ENCYCLOPÆDIA BRITANNICA;
OR, A
DICTIONARY
OF
ARTS, SCIENCES, &c.

On a PLAN entirely NEW:

By WHICH,
THE DIFFERENT SCIENCES AND ARTS
Are digested into the FORM of Distinct
TREATISES OR SYSTEMS,

COMPREHENDING

The HISTORY, THEORY, and PRACTICE, of each,
according to the Latest Discoveries and Improvements;

AND FULL EXPLANATIONS GIVEN OF THE
VARIOUS DETACHED PARTS OF KNOWLEDGE,

WHETHER RELATING TO

NATURAL and ARTIFICIAL Objects, or to Matters ECCLESIASTICAL,
CIVIL, MILITARY, COMMERCIAL, &c.

TOGETHER WITH

A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, &c. throughout
the World; a General HISTORY, *Ancient and Modern*, of the different Empires, Kingdoms,
and States; and an Account of the LIVES of the most Eminent Persons in every Nation,
from the earliest ages down to the present times.

THE WHOLE COMPILED FROM
THE WRITINGS OF THE BEST AUTHORS, IN SEVERAL LANGUAGES; THE MOST APPROVED DICTIONARIES,
AS WELL OF GENERAL SCIENCE AS OF PARTICULAR BRANCHES; THE TRANSACTIONS, JOURNALS, AND MEMOIRS, OF LEARNED
SOCIETIES, BOTH AT HOME AND ABROAD; THE MS. LECTURES OF EMINENT PROFESSORS ON DIFFERENT SCIENCES;
AND A VARIETY OF ORIGINAL MATERIALS, FURNISHED BY AN EXTENSIVE CORRESPONDENCE.

The SECOND EDITION; greatly Improved and Enlarged.

ILLUSTRATED WITH ABOVE TWO HUNDRED COPPERPLATES.

Dictionary of Arts, Sciences, &c.

D.

D
||
Dacca.**D**, THE fourth letter of the alphabet, and the third consonant.

Grammarians generally reckon D among the lingual letters, as supposing the tongue to have the principal share in the pronunciation thereof; though the Abbot de Dangeau seems to have reason in making it a palate letter. The letter D is the fourth in the Hebrew, Chaldee, Samaritan, Syriac, Greek, and Latin alphabets; in the five first of which languages it has the same name, though somewhat differently spoke, *e. g.* in Hebrew and Chaldee *Daleth*, in Syriac *Doletb*, and in Greek *Delta*.

The form of our D is the same with that of the Latins, as appears from all the ancient medals and inscriptions; and the Latin D is no other than the Greek Δ, rounded a little, by making it quicker and at two strokes. The Δ of the Greeks, again, is borrowed from the ancient character of the Hebrew *Daleth*; which form it still retains, as is shewn by the Jesuit Souciet, in his Dissertation on the Samaritan Medals.

D is also a numeral letter, signifying *five hundred*; which arises hence, that, in the Gothic characters, the D is half the M, which signifies a *thousand*. Hence the verse,

Litera D velut A quingentos significabit.

A dash added a-top, *Ḍ*, denotes it to stand for five thousand.

Used as an abbreviation, it has various significations: thus, D stands for Doctor; as, M. D. for Doctor of Medicine; D. T. Doctor of Theology; D. D. implies Doctor of Divinity, or "dono dedit;" D. D. D. is used for "dat, dicat, dedicat;" and D. D. D. D. for "dignum Deo donum dedit."

DAB, in ichthyology, the English name of a species of *PLEURONECTES*.

DABUL, a town of Asia, in the East Indies, on the coast of Malabar, and to the south of the gulf of Cambaye, on a navigable river. It was formerly very flourishing, but is now much decayed. It belongs to the Portuguese, and its trade consists principally in pepper and salt. E. Long. 73. 55. N. Lat. 17. 30.

DACCA, a town of Asia, in the kingdom of Bengal in the East Indies, situated in E. Long. 89. 10. N. Lat. 24. 0.—The advantages of the situation of this place, and the fertility of the soil round it, have

long since made it the centre of an extensive commerce.

The courts of Delhi and Muxadav are furnished from thence with the cottons wanted for their own consumption. They each of them maintain an agent on the spot to superintend the manufacture of them; and he has an authority, independent of the magistrate, over the brokers, weavers, embroiderers, and all the workmen whose business has any relation to the object of his commission. These unhappy people are forbidden, under pecuniary and corporal penalties, to sell, to any person whatever, a piece exceeding the value of three guineas: nor can they, but by dint of money, relieve themselves from this oppression.

In this, as in all the other markets, the Europeans treat with the Moorish brokers settled upon the spot, and appointed by the government. They likewise lend their name to the individuals of their own nation, as well as to Indians and Armenians living in their settlements, who, without this precaution, would infallibly be plundered. The Moors themselves, in their private transactions, sometimes avail themselves of the same pretence, that they may pay only two, instead of five, *per cent*. A distinction is observed, in their contracts, between the cottons that are bespoke, and those which the weaver ventures, in some places, to manufacture on his own account. The length, the number of threads, and the price, of the former are fixed: nothing further than the commission for the latter is stipulated, because it is impossible to enter into the same detail. Those nations that make a point of having fine goods, take proper measures that they may be enabled to advance money to their workmen at the beginning of the year. The weavers, who in general have but little employment at that time, perform their work with less hurry than in the months of October, November, and December, when the demand is pressing.

Some of the cottons are delivered unbleached, and others half-bleached. It were to be wished that this custom might be altered. It is very common to see cottons, that look very beautiful, go off in the bleaching. Perhaps the manufacturers and brokers foresee how they will turn out; but the Europeans have not so exquisite a touch, nor such an experienced eye to discern this. It is a circumstance peculiar to India, that cottons, of what kind soever they are, can never be well

Dacca.

Dace
Dacier.

bleached and prepared, but in the place where they are manufactured. If they have the misfortune to get damaged before they are shipped for Europe, they must be sent back to the places from whence they came.

DACE, in ichthyology, a species of *CYPRINUS*.

This fish is extremely common in our rivers, and gives the expert angler great diversion. The dace will bite at any fly; but he is more than ordinarily fond of the stone caddis, or May-fly, which is plentiful in the latter end of April, and the whole month of May. Great quantities of these may be gathered among the reeds or sedges by the water-side; and on the hawthorn bushes near the waters. These are a large and handsome bait; but as they last only a small part of the year in season, recourse is to be had to the ant-fly. Of these the black ones found in large mole-hills or ant-hills, are the best. These may be kept alive a long time in a bottle, with a little of the earth of the hill, and some roots of grafs; and they are in season throughout the months of June, July, August, and September. The best season of all is when they swarm, which is in the end of July, or beginning of August; and they may be kept many months in a vessel washed out with a solution of honey in water, even longer than with the earth and grafs-roots in the vial; though that is the most convenient method with a small parcel taken for one day's fishing. In warm weather this fish very seldom refuses a fly at the top of the water; but at other times he must have the bait sunk to within three inches of the bottom. The winter fishing for dace requires a very different bait: this is a white maggot with a reddish head, which is the produce of the eggs of the beetle, and is turned up with the plough in great abundance. A parcel of these put in any vessel, with the earth they were taken in, will keep many months, and are an excellent bait. Small dace may be put into a glass jar with fresh water; and there preferred alive for a long time, if the water is properly changed. They have been observed to eat nothing but the animalcula of the water. They will grow very tame by degrees.

DACHAW, a town of Bavaria in Germany. It is pretty large, well built, and seated on a mountain, near the river Amber. Here the elector has a palace and fine gardens. E. Long. 11. 30. N. Lat. 48. 20.

DACIER (Andrew), born at Castrès in Upper Languedoc, 1651, had a great genius and inclination for learning, and studied at Saumur under Tannegui Le Fevre, then engaged in the instruction of his daughter, who proved afterwards an honour to her sex. This gave rise to that mutual tenderness which a marriage of 40 years could never weaken in them. The duke of Montausier hearing of his merit, put him in the list of commentators for the use of the dauphin, and engaged him in an edition of *Pompeius Festus*, which he published in 1681. His edition of Horace printed at Paris in 10 vols in 12mo. and his other works, raised him a great reputation. He was made a member of the academy of inscriptions in 1695. When the history of Lewis XIV. by medals was finished, he was chosen to present it to his majesty; who being informed of the pains which he had taken in it, settled upon him a pension of 2000 livres, and appointed him keeper of the books of the king's closet in the Louvre. When that post was united to that of library-keeper to the

Dacier
Daçtlyl.

king, he was not only continued in the privileges of his place during life, but the survivance was granted to his wife, a favour of which there had been no instance before. But the death of Madam Dacier in 1720, rendered this grant, which was so honourable to her, ineffectual. He died Sept. 18. 1722, of an ulcer in the throat. In his manners, sentiments, and the whole of his conduct, he was a complete model of that ancient philosophy of which he was so great an admirer, and which he improved by the rules and principles of Christianity.

DACIER (Anne), daughter of Tannegui le Fevre, professor of Greek at Saumur in France. She early shewed a fine genius, which her father cultivated with great care and satisfaction. After her father's death she went to Paris, whither her fame had already reached; she was then preparing an edition of Callimachus which she published in 1674. Having shewn some sheets of it to Mr Huet, preceptor to the dauphin, and to several other men of learning at the court, the work was so highly admired, that the duke of Montausier made a proposal to her of publishing several Latin authors for the use of the dauphin. She rejected this proposal at first, as a task to which she was not equal. But the duke insisted upon it; so that at last he gained her consent; upon which she undertook an edition of Florus, published in 1674. Her reputation being now spread over all Europe, Christina queen of Sweden ordered count Königsmark to make her a compliment in her name: upon which Mademoiselle le Fevre sent the queen a Latin letter, with her edition of Florus: to which her majesty wrote an obliging answer; and not long after sent her another letter, to persuade her to abandon the Protestant religion, and made her considerable offers to settle at her court. In 1683, she married Mr Dacier; and soon after declared her design to the duke of Montausier and the bishop of Meaux, of reconciling herself to the church of Rome, which she had entertained for some time: but as Mr Dacier was not yet convinced of the reasonableness of such a change, they retired to Castrès in 1684, where they had a small estate, in order to examine the points of controversy between the Protestants and the Roman Catholics. They at last determined in favour of the latter, and signed their public abjuration in 1685. After this, the king gave both husband and wife marks of his favour. In 1693, she applied herself to the education of her son and daughter, who made a prodigious progress: the son died in 1694, and the daughter became a nun in the abbey of Longchamp. She had another daughter, who had united in her all the virtues and accomplishments that could adorn the sex; but she died at 18. Her mother has immortalized her memory in the preface to her translation of the *Iliad*. Madam Dacier was in a very infirm state of health the two last years of her life; and died, after a very painful sickness, August 17. 1720, aged 69. She was remarkable for her firmness, generosity, equality of temper, and piety.

DACTYL, in poetry, a metrical foot, consisting of one long and two short syllables; as, *carmina, evident, excellence*.

The dactyl and spondee are the only feet used in hexameter verses. See *HEXAMETER*.

DACTYLI 1031; the *Fingers of Mount Ida*. Concerning these, Pagan theology and fable give very different

Dactylis different accounts. The Cretans paid divine worship to them, as those who had nursed and brought up the god Jupiter; whence it appears, that they were the same as the Corybantcs and Curetes. Nevertheless Strabo makes them different; and says, that the tradition in Phrygia was, that "Curetes and Corybantcs were descended from the Dactyli Idæi: that there were originally an hundred men in the island, who were called *Dactyli Idæi*; from whom sprang nine Curetes, and each of these nine produced ten men, as many as the fingers of a man's two hands; and that this gave the name to the ancestors of the *Dactyli Idæi*." He relates another opinion, which is, that there were but five *Dactyli Idæi*; who, according to Sophocles, were the inventors of iron: that these five brothers had five sisters, and that from this number they took the name of *fingers of mount Ida*, because they were in number ten; and that they worked at the foot of this mountain. Diodorus Siculus reports the matter a little differently. He says "the first inhabitants of the Island of Crete were the *Dactyli Idæi*, who had their residence on mount Ida: that some said, they were an hundred; others only five, in number equal to the fingers of a man's hand, whence they had the name of *Dactyli*: that they were magicians, and addicted to mystical ceremonies: that Orpheus was their disciple, and carried their mysteries into Greece: that the *Dactyli* invented the use of iron and fire, and that they had been recompensed with divine honours."

Diomedes the Grammarian says, The *Dactyli Idæi* were priests of the goddess Cybele: called *Idæi*, because that goddess was chiefly worshipped on mount Ida in Phrygia; and *Dactyli*, because that, to prevent Saturn from hearing the cries of infant Jupiter, whom Cybele had committed to their custody, they used to sing certain verses of their own invention, in the Dactylic measure. See CURETES and CORYBANTES.

DACTYLIS, COCK'S-FOOT GRASS; a genus of the digynia order, belonging to the triandria class of plants. There are two species, the cynosuroides or smooth cock's-foot grass, and the glomeratus or rough cock's-foot grass. Both are natives of Britain: the first grows in marshy places, and the latter is common in meadows and pasture-grounds. This last is eat by horses, sheep, and goats; but refused by cows.

DACTYLUS in zoology, a name given by Pliny to the PHOLAS.

DADUCHI, in antiquity, priests of the goddess Ceres, so called, because at the feasts and sacrifices of that goddess, they ran about the temple, carrying a lighted torch, which they delivered from hand to hand, till it had passed through them all. This they did in memory of Ceres's searching for her daughter Proserpine, by the light of a torch, which she kindled in mount Ætna.

DÆDALUS, an ingenious Athenian artist, who invented divers mechanical instruments, as the saw, &c. and made walking statues, with their eyes rolling as if alive. He threw his brother's son out of a window, for fear he should excel him in his art, because he had invented the potter's wheel: whereupon he fled into Crete to king Minos, and carried his son Icarus along with him. There he built the celebrated labyrinth; in which he and his son were shut up, because of his having served Pasiphaë the queen in her base amours: he,

however, made himself and his son wings, by which he escaped; but his son not observing his directions, fell into the sea and was drowned. He fled to Cocceus king of Egypt, who caused him to be choaked in a flove, to prevent Minos's making war against him on his account. He is said to have lived about the year 2600. He made many famous works at Memphis in Egypt, where the inhabitants paid him divine honours.

DÆMON, a name given by the ancients to certain spirits, or genii, which appeared to men, either to do them service, or to hurt them. The Platonists distinguish between gods, demons, and heroes. The gods are those whom Cicero calls *Dii majorum gentium*. The demons are those whom we call *angels*. Christians, by the word *dæmon*, understand only evil spirits, or devils.

DÆMONIAC, a word applied to a person supposed to be possessed with an evil spirit, or *DÆMON*.

DÆMONIACS, in church-history, a branch of the anabaptists; whose distinguishing tenet is, that the devils shall be saved at the end of the world.

DAFFY'S ELIXIR. See PHARMACY, n° 421.

DAGNO, a town of Turkey in Europe, in Albania, with a bishop's see. It is the capital of the district of Ducagini, and it is seated on the rivers Drino and Nero, near their confluence. It is 15 miles south-east of Scutari, and 15 north-east of Alessio. E. Long. 19. 48. N. Lat. 42. o.

DAGO, or **DAGHO**, an island in the Baltic Sea, on the coast of Livonia, between the gulph of Finland and Riga. It is of a triangular figure, and may be about 20 miles in circumference. It has nothing considerable but two castles, called *Daggerwort* and *Paden*. E. Long. 22. 30. N. Lat. 58. 48.

DAGON, the false god of Ahhdod *, or, as the Greeks call it, *Azotus*. He is commonly represented as a monster, half man and half fish: whence most learned men derive his name from the Hebrew *dag*, which signifies a *fish*. Those, who make him to have been the inventor of *bread-corn*, derive his name from the Hebrew *Dagan*, which signifies *frumentum*; whence Philo Biblius calls him *Ζεύς Ἀγρίων*, *Jupiter Atratrius*.

This deity continued to have a temple at Ahhdod, during all the ages of idolatry, to the time of the Maccabees. For the author of the first book of Maccabees tells us, that "Jonathan, one of the Maccabees, having beaten the army of Apollonius, Demetrius's general, they fled to Azotus, and entered into Bethdagon (the temple of their idol); but that Jonathan set fire to Azotus, and burnt the temple of Dagon, and all those who were fled into it.

DAGON, according to some, was the same with Jupiter, according to others Saturn, according to others Venus, and according to most Neptune.

DAHGESTAN, a country of Asia, bounded by Circassia on the north, by the Caspian sea on the east, by Chirvein a province of Persia on the south, and by Georgia on the west. Its chief towns are Tarku and Derbent, both situated on the Caspian Sea.

DAHOMÉ, a kingdom of Africa, on the coast of Guinea, to the north of Whidah, or Fida. The king of this country conquered Whidah, and very much disturbed the slave-trade of the Europeans.

DAILLIE (John), a Protestant minister near Paris,

Dæmon
Dæilie.

* See 1 Sam.
chap. v.

Daisy
Dalea.

Dalkeith
Damasce-
nus.

ris, was one of the most learned divines of the 17th century, and was the most esteemed by the Catholics, of all the controversial writers among the Protestants. He was tutor to two of the grandsons of the illustrious Mr Du Pleffis Mornai. Mr Daille having lived 14 years with so excellent a master, travelled into Italy with his two pupils : one of them died abroad ; with the other he saw Italy, Switzerland, Germany, Flanders, Holland, and England, and returned in 1621. He was received minister in 1623, and first exercised his office in the family of Mr Du Pleffis Mornai ; but this did not last long, for that lord died soon after. The memoirs of this great man employed Mr Daille the following year. In 1625 he was appointed minister of the church of Saumur, and in 1626 removed to Paris. He served all the rest of his life in the service of this last church, and composed several works : his first piece was his master-piece, and an excellent work, *Of the Use of the Fathers*, printed 1631. It is a strong chain of reasoning, which forms a moral demonstration against those who would have religious disputes decided by the authority of the fathers. He died in 1670, aged 77.

DAISY. See BELLIS.

OX-EYE DAISY. See BUPHTHALMUM.

DALACA, an island of the Red Sea, over-against the coast of Abex, about 72 miles in length, and 15 in breadth. It is very fertile, populous, and remarkable for a pearl fishery. The inhabitants are negroes, and great enemies to the Mahometans. There is a town of the same name seated over-against Abassia.

DALEBURG, a town of Sweden, and capital of the province of Dalia, seated on the western bank of the lake Wener, 50 miles north of Gottenburg. E. Long. 13. o. N. Lat. 59. o.

DALECARLIA, a province of Sweden, so called from a river of the same name, on which it lies, near Norway. It is divided into three parts, which they call *valleys*; and is about 175 miles in length, and 100 in breadth. It is full of mountains, which abound in mines of copper and iron, some of which are of a prodigious depth. The towns are very small, and Idra is the capital. The inhabitants are rough, robust, and warlike ; and all the great revolutions in Sweden had their rise in this province. The river rises in the Dofrine mountains ; and, running south-east thro' the province, falls into the gulph of Bothnia.

DALECHAMP (James), a physician in Normandy, in the 16th century, wrote a history of plants, and was well skilled in polite learning. He wrote notes on Pliny's natural history, and translated Athenæus into Latin.

DALECHAMPIA, in botany ; a genus of the monadelphous order, belonging to the monœcia class of plants. There is but one species, viz. the scandens, a native of Jamaica. It is a climbing plant, which rises to a considerable height ; and is remarkable for nothing but having its leaves armed with bristly hairs, which sting the hands of those who unwarily touch them.

DALEM, a town of the United Provinces, and capital of a district of the same name. It was taken by the French in 1672, who demolished the fortifications. It is seated on the river Bervine, five miles north-east of Liege. E. Long. 5. 59. N. Lat. 50. 40.

DALEA, a province of Sweden, bounded on the

north by Dalecarlia, on the east by the Wermeland and the lake Wener, on the south by Gothland, and on the north by Norway and the sea.

DALKEITH, a town of Scotland, in Mid-Lothian, 6 miles south-east of Edinburgh. W. Long. 2. 20. N. Lat. 55. 50.

DALMATIA, a province of Europe ; bounded on the north by Bosnia, on the south by the gulph of Venice, on the east by Servia, and on the west by Morlachia. Spalatro is the capital of that part belonging to the Venetians ; and Ragusa, of a republic of that name : the Turks have a third, whose capital is Herzegovina. The air is wholesome, and the soil fruitful ; and it abounds in wine, corn, and oil.

DALTON, a town of Lancashire, in England. It is seated on the spring-head of a river, in a champaign country, not far from the sea ; and the ancient castle is made use of to keep the records, and prisoners for debt in the liberty of Furness. W. Long. 3. o. N. Lat. 54. 18.

DALTON (John), D. D. an eminent divine and poet, was the son of the rev. Mr John Dalton, rector of Deane, near Whitehaven in Cumberland, where he was born in 1709. He was educated at Queen's college, Oxford, and became tutor or governor to the lord Beauchamp, only son of the earl of Hertford, late duke of Somerset ; during which time he adapted Milton's admirable Masque of Comus to the stage, by a judicious insertion of several songs and different passages selected from other of Milton's works, as well as of several songs and other elegant additions of his own, suited to the characters and to the manner of the original author. During the run of this piece he industriously sought out a grand-daughter of Milton's, oppressed both by age and poverty ; and procured her a benefit from it, the profits of which amounted to a very considerable sum. He was promoted by the king to a prebend of Worcester ; where he died, on the 22^d of July 1763. Besides the above, he wrote a descriptive poem, addressed to two ladies at their return from viewing the coal-mines near Whitehaven ; and Remarks on 12 historical designs of Raphael, and the *Museum Græcum & Egyptiacum*.

DAMA, in zoology. See CERVUS.

DAMAGE, in law, is generally understood of a hurt or hindrance attending a person's estate : but, in common law, it is part of what the jurors are to inquire of in giving verdict for the plaintiff or defendant, in a civil action, whether real or personal ; for, after giving verdict on the principal cause, they are likewise asked their consciences, touching costs and damages, which contain the hindrances that one party hath suffered from the wrong done him by the other. See COSTS.

DAMAN, a maritime town of the East-Indies, at the entrance into the gulph of Cambay. It is divided by the river Daman into two parts ; one of which is called *New Daman*, and is a handsome town, well fortified, and defended by a good Portuguese garrison. The other is called *Old Daman*, and is very ill built. There is a harbour between the two towns, defended by a fort. It was taken by the Portuguese in 1535. The mogul has attempted to get possession of it several times, but always without effect. E. Long. 72. 35. N. Lat. 21. 5.

DAMASCENUS (John), an illustrious father of the

Damascus,
Damascus.

the church in the 8th century, born at Damascus, where his father, though a Christian, enjoyed the office of counsellor of state to the Saracen caliph; to which the son succeeded. He retired afterwards to the monastery of St Sabas, and spent the remainder of his life in writing books of divinity. His works have been often printed; but the Paris edition in 1712, 2 vols folio, is esteemed the best.

DAMASCIUS, a celebrated heathen philosopher, born at Damascus in the year 540, when the Goths reigned in Italy. He wrote the life of his master Iliodorus; and dedicated it to Theodora, a very learned and philosophical lady, who had also been a pupil to Iliodorus. In this life, which was copiously written, he frequently made oblique attacks on the Christian religion. We have nothing remaining of it but some extracts preserved by Photius. Damascius succeeded Theon in the rhetorical school, and Iliodorus in that of philosophy, at Athens.

DAMASCUS, a very ancient city of Syria in Asia, seated in E. Long. 47. 18. N. Lat. 33. 0. Some of the ancients suppose this city to have been built by one Damascus, from whom it took its name; but the most generally received opinion is, that it was founded by Uz the eldest son of Aram. It is certain, from Gen. xiv. 5. that it was in being in Abraham's time, and consequently may be looked upon as one of the most ancient cities in the world. In the time of king David it seems to have been a very considerable place; as the sacred historian tells us, that the Syrians of Damascus sent 20,000 men to the relief of Hadadezer king of Zobah. We are not informed whether at that time it was governed by kings, or was a republic. Afterwards, however, it became a monarchy which proved very troublesome to the kingdom of Israel, and would even have destroyed it entirely, had not the Deity miraculously interposed in its behalf. At last this monarchy was destroyed by Tiglath Pileser king of Assyria, and Damascus was never afterwards governed by its own kings. From the Assyrians and Babylonians it passed to the Persians, and from them to the Greeks under Alexander the Great. After his death it belonged, with the rest of Syria, to the Seleucidæ; till their empire was subdued by the Romans, about 70 years before Christ. From them it was taken by the Saracens in 633; and it is now in the hands of the Turks.—Notwithstanding the tyranny of the Turkish government, Damascus is still a considerable place. It is situated in a plain of so great extent, that one can but just discern the mountains which compass it on the other side. It stands on the west side of the plain, about two miles from the head of the river Barrady, which waters it. It is of a long, straight figure, extending about two miles in length, adorned with mosques and steeples, and encompassed with gardens computed to be full 30 miles round. The river Barrady, as soon as it issues from the clefts of the Antilibanus into the plain, is divided into three streams, whereof the middlemost and biggest runs directly to Damascus, and is distributed to all the cisterns and fountains of the city. The other two seem to be artificial; and are drawn round, one to the right, and the other to the left, on the borders of the gardens, into which they are let by little currents, and dispersed every where. The houses of the city, whose streets are very narrow, are all built

on the outside either with sun-burnt brick, or Flemish wall: and yet it is no uncommon thing to see the gates and doors adorned with marble portals, carved and inlaid with great beauty and variety; and within these portals to find large square courts beautified with fragrant trees and marble fountains, and compassed round with splendid apartments. In these apartments the ceilings are usually richly painted and gilded; and their duans, which are a sort of low stages seated in the pleasantest part of the room; and elevated about 16 or 18 inches above the floor, whereon the Turks eat, sleep, say their prayers, &c. are floored, and adorned on the sides with variety of marble mixed in mosaic knots and mazes, spread with carpets, and furnished all round with bolsters and cushions, to the very height of luxury. In this city are shewn the church of John the Baptist, now converted into a famous mosque; the house of Ananias, which is only a small grotto or cellar wherein is nothing remarkable; and the house of Judas with whom Paul lodged. In this last is an old tomb, supposed to be that of Ananias; which the Turks hold in such veneration, that they keep a lamp continually burning over it. There is a castle belonging to Damascus, which is like a little town, having its own streets and houses; and in this castle a magazine of the famous Damascus steel was formerly kept. The fruit-tree called the *damascene*, and the flower called the *damask rose*, were transplanted from the gardens belonging to this city; and the silks and linens known by the name of *damask*, were probably invented by the inhabitants.

DAMASK, a silk stuff, with a raised pattern, so as that the right side of the damask is that which hath the flowers raised or fattened.

Damaks should be of dressed silk, both in warp and woof; and, in France, half an ell in breadth: they are made at Chalons in Champagne, and in some places in Flanders, as at Tournay, &c. entirely of wool, $\frac{1}{8}$ of an ell wide, and 20 ells long.

DAMASK is also applied to a very fine steel, in some parts of the Levant, chiefly at Damascus in Syria; whence its name. It is used for sword and cutlass blades, and is finely tempered.

DAMASKEENING, or DAMASKING, the art or operation of beautifying iron, steel, &c. by making incisions therein, and filling them up with gold or silver wire; chiefly used for adorning sword-blades, guards and grips, locks of pistols, &c.

Damaskeneering partakes of the mosaic, of engraving, and of carving: like the mosaic, it has inlaid work; like engraving, it cuts the metal, representing divers figures; and, as in chasing, gold and silver is wrought in relievo. There are two ways of damasking: the one, which is the finest, is when the metal is cut deep with proper instruments, and inlaid with gold and silver wire: the other is superficial only.

DAMELOPRE, a kind of Bilander, used in Holland for conveying merchandize from one canal to another; being very commodious for passing under the bridges.

DAMIANISTS, in church-history, a branch of the ancient acephali-severite. They agreed with the catholics in admitting the IVth council, but disowned any distinction of persons in the Godhead; and professed one single nature, incapable of any difference.

Damietta
Damps.

Damps.

yet they called God "the Father, Son, and Holy Ghost."

DAMIETTA, a port-town of Egypt, situated on the eastern mouth of the river Nile, four miles from the sea, and 100 miles north of Grand Cairo. E. Long. 32°, and N. Lat. 31°.

DAMON, a philosopher B. C. 400, was so closely connected in friendship with his colleague Pythias, that Dionysius having sentenced one of them to death, permitted Damon to settle his affairs accordingly, on condition of finding a surety to return, which Pythias undertook. Damon coming at the time appointed, the tyrant admiring their friendship, pardoned them.

DAMPIER (William), a famous navigator, descended from a good family in Somersetshire in England, was born in 1652. Losing his father when very young, he was sent to the sea, where he soon distinguished himself, particularly in the South Sea. His voyage round the world is well known, and has gone through many editions. He appears afterward to have engaged in the Bristol expedition with Captain Woods Rogers; who failed in August 1708, and returned in September 1711: but we have no farther particulars of his life or death.

DAMPS, in natural history, (from the Saxon word *damp*, signifying vapour or exhalation), are certain noxious exhalations issuing from some parts of the earth, and which prove almost instantly fatal to those who breathe them.

These damps are chiefly observed in mines and coal-pits: though vapours of the same kind often issue from old lavas of burning mountains; and, in those countries where volcanos are common, will frequently enter houses, and kill people suddenly without the least warning of their approach. In mines and coal-pits they are chiefly of two kinds, called by the miners and colliers the *choke* and *fire damps*; and both go under one general name of *foul air*. The *choke-damp* is very much of the nature of fixed air; and usually infests those places which have been formerly worked, but long neglected, and are known to the miners by the name of *wastes*. No place, however, can be reckoned safe from this kind of damps, except where there is a due circulation of air; and the procuring of this is the only proper means of preventing accidents from damps of all kinds. The *choke-damp* suffocates the miners suddenly, with all the appearances found in those that are suffocated by fixed air. Being heavy, it descends towards the lowest parts of the workings, and thus is dangerous to the miners, who can scarce avoid breathing it. The *fire-damp*, which seems chiefly to be composed of inflammable air, rises to the roof of the workings, as being specifically lighter than the common atmosphere; and hence, though it will suffocate as well as the other, it seldom proves so dangerous in this way as by its inflammable property, by which it often takes fire at the candles, and explodes with extreme violence.

In the Phil. Transf. n° 119. there is an account of some explosions by damps of this kind, on which we have the following observations. 1. Those who are in the place where the vapour is fired, suddenly find themselves surrounded with flames, but hear little or no noise; though those who are in places adjacent, or above ground, hear a very great one. 2. Those who are surrounded by the inflamed vapour feel themselves

scorched or burnt, but are not moved out of their places, though such as unhappily stand in the way of it are commonly killed by the violence of the shock, and often thrown with great force out at the mouth of the pit; nor are the heaviest machines found able to resist the impetuosity of the blast. 3. No smell is perceived before the fire, but a very strong one of brimstone is afterwards felt. 4. The vapour lies towards the roof, and is not perceived if the candles are held low; but when these are held higher, the damp descends like a black mist, and catches hold of the flame, lengthening it to two or three handfuls; and this appearance ceases when the candles are held nearer the ground. 5. The flame continues in the vault for several minutes after the crack. 6. Its colour is blue, something inclining to green, and very bright. 7. On the explosion of the vapour, a dark smoke like that proceeding from fired gunpowder is perceived. 7. Damps are generally observed to come about the latter end of May, and to continue during the heat of summer. They return several times during the summer season, but observe no certain rule.

Besides these kind of damps, which are very common, we find others described in the Philosophical Transactions, concerning the nature of which we can say nothing. Indeed the account seems somewhat suspicious. They are given by Mr Jessop, from whom we have the foregoing observations concerning the fire-damp, and who had these from the miners in Derbyshire. After describing the common damp, which consists of fixed air, "They call the second sort (says he) the *pease-bloom damp*, because, as they say, it smells like pease-bloom. They tell me it always comes in the summer-time; and those grooves are not free which are never troubled with any other sort of damps. I never heard that it was mortal; the scent, perhaps, freeing them from the danger of a surprise: but by reason of it many good grooves lie idle at the best and most profitable time of the year, when the subterraneous waters are the lowest. They fancy it proceeds from the multitude of red-trefoil flowers, by them called *honeysuckles*, with which the limestone meadows in the Peake do much abound. The third is the strangest and most pestilential of any; if all be true which is said concerning it. Those who pretend to have seen it, (for it is visible), describe it thus: In the highest part of the roof of those passages which branch out from the main groove, they often see a round thing hanging, about the bigness of a foot-ball, covered with a skin of the thickness and colour of a cobweb. This they say, if it is broke by any accident, as the splinter of a stone, or the like, disperseth itself immediately, and suffocates all the company. Therefore, to prevent casualties, as soon as they have espied it, they have a way, by the help of a stick and long rope, of breaking it at a distance; which done, they purify the place well with fire, before they dare enter it again. I dare not avouch the truth of this story in all its circumstances, because the proof of it seems impossible, since they say it kills all that are likely to bear witness to the particulars: neither dare I deny, but such a thing may have been seen hanging on the roof, since I have heard many affirm it."—Some damps, seemingly of the same nature with those last mentioned, are noticed by the author of the Chemical Dictionary, under the word

Damps.

Damps. “ Amongst the noxious mineral exhalations, (says he), we may place those which are found in the mines of sal-gem in Poland. These frequently appear in form of light flocks, threads, and spiders webs. They are remarkable for their property of suddenly catching fire at the lamps of the miners with a terrible noise and explosion. They instantly kill those whom they touch. Similar vapours are found in some mines of fossil coal.”

With regard to damps, it is a question well worth deciding, Whether they are occasioned by a stagnation of the common atmosphere in the pit, impregnating itself by degrees with various noxious effluvia; or whether they are occasioned by some imperceptible operation of nature within the bowels of the earth itself?—As the choke-damp is often to be met with in old wastes, it would seem, that the air in those places becomes noxious merely from stagnation. But from some accounts given by those who are conversant in coal-mines, it appears that these damps, the inflammable ones especially, issue from particular places in great quantity, and often very suddenly; and that very dangerous effects will follow from merely beating on those places with a hammer. It cannot be denied, however, but that these accounts must be suspicious: for philosophers seldom visit these regions, at least with a design to take up their abode in them; and the workmen are no doubt apt to indulge the natural passion for the marvellous, in all their accounts of such phenomena. In the Phil. Transf. n^o 136, we have the following account of a fire-damp which seemed plainly to issue from the earth. “ This work is upon a coal of five yards in thickness, and hath been begun upon about six or eight and thirty years ago. When it was first found, it was extreme full of water, so that it could not be wrought down to the bottom of the coal; but a *witchet*, or cave, was driven out of the middle of it, upon a level for gaining room to work, and drawing down the spring of water that lies in the coal to the eye of the pit. In driving of which witchet, after they had gone a considerable way under ground, and were scant of wind, the fire-damps did begin by little and little to breed, and to appear in crevices and slits of the coal, where water had lien before the opening of the coal, with a small bluish flame, working and moving continually; but not out of its first seat, unless the workmen held their candles to it; and then being weak, the blaze of the candle would drive it with a sudden fizz, away to another crevice, where it would soon after appear blazing and moving as formerly. This was the first knowledge of it in this work, which the workmen made but a sport of; and so partly neglected, till it had gotten some strength; and then upon a morning, the first collier that went down, going forwards in the witchet with his candle in his hand, the damp presently darted out so violently at his candle, that it struck the man clear down, singed all his hair and clothes, and disabled him from working for a while after. Some other small warnings it gave them, inasmuch that they resolved to employ a man on purpose that was more resolute than the rest, to go down a while before them every morning, to chase it from place to place, and so to weaken it. His usual manner was to put on the worst rags he had, and to wet them all in water, and when he came within the danger of it, then he fell down groveling upon his belly, and so went forward,

holding in one hand a long wand or pole, at the head whereof he tied candles burning, and reached them by degrees towards it; then the damp would fly at them, and, if it missed of putting them out, would quench itself with a blast, and leave an ill-scented smoke behind. Thus they dealt with it till they had wrought the coal down to the bottom, and the water following, and not remaining as before in the body of it, among sulphureous and brassy metal that is in some veins of the coal, the fire-damp was not seen nor heard of till the latter end of the year 1675, which happened as followeth.

“ After long working of this coal, it was found upon the rising grounds, that there lay another roach of coal at the depth of 14 yards under it, which proved to be 3¹/₂ yards thick, and something more sulphureous. This encouraged us to sink in one of the pits we had formerly used on the five-yards coal.—As we sunk the lower part of it, we had many appearances of the fire-damp in the watery crevices of the rocks we sunk thro’, flashing and darting from side to side of the pit, and shewing rainbow-like colours upon the surface of the water in the bottom; but upon drawing up of the water with buckets, which stirred the air in the pit, it would leave burning, till the colliers at work, with their breath and sweat, and the smoke of their candles, thickened the air in the pit, and then it would appear again; they lighted their candles at it sometimes when they went out; and so in this pit it did no further harm.”

In another pit, however, it soon appeared, and at last produced a most terrible explosion. This was occasioned by one of the workmen going imprudently down with a lighted candle, after a cessation of work for some days, and the force exerted by it seemed equal to that of gunpowder.—Many very terrible accidents are also daily known to happen from vapours of this kind; but from any histories of these cases which can yet be obtained, no certain theory of the formation of these vapours can be established. Doctor Priestley hath indeed shewed, that inflammable air may be produced artificially in a great number of ways. It arises from a mixture of iron-sfilings and oil of vitriol or spirit of salt; and therefore the fire-damp hath been thought to proceed from large quantities of pyrites. But it is also produced from vegetable and animal substances in great quantities by distillation; and even from several metals by heat only, without any acid. From a letter by Doctor Franklin to Doctor Priestley, it appears, that inflammable vapours rise up even from the bottom of ponds of water in some places, take fire on the surface, and will burn for two or three seconds.—It doth not appear that these artificial methods of procuring inflammable air can throw the smallest light upon the natural processes by which it is produced in mines, or at the bottom of the waters above-mentioned. The supposition of its being produced by pyrites in a manner analogous to that from oil of vitriol and iron-sfilings can by no means be admitted: for the pyrites produce no acid capable of acting upon iron, unless after long exposure to the air; neither do they contain any iron in its metalline form, which is absolutely necessary to the success of the experiment. Though a mixture of iron-sfilings and brimstone will take fire from being exposed to the air, or even if slightly covered with earth,

Damps
Danaides.

yet if covered with water, though the mixture swells and turns black, it does not generate the least quantity of inflammable vapour.

The difficulty is still greater with regard to fixed air. This is well known to have issued from many parts of the earth, for a number of ages together; particularly the Grotto del Cani in Italy. Now, though we know that this kind of air is discharged in great quantity from fermenting and putrefying substances, and also from earthy ones when calcined by heat, it seems altogether impossible, upon these principles, to account for such a constant and regular production of this kind of air in the cavern above-mentioned.—The greatest quantity of fermenting or putrefying substances we can imagine, must in time have finished their fermentation or putrefaction, and then ceased to discharge this kind of air; and the like must have happened with any quantity of calcareous matter we can suppose to be subjected to the action of subterraneous heat. It seems probable, therefore, that nature hath some method of producing these kinds of air which hath not yet been imitated by any artificial processes; and, in all probability, both fixed and inflammable air answer some purposes in the natural operations which are as yet unknown to us.—Concerning this, the author of the Chemical Dictionary offers the following conjecture. “Almost all chemists and metallurgists agree in believing, that mineral exhalations contribute to the production of metals. This opinion is so much more probable, that, as phlogiston is one of the principles of metals, (if it be true that these mineral exhalations are nothing else than phlogiston), and as this principle is then in a state of vapour, and consequently much divided, perhaps reduced to its smallest integrant particles, it is then in its most favourable state for combination: it is therefore probable, that when these exhalations meet earths disposed to receive them, they combine more or less intimately with those earths, according to their nature. Perhaps this is the chief operation of the grand mystery of metallification.”

DAMSEL, from the French *dameiselle* or *dameiselle*, an appellation anciently given to all young people of either sex, that were of noble or genteel extraction, as the sons and daughters of princes, knights, and barons: thus we read of Damsel Pepin, Damsel Louis le Gros, Damsel Richard prince of Wales.

From the sons of kings this appellation first passed to those of great lords and barons, and at length to those of gentlemen who were not yet knights.

At present, damsel is applied to all maids or girls not yet married, provided they be not of the vulgar.

DANAE, in antiquity, a coin somewhat more than an obolus, used to be put into the mouths of the dead, to pay their passage over the river Acheron.

DANAE, in fabulous history, daughter to Acrisius, king of Argos; who being informed by an oracle, that he should be killed by her son, shut her up in a castle of brass to prevent it: but Jupiter transforming himself into a shower of gold, or, in other words, corrupting her guards, he obtained access to her; and Danaë becoming pregnant, brought forth Perseus, who at length killed Acrisius.

DANAIDES, in the ancient mythology, the daughters of Danaos, or Danaus, eleventh king of Argos, and brother of Ægyptus.—They were 50 in number,

and were espoused to the 50 sons of their uncle Ægyptus. Danaus, fearing the accomplishment of an oracle which had foretold that he should be expelled his kingdom by a son-in-law, persuaded his daughters to murder each of them her husband the first night; which they performed, all but Hypermenestra, who spared her husband Lynceus.—In vengeance for this crime of the 49 Danaides, the poets have condemned them to hell, to be continually employed in filling a cask perforated at the bottom.—The Danaides are sometimes also called *B-liders*, from their father, who was the son of the Ægyptian Belus. Hyginus has preserved the names of 47 of them.

DANAUS, in fabulous history, king of Argos, was, according to some authors, an Egyptian, and the brother of Ramesses. After having reigned nine years in conjunction with his brother, he, it is said, was forced to seek an asylum in the country of Argos, which he erected into a kingdom B. C. 1476; but was dethroned by his nephew Danaus. See the preceding article.

DANCE, or DANCING, as at present practised, may be defined, “an agreeable motion of the body, adjusted by art to the measures or tune of instruments, or of the voice.”—But, according to what some people reckon more agreeable to the true genius of the art, dancing is “the art of expressing the sentiments of the mind, or the passions, by measured steps or bounds that are made in cadence by regulated motions of the body, and by graceful gestures; all performed to the sound of musical instruments, or of the voice.”

There is no account of the original of the practice of dancing among mankind. It is found to exist among all nations whatever, even the most rude and barbarous; and, indeed, however much the assistance of art may be necessary to make any one perfect in the practice, the foundation must certainly lie in the mechanism of the human body itself.

The connection that there is between certain sounds and those motions of the human body called *dancing*, hath seldom or never been inquired into by philosophers, though it is certainly a very curious speculation. The power of certain sounds not only over the human species, but even over the inanimate creation, is indeed very surprising. It is well known, that the most solid walls, nay the ground itself, will be found to shake at some particular notes in music. This strongly indicates the presence of some universally diffused and exceedingly elastic fluid, which is thrown into vibrations by the concussions of the atmosphere upon it, produced by the motion of the sounding body.—If these concussions are so strong as to make the large quantity of elastic fluid vibrate that is dispersed through a stone wall, or a considerable portion of earth, it is no wonder they should have the same effect upon that invisible and exceedingly subtle matter that pervades and seems to reside in our nerves. The consequence in both cases is precisely the same: the inanimate bodies tremulate, i. e. *dance*, to the sound of the instrument; and the person who hears the sounds, has an inclination to move his limbs in proportion to the measure or succession of the musical notes.

It would seem, therefore, that the origin of dancing lies entirely in the mechanism of the nerves of the body.—Some there are that have their nerves constructed in

Danaos,
Daice.

in such a manner, that they cannot be affected by the sounds which affect others, and some scarce with any; while others have such an irritability of the nerves in this case, that they cannot, without the greatest difficulty, sit or stand still when they hear a favourite piece of music played.

It is conjectured, with a great degree of probability, by very eminent philosophers, that all the sensations and passions to which we are subject, do immediately depend upon the vibrations excited in the nervous fluid above-mentioned. Hence, musical sounds have the greatest power over those people who are of a delicate, sensible frame, and who have strong passions. If it is true, therefore, which is indeed conjectured with a great deal of probability, that every passion in the human nature immediately depends upon a certain affection of the nervous system, or a certain motion or vibration in the nervous fluid, we shall immediately see the origin of the different dances among different nations. One kind of vibration, for instance, raises the passions of anger, pride, &c. which are indispensably necessary in warlike nations. The sounds, for such there are, capable of exciting a similar vibration, would naturally constitute the martial music among such nations, and dances conformable to it would be instituted. This appears to be the case particularly among barbarous nations, as we shall presently have occasion to remark. Other vibrations of the nervous fluid produce the passions of joy, love, &c. and sounds capable of exciting these particular vibrations will immediately be formed into music for dances of another kind.

As barbarous people are observed to have the strongest passions, so they are also observed to be the most easily affected by sounds, and the most addicted to dancing. Sounds to us the most disagreeable, the drumming with sticks upon an empty cask, or the noise made by blowing into reeds incapable of yielding one musical note tolerable to us, is agreeable music to them. Much more are they affected by the sound of instruments which have any thing agreeable in them. Mr Gallini informs us, that "The spirit of dancing prevails almost beyond imagination among both men and women in most parts of Africa. It is even more than instinct, it is a rage, in some countries of that part of the globe.—Upon the Gold Coast especially, the inhabitants are so passionately fond of it, that in the midst of their hardest labour, if they hear a person sing, or any musical instrument played, they cannot refrain from dancing.—There are even well attested stories of some Negroes flinging themselves at the feet of an European playing on a fiddle, intreating him to desist, unless he had a mind to tire them to death; it being impossible for them to cease dancing while he continued playing."—The same thing is found to take place in America, though, as the inhabitants of that continent are found to be of a more fierce and barbarous nature than the African nations, their dances are still more uncouth and barbarous than those of the Negroes. "In Mexico, says Gallini, they have also their dances and music, but in the most uncouth and barbarous style. For their symphony they have wooden drums, something in form of a kettle-drum, with a kind of pipe or flagellet, made of a hollow cane or reed, but very grating to an European ear. It is observed they love every thing that makes a noise, how disagreeable soever the sound is.

They will also hum over something like a tune when they dance 30 or 40 in a circle, stretching out their hands, and laying them on each others shoulders. They stamp and jump, and use the most antic gestures for several hours, till they are heartily weary. And one or two of the company sometimes step out of the ring to make sport for the rest, by showing feats of activity, throwing their lances up into the air, catching them again, bending backwards, and springing forwards with great agility."

The origin of dancing among the Greeks was most certainly the same as among all other nations; but as they proceeded a certain length in civilization, their dances were of consequence more regular and agreeable than those of the more barbarous nations. They reduced dancing into a kind of regular system; and had dances proper for exciting, by means of the sympathy above-mentioned, any passion whatever in the minds of the beholders. In this way they are said to have proceeded very great lengths, to us absolutely incredible. At Athens, it is said, that the dance of the Eumenides or Furies on the theatre, had so expressive a character as to strike the spectators with irresistible terror: men grown old in the profession of arms trembled; the multitude ran out; women with child miscarried; people imagined they saw in earnest those terrible deities commissioned with the vengeance of Heaven to pursue and punish crimes upon earth.

To produce such effects as these would now be utterly impossible. For this reason it is, that many look upon the art of dancing as lost; and that the ancient dancers were possessed of some peculiar skill in executing these gestures that raise the passions, which are to us unknown. It seems rather probable, however, that the passions of mankind are now more under the dominion of reason, or some other principle, which keeps them from appearing with such violence as formerly. Hence it might very readily happen, that though these celebrated dancers, or others equally skilful, were to appear on modern theatres, they might be treated with contempt and derision. It is certain, that the ancients fell far short of the civilization of the modern Europeans, inasmuch, that they may very well be called barbarians and savages, in comparison of them. The art of dancing, therefore, is not lost, but only become different from what it was; and unless people were to live in a different manner from what they now do, it is utterly impossible to expect the same effects from any kind of gestures whatever.

It is remarkable, however, that though the Greeks were so extravagantly fond of dancing, that it entered into their polity both civil and religious, it was quite otherwise with the Romans. As long as the republic lasted, dancing was accounted dishonourable; inasmuch that Cicero reproaches Gabinius, a consular man, with having danced. It was introduced indeed under the Emperor Augustus, but the dancers were banished by Tiberius; and several senators were expelled by Domitian, because they had danced. The Greeks had martial dances, which they reckoned to be very useful for keeping up the warlike spirit of their youth; but the Romans, though equally warlike with the Greeks, never had any thing of the kind.—This probably may be owing to the want of that romantic turn for which the Greeks were so remarkable. The Romans had no

heroes among them such as Hercules, Achilles, or Ajax; nor does the whole Roman history furnish an example of a general that made war after the manner of Alexander the Great. Though their soldiers were as valiant as ever the Greeks could pretend to be, the object with them was the honour of the republic, and not their own personal praise. Hence there was less fury, and much more cool deliberate valour, exercised by the Romans, than any other nation whatever. The passions of pride, resentment, obduracy, &c. were excited in them, not by the mechanical means of music and dancing, but by being taught that it was their chief honour to fight for the republic.—It does not however appear, that the Romans were at all less capable of being affected in this mechanical manner than the Greeks. When dancing was once introduced, it had the very same effects at Rome as at Athens.

Among the Jews, dancing seems to have made a part of the religious worship on some occasions, as we learn from some passages in the Psalms, though we do not find either that or singing positively enjoined as a divine precept.—In the Christian churches mentioned in the New Testament, there is no account of dancing being introduced as an act of worship, though it is certain that it was used as such in after ages. Mr Gallini tells us, that “at *Limoges*, not long ago, the people used to dance the round in the choir of the church which is under the invocation of their patron saint, and at the end of each psalm, instead of the *Gloria Patri*, they sung as follows: *St Marcel, pray for us, and we will dance in honour of you*.” Though dancing would now be looked upon as the highest degree of profanation in a religious assembly, yet it is certain, that dancing, considered as an expression of joy, is no more a profanation than singing, or than simple speaking; nor can it be thought in the least more absurd, that a Christian should dance for joy that Jesus Christ is risen from the dead, than that David danced before the ark when it was returned to him after a long absence.

Plato reduces the dances of the ancients to three classes. 1. The military dances, which tended to make the body robust, active, and well-disposed for all the exercises of war. 2. The domestic dances, which had for their object an agreeable and innocent relaxation and amusement. 3. The mediatorial dances, which were in use in expiations and sacrifices.—Of military dances there were two sorts: the *gymnopedique* dance, or the dance of children; and the *enoplian*, or armed dance. The Spartans had invented the first for an early excitation of the courage of their children, and to lead them on insensibly to the exercise of the armed dance. This childrens dance used to be executed in the public place. It was composed of two choirs; the one of grown men, the other of children; whence, being chiefly designed for the latter, it took its name. They were both of them in a state of nudity. The choir of the children regulated their motions by those of the men, and all danced at the same time, singing the poems of Thales, Alcman, and Dionysodorus.—The *enoplian* or *pyrrhic* was danced by young men armed cap-a-pee, who executed, to the sound of the flute, all the proper movements either for attack or for defence. It was composed of four parts.—The first, the *podisus* or footing; which consisted in a quick shifting motion of the feet, such as was necessary for over-

taking a flying enemy, or for getting away from him when an overmatch.—The second part was the *xiphisus*; this was a kind of mock-fight, in which the dancers imitated all the motions of combatants; aiming a stroke, darting a javelin, or dextrously dodging, parrying, or avoiding a blow or thrust. The third part, called the *kamos*, consisted in very high leaps or vaultings, which the dancers frequently repeated, for the better using themselves occasionally to leap over a ditch, or spring over a wall. The *tetracomos* was the fourth and last part: this was a square figure, executed by slow and majestic movements; but it is uncertain whether this was every where executed in the same manner.

Of all the Greeks, the Spartans were those who most cultivated the Pyrrhic dance. Athenæus relates, that they had a law by which they were obliged to exercise their children at it from the age of five years. This warlike people constantly retained the custom of accompanying their dances with hymns and songs. The following was sung for the dance called *trichoria*, said to be instituted by Lycurgus, and which had its name from its being composed of three choirs, one of children, another of young men, and the third of old. The old men opened the dance, saying, “In time past we were valiant.” The young men answered, “We are so at present.”—“We shall be still more so, when our time comes,” replied the chorus of children. The Spartans never danced but with real arms. In process of time, however, other nations came to use only weapons of wood on such occasions. Nay, it was only so late as the days of Athenæus, who lived in the second century, that the dancers of the Pyrrhic, instead of arms, carried only stalks, ivy-bound wands, (thyrsus), or reeds. But, even in Aristotle's days, they had begun to use thyrsuses instead of pikes, and lighted torches in lieu of javelins and swords. With these torches, they executed a dance called the *conflagration of the world*.

Of the dances for amusement and recreation, some were but simply gambols, or sportive exercises, which had no character of imitation, and of which the greater part exist to this day. The others were more complex, more agreeable, figured, and were always accompanied with singing. Among the first or simple ones was the *ascolianus*; which consisted in jumping, with one foot only, on bladders filled with air or with wine, and rubbed on the outside with oil. The *dyspodium* was jumped with both feet close. The *kybistesis* was what is called in this country the *somerfet*.—Of the second kind was that called the *wine-press*, of which there is a description in Longinus, and the Ionian dances: these last, in the original of their institution, had nothing but what was decent and modest; but, in time, their movements came to be so depraved, as to be employed in expressing nothing but voluptuousness, and even the grossest obscenity.

Among the ancients there were no festivals nor religious assemblies but what were accompanied with songs and dances. It was not held possible to celebrate any mystery, or to be initiated, without the intervention of these two arts. In short, they were looked upon to be so essential in these kinds of ceremonies, that to express the crime of such as were guilty of revealing the sacred mysteries, they employed the word *kheistæ*, “to be out of

of the dance."—The most ancient of these religious dances is the *Bacchic*; which was not only consecrated to Bacchus, but to all the deities whose festival was celebrated with a kind of enthusiasm.—The most grave and majestic was the *hyporchrematic*: it was executed to the lyre, and accompanied with the voice.—At his return from Crete, Theseus instituted a dance at which he himself assisted at the head of a numerous and splendid band of youth round the altar of Apollo. The dance was composed of three parts; the *strophe*, the *antistrophe*, and the *stationary*.—In the *strophe*, the movements were from the right to the left; in the *antistrophe*, from the left to the right. In the *stationary*, they danced before the altar; so that the *stationary* did not mean an absolute pause or rest, but only a more slow or grave movement.—Plutarch is persuaded, that in this dance there is a profound mystery: he thinks, that by the *strophe* is indicated the motion of the world from east to west; by the *antistrophe*, the motion of the planets from the west to the east; and by the *stationary*, the stability of the earth: To this dance Theseus gave the name of *geranos*, or the crane; because the figures which characterized it bore a resemblance to those described by cranes in their flight.

With regard to the modern practice of dancing as an art, there are few directions that can be of much service. The following is extracted from Mr Gallini's description of the several steps or movements.

"The dancing (says he) is generally on a theatre, or in a saloon or room.—At the theatre there are four parts to be considered. 1. The nearest front to the spectators. 2, and 3. The two sides or wings. 4. The furthest front from the spectators.

"In a saloon or room, the place in which are the spectators decides the appellation respectively to them of right and left. The dancer should place himself in as advantageous a point of view to them as possible.

"In the dance itself, there are to be distinguished, the attitude of the body, the figure, the positions, the bends, the raisings or leaps, the steps, the cabriol, the fallings, the slides, the turns of the body; the cadences.

"The attitude of the body requires the presenting one's self in the most graceful manner to the company.

"The figure is to follow the track prescribed to the steps in the dance.

"The position is that of the varied attitudes, which must be at once striking and easy, as also of the different exertions of the legs and feet in dancing.

"The bends are inflexions of the knees, of the body, of the head, or the arms.

"The raisings are the contrast to the bends, the extension of the knee. One of these two motions necessarily precedes the other.

"The step is the motion by the foot or feet from one place to another.

"The leap is executed by springing up into the air; it begins with a bend, and proceeds with a quick extension of the legs, so that both feet quit the ground.

"The cabriole is the crossing, or cutting of capers, during the leap, before the return of the feet to the ground.

"The falling is the return of the feet to the ground, by the natural gravitation of the body.

"The slide is the action of moving the foot along

the ground without quitting it.

"The turn is the motion of the body towards either side, or quite round.

"The cadence is the knowledge of the different measures, and of the times of movement the most marked in the music.

"The track is the line marked by the dance: it may be either straight or curve, and is susceptible of all the inflexions correspondent to the various designs of the composer.—There are the right, the diametral line, the circular line, and the oblique line. The right line is that which goes lengthways, reckoning from one end of the room towards the other. The diametral line is across the room, from one side to the other. The circular line is waving, or undulatory, from one place to another. The oblique line proceeds obliquely from one quarter of the room towards another.—Each of these lines may directly or separately form the dancer's track, diversified with steps and positions.

"The regular figure is when two or more dancers move in contrary directions; that is to say, that when one moves towards the right, the other moves to the left.—The irregular line is when the couples figuring together are both on the same side.

"Commonly the man gives the right-hand to the lady in the beginning or ending of the dance, as we see in the *minuet*, *louvre*, &c.

"When a greater number of dancers figure together, they are to execute the figure agreeably to the composition of the dance, with special attention to keep an eye constantly on the partner.—When, in any given dance, the dancers have danced for some time in the same place, the track is only to be considered as the conductor of the steps, but not of the figure; but when the dance continues, without being confined to the same place, then the track must be considered as the conductor both of the steps and of the figure.

"Now, to observe the figure, the dancer must have placed himself at the beginning of the track upon which he is to dance, and comprehend the figure before he himself begins it. He is to remark and conceive whether the figure is right, diametral, circular, or oblique; if it is progressive or retrogressive, or towards the right or left. He should have the air played or sung to him, to understand the movement.—Where the tracks cross one another, the steps of each of the couples must leave a sufficient distance between them not to confuse the figure.

"There are commonly reckoned ten kinds of positions, which are divided into *true* and *false*, five each.—There are three principal parts of the foot to be observed; the toes, the heel, and the ankle.

"The true positions are when the two feet are in a certain uniform regularity, the toes turned equally outwards.—The false are divided into regular and irregular. They differ from the true, in that the toes are either both turned inwards; or if the toes of one foot are turned outwards, the others are turned inward.

"In the first of the true positions, the heels of the two feet are close together, so that they touch; the toes being turned out. In the second the two feet are open, in the same line, so that the distance between the two heels is precisely the length of one foot. In the third the heel of one foot is brought to the angle

of the other, or seems to lock in with it. In the fourth, the two feet are the one before the other, a foot's length distance between the two heels, which are on the same line. In the fifth, the two feet are across, the one before the other; so that the heel of one foot is directly opposite to the toes of the other.

"In the first of the false positions, the toes of both feet are turned inwards, so that they touch, the heels being open. The second is, when the feet are asunder at a foot's distance between the toes of each, which are turned inward, the heels being on a line. The third is, when the toes of one foot are turned outwards, the other inwards, so that the two feet form a parallel. The fourth is, when the toes of the two feet are turned inwards; but the toes of one foot are brought nearer the angle of the other. The fifth is, when the toes of the two feet are turned inwards, but the heel of one foot is opposite to the toes of the other.

"There are mixed positions, composed of the true and false in combination; which admit of such an infinite variety, and are in their nature so unsusceptible of description by words, that it is only the sight of the performance that can give any tolerable idea of them.

"Of the bends of the knee there are two kinds; the one *simple*, the other *forced*. The simple bend is an inflexion of the knees without moving the heel, and is executed with the foot flat to the ground. The forced bend is made on the toes with more force and lower.

"Much is to be observed on the head of *steps*. First, not to make any movement before having put the body in an upright posture, firm on the haunches.

"Begin with the inflexion of the knee and thigh; advance one leg foremost; with the whole foot on the ground, laying the stress of the body on the advanced leg.

"There are some who begin the step by the point of the toes; but that has an air of theatrical affectation. Nothing can be more noble than a graceful ease and dignity of step. The quantity of steps used in dancing are almost innumerable; they are nevertheless reducible under five denominations, which may serve well enough to give a general idea of the different movements that may be made by the leg, *viz.* the direct step, the open step, the circular step, the twisted step, and the cut step.

"The *direct* step is when the foot goes upon a right line, either forwards or backwards.

The *open* step is when the legs open. Of this step there are three kinds: one when they open outwards; another, when, describing a kind of circle, they form an in-knee'd figure: a third, when they open sideways; this is a sort of right step, because the figure is in a right line.

"The *round* step, is when the foot, in its motion, makes a circular figure, either inwards or outwards.

"The *twisted* step, or *pas tortille*, is when the foot in its motion turns in and out. There are three kinds of this step; one forwards, another backwards, the third sidelong.

"The *cut* step is when one leg or foot comes to strike against the other. There are also three sorts of this step; backwards, forwards, and sidelong.

"The steps may be accompanied with bendings,

risings, leaps, cabrioles, fallings, slidings, the foot in the air, the tip-toe, the rest on the heel, quarter-turns, half-turns, three-quarter turns, and whole-turns.

"There may be practised three kinds of bends, or sinkings, in the steps; *viz.* bending before the step proceeds, in the act of stepping, and at the last of the steps.

"The beginning or initial sink-pace is at the first setting off, on advancing the leg.

"The bend in the act of stepping continues the march or walk.

"The final sink-pace closes the march.

"The rising is just the reverse of the bend, or sink-pace, which shall have preceded it.

"Some great masters in the art of dancing, having observed that music, which is inseparable from it, was capable of being preserved and conveyed by the musical characters, imagined by analogy, that the like advantage could be procured to the composition of dances. Upon this plan they attempted what is called the *choreography*, an art which they suppose was either utterly unknown to the ancients, or not transmitted to us from them.

"It may indeed be easily allowed, that the track or figure of a dance may be determined by written or engraved lines; but those lines will necessarily appear so perplexing, so intricate, so difficult, if not impossible to seize, in their various relations, that they are only fit to disgust and discourage, without the possibility of their conveying a satisfactory or retainable instruction. —Thence it is, that the article of *Choreography* in the French *Encyclopédie* is universally exploded as unintelligible and useless: though nothing more than an elementary indication of the art; and an explanation, such as it is, of some of the technical terms of it."

Rope-DANCER, *schenobater*, a person who walks, leaps, dances, and performs several other feats, upon a small rope or wire.

The ancients had their rope-dancers as well as we. These had four several ways of exercising their art: The first vaulted, or turned round the rope like a wheel round its axis, and there hung by the heels or neck. The second flew or slid from above, resting on their stomach, with the arms and legs extended. The third ran along a rope stretched in a right line or up and down. Lastly, the fourth not only walked on the rope, but made surprising leaps and turns thereon. They had likewise the *crenobates*, and *orobates*; that is, people who walked on the brinks of precipices: Nay more, Suetonius in *Galba*, c. 6. Seneca in his 85th Epistle, and Pliny, *lib. viii. c. 2.* make mention of elephants that were taught to walk on the rope.

St Vitus's DANCE. See (the *Index* subjoined to)

MEDICINE.

DANCELETTE, in heraldry, is when the outline of any bordure, or ordinary, is indented very largely, the largeness of the indentures being the only thing that distinguishes it from indented.

DANDELION, in botany. See LEONTODON.

DANEGELT, an annual tax laid on the Anglo-Saxons, first of 1 s. afterwards 2 s. for every hide of land thro' the realm, for maintaining such a number of forces as were thought sufficient to clear the British seas of Danish pirates, which heretofore greatly annoyed our coasts.

DANEGELT,

Danegelt
li
Daniel.

DANEGLT was first imposed as a standing yearly tax on the whole nation, under king Ethelred, A. D. 991. That prince, says Camden, *Britan.* 142. much distressed by the continual invasions of the Danes; to procure his peace, was compelled to charge his people with heavy taxes, called *danegelt*.—At first he paid 10,000 *l.* then 16,000 *l.* then 24,000 *l.* after that 36,000 *l.* and lastly, 48,000 *l.*

Edward the Confessor remitted this tax: William I. and II. reassumed it occasionally. In the reign of Henry I. it was accounted among the king's standing revenues; but king Stephen, on his coronation-day, abrogated it for ever.

No church or church-land paid a penny to the *danegelt*: because, as is set forth in an ancient Saxon law, the people of England placed more confidence in the prayers of the church than in any military defence they could make.

DANDOLO (Henry), doge of Venice, a brave admiral and politician. With a Venetian fleet he took Constantinople in 1203, and had the moderation to refuse to be emperor. He died in 1250.

DANET (Peter), abbot of St Nicholas de Verdun, was one of the persons chosen by the duke of Montausier to write on the classics for the use of the dauphin. He had a share in Phædrus, which he published with notes and explications in Latin. He also wrote a dictionary in Latin and French, and another in French and Latin. He died at Paris in 1709.

DANIEL, the fourth of the greater prophets, was born in Judea of the tribe of Judah, about the 25th year of the reign of Josiah. He was led captive to Babylon, with other young Hebrew lords, after the taking of Jerusalem by Nebuchadnezzar, who took them into his service. That prince gave them masters to instruct them in the language and sciences of the Chaldeans, and ordered them to be fed with the most delicate viands; but they, fearing that they should eat meat forbidden by the law of Moses, desired the king's officers to allow them only pulse. The wisdom and conduct of Daniel pleasing Nebuchadnezzar, that prince gave him several posts of honour. It is commonly believed, that this prophet, when but 12 years of age, made known the innocence of the chaste Susannah; but the learned are not agreed, that the young Daniel, who confounded the old men, was the same with this prophet. However, he explained Nebuchadnezzar's dream of the mysterious statue, which foretold the four great monarchies; on which account he was made prefect of the province of Babylon. In the reign of Darius the king of the Medes, he refused to adore the golden statue of the king, and was cast into the lions den, when those beasts, tho' pinched with hunger, did him no manner of hurt. And he explained the characters written on the wall of the room where Belshazzar was feasting.

It is believed that Daniel died in Chaldæa, and that he did not take advantage of the permission granted by Cyrus to the Jews of returning to their own country. St Epiphanius says he died at Babylon; and herein he is followed by the generality of historians. The first six chapters of the book of Daniel are an history of the kings of Babylon, and what befel the captive Jews under their government. In the six last he is altogether prophetic, foretelling not only what should happen

Daniel,
Dante.

to his own church and nation, but events in which foreign princes were concerned; particularly the rise and downfall of the four secular monarchies of the world, and the establishment of the fifth, or spiritual kingdom of the Messiah. "Amongst the old prophets (says the great Sir Isaac Newton), Daniel is the most distinct in the order of time, and easiest to be understood; and therefore, in those things which relate to the last times, he must be made key to the rest.—His prophecies are all of them related to one another, as if they were but several parts of one general prophecy. The first is the easiest to be understood, and every following prophecy adds something to the former."

DANIEL (Samuel), an eminent poet and historian, was born near Taunton in Somersetshire in the year 1562, and educated at Oxford: but leaving that university without a degree, he applied himself to English history and poetry under the patronage of the earl of Pembroke's family. He was afterwards tutor to the lady Ann Clifford; and, upon the death of Spencer, was created poet-laureat to queen Elizabeth. In king James's reign he was appointed gentleman extraordinary, and afterwards one of the groom of the privy-chamber, to the queen consort, who took great delight in his conversation and writings. He wrote an history of England, several dramatic pieces, and some poems; and died in 1619.

DANIEL (Gabriel), a celebrated Jesuit, and one of the best French historians, was born at Rouen in 1649. He taught polite literature, philosophy, and divinity, among the Jesuits; and was superior of their house at Paris, where he died in 1728. There are a great number of his works published in French, of which the principal are, 1. An History of France, of which he also wrote an abridgment in nine volumes 12^{mo}. 2. An history of the French Militia, in 2 vols 4^{to}. 3. An answer to the Provincial Letters. 4. A voyage to the World of Descartes. 5. Letters on the doctrines of the Theorists, and on Probability. 6. New difficulties relating to the knowledge of Brutes; and, 7. A theological treatise on the Efficacy of Grace.

DANTE (Alighieri), one of the first poets of Italy, born at Florence in 1265, of a good family. He consecrated the first of his muse to love; but afterwards he undertook a more serious work. He would have been more happy if he had never meddled with any thing else: for being ambitious, and having attained some of the most considerable posts of the common wealth, he was crushed by the ruins of the faction he had embraced. Pope Boniface VIII. sent Charles of Valois thither in 1301, to re-establish the peace; Florence being divided into two factions, one named the *whites*, and the other the *black*. No better way was found to pacify the city than to expel thence the faction of the white, which Dante favoured. He endeavoured to revenge himself at the expence of his country, and did all he could to expose it to a bloody war. He died in exile in 1321. He applied himself diligently to study during his banishment; and wrote some books wherein he showed more fire and spirit than he would have done had he enjoyed a more quiet state of life. The most considerable of his works is the poem entitled "The Comedy of Hell, Purgatory, and Paradise." It has much displeased the church of Rome; as did likewise another book of his entitled, "De

"De

Dante
Danube.

“De Monarchia;” wherein he maintains, that the authority of the emperors ought not to depend on that of the Popes.

DANTE (John Baptist), a native of Perugia, an excellent mathematician, called the *new Dadaus*, for the wings he made himself, and with which he flew several times over the lake Trasymenus. He fell in one of his enterprises; the iron work with which he managed one of his wings having failed; by which accident he broke his thigh: but it was set by the surgeons, and he was afterwards called to Venice to profess mathematics.

DANTZIC, the metropolis of the palatinate of Pomerania in Poland, standing on a branch of the Vistula, about four miles above where it falls into the Baltic; in E. Long. 18. 36. N. Lat. 54. 20. It is large, populous, and rich; and carries on a vast trade, being the chief mart and magazine of Poland, and one of the greatest granaries in the world; so that whole fleets of ships come hither every year to load with corn alone. It consists of the Old and New town, with their suburbs, has a fine harbour, a great number of ships, and had many valuable privileges. Among the last were those of coining money, gathering amber, and sending representatives to the general diets of Poland and the Prussian senate. It is well fortified; but, being commanded by two hills on the south side, cannot sustain a long siege. It is computed that 365,000 lasts of Polish wheat are shipped from this place, one year with another. Hither Poland sends its commodities for exportation, and from hence is chiefly supplied with those of other countries. Among the latter are great quantities of herrings, both Scotch and Dutch. The exports and imports consist of a variety of articles, and furnish a vast deal of business and wealth to the city. The inhabitants, who are computed at 200,000, are mostly Lutherans, with a mixture of Calvinists and Papists. A constant garrison of 200 soldiers is kept in the city. One of the suburbs is called *Scotland*; and the Scots have great privileges in consequence of their gallant defence of the town, under one of the family of Douglas, when it was besieged by the Poles. It is said there are upwards of 30,000 pedlars of that nation in Poland, who travel on foot, and some with three, four, or five horses. In king Charles II.'s time they were about 23,000: in that reign Sir John Denham and Mr Killigrew were sent to take the number of them, and to tax them by the poll, with the king of Poland's licence; which having obtained, they brought home L. 10,000 Sterling, besides their charges in the journey. Here is a Lutheran college with seven professors, and one teacher of the Polish language. At the mouth of the Vistula, which is defended by several forts, is a good harbour belonging to Dantzic. Its territory consists mostly of islands formed by the Vistula and Motlau.—It is hardly credible how this city has changed its masters in competition for the crown of Poland, and what sums have been extorted from it. While the kingdom of Poland remained, Dantzic was under its protection, but governed by its own magistrates in the form of a republic; but since the destruction of that kingdom, the city of Dantzic has been greatly oppressed by the king of Prussia.

DANUBE, the largest and most considerable river in Europe, rising in the Black Forest, near Zunberg;

and running N. E. through Swabia by Ulm, the capital of that country; then running E. through Bavaria and Austria, passes by Ratibon, Passau, Ens, and Vienna. It then enters Hungary, and runs S. E. from Pressburg to Buda, and so on to Belgrade; after which it divides Bulgaria from Molachia and Moldavia, discharging itself by several channels into the Black Sea, in the province of Bessarabia. Towards the mouth, it was called the *Ister* by the ancients; and it is now said, that four of the mouths are choked up with sand, and that there are only two remaining. It begins to be navigable for boats at Ulm, and receives several large rivers as it passes along. It is so deep between Buda and Belgrade, that the Turks and Christians have had men of war upon it; and yet it is not navigable to the Black Sea, on account of the cataracts.

DAPHNE, in fabulous history, the daughter of the river Peneus, was at her own desire turned into a laurel by her father, to avoid the amours of Apollo.

DAPHNE, *Spurge-laurel*; a genus of the monogynia order, belonging to the octandria class of plants. There are 11 species, of which the two following are the most remarkable. 1. The *laureola*, or common spurge laurel, is a native of the woods in many parts of England. It is a low evergreen shrub, rising with several stalks from the root to the height of three feet, garnished with thick spear-shaped leaves sitting close to the branches, of a lucid green colour. Between these to the upper part of the stalks, come out the flowers in small clusters, of a yellowish green colour, and appear soon after Christmas, if the season is not remarkably severe. The leaves continue green all the year, which renders the plants very ornamental; and as they will thrive under tall trees, they are therefore proper to fill up the spaces of plantations. 2. The *mezereon*, or spurge-olive, is a native of England, Germany, &c. and is a very ornamental shrub in gardens. It rises to the height of five or six feet, with a strong woody stalk, putting forth many woody branches, so as to form a regular head. The flowers come out very early in the spring, before the leaves appear, growing in clusters all round the shoots of the former year. There are commonly three flowers produced from each joint or knot, standing on the same short footstalk, which have short swelling tubes divided into four parts at the top, which spread open: they have a very fragrant odour; so that where there are plenty of the shrubs together, they perfume the air to a considerable distance around them. The flowers are of a white or peach-blossom colour. After the flowers are past, the leaves come out, which are spear-shaped, smooth, and placed without order. The flowers are succeeded by oval berries; those of the white kind being yellow; and of the other, red. Both sorts are easily propagated by seeds, which should be sown soon after they are ripe; for if not sown till the next spring, they very often miscarry.

Very happy effects have been found from the use of the first species in rheumatic fevers. It operates as a brisk and rather severe purgative. It is an efficacious medicine in worm cases; but is dangerous in unskillful hands, as being possessed of considerable acrimony. The whole plant hath the same qualities, but the bark of the root is the strongest. Dr Aitton fixes the outside dose at ten grains.—An ointment prepared from the

Daphne.

Dapifer
Darda
nelles.

the bark or the berries of mezereum root hath been successfully applied to ill-conditioned ulcers. The whole plant is very corollive. Six of the berries will kill a wolf. A woman gave 12 grains of the berries to her daughter, who had a quartan ague: she vomited blood, and died immediately. A decoction made of two drams of the cortical part of the root, boiled in three pints of water till one pint is waisted; and this quantity drunk daily, is said to be very efficacious in relolving venereal nodes, and other indurations of the pectorum. The considerable and long-continued heat and irritation produced by this root in the throat when chewed, made Mr Withering think of giving it in a case of difficulty of swallowing, seemingly occasioned by a paralytic affection. The patient was directed to chew a thin slice of the root as often as she could bear it; and, in about two months, she recovered her power of swallowing. She bore the disagreeable irritation and ulcerations its acrimony occasioned in her mouth with great resolution: for she was reduced to skin and bone, and for three years before had suffered extremely from hunger, not being able to satisfy her appetite; for she swallowed liquids very imperfectly, and solids not at all: her complaint came on after lying in.—The plant is eaten by sheep and goats, but refused by cows and horses.

DAPIFER, the dignity or office of grand-master of a prince's household. This title was given by the emperor of Constantinople to the Czar of Russia, as a testimony of favour. In France the like officer was instituted by Charlemagne, under the title of *dapiferat*; and the dignity of dapifer is still subsisting in Germany, the elector of Bavaria assuming the title of *arch-dapifer of the empire*, whose office is, at the coronation of the emperor, to carry the first dish of meat to table, on horse-back.

DAPPLE-BAY, in the menage: When bay horses have marks of a dark bay, they are called *dapple-bays*.

DAPPLE-Black: When a black horse has got spots or marks more black or shining than the rest of his skin, he is called a *dapple-black*.

DARAPT1, among logicians, one of the modes of syllogisms of the third figure, whose premises are universal affirmatives, and the conclusion is a particular affirmative: thus,

DAR- Every body is divisible;

AP- Every body is a substance;

TI, Therefore, some substance is divisible.

DARDA, a town and fort of Lower Hungary, built by the Turks in 1686, and taken by the Imperialists the next year, in whose hands it remains. It is seated on the river Draw, 10 miles from its confluence with the Danube, and at the end of the bridge of Esseck. E. Long 19. 10. N. Lat. 45. 45.

DARDANELLES, two ancient and strong castles of Turkey, one of which is in Romania, and the other in Natolia, on each side the canal formerly called the *Hellepont*. This keeps up a communication with the Archipelago, and the Propontis or Sea of Marmora. The mouth of the canal is four miles and a half over; and the castles were built in 1659, to secure the Turkish fleet from the insults of the Venetians. The ships that come from Constantinople are searched at the castle on the side of Natolia, to see what they have on board.

DARDANUS, son of Jupiter and Eleëtra, founded the city and kingdom of Troy.

DARE, in ichthyology, the same with dace. See **DACE**.

DARIEN, or the Isthmus of Panama, is a province between South and North America, being a narrow isthmus, or neck of land, which joins them together. It is bounded on the north by the North Sea, on the south by the South Sea, on the east by the gulph or river of Darien, and on the west by another part of the South Sea and the province of Veragua. It lies in the form of a bow, or crescent, about the great bay of Panama, in the South Sea; and is 300 miles in length, and 60 in breadth. This province is not the richest, but is of the greatest importance to Spain, and has been the scene of more actions than any other in America. The wealth of Peru is brought hither, and from hence exported to Europe. This has induced many enterprising people to make attempts on Panama, Porto-Bello, and other towns of this province, in hopes of obtaining a rich booty.

The Scotch got possession of part of this province in 1699, and had laid the foundations of a new town, designing to call it *New Edinburgh*; but, as the English were then in alliance with the Spaniards, king William would not permit them to go on. However, this country is not a very desirable place to settle in, it being generally mountainous and barren, as well as excessively hot, and the lower grounds are liable to be suddenly overflowed in the rainy season. Some of the mountains are so high, and of such difficult access, that it requires several days to pass them. It was from these mountains the Spaniards first discovered the South Sea, or Pacific Ocean, in 1513.

DARIL, in logic, one of the modes of syllogism of the first figure, wherein the major proposition is an universal affirmative, and the minor and conclusion particular affirmatives: thus,

DA- Every thing that is moved, is moved by another;

RI- Some body is moved;

I. Therefore, some body is moved by another.

DARIUS, the name of several kings of Persia. See (*History of*) **PERSIA**.

DARKING, a market-town of Surrey in England, situated ten miles east of Guilford. The market is noted for corn and provisions, more especially for fowls. W. Long. 8. 20. N. Lat. 51. 18.

DARLINGTON, a town of the county of Durham, situated in a flat on the river Skerne, which falls into the Tees. It is a pretty large place, has several streets and a spacious market-place. W. Long. 1. 15. N. Lat. 54. 30.

DARMSTADT, a town of Germany in the circle of the Upper Rhine, and capital of the Landgraviate of Hesse-Darmstadt, with a handsome castle, where its own prince generally resides. It is seated on a river of the same name in E. Long. 8. 40. N. Lat. 49. 50.

DARNEL, in botany. See **LILIUM**.

DARNLEY (Lord). See (*History of*) **SCOTLAND**.

DARTFORD, a town of the county of Kent in England, seated on the river Darent not far from its

Dardan
Dartford.

Dartmouth influx into the Thames. E. Long. o. 16. N. Lat. 51.

Date,
Date.

DARTMOUTH, a sea-port town of Devonshire, seated on the river Dart, near its fall into the sea. It is a well frequented and populous place, having a commodious harbour, and a considerable trade by sea. The town is large and well built; but the streets are narrow and bad, though all paved. It has the title of an earldom, and sends two members to parliament. W. Long. 4. o. N. Lat. 50. 25.

DARTOS, in anatomy, one of the coats which form the scrotum. It is called the *dartos muscle*; but Dr Hunter says, that no such muscle can be found, and Albinus takes no notice of it in his tables.

DASYPUS, the *ARMADILLO* or *Tatou*, in zoology; a genus of quadrupeds, belonging to the order of bruta. The dasypus has neither foreteeth nor dogteeth; it is covered with a hard bony shell, intersected with distinct moveable zones or belts: this shell covers the head, the neck, the back, the flanks, and extends even to the extremity of the tail; the only parts to which it does not extend, are the throat, the breast, and the belly, which are covered with a whitish skin of a coarse grain, resembling that of a hen after the feathers are pulled off. The shell does not consist of one entire piece, like that of the tortoise; but is divided into separate belts, connected to each other by membranes, which enable the animal to move it, and even to roll itself up like a hedge-hog. The number of these belts does not depend on the age of the animal, as some have imagined; but is uniformly the same at all times, and serves to distinguish the different species. All the species of this animal were originally natives of America: they were entirely unknown to the ancients; and modern travellers mention them as peculiar to Mexico, Brazil, and the southern parts of America; though some indeed have confounded them with two species of manis, or shell-lizard, which are found in the East Indies: others report that they are natives of Africa, because some of them have been transported from Brazil to the coast of Guinea, where a few have since been propagated: but they were never heard of in Europe, Asia or Africa, till after the discovery of America.—They are all endowed with the faculty of extending and contracting their bodies, and of rolling themselves up like a ball, but not into so complete a sphere as the hedge-hog. They are very inoffensive animals, excepting when they get into gardens, where they devour the melons, potatoes, and other roots. They walk quickly; but can hardly be said to run or leap, so that they seldom escape the pursuit either of men or dogs. But nature has not left them altogether defenceless. They dig deep holes in the earth; and seldom go very far from their subterraneous habitations: upon any alarm, they immediately go into their holes; but, when at too great a distance, they require but a few moments to make one. The hunters can hardly catch them by the tail before they sink their body in the ground; where they stick so close, that the tail frequently comes away and leaves the body in the earth; which obliges the hunters, when they want to take them alive and unimpaired, to dilate the sides of the hole. When they are taken, and find that there is no resource, they instantly roll themselves up, and will not extend their bodies, unless they are held near a

fire. When in deep holes, there is no other method of making them come out, but by forcing in smoke or water. They keep in their holes through the day, and seldom go abroad in quest of subsistence but in the night. The hunters usually chase them with small dogs, which easily come up with them. When the dogs are near, the creatures instantly roll themselves up, and in this condition the hunters carry them off. However, if they be near a precipice they often escape both the dogs and hunters: they roll themselves up, and tumble down like a ball, without breaking their shell, or receiving any injury. The dasypus is a very fruitful animal: the female generally brings forth four young ones every month; which is the reason why the species are so numerous, notwithstanding they are so much fought after on account of the sweets of their flesh. The Indians likewise make baskets, boxes, &c. of the shells which cover their heads.

Linnaeus enumerates six species of dasypus, principally distinguished by the number of their moveable belts. See Plate LXXXVII. fig. 1.

DATA, among mathematicians, a term for such things or quantities as are given or known, in order to find other things thereby that are unknown. Euclid uses the word *data* (of which he hath a particular tract) for such spaces, lines, and angles as are given in magnitude, or to which we can assign others equal.

From the primary use of the word *data* in mathematics, it has been transplanted into other arts; as philosophy, medicine, &c. where it expresses any quantity, which, for the sake of a present calculation, is taken for granted to be such, without requiring an immediate proof for its certainty; called also the *given* quantity, number, or power. And hence also such things as are known, from whence either in natural philosophy, the animal mechanism, or the operation of medicines, we come to the knowledge of others unknown, are now frequently in physical writers called *data*.

DATE, an addition or appendage in writings, acts, instruments, letters, &c. expressing the day and month of the year when the act, or letter, was passed or signed; together with the place where the same was done. The word is formed from the Latin *datum* "given," the participle of *do* "I give."

DATE, the fruit of the phoenix or great palm-tree. This fruit is somewhat in the shape of an acorn. It is composed of a thin, light, and glossy membrane, somewhat pellucid and yellowish; which contains a fine, soft, and pulpy fruit, which is firm, sweet, and somewhat viscid to the taste, esculent, and wholesome; and within this is inclosed a solid, tough, and hard kernel, of a pale grey colour on the outside, and finely marbled within like the nutmeg.—For medicinal uses, dates are to be chosen large, full, fresh, yellow on the surface, soft and tender, not too much wrinkled; such as have a viscid taste, and do not rattle when shaken. They are produced in many parts of Europe, but never ripen perfectly there. The best are from Tunis: they are also very fine and good in Egypt, and in many parts of the east. Those of Spain and France look well; but are never perfectly ripe, and are very subject to decay. They are preserved three different ways: some pressed and dry; others pressed more moderately,

derately, and again moistened with their own juice; and others not pressed at all, but moistened with the juice of other dates, as they are packed up, which is done in baskets or in skins. Those preserved in this last way are much the best. Dates have always been esteemed moderately strengthening and aftringent.

