in some respects the advantage of his own, particularly in being more cleanly to the operator, and requiring less attendance; though it was more inconvenient, where large quantities of water were to be impregnated, on account of its being much slower.

53
Dr Nooth's
apparatus.

This apparatus is represented, fig. 3. In the lowest Plate VII. vefsel, the chalk, or pounded marble, (which last is preferred by Dr Priestley), and the water acidulated with oil of vitriol, is to be put; in the middle vefsel is the water to be impregnated, the descent of which is prevented by the ascent of the fixed air. During the effervescence, the fixed air rises into the middle vefsel, displaces part of the water in it, thro' the bent tube into the upper vefsel, the common air going out through a channel in the stopple. When this bent tube

Air,
in Music.

tube is of a proper length, the process requires no attention; and if the production of air be copious, the water will generally be sufficiently impregnated in five or six hours. At least, all the attention that needs be given to it is to raise the uppermost vessel once or twice, to let out that part of the fixed air which is not readily absorbed by water. If the operator chuses to accelerate the process by agitating the mixture, he must separate the two uppermost vessels from the lowest, or the air will be too copiously produced, and he will also be in danger of throwing the liquor contained in the lowest vessel, in contact with the flopple which separates it from the middle vessel, by which means some of the oil of vitriol might get into the water.

Vitriolic-acid Air } n° 163.

AIR, in mythology, was adored by the heathens under the names of Jupiter and Juno; the former representing the superior and finer part of the atmosphere, and the latter the inferior and grosser part. The augurs also drew presages from the clouds, thunder, lightning, &c.

AIR, in painting, &c. denotes the manner and very life of action; or it is that which expresses the disposition of the agent.—It is sometimes also used in a synonymous sense with gesture or attitude.

AIR, in music, is taken in different senses. In a vulgar acceptance, it signifies any particular manner of execution: thus, we say of a practical musician, that he performs with a good or bad, proper or improper, *air*. But this is certainly a solecism of speech. The animating graces, and moving touches, with which melody is adorned and heightened in execution, are resolvable either into manner or expression.—*Air* is likewise sometimes contrasted with harmony; and, in this sense, it is synonymous with melody in general.—Its proper meaning is, A tune, which is set to words, or to short pieces of poetry that are called *songs*.

In operas, we give the name of *air* to such pieces of music as are formed with measures and cadences, to distinguish it from the recitative; and, in general, every piece of music is called an *air*, which is formed for the voice, or even for instruments, and adapted to stanzas, whether it forms a whole in itself, or whether it can be detached from any whole of which it forms a part, and be executed alone.

If the subject admits of harmony, and is set in parts, the *air* is, according to their number, denominated a *duet*, a *trio*, a *quartetto*, &c. We need not follow Rousseau, and the other philologists, in their endeavours to investigate the etymon of the word *air*. Its derivation, though found and ascertained, would contribute little to illustrate its meaning in that remote sense, to which, through a long continuance of time, and the various vicissitudes of language, it has now passed. The curious may consult the same article in the *Dictionnaire de Musique* by M. Rousseau.

In modern music, there are several different kinds of *airs*, each of which agrees to a certain kind of dancing, and from these dances the *airs* themselves take their specific names. See MUSIC, Art. 252.

The *airs* of our operas, are, if we may be permitted the expression, the canvass or substratum upon which

are painted all the pictures of imitative music; melody is the design, and harmony the colouring: every picturesque object selected from the most beautiful parts of nature, every reflected sentiment of the human heart, are the models which the artist imitates; whatever gains attention, whatever interests the soul, whatever charms the ear, or causes emotion in the heart, these are the objects of his imitation*. An *air* which delights the ear, and discovers the learning of the composer; an *air* invented by genius, and composed with taste; is the noblest effort of music: it is this which explores the compass, and displays the delicacy, of a beautiful voice; it is in this where the charms of a well-conducted symphony shine; it is by this, that the passions, excited and inflamed by nice gradations, reach and agitate the soul through the avenues of external sense. After hearing a beautiful *air*, the mind is acquiescent and serene: the ear is satisfied, not disgusted: it remains impressed on the fancy, it becomes a part of our essence, we carry it with us, we are able to repeat it at pleasure: without the ability acquired by habit to breathe a single note of it, we execute it in our imagination in the same manner as we heard it upon the theatre: one sees the scene, the actor, the theatre; one hears the accompaniments and the applause. The real enthusiast in music never forgets the beautiful *airs* which he has heard; when he chuses, he causes the opera to recommence.

The words to which *airs* are adapted, are not always rehearsed in regular succession, nor spoken in the same manner with those of the recitative; and though, for ordinary, they are very short, yet they are interrupted, repeated, transposed, at the pleasure of the artist. They do not constitute a narrative, which once told is over: they either delineate a picture, which it is necessary to contemplate in different points of view; or inspire a sentiment in which the heart acquiesces with pleasure, and from which it is neither able nor willing to be disengaged; and the different phrases of the *air*, are nothing else but different manners of beholding the same image. This is the reason why the subject of an *air* should be one. It is by these repetitions properly placed, it is by these redoubled efforts, that an impression, which at first was not able to move you, at length shakes your soul, agitates you, transports you out of yourself: and it is likewise upon the same principle, that the runnings as they are called, or those long, mazy, and inarticulate inflections of the voice, which, in pathetic *airs*, frequently seem, though they are not always so, improperly placed; whilst the heart is affected with a sentiment exquisitely moving, it often expresses its emotions by inarticulate sounds, more strongly and sensibly than it could do by words themselves.

The form of *airs* is of two kinds. The small *airs* are often composed of two strains, which ought each of them to be sung twice; but the important *airs* in operas, are frequently in the form of rondeaus.

AIRS, in the menage, are the artificial motions of taught horses; as the demivolt, curvet, capriole, &c.*

AIR-Bladder, in fishes. See COMPARATIVE ANATOMY, n° 147.

AIR-Gun, a pneumatic machine for exploding bullets, &c. with great violence.

The common air-gun is made of brass, and has two barrels; the inside barrel A, fig. 1. which is of a small bore, from whence the bullets are exploded; and a large barrel

Air,
in Music.

* See Demivolt, &c.

Plate IX.

Air-gun.

barrel E C D R on the outside of it. There is a syringe S M N P fixed in the flock of the gun, by which the air is injected into the cavity between the two barrels through the valve E P. The ball K is put down into its place in the small barrel, with the rammer, as in any other gun. At S L is another valve, which, being opened by the trigger O, permits the air to come behind the bullet, so as to drive it out with great force. If this valve be opened and shut suddenly, one charge of condensed air may be sufficient for several discharges of bullets; but if the whole air be discharged on one single bullet, it will drive it out with a great force. This discharge is effected by means of a lock, fig. 2. placed here as usual in other guns; for the trigger being pulled, the cock will go down and drive the lever O, fig. 1. which will open the valve, and let in the air upon the bullet K.

The *Magazine Air-gun* was invented by that ingenious artist L. Colbe. By this contrivance ten bullets are so lodged in a cavity, near the place of discharge, that they may be drawn into the shooting-barrel, and successively discharged so fast as to be nearly of the same use as so many different guns.

Fig. 3. represents the present form of this machine, where part of the flock is cut off, to the end of the injecting syringe. It has its valve opening into the cavity between the barrels, as before. K K is the small shooting-barrel, which receives the bullets from the magazine E D, which is of a serpentine form, and closed at the end D when the bullets are lodged in it. The circular part *abc*, is the key of a cock, having a cylindric hole through it, *ik*, which is equal to the bore of the same barrel, and makes a part of it in the present situation. When the lock is taken off, the several parts Q, R, T, W, &c. come into view, by which means the discharge is made by pushing up the pin P *p*, which raises and opens a valve V, to let in the air against the bullet I, from the cavity F F; which valve is immediately shut down again by means of a long spring of brass, N N. This valve V being a conical piece of brass, ground very true in the part which receives it, will of itself be sufficient to confine the air.

To make a discharge, you will pull the trigger Z Z, which throws up the feather *y*, and disengages it from the notch *a*, upon which the strong spring W W moves the tumbler T, to which the cock is fixed. This, by its end *u*, bears down the end *v* of the tumbling lever R, which, by the other end *m*, raises at the same time the flat end of the horizontal lever Q; and by this means, of course, the pin F *p*, which stands upon it, is pushed up, and thus opens the valve V, and discharges the bullet. This is all evident from a bare view of the figure.

To bring another bullet to succeed that marked I, instantaneously, turn the cylindric cavity of the key of the cock, which before made part of the barrel K K, into the situation *ik*, so that the part *i* may be at K; and hold the gun upon your shoulder, with the barrel downwards, and the magazine upwards, by which means that bullet next the cock will fall into it out of the magazine, but go no farther into this cylindric cavity than the two little springs *s s*, which detain it. The two circles represent the cock-barrel, wherein the key abovementioned turns upon an axis not represented here, but visible in fig. 4. This axis is a square

piece of steel, on which comes the square hole of the hammer H, fig. 5; by which the cylindric cavity mentioned is opened to the magazine. Then opening the hammer, as in that figure, the bullet is brought into its proper place near the discharge-valve, and the cylindric cavity of the key of the cock again makes part of the inward barrel K K.

It evidently appears how expeditious a method this is of charging and discharging a gun; and were the force of condensed air equal to that of gunpowder, such an air-gun would answer the end of several guns.

In the air-gun, and all other cases where the air is required to be condensed to a very great degree, it will be requisite to have the syringe of a small bore, viz. not exceeding half an inch in diameter; because the pressure against every square inch is about 15 pounds, and therefore against every circular inch about 12 pounds. If therefore the syringe be one inch in diameter, when one atmosphere is injected, there will be a resistance of 12 pounds against the piston; and when 10 are injected, there will be a force of 120 pounds to be overcome; whereas ten atmospheres act against the circular half-inch piston (whose area is only one-fourth part so big) with only a force equal to 30 pounds; or 40 atmospheres may be injected with such a syringe, as well as 10 with the other. In short, the facility of working will be inversely as the squares of the diameter of the syringe.

Air-Jacket, a sort of jacket made of leather, in which are several bags, or bladders, composed of the same materials, communicating with each other. These are filled with air through a leather tube, having a brass stop-cock accurately ground at the extremity, by which means the air blown in through the tube is confined in the bladders. The jacket must be wet, before the air be blown into the bags, as otherwise it will immediately escape through the pores of the leather. By the help of these bladders, which are placed near the breast, the person is supported in the water, without making the efforts used in swimming.*

Air-Pipes, an invention for drawing foul air out of ships, or any other close places, by means of fire. These pipes were first found out by one Mr Sutton, a brewer in London; and from him have got the name of *Sutton's Air-pipes*. The principle on which their operation depends is known to every body, being indeed no other than that air is necessary for the support of fire; and, if it has not access from the places most adjacent, will not fail to come from those that are more remote. Thus, in a common furnace, the air enters through the ash-hole; but if this is closed up, and a hole made in the side of the furnace, the air will rush in with great violence through that hole. If a tube of any length whatever is inserted in this hole, the air will rush through the tube into the fire, and of consequence there will be a continued circulation of air in that place where the extremity of the tube is laid. Mr Sutton's contrivance then, as communicated to the Royal Society by Doctor Mead, amounts to no more than this.—“As, in every ship of any bulk, there is already provided a copper or boiling-place proportionable to the size of the vessel; it is proposed to clear the bad air, by means of the fire already used under the said coppers or boiling-places for the necessary uses of the ship.

Air-pipes.

* See also the articles *CORK-Jacket*, *Habit*, and *BAMBOO-Habit*.

Air-pipes.

"It is well known, that, under every such copper or boiler, there are placed two holes, separated by a grate; the first of which is for the fire, and the other for the ashes falling from the fame; and that there is also a flue from the fire-place upward, by which the smoke of the fire is discharged at some convenient place of the ship.

"It is also well known, that the fire once lighted in these fire-places, is only preserved by the constant draught of air through the forementioned two holes and flue; and that if the said two holes are closely stopped up, the fire, though burning ever so briskly before, is immediately put out.

"But if, after shutting up the abovementioned holes, another hole be opened, communicating with any other room or airy place, and with the fire; it is clear, the said fire must again be raised and burn as before, there being a like draught of air through the fame as there was before the stopping up of the first holes; this case differing only from the former in this, that the air feeding the fire will now be supplied from another place.

"It is therefore proposed, that, in order to clear the holds of ships of the bad air therein contained, the two holes abovementioned, the fire-place and ash-place, be both closed up with substantial and tight iron-doors; and that a copper or leaden pipe, of sufficient size, be laid from the hold into the ash-place, for the draught of air to come in that way to feed the fire. And thus it seems plain, from what has been already said, that there will be, from the hold, a constant discharge of the air therein contained; and consequently, that that air, so discharged, must be as constantly supplied by fresh air down the hatches or such other communications as are opened into the hold; whereby the fame must be continually freshened, and its air rendered more wholesome and fit for respiration.

"And if into this principal pipe so laid into the hold, other pipes are let in, communicating respectively either with the well or lower decks; it must follow, that part of the air, consumed in feeding the fire, must be respectively drawn out of all such places to which the communication shall be so made."

This account is so plain, that no doubt can remain concerning the efficacy of the contrivance; it is evident, that, by means of pipes of this kind, a constant circulation of fresh air would be occasioned thro' those places where it would otherwise be most apt to stagnate and putrefy. Several other contrivances have been used for the same purpose; and Doctor Hales's ventilators, by some unaccountable prejudice, have been reckoned superior in efficacy and even simplicity to Mr Sutton's machine, which at its first invention met with great opposition*, and even when introduced by Dr Mead, who used all his interest for that purpose, was shamefully neglected.

A machine capable of answering the same purpose was invented by Mr Defaguliers, which he called the *ship's lungs*. It consisted of a cylindrical box set up on its edge, and fixed to a wooden pedestal. From the upper edge of the box issued a square trunk open at the end, and communicating with the cavity of the box. Within this box was placed a cylindrical wheel turning on an axis. It was divided into 12 parts, by means of partitions placed like the radii of a circle. These par-

titions did not extend quite to the centre, but left an open space of about 18 inches diameter in the middle; towards the circumference, they extended as far as possible without interfering with the case, so that the wheel might always be allowed to turn freely.—Things being thus circumstanced, it is plain, that if the wheel was turned towards that side of the box on which the trunk was, every division would push the air before it, and drive it out through the trunk, at the same time that fresh air would come in through the open space at the centre, to supply that which was thrown out thro' the trunk. By turning the wheel swiftly, a strong blast of air would be continually forced out thro' the square trunk, on the same principles on which a common fan-ner winnows corn. If the wheel is turned the opposite way, a draught of air may be produced from the trunk to the centre.—If this machine, then, is placed in a room where a circulation of air is wanted, and the trunk made to pass through one of the walls; by turning the wheel swiftly round, the air will be forced with great velocity out of that room, at the same time that fresh air will enter through any chinks by which it can have access to supply that which has been forced out.

It is evident, that the circulation which is promoted by this machine, is entirely of the same kind with that produced by Mr Sutton's; the turning of the wheel in Mr Defaguliers's machine being equivalent to the rarefaction of the air by fire in Mr Sutton's: but that the latter is vastly superior, as acting of itself, and without intermission, requires no arguments to prove. Mr Sutton's machine has yet another convenience, of which no other contrivance for the same purpose can boast; namely, that it not only draws out putrid air, but destroys it by causing it pass through fire; and experience has abundantly shewn, that though putrid air is thrown into a great quantity of fresh air, it is so far from losing its pernicious properties, that it often produces noxious diseases. We do not say, indeed, that putrid air becomes salutary by this means; but it is undoubtedly rendered less noxious than before; tho' whether it is equally innocent with the smoke of a fire fed in the common way, we cannot pretend to determine.

Besides this machine by Mr Defaguliers, the ventilators of Doctor Hales, already mentioned, and those called *Wind-sails*, are likewise used for the same purpose. The former of which is an improvement of the Hessian-bellows*: the other is a contrivance for throwing fresh air into those places where putrid air is apt to lodge; but this has the last-mentioned inconvenience in a much greater degree than any of the others, as the blast of fresh air throws out that which was rendered putrid by stagnation, in such a manner as to contaminate all around it. See *WIND-SAILS*.

Air-Trunk, is also a contrivance by Doctor Hales to prevent the stagnation of putrid effluvia in jails, and other places where a great number of people are crowded together in a small space. It consists only of a long square trunk open at both ends; one of which is inserted into the ceiling of the room, the air of which is required to be kept pure; and the other extends a good way beyond the roof. Through this trunk a continued circulation is carried on: and the reason is, that the putrid effluvia which do so much mischief when collected, being much lighter than the pure atmosphere, arise to the top of the room; and, if they there find a

* See *Ventilator*.

vent,

* See *Sutton*.

Air-trunks vent, but continually go out through it. These effluvia arise in very considerable quantity, being calculated by the late Dr Keil at no less than 39 ounces from one man in 24 hours.

These trunks were first made trial of by Mr Yeoman, over the House of Commons, where they were nine inches wide within; and over the Court of King's-bench in Westminster-hall, where they were six inches wide. They are sometimes made wider, and sometimes narrower: but the wider they are, the longer they ought to be, more effectually to promote the ascent of the vapour. The reason why vapours of this kind ascend more swiftly through a long trunk than a short one, is, that the pressure of fluids is always according to their different depth, without regard to the diameter of their basis, or of the vessel which contains them; and, upon this principle, a gallon of water may be made to split a strong cask*. When the column of putrid effluvia is long and narrow, the difference between the column of atmosphere pressing on the upper end of the trunk, and that which presses on the lower end, is much greater than if the column of putrid effluvia was short and wide; and consequently the ascent is much swifter.—One pan of a single pair of scales, which was two inches in diameter, being held within one of these trunks, over the house of commons, the force of the ascending air made it rise so as to require four grains to restore the equilibrium, and this when there was no person in the house; but when it was full, no less than 12 grains were requisite to restore the equilibrium; which clearly shews that these trunks must be of real, and very great efficacy.

Air-Pump, a machine by which the air contained in a proper vessel may be exhausted, or drawn out*.

Air-Shafts, among miners, are holes made to meet the adits, and supply them with fresh air.

Air-Threads, in natural history, a name given to the long filaments, so frequently seen in autumn floating about in the air.

These threads are the work of spiders, especially of that species called the long-legged field-spider; which, having mounted to the summit of a bush or tree, darts from its tail several of these threads, till one is produced capable of supporting the creature in the air: on this it mounts in quest of prey, and frequently rises to a very considerable height. See ARANEA.

Air-Vessels, are spiral ducts in the leaves, &c. of plants, supposed to be analogous to the lungs of animals, in supplying the different parts of a plant with air. See PLANTS, n° 35. and the figure there referred to.

AIRA, in botany, a genus of the triandria digynia class. There are 14 species of the aira, nine of which are natives of Britain. The English name is *Hair-grass*. See the general article GRASS.

AIRANI, in church-history, an obscure sect of Arians, in the fourth century, who denied the consubstantiality of the Holy Ghost with the Father and the Son. They are otherwise called *Airanists*; and are said to have taken their name from one *Airan*, who distinguished himself at the head of this party, in the reigns of Valentinian and Gratian.

AIRE, in geography, a sea-port town in Scotland, situated in N. lat. 55. 30. and W. long. 4. 40. at the mouth of a river of the same name, which discharges itself into the frith of Clyde. Aire is the chief town of the county, and very ancient. About a mile north

from the town, there is a lazar-house, commonly called the *King's chapel*, which King Robert de Bruce set apart for the maintenance of lepers.

AIRE, a town of France, in Proper Gascony, of which it is the capital, with a bishop's see. It is seated on the river Adour, on the declivity of a mountain. E. Long. 0. 3. N. Lat. 43. 47.

AIRE, a strong town in the Netherlands, in the county of Artois, with a castle. It was taken by the French in 1710, and was confirmed to them by the treaty of Utrecht. It is seated on the river Lis, 22 miles south of Dunkirk, and communicates with St Omer's by a canal cut from the river Aa. E. Long. 2. 31. N. Lat. 50. 38.

AIRESHIRE, a county of Scotland, the capital of which is the town of Aire. It lies eastward of the frith of Clyde.

AIRING, a term peculiarly used for the exercising horses in the open air. It purifies the blood; purges the body from gross humours; and, as the jockies express it, teaches the horse how to make his wind rake equally, and keep time with the other motions of his body. It also sharpens the stomach, and keeps the creature hungry; which is a thing of great consequence, as hunters and racers are very apt to have their stomach fall off, either from want of exercise, or from the too violent exercise which they are often exposed to. If the horse be over fat, it is best to air him before sun-rise, and after sun-setting; and in general, it is allowed by all, that nothing is more beneficial to those creatures than early and late airings. Some of our modern managers, however, dispute this: they say, that the cold of these times is too great for the creature; and that if, in particular, he is subject to catarrhs, rheums, or the like complaints, the dews and cold fogs, in these early and late airings, will be apt to increase all those disorders. Nature, we see, also points out the sun-beams as of great use to these animals; those which are kept hardy and lie out all night, always running to those places where the sunshine comes, as soon as it appears in a morning. This should seem to recommend those airings that are to be made before sun-set, and a little time after sun-rise. As to the caution, so earnestly inculcated by Markham, of using these early and late airings for fat horses, it is found unnecessary by many: for they say, that the same effect may be produced by airings at warmer times, provided only that they are made longer; and that, in general, it is from long airings that we are to expect to bring a horse to a perfect wind and sound courage.

AIRY, or **AERY**, among sportsmen, a term expressing the nest of a hawk or eagle.

AIRY Triplicity, among astrologers, denotes the three signs, gemini, libra, and aquarius.

AISNE, a river of France, which rises in Champagne, and runs W. by Soissons in the lfe of France, falling into the river Oise, a little above Campeigne.

ALTOCZU, a considerable river of Lesser Asia, which, arising in the mountain Taurus, falls into the south part of the Euxine sea.

AJUGA, **BUGLE**, a genus of the gymnospermia order, belonging to the didynamia class of plants. The Species enumerated by Linnæus are, 1. The orientalis, with inverted flowers, which is a native of the East. 2. The genevensis, with woolly leaves and hairy cups,

* See Hydrostatics, n° 6.

† See Pneumatics, n° 6.

Ajoga
Aix.

is a native of Swisserland and of the southern parts of Europe. 3. The pyramidalis, or mountain-bugle, with a square pyramidal spike, and blue flowers, is a native of Sweden, Germany, Swisserland, and the hilly parts of Britain. Sheep and goats eat it; cows are not fond of it; horses and swine refuse it. 4. The reptans, common, or pasture bugle, with creeping suckers, and blue, red, or white blossoms, in long leafy spikes, is a native of the southern parts of Europe, and is met with in woods and moist places in many parts of Britain. The roots are astringent, and strike a black colour with vitriol of iron.

Culture. The first species is propagated by sowing the seeds soon after they are ripe, in a pot filled with loamy earth, and placed in a shady situation till autumn; when it must be removed under a frame, and protected from the frosts. In the spring, after the plants are come up, let them be translated each into a separate pot, and in summer placed under a shady situation. The other sorts are easily propagated by their side-shoots, and succeeded best in a moist shady situation.

A I U S L O C U T I U S, the name of a deity to whom the Romans erected an altar.—The words are Latin, and signify “a speaking voice.”—The following accident gave occasion to the Romans erecting an altar to the *Aius Locutius*. One M. Ceditius, a plebeian, acquainted the tribunes, that, in walking the streets by night, he had heard a voice over the temple of Vesta, giving the Romans notice that the Gauls were coming against them. This intimation was however neglected; but after the truth was confirmed by the event, Camillus acknowledged this voice to be a new deity, and erected an altar to it under the name of the *Aius Locutius*.

A J U T A G E, or **A N J U T A G E**, a kind of tube fitted to the mouth of the vessel through which the water of a fountain is to be played. To the different form and structure of *ajutages*, is owing the great variety of fountains. See **F O U N T A I N**.

A I X, a small, but ancient town, in the duchy of Savoy, with the title of a marquissate. It is seated on the lake Bourget, at the foot of a mountain, between Chamberry, Annecy, and Rumilly. There is here a triumphal arch of the ancient Romans, but it is almost entirely ruined. The mineral waters bring a great number of strangers to this place. E. Long. 7. 10. N. Lat. 45. 40.

A I X, an ancient city, the capital of Provence, in France. It is an archbishopric; and has a parliament, a court of aids, a chamber of accounts, a seneschal's jurisdiction, a generality, and an university. It is a well-built city; and most like Paris of any place in the kingdom, as well for the largeness of the buildings, as in respect of the politeness of the inhabitants. It is embellished with abundance of fine fountains and several beautiful squares. The preachers square is on the side of a hill; it is about 160 yards in length, and is surrounded with trees, and houses, built with stone, three stories high. The town-hall is at one end of the city, and is distributed into several fine apartments: the two lowest are taken up by the board of accounts, and by the seneschal; that above is designed for the sessions of parliament. The hall of audience is adorned with the pictures of the kings of France on horseback. The hotel of the city is a handsome building, but hid by the houses of the narrow street in which it is placed.

The cathedral church is a Gothic structure. The church of the fathers of the oratory is a handsome building; and not far from thence is the chapel of the blue penitents, which is full of paintings. The convent of preachers is very fine; in their church is a silver statue of the Virgin Mary almost as big as the life. There are other churches and buildings which contain a great number of rarities. The baths without the city, which were discovered not long since, have good buildings, raised at a vast expence, for the accommodation of those that drink the waters. E. Long. 5. 32. N. Lat. 43. 32.

A I X, a small island on the coast of France, between the isle of Oleron and the continent. It is twelve miles north-west of Rochfort, and twelve south-west of Rochelle. W. Long. 1. 4. N. Lat. 46. 5.

A I X LA CHAPELLE, a fine city of Germany, in the circle of Westphalia and duchy of Juliers. All authors are agreed about its antiquity, it being mentioned in Cæsar's Commentaries and the Annals of Tacitus. The Romans had colonies and fortresses there, when they were at war with the Germans; but the mineral waters and the hot bath so increased its fame, that, in process of time, it was advanced to the privileges of a city, by the name of *Aquægrani*, that is, the waters of Granius; that which it has now, of *Aix la Chapelle*, was given it by the French, to distinguish it from the other Aix. It is so called, on account of a chapel built by Charlemagne in honour of the Holy Virgin. Having repaired, beautified, and enlarged the city, that was destroyed by the Huns, in the reign of Attila, in 451, he made it the usual place of his residence. The town is seated in a valley surrounded with mountains and woods, and yet the air is very wholesome. It may be divided into the inward and outward city. The inward is compassed with a wall about three quarters of a league in circumference, having ten gates; and the outward wall, in which there are eleven gates, is about a league and a half in circumference. There are rivulets which run through the town and keep it very clean, turning several mills; besides twenty public fountains, and many private ones. They have stone-quarries in the neighbourhood, which furnish the inhabitants with proper materials for their magnificent buildings, of which the stadthoufe and the cathedral are the chief. There are likewise thirty parochial or collegiate churches. The market-place is very spacious, and the houses round it stately. In the middle, before the stadthoufe, is a fountain of blue stones, which throws out water, from six pipes, into a marble basin placed beneath, thirty feet in circumference. On the top of this fountain, is placed the statue of Charlemagne, of brass, gilt, holding a sceptre in his right hand, and a globe in his left. The stadthoufe is adorned with the statues of all the emperors since Charlemagne. This fabric has three stories, the upper of which is one entire room, of 162 feet in length and 60 in breadth. In this the new-elected emperor formerly entertained all the electors of the empire.—*Aix la Chapelle* is a free imperial city, and changes its magistracy every year on the eve of St John Baptist. The mayor is in the nomination of the elector palatine, in the quality of the duke of Juliers, as protector of the city. This place is famous for several councils, and treaties of peace concluded here, particularly those between France and Spain in 1668, and between Great Britain

Aix la
Chapelle.

Aix la
Chapelle,
Akenide.

Britain and France in 1748. The baths have been frequented for several centuries, of which some are hot and some are warm. The principal are called the Emperor's Bath, the Bath of St Cornille, the Bath of Roses, the Bath of St Quirin, the Little Bath, and the Bath of the Poor, besides several others. The Emperor's Bath has the name of Charlemagne, who repaired it, and bathed very often in its waters; it is the finest and most commodious. The Little Bath receives its waters from the Emperor's Bath, and contains three bathing places. That of St Quirin has particular springs, but its virtues are the same as the former. The Bath of St Cornille is so called from the sign of the house where it is seated; it is only warm, and is divided into five different baths. The Bath of Roses, is so called from a citizen called John Rosen, who built it. The Poor's Bath is free for every one, and is frequented by crowds of poor people. The men bathe in distinct baths from the women, and even private baths are to be had for money. There are two springs in the lower part of the city, over one of which there is the statue of the Virgin Mary, and over the other that of Charlemagne. These are for drinking; and there are two pumps to raise up the waters. There are several galleries or piazzas, under which they walk during the time of drinking, to make them pass the more freely.—About a quarter of a league from Aix, stands the abbey of Borzet, or Burscheit, which is a very magnificent pile of building. It was formerly a monastery; but serves for a nunnery, whose abbess is a princess of the empire, and lady of Borzet. The baths here are much hotter than at Aix la Chapelle: some of them are so hot, that they will boil eggs, which is frequently done by poor people; and if you throw in a dog, he will be killed in an instant. Therefore, here, as at Aix, the water must stand till it is of a proper coolness. You may bathe here at fourteen different houses; and there is likewise one open bath where the poor may bathe gratis. Near this place are several mines of lead, coal, and lapis calamaris. The time of drinking the waters, in the first season, is from the beginning of May to the middle of June; and, in the latter season, from the middle of August to the latter end of September. They are said to be efficacious in almost all tedious chronic diseases, whether internal or of the skin, particularly in all disorders of the nerves, or in all cold diseases, and inward decays.—We need not to mention, that there are all kinds of amusements common to other places of public resort; but the sharpers appear more splendid here than elsewhere, assuming titles, with an equipage suitable to them.—Aix la Chapelle is 36 miles from Liege, and 30 from Cologne. E. Long. 5. 48. N. Lat. 51. 55.

AIZOON, called by Mr Miller *sempervire*; though the name Aizoon has been by some writers applied to the house-leek, and also to the aloes: A genus of the pentagynia order, belonging to the icofandria class of plants. Linnaeus mentions three species; the canariense, hispanicum, and paniculatum. The first is a native of the Canary islands, the second of Spain, and the third of the Cape of Good Hope. They may all be raised in this country on hot-beds; but as they are not at all remarkable either for beauty or any other property, we reckon it unnecessary to take further notice of them.

AKENSIDE (Dr Mark), a celebrated physician

and poet, born at Newcastle upon Tyne in 1721; where, and at the universities of Edinburgh and Leyden, he was educated. He was afterwards admitted by mandamus to the degree of doctor in physic at Cambridge; and was appointed one of the queen's physicians, upon the establishment of her household. He was possessed of a fine luxuriant fancy; which, tho' he wrote many pieces, particularly odes, is principally displayed in that admired poem, *The Pleasures of Imagination*; which, however, he did not live to finish according to his plan. He died of a putrid fever in 1770.

AKIBA, a famous rabbin, flourished a little after the destruction of Jerusalem by Titus. He kept the flocks of a rich citizen of Jerusalem till the 40th year of his age, and then applied himself to study in the academies for 24 years; and was afterwards one of the greatest masters in Israel, he having 24,000 scholars. He declared for the impostor Barcochebas, whom he owned for the Messiah; and not only anointed him king, but took upon himself the office of his master of the horse. The troops which the emperor Hadrian sent against the Jews, who under the conduct of this false Messiah had committed horrid massacres, exterminated this faction. Akiba was taken, and put to death with great cruelty. He lived 120 years; and was buried with his wife in a cave upon a mountain not far from Tiberias, and his 24,000 scholars were buried round about him upon the same mountain. It is imagined he invented a supposititious work under the name of the patriarch Abraham.

AKISSAT, the ancient Thyatira, a city in Natioia, in Asia, situated in a plain 18 miles broad, which produces plenty of cotton and grain. The inhabitants, who are reckoned to be about 5000, are said to be all Mahometans, and not one Christian among them, except a few slaves. The houses are built of nothing but earth or turf dried in the sun, and are very low and ill contrived: but there are six or seven mosques, which are all of marble. There are remarkable inscriptions on marble in several parts of the town, which are part of the ruins of ancient Thyatira. It is seated on the river Hermus, 50 miles from Pergamos. E. Long. 28. 30. N. Lat. 38. 50.

AKOND, in the Persian affairs, the chief judge in all cases of contracts and other civil matters. He is at the head of the lawyers, and has his deputies in all courts of the kingdom.

AL, an Arabic particle prefixed to words, and signifying much the same with the English particle *the*: Thus they say, alkermes, alkoran, &c. *i. e.* the kermes, the koran, &c.

AL, or ALD, a Saxon term frequently prefixed to the names of places, denoting their antiquity; as Aldborough, Aldgate, &c.

ALA, a Latin term properly signifying a wing; from a resemblance to which several other things are called by the same name: Thus,

ALA, is a term used by botanists for the hollow of a stalk, which either the leaf, or the pedicle of the leaf, makes with it; or it is that hollow turning, or sinus, placed between the stalk or branch of a plant, and the leaf, whence a new offspring usually issues. Sometimes it is used for those parts of leaves otherwise called *lobes*, or *wings*.

ALÆ,

Akiba
||
Ala.

Alæ
||
Aladinists.

ALÆ (the plural number) is used to signify those petals or leaves of papilionaceous flowers, placed between those others which are called the vexillum and carina, and which make the top and bottom of the flowers. Instances of flowers of this structure are seen in those of pease and beans, in which the top leaf or petal is the vexillum, the bottom the carina, and the side ones the alæ. See **PAPILIONACEOUS**.

ALÆ is also used for those extremely slender and membranaceous parts of some seeds, which appear as wings placed on them; it likewise signifies those membranaceous expansions running along the stems of some plants, which are therefore called alated stalks.

ALÆ, in anatomy, a term applied to the lobes of the liver, the cartilages of the nostril, &c.

ALÆ, in the Roman art of war, were the two wings or extreme parts of the army drawn up in order of battle.

ALABA, one of the three smallest districts of Biscay in Spain, but pretty fertile in rye, barley, and fruits. There are in it very good mines of iron, and it had formerly the title of a kingdom.

ALABARCHA, in antiquity, a kind of magistrate among the Jews of Alexandria, whom the emperors allowed them to elect, for the superintendency of their policy, and to decide differences and disputes which arose among them.

ALABASTER, in natural history, a genus of fossils resembling marble, which are bright, brittle, and do not give fire with steel; they ferment with acids, and readily calcine with heat. There are three species of alabaster. 1. The snow-white shining alabaster, or lydium of the ancients, is found in Taurus, in pieces large enough to make dishes, or the like. It cuts very freely, and is capable of a fine polish. 2. The yellowish alabaster, or phengites of Pliny, is found in Greece; and is of a soft loose open texture, pretty heavy, and nearly of the colour of honey. This species has likewise been found in Germany, France, and in Derbyshire in England. 3. Variegated, yellow, and reddish alabaster. This species is the common alabaster of the ancients, and is so soft that it may be cut with a knife: It is remarkably bright, and almost transparent; admits of a fine polish and consists of large angular sparry concretions. It is not proof against water; it ferments violently with aqua-fortis, and burns to a pale yellow. The colour of this species is a clear pale yellow resembling amber, and variegated with undulated veins; some of which are pale red, others whitish, and others of a pale brown. It was formerly brought from Egypt, but is now to be met with in several parts of England. The alabasters are frequently used by statuary for small statues, vases, and columns. After being calcined and mixed with water, they may be cast in any mould like plaster of Paris. See **GYPsum**.

ALABASTER, in antiquity, a term not only used for a box of precious ointment; but also for a liquid measure, containing ten ounces of wine, or nine of oil.

ALABASTRUM DENDROIDE, a kind of laminated alabaster, beautifully variegated with the figures of shrubs, trees, &c. found in great abundance in the province of Hohenstein.

ALADINISTS, a sect among the Mahometans, answering to free-thinkers among us.

Vol. I.

Aladulia
||
Alamanj.

ALADULIA, a considerable province of Turkey in Asia, in that part called Natolia, between the mountains of Antitaurus, which separate it from Amasia on the north, and from Carmania on the west. It has the Mediterranean sea on the south; and the Euphrates, or Frat, on the east, which divides it from Diarbeker. It comprehends the Lesser Armenia of the ancients, and the east part of Cilicia. Formerly it had kings of its own; but the head of the last king was cut off by Selim I. emperor of the Turks, who had conquered the country. It is now divided into two parts: the north, comprehended between Taurus, Antitaurus, and the Euphrates, is a beglerbeglic, which bears the name of Marash, the capital town; and the south, seated between mount Taurus and the Mediterranean, is united to the beglerbeglic of Aleppo. The country is rough, ragged, and mountainous; yet there are good pastures, and plenty of horses and camels. The people are hardy and thievish. The capital is Malatiah.

ALAIN (Chartier), secretary to Charles VII. king of France, born in the year 1386. He was the author of several works in prose and verse; but his most famous performance was his Chronicle of King Charles VII. Bernard de Girard, in his preface to the History of France, styles him "an excellent historian, who has given an account of all the affairs, particulars, ceremonies, speeches, answers, and circumstances, at which he was present himself, or had information of." Giles Coroxet tells us, that Margaret, daughter to the king of Scotland, and wife to the dauphin, passing once through a hall where Alain lay asleep, she stopped and kissed him before all the company who attended: some of them telling her, that it was strange she should kiss a man who had so few charms in his person, she replied, "I did not kiss the man, but the mouth from whence proceeded so many excellent sayings, so many wise discourses, and so many elegant expressions." Mr Fontenelle, among his Dialogues of the Dead, has one upon this incident, between the princess Margaret and Plato. Mr Pasquier compares Alain to Seneca, on account of the great number of beautiful sentences interspersed throughout his writings.

ALAIS, a considerable town of France, in the province of Languedoc, situated on the river Gardon, at the foot of the Cevennes. The Jesuits had a college in this place; and a fort was built here in 1689. It is 34 miles north of Montpellier, and 340 from Paris. E. Lon. 4. 20. N. Lat. 44. 8.

ALALCOMENIUS, in Grecian antiquity, the Boeotian name of the month called, by the Athenians, *Mæmacterion*.

ALAMANNI (Lewis) was born at Florence, of a noble family, on the 28th of October, 1495. He was obliged to fly his country for a conspiracy against Julius de Medici, who was soon after chosen pope under the name of Clement VII. During this voluntary banishment, he went into France; where Francis I. from a love to his genius and merit, became his patron. This prince employed him in several important affairs, and honoured him with the collar of the order of St. Michael. About the year 1540, he was admitted a member of the Inflammati, an academy newly erected at Padua, chiefly by Daniel Barbaro and Ugolin Martelli. After the death of Francis, Henry duke of Orleans, who succeeded him in 1537, shewed no less fa-

Alan.

vour to Alamanni; and in the year 1551, sent him as his ambassador to Genoa: this was his last journey to Italy; and being returned to France, he died at Amboise on the 18th of April 1556, being in the 61st year of his age. He left many beautiful poems, and other valuable performances, in the Italian language. We have also some notes of his upon Homer's Iliad and Odyssey; those upon the Iliad were printed in the Cambridge edition of Homer in 1689, and Joshua Barnes has also inserted them in his fine edition of Homer in 1711.

ALAMODALITY, in a general sense, is the accommodating a person's behaviour, dress, and actions, to the prevailing taste of the country or times in which he lives.

ALAMODALITY of writing, is defined the accommodation of mental productions, both as to the choice of subject and the manner of treating it, to the genius or taste of the times, in order to render them more acceptable to the readers.

ALAMODE, a phrase originally French, importing a thing to be in the fashion or mode. The phrase has been adopted not only into several of the living languages, as the English and High-Dutch, but some have even taken it into the Latin. Hence we meet with *Alamodicus* and *Alamodalitas*.

ALAMODE, in commerce, a thin glossy black silk, chiefly used for womens hoods and mens mourning scarfs.

ALAN (Cardinal William), was born at Rossal in Lancashire, in the year 1532. He went to Oxford at the age of 15, and in 1550 was elected fellow of Oriel college. In 1556, being then only 24 years old, he was chosen principal of St Mary's hall, and one of the proctors of the university. In 1558 he was made canon of York; but, upon queen Elizabeth's accession to the throne, he left England, and settled at Louvain in an English college, of which he became the chief support. In 1565 he visited his native country; but, on account of his extreme activity in the propagation of the Roman-catholic religion, he was obliged to fly the kingdom in 1568. He went first to Mechlin; and then to Doway, where he was made doctor of divinity. Soon after, he was appointed canon of Cambrai, and then canon of Rheims. He was created cardinal on the 28th of July, 1587, by the title of *St Martin in Montibus*; and obtained from the king of Spain a rich abbey in the kingdom of Naples, and afterwards the bishoprick of Mechlin. It is supposed to have been by the advice and instigation of this priest, that Philip II. attempted to invade England. He died on the 20th of October 1594, aged 63; and was buried in the English college at Rome. He was a man of considerable learning, and an elegant writer. He wrote many books in defence of the Romish religion. The most remarkable are, 1. *A defence of the 12 martyrs in one year*. Tho. Alford was hanged for bringing, and publishing, this and other of Alan's works, into England, in the year 1584. 2. *A declaration of the sentence of Sextus V.* &c. A work intended to explain the pope's bull for the excommunication of queen Elizabeth, and to exhort the people of England to take up arms in favour of the Spaniards. Many thousand copies of this book, printed at Antwerp, were put on board the Armada; but the enterprize failing,

they were afterwards destroyed. 3. *Of the worship due to saints and their rellicts*, 1583. This treatise was answered by lord Burleigh, and is esteemed the most elegant of the cardinal's writings.

ALAND, an island of the Baltic sea, between Sweden and Finland, subject to the former. It lies between 17 and 19 degrees of E. Long. and between 59 and 61 degrees of Lat. at the entrance of the gulph of Bothnia.

ALANORARIUS, in our old customs, was a keeper of spaniels, setting-dogs, &c. for the use of sportsmen. The word is derived from *alan*, a gothic term for a *grey-hound*.

ALAUKECA, a stone brought from the East Indies in small glossy fragments, said to stop hæmorrhages by external application.

ALARAF, in the Mahometan theology, the partition wall that separates heaven from hell. The word is plural, and properly written *al araf*; in the singular it is written *al arf*. It is derived from the Arabic verb *arafa*, to distinguish. Al araf gives the denomination to the seventh chapter of the alcoran, wherein mention is made of this wall. Mahomet seems to have copied his al araf, either from the great gulf of separation mentioned in the New Testament, or from the Jewish writers, who also speak of a thin wall dividing heaven from hell. Mahometan writers differ extremely as to the persons who are to be found on al araf. Some take it for a sort of limbus for the patriarchs, prophets, &c. others place here such whose good and evil works so exactly balance each other, that they deserve neither reward nor punishment. Others imagine this intermediate space to be possessed by those who, going to war without their parents leave, and suffering martyrdom there, are excluded paradise for their disobedience, yet escape hell because they are martyrs.

ALARBES, or ALARABES, a name given to those Arabians who live in tents, and distinguish themselves by their dress from the others who live in towns.

ALARES, in Roman antiquity, an epithet given to the cavalry, on account of their being placed in the two wings of the army.

ALARM, in the military art, denotes either the apprehension of being suddenly attacked; or the notice thereof, signified by firing a cannon, firelock, or the like.—False alarms are frequently made use of to harass the enemy, by keeping them constantly under arms. Sometimes also this method is taken to try the vigilance of the picket-guard, and what might be expected from them in case of real danger.

ALARM-Bell, that rung upon any sudden emergency, as a fire, mutiny, or the like.

ALARM-Post, or ALARM-place, the ground for drawing up each regiment in case of an alarm. This is otherwise called the *rendezvous*.

ALARM, in fencing, is the same with what is otherwise called an appeal, or challenge.

ALASANI, in church-history, a sect of Antilutherans, whose distinguishing tenet, besides their denying baptism, is said to have been this, that the words, *This is my body*, in the institution of the eucharist, are not to be understood of the bread, but of the whole action, or celebration of the supper. They are said to have taken the name from one Joannes a Lasco, a Polish baron, superintendent of the church of that country.

Aland
|
Alasani.

Alasco
||
Alauda.

in England. See the next article.

ALASCO (John), a Polish nobleman of the 16th century, who, imbibing the reformed opinions, was expelled his country, and became preacher to a Protestant congregation at Embden; but foreseeing persecution there, came to England about the year 1551, while the reformation was carrying on under Edward the VI. The publication of the Interim driving the Protestants to such places as afforded them toleration, 380 were naturalized here, and obtained a charter of incorporation, by which they were erected into an ecclesiastical establishment, independent on the church of England. The Augustine friars church was granted them, with the revenues, for the maintenance of Alasco as superintendant, with four assistant ministers, who were to be approved by the king: and this congregation lived undisturbed until the accession of Queen Mary, when they were all sent away. They were kindly received and permitted to settle at Embden; and Alasco at last, after an absence of twenty years, by the favour of Sigismund returned to his own country, where he died in 1560. Alasco was much esteemed by Erasmus, and the historians of his time speak greatly in his praise: we have of his writing, *De Cena Domini liber; Epistola continens summam Controversie de Cena Domini, &c.* He had some particular tenets; and his followers are called *Alascani* in church-history. See the preceding article.

ALATAMAHA, a large river of North America, which, rising in the Apalachian mountains, runs south-east through the province of Georgia, and falls into the Atlantic ocean, below the town of Frederica.

ALATED ANIMALS, such as are furnished with wings.

ALATED *Leaves*, in botany, such as are composed of several pinnated ones. See PINNATED.

ALATERNOIDES, in botany, a synonyme of a species of the myrica. See MYRICA.

ALATERNUS, in botany, the trivial name of a species of the rhamnus. See RHAMNUS.

ALAVA, a district of Spain, about 20 miles in length, and 17 in breadth, containing very good iron mines. Victoria is the capital town.

ALAUDA, or LARK, in ornithology, a genus of birds of the order of passerines; the characters of which are these: The beak is cylindrical, subulated, straight; and the two mandibles or chaps are of equal size. The tongue is bifid, and the hinder claw is straight, and longer than the toe. There are nine species of the alauda. 1. The arvensis, or common sky-lark. This and the wood-lark are the only birds that sing as they fly; this raising its note as it soars, and lowering it till it quite dies away as it descends. It will often soar to such a height, that we are charmed with the music when we lose sight of the songster; it also begins its song before the earliest dawn. Milton, in his *Allegro*, most beautifully expresses these circumstances; and bishop Newton observes, that the beautiful scene that Milton exhibits of rural cheerfulness, at the same time gives us a fine picture of the regularity of his life, and the innocence of his own mind: thus he describes himself as in a situation

To hear the lark begin his flight,
And singing scramble the dull night,
From his watch-tow'r in the skies,
Till the dappled dawn doth rise.

Sky-lark,
Pl. III, fig. 8.

It continues its harmony several months, beginning early in the spring, on pairing. In the winter they assemble in vast flocks, grow very fat, and are taken in great numbers for our tables. They build their nest on the ground, beneath some clod, forming it of hay, dry fibres, &c. and lay four or five eggs.—The place these birds are taken in the greatest quantity, is the neighbourhood of Dunstable: the season begins about the 14th of September, and ends the 25th of February; and during that space, about 4000 dozen are caught, which supply the markets of the metropolis. Those caught in the day are taken in clap-nets of fifteen yards length, and two and a half in breadth; and are enticed within their reach by means of bits of looking-glass, fixed in a piece of wood, and placed in the middle of the nets, which are put in a quick whirling motion by a string the larker commands; he also makes use of a decoy-lark. These nets are used only till the 14th November: for the larks will not *dare*, or frolic in the air, except in fine sunny weather; and of course cannot be inveigled into the snare. When the weather grows gloomy, the larker changes his engine, and makes use of a trammel net, twenty-seven or twenty-eight feet long, and five broad; which is put on two poles, eighteen feet long, and carried by men under each arm, who pass over the fields and quarter the ground as a setting dog: when they hear or feel a lark hit the net, they drop it down, and so the birds are taken.—2. The pratensis, or tit-lark, has the two outward feathers of the wing edged with white, and frequents the meadows. It is found frequently in low marshy grounds: like other larks, it builds its nest among the grass, and lays five or six eggs. Like the wood-lark, it sits on trees; and has a most remarkable fine note, singing in all situations, on trees, on the ground, while it is sporting in the air, and particularly in its descent. This bird, with many others, such as the thrush, blackbird, willow-wren, &c. become silent about midsummer, and resume their notes in September: hence the interval is the most mute of the year's three vocal seasons, spring, summer, and autumn. Perhaps the birds are induced to sing again as the autumnal temperament resembles the vernal.—3. The arborea, or wood-lark, is a native of Europe, and is distinguished by an annular white fillet about the head. It is inferior in size to the sky-lark, and is of a shorter thicker form; the colours are paler, and its note is less sonorous and less varied, though not less sweet. It perches on trees, and whistles like the black-bird. It will sing in the night; and, like the common lark, will sing as it flies. It builds on the ground, and makes its nest on the outside with moss, within of dried bents, lined with a few hairs. It lays five eggs, dusky and blotched with deep brown marks, darkest at the thicker end. The males of this and the last are known from the females by their superior size. But this species is not near so numerous as that of the common kind.—4. The campestris, has one half of its chief feathers of the wings brown, except two in the middle which are white, and the throat and breast are yellowish.—5. The trivialis, whose chief feathers on the tail are brown, only half of the outermost is white, and the second is white at the end, in the shape of a wedge; there is likewise a double whitish line on the wings. It is a native of Sweden, and perches on the tops of trees.—6. The cristata: the chief

Alauda,
or lark.

Tit-lark.

Wood-lark,
&c.

many years since, a tomb was discovered in this church, said to be that of Humphrey duke of Gloucester: when the leaden coffin was opened, the body was pretty entire, being preserved in a sort of pickle. There was a stately cross in the middle of the town, as there were in many other places where queen Eleanor's body rested when it was brought out of the north for interment at Westminster; but it has been demolished, as some say, by the inhabitants. The market-days are Wednesdays and Saturdays. W. Long. o. 12. N. Lat. 51. 44.

ALBANUS MONS, (anc. geog.) now called *Mont Albano*, 16 miles from Rome, near where Alba Longa stood.

ALBANUS MONS, (anc. geog.) to the north of Istria, called *Albius* by Strabo; the extremity of the Alps, which, together with the mountains to the east, joining it, called *Montes Bebi*, separates the farther Liburnia and Dalmatia from Pannonia.

ALBA REGALIS. See *STUL WEISSENBURGH*.

ALBANY, a fortress belonging to the British, seated on the S. W. of Hudson's bay. W. long. 84. 20. N. lat. 53. 20.

ALBANY, a town of North America, the capital of one of the ten counties of the province of New-York, which goes by the same name, is a well built place, considering the country. Here the sachems, or the kings of the Five Nations of Iroquois, met the governors of the British plantations, when they entered into any treaty with them. W. Long. 44. 29. N. Lat. 42. 30.

ALBARAZIN, a strong town, and one of the most ancient of the kingdom of Arragon in Spain. It is seated upon an eminence, near the river Guadaluquivir, a little below its source, and on the frontiers of Valencia and New Castile. It is the seat of a bishop, and produces the best wool in all Arragon. It is about 100 miles east of Madrid. E. Long. 2. 10. N. Lat. 40. 32.

ALBARI, in antiquity, properly denoted those who gave the whitening to earthen vessels, &c. In which sense they stood contradistinguished from *Dealbatores*, who whitened walls.

ALBARIUM OPUS, in the ancient building, the incrustation or covering of the roofs of houses with white plaster, made of mere lime. This is otherwise called *opus album*. It differs from *Tectorium*, which is a common name given to all roofing or ceiling, including even that formed of lime and sand, or lime and marble; whereas *Albarium* was restrained to that made of lime alone.

ALBATI EQUI, an appellation given to such horses, in the games of the ancient circus, as wore white furniture, in contradistinction from the *Venetii*, *Prasini*, and *Rufesti*. See *VENETI*, *PRASINI*, &c.

ALBATROSS, in ornithology, a species of the diomedea. See *DIOMEDEA*.

ALBAZIN, a town of Greater Tartary, with a strong castle: It is situated upon the river Amur, or Yamour, and belongs to the Muscovites. E. long. 103. 30. N. lat. 54. o.

ALBE, a small piece of money, current in Germany, worth only a French fol and seven deniers.

ALBEMARLE, or **AUMARLE**, a town of France, in Upper Normandy, and in the territory of Caux, from whence the noble family of Keppel takes the title

of *Earl*. The ferges of this town are in high esteem. It is seated on the declivity of a hill, on the confines of Picardy, 35 miles N. E. of Rouen, and 70 N. W. of Paris. E. Long. 2. 21. N. Lat. 49. 50.

ALBEMARLE, the most northern part of the province of North Carolina, in America.

ALBENGUA, a town of Italy, in the territory of Genoa. It is the see of a bishop; and is a very ancient handsome town, but not well peopled on account of the insalubrity of the air. However, it is seated in a very beautiful plain, which is well cultivated; and the outside of the town is surrounded with olive-trees. It is a seaport, about 38 miles S. W. of Genoa. E. Long. 8. 13. N. Lat. 44. 4.

ALBERONI (Julius), the son of a poor gardener, in the suburbs of Placentia, born in 1664; who, by his great abilities and good fortune, rose from this low original, to the employment of first minister of state at the court of Spain, and to the dignity of cardinal. He roused that kingdom out of the lethargy it had sunk into for a century past; awakened the attention, and raised the astonishment, of all Europe, by his projects; one of which was to set the Pretender on the throne of Great Britain. He was at length deprived of his employment, and banished to Rome: he died in 1752, at the great age of 89. His *Testament Politique*, collected from his memoirs and letters, was published at Lausanne in 1753.

ALBERTI (Leone Battista), was descended from a noble family in Florence; and was perfectly acquainted with painting, sculpture, and architecture. He wrote of all three in Latin; but his studies did not permit him to leave any thing considerable behind him in painting. He was employed by Pope Nicholas V. in his buildings, which he executed in a beautiful manner; and his work on architecture, which consists of ten books, is greatly esteemed. He also wrote some treatises of morality, and a piece on arithmetic. He died in 1485.

ALBERTUS (Magnus), a Dominican friar, and afterwards archbishop of Ratibon, was one of the most learned men and most famous doctors of the 13th century. He was by the ignorant charged with being a magician, and making a machine resembling a man, which they foolishly imagined explained all the difficulties he proposed to it. He died at Cologne, November 15. 1280. His works were printed at Lyons, in 1651, in 21 volumes in folio.

ALBERTUS, a gold coin, worth about 14 French livres: it was coined during the administration of Albertus archduke of Austria.

ALBESIA, in antiquity, a kind of shields otherwise called *Decumana*. See *DECUMANA*.

ALBI, a city of France, the capital of the Albigeois, in Languedoc, and the see of an archbishop. The cathedral is dedicated to St Cecilia, and has one of the finest choirs in the kingdom. Here is a very valuable silver shrine, of exquisite workmanship, of the Mosaic kind: it contains the reliques of St Clair, the first bishop of this city. The chapel of this pretended saint is magnificent, and adorned with paintings. The Lice is a fine large walk without the city: what distinguishes this from all others, is a terras above a deep mall, which serves instead of a fosse; it is bordered with two rows of very fine trees, which are kept in excellent order.

Albigenses.

order. There are four gates, through which you may view all the beauties of a delightful plain. At one end of this is the convent of the Dominicans. The archbishop's palace is very beautiful. The river washes its walls, and serves both for an ornament and defence. This city is seated on the river Tarn, 35 miles north-by-west of Toulouse, and 250 south of Paris. E. Long. o. 52. N. Lat. 43. 56.

The Albigeois is a small territory about 27 miles in length, and 20 in breadth, abounding in corn, woad, grapes, saffron, plums, and sheep; and the inhabitants drive a great trade in dried prunes, grapes, a coarse sort of cloth, and wines of Gaillac. These wines are the only sorts hereabouts that are fit for exportation: they are carried down to Bourdeaux, and generally sold to the British. They have likewise several coal-mines.

ALBIGENSES, in church-history, a sect or party of reformers, about Toulouse and the Albigeois in Languedoc, who sprung up in the 12th century, and distinguished themselves by their opposition to the discipline and ceremonies of the Romish church.

This sect had their name, it is supposed, either by reason there were great numbers of them in the diocese of Albi, or because they were condemned by a council held in that city. In effect, it does not appear that they were known by this name, before the holding of that council. The *Albigenses* were also called *Albiani*, *Albigesi*, *Albii*, and *Albanenses*, though some distinguish these last from them. Other names given to them are, *Henricians*, *Abelardists*, *Bulgarians*, &c. some on account of the qualities they assumed; others on that of the country from whence it is pretended they were derived; and others on account of persons of note who adopted their cause, as Peter de Brius, Arnold de Bresse, Abelard, Henry, &c. Berengarius, if not Wickliff himself, is by some ranked in the number. The *Albigenses* are frequently confounded with the *Waldenses*; from whom, however, they differ in many respects, both as being prior to them in point of time, as having their origin in a different country, and as being charged with divers heresies, particularly Manicheism, from which the *Waldenses* are exempt. But several Protestant writers have vindicated them from that imputation. Dr Allix shews, that a great number of *Manichees* did spread over the western countries from Bulgaria; and settled in Italy, Languedoc, and other places, where there were also *Albigenses*; by which means, being both under the imputation of *heresy*, they came, either by ignorance or malice, to be confounded, and called by the same common name, tho' in reality entirely different.

Other errors imputed to them by their opponents, the monks of those days, were, That they admitted two Christs; one evil, who appeared on earth; the other good, who has not yet appeared: That they denied the resurrection of the body; and maintained human souls to be demons imprisoned in our bodies, by way of punishment for their sins: That they condemned all the sacraments of the church; rejected baptism as useless; held the eucharist in abhorrence; excluded the use of confessions and penance; maintained marriage unlawful; laughed at purgatory, prayers for the dead, images, crucifixes, &c.—There were likewise said to be two classes of them; the Perfect, and the Believers. The perfect boasted of their living in continence, of eating

neither flesh, eggs, nor cheese. The believers lived like other men, and were even loose in their morals; but they were persuaded they should be saved by the faith of the perfect, and that none were damned who received imposition of hands from them. But from these charges also they are generally acquitted by Protestants; who consider them as the pious inventions of the Romish church, whose members deem it meritorious by any means to blacken heretics.

However this be, the Albigenes grew so formidable, that the Catholics agreed upon a holy league or crusade against them. They were at first supported by Raimond, count of Toulouse. Pope Innocent III. desirous to put a stop to their progress, sent a legate into their country; which failing, he stirred up Philip Augustus, king of France, and the other princes and great men of the kingdom, to make war upon them. Upon this the count of Toulouse, who had sided with them, made his submission to the pope, and went over to the Catholics: but soon after, finding himself plundered by the crusaders, he declared war against them, and was joined by the king of Aragon. His army was defeated at the siege of Muret, where he himself was killed, and the defeat followed by the surrender of the city of Toulouse, and the conquest of the greatest part of Languedoc and Provence. His son Raimond succeeded him; who agreed with the king and the pope to set up the inquisition in his estates, and to extirpate the Albigenes. In an assembly held at Milan, the archbishop of Toulouse drew up articles; agreeable to which the count made a most ample declaration against them, which he published at Toulouse in 1253. From this time the Albigenes dwindled by little and little, till the times of the reformation; when such of them as were left fell in with the Vaudois *, and became conformable to the doctrine of Zuinglius and the discipline of Geneva.

The curious reader who desires to know more concerning the history of the *Albigenses*, may consult *Præf. Elench. Hæc.*—For the persecutions, wars, and cruades raised against them, see *Limborch. ALBIGENSES is also a name sometimes given to the followers of Peter Vaud, or Waldo; and hence synonymous with what we more properly call *Waldenses*, or Poor Men of Lyons. In this sense the word is applied by Camerarius, Thuanus, and several other writers. The reason seems to be, that the two parties

* See *Vau-*
doi.

Albintemel-
lum
||
Alborak.

parties agreed in their opposition to the papal innovations and encroachments, though in divers other respects said to be different enough. The bishop of Meaux laboured hard to support a distinction between the two sects, alleging that the *Albigenses* were heretics and Manichees; whereas the *Waldenses* were only schismatics, not heretics; being found as to articles of faith, and only separating from the church of Rome on account of ceremonies and discipline. Dr Allix endeavours to set aside the distinction; and shews, that both of them held the same opinions; and were equally condemned and held for heretics: and this not for points of faith, but for declaiming against the papal tyranny and idolatry, and holding the pope to be the Antichrist; which last, according to M. de Meaux, constitutes nothing less than Manicheism. In this sense the Lollards and Wickliffites in England were not only Albigenes, but Manichees.

ALBINTEMELIUM, ALBINTIMILIUM, (Tacitus;) or at full length, ALBIUM INTEMELIUM, (Pliny, Strabo); now *Vintiniglia*, situated in the south-west of the territory of Genoa, near the borders of the county of Nice, with a port on the Mediterranean, at the mouth of the rivulet Rotta, almost about half-way between Monaco and S. Remo. E. Long. 7. 40. Lat. 43. 17.

ALBIOECE, or ALEBECE, (Pliny, Strabo;) otherwise called *Reii Apollinares*, from their superstitious worship of Apollo; also *Civitas Reiensum*; now *Riez*, in Provence, about 18 leagues to the north-east of Toulon, on the north side of the rivulet Verdon; was originally a Roman colony, (Inscription.) It is sometimes written *Regium*. The people were called *Albici*, (Cæsar.) E. Long. 1. 0. Lat. 43. 20.

ALBINI, in antiquity, the workmen employed in what was called *Opus Albarium*. They made a different profession from the *dealatores* or *rubiteneri*.

ALBINOS, the name by which the Portuguese call the white Moors, who are looked upon by the negroes as monsters. They are the issue of a white man and black woman, and at a distance might be taken for Europeans; but, when you come near them, their white colour appears like that of persons affected with a leprosy.

ALBINOVANUS, a Latin poet, whom Ovid surnamed the *Divino*. There is now nothing of his extant, except an Elegy on Drusus, and another on the death of Mecænas.

ALBION, the ancient name of Britain*.

New Albion, a name given by Sir Francis Drake to California.

ALBISOLA, a small town belonging to the republic of Genoa: here is a porcelain manufacture, and several country-houses of the Genoese nobility. It was bombarded in 1745, by the English. E. Long. 8. 20. N. Lat. 44. 15.

ALBOGALERUS, in Roman antiquity, a white cap worn by the *flamen dialis*, on the top of which was an ornament of olive branches.

ALBORAK, amongst the Mahometan writers, the beast on which Mahomet rode, in his journeys to heaven. The Arab commentators give many fables concerning this extraordinary vehicle. It is represented as of an intermediate shape and size between an ass and a mule. A place, it seems, was secured for it in pa-

radise, at the intercession of Mahomet; which, however, was in some measure extorted from the prophet, by Alborak's refusing to let him mount him when the angel Gabriel was come to conduct him to heaven.

ALBOURG, a town of Denmark, in North Jutland, capital of the diocese of the same name, and a bishop's see. It has this name, which signifies *cel-town*, on account of the great number of cels taken here. It is seated on a canal, 10 miles from the sea, 30 north of Wiburg, and 50 north of Arhuys. It has an exchange for merchants, and a safe and deep harbour. They have a considerable trade in herrings and corn; and a manufactory of guns, pistols, saddles, and gloves. E. Long. 29. 16. N. Lat. 56. 35.

ALBRICIUS, born at London, was a great philosopher, a learned and able physician, and well versed in all the branches of polite literature. He lived in the 11th century, and wrote several works in Latin, particularly, 1. Of the origin of the gods. 2. The virtues of the ancients. 3. The nature of poison, &c.

ALBUCA, BASTARD STAR-OF-BETHELEHEM, a genus of the monogynia order, belonging to the hexandria class of plants. Of this genus Linnæus reckons only two

Species. 1. The major, or star-flower, with spear-shaped leaves. This is a native of Canada, and some other parts of North America: the root is bulbous; from whence shoot up eight or ten long, narrow, spear-shaped leaves. In the center of these arises a flower-stem, a foot or more in height, garnished with a loose spike of greenish yellow flowers. After the flowers are past, the germen swells to a three-cornered capsule, having three cells filled with flat seeds. 2. The minor, or African star-flower, is a native of the Cape of Good Hope. This hath also a pretty large bulbous root, from which arise four or five narrow awl-shaped leaves, of a deep green colour; the flower-stem, which comes from the center of the root, is naked, and rarely rises more than eight or nine inches high, having five or six greenish-yellow flowers, growing almost in the form of an umbel at top: these are rarely succeeded by seeds in Britain.

Culture. The Canada albucæ is hardy; so the roots may be planted about four inches deep in a border of light earth, where they will thrive, and produce their flowers late in the summer: but as the seeds do not often ripen in Britain, and the bulbs put out few off-sets, the plants are not common in this country. The African fort generally flowers twice a-year; first in March or April, and again in July or August; and if its roots are kept in pots filled with light earth, sheltered under a hot-bed frame, they will flower even in winter; but the best method is to have a border in the front of a green-house, or stove, where the roots of most of the bulbous flowers may be planted in the full ground, and screened in winter from frost: in such situations they thrive much better, and flower stronger, than when kept in pots.

ALBUGINEA TUNICA, in anatomy, the third or innermost coat or covering of the testes; it is likewise the name given to one of the coats of the eye.

ALBUGINEUS, in anatomy, a term sometimes applied to the aqueous humour of the eye.

ALBUGO, or LEUCOMA, in medicine, a distemper occasioned by a white opaque spot growing on the cornea

nea of the eye, and obstructing vision*.

ALBUM, in antiquity, a kind of white table, or register, wherein the names of certain magistrates, public transactions, &c. were entered. Of these there were various sorts; as the *album decurionum*, *album senatorum*, *album judicum*, *album prætoris*, &c.

ALBUM Decurionum, was the register wherein the names of the *decuriones* were entered. This is otherwise called *matriculatio decurionum*.

ALBUM Senatorum, the list of senators names, which was first introduced by Augustus, and renewed yearly.

ALBUM Judicum, that wherein the names of the persons of those *decurie* who judged at certain times, were entered.

ALBUM Prætoris, that wherein the *formulae* of all actions, and the names of such judges as the prætor had chosen to decide causes, were written.

The high-priest entered the chief transactions of each year into an *album*, or table, which was hung up in his house for the public use.

ALBUM Græcum, among physicians, the white dung of dogs, formerly prescribed for inflammations of the throat, &c. but now justly despised.

ALBUMAZAR, a learned Arabian astronomer in the tenth century, who wrote a treatise, *Of the Revolution of the Years*.

ALBUMEN, the white of an egg. For its nature, origin, and office, see Egg.

The white of an egg, according to Boerhaave, makes an extraordinary menstruum. Being boiled hard in the shell, and afterwards suspended in the air by a thread, it resolves and drops down into an insipid, scentless liquor, which appears to be that anomalous unaccountable menstruum so much used by Paracelsus; and will, though it contain nothing sharp, oleaginous, or saponeous, make a thorough solution of myrrh; which is more than either water, oil, spirits, or even fire itself, can effect.

A little putrid white of egg taken into the stomach, occasions a nausea, horror, fainting, vomiting, diarrhoea, and gripes; it inflames the bile, excites heat, thirst, fever; and dissolves the humours like the plague. On the contrary, the white of fresh-laid eggs, if taken while warm from the hen, is extremely nourishing to the infirm: it may be taken in luke-warm milk; but if any other heat is applied to it, the nutritious quality will be destroyed. The fresh white of egg prevents burns from rising in blisters, if it is used immediately after the accident: it mitigates inflammations of the eyes, and preserves the face from sun-burning. In pharmacy, it is used as a medium to render balsams and turpentine, &c. miscible with aqueous fluids; but as it disagrees with many stomachs when thus taken, a mucilage of gum arabic may supply its place, it being as good a medium in similar circumstances, and not apt to offend the tenderest stomach.—Whites of eggs are also useful for clarifying liquors; to which purpose, being mixed and incorporated with the liquors to be clarified, and the whole afterwards boiled, the whites of eggs are by this means brought together and hardened, and thus carry off the gross parts of the liquor along with them.

ALBUQUERQUE, a small city in Spain, in the province of Estremadura, is seated on an eminence, nine miles from the frontiers of Portugal. It is command-

VOL. I.

ed by an almost impregnable fortress, built on a high mountain, and serving to defend the town. It carries on a great trade in wool and woollen manufactures. It was taken by the allies of Charles king of Spain, in 1705. W. Long. 7. o. N. Lat. 38. 52.

ALBURN, the English name of a compound colour, being a mixture of white and red, or reddish brown. Skinner derives the word, in this sense, from the Latin *albus*, and the Italian *burno*, from *bruno*, brown.

ALCA, or Auk, in ornithology, a genus of the order of anseres. The beak of this genus is without teeth, short, convex, compressed, and frequently furrowed transversely; the inferior mandible is gibbous near the base; the feet have generally three toes. The species of the alca are five.—1. The impenis, northern penguin, or great auk, with a compressed bill furrowed on each side, and an oval spot on each side of the eyes. According to Mr Martin, this bird breeds on the isle of St Kilda; appearing there the beginning of May, and retiring the middle of June. It lays one egg, which is six inches long, of a white colour; some are irregularly marked with purplish lines crossing each other, others blotched with black, and ferruginous about the thicker end: if the egg is taken away, it will not lay another that season. Mr Macaulay informs us that it does not visit that island annually, but sometimes keeps away for several years together; and adds, that it lays its egg close to the sea-marsh, being incapable, by reason of the shortness of its wings, to mount higher. The length of this bird, to the end of its toes, is three feet: but its wings are so small, as to be useless for flight; the length, from the tip of the longest quill-feathers to the first joint, being only four inches and a quarter. This bird is observed by seamen never to wander beyond soundings; and according to its appearance they direct their measures, being then assured that land is not very remote. Thus the modern sailors pay respect to auguries, in the same manner as Aristophanes * tells us those of Greece did above 2000 years ago:

From birds, in sailing men instructions take;
Now lie in port; now sail, and profit make.

2. The alle, little auk, or black and white diver, with a smooth conical bill, a white streak on the belly and wings, and black feet. The bulk of this species exceeds not that of a black-bird.—3. The arctica, or puffin, with a compressed bill and four furrows; the orbit of the eyes and temples are white. The legs of this species are very small; and placed so far behind as to disqualify it from standing, except quite erect, resting not only on the foot, but the whole length of the leg. This circumstance * makes the rise of the puffin from the ground very difficult, and it meets with many falls before it gets on wing; but when that is effected, few birds fly longer or stronger. These birds frequent the coasts of several parts of Great Britain and Ireland; but no place in greater numbers than Priestholm Isle, where their flocks may be compared to swarms of bees for multitude. These are birds of passage; they resort there annually about the fifth or tenth of April, quit the place (almost to a bird), and return twice or thrice before they settle to burrow and prepare for ovation and incubation. They begin to burrow the first week in May; but some few save themselves that trouble, and

Alca.

dislodge the rabbits from their holes, taking possession of them till their departure from the isle. Those which form their own burrows, are at that time so intent on the work as to suffer themselves to be taken by the hand. This task falls chiefly to the share of the males; who also assist in incubation. The first young are hatched the beginning of July. The old ones shew vast affection towards them; and seem totally insensible of danger in the breeding season. If a parent is taken at that time, and suspended by the wings, it will in a sort of despair treat itself most cruelly, by biting every part it can reach; and the moment it is loosed, will never offer to escape, but instantly resort to its unledged young: this affection ceases at the stated time of migration, which is most punctually about the eleventh of August, when they leave such young as cannot fly, to the mercy of the peregrine falcon, who watches the mouths of the house for the appearance of the little deserted puffins, which, forced by hunger, are compelled to leave their burrows. They lay only one egg. The eggs differ much in form: some have one end very acute; others have both extremely obtuse; all are white. Their flesh is excessively rank, as they feed on sea-weeds and fish, especially sprats: but when pickled and preserved with spices, are admired by those who love high-eating. Dr Caius tells us, that, in his days, the church allowed them in lent, instead of fish: he also acquaints us, that they were taken by means of ferrets, as we take rabbits: at present, they are either dug out, or drawn from their burrows by a hooked stick: they bite extremely hard; and keep such fast hold on whatever they fasten, as not to be easily disengaged. Their noise, when taken, is very disagreeable; being like the efforts of a dumb person to speak. 4. The tora, or razor-bill, with four furrows on the bill, and a white line on each side running from the bill to the eyes. These birds, in company with the guillemot, appear in our seas the beginning of February; but do not settle on their breeding places till they begin to lay, about the beginning of May. They inhabit the ledges of the highest rocks that impend over the sea, where they form a grotesque appearance; sitting close together, and in rows one above another. They properly lay but one egg a-piece, of an extraordinary size for the bulk of the bird, being three inches long: it is either white, or of a pale sea-green, irregularly spotted with black: if this egg is destroyed, both the auk and the guillemot will lay another; if that is taken, then a third: they make no nest, depositing their egg on the bare rock; and those such multitudes lay contiguous, by a wonderful instinct each distinguishes its own. What is also matter of great amazement, they fix their egg on the smooth rock, with so exact a balance, as to secure it from rolling off; yet should it be removed, and then attempted to be replaced by the human hand, it is extremely difficult, if not impossible, to find its former equilibrium. The eggs are food to the inhabitants of the coasts they frequent; which they get with great hazard; being lowered from above by ropes, trusting to the strength of their companions, whose footing is often so unstable that they are forced down the precipice, and perish together. 5. The pica, or black-billed auk, has the bill of the same form with the tora, but is entirely black. The cheeks, chin, and throat, are white: in all other respects it agrees with the former species.