DATI (Carlo), professor of polite learning at Florence. His native country became very famous, as well on account of his works, as of the eulogies which have been bestowed on him by learned men. The chief work to which Dati applied himself, was *Della Pittura Antica*, of which he published an essay in the year 1667. He died in 1675, much lamented, as well for his humanity and amiable manners, as for his parts and learning.

DATISI, in logic, a mode of syllogisms in the third figure, wherein the major is an universal affirmative, and the minor and conclusion particular affirmative propositions. For example,

Da- All who serve God are kings;

Ti- Some who serve God are poor;

si Therefore, some who are poor are kings.

DATIVE, in grammar, the third case in the declension of nouns; expressing the state or relation of a thing to whose profit or loss some other thing is referred. See GRAMMAR.

It is called *dative*, because usually governed by a verb implying something to be given to some person. As, *commodare Socrati*, "to lend to Socrates;" *utilis reipublice*, "useful to the commonwealth;" *pernicius ecclesie*, "pernicious to the church."

In English, where we have properly no cases, this relation is expressed by the sign *to*, or *for*.

DATURA, the THORN-APPLE; a genus of the monogynia order, belonging to the pentandria class of plants. There are six species. The stramonium, or common thorn-apple, rises a yard high, with an erect, strong, round, hollow, green stalk, branching luxuriantly, having the branches widely extended on every side; large, oval, irregularly-angulated, smooth, dark-green leaves; and from the divisions of the branches, large white flowers singly, succeeded by large, oval, prickly capsules, growing erect, commonly called *thorn-apples*. At night the upper leaves rise up and inclose the flowers. The blossoms have sometimes a tinge of purple or violet. The flowers consist of one large, funnel-shaped petal, having a long tube, and spreading pentagonal limb, succeeded by large roundish capsules of the size of middling apples, closely beset with sharp spines. An ointment prepared from the leaves gives ease in external inflammations and in the hæmorrhoids. The seeds were lately recommended by Dr Storck to be taken internally in cases of madness; but they seem to be a very unsafe remedy. Taken even in a small dose, they bring on a delirium, and in a large one would certainly prove fatal. Cows, horses, sheep, and goats, refuse to eat this plant.

DATYL, in natural history, a sort of PHOLAS.

DAUCUS, the CARROT; a genus of the digynia order, belonging to the pentandria class of plants. There are five species; but the only one which merits attention is the carota, or common carrot. This is so well known as to need no description. There are several varieties, as the white, the orange, and the purple carrot; but of these the orange carrot is the most e-

steemed. It grows larger, larger, and is commonly more handsome than the others, being often 15 or 18 inches long in the eatable part, and from two to four in diameter at top. Carrots are propagated by seeds, which are sown at different seasons of the year, in order to procure a supply of young roots for the table at all times. The season for sowing for the earliest crop is soon after Christmas. They should be sown in an open situation, but near a wall; though if they are sown close under it they will be apt to run up to feed too fast, and give no good roots: about eight inches distance is the most proper. They delight in a warm sandy soil, which should be light, and well dug to a good depth, that the roots may meet with no obstruction in running down, so as to make them forked, and shoot out lateral branches. This will happen especially when the ground has been too much dunged the same year that the seeds were sown, which will also occasion them to be worm-eaten. The hairyness of these seeds makes the sowing of them difficult, on account of their being so apt to stick together. Before sowing, therefore, they should be put through a fine chaff sieve; and a calm day should be chosen for sowing them. When sown, they should be trod in with the feet, and the ground raked level over them. When they first come up they should be cut up to four inches distance, and a month after this they are to be cleared again; and if drawn while young, they are now to be left at six inches distance every way: if they are to stand to grow large, they must be separated to ten inches distance. The second season for sowing carrots is in February. This must be done under a wall or hedge, on warm banks: but those which are to be on open large quarters should not be sown till the beginning of March. In July, carrots may be sown for an autumnal crop; and lastly, in the end of August, for those which are to stand the winter. These last will be fit for use in March, before any of the spring ones; but they are seldom so tender or well tasted. In order to preferre carrots for use all winter, they are to be dug up in the beginning of November, and laid in a dry place in sand; and these roots being again planted in February, will ripen seeds in August for succeeding crops: the longest and straightest roots are to be chosen for this purpose.

Under the article AGRICULTURE, n^o 44. we have taken notice of the good properties of carrots as a food for cattle. They have been greatly recommended as proper for fattening hogs; but from some experiments mentioned in the *Georgical Essays*, it appears, that tho' the bacon thus fed is of excellent quality, the feeding is considerably dearer than that fed with pease, pollard, &c. In the same essays, the following experiment is mentioned by Dr Hunter, concerning the propriety of raising carrots for the use of the distiller. "In the month of October (1773), I took 24 bushels of carrots. After being washed, topped, and tailed, I put them into a large brewing copper with four gallons of water; and covering them up with cloths to hasten the maceration, I ordered a fire to be kindled underneath, which in a short time reduced the whole into a tender pulp. They were then put into a common screw-press, and the juice taken from them; which, together with the liquor left in the copper, was run through a flannel bag. The juice was then returned into the copper; and, as it was my design to make it

Daucus,
Davenant.

into ale, I put to it a proportionable quantity of hops. The liquor was then boiled about an hour, when it acquired both the taste and colour of wort. It was next put into a cooler, and afterwards into the working vessel, where the yeast was added to it. It worked kindly, and in all respects was treated as ale. I allowed it to remain in the cask about four months, when I broached it, but found it of a thick, muddy appearance. I attempted to fine it, but in vain. The taste was by no means displeasing, as it much resembled malt liquor. My first intention being frustrated, I threw it into the still, being about 40 gallons in measure, and by two distillations obtained four gallons of a clean proof spirit. It had, however, contracted a flavour from the hop, which should be left out when the intention is to reduce the liquor into spirit. From a gross calculation I am induced to think that a good acre of carrots manufactured in this manner, will leave a profit of L. 40, after deducting the landlord's rent, cultivation, distillation, and other incidental expences. In this calculation, I presume that the spirit is worth six shillings per gallon, and not excised. An acre of barley will by no means produce so much spirit. A rich sandy loam is the best land for carrots; which, after the crop is removed, will be in high cultivation for corn."

Attempts have also been made to prepare sugar from carrots, but without success; a thick syrupy matter like treacle being only obtainable.—Raw carrots are given to children troubled with worms. They pass thro' most people but little changed.—A poultice made of the roots hath been found to mitigate the pain and abate the stench of foul and cancerous ulcers.—Crickets are very fond of carrots; and are easily destroyed by making a paste of powdered arsenic, wheat-meal, and scraped carrots, which must be placed near their habitations.—By their strong antiseptic qualities, a marmalade made from carrots has also been found useful in preventing and curing the sea-scurvy.—The seeds have been reckoned carminative and diuretic; and were formerly much used as a remedy for the stone, but are at present disregarded.—Carrots were first introduced into England, by the Flemings, in the reign of queen Elizabeth.

DAVENANT (Sir William), an eminent poet in the 17th century, was born at Oxford in 1606. After some stay at the university, he entered into the service of Frances first duchess of Richmond, and afterward of Fulke Grevil, lord Brook; who having an excellent taste for poetry, was much charmed with him. He got great esteem by writing poems and plays; and upon the death of Ben Jonhson was created poet-laureat. He wrote his poem *Gondibert* at Paris. He formed a design for carrying over a considerable number of artificers, especially weavers, to Virginia, by the encouragement of Henrietta Maria, the queen-mother of England, who obtained leave for him of the king of France. But he and his company were seized by some parliament ships, and he carried prisoner first to the Isle of Wight, and then to the Tower of London; but, by the mediation of Milton and others, he got his liberty as a prisoner at large. At this time tragedies and comedies being prohibited, he contrived to set up an Opera, to be performed by declamations and music. This Italian opera began in Rutland-house in Charter-

house-yard, 1656; but was afterwards removed to the Cock-Pit in Drury-Lane, and was much frequented for many years. In 1648, his *Madagascar*, with other poems, were printed. He died in 1668.

DAVENANT (Doctor Charles), an eminent civilian and writer, eldest son of the preceding, and educated in Cambridge: he wrote several political tracts; and likewise plays. He was (1685) impowered, with the matter of the revels, to inspect the plays designed for the stage, that no immoralities might be presented. His *Essays on Trade* are in high esteem; and were lately reprinted in 5 vols. 8vo. Doctor Davenant was inspector-general of exports and imports; and died in 1712.

DAVENTRY, or DAINTRY, a handsome town of Northamptonshire in England, situated on the side of a hill on the great road to Chester and Carlisle. W. Long. 1. 15. N. Lat. 52. 12.

DAUGHTER, *filia*, a female child. See the article CHILDREN.

DAVID, king of Israel, and Hebrew poet, was born at Bethlehem 1085, and died 1014 years B. C. His history is particularly recorded in the sacred writings.

St DAVID's, an episcopal town of Pembrokeshire, in S. Wales; but has neither market nor fair. It is seated in a barren soil on the river Ilen, not a mile from the sea-shore. It was once a considerable place, and had walls, which are now demolished; but it is small at present, and thinly inhabited; however, the cathedral is a pretty good structure. From the cape, near this place, there is a prospect into Ireland. W. Lon. 5. 20. N. Lat. 52. 0.

St DAVID's, a town and fort of Asia, in the peninsula on this side the Ganges, and on the coast of Coromandel. It is an English factory, and one of the strongest places they have in the East-Indies. The fort stands close to the river, and the territory belonging to it is 8 miles on the sea-shore, and 4 within land. It produces good long-cloths, chints, calicoes, and muslins. Each house has a garden; and there are plenty of black cattle, but small. The rivers and sea abound with excellent fish. It is 80 miles S. of Fort St George. E. Long. 79. 55. N. Lat. 11. 30.

DAVIES (Sir John), an eminent lawyer and poet, born about the year 1570. He first distinguished himself by his poem *Noſce Teipſum* on the Immortality of the Soul. He became attorney-general, and speaker of the House of Commons in Ireland; and afterward was appointed lord chief justice of the court of King's Bench in England, but died before his installation, in 1626. He published many law tracts; but was esteemed more of a scholar and a wit, than of a lawyer.

DAVILA (Henrico Catherino), a celebrated historian, was born of an illustrious family in the Isle of Cyprus; but was obliged to leave his country, on its being taken by the Turks, in 1571. He first retired to Avila in Spain, whence his family supposed they had derived their name and origin; from thence he went to France, and made himself known at court under the reigns of Henry III. and Henry the Great. He there distinguished himself on several occasions by his valour; and at length went to Venice, where he had a very handsome pension settled upon him by that republic, in whose service his brother Lewis Davila had

been

Davenant
|| Davila.

DAVIS
Dauphin.

been a commander. Davila, while he was at Venice, wrote his admirable History of the Civil Wars of France, which contains every thing worth notice that passed from the death of Henry II. in 1559, to the peace of Vervins in 1598. He was killed about the year 1635, by a gentleman of Verona; who, in a dispute about furnishing him with carriages in pursuance of his having a commission from the republic, discharged a pistol at Davila, and wounded him in such a manner, that he died soon after. Davila's son, a youth of about 18, being present, had the spirit to revenge the death of his father; for, instantly rushing upon the murderer, he cut him in pieces.

DAVIS (John), a famous navigator in the 16th century, was born at Sandridge, near Dartmouth, in Devonshire; and distinguished himself by making three voyages to the most northern parts of America, in order to discover a North-west passage to the East-Indies; in which he discovered the Straits which bear his name. He afterwards performed five voyages to the East-Indies; in the last of which he was slain in a desperate fight with some Japanese, near the coast of Malacca, on the 27th of December 1605. He wrote an account of his second voyage for the discovery of the North-west passage; a Voyage to the East-Indies; and other tracts.

DAVIS'S *Straits*. See *New Britain*.

DAVIT, in a ship, a long beam of timber, represented by *a, a*, Plate LXXXVII. fig. 2. and used as a crane whereby to hoist the flukes of the anchor to the top of the bow, without injuring the sides of the ship as it ascends; an operation which, by mariners, is called *fish- ing the anchor*. The anchors being situated on both the bows, the davit may be occasionally shifted, so as to project over either side of the ship, according to the position of that anchor on which it is employed. The inner end of the davit is secured by being thrust into a square ring of iron *b*, which is bolted to the deck, and forelocked under the beams. This ring, which is called the *span-shackle*, exhibited at large by fig. 9. is fixed exactly in the middle of the deck, and close behind the foremast. Upon the outer end of the davit is hung a large block *c*, through which a strong rope traverses, called the *fish-pendent*, *d*; to whose foremoist end is fitted a large iron hook *e*, and to its after-end a tackle or complication of pulleys *f*; the former of which is called the *fish-hook*, and the latter the *fish-tackle*.

The davit, therefore, according to the sea-phrase, is employed to *fish the anchor*; which being previously *catted*, the fish-hook is fastened upon its flukes; and the effort of the tackle being transmitted to the hook, by means of the fish-pendent, draws up that part of the anchor sufficiently high upon the bow to fasten it, which is done by the *shank painter*. See that article. —There is also a davit of a smaller kind occasionally fixed in the long-boat, and employed to weigh the anchor therein.

DAUPHIN, a title given to the eldest son of France, and heir presumptive of the crown, on account of the province of Dauphiny; which, in 1343, was given to Philip of Valois, on this condition, by Humbert, dauphin of the Viennois.

The seigneurs or lords of Auvergne have likewise borne the appellation of dauphin; but the dauphins of

Dauphiny
Day.

Auvergne held it not till a good while after those of the Viennois, and even received it from them.

DAUPHINY, a province of France, bounded on the west by the river Rhone, on the north by the Rhone and Savoy, on the south by Provence, and on the east by the Alps. Hence the presumptive heir of France is called the Dauphin. In some places it is very fertile; and produces corn, wine, olives, wood, coppers, silk, crystal, iron, and copper. But the greatest part of this province is barren, and the inhabitants are obliged to go into other countries for subsistence. The mountains abound in fables and game of all sorts; and here are fir-trees proper for masts. The principal rivers are, the Rhone, the Durance, the Isere, and the Drone. There a great number of mineral springs; and Grenoble is the capital town.

DAURAT (John), an eminent French poet, born in 1507. In the reign of Henry II. he was preceptor to the king's pages, and Charles IX. who took great delight in his conversation, and honoured him with the title of his poet: but his generosity and want of management, placed him in that class of learned men who have been very near starving. Conformable to the taste of the age, he had so much skill in making anagrams, that several illustrious persons gave him their names to anagrammatise: he also undertook to explain the Centuries of Nostradamus. Making verses was a disease in him: for no book was printed, nor did any person of consequence die, but Daurat made some verses on the occasion; as if he had been poet in ordinary, or his muse had been a hired mourner, to the whole kingdom. Scaliger tells us, that he spent the latter part of his life in endeavouring to find all the bible in Homer. He died in 1588.

DAY, according to the most natural and obvious sense of the word, signifies that space of time during which it continues to be light; in contradistinction to night, being that partition of time wherein it is dark; but the space of time in which it is light, being somewhat vague and indeterminate, the time between the rising and the setting of the sun is usually looked on as the day; and the time which lapses from its setting to its rising again, the night.

The word *day* is often taken in a large sense, so as to include the night also; or to denote the time of a whole apparent revolution of the sun round the earth; in which sense it is called by some a natural day, and by others an artificial one: but, to avoid confusion, it is usual to call it in the former sense simply the *day*, and in the latter a *nychthemeron*; by which term that acceptance of it is aptly denoted, as it implies both day and night.

The *nychthemeron* is divided into twenty-four parts, called *hours*; which are of two sorts, equal and unequal or temporary. See the article *HOUR*.

Different nations begin their day at a different hour. Thus the Egyptians began their day at midnight; from whom Hippocrates introduced that way of reckoning into astronomy, and Copernicus and others have followed him: But the greatest part of astronomers reckon the day to begin at noon, and so count twenty-four hours, till the noon of the next day; and not twice twelve, according to the vulgar computation. The method of beginning the day at midnight prevails also in Great Britain, France, Spain, and most parts of Europe.

Day-coal. Europe. See ASTRONOMY, n° 300.

The Babylonians began their day at sun-rising; reckoning the hour immediately before its rising again, the twenty-fourth hour of the day; from whence the hours reckoned in this way are called the *Babylonic*. In several parts of Germany, they begin their day at sun-setting, and reckon on till it sets next day, calling that the *twenty-fourth hour*: these are generally termed *Italian hours*. The Jews also began their nycthemeron at sun-setting: but then they divided it into twice twelve hours, as we do; reckoning twelve for the day, be it long or short, and twelve for the night; so that their hours continually varying with the day and night, the hours of the day were longer than those of the night for one half year, and the contrary the other; from whence their hours are called temporary: those at the time of the equinoxes became equal, because then those of the day and night are so. The Romans also reckoned their hours after this manner, as do the Turks at this day.

This kind of hours is called *planetary*, because the seven planets were anciently looked upon as presiding over the affairs of the world, and to take it by turns each of these hours, according to the following order: Saturn first, then Jupiter, Mars, the Sun, Venus, Mercury, and last of all the Moon: hence they denominated each day of the week from that planet whose turn it was to preside the first hour of the nycthemeron. Thus, assigning the first hour of Saturday to Saturn, the second will fall to Jupiter, the third to Mars; and so the twenty-second of the same nycthemeron will fall to Saturn again, and therefore the twenty-third to Jupiter, and the last to Mars: so that on the first hour of the next day, it will fall to the Sun to preside; and by the like manner of reckoning, the first hour of the next will fall to the Moon; of the next, to Mars; of the next, to Mercury; of the next, to Venus: hence, the days of the week came to be distinguished by the Latin names of *Dies Saturni, Solis, Lunæ, Martis, Mercurii, Jovis, et Veneris*; and among us, by the names of Saturday, Sunday, Monday, &c.

Day-Coal, in natural history, a name given by the miners of England, and the common people who live in coal-countries, to that seam or stratum of the coal which lies uppermost in the earth. The same vein or stratum of coal usually runs a great way thro' the country, and dips and rises in the earth at different places; so that this upper stratum, or day-coal, is, in the various parts of the same stratum, sometimes near the surface, and sometimes many fathoms deep. The subterranean fires found in some of our coal-countries feed principally on this coal; and are nearer to or farther from the surface, as it rises or sinks.

Day-Net, among fowlers, a net generally used for taking such small birds as play in the air, and will stoop either to prey, gig, or the like; as larks, linnets, buntings, &c. The time of the year for using this net is from August to November; and the best time is very early in the morning: and it is to be observed, that the milder the air, and the brighter the sun is, the better will be the sport, and of longer continuance. The place where this net should be laid, ought to be plain champaign, either on short stubbles, green lays, or flat meadows, near corn-fields, and somewhat remote from towns and villages: you must be sure to let your net

lie close to the ground, that the birds creep not out and make their escape.—The net is made of a fine pack-thread with a small mesh, not exceeding half an inch square; it must be three fathoms long, and but one broad: it must be verged about with a small, but strong, cord; and the two ends extended upon two small, long, poles, suitable to the breadth of the net, with four stakes, tail-strings, and drawing-lines.—This net is composed of two, which must be exactly alike; and are to be laid opposite to one another, so even and close, that when they are drawn and pulled over, the sides must meet and touch each other.—You must stake this net down with strong stakes, very stiff on their lines, so that you may with a nimble touch cast them to and fro at pleasure; then fasten your drawing-cords or hand-lines (of which there must be a dozen at least, and each two yards long) to the upper end of the foremost stakes: and so extend them of such a straightness, that with a little strength they may rise up in the nets, and cast them over.

Your nets being thus laid, place your gigs, or playing-wantons, about 20 or 30 paces beyond, and as much on this side your nets: the gigs must be fastened to the tops of long poles, and turned into the wind, so as they may play to make a noise therein. These gigs are a sort of toys made of long goose-feathers, like shuttle-cocks, and with little small tunnels of wood running in broad and flat swan-quills, made round like a small hoop; and so, with longer strings fastened to a pole, will, with any small wind or air, move after such a manner, that birds will come in great flocks to play about them.

When you have placed your gigs, then place your stake; which is a small stake of wood, to prick down into the earth, having in it a mortice-hole, in which a small and slender piece of wood, about two foot long, is fastened, so as it may move up and down at pleasure: and fasten to this longer stick a small line, which, running through a hole in the stick above-mentioned, and so coming up to the place where you are to sit, you may, by drawing the line up and down with your right hand, raise up the longer stick as you see occasion.

Fasten a live lark, or such like bird, to this longer stick, which, with the line making it to stir up and down by your pulling, will entice the birds to come to your net.

There is another stake, or enticement, to draw on these birds, called a *looking-glass*; which is a round stake of wood, as big as a man's arm, made very sharp at the end, to thrust it into the ground: they make it very hollow in the upper part, above five fingers deep; into which hollow they place a three-square piece of wood about a foot long, and each two inches broad, lying upon the top of the stake, and going with a foot into the hollowness: which foot must have a great knob at the top, and another at the bottom, with a deep slenderness between; to which slenderness you are to fasten a small pack-thread, which, running through a hole in the side of the stake, must come up to the place where you sit. The three-square piece of wood which lies on the top of the stake, must be of such a poise and evenness, and the foot of the socket so smooth and round, that it may whirl and turn round upon the least touch; winding the pack-thread so many times about it,

Days,
Daze.

it, which being suddenly drawn, and as suddenly let go, will keep the engine in a constant rotatory motion: then fasten with glue on the uppermost flat squares of the three-square piece, about twenty small pieces of looking-glass, and paint all the square wood between them of a light and lively red: which, in the continual motion, will give such a reflection, that the birds will play about to admiration until they are taken.

Both this and the other fable are to be placed in the middle between the two nets, about two or three feet distance from each other; so that, in the falling of the nets, the cords may not touch or annoy them: neither must they stand one before or after another; the glass being kept in a continual motion, and the bird very often fluttering. Having placed your nets in this manner, as also your gigs and fables, go to the further end of your long-drawing lines and fable lines; and, having placed yourself, lay the main drawing line across your thigh, and, with your left, pull the fable-line to shew the birds; and when you perceive them to play near and about your nets and fables, then pull the net over with both hands, with a quick, but not too hasty motion; for otherwise your sport will be spoiled.

See Plate XCV. fig. 1. where A shews the bodies of the main net, and how they ought to be laid. B, the tail-lines, or the hinder lines, flaked to the ground. C, the fore-lines flaked also to the ground. D, the bird-fable. E, the looking-glass fable. G, the line which draws the bird-fable. H, the line that draws the glass-fable. I, the drawing, double lines of the nets, which pull them over. K, the flakes which flake down the four nether points of the net, and the two tail-lines. L, the flakes that flake down the fore-lines. M, the single line, with the wooden button to pull the net over with. N, the flake that flakes down the single line, and where the man should sit; and Q the gite.

DAYS of Grace are those granted by the court at the prayer of the defendant, or plaintiff, in whose delay it is.

Days of grace, in commerce, are a customary number of days allowed for the payment of a bill of exchange, &c. after the same becomes due.

Three days of grace are allowed in Britain; ten in France and Dantzic; eight at Naples; six at Venice, Amsterdam, Rotterdam, and Antwerp; four at Frankfurt; five in Leipzig; twelve at Hamburg; six in Portugal; fourteen in Spain; thirty in Genoa, &c.

Day's-Man, in the north of England, an arbitrator or person chosen to determine an affair in dispute.

Intercalary Days. See **INTERCALARY Days**.

Day's-Work, among seamen, the reckoning or account of the ship's course during 24 hours, or between noon and noon, according to the rules of trigonometry. See **DEAD-RECKONING**.

DAZE, in natural history, a name given by our miners to a glittering sort of stone, which often occurs in their works; and, as it is unprofitable substance, is one of those things they call *wrecks*. The word *daze* takes in with them every stone that is hard and glittering; and therefore it comprehends the whole genus of the telangia, or stony modules, which have the flakes of talc in their substance: these, according to the colour of the stony matter they are bedded in, and their own colour, give the names of *black daze*, *white*, *red*,

and *yellow daze*, to these stones.

DEACON, DIACONUS, a person in the lowest degree of holy orders, whose business is to baptize, read in the church, and assist at the celebration of the eucharist. The word is formed from the Latin *Diaconus*, of the Greek *διακονος*, minister, servant. Deacons were instituted seven in number, by the apostles, *Act.* chap. vi. which number was retained a long time in several churches. Their office was to serve in the Agapæ, and to distribute the bread and wine to the communicants. Another part of the office of deacons, was to be a sort of monitors and directors to the people in the exercise of their public devotions in the church; for which purpose they made use of certain known forms of words, to give notice when each part of the service began. Whence they are sometimes called *eirokerukes*; "the holy cryers of the church."

Deacons had, by licence and authority from the bishop, a power to preach, to reconcile penitents and grant them absolution, and to represent their bishops in general councils. Their office out of the church was to take care of the necessitous, such as orphans, widows, prisoners, and all the poor and sick who had any title to be maintained out of the revenues of the church; to inquire into the morals and conversation of the people, and to make their report thereof to the bishop. Whence, on account of the variety of business, it was usual to have several deacons in the same church.

In the Romish church, it is the deacon's office to incense the officiating priest or prelate; to lay the corporal on the altar; to receive the patten or cup from the subdeacon, and present them to the person officiating; to incense the choir; to receive the pax from the officiating prelate, and carry it to the subdeacon; and at the pontifical mass, when the bishop gives the blessing, to put the mitre on his head, and to take off the archbishop's pall and lay it on the altar. In England, the form of ordaining deacons, declares that it is their office to assist the priest in the distribution of the holy communion; in which, agreeably to the practice of the ancient church, they are confined to the administering the wine to the communicants. A deacon in England is not capable of any ecclesiastical promotion; yet he may be a chaplain to a family, curate to a beneficed clergyman, or lecturer to a parish-church. He may be ordained at 23 years of age, *anno corrente*; but it is expressly provided, that the bishop shall not ordain the same person a priest and deacon in the same day. Deacons, according to St Paul, should be chaste, sincere, and blameless; neither great drinkers, nor given to filthy lucre: they should hold the mystery of the faith in a pure conscience; and should be well approved before they are admitted to the ministry.

DEACONESS, a female deacon; an order of women who had their distinct offices and services in the primitive church. This office appears as ancient as the apostolical age; for St Paul calls Phebe a servant of the church of Cenchrea. The original word is *διακονος*, answerable to the Latin word *ministra*. Tertullian calls them *vidue*, widows, because they were commonly chosen out of the widows of the church; and, for the same reason, Epiphanius, and the council of Laodicea, calls them *πρεβυτερας*, elderly women, because none but such were ordinarily taken into this office. For, indeed, by some ancient laws, these four quali-

Deacon,
Deaconess.

qualifications were required in every one that was to be admitted into this order. 1. That she should be a widow. 2. That she should be a widow that had born children. 3. A widow that was but once married. 4. One of a considerable age, 40, 50, or 60 years old. Though all these rules admitted of exceptions. Concerning their ordination, whether it was always performed by imposition of hands, the learned are much divided in their sentiments. Baronius and Valefius think they were not, and make no other account of them than as mere lay-perfons. But the author of the constitutions, speaking of their ordination, requires the bishop to use imposition of hands, with a form of prayer which is there recited. We are not, however, to imagine, that this ordination gave them any power to execute any part of the sacerdotal office. They were only to perform some inferior services of the church, and those chiefly relating to the women for whose fakes they were ordained. One part of their office was to assist the minister at the baptizing of women, to undress them for immersion, and to dress them again, that the whole ceremony might be performed with all the decency becoming so sacred an action. Another part of their office was to be private catechists to the women-catechumens who were preparing for baptism. They were likewise to attend the women that were sick and in distress; to minister to martyrs and confessors in prison; to attend the womens gate in the church; and, lastly, to assign all women their places in the church, regulate their behaviour, and preside over the rest of the widows; whence in some canons they are styled *regulatrici*, "governesses." This order, which since the 10th or 12th century has been wholly laid aside, was not abolished every where at once, but continued in the Greek church longer than in the Latin, and in some of the Latin churches longer than in others.

DEAD LANGUAGES. See PHILOLOGY, chap. iii. *Preservation of Dead Bodies.* See EMBALMING.

DEAD-LIGHTS, certain wooden ports which are made to fasten into the cabin windows, to prevent the waves from gushing into the ship in a high sea. As they are made exactly to fit the windows, and are strong enough to resist the waves, they are always fixed in on the approach of a storm, and the glass lights taken out, which must otherwise be shattered to pieces by the surges, and suffer great quantities of water to enter the vessel.

DEAD-mens-eyes, in the sea-language, a kind of blocks with many holes in them, but no sheevers, whereby the shrouds are fastened to the chains: the crow-feeve reeve also through these holes; and, in some ships, the main-flays are set tight in them; but then they have only one hole, through which the lanyards are passed several times. See Plate LXXXVII. fig. 3.

DEAD'S Part. See LAW, N^o clxxi. 6.

DEAD-Reckoning, in navigation, the judgement or estimation which is made of the place where a ship is situated; without any observation of the heavenly bodies. It is discovered by keeping an account of the distance she has run by the log, and of her course steered by the compass; and by rectifying these data by the usual allowances for drift, lee-way, &c. according to the ship's known trim. This reckoning, however, is always to be corrected, as often as any good observation of the sun can be obtained.

DEAD-Sea, in geography, a lake of Judea, into which

the river Jordan discharges itself; being about 70 miles long, and 20 broad. See ASPHALTITES.

DEAD-Tops, a disease incident to young trees, and cured by cutting off the dead parts close to the next good twig or shoot, and claying them over as in grafting.

DEAD-Water, at sea, the eddy-water just astern of a ship; so called, because it does not pass away so swift as the water running by her sides does. They say that a ship makes much dead-water, when she has a great eddy following her stern.

DEADLY-CARROT. See THAPSIA.

DEADLY-Feud, in English law-books, a profession of irreconcilable enmity, till a person is revenged by the death of his enemy. The word *feud* is derived from the German *Fehd*; which, as Hottoman observes, signifies *modo bellum, modo capitales inimicitias* *. Such enmity and revenge was allowed by law in the time of the Saxons, viz. If any man was killed, and a pecuniary satisfaction was not made to the kindred, it was lawful for them to take up arms and revenge themselves on the murderer: which was called *deadly feud*. And this probably was the original of an *APPEAL*.

DEAFNESS, the state of a person who wants the sense of hearing; or the disease of the ear, which prevents its due reception of sounds †.

Deafness generally arises either from an obstruction, or a compression, of the auditory nerve; or from some collection of matter in the cavities of the inner ear; or from the auditory passage being stopped up by some hardened excrement; or, lastly, from some excrescence, a swelling of the glands, or some foreign body introduced within it.

Those born deaf are also dumb, as not being able to learn any language; at least in the common way. However, as the eyes in some measure serve them for ears, they may understand what is said by the motion of the lips, tongue, &c. of the speaker; and even accustom themselves to move their own, as they fee other people do; and by this means learn to speak.—Thus it was that Dr Wallis taught two young gentlemen born deaf, to know what was said to them, and to return pertinent answers. Digby gives us another instance of the same, within his own knowledge. And there was a Swiss physician lately living at Amsterdam, one John Conrad Amman, who effected the same in several children born deaf, with surprising success. He has reduced the thing to a fixed art or method, which he has published in his *Surdus Loquens*, Amstelod. 1692, and *de Loquela*, ibid. 1700.

In the Phil. Trans. N^o 312. we have an account by Mr Waller, R. S. Secr. of a man and his sister, each about 50 years old, born in the same town with Mr Waller, who had neither of them the least sense of hearing; yet both of them knew, by the motion of the lips only, whatever was said to them, and would answer pertinently to the question propoed. It seems they could both hear and speak when children; but lost their sense afterwards; whence they retained their speech, which, though uncouth, was yet intelligible.

Such another instance is that of Mr Goddy's daughter, minister of St Gervais in Geneva, related by bishop Burnet. "At two years old they perceived she had lost her hearing; and ever since, though she hears great noises, yet hears nothing of what is said to her.

But

† See (Index subjoined to) Medicine.

* See Feud.

Deal
Dean.

But by observing the motions of the mouth and lips of others, she acquired so many words, that out of these she has formed a sort of jargon, in which she can hold conversation whole days with those that can speak her language. She knows nothing that is said to her, unless she see the motion of their mouths that speak to her; so that in the night they are obliged to light candles to speak to her. One thing will appear the strangest part of the whole narration: she has a filter, with whom she has practised her language more than with any body else; and in the night, by laying her hand on her filter's mouth, she can perceive by that what she saith, and so can discourse with her in the dark." *Burn. Let. IV. p. 248.*

It is observable that deaf persons, and several others thick of hearing, hear better and more easily if a loud noise be raised at the time when you speak to them: which is owing, no doubt, to the greater tension of the ear-drum on that occasion. Dr Willis mentions a deaf woman, who, if a drum were beat in the room, could hear any thing very clearly; so that her husband hired a drummer for a servant, that by this means he might hold conversation with his wife. The same author mentions another, who, living near a steeple, could always hear very well if there was a ringing of three or four bells, but never else.

DEAL, a thin kind of fir-planks, of great use in carpentry: they are formed by sawing the trunk of a tree into a great many longitudinal divisions, of more or less thickness according to the purposes they are intended to serve.

A very good method of seasoning planks of deal and fir, is to throw them into salt water as soon as they are sawed; and keep them there three or four days, frequently turning them. In this case they will be rendered much harder, by drying afterwards in the air and sun: but neither this nor any other method yet known will preserve them from shrinking.

Rods of deal expand laterally, or cross the grain, in moist weather, and contract again in dry; and thence have been found to make an useful hygrometer.

DEAL, a town of Kent in England, lying between Dover and Sandwich, in E. Long. 1. 30. N. Lat. 51. 16. is supposed to be the *Dola* of Nennius, and is situated on a flat and level coast. This town, according to Dr Campbell, justifies an observation he had made in favour of situations of this kind, viz. that they are less liable than others to be injured by the sea. The town of Deal, as far as we are able to judge, except it may be the sea's shrinking a little from it, is in much the same condition in which it ever was, even from the earliest accounts. The learned Dr Halley has proved, *Miscellanea Curiosa*, vol. iii. p. 426, that Julius Cæsar landed here, August 26th, the year before the coming of Christ 55.—The great conveniency of landing, has been of infinite service to the place; so that it is large and populous, divided into the upper and lower towns, adorned with many fair buildings, and is in effect the principal place on the Downs.

DEAN, an ecclesiastical dignity in cathedral and collegiate churches, and head of the Chapter.

Rural DEAN, called also *Arch-prefbyter*, originally exercised jurisdiction over ten churches in the country, and afterwards became only the bishop's substitute, to grant letters of administration, probate of wills, &c.;

Dean
Death.

to convocate the clergy; and to signify to them sometimes by letters the bishop's will, and to give induction to the arch-deacon. Their office is now lost in that of the arch-deacons and chancellors.

DEAN of a *Monastery*, was a superior established under the abbot, to ease him in taking care of ten monks; whence he was called *decanus*.

DEAN and *Chapter*, are the council of the bishop, to assist him with their advice in affairs of religion, and also in the temporal concerns of his see. When the rest of the clergy were settled in the several parishes of each diocese, these were reserved for the celebration of divine service in the bishop's own cathedral; and the chief of them, who presided over the rest, obtained the name of *decanus* or *dean*, being probably at first appointed to superintend ten canons or prebendaries.

All ancient deans are elected by the chapter, by *congregatio* from the king, and letters missive of recommendation; in the same manner as bishops: but in those chapters that were founded by Henry VIII. out of the spoils of the dissolved monasteries, the deanery is donative, and the installation merely by the king's letters patent. The chapter, consisting of canons or prebendaries, are sometimes appointed by the king, sometimes by the bishop, and sometimes elected by each other.

The dean and chapter, are the nominal electors of a bishop. The bishop is their ordinary and immediate superior; and has, generally speaking, the power of visiting them; and correcting their excesses and enormities. They had also a check on the bishop at common law; for till the statute 32 Hen. VIII. c. 28, his grant or lease would not have bound his successors, unless confirmed by the dean and chapter.

DEAN of *Guild*. See LAW, N° clviii. 11.

DEANERY, the office of a DEAN.—Deaneries and prebends may become void, like a bishopric, by death, by deprivation, or by resignation either to the king or bishop. If a dean, prebendary, or other spiritual person, be made a bishop, all the preferments of which he was before possessed are void; and the king may present to them, in right of his prerogative royal. But they are not void by the election, but only by the consecration.

DEATH is generally considered as the separation of the soul from the body; in which sense it stands opposed to life, which consists in the union thereof.

Physicians usually define death by a total stoppage of the circulation of the blood, and a cessation of the animal and vital functions consequent thereon; as respiration, sensation, &c.

An animal body, by the actions inseparable from life, undergoes a continual change. Its smallest fibres become rigid; its minute vessels grow into solid fibres no longer pervious to the fluids; its greater vessels grow hard and narrow; and every thing becomes contracted, closed, and bound up: whence the dryness, immobility, and extenuation, observed in old age. By such means the offices of the minute vessels are destroyed; the humours stagnate, harden, and at length coalesce with the solids. Thus are the subtillest fluids in the body intercepted and lost, the concoction weakened, and the reparation prevented; only the coarser juices continue to run slowly through the greater vessels, to the preservation of life, after the animal functions

tions are destroyed. At length, in the process of these changes, death itself becomes inevitable, as the necessary consequence of life. But it is rare that life is thus long protracted, or that death succeeds merely from the decays and impairment of old age. Diseases, a long and horrid train, cut the work short.

The signs of death are in many cases very uncertain. If we consult what Winslow or Bruchier have said on this subject, we shall be convinced, that between life and death the shade is so very undistinguishable, that even all the powers of art can scarcely determine where the one ends and the other begins. The colour of the visage, the warmth of the body, and suppleness of the joints, are but uncertain signs of life still subsisting; while, on the contrary, the paleness of the complexion, the coldness of the body, the stiffness of the extremities, the cessation of all motion, and the total insensibility of the parts, are but uncertain marks of death begun. In the same manner also, with regard to the pulse and breathing; these motions are often so kept under, that it is impossible to perceive them. By bringing a looking-glass near to the mouth of the person supposed to be dead, people often expect to find whether he breathes or not. But this is a very uncertain experiment: the glass is frequently filled by the vapour of the dead man's body; and often the person is still alive, though the glass is no way tarnished. In the same manner, neither burning nor scarifying, neither noises in the ears nor pungent spirits applied to the nostrils, give certain signs of the discontinuance of life; and there are many instances of persons who have endured them all, and afterwards recovered, without any external assistance, to the astonishment of the spectators. This ought to be a caution against hasty burials, especially in cases of sudden death, drowning, &c.

DEATH in Law. In law, there is a natural death and a civil death: natural, where nature itself expires; civil, where a person is not actually dead, but adjudged so by law. Thus, if any person, for whose life an estate is granted, remains beyond sea, or is otherwise absent, seven years, and no proof made of his being alive, he shall be accounted naturally dead.

LAW of DEATHBED. See LAW, N° cxxxix. 38—41.

DEATH-Watch, in natural history, a little insect famous for a ticking noise, like the beat of a watch, which the vulgar have long taken for a preface of death in the family where it is heard: whence it is also called *pediculus, fatidicus, mortifaga, pulsatorius*, &c.

There are two kinds of death-watches. Of the first we have a good account in the Phil. Trans. by Mr Allen. It is a small beetle $\frac{1}{2}$ of an inch long, of a dark-brown colour, spotted; having pellucid wings under the vagina, a large cap or helmet on the head, and two antennæ proceeding from beneath the eyes, and doing the office of proboscides. The part it beats withal, he observed, was the extreme edge of the face, which he chuses to call the upper-lip, the mouth being protracted by this bony part, and lying underneath out of view.

This account is confirmed by Dr Derham; with this difference, that instead of ticking with the upper-lip, he observed the insect to draw back its mouth, and beat with its forehead. That author had two death-watches, a male and a female, which he kept alive in a box several months; and could bring one of them to

beat whenever he pleased, by imitating its beating. By his ticking noise he could frequently invite the male to get up upon the other in the way of coition. When the male found he got up in vain, he would get off again, beat very eagerly, and then up again: Whence the ingenious author concludes, those pulsations to be the way whereby these insects woo one another, and find out and invite each other to copulation.

The second kind of death-watch is an insect in appearance quite different from the first. The former only beats seven or eight strokes at a time, and quicker; the latter will beat some hours together without intermission; and his strokes are more leisurely, and like the beat of a watch. This latter is a small greyish insect, much like a louse when viewed with the naked eye.

It is very common in all parts of the house in the summer-months: it is very nimble in running to shelter, and shy of beating when disturbed; but will beat very freely before you, and also answer the beating, if you can view it without giving it disturbance, or shaking the place where it lies, &c. The author cannot say whether they beat in any other thing, but he never heard their noise except in or near paper. As to their noise, the same person is in doubt, whether it be made by their heads, or rather snouts, against the paper; or, whether it be not made after some such manner as grasshoppers and crickets make their noise. He inclines to the former opinion: the reason of his doubt is, that he observed the animal's body to shake and give a jerk at every beat, but could scarce perceive any part of its body to touch the paper. But its body is so small and near the paper, and its motion in ticking so quick, that he thinks it might be, yet he not perceive it. The ticking, as in the other, he judges to be a wooing-aft; as having observed another, after much beating, come and make offers to the beating insect, who, after some offers, left off beating, and got upon the back of the other. When they were joined, he left off again; and they continued some hours joined tail to tail, like dog and bitch in coition. Whether this insect changes its shape and becomes another animal, or not, he cannot say; though he has some cause to suspect that it becomes a sort of fly. It is at first a minute white egg, much smaller than the nits of lice; though the insect is near as big as a louse. In March it is hatched, and creeps about with its shell on. When it first leaves its shell, it is even smaller than its egg; though that be scarce discernible without a microscope. In this state it is perfectly like the mites in cheese: from the mite-state they grow gradually to their mature perfect state; when they become like the old ones, they are at first very small, but run about much more swiftly than before.

DEBENTURE, a term of trade used at the custom-house for a kind of certificate signed by the officers of the customs, which entitles a merchant exporting goods to the receipt of a bounty or draw-back. All merchandises that are designed to be taken on board for that voyage being entered and shipped, and the ship being regularly cleared out, and failed out of port on her intended voyage, debentures may be made out from the exporter's entries, in order to obtain the drawbacks, allowances, bounties, or premiums; which debentures for foreign goods are to be paid within one month after demand. And in making out these debentures, it must be observed, that every piece of vel-

Debenture || **Decalogue.** lum, parchment, or paper, containing any debenture for drawing back customs or duties, must, before writing, be stamped, and pay a duty of 8d.

The forms of debentures vary, according to the merchandise exported. In the execution of debentures for tobacco, it must be particularly observed, 1. That debentures for the same quantity, may be made on one or more parchments. 2. That the exporter's oath must be printed, specifying whether he acts for himself or on commission. If exported to any other foreign ports than Ireland, the word *Ireland* must be added to the oath after *Great-Britain*. 4. That as no tobacco may be consumed on board ships of war in Europe, but what has paid full duties, and been manufactured in Great Britain, no drawback is to be allowed for tobacco exported in any man of war. 5. That the eight pounds *per* hoghead of 350 pounds, or more, allowed for draught at importation, must not be deducted on exportation. 6. That debentures for tobacco exported to Ireland, must not be paid till a certificate be produced, testifying the landing thereof. 7. That no persons may swear to the exportation, but such as are permitted to swear to debentures for other goods. In debentures for all other foreign goods, no person may be admitted to swear to the exportation, but the true exporter, either as a proprietor, or who, being employed by commission, is concerned in the direction of the voyage. All kinds of debentures, before delivered or paid to the exporters, are entered into a separate book kept for that purpose by the collector and comptroller of the customs.

DEBITA FUNDI. See LAW, N° clxvi. 1.

DEBITA Frustrum. See LAW, N° clxx. 17.

DEBILITY, among physicians, a relaxation of the solids, occasioning oftentimes weaknesses and faintings.

DEBRECHEN, a town of Upper Hungary, about 77 miles east of Buda: E. Long. 21. 10. N. Lat. 47. 45.

DEBRUIZED, in heraldry, a term peculiar to the English, by which is intimated the grievous restraint of any animal, debarred of its natural freedom, by any of the ordinaries being laid over it.

DEBT, in law, any thing due to another, whether it be money, goods, or services; or the action brought for recovering the same.

DEBTOR, a person who owes any thing to another; in contradistinction to creditor, which is he to the debt is owing.

DEBTOR, in merchants accounts. See BOOK-KEEPING.

DECAGON, in geometry, a plane figure with ten sides and ten angles.

DECAGYNIA, (from *deka ten*, and *gyn a woman*;) the name of an order, or secondary division, in the class decandria, of the sexual method, consisting of plants whose flowers are furnished with ten stamens and the same number of styles; which last are considered by Linnaeus, and the sexualists, as the female organs of generation in plants. Neurada, and American night-shade, furnish examples.

DECALOGUE, the ten precepts or commandments delivered by God to Moses, after engraving them on two tables of stone.

The Jews, by way of excellence, call these commandments the *ten words*, from whence they had af-

terwards the name of *decalogue*: but it is to be observed, that they joined the first and second into one, and divided the last into two: they understand that against stealing, to relate to the stealing of men, or kidnapping; alleging, that the stealing one anothers goods or property, is forbidden in the last commandment.

The emperor Julian objected to the decalogue, that the precepts it contained (those only excepted which concern the worship of false gods, and the observance of the sabbath) were already so familiar to all nations, and so universally received, that they were unworthy, for that very reason, to be delivered, by so great a legislator, to so peculiar a people. The church of Rome has struck the second commandment quite out of the decalogue; and to make their number complete, hath split the tenth into two: The reason of which may be easily conceived.

DECAN, a kingdom of Asia, in the peninsula on this side the Ganges, bounded on the south by the kingdom of Bissnagar, on the west by the ocean, on the north by Mogulistan, and on the east by the mountains which separate it from Golconda.

DECANDRIA (*deka ten*, and *ang a husband*); Linnaeus's tenth class, comprehending those hermaphrodite plants which bear flowers with ten stamens. See BOTANY, p. 1292, and Plate LIX. fig. 10.

DECANTATION, among chemists, &c. the gently pouring off a liquor from its feces, by inclining the lip or *canthus* of the vessel; whence the name.

DECANUS, in Roman antiquity, an officer who presided over the other ten officers, and was head of the contubernum, or serjeant of a file of soldiers.

DECAPROTI, **DECEMPRIMI**, in Roman antiquity, officers for gathering the tributes and taxes.

The decaproti were also obliged to pay for the dead, or to answer to the emperor for the quota parts of such as died, out of their own estates.

DECASTYLE, in the ancient architecture, a building with an ordnance of ten columns in front, as the temple of Jupiter Olympius was.

DECEIT, in law; a subtle trick, or device, to which may be added all manner of craft and collusion, or underhand practice, used to defraud another, by any means whatever.

DECEMBER, the last month of the year, consisting of thirty-one days; and so called as being the tenth month in the Roman year, which commenced with March.

DECEMPEDA, in antiquity, a rule or rod divided into ten feet, each of which was subdivided into inches, and those into digits, used in measuring of land, and by architects, in giving the proper dimensions and proportions to the parts of their buildings.

DECEMVIRI, in Roman antiquity, ten magistrates chosen annually at Rome, to govern the commonwealth instead of consuls, with an absolute power to draw up and make laws for the people.

One of the decemvirs had all the ensigns and honours of the function, and the rest had the like in their turn, during the year of their decemvirate. In them was vested all the legislative authority ever enjoyed by the kings, or, after them, by the consuls. It was the decemviri that drew up the laws of the Twelve Tables, thence called *leges decemvirales*, which were the whole or the Roman law for a considerable time.

Decan

Decemviri.

Decennalia
||
Decius.

DECENNALIA, ancient Roman festivals, celebrated by the emperors every tenth year of their reign, with sacrifices, games, and largesses for the people. The emperor Augustus first instituted these solemnities, in which he was imitated by his successors. At the same time the people offered up vows for the emperor, and for the perpetuity of the empire; which were therefore called *vota decennalia*. Augustus's view in establishing the decennalia was to preserve the empire and the sovereign power without offence or restraint to the people. For during the celebration of this feast, that prince used to surrender up all his authority into the hands of the people; who, filled with joy, and charmed with the goodness of Augustus, immediately delivered it him back again.

DE CHALES (Claudius Francis Milliet), an excellent mathematician, mechanic, and astronomer, descended from a noble family, and born at Chamberry in 1611. His principal performances are an edition of Euclid's elements of geometry, in which the unserviceable propositions are rejected, and the uses of those retained, annexed; a discourse on fortification; and another on navigation. These with others have been collected, first in 3 vols folio, and afterwards in 4, under the title of *Mundus Mathematicus*: being indeed a complete course of mathematics. He died in 1678, professor of mathematics in the university of Turin.

DECIDUOUS, an appellation chiefly used in respect of plants: thus, the calix or cup of a flower is said to be *deciduous*, when it falls along with the flower-petals; and, on the contrary, it is called *permanent*, when it remains after they are fallen. Again, deciduous leaves are those which fall in autumn; in contradistinction to those of the ever-greens, which remain all the winter. See **DEFOLIATION**.

DECLI, in astronomy, an aspect or position of two planets, when they are distant from each other a tenth part of the zodiac.

DECIMAL ARITHMETIC, the art of computing by decimal fractions. See **ARITHMETIC**.

DECIMATION, a punishment inflicted by the Romans, on such soldiers as quitted their posts, or behaved themselves cowardly in the field. The names of the guilty were put into an urn or helmet, and as many were drawn out as made the tenth part of the whole number, and these were put to the sword and the others saved. This was called *decimare*; a word of the ancient Roman militia, who, to punish whole legions, when they had failed in their duty, made every tenth soldier draw lots, and put him to death for an example to the others.

As the Romans had their decimatio, they had also the vicefimatio, and even centesimatio, when only the 20th or 100th man suffered by lot.

DECIPHERING, the art of finding the alphabet of a cipher. For the art both of Ciphering and Deciphering, see the article **CIPHER**.

DECIVS (Publius), the Roman consul, and brave general, memorable for devoting himself for his country, in a battle with the Latins 340 B. C. Decius Mus, his son, followed his father's example, as did a grandson. The custom was, that the officer who devoted himself to the gods for the service of his country, after certain ceremonies of consecration, rushed completely armed into the midst of the enemy's fore-

most ranks, when their own depaired of victory: tho' this was an act of superstition which proved fatal to the hero, it reanimated his party, and occasioned them to gain the battle. See **DEVOTION**.

DECIVS, the Roman emperor. He persecuted the Christians, which was accounted the 7th persecution. At last he drowned himself in a marsh, that he might escape his enemies; who had killed his son, and defeated his army; A. D. 251.

DECK of a SHIP, (from *decken*, Dan. to cover); the planked floors of a ship, which connect the sides together, and serve as different platforms to support the artillery and lodge the men, as also to preserve the cargo from the sea in merchant-vessels. As all ships are broader at the lower deck than on the next above it, and as the cannon thereof are always heavier, it is necessary that the frame of it should be much stronger than that of the others; and for the same reason the second or middle deck ought to be stronger than the upper deck or forecaille.

Ships of the first and second rates are furnished with three whole decks, reaching from the stem to the stern, besides a forecaille and a quarter-deck, which extends from the stern to the mainmast; between which and the forecaille a vacancy is left in the middle, opening to the upper deck, and forming what is called the *waist*. There is yet another deck above the hinder or utmost part of the quarter-deck, called the *poop*, which also serves as a roof for the captain's cabin or couch.

The inferior ships of the line of battle are equipped with two decks and a half; and frigates, sloops, &c. with one gun-deck and a half, with a spar-deck below to lodge the crew.

The decks are formed and sustained by the beams, the clamps, the water-ways, the carlings, the ledges, the knees, and two rows of small pillars called *stanchions*, &c. See those articles.

That the figure of a deck, together with its corresponding parts, may be more clearly understood, we have exhibited a plan of the lower-deck of a 74 gun ship in Plate LXXXVIII. And as both sides of the deck are exactly similar, the pieces by which it is supported appear on one side, and on the other side the planks of the floor of which it is composed, as laid up on those upper pieces.

A, the principal or main hatch-way.

B, the stern-post.

C, the stem.

D, the beams, composed of three pieces, as exhibited by D, in one of which the dotted lines shew the arrangement of one of the beams under the other side of the deck.

E, part of the vertical, or hanging knees.

F, the horizontal or lodging knees, which fasten the beams to the sides.

G, the carlings ranging fore and aft, from one beam to another.

H, the gun-ports.

I, the pump-decies, being large wooden tubes, which return the water from the pumps into the sea.

K, the spurs of the beams, being curved pieces of timber serving as half-beams to support the decks, where a whole beam cannot be placed on account of the hatchways.

Decius,
Deck.

Deck,
Declama-
tion.

Declama-
tion.

L, the wing-transom, which is bolted by the middle to the stern-post, and whose ends rest upon the fashion-pieces.

M, the bulk-head or partition, which incloses the manger, and prevents the water which enters at the hawse-holes from running aft between decks.

N N, the fore hatch-way.

O O, the after hatch-way.

P, the drum-head of the gear capstern.

P p, the drum-head of the main capstern.

Q, the wing-transom knee.

R, one of the breast-hooks under the gun-deck.

S, the breast-hook of the gun-deck.

T T, the station of the chain-pumps.

V, the breadth and thickness of the timbers at the height of the gun-deck.

U U, scuttles leading to the gunner's store-room, and the bread-room.

W, the station of the fore-mast.

X, the station of the main-mast.

Y, the station of the mizen-mast.

Z, the ring-bolts of the decks, used to retain the cannon whillit charging.

a a, The ring-bolts of the sides whereon the tackles are hooked that secure the cannon at sea.

c a d, The water-ways, through which the scupper holes are pierced, to carry the water off from the deck into the sea.

b b, Plan of the foremast and aftmast cable-bits, with their cross-pieces g g, and their standards e e.

Thus we have represented on one side all the pieces which sustain the deck with its cannon; and on the other side, the deck itself, with a tier of 32-pounders planted in battery thereon. In order also to shew the use of the breaching and train-tackle, one of the guns is drawn in as ready for charging.

The number of beams by which the decks of ships are supported, is often very different, according to the practice of different countries; the strength of the timber of which the beams are framed; and the services for which the ship is calculated.

As the deck which contains the train of a fire-ship is furnished with an equipage peculiar to itself, the whole apparatus is particularly described in the article *FIRE-SHIP*.

Flush-Deck implies a continued floor laid from stem to stern, upon one line, without any stops or intervals.

Half-Deck, a space under the quarter-deck of a ship of war, contained between the foremast bulk-head of the steerage, and the fore-part of the quarter-deck. In the colliers of Northumberland the steerage itself is called the *half-deck*, and is usually the habitation of the crew.

DECLAMATION, a speech made in public, in the tone and manner of an oration, uniting the expression of action to the propriety of pronunciation, in order to give the sentiment its full impression upon the mind. According to the manners and customs of the present age, public harangues are made only, 1. In the pulpit. 2. In the senate, in council, or other public assembly. 4. By public professors. 5. On the theatre.

I. With regard to the declamation of the pulpit, the dignity and sanctity of the place, and the importance

of the subject, require the preacher to exert the utmost powers of his voice to produce a pronunciation that is perfectly distinct and harmonious, and that he observe a deportment and action which is expressive and graceful. No man therefore, who is destitute of a voice, should ascend the pulpit, and there act the part of a pantomime before his audience. The preacher should not, however, roar like a common crier, and rend the ear with the voice of thunder; for such kind of declamation is not only without meaning and without persuasion, but highly incongruous with the meek and gentle expressions of the gospel. He should likewise take particular care to avoid a monotony; his voice should rise from the beginning, as it were by degrees, and its greatest strength should be exerted in the application. Each inflexion of the voice should be adapted to the phrase, and to the meaning of the words; and each remarkable expression should have its peculiar inflexion. The dogmatic requires a plain, uniform tone of voice only; and the menaces of the gospel demand a greater force than do its promises and rewards; but the latter should not be pronounced in the soft tone of a flute, nor the former with the loud sound of a trumpet. The voice should still retain its natural tone in all its various inflexions. Happy is that preacher, to whom nature has given a voice that is at once strong, flexible, and harmonious.

An air of complacency and benevolence, as well as devotion, should be constantly visible in the countenance of the preacher. But every appearance of affectation must be carefully avoided: for nothing is so disgusting to an audience, as even the semblance of dissimulation. Eyes constantly rolling, turned towards heaven, and streaming with tears, rather denote a hypocrite, than a man possessed of the real spirit of religion, and that feels the true import of what he preaches. An air of affected devotion infallibly destroys the efficacy of all that the preacher can say, however just and important it may be. On the other hand, he must avoid every appearance of mirth or raillery, or of that cold unfeeling manner which is so apt to freeze the hearts of his hearers.

The body should be in general erect, and in a natural and easy attitude. The perpetual movement, or contortion, of the body, has a ridiculous effect in the pulpit, and makes the figure of a preacher and a harlequin much too similar. But, on the other hand, he ought not to remain constantly upright and motionless, like a speaking statue.

The motions of the hands give a strong expression to a discourse; but they should be constantly decent, grave, noble, and expressive. The preacher, who is incessantly in action, who is perpetually clapping his hands, or who menaces with a clenched fist, or counts his arguments on his fingers, will only excite mirth among his auditory. In a word, declamation is an art that the sacred orator should study with the utmost assiduity. The design of a sermon is to convince, to affect, and to persuade. The voice, the countenance, and the action, which are to produce this triple effect, are therefore the objects to which the preacher should particularly apply himself.

II. The declamation of a minister or statesman in the senate, in council, or other public assembly, is of a more unconfined nature. To persuade, to move the passions,

Bielfield's
Elements.

passions, and gain an ascendancy in a public assembly, the orator should himself feel the force of what he says, and the declamation should only express that internal sensation. But nothing should be carried to excess. A finavity in the tone of voice, a dignity of deportment, a graceful action, and a certain tranquillity of countenance, should constantly accompany the statesman when he speaks in public, even when he is most earnestly engaged in debate, or when he is addressing his sovereign in person. A pleasing tone of voice, and a distinct pronunciation, prejudice the hearers greatly in the speaker's favour. A young man may improve these to a surprising degree. Demosthenes, who had a natural impediment in his speech, was accustomed to go to the sea-shore, and partly filling his mouth with pebbles he declaimed with a loud voice. The stones by degrees gave a volubility to his tongue, and the roaring of the waves reconciled him insensibly to the noise of the multitude.

III. The principal object of a public professor is the instruction of the studious youth: for which purpose, he is to convince and persuade. Every tone of voice, every expression of the countenance, or action of the body, which can produce this effect by enforcing the words, should therefore be employed by those who are to teach the sciences. There is, moreover, one very essential reflection which every professor ought to make, and which is, that the chair, from which he harangues, is surrounded by young students, naturally possessed with vivacity, not infrequently ludicrous, and for the most part previously instructed in the preparatory sciences. They are therefore constantly inclined to criticise, to jest, and to ridicule: for which reason, the professor should endeavour to inspire them with respect and attention, by a grave, commanding, and venerable countenance; and carefully avoid all appearance of grimace in his action, and every kind of affectation in his discourse, that he may not afford the least opportunity for pleasantry.

IV. We are now come to *theatric declamation*.

1. This was very different among the ancients from what it is, and ought to be, with us, from the nature of the thing itself, and from the difference of circumstances. Numberless passages in Quintilian, and other ancient historians, critics, grammarians, and commentators, evidently prove, that the ancient dramatic declamation was subservient to the rules of the musical rhythmus: and by this, according to Aristides*, their action, as well as recital, was regulated. But to explain this seeming paradox, it will be necessary to make here some preliminary remarks. The ancients gave a much more extensive signification than we do to the word *music*, (*musica*), which they derived from the muses, or at least from some of them. It is for this reason, that the same Aristides and Quintilian define it to be "An art that teaches all that relates to the use of the voice, and the manner of performing all the motions of the body with grace." *Arts decoris in vocibus & motibus*. Therefore poetry, declamation, dancing, pantomimes, and many other gestures and exercises, were subservient to this art.

2. That part of general music which taught the art of declamation and gesture according to the rules of an established method, (and which we perform by instinct, or at most by the aid of common sense), was

distinguished by the name of *hypocritic music*: and this musical art was called, by the Greeks, *orchestis*; and by the Romans, *saltatio*. It was, however, so far from being an advantage to the ancients to have had this art, which we have not, that it was, on the contrary, a mark of great imperfection. For, in the first place, it was an instance of high absurdity to represent a tragedy, or comedy, before an audience of twenty thousand people, the far greatest part of whom could neither hear nor see what passed to any good purpose, unless they were possessed of organs which we have not. The theatres of London and Paris may conveniently contain about a thousand persons; and that is found sufficient in the most populous cities, where there are several places of entertainment on the same day, and where the people are reasonable enough to succeed each other in their diversions. As the features of the face could not be distinguished at so great a distance, and still less the alteration of countenance in order to represent the different passions, they were obliged to have recourse to *masks*; a wretched, childish invention, that destroyed all the strength and variety of expression. Their action became extravagant; and, at the same time, subservient to a regular mechanism, which prevented all the refinement, and all the pleasure of surprise, in the performance; and must have had an effect horribly disagreeable to those who were placed near the stage.

3. The egregious imperfection of their language likewise, which consisted of syllables long and short, whose duration was determined by a set measure of time, and their manner of tuning these syllables, after the method of the orchestis of the Greeks, was another disadvantage. For by this means they determined by notes or characters placed after the long and short syllables, not only the nature, but the duration, of each action. Now, nothing could be more affected, more constrained and disgusting, than such method of declaiming. How far superior in this respect are the moderns, who consult nature alone in their theatrial declamation; who can make the audience hear each sigh; who can accompany it with a proper attitude; who can incessantly vary their action; who can seize the lucky moment, and make the countenance fully express the sensations of the mind? Nature does all here; and art, infinitely inferior to nature, did all among the ancients. Modern declamation cannot be subservient to a musical rhythmus, seeing we speak rapidly, and without affectation. Our actors learn their art without art, from nature itself, assisted by reflection; and they arrive at a degree of excellence infinitely greater than that of the ancients, by a method far more simple, and by efforts incomparably more easy.

4. We do not, moreover, precisely know what the theatrial declamation of the ancients was; nor what were the musical instruments which accompanied that declamation. The title to the Eunuch of Terence says, for example, "That Flaccus, the freedman of Claudius, made the music of that piece, in which he employed the two flutes, the right and the left." These flutes, it is likely, gave the tone to the actor; which must have had a very odd effect on the audience. Most of the ancient pieces have similar titles. They who would be particularly informed of the art of declaiming among the Greeks and Romans, may read to advantage the Critical Reflections on Poetry and Painting

* *Demusica*,
lib. i.

ting by the Abbé du Bos. The third part of that work consists entirely of learned researches, and ingenious reflections, on this silly practice of the ancients. But as this art has happily no place in modern declamation, and can at best serve only to make a parade of erudition, we shall say no more of it, but pass to matters of real utility.

5. We think there is good reason to believe, moreover, that the most polished nations of modern Europe do not accompany their discourses, in general, with so many gesticulations, as did the Greeks, the Romans, and other inhabitants of warm climates. They appear to have found the method of animating a discourse, and giving it an expression, by the simple inflexions of the voice, and by the features of the countenance; which is far more decent, more just, and rational, than all those contortions which perpetually derange the natural attitude of the body and its members, and give the speaker the air of a harlequin.

6. *Expression*, therefore, forms at once the essence and the end of declamation; and the means of producing it consists in a pronunciation that is sonorous, distinct, and pleasing, supported by an action that is decent and proper to the subject. If the best dramatic poet has need of a good declaimer or actor to make his writing produce its proper effect, the actor has likewise need of a good poet to enable him to please and affect by his action: for it is to little purpose that he endeavours to charm his auditory by uniting, with nature, all the powers of art, if the poet has not furnished him with sentiments that are rational and affecting.

7. The actor, in studying his part before a large mirror, where he can see his whole figure, in order to determine the most proper expression for every thought, should consult nature, and endeavour to imitate her. But, in this imitation, he should take care not to make too servile a copy. He has this to observe, in common with his colleagues, the masters in all the polite arts: 'The theatre is intended to exhibit an imitation of nature, and not nature itself. Tragedy and comedy form pictures of human life; but these pictures are also pieces of perspective, which require strokes somewhat stronger than nature, that they may be discerned at a distance. The actor is elevated to a considerable height from the ground; he is surrounded by scenery, he is separated from the audience by the orchestra, and he speaks in verse; all this is not natural: but the spectator is to accede to this necessary illusion, in order to promote his own pleasure, which would not be so great as it is were all these matters otherwise disposed. Declamation, therefore, should somewhat exceed, but never lose sight of, nature.'

8. The tone of the actor's voice should be natural, but regulated by the extent of the theatre; sufficiently loud to be heard by all the audience, but not so violent as to rend their ears. A pure and graceful pronunciation, without any provincial accent, is likewise a great merit in an actor; and he should also habituate himself to speak in a manner perfectly distinct. It is a capital point in the pronouncing of verse, not to separate the two hemistichs, by resting too long on the *cesura* in the middle, or dwelling on the end of each hemistich: for, by so doing, the actor falls into a monotony, an insufferable uniformity of cadence, in a piece that consists of some thousand verses. The gra-

dations of the voice demand also a very judicious observance. The speaker, who begins in a high tone, will find it very difficult to sustain it through the whole piece; and he, who clamours incessantly, will find his lungs fail him in those parts where the vehemence of passion requires the strongest efforts. If we may be allowed the expression, the strongest touches, the boldest figures, will not there stand out from the picture in a striking manner.

9. The deportment of an actor should be constantly graceful, decent, and proper to the character he represents. An old man has a different position of body from a young *petit maitre*; an aged queen from a young princess; a noble gallant from a valet de chambre. A rational observance of nature, and an imitation of the best actors, are here the surest guides. The same may be said of the action of the hands, the theatrical step, &c. An inanimated figure, a body in the position of a statue, and hands immovable, are as displeasing in the scene, as a player whose incessant gesticulation resembles the action of a puppet.

10. Every actor who aspires to make his art something more than merely mechanical, will begin by enabling himself readily to repeat his part, that the defect of his memory may not embarrass his action. When he is so far a master of it, he will make it the subject of serious reflection in his closet; endeavour to seize the true sense of the author; and to find out that expression of each sentiment and passion, which is the most natural, the most striking, and best adapted to the stage; and which he will cultivate by repeated essays, till he is able to render it in its full force.

DECLARATORY ACTION. See LAW, N^o clxxxiii.

21.

DECLENSION, in grammar, an inflection of nouns according to their divers cases; as nominative, genitive, dative, &c. See GRAMMAR.

DECLINATION, in astronomy, the distance of any celestial object from the equinoctial, either northward or southward. It is either true or apparent, according as the real or apparent place of the object is considered. See ASTRONOMY, N^o 210, 211.

DECLINATION of the *Sea-Compass* or *Needle*, is its variation from the true meridian of any place.

DECLINATION of a *Wall*, or *Plane*, for *Dials*, is an arch of the horizon, contained either between the plane and the prime vertical circle, if you reckon it from the east or west; or else between the meridian and the plane, if you account it from the north or south. See DIAL.

DECLINATORIES, are instruments for taking the declinations, inclinations, and reclinations of planes; and they are of several kinds.

The best sort for taking the declination consists of a square piece of brass, or wood, with a limb accurately divided into degrees; and every fifth minute, if possible, having a horizontal dial moving on the centre, made for the latitude of the place it is to serve in; and which has a small bit of fine brass fixed on its meridian line, like a fiducial edge, to cut the degrees of the limb: for at any time when the sun shines, by having the hour of the day, you may find the declination of any wall or plane by this instrument.

DECLINATURE of JUDGES. See LAW, N^o clvi. 12.

DECLIVITY denotes the reverse of ACCLIVITY.
DECOC.

Decoction
||
Decoration.

DECOCTION, usually signifies either the action of boiling a substance in water, or the water itself in which the substance has been boiled. It is only applicable to matters containing some principles soluble in water; such particularly are animal and vegetable matters. Decoction ought not to be used with such substances as contain any volatile principles, as they would be dissipated in the air during the process. But it may be safely used, nay even becomes necessary, when the matters to be treated are solid, and of a close and compact texture; because then the water could not extract its principles without a boiling heat. Most soft animal matters, as flesh, skin, tendons, may be conveniently boiled in water; because they contain no principle volatile with a boiling heat. Water extracts from them nothing but a gelatinous substance, and some oily parts which float on the surface of the water. All vegetable matters which are inodorous, and particularly those which are hard, as roots, barks, &c. are generally boiled, when an extraction of their principles by water is required.—To this rule, however, there are some exceptions. Peruvian bark, for instance, gives its strength to cold water better than to such as is boiling hot. Many other vegetables also have the same property of yielding less to boiling than to cold water. And therefore a general rule may be established, that decoction ought not to be employed but when absolutely necessary; that is, when the same principles, or the same quantities of those principles, cannot be obtained by an infusion, and that without heat, if it can be so done, considering that the proximate principles of vegetables are generally so delicate, and so susceptible of change and decomposition, that frequently the most gentle heat changes much their nature and properties.

DECOLLATION, **BEHEADING**, a term seldom used but in the phrase *decollation* of St John Baptist; which denotes a painting, wherein is represented the Baptist's head, struck off from his trunk; or the feast held in honour of that martyr.

DECOMPOSITION, in chemistry, usually signifies the division or separation of the constituent parts of bodies.—It differs from mere mechanical division, in that when a body is chemically decomposed, the parts into which it is resolved are essentially different from the body itself; but though a mechanical force is applied to it ever so long, or with ever so much violence, the minutest particles into which the body may be reduced, still retain their original nature.—Thus, for example, though we suppose nitre, or any other salt, to be reduced to ever so fine powder, each particle retains the nature of nitre, as much as the largest unpounded mass; but if oil of vitriol is applied, a decomposition takes place, and one of the component parts of the nitre rises in the form of a smoking acid spirit, which never could have been suspected to lie hid in the mild neutral salt.

DECORATION, in architecture, any thing that adorns and enriches a building, church, triumphal arch, or the like, either without side or within.

The orders of architecture contribute greatly to the decoration: but then the several parts of those orders must have their just proportions, characters, and ornaments; otherwise the finest order will bring confusion rather than richness. See **ARCHITECTURE**.

Decorations in churches, are paintings, vases, festoons, &c. occasionally applied to the walls; and with so much conduct and discretion, as not to take off any thing from the form of the architecture: as is much practised in Italy, at the solemn feasts.

DECORATION is more particularly applied to the scenes of theatres.

In operas, and other theatrical performances, the decorations must be frequently changed conformably to the subject.

The ancients had two kinds of decorations for their theatres: the first, called *versatiles*, having three sides, or faces, which were turned successively to the spectators: the other called *distiles*, shewing a new decoration by drawing or sliding another before it.—This latter sort is still used, and apparently with much greater success than among the ancients, who were obliged to draw a curtain whenever they made a change in the decoration; whereas on our stage the change is made in a moment, and almost without being perceived.

DECORUM, in architecture, is the suitableness of a building, and the several parts and ornaments thereof, to the station and occasion.

DECOUPLE, in heraldry, the same as uncoupled: thus a chevron decouple, is a chevron wanting so much of it towards the point, that the two ends stand at a distance from one another, being parted and uncoupled.

DECOY, in naval affairs, a stratagem employed by a small ship of war to betray a vessel of inferior force into an uncautions pursuit, till she has drawn her within the range of her cannon, or what is called within *gunshot*. It is usually performed by painting the stern and sides in such a manner as to disguise the ship, and represent her either much smaller and of inferior force, or as a friend to the hostile vessel, which she endeavours to ensnare, by assuming the emblems and ornaments of the nation to which the stranger is supposed to belong. When she has thus provoked the adversary to chase, in hopes of acquiring a prize, she continues the decoy by spreading a great sail, as endeavouring to escape; at the same time that her course is considerably retarded by an artful alteration of her trim, till the enemy approaches. Decoying is also performed to elude the chase of a ship of a superior force in a dark night, by throwing out a lighted cask of pitch into the sea, which will burn for a considerable time and misguide the enemy. Immediately after the cask is thrown out, the ship changes her course, and may easily escape if at any tolerable distance from the foe.

Decoy, among fowlers, a place made for catching wild-fowl. A decoy is generally made where there is a large pond surrounded with wood, and beyond that a marshy and uncultivated country: if the piece of water is not thus surrounded, it will be attended with the noise and other accidents which may be expected to frighten the wild-fowl from a quiet haunt, where they mean to sleep, during the day-time, in security. If these noises or disturbances are wilful, it hath been held that an action will lie against the disturber.—As soon as the evening sets in, the decoy *rises* (as they term it), and the wild fowl feed during the night. If the evening is still, the noise of their wings, during their flight, is heard at a very great distance, and is a pleasing

Decorum
||
Decoy.

Decoy. pleasing though rather melancholy sound. This *rising* of the decoy in the evening, is in Somersetshire called *radding*.

The decoy-ducks are fed with hempseed, which is thrown over the screens in small quantities, to bring them forwards into the pipes, and to allure the wild-fowl to follow, as this seed is so light as to float.

There are several *pipes*, as they are called, which lead up a narrow ditch that closes at last with a funnel-net. Over these pipes, (which grow narrower from their first entrance), is a continued arch of netting suspended on hoops. It is necessary to have a pipe or ditch for almost every wind that can blow, as upon this circumstance it depends which pipe the fowl will take to; and the decoy-man always keeps on the leeward side of the ducks, to prevent his effluvia reaching their sagacious nostrils. All along each pipe at certain intervals, are placed screens made of reeds, which are so situated, that it is impossible the wild-fowl should see the decoy-man, before they have passed on towards the end of the pipe, where the purse-net is placed. The inducement to the wild-fowl to go up one of these pipes is, because the decoy-ducks trained to this, lead the way, either after hearing the whistle of the decoy-man, or enticed by the hempseed; the latter will dive under water, whilst the wild-fowl fly on, and are taken in the purse.

It often happens, however, that the wild-fowl are in such a state of sleepiness and dozing, that they will not follow the decoy-ducks. Use is then generally made of a dog, who is taught his lesson: he passes backwards and forwards between the reed-screens, (in which are little holes, both for the decoy-man to see, and the little dog to pass through); this attracts the eye of the wild-fowl, who, not choosing to be interrupted, advance towards the small and contemptible animal, that they may drive him away. The dog all the time, by the direction of the decoy-man, plays among the screens of reeds, nearer and nearer the purse-net; till, at last, perhaps, the decoy-man appears behind a screen, and the wild-fowl not daring to pass by him in return, nor being able to escape upwards on account of the net-covering, rush on into the purse-net. Sometimes the dog will not attract their attention, if a red handkerchief, or something very singular, is not put about him.

The general season for catching fowl in decoys, is from the latter end of October till February: the taking of them earlier is prohibited by an act 10 *Geo. II. c. 32.* which forbids it from June 1st to October 1st, under the penalty of five shillings for each bird destroyed within that space.

The Lincolnshire decoys are commonly set at a certain annual, from 5 to 20 pounds a-year: and there is one in Somersetshire that pays 30*l.* The former contribute principally to supply the markets in London. Amazing numbers of ducks, wigsons, and teal, are taken: by an account sent us* of the number caught a few winters past, in one season, and in only ten decoys, in the neighbourhood of Wainfleet, it appeared to amount to 31,200, in which are included several other species of ducks: it is also to be observed, that, in the above particular, wigson and teal are reckoned but as one, and consequently sell but at half price of the ducks. This quantity makes them so cheap on

the spot, that we have been assured, several decoy-men would be content to contract for years to deliver their ducks at Boston, for 10*d.* per couple. The account of the numbers here mentioned, relates only to those that were sent to the capital.

It was customary formerly to have in the fens an annual *driving* of the young ducks before they took wing. Numbers of people assembled, who beat a vast tract, and forced the birds into a net placed at the spot where the sport was to terminate. A hundred and fifty dozens have been taken at once: but this practice being supposed to be detrimental, has been abolished by act of parliament.

DECREE, an order made by a superior power for the regulation of an inferior.

DECREE, in the civil law, is a determination which the emperor pronounces upon hearing a particular cause between the plaintiff and defendant.

DECREEs of *Council*, are the laws made by them, to regulate the doctrine and policy of the church.

DECREEs in *Chancery*, are the determination of the lord-chancellor, upon a full hearing of the merits of a cause.

DECREET, in the law of Scotland, a final decree or judgment of the lords of session, from which an appeal only lies to parliament.

DECREET-*Arbital*, in Scots law, the sentence or judgment of one to whom parties voluntarily submit the determination of any question betwixt them *.

DECUREMENT, in heraldry, signifies the wane of the moon from the full to the new. The moon in this state is called *moon decrecent*, or in *decours*; and when borne in coat-armour, faces to the left side of the escutcheon, as she does to the right side when in the increment. * See Law, N^o cxxxv.

DECREPITATION, in chemistry, signifies the quick separation of the parts of a body, occasioned by a strong heat, and accompanied with noise and crackling. This effect is most frequently produced by water contained betwixt the parts of the decrepitating body, when these parts have a certain degree of adhesion together. This water being quickly reduced into vapours by the heat suddenly applied to it, rarifies, and bursts with noise the parts which compress it. The bodies most subject to decrepitation are certain salts, such as common salt, vitriolated tartar, nitre of lead, &c. the decrepitation of all which proceeds from the water of their crystallization. Clays which are not perfectly dry, and flints, are also subject to decrepitation.

DECRETAL, in the canon law, a letter of a Pope determining some point or question in the ecclesiastical law. The decretals compose the second part of the canon law. The first genuine one, acknowledged by all the learned as such, is a letter of Pope Siricius, written in the year 385, to Himerus bishop of Tarragona, in Spain, concerning some disorders which had crept into the churches of Spain. Gratian published a collection of decretals, containing all the ordinances made by the Popes till the year 1150. Gregory IX. in 1227, following the example of Theodosius and Justinian, formed a constitution of his own, collecting into one body all the decisions and all the causes which served to advance the papal power; which collection of decretals was called the *pentateuch*, because it contains five books.

Decree
Decretation.

DECUPLE PROPORTION, that of ten to one.
DECURIO, in Roman antiquity, a commander of ten men in the army, or the chief of a decury.
DECURRENT LEAF. See **BOTANY**, p. 1297.
DECURY, ten persons ranged under one chief, or leader, called the *decurio*.

The Roman cavalry was divided into decuries, which were subdivisions of a century, each century containing ten decuries.

DECUSSATION, a term in geometry, optics, and anatomy, signifying the crossing of two lines, rays, or nerves, when they meet in a point, and then go on separately from one another.

DECUSSORIUM, a surgeon's instrument, which, by pressing gently on the dura mater, causes an evacuation of the pus collected between the cranium and the before-mentioned membrane, through the perforation made by the trepan.

DEDHAM, a town of Essex in England, consisting of about 400 lofty houses. The streets are not paved, but very clean, occasioned by their lying pretty high. It has one large old church, remarkable for a fine Gothic steeple, with a great deal of carved work about it, but much injured by time. E. Long. 1. 10. N. Lat. 52. 5.

DEDICATION, the act of consecrating a temple, altar, statue, palace, &c. to the honour of some deity.

The use of dedications is very ancient both among the worshippers of the true God, and among the heathens: the Hebrews call it *חננה* *hannuchah*, "imitation;" which the Greek translators render *Εκκατα*, and *Εκκαταρος*, "renewing."

In the scripture we meet with dedications of the tabernacle, of altars, of the first and second temple, and even of the houses of private persons. There are also dedications of vessels, and garments of the priests and Levites, and even of the men themselves.

The heathens had also dedications of temples, altars, and images of their gods, &c. Nebuchadnezzar held a solemn dedication of his statue, *Dan. iii. 2*. Pilate dedicated gilt bucklers at Jerusalem to Tiberius, *Philo de legat.* Petronius would have dedicated a statue to the emperor in the same city, *ibid. p. 791*. Tacitus, *Hist. lib. iv. c. 53*, mentions the dedication of the capitol, upon rebuilding it by Vespasian, &c.

The Jews celebrated the anniversary of the dedication of their temple every year for eight days. This was first enjoined by Judas Maccabeus, and the whole synagogue, in the year of the Syro-Macedonian Æra 148, i. e. 164 years before Christ. The heathens had the like anniversaries, as that of the dedication of the temple of Parthenope, mentioned by Lycophron. Under Christianity, dedication is only applied to a church; and is properly the consecration thereof performed by a bishop, with a number of ceremonies prescribed by the church.

The Christians finding themselves at liberty under Constantine, in lieu of their ruinous churches, built new ones in every place; and dedicated them with a deal of solemnity. The dedication was usually performed in a synod; at least they assembled a number of bishops to assist at the service. We have the description of those of the churches at Jerusalem and Tyre in Eusebius, and many others in later writers.

DEE (John), a famous mathematician and astro-

loger, was born (July 1527) in London, where his father was a wealthy vintner. In 1542, he was sent to St John's college, Cambridge. After five years close application to mathematical studies, particularly astronomy, he went to Holland, in order to visit several eminent mathematicians on the continent. Having continued abroad near a year, he returned to Cambridge; and was there elected one of the fellows of Trinity college, then first erected by king Henry VIII. In 1548, he took the degree of master of arts; and, in the same year, left England a second time; his stay at home being rendered uneasy to him, by the suspicions that were entertained of his being a conjuror; arising partly from his application to astrology, but especially on account of a piece of machinery in the *Lispis* of Aristophanes, which he exhibited to the university, and in which he represented the *Scarabeus* flying up to Jupiter, with a man and a basket of victuals on its back. These suspicions he could never after shake off: nor did his subsequent conduct, as we shall see, tend to clear him of the imputation; for if he was not actually a conjuror, it was not for want of endeavours.

Upon leaving England, he went to the university of Louvain; where he was much esteemed, and visited by several persons of high rank. Here he resided about two years, and then set out for France; where, in the college of Rheims, he read lectures of Euclid's elements with vast applause. In 1551, he returned to England, and was introduced by the secretary Cecil to king Edward, who assigned him a pension of 100 crowns, which he afterwards relinquished for the rectory of Upton upon Severn; but soon after the accession of queen Mary, having some correspondence with the lady Elizabeth's servants, he was accused of practising against the queen's life by enchantment. On this account he suffered a tedious confinement, and was several times examined; till, in the year 1555, he obtained his liberty by an order of council.

When queen Elizabeth ascended the throne, our astrological Dee was consulted by lord Dudley, concerning a propitious day for her majesty's coronation. He was on this occasion introduced to the queen, who made him great promises, which were never performed, though she condescended to receive his instructions relative to the mystical interpretation of some of his unintelligible writings, which he published about this time. In 1564, he made another voyage to the continent; in order to present a book which he had dedicated to the emperor Maximilian. He returned to England in the same year; but in 1571, we find him in Lorain; where, being dangerously ill, the queen sent over two physicians to his relief. Having once more returned to his native country, he settled at Mortlake in Surrey, where he continued his studies with unremitting ardor, and collected a considerable library of curious books and manuscripts, with a variety of instruments; most of which were afterwards destroyed by the mob, as belonging to one who dealt with the devil. In 1578, the queen being much indisposed, Mr Dee was sent abroad to consult with German physicians and philosophers (astrologers no doubt) on the occasion. We now behold him again in England, where he was soon after employed in a more rational service. Her majesty, desirous to be informed concerning her title to those countries which had been discovered by her subjects,

Dec.

jects, commanded Mr Dee to consult the ancient records, and furnish her with proper geographical descriptions. Accordingly, in a short time he presented to the queen, in the gardens at Richmond, two large rolls, in which the discovered countries were geographically described and historically illustrated. These rolls are preserved in the Cotton library, *Augustus* 1. His next employment was the reformation of the calendar, on which subject he wrote a rational and learned treatise, preserved in the Ashmolean library at Oxford.

Hitherto the extravagancies of our eccentric philosopher seem to have been counterpoised by a tolerable proportion of reason and science; but henceforward we consider him as a mere necromancer, and credulous alchymist. In the year 1581, he became acquainted with one Edward Kelley, by whose assistance he performed diverse incantations, and maintained a frequent imaginary intercourse with spirits. He was particularly intimate, it seems, with the angels Raphael and Gabriel. One of them made him a present of a black speculum, in which his angels and demons appeared as often as he had occasion for them; they answered his questions, and Kelley's business was to record their dictates:

Kelley did all his feats upon
The devil's looking-glass, a stone.

HV D18. part II. cant. III. v. 631.

In 1583, they were both introduced to a certain Polish nobleman, then in England, named *Albert Laski*, palatine of Siradia, a person equally addicted to the same ridiculous pursuits. He was so charmed with Dee and his companion, that he persuaded them to accompany him to his native country. They embarked for Holland in Sept. 1583; and travelling over land, arrived at the town of Laski, in February following. Their patron, however, finding himself abused by their idle pretensions, persuaded them to pay a visit to Rodolph king of Bohemia; who, tho' a credulous man, was soon disgusted with their nonsense. They were afterwards introduced to the king of Poland, but with no better success. Soon after this, they were invited by a rich Bohemian nobleman, to his castle of Trebona, where they continued for some time in great affluence; owing, as they asserted, to their art of transmutation by means of a certain powder in the possession of Kelley.

Dee, now quarrelling with his companion in iniquity, quitted Bohemia, and returned to England, where he was once more graciously received by the queen; who, in 1595, made him warden of Manchester college, in which town he resided several years. In 1604, he returned to his house at Mortlake, where he died in the year 1608, aged 81; leaving a large family, and many works, behind him.—The black stone into which Dee used to call his spirits, was in the collection of the earls of Peterborough, whence it came to lady Elizabeth Germaine. It was next the property of the late duke of Argyll, and is now Mr Walpole's. It appears upon examination to be nothing but a polished piece of cannel-coal.—That Dee was a man of considerable acquirements, is beyond a doubt; his mathematical knowledge is generally allowed; but, unless we suppose him a wicked impostor, which is by no means improbable, we must transmit him to posterity as one of the most foolish, superstitious, necromancers of his

time. Nevertheless, the celebrated Dr Hook, many years after Dee's death, took it into his head to prove that his journal, published by Casaubon, was entirely cryptographical, concealing his political transactions, and that he was employed by queen Elizabeth as a spy.

DEE, the name of several rivers in Scotland and England; as those whereon the cities of Chester in England, and New Aberdeen in Scotland, are situated.

DEED, an instrument written on paper or parchment, comprehending some contract, bargain or agreement between the parties thereto, in relation to the matter therein contained.

DEEMSTERS, or DEMSTERS; (from the Saxon *dema*, judge or umpire). All controversies in the life of Man are decided without process, writings, or any charges, by certain judges, chosen yearly from among themselves, called *deemsters*; there being two of them for each division of the island: they sit judges in all courts, either for life or property; and with the advice of 24 keys, declare what is law in uncommon emergencies.

DEEPING, a town of Lincolnshire in England, seated on the river Weland, in a sunny ground. W. Long. o. 20. N. Lat. 52. 35.

DEER, in zoology. See CERVUS.—The method of hunting deer in the island of Ceylon, is very particular. The huntmen go out in the night, and only two usually go together: the one of these carries upon his head an earthen vessel, in which there is some fire burning and flaming; the ingredients are generally small sticks cut into pieces, and common rosin. Of this the other man carries a supply about him to replenish the pot when it grows low. The person who has the fire upon his head, carries in one hand a staff, on which there are fixed eight bells; and the larger these are, the better. This man goes first into the woods, and the other follows close behind with a spear in his hand. As soon as the deer hears the noise of the bells, he turns towards the place whence the sound comes; and seeing the fire, he eagerly runs up to it, and stands gazing at a small distance: the second man has then nothing to do but to kill him with the spear; for he sees neither of them.—Not only deer, but even elks and hares, are thus taken; for they gaze at the fire, and never fee the men. The profits of this sort of hunting are very large, and the danger nothing; for tho' there are numbers of tygers, elephants, and wild boars, in these woods, the huntmen are in no danger from them while the fire burns, for they all run away from it.

DE FACTO, something actually in fact, or existing; in contradistinction to *de jure*, where a thing is only so in justice, but not in fact: as a king *de facto*, is a person who is actually in possession of a crown, but has no legal right to the same; and a king *de jure*, is the person who has a just right to the crown, though he is out of possession thereof.

DEFAMATION, the speaking slanderous words of another; for which the slanderer is punishable, according to the nature of his offence, either by action upon the case at common law, or by statute in the ecclesiastical court.

DEFAULT, in law, is generally taken for non-appearance in court, at a day assigned; but imports any omission of that which we ought to do, for which

Deed

Default.

Defeasance judgment may be given against the default.

DEFEASANCE. See DEFEASANCE.

DEFECATE, or DEFECATE, in chemistry, a term applied to a body freed and purged from feces and impurities.

DEFECTION, the act of abandoning or relinquishing a party or interest a person had been engaged in.—The word is formed of the Latin *deficio*, to fall of.

DEFECTIVE, in general, an appellation given to things which want some of the properties that naturally they ought to have. Thus,

DEFECTIVE or *Deficient Nouns*, in grammar, are such as want either a whole number, a particular case, or are totally indeclinable. See *NOUN*.

The term *defective* is also applied to a verb that has not all its moods and tenses. See *VERB*, *MOOD*, &c.

DEFEISANCE, in law, a condition relating to some certain deed, which being performed, the deed is defeated and rendered void, as if it had never been made.

DEFENCE, in fortification, all sorts of works that cover and defend the opposite posts, as flanks, casements, parapets, and saussebrays. See *FORTIFICATION*.

Line of DEFENCE, a supposed line drawn from the angle of the curtain, or from any other part in the curtain, to the flanked angle of the opposite bastion.

DEFEND, in general, signifies much the same with *protecting*, or keeping off injuries offered to any person either by enemies or otherwise.

DEFEND, in our ancient laws and statutes, signifies to prohibit or forbid : as, *Usurarius defendit quoque rex Edwardus ne remaneant in regno*. L. L. Edw. Conf. c. 37. & 5 Rich. 2. c. 7. In which sense Chaucer also uses it in the following passage :

“Where can you fay in any manner age,

“That ever God defended marriage.”

In 7 Edw. I. there is a statute, intitled, “*Statutum de defensione portandi arma*,” &c. And “it is defended by law to distrain on the highway ;” *Coke on Littl.* fol. 161.

DEFENDANT, in law, the person sued in an action personal ; as *tenant* is he who is sued in an action real. See *ACTION*.

DEFENDERS, were anciently notable dignities both in church and state, whose business was to look to the preservation of the public weal, to protect the poor and helpless, and to maintain the interests and causes of churches and religious houses. See *PROTECTOR*.—The council of Chalcedon, can. 2. calls the *defender* of a church *Ephesus*. Codin, *de officiis aule Const.* makes mention of *defenders* of the palace. There were also a defender of the kingdom, *defensor regni* ; defenders of cities, *defensores civitatis* ; defenders of the people, *defensores plebis* ; of the poor, fatherless, widows, &c.

About the year 420, each patriarchal church began to have its defender ; which custom was afterwards introduced into other churches, and continued to later days under other names ; as those of *Advocate*, and *Advocæ*.

In the year 407, we find the council of Carthage asking the emperor for defenders, of the number of *Scholaſtici*, i. e. advocates who were in office ; and that it might be allowed them to enter and search

the cabinets and papers of the judges and other civil magistrates, whenever it should be found necessary for the interest of the church. The emperor still retains the quality of advocate of the church ; and the kings of Great Britain preserve the title of *Defender of the Faith*, granted to Henry VIII. by pope Leo X. in 1521, on occasion of that prince's writing against Luther, and afterwards confirmed by Clement VII. Tho. Chamberlayne says, the title belonged to the kings of England before that time ; and for proof hereof appeals to several charters granted to the university of Oxford : So that pope Leo's bull was only a renovation of an ancient right. *Pres. Stat. l. 1. c. 2.*

DEFILE, in fortification, a straight narrow passage, through which a company of horse or foot can pass only in file, by making a small front.

DEFINITE, in grammar, is applied to an article that has a precise determinate signification ; such as the article *the* in English, *le* and *la* in French, &c. which fix and ascertain the noun they belong to, to some particular ; as *the king*, *le roy* : whereas, in the quality of *king*, *de roy*, the articles *of* and *de* mark nothing precise, and are therefore indefinite.

DEFINITION, in general, a short description of a thing by its properties ; or, in logic, the explication of the essence of a thing by its kind and difference. See *LOGIC*, n° 6.—24. 51, 52.

DEFINITIVE, a term applied to whatever terminates a process, question, &c. ; in opposition to provisional and interlocutory.

DEFLAGRATION, in chemistry, the kindling or setting fire to a salt or mineral, &c. either alone or mixed for that purpose with a sulphureous one, in order to purify it. See *CHEMISTRY*, n° 83.

This short process has been often recommended to the world as of great use in trying the strength of brandies and other vinous spirits, and has been greatly improved in this respect by Mr Geoffroy.

The common way of trying spirits by deflagration, is to measure out any quantity of it, then to heat it, and set it on fire. If, after it will no longer burn, the remainder is half as much as the quantity measured out for the trial was, then the spirit tried is found to consist of half water, and half totally inflammable spirit ; that is, it is somewhat below what we understand by the term *perfect proof*.—This method is much more certain than that by the crown of bubbles which arises upon shaking the spirit in a vial. Monſ. Geoffroy's method is this : Take a cylindric vessel two inches high, and as much in diameter, consisting of thin plate silver, that metal being much less liable to rust than copper ; this vessel must be fitted with a little rectangular gage exactly graduated into lines, half lines, &c. then the vessel being set level upon a copper case made to contain it, a parcel of the brandy to be examined is poured in, to the height of 16 lines. This height is to be exactly hit by pouring in more than enough at first, and then sucking out the overplus with a very small tube. Then the vessel being heated a little, so as just to make the liquor fume, it is to be set on fire, and left to go out of itself ; at the instant when the flame expires, the gage is plunged perpendicularly into the vessel, and the lines and quarters exactly noted which the liquor wants of its former height : this difference

Defile
Deflagration.

Deflection, ference gives the precise quantity of alcohol or pure spirit contained in the liquor. Thus, if eight lines of phlegm are found remaining, this being the half of the 16 lines of the original filling, it is plain, that the liquor contained one half spirit, or was something below proof. If only four lines remained, it was nearly double proof, or of a middle nature betwixt alcohol and common proof-spirit.

DEFLECTION of the RAYS of LIGHT, a property which Doctor Hook observed in 1675, and read an account of before the Royal Society, March 18, the same year. He says he found it different both from reflection and refraction, and that it was made towards the surface of the opaque body, perpendicularly. This is the same property, which Sir Isaac Newton calls *inflection*. See the article **INFLECTION**.

DEFLOURATION, or **DEFLOWERING**, the act of violating or taking away a woman's virginity. See **VIRGINITY**.—Death, or marriage, are decreed by the civil law in case of defloration.

The ancients had so much respect for virgins, that they would not put them to death, till they had first procured them to be deflowered. It is said, the natives of the coast of Malabar pay strangers to come and deflower their brides.

In Scotland, and the northern parts of England, it was a privilege of the lords of the manor, granted them by king Ewen, that they should have the first night's lodging with their tenants wives. King Malcolm III. allowed the tenants to redeem this service at a certain rate, called *marcbeta*, consisting of a certain number of cows: Buchanan says it was redeemed with half a mark of silver. The same custom had place in Wales, Flanders, Friseland, and some parts of Germany.

DEFLUXION, in medicine, the falling of the humours from a superior to an inferior part of the body.

DE FOE (Daniel), a writer famous for politics and poetry, was bred a hofier; which profession however he soon forsook, and became one of the most enterprising authors that any age produced. When dissenters ran high at the Revolution, and king William was obliged to dismiss his Dutch guards, De Foe, who had true notions of civil liberty, ridiculed the enemies of government in his well-known poem, called *The True-born Englishman*, which had a prodigious sale. The next satire he wrote was intitled, *Reformation of Manners*; aimed at some persons of high rank, who rendered themselves a disgrace to their country. When the ecclesiastics in power breathed too much of a spirit of persecution, De Foe wrote a tract called *The Short-cut away with the Dissenters*; for which he was called to account, and explained himself with great firmness. He was afterward sentenced to the pillory for attacking some public measures; which so little intimidated him, that, in defiance of their usage, he wrote *A Hymn to the Pillory*. It would be endless to enumerate all his publications: but as he is perhaps best known for his admirable *History of Robinson Crusoe*, it may be worth while to give the history of that work; which does the author of it no credit as to the better part of a writer's character, honestly. When captain Woods Rogers touched at the island of Juan Fernandez, in the South Sea, he brought away Alexander Selkirk, a Scots sailor, who had been left ashore there, and had lived on that desolate place above four years. When Selkirk

came back to England, he wrote a narrative of his adventures, and put the papers into the hands of De Foe, to digest for publication; who ungenerously converted the materials into the *History of Robinson Crusoe*, and returned Selkirk his papers again! A fraud for which, in a humane view, the distinguished merit of that romance can never atone. Daniel de Foe died at Ilfington, in 1731.

DEFOLIATION, (from *de*, and *folium* a leaf); the fall of the leaves. A term opposed to *frondeſcentia*, the annual renovation of the leaves, produced by the unfolding of the buds in spring. See **FRONDESCENTIA**.

Molt plants in cold and temperate climates shed their leaves every year: this happens in Autumn, and is generally announced by the flowering of the common meadow saffron. The term is only applied to trees and shrubs; for herbs perish down to the root every year, losing stem, leaves, and all.

All plants do not drop their leaves at the same time. Among large trees, the ash and walnut, although latest in unfolding, are soonest divested of them: the latter seldom carries its leaves above five months.

On the oak and horn-beam, the leaves die, and wither, as soon as the colds commence; but remain attached to the branches till they are pushed off by the new ones, which unfold themselves the following spring. These trees are doubtless a kind of ever-greens: the leaves are probably destroyed only by cold; and perhaps would continue longer on the plant, but for the force of the spring-fap, joined to the moisture.

In mild and dry seasons, the lilac, privet, yellow jessamine of the woods, and maple of Crete, preserve their leaves green until spring, and do not drop them till the new leaves are beginning to appear. The fig-tree, and many other trees that grow between the tropics, are of this particular class of ever-greens. The trees in Egypt, says Doctor Hasselquist, cast their leaves in the latter end of December and beginning of January, having young leaves ready before all the old ones are fallen off; and, to forward this operation of nature, few of the trees have buds: the sycamore and willow, indeed, have some, but with few and quite loose *ſtipule* or scales. Nature did not imagine buds to be necessary in the southern as in the northern countries; this occasions a great difference between them.

Lastly, some trees and shrubs preserve their leaves constantly through the whole year: and are not in the least influenced by the clemency or inclemency of seasons. Such are the fir, juniper, yew, cedar, cypress, and many other trees, hence denominated *ever-greens*. These preserve their old leaves a long time after the formation of the new, and do not drop them at any determinate time. In general, the leaves of ever-greens are harder, and less succulent, than those which are renewed annually. The trees are generally natives of warm climates: as the alaternuses of France and Italy, the ever-green oak of Portugal and Suabia.

Some herbaceous perennials, as the house-leeks and navel-worts, enjoy the same privilege with the ever-green trees, and resist the severities of winter: some even can dispense with the earth for some time; being replete with juices, which the leaves imbibe from the humidity of the atmosphere, and which, in such plants, are, of themselves, sufficient for effecting the purposes of vegetation. It is for this reason, that, unless in excessive

Defoliation
Deforce-
ment.

cessive hot weather, gardeners are seldom wont to water fat succulent plants, as the aloes, which rot, when they are moistened, if the sun does not quickly dry them up.

The leaves of all the ever-green shrubs and trees, have a thin compact skin, or cover, over their surface; as is easily discovered by macerating them in water, in order to separate the parenchyma, or pulp, from the vessels of the leaves; which cannot be effected in any of these ever-greens, till a thin parchment-like cover is taken off. These trees and shrubs are found by experiment to perspire but little, when compared with others which shed their leaves; and it is, perhaps, principally owing to this close covering, as also to the small proportion of moisture contained in their vessels, that they retain their verdure, and continue thro' the winter on the trees. The nutritive juices of these plants always abound, more or less, with an oily quality, which secures them from being injured by severe frosts; so that many of these ever-green trees are adapted to grow in the coldest parts of the habitable world.

With respect to deciduous trees, the falling off of the leaves seems principally to depend on the temperature of the atmosphere, which likewise serves to hasten or retard the appearance in question. An ardent sun contributes to hasten the dropping of the leaves. Hence in hot and dry summers, the leaves of the lime-tree and horse-chestnut turn yellow about the first of September; whilst in other years, the yellowness does not appear till the beginning of October. Nothing, however, contributes more to hasten the fall of the leaves, than immoderate cold or moist weather in autumn; moderate droughts, on the other hand, serve to retard it. As a proof of this position, Mr Adanson relates, that in the year 1759, the leaves of the elm-tree, which generally fall off about the 25th of November, continued in verdure and vigour at Paris, where the autumn was remarkably dry, till the 10th of the following month.

The following table, respecting the mean times in which different trees shed their leaves, is founded upon observations.

Gooseberry-tree, and bladder-sena,	} Generally quit their leaves about	October 1st.
Walnut and ash,		—— 15th.
Almond-tree, horse - chestnut, and lime-tree,		—— 20th.
Maple, hazel-nut, black-poplar, and aspen tree,		—— 25th.
Birch, plane-tree, mountain-osier, false-acacia, pear, and apple-tree,		November 1st.
Vine, mulberry, fig, sumac, and angelica-tree,		—— 10th.
Elm-tree, and willow,		—— 15th.
Apricot, and elder-trees,		—— 20th.

Milne's
Bot. Dist.

It deserves to be remarked, that an ever-green tree grafted upon a deciduous, determines the latter to retain its leaves. This observation is confirmed by repeated experiments; particularly by grafting the laurel, or cherry-bay, an ever-green, on the common cherry; and the ilex, or ever-green oak, on the oak.

DEFORCEMENT, in law, the casting any one out of his land, or with-holding of lands and tenements by force from the right owner.

DEFORCEMENT, in Scots law, the opposing or resisting of the officers of the law in the execution of their office. See LAW, N° clxxxvi. 15.

DEFORMITY, the want of that uniformity necessary to constitute the beauty of an object *.

DEFOSSION, DEFOSSIO, the punishment of burying alive, inflicted among the Romans on veital virgins guilty of incontinency. It is also a custom among the Hungarians to inflict this punishment on women convicted of adultery. Heretics were also punished in this manner. See BURYING-Alive.

DEGENERATION, or DEGENERATING, in general, denotes the growing worse, or losing some valuable qualities whereof a thing was formerly possessed. Some naturalists have been of opinion, that things are capable of degenerating into quite a distinct species; but this is a mere chimera. All that happens in the degeneration of a plant, for instance, is the losing its usual beauty, colour, smell, &c. a misfortune entirely owing to its being planted in an improper soil, climate, &c.

DEGLUTITION, the action of swallowing. See ANATOMY, n° 368.

A difficulty of swallowing may be caused, 1st, By ulcers of the oesophagus; in which case, there will be frequent vomiting of blood, and other kinds of matter. 2dly, A scirrhus bronchocele. 3dly, A thickening of the mucus in the oesophagus. 4thly, Indurations of the oesophagus. 5thly, A fungus in the oesophagus. 6thly, A sacculus formed by some hard substance lodging a little time in the oesophagus, and weakening its coats. 7thly, By spasms.

When any thing sticks in its passage into the stomach, the best method is to relieve the patient with the greatest speed, by drawing it up, or pushing it down into the stomach.

DEGRADATION, the act of depriving a person for ever of a dignity or degree of honour, and taking away the title, badge, and privileges of it.

DEGRADATION, in painting, expresses the lessening the appearance of distant objects in a landscape, in the same manner as they would appear to an eye placed at that distance from them.

DEGREE, in geometry, a division of a circle, including a three hundred and sixtieth part of its circumference.

DEGREE of Latitude. See LATITUDE.

DEGREE of Longitude. See LONGITUDE.

A degree of the meridian on the surface of the globe is variously determined by various observers. Mr Picart measured a degree in the latitude of 49° 21', and found it equal to 57060 French toises. But the French mathematicians, who have lately examined Mr Picart's operations, assure us, that the degree in that latitude is 57183 toises. Our countryman, Mr Norwood, measured the distance between London and York, and found it 905751 English feet; and finding the difference of latitudes 2° 28', determined the quantity of one degree to be 367196 English feet, or 69 English miles and 288 yards. Mr Maupertuis measured a degree in Lapland, in the latitude of 66° 20', and found it 57438 toises. A degree was likewise measured at the equator by other French mathematicians, and found to contain 56767.8 toises. Whence it appears, that the earth is not a sphere, but an oblate spheroid.

Deforce-
ment
||
Degre e.

See Beauty.

Degree
Deity.

DEGREE, in the civil and canon law, denotes an interval in kinship, by which proximity and remoteness of blood are computed. See **CONSANGUINITY**, and **DESCENT**.

DEGREES, in music, are the little intervals whereof the concords or harmonical intervals are composed.

DEGREE, in universities, denotes a quality conferred on the students or members thereof, as a testimony of their proficiency in the arts or sciences, and intitling them to certain privileges.

DEJANIRA, in fabulous history, daughter of Oeneus king of Etolia, and wife to Hercules. The centaur Nessus endeavouring to ravish her, was slain by Hercules with a poisoned arrow. Nessus, when dying, gave his bloody shirt to Dejanira; assuring her, that it was a sovereign remedy to cure her husband if ever he proved unfaithful. Some time after, Dejanira thinking he had reason to suspect his fidelity, sent him the shirt; which he had no sooner put on, than he was seized with the most excruciating torments; when being unable to support his pains, he retired to mount Oeta, and erecting a pile of wood set fire to it, and threw himself into the flames; upon which Dejanira killed herself in despair.

DEJECTION, in medicine, the act of voiding the excrements by the anus.—When the feces are accumulated in the intestinum rectum * in sufficient quantity to become troublesome either by their weight or acrimony, they excite a certain uneasiness, which produces an inclination to go to stool. The efforts for this purpose are begun by a considerable inspiration, in consequence of which the diaphragm is carried down towards the lower belly; the abdominal muscles are at the same time contracted in obedience to the will; and the intestines being compressed on all sides, the resistance of the sphincters is overcome, and the feces pass out at the anus; which is afterwards drawn up by its longitudinal fibres, which are called *levatoris ani*, and then by means of its sphincters is again contracted: but it sometimes happens, as in dysenteries, for instance, that the feces are very thin, and have considerable acrimony; and then the irritation they occasion is more frequent, so as to promote their discharge without any pressure from the diaphragm or abdominal muscles; and sometimes involuntarily, as is the case when the sphincters become paralytic.

DEIFICATION, in antiquity. See **APOTHEOSIS**.

DEISM, the system of religion acknowledged by the deists.

DEISTS, in the modern sense of the word, are those persons in Christian countries, who, acknowledging all the obligations and duties of natural religion, disbelieve the Christian scheme of revealed religion. They are so called from their belief in God alone, in opposition to Christians. The learned Dr Clarke taking the denomination in the most extensive signification, distinguishes deists into four sorts. 1. Such as pretend to believe the existence of an eternal, infinite, independent, intelligent Being; and who teach, that this supreme Being made the world, though they fancy he does not at all concern himself in the management of it. 2. Those who believe not only the being, but also the providence, of God with respect to the natural world; but who, not allowing any difference between moral good and evil, deny that God takes any

notice of the morally good or evil actions of men; these things depending, as they imagine, on the arbitrary constitutions of human laws. 3. Those who having right apprehensions concerning the natural attributes of God, and his all-governing providence, and some notion of his moral perfections also; yet, being prejudiced against the notion of the immortality of the human soul, believe that men perish entirely at death, and that one generation shall perpetually succeed another, without any future restoration or renovation of things. 4. Such as believe the existence of a supreme Being, together with his providence in the government of the world, as also the obligations of natural religion; but so far only as these things are discoverable by the light of nature alone, without believing any divine revelation. These last are the only true deists; but as the principles of these men would naturally lead them to embrace the Christian revelation, the learned author concludes there is now no consistent scheme of deism in the world.

DEITY, a term frequently used in a synonymous sense with God.

DELEGATE, in a general sense, a deputy or commissioner.

DELEGATES, commissioners appointed by the king, under the great seal, to hear and determine appeals from the ecclesiastical court.

Court of DELEGATES, the great court of appeal in all ecclesiastical causes. These delegates are appointed by the king's commission under his great seal, and issuing out of chancery, to represent his royal person, and hear all appeals to him made by virtue of the statute 25 Henry VIII. c. 19. This commission is usually filled with lords spiritual and temporal, judges of the courts at Westminster, and doctors of the civil law. Appeals to Rome were always looked upon by the English nation, even in the times of Popery, with an evil eye, as being contrary to the liberty of the subject, the honour of the crown, and the independence of the whole realm; and were first introduced in very turbulent times, in the 16th year of king Stephen (A. D. 1151), at the same period (Sir Henry Spelman observes) that the civil and canon laws were first imported into England. But in a few years after, to obviate this growing practice, the constitutions made at Clarendon, 11 Hen. II. on account of the disturbances raised by archbishop Becket and other zealots of the holy see, expressly declare, that appeals in causes ecclesiastical ought to lie from the archdeacon to the diocesan; from the diocesan to the archbishop of the province; and from the archbishop to the king; and are not to proceed any farther without special license from the crown. But the unhappy advantage that was given in the reign of king John, and his son Hen. III. to the encroaching power of the Pope, who was ever vigilant to improve all opportunities of extending his jurisdiction to Britain, at length rivetted the custom of appealing to Rome in causes ecclesiastical so strongly, that it never could be thoroughly broken off, till the grand rupture happened in the reign of Hen. VIII. when all the jurisdiction usurped by the Pope in matters ecclesiastical was restored to the crown, to which it originally belonged: so that the statute 25 Hen. VIII. was but declaratory of the ancient law of the realm. But in case the king himself be party in any of these

tomy, n^o 334.

Delegation, suits, the appeal does not lie to him in chancery, which would be absurd; but, by the 24 Henry VIII. c. 12. to all the bishops of the realm, assembled in the upper house of convocation.

DELEGATION, a commission extraordinary given by a judge to take cognizance of and determine some cause which ordinarily does not come before him.

DELEGATION, in Scots Law. See LAW, N^o cxxvii. 8.

DELETERIOUS, an appellation given to things of a destructive or poisonous nature. See POISON.

DELFT, a town of the united provinces, and capital of Delfland in Holland. It is a pretty large place, very clean and well built, with canals in the streets, planted on each side with trees. The public buildings, especially the town-house, are very magnificent. Here are two churches: in one is the tomb of the prince of Orange, who was assassinated; and in the other, that of admiral Tromp. It has a fine arsenal, well furnished; is about two miles in circumference, and is defended against inundations by three dams or dikes. Here is made a prodigious quantity of fine earthen ware called *delft-ware*; but the town has no other trade. It is pleasantly situated among the meadows on the river Schie, in E. Long. 4. 13. N. Lat. 32. 6.

DELFT-Ware, a kind of pottery of baked earth, covered with an enamel or white glazing, which gives it the appearance and neatness of porcelain.—Some kinds of this enamelled pottery differ much from others, either in their sustaining sudden heat without breaking, or in the beauty and regularity of their forms, of their enamel, and of the painting with which they are ornamented. In general, the fine and beautiful enamelled potteries, which approach the nearest to porcelain in external appearance, are at the same time those which least resist a brisk fire. Again, those which sustain a sudden heat, are coarse, and resemble common pottery.

The basis of this pottery is clay, which is to be mixed, when too fat, with such a quantity of sand, that the earth shall preserve enough of its ductility to be worked, moulded, and turned easily; and yet that its fatness shall be sufficiently taken from it, that it may not crack or shrink too much in drying or in baking. Vessels formed of this earth must be dried very gently, to avoid cracking. They are then to be placed in a furnace to receive a slight baking, which is only meant to give them a certain consistence or hardness. And, lastly, they are to be covered with an enamel or glazing; which is done, by putting upon the vessels thus prepared, the enamel, which has been ground very fine, and diluted with water.

As vessels on which the enamel is applied are but slightly baked, they readily imbibe the water in which the enamel is suspended, and a layer of this enamel adheres to their surface: these vessels may then be painted with colours composed of metallic calces, mixed and ground with a fusible glass. When they are become perfectly dry, they are to be placed in the furnace, included in cases of baked earth called *seggars*, and exposed to a heat capable of fusing uniformly the enamel which covers them.—This heat given to fuse the enamel being much stronger than that which was applied at first to give some consistence to the ware, is also the heat necessary to complete the baking of it. The furnace and the colours used for painting this ware, are the

same as those employed for PORCELAIN. The glazing, which is nothing but white enamel, ought to be so opaque as not to shew the ware under it. There are many receipts for making these enamels: but all of them are composed of sand or flints, vitrifying salts, calx of lead, and calx of tin; and the sand must be perfectly vitrified, so as to form a glass considerably fusible. Somewhat less than an equal part of alkaline salt, or twice its weight of calx of lead, is requisite to effect such vitrifications of sand. The calx of tin is not intended to be vitrified, but to give a white opaque colour to the mass; and one part of it is to be added to three or four parts of all the other ingredients taken together. From these general principles, various enamels may be made to suit the different kinds of earths. To make the enamel, lead and tin are calcined together with a strong fire; and the sand is also to be made into a frit with the salts or ashes. The whole is then to be well mixed and ground together. This matter is then to be placed under the furnace, where it is melted and vitrified during the baking of the ware. It is next to be ground in a mill, and applied as above directed.

The preparation of the white enamel is a very essential article in making delft-ware, and one in which many artists fail. M. Bosc. d'Antic, in a Memoir concerning this kind of ware, published in the *Mém. des Savans Etrangers*, tom. 6. recommends the following proportions. An hundred pounds of calx of lead are to be mixed with about a seventh part of that quantity of calx of tin for common delft-ware, or a fourth part of calx of tin for the finest kind; an hundred, or an hundred and ten, pounds of fine sand; and about 20 or 30 pounds of sea-salt.—Concerning the earth of which the ware is made, he observes, that pure clay is not a proper material when used alone. Different kinds of earths mixed together are found to succeed better. Pieces of ware made of clay alone, are found to require too much time to dry; and they crack, and lose their form, unless they are made exceedingly thick. An addition of marle diminishes the contraction of the clay; renders it less compact; and allows the water to escape, without altering the form of the ware in drying. It affords also a better ground for the enamel; which appears more glossy and white, than when laid on clay alone.—The kinds of clay which are chiefly used in the composition of delft-ware, are the blue and green. A mixture of blue clay and marle would not be sufficiently solid, and would be apt to scale, unless it were exposed to a fire more intense than what is commonly used for the burning of delft-ware. To give a greater solidity, some red clay is added; which, on account of its ferruginous matter, possesses the requisite binding quality. The proportions of these ingredients vary in different works, according to the different qualities of the earths employed. Three parts of blue clay, two parts of red clay, and five parts of marle, form the composition used in several manufactories. M. d'Antic thinks, that the best delft-ware might be made of equal parts of pure clay and pure calcareous earth; but this composition would require that the fire should be continued twice as long as it generally is.

DELIA, in antiquity, feasts celebrated by the Athenians in honour of Apollo, surnamed *Delius*.

DELIA was also a quinquennial festival in the island of

Delia.

Chem. Dist.

Delibamenta

Deliquium.

of Delos, instituted by Theseus at his return from Crete, in honour of Venus, whose statue, given him by Ariadne, he erected in that place, having by her assistance met with success in his expedition.

DELIBAMENTA, in antiquity, a libation to the infernal gods, always offered by pouring downwards. See **LIBATION**.

JUS DELIBERANDI. See **LAW**, N° clxxx. 23.

DELIBERATIVE, an appellation given to a kind or branch of rhetoric, employed in proving a thing, or convincing an assembly thereof, in order to persuade them to put it in execution.

To have a **DELIBERATIVE** voice in the assembly, is when a person has a right to give his advice and his vote therein. In councils, the bishops have *deliberative* voices; those beneath them have only consultative voices.

DELICT, in Scots law, signifies such small offences or breaches of the peace as are punishable only by fine or short imprisonment.

DELINQUENT, a guilty person, or one who has committed some fault or offence for which he is punishable. See **BRITAIN**, N° 97.

DELIQUESCENTE, in chemistry, signifies the property which certain bodies have of attracting moisture from the air, and becoming liquid thereby. This property is never found but in saline substances, or matters containing them. It is caused by the great affinity which these substances have with water. The more simple they are, according to Mr Macquer, the more they incline to deliquescence. Hence, acids, and certain alkalis, which are the most simple, are also the most deliquescent salts. Mineral acids are so deliquescent, that they strongly imbibe moisture from the air, even though they are already mixed with a sufficient quantity of water to be fluid. For this purpose, it is sufficient that they be concentrated only to a certain degree.—Many neutral salts are deliquescent, chiefly those whose bases are not saline substances. Salts formed by the vitriolic acid, with fixed or volatile alkalis, earths, or most metallic substances, are not deliquescent; although this acid is the strongest of all, and, when disengaged, attracts the moisture of the air most powerfully.

Though the immediate cause of deliquescence is the attraction of the moisture of the air, as we have already observed; yet it remains to be shewn why some salts attract this moisture powerfully, and others, though seemingly equally simple, do not attract it at all. The vegetable alkali, for instance, attracts moisture powerfully; the mineral alkali, though to appearance equally simple, does not attract it at all. The acid of tartar by itself does not attract the moisture of the air; but if mixed with borax, which has a little attraction for moisture, the mixture is exceedingly deliquescent.—Some theories have been suggested, in order to account for these and other similar facts; but we are as yet too little acquainted with the nature of the atmosphere, and the relation its constituent parts have to those of terrestrial substances, to determine any thing with certainty on this head.

DELIQUIM, a term frequently employed by chemists to characterise a body which is resolved into a liquor by exposure to the air. In this sense they talk of the *deliquium* of a salt, as of salt of tartar for in-

Vol. IV.

stance. This word is also frequently used instead of **DELIQUESCENTE**.

DELIRIUM, from *deliro*, to rave or talk idly. When the ideas excited in the mind do not correspond to the external objects, but are produced by the change induced on the common sensory, the patient is said to be delirious. The Greeks call it *paraphrenesis*. In the English there is no word for it, except *light-headedness* be admitted.

The paraphrenesis, or delirium, differs from a madness, in not being perpetual, which happens in deliriums without a fever.—The proximate cause of a delirium is an affection of the brain; but the remote causes may be an irritation, sometimes a very slight one, of any part of the nervous system. See (the *Index* subjoined to) **MEDICINE**.

DELIVERY, or **CHILD-BIRTH**. See **MIDWIFERY**.

DELLY, or **DELHI**, a kingdom and city of the Mogul's empire, in Asia. The city is one of the capitals of the empire. The road between it and *Agra* the other capital, is that famous alley or walk planted with trees by Jehan Ghir, and 150 leagues in length. Each half league is marked with a kind of turret; and at every stage there are little sarays, or caravanseras, for the benefit of travellers. The road, though pretty good, has many inconveniences. It is not only frequented by wild beasts, but by robbers. The latter are so dextrous at casting a noose about a man's neck, that they never fail, if within reach, to seize and strangle him. They gain their point likewise by means of handsome women; who, feigning great distress, and being taken up behind the unwary traveller, choke him with the same snare.—The capital consists of three cities, built near one another. The first, now quite destroyed, is said to have had 52 gates; and to have been the residence of king Porus, conquered by Alexander the Great. The second, which is also in ruins, was demolished by Shah Jehan, to build *Jehanabad* with the materials. This makes the third city, and joins the ruins of the second. This city stands in an open plain country, on the river *Jamna*, which rises in this province. It is encompassed with walls, except towards the river. These are of brick, flanked with round towers; but without a ditch, and terraced behind, four or five feet thick. The circumference of the walls may be about nine miles. The fortrefs, which is a mile and an half in circuit, has good walls and round towers, and ditches full of water, faced with stone. It is surrounded with fine gardens, and in it is the Mogul's palace. See **INDOSTAN**. E. Long. 79. 25. N. Lat. 28. 20.

DELMENHORST, a strong town of Germany, in the circle of Westphalia, and county of Oldenburg, belonging to Denmark; seated on the river Delm near the Weser. E. Long. 8. 37. N. Lat. 53. 10.

DELOS, an island of the Archipelago, very famous in ancient history. Originally it is said to have been a floating island, but afterwards it became fixed and immovable. It was held sacred on account of its being the birth-place of Apollo and Diana.—Anciently this island was governed by its own kings. Virgil mentions one Anius reigning here in the time of the Trojan war. He was, according to that poet, both king and high-priest of Apollo, and entertained Æneas with great kindness. The Persians allowed the De-

14 B

Iians

Delirium

Delos.

Delos.

lians to enjoy their ancient liberties, after they had reduced the rest of the Grecian islands. In after ages, the Athenians made themselves masters of it; and held it till they were driven out by Mithridates the Great, who plundered the rich temple of Apollo, and obliged the Delians to side with him. Mithridates was in his turn driven out by the Romans, who granted the inhabitants many privileges, and exempted them from all sorts of taxes. At present it is quite abandoned; the lands being covered with ruins and rubbish, in such a manner as to be quite incapable of cultivation. The inhabitants of Mycone hold it now, and pay but ten crowns land-tax to the Grand Signior for an island which was once one of the richest in the world.—Strabo and Callimachus tell us that the island of Delos was watered by the river Inapus: but Pliny calls it only a spring; and adds, that its waters swelled and abated at the same time with those of the Nile. At present there is no river in the island, but one of the noblest springs in the world; being twelve paces in diameter, and inclosed partly by rocks, and partly by a wall. Mount Cynthus, whence Apollo had the surname of *Cynthius*, is by Strabo placed near the city, and said to be so high, that the whole island was covered by its shadow; but our modern travellers speak of it as an hill of a very moderate height. It is but one block of granite of the ordinary sort, cut, on that side which faced the city, into regular steps, and inclosed on both sides by a wall. On the top of the mountain are still to be seen the remains of a stately building, with a mosaic pavement, many broken pillars, and other valuable monuments of antiquity. From an inscription discovered there some time ago, and which mentions a vow made to Serapis, Isis, and Anubis, some have conjectured, that on this hill stood a temple dedicated to these Egyptian deities, though no where mentioned in history.—The city of Delos, as is manifest from the magnificent ruins still extant, took up that spacious plain reaching from one coast to the other. It was well peopled, and the richest city in the Archipelago, especially after the destruction of Corinth; merchants flocking thither from all parts, both in regard of the immunity they enjoyed there, and of the convenient situation of the place between Europe and Asia. Strabo calls it one of the most frequented empories in the world; and Pliny tells us, that all the commodities of Europe and Asia were sold, purchased, or exchanged there. It contained many noble and stately buildings; as, the temples of Apollo, Diana, and Latona; the porticoes of Philip of Macedon, and Dionysius Eutyches; a gymnasium; an oval basin made at an immense expence, for the representation of sea-fights; and a most magnificent theatre. The temple of Apollo was, according to Plutarch, begun by *Eryciston* the son of *Cecrops*; but afterwards enlarged and embellished at the common charges of all the states of Greece. Plutarch tells us, that it was one of the most stately buildings in the universe; and speaks of an altar in it, which, in his opinion, deserved a place among the wonders of the world. It was built with the horns of various animals, so artificially adapted to one another, that they hunged together without any cement. This altar is said to have been a perfect cube; and the doubling it was a famous mathematical problem among the ancients. This went under the name of *Problema*

Deliacum; and is said to have been proposed by the oracle, for the purpose of freeing the country from a plague. The distemper was to cease when the problem was solved.—The trunk of the famous statue of Apollo, mentioned by Strabo and Pliny, is still an object of great admiration to travellers. It is without head, feet, arms, or legs; but from the parts that are yet remaining, it plainly appears, that the ancients did not exaggerate when they commended it as a wonder of art. It was of a gigantic size, though cut out of a single block of marble; the shoulders being six feet broad, and the thighs nine feet round. At a small distance from this statue lies, amongst confused heaps of broken columns, architraves, bases, chapiters, &c. a square piece of marble 15½ feet long, ten feet nine inches broad, and two feet three inches thick; which undoubtedly served as a pedestal for this colossus. It bears, in very fair characters, this inscription in Greek, “The Naxians to Apollo.” Plutarch tells us, in the life of Nicias, that he caused to be set up, near the temple of Delos, an huge palm-tree of brass, which he consecrated to Apollo; and adds, that a violent storm of wind threw down this tree on a colossian statue raised by the inhabitants of Naxos. Round the temple were magnificent porticoes built at the charge of various princes, as appears from inscriptions which are still very plain. The names of Philip king of Macedon, Dionysius Eutyches, Mithridates Euergetes, Mithridates Eupator, kings of Pontus, and Nicomedes king of Bithynia, are found on several pedestals.—To this temple the inhabitants of the neighbouring islands sent yearly a company of virgins to celebrate, with dancing, the festival of Apollo and his sister Diana, and to make offerings in the name of their respective cities.

So very sacred was the island of Delos held by the ancients, that no hostilities were practised here, even by the nations that were at war with one another, when they happened to meet in this place. Of this, Livy gives an instance. He tells us, that some Roman deputies being obliged to put in at Delos, in their voyage to Syria and Egypt, found the galleys of Perseus king of Macedon, and those of Eumenes king of Pergamus, anchored in the same harbour, though these two princes were then making war upon one another.—Hence this island was a general asylum, and the protection extended to all kinds of living creatures; for this reason it abounded with hares, no dogs being suffered to enter it. No dead body was suffered to be buried in it, nor was any woman suffered to lie in there; all dying persons, and women ready to be delivered, were carried over to the neighbouring island of Rhenea.

DELPHINIUM, DOLPHIN-FLOWER, OR LARKSPUR; a genus of the trigynia order, belonging to the polyandria class of plants. There are seven species; four are cultivated in gardens. Two of these are annual, and two perennial. They are herbaceous plants of upright growth, rising from 18 inches to four feet in height, garnished with finely divided leaves, and terminated by long spikes of pentapetalous flowers of blue, red, white, or violet colours.—One species, the *consolida*, is found wild in several parts of Britain, and grows in corn-fields. According to Mr Withering, the expressed juice of the petals, with a little alum, makes a good blue ink. The seeds are acrid and poisonous.

or dolphin.

fonous. When cultivated, the blossoms often become double. Sheep and goats eat this plant; horses are not fond of it; cows and swine refuse it.—The first-mentioned species makes a very fine appearance in gardens, and is easily propagated by seeds; being so hardy, that it thrives in any soil or situation.

DELPHINUS, or DOLPHIN; a genus of fishes belonging to the order of Cete. There are three species.

1. The delphis, or dolphin. Historians and philosophers seem to have contended who should invent most fables concerning this fish. It was consecrated to the gods, was celebrated in the earliest time for its fondness of the human race, was honoured with the title of the *sacred fish*, and distinguished by those of *boy-loving* and *philanthropic*. It gave rise, to a long train of inventions, proofs of the credulity and ignorance of the times. Aristotle steers the clearest of all the ancients from these fables, and gives in general a faithful history of this animal; but the elder Pliny, Ælian, and others, seem to preserve no bounds in their belief of the tales related of this fish's attachment to mankind. Scarce an accident could happen at sea, but the dolphin offered himself to convey to shore the unfortunate. Arion the musician, when flung into the ocean by the pirates, is received and saved by this benevolent fish.

*Inde (sive majus) tergo Delphin recurvo,
Se memorant ovari: supposuisse novo.
Ille sedens citharæque tenens, pretiosum vehendi
Cantat, et æquoreis carmine mulcet aquas.*

OVID. *Festiv.* lib. ii. 113.

But (past belief) a dolphin's arched back
Preserved Arion from his destined wreck;
Secure he sits, and with harmonious strains
Requies his bearer for his friendly pains.

We are at a loss to account for the origin of those fables, since it does not appear that the dolphin shews a greater attachment to mankind, than the rest of the cetaceous tribe. We know that at present the appearance of this fish, and the porpoise, are far from being esteemed favourable omens by the seamen; for their boundings, springs, and frolics, in the water, are held to be sure signs of an approaching gale.

It is from their leaps out of that element, that they assume a temporary form that is not natural to them; but which the old painters and sculptors have almost always given them. A dolphin is scarce ever exhibited by the ancients in a straight shape, but almost always incurvated: such are those on the coin of Alexander the Great, which is preserved by Belon, as well as on several other pieces of antiquity.* The poets describe them much in the same manner, and it is not improbable that the one had borrowed from the other:

*Tumidæque pauda transiit dorso mare
Tyrhæus omni piscis exaltat freta,
Ægæique gyres.* SENECA. *Trag.* Agam. 450.

Upon the swelling waves the dolphins show
Their bending backs; then, swiftly dashing, go,
And in a thousand wreaths their bodies throw.

The natural shape of the dolphin* is almost straight, the back being very slightly incurvated, and the body slender: the nose is long, narrow, and pointed, not much unlike the beak of some birds, for which reason the French call it *P oye de m. r.* It has in all 40 teeth; 21 in the upper jaw, and 19 in the lower; a little above an inch long, conic at their upper end, sharp-pointed, bending a little in. They are placed at

small distances from each other; so that when the mouth is shut, the teeth of both jaws lock into one another: the spout-hole is placed in the middle of the head; the tail is semilunar; the skin is smooth, the colour of the back and sides dusky, the belly whitish: it swims with great swiftness; and its prey is fish. It was formerly reckoned a great delicacy: Dr Caius says, that one which was taken in his time, was thought a present worthy the duke of Norfolk, who distributed part of it among his friends. It was roasted and dressed with porpoise fauce, made of crumbs of fine wheat bread, mixed with vinegar and sugar.

This species of dolphin must not be confounded with that to which seamen give the name; the latter being quite another kind of fish, the *coryphæna hippuris* of Linnæus, and the *dorado* of the Portuguese.

2. The phocæna, or porpoise. This species is found in vast multitudes in all parts of the British seas; but in greatest numbers at the time when fish of passage appear, such as mackerel, herrings, and salmon, which they pursue up the bays with the same eagerness as a dog does a hare. In some places they almost darken the sea as they rise above water to take breath: but porpoises not only seek for prey near the surface, but often descend to the bottom in search of sand-eels, and sea-worms, which they root out of the sand with their noses in the same manner as hogs do in the fields for their food.

Their bodies are very thick towards the head, but grow slender towards the tail, forming the figure of a cone. The nose projects a little, is much shorter than that of the dolphin, and is furnished with very strong muscles, which enables it the readier to turn up the sand. In each jaw are 48 teeth, small, sharp-pointed, and a little moveable: like those of the dolphin, they are so placed as that the teeth of one jaw locks into those of the other when closed. The eyes are small; the spout-hole is on the top of the head; the tail semilunar. The colour of the porpoise is generally black, and the belly whitish; but they sometimes vary: in the river St Laurence there is a white kind; and Dr Borlase, in his voyage to the Scilly isles, observed a small species of cetaceous fish, which he calls *thornbacks*, from their broad and sharp fin on the back; some of these were brown, some quite white, others spotted: but whether they were only a variety of this fish, or whether they were small grampuses, which are also spotted, we cannot determine.

The porpoise is remarkable for the vast quantity of the fat or lard that surrounds the body; which yields a great quantity of excellent oil: from this lard, or from their rooting like swine, they are called in many places *sea-hogs*; the Germans call them *meerschwein*; the Swedes *marjuin*; and the English *porpoise*, from the Italian *porco pesce*.

It would be curious to trace the revolutions of fashion in the article of eatables; what epicure first rejected the sea-gull and heron, and what delicate stomach first nauseated the greasy flesh of the porpoise. This latter was once a royal dish, even so late as the reign of Henry VIII. and from its magnitude must have held a very respectable station at the table; for in a household book of that prince, extracts of which are published in the third volume of the *Archæologia*, it is ordered, that if a porpoise should be too big for a horse-

Delphinus,
or dolphin.

load, allowance should be made to the purveyor. This fish continued in vogue even in the reign of Elizabeth: for Doctor Caius, on mentioning a dolphin (that was taken at Shoreham, and brought to Thomas duke of Norfolk, who divided, and sent it as a present to his friends) says, that it eat best with porpessæ sauce, which was made of vinegar, crums of fine bread, and sugar.

3. The orca, or grampus, is found from the length of 15 feet to that of 25. It is remarkably thick in proportion to its length, one of 18 feet being in the thickest place 10 feet diameter. With reason then did Pliny call this "an immense heap of flesh armed with dreadful teeth." It is extremely voracious; and will not even spare the porpessæ, a congenerous fish. It is said to be a great enemy to the whale, and that it will fasten on it like a dog on a bull, till the animal roars with pain. The nose is flat, and turns up at the end. There are 30 teeth in each jaw: those before are blunt, round, and slender; the farthest sharp and thick: between each is a space adapted to receive the teeth of the opposite jaw when the mouth is closed. The spout-hole is in the top of the neck. The colour of the back is black, but on each shoulder is a large white spot; the sides marbled with black and white; the belly of a snowy whiteness.

These fishes sometimes appear on our coasts; but are found in much greater numbers off the North Cape in Norway, whence they are called the *North-Capers*. These and all other whales are observed to swim against the wind; and to be much disturbed, and tumble about with unusual violence, at the approach of a storm.

DELPHINUS, in astronomy, a constellation of the northern hemisphere. See ASTRONOMY, n° 206.

DELPHOS, a town of Turkey in Asia, in the province of Libadia, anciently Phocis. In former times it was famous for an oracle of Apollo. See ORACLE.

DELTA, is a part of Lower Egypt, which takes up a considerable space of ground between the branches of the Nile and the Mediterranean Sea: the ancients called it the *Ile of Delta*, because it is in the shape of a triangle, like the Greek letter of that name. It is about 120 miles along the coast from Damietta to Alexandria, and 70 on the sides from the place where the Nile begins to divide itself. It is the most plentiful country of all Egypt, and it rains more there than in other parts, but the fertility is chiefly owing to the inundation of the river Nile. The principal towns on the coast are, Damietta, Rosetta, and Alexandria; but, within land, Menoufia and Maala, or Elmalâ.

DELTOIDES, in anatomy, See ANATOMY, *Table of the Muscles*.

DELUGE, an inundation or overflowing of the earth, either wholly or in part, by water.

We have several deluges recorded in history; as that of Oggyes, which overflowed almost all Attica; and that of Deucalion, which drowned all Thessaly in Greece: but the most memorable was that called the *Universal Deluge*, or *Noah's Flood*, which overflowed and destroyed the whole earth; and from which only Noah, and those with him in the ark, escaped.

The destruction of the whole earth by water, and its formation anew in the way we see it, is an event so exceedingly remarkable, and so much out of the ordinary

Deluge.

course of nature, that it is no wonder to find the reality of the fact called in question by many. As the giving up this point, however, would utterly destroy the authenticity of the sacred writings, those who have undertaken the defence of revelation, have consequently laboured to bring some positive evidence of the fact, distinct from that of Moses; and not only to shew how by natural means such an event might have happened, but likewise to bring proofs that it actually did happen. There are two principal arguments against the existence of a universal deluge: 1. The want of a sufficient quantity of water to cover the whole earth to the height mentioned by Moses. Or, 2. Supposing this to be obviated, the immutability of the laws of nature are urged; as it is thought, that, during the time of the flood, the great law of gravitation must have been suspended, or rather reversed, and the fluid water have had no tendency to return to the lowest parts of the earth as we see it hath at present.—On the other hand, most of those who maintain the reality of the universal deluge, have had recourse to the waters of the ocean as sufficient in quantity; and to the omnipotence of God, exerted either immediately, or by the mediation of some of the great natural agents, for raising them to the height to which they are said to have risen.

The finding a quantity of water sufficient for an universal deluge, hath however been looked on as a matter of great difficulty, and various hypotheses have been invented to solve it.

1. It hath been asserted, that a quantity of water was created on purpose, and at a proper time annihilated by divine power. This, however, besides its being absolutely without evidence, is directly contrary to the words of the sacred writer whom the asserters of this hypothesis mean to defend: He expressly derives the waters of the flood from two sources; first, the *fountains of the great deep*, which he tells us were all broken up; and secondly, the *windows of heaven*, which he says were opened: and speaking of the decrease of the waters, he says, the *fountains of the deep* and the *windows of heaven were stopped*, and the waters returned continually from off the earth. Here it is obvious, that Moses was so far from having any difficulty about the quantity of water, that he thought the sources from whence it came were not exhausted; since both of them required to be *stopped* by the same Almighty hand who opened them, lest the flood should increase more than it actually did.

2. Dr Burnet, in his *Telluris Theoria Sacra*, endeavours to shew, that all the waters in the ocean are not sufficient to cover the earth to the depth assigned by Moses. Supposing the sea drained quite dry, and all the clouds of the atmosphere dissolved into rain, we should still, according to him, want much the greatest part of the water of a deluge. To get clear of this difficulty, Dr Burnet and others have adopted Descartes's theory. That philosopher will have the antediluvian world to have been perfectly round and equal, without mountains or valleys. He accounts for its formation on mechanical principles, by supposing it at first in the condition of a thick turbid fluid replete with divers heterogeneous matters; which, subsiding by slow degrees, formed themselves into different concentric strata, or beds; by the laws of gravity. Dr Burnet improves on this theory, by supposing the

Deluge.

Deluge.

* See *Abyssi*.

the primitive earth to have been no more than a shell or crust investing the surface of the water contained in the ocean, and in the central abyfs which he and others suppose to exist in the bowels of the earth *. At the time of the flood, this outward crust, according to him, broke in a thousand places; and consequently sunk down among the water, which thus spouted up in vast cataracts, and overflowed the whole surface. He supposes also, that before the flood there was a perfect coincidence of the equator with the ecliptic, and consequently that the antediluvian world enjoyed a perpetual spring; but that the violence of the shock by which the outer crust was broken, shifted also the position of the earth, and produced the present obliquity of the ecliptic. This theory, it will be observed, is equally arbitrary with the former. But it is, besides, directly contrary to the words of Moses, who assures us, that all the *high hills* were covered; while Dr Burnet affirms that there were then no hills in being.

3. Other authors, supposing a sufficient fund of water in the abyfs, or sea, are only concerned for an expedient to bring it forth: accordingly, some have recourse to a shifting of the earth's centre of gravity, which, drawing after it the water out of its channel, overwhelmed the several parts of the earth successively.

4. The inquisitive Mr Whiston, in his *New Theory of the Earth*, shews, from several remarkable coincidences, that a comet descending in the plane of the ecliptic, towards its perihelion, passed just before the earth on the first day of the deluge; the consequences whereof would be, first, that this comet, when it came below the moon, would raise a vast and strong tide, both in the small seas which according to his hypothesis were in the antediluvian earth, (for he allows no great ocean there, as in ours), and also in the abyfs which was under the upper crust of the earth. And this tide would rise, and increase all the time of the approach of the comet towards the earth; and would be at its greatest height when the comet was at its least distance from it. By the force of which tide, as also by the attraction of the comet, he judges, that the abyfs must put on an elliptical figure, whose surface being considerably larger than the former spherical one, the outward crust of the earth, incumbent on the abyfs, must accommodate itself to that figure, which it could not do while it held solid, and conjoined together. He concludes, therefore, that it must of necessity be extended, and at last broke by the violence of the said tides, and attraction; out of which the included water issuing, was a great means of the deluge; this answering to what Moses speaks of the "fountains of the great deep being broke open."—Again, the same comet, he shews, in its descent towards the sun, passed so close by the body of the earth, as to involve it in its atmosphere, and tail, for a considerable time; and of consequence, left a vast quantity of its vapours, both expanded and condensed, on its surface; a great part of which being afterwards rarefied by the solar heat would be drawn up into the atmosphere, and afterwards return in violent rains: and this he takes to be what Moses intimates by "the windows of heaven being opened," and particularly by the "forty days rain." For as the following rain, which with this made the whole time of raining 150

days, Mr Whiston attributes it to the earth coming a second time within the atmosphere of the comet, as the comet was on its return from the sun. Lastly, to remove this vast orb of waters again, he supposes a mighty wind to have arisen, which dried up some, and forced the rest into the abyfs again through the clefts by which it came up: only a good quantity remained in the alveus of the great ocean, now first made, and in lesser seas, lakes, &c.—This theory was at first only proposed as an hypothesis; but, on further consideration, Mr Whiston thought he could actually prove that a comet did at that time pass very near the earth, and that it was the same which afterwards appeared in 1680. After this, he looked upon his theory no longer as an hypothesis, but published it in a particular tract entitled *The cause of the deluge demonstrated*.—But the uncertainty of the comet's return in 1758, when supposed to be absent only 75 or 76 years *, must certainly render Mr Whiston's calculations for such a length of time extremely dubious; and, the great similarity between the tails of comets and streams of electric matter renders his supposition of their being aqueous vapours exceedingly improbable.

5. According to Mr de la Pryme, the antediluvian world had an external sea, as well as land, with mountains, rivers, &c. and the deluge was effected by breaking the subterraneous caverns, and pillars thereof, with dreadful earthquakes, and causing the same to be for the most part, if not wholly, absorbed and swallowed up, and covered by the seas that we now have. Lastly, this earth of ours arose out of the bottom of the antediluvian sea; and in its room, just as many islands are swallowed down, and others thrust up in their stead.—On this, as on all the other hypotheses, it may be remarked, that it is quite arbitrary, and without the least foundation from the words of Moses. The sacred historian speaks not one word of earthquakes; nay, from the nature of the thing, we know it is impossible that the flood could have been occasioned by an earthquake, and the ark preserved, without a miracle. It is certain, that, if a ship sinks at sea, the commotion excited in the water by the descent of such a large body, will swallow up a small boat that happens to come too near. If the pillars of the earth itself then were broken, what must the commotion have been, when the continents of Europe, Asia, and Africa, descended into the abyfs at once? not to mention America, which lying at so great a distance from Noah, he might be supposed out of danger from that quarter. By what miracle was the little ark preserved amidst the tumult of those impetuous waves which must have rushed in from all quarters? Besides, as the ark was built not at sea, but on dry ground; when the earth on which it rested sunk down, the ark must have sunk along with it; and the waters falling in as it were over-head, must have dashed in pieces the strongest vessel that can be imagined. Earthquakes, also, operate suddenly and violently; whereas, according to the Mosaic account, the flood came on gradually, and did not arrive at its height till six weeks, or perhaps five months, after it began.

6. Mr Hutchinson and his followers present us with a theory of the deluge, which they pretend to derive from the word of God itself. This theory hath been particularly enlarged upon and illustrated by Mr Catcott, who in 1768 published a volume on the subject.

This

* See *Astronomy*, vol 50, —55.

Deluge.

This gentleman asserts, that when the world was first created, at the time when it is said to have been "without form and void," the terrestrial matter was then entirely dissolved in the aqueous; so that the whole formed, as it were, a thick muddy water. The figure of the whole was spherical; and on the outside of this sphere, lay the gross dark air. Within the sphere of earth and water, was an immense cavity, called by Moses the *deep*; and this internal cavity was filled with air of a kind similar to that on the outside. On the creation of light, the internal air received elasticity sufficient to burst out through the external covering of earth and water. Upon this the water descended, filled up the void, and left the earth in a form similar to what it hath at present.—Thus, according to him, the antediluvian world, as well as the present, consisted of a vast collection or nucleus of water, called the *great deep*, or the *abyss*; and over this the shell of earth, perforated in many places; by which means the waters of the ocean communicated with the abyss. The breaking up of these fountains was occasioned by a miraculous pressure of the atmosphere, from the immediate action of the Deity himself. So violent was this pressure, that the air defended to where it had been originally; occupied the space of the abyss; and drove out the waters over the whole face of the dry land.—But this account, so far from being infallibly certain, seems inconsistent with the most common observations. No pressure, however violent, will cause water rise above its level, unless that pressure is unequal. If, therefore, the atmosphere entered into the supposed abyss, by a vehement pressure on the surface of the ocean, that pressure must only have been on one place, or on a few places: and even though we suppose the atmosphere to have been the agent made use of, it is impossible, that it could have remained for any time in the abyss, without a continued miracle; as the pressure of the water would immediately have forced it up again, through those holes which had afforded it a passage downwards.

The explication given from Hutchinson by Mr Catcott, of the "windows of heaven," is some what extraordinary. According to him, these windows are not in heaven, but in the bowels of the earth; and mean no more than the cracks and fissures by which the *airs*, as he calls them, found a passage through the shell or covering of earth, which they utterly dissolved, and reduced to its original state of fluidity. It is, however, difficult to conceive how the opening of such windows as these could cause a violent rain for 40 days and nights.

It is not to be supposed, that we can pretend to ascertain any thing on the subject more than others have done. The following conjectures, however, may be offered on the manner in which the deluge might have happened without any violence to the established laws of nature.

1. If we consider the quantity of water requisite for the purpose of the deluge, it will not appear so very extraordinary as has been commonly represented. The height of the highest hills is not thought to exceed three miles. It will therefore be deemed a sufficient allowance, when we suppose the waters of the deluge to have been four miles deep on the surface of the ground. Now, it is certain, that water, or any other matter, when spread out at large upon the

Deluge.

ground, seems to occupy an immense space in comparison of what it does when contained in a cubical vessel, or when packed together in a cubical form. Suppose we wanted to overflow a room 16 feet every way, or containing 256 square feet, with water, to the height of one foot, it may be nearly done by a cubical vessel of six feet, filled with water. A cube of eight feet will cover it two feet deep, and a cube of ten feet will very nearly cover it four feet deep. It makes not the least difference, whether we suppose feet or miles, to be covered. A cube of ten miles of water, would very nearly overflow 256 square miles of plain ground, to the height of four miles. But if we take into our account the vast number of eminences with which the surface of the earth abounds, the abovementioned quantity of water would do a great deal more. If, therefore, we attempt to calculate the quantity of water sufficient to deluge the earth, we must make a very considerable allowance for the bulk of all the hills on its surface. To consider this matter, however, in its utmost latitude. The surface of the earth is supposed, by the latest computations, to contain 199,512,595 square miles. To overflow this surface to the height of four miles, is required a parallelopiped of water 16 miles deep, and containing 49,878,143 square miles of surface. Now, considering the immense thickness of the globe of the earth, it can by no means be improbable, that this whole quantity of water may be contained in its bowels; without the necessity of any remarkable abyss, or huge collection of water, such as most of our theorists suppose to exist in the centre. It is certain, that as far as the earth has been dug, it hath been found not dry, but moist; nor have we the least reason to imagine, that it is not at least equally moist all the way down to the centre. How moist it really is, cannot be known, nor the quantity of water requisite to impart to it the degree of moisture it has; but we are sure it must be immense. The earth is computed to be near 8000 miles in diameter. The ocean is of an unfathomable depth; but there is no reason for supposing it more than a few miles. To make all reasonable allowances, however, we shall suppose the whole solid matter in the globe to be only equal to a cube of 5000 miles; and even on this supposition we shall find, that all the waters of the deluge would not be half sufficient to moisten it. The above mentioned parallelopiped of water would indeed contain 798,050,368 cubic miles of that fluid; but the cube of earth containing no less than an hundred and twenty-five thousand millions of cubic miles, it is evident, that the quantity assigned for the deluge would scarce be known to moisten it. It could have indeed no more effect this way, than a single pound of water could have upon 150 times its bulk of dry earth. We are persuaded therefore, that any person who will try by experiment how much water a given quantity of earth contains, and from that experiment will make calculations with regard to the whole quantity of water contained in the bowels of the earth, must be abundantly satisfied, that though *all* the water of the deluge had been thence derived, the diminution of the general store would, comparatively speaking, have been next to nothing.

2. It was not from the bowels of the earth only that the waters were discharged, but also from the air; for we are assured by Moses, that it rained 40 days and

and 40 nights. This source of the diluvian waters hath been considered as of small consequence by almost every one who hath treated on the subject. The general opinion concerning this matter we shall transcribe from the Universal History, Vol. I. where it is very fully expressed. "According to the observations made of the quantity of water that falls in rain, the rains could not afford one ocean, nor half an ocean, and would be a very inconsiderable part of what was necessary for a deluge. If it rained 40 days and 40 nights throughout the whole earth at once, it might be sufficient to lay all the lower grounds under water, but it would signify very little as to the overflowing of the mountains; so that it has been said, that if the deluge had been made by rains only, there would have needed not 40 days, but 40 years to have brought it to pass. And if we suppose the whole atmosphere condensed into water, it would not all have been sufficient for this effect; for it is certain that it could not have risen above 32 foot, the height to which water can be raised by the pressure of the atmosphere: for the weight of the whole air, when condensed into water, can be no more than equal to its weight in its natural state, and must become no less than 800 times denser; for that is the difference between the weight of the heaviest air, and that of water."

On this subject we must observe, that there is a very general mistake with regard to the air, similar to the afore-mentioned one regarding the earth. Because the earth below our feet appears to our senses firm and compact, therefore the vast quantity of water, contained even in the moist solid parts of it, and which will readily appear on proper experiment, is overlooked, and treated as a non-entity. In like manner, because the air does not always deluge with excessive rains, it is also imagined that it contains but very little water. Because the pressure of the air is able to raise only 32 feet of water on the surface of the earth, it is therefore supposed we may know to what depth the atmosphere could deluge the earth if it was to let fall the *whole* water contained in it. But daily observations shew, that the pressure of the atmosphere hath not the least connection with the quantity of water it contains. Nay, if there is any connection, the air seems to be lightest when it contains most water. In the course of a long summer's drought, for instance, the mercury in the barometer will stand at 30 inches, or little more. If it does so at the beginning of the drought, it ought to ascend continually during the time the dry weather continues; because the air is all the while absorbing water in great quantity from the surface of the earth and sea. This, however, is known to be contrary to fact. At such times the mercury does not ascend, but remains stationary; and what is still more extraordinary, when the drought is about to have an end, the air, while it yet contains the whole quantity of water it absorbed, and hath not discharged one single drop, becomes suddenly lighter, and the mercury will perhaps sink an inch before any rain falls. The most surprising phenomenon, however, is yet to come. After the atmosphere has been discharging for a number of days successively a quantity of matter 800 times heavier than itself, instead of being *lightened* by the discharge, it becomes *heavier*, nay *specifically* heavier, than it was before. It is also certain, that very dry

air, provided it is not at the same time very hot, is always heavier; and the drier air which we are acquainted with, namely Dr Priestley's *dephlogisticated* air, is considerably heavier than the air we commonly breathe. For these reasons we think the quantity of water contained in the whole atmosphere ought to be considered as *indefinite*, especially as we know that by whatever agent it is suspended, that agent must counteract the force of gravity, otherwise the water would immediately descend; and while the force of gravity in any substance is counteracted, that substance cannot appear to us to gravitate at all.

3. The above considerations render it *probable* at least, that there is in nature a quantity of water sufficient to deluge the world, provided it was applied to the purpose. We must next consider whether there is any natural agent powerful enough to effectuate this purpose. We shall take the phrases used by Moses in their most obvious sense. The breaking up of the fountains of the deep we may reasonably suppose to have been the opening of all the passages whether small or great, thro' which the subterraneous waters possibly could discharge themselves on the surface of the earth. The opening of the windows of heaven we may also suppose to be the pouring out the water, contained in the atmosphere, thro' those invisible passages by which it enters in such a manner as totally to elude every one of our senses, as when water is absorbed by the air in evaporation. As both these are said to have been opened at the same time, it seems from thence probable, that one natural agent was employed to do both. Now it is certain, that the industry of modern inquirers hath discovered an agent unknown to the former ages, and whose influence is so great, that with regard to this world it may be said to have a kind of *omnipotence*. The agent we mean is electricity. It is certain, that, by means of it, immense quantities of water can be raised to a great height in the air. This is proved by the phenomena of water-spouts. Mr Forster relates, that he happened to see one break very near him, and observed a flash of lightning proceed from it at the moment of its breaking. The conclusion from this is obvious. When the electric matter was discharged from the water, it could no longer be supported by the atmosphere, but immediately fell down. Though water-spouts do not appear in this country, yet every one must have made an observation somewhat similar to Mr Forster's. In a violent storm of thunder and rain, after every flash of lightning, or discharge of electricity from the clouds, the rain pours down with increased violence; thus shewing, that the cloud, having parted with so much of its electricity, cannot longer be supported in the form of vapour, but must descend in rain. It is not indeed yet discovered that electricity is the cause of the suspension of water in the atmosphere; but it is certain that evaporation is promoted by electrifying the fluid to be evaporated*. It may therefore be admitted as a *possibility*, that the electric fluid contained in the air is the agent by which it is enabled to suspend the water which rises in vapour. If therefore the air is deprived of the due proportion of this fluid, it is evident that rain must fall in prodigious quantities.

Again, we are assured, from the most undeniable observations, that electricity is able to swell up water on the surface of the earth. This we can make it do even

* See Electricity, and Evaporation.

Deluge.

See Earth-quake.

in our trifling experiments; and much more must the whole force of the fluid be supposed capable of doing it, if applied to the waters of the ocean, or any others. The agitation of the sea in earthquakes is a sufficient proof of this †. It is certain, that at these times there is a discharge of a vast quantity of electric matter from the earth into the air; and as soon as this happens, all becomes quiet on the surface of the earth.

From a multitude of observations, it also appears, that there is, at all times, a passage of electric matter from the atmosphere into the earth, and *vice versa* from the earth into the atmosphere. There is therefore no absurdity in supposing the Deity to have influenced the action of the natural powers in such a manner that for 40 days and nights the electric matter contained in the atmosphere should descend into the bowels of the earth;—if indeed there is occasion for supposing any such immediate influence at all, since it is not impossible that there might have been, from some natural cause, a descent of this matter from the atmosphere for that time. But by whatever cause the descent was occasioned, the consequence would be, the *breaking up of the fountains of the deep, and the opening the windows of heaven*. The water contained in the atmosphere being left without support, would descend in impetuous rains; while the waters of the ocean, those from which fountains originate, and those contained in the solid earth itself, would rise from the very centre, and meet the waters which descended from above. Thus the breaking up of the fountains of the deep, and the opening the windows of heaven, would accompany each other, as Moses tells us they actually did; for, according to him, both happened on the same day.

In this manner the flood would come on quietly and gradually, without that violence to the globe which Burnet, Whiston, and other theorists, are obliged to suppose. The abatement of the waters would ensue on the ascent of the electric fluid to where it was before. The atmosphere would then absorb the water as formerly; that which had ascended through the earth would again subside; and thus every thing would return to its pristine state.

Thus, we think, the Mosaic account of the deluge may reasonably enough be received as a *possibility*, even by the most rigid inquirers: it remains now to take notice of those proofs which have been brought for it as a *matter of fact*. These may be reduced to two: 1. The general consent of all nations; and, 2. The existence of vast quantities of marine productions on the tops of mountains, and under the surface of the ground, at great distances from the sea.—The latter of these hath been most insisted on, and till lately was generally reckoned decisive. The observations, however, of the latest philosophers, on volcanoes, have furnished an evasion of this argument. Sir William Hamilton first shewed, that volcanoes are capable of forming mountains of very considerable size; that the fire of them lies very deep, and often below the water of the ocean itself. Hence, it is easy to see, how marine substances may be found at all depths on these volcanic mountains, and yet afford no proof of a deluge. Others have improved on this, and seem inclined to suppose that *all* the mountains, nay, *all* the habitable parts of the globe, were originally thrown up

by volcanic explosions from the bottom of the ocean. But for a particular consideration of these matters, see the articles *EARTH, MOUNTAIN, and VOLCANO*.

DEMADES, a famous Athenian, who, from being a mariner, became a great orator, and appeased Philip by his eloquence, after the famous victory over the Athenians at Cheronea, in the 338th year B. C.

DEMAIN, or DEMESNE, in its common acceptance, is used for the lands round a manor-house, occupied by the lord.

DEMAIN, or *Demefne*, in law, is commonly understood to be the lord's chief manor-place, with the lands thereto belonging, which he and his ancestors have, time out of mind, kept in their own manual occupation.

DEMAND, in its popular sense, denotes a calling for or requiring one's due.

DEMAND, in law, has a more special signification, as contradicting with *plaint*: for all civil actions are pursued either by demands or plaints; according to which the pursuer is called either *demandant* or *plaintiff*: viz. in real actions, *demandant*; and in personal actions, *plaintiff*. See PLAINTIFF.

Where the party pursuing is called *demandant*, the party pursued is called *tenant*; and where *plaintiff*, *defendant*. See DEFENDANT.

There are two kinds of demands: the one in *deed, de facto*, as in every precept; the other in *law, de jure*; such is entry in land, distress for rent, &c.

DEMEBRE, in heraldry, is said of dismembered animals, or those with their limbs cut off.

DEMEMBRATION, in Scots law. See LAW, N° clxxvi. 17.

DEMESNE. See DEMAINE.

DEMETRIA, a festival celebrated by the Greeks in honour of Ceres, wherein it was usual for the devotees to lash themselves.

DEMETRIOWITZ, a city of the duchy of Smolensko, in the Russian empire, situated upon the river Ugra, in E. Long. 37. O. N. Lat. 53. 20.

DEMETRIUS PHALEREUS, a celebrated orator and peripatetic philosopher, the scholar of Theophrastus. He acquired so much authority at Athens, that he governed the city for ten years; and ruled with so much wisdom and virtue, that they set up 36 statues in honour of him. By the slanders of some malicious persons, in his absence, he was, however, condemned to die; and his images were pulled down: which when Demetrius heard, he said, they could not pull down that virtue for which those images were set up. He escaped into Egypt, and was protected by Ptolemy Lagos. This king, it is said, asked his advice concerning the succession of his children to the throne; viz. whether he ought to prefer those he had by Eurydice to Ptolemy Philadelphus whom he had by Berenice; and Demetrius advised him to leave his crown to the former. This displeased Philadelphus so much, that, his father being dead, he banished Demetrius; who was afterwards killed by the bite of an asp. Demetrius composed more works in prose and verse than any other peripatetic of his time; and his writings consisted of poetry, history, politics, rhetoric, harangues, and embassies. None of them are extant except his rhetoric, which is usually printed among the *Rhetores Selecti*.

DEMETRIUS POLIORETES, that is, the Taker of Towns, king of Macedonia, was the son of Antigonus,

Demades
Demetrius

Demi-
Democritus

gonus, one of the generals and successors of Alexander the Great. See (History of) MACEDONIA.

DEMI, a word of the same use and effect in the French language, with *semi* in the Latin and English, being formed from *dimidium*; and used, in composition with other words, to signify *half*. In words borrowed from the Latins, we use *semi*; and in those from the French, we retain their *demi*. See SEMI.

DEMI-CULVERIN, a piece of ordnance usually 4½ inches bore, 2700 pound weight, ten feet long, and carrying point blank 175 paces.

DEMI-CULVERIN of the *least size*, is 4½ inches bore, ten feet long, and 2000 pounds weight. It carries a ball of 4 inches diameter, and of 9 pounds weight, and its level range is 174 paces.

DEMI-CULVERIN of the *largest sort*, is 4½ inches bore, 10½ feet long, and weighs 3000 pounds weight. It carries a ball 4½ inches diameter, weighing 12 pounds 11 ounces, point blank 178 paces.

DEMI-GOD. See HERO.

DEMI-GORGE, in fortification, is that part of the polygon which remains after the flank is raised, and goes from the curtain to the angle of the polygon. It is half of the vacant space or entrance into a bastion.

DEMI-QUAVER, a note in music, two of which are equal to a quaver.

DEMI-SEMI-QUAVER, in music, the shortest note, two of them being equal to a semi-quaver.

DEMOCRACY, from *δημος*, *people*, and *κρατος*, to *command* or *govern*; the same with a popular government, wherein the supreme power is lodged in the hands of the people: such were Rome and Athens of old; but as to our modern republics, Basil only excepted, their government comes nearer to aristocracy than democracy. See LAW, § 14.

DEMOCRITUS, one of the greatest philosophers of antiquity, was born at Abdera, a town of Thrace, about the 80th Olympiad; that is, about 460 years before Christ. His father, says Valerius Maximus, was able to entertain the army of Xerxes; and Diogenes Laertius adds, upon the testimony of Herodotus, that the king, in requital, presented him with some Magi and Chaldeans. From these Magi and Chaldeans, Democritus received the first part of his education; and from them, whilst yet a boy, he learned theology and astronomy. He next applied to Leucippus, and learned from him the system of atoms and a vacuum. His father dying, for so many there were, divided the estate. Democritus made choice of that part which consisted in money, as being, though the least share, the most convenient for travelling; and it is said, that his portion amounted to above 100 talents, which is near 20,000. Sterling. His extraordinary inclination for the sciences and for knowledge, induced him to travel into all parts of the world where he hoped to find learned men. He went to visit the priests of Egypt, from whom he learned geometry; he consulted the Chaldeans and the Persian philosophers; and it is said, that he penetrated even into India and Ethiopia, to confer with the Gymnosophists. In these travels, he wasted his substance; after which, at his return, he was obliged to be maintained by his brother; and if he had not given proofs of the greatest understanding, and thereby procured to himself the highest honours, and the strongest interest in his country, he would have

Demon-
strable
||
Demost-
henes.

incurred the penalty of that law which denied the interment in the family-sepulchre to those who had spent their patrimony. After his return from travelling, he lived at Abdera, and governed there in a most absolute manner, by virtue of his consummate wisdom. The magistrates of that city made him a present of 500 talents, and erected statues to him even in his lifetime: but being naturally more inclined to contemplation, than delighted with public honours and employments, he withdrew into solitude and retirement. Democritus incessantly laughed at human life, as a continued farce, which made the inhabitants of Abdera think he was mad; on which they sent for Hippocrates to cure him: but that celebrated physician having discoursed with the philosopher, told the Abderians, that he had a great veneration for Democritus; and that, in his opinion, those who esteemed themselves the most healthy were the most distempered. Democritus died, according to Diogenes Laertius, in the 361st year before the Christian æra, aged 109. It is said that he blinded himself, that he might meditate more profoundly on philosophical subjects; but this has little probability. He was the author of many books, which are lost; and from these Epicurus borrowed his philosophy.

DEMONSTRABLE, a term used in the schools, to signify that a thing may be clearly proved. Thus, it is demonstrable, that the three angles of a triangle are equal to two right ones.

DEMONSTRATION, in logic, a series of syllogisms, all whose premises are either definitions, self-evident truths, or propositions already established. See LOGIC, n^o 27. 102—113.

DEMONSTRATIVE, in grammar, a term given to such pronouns as serve to indicate or point out a thing. Of this number are *hic*, *hæc*, *hoc*, among the Latins; and *this*, *that*, *these*, *those*, in English.

DEMOSTHENES, the famous Athenian orator, was born at Athens 381 B. C. He lost his father at seven years of age; and was placed under the conduct of guardians, who robbed him of his substance, and neglected his education. Demosthenes repaired this loss by his love of eloquence and his extraordinary abilities. He became the disciple of Iſocrates, Plato, and Iſæus; and made such progress under those excellent masters, that, at 17 years of age, he pleaded against his guardians, and caused them to be sentenced to pay him 30 talents. This was the first time that he distinguished himself by his eloquence, in which he arrived at the highest excellence; though he set out under the greatest disadvantages. For he had an impediment in his speech, which for a long time would not suffer him to pronounce the letter R. He had a weak voice, short breath, and a very uncouth manner. However, by dint of resolution, and infinite pains, he overcame all these defects: See DECLAMATION, N^o II. It is universally agreed, that no orator ever spoke with less force, or had the passions of others so much in his power, as Demosthenes. He could dress a thing up in any light he pleased, and give it whatever colouring best answered his purpose; and that with such force of oratory, as bore down, like a thunder-bolt, all before it. Hence Philip king of Macedon said, his eloquence was of more weight against him, than all the fleets and armies of the Athenians; and that he had no enemy but Demosthenes. After the death of Philip, he op-

Dempster
||
Demurrage.

posed Alexander the Great; on which account he was obliged to leave the city: but, after the death of that conqueror, he returned to Athens, where he was received in the most glorious manner, and continued declaiming against the Macedonians. Antipater being informed of this, desired the Athenians to deliver up to him all the orators who had spoken against him; on which Demosthenes withdrew into the life of Celauria. Archas coming hither to seize him in behalf of Antipater, he pretended a desire to write to some of his friends; and sucking some poison he had concealed in a pen, died 322 B. C. Many of his orations are still extant, the style of which is grand, sublime, and nervous; and they are all of them master-pieces of eloquence.

DEMPSTER (Thomas), a very learned man, but of a singular character. He was born in Scotland, but we do not find in what year. He went over to France, for the sake of embracing the catholic religion; and taught classical learning at Paris about the beginning of the 17th century. Tho' his business was to teach school; yet he was as ready to draw his sword, and as quarrelsome, as if he had been a duellist by profession: and it is said, that there scarce passed a day but he had something or other of this kind upon his hands. This spirit and turn of temper drew him into many scrapes; and one in particular, which obliged him to quit the country. Grangier, principal of the College of Beauvais at Paris, being obliged to take a journey, appointed Dempster his substitute. Dempster caused whip a scholar, in full school, for challenging one of his fellows to fight a duel. The scholar, to revenge this affront, brought three gentlemen of his relations, who were of the king's life-guards, into the college. Dempster made the whole college take arms; hamstringed the three life guard-men's horses before the college gate; and put himself into such a posture of defence, that the three sparks were forced to ask for quarter. He gave them their lives; but imprisoned them, and did not release them for some days. They sought another way to revenge themselves: they caused an information to be made of the life and moral behaviour of Dempster, and got some witnesses to be heard against him. Upon this he went over to England, where he found refuge; but did not make any long stay. He went abroad again, and read lectures upon polite learning in several universities; in that of Nismes particularly, where he disputed for a professor's chair, and obtained it. He went to Bologna, and was professor there for the remainder of his life; and was then also admitted a member of the Academy della Rotte. He died there in September 1625, leaving behind him several learned works; as Commentaries on *Resinus de Antiquitatibus Romanorum*, and upon Claudian, &c.; four books of Epistles; several dramatic pieces, and other poems; some books of law; an Apparatus to the History of Scotland; a Martyrology of Scotland; and a List of the Scottish Writers.

DEMULCENTS, among physicians, medicines good against acrimonious humours. Such are the roots of marsh-mallows, of white lilies, of liquorice, and of viper-grass, the five emollient herbs, &c.

DEMURRAGE, in commerce, an allowance made to the master of a ship by the merchants, for staying in a port longer than the time first appointed for his de-

parture.

DEMURRER, in law, a stop put to any action upon some point of difficulty which must be determined by the court, before any further proceedings can be had in the suit.

DEN, a syllable which, added to the names of places, shews them to be situated in valleys, or near woods; as Tenterden.

DENARIUS, in Roman antiquity, the chief silver coin among the Romans, worth in our money about seven-pence three farthings. As a weight, it was the seventh part of a Roman ounce.

DENARIUS is also used in our law-books for an English penny.

DENBIGH-SHIRE, a county of Wales, bounded on the south by Merioneth and Montgomery shires; on the north by Flintshire, and the Irish sea; on the west by Carnarvon, and part of Merionethshire. It is about 40 miles long, and 21 broad. The air is wholesome, but sharp; the county being pretty hilly, and the snow lying long on the tops of the mountains. The soil in general is barren; but the vale of Clwyd, so called from its being watered by that river, is a very fertile pleasant spot, of great extent, and well inhabited. The chief commodities are black cattle, sheep, and goats, rye, called here *amelcorn*, and lead-ore. The county sends two members to parliament, viz. a knight for the shire, and a burgess for Denbigh the capital.

DENBIGH, the capital town of Denbigh-shire in N. Wales. It is seated on the side of a rocky hill, on a branch of the river Clwyd, and was formerly a place of great strength, with an impregnable castle, now demolished. It is pretty large, well built, and inhabited by tanners and glovers, and gives the title of Earl to the noble family of Fielding. W. Long. 3. 30. N. Lat. 53. 15.

DENDERMOND, a handsome and strong town of the Austrian Netherlands, in Flanders, with a strong citadel. It was taken by the allies in 1706, and by the French in 1745. It is surrounded by marshes and fine meadows, which the inhabitants can lay under water when they please. It is seated at the confluence of the rivers Deuder and Schelde. E. Long. 4. 3. N. Lat. 51. 3.

DENDRACHATES, in natural history, the name used by the ancients for an extremely elegant and beautiful species of agate, the ground of which is whitish, variegated with veins of a brighter white. These veins are beautifully disposed in a number of various figures; but generally in many concentric irregular circles, drawn round one or more points. It is common also, in various parts of this stone, to find very beautiful delineations of trees, mosses, sea-plants, and the like, so elegantly expressed, that many have erroneously taken them for real plants included in the substance of the stone; whence the name dendrachates.

DENDRANATOMY, a term used by some for a description of the various parts of trees; as root, trunk, branch, bark, wood, pith, flower, fruit, &c. See **PLANTS**, **VEGETATION**, &c.

DENDROPHORIA, in antiquity, the carrying of boughs or branches of trees; a religious ceremony so called, because certain priests called from thence *dendrophori*, tree-bearers, marched in procession, carrying the branches of trees in their hands in honour of some god,

Demurrer
||
Dendrophoria.

^{Denb} god, as Bacchus, Cebale, Sylvanus, &c. The college of the dendrophori is often mentioned in ancient marbles; and we frequently see in basso relievo the bacchantes represented as men carrying little shrubs or branches of trees.

^{Denmark.} DENEb, an Arabic term signifying *tail*, used by astronomers to denote several fixed stars. Thus, *deneb elceti*, signifies the bright star in the lion's tail. *Deneb adigece*, that in the swan's tail, &c.