Razor-bill,
Pl. ix. fig. 7.

The winter residence of this genus, and that of the guillemot *, is but imperfectly known: it is probable they live at sea, in some more temperate climate, remote from land; forming those multitudes of birds that navigators observe in many parts of the ocean: they are always found there at certain seasons, retiring only at breeding time; when they repair to the northern latitudes, and during that period are found as near the pole as navigators have penetrated. During winter, razor-bills and puffins frequent the coast of Andalusia, but do not breed there.

ALCÆUS, a famous ancient lyric poet, born at Mitylene, in the island of Lesbos. Horace seems to think him the inventor of this kind of poetry.

Now the Roman muse inspire,
And warm the song with Grecian fire.

Francis.

He flourished in the 44th Olympiad, at the same time with Sappho, who was likewise of Mitylene. Alcæus was a great enemy to tyrants, but not a very brave soldier. He was present at an engagement, wherein the Athenians gained a victory over the Lesbians; and here, as he himself is said to have confessed in one of his pieces, he threw down his arms, and saved himself by flight. Horace, who, of all the Latin poets, most resembled Alcæus, has made the like confession:

With thee I saw Philippi's plain,
Its fatal rout, a fearful scene;
And dropp'd, alas! th' inglorious shield,
Where valour's self was forc'd to yield,
Where soil'd in dust the vanquish'd lay,
And breath'd th' indignant soul away.

Francis.

The poetical abilities of Alcæus are indisputed; and though his writings were chiefly in the lyric strain, yet his muse was capable of treating the sublimest subjects with a suitable dignity. Hence Horace says,

Alcæus strikes the golden strings,
And seas, and war, and exile, sings.
Thus while they strike the various lyre,
The ghosts the sacred sounds admire:
But when Alcæus lifts the strain
To deeds of war and tyrants slain,
In thicker crowds the shadowy throng
Drink deeper down the martial song.

Francis.

ALCÆUS, an Athenian tragic poet, and, as some think, the first composer of tragedies. He renounced his native country Mitylene, and passed for an Athenian. He left ten pieces, one of which was *Pasiphaë*, that which he produced when he disputed with Aristophanes, in the fourth year of the 97th Olympiad. There is another ALCÆUS mentioned in Plutarch, perhaps the same whom Porphyrius mentions as a composer of satirical iambics and epigrams, and who wrote a poem concerning the plagiarism of Euphorus the historian. He lived in the 145th Olympiad.

We are told likewise of one ALCÆUS, a Messenian, who lived in the reign of Vespasian and Titus. We know not which of these it was who suffered for his lewdness a very singular kind of death, which gave occasion to the following epitaph:

Ἀλκαίου τρεπὸς ὄρεος, &c.

This is Alcæus's tomb, who died by a radish,
The daughter of the earth, and punisher of Adulterers.

This punishment inflicted on adulterers*, was thrusting one of the largest radishes up the anus of the adulterer; or, for want of radishes, they made use of a fish † with † See Mugil.

a very large head, which Juvenal alludes to:

*Quosdam machos et mugilis intrat.
The mullet enters me behind.*

Hence we may understand the menace of Catullus,

*Ah! tum te miserum, malique fati,
Quem atrastris pedibus, patente porta,
Percurrent raphanisque mugilesque.*

Epig. xv.

*Ah! wretched thou, and born to luckless fate,
Who art discover'd by the unhut gate!
If once, alas! the jealous husband come,
The radish, or the sea-fish, is thy doom.*

ALCAICS, in ancient poetry, a denomination given to several kinds of verse, from Alcæus their inventor.

The first kind consists of five feet, viz. a spondee, or iambic; an iambic; a long syllable; a dactyle; another dactyle: such is the following verse of Horace,
*Omnes | eodem cogimus, | omnium
Versatur ur̄bis | Jervius | oculus |**Sors exitura.*

The second kind consists of two dactyles and two trochees: as,

Exitūm impossitūra | cymbæ.

Besides these two, which are called dactylic Alcaics, there is another styled simply Alcaic; consisting of an epitrite; a coriambus; another coriambus; and a bacchius: the following is of this species,

*Cur timent solum Tiberim tangere, cur | olivum?*ALCAIC Ode, a kind of manly ode composed of several strophes, each consisting of four verses; the two first of which are always Alcaics of the first kind; the third verse is a diameter hypercatalectic, or consisting of four feet and a long syllable; and the fourth verse is an Alcaic of the second kind. The following strophe is of this species, which Horace calls *minaces Alcaei camenæ*.*Non possidentem multa vocaveris
Rette beatum: rectius occupat
Nomen beati, qui deorum
Muneribus sapienter uti, &c.*

ALCAID, ALCAYDE, or ALCALDE, in the polity of the Moors, Spaniards, and Portuguese, a magistrate, or officer of justice, answering nearly to the French provost, and the British justice of peace.—The alcaid among the Moors is vested with supreme jurisdiction, both in civil and criminal cases.

ALCALA DE GUADAIRA, a small town of Spain, in Andalusia, upon the river Guadaira. Here are abundance of springs, from whence they convey water to Seville by an aqueduct. W. Long. 6. 16. N. lat. 37. 15.

ALCALA de Henares, a beautiful and large city of Spain, in new Castile, seated upon the river Henares, which washes its walls. It is built in a very agreeable plain, and is of an oval figure. The streets are handsome and pretty straight; one of them is very long, running from one end of the city to the other. The houses are well built; and there are several squares, the largest of which is an ornament to the city; it is surrounded on all sides with piazzas, where tradesmen have their shops, to expose several sorts of commodities to sale, of which there is as great plenty and variety as in most towns of Spain. The university was founded by cardinal Ximenes, archbishop of Toledo, about the beginning of the 16th century. The land about Alcala is watered by the Henares, well cultivated, and very fruitful, while

that at a distance is dry and sterile: it yields grain in plenty, very good mulcat wine, and melons of a delicious kind. Without the walls is a spring, the water of which is so pure, and so well tasted, that it is inclosed and shut up for the king of Spain's own use, from whence it is carried to Madrid.—This city is 10 miles south-west of Guadalaxara, and 13 miles east of Madrid. W. Long. 4. 20. N. Lat. 40. 30.

ALCALA-Real, a small city of Spain, in Andalusia, with a fine abbey. It is built on the top of a high mountain, in a mountainous country; and the road to it is incommodious, rough, and unequal; but to make amends for this, here are several kinds of exquisite fruit and wine. W. Long. 4. 15. N. Lat. 37. 18.

ALCALY, or ALKALI. See CHEMISTRY, n^o 23, 119, 184, 274, 316, 389.

ALCANIS, a town of Arragon in Spain, seated on the river Guadaloup, twelve miles from Caspe. It was formerly the capital of the kingdom of the Moors; but being taken from them, it was made a commandery of the order of Calatrava. Here is a very remarkable fountain, which throws up water through 42 pipes. It is surrounded with gardens and fruit-trees, and defended with a good fortress. W. Long. o. 5. N. Lat. 41. o.

ALCANNA, in commerce, a powder prepared from the leaves of the Egyptian privet, in which the people of Cairo drive a considerable trade. It is much used by the Turkish women to give a golden colour to their nails and hair. In dyeing, it gives a yellow colour when steeped with common water, and a red one when infused in vinegar. There is also an oil extracted from the berries of alcanna, and used in medicine as a calm-cr.

ALCANTARA, a small, but very strong city of Estremadura, in Spain. It gives name to one of the three orders of knighthood. It is seated on the banks of the Tajo, or Tagus, 21 miles from Coria, in a very fruitful soil, and is celebrated for its bridge over that river. This was built in the time of the emperor Trajan, as appears by an inscription over one of the arches, by the people of Lusitania, who were assailed to supply the expence: it is raised 200 feet above the level of the water; and though it consists but of six arches, is 670 feet in length, and 28 in breadth. At the entrance of the bridge, there is a small antique chapel hewn in a rock by the ancient Pagans, who dedicated it to Trajan, as the Christians did to St Julian. This city was built by the Moors, on account of the convenience of this bridge; which is at a place where the Tajo is very deep, running between two high steep rocks: for this reason, they called it *Al-Cantara*, which, in their language, signifies the *Bridge*. It was taken from them in 1214, and given to the knights of *Calatrava*, who afterwards assumed the name of *Alcantara*. It was taken by the earl of Galloway, in April, 1706, and retaken by the French in November following. It is 45 miles from Madrid, and 125 from Seville. W. Long. 7. 12. N. Lat. 39. 30.*Knights of ALCANTARA*, a military order of Spain, which took its name from the above mentioned city. They make a very considerable figure in the history of the expeditions against the Moors.

ALCAREZ, a small city of La Mancha, in Spain, defended by a pretty strong castle, and remarkable for

Alcala

Alcarez.

Alcazar
||
Alce

an ancient aqueduct. It stands near the river Guardamena, and the soil about it is very fruitful. They have a breed of little running-horses, which are very fleet and strong. It is 25 miles north of the confines of Andalusia, 108 south of Cuenza, and 138 south-by-east of Madrid. W. Long. 1. 50. N. Lat. 38. 28.

ALCASSAR DO SAL, a town of Portugal, in Estremadura, which has a castle said to be impregnable. It is indeed very strong both by art and nature, being built on the top of a rock which is exceedingly steep on all sides. Here is a salt-work which produces very fine white salt, from whence the town takes its name. The fields produce large quantities of a sort of rushes, of which they make mats, which are transported out of the kingdom. W. long. 9. 10. N. lat. 38. 18.

ALCASSAR, a city of Barbary, seated about two leagues from Larache, in Asfa, a province of the kingdom of Fez. It was of great note, and the seat of the governor of this part of the kingdom. It was built by Jacob Almanzor, king of Fez, about the year 1180, and designed for a magazine and place of rendezvous for the great preparations he was making to enter Granada in Spain; and to make good the footing Joseph Almanzor had got some time before. It is said his father first invaded Spain with 300,000 men, most of whom he was obliged to bring back to Africa to quiet a rebellion that had broke out in Morocco. This done, he returned to Spain again with an army, as is said, of 200,000 horse, and 300,000 foot. The city is now fallen greatly to decay, so that of fifteen mosques there are only two that they make use of. The reason, probably, is the bad situation of the town; for it stands so low, that it is excessively hot in summer, and almost overflowed with water in the winter. This they affirm to be owing to a curse of one of their faints. Here are a great number of flocks, who live very familiarly with the people, walking about the town, poskissing the tops of the houses and mosques without molestation; for they esteem them sacred birds, and account it sinful to disturb them. At present, the bashaw of Tetuan appoints a governor to this town, which is the last of his dominions towards Mequinez. Near this city there is a high ridge of mountains, running towards Tetuan, whose inhabitants were never brought entirely under subjection; and whenever it was attempted, they revenged themselves by infesting the roads, and robbing and destroying the travellers; when they were pursued, they retired into their woody mountains, where none could safely follow them. Not far from hence is the river Elmahallen, famous for the battle fought between Don Sebastian king of Portugal, and the Moors; in which the Portuguese were defeated, and their king slain. W. Long. 12 35. N. Lat. 35. 15.

ALCAZAR LEGER, a town of Africa, in the kingdom of Fez, and in the province of Ilabat. It was taken by Alphonso, king of Portugal, in 1468; but soon after that, it was abandoned to the Moors. It is seated on the coast of the straits of Gibraltar. W. Long. 5. 30. N. Lat. 38. 0.

ALCAZER, a town of Spain, in New Castile, seated on the river Guardamana, which has a fortress on a high hill for its defence, and lies in a very fruitful country. It is 100 miles north-west of Carthagena. W. long. 2. 10. N. lat. 38. 15.

ALCE, Alces, or Elk, in zoology, the trivial

name of a species of the cervus, belonging to the order of mammalia pecora. See CERVUS.

ALCEA, the HOLLY-HOCK; a genus of the polyandria order, belonging to the monodelphia class of plants.

Species. Although Linnæus mentions two distinct species of this genus, viz. the *rosea* and *tricolor*, he thinks, that the latter may perhaps be only a variety of the former; but Mr Miller affirms them to be distinct species, whose difference in the form of their leaves always continues: The leaves of the first sort are roundish, and cut at their extremities into angles; those of the second are deeply cut into six or seven segments, so as to resemble a hand. Cultivation produces almost an infinite variety of this plant, such as double-flowered, single-flowered, deep red, pale red, blackish red, white, purple, yellow, and flesh-colour. The first species is a native of China, the second grows also in Istria: Tho' natives of warm countries, they are hardly enough to thrive in the open air in Britain, and have for many years been some of the greatest ornaments in gardens, towards the end of summer; but they have the inconvenience of growing too large for small gardens, and requiring tall stakes to secure them from being broken by strong winds. In large gardens, however, when properly disposed, they make a fine appearance; for as their spikes of flowers grow very tall, there will be a succession of them on the same stems more than two months: the flowers on the lower part of the spike appear in July; and as their stalks advance, new flowers are produced till near the end of September. When planted in good ground, the stalks will often rise to the height of eight or nine feet; so that near six feet of each will be garnished with flowers, which, when double and of good colours, make a very beautiful appearance.

Culture. The holly-hock is propagated by seeds, which should be carefully sowed from those plants whose flowers are double and of the best colours: for though the duplicity of the flowers, as well as their colour, are only accidental properties, yet the young plants will produce nearly the same kind of flowers with those from which the seeds are taken, provided no plants with single or bad-coloured flowers are permitted to grow near them; and as soon as such appear they ought to be removed from the good ones, that their farina may not spread into the others, which would cause them to degenerate. The seeds ought to be gathered very dry, and remain in their capsules until spring; but care must be taken that no wet comes to them in winter, otherwise the covers would turn mouldy, and spoil their contents.—They should be sown in drills, about the middle of April, on a bed of light earth, and covered with earth of the same kind about half an inch deep. When the plants have put out six or eight leaves, they should be transplanted into nursery-beds, observing to water them until they have taken good root; after which they will require no farther care, but to keep them clean from weeds till October, when they should be transplanted where they are to remain.

ALCEDO, or KINGFISHER, in ornithology, a genus of the order of picæ. The alcedo has a long, straight, thick, triangular bill; with a fleshy, plain, short, flat tongue.—There are seven species of the alcedo.

1. The *ipsidea*, or common kingfisher, haunts the shores of Europe and Asia. It is not much larger than

a swallow; its shape is clumsy; the bill disproportionately long; it is two inches from the base to the tip; the upper chap black, and the lower yellow. But the colours of this bird atone for its inelegant form: the crown of the head and the coverts of the wings are of a deep blackish green, spotted with bright azure; the back and tail are of the molt resplendent azure; the whole under-side of the body is orange-coloured; a broad mark of the same, passes from the bill beyond the eyes; beyond that, is a large white spot; the tail is short, and consists of twelve feathers of a rich deep blue; the feet are of a reddish yellow, and the three joints of the out-molt toe adhere to the middle toe, while the inner-toe adheres only by one.

From the diminutive size, the slender short legs, and the beautiful colours of this bird, no person would be led to suppose it one of the molt rapacious little animals that skim the deep. Yet it is for ever on the wing, and feeds on fish; which it takes in surprising quantities, when we consider its size and figure. It takes its prey after the manner of the osprey, balancing itself at a certain distance above the water for a considerable space, then darting into the deep, and seizing the fish with inevitable certainty. While it remains suspended in the air, in a bright day, the plumage exhibits a beautiful variety of the molt dazzling and brilliant colours. This striking attitude did not escape the notice of the ancients; for Ibycus, as quoted by Athenæus, styles these birds *αλκυονες τανυσστιγοι*, the halcyons with expanded wings. It makes its nest in holes in the sides of the cliffs, which it scoops to the depth of three feet; and lays from five to nine eggs, of a molt beautiful semi-transparent white: the nest is very fetid, by reason of the remains of the fish brought to feed the young. The female begins to lay early in the season; and excludes her first brood about the beginning of April. The male, whose fidelity exceeds even that of the turtle, brings her large provisions of fish while she is thus employed; and she, contrary to molt other birds, is found plump and fat at that season. The male, that used to twitter before this, now enters the nest as quietly and as privately as possible. The young ones are hatched at the expiration of 20 days; but are seen to differ as well in their size as in their beauty.

This species is the *αλκυοναυρον*, or mute halcyon of Aristotle, which he describes with more precision than is usual with that great philosopher: after his description of the bird, follows that of its nest, than which the molt inventive of the ancients have delivered nothing that appears at first sight more fabulous and extravagant. He relates, that it resembled those concretions that are formed by the sea-water; that it resembled the long-necked gourd; that it was hollow within; that the entrance was very narrow, so that, should it over-set, the water could not enter; that it resisted any violence from iron, but could be broke with a blow from the hand; and that it was composed of the bones of the *βιαδον*, or sea-needle. The nest had medical virtues ascribed to it; and from the bird was called *Halcyonem*. In a fabulous age, every odd substance that was flung ashore received that name; a species of tubular coral, a sponge, a zoophite, and a miscellaneous concrete, having by the ancients been dignified with that title from their imaginary origin*. Yet much of this seems to be founded on truth. The form of the

nest is justly described; and the materials which Aristotle says it was composed of, are not entirely of his own invention. Whoever has seen the nest of the kingfisher, will observe it strewn with the bones and scales of fish; the fragments of the food of the owner and its young.—On the foundation laid by the philosopher, succeeding writers formed other tales extremely absurd; and the poets, indulging the powers of imagination, dressed the story in all the robes of romance. This nest was a floating one:

Incubat halcyon pendentebus æquore nidis. OVID. Met. lib. xi.

It was therefore necessary to place it in a tranquil sea, and to supply the bird with charms to allay the fury of a turbulent element during the time of its incubation; for it had, at that season, power over the seas and the winds.

*Χ' αλκυονες σφραγισιντι τα κυματα, την τε θαλασσαν,
Τον τε νelson, τον τ' ιουρον, ος ισχυατα κυκλι χινι!
Α' λκυονες, γλυνκισαι νηρηισται τι μαλιστα
Οργιδων ιραλιδις.*

THEOCRIT. Idyl. vii. l. 57.

*May Halcyon smooth the waves, and calm the seas,
And the rough south-east sink into a breeze;
Halcyon, of all the birds that haunt the main,
Most lov'd and honour'd by the Nereid train.* FAWKES.

These birds were equally favoured with Thetis as with the Nereids;

Dilectæ Thetidi Halcyones.

VIRG. Georg. l. 399.

as if to their influence these deities owed a repose in the midst of the storms of winter, and by their means were secured from those winds that disturb their submarine retreats, and agitated even the plants at the bottom of the ocean.

Such are the accounts given by the Roman and Sicilian poets. Aristotle and Pliny tell us, that this bird is molt common in the seas of Sicily: that it fat only a few days, and those in the depth of winter; and during that period the mariner might fail in full security; for which reason they were styled *Halcyon days*.

*Perque dies placidos hiberno tempore septem
Incubat Halcyon pendentebus æquore nidis:
Tum via tutâ maris: ventos cunctodit, et arcet
Æolus egressu.*

OVID. Met. lib. XI.

*Alcyon, compressed,
Seven days sits brooding on her watery nest,
A wintry queen; her fire at length is kind,
Calms every storm, and hushes every wind.* DRYDEN.

In after-times, these words expressed any season of prosperity: these were the *Halcyon days* of the poets; the brief tranquillity, the *septem placidi dies*, of human life.

The poets also made it a bird of song. Virgil seems to place it in the same rank with the linnet;

Littoraque Halcyonem resonant, et Acanthida dum.

GEORG. III. 338.

And Silius Italicus celebrates its music, and its floating nest:

*Cum sonat Halcyon cantu, nidisque natantes
Immotæ gestat sopitis fluctibus undæ.*

Lib. XIV. 275.

But these writers seem to have transferred to our species, the harmony that belongs to the vocal alcedo*, one of the molt birds of the ancients.

As the ancients have had their fables concerning this bird, so have the modern vulgar. It is an opinion generally received among them, that the flesh of the kingfisher will not corrupt, and that it will even banish

banish all vermin. This has no better foundation than that which is said of its always pointing, when hung up dead, with its breast to the north. The only truth which can be affirmed of this bird when killed is, that its flesh is utterly unfit to be eaten; while its beautiful plumage preserves its lustre longer than that of any other bird we know.

The other species are, 2. The *erathaca*, with a short tail, a blue back, a yellow bill, a purple head and rump, and the throat and opposite part of the neck white. It is a native of Bengal. 3. The *alcyon* with a short black tail, white belly, and ferruginous breast. It is a native of America. Its cry, its solitary abode about rivers, and its manner of feeding, are much the same as of those in Britain. It preys not only on fish, but likewise on lizards. 4. The *todus*, with a short green tail, a blood-coloured throat, and a white belly. It is a native of America; and is the green sparrow, or green humming-bird, of Edwards. 5. The *myrmicis*, with a short green tail, ferruginous wings, and a green back. It is a native of Africa, and Asia. 6. The *rudis*, with a brown short tail variegated with white. It is a native of Persia and Egypt. 7. The *dea*, with two very long feathers in the tail, a blackish blue body, and greenish wings. It is a native of Surinam. All these likewise dive in the water, and catch fish with their long beaks.

ALCHEMILLA, or **LADIES-MANTLE**, a genus of the monogynia order, belonging to the tetrandria class of plants. Of this genus there are three

Species. 1. The *vulgaris*, or common ladies-mantle, with leaves plaited like a fan, and yellowish-green blossoms. It grows naturally in pasture-lands in this as well as in most other countries in Europe. The leaves discover to the taste a moderate astringency; and were formerly much esteemed in some female weaknesses, and in fluxes of the belly. They are now rarely made use of, tho' both the leaves and roots might doubtless be of service in cases where mild astringents are required. In the province of Smolandia in Gothland, they make a tincture of the leaves, and give it in spasmodic or convulsive diseases. Horses, sheep, and goats, eat it; cows are not fond of it; swine refuse it.—2. The *alpina*, or cinque-foil ladies-mantle, with finger-shaped sawed leaves, and greenish blossoms. It is a native of the mountainous parts of Europe. Goats and cows eat it; horses, sheep, and swine, refuse it.—3. The *minor*, or least ladies-mantle, with five smooth leaves growing at a joint and cut into many segments. It grows naturally in Sweden, Lapland, and other cold countries. Eaten by cows and goats; refused by horses, sheep, and swine.

Culture. These plants have perennial roots, and annual stalks. They are easily propagated by parting of their roots, or sowing their seeds in autumn. They should have a moist soil and shady situation, and be kept clear from weeds; which is all the culture they require.

ALCHEMIST, a practitioner in alchemy.

ALCHEMY, that branch of chemistry which had for its principal objects, the transmutation of metals into gold; the panacea, or universal remedy; an alkali, or universal menstruum; an universal ferment; and many other things equally ridiculous†.

ALCIAT (Andrew), a great lawyer, who flourished in the 16th century, born at Milan. He mixed much of polite learning in the explication of the laws,

Alciades
Alcmaer.

and happily drove out the barbarity of language which till then had reigned in the lectures and writings of lawyers; for which Thuanus highly praises him. He published a great many law-books, and some notes upon Tacitus. His Emblems have been much admired, and translated into French, Italian, and Spanish; and several learned men have written commentaries on them.

ALCIBIADES, an Athenian general. It was the fate of this great man to live at a time when his country was a scene of confusion. The Greeks, grown insolent from their conquests in Persia, turned their arms against each other, and banded together under the conduct of the two most opulent states Athens and Lacedæmon. Alcibiades, in the midst of an expedition he had planned against the enemy of his country, was recalled home to answer some charge of a private nature; but fearing the violence of his enemies, instead of going to Athens, he offered his services at Sparta, where they were readily accepted. By his advice the Lacedæmonians made a league with Persia, which gave a very favourable turn to their affairs. But his credit in the republic raising jealousies against him, he privately reconciled himself to his country, and took again the command of an Athenian army. Here victory, waiting as it were at his command, attended all his motions. The loss of seven battles obliged the Spartans to sue for peace. He enjoyed his triumphs, however, only a short time at Athens. One unsuccessful event made him again obnoxious to the malice of his citizens; and he found it expedient to retire from Athens. In his absence the Spartans again took the lead, and at the fatal battle of *Egos* entirely subdued the Athenian power. Alcibiades, though an exile, endeavoured to restore the power of his country; of which the Spartans having intelligence, procured him to be assassinated. He was a man of admirable accomplishments, but indifferently principled; of great parts; and of an amazing versatility of genius.

ALCINOUS, king of the Phæacians, in the island now called *Corfu*, was son of Nautilus, and grandson of Neptune and Peribea. It is by his gardens this king has chiefly immortalized his memory. He received Ulysses with much civility, when a storm had cast him on his coast. The people here loved pleasure and good cheer, yet were skilful seamen; and Alcinoüs was a good prince.

ALCMAER, a city of the United Provinces, situated in North Holland, about four miles from the sea, fifteen from Haerlem, and eighteen from Amsterdam. It is a handsome city, and one of the cleanest in Holland. The streets and houses are extremely neat and regular, and the public buildings very beautiful. It had formerly two parish-churches, dedicated to St Matthew and St Lawrence. The latter had so high a tower, that it served for a sea-mark to the vessels that were in the open sea; but, in 1464, it tumbled down, and damaged the other church so much, that they were both demolished in 1470, and one church was built in their stead, dedicated to the same saints. The Spaniards, under the command of Frederic of Toledo, son of the duke d'Alva, came to besiege it, after they had taken Haerlem in 1573; but were forced to raise the siege, after three months lying before it, as well on account of the infection of the air as the stout resistance of the inhabitants and soldiers; even the women

† See *Cher-
mistry*, n^o 5,
10.

Alcman
Alcock.

men signaling themselves bravely in its defence. It is recorded in the register of this city, that, in the year 1637, one hundred and twenty tulips, with the off-sets, fold for 90,000 florins. The town has a very good trade in butter and cheese, of which a vast quantity is sold every year, and is esteemed the best in Holland. E. long. 4. 26. N. lat. 52. 28.

ALCMAN, a lyric poet, who flourished in the 27th Olympiad. He was born at Sparta; and composed several poems, of which only some fragments are remaining, quoted by Athenæus and some other ancient writers. He was very amorous; accounted the father of gallant poetry; and is said to have been the first that introduced the custom of singing love-songs in company. He is reported to have been one of the greatest eaters of his age; upon which Mr Bayle remarks, that such a quality would have been extremely inconvenient, if poetry had been at that time upon such a footing as it has been often since, not able to procure the poet bread. He died of a strange disease; for he was eat up with lice.

ALCMANIAN, in ancient lyric poetry, a kind of verse consisting of two dactyls and two trochees; as,—
Virgibus puerisque canto.

The word is formed from *Alcman*, the name of an ancient Greek poet, in great esteem for his erotic or amorous compositions.

ALCMENA, the daughter of Electryo king of Mycenæ, and wife of Amphitryon. Jupiter putting on the shape of her husband while he was abroad in the wars, begot Hercules upon her: he made that night as long as three ordinary ones.

ALCOA ARBOR, the name of a tree in St Helena, said to emulate ebony.

ALCOCK (John), doctor of laws, and bishop of Ely in the reign of king Henry VII. born at Beverly in Yorkshire, and educated at Cambridge. He was first made dean of Westminster, and afterwards appointed master of the rolls. In 1471, he was consecrated bishop of Rochester: in 1476, he was translated to the see of Worcester; and in 1486, to that of Ely, in the room of Dr John Morton, preferred to the see of Canterbury. He was a prelate of great learning and piety; and so highly esteemed by king Henry, that he appointed him lord president of Wales, and afterwards lord chancellor of England. Alcock founded a school at Kingston upon Hull, and built the spacious hall belonging to the episcopal palace at Ely. He was also the founder of Jesus-college in Cambridge, for a master, six fellows, and as many scholars. This house was formerly a nunnery, dedicated to St Radigund; and, as Godwin tells us, the building being greatly decayed, and the revenues reduced almost to nothing, the nuns had all forsaken it, except two; whereupon bishop Alcock procured a grant from the crown, and converted it into a college. But Camden and others tell us, that the nuns of that house were so notorious for their incontinence, that King Henry VII. and Pope Julius II. consented to its dissolution: Bale accordingly calls this nunnery *spiritualium meretricum cœnobium*, “a community of spiritual harlots.” Bishop Alcock wrote several pieces, amongst which are the following: 1. *Mons Perfectionis*. 2. *In Psalmos Penitentiales*. 3. *Homilia Vulgares*. 4. *Meditationes Pie*. He died October 1st, 1500; and was buried in

the chapel he had built at Kingston upon Hull.

ALCOHOL, or ALKOOOL, in chemistry, spirit of wine highly rectified *. It is also used for any highly rectified spirit.—Alcohol is extremely light and inflammable: It is a strong antiseptic, and therefore employed to preserve animal substances.

ALCOHOL is also used for any fine impalpable powder.

ALCOHOLIZATION, the process of rectifying any spirit. It is also used for pulverization.

ALCORAN, or AL-KORAN, the scripture, or bible, of the Mahometans. The word is compounded of the Arabic particle *al*, and *coran* or *koran*, derived from verb *caraa* or *karaa*, to read. The word therefore properly signifies, the reading; or rather, *that which ought to be read*. By this name the Mahometans denote not only the entire book or volume of the Koran, but also any particular chapter or section of it; just as the Jews call either the whole scripture, or any part of it, by the name of *Karah*, or *Mikra*, words of the same origin and import.

Besides this peculiar name, the Koran is also honoured with several appellations common to other books of scripture: as, *al Farkan*, from the verb *forak*, to divide or distinguish; not, as the Mahometan doctors say, because those books are divided into chapters or sections, or distinguish between good and evil; but in the same notion that the Jews use the word *Perek*, or *Pirka*, from the same root, to denote a section or portion of scripture. It is also called *al Moftaf*, the volume, and *al Kitab*, the book, by way of eminence, which answers to the *Biblia* of the Greeks; and *al Dhikr*, the admonition, which name is also given to the Pentateuch and Gospel.

The Koran is divided into 114 larger portions of very unequal length, which we call *chapters*; but the Arabians *sowar*, in the singular *sura*; a word rarely used on any other occasion, and properly signifying a row, order, or a regular series; as a course of bricks in building, or a rank of soldiers in an army; and is the same in use and import with the *Sura*, or *Tora*, of the Jews, who also call the fifty-three sections of the Pentateuch *Sedarim*, a word of the same signification.

These chapters are not, in the manuscript copies, distinguished by their numerical order, but by particular titles, which are taken sometimes from a particular matter treated of, or person mentioned therein; but usually from the first word of note, exactly in the same manner as the Jews have named their *Sedarim*; though the word from which some chapters are denominated be very far distant, towards the middle, or perhaps the end, of the chapter; which seems ridiculous. But the occasion of this appears to have been, that the verse or passage wherein such word occurs, was, in point of time, revealed and committed to writing before the other verses of the same chapter which precede it in order; and the title being given to the chapter before it was completed, or the passages reduced to their present order, the verse from whence such title was taken did not always happen to begin the chapter. Some chapters have two or more titles, occasioned by the difference of the copies.

Some of the chapters having been revealed at Mecca, and others at Medina, the noting this difference makes a part of the title: but the reader will observe, that several

Alcock

Alcoran.

* See Chemistry, n° 563.

veral of the chapters are said to have been revealed partly at Mecca, and partly at Medina; and, as to others, it is yet a dispute among the commentators to which of the two places they belong.

Every chapter is subdivided into smaller portions, of very unequal length also, which we customarily call *verses*: but the Arabic word is *ayat*, the same with the Hebrew *oth*, and signifies *signs* or *wonders*: such as are the secrets of God, his attributes, works, judgments, and ordinances, delivered in those verses; many of which have their particular titles also, imposed in the same manner as those of the chapters.

Besides these unequal divisions of chapter and verse, the Mahometans have also divided their Koran into sixty equal portions, which they call *Ahzab*, in the singular *Hizb*, each subdivided into four equal parts; which is also an imitation of the Jews, who have an ancient division of their Mishna into sixty portions called *Masichtoth*. But the Koran is more usually divided into thirty sections only, named *Ajza*, from the singular *Juz*, each of twice the length of the former, and in the like manner subdivided into four parts. These divisions are for the use of the readers of the Koran in the royal temples, or in the adjoining chapels where the emperors and great men are interred. There are thirty of these readers belonging to every chapel, and each reads his section every day, so that the whole Koran is read over once a-day.

Next after the title, at the head of every chapter, except only the ninth, is prefixed the following solemn form, by the Mahometans called the *Bismallah*, IN THE NAME OF THE MOST MERCIFUL GOD; which form they constantly place at the beginning of all their books and writings in general, as a peculiar mark or distinguishing characteristic of their religion, it being counted a sort of impiety to omit it. The Jews, for the same purpose, make use of the form, *In the name of the LORD*, or, *In the name of the great God*; and the eastern Christians that of, *In the name of the Father, and of the Son, and of the Holy Ghost*. But Mahomet probably took this form, as he did many other things, from the Persian Magi, who used to begin their books in these words, *Benam Yazdan bakhshai/gher dadar*; that is, *In the name of the most merciful just God*.

There are twenty-nine chapters of the Koran, which have this peculiarity, that they begin with certain letters of the alphabet, some with a single one, others with more. These letters the Mahometans believe to be the peculiar marks of the Koran, and to conceal several profound mysteries, the certain understanding of which, the more intelligent confess, has not been communicated to any mortal, their prophet only excepted. Notwithstanding which, some will take the liberty of guessing at their meaning by that species of Cabala called by the Jews *Notarikon*, and suppose the letters to stand for as many words, expressing the names and attributes of God, his works, ordinances, and decrees; and therefore these mysterious letters, as well as the verses themselves, seem in the Koran to be called *signs*. Others explain the intent of these letters from their nature or organ, or else from their value in numbers, according to

another species of the Jewish Cabala called *Gematria*; the uncertainty of which conjectures sufficiently appears from their disagreement. Thus, for example, five chapters, one of which is the second, begins with these letters, A. L. M. which some imagine to stand for *Allah latif magid*, "God is gracious and to be glorified;" or, *Ana li mini*, i. e. *to me and from me*, viz. belongs all perfection, and proceeds all good; or else for *Ana Allah alam*, "I am the most wise God," taking the first letter to mark the beginning of the first word, the second the middle of the second word, and the third the last of the third word; or for *Allah, Gabriel, Mohammed*, the author, revealer, and preacher of the Koran. Others say, that as the letter A belongs to the lower part of the throat, the first of the organs of speech; L to the palate, the middle organ; and M to the lips, which are the last organ; so these letters signify that God is the beginning, middle, and end, or ought to be praised in the beginning, middle, and end, of all our words and actions: or, as the total value of those three letters, in numbers, is seventy-one, they signify, that, in the space of so many years, the religion preached in the Koran should be fully established. The conjecture of a learned Christian is at least as certain as any of the former, who supposes those letters were set there by the amanuensis, for *Amar li Mohammed*, i. e. *At the command of Mohammed*, as the five letters prefixed to the nineteenth chapter seem to be there written by a Jewish scribe, for *Coh yaas*, i. e. *Thus he commanded*.

The Koran is universally allowed to be written with the utmost elegance and purity of language, in the dialect of the tribe of Koreish, the most noble and polite of all the Arabians, but with some mixture, though very rarely, of other dialects. It is confessedly the standard of the Arabic tongue, and, as the more orthodox believe, and are taught by the book itself, inimitable by any human pen (though some sectaries have been of another opinion), and therefore insisted on as a permanent miracle, greater than that of raising the dead, and alone sufficient to convince the world of its divine original.

And to this miracle did Mahomet himself chiefly appeal for the confirmation of his mission, publicly challenging the most eloquent men in Arabia, which was at that time stocked with thousands whose sole study and ambition it was to excel in elegance of style and composition, to produce even a single chapter that might be compared with it (A).

To the pomp and harmony of expression some ascribe all the force and effect of the Alcoran; which they consider as a sort of music, equally fitted with other species of that art to ravish and amaze. In this Mahomet succeeded so well, and so strangely captivated the minds of his audience, that several of his opponents thought it the effect of witchcraft and enchantment, as he himself complains.—Others have attributed the effect of the Alcoran to the frequent mention of rewards and punishments; heaven and hell occurring almost in every page. Some suppose, that the sensual pleasures of paradise, so frequently set before the imaginations of the readers of the Alcoran, were what chiefly bewitched them. Tho', with

(A) As the composition and arrangement of words, however, admit of infinite varieties, it can never be absolutely said that any one is the best possible. In fact, Hamzah Benahmed wrote a book against the alcoran with at least equal elegance; and Moselema another, which even surpassed it, and occasioned a defection of a great part of the Mussulmans. *Journ. de Scav.* tom. xiii. p. 280. *Ouvr. de Scav.* Nov. 1708. p. 404.

with regard to these, there is great dispute whether they are to be understood literally or spiritually. Several have even allegorized the whole book.

The general design of the Koran was to unite the professors of the three different religions then followed in the populous country of Arabia, (who, for the most part, lived promiscuously, and wandered without guides, the far greater number being idolaters, and the rest Jews and Christians mostly of erroneous and heterodox belief) in the knowledge and worship of one God, under the sanction of certain laws, and the outward signs of ceremonies partly of ancient and partly of novel institution, enforced by the consideration of rewards and punishments both temporal and eternal; and to bring them all to the obedience of Mahomet, as the prophet and ambassador of God, who, after the repeated admonitions, promises, and threats, of former ages, was at last to establish and propagate God's religion on earth, and to be acknowledged chief pontiff in spiritual matters, as well as supreme prince in temporal.

The great doctrine then of the Koran, is the unity of God; to restore which point Mahomet pretended was the chief end of his mission; it being laid down by him as a fundamental truth, That there never was, nor ever can be, more than one true orthodox religion. For, though the particular laws or ceremonies are only temporary, and subject to alteration, according to the divine direction; yet, the substance of it being eternal truth, is not liable to change, but continues immutably the same. And he taught, that, whenever this religion became neglected, or corrupted in essentials, God had the goodness to re-inform and re-admonish mankind thereof, by several prophets, of whom Moses and Jesus were the most distinguished, till the appearance of Mahomet, who is their seal, and no other to be expected after him. The more effectually to engage people to hearken to him, great part of the Koran is employed in relating examples of dreadful punishments formerly inflicted by God on those who rejected and abused his messengers; several of which stories, or some circumstances of them, are taken from the Old and New Testaments, but many more from the apocryphal books and traditions of the Jews and Christians of those ages, set up in the Koran as truths in opposition to the scriptures, which the Jews and Christians are charged with having altered: and indeed, few or none of the relations or circumstances in the Koran were invented by Mahomet, as is generally supposed, it being easy to trace the greatest part of them much higher, as the rest might be, were more of those books extant, and was it worth while to make the inquiry.

The rest of the Alcoran is taken up in prescribing necessary laws and directions, frequent admonitions to moral and divine virtues, the worship and reverence of the supreme being, and reformation to his will. One of their most learned commentators distinguishes the contents of the Alcoran into *allegorical* and *literal*; under the former are comprehended all the obscure, parabolical, and enigmatical passages, with such as are repealed, or abrogated; the latter, such as are clear, and in full force.

The most excellent moral in the whole Alcoran interpreters say, is that in the chapter *Al Araf*; viz. Shew mercy, do good to all, and dispute not with the ignorant; or, as Mr Sale renders it, Use indulgence, com-

mand that which is just, and withdraw far from the ignorant. Mahomet, according to the authors of the *Keshaf*, having begged of the angel Gabriel a more ample explication of this passage, received it in the following terms: "Seek him who turns thee out, give to him who takes from thee, pardon him who injures thee; for God will have you plant in your souls the roots of his chief perfections." It is easy to see, that this commentary is copied from the Gospel.—In reality, the necessity of forgiving enemies, though frequently inculcated in the Alcoran, is of a later date among the Mahometans than among the Christians; among those latter, than among the heathens; and to be traced originally among the Jews*. But it matters not so much who had it first, as who observes it best. The caliph Hassan, son of Hali, being at table, a slave unfortunately let fall a dish of meat reeking hot, which scalded him severely. The slave fell on his knees, rehearsing these words of the Alcoran, "Paradise is for those who restrain their anger." I am not angry with thee, answered the caliph. "And for those who forgive offences against them," continues the slave. I forgive thee, replies the caliph. "But above all, for those who return good for evil," adds the slave. I set thee at liberty, rejoined the caliph, and I give thee ten dinars.

There are also a great number of occasional passages in the Alcoran, relating only to particular emergencies. For this advantage Mahomet had in the piecemeal method of receiving his revelation, that whenever he happened to be perplexed and gruelled with any thing, he had a certain resource in some new morsel of revelation. It was an admirable contrivance of his, to bring down the whole Alcoran at once, only to the lowest heaven, not to earth; since, had the whole been published at once, innumerable objections would have been made, which it would have been impossible for him to solve: but as he received it by parcels, as God saw fit they should be published for the conversion and instruction of the people, he had a sure way to answer all emergencies, and to extricate himself with honour from any difficulty which might occur.

That Mahomet was really the author and chief contriver of the Koran, is beyond dispute; though it is highly probable that he had no small assistance in his design from others, as his countrymen failed not to object to him: however, they differed so much in their conjectures as to the particular persons who gave him such assistance, that they were not able, it seems, to prove the charge; Mohammed, it is to be presumed, having taken his measures too well to be discovered.

However it be, the Mahometans absolutely deny the Koran was composed by their prophet himself, or any other for him. It is their general and orthodox belief, that it is of divine original; nay, that it is eternal and uncreated, remaining, as some express it, in the very essence of God: that the first transcript has been from everlasting by God's throne, written on a table of vast bigness, called the *preserved table*, in which are also recorded the divine decrees past and future: that a copy from this table, in one volume on paper, was by the ministry of the angel Gabriel sent down to the lowest heaven, in the month of Ramadan, on the night of power: from whence Gabriel revealed it to Mahomet by parcels, some at Mecca, and some at Medina,

Alcoran.

at different times, during the space of twenty-three years, as the exigency of affairs required; giving him, however, the consolation to shew him the whole (which they tell us was bound in silk, and adorned with gold and precious stones of paradise) once a-year; but in the last year of his life he had the favour to see it twice. They say, that few chapters were delivered entire, the most part being revealed piecemeal, and written down from time to time by the prophet's amanuensis in such a part of such or such a chapter, till they were completed, according to the directions of the angel. The first parcel that was revealed is generally agreed to have been the first five verses of the ninety-sixth chapter.

After the new-revealed passages had been from the prophet's mouth taken down in writing by his scribe, they were published to his followers, several of whom took copies for their private use, but the far greater number got them by heart. The originals, when returned, were put promiscuously into a chest, observing no order of time, for which reason it is uncertain when many passages were revealed.

When Mahomet died, he left his revelations in the same disorder, and not digested into the method, such as it is, in which we now find them. This was the work of his successor Abu Becr; who, considering that a great number of passages were committed to the memory of Mahomet's followers, many of whom were slain in their wars, ordered the whole to be collected, not only from the palm-leaves and skins on which they had been written, and which were kept between two boards or covers, but also from the mouths of such as had gotten them by heart. And this transcript, when completed, he committed to the custody of Hafsa the daughter of Omar, one of the prophet's widows.

From this relation it is generally imagined that Abu Becr was really the compiler of the Koran; though, for aught appears to the contrary, Mahomet left the chapters complete as we now have them, excepting such passages as his successor might add or correct from those who had gotten them by heart; what Abu Becr did else, being perhaps no more than to range the chapters in their present order, which he seems to have done without any regard to time, having generally placed the longest first.

However, in the thirtieth year of the Hegira, Othman being then caliph, and observing the great disagreement in the copies of the Koran in the several provinces of the empire; those of Irak, for example, following the reading of Abu Musa al Ashari, and the Syrians that of Macdad Ebn Afwad; he, by the advice of the *companions*, ordered a great number of copies to be transcribed from that of Abu Becr, in Hafsa's care, under the inspection of Zeid Ebn Thabet, Abd'allah Ebn Zobair, Said Ebn al As, and Ad'alrahman Ebn al Hareth the Makhzumite; whom he directed, that, wherever they disagreed about any word, they should write it in the dialect of the Koreish, in which it was at first delivered. These copies, when made, were dispersed in the several provinces of the empire, and the old ones burnt and suppressed. Though many things in Hafsa's copy were corrected by the abovementioned revisers, yet some few various readings still occur.

In fine, the book of the Alcoran is held in the highest esteem and reverence among the Musselmans. They dare not so much as touch the Alcoran, without being

first washed, or legally purified; to prevent which, an inscription is put on the cover or label, *Let none touch but they who are clean*. It is read with great care and respect; being never held below the girdle. They swear by it; take omens from it on all weighty occasions; carry it with them to war; write sentences of it in their banners; adorn it with gold and precious stones; and knowingly suffer it not to be in the possession of any of a different religion. Some say that it is punishable even with death, in a Christian, to touch it; others, that the veneration of the Musselmans leads them to condemn the translating it into any other language as a profanation: but these seem to be aggravations. The Mahometans have taken care to have their scripture translated into the Persian, the Javan, the Malayan, and other languages; though, out of respect to the original, these versions are generally, if not always, interlineated.

See further concerning the history of the Alcoran, *Boulainvilliers*, Vie de Mahom. p. 258. *Ad. Erudit. Lipf.* 1694, p. 382. & 1692, p. 331, seq.—Its excellency and use, *Reland*, Relig. Mahom. in Pref. Jour. Liter. T. 10. p. 29.—Its Characters and Confusion, *Ouvr. des Scav.* Sept. 1704, p. 419. Jour. des Scav. T. 37. p. 39. 48. p. 87, T. seq.—Its Obscurity and Difficulties, *Mem. de Trev.* 1714, p. 1147.—Its Doctrine of Christ, *Phil. Transf.* N° 154. p. 433. See also *Possellus* on its conformity with the Gospel.—Contradictions in it, how solved, *D'Herbel.* p. 87.

ALCORAN, is also figuratively applied to certain other books full of impieties and impostures.—In this sense we meet with the *Alcoran* of the Cordeliers, which has made a great noise; wherein St Francis is extravagantly magnified, and put on a level with Jesus Christ. The Alcoran of the Cordeliers is properly an extract of a very scarce book, entitled, The conformity of the life of the seraphic father St Francis with the life of Christ, published in 1510, 4to.; since, at Bologna, in folio. Erasmus Albertus, being by the elector of Brandenburg appointed to visit a monastery of Franciscans, found this book; and being struck with the extreme folly and absurdity of it, collected a number of curiosities out of it, and published them under the title of the *Alcoran* of the Franciscans, with a preface by Martin Luther.

ALCORANISTS, among Mahometans, those who adhere strictly to the letter or text of the alcoran, from an opinion of its ultimate sufficiency and perfection. The Persians are generally *Alcoranists*, as admitting the alcoran alone for their rule of faith. The Turks, Tartars, Arabs, &c. besides the alcoran, admit a multitude of traditions. The Alcoranists, among Mahometans, amount to much the same with the textualists among the Jews. The Alcoranists can find nothing excellent out of the alcoran; are enemies of philosophers, metaphysicians, and scholastic writers. With them the alcoran is every thing.

ALCOVE, among builders, a recess, or part of a chamber separated by an estrade, or partition of columns, and other corresponding ornaments, in which is placed a bed of state, and sometimes seats to entertain company. These alcoves are frequent in Spain; and the bed is raised two or three ascents, with a rail at the foot.

ALCUINUS (Flaccus,) an ecclesiastic of the eighth century. Where he was born, is a matter of dispute;

Alcoran

Alcuinus.

Alcynus || **Aleyonius.** dispute; but, according to the most probable opinion, it was in Yorkshires. It is pretty certain, however, that he was educated first under Bede, and afterwards by Egbert archbishop of York, by whom he was made keeper of the library of that city (A). He thence rose to be deacon of the church, and afterwards became abbot of Canterbury. In the year 793 he went over to France, upon the invitation of Charlemagne, by whom he was greatly cared for, and amply provided for. He was not only honoured with his friendship and confidence, but became his instructor in rhetoric, logic, mathematics, and divinity. He attended him to the council of Francfort; and, at his return, was presented with the abbey of Ferrara, St Jodocus, and St Lupus. He retired at last to the abbey of St Martin at Tours, where he spent the latter part of his life, and died in the year 804. Doubtless, he was one of the best scholars and wisest men of his time. France was chiefly indebted to him for her improvements in literature. The universities of Paris, Tours, Fulden, Soissons, and many others, owe to him their origin and increase; and to him was owing the institution of learned academies, at least the first one * we read of was set on foot by the emperor at his instigation. His works were collected and published by Andrew du Chesne in one volume folio, Paris, 1617. They consist of, 1. Tracts upon scripture. 2. Tracts upon doctrine, discipline, and morality. 3. Historical treatises, letters, and poems. Since this edition, there has been published an incredible number of tracts, poems, &c. ascribed to this author, most of which, in all probability, were not his.

* See *Alcedo*.

† See *Alcedo*.

ALCYON, the trivial name of a species of alcedo †. **ALCYONIUM**, an obsolete name of a submarine plant. It is also used for a kind of coral, or alroites, frequently found fossil in England.

ALCYONIUS STAGNUM, (anc. geogr.) a lake in the territory of Corinth, whose depth was unfathomable, and in vain attempted to be discovered by Nero: through this lake Bacchus is said to have defended to hell, to bring back Semele; (Pausanias).

ALCYONIUS (Peter), a learned Italian, who flourished in the 16th century. He was well versed in the Greek and Latin tongues, and wrote some pieces of eloquence which met with great approbation. He was corrector of the press a considerable time for Aldus Manutius, and is intitled to a share in the praises given to the editions of that learned printer. He published a treatise concerning banishment, which contained so many fine passages intermixed with others quite the reverse, that it was thought he had tacked to somewhat of his own, several fragments of a treatise of *Cicero de gloria*; and that afterwards, in order to save himself from being detected in this theft, he burnt the manuscript of Cicero, the only one extant. Paulus Manutius, in his commentary upon these words of Cicero, "Librum tibi celeriter mittam de gloria, I will speedily send you my treatise on glory;" has the following passage relating to this affair: "He means (says he) his two books On Glory, which were handed down to the age of our fathers; for Bernard Justinian, in the index of his books, mentions *Cicero de Gloria*. This treatise however, when Bernard had left his whole

library to a nunnery, could not be found, though sought after with great care: nobody doubted but Peter Alcyonius, who, being physician to the nunnery, was entrusted with the library, had basely stole it. And truly, in his treatise Of Banishment, some things are found interperled here and there, which seem not to favour of Alcyonius, but of some higher author." The two orations he made after the taking of Rome, wherein he represented very strongly the injustice of Charles V. and the barbarity of his soldiers, were excellent pieces. There is also an oration ascribed to him, on the knights who died at the siege of Rhodes.

ALDBOROUGH, a sea-port town in Suffolk, with a market on Saturdays. It is pleasantly situated, in a dale, between a high hill to the westward, on which its large old-built church stands; the sea to the east, and its river, running south-west. It is a large, long, ordinary town, made up of two or three streets of low houses, running parallel to each other. A quarter of a mile to the south lies Slaughden, where they have a commodious key, with warehouses for fish: more southerly still, they have conveniences for drying their north-sea fish. Their employment in the fishery is their chief business, which is considerable in the seasons for catching herrings and sprats; and it is the only place in England for curing red sprats. It is a town corporate, and sends two members to parliament. Towards the sea, it has some pieces of cannon planted for its defence. It is 88 miles north-east from London. E. Long. 1. 32. N. Lat. 52. 50.

ALDBOROUGH, a market-town in the west riding of Yorkshire, seated on the river Ouse, 15 miles north-west of York, and 200 miles north of London. It sends two members to parliament. W. Long. o. 20. N. Lat. 54. 15. It was anciently a Roman city, called *Isurium Brigantium*; and several coins and monuments of the Saxons and Romans have been discovered there.

ALDEBARAN, in astronomy, a star of the first magnitude, called in English the *bull's-eye*, as making the eye of the constellation Taurus. Its longitude is 6 deg. 32 min. 9 sec. of Gemini, and its latitude 5 deg. 29 min. 40 sec. south.

ALDER-TREE, in botany. See **ALNUS**.

ALDERHOLM, a pleasant island of Sweden, formed by the three arms of a river running thro' Gentle, a town of Norland, in Sweden. Here is a wharf, a repository for planks and deals, two packing houses, a large custom-house for taking toll of the ships, an arsenal for cannon, and a granary.

ALDERMAN, in the British policy, a magistrate subordinate to the lord-mayor of a city or town-corporate. The number of these magistrates is not limited, but is more or less according to the magnitude of the place. In London they are 26; each having one of the wards of the city committed to his care. This office is for life; so that when one of them dies, or resigns, a ward-mote is called, who return two persons, one of whom the lord-mayor and aldermen chuse to supply the vacancy. By the charter of the city of London, all the aldermen who have been lord-mayors, together with the three eldest ones not arrived at that dignity, are justices of the peace.

D d 2

ALDERMAN,

(A) William of Malmshury calls this library *omnium liberalium artium armarium*. It was destroyed by fire in the reign of king Stephen, with great part of the city of York.

Aldborough || **Alderman.**

Alderman
Aldhelm.

ALDERMAN, among our Saxon ancestors, was a degree of nobility answering to earl or count at present.

ALDERMAN was also used, in the time of king Edgar, for a judge or justice; in which sense, Alwin is called *aldermannus totius Angliæ*.

ALDERNEY, an island in the British channel, subject to the crown of Great Britain. It is about eight miles in compass, and is separated from Cape la Hogue, in Normandy, by a narrow freight, called the *Race of Alderney*, which is a very dangerous passage in stormy weather when the two currents meet; otherwise it is safe, and has depth of water for the largest ships. Thro' this freight the French fleet made their escape, after their defeat at La Hogue, in 1692. It is a healthy island, has but one church, is fruitful both in corn and pasture, and is remarkable for a fine breed of cows. The inhabitants, for their greater safety, live together in a town of the same name. The number of houses are said to be 200, and the inhabitants 1000. It has but one harbour, called *Crabby*, which is at a good distance from the town; and is only fit for small vessels. To the west lie the range of rocks called the *Caskets*, so dangerous to mariners. W. Long, 2. 17. N. Lat. 49. 50.

ALDHELM (St.), bishop of Shireburn in the time of the Saxon Heptarchy. He is said to have been the son of Kenred, brother to Ina, king of the West-Saxons; but, in the opinion of William of Malmesbury, his father was no more than a distant relation to the king. He was born and educated at Malmesbury in Wiltshire; where he built a monastery, of which he himself was the first abbot. He was afterwards, in 705, by king Ina, promoted to the see of Shireburn, and consecrated at Rome by Pope Sergius I. whom he is said to have reproved for his incontinency. He was the first Englishman who wrote in Latin, and the first who introduced Latin poetry into this island. Bale gives him also the character of a skilful musician. According to the monkish writers, he wrought many miracles. He died May 25th, 709. Malmesbury says, that he might be justly deemed *ex acumine Græcum, ex nitore Romanum, et ex pompa Anglum*. And an ancient chronicler says, that he was an excellent harper, a most eloquent Saxon and Latin poet, a most expert chanter or singer, *doctor egregius*, and admirably well versed in the scriptures and the liberal sciences. Bede says of Aldhelm, that "he was a man of universal erudition, having an elegant style, and being wonderfully well acquainted with books." In fact, considering the cloud of ignorance by which he was surrounded, and the great difficulty of acquiring knowledge without proper instruction, Aldhelm was a very extraordinary man. From one of his letters to Hedda, bishop of Winchester, concerning the nature of his studies whilst at Canterbury, he appears to have been indefatigably determined to acquire every species of learning in his power. For a copy of this curious epistle, see Henry's History, vol. i. p. 318.—He wrote, 1. *De octo vitiis principalibus*. This treatise is extant in *Bibliotheca Patrum* of Canisius. 2. *Ænigmatum versus mille*. This, with several other of his poems, was published by Martin Delrio at Mentz, 8vo, 1601. 3. A book addressed to a certain king of Northumberland, named Alfrid, on various subjects. 4. *De vita monachorum*. 5. *De laude sanctorum*. 6. *De arithmetica*. 7. *De astrologia*. 8. A book against the mi-

stake of the Britons concerning the celebration of Easter; printed by Sonius, 1576. 9. *De laude virginis*. Manuscript, in Bennet-college, Cambridge. Published among Bede's *Opuscula*. Besides many sonnets, epistles, and homilies in the Saxon language.

ALDPORT, an ancient name for Manchester*.

ALDRICH (Robert), bishop of Carlisle, was born at Burnham in Buckinghamshire about the year 1493, and educated at Eaton-school; from whence, in 1507, he was elected scholar of King's-college, Cambridge, where he took his degrees in arts, and was afterwards proctor of the university. In 1525, he was appointed master of Eaton-school, then became fellow of that college, and finally provost. In 1529, he went to Oxford, where, being first incorporated bachelor of divinity, in the following year he proceeded doctor in that faculty; in 1531, he was made arch-deacon of Colchester; in 1534, canon of Windsor; and the same year, regent of the order of the garter. He was consecrated bishop of Carlisle in the year 1537, and died at Horncastle in Lincolnshire in 1556. He wrote, 1. *Epistola ad Gul. Hormannum*, in Latin verse; printed in Horman's *Antibiscon*, Lond. 1521, of which book Pitts erroneously makes Aldrich the author. 2. *Epigrammata varia*. 3. *Latin verses, and another epistle to Horman*, prefixed to the *Vulgaria puerorum* of that author, Lond. 1519, 4to. 4. *Answers to certain queries concerning the abuses of the mass*; also about receiving the sacrament.

ALDRICH (Dr Henry), an eminent English divine and philosopher, born at London in 1647, was educated at Westminster school under the famous Dr Busby, and admitted of Christ-church college, Oxford. He had a great share in the controversy with the Papists in the reign of James II. and bishop Burnet ranks him among those who examined all the points of popery with a solidity of judgment, clearness of argument, depth of learning, and vivacity of writing, far beyond any who had before that time written in our language. He rendered himself so conspicuous, that at the revolution, when Mafsey the popish dean of Christ-church fled, his deanry was conferred on him. In this station he behaved in an exemplary manner; and that fabric owes much of its beauty to his ingenuity: it was Aldrich who designed the beautiful square called *Peckwater-Quadrangle*, which is esteemed an excellent piece of architecture. In imitation of his predecessor Dr Fell, he published, yearly, a piece of some ancient Greek author, as a present to the students of his house: he published *A System of Logic*, with some other pieces; and the revising Clarendon's History of the Rebellion, was intrusted to him and bishop Spratt. He died about the year 1711.

ALDROVANDUS (Ulysses), professor of philosophy and physic at Bologna, the place of his nativity. He was a most curious inquirer into natural history, and travelled into the most distant countries on purpose to inform himself of their natural productions. Minerals, metals, plants, and animals, were the objects of his curious researches; but he applied himself chiefly to birds, and was at great expence to have figures of them drawn from the life. Aubert le Mire says, that he gave a certain painter, famous in that art, a yearly salary of 200 crowns, for thirty years and upwards; and that he employed at his own expence Lorenzo Bennini

Aldport
Aldrovandus.

and

Aldro-
vandus
Ale.

and Cornelius Svinus, as well as the famous engraver Christopher Coriolanus. These expences ruined his fortune, and at length reduced him to the utmost necessity; and it is said that he died blind in an hospital at Bologna, at a great age, in 1605. Mr Bale observes, that antiquity does not furnish us with an instance of a design so extensive and so laborious as that of Aldrovandus, with regard to natural history; that Pliny has treated of more kinds of subjects, but only touches lightly on them, saying but a little upon any thing, whereas Aldrovandus has collected all he could meet with. His compilation, or that compiled upon his plan, consists of thirteen volumes in folio, several of which were printed after his death. He himself published his Ornithology, or History of Birds, in three folio volumes, in 1599; and his seven books Of Insects, which make another volume of the same size. The volume Of Serpents, three Of Quadrupeds, one Of Fishes, that Of exanguinous Animals, the History of Monsters, with the Supplement to that of Animals, the treatise Of Metals, and the Dendrology or History of Trees, were published at several times after the death of Aldrovandus, by the care of different persons; and Aldrovandus is the sole author only of the first six volumes of this work, the rest having been finished and compiled by others, upon the plan of Aldrovandus: a most extensive plan, wherein he not only relates what he has read in naturalists, but remarks also what historians have written, legislators ordained, and poets feigned: he explains also the different uses which may be made of the things he treats of, in common life, in medicine, architecture, and other arts; in short, he speaks of morality, proverbs, devices, riddles, hieroglyphics, and many other things which relate to his subject.

ALDROVANDA, in botany, a genus of the pentandria order, belonging to the pentagynia class of plants; of which there is but one species. The calix is divided into five parts; the petals are five; and the capsule has five valves, with ten seeds. It is a native of Italy and the Indies; and has no English name.

ALDUABIS, (anc. geogr.) a river of Celtic Gaul, which rising from mount Jura, separating the Sequani from the Helvetii, and running through the county of Burgundy, or the Franche Comté, environs almost on every side the city of Besançon; and running by Dole, falls into the Saône near Chalons. In Cæsar it is called *Alduafubis*; (in Ptolemy), *Dubis*: now *le Doux*.

ALE, a fermented liquor obtained from an infusion of malt, and differing from beer chiefly in having a less proportion of hops*. This liquor, the natural substitute of wine in such countries as could not produce the grape, was originally made in Egypt, the first planted kingdom, on the dispersion from the east, that was supposed unable to produce grapes. And, as the Noachian colonies pierced further into the west, they found, or thought they found, the same defect; and supplied it in the same manner. Thus the natives of Spain, the inhabitants of France, and the aborigines of Britain, all used an infusion of barley for their ordinary liquor; and it was called by the various names of *Calia* and *Ceria* in the first country, *Cerevisia* in the second, and *Gurmi* in the last; all literally importing only the *strong water*.

There are various sorts of ale known in Britain, particularly *pale* and *brown*: the former is brewed from

malt slightly dried; and is esteemed more viscid than the latter, which is made from malt more highly dried or roasted.

Pale ale brewed with hard waters, as those of springs and wells, is judged the most wholesome, in regard the mineral particles tend to prevent the cohesions of those drawn from the grain, and enable them to pass the proper secretions the better; softer waters, as those of rivers, and rain, seem better suited to draw out the substance of high-dried malts, which retain many igneous particles, best absorbed in a smooth vehicle.

In Staffordshire, they have a secret of fining ale, in a very short time. Plot conjectures it to be done by adding alum, or vinegar, in the working.

Ale is prepared various ways, and of various ingredients, as of wheat, rye, millet, oats, barley, the berries of the quick-bean, &c.

Some have found that the juice which bleeds from the birch or sycamore, is of great use on this occasion, applied instead of water. It makes one bushel of malt go as far as four in the common way.

Some have a method of preparing ale, so that it will keep, carried to the East or West Indies. The secret Phil. Trans. N^o xxvii. is, by mashing twice with fresh malt; boiling twice; and, after shipping it, putting to every five gallons two new-laid eggs whole, to remain therein. It is said, that, in a fortnight's time, the shells will be dissolved; and the eggs become like wind-eggs; and that afterwards the white would disappear, and the yoke remain untouched.

Ale is generally held to be more diuretic than beer, in regard it is smoother, more softening, and relaxing; so that where urine is to be promoted by facilitating the passage, ale is most likely to effect it.

Ale is flatulent; and hence sometimes produces colics, and the cholera morbus: it is acceft; but it does not produce calcareous diseases, as has been asserted.

If malt-liquor, of any degree of strength, is become flat and tartish, as it is used, it should be drawn out of the cask into a jug, in which as many drams of powdered chalk is put as there are to be pints of liquor; thus a new ferment will be raised, a sprightly taste will be restored to the liquor, and its acidity will be destroyed. Tart liquors of this kind are apt to produce a dysury, strangury, or a gonorrhœa; in which cases, a small quantity of brandy may be taken.

The consumption of ale in these kingdoms is incredible. It was computed twenty years ago at the value of four millions yearly, including Great Britain and Ireland.

Medicated ALES, those wherein medicinal herbs have been infused, or added during the fermentation*.

Gill ALE, is that in which the dried leaves of gill Pharmacy, or ground-ivy have been infused. It is esteemed ab- N^o 381, &c. sterile and vulnerary, and consequently good in disorders of the breast and obstructions of the viscera.

ALE-conners, an officer in London, who inspects the measures used in public-houses. There are four ale-conners, who are all chosen by the common-council of the city.

ALE-silver, a tax paid annually to the lord-mayor of London, by all who sell ale within the city.

ALEA, in Roman antiquity, denotes in general all manner of games of chance; but, in a more restricted sense,

Ale

Aleander
Alectoromantia.

A-lec
Alentejo.

fense, was used for a particular game played with dice and tables, not unlike our backgammon.

ALEANDER (Jerome), cardinal and archbishop of Brindisi, was born in 1480; and distinguished himself at the beginning of the reformation, by the opposition he made to Luther: for being sent into Germany as the pope's nuncio in 1519, he acted, as occasion served, in the character both of ambassador and doctor; and declaimed three hours together against Luther's doctrine before the diet of Worms, but could not prevent that celebrated reformer from being heard in that diet. He published several works, and died at Rome in 1542.

ALEANDER (Jerome), a learned man of the seventeenth century, born in the principality of Friuli, of the same family with the preceding. When he went to Rome, he was employed as secretary under cardinal Octavius Bandini, and discharged this office with great honour for almost twenty years. He afterwards, by the persuasion of Urban VIII. who had a great esteem for him, became secretary to Cardinal Barberini, whom he accompanied to Rome when he went there in the character of legate *a latere*, and in whose service he died in 1631. He was one of the first members of the academy of Humorists, wrote a learned treatise in Italian on the device of the society, and displayed his genius on many different subjects. Barberini gave him a magnificent funeral at the academy of Humorists; the academists carried his corpse to the grave; and Gaspar Simeonibus, one of the members, made his funeral oration.

ALECTO, one of the furies, daughter of Acheron and the Night, or, as others would have it, of Pluto and Proserpine.

ALECTORIA, a stone said to be formed in the gall-bladders of old cocks, to which the ancients ascribed many fabulous virtues. This is otherwise called *Alectorius Lapis*, sometimes *Alectorolithos*, in English the *cock-stone*. The more modern naturalists hold the *alectorius lapis* to be originally swallowed down, not generated in, the stomach or gizzard of cocks and capons. It is known that many of the fowl-kind make a practice of swallowing pebbles, as it is supposed to be of service in the business of trituration and digestion.

ALECTOROMANTIA, in antiquity, a species of divination performed by means of a cock. This is otherwise called *AleAromancy*; of which there appear to have been different species. But that most spoken of by authors was in the following manner: A circle being described on the ground, and divided into twenty-four equal portions, in each of these spaces was written one of the letters of the alphabet, and on each of the letters was laid a grain of wheat; after which, a cock being turned loose in the circle, particular notice was taken of the grains picked up by the cock, because the letters under them, being formed into a word, made the answer desired. It was thus, according to Zonaras, that Libanius and Jamblicus fought who should succeed the emperor Valens; and the cock eating the grains answering to the spaces ΘΕΟΔ, several whose names began with those letters, as Theodotus, Theodistes, Theodulus, &c. were put to death; which did not hinder, but promote, Theodosius to the succession. But the story, however current, is but ill supported: It has been called in question by some, and refuted by others, from the silence of Marcellinus,

Socrates, and other historians of that time.

A-LEE, in the sea-language, a term only used when the wind, crossing or flanking the line of a ship's course, presses upon the masts and sails so as to make her incline to one side, which is called the lee-side; hence, when the helm is moved over to this side, it is said to be *a-lee*, or *hard-a-lee*.

ALEGAMBE (Philip), a celebrated Jesuit, born at Brussels in 1592, distinguished himself by publishing a Bibliothéque of the writers of his order, and died at Rome in 1652.

ALEGRETTE, a small town of Portugal, in Alentejo, on the confines of Port Alegre, on the river Caja, which falls into the Guadiana, a little below Bajadoz, near the frontiers of Spanish Estremadura. It is a very pretty town, and finely situated; seven miles south-east of Port Alegre, and thirty north of Elvas. W. Long. 5. 20. N. Lat. 39. 6.

ALEIUS CAMPUS, in ancient geography, (Homer, Strabo, Pliny); a plain in Cilicia, on this side the river Pyramus, near the mountain Chimera, famous for Bellerophon's wandering and perishing there, after being thrown off Pegasus; which is the reason of the appellation.

ALEMANIA, or ALLEMANIA, (anc. geog.) a name of Germany, but not known before the time of the Antonines, and then used only for a part. After the Marcomanni and their allies had removed from the Rhine, a rabble, or collection of people from all parts of Gaul, as the term *Alemanni* denotes, prompted either by levity or poverty, occupied the Agri, called *Decumates* by Tacitus, because they held them on a title; now supposed to be the duchy of *Wurtemberg*. Such appear to be the small beginnings of Alemania, which was in after-times greatly enlarged; but still it was considered as a distinct part; for Caracalla, who conquered the Alemanni, assumed the surname both of *Alemannicus* and *Germanicus*.

ALEMBIC, a chemical vessel, usually made of glass, or copper, for condensing the vapours that rise in distillation; for the alembic is properly the head or upper part of the apparatus used in distilling; though it is often used to signify the whole. See DISTILLING.

ALEMBROTH, in the writings of the alchemists, a word used for a sort of fixed alkaline salt, which had the power of the famous alkali, in dissolving bodies, opening the pores of most or all known substances, and thence, as well as by destroying sulphurs, promoting the separation of metals from their ores.—It is also used for a compound of corrosive mercury and sal ammoniac. See CHEMISTRY, n° 337.

ALENIO (Julius), a Jesuit, born at Brescia in the republic of Venice. He travelled into the eastern countries; and arrived at Maca in 1610, where he taught mathematics. From thence he went to the empire of China, where he continued to propagate the Christian religion for thirty-six years. He was the first who planted the faith in the province of Xansi, and he built several churches in the province of Fokien. He died in August 1649, leaving behind him several works in the Chinese language.

ALENTEJO, a province of Portugal, between the rivers of Tajo and Guadiana: the soil is very fertile, and the inhabitants laborious and industrious. The principal town is Eborá.

ALENZON,

Alençon,
Aleppo.

ALENZON, a large handsome town of France, in lower Normandy, with the title of a duchy. It is surrounded with good walls, and flanked with towers. The castle was formerly a place of great consequence, and has held out long sieges. It has but one parish-church, which has a bold and noble front. Among the nunneries, that of St Clair is most remarkable. It is seated on the river Sarthe, in a vast open plain, which produces all sorts of corn and fruit. Near it there are quarries of stone fit for building, wherein are found a sort like Bristol stones. The linen made at Alençon is very good, and sells at Paris. It is 20 miles north of Mans, 63 south-by-west of Rouen, and 88 south-west of Paris. Lon. o. 10. N. lat. 48. 25.

ALEPPO, or **HALEB**, the metropolis of Syria, is built on eight small hills or eminences, on the highest of which the castle is erected, and is now generally agreed to be the ancient Berzæ. This mount is of a conic form, and seems in a great measure to be raised with the earth thrown up out of a deep broad ditch which furrounds it. The suburbs to the north-north-east are next in height to this, and those to the west-south-west are much lower than the parts adjacent and than any other part of the city. It is encompassed by an old wall considerably decayed, and by a broad ditch now in most places turned into gardens. It is about three miles and a half in circumference, but the suburbs cight.

The mosques in Aleppo are numerous, and some few of them magnificent. Before each of them is an area, with a fountain in the middle, designed for ablutions before prayers; and behind some of the larger there are little gardens. There are many large khans, or caravanseras, consisting of a capacious square, on all sides of which are a number of rooms, built on a ground-floor, used occasionally for chambers, ware-houses, or stables. Above stairs there is a colonade or gallery on every side, in which are the doors of a number of small rooms, wherein the merchants, as well strangers as natives, transact most of their business. The streets are narrow; but well paved, and kept very clean.

The bazars or market-places are long covered narrow streets, on each side of which are a great number of small shops, just sufficient to hold the tradesman and his goods, the buyer being obliged to stand without. Each separate branch of business has a particular bazar, which is locked up, as well as the streets, an hour and a half after sun-set: but the locks are of wood, though the doors are cased with iron. The slaughter-houses are in the suburbs, open to the fields. The tanners have a khan to work in near the river. To the southward in the suburbs they burn lime, and a little beyond that there is a village where they make ropes and catgut. On the opposite side of the river, to the westward, there is a glass-house, where they make a coarse white glass, in the winter only, for the greatest part of this manufacture is brought from a village thirty-five miles westward.

The city is supplied with good water from springs, near the banks of the river Heylen, about five miles to the north-east, which is conveyed from thence by an aqueduct, and distributed all over the town by earthen pipes. This is sufficient for drinking, cookery, &c. but the fountains are supplied by wells of brackish water, of which there is one in every house. Their

fuel is wood and charcoal in the house; but they treat their bagnios with the dung of animals, leaves of plants, parings of fruit, and the like.

The inhabitants of Aleppo, though of different religions, seem to be much the same sort of people. The number of souls in the city and suburbs is computed at about 235,000, of whom 200,000 are Turks, 30,000 Christians, and 5000 Jews. Of the Christians the greater number are Greeks, next to them the Armenians, then the Syrians, and lastly the Maronites; each of whom have a church in the city called *Judida*, in which quarter, and the parts adjacent, most of them reside. The common language is the vulgar Arabic, but the Turks of condition use the Turkish. Most of the Armenians can speak the Armenian, some few Syrians understand Syriac, and many of the Jews Hebrew; but scarce one of the Greeks understand a word of Greek: however, in their manners, they all are much alike. Aleppo is 70 miles east of Scanderon, on the sea-coast, and 175 north-by-east of Damascus. E. long. 37. 40. N. lat. 36. 12.

ALERIA, **ALALIA**, or **ALARIA**, (anc. geog.) a town of Corfica, situated near the middle of the east side of the island, on an eminence, near the mouth of the river Rotanus mentioned by Ptolemy; built by the Phœceans, (Diodorus Siculus.) Afterwards Sylla led a colony thither. It is now in ruins, and called *Aleria Distrutta*.

ALES (Alexander), a celebrated divine of the confession of Augsbourgh, born at Edinburgh the 23d of April 1500. He soon made a considerable progress in school-divinity, and entered the lists very early against Luther, this being then the great controversy in fashion, and the grand field wherein all authors young and old used to display their abilities. Soon after, he had a share in the dispute which Patrick Hamilton maintained against the ecclesiastics, in favour of the new faith he had imbibed at Marpurg: he endeavoured to bring him back to the Catholic religion; but this he could not effect, and even began himself to doubt about his own religion, being much affected by the discourse of this gentleman, and still more by the constancy he shewed at the stake, where David Becon archbishop of St Andrew's caused him to be burnt. Beginning thus to waver, he was himself persecuted with so much violence, that he was obliged to retire into Germany, where he became at length a perfect convert to the Protestant religion. The change of religion which happened in England after the marriage of Henry VIII. with Anna Bullen, induced Ales to go to London, in 1535. He was highly esteemed by Cranmer archbishop of Canterbury, Latimer, and Thomas Cromwel, who were at that time in high favour with the king. Upon the fall of these favourites, he was obliged to return to Germany; where the elector of Brandenburg appointed him professor of divinity at Francfort upon the Oder, in 1540. But leaving this place upon some disgust, he returned to Leipsic, where he was chosen professor of divinity, and died in March 1565. He wrote a Commentary on St John, on the Epistles to Timothy, and on the Psalms, &c.

ALESA, **ALESÆ**, or **HALESÆ**, (anc. geogr.) a town of Sicily, on the Tuscan sea, built, according to Diodorus Siculus, by Archonides of Herbita, in the second year of the ninety-fourth olympiad, or four hundred

Aleppo
Alefi.

Aletham
Alexander.

dred and three years before Christ; situated on an eminence about a mile from the sea: now in ruins. It enjoyed immunity from taxes under the Romans, (Diodorus, Cicero.) The inhabitants were called *Halefni*, (Cicero, Pliny); also *Alefni*, and *Alefni*.

ALESHAM, a small neat town in Norfolk. It is 15 miles N. of Norwich, and 121 N. E. by N. of London. E. Long. o. 30. N. Lat. 52. 53. The town consists of about 400 pretty good houses; but the streets are narrow, though well paved.

ALESIA, (anc. geog.) called *Alexia* by Livy and others; a town of the Mandubii, a people of Celtic Gaul; situated, according to Caesar, on a very high hill, whose foot was washed on two sides by two rivers. The town was of such antiquity, that Diodorus Siculus relates it was built by Hercules. It is supposed to be the city of *Alise*, in the duchy of Burgundy, not far from Dijon.

ALET, a town of France, in Lower Languedoc, with a bishop's see. It is remarkable for its baths, and for the grains of gold and silver found in the stream which runs from the Pyrenean mountains, at the foot of which it stands. It is feated on the river Aude, 15 miles S. of Carcassone, and 37 N. W. of Narbonne. E. Long. 2. 5. N. Lat. 42. 59.

ALETTRIS, in botany, a genus of the monogynia order, belonging to the hexandria class of plants. Of this genus, botanical writers enumerate five species, viz. 1. The farinosa, a native of Virginia, and other parts of North America. 2. The capensis, a native of the Cape of Good Hope. 3. The hyacinthoides, or Guinea aloe. 4. The zeylanica, or Ceylon aloe. 5. The fragrans, or tree-aloe, a native of Africa. Of these only the first is so hardy as to outlive the winter in Britain, unless placed in a stove; and even this requires to be sheltered under a frame. The flowers appear in June or July, of a whitish green colour. The third and fifth produce fine spikes of white flowers; those of the third kind appearing in July, of the fifth in March or April. By proper management the last kind becomes a stately plant, rising to the height of twelve or fourteen feet; the flowers open wide in the evening, and perfume the air of the stove. These send out one or two heads, or tufts, towards their tops; which may be cut off; and after they have lain a week in the stove to heal the wounded parts, they may be planted for increase. The other species seldom or never flower in this country, nor does their appearance otherwise merit notice.

ALETUM, or ALETA, (anc. geogr.) a town of Celtic Gaul, now extinct. From its ruins arose St. Malo, in Brittany, at the distance of a mile. Its ruins are called *Guich Aleth* in the British.

ALEXANDER THE GREAT, king of Macedonia. His father Philip laid the plan of that extensive empire, which his son afterwards executed.—Philip, having made himself master of Greece, began to cast his eyes upon Persia, with a view to retaliate upon that haughty empire the injuries of former times. It was the popular topic of the day. But this prince was cut off in the midst of his enterprise. Such, however, was the influence of Alexander in the assembly of the Grecian states, that he was created general of their combined forces in the room of his father. Having made every needful preparation, at the head of a veteran army he invaded Asia. The lieutenants of Darius,

Alexander.

who was then king of Persia, opposed him at the river Granicus, where Alexander obtained a complete victory, after which he pursued his march through Asia. At Issus, near Scanderoon, he was met by Darius in person, at the head of a prodigious army. Here he obtained a second victory; and took the camp of Darius, together with his family, whom he treated with the utmost humanity. Contrary to all the maxims of war, instead of pursuing Darius, he made an excursion into Egypt; and, as far as appears, through no better motives than those of vanity. Here he was acknowledged to be the son of Jupiter Ammon. In the mean time Darius recruited his strength, and got together an army superior to what he brought into the plain of Issus. Alexander having finished his Egyptian expedition, traversed Asia, and passed the Euphrates. At Arbella, a town in Assyria, he met Darius. Here a decisive battle was fought, which put all Persia into the hands of Alexander. His ambition not being satisfied with the conquest of that vast country, he projected an expedition into India. Here he met with great opposition from Porus, a gallant prince, whom in the end he reduced. Beyond the Ganges lay a country still unsubdued. He notified it to his army, that he proposed to pass the river. But these veterans, harassed with the fatigues, and seeing no end of their labour, mutinied, and refused to march further. The disappointed chief was therefore obliged to return. At Babylon he proposed to receive ambassadors, appoint governors, and settle his vast monarchy; but his excesses put an end to his life in the midst of his designs, and in the flower of his age.—Alexander had a noble education under Aristotle, and other masters of the first eminence; the good effects of which were seen in the early part of his life. No prince ever gave nobler instances of generosity, candour, justice, prudence, and fortitude. But the tide of his successes changed his manners; and he became luxurious, arrogant, cruel, and even brutal. With regard to his public character, he hath been as much the subject of different opinions, as any prince of antiquity. By some, his conquest of Persia has been considered as the greatest effort of heroism. His Indian expedition has likewise been magnified as an appendage to one vast plan of universal commerce and legislation. But they seem to have a truer idea of Alexander, who consider the whole scheme of his conquests as the project solely of ambition.

ALEXANDER AB ALEXANDRO, a Neapolitan lawyer, of great learning, who flourished toward the end of the 15th and beginning of the 16th century. He followed the profession of the law first at Naples, afterwards at Rome: but he devoted all the time he could spare to the study of polite literature; and at length he entirely left the bar, that he might lead a more easy and agreeable life with the muses. The particulars of his life are to be gathered from his work intitled *Genialium Dierum*: We are there informed, that he lodged at Rome, in a house that was haunted; and he relates many surprising particulars about the ghost: he says also, that, when he was very young, he went to the lectures of Philoepus, who explained at Rome the Tusculan questions of Cicero; he was there also when Nicholas Perot and Domitius Calderinus read their lectures upon Martial. The particular time when he died is not known; but he was buried in the monastery of

Alexander. of the Olivets. Tiraqueau wrote a learned commentary upon his work, which was printed at Lyons in 1587, and reprinted at Leyden in 1673, with the notes of Dennis Godfrey, Christopher Colerus, and Nicholas Mercerus.

ALEXANDER SEVERUS, emperor of Rome, succeeded Heliogabalus about A. D. 222, when but 16 years of age. His mother's name was Mammæa, and by her advice he in a great measure regulated his conduct. He applied himself to the reformation of abuses, the state having been greatly disordered by the vicious conduct of his predecessor; he was a most strict lover of justice, an encourager of learning and learned men, and favourable to the Christians. He made a successful expedition against the Persians; but endeavouring to reform his troops, which had grown very licentious under the late bad government, they murdered him at the instigation of Maximinus in the 29th year of his age, together with his mother, A. D. 235.

ALEXANDER VI. (Pope), had four bastards when he was cardinal, for one of which he had so great affection that he stuck at nothing to raise him. Desiring to poison some cardinals, he was poisoned himself, A. D. 1503. See BORGIA.

ALEXANDER VII. (Pope), whose real name was Fabio Chigi, was born at Sienna in 1599. His family finding him a hopeful youth, sent him early to Rome, where he soon engaged in a friendship with the marquis Pallavicini, who recommended him to effectually to Pope Urban VIII. that he procured him the post of Inquisitor at Malta. He was sent Vice-legate to Ferrara, and afterward nuncio into Germany: there he had an opportunity of displaying his intriguing genius; for he was mediator at Munster, in the long conference held to conclude a peace with Spain. Cardinal Mazarin had some resentment against Chigi, who was soon after made a cardinal and secretary of state by Innocent X. but his resentment was sacrificed to political views. In 1655, when a pope was to be chosen, Cardinal Sacchetti, Mazarin's great friend, finding it was impossible for him to be raised into St Peter's chair because of the powerful opposition made by the Spanish faction, desired Cardinal Mazarin to consent to Chigi's exaltation. His request was granted, and he was elected pope by the votes of all the 64 cardinals who were in the conclave: an unanimity of which there are but few instances in the election of popes. He shewed uncommon humility at his election, and at first forbade all his relations to come to Rome without his leave; but he soon became more favourable to his nephews, and loaded them with favours. It is asserted that he had once a mind to turn Protestant. The news-papers in Holland bestowed great encomiums upon him; and acquainted the world, that he did not approve of the cruel persecutions of the Waldenses in Piedmont. There is a volume of his poems extant. He loved the *Belles-Lettres*, and the conversation of learned men. He was extremely fond of stately buildings; the grand plan of the college *Della Sapienza*, which he finished, and adorned with a fine library, remains a proof of his taste in architecture. He died in 1667.

ALEXANDER (William), earl of Stirling, an eminent Scots statesman and poet in the reigns of James I. and Charles I. who, after travelling with the duke of Argyll as his tutor or companion, wrote a poetical com-

VOL. I.

plaint of his unsuccessful love of some beauty, under the title of *Aurora*. He then removed to the court of James VI. where he applied to the more solid parts of poetry, forming himself upon the plan of the Greek and Roman tragedians. In 1607, he published some dramatic performances, intitled *The Monarchic Tragedie*, dedicated to king James; who was so well pleased with them, as to call him his philosophical poet. After this, he is said to have written *A supplement* to complete the third part of Sir Philip Sidney's *Arcadia*; and in 1613, he produced a poem called *Doomday, or the great day of judgment*. He was made gentleman-usher to prince Charles, and master of the requests; was knighted; and obtained a grant of Nova Scotia, where he projected the settlement of a colony, but afterward sold it to the French. In 1626, he was made secretary of state for Scotland; was created first viscount, and then earl, of Stirling; and died in 1640.

ALEXANDER I. (St), whom St Ireneus reckons the fifth bishop of Rome, succeeded St Evaristus in the year 109, and died in the year 119. There is no account of his life; and the epistles which are attributed to him are supposititious.

ALEXANDER II. king of Scotland, succeeded his father William in 1213, at 16 years of age. He made an expedition into England, to oppose the tyranny of king John; who returned the visit, and was offered battle by Alexander, but refused it. He took the city of Carlisle from Henry III. which was afterwards exchanged for Berwick. Alexander died in 1249, in the 51st year of his age, and 35th of his reign; and left for his successor, his son—

ALEXANDER III. who was crowned king of Scotland in 1249. The Cummings, lords of Scotland, took arms against him; and taking him prisoner, confined him at Striveling: but he was afterwards released by his subjects. He married the daughter of Henry III. king of England; and was at length killed by a fall from his horse, on the 10th of April 1290, after having reigned 42, or according to others 37, years.

ALEXANDERS, in botany. See SMYRNium.

ALEXANDREA, (anc. geogr.) a mountain of Mylia, on the sea-coast, forming a part of mount Ida, where Paris gave judgment on the three goddesses.

ALEXANDRETTA, by the Turks called *Scanderoon*; a town in Syria, at the extremity of the Mediterranean sea. It is the port of Aleppo, from which it is distant 28 or 30 leagues. It is now little else but a heap of ruined houses, chiefly inhabited by Greeks, who keep tippling-houses for sailors. The air is very unwholesome; and therefore the better sort of inhabitants, during the hot weather, live at a village called *Bayland*, on a mountain about ten miles off, where there is wholesome water and excellent fruit. What surprises strangers most, when they arrive at this place, are the pigeons which carry letters to Aleppo, which they reach in about three hours: these pigeons are of a singular kind*, and are very much celebrated throughout the east. E. Long. 37. 5. N. Lat. 36. 35. ^{b. 1.}

ALEXANDRIA, now *Scanderia*, by Athenæus called *Ægyptus*; a city of Lower Egypt, and for a long time its capital. This city was built by Alexander the Great, soon after the overthrow of Tyre, about 333 years before Christ. It is situated on the Mediterranean, twelve miles west of that mouth of the Nile

E c

anciently

Alexander
Alexandria.

* See Colum.

Alexandria, anciently called *Canopicum*; and lies in E. long. 30. 19. N. lat. 31. 10.

Alexander is said to have been induced to build this city, on account of its being conveniently situated for a fine port; and so sudden was his resolution, that after he had directed where every public structure was to be placed, fixed the number of temples, and the deities to whom they should be dedicated, &c. there were no instruments at hand proper for marking out the walls, according to the custom of those times. Upon this, a workman advised the king to collect what meal was among the soldiers, and to sift it in lines upon the ground, whereby the circuit of the walls would be sufficiently marked out. This advice was followed; and the new method of marking out the walls was, by Aristander, the king's soothsayer, interpreted as a preface of the city's abounding with all the necessities of life. Nor was he deceived in his prediction; for Alexandria soon became the staple, not only for merchandise, but also for all the arts and sciences of the Greeks.

All authors agree, that this city was very commodiously situated. Its form resembled that of a soldier's coat. The streets were wisely contrived, so as to admit the cooling breezes to refresh the air. One large beautiful street passed from gate to gate, being 100 feet broad, and five miles long. It had a broad and high wall round it, so as to have the sea close on one side, and a great lake on the other, with a narrow pass at each end.

The architect employed by Alexander in this undertaking was the celebrated Dinocrates, who had acquired so much reputation by rebuilding the temple of Diana at Ephesus. The city was first rendered populous by Ptolemy Soter, one of Alexander's captains, who, after the death of the Macedonian monarch, being appointed governor of Egypt, soon assumed the title of king, and took up his residence at Alexandria, about 304 years before Christ.

In the 30th year of Ptolemy Soter's reign, he took his son Ptolemy Philadelphus partner with him in the empire; and by this prince the city of Alexandria was much embellished. In the first year of his reign the famous watch-tower of Pharos was finished. It had begun several years before by Ptolemy Soter; and, when finished, was looked upon as one of the wonders of the world. The same year, the island of Pharos itself, originally seven furlongs distant from the continent, was joined to it by a causeway. This was the work of Dexiphanes, who completed it at the same time that his son put the last hand to the tower. The tower was a large square structure of white marble; on the top of which, fires were kept constantly burning, for the direction of sailors. The building cost 800 talents; which, if Attic, amounted to L. 165,000; if Alexandrian, to twice that sum.

The architect employed in this famous structure fell upon the following contrivance to usurp the whole glory to himself.—Being ordered to engrave upon it the following inscription, “King Ptolemy to the Gods the Saviours, for the benefit of Sailors;” instead of the king's name he substituted his own, and then filling up the hollow of the marble with mortar, wrote upon it the abovementioned inscription. In process of time, the mortar being wore off, the follow-

ing inscription appeared: “SOSTRATUS the Cnidian, Alexandria, the son of DEXIPHANES, to the Gods the Saviours, for the benefit of Sailors.”

This year also was remarkable for the bringing of the image of Serapis from Pontus to Alexandria. It was set up in one of the suburbs of the city called *Rhacotis*, where a temple was afterwards erected to his honour, suitable to the greatness of that stately metropolis, and called, from the god worshipped there, *Serapeum*. This structure, according to Ammianus Marcellinus, surpassed in beauty and magnificence all others in the world, except the capitol at Rome.—Within the verge of this temple was the famous Alexandrian library. It was founded by Ptolemy Soter, for the use of an academy he instituted in this city; and, by continual additions by his successors, became at last the finest library in the world, containing no fewer than 700,000 volumes. The method followed in collecting books for this library, was, to seize all those which were brought into Egypt by Greeks or other foreigners. The books were transcribed in the museum, by persons appointed for that purpose; the copies were then delivered to the proprietors, and the originals laid up in the library. Ptolemy Euergetes, having borrowed from the Athenians the works of Sophocles, Euripides, and Æschylus, returned them only the copies, which he caused to be transcribed in as beautiful a manner as possible; presenting the Athenians at the same time with fifteen talents (upwards of L. 3000 Sterling) for the exchange.

As the museum was at first in that quarter of the city call *Bruchion*, near the royal palace, the library was placed there likewise; but when it came to contain 400,000 volumes, another library, within the Serapeum, was erected by way of supplement to it, and on that account called the *daughter* of the former. In this second library 300,000 volumes, in process of time, were deposited; and the two together contained the 700,000 volumes already mentioned. In the war carried on by Julius Cæsar against the inhabitants of this city, the library in the Bruchion, with the 400,000 volumes it contained, was reduced to ashes. The library in the Serapeum, however, still remained; and here Cleopatra deposited 200,000 volumes of the Pergamean library, which Marc Antony presented her with. These, and others added from time to time, rendered the new library at Alexandria more numerous and considerable than the former; and though it was often plundered during the revolutions and troubles of the Roman empire, yet it was again and again repaired, and filled with the same number of books.

This library continued to be of great fame and use in these parts, till the year 642, when the Saracens made themselves masters of Alexandria. At that time, John, furnished the *grammarian*, a famous Peripatetic philosopher, being in the city, and in high favour with Amri-Abnol-As, the Saracen general, begged of him the royal library. Amri replied, that it was not in his power to grant such a request; but that he would write to the khalif on that head; since, without knowing his pleasure, he dared not to dispose of a single book. He accordingly wrote to Omar, who was then khalif, acquainting him with the request of his friend: To which the ignorant tyrant replied, That if those books contained the same doctrine with the koran, they could

Alexandria. be of no use, since the koran contained all necessary truths; but if they contained any thing contrary to that book, they ought not to be suffered; and therefore, whatever their contents were, he ordered them to be destroyed. Pursuant to this order, they were distributed among the public baths; where, for the space of six months, they served to supply the fires of those places, of which there was an incredible number in Alexandria.

This city, as we have already observed, soon became extremely populous; and was embellished both by its own princes, and the Romans; but, like most other noted cities of antiquity, hath been the seat of terrible massacres. About 141 years before Christ, it was almost totally depopulated by Ptolemy Physcon. That barbarous monster, without the least provocation, gave free liberty to his guards to plunder his metropolis, and murder the inhabitants at their pleasure. The cruelties practised on this occasion cannot be expressed; and the few who escaped, were so terrified, that they fled into other countries. Upon this, Physcon, that he might not reign over empty houses, invited thither strangers from the neighbouring countries; by whom the city was re-peopled, and soon recovered its former splendor. On this occasion many learned men having been obliged to fly, proved the means of reviving learning in Greece, Asia Minor, the islands of the Archipelago, and other places, where it was almost totally lost.

The new inhabitants were not treated with much more kindness by Physcon than the old ones had been; for, on their complaining of his tyrannical behaviour, he resolved on a general massacre of the young men. Accordingly, when they were one day assembled in the gymnasium, or place of their public exercises, he ordered it to be set on fire; so that they all perished, either in the flames, or by the swords of his mercenaries, whom the tyrant had placed at all the avenues.

Though Julius Cæsar was obliged to carry on a war for some time against this city, it seems not to have suffered much damage, except the burning of the library already mentioned. Before Cæsar left Alexandria, in acknowledgment of the assistance he had received from the Jews, he confirmed all their privileges there, and even engraved his decree on a pillar of brass. This, however, did not prevent the massacre of 50,000 of them in this city about the year of Christ 67.

The city of Alexandria seems to have fallen into decay soon after this, and to have forfeited many of its ancient privileges, though for what offence is not known; but when Adrian visited Egypt, about the year 141, it was almost totally ruined. He repaired both the public and private buildings, not only restoring the inhabitants to their ancient privileges, but heaping new favours upon them; for which they returned him their solemn thanks, and conferred upon him what honours they could while he was present; but as soon as he was gone, they published the most bitter and virulent lampoons against him.

The fickle and satirical humour of the Alexandrians was highly disliked by Adrian, though he inflicted no punishment upon them for it; but when they lampooned Caracalla, he did not let them escape so easily. That tyrant, in the year 215, when he visited their city, having become the subject of their foolish satires,

ordered a general massacre by his numerous troops, who were dispersed all over the city. The inhuman orders being given, all were murdered, without distinction of age or sex; so that in one night's time the whole city floated in blood, and every house was filled with carcases. The monster, who occasioned this, had retired during the night to the temple of Serapis, to implore the protection of that deity; and, not yet fatiated with slaughter, commanded the massacre to be continued all the next day; so that very few of the inhabitants remained. As if even this had not been sufficient, he stripped the city of all its ancient privileges; suppressed the academy; ordered all strangers, who lived there, to depart; and that the few who remained might not have the satisfaction of seeing one another, he cut off all communication of one street with another, by walls built for that purpose, and guarded by troops left there.

Notwithstanding this terrible disaster, Alexandria soon recovered its former splendor, as Caracalla was murdered a short time after. It was long esteemed the first city in the world, next to Rome; and we may judge of its magnificence, and the multitude of people contained in it, from the account of Diodorus Siculus, who relates, that in his time, (44 years before Christ), Alexandria had on its rolls 300,000 freemen. Nor does it seem to have been at all inferior at the time it was taken by the Saracens; for the general above mentioned seems to have been astonished at its wealth and beauty, as appears by the following passage in his letter to the khalif, mentioned by Eutychius: "I shall not pretend to give a particular description of the city I have taken, nor send you an account of all the curious and valuable things contained in it. At present it will be sufficient to observe, that I have found in it 4000 palaces; 4000 baths; 40,000 Jews that pay tribute; 400 royal *Circi*, or places set apart for public diversions; and 12,000 gardeners, who supply the city with all kinds of herbs in great plenty."

At this time, according to the Arabian historians, Alexandria consisted of three cities, *viz.* *Menna*, or the port, which included Pharos, and the neighbouring parts; *Alexandria*, properly so called, where the modern Scanderia now stands; and *Nekita*, probably the Necropolis of Josephus and Strabo.

After the city was taken, Amri, the Saracen general, thought proper to pursue the Greeks who had fled farther up the country; and therefore marched out of Alexandria, leaving but a very slender garrison in the place. The Greeks, who had before fled on board their ships, being apprised of this, returned on a sudden, surprised the town, and put all the Arabs they found therein to the sword: but Amri, receiving advice of what had happened, suddenly returned, and drove them out of it with great slaughter; after which the Greeks were so intimidated, that he had nothing farther to fear from them.—A few years after, however, Amri being deprived of his government by the khalif Othman, the Egyptians were so much displeased with his dismissal, that they inclined to a revolt; and Constantine, the Greek emperor, having received intelligence of their disaffection, began to meditate the reduction of Alexandria. For this purpose, he sent one Manuel, an eunuch, and his general, with a powerful army, to retake that place; who, by the assistance of the Greeks in the city, who kept a secret correspondence

Alexandria.

dence with the imperial forces while at sea, and joined them as soon as they had made a descent, he effected, without any considerable effusion of Christian blood. The khalif, now perceiving his mistake, immediately restored Amri to his former dignity. This step was very agreeable to the natives; who having had experience of the military skill and bravery of this renowned general, and apprehending that they should be called to an account by the Greeks for their former perfidious conduct, had petitioned Othman to send him again into Egypt.—Upon Amri's arrival, therefore, at Alexandria, the Copts, or natives, with the traitor Al-Mokawkas (who had formerly betrayed to Amri the fortrefs of Mefr) at their head, not only joined him, but supplied him with all kinds of provisions, exciting him to attack the Greeks without delay. This he did; and, after a most obstinate dispute which lasted several days, drove them into the town, where, for some time, they defended themselves with great bravery, and repelled the utmost efforts of the besiegers. This so exasperated Amri, that he swore, "If God enabled him to conquer the Greeks, he would throw down the walls of the city, and make it as easy of access as a *baroud-house*, which lies open to every body." Nor did he fail to execute this menace; for having taken the town by storm, he quite dismantled it, entirely demolishing the walls and fortifications. The lives of the citizens, however, were spared, at least as far as lay in the general's power; but many of them were put to the sword by the soldiers on their first entrance. In one quarter, particularly, Amri found them butchering the Alexandrians with unrelenting barbarity; to which, however, by his reasonable interposition, he put a stop, and on that spot erected a mosque, which he called the *mosque of mercy*.

From this time Alexandria never recovered its former splendor. It continued under the dominion of the khalifs till the year 924, when it was taken by the Magrebians, two years after its great church had been destroyed by fire. This church was called by the Arabs *Al Kaifaria*, or *Cesarea*; and had formerly been a pagan temple, erected in honour of Saturn, by the famous queen Cleopatra.

The city was soon after abandoned by the Magrebians; but in 928 they again made themselves masters of it: their fleet being afterwards defeated by that belonging to the khalif, *Abul Kafem* the Magrebian general retired from Alexandria, leaving there only a garriſon of 300 men; of which *Thmael*, the khalif's admiral, being apprised, he in a few days appeared before the town, and carried off the remainder of the inhabitants to an island in the Nile called *Abukair*. This was done, to prevent Abul-Kâfem from meeting with any entertainment at Alexandria, in case he should think proper to return. According to Eutychius, above 200,000 of the miserable inhabitants perished this year.

What contributed to raise Alexandria to such a prodigious height of splendor as it enjoyed for a long time, was, its being the centre of commerce between the Eastern and Western parts of the world. It was with the view of becoming master of this lucrative trade, that Alexander built this city, after having extirpated the Tyrians, who formerly engrossed all the East-India traffic. Of the immense riches which that trade afforded, we may form an idea, from considering that the

Romans accounted it a point of policy to oppress the Egyptians, especially the Alexandrians; and after the defeat of Zenobia, there was a single merchant of Alexandria who undertook to raise and pay an army out of the profits of his trade. The Greek emperors draw prodigious tributes from Egypt, and yet the khalifs found their subjects in so good circumstances as to screw up their revenues to three hundred millions of crowns.

Though the revolutions which happened in the government of Egypt, after it fell into the hands of the Mahometans, frequently affected this city to a very great degree; yet still the excellence of its port, and the innumerable conveniences resulting from the East-India trade, to whomsoever were masters of Egypt, preserved Alexandria from total destruction, even when in the hands of the most barbarous nations. Thus, in the 13th century, when the barbarism introduced by the Goths, &c. began to wear off from the European nations, and they acquired a taste for the elegancies of life, the old mart of Alexandria began to revive; and the port, though far from recovering its former magnificence, grew once more famous by becoming the centre of commerce: but having fallen under the dominion of the Turks, and the passage round the Cape of Good Hope being discovered by the Portuguese in 1499, a fatal blow was given to the Alexandrian commerce, and the city has since fallen into decay.

At present, the city of Alexandria is reckoned to have about 14,000 or 15,000 inhabitants; a strange coluvies of different nations, as well as from various parts of the Turkish empire. They are in general given to thieving and cheating; and (like their predecessors,) seditious above all others, were they not kept in awe by the severity of their government. The British and French carry on a considerable commerce with them, and have each a consul residing here. Some Venetian ships also fail thither yearly, but with French colours, and under the protection of France. The subjects of those kingdoms which keep no consul here, are subjected to a tax by the Grand Signior: but the Jews have found out a method of indemnifying themselves for this disadvantage; namely, by selling their commodities cheaper than other foreigners can afford. They are also favoured by the farmers of the revenue; who know, that, if they do not pay some private regard to them, the Jews have it in their power to cause fewer merchandizes come into their port during the two years that their farm lasts.

The city is governed like others in the same kingdom*. It hath a small garriſon of soldiers, part of which are Janisaries and Assassins; who are very haughty and insolent, not only to strangers, but to the mercantile and industrious part of the people, though ever so considerable and useful. The government is so remiss in favour of these wretches, that Mr Norden informs us, one of them did not hesitate to kill a farmer of the customs, for refusing to take less of him than the duty imposed, and went off unpunished; it being a common salvo among them, that what is done cannot be undone.

The present condition of Alexandria is very deplorable, being now so far ruined, that the rubbish in many places overtops the houses. The famous tower of Pharos has long since been demolished; and a castle, called *Farillon*, built in its place. The causeway which joined

Alexandria.

* See Egypt.

Alexandria. the island to the continent is broken down, and its place supplied by a stone-bridge of several arches.

Some parts of the old walls of the city are yet standing. They are flanked with large towers, about 200 paces distant from each other, with small ones in the middle. Below are magnificent cafemates, which may serve for galleries to walk in. In the lower part of the towers is a large square hall, whose roof is supported by thick columns of Thebaic stone. Above this are several rooms, over which there are platforms more than 20 paces square.

The next piece of antiquity is the pillar of Pompey, said to be built by Julius Cæsar in commemoration of his victory at Pharsalia. It stands upon an eminence, about 200 paces from the city, and is placed upon a square pedestal about seven or eight feet high; and the pedestal stands upon a square base, one of whose sides is 20 feet. Sandys says, it is 36 palms round, and 86 in height, each palm consisting of nine inches. The shaft is a single stone, by some called Theban marble, by others granite. On the top is a very fine capital. It is hard to say what machines they had in former times to raise such a vast stone as this; for Thevnot, in his last visit, by measuring the shadow, found it to be 75 royal feet of Paris, which is equal to 80 English. A few paces from hence stood Cæsar's palace: but the remains are only a few porphyry pillars, and the front, which is almost entire, and looks very beautiful. The palace of Cleopatra was built upon the walls facing the port, having a gallery on the outside, supported by several fine columns. Not far from Cleopatra's palace are two obelisks: one of these is thrown down, and almost buried in the sand; and though the other stands upright, the pedestal is hid by the sand that surrounds it. They are of granite; and each of the four sides are covered with hieroglyphics. About 70 paces from Pompey's pillar, is the khalis, or the canal of the Nile, which was dug by the ancient Egyptians, to convey the water of the Nile to Alexandria, and fill the cisterns under the city. On the side of the khalis, are gardens full of orange and lemon trees, and the fields are full of caper and palm trees. On the top of a hill is a tower, on which a centinel is always placed, to give notice, by means of a flag, of the ships that are coming into the port. From this hill may be seen the sea, the whole extent of the city, and the parts round it.

On the fourth-west side of the city, at a mile's distance, there are catacombs cut out of a rock, to enter which persons must creep upon all four; but the roof is ten feet high: on each side are sepulchres, cut out of the rock, of which there are four rows one above another. The bones in these places were very hard and looked very fresh. Over-against this there is another, that runs a long way, but will not admit a man to stand upright. These were, doubtless, burying-places belonging to the city. The Romans called such places catacombs. Alexandria is about 50 leagues north of Cairo. E. Long. 31. 15. N. Lat. 31. 12.

ALEXANDRIA, a strong and considerable city of Italy, belonging to the duchy of Milan, with a good castle, built in 1178 in honour of Pope Alexander III. This pope made it a bishopric, with several privileges and exemptions. Prince Eugene of Savoy took this city in 1706, after three days siege. The French took it in

1745; but the king of Sardinia, to whom it belongs by the treaty of Utrecht, retook it in 1746. The fortifications of the town are trifling, but the citadel is considerable. It is 15 miles south-east of Casal, 35 north-by-west of Genoa, and 40 south-by-west of Milan. E. Long. 8. 40. N. Lat. 44. 53. The country about this town is called the *Alexandria*.

ALEXANDRIA, (an. geog.) a city of Arachosia, called also *Alexandropolis*, on the river Arachotus, (Stephanus, Isidorus Characenus.)—Another *Alexandria* in Gedrosia, built by Leonatus, by order of Alexander, (Pliny.)—A third *Alexandria* in Aria, situated at the lake Arias, (Ptolemy); but, according to Pliny, built by Alexander on the river Arius.—A fourth in the Bactriana, (Pliny.)—A fifth *Alexandria*, an inland town of Carmania, (Pliny, Ptolemy, Ammian.)—A sixth *Alexandria*, or *Alexandropolis*, in the Sogdiana, (Isidorus Characenus.)—A seventh in India, at the confluence of the Acesines and Indus, (Arrian.)—An eighth called also *Alexandretta* near the Sinus Ifficus, on the confines of Syria and Cilicia, now *Scanderoun**, the port-town to Aleppo.—A ninth *Alexandria* of Margiana, which being demolished by the barbarians, was rebuilt by Antiochus the son of Seleucus, and called *Antiochia* of Syria, (Pliny); watered by the river Margus, which is divided into several channels, for the purposes of watering the country, which was called *Zotale*. The city was seventy stadia in circuit, according to Pliny; who adds, that, after the defeat of Crassus, the captives were conveyed to this place by Orodes, the king of the Parthians.—A tenth, of the Oxiana, built on the Oxus by Alexander, on the confines of Bactria, (Pliny.)—An eleventh, built by Alexander at the foot of mount Paropamisus, which was called *Caucasus*, (Pliny, Arrian.)—A twelfth *Alexandria* in Troas, called also *Troas* and *Antigonis*, (Pliny.)—A thirteenth, on the Ixartæ, the boundary of Alexander's victories towards Scythia, and the last that he built on that side.

ALEXANDRIAN, in a particular sense, is applied to all those who professed or taught the sciences in the school of Alexandria. In this sense, Clemens is denominated *Alexandrinus*, though born at Athens. The same may be said of Apion, who was born at Oasis; and Arostarchus, by birth a Samothracian. The chief Alexandrian philosophers were, Ammonius, Plotinus, Origen, Porphyry, Jamblicus, Sopater, Maximus, and Dexippus.

ALEXANDRIAN is more particularly understood of a college of priests, consecrated to the service of Alexander Severus after his deification. Lampridius relates, that, notwithstanding Severus was killed by Maximin, the senate prosecuted his apotheosis; and, for regularity of worship, founded an order of priests, or *sodales*, under the denomination of *Alexandrini*.

ALEXANDRIAN, or *Alexandrin*, in poetry, a kind of verse consisting of twelve, or of twelve and thirteen syllables alternately; so called from a poem on the life of Alexander, written in this kind of verse by some French poet. Alexandrines are peculiar to modern poetry, and seem well adapted to epic poems. They are sometimes used by most nations of Europe; but chiefly by the French, whose tragedies are generally composed of Alexandrines.

ALEXICACUS, something that preserves the body

Alexandria,
Alexandrian.

* See *Alexandretta*.

Alexicacus
||
Alfred.

dy from harm or mischief. The word amounts to much the same as *alexiterial*.

ALEXICACUS, in antiquity, was an attribute of Neptune, whom the tunny-fishers used to invoke under this appellation, that their nets might be preserved from the *xi-xac*, or sword-fish, which used to tear them; and that he might prevent the affliction, which it was pretended the dolphins used to give the tunnies on this occasion.

ALEXIPHARMICS, in medicine, are properly remedies for expelling or preventing the ill effects of poison: but some of the moderns having imagined that the animal spirits, in acute distempers, were affected by a malignant poison, the term has been understood to mean medicines adapted to expel this poison by the cutaneous pores, in the form of sweat. In this sense, alexipharmics are the same as fudorifics.

ALEXITERIAL, among physicians, a term of much the same import with *alexipharmic*; though sometimes used in a synonymous sense with amulet.

ALEYN (Charles), an English poet in the reign of Charles I. In 1631, he published two poems on the famous victories of Creci and Poitiers. He succeeded his father as clerk of the ordnance, and was commissary-general of the artillery to the king at the battle of Edgehill. The next piece he wrote was a poem in honour of Henry VII. and the victory that gained him the crown of England. In 1639, the year before he died, he translated the history of Eurialus and Lucretia, from the Latin epistles of *Æneas Sylvius*.

ALFAQUES, among the Moors, the name generally used for their clergy, or those who teach the Mahometan religion; in opposition to the Morabites, who answer to monks among Christians.

ALFATERNA, (anc. geog.) the last town of Campania, beyond Vesuvius, (Diodorus); the same with *Nuceria*, which see. The inhabitants *Alfaterni*, (Pliny.)

ALFET, in our old customs, denotes a caldron full of boiling water, wherein an accused person, by way of trial or purgation, plunged his arm up to the elbow.

ALFORD, a town in Lincolnshire, with a market on Tuesdays for provisions and corn; and two fairs, on Whit-Tuesday, and November 8. for cattle and sheep. It is seated on a small brook that runs through the town, and is a compact place. It is six miles from the sea, and 20 N. of Boston. E. Lon. \circ 15. N. Lat. 53. 30.

ALFRED, or *ÆLFRED*, the Great, king of England, was the fifth and youngest son of *Æthelwolf* king of the West Saxons, and was born at Wantage in Berkshire in 849. He distinguished himself, during the reign of his brother *Ethelred*, in several engagements against the Danes; and upon his death succeeded to the crown, in the year 871, and the 22^d of his age. At his ascending the throne he found himself involved in a dangerous war with the Danes, and placed in such circumstances of distress as called for the greatest valour, resolution, and all the other vir-

Alfred.

tues with which he was adorned. The Danes had already penetrated into the heart of his kingdom; and before he had been a month upon the throne, he was obliged to take the field against those formidable enemies. After many battles gained on both sides, he was at length reduced to the greatest distress, and was entirely abandoned by his subjects. In this situation, Alfred, conceiving himself no longer a king, laid aside all marks of royalty, and took shelter in the house of one who kept his cattle. He retired afterwards to the Isle of *Æthelney* in Somersetshire, where he built a fort for the security of himself, his family, and the few faithful servants who repaired thither to him. When he had been about a year in this retreat, having been informed that some of his subjects had routed a great army of the Danes, killed their chiefs, and taken their magical standard (A), he issued his letters, giving notice where he was, and inviting his nobility to come and consult with him. Before they came to a final determination, Alfred, putting on the habit of a hermit, went into the enemy's camp, where, without suspicion, he was every where admitted, and had the honour to play before their princes. Having thereby acquired an exact knowledge of their situation, he returned in great secrecy to his nobility, whom he ordered to their respective homes, there to draw together each man as great a force as he could; and upon a day appointed there was to be a general rendezvous at the great wood, called *Schusod*, in Wiltshire. This affair was transacted so secretly and expeditiously, that, in a little time, the king, at the head of an army, approached the Danes, before they had the least intelligence of his design. Alfred, taking advantage of the surprise and terror they were in, fell upon them, and totally defeated them at *Æthendune*, now Eddington. Those who escaped fled to a neighbouring castle, where they were soon besieged, and obliged to surrender at discretion. Alfred granted them better terms than they could expect: he agreed to give up the whole kingdom of the East-Angles to such as would embrace the Christian religion, on condition they should oblige the rest of their countrymen to quit the island, and, as much as it was in their power, prevent the landing of any more foreigners. For the performance thereof he took hostages; and when, in pursuance of the treaty, Guthrum, the Danish captain, came, with thirty of his chief officers, to be baptized, Alfred answered for him at the font, and gave him the name of *Ethelstan*; and certain laws were drawn up betwixt the king and Guthrum for the regulation and government of the Danes settled in England. In 884, a fresh number of Danes landed in Kent, and laid siege to Rochester; but the king coming to the relief of that city, they were obliged to abandon their design. Alfred had now great success; which was chiefly owing to his fleet, an advantage of his own creating. Having secured the sea-coasts, he fortified the rest of the kingdom with castles and walled towns; and he besieged and recovered from

the

(A) " This (says Sir John Spelman) was a banner with the image of a raven magically wrought by the three sisters of Hingur and Hubba, on purpose for their expedition, in revenge of their father Lodebroch's murder, made, they say, almost in an instant, being by them at once begun and finished in a noontide, and believed by the Danes to have carried great fatality with it, for which it was highly esteemed by them. It is pretended, that being carried in battle, towards good success it would always seem to clap its wings, and make as if it would fly; but towards the approach of mishap, it would hang down and not move." *Life of Alfred*, p. 61.

the Danes the city of London, which he resolved to repair, and keep as a frontier (b).

After some years respite, Alfred was again called into the field: for a body of Danes, being worsted in the west of France, came with a fleet of 250 sail on the coast of Kent; and having landed, fixed themselves at Appletree: shortly after, another fleet of 80 vessels coming up the Thames, the men landed, and built a fort at Middleton. Before Alfred marched against the enemy, he obliged the Danes, settled in Northumberland and Essex, to give him hostages for their good behaviour. He then moved towards the invaders, and pitched his camp between their armies, to prevent their junction. A great body, however, moved off to Essex; and crossing the river, came to Farnham in Surrey, where they were defeated by the king's forces. Mean while the Danes settled in Northumberland, in breach of treaty, and notwithstanding the hostages given, equipped two fleets; and, after plundering the northern and southern coasts, sailed to Exeter, and besieged it. The king, as soon as he received intelligence, marched against them; but before he reached Exeter, they had got possession of it. He kept them, however, blocked up on all sides; and reduced them at last to such extremities, that they were obliged to eat their horses, and were even ready to devour each other. Being at length rendered desperate, they made a general sally on the besiegers; but were defeated, though with great loss on the king's side. The remainder of this body of Danes fled into Essex, to the fort they had built there, and to their ships. Before Alfred had time to recruit himself, another Danish leader, whose name was Laf, came with a great army out of Northumberland, and destroyed all before him, marching on to the city of Werheal in the west, which is supposed to be Chester, where they remained the rest of that year. The year following they invaded North-Wales; and after having plundered and destroyed every thing, they divided, one body returning to Northumberland, another into the territories of the East-Angles; from whence they proceeded to Essex, and took possession of a small island called *Merefig*. Here they did not long remain: for having parted, some sailed up the river Thames, and others up the Lea-road; where drawing up their ships, they built a fort not far from London, which proved a great check upon the citizens, who went in a body and attacked it, but were repulsed with great loss: at harvest-time the king himself was obliged to encamp with a body of troops in the neighbourhood of the city, in order to cover the reapers from the excursions of the Danes. As he was one day riding by the side of the river Lea, after some observation, he began to think that the Danish ships might be laid quite dry: this he attempted, and succeeded; so that the Danes de-

serted their fort and ships, and marched away to the banks of the Severn, where they built a fort, and wintered at a place called *Quatbrig* (c). Such of the Danish ships as could be got off, the Londoners carried into their own road; the rest they burnt and destroyed.

Alfred enjoyed a profound peace during the three last years of his reign, which he chiefly employed in establishing and regulating his government, for the security of himself and his successors, as well as the ease and benefit of his subjects in general. After a troublesome reign of 28 years, he died on the 28th of October A. D. 900; and was buried at Winchester, in Hyde-abbey, under a monument of porphyry.

All our historians agree in distinguishing him as one of the most valiant, wisest, and best of kings that ever reigned in England; and it is also generally allowed, that he not only digested several particular laws still in being, but that he laid the first foundation of our present happy constitution. There is great reason to believe that we are indebted to this prince for trials by juries; and the doomsday-book, which is preserved in the exchequer, is thought to be no more than another edition of Alfred's book of Winchester, which contained a survey of the kingdom. It is said also, that he was the first who divided the kingdom into shires: what is ascribed to him is not a bare division of the country, but the settling a new form of judicature; for after having divided his dominions into shires, he subdivided each shire into three parts, called *tythings*. There are some remains of this ancient division in the ridings of Yorkshire, the laths of Kent, and the three parts of Lincolnshire. Each *tything* was divided into hundreds or wapentakes; and these again into *tythings*, or dwellings of ten householders: each of these householders stood engaged to the king, as a pledge for the good behaviour of his family, and all the ten were mutually pledges for each other; so that if any one of the *tything* was suspected of an offence, if the head borough or chiefs of the *tything* would not be security for him, he was imprisoned; and if he made his escape, the *tything* and hundred were fined to the king. Each shire was under the government of an earl, under whom was the reeve, his deputy; since, from his office, called *shire-reeve*, or *sheriff*. And so effectual were these regulations, that it is said he caused bracelets of gold to be hung up in the highways, as a challenge to robbers; and they remained untouched.

In private life, Alfred was the most amiable man in his dominions; of so equal a temper, that he never suffered either sadness or unbecoming gaiety to enter his mind; but appeared always of a calm, yet cheerful disposition, familiar to his friends, just even to his enemies, kind and tender to all. He was a remarkable economist of his time, and Asserius has given us an account

(b) The Danes had possessed themselves of London in the time of his father; and had held it till now as a convenient place for them to land at, and fortify themselves in; neither was it taken from them but by a close siege. However, when it came into the king's hands, it was in a miserable condition, scarce habitable, and all its fortifications ruined. The king, moved by the importance of the place, and the desire of strengthening his frontier against the Danes, restored it to its ancient splendor. And observing, that, through the confusion of the times, many, both Saxons and Danes, lived in a loose disorderly manner, without owing any government, he offered them now a comfortable establishment, if they would submit and become his subjects. This proposition was better received than he expected; for multitudes growing weary of a vagabond kind of life, joyfully accepted such an offer. *Chron. Sax.* p. 88.

(c) The king's contrivance is thought to have produced the meadow between Hertford and Bow; for at Hertford was the Danish fort, and from thence they made frequent excursions on the inhabitants of London. Authors are not agreed as to the method the king pursued in laying dry the Danish ships: Dugdale supposes that he did it by straitening the channel; but Henry of Huntingdon alleges, that he cut several canals, which exhausted its water.

Alfred.

account of the method he took for dividing and keeping an account of it: he caused fix wax-candles to be made, each of 12 inches long, and of as many ounces weight; on the candles the inches were regularly marked, and having found that one of them burnt just four hours, he committed them to the care of the keepers of his chapel, who from time to time gave him notice how the hours went: but as in windy weather the candles were wasted by the impresson of the air on the flame, to remedy this inconvenience, he invented lanterns, there being then no glass in his dominions.

This prince, we are told, was 12 years of age before a master could be procured in the western kingdom to teach him the alphabet; such was the state of learning when Alfred began to reign. He had felt the misery of ignorance; and determined even to rival his contemporary Charlemagne in the encouragement of literature. He is supposed to have appointed persons to read lectures at Oxford, and is thence considered as the founder of that university. By other proper establishments, and by a general encouragement to men of abilities, he did every thing in his power to diffuse knowledge throughout his dominions. Nor was this end promoted more by his countenance and encouragement, than by his own example and his writings. For notwithstanding the lateness of his initiation, he had acquired extraordinary erudition; and had he not been illustrious as a king, he would have been famous as an author.

His works are, 1. *Breviarum quoddam collectum ex Legibus Trojanorum*, lib. I. A Breviary collected out of the Laws of the Trojans, Greeks, Britons, Saxons, and Danes; in one book. Leland saw this book in the Saxon tongue, at Christ-church in Hampshire. 2. *Vest-Saxonum Leges*, lib. I. The laws of the West-Saxons, in one book. Pitts tells us, that it is in Bennet-College library, at Cambridge. 3. *Instituta quedam*, lib. I. Certain Institutes, in one book. This is mentioned by Pitts, and seems to be the second capitulation with Guthrum. 4. *Contra Judices iniquos*, lib. I. An Inveective against Unjust Judges, in one book. 5. *Acta Magistratum suorum*, lib. I. Acts of his Magistrates, in one book. This is supposed to be the book of judgments mentioned by Horne; and was, in all probability, a kind of reports, intended for the use of succeeding ages. 6. *Regum Fortuna varia*, lib. I. The various Fortunes of Kings, in one book. 7. *Dicta Sapientum*, lib. I. The Sayings of Wise Men, in one book. 8. *Parabolæ et Sæpe*, lib. I. Parables and

pleasant Sayings, in one book. 9. *Collectiones Chronicorum*. Collections of Chronicles. 10. *Epistole ad Wulfstigm Episcopum*, lib. I. Epistles to Bishop Wulfstigm, in one book. 11. *Manuale Meditationum*. A Manual of Meditations.—Besides these original works, he translated many authors from the Latin, &c. into the Saxon language, viz. 1. Bede's History of England, 2. Paulinus Orosius's History of the Pagans. 3. St Gregory's Pastoral, &c. The first of these, with his prefaces to the others, together with his laws, were printed at Cambridge, 1644. His laws are likewise inserted in Spelman's Councils. 4. *Boetius de Consolatione*, lib. V. Boetius's Consolations of Philosophy, in five books. Dr Plot tells us, king Alfred translated it at Woodstock, as he found in a MS. in the Cotton Library. 5. *Æsopi Fabule*. Æsop's Fables: which he is said to have translated from the Greek both into Latin and Saxon. 6. *Psalterium Davidicum*, lib. I. David's Psalter, in one book. This was the last work the king attempted, death surprizing him before he had finished it; it was however completed by another hand, and published at London in 1640, in quarto, by Sir John Spelman. Several others are mentioned by Malmibury; and the old History of Ely asserts, that he translated the Old and New Testaments.

The life of this great king was first written by Aferius Menevensis; and first published by Archbishop Parker, in the old Saxon character, at the end of his edition of Hasslingham's history, printed in 1674, fol.

ALGA, in botany, the trivial name of the lichen, fucus, and several other plants of the cryptogamia class.

ALGAGIOLA, a small sea-port town in the island of Corsica, fortified with walls and bastions. It was almost destroyed by the malcontents in 1731, but has since been repaired. E. Long. 9. 45. N. Lat. 42. 20.

ALGAROT, in chemistry, an Arabic term for an emetic powder, prepared from regulus of antimony, dissolved in acids, and separated by repeated lotions in warm water.

ALGARVA, a province in the kingdom of Portugal, 67 miles in length, and 20 in breadth; bounded on the W. and S. by the sea, on the E. by the river Guadiana, and on the N. by Alentejo. It is very fertile in figs, almonds, dates, olives, and excellent wines; besides, the fishery brings in large sums. The capital town is Pharo. It contains four cities, 12 towns, 67 parishes, and 61,000 inhabitants.

A L G E B R A,

Definition,
and etymology.

A GENERAL method of computation, wherein signs and symbols, commonly the letters of the alphabet, are made use of to represent numbers, or any other quantities.

This science, properly speaking, is no other than a kind of short-hand, or ready way of writing down a chain of mathematical reasoning on any subject whatever; so that it is applicable to arithmetic, geometry, astronomy, mensuration of all kinds of solids, &c. and the great advantages derived from it appear manifestly to arise from the conciseness and perspicuity with which every proposition on mathematical subjects can be wrote down in algebraic characters, greatly superior to the

tedious circumlocutions which would be necessary were the reasoning to be written in words at length.

With regard to the etymology of the word *algebra*, it is much contested by the critics. Menage derives it from the Arabic *aljabharat*, which signifies the restitution of any thing broken; supposing that the principal part of algebra is the consideration of broken numbers. Others rather borrow it from the Spanish, *algebrista*, a person who replaces dislocated bones; adding, that algebra has nothing to do with fraction. Some, with M. d'Herbelot, are of opinion, that algebra takes its name from Gebar, a celebrated philosopher, chemist, and mathematician, whom the Arabs call

Alfred.
Algarva.

History.

call Giaber, and who is supposed to have been the inventor. Others from *gefr*, a kind of parchment made of the skin of a camel, whereon Ali and Giafer Sadek wrote, in mystic characters, the fate of Mahometanism, and the grand events that were to happen, till the end of the world. But others, with more probability, derive it from *geber*; a word whence, by prefixing the article *al*, we have formed *algebra*; which is pure Arabic, and properly signifies the reduction of fractions to a whole number. However, the Arabs, it is to be observed, never use the word *algebra* alone, to express what we mean by it; but always add to it the word *macabalah*, which signifies opposition and comparison: thus *algebra-almacabalah*, is what we properly call *algebra*.

Some authors define algebra, The art of solving mathematical problems; but this is rather the idea of analysis, or the analytic art. The Arabs call it, *The art of restitution and comparison*; or, *The art of resolution and equation*. Lucas de Burgo, the first European who wrote of algebra, calls it, *Regula rei et census*; that is, the rule of the root and its square; the root with them being called *res*, and the square *census*. Others call it *Specious Arithmetic*; and some, *Universal Arithmetic*.

HISTORY.

It is highly probable that the Indians or Arabians first invented this noble art: for it may be reasonably supposed, that the ancient Greeks were ignorant of it; because Pappus, in his mathematical collections, where he enumerates their analysis, makes no mention of any thing like it; and, besides, speaks of a local problem, begun by Euclid, and continued by Apollonius, which none of them could fully resolve; which doubtless they might easily have done, had they known any thing of algebra.

Diaphantus was the first Greek writer of algebra, who published thirteen books about the year 800, tho' only six of them were translated into Latin, by Xylander, in 1575; and afterwards, viz. anno 1621, in Greek and Latin, by M. Bachet and Fermat, with additions of their own. This algebra of Diaphantus's only extends to the solution of arithmetical indeterminate problems.

Before this translation of Diaphantus came out, Lucas Pacciolus, or Lucas de Burgo, a Minorite friar, published at Venice, in the year 1494, an Italian treatise of algebra. This author makes mention of Leonardus Pisanus, and some others, of whom he had learned the art; but we have none of their writings. He adds, that algebra came originally from the Arabs, and never mentions Diaphantus; which makes it probable, that that author was not then known in Europe. His algebra goes no farther than simple and quadratic equations.

After Pacciolus, appeared Stifelius, a good author; but neither did he advance any farther.

After him, came Scipio Ferreus, Cardan, Tartaglia, and some others, who reached as far as the solution of some cubic equations. Bombelli followed these, and went a little farther. At last came Nunnus, Ramus, Schoner, Salignac, Clavius, &c. who all of them took different courses, but none of them went beyond quadratics.

In 1500, Vieta introduced what he called his *Specious Arithmetic*, which consists in denoting the quantities, Vol. I.

both known and unknown, by symbols or letters. He also introduced an ingenious method of extracting the roots of equations, by approximations; since greatly improved and facilitated by Raphson, Halley, Simpson, and others.

Vieta was followed by Oughtred, who, in his *Clavis Mathematica*, printed in 1631, improved Vieta's method, and invented several compendious characters, to shew the sums, differences, rectangles, squares, cubes, &c.

Harriot, another Englishman, cotemporary with Oughtred, left several treatises at his death; and among the rest, an *Analysis*, or *Algebra*, which was printed in 1631, where Vieta's method is brought into a still more commodious form, and is much esteemed to this day.

In 1657, Des Cartes published his geometry, wherein he made use of the literal calculus and the algebraic rules of Harriot; and as Oughtred in his *Clavis*, and Marin. Ghetaldus in his books of mathematical composition and resolution published in 1630, applied Vieta's arithmetic to elementary geometry, and gave the construction of simple and quadratic equations; so Des Cartes applied Harriot's method to the higher geometry, explaining the nature of curves by equations, and adding the constructions of cubic, biquadratic, and other higher equations.

Des Cartes's rule for constructing cubic and biquadratic equations, was farther improved by Thomas Baker, in his *Clavis Geometrica Catholica*, published in 1684; and the foundation of such constructions, with the application of algebra to the quadratures of curves, questions of *maximi et minimi*, the centrobary method of Guldinus, &c. was given by R. Slusius, in 1668; as also by Fermat in his *Opera Mathematica*, Roberval in his *Mém. de Mathem. et de Physique*, and Barrow in his *Leit. Geomet.* In 1708, algebra was applied to the laws of chance and gaming, by R. de Montmort; and since by de Moivre and James Bernouilli.

The elements of the art were compiled and published by Kersey, in 1671; wherein the specious arithmetic, and the nature of equations, are largely explained, and illustrated by a variety of examples: the whole substance of Diaphantus is here delivered, and many things added concerning mathematical composition and resolution from Ghetaldus. The like has been since done by Prefect in 1694, and by Ozanam in 1703: but these authors omit the application of algebra to geometry; which defect is supplied by Guisnee in a French treatise expressly on the subject published in 1704, and l'Hospital in his analytical treatise of the conic sections in 1707. The rules of algebra are also compendiously delivered by Sir Isaac Newton, in his *Arithmetica Universalis*, first published in 1707, which abounds in select examples, and contains several rules and methods invented by the author.

Algebra has also been applied to the consideration and calculus of infinites; from whence a new and extensive branch of knowledge has arisen, called the *Docrine of Fluxions*, or *Analysis of Infinites*, or the *Calculus Differentialis*.

SECT. I. Elementary Rules.

In algebra, a letter of the alphabet may stand for any quantity whatever; whether length, breadth, thickness, &c.

Elementary Rules.

Notation.

Elementary
Rules.

Elementary
Rules.

ness, solidity, &c. but when once a letter is appropriated to one particular kind of quantity, it cannot stand for any other, in that demonstration, or piece of reasoning. Thus, though the letter a may represent any quantity of water, earth, &c. yet if it is once appropriated to any of these, water, for instance, it cannot likewise represent earth; as this would produce confusion. Each species of quantity, therefore, must be represented by a different letter.—As all quantities, concerning which we speak, must be either known or unknown; and both these are frequently represented by letters in algebraic operations; it will be proper to use the first letters of the alphabet, a, b, c , &c. to represent one kind of quantities; and the last letters, x, y, z , to represent the others; that there may be as little danger of mistake as possible.

Positive and
negative
quantities.

Besides this obvious division of quantity, into known and unknown; algebraists consider quantities as positive or negative, simple or compound, roots or powers, rational or irrational.—Positive quantities are such as, by their preference, always denote an increase, or addition of something which was not there before; and therefore they have always *plus*, the sign of addition, prefixed to them: but as quantity is generally spoken of in a positive sense, the sign is omitted before a single letter, or before the first term of any series of quantities expressed by letters. Thus, if a simply is wrote down, $+a$ is supposed to be meant; in like manner, in the series $a+b+c$, &c. the first term or letter is always supposed to be positive. Negative quantities are intended to express the difference between one positive quantity and another. By themselves they cannot have any existence, as they would be less than nothing, which is absurd. These quantities have always the sign of subtraction, *minus*, prefixed to them; whether they stand first or last. If a single letter is marked with the sign of subtraction, it is always supposed to have a respect to some other quantity which is not expressed. Thus, a by itself represents a positive quantity of any kind; $-a$ does not by itself represent any thing, but only the difference between the former a , or $+a$, and some other quantity which at that time is not expressed; but if another quantity, expressed by b , is wrote down before it, as $b-a$, this denotes the difference between b and a . The same thing would be denoted though the order of the terms were inverted; $b-a$ is the same with $-a+b$: but in writing the terms of an algebraic series, positive quantities ought to precede negative ones; and those which have like signs, whether $+$ or $-$, ought always to be placed together.

Addition &
subtraction.

By attending to this distinction between positive and negative quantities, addition and subtraction of algebraic characters will be very easy. Every letter in algebra is supposed to represent something real, and the letter is only put for it; because it is easier expressed than the name of the thing itself. Thus, suppose a to represent a gallon of water; if I want to add another gallon, or another a , to the first one, the sum is two gallons; or, in algebraic short-hand, $2a$. In like manner, if we want to add another a , the sum will be $3a$. But if we want to add one species of quantity to another, as a pound of earth to a gallon of water, we must take one letter for the one species, and another for the other. Thus, let a represent the earth, and b the water; when these two are added together, the sum is nei-

ther two pounds of earth, nor two gallons of water: the sum of their literal representatives, therefore, can neither be $2a$, nor $2b$; but $a+b$. Here it will be observed, that, where quantities of the same kind, expressed by the same letter, are added together, some arithmetical figures must be prefixed to the algebraic ones; and these numbers, called *coefficients*, or *uncies*, are to be managed exactly in the same way, as in common arithmetic. Thus $a+a$ is $2a$, and $2a+3a$ is $5a$: a added to b can only be represented by $a+b$; in like manner, $7a$ added to $5b$ will neither make $12a$, nor $12b$; therefore, the sum of these two can only be represented by $7a+5b$. When quantities occur which have contrary signs, there is a necessity for subtracting the one from the other, in order to come at the true sum. Thus if a man has £10 of stock in hand, and £5 of debt; in order to come at his real worth, we must subtract the debt from the goods. If the £10 of goods is represented by $10a$, and the £5 of debt by $5a$; it is as plain, that the sum must be only $10a-5a$, or $5a$. If dissimilar letters occur, having contrary signs, they must be wrote down with the signs prefixed that are proper to each. Thus, the sum of $2a$, $3a$, and $-7b$, is $2a+3a-7b$, or $5a-7b$; of $2a$, $5a$, $6b$, and $-7b$, is $2a+5a+6b-7b$, or $7a-b$, &c.

Subtraction of algebraic characters confills only in changing the sign of the quantity to be subtracted, and then following the above rules for addition. Thus, if I am to take $2a$ from $5a$, I change the sign of the $2a$, and write it thus, $5a-2a$; adding these, I find the sum to be $3a$, as already mentioned. If the letters are dissimilar, they must be wrote down with the sign of subtraction — between them: as, if I subtract b from a , the remainder will be $a-b$; but if I take $-b$ from a , I must change its sign to $+$, and then the remainder is $a+b$. The reason is evident, from the former example. If a man has £10 in goods, and owes £5; if I want to take away his debt, I must add to his stock, or prevent the debt from affecting it, which is the same thing. If I represent the goods by a , and the debt by b , the true state of his affairs will be represented by $a-b$. If I want to take away $-b$ from this, I must change its sign to $+$; and then the $+b$ and $-b$ destroy one another: so that the remainder, after taking away the debt, is a , or £10; which is agreeable to truth.

Quantities are considered by algebraists as simple or compound. The simple quantities are such as are represented by single letters, as a, b, c , &c. Compound quantities arise only from the addition or subtraction of dissimilar simple ones: thus, $a+b$, $b+c$, and all others connected by the signs $+$ or $-$, are called *compound quantities*. By multiplication of simple quantities, compound ones are not produced: for letters are multiplied into one another by writing them down in connection, without any sign, or with \times , the sign of multiplication, between them; as $a \times b$, or ab , denotes the product of a multiplied into b . In algebra, the signs prefixed to the quantities, are objects of multiplication, as well as the letters or coefficients of the letters themselves: thus, $+$ multiplied into $+$, always gives $+$ for the product; and $-$ multiplied into $-$ gives the same; but $+$ into $+$, or $+$ into $-$, give $-$ for the product.

That $+$ multiplied into $+$ should give $+$, or that $+$ into $-$ should give $-$ for the product, will readily be comprehended: but why $-$ multiplied into $-$ should give $+$, is not so easily understood. Different methods have

Simple or
compound
quantities.

Multiplication.

Elementary Rules.
6
Why $-x$ gives $+$ for the product.

have been used to illustrate the reason of this; but all of them seem involved in some degree of obscurity, from which we hope the following will be altogether free.

We have already observed, that no quantity is in itself negative, but only as it stands in relation to another. Positive and negative quantities, therefore, arise only from addition and subtraction, but not from multiplication. Four inches in measure are a positive quantity in themselves, and are positive or negative in algebraic writing according as they are added to or taken away from any thing. Negative quantities, therefore, are capable of being added or subtracted, but not of being multiplied, as negatives. Suppose one merchant owes £100, another £50, and a third buys the stock, and becomes liable for the debts of both. His capital will then be negatively affected by both debts; and if we call it a , the debt of the first merchant b , and of the second c , his real worth will be expressed by $a-b-c$, and may be found by subtracting the sum of the debts from his stock; but it is impossible to multiply the two debts together in any manner of way, so as to affect him by the product of the numbers; the reason is, because we change the relation by multiplying them. In like manner, if we cut four inches from a ruler, these with respect to the whole ruler will be -4 ; but if we multiply the -4 , or the part cut off, by itself, we produce $+16$ square inches, which have not, nor can have, any relation to the ruler itself, but will become positive or negative with regard to another quantity, just as we please to add or subtract them. The case is different when a negative quantity is multiplied by a positive one; because then the relation is not changed. Thus, in the former example, if we cut off four inches from a ruler, the quantity cut off is -4 ; if we multiply this -4 by $+2$, or, which is the same thing, want to add other four inches to those already cut off, we must take them from the ruler, and thus the product will be -8 .

In multiplication of algebraic characters, there is not the least difficulty. The signs are multiplied as we have already mentioned; the coefficients, as in common arithmetic; and the letters, by writing them down without any sign between them: thus, $2a$ multiplied into $3b$, produces $6ab$, or $6ba$; for the order of the letters is of no consequence. If the multiplier and multiplicand are both compound quantities, each term of the first must be multiplied into all those of the second, and all the products added together: thus, if $a-b$ is to be multiplied by $a-b$, I first multiply by a , which produces $aa-ab$; I then multiply by $-b$, and the produce is $-ab+bb$; and, adding these two products together, we have $aa-2ab+bb$ for the total produce.

Division being the converse of multiplication, what has been said concerning the latter, will also serve to make the former easily understood. When the same letters are contained in the divisor and dividend, these division may properly take place: thus, if I am required to divide abc by a , the quotient will be bc ; because bc multiplied into a , produces abc the dividend. If I am to divide it by b , the quotient will be ac ; because ac multiplied by b , produces abc . With regard to the signs, they are to be managed so, that the sign of the divisor multiplied into that of the quotient may produce the sign of the dividend; and it must always be carefully observed to change the sign of that quantity which is subtracted from the dividend, whether the subtraction

Elementary Rules.

can properly take place or not. The coefficients, or pure numbers, are to be divided exactly as in common arithmetic. Suppose now it is required to divide $aa-2ab+bb$ by $a-b$, I begin with considering what sign multiplied into that of the divisor will give that of the dividend for a product: as they are both positive quantities, this must be $+$. I next consider what letter multiplied into the first term of the divisor will give the first term of the dividend for a product. This I find to be a ; for $a \times a$ gives aa for the product. I then multiply this first term of the quotient into both terms of the divisor; and behaved to do so, though there were three, four, or more terms in it. The product is $aa-ab$. Subtracting this product from the dividend, there remains $-ab+bb$ for a new dividend. I must now again consider what sign multiplied into that of the first term of the divisor will give the sign of the first term of the dividend; which I here find to be $-$. By again considering what letter multiplied into the first term of the divisor will give the first term of the dividend for a product, I find it to be b ; which multiplied into both terms of the divisor, produces $-ab+bb$; which, subtracted from the new dividend, leaves no remainder.

If the letters are totally different, or the first term of the divisor cannot be found in the dividend, these division cannot take place; the quantities must in this case be wrote down with $+$ the sign of division between them, or placed the one over the other like fractions, as $a+b$, $\frac{a}{b}$, $\frac{bd+cf}{e^2}$, &c. but as long as the first term of the divisor will divide the first term of the dividend, the operation may be continued; and sometimes the quotient will run out an infinite series of terms, as in the following example:

$$\begin{array}{r} 1+x) 1(1-x+xx-xxx, \&c. \\ \underline{1+x} \\ -x \\ \underline{-x+xx} \\ +xx \\ \underline{+xx+xxx} \\ -xxx \\ \underline{-xxx-xxxx} \\ +xxxx, \&c. \end{array}$$

If a quantity is multiplied into itself any number of times, the products are said to be the powers of that quantity, which is called the root, with respect to them. The powers are distinguished by the names of square; cube, or third power; biquadrate, or fourth power; sursolid, or fifth power; cube squared, or sixth power, &c. and are thus wrote: a^2 , or simply a , the radical quantity; a^2 , or a squared, or multiplied into itself; a^3 , a cubed, or the square of a multiplied by a ; a^4 , signifying the square of a multiplied by itself, &c. The multiplying a quantity by itself any number of times is called involving that quantity to a certain height, the sign of which is ϕ ; and if the root of an involved quantity is required, the operation by which it is found is called evolution, and is expressed by the sign ω .

Involution of a simple quantity is performed merely by writing it down with a figure above; as a^2 , a^3 , a^4 , &c. expressing the height of the power to which it is involved.

8
Roots and Powers what
9
Involution and evolution.

7
Division.

involved. These figures are named the *indices*, or exponents of the powers. Involution of compound quantities is performed by continual multiplication; but any root, consisting of only two terms, such as $a+b$, or $a-b$, (the first of which is called a *binomial*, and the second a *residual* root) may be involved to any height, by the following rule.

The power must always consist of one term more than is expressed by its index: that is, if it is required to raise $a+b$ to the square, the power will consist of three terms; if to the cube, of 4 terms; to the biquadrate, of 5; to the surfold, of 6, &c. The first and last terms are both pure powers, without any coefficients, the one of the first and the other of the last term of the root, the indices of both which express the height of the power. Thus, if I am to involve $a+b$ to the sixth power, the first term must be a^6 , and the last b^6 . In the intermediate terms the index of a decreases, and that of b gradually increases, till it attains the same height that a had at first. The letters of the 6th power of $a+b$, therefore, without their coefficients, will stand thus:

$$a^6 + 6a^5b + 15a^4b^2 + 20a^3b^3 + 15a^2b^4 + 6ab^5 + b^6.$$

To find the coefficients, multiply the index of any term into its coefficient, and divide by the number of terms; the quotient is the coefficient of the term immediately following. In the first term, the coefficient, though not expressed, is supposed to be 1. This multiplied by 6 the index, and divided by the number of terms 1, quotes 6 for the coefficient of the second term, which therefore is $6a^5b$: multiplying then the index 5, by this coefficient 6, and dividing by 2, the number of terms, I have 15 for the coefficient of the third, and the term is $15a^4b^2$. Proceeding in this manner, I find the power required, to be

$$a^6 + 6a^5b + 15a^4b^2 + 20a^3b^3 + 15a^2b^4 + 6ab^5 + b^6.$$

The residual root, $a-b$, is involved by the very same rules; only the signs, instead of being constantly +, are + and - alternately; and thus the 6th power of $a-b$ will be

$$a^6 - 6a^5b + 15a^4b^2 - 20a^3b^3 + 15a^2b^4 - 6ab^5 + b^6.$$

If the root consists of three or more terms, no rule can be formed by which the quantity can be so easily involved to the required height, as continual multiplication; because there are such a number of terms, and the letters are so intermingled with one another, that it would be difficult to remember the numerous directions necessary in such a case: nor do such tedious multiplications often occur; but where they do, it is proper to range the product according to the number of times that a certain letter is repeated in every term, which is called the ranging it according to the *dimensions* of that letter. Thus, suppose I am to raise $a+b+c$ to the cube: by multiplying it twice, I find the product to be $a^2+3ab^2+3a^2c+6abc+3ab^2+3ac^2+3b^2c+b^2+c^2$

This long line is exceedingly confused, and difficult to be comprehended at one view; but by ranging it according to the dimensions of any of its letters, is much more plain and intelligible: according to the dimensions of the letter a , it stands thus:

$$\begin{array}{r} a^3+3b^2a+3c^2a \\ +3ac^2+3b^2a+3b^2c \\ +3ac^2+3b^2c+b^2+c^2 \end{array}$$

As Evolution, or the extraction of roots, is proper-

ly the solution of a certain kind of equations, it will be more properly treated of, after the nature of equations in general, and the methods of solving the more simple ones, are considered.

In algebra, as in common arithmetic, fractions arise from the division of quantities that are incommensurable to one another, or those of which the lesser will not divide the greater without a remainder; but as the rules for adding, subtracting, multiplying, &c. of algebraic fractions are exactly the same with those for performing the same operations on arithmetical ones, only making allowance for the difference between adding, subtracting, &c. letters, instead of figures, we refer to the article ARITHMETIC.