DENHAM (Sir John), an eminent English poet, the only son of Sir John Denham, chief baron of the exchequer in Ireland, and one of the lords commissioners there, was born in Dublin in 1615; but his father, in 1617, being made a baron of the exchequer in England, he received his education in that country. In his youth he followed gaming more than any thing else; but, in 1641, published a tragedy called the *Sophy*, which was much admired by the best judges; and, in 1643, wrote his famous poem called *Cooper's Hill*; which Mr Dryden pronounces will ever be the standard of good writing for majesty of style. Denham was sent ambassador from Charles II. to the king of Poland; and at the Restoration, was made surveyor-general of his majesty's buildings, and created knight of the Bath. On obtaining this post, he is said to have renounced his poetry for more important studies; tho' he afterward wrote a fine copy of verses on the death of Cowley. He died at his office in Whitehall in 1668; and his works have been often since printed.

DENIER, a small French copper-coin, of which twelve make a sol.

There were two kinds of deniers, the one tournois, the other paris, whereof the latter was worth a fourth part more than the former.

DENIZEN, in law, an alien made a subject by the king's letters-patent; otherwise called *denaison*, because "his legitimization proceeds *ex donatione regis*, from the king's gift."

A denizen is in a kind of middle state between an alien and a natural-born subject, and partakes of both of them. He may take lands by purchase or devise, which an alien may not: but cannot take by inheritance; for his parent, through whom he must claim, being an alien, had no inheritable blood, and therefore could convey none to the son: and, upon a like defect of blood, the issue of a denizen born before denization, cannot inherit to him; but his issue born after, may. A denizen is not excused from paying the alien's duty, and some other mercantile burthens. And no denizen can be of the privy council, or either house of parliament, or have any office of trust civil or military, or be capable of any grant of lands, &c. from the crown.

DENMARK, one of the most ancient monarchies in Europe, comprehending the peninsula of Jutland, and the islands of Zeland, Funen, &c. But Denmark, properly so called, is only that part of Scandinavia which formerly went by the name of *Cimbria Chersonesus*, and now is called *Jutland*. Including Holstein, it is bounded by the sea called the *Gategate* on the north; by the Baltic on the east; by the river Elbe, which separates it from Bremen, on the south; and by the duchy of Saxe-Lauenburg towards the south-east; extending from 54. 40. to 58. 20. N. Lat.

The origin of the name *Denmark* is very uncertain.

The most probable conjecture concerning it is that of *Saxo-Grannaticus*, the most ancient and best Danish historian. He derives it from *Dan* the son of *Humble*, the first king, and *Mark*, or *Marc*, signifying a country in several dialects of the Teutonic; according to which etymology, the word *Denmark* signifies the land, or country, of *Dan*.—This *Dan* is thought to have lived about 1038 years before the Christian era. ² *Dan* the Almost all historians agree that he was the son of *Humble*, a native of Zealand. His possessions and influence were very considerable, not only in Zealand, but in the islands of Langland and Mona. It was his courage, however, and skill in the art of war, that induced the inhabitants of Denmark to choose him for their king. He was called to the assistance of the Jutlanders upon an irruption of the Saxons into their territories, and promised the sovereignty of the country if he drove out the enemy. On this he immediately raised an army, gained a complete victory over the Saxons, and obliged them to leave the country; and he was accordingly elected king.

In such early ages as these, we are not to look for any authentic history either of this or any other kingdom. The history of Denmark, for a great number of ages after the reign of *Dan*, is filled with fabulous exploits of heroes, encounters with giants, dragons, &c. ³ *History of this country* One of their kings named *Frotho*, who reigned about 761 years before Christ, is said to have conquered all Britain, Sleswick, Russia, Pomerania, Holstein, &c.; an assertion which cannot easily be credited, considering the difficulty which succeeding warriors, even the greatest in the world, found to subdue the inhabitants of those countries.—It is certain, however, that anciently the kingdom of Denmark made a much more conspicuous figure than it does at present. The Danes appear to have had a very considerable naval force almost from the foundation of their empire; and the conquests they undoubtedly made in our island, are certain proofs of their valour.

The natural enemies of the Danes were the Swedes, Norwegians, and Saxons; especially the first. With one or other of these nations almost perpetual war was carried on. The kingdom was also often rent by civil dissensions; which the neighbouring monarchs did not fail to take advantage of, in order to reduce the kingdom of Denmark under their subjection. As neither party, however, generally came off with advantage, the history of these wars affords nothing interesting or entertaining.—One of the greatest of the Danish monarchs was *Valdemar* I. who obtained the throne in 1157; having defeated and killed his competitor *Swen*, after a ten years civil war. He maintained a long war with the Vandals, whose power he at last entirely broke, and reduced under his subjection the island of Rugen. He also proved victorious over the Norwegians, so that their king and queen came in person to submit to him. In 1165, he also laid the foundations of the city of Dantzic: which, though it hath since become a place of such consequence, consisted at first only of a few poor fishermen's huts; but the privileges and immunities conferred upon it by this monarch, soon proved the means of its becoming a flourishing city.—In 1169, he entirely subdued the Courlanders; and, soon after, was invested with the duchy of Holstein, by the emperor Frederic Barbarossa. He is said

Denmark. to have been poisoned by a quack medicine, given with a design to recover him from a distemper with which he was seized in 1182.

5
Power of
Denmark
in 1193.

In the year 1195, Canute, Valdemar's successor, caused a multer to be made of all the men fit to bear arms in his dominions; and ordered each province to fit out its proportion of shipping, every way equipped, and ready for action. The whole force of Denmark, at that time, consisted of 670 ships of war, besides the squadrons supplied by vassals, tributary states, and allies. The number of the land-forces is not mentioned. In the reign of this prince, the Danish dominions were enlarged by the entire conquest of Stromar; the districts of Lubeck and Hamburg, formerly known by the name of *Nordalbingia*, but now included under the general name of *Holstein*. He died in 1203, and was succeeded by Valdemar II. who proved a very great and warlike prince. In 1211, he founded the city of Stralfund, opposite to the Isle of Rugen. The same year, his queen died in child-bed; and in memory of her he built the castle of *Dronningholm*, that name importing the *Queen's island*. In 1218, he undertook an expedition against the Livonians, having received advice that they, assisted by the Lithuanians, Muscovites, and other barbarous nations, had driven from their habitations all those in their neighbourhood who had embraced Christianity, and taken an oath of allegiance to the crown of Denmark. Fitting out a powerful fleet, therefore, he immediately set sail for that country; but his troops were no sooner landed, than they were seized with a panic, at the sight of such a powerful army of savages as were assembled to oppose them. The king himself was dismayed at the unusual spectacle of a whole army clothed in skins, and resembling beasts more than human creatures. Encouraged, however, by the bishops who attended him, he ventured an engagement, and overthrew the Barbarians with incredible slaughter. This victory was gained near the fortrefs of *Valdemar*, which received its name on that account.

7
Flourishing
state of the
kingdom.

How potent and flourishing the kingdom of Denmark was at this time, appears from an estimate of the revenues of the tributary provinces, those countries conquered by Valdemar, and the standing forces of the whole kingdom. This account was copied by Pontanus from Wittfeld a writer of those days, who had it from a register kept by Valdemar's steward. From the provinces were daily sent in 24 laits of oats, 24 laits of rye and half that quantity of wheat, 13 *talents* of cheese and butter, and nine of honey; 24 oxen, 300 sheep, 200 hogs; and 600 marks of coined money. This was the certain revenue: but to this was added near an equal sum from adventitious circumstances; such as fines, forfeitures, taxes on law-suits and pleadings, with a variety of other contingencies; the whole amounting to above 100,000 marks a-day, or 23,730,000 *l. per annum*; a sum in those days almost incredible.—With this revenue were kept for constant service 1400 great and small ships for the king's use, each of which at a medium carried 121 soldiers; making the whole of the standing forces, besides garrisons, consist of 169,400 fighting men.

8
Valdemar
taken pri-
soner.

In 1223, a very great misfortune befel Valdemar, notwithstanding all his power. Henry earl of Swerin, otherwise called *Henry Palatine*, a German prince,

having been deprived of part of his dominions by Valdemar, surprised and carried off the king himself, and kept him close prisoner for three years. The conditions on which he at last obtained his liberty, were very hard. He was obliged to pay a prodigious sum of money; to relinquish Holstein, Swerin, Hamburg, and all his possessions on the other side of the Elbe; and lastly, solemnly to swear that he would maintain this compulsive contract, and never take any measures to punish Henry or his associates. This treaty was signed on the 25th of March 1226.

Besides these territories which the Danish monarch had been obliged to cede by treaty, many tributary princes took the opportunity of his captivity, to recover their liberty; and among the rest, the inhabitants of Lubeck revolted, and entered into alliance with Albert duke of Saxony against Valdemar. The latter, however, was not of a disposition to submit tamely to such treatment. He obtained a dispensation from the Pope to break his engagements with Henry, and immediately entered Holstein at the head of a numerous army. Here he was met by several German princes, at the head of a very numerous army; and a desperate engagement ensued. Valdemar at first had the advantage; but being wounded in the eye, his troops were at last defeated with great slaughter. It doth not appear, that ever the king of Denmark was able to revenge himself of his enemies, or to recover the dominions he had lost. So far from this, he was obliged, in 1228, to cede Lawenberg to the duke of Saxony, who had already seized on Ratzburg and Molna. Soon after this, his eldest son Valdemar was accidentally killed as he was hunting, and his two other sons married the daughters of his two greatest enemies. Abel, the third son, married the daughter of Adolphus duke of Holstein; and Eric, the second, married the duke of Saxony's daughter. These misfortunes are supposed to have hastened his death, which happened in the month of April 1242.

On the death of Valdemar, the kingdom was divided between the two young princes; and between them a war commenced the very next year. A peace was concluded the year following, and war renewed the year after; but how long it continued, we are not informed. In 1250, Eric paid a visit to his brother Abel, intreating his mediation between him and the princes of Holstein, with whom he was then at war. Abel received him, in appearance, with great kindness, and promised that his utmost endeavours to procure a reconciliation should not be wanting; but in the mean time, laid a plan for having him murdered at sea: this was effected, and Abel became master of the whole kingdom.

The new king did not long enjoy the sovereignty he had so wickedly obtained. He was tormented by his own conscience; especially when he found, among his brother's papers, one by which he was left heir to the whole kingdom on the decease of Eric, and many kind expressions with regard to himself. He was at last killed in a battle with his own subjects, in 1252; on account of some taxes he intended to impose.

From this time to the year 1333, the kingdom of Denmark gradually declined. Usurpers established themselves in different provinces; while the kings of Sweden did not fail to avail themselves of the distracted

Denmark.

rants.

Denmark. ted state of the Danish affairs. In 1333, died Christopher II. who possessed only the cities of Scanderburg in Jutland, and Neoburg in Fionia; with some few other inconsiderable places, of all the hereditary dominions of Denmark. Halland, Holbec, Calemberg, and Samsoe, were held by Canute Porcius; Schonen, Lyttre, and Bleking, by the king of Sweden, to whom they had been lately sold: John, earl of Wagria, had the jurisdictions of Zealand, Falstie, Laaland, and Femmerin; Gerhard of Jutland and Fionia; and Lawrence Jonea of Lang-land and Arras.

After the death of Christopher, an interregnum of seven years ensued.—The first attempt for the sovereignty was made by Otho, second son to the late king, who laid a scheme for driving Gerhard out of Jutland; but not being able to accomplish it, he was taken prisoner, and closely confined by Gerhard.—The king of Sweden next wrote to Pope Benedict XIII. beseeching his Holiness to confirm to him the provinces of Schonen and others which he possessed; and to allow him to subdue the rest of the kingdom, which was now usurped and rendered miserable, by a set of petty princes, who knew not how to govern. To influence him the more powerfully, he also promised to hold this kingdom of the Pope; and to pay him the usual tax collected by the church. This request, however, was refused.—Valdemar of Slefwic, nephew to Gerhard, then aspired to the sovereignty. He had formerly been elected king; but had given over all thoughts of enjoying the sovereignty, on account of the superior influence of Christopher; but now resumed his ambitious views, at the instigation of his uncle. Several of the nobility also cast their eyes on young Valdemar Christopher's son, now at the emperor's court. But, while each of these princes were laying

¹³
Distressed
state of the
kingdom.

schemes to aggrandise themselves, the unhappy Danes were distressed by exorbitant taxes, famine, and pestilence; and the two last, in consequence of the former. The peasants neglected to cultivate the lands, which they held on a very precarious tenure; the consequence of this was poverty, and an unwholesome diet; and this, co-operating with the peculiar disposition of the air, produced a plague, which destroyed more than half the inhabitants of the country. The poor dropped down dead on the streets with disease and hunger, and the gentry themselves were reduced to a state of wretchedness; yet, though the whole kingdom was evidently on the verge of ruin, ambitious projects employed the great, as if every thing had been in the most profound tranquillity.

In the midst of these grievous calamities, Gerhard, sovereign of Jutland, proposed to his nephew Valdemar an exchange of territories, which he believed would prove favourable to the designs of the latter on the crown. A treaty for this purpose was actually drawn up and signed; but the inhabitants, notwithstanding their distressed situation, so highly resented their being disposed of like cattle, from one master to another, that they refused to pay the usual taxes. Gerhard resolved to compel them; and therefore led 10,000 men, whom he had levied in Germany, into the heart of the province. Providence, however, now raised up an enemy to this tyrant. One Nicholas Norevi, a man greatly esteemed for his courage, public spirit, and prudence, beheld with sorrow the condition to which Denmark was reduced. He had long meditated a variety of

¹⁴
Nicholas
Norevi re-
covers the
liberty of
Jutland.

Denmark. projects for its relief, and at last imagined things were in such a situation that the whole depended on his single arm. Young Valdemar, Christopher's son, had a number of adherents in the kingdom; his most dangerous enemy was Gerhard; and could he be removed, the Jutlanders would at least be free from an oppressor, and might choose Valdemar, or any other they thought proper, for their sovereign. Collecting a body of chosen horse, therefore, he marched in the night to Rander-shusen, where Gerhard had fixed his head-quarters; and having forced open the tyrant's quarters, immediately put him to death. He then fled with the utmost expedition; but was pursued and overtaken by a party of the enemy's horse, through which he forced his way and escaped. Gerhard's sons, hearing of his death, retired into Holstein from whence they had come; leaving the army, composed chiefly of Holsteiners, to be cut in pieces by the enraged peasants, who fell upon them from every quarter.

Still, however, the Holsteiners kept possession of the citadels and fortified places, from whence Nicholas resolved to dislodge them. He accordingly raised a body of forces; attacked and took Landen, a castle situated on the river Scherne: after which he laid siege to Alberg; but the garrison making an obstinate defence, he turned the siege into a blockade, by which they were soon reduced to great extremity. The governor sent an express to the sons of Gerhard, acquainting them with the impossibility of his holding out more than a few days, without being relieved. This determined them to march to the relief of so important a place. They came up with Nicholas just as the governor was ready to surrender, but were defeated; ¹⁵ed. He is killed. though Nicholas was unfortunately killed in the engagement.

Jutland having thus regained its liberty, the rest of the kingdom followed its example. Zealand first openly declared itself. Here Henry, Gerhard's son, maintained several garrisons; and resolved to defend his possessions in spite of all the power of the inhabitants. For this purpose he drew together an army; but, in the mean time, a tumult arose among the peasants on account of a Danish nobleman slain by the Holsteiners. By this the people were at last so irritated, that, falling upon the Holsteiners sword in hand, they killed 300 of them; drove the rest out of the island; and chose Valdemar, Christopher's son, for their sovereign.

The Danes now resumed their courage; the lands were cultivated, the famine and pestilence ceased, and the kingdom began to flourish as formerly. Matters continued in a prosperous way till 1387, when Margaret mounted the throne. She raised the kingdom to its highest pitch of glory, as partly by her address, and partly by hereditary right, she formed the union of Sweden, Denmark, and Norway. She held her dignity with such firmness and courage, that she was justly stiled the *Semiramis of the North*. Her successors being destitute of her great qualifications, the union of Calmar fell to nothing: but Norway still continued annexed to Denmark. About the year 1448, the crown of Denmark fell to Christian, count of Oldenburg, from whom the present royal family of Denmark is descended; and, in 1536, the protestant religion was ¹⁶esta- Margaret unites the crowns of Denmark, Sweden, and Nor- way.

Denmark established in Denmark, by that wife and politic prince Christian III.

Christian IV. of Denmark, in 1629, was chosen for the head of the Protestant league, formed against the house of Austria: but, though brave in his own person, he was in danger of losing his dominions; when he was succeeded in that command by the famous Gustavus Adolphus, king of Sweden. The Dutch having obliged Christian, who died in 1648, to lower the duties of the Sound, his son Frederic III. consented to accept of an annuity of 150,000 florins for the whole. The Dutch, after this, persuaded him to declare war against Charles Gustavus, king of Sweden, which had almost cost him his crown in 1657. Charles stormed the fortrefs of Fredericksstadt; and in the succeeding winter, he marched his army over the ice to the island of Funen, where he surprised the Danish troops, took Odensee and Nyburg and marched over the Great Belt to besiege Copenhagen itself. Cromwell, the English usurper interposed: and Frederic defended his capital with great magnanimity, till the peace of Roschild; by which Frederic ceded the provinces of Halland, Bleking, and Scania, the island of Bornholm, Bahus, and Drontheim, in Norway, to the Swedes. Frederic fought to elude those severe terms; but Charles took Cronenburg, and once more besieged Copenhagen by sea and land. The steady intrepid conduct of Frederic under these misfortunes, endeared him to his subjects; and the citizens of Copenhagen made an admirable defence, till a Dutch fleet arrived in the Baltic, and beat the Swedish fleet. The fortune of war was now entirely changed in favour of Frederic: who shewed on every occasion great abilities, both civil and military; and having forced Charles to raise the siege of Copenhagen, might have carried the war into Sweden, had not the English fleet, under Montague, appeared in the Baltic. This enabled Charles to besiege Copenhagen a third time: but France and England offering their mediation, a peace was concluded in that capital; by which the island of Bornhold returned to the Danes; but the island of Rugen, Bleking, Halland, and Schonen, remained with the Swedes.

17
Several provinces ceded to Sweden.

18
Perpetual wars with that kingdom.

Though this peace did not restore to Denmark all she had lost, yet the magnanimous behaviour of Frederic, under the most imminent dangers, and his attention to the safety of his subjects, even preferably to his own, endeared him so much in their eyes, that they rendered him absolute. Frederic was succeeded, in 1670, by his son Christian V. who obliged the duke of Holstein Gottorp to renounce all the advantages he had gained by the treaty of Roschild. He then recovered a number of places in Schonen; but his army was defeated in the bloody battle of Lundén, by Charles XI. of Sweden. This defeat did not put an end to the war; which Christian obstinately continued, till he was defeated entirely at the battle of Landseroon; and he had almost exhausted his dominions in his military operations, till he was in a manner abandoned by all his allies, and forced to sign a treaty on the terms prescribed by France, in 1679. Christian, however, did not desist from his military attempts; and at last he became the ally and subsidiary of Lewis XIV. who was then threatening Europe with chains. Christian, after a vast variety of treating and fighting with

the Holsteiners, Hamburgers, and other northern powers, died in 1699. He was succeeded by Frederic IV. who, like his predecessors, maintained his pretensions upon Holstein; and probably must have become masters of that duchy, had not the English and Dutch fleets raised the siege of Tonningen; while the young king of Sweden, Charles XII. who was no more than 16 years of age, landed within eight miles of Copenhagen, to assist his brother-in-law the duke of Holstein. Charles probably would have made himself master of Copenhagen, had not his Danish majesty agreed to the peace of Travendahl, which was entirely in the duke's favour. By another treaty concluded with the States-General, Frederic obliged himself to furnish a body of troops, who were to be paid by the confederates; and who afterwards did great service against the French.

Notwithstanding this peace, Frederic was perpetually engaged in wars with the Swedes; and while Charles was an exile at Bender, he marched through Holstein into Swedish Pomerania; and in the year 1712, into Bremen, and took the city of Stade. His troops, however, were totally defeated by the Swedes at Gadebusch, who laid his favourite city of Altona in ashes. Frederic revenged himself, by seizing great part of the ducal Holstein, and forcing the Swedish general, count Steinbock, to surrender himself prisoner, with all his troops. In the year 1716, the successes of Frederic was so great, by taking Tonningen and Stralfund, by driving the Swedes out of Norway, and reducing Wismar and Pomerania, that his allies began to suspect he was aiming at the sovereignty of all Scandinavia. Upon the return of Charles of Sweden from his exile, he renewed the war against Denmark, with a most embittered spirit; but on the death of that prince, who was killed at the siege of Frederickschal, Frederic durst not refuse the offer of his Britannic majesty's mediation between him and the crown of Sweden; in consequence of which, a peace was concluded at Stockholm, which left him in possession of the duchy of Sleswick. Frederic died in the year 1730, after having, two years before, seen his capital reduced to ashes, by an accidental fire. His son and successor, Christian Frederic, made no other use of his power, and the advantages with which he mounted the throne, than to cultivate peace with all his neighbours, and to promote the happiness of his subjects, whom he eased of many oppressive taxes.

In 1734, after guarantying the Pragmatic Sanction, Christian sent 6000 men to the assistance of the emperor, during the dispute of the succession to the crown of Poland. Though he was pacific, yet he was jealous of his rights, especially over Hamburg. He obliged the Hamburgers to call in the mediation of Prussia, to abolish their bank, to admit the coin of Denmark as current, and to pay him a million of silver marks. He had, two years after, viz. 1738, a dispute with his Britannic majesty, about the little lordship of Steinhort, which had been mortgaged to the latter by the duke of Holstein Lawenburg, and which Christian said belonged to him. Some blood was spilt during the contest; in which Christian, it is thought, never was in earnest. It brought on, however, a treaty, in which he availed himself of his Britannic majesty's predilection for his German domi-

19
An advantageous treaty with Great Britain; tain.

Denmark. nions; for he agreed to pay Christian a subsidy of 70,000 *l.* Sterling a-year, on condition of keeping in readiness 7000 troops for the protection of Hanover: this was a gainful bargain for Denmark. And two years after, he seized some Dutch ships, for trading without his leave, to Iceland: but the difference was made up by the mediation of Sweden. Christian had so great a party in that kingdom, that it was generally thought he would revive the union of Calmar, by procuring his son to be declared successor to his then Swedish majesty. Some steps for that purpose were certainly taken: but whatever Christian's views might have been, the design was frustrated by the jealousy of other powers, who could not bear the thoughts of seeing all Scandinavia subject to one family. Christian died in 1746, with the character of being the father of his people.

His son and successor, Frederic V. had, in 1743, married the princess Louisa, daughter to his Britannic majesty. He improved upon his father's plan, for the happiness of his people; but took no concern, except that of a mediator, in the German war. For it was by his intervention, that the treaty of Closter-seven was concluded between his royal highness the late duke of Cumberland, and the French general Richlieu. Upon the death of his first queen, who was mother to his present Danish majesty, he married a daughter of the duke of Brunswick Wolfenbuttel; and died in 1766. He was succeeded by his son Christian VII. his present Danish majesty, who married the princess Carolina Matilda of England.

²⁰ Division of the kingdom. The kingdom of Denmark at present is divided into six grand districts or provinces; *viz.* 1. Denmark properly so called, comprehending the islands of Zealand, Funen, Langeland, Laaland, Falstria, Mona, Samsoe, Arroe, Bornholm, Auhoult, Leflaw, and that part of the continent called *North Jutland*. 2. The dutchy of Sleswick, or South Jutland. 3. The dutchy of Holstein. 4. The earldoms of Oldenburg and Delmenhorst. 5. The kingdom of Norway; and 6. Iceland, with the islands lying in the Northern Seas; for a particular description of which see these articles.

²¹ Language, religion, &c. The language of Denmark is a dialect of the Teutonic, and bears a strong affinity to the Norwegian tongue; but is disagreeable to strangers, on account of the drawing tone with which it is pronounced. They have borrowed many words from the Germans; and, indeed, the high Dutch is used in common discourse by the court, the gentry, and the burghers. The better sort likewise understand French, and speak it fluently. The Lutheran doctrine is universally embraced through all Denmark, Sweden, and Norway; so that there is not another sect in these kingdoms. Denmark is divided into six dioceses, one in Zealand, one in Funen, and four in Jutland: but the bishops are, properly speaking, no other than superintendants, or *primi inter pares*. They have no cathedrals, ecclesiastical courts, or temporalities. Their business is to inspect the doctrine and morals of the inferior clergy. The revenue of the bishop of Copenhagen amounts to about 2000 rixdollars; and this is the richest benefice in the kingdom. The clergy are wholly dependant on the government. They never intermeddle, nor are employed or consulted in civil affairs. They, nevertheless, have acquired great influence, and erected a fort

of spiritual tyranny over the minds of the common people, by whom they are much revered. They are, generally speaking, men of exemplary lives, and some erudition. Their churches are kept more clean, and better adorned, than those of England: the people are great lovers of music, and their organs commonly entertain the congregation for half an hour before or after service. The state of literature is very low in Denmark. There is, indeed, an university at Copenhagen; but meanly endowed, and very ill supplied with matters. Taste and the belles lettres are utterly unknown in this country, which yet has produced some men of great eminence in mathematics and medicine; such as Tycho Brahe, Borrichius, and the Bartholines.

²² The constitution of Denmark was heretofore of the free Gothic original. The convention of the estates, even including the representatives of the boors or peasants, elected a king for his personal virtues, having still a regard to the son of their late monarch, whom, however, they made no scruple of setting aside, if they deemed him unworthy of the royal dignity. They enacted laws; conferred the great offices of state; debated all affairs relating to commerce, peace, war, and alliances; and occasionally gave their consent to the imposition of necessary taxes. The king was no other than chief magistrate, generalissimo, and as it were prime minister to his people. His business was to see justice administered impartially; to command the army in time of war; to encourage industry, religion, arts, and sciences; and to watch over the interests of his subjects.

²³ King, how rendered absolute. Such was the constitution of Denmark, till the year 1660, when it underwent a very strange and surprising revolution. At that time peace was concluded with Sweden, and the nation reformed with the clamour of misery and discontent. There was nothing left in the public treasury, to pay off and disband the army; which therefore became insolent and licentious. The common people, and even the burghers, had been exhausted by the long, expensive war: the clergy were unsatisfied with their condition and want of importance; and the nobility were become proud and tyrannical. When the estates assembled to deliberate and redress the grievances of the nation, the commons proposed that an equal tax should be laid upon all persons, without distinction, in proportion to their circumstances. The nobles pleaded their privilege of being exempted from all imposition. The burghers alleged, that as the nobility engrossed all the lands and riches in the kingdom, it was reasonable that they should bear their share of the common burden. Violent disputes ensued. At length a nobleman, called *Otto Craeg*, stood up, and in a transport of passion told the commons, that they neither understood the privileges of the nobility, who were always exempted from such impositions, nor the condition of themselves, who were no other than their *slaves*. This inglorious term produced an immediate ferment in the assembly; and the hall resounded with murmurs and altercation. Nan-son, speaker of the commons, starting up in a rage of indignation, swore that the nobility should repent their having branded the commons with such an opprobrious epithet. He had previously concerted the design with the bishop of Copenhagen, and the court was not ignorant of their intention. The clergy and burghers, breaking

Denmark

breaking up in disorder, marched, under the auspices of these leaders, to the brewer's hall; where, after much debate, they agreed to make a solemn tender of their freedom and services to the king, that he might become absolute monarch of the realm, and see the right of hereditary succession established in his family. Next morning they marched in couples, each burgher being paired with a clergyman, through the streets, which were filled with the populace, who shouted as they passed, to the council-hall, where the nobles had re-assembled. There Nanfon, in a short harangue, signified the intention of the clergy and commons, demanded the concurrence of the nobles, and threatened, that, in case of a refusal, they would forthwith proceed without them to the palace. The nobles were confounded and abashed. They endeavoured to gain time: they professed a desire of concurring with the other estates; but desired that an affair of such consequence might not be precipitated. The others being deaf to their remonstrances and intreaties, continued their procession to the palace; where they were met by the prime minister, who conducted them to the hall of audience. There the bishop of Copenhagen, in a florid speech, as deputy from the two orders, made a solemn tender to the king of an absolute and hereditary dominion; assuring his majesty, that he might command their purges and arms, to support a measure so necessary to the welfare of his people. The king received them graciously, assented to the proposal, thanked them for their zeal and confidence, and assured them they might depend upon his royal favour and protection. The city-gates were immediately shut, that none of the senators should escape: a precaution by which the nobles were so intimidated, that they signified their readiness to concur with the step which the other two orders had taken. Preparations were forthwith made for this strange inauguration. Scaffolds were raised in the open space before the castle; and the troops and burghers received orders to appear in arms, under their respective officers. On the 16th day of October, in the year 1660, the king, queen, and royal family, ascended an open theatre; and placing themselves on chairs of state, under canopies of velvet, received in public the homage of all the senators, nobility, clergy, and commons, couched in an oath of allegiance composed for the purpose. Thus the people, with a rash and desperate hand, from motives of revenge, fomented by an artful ministry and ambitious clergy, resigned their liberty and independence, and invested their sovereign with a despotic power over their lives and fortunes. The king of Denmark is now so absolute, that he not only can impose what tolls and taxes he shall think convenient; but also, by a maxim in the present jurisprudence of that nation, he enjoys the prerogative of explaining the law, and even of altering it occasionally.

24
Laws, &c.

The laws of Denmark are so concise, that the whole body is contained in one quarto volume, written in the language of the country. Every man may plead his own cause, without employing either council or attorney: but there are a few advocates for the benefit of those who cannot or will not speak in their own defence. The proceedings are so summary, that a suit may be carried through all the courts, and finally decided, in 13 months. There are three courts in Den-

Denmark

mark, and an appeal lies from the inferior to the superior tribunal. The lowest of these is, in cities and towns, denominated the *Byfogtids Court*; and in the country, the *Herredsfogtids*. Causes may be appealed from this to the *Landsting*, or general head court for the province: but the final appeal lies to the court of *High-right* in Copenhagen, where the king presides in person, assisted by the prime nobility. The judges of the two other courts are appointed by his majesty's letters patent, to sit and determine causes *durante bene placito*. These are punishable for any misdemeanours of which they may be guilty; and when convicted of having passed an unjust sentence, they are condemned to make reparation to the injured party. Their salaries are very inconsiderable, and paid out of the king's treasury, from the fines of delinquents, besides a small gratuity from the plaintiff and defendant when sentence is passed. Such is the peculiar privilege enjoyed by the city of Copenhagen, that causes appealed from the *Byfogtids court*, instead of passing through the provincial court, are tried by the burgo-master and common-council; from whence they proceed immediately to the highest court, as the last resource. Affairs relating to the revenue are determined in the rent-chamber of Denmark, which is analogous to our court of exchequer. To another tribunal, composed of some members from this rent-chamber, from the admiralty, and college of commerce, merchants appeal for redress, when their commodities are seized for non-payment of duties. All disputes relating to the sea are determined by the court of admiralty, constituted of commissioners appointed for these purposes. The chancery may be more properly termed a *secretary's office*. It consists of clerks, who write and issue all the king's decrees and citations, transcribe papers, and, according to the directions they receive, make draughts of treaties and alliances with other nations. The government of Denmark is very commendable for the excellent policy it maintains. Justice is executed upon criminals with great severity; and such regulations are established as effectually prevent those outrages that are daily committed in other countries. No man presumes to wag his tongue against the government, far less to hatch schemes of treason. All the subjects are, or seem to be, attached to their sovereign by the ties of affection. Robbery on the high-way, burglary, coining or clipping, are crimes seldom or never heard of in Denmark. The capital crimes usually committed are theft and manslaughter. Such offenders are beheaded very dexterously with one stroke of a sword. The executioner, though infamous, is commonly rich; because, over and above the functions of his office, he is employed in other scandalous occupations, which no other person will undertake. He, by means of his undertrapper, called the *pracher*, empties all the jakes, and removes from houses, stables, or streets, dead dogs, horses, &c. which no other Dane will vouchsafe to touch on any consideration whatsoever.

In Copenhagen there is a master of the police, who superintends the economy of that city. No torches are allowed to be carried through the streets of this city, because great part of the houses are of timber, and the wind is generally high. In lieu of flambeaux, the court and quality use large round lanterns, fixed to the end of long poles. In a word, the master of
the

Denmark. the police regulates every thing that relates to the decency, good order, quiet, and security, of the capital. The apothecaries in this kingdom are under excellent regulations : their number at Copenhagen is restricted to two ; and one is allowed to every other town of importance. They are examined and appointed by the college of physicians, and confirmed by the king himself ; otherwise they cannot exercise the profession. Their shops are visited three times a-year by the magistrates, accompanied with physicians, who inspect their medicines and regulate the prices. They are obliged to keep an exact account of every thing they sell, to specify the name of the person who bought it, and that of the doctor by whom it was prescribed ; so that accidents are prevented, and murders by poison easily discovered.

22
Slavish condition of the Danish subjects.

The Danish nobility and gentry are all included in the term *noblesse* ; and formerly there were no distinctions of title : but, within these 60 or 70 years, some few favourites have been dignified with the titles of *count* and *baron*. These, and these only, enjoy the privilege of disposing of their estates by will ; though others may make particular dispositions, provided they have sufficient interest to procure the king's approbation and signature. The noblesse of Denmark formerly lived at their own seats with great magnificence ; and at the conventions of estates met the king with numerous and superb retinues : but since he became absolute, they are so impoverished by exorbitant taxes, that they can hardly procure subsistence ; and, for the most part, live obscurely in some corner of their ruined country palaces, unless they have interest enough to procure some employment at court. They no longer inherit the spirit and virtues of their ancestors ; but are become ferile, indolent, ostentatious, extravagant, and oppressive.

Their general character is a strange composition of pride and meanness, insolence and poverty. If any gentleman can find a purchaser for his estate, the king, by the Danish law, has a right to one third of the purchase-money : but the lands are so burdened with impositions that there would be no danger of an alienation, even tho' this restriction was not in force. Nay, some gentlemen in the Island of Zealand have actually offered to make a surrender to the king of large tracts of very fertile land in the Island of Zealand, if his majesty would be pleased to accept of them in place of the impositions laid on them. The reason of this is, because, by the law of Denmark, if any estate is burdened beyond what it can bear, the owner must make up the deficiency out of his other estates, if he has any. Hence the king generally refuses such offers ; and some gentlemen have been transported with joy when they heard that his majesty had been " graciously pleased to accept their whole estates."

This oppression of the nobles by the king produces in them a like disposition to oppress the commons ; and the consequence of all this is, that there is no part of the world where extravagance and dissipation reigns to such a degree. The courtiers maintain splendid equipages, wear fine clothes, drink a vast quantity of French wine, and indulge themselves with eating to excess. Such as derive money from their employments, instead of purchasing land in Denmark, remit their cash to the banks of Hamburg and Amsterdam. The merchants and burghers tread in the steps of their superiors : they

spend all their gains in luxury and pleasure, afraid of incurring the suspicion of affluence, and being stripped by taxation. The peasant, or boor, follows the same example. No sooner has he earned a rix-dollar than he makes haste to expend it in brandy, lest it should fall into the hands of his oppressive landlord. This lower class of people are as absolute slaves as the negroes in the West Indies, and subsist upon much harder fare. The value of estates is not computed by the number of acres, but by the stock of boors, who, like the timber, are reckoned a parcel of the freehold ; and nothing can be more wretched than the state of these boors. They feed upon stock-fish, salted meats, and other coarse diet : there is not the least piece of furniture of any value in their houses, except feather-beds, of which there is great plenty in Denmark ; and which are used not only as beds to lie on, but as blankets for covering. After the boor has toiled like a slave to raise the king's taxes, he must pay the overplus of his toil to his needy landlord. Should he improve his ground and repair his farm-house, his cruel master will immediately transplant him to a barren farm and a naked habitation, that he may let the improved ground to another tenant at a higher price. The peasants likewise sustain a great deal of damage and violence from the licentious soldiers that are quartered in their houses. They are moreover obliged to furnish horses and waggons for the royal family and all their attendants when the king makes a progress through the country, or removes his residence from one palace to another. On such occasions the neighbouring boors are summoned to assemble with their cattle and carriages, and not only to live at their own expence, but to bear every species of outrage from the meanest lacquies of those who attend his majesty. The warlike spirit of the Danes no longer subsists : the common people are mean-spirited, suspicious, and deceitful ; nor have they that talent for mechanics so remarkable in some northern nations. While the peasants are employed in their labour without doors, the women are occupied at home in spinning yarn for linen, which is here made in great perfection.

27
Dress, &c.

In Denmark, all persons of any rank above the vulgar dress in the French taste, and affect finery ; the winter-dress of the ladies is peculiar to the country, very neat, warm, and becoming. The common people are likewise remarkably neat, and pride themselves in different changes of linen. They are very little addicted to jollity and diversion : their whole amusements consist in running at the goose on Shrove Tuesday, and in winter in being drawn in sleds upon the ice. They also feast and make merry at weddings and funerals. With respect to marriage, the man and woman frequently cohabit together on contract long before the ceremony is performed. The nobility and gentry pique themselves on sumptuous burials and monuments for the dead : the corpse is very often kept in a vault, or in the chancel of a church, for several years, before an opportunity offers of celebrating the funeral.

The taverns in this country are poorly supplied ; and he who diets in them must be contented to eat in a public room, unless he will condescend to pay an extravagant price for a private apartment. The metropolis is but indifferently furnished with game. The wild-ducks and plover are hardly eatable ; but the hares are good, and the markets sometimes produce tolerable

Denmark. roebuck. Their sea-fish are not to be commended; but the rivers produce plenty of delicious carp, perch, and craw-fish. The gardens of the gentry are well provided with melons, grapes, peaches, and all sorts of greens and salads in perfection.

23
Forces by sea and land. The naval power of Denmark, formerly so great, is now become much less considerable. Of late, however, commerce has considerably increased; a considerable East India trade has been carried on; they have also extended their commerce to the West Indies, where they have settled the island of St Thomas; to the coast of Guinea, where they maintain the fort of Chrikianburgh; to the Mediterranean; and to Greenland. The navy consists of about 30 ships of the line; besides frigates, bombs, tenders, and yachts. The land-forces, including 5000 reserves, which form a kind of militia, amount to near 40,000 men, horse, dragoons, and infantry. These last, officers as well as soldiers, consist chiefly of strangers, Germans, Poles, Courlanders, Dutch, Swedes, Scots, and Irish. The cavalry are generally natives.

24
Revenue. The revenue of his Danish majesty arises from taxes laid on his own subjects; from the duties paid by foreigners, from his own estate, crown-lands, and confiscations. The taxes are altogether arbitrary, and therefore fluctuating; but they are always grievous to the subject. They commonly consist of customs or toll, for export and import; of excise upon the consumption of wine, salt, tobacco, and all kinds of provisions; of taxes upon marriages, paper, brewing, grinding, and the exercise of different professions; of impositions on land, poll-money, ground-rent for all houses in Copenhagen and elsewhere; of money raised for maintaining fortifications, and for a portion to the king's daughter when she happens to be married; but this seldom exceeds 100,000 rix-dollars. One considerable article in the revenue is the toll paid by foreign ships that pass through the Sound, or *Ore-Sound* (the strait between Schonen and Zealand), into the Baltic. This was originally no other than a small contribution, which trading nations agreed to make for maintaining lights at certain places, to direct their course through the passage in dark and stormy weather. At the same time these trading nations agreed, that every ship should pass this way and pay its share of the expence, rather than use the Great Belt, which is the other passage, but unprovided with any such convenience. In process of time the Danes converted this voluntary contribution into an exorbitant toll, and even exacted arbitrary sums, in proportion to the weakness of the nation whose ships they visited. These exactions sometimes involved them in quarrels with their neighbours, and the toll was regulated in repeated treaties.

25
Orders of knighthood. To the court of Copenhagen belong two orders of knighthood; namely, that of the elephant, and that of Danebrugh: the badge of the former, which they deem the most honourable, is an elephant surmounted with a castle, set in diamonds, and suspended to a sky-coloured watered ribbon, worn like the George in England. This order is conferred only on persons of the highest quality, and the most extraordinary merit. The order of Danebrugh is bestowed as an honorary reward upon the noblest of an inferior rank, who have distinguished themselves in the service. Its insignia consist of a white ribbon with red edges, worn over the left

shoulder, from which depends a small cross of diamonds, and an embroidered star on the breast of the coat, surrounded with the motto *pietate & justitia*.

DENNIS, or **ST DENNIS**, a famous town of the Isle of France, with a Benedictine abbey, wherein are the tombs of the kings of France, with a considerable treasure. E. Long. 2. 26, N. Lat. 48. 56.

DENNIS (John), the celebrated critic, was the son of a reputable tradesman in London, and born in the year 1657. He received the first branches of education at the great school in Harrow on the Hill, where he commenced acquaintance and intimacy with many young noblemen and gentlemen, who afterwards made considerable figures in public affairs, whereby he laid the foundation of a very strong and extensive interest, which might, but for his own fault, have been of infinite use to him in future life. From Harrow he went to Caius-college Cambridge; where, after his proper standing, he took the degree of bachelor of arts. When he quitted the university, he made the tour of Europe; in the course of which he conceived such a detestation for despotism, as confirmed him still more in those Whig principles which he had from his infancy imbibed.

On his return to England he became early acquainted with Dryden, Wycherly, Congreve, and Southerne; whose conversation inspiring him with a passion for poetry, and a contempt for every attainment that had not something of the *belles lettres*, diverted him from the acquisition of any profitable art, or the exercise of any profession. This, to a man who had not an independent income, was undoubtedly a misfortune; however, his zeal for the Protestant succession having recommended him to the patronage of the duke of Marlborough, that nobleman procured him a place in the customs worth 120l. per annum; which he enjoyed for some years, till from profuse and want of economy, he was reduced to the necessity of disposing of it to satisfy some very pressing demands. By the advice of Lord Halifax, however, he reserved to himself, in the sale of it, an annuity for a term of years; which term he outlived, and was, in the decline of his life, reduced to extreme necessity.

Mr Theo. Cibber relates an anecdote of him, which we cannot avoid repeating, as it is not only highly characteristic of the man whose affairs we are now considering, but also a striking and melancholy instance, among thousands, of the distressful predicaments into which men of genius and literary abilities are perhaps apter than any others to plunge themselves, by paying too slight an attention to the common concerns of life, and their own most important interests. "After that he was worn out, (says that author,) with age and poverty, he resided within the verge of the court, to prevent danger from his creditors. One Saturday night, he happened to saunter to a public house, which in a short time he discovered to be without the verge. He was sitting in an open drinking-room, when a man of a suspicious appearance happened to come in. There was something about the man which denoted to Mr Dennis that he was a bailiff. This struck him with a panic; he was afraid his liberty was at an end; he sat in the utmost solicitude, but durst not offer to stir lest he should be seized upon. After an hour or two had passed in this painful anxiety, at last the clock struck

Dennis.

Denomina-
tor
||
Dentaria.

struck twelve; when Mr Dennis, in an ecstasy, cried out, addressing himself to the suspected person, "Now, Sir, bailiff or no bailiff, I don't care a farthing for you, you have no power now." The man was astonished at his behaviour; and when it was explained to him, was so much affronted with the suspicion, that had not Mr Dennis found his protection in age, he would probably have smarted for his mistaken opinion. A strong picture of the effects of fear and apprehension, in a temper naturally so timorous and jealous as Mr Dennis's; of which the following is a still more whimsical instance. In 1704, came out his favourite tragedy, *Liberty Asserted*; in which were so many strokes on the French nation, that he thought they were never to be forgiven. He had worked himself into a persuasion that the king of France would insist on his being delivered up, before he would consent to a peace: and full of this idea of his own importance, when the congress was held at Utrecht, he is said to have waited on his patron the duke of Marlborough, to desire that no such article might be stipulated. The duke told him he really had no interest then with the ministry; but had made no such provision for his own security, though he could not help thinking he had done the French as much injury as Mr Dennis himself. Another story relating to this affair is, that being at a gentleman's house on the coast of Suffex, and walking one day on the sea-shore, he saw a ship sailing, as he fancied, towards him: he instantly set out for London, in the fancy that he was betrayed; and, congratulating himself on his escape, gave out that his friend had decoyed him down to his house, to surrender him up to the French.

Mr Dennis, partly through a natural peevishness and petulance of temper, and partly perhaps for the sake of procuring the means of subsistence, was continually engaged in a paper-war with his contemporaries, whom he ever treated with the utmost severity: and, though many of his observations were judicious, yet he usually conveyed them in language so scurrilous and abusive, as destroyed their intended effect; and as his attacks were almost always on persons of superior abilities to himself, viz. Addison, Steele, and Pope; their replies usually turned the popular opinion so greatly against him, that, by irritating his testy temper the more, it rendered him a perpetual torment to himself; till at length, after a long life of vicissitudes, disappointments and turmoils, rendered wretched by indigestion, and hateful by malevolence, having outlived the reversion of his estate, and reduced to distress, from which his having been daily creating enemies had left him scarcely any hopes of relief, he was compelled to what must be the most irksome situation that can be conceived in human life, the receiving obligations from those whom he had been continually treating ill. In the very close of his days, a play was acted for his benefit at the little theatre in the Hay-market, procured through the united interests of Messrs Thompson, Mallet, and Pope; the last of whom, notwithstanding the gross manner in which Mr Dennis had on many occasions used him, and the long warfare that had subsisted between them, interested himself very warmly for him; and even wrote an occasional prologue to the play, which was spoken by Mr Cibber. Not long after this, viz. on the 6th of January 1733, he died, being then in the 77th year of his age.

Mr Dennis certainly was possessed of much erudition, and a considerable share of genius. In prose, he is far from a bad writer, where abuse or personal scurrility does not mingle itself with his language. In verse, he is extremely unequal; his numbers being at some times spirited and harmonious, and his subjects elevated and judicious; and at others, flat, harsh, and puerile.—As a dramatic author, he certainly deserves not to be held in any consideration. It was justly said of him by a wit, that he was the most complete instructor for a dramatic poet, since he could teach him to distinguish good plays by his *precepts*, and bad ones by his *examples*.

DENOMINATOR, in arithmetic, a term used in speaking of fractions. See ARITHMETIC, n° 21.

DENS CANIS, or *Dog's-tooth*, in botany. See ERYTHRONIUM.

DENS LEONIS. See LEONTODON.

DENSITY of Bodies, is that property directly opposite to rarity, whereby they contain such a quantity of matter under such a bulk.

Accordingly, a body is said to have double or triple the density of another body, when, their bulk being equal, the quantity of matter is in the one double or triple the quantity of matter in the other.

DENSITY of the Air, is a property that has employed the later philosophers, since the discovery of the Toricellian experiment.

It is demonstrated, that in the same vessel, or even in vessels communicating with each other, at the same distance from the centre, the air has every where the same density. The density of air, *ceteris paribus*, increases in proportion to the compressing powers. Hence the inferior air is denser than the superior; the density, however, of the lower air is not proportional to the weight of the atmosphere on account of heat and cold, and other causes perhaps which make great alterations in density and rarity. However, from the elasticity of the air, its density must be always different at different heights from the earth's surface; for the lower parts being pressed by the weight of those above, will be made to accede nearer to each other, and the more so as the weight of the incumbent air is greater. Hence, the density of the air is greatest at the earth's surface, and decreases upwards in geometrical proportion to the altitudes taken in arithmetical progression.

If the air be rendered denser, the weight of bodies in it is diminished; if rarer, increased, because bodies lose a greater part of their weight in denser than in rarer mediums. Hence, if the density of the air be sensibly altered, bodies equally heavy in a rarer air, if their specific gravities be considerably different, will lose their equilibrium in the denser, and the specifically heavier body will preponderate. See PNEUMATICS.

DENTALIUM, in natural history, a shell-fish belonging to the order of vermes testacea. The shell consists of one tubulous straight valve, open at both ends. There are eight species, distinguished by the angles, striæ, &c. of their shells.

DENTARIA, TOOTH-WORT, or *Tooth-violet*; a genus of the siliquosa order, belonging to the tetradynamia class of plants. There are three species, all of them hardy perennials; producing annual stalks 12 or 18 inches high, adorned with many-lobed leaves, and spikes of quadrupetalous cruciform flowers of a red or purple colour.

Dentated
||
Deodand.

colour. They delight in shady places; and are propagated either by seeds, or parting the roots. The seeds may be sown in autumn, or early in the spring, in a shady border of light earth; and when the plants are three inches high, they may be planted where they are to remain. The time for parting the roots is in October or November, or early in the spring.

DENTATED LEAF. See BOTANY, p. 1296.

DENTATUS (Curius), a renowned disinterested Roman general; whose virtues render him more memorable than even his great military reputation, flourished 272 years B. C. He was thrice consul; he conquered the Samnites, Sabines, and Lucanians; and gave each citizen 40 acres of land, allowing himself no more. The ambassadors of the Samnites making him a visit, found him boiling turnips in a pipkin; upon which, they offered him gold to come over to their interest; but he told them, his design was not to grow rich, but to command those who were so. He defeated Pyrrhus near Tarentum, and received the honour of a triumph.

DENTEX, in ichthyology. See SPARUS,

DENTILES, or DENTILS, in architecture, an ornament in corniches bearing some resemblance to teeth, particularly used in the Ionic and Corinthian orders. See ARCHITECTURE.

DENTIFRICE, in medicine, a remedy for the teeth. There are various kinds; generally made of earthy substances finely pounded, and mixed with alum, or some other saline substances; but these are pernicious, on account of their wearing away the enamel of the teeth; but more especially by the septic quality with which these earthy substances are endowed. On this account, a portion of Peruvian bark finely pounded is now commonly added, which answers the double purpose of cleaning the teeth, and preserving them afterwards from corruption.

DENTILLARIA. See PLUMBAGO.

DENTISCALPRA, in surgery, an instrument for scouring yellow, livid, or black teeth; to which being applied near the gums, it scrapes off the foul morbid crust.

DENTITION, the breeding or cutting the teeth in children. See (*Index* subjoined to) MEDICINE.

DENUNCIATION, a solemn publication or promulgation of any thing.

All vessels of enemies are lawful prizes, after denunciation or proclamation of war. The design of the denunciation of excommunicated persons, is that the sentence may be the more fully executed by the person's being more known.

DENUNCIATION *at the Horn*, in Scots law. See LAW, Part III. N^o clxvi. 14.

DENYS (the Little), a Scythian, became abbot of a monastery at Rome: he was the first who computed time from the birth of Dionysius to Christ, and fixed that great event, according to the vulgar æra. He was also a learned canon-law writer, and died about the year 540.

DEOBSTRUENTS, in pharmacy, such medicines as open obstructions. See DETERGENT.

DEODAND, in our customs, a thing given or forfeited as it were to God, for the pacification of his wrath in a case of misadventure, whereby a Christian soul comes to a violent end, without the fault of any

reasonable creature.

As, if a horse strike his keeper and kill him: if a man, in driving a cart, falls so as the cart-wheel runs over him, and presses him to death: if one be felling a tree, and gives warning to the standers-by to look to themselves; yet a man is killed by the fall thereof: in the first place, the horse; in the second, the cart-wheel, cart, and horses; and in the third, the tree, is *Deo dandus*, "*to be given to God*," that is, to the king, to be distributed to the poor by his almoner, for expiation of this dreadful event; though effected by irrational, nay, senseless and dead creatures.

Omnia que movent ad mortem sunt Deodanda.

What moves to death, or kills him dead, is Deodand, and forfeited.

This law seems to be an imitation of that in Exodus, chap. xxi. "If an ox gore a man, or a woman, with his horns, so as they die; the ox shall be stoned to death, and his flesh not be eat; so shall his owner be innocent."

Fleta says, the Deodand is to be sold, and the price distributed to the poor, for the soul of the king, his ancestors, and all faithful people departed this life.

DEPHLEGMATION, is an operation by which the superabundant water of a body is taken from it; and it is principally effected by evaporation or distillation. Dephlegmation is also called *concentration*, particularly when acids are the subject. See CONCENTRATION.

DEPILATORY MEDICINES, those applied in order to take off the hair: such are lime and orpiment known to be, but which ought to be used with great caution.

DEPONENT, in Latin grammar, a term applied to verbs which have active significations, but passive terminations or conjugations, and want one of their participles passive.

DEPONENT, in the law of Scotland, a person who makes a deposition. See DEPOSITION.

DEPOPULATION, the act of diminishing the number of people in any country, whether by war or bad politics.

DEPORTATION, a sort of banishment used by the Romans, whereby some island or other place was allotted to a criminal for the place of his abode, with a prohibition not to stir out of the same on pain of death.

DEPOSIT, among civilians, something that is committed to the custody of a person, to be kept without any reward, and to be returned again on demand.

DEPOSITARY, in law, a person intrusted as keeper or guardian of a deposit.

DEPOSITION, in Scots law. See LAW, N^o clxxiii. 8.

DEPOSITION, in law, the testimony given in court by a witness upon oath.

DEPOSITION also signifies the sequestring or depriving a man of some dignity and office.

DEPRECATION, in rhetoric, a figure whereby the orator invokes the aid and assistance of some one; or prays for some great evil or punishment to befall him who speaks falsely, either himself or his adversary.

DEPRECATORY, or DEPRECATIVE, in theology, a term applied to the manner of performing some ceremonies in the form of prayer.

Deodand
||
Deprecatory.

Depression
||
Deputatus.

The form of abso- lution is depre- cative in the Greek church, being conceived in these terms, *May God ab- solve you*: whereas it is in the declarative form in the Latin church, and in some of the reformed churches, *I absolve you*.

DEPRESSION of the POLE. When a person sails or travels towards the equator, he is said to depress the pole; because as many degrees as he approaches nearer the equator, so many degrees will the pole be nearer the horizon. This phenomenon arises from the spher- ical figure of the earth.

DEPRESSOR, or DEPRIMENS, in anatomy, a name applied to several muscles, because they depress the parts they are fastened to.

DEPRIVATION, in the canon-law, the deposing a bishop, parson, vicar, &c. from his office and preferment.

DEPTFORD, a town three miles east of London, on the southern banks of the Thames; chiefly con- siderable for its fine docks for building ships, and the king's yard. E. Long. o. 4. N. Lat. 51. 30.

DEPTH, the measure of any thing from the sur- face downwards.

Measuring of DEPTHS by the Barometer, depends on the same principles on which heights are measured by the same instrument. The mensuration of depths, being chiefly applied to mines, is still more precarious than the mensuration of heights, on account of the various kinds of vapours with which these subterranean regions are filled. But for a particular account of these difficulties, with the best methods of obviating them, see the articles **BAROMETER** and **MINES**.

DEPTH of a Squadron, or Battalion, is the number of men in a file; which in a squadron is three, and in a battalion generally six. See **SQUADRON**, **FILE**, &c.

We say, the battalion was drawn up *six deep*; the enemies horse were drawn up *six deep*.

DEPURATION is the freeing of any fluid from its heterogeneous matter or feculence. It is of three kinds. 1. Decantation; which is performed by letting the liquid to be depurated stand for some time in a pretty deep vessel, till the gross sediment has fallen to the bottom; after which the clear fluid is poured off. 2. Depumation; which is performed by means of the whites of eggs, or other viscid matter, and is also called **CLARIFICATION**. 3. Filtration. See **CHEMISTRY**, n° 69.

DEPURATORY FEVER, a name given by Syden- ham to a fever which prevailed much in the years 1661, 1662, 1663, and 1664. He called it depuratory, be- cause he supposed that nature regulated all the symp- toms in such a manner, as to fit the febrile matter, pre- pared by proper concoction, for expulsion in a certain time, either by a copious sweat, or a freer perspira- tion.

DEPUTATION, a mission of select persons out of a company or body, to a prince or assembly, to treat of matters in their name.

DEPUTY, a person sent upon some business, by some community.

DEPUTY is also one that exercises an office in an- other's right; and the forfeiture or misdemeanour of such deputy shall cause the person whom he represents to lose his office.

DEPUTATUS, among the ancients, a name ap-

plied to persons employed in making of armour; and likewise to brisk active people, whose business was to take care of the wounded in engagements, and carry them off the field.

DERBEND, a strong town of Asia, in Persia, said to have been founded by Alexander the Great. The walls are built with stones as hard as marble; and near it are the remains of a wall which reached from the Caspian to the Black sea. It is seated near the Cas- pian sea, at the foot of Mount Caucasus. E. Long. 50. o. N. Lat. 42. 8.

DERBY, the capital of a county of the same name in England. It is thought to have received its name from being formerly a park or shelter for deer; and what makes this supposition more probable is, that the arms of the town consist of a buck couchant in a park. It is very ancient, having been a royal borough in the time of Edward the Confessor. At present it is a neat town, very populous, and sends two members to par- liament. In digging for foundations of houses, hu- man bones of a monstrous size have sometimes been found. The trade consists in wool, corn, malt, and ale, of which considerable quantities are sent to Lon- don. Here also is that curious machine for throwing silk, the model of which Sir Thomas Lombe, at the hazard of his life, brought from Italy. Before that time, the English merchants used to purchase thrown silks of the Italians for ready money. But by the help of this wonderful machine, one hand-mill will twist as much silk as 50 people could do without it. It works 73,726 yards of silk every time the water-wheel goes round, which is thrice in a minute. The houlc in which it is contained, is five or six stories high, and half a quarter of a mile in length. When Sir Thomas's patent expired in 1732, the parliament was so sensible of the value and importance of the machine, that they granted him a further recompence of 14,000*l.* for the hazard and expence he had incurred in introducing and erecting it, upon condition he should allow an exact model of it to be taken. This model is deposited in the Tower of London, in order to prevent so curious and important an art from being lost.—The town of Derby is watered by a river and a brook; the latter of which has nine bridges over it, the former only one. W. Long. 1. 45. N. Lat. 52. 57.

DERBY-SHIRE, a county of England, bounded on the east by Nottinghamshire, and a part of Leicester- shire, which last bounds it also on the south. On the west it is bounded by Staffordshire, and part of Che- shire; and on the north by Yorkshire. It is near 40 miles in length from south to north; about 30 in breadth on the north side, but on the south no more than six.—The air is pleasant and healthful, especially on the east side; but on the west, about the peaks, it is sharper and more subject to wind and rain. The soil is very different in different parts of the country. In the east and south parts it is very fruitful in all kinds of grain; but, in the west, beyond the Derwent, it is barren and mountainous, producing nothing but a little oats. There is, however, plenty of grass in the val- leys, which affords pasture to a great number of sheep. This part of the county is called the *Peak*, from a Saxon word signifying an eminence. Its mountains are very bleak, high, and barren; but extremely pro- fitable to the inhabitants. They yield great quanti- ties.

Derbend,
Derby.

Derham.

Derivative.

ties of the best lead, antimony, iron, scythe-stones, grind-stones, marble, alabaster, a coarse sort of crystal, azure, spar, and pit-coal. In these mountains are two remarkable caverns, named *Poole's Hole*, and *Elden-Hole*; for a description of which, see these articles.

DEREHAM, a town of Norfolk in England, situated in E. Long. 1. 0. N. Lat. 52. 40. It is pretty large, and the market is noted for woollen yarn.

DERHAM (Doctor William), a very celebrated English philosopher and divine, born in 1657. In 1682, he was presented to the vicarage of Wargrave in Berkshire; and, in 1689, to the valuable rectory of Upminster in Essex; which latter lying at a convenient distance from London, afforded him an opportunity of conversing and corresponding with the greatest virtuosos of the nation. Applying himself there with great eagerness to natural and experimental philosophy, he soon became a distinguished member of the Royal Society, whose Philosophical Transactions contain a great variety of curious and valuable pieces, the fruits of his laudable industry. In his younger years he published his *Artificial Clockmakers*, which has been often printed: and in 1711, 1712, and 1714, he preached those sermons at Boyle's lecture which he afterward digested under the well-known titles of *Physico-Theology* and *Astro-Theology*, and enriched with valuable notes and copper-plates. The last thing he published of his own composition was *Christo-Theology*, a demonstration of the divine authority of the Christian religion, being the substance of a sermon preached at Bath in 1729. This great good man, after spending his life in the most agreeable as well as improving study of nature, died at Upminster in 1735; and, beside many other works, left a valuable collection of curiosities, particularly specimens of birds and insects of this island.—It may be necessary just to observe, that Doctor Derham was very well skilled in medical, as well as in physical, knowledge; and was constantly a physician to the bodies as well as the souls of his parishioners.

DERIVATION, in medicine, is when a humour which cannot conveniently be evacuated at the part affected, is attracted from thence, and discharged elsewhere; thus, a blister is applied to the neck to draw away the humour from the eyes.

The doctrine of derivation and revulsion so much talked of by the ancients is, in their sense of these terms, wholly exploded. By revulsion, they meant the driving back of the fluids from one part to another. The only rational meaning the word *revulsion*, as here applied, can have, is, the preventing too great an afflux of humours to any part, either by contracting the area of the vessels, or diminishing the quantity of what flows from them; the first of these intentions is answered by the application of repellents to the part; the last by bleeding, and other evacuations: thus, any medicines promoting the secretions, may be said to make a revulsion; and in this sense derivation can only be understood.

DERIVATION, in grammar, the affinity one word has with another, by having been originally formed from it. See DERIVATIVE.

DERIVATIVE, in grammar, a word which is derived from another called its PRIMITIVE. Thus, *manhood* is derived from *man*, *deity* from *Deus*, and

lawyer from *law*.

DERMESTES, in zoology, a genus of insects belonging to the order of coleoptera. The antennæ are clavated, with three of the joints thicker than the rest; the breast is convex; and the head is inflexed below the breast. There are thirty species, distinguished by their colour, &c.

DERNIER RESSORT. See RESSORT.

DEROGATION, an act contrary to a preceding one, and which annuls, destroys, and revokes it, either in whole or in part.

DEROGATORY, a clause importing derogation. A derogatory clause in a testament, is a certain sentence, cipher, or secret character, which the testator inserts in his will, and of which he reserves the knowledge to himself alone, adding a condition, that no will he may make hereafter is to be reckoned valid, if this derogatory clause is not inserted expressly and word for word. It is a precaution invented by lawyers against latter-wills extorted by violence, or obtained by suggestion.

DERP, a town of Livonia, and capital of a palatinate of the same name, with a bishop's see, and an university. It is subject to the Russians, and lies near the river Ambeck. E. Long. 31. 55. N. Lat. 30. 40.

DERVIS, a name given to all Mahomedan monks, though of various orders. The most noted among them are the Bektaishi, the Mevelevi, the Kadri, and the Seyah. The Bektaishi, who are allowed to marry and live in cities and towns, are obliged, by the rules of their order, to visit remote lands, and to salute every one they meet with *gazel* or love-songs, and with *efma* or the invocation of the names of God, and humbly to wish him prosperity, which they do by repeating the word *evallah*, a solemn exclamation of the wrestlers, by which the conquered yields the palm to the conqueror. The Mevelevi, so called from Mevelava their founder, are used to turn round for two or three hours together, with such swiftness, that you cannot see their faces. They are great lovers of music: in their monasteries they profess great humility and poverty; and when visited, make no distinction of persons: they first bring their guests coffee to drink; and if the ways have been dirty, they wash their feet and sandals. The Kadri, with a peculiar superstition, emaciate their bodies; they go quite naked, except their thighs, and often join hands and dance, sometimes a whole day, repeating with great vehemence, *bul bul bul* (one of the names of God), till, like madmen, they fall on the ground, foaming at the mouth, and running down with sweat. The prime vizir Kupruli Achmed Pasha, thinking this sect unbecoming the Mahomedan religion, ordered it to be suppressed; but, after his death, it revived, and is at present more numerous than ever, especially at Constantinople. The Seyah are wanderers; and though they have monasteries, yet they often spend their whole life in travelling. When they are sent out, their superiors impose upon them such a quantity of money or provisions, forbidding them to come back till they have procured it and sent it to the monastery; wherefore, when a Seyah comes into a town, he cries aloud in the market-place, *Tu allah fenden*, &c. O God! give me, I pray, five thousand crowns, or a thousand measures of rice. Many of these dervises travel over the whole Mahomedan world, entertaining the people, wherever

Dermest
Dervis

Desaguliers
Defendant

wherever they come, with agreeable relations of all the curiosities they have met with. There are dervises in Egypt, who live with their families, and exercise their trades; of which kind are the dancing dervises at Damascus. They are all distinguished among themselves by the different forms and colours of their habits; those of Persia wear blue; the solitaires and wanderers wear only rags of different colours; others carry on their heads a plume made of the feathers of a cock; and those of Egypt wear an octagonal badge of a greenish white alabaster at their girdles, and a high stiff cap without any thing round it.

DESAGULIERS (John Theophilus), who introduced the practice of reading public lectures in experimental philosophy in the metropolis, and who made several improvements in mechanics; was the son of the reverend John Desaguliers, a French protestant refugee, and was born at Rochelle in 1683. His father brought him to England an infant; and at a proper age placed him at Christ-church college, Oxford: where he succeeded Doctor Keil in reading lectures on experimental philosophy at Hart Hall. The magnificent duke of Chandos made Doctor Desaguliers his chaplain, and presented him to the living of Edgware, near his seat at Cannons; and he was afterward chaplain to Frederic prince of Wales. He read lectures with great success to the time of his death in 1749. He communicated many curious papers printed in the Philosophical Transactions; published a valuable *Course of Experimental Philosophy*, in 2 vols 4to.; and gave an edition of *Gregory's Elements of Catoptrics and Dioptrics*, with an Appendix on reflecting telescopes, 8vo. He was a member of the Royal Society, and of several foreign academies.

DESART, a large extent of country entirely barren, and producing nothing. In this sense some are sandy deserts; as those of Lop, Xamo, Arabia, and several others in Asia; in Africa, those of Libya and Zara: others are stony, as the desert of Pharan in Arabia Petrea.

The DESART, absolutely so called, is that part of Arabia, south of the Holy Land, where the children of Israel wandered forty years.

DESCANT, in music, the art of composing in several parts. See COMPOSITION.

Descant is three-fold, viz. plain, figurative, and double.

Plain DESCANT is the ground-work and foundation of all musical compositions, consisting altogether in the orderly placing of many concords, answering to simple counterpoint. See COUNTERPOINT.

Figurative or Florid DESCANT, is that part of an air of music wherein some discords are concerned, as well, though not so much, as concords. This may be termed the ornamental and rhetorical part of music; in regard that there are introduced all the varieties of points, syncopes, diversities of measures, and whatever is capable of adorning the composition.

DESCANT Double, is when the parts are so contrived, that the treble, or any high part, may be made the bass; and, on the contrary, the bass the treble.

DESCARTES. See CARTES.

DESCENDANT. The issue of a common parent, in *infinitum*, are called his descendants. See article DESCENT.

DESCENSION, in astronomy, is either right or oblique.

Right DESCENSION, is an arch of the equinoctial, intercepted between the next equinoctial point and the intersection of the meridian, passing through the centre of the object, at its setting, in a right sphere.

Oblique DESCENSION, an arch of the equinoctial, intercepted between the next equinoctial point and the horizon, passing through the centre of the object, at its setting, in an oblique sphere.

DESCENT, in general, is the tendency of a body from a higher to a lower place; thus all bodies, unless otherwise determined by a force superior to their gravity, descend towards the centre of the earth. See GRAVITY and MECHANICS.

DESCENT, or *Hereditary Succession*, in law, is the title whereby a man, on the death of his ancestor, acquires his estate by right of representation, as his heir at law. An heir therefore is he upon whom the law casts the estate, immediately on the death of the ancestor: and an estate so descending to the heir, is in law called the *inheritance*.

Descent is either *lineal* or *collateral*. The former is that conveyed down in a right line from the grandfather to the father, and from the father to the son, and from the son to the grandson. The latter is that springing out of the side of the line or blood; as from a man to his brother, nephew, or the like.

The doctrine of descents, or law of inheritances in fee-simple, is a point of the highest importance. (See the article FEE.) All the rules relating to purchases, whereby the legal course of descents is broken and altered, perpetually refer to this settled law of inheritance, as a *datum* or first principle universally known, and upon which their subsequent limitations are to work. Thus a gift in tail, or to a man and the heirs of his body, is a limitation that cannot be perfectly understood, without a previous knowledge of the law of descents in fee-simple. One may well perceive, that this is an estate confined in its descent to such heirs only of the donee, as have sprung or shall spring from his body: but who those heirs are, whether all his children both male and female, or the male only, and (among the males) whether the eldest, youngest, or other son alone, or all the sons together, shall be his heir; this is a point, that we must refer back to the standing law of descents in fee-simple to be informed of.

And, as this depends not a little on the nature of kindred, and the several degrees of consanguinity, it will be necessary to refer the reader to the article CONSANGUINITY, where the true notion of this kindred or alliance in blood is particularly stated.

We shall here exhibit a series of rules or canons of inheritance, with illustrations, according to which, by the law of England, estates are transmitted from the ancestor to the heir.

1. "Inheritances shall lineally descend to the issue "of the person last actually seized, in *infinitum*; but "shall never lineally ascend."

To understand both this and the subsequent rules, it must be observed, that by law no inheritance can vest, nor can any person be the actual complete heir of another, till the ancestor is previously dead. *Nemo est hæres viventis*. Before that time, the person who is next in the line of succession is called an *heir apparent*, or *heir*.

Defension,
Defcent.

Descent.

heir presumptive. Heirs apparent are such, whose right of inheritance is indefeasible, provided they outlive the ancestor; as the eldest son or his issue, who must, by the course of the common law, be heirs to the father whenever he happens to die. Heirs presumptive are such, who, if the ancestor should die immediately, would in the present circumstances of things be his heirs; but whose right of inheritance may be defeated by the contingency of some nearer heir being born: as a brother or nephew, whose presumptive succession may be destroyed by the birth of a child; or a daughter, whose present hopes may be hereafter cut off by the birth of a son. Nay, even if the estate hath descended, by the death of the owner, to such a brother, or nephew, or daughter; in the former cases, the estate shall be devested and taken away by the birth of a posthumous child; and, in the latter, it shall also be totally devested by the birth of a posthumous son.

We must also remember, that no person can be properly such an ancestor, as that an inheritance in lands or tenements can be derived from him, unless he hath had actual seisin of such lands, either by his own entry, or by the possession of his own or his ancestor's lessee for years, or by receiving rent from a lessee of the freehold: or unless he hath what is equivalent to corporal seisin in hereditaments that are incorporeal; such as the receipt of rent, a presentation to the church in case of an advowson, and the like. But he shall not be accounted an ancestor, who hath had only a bare right or title to enter or be otherwise seised. And therefore all the cases, which will be mentioned in the present article, are upon the supposition that the deceased (whose inheritance is now claimed) was the last person actually seised thereof. For the law requires this notoriety of possession, as evidence that the ancestor had that property in himself, which is now to be transmitted to his heir. Which notoriety hath succeeded in the place of the ancient feudal investiture, whereby, while feuds were precarious, the vassal on the descent of lands was formerly admitted in the lord's court (as is still the practice in Scotland); and therefore received his seisin, in the nature of a renewal of his ancestors grant, in the presence of the feudal peers: till at length, when the right of succession became indefeasible, an entry on any part of the lands within the county (which if disputed was afterwards to be tried by those peers) or other notorious possession, was admitted as equivalent to the formal grant of seisin, and made the tenant capable of transmitting his estate by descent. The seisin therefore of any person, thus understood, makes him the root or stock from which all future inheritance by right of blood must be derived: which is very briefly expressed in this maxim, *seisina facit stirpem*.

When therefore a person dies so seised, the inheritance first goes to his issue: as if there be Geoffrey, John, and Mathew, grandfather, father, and son; and John purchases land, and dies; his son Mathew shall succeed him as heir, and not the grandfather Geoffrey; to whom the land shall never ascend, but shall rather escheat to the lord.

2. "The male issue shall be admitted before the female."—Thus sons shall be admitted before daughters; or, as our male lawgivers have somewhat uncomplaisantly expressed it, the worthiest of blood shall

be preferred. As if John Stiles hath two sons, Matthew and Gilbert, and two daughters, Margaret and Charlotte, and dies; first Matthew, and (in case of his death without issue) then Gilbert, shall be admitted to the succession in preference to both the daughters.

3. "Where there are two or more males in equal degree, the eldest only shall inherit; but the females all together."—As if a man hath two sons, Matthew and Gilbert, and two daughters, Margaret and Charlotte, and dies; Matthew his eldest son shall alone succeed to his estate, in exclusion of Gilbert the second son and both the daughters; but, if both the sons die without issue before the father, the daughters Margaret and Charlotte shall both inherit the estate as coparceners.

4. "The lineal descendants, *in infinitum*, of any person deceased, shall represent their ancestor; that is, shall stand in the same place as the person himself would have done, had he been living."—Thus the child, grandchild, or great-grandchild (either male or female) of the eldest son, succeeds before the younger son, and so *in infinitum*. And these representatives shall take neither more nor less, but just so much as their principals would have done. As if there be two sisters, Margaret and Charlotte; and Margaret dies, leaving six daughters; and then John Stiles the father of the two sisters dies, without other issue: these six daughters shall take among them exactly the same as their mother Margaret would have done, had she been living; that is, a moiety of the lands of John Stiles in coparcenary: so that, upon partition made, if the land be divided into twelve parts, three of Charlotte the surviving sister shall have six, and her six nieces, the daughters of Margaret, one a-piece.

5. "On failure of lineal descendants, or issue, of the person last seised, the inheritance shall descend to the blood of the first purchaser; subject to the three preceding rules."—Thus, if Geoffrey Stiles purchases land, and it descends to John Stiles his son, and John dies seised thereof without issue; whoever succeeds to this inheritance must be of the blood of Geoffrey the first purchaser of this family. The first purchaser, *perquisitor*, is he who first acquired the estate to his family, whether the same was transferred to him by sale, or by gift, or by any other method, except only that of descent.

6. "The collateral heir of the person last seised, must be his next collateral kinsman, of the whole blood."

First, he must be his next collateral kinsman, either personally or *jure representationis*; which proximity is reckoned according to the canonical degrees of consanguinity: See CONSANGUINITY. Therefore, the brother being in the first degree, he and his descendants shall exclude the uncle and his issue, who is only in the second.—Thus if John Stiles dies without issue, his estate shall descend to Francis his brother, who is lineally descended from Geoffrey Stiles his next immediate ancestor, or father. On failure of brethren, or sisters, and their issue, it shall descend to the uncle of John Stiles, the lineal descendant of his grandfather George, and so on *in infinitum*.

But, secondly, the heir need not be the nearest kinsman absolutely, but only *sub modo*; that is, he must be the nearest kinsman of the whole blood: for if there

be

Blackst.
Comment.

Descent.

Descent.

be a much nearer kinsman of the *half* blood, a distant kinsman of the whole blood shall be admitted, and the other entirely excluded.—A kinsman of the whole blood is he that is derived, not only from the same ancestor, but from the same couple of ancestors. For, as every man's own blood is compounded of the bloods of his respective ancestors, he only is properly of the whole or entire blood with another, who hath (so far as the distance of degrees will permit) all the same ingredients in the composition of his blood that the other hath. Thus, the blood of John Stiles being composed of those of Geoffrey Stiles his father and Lucy Baker his mother, therefore his brother Francis, being descended from both the same parents, hath entirely the same blood with John Stiles; or he is his brother of the whole blood. But if, after the death of Geoffrey, Lucy Baker the mother marries a second husband, Lewis Gay, and hath issue by him; the blood of this issue, being compounded of the blood of Lucy Baker (it is true) on the one part, but that of Lewis Gay (instead of Geoffrey Stiles) on the other part, it hath therefore only half the same ingredients with that of John Stiles; so that he is only his brother of the half blood, and for that reason they shall never inherit to each other. So also, if the father has two sons, A and B, by different venters or wives; now these two brethren are not brethren of the whole blood, and therefore shall never inherit to each other, but the estate shall rather escheat to the lord. Nay, even if the father dies, and his lands descend to his eldest son A, who enters thereon, and dies seized without issue; still B shall not be heir to this estate, because he is only of the half blood to A, the person last seized: but, had A died without entry, then B might have inherited; not as heir to A his half-brother, but as heir to their common father, who was the person last actually seized.

The rule then, together with its illustration, amounts to this, That, in order to keep the estate of John Stiles as nearly as possible in the line of his purchasing ancestor, it must descend to the issue of the nearest couple of ancestors that have left descendants behind them; because the descendants of one ancestor only are not so likely to be in the line of that purchasing ancestor, as those who are descended from two.

But here a difficulty arises. In the second, third, fourth, and every superior degree, every man has many couples of ancestors, increasing according to the distances in a geometrical progression upwards, the descendants of all which respective couples are (representatively) related to him in the same degree. Thus, in the second degree, the issue of George and Cecilia Stiles and of Andrew and Esther Baker, the two grandfathers and grandmothers of John Stiles, are each in the same degree of propinquity; in the third degree, the respective issues of Walter and Christian Stiles, of Luke and Francis Kempe, of Herbert and Hannah Baker, and of James and Emma Thorpe, are (upon the extinction of the two inferior degrees) all equally entitled to call themselves the next kindred of the whole blood to John Stiles. To which therefore of these ancestors must we first resort, in order to find out descendants to be preferably called to the inheritance? In answer to this, and to avoid the confusion and uncertainty that might arise between the several stocks wherein the purchasing ancestor may be

fought for,—

7. The seventh and last rule or canon is, “that in collateral inheritances the male stocks shall be preferred to the female; (that is, kindred derived from the blood of the male ancestors shall be admitted before those from the blood of the female)—unless where the lands have, in fact, descended from a female.”—Thus the relations on the father's side are admitted *in infinitum*, before those on the mother's side are admitted at all; and the relations of the father's father, before those of the father's mother; and so on.

For the original and progress of the above canons, the reasons upon which they are founded, and their agreement with the laws of other nations, the curious reader may consult *Blackstone's Commentaries*, Vol. II. p. 208—237.

We shall conclude with exemplifying the rules themselves by a short sketch of the manner in which we must search for the heir of a person, as John Stiles, who dies seized of land which he acquired, and which therefore he held as a feud of indefinite antiquity. See the *Table of Descents*, on Plate LXXXVIII.

In the first place succeeds the eldest son, Matthew Stiles, or his issue, (n^o 1.) :—if his line be extinct, then Gilbert Stiles and the other sons, respectively, in order of birth, or their issue, (n^o 2.) :—in default of these, all the daughters together, Margaret and Charlotte Stiles, or their issue, (n^o 3.)—On failure of the descendants of John Stiles himself, the issue of Geoffrey and Lucy Stiles, his parents, is called in: *viz.* first, Francis Stiles, the eldest brother of the whole blood, or his issue, (n^o 4.) :—then Oliver Stiles, and the other whole brothers, respectively, in order of birth, or their issue, (n^o 5.) :—then the sisters of the whole blood all together, Bridget and Alice Stiles, or their issue, (n^o 6.)—In defect of these, the issue of George and Cecilia Stiles, his father's parents; respect being still had to their age and sex; (n^o 7.) :—then the issue of Walter and Christian Stiles, the parents of his paternal grandfather, (n^o 8.) :—then the issue of Richard and Anne Stiles, the parents of his paternal grandfather's father, (n^o 9.) :—and so on in the paternal grandfather's paternal line, or blood of Walter Stiles, *in infinitum*. In defect of these, the issue of William and Jane Smith, the parents of his paternal grandfather's mother, (n^o 10.) :—and so on in the paternal grandfather's maternal line, or blood of Christian Smith, *in infinitum*; till both the immediate bloods of George Stiles, the paternal grandfather, are spent.—Then we must resort to the issue of Luke and Frances Kempe, the parents of John Stiles's paternal grandmother, (n^o 11.) :—then to the issue of Thomas and Sarah Kempe, the parents of his paternal grandmother's father, (n^o 12.) :—and so on in the paternal grandmother's paternal line, or blood of Luke Kempe, *in infinitum*.—In default of which, we must call in the issue of Charles and Mary Holland, the parents of his paternal grandmother's mother, (n^o 13.) :—and so on in the paternal grandmother's maternal line, or blood of Frances Holland, *in infinitum*; till both the immediate bloods of Cecilia Kempe, the paternal grandmother, are also spent.—Whereby the paternal blood of John Stiles entirely failing, recourse must then, and not before, be had to his maternal relations; or the blood of the Bakers (n^o 14, 15, 16.), Willis's (n^o 17.), Thorpes (n^o 18,

Defcent
||
Defidera-
tum.

Design.

19.), and Whites (n° 20.); in the same regular fucceffive order as in the paternal line.

The student fhould bear in mind, that during this whole procefs, John Stiles is the perfon fupposed to have been laft actually feifed of the eftate. For if ever it comes to veft in any other perfon, as heir to John Stiles, a new order of fucceffion muft be obferved upon the death of fuch heir; fince he, by his own feifin, now becomes himfelf an anceftor, or *ftipes*, and muft be put in the place of John Stiles. The figures therefore denote the order in which the feveral claffes would fucceed to John Stiles, and not to each other: and before we fearch for an heir in any of the higher figures, (as n° 8.) we muft be firft affured that all the lower claffes (from n° 1 to 7.) were extinct, at John Stiles's deceafe.

DESCENT, or *Succession*, in the law of Scotland. See LAW, Part III. N° clxxx. clxxxi.

DESCENT of the Crown. See SUCCESSION.

DESCENT of *Dignities*. A dignity differs from common inheritances, and goes not according to the rules of the common law: for it defcends to the half-blood; and there is no coparcenerfhip in it, but the eldeft takes the whole. The dignity of peerage is perfonal, annexed to the blood; and fo ineparable, that it cannot be transferred to any perfon, or furrendered even to the Crown: it can move neither forward nor backward, but only downward to pofterity; and nothing but corruption of blood, as if the anceftor be attainted of treason or felony, can hinder the defcent to the right heir.

DESCENT, in genealogy, the order or fucceffion of defcendants in a line or family; or their diftance from a common progenitor: thus we fay, one defcent, two defcents, &c.

DESCENT, in heraldry, is ufed to exprefs the coming down of any thing from above; as, a *lion en defcent* is a lion with his head towards the bafe points, and his heels towards one of the corners of the chief, as if he were leaping down from fome high place.

DESCHAMPS (Francis), a French poet, born in Champagne, was the author of a tragedy intitled *Cato of Utica*, and a hiftory of the French theatre. He died at Paris in 1747.

DESCRIPTION, in literary compofition, is fuch a ftrong and beautiful representation of a thing, as gives the reader a diftinct view and fatisfactory notion of it. See NARRATION and *Description*.

DESCRIPTIVE POETRY. See POETRY, n° 82.

DESEADA, or DESIDERADA, one of the Caribbee iflands, fubject to France, lying eaftward of Guadaloupe.

DESERTER, in a military fenfe, a foldier who, by running away from his regiment or company, abandons the fervice.

A defter is, by the articles of war, punifhable by death; which, after conviction, is executed upon him at the head of the regiment he formerly belonged to, with his crime writ on his breaft.

DESERTION, in law. See LAW, N° clx. 24.

DESHACHE', in heraldry, is where a beaft has its limbs feparated from its body, fo that they ftill remain on the efcutcheon, with only a fmall feparation from their natural places.

DESIDERATUM, is ufed to fignify the defirable perfections in any art or fcience: thus, it is a defide-

ratum with the blackfmith, to render iron fufible by a gentle heat, and yet prefeve it hard enough for ordinary ufes; with the glafsman, and looking-glafs maker, to render glafs malleable; with the clock-maker, to bring pendulums to be ufeul where there are irregular motions, &c.

DESIGN, in a general fenfe, the plan, order, representation, or contruction of a building, book, painting, &c. See ARCHITECTURE, PAINTING, POETRY, ORATORY, and HISTORY.

DESIGN, in the manufactories, expreffes the figures wherewith the workman enriches his ftuff, or filk, and which he copies after fome painter, or eminent draughtfman, as in diaper, damask, and other flowered filk and tapeftry, and the like.

In undertaking of fuch kinds of figured ftuffs, it is neceffary, fays Monf. Savary, that, before the firft ftroke of the fhuttle, the whole design be represented on the threads of the warp, we do not mean in colours, but with an infinite number of little packthreads, which, being difpofed fo as to raife the threads of the warp, let the workmen fee, from time to time, what kind of filk is to be put in the eye of the fhuttle for woof. This method of preparing the work is called *reading the design*, and *reading the figure*, which is performed in the following manner: A paper is provided, confiderably broader than the ftuff, and of a length proportionate to what is intended to be represented thereon. This they divide lengthwife, by as many black lines as there are intended threads in the warp; and crofs thefe lines, by others drawn breadthwife, which, with the former, make little equal fquares: on the paper thus fquared, the draughtfman designs his figures, and heightens them with colours as he fees fit. When the design is finifhed, a workman reads it, while another lays it on the fimblot.

To read the design, is to tell the perfon who manages the loom, the number of fquares, or threads, comprifed in the fpace he is reading, intimating at the fame time, whether it is ground or figure. To put what is read on the fimblot, is to faften little ftirings to the feveral packthreads, which are to raife the threads named; and thus they continue to do till the whole design is read.