Hitherto we have only considered such quantities as ^{to} surds, or must be supposed always to have a positive or real existence, and consequently can be expressed by a certain symbol; but, besides these, there are other imaginary quantities, the existence of which it is often necessary to suppose, though in fact they have not, nor cannot have, an existence. Thus, if I am required to find a number which, multiplied into itself, will produce 16; it is easily found, and such a number may be expressed by a : but if I am required to find one, which, multiplied by itself, will produce 15, it cannot be found by any art, and consequently cannot be expressed by a letter. Quantities of this kind are denominated, by algebraists, *surds*, or *irrational* ones; and have the sign $\sqrt{\quad}$ prefixed to them, which denotes their imaginary existence. This sign denotes the extraction of a root; and the different kinds of roots desired, are expressed by figures set over it. Thus, $\sqrt[3]{\quad}$, or simply $\sqrt[3]{\quad}$, denotes that the square root is desired; $\sqrt[4]{\quad}$, the cube-root, &c. Sometimes this sign is prefixed to a number, or to an algebraic series which is capable of affording a true rational root; but it then only denotes that the root hath not been extracted, and consequently exists as yet only in idea. The prefixing this sign to any letter makes no other difference with regard to addition, subtraction, multiplication, or division, than causing the letter represent a different quantity than otherwise it would have done, and so must be added or subtracted by signs. Thus a added to a , makes $2a$; but a added to \sqrt{a} , is $a+\sqrt{a}$. Among themselves surds are as easily managed as other quantities: for $\sqrt{a}+\sqrt{a}$ is $2\sqrt{a}$, and $\sqrt{a}-\sqrt{a}$ is 0; $\sqrt{a}+\sqrt{3a}-2\sqrt{a}$, is $2\sqrt{a}$; $\sqrt{a} \times 2b$, is $2b\sqrt{a}$; $8\sqrt{a}+2\sqrt{a}$, is $4\sqrt{a}$; $10\sqrt{a}+5\sqrt{a}$, is $2\sqrt{a}$, &c.—In the multiplying surds by themselves, or involving them, we need sometimes only throw away the radical sign: thus $\sqrt{a} \times \sqrt{a}$ is a ; but $\sqrt{a} \times \sqrt{a^3}$ is $a\sqrt{a}$; $\sqrt{a} \times \sqrt{a^5}$ is a^3 , &c. When the root of any compound quantity is sought, it multiplies, besides the radical sign, have a line drawn over it, to denote that it is only to be reckoned a simple quantity; thus $\sqrt{ab+cd}$, &c. In cases where irrational quantities of this kind occur, it will be proper to put some letter, as x , y , z , or any other not already used, for the surd, and let that symbol remain till the last step of the operation, when the true value may be substituted in its place.

Surds, like fractions, may be reduced to their least terms; or two unlike surd quantities may be reduced to two having the same denomination. To reduce a surd quantity to its lowest terms, a certain rational root must be found in it, multiplied by a surd; the root must be extracted according to the rules hereafter given.

Equations.

ven for evolution, and prefixed to the other quantity with the radical sign. Thus, though no number multiplied into itself will produce 8, yet such an imaginary quantity may be expreffed otherwife than by $\sqrt{8}$; for 8 contains the number 4, which is a perfect square, and produced by multiplying 2 into itself. $\sqrt{8}$ therefore is reduced to $\sqrt{4 \times 2}$: but one of these is a perfect square; and therefore $\sqrt{4 \times 2}$ is $2\sqrt{2}$, which is the surd in its lowest terms. In like manner, $\sqrt{28}$ is $\sqrt{4 \times 7}$ or, $2\sqrt{7}$; $\sqrt{18}$ is $\sqrt{9 \times 2}$, or $3\sqrt{2}$. The same rule holds in algebraic quantities. $\sqrt{4a^2b}$ is $\sqrt{4a^2} \times \sqrt{b}$, or $2a\sqrt{b}$; $\sqrt{4a^2b^2}$ is $\sqrt{4a^2} \times \sqrt{b^2}$; which being both complete squares, the surd is reduced to $2a\sqrt{b}$, or $2ab$.

This method of reducing surds is often very convenient for bringing them into less compass, so as to facilitate their addition or subtraction. Thus $\sqrt{18} + \sqrt{32}$, being reduced to their least terms, become $3\sqrt{2} + 4\sqrt{2}$, or $7\sqrt{2}$; and $\sqrt{8a^2} + \sqrt{50a^2} = \sqrt{72a^2}$, is reduced to $2a\sqrt{2} + 5a\sqrt{2} = 6a\sqrt{2}$, or $6a\sqrt{2}$; $\sqrt{12a^2x} + \sqrt{75a^2x}$, becomes $2a\sqrt{3x} + 5a\sqrt{3x}$, or $7a\sqrt{3x}$, &c.

11
Reduction
of surds.

Surds are reduced to the same denomination, by involving them to a proper height; but in order to understand this the more readily, it is proper to take notice, that in any series of powers, as $a, a^2, a^3, a^4, a^5, a^6$, &c. the addition of the indices is equivalent to the involution of the power, and the subtraction of the indices is equivalent to the division of the powers by one another. Thus, by subtracting the index 4 from 7 in the powers a^4 and a^7 , there remains a^3 ; which is the quotient of a^7 divided by a^4 ; as is evident from dividing $aaaaaa$ by $aaaa$. In like manner, the division of the indices answers to the extraction of the root: thus, to divide the index of a^6 by 2, is the same thing as to extract its square root; to divide it by 3, is the same thing as to extract its cube root; the quotients being a^3 and a^2 , answering to the powers aaa and aa . This division cannot go farther in rational quantities, than that of 2 the index of the square by itself. The quotient is 1, which is the index of $\sqrt{a^2}$, being a^1 , or simply a . The square or cube root of a , then, must be expreffed by a division of its index 1, by 2 or 3,

and may be wrote $a^{\frac{1}{2}}$, $a^{\frac{1}{3}}$, as well as \sqrt{a} and $\sqrt[3]{a}$. When surds are to be reduced to the same denomination, it will be most proper to write them with these fractional indices; the fractions have then only to be reduced to a common denominator, according to the rules of arithmetic: and thus, $a^{\frac{1}{2}}$ and $a^{\frac{1}{3}}$ will become $a^{\frac{2}{6}}$ and $a^{\frac{1}{6}}$. This reduction is convenient when surds are to be multiplied or divided by one another. For example; suppose I was to multiply the two above-mentioned surds into one another, no more is necessary than to add the two indices together, after having reduced them to a common denominator, and the product is $a^{\frac{3}{6}}$; which intimates, that the product of \sqrt{a} into $\sqrt[3]{a}$ is equivalent to $\sqrt[6]{a^3}$; $\sqrt{2}$ and $\sqrt[3]{3}$ will become $2^{\frac{2}{6}}$ and $3^{\frac{1}{6}}$, or $\sqrt[6]{2^2}$ and $\sqrt[6]{3}$, which is $\sqrt[6]{8}$ and $\sqrt[6]{9}$; multiplied together, they become $\sqrt[6]{72}$, &c.

SECT. II. EQUATIONS, or the application of the foregoing general rules to the solution of various kinds of problems.

THE word equation implies no more than simply the

making one thing equal to another, or asserting it to be so, if the assertion is really true; and, in fact, it is by this very simple operation that the most abstruse and difficult algebraic problems are resolved. The method of noting down equations, or making the affirmation of equality, is by writing down the two quantities, with $=$, the sign of equality, between them; and the quantities are then called the two different sides of the equation. Thus, $a+b=c$; that is, the sum of a and b is equal to the third quantity c , where $a+b$ are one side of the equation, and c is the other: $4+5=6=3$. Here, $4+5=6$ are one side, and 3 is the other side, of the equation.

It is needless to observe, that no problem can be resolved by making false equations, or affirming a thing to be equal to what it is not: but tho' this will never be done intentionally, it is very often done by mistake; and to prevent mistakes of this kind, it will be always necessary to keep in view the following self-evident axioms.

Equations.

13
Axioms.

1. If equal quantities are added to equal quantities, the sums will be equal. Thus, if a bottle contains a gallon of water, and a cask contains another gallon; if a third gallon is poured into the bottle, and a fourth one into the cask, there will be equal quantities of water in the bottle and the cask.

2. If equal quantities are subtracted from, multiplied into, or divided by, equal quantities; the remainders, products, or quotients, will be equal.

In conformity to these axioms, it is plain, that an algebraist may do what he pleases with his equations, provided he does the same thing with both sides of them: thus, if $a=4$, I may then say $2a=8$, $7a=28$, $a-4=4-4=0$; or $a+2=2$, $a+4=1$, $a+8=0,5$, &c. where every one of these equations is as true as the first; because what is done to one side of the equation is likewise done to the other: but if I either add, subtract, multiply, or divide, one side, without doing so to the other, I evidently affirm a falsehood; for if $a=4$, then it is plain that if I multiply one side by 2, and only add 2 to the other, I make $2a=6$, or say that twice four is six.

As there is no science whatever wherein people are more liable to mistake, and to perplex themselves, than algebraic operations, it will be very proper for young algebraists to number the steps of their operation, and on the left-hand margin to mark what is done in each step, that a more full and distinct view of the whole may be at once obtained, and any mistake more easily corrected, as in the following example.

$$\begin{array}{rcl} 1 \times 2 & 1 & a=6 \\ 2 & 2 & 2a=12 \\ 2+b & 3 & 2a+b=12+b \\ 2+1 & 4 & \frac{2a}{a} = \frac{12}{6} \\ 2 \div 1 & 5 & 4a^2=144, \&c. \end{array}$$

Here the figures on the margin denote what is done with each preceding step, or equation: 1×2 denotes that the first equation is multiplied, not by the second equation, but by the number 2; which, for this reason, has a line drawn over it: $2+b$ signifies, that b is added to both sides of the second equation: $2+1$ signifies, that both sides of the second equation are divided by both sides of the first: $2 \div 1$, that both sides of the second equation are involved to the second power or square

12
Meaning of
the term
equation.

Equations. square, &c.

In all equations there are some quantities supposed to be known, and others unknown: the design of the equation is to discover the value of the unknown quantities; in order to which they must be compared with those quantities which are known; for if the equation consists only of unknown quantities, it is impossible to know any thing about them.

14
Reduction
of equations

The end proposed in every equation is to place the unknown quantities all by themselves on one side of the equation, and the known ones by themselves on the other: when this is done, the equation is said to be *reduced*, and the operation is at an end.

15
By transpo-
sition.

Equations may be reduced, (1.) By addition and subtraction; or, as it is commonly called, by *transposition*. This is performed by adding to, or subtracting from, both sides of the equation, a quantity with which it is encumbered, and which tends to obscure the true meaning. Thus, $x+6=7$; here the unknown quantity x is combined, by addition, with 6 a known one; which I want to get clear of, that I may know the precise value of x . For this purpose I make an equation of $6=6$, which I subtract from the former, and the work stands thus.

$$\begin{array}{r|l} 1 & x+6=7 \\ 2 & 6=6 \\ \hline 1-2 & 3 \quad x=7-6=1 \end{array}$$

Here I find the true value of x , because it stands alone upon one side, and a known quantity stands alone on the other. It is evident also, that if, instead of writing down the equation $6=6$, I only change the sign of the known quantity, and carry it over to the other side of the equation with the sign so changed, the event will be the same; for, if $x+6=7$, then undoubtedly $x=7-6$, or $6=7-x$. It is a rule, therefore, in algebra, That whatever quantity is carried over from one side of an equation to another, must have its sign changed, whether it was + or -, and whether the quantity be known or unknown; it will then produce the effects of a positive or negative quantity, among those to which it is carried, according as the sign is changed from - to +, or from + to -. Suppose the following equation given,

$$\begin{array}{r|l} 1 & 3x+5=2x+6 \\ 1-2x & 2 \quad x+5=6 \\ 2-\frac{5}{3} & 3 \quad x=1 \end{array}$$

The reason of this operation is obvious: for carrying over $2x$ with its sign changed, it meets with $3x$, which it destroys as far as it can; the remainder is then only x , which being still combined with 5, makes the transposition again necessary, as in the former example.

16
By division.

(2.) When the unknown quantity is combined with any known one by multiplication, it is necessary to divide both sides of the equation by that quantity into which the unknown one is multiplied. Thus, suppose $4x=20$, I cannot make x stand alone upon one side of the equation, unless I divide $4x$ by 4; the quotient is x ; and dividing the other side also by 4, we have $x=5$. In like manner, if $4x-2=8$, then, by transposition, $4x=8+2=10$, and, by division, $x=\frac{10}{4}=2.5$, &c.

17
By multipli-
cation,

(3.) If the unknown quantity is divided by any known one, both sides of the equation must be multiplied by that quantity which divides the unknown one,

in order to take away the fraction, without which Equations.

the equation could not be conveniently reduced. With regard to fractional quantities, according to the rules of arithmetic, it is the same thing to multiply a fraction by its denominator, and merely to throw away that denominator; hence, if one side of an equation is divided by any quantity, and not another, it will be sufficient to multiply by the dividing quantity that side of the equation which is not affected by it. This is equally evident with any of the former methods of

reduction; for if $\frac{x}{2}=4$, then it is plain, that $x=8$, and

so of others. If several fractional quantities occur in one, or both sides of the equation, the same operation must be repeated with every one of them, as

$$\frac{x}{2} + \frac{x}{3} + \frac{x}{4} = 6; \text{ then } x + \frac{2x}{3} + \frac{2x}{4} = 12; \text{ and } 3x + 2x, \text{ or}$$

$$5x + 6x = 36, \text{ and } 20x + 6x = 144; \text{ whence, by division,}$$

$$x = 144 \div 26 = 5.5385, \text{ nearly.}$$

(4.) Reduction by involution takes place when the unknown quantity is under the radical sign. In this case, in order to come at its value, both sides of the equation must be involved to the power expressed by the index of the surd quantity, as $\sqrt{x}=4$: then, $x=16$, by involving both sides of the equation to the square; if $\sqrt[3]{x}=3$, then $x=27$, &c.

These are all the methods of reduction that are applicable to simple equations, or those where the unknown quantity is not multiplied by itself; in which case, very different methods are to be used, which shall be explained under quadratic, cubic, &c. equations: we must now take notice of the preliminary steps necessary to be taken in order to the solution of an algebraic problem.

The first thing to be done is to state the question, as it is called; or to write down in algebraic characters what is before expressed in the words at length. This will be most easily understood by the following example.

It is required to find a number, which being multiplied by 5, and 8 subtracted from the product, the remainder shall be 52.—As the thing here sought is only one number, I put x , or any letter at pleasure, for it: then, as the question intimates that the number sought is multiplied by 5, and 8 subtracted from the product, I do the same with the letter taken to represent it; and find the remainder to be $5x-8$: this therefore, by the question, being equal to 52, I write it down in algebraic characters, thus, $5x-8=52$. By transposition $5x=52+8=60$; and by division, $x=60 \div 5=12$, the number sought.

When only one thing is sought, generally the solution of algebraic problems is not difficult; but when two or more things are required to be discovered, the difficulty becomes proportionably greater. It is necessary, however, that where there are two or more unknown quantities, there should be data sufficient to find them all out; because questions proposed without sufficient data, cannot be resolved but in an indeterminate manner. Thus, if it be required to find two numbers x and y , with this single condition, that their sum shall be 100; it is evident, that the question is capable of 99 different answers, each of which shall fulfil

18
Method of
stating or
writing down an al-
gebraic prob-
lem.

Equations. fil the condition required; for x may be 1, and y 99; or x may be 2, and y 98, &c. but if to the foregoing condition I add another, namely, that the difference of the two numbers required is 50, the question is then properly limited, and capable only of one direct answer. If a third condition is required, suppose, that their product should be 740; this condition is either superfluous, because the values of x and y may be found without it; or absurd, as being inconsistent with the rest. It is therefore a general rule in algebra, That where there are two unknown quantities, the problem must be laid down in such a manner as to admit of two equations being formed from it, which shall neither be inconsistent with, nor consequences of, one another; for if this last is the case, it is the same thing as tho' only one equation were given: for instance, if am required to find two numbers whose sum is 100, and double their sum 200, this last equation is only the first one doubled; and consequently the question is still as unlimited as before.

19 **Extermination of unknown quantities.** For the solution of problems where two or more quantities are concerned, there is one general rule which will certainly hold in all cases, namely, to find a value of each of the unknown quantities from each of the equations, treating the other unknown quantity exactly as a known one. By this means we have two sides of a new equation, where only one unknown quantity is concerned, the other being exterminated, as it is called, by the preceding operation; and it is evident, that if the equations are consistent with one another, the value of the unknown quantity found by one equation, will be precisely equal to that found by the other. We shall illustrate this by the preceding example, which, being stated, will be $x+y=100$, and $x-y=50$. By transposing the first equation, we have $x=100-y$; and by transposing the second, $x=50+y$; it is plain, that x , though an unknown quantity, must always be equal to itself; and therefore the values of it obtained from both these equations will be equal to one another; of these therefore I form the new equation $100-y=50+y$: by transposition, we have first $100=50+2y$, and then $50=2y$; whence, by division, $25=y$, and $100-y$, or $100-25=75=x$.

The same method is to be followed when there are three, or four unknown quantities; but the operation will then be much more tedious; because, having formed a new equation in which one quantity is exterminated, we must still continue to form new ones in order to exterminate the others, as in the following example.

It is required to find three numbers whose sum is 130; if the third is multiplied by 3, and that product is subtracted from the sum of the first and second, the remainder will be 10; if the first is multiplied by 2, the second by 3, these two products are added together, and 15 subtracted from the sum, the remainder will be 7 times the third number.

Having put x, y, z , for the three numbers, the question resolves itself into the following equations.

$$\begin{cases} 1 & x+y+z=130 \\ 2 & x+y-3z=10 \\ 3 & 2x+3y-15z=7z \end{cases}$$

By transposing the first equation, we have $x=130-y-z$; by transposing the second, $x=10+3z-y$; on transposing the third, and dividing by 3z, we have $x=\frac{7z+15-3y}{2}$. These three values of x must neces-

arily be equal to one another; I therefore form a new equation from the first and third; then $130-y-z=\frac{7z+15-3y}{2}$. Reducing this equation by multiplication

and transposition, it becomes $y=9z-245$. To have another value of y , I form a new equation from the second and third values of x , or I might for the same purpose make an equation of the first and second values of x ; this will be $10+3z-y=\frac{7z+15-3y}{2}$. Reducing this equation in the same manner as before, we have $y=2z-5$. We must now form a third equation from the two values of y already found; and thus we will have $9z-245=2z-5$; from whence, by transposition and division, we have $z=30$.

In the same manner we might now proceed to find the values of the other unknown quantities; but it is evident, that though this method must infallibly answer, a great deal of needless trouble is occasioned by it in the present case; for, if, instead of finding the three values of x , I only find one from the first equation, and substitute that in place of the letter x in the second, the quantity y will be exterminated at once. The value of x from the first equation is $x=130-y-z$, the second equation is $x+y-3z=10$; writing therefore into this equation, $130-y-z$, in place of x , we have $130-y-z+y-3z=10$, where the positive and negative y destroy one another, and the equation becomes $130-4z=10$; whence, $4z=120$, and $z=30$. But it is plain, that the remarkable success of this substitution depends entirely upon the circumstance of a single y in the second equation; for had there been $2y$ there, the same advantage would not have been derived from following this method. There can therefore be no rules laid down for obtaining the solution of algebraic problems in the most easy manner possible; these must depend on the particular circumstances of each problem; and hence there is no science where the rational faculties and ingenuity are put to a greater stretch than in algebra, and no branch of education is more proper for producing a quickness of understanding, provided the algebraist does not lose himself in the depths of his science, in which case he will be quick-sighted only to algebra itself.

As so much difficulty is occasioned by a number of unknown quantities, it will seldom be proper to state a question with two unknown quantities, where one will answer the purpose, though sometimes the unknown quantities may be made to disappear surprisingly, by proper management. On some occasions, instead of chusing a single letter to represent an unknown quantity, it will be proper to express it by a sum, or a difference; as $x+y$, or $x-y$. As an example, we shall give three methods of solving the former problem, "Required to find two numbers whose sum is 100, and difference 50." With one unknown quantity, the question is stated in the following manner.

	1	x = the least number sought.
	2	$100-x$ = the greatest
1-2	3	$100-2x=50$ = their difference by question
3+2x	4	$100=50+2x$
4-50	5	$50=2x$
5÷2	6	$25=x$ = the least number sought
	7	$100-x=100-25=75$, the greatest number

With two unknown quantities this may be solved otherwise

Equations.

20 **Extermination by substitution.**

Equations. therwise than by forming a new equation, thus :

$$\begin{array}{rcl} 1 & x = \text{greatest number} \\ 2 & y = \text{least} \\ 3 & x+y=100 \\ 4 & x-y=50 \end{array} \left. \vphantom{\begin{array}{l} 1 \\ 2 \\ 3 \\ 4 \end{array}} \right\} \text{by question}$$

$$\begin{array}{rcl} 3+4 & 5 & 2x=150 \\ 5+2 & 6 & x=75 \\ 3-4 & 7 & 2y=50 \\ 7+2 & 8 & y=25 \end{array}$$

Representing one of the numbers by a sum, and the other by a difference, the work will stand thus :

$$\begin{array}{rcl} 1 & x+y = \text{greatest number} \\ 2 & x-y = \text{least} \\ 1+2 & 3 & 2x=100, \\ 1-2 & 4 & 2y=50 \end{array} \left. \vphantom{\begin{array}{l} 1 \\ 2 \\ 3 \\ 4 \end{array}} \right\} \text{by question}$$

$$\begin{array}{rcl} 3+2 & 5 & x=50 \\ 4+2 & 6 & y=25 \\ 7 & x+y=75 \\ 8 & x-y=25 \end{array}$$

Though this problem is so easily resolved by all the three methods, that it is difficult to say which has the advantage; yet it is sufficient to shew the prodigious diversity of operation that must occur in the solution of algebraic problems, according as we use different methods. The last method is exceedingly proper, where equations have to be multiplied into one another, which is the origin of quadratic, cubic, and other high equations, of which we are now to treat.

21
Quadratic
equations.

If an equation is multiplied into itself once, the produce is another equation, which is as strictly just as the former: but after having reduced it by all the methods proposed for the reducing simple equations, and having brought the unknown quantities to one side, and the known ones to the other, we are still at a loss; because the unknown quantity being multiplied into itself, we know not what relation it bears to the known one. Thus, if the equation $a=12$ is multiplied once into itself, the produce is $a^2=144$; where the unknown quantity cannot be discovered till we know what number multiplied into itself will produce 144. The above equation is one of that kind called *quadratic* equations; and, from its consisting only of the literal quantity multiplied into itself, is called a *simple* quadratic: but if we multiply the equation $a+3=15$ once into itself, the product is $a^2+6a+9=225$; and reducing this by transposition, we have $a^2+6a=216$, where the literal quantity is not only multiplied by itself, but by the number 6. This addition is called the *affectation* of an equation, and the last mentioned one is of that kind called *quadratic affected equations*.

It is not to be supposed that any person would produce equations of this kind by multiplying such simple ones as those above mentioned; but very often the circumstances of the question oblige him to state them in this manner, or they are unavoidably multiplied in the course of the operation. Thus, suppose it is required to find two numbers whose sum is 100, and product 1875; by the common method, we have $x+y=100$, and $xy=1875$. From the first equation $x=100-y$, and from the second $x=\frac{1875}{y}$, whence $100-y=\frac{1875}{y}$. Reducing this, we have $100y-y^2=1875$. We do not get clear of this difficulty by using only one unknown quantity; for putting x for the one, and $100-x$ for the o-

ther, we come at once to the equation $100x-x^2=1875$. Neither is it to be totally avoided by making $x+y=$ one of the numbers, and $x-y=$ the other; thus indeed, by the question, we have $2x=100$, and $x^2-y^2=1875$; whence, by substituting the value of x , we have $y^2=625$; so that, though the equation is now only a simple quadratic, we must still remain ignorant of the value of y , till we know what number multiplied into itself will produce 625. Here, however, we see the utility of sometimes representing unknown quantities by a sum and a difference.

We have already observed, that, when literal powers are to be divided by one another, the division is performed by subtracting their indices. The extraction of their roots, in like manner, is performed by dividing their indices by 2, 3, 4, &c. according as we want the square, cube, or biquadrate root; so, if required to find the square root of a^8 , I divide its index 8 by 2, the quotient a^4 is the root required. If the root of any series of terms is required, as of x^2+6x+9 , we must proceed to find it by supposing it to be $a+b$. This root we involve to the square, and then make the following equation $a^2+2ab+b^2=x^2+6x+9$. From this it is evident, that if a^2 corresponds with x^2 , $2ab$ must correspond with $6x$, and b^2 to 9: therefore, as x is the first term of the root, and corresponds with a , 6 the coefficient of x must correspond with $2b$ the coefficient of a . Dividing, therefore, the coefficient of x in the second term by 2, the quotient 3 is the second term of the root, and the square root of x^2+6x+9 is $x+3$. Hence we have an easy rule for completing an imperfect square, viz. to take half the coefficient of the unknown quantity, multiply it by itself, and add it to both sides of the equation, which will then be exact squares. Thus the affected quadratics are easily reduced to simple ones, as in the following example. Suppose, $x^2+14x=32$, then taking the half of 14 or 7, multiplying it by itself, and adding it to both sides of the equation, we have $x^2+14x+49=81$. From the foregoing example we are sure that the root of the literal part is $x+7$, and from the multiplication table we know that 9 multiplied into itself produces 81. Extracting the root on both sides, therefore, we have $x+7=9$; whence $x=2$.

As long as the root of the number sought does not exceed some of the 9 digits, there is no difficulty; but supposing it to consist of many places of figures, a tedious operation is required, which will be best understood by an example. Suppose the following equation is given; $x^2=2985984$, I take $x=a+b$; whence $x^2=a^2+2ab+b^2$, which consequently must be equal to the number given. The extraction of the root is now facilitated by the following consideration, that no digit multiplied into itself can produce more than two places of figures. To ascertain the number of places therefore in the root of the abovementioned number, I place a point over every third figure, beginning at the right hand, and the equation will stand thus:

$$a^2+2ab+b^2=2985984.$$

Hence I conclude, that the root required must consist of 4 places of figures, or be above 1000. I next consider what digit multiplied into itself will produce the nearest figure under 2, the first figure of the power. Had the point been placed over the second figure, I must

Equations. must have considered what digit multiplied into itself would have produced the nearest square under the first two figures. In the present case, I find it to be 1. I therefore suppose $a=1000$; multiply it by itself, and subtract it from the power, in the following manner:

$$\begin{array}{r} a^2+2ab+b^2=2985984 \quad (1000=a \\ a^2=1000000 \end{array}$$

$$2ab+b^2=1985984$$

It now appears, that if this remainder was divided by $2a+b$, the quotient must be b ; for $2a+b \times b=2ab+b^2$. But as b is still unknown, I must first proceed with $2a$, as in common division: but as it has something to be added, I must have regard to this in chusing the quotient figure; therefore, though in common division I might chuse 8 for the quotient, I only chuse 7, a being $=1000$, $2a=2000$; and to find the other term b , the work will stand thus:

$$\begin{array}{r} 2a=2000 \\ b=700 \\ 2a+b=2700 \end{array} \left. \begin{array}{l} 1985984 \quad (700=b \\ 1890000 \\ \hline 2ab+b^2 \end{array} \right\}$$

$$95984$$

To find the other figures of the root, I must now suppose $a=1700$; in which case, the former $a^2+2ab+b^2$ will now only be equivalent in value to a^2 , and $95984=2ab+b^2$. The operation is now to be repeated; a being 1700, $2a$ is 3400; which I set as a new divisor, and proceed as follows:

$$\begin{array}{r} 2a=3400 \\ b=20 \\ 2a+b=3420 \end{array} \left. \begin{array}{l} 95984 \quad (20=b \\ 68400 \\ \hline 2ab+b^2 \end{array} \right\}$$

$$27584$$

I now make a third supposition, of $a=1720$, and proceed as before; thus,

$$\begin{array}{r} 2a=3440 \\ b=8 \\ 2a+b=3448 \end{array} \left. \begin{array}{l} 27584 \quad (8=b \\ 27584 \\ \hline 2ab+b^2 \end{array} \right\}$$

$$0$$

Here there being no remainder, we find 1728 to be the true root of the number required; and if the above example is attended to, the reasons of the arithmetical rules given for extracting roots will be sufficiently understood. See ARITHMETIC.

Cubic equations. If the equations are multiplied into themselves twice, the produce is called a cubic equation; and, like the quadratic, is either simple, or affected: thus, $x^3=1728$ is a simple cubic; $x^3-10x^2+3x=997474$, $x^3+10x=104$, &c. are cubic affected equations.

The solution of simple cubic equations, or the method of extracting the cube root, will easily be understood by an example of the same kind with that by which we illustrated the extraction of the square root. If the cube root of any simple algebraic power is required, it is found by dividing the index of that power by 3, as already observed. If of any series, the root must be supposed $=a+b$, as before; then, this involved to the cube, or $a^3+3a^2b+3ab^2+b^3$, will be equal to the cube proposed. Let it be required to find the cuberoot of $x^3+18x^2+108x+216$. Here, taking $a+b$ the root required, and involving it to the cube, we have $a^3+3a^2b+3ab^2+b^3=x^3+18x^2+108x+216$. From inspection, it is evident, that if a^3 corresponds to x^3 , $3a^2b$ must cor-

respond to $18x^2$, and consequently that $b=18 \div 3=6$, the root of the cube required therefore must be $x+6$.

By attentively considering this, we may easily see how an algebraic cube can be completed. Let us suppose the equation $x^3+6x^2=32$ given, and it is required to complete the cube. Here it is plain that $b=2$, and consequently that the cube which wants the terms equivalent to $3ab^2$ and b^3 will be completed by adding them. As $b=2$, they are easily found to be $12x+8$; and adding these to both sides of the equation, we have $x^3+6x^2+12x+8=40+12x$. Both sides of this equation are complete cubes; but it is impossible to reduce an affected cubic equation by completing its cube, as we reduce a quadratic equation by completing its square: the reason is, because the square consists but of three terms; if it wants the third, that can always be made up from the known quantity with which the unknown one is multiplied in the second; if it wants both the second and the third, it is a complete square; but in a cube which consists of four terms, the unknown quantity enters into them all except the last; and therefore, if any other than the last is wanting, the unknown quantity must again be added to both sides of the equation, as in the last example. Some cases may indeed occur, as the following, where the cube can be advantageously completed. Suppose the following equation is given; $x^3+12x^2+48x=448$. As these terms are equivalent to $a^3+3a^2b+3ab^2$, and only want b^3 to make it complete, we need only take the third of the coefficient of the second term, and, involving it to the cube, add it to both sides of the equation, which will then be $x^3+12x^2+48x+64=512$. By extracting the root, we have $x+4=8$, and $x=4$. Instances of this kind, however, occur so rarely, that we should not have mentioned this had it not been to shew the reason why cubic equations cannot be solved on the same principles with quadratics.

If the cube root of a large number is to be extracted, the principles are the same with those on which the extraction of the square root depends, but the operation is more tedious. Let it be required to find the cube root of 5832. Taking $a+b$ the root required, as before: we have then $a^3+3a^2b+3ab^2+b^3=5832$. The number of places in the root must be determined by points, as in the extraction of the square root; but for the cube they must be placed at the interval of two figures from one another, because the cube of some of the digits extends to three places of figures. I then chuse the digit which produces the cube next less than that of the first one, two, or three figures of the resolvend, according as the point happens to fall, for the significant figure of a , annexing to it as many cyphers as there are places of figures in the root; then having cubed this and subtracted it, I take $3a^2$ for a divisor, multiplying it by b , and adding $3ab^2$, and b^3 , thus:

$$\begin{array}{r} a^3+3a^2b+3ab^2+b^3=5832 \quad (10=a \\ a^3=1000 \quad 8=b \\ \hline 3a^2=300 \quad 4832 \\ \hline 3a^2b=2400 \\ 3ab^2=1920 \\ b^3=512 \\ \hline 3a^2b+3ab^2+b^3=4832 \end{array}$$

G g

Here

Equations.

Here 18 is the root required; but had there been a remainder, a mult. have been taken =180, and the operation repeated. The finding of b is attended with much more difficulty in the cube than in the square, on account of the great additions to be made; and the higher the powers, the greater is this difficulty: but as it is evident that an algebraic theorem will be sufficient direction for the extraction of every root, however high the power may be involved, we shall take no farther notice of the evolution of simple powers; only that all powers whose indices are multiples of 2 and 3, may be evolved by repeated extractions of the square or cube roots: thus, if I want the biquadrate root of any power, it is obtained, by extracting the square twice; if the root of the sixth power, it may be had by extracting the square thrice, or the cube twice; of the 8th power, by extracting the square four times; of the 9th power, by extracting the cube root thrice, &c.; but the roots of the 5th, 7th, and 11th powers, can only be had by following an algebraic theorem constructed for purpose for themselves.

33
Different origins of high equations.

Hitherto we have considered cubic and other high equations as originating from a continued multiplication of one simple equation into itself; but their most common original is from the multiplication of three or more different equations into one another. Thus, if we multiply the equations $x+1=5$, $x-3=1$, $x+2=6$, into one another, the cubic equation $x^3-7x-6=30$, and by transposition $x^3-7x=36$, will be produced. Here it is observable, that this equation wants the second term, because some of the numbers combined with x are negative, and others positive, and the negative and positive ones are exactly equal to one another. Had the negative quantity been either greater or less than the two positive ones, all the three terms would have remained in the product; and hence, when we see a cubic equation without the second term, we may know that the positive and negative quantities combined with x in the simple equations, or roots, from which it is formed, have been exactly equal to one another.

Cubic equations in which the third term is wanting arise from the multiplication of a simple quadratic by $x=1$, $x=2$, $x=3$, &c. thus, $x^2 \times x-1=x^3-x^2$; $x^2 \times x+2=x^3+2x^2$, &c.

We have already observed, that the higher equations are produced by the terms of a question which secretly oblige us either to state it in equations already involved, or to involve them when we attempt their reduction. An example or two, we apprehend, will here be proper. Let it be required to find two numbers, of which, if the second is subtracted from 20, and the remainder divided by the unknown number, the quotient will be the first number; also, if the second is multiplied by itself, and the original number subtracted from the product, it will be 38 times the first.

$$\left. \begin{array}{l} 1 \ x = \text{the one number,} \\ 2 \ y = \text{the other,} \\ 3 \ \frac{20-y}{y} = x \\ 4 \ y^2 - y = 38x \\ 5 \ \frac{y^2 - y}{38} = x \end{array} \right\} \text{by question.}$$

$$\begin{array}{l} 5=3 \ 6 \ y^2 - y = 220 - y \\ \quad \quad \quad \frac{38}{y} \\ 7 \ y^2 - y = 8360 - 38y \\ \quad \quad \quad \frac{y}{y} \\ 7+y \ 8 \ y^2 - y = 8360 - 38y \\ 8+38y \ 9 \ y^2 - y^2 + 38y = 8360 \end{array}$$

By a little variation in the terms of this question, a cubic equation, in which the third term is wanting, may be produced. Suppose two numbers, x and y , are required, of which 200 divided by the second may equal the first; and the square of the second may be equal to 38 times the first + the second. Here,

$$\left. \begin{array}{l} 1 \ x = \frac{200}{y} \\ 2 \ y^2 = 38x + y \\ 3 \ y^2 - y = 38x \\ 3+38 \ 4 \ y^2 - y = x \\ \quad \quad \quad \frac{38}{y} \\ 1+5 \ 5 \ y^2 - y = \frac{200}{y} \\ \quad \quad \quad \frac{38}{y} \\ 5 \times y \ 6 \ y^2 - y^2 = 200 \\ \quad \quad \quad \frac{38}{y} \\ 7 \ y^2 - y^2 = 7600 \end{array} \right\} \text{by question.}$$

If the simple equations, or roots, of which a cubic or other high equation is composed, are of such a nature that one of them destroys itself and becomes =0, a new species of cubic will arise, which is capable of three different solutions, and consequently a kind of indeterminate problem. If the equation is a biquadratic, it will have four solutions of this kind, of the fifth power five, and so on, the number of solutions always being expressed by the index of the power. This does not hold, however, in any other kind of equations than those where one of the original ones destroys itself; as will appear from the following examples.

If we multiply the equations $x+1=5$, $x-1=4$, and $x-4=0$, into one another, we will produce the cubic equation, $x^3-4x^2-x+4=0$; or, by transposition, $x^3-4x^2-x=-4$. Here, x may either be +1, -1, or 4; for if either of these are substituted in place of x , it answers the terms of the question. If $x=1$, then $x^3=1$; $-4x^2=-4$, and $-x=-1$; and $x^3-4x^2-x=1-4-1=-4$. If $x=-1$, then $x^3=-1$; $-4x^2=-4$, and $-x=+1$, according to the rules of subtraction; consequently $x^3-4x^2-x=-1-4+1=-4$ as the equation imports. Lastly, if $x=4$, then $x^3=4x^2-x=64-64-4=-4$, as in the other cases. In like manner, in the equation $x^3-9x^2+26x=24$, the value of x may be either 2, 3, or 4; for if $x=2$, then $x^3-9x^2+26x=8-36+52=24$; if $x=3$, then $x^3-9x^2+26x=27-81+78=24$; and if $x=4$, then $x^3-9x^2+26x=64-144+104=24$; and so of others.

But, when cubics are formed from the multiplication of equations into one another, all of which have some positive value, it is evident, that then they can only have one true solution: and the reason is plain; because, when any of the equations destroys itself, it likewise destroys the value of all the rest, and the whole becomes =0; and were it not that algebra can represent imaginary beings as well as real ones, there could be nothing to work upon in such a case. In such equations, the absolute number which constitutes their value is obtained from the continual multiplication of the known quantities combined with x into one another; or the last term.

Equations.

$y+z$ to be $=x$: but it must be considered, that the product of two numbers is by no means determined by their sum; for by making one of the numbers a fraction and the other an integer, by making one of them positive, and the other negative, we may fix their product, or any number of times their product, at what we please, without affecting their sum in the least. But we must be careful, if we have once assumed a sum, not to assume a difference also; for that would determine the unknown quantities. Thus, having assumed $y+z=x$, we cannot assume $y-z$ any known quantity, because it might alter the value of y and z with regard to x ; but though we assume any imaginable product, we only alter the value of y and z with regard to one another, which is of no consequence.

From the above operation may be deduced a general rule for the solution of all cubics to which this method is applicable; which, as corrected by Mr Simon, may be expressed in the following words. "Multiply the whole value of the equation by itself; divide the product by four; to the quotient add the cube of the coefficient of x in the third term (the second being destroyed) divided by 27; extract the square root of this sum, to which add half the value of the equation, and extract the cube root of the whole. Divide, now, one third of the coefficient of x by the root just found; subtract the quotient from the divisor, and the remainder is the value of x ." For the better understanding this theorem, in the foregoing example, $x^3+7x=92$, let $a=7$, and $b=92$; then, the rule we have just now mentioned will stand thus in algebraic characters:

$$x = \frac{b}{4a} + \sqrt[3]{\frac{b^2}{4a^2} + \frac{b^3}{27a^3}}$$

29
Why it will not always succeed.

Though this theorem seems capable of resolving every kind of cubic equation, yet one unlucky circumstance destroys its utility in a great many cases. For instance; let the equation $x^3-12x=-9$ be proposed. Here, according to the theorem, I multiply -9 by itself, the product is $+81$; this, divided by 4 quotes, 20,25. I now divide the cube of -12 , or -1728 , by 27; and the quotient -64 added to $+20,25$, destroys it entirely, and leaves a remainder of $-44,25$. From this the square root ought to be extracted; but this is impossible, because it is a negative quantity, and is formed neither from the multiplication of a positive into itself, nor of a negative into itself, but of a positive into a negative. Here, therefore, the operation must stop; and it is easy from this example to see when Cardan's method will succeed, and when it will not.

30
Sir Isaac Newton's method of divisors.

Other methods have been invented of solving the higher equations; but all of them are excessively laborious, and even precarious. A very ingenious method was invented by Sir Isaac Newton from finding the divisors of the absolute number by which the value of the equation is expressed; each of these was to be substituted in place of the unknown quantity, till some of them was found to answer the terms of the question.

It is easily shown, indeed, that x must always be a divisor of this number, and thus equations may be solved which could not be solved by Cardan's method; of which the last-mentioned one $x^3-12x=-9$, is an instance: for here, the only divisors of -9 are, $+1$, -1 , $+3$, -3 , and $+9$, -9 ; and substituting these succes-

sively in place of x , 3 will be found to answer, and is the true value of x . Notwithstanding this advantage, however, when the number is large, it is excessively tedious to substitute all the divisors; and indeed, as we may easily know within a figure or two of the true value, perhaps we might succeed as well by random trials as any other way. The last term, and consequently the number of divisors, however, may be lessened by changing the equation into another, wherein a binomial or residual root is put for the unknown quantity; thus, in the equation $y^4-4y^3-8y+32=0$, if $x+1$ be substituted for y , it will become $x^4-16x^3-16x^2+21=0$.

Another very curious method is, instead of substituting all the divisors of the last term, to substitute successively the terms of the arithmetical progression 2, 0, -1 , -2 , &c. with the numbers thence resulting; then find all the divisors of each of these numbers, and write them down over against the number they divide. This being done, search for one or more arithmetical progressions, either ascending or descending, whose common difference is either unity, or some divisor of the index of the highest power of x ; that term of such progression which stands over against 0, if divided by the common difference, and substituted into the equation with the sign $+$ or $-$, according as the progression from whence it was taken was ascending or descending, will be one of the roots of the equation. If x has more values than one, there will be more arithmetical progressions. Sometimes indeed there will be deceptions by this method, and progressions will appear, which do not point out the true root; but these would fail if the substitution was continued two or three steps further: an example or two will sufficiently illustrate this.

Let the equation given be $x^3+x=68$. By transposition it becomes $x^3+x-68=0$. Here I first suppose $x=2$; which being substituted, produces -58 : then I suppose $x=1$, which produces 66; if $x=0$, then -68 is produced; with -1 , then -70 is produced; with -2 , 78 is produced; and so on. Having thus made the requisite substitutions, they are wrote down with the terms of the arithmetical progression from which they are produced, on one hand, and their divisors on the other, thus:

	Divisors	Progression ascending
2	-58	1. 2. 29. &c.
1	-66	1. 2. 3. 6. 11. &c.
0	-68	1. 2. 4. 17. &c.
-1	-70	1. 2. 5. 7. &c.
-2	-78	1. 2. 3. 6. 13. &c.
-3	-98	1. 2. 7. 14. &c.

Among these divisors only one progression is discovered; and the number 4, pointing over against 0, shews 4 to be the only true root of the equation.— Let now the equation $x^4+x^3-29x^2-9x+18=0$ be proposed, and the work will stand as follows.

	Divisors	Progressions
2	70	1. 2. 5. 7. 10. 14. 35. 70
1	144	1. 2. 3. 4. 6. 8. 9. 12, &c
0	180	1. 2. 3. 4. 5. 6. 9. 10, &c
-1	160	1. 2. 4. 5. 8. 10. 16. 20, &c
-2	90	1. 2. 3. 5. 6. 9. 10. 15, &c

In this example there are four progressions, two ascending, and two descending: which show the four roots of the equation to be $+3$, $+4$, -3 , and -5 . The reason

31
Another method by finding an arithmetical progression among the divisors.

32
Why this method succeeds.

Equations. reason of our success in this method is, that all the values of x must necessarily be divisors of the absolute number by which the value of the whole equation is expressed. When x is supposed $=0$, then that number stands alone; because it cannot be affected by any of the values of x . The true roots of the equation must therefore lie in that line of divisors opposite to 0. The progressions serve to point them out; because, as $+1$, $+2$, or -1 , -2 , are successively substituted in place of 0, there is a proportionable alteration in the value of the equation, and consequently in the divisors of the number by which it is expressed; and as long as the substitution is continued, using quantities that differ by one certain increase or decrease, the same progression must continue among the divisors.

A method of depressing biquadratic equations into cubic ones was invented by Des Cartes, which is published in Simpson's algebra, together with an improvement: but as the difficulty of solving cubic equations is very little inferior to that of solving biquadratics, we think it unnecessary to take farther notice of this, or any other method that is applicable to particular cases; and shall therefore explain the method of solving equations by approximation, or by the converging series; which, though sufficiently laborious, will certainly answer in all cases, and for every kind of equation.

General method by approximation. Let the proposed equation be $x^3 + 10x^2 + 50x = 2600$. Here it is plain, that x cannot much exceed 10: making trial of 11, therefore, I find it too much, so that the true value of x must lie between 10 and 11. The difference between 10 and the true root, I call e ,

which is an unknown quantity; and for the more easy finding its value, I put r for 10, and say $x=r+e$. Then,

$$\begin{array}{r|l} 1 & x^3=r^3+3r^2e+3re^2+e^3 \\ 2 & 10x^2=10r^2+20re+10e^2 \\ 3 & 50x=50r+50e \\ 1+2+3 & 4 \quad x^3+10x^2+50x=r^3+3r^2e+3re^2+e^3+10r^2+20re+10e^2+50r+50e \end{array}$$

Because e is of small value in comparison of r , and to avoid being involved in high equations, I reject all the powers of e above the first; and having thrown them out, the equation becomes x^3+10x^2+50x , or $2600=r^3+3r^2e+10r^2+20re+50e$; whence, by transposition, $2600-r^3-10r^2-50r=3r^2e+20re+50e$; and, by division, $\frac{2600-r^3-10r^2-50r}{3r^2+20r+50}=e$. As

the value of r is known, I substitute that value into this new equation; and having made the division, e is found to be 0,18 nearly. Having then assumed $r=10,18$, and substituted this value into the equation instead of 10, in order to find the value of e more exactly, it will come out $-0,0005347$; which added to 10,18, gives 10,1794653; and if this value is again substituted, we will have another value of e , which will determine the root still more exactly; and so on, to as many places of decimals as we please.

It is not necessary, in the solution of equations by this method, to take r always the nearest root less than just; the same purpose will be answered by taking it more than just, making $r=e-x$; and proceeding accordingly.

A L G

ALGEDO, the running of a gonorrhoea stopping suddenly after it appears. When it thus stops, a pain reaches to the anus, or to the testicles, without their being swelled; and sometimes this pain reaches to the bladder, in which case there is an urging to discharge the urine, which is with difficulty passed, and in very small quantities at a time. The pain is continued to the bladder by the urethra; to the anus, by the acceleratory muscles of the penis; and to the testicles, by the vasa deferentia, and vesiculae seminales. In this case, calomel repeated so as to purge, brings back the running, and then all difficulty from this symptom ceases.

ALGENEB, a fixed star, of the second magnitude, in Perseus's right side; its longitude is $27^\circ, 46', 12''$, of Taurus, and its latitude $30^\circ, 05', 28''$, north, according to Mr Flamsteed's catalogue.

ALGEZIRA, a town of Andalusia in Spain, with a port on the coast of the Straits of Gibraltar. By this city the Moors entered Spain in 713; and it was taken from them in 1344, after a very long siege, remarkable for being the first in which cannon were made use of. It was called *Oli Gibraltar*, and is about four leagues from the New. W. Long. 5. 2. N. Lat. $36^\circ, 0$.

ALGHIER, or ALGERI, a town in Sardinia, with a bishop's see, upon the western coast of the island, between Safferi and Bofa. Though it is not large, it is well peopled, and has a commodious port. The coral fished for on this coast is in the highest esteem of any in the Mediterranean. W. Long. 4. 2. Lat. $36^\circ, 0$.

A L G

ALGIABARII, a Mahometan sect of predestinarians, who attribute all the actions of men, good or evil, to the agency or influence of God. The Algjabarii stand opposed to the Alkadarii*. They hold absolute degrees and physical premotion. For the justice of God in punishing the evil he has caused, they resolve it wholly into his absolute dominion over the creatures.

ALGIERS, a kingdom of Africa, now one of the states of Barbary.—According to the latest and best computations, it extends 460 miles in length from east to west, and is very unequal in breadth; some places being scarce 40 miles broad, and others upwards of 100. It lies between Long. $0^\circ, 16'$ and $9^\circ, 16'$ W. and extends from Lat. $36^\circ, 55'$ to $44^\circ, 50'$ N.—It is bounded on the north, by the Mediterranean; on the east, by the river Zaine, the ancient Tufca, which divides it from Tunis; on the west, by the Mulvyra, and the mountains of Trava, which separate it from Morocco; and on the south by the Sahara, Zaara, or Numidian desert.

The climate of Algiers is in most places moderate, and that they enjoy a constant verdure; the leaves of the trees being neither parched up by heat in summer, nor nipped by the winter's cold. They begin to bud in February; in April, the fruit appears in its full bigness; and is commonly ripe in May. The soil, however, is excessively various; some places being very hot, dry, and barren, on which account they are generally suffered to lie uncultivated by the inhabitants, who are very negligent. These barren places, especially such as lie on the southern side, and are at a great distance from the

* See Alkadarii.

Climate and soil.

Algiers.

the sea, harbour vast numbers of wild creatures, as lions, tigers, buffaloes, wild boars, stags, porcupines, monkeys, ostriches, &c. On account of their barrenness, they have but few towns, and those thinly peopled; though some of them are so advantageously situated for trading with Bildulgerid and Negroland, as to drive a considerable traffic with them.

* See Mauritania.

The Algerine kingdom made formerly a considerable part of the Mauritania Tingitana², which was reduced to a Roman province by Julius Cæsar, and from him also called *Mauritania Cæsariensis*.—In our general account of Africa, we have related, that the Romans were driven out of that continent by the Vandals; these by Belisarius, the Greek emperor Justinian's general; and the Greeks in their turn by the Saracens. This last revolution happened about the middle of the seventh century; and the Arabs continued masters of the country, divided into a great number of petty kingdoms or states, under chiefs of their own choosing, till the year 1051. This year, one Abubeker-ben-Omar, or, as the Spanish authors call him, *Abu-Texefien*, an Arab of the Zinhagian tribe, being provoked at the tyranny of those despots, gathered, by the help of his marabouts or saints, a most powerful army of malcontents, in the southern provinces of Numidia and Libya. His followers were nicknamed *Marabites*, or *Morabites*; by the Spaniards, *Almoravides*; probably from their being assembled principally by the saints who were also called *Morabites*. The khalif of Kayem's forces were at this time taken up with quelling other revolts in Syria, Mesopotamia, &c. and the Arabs in Spain engaged in the most bloody wars; so that Texefien having nothing to fear from them, had all the success he could wish against the Arabian cheyks or petty tyrants, whom he defeated in many battles, and at last drove them not only out of Numidia and Libya, but out of all the western parts, reducing the whole province of Tingitania under his dominion.

Texefien was succeeded by his son Yusef, or Joseph, a brave and warlike prince. In the beginning of his reign, he laid the foundation of the city of Morocco, which he designed to make the capital of his empire. While that city was building, he sent some of his marabouts ambassadors to Tremecen, (now a province of Algiers,) at that time inhabited by a powerful and insolent sect of Mahometans called *Zenetti*. The design of this embassy was to bring them back to what he called the *true faith*; but the *Zenetti*, despising his offers, assembled at Amaf, or Amfa, their capital, murdered the ambassadors, and invaded Joseph's dominions with an army of 50,000 men.

³ Zeneti destroyed.

The king hearing of their infamous proceedings, speedily mustered his army, and led it by long marches into their country, destroying all with fire and sword; while the *Zenetti*, instead of opposing his progress, retired as fast as possible towards Fez, in hopes of receiving assistance from thence. In this they were miserably deceived: the Fezzans marched out against them in a hostile manner; and coming up with the unhappy *Zenetti*, encumbered with their families and baggage, and ready to expire with hunger and weariness, they cut them all to pieces, except a small number who were mostly drowned in attempting to swim across a river; and some others, who, in their flight, perished by falling from the high adjacent rocks. In the mean time

Algiers.

Joseph reduced their country to a mere desert; which was, however, soon peopled by a numerous colony of Fezzans, who settled there under the protection of the reigning kings. In this war it is computed that near a million of the *Zenetti*, men, women, and children, lost their lives.

The restless and ambitious temper of Joseph did not let him remain long at peace. He quickly declared war against the Fezzans, reduced them to become his tributaries, and extended his conquests all along the mediterranean. He next attacked some Arabian cheyks who had not yet submitted to his jurisdiction; and pursued them with such fury, that neither the Libyan deserts, nor ridges of the most craggy rocks, could shelter them from his arms. He attacked them in such of their retreats, castles, and fortresses, as were till then deemed impregnable; and at last subdued them, to the great grief of the other African nations, who were greatly annoyed by the ravages committed by his numerous forces.

Thus was founded the empire of the Morabites; which, however, was of no long duration; that race being in the 12th century driven out by Mohavedin, a marabout. This race of priests was expelled by Abdulac governor of Fez; and he, in the 13th century, stripped of his new conquests by the Sharifs of *Hafzen*, the descendants of Sharifs of *Hafzen* whom Abu-Texefien had formerly expelled.

⁴ Sharifs of Hafzen who.

The better to secure their new dominions, the Sharifs divided them into several little kingdoms or provinces; and among the rest the present kingdom of Algiers was divided into four, namely, *Tremecen*, *Tenez*, *Algiers proper*, and *Bujayah*. The four first monarchs laid so good a foundation for a lasting balance of power between their little kingdoms, that they continued for some centuries in mutual peace and amity; but at length the king of Tremecen, having ventured to violate some of their articles, Abul-Farez, king of Tenez, declared war against him, and obliged him to become his tributary. This king dying soon after, and having divided his kingdom among his three sons, new discords arose; which Spain taking advantage of, a powerful fleet and army was sent against Barbary, under the Count of Navarre, in 1505. This commander soon made himself master of the important cities of Oran, Bujayah, and some others; which so alarmed the Algerines, that they put themselves under the protection of Selim Eutemi, a noble and warlike Arabian prince. He came to their assistance with a great number of his bravest subjects, bringing with him his wife Zaphira, and a son then about 12 years old. This however was not sufficient to prevent the Spaniards from landing a number of forces near Algiers that same year, and obliging that metropolis to become tributary to Spain. Nor could Prince Selim hinder them from building a strong fort on a small island opposite to the city, which terrified their corsairs from sailing either in or out of the harbour.

⁵ Algerines in danger from the Spaniards.

To this galling yoke the Algerines were obliged to submit, till the year 1516; when, hearing of the death of Ferdinand king of Spain, they sent an embassy to *Aruch Barbarossa*, who was at this time no less dreaded for his valour than his surprising success, and was then sent on a cruise with a Squadron of galleys and barks. The purport of the embassy was, that he should come

⁹ Invited Barbarossa.

Algiers.

come and free them from the Spanish yoke; for which they agreed to pay him a gratuity answerable to his great service. Upon this, Barbarossa immediately dispatched 18 gallees and 30 barks to the assistance of the Algerines; while he himself advanced towards the city with 800 Turks, 3000 Jigellites, and 2000 Moorish volunteers. Instead of taking the nearest road to Algiers, he directed his course towards *Sharshel*, where *Haffan*, another famed corsair, had settled himself. Him he surpris'd, and oblig'd to surrender; not without a previous promise of friendship: but no sooner had Barbarossa got him in his power, than he cut off his head; and oblig'd all *Haffan's* Turks to follow him in his new expedition.

7
His treachery and
cruelty.

On Barbarossa's approach to Algiers, he was met by prince Eutemi, attended by all the people of that metropolis, great and small; who looked for deliverance from this abandoned villain, whom they accounted invincible. He was conducted into the city amidst the acclamations of the people, and lodg'd in one of the noblest apartments of prince Eutemi's palace, where he was treated with the greatest marks of distinction. Elated beyond measure with this kind reception, Barbarossa formed a design of becoming king of Algiers; and fearing some opposition from the inhabitants, on account of the excesses he suffered his soldiers to commit, murdered prince Eutemi, and caus'd himself to be proclaimed king; his Turks and Moors crying out as he rode along the streets, "Long live King Aruch Barbarossa, the invincible king of Algiers, the *chosen of God* to deliver the people from the oppression of the Christians; and destruction to all that shall oppose, or refuse to own him as their lawful sovereign." These last threatening words so intimidated the inhabitants, already apprehensive of a general massacre, that he was immediately acknowledged king. The unhappy prince Zaphira, it is said, poison'd herself, to avoid the brutality of this new king, who she unsuccessfully endeavoured to slay with a dagger.

Barbarossa was no sooner seated on the throne, than he treated his subjects with such cruelty, that they us'd to shut up their houses and hide themselves when he appear'd in public. In consequence of this, a plot was soon form'd against him; but being discovered, he caus'd twenty of the principal conspirators to be behead'd, their bodies to be buried in a dunghill, and laid a heavy fine on those who surviv'd. This so terrified the Algerines, that they never afterwards durst attempt any thing against either Barbarossa or his successors.

In the mean time, the son of prince Eutemi having fled to Oran, and put himself under the protection of the marquis of Gomarez, laid before that nobleman a plan for putting the city of Algiers into the hands of the king of Spain. Upon this, young Selim Eutemi was sent to Spain, to lay his plan before cardinal Ximenes; who having approv'd of it, sent a fleet with 10,000 land forces, under the command of *Don Francisco*, or, as others call him, *Don Diego de Vera*, to drive out the Turks, and restore the young prince. But the fleet was no sooner come within sight of land, than it was dispers'd by a storm, and the greatest part of the ships dash'd against the rocks. Most of the Spaniards were drown'd; and the few who escap'd to shore, were either killed by the Turks, or made slaves.

Though Barbarossa had nothing to boast on this oc-

casión, his pride and insolence were now swell'd to such a degree, that he imagin'd himself invincible, and that the very elements conspir'd to make him so. The Arabians were so much alarm'd at his success, that they implored the assistance of Hamidel Abdes king of Tenez, to drive the Turks out of Algiers. That prince readily undertook to do what was in his power for this purpose, provided they agreed to settle the kingdom on himself and his descendants. This proposal being accepted, he immediately set out at the head of 10,000 Moors; and, upon his entering the Algerine dominions, was join'd by all the Arabians in the country. Barbarossa engag'd him, only with 1000 Turkish musqueteers and 500 Granada Moors; totally defeated his numerous army; pursu'd him to the very gates of his capital, which he easily made himself master of; and, having given it up to be plunder'd by his Turks, oblig'd the inhabitants to acknowledge him as their sovereign. This victory, however, was chiefly owing to the advantage which his troops had from their fire-arms; the enemy having no other weapons than arrows and javelins.

No sooner was Barbarossa become master of the kingdom of Tenez, than he received an embassy from the inhabitants of Tremecen; inviting him to come to their assistance against their then reigning prince, with whom they were dissatisfis'd on account of his having dishonour'd his nephew, and forced him to fly to Oran; offering him even the sovereignty, in case he accept'd of their proposal. The king of Tremecen, not suspecting the treachery of his subjects, met the tyrant with an army of 6000 horse and 3000 foot: but Barbarossa's artillery gave him such an advantage, that the king was at length forced to retire into the capital; which he had no sooner enter'd, than his head was cut off, and sent to Barbarossa, with a fresh invitation to come and take possession of the kingdom. On his approach, he was met by the inhabitants, whom he received with great complaisance, and many fair promises; but beginning to tyrannize as usual, his new subjects soon convinc'd him that they were not so passive as the inhabitants of Algiers. Apprehending, therefore, that his reign might prove uneasy and precarious, he enter'd into an alliance with the king of Fez; after which, he took care to secure the rest of the cities in his new kingdom, by garrisoning them with his own troops. Some of these, however, revolted soon after; upon which he sent one of his corsairs, named *Escaner*, a man no less cruel than himself, to reduce them. The Tremecenians now began to repent in good earnest of their having invited such a tyrant to their assistance; and held consultations on the most proper means of driving him away, and bringing back their lawful prince *Abuchen Men*: but their cabals being discovered, a great number of the conspirators were massacred in the most cruel manner. The prince had the good luck to escape to Oran, and was taken under the protection of the marquis of Gomarez, who sent immediate advice of it to Charles V. then lately arriv'd in Spain, with a powerful fleet and army. That monarch immediately order'd the young king a succour of 10,000 men, under the command of the governor of Oran; who, under the guidance of *Abuchen Men*, began his march towards Tremecen; and in their way they were join'd by prince Selim, with a great number of Arabs and Moors. The

Algiers.

Algiers.

first thing they resolved upon, was, to attack the important fortrels of *Calau*, situated between Tremecen and Algiers, and commanded by the corsair Efcander at the head of about 300 Turks. They invested it closely on all sides, in hopes Barbarossa would come out of Tremecen to its relief, which would give the Tremecenians an opportunity of keeping him out. That tyrant, however, kept close in his capital, being embarrassed by his fears of a revolt, and the politic delays of the king of Fez, who had not sent the auxiliaries he promised. The garrison of *Calau*, in the mean time, made a brave defence; and, in a fallly they made at night, cut off near 300 Spaniards. This encouraged them to venture a second time; but they were now repulsed with great loss, and Efcander himself wounded: soon after which, they surrendered upon honourable terms; but were all massacred by the Arabians, except sixteen, who clung close to the stirrups of the king, and of the Spanish general.

Barbarossa being now informed that Abuchen Men, with his Arabs, accompanied by the Spaniards, were in full march to lay siege to Tremecen, thought proper to come out, at the head of 1500 Turks and 5000 Moorish horse, in order to break his way through the enemy; but he had not proceeded far from the city, before his council advised him to return and fortify himself in it. This advice was now too late; the inhabitants being resolved to keep him out, and open their gates to their own lawful prince as soon as he appeared. In this distress Barbarossa saw no way left but to retire to the citadel, and there defend himself till he could find an opportunity of stealing out with his men and all his treasure. Here he defended himself vigorously; but his provisions failing him, he took advantage of a subterranean back-way, which he had caused to be digged up for that purpose, and, taking his immense treasure with him, stole away as secretly as he could. His flight, however, was soon discovered; and he was so closely pursued, that to amuse, as he hoped, the enemy, he caused a great deal of his money, plate, jewels, &c. to be scattered all the way, thinking they would not fail to stop their pursuit to gather it up. This stratagem, however, failed, through the vigilance of the Spanish commander, who being himself at the head of the pursuers, obliged them to march on, till he was come up close to him on the banks of the *Hueda*, about eight leagues from Tremecen. Barbarossa had just crossed the river with his vanguard, when the Spaniards came up with his rear on the other side, and cut them all off; and then crossing the water, overtook him at a small distance from it. Here a bloody engagement ensued, in which the Turks fought like as many lions; but, being at length overpowered by numbers, they were all cut to pieces, and Barbarossa among the rest, in the 44th year of his age, and four years after he had raised himself to the royal title of *Sigel* and the adjacent country; two years after he had acquired the sovereignty of Algiers, and scarce a twelvemonth after the reduction of Tremecen. His head was carried to Tremecen, on the point of a spear; and Abuchen Men proclaimed king, to the joy of all the inhabitants. A few days after the fight, the king of Fez made his appearance at the head of 20,000 horse, near the field of battle; but hearing of Barbarossa's defeat and death, marched off with all possible speed, to avoid being

attacked by the enemy.

The news of Barbarossa's death spread the utmost consternation among the Turks at Algiers; however, they caused his brother Hayradin to be immediately proclaimed king. The Spanish commander now sent back the emperor's forces, without making any attempt upon Algiers; by which he lost the opportunity of driving the Turks out of that country; while Hayradin, justly dreading the consequences of the tyranny of his officers, fought the protection of the Grand Signior. This was readily granted, and himself appointed bawhaw or viceroxy of Algiers; by which means he received such considerable reinforcements, that the unhappy Algerines durst not make the least complaint; and such numbers of Turks resorted to him, that he was not only capable of keeping the Moors and Arabs in subjection at home, but of annoying the Christians at sea. His first step was to take the Spanish fort abovementioned, which was a great nuisance to his metropolis. The Spaniards held out to the last extremity; but being all slain or wounded, Hayradin easily became master of the place.

Hayradin next set about building a strong mole for the safety of his ships. In this he employed 30,000 Christian slaves, whom he obliged to work without intermission for three years; in which time the work was completed. He then caused the fort he had taken from the Spaniards to be repaired, and placed a strong garrison in it, to prevent any foreign vessels from entering the harbour without giving an account of themselves. By these two important works, Hayradin soon became dreaded not only by the Arabs and Moors, but also by the maritime Christian powers, especially the Spaniards. The viceroxy failed not to acquaint the Grand Signior with his success, and obtained from him a fresh supply of money, by which he was enabled to build a stronger fort, and to erect batteries on all places that might favour the landing of an enemy. All these have since received greater improvements from time to time, as often as there was occasion for them.

In the mean time the Sultan, either out of a sense of the great services Hayradin had done, or perhaps out of jealousy lest he should make himself independent, raised Hayradin to the dignity of bawhaw of the empire, and appointed Hassan Aga, a Sardinian renegade, an intrepid warrior, and an experienced officer, to succeed him as bawhaw of Algiers. Hassan had no sooner taken possession of his new government, than he began to pursue his ravages on the Spanish coast with greater fury than ever; extending them to the ecclesiastical state, and others parts of Italy. But Pope Paul III. being alarmed at this, exhorted the emperor Charles V. to send a powerful fleet to suppress those frequent and cruel piracies; and, that nothing might be wanting to render the enterprise successful, a bull was published by his holiness, wherein a plenary absolution of sins, and the crown of martyrdom, was promised to all those who either fell in battle or were made slaves. The emperor on his part needed no spur; and therefore set sail at the head of a powerful fleet consisting of 120 ships and 20 galleys, having on board 30,000 chosen troops, an immense quantity of money, arms, ammunition, &c. In this expedition many young nobility and gentry attended as volunteers, and among these many knights of Malta, so remarkable for

Algiers. for their valour against the enemies of Christianity. Even ladies of birth and character attended Charles in his expedition, and the wives and daughters of the officers and soldiers followed them with a design to settle in Barbary after the conquest was finished. All these meeting with a favourable wind, soon appeared before Algiers; every ship displaying the Spanish colours on the stern, and another at the head, with a crucifix to serve them for a pilot.

15
Algiers in
great con-
federation.

By this prodigious armament, the Algerines were thrown into the utmost consternation. The city was surrounded only by a wall with scarce any outworks. The whole garrison consisted of 800 Turks and 6000 Moors, without fire-arms, and poorly disciplined and accounted; the rest of their forces being dispersed in the other provinces of the kingdom, to levy the usual tribute on the Arabs and Moors. The Spaniards landed without opposition, and immediately built a fort, under the cannon of which they encamped, and diverted the course of a spring which supplied the city with water. Being now reduced to the utmost distress, Hassan received a summons to surrender at discretion, on pain of being put to the sword with all the garrison. The herald was ordered to extol the vast power of the emperor both by sea and land, and to exhort him to return to the Christian religion. But to this Hassan only replied, that he must be a madman who would pretend to advise an enemy, and that the advised must still act more madly who would take counsel of such an adviser. He was, however, on the point of surrendering the city, when advice was brought him that the forces belonging to the western government were in full march towards the place; upon which it was resolved to defend it to the utmost. Charles, in the mean time, resolving upon a general assault, kept a constant firing upon the town; which, from the weak defence made by the garrison, he looked upon as already in his hands.

16
Prevented
by a mad
prophet
from sur-
rendering.

But while the *douwan*, or Algerine senate, were deliberating on the most proper means of obtaining an honourable capitulation, a mad prophet, attended by a multitude of people, entered the assembly, and foretold the speedy destruction of the Spaniards before the end of the moon, exhorting the inhabitants to hold out till that time. This prediction was soon accomplished in a very surprising and unexpected manner: for, on the 28th of October 1541, a dreadful storm of wind, rain, and hail, arose from the north, accompanied with violent shocks of earthquakes, and a dismal and universal darkness both by sea and land; so that the sun, moon, and elements, seemed to combine together for the destruction of the Spaniards. In that one night, some say in less than half an hour, 86 ships and 15 galleys were destroyed, with all their crews and military stores; by which the army on shore was deprived of all means of subsisting in these parts. Their camp also, which spread itself along the plain under the fort, was laid quite under water by the torrents which descended from the neighbouring hills. Many of the troops, by trying to remove into some better situation, were cut in pieces by the Moors and Arabs; while several galleys, and other vessels, endeavouring to gain some neighbouring creeks along the coasts, were immediately plundered, and their crews massacred by the inhabitants.

17
Spanish fleet
destroyed by
a storm.

The next morning, Charles beheld the sea covered with the fragments of so many ships, and the bodies of

Vol. I.

men, horses, and other creatures, swimming on the waves; at which he was so disheartened, that abandoning his tents, artillery, and all his heavy baggage, to the enemy, he marched at the head of his army, though in no small disorder, towards cape *Malabux*, in order to re-embark in those few vessels which had outweathered the storm. But Hassan, who had caused his motions to be watched, allowed him just time to get to the shore, when he fellied out and attacked the Spaniards in the midst of their hurry and confusion to get into their ships, killing great numbers, and bringing away a still greater number of captives; after which he returned in triumph to Algiers, where he celebrated with great rejoicings his happy deliverance from such distresses and danger.

Algiers.
18
Siege of Al-
giers raised.

Soon after this, the prophet *Yusef*, who had foretold the destruction of the Spaniards, was not only declared the deliverer of his country, but had a considerable gratuity decreed him, with the liberty of exercising his prophetic function unmolested. It was not long, however, before the marabouts, and some interpreters of the law, made a strong opposition against him; remonstrating to the bashaw, how ridiculous and scandalous it was to their nation, to ascribe the deliverance of it to a poor fortune-teller, which had been obtained by the fervent prayers of an eminent saint of their own profession. But tho' the bashaw and his *douwan* seemed, out of policy, to give into this last notion, yet the impression which Yusef's predictions and their late accomplishment had made upon the minds of the common people, proved too strong to be eradicated; and the spirit of divination and conjuring has since got into such credit among them, that not only their great statesmen, but their priests, marabouts, and santouns, have applied themselves to that study, and dignified it with the name of *Mahomet's Revelations*.

19
The mad
prophet re-
warded.

The unhappy Spaniards had scarce reached their ships, when they were attacked by a fresh storm, in which several more of them perished; one ship in particular, containing 700 soldiers, besides sailors, sunk in the emperor's sight, without a possibility of saving a single man. At length, with much labour, they reached the port of *Bujeyah*, at that time possessed by the Spaniards, whither Hassan king of Tunis soon after repaired, with a supply of provisions for the emperor, who received him graciously, with fresh assurances of his favour and protection. Here he dismissed the few remains of the Maltese knights and their forces, who embarked in three shattered galleys, and with much difficulty and danger reached their own country. Charles himself staid no longer than till the 16th of November, when he set sail for Carthage, and reached it on the 25th of the same month. In this unfortunate expedition upwards of 120 ships and galleys were lost, above 300 colonels and other land and sea officers, 8000 soldiers and marines, besides those destroyed by the enemy on their re-embarkation, or drowned in the last storm. The number of prisoners was so great, that the Algerines sold some of them, by way of contempt, for an onion per head.

20

to him. The balfhaw returned to Algiers, laden with riches; and foon after died of a fever, in the 66th year of his age.

From this time the Spaniards were never able to annoy the Algerines in any confiderable degree. In 1555, they loft the city of Bujayah, which was taken by *Salha Rai*, Haffan's fuccellor; who next year fet out on a new expedition, which he kept a fecret, but was fufpected to be intended againft Oran; but he was fcarcely got four leagues from Algiers, when the plague, which at that time raged violently in the city, broke out in his groin, and carried him off in 24 hours.

Immediately after his death the Algerine foldiery chofe a Corican renegade, Haffan Corfo, in his room, till they fhould receive further orders from the Porte. He did not accept of the balfhawfhip without a good deal of difficulty; but immediately profecuted the intended expedition againft Oran, difpatching a melfenger to acquaint the Porte with what had happened. They had hardly begun their hoftilities againft the place, when orders came from the Porte, exprefly forbidding Haffan Corfo to begin the fiege, or, if he had begun it, enjoining him to raife it immediately. This news was received with great grief by the whole fleet and army, as they thought themfelves fure of fuccels, the garrifon being at that time very weak. Nevertheless, as they dared not difobey, the fiege was immediately raifed.

Corfo had hardly enjoyed his dignity four months, before news came, that eight galleys were bringing a new balfhaw to fucceed him; one *Tekelli*, a principal Turk of the Grand Signor's court: upon which the Algerines unanimofoy refolved not to admit him. By the treachery of the Levantine foldiers, however, he was admitted at laft, and the unfortunate Corfo thrown over a wall in which a number of iron hooks were fixed; one of which catching the ribs of his right fide, he hung three days in the moft exquisite torture, before he expired.

Tekelli was no fooner entered upon his new government, than he behaved with fuch cruelty and rapacioufnefs, that he was affaffinated, even under the dome of a faint, by Yufef Calabres, the favourite renegade of Haffan Corfo; who for this fervice was unanimofoy chofen balfhaw, but died of the plague fix days after his election.