Every piece being compofed of feveral repetitions of the fame design, when the whole design is drawn, the drawer, to re-begin the design afrefh, has nothing to do but to raife the little ftirings, with flip-knots, to the top of the fimblot, which he had let down to the bottom: this he is to repeat as often as is neceffary till the whole be manufactured.

The ribbon-weavers have likewife a design, but far more fimple than that now defcribed. It is drawn on paper with lines and fquares, representing the threads of the warp and woof. But inftead of lines, whereof the figures of the former confift, thefe are conftituted of points only, or dots, placed in certain of the little fquares, formed by the interfection of the lines. Thefe points mark the threads of the warp that are to be raifed, and the fpaces left blank denote the threads that are to keep their fituation: the reft is managed as in the former.

DESIGN is alfo ufed, in painting, for the firft idea of a large work, drawn roughly, and in little, with an intention to be executed and finifhed in large.

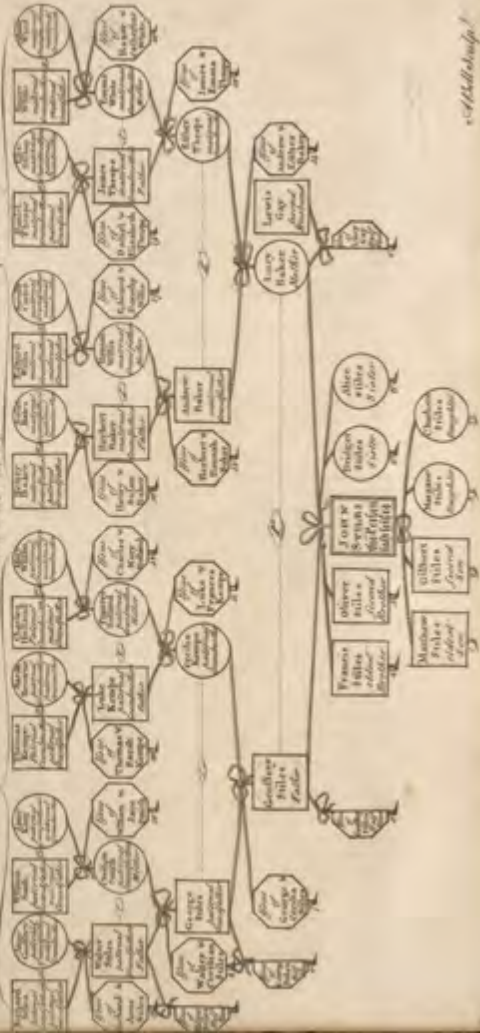

TABLE of DESCENT

Particular Line

Material Line

Design

Desportes.

In this sense, it is the simple contour, or outlines, of the figures intended to be represented, or the lines that terminate and circumscribe them: such design is sometimes drawn in crayons, or ink, without any shadows at all; sometimes it is hatched, that is, the shadows are expressed by sensible outlines, usually drawn across each other with the pen, crayon, or graver. Sometimes, again, the shadows are done with the crayon rubbed so as that there do not appear any lines: at other times, the grains or strokes of the crayon appear, as not being rubbed: sometimes the design is washed, that is, the shadows are done with a pencil in Indian ink, or some other liquor; and sometimes the design is coloured, that is, colours are laid on much like those intended for the grand work.

DESIGN, in music, is justly defined by Rousseau to be the invention and the conduct of the subject, the disposition of every part, and the general order of the whole.

It is not sufficient to form beautiful airs, and a legitimate harmony; all these must be connected by a principal subject, to which all the parts of the work relate, and by which they became one. Thus unity ought to prevail in the air, in the movement, in the character, in the harmony, and in the modulation. All these must indispensably relate to one common idea which unites them. The greatest difficulty is, to reconcile the observation of those precepts with an elegant variety, which, if not introduced, renders the whole piece irksome and monotonous. Without question the musician, as well as the poet, and the painter, may risk every thing in favour of this delightful variety; if, under the pretext of contrailing, they do not endeavour to cheat us with false appearances, and instead of pieces justly and happily planned, present us with a musical minced-meat, composed of little abortive fragments, and of characters so incompatible, that the whole assembled forms a heterogeneous monster.

*Non ut placidis coeant immitia, non ut
Serpentis avibus gementur, tigribus agni.*

Translated thus:

But not that nature should reverse'd appear;
Mix mild with fierce, and gentle with severe;
Profane her laws to contradiction's height;
Tygers with lambs, with serpents birds unite.

It is therefore in a distribution formed with intelligence and taste, in a just proportion between all the parts, that the perfection of design consists; and it is above all, in this point, that the immortal perogee has shown his judgment and his taste, and has left so far behind him all his competitors. His *Stabat Mater*, his *Orfeo*, his *Serva Padrona*, are, in three different species of composition, three master pieces of design equally perfect.

This idea of the general design of a work, is likewise particularly applicable to every piece of which it consists; thus the composer plans an air, a duet, a chorus, &c. For this purpose, after having invented his subject, he distributes it, according to the rules of a legitimate modulation, into all the parts where it ought to be perceived, in such a proportion, that its impression may not be lost on the minds of the audience; yet that it may never be reiterated in their ears, without the graces of novelty. The composer errs in designing who suffers his subject to be forgot; he is still more culpable who pursues it till it becomes trite and tiresome.

DESPORTES (Francis), a French painter of the

18th century, was born in Champagne, in 1661. He acquired great reputation, not only in France, but in England and Poland; he particularly excelled in still life. He was received into the academy of painting, made pictures for the tapestry of the Gobelins, and died at Paris in 1743.

DESPO^T, a term sometimes used for an absolute prince. See the next article.

Under the emperors of Constantinople, *despot* was a title of honour given to the emperor's sons, or sons-in-law; as also to their colleagues and partners in the imperial dignity, in the same manner as Cæsar was at Rome. See CÆSAR.

DESPO^TICAL, in general, denotes any thing that is uncontrolled and absolute; but is particularly used for an arbitrary government, where the power of the prince is unlimited, and his will a law to his subjects: such are those of Turkey, Persia, and most of the eastern governments; and even those of Europe, if we except the republics, our own, and the Swedish government.

DESPOUILLE, in heraldry, the whole case, skin, or slough of a beast, with the head, feet, tail, and all appurtenances, so that being filled and stuffed it looks like the entire creature.

DESSAW, a city of upper Saxony, in Germany, situated on the river Elbe, 60 miles north-west of Dresden, and subject to the prince of Anhalt Dessau: E. Long. 12. 40. N. Lat. 51. 50.

DESSERT, or DESERT, a service of fruits and sweetmeats, usually served up last to table.

DESSICATIVE, or DESICCATIVE, in pharmacy, an epithet applied to such topical medicines as dry up the humours flowing to a wound or ulcer.

DESTINIES, in mythology. See PARCÆ.

DESTINY, among philosophers and divines. See FATE.

DESTRUCTION, in general, an alteration of any thing from its natural state to one contrary to nature; whereby it is deemed the same with CORRUPTION.

A chemical destruction, or corruption, is nothing but a resolution of the whole naturally mixt body into its parts.

DESUDATION, in medicine, a profuse and inordinate sweat, succeeded by an eruption of pustules, called *sudamina*, or *heat-pimples*.

DESULTOR, in antiquity, a vaulter or leaper, who, leading one horse by the bridle, and riding another, jumped from the back of one to the other, as the custom was after they had run several courses or heats. — This practice required great dexterity, being performed before the use of either saddles or stirrups. The custom was practised in the army when necessity required it; but chiefly amongst the Numidians, who always carried with them two horses at least for that purpose, changing them as they tired. The Greeks and Romans borrowed the practice from them; but only used it at races, games, &c. The Sarmatæ were great masters of this exercise, and the Hussars have still some small remains of it.

DETACHMENT, in military affairs, a certain number of soldiers drawn out from several regiments or companies equally, to be employed as the general thinks proper, whether on an attack, at a siege, or in parties to scour the country.

Despot

Detachment.

Detergents
Deucalion.

DETERGENTS, in pharmacy, such medicines as are not only softening and adhesive, but also, by a peculiar activity, conjoined with a suitable configuration of parts, are apt to abrade and carry along with them such particles as they lay hold on in their passage.

DETERIORATION, the impairing or rendering a thing worse: it is just the reverse of **MELIORATION**.

DETERMINATION, in mechanics, signifies much the same with the tendency or direction of a body in motion. See **MECHANICS**.

DETERMINATION, among school-divines, is an act of divine power, limiting the agency of second causes, in every instance, to what the Deity predestinated concerning them. See **PREDESTINATION**.

DETERSIVES, the same with **DETERGENTS**.

DETINUE, in law, a writ or action that lies against one who has got goods or other things delivered to him to keep, and afterwards refuses to deliver them.—In this action, the thing detained is generally to be recovered, and not damages; but if one cannot recover the thing itself, he shall recover damages for the thing, and also for the detainer. Detinue lies for any thing certain and valuable, wherein one may have a property or right; as for a horse, cow, sheep, hens, dogs, jewels, plate, cloth, bags of money, sacks of corn, &c. It must be laid so certain, that the thing detained may be known and recovered: and therefore, for money out of a bag, or corn out of a sack, &c. it lies not; for the money or corn cannot in this case be known from other money or corn; so that the party must have an action on the case, &c. Yet detinue may be brought for a piece of gold of the price of 22 sh. though not for 22 sh. in money.

DETONATION, in chemistry, signifies an explosion with noise made by the sudden inflammation of some combustible body: Such are the explosions of *gun-powder*, *fulminating gold*, and *fulminating powder*. As nitre is the cause of most explosions, the word *detonation* has been appropriated to the inflammation of the acid of this salt with bodies containing phlogiston; and it is frequently given to those inflammations of nitrous acid which are not accompanied with explosion. Thus nitre is said to detonate with sulphur, with coals, with metals; although in the ordinary method of making these operations, that is, in open crucibles, and with small quantities of detonating substances, the nitre does not truly explode. See **NITRE**.

DETRANCHE, in heraldry, a line bend-wise, proceeding always from the dexter-side, but not from the very angle diagonally athwart the shield.

DETTINGEN, a village of Germany, in the circle of the Upper Rhine, and in the territory of Hanau. Here the Austrians and the British, in June 1743, were attacked by the French, who met with a repulse; but as the allies were inferior in number, they did not make the advantage of it they might have done. E. Long. 8. 45. N. Lat. 50. 8.

DEUCALION, king of Thessaly. The flood said to have happened in his time, (1500 B. C.), was no more than an inundation of Thessaly, occasioned by heavy rains, and an earthquake that stopped the course of the river Peneus where it usually discharged itself into the sea. On these circumstances the fable of Deucalion's flood is founded.—According to the fable, he was the son of Prometheus. He governed his peo-

ple with equity; but the rest of mankind being extremely wicked, were destroyed by a flood, while Deucalion and Pyrrha his queen saved themselves by ascending mount Parnassus. When the waters were decreased, they went and consulted the oracle of Themis, on the means by which the earth was to be repopled; when they were ordered to veil their heads and faces, to unloose their girdles, and throw behind their backs the bones of their great mother. At this advice Pyrrha was seized with horror: but Deucalion explained the mystery, by observing, that their great mother must mean the earth, and her bones the stones; when taking them up, those Deucalion threw over his head became men, and those thrown by Pyrrha, women.

DEVENSHRING. See **DEVONSHIRING**.

DEVENTER, a large, strong, trading, and populous town of the United Provinces, in Overijssel, with an university. It is surrounded with strong walls, flanked with several towers, and with ditches full of water. It is seated on the river IJssel, 55 miles east of Amsterdam, and 42 west of Bentheim. E. Long. 5. 8. N. Lat. 52. 18.

DEVEREUX (Robert), earl of Essex, the son of Walter Devereux, viscount Hereford, was born at Netherwood in Herefordshire, in the year 1567. He succeeded to the title of earl of Essex at ten years of age; and about two years after, was sent by his guardian lord Burleigh, to Trinity-college in Cambridge. He took the degree of master of arts in 1582, and soon after retired to his seat at Lampfie in South-Wales. He did not however continue long in this retreat; for we find him, in his seventeenth year, at the court of queen Elizabeth, who immediately honoured him with singular marks of her favour. Authors seem very unnecessarily perplexed to account for this young earl's gracious reception at the court of Elizabeth. The reasons are obvious: he was her relation, the son of one of her most faithful servants, the son-in-law of her favourite Leicester, and a very handsome and accomplished youth. Towards the end of (the following year) 1585, he attended the earl of Leicester to Holland; and gave signal proofs of his personal courage during the campaign of 1586, particularly at the battle of Zutphen, where the gallant Sidney was mortally wounded. On this occasion the earl of Leicester conferred on him the honour of knight banneret.

In the year 1587, Leicester being appointed lord steward of the household, Essex succeeded him in the honourable post of master of the horse; and the year following, when the queen assembled an army at Tilbury to oppose the Spanish invasion, Essex was made general of the horse, and knight of the garter. From this time he was considered as the happy favourite of the queen. And, if there was any mark yet wanting to fix the people's opinion in that respect, it was shewn by the queen's conferring on him the honour of the garter.

We need not wonder, that so quick an elevation, and to so great a height, should affect so young a man as the earl of Essex; who shewed from henceforward a very high spirit, and often behaved petulantly enough to the queen herself, who yet did not love to be controlled by her subjects. His eagerness about this time to dispute her favour with Sir Charles Blunt, afterwards lord

Deven-
shiring
Devereux.

Devereux.

lord Montjoy and earl of Devonshire, cost him some blood; for Sir Charles, thinking himself affronted by the earl, challenged him, and, after a short dispute, wounded him in the knee. The queen, so far from being displeased with it, is said to have sworn a good round oath, that it was fit somebody should take him down, otherwise there would be no ruling him. However, she reconciled the rivals; who, to their honour, continued good friends as long as they lived.

The gallant Essex however was not so entirely captivated with his situation, as to become insensible to the allurements of military glory. In 1589, Sir John Norris and Sir Francis Drake having sailed on an expedition against Spain, our young favourite, without the permission or knowledge of his royal mistress, followed the fleet; which he joined as they were failing towards Lisbon, and acted with great resolution in the repulse of the Spanish garrison of that city. The queen wrote him a very severe letter on the occasion; but she was, after his return, soon appeased. Yet it was not long before he again incurred her displeasure, by marrying the widow of Sir Philip Sidney. In 1591, he was sent to France with the command of 4000 men to the assistance of Henry IV. In 1596, he was joined with the lord high admiral Howard in the command of the famous expedition against Cadiz, the success of which is universally known. In 1597, he was appointed master of the ordnance; and the same year commanded another expedition against Spain, called the *Island voyage*, the particulars of which are also well known.

Soon after his return, he was created earl marshal of England; and on the death of the great lord Burleigh, in 1598, elected chancellor of the university of Cambridge. This is reckoned one of the last instances of this great man's felicity, who was now advanced too high to sit at ease; and those who longed for his honours and employments, very closely applied themselves to bring about his fall. The first great shock he received, in regard to the queen's favour, arose from a warm dispute between her majesty and himself, about the choice of some fit and able person to superintend the affairs of Ireland. The affair is related by Camden; who tells us, that nobody was present but the lord admiral, Sir Robert Cecil secretary, and Windesbank clerk of the seal. The queen looked upon Sir William Knolls, uncle to Essex, as the most proper person for that charge: Essex contended, that Sir George Carew was a much fitter man for it. When the queen could not be persuaded to approve his choice, he so far forgot himself and his duty, as to turn his back upon her in a contemptuous manner; which insolence her majesty not being able to bear, gave him a box on the ear, and bid him go and be hanged: Essex, like a blockhead, put his hand to his sword, and swore revenge. Where was his gallantry on this occasion? Could a stroke from an angry woman tinge the honour of a gallant soldier? This violent storm, however, soon subsided; and they were again reconciled, at least apparently.

The total reduction of Ireland being brought upon the tapis soon after, the earl was pitched upon as the only man from whom it could be expected. This was an artful contrivance of his enemies, who hoped by this means to ruin him; nor were their expectations dis-

appointed. He declined this fatal preferment as long as he could: but, perceiving that he should have no quiet at home, he accepted it; and his commission for lord lieutenant passed the great seal on the 12th of March 1598. His enemies now began to insinuate, that he had fought this command, for the sake of greater things which he then was meditating; but there is a letter of his to the queen, preserved in the Harleian collections, which shews, that he was so far from entering upon it with alacrity, that he looked upon it rather as a banishment, and a place assigned him for a retreat from his sovereign's displeasure, than a potent government bestowed upon him by her favour. "To the Queen. From a mind delighting in sorrow; from spirits waisted with passion; from a heart torn in pieces with care, grief, and travail; from a man that hateth himself, and all things else that keep him alive; what service can your majesty expect, since any service palk deserves no more than banishment and proseription to the curfedeft of all islands? It is your rebels pride and succession must give me leave to range som myself out of this hateful prison, out of my loathed body; which, if it happen so, your majesty shall have no cause to mislike the fashion of my death, since the course of my life could never please you.

"Happy he could finish forth his fate,
"In some unhaunted desert most obscure
"From all society, from love and hate
"Of worldly folk; then should he sleep secure.
"Then wake again, and yield God ever praise,
"Content with hips, and hawes, and brambleberry;
"In contemplation passing out his days,
"And change of holy thoughts to make him merry.
"Who, when he dies, his tomb may be a bush,
"Where harmless robin dwells with gentle thrush.

"Your Majesty's" exiled servant,
"ROBERT ESSEX."

The earl met with nothing in Ireland but ill success and crosses: in the midst of which, an army was suddenly raised in England, under the command of the earl of Nottingham; no-body well knowing why, but in reality from the suggestions of the earl's enemies to the queen, that he rather meditated an invasion on his native country, than the reduction of the Irish rebels. This and other considerations made him resolve to quit his post, and come over to England; which he accordingly did without leave. He burst into her majesty's bed-chamber as she was rising, and she received him with a mixture of tenderness and severity: but she, soon after, thought fit to deprive him of all his employments, except that of master of the horse. He was committed to the custody of the lord-keeper, with whom he continued six months. No sooner had he regained his liberty, than he was guilty of many extravagancies; to which he was instigated by knaves and fools, but perhaps more powerfully by his own passions. He first determined to obtain an audience of the queen by force. He refused to attend the council when summoned. When the queen sent the lord-keeper, the lord chief-justice, and two others, to know his grievances, he confined them; and then marched with his friends into the city, in expectation that the people would rise in his favour; but in that he was disappointed. He was at last besieged, and taken in his house in Essex-street; committed to the Tower; tried

Devereux.

Devereux. by his peers, condemned, and executed. Thus did this brave man, this favourite of his queen, this idol of the people, fall a sacrifice to his want of that dissimulation, that cunning, that court-policy, by which his enemies were enabled to effect his ruin. He was a polite scholar, and a generous friend to literature.

To those, who have not taken the trouble to consult and compare the several authors who have related the story of this unfortunate earl, it must appear wonderful, if, as hath been suggested, he was really beloved by queen Elizabeth, that she could consent to his execution. Now, that she had conceived a tender passion for him, is proved beyond a doubt by Mr Walpole in his very entertaining and instructive *Catalogue of Noble Authors*.—"I am aware," says that author, "that it is become a mode to treat the queen's passion for him as a romance. Voltaire laughs at it; and observes, that when her struggle about him must have been the greatest (the time of his death), she was sixty-eight.—Had he been sixty-eight, it is probable she would not have been in love with him."—"Whenever Essex acted a fit of sickness, not a day passed without the queen's sending often to see him; and once went so far as to sit long by him, and order his *broths and things*. It is recorded by a diligent observer of that court, that in one of his sick moods, he took the liberty of going up to the queen in his night-gown. In the height of these frolic fooleries, there was a mask at Black Fryars on the marriage of lord Herbert and Mrs Ruffel. Eight lady-makers chose eight more to dance the measures. Mrs Fitton, who led them, went to the queen, and wooed her to dance. Her majesty asked what she was?—*Affection*, she said. *Affection!* said the queen; *Affection is false*. Were not these the murmurs of a heart ill at ease? Yet her majesty rose, and danced. She was then sixty-eight. Sure it was as natural for her to be in love."

Mr Walpole farther observes, that her court and contemporaries had an uniform opinion of her passion for Essex, and quotes several instances from a letter written by Sir Francis Bacon to the earl; in which, among other things, he advises him to consult her taste in his very apparel and gestures, and to give way to any other inclination she may have. Sir Francis advised the queen herself, knowing her inclination, to keep the earl about her for *society*. What Henry IV. of France thought of the queen's affection for Essex, is evident from what he said to her ambassador—"Que sa majesté ne laisseroit jamais son cousin d'Essex s'éloigner de son cottillon."—After his confinement, on hearing he was ill, she sent him word, with tears in her eyes, that if she might with her honour, she would visit him.

"If," says Mr Walpole, "these instances are problematic, are the following so? In one of the curious letters of Rowland White, he says, the queen *bath of late used the fair Mrs Bridges with words, and blows of anger*. In a subsequent letter, he says, the earl is again *fallen in love with his fairest B. It cannot chuse but come to the queen's ears, and then he is undone*."—Essex himself says, that her fond parting with him when he set out for Ireland, pierced his very soul.

Probably the reader has now very little doubt as to queen Elizabeth's affection for the unfortunate Essex; but, in proportion to our belief of the existence of this affection, her motives for consenting to his execution

become more inexplicable. Queen Elizabeth had a very high opinion of her beauty and personal attractions, and probably expected more entire adoration than the earl's passion for variety would suffer him to pay. Towards the latter end of her life, she was certainly an object of disgust. He had too much honest simplicity in his nature, to feign a passion which he did not feel. She foolishly gave credit to the stories of his ambitious projects incompatible with her safety; and was informed that he had once inadvertently said, that *she grew old and cankered, and that her mind was become as crooked as her carcase*. If this be true, where is the woman that would not sacrifice such a lover to her resentment?

It is said, however, that, concerning his execution, her majesty was irresolute to the last, and sent orders to countermand it; but, considering his obstinacy in refusing to ask her pardon, afterwards directed that he should die. It is reported, that the queen, in the height of her passion for the earl of Essex, had given him a ring, ordering him to keep it, and that whatever crime he should commit, she would pardon him when he should return that pledge. The earl, upon his condemnation, applied to admiral Howard's lady, his relation, desiring her, by a person whom she could trust, to return it into the queen's own hands; but her husband, who was one of the earl's greatest enemies, and to whom she had imprudently told the circumstance, would not suffer her to acquit herself of the commission; so that the queen consented to the earl's death, being full of indignation against so proud and haughty a spirit, who chose rather to die than implore her mercy. Some time after, the admiral's lady fell sick, and being near her death, she sent word to the queen that she had something of great consequence to communicate before she died. The queen came to her bed-side, and having ordered all her attendants to withdraw, the lady retired, but too late, the ring, desiring to be excused that she did not return it sooner: on which, it is said, the queen immediately retired, overwhelmed with grief.

The earl of Essex died in the thirty-fourth year of his age; leaving by his lady, one son and two daughters.

DEVICE, among painters. See DEVISE.

DEVIL, an evil angel, one of those celestial spirits cast down from heaven for pretending to equal himself with God. The Ethiopians paint the devil white, to be even with the Europeans who paint him black.

There is no mention of the word *devil* in the Old Testament, but only of the word *Satan* and *Belial*: nor do we meet with it in any heathen authors, in the sense it is taken among Christians, that is, as a creature revolted from God. Their theology went no farther than to evil genii, or demons.

Some of the American idolaters have a notion of two collateral independent beings, one of whom is good, and the other evil; which last they imagine has the direction and superintendence of this earth, for which reason they chiefly worship him: whence those that give us an account of the religion of these savages give out, with some impropriety, that they worship the devil. The Chaldeans, in like manner, believed both a good principle and an evil one; which last they imagined was an enemy to mankind.

Devil
Devon-
shire.

Isaiah, speaking, according to some commentators, of the fall of the devil, calls him Lucifer, from his former elevation and state of glory: but others explain this passage of Isaiah in reference to the king of Babylon, who had been precipitated from his throne and glory. The Arabians call Lucifer, *Eblis*; which some think is only a diminutive or corruption of the word *Diabolus*.

DEVIL on the Neck, a tormenting engine made of iron, straitening and wincing the neck of a man, with his legs together, in a horrible manner; so that the more he striveth in it, the straiter it presseth him; formerly in use among the persecuting papists.

DEVINCTION, in antiquity, a kind of love-charm, described by Virgil in his eighth eclogue: it consisted in tying certain knots, and repeating a formula of words.

DEVISE, or **DEVICE**, in heraldry, painting, and sculpture, any emblem used to represent a certain family, person, action, or quality; with a suitable motto, applied in a figurative sense. See **MOTTO**.

The essence of a device consists in a metaphorical similitude between the things representing and represented: thus, a young nobleman, of great courage and ambition, is said to have borne for his devise, in a late carousal at the court of France, a rocket mounted in the air, with this motto in Italian, "*a poco dari purehe m'inalzi*"; expressing, that he preferred a short life, provided he might thereby attain to glory and eminence.

The Italians have reduced the making of devices into an art, some of the principal laws of which are these. 1. That there be nothing extravagant or monstrous in the figures. 2. That figures be never joined which have no relation or affinity with one another; excepting some whimsical unions established in ancient fables, which custom has authorized. 3. That the human body be never used. 4. The fewer figures the better. 5. The motto should be every way suitable.

DEVISE, in law, the act whereby a person bequeaths his lands or tenements to another by his last will or testament.

DEUNX, in Roman antiquity, 11 ounces, or $\frac{1}{12}$ of the **LIBRA**.

DEVOLUTION, in law, a right acquired by succession from one to another.

DEVONSHEERING, a term used by the farmers to express the burning of land by way of manure: the method is to cut off the turf about four inches thick, and burn it in heaps, and then spread the ashes upon the land. The name is probably derived from its having been earliest practised in Devonshire.

DEVONSHIRE, a county of England, bounded on the south by the English channel, on the north by the Bristol channel, on the east by Somersetshire, and on the west by Cornwall. It is about 69 miles long, and 66 broad. The soil is various; in the western parts of the county it is coarse and moorish, bad for sheep, but proper for black cattle. In the northern parts, the dry soil and downs are well adapted to sheep, with numerous flocks of which they are well covered. Tolerable crops of corn are also produced there when the land is well manured. The soil of the rest of the county is rich and fertile both in corn and pasture, yielding also in some places plenty of marle for ma-

nuring it. In other places they pare off and burn the surface, making use of the ashes as a manure. Dr Campbell styles it a rich and pleasant country; as in different parts it abounds with all sorts of grain, produces abundance of fruit, has mines of lead, iron, and silver, in which it formerly exceeded Cornwall, though now it is greatly inferior. On the coast also they have herring and pilchard fisheries.

DEVOTION, **DEVOTIO**, a sincere ardent worship of the Deity. See **PRAYER**, **ADORATION**, **WORSHIP**, &c.

Devotion, as defined by Jurieu, is a softening and yielding of the heart, with an internal consolation, which the souls of believers feel in the practice or exercise of piety. By devotion is also understood certain religious practices, which a person makes it a rule to discharge regularly; and with reason, if the exactitude be founded on solid piety, otherwise it is vanity or superstition. That devotion is vain and trifling, which would accommodate itself both to God and to the world. *Trepoux*.

DEVOTION, among the Romans, was a kind of sacrifice, or ceremony, whereby they consecrated themselves to the service of some person. The ancients had a notion, that the life of one might be ransomed by the death of another, whence those devotions became frequent for the lives of the emperors. Devotion to any particular person, was unknown among the Romans till the time of Augustus. The very day after the title of Augustus had been conferred upon Octavius, Pacuvius, a tribune of the people, publicly declared, that he would devote himself to Augustus, and obey him at the expence of his life, (as was the practice among barbarous nations), if he was commanded. His example was immediately followed by all the rest; till, at length, it became an established custom never to go to salute the emperor, without declaring that they were devoted to him.—Before this, the practice of the Romans was that of devoting themselves to their country.*

DEUTEROCANONICAL, in the school-theology, an appellation given to certain books of holy scripture, which were added to the canon after the rest; either by reason they were not wrote till after the compilation of the canon, or by reason of some dispute as to their canonicity. The word is Greek, being compounded of *deuteros*, second, and *kanonikos*, canonical.

The Jews, it is certain, acknowledged several books in their canon, which were put there later than the rest. They say, that under Esdras, a great assembly of their doctors, which they call by way of eminence the *great synagogue*, made the collection of the sacred books which we now have in the Hebrew Old Testament. And they agree that they put books therein which had not been so before the Babylonish captivity; such are those of Daniel, Ezekiel, Haggai, &c. and those of Esdras and Nehemiah.

And the Romish church has since added others to the canon, that were not, nor could not be, in the canon of the Jews; by reason some of them were not composed till after. Such is the book of Ecclesiasticus; with several of the apocryphal books, as the Maccabees, Wisdom, &c. Others were added still later, by reason their canonicity had not been yet examined; and till such examen, and judgment, they might be set aside at pleasure.—But since that church has pronounced

ced as to the canonicity of these books, there is no more room now for her members to doubt of them, than there was for the Jews to doubt of those of the canon of Eldras. And the deuteronical books are with them as canonical, as the proto-canonical; the only difference between them consisting in this, that the canonicity of the one was not generally known, examined, and settled, so soon as that of the others.

The deuteronical books in the modern canon, are the book of Esther, either the whole, or at least the seven last chapters thereof. The epistle to the Hebrews; that of James; and that of Jude; the second of St Peter; the second and third of St John; and the Revelation. The deuteronical parts of books, are, in Daniel, the hymn of the three children; the prayer of Azariah; the histories of Sufannah, of Bel and the Dragon; the last chapter of St Mark; the bloody sweat, and the appearance of the angel, related in St Luke, chap. xxii; and the history of the adulterous woman in St John, chap. viii.

DEUTERONOMY, one of the sacred books of the Old Testament; being the last of those written by Moses: (See *PENTATEUCH*.) The word is Greek, compounded of *δευτερος* second, and *νομος*, law.

Deuteronomy was written the 40th year after the delivery from Egypt, in the country of the Moabites beyond Jordan; Moses being then in the 120th year of his age. It contains, in Hebrew, 11 parafches, though only 10 in the edition of the rabbins at Venice; XX chapters, and 955 verses. In the Greek, Latin, and other versions, it contains XXXIV chapters. The last is not of Moses. Some say it was added by Joshua immediately after Moses's death; which is the most probable opinion. Others will have it added by Eldras.

DEUTEROPOTMI, in Grecian antiquity, a designation given to such of the Athenians as had been thought dead, and, after the celebration of the funeral rites, unexpectedly recovered. It was unlawful for the deuteropotmi to enter into the temple of the Eumenides, or to be admitted to the holy rites, till after they were purified, by being let through the lap of a woman's gown, that they might seem to be new born.

DEUTEROSIS, the Greek name by which the Jews called their Mischnah, or second law. See *MISCHNAH*.

DEW, a dense, moist vapour, found on the earth in spring and summer mornings, in form of a misting rain, being collected there chiefly while the sun is below the horizon.

It hath been disputed whether the dew is formed from the vapours *ascending* from the earth during the night-time, or from the *descent* of such as have been already raised through the day. The most remarkable experiments adduced in favour of the first hypothesis are those of Mr Dufay of the Royal Academy of Sciences at Paris. He supposed, that if the dew *ascended*, it must wet a body placed low down sooner than one placed in a higher situation: and, if a number of bodies were placed in this manner, the lowermost would be wetted first; and the rest in like manner, gradually up to the top.

To determine this, he placed two ladders against one another, meeting at their tops, spreading wide a-

funder at the bottom, and so tall as to reach 32 feet high. To the several steps of these he fastened large squares of glass like the panes of windows, placing them in such a manner that they should not overhade one another. On the trial it appeared exactly as Mr Dufay had apprehended. The lower surface of the lowest piece of glass was first wetted, then the upper, then the lower surface of the pane next above it; and so on, till all the pieces were wetted to the top. Hence it appeared plain to him, that the dew consisted of the vapours ascending from the earth during the night-time; which, being condensed by the coldness of the atmosphere, are prevented from being dissipated as in the day-time by the sun's heat. He afterwards tried a similar experiment with pieces of cloth instead of panes of glass, and the result was quite conformable to his expectations. He weighed all the pieces of cloth next morning, in order to know what quantity of water each had imbibed, and found those that had been placed lowermost considerably heavier than such as had been placed at the top; tho' he owns that this experiment did not succeed so perfectly as the former.

M. Muschenbroek, who embraced the contrary opinion, thought he had invalidated all Mr Dufay's proofs, by repeating his experiments, with the same success, on a plane covered with sheet-lead. But to this Mr Dufay replied, that there was no occasion for supposing the vapour to rise through the lead, nor from that very spot; but that as it arose from the adjoining open ground, the continual fluctuation of the air could not but spread it abroad, and carry it thither in its ascent.

But though this experiment of M. Muschenbroek's is not sufficient to overthrow those of Mr Dufay, it must still remain dubious whether the dew *rises* or *falls*. One thing which seems to favour the hypothesis of its *descent* is, that in cloudy weather there is little or no dew to be observed. From this M. de Luc brings an argument in favour of the hypothesis just now mentioned. He accounts for it in the following manner. When there are no clouds in the air, the heat of the inferior air and that which rises from the earth, dissipates itself into the superior regions; and then the vapours which are dispersed throughout the air, condense, and fall down in dew: But, when the clouds continue, they separate the inferior from the superior part of the atmosphere, and thus prevent the dissipation of the heat, by which means the vapours remain suspended. When the sky grows cloudy, some hours after sun-set, although the heat has been sensibly diminished, it is again increased; because, continuing to rise out of the earth, it is accumulated in the inferior air. But neither can this be reckoned a positive proof of the *descent* of the dew; since we may as well suppose the heat of the atmosphere to be great enough to dissipate it in its ascent, as to keep it suspended after its ascent through the day.

On the other hand, its being found in greater quantities on bodies placed low down than on such as are high up, is no proof of the *ascent* of the dew; because the same thing is observed of rain. A body placed low down receives more rain than one placed in an elevated situation; and yet the rain certainly descends from the atmosphere. The reason why the dew appears first on the lower parts of bodies may be, that, in the evening, the

Dew.

Phil. Tran.
vol. 63.
part 2.

lower

Dew.

lower part of the atmosphere is first cooled, and consequently most disposed to part with its vapour. It is also certain, that part of the water contained in the air may be condensed at any time on the sides of a glass, by means of cold, so as to run down its sides in small drops like dew. It seems, therefore, that this subject is not sufficiently determined by such experiments as have yet been made; nor indeed does it appear easy to make such experiments as shall be perfectly decisive on the matter.

Several substances, exposed to the same dew, receive and charge themselves with it in a very different manner; some more, others less, and some even not at all. The drops seem to make a sort of choice of what bodies they shall affix themselves to: glass and crystals are those to which they adhere in the most ready manner, and in the largest quantity; but metals of all kinds never receive them at all, nor do the drops ever adhere to them. The reason of this is probably because metals promote evaporation more than glass does. Thus, if a piece of metal and a piece of glass are both made equally moist, the former will be found to dry in much less time than the latter. Hence it would seem, that there is between metals and water some kind of repulsion: and this may be sufficient to keep off the very small quantity that falls in dew; for whatever tends to make water evaporate after it is actually in contact with any substance, also tends to keep the water from ever coming into contact with it.

SUBSTANCES of a very different kind from the usual dew, are said to have sometimes fallen from the atmosphere. In the Phil. Trans. we are told, that in the year 1695 there fell in Ireland, in the provinces of Leinster and Munster, for a considerable part of the winter and spring, a fatty substance resembling butter, instead of the common dew. It was of a clammy texture, and dark yellow colour; and was, from its great resemblance, generally called *dew-butter* by the country people. It always fell in the night, and chiefly in the moorish low grounds; and was found hanging on the tops of the grass, and on the thatch of the houses of the poor people. It was seldom observed to fall twice in the same place; and usually, wherever it fell, it lay a fortnight upon the ground before it changed colour; but after that it gradually dried up, and became black. The cattle fed in the fields where it lay as well as in others, and received no harm by it. It fell in pieces of the bigness of one's finger-end; but they were dispersed scatteringly about, and it had an offensive smell like a church-yard. There were in the same places very stinking fogs during the winter, and some people supposed this no other than a sediment from the fog. It would not keep very long, but never bred worms.

May-Dew whitens linen and wax; the dew of autumn is converted into a white frost. Out of dew putrified by the sun, arise divers insects, which change apace from one species into another: what remains is converted into a fine white salt, with angles like those of salt-petre, after a number of evaporations, calcinations, and fixations.

There is a spirit drawn from May-dew, which has wonderful virtues attributed to it. The method of collecting and preparing it, is prescribed by Hanneman, physician at Kiel. It is to be gathered in clean linen cloths; exposed to the sun in close vials; then di-

stilled, and the spirit thrown upon the caput mortuum; this is to be repeated till the earth unite with the spirit, and become liquid; which happens about the seventh or eighth cohobation, or distillation. By such means you gain a very red, odoriferous spirit. Stolterfoht, a physician of Lubec, thinks May-dew may be gathered in glass-plates, especially in still weather, and before sun-rise. And Etmuller is of the same sentiment. It might likewise be collected with a glass funnel, exposed to the air, having a crooked neck to bring the dew into a vial in a chamber. See Phil. Transl. n° 3. Hoffman, and others. It is apparently from the preparation of this dew, that the brothers of the Rosy-Crofs took their denomination *.

Dew-Born, in country affairs, a distemper in cattle, being a swelling in the body, as much as the skin can hold, so that some beasts are in danger of bursting. This distemper proceeds from the greediness of a beast to feed, when put into a rank pasture; but commonly when the grass is full of water. In this case the beast should be stirred up and down, and made to purge well: but the proper cure is bleeding in the tail; then take a grated nutmeg, with an egg, and breaking the top of the shell, put out so much of the white as you may have room to slip the nutmeg into the shell; mix them together, and then let shell and all be put down the beast's throat; that done, walk him up and down, and he will soon mend.

Dew-Worm. See LUMBRICUS.

DE WIT (John), the famous pensionary, was born in 1625, at Dort; where he prosecuted his studies so diligently, that, at the age of 23, he published *Elementa Curvarum Linearum*, one of the deepest books in mathematics at that time. After taking his degrees, and travelling, he, in 1650, became pensionary of Dort, and distinguished himself very early in the management of public affairs. He opposed with all his power the war between the English and the Dutch; and when the event justified his predictions, he was unanimously chosen pensionary of Holland. In this capacity he laboured to procure a peace with Cromwell; in which peace a secret article was introduced by one side or other, for the exclusion of the house of Orange. In the war with England after the king's restoration, when it was thought expedient, on Opdam's defeat and death, that some of their own deputies should command the fleet, he was one of the three put in commission; and wrote an accurate relation of all that happened during the expedition he was engaged in, for which, at his return, he received the solemn thanks of the States-General. In 1667, he established the perpetual edict for abolishing the office of Stadtholder, to fix the liberty of the republic, as it was hoped, on a firm basis; which produced seditions and tumults, that restored the office, on pretence that the De Wits were enemies to the house of Orange, and plundered the state. The pensionary begged dismissal from his post; which was granted, with thanks for his faithful services. But the invasion of the French, and the internal divisions among the Hollanders themselves, spread every where terror and confusion; which the Orange party heightened, to ruin the De Wits. Cornelius, the pensionary's brother, was imprisoned and condemned to exile; and a report being raised that he would be rescued, the mob armed, and surrounded the prison where the two bro-

||
Diachylon.

thers then were together, dragged them out, barbarously murdered them, hung the bodies on the gallows, and cut them to pieces, which many of them even broiled, and ate with savage fury. Such was the end of one of the greatest geniuses of his age; of whom Sir William Temple, who was well acquainted with him, writes with the greatest esteem and admiration. He observes, that when he was at the head of the government, he differed nothing in his manner of living from an ordinary citizen. His office, for the first ten years, brought him in little more than 300*l.* and in the latter part of his life, not above 700*l.* per ann. He refused a gift of 10,000*l.* from the States-General, because he thought it a bad precedent in the government. With great reason, therefore, Sir William Temple, speaking of his death, observes, "He was a person that deserved another fate, and a better return from his country; after 18 years spent in their ministry, without any care of his entertainments or ease, and little of his fortune. A man of unwearied industry, inflexible constancy, sound, clear, and deep understanding, and untainted integrity; so that whenever he was blinded, it was by the passion he had for that which he esteemed the good and interest of his state. This testimony is justly due to him from all that were well acquainted with him; and is the more willingly paid, since there can be as little opportunity to flatter, as honour to reproach, the dead."

Besides the works already mentioned, he wrote a book containing those maxims of government, upon which he acted; which will be a never-fading monument to his immortal memory. A translation of it from the original Dutch, entitled, *The true interest and political maxims of the republic of Holland*, has been printed in London; to the last edition of which, in 1746, are prefixed historical memoirs of the illustrious brothers Cornelius and John de Witt, by John Campbell, Esq.

DEXTANS, in Roman antiquity, tea ounces, or $\frac{1}{16}$ of their libra. See *LIBRA*.

DEXTER, in heraldry, an appellation given to whatever belongs to the right side of a shield, or coat of arms: thus we say, *bend-dexter, dexter point*, &c.

DEXTROCHERE, or DESTROCHERE, in heraldry, is applied to the right arm painted in a shield, sometimes naked; sometimes clothed, or adorned with a bracelet; and sometimes armed, or holding some moveable or member used in the arms.

DEY, in matters of government, the sovereign prince of Algiers, answering to the *BEY* of Tunis.

DIABETES, in physic, an excessive discharge of urine, which comes away crude, and exceeds the quantity of liquids drank. See (the *Index* subjoined to) *MEDICINE*.

DIABOLUS. See *DEVIL*.

DIABOLUS Marinus. See *RAIA*.

DIABOLUS Metellorum, a title given by chemists to jupiter or tin, because, when incorporated with other metals, it renders them incapable of reduction, or at least very difficult to undergo that operation.

DIACAUSTIC CURVE, a species of the caustic curves formed by refraction.

DIACHYLON, in pharmacy, an emollient digestive plaster, composed of mucilages or viscid juices drawn from certain plants. See *PHARMACY*, n° 967.

DIACODIUM, in pharmacy, a syrup prepared from poppy-heads. It is also called the *syrupus de meconio*. See *PHARMACY*, n° 491.

DIACOUSTICS, called also DIAPHONICS, the consideration of the properties of refracted sound, as it passes through different mediums. See *ACOUSTICS*.

The word is formed from the Greek *δια, per*, "thro'"; which intimates a passage; and *ακου, I hear*, q. d. the consideration of the passage of the sounds we hear. See *SOUND*.

DIADELPHIA, (*δια, twice*, and *αδελφος a brother*.) class the 17th in the sexual system, comprehending those plants which bear hermaphrodite flowers with two sets of united stamina, but this circumstance must not be absolutely depended on. They are the *papilionaceæ* of Tournefort, the *irregulares tetrapetalæ* of Rivinus, and the *leguminosæ* of Ray. See *BOTANY*, p. 1292. and Plate *LIX*.

DIADEM, in antiquity, a head-band, or fillet, worn by kings as a badge of their royalty. It was made of silk, thread, or wool, and tied round the temples and forehead, the ends being tied behind, and let fall on the neck. It was usually white, and quite plain; though sometimes embroidered with gold, and set with pearls and precious stones. In latter times, it came to be twilted round crowns, laurels, &c. and even appears to have been worn on divers parts of the body. See *CROWN*.—The word comes from the Latin *diadema*; of the Greek *διαδμα*, a little band encompassing the head, of the verb *διαδο, cingo*, "I gird."

DIADÉM, in heraldry, is applied to certain circles, or rims, serving to inclose the crowns of sovereign princes, and to bear the globe and cross, or the flower de luces for their crest. The crowns of sovereigns are bound, some with a greater, and some with a less number of diadems.—The bandage about the heads of Moors on shields is also called *diadem*, in blazoning.

DIÆRESIS, in surgery, an operation serving to divide and separate the part when the continuity is a hindrance to the cure.

DIÆRESIS, in medicine, is the consuming of the vessels of an animal body, when from some corroding cause certain passages are made, which naturally ought not to have been; or certain natural passages are dilated beyond their ordinary dimensions, so that the humours which ought to have been contained in the vessels extravasate or run out.

DIÆRESIS, in grammar, the division of one syllable into two, which is usually noted by two points over a letter, as *aulâi* instead of *aule*, *dissolvienda* for *dissolvenda*.

DIÆTETÆ, in Grecian antiquity, a kind of judges, of which there were two sorts, the cleroti and diallacterii. The former were public arbitrators, chosen by lot to determine all causes exceeding ten drachms, within their own tribe, and from their sentence an appeal lay to the superior courts.

The diallacterii, on the contrary, were private arbitrators from whose sentence there lay no appeal, and accordingly they always took an oath to administer justice without partiality.

DIAGLYPHICE, the art of cutting or engraving figures on metals, such as seals, intaglias, matrices of letters, &c. or coins for medals. See *ENGRAVING*.

DIAGNOSIS, (from *διαγνωσκο, to discern or distinguish*;

Diacodium
||
Diagnosis

Diagnostic *gnōsis*; the diagnostics, or the signs of a disease. They are of two kinds, viz. the adjunct, and pathognomonic; the first are common to several diseases, and serve only to point out the difference between diseases of the same species; the latter are those which always attend the disease, and distinguish it from all others.

DIAGNOSTIC, in medicine, a term given to those signs which indicate the present state of a disease, its nature and cause.

DIAGONAL, in geometry, a right line drawn across a quadrilateral figure, from one angle to another, by some called the *diameter*, and by others the *diameter*, of the figure. See **GEOMETRY**.

DIAGORAS, surnamed the *atheist*, lived in the 91st Olympiad. He was not a native of Athens, but he philosophized there. He delighted in making verses, and had composed a poem which a certain poet stole from him. He sued the thief, who swore it was his own, and got glory by it. This tempted Diagoras to deny a Providence. The Athenians summoned him to give an account of his doctrine. He fled, and they set a price upon his head, promising a reward to any who should kill him; but he took shipping, and was cast away.

DIAGRAM, in geometry, a scheme for explaining and demonstrating the properties of any figure, whether triangle, square, circle, &c. *

DIAGRAM, among ancient musicians, the same with the scale of the moderns. See **SCALE**.

DIAHEXAPLA, or **DIAHEXAPTE**, among farriers, a compound medicine, so called from its containing six ingredients, viz. birthwort and gentian roots, juniper-berries, bay-berries, myrrh, and ivory shavings. It is commended for colds, consumptions, purfines, and many other disorders in horses.

DIAL, or **SUN-DIAL**, an instrument serving to measure time, by means of the shadow of the sun. The word is formed from the Latin *dies*, "day," because indicating the *hour of the day*.

The ancients also called it *scithericum*, from its doing it by the shadow.

Definitions. **DIAL** is more accurately defined, a plane, upon which lines are described in such a manner, that the shadow of a wire, or of the upper edge of another plane, erected perpendicularly on the former, may shew the true time of the day.

The edge of the plane by which the time of the day is found, is called the *stile of the dial*, which must be parallel to the earth's axis; and the line on which the said plane is erected, is called the *substile*.

The angle included between the substile and stile, is called the *elevation* or *height of the stile*.

Those dials whose planes are parallel to the plane of the horizon, are called *horizontal dials*; and those dials whose planes are perpendicular to the plane of the horizon, are called *vertical* or *erect dials*.

Those erect dials, whose planes directly front the north or south, are called *direct north* or *south dials*; and all other erect dials are called *decliners*, because their planes are turned away from the north or south.

Those dials whose planes are neither parallel nor perpendicular to the plane of the horizon, are called *inclining* or *reclining dials*, according as their planes

make acute or obtuse angles with the horizon; and if their planes are also turned aside from facing the fourth or north, they are called *declining-inclining* or *declining-reclining dials*.

The intersection of the plane of the dial, with that of the meridian, passing through the stile, is called the *meridian of the dial*, or the *hour-line of XII*.

Those meridians, whose planes pass through the stile, and make angles of 15, 30, 45, 60, 75, and 90 degrees with the meridian of the place (which marks the hour-line of XII.) are called *hour-circles*; and their intersections with the plane of the dial are called *hour-lines*.

In all declining dials, the substile makes an angle with the hour-line of XII; and this angle is called the *distance of the substile from the meridian*.

The declining plane's difference of longitude, is the angle formed at the intersection of the stile and plane of the dial, by two meridians; one of which passes thro' the hour-line of XII, and the other through the substile.

Thus much being premised concerning dials in general, we shall now proceed to explain the different methods of their construction.

If the whole earth *aPp*, were transparent, and hollow, like a sphere of glass, and had its equator divided into 24 equal parts by so many meridian *fig. 1.* The universal principle on which depends.

femicles, *a, b, c, d, e, f, g*, &c. one of which is the geographical meridian of any given place, as London (which is supposed to be at the point *a*); and if the hours of XII were marked at the equator, both upon that meridian and the opposite one, and all the rest of the hours in order on the rest of the meridians, those meridians would be the hour-circles of London: then, if the sphere had an opake axis, as *PEp*, terminating in the poles *P* and *p*, the shadow of the axis would fall upon every particular meridian and hour, when the sun came to the plane of the opposite meridian, and would consequently shew the time at London, and at all other places on the meridian of London.

If this sphere was cut through the middle by a solid plane *ABCD*, in the rational horizon of London, one half of the axis *EP* would be above the plane, and the other half below it; and if straight lines were drawn from the centre of the plane, to those points where its circumference is cut by the hour-circles of the sphere, those lines would be the hour-lines of a horizontal dial for London: for the shadow of the axis would fall upon each particular hour-line of the dial, when it fell upon the like hour-circle of the sphere.

If the plane which cuts the sphere be upright, as *Fig. 2.* *AFCG*, touching the given place (London) at *F*, and directly facing the meridian of London, it will then become the plane of an erect direct south-dial: and if right lines be drawn from its centre *E*, to those points of its circumference where the hour-circles of the sphere cut it, these will be the hour-lines of a vertical or direct south-dial for London, to which the hours are to be set as in the figure (contrary to those on a horizontal dial), and the lower half *Ep* of the axis will cast a shadow on the hour of the day in this dial, at the same time that it would fall upon the like hour-circle of the sphere, if the dial plane was not in the way.

If the plane (still facing the meridian) be made to incline, or recline, any given number of degrees, the

Dial.

Inclining,
reclining,
and declin-
ing, dials.

hour-circles of the sphere will fill cut the edge of the plane in those points to which the hour-lines must be drawn straight from the centre; and the axis of the sphere will cast a shadow on these lines at the respective hours. The like will still hold, if the plane be made to decline by any given number of degrees from the meridian toward the east or west: provided the declination be less than 90 degrees, or the reclination be less than the co-latitude of the place: and the axis of the sphere will be a gnomon, or stile, for the dial. But it cannot be a gnomon, when the declination is quite 90 degrees, nor when the reclination is equal to the co-latitude; because, in these two cases, the axis has no elevation above the plane of the dial.

And thus it appears, that the plane of every dial represents the plane of some great circle upon the earth; and the gnomon of the earth's axis, whether it be a small wire as in the above figures, or the edge of a thin plate, as in the common horizontal dials.

The whole earth, as to its bulk, is but a point, if compared to its distance from the sun: and therefore, if a small sphere of glass be placed upon any part of the earth's surface, so that its axis be parallel to the axis of the earth, and the sphere have such lines upon it, and such planes within it, as above described; it will shew the hours of the day as truly as if it were placed at the earth's centre, and the shell of the earth were as transparent as glass.

But because it is impossible to have a hollow sphere of glass perfectly true, blown round a solid plane; or if it was, we could not get at the plane within the glass to set it in any given position; we make use of a wire-sphere to explain the principles of dialing, by joining 24 semi-circles together at the poles, and putting a thin flat plate of brass within it.

Fig. 1. a.

Dialing by
the com-
mon ter-
restrial globe.

A common globe of 12 inches diameter, has generally 24 meridian femicircles drawn upon it. If such a globe be elevated to the latitude of any given place, and turned about until one of these meridians cut the horizon in the north point, where the hour of XII is supposed to be marked, the rest of the meridians will cut the horizon at the respective distances of all the other hours from XII. Then if these points of distance be marked on the horizon, and the globe be taken out of the horizon, and a flat board or plate be put into its place, even with the surface of the horizon; and if straight lines be drawn from the centre of the board, to those points of distance on the horizon which were cut by the 24 meridian femicircles; these lines will be the hour-lines of a horizontal dial for that latitude, the edge of whose gnomon must be in the very same situation that the axis of the globe was, before it was taken out of the horizon: that is, the gnomon must make an angle with the plain of the dial, equal to the latitude of the place for which the dial is made.

If the pole of the globe be elevated to the co-latitude of the given place, and any meridian be brought to the north point of the horizon, the rest of the meridians will cut the horizon in the respective distances of all the hours from XII, for a direct south dial, whose gnomon must be an angle with the plane of the dial, equal to the co-latitude of the place; and the hours must be set the contrary way on this dial to what they are on the horizontal.

But if your globe have more than 24 meridian femi-

circles upon it, you must take the following method for making *horizontal and south dials*.

Elevate the pole to the latitude of your place, and turn the globe until any particular meridian (suppose the first) comes to the north point of the horizon, and the opposite meridian will cut the horizon in the south. Then, set the hour-index to the uppermost XII on its circle; which done, turn the globe westward until 15 degrees of the equator pass under the brazen meridian, and then the hour-index will be at I (for the sun moves 15 degrees every hour), and the first meridian will cut the horizon in the number of degrees from the north point, that I is distant from XII. Turn on, until other 15 degrees of the equator pass under the brazen meridian, and the hour-index will then be at II, and the first meridian will cut the horizon in the number of degrees that II is distant from XII: and so, by making 15 degrees of the equator pass under the brazen meridian for every hour, the first meridian of the globe will cut the horizon in the distances of all the hours from XII to VI, which is just 90 degrees; and then you need go no farther, for the distances of XI, X, IX, VIII, VII, and VI, in the forenoon, are the same from XII, as the distances of I, II, III, IV, V, and VI, in the afternoon: and these hour-lines continued through the centre, will give the opposite hour lines on the other half of the dial.

Thus, to make a horizontal dial for the latitude of London, which is $51\frac{1}{2}$ degrees north, elevate the north pole of the globe $51\frac{1}{2}$ degrees above the north point of the horizon; and then turn the globe, until the first meridian (which is that of London on the English terrestrial globe) cuts the north point of the horizon, and set the hour-index to XII at noon.

Then turning the globe westward until the index points successively to I, II, III, IV, V, and VI, in the afternoon, or until 15, 30, 45, 60, 75, and 90 degrees of the equator pass under the brazen meridian, you will find that the first meridian of the globe cuts the horizon in the following numbers of degrees from the north towards the east, *viz.* $11\frac{1}{2}$, $24\frac{1}{2}$, $38\frac{1}{2}$, $53\frac{1}{2}$, $71\frac{1}{2}$, and 90; which are the respective distances of the above hours from XII upon the plane of the horizon.

To transfer these, and the rest of the hours, to a Plate horizontal plane, draw the parallel right lines *a c* and *d b*, upon that plane, as far from each other as is equal to the intended thickness of the gnomon or stile of the dial, and the space included between them will be the meridian or twelve o'clock line on the dial. Cross this meridian at right angles with the six o'clock line *g h*, and setting one foot of your compasses in the intersection *a*, as a centre, describe the quadrant *g e* with any convenient radius or opening of the compasses; then, setting one foot in the intersection *b*, as a centre, with the same radius describe the quadrant *f h*, and divide each quadrant into 90 equal parts or degrees, as in the figure.

Because the hour-lines are less distant from each other about noon, than in any other part of the dial, it is best to have the centres of these quadrants at a little distance from the centre of the dial-plane, on the side opposite to XII, in order to enlarge the hour-distances thereabouts, under the same angles on the plane. Thus, the centre of the plane is at *C*, but the centres of the quadrants are at *a* and *b*.

Dial.

To con-
struct a ho-
rizontal
dial.LXXXIX.
fig. 3.

Dial.	D I A	[244I]	D I A	Dial.
Plate LXXXIX.	<p>Lay a ruler over the point <i>b</i> (and keeping it there for the centre of all the afternoon hours in the quadrant <i>f b</i>) draw the hour-line of I through $11\frac{1}{2}$ degrees in the quadrant; the hour-line of II, through $24\frac{1}{2}$ degrees; of III, through $38\frac{1}{2}$ degrees; IIII, through $53\frac{1}{2}$; and V, through $71\frac{1}{2}$; and because the sun rises about four in the morning, on the longest days at London, continue the hour-lines of IV and V in the afternoon through the centre <i>b</i> to the opposite side of the dial.— This done, lay the ruler to the centre <i>a</i> of the quadrant <i>e g</i>; and through the like divisions or degrees of that quadrant, viz. $11\frac{1}{2}$, $24\frac{1}{2}$, $38\frac{1}{2}$, $53\frac{1}{2}$, and $71\frac{1}{2}$, draw the forenoon hour-lines of XI, X, IX, VIII, and VII; and because the sun sets not before eight in the evening on the longest days, continue the hour-lines of VII and VIII in the forenoon, through the centre <i>a</i>, to VII and VIII in the afternoon; and all the hour-lines will be finished on this dial; to which the hours may be set, as in the figure.</p> <p>Lastly, through $51\frac{1}{2}$ degrees of either quadrant, and from its centre, draw the right line <i>a g</i> for the hypotenuse or axis of the gnomon <i>a g i</i>; and from <i>g</i>, let fall the perpendicular <i>g i</i>, upon the meridian line <i>a i</i>, and there will be a triangle made, whose sides are <i>a g</i>, <i>g i</i>, and <i>i a</i>. If a plate similar to this triangle be made as thick as the distance between the lines <i>a c</i> and <i>b d</i>, and set upright between them, touching at <i>a</i> and <i>b</i>, its hypotenuse <i>a g</i> will be parallel to the axis of the world, when the dial is truly set; and will cast a shadow on the hour of the day.</p> <p>N.B. The trouble of dividing the two quadrants may be saved, if you have a scale with a line of chords upon it, such as that on the top of Plate XC.: for if you extend the compasses from 0 to 60 degrees of the line of chords, and with that extent, as a radius, describe the two quadrants upon their respective centres, the above distances may be taken with the compasses upon the line, and set off upon the quadrants.</p> <p>To make an erect direct south dial. Elevate the pole to the co-latitude of your place, and proceed in all respects as above taught for the horizontal dial, from VI in the morning to VI in the afternoon; only the hours must be reversed, as in the figure; and the hypotenuse <i>a g</i> of the gnomon <i>a g f</i>, must make an angle with the dial-plane equal to the co-latitude of the place. As the sun can shine no longer on this dial than from six in the morning until six in the evening, there is no occasion for having any more than 12 hours upon it.</p> <p>To make an erect dial, declining from the south towards the east or west. Elevate the pole to the latitude of your place, and screw the quadrant of altitude to the zenith. Then, if your dial declines towards the east, (which we shall suppose it to do at present), count in the horizon the degrees of declination, from the east point towards the north, and bring the lower end of the quadrant to that degree of declination at which the reckoning ends. This done, bring any particular meridian of your globe (as suppose the first meridian) directly under the graduated edge of the upper part of the brazen meridian, and set the hour to XII at noon. Then, keeping the quadrant of altitude at the degree of declination in the horizon, turn the globe eastward on its axis, and observe the degrees cut by the first meridian in the quadrant of altitude (counted from the zenith) as the hour-index comes to XI, X, IX, &c. in the forenoon, or as 15, 30, 45, &c. degrees of the equator pass under the brazen meridian at these hours respectively; and the degrees then cut in the quadrant by the first meridian, are the respective distances of the forenoon hours from XII on the plane of the dial.— Then, for the afternoon hours, turn the quadrant of altitude round the zenith until it comes to the degree in the horizon opposite to that where it was placed before; namely, as far from the west point of the horizon towards the south, as it was set at first from the east point towards the north; and turn the globe westward on its axis, until the first meridian comes to the brazen meridian again, and the hour-index to XII: then, continue to turn the globe westward, and as the index points to the afternoon hours I, II, III, &c. or as 15, 30, 45, &c. degrees of the equator pass under the brazen meridian, the first meridian will cut the quadrant of altitude in the respective number of degrees from the zenith that each of these hours is from XII on the dial.— And note, that when the first meridian goes off the quadrant at the horizon in the forenoon, the hour-index shews the time when the sun will come upon this dial; and when it goes off the quadrant in the afternoon, the index will point to the time when the sun goes off the dial.</p> <p>Having thus found all the hour-distances from XII, lay them down upon your dial-plane, either by dividing a semicircle into two quadrants of 90 degrees each (beginning at the hour-line of XII), or by the line of chords, as above directed.</p> <p>In all declining dials, the line on which the stile or gnomon stands (commonly called the <i>subfile-line</i>) makes an angle with the twelve o'clock line, and falls among the forenoon hour-lines, if the dial declines towards the east; and among the afternoon hour-lines, when the dial declines towards the west; that is, to the left hand from the twelve o'clock line in the former case, and to the right hand from it in the latter.</p> <p>To find the distance of the subfile from the twelve o'clock line; if your dial declines from the south toward the east, count the degrees of that declination in the horizon from the east point toward the north; and bring the lower end of the quadrant of altitude to that degree of declination where the reckoning ends: then, turn the globe until the first meridian cuts the horizon in the like number of degrees, counted from the south point toward the east; and the quadrant and first meridian will then cross one another at right angles; and the number of degrees of the quadrant, which are intercepted between the first meridian and the zenith, is equal to the distance of the subfile line from the twelve o'clock line; and the number of degrees of the first meridian, which are intercepted between the quadrant and the north pole, is equal to the elevation of the stile above the plane of the dial.</p> <p>If the dial declines westward from the south, count that declination from the east point of the horizon towards the south, and bring the quadrant of altitude to the degree in the horizon at which the reckoning ends; both for finding the forenoon hours, and distance of the subfile from the meridian: and for the afternoon hours, bring the quadrant to the opposite degree in the horizon, namely, as far from the west towards the north, and then proceed in all respects as above.</p>			Plate LXXXIX.

Plate LXXXIX.				

Thus,

Dial.
Plate
LXXXIX.

Thus, we have finished our declining dial; and in fo doing, we made four dials, *viz.*

1. A north dial, declining eastward by the same number of degrees. 2. A north dial, declining the same number west. 3. A fourth dial, declining east. And, 4. A fourth dial declining west. Only, placing the proper number of hours, and the stile or gnomon respectively, upon each plane. For (as above-mentioned) in the fourth-west plane, the sub-tilar line falls among the afternoon hours; and in the fourth-east, of the same declination, among the forenoon hours, at equal distances from XII. And so all the morning hours on the west decliner will be like the afternoon hours on the east decliner: the fourth-east decliner will produce the north-west decliner; and the fourth-west decliner, the north-east decliner, by only extending the hour-lines, stile and sub-tile, quite through the centre: the axis of the stile (or edge that casts the shadow on the hour of the day) being in all dials whatever parallel to the axis of the world, and consequently pointing towards the north pole of the heaven in north latitudes, and toward the south pole in south latitudes.

An easy
method
for con-
structing of
dials.

But because every one who would like to make a dial, may perhaps not be provided with a globe to assist him, and may probably not understand the method of doing it by logarithmic calculation; we shall shew how to perform it by the plain dialing lines, or scale of latitudes and hours; such as those on the top of Plate XC. and which may be had on scales commonly sold by the mathematical instrument makers.

This is the easiest of all mechanical methods, and by much the best, when the lines are truly divided: and not only the half hours and quarters may be laid down by all of them, but every fifth minute by most, and every single minute by those where the line of hours is a foot in length.

Fig 5.

Having drawn your double meridian line *a b, c d*, on the plane intended for a horizontal dial, and crossed it at right angles by the fix o'clock line *f e* (as in fig. 3.) take the latitude of your place with the compasses, in the scale of latitudes, and set that extent from *c* to *e*, and from *a* to *f*, on the fix o'clock line: then, taking the whole six hours between the points of the compasses in the scale of hours, with that extent set one foot in the point *e*, and let the other foot fall where it will upon the meridian line *c d*, as at *d*. Do the same from *f* to *b*, and draw the right lines *e d* and *f b*, each of which will be equal in length to the whole scale of hours. This done, setting one foot of the compasses in the beginning of the scale at XII, and extending the other to each hour on the scale, lay off these extents from *d* to *e* for the afternoon hours, and from *b* to *f* for those of the forenoon: this will divide the lines *d e* and *b f* in the same manner as the hour-scale is divided at 1, 2, 3, 4, and 6; on which the quarters may also be laid down, if required. Then, laying a ruler on the point *e*, draw the first five hours in the afternoon, from that point, through the dots at the numeral figures 1, 2, 3, 4, 5, on the line *d e*; and continue the lines of IIII and V through the centre *c* to the other side of the dial, for the like hours of the morning: which done, lay the ruler on the point *a*, and draw the last five hours in the forenoon through the dots 5, 4, 3, 2, 1, on the line *f b*; continuing the hour-lines of VII and VIII through the centre *a* to the o-

ther side of the dial, for the like hours of the evening; and set the hours to their respective lines, as in the figure. Lastly, make the gnomon the same way as taught above for the horizontal dial, and the whole will be finished.

To make an erect fourth-dial, take the co-latitude of your place from the scale of latitudes, and then proceed in all respects for the hour-lines, as in the horizontal dial; only reverting the hours, as in fig. 4. and making the angle of the stile's height equal to the co-latitude.

But, lest the young dialist should have neither globe nor wooden scale, we shall now shew him how he may make a dial without any of these helps. Only, if he has not a line of chords, he must divide a quadrant into 90 equal parts or degrees for taking the proper angle of the stile's elevation; which is easily done.

With any opening of the compasses, as *Z L*, describe the two semicircles *L F k* and *L Q k*, upon the centres *Z* and *L*, where the fix o'clock line crosses the double meridian line, and divide each semicircle into 12 equal parts, beginning at *L*, (though, strictly speaking, only the quadrants from *L* to the fix o'clock line need be divided;) then connect the divisions which are equidistant from *L*, by the parallel lines *K M, I N, H O, G P*, and *F Q*. Draw *V Z* for the hypothenuse of the stile, making the angle *V Z E* equal to the latitude of your place; and continue the line *V Z* to *R*. Draw the line *R r* parallel to the fix o'clock line, and set off the distance *a K* from *Z* to *T*, the distance *b I* from *Z* to *X*, *c H* from *Z* to *W*, *d G* from *Z* to *T*, and *e F* from *Z* to *S*. Then draw the lines *S r, T t, W w, X x*, and *Y y*, each parallel to *R r*. Set off the distance *y T* from *a* to 11, and from *f* to 1; the distance *x X* from *b* to 10, and from *g* to 2; *w W* from *c* to 9, and from *h* to 3; *t T* from *d* to 8, and from *i* to 4; *s S* from *e* to 7, and from *n* to 5. Then laying a ruler to the centre *Z*, draw the forenoon hour-lines through the points 11, 10, 9, 8, 7; and laying it to the centre *z*, draw the afternoon lines through the points 1, 2, 3, 4, 5; continuing the forenoon lines of VII and VIII through the centre *Z*, to the opposite side of the dial, for the like afternoon hours; and the afternoon lines IIII and V through the centre *z*, to the opposite side, for the like morning hours. Set the hours to these lines as in the figure, and then erect the stile or gnomon, and the horizontal dial will be finished.

Horizontal
dial.

To construct a fourth dial, draw the line *V Z*, making an angle with the meridian *Z L* equal to the co-latitude of your place; and proceed in all respects as in the above horizontal dial for the same latitude, reverting the hours as in fig. 4. and making the elevation of the gnomon equal to the co-latitude.

Perhaps it may not be unacceptable to explain the method of constructing the dialing lines, and some others; which is as follows.

With any opening of the compasses, as *E A*, according to the intended length of the scale, describe the circle *A D C B*, and cross it at right angles by the diameters *C E A* and *D E B*. Divide the quadrant *A B* first into 9 equal parts, and then each part into 10; so shall the quadrant be divided into 90 equal parts or degrees. Draw the right line *A F B* for the chord of this quadrant; and setting one foot of the compasses in the point *A*, extend the other to the several divisions of the quadrant, and transfer these

Dial.
Plate XC.

these divisions to the line AFB by the arcs 10, 10, 20, 20, &c. and this will be a line of chords, divided into 90 unequal parts; which, if transferred from the line back again to the quadrant, will divide it equally. It is plain by the figure, that the distance from A to 60 in the line of chords, is just equal to AB , the radius of the circle from which that line is made; for if the arc 60, 60 be continued, of which A is the centre, it goes exactly through the centre E of the arc AB .

And therefore, in laying down any number of degrees on a circle, by the line of chords, you must first open the compasses so, as to take in just 60 degrees upon that line, as from A to 60: and then, with that extent, as a radius, describe a circle, which will be exactly of the same size with that from which the line was divided: which done, let one foot of the compasses in the beginning of the chord line, as at A , and extend the other to the number of degrees you want upon the line; which extent, applied to the circle, will include the like number of degrees upon it.

Divide the quadrant CD into 90 equal parts, and from each point of division draw right lines, as $i, k, l, \&c.$ to the line CE ; all perpendicular to that line, and parallel to DE , which will divide EC into a line of lines; and although these are seldom put among the dialing lines on a scale, yet they assist in drawing the line of latitudes. For if a ruler be laid upon the point D , and over each division in the line of lines, it will divide the quadrant CB into 90 unequal parts, as $Ba, Bb, \&c.$ shewn by the right lines $10a, 20b, 30c, \&c.$ drawn along the edge of the ruler. If the right line BC be drawn, subtending this quadrant, and the nearest distances $Ba, Bb, Bc, \&c.$ be taken in the compasses from B , and set upon this line in the same manner as directed for the line of chords, it will make a line of latitudes BG , equal in length to the line of chords AB , and of an equal number of divisions, but very unequal as to their lengths.

Draw the right line DGA , subtending the quadrant DA ; and parallel to it, draw the right line rs , touching the quadrant DA at the numeral figure 3. Divide this quadrant into six equal parts, as 1, 2, 3, &c. and through these points of division draw right lines from the centre E to the line rs , which will divide it at the points where the six hours are to be placed, as in the figure. If every sixth part of the quadrant be subdivided into four equal parts, right lines drawn from the centre through these points of division, and continued to the line rs , will divide each hour upon it into quarters.

In Fig. 2. we have the representation of a portable dial, which may be easily drawn on a card, and carried in a pocket-book. The lines ad, ab , and bc of the gnomon, must be cut quite through the card; and as the ab of the gnomon is raised occasionally above the plane of the dial, it turns upon the uncut line cd as on a hinge. The dotted line AB must be slit quite through the card, and the thread C must be put through the slit, and have a knot tied behind, to keep it from being easily drawn out. On the other end of this thread is a small plummet D , and on the middle of it a small bead for shewing the hour of the day.

To rectify this dial, set the thread in the slit right against the day of the month, and stretch the thread from the day of the month over the angular point where

the curve-lines meet at XII; then shift the bead to that point on the thread, and the dial will be rectified.

To find the hour of the day, raise the gnomon (no matter how much or how little) and hold the edge of the dial next the gnomon towards the sun, so as the uppermost edge of the shadow of the gnomon may just cover the *shadow-line*; and the bead then playing freely on the face of the dial, by the weight of the plummet, will shew the time of the day among the hour-lines, as it is forenoon or afternoon.

To find the time of sun-rising and setting, move the thread among the hour-lines, until it either covers some one of them, or lies parallel betwixt any two; and then it will cut the time of sun-rising among the forenoon hours, and of sun-setting among the afternoon hours, for that day of the year to which the thread is set in the scale of months.

To find the sun's declination, stretch the thread from the day of the month over the angular point at XII, and it will cut the sun's declination, as it is north or south, for that day, in the proper scale.

To find on what days the sun enters the signs: when the bead, as above rectified, moves along any of the curve-lines which have the signs of the zodiac marked upon them, the sun enters those signs on the days pointed out by the thread in the scale of months.

The construction of this dial is very easy, especially if the reader compares it all along with fig. 3. as he reads the following explanation of that figure.

Draw the occult line AB parallel to the top of Fig. 3. the card, and cross it at right angles with the fix o'clock line ECD ; then upon C , as a centre, with the radius CA , describe the semicircle AEL , and divide it into 12 equal parts (beginning at A), as $Ar, As, \&c.$ and from these points of division draw the hour-lines r, s, t, u, v, E, w , and x , all parallel to the fix o'clock line EC . If each part of the semicircle be subdivided into four equal parts, they will give the half-hour lines and quarters, as in fig. 2. Draw the right-line ASD , making the angle SAB equal to the latitude of your place. Upon the centre A describe the arch RST , and set off upon it the arcs SR and ST , each equal to $23\frac{1}{2}$ degrees, for the sun's greatest declination; and divide them into $23\frac{1}{2}$ equal parts, as in fig. 2. Through the intersection D of the lines ECD and ASD , draw the right line FDG at right angles to AD . Lay a ruler to the points A and R , and draw the line ARF through $23\frac{1}{2}$ degrees of south declination in the arc SR ; and then laying the ruler to the points A and T , draw the line ATG through $23\frac{1}{2}$ degrees of north declination in the arc ST : so shall the lines ARF and ATG cut the line FDG in the proper length for the scale of months. Upon the centre D , with the radius DF , describe the semicircle FpG ; which divide into six equal parts, $Fm, mn, no, \&c.$ and from these points of division draw the right lines mb, nt, pk , and ql , each parallel to oD . Then setting one foot of the compasses in the point F , extend the other to A , and describe the arc AZH for the tropic of φ : with the same extent, setting one foot in G , describe the arc AEO for the tropic of \varnothing . Next setting one foot in the point h , and extending the other to A , describe the arc ACI for the beginnings of the signs ♈ and ♊ ; and with the same extent, setting one foot in the point

Dial.
Plate XC.

Dial. *l*, describe the arc *AN* for the beginnings of the signs **II** and **Q**. Set one foot in the point *i*, and having extended the other to *A*, describe the arc *AK* for the beginnings of the signs **X** and **M**; and with the same extent, set one foot in *k*, and describe the arc *AM* for the beginnings of the signs **Y** and **W**. Then setting one foot in the point *D*, and extending the other to *A*, describe the curve *AL* for the beginnings of φ and \ominus ; and the signs will be finished. This done, lay a ruler from the point *A* over the sun's declination in the arch *RST*; and where the ruler cuts the line *PDG*, make marks; and place the days of the months right against these marks, in the manner shewn by fig. 2. Lastly, draw the shadow-line *PQ* parallel to the occult line *AB*; make the gnomon, and set the hours to their respective lines, as in fig. 2. and the dial will be finished.

An universal dial. There are several kinds of dials, which are called *universal*, because they serve for all latitudes. Of these, the best is Mr Pardie's, which consists of three principal parts; the first whereof is called the horizontal plane (*A*), because in practice it must be parallel to the horizon. In this plane is fixed an upright pin, which enters into the edge of the second part *BD*, called the meridional plane; which is made of two pieces, the lowest whereof (*B*) is called the *quadrant*, because it contains a quarter of a circle, divided into 90 degrees; and it is only into this part, near *B*, that the pin enters. The other piece is a semicircle (*D*) adjusted to the quadrant, and turning in it by a groove, for raising or depressing the diameter (*EF*) of the semicircle, which diameter is called the *axis of the instrument*. The third piece is a circle (*G*), divided on both sides into 24 equal parts, which are the hours. This circle is put upon the meridional plane so, that the axis (*EF*) may be perpendicular to the circle, and the point *C* be the common centre of the circle, semicircle, and quadrant. The straight edge of the semicircle is chamfered on both sides to a sharp edge, which passes through the centre of the circle. On one side of the chamfered part, the first six months of the year are laid down, according to the sun's declination for their respective days, and on the other side the last six months. And against the days on which the sun enters the signs, there are straight lines drawn upon the semicircle, with the characters of the signs marked upon them. There is a black line drawn along the middle of the upright edge of the quadrant, over which hangs a thread (*H*), with its plummet (*I*), for levelling the instrument. *N. B.* From the twenty-third of September to the twentieth of March, the upper surface of the circle must touch both the centre *C* of the semicircle, and the line of φ and \ominus ; and from the twentieth of March to the twenty-third of September, the lower surface of the circle must touch that centre and line.

To find the time of the day by this dial. Having set it on a level place in sun-shine, and adjusted it by the levelling screws *k* and *l*, until the plumb-line hangs over the black line upon the edge of the quadrant, and parallel to the said edge; move the semicircle in the quadrant, until the line of φ and \ominus (where the circle touches) comes to the latitude of your place in the quadrant: then turn the whole meridional plane *BD*, with its circle *G*, upon the horizontal plane *A*, until

the edge of the shadow of the circle falls precisely on the day of the month in the semicircle; and then the meridional plane will be due north and south, the axis *EF* will be parallel to the axis of the world, and will cast a shadow upon the true time of the day, among the hours on the circle.

N. B. As, when the instrument is thus rectified, the quadrant and semicircle are in the plane of the meridian, so the circle is then in the plane of the equinoctial. Therefore, as the sun is above the equinoctial in summer (in northern latitudes), and below it in winter; the axis of the semicircle will cast a shadow on the hour of the day, on the upper surface of the circle, from the 20th of March to the 23d of September: and from the 23d of September to the 20th of March the hour of the day will be determined by the shadow of the semicircle, upon the lower surface of the circle. In the former case, the shadow of the circle falls upon the day of the month, on the lower part of the diameter of the semicircle; and in the latter case, on the upper part.

The method of laying down the months and signs Fig. 5. upon the semicircle is as follows. Draw the right-line *ACB*, equal to the diameter of the semicircle *ADB*, and cross it in the middle at right angles with the line *ECD*, equal in length to *ADB*; then *EC* will be the radius of the circle *FCG*, which is the same as that of the semicircle. Upon *E*, as a centre, describe the circle *FCG*, on which set off the arcs *Ch* and *Gi*, each equal to 23½ degrees, and divide them accordingly into that number, for the sun's declination. Then laying the edge of a ruler over the centre *E*, and also over the sun's declination for every fifth day of each month (as in the card-dial) mark the points on the diameter *AB* of the semicircle from *a* to *g*, which are cut by the ruler; and there place the days of the months accordingly, answering to the sun's declination. This done, setting one foot of the compasses in *C*, and extending the other to *a* or *g*, describe the semicircle *abcdegf*; which divide into six equal parts, and through the points of division draw right lines, parallel to *CD*, for the beginning of the lines (of which one half are on one side of the semicircle, and the other half on the other), and set the characters of the signs to their proper lines, as in the figure.

Having shewn how to make sun dials by the assistance of a good globe, or of a dialing scale, we shall now proceed to the method of constructing dials arithmetically; which will be more agreeable to those who have learned the elements of trigonometry, because globes and scales can never be so accurate as the logarithms in finding the angular distances of the hours. Yet, as a globe may be found exact enough for some other requisites in dialing, we shall take it in occasionally.

The construction of sun-dials on all planes whatever, may be included in one general rule: intelligible, if that of a horizontal dial for any given latitude be well understood. For there is no plane, however obliquely situated with respect to any given place, but what is parallel to the horizon of some other place; and therefore, if we can find that other place by a problem on the terrestrial globe, or by a trigonometrical calculation, and construct a horizontal dial for it; that dial applied to the plane where it is to serve, will be a true dial for that place.—Thus, an erect direct south dial in

$51\frac{1}{2}$ degrees north-latitude, would be a horizontal dial on the same meridian, 90 degrees fouthward of $51\frac{1}{2}$ degrees north-latitude : which falls in with $38\frac{1}{2}$ degrees of south latitude. But if the upright plane declines from facing the south at the given place, it would still be a horizontal plane 90 degrees from that place, but for a different longitude, which would alter the reckoning of the hours accordingly.

C A S E I.

1. Let us suppose, that an upright plane at London declines 36 degrees westward from facing the south; and that it is required to find a place on the globe, to whose horizon the said plane is parallel; and also the difference of longitude between London and that place.

Rectify the globe to the latitude of London, and bring London to the zenith under the brafs meridian; then that point of the globe which lies in the horizon at the given degree of declination (counted westward from the fourth point of the horizon) is the place at which the abovementioned plane would be horizontal.

—Now, to find the latitude and longitude of that place, keep your eye upon the place, and turn the globe eastward, until it comes under the graduated edge of the brafs meridian : then, the degree of the brafs meridian that stands directly over the place, is its latitude; and the number of degrees in the equator, which are intercepted between the meridian of London and the brafs meridian, is the place's difference of longitude.

Thus, as the latitude of London is $51\frac{1}{2}$ degrees north, and the declination of the place is 36 degrees west; elevate the north pole $51\frac{1}{2}$ degrees above the horizon, and turn the globe until London comes to the zenith, or under the graduated edge of the meridian; then count 36 degrees on the horizon westward from the fourth point, and make a mark on that place of the globe over which the reckoning ends, and bringing the mark under the graduated edge of the brafs meridian, it will be found to be under $30\frac{1}{2}$ degrees in south latitude : keeping it there, count in the equator the number of degrees between the meridian of London and the brafs meridian (which now becomes the meridian of the required place) and you will find it to be $42\frac{1}{2}$. Therefore an upright plane at London, declining 36 degrees westward from the south, would be a horizontal plane at that place, whose latitude is $30\frac{1}{2}$ degrees south of the equator, and longitude $42\frac{1}{2}$ degrees west of the meridian of London.

Which difference of longitude being converted into time, is 2 hours 51 minutes.

The vertical dial declining westward 36 degrees at London, is therefore to be drawn in all respects as a horizontal dial for south latitude $30\frac{1}{2}$ degrees; save only, that the reckoning of the hours is to anticipate the reckoning on the horizontal dial, by 2 hours 51 minutes : for so much sooner will the sun come to the meridian of London, than to the meridian of any place whose longitude is $42\frac{1}{2}$ degrees west from London.

2. But to be more exact than the globe will shew us, we shall use a little trigonometry.

Let $NESW$ be the horizon of London, whose zenith is Z , and P the north pole of the sphere; and let Zh be the position of a vertical plane at

Z , declining westward from S (the south) by an angle of 36 degrees; on which plane an erect dial for London at Z is to be described. Make the semi-diameter ZD perpendicular to Zh ; and it will cut the horizon in D , 36 degrees west of the south S . Then a plane, in the tangent HD , touching the sphere in D , will be parallel to the plane Zh ; and the axis of the sphere will be equally inclined to both these planes.

Let WQE be the equinoctial, whose elevation above the horizon of Z (London) is $38\frac{1}{2}$ degrees; and PRD be the meridian of the place D , cutting the equinoctial in R . Then it is evident, that the arc RD is the latitude of the place D (where the plane Zh would be horizontal) and the arc RQ is the difference of longitude of the planes Zh and HD .

In the spherical triangle WDR , the arc WD is given, for it is the complement of the plane's declination from S to south; which complement is 54° (viz. $90^\circ - 36^\circ$) : the angle at R , in which the meridian of the place D cuts the equator, is a right angle; and the angle RWD measures the elevation of the equinoctial above the horizon of Z , namely, $38\frac{1}{2}$ degrees. Say therefore, As radius is to the co-sine of the plane's declination from the south, so is the co-sine of the latitude of Z to the sine of RD the latitude of D : which is of a different denomination from the latitude of Z , because Z and D are on different sides of the equator.

As radius - - - - - 10.00000

To co-sine 36° $0'$ = RQ 9.90796

So co-sine $51^\circ 30'$ = QZ 9.79415

To sine $30^\circ 14' = DR$ (9.70211) = the lat. of D , whose horizon is parallel to the vertical plane Zh at Z .

$N. B.$ When radius is made the first term, it may be omitted; and then by subtracting it mentally from the sum of the other two, the operation will be shortened. Thus, in the present case,

To the logarithmic sine of $WDR = 54^\circ 0'$ 9.90796.

Add the logarithmic sine of $RD = 38^\circ 30'$ 9.79415.

Their sum—radius - - - - - 9.70211 gives the same solution as above. And we shall keep to this method in the following part of this article.

To find the difference of longitude of the places D and Z , say, As radius is to the co-sine of $38\frac{1}{2}$ degrees, the height of the equinoctial at Z , so is the co-tangent of 36 degrees, the plane's declination, to the co-tangent of the difference of longitudes. Thus,

To the logarithmic sine of $51^\circ 30'$ 9.89354

Add the logarithmic tang. of $\dagger 54^\circ 0'$ 10.13874

Their sum—radius - - - - - 10.03228 is the nearest tangent of $47^\circ 8' = WR$; which is the co-tangent of $42^\circ 52' = RQ$, the difference of longitude sought. Which difference, being reduced to time, is two hours 51 minutes.

3. And thus having found the exact latitude and longitude of the place D , to whose horizon the vertical plane at Z is parallel, we shall proceed to the construction of a horizontal dial for the place D , whose latitude is $30^\circ 14'$ south; but anticipating the time at D by two hours 51 minutes (neglecting the $\frac{1}{2}$ min. in practice because

14 G

because

* The co-sine of 36.0 . or of RQ . \dagger The co-sine of 51.30 . or of QZ . * The co-sine of 38.30 . or of WDR .

\dagger The co-tangent of 36.0 . or of DR .

Fig. 7. Assume any right line CSL , for the subfile of the dial, and make the angle KCP equal to the latitude of the place (viz. $30^\circ 14'$.) to whose horizon the plane of the dial is parallel; then CRP will be the axis of the stile, or edge that casts the shadow on the hours of the day, in the dial. This done, draw the contingent line EQ , cutting the subfilar line at right angles in K ; and from K make KR perpendicular to the axis CRP . Then $KG (=KR)$ being made radius, that is, equal to the chord of 60° or tangent of 45° on a good sector, take $42^\circ 52'$ (the difference of longitude of the places Z and D) from the tangents, and having set it from K to M , draw CM for the hour-line of XII. Take KN , equal to the tangent of an angle less by 15 degrees than KM ; that is, the tangent of $27^\circ 52'$; and through the point N draw CN for the hour-line of I. The tangent of $12^\circ 52'$ (which is 15° less than $27^\circ 52'$), set off the same way, will give a point between K and N , through which the hour-line of II is to be drawn. The tangent of $2^\circ 8'$ (the difference between 45° and $42^\circ 52'$) placed on the other side of CL , will determine the point through which the hour-line of III is to be drawn: to which $2^\circ 8'$, if the tangent of 15° be added, it will make $17^\circ 8'$; and this set off from K towards Q on the line EQ , will give the point for the hour-line of IV: and so of the rest.—The forenoon hour-lines are drawn the same way, by the continual addition of the tangents 15° , 30° , 45° , &c. to $42^\circ 52'$ (=the tangent of KM) for the hours of XI, X, IX, &c. as far as necessary; that is, until there be five hours on each side of the subfile. The sixth hour, accounted from that hour or part of the hour on which the subfile falls, will be always in a line perpendicular to the subfile, and drawn through the centre C .

4. In all erect dials, CM , the hour-line of XII, is perpendicular to the horizon of the place for which the dial is to serve; for that line is the intersection of a vertical plane with the plane of the meridian of the place, both which are perpendicular to the plane of the horizon: and any line HO , or h_o , perpendicular to CM , will be a horizontal line on the plane of the dial, along which line the hours may be numbered; and CM being set perpendicular to the horizon, the dial will have its true position.

5. If the plane of the dial had declined by an equal angle toward the east, its description would have differed only in this, that the hour-line of XII would have fallen on the other side of the subfile CL , and the line HO would have a subcontrary position to what it has in this figure.

6. And these two dials, with the upper points of their files turned toward the north pole, will serve for other two planes parallel to them; the one declining from the north toward the east, and the other from the north toward the west, by the same quantity of angle. The like holds true of all dials in general, whatever be

their declination and obliquity of their planes to the horizon.

CASE II.

7. If the plane of the dial not only declines, but also reclines, or inclines. Suppose its declination from fronting the south S be equal to the arc SD on the horizon; Fig. 1. and its reclination be equal to the arc Dd of the vertical circle DZ : then it is plain, that if the quadrant of altitude ZdD on the globe cuts the point D in the horizon, and the reclination is counted upon the quadrant from D to d ; the intersection of the hour circle PRd , with the equinoctial WQE , will determine Rd , the latitude of the place d , whose horizon is parallel to the given plane Zh at Z ; and RQ will be the difference in longitude of the places at Z and Z .

Trigonometrically thus: let a great circle pass thro' the three points W, d, E ; and in the triangle WdD , right-angled at D , the sides WD and Dd are given; and thence the angle DWD is found, and so is the hypothenuse Wd . Again, the difference, or the sum, of DWD and DWR , the elevation of the equinoctial above the horizon of Z , gives the angle dWR ; and the hypothenuse of the triangle WRd was just now found; whence the sides Rd and WR are found, the former being the latitude of the place d , and the latter the complement of RQ , the difference of longitude sought.

Thus, if the latitude of the place Z be $52^\circ 10'$ north; the declination SD of the plane Zh (which would be horizontal at d) be 36° ; and the reclination be 15° , or equal to the arc Dd ; the south latitude of the place d , that is, the arc Rd , will be $15^\circ 9'$; and RQ , the difference of the longitude, $36^\circ 2'$. From these data, therefore, let the dial (fig. 2.) be described, as in the former example.

8. There are several other things requisite in the practice of dialing; the chief of which shall be given in the form of arithmetical rules, simple and easy to those who have learned the elements of trigonometry. For in practical arts of this kind, arithmetic should be used as far as it can go; and scales never trilled to, except in the final construction, where they are absolutely necessary in laying down the calculated hour-distances on the plane of the dial.

RULE I. To find the angles which the hour-lines on any dial make with the subfile.

To the logarithmic sine of the given latitude, or of the file's elevation above the plane of the dial, add the logarithmic tangent of the hour * distance from the meridian, or from the † subfile; and the sum minus radius will be the logarithmic tangent of the angle sought.

For KC is to KM in the ratio compounded of the ratio of KC to $KG (=KR)$ and of KG to KM ; which making CK the radius 10,000,000, or 10,000,000, or 10, or 1, are the ratio of 10,000,000, or of 10,000,000, or of 10, or of 1, to $KG \times KM$.

Thus, in a horizontal dial, for latitude $51^\circ 30'$, to find the angular distance of XI in the forenoon, or I the afternoon, from XII:

To

* That is, of 15, 30, 45, 60, 75°, for the hours of I, II, III, IIII, V, in the afternoon; and XI, X, IX, VIII, VII, in the forenoon.

† In all horizontal dials, and erect north or south dials, the subfile and meridian are the same: but in all declining dials, the subfile line makes an angle with the meridian.

Dial.

To the logarithmic fine of $51^{\circ} 30'$ 9.89354 $\frac{1}{2}$
 Add the logarithmic tang. of $15^{\circ} 0'$ 9.42805

Plate XC.
fig. 7.

The sum—radius is - - - 9.32159—the logarithmic tangent of $11^{\circ} 50'$, or of the angle which the hour-line of XI or I makes with the hour of XII.

And by computing in this manner, with the fine of the latitude, and the tangents of $30, 45, 60$, and 75° , for the hours of II, III, IIII, and V in the afternoon; or of X, IX, VIII, and VII in the forenoon; you will find their angular distances from XII to be $24^{\circ} 18', 38^{\circ} 4', 53^{\circ} 35'$, and $71^{\circ} 6'$; which are all that there is occasion to compute for.—And these distances may be set off from XII by a line of chords; or rather, by taking 1000 from a scale of equal parts, and setting that extent as a radius from C to XII; and then, taking 209 of the same parts (which, are the natural tangent of $11^{\circ} 50'$), and setting them from XII to XI and to I, on the line *h₀*, which is perpendicular to CXII: and so for the rest of the hour-lines, which, in the table of natural tangents, against the above distances, are 451, 782, 1355, and 2020, of such equal parts from XII, as the radius CXII contains 1000. And, lastly, set off 1257 (the natural tangent of $51^{\circ} 30'$) for the angle of the stile's height, which is equal to the latitude of the place.

RULE II. *The latitude of the place, the sun's declination, and his hour-distance from the meridian, being given, to find (1.) his altitude; (2.) his azimuth.*

Plate XCI.
fig. 1.

1. Let *d* be the sun's place, *R* his declination; and, in the triangle *PZd*, *Pd* the sum, or the difference, of *dR*, and the quadrant *PR*, being given by the supposition, as also the complement of the latitude *PZ*, and the angle *dPZ*, which measures the horary distance of *d* from the meridian; we shall (by Case 4. of Keill's oblique spheric Trigonometry) find the base *Zd*, which is the sun's distance from the zenith, or the complement of his altitude.

And (2.) As fine *Zd*: fine *Pd*: : fine *dPZ*: *dZP*, or of its supplement *DZS*, the azimuthal distance from the south.

Or the practical rule may be as follows.

Write *A* for the sign of the sun's altitude, *L* and *l* for the sine and co-sine of the latitude, *D* and *d* for the sine and co-sine of the sun's declination, and *H* for the sine of the horary distance from VI.

Then the relation of *H* to *A* will have three varieties.

1. When the declination is toward the elevated pole, and the hour of the day is between XII and VI; it is $A=LD+Hld$, and $H=\frac{A-LD}{ld}$.

2. When the hour is after VI, it is $A=LD-Hld$, and $H=\frac{LD-A}{ld}$.

3. When the declination is toward the depressed pole, we have $A=Hld-LD$, and $H=\frac{A+LD}{ld}$.

Which theorems will be found useful, and expedient.

tious enough for solving those problems in geography and dialing, which depend on the relation of the sun's altitude to the hour of the day.

Dial.

Plate XCI.
fig. 1.

EXAMPLE I.

Suppose the latitude of the place to be $51\frac{1}{2}$ degrees north: the time five hours distant from XII, that is, an hour after VI in the morning, or before VI in the evening; and the sun's declination 20° north. *Required the sun's altitude?*

Then to log. *L* = log. fin. $51^{\circ} 30'$ 1.89354*
 add log. *D* = log. fin. $20^{\circ} 0'$ 1.53405

Their sum 1.42759 gives

LD = logarithm of 0.267664, in the natural fines.

And, to log. *H* = log. fin. $+15^{\circ} 0'$ 1.41300

add $\left\{ \begin{array}{l} \log. l = \log. \sin. 38^{\circ} 0' \\ \log. d = \log. \sin. 70^{\circ} 0' \end{array} \right.$ 1.79414

1.97300

Their sum 1.18015 gives

Hld = logarithm of 0.151408, in the natural fines.

And these two numbers (0.267664 and 0.151408) make 0.419072 = *A*; which, in the table, is the nearest natural sine of $24^{\circ} 47'$, the sun's altitude sought.

The same hour-distance being assumed on the other side of VI, then *LD* — *Hld* is 0.116256, the sine of $6^{\circ} 40\frac{1}{2}'$; which is the sun's altitude at V in the morning, or VII in the evening, when his north declination is 20° .

But when the declination is 20° south (or towards the depressed pole) the difference *Hld* — *LD* becomes negative; and thereby shews, that, an hour before VI in the morning, or past VI in the evening, the sun's centre is $6^{\circ} 40\frac{1}{2}'$ below the horizon.

EXAMPLE II.

From the same data, to find the sun's azimuth.

If *H*, *L*, and *D* are given, then (by par. 2. of Rule II.) from *H* having found the altitude and its complement *Zd*; and the arc *Pd* (the distance from the pole) being given; say, As the co-sine of the altitude is to the sine of the distance from the pole, so is the sine of the hour-distance from the meridian to the sine of the azimuth distance from the meridian.

Let the latitude be $51^{\circ} 30'$ north, the declination $15^{\circ} 9'$ south, and the time II h. 24 m. in the afternoon, when the sun begins to illuminate a vertical wall, and it is required to find the position of the wall.

Then, by the foregoing theorems, the complement of the altitude will be $81^{\circ} 32\frac{1}{2}'$, and *Pd* the distance from the pole being $109^{\circ} 5'$, and the horary distance from the meridian, or the angle *dPZ*, 36° .

To log. fin. $74^{\circ} 51'$ 1.98464

Add. log. fin. $36^{\circ} 0'$ 1.76922

And from the sum 1.75386

Take the log. fin. $81^{\circ} 32\frac{1}{2}'$ 1.99525

Remains 1.75861 = log. fin.

35° , the azimuth distance sought.

When

† In which case, the radius *GK* is supposed to be divided into 100000 equal parts.

§ Here we consider the radius as unity, and not 10.0000, by which, instead of the index 9, we have —1, as above; which is of no farther use than making the work a little easier.

† The distance of one hour from VI.

§ The co-latitude of the place.

|| The co-declination of the sun.

Dial.

hour. When the altitude is given, find from thence the hour, and proceed as above.

Plate XCI.

This praxis is of singular use on many occasions; in finding the declination of vertical planes more exactly than in the common way, especially if the transits of the sun's centre are observed by applying a ruler with sights, either plain or telescopic, to the wall or plane whose declination is required.—In drawing a meridian line, and finding the magnetic variation.—In finding the bearings of places in terrestrial surveys; the transits of the sun over any place, or his horizontal distance from it, being observed, together with the altitude and hour.—And thence determining small differences of longitude.—In observing the variations at sea, &c.

Of the double Horizontal Dial; and the Babylonian and Italian Dials.

To the *gnomonic* projection, there is sometimes added a *stereographic* projection of the hour-circles, and the parallels of the sun's declination, on the same horizontal plane; the upright side of the gnomon being sloped into an edge, standing perpendicularly over the centre of the projection: so that the dial, being in its due position, the shadow of that perpendicular edge is a vertical circle passing thro' the sun, in the stereographic projection.

The months being duly marked on this dial, the sun's declination, and the length of the day at any time, are had by inspection (as also his altitude, by means of a scale of tangents.) But its chief property is, that it may be placed true, whenever the sun shines, without the help of any other instrument.

Fig. 1.

Let d be the sun's place in the stereographic projection, $x d y z$ the parallel of the sun's declination, $Z d$ a vertical circle through the sun's centre, $P d$ the hour-circle; and it is evident, that the diameter NS of this projection being placed duly north and south, these three circles will pass through the point d . And therefore, to give the dial its due position, we have only to turn its gnomon toward the sun, on a horizontal plane, until the hour on the common gnomonic projection coincides with that marked by the hour-circle $P d$, which passes through the intersection of the shadow $Z d$ with the circle of the sun's present declination.

The Babylonian and Italian dials reckon the hours, not from the meridian, as with us, but from the sun's rising and setting. Thus, in Italy, an hour before sun-set is reckoned the 23d hour; two hours before sun-set the 22d hour; and so of the rest. And the shadow that marks them on the hour-lines, is that of the point of a stile. This occasions a perpetual variation between their dials and clocks, which they must correct from time to time, before it arises to any sensible quantity, by setting their clocks so much faster or slower. And in Italy, they begin their day, and regulate their clocks, not from sun-set, but from about mid-twilight, when the *Ave-Maria* is said; which corrects the difference that would otherwise be between the clock and the dial.

The improvements which have been made in all sorts of instruments and machines for measuring time, have rendered such dials of little account. Yet, as the theory of them is ingenious, and they are really, in some

Dial.

respects, the best contrived of any for vulgar use, a general idea of their description may not be unacceptable.

Plate XCI.

Let fig. 3. represent an erect direct south wall, on which a Babylonian dial is to be drawn, shewing the hours from sun-rising; the latitude of the place, whose horizon is parallel to the wall, being equal to the angle KCR . Make, as for a common dial, $KG=KR$ (which is perpendicular to CR) the radius of the equinoctial EQ , and draw RS perpendicular to CK for the stile of the dial; the shadow of whose point R is to mark the hours, when SR is set upright on the plane of the dial.

Then it is evident, that, in the contingent line EQ , the spaces $K 1$, $K 2$, $K 3$, &c. being taken equal to the tangents of the hour-distances from the meridian, to the radius KG , one, two, three, &c. hours after sun-rising, on the equinoctial day; the shadow of the point R will be found, at these times, respectively in the points 1, 2, 3, &c.

Draw, for the like hours after sun-rising, when the sun is in the tropic of Capricorn $\propto V$, the like common lines CD , CE , CF , &c. and at these hours the shadow of the point R will be found in those lines respectively. Find the sun's altitudes above the plane of the dial at these hours; and with their co-tangents Sd , Se , Sf , &c. to radius SR , describe arcs intersecting the hour-lines in the points d , e , f , &c. so shall the right lines 1 d , 2 e , 3 f , &c. be the lines of I, II, III, &c. hours after sun-rising.

The construction is the same in every other case; due regard being had to the difference of longitude of the place at which the dial would be horizontal, and the place for which it is to serve; and likewise, taking care to draw no lines but what are necessary; which may be done partly by the rules already given for determining the time that the sun shines on any plane; and partly from this, that on the tropical days, the hyperbola described by the shadow of the point R limits the extent of all the hour-lines.

Of the right placing of dials, and having a true meridian line for the regulating of clocks and watches.

The plane on which the dial is to rest being duly prepared, and every thing necessary for fixing it, you may find the hour tolerably exact by a large equinoctial ring-dial, and set your watch to it. And then the dial may be fixed by the watch at your leisure.

If you would be more exact, take the sun's altitude by a good quadrant, noting the precise time of observation by a clock or watch. Then compute the time for the altitude observed; and set the watch to agree with that time, according to the sun. A Hadley's quadrant is very convenient for this purpose: for by it you may take the angle between the sun and his image reflected from a basin of water; the half of which angle, subtracting the refraction, is the altitude required. This is best done in summer; and the nearer the sun is to the prime vertical (the east or west azimuth) when the observation is made, so much the better.

Or, in summer, take two equal altitudes of the sun in the same day; one any time between 7 and 10 in the morning, the other between 2 and 5 in the afternoon; noting the moments of these two observations by

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Dial.

by a clock or watch: and if the watch shews the observations to be at equal distances from noon, it agrees exactly with the sun: if not, the watch must be corrected by half the difference of the forenoon and afternoon intervals; and then the dial may be set true by the watch.

Thus, for example, suppose you had taken the sun's altitude when it was 20 minutes past VIII in the morning by the watch; and found, by observing in the afternoon, that the sun had the same altitude 10 minutes before IIII; then it is plain, that the watch was 5 minutes too fast for the sun: for 5 minutes after XII is the middle time between VIII h. 20 m. in the morning, and III. h. 50 m. in the afternoon; and therefore, to make the watch agree with the sun, it must be set back five minutes.

A good *meridian line*, for regulating clocks or watches, may be had by the following method.

Make a round hole, almost a quarter of an inch diameter, in a thin plate of metal; and fix the plate in the top of a south window, in such a manner, that it may recline from the zenith at an angle equal to the co-latitude of your place, as nearly as you can guess: for then the plate will face the sun directly at noon on the equinoctial days. Let the sun shine freely thro' the hole into the room; and hang a plumb line to the ceiling of the room, at least five or six feet from the window, in such a place as that the sun's rays, transmitted through the hole, may fall upon the line when it is noon by the clock; and having marked the said place on the ceiling, take away the line.

Having adjusted a sliding bar to a dove-tail groove, in a piece of wood about 18 inches long, and fixed a hook into the middle of the bar, nail the wood to the above-mentioned place on the ceiling, parallel to the side of the room in which the window is; the groove and bar being towards the floor. Then, hang the plumb-line upon the hook in the bar, the weight or plummet reaching almost to the floor; and the whole will be prepared for farther and proper adjustment.

This done, find the true solar time by either of the two last methods, and thereby regulate your clock. Then, at the moment of next noon by the clock, when the sun shines, move the sliding-bar in the groove, until the shadow of the plumb-line bisects the image of the sun (made by his rays transmitted thro' the hole) on the floor, wall, or on a white screen placed on the north-side of the line; the plummet or weight at the end of the line hanging freely in a pail of water placed below it on the floor.—But because this may not be quite correct for the first time, on account that the plummet will not settle immediately, even in water; it may be farther corrected on the following days, by the above method, with the sun and clock; and so brought to a very great exactness.

N. B. The rays transmitted through the hole, will cast but a faint image of the sun, even on a white screen, unless the room be so darkened that no sun-shine may be allowed to enter but what comes through the small hole in the plate. And always, for some time before the observation is made, the plummet ought to be immersed in a jar of water, where it may hang freely; by which means the line will soon become steady, which otherwise would be apt to continue swinging.

Dial.

An Universal Dial, shewing the hours of the day by a terrestrial globe, and by the shadows of several gnomons, at the same time: together with all the places of the earth which are then enlightened by the sun; and those to which the sun is then rising, or on the meridian, or setting.

This dial is made of a thick square piece of wood^{or Plate} hollow metal. The sides are cut into semicircular hollows, in which the hours are placed; the stile of each hollow coming out from the bottom thereof, as far as the ends of the hollows project. The corners are cut out into angles, in the insides of which the hours are also marked; and the edge of the end of each side of the angle serves as a stile for casting a shadow on the hours marked on the other side.

In the middle of the uppermost side, or plane, there is an equinoctial dial; in the centre whereof an upright wire is fixed, for casting a shadow on the hours of that dial, and supporting a small terrestrial globe on its top.

The whole dial stands on a pillar, in the middle of a round horizontal board, in which there is a compass and magnetic needle, for placing the *meridian stile* toward the south. The pillar has a joint with a quadrant upon it, divided into 90 degrees (supposed to be hid from sight under the dial in the figure) for setting it to the latitude of any given place.

The equator of the globe is divided into 24 equal parts, and the hours are laid down upon it at these parts. The time of the day may be known by these hours, when the sun shines upon the globe.

To rectify and use this dial, set it on a level table, or sole of a window, where the sun shines, placing the meridian stile due south, by means of the needle; which will be, when the needle points as far from the north fleur-de-lis toward the west, as it declines westward, at your place. Then bend the pillar in the joint, till the black line on the pillar comes to the latitude of your place in the quadrant.

The machine being thus rectified, the plane of its dial part will be parallel to the equator, the wire or axis that supports the globe will be parallel to the earth's axis, and the north pole of the globe will point toward the north pole of the heavens.

The same hour will then be shewn in several of the hollows, by the ends of the shadows of their respective stiles: the axis of the globe will cast a shadow on the same hour of the day, in the equinoctial dial, in the centre of which it is placed, from the 20th of March to the 23d of September; and, if the meridian of your place on the globe be set even with the meridian stile, all the parts of the globe that the sun shines upon, will answer to those places of the real earth which are then enlightened by the sun. The places where the shade is just coming upon the globe, answer to all those places of the earth to which the sun is then setting; as the places where it is going off, and the light coming on, answer to all the places of the earth where the sun is then rising. And lastly, if the hour of VI be marked on the equator in the meridian of your place (as it is marked on the meridian of London in the figure) the division of the light and shade on the globe will shew the time of the day.

The

Dial.

Dial.

The northern file of the dial (opposite to the southern or meridian one) is hid from sight in the figure, by the axis of the globe. The hours in the hollow to which that file belongs, are also supposed to be hid by the oblique view of the figure: but they are the same as the hours in the front-hollow. Those also in the right and left hand semicircular hollows are mostly hid from sight; and so also are all those on the sides next the eye of the four acute angles.

The construction of this dial is as follows:

Plate XCI.
fig. 4.

On a thick square piece of wood, or metal, draw the lines ac and bd , as far from each other as you intend for the thickness of the file $abcd$; and in the same manner, draw the like thickness of the other three files, $efgh$, $iklm$, and $nopq$, all standing out-right as from the centre.

With any convenient opening of the compasses, as aa , (so as to leave proper strength of stuff when KI is equal to ad), set one foot in a , as a centre, and with the other foot describe the quadrantal arc Ac . Then, without altering the compasses, set one foot in b as a centre, and with the other foot describe the quadrantal arc bB . All the other quadrants in the figure must be described in the same manner, and with the same opening of the compasses, on their centres ef , ik , and no ; and each quadrant divided into six equal parts, for as many hours, as in the figure; each of which parts must be subdivided into 4, for the half-hours and quarters.

At equal distances from each corner, draw the right lines Ip and Kp , Lq and Mq , Nr and Or , P_s and Q_s ; to form the four angular hollows IpK , LqM , NrO , and P_sQ_s ; making the distances between the tips of these hollows, as IK , LM , NO , and P_sQ_s , each equal to the radius of the quadrants; and leaving sufficient room within the angular points pqr and s , for the equinoctial in the middle.

To divide the insides of these angles properly for the hour-spaces thereon, take the following method.

Set one foot of the compasses in the point I , as a centre, and open the other to K ; and with that opening describe the arc Kt : then, without altering the compasses, set one foot in K , and with the other foot describe the arc It . Divide each of these arcs, from I and K to their intersection at t , into four equal parts; and from their centres I and K , through the points of division, draw the right lines $I3$, $I4$, $I5$, $I6$, $I7$; and $K2$, $K1$, $K12$, $K11$; and they will meet the sides Kp and Ip of the angle IpK where the hours thereon must be placed. And these hour-spaces in the arcs must be subdivided into four equal parts, for the half hours and quarters.—Do the like for the other three angles, and draw the dotted lines, and set the hours in the insides where those lines meet them, as in the figure: and the like hour-lines will be parallel to each other in all the quadrants and in all the angles.

Mark points for all these hours on the upper side; and cut out all the angular hollows, and the quadrantal ones quite through the places where their four gnomons must stand; and lay down the hours on their insides, (as in Plate XCII.), and set in their gnomons, which must be as broad as the dial is thick; and this breadth and thickness must be large enough to keep the shadows of the gnomons from ever falling quite

out at the sides of the hollows, even when the sun's declination is at the greatest.

Lastly, draw the equinoctial dial in the middle, all the hours of which are equidistant from each other: and the dial will be finished.

As the sun goes round, the broad end of the shadow of the file $abcd$ will shew the hours in the quadrant Ac , from sun-rise till VI in the morning; the shadow from the end M will shew the hours on the side Lq from V to IX in the morning; the shadow of the file $efgh$ in the quadrant Dg (in the long days) will shew the hours from sun-rise till VI in the morning; and the shadow of the end N will shew the morning-hours, on the side Or , from III to VII.

Just as the shadow of the northern file $abcd$ goes off the quadrant Ac , the shadow of the southern file $iklm$ begins to fall within the quadrant Fh , at VI in the morning; and shews the time, in that quadrant, from VI till XII at noon; and from noon till VI in the evening in the quadrant me . And the shadow of the end O , shews the time from XI in the forenoon till III in the afternoon, on the side rN ; as the shadow of the end P shews the time from IX in the morning till I o'clock in the afternoon, on the side Q_s .

At noon, when the shadow of the eastern file $efgh$ goes off the quadrant bC (in which it shewed the time from VI in the morning till noon, as it did in the quadrant gD from sun-rise till VI in the morning) the shadow of the western file $nopq$ begins to enter the quadrant Hp ; and shews the hours thereon from XII at noon till VI in the evening; and after that till sunset, in the quadrant gG ; and the end Q_s casts a shadow on the side P_s from V in the evening till IX at night, if the sun be not set before that time.

The shadow of the end I shews the time on the side Kp from III till VII in the afternoon; and the shadow of the file $abcd$ shews the time from VI in the evening till the sun sets.

The shadow of the upright central wire, that supports the globe at top, shews the time of the day, in the middle or equinoctial dial, all the summer half-year, when the sun is on the north side of the equator.

DIALECT, an appellation given to the language of a province, in so far as it differs from that of the whole kingdom. The term, however, is more particularly used in speaking of the ancient Greek, whereof there were four dialects, the Attic, Ionic, Æolic, and Doric, each of which was a perfect language in its kind, that took place in certain countries, and had peculiar beauties.

In Great Britain, besides the grand diversity of English and Scotch, almost every county has a dialect of its own, all differing considerably in pronunciation, accent, and tone, although one and the same language.

DIALECTICS, in the literary history of the ancients, that branch of logics which taught the rules and modes of reasoning. See LOGIC, Part III.

DIALIA, in antiquity, sacrifices performed by the flames dialis. See FLAMEN.

DIALING, the art of drawing dials, on any given plane, or on the surface of any given body. See DIAL.

The Greeks and Latins called this art *gnomonica* and *sciatherica*, by reason it distinguishes the hours by the shadow of a gnomon. Some call it *photo-sciatherica*, by

DORIS.
N^o 1.

Plate XCII.

DORIS.
N^o 2.

Dialing.

by reason the hours are sometimes shewn by the light of the sun. Lastly, others call it *horologigraphy*.

The antiquity of dials is beyond doubt. Some attribute their invention to Anaximenes Milesius; and others to Thales. Vitruvius mentions one made by the ancient Chaldee historian Berosus, on a reclining plane, almost parallel to the equinoctial. Aristarchus Samius invented the hemispherical dial. And there were some spherical ones, with a needle for a gnomon. The discus of Aristarchus was an horizontal dial, with its limb raised up all around, to prevent the shadows stretching too far.

But it was late ere the Romans became acquainted with dials. The first sun-dial at Rome was set up by Papirius Cursor, about the year of the city 460; before which time, says Pliny, there is no mention of any account of time but by the sun's rising and setting: it was set up at or near the temple of Quirinus, but went ill. About 30 years after, M. Valerius Messala being consul, brought out of Sicily another dial, which he set up on a pillar near the rostrum; but for want of its being made for that latitude, it could not go true. They made use of it 99 years; till Martius Philippus set up another more exact.

But there seem to have been dials among the Jews much earlier than any of these. Witness the dial of Ahaz; who began to reign 400 years before Alexander, and within 12 years of the building of Rome; mentioned by Isaiah, chap. xxxviii. verse 8.

The first professed writer on dialing is Clavius; who demonstrates all, both the theory and the operations, after the rigid manner of the ancient mathematicians; but so intricately, that few, we dare say, ever read them all. Dechales and Ozanam give much easier demonstrations in their *Courses*, and Wolhus in his *Elements*. M. Picard has given a new method of making large dials, by calculating the hour-lines; and Mr de la Hire, in his *Dialing*, printed in 1683, a geometrical method of drawing hour-lines from certain points determined by observation. Eberhardus Welperus, in 1625, published his *Dialing*, wherein he lays down a method of drawing the primary dials on a very easy foundation. The same foundation is described at length by Sebastian Munster, in his *Rudimenta Mathematica*, published in 1551. Sturmius, in 1672, published a new edition of Welperus's *Dialing*, with the addition of a whole second part, about inclining and declining dials, &c. In 1708, the same work, with Sturmius's additions, was republished with the addition of a fourth part, containing Picard's and de la Hire's methods of drawing large dials. Paterson, Michael, and Muller, have each wrote on dialing, in the German tongue; Coetfius in his *Horologigraphia Plana*, printed in 1689; Gauppenius, in his *Gnomonica Mechanica*; Bion, in his *Use of Mathematical Instruments*; and the late ingenious Mr Ferguson, in his *Select Lectures*. See the article DIAL.

DIALING-Lines, or Scales, are graduated lines, placed on rules, or the edges of quadrants, and other instruments, to expedite the construction of dials. See DIAL, p. 2442, col. 2. and Plate XC.

DIALING-Sphere, is an instrument made of brass, with several femicircles sliding over one another, on a moving horizon, to demonstrate the nature of the doctrine of spherical triangles, and to give a true idea of

the drawing of dials on all manner of planes.

DIALING, in a mine, called also *Plumming*, is the using of a compass (which they call *dial*), and a long line, to know which way the load, or vein of ore inclines, or where to shift an air-shaft, or bring an adit to a desired place.

DIALIS, in antiquity, a Latin term signifying something that belongs to Jupiter.—The word is formed from *Δις*, the genitive of *Ζεύς*, Jupiter.

Flamen DIALIS. See **FLAMEN**.

DIALITHA, in the writings of the ancients, a word used to express the elegant ornaments of the Greeks and Romans, composed of gold and gems. They also called these, *lithocolla*, “cemented stones or gems;” the gold being in this case as a cement to hold the stones together. They wore bracelets and other ornamental things about their habits thus made; and their cups and table-furniture, for magnificent treats, were of this kind. The green stones were found to succeed best of all in these things; and the emerald, and greenish topaz, or, as we call it, chrysolite, were most in esteem for this purpose. This use of the stones explains what Pliny very often says of them in his description: *Nihil jucundius aurum decet*, “Nothing becomes gold better;” this he says of the green topaz or chrysolite; and this and many other like passages have greatly perplexed the critics, who did not hit upon this explanation.

DIALOGISM, in rhetoric, is used for the soliloquy of persons deliberating with themselves. See **SOLILOQUY**.

DIALOGUE, in matters of literature, a conversation between two or more persons, either by writing or by word of mouth.

Composition and Style of Written Dialogue. As the end of speech is conversation, no kind of writing can be more natural than dialogue, which represents this. And accordingly we find it was introduced very early, for there are several instances of it in the Mosaic history. The ancient Greek writers also fell very much into it, especially the philosophers, as the most convenient and agreeable method of communicating their sentiments and instructions to mankind. And indeed it seems to be attended with very considerable advantages, if well and judiciously managed. For it is capable to make the driest subjects entertaining and pleasant, by its variety, and the different characters of the speakers. Besides, things may be canvassed more minutely, and many lesser matters, which serve to clear up a subject, may be introduced with a better grace, by questions and answers, objections and replies, than can be conveniently done in a continued discourse. There is likewise a further advantage in this way of writing, that the author is at liberty to choose his speakers: And therefore, as Cicero has well observed, when we imagine, that we hear persons of an established reputation for wisdom and knowledge talking together, it necessarily adds a weight and authority to the discourse, and more closely engages the attention. The subject-matter of it is very extensive. For whatever is a proper argument of discourse, public or private, serious or jocular; whatever is fit for wise and ingenious men to talk upon, either for improvement or diversion; is suitable for a dialogue.

From this general account of the nature of dialogue,

Dialogue.

Dialogue.

it is easy to perceive what kind of style best suits it. Its affinity with *EPISTLES*, shews there ought to be no great difference between them in this respect. Indeed, some have been of opinion, that it ought rather to sink below that of an epistle, because dialogues should in all respects represent the freedom of conversation; whereas, epistles ought sometimes to be composed with care and accuracy, especially when written to superiors. But there seems to be little weight in this argument, since the design of an epistle is to say the same things, and in the same manner, as the writer judges would be most fit and proper for him to speak, if present. And the very same thing is designed in a dialogue, with respect to the several persons concerned in it. Upon the whole, therefore, the like plain, easy, and simple style, suited to the nature of the subject, and the particular characters of the persons concerned, seems to agree to both.

But as greater skill is required in writing dialogues, than letters; we shall give a more particular account of the principal things necessary to be regarded in their composition, and illustrate them chiefly from Cicero's excellent *Dialogues concerning an orator*.—A dialogue, then, consists of two parts; an introduction, and the body of the discourse.

1. The introduction acquaints us with the place, time, persons, and occasion, of the conversation. Thus Cicero places the scene of his dialogues at Crassus's country seat; a very proper recess, both for such a debate, and the parties engaged in it. And as they were persons of the first rank, and employed in the greatest affairs of state, and the discourse held them for two days; he represents it to have happened at the time of a festival, when there was no business done at Rome, which gave them an opportunity to be absent.

And because the greatest regard is to be had in the choice of the persons, who ought to be such as are well acquainted with the subject upon which they discourse; in these dialogues of Cicero, the two principal disputants are Crassus and Antony, the greatest orators of that age, and therefore the most proper persons to dispute upon the qualifications necessary for their art. One would think it scarce necessary to observe, that the conference should be held by persons who lived at the same time, and so were capable to converse together. But yet, some good writers have run into the impropriety of feigning dialogues between persons who lived at distant times. Plato took this method, in which he has been followed by Macrobius. But others, who have been willing to bring persons to discourse together, who lived in different ages, without such inconsistency, have wrote dialogues of the dead. Lucian has made himself most remarkable in this way. As to the number of persons in a dialogue, they may be more or less; so many, as can conveniently carry on a conversation without disorder or confusion, may be admitted. Some of Cicero's dialogues have only two, others three or more, and those concerning an orator seven. And it is convenient they should all, in some respects, be persons of different characters and abilities; which contributes both to the variety and beauty of the discourse, like the different attitude of figures in a picture. Thus in Cicero's dialogues last mentioned, Crassus excelled in art, Antony principally for the force of his genius, Catullus for the purity of his style, Sce-

vola for his skill in the law, Cæsar for wit and humour; and though Sulpitius and Cotta, who were young men, were both excellent orators, yet they differed in their manner. But there should be always one chief person, who is to have the main part of the conversation; like the hero in an epic poem or a tragedy, who excels the rest in action; or the principal figure in a picture, which is most conspicuous. In Plato's dialogues, this is Socrates; and Crassus, in those of Cicero above mentioned.

It is usual, likewise, in the introduction, to acquaint us with the occasion of the discourse. Indeed this is not always mentioned; as in Cicero's dialogue of the parts of oratory, where the son begins immediately with desiring his father to instruct him in the art. But it is generally taken notice of, and most commonly represented, as accidental. The reason of which may be, that such discourses appear most natural; and may likewise afford some kind of apology for the writer in managing his different characters, since the greatest men may be supposed not always to speak with the utmost exactness in an accidental conversation. Thus Cicero, in his dialogues concerning an orator, makes Crassus occasionally fall upon the subject of oratory, to divert the company from the melancholy thoughts of what they had been discoursing of before, with relation to the public disorders, and the dangers which threatened their country. But the introduction ought not to be too long and tedious. Mr Addison complains of this fault in some authors of this kind. "For though, as he says, some of the finest treatises of the most polite Latin and Greek writers are in dialogue, as many very valuable pieces of French, Italian, and English, appear in the same dress; yet in some of them there is so much time taken up in ceremony, that, before they enter on their subject, the dialogue is half over."

2. We come now to the *body* of the discourse, in which some things relating to the persons, and others to the subject, are proper to be remarked.

And as to the *persons*, the principal thing to be attended to, is to keep up a justness of character thro' the whole. And the distinct characters ought to be so perfectly observed, that from the very words themselves it may be always known who is the speaker. This makes dialogue more difficult than single description, by reason of the number and variety of characters which are to be drawn at the same time, and each of them managed with the greatest propriety. The principal speaker should appear to be a person of great sense and wisdom, and best acquainted with the subject. No question ought to be asked him, or objection started to what he says, but what he should fairly answer. And what is said by the rest should principally tend to promote his discourse, and carry it through in the most artful and agreeable manner. Where the argument is attended with difficulties, one other person or more may be introduced, of equal reputation, or near it, but of different sentiments, to oppose him and maintain the contrary side of the question. This gives opportunity for a thorough examination of the point on both sides, and answering all objections. But if the combatants are not pretty equally matched, and masters of the subject, they will treat it but superficially. And through the whole debate, there ought not to be

the least wrangling, peevishness, or obliquity; nothing but the appearance of good-humour and good breeding, the gentleman and the friend, with a readiness to submit to conviction and the force of truth, as the evidence shall appear on one side or the other. In Cicero, these two characters are Crassus and Antony. And from them Mr Addison seems to have taken his Philander and Cynthio, in his *Dialogues upon the usefulness of ancient medals*, which are formed pretty much on Cicero's plan. Where younger persons are present, or such who are not equally acquainted with the subject, they should be rather upon the inquiry than dispute: And the questions they ask should be neither too long, nor too frequent; that they may not too much interrupt the debate, or appear over talkative before wiser and more experienced persons. Sulpitius and Cotta sustain this character in Cicero, and Eugenius in Mr Addison. And it is very convenient there should be one person of a witty and jocular humour, to enliven the discourse at proper seasons, and make it the more entertaining, especially when the dialogue is drawn out to any considerable length. Cæsar has this part in Cicero. And in Mr Addison, Cynthio is a person of this turn, and opposes Philander in a merry way. Mr Addison's subject admitted of this; but the seriousness and gravity of Cicero's argument required a different speaker for the jocular part. Many persons ought not to speak immediately one after another. Horace's rule for plays is:

To crowd the stage is odious and absurd,
Let no fourth actor strive to speak a word.

Though Scaliger and others think a fourth person may sometimes be permitted to speak in the same scene without confusion. However, if this is not commonly to be allowed upon the stage, where the actors are present, and may be distinguished by their voice and habit; much less in a dialogue, where you have only their names to distinguish them.

With regard to the *subject*, all the arguments should appear probable at least, and nothing be advanced which may seem weak or trivial. There ought also to be an union in dialogue, that the discourse may not ramble, but keep up to the main design. Indeed, short and pleasant progressions are sometimes allowable for the ease and entertainment of the reader. But every thing should be so managed, that he may still be able to carry on the thread of the discourse in his mind, and keep the main argument in view, till the whole is finished. The writers of dialogue have not confined their discourses to any certain space of time; but either concluded them with the day; or broke off when their speakers have been tired, and reassumed them again the next day. Thus Cicero allows two days for his three dialogues concerning an orator; but Mr Addison extends his to three days, allowing a day for each. Nor has the same method always been observed in composing dialogues. For sometimes the writer, by way of narrative, relates a discourse which passed between other persons. Such are the dialogues of Cicero and Mr Addison last mentioned, and many others both of the ancients and moderns. But, at other times, the speakers are introduced in person, as talking to each other. This, as Cicero observes, prevents the frequent repetition of those words, *he said, and he replied*; and by placing the hearer, as it were, in the conversation, gives him a more lively representation of

the discourse, which makes it the more affecting. And therefore Cicero, who wrote his *dialogue of old age* in this manner, in which Cato, who was then in years, largely recounts the satisfactions of life which may be enjoyed in old age, tells his friend Atticus, he was himself so affected with that discourse, that when he reviewed it sometimes, he fancied they were not his own words, but Cato's. There are some other dialogues of Cicero, written in the same way; as that *Of friendship*, and *Of the parts of oratory*. And both Plato and Lucian generally chose this method.

DIALOGUES, in dramatic composition. See POETRY, chap. ii. 22, 23.

DIALTHÆA, in pharmacy, an unguent much used as a resolvent; so called from ALTHÆA, or marshmallows, which is the principal ingredient in it.

DIALYSIS, in grammar, a mark or character, consisting of two points, “, placed over two vowels of a word, in order to separate them, because otherwise they would make a diphthong, as *Mosais*, &c.

DIAMASTIGOSIS, in Grecian antiquity, a solemnity at Sparta in honour of Diana Orthia, wherein the children of the most distinguished families were wont to slash and tear each others bodies with rods before the altar of the goddess: the parents of the children being always present, used to animate and excite them not to give the least sign of pain or concern; and indeed so great was the bravery and resolution of the boys, that seldom or never any cry or groan was heard to proceed from them, tho' they frequently whipped one another to death. The design of this custom was to fortify the children betimes, and harden them against wounds, bruises, &c.

DIAMETER, in geometry, a right line passing thro' the centre of a circle, and terminated at each side by the circumference thereof. See GEOMETRY.

DIAMOND, in natural history, a genus of precious stones, of a fine pellicul substance, of great hardness, seldom souled by any admixture of earthy or other coarse matter, susceptible of elegant tinges from metal-line particles, giving fire with steel, not fermenting with acid menstruums, and of one simple and permanent appearance in all lights.

DIAMONDS are the hardest and most brilliant of all stones. They are either hexagonal prisms, terminated by eight-sided points or pyramids; or they are flat, or cubical, or rounded. Whether this difference of form be original, or adventitious, has not been determined. The first kind are the best and hardest; and may therefore have preserved their original form against accidents better than the others, especially than those which are rounded, which are said to be least hard, and consequently most liable to have their forms altered by attrition. Diamonds are said to consist of laminæ or plates, and probably they have some uniform texture; because lapidaries find that they may be polished much more easily in one than in any other direction. This stone becomes luminous in the dark, by exposure during a certain time to the rays of the sun; by heating it in a crucible; by plunging it in boiling water; or by rubbing it with a piece of glass. By friction it acquires an electrical property, by which it attracts the substance used for soils, called *black mastic*, and other light matters. The author of the Chemical Dictionary says, that diamonds are refractory in the fire,

Diamond. and even apyrrous. Nevertheless, experiments have been made, which prove that diamonds are capable of being dissipated, not only by the collected heat of the sun, but also by the heat of a furnace. Mr Boyle says, that he perceived certain acrid and penetrating exhalations from diamonds exposed to fire. A diamond by exposure to a concave speculum, the diameter of which was 40 inches, was reduced to an eighth part of its weight *. In the *Giornale de Letterati d' Italia*, tom. viii. art. 9. we may read a relation of experiments made on precious stones, by order of the grand duke of Tuscany, with a burning lens, the diameter of which was two thirds of a Florentine ell, near the focus of which was placed another smaller lens. By these experiments we find, that diamonds were more altered by solar heat than most of the other precious stones, although not the least appearance of a commencing fusion was observable. A diamond weighing 30 grains, thus exposed during 30 seconds, lost its colour, lustre, and transparency, and became of an opaque white. In five minutes, bubbles appeared on its surface; soon afterwards it burst into pieces, which were dissipated; and the small fragment which remained was capable of being crushed into fine powder by the pressure of the blade of a knife. Neither the addition of glass, flints, sulphur, metals, or salt of tartar, prevented this dissipation of diamonds, or occasioned any degree of fusion. By this heat rubies were softened, and lost some of their colour, but preserved their form and weight. By addition of a third lens, a further degree of fusion was given to rubies. Even then rubies could not be made to unite with glass. By having been exposed to this heat, the surface of the rubies which had suffered fusion, lost much of their original hardness, and were nearly as soft as crystal. But their internal parts, which had not been fused, retained their hardness. Emeralds by this heat were rendered white, or of various colours, and soon afterwards were fused. They were found to have lost part of their weight, and to be rendered less hard and brittle.

Experiments were also made by order of the emperor Francis I. on precious stones; from which we find, that diamonds were entirely dissipated by having been exposed in crucibles to a violent fire of a furnace during 24 hours; while rubies by the same heat were not altered in weight, colour, or polish. By exposing diamonds during two hours only at a time, the following alterations produced on them by fire were observed. First, they lost their polish; then they were split into thin plates; and, lastly, totally dissipated. By the same fire, emeralds were fused. See *Magasin de Hambourg*, tom. xviii.

The action of fire on diamonds has, notwithstanding the above mentioned experiments, been lately doubted in France; and the question has been agitated by several eminent chemists with much interest, and numerous experiments have been made which throw some light on the subject. M. D'Arcet found, not only that diamonds included in porcelain crucibles close, or covered with perforated lids, and exposed to the long and intense heat of a porcelain furnace, were perfectly dissipated; but also, that these stones could in a few hours be totally volatilised with a much inferior degree of heat, by exposing them in a coppel, under the muffle of an essay-furnace. In this latter experiment, he observed that the dissipation was gradual, and that it was

effected by a kind of exfoliation. The dissipation of diamonds exposed in coppels was confirmed by M. Macquer; who further observed, that the diamonds were, before the dissipation began, rendered, by the fire, brilliant and shining, as it were, with a phosphoric light. In order to determine whether the dissipation of diamonds was actually effected by their reduction into vapour, or by a combustion or other effect of air upon them, Messrs Lavoisier, Macquer, and Cadet, exposed diamonds to intense heat in an earthen retort, during several hours, but without any other effect than that their polish was destroyed, and about $\frac{1}{4}$ th of their weight diminished. M. Mitouard put diamonds in a tobacco-pipe filled with pounded charcoal and accurately closed with lute. He further secured the diamonds from access of air or flame, by placing the tobacco-pipe in a crucible, to which another crucible was inverted and carefully luted. The diamonds, thus secluded from external air, having been exposed to the most intense heat which could be excited in a well constructed furnace, were not thereby altered or diminished. M. Mitouard was induced to believe, that the charcoal conducted to the preservation of diamonds not merely by excluding the air, but by some peculiar property, which he supposes may be the same as that by which this substance defends metals from destruction by fire. He was confirmed in his opinion, by observing that diamonds were not preserved from the action of fire by surrounding them with powder of chalk and of calcined hartshorn, and including them in close vessels, so well as when the charcoal had been employed. Some chemists even thought that the perfect exclusion of air alone was sufficient to preserve diamonds, and doubted whether the balls and crucibles of porcelain employed by M. D'Arcet had excluded the air with sufficient accuracy. Indeed, in one of M. D'Arcet's own experiments, a diamond included in a ball of porcelain had resisted the action of fire. In order to ascertain this question, M. Cadet exposed diamonds in covered and luted crucibles to the violent heat of a forge during two hours; by which operation the diamonds lost only $\frac{1}{4}$ th part of their weight. He infers, that the destruction of diamonds by fire in open vessels is not a true volatilization; but merely an exfoliation, caused by the fire expanding the air contained between the thin plates of which these stones consist and that by this exfoliation or decapitation these plates are reduced to so fine a powder as to escape observation. M. D'Arcet objected against the experiments of his adversaries, that they were not of sufficient duration to decide against his, which had lasted several days. He renewed and multiplied his experiments, which confirmed him in his opinion of the volatilisation of diamonds in vessels perfectly closed; and that this effect of fire on diamonds is not a mere exfoliation or mechanical separation of the plates of which these stones consist, he infers from the parts of the diamonds pervading the most solid porcelain crucibles without being perceptible, and from the luminous appearance first noticed by M. Macquer, and which was afterwards observed by M. Roux to be an actual flame.

Diamonds are found only in the East Indies, and in Brasil in South America; but the Oriental diamonds are preferable to the Brazilian ones. The diamond mines are found only in the kingdoms of Golconda, Vifapour,

Vilapour, Bengal, and the Island of Borneo. There are four mines, or rather two mines and two rivers, whence diamonds are drawn. The mines are, 1. That of Raolconda, in the province of Carnatica, five days journey from Golconda, and eight from Vilapour. It has been discovered about 200 years. 2. That of Gani, or Coulour, seven days journey from Golconda eastwardly. It was discovered 140 years ago by a peasant, who digging in the ground found a natural fragment of 25 carats. 3. That of Soumelpour, a large town in the kingdom of Bengal, near the Diamond-mine. This is the most ancient of them all: it should rather be called that of *Gouah*, which is the name of the river, in the fand whereof these stones are found. Lastly, the fourth mine, or rather the second river, is that of Succudan, in the island of Borneo.

DIAMOND-Mine of Raolconda.—In the neighbourhood of this mine the earth is sandy, and full of rocks and cople. In these rocks are found several little veins of half and sometimes a whole inch broad, out of which the miners, with a kind of hooked irons, draw the sand, or earth, wherein the diamonds are; breaking the rocks when the vein terminates, that the track may be found again, and continued. When a sufficient quantity of earth or sand is drawn forth, they wash it two or three times, to separate the stones therefrom. The miners work quite naked, except for a thin linen cloth before them; and besides this precaution, have likewise inspectors, to prevent their concealing of stones: which, however, maugre all this care, they frequently find means to do, by watching opportunities when they are not observed, and swallowing them down.

DIAMOND-Mine of Gani or Coulour.—In this mine are found a great number of stones from 10 to 40 carats, and even more; and it was here that famous diamond of Aureng-Zeb the Great Mogul, which before it was cut weighed 793 carats, was found. The stones of this mine are not very clear; their water is usually tinged with the quality of the soil; being black where that is marshy, red where it partakes of red, sometimes green and yellow, if the ground happen to be of those colours. Another defect of some consequence is a kind of greasiness appearing on the diamond, when cut, which takes off part of its lustre. —There are usually no less than 60,000 persons, men, women, and children, at work in this mine.

When the miners have found a place where they intend to dig, they level another somewhat bigger in the neighbourhood thereof, and inclose it with walls about two foot high, only leaving apertures from space to space, to give passage to the water. After a few superstitious ceremonies, and a kind of feast which the master of the mine makes for the workmen, to encourage them, every one goes to his business, the men digging the earth in the place first discovered, and the women and children carrying it off into the other walled round. They dig 12 or 14 foot deep, and till such time as they find water. Then they cease digging; and the water thus found serves to wash the earth two or three times, after which it is let out at an aperture reserved for that end. This earth being well washed, and well dried, they sift it in a kind of open sieve, or riddle, much as we do corn in Europe; then thrash it, and sift it afresh; and lastly, search it well with the

hands to find the diamonds. They work naked as in the mine of Raolconda, and are watched after the like manner by inspectors.

DIAMOND-Mine of Soumelpour, or river Gouah.—Soumelpour is a large town built all of earth, and covered with branches of cacao-trees: the river Gouah runs by the foot thereof, in its passing from the high mountains towards the south to the Ganges, where it loses its name. It is from this river that all our fine diamond points, or sparks, called *natural sparks*, are brought. They never begin to seek for diamonds in this river till after the great rains are over, that is, after the month of December; and they usually even wait till the water is grown clear, which is not before January. The season at hand, eight or ten thousand persons, of all ages and sexes, come out of Soumelpour and the neighbouring villages. The most experienced among them search and examine the sand of the river, going up it from Soumelpour to the very mountain whence it springs. A great sign that there are diamonds in it, is the finding of those stones which the Europeans call *thunder-stones*. When all the sand of the river, which at that time is very low, has been well examined, they proceed to take up that wherein they judge diamonds likely to be found; which is done after the following manner: They dam the place round with stones, earth, and fscines, and lading out the water, dig about two foot deep: the sand thus got is carried into a place walled round on the bank of the river. The rest is performed after the same manner as at Coulour, and the workmen are watched with equal strictness.

DIAMOND-Mine in the island of Borneo, or river of Succudan.—We are but little acquainted with this mine; the queen who reigns in that part of the island not allowing strangers to have any commerce in these stones: though there are very fine ones to be bought at Batavia, brought thither by stealth. They were anciently imagined to be softer than those of the other mines; but experience shews, they are in no respect inferior to them.

Beside these four diamond-mines, there have been two others discovered; one of them between Coulour and Raolconda, and the other in the province of Carnatica; but they were both closed up almost as soon as discovered: that of Carnatica, because the water of the diamonds was always either black, or yellow; and the other, on account of their cracking, and flying in pieces when cut and ground.

The diamond, we have already observed, is the hardest of all precious stones. It can only be cut and ground by itself and its own substance. To bring it to that perfection which augments its price so considerably, they begin by rubbing several against each other, while rough; after having first glued them to the ends of two wooden blocks, thick enough to be held in the hand. It is this powder thus rubbed off the stones, and received in a little box for the purpose, that serves to grind and polish the stones.

Diamonds are cut and polished by means of a mill, which turns a wheel of soft iron sprinkled over with diamond-dust mixed with oil of olives. The same dust, well ground, and diluted with water and vinegar, is used in the sawing of diamonds; which is performed with an iron or brass wire, as fine as a hair. Sometimes, in lieu of sawing the diamonds, they

Diamond. cleave them, especially if there be any large shivers therein. But the Europeans are not usually daring or expert enough to run the risque of cleaving, for fear of breaking.

The finest diamonds are those of a complexion like that of a drop of pure water. It is likewise a valuable property if they are of a regular form and truly made; as also, that they be free from stains, spots, specks, flaws, and cross veins. If diamonds are tintured yellow, blue, green, or red, in a high degree, they are next in esteem; but if they are tintured with these colours only in a low degree, the value of them is greatly diminished. There are also diamonds of other complexions; such as brown, and those of a dark hue: the first resembling the brownest figar-candy, and the latter dusky iron. In the *Philosophical Commerce of Arts*, Dr Lewis tells us of a black diamond that he himself had seen. At a distance, it looked uniformly black; but, on closer examination, appeared in some parts transparent, and in others charged with foulness, on which the black hue depended.

The *first water* in diamonds means the greatest purity and perfection of their complexion, which ought to be that of the purest water. When diamonds fall short of this perfection, they are said to be of the *second* or *third water*, &c. till the stone may be properly called a *coloured one*: for it would be an impropriety to speak of an imperfectly coloured diamond, or one that has other defects, as a stone of a bad water only.

Mr Boyle has observed, from a person much conversant in diamonds, that some of these gems, in their rough state, were much heavier than others of the same bigness, especially if they were cloudy or foul; and Mr Boyle mentions one that weighed 8½ grains, which, being carefully weighed in water, proved to an equal bulk of that liquor as $2\frac{2}{3}$ to 1. So that, as far as could be judged by that experiment, a diamond weighs not thrice as much as water: and yet, in his table of specific gravities, that of a diamond is said to be to water as 3400 to 1000; that is, as $3\frac{4}{5}$ to 1; and therefore, according to these two accounts, there should be some diamonds whose specific gravity differs nearly $\frac{1}{5}$ from that of others. But this is a much greater difference than can be expected in two bodies of the same species; and indeed, on an accurate trial, does not prove to be the case with diamonds. The Brasil diamonds differ a little in weight one from another, and greatly vary from the standard set by Mr Boyle for the specific gravity of this gem in general; two large diamonds from that part of the world being carefully weighed, one was found as 3518, the other as 3521, the specific gravity of water being reckoned 1000. After this, ten East India diamonds were chosen out of a large parcel, each as different from the other in shape, colour, &c. as could be found. These being weighed in the same scales and water with the former, the lightest proved as 3512, the heaviest as 3525, still supposing the water to be 1000.—Mr Elliot, who made these experiments, has drawn out a table of their several differences, which is done with great care and accuracy; and, taking in all the common varieties in diamonds, may serve as a general rule for their mean gravity and differences.

	Water	In air.	In water	Specific gravity.	Diamond
		Grains.	Grains.	1000	
Nº 1.	A Brazil diamond, fine water, and rough coat	92,425	66,16	3518	
2.	Ditto, fine water, rough coat	88,21	63,16	3521	
3.	Ditto, fine bright coat	10,025	7,170	3511	
4.	Ditto, fine bright coat	95,60	68,30	3501	
5.	An East India diamond, pale blue	26,485	18,945	3512	
6.	Ditto, bright yellow	23,33	16,710	3524	
7.	Ditto, very fine water, bright coat	20,66	14,800	3525	
8.	Ditto, very bad water, honeycomb coat	20,38	14,590	3519	
9.	Ditto, very hard bluish cast	22,5	16,1	3515	
10.	Ditto, very soft, good water	22,615	16,2	3525	
11.	Ditto, a very large red foulness in it	25,480	18,230	3514	
12.	Ditto, soft, bad water	29,525	21,140	3521	
13.	Ditto, soft, brown coat	26,535	18,990	3516	
14.	Ditto, very deep green coat	25,250	18,080	3521	

The mean specific gravity of the Brasil diamonds appears to be	-	-	-	3513
Of the East India diamonds	-	-	-	3519
The mean of both	-	-	-	3517

Therefore if any thing is to be concluded as to the specific gravity of the diamond, it is, that it is to water as 3517 to 1000.

For the valuation of diamonds of all weights, Mr Jefferies lays down the following rule. He first supposes the value of a rough diamond to be settled at 21. per carat, at a medium; then to find the value of diamonds of greater weights, multiply the square of their weight by 2, and the product is the value required: *E. G.* to find the value of a rough diamond of two carats; $2 \times 2 = 4$, the square of the weight; which, multiplied by two, gives 8. the true value of a rough diamond of two carats. For finding the value of manufactured diamonds, he supposes half their weight to be lost in manufacturing them; and therefore, to find their value, we must multiply the square of double their weight by 2, which will give their true value in pounds. Thus, to find the value of a wrought diamond weighing two carats; we first find the square of double the weight, *viz.* $4 \times 4 = 16$; then $16 \times 2 = 32$. So that the true value of a wrought diamond of two carats is 32 l.—On these principles Mr Jefferies has constructed tables of the price of diamonds from 1 to 100 carats.

Diamonds are commonly found but of very small sizes. The largest ever seen was brought from Brasil, and is in the possession of the king of Portugal. It weighs $12\frac{1}{2}$ ounces, and has been valued at upwards of 50 millions sterling. By some skilful lapidaries, however, this stone is only reckoned to be a topaz; in which case, its value must be prodigiously diminished. The largest oriental diamond in the world belongs to the great Mogul. It weighs 279 carats. According to the computation of M. Tavernier, this diamond is worth 779,244 l. Ster. but by the tables of Mr Jefferies above-mentioned,

Diamond. mentioned, its value is only 624,962 l.

Brilliant DIAMOND, is that cut in faces both at top and bottom; and whose table, or principal face at top, is flat. To make a complete square brilliant, if the rough diamond be not found of a square figure, it must be made so; and if the work is perfectly executed, the length of the axis will be equal to the side of the square base of the pyramid.—Jewellers then form the table and collet by dividing the block, or length of the axis, into 18 parts. They take $\frac{1}{2}$ from the upper part, and $\frac{1}{8}$ from the lower. This gives a plane at $\frac{1}{4}$ distance from the girdle for the table; and a smaller plane at $\frac{1}{8}$ distance for the collet; the breadth of which will be $\frac{1}{2}$ of the breadth of the table. In this state the stone is said to be a *complete square table diamond*.—The brilliant is an improvement on the table-diamond, and was introduced within the last century, according to Mr Jefferies.—To render a brilliant perfect, each corner of the above described table-diamond must be shortened by $\frac{1}{10}$ of its original. The corner ribs of the upper sides must be flattened, or run towards the centre of the table $\frac{1}{2}$ less than the sides; the lower part, which terminates in the girdle, must be $\frac{1}{2}$ of one side of the girdle; and each corner rib of the under sides must be flattened at the top, to answer the above flattening at the girdle, and at bottom must be $\frac{1}{2}$ of each side of the collet.

The parts of the small work which completes the brilliant, or the star and skill facets, are of a triangular figure. Both of these partake equally of the depth of the upper sides from the table to the girdle; and meet in the middle of each side of the table and girdle, as also at the corners. Thus they produce regular lozenges on the four upper sides and corners of the stone. The triangular facets, on the under sides, joining to the girdle, must be half as deep again as the above facets, to answer to the collet part.—The stone here described is said to be a *full-substantive brilliant*.—If the stone is thicker than in the proportion here mentioned, it is said to be an *over-weighted brilliant*.—If the thickness is less than in this proportion, it is called a *spread-brilliant*.—The beauty of brilliants is diminished from their being either over-weighted or spread. The true proportion of the axis, or depth of the stone to its side, is as 2 to 3.—Brilliants are distinguished into square, round, oval, and drops, from the figure of their respective girdles.

Cornish DIAMOND, a name given by many people to the crystals found in digging the mines of tin in Cornwall. These crystals are of the nature of the Kerry-stone of Ireland, but somewhat inferior to it: they are usually bright and clear, except towards the root, where they are coarse and foul, or whitish. They are usually found in the common form of an hexangular column terminated at each end by a hexangular pyramid.

Rose-DIAMOND is one that is quite flat underneath, with its upper part cut in divers little faces, usually triangles, the uppermost of which terminate in a point.—In rose-diamonds, the depth of the stone from the base to the point must be half the breadth of the diameter of the base of the stone. The diameter of the crown must be $\frac{2}{3}$ of the diameter of the base. The perpendicular, from the base to the crown, must be $\frac{1}{2}$ of the diameter of the stone. The lozenges which appear in

all circular rose-diamonds, will be equally divided by the ribs that form the crown; and the upper angles or facets will terminate in the extreme point of the stone, and the lower in the base or girdle.

Rough DIAMOND, is the stone as nature produces it in the mines.

A rough diamond must be chosen uniform, of a good shape, transparent, not quite white, and free of flaws and shivers. Black, rugged, dirty, flawed, veiny stones, and all such as are not fit for cutting, they use to pound in a steel mortar made for that purpose; and when pulverized, they serve to saw, cut, and polish the rest. Shivers are occasioned in diamonds by this, That the miners, to get them more easily out of the vein, which winds between two rocks, break the rocks with huge iron levers, which shakes, and fills the stone with cracks and shivers. The ancients had two mistaken notions with regard to the diamond: the first, that it became soft, by steeping it in hot goat's blood; and the second, that it is malleable, and bears the hammer. Experience shews us the contrary; there being nothing capable of mollifying the hardness of this stone; though its hardness be not such, that it will endure being struck at pleasure with the hammer.

Table-DIAMOND. See *Brilliant DIAMOND*.

DIAMOND, in the glass-trade, an instrument used for squaring the large plates or pieces; and, among glaziers, for cutting their glass.

These sort of diamonds are differently fitted up. That used for large pieces, as looking-glasses, &c. is set in an iron ferril, about two inches long, and a quarter of an inch in diameter; the cavity of the ferril being filled up with lead, to keep the diamond firm: there is also a handle of box, or ebony, fitted to the ferril, for holding it by.

DIAMOND, in heraldry, a term used for expressing the black colour in the achievements of peerage.

Guillim does not approve of blazoning the coats of peers by precious stones instead of metals and colours; but the English practice allows it. Morgan says the diamond is an emblem of fortitude.

DIANA, the goddess of hunting, in heathen mythology, was the daughter of Jupiter and Latona. She is called Hecate in hell, Diana on earth, and Phoebe in heaven. She was famous for her chastity. Her temple at Epheusus was one of the seven wonders of the world. It was burnt the same day that Alexander the Great was born, by Erostratus, from no other motive but to perpetuate his name.

DIANÆ ARBOR, or **ARBOR LUNÆ**, in chemistry, the beautiful crystallizations of silver, dissolved in aqua fortis, to which some quicksilver is added: and so called from their resembling the trunk, branches, leaves, &c. of a tree. See *CHEMISTRY*, n° 198.

DIANDRIA, (from *δύο*, twice, and *άνδρ*, a man) the name of the second class in Linnaeus's sexual system, consisting of hermaphrodite plants; which, as the name imports, have flowers with two stamens or male organs.

The orders in this class are three, derived from the number of styles or female parts. Most plants with two stamens have one style; as jessamy, lilac, privet, veronica, and bastard alaternus: vernal grafs has two styles; pepper, three.

DIANTHERA, in botany, a genus of the monogynia,

Diamond
Dianthera.

Dianthus.

gynia order, belonging to the diandria class of plants, for which there is no English name.—There is only one species, a native of Virginia and other parts of North America. It is a low herbaceous plant, with a perennial root, sending out upright stalks a foot high, garnished with long narrow leaves of an aromatic odour, standing close to the stalks; from the side of the stalks the footstalks of the flowers are produced, sustaining small spikes of flowers.—This plant is very difficult to be preserved in Britain; for though it is hardy enough to live in the open air, it is very subject to rot in winter. It may be propagated by seeds sown on a gentle hot-bed; and in the winter the plants must be kept in a dry stove.

DIANTHUS, CLOVE-GILLIFLOWER, CARNATION, PINK, SWEET-WILLIAM, &c. a genus of the digynia order, belonging to the decandria class of plants.—There are a great number of species; but not more than four that have any considerable beauty as garden-flowers, each of which furnishes some beautiful varieties. 1. The caryophyllus, or clove-gilliflower, including all the varieties of carnation. It rises with many short trailing shoots from the root, garnished with long, very narrow, evergreen leaves; and amidst them upright slender flower-stalks, from one to three feet high, emitting many side-shoots; all of which, as well as the main stalk, are terminated by large solitary flowers, having short oval scales to the calix, and crenated petals. The varieties of this are very numerous, and unlimited in the diversity of flowers. 2. The deltoides, or common pink, rises with numerous short leafy shoots crowning the root, in a tufted head close to the ground, closely garnished with small narrow leaves; and from the ends of the shoots, many erect flower-stalks from about 6 to 15 inches high, terminated by solitary flowers of different colours, single and double, and sometimes finely variegated. This species is perennial, as all the varieties of it, commonly cultivated, also are. 3. The Chinensis, Chinese, or Indian pink, is an annual plant with upright firm flower-stalks, branching erect on every side, a foot or 15 inches high, having all the branches terminated by solitary flowers of different colours and variegations, appearing from July to November. 4. The barbatous, or bearded dianthus, commonly called *sweet-william*. This rises with many thick leafy shoots, crowning the root in a cluster close to the ground; garnished with spear-shaped evergreen leaves, from half an inch to two inches broad. The stems are upright and firm, branching erect two or three feet high, having all the branches and main stem crowned by numerous flowers in aggregate clusters of different colours and variegations.

Culture. Though the carnations grow freely in almost any garden earth, and in it produce beautiful flowers, yet they are generally superior in that of a light loamy nature: and of this kind of soil the florists generally prepare a kind of compost in the following manner, especially for those fine varieties which they keep in pots. A quantity of loamy earth must be provided, of a light sandy temperature, from an upland or dry pasture-field or common, taking the top spit turf and all, which must be laid in a heap for a year, and turned over frequently. It must then be mixed with about one third of rotten dung of old hot-beds, or rotten neats dung, and a little sea-sand, form-

ing the whole into a heap again, to lie three, four, or six months, at which time it will be excellent for use; and if one parcel or heap was mixed with one of these kinds of dungs, and another parcel with the other, it will make a change, and may be found very beneficial in promoting the size of the flowers. This compost, or any other made use of for the purpose, should not be sifted, but only well broken with the spade and hands.—When great quantities of carnations are required, either to furnish large grounds, or for market, or when it is intended to raise new varieties, it is easily effected by sowing some seed annually in spring, in common earth, from which the plants will rise abundantly. Several good varieties may also be expected from the plants of each sowing; and possibly not one exactly like those from which the seed was sowed. The single flowers are always more numerous than the double ones; but it is from the latter only that we are to select our varieties. The season for sowing the seed, is any time from the 20th of March to the 15th of April.—The plants generally come up in a month after sowing: they must be occasionally weeded and watered till July, when they will be fit for transplanting into the nursery beds. These beds must be made about three feet wide, in an open situation; and taking advantage of moist weather, prick the plants therein four inches asunder, and finish with a gentle watering, which repeat occasionally till the plants have taken good root. Here they must remain till September, when they will be so well advanced in growth as to require more room; and should then have their final transplantation into other three feet wide beds of good earth, in rows 9 inches asunder, where they are to be placed in the order of quincunx. Here they are to remain all winter, until they flower, and have obtained an increase of the approved varieties of doubles by layers; and until this period, all the culture they require is, that if the winter should prove very severe, an occasional shelter of mats will be of advantage. In spring, the ground must be loosened with a hoe; they must be kept clear from weeds; and when the flower-stalks advance, they are to be tied up to sticks, especially all those that promise by their large flower-pods to be doubles.

The only certain method of propagating the double varieties is by layers. The proper parts for layers are those leafy shoots arising near the crown of the root, which, when about five, six, or eight inches long, are of a proper degree of growth for layers. The general season for this work is June, July, and the beginning of August, as then the shoots will be arrived at a proper growth for that operation; and the sooner it is done after the shoots are ready, the better, that they may have sufficient time to acquire strength before winter: those laid in June and July will be fit to take off in August and September, so will form fine plants in the month of October. The method of performing the work is as follows.—First provide a quantity of small hooked sticks for pegs. They must be three or four inches long, and their use is to peg the layers down to the ground. Get ready also in a barrow a quantity of light, rich mould, to raise the earth, if necessary, round each plant, and provide also a sharp penknife. The work is begun by stripping off all the leaves from the body of the shoots, and shortening those at top an inch or two evenly. Then choosing a strong

Dianthus

strong joint on the middle of the shoot or thereabouts, and on the back or under side thereof, cut with the penknife the joint half-way through, directing your knife upward so as to slit the joint up the middle, almost to the next joint above, by which you form a kind of tongue on the back of the shoot; observing that the swelling fleshy part of the joint remaining at the bottom of the tongue must be trimmed off, that nothing may obstruct the issuing of the fibres; for the layers always form their roots at that part. This done, loosen the earth about the plant; and, if necessary, add some fresh mould, to raise it for the more ready reception of the layers; then with your finger make a hollow or drill in the earth to receive the layer; which, bend horizontally into the opening, raising the top upright, so as to keep the gash or slit part of the layer open; and, with one of the hooked ticks, peg down the body of the layer, to secure it in its proper place and position, still preserving the top erect, and the slit open, and draw the earth over it an inch or two, bringing it close about the erect part of the shoot; and when all the shoots of each plant are thus laid, give directly some water to settle the earth close, and the work is finished. In dry weather the waterings must be often repeated, and in five or six weeks the layers will have formed good roots. They must then be separated with a knife from the old plant, gently raised out of the earth with the point of a knife or trowel in order to preserve the fibrous roots of the layers as entire as possible; and when thus taken up, cut off the naked sticky part at bottom close to the root, and trim the tops of the leaves a little. They are then ready for planting either into beds or pots. In November the fine varieties in pots should be moved to a sunny, sheltered, situation for the winter; and if placed in a frame, to have occasional protection from hard frost, it will be of much advantage. In the latter end of February, or some time in March, the layers in the small pots, or such as are in beds, should be transplanted with balls into the large pots, where they are to remain for flower. To have as large flowers as possible, curious florists clear off all side-shoots from the flower-stem, suffering only the main or top buds to remain for flowering. When the flowers begin to open, attendance should be given to assist the fine varieties, to promote their regular expansion, particularly the largest kinds called *butchers*, whose flowers are sometimes three or four inches diameter. Unless these are assisted by art, they are apt to burst open on one side, in which case the flower will become very irregular: therefore, attending every day at that period, observe, as soon as the calix begins to break, to cut it a little open, at two other places in the indenting at top with narrow-pointed scissors, and hereby the more regular expansion of the petals will be promoted; observing, if one side of any flower comes out faster than another, to turn the pot about, that the other side of the flower may be next the sun, which will also greatly promote its regular expansion. When any fine flower is to be blown as large and spreading as possible, florists place spreading paper collars round the bottom of the flowers, on which they may spread their petals to the utmost expansion. These collars are made of stiff, white paper, cut circular, about three or four inches over, having a hole in the middle to receive the bottom of the flower,

and one side cut open to admit it. This is to be placed round the bottom of the petals in the inside of the calix, the leaves of which are made to spread flat for its support: the petals must then be drawn out and spread upon the collar to their full width and extent; the longest ones undermost, and the next longest upon these; and so on; observing that the collar must no where appear wider than the flower; and thus a carnation may be rendered very large and handsome.

These directions will answer equally well for the propagation of the pinks and sweet-williams, tho' neither of these require such nicety in their culture as the carnations.

DIAPASON, in music, a musical interval, by which most authors who have wrote on the theory of music, use to express the OCTAVE of the Greeks.

DIAPASON, among the musical instrument-makers, a kind of rule or scale whereby they adjust the pipes of their organs, and cut the holes in their hautboys, flutes, &c. in due proportion for performing the tones, semitones, and concords, just.

DIAPASON-Diaex, in music, a kind of compound concord, whereof there are two sorts; the greater, which is in the proportion of 10-3; and the lesser, in that of 16-5.

DIAPASON Diapente, in music, a compound consonance in a triple ratio, as 3-9. This interval, says Martianus Capella, consists of 9 tones and a semitone; 19 semitones, and 38 dieses. It is a symphony made when the voice proceeds from the first to the twelfth sound.

DIAPASON Diatessaron, in music, a compound concord founded on the proportion of 8 to 3. To this interval Martianus Capella allows 8 tones and a semitone; 17 semitones, and 34 dieses. This is when the voice proceeds from its first to its eleventh sound. The moderns would rather call it the *clavichord*.

DIAPASON Ditone, in music, a compound concord, whose terms are as 10-4, or as 5-2.

DIAPASON Semiditone, in music, a compound concord, whose terms are in the proportion of 12-5.

DIAPADESIS, in medicine, a transudation of the fluids through the sides of the vessels that contain them, occasioned by the blood's becoming too much attenuated, or the pores becoming too patent.

DIAPENTE, in the ancient music, an interval marking the second of the concords, and with the diatessaron an octave. This is what in the modern music is called a *fifth*.

DIAPHANOUS, an appellation given to all transparent bodies, or such as transmit the rays of light *. * See *Optics*.

DIAPHORESIS, in medicine, an elimination of the humours in any part of the body thro' the pores of the skin. See *PERSPIRATION*.

DIAPHORETICS, among physicians, all medicines which promote perspiration.

DIAPHRAGM. See *ANATOMY*, n° 370.

DIAPORESIS, a figure in oratory, expressing the uncertainty of the speaker how he shall proceed in his discourse.

DIARBECK, or **DIARBÈKER**, the modern name of the province of MESOPOTAMIA in Turkey in Asia.

DIARRHOEA, or **LOOSENESS**, in medicine, is a frequent and copious evacuation of liquid excrement by stool. See (the *Index* subjoined to) *MEDICINE*.

DIAR-

Diarthrosis

DIARTHROSIS. See ANATOMY, n° 2. c.

DIARY, among traders, denotes a day-book, containing the proceedings of one day.

DIACHISM, among musicians, denotes the difference between the comma and enharmonic diesis, commonly called the *lessor comma*.DIASCORDIUM, in pharmacy, a celebrated composition, so called from *seordum*, one of its ingredients. See PHARMACY, n° 888.DIASTOLE, among physicians, signifies the dilatation of the heart, auricles, and arteries; and stands opposed to the *SYSTOLE*, or contraction of the same parts. See ANATOMY, n° 388.DIASTOLE, in grammar, a figure in prosody whereby a syllable naturally short is made long. Such is the first syllable of *Priamides* in the following verse of Virgil: *Atque hic Priamides! nihil o tibi, amice, relictum.*

DIASYRMUS, in rhetoric, a kind of hyperbole, being an exaggeration of some low, ridiculous thing.

DIATESSARON, among ancient musicians, a concord, or harmonical interval, composed of a greater tone, a less tone, and one greater semitone: its proportion in numbers is as 4 : 3.

DIATONICK, in music, (compounded of two Greek words, *viz.* the preposition *dia*, signifying a transition from one thing to another, and the substantive *tonos*, importing a given degree of tension or musical note), is indifferently applied to a scale or gammut, to intervals of a certain kind, or to a species of music, whether in melody or harmony, composed of these intervals. Thus we say the *diatonick series*, a *diatonick interval*, *diatonick melody* or harmony. As the *diatonick scale* forms the system of *diatonick music*, and consists of *diatonick intervals*, it will be necessary, for understanding the former, that we should explain the latter. See INTERVAL.

DIATRAGACANTH, in pharmacy, a name applied to certain powders, of which gum tragacanth is the chief ingredient. See PHARMACY, n° 825. b.

DIAUGOPHRAGMIA, in natural history, a genus of fossils of the order of septariae, whose partitions, or septa, consist of spar with an admixture of crystal. Of this genus there are three species. 1. A red kind, with brownish yellow partitions. 2. A brownish yellow kind, with whitish partitions. 3. A bluish-white kind, with straw-coloured partitions.

DIBBLE, or DIBBER, a simple but useful implement in gardening, used for planting out all sorts of young plants, &c.

DIBBLING WHEAT. See WHEAT.

DICE, among gamblers, certain cubical pieces of bone or ivory, marked with dots on each of their faces, from one to six, according to the number of faces.

Sharps have several ways of falsifying dice. 1. By sticking a hog's bristle in them, so as to make them run high or low, as they please. 2. By drilling, and loading them with quicksilver: which cheat is found out by holding them gently by two diagonal corners; for if false, the heavy sides will turn always down. 3. By filing and rounding them. But all these ways fall far short of the art of the dice-makers; some of whom are so dexterous this way, that your sharpening gamblers will give any money for them.

Dice formerly paid 5 s. every pair imported, with an additional duty of 4 s. 5 $\frac{1}{2}$ d. for every 20 s. value up-

on oath; but are now prohibited to be imported.

Dicæarchus

DICÆARCHUS, a scholar of Aristotle, composed a great number of books which were much esteemed. Cicero and his friend Pomponius Atticus valued him highly. He wrote a book to prove, that men suffer more mischief from one another, than from all evils beside. And the work he composed concerning the republic of Lacedæmon was extremely honoured, and read every year before the youth in the assembly of the ephori. Geography was one of his principal studies, on which science there is a fragment of a treatise of his still extant, and preserved among the *Veteris geographiæ scriptores minores*.

DICHOTOMY, a term used by astronomers for that phasis or appearance of the moon, wherein she is bisected, or shews just half her disk. In this situation the moon is said to be in a quadrat aspect, or to be in her quadrature.

DICHOTOMY, in botany. See BOTANY, p. 1298.

DICKER, in old writers, denotes the quantity of ten hides of skins, whereof 20 made a last: also 10 pair of gloves, ten bars of iron, and the like, are sometimes expressed by the term *dicker*.DICKINSON (Edmund), a celebrated English physician and chemist, born in 1624. He studied and took his degrees at Merton-college, Oxford; and in 1655 published there his *Delphi Phœnicizantes*, &c. a most learned piece, in which he attempted to prove that the Greeks borrowed the story of the Pythian Apollo, and all that rendered the oracle at Delphos famous, from the Holy Scriptures, and the book of Joshua in particular: a work that procured him great reputation both at home and abroad. He practised physic first at Oxford; but removing to London in 1684, his good fortune in recovering the earl of Arlington from a dangerous sickness, procured his promotion to be physician in ordinary to Charles II. and to his household. As that prince understood and loved chemistry, Dr Dickinson grew into great favour at court; and was continued in his appointments under James II. After the abdication of his unfortunate master, being then in years, and afflicted with the stone, he retired from practice, and died in 1707. He published many other things, particularly *Physica vetus & vera*, &c. containing a system of philosophy chiefly framed on principles collected from the Mosiac history.DICTAMNUS, WHITE DITTANY, or *Fraxinella*: a genus of the monogynia order, belonging to the dicandria class of plants. There is only one species. It hath thick, penetrating, perennial roots, collected into a head at top, sending up erect stalks annually, two or three feet high, garnished with pinnated alternate leaves, of three or four pair of oblong stiff lobes, terminated by an odd one; and the stalks crowned by long, pyramidal, loose spikes of flowers, of white, red, and purple colours. They are very ornamental plants, and succeed in any of the common borders. The dittany which grows in Crete, Dalmatia, and the Morea, forms an article in the materia medica. The leaves, which are the only parts used, are imported from Italy. The best sort are well covered over with a thick white down, and now and then intermixed with purplish flowers. In smell and taste they somewhat resemble lemon-thyme, but have more of an aromatic

Dictator
Dictionary

matic flower, as well as a greater degree of pungency; when fresh they yield a considerable quantity of an excellent essential oil.

DICTATOR, in the policy of the ancient Romans, a magistrate invested with sovereign and even arbitrary power.

He had power of life and death; also to raise and disband troops, make war or peace, and that without the consent either of the senate or people, or being accountable for his proceedings. He was elected by one of the consuls in the night-time, on the frontiers of the commonwealth, and nowhere else; and the ordinary duration of his office was only for six months, during which time all other magistracies ceased, the tribuneship excepted. Whenever he appeared in public, he was attended by 24 lictors, or double the number allowed a consul. However, notwithstanding all this power, he could not go out of Italy, or even ride on horseback during a march, without leave from the people.

This office was accounted the safeguard of the commonwealth for 400 years together; till Sylla and Cæsar, by assuming the title of *perpetual dictators*, converted it into tyranny, and rendered the very name odious.

DICTION, the phrase, elocution, or style of a writer or speaker. See **ORATORY**, n° 99—121.

DICTIONARY, in its original acceptation, is the arranging all the words of a language according to the order of the alphabet, and annexing a definition or explanation to each word. When arts and sciences began to be improved and extended, the multiplicity of technical terms rendered it necessary to compile dictionaries either of science in general, or of particular sciences, according to the views of the compiler.

DICTIONARY of the English Language. The only attempt which has hitherto been made towards forming a regular dictionary of the English language, is that of the learned Dr Samuel Johnson. But altho' it is executed in a masterly manner, yet as it cannot be expected that an undertaking of this nature could be brought to perfection by one man, we shall venture to suggest a few circumstances which, if duly attended to, may perhaps be of some utility.

The design of every dictionary of language, is to explain, in the most accurate manner, the meaning of every word; and to shew the various ways in which it can be combined with others, in as far as this tends to alter its meaning. The dictionary which does this in the most accurate manner, is the most complete. Therefore the principal study of a lexicographer ought to be, to discover a method which will be best adapted for that purpose. Dr Johnson, with great labour, has collected the various meanings of every word, and quoted the authorities; but, would it not have been an improvement if he had given an accurate definition of the precise meaning of every word; pointed out the way in which it ought to be employed with the greatest propriety; showed the various deviations from that original meaning, which custom had so far established as to render allowable; and fixed the precise limits beyond which it could not be employed without becoming a vicious expression? With this view, it would have been necessary to exhibit the nice distinctions that take place between words which are

nearly synonymous. Without this, many words can only be defined in such a manner, as that they must be considered as exactly synonymous. We omit giving any quotations from Johnson, to point out these defects; and shall content ourselves with giving a few examples, to show how, according to our idea, a dictionary of the English language ought to be compiled.

IMMEDIATELY. *adv. of time.*

1. Instantly, without delay. Always employed to denote future time, and never past. Thus, we may say, *I will come immediately*; but not, *I am immediately come from such a place*. See **PRESENTLY**.
2. Without the intervention of any cause or event; as opposed to *mediately*.

PRESENTLY. *adv. of time.*

1. Instantly, without delay. Exactly synonymous with *immediately*; being never with propriety employed to denote any thing but future time.
2. Formerly it was employed to express present time. Thus, *The house presently possessed by such a one*, was often used: but this is now become a vicious expression; and we ought to say, *The house possessed at present*. It differs from *immediately* in this, that even in the most corrupt phrases it never can denote past time.

FORM. *subst.* The external appearance of any object, when considered only with respect to shape or figure. This term therefore, in the literal sense, can only be applied to the objects of the sight and touch; and is nearly synonymous with *figure*: but they differ in some respects. *Form* may be employed to denote more rude and unfinished shapes; *figure*, those which are more perfect and regular. *Form* can never be employed without denoting matter; whereas *figure* may be employed in the abstract: thus, we say a square or a triangular *figure*; but not a square or triangular *form*. And in the same manner we say, the *figure* of a house: but we must denote the substance which forms that figure, if we use the word *form*; as, *a shroud of the form of a house*, &c. See **FIGURE**.

2. In contrast to irregularity, or confusion. As beauty cannot exist without order, it is by a figure of speech employed to denote beauty, order, &c.
3. As *form* respects only the external appearance of bodies, without regard to their internal qualities, it is, by a figure of speech, employed in contrast to these qualities, to denote empty show, without essential qualities. In this sense it is often taken when applied to religious ceremonies, &c.
4. As *form* is employed to denote the external appearance of bodies; so, in a figurative sense, it is applied to reasoning, denoting the particular mode or manner in which this is conducted; as, *the form of a syllogism*, &c.
5. In the same manner it is employed to denote the particular mode of procedure established in courts of law; as, *the forms of law, religion*, &c.
6. *Form* is sometimes, although improperly, used to denote the different circumstances of the same body; as, *water in a fluid or a solid form*. But

as this phrase regards the internal qualities rather than the external figure, it is improper; and ought to be, *water in a fluid or a solid state*.