Yufef was fucceeded by Haffan the fon of Hayradin, who had been formerly recalled from his balfhawfhip, when he was fucceeded by *Selha-Rais*; and now had the good fortune to get himfelf reinfated in his employment. Immediately on his arrival, he engaged in a war with the Arabs, by whom he was defeated with great lofs. The next year, the Spaniards undertook an expedition againft Moltagan, under the command of the count d' Alcadela; but were utterly defeated, the commander himfelf killed, and 12,000 taken prifoners. This difafter was owing to the inconfiderate rafhnefs, or rather madnefs, of the commander; which was fo great, that, after finding it impoffible to rally his fattered forces, he rufhed, fword in hand, into the thickeft of the enemy's ranks, at the head of a fmall number of men, crying out, St Jago! St Jago! the victory is ours, the enemy is defeated;'' foon after which he was thrown from his horfe, and trampled to death.

Haffan having had the misfortune to difoblige his

fubjects by allowing the mountaineers of Cuco to buy ammunition at Algiers, was fent in irons to Conftantinople, while the aga of the Janifaries, and general of the land forces, fupplied his place.—Haffan eafily found means to clear himfelf; but a new balfhaw was appointed, called *Achmet*; who was no fooner arrived, than he fent the two deputy-balfhaws to Conftantinople, where their heads were ftruck off.—*Achmet* was a man of fuch infatiable avarice, that, upon his arrival at Algiers, all ranks of people came in fhools to make him prents; which he the more greedily accepted, as he had bought his dignity by the money he had amaffed while head-gardener to the fultan. He enjoyed it, however, only four months; and after his death, the ftate was governed other four months by his lieutenant; when Haffan was a third time fent viceroiy to Algiers, where he was received with the greateft demonstrations of joy.

The firft enterprife in which Haffan engaged, was the fiege of Marfalquiver, fited near the city Oran, which he defigned to inveft immediately after. The army employed in this fiege confifted of 26,000 foot and 10,000 horfe, befides which he had a fleet confifting of 32 galleys and galliots, together with three French vellels laden with bifcuit, oil, and other provifions. The city was defended by Don Martin de Cordova, brother of the Count d'Alcadela, who had been taken prifoner in the battle where that nobleman was killed, but had obtained his liberty from the Algerines with immense fums, and now made a moft gallant defence againft the Turks. The city was attacked with the utmoft fury by fea and land, fo that feveral breaches were made in the walls. The Turkiſh ftandards were feveral times planted on the walls, and as often diflodged; but the place muft have in the end fubmitted, had not Haffan been obliged to raife the fiege in hafte, on the news that the famed Genoefe admiral Doria was approaching with confiderable fuccours from Italy. The fleet accordingly arrived foon after; but miffing the Algerine gallies, bore away for Pennon de Velez, where they were fhamefully repulſed by an handful of Turks who garrifoned that place; which, however, was taken the following year.

In 1567, Haffan was again recalled to Conftantinople, where he died three years after. He was fucceeded by Mahomet, who gained the love of the Algerines by feveral public-fpirited actions. He incorporated the Janifaries and Levantine Turks together, and by that means put an end to their diffentions, which laid the foundation of the Algerine independency on the Porte. He likewife added fome confiderable fortifications to the city and caſtle, which he defigned to render impregnable. But while he was thus ftudying the intereft of Algiers, one John Gafcon, a bold Spanifh adventurer, formed a defign of fuprifing the whole piratic navy in the bay, and letting them on fire in the night-time, when they lay defencelefs, and in their firft fleep. For this he had not only the permiffion of king Philip II. but was furnifhed by him with proper vellels, mariners, and fireworks, for the execution of his plot. With thefe he fet fail for Algiers in the moft proper feafon, viz. the beginning of October, when molt, if not all the ſhips lay at anchor there; and eafily failed near enough, unſufpected, to view their manner of riding, in order to catch them napping, at a time

time when the greater part of their crew were dispersed in their quarters. He came accordingly, unperceived by any, to the very mole-gate, and dispersed his men with their fire-works; but to their great surprise, they found them so ill mixed, that they could not with all their art make them take fire. In the mean time, Gascon took it into his head, by way of bravado, to go to the mole-gate, and give three loud knocks at it with the pommel of his dagger, and to leave it fixed in the gate by its point, that the Algerines might have cause to remember him. This he had the good fortune to do without meeting with any disturbance or opposition: but it was not so with his men; for no sooner did they find their endeavours unsuccessful, than they made such a bustle as quickly alarmed the guard posted on the adjacent bastion, from which the uproar quickly spread itself thro' the whole garrison. Gascon, now finding himself in the utmost danger, failed away with all possible haste: but he was pursued, overtaken, and brought back a prisoner to Mahomet; who no sooner got him into his power, than he immediately caused a gibbet of considerable height to be erected on the spot where Gascon had landed, ordering him to be hoisted up, and hung by the feet to a hook, that he might die in exquisite torture; and to shew his resentment and contempt of the king his master, he ordered his commission to be tied to his toes. He had not, however, hung long in that state, when the captain who took him, accompanied by a number of other corsairs, interceded so strongly in his behalf, that he was taken down, and put under the care of some Christian surgeons; but two days after, some Moors reporting that it was the common talk and belief in Spain, that the Algerines durst not hurt a hair of Gascon's head, &c. the unfortunate Spaniard was hoisted up by a pulley to the top of the execution-wall, and let down again upon the hook, which in his fall caught him by the belly, and gave him such a wound, that he expired without a groan.—Thus ended the expedition of John Gascon, which has procured him a place among the Spanish martyrs; while, on the other hand, the Algerines look upon his disappointment to have been miraculous, and owing to the efficacious protection of the powerful saint *Sidi Outeddeda*, whose prayers had before raised such a terrible storm against the Spanish fleet.

Mahomet, being soon after recalled, was succeeded by the famous renegade Ochali, who reduced the kingdom of Tunis; which, however, remained subject to the viceroy of Algiers only till the year 1586, when a bashaw of Tunis was appointed by the Porte.

The kingdom of Algiers continued to be governed, till the beginning of the seventeenth century, by viceroys or bashaws appointed by the Porte; concerning whom we find nothing very remarkable, further than that their avarice and tyranny was intolerable both to the Algerines and the Turks themselves. At last the Turkish janisaries and militia becoming powerful enough to suppress the tyrannic sway of these bashaws, and the people being almost exhausted by the heavy taxes laid upon them, the former resolved to depose these petty tyrants, and set up some officers of their own at the head of the realm. The better to succeed in this attempt, the militia sent a deputation of some of their chief members to the Porte, to complain of the avarice and oppression of these bashaws, who sunk both

the revenue of the state, and the money remitted to it from Constantinople, into their own coffers, which should have been employed in keeping up and paying the soldiery; by which means they were in continual danger of being overpowered by the Arabians and Moors, who, if ever so little assisted by any Christian power, would hardly fail of driving all the Turks out of the kingdom. They represented to the Grand Vizir how much more honourable, as well as easier and cheaper, it would be for the Grand Signior to permit them to chuse their own dey, or governor, from among themselves, whose interest it would then be to see that the revenue of the kingdom was rightly applied in keeping up its forces complete, and in supplying all other exigencies of the state, without any farther charge or trouble to the Porte than that of allowing them its protection. On their part, they engaged always to acknowledge the Grand Signiors as their sovereigns, and to pay them their usual allegiance and tribute, to respect their bashaws, and even to lodge and maintain them and their retinue, in a manner suitable to their dignity, at their own charge. The bashaws, however, were, for the future, to be excluded from assisting at any but general douwans, unless invited to it; and from having the liberty of voting in them, unless when their advice was asked, or the interest of the Porte was likely to suffer by their silence. All other concerns, which related to the government of Algiers, were to be wholly left under the direction of the dey and his douwan.

These proposals having been accepted by the Porte, the deputies returned highly satisfied; and having notified their new privileges, the great douwan immediately proceeded to the election of a dey from among themselves. They compiled a new set of laws, and made several regulations for the better support and maintenance of this new form of government, to the observation of which they obliged all their subjects to swear; and the militia, navy, commerce, &c. were all settled pretty nearly on the footing upon which they now are, and which shall be afterwards described; tho' the subsequent alterations that frequently happened between the bashaws and deys, the one endeavouring to recover their former power, and the other to curtail it, caused such frequent complaints and discontents at the Ottoman court, as made them frequently repent their compliance.

In the year 1601, the Spaniards, under the command of Doria the Genoese admiral, made another attempt upon Algiers, in which they were more fortunate than usual, their fleet being only driven back by contrary winds, so that they came off without loss. In 1609, the Moors being expelled from Spain, flocked in great numbers to Algiers; and as many of them were very able sailors, they undoubtedly contributed to make the Algerine fleet so formidable as it became soon after; tho' it is probable the frequent attempts made on their city would also induce them to increase their fleet. In 1616, their fleet consisted of 40 sail of ships between 200 and 400 tons, their admiral 500 tons. It was divided into two squadrons, one of 18 sail, before the port of Malaga; and the other at the Cape of Santa Maria, between Lisbon and Seville; both of which fell foul on all Christian ships, both English and French, with whom they pretended to be in friendship, as well

Algiers. as Spaniards and Portuguese, with whom they were at war.

The Algerines were now become very formidable to the European powers. The Spaniards, who were most in danger, and least able to cope with them, solicited the assistance of England, the pope, and other states. The French, however, were the first who dared to shew their resentment of the perfidious behaviour of these miscreants; and in 1617, M. Beaulieu was sent against them with a fleet of 50 men of war, who defeated their fleet, took two of their vessels, while their admiral sunk his own ship and crew, rather than fall into his enemies hands.

36
An English
squadron
sent against
the Alge-
rines.

In 1620, a squadron of English men of war was sent against Algiers, under the conduct of Sir Robert Mansel: but of this expedition we have no other account, than that it returned without doing any thing; and the Algerines, becoming more and more insolent, openly defied all the European powers, the Dutch only excepted, to whom, in 1625, they sent a proposal, directed to the prince of Orange, that in case they would fit out 20 sail of ships the following year, upon any good service against the Spaniards, they would join them with 60 sail of their own.

The next year, the *Coulolies*, or *Cologlies*, (the children of such Turks as had been permitted to marry at Algiers), who were enrolled in the militia, having seized on the citadel, had well nigh made themselves masters of the city; but were attacked by the Turks and renegades, who defeated them with terrible slaughter. Many scores of them were executed; and their heads thrown in heaps upon the city-walls, without the eastern gate. Part of the citadel was blown up; and the remaining Coulolies were dismissed from the militia, to which they were not again admitted till long after.

37
States of
Barbary
throw off
their de-
pendence on the
Porte.

In 1623, the Algerines and other states of Barbary threw off their dependence on the Porte altogether, and set up for themselves. What gave occasion to this was the 25 years truce which Sultan Amurath IV. was obliged to make with the emperor Ferdinand II. to prevent his being overmatched by carrying on a war against him and the sophi of Persia at the same time. As this put a stop to the piratical trade of the Algerines, they proceeded as above-mentioned; and resolved, that whoever desired to be at peace with them, must distinctly and separately, apply to their government.—No sooner was this resolution taken, than the Algerines began to make prizes of several merchant ships belonging to powers at peace with the Porte. Nay, having seized a Dutch ship and poleacre at Scanderon, they ventured on shore; and finding the town abandoned by the Turkish aga and inhabitants, they plundered all the magazines and warehouses, and set them on fire.—About this time Lewis XIII. undertook to build a fort on their coasts, instead of one formerly built by the Marisians, and which they had demolished. This, after some difficulty, he accomplished; and it was called the *Bastion of France*: but the situation being afterwards found inconvenient, the French purchased the port of La Calle, and obtained liberty to trade with the Arabians and Moors. The Ottoman court, in the mean time, was so much embarrassed with the Persian war, that there was no leisure to check the Algerine piracies. This gave an opportunity to the vizir and other courtiers to compound matters with the Algerines,

and to get a share of their prizes, which were very considerable. However, for form's sake, a severe reprimand, accompanied with threats, was sent them; to which they replied, that "these depredations deserved to be indulged to them, seeing they were the only bulwark against the Christian powers, especially against the Spaniards, the sworn enemies of the Moslem name!" adding, that "if they should pay a punctilious regard to all that could purchase peace, or liberty to trade with the Ottoman empire, they would have nothing to do but set fire to all their shipping, and turn camel-drivers for a livelihood."

In the year 1635, four younger brothers of a good family in France, entered into an undertaking so desperate, that perhaps the annals of knight-errantry can scarce furnish its equal.—This was no less than to retort the piracies of the Algerines, upon themselves; and as they indiscriminately took the ships of all nations, so were these heroes indiscriminately to take the ships belonging to Algiers; and this with a small frigate of ten guns!—In this ridiculous undertaking, 100 volunteers embarked; a Maltese commission was procured, together with an able master, and 36 mariners.—They had the good fortune, on their first setting out, to take a ship laden with wine, on the Spanish coast: with which they were so much elated, that three days after they madly encountered two large Algerine corsairs, one of 20 and the other of 24 guns, both well manned, and commanded by able officers. These two large vessels having got the small frigate between them, plied her furiously with great shot, which soon took off her main mast: notwithstanding which, the French made so desperate a resistance, that the pirates were not able to take them, till the noise of their fire brought up five more Algerines; when the French vessel, being almost torn to pieces, was boarded and taken. The young knights-errant were punished for their temerity by a dreadful captivity, from which they redeemed themselves in 1642 at the price of 6000 dollars.

The Algerines prosecuted their piracies with impunity, to the terror and disgrace of the Europeans, till the year 1652; when a French fleet being accidentally driven to Algiers, the admiral took it into his head to demand a release of all the captives of his nation, without exception. This being refused, the Frenchman without ceremony carried off the Turkish vice-roy, and his cadî or judge, who were just arrived from the Porte, with all their equipage and retinue. The Algerines, by way of reprisal, surprised the Bastion of France already mentioned, and carried off the inhabitants to the number of 600, with all their effects; which so provoked the admiral, that he sent them word that he would pay them another visit the next year with his whole fleet.

The Algerines, undismayed by the threats of the French admiral, fitted out a fleet of 16 galleys and galliots, excellently manned and equipped, under the command of Admiral Hali Pinchinin.—The chief design of this armament was against the treasure of Loretto; which, however, they were prevented by contrary winds from obtaining. Upon this they made a descent on Puglia in the kingdom of Naples; where they ravaged the whole territory of Necotra, carrying off a vast number of captives, and among them some nuns. From thence steering towards Dalmatia, they scoured the

Adriatic; and loading themselves with immense plunder, left those coasts in the utmost conflagration and resentment.

41
Which is-
tally de-
stroyed by
the Veneti-
ans.

At last the Venetians, alarmed at such terrible depredations, equipped a fleet of 28 fairs, under the command of admiral Capello, with express orders to burn, sink, or take, all the Barbary corsairs he met with, either on the open seas, or even in the Grand Signior's harbours, pursuant to a late treaty of peace with the Porte. On the other hand, the captain bashaw, who had been sent out with the Turkish fleet to chase the Florentine and Maltese cruisers out of the Archipelago, understanding that the Algerine squadron was so near, sent express orders to the admiral to come to his assistance. Pinchinin readily agreed; but having first resolved on a descent upon the island of Liffia, or Lissina, belonging to the Venetians, he was overtaken by Capello, from whom he retired to Valona, a sea-port belonging to the Grand Signior, whither the Venetian admiral pursued him; but the Turkish governor refusing to eject the pirates according to the articles of the peace between the Ottoman court and Venice, Capello was obliged to content himself with watching them for some time. Pinchinin was soon weary of restraint, and ventured out; when an engagement immediately ensued, in which the Algerines were defeated, and five of their vessels disabled; with the loss of 1500 men, Turks, and Christian slaves; besides 1600 galley-slaves who regained their liberty. Pinchinin, after this defeat, returned to Valona, where he was again watched by Capello; but the latter had not lain long at his old anchorage before he received a letter from the senate, desiring him to make no farther attempt on the pirates at that time, for fear of a rupture with the Porte. This was followed by a letter from the governor of Valona, desiring him to take care lest he incurred the Sultan's displeasure by such insults. The brave Venetian was forced to comply; but, resolving to take such a leave of the Algerines as he thought they deserved, observed how they had reared their tents, and drawn their booty and equipage along the shore. He then kept firing among their tents, while some well-manned galliots and brigantines were ordered among their shipping, who attacked them with such bravery, that, without any great loss, they towed out their 16 galleys, with all their cannon, stores, &c.—In this last engagement, a ball from one of the Venetian galleys happening to strike a Turkish mosque, the whole action was considered as an insult upon the Grand Signior. To conceal this, Capello was ordered to sink all the Algerine ships he had taken, except the admiral; which was to be conducted to Venice, and laid up as a trophy. Capello came off with a severe reprimand; but the Venetians were obliged to buy, with 500,000 ducats, a peace from the Porte. The Grand Signior, offered to repair the loss of the Algerines by building ten galleys for them, upon condition that they should continue in his service till the end of the ensuing summer; but Pinchinin, who knew how little the Algerines chose to lie under obligations to him, civilly declined the offer.

42
Algiers in
the utmost
confusion at
the news.

In the mean time, the news of this defeat and loss filled Algiers with the utmost grief and confusion. The whole city was on the point of a general insurrection, when the bashaw and douwan issued out a proclamation, forbidding, not only complaints and outcries, under the

severest penalties; but all persons whatever to *take their thumbs from within their girdles*, while they were deliberating on this important point. In the mean time, they applied to the Porte for an order, that the Venetians settled in the Levant should make up their loss. But with this the Grand Signior refused to comply, and left them to repair their losses, as well as build new ships, in the best manner they could. It was not long, however, before they had the satisfaction to see one of their corsairs land, with a fresh supply of 600 slaves, whom he had brought from the coast of Iceland, whither he had been directed by a miscreant native taken on board a Danish ship.

Algiers.

Our pirates did not long continue in their weak and defenceless state; being able, at the end of two years, to appear at sea with a fleet of 65 sail. The admiral Pinchinin equipped four galliots at his own expence; with which, in conjunction with the Chiaiah, or secretary of the bashaw of Tripoli, he made a second excursion. This small squadron, consisting of five galleys and two brigantines, fell in with an English ship of 40 guns; which, however, Pinchinin's captains refused to engage; but being afterwards reproached by him for their cowardice, they swore to attack the next Christian ship which came in their way. This happened

43
They set out
a new fleet.

to be a Dutch merchantman, of 28 guns and 40 men, deeply laden, and unable to use her sails by reason of a calm. Pinchinin immediately summoned her to surrender; but, receiving an ironical answer, drew up his squadron in form of an half-moon, that they might pour their shot all at once into their adversary. This, however, the Dutchman avoided, by means of a breeze of wind which fortunately sprung up and enabled him to turn his ship; upon which the galleys ran foul of each other.—Upon this, Pinchinin ran his own galley along side of the merchantman, the upper deck of which seventy Algerines immediately took possession of, some of them cutting the rigging, and others plying the hatches with hand-grenades: but the Dutchmen having secured themselves in their close quarters, began to fire at the Algerines on board, from two pieces of cannon loaded with small shot; by which they were all soon killed, or forced to submit. Pinchinin, in the mean time, made several unsuccessful attempts to relieve his men, as well as to surround the Dutchman with his other galleys: but that ship lay so deep in the water that every shot did terrible execution among the pirates; so that they were obliged to remove farther off. At last the Dutch captain, having ordered his guns to be loaded with cartouches, gave them such a parting volley as killed 200 of them, and sent the rest back to Algiers in a most dismal plight.

44
Five of their
galleys de-
feated by a
Dutch mer-
chantman.

But though Pinchinin thus returned in disgrace, the rest of the fleet quickly came back with vast numbers of slaves, and an immense quantity of rich spoils; inasmuch that the English, French, and Dutch, were obliged to cringe to the mighty Algerines, who sometimes vouchsafed to be at peace with them, but swore eternal war against Spain, Portugal, and Italy, whom they looked upon as the greatest enemies to the Mahometan name. At last, Lewis XIV. provoked by the grievous outrages committed by the Algerines on the coasts of Provence and Languedoc, ordered, in 1681, a considerable fleet to be fitted out against them, under the marquis du Quesne, vice-admiral of France. His

first

Algiers.

first expedition was against a number of Tripolitan corsairs; who had the good fortune to outrow him, and shelter themselves in the Island of Scio belonging to the Turks. This did not, however, prevent him from pursuing them thither, and making such terrible fire upon them as quickly destroyed 14 of their vessels, besides battering the walls of the castle.

46
Algiers
bombarded
and set on
fire by the
French.

This severity seemed only to be designed as a check to the piracies of the Algerines; but, finding they still continued their outrages on the French coast, he failed to Algiers in August 1682, cannonading and bombarding it so furiously, that the whole town was in flames in a very little time. The great mosque was battered down, and most of the houses laid in ruins, inasmuch that the inhabitants were on the point of abandoning the place; when on a sudden, the wind turned about, and obliged Du Quesne to return to Toulon. The Algerines immediately made reprisals, by sending a number of galleys and galliots to the coasts of Provence, where they committed the most dreadful ravages, and brought away a vast number of captives: upon which a new armament was ordered to be got ready at Toulon and Marseilles, against the next year; and the Algerines, having received timely notice, put themselves into as good a state of defence as the time would allow.

47
Algerines
commit
dreadful ra-
vages in
France.

48
The city
gain bom-
barded.

In May 1683, Du Quesne with his squadron cast anchor before Algiers; where, being joined by the Marquis D'Affranville, at the head of five stout vessels, it was resolved to bombard the town next day. Accordingly 100 bombs were thrown into it the first day; which did terrible execution, while the besieged made some hundred discharges of their cannon against them, without doing any considerable damage. The following night the bombs were again thrown into the city in such numbers, that the dey's palace and other great edifices were almost destroyed; some of their batteries were dismounted, and several vessels sunk in the port. The dey, and Turkish bashaw, as well as the whole soldiery, alarmed at this dreadful havoc, immediately sued for peace. As a preliminary, the immediate surrender was insisted on of all Christian captives who had been taken fighting under the French flag; which being granted, 142 of them were immediately delivered up, with a promise of sending him the remainder as soon as they could be got from the different parts of the country. Accordingly Du Quesne sent his commissary-general and one of his engineers into the town; but with express orders to insist upon the delivery of all the French captives without exception, together with the effects they had taken from the French; and that Mezomorto their then admiral, and Hali Rais one of their captains, should be given as hostages.

This last demand having embarrassed the dey, he assembled the douwan, and acquainted them with it: upon which Mezomorto fell into a violent passion, and told the assembly, that the cowardice of those who sat at the helm had occasioned the ruin of Algiers; but that, for his part, he would never consent to deliver up any thing that had been taken from the French. He immediately acquainted the soldiery with what had passed; which so exasperated them, that they murdered the dey that very night, and on the morrow chose Mezomorto in his place. This was no sooner done, than he cancelled all the articles of peace which had

been made, and hostilities were renewed with greater fury than ever.

Algiers.

The French admiral now kept pouring in such volleys of bombs, that, in less than three days, the greatest part of the city was reduced to ashes, and the fire burnt with such vehemence, that the sea was enlightened with it for more than two leagues round. Mezomorto, unmoved at all these disasters, and the vast number of the slain, whose blood ran in rivulets along the streets; or rather, grown furious and desperate, fought only how to wreak his revenge on the enemy; and, not content with causing all the French in the city to be cruelly murdered, ordered their confal to be tied hand and foot, and fastened alive to the mouth of a mortar, from whence he was shot away against their navy.—By this piece of inhumanity Du Quesne was so exasperated, that he did not leave Algiers till he had utterly destroyed all their fortifications, shipping, almost all the lower part, and above two thirds of the upper part, of the city; by which means it became little else than an heap of ruins.

49
Set on fire
and almost
destroyed.

The haughty Algerines were now thoroughly convinced that they were not invincible; and, therefore, immediately sent an embassy into France, begging in the most abject terms for peace; which Lewis immediately granted, to their inexpressible joy. They now began to pay some regard to other nations, and to be a little cautious how they wantonly incurred their displeasure. The first bombardment by the French had so far humbled the Algerines, that they condescended to enter into a treaty with England; which was renewed, upon terms very advantageous to the latter, in 1686. It is not to be supposed, however, that the natural perfidy of the Algerines would disappear on a sudden: notwithstanding this treaty, therefore, they lost no opportunity of making prizes of the English ships, when they could conveniently come at them. Upon some infringement of this kind, captain Beach drove ashore and burnt seven of their frigates in 1695; which produced a renewal of the treaty five years after: but it was not till the taking of Gibraltar and Port Mahon, that Britain could have a sufficient check upon them to enforce the observance of treaties; and these have since proved such restraints upon Algiers, that they still continue to pay a greater deference to the English, than to any other European power.

50
Algerines

51
Seven of
their ships
burnt by
capt Beach.

The present century furnishes no very remarkable events with regard to Algiers; except the taking of the famed city of Oran from the Spaniards in 1708, (which however they regained in 1737,) and the expulsion of the Turkish bashaw, and uniting his office to that of dey in 1710. This introduced the form of government which still continues in Algiers.

of the Turk-
ish bashaw.

The dey is now absolute monarch; and pays no other revenue to the Porte, than that of a certain number of fine boys or youths, and some other presents which are sent thither yearly. His own income, probably, rises and falls according to the opportunities he hath of fleecing both natives and foreigners; whence it is variously computed by different authors. Dr Shaw computes the taxes of the whole kingdom to bring into the treasury no more than 300,000 dollars; but supposes that the eighth part of the prizes, the effects of those persons who die without children, joined to the yearly contributions raised by the government, presents from foreigners,

53
Revenues,

Dey.

Algers. foreigners, fines and oppressions, may bring in about as much more. Both the dey, and officers under him, enrich themselves by the same laudable methods of rapine and fraud; which it is no wonder to find the common people practising upon one another, and especially upon strangers, seeing they themselves are impoverished by heavy taxes and the injustice of those who are in authority.

We have already hinted, that the first deys were elected by the militia, who were then called the *douwan*, or common-council. This elective body was at first composed of 800 militia-officers, without whose consent the dey could do nothing; and upon some urgent occasions, all the officers residing in Algiers, amounting to above 1500, were summoned to assist. But since the deys, who may be compared to the Dutch Stadtholders, have become more powerful, the *douwan* is principally composed of 30 *chiaik*-basha's, or colonels, with now and then the mufti and cadi upon some emergencies; and, on the election of a dey, the whole soldiery are allowed to come and give their votes. All the regulations of state ought to be determined by that assembly, before they pass into a law, or the dey hath power to put them in execution: but, for many years back, the *douwan* is of so little account, that it is only convened out of formality, and to give assent to what the dey and his chief favourites have concerted beforehand. The method of gathering the votes in this august assembly, is perfectly agreeable to the character of those who compose it. The aga, or general of the janissaries, or the president *pro tempore*, first proposes the question, which is immediately repeated with a loud voice by the *chiaik*-basha's, and from them echoed again by four officers called *bashaldulas*, from these the question is repeated from one member of the *douwan* to another, with strange contortions, and the most hideous growlings, if it is not to their liking. From the loudness of this growling noise, the aga is left to guess as well as he can whether the majority of the assembly are pleased or displeased with the question; and from such a preposterous method, it is not surprising that these assemblies should seldom end without some tumult or disorder. As the whole body of the militia is concerned in the election of a new dey, it is seldom carried on without blows and bloodshed: but when once the choice is made, the person elected is saluted with the words *ALLA BARICK*, "God bless you, or prosper you;" and the new dey usually causes all the officers of the *douwan*, who had opposed his election, to be strangled, filling up their places with those who had been most zealous in promoting it. From this account of the election of the deys, it cannot be expected that their government should be at all secure; and as they arrive at the throne by tumult, disorder, and bloodshed, they are generally deprived of it by the same means, scarcely one in ten of them having the good fortune to die a natural death.

In this country it is not to be expected that justice will be administered with any degree of impartiality. The Mahometan soldiery, in particular, are so much favoured, that they are seldom put to death for any crime, except rebellion; in which case, they are either strangled with a bow-string, or hanged to an iron hook. In lesser offences, they are fined, or their pay stopped; and if officers, they are reduced to the station of com-

mon soldiers, from whence they may gradually raise themselves to their former dignity. Women guilty of adultery, have a halter tied about their necks, with the other end fastened to a pole, by which they are held under water till they are suffocated. The *bastinado* is likewise inflicted for small offences; and is given either upon the belly, back, or soles of the feet, according to the pleasure of the cadi; who also appoints the number of strokes. These sometimes amount to 200 or 300, according to the indulgence the offender can obtain either by bribery or friends; and hence he often dies under this punishment, for want of powerful enough advocates. But the most terrible punishments, are these inflicted upon the Jews, or Christians, who speak against Mahomet or his religion; in which case, they must either turn Mahometans, or be impaled alive. If they afterwards apostatize, they are burned or roasted alive; or else thrown down from the top of the city-walls, upon iron hooks, where they are caught by different parts of their body, according as they happen to fall, and sometimes expire in the greatest torments; though by accident they may be put out of pain at once, as we have already related of the Spanish adventurer John Gascon. This terrible punishment, however, begins now to be disused.

The officer next in power to the dey is the aga of the janissaries, who is one of the oldest officers in the army, and holds his post only for two months. He is then succeeded by the *chiaik*, or next senior officer.—During the two months in which the aga enjoys his dignity, the keys of the metropolis are in his hands; all military orders are issued out in his name; and the sentence of the dey upon any offending soldier, whether capital or not, can only be executed in the court of his palace.—As soon as he is gone through this short office, he is considered as *mazoul*, or superannuated; receives his pay regularly, like the rest of the militia, every two moons; is exempt from all further duties, except when called by the dey to assist at the grand council, to which he hath, however, a right to come at all times, but hath no longer a vote in it.—Next to the aga in dignity, is the secretary of state, who registers all the public acts; and after him are the 30 *chiaiks*, or colonels, who sit next to the aga in the *douwan*, and in the same gallery with him. Out of this class are generally chosen those who go ambassadors to foreign courts, or who disperse the dey's orders throughout the realm.—Next to them are 800 *bollock*-basha's, or eldest captains, who are promoted to that of *chiaik*-basha's, according to their seniority. The *oldack*-basha's, or lieutenants, are next; who amount to 400, and are regularly raised to the rank of captains in their turn, and to other employments in the state, according to their abilities. These, by way of distinction, wear a leather strap, hanging down to the middle of their back. One rule is strictly observed in the rotation of these troops from one deputy to a higher; viz. the right of seniority; one single infringement of which would cause an insurrection, and probably cost the dey his life. Other military officers of note are the *vekelars*, or purveyors of the army; the *peys*, who are the four oldest soldiers, and consequently the nearest to preferment; the *soulacks*, who are the next in seniority to them, and are part of the dey's body-guard, always marching before him when he takes the field, and distinguished.

Algiers.

tinguished by their carbines and gilt scymiters, with a brass gun on their caps; the kayts, or Turkish soldiers, each band of whom have the government of one or more adowars, or itinerant villages, and collect their taxes for the dey; and the fagiards, or Turkish lance-men, 100 of whom always attend the army, and watch over the water appointed for it. To these we may add the beys, or governors of the three great provinces of the realm. All the above-mentioned officers ought to compose the great douwan or council above-mentioned; but only the 30 chiah-bahaws have a right to sit in the gallery next after the dey: The rest are obliged to stand on the floor of the hall, or council-chamber, with their arms across, and, as much as possible, without motion; neither are they permitted to enter with their swords on, for fear of a tumult. As for those who have any matters to transact with the douwan, they must stand without, let the weather be ever so bad; and there they are commonly presented with coffee by some of the inferior officers, till they are dismissed.

57
Division of
the king-
dom.

The kingdom of Algiers is at present divided into three provinces or districts, viz. the eastern, western, and southern. The eastern or Levantine government, which is by far the most considerable of the three, and is also called *Beylick*, contains the towns of Bona, Constantina, Gigeri, Bujeyah, Steffa, Tebef, Zamoura, Biscara, and Necanz, in all which the Turks have their garrisons: besides which, it includes the two ancient kingdoms of Cuco and Labez, though independent of the Algerine government, to whose forces their country is inaccessible; so that they still live under their own cheyks, chosen by each of their adowars or hords. To these we may add a French factory at Callo, under the direction of the company of the French Bastion.—The western government hath the towns of Oran, Tremecen, Mostagan, Tenez, and Secrelly with its castle and garrison.—The southern government hath neither town, village, nor even a house, all the inhabitants living in tents, which obliges the bey and his forces to be always encamped.

58
Rivers.

The most considerable rivers of Algiers are the Zha, or Ziz, which runs across the province of Tremecen, and the desert of Anguid, falling into the Mediterranean, near the town of Tabacrita, where it has the name of *Sirut*. (2.) The Haregol, supposed the *Sign* of Ptolemy, comes down from the great Atlas, crosses the desert of Anguid, and falls into the sea, about five leagues from Oran. (3.) The Mina, supposed the *Chylematis* of Ptolemy, a large river, which runs through the plains of Bathala, and falls into the sea near the town of Arzew. This river hath lately received the name of *Gena*, who rebuilt the town of Bathalah, after it had been destroyed. (4.) The Shelliff, Zilef, or Zilif, descending from the mount Gnanexeris, runs through some great deserts, the lake Titteri, the frontiers of Tremecen and Tenez, falling into the sea a little above the city of Mostagan. (5.) The Celef, supposed to be the *Carthena* of the ancients, falls into the sea, about three leagues west of Algiers, after a short course of 18 or 20 leagues. (6.) The Hued-alquivir, supposed to be the *Nalabata*, or *Najaba*, of the ancients, and called by the Europeans *Zingair*, runs down, with a swift course, through some high mountains of Cuco, and falls into the sea near Bujeyah.

Whilst the city of Bujeyah was in the hands of the Christians, the mouth of this river was so choked up with sand, that no vessel could come up into it: but in 1555, very soon after it was taken by the Moors, the great rains swelled it to such a degree, that all the sand and mud was carried off; so that galleys, and other vessels, have ever since entered it with ease, where they lie safe from storms, and all winds, but that which blows from the north. (7.) Suf-Gemar, or Suf-Gimmar al Rummel, supposed to be the *Ampfaga* of Ptolemy, hath its source on mount Auras, on the confines of Atlas; thence runs through some barren plains, and the fruitful ones of Constantina, where its stream is greatly increased by some other rivers it receives; from thence running northward, along the ridges of some high mountains, it falls into the sea a little east of Gigeri. (8.) The Ladag, or Ludeg, runs down from mount Atlas through part of Constantina, and falls into the sea a little eastward of Bona. (9.) Guadi, or Guadel Barbar, springs from the head of Orbus, or Urbs, in Tripoli, runs through Bujeyah, and falls into the sea near Tabarca.

Besides these there are many others of less note; of which, however, we do not find that the Algerines avail themselves as they might do, their genius leading them too much to the piratical trade to mind any real advantage that might be derived from their own country. The corsairs, or pirates, form each a small republic, of which the rais or captain is the supreme bashaw; who, with the officers under him, form a kind of douwan, in which every matter relating to the vessel is decided in an arbitrary way. These corsairs are chiefly instrumental in importing whatever commodities are brought into the kingdom either by way of merchandise or prizes. These consist chiefly of gold and silver stuffs, damasks, cloths, spices, tin, iron, pulled brass, lead, quicksilver, cordage, sail-cloth, bullets, cochineal, linen, tartar, alum, rice, sugar, soap, cotton raw and spun, copperas, aloes, brazil and logwood, vermilion, &c. Very few commodities, however, are exported from this part of the world; the oil, wax, hides, pulse and corn produced, being but barely sufficient to supply the country; though, before the loss of Oran, the merchants have been known to ship off from one or other of the ports of Barbary several thousand tons of corn. The consumption of oil, though here in great abundance, is likewise so considerable in this kingdom, that it is seldom permitted to be shipped off for Europe. The other exports consist chiefly in ostriches feathers, copper, rugs, silk sashes, embroidered handkerchiefs, dates, and Christian slaves. Some manufactures in silk, cotton, wool, leather, &c. are carried on in this country, but mostly by the Spaniards settled here, especially about the metropolis. Carpets are also a manufacture of the country, which, though much inferior to those of Turkey, both in beauty and fineness, are preferred by the people to lie upon, on account of their being both cheaper and softer. There are also, at Algiers, looms for velvet, taffeties, and other wrought silks; and a coarse sort of linen is likewise made in most parts of the kingdom.

The inhabitants along the sea-coasts are a mixture of different nations; but chiefly Moors and Morecos driven out of Catalonia, Arragon, and other parts of Spain. Here are also great numbers of Turks, who come

Algiers.

come from the Levant to seek their fortune; as well as multitudes of Jews and Christians taken at sea, who are brought hither to be sold for slaves. The Berebers are some of the most ancient inhabitants of the country; and are supposed to be descended from the ancient Sabæans, who came hither from Arabia Felix, under the conduct of one of their princes. Others believe them to be some of the Canaanites driven out of Palestine by Joshua. These are dispersed all over Barbary, and divided into a multitude of tribes under their respective chiefs: most of them inhabit the mountainous parts; some range from place to place, and live in tents, or portable huts; others in scattered villages: they have, nevertheless, kept themselves for the most part from intermixing with other nations. The Berebers are reckoned the richest of all, go better clothed, and carry on a much larger traffic of cattle, hides, wax, honey, iron, and other commodities. They have also some artificers in iron, and some manufacturers in the weaving branch.—The name of *Bereber* is supposed to have been originally given them on account of their being first settled in some desert place. Upon their increasing in process of time, they divided themselves into five tribes, probably on account of religious differences, called the *Zinhagians*, *Musamedini*, *Zeneti*, *Hoares*, and *Gomerers*; and these having produced 600 families, subdivided themselves into a great number of petty tribes.—To these we may add the *Zuwarabs*, by European authors called *Azuagues*, or *Assagues*, who are likewise dispersed over most parts of Barbary and Numidia. Great numbers of these inhabit the mountainous parts of Cuco, Labez, &c. leading a wandering pastoral life.—But the most numerous inhabitants are the Moors and Arabians. The former are very stout and warlike, and skillful horsemen; but so addicted to robbing, that one cannot safely travel along the country at a distance from the towns without a guard, or at least a marabout or faint for a safeguard. For as they look upon themselves to be the original proprietors of the country, and not only as dispossessed by the rest of the inhabitants, but reduced by them to the lowest state of poverty, they make no scruple to plunder all they meet by way of reprisal. See **MOORS**.

ALGIERS, a city, the capital of the above kingdom, is probably the ancient *Icosium*: by the Arabians called *Algezair*, or rather *Al-Jezier*, or *Al-Jezerah*, i. e. *the island*, because there was an island before the city, to which it hath been since joined by a mole. It is built on the declivity of a hill by the sea-side, in the form of an amphitheatre: at sea, it looks like the top-sail of a ship. The tops of the houses are quite flat and white; inasmuch, that when it is first discovered, one would take it to be a place where they bleach linen. One house rises above another in such a manner that they do not hinder each other's prospect. The streets are so narrow, that they will scarce admit two persons to walk a-breast, and the middle part is lower than the sides. When any loaded beasts, such as camels, horses, mules, or asses, pass along, you are forced to stand up close to the wall to let them pass by. There is but one broad street, which runs through the city from east to west, in which are the shops of the principal merchants, and the market for corn and other commodities. The lower part of the walls of the city are of hewn stone, and the upper part of brick; they are

30 feet high on the land side, and 40 towards the sea; the fosses or ditches are twenty feet broad, and seven deep. There is no sweet water in the city; and though there is a tank or cistern in every house, yet they often want water, because it rains but seldom: the chief supply is from a spring on a hill, the water of which is conveyed by pipes to above a hundred fountains, at which a bowl is fastened for the use of passengers. The common reservoir is at the end of the mole, where the ships take in their water. Every one takes his turn at these places, except the Turks, who are first, and the Jews last. There are five gates, which are open from sunrise till sun-setting; and seven forts, or castles, without the walls, the greatest of which is on the mole without the gate, all of which are well supplied with great guns. There are ten large mosques, and fifty small ones; three great colleges or public schools, and a great number of petty ones for children. The houses are square, and built of stone and brick, with a square court in the middle, and galleries all round. There are said to be about 100,000 inhabitants in the city, comprehending 5000 Jewish families, besides Christians. There are four fundics, or public inns, such as are in Turkey; and six cazernes, or barracks, for the unmarried Turkish soldiers, which will hold six hundred each. There are no inns for Christians to lodge in; but only a few tipping-huts kept by slaves, for the accommodation of Greeks and the poorer sort of travellers, where any thing may be had for money. Here are bagnios, or public baths, in the same manner as in Turkey, at a very moderate rate. The women have baths of their own, where the men dare not come. Without the city there are a great number of sepulchres, as also cells or chapels, dedicated to marabouts, or reputed saints, which the women go to visit every Friday. The Turkish soldiers are great tyrants; for they not only turn others out of the way in the streets, but will go to the farm-houses in the country for twenty days together, living on free quarters, and making use of every thing, not excepting the women. The Algerines eat, as in Turkey, sitting cross-legged round a table about four inches high, and use neither knives nor forks; before they begin, every one says, *Be isme Allah*, "In the name of God." When they have done, a slave pours water on all their hands as they sit, and then they wash their mouths. Their drink is water, sherbet, and coffee. Wine is not allowed, though drank immoderately by some. E. Long. 3. 30. N. Lat. 36. 40.

ALGOL, a fixed star of the third magnitude, called *Medusa's Head*, in the constellation Perseus; its longitude is 21°, 50', 42", of Taurus, and its latitude 23°, 23', 47", north; according to Flamsteed's catalogue.

ALGONQUINS, a nation in North America, who formerly possessed great tracts of land along the north shore of the river St Lawrence. For a long time they had no rivals as hunters and warriors, and were long in alliance with the Iroquois; whom they agreed to protect from all invaders, and to let them have a share of their venison. The Iroquois, on the other hand, were to pay a tribute to their allies, out of the culture of the earth; and to perform for them all the menial duties, such as slaying the game, curing the flesh, and dressing the skins. By degrees, however, the Iroquois associated in the hunting matches and warlike expeditions of the

Algiers

Algonquins

Algonquias

||
Ali.

Algonquins; so that they soon began to fancy themselves as well qualified, either for war or hunting, as their neighbours. One winter, a large detachment of both nations having gone out a-hunting, and secured, as they thought, a vast quantity of game, six young Algonquins and as many Iroquois were sent out to begin the slaughter. The Algonquins, probably become a little jealous of their associates, upon seeing a few elks, desired the Iroquois to return, on pretence that they would have sufficient employment in faying the game they should kill; but after three days hunting, having killed none, the Iroquois exulted, and in a day or two privately set out to hunt for themselves. The Algonquins were so exasperated at seeing their rivals return laden with game, that they murdered all the hunters in the night-time. The Iroquois dissembled their resentment; but in order to be revenged, applied themselves to study the art of war as practised among those savage nations. Being afraid of engaging with the Algonquins at first, they tried their prowess on other inferior nations, and, when they thought themselves sufficiently expert, attacked the Algonquins with such diabolical fury, as shewed they could be satisfied with nothing less than the extermination of the whole race; which, had it not been for the interposition of the French, they would have accomplished.—The few Algonquin nations that are now to be seen, seem entirely ignorant of agriculture, and subsist by fishing and hunting. They allow themselves a plurality of wives; notwithstanding which, they daily decrease in populousness, few or none of their nations containing above 6000 souls, and many of them not 2000. Their language is one of the three radical ones in North America, being understood from the river St Lawrence to the Mississippi.

ALGOR, with physicians, an unusual coldness in any part of the body.

ALGORITHM, an Arabic word expressive of numerical computation.

ALGUAZIL, in the Spanish polity, an officer whose business it is to see the decrees of a judge executed.

ALHAGI, in botany, the trivial name of a species of hedyfarum. See HEDYSARUM.

ALHAMA, a very pleasant town of the kingdom of Granada, in Spain, situated in the midst of some craggy mountains, about 25 miles S. W. of Granada, on the banks of the Rio Frio, in W. Long. 1. 10. N. Lat. 36. 59. and having the finest warm baths in all Spain. It was taken from the Moors in 1481. The inhabitants, though surpris'd, and the town without a garrison, made a gallant defence: but being at length forced to submit, the place was abandoned to the pillage of the *Christian* soldiers; who, not satisfied with an immense quantity of gold and jewels, made slaves of upwards of 3000 of the inhabitants.

ALI, gives the denomination to a sect, or division, among the Mahometans, who adhere to the right of succession of Ali, the fourth caliph, or successor of Mahomet, and the reform of Mussulmanism introduced by him. The sectaries of Ali are more particularly called *Schittes*; and stand opposed to the *Sunnites*, or sect of Omar, who adhere to the law, as left by Mahomet, Abubeker, and Omar. Ali was cousin of Mahomet, and son-in-law of that prophet, having married his daughter Fatimah. After Mahomet's death, great dif-

putes arose about the succession: many stood for Ali; but Abubeker was preferred, and elected the first kalif. Ali took his turn, after the death of Othman.—The Persians are the chief adherents to the sect of Ali, whom they hold to have been the legitimate successor of Mahomet, and Abubeker an usurper. On the contrary, the Turks are of the sect of Omar; and hold Ali in execration, having raised a furious civil war among the Mussulmans. The distinguishing badge of the followers of Ali is a red turban, which is worn by the Persians, who are hence called in derision, by the Turks, *Kishbachi*, *q. d. red-heads*. Ali is reputed the author of several works, particularly a Centiloquium, in great repute among the Arabs and Persians, part of which has been published in English by Mr Ockley.

ALIBI, in law: When a person pursued for the commission of a crime, libelled to have been perpetrated at a certain place, and upon a certain day, proves in his defence, that he was elsewhere at the time libelled, he is said to have proved *alibi*.

ALICANT, a large sea-port town, in the province of Valencia and territory of Segura. It is seated between the mountains and the sea, and has a castle deemed impregnable. The port is defended by three bastions furnished with artillery. To prevent the visits of the Algerine pirates, watch-towers were built to give notice of the approach of an enemy's ship. It was taken from the Moors in 1264. The castle was taken by the English in 1706, and held out a siege of two years before it was retaken by the French and Spaniards, and at last surrendered upon honourable terms, after part of the rock was blown up on which the castle stood, and the governor killed. The houses are high, and well built; and a very great trade is carried on here, particularly in wine and fruit. It is seated in the Mediterranean, on a bay of the same name, 37 miles north-east of Murcia, and 75 south of Valencia. W. Long. o. 36. N. Lat. 38. 24.

ALICATA, a mountain of Sicily, near the valleys Mazara and Noto, upon which was situated (as is generally thought) the famous Dardalion, where the tyrant Phalaris kept his brazen bull.

ALICATA, a town of Sicily, remarkable for corn and good wine. It was plundered by the Turks in 1543; and is seated on a sort of peninsula near the sea, twenty-two miles S. E. of Girgenti. E. Long. 15. 20. N. Lat. 37. 11.

ALIEN, in law, implies a person born in a strange country, not within the king's allegiance; in contradistinction to a denizen, or natural subject. The word is formed from the Latin *alius*, another; *q. d.* one born in another country. An alien is incapable of inheriting lands in Britain, till naturalized by an act of parliament. No alien is entitled to vote at the election of members of parliament; nor can he enjoy any office, or be returned on any jury, unless where an alien is party in a cause, when the inquest is composed of an equal number of denizens and aliens. The reasons for establishing these laws were, that every man is presumed to bear faith and love to that prince and country where he received protection during his infancy; and that one prince might not settle spies in another's country; but chiefly, that the rents and revenues of the country might not be drawn to the subjects of another. Some have thought that the laws against a-

Alibi

||
Alien.

liens

Alien,
Aliment.

liens were introduced in the time of Henry II. when a law was made at the parliament of Wallingford, for the expulsion of strangers, in order to drive away the Flemings and Picards introduced into the kingdom by the wars of king Stephen. Others have thought that the origin of this law was more ancient; and that it is an original branch of the feudal law: for by that law no man can purchase any lands but he must be obliged to do fealty to the lords of whom the lands are holden; so that an alien who owed a previous faith to another person, could not take an oath of fidelity in another sovereign's dominions. Among the Romans, only the *Cives Romani* were esteemed freemen; but, when their territories increased, all the Italians were made free, under the name of *Latini*, tho' they had not the privilege of wearing gold rings till the time of Justinian. Afterwards all born within the pale of the empire were considered as citizens.

ALIEN-DUTY, an impost laid on all goods imported by aliens, over and above the customs paid for such goods imported by British, and on British bottoms.

ALIEN-PRIORIES, a kind of inferior monasteries, formerly very numerous in England, and so called from their belonging to foreign abbeyes.

ALIENATION, in law, denotes the act of making over a man's property in land, tenements, &c. to another person.

ALIENATION in mortmain, is making over lands, tenements, &c. to a body-politic, or to a religious house, for which the king's licence must first be obtained, otherwise the lands, &c. alienated will be forfeited *.

* See Mortmain.

ALIMENT, (from *alo* to nourish,) implies food both solid and liquid: from which, by the process of digestion, is prepared a very mild, sweet, and whitish liquor, resembling milk, and distinguished by the name of *chyle*; which being absorbed by the lacteal veins, by them conveyed into the circulation, and there assimilated into the nature of blood, affords that supply of nutrition which the continual waste of the body is found to require.—Next to air, food is the most necessary thing for the preservation of our bodies: and as on the choice thereof our health greatly depends, it is of great importance to understand, in general, what is the properest for our nourishment; and, in particular deviations from health, what is the best adapted to restore us. Our blood and juices naturally incline to become putrid and acrimonious: fresh chyle, duly received, prevents this destructive tendency, and preserves in them that mild state which alone consists with health. An animal diet affords the most of this bland nutritious mucilage; watery fluids dilute the too gross parts, and carry off what is become unfit for use. It is only the small portion of jelly which is separated from the farinaceous parts of vegetables, that, after being much elaborated, is converted into the animal nature; yet the use of vegetables prevents both repletion, and a too great tendency to a putrescent acrimony of the blood. In hot climates, as well as against the constitutional heat of particular persons, vegetables are demanded in the largest portion; animal substances afford the highest relish while our appetite continues, but will sate the appetite before the stomach is duly filled. Vegetables may be eaten after either flesh or fish: few herbs or fruits satiate so much as that the stomach may not be filled with them, when it is already

satisfied with flesh or fish; whence it may be observed, that no diet which is very nourishing can be eat to fulness, because its nutritious parts are oily and fatiating.—Health depends almost wholly on a proper crasis of the blood; and to preserve this a mixture of vegetables in some degree is always required, for a loathing is soon the consequence of animal food alone: hot acrid habits, too, receive from milk and vegetables the needful for correcting their excesses; but in cold, pituitous, and nervous habits, who want most nourishment from least digestion, and from the smallest quantity of food, animal diet is to be used more freely.

Thus much being offered as general principles with respect to the matter and quality of our aliment, the valetudinarian may easily regulate his diet with some advantage to himself by an attention to the few ensuing particulars. In winter, eat freely, but drink sparingly: roast meat is to be preferred, and what is drank should be stronger than at other seasons. In summer, let thirst determine the quantity to be drank; cold stomachs never require much: boiled meats and vegetables, if not otherwise contradicted, may now be more freely used. Lax habits require the winter's diet to be continued all the year, and rigid ones should be confined to that of summer. Fat people should fast at times, but the lean should never do so. Those who are troubled with eruptions occasioned by their food, should drink but little, and use some unaccustomed exercise. The thirsty should drink freely, but eat sparingly. In general, let moderation be observed; and tho' no dinner hath been had, a light supper is at all times to be preferred. After very high-seasoned meats, a glass of water acidulated with the acid elixir of vitriol *, or in very weak stomachs the sweet elixir of vitriol †, is far more assuaging to the work of digestion than the common method of taking brandy.

Obligation of ALIMENT, in Scots law, the natural obligation on parents to provide their children with the necessaries of life, &c. See LAW, Part III. No clxxiii. 4

ALIMONY, in law, implies that allowance which a married woman sues for, and is entitled to, upon any occasional separation from her husband *.

ALIPILARIUS, or **ALIPILUS**, in Roman antiquity, a servant belonging to the baths, whose business it was, by means of waxen plasters, and an instrument called *collella*, to take off the hairs from the arm-pits, and even arms, legs, &c. this being deemed a point of cleanliness.

ALIPTERIUM, *achirologus*, in antiquity, a place in the ancient *palastra*, where the *athleta* were anointed before their exercises.

ALIQUNT PART, in arithmetic, is that number which cannot measure any other exactly without some remainder. Thus 7 is an aliquant part of 16; for twice 7 wants two of 16, and three times 7 exceeds 16 by 5.

ALIQUNT PART, is that part of a number or quantity, which will exactly measure it without any remainder. Thus 2 is an aliquot part of 4; 3 of 9; 4 of 16; &c.

ALISMA, or **THRUMWORT**, a genus of the polygynia order, belonging to the hexandria class of plants. Of this genus, Linnaeus enumerates seven species, viz. the plantago, or great water-plantain, which grows in all the marshy parts of this country; the ranunculoides, or lesser water-plantain; the natans, or creeping water-plantain; the damasonium, or star-headed water-plantain; all which

* See Law, Part III. No clx. 13.

Allies
||
Allatius.

are natives of Britain. The others, *viz.* the flava, cordifolia, and subulata, are natives of America, where they are generally found in stagnating waters, and other swampy places; so that it would be difficult to preserve them in Britain, for they will not live in the open air, and require a bog to make them thrive: but as they are plants of no great beauty or use, it is not worth while to cultivate them in this country.

ALITES, in Roman antiquity, a designation given to fuch birds as afforded matter of auguries by their flight.

ALKAHEST, or ALCAHEST, in chemistry, an universal menstruum capable of resolving all bodies into their first principles. Van Helmont pretended he was possessed of such a menstruum; but, however credulous people might be imposed on in his days, the notion is now become as ridiculous as the philosopher's stone, the perpetuum mobile, &c.—It is likewise used by some authors for all fixed salts volatilized.

ALKALI, in chemistry. See *ALCALI*.

ALKANET, in botany. See *ANCHUSA*.

ALKEKENGI, in botany, the trivial name of a species of physalis. See *PHYSALIS*.

ALKERMES, in pharmacy, a compound cordial medicine made in the form of a confection, deriving its name from the kermes-berries used in its composition*.

ALL-HALLOWES. See the next article.

ALL-SAINTS, in the calendar, denotes a festival celebrated on the first of November, in commemoration of all the saints in general; which is otherwise called *All-hallows*. The number of saints being so excessively multiplied, it was found too burdensome to dedicate a feast-day to each. In reality, there are not days enough, scarce hours enough, in the year, for this purpose. Hence an expedient was had recourse to, by commemorating such in the lump as had not their own days. Boniface IV. in the ninth century, introduced the feast of *All-Saints* in Italy, which was soon after adopted into the other churches.

ALL-SAINTS Bay, a spacious harbour near St Salvador in Brazil, in S. America, on the Atlantic Ocean. W. long. 40°, S. lat. 12°.

ALL-SOULS, a festival kept in commemoration of all the faithful deceased, on the second of November.

ALLA, or ALLAH, the name by which the professors of Mahometanism call the Supreme Being.

The term *alla* is Arabic, derived from the verb *alab*, to adore. It is the same with the Hebrew *Elab*, which signifies the *Adorable Being*.

ALLANTOIS, or ALLANTOIDES, a gut-shaped vesicle investing the fetus of cows, goats, sheep, &c. filled with an urinous liquor conveyed to it from the urachus.—Anatomists are not agreed whether the allantoids has any existence in the human species or not*.

ALLATIUS (Leo), keeper of the Vatican library, a native of Scio, and a celebrated writer of the 17th century. He was of great service to the gentlemen of Port Royal in the controversy they had with M. Claude touching the belief of the Greeks with regard to the eucharist. No Latin was ever more devoted to the see of Rome, or more inveterate against the Greek schismatics, than Allatius. He never engaged in matrimony, nor was he ever in orders; and Pope Alexander VII. having asked him one day, why he did not enter into orders, he answered, "Because I would be

free to marry." The pope rejoined, "If so, why do you not marry?" "Because," replied Allatius, "I would be at liberty to take orders." Thus, as Mr Bayle observes, he passed his whole life, wavering betwixt a parish and a wife; sorry, perhaps, at his death, for having chosen neither of them; when, if he had fixed upon one, he might have repented his choice for 30 or 40 years.—If we believe John Patricius, Allatius had a very extraordinary pen, with which, and no other, he wrote Greek for 40 years; and we need not be surpris'd, that, when he lost it, he was so grieved, that he could scarce forbear crying. He published several manuscripts, several translations of Greek authors, and several pieces of his own composing. In his compositions he is thought to shew more erudition than judgment: he used also to make frequent digressions from one subject to another. He died at Rome in 1669, aged 83.

ALLAY. See *ALLOY*.

ALLEGATA, a word anciently subscribed at the bottom of rescripts and constitutions of the emperors; as *signata*, or *testata*, was under other instruments.

ALLEGIANCE, in law, is the tie, or *ligamen*, which binds the subject to the king, in return for that protection which the king affords the subject. The thing itself, or substantial part of it, is founded in reason and the nature of government; the name and the form are derived to us from our Gothic ancestors. Under the feudal system, every owner of lands held them in subjection to some superior or lord, from whom or from whose ancestors the tenant or vassal had received them: and there was a mutual trust or confidence subsisting between the lord and vassal, that the lord should protect the vassal in the enjoyment of the territory he had granted him; and, on the other hand, that the vassal should be faithful to the lord, and defend him against all his enemies. This obligation on the part of the vassal was called his *fidelitas* or fealty; and an oath of fealty was required by the feudal law to be taken by all tenants to their landlord, which is couched in almost the same terms as our ancient oath of allegiance: except, that in the usual oath of fealty, there was frequently a saving or exception of the faith due to a superior lord by name, under whom the landlord himself was perhaps only a tenant or vassal. But when the acknowledgement was made to the absolute superior himself, who was vassal to no man, it was no longer called the oath of fealty, but the oath of allegiance; and therein the tenant swore to bear faith to his sovereign lord, in opposition to all men, without any saving or exception: "*contra omnes homines fidelitatem fecit*." Land held by this exalted species of fealty, was called *feudum ligium*, a liege fee; the vassals *homines ligii*, or liege men; and the sovereign, their *dominus ligius*, or liege lord. And when sovereign princes did homage to each other for lands held under their respective sovereignties, a distinction was always made between *simple* homage, which was only an acknowledgement of tenure; and *liege* homage, which included the fealty before-mentioned, and the services consequent upon it. Thus, when Edward III. of England in 1329, did homage to Philip VI. of France, for his dual dominions on that continent; it was warmly disputed of what species the homage was to be, whether *liege* or *simple* homage. But with us in Britain, it becoming a settled principle of tenure, that all lands in the king-
dom

and *Compara-
tive Ana-
tomy*, no 79.

dom are holden of the king as their sovereign and lord paramount, no oath but that of fealty could ever be taken to inferior lords; and the oath of allegiance was necessarily confined to the person of the king alone. By an easy analogy, the term of *allegiance* was soon brought to signify all other engagements which are due from subjects to their prince, as well as those duties which were simply and merely territorial. And the oath of allegiance, as administered in England for upwards of 600 years, contained a promise "to be true and faithful to the king and his heirs, and truth and faith to bear of life and limb and terrene honour, and not to know or hear of any ill or damage intended him, without defending him therefrom." But, at the revolution, the terms of this oath being thought perhaps to favour too much the notion of non-resistance, the present form was introduced by the convention parliament, which is more general and indeterminate than the former; the subject only promising "that he will be faithful and bear true allegiance to the king," without mentioning "his heirs," or specifying in the least wherein that allegiance consists. The oath of supremacy is principally calculated as a renunciation of the pope's pretended authority: and the oath of abjuration, introduced in the reign of King William, very amply supplies the loose and general texture of the oath of allegiance; it recognizing the right of his majesty, derived under the act of settlement; engaging to support him to the utmost of the juror's power; promising to disclose all traitorous conspiracies against him; and expressly renouncing any claim of the defendants of the late pretender, in as clear and explicit terms as the English language can furnish. This oath must be taken by all persons in any office, trust, or employment; and may be tendered by two justices of the peace to any person whom they shall suspect of disaffection. And the oath of allegiance may be tendered to all persons above the age of twelve years, whether natives, denizens, or aliens.

But, besides these *express* engagements, the law also holds that there is an *implied*, *original*, and *virtual* allegiance, owing from every subject to his sovereign, antecedently to any express promise, and although the subject never swore any faith or allegiance in form. For as the king, by the very descent of the crown, is fully invested with all the rights and bound to all the duties of sovereignty, before his coronation; so the subject is bound to his prince by an intrinsic allegiance, before the super-induction of those outward bonds of oath, homage, and fealty, which were only instituted to remind the subject of this his previous duty, and for the better securing its performance. The formal profession, therefore, or oath of subjection, is nothing more than a declaration in words of what was before implied in law. Which occasions Sir Edward Coke very justly to observe, that "all subjects are equally bounden to their allegiance, as if they had taken the oath; because it is written by the finger of the law in their hearts, and the taking of the corporal oath is but an outward declaration of the same." The sanction of an oath, it is true, in case of violation of duty, makes the guilt still more accumulated, by superadding perjury to treason; but it does not increase the civil obligation to loyalty; it only strengthens the *social* tie, by uniting it with that of *religion*.

Allegiance, both express and implied, is however distinguished by the law into two sorts or species, the one *natural*, the other *local*; the former being also perpetual, the latter temporary.

Natural allegiance is such as is due from all men born within the king's dominions immediately upon their birth. For, immediately upon their birth, they are under the king's protection; at a time too, when (during their infancy) they are incapable of protecting themselves. Natural allegiance is, therefore, a debt of gratitude; which cannot be forfeited, cancelled, or altered, by any change of time, place, or circumstance, nor by any thing but the united concurrence of the legislature. A Briton who removes to France, or to China, owes the same allegiance to the king of Britain there, as at home, and twenty years hence as well as now. For it is a principle of universal law, That the natural-born subject of one prince cannot by any act of his own, no, not by swearing allegiance to another, put off or discharge his natural allegiance to the former: for this natural allegiance was intrinsic, and primitive, and antecedent to the other; and cannot be divested without the concurrent act of that prince to whom it was first due. Indeed the natural-born subject of one prince, to whom he owes allegiance, may be entangled by subjecting himself absolutely to another: but it is his own act that brings him into those straits and difficulties, of owing service to two masters; and it is unreasonable, that, by such voluntary act of his own, he should be able at pleasure to unloose those bands by which he is connected to his natural prince.

Local allegiance is such as is due from an alien, or stranger born, for so long time as he continues within the king's dominion and protection; and it ceases, the instant such stranger transfers himself from this kingdom to another. Natural allegiance is therefore *perpetual*, and *local* *temporary* only; and that for this reason, evidently founded upon the nature of government, That allegiance is a debt due from the subject, upon an implied contract with the prince, that so long as the one affords protection, so long the other will demean himself faithfully. As, therefore, the prince is always under a constant tie to protect his natural-born subjects at all times and in all countries, for this reason their allegiance due to him is equally universal and permanent. But, on the other hand, as the prince affords his protection to an alien, only during his residence in this realm, the allegiance of an alien is confined (in point of time) to the duration of such his residence, and (in point of locality) to the dominions of the British empire. From which considerations, Sir Matthew Hale deduces this consequence, That, though there be an usurper of the crown, yet it is treason for any subject, while the usurper is in full possession of the sovereignty, to practice any thing against his crown and dignity: wherefore, altho' the true prince regain his sovereignty yet such attempts against the usurper (unless in defence or aid of the rightful king) have been afterwards punished with death; because of the breach of that temporary allegiance, which was due to him as king *de facto*. And upon this footing, after Edward IV. recovered the crown, which had been long detained from his house by the line of Lancaster, traitors committed against Henry VI. were capitally punished, tho' Henry had been declared an usurper by parliament.

Allegory
||
Allegro.

The oath of allegiance, or rather the *allegiance* itself, is held to be applicable not only to the political capacity of the king, or regal office; but to his natural person, and blood-royal: and for the misapplication of their allegiance, *viz.* to the regal capacity or crown, exclusive of the person of the king, were the Spencers banished in the reign of Edward II. And from hence arose that principle of personal attachment, and affectionate loyalty, which induced our forefathers (and, if occasion required, would doubtless induce their sons) to hazard all that was dear to them, life, fortune, and family, in defence and support of their liege lord and sovereign.

ALLEGORY, in composition, consists in chusing a secondary subject, having all its properties and circumstances resembling those of the principal subject, and describing the former in such a manner as to represent the latter. The principal subject is thus kept out of view, and we are left to discover it by reflection. In other words, an allegory is, in every respect, similar to an hieroglyphical painting, excepting only that words are used instead of colours. Their effects are precisely the same: An hieroglyphic raises two images in the mind; one seen, that represents one that is not seen: An allegory does the same; the representative subject is described, and the resemblance leads us to apply the description to the subject represented.

There cannot be a finer or more correct allegory than the following, in which a vineyard is made to represent God's own people the Jews:

"Thou hast brought a vine out of Egypt; thou hast cast out the heathen, and planted it. Thou didst cause it to take deep root, and it filled the land. The hills were covered with its shadow, and the boughs thereof were like the goodly cedars. Why hast thou then broken down her hedges, so that all that pass do pluck her? The bear out of the wood doth waste it, and the wild beast doth devour it. Return, we beseech thee, O God of hosts: look down from heaven, and behold, and visit this vine and the vineyard thy right-hand hath planted, and the branch thou madest strong for thyself." Psal. lxxx.

Nothing gives greater pleasure than an allegory, when the representative subject bears a strong analogy, in all its circumstances, to that which is represented. But most writers are unlucky in their choice, the analogy being generally so faint and obscure, as rather to puzzle than to please. Allegories, as well as metaphors and similes, are unnatural in expressing any severe passion which totally occupies the mind. For this reason, the following speech of Macbeth is justly condemned by the learned author of the Elements of Criticism:

Methought I heard a voice cry, Sleep no more!
Macbeth doth murder Sleep; the innocent sleep;
Sleep that knits up the ravell'd sleeve of Care,
The birth of each day's life, fore Labour's bath,
Balm of hurt minds, great Nature's second course,
Chief nourisher in life's feast. Act. ii. Sc. 3.
But see this subject more fully treated under the article METAPHOR and Allegory.

ALLEGRO, in music, an Italian word, denoting that the part is to be played in a sprightly, brisk, lively, and gay manner.

Piu ALLEGRO, signifies, that the part it is joined to

should be sung or played quicker; as

Poco piu ALLEGRO intimates, that the part to which it refers ought to be played or sung only a little more briskly than allegro alone requires.

ALLEIN (Joseph), the son of Tobias Allein, was born in the Devezes, in Wiltshire, in 1633, and educated at Oxford. In 1655, he became assitant to Mr Newton, in Taunton-Magdalen, in Somersetshire; but was deprived for non-conformity. He died in 1668, aged 35. He was a man of great learning, and greater charity; preferring, though a nonconformist and a severe sufferer on that account, great respect for the church, and loyalty to his sovereign. He wrote several books of piety, which are highly esteemed; but his *Alarm to unconverted sinners* is more famous than the rest. There have been many editions of this little pious work, the sale of which has been very great; of the edition 1672, there were 20,000 sold; of that 1675, with this title, *A sure guide to heaven*, 50,000. There was also a large impression of it with its first title, in 1720.

ALLEMAND, a sort of grave solemn music, with good measure, and a slow movement.—It is also a brisk kind of dance, very common in Germany and Switzerland.

ALLEMANNIC, in a general sense, denotes any thing belonging to the ancient Germans. Thus, we meet with Allemannic history, Allemannic language, Allemannic law, &c.

ALLEN (Thomas), a famous mathematician of the sixteenth century, born at Uttoxeter in Staffordshire, the 21st of December 1542. He was admitted scholar of Trinity-college, Oxford, the 4th of June 1561; and in 1567, took his degree of master of arts. In 1570, he quitted his college and fellowship, and retired to Gloucester-hall; where he studied very closely, and became famous for his knowledge in antiquity, philosophy, and mathematics. Having received an invitation from Henry earl of Northumberland, a great friend and patron of the mathematicians, he spent some time at the earl's house, where he became acquainted with those celebrated mathematicians Thomas Harriot, John Dee, Walter Warner, and Nathaniel Torporley. Robert earl of Leicester had a particular esteem for Mr Allen, and would have conferred a bishopric upon him, but his love of solitude and retirement made him decline the offer. His great skill in the mathematics, made the ignorant and vulgar look upon him as a magician or conjurer: the author of a book intitled *Leicester's Commonwealth*, has accordingly accused him with using the art of figuring, to procure the earl of Leicester's unlawful designs, and endeavouring by the black art to bring about a match betwixt him and Queen Elizabeth. But without pretending to point out the absurdity of the charge, it is certain that the earl placed such confidence in Allen, that nothing material in the state was transacted without his knowledge; and the earl had constant information, by letter, from Mr Allen, of what passed in the university. Mr Allen was very curious and indefatigable in collecting scattered manuscripts relating to history, antiquity, astronomy, philosophy, and mathematics: these collections have been quoted by several learned authors, &c. and mentioned to have been in the Bibliotheca Alleniana. He published in Latin the second and third books of Claudius

Allein
||
Allen.

Allendorf

Alley.

dus Ptolemy of Pelusium, *Concerning the Judgment of the Stars*, or, as it is commonly called, of the *Quadripartite Constitution*, with an exposition. He wrote also notes on many of Lilly's books, and some on John Bale's work *De Scripturis Maj. Britannia*. Having lived to a great age, he died at Gloucester-hall, on the 30th of September 1632.

ALLENDORF, a small town in the circle of the Upper Rhine, and in the landgraviate of Hesse-Cassel, remarkable for its falt-works, and three stone-bridges. It is seated on the river Wefer, 15 miles east of Cassel; E. Long. 10. 5. N. Lat. 51. 26.

ALLER, a river which runs thro' the duchy of Lunenburg, and falls into the Wefer, a little below Verden.

ALLERION, or ALERION, in heraldry, a sort of eagle without beak or feet, having nothing perfect but the wings. They differ from martlets by having their wings expanded, whereas those of the martlet are clofe; and denote imperialists vanquished and disarmed, for which reason they are more common in French than in German coats of arms.

ALLESTRY (Richard) D. D. an eminent divine, born at Uppington in Shropshire, in March 1619, was educated in the grammar school at Coventry, and afterwards at Christ-church in Oxford. His parts, which were extraordinary, were improved by a no less extraordinary industry. He took up arms for King Charles I. and was sometimes seen with his musket in one hand and his book in the other. He was very active in the service of King Charles II. before his restoration, and was employed by the royalists in transacting business with that prince during his exile; but was at last seized at Dover by a party of soldiers, and committed prisoner to Lambeth-house, where he was confined six or eight weeks: but soon after the restoration he was made canon of Christ-church, created doctor of divinity, and appointed chaplain in ordinary to the king, and regius professor of divinity. In 1665, he was appointed provost of Eton college, where he raised the school, which he found in a low condition, to an uncommon pitch of reputation. The west side of the outward quadrangle of that college was built from the ground at his expence. The excellent Dr Hammond, who was his intimate friend, left him his valuable library, which he himself afterwards bequeathed to his successors in the divinity-chair. He was eminent for his piety, benevolence, and integrity; for the sincerity of his friendships, and his disinterested temper. He wrote several books; and a collection of his sermons were printed after his decease, by Dr Fell, bishop of Oxford. He died August 28th 1680.

ALLEVEURE, a small brass Swedish coin, worth about $\frac{1}{4}$ d. English money.

ALLEY (William), bishop of Exeter in the reign of Queen Elizabeth, was born at Great Wychomb in Buckinghamshire. From Eton school, in the year 1528, he removed to king's college, Cambridge, where he took the degree of bachelor of arts. He also studied some time at Oxford; afterwards he married, was presented to a living, and became a zealous reformer. Upon Queen Mary's accession, he left his cure, and retired into the north of England; where he maintained his wife and himself by teaching a school, and practising physic. Queen Elizabeth ascending the throne, he went to London, where he acquired great reputa-

tion by reading the divinity-lecture at St Paul's, and in July 1560 was consecrated bishop of Exeter. He was created doctor of divinity at Oxford in Nov. 1561. He died on the 15th of April 1570; and was buried at Exeter, in the cathedral. He wrote, 1. *The poor man's library*, 2 vol. fol. Lond. 1571. These volumes contain twelve lectures on the first epistle of St Peter, read at St Paul's. 2. *A Hebrew grammar*. Whether it was ever published, is uncertain. He translated the Pentateuch, in the version of the Bible which was undertaken by queen Elizabeth's command.

ALLEY, in gardening, a straight parallel walk, bounded on both sides with trees, shrubs, &c. and usually covered with gravel or turf.

ALLEY, among builders, denotes a narrow passage leading from one place to another.

ALLEY, in perspective, that which, in order to have a greater appearance of length, is made wider at the entrance than at the termination.

ALLIA, a river of Italy, which running down a very steep channel from the mountains of Crustumium, mixes with the Tiber at 40 miles from Rome; famous for the great slaughter of the Romans by the Gauls, under Brennus: hence *Allien's die*, an unlucky day, (Virgil, Ovid, Lucan.) Our ancestors, says Cicero, deemed the day of the fight of *Allia*, more fatal than that of taking the city.

ALLIANCE, in the civil and canon law, the relation contracted between two persons or two families by marriage.