7. But when bodies of different kinds are compared with one another, this term may be employed to denote other circumstances than shape or figure: for we may say, *a juice exuding from a tree in the form of wax or resin*; although, in this case, the consistence, colour, &c. and not the external arrangement of parts, constitutes the resemblance.
8. From the regular appearance of a number of persons arranged in one long seat, such persons so arranged are sometimes called a *form*; as, *a form of students*, &c. And,
9. By an easy transition, the seat itself has also acquired that name.

GREAT. *adj.* A relative word, denoting largeness of quantity, number, &c. serving to augment the value of those terms with which it is combined, and opposed to *small* or *little*. The principal circumstances in which this word can be employed, are the following:

1. When merely inanimate objects are considered with regard to quantity, *great* is with propriety employed, to denote that the quantity is considerable; as, *a great mountain, a great house*, &c. and it is here contrasted with *small*. When *great* is thus employed, we have no other word that is exactly synonymous.
2. When inanimate objects are considered with regard to their extent, this term is sometimes employed, although with less propriety; as, *a great plain, a great field*, &c. And in this sense it is nearly synonymous with *large*; and they are often used indiscriminately, but with some difference of meaning: for, as *large* is a term chiefly employed to denote extent of superficies, and as *great* more particularly regards the quantity of matter; therefore, when *large* is applied to any object which is not merely superficial, it denotes that it is the extent of surface that is there meant to be considered, without regard to the other dimensions; whereas when the term *great* is employed, it has a reference to the whole contents. If, therefore, we say, *a large house, or a large river*, we express that the house, the river, have a surface of great extent, without having any necessary connection with the size in other respects. But if we say, *a great house, or a great river*, it at once denotes that they have not only a large surface, but are also of great size in every respect.
3. *Great*, when applied to the human species, never denotes the size or largeness of body, but is applied solely to the qualities of the mind. Thus, when we say, that *Socrates was a great man*, we do not mean that he was a man of great size, but that he was a man who excelled in the endowments of the mind. The terms which denote largeness of size in the human body are, *big, bulky, huge*, &c.
4. *Great* is sometimes applied to the human species, as denoting high rank. In this case it is oftener used in the plural number than otherwise. Thus

we say simply, *the great*, meaning the whole body of men in high station, as opposed to *mean*. It should seldom be employed in this sense, as it tends to confound dignity of rank with elevation of mind.

5. As this is a general term of augmentation, it may be joined with all nouns which denote *quantity, quality, number, excellence, or defects*; or such as imply *praise, blame, anger, contempt*, or any other affection of the mind.
6. It is employed to denote every step of ascending or descending consanguinity; as, *great-grandfather, great-grandson*, &c.

HIGH. *adj.* Exalted in a perpendicular direction at a distance from the surface of the earth. Opposed to *low*.

1. *High* is a term altogether indefinite, and is employed to express the degree of elevation of any inanimate body. Thus, we say, *a high mountain, a high house, steeple, tower, pillar*, &c. Nor is there any other word that can here be considered as synonymous; *lofty* being employed only to denote a very eminent degree of elevation.
2. To express the perpendicular elevation of vegetables, either *high* or *tall* may be employed, as being in this case nearly synonymous. We may therefore say, *a high or tall tree, a high or tall mast*, &c.: but with this difference between these two expressions, that *tall* can be more properly applied to those that are much elevated and of small dimensions; and *high*, to such as are more bulky, and of greater size.
3. The perpendicular height of man can never be expressed by the word *high*: *tall* being here the proper expression. And altho' *high* is sometimes used to express the height of other animals, yet it seems to be an improper expression. See **TALL**.
4. *High*, when applied to the human species, always refers to the mind; and denotes *haughtiness, stateliness, pride*, &c.; and, when combined with the expressions of any energy of the mind, it denotes that in a higher degree. In this sense, it is opposed to *meanness, abjectness, and humility*.
5. As this is an indefinite term, tending to denote any thing that is elevated above us, it may be combined with almost every noun which admits of this elevation. And as objects high above us are always out of our reach, it is in a metaphorical sense used to denote any thing that seems to be above the ordinary condition of mankind; or those qualities or endowments of mind that are not easily acquired: as, *dignity or elevation of sentiment; dignity of rank; acuteness in reasoning; difficult subjects; pride, haughtiness*, or any other quality which seems beyond the ordinary level of mankind; *dearths of price*, &c.
6. In the same manner we apply this term to time; which having a metaphorical resemblance to a river flowing on with an unceasing current thro' all successive ages, any thing of remote antiquity is denoted by the term *high*.
7. Likewise those degrees of latitudes far removed from the line, where the pole becomes more elevated.
8. And to some particular crimes, as being attended

tended with peculiar degrees of guilt; as, *high treason*.

TALL. *adj.* Something elevated to a considerable degree in a perpendicular direction. Opposed to *low*.

1. This term is chiefly employed to express the height of man, and other animals; and is applied to denote the height of the body only, without having any reference to the mind. When applied to man, no other word can be substituted in its stead; when applied to other animals, *high* is sometimes considered as nearly synonymous. See **HIGH**.

2. It is likewise employed to denote the perpendicular height of vegetables; and in this case, it is nearly synonymous with *high*. See **HIGH**.

3. It can in no case be employed to express the height of merely inanimate objects; as we can never say a *tall steeple, tower, or pillar*, but a *high steeple, &c.* For the distinctions in these cases, see **HIGH**.

LONG. *adj.* A relative term, denoting the distance between the extremes of any body, which is extended more in one of its geometrical dimensions than another. Opposed to *short*.

1. This term may be applied to all inanimate objects, of whatever kind, whose dimensions in one way exceeds the other, and when not in an erect posture, whatever be the other circumstances attending them; whether it relates to superficies alone, or to solid bodies; whether these be bounded or open, straight or crooked, flexible or rigid, or in any other circumstances whatever: thus we say, a *long or short line, a long or short ridge, street, ditch, rope, chain, staff, &c.* But it is to be observed, that although *long* is in the strict sense only opposed to *short*; yet as it expresses the extension of matter in one of its geometrical proportions, it is often contrasted by those words which express the other proportions when we mean only to describe the several proportions; as, a *table long and broad*. And as these several dimensions are expressed by different words, according to the various forms, modifications, and circumstances, in which bodies are found, therefore it is in this sense contrasted by a great diversity of terms: as, a *long and broad or wide, narrow or strait, street or lane, a long and thick, or small, rope, chain, staff, &c.* For the distinctions in these cases, see **BROAD**, **WIDE**, &c.

2. Objects necessarily fixed in an erect position can never have this term applied to them; and therefore we cannot say a *long, but a high, tower or steeple*. And for the same reason, while trees are growing and fixed in an erect position, we cannot apply this term to them; but when they are felled and laid upon the ground, it is quite proper and necessary. Thus, we do not say a *long, but a tall or high tree*, while it is growing; but we say a *long, not a tall, log of wood*: and in the same manner we say a *tall mast*, when it is fixed in the ship; but a *long mast*, while it lies upon the beach. See **TALL** and **HIGH**.

3. Those vegetables which are of a tender pliant nature, or so weak as not to be able to retain a fixt

position, being considered as of a middle nature between erect and prostrate bodies, admit of either of the terms *long, tall, or high*; as, a *long or tall rush or willow wand, or a long, tall, or high stalk of corn*. See **HIGH** and **TALL**.

4. The parts of vegetables, when considered as distinct from the whole, even when growing and erect, assume the term *long*: for we do not say a *tall, but a long, shoot of a tree; and a tree with a long stem*, in preference to a *tree with a high stem*.

5. For the same reason, a *staff, and pole*, even when fixed in a perpendicular direction, assume the word *long*, in preference to *tall or high*.

6. With regard to animals, the general rule is applied, without any exceptions: *tall*, and not *long*, being employed to denote the height of the human body, when in an erect posture; and *long*, and not *tall*, to denote its length when in an incumbent situation. *Long*, applied to all other animals which do not walk erect, always denotes their greatest length in a horizontal position from head to tail.

7. In a figurative sense, it denotes, with regard to time, any thing at a great distance from us.

8. As also, any thing that takes up much time before it is finished; as, a *long discourse, a protracted note in music, &c.*

BROAD. *adj.* The distance between the two nearest sides of any body, whose geometrical dimensions are larger in one direction than in another; and has a reference to superficies only, and never to the solid contents. Opposed to *narrow*.

1. *Broad*, in the strictest acceptation, is applied to denote those bodies only whose sides are altogether open and unconfined; as, a *broad table, a broad wheel, &c.*: and in these cases it is invariably contrasted by the word *narrow*; nor is there any other word which in these cases can be considered as synonymous with it, or used in its stead.

2. When any object is in some sort bounded on the sides, although not quite closed up, as a road, street, ditch, &c. either *broad or wide* may be employed, but with some difference of signification; *broad* being most properly used for those that are more open, and *wide* for those which are more confined: nor can this term be ever applied to such objects as are close bounded all around, as a house, a church, &c. *Wide* being here employed. For the more accurate distinctions in these cases, see the article **WIDE**.

WIDE. *adj.* A term employed to denote relative extent in certain circumstances. Opposed to *narrow and strait*.

1. This term is in its proper sense applied only to denote the space contained within any body closed all round on every side; as a house, gate, &c.: and differs from *broad* in this, that it never relates to the superficies of solid objects, but is employed to express the capaciousness of any body which containeth vacant space; nor can capaciousness in this sense be expressed by any other word but *wide*.

2. As many bodies may be considered either with respect to their capaciousness, or superficial extent; in all these cases, either the term *broad or wide* may be used; as, a *broad or wide street or ditch*,

ditch, &c. but with a greater or less degree of propriety, according to the circumstances of the object, or the idea we wish to convey. In a street where the houses are low and the boundaries open, or in a ditch of small depth and large superficies, as this largeness of superficies bears the principal proportion, *broad* would be more proper: but if the houses are of great height, or the ditch of great depth, and capaciousness is the principal property that affects the mind, we would naturally say a *wide street* or *ditch*; and the fame may be said of all similar cases. But there are some cases in which both these terms are applied, with a greater difference of meaning; thus we say, a *broad* or a *wide gate*: But as the gate is employed to denote either the aperture in the wall, or the matter which closes that aperture, these terms are each of them used to denote that particular quality to which they are generally applied: and as the opening itself can never be considered as a superficies, the term *wide*, in this case, denotes the distance between the sides of the aperture; while, on the contrary, *broad* denotes the extent of matter fitted to close that aperture; nor can these two terms in any case be substituted for one another.

3. As a figurative expression, it is used as a cant phrase for a mistake: as, *you are wide of the mark*; that is, not near the truth.

NARROW. *adj.* A relative term, denoting a proportional smallness of distance between the sides of the superficies of plain bodies. Opposed to *broad*.

1. As this is only applied to superficies, it is exactly contrasted by *broad*, and is applied in all cases where the term *broad* can be used, (see **BROAD**); and in no other case but as a contrast to it, except the following.
2. It sometimes is employed to describe the smallness of space circumscribed between certain boundaries, as opposed to *wide*, and nearly synonymous with *strait*; as we say a *wide* or a *narrow house*, *church*, &c. For the necessary distinctions here, see the article **STRAIT**.
3. In a figurative sense it denotes *parsimony*, *poverty*, *confined sentiments*, &c.

STRAIT. *adj.* A relative term, denoting the extent of space in certain circumstances. Opposed to *wide*; see **WIDE**.

4. This term is employed, in its proper sense, to denote only space, as contained between surrounding bodies in such circumstances as to denote some degree of confinement; and is exactly opposed to *wide*: as, a *wide* or a *strait gate*, &c. See **WIDE**.
2. So necessary is it that the idea of confinement should be connected with this word, that in all those cases where the space contained is large, as in a church or house, we cannot express a smaller proportional width by this term. And as we have no other word to express space in these circumstances, we have been obliged to force the word *narrow* from its natural signification, and make it express this. See **NARROW**.
3. In some particular cases, *narrow* or *strait* may be employed to the same object; as, a *narrow* or a *strait lane*: but here *strait* is never employed but

where an idea of confinement is suggested, and where it is exactly contrasted to *wide*; nor can *narrow* be employed but in such circumstances where *broad* would be a perfect contrast to it. Therefore these two terms may be always employed in the same circumstances as those which contrast them may be. For an account of which, see **WIDE**.

3. The term *strait* is likewise in a peculiar manner used to denote the smallness of the internal diameter of those small bodies which are fitted to receive or contain others, as any kind of bag, tube, body-cloaths, mortoise, and others of the same kind; and in all these cases this term may be employed to denote the smallness of their lesser diameter, and never the term *narrow*. But in certain circumstances the word *tight* may be substituted for it. See **TIGHT**.
4. *Strait*, in a figurative sense, denotes any sort of confinement of sentiment or disposition.

TIGHT. *adj.* A term employed in certain circumstances to denote the internal capacity of particular bodies. Nearly synonymous with *strait*.

This term is confined entirely to denote the smallness of the internal dimensions of such objects as are formed to cover or to receive or contain other solid bodies, and can be employed in no other case. And although it agrees with *strait*, in always denoting confinement, and by being applicable to the same species of objects, yet it differs in the following respects: 1. If there be any difference of the diameter of the objects to which the term *strait* can be applied, it always has reference to the smaller; yet *tight* may be applied to any sort of confinement, whether it regards the length or breadth. 2. *Strait* can be applied to all bodies of capacity when of small diameter, without any sort of reference to the nature of the substance which it may be capable of containing. For we can say a *strait bag*, a *strait sleeve*, a *strait mortoise*, a *strait gate*, &c. whereas *tight* can only be applied to any body when it is considered as having reference to another body which is intended to be contained in it, and is pinched for want of room. Thus, we say, the *sleeve of a coat is too tight for the arm*, the *mortoise is too tight for the tenon*, &c.; but we cannot say, the *bag*, or the *gate*, is too tight, because these are fitted to receive any sort of objects. And hence it happens, that, in many cases, the dimensions of the same body may be expressed by *tight* or *strait* when considered in different circumstances. Thus, we may say, *this sleeve is too strait*, when we look at a coat when lying on the table, and consider its proportions; but it is not till we have tried it upon the arm that it is intended to cover, that we call it *tight*. And we may say, a *gate is too strait*, or *too tight*: but in the first case we consider it as being too confined for admitting objects to pass through it; and in the last, as being too confined with respect to the leaves that are to shut the aperture, not allowing them space to move with freedom.

These examples may serve to give some idea of the plan of an English Dictionary composed upon philosophical

Dictionary. phical principles: But, besides the circumstances above enumerated, there are many others which would require particular attention in the execution of a work of this kind. In the English language, a great variety of terms occur, which denote matter under certain general forms or circumstances, without regarding the minute diversities that may take place; as the word *cloth*, which denotes matter as manufactured into a particular form, including under it all the variety of stuffs manufactured in that particular way, of whatever materials, colours, texture, or fineness, they may be. The same may be said of *wood*, *iron*, *yarn*, and a great variety of terms of the same nature, some of which cannot assume any plural; while others admit of it in all cases, and others admit or refuse it according to the different circumstances in which they are considered. In a dictionary, therefore, all this variety of cases ought to be clearly and distinctly pointed out under each particular article: this is the more necessary, as some of these words have others formed from them, which might be readily mistaken for their plurals, altho' they have a very different signification; as *cloaths*, which does not denote any number of pieces or different kinds of *cloth*, but *wearing apparel*. The following example will illustrate this head.

WOOD. *fab.* A solid substance, of which the trunks and branches of trees consist.

1. This term is employed to denote the solid parts of vegetables of all kinds, in whatever form or circumstances they are found. Nor does this term admit of plural with propriety, unless in the circumstances after-mentioned: for we say, *many different kinds of woods*, in preference to *many kinds of woods*; or, we say, *oak*, *ash*, or *elm wood*, not *woods*.

2. But where we want to contrast *wood* of one quality or country with that of another, it admits of a plural: for we say, *white woods are in general softer than red*; or *West-Indian woods are in general of greater specific gravity than the European woods*: But unless where the colour, or some quality which distinguishes it from growing wood, is mentioned, this plural ought as much as possible to be avoided, as it always suggests an idea of growing wood.

3. *Wood* likewise denotes a number of trees growing near one another; being nearly synonymous with *forest*: See FOREST. In this sense it always admits of a plural; as, *The woods and wilds whose solitary gloom, &c.*

A Dictionary cannot be reckoned complete without explaining obsolete words; and if the terms of the several provincial dialects were likewise given, it would be of great utility: nor would this take much time; because a number of these words need no other explanation than to mark along with them the words which had come in their place, when there happened to be one perfectly synonymous: and in those cases where the same idea could not be expressed in modern language without a periphrasis, it would be of use to explain them distinctly; so that, when a writer found himself at a loss for a term, and obliged to search for one beyond the bounds of our own language, he might take one of these, when he found that it was expressive and energetic, in preference to another drawn from a

foreign language. This would at least have one good effect; it would make our language more fixed and stable; not to say more accurate and precise, than by borrowing from foreign languages. The following examples may serve to give some idea of the manner of treating this part of the work.

MOE, or MO. *adj.* An obsolete term, still employed in the Scotch dialect, and by them pronounced *mae*; denoting a greater number, and nearly synonymous with *more*: but it differs in this respect, that, in the Scotch dialect, *mae* and *mair* (English, *more*) are each employed in their distinct sphere, without encroaching upon one another; *mae* being employed to denote number, but never quantity or quality; and *mair*, to denote quantity and quality, but never number: thus they say *mae*, not *mair*, *apples*, *men*, &c. and they say *mair*, not *mae*, *cloth*, *earth*, *courage*, &c. See MAIR. Both of these terms are supplied by the word *more*; which, in the English language, is applied indiscriminately to denote quantity, quality, and number. See MORE.

THIR. *pron.* Obsolete; still employed in the Scotch dialect: the plural of *this*; and contrasted to *these*, in the same manner as *that* is to *this*.

As there is no word in the English language equivalent to this, we thus shew the manner in which it is employed. In the English language we say, *that stone or house*, pointing at one at a distance, *is larger or more commodious than this stone or this house*, which is supposed to be at hand. In the same manner, in the Scotch dialect, they say, *these* (or, as it is pronounced, *thae*) *stones are rubbier than thir stones*; denoting, that the former are at a distance, and the latter at hand. And, in the same manner, it is invariably applied to denote any present object in the plural number, as opposed to *these*: as *these or thir apples*, as at hand or at a distance; *these or thir trees*, &c.; but never in the singular number, as it is always *this* or *that tree, house*, &c.

As the English language is so exceedingly irregular in the pronunciation, the same letter in the same situation often assuming sounds totally different in different words, it is impossible to establish any general rules on this subject, which do not admit of many exceptions: therefore, a dictionary is the best means of ascertaining and pointing out the proper pronunciation of words. For, if the writer first pointed out all the different sounds that the same letter could ever be made to express, and assigned to every particular sound which each letter could be made to assume, a particular mark, which was appropriated to denote that particular sound of the letter whenever it occurred; by placing these particular marks above the letters in the dictionary, the sound of each letter would be pointed out in all cases with the utmost certainty. It would be impossible for us to illustrate this by examples, without first ascertaining all the sounds of each letter; which would lead us into a discussion too long for this place; and this is at present the more unnecessary, as the public have been long in expectation of a dictionary, by a very able hand, in which this particular will be attended to.

We shall only further observe, that, besides having the

Dictionary

Didelphis.

the accented syllable of every word *properly* distinguished in a dictionary to assist in the pronunciation, the English language requires another essential improvement, *viz.* the use of accents to distinguish the meaning of words and phrases; which, although it is not so properly confined to a lexicographer, yet it is not quite without his sphere. Thus the word *as* admits of two very different sounds, as well as different significations; as in this example, "Cicero was nearly as eloquent as Demosthenes;" in which the first *as* is pronounced *af*, and the last is pronounced *az*. Now, it often happens, that, in reading, the particular way in which it ought to be understood is not pointed out by the context, till after the word itself is pronounced, which has an equal chance at least of being pronounced wrong; whereas, if it were always accented when employed in the one sense, and not in the other, it would free the reader from this perplexity. There are other cases in which the use of proper accents in writing would be of great consequence; as at the beginning of a sentence, when it was put as a question, or used ironically, &c. the want of which every one must have observed. But as this does not so properly belong to the lexicographer as the grammarian, we shall here take no further notice of it.

The above examples, we hope, will be sufficient to give the reader some idea of the plan that we would propose; and enable him to determine, whether or not a dictionary, executed upon this plan, would convey to his mind a more perfect knowledge of the English language, than those dictionaries that have been hitherto published. These examples were given rather with a view to show the manner in which a work of this kind might be conducted, than as perfect and unexceptionable explanations of the several articles there enumerated; and therefore we did not think it necessary to produce any authorities, although we are sensible that they would be requisite in a work of this kind.

DICTYS (Cretensis), a very ancient historian, who serving under Idomeneus king of Crete in the Trojan war, wrote the history of that expedition in nine books; and Tzetzes tells us, that Homer formed his Iliad upon the plan of that history. It is however maintained, that the Latin history of Dictys which we have at present is spurious.

DIDACTIC, in the schools, signifies the manner of speaking, or writing, adapted to teach or explain the nature of things.

DIDACTIC Poetry. See **POETRY**, n° 69, &c.

DIDAPPER, in ornithology. See **COLYMBUS**.

DIDELPHIS, or **OPPOSSUM**, in zoology; a genus of quadrupeds belonging to the order of ferae, the characters of which are these: they have ten fore-teeth in the upper jaw, and eight in the under one. The dog-teeth are long; the tongue is somewhat ciliated; and they have a pocket formed by a duplicature of the skin of the belly, in which the dugs are included.

There are six species. 1. The marsupialis, with a long sharp-pointed nose; large, round, naked, and very thin ears; small, black, lively, eyes; long stiff hairs on each side the nose, and behind the eyes: the hind part of the neck and back covered with hair two inches long; the bottoms of a yellowish white, middle part black, ends whitish: the sides covered with hair

of a dirty and dusky colour; the belly with soft, woolly, dirty white hair: the tail, for near three inches, clothed with long hairs like those on the back; the rest of the tail covered with small scales. The tail of this animal has a disagreeable appearance, looking like the body of a snake, and has the same prehensile quality with that of some monkeys; the body is round and pretty thick, the legs short: on the lower part of the belly of the female is a large pouch, in which the teats are lodged, and where the young shelter as soon as they are born. The length of the body is 16 or 17 inches; that of the tail 14.—This creature inhabits many parts of America and the East Indies. It is very destructive to poultry, and sucks the blood without eating the flesh; it feeds also on roots and wild fruits, and is very active in climbing trees. It hunts eagerly after birds and their nests; and will hang suspended from the branches of a tree by its tail; then, by swinging its body, it will fling itself among the trees that grow in the neighbourhood. It walks very slow; and when pursued and overtaken, will feign itself dead. It is not easily killed, being as tenacious of life as a cat. When the female is about to bring forth, she makes a thick nest of dry grass in some close bush at the foot of a tree; and brings four, five, or six, young at a time. As soon as the young are brought forth, they take shelter in the pouch or false belly; and fasten so closely to the teats, that they cannot be separated without difficulty. They are blind, naked, and very small, when new-born, and resemble fetuses: it is therefore necessary that they should continue in that false belly, till they attain proper strength and sight; and are prepared to undergo what may be called a *second birth*. After this they run into the pouch as into an asylum in time of danger; and the parent carries them about with her. During the time of this second gestation, the female shews an excessive attachment to her young, and will suffer any torture rather than allow this receptacle to be opened; for she has the power of opening or closing it by the assistance of some very strong muscles. The flesh of the old animal is very good, like that of a sucking pig: the hair is dyed by the Indian women, and wove into garters and girdles: the skin is very fetid.

2. The murina, hath the face and upper parts of the body of a tawny colour; the belly yellowish white; the tail slender, and covered with minute scales to the very rump: the length from the nose to the tail, about six inches and a half; the tail of the same length: the female wants the false belly of the former; but on the lower part the skin forms on each side a fold, between which the teats are lodged. It inhabits the hot parts of South America; agrees with the others in its food manners, and the prehensile power of its tail. It brings from 10 to 14 young ones at a time: they assist themselves to the teats as soon as they are born, and remain attached like inanimate things, till they attain growth and vigour to shift a little for themselves.

3. The Mexican oppossum, is of an ash-colour on the head and upper parts of the body: the belly and legs whitish: the tail long and pretty thick, varied with brown and yellow; it is hairy near an inch from its origin, the rest naked: the length from the nose to the tail, about seven inches and a half; of the tail, more than 11.—It inhabits the mountains of Mexico,

and

Diadelp

Plate
LXXX
fig. 7.

and lives in trees, where it brings forth its young: when in any fright, they embrace the parent closely; the tail is prehensile, and serves instead of a hand.

4. The short-tailed opossum, hath the back of a dull red, and the belly of a paler colour; the tail scarce half the length of the body, thick at the base, and gradually lessening towards the end: no false belly. It inhabits South America: the young adhere to the teats as soon as born. Seba says, it lives in woods, and brings from 9 to 12 young ones at a time.

5. The opossum of Surinam, hath the upper part of the body reddish, mixed with a light ash-colour and yellow: the under-parts are of a dirty yellowish white; the bottom of the tail is covered with hair, for near two inches and a half; the rest naked: the length from the nose to the tail near nine inches; the tail ten. It inhabits Surinam, and perhaps may be the species called by the colonists the *cane-rat*; which is so destructive to the sugar-canes.

6. The dorifera, or merian opossum, hath the head and upper part of the body, of a yellowish brown colour; the belly white, and tinged with yellow; the tail very long and slender, and, except at the base, quite naked.—It is a native of Surinam, and burrows under ground: it brings five or six young at a time, which follow their parent: On any apprehension of danger, they all jump on her back; and, twining their tails round her's, she immediately runs with them into her hole.

DIDO, the daughter of Belus king of Tyre, and the wife of Sichæus. To avoid the tyranny of her brother Pygmalion, who had put her husband to death, she fled into Africa, where she built Carthage, 882 B. C. At length Hiarbas, king of the Gethuli, having demanded her in marriage, and threatening, in case of refusal, to make war on the Carthaginians, Dido caused a pile to be erected, and after having sacrificed victims, as if to appease the manes of her husband, ascended the pile, and stabbed herself with a poinard in sight of the people. From this action she obtained the name of *Dido*, or the *Resolute Woman*, the being before called *Elissa*.—Virgil makes her cotemporary with Æneas, and his chronology is justified by Sir Isaac Newton; while other learned men maintain that Æneas was never either in Carthage or Italy, and that he lived above 300 years before Dido.

DIDUS, or popo, in ornithology, a genus belonging to the order of gallinæ. The bill is contracted in the middle by two transverse rugæ; each mandible is inflexed at the point; and the face is bare behind the eyes. The body is blackish and cloudy; the tail is very short, and the upper part of the bill red. It is a native of India; and is incapable of flying, because the wings are not furnished with feathers sufficient for that purpose.

DIDYMUS of Alexandria, an ecclesiastical writer of the fourth century; who, though he is said to have lost his eyes at five years of age, when he had scarcely learned to read, yet applied so earnestly to study, that he attained all the philosophic arts in a high degree, and was thought worthy to fill the chair in the famous divinity-school at Alexandria. He was the author of a great number of works: but all we have now remaining, are a Latin translation of his book upon the *Holy Spirit*, in the works of St Jerome who was the trans-

lator; short strictures on the Canonical epistles; and a book against the Manichees.

DIDYNAMIA, (from *dis* twice, and *dynamis* power), the name of the 14th class in Linnæus's sexual method; consisting of plants with hermaphrodite flowers, which have four stamina or male organs, two of which are long and two short. See BOTANY, p. 1292, and Plate LIX. fig. 14.

DIEMERBROEK (Ibbrand), a learned professor of physic and anatomy at Utrecht, was born at Montfort, in Holland, in 1609, where he acquired great reputation by his lectures and his practice; and died at Utrecht, in 1674. He wrote a treatise on the plague, which is esteemed; and several learned works in anatomy and medicine; which were printed at Utrecht in 1685, in folio.

DIEPPE, a handsome sea-port town of France, in Upper Normandy, in the territory of Caux; with a good harbour, an old castle, and two handsome moles. The parish-church of St James is an elegant structure; and there is a tower from which, in fine weather, the coast of England may be seen. The principal trade consists in herrings, whittings, mackerel, ivory, toys, and laces. It was bombarded by the English in 1694, and it is not now so considerable as it was formerly. It is seated at the mouth of the river Argues, in E. Long. 1. 9. N. Lat. 49. 55.

DIES MARCHIÆ was the day of congress, or meeting of the English and Scots, annually appointed to be held on the marches or borders, in order to adjust all differences between them.

DIESIS, in music, is the division of a tone less than a semitone; or an interval consisting of a less or imperfect semitone.

Diclis is the smallest and softest change or inflexion of the voice imaginable: it is called a *faint*, expressed thus X, by a St Andrew's cross, or saltier.

DIET, in medicine, according to some, comprehends the whole regimen, or rule of life, with regard to the six non-naturals; air, meats, and drinks, sleep, and watching, motion and rest, passions of the mind, retentions and excretions. Others restrain the term of *diet*, to what regards eating and drinking, or solid aliments and drinks. See FOOD.

The natural constitution of the body of man is such, that it can easily bear some changes and irregularities, without much injury: had it been otherwise, we should be almost constantly put out of order by every slight cause. This advantage arises from those wonderful communications of the inward parts, whereby, when one part is affected, another comes immediately to its relief.

Thus, when the body is too full, nature causes evacuations through some of the outlets: and for this reason it is, that diseases from inanition are generally more dangerous than from repletion; because we can more expeditiously diminish than increase the juices of the body. Upon the same account also, though temperance be beneficial to all men, the ancient physicians advised persons in good health and their own masters, to indulge a little now and then, by eating and drinking more plentifully than usual. But, of the two, intemperance in drinking is safer than in eating; and if a person has committed excess in the latter, cold water drank upon a full stomach will help digestion; to which

Didymia
Diet.

it will be of service to add lemon juice, or elixir of vitriol. If he has eaten high seasoned things, rich sauces, &c. then let him sit up for some little time, and afterwards sleep. But if a man happen to be obliged to fast, he ought to avoid all laborious work. From satiety it is not proper to pass directly to sharp hunger, nor from hunger to satiety; neither will it be safe to indulge absolute rest immediately after excessive labour, nor suddenly fall to hard work after long idleness. In a word, therefore, all changes in the way of living should be made by degrees.

The softer and milder kinds of aliment are proper for children, and for youth the stronger. Old people ought to lessen the quantity of their food, and increase that of their drink: but yet some allowance is to be made for custom, especially in the colder climates like ours; for as in these the appetite is keener, so is the digestion better performed. *Mead's Monita & Præcepta.*

DIET-Drinks, a form in physic, including all the medicated wines, ales, and wheys, used in chronic cases. They require a course or continuation to answer any intention of moment.

DIET of Appearance, in Scots law, the day to which a defender is cited to appear in court; and every other day to which the court shall afterwards adjourn the consideration of the question.

DIET, or DYET, in matters of policy, is used for the general assembly of the states or circles of the empire of Germany, and of Poland, to deliberate and concert measures proper to be taken for the good of the public.

The general diet of the empire is usually held at Ratisbon: it consists of the emperor, the nine electors, and the ecclesiastical princes; viz. the archbishops, bishops, abbots, and abbesses; the secular princes, who are dukes, marquises, counts, viscounts, or barons; and the representatives of the imperial cities. It meets on the emperor's summons, and any of the princes may send their deputies thither in their stead. The diet makes laws, raises taxes, determines differences between the several princes and states, and can relieve the subjects from the oppressions of their sovereigns.

The diet of Poland, or the assembly of the states, consisted of the senate and deputies, or representative of every palatinate or county and city; and usually met every two years, and oftener upon extraordinary occasions, if summoned by the king, or, in his absence, by the archbishop of Gnesna. The general diet of Poland sat but six weeks, and often broke up in a tumultuous manner: for one dissenting voice prevented their passing any laws, or coming to any resolutions on what was proposed to them from the throne. Switzerland has also a general diet, which is usually held every year at Baden, and represents the whole Helvetic body: it seldom lasts longer than a month. Besides this general diet, there are diets of the protestant cantons, and diets of the catholic ones: the first assemble at Araw, and are convoked by the canton of Zurich; the second at Lucern, convoked by the canton of that name.

DIETETIC, denotes something belonging to diet, but particularly that part of physic which treats of this subject. See **DIET**, **FOOD**, and **DRINK**.

DIETS, a town in the circle of the Upper Rhine in Germany, situated on the river Lohr, twenty miles north of Mentz, and subject to the house of Nassau-Orange. E. Long. 7. 40. N. Lat. 50. 28.

DIEU ET MON DROIT, i. e. *God and my right*, the motto of the royal arms of England, first assumed by king Richard I. to intimate that he did not hold his empire in vassalage of any mortal.

It was afterwards taken up by Edward III. and was continued without interruption to the time of the late king William, who used the motto *Je maintiendrai*, though the former was still retained upon the great seal. After him queen Anne used the motto *Semper eadem*, which had been before used by queen Elizabeth; but ever since queen Anne, *Dieu et mon droit* continues to be the royal motto.

DIFFERENCE, in mathematics, is the remainder, when one number or quantity is subtracted from another.

DIFFERENCE, in logic. See **LOGIC**, n° 20—24.

DIFFERENCE, in heraldry, a term given to a certain figure added to coats of arms, serving to distinguish one family from another; and to shew how distant younger branches are from the elder or principal branch.

DIFFERENTIAL, **DIFFERENTIALE**, in the higher geometry, an infinitely small quantity, or a particle of quantity so small as to be less than any assignable one. It is called a *differential*, or *differential quantity*, because frequently considered as the difference of two quantities; and, as such, is the foundation of the *differential calculus*: Sir Isaac Newton, and the English, call it a *moment*, as being considered as the momentary increase of quantity. See **FLUXIONS**.

DIEXAHEDRIA, in natural history, a genus of pellucid and crystalliform spars, composed of two pyramids, joined base to base, without any intermediate column: the diexahedria are dodecahedral, or composed of two hexangular pyramids.

DIFFUZE, an epithet applied to such writings as are wrote in a prolix manner. Among historians, Salust is reckoned sententious, and Livy diffuse. Thus also among the orators, Demosthenes is close and concise; Cicero, on the other hand, is diffuse.

DIFFUSION, the dispersion of the subtle effluvia of bodies into a kind of atmosphere all round them. Thus the light diffused by the rays of the sun, issues all round from that amazing body of fire.

DIGASTRICUS, in anatomy, a muscle of the lower jaw, called also **BIVENTER**.

DIGBY (Sir Kenelm), became very illustrious in the 17th century for his virtue and learning. He was descended of an ancient family in England. His great-grandfather, accompanied by six of his brothers, fought valiantly at Bosworth-field on the side of Henry VII. against the usurper Richard III. His father, Everard, suffered himself to be engaged in the gun-powder plot against king James I. and for that crime was beheaded. His son wiped off that stain, and was restored to his estate. King Charles I. made him gentleman of the bed-chamber, commissioner of the navy, and governor of the Trinity-house. He granted him letters of reprisal against the Venetians, by virtue whereof he took several prizes with a small fleet which he commanded. He fought the Venetians near the port of

Scan-

Digby Scanderoun, and bravely made his way through them with his booty. He was a great lover of learning, and translated several authors into English; and his "Treatise of the Nature of Bodies and the Immortality of the Soul," discovers great penetration and extensive knowledge. He applied to chemistry; and found out several useful medicines, which he gave freely away to people of all sorts, especially to the poor. He distinguished himself particularly by his sympathetic powder for the cure of wounds at a distance; his discourse concerning which made a great noise for a while. He had conferences with Des Cartes about the nature of the soul.

In the beginning of the civil wars, he exerted himself very vigorously in the king's cause; but he was afterwards imprisoned, by the parliament's order, in Winchester house, and had leave to depart thence in 1643. He afterwards compounded for his estate, but was ordered to leave the nation; when he went to France, and was sent on two embassies to pope Innocent X. from the queen, widow to Charles I. whose chancellor he then was. On the restoration of Charles II. he returned to London; where he died in 1665, aged 60.

This eminent person was, for the early pregnancy of his parts, and his great proficiency in learning, compared to the celebrated Picus de Mirandola, who was one of the wonders of human nature. His knowledge, though various and extensive, appeared to be greater than it really was; as he had all the powers of elocution and address to recommend it. He knew how to shine in a circle of ladies, or philosophers; and was as much attended to when he spoke on the most trivial subjects, as when he spoke on the most important. It is said that one of the princes of Italy, who had no child, was desirous that his princeps should bring him a son by Sir Kenelm, whom he esteemed a just model of perfection.

DIGEST, in matters of literature, a collection of the decisions of the Roman lawyers properly digested, or arranged under distinct heads, by order of the emperor Justinian. It constitutes the first part or volume of the civil law.

DIGESTION, in medicine, is the dissolution of the aliments into such minute parts as are fit to enter the lacteal vessels, and circulate with the mass of blood. See **ANATOMY**, n^o 366—369.

DIGESTION, in chemistry, is an operation which consists in exposing bodies to a gentle heat, in proper vessels, and during a certain time. This operation is very useful to favour the action of certain substances upon each other; as, for example, of well calcined, dry, fixed alkali upon rectified spirit of wine. When these two substances are digested together in a matrafs, with a gentle sand-bath heat, the spirit of wine acquires a yellow-reddish colour, and an alkaline quality. The spirit would not so well acquire these qualities by a stronger and shorter heat.

Want of DIGESTION, a disease attended with pain and a sense of weight, with eructations and copious flatulencies from corrupt humours in the stomach.

DIGESTIVE, in medicine, such remedies as strengthen and increase the tone of the stomach, and assist in the digestion of foods. To this class belong all stomachics and strengtheners or corroborants.

VOL. IV.

DIGGING, among miners, is appropriated to the operation of freeing any kind of ore from the bed or stratum in which it lies, where every stroke of their tools turns to account: in contradistinction to the openings made in search of such ore, which are called *hatches*, or *essay-hatches*; and the operation itself, *tracing of mines*, or *hatchbing*.

When a bed of ore is discovered, the bee-men, so called from the instrument they use, which is a kind of pick-ax, free the ore from the fossils around it; and the shovel-men throw it up from one shamble to another, till it reaches the mouth of the hatch.

In some mines, to save the expence as well as fatigue of the shovel-men, they raise the ore by means of a winder and two buckets, one of which goes up as the other comes down.

DIGIT, in astronomy, the twelfth part of the diameter of the sun or moon, used to express the quantity of an eclipse. Thus an eclipse is said to be of six digits, when fix of these parts are hid.

DIGITS, or *Monades*, in arithmetic, signify any integer under 10; as 1, 2, 3, 4, 5, 6, 7, 8, 9.

DIGIT is also a measure taken from the breadth of the finger. It is properly $\frac{1}{4}$ of an inch, and contains the measure of four barley-corns laid breadth-wise.

DIGITALIS, *fox-glove*; a genus of the angiospermia order, belonging to the didynamia class of plants.—There are six species; five of which are hardy, herbaceous, biennial and perennial plants, and the sixth a tender shrubby exotic. The herbaceous species rise two or three feet high, crowned with spikes of yellow iron-coloured or purple flowers. The shrubby sort rises five or six feet high, having spear-shaped rough leaves, four or five inches long, and half as broad; the branches being all terminated with flowers growing in loose spikes.—All the species are easily raised by seeds.—An ointment made of the flowers of purple fox-glove and May-butter, is much commended by some physicians for scrophulous ulcers which run much and are full of matter. Taken internally, this plant is a violent purgative and emetic; and is therefore only to be administered to robust constitutions. The country people in England frequently use a decoction of it with poly-pody of the oak in epileptic fits. In Italy, fox-glove is esteemed an excellent vulnerary.

DIGITATED, among botanists. See **BOTANY**, p. 1297.

DIGLYPH, in architecture, a kind of imperfect triglyph, console, or the like; with two channels or engravings, either circular or angular.

DIGNE, an episcopal town of Provence in France, famous for the baths that are near it. It is seated on a river called Marderic; in E. Long. 5. 27. N. Lat. 44. 5.

DIGNITARY, in the canon law, a person who holds a dignity, that is, a benefice which gives him some pre-eminence over mere priests and canons. Such is a bishop, dean, arch-deacon, prebendary, &c.

DIGNITY, as applied to the titles of noblemen, signifies honour and authority. And *dignity* may be divided into superior and inferior; as the titles of duke, earl, baron, &c. are the highest names of *dignity*; and those of baronet, knight, squire, at law, &c. the lowest. **NOBILITY** only can give so high a name of dignity as to supply the want of a surname in legal proceedings;

Dignity.

ings; and as the omission of a name of dignity may be pleaded in abatement of a writ, &c. so it may be where a peer who has more than one name of dignity, is not named by the Most Noble. No temporal dignity of any foreign nation can give a man a higher title here than that of *ESQUIRE*.

DIGNITY, in the human character, the opposite of *Meanness*.

Elements of
Criticism.

Man is endued with a *SENSE* of the worth and excellence of his nature: he deems it more perfect than that of the other beings around him; and he perceives that the perfection of his nature consists in virtue, particularly in virtues of the highest rank. To express that sense, the term *dignity* is appropriated. Further, to behave with dignity, and to refrain from all mean actions, is felt to be, not a virtue only, but a duty: it is a duty every man owes to himself. By acting in that manner, he attracts love and esteem: by acting meanly, or below himself, he is disapproved and contemned.

This sense of the dignity of human nature, reaches even our pleasures and amusements. If they enlarge the mind by raising grand or elevated emotions, or if they humanize the mind by exercising our sympathy, they are approved as suited to the dignity of our nature: if they contract the mind by fixing it on trivial objects, they are contemned as not suited to the dignity of our nature. Hence, in general, every occupation, whether of use or amusement, that corresponds to the dignity of man, is termed *manly*; and every occupation below his nature, is termed *childish*.

To those who study human nature, there is a point which has always appeared intricate: How comes it that generosity and courage are more esteemed, and below more dignity, than good-nature, or even justice; though the latter contribute more than the former to private as well as to public happiness? This question, bluntly proposed, might puzzle even a philosopher; but, by means of the foregoing observations, will easily be solved. Human virtues, like other objects, obtain a rank in our estimation, not from their utility, which is a subject of reflection, but from the direct impression they make on us. Justice and good-nature are a sort of negative virtues, that scarce make any impression but when they are transgressed: courage and generosity, on the contrary, producing elevated emotions, enliven greatly the sense of a man's dignity, both in himself and in others; and for that reason, courage and generosity are in higher regard than the other virtues mentioned: we describe them as grand and elevated, as of greater dignity, and more praise-worthy.

This leads us to examine more directly emotions and passions with respect to the present subject: and it will not be difficult to form a scale of them, beginning with the meanest, and ascending gradually to those of the highest rank and dignity. Pleasure felt as at the organ of sense, named *corporeal pleasure*, is perceived to be low; and when indulged to excess, is perceived also to be mean: for that reason, persons of any delicacy dissemble the pleasure they take in eating and drinking. The pleasures of the eye and ear, having no organic feeling, and being free from any sense of meanness, are indulged without any shame: they even rise to a certain degree of dignity when their objects are grand or elevated. The same is the case of the sym-

Dignity.

pathetic passions: a virtuous person behaving with fortitude and dignity under cruel misfortunes, makes a capital figure; and the sympathizing spectator feels in himself the same dignity. Sympathetic distress at the same time never is mean: on the contrary, it is agreeable to the nature of a social being, and has general approbation. The rank that love possesses in the scale, depends in a great measure on its object: it possesses a low place when founded on external properties merely; and is mean when bestowed on a person of inferior rank without any extraordinary qualification: but when founded on the more elevated internal properties, it assumes a considerable degree of dignity. The same is the case of friendship. When gratitude is warm, it animates the mind; but it scarce rises to dignity. Joy bestows dignity when it proceeds from an elevated cause.

If we can depend upon induction, dignity is not a property of any disagreeable passion: one is slight, another severe; one depresses the mind, another animates it; but there is no elevation, far less dignity, in any of them. Revenge, in particular, though it enflame and swell the mind, is not accompanied with dignity, not even with elevation: it is not however felt as mean or groveling, unless when it takes indirect measures for gratification. Shame and remorse, though they sink the spirits, are not mean. Pride, a disagreeable passion, bestows no dignity in the eye of a spectator. Vanity always appears mean; and extremely so where founded, as commonly happens, on trivial qualifications.

We proceed to the pleasures of the understanding, which possess a high rank in point of dignity. Of this every one will be sensible, when he considers the important truths that have been laid open by science; such as general theorems, and the general laws that govern the material and moral worlds. The pleasures of the understanding are suited to man as a rational and contemplative being, and they tend not a little to ennoble his nature; even to the Deity he stretcheth his contemplations, which, in the discovery of infinite power, wisdom, and benevolence, afford delight of the most exalted kind. Hence it appears, that the fine arts, studied as a rational science, afford entertainment of great dignity; superior far to what they afford as a subject of taste merely.

But contemplation, however in itself valuable, is chiefly respected as subservient to action; for man is intended to be more an active than a contemplative being. He accordingly shows more dignity in action than in contemplation: generosity, magnanimity, heroism, raise his character to the highest pitch: these best express the dignity of his nature, and advance him nearer to divinity than any other of his attributes.

Having endeavoured to assign the efficient cause of dignity and meanness, by unfolding the principle on which they are founded, we proceed to explain the final cause of the dignity or meanness bestowed upon the several particulars above-mentioned, beginning with corporeal pleasures. These, as far as useful, are, like justice, fenced with sufficient sanctions to prevent their being neglected: hunger and thirst are painful sensations; and we are incited to animal love by a vigorous propensity: were corporeal pleasures dignified over and above with a place in a high class, they would infallibly

Dignity
Digynia.

libly overturn the balance of the mind, by outweighing the social affections. This is a satisfactory final cause for refusing to these pleasures any degree of dignity: and the final cause is not less evident of their meanness, when they are indulged to excess. The more refined pleasures of external sense, conveyed by the eye and the ear from natural objects and from the fine arts, deserve a high place in our esteem, because of their singular and extensive utility: in some cases they rise to a considerable dignity; and the very lowest pleasures of the kind are never esteemed mean or grovelling. The pleasure arising from wit, humour, ridicule, or from what is simply ludicrous, is useful, by relaxing the mind after the fatigue of more manly occupation: but the mind, when it surrenders itself to pleasure of that kind, loses its vigour, and sinks gradually into sloth. The place this pleasure occupies in point of dignity, is adjusted to these views: to make it useful as a relaxation, it is not branded with meanness; to prevent its usurpation, it is removed from that place but a single degree: no man values himself for that pleasure, even during gratification; and if it have engrossed more of his time than is requisite for relaxation, he looks back with some degree of shame.

In point of dignity, the social emotions rise above the selfish, and much above those of the eye and ear: man is by his nature a social being; and to qualify him for society, it is wisely contrived, that he should value himself more for being social than selfish.

The excellency of man is chiefly discernible in the great improvements he is susceptible of in society: these, by perseverance, may be carried on progressively, above any assignable limits; and even abstracting from revelation, there is great probability, that the progress begun here will be completed in some future state. Now, as all valuable improvements proceed from the exercise of our rational faculties, the Author of our nature, in order to excite us to a due use of these faculties, hath assigned a high rank to the pleasures of the understanding: their utility, with respect to this life as well as a future, intitles them to that rank.

But as action is the aim of all our improvements, virtuous actions justly possess the highest of all the ranks. These, we find, are by nature distributed into different classes, and the first in point of dignity assigned to actions that appear not the first in point of use: generosity, for example, in the sense of mankind is more respected than justice, though the latter is undoubtedly more essential to society; and magnanimity, heroism, undaunted courage, rise still higher in our esteem: The reason of which is explained above.

DIGNITY, in composition. See ORATORY, n° 48.

DIGON, an ancient, handsome, rich, and very considerable town of France; capital of Burgundy, and of the Digois; with a parliament, bishop's see, a mint, an university, academy of sciences, an abbey, and a citadel: most part of the churches and public structures are very beautiful, and in one of the squares there is an equestrian statue of Lewis XIV. It is seated in a very pleasant plain between two small rivers, which produces excellent wine. E. Long. 5. 7. N. Lat. 47. 19.

DIGRESSION. See ORATORY, n° 37.

DIGYNIA, (from *dis* twice, and *gyn* a woman),

the name of an order or secondary division in each of the first 13 classes, except the 9th, in Linnæus's sexual method; consisting of plants, which to the classic character, whatever it is, add the circumstance of having two styles or female organs.

DIKE, a ditch, or drain, made for the passage of waters.—The word seems formed from the verb, to *dig*; tho' others choose to derive it from the Dutch, *diik*, a dam, sea-bank, or wall.

DIKE, or *Dyke*, also denotes a work of stone, timber, or fascines, raised to oppose the entrance or passage of the waters of the sea, a river, lake, or the like.—The word comes from the Flemish *dyk*, or *diik*, a heap of earth to bound or stem the water. Junius and Menage take the Flemish to have borrowed their word from the Greek *ταχος*, wall. Guichard derives it from the Hebrew *daghah*.

Dikes are usually elevations of earth, with hurdles of stakes, stones, and other matters.

The dike of Rochel is made with vessels fastened to the bottom. The dikes of Holland are frequently broke through, and drown large tracts of land.

DILAPIDATION, in law, a wasteful destroying or letting buildings, especially parsonage-houses, &c. run to decay, for want of necessary reparation. If the clergy neglect to repair the houses belonging to their benefices, the bishop may sequester the profits thereof for that purpose. And in these cases, a prosecution may be brought either in the spiritual court, or at common law, against the incumbent himself, or against his executor or administrator.

DILATATION, in physics, a motion of the parts of any body, by which it is so expanded as to occupy a greater space. This expansive motion depends upon the elastic power of the body; whence it appears that dilatation is different from rarefaction, this last being produced by the means of heat.

DILATATOIRES, in anatomy, a name given to several muscles in the human body. See ANATOMY, *Table of the Muscles*.

DILEMMA, in logic, an argument equally conclusive by contrary suppositions*.

DILIGENCE, in Scots law, signifies either that care and attention which parties are bound to give, in implementing certain contracts or trusts, and which varies according to the nature of the contract; as to which, see LAW, N° clxi. 12, 13. clxxiii. 8. & clxxxi. 18. Or it signifies certain forms of law, whereby the creditor endeavours to operate his payment, either by affecting the person or estate of the debtor; *ibid*. N° clxxi. clxxii.

DILL, in botany. See ANETHUM.

DILLEMBURG, a town of Germany, in Wetteravia, and capital of a county of the same name. It is subject to a prince of the house of Nassau, and is situated in E. Long. 8. 24. N. Lat. 50. 45.

DILLENGEN, a town of Germany, in the circle of Suabia, with an university, and where the bishop of Augsburg resides. It is seated near the Danube, in E. Long. 11. 35. N. Lat. 48. 38.

DILUTE. To dilute a body is to render it liquid; or, if it were liquid before, to render it more so, by the addition of a thinner thereto. These things thus added, are called *diluents*, or *dilutors*.

DIMENSION, in geometry, is either length, breadth,

Dike
Dimension.

* See LEGIS, n° 100, 101.

Dimination breadth, or thickness: hence, a line hath one dimension, *viz.* length; a superficies two, *viz.* length and breadth; and a body, or solid, has three, *viz.* length, breadth, and thickness.

DIMINATION, in architecture, a contraction of the upper part of a column, by which its diameter is made less than that of the lower part *.

* See Architecture, no 43.

DIMINUTIVE, in grammar, a word formed from some other, to soften or diminish the force of it, or to signify a thing is little in its kind. Thus, *cellula* is a diminutive of *cell*, *globule* of *globe*, *hillock* of *hill*.

DINGWEL, a parliament-town of Scotland in the shire of Ross, seated on the frith of Cromarty, 15 miles west of the town of Cromarty. Near it runs the river Conel, famous for producing pearls. W. Long. 4. 15. N. Lat. 57. 45.

DINNER, the meal taken about the middle of the day.—The word is derived from the French *dîner*, which Du Cange derives from the barbarous Latin *dinsare*. Henry Stephens derives it from the Greek *deinai*; and will have it wrote *dinner*. Menage deduces it from the Italian *desinare*, to dine; and that from the Latin *desinere*, to leave off work.

It is generally agreed to be the most salutary to make a plentiful dinner, and to eat sparingly at supper. This is the general practice among us. The French, however, in imitation of the ancient Romans, defer their good cheer to the evening; and Bernardinus Paternus, an eminent Italian physician, maintains it to be the most wholesome method, in a treatise expressly on the subject.

The grand Tartar emperor of China, after he has dined, makes publication by his heralds, that he gives leave for all the other kings and potentates of the earth to go to dinner; as if they waited for his leave.

DINOCRATES, a celebrated architect of Macedonia, who rebuilt the temple of Ephesus, when burned by Erostratus, with much more magnificence than before. Vitruvius informs us that Dinocrates proposed to Alexander the Great to convert mount Athos into the figure of a man, whose left hand should contain a walled city, and all the rivers of the mount flow into his right, and from thence into the sea? He also conceived a scheme for building the dome of the temple of Arsinoe at Alexandria, of loadstone; that should by its attraction uphold her iron image in the centre, suspended in the air! Projects which at least shewed a vast extent of imagination.

DIO CASSIUS, a famous Greek historian, a native of Nicea, a city of Phrygia, was governor of Pergamus and Smyrna, and commanded in Africa and Pannonia. In the year 229, he was raised by Alexander Severus to the dignity of consul; but not being agreeable to the troops, was obliged to retire to the place of his birth, where he ended his days. He composed a Roman History in Greek, a part of which only has been handed down to us. He is accused of partiality against Pompey, Cicero, Seneca, and several other great men. He is chiefly esteemed for the speeches he puts into the mouths of Agrippa and Mecenas, when Augustus advised with them whether he should preserve the empire, or restore the ancient government.

DIO Chrysostom, that is, *Golden Mouth*, a cele-

brated orator and philosopher of Greece, in the first century, was born at Prusa in Bithynia. He attempted to persuade Vespasian to quit the empire; was hated by Domitian; but acquired the esteem of Trajan. This last prince took pleasure in conversing with him, and made him ride with him in his triumphal chariot. There are still extant, 80 of Dio's orations, and some other of his works: the best edition of which is that of Hermand Samuel Raimarus, in 1750, in folio.

DIOCESE, or **DIOCESS** the circuit, or extent of the jurisdiction of a **BISHOP**.—The word is formed from the Greek *διοικησις* government, administration; formed of *διοικω*, which the ancient glossaries render *administro*, *moderor*, *ordino*: hence *διοικησις της πολιως*, the administration or government of a city.

DIOCESE is also used in ancient authors, &c. for the province of a **METROPOLITAN**.

Diocesis, *diocesis*, was originally a civil government, or prefecture, composed of diverse provinces.

The first division of the empire into dioceses is ordinarily ascribed to Constantine; who distributed the whole Roman state into four, *viz.* the diocese of Italy, the diocese of Illyria, that of the east, and that of Africa. And yet, long time before Constantine, Strabo, who wrote under Tiberius, takes notice, lib. xiii. p. 432. that the Romans had divided Asia into dioceses; and complains of the confusion such a division occasioned in geography, Asia being no longer divided by people, but by dioceses, each whereof had a tribunal, or court, where justice was administered. Constantine, then, was only the institutor of those large dioceses, which comprehended several metropolises and governments; the former dioceses only comprehending one jurisdiction or district, or the country that had resort to one judge, as appears from this passage in Strabo, and (before Strabo) from Cicero himself, lib. iii. *epist. ad fam.* 9. and lib. xiii. *ep.* 67.

Thus, at first a province included divers dioceses; and afterwards a diocese came to comprise divers provinces. In after-times the Roman empire became divided into XIII dioceses or prefectures; though, including Rome, and the suburbicary regions, there were XIV. These XIV dioceses comprehended 120 provinces: each province had a proconsul, who resided in the capital or metropolis; and each diocese of the empire had a consul, who resided in the principal city of the district.

On this civil constitution, the ecclesiastical one was afterwards regulated: each diocese had an ecclesiastical vicar, or primate, who judged finally of all the concerns of the church within his territory.

At present there is some further alteration: for diocese does not now signify an assemblage of divers provinces; but is limited to a single province under a metropolitan, or more commonly to the single jurisdiction of a bishop.

Gul. Brito affirms diocese to be properly the territory and extent of a baptismal or parochial church; whence divers authors use the word to signify a simple parish. See **PARISH**.

DIOCELESIAN, the Roman emperor: see (*History of*) **ROME**. His bloody persecution of the Christians forms a chronological æra, called the *era of Dioclesian*, or of the martyrs. It was for a long time in use in theological writings, and is still followed by the

Diocesi
Dioclesia

the Copts and Abyssinians. It commenced Aug. 29th, A. D. 284.

DIOCTAHEDRIA, in natural history, a genus of pellucid and crystalliform spars, composed of two octangular pyramids, joined base to base, without any intermediate column. Of these some have long pyramids, others short and sharp-pointed ones, and others short and obtuse-pointed ones; the two former species being found in the Hartz-forest, and the last in the mines of Cornwall.

DIODON, or **SUN-FISH**, in ichthyology, a genus belonging to the order of amphibia nantes.

There are three species, 1. The oblong sun-fish grows to a great bulk: one examined by Sylvianus was above 100 pounds in weight; and Dr Borlase mentions another taken at Plymouth in 1734, that weighed 500. In form it resembles a bream or some deep fish cut off in the middle. The mouth is very small, and contains in each jaw two broad teeth, with sharp edges. The eyes are little; before each is a small semilunar aperture; the pectoral fins are very small, and placed behind them. The colour of the back is dusky, and dappled; the belly silvery; between the eyes and the pectoral fins are certain streaks pointing downwards. The skin is free from scales.

When boiled, it has been observed to turn into a glutinous jelly, resembling boiled starch when cold, and served the purposes of glue on being tried on paper and leather. The meat of this fish is uncommonly rank: it feeds on shell-fish.

There seems to be no satisfactory reason for the old English name. Care must be taken not to confound it with the sun-fish of the Irish *, which differs in all respects from this.

2. The mola, or short sun-fish, differs from the former, in being much shorter and deeper. The back and the anal fins are higher, and the aperture to the gills not semilunar, but oval. The situation of the fins are the same in both.

Both kinds are taken on the western coasts of this kingdom, but in much greater numbers in the warmer parts of Europe.—Mr Brunnich informs us, that between Antibes and Genoa, he saw one of this species lie asleep on the surface of the water: a sailor jumped overboard, and caught it.

3. The levigatus, or globe, is common to Europe and South Carolina. As yet only a single specimen has been discovered in our seas; taken at Penzance in Cornwall. The length was one foot seven: the length of the belly, when distended, one foot; the whole circumference in that situation two feet six. The form of the body is usually oblong; but when alarmed, it has the power of inflating the belly to a globular shape of great size. This seems designed as a means of defence against fish of prey: as they have less means of laying hold of it; and are besides terrified by the numbers of spines with which that part is armed, and which are capable of being erected on every part. The mouth is small: the irides white, tinged with red: the back from head to tail almost straight, or at least very slightly elevated; of a rich deep blue colour. It has the pectoral, but wants the ventral fins: the tail is almost even, divided by an angular projection in the middle; tail and fins brown. The belly and sides are white, tinged or wrinkled; and beset with innumerable small

sharp spines, adhering to the skin by four processes.

DIODORUS SICULUS, a celebrated historian, under Julius Cæsar and Augustus, was thus named from his being a native of Agrigium in Sicily. He spent 50 years in composing his *Bibliotheca Historica*; and travelled into the places he describes, for perfect information. This important work, which he composed in Greek, contained 40 books, of which there are only 15 remaining. The style is clear and neat, and very suitable to history. The best edition is that of Amsterdam, 1745, in two volumes, folio.

DIOECIA, (from *dis* twice, and *oikia* a house or habitation) two houses. The name of the 22d class in Linnæus's sexual method, consisting of plants, which having no hermaphrodite flowers, produce male and female flowers on separate roots. These latter only ripen seeds; but require for that purpose, according to the sexualists, the vicinity of a male plant; or the aspersum, that is, sprinkling, of the male dust. From the seeds of the female flowers are raised both male and female plants. The plants then in the class dioecia are all male and female; not hermaphrodite, as in the greater number of classes; nor with male and female flowers upon one root, as in the class monœcia of the same author. See BOTANY, p. 1292.

DIOGENES of Apollonia, in the island of Crete, held a considerable rank among the philosophers who taught in Ionia before Socrates appeared at Athens. He was the scholar and successor of Anaximenes, and in some measure rectified his master's opinion concerning air being the cause of all things. It is said, that he was the first who observed that air was capable of condensation and rarefaction. He passed for an excellent philosopher, and died about the 450th year before the Christian æra.

DIOGENES the Cynic, a famous philosopher, was the son of a banker of Sinope in Pontus. Being banished with his father for coining false money, he retired to Athens, where he studied philosophy under Antisthenes. He added new degrees of austerity to the sect of the Cynics, and never did any philosopher carry so far a contempt for the conveniences of life. He was one of those extraordinary men who run every thing to extremity, without excepting even reason itself; and who confirm the saying, that "there is no great genius without a tincture of madness." He lodged in a tub; and had no other movables besides his staff, wallet, and wooden bowl, which last he threw away on seeing a boy drink out of the hollow of his hand. He used to call himself a vagabond, who had neither house nor country; was obliged to beg, was ill clothed, and lived from hand to mouth: and yet, says Ælian, he took as much pride in these things as Alexander could in the conquest of the world. He was not indeed a jot more humble than those who are clothed in rich apparel, and fare sumptuously every day. He looked down on all the world with scorn; he magisterially censured all mankind, and thought himself unquestionably superior to all other philosophers. Alexander one day paid him a visit, and made him an offer of riches or any thing else: but all that the philosopher requested of him was, to stand from betwixt the sun and him. As if he had said, "Do not deprive me of the benefits of nature, and I leave to you those of fortune." The conqueror was so affected with the vigour and elevation of his

his.

Diogenes,
Dionæda.

his soul, as to declare, that "if he was not Alexander, he would choofe to be Diogenes:" that is, if he was not in poffeffion of all that was pompous and fplendid in life, he would, like Diogenes, heroically defpife it. Diogenes had great prefence of mind, as appears from his fmart fayings and quick repartees; and Plato feems to have hit off his true charaâer when he called him a Socrates run mad. He fpent a great part of his life at Corinth, and the reafon of his living there was as follows: As he was going over to the ifland of Ægina, he was taken by pirates, who carried him into Crete, and there expofed him to fale. He answered the crier, who asked him what he could do, that "he knew how to command men:" and perceiving a Corinthian who was going by, he fhewed him to the crier, and faid, "Sell me to that gentleman, for he wants a mafter." Xeniaades, for that was the Corinthian's name, bought Diogenes, and carried him with him to Corinth. He appointed him tutor to his children, and entrusted him alfo with the management of his houfe. Diogenes's friends being defirous of redeeming him, "You are fools, (faid he); the lions are not the flaves of thofe who feed them, but they are the fervants of the lions." He therefore plainly told Xeniaades, that he ought to obey him, as people obey their governors and phyficians. Some fay, that Diogenes fpent the remainder of his life in Xeniaades's family; but Dion Chryfoftom afferts that he paffed the winter at Athens, and the fummer at Corinth. He died at Corinth when he was about 90 years old: but authors are not agreed either as to the time or manner of his death. The following account, Jerom fays, is the true one. As he was going to the Olympic games, a fever feized him in the way; upon which he lay down under a tree, and refufed the affiftance of thofe who accompanied him, and who offered him either a horfe or a chariot. "Go you to the games, (fays he), and leave me to contend with my illnefs. If I conquer, I will follow you: If I am conquered, I fhall go to the fhades below." He difpatched himfelf that very night; faying, that "he did not fo properly die, as get rid of his fever." He had for his difciples Oneficritus, Phocion, Stilpo of Megara, and feveral other great men. His works are loft.

DIÖGENES Laertius, from Laerta in Cilicia where he was born, was an hiftorian in the time of Antoninus the philofopher. He is reputed to have been an epicurean; and wrote ten books of "The lives of the philofophers," which are ftill extant: they were infcribed to a learned lady, as he intimates in his life of Plato.

DIOMEDEA, in ornithology, a genus belonging to the order of anferes. The bill is ftrait; the fuperior mandible is crooked at the point, and the lower one is truncated; the noftrils are oval, open, a little prominent, and placed on the fides. There are two fpecies, viz. 1. The exulans, has pennated wings, and three toes on each foot. It is the albatros of Edwards; and is found in the ocean betwixt the tropics, and at the Cape of Good Hope. It flies pretty high, feeds upon flying-fifh, and is about the fize of a pelican. 2. The dæmæfa, has no quill-feathers on the wings; and the feet have four toes, connected together by a membrane. It is the black penguin of Edwards, about the fize of a goofe, and is found at the Cape of Good Hope.

DIOMEDES, king of Etolia, the fon of Tydeus, and the moft valiant of the Grecian heroes, next to Achilles and Ajax, fignalized himfelf at the fiege of Troy againft Æneas and Hector, and carried off the Palladium.

DIONIS (Peter), a famous furgeon, born at Paris, diftinguifhed himfelf by his fkill in his profefſion, and by his works, the principal of which are, 1. A courſe of operations in furgery; 2. The anatomy of man; and, 3. A treatife on the manner of affifting women in child-birth. He died in 1718.

DIONÆA MUSCIPULA, or *Venus's Fly-trap*, in botany, a newly difcovered fenſitive plant.

Every one ſkilled in natural hiftory knows, that the mimofæ, or fenſitive plants, clofe their leaves, and bend their joints, upon the leaſt touch: and this has aſtoniſhed us; but no end or deſign of nature has yet appeared to us from theſe furprizing motions: they ſoon recover themſelves again, and their leaves are expanded as before. But the plant we are now going to deſcribe, ſhews that nature may have ſome view towards its nourifhment, in forming the upper joint of its leaf like a machine to catch food: upon the middle of this, lies the bait for the unhappy infect that becomes its prey. Many minute red glands that cover its inner ſurface, and which perhaps diſcharge ſome ſweet liquor, tempt the poor animal to taſte them; and the infant theſe tender parts are irritated by its feet, the two lobes riſe up, graſp it faſt, lock the two rows of ſpines together, and ſqueeze it to death. And further, leſt the ſtrong efforts for life, in the creature thus taken, ſhould ſerve to diſengage it, three ſmall erect ſpines are fixed near the middle of each lobe among the glands, that effectually put an end to all its ſtruggles. Nor do the lobes ever open again, while the dead animal continues there. But it is nevertheleſs certain, that the plant cannot diſtinguiſh an animal from a mineral ſubſtance; for, if we introduce a ſtraw or a pin between the lobes, it will graſp it full as faſt as if it was an infect.—The plant is one of the monogynia order, belonging to the decandria claſs. It grows in America, about 35 deg. N. Lat. in wet ſhady places, and flowers in July and Auguſt. The largeſt leaves are about three inches long, and an inch and half acroſs the lobes: the glands of thoſe expoſed to the fun are of a beautiful red colour; but thoſe in the ſhade are pale, and inclining to green. The roots are ſquamous, ſending forth but few fibres, and are perennal. The leaves are numerous, inclining to bend downwards, and are placed in a circular order; they are jointed and ſucculent; the lower joint, which is a kind of ſtalk, is flat, longiſh, two-edged, and inclining to heart-shaped. In ſome varieties they are ferrated on the edges near the top. The upper joint conſiſts of two lobes; each lobe is of a ſemi-oval form, with their margins furniſhed with ſtiff hairs like eye-brows, which embrace or lock in each other when they cloſe: this they do when they are inwardly irritated. The upper ſurfaces of theſe lobes are covered with ſmall red glands; each of which appears, when highly magnified, like a compressed arbutus berry.—Among the glands, about the middle of each lobe, are three very ſmall erect ſpines. When the lobes incloſe any ſubſtance, they never open again while it continues there. If it can be ſhoved out ſo as not to ſtrain the lobes, they expand again; but if force is uſed to open them, ſo ſtrong has nature formed

Diomedes
Dionæa.

Dionysia
||
Dionysius.

formed the spring of their fibres, that one of the lobes will generally snap off rather than yield. The stalk is about six inches high, round, smooth, and without leaves; ending in a spike of flowers. The flowers are milk-white, and stand on footstalks, at the bottom of which is a little painted bractea or flower leaf. The soil in which it grows, as appears from what comes about the roots of the plants when they are brought over, is a black, light, mould, intermixed with white sand, such as is usually found in our moorish heaths. Being a swamp plant, a north-east aspect will be properest for it at first, to keep it from the direct rays of the sun; and in winter, till we are acquainted with what cold weather it can endure, it will be necessary to shelter it with a bell-glass, such as is used for melons. This should be covered with straw or a mat, in hard frosts. By this means several of these plants have been preserved through the winter in a very vigorous state. Its sensitive quality will be found in proportion to the heat of the weather, as well as the vigour of the plant. Our summers are not warm enough to ripen the seed; or possibly we are not yet sufficiently acquainted with the culture of it. In order to try further experiments on its sensitive powers, some of the plants might be placed in pots of light moorish earth, and placed in pans of water, in an airy stove in summer; where the heat of such a situation, being like that of its native country, will make it surprisingly active.

DIONYSIA, in Grecian antiquity, solemnities in honour of Bacchus, sometimes called by the general name of *Orgia*; and by the Romans *Bacchanalia*, and *Liberalia*. See *BACCHANALIA* and *BACCHUS*.

DIONYSIAN PERIOD. See *ASTRONOMY*, no 308.

DIONYSIUS I. from a private secretary became general and tyrant of Syracuse and all Sicily. He was likewise a poet; and having, by bribes, gained the tragedy-prize at Athens, he indulged himself so immoderately at table from excess of joy, that he died of the debauch, 386 B. C. but some authors relate that he was poisoned by his physicians.

DIONYSIUS II. (his son and successor) was a greater tyrant than his father: his subjects were obliged to apply to the Corinthians for succour; and Timoleon, their general, having conquered the tyrant, he fled to Athens, where he was obliged to keep a school for subsistence. He died 343 B. C.

DIONYSIUS (*Halicarnassensis*), a celebrated historian, and one of the most judicious critics of antiquity, was born at Halicarnassus; and went to Rome after the battle of Actium, where he died 22 years, under the reign of Augustus. He there composed in Greek, his History of the Roman Antiquities, in 20 books, of which the first 11 only are now remaining. There are also still extant several of his critical works. The best edition of the works of this author is that of Oxford, in 1704; in Greek and Latin, by Dr Hudson.

DIONYSIUS, a learned geographer, to whom is attributed a *Periegesis*, or Survey of the Earth, in Greek verse. Some suppose that he lived in the time of Augustus; but Scaliger and Saumaisius place him under the reign of Severus, or Marcus Aurelius. He wrote many other works, but his *Periegesis* is the only one we have remaining; the best and most useful edition of which is that improved with notes and illustrations by Hill.

DIONYSIUS (*Arcopagita*), was born at Athens, and educated there. He went afterwards to Heliopolis in Egypt; where, if we may believe some writers of his life, he saw that wonderful eclipse which happened at our Saviour's passion, and was urged by some extraordinary impulse to cry out, *Aut Deus patitur, aut cum patiente dolet*; "either God himself suffers, or condescends with him who does." At his return to Athens he was elected into the court of Arcopagus, from whence he derived his name of *Arcopagite*. About the year 50 he embraced Christianity; and, as some say, was appointed first bishop of Athens by St Paul. Of his conversion we have an account in the 17th Chapter of the Acts of the Apostles.—He is supposed to have suffered martyrdom; but whether under Domitian, Trajan, or Adrian, is not certain. We have nothing remaining under his name, but what there is the greatest reason to believe spurious.

DIOPHANTUS, a celebrated mathematician of Alexandria, reputed to have been the inventor of algebra. When he lived, is not known: some have placed him before Christ, and some after, with equal uncertainty. He wrote 13 books of arithmetic; which, the astronomer Regiomontanus tells us, are still preserved in MSS. in the Vatican library: Meziriac's edition of seven of these books has been several times reprinted, with notes and illustrations.

D I O P T R I C S,

THAT part of *OPTICS* which treats of the laws of refraction, and the effects which the refraction of light has in vision. The word is originally Greek, formed of *dia*, per, "through," and *optoma*, I see.

As this and the other branches of *OPTICS* are fully treated under the collective name, we shall here, 1. Just give a summary of the general principles of the branch, in a few plain aphorisms, with some preliminary definitions; and, 2. Present our readers with a set of entertaining experiments illustrative of, or dependent upon, those principles.

DEFINITIONS.

1. When a ray of light passing out of one medium

into another of a different density, is turned from that straight line in which it would otherwise proceed into one of a different direction, it is said to be refracted. Thus the rays AB, AC, &c. by passing out of air into the glass BGC, are turned from their natural course into XCII. that of BF, CF, &c. and are therefore said to be re-fig. 11. fracted by the lens BGC.

2. Any spherical transparent glass, that converges or diverges the rays of light as they pass through it, is called a *lens*.

3. Of lenses there are five sorts: 1. A plane or single convex lens, which is plane on one side, and convex on the other; as AZ, fig. 3. 2. A double convex lens, as B. 3. A plano-concave lens, that is, plane on one side

side and concave on the other, as C. 4. A double concave, as D. And, 5. A meniscus, which is convex on one side and concave on the other, as E.

4. The point C, round which the spherical surface of a lens, as AZ, is described, is called its *centre*; the line XY, drawn from that centre perpendicular to its two surfaces, is the axis; and the point V, to which the axis is drawn, is the vertex of that lens.

5. When the rays of light that pass through a single or double convex lens are brought into their smallest compass, that point is the focus of the lens.

6. In optical instruments, that lens which is next the object is called the *object-glass*; and that next the eye, the *eye glass*.

Fig. 13.

7. The distance between the line AB, and the perpendicular EF, is called the *angle of incidence*; and the distance between the line BD, and the perpendicular EF, is called the *angle of refraction*.

A P H O R I S M S.

Fig. 13.

1. A ray of light passing obliquely out of one medium into another that is denser, will be refracted toward the perpendicular; as the ray AB, by passing out of air into glass, is refracted into B F, inclined to the perpendicular A F. On the contrary, a ray passing out of a denser into a rarer medium, will be refracted from the perpendicular; as the ray BC, passing out of the glass G H into air, is refracted into D I.

2. The angles of incidence and refraction, when the lines that contain them are all equal, will have a determinate proportion to each other, in the same mediums: which between air and water will be as 4 to 3; between air and glass, as 3 to 2, nearly; and in other mediums in proportion to their densities.

3. When an object is viewed through a glass whose two surfaces are parallel, it will appear of its natural dimensions; its situation only being a small matter altered, in proportion to the thickness of the glass, and the obliquity of the rays.

4. All the rays of light, whether diverging, parallel, or converging, that fall on a single or double convex lens, will meet in a focus behind the glass: and the distance of that focus will be greatest in diverging, and least in converging, rays.

5. When parallel or converging rays fall on a single or double concave lens, they will diverge behind it. If they be diverging at their incidence, they will become more so by passing through it.

6. When an object is viewed thro' two convex lenses, its apparent length, or diameter, will be to its real length, as the distance of the focus of the object-glass is to that of the eye-glass.

By these, and the foregoing aphorisms we are enabled to account for the various effects of dioptric machines, as refracting telescopes, microscopes, the camera obscura, &c. See OPTICS.

ENTERTAINING EXPERIMENTS.

I. Optical illusions.

Fig. 4.

On the bottom of the vessel ABCD, place three pieces of money, as a shilling, a half-crown, and crown; the first at E, the second at F, and the last at G. Then place a person at H, where he can see no further into the vessel than I: and tell him, that by

pouring water into the vessel you will make him see three different pieces of money; bidding him observe carefully whether any money goes in with the water.

Here you must observe to pour in the water very gently, or contrive to fix the pieces, that they may not move out of their places by its agitation.

When the water comes up to K, the piece at E will become visible; when it comes up to L, the pieces at E and F will appear; and when it rises to M, all the three pieces will be visible.

From what has been said of the refraction of light, the cause of this phenomenon will be evident: for while the vessel is empty, the ray H I will naturally proceed in a straight line: but in proportion as it becomes immersed in water, it will be necessarily refracted into the several directions NE, OF, PG, and consequently the several pieces must become visible.

II. Optical Augmentation.

TAKE a large drinking glass of a conical figure, that is small at bottom and wide at top; in which put a shilling, and fill the glass about half full with water: then place a plate on the top of it, and turn it quickly over, that the water may not get out. You will then see on the plate, a piece of the size of a half crown; and somewhat higher up, another piece of the size of a shilling.

This phenomenon arises from seeing the piece thro' the conical surface of the water at the side of the glass, and through the flat surface at the top of the water, at the same time: for the conical surface dilates the rays, and makes the piece appear larger; but by the flat surface the rays are only refracted, by which the piece is seen higher up in the glass, but still of its natural size. That this is the cause will be further evident by filling the glass with water; for as the shilling cannot then be seen from the top, the large piece only will be visible.

III. Optical Subtraction.

AGAINST the wainscot of a room fix three small pieces of paper, as A, B, C, at the height of your eye; and placing yourself directly before them, shut your right eye and look at them with the left; when you will see only two of those papers, suppose A and B: but altering the position of your eye, you will then see the third and one of the first, suppose A; and by altering your position a second time, you will see B and C; but never all three of them together.

The cause of this phenomenon is, that one of the three pencils of rays that come from these objects, falls constantly on the optic nerve at D; whereas to produce distinct vision, it is necessary that the rays of light fall on some part of the retina E, F, G, H. We see by this experiment, one of the uses of having two eyes; for he that has one only, can never see three objects placed in this position, nor all the parts of one object of the same extent, without altering the situation of his eye.

IV. Alternate Illusion.

WITH a convex lens of about an inch focus, look attentively at a silver seal, on which a cipher is engraved. It will at first appear cut in, as to the naked eye; but if you continue to observe it some time, without changing

changing your situation, it will seem to be in relief, and the lights and shades will appear the same as they did before. If you regard it with the same attention till longer, it will again appear to be engraved: and so on alternately.

If you look off the seal for a few moments, when you view it again, instead of seeing it, as at first, engraved, it will appear in relief. If, while you are turned toward the light, you suddenly incline the seal, while you continue to regard it, those parts that seemed to be engraved will immediately appear in relief: and if, when you are regarding these seeming prominent parts, you turn yourself so that the light may fall on the right hand, you will see the shadows on the same side from whence the light comes, which will appear not a little extraordinary. In like manner the shadows will appear on the left, if the light fall on that side. If, instead of a seal, you look at a piece of money, these alterations will not be visible, in whatever situation you place yourself.

It has been suspected that this illusion arises from the situation of the light: and in fact, "I have observed, (says M. Guyot, from whom this article is taken) that when I have viewed it with a candle on the right, it has appeared engraved; but by changing the light to the left side, it has immediately appeared in relief." It still, however, remains to be explained, why we see it alternately hollow and prominent, without changing either the situation or the light. Perhaps it is in the light itself that we must look for the cause of this phenomenon; and this seems the more probable, as all these appearances are not discernable by all persons.

V. *The Camera Obscura, or Dark Chamber.*

MAKE a circular hole in the shutter of a window, from whence there is a prospect of the fields, or any other object not too near; and in this hole place a convex glass, either double or single, whose focus is at the distance of five or six feet (A). Take care that no light enter the room but by this glass: at a distance from it, equal to that of its focus, place a pasteboard, covered with the whitest paper; which should have a black border, to prevent any of the side rays from disturbing the picture. Let it be two feet and a half long, and 18 or 20 inches high: bend the length of it inwards, to the form of part of a circle, whose diameter is equal to double the focal distance of the glass. Then fix it on a frame of the same figure, and put it on a moveable foot, that it may be easily fixed at that exact distance from the glass where the objects paint

VOL. IV.

(A) The distance should not be less than three feet; for if it be, the images will be too small, and there will not be sufficient room for the spectators to stand conveniently. On the other hand, the focus should never be more than 15 or 20 feet, for then the images will be obscure, and the colouring faint. The best distance is from 6 to 12 feet.

(B) This inverted position of the images may be deemed an imperfection, but it is easily remedied: for if you stand above the board on which they are received, and look down on it, they will appear in their natural position: or if you stand before it, and, placing a common mirror against your breast in an oblique direction, look down in it, you will there see the images erect, and they will receive an additional lustre from the reflection of the glass; or place two lenses, in a tube that draws out; or, lastly, if you place a large concave mirror at a proper distance before the picture, it will appear before the mirror, in the air, and in an erect position.

(C) There is another method of making the dark chamber; which is by a scioptropic ball, that is, a ball of wood, through which a hole is made, in which hole a lens is fixed: this ball is placed in a wooden frame, in which it turns freely round. The frame is fixed to the hole in the shutter; and the ball, by turning about, answers, in great part, the use of the mirror on the outside of the window. If the hole in the window be no bigger than a pea, the objects will be represented without any lens, though by no means so distinctly, or with such vivid colours.

(D) When the sun is directly opposite to the hole, the lens will itself be sufficient: or by means of the mirror on the outside of the window, as in Experiment V. the lens will answer the purpose at any time.

themselves to the greatest perfection. When it is thus placed, all the objects that are in the front of the window will be painted on the paper, in an inverted position (a), with the greatest regularity and in the most natural colours.

If you place a moveable mirror without the window; by turning it more or less, you will have on the paper all the objects that are on each side of the window (c).

If instead of placing the mirror without the window you place it in the room, and above the hole (which must then be made near the top of the shutter), you may receive the representation on a paper placed horizontally on a table; and draw, at your leisure, all the objects that are there painted.

Nothing can be more pleasing than this experiment, especially when the objects are strongly enlightened by the sun: and not only land-prospects, but a sea-port, when the water is somewhat agitated, or at the setting of the sun, presents a very delightful appearance.

This representation affords the most perfect model for painters, as well for the tone of colours, as that degradation of shades, occasioned by the interposition of the air, which has been so justly expressed by some modern painters.

It is necessary that the paper have a circular form; for otherwise, when the centre of it was in the focus of the glass, the two sides would be beyond it, and consequently the images would be confused. If the frame were contrived of a spherical figure, and the glass were in its centre, the representation would be still more accurate. If the object without be at the distance of twice the focal length of the glass, the image in the room will be of the same magnitude with the object.

The lights, shades, and colours, in the camera obscura, appear not only just, but, by the images being reduced to a smaller compass, much stronger than in nature. Add to this, that these pictures exceed all others, by representing the motion of the several objects: thus we see the animals walk, run, or fly; the clouds float in the air; the leaves quiver; the waves roll, &c.; and all in strict conformity to the laws of nature. The best situation for a dark chamber is directly north, and the best time of the day is noon.

VI. *To show the Spots on the Sun's Disk, by its Image in the Camera Obscura.*

PUT the object-glass of a 10 or 12 foot telescope into the scioptropic ball, and turn it about till it be directly opposite to the sun (D). Then place the pasteboard,

14 L

board, mentioned in the last experiment, in the focus of the lens; and you will see a clear bright image of the sun, of about an inch diameter, in which the spots on the sun's surface will be exactly described.

As this image is too bright to be seen with pleasure by the naked eye, you may view it thro' a lens whose focus is at six or eight inches distance; which at the same time that it prevents the light from being offensive, will, by magnifying both the image and the spots, make them appear to greater advantage.

VII. *To magnify small Objects by means of the Sun's Rays let into a Dark Chamber.*

LET the rays of light that pass through the lens in the shutter be thrown on a large concave mirror, properly fixed in a frame. Then take a slip or thin plate of glass; and sticking any small object on it, hold it in the incident rays, at a little more than the focal distance from the mirror; and you will see, on the opposite wall, amidst the reflected rays, the image of that object, very large, and extremely clear and bright. This experiment never fails to give the spectator the highest satisfaction.

VIII. *The Portable Camera Obscura.*

THE great pleasure produced by the camera obscura in the common form, has excited several to render it more universally useful by making it portable; easily fixed on any spot, and adapted to every prospect. We shall not here examine the merits of the various sorts that have been invented; but content ourselves with describing one that may have some advantages not to be found in others, and which appears to be the invention of M. Guyot.

Let ABCD be a frame of wood, of two feet long and about 20 inches wide; let its four sides be two inches and a half thick, and firmly joined together. In a groove formed in this frame place a plate of clear glass, E; and if the upper side of the glass were convex, it would be still better. To each of the corners of this frame join a leg, with a hinge, that it may turn up under the table. To the under part of the frame join four pieces of light wood, as H, which must also have hinges to fold up; and observe, that when they are let down, as in the figure, they must closely join, by means of hooks, it being quite necessary that no light enter the box. For this reason, the inside of the box should be lined with black cloth.