ALLIANCE is also used for a treaty entered into by sovereign princes and states, for their mutual safety and defence.—In this sense, alliances may be distinguished into such as are offensive, whereby the contracting parties oblige themselves jointly to attack some other power; and into defensive ones, whereby they bind themselves to stand by and defend each other in case they are attacked by others.

ALLIANCE, in a figurative sense, is applied to any kind of union or connection; thus we say, there is an alliance between the church and state.

ALLIGATI, in Roman antiquity, the basest kind of slaves, who were usually kept fettered. The Romans had three degrees, or orders, of slaves or servants; the first employed in the management of their estates; the second in the menial or lower functions of the family; the third called *alligati*, abovementioned.

ALLIGATION, the name of a method of solving all questions that relate to the mixture of one ingredient with another. Though writers on arithmetic generally make alligation a branch of that science; yet, as it is plainly nothing more than an application of the common properties of numbers, in order to solve a few questions that occur in particular branches of business, we chuse rather to keep it distinct from the science of arithmetic.

Alligation is generally divided into *medial* or *alter-nate*.

ALLIGATION *Medial*, from the rates and quantities of the simples given, discovers the rate of the mixture.

Rule. As the total quantity of the simples,
To their price or value;
So any quantity of the mixture,
To the rate.

Examp. A grocer mixeth 30 lb. of currants, at
4 d.

Alley
||
Alligation.

Alligation. 4 d. per lb. with 10 lb. of other currants, at 6 d. per lb : What is the value of 1 lb. of the mixture. *Ans.* 4½ d.

lb.	d.	d.
30,	at 4 amounts to	120
10,	at 6 ———	60
40		180

If 40 : 180 :: 1 : 4½

Note 1. When the quantity of each simple is the same, the rate of the mixture is readily found by adding the rates of the simples, and dividing their sum by the number of simples, thus.

Suppose a grocer mixes several forts of sugar, and of each an equal quantity, viz. at 50 s. and at 54 s. and at 60 s. per Cwt. the rate of the mixture will be 54 s. 8 d. per Cwt.; for

$$50 + 54 + 60 = 164, \text{ and } 3)164)54 \text{ 8}$$

Note 2. If it be required to increase or diminish the quantity of the mixture, say, As the sum of the given quantities of the simples, to the several quantities given; so the quantity of the mixture proposed, to the quantities of the simples sought.

Note 3. If it be required to know how much of each simple is in an assigned portion of the mixture, say, As the quantity of the mixture, to the several quantities of the simples given; so the quantity of the assigned portion, to the quantities of the simples sought. Thus,

Suppose a grocer mixes 10 lb. of raisins, with 30 lb. of almonds, and 40 lb of currants, and it be demanded, how many ounces of each fort are found in every pound or in every sixteen ounces of the mixture, say,

	Oz.
80 : 10 :: 16 : 2 raisins.	
80 : 30 :: 16 : 6 almonds.	
80 : 40 :: 16 : 8 currants.	

Proof 16

Note 4. If the rates of two simples, with the total value and total quantity of the mixture, be given, the quantity of each simple may be found as follows, viz. Multiply the lesser rate into the total quantity, subtract the product from the total value, and the remainder will be equal to the product of the excess of the higher rate above the lower, multiplied into the quantity of the higher-priced simple; and consequently the said remainder, divided by the difference of the rates, will quote the said quantity. Thus,

Suppose a grocer has a mixture of 400 lb weight, that cost him 7 l. 10 s. consisting of raisins at 4 d. per lb. and almonds at 6 d. how many pounds of almonds were in the mixture?

L. s. d.	Rates.
400	6 d.
7 10=1800	4 4 d.
1600	1600 d. 2 d.

2)200(100 lb. of almonds at 6 d. is
And 300 lb. of raisins at 4 d. is,

Total 400

L. s.
2 10
5 0

Proof 7 10

ALLIGATION Alternate, being the converse of alligation medial, from the rates of the simples, and rate of the mixture given, finds the quantities of the simples.

Rules. I. Place the rate of the mixture on the left side of a brace, as the root; and on the right side of the brace set the rates of the several simples, under one another, as the branches. II. Link or alligate the branches, so as one greater and another less than the root may be linked or yoked together. III. Set the difference betwixt the root and the several branches, right against their respective yoke-fellows. These alternate differences are the quantities required. Note, 1. If any branch happen to have two or more yoke-fellows, the difference betwixt the root and these yoke-fellows must be placed right against the said branch, one after another, and added into one sum. 2. In some questions, the branches may be alligated more ways than one; and a question will always admit of so many answers, as there are different ways of linking the branches.

Alligation alternate admits of three varieties, viz.

1. The question may be unlimited, with respect both to the quantity of the simples, and that of the mixture. 2. The question may be limited to a certain quantity of one or more of the simples. 3. The question may be limited to a certain quantity of the mixture.

Variety I. When the question is unlimited, with respect both to the quantity of the simples, and that of the mixture, this is called *Alligation Simple*.

Examp. A grocer would mix sugars, at 5 d. 7 d. and 10 d. per lb. so as to sell the mixture or compound at 8 d. per lb : What quantity of each must he take?

	lb.
8 { 5 2	2
7 { 7 2	2
10 { 3, 1	4

Here the rate of the mixture 8 is placed on the left side of the brace, as the root; and on the right side of the same brace are set the rates of the several simples, viz. 5, 7, 10, under one another, as the branches; according to Rule I.

The branch 10 being greater than the root, is alligated or linked with 7 and 5, both these being less than the root; as directed in Rule II.

The difference between the root 8 and the branch 5, viz. 3, is set right against this branch's yoke-fellow 10. The difference between 8 and 7 is likewise set right against the yoke-fellow 10. And the difference betwixt 8 and 10, viz. 2, is set right against the two yoke-fellows 7 and 5; as prescribed by Rule III.

As the branch 10 has two differences on the right, viz. 3 and 1, they are added; and the answer to the question is, that 2 lb at 5 d. 2 lb at 7 d. and 4 lb at 10 d. will make the mixture required.

The truth and reason of the rules will appear by considering, that whatever is lost upon any one branch is gained upon its yoke-fellow. Thus, in the above example, by selling 4 lb of 10 d. sugar at 8 d. per lb there is 8 d. lost: but the like sum is gained upon its two yoke-fellows; for by selling two 2 lb of 5 d. sugar at 8 d. per lb. there is 6 d. gained; and by selling 2 lb of 7 d. sugar at 8 d. there is 2 d. gained; and 6 d. and 2 d. make 8 d.

Hence it follows, that the rate of the mixture must always be mean or middle with respect to the rates of the

Alligation
Allium.

the simples; that is, it must be lefts than the greatest, and greater than the least; otherwise a solution would be impossible. And the price of the total quantity mixed, computed at the rate of the mixture, will always be equal to the sum of the prices of the several quantities cast up at the respective rates of the simples.

Variety II. When the question is limited to a certain quantity of one or more of the simples, this is called *Alligation Partial*.

If the quantity of one of the simples only be limited, alligate the branches, and take their differences, as if there had been no such limitation; and then work by the following proportion:

As the difference right against the rate of the simple whose quantity is given,

To the other differences respectively;

So the quantity given,

To the several quantities sought.

Examp. A distiller would, with 40 gallons of brandy at 12 s. *per* gallon, mix rum at 7 s. *per* gallon, and gin at 4 s. *per* gallon: How much of the rum and gin must he take, to sell the mixture at 8 s. *per* gallon?

Gal.

$$8 \left\{ \begin{array}{l} 12 \\ 7 \\ 4 \end{array} \right. \begin{array}{l} 14 \\ 4 \\ 4 \end{array} \left| \begin{array}{l} 5 \\ 4 \\ 4 \end{array} \right. \left\{ \begin{array}{l} 40 \text{ of brandy.} \\ 32 \text{ of rum.} \\ 32 \text{ of gin.} \end{array} \right\} \text{Ans.}$$

The operation gives for answer, 5 gallons of brandy, 4 of rum, and 4 of gin. But the question limits the quantity of brandy to 40 gallons; therefore say,

If 5 : 4 :: 40 : 32

The quantity of gin, by the operation, being also 4, the proportion needs not be repeated.

Variety III. When the question is limited to a certain quantity of the mixture, this is called *Alligation Total*.

After linking the branches, and taking the differences, work by the proportion following:

As the sum of the differences,

To each particular difference;

So the given total of the mixture,

To the respective quantities required.

Examp. A vintner hath wine at 3 s. *per* gallon, and would mix it with water, so as to make a composition of 144 gallons, worth 2 s. 6 d. *per* gallon: How much wine, and how much water, must he take?

Gal.

$$\begin{array}{r|l} 30 \left\{ \begin{array}{l} 36 \\ 0 \end{array} \right. 36 \left\{ \begin{array}{l} 120 \text{ of wine.} \\ 24 \text{ of water.} \end{array} \right\} \text{Ans.} \\ \hline 36 \quad 144 \text{ total.} \\ 120 \times 36 = 4320 \\ 24 \times 0 = 0 \end{array}$$

Proof 144, 4320 (30

As 36 : 30 :: 144 : 120

As 36 : 6 :: 144 : 24.

There being here only two simples, and the total of the mixture limited, the question admits but of one answer.

ALLIGATOR, in zoology, a synonyme of the *lacerta crocodilus*. See *LACERTA*.

ALLIOTH, a star in the tail of the greater bear, much used for finding the latitude at sea.

ALLIUM, (from *ἄλλω*, to avoid or shun, because many shun the smell of it), **GARLIC**; a genus of the mo-

Vol. I.

nogynia order belonging to the hexandria class of plants. Of this genus no fewer than 33 different species are enumerated by Linnæus, among which he includes the *cepa* and *porrum*; but as these are so generally known by the names of *onions* and *leeks*, we have given the description of them under these words **CEPA** and **PORRUM**.

The roots of garlic are of the bulbous kind, of an irregularly roundish shape, with several fibres at the bottom; each root is composed of a number of lesser bulbs, called *cloves* of garlic, inclosed in one common membranous coat, and easily separable from one another. All the parts of this plant, but more especially the roots, have an acrimonious, and almost caustic taste, with a strong offensive smell, which last has induced those who preserved some of the species in gardens on account of their yellow flowers, to eradicate them.

Culture. All the species of Garlic are very hardy, and will thrive in almost any soil or situation. They are easily propagated either by the roots or seeds. If from the roots, they ought to be planted in autumn, that they may take good root in the ground before the spring, which is necessary to make them flower strong the following summer. If they are propagated by seeds, they may be sown on a border of common earth, either in autumn, soon after the seeds are ripe, or in the spring following; and will require no farther care than to keep them clear from weeds. In the following autumn, they may be transplanted into the borders where they are to remain.

Medicinal Uses. This pungent root warms and stimulates the solids, and attenuates tenacious juices; for which it is well adapted, on account of its being very penetrating; inasmuch, that, when applied to the feet, its scent is soon discovered in the breath; and, when taken internally, its smell is communicated to the urine, or the matter of an issue, and perspires through the pores of the skin. Hence, in cold leucophlegmatic habits, it proves a powerful expectorant, diuretic, and emmenagogue; and, if the patient is kept warm, sudorific. It is also of great service in humoral asthma and catarrhus disorders of the breast, and in other disorders proceeding from a laxity of the solids, and cold sluggish disposition of the fluids. It is also frequently of service in the dropsy; in the beginning of which it is particularly recommended by Sydenham, as a warm strengthening medicine. By him it is also recommended as a most powerful revellent; for which purpose he was led to make use of it in the confluent small-pox. His method was to cut the root in pieces, and apply it, tied in a linnen cloth, to the soles of the feet, about the eighth day of the disease, after the face began to swell; renewing it once a-day till the danger was over. When made into an unguent with oils, and applied externally, garlic is said to resolve and disperse cold tumours, and has been by some greatly celebrated in cutaneous disorders.

The acrimonious qualities of this root, however, render it manifestly improper on many occasions.—Its liberal use is apt to occasion headaches, flatulencies, thirst, febrile heats, inflammatory distempers, and sometimes discharges of blood from the hemorrhoidal vessels. In hot bilious constitutions, where there is already a degree of irritation, where the juices are too thin and acrimonious, or the viscera unbound, it never fails to aggravate

vate the diftemper. See MATERIA MEDICA, n° 85.

ALLIX (Dr Peter), a learned French proteſtant divine, born at Alençon, in 1641. He became miniſter of the reformed church at Rothen, where he published many learned and curious pieces; the credit of which induced the reformed to call him to Charenton, about a league from Paris, being the principal church they had in France. On the revocation of the edict of Nantz, he retired to England; where he ſtudied the language with ſo much ſucceſs, as to publish a work, intitled *Reflections on the books in the Holy Scriptures, to eſtabliſh the truth of the Chriſtian Religion*, 2 vols; which he dedicated to James II. acknowledging his obligations to that prince, and his kind behaviour to the diſtreſſed refugees in general. He wrote ſeveral other treatiſes relating to eccleſiaſtical hiſtory; which rendered him as famous in England as in France, for his ingenious and ſolid defences of the reformed religion. He was complimented with the degree of D. D. and in 1690 was made treaſurer of the church of Salisbury. He died in 1717.

ALLOA, or ALLOWAY, a ſea-port town of Mentieth, in Scotland, ſeated on the river Forth, five miles eaſt of Stirling; and remarkable for its fine caſtle, the feat of the earl of Mar, and for the coal-mines near it. W. Long. 3. 45. N. Lat. 56. 10.

ALLOBROGES, (Inſcriptions, Livy, Velleius, Florus); from *Allobrox*, (Horace): a people of Gallia Narbonenſis, ſituated between the rivers Iſara and Rhodanus, and the Lacus Lemanus; commended by Cicero for their fidelity, diſcommended by Horace on account of their fondneſs for novelty.

ALLOCATION denotes the admitting or allowing of an article of an account, eſpecially in the exchequer. Hence,

ALLOCATIONE *Pacienda*, is a writ directed to the lord treaſurer, or barons of the exchequer, commanding them to allow an accountant ſuch ſums as he has lawfully expended in the execution of his office.

ALLODIUM, or ALEUD, denotes lands which are the abſolute property of their owner, without being obliged to pay any ſervice or acknowledgment whatever to a ſuperior lord.

ALLOY, or ALLAY, properly ſignifies a proportion of a baſer metal mixed with a finer one. The alloy of gold is eſtimated by carats, that of ſilver by penny-weights. See GOLD, &c. In different nations, different proportions of alloy are uſed; whence their moneys are ſaid to be of different degrees of fineneſs or baſeneſs, and are valued accordingly in foreign exchanges.

In a more general ſenſe, the word is employed in chemistry to ſignify the union of different metallic matters.—As an infinity of different combinations may be made according to the nature, the number, and the proportions of the metallic matters capable of being alloyed, we ſhall not here enter into the detail of the particular alloys, all which are not yet nearly known. Thoſe which are uſed, as *Bronze, Tombac, Braſs, White Copper*, &c. may be found under their particular names; and what is known concerning other alloys may be found under the names of the different metals and ſemi-metals.

ALLUMINOR, a perſon who colours or paints upon paper or parchment.—The word is derived from

the French *allumer*, to lighten.

ALLUSION, in rhetoric, a figure by which ſomething is applied to, or underſtood of, another, on account ſome ſimilitude between them.

ALLUVION, in law, denotes the gradual increaſe of land along the ſea-ſhore, or on banks of rivers *. * See Law, Part II.

ALLY, in matters of polity, a ſovereign prince or ſtate that has entered into alliance with others †. † See Alliance.

ALMACANTARS. See ALMUCANTARS.

ALMACARRON, a ſea-port town of Spain, in the province of Murcia, at the mouth of the river Guadalatin. It is about twenty miles weſt of Carthagena, and is remarkable for the prodigious quantity of alum found in its territory. W. Long. 1. 15. N. Lat. 37. 40.

ALMADE, a town of Spain, in the province of La Mancha, in the kingdom of Caſtile, ſituated upon the top of a mountain, where are the moſt ancient as well as the richeſt ſilver mines in Europe.

ALMADIE, a kind of canoe, or ſmall veſſel, about four fathoms long, commonly made of bark, and uſed by the negroes of Africa.

ALMADIE is alſo the name of a kind of long-boats, fitted out at Calicut, which are eighty feet in length, and fix or ſeven in breadth. They are exceedingly ſwift, and are otherwiſe called *cathuri*.

ALMAGEſT, in matters of literature, is particularly uſed for a collection or book compoſed by Ptolemy, containing various problems of the ancients both in geometry and aſtronomy.

ALMAGEſT is alſo the title of other collections of this kind. Thus, Riccioli has published a book of aſtronomy, which he calls the *New Almageſt*; and Plukenet, a book which he calls *Almageſtrum Botanicum*.

ALMAGRA, a fine deep red ochre, with ſome admixture of purple, very heavy, and of a denſe yet friable ſtructure, and rough duſty ſurface. It adheres very firmly to the tongue, melts freely and eaſily in the mouth, is of an auſtere and ſtrongly aſtringent taſte, and ſtains the ſkin in touching. It is the *Sil Atticum* of the ancients: it ferments very violently with acid menſtrums, by which ſingle quality, it is ſufficiently diſtinguiſhed from the *Sil Syricum*, to which it has in many reſpects a great affinity. It is found in immense quantities, in many parts of Spain; and in Andaluſia there are in a manner whole mountains of it. It is uſed in painting, and in medicine as an aſtringent.

ALMAGRO, a ſtoreſs of Spain, the capital of one of the diſtricts of La Mancha. It was built by the archbiſhop Roderic of Toledo, who finiſhed it in 1214, and put a conſiderable gariſon into it to reſtrain the incuſions of the Moors. This was hardly done, when the ſtoreſs was beſieged by an army of 5000 horſe and foot, under the command of a Moorish officer of great reputation; but the prelate, its founder, took care to ſupply thoſe within with ſuch plenty of neceſſaries, that at length the enemy found themſelves obliged to raiſe the ſiege and retire with great loſs.

ALMANACK, a book, or table, containing a calendar of days and months, the riſing and ſetting of the ſun, the age of the moon, the eclipſes of both luminaries, &c.—Authors are divided with regard to the etymology of the word; ſome deriving it from the Arabic particle *al*, and *manack*, to count; ſome from *al-manab*, new-years gifts, becauſe the Arabian aſtrologers uſed at the beginning of the year to make preſents

Almanack.

* See Law,
Part II.
Nº clxii. 6.

† See Al-
liance.

Almanack. of their ephemerides; and others, from the Teutonic *almaen-achte*, observations on all the months. Mr Johnson derives it from the Arabic particle *al*, and the Greek $\alpha\omega$, a month. But the most simple etymology appears from the common spelling; the word being composed of two Arabic ones, *Al Manack*, which signify *the Diary*. All the classes of Arabs are commonly much given to the study of astronomy and astrology; to both which a pastoral life, and a sort of husbandry, not only incline them, but give them time and leisure to apply themselves to them. They neither sow, reap, plant, travel, buy or sell, or undertake any expedition or matter, without previously consulting the stars, or, in other words, their almanacks, or some of the makers of them. From these people, by their vicinity to Europe, this art, no less useful in one sense than stupid and ridiculous in another, hath passed over hither: and those astronomical compositions have still every where not only retained their old Arabic name; but were, like theirs, for a long while, and still are among many European nations, interperfed with a great number of astrological rules for planting, sowing, bleeding, purging, &c. down to the cutting of the hair and paring of the nails.—Regiomontanus appears to have been the first in Europe, however, who reduced almanacks into their present form and method, gave the characters of each year and month, foretold the eclipses and other phases, calculated the motions of the planets, &c. His first almanack was published in 1474.

Almanacks differ from one another, chiefly, in containing some more, others fewer, particulars.

The essential part is the calendar of months and days, with the risings and settings of the sun, age of the moon, &c. To these are added various pererga, astronomical, meteorological, chronological, political, rural, &c. as calculations and accounts of eclipses, solar ingresses, prognostics of the weather, tables of the tides, terms, &c. lists of posts, offices, dignities, public institutions, with many other articles political as well as local, and differing in different countries.—A great variety are annually published in Britain; some for binding, which may be denominated *book-almanacks*; others in loose papers, called *sheet-almanacks*.

The modern almanack answers to the *Fasti* of the ancient Romans. See **FASTI**.

Construction of ALMANACKS. The first thing to be done is, to compute the sun's and moon's place for each day of the year, or it may be taken from some ephemerides and entered into the almanack; next, find the dominical letter, and, by means thereof, distribute the calendar into weeks; then, having computed the time of easter, by it fix the other moveable feasts; adding the immovable ones, with the names of the martyrs, the rising and setting of each luminary, the length of day and night, the aspects of the planets, the phases of the moon, and the sun's entrance into the cardinal points of the ecliptic, *i. e.* the two equinoxes and solstices *. By the help of good astronomical tables or ephemerides, the construction of almanacks is extremely easy.

ALMANACK, among antiquaries, is also the name given to a kind of instrument, usually of wood, inscribed with various figures and Runic characters, and representing the order of the feasts, dominical letters, days of the week, and golden number, with other mat-

ters necessary to be known throughout the year; used by the ancient northern nations, in their computations of time, both civil and ecclesiastical. Almanacks of this kind are known by various names, among the different nations wherein they have been used; as *rim-flocks*, *primfaries*, *runflocks*, *runfaffs*, *Scipiones Runici*, *Bacculi Annales*, *clogs*, &c. They appear to have been used only by the Swedes, Danes, and Norwegians. From the second of these people, their use was introduced into England, whence divers remains of them in the counties. Dr Plot has given the description and figure of one of these clogs, found in Staffordshire, under the title of *The perpetual Staffordshire Almanack*. The external figure and matter of these calendars appear to have been various. Sometimes they were cut on one or more wooden leaves, bound together after the manner of books; sometimes on the scabbards of swords, or even on daggers; sometimes on tools and implements, as portable steelyards, hammers, the helms of hatchets, flails, &c. Sometimes they were made of brass or horn; sometimes of the skins of eels, which, being drawn over a stick properly inscribed, retained the impressions of it. But the most usual form was that of walking-staves, or sticks, which they carried about with them to church, market, &c. Each of these staves is divided into three regions, whereof the first indicates the signs, the second the days of the week and year, and the third the golden number. The characters engraven on them are, in some, the ancient Runic; in others, the later Gothic characters of Uffius. The saints days are expressed in hieroglyphics, significative either of some endowment of the saint, the manner of his martyrdom, or the like. Thus, against the notch for the first of March, or St David's day, is represented a harp; against the 25th of October, or Crispin's day, a pair of shoes; against the 10th of August, or St Lawrence's day, a gridiron; and, lastly, against New-year's day, a horn, the mark of good drinking, which our ancestors gave a loose to at that season.

ALMANZA, a little town of New-Castile, on the frontiers of the kingdom of Valencia in Spain, situated in W. Long. 1. 19. N. Lat. 38. 54. It is remarkable for the defeat of the allies in 1707, under the Marquis de las Minas and the Earl of Galway. In the beginning of this action, the English troops penetrated thro' the centre of the Spanish army; but the Portuguese cavalry being broken by the Spanish, and the French infantry making a dreadful fire on their flanks, the allied army was at last broken, and began their retreat when it was almost dark. Colonel Hill carried off the remains of thirteen battalions towards the river Xucar, which, if they could have passed, they might have been safe; but being very much fatigued, they were obliged to halt; by which means they were surrounded, and forced to surrender prisoners of war. In this battle, the allies lost 120 standards, together with all their artillery and baggage; a great number were killed, and several thousands taken prisoners. The Marquis de las Minas was dangerously wounded; and his mistress, in the garb of an amazon, killed by his side. The earl of Galway had two cuts cross the face, which, though not dangerous, had prevented him from seeing, or giving orders properly.

HERESY OF ALMARIC, a tenet broached in

ASTRO-
NOMY, pag.
51m.

Almedia
||
Almeria.

France by one Almaric, in the year 1209. It consisted in affirming, that every Christian was actually a member of Christ; and that without this faith no one could be saved. His followers went farther, and affirmed, that the power of the Father lasted only during the continuance of the Mosaic law; that the coming of Christ introduced a new law; that at the end of this began the reign of the Holy Ghost; and that now confession and the sacraments were at an end, and that every one is to be saved by the internal operations of the Holy Spirit alone, without any external act of religion.

ALMEDIA, a frontier-town of Portugal, in the province of Tralos Montes, on the confines of Leon, where there was a very brisk action between the French and Portuguese in 1663; 17 miles N. W. of Ciudad Rodrigo. W. Long. 7. 10. N. Lat. 40. 41.

ALMEHRAB, in the Mahometan customs, a nich in their mosques, pointing towards the kebla or temple of Mecca, to which they are obliged to bow in praying. See *KEBLA*.

ALMENE, in commerce, a weight of two pounds used to weigh saffron in several parts of the continent of the E. Indies.

ALMERIA, a sea-port town in the kingdom of Granada in Spain, pleasantly situated in a fine bay at the mouth of the river Almeria, on the Mediterranean: W. Long. 3. 20. N. Lat. 36. 51. This town is by some thought to have risen upon the ruins of the ancient Abdera, and was formerly a place of great consequence. It was taken from the Moors in 1147, by the emperor Conrad III. in conjunction with the French, Genoese, and Pisans.—It was at that time the strongest place in Spain, held by the infidels; from which their privaters, which were exceedingly numerous, not only troubled the sea-coasts inhabited by the Christians, but gave equal disturbance to the maritime provinces of France, Italy, and the adjacent islands. The city being well fortified, having a strong castle, a numerous garrison, and being excellently provided with every thing necessary, made a vigorous resistance; but was at last taken by storm, when the victor put to the sword all the inhabitants who were found in arms, distributing the best part of the plunder among his allies, whom he sent away thoroughly satisfied. The Genoese, particularly, acquired here that emerald vessel which still remains in their treasury, and is deemed invaluable.

Upon its reduction by the Christians, Almeria became a bishopric; but is, at present, very little better than a village, indifferently inhabited, and has nothing to testify so much as the probability of its former greatness, except certain circumstances which cannot be effaced even by the indolence of the Spaniards themselves. What these are, Udal ar Rhys, a Welshman, thus describes, in his tour through Spain and Portugal. "Its climate," says he, "is so peculiarly blessed, that one really wants words to express its charms and excellence. Its fields and meads are covered with flowers all the year round; they are adorned also with palms, myrtles, plane-trees, oranges, and olives; and the mountains and promontories near it are as noted for their producing a great variety of precious stones, inasmuch that the next promontory to it is called the *Cape of Gater*, which is a corruption from the word *agates*, the

hills thereabouts abounding in that sort of precious stones, as well as in emeralds and amethysts, granites or coaric rubies, and extreme curious alabaster in the mountains of Filaires."

ALMIGIM-wood, (Scripture), is thought to be that of the Indian pine-tree; which being light and white, was greatly esteemed for making musical instruments.

ALMISSA, a small but strong town at the mouth of the Cetina, in Dalmatia, famous for its piracies; ten miles East of Spalatro. E. Long. 39. 33. N. Lat. 43. 56.

ALMOND, the fruit of the almond-tree *.

ALMOND, in commerce, a measure by which the Portuguese sell their oil; 26 almonds make a pipe.

ALMONDS, in anatomy, a name sometimes given to two glands, generally called the *tonsils*.

ALMOND-Furnace, among refiners, that in which the slags of litharge, left in refining silver, are reduced to lead again, by the help of charcoal.

ALMONDS, among lapidaries, signify pieces of rock-crystal, used in adorning branch-candlesticks, &c. on account of the resemblance they bear to the fruit of that name.

ALMONDBURY, a village in England, in the well-riding of Yorkshire, six miles from Halifax.

ALMONER, in its primitive sense, denotes an officer in religious houses, to whom belonged the management and distribution of the alms of the house. By the ancient canons, all monasteries were to spend at least a tenth part of their income in alms to the poor. The almoner of St Paul's is to dispose of the monies left for charity, according to the appointment of the donors, to bury the poor who die in the neighbourhood, and to breed up eight boys to singing, for the use of the choir. By an ancient canon, all bishops are required to keep almoners.

Lord ALMONER, or Lord High ALMONER, of England, is an ecclesiastical officer, generally a bishop, who has the forfeiture of all deadlands, and the goods of *felos de se*, which he is to distribute among the poor. He has also, by virtue of an ancient custom, the power of giving the first dish from the king's table to whatever poor person he pleases, or, instead of it, an alms in money.

Great ALMONER, Grand ALMONIER, in France, is the highest dignity in that kingdom. To him belongs the superintendency of all hospitals and houses of lepers. The king receives the sacrament from his hand; and he lays hands before the king, in all grand ceremonies and solemnities.

ALMONRY, AUMERY, AMERY. See AMERY.

ALMS, a general term for what is given out of charity to the poor.

In the early ages of Christianity, the alms of the charitable were divided into four parts; one of which was allotted to the bishop, another to the priests, and a third to the deacons and sub-deacons, which made their whole subsistence; the fourth part was employed in relieving the poor, and in repairing the churches.

No religious system is more frequent or warm in its exhortations to alms-giving, than the Mahometan. The Alcoran represents alms as a necessary means to make prayer be heard. Hence that saying of one of their kalifs: "Prayer carries us half-way to God, fasting brings

Almigim
||
Alms.

* See *Amygdalus*.

brings us to the door of his palace, and alms introduces us into the presence-chamber." Hence many illustrious examples of this virtue among the Mahometans. Hafan, the son of Ali, and grandson of Mohammed, in particular, is related to have thrice in his life divided his substance equally between himself and the poor, and twice to have given away all he had. And the generality are so addicted to the doing of good, that they extend their charity even to brutes.

ALMS, also denotes lands or other effects left to churches or religious houses, on condition of praying for the soul of the donor. Hence,

Free ALMS was that which is liable to no rent or service.

Reasonable ALMS was a certain portion of the estates of intestate persons, allotted to the poor.

ALMS Box, or Chest, a small chest, or coffer, called by the Greeks *Kibalion*, wherein anciently the alms were collected, both at church and at private houses.

The alms-chest, in English churches, is a strong box, with a hole in the upper part, having three keys, one to be kept by the parson or curate, the other two by the church-wardens. The erecting of such alms-chest in every church is enjoined by the book of canons, as also the manner of distributing what is thus collected among the poor of the parish.

ALMS-House, a petty kind of hospital, for the maintenance of a certain number of poor, aged, or disabled people.

ALMUCANTARS, in astronomy, an Arabic word denoting circles of the sphere passing through the center of the sun, or a star, parallel to the horizon, being the same as PARALLELS of Altitude.

ALMUCANTARS-Staff, is an instrument usually made of pear-tree or box, having an arch of fifteen degrees; used to take observations of the sun, about the time of its rising and setting; in order to find the amplitude, and consequently the variation of the compass.

ALMUCIUM, denotes a kind of cover for the head, worn chiefly by monks and ecclesiastics: It was of a square form, and seems to have given rise to the bonnets of the same shape still retained in universities and cathedrals.

ALMUG-TREE, mentioned in Scripture, is supposed to be the same with that which produces the gum arabic.

ALMUNECAR, a sea-port town in the kingdom of Granada, seated on the Mediterranean, with a good harbour, defended by a strong castle, twenty miles south of Alhama. W. Long. 3. 45. N. Lat. 36. 50.

ALNAGE, or AULNAGE, the measuring of woollen manufactures with an ell. It was at first intended as a proof of the goodness of that commodity, and accordingly a seal was invented as a mark that the commodity was made according to the statute; but, it being now possible to purchase these seals, they are affixed, whenever the vender pleases, to all cloaths indiscriminately, to the great prejudice of our woollen manufactures.

ALNAGER, a public officer, whose duty it is to examine into the affize of all woollen cloth, fix seals upon the various pieces, and collect the alnage-duty for the king.

ALNUS; a species of the alder tree. See BETULA.

ALNUS, in the ancient theatres, that part which was

most distant from the stage.

ALNWICK, a thoroughfare town in Northumberland, on the road to Scotland. Here Malcom, king of Scotland, making an inroad into Northumberland, was killed, with Edward his son, and his army defeated by Robert Mowbray, earl of this county, *anno* 1092. Likewise William, king of Scotland, in 1174, invading England with an army of 80,000 men, was here encountered, his army routed, and himself made prisoner. The town is populous, and in general well built; it has a large town-house, where the quarter-sessions and county-courts are held, and members of parliament elected. It has a spacious square, in which a market is held every Saturday. Alnwick appears to have been formerly fortified, by the vestiges of a wall still visible in many parts, and three gates which remain almost entire. It is governed by four chamberlains, who are chosen once in two years out of a common council, consisting of 24 members. It is ornamented by a stately old Gothic castle, which has been the seat of the noble family of Piercy, earls of Northumberland. As the audits for receipt of rents have ever been in this castle, it has always been kept in tolerable repair; and not many years ago, it was repaired and beautified by the earl of Northumberland, who made very considerable alterations, upon a most elegant plan, with a view to reside in it some part of the summer-season. The manner of making freemen is peculiar to this place, and indeed is as ridiculous as singular. The persons who are to be made free, or, as the phrase is, leap the well, assemble in the market-place, very early in the morning, on the 25th of April, being St Mark's day. They appear on horse-back, with every man his sword by his side, dressed in white, and with white night-caps, attended by the four chamberlains and the castle-bailiff, mounted and armed in the same manner; from hence they proceed, with music playing before them, to a large dirty pool, called *Freeman's-well*, where they dismount, and draw up in a body, at some distance from the water; and then rush into it all at once, and scramble through the mud as fast as they can. As the water is generally very foul, they come out in a dirty condition; but taking a dram, they put on dry cloaths, remount their horses, and ride full gallop round the confines of the district; then re-enter the town, sword in hand, and are met by women dressed in ribbons with bells and garlands, dancing and singing. These are called *timber-waifs*. The houses of the new freemen are on this day distinguished by a great holly-bush, as a signal for their friends to assemble and make merry with them after their return. This ceremony is owing to King John, who was mired in this well; and who, as a punishment for not mending the road, made this a part of their charter. Alnwick is 310 miles north by west from London, 33 north of Newcastle, and 29 south of Berwick. Long. 1. 10. Lat. 55. 24.

ALOA, in Grecian antiquity, a festival kept in honour of Ceres by the husbandmen, and supposed to resemble our harvest-home.

ALOE, in botany, a genus of the monogynia order, belonging to the hexandria class of plants. Of this genus, botanical writers enumerate 23

Species. 1. The mitriformis, or mitre-shaped aloë. The leaves of this closely embrace the stalks; they are

Aloe.

Aloe.

are thick, succulent, broad at their base, growing narrower, and ending in a point; they draw together towards the top, where they somewhat resemble a nitre, from whence the species takes its name. The flower-stem rises about three feet high; on the top of which the flowers come out in a sort of globular spike, which afterwards becomes cylindrical. They have long footstalks, which come out horizontally, so that the flowers hang downward. They are tubulous, and cut into six unequal segments to the bottom, three being alternately broader than the others. The tube of the flower is of a fine red colour, and the brim of it a pale green, so that they make a fine appearance when the spikes of flowers are large. 2. The *barbadensis*, common, or Barbadoes aloë. The leaves of this sort are about four inches broad at their base, where they are near two inches thick, and diminish gradually to a point, having a few indentures on their edges, and when young are spotted with white. The flower-stem rises near three feet high. The flowers stand in a slender loose spike with very short footstalks, hanging downwards. They are tubulous, cut into six parts, and of a bright yellow colour. 3. The *arborescens*, or sword-aloe. This grows to the height of 10 or 12 feet, with a strong naked stem, the leaves growing at the top, which closely embrace the stalk; they are about two inches broad at their base, growing narrower to a point, and are indented on their edges, each being armed with a strong crooked spine. The flowers grow in a pyramidal spike, of a bright red colour; and are in beauty in November and December. 4. The *africana*, or African aloë. This species resembles the former; but the leaves are broader, and have several spines on the back side towards the extremities, and the flowers grow in a looser spike. 5. The *disticha*, by some called the *soap-aloe*, by others *Carolina-aloe*. This seldom rises above two feet high. The leaves are very broad at the base, where they closely embrace the stalk, and gradually decrease to a point. The edges are set with sharp spines, and the under leaves spread open horizontally every way. These are of a dark green colour spotted with white, somewhat resembling the colour of soft soap, from whence the plant got the name of *soap-aloe*. The flowers grow in umbels on the tops of the stalks, are of a beautiful red colour, and appear in August and September. 6. The *obscura*, with very broad spotted leaves embracing the stalk, whose edges are set with spines, and flowers growing in an umbel. This very much resembles the former; only the leaves are broader, and of a lighter green. The edges and also the spines are of a copper colour, and the flowers grow in loose spikes. They appear in September. 7. The *placitilis*, with sword-shaped smooth leaves, grows to the height of six or seven feet. It has a strong stem, towards the upper part of which are produced two, three, or four heads, composed of long, compressed, pliable leaves, placed two ways, lying over one another, with their edges the same way. The flowers are produced in short loose spikes of a red colour, and appear at different times of the year. 8. The *brevioribus*, with leaves embracing the stalks, which are prickly on every side. This is an humble plant, seldom rising more than a foot high. The leaves grow near the ground, are broad at the base, where they embrace the stalk, and gradually dimi-

nish to a point. Their edges, and also their upper parts, are beset with pretty sharp spines. The flowers grow in loose spikes, the tubulous part being red, and the brim of a light green colour. 9. The *variegata*, or partridge-breast aloë, is a low plant, seldom rising above eight inches high. The leaves of this are triangular, and curiously veined and spotted, somewhat like the feathers of a partridge's breast. The flowers grow in very loose spikes, and are of a fine red colour tipped with green. 10. The *hedge-hog* aloë is a very low plant, never rising to have stalks. The leaves are beset on their edges and both surfaces, with soft spines, very closely; from whence its name. The flowers grow on a loose head; and are of a fine red colour below, but of a pale green above. 11. The *viscosa*, with funnel-shaped flowers, grows near a foot high, with triangular leaves of a dark green colour. The flowers grow thinly upon very slender footstalks, are of an herbaceous colour, and their upper part turns backward. 12. The *spiralis*, with oval crenated flowers, grows somewhat like the former; only the flowers grow upon taller stalks, which branch out and grow in very long close spikes. 13. The *linguiforme*, or tongue-aloe, has its leaves about six inches in length, and shaped like a tongue. The flowers grow in slender loose spikes, each hanging downward, of a red colour below, and green at the top. 14. The *margaritifera*, or large pearl aloë, is a very beautiful plant. It is smaller than most of the aloë kind. The leaves are short, very thick, sharp pointed, and turning down, with a large thick end, appear there triangular. The colour of the leaves is a fine green, striped in an elegant manner with white, and frequently tipped with red at the point. The flower-stalk, which rises in the midst of the leaves, is round, smooth, of a purple colour, and generally about eight inches high. When the plant has been properly cultivated, the flowers are striped with green and white; and sometimes they are entirely white. This aloë is singular in not having the bitter resinous juice with which the leaves of most others abound; when a leaf of this species is cut, what runs from it is watery, colourless, and perfectly insipid *. 15. The *vera*, or *focotorine* aloë, hath long, narrow, succulent leaves, which come out without any order, and form large heads. The stalks grow three or four feet high; and have two, three, and sometimes four, of these heads branching out from it. The flowers grow in long spikes, each standing on a pretty long footstalk; they are of a bright red colour tipped with green, and generally appear in the winter season. 16. The *glauca*, with a short stalk, and flowers growing in a head. This resembles the eighth in some particulars; but the leaves are much broader, and spread wide on every side, whereas those of the eighth are ranged only two ways, and are narrow. The *brevioribus* also flowers but seldom, whereas the *glauca* flowers annually in the spring. 17. The *arachnoidea*, or cobweb-aloe, never rises from the ground, but the leaves spread flat on the surface. The flower-stalk rises about a foot high, is very slender, and hath three or four small herbaceous flowers standing at a distance from each other. These are tubulous, and, at the brim, cut into six parts which turn backward. 18. The *herbacea*, with oval leaves, is also a small plant growing near the ground. The leaves are almost cylindrical

* Plate X.
63. 11.

dricul around their base, but angular near their ends, and are set with short soft spines at the angles. These leaves are shorter, and of a darker green colour, than those of the former sort. 19. The retufa, or cushion-aloe, hath very short, thick, succulent leaves, compressed on the upper side like a cushion. This grows very close to the ground; the flowers grow on slender stalks, and are of an herbaceous colour. 20. The verrucosa, or pearl-tongue-aloe, hath long, narrow, tongue-shaped leaves, which are hollowed on their upper side, but keel-shaped below. They are closely fludded on every side, with small white protuberances; from whence the plant hath had the name of *pearl-tongue-aloe*. The flowers grow on pretty tall stalks, and form loose spikes, each hanging downward. They are of a beautiful red colour, tipped with green. 21. The carinata, or low aloe, with fleshy, keel-shaped, spotted leaves. This hath some resemblance to the last, but the leaves are much broader and thicker; the flowers also are of a paler colour, and the spikes shorter. 22. The ferox, with dark green leaves, beset with spines on every side. This species grows to the height of eight or ten feet, with a strong stem. The leaves grow on the top, and closely embrace the stalk. They come out irregularly, and spread every way. They are near four inches broad at the base; and diminish gradually to the top, where they end in a spine. This sort hath not as yet flowered in Britain. 23. The uvaria, with reflexed flowers, lying over each other like tiles on a house. This species hath very long, narrow, triangular leaves, shaped like those of the bulrush. The flowers are produced in close thick spikes, upon stalks near three feet high. They are of an orange colour, having six yellow stamina, which come out beyond the tube of the flower; so that when the plants are strong, and produce large spikes, they make a fine appearance. The flowers appear in August and September. There is a variety of this species with narrower leaves, and longer spikes of flowers.

Culture. The proper earth for planting these vegetables is, one half fresh light earth from a common, and the rest an equal mixture of white sea-sand and sifted lime-rubbish. This mixture should be always made six or eight months before the plants are to be set in it. The common aloe will live in a dry green-house in winter; and may be placed in the open air in summer, in a sheltered situation, but must have very little water. Most of the other aloes are best preserved in an airy glass-case, in which there is a stove, to make a little fire in very bad weather. The tenderest kinds require a greater share of heat to preserve them in winter, and should be kept in a good stove, in a degree of heat ten degrees above temperate. Many other kinds may also be kept in this heat; but the greater the heat, the more water they always require. About the beginning of June, it is usual in England to set the pots of aloes out of the house: but they should be set under the shelter of hedges, or trees, to keep them from the violence of the sun; the rains also, which usually fall in this and the following month, are apt to rot them. It is therefore best to keep them under cover the greatest part of the year. The best time to shift these plants is the middle of July. They are, on this occasion, to be taken out of the pots, the loose earth to be picked from

about their roots, and the decayed or mouldy parts of them cut off; then a few stones are to be put at the bottom of the pot, and it is to be filled with the composition before described, and the plants carefully put in, the roots being so disposed as not to interfere with one another. They are to be carefully watered after this, at times, for three weeks, and set in a shady place. The common kind will bear the open air from May to October, and should be shifted every year. All the aloes are propagated by off-fets, or by planting the leaves. The off-fets should be taken from the mother plant, at the time when it is shifted: they are to be planted in very small pots of the proper mixed earth; and if that part of them which joined to the mother-plant be observed to be moist when taken off, it should lie on the ground in a shady place two or three days before it is planted, otherwise it will rot. After planting these, they should remain in a shady place a fortnight; and then be removed to a very moderate hot-bed, plunging the pots therein, which will help their striking new roots. Towards the end of August they must be, by degrees, hardened to the open air, by taking off the glasses of the hot-bed; and in September they may be removed into the green-house.

ALOES, in medicine, the inspissated juice of some of the abovementioned species. The ancients distinguished two sorts of aloes: the one was pure and of a yellowish colour, inclining to red, resembling the colour of a liver, and thence named *hepatic*; the other was full of impurities, and hence supposed to be only the dross of the better kind. At present, various sorts are met with in the shops; which are distinguished either from the places, from the species of the plants, or from some differences in the juices themselves. These may be all ranged in three classes:

1. *Aloe Socotorina*, socotorine aloes, brought from the island Socotora in the Indian ocean, wrapt in skins; it is obtained from the 15th species abovementioned.—This sort is the purest of the three: it is of a glossy surface, clear, and in some degree pellucid; in the lump, of a yellowish red colour, with a purple cast; when reduced to powder, of a bright golden colour. It is hard and friable in the winter, somewhat pliable in summer, and grows soft betwixt the fingers. Its taste is bitter, accompanied with an aromatic flavour, but insufficient to prevent its being disagreeable: the smell is not very unpleasant, and somewhat resembles that of myrrh.

2. *Aloe Hepatica*, hepatic, Barbadoes, or common aloes, (the juice of the second species), is not so clear and bright as the foregoing sort; it is also of a darker colour, more compact texture, and for the most part drier. Its smell is much stronger and more disagreeable; the taste intensely bitter and nauseous, with little or nothing of the fine aromatic flavour of the Socotorine.—The best hepatic aloes come from Barbadoes in large gourd shells; an inferior sort of it (which is generally soft and clammy) is brought over in casks.

3. *Aloe Caballina*, fetid, caballine, or horse aloes, (the produce of an African aloe), is easily distinguished from both the foregoing, by its strong rank smell; although, in other respects, it agrees pretty much with the hepatic, and is not unfrequently sold in its stead. Sometimes the caballine aloes is prepared too pure and bright, as not to be distinguishable by the eye even from

Aloes
|
Alost.

from the Socotorine; but its offensive smell, which it cannot be devoid of, readily betrays it.

Aloes is a stimulating cathartic bitter: if given in too large a dose as to purge effectually, it often occasions an irritation about the anus, and sometimes a discharge of blood. Small doses of it frequently repeated, not only cleanse the *primæ viæ*, but likewise attenuate and dissolve viscid juices in the remoter parts, warm the habit, quicken the circulation, and promote the uterine and hæmorrhoidal fluxes. This medicine is particularly serviceable to persons of a phlegmatic temperament and sedentary life, and where the stomach is oppressed and weakened: in dry bilious habits, aloes prove injurious, immoderately heating the blood, and inflaming the bowels.

This juice is likewise, on account of its bitterness, supposed to kill worms, either taken internally, or applied in plasters to the umbilical region. It is also celebrated for restraining external hæmorrhages, and cleaning and healing wounds and ulcers.

Socotorine aloes contains more gummy matter than the hepatic; and hence it is likewise found to purge more, and with greater irritation. The first fort therefore is most proper where a stimulus is required, as for promoting or exciting the menstrual flux; whilst the latter is better calculated to act as a common purge.

ALOGIANS, in church-history, a sect of ancient heretics, who denied that Jesus Christ was the Logos, and consequently rejected the gospel of St John.

ALOGOTROPHIA, among physicians, a term signifying the unequal growth or nourishment of any part of the body, as in the rickets.

ALOOF, has frequently been mentioned as a sea-term; but whether justly or not, we shall not presume to determine. It is known in common discourse to imply *at a distance*; and the resemblance of the phrases *keep a loof*, and *keep a luff*, or *keep the luff*, in all probability gave rise to this conjecture. If it was really a sea-phrase originally, it seems to have referred to the dangers of a lee-shore, in which situation the pilot might naturally apply it in the sense commonly understood, *viz.* keep *all off*, or quite off: it is, however, never expressed in that manner by seamen now*. It may not be improper to observe, that besides using this phrase in the same sense with us, the French also call the weather-side of a ship, and the weather-clue of a course, *le lof*.

ALOPECIA, in medicine, signifies a falling off of the hair, occasioned either by want of nourishment, or by a bad state of the humours. It is also used by Galen for a change in the colour of the hair.—See MEDICINE, n° 853.

ALOPECURUS, or FOX-TAIL GRASS, in botany, a genus of the triandria digynia class. There are seven species, *viz.* the pratensis, or meadow fox-tail grass; the bulbosus, or bulbous fox-tail grass; the geniculatus, or flote fox-tail grass; and the myosuroides, or field fox-tail grass; these four grow wild in Britain: the agrestis, the montpeliensis, the panicus, and the hordeiformis, are all natives of France and the southern parts of Europe, except the last, which is a native of India*.

ALOST, a town in Flanders, belonging to the house of Austria, seated on the river Dender, in the midway between Brussels and Ghent. It has but one

parish; but the church is collegiate, and has a provost, a dean, and twelve canons. Here is a convent of Carmelites, another of capuchins, another of bare-footed Carmelites, three nunnies, an hospital, and a convent of Guillemins, in which is the tomb of Theodore Martin, who brought the art of printing out of Germany into the Low Countries. He was a friend of Erasmus, who wrote his epitaph. E. Long. 4. 10. N. Lat. 49. 55.

ALPHA, the name of the first letter of the Greek alphabet, answering to our A.—As a numeral, it stands for one, or the first of any thing. It is particularly used, among ancient writers, to denote the chief or first man of his class or rank. In this sense, the word stands contradistinguished from *beta*, which denotes the second person. Plato was called the *Alpha* of the wits: Eratosthenes, keeper of the Alexandrian library, whom some called a Second Plato, is frequently named *Beta*.

ALPHA is also used to denote the beginning of any thing. In which sense it stands opposed to *omega*, which denotes the end. And these two letters were made the symbol of Christianity; and accordingly were engraven on the tombs of the ancient Christians, to distinguish them from those of idolaters. Moralez, a Spanish writer, imagined that this custom only commenced since the rise of Arianism; and that it was peculiar to the orthodox, who hereby made confession of the eternity of Christ: but there are tombs prior to the age of Constantine whereon the two letters were found, besides that the emperor just mentioned bore them on his labarum before Arius appeared.

ALPHABET, the natural or customary series of the several letters of a language*. The word is formed from *alpha* and *beta*, the first and second letters of Greek alphabet. The number of letters is different in the alphabets of different languages. The English alphabet contains 24 letters; to which if we add *j* and *v* consonant, the sum will be 26: the French contains 23; the Hebrew, Chaldee, Syriac, and Samaritan, 22 each; the Arabic 28; the Persian 31; the Turkish 33; the Georgian 36; the Coptic 32; the Muscovite 43; the Greek 24; the Latin 22; the Slavonic 27; the Dutch 26; the Spanish 27; the Italian 20; the Ethiopic and Tartarian, each 202; the Indians of Bengal 21; the Baramese 19. The Chinese have, properly speaking, no alphabet, except we call their whole language by that name; their letters are words, or rather hieroglyphics, amounting to about 80,000.

ALPHEUS, (Strabo); ALPHEIUS, (Ptolemy); a noted and large river of the Peloponnesus; which, rising in, and after several windings running through, Arcadia, and by Olympia in Elis, with a south-west course, pours into the Sinus Chelonites, about ten miles to the south of Olympia. It has a common spring with the Eurotas, at the foot of mount Parthenius, near the village Asca, (Strabo.) The Alpheus and Eurotas mix and run together for 20 stadia; after which, they enter a subterraneous passage at Mantinea; then again emerge, the Eurotas in Laconica, and the Alpheus in the territory of Megalopolis, (Pausanias.) The poets feign strange things of this river; particularly, that, out of love to the nymph *Arcthyia*, it runs under the sea to Sicily, and bursts out at the fountain of that name in Syracuse, (Virgil.) Its waters were reckoned good in the leprosy, which is called *αλφει* by the Greeks; and hence

Alpha

Alpheus.

* See Luff.

* See the article Grass.

* See Languages, and Writings.

the name *Alpheus*.—Pausanias adds, that the Eleans had a law, which condemned any woman to death that should either appear at the Olympic games, or even cross this river during that solemnity: and the Eleans add, that the only woman who transgressed it, had disguised herself in the habit of a mafter or keeper of these games, and conducted her son thither; but when she saw him come off victorious, her joy made her forget her disguise, so that her sex was discovered. She was pardoned, but from that time a law was made that the keepers should appear there naked.

ALPHONSIN, in surgery, an instrument for extracting bullets out of gun-shot wounds. This instrument derives its name from the inventor Alphonfus Ferrer, a physician of Naples. It consists of three branches, which are closed by a ring. When closed and introduced into the wound, the operator draws back the ring towards the handle, upon which the branches opening take hold of the ball; and then the ring is pushed from the haft, by which means the branches grasp the ball so firmly, as to extract it from the wound.

ALPHONSUS X. king of Leon and Castile, furnished the Wife, was author of the astronomical tables called *Alphonfinæ*. Reading of Quintus Curtius gave him such delight, that it recovered him out of a dangerous illness. He read the Bible fourteen times, with several comments on it. He is said to have found fault with the structure of the mundane system, and has been charged with impiety on that score; but unjustly, for he only found fault with the involved system of some astronomers. He was dethroned by his son Sancho; and died of grief, A. D. 1284.

ALPINI (Prospero), a famous physician and botanist, born in the Venetian territory, in 1553. He travelled in Egypt to acquire a knowledge of exotic plants, and was the first who explained the fructification and generation of plants; by the sexual system. Upon his return to Venice, in 1586, Andrea Doria, prince of Melfi, appointed him his physician: and he distinguished himself so much in this capacity, that he was esteemed the first physician of his age. The republic of Venice began to be uneasy, that a subject of theirs, of so great merit as Alpini, should continue at Genoa, when he might be of so much service and honour to their state: they therefore recalled him in 1593, to fill the professorship of botany at Padua; and he had a salary of 200 florins, which was afterwards raised to 750. He discharged this office with great reputation; but his health became very precarious, having been much broke by the voyages he had made. According to the register of the university of Padua, he died the 5th of February 1617, in the 64th year of his age; and was buried the day after, without any funeral pomp, in the church of St Anthony.—Alpini wrote the following works in Latin: 1. Of the physic of the Egyptians, in four books. Printed at Venice, 1591, in 4^{to}. 2. A treatise concerning the plants of Egypt. Printed at Venice, 1592, in 4^{to}. 3. A dialogue concerning balsams. Printed at Venice, 1592, in 4^{to}. 4. Seven books concerning the method of forming a judgment of the life or death of patients. Printed at Venice, 1601, in 4^{to}. 5. Thirteen Books concerning methodical Physic. Padua, 1611, folio; Leyden, 1719, in 4^{to}. 6. A Disputation held in the school at Padua, concerning the Raphanticum. Padua, 1612,

and 1629, 4^{to}. 7. Of exotic plants, in two books: Venice, 1609, in 4^{to}. He left several other works, which have never been printed; particularly, 8. The fifth book concerning the physic of the Egyptians. 9. Five books concerning the natural history of things observed in Egypt, adorned with a variety of draughts of plants, stones, and animals.

ALPINIA, in botany, a genus of the monogynia order, belonging to the monandria class of plants. Of this genus there is but one species, which is a native of the West Indies, where it grows naturally in moist places. The leaves decay every winter, and are pushed out from the roots in the spring, like the ginger and maranta; so must be managed in the same manner as directed for these two plants, and may be propagated by parting the roots when the leaves decay.

ALPS, a range of high mountains, separating Italy from Gaul and Germany, in the form of a crescent. They take their rise from the Vada Sabatia, or Savona; and reach to the Sinus Planaticus (now *Golfo di Carnaro* of the Adriatic), and the springs of the river Colapis (now the *Kulpe*); extending, according to Livy, 2000 stadia in length, or 250 miles: they are divided into several parts, and accordingly have different names. From Savona to the springs of the Varus, where the Alps lie against the sea of Genoa, they are called *Maritima*, now *le Montagne di Tenda*. They extend from south to north, between Gaul to the west, and Genoa to the east, beginning at Monaco on the Mediterranean; then running out thro' the east of the county of Nice, and between that and the marquise of Saluzzo, terminate at length at mount Viso, between Dauphine and Piedmont. Hence to Suva run the *Alpes Cottie*, (Sueton.); *Cottane*, (Tacitus); mountains extremely high, separating Dauphine from Piedmont, and extending from mount Viso to mount Cenis, between the *Alpes Maritima* to the south, and the *Graie* to the north. The *Alpes Graie*, (Pliny), so called from the passage of Hercules, begin from mount Cenis, where the *Cottie* terminate; and run out between Savoy and the Tarentese to the west, and Piedmont and the Duché d'Aouste to the east, quite to the Great St Bernard, where the *Alpes Pennine* begin. They are also called by some *Graie Alpes*, and *Graius Mons*, (Tacitus); which extend from west to east, between St Bernard and the Adula, or St Godard; and thus they run out between the Valesc to the north, and the Milanese to the south. With these are continued the *Alpes Rheticæ*, to the head of the river Piave; a part of which are the *Alpes Tridentina*, to the north of Trent. To these join the *Alpes Noricæ*, reaching to Doblach in Tyrol, to the north of the river Tajamento: thence begin the *Alpes Carnicæ*, or of *Carniola*, extending to the springs of the Save; and the last, called *Alpes Pannonicæ*, and *Julia*, extend to the springs of the Kulpe. Some, however, extend the Alps to the north of Dalmatia; others again to Thrace and the Euxine. But their termination at the Kulpe, as above, is more generally received. They were formerly called *Albia*, and *Alpionia*, (Strabo.) Through these mountains Annibal forced his passage into Italy, by pouring vinegar on the rock, heated by burning large piles of wood on them, by which means they became crumbled; (Livy.) They are covered with perpetual snow.—*Alpes* or *Alper* is a celtic term for high mountains. Cluverius makes

Alpuxarras the height of some 30, of others 50 miles; a height altogether incredible, even supposing we reckon from the level of the sea: the manner by which he found this height is nowhere said. According to the calculations of some geometricians, these mountains are somewhat less than two miles in perpendicular height.

ALPUXARRAS, or ALPAKARES, mountains of Spain, in the province of Granada, on the coast of the Mediterranean sea. They are about 17 leagues in length, and 11 in breadth, reaching from the city of Velez to Almeria. They are inhabited by Moors, who are the remains of the dispersion and ruin of their empire. They embraced the Christian religion; but preserve their own manner of living, and their language, though much corrupted. Here is a rivulet between Pitros and Portugos, which dyes linen that is dyed in it black in an instant. Near this rivulet is a cavern, from which proceeds so malignant a steam, that it destroys such animals as come near it. The Moriscos cultivate the soil extremely well, and plant-fruit trees; some of which grow to a prodigious height and thickness, and give the mountains a very agreeable aspect.

ALQUIER, a liquid measure, used in Portugal to measure oil, two of which make an almond *.

ALQUIFOU, or ARQUIFOU, is a sort of lead-ore, which, when broken, looks like antimony. It is used by the potters to give a green varnish to their works, and thence is called potter's ore. It is met with in Cornwall, &c. The potters mix a small portion of manganese with the alquifou, and then the varnish or glazing on their ware is of a blackish hue.

ALREDUS, ALURED, or ALFREDUS, of Beverley, one of the most ancient and best English historians. He wrote in the reign of Henry I. There are no circumstances of his life known with any degree of certainty. It is generally believed that he was educated at Cambridge, and that he afterwards became one of the canons and treasurer of St John's at Beverley. And we learn in a note of bishop Tanner's, that, for the sake of improvement, he travelled thro' France and Italy; and that at Rome he became domestic chaplain to cardinal Othoboni. He died in the year 1128, or 1129; leaving behind him the following works: 1. *The Annals of Alured of Beverley*. Oxford, 1726. Published by Mr Hearne, from a manuscript belonging to Thomas Rawlinson, Esq. It contains an abridgement of our history from Brutus to Henry I. written in good Latin, and with great accuracy. 2. *Liberatus ecclesie S. Johannis de Beverlac*, &c. a manuscript in the Cotton Library. It is a collection of records relative to the church at Beverley, translated by our author from the Saxon language. The Biographia Britannica evidently proves these to be all that were written by Alredus.

ALRESFORD, a town of Hampshire, seated on the road from London to Southampton, close by the river Itchen, which feeds a great pond to the left of the town. Part of a Roman highway runs from hence to Alton. It is a rectory, with the mediety of Old Alresford, of 49*l*. 12*s*. 8*d*. in the king's books. It consists of about 200 houses; has one church; two principal streets, which are large and broad; and a small manufacture of lisleys.

ALSA, a river of Carniola, (Pliny;) now the *Ausa*; running by Aquileia, with a short course from north to

south, into the Adriatic; where Constantine, the son of Constantine the Great, fighting against Constant his brother, lost his life.

ALSACE, a province of France, bounded on the east by the Rhine, on the south by Switzerland, on the west by Lorrain, and on the north by the palatinate of the Rhine. It was formerly a part of Germany, but was given to France by the treaty of Munster. It is one of the most fruitful and plentiful provinces of Europe, abounding in corn, wine, wood, flax, tobacco, pulse, fruits, &c. The mountains which divide it from Lorrain are very high; and generally covered with fir, beech, oak, and horn-beam. Those on the side of Switzerland are less high; and furnished with all sorts of wood, as well for fuel as building. The country itself is diversified with rising hills and fertile vales, besides large forests; but that between the rivers Ill, Hart, and the Rhine, as far as Straßburg, is inferior to the rest, on account of the frequent overflowing of the Rhine. In High Alsace, there are mines of silver, copper, and lead. They however work none but those of Giromany, from which are annually drawn 1600 marks of silver, each mark being eight ounces; and 24000 pounds of copper; but the expence of working them is almost equal to the profit. There are iron-works in several parts of Alsace, and particularly at Betford. There is a mineral spring at Sultzbach, near Munster, in High Alsace; which is in great reputation for the palsy, weakness of the nerves, and the gravel.—The original inhabitants of Alsace are honest and good-natured, but wedded to their own manners and customs. The fruitfulness of their country renders them indolent and inactive; for the Swiss make their hay and reap their corn, as well as manage the vintage of High Alsace, which sends a great deal of money out of the province. The common language is the German: however, the better sort of people speak French in the towns; and even in the country, they speak French well enough to be understood.

ALSEN, an island of Denmark in the lesser Belt, or entrance into the Baltic sea, between Sleswick and Funen. It is remarkable for nothing except two castles, and producing large crops of aniseeds, a carminative much used in seasoning the food and mixing with the bread all over the Danish dominions. E. Long. 10. 12. N. Lat. 55. 12.

ALSFIELD, a town of Germany, in the landgrate of Hesse Cassel, ten miles north-west of Marburg, and thirty-five south of Hesse Cassel. It is an ancient town, and well-built; and the inhabitants were the first of this country who embraced the Reformation. E. Long. 9. 5. N. Lat. 50. 40.

ALSHASH, a very beautiful city in Bukharia, supposed to be the same with that which is now called *Tashkent*, the capital of the eastern part of Turkestan, possessed by the Kassats. It is situated on the river *Sihán*, now *Sir*, and had a well watered garden for every house; but was ruined by Jenghiz Khan, who took the city, and caused a great number of its inhabitants to be massacred.

ALSHEDA, a parish of Sweden, in the province of Smaland, where a gold mine was discovered in 1738.

ALSINA, in botany, a synonyme of the *theligonum*. See *THELIGONUM*.

ALSINASTRUM, in botany, the trivial name and *alfo*.

ALTAR of Incense

Alfine also a synonyme of the elatine. See ELATINE.

ALSINE, *CHICKWEED*; a genus of the trigynia order, belonging to the pentandria class of plants. Of this genus a great number of species are enumerated by some botanical writers; but none of them possess any remarkable properties, except the media, or common chickweed, with white blossoms, which is so well known as to need no particular description.—This species affords a notable instance of what is called the *sleep of plants*: for, every night, the leaves approach in pairs, so as to include within their upper surfaces the tender rudiments of the new shoots; and the uppermost pair but one at the end of the stalk are furnished with longer leaf-stalks than the others; so that they can close upon the terminating pair, and protect the end of the branch. The young shoots and leaves, when boiled, can hardly be distinguished from spring spinach, and are equally wholesome.—Swine are extremely fond of chickweed; cows and horses eat it; sheep are indifferent to it; and goats refuse it.

ALSIRAT, in the Mahometan theology, denotes a bridge laid over the middle of hell, the passage or path whereof is sharper than the edge of a sword; over which every body must pass at the day of judgement, when the wicked will tumble headlong into hell, whereas the good will fly over it like the wind.

ALSIMUM, a city of ancient Etruria, occupying (according to Cluverius) the spot on which *Pala* now stands. We are told by Dionysius Halicarnassensis, that Alsum was built by the Aborigines, long before the Tyrrhenians invaded Italy. In this case it must have been founded not long after the dispersion in the days of Peleg. Its founder is said to have been one *Alafus*, *Alafus*, or *Alafa*; whom some conjecture to have been Alafah, or Elifah, the son of Javan, mentioned in Scripture.

ALSTEDIUS (John-Henry), a German Protestant divine, and one of the most indefatigable writers of the 17th century. He was some time professor of philosophy and divinity at Herborn in the county of Nassau: from thence he went into Transylvania, to be professor at Alba Julia; where he continued till his death, which happened in 1638, being then 50 years of age. His *Encyclopædia* has been much esteemed even by the Roman-catholics; it was printed at Lyons, and sold very well throughout all France. His *Theaurus Chronologicus* is by some esteemed one of his best works, and has gone through several editions. He also wrote *Triumphus Biblicus*, to show that the principles of all arts and sciences are to be found in the Scriptures; but he gained very few to his opinion. He was a Millenarian; and published, in 1627, a treatise *De mille annis*, in which he asserted that the reign of the saints on earth was to begin in 1694.

ALSTON-MORE, a town in Cumberland, seated on a hill, at the bottom of which runs the river Tyne, with a stone bridge over it. Near this place is plenty of lead ore. W. Long. 2. 4. N. Lat. 54. 45.

ALT, in music, a term applied to the high notes in the scale.

ALTAMONT, a very handsome town of Italy, in the kingdom of Naples, and in Calabria Citerior, 15 miles north-west of Bagniano. E. Long. 16. 22. N. Lat. 39. 40.

ALTAMURA, a town of Naples, in the territory

of Bari, with the title of a principality, seated on the foot of the Apennine mountains. E. Long. 16. 54. N. Lat. 41. 0.

ALTAR, a place upon which sacrifices were anciently offered to some deity.

The heathens at first made their altars only of turf; afterwards they were made of stone, of marble, of wood, and even of horn, as that of Apollo in Delos.

Altars differed in figure as well as in materials. Some were round, others square, and others oval. All of them were turned towards the east, and stood lower than the statues of the gods; and were generally adorned with sculpture, inscriptions, and the leaves and flowers of the particular tree consecrated to the deity. Thus, the altars of Jupiter were decked with oak, those of Apollo with laurel, those of Venus with myrtle, and those of Minerva with olive.

The height of altars also differed according to the different gods to whom they sacrificed. Those of the celestial gods were raised to a great height above the ground; those appointed for the terrestrial, were almost on a level with the surface of the earth. On the contrary, they dug a hole for the altars of the infernal gods.

Before temples were in use, altars were erected sometimes in groves, sometimes in the highways, and sometimes on the tops of mountains; and it was a custom to engrave upon them the name, ensign, or character, of the deity to whom they were consecrated.

In the great temples of ancient Rome, there were ordinarily three altars: The first was placed in the sanctuary, at the foot of the statue of the divinity, upon which incense was burnt and libations offered; the second was before the gate of the temple, and upon it they sacrificed the victims; and the third was a portable altar, upon which were placed the offering and the sacred vessels.

Besides these uses of altars, the ancients swore upon them, and swore by them, in making alliances, confirming treaties of peace, and other solemn occasions. Altars also served as places of refuge to all those who fled to them, whatever crime they had committed.

Among the Jews, altars in the patriarchal times were very rude. The altar which Jacob set up at Beth-el was nothing but a stone, which served him instead of a bolster; that of Gideon, a stone before his house; and the first which God commanded Moses to erect was probably of earth, or unpolished stones, without any iron; for if any use was made of that metal, the altar was declared impure.

The principal altars of the Jews were, The altar of incense; that of burnt-offering; and the altar, or table, for the shew-bread.

The altar of incense was a small table of shittim-wood, covered with plates of gold, of one cubit in length, another in width, and two in height. At the four corners, were four kinds of horns, and all round a little border or crown over it. This was the altar hidden by Jeremiah before the captivity; and upon it the officiating priest offered, every morning and evening, incense of a particular composition. See Plate X. fig. 3.

The altar of burnt-offerings was made of Shittim-wood, and carried upon the shoulders of the priests by staves of the same wood overlaid with brass. In the

Altar
||
Altara.

time of Moses, this altar was five cubits square, and three high; but in Solomon's temple it was much larger, being twenty cubits square, and ten in height. It was covered with brass; and at each corner was a horn of spire, wrought out of the same wood with the altar to which the sacrifices were tied. Within the hollow was a grate of brass, on which the fire was made; through it fell the ashes, and were received in a pan below. At the four corners of the grate were four rings and four chains, which kept it up at the horns. This altar was placed in the open air, that the smoke of the burnt-offerings might not fully the inside of the tabernacle. See Plate X. fig. 2.

The altar, or table, for the *show-bread*, was likewise of shittim-wood, covered with plates of gold, having a little border round it, adorned with sculpture. It was two cubits long, one wide, and one and an half in height. Upon this table, which stood in the holy of holies, were put, every sabbath-day, twelve loaves, with salt and incense.

The Jewish altars, after their return from the captivity, and the building of the second temple, were in some respects different from those described above. That of burnt-offerings was a large pile, built of unhewn stone, thirty-two cubits square at the bottom, and twenty-four square at the top. The ascent was by a gentle rising, thirty-two cubits in length, and sixteen in breadth.

ALTAR, is also used among Christians for the communion-table.

ALTAR-THANE, or ALTARIST, in old law-books, an appellation given to the priest or parson of a parish, to whom the altarage belonged. See ALTARAGE.

ALTARAGE, in law, altars erected in virtue of donations, before the Reformation, within a parochial church, for the purpose of singing of masses for deceased friends.

ALTARAGE likewise signifies the profits arising to the priest on account of the altar.

ALTAYEF, a town of Hejaz, a district of Arabia Felix. It is situated about 60 miles east of Mecca, behind mount Gazwan, where the cold is more intense than in any other part of the district, but the air very wholesome. Its territory abounds in fountains, and produces excellent raisins. The town is surrounded with a wall, but is not very large.

ALTDORF, a large handsome town in Switzerland, and the chief of the canton of Uri. It is situated below the lake of the four cantons, in a plain, at the foot of a mountain, whose passages are difficult, and serve instead of fortifications. It has four churches and two convents; St Martin's church and that of the Holy Cross are the finest. The town-house and the arsenal are also worth seeing. E. long. 8. 30. N. lat. 46. 50.

ALTEA, a sea-port town of Valencia, in Spain. It was taken in 1705, in favour of the archduke Charles; but lost after the battle of Almanza. W. long. 0. 15. N. lat. 46. 34.

ALTENBURG, a town of Transylvania, 17 miles S. W. of Wissemburg, and 35 S. of Claufenbourg. E. long. 23. 5. N. lat. 46. 25.

ALTENA, a sea-port town of Germany, in the duchy of Holstein, in Lower Saxony. It is a modern town, built by the king of Denmark, and was burnt by the Swedes in 1712; but has since been beautiful-

ly re-built. The merchandize brought from Asia, by the Danish East-India company, is sold here. E. long. 10. 0. N. lat. 53. 51.

Altenburg
||
Althæa.

ALTENBERG, an ancient town of Germany, situated on the river Pleiss, with a good castle placed on a rock, in Misnia, in the circle of the Upper Saxony. It was formerly an imperial city, but at present belongs to the house of Saxony. Here is a college which has always been in a flourishing condition. In 1705, there was a nunnery founded for women of a high rank, who are Protestants. E. Long. 15. 8. N. Lat. 50. 59.

ALTENBURG, a small fortified town of Hungary, in the territory of Moson, near the Danube, about 55 miles from Vienna. E. long. 35. 30. N. lat. 48. 15.

ALTENBURG, or OWAR, a small but strong town of Hungary, seated in a marsh, with wide streets. It is near the river Danube, and is surrounded with deep ditches. It is 15 miles south of Presburg, 40 south-east of Vienna, and 65 south-west of Buda. E. long. 17. 56. N. lat. 44. 0.

ALTERANTS, or ALTERNATIVE Medicines, such as correct the bad qualities of the blood and other humours, without occasioning any sensible evacuation *.

* See Medicines, n^o 373, &c.

ALTERATION, in a general sense, denotes some variation in the qualities or circumstances of a thing, without wholly changing its nature.

ALTERATION, in music, the distance of any interval increased or diminished, which of consequence must sharpen or flatten the chords which these altered intervals compose.

ALTERN-BASE, in trigonometry, a term used in contradistinction to the true base. Thus in oblique triangles, the true base is either the sum of the sides, and then the *difference* of the sides is called the altern-base; or the true base is the difference of the sides, and then the *sum* of the sides is called the altern-base.

ALTERNATE, in a general sense, a term applied to such persons or things as succeed each other by turns. Thus, two who command each his day, are said to have an alternate command, or to command alternately.

ALTERNATE, in heraldry, is said in respect of the situation of the quarters. Thus the first and fourth quarters, and the second and third, are usually of the same nature, and are called alternate quarters.

ALTERNATE, in botany, when the leaves or branches of plants arise higher on opposite sides alternately.

ALTHÆA, MARSHMALLOW; a genus of the polyandria order, belonging to the monodelphia class of plants. There are three

Species. 1. The vulgaris, or common marshmallow, is a native of Britain, and hath a perennial root, and an annual stalk, which perishes every autumn. The stalks grow erect to the height of four or five feet. These are garnished with leaves which are hoary, soft to the touch, and placed alternately on the branches. The flowers come out from under the wings of the leaves, like the mallow, and are of a purplish white. 2. The hirsuta, or hairy marshmallow, is a native of Spain and Portugal. It is a low plant, whose branches trail on the ground, unless they are supported by stakes. The leaves and stalks are beset with strong hairs, the flowers come out like those of the common sort, but are smaller, and have purplish bottoms. 3. The cannabina, or shrubby

Althæa
Alting.

shrubby marshmallow, is a native of Hungary and Istria. It has a woody stem, which rises to the height of four or five feet; and puts out many side-branches. The flowers come out in the same manner as in the others, but are of a deeper red colour. This sort seldom flowers the first year, unless the summer proves warm; but, when the plants live thro' the winter, they will flower early in the following summer, and produce good seeds.

Culture. Though the first sort is found naturally in salt marshes, it will thrive when transplanted into any soil, or in any situation; however, it will always grow larger in moist than in dry soil. It may be propagated either by parting the roots in autumn when the stalks decay, or by sowing the seeds in the spring. If the seeds of the second species are sown in April, the plants will flower in July, and carry ripe seed in September. They ought to be sown in the places where they are to remain, as the roots shoot deep into the ground; so that, unless the plants are removed very young, they seldom survive it. The seeds of the cannabina ought also to be sown where the plants are to remain, for the reason just now given. They should have a sheltered situation and a dry soil, otherwise they will not live through the winter. Indeed they seldom continue in this country above two years, with all the care that can be taken of them.

Medicinal Uses. The first is the only species used in medicine. The whole plant, especially the root, abounds with a mild mucilage. It has the general virtues of an emollient medicine; and proves serviceable in a thin acrimonious state of the juices, and where the natural mucus of the intestines is abraded. It is chiefly recommended in sharp disfluxions upon the lungs, hoarseness, dysenteries; and likewise in nephritic and calculous complaints: not, as some have supposed, that this medicine has any peculiar power of dissolving or expelling the calculus; but as, by lubricating and relaxing the vessels, it procures a more free and easy passage. The root is sometimes employed externally for softening and maturing hard tumours; chewed, it is said to give ease in difficult dentition of children *.

ALTHÆA Frut. See HIBISCUS and LAVATERA.

ALTIMETRY, the art of measuring altitudes or heights, whether accessible or inaccessible *.

ALTIN, a lake in Siberia, from whence issues the river Ob, or Oby, in N. lat. 52. o. E. long. 85° 55'. This lake is called by the Russians *Telykoi Ozero*, from the Telyks, a Tartarian nation, who inhabit the borders of it, and who give it the name of *Altin-Kul*. By the Calmucks it is called *Altinnor*. It is near ninety miles long and 50 broad, with a rocky bottom. The north part of it is sometimes frozen so hard as to be passable on foot, but the southern part is never covered with ice. The water in the Altin lake, as well as in the rivers which run through the adjacent places, only rises in the middle of summer, when the snows on the mountains are melted by the heat of the sun.

ALTING (Henry), professor of divinity at Heidelberg and Groningen, born at Embden, Feb. 17. 1583, of a family which had been long conspicuous in Friesland. His father, Menso Alting, was the first, who, with two others, preached the reformation in the territory of Groningen, about the year 1566, under the tyrannical government of the duke of Alva; and the first that preached in the great church of Gronin-

Alting
Alton.

gen, after the reduction of that town by the States General in 1594. Henry was chosen, in 1605, preceptor to the three young counts of Nassau, Solms, and Izenberg. After various difficulties, he settled at Groningen, where he continued till his death, August 25. 1644. He was a sound protestant divine, a pious Christian, a useful member of society in many respects, and one who suffered much for the truth. Most of his works were never published; those which have been, are the following: *Nota in decadem problematum J. Behm*, 1618. *Loci communes explicatio catechesos Palatine*, 1646, in 3 vols. *Exegesis Augustana confes.* 1647. *Methodus theologiae*, 1650. It appears from the catalogue of his works annexed to his life, that the *Medulla hist. prophana*, published by D. Pareus, was composed by Alting. The most remarkable piece among Alting's MSS. is The ecclesiastical history of the Palatinate, from the reformation to the administration of John Casimir.

ALTING (James), son of the former, was born at Heidelberg, September 27. 1618. He travelled into England in 1640, where he was ordained by the learned Dr Prideaux, bishop of Worcester. He afterwards accepted of the professorship of Groningen, vacant by the death of Gomarus; but his situation was rendered very disagreeable by the continual disputes which he had with his colleague Sam. des Marets, who favoured the school-divinity. He made a pious exit, August 20, 1679, recommending the edition of his works to Menso Alting (author of *Notitia German. Infer. Antiquæ*, fol. Amst. 1697); but they were published in 5 vols folio, with his life, by Mr Bekker of Amsterdam. They contain various analytical, exegetical, practical, problematical, and philosophical tracts, which shew his great industry and knowledge. Alting was a divine greatly addicted to the text of the scripture, to Cocceianism, and Rabbinitim. He preached well in German, Dutch, and English.

ALTITUDE, accessible, and inaccessible. See GEOMETRY, Part II. chap. i.

The method of taking considerable terrestrial altitudes, of which those of mountains are the greatest, by means of the barometer, is very easy and expeditious. It is done by observing, on the top of the mountain, how much the mercury has fallen below what it was at the foot of the mountain. See BAROMETER.

ALTICK, a town of Alsace in Germany, situated on the river Ill, in N. lat. 47. 40. and E. lon. 7. 15.

ALTMORE, a town of Ireland, in the county of Tyrone, and province of Ulster, situated in N. lat. 54. 34. and W. long. 7. 2.

ALTON, a town in Hampshire, seated on the river Wey; W. long. o. 46. N. lat. 51. 5. It is governed by a constable; and consists of about 250 houses, indifferently built, chiefly laid out in one pretty broad street, a part of which only is paved. It has one church, a Presbyterian, and a Quaker's meeting, a famous free-school, a large manufacture of plain and figured baragons, ribbed druggets, and serge de Nîmes; and round the town is a large plantation of hops.

ALTON, or AVELTON, a village in Staffordshire, five miles north of Uttoxeter. There are the ruins of a castle here, which some would have to be built before the Norman conquest; but Dr Plot is pretty certain that it was erected by Theobald de Verdun, in the be-
ginning

* See *Materia Medica*, no 90.
† See *Altitude*.

Alto-
relievo
||
Alundum.

ginning of the reign of Edward II. A great part of the walls are still standing, but they are in a very ruinous condition.

ALTO-RELIEVO. See **RELIEVO.**

ALTO-RIPIENO, in music, the tenor of the great chorus which sings and plays only now and then in some particular places.

ALTORF, a town of the circle of Franconia, in Germany. It has a physic-garden, with 2000 different plants; a theatre for dissections, which has many curiosities in the anatomical way; and a handsome library. It is subject to the house of Brandenburg; and is seated on the confines of Bavaria, 15 miles from Nuremberg. E. lon. 9. 35. N. lat. 47. 46.

ALT-RANSTADT, a town in Saxony, famous for the treaty between Charles XII. king of Sweden, and Augustus elector of Saxony, in 1706, wherein the latter reigned the kingdom of Poland.

ALTRINGHAM, a town of Cheshire in England, upon the borders of Lancashire, seven miles from Manchester. W. long. 1. 30. N. lat. 53. 25.

ALTZEG, a town of Germany in the Lower Palatinate, the capital of a territory of the same name, with an old castle. W. long. 7. 25. N. lat. 49. 44.

ALVA DE TORMES, a considerable town in Spain, in the kingdom of Leon, and territory of Salamanca, with a very handsome castle. It is seated on the north bank of the river Tormes. W. long. 6. 1. N. lat. 41. 0.

ALVARISTS, in ecclesiastical history, a branch of the Thomists, so called from Alvares their leader, who asserted the doctrine of sufficient grace, instead of the efficacious grace of the ancient Thomists. The Alvarists came near to the Jesuits, the ancient Thomists to the Janfenists.

ALUDELS, in chemistry, are earthen pots without bottoms, inserted into each other, and used in sublimations. See **CHEMISTRY**, n° 80.

ALVEOLUS, in natural history, the name of the waxen cells in bee-hives*. Also the name of a sea-fossil of a conic figure, composed of a number of cells, like bee-hives, joined into each other, with a pipe of communication.

ALVEOLUS, in anatomy, the sockets in the jaws wherein the teeth are fixed†.—Some writers speak of teeth growing without alveoli. Pliny mentions a person who had a tooth in his palate. Eustachius relates, that he saw a man who at 60 had a tooth growing out of the middle of his fauces. Holler gives an instance of a person, whose teeth were of a piece with his jaws, without any insertion into alveoli.

ALUM, or **ALUMEN**, in natural history, a peculiar kind of salt, sometimes found pure, but oftener separated from several substances; as, a soft reddish stone in Italy; several kinds of earth; and, in England, from a whitish or bluish stone, called Irish slate*.—In medicine, it is a powerful astrigent†. In dyeing, it fixes the colours upon the stuffs. See **DYEING**.

ALUNTUM, **ALUNTUM**, (anc. geogr.) a town in the north of Sicily, situated on a steep eminence, at the mouth of the Chydus, (Ptolemy, Pliny, Cicero;) said to be as old as the war of Troy, (Dionys. Halicarn.) Now in ruins; from which arose the hamlet *St Filadelfo*, in the Val di Demona. The inhabitants were called *Haluntini*, (Cicero.)

* See *Chemistry*, n° 129.
† See *Mathe-
ria Medica*,
n° 91.

ALVUS, in anatomy, a term used for the belly in general, but more frequently applied to the bowels.

ALWAIDII, a sect of Mahometans who believe all great crimes to be unpardonable.—The Alwadii stand in opposition to the Morgii. They attribute less efficacy to the true belief in the salvation of men, than the rest of the Musselmans.

ALYSSUM, **ALYSSON**, or **ALLYSOIDES**, Madwort; (from *αλυσω*, to be mad; because it was believed to have the property of curing madnes): a genus of the filiculosa order, belonging to the tetradynamia class of plants.

Species. Of this genus, Linnaeus enumerates 19 species; but none of them are remarkable either for beauty, or any other property, except the halimifolium, or madwort with whole spear-shaped leaves. This spreads itself upon the ground, and never rises to any height. It produces, at the extremity of its branches, very pretty tufts of small white flowers; of which it is seldom destitute for six or seven months successively; for which reason it well deserves a place in the gardens of the curious.

Culture. Though these plants are natives of the southern parts of Europe; yet, if planted on a dry, lean, or rubbisy soil, they will endure our severest winters in the open air.—The halimifolium seldom continues above two or three years, and must therefore be often sown to preserve it; or if the seeds are suffered to fall, the plants will rise without any trouble. It may also be propagated by cuttings, which ought to be planted in April or May, and are very apt to take root, if kept shaded in the heat of the day, and gently refreshed with water.

This plant, as already observed, was thought to cure some kinds of madnes; but the present practice has entirely rejected it for this or any other purpose.

ALYTARCHA, a priest of Antioch in Syria, who, in the games instituted in honour of the gods, presided over the officers who carried rods to clear away the crowd and keep order.

In the Olympic games, the alytarches had the same command, and obliged every person to preserve order and decency.

ALZIRA, a town of Spain, in the kingdom of Valencia, seated on the river Xucar, E. Long. o. 20. N. Lat. 39. 10.

AMABYR, a barbarous custom which formerly prevailed in several parts of England and Wales, being a sum of money paid to the lord, when a maid was married within his lordship. The word is old British, and signifies "the price of virginity."

AMADABAT, a corruption from **AHMED ABAD**, or *Ahmed's city*, (so called from a king of that name); a large and populous city of India, and the capital of the province of Guzarat. It is situated in E. Long. 72. 12. N. Lat. 23. 0. Amadabat was formerly called *Guzerat*; and by Shah Jehân nicknamed *Gherd-abad*, or the habitation of dust, because it was much incommoded therewith. It was the seat of the Guzarat kings, as it is now of the Mogul governor. The city stands in a beautiful plain; and is watered by the little river Sabremetti, which, though not deep, in time of rains overflows the plains prodigiously. The walls are built with stone and brick, flanked at certain distances with great round towers and battlements. It has

Alvus
||
Amadabat.

Amadan
||
Amad-
magda.

has twelve gates; and, including the suburbs, is about four miles and an half long. The streets are wide. The *meydan shah*, or king's square, is 700 paces long, and 400 broad, planted round with trees. On the west side is the castle, well walled with free stone, and as spacious as a little city; but its inward appearance is not conformable to its external magnificence. The caravanera is on the south of the square, and its chief ornament. Near the meidan also is the king's palace, whose apartments are richly ornamented: and in the midst of the city is the English factory, where they purchase fine chints, callicoes, and other Indian merchandize. The place is so full of gardens stored with fruit-trees, that from an eminence it looks like a wood. The Hindoos have here an hospital for sick beasts, and another for sick birds, which they take great care of. According to some late accounts, this city is little inferior to the best in Europe, and is thought to yield ten times as much revenue as Surat.

AMADAN, or HAMADAN, a town of Persia, between Tauris and Ispahan, E. Long. 47. 4. N. Lat. 35. 15. It is seated at the foot of a mountain, where there are a great many springs, which water the adjacent country. The extent of the city is very large; but there are a great many waste spots within it, as well as cultivated land. The houses are built of brick hardened in the sun, and have but a very indifferent aspect. There is but one tolerable street; and that is where stuffs, garments, and the like, are exposed to sale: it is straight, long, and wide; and the shops are very well furnished. The adjacent parts are fruitful in corn and rice, inasmuch that the neighbouring provinces are supplied from hence. It is said to enjoy a very salubrious air, but the cold in winter is intense. The Armenians have a church in this town, but it is a very ill-contrived structure. The Jews have a synagogue near a tomb where they pretend Esther and Mordecai lie interred. To this place they come in pilgrimage from several parts of the Levant. About a league from Amadan, there is a mountain called *Nalbana*, which abounds with all sorts of curious herbs. In the spring, people flock to this mountain from all parts to recover their health, by sucking in the salutary effluvia with their breath.

Amadan is a very ancient city. It is said to have been destroyed by Nebuchadnezzar, and rebuilt by Darius, who brought hither all his riches. The kings of Persia frequently retired to this place on account of its delightful situation; for which reason it obtained the name of the *Royal city*. It was conquered by the khalif Othman, and narrowly escaped being destroyed by Jenghis Khan in 1220. It had then strong walls and a good castle, which are now in ruins. Its present beauty consists in its gardens and springs.

AMADANAGER, a town in the hither peninsula of India, in the province of Decan. E. Long. 74. 15. N. Lat. 18. 10.—It was taken by the Moguls in 1598, after a siege of six months; being at that time defended by a strong castle, situated on an eminence, and surrounded with deep ditches, into which several springs discharged their waters.

AMADIA, a trading town of Asia, in Kurdistan, belonging to the Turks; seated on a high mountain. E. Long. 43. 1. N. Lat. 36. 25.

AMADMAGDA, an Abyssinian plant, said to be used by the inhabitants of that country for facilitating

the consolidation of fractures, and the discharge of bony splinters from wounds.

AMAIN, in the sea-language, a term importing to lower something at once. Thus, to *strike amain*, is to lower, or let fall, the top-sails; to *wave amain* is to make a signal, by waving a drawn sword, or the like, as a demand that the enemy strike their top-sails.

AMAK, a small island in the Baltic sea, near Copenhagen, from which it is separated by a canal, over which there is a draw-bridge. There is a good citadel, which they call *Christians-Haven*. It is remarkable for a village of Dutch, who are descended from a colony that settled there to make butter and cheese for the court. They retain their own language, manner of dress, and other customs. E. Long. 12. 10. N. Lat. 55. 20.

AMAL, a town of Sweden, in the province of Daland, seated on the river Wefer. It has a good harbour; and carries on a great trade, especially in timber, deals, and tar. E. Long. 12. 40. N. Lat. 58. 50.

AMALEKITES, by some thought to be the descendants of Amalek the grandson of Esau; by others, with more probability, to have been a Canaanitish tribe. They were a wicked people, and therefore devoted to destruction. They lived to the east of the Lacus Asphalites; next the Moabites to the south, and the Ammonites to the north. A branch of them dwelt to the south of Canaan.

AMALFI, an ancient city of Italy, situated in E. Long. 15. 20. N. Lat. 40. 35.—It is generally supposed to have been founded about the year 600. It was at first subject to the dukedom of Naples, and was governed by annual prefects; but being afterwards erected into a duchy, it extended its territory, which reached eastward from Vico Vecchio, and westward to the promontory of Minerva, including likewise the island of Caprea, and the two islands of the Galli. Towards the north it comprehended the cities of Lettere, Gragnano, Pimontio, and Capule di Franchi; towards the south, those of Scala, Ravelli, Minori, Majuri, Atrani, Tramonti, Agerula, Citara, Prajano, and Rofilano.—The laws which this republic made with regard to trade and commerce, afterwards had the same authority in the kingdom of Naples as the Rhodian laws had among the Romans.—At present Amalfi is subject to Naples, and is the see of an archbishop. It is famous for giving birth to Flavius Blendus, inventor of the mariners compass.

AMALGAM, mercury united with some metal.

AMALGAMATION, the operation of making an amalgam, or mixing mercury with any metal.

AMALTHEA, the name of the Cuman Sibyl, who offered to Tarquinius Superbus nine books, containing the Roman destinies, and demanded 300 pieces of gold for them. He derided her, whereupon she threw three of them into the fire; and returning, asked the same price for the other six: which being denied, she burnt three more; and returned, still demanding the same price. Upon which, Tarquin consulting the pontiffs, was advised to buy them. These books were in such esteem, that two magistrates were created to consult them upon extraordinary occasions.

AMALTHEA, in pagan mythology, the daughter of Melidius, king of Crete, and the nurse of Jupiter, whom she fed with goat's milk and honey. Accord-

ing

Amain
||
Amalthes.* See Chemi-
stry, no 421.

Amalthæus
||
Amapalla.

ing to others, Amalthæa was a goat, which Jupiter translated into the sky, with her two kids, and gave one of her horns to the daughters of Meliflus, as a reward for the pains they had taken in attending him. This horn had the peculiar property of furnishing them with whatever they wished for; and was thence called the *cornucopia*, or horn of plenty.

AMALTHEUS (Jerome, John Baptista, and Corneille), three celebrated Latin poets of Italy, who flourished in the 16th century. Their compositions were printed at Amsterdam in 1685. One of the prettiest pieces in that collection is an epigram on two children, whose beauty was very extraordinary, though each of them was deprived of an eye:

‘ Lumine Acon dextro, capta est Leonilla sinistro:

‘ Et poterat forma vincere uterque deos.

‘ Parve puer, lumen quod habes concede foriori;

‘ Sic tu cæcus Amor, sic erit illa Venus.’

AMAMA (Sixtinus), professor of the Hebrew tongue in the university of Franeker, a man of great learning, was born in Friesland, and had studied under Drufius. He published a criticism upon the translation of the Pentateuch; collated the Dutch translation of the Bible with the original and the most accurate translations; and wrote a censure of the Vulgate translation of the historical books of the Old Testament, Job, the Psalms, and Canticles. It is impossible to answer the reasons whereby he shews the necessity of consulting the originals. This he recommended so earnestly, that some synods, being influenced by his reasons, decreed, that none should be admitted into the ministry but such as had a competent knowledge of the Hebrew and Greek text of the Scripture. He died in 1629.

AMANCE, a town in the duchy of Lorraine, upon a rivulet of the same name. E. Long. 6. 10. N. Lat. 48. 45.

AMAND (St), a city of France, in Bourbonnois, on the confines of Berry, seated upon the river Cher. It was built in 1410 on the ruins of Orval. E. Long. 3. 30. N. Lat. 46. 32.

AMAND (St), a city of the Low Countries, in the earldom of Flanders, seated upon the river Scarpe. It contains about 600 houses, and 3000 or 4000 inhabitants. The abbot of the place is the temporal lord, and disposes of the magistracy. It was given to France by the treaty of Utrecht. E. Long. 2. 35. N. Lat. 50. 27.

AMANICÆ PYLÆ, (Ptolemy); AMANIDES PYLÆ, (Strabo); AMANI PORTÆ, (Pliny): traits or defiles in mount Amanus, through which Darius entered Cilicia; at a greater distance from the sea than the Pylæ Ciliciæ or Syriæ, through which Alexander passed.

AMANTEA, a sea-port town and bishop's see of the kingdom of Naples, situated near the bay of Euphemia, in the province of Calabria, in E. Long. 16. 20. N. Lat. 39. 15.

AMANUS, a mountain of Syria, separating it from Cilicia; a branch of mount Taurus, (Cicero, Strabo, Pliny); extending chiefly eastward, from the sea of Cilicia, to the Euphrates: now called *Monte Negro*, or rather *Montagna Neres*, by the inhabitants; that is, the watery mountain, as abounding in springs and rivulets.

AMAPALLA, a city and port-town of north America, in the province of Guatimala, seated on the

gulph of the same name, in the Pacific ocean. W. Long. 63. 20. N. Lat. 12. 30.

AMARANTE, an order of knighthood, instituted in Sweden by Queen Christina, in 1653, at the clofe of an annual feast, celebrated in that country, called *Wirtfchaft*. This feast was solemnized with entertainments, balls, masquerades, and the like diversions, and continued from evening till the next morning.—That princefs, thinking the name too vulgar, changed it into that of the *feast of the gods*, in regard each person here represented some deity as it fell to his lot. The Queen assumed the name of *Amarante*; that is, unfading, or immortal. The young nobility, dressed in the habit of nymphs and shepherds, served the gods at the table.—At the end of the feast, the queen threw off her habit, which was covered with diamonds, leaving it to be pulled in pieces by the mafques; and, in memory of so gallant a feast, founded a military order, called in Swedish *Cefchilfchaft*, into which all that had been present at the feast were admitted, including 16 lords and as many ladies, besides the queen. Their device was the cypher of *Amarante*, compofed of two A's, the one erect, the other inverted, and interwoven together; the whole inclofed by a laurel crown, with this motto, *Dolce nella memoria*.

Bullstrode Whitlock, the English ambassador from Cromwell to the court of Sweden, was made a knight of the order of *Amarante*: on which account it seems to be, that we sometimes find him styled Sir Bullstrode Whitlock.

AMARANTHOIDES, in botany, the trivial name of a species of illecebrum. See ILLECEBRUM.

AMARANTHUS, (of a privative, and *maranto* to wither, becaufe the flower of this plant when cropped does not soon wither,) AMARANTH, or FLOWER-GENTLE; a genus of the pentandria order belonging to the monœcia class of plants.

Species. Of this genus, Linnæus enumerates 19 species; the most remarkable of which are the following. 1. The tricolor, or three-coloured amaranthus. This has been long cultivated in gardens, on account of the beauty of its variegated leaves, which are of three colours, green, yellow, and red; and very elegantly mixed. When the plants are in full vigour, the leaves are large, and closely fet from the bottom to the top of the stalks, and the branches form a sort of pyramid; so that there is not a more beautiful plant than this, when it is in full lustre. 2. The melancholicus, bicolor, or two-coloured amaranthus. This greatly resembles the former in its manner of growth; but the leaves have only two colours, which are an obfcure purple, and a bright crimson. These are so blended as to set off each other, and, when the plants are vigorous, make a fine appearance. 3. The trifist, with oval heart-shaped leaves. This has very little beauty; and is mentioned only on account of its being used by the Indians as an esculent plant, and substituted for spinach. 4. The caudata, with very long hanging cylindrical spikes. This species is a native of America. It hath an upright stem three feet high; the leaves and stalks are of a pale green colour. The spikes of flowers are produced from the wings of the stalks, and also at the extremities of the branches. They are of a bright purple colour, and hang downward, sometimes to the length of two feet and an half, so that many of them

Amarante
||
Amaranthus.

Amaranthus.

them touch the ground. 5. The maximus, or tree-like amaranthus, grows with a strong stem, to the height of seven or eight feet. Towards the top it sends forth many horizontal branches, garnished with oblong rough green leaves. At the extremity of every shoot, the cylindrical spikes of flowers are produced. They are of a purple colour, and hang downward like the last; but are seldom half the length, tho' much thicker than the former. 6. The lividus, with roundish spikes of flowers. This grows near three feet high, putting out several side-branches, which are garnished with oval blunt leaves. At the ends of the branches the spikes of flowers are produced in clusters, and grow erect. These are of a deep purple colour. 7. The flavus, with oval pointed leaves. This grows naturally in Portugal, where it is accounted a culinary herb. It grows to the height of four feet; the stalks are inclined to red; the leaves are of an oval figure, marked with purple spots, and have very long foot-stalks. The spikes of flowers are of a pale green colour, and grow erect. They come out from the extremity of the branches in clusters, and also from the wings of the stalks. 8. The fanguineus, with compound spikes, and oblong oval leaves. This is a native of the Bahama islands. It is an esculent plant, and bears fine flowers. It grows to the height of three feet, with purple stalks and leaves. The spikes are short and cylindrical, of a bright purple at first, but afterwards fade to a darker colour. They are frequently produced from the wings of the stalks; but at the extremity of the stalk arises a large cluster of spikes, which are placed cross-wise, with one upright stalk in the middle. 9. The olcerans, with obtuse indented leaves. This has no beauty; but it is used by the Indians as a substitute to spinach, to which, however, it is greatly inferior.

Culture. The species most worthy of cultivation are the first and second. Next to these are the fourth, fifth, and eighth sorts.—The two first being tender plants, require some art and care to bring them to perfection in Britain. They should be sown on a good hot-bed in February, or in the beginning of March; and in about a fortnight's time the plants will rise. Another hot-bed must then be prepared, covered with fine mould to about four inches deep, and the young plants must be carefully raised, and removed from the other, and planted at about four inches distance every way, and gently watered, to settle the earth to their roots. In the middle of the day they must be screened with mats from the heat of the sun; and they must have air given them, by raising the glass that covers the bed; and the glasses must be either turned, or wiped from their moisture, as often as they appear wet. In about three weeks or a month's time, these plants will have grown so large as to require another hot-bed; this must be of a moderate temperature, and covered six inches deep with fine earth: then take them carefully up, and preserve as much of the earth about their roots as may be, and plant them in this bed at eight inches distance; then let them be watered frequently a little at a time, and shaded with mats in the heat of the day. In the beginning of May another hot-bed must be prepared, with a deep frame, that the plants may have room to grow: in this set as many pots as it will conveniently hold; let these be filled with fresh earth, and the intermediate spaces every way be filled also with earth.

VOL. I.

The plants are now to be raised with as much earth about their roots as may be, and planted in these pots. In about three weeks more, these plants will be grown to a large size, and must have air given them more and more every day in good weather; and in July they are to be set out in their places, often watering them. The seeds of the fourth, fifth, and eighth species, should be sown upon a moderate hot-bed, towards the end of March; and when the plants come up, they should have a large share of air admitted to them in mild weather, to prevent their drawing up weak. When they are large enough to transplant, another moderate hot-bed must be provided, in which they should be planted at six inches distance every way, observing to water them, as also to shade them from the sun, until they have taken new root. After this the air may be freely admitted to them at all times, when the weather is favourable; their waterings should be frequent, but not in great quantities. As the plants advance, and the warmth of the season increases, they should have a greater share of air, that by degrees they may be hardened to bear the open air. The beginning of June they may be taken up, with large balls of earth to their roots, and planted, some into pots, and others into borders, observing to shade them well until they have taken good root; after which they must be watered frequently, especially those in the pots, which in warm dry weather will require it every evening. The fifth sort will not thrive in pots; so should be planted in a rich, light soil; where if it is allowed room, and plentifully watered in dry weather, the plants will grow to a very large size, and make a fine appearance.

Where people are curious in having these annual plants in great perfection, there should be a glass-case erected, with upright and sloping glasses on every side, with a pit in the bottom for tan, in which the pots should be plunged. If this is raised eight or nine feet to the ridge, and the upright glasses are five feet, there will be room enough to raise these and other annual plants to great perfection; and, in such a building, many tender vegetables, which rarely perfect their seeds in this climate, may be every year brought forward so as to ripen their seeds.

AMARANTHUS CRISTATUS. See CELOSIA.

AMARYLLIS, LILY DAFODIL; a genus of the monogynia order, belonging to the hexandria class of plants.

Species. 1. The lutea, or autumnal narcissus. This is usually sold by gardeners, along with colchicums, for autumnal ornaments to gardens. For this purpose it is very proper, as it will keep flowering from the beginning of September to the middle of November, provided the frost is not so severe as to destroy the flowers. Although there is but one flower in each cover, yet there is a succession of flowers from the same root, especially when they are suffered to remain three or four years unremoved. The flowers seldom rise above three or four inches high. They are shaped somewhat like the flowers of the yellow crocus; the green leaves come up at the same time, like the saffron; and, after the flowers are past, the leaves increase all the winter. The roots are bulbous, and shaped like those of the narcissus; so are proper ornaments for such borders as are planted with cyclamens, saffron, autumnal crocus, colchicums, and such low autumnal flowers. 2. The alta-

M m

masco,

Amaranthus, Amaryllis.

Amaryllis.

masco, or atamusco lily, is a native of Virginia and Carolina, where it grows plentifully in the fields and woods, making a very beautiful appearance when in flower. The flowers of this sort are produced single; and, at their first appearance, have a fine carnation colour on the outside: but this fades away to a pale, or almost white colour, before they decay. The flowers of this sort are almost as large as those of the small orange-lily, but do not grow above six or eight inches high. They appear the latter end of May, or beginning of June, or sometimes it flowers in August in this country. 3. The formosissima, or jacobæa lily, produces its flowers two or three times in a year, without being regular to any season. The flowers are of a deep red, the under petals very large, and the whole flower stands nodding on one side of the stalk, making a beautiful appearance. The stems of these flowers are produced from the sides of the bulbs; so that when the flowers produced on one side are decayed, another stalk arises from the other side of the bulb; but there is no more than one flower produced on the same stalk. When the roots are in vigour, flowers will be produced from March to the beginning of September. 4. The farniensis, or Guernsey lily, is supposed to have come originally from Japan, but has been many years cultivated in the gardens of Guernsey and Jersey; in both which places they seem to thrive as well as if it was their native country, and from these islands their roots are sent annually to the curious in most parts of Europe. The flowers of this species are admired for the richness of their colour, which is commonly red, though they have no scent. They appear towards the end of September; and, if properly managed, will continue a month in beauty. The roots of these plants do not flower again the succeeding year, as is the case with many other bulbs: but if their bulbs contain two buds in their centre, which is often the case, they frequently flower twice in three years; after which the same individual root does not flower again in several years, but only the offsets from it. 5. The regina, or belladonna lily, is a native of Portugal, where it was formerly cultivated in great plenty; but of late it has been supplanted by the jacobæa lily, so that the roots which have been brought from that country for some time past, for the belladonna, have generally proved the jacobæa lily. This kind, if properly managed, will sometimes put out two or three stems, growing near three feet high, and produce many flowers in each umbel, which make a fine appearance during the month of October. 6. The belladonna, or Mexican lily, seldom rises more than one foot high; each stem supporting two, three, or four flowers, but rarely more than that number. The flowers are of a bright copper colour, inclining to red; the spathe or sheath, which covers the buds before they open, divides into two parts to the bottom, standing on each side the umbel of the flowers, joined to the small footstalks. 7. The longifolia, with many flowers in one cover, produces, in each umbel, a great number of flowers, which appear in December: on which account they are the more valuable, there being few flowers at that season. They are of a deep purple colour; but the stalk, which supports them, seldom rises to more than three or four inches high. The roots of this species are large, and the leaves long and narrow. 8. The zeylanica, or Ceylon lily, is a

native of the West Indies, and usually flowers in June. Sometimes the same root will flower again in autumn, but the flowers are of no long duration. 9. The ciliaris, or African scarlet lily, seldom flowers in Britain. The leaves are long and narrow, not unlike the snow-drop. The roots are small: the petals of the flower turn back, like those of the Guernsey lily; but are of a lighter colour, inclining to scarlet. 10. The vernalis, or spring yellow lily narcissus, grows naturally in Spain and Portugal, where it flowers early in January. In this country it flowers in April and the beginning of May; but the flowers are of no long duration. It was formerly kept in several curious gardens; but as it flowers at a season when there are so many finer kinds in beauty, it was neglected, so that it is at present almost lost in Britain. 11. The orientalis, or lily daffodil, with leaves shaped like a tongue. This is a native of the Cape of Good Hope. The bulbs of the root are large and almost round; the leaves long, broad, and rounded at their extremities; these spread two ways on the surface of the ground, and do not come up till after the flower-stem appears, which is generally in November. After the flowers are past, the leaves increase till spring, and in May they begin to decay; so that from the middle of June to October, the roots are entirely destitute of leaves. 12. The capensis, with three leaves in one cover. This is also a native of Africa. The stems rise near two feet high, and have commonly three flowers inclosed in each sheath or cover. The flowers appear in February and March. They are as large as those of the belladonna lily, and of the same form, but of a deeper red colour. The leaves are long and narrow; have a hollow furrow on their upper side, where there is a pale stripe running the length of the leaves; and are very like those of the American pancratium. These leaves decay in summer, about the same time as those of the former, and appear again at the same season.

Culture. The first sort is very hardy, and will thrive in almost any soil or situation; but will succeed best in a fresh light dry soil, and not too near the dripping of trees, or too near walls. It increases very fast by offsets, by which all the other species are also to be propagated. These roots may be transplanted any time from May to the end of July; after which it will be too late to remove them.—The second kind is likewise hardy enough to thrive in the open air in Britain, provided the roots are planted in a warm situation, and in a dry soil.—The jacobæa ought to be kept in a moderate stove all winter; in which case it will send forth plenty of offsets, that will produce vigorous plants.—The roots of the Guernsey lily are generally brought over in June and July; but the sooner they are taken out of the ground after the leaves decay, the better: for, altho' the roots which are taken up when their flower-stems begin to appear, will flower; yet their flowers will not be so large, nor will their roots be near so good after, as those which were removed before they sent forth fresh fibres.

When these roots come over, they should be planted in pots filled with fresh, light, sandy earth, mixed with a little very rotten dung, and placed in a warm situation, observing now and then to refresh the earth with water: but by no means let them have too much wet, which would rot their roots, especially before they come

Plate XI.
fig. 1.

up.

Amaryllis
||
Amatorii.

up. About the middle of September, such of the roots as are strong enough to flower, will begin to show the bud of their flower-stem; therefore these pots ought to be removed into a situation where they may have the benefit of the sun, and be sheltered from strong winds; but by no means place them too near a wall, nor under glasses, as this would draw them up weak, and render them less beautiful. At this season they should be gently refreshed with water, if the weather be warm and dry; but if wet, they should be screened from it.

When the flowers begin to open, the pots should be removed under shelter, to prevent the flowers from being injured by too much wet: but they must not be kept too close, nor placed in a situation too warm, as this would occasion their colour to be less lively, and hasten their decay.—After the flowers are decayed, the green leaves will begin to shoot forth in length; and, if sheltered from severe cold, will continue growing all winter: but they must have as much free air as possible in mild weather, and are to be covered only in great rains or frosts. For this purpose, a common hot-bed frame is the most proper shelter for them; the glasses of which may be taken off every day in dry open weather, which will encourage the leaves to grow strong and broad. The roots should be transplanted every fourth or fifth year, toward the end of June, or beginning of July; the offsets also should be taken off, and planted in pots, where in three years time they will produce flowers.

The other species of the amaryllis may easily be raised by taking care to shelter them in a stove from the winter's cold.

AMARYNTHUS, (anc. geogr.) a hamlet of Eretrias, in the island of Eubœa, about seven stadia distant from its walls, (Strabo.) Here Diana was worshipped by an annual solemnity, at which those of Carystus assisted; hence the title of the goddess was *Amarynthis*, and *Amarysia*, (Livy, Pausanias).

AMASIA, an ancient town of Turkey, in Natolia, remarkable for the birth of Strabo, the geographer. It is the residence of a bashaw, and gives its name to the province it stands in, where there are the best wines and the best fruits in Natolia. It is seated near the river Cafalmack. E. Long. 36. 10. N. Lat. 39. 33.

AMATHUS, a very ancient town in the south of Cyprus, (Strabo, Ptolemy); so called, from Amathus the founder; or, according to others, from *Amath*, a Phœnician town sacred to Venus, with a very ancient temple of Adonis and Venus: and hence Venus is denominated *Amathusia*, (Tacitus). According to Ovid, it was a place rich in copper-ore, and where the inhabitants became *Cæstææ*, or horned. Now called *Limisso*.

AMATHUS, (Josephus), a town of the tribe of Gad, beyond Jordan; but whether at a greater or less distance from it, is not so easy to determine. Eusebius places it in the Lower Perzæ; Reland, in Ramoth-Gilead; Gabinius, proconsul of Syria, established five juridical conventions in Judea; two of which were on the other side Jordan; one at Gadara, the other at Amathus, (Josephus).

AMATORII MUSCULI, in anatomy, a term sometimes used for the obliquus superior and obliquus inferior muscles of the eye, as these muscles assist in oggling or drawing the eye sideways.

AMATRICE, a city of the kingdom of Naples, in the farther Abruzzo, upon the confines of the pope's territories, and the marquise of Ancona.

AMAUROSIS, in medicine, a distemper in the eye, occasioned by an insensibility of the retina*.

AMAZONS, a nation of female warriors, whose existence has been esteemed merely fabulous by Strabo, Arrian, Palephates, and some of the moderns: while others maintain that their existence is sufficiently proved, by the testimony of such of the historians of antiquity as are most worthy of credit; by the monuments which many of them have mentioned; and by medals, some of which are still remaining; and that there is not the least room to believe that what is said of them is fabulous.

The Scythians had a great part of Asia under their dominion upwards of 400 years, till they were conquered by Ninus, the founder of the Assyrian empire. After his death, which happened about 1150 years before the Christian æra, and that of Semiramis and their son Ninias, Ilus and Scolopites, princes of the royal blood of Scythia, were driven from their country by other princes, who like them aspired to the crown. They departed with their wives, children, and friends; and being followed by a great number of young people of both sexes, they passed into Asiatic Sarmatia, beyond mount Camassus, where they formed an establishment, supplying themselves with the riches they wanted, by making excursions into the countries bordering on the Euxine Sea. The people of those countries, exasperated by the incursions of their new neighbours, united, surprized, and massacred the men.

The women then resolving to revenge their death, and at the same time to provide for their own security, resolved to form a new kind of government, to chuse a queen, enact laws, and maintain themselves, without men, even against the men themselves. This design was not so very surprising as at first sight appears: for the greatest number of the girls among the Scythians had been inured to the same exercises as the boys; to draw the bow, to throw the javelin, to manage other arms; to riding, hunting, and even the painful labours that seem reserved for men; and many of them, as among the Sarmatians, accompanied the men in war. Hence they had no sooner formed their resolution, than they prepared to execute it, and exercised themselves in all military operations. They soon secured the peaceable possession of the country; and not content with shewing their neighbours that all their efforts to drive them thence or to subdue them were ineffectual, they made war upon them, and extended their own frontiers. They had hitherto made use of the instructions and assistance of a few men that remained in the country; but finding at length that they could stand their ground, and aggrandize themselves, without them, they killed all those whom flight or chance had saved from the fury of the Sarmatians; and for ever renounced marriage, which they now considered as an insupportable slavery. But as they could only secure the duration of their new kingdom by propagation, they made a law to go every year to the frontiers, to invite the men to come to them; to deliver themselves up to their embraces, without choice on their part, or the least attachment; and to leave them as soon as they were pregnant. All those whom age rendered fit for propagation, and were

Amatrice

Amazons.

willing to serve the state by breeding girls, did not go at the same time in search of men: for in order to obtain a right to promote the multiplication of the species, they must first have contributed to its destruction; nor was any thought worthy of giving birth to children, till the had killed three men.

If from this commerce they brought forth girls, they educated them; but with respect to the boys, if we may believe Justin, they strangled them at the moment of their birth: according to Diodorus Siculus, they twisted their legs and arms, so as to render them unfit for military exercises; but Quintus Curtius, Philostrates, and Jordanus, say, that the less savage sent them to their fathers. It is probable, that at first, when their fury against the men was carried to the greatest height, they killed the boys: that when this fury abated, and most of the mothers were filled with horror at depriving the little creatures of the lives they had just received from them, they fulfilled the first duties of a mother; but, to prevent their causing a revolution in the state, maimed them in such a manner as to render them incapable of war, and employed them in the mean offices which these warlike women thought beneath them: in short, that, when their conquests had confirmed their power, their ferocity subsiding, they entered into political engagements with their neighbours; and the number of the males they had preserved becoming burthenfome, they, at the desire of those who rendered them pregnant, sent them the boys, and continued still to keep the girls.

As soon as the age of the girls permitted, they took away the right breast, that they might draw the bow with the greater force. The common opinion is, that they burnt that breast, by applying to it, at eight years of age, hot iron, which infensibly dried up the fibres and glands: some think that they did not make use of so much ceremony, but that when the part was formed they got rid of it by amputation: some, again, with much greater probability, assert, that they employed no violent measures; but, by a continual compression of that part from infancy, prevented its growth, at least so far as to hinder its ever being incommodious in war.

The Amazons were commonly clothed in the skins of the beasts they killed in hunting; which were tied on the left shoulder, and, leaving the right side uncovered, fell down to their knees. In war, the queens and other chiefs carried a corselet, or slight armour for the body, formed of small pieces of iron, in the manner of leaves or scales, fastened by a girdle, below which the coat of arms hung to the knee. The head was armed with a helmet and plume of feathers. The rest of their arms were a bow and arrows, lances, javelins, a battle-axe (said to be invented by Penthesilea one of their queens), and buckler nearly in the form of a crescent, about a foot and a half in diameter, with the points upward. Thalestris appeared before Alexander with two lances in her hand, though she only came to make him a gallant request. Those who accompanied her bore battle-axes with two edges, the handles of which were as long as the wood of a javelin.

They are said to have made great conquests, and to have obtained very extensive dominions, particularly Crimea and Circassia; and to have rendered Iberia, Colchis, and Albania, tributary to them. They enjoyed their power for several centuries; but an expedition in-

to Greece, and into the island of Achilles, is said to have ruined their empire.

The *AMAZONS* of Africa were female warriors, who were obliged to continue virgins to a certain period of their military service. When that period was elapsed, they married, merely with the view of propagating the species. All the offices of state were filled by them. The men were employed in domestic affairs, and passed their whole life in the house, as women did in other countries: for these imperious females usurped from them every function that might awake their valour. As soon as the Amazons were delivered, they committed their children to the care of the men, who nourished them with milk, and other food proper for infancy. If the child was a female, they burned its breasts to prevent their growth, which would have been inconvenient in battle. Historians inform us, that they inhabited an island which was called Hesperia, because it lay to the west of the lake Tritonis.

AMAZONS, (the river of), called by the Spaniards *Maranon*, is the greatest river in the world. It received the name of *Amazons*, because the Spaniards who first passed through the country on its banks, having some smart skirmishes with the natives, and afterwards examining the slain, found the bodies of some women among them. Orellana was the first who discovered this river, about the year 1539. The Maranon, after issuing from the lake from whence it takes its rise, in about eleven degrees of south latitude, runs towards the north to Jaen de Bracamoros, for the length of six degrees, from whence it directs its course towards the east, almost parallel to the equinoctial line, as far as the north cape, where it discharges itself into the ocean directly under the equator, by a mouth 50 or 60 leagues broad. It runs from Jaen, where it begins to be navigable, thirty degrees of longitude, according to Condamine, who was sent into these parts by the French king to discover the true measure of the earth. This is equal to 1800 miles of 60 to a degree. But if the turnings and windings are reckoned, it will then be at least 2700 miles. It receives from the north and south a prodigious number of rivers, some of which run 1500 miles, and are not inferior to the Danube or Nile. The country through which this river runs, is very little known to the Europeans.

AMBA, an Abyssinian or Ethiopic word, signifying a rock. The Abyssinians give names to each of their rocks, as *Amba-Dorho*, the rock of a hen, &c. Some of these rocks are said to have the name of *Aorni*; and are of such a stupendous height, that the Alps and Pyrenees are but low hills in comparison of them. Amongst the mountains, and even frequently in the plains, of this country, arise steep and craggy rocks of various forms, some resembling towers, others pyramids, &c. so perpendicular, and smooth on the sides, that they seem to be works of art; inasmuch, that men, cattle, &c. are craned up by the help of ladders and ropes: and yet the tops of these rocks are covered with woods, meadows, fountains, fishponds, &c. which very copiously supply the animals seated thereon with all the conveniences of life. The most remarkable of these rocks is called *Amba-Geshen*. It is prodigiously steep, in the form of a castle built of free-stone, and almost impregnable. Its summit is about half a Portuguese league in breadth, and the circumference at the bottom about half,

Amazons,
Amba,

Ambages half a day's journey. The ascent at first is easy; but grows afterwards so steep, that the Abassine oxen, which will otherwise clamber like goats, must be craned up, and let down with ropes. Here the princes of the blood were formerly confined, in low cottages amongst shrubs and wild cedars, with an allowance barely sufficient to keep them alive. There is, according to Kircher, in this country, a rock so curiously hollowed by nature, that at a distance it resembles a looking-glass; and opposite to this, another, on the top of which nothing can be so softly whispered that it may be heard a great way off. Between many of these rocks and mountains, are vast abysses, which appear very dreadful to the eye.

AMBAGES. See **CIRCUMLOCUTION**.

AMBARVALIA, in antiquity, a ceremony among the Romans, when, in order to procure for the gods an happy harvest, they conducted the victims thrice round the corn-fields in procession, before sacrificing them.—*Ambarvalia* were either of a private or public nature: the private were performed by the master of a family; and the public by the priests who officiated at the solemnity, called *fratres ovales*. The prayer preferred on this occasion, the formula of which we have in *Cato de Re Rustica*, cap. cxlii. was called *carmen ambarvale*. At these feasts they sacrificed to Ceres a fow, a sheep, and a bull or heifer, whence they took the name of *suovetaurilia*. The method of celebrating them, was, to lead a victim round the fields, while the peasants accompanied it, and one of their number, crowned with oak, hymned forth the praises of Ceres, in verses composed on purpose. This festival was celebrated twice a-year; at the end of January, according to some, or in April, according to others; and for the second time, in the month of July.

AMBASSADOR, or EMBASSADOR, a public minister sent from one sovereign prince, as a representative of his person, to another.

Ambassadors are either ordinary or extraordinary. *Ambassador in ordinary*, is he who constantly resides in the court of another prince, to maintain a good understanding, and look to the interest of his master. Till about two hundred years ago, ambassadors in ordinary were not heard of: all, till then, were ambassadors *extraordinary*; that is, such as are sent on some particular occasion, and who retire as soon as the affair is dispatched.

By the law of nations, none under the quality of a sovereign prince can send or receive an ambassador. At Athens, ambassadors mounted the pulpit of the public orators, and there opened their commission, acquainting the people with their errand. At Rome, they were introduced to the senate, and delivered their commissions to the fathers.

Ambassadors should never attend any public solemnities, as marriages, funerals, &c. unless their masters have some interest therein: nor must they go into mourning on any occasions of their own, because they represent the person of their prince. By the civil law, the moveable goods of an ambassador, which are accounted an accession to his person, cannot be seized on, neither as a pledge, nor for payment of a debt, nor by order or execution of judgment, nor by the king's or state's leave where he resides, as some conceive; for all actions ought to be far from an ambassador, as well that which toucheth his necessities, as his person: if, therefore, he

hath contracted any debt, he is to be called upon kindly; and if he refuses, then letters of request are to go to his master. Nor can any of the ambassador's domestic servants that are registered in the secretaries of state's office be arrested in person or goods; if they are, the process shall be void, and the parties suing out and executing it shall suffer and be liable to such penalties and corporal punishment as the lord chancellor or either of the chief justices shall think fit to inflict. Yet ambassadors cannot be defended when they commit any thing against that state, or the person of the prince, with whom they reside; and if they are guilty of treason, felony, &c. or any other crime against the law of nations, they lose the privilege of an ambassador, and may be subject to punishment as private aliens.

AMBE, in *surgery*, the name of an instrument for reducing dislocated bones. In *anatomy*, a term for the superficial jutting out of a bone.

AMBER, in natural history. See the article **SUC-CINUM**; and **CHEMISTRY**, n° 313, 511.

AMBERG, a city of Germany, the capital of the palatinate of Bavaria, with a good castle, ramparts, bastions; and deep ditches. It is seated near the confines of Franconia, on the river Wils. It drives a great trade in iron and other metals, found in the neighbouring mountains. E. Long. 12. 4. N. Lat. 29. 46.

AMBERGREASE, or AMBERGRISSE, in natural history, is a solid, opaque, ash-coloured, fat, inflammable substance, variegated like marble, remarkably light, rugged and uneven in its surface, and has a fragrant odour when heated. It does not effervesce with acids; it melts freely over the fire, into a kind of yellow resin; and is hardly soluble in spirit of wine.

Ambergrie is in general the most agreeable of the perfumes, and rarely accompanied with the inconveniences which other substances of this class frequently occasion. It is looked upon as an high cordial; and esteemed of great service in all disorders of the head, and in nervous complaints: a solution of it in spirit distilled from roses, stands recommended by Hoffman as one of the most efficacious corroborants of the nervous system. The Orientals entertain an high opinion of the aphrodisiac virtues of this concrete; and likewise suppose that the frequent use of it conduces to long life.

Ambergrie is found in great quantities in the Indian ocean, near the Molucca isles; as also near Africa; and sometimes near the northern parts of England, Scotland, and Norway. There have been many different hypotheses concerning its origin; but the most probable is that which supposes it to be a fossil bitumen, or naphtha, exuding out of the bowels of the earth, in a fluid form, and distilling into the sea, where it hardens and floats on the surface. See **CHEMISTRY**, n° 513.

AMBERT, a small town of France, in Lower Auvergne, the chief place of a small territory called *Livradoir*. It is remarkable for its paper manufactory and camblets. E. Long. 3. 35. N. Lat. 45. 28.

AMBETT-UWAY, in botany, a barbarous name of a tree, the leaves of which, when boiled in wine, are said to create an appetite, and is used by the people in Guinea with that intention.

AMBIANI, or AMBIANENSIS CIVITAS, now *Amiens*, a city of Picardy. It is called *Samarobriwa* by Caesar and Cicero; which, according to Valerius, signifies the bridge of the *Samara* or *Somme*. *Ambiani* is a later name,

Ambe
Ambiani.

Ambidex-
ter
||
Ambit.

name, taken from that of the people, after the usual manner of the lower age.

AMBIDEXTER, a person who can use both hands with the same facility, and for the same purposes, that the generality of people do their right hands.—As to the natural cause of this faculty, some, as Hæfer, attribute it to an extraordinary supply of blood and spirits from the heart and brain, which furnish both hands with the necessary strength and agility: others, as Nicholas Massa, to an erect situation of the heart, inclining neither to the right-hand nor left; and others to the right and left subclavian arteries being of the same height, and the same distance from the heart, by which the blood is propelled with equal force to both hands.—But these are only conjectures, or rather chimeras. Many think, that, were it not for education and habit, all mankind would be ambidexters; and in fact, we frequently find nurses obliged to be at a good deal of pains before they can bring children to forego the use of their left hands. How far it may be an advantage to be deprived of half our natural dexterity, may be doubted. It is certain, there are infinite occasions in life, when it would be better to have the equal use of both hands. Surgeons and oculists are of necessity obliged to be ambidexters; bleeding, &c. in the left-arm or left ankle, and operations on the left-eye, cannot be well performed but with the left-hand.—Various instances occur in history, where the left-hand has been exercised preferably to the right. But by the laws of the ancient Scythians, people were enjoined to exercise both hands alike; and Plato enjoins ambidexterity to be observed and encouraged in his republic.

AMBIDEXTER, among English lawyers, a juror or embracer, who accepts money of both parties, for giving his verdict; an offence for which he is liable to be imprisoned, for ever excluded from a jury, and to pay ten times the sum he accepted of.

AMBIEGNÆ OVES, in the heathen sacrifices, an appellation given to such ewes as, having brought forth twins, were sacrificed together with their two lambs, one on each side. We find them mentioned among other sacrifices to Juno.

AMBIENT, a term used for such bodies, especially fluids, as encompass others on all sides: thus, the air is frequently called an ambient fluid, because it is diffused round the earth.

AMBIGENAL HYPERBOLA, a name given by Sir Isaac Newton to one of the triple hyperbolas of the second order, having one of its infinite legs falling within an angle formed by the asymptotes, and the other without.

AMBIGUITY, a defect of language, whereby words are rendered ambiguous. See the next article.

AMBIGUOUS, a term applied to a word or expression which may be taken in different senses.—An anonymous writer has published a dictionary of ambiguous words: *Lexicon Philosophicum de Ambiguitate Vocabulorum*, Francf. 1597. 4to.—The responses of the ancient oracles were always ambiguous.

AMBIT, in geometry, is the same with what is otherwise called the perimeter of a figure.*

AMBIT was particularly used, in antiquity, to denote a space of ground to be left vacant betwixt one building and another. By the laws of the twelve ta-

bles, houses were not to be built contiguous, but an ambit or space of $2\frac{1}{2}$ feet was to be left about each for fear of fire.—The ambitus of a tomb or monument, denoted a certain number of feet, in length and breadth, around the same, within which the sanctity assigned to it was limited. The whole ground wherein a tomb was erected, was not to be consecrated from the common uses; for this reason, it was frequent to inscribe the ambit on it, that it might be known how far its sanctity extended: thus, *in fronte pedes tot, in agrum pedes tot*.

AMBITION, (*ambitio*), is generally used in a bad sense, for an immoderate or illegal pursuit of power.

In the strict meaning, however, of the word, it signifies the same with the *ambitus* of the Romans. See the next article.

AMBITUS, in Roman antiquity, the setting up for some magistracy or office, and formally going round the city to solicit the interest and votes of the people.

Ambitus differed from *ambition*, as the former lies in the act, the latter in the mind.

Ambitus was of two kinds; one lawful, the other infamous. The first, called also *ambitus popularis*, was when a person offered his service to the republic frankly, leaving it to every body to judge of his pretensions as they found reasonable. The means and instruments here made use of were various. 1. *Amici*, or friends, under different relations, including *cognati, affines, necessarii, familiares, vicini, tribules, clientes, municipes, sodales, collegæ*. 2. *Nomenclatura*, or the calling and saluting every person by his name; to which purpose, the candidates were attended with an officer, under the denomination of *interpres*, or *nomenclator*. 3. *Blanditia*; or obliging persons, by serving them, or their friends, patrons, or the like, with their vote and interest on other occasions. 4. *Prenatio*; the shaking every person by the hand, offering him his service, friendship, &c.—The second kind was that wherein force, cajoling, money, or other extraordinary influence, was made use of. This was held infamous, and severely punished, as a source of corruption and other mischiefs.

Ambitus was practised not only at Rome and in the forum, but in the meetings and assemblies of other towns in Italy, where numbers of citizens were usually found, on account of trade and business.—The practice ceased in the city from the time of the emperors, by reason posts were not then to be had by courting the people, but by favour from the prince.

Persons who had causes depending practised the same, going about among the judges to implore their favour and mercy. They who practised this, were called *Ambitiosi*. Hence we also meet with *ambitiosa decreta*, and *ambitiosa jussa*, used for such sentences and decrees as were thus procured from the judges, contrary to reason and equity, either gratuitously, or for money.

AMBLE, in horsemanship, a peculiar pace by which a horse's two legs of the same side move at the same time.

AMBLESIDE, a town in Westmoreland, seated at one end of Winandermer, W. long. o. 49. N. lat. 54. 30.

AMBLETEUSE, a sea-port town of France, in Picardy, defended with a battery of canon. E. long. 1. 30. N. lat. 49. 40.

* See Perimeter.

Ambygon
|
Amboule.

AMBYGON, in geometry, denotes an obtuse-angled triangle, or a triangle one of whose angles consists of more than ninety degrees.

AMBYOPY, among physicians, signifies an obscuration of the sight, so that objects at a distance cannot be clearly distinguished. The word is Greek; and compounded of *αμβω* dull, and *ω*, the eye.

AMBO, or **AMBON**, a kind of pulpit or desk, in the ancient churches, where the priests and deacons stood to read, or sing part of the service, and preach to the people; called also *Analogium*. The term is derived from *αμβωνιον*, to mount.—The ambo was mounted upon two sides; whence some also derive the appellation from the Latin *ambo*, both.

The ambo was ascended by steps; which occasioned that part of the office performed there, to be called the *Gradual*. See **GRADUAL**.

Besides the gospel, which was read at the top of the ambo, and the epistle, which was read a step lower, they likewise published from this place the acts of the martyrs, the commemoration of departed saints, and the letters of peace and communion sent by one church to another: here, too, converts made a public profession of their faith; and bishops, their defence, when accused: treaties also were sometimes concluded, and the coronations of emperors and kings performed, in the same place.

The modern reading-desks and pulpits have been generally substituted to the ancient Ambos; though, in some churches, remains of the ambos are still seen. In that of St John de Lateran at Rome, there are two moveable ambos.

AMBOHITSMENE, or **VOHITSANGHOMBE**, a province of the island of Madagascar, so called from some red mountains of the same name, lying in S. lat. 20°. These mountains are very high, resembling the Tafelberg of the Cape of Good Hope. On one side of this ridge the sea extends into the country for fifteen leagues; on the other is a flat country abounding in ponds and marshes. Here is also a lake fifteen leagues in length, and the same in breadth, containing many small islands. The inhabitants of the mountains are called *Zaferahongs*; and have plenty of gold, iron, cattle, silk, &c.

AMBONUM. See **OCULUS BELI**.

AMBOISE, a town of France, in Touraine, seated at the confluence of the rivers Loire and Malfec. E. Lon. 1. 30. N. Lat. 47. 25.

AMBOULE, a province of Madagascar, somewhat to the northward of S. lat. 23°. It is a fertile and agreeable country, watered by the river Manampani, whose mouth lies in S. lat. 23. 30. The country produces plants and fruits in plenty. Iron mines are also found here. The black cattle are extremely fat, and their flesh excellent. In this province stands a large town of the same name; near which is a fountain of hot water, within 20 feet of a small river whose sand is almost burning. The water of the fountain is said to boil an egg hard in two hours; and the inhabitants affirm it to be a sovereign remedy against the gout. The people here are employed in different preparations of iron and steel, which they have from their own mines, and forge several instruments with tolerable skill. Their governor is honoured with the title of *Rabertan*, or *Great Lord*. He exercises sovereign authority and ab-

Amboyna.

solute power; but is frequently, in times of distress, surprised by his subjects, who assemble in great numbers, seize his person, and threaten him with death unless they are relieved. To extricate himself from this dilemma, he is instantly obliged to issue orders for distributing provisions among them; but is usually repaid with interest, a quadruple return being made in a plentiful harvest. The people of Amboule live in great licentiousness with their superiors, and their country is generally a retreat for the roguish and lazy.

AMBOYNA, one of the Molucca islands, in the East Indies. It lies in S. lat. 3. 36. and E. long. 126. 20. and is remarkable for being the centre of the commerce for nutmegs and cloves, which is entirely monopolized by the Dutch East-India company. It is about 24 leagues in circumference. The air is but indifferent; and infects the body with a scrophulous disorder, not unlike the French-pox, except it is not being so painful, and not corroding the bones. This disorder is said to be easily cured in the first stage; but very difficultly, if allowed to proceed to any height.

The island is fertile in millet, tobacco, sugar, coco, potatoes, oranges, lemons, citrons, &c. Here is likewise the fago tree, a kind of palm, of the pith of which they make bread; and by cutting off one of the branches near the top, the sap will flow out: this juice is very sweet, and will ferment into a sort of wine. A bitter root, called *oubat*, is made use of to prevent it from turning, otherwise it would soon grow sour as vinegar. Some trees will yield 30 quarts in 24 hours.

The men wear large whiskers, and but little hair upon their chin; and have only a slight piece of stuff wrapped round their middle. The women tie their hair in knots: the maids are bought of their fathers before they are married; and if the wife proves barren, the marriage is dissolved. Some of the natives are Mahometans, and some Christians: but they are all said to be lazy, deceitful, and treacherous; and will rather die than leave their ancient customs. They make war with small swift vessels, in shape like dragons with regard to the head and tail. Their houses are built of bamboo canes and fago-trees. They sleep on mats. Their weapons are bows and arrows, javelins, scymitars, and targets. They have likewise trunks, out of which they shoot poisoned arrows. The women are very amorous; and if they are deceived by their gallants, they give them a slow poison, which causes them to linger a great while before they die.

Amboyna was first discovered by the Portuguese, who built a fort upon it, which was taken from them by the Dutch in 1605. They did not, however, become masters of the whole island at once. The English had here five factories, which lived under the protection of the Dutch castle; holding themselves safe, in respect of the friendship between the two nations. Great differences had arisen between the Dutch and English colonists in this part of the world; till at last, the English East-India company applying to King James, a treaty was concluded in 1619, by which the concerns both of the English and Dutch were regulated, and certain measures agreed upon for preventing future disputes. This was an additional security to the English; and, by virtue of the treaty, they continued two years in Amboyna, trading with the Dutch. During this time, however, several differences happened; which occasioning

Amboyna.

cañoning mutual difcontents, the complaints were sent to Jaccatra, in the island of Java Major, to the council of defence of both nations there residing: but they not agreeing, a state of the case was sent over to Europe, to be decided by the East-India Companies of both nations; or, in case they could not agree, by the King of England, and the States of Holland, according to an article in the treaty of 1619.—But before these disputes could be decided in a legal way, the Dutch at Amboyna thought proper to invent a report of a plot intended by the English to surprize the Dutch fort and destroy them.

To give credit to this report, and to obtain a plausible pretext for destroying the English, a Japanese soldier was apprehended for asking some questions at a centinel concerning the strength of the castle. Being cruelly tortured, he signed a confession that he himself and several others of his countrymen had contrived the taking of the castle. Upon this, some other Japanese were also seized and tortured; as also a Portuguese, the guardian of the slaves of the Dutch. This happened about the 11th of February 1622.—At this time there was one Abel Price, surgeon to the English, in prison, for threatening to set a Dutchman's house on fire. Him they tortured, and soon made to confess whatever they pleased. The same day, (Feb. 15th) they sent for Captain Towerfon, and all the English who were in the town, to come to speak with the governor of the castle. They all went except one, who was left to keep the house. Being come to the governor, he told Captain Towerfon, that himself and others of his nation were accused of a conspiracy to surprize the castle; and therefore, until further trial, were to remain prisoners. Immediately also they seized him who was left alone in the house; took the merchandise of the English company into their own custody, by an inventory; and seized all the chests, boxes, books, and papers, in the English house.

The Dutch, having now got them into their power, proceeded to torment them in the most horrid manner. The cruelties practised upon them were of the same nature with those inflicted by the inquisitors on such unhappy people as fell into their hands.—The miserable victim was first hoisted up by the hands with a cord, on a large door, where they made him fast, upon two stapples of iron fixed on both sides at the top of the door-posts, hauling his hands one from the other as wide as they could stretch. Being thus made fast, his feet were also stretched asunder as far as they could, and made fast beneath under the door-trees on each side. Then they tied a cloth about his neck and face, so close that little water could get out. This being done, they poured water softly upon his head, which running down, filled up the napkin, and stretched it out all round. They suffered the water to ascend a little above his nostrils, so that he could not draw breath without sucking in a great quantity of water; with which he soon was filled to such a degree as to be ready to burst. If he happened to faint, which was often the case, the barbarians took him down, making him quickly vomit up the water, and then tied him up again. If this torture did not produce the confession they desired, they burnt the soles of his feet, arm-pits, and the most sensible parts of his body, with candles, till the fat dropped out upon them.

Amboyna.

The unhappy sufferers, exhausted with these tortures, confessed whatever they thought would be agreeable to their savage tormentors; who having caused them sign their confessions, and thereby obtained a colour of justice for their proceedings, put as many to death as they thought proper, and out of their great clemency spared the rest.

That such an unheard-of proceeding as this should neither be reſented by the British, nor the perpetrators of it called to an account in their own country, may appear very surprizing. It muſt, however, be conſidered, that at that time the liberty of the preſs was not ſo great as it is now. It was not till long after that the account was allowed to be publiſhed; and the troubles in which the nation was then involved, prevented much attention being paid to it.

By this tranſaction, the clove-trade fell entirely into the hands of the Dutch; and the more eſſectually to preſerve it, the company takes care to have all the clove-trees in the adjacent iſlands grubbed up. Sometimes alſo, when the harveſt is very large, part of the produce of Amboyna itſelf is burnt.—To prevent the rearing of cloves in any of the neighbouring iſlands, or the inhabitants from ſelling them to ſtrangers, the governor of Amboyna makes the tour of his government with a fleet of curricurries, conſiſting ſometimes of 20, and at others of 30, 40, or 50 ſail. This expedition is made with all the pomp imaginable, in order to gratify the pride and folly of the Indian chiefs. The true reaſon of their taking all this pains is, becauſe experience has ſhewn, that no contracts, however ſolemn, can prevent the inhabitants of thoſe iſlands from ſelling their ſpice to ſtrangers; and even now, frauds are ſo frequently practiſed by the Dutch themſelves, tho' the company is inexorable in puniſhing them, that the common people call the cloves *galcken-kruid*, that is, the gallows-ſpice.

Befides the cloves, coffee is alſo cultivated here by the Dutch, and a gold mine has been lately found out. This was diſcovered by the quantities of gold-duſt that were waſhed from ſome mountains by the torrents. Here alſo grows a kind of red wood, which, beſides the beauty of its colour, is exceedingly firm and durable; and, which is ſtill more remarkable, its grain is naturally embelliſhed with abundance of beautiful figures. Of this wood they make tables, chairs, eſcrutoires, &c. for the principal perſons in the government; and the reſt is ſold all over the Indies at a very extravagant rate.

Amboyna is divided into two parts, *viz.* a greater and leſſer peninſula. The former, called *Hion*, is 12 leagues in length, and two and a half broad. In this the Dutch have no leſs than five forts, or rather ſtrong redoubts, mounted with cannon. The other is called *Leytimor*, five leagues in length, and one and a half broad, which is the ſouthern part of the iſland; on this ſtands the fort of Victoria, which is the reſidence of the governor, and his council, compoſed of 15 gentlemen or merchants. The fortrefs is a ſquare, the ramparts mounted with 60 pieces of braſs cannon, and the gariſon uſually compoſed of 600 men. It is ſo ſtrong by nature and art, as to be in a manner impregnable; and ſo eſſectually does it command the harbour, that no veſſel could come in or go out without being ſunk by the cannon, if the governor choſe. The inhabitants of

Amboyna,

Ambracia.

Amboyna, are computed at 70 or 80,000, of whom but a small number are Dutch; and this obliges them to be continually upon their guard, and to keep a competent number of troops in each of their forts, particularly in that of Middleburgh, which stands upon the isthmus that connects these peninsulas. There are also redoubts and garrisons in all the islands of this government.

AMBRACIA, one of the most considerable cities of ancient Epirus, situated on the river Aracthus, at a small distance from the sea. At first it was a free city; but was afterwards reduced by the *Ætæacide* kings of Epirus, who chose it for the place of their residence. In process of time, the *Ætoli*ans made themselves masters of it, and held it till the year before Christ 189, when it fell into the hands of the Romans.

At this time Ambracia was a place of great strength. It was defended on one side by the river Aracthus, and on the other by steep and craggy hills; and surrounded with an high and thick wall, above three miles in compass. The Roman consul Fulvius began the siege by forming two camps, separated by the river, but with a communication between them; the Romans were posted in one, and the Epirots their allies in the other. He then threw up two lines, one of circumvallation, and the other of contravallation; and built a wooden tower, in form of a castle, over against the citadel, which stood on a hill. The *Ætoli*ans, however, before the lines were quite finished, found means to throw about 1000 men into the place.

The lines being completed, the city was attacked in five different places at once. The battering-rams shook the walls on all sides; and the Romans, from their moveable towers, pulled down the battlements with a kind of fishes which they fastened to long beams. The besieged made a vigorous defence. They were night and day on the walls, and indefatigable in preventing the effects of the rams and fythes. The strokes of the former they deadened, by letting down beams, large stones, lumps of lead, &c. by means of, pulleys, upon them when they were in motion; the others they rendered useless, by pulling the beams to which they were fastened into the city with hooks contrived for the purpose.

While Fulvius was carrying on the siege, Nicander the *Ætolian* prætor found means to throw 500 men into the city, under the command of one Nicodamus, with whom Nicander agreed to attack the Roman camp in the night-time; not doubting, that, if the garrison from within, and the army from without, fell upon them at the same time, they would be obliged to raise the siege. Nicodamus narrowly watched the time at which he was ordered to fall; and, though Nicander did not appear, marched out at the head of the garrison, armed with fire-brands and torches. The Roman centinels, surprised at this sight, ran to wake the legionaries, and soon spread a general alarm all over the camp. The legionaries marched in small bodies as they happened to meet, to repulse the enemy, whom they engaged in three different places. Two parties of the garrison were driven back: but the third, commanded by two *Ætolian* generals, made a great slaughter of the Romans; and, not finding themselves seconded by Nicander, retired in good order into the city.

Though the besieged were thus abandoned, and had no hopes of assistance, they continued to defend themselves with incredible vigour and resolution. The Ro-

mans had no sooner made a breach in the wall, but it was repaired, and a new one built behind it. The consul, therefore, altered his measures; and, instead of making breaches with the ram, began to undermine the wall, in hopes of throwing down great part of it at once, and entering the city before the besieged could have time to build a new wall. The miners being covered, were not observed by the garrison, till the great quantities of earth brought out of the mine gave the alarm. The *Ætoli*ans immediately began to countermine; and, having dug a trench of the depth they supposed the mine to be, they carried it along the wall where they heard the strokes of the pick-axes of the Romans. When the two mines met, a battle ensued, first with pick-axes and spades, and then with swords and spears: but this attack did not last long, each party making themselves a kind of rampart with the loose earth. The *Ætoli*ans, in order to drive their enemies quite out of the mine, invented a machine, which they brought to the place where the two mines met: this was a hollow vessel, with an iron bottom, bored thro' in many places, and armed with spikes at proper distances to prevent the enemy from approaching it: this vessel they filled with feathers, which they set on fire, and with bellows driving the smoke on the besiegers, obliged them to leave the mine, half-suffocated. This interval the *Ætoli*ans made use of in repairing the foundations of the wall.

The vigorous resistance made by the Ambracians, however, did not raise the courage of the nation in general, who were determined on a peace with Rome at all events. Fulvius, in the mean time, being desirous of getting possession of Ambracia before the conclusion of the peace, employed Amynder, king of the Athamans, to persuade the inhabitants to surrender. As Amynder had great interest in Ambracia, having long resided there, he easily persuaded them to capitulate on the following terms. *viz.* That the *Ætolian* garrison should have leave to march out of the city; that the inhabitants should pay 500 talents, 200 down, and the rest at six equal payments; and that they should deliver to the consul all the prisoners and deserters that were in the city. The gates were then opened to Fulvius; and he was presented with a crown of gold, together with many fine statues and pictures, of which there were great numbers in the city, it having been the capital of Pyrrhus, who had enriched it with many valuable monuments.

From this time the city of Ambracia made no figure in history. It is scarce known at present where the city stood; but that called *Arba*, in upper Albania, seems best to agree with what is said of the ancient situation of this city. The river Aracthus, on which Ambracia was situated, is now called, by the natives, *Spagnagmurisi*.

AMBRÉSBERRY, a market-town in Wiltshire, about six miles north of Salisbury, and situated in W. Long. 1. 40. and N. Lat. 51. 20.

AMBRONES, a Gaulish people who lived near the foot of the Alps, between Switzerland and Provence. They invaded the Roman territories in conjunction with the Cimbri and Teutones; but were defeated with great slaughter by Marius, about 101 years before Christ. Their women, who had staid during the engagement in a kind of fortification made with their carts, on see-

Island,
Ambrose.

ing their husbands flying, and the Romans at their heels, armed themselves with axes, and, gnashing with their teeth, fell with fury on the pursuers and the pursued. Their first rage being spent, they desired to surrender themselves, upon the single condition, that their chastity should not be violated; but this equitable request being denied, they first killed their children, and then themselves, not one remaining alive out of the whole multitude.

AMBROSE-ILSAND, a small island laid down in some of the most approved charts, and particularly mentioned in Mr Robertson's Elements of Navigation, as lying in S. Lat. 25. 30. W. Long. 82. 20. It was searched for, however, in 1767, by Captain Carteret, with such diligence, that he concludes it to have no existence, as he could not discover land any where near that place.

AMBROSE (St.), bishop of Milan, one of the most eminent fathers of the fourth century, born in Gaul in the year 333, according to Dr Cave, or in 340, as Mr Du Pin affirms. His father was at this time *præfector prætorio* in Gaul; and resided at Arles, the capital of Gallia Narbonensis. The birth of Ambrose is said to have been followed with a remarkable preface of his future eloquence; for we are told, that a swarm of bees came and settled upon his mouth as he lay in his cradle. He soon made himself master of the several parts of secular learning; and pleaded causes before Probus with so much eloquence, that he was appointed his assessor, and soon after governor of the provinces of Liguria and Æmilia. He settled at Milan; where, in the year 374, upon the death of Auxentius bishop of that city, there being a great contest between the Catholics and Arians concerning the choice of a new bishop, Ambrose thought it his duty, as governor, to go to the church, in order to compose the tumult. He accordingly addressed himself to the people in a gentle pathetic speech, exhorting them to proceed to their choice in a calm and friendly manner: while he was speaking to them, the whole assembly cried out with one voice, "Let Ambrose be bishop!" Such a sudden and unexpected incident surprised him extremely; so that he retired immediately, and used every method to divert them from their resolution of choosing him: but at last he was obliged to comply; and was baptized, (being but a catechumen before), and ordained bishop, towards the latter end of the year 374, or beginning of 375. About the year 377, the barbarous nations making an incursion into the Roman empire, he fled to Illyricum, and afterwards to Rome. In the year 384, he was sent to the tyrant Maximus, who had usurped the empire, and prevailed upon him not to pass over into Italy. The heathens being encouraged by these intestine commotions in the empire, attempted to restore their religion, and employed Q. Aurelius Symmachus, prefect of Rome, a man of great eloquence, to plead their cause. This gave rise to the famous contest between St Ambrose and him, about repairing the altar of Victory. But Symmachus having lost his cause, was expelled the city, and commanded not to approach within an hundred miles of it. The petition which he presented to the emperor Valentinian the younger, is still extant; we find in it the strongest figures of rhetoric and the greatest force of eloquence. St Ambrose wrote a confutation of this petition; but he has been thought

guilty of many paralogisms: and yet he protests, "that he endeavoured only after the solidity of reasoning, leaving Symmachus all the glory of eloquence and politeness; it being (says he) the peculiar privilege of the pagan philosophers to amuse the mind with colours as false as their idols; and to say great things, not being capable of saying true ones." Ambrose met with a good deal of opposition from the Arians, against whom he acted with great spirit and intrepidity. Justina the empress and mother of Valentinian, who was an Arian, resolving to restore Arianism at Milan, began with demanding of St Ambrose one of the churches, which was called the Portian church: but he refused it; and the people surrounding the palace in a body, she was obliged to leave him in possession of his church, and even desire him to pacify the people.

Ambrose was a second time sent to the tyrant Maximus, for Valentinian found no person so proper to negotiate with him. He spoke to him with great courage and boldness, but could obtain nothing; for Maximus soon after marched into Italy, and made himself master of the western empire: so that Valentinian was obliged to retire, with his mother Justina and his sister Galla, to Thessalonica in Illyricum, in order to desire Theodosius's assistance; who defeated Maximus, and restored Valentinian to the empire.

While Theodosius continued in Italy, after the defeat of Maximus, an insurrection happened at Thessalonica, in which several of the magistrats were slain, and their bodies dragged along the streets. Theodosius being informed of this, rashly commanded a certain number of the inhabitants to be put to death promiscuously; by which means the city was filled with the blood of many innocent persons, and amongst the rest several strangers who were but just come there: no regard was had to any distinction of persons, no form of trial was observed; but they were cut down like corn in the harvest, as Theodoret expresses it, to the number of 7000. At this time an assembly of bishops was held at Milan, who all expressed an abhorrence of such cruelty in the emperor. Ambrose wrote a letter to him, in which he represented the enormity of his crime, and exhorted him to make satisfaction by a sincere submission and repentance. Sometime after, Theodosius coming to Milan, went to receive the sacrament at the great church; where Ambrose meeting him at the door, denied him entrance, and represented his guilt in the most forcible and pathetic terms. The emperor was struck with his words, and with great uneasiness of mind returned to his palace; but about a year after, Ambrose, being convinced of the sincerity of his repentance, admitted him into the church.

In 392, Valentinian the emperor being assassinated by the contrivance of Argobastes, and Eugenius usurping the empire, Ambrose was obliged to leave Milan; but he returned the year following, when Eugenius was defeated. He died at Milan the 4th of April 397; being 57 years of age, according to Mr Du Pin and some other writers; but Dr Cave and Olearius say that he was 64 years old at his death. He was buried in the great church at Milan. He wrote several works, the most considerable of which is that *De Officiis*. He is concise and sententious in his manner of writing, and full of turns of wit; his terms are well chosen, and his expressions noble; he diversifies his subject by an admirable

Ambrose.

Ambrose
||
Ambrosius.

mirable copiousness of thought and language; he is very ingenious in giving an easy and natural turn to every thing which he treats of, and is not without strength and pathos when there is occasion for it. This is part of the character which Du Pin gives him as a writer; but Erasmus observes that he has many quaint and affected sentences, and frequently very obscure ones; and it is certain that his writings are intermixed with many strange and peculiar opinions. Paulinus wrote his life, and dedicated it to St Augustin: this life is prefixed to St Ambrose's works; the best edition of which is reckoned to be that published by the Benedictine monks, in two volumes in folio, at Paris, in 1686 and 1690.

AMBROSE (Isaac), an eminent presbyterian minister, was educated at Brazen-nose college Oxford, where he took the degree of bachelor of arts, and became minister of Preston, and afterwards of Garstang in Lancashire, where he was in 1662 ejected for non-conformity. It was usual with him to retire every year for a month into a little hut in a wood; where he shunned all society, and devoted himself to religious contemplation. Dr Calamy observes, that he had a very strong impulse on his mind of the approach of death, and took a formal leave of his friends at their house, a little before his departure; and the last night of his life he sent his discourse concerning *angels* to the press. The next day he shut himself up in his parlour, where, to the great surprise and regret of all who saw him, he was found just expiring. He died in 1663-4, in the 72^d year of his age. He wrote several other books; as the *Prima, Media, & Ultima*, or the First, Middle, and Last Things; War with devils; Looking unto Jesus; &c.

AMBROSE, or *St AMBROSE in the Wood*, an order of religious, who use the Ambrosian office, and wear an image of that saint engraven on a little plate: in other respects, they conform to the rule of the Augustines. See *AMBRASIAN OFFICE*, and *AUGUSTINES*.

AMBROSIA, in heathen antiquity, denotes the solid food of the gods, in contradistinction from the drink, which was called *nectar*. It had the appellation *ambrosia*, (compounded of the particle *a*, and *beot*, *immortalis*) as being supposed to render those immortal who fed on it.

AMBROSIA, a genus of the pentandria order, belonging to the monœcia class of plants. Of this genus five species are enumerated; but having no properties worthy of notice, we omit any farther account of them.

AMBRASIAN OFFICE, in church-history, a particular formula of worship in the church of Milan, which takes its name from St Ambrose, who instituted that office in the fourth century. Each church originally had its particular office; and when the Pope, in after-times, took upon him to impose the Roman office upon all the western churches, that of Milan sheltered itself under the name and authority of St Ambrose; from which time the Ambrosian ritual has prevailed.

AMBROSIN, in middle-age writers, denotes a coin struck by the lords or dukes of Milan, whereon was represented St Ambrose on horseback, with a whip in his right hand. The occasion of this coinage is said to have been a vision of that saint, who appeared to the Milanese general in 1339, during the time of a battle.

AMBROSIIUS AURELIANUS, or AURELIUS AM-

BROSIIUS, a famous general of the ancient Britons, of Roman extraction. He was educated at the court of Aldroen of America; who, at the request of the Britons, sent him over with ten thousand men, to assist them against the Saxons, whom Vortigern had invited into Britain. Ambrosius had such success against the Saxons, that the Britons chose him for their king, and compelled Vortigern to give up to him all the western part of the kingdom divided by the Roman highway called *Watling-street*. Some time after, the Britons being discontented with Vortigern, and having withdrawn their allegiance from him, he returned to a castle in Wales, where being besieged by Ambrosius, and the castle taking fire, he perished in the flames, and left his rival sole monarch of Britain; who now took upon him the imperial purple, after the manner of the Roman emperors. Geoffrey of Monmouth tells us, that Ambrosius built Stonehenge near Salisbury, in Wiltshire. Ambrosius, according to this historian, coming to a monastery near Caeracadoc, now *Salisbury*, where three hundred British lords, massacred by Hengist, lay buried, and resolving to perpetuate the memory of this action, he ordered his workmen to prepare a large quantity of stones and other materials. But having, at the instigation of Tremouous archbishop of Caerleon, consulted the famous Merlin, this magician advised him to send over to Ireland for certain great stones, called *choera gigantum*, the giant's dance, placed in a circle on a hill called *Killair*, having been brought thither by giants from the farthest borders of Africa. A body of forces were accordingly sent into Ireland, under Pendragon, Ambrosius's brother, to fetch these stones; but were opposed in their attempt by Giliomanus king of the country, who derided the folly of the Britons in undertaking so ridiculous an expedition. Nevertheless, the Britons having vanquished this prince in battle, brought away the stones; and by the direction and assistance of Merlin, who had accompanied them, these wonderful stones, by order of Ambrosius, were placed over the graves of the British lords, and are now what is called *Stonehenge*. Alexander Mechem celebrates this fable in his poem *De divina sapientie laudibus*. Polydore Virgil assigns another origin of Stonehenge: he tells us it was erected by the Britons as a monument to their general Ambrosius, on the place where he fell in battle, to perpetuate the memory of his glorious actions and services done to his country. Both these stories are rejected by our best antiquaries; who, however, are by no means agreed as to the true origin of this famous piece of antiquity *.

After the Britons had defeated the Saxons, and obliged them to retire northward, Ambrosius is said to have convened the princes and great men at York, where he gave orders for repairing the churches destroyed by the Saxons, and restoring the exercise of religion to its former lustre. This is confirmed by Matthew of Westminster; who highly applauds the great zeal of Ambrosius in repairing the churches, encouraging the clergy, and restoring the honour of religion. The Monmouth historian gives this prince a very high character: "He was a man (says he) of such bravery and courage, that when he was in Gaul no one durst enter the lists with him; for he was sure to unhorse his antagonist, or to break his spear into shivers. He was, moreover, generous in bestowing, careful in perform-

* See *Stonehenge*.

Ambrun
||
Amellus.

ing religious duties, moderate in all things, and more especially abhorred a lie. He was strong on foot, stronger on horseback, and perfectly qualified to command an army." The same author tells us he was poisoned at Winchester by one Eopa a Saxon, disguised as a physician, and hired for that purpose by Pafcentius one of the sons of Vortigern: but the generally received opinion is, that he was killed in a battle which he lost in the year 508, against Cerdric, one of the Saxon generals.

AMBRY, a place in which are deposited all utensils necessary for house-keeping. In the ancient abbeyes and priories, there was an office under this denomination, wherein were laid up all charities for the poor.

AMBUBAJÆ, in Roman antiquity, were immodest women, who came from Syria to Rome, where they lived by prostitution, and by playing on the flute: the word is derived from the Syriac *ahub*, which signifies a flute; altho' others make it to come from *am* and *Baie*, because these prostitutes often retired to Baie. According to Cruiquius, these women used likewise to sell paint for ornamenting the face, &c.

AMBURBIUM, in Roman antiquity, a procession made by the Romans round the city and pomerium, in which they led a victim, and afterwards sacrificed it, in order to avert some calamity that threatened the city.

AMBURY, or ANBURY, among farriers, denotes a tumour, wart, or swelling, which is soft to the touch, and full of blood.

This disorder of horses is cured by tying a horse-hair very hard about its root; and, when it has fallen off, which commonly happens in about eight days, strewing some powder of verdigris upon the part, to prevent the return of the complaint. If the tumour be so low that nothing can be tied about it, they cut it out with a knife, or else burn it off with a sharp hot iron; and, in sinewy parts, where a hot iron is improper, they eat it away with oil of vitriol, or white sublimate.

AMBUSCADE, or AMBUSH, in the military art, properly denotes a place where soldiers may lie concealed, till they find an opportunity to surprize the enemy.

AMBY, a town of the Austrian Netherlands, in the province of Limburg, situated opposite to Maestricht, on the east-side of the river Maese, in E. Long. 5. 45. N. Lat. 50. 57.

AMEDIANs, in church-history, a congregation of religious in Italy, so called from their professing themselves *amantes Deum*, lovers of God; or rather, *amati Deo*, beloved of God.

AMELIA, an episcopal city of Italy, in the state of the church, seated on a mountain, in the duchy of Spoleto. E. Long. 13. 20. N. Lat. 42. 33.

AMELLUS, STARWORT, a genus of the polygamia superflua order, belonging to the syngenesia class of plants.—Of this there are two

Species. 1. The lynchitis, with one flower on each footstalk. This is a native of the Cape of Good Hope. It is a perennial plant, rising about three feet high, sending out many branches on each side, so as to form a bushy plant; the branches are garnished with obtuse spear-shaped leaves placed opposite, and are terminated by single naked flower-stalks, each supporting one vio-

Amem
||
America.

let-coloured flower, having a yellow disk, which is succeeded by oblong seeds. 2. The umbellatus, with flowers growing in umbels, is a native of Jamaica; and rises from two to three feet high, sending out many branches clothed with opposite leaves, which are terminated by small flowers in umbels.

Culture. The first is easily propagated, either by cuttings planted in the summer-months, or by seeds sown on a moderate hot-bed in the spring, but the plants require a slight shelter in winter. The second is much more tender, and therefore requires to be preserved in a stove during the winter-season.

AMEN, in the scripture-language, a solemn formula, or conclusion to all prayer, signifying *so be it*. The term *amen* is Hebrew, being derived from the verb *aman*, i. e. to be true, faithful, &c. So that, strictly speaking, it signifies *truth*; and used adverbially, as is frequently done in the gospels, *truly* or *verily*. Sometimes it is repeated twice together, and then it stands for the superlative: as, *Amen, amen, dico vobis*; "*Verily, verily, I say unto you.*"

AMEND, or AMENDE, in the French customs, a pecuniary punishment imposed by a judge for any crime, false profecution, or groundless appeal.

AMENDE *Honorable*, an infamous kind of punishment inflicted in France upon traitors, parricides, or sacrilegious persons, in the following manner: The offender being delivered into the hands of the hangman, his shirt is stripped off, a rope put about his neck, and a taper in his hand; then he is led into court, where he must beg pardon of God, the king, the court, and his country. Sometimes the punishment ends here; but sometimes it is only a prelude to death, or banishment to the galleys.

AMENDE *Honorable* is a term also used for making recantation in open court, or in presence of the person injured.

AMENDMENT, in a general sense, denotes some alteration or change made in a thing for the better.

AMENDMENT, in law, the correction of an error committed in a process, which may be amended after judgment, unless the error lies in giving judgment; for in that case it is not amendable, but the party must bring a writ of error. A bill may be amended on the file at any time before the plea is pleaded; but not afterwards, without motion and leave of the court.

AMENDMENT *of a Bill*, in parliament, is some alteration made in the first draught of it.

AMENTUM, in botany, the name of a species of calix, consisting of valves, and hanging down in different directions from the caulis. Common oats afford a good example of the amentum.

AMENTUM, in Roman antiquity, a thong tied about the middle of a javelin or dart, and fastened to the fore-finger, in order to recover the weapon as soon as it was discharged. The ancients made great use of the amentum, thinking it helped to enforce the blow. It also denotes a latchet that bound their sandals.

AMERCEMENT, or AMERCIAMENT, in law, a pecuniary punishment imposed on offenders at the mercy of the court. It differs from a fine in being imposed arbitrarily in proportion to the fault; whereas a fine is a certain punishment settled expressly by some statute.

to be the first discoverer of the continent); one of the four quarters of the world, probably the largest of the whole, and, from its late discovery, frequently denominated the *New World*.

This vast country is bounded, on the east, by the Atlantic ocean, which separates it from Europe and Africa; on the west, by the Pacific ocean, or great South sea, by which it is separated from Asia. On the fourth, it is bounded by the Frozen ocean. But its boundaries towards the north have never been ascertained; nor is it known whether the northern parts of America join to those of Europe and Asia or not. As far as it is known, America extends from Lat. 80° N. to 56° S. and from 35° to 136° Long. W. from London; its length being between 8000 and 9000 miles, and its greatest breadth 3690.

America is by no means of equal breadth throughout its whole extent; but is divided into two great continents, called *North* and *South America*, by an Isthmus 1500 miles long, and which at Darien, about Lat. 9° N. is only 60 miles over. This isthmus forms, with the northern and southern continents, a vast gulph, in which lie a great number of islands, called the *West Indies*, in contradistinction to the eastern parts of Asia, which are called the *East Indies*.

Between the New World and the Old, there are several very striking differences; but the most remarkable is the general predominance of cold throughout the whole extent of America. Though we cannot, in any country, determine the precise degree of heat, merely by the distance from the equator; because the elevation above the sea, the nature of the soil, &c. affect the climate; yet, in the ancient continent, the heat is much more in proportion to the vicinity to the equator, than in any part of America. Here the rigour of the frigid zone extends over half that which should be temperate by its position. Even in those latitudes where the winter is scarcely felt on the old continent, it reigns with great severity in America, tho' during a short period. Nor does this cold, prevalent in the New world, confine itself to the temperate zones; but extends its influence to the torrid zone also, considerably mitigating the excess of its heat.—Along the eastern coast, the climate, tho' more similar to that of the torrid zone in other parts of the earth, is nevertheless considerably milder than in those countries of Asia and Africa which lie in the same latitude. From the southern tropic, to the extremity of the American continent, the cold is said to be much greater than in parallel northern latitudes even of America itself.

For this so remarkable difference between the climate of the New continent and the Old, various causes have been assigned by different authors. The following is the opinion of the learned Dr Robertson on this subject. "Though the utmost extent of America towards the north be not yet discovered, we know that it advances nearer to the pole than either Europe or Asia. The latter have large seas to the north, which are open during part of the year; and, even when covered with ice, the wind that blows over them is less intensely cold than that which blows over land in the same latitudes. But, in America, the land stretches from the river St Lawrence towards the pole, and spreads out immensely to the west. A chain of enormous mountains, covered with snow and ice, runs through all this

dreary region. The wind passing over such an extent of high and frozen land, becomes so impregnated with cold, that it acquires a piercing keenness, which it retains in its progress through warmer climates; and is not entirely mitigated until it reach the Gulph of Mexico. Over all the continent of North America, a north-westerly wind and excessive cold, are synonymous terms. Even in the most sultry weather, the moment that the wind veers to that quarter, its penetrating influence is felt in a transition from heat to cold, no less violent than sudden. To this powerful cause we may ascribe the extraordinary dominion of cold, and its violent inroads into the southern provinces in that part of the globe.

"Other causes, no less remarkable, diminish the active power of heat in those parts of the American continent which lie between the tropics. In all that portion of the globe, the wind blows in an invariable direction from east to west. As this wind holds its course across the ancient continent, it arrives at the countries which stretch along the western shore of Africa, inflamed with all the fiery particles which it hath collected from the sultry plains of Asia, and the burning sands in the African deserts. The coast of Africa is, accordingly, the region of the earth which feels the most fervent heat, and is exposed to the unmitigated ardour of the torrid zone. But this same wind, which brings such an accession of warmth to the countries lying between the river of Senegal and Caffaria, traverses the Atlantic ocean before it reaches the American shore. It is cooled in its passage over this vast body of water; and is felt as a refreshing gale along the coasts of Brazil and Guiana, rendering those countries, tho' amongst the warmest in America, temperate, when compared with those which lie opposite to them in Africa. As this wind advances in its course across America, it meets with immense plains, covered with impenetrable forests; or occupied by large rivers, marshes, and stagnating waters, where it can recover no considerable degree of heat. At length it arrives at the Andes, which run from north to south thro' the whole continent. In passing over their elevated and frozen summits, it is so thoroughly cooled, that the greater part of the countries beyond them hardly feel the ardour to which they seem exposed by their situation. In the other provinces of America, from Terra Firma westward, to the Mexican empire, the heat of the climate is tempered, in some places, by the elevation of the land above the sea; in others, by their extraordinary humidity; and in all, by the enormous mountains scattered over this tract. The islands of America in the torrid zone are either small or mountainous, and are fanned alternately by refreshing sea and land breezes.

"The causes of the extraordinary cold towards the southern limits of America, and in the seas beyond it, cannot be ascertained in a manner equally satisfying. It was long supposed, that a vast continent, distinguished by the name of *Terra Australis Incognita*, lay between the southern extremity of America and the antarctic pole. The same principles which account for the extraordinary degree of cold in the northern regions of America, were employed in order to explain that which is felt at Cape Horn and the adjacent countries. The immense extent of the southern continent, and the rivers which it poured into the ocean, were mentioned

and

America.

and admitted by philosophers as causes sufficient to occasion the unusual sensation of cold, and the still more uncommon appearances of frozen seas in that region of the globe. But the imaginary continent to which such influence was ascribed having been searched for in vain, and the space which it was supposed to occupy having been found to be an open sea; new conjectures must be formed with respect to the causes of a temperature of climate, so extremely different from that which we experience in countries removed at the same distance from the opposite pole.

Tibid. p. 451.
note XXXI.

"The most obvious and probable cause of this superior degree of cold, towards the southern extremity of America, seems to be the form of the continent there. Its breadth gradually decreases as it stretches from St Antonio southwards, and from the bay of St Julian to the straits of Magellan its dimensions are much contracted. On the east and west sides, it is washed by the Atlantic and Pacific oceans. From its southern point, it is probable, that an open sea stretches to the antarctic pole. In which ever of these directions the wind blows, it is cooled before it approaches the Magellanic regions, by passing over a vast body of water; nor is the land there of such extent, that it can recover any considerable degree of heat in its progress over it. These circumstances concur in rendering the temperature of the air in this district of America, more similar to that of an insular, than to that of a continental climate; and hinder it from acquiring the same degree of summer-heat, with places in Europe and Asia, in a corresponding northern latitude. The north wind is the only one that reaches this part of America, after blowing over a great continent. But, from an attentive survey of its position, this will be found to have a tendency rather to diminish than augment the degree of heat. The southern extremity of America, is properly the termination of the immense ridge of the Andes, which stretches nearly in a direct line from north to south, through the whole extent of the continent. The most sultry regions in South America, Guiana, Brazil, Paraguay, and Tucuman, lie many degrees to the east of the Magellanic regions. The level country of Peru, which enjoys the tropical heats, is situated considerably to the west of them. The north wind, then, though it blows over land, does not bring to the southern extremity of America an increase of heat collected in its passage over torrid regions; but, before it arrives there, it must have swept along the summit of the Andes, and come impregnated with the cold of that frozen region."

These reasons insufficient.

Was the southern part of America only moderately cool, no doubt the above reasons would be entirely satisfactory; but it must be remembered, that the cold at the southern extremity of America is not only much greater than in those parts of Europe or Asia lying under equal parallels of north latitude, but even the places in North America itself which lie in the same latitudes. We must even observe, with all due deference to the abilities of our learned and eloquent historian, that the reasons he gives, as a philosopher, for the extreme cold in North and South America, contain a direct contradiction.—The wind which blows over frozen land, he tells us, p. 253. is colder than that which blows over frozen sea. This of itself is somewhat problematical; however, we shall accept of it without dispute. North America, then, is

colder than Europe or Asia, because the continent is larger than the northern parts of Europe and Asia put together. This hath never been proved, and is not far from being incredible; but still we shall not dispute. North America is excessively cold because it is a large continent; but why is South America still colder?—Because it is a small one.

We are now led into a discussion of the philosophical question concerning the reason why cold predominates more in large continents than in islands; and if we determine this question in the common way, namely, that the vicinity of the sea keeps the cold from becoming so violent in the latter as in the former, it is plain, we shall then run into the same difficulty which we have just now observed Dr Robertson unsuccessfully endeavouring to solve. It will be proper, however, before entering upon either of these questions, to consider the general causes by which different degrees of heat are produced in different parts of the world; and then to examine the state of facts with regard to the different degrees of cold in North and South America.

Though the sun is the prime agent in nature by which every degree of sensible heat is produced, and to the presence or absence of his rays heat and cold are to be ultimately ascribed; yet so many circumstances concur in augmenting or diminishing the effect of his light, that some philosophers have not scrupled to assert, that this luminary does not produce heat, but only regulate that which is produced from other causes *.

* See Heat.

The determination of this question we reckon to be of no importance at present; for if the sun produces heat, why does he not produce it equally in countries equally exposed to his action? If he only regulates it, why does he not regulate the heat equally in similar parallels of northern or southern latitude? Whether, therefore, we allow the sun to be the original fountain, or only the regulator of heat, we must own that there are certain circumstances peculiar to different countries, which tend very much to supercede his action.

It is certain, that there are some kinds of bodies of such a nature, that, though they are exposed to equal degrees of heat, one of them will become much hotter to the touch than the other, in the same time. All solid bodies will become hot much sooner than water, and will be also sooner susceptible of a violent degree of cold. Earth is therefore always disposed to be sooner affected than water by the influence of the sun's rays; and consequently to become much hotter in summer, as well as more violently cold in winter, than that element. The great quantity of moisture with which the earth is always impregnated, can be no objection to the truth of this observation: for it is certain, that moist earth will be affected by frost much sooner than an equal surface of water; and it is a well known fact, that water can by no means be made to evaporate by heat so fast as when it is mixed with earth, or some other solid substance in powder, so as to form a kind of paste; provided that paste is not suffered to harden in such a manner as to detain the aqueous moisture in the middle of it.

This single principle, therefore, namely, that water is less susceptible of heat than earth, will in a great measure determine what must be the difference of climate between a large tract of land, and an equal one of sea.—In summer, the land, being exposed to the sun's rays acting more powerfully than at other times, must

necessarily

America.

Discussion of the question why continents are colder than islands.

Some bodies more susceptible of heat than others.

The summer necessarily very hot in continents.

America.

necessarily acquire a great degree of heat, as long as their operation continues with much force. But as solid bodies are apt to part readily with their heat, the superfluous quantity will be daily discharged into the atmosphere; and the earth will have lost so much heat during the night, as will enable it to receive a fresh quantity next day without injury to plants or animals. In consequence of this, the air will gradually come to be very hot; and if there was not some cause whereby this continual increase of heat is limited, it might certainly become intolerable.

9
cool on the
can.

Where there is a vast tract of sea, the case must be widely different. Water is an element in itself not so easily heated as earth. By reason of its fluidity, also, the heat will penetrate deeper into it than into the earth; hence, in the course of one summer, equal tracts of land and sea will be very unequally heated. The warmth of the latter will be much less, but it will extend much deeper, and will be more durable; and having less heat to communicate to the atmosphere than earth, the climate, even in summer, must be much colder than on an equal tract of land.—On the approach of winter, the atmosphere is first cooled by reason of its wanting the usual influence of the sun's rays. The surface of the earth then communicates part of its heat to the air, which absorbs it with avidity; but, as the heat could not penetrate far into the earth, neither can the cold, and consequently the dry land is exposed to the action of heat or cold only for a small space downwards.—In water, the case is different: that element becomes specifically heavier by cold: in consequence of which, its uppermost surface is no sooner cooled, ever so little beyond that which lies immediately below, than it sinks down, and presents a new surface to the action of the air; and, it is plain, that this must be repeated, till the whole body of water is reduced to the same temperature. In the instant of freezing, water discharges a great quantity of heat, as has been observed by Dr Black and others *. This affords a new supply to the atmosphere; so that all the time water is freezing, the cold of the atmosphere will be considerably moderated by the heat discharged from the newly formed ice. When the ice is once formed, indeed, the atmosphere still continues to act upon it, and to cool it still more; but as it is now a solid body, this action will be confined to its surface, the under parts remaining pretty much inactive either as to the production of heat or cold beyond the freezing point.

See Cold,
congelation,
and Evapo-
ration.

On the return of summer, the ice, which has been formed during the winter, will require as much heat merely to melt it, as would be sufficient to heat a solid body of an equal bulk almost to 175° of Fahrenheit, as Dr Black's experiments have undeniably proved †; and tho' the snow and ice on land will require the same degree of heat to melt them as on sea, yet their quantity at land must always be much less than at sea, because of the small quantity of water on the land.—When the snow, with which the ground was covered, is totally melted, the sun has then liberty to act upon the ground itself, and will heat it accordingly. Thus, on account of the much greater quantity of ice on sea than on land, a great part of the summer will be spent before the water can be reduced to a temperature barely above the freezing point; while the land will have received as much heat as to communicate a very

See Conge-
lation.

considerable degree to the atmosphere.

From what we have just now said, it must be easy to discover, what will be the difference between the corresponding seasons on sea and on land.—On sea, where there is much ice, the heat of the summer is in a manner totally absorbed in a latent state*, so as scarcely to be perceived. In winter, the extreme cold is moderated by the emission of the latent heat formerly absorbed on the melting of the ice, but now again discharged on its second freezing. The whole year, therefore, on a large tract of sea, will be in a manner one continued winter. On a continent, as the land does not absorb much heat, the greatest part will be reverberated into the atmosphere, so that the summer must be extremely hot; and, in winter, as the ground has not absorbed much heat, so it can communicate little to moderate the cold, which, of consequence, will be excessive.—We may conclude, therefore, that, in a large continent, the winter will be excessively cold, and the summer excessively hot; but, on the ocean, or in islands at a considerable distance from the continent, the summer will neither be so hot nor the winter so cold as in the corresponding places on the continent; and if the heat of summer is not sufficient to thaw the ice collected during the winter, there must be afterwards a perpetual absence of summer without any violent degree of winter.

10
winter on
the conti-
nents very
pleasant:

11
on the o-
cean, cool.

What we have here advanced is supported by the testimonies of all respectable authors who have treated of the different degrees of heat found in different parts of the world.—In Lapland, the most northerly part of the continent of Europe, the winters are so severe, that it is not unusual for people's lips to be frozen to the cup while they are attempting to drink, the limbs of the inhabitants very often mortify with cold, and the ground is covered with snow to the depth of several feet; but, in summer, the heat is excessive for a short time. The heats of summer in Norway, also, are very great, according to the bishop of Pontoppidan's account. The same thing is likewise related of Sweden, where, though the winter is extremely severe, the summer's heat is said to be so great as sometimes to set forests on fire; but this is undoubtedly an exaggeration. Certain it is, however, that in these northern countries, where the summer is very short, it must be proportionally hotter than in this country, otherwise no kind of grain could be brought to perfection. In Siberia, the winter cold is excessive beyond what in this country we can have any notion of: and it may be well supposed to be so; as being environed by land on all sides except the north, where it is probably bounded by the frozen ocean. According to some observations communicated to the Royal Academy of Sciences by M. de Lifle of Peterburg, the mercury in Fahrenheit's thermometer, in the winter 1737, fell to 118° below 0; and this at Kirenga, a place lying only in N. Lat. 58° 10'; scarce so far to the northward as the shrine of Caithness in Scotland. Yet even in Siberia, much farther north, within the arctic circle itself, we find several towns marked on our maps; and were not such excessive cold balanced in some degree by a warm summer, it is utterly impossible that human creatures could support the climate. At Peterburg, lying in Lat. 60°, the cold was lately so intense, as to sink the thermometer 40° below 0, when the remarkable experiment concerning the freezing of quicksilver was tried*: but even

lation.
this

America.

this extreme cold was far short of that just now mentioned at Kirenga; probably owing to the latter being more to the eastward, and farther in the continent, than Petersburg. The cold at Kirenga was only 22° below what is sufficient to freeze quicksilver, as Dr Black hath rendered very probable; and in some places of Siberia, lying near the polar circle, it is not improbable that mercury might freeze naturally without the help of artificial cold.

14
North American winters not so cold as those of Asia.

Though the climate of North America certainly appears colder to those who have visited it, than the corresponding places of Europe, yet we have no proof that the colds in that part of the world are absolutely superior to those on the eastern continent; indeed we cannot well suppose any degree of cold superior to what we have already mentioned. At Albany-fort, on Hudson's-bay, situated in Lat. 53°. 20'. N. the thermometer in winter 1775 stood at 28° below 0. This was certainly very great, but far inferior to the above-mentioned Siberian cold in Lat. 58° 10'; and it cannot be thought, that the small difference in latitude would occasion such an enormous difference in the degree of cold.

In a strict sense, then, we must allow the climate of North America to be warmer than that of the eastern continent; for no experiments made with the thermometer have hitherto shewn such a degree of cold to exist in North America as in Asia. It is colder, however, in this respect, that the winter is, as it were, mixed with the summer; and this undoubtedly is owing to the continent being *smaller*, not larger as Dr Robertson asserts, than Europe and Asia put together.—It is certain, that where any country is so situated that great part of it is covered with snow throughout the whole year, those places which lie near the snowy regions will be fenible of winter even in the midst of summer. From the principles already laid down, if the summer heat is insufficient to melt the snow, the air will continue almost as cold in summer as in winter, because whatever quantity of heat is sent forth by the sun, it is all absorbed and in a latent state.—Here we cannot help remarking, that, notwithstanding the learned Doctor's assertion, it is utterly impossible that a tract of land covered with snow, and a tract of sea covered with snow, can affect the temperature of the atmosphere differently. The reason is plain; because it is only the snow or ice, and neither the land below it nor the sea below it, that affects the atmosphere. The vicinity of a tract of land covered with snow, or a tract of sea covered with snow, must therefore prodigiously affect the summer of countries adjacent to them, and will undoubtedly produce chilling blasts as often as the wind blows from that quarter; and this is the case with North America, as already mentioned.

The reason why such large tracts in North America are constantly covered with snow, is probably the prodigious number and size of its mountains, greatly exceeding what are to be found on the eastern continent. The tops of high mountains are always excessively cold, even in the warmest regions; and they necessarily keep off the warmth of the sun in summer from large tracts of ground. For this reason, they naturally produce cold summers; but they also afford shelter to the trees and other vegetables in winter; so that wood is found in America much farther north than in Asia. This,

which is a very strong proof of the greater cold of the Asiatic winters than the North American, will appear from the following account * of the climate of North America, contrasted with that of the eastern coast of Asia.

America.

* Dume-
resque's trans-
lation of
Krafft's
account
of Kamchat-
ka.

"The American land is in a much better state, with regard to climate, than the farthestmost eastern part of Asia, though it lies near the sea, and has every where high mountains, some of which are covered with perpetual snows; for that country, when its qualities are compared with those of Asia, has by far the advantage. The mountains of that part of Asia are every where ruinous and cleft; from whence they have, long since, lost their consistency, and likewise their inward warmth; upon which account, they have no good metal of any kind; no wood nor herbs grow there, except in the valleys, where is seen small brush-wood and stiff herbs. On the contrary, the mountains of America are firm, and covered on the surface, not with moss, but with fruitful earth or mold; and therefore, from the foot to the very top, they are decked with thick and very fine trees. At the foot of them, grow herbs proper to dry places, and not to marshy ones; besides that, for the most part, those plants are of the same largeness and appearance both on the lower grounds and on the very tops of the mountains, by reason that there is every where the same inward heat and moisture. But, in Asia, there is so great a difference between them, that of one kind of plants growing there, one would be apt to make several kinds, if one did not observe a rule, which holds generally with regard to those places, *viz.* That, in lower grounds, herbs grow twice as large as on the mountains.

15
North American climate contrasted with that of Asia.

"In America, even the sea-shores, at 60° latitude, are woody; but in Kamchatka, at 51° lat. no place set with small willows and alder-trees is found nearer than 20 verstes from the sea: plantations or woods of birch-trees are, for the most part, at the distance of 30 verstes; and with regard to pitch-trees, on the river Kamchatka, they are at the distance of 50 verstes, or more, from its mouth. At 62°, there is no wood at Kamchatka.

"In Steller's opinion, from the aforementioned latitude of America, the land extends as far as 70°, and farther; and the chief cause of the aforesaid growth of woods in that country, is the cover and shelter it has from the west. On the other hand, the want of wood on the Kamchatkalian shores, especially on the shore of the Peninsular sea, doubtless comes from a sharp north wind, to which it is much exposed. That those parts which lie from the Lopatka, farther to the north, are more woody and fruitful, is owing to cape Tehukotki, and the land that has been observed over against it, by which those parts are sheltered from the sharp winds.

"For this reason, also, fish come up the rivers of America earlier than those of Kamchatka. The 20th of July, there has been observed a great plenty of fish in those rivers; whilst at Kamchatka, it is then but the beginning of an abundant fishery."

In the southern hemisphere the water bears a much larger proportion to the land than in the northern. From the chart prefixed to Mr Forster's account of Cap^t Cook's voyages in 1772, 1773, 1774, and 1775, it appears, that the whole space contained between the south pole, and 30° of lat. all round the globe, is entirely occupied

America.

16
perpetual
inter in
the southern
climates.

ped by the ocean, except a small part of South America, a still smaller part of Africa, the islands of New Zealand, and a very inconsiderable portion of New Holland. Here, according to what we have advanced, a perpetual winter ought to take place; and for a great part of the space it actually does so. In 1766, Oct. 30th, Commodore Byron, while in lat. 35. 50 S. found the weather as cold as in the same month in England. In 1766, Nov. 12. Captain Wallis found it very cold in Lat. 30° S. though the month of November in that climate corresponds to that of May with us.—In 1769, January 3. Captain Cook's people complained of cold in lat. 47. 17. S. and were clothed in their winter-garments; though this was the month which corresponds to July with us, and consequently the warmest in the whole year: may, on the 16th of this month, Dr Banks and Dr Solander having gone ashore on Tierra del Fuego, lying in a south latitude corresponding to that of England, they were overtaken by a violent storm of snow, and the cold was so excessive as to kill two of their attendants. In 1770, March 18th, corresponding to the same day of September with us, the whole country of New-Zealand, in lat. 43. 4. S. was covered with snow. In November 1772, Captain Cook's people put on their winter-dress in lat. 42° S. and on December 5th, corresponding to the same day of June in this country, the thermometer sunk to 38° during the night; and some snow fell next morning. Five days after, having advanced as far as lat. 49. 45. S. the thermometer sunk to 32°, and fresh water began to freeze aboard their ship. The next morning, they fell in with ice floating on the sea. Proceeding still to the southward, they were stopped in lat. 67. 15. S. by field ice, such as is met with in the high northern latitudes, only much thicker.

When they had once fallen in with the ice, it does not appear that the cold had greatly increased: for though they afterwards proceeded as far as 71° 10'. S. the weather was far from being intolerable; for at that latitude, on January 30th 1774, the thermometer stood only at 32°.

We shall conclude this subject with some observations made by Mr Forster, on the climate of different places in the southern hemisphere. The following is an account of the climate of New Zealand in Nov^r. 1773.—“ Scarcely a day passed without heavy squalls of wind, which hurried down with redoubled velocity from the mountains; and strong showers of rain, which retarded all our occupations. The air commonly was cold and raw, vegetation made slow advances, and the birds were only found in the valleys sheltered from the chilling southern blast. This kind of weather, in all likelihood, prevails throughout the winter; and likewise, far into the middle of summer, without a much greater degree of cold in the former, or of warmth in the latter season. Islands far from any continent, or at least not situated near a cold one, seem in general to have an uniform temperature of air; owing, perhaps, to the ocean which every where surrounds them. It appears from the meteorological journals kept at Port Egmont, on the Falkland Islands; that the extremes of the greatest cold and the greatest heat observed there throughout the year, do not exceed 30° on Fahrenheit's scale. The latitude of that port is 51. 25. S. and that of Ship-cove, in Queen Charlotte's sound, only 41. 5. This consider-

Vol. I.

able difference of site, will naturally make the climate infinitely milder than that of Falkland's Islands, but cannot affect the general hypothesis concerning the temperature of all islands; and the immense height of the mountains in New Zealand, some of which are covered with snow throughout the year, doubtless contributes to refrigerate the air, so as to assimilate it to that of the Falkland's Isles, which are not so high.”

Tierra del Fuego, the southern extremity of America, is thus described. “ On the 2^d of December 1774, after a short calm, we had a fresh breeze, which continued to blow without intermission, but with different degrees of velocity, till the 18th, when we made the land, a little after midnight, near Cape Defeado, on one of the westernmost islands of Tierra del Fuego. The part of the world which was now in sight, had a very unfavourable aspect. About 3 o'clock in the morning, we ran along it, and found it for the greatest part hid in a thick haze. The parts near us seemed to be small islands, which, though not very high, were, however, very black, and almost entirely barren. Beyond them we saw some broken high lands, which were covered with snow, almost to the water's edge.—In the afternoon, we passed the island upon which cape Noir is situated, mentioned by M. Frezier.—We found many separate islands, from the place where we made the coast, to Cape Noir; and should perhaps have seen many more, if the weather had not been very hazy.

“ We found the land to all appearance much more compact after passing Cape Noir; and the next morning, December 19th, in particular, the coast seemed to be entirely connected; the mountains rose to a much greater height, immediately from the sea-side, and were covered with snow in every part. The wind gradually lessened, and towards noon we were entirely becalmed, having the finest sunshine and mild weather.—It was very amusing to us to meet with mild weather in the neighbourhood of that tempestuous cape, of which the name alone has afflicted the mariners ever since Lord Anson's voyage. The destruction of vulgar prejudices is of so much service to science, and to mankind in general, that it cannot fail of giving pleasure to every one sensible of its benefits. We had this day the thermometer at 48°; which, considering the neighbourhood of the huge heaps of snow on shore, was very moderate. This part of the world has been called the *Coast of Deposition* by the navigators who first visited it, and seems fully to deserve the appellation. Here we discovered nothing but vast mountains, of which the spiry summits were every where covered with eternal snow. Along the sea, the nearest rocks were clear of snow; but black, and destitute of grasses and shrubbery. Some inlets appeared in different parts, where a few islands seemed to have a covering of green. We stood in to one of these in the evening, having obtained an easterly breeze. A huge perpendicular wall of rock formed its western entrance, and Captain Cook called it the *York Minster*; having discovered a strong resemblance between that Gothic building, and this dreary chaotic rock. It lies in 55. 30. S. and 70. 28. W. Along the coast we found regular foundations; but, in the mouth of the inlet, we could not reach the bottom with 150 fathom of line. This circumstance had already happened to us before, at Dusky Bay (New-Zealand); but, as we saw a very spacious found before us,

O o

we

America.

Climate of
New Zea-
land.

America.

we ventured to stand on, amidst different rude islands; on which the summits of the hills were sometimes capped with snow.—After being much retarded by calms, we arrived about 9 o'clock in a small cove, indifferently sheltered either from wind or sea, but a welcome place of refuge on account of the approach of night.

“The next morning Captain Cook, &c. went in a boat in quest of a more safe and convenient anchorage. We only rowed round a single point of the island under which our ship lay, and immediately found a fine cove sheltered from all winds, and perfectly land-locked, with a little rill of water, and a shrubbery. The weather was mild, considering the climate; and several birds were heard on shore. We found many little clefts, which cannot properly be called valleys, where a few shrubs of different species sprung up in a thin layer of swampy soil, being defended against the violence of storms, and exposed to the genial influence of reverberated sunbeams. The rock, of which the whole island consisted, is a coarse granite, composed of feld-spath, quartz, and black mica or glimmer. This rock is in most places entirely naked, without the smallest vegetable particle; but wherever the rains or melted snows have washed together some little rubbish, and other particles in decay, it is covered with a coating of minute plants, in growth like mosses, which forming a kind of turf about an inch or more in thickness, very easily slip away under the foot, having no firm hold on the rock. In sheltered places, a few other plants thrive among these mossy species, and these at last form a sufficient quantity of soil for the nutriment of shrubs, especially in such spots as I have mentioned before.—Barron as these rocks appeared, yet almost every plant we gathered on them was new to us; and some species were remarkable for the beauty of their flowers, or their smell.

“Early the next morning, Captain Cook set out to take bearings in the found, and we took that opportunity to examine its natural productions. The found is very spacious, and surrounded to the north and east by several ranges of high mountains, which seem covered with permanent snow and ice.—On entering this found, and taking notice of its dreary desolate appearance, we had supposed that the natives of Tierra del Fuego never touch upon this inhospitable part, but confine themselves to the neighbourhood of the straits of Magalhaens, and to the eastern side of Tierra del Fuego; but it seems that human nature is capable of withstanding the greatest inclemencies of weather, and of supporting its existence alike in the burning sands of Africa, and in the frozen extremities of the globe. We landed on several other islands, from whence we had a most extensive prospect across the found, which looked wild and horrid in its wintry dress. This was, however, the first summer month of these regions; most of the plants we saw were in flower, and the birds were every where bringing up their young. From thence we may easily form an adequate idea of the torpid state of these regions, where the sun-beams cannot melt the snow, at a season when their influence is the strongest. The farther we advanced from the sea, the more snow appeared on the mountains. In some places, we saw cascades, and streams, gushing down over the snow, especially where the rays of the sun took effect by being frequently reflected. We found a most beautiful cove on this coast, which formed a circular basin, where the

America.

water was smooth and transparent as a mirror. All the lower parts were fringed with trees, which we had no where seen so tall in the neighbourhood, and many streams gushed down with great impetuosity between their roots, making a most convenient watering place. A prodigious number of small birds sat on every branch, and twittered around us in the sun-shine. They were of many different species; but, unacquainted with men—hopped so near us, that it was impossible to shoot them, especially as we had no other than coarse shot left, and that in very small quantity. Abundance of mosses, ferns, and climbers, grew up between the trees, and were no small impediment to us in walking. Various flowers enlivened these woods, and increased our collection with new species. Here, then, there was the appearance of summer; but if we looked up to the monstrous cloud-capt mountains which formed almost perpendicular walls on all sides of the harbour, and beheld them covered with snow and ice, which had sometimes a blue, and sometimes a yellowish tinge, we thought ourselves transported to the Glaciers of Switzerland, where the seasons seem likewise to be lost and confounded in each other. The height of these mountains was very considerable, tho' not equal to the Alps; and their summits were divided into many sharp and craggy points, between which the interval was filled with snow.

We landed here; and walked along the shore to another port, formed by a number of low islands, which entirely sheltered it from all winds.—We were fortunate enough to meet with an island entirely covered with the shrubs of a species of arbutus, loaded with red fruit, of the size of small cherries, which were very well tasted, and combined an agreeable tartness with a sweet and a bitter flavour. The rocks of the same island, at the water's edge, were covered with large muscle-shells, of which we found the fish more delicious than oysters.—To add to our good fortune, we met with several islands on our return, covered with excellent celery, which, tho' much smaller than that of New Zealand, was much higher flavoured, its juices being probably more concentrated. We loaded our boat with it, and returned late on board, after being overtaken by several smart showers. On our return, we found that the neighbourhood of the ship was very sensibly warmer than the northern parts of the found, where the air was refrigerated by the abundance of snow on the mountains.—

December 25th. “During our absence, some of the natives, in four small canoes, had visited the ship: they were described to us as wretched and poor; but inoffensive, and ready to part with their spears, seal-skins, and the like. We now regretted that we had lost the opportunity of seeing them; but fortunately they returned the next morning, tho' the weather was rainy. The four canoes in which they came were made of the bark of trees, which could hardly have grown in this found, on account of their size. Several small sticks are the ribs which defend this bark, and another stick forms the gunwale, over which they have wrapped the extremity of the bark and sewed it on. A few stones, with a small quantity of earth, are laid in the bottom of each canoe, and on this the natives keep a constant fire. Their paddles are small, and rudely formed, and they work very slowly with them. Each canoe contained from five to eight persons, including children, who,

19

Tierra del
Fuego.

COR-

America.

contrary to the custom of all the nations in the south sea, were very silent in their approach to the ship, and when aboard hardly pronounced any other word than *Pessera*. Those whom M. Bougainville saw in the strait of Magalhaens, not far from hence, used the same word, from whence he gave them the general name of *Pecherai*. We beckoned to them to come into the ship; and some accepted the invitation, tho' without the least sign of being pleased, and seemingly without the smallest degree of curiosity. Their persons were short, not exceeding five feet six inches at most, their heads large, the face broad, the cheek-bones very prominent, and the nose very flat. They had little brown eyes without life; their hair was black and lank, hanging about their heads in disorder, and besmeared with train-oil. On the chin they had a few straggling short hairs instead of a beard, and from their nose there was a constant discharge of mucus into their ugly open mouth. The whole assemblage of their features formed the most loathsome picture of misery and wretchedness to which human nature can possibly be reduced.—The shoulders and chest were broad and bony; but the rest of the figure was so lean and shrivelled, that to have seen it separate, we could not have believed that it belonged to the same person. Their legs were lean and bowed, and their knees disproportionately large. They had no other clothing than a small piece of old seal-skin, which hung from their shoulders to the middle of the back, being fastened round the neck with a string. The rest of their body was perfectly naked, not the least regard being paid to what Europeans would term decency. Their natural colour appeared to be an olive-brown, with a kind of gloss, which has really some resemblance to that of copper; but many of them had disfigured themselves with streaks of red paint, and sometimes, tho' seldom, with white.—The women were nearly formed as the men, though somewhat less in stature; their features were not less uncouth and ugly, and their dress exactly the same. They had only added a small piece of seal-skin, not so large as the palm of the hand, which hung down before, fixed to a string which was tied about the waist. Round their necks they wore leather strings, on which they had hung a number of shells; and on their heads they had a kind of bonnet, consisting of a few white quill-feathers of geese, which they occasionally placed upright on the head, by that means giving them a resemblance to the French head-dresses of the last century. There was but one single person among them, who had a small piece of a guanaco's skin sewed on his seal-skin, to lengthen it. The children were perfectly naked; and, like their mothers, huddled continually about the fire, in each canoe, shivering continually with cold, and rarely uttering any other word than *Pessera*, which sometimes sounded like a word of endearment, and sometimes seemed to be the expression of complaint. Those of the men who had come on deck, spoke a few other words, which contained many consonants and gutturals, particularly the *h* of the Welsh; and all seemed to lip very strongly, which contributed to make them wholly unintelligible. They accepted trifles, such as beads, without seeming to value them; but, at the same time, they also gave away their own arms, or even their ragged seal-skins, without the least concern; their whole character being the strangest compound of stupidity,

indifference, and inactivity."

From this description of the country and inhabitants of Tierra del Fuego, we might reasonably enough conclude that no spot on earth can be in a more wretched state, unless it lies much nearer the south-pole: but had as this country is, it appears to profit considerably by the neighbourhood of the continent of South America; for small islands lying at a great distance from the continent, and nearly in the same latitude with Tierra del Fuego, are in a much worse state; as evidently appears from the description given by our author of South Georgia, and the southern Thule.

1774, January 16th.—"We had very cold weather all this time, the thermometer being at 34th, and great falls of snow covering our decks. This morning we had sight of the land again, and found its mountains of a vast height, covered with loads of snow and ice, in moist places down to the water's edge. The only parts which were clear of snow were a few black and barren cliffs, and particularly some huge hollow rocks, that

—o'er their wave-worn basis bowed. SHAKESPEARE.

"Towards the fourth end of this land we saw several low islands, like the New-year's islands, which appeared to have some verdure upon them, and were therefore called the *Green Islands*. As it had been the main object of our voyage to explore the high southern latitudes, my father suggested to Captain Cook, that it would be proper to name this land after the monarch who had set on foot our expedition, solely for the improvement of science, and whose name ought therefore to be celebrated in both hemispheres.—It was accordingly honoured with the name of *Southern Georgia*, which will give it importance, and continue to spread a lustre over it, which it cannot derive from its barrenness and dreary appearance.

"In the afternoon we saw two rocky islands at the north end of Georgia, which lay about a league asunder, and were of a dull black colour. We steered towards them, and about five o'clock passed in the middle between them. The northernmost was a craggy cliff, nearly perpendicular, which contained the nests of many thousand thags, and was named *Willis's Island*; it is situated in 54° S. and 38. 25. W. The southernmost sloped gradually to the westward, being covered on that side with some grass, and with innumerable flocks of birds of all sorts, from the largest albatrosses down to the least petrels; for which reason, it was named *Bird Island*. Great numbers of thags, penguins, divers, and other birds, played about, and settled in the water around us, this cold climate seeming to be perfectly agreeable to them. Several porpoises were likewise noticed, and many seals, which probably came to breed on these inhospitable shores.

"We ran along the north-east coast of the land, till it was dark, when we brought to, and did not resume our course till the next morning at three o'clock. The aspect of the land was extremely unpromising; the mountains were the most craggy we had ever seen, and formed many sharp points, between which the intervals were filled with snow. We passed a bay, which, from the numbers of low green islands in it, was named the *Bay of Islands*; and opened another towards which we stood with the ship, having foundings at the distance of two or three miles.—Upon advancing into the furthest reefs of the bay, we soon observed a solid mass of ice,

O o 2

such

America.

20
South Georgia described.

America.

such as is found in the harbours of Spitzbergen (N. Lat. 79. 30.) This mass of ice bore a great resemblance to those detached islands of which we saw such numbers floating upon the ocean in the high southern latitudes. The shores of the bay nearer the sea were clear of snow, but excessively dreary, and almost perpendicular. We landed in a spot which was perfectly sheltered from the swell, and where the land formed a long projecting point. Here we saw a number of seals assembled on a stony beach; and among them a huge animal, which we had taken to be a rock at a distance, but which proved to be exactly the same animal with Lord Anson's sea-lion.—The seals which we found here, were more fierce than any we had seen on the New-year's Isles, and did not run out of our way. The youngest cubs barked at us; and ran after our heels when we passed by them, trying to bite our legs.—We climbed upon a little hummock, about eight yards high, where we found two species of plants; one was the grass which grows plentifully on the New-year's Isles (*dactylis glomerata*), and the other a kind of burnet (*sanguisorba*). Here Captain Cook displayed the British flag, and performed the ceremony of taking possession of these barren rocks, "in the name of his Britannic Majesty, and his heirs for ever." A volley of two or three muskets was fired into the air, to give greater weight to this assertion; and the barren rocks re-echoed with the sound, to the utter amazement of the seals and penguins, the inhabitants of these newly discovered dominions. The rocks consisted of a bluish grey slate, in horizontal strata, of which many fragments every where covered the beaches. As far as we were able to examine them, they contained no other minerals of any kind; the whole country being useless, and frightfully barren, in every respect. During our stay on shore, we saw some small fragments of ice floating out to sea, and heard the huge masses in the farthest part of the bay crack very loud from time to time. We continued to coast the land during the two following days, and discovered several bays and headlands upon it.—The appearance of the land was always nearly the same; its mountains towards the south were excessively high; and divided into innumerable ragged points, like the flames in a raging fire.—On the 19th, we reached the S. E. extremity of southern Georgia, which we now discovered to be an island, between 50 and 60 leagues in length.

"It has been supposed, that all parts of this globe, including those which are barren and dreary in the highest degree, are fit to become the abode of men. Before we arrived at this island of Georgia, we had nothing to oppose to this opinion, since even the wintry shores of Tierra del Fuego were inhabited by human beings, who were still one step removed from brutes. But the climate of Tierra del Fuego is mild with respect to that of Georgia, the difference in the thermometer which we observed being at least ten degrees. It has besides the advantage of producing a quantity of shrubbery and wood sufficient to supply the wants of the natives, who are by that means enabled to rest sheltered from the inclemencies of the air, and to light fires, which give them warmth, and may serve to make their food eatable and wholesome. As New Georgia is wholly destitute of wood, and of any other combustible to serve as a succedaneum, I apprehend it would

be impossible for any race of men to live upon it, though they should, instead of the stupidity of the Pellerais, be possessed of the ingenuity of the Europeans. The summers of this new island are rigorously cold, the thermometer having never risen ten degrees above the freezing point during our stay on the coast; and though we have reason to suppose, that the winters are not colder in the same proportion as in our hemisphere, yet it is probable there will be at least a difference of 20 or 30 degrees. This I think is sufficient to kill any men who may survive the summer there, supposing them provided with no other defence than that which the country affords. But South Georgia, besides being uninhabitable, does not appear to contain any single article for which it might be occasionally visited by European ships. Seals and sea-lions, of which the blubber is accounted an article of commerce, are much more numerous on the desert coasts of South America, the Falkland and the New-Year's islands, where they may likewise be obtained at a much smaller risk."

We can hardly expect an account of a country where winter prevails more perfectly than in New Georgia; yet even this island appears to have been greatly superior to that named the southern *Thule*, of which we have the following account.

"The discovery of this land happened on the 31st of January, at seven in the morning, when the weather was so hazy, that we could not see four or five miles around us. We ran towards it near an hour, when we were within half a mile of the rocks, which were black, cavernous, and perpendicular to a vast height, inhabited by flocks of flags, and beaten by dreadful breakers. Thick clouds veiled the upper parts of the mountains; but one immense peak appeared towering beyond them, covered with snow. It was agreed by all present, that the perpendicular height of this mountain could not be far short of two miles. We founded with 170 fathoms close in shore; and then put about, standing to the south, in order to weather the western point, which we had now discovered. We had not run above an hour on this tack, when we saw high mountains to the S. S. E. about five or six leagues distant; which, from the course we had kept, we must have narrowly escaped about midnight. This being the southernmost extremity of the land, my father named it the *Southern Thule*, a name which Captain Cook has preferred. It is situated in 59. 30. S. and 27. 30. W.—Captain Cook, however, did not venture to lose any time in the investigation of this coast, where he was exposed to imminent danger from the violence of westerly winds. He chose rather to explore its northern extremities, which besides were doubtless the most likely to be of importance to navigators. We kept at the distance of two or three leagues from the land, having little winds, and seeing the coast every where steep and inaccessible. The mountains appeared to be of vast height, their summits being constantly wrapped in clouds, and the lower part covered with snow down to the water's edge, in such a manner, that we should have found it difficult to pronounce whether we saw land or ice, if some hollow rocks had not shewn their black and naked caverns in several places.

Feb. 1. "We found ourselves abreast of another projecting point in the morning, which Captain Cook has since named *Cape Montague*. Beyond it we discovered

America.

21
Southern
Thule described.

vered

America.

vered another point to the north, which, upon our nearer approach, was discovered to be a separate island, and named *Saunders's Island*. It was not inferior in height to the mountainous coast to the south of it, and was covered with snow and ice in the same manner. It is situated in 57. 48. S. and 26. 35. W.

"We had little wind during the night; but, with the return of day-light, flood to the eastward, in order to weather *Saunders's Island*.—We could not accomplish our point with a single board; but, the wind being contrary, tacked all the afternoon, in order to double the northern extremity of *Saunders's Island*. We came very near it several times, and observed a flat point or beach running out to the northward, covered with heaps of shingle, which were piled up in the wildest manner, and offered nothing but sharp points and ridges to the eye. The whole country had the most desolate and horrid appearance which can possibly be conceived; not a single grass could be discerned upon it, and it seemed to be forsaken even by the amphibious and lumpy animals which dwell on Southern Georgia. In short, we could not help applying to it that remarkable expression of Pliny,

Paras mundi damnata a rerum natura, et densa merfa caligine.

Hist. Nat. lib. xv. c. 36.

23
Islands naturally colder than continents.

We have now abundant reason to conclude, that all islands are colder than continents lying in the same parallels of latitude; and that the vicinity of the ocean by no means contributes to produce warmth, but the contrary: and though water, by its property of absorbing heat in a latent state, and then discharging it in a sensible one, may be said to regulate the cold, so as to prevent its going to great extremes at any season; yet, by this very property, the distinction of seasons is lost, so that an island situated at a great distance from land may be uninhabitable by reason of the cold, while parts of a continent much nearer the pole than that island might furnish mankind with a comfortable abode.

24
Coldness in America accounted for.

From its shape, America may almost be considered as consisting of two islands; for only a narrow isthmus prevents the southern continent from being entirely surrounded with water. These, though very large, are far from equalling the bulk of Europe, Asia, and Africa, put together. The southern continent is not so big as Africa, and it is doubtful whether Asia does not equal the bulk of both North and South America, especially if we take in the new-discovered island of New Holland, which is very little if at all inferior in bulk to Europe.—The three old continents are connected with one another, and are no doubt considerably warmer on that account. America is at a vast distance; and cannot profit by the warmth either of Africa or Asia, let it be ever so great. It is impossible, then, that the climate of New-York, New-England, and New-Scotland, can be so mild as that of France and Spain; because the winter in them is moderated by their having the Mediterranean sea to the south, and the Atlantic ocean to the west and north, at the same time that the vicinity of Africa prevents this vast quantity of water from absorbing much of their summer-heat. The American countries just now mentioned, have indeed the Atlantic Ocean on one side, but are surrounded with land on every other, nor have they any warm continent so near them as Asia and Africa are to the southern parts of Europe; and hence they are subject to

violent extremes of heat and cold; so that, in the streets of Boston, the capital of New-England, the ice frequently lies a foot thick, for several months in winter; while the summer-heats are very great. In like manner is South America colder than Africa, because of its inferiority in size, and its distance from any other continent; while the small islands in the southern ocean lying in latitudes corresponding to that of Britain, are utterly uninhabitable, and covered with perpetual snow and ice.

Another particularity in the climate of America is its excessive moisture in general. In some places, indeed, on the western coast, rain is not known; but, in all other parts, the moistness of the climate is as remarkable as the cold; and this moisture undoubtedly contributes to render America in general very unhealthy.—The forests wherewith it is every where covered, no doubt, partly occasion the moisture of its climate; but the most prevalent cause is the vast quantity of water in the Atlantic and Pacific Oceans with which America is invironed on all sides. Hence those places where the continent is narrowest are deluged with almost perpetual rains, accompanied with violent thunder and lightning, by which some of them, particularly Porto Bello, are rendered in a manner uninhabitable.

25
Extreme moisture of the American climate.

This extreme moisture of the American climate is productive of much larger rivers there, than in any other part of the world. The Danube, the Nile, the Indus, or the Ganges, are not comparable to the Mississippi, the River St Lawrence, or that of the Amazons; nor are such large lakes to be found any where as those which North America affords.—To the same cause we are also partly to ascribe the excessive luxuriance of all kinds of vegetables in almost all parts of this country. In the southern provinces, where the moisture of the climate is aided by the warmth of the sun, the woods are almost impervious, and the surface of the ground is hid from the eye, under a thick covering of shrubs, herbs, and weeds.—In the northern provinces, the forests are not encumbered with the same luxuriance of vegetation; nevertheless, they afford trees much larger of their kind than what are to be found any where else.

26
Large rivers, and excessive luxuriance of vegetation.

The same moisture which is so favourable to vegetation, is found to be very unfavourable to animal life. The brute creatures of America are generally of a small size when compared with those of Europe, Asia, or Africa; nay, those which have been imported by the Europeans, though they multiplied excessively, have never failed to degenerate in size, as well as in strength and vigour. We may with the more certainty ascribe this to the pernicious influence of the moisture, as it is observed, that black cattle brought from other parts of the continent to Porto Bello, where the moisture is exceedingly great, lose their flesh so fast, as to become in a few weeks scarce eatable.—To this, however, there is one exception; for America produces a species of ravenous birds called *condors*, superior both in size and strength to any that are to be found in other parts of the world.

27
Moisture of the climate unfavourable to animals.

The same causes which check the growth and vigour of the more noble animals, are friendly to the propagation and increase of insects. Accordingly, these, especially such as delight in taking up their habitation in moist earth, are to be found in immense quantities throughout

28
Produce vast numbers of insects.

America.

throughout the continent. At Porto Bello, toads are found in such multitudes that they hide the surface of the earth. At Guyaquil, snakes and vipers are hardly less numerous. It doth not appear, however, that serpents abound more, or even so much, in America, as in some places of Africa; for there, according to the accounts given by Mr Adanson, large plains are to be met with entirely covered with them. Nor have we any accounts of the locusts, which sometimes commit such devastations on the eastern continent, being ever found in America. Instead of these, they have a kind of ants, which, in some of the islands, have frequently consumed every vegetable production, and left the earth entirely bare, as if it had been burnt with fire. In Dec^r 1768, Captain Cook found the air at Rio Janeiro loaded with butterflies. They were chiefly of one sort; but in such numbers, that thousands might be seen in every direction, and the moist of them flew above the mast head.

29
Account of
the natives.

At the time America was discovered, it was found inhabited by a race of men no less different from those in the other parts of the world, than the climate and natural productions of this continent are different from those of Europe, Asia, or Africa.—One great peculiarity in the native Americans is their colour, and the identity of it throughout the whole extent of the continent. In Europe and Asia, the people who inhabit the northern countries are of a fairer complexion than those who dwell more to the southward. In the torrid zone, both in Africa and Asia, the natives are entirely black, or the next thing to it. This, however, must be understood with some limitation. The people of Lapland, who inhabit the most northerly part of Europe, are by no means so fair as the inhabitants of Britain; nor are the Tartars so fair as the inhabitants of Europe, who lie under the same parallels of latitude. Nevertheless, a Laplander is fair when compared with an Abyssinian, and a Tartar if compared with a native of the Molucca islands.—In America, this distinction of colour was not to be found. In the torrid zone there were no negroes, and in the temperate and frigid zones there were no white people. All of them were of a kind of red copper-colour, which Mr Forster observed, in the Pessierays of Terra del Fuego, to have something of a gloss resembling that metal. It doth not appear, however, that this matter hath ever been inquired into with sufficient accuracy. The inhabitants of the inland parts of South America, where the continent is widest, and consequently the influence of the sun the most powerful, have never been compared with those of Canada, or more northerly parts, at least by any person of credit. Yet this ought to have been done, and that in many instances too, before it could be asserted so positively as most authors do, that there is not the least difference of complexion among the natives of America. Indeed, so many systems have been formed concerning them, that it is very difficult to obtain a true knowledge of the most simple facts.—If we may believe the Abbe Raynal, the Californians are swarther than the Mexicans; and so positive is he in this opinion, that he gives a reason for it. "This difference of colour," says he, "proves, that the civilized life of society subverts, or totally changes, the order and laws of nature, since we find, under the temperate zone, a savage people that are blacker than the civilized nations of the torrid zone."—On the other hand, Dr Robertson classes all the in-

America.

habitants of Spanish America together with regard to colour, whether they are civilized or uncivilized; and when he speaks of California, takes no notice of any peculiarity in their colour more than others.—Certain it is, however, that the northern inhabitants of America are of a colour very different from the Europeans, or even the Asiatics, in the same latitudes; nor are those who dwell under the line so black as negroes.—The general appearance of the Americans in various districts is thus described by Don Antonia Ulloa. They have a very small fore-head, covered with hair towards its extremities, as far as the middle of the eye-brows; little eyes; a thin nose, small, and bending towards the upper lip; the countenance broad; the ears large; the hair very black, lank, and coarse; the limbs well turned; the feet small; the body of just proportion, and altogether smooth and free from hair, until old age, when they acquire some beard, but never on the cheeks."—The chevalier Pinto gives the following account of them. "They are all of a copper colour, with some diversity of shade, not in proportion to their distance from the Equator, but according to the degree of elevation of the territory in which they reside. Those who live in a high country are fairer than those in the marshy low lands on the coast. Their face is round; farther removed, perhaps, than that of any people, from an oval shape. Their fore-head is small; the extremity of their ears far from the face; their lips thick; their nose flat; their eyes black, or of a chestnut colour, small, but capable of discerning objects at a great distance. Their hair is always thick and sleek, and without any tendency to curl. They have no hair on any part of their body but the head. At the first aspect, a South-American appears to be mild and innocent; but, on a more attentive view, one discovers in his countenance something wild, distrustful, and sullen."

The Americans were also remarkable for their debility of body. They were not only averse to toil, but incapable of it; and when roused by force from their native indolence, and compelled to work, they sunk under tasks which people of the other continent would have performed with ease. On the continent, however, where many tribes employed themselves in hunting, they acquired greater firmness; but still they were more remarkable for agility than strength. Of their swiftness, indeed, surprising accounts are given. Adair relates the adventures of a Chikakah warrior, who run America, through woods and over mountains, 300 computed miles in a day and an half and two nights. *History of America, p. 396.*

Another particularity in these people is the smallness of their appetite for food. This was so remarkable, that the Spaniards considered the constitutional temperance of the Americans, not only in the islands, but in several parts of the continent, as far exceeding the abstinence of the most mortified hermits. On the other hand, the appetite of the Spaniards appeared to them to be insatiably voracious. They affirmed, that one Spaniard devoured more food in a day than was sufficient for ten Americans. Nay, they even imagined, that the Spaniards had left their own country because they could not find provisions in sufficient quantity to satisfy their ravenous appetites.

Nor were the Americans less singular in their mental than their corporeal qualities. The understandings of many nations seemed to be so limited, that they were

Robertson's
History of Amer. vol. 1.
p. 469.

39
Understanding
of the
Americans
very limited.
ed.

neither

America. neither capable of forming an arrangement for futurity, nor did their solicitude or foresight extend so far. They set no value upon those things of which they were not in some immediate want. In the evening, when a Carribee is going to rest, no consideration will tempt him to sell his hammock; but in the morning, he will part with it for the slightest trifle. At the close of winter, a North-American, mindful of what he has suffered from the cold, sets himself with vigour to prepare materials for erecting a comfortable hut to protect him against the inclemency of the succeeding season: but as soon as the weather becomes mild, he abandons his work, and never thinks of it more, till the return of the cold compels him to resume it.—In short, to be free from labour, seems to be the utmost wish of an American. They will continue whole days stretched in their hammocks, or seated on the earth, without changing their posture, raising their eyes, or uttering a single word. The men seem to be possessed of a degree of insensibility towards the women which is not to be found in any other part of the world; but it was not so with the women at the arrival of the Spaniards among them. Their passions in this respect seemed to be so strong as to swallow up every other consideration, inasmuch that they would have trampled over heaps of their countrymen, in order to give themselves up to the embraces of the barbarians who had deprived them of life; nor would they hesitate at betraying their country, their nearest relations not excepted, into the hands of these strangers.

31
Insatiable
desire of re-
venge.

Notwithstanding the seeming imbecillity of their minds in most respects, there is one pursuit in which the Americans are indefatigable beyond what is recorded of any race of men either ancient or modern; and that is revenge. This they carry such a length as we could scarce think would be done by any other than infernal spirits themselves.—Among these savages the forgiveness of enemies is never heard of. They will not attack enemies who are prepared for them; but watch their opportunity to murder them when asleep or incapable of making any resistance. If they find it impossible to revenge themselves when the injury is committed, they will dissemble their resentment, but no length of time is sufficient to eradicate that passion from their breasts; and whenever an opportunity offers, they will revenge themselves with the same hellish fury as if the offence was but just then committed. A single warrior has been known to march several hundred miles to surprise and cut off a straggling enemy. If a quarrel is once begun, these wretches are not satisfied with the destruction of the person who gave the offence; nor will their revenge be satiated with the death of all his family or relations, nothing less is aimed at than the extermination of the whole tribe or nation to which he belongs.—Agreeably to this principle their wars are carried on; and by acting upon this principle the Iroquois actually exterminated a nation called the *Eries*, from which one of the lakes of Canada took its name, so that now there is not the least trace of their existence. When two nations, at war, make peace with one another, it is not because they are weary of slaughter, or that they think they have had revenge enough; but because they find themselves unable to carry on the war any longer. Hence the peace which the savage nations make with one another, may be considered only as a

kind of truce, till both parties have recovered strength enough to renew their hostilities.

As the Indian nations are not populous, and many of them lie at a great distance from one another, it is impossible there could be any animosities between them was the desire of revenge to abate.—For declaring war, against a nation no new provocation is necessary, nor is it even pretended that any has been received. It is the memory of past quarrels only, which are thought not to be sufficiently revenged; that incites them to war.—Private chiefs sometimes invade their neighbour territories without consulting the rulers of the community; nay, often single persons will take the field; and these expeditions are connived at by the elders, as tending to cherish a martial spirit, and to accustom their people to enterprise and danger. If a chief wishes to allure a band of warriors to follow him in invading an enemy's country, his persuasions are addressed to their favourite passion revenge. "The bones of our country-men," says he, "lie uncovered, their bloody bed has not been washed clean. Their spirits cry against us; they must be appeased. Let us go and devour the people by whom they were slain. Sit no longer inactive upon your mats; lift the hatchet; console the spirits of the dead, and tell them that they shall be avenged."—Animated by such exhortations as these, the young men seize their arms, and fall forth against their enemies, singing the war-song, which may be expressed in the following words. "I go to war to revenge the death of my brothers; I shall kill, I shall exterminate, I shall burn my enemies; I shall bring away slaves; I shall devour their heart, dry their flesh, and drink their blood. I shall tear off their scalps, and make cups of their skulls."

Such is the implacable nature of these savages, that they will go, for the purpose of revenge, 1000 miles in pathless woods, over hills and mountains, thro' huge swamps, exposed to the extremities of heat and cold, the vicissitude of seasons, and to hunger and thirst. All these difficulties they despise as trifles, provided they can obtain the scalps of their enemies.—A remarkable instance of their innate desire of blood we have in the following anecdote of an Algonquin woman.

32
Anecdote of
an Algon-
quin wo-
man.

That nation being at war with the Iroquois, she happened to be taken prisoner, and was carried to one of the villages belonging to them. Here she was stripped naked, and her hands and feet bound with ropes in one of their cabins. In this condition she remained ten days, the savages sleeping round her every night. The eleventh night, while they were asleep, she found means to disengage one of her hands, with which she immediately freed herself from the ropes, and went to the door. Tho' she had now an opportunity of escaping unperceived, her revengeful temper could not let slip so favourable an opportunity of killing one of her enemies. The attempt was manifestly at the hazard of her own life; yet, snatching up a hatchet, she killed the savage that lay next her, and, springing out of the cabin, concealed herself in a hollow tree which she had observed the day before. The groans of the dying person soon alarmed the other savages, and the young ones immediately set out in pursuit of her.—Perceiving from her tree, that they all directed their course one way, and that no savage was near her, she left her sanctuary, and, flying by an opposite direction, ran into a forest with-

America.