To that just described, there must be added a smaller box M, in which must be an inclined mirror N, and in one of its sides a moveable tube O, five or six inches long. This tube must be furnished with a convex glass, the focus of which, by the reflection of the mirror, must reach the glass E in the frame. There must also be a covering of black stuff, in form of a tent, to place over the top of the frame, by means of four little poles that go into holes in the corners of it. There must be an opening to this tent on the side A B, by a curtain to be drawn up; and which you are to let down over you, when you place yourself under it; that no light may enter. The three other sides should hang down some inches over the frame.—This camera is, indeed, something more cumbersome than those that have been hitherto invented; and yet, if properly made, it will not weigh more than from 20 to 25 pounds. On the other

hand, it is much more convenient; for as the coloured rays of objects paint themselves on the bottom of the glass in the frame, you may draw them without having your hand between the rays and their image.

When you have placed the frame on a spot a little elevated, that nothing may intercept the rays from falling on the glass in the tube, you fix a sheet of transparent varnished paper on the glass in the frame, by means of wax at its corners. Then placing yourself under the curtain, you trace on the paper all the outlines of the objects there represented; and if you think fit, you may also mark the extent of the shadows. If you want only the outlines, you may lay a thin plate of glass on that in the frame, and trace the strokes with a pencil and carmine. After which you must dip a sheet of paper in water, without making it too wet; and spreading it lightly over that glass, you will have the impression of the design there drawn.

Note, By each of these methods you will have the objects either in their natural position, or reversed; which will be an advantage when the design is to be engraved, and you would have it then appear in the natural position. In using this machine, you should make choice of those objects on which the sun then shines, as the appearance of the shadows add greatly to the beauty of the design. There are, however, circumstances in which it is to be avoided, as when you would paint a rising or setting sun, &c.

IX. *The Magic Lantern.*

THIS very remarkable machine, which is now known over all the world, caused great astonishment at its origin. It is still beheld with pleasing admiration; and the spectator very frequently contents himself with wondering at its effects, without endeavouring to investigate their cause. The invention of this ingenious illusion is attributed to the celebrated P. Kircher, who has published, on various sciences, works equally learned, curious, and entertaining. Its design is to represent at large, on a cloth or board, placed in the dark, the images of small objects, painted with transparent colours on plates of glass.

The construction is as follows. Let ABCD be a tin box, eight inches high, ten long, and six wide (or any other similar dimensions). At the top must be a funnel E, of four inches in diameter, with a cover F, which, at the same time that it gives a passage to the smoke, prevents the light from coming out of the box.

On the side A C there is a door, by which is adjusted a concave mirror G, of metal or tin, and of five inches diameter; being part of a sphere whose diameter is 18 inches. This mirror must be so disposed that it may be pushed forward or drawn back by means of the handle H, that enters the tin tube I, which is foldered to the door. In the middle of the box must be placed a low tin lamp K, which is to be moveable. It should have three or four lights, that must be at the height of the focus of the mirror G. In the side B D, and opposite to the mirror, there must be an aperture of three inches wide and two inches and a half high; in which is to be fixed a convex glass L, of the same dimension, whose focus must be from four inches and a half to five inches, so that the lamp may be placed both in its focus, and in that of the concave mirror.

On the same side is to be placed a piece of tin MN, of four inches and a half square, having an opening at the sides of about four inches and a half high, and a quarter of an inch wide. Through this opening or groove are to pass the glasses, on which are painted the figures that are to be seen on the cloth. In this tin piece, and opposite to the glass L, let there be an aperture of three inches and a quarter long, and two inches and a quarter high; to which must be adjusted a tube O, of the same form, and six inches long. This tube is to be fixed into the piece MN. Another tube, six inches long, and moveable, must enter that just mentioned, in which must be placed two convex lenses, P and Q; that of P may have a focus of about three inches; and that of Q, which is to be placed at the extremity of the tube, one of 10 or 12 inches. The distance between these glasses is to be regulated by their foci. Between these glasses there must be placed a pasteboard R, in which is an aperture of an inch wide, and $\frac{4}{5}$ ths of an inch high. By placing this tube farther in or out of the other, the images on the cloth will appear larger or smaller.

From what has been said of the preceding machines, the construction of this will be easily understood. The foci of the concave mirror, and the lens L, meeting in the flame of the lamp, they together throw a strong light on the figures painted on the glasses that pass through the groove MN, and by that means render their colours distinct on the cloth. The rays from those glasses passing through the lens P are collected by the aperture in the pasteboard R, and conveyed to the lens Q, by which they are thrown on the cloth.

The lantern being thus adjusted, you must provide plates of clear glass, of 12 or 15 inches long, and three inches wide, which are to be placed in thin frames, that they may pass freely through the groove MN, after being painted in the manner we shall now describe.

Method of Painting the Glasses for the Lantern.

DRAW on a paper the subject you desire to paint, and fix it at each end to the glass. Provide a varnish with which you have mixed some black paint; and with a fine pencil draw on the other side of the glass, with very light touches, the design drawn on the paper. If you are desirous of making the painting as perfect as possible, you should draw some of the outlines in their proper colours, provided they are the strongest tints of those colours that are used. When the outlines are dry, you colour the figures with their proper tints or degradations. Transparent colours are most proper for this purpose, such as carmine, lake, Prussian blue, verdigris, &c. and these must be tempered with a strong white varnish, to prevent their peeling off. You are then to shade them with black mixed with the same varnish, or with bistre, as you find convenient. You may also leave strong lights in some parts, without any colours, in order to produce a more striking effect. Observe, in particular, not to use more than four or five colours, such as blue, red, green, and yellow. You should employ, however, a great variety of tints, to give your painting a more natural air; without which they will represent vulgar objects, which are by no

means the more pleasing because they are gawdy.

When the lamp in this lantern is lighted, and, by drawing out the tube to a proper length, the figures painted on the glass appear bright and well defined, the spectator cannot fail of being highly entertained by the success of natural or grotesque figures that are painted on the glasses. This piece of optics may be rendered much more amusing, and at the same time more marvellous, by preparing figures to which different natural motions may be given (ϵ), which every one may perform according to his own taste; either by movements in the figures themselves, or by painting the subject on two glasses, and passing them at the same time through the groove, as will be seen in the next experiment.

X. To represent a Tempest by the Magic Lantern.

PROVIDE two plates of glass, whose frames are so thin that they may both pass freely through the groove MN, at the same time, (fig. 7.)

On one of these glasses you are to paint the appearance of the sea, from the slightest agitation to the most violent commotion. Representing from A to B a calm; from B to C a small agitation, with some clouds; and and so on to F and G, which should exhibit a furious storm. Observe, that these representations are not to be distinct, but run into each other, that they may form a natural gradation: remember also, that great part of the effect depends on the perfection of the painting, and the picturesque appearance of the design.

On the other glass you are to paint vessels of different forms and dimensions, and in different directions, together with the appearance of clouds in the tempestuous parts.

You are then to pass the glass slowly through the groove; and when you come to that part where the storm begins, you are to move the glass gently up and down, which will give it the appearance of a sea that begins to be agitated: and so increase the motion, till you come to the height of the storm. At the same time you are to introduce the other glass with the ships, and moving that in like manner, you will have a natural representation of the sea, and of ships in a calm and in a storm. As you draw the glasses slowly back, the tempest will seem to subside, the sky grow clear, and the ships glide gently over the waves.—By means of two glasses disposed in this manner you may likewise represent a battle, or sea-fight, and numberless other subjects, that every one will contrive according to his own taste. They may also be made to represent some remarkable or ludicrous action between different persons, and many other amusements that a lively imagination will easily suggest.

XI. The Nebulous Magic Lantern.

THE light of the magic lantern, and the colour of images, may not only be painted on a cloth, but also reflected by a cloud of smoke.

Provide a box of wood or pasteboard A B, of about four feet high, and of seven or eight inches square at bottom, but diminishing as it ascends, so that its aperture at top is but six inches long, and half an inch wide. At the bottom of this box there must be a door

14 L 2

that

(ϵ) There are in the Philosophical Essays of M. Muschenbroek, different methods of performing all these various movements, by some mechanical contrivances that are not difficult to execute.

Fig. 8.

Fig. 9.

Fig. 10.

that shuts quite close, by which you are to place in the box a chafing-dish with hot coals, on which is to be thrown incense, whose smoke goes out in a cloud at the top of the box. It is on this cloud that you are to throw the light that comes out of the lantern, and which you bring into a smaller compass by drawing out the moveable tube. The common figures will here serve. It is remarkable in this representation, that the motion of the smoke does not at all change the figures; which appear so conspicuous, that the spectator thinks he can grasp them with his hand.

Notes. In this experiment some of the rays passing through the smoke, the representation will be much less vivid than on the cloth; and if care be not taken to reduce the light to its smallest focus, it will be still more imperfect.

XII. To produce the appearance of a Phantom, upon a pedestal placed on the middle of a table.

Fig. 11.

INCLOSE a common small magic lantern in a box A B C D, that is large enough to contain also an inclined mirror M; which must be moveable, that it may reflect the cone of light thrown on it by the lantern, in such a manner that it may pass out at the aperture made in the top of the box. There should be a flap with hinges to cover the opening, that the inside of the box may not be seen when the experiment is not making. This aperture should likewise be oval, and of a size adapted to the cone of light that is to pass thro' it. There must be holes made in that part of the box which is over the lantern, to let out the smoke; and over that part must be placed a chafing-dish of an oblong figure, and large enough to hold several lighted coals. This chafing-dish may be inclosed in a painted tin box of about a foot high, and with an aperture at top something like fig. 10. It should stand on four short feet, to give room for the smoke of the lamp to pass out. There must also be a glass that will ascend and descend at pleasure in the vertical groove *ab*. To this glass let there be fixed a cord, that, going over a pulley *c*, passes out of the box at the side C D, by which the glass may be drawn up, and will descend by its own weight. On this glass may be painted a spectre, or any other more pleasing figure. Observe that the figures must be contracted in drawing, as the cloud of smoke does not cut the cone of light at right angles, and therefore the figures will appear longer than they do on the glass.

After you have lighted the lamp in the lantern, and put the mirror in a proper direction, you place the box or pedestal A B C D on a table; and putting the chafing-dish in it, throw some incense in powder on the coals. You then open a trap-door, and let down the glass slowly; and when you perceive the smoke diminish you draw up the glass, that the figure may disappear, and shut the trap-door. This appearance will occasion no small surprize, as the spectre will seem to rise gradually out of the pedestal, and on drawing up the glass will disappear in an instant. Observe, that when you exhibit this experiment, you must put out all the lights in the room; and the box should be placed on a high table, that the spectators may not perceive the aperture by which the light comes out. Tho'

we have mentioned a small magic lantern, yet the whole apparatus may be so enlarged, that the phantom may appear of a formidable size.

XIII. The Magical Theatre.

By making some few additions to the magic lantern with the square tube, used in Experiment ix. various scenes, characters, and decorations of a theatre, may be represented in a lively manner. In this experiment it is quite necessary to make the lantern much larger than common, that the objects painted on the glasses, being of a larger size, may be represented with greater precision, and consequently their several characters more strongly marked.

Let there be made a wooden box A B C D, a foot Fig. 12. and a half long, 15 inches high, and 10 wide. Let it be placed on a stand E F, that must go round it, and by which it may be fixed with two screws to a table. Place over it a tin cover, as in the common lantern. Make an opening in its two narrowest sides; in one of which place the tube H, and in the other the tube I: let each of them be six inches wide, and five inches high: in each of these tubes place another that is moveable, in order to bring the glasses, or concave mirror, that are contained in them, to a proper distance. In the middle of the bottom of this box place a tin lamp, M; which must be moveable in a groove, that it may be placed at a proper distance with regard to the glasses and mirror: this lamp should have five or six lights, each of them about an inch long. At the beginning of the tube H, toward the part N, make an opening of an inch wide, which must cross it laterally: another of three quarters of an inch, that must cross it vertically, and be nearer the box than the first; and a third of half an inch, that must be before the first. The opening made laterally must have three or four grooves, the second two, and the third one: that different subjects of figures and decorations may be passed, either sideways, ascending, or descending, so that the scenes of a theatre may be the more exactly imitated (F). Inclose these grooves between two convex rectangular glasses, of six inches long, and five inches high, and of about 20 inches focus; one of which must be placed at O, and the other toward P. Have another tube Q, of about a foot long, which must enter that marked H; and at its outward extremity place a lens of about 15 inches focus. There must also be a third tube R, four inches long, into which that marked I is to enter: to the exterior end of this adjust a concave mirror, whose focus must be at seven or eight inches from its reflecting surface.

The magic lantern being thus adjusted, nothing more is necessary than to provide glasses, painted with such subjects as you would represent, according to the grooves they are to enter. The lamp is then to be lighted; and placing a glass in one of the grooves, you draw out the moveable tubes till the object paints itself on a cloth to the most advantage: by which you determine the distance of the lantern, and the size of the image. You then make a hole in the partition of that size, and fix in it a plate of clear glass, over which you paste a very thin paper, which must be varnished, that it may be as transparent as possible.

On

(F) In the decorations, the clouds and the palaces of the gods should descend; caves and infernal palaces should ascend; earthly palaces, gardens, &c. enter at the sides.

On this paper are to be exhibited the images of all those objects, that, by passing successively through the grooves, are to represent a theatric entertainment. The exhibition will be very agreeable; because the magic lantern being concealed behind the partition, the cause of the illusion cannot by any means be discovered.

In order to shew more clearly in what manner a subject of this sort should be painted, and the glasses disposed, we will here make choice of the siege of Troy for a theatric subject; in which will be found all the incidents necessary to the exhibition of any other subject whatever.—In the first act, the theatre may represent, on one side, the ramparts of Troy; toward the back part, the Grecian camp; and at a further distance, the sea, and the isle of Tenedos. We will suppose the time to be that when the Greeks feigned to raise the siege; and embarked, leaving behind them the wooden horse, in which were contained the Grecian soldiers.—On a glass, therefore, of the same width with the aperture made in the side AC of the box, you are to paint a deep blue curtain, lightly charged with ornaments, quite transparent. This glass is to be placed in the first vertical groove; so that by letting it gently down, its image may appear to rise in the same manner as the curtain of a theatre. All the glasses that are to ascend or descend must be bordered with thin pieces of wood, and so exactly fill the grooves, that they may not slide down of themselves.—You must have several glasses of a proper size to pass through the horizontal grooves, and of different lengths according to the extent of the subject. You may paint, on the first, the walls of Troy. On the second, the Grecian camp. On the third, the sea, the isle of Tenedos, and a serene sky. On the fourth, the Grecian troops by detached figures. On the fifth, other troops, disposed in battalions, and placed at a distance. On the sixth, divers vessels, which as the glass advances in the groove diminish in size. On the seventh, the wooden horse and Sinon. On the eighth, Trojan men and women.

These glasses being properly painted, you place in the horizontal grooves the first, second, third, and fourth. Then draw up the curtain, by letting down the glass on which it is painted, and draw away gently the fourth glass, and after that the second; then advance, very gently, the fifth, that represents the embarkment, and pass it quite through. Next pass, the opposite way, the sixth, which represents the Grecian fleet. The objects painted on the fourth, fifth, and sixth, quite disappearing, you are to advance the seventh, on which is painted the wooden horse; and at the same time the eighth, where the Trojans will appear to draw the horse into the city. The curtain is then to be let down, that you may withdraw the scenes of the first act, and place in the grooves those that are to compose the second.—In the second act may be represented the interior part of the city of Troy: on one side may be seen the wooden horse, and in the back part the temple of Pallas. The glasses for this act may be painted in the following manner.—On the first, may be palaces and houses, representing the inside of a city. On the second, the temple of Pallas in the centre, with a clear night and the moon. In the front may be seen the wooden horse, that the Trojans have

placed near the temple of Pallas. On the third, a troop of Greeks, with Sinon at their head, who are going to open the gates of the city to the Grecians. On the fourth, different troops of armed Greeks; painted on a long glass, to afford variety. On the fifth, several troops of Trojans. On the sixth, various appearances of fire and smoke, so disposed, that, this glass being drawn up above the others, the objects painted on the first glass may appear in a conflagration.

Before you draw up the curtain, you should place the first and second glasses. You then pass the whole third glass slowly; a little after, the fourth, on which are painted the different bodies of armed Greeks; and at the same time, from the opposite side, the sixth glass, that represents the Trojan troops; observing to move them slowly both in advancing and retreating, to imitate a combat (c). Then draw up, by degrees, the sixth, on which are painted the fire, flame, and smoke, so that the palaces and houses painted on the first glass may appear to take fire gradually, and at last present a general conflagration. After having represented these incidents with the greatest attention, you let fall the curtain to prepare for the third act. In this may be represented the inside of Priam's palace; where is seen an altar, round which several Trojan princesses appear, who have fled thither for safety.—On the first glass may be painted the palace. On the second, a view of the back part of the palace, with the altar. On the third, Priam with several Trojan men and women. On the fourth, Pyrrhus, and a troop of Greeks. On the fifth, the same actors, with the palace in flames. On the sixth, a conflagration.—The two first glasses which are to be drawn up, should be placed before you raise the curtain. Then pass the third; next advance the fourth, which being drawn up, discovers on the fifth the palace in flames; then drawing up the sixth, let down the first, that the palace may appear entirely destroyed by the conflagration.

The fourth act may represent the environs of Troy, with a distant prospect of the sea. The first and third glasses of the first act may be here used; to which may be added a third, representing Eneas bearing his father Anchises, followed by his son Iulus, and some Trojans. With this glass may be represented the flight of the Trojans, and the embarkment of Eneas; with another glass, on which are painted certain vessels.—To this act the following scenes may be added. The cave of Æolus; the back part of the cave; Æolus; the winds; Juno in her chariot.

The fifth act should represent the open sea, with the fleet of Eneas sailing for Italy.—On the first glass must be painted the sea, as in the tenth Experiment; or else the waves should be imitated by another glass under the first. On the second, the Trojan fleet. On the third, Neptune in his car. On the fourth, the palace of Jupiter. On the fifth, the inside of the palace; the gods assembled in council; with Venus, obtaining leave of Jupiter for Eneas to land in Italy.—After having placed the first glass, that represents a calm sea, the curtain is raised, and the second scene is advanced, which contains the Trojan fleet. The first is then brought forward, to represent a violent tempest: then raising the third glass, Neptune appears, who commands

(c) He that moves the glasses, seeing the effect they produce, is the better able to render the representation as natural as possible.

mands the waves to be still, which is done by making the tempest subside by degrees. The fleet then advances, and passes over the whole theatre: presently after the fourth and fifth scenes descend, that represent Olympus, and finish the exhibition.

Note, We must here repeat, that if you would represent a subject of this sort to advantage, it is quite necessary that the glasses be well painted: and those that are to be in front, should be in stronger and more opaque colours, that the images of those behind may

not appear mixed with them, which will be the case if they are all equally transparent. The glasses should also be of different lengths; that, some being placed before the others are drawn away, their extremities may not be perceived.

The larger these subjects are represented, the better effect they will have: the front of the theatre should appear to be about three feet wide; and if some parts of the figures were moveable, it would still add to the variety of the entertainment.

D I O

Dioscorea
||
Diosma.

DIOSCOREA, in botany, a genus of the hexandria order, belonging to the diœcia class of plants, for which there is no English name. There are eight species, of which the only remarkable one is the bulbifera or yam. This hath triangular winged stalks, which trail upon the ground, and extend a great way: these frequently put out roots from their joints as they lie upon the ground, by which the plants are multiplied. The roots are eaten by the inhabitants of both the Indies; and are particularly serviceable in the West India islands, where they make the greatest part of the negroes food. The plant is supposed to have been brought from the East to the West Indies; for it has never been observed to grow wild in any part of America; but in the island of Ceylon, and on the coast of Malabar, it grows in the woods, and there are in those places a great variety of sorts. It is propagated by cutting the root in pieces, observing to preserve an eye in each, as is practised in planting potatoes. One plant will produce three or four large roots. The skin of these roots is pretty thick, rough, unequal, covered with many stringy fibres or filaments, and of a violet colour approaching to black. The inside is white, and of the consistence of red beet. It resembles the potatoe in its meanness, but is of closer texture. When raw, the yams are viscous and clammy: when roasted or boiled, they afford very nourishing food; and are often preferred to bread by the inhabitants of the West Indies, on account of their lightness, and facility of digestion. When first dug out of the ground, the roots are placed in the sun to dry: after which, they are either put into sand, dry garrets, or casks; where, if kept from moisture, they may be preserved whole years, without being spoiled, or diminished in their goodness. The root commonly weighs two or three pounds; though some yams have been found upwards of 20 pounds weight.

DIOSCORIDES (Pedacius), a physician of Anaxarba, since named *Cæsaria*, in Cilicia; lived in Nero's reign, and composed seven books de *Materia Medica*.

DIOSMA, **AFRICAN SPIRÆA**; a genus of the monogynia order, belonging to the pentandria class of plants. There are nine species; of which the most remarkable are the hirsuta, with narrow hairy leaves; and the oppositifolia, with leaves placed in the form of a cross. The first is a very handsome shrub, growing to the height of five or six feet: the stalks are of a fine coral colour: the leaves come out alternately on every side of the branches, and are narrow-pointed and hairy: the flowers are produced in small clusters at the end of the shoots, and are of a white colour. They are succeeded by starry seed-vessels having five corners; in each

D I O

of which corners is a cell, containing one smooth, shining, oblong, black seed: these seed-vessels abound with a resin which emits a grateful scent, as doth also the whole plant.—The second species rises to the height of three or four feet: the branches are slender, and produced from the stem very irregularly; the leaves are placed cross-ways; the flowers are produced at the ends of the branches, between the leaves: the plants continue a long time in flower, and make a fine appearance when they are intermixed with other exotics in the open air. Both species are propagated by cuttings; which may be planted during any of the summer-months in pots, and plunged into a moderate hot-bed, where they should be shaded from the sun, and frequently watered. In about two months they will have taken root; when each should be transplanted into a small pot where they are to remain; but during winter, like most other exotic plants, they must be preserved in a green-house.

DIOSPYROS, **THE INDIAN DATE-PLUMB**; a genus of the diœcia order, belonging to the polygamia class of plants. There are two species. 1. The lotus is supposed to be a native of Africa, from whence it was transplanted into several parts of Italy, and also into the south of France. The fruit of this tree is supposed to be the lotus with which Ulysses and his companions were enchanted. In the warm parts of Europe this tree grows to the height of 30 feet. In the botanic garden at Padua, there is one very old tree which has been described by some of the former botanists under the title of *guaiacum patavinum*. This tree produces plenty of fruit every year; from the seeds of which many plants have been raised. 2. The virginiana, pishanon, persimon, or pitchumon plumb, is a native of America, but particularly of Virginia and Carolina. The seeds of this sort have been frequently imported into Britain, and the trees are common in many nurseries about London. It rises to the height of 12 or 14 feet; but generally divides into many irregular trunks near the ground, so that it is very rare to see a handsome tree of this sort. Though plenty of fruit is produced on these trees, it never comes to perfection in this country. In America the inhabitants preserve the fruit till it is rotten, as is practised with medlars in England; when they are esteemed very pleasant. Both species are propagated by seeds: and the plants require to be treated tenderly while young; but when they are grown up, they resist the greatest cold of this country.

DIPHTHONG, in grammar, a double vowel, or the mixture of two vowels pronounced together, so as to make one syllable.

The Latins pronounced the two vowels in their diphthongs

Diosma
||
Diphthong.

DIOPTRICS.

DIVISIBILITY.

A. Bell Sculp.^t

thongs *ae* or *æ*, *oe* or *œ*, much as we do; only that the one was heard much weaker than the other, tho' the division was made with all the delicacy imaginable. Diphthongs, with regard to the eyes, are distinguished from those with regard to the ears: In the former, either the particular sound of each vowel is heard in the pronunciation; or the sound of one of them is drowned; or, lastly, a new sound, different from either, results from both: the first of these only are real diphthongs, as being such both to the eye and ear. Diphthongs with regard to the ear are either formed of two vowels meeting in the same syllable, or whose sounds are severally heard; or of three vowels in the same syllable, which only afford two sounds in the pronunciation.

English diphthongs, with regard to the eye and ear, are *ai, au, ea, eo, oi, ou, oo*. Improper English diphthongs, with regard to the eye only, are *aa, ea, eo, eu, ie, ei, oa, oe, ue, ui*.

DIPLOE, in anatomy, the soft medullium, or medullary substance, which lies between the two laminae of the bones of the CRANIUM.

DIPLOMA. See DIPLOMATICS.

In a peculiar sense, it is used for an instrument or licence given by colleges, societies, &c. to a clergyman to exercise the ministerial function, or to a physician to practise the profession, &c. after passing examination, or admitting him to a degree.

DIPLOMATICS, the science of diplomas, or of ancient literary monuments, public documents, &c. It does not, however, nor can it, absolutely extend its researches to antiquity; but is chiefly confined to the middle age, and the first centuries of modern times. For though the ancients were accustomed to reduce their contracts and treaties into writing; yet they grav'd them on tables, or covered them over with wax, or brass, copper, stone, or wood, &c. And all that in the first ages were not traced on brass or marble, has perished by the length of time, and the number of destructive events.

1. The word *diploma* signifies, properly, a letter or epistle, that is folded in the middle, and that is not open. But, in more modern times, the title has been given to all ancient epistles, letters, literary monuments, and public documents, and to all those pieces of writing which the ancients called *Syngrapha, Chirographa, Codicilli*, &c. Is the middle age, and in the diplomas themselves, these writings are called *Litteræ, Præcepta, Placita, Chartæ indidula, Sigilla, and Bullæ*; as also *Parcharte, Pantocharte, Tractorie, Descriptions*, &c. The originals of these pieces are named *Exemplaria, or Autographa, Chartæ authentica, Originalia*, &c. and the copies, *Apographa, Copiæ, Particulæ*, and so forth. The collections that have been made of them, are called *Chartaria* and *Chartulæ*. The place where these papers and documents were kept, the ancients named *Scrinia, Tabularium, or Ærarium*, words that were derived from the tables of brass, and, according to the Greek idiom, *Archeum* or *Archicum*.

2. In order to understand the nature of these ancient papers, diplomas, and manuscripts, and to distinguish the authentic from the counterfeit, it is necessary to know that the paper of the ancients came from Egypt, and was formed of thin leaves or membranes, taken from the branches of a tree named *Papyrus*, or *Bibulum*

Egyptiacum, and which were pasted one over the other with the slime of the Nile, and were pressed and polished with a pumice-stone. This paper was very scarce; and it was of various qualities, forms, and prices, which they distinguished by the names of *charta hieratica, luria, augusta, amphitheatica, fœtica, tanirica, empetrica*, &c. They cut this paper into square leaves, which they pasted one to the other, in order to make rolls of them: from whence an entire book was called *volumen, from volvendo*; and the leaves of which it consisted, *pagina*. Sometimes, also, they pasted the leaves all together by one of their extremities, as is now practised in binding; by this method they formed the back of a book, and these the learned call *codices*. They rolled the volume round a stick, which they named *umbilicus*; and the two ends that came out beyond the paper, *cornua*. The title, wrote on parchment, in purple characters, was joined to the last sheet, and served it as a cover. They made use of all sorts of strings or ribbands, and even sometimes of locks, to close the book; and sometimes also it was put into a case. But there is not now to be found, in any library or cabinet whatever, any one of these volumes. We have been assured, however, by a traveller, that he had seen several of them in the ruins of Herculaneum; but so damaged, the paper so stiff and brittle, by the length of time, that it was impossible to unroll them, and consequently to make any use of them; for on the first touch they fell into shatters. We shall speak hereafter of those books they call *codices*.

3. We are ignorant of the precise time when our modern paper was invented; and when they began to make use of pens in writing, instead of the stalks of reeds. The ink that the ancients used, was not made of vitriol and galls, like the modern, but of foot. Sometimes also they wrote with red ink made of vermilion; or in letters of gold, on purple or violet parchment. It is not difficult for those whose apply themselves to this study, to distinguish the parchment of the ancients from that of the moderns, as well as their ink and various exterior characters: but that which best distinguishes the original from the counterfeit, is the writing or character itself; which is so distinctly different from one century to another, that we may tell with certainty, within about 40 or 50 years, when any diploma was written. There are two works which furnish the clearest lights on this matter, and which may serve as sure guides in the judgments we may have occasion to make on what are called ancient diplomas. The one is the celebrated treatise on the Diplomatic, by F. Mabillon; and the other, the first volume of the *Chronicon Gotvicensæ*. We there find specimens of all the characters, the flourishes, and different methods of writing, of every age. For these matters, therefore, we must refer our readers to those authors; and shall here only add, that,

4. All the diplomas are wrote in Latin, and consequently the letters and characters have a resemblance to each other: but there are certain strokes of the pen which distinguish not only the ages, but also the different nations; as the writings of the Lombards, French, Saxon, &c. The letters in the diplomas are also usually longer, and not so strong as those of manuscripts. There has been also introduced a kind of court-hand, of a very disproportionate length, and the letters of

Diplomatics. which are called *Exiles litteræ, crispæ ac protrahiores*. The first line of the diploma, the signature of the sovereign, that of the chancellor, notary, &c. are usually wrote in this character.

5. The signature of a diploma consists either of the sign of the cross, or of a monogram or cipher, composed of the letters of the names of those who subscribed it. The initial letters of the name, and sometimes also the titles, were placed about this cross. By degrees the custom changed, and they invented other marks; as for example, the sign of Charlemagne was thus:

They sometimes added also the dates and epoch of the signature, the feasts of the church, the days of the calendar, and other like matters. The successive corruption of the Latin language, the style and orthography of each age, as well as their different titles and forms; the abbreviations, accentuation, and punctuation, and the various methods of writing the diphthongs; all these matters united, form so many characters and marks by which the authenticity of a diploma is to be known.

6. The seal annexed to a diploma was anciently of white wax, and artfully imprinted on the parchment itself. It was afterward pendent from the paper, and inclosed in a box or case, which they called *bulia*. There are some also that are stamped on metal, and even on pure gold. When a diploma bears all the characters that are requisite to the time and place where it is supposed to be written, its authenticity is not to be doubted: but, at the same time, we cannot examine them too scrupulously, seeing that the monks and priests of former ages have been very adroit in making of counterfeits; and the more, as they enjoyed the confidence of princes and statesmen, and were even sometimes in possession of their rings or seals.

7. With regard to manuscripts that were wrote before the invention of printing, it is necessary, (1.) to know their nature, their essential qualities, and matter; (2.) to be able to read them freely, and without error; (3.) to judge of their antiquity by those characters which we have just mentioned with regard to the diplomas; and, (4.) to render them of use in the sciences. As there are scarce any of the ancient codes now remaining, (see par. 2.) wrote on the Egyptian paper, or on wood, ivory, &c. we have only to consider those that are written on parchment or vellum (*membranes*), and such as are wrote on our paper (*chartaceæ*). The former of these are in most esteem. With regard to the character, these codes are written either in square and capital letters, or in half square, or round and small letters. Those of the first kind are the most ancient. There are no intervals between the words, no letters different from the others at the beginning of any word, no points, nor any other distinction. The codes which are wrote in letters that are half square, resemble those we have in Gothic characters, as well for the age as the form of the letters. Such as are wrote in round letters are not so ancient as the former, and do not go higher than the ninth or tenth century. These have spaces between the words, and some punctuation. They are likewise not so well wrote as the preceding, and are

frequently disfigured with comments. The codes are divided, according to the country, into Lombard, Italian, Gaulic, Franco-Gaulic, Saxon, Anglo-Saxon, &c.

8. In the ancient Greek books, they frequently terminated the periods of a discourse, instead of all other division, by lines; and these divisions were called, in Latin, *versus*, from *vertendo*: for which reason these lines are still more properly named *versus* than *lineæ*. At the end of a work, they put down the number of verses of which it consisted, that the copies might be more easily collated: and it is in this sense we are to understand Trebonius, when he says, that the pandects contain 150,000 *pæne versusum*. These codes were likewise *vel probæ vel deterioris notæ*, more or less perfect, not only with regard to the calligraphy or beauty of the character, but to the correction of the text also.

9. It is likewise necessary to observe, in ancient codes, the abbreviations, as they have been used in different centuries. Thus, for example, A. C. D. signifies, Aulus Caius Decimus; Ap. Cn. Appius Cneius; Ang. Imp. Augustus Imperator. The characters that are called *notæ*, are such as are not to be found in the alphabet; but which, notwithstanding, signify certain words. All these matters are explained in a copious manner by Vossius, and in the Chronicon Gotviciense. Lastly, the learned divide all the ancient codes into *codices minus raros, rariore, editos, & anecdotos*. The critical art is here indispensably necessary: its researches, moreover, have no bounds; and the more, as the use of it augments every day, by the discoveries that are made in languages, and by the increase of erudition.

DIPONDIOUS, in the scripture-language, is used by St Luke to signify a certain coin, which was of very little value: our translation of the passage is, *Are not five sparrows sold for two farthings?* In St Matthew, who relates the same thing, we read, *Are not two sparrows sold for a farthing?*

DIPPING, among miners, signifies the interruption, or breaking off, of the veins of ore; an accident that gives them a great deal of trouble before they can discover the ore again.

DIPPING Needle. See NEEDLE.

DIPSACUS, TEAZEL; a genus of the monogynia order, belonging to the tetrandria class of plants. There are four species, the most remarkable of which is the *carduus fullonum*, which grows wild in many parts of England. It is of singular use in raising the knap upon woollen cloth. For this purpose, the heads are fixed round the circumference of a large broad wheel, which is made to turn round, and the cloth is held against them. In the west of England, great quantities of the plant are cultivated for the use just now mentioned. It is propagated by sowing the seeds in March, upon a soil that is well prepared. About one peck of seed is sufficient for an acre, as the plants must have room to grow; otherwise the heads will not be large enough, nor in great quantity. When the plants come up, they must be hoed in the same manner as is practised for turnips, cutting down all the weeds, and thinning the plants to about eight inches distance; and as the plants advance, and the weeds begin to grow again, they must be hoed a second time, cutting out the plants to a wider distance, so that they may finally stand a

foot

Diplomatics
Diplomatics

Disas
Director.

foot distant from each other. The second year they will shoot up heads, which may be cut about the beginning of August. They are then to be tied up in bunches, and let in the sun if the weather is fair; or if not, in rooms to dry them. The common produce is about 160 bundles or staves upon an acre, which are sold for one shilling each.

The leaves of the common wild teal, dried, and given in powder or infusion, are a very powerful remedy against statutes and crudities in the stomach. There is also another, though somewhat whimsical, use for which this plant is famous among the country people in England. If the heads are opened longitudinally, about September or October, there is generally found a small worm in them: one of these only is found in each head, whence naturalists have named it the *vermis solitarius displaci*. They collect three, five, or seven of these, always observing to make it an odd number; and, sealing them up in a quill, give them to be worn as an amulet against the ague. This superstitious remedy is of much higher repute than the bark, in many parts of England.

DIPSAS, a sort of serpent, the bite of which produces such a thirst as proves mortal; whence its name *dispas*, which signifies thirsty. In Latin it is called *fitula*, a pail. Moses speaks of it in Deut. viii. 15.

DIPTOTES, in grammar, are such nouns as have only two cases, as *suppetia*, *suppetiar*, &c.

DIPTYCHS, in antiquity, a public register in which were written the names of the consuls and other magistrates among the heathens; and among the Christians, they were a sort of tablets, on one of which were written the names of the deceased, and on the other those of the living, patriarchs, bishops, &c. or those who had done any service to the church, for whom prayers were offered, the deacon reading the names at mass.

DIRÆ, the general name of the three Furies in the Pagan system of theology. They were so called, as being *quasi Deorum ira*, the ministers of divine vengeance in punishing guilty souls after death. They were the daughters of *Night* and *Acheron*. See FURIES.

DIRECT HARMONY. See HARMONY.

DIRECTION, in mechanics, signifies the line or path of a body's motion, along which it endeavours to proceed according to the force impressed upon it. See MECHANICS.

DIRECTOR, in commercial polity, a person who has the management of the affairs of a trading company: thus we say, the directors of the India company, South-sea company, &c. See COMPANY.

The directors are considerable proprietors in the stocks of their respective companies, being chosen by plurality of votes from among the body of proprietors. The Dutch East India company have 60 such directors; that of France, 21; the British East India company has 24, including the chairman, who may be re-elected for four years successively. These last have salaries of 150 l. a-year each, and the chairman 200 l. They meet at least once a-week, and commonly oftener, being summoned as occasion requires.

DIRECTOR, in surgery, a grooved probe, to direct the edge of the knife or scissars in opening sinuses or fistule, that by this means the adjacent vessels, nerves, and tendons, may remain unharmed. See SURGERY.

VOL. IV

DIRIBITORES, among the Romans, officers appointed to distribute tablets to the people at the comitia. See COMITIA.

DIRIGENT, or DIRECTRIX, a term in geometry, signifying the line of motion, along which the deficient line or surface is carried in the genesis of any plane or solid figure.

DIS, an inseparable article prefixed to divers words, the effect whereof is either to give them a signification contrary to what the simple words have, as *disoblige*, *disobey*, &c.; or to signify a separation, detachment, &c. as *disposing*, *distributing*.

DIS, a town of Norfolk, seated on the river Wavenay, on the side of a hill. It is a neat flourishing town, with one large church, a Presbyterian and a Quaker meeting. It has about 600 good houses, the streets are well paved, pretty wide, and always clean. At the west end of the town is a large meer, or lake; but so muddy, that the inhabitants can make no other use of it but in catching of eels. In the town are carried on manufactories of fail-cloth, hofe, and the making of staves. E. Long. 1. 16. N. Lat. 52. 25.

DISABILITY, in law, is when a man is disabled, or made incapable to inherit any lands, or take that benefit which otherwise he might have done: and this may happen four ways; by the act of an ancestor, or of the party himself, by the act of God, or of the law. 1. Disability by the act of the ancestor, is where the ancestor is attainted of high treason, &c. which corrupts the blood of his children, so that they may not inherit his estate. 2. Disability by the act of the party is where a man binds himself by obligation, that, upon surrender of a lease, he will grant a new estate to a lessee; and afterwards he grants over the reversion to another, which puts it out of his power to perform it. 3. Disability by the act of God is where a man is *non sane memorie*, whereby he is incapable to make any grant, &c. So that, if he passeth an estate out of him, it may after his death be made void; but it is a maxim in law, "That a man of full age, shall never be received to disable his own person." 4. Disability by the act of the law, is where a man by the sole act of the law, without any thing by him done, is rendered incapable of the benefit of the law; as an alien born, &c.

ISLANDS OF DISAPPOINTMENT, are a cluster of small islands, lying in S. Lat. 14. 10. W. Long. 141. 16. They were discovered by Commodore Byron in 1765, who gave them their name from the shores affording no anchorage for his ships; for which reason he was obliged to quit them without landing, or procuring any refreshments for his crew, who were then languishing with sickness. They are inhabited by Indians, who appeared on the beach with spears in their hands, that were at least 16 feet long. They every where discovered hostile intentions, and seemed by signs to threaten the people in the boat with death if they came ashore. There are cocoa-trees in great abundance, and the shore abounds with turtle.

DISC, in antiquity, a quoit made of stone, iron, or copper, five or six fingers broad, and more than a foot long, inclining to an oval figure, which they hurled in form of a bowl, to a vast distance, by the help of a leathern thong tied round the person's hand who threw it, and put through a hole in the middle. Homer has made Ajax and Ulysses great artists at this sport.

14 M

sport.

Disibiores
Dife.

Disc
||
Discord.

sport.

DISC, in astronomy, the body and face of the sun and moon, such as it appears to us on the earth; or the body and face of the earth, such as it appears to a spectator in the moon.

DISC, in optics, is the width of the aperture of telescopic glasses, whatever their form be, whether plain, convex, concave, &c.

DISCERNING, or DISCERNMENT, a faculty of the mind whereby it distinguishes between ideas. See METAPHYSICS, n^o 44, &c.

DISCIPLE, one who learns any thing from another: thus, the followers of any teacher, philosopher, &c. are called *disciples*. In the Christian sense, they were followers of Jesus Christ, in general; but in a more restrained sense, the disciples denote those alone who were the immediate followers and attendants on his person, of which there were 70 or 72. The names *disciple* and *apostle* are often synonymously used in the gospel-history; but sometimes the apostles are distinguished from disciples, as persons selected out of the number of disciples, to be the principal ministers of his religion: of these there were only 12. The Latins kept the festival of the 70 or 72 disciples on July 15th, and the Greeks on January 4th.

DISCIPLINE, in a general sense, denotes instruction and government, as military discipline, ecclesiastical discipline, &c.

Ecclesiastical discipline consists in putting those laws in execution by which the church is governed, and inflicting the penalties enjoined by them against the several sorts of offenders that profess the religion of Jesus. The primitive church never pretended to exercise discipline upon any but such as were within her pale, in the largest sense, by some act of their own profession; and even upon these she never pretended to exercise her discipline so far as to cancel or disannul their baptism: all that she pretended to, was to deprive men of the benefits of external communion, such as public prayer, receiving the eucharist, and other acts of divine worship. The church-discipline was only confined to the admonition of the party, and to the lesser and greater excommunication.

As to the objects of ecclesiastical discipline, they were all such delinquents as fell into great and scandalous crimes after baptism.

Discipline, in a more peculiar sense, is used for the chastisements or bodily punishments inflicted on a religious of the Romish church who has been found a delinquent; or even for that which the religious voluntarily undergo or inflict on themselves, by way of mortification.

DISCLAMATION. See LAW, N^o clxv. 23.

DISCORD, in general, signifies disagreement, or opposition between different persons or things.

DISCORD, in music, every sound which, joined with another, forms an assemblage disagreeable to the ear; or rather, every interval whose extremes do not coalesce. Now, as there are no other concords or consonances, except those which form amongst themselves, and with their fundamental sound, perfect chords, it follows, that every other interval must be a real dissonance or discord: even the third and sixth were reckoned such among the ancients, who excluded them from the number of consonant chords.

The term *dissonance*, which is synonymous with discord, is compounded of two words, the inseparable preposition *dis* and the verb *sonare*; which, both in a literal and metaphorical sense, signifies *disagreement* or *disunion*. In reality, that which renders dissonances grating, is, that the sounds which form them, far from uniting in the ear, seem to repel each other, and are heard each by itself as two distinct sounds tho' produced at the same time.

This repulsion or violent oscillation of sounds is heard more or less as the vibrations which produce it are more or less frequently coincident. When two vocal strings are gradually tuned, till they approach a consonant interval, the pulsations become slower, as the chord grows more just, till at last they are scarcely heard, if heard at all; from whence it appears certain, that the pleasure produced in us by harmony results from the more or less exact and frequent coincidence of vibrations; tho' the reason why this coincidence should give pleasure, more than any other modification or combination of sounds, appears to us inscrutable. The agreeable effects of dissonance in harmony, are no objection to this theory; since it is allowed, that the sensations excited by discord are not in themselves immediately and necessarily pleasing, but only please by auricular deception. The ear is surprized with the shock it receives, without being able to imagine how it should have happened; and in proportion as it is harsh and grating, we feel the pleasure of returning harmony enhanced, and the disappointment of being artfully and insensibly extricated more agreeable.

The name of *dissonance*, is given sometimes to the interval, and sometimes to each of the two sounds which form it. But though two sounds equally form a dissonance between themselves, the name is most frequently given to that sound in particular which is most extraneous to the chord.

The number of possible *dissonances* is indefinite; but as in music we exclude all intervals which are not found in the system received, the number of dissonances is reduced to a very few: besides, in practice, we can only select from those few, such as are agreeable to the species, and the mode in which we compose; and from this last number we must exclude such as cannot be used consistently with the rules prescribed. But what are these rules? Have they any foundation in nature, or are they merely arbitrary? This is what Rousseau, whom in this article we have followed or abandoned as his observations appeared useful or frivolous, proposes to investigate as its principal object.

But where does his scrutiny terminate? Not in the abolition of the rules prescribed. These have still subsisted, and will still subsist, while the frame of man, and the nature of music, remain what they are. If then the rules be permanent and universal, the principle upon which they are founded may be latent or ambiguous; but the rules themselves can never be purely arbitrary. How else could it happen, that Rameau, D'Alembert, and Rousseau, should admit the force and effect of these rules, whilst each of those masters exerts his whole genius to give a different account of their cause and origin? Rousseau himself, as we have seen in a former article, inculcates the necessity of dissonances for the completion of harmony; (see CHORD). Now if this be true, the easiest methods of introducing and
dimin-

D'scord.

Discord
Discrete.

dismissing these discords must be the most eligible, and of consequence the rules for using them must be established. It is not then upon the subsistence or demolition of any particular theory, that they depend. Should we attend to the particular objections which may be urged against any system whatever; where is the theory which will be found proof to the efforts of scepticism? After all, the objections of Rousseau against Rameau's theory, as applied by D'Alembert to the origin of consonances, (see MUSIC, art. 94, 95, 96, 97, 98, 99.) appear to be much more frivolous than the analogies from which he pretends this origin to be deduced. It appears from D'Alembert's exposition of this theory, that, if not for all, it affords a solution for the most material and essential phenomena in harmony, which is sufficient for its establishment, till another can be found, which gives a rational and consistent account of the whole: a discovery which has not yet been made. But, whilst we acknowledge the utility of Rousseau's objections against D'Alembert's explication of dissonances, we must at the same time admire the ingenuity with which he has deduced them from principles purely mechanical, without departing from the system of M. Rameau. This mechanical explication will be found in his Musical Dictionary, under the article *Dissonance*.

DISCORD, (the goddess of), in Pagan theology She is represented by Ariettes with fiery eyes, a pale countenance, livid lips, and wearing a dagger in her bosom. It was she who at the marriage of Peleus and Thetis threw in the golden apple, whereon was written "To the fairest;" which occasioned a contention between the goddesses Juno, Minerva, and Venus; each pretending a title to the apple.—She was likewise called *Ate* and *Eris*.

DISCOVERY, in dramatic poetry, a manner of unravelling a plot, or fable, in tragedies, comedies, and romances; wherein, by some unforeseen accident, a discovery is made of the name, fortune, quality, &c. of a principal person, which were before unknown. See CATASTROPHE.

DISCOUNT, in commerce, a term among traders, merchants, and bankers. It is used by the two former on occasion of their buying commodities on the usual time of credit, with a condition that the seller shall allow the buyer a certain discount at the rate of so much per cent. per annum, for the time for which the credit is generally given, upon condition that the buyer pays ready money for such commodities, instead of taking the time of credit. Traders and merchants also frequently taking promissory notes for moneys due payable to them or order at a certain time, and sometimes having occasion for money before the time is elapsed, procure these notes to be discounted by bankers before the time of payment. Bills of exchange are also discounted by bankers; and in this consists one article of the profits of banking. See BANK.

DISCRETE, or DISJUNCT, PROPORTION, is when the ratio of two or more pairs of numbers or quantities is the same, but there is not the same proportion between all the four numbers. Thus if the numbers 3 : 6 :: 8 : 16 be considered, the ratio between 3 : 6 is the same as that between 8 : 16, and therefore the numbers are proportional: but it is only discretely or disjunctly, for 3 is not to 6 as 6 to 8; that is, the

proportion is broken off between 8 and 3, and is not continued as in the following continual proportionals, 3 : 6 :: 12 : 24.

DISCUS, in antiquity. See DISC.

DISCUS, in botany, the middle part of a radiated compound flower, generally consisting of small florets, with a hollow regular petal. It is commonly surrounded by large, plain, or flat, tongue-shaped petals, in the circumference or margin; as in daisy, groundsel, and leopards bane: sometimes the circumference is naked, as in cotton-weed and some species of colts-foot.

DISCUS *Folii*, the surface of the leaf.

DISCUSSION, in matters of literature, signifies the clear treating or handling of any particular point, or problem, so as to shake off the difficulties with which it is embarrassed: thus we say, *such a point was well discussed*, when it was well treated of and cleared up.

DISCUTIENTS, in medicine, are such remedies, as, by their subtilty, dissolve a stagnating or coagulated fluid, and dissipate the same without an external solution of continuity.

DISDIACLASTIC CRYSTAL, in natural history, a name given, by Bartholine and some others, to the pellucid fossil substance more usually called from the place whence it was first brought, *Island crystal*; tho' properly it is no crystal at all, but a fine pellucid spar, called by Dr Hill, from its shape, *parallelopipedum*. See *ISLAND CRYSTAL*.

DISDIAPASON, or BISIAPASON, in music, a compound concord, described by F. Parran, in the quadruple ratio of 4 : 1, or 8 : 2.

DISDIAPASON *Diapente*, a concord in a sextuple ratio of 1 : 6.

DISDIAPASON *Semi-Diapente*, a compound concord in the proportion of 16 : 3.

DISDIAPASON *Ditone*, a compound consonance in the proportion of 10 : 2.

DISDIAPASON *Semi-Ditone*, a compound concord in the proportion of 24 : 5.

DISEASE, has been variously defined by physicians, almost every founder of a new system having given a definition of *disease*, differing in some respects from his predecessors. For a particular account of these definitions, see MEDICINE.

It has always been observed, that people of particular places are subject to particular diseases, owing to their manner of living, or to the air and effluvia of the waters. The colder the country, the fewer and less violent the diseases in general are. Scheffer tells us, that the Laplanders know no such thing as the plague, or fevers of the burning kind, nor are subject to half the distempers we have. Some particular distempers, however, they are subject to more than other nations: thus they have often distempers of the eyes, which arise from their living continually in smoke, or from the glaring of the snow which covers their country for a great part of the year. Pleurifies, and inflammations of the lungs, are also very common among them; and the small-pox often rages with great violence. They have one general remedy against these and all other internal diseases: this is the root of that sort of moss which they call *jerib*. They make a decoction of this root in the whey of rein-deer milk, and drink very

Disease
Disease.

Disease. large doses of it warm, to keep up a breathing sweat. If they cannot get this, they use the stalks of Angelica boiled in the same manner. They have not so great an opinion of this remedy as of the former. The quantity of diluting liquors, however, that is drunk on these occasions, most probably contributes more to the cure of their diseases, than either of the drugs.

Hoffman has made some very curious observations on the diseases incident to particular places. He informs us, that swellings of the throat have been always common to the inhabitants of mountainous countries. The people of Switzerland, Carinthia, Styria, the Hartz-forest, Transylvania, and the inhabitants of Cronstadt, he observes, are all subject to this disease from the same cause: which probably is their using great quantities of snow water; and this, in all probability, derives its pernicious quality from the expulsion of the fixed air contained in it by the congelation, and which is not restored by melting.—The French are peculiarly troubled with fevers, worms, hydroceles, and farcoceles: and all these disorders are thought to proceed originally from their eating very large quantities of chestnuts. The British are peculiarly afflicted with hoarseness, catarrhs, coughs, dysenteries, consumptions; the women with the fluor-albus or whites; and children with a particular distemper scarce known any where else, called the *ricketts*. In different parts of Italy, different diseases prevail. At Naples, the venereal disease is more common than in other part of the world. At Venice people are peculiarly subject to the bleeding piles. At Rome, tertian agues and lethargic distempers are the most common; in Tuscany, the epilepsy or falling-sickness; and in Apulia, they are most subject to burning fevers, pleuritis, &c. In Spain, apoplexies are common, as also melancholy, hypochondriacal complaints, and bleeding piles. The Dutch are peculiarly subject to the scurvy, and to the stone in the kidneys. Denmark, Norway, Sweden, Pomerania, and Livonia, are all terribly afflicted with the scurvy: and it is remarkable, that, in Denmark, Sweden, and Norway, fevers are very common; but in Iceland, Lapland, and Finland, such a disease is scarce ever to be met with; though peripneumonies are very common in these places, and likewise diseases of the eyes, and violent pains in the head. The Russians and Tartars are afflicted with ulcers made by the cold, of the nature of what we call *chilblains*, but greatly worse; and in Poland there reigns a disease called the *plica Polonica*, so terribly offensive and painful, that scarce any thing can be worse. The people of Hungary are very much subject to the gout and rheumatism: they are also more infested with lice and fleas than any other people in the world. The Germans in different parts of the empire are subject to different reigning diseases. In Westphalia, they are peculiarly troubled with peripneumonies and the itch. In Silesia, Franconia, Aultria, and other places thereabout, they are very liable to fevers of the burning kind, to bleedings at the nose, and to other hæmorrhages; also to the gout, inflammations, and consumptions. In Misnia, they have purple fevers; and the children are peculiarly infested with worms. In Greece, Macedonia, and Thrace, there are very few diseases; but what they have are principally burning fevers and pleuritis. At Constantinople the plague always rages; and in the West India islands, ma-

lignant fevers, and the most terrible colics. See MEDICINE.

DISEASES of *Horses*. See FARRIERY.

DISEASES of *Dogs*. See DOGS.

DISEASES of *Plants*. See AGRICULTURE, n^o 67, *et seq.* and BLIGHT, MILDEW, MOSS, &c.

DISFRANCHISING, among civilians, signifies the depriving a person of the rights and privileges of a free citizen or subject.

DISGUISE, a counterfeit habit. Persons doing unlawful acts in disguise are by our statutes sometimes subjected to great penalties, and even declared felons. Thus by an act, commonly called the *black act*, persons appearing disguised and armed in a forest or grounds inclosed, or hunting deer, or robbing a warren or a fish-pond, are declared felons.

DISH, in mining, is a trough made of wood, about 28 inches long, four inches deep, and six inches wide; by which all miners measure their ore. If any be taken selling their ore, not first measuring it by the bar-masser's dish, and paying the king's duty, the seller forfeits his ore, and the buyer forfeits for every such offence 40 shillings to the lord of the field or farmer.

DISJUNCTIVE, something that separates or disjoins. Thus, *or, neither*, &c. which in connecting a discourse yet separates the parts of it, are called *disjunctive conjunctions*.

DISLOCATION, the same with LUXATION.

DISPART, in gunnery, is the setting a mark upon the muzzle-ring, or thereabouts, of a piece of ordnance, so that a light-line taken upon the top of the base-ring against the touch-hole, by the mark set on or near the muzzle, may be parallel to the axis of the concave cylinder. The common way of doing this, is to take the two diameters of the base ring, and of the place where the dispart is to stand, and divide the difference between them into two equal parts, one of which will be the length of the dispart which is set on the gun with wax or pitch, or fastened there with a piece of twine or marlin. By means of an instrument it may be done with all possible nicety.

DISPAUPER. A person suing in *forma pauperis*, is said to be dispaupered, if, before the suit is ended, he has any lands or other estate fallen to him, or if he has any thing to make him lose his privilege. See the article *FORMA PAUPERIS*.

DISPENSARY, or DISPENSATORY, denotes a book containing the method of preparing the various kinds of medicines used in pharmacy. Such are those of Bauderon, Quercetan, Zwelfer, Charas, Bates, Mesue, Salmon, Lemery, Quincy, &c. but the latest and most esteemed are the Edinburgh and London dispensaries, and Dr Lewis's dispensatory.

DISPENSARY, or *Dispensatory*, is likewise a magazine or office for selling medicines at prime cost to the poor. The college of physicians maintain three of these in London; one at the college itself in Warwick-lane; another in St Peter's alley, Cornhill; and a third in St Martin's lane. Dispensaries have also been established in several of the principal towns in Scotland and England; particularly in Edinburgh, Dundee, and Kello; as also at Newcastle upon Tyne. The first of these hath given risen to a course of Medical Lectures there, which promises to be of much advantage

Disease
Dispensary

tage to the students of medicine : and though the undertaking hath not been patronised by people of the first rank, yet the support of some generous and humane citizens hath made some progress towards rendering the institution permanent ; and some hundreds of patients, who could not be admitted into the royal infirmary, have found relief from the medicines charitably bestowed on them in the dispensary.

DISPENSATION, in law, the granting a license of doing some certain action that otherwise is not permitted.

DISPERSION, in general, signifies the scattering or dissipating something. Hence,

DISPERSION, in optics, the same with the divergency of the rays of light.

Point of DISPERSION, in dioptrics, the point from which refracted rays begin to diverge, where their refraction renders them divergent.

DISPERSION of Inflammation, in medicine and surgery, is the removing the inflammation, and restoring the inflamed part to its natural state.

DISPLAYED, in heraldry, is understood of the position of an eagle, or any other bird, when it is erect, with its wings expanded or spread forth.

DISPONDEE, in the Greek and Latin poetry, a double spondee or foot, consisting of four long syllables ; as *mæcênâtes*, *conclûdêntes*.

DISPOSITION, in Scots law, is that deed or writing which contains the sale or grant of any subject : when applied to heritable subjects, it in some cases gets the name of *charter*, which differs from a disposition in nothing else than a few immaterial forms *.

* See Char-
ter.

DISPOSITION, in architecture, the just placing the several parts of an edifice according to their nature and office. See **ARCHITECTURE**, n° 30, &c.

DISPOSITION, in oratory. See **ORATORY**, Part I.

DISPOSITION, in painting. See **PAINTING**, n° 14.

DISPOSITION, in human nature.—In every man there is something original, that serves to distinguish him from others, that tends to form a character, and to make him meek or fiery, candid or deceitful, resolute or timorous, cheerful or morose. This original bent, termed *disposition*, must be distinguished from a *principle* : the latter, signifying a law of human nature, makes part of the common nature of man ; the former makes part of the nature of this or that man. *Propensity* is a name common to both ; for it signifies a principle, as well as a disposition.

DISQUISITION, a serious and exact examination into the circumstances of any affair, in order to discourse clearly about it.

DISSECTION, in anatomy, the cutting up a body, with a view of examining the structure and use of the parts. See **ANATOMY**.

Le Gendre observes, that the dissection of a human body, even dead, was held a sacrilege till the time of Francis I. And the same author assures us, he has seen a consultation held by the divines of Salamanca, at the request of Charles V. to settle the question whether or no it were lawful in point of conscience to dissect a human body in order to learn the structure thereof.

DISSEISIN, in law, an unlawful dispossessing a person of his lands or tenements.

DISSEPIMENTUM, in botany, the name by which Linnæus denominates the partitions which in

dry seed-vessels, as *capsules* and pods (*siliqua*), divide the fruit internally into cells. Diffenters
Dissolution.

DISSENTERS, separatists from the service and worship of any established church.

DISSIMILITUDE, unlikeness, or want of similitude. See the article **RESEMBLANCE** and *Dissimilitude*.

DISSIPATION, in physics, an insensible loss or consumption of the minute parts of the body ; or, that flux whereby they fly off, and are lost.

Circle of DISSIPATION, in optics, is used for that circular space upon the retina, which is taken up by one of the extreme pencils or rays issuing from an object.

DISSOLUTION, in general, whatever dissolves or reduces a solid body into such minute parts as to be sustained in a fluid.

The principal dissolvents for metals, are *aqua-regia* and *aqua-fortis* ; for salts, earths, and gums, water ; for coral, and other alkaline substances, distilled vinegar or spirits of wine. Dissolvents are the same with what the chemists call *menstruans*. See the article **MENSTRUUM**.

Universal DISSOLVENT. See the article **ALKAHEST**.

DISSOLUTION, in physics : a discontinuation, or analysis, of the structure of a mixed body ; whereby, what was one, and contiguous, is divided into little parts, either homogeneous, or heterogeneous.

Dissolution, then, is a general name for all reductions of concrete bodies into their smallest parts, without any regard either to solidity or fluidity : though in the usual acceptation of the word among authors, it is restrained to the reduction of solid bodies into a state of fluidity ; which is more properly expressed by *solution*, as a branch of *dissolution*.

According to the opinion of Fr. Tertius de Lanis, Boerhaave, and some other learned men, the power or faculty of dissolving is lodged in fire alone. See **FIRE** and **HEAT**.

According to this hypothesis, other fluids commonly supposed dissolvents, only produce their effect by means of the fiery spicula they abound with ; and even air, which is judged a powerful menstruum, owes all its force to the rays of light diffused therein.

Sir Isaac Newton accounts for all dissolutions, and the several phenomena thereof, from the great principle of attraction ; and, in effect, the phenomena of dissolution furnish a great part of the arguments and considerations whereby he proves the reality of that principle. The following is a specimen of that great author's way of philosophising on the subject of dissolution.

“ When salt of tartar dissolves by lying in a moist place, is not this done by an attraction between the particles of the salt of tartar, and those of the water which float in the air in form of vapours ? and why does not common salt, or salt-petre, or vitriol, do the like, but for want of such an attraction ? And when *aqua-fortis*, or spirit of vitriol, poured on steel-slings, dissolves the filings, with a great heat, and ebullition ; is not this heat and ebullition effected by a violent motion of the parts ? and does not that motion argue, that the acid parts of the liquor rush towards the parts of the metal with violence, and run forcibly into its pores ; till, getting between the utmost particles and the main mass of metal, they loosen them therefrom, and set them

at

Diffolution

at liberty to float off into the water? When a solution of iron in aqua fortis dissolves lapis calamaris, and lets go the iron; or a solution of copper dissolves iron immersed in it, and lets go the copper; or a solution of mercury in aqua-fortis poured on iron, copper, tin, or lead, dissolves the metal, and lets go the mercury; Does not this argue, that the acid particles of the aqua-fortis are attracted more strongly by the lapis calamaris than by iron; by iron than by copper; by copper than by silver; and by iron, copper, tin, and lead, than by mercury? And is it not for the same reason, that iron requires more aqua-fortis to dissolve it than copper, and copper more than the other metals; and that of all metals iron is dissolved most easily, and is most apt to rust; and next after iron, copper? When aqua-fortis dissolves silver, and not gold; and aqua-regia dissolves gold, and not silver; May it not be said, that aqua-fortis is subtle enough to penetrate the pores of gold as well as of silver, but wants the attractive force to give it entrance: and the same of aqua-regia, and silver? And when metals are dissolved in acid menstruums, and the acids in conjunction with the metal act after a different manner, so as that the taste of the compound is milder than that of the simples, and sometimes a sweet one; Is it not because the acids adhere to the metallic particles, and thereby lose much of their activity? And if the acid be in too small a proportion to make the compound dissolvable in water; will it not, by adhering strongly to the metal, become unactive, and lose its taste; and the compound become a tasteless earth? for such things as are not dissolvable by the moisture of the tongue, are infipid."

Dr Freind gives us a mechanical account of dissolution, in the instance of salt dissolved in water, which is the most simple operation that falls under this head. This motion he ascribes to that attractive force, which is so very extensive in natural philosophy, that there is no kind of matter but what is under its influence. It may be observed, says he, that the corpuscles of salts, which are the most simple of any, are withal very minute, and for their bulk very solid; and, therefore, exert a very strong attractive force, which, *ceteris paribus*, is proportional to the quantity of matter. Hence it comes to pass, that the particles of water are more strongly attracted by the saline particles, than they are by one another: the particles of water, therefore, cohering but loosely, and being easily moveable, approach the corpuscles of salts, and run, as it were, into their embraces: and the motion of them is quicker, or slower, according to their less or greater distances; the attractive force in all bodies being strongest, at the point of contact. Therefore, if salt be thrown into the middle of a dish full of water, we shall find the aqueous particles which are in the middle of the dish sharp and pungent to the taste, but the water upon the sides of the vessel almost infipid; so that, when such a motion once arises, the aqueous particles are carried with the same force towards the salts, and the moment of them is to be estimated from the ratio of their weight and celerity conjunctly. By the force of this impulse, they open to themselves a passage into the pores of the salts, which are very numerous; and at length so break and divide their texture, that all cohesion of their parts is destroyed: hereupon, being separated, and removed to a convenient distance from one

another, they are dispersed, and float here and there about the water.

The simple dissolution of saline substances of every kind in water, may indeed be plausibly enough explained on the hypothesis of attraction; but where the dissolution is attended with heat, the emission of vapours, &c. it seems necessary to seek for some other principle than mere attraction to solve these phenomena. When diluted oil of vitriol, for instance, is poured upon iron-slings, a great quantity of vapour arises, which, if it was attempted to be confined, would certainly break the containing vessel.—It is impossible to imagine any connection between attraction and the emission of a vapour; and what is still more unaccountable, this vapour is *inflammable*, though neither the oil of vitriol nor the iron are so by themselves. Another very strong objection against the hypothesis of attraction may be derived from the phenomena of metallic dissolutions in general; for they do not dissolve completely in acids, as salts do in water. By dissolution they are always decomposed, and cannot be recovered in their proper form without a good deal of trouble. One metal, indeed, will very often precipitate another from an acid in its metalline form; but this is attended with the decomposition of the second metal; so that this can by no means be reckoned a fair experiment. But, whatever other method is used, the dissolved metal is always recovered in form of an earthy powder, that we could scarcely imagine capable of ever becoming malleable, and assuming the splendid appearance of a metal. Now, if there was a strong attraction between this and the acid, we might very justly conjecture, that the dissolution happened by means of that attraction; but so far from this, after a metal has been dissolved by any acid, and the calx has been separated from it, it is always difficult, and very often impossible, to procure a dissolution of the calx in the same acid. The action of the acid in this case seems not unlike that of fire upon wood or any other inflammable substance. Dry wood, thrown into the fire, burns and flames with great violence; but the same wood reduced to ashes, instead of burning, extinguishes fire already kindled. In like manner, a piece of clear metal thrown into an acid, dissolves with great violence; but the same metal, deprived of its phlogistic principle, and reduced to a calx, cannot be acted upon by acids, in whatever manner they are applied; at least, not without the greatest difficulty; and the more perfect the calx is, *i. e.* the more completely it is deprived of its inflammable principle, the greater the difficulty is of combining it afterwards with an acid.

Another thing in which the dissolution of metals by an acid resembles the burning of combustibles by fire is, that in both cases there is a separation of the principle of inflammability. In the case of oil of vitriol and iron filings, this is exceedingly obvious; for there the vapour which arises from the mixture takes fire, and explodes with great vehemence. In all other cases it is very easily proved; for the calx is always capable of being revived into metal by the addition of any substance containing the phlogiston. The calces prepared by fire, and by precipitation from acids, also resemble one another so much, that in many cases they are scarce to be distinguished.

These considerations seem to favour the hypothesis of

Diffoluti

ce of Dr Boerhaave; and much more does the following, namely, that almost all metallic solutions produce some degree of sensible heat. In some metals this is very considerable; but the greatest heat producible by an aqueous solution of any substance is by dissolving quicklime in the nitrous acid. The heat here greatly exceeds that of boiling water. In some dissolutions of inflammable matters by a mixture of the vitriolic and nitrous acids, the heat is so great, that the whole mixture takes fire almost instantaneously. Hence the Boerhaavians think they have sufficient grounds to conclude, that fire alone is the agent by which all dissolutions are performed.

These appearances have also been explained on the hypothesis of attraction; and it has been said, that the heat, &c. was owing to nothing but the violent action of the particles of the acid and metal upon each other. But the late discoveries made by Dr Black, with regard to heat, show, that it is capable of remaining concealed in substances for any length of time, and afterwards breaking out in its proper form. It is probable therefore, that the heat produced in these dissolutions is no other than what existed before, either in the acid, or in the metal. But for a full discussion of this subject see the articles COLD, CONGELATION, EVAPORATION, FIRE, HEAT, &c.

DISSONANCE, in music. See DISCORD.

DISSYLLABLE, among grammarians, a word consisting only of two syllables: such are nature, science, &c.

DISTAFF, an instrument about which flax is tied in order to be spun.

DISTANCE, in general, an interval between two things, either with regard to time or place *.

ACCESSIBLE DISTANCES, in geometry, are such as may be measured by the chain, &c. See GEOMETRY.

INACCESSIBLE DISTANCES, are such as cannot be measured by the chain, &c. by reason of some river, or the like, &c. which obstructs our passing from one object to another. See GEOMETRY.

DISTANCE, in astronomy. The distance of the sun, planets, and comets, is found only from their parallax, as it cannot be found either by eclipses or their different phases: for from the theory of the motions of the earth and planets we know, at any time, the proportion of the distances of the sun and planets from us; and the horizontal parallaxes are in a reciprocal proportion to these distances. See ASTRONOMY, n° 182.

DISTASTE properly signifies an aversion or dislike to certain foods; and may be either constitutional, or owing to some disorder of the stomach.

DISTEMPER, among physicians, the same with DISEASE.

DISTEMPER, in painting, a term used for the working up of colours with something besides water or oil. If the colours are prepared with water, that kind of painting is called *limning*; and if with oil, it is called *painting in oil*, and simply *painting*. If the colours are mixed with size, whites of eggs, or any such proper glutinous or unctuous matter, and not with oil, then they say it is done in *distemper*.

DISTENSION, in general, signifies the stretching or extending a thing to its full length or breadth.

DISTICH, a couplet of verses making a complete sense. Thus hexameter and pentameter verses

are disposed in distichs. There are excellent morals in Cato's distichs.

DISTICHIASIS, in surgery, a disease of the eyelids, when under the ordinary eye-lashes there grows another extraordinary row of hair, which frequently eradicates the former, and, pricking the membrane of the eye, excites pain, and brings on a defluxion.—It is cured by pulling out the second row of hairs with nippers, and cauterizing the pores out of which they issued.

DISTILLATION. See CHEMISTRY, n° 75, *et seq.* The objects of distillation, considered as a trade distinct from the other branches of chemistry, are chiefly spirituous liquors, and those waters impregnated with the essential oils of plants, commonly called *simple distilled waters*. The distilling compound spirits and waters is reckoned a different branch of business, and they who deal in that way are commonly called *redifiers*. This difference, however, though it exists among commercial people, is not at all founded in the nature of the thing; compound spirits being made, and simple spirits being rectified, by the very same operations by which they are at first distilled, or at least with very trifling alterations.

The great object with every distiller ought to be, to procure a spirit perfectly flavourless, or at least as well freed from any particular flavour as may be; and in this country the procuring of such a spirit is no easy matter. The only materials for distillation that have been used in large quantity, are malt and molasses or treacle. Both of these, especially the first, abound with an oily matter, which, rising along with the spirit, communicates a disagreeable flavour to it, and from which it can scarce be freed afterwards by any means whatever.—Some experiments have been made upon carrots, as a subject for the distillers: but these are not as yet sufficiently decisive; nor is it probable, that a spirit drawn from carrots would be at all devoid of flavour, more than one drawn from malt.—To dissipate the essential oil which gives the disagreeable flavour to malt spirits, it has been proposed to inspissate the wort into a rob, or thin extract like a syrup; afterwards to thin it with water, and ferment it in the usual manner. This certainly promises great success; there is no subject we know of that is possessed of any kind of essential oil, but what will part with it by distillation, or by long boiling. The inspissating of the wort, however, does not seem to be either necessary, or safe to be attempted; for, in this case, there is great danger of its contracting an empyreuma, which never could be remedied. The quantity lost by evaporation, therefore, might be occasionally added, with an equal certainty of dissipating the obnoxious oil. Whether the yield of spirit would be as great in this case as in the other, is a question that can by no means be discussed without further experiments. According to a theory adopted by some

distillers, namely, that essential oils are convertible into ardent spirits; and that the more oily any subject is, the greater quantity of spirit is obtainable from it; the practice of dissipating the oil before fermentation must certainly be a loss. But we are too little acquainted with the composition of vinous spirits, to have any just foundation for adopting such theories. Besides, it is certain, that the quantity of ardent spirit producible from any substance, malt for instance, very greatly exceeds

Distichiasis,
Distillation.

thought
convertible
into spirit.

Distillation, ceeds the quantity of essential oil which can by any means be obtained from the fume; nor do we find that those substances, which abound most in essential oil, yield the greatest quantity of spirits. So far from this, fine fugar, which contains little or no essential oil, yields a great deal of ardent spirit.

4
Directions
concerning
fermenta-
tion.

Previous to the operation of distilling, those of brewing and fermentation are necessary; but as these are fully treated of under the article *Brewing*, we shall here only observe, that unless the boiling of the wort, before fermentation, is found to dissipate the essential oil, so as to take away the flavour of the malt, there is no necessity for being at the trouble of that operation. The wort may be immediately cooled and fermented. —The fermentation ought always to be carried on as slowly as possible, and performed in vessels closely stopp'd; only having at the bung a valve press'd down by a spring, which will yield with less force than is sufficient to burst the vessel. It should even be suffered to remain till it has become perfectly fine and transparent; as by this means the spirit will not only be superior in quantity, but also in fragrance, pungency, and viscosity, to that commonly produced.

5
For distilla-
tion.

With regard to performing the operation of distilling, there is only one general rule that can be given; namely, to let the heat, in all cases, be as gentle as possible. Accidents will be effectually prevented by having the worm of a proper wideness, and by rectifying the spirits in a water-bath; which, if sufficiently large, will perform the operation with all the dispatch requisite for the most extensive business. —The vessel in which the rectification is performed, ought to be covered with water up to the neck, and to be loaded with lead at the bottom, so that it may sink in the water. Thus the operation will go on as quickly as if it was on an open fire, and without the least danger of a miscarriage; nor will it ever be necessary to make the water in the bath come to a boiling heat.

6
For distilla-
tion.

As the end of rectification is to make the spirit *clean* as well as *strong*, or to deprive it of the essential oil as well as the aqueous part, it will be proper to have regard to this even in the first distillation. For this purpose, the spirit, as it first comes over, should be received into a quantity of cold water; as by this means the connection betwixt it and the oily matter will be considerably lessened. For the same reason, after it has been once rectified in the water-bath, it should be again mixed with an equal quantity of water, and distilled a second time. Thus the spirit will be freed from most of the oily matter, even though it hath been very much impregnated with it at first. It is necessary to observe, however, that by using such a quantity of water, a considerable part of the spirit will be left in the residuum of each rectification. All these residuums, therefore, must be mixed together, and distilled on an open fire, with a brisk heat, that the remainder of the spirit may be got out.

After the spirit has been distilled once or twice in this manner from water, it may be distilled in a water-bath without any addition; and this last rectification will free it from most of the water it contains. But if it is required to be highly dephlegmated, a quantity of pure and dry salt of tartar must be added. The attraction betwixt this salt and water is greater than that betwixt water and spirit of wine. The salt therefore

imbibes the water contained in the spirit, and sinks with it to the bottom. The spirit, by a single distillation, may then be rendered perfectly free from water; but there is great danger of some of the alkaline salt rising along with it, and impregnating it with what is called an *urinous* flavour. When this once happens, it is impossible to be remedied; and the only way to prevent it, is to make the heat with which the spirit is distilled as gentle as possible. —It hath been propos'd, indeed, to prevent the rising of any thing alkaline, by the admixture of some calcined vitriol, sal catharticus amarus, or other imperfect neutral salt; but this can scarce be supposed to answer any good purpose, as the alkali unites itself with the oily matter of the spirit, and forms a kind of saponaceous compound, which is not so easily affected by the acid of the vitriol or other salt, especially as these salts will not dissolve in the spirit itself.

One very great desideratum among the distillers of this country, is a method of imitating the foreign spirits, brandy, rum, gin, &c. to a tolerable degree of perfection; and notwithstanding the many attempts that are daily made for this purpose, the success in general hath been but very indifferent. On this subject, Mr Cooper hath the following observations, in his

“Complete System of Distillation;” which, as they are applicable to all other spirits as well as brandy, we shall here transcribe. —“The general method of distilling brandies in France need not be formally described, as it differs in nothing from that practised here in working from malt-wash, or molasses; nor are they in the least more cleanly or exact in the operation. They only observe more particularly to throw in a little of the natural ley into the still along with the wine, as finding this gives their spirit the flavour for which it is generally admired abroad. —But, though brandy is extracted from wine, experience tells us that there is a great difference in the grapes from which the wine is made. Every soil, every climate, every kind of grapes, varies with regard to the quantity and quality of the spirits extracted from them. There are some grapes which are only fit for eating; others for drying, as those of Damascus, Corinth, Provence, and Avignon, but not fit to make wine. —Some wines are very proper for distillation, and others much less so. The wines of Languedoc and Provence afford a great deal of brandy by distillation, when the operation is performed on them in their full strength. The Orleans wines, and those of Blois, afford yet more; but the best are those of the territories of Cogniac and Andaye; which are, however, in the number of those the least drunk in France. Whereas those of Burgundy and Champagne, though of a very fine flavour, are improper, because they yield but very little in distillation.

“It must also be farther observed, that all the wines for distillation, as those of Spain, the Canaries, of Alicante, of Cyprus, of St Peres, of Toquet, of Grave, of Hungary, and others of the same kind, yield very little brandy by distillation; and consequently would cost the distiller considerably more than he could sell it for. What is drawn from them is indeed very good, always retaining the saccharine quality and rich flavour of the wine from whence it is drawn; but as it grows old, this flavour often becomes aromatic, and is not agreeable

8
Method of
making
brandies in
France.

Distillation. able to all palates.

"Hence we see that brandies always differ according as they are extracted from different species of grapes. Nor would there be so great a similarity as there is between the different kinds of French brandies, were the strongest wines used for this purpose: but this is rarely the case; the weakest and lowest flavoured wines only are distilled for their spirit, or such as prove absolutely unfit for any other use.

"A large quantity of brandy is distilled in France during the time of the vintage; for all those poor grapes that prove unfit for wine, are usually first gathered, pressed, their juice fermented, and directly distilled. This rids their hands of their poor wines at once, and leaves their casks empty for the reception of better. It is a general rule with them not to distil wine that will fetch any price as wine; for, in this state, the profits upon them are vastly greater than when reduced to brandies. This large stock of small wines, with which they are almost over-run in France, sufficiently accounts for their making such vast quantities of brandy in that country, more than in others which lie in warmer climates and are much better adapted to the production of grapes.—Nor is this the only fund of their brandies: for all the wine that turns eager, is also condemned to the still; and, in short, all that they can neither export nor consume at home, which amounts to a large quantity; since much of the wine laid in for their family provision is so poor as not to keep during the time of spending.

How brandy may be imitated in this country.

"Hence many of our English spirits, with proper management, are convertible into brandies that shall hardly be distinguished from the foreign in many respects, provided the operation be neatly performed.

"The common method of rectifying spirits from alkaline salts, destroys their vinosity, and in its stead introduces an urinous or lixivious taste. But as it is absolutely necessary to restore, or at least to substitute in its room, some degree of vinosity, several methods have been proposed, and a multitude of experiments performed, in order to discover this great desideratum. But none has succeeded equal to the spirit of nitre; and accordingly this spirit, either strong or dulcified, has been used by most distillers to give an agreeable vinosity to their spirits. Several difficulties, however, occur in the method of using it; the principal of which is, its being apt to quit the liquor in a short time, and consequently depriving the liquor of that vinosity it was intended to give. In order to remove this difficulty, and prevent the vinosity from quitting the goods, the dulcified spirit of nitre, which is much better than the strong spirit, should be prepared by a previous digestion, continued for some time, with alcohol; the longer the digestion is continued, the more intimately will they be blended, and the compound rendered the milder and softer.

"After a proper digestion, the dulcified spirit should be mixed with the brandy, by which the vinosity will be intimately blended with the goods, and not disposed to fly off for a very considerable time.—No general rule can be given for the quantity of this mineral acid requisite to be employed; because different proportions of it are necessary in different spirits. It should, however, be carefully attended to, that though a small quantity of it will undoubtedly give an agreeable vino-

Vol. IV.

sity resembling that naturally found in the fine subtle spirits drawn from wines, yet an over large dose of it will not only cause a disagreeable flavour, but also render the whole delign abortive, by discovering the imposition. Those, therefore, who endeavour to cover a foul taste in goods by large doses of dulcified spirit of nitre, will find themselves deceived.

"But the best, and indeed the only method of imitating French brandies to perfection, is by an essential oil of wine; this being the very thing that gives the French brandies their flavour. It must, however, be remembered, that, in order to use even this ingredient to advantage, a pure, tasteless spirit must first be procured; for it is ridiculous to expect that this essential oil should be able to give the agreeable flavour of French brandies to our fulsome malt spirit, already loaded with its own nauseous oil, or strongly impregnated with a lixivious taste from the alkaline salts used in rectification. How a pure insipid spirit may be obtained, has already been considered; it only therefore remains to shew the method of procuring this essential oil of wine, which is this:

"Take some cakes of dry wine-lees, such as are used by our hatters, dissolve them in six or eight times their weight of water, distil the liquor with a slow fire, and separate the oil with a separating glass; reserving for the nicest uses only that which comes over first, the succeeding oil being coarser and more resinous.—Having procured this fine oil of wine, it may be mixed into a quintsence with pure alcohol; by which means it may be preserved a long time fully possessed of all its flavour and virtues; but, without such management, it will soon grow resinous and rancid.

"When a fine essential oil of wine is thus procured, and also a pure and insipid spirit, French brandies may be imitated to perfection, with regard to the flavour. It must however be remembered, and carefully adverted to, that the essential oil be drawn from the same kind of lees as the brandy to be imitated was procured from; we mean, in order to imitate Coniac brandy, it will be necessary to distil the essential oil from Coniac lees; and the same for any other kind of brandy. For, as different brandies have different flavours, and as these flavours are entirely owing to the essential oil of the grape, it would be preposterous to endeavour to imitate the flavour of Coniac brandy with an essential oil procured from the lees of Bordeaux wine.—When the flavour of the brandy is well imitated by a proper dose of the essential oil, and the whole reduced into one simple and homogeneous fluid, other difficulties are still behind: The flavour, though the essential part, is not, however, the only one; the colour, the proof, and the softness, must also be regarded, before a spirit that perfectly resembles brandy can be procured. With regard to the proof, it may be easily hit, by using a spirit rectified above proof; which, after being intimately mixed with the essential oil of wine, may be let down to a proper standard with fair water. And the softness may, in a great measure, be obtained by distilling and rectifying the spirit with a gentle fire; and what is wanting of this criterion in the liquor when first made, will be supplied by time: for it must be remembered, that it is time alone that gives this property to French brandies; they being at first acrid, foul, and fiery. But, with regard to the colour, a particular

14 N

method

Distillation. method is required to imitate it to perfection.

¹⁰
Spirits how
coloured.

“ The art of colouring spirits owes its rule to observations on foreign brandies. A piece of French brandy that has acquired by age a great degree of softness and ripeness, is observed, at the same time, to have acquired a yellowish brown colour; and hence our distillers have endeavoured to imitate this colour in such spirits as are intended to pass for French brandy. And in order to this, a great variety of experiments have been made on different substances. But in order to know a direct and sure method of imitating this colour to perfection, it is necessary we should be informed whence the French brandies themselves acquire their colour. This discovery is very easily made. The common experiment of trying whether brandy will turn blackish with a solution of iron, shews that the colour is owing to some of the resinous matter of the oak-cask dissolved in the spirit. There can be no difficulty, therefore, in imitating this colour to perfection. A small quantity of the extract of oak, or the shavings of that wood, properly digested, will furnish us with a tincture capable of giving the spirit any degree of colour required. But it must be remembered, that as the tincture is extracted from the cask by brandy, that is, alcohol and water, it is necessary to use both in extracting the tincture; for each of these dissolves different parts of the wood. Let, therefore, a sufficient quantity of oak shavings be digested in strong spirit of wine, and also at the same time other oak shavings be digested in water; and when the liquors have acquired a strong tincture from the oak, let both be poured off from the shavings into different vessels, and both placed over a gentle fire till reduced to the consistence of treacle. In this condition let the two extracts be intimately mixed together; which may be effectually done by adding a small quantity of loaf-sugar, in fine powder, and rubbing the whole well together. By this means a liquid essential extract of oak will be procured, and always ready to be used as occasion shall require.

“ There are other methods in use for colouring brandies; but the best, besides the extract of oak above-mentioned, are treacle and burnt sugar. The treacle gives the spirits a fine colour, nearly resembling that of French brandy; but as its colour is but dilute, a large quantity must be used: this is not, however, attended with any bad consequences; for notwithstanding the spirit is really weakened by this addition, yet the bubble proof, the general criterion of spirits, is greatly mended by the tenacity imparted to the liquor by the treacle. The spirit also acquires from the mixture a sweetish or luscious taste, and a fullness in the mouth; both which properties render it very agreeable to the palates of the common people, who are, in fact, the principal consumers of these spirits. A much smaller quantity of burnt sugar than of treacle will be sufficient for colouring the same quantity of spirits: the taste is also very different; for instead of the sweetness imparted by the treacle, the spirit acquires from the burnt sugar an agreeable bitterness, and by that means recommends itself to nicer palates, which are offended with a luscious spirit. The burnt sugar is prepared by dissolving a proper quantity of sugar in a little water, and scorching it over the fire till it acquires a black colour. Either treacle or burnt sugar will nearly imitate the genuine colour of old

French brandy; but neither of them will succeed when put to the test of the viriolic solution.

“ The spirit distilled from molasses or treacle is very clean or pure. It is made from common treacle dissolved in water, and fermented in the same manner as the wash for the common malt spirit. But if some particular art is not used in distilling this spirit, it will not prove so vinous as malt spirit, but more flat and less pungent and acid, though otherwise much cleaner tasted, as its essential oil is of a much less offensive flavour. Therefore, if good fresh wine lees, abounding in tartar, be added and duly fermented with the molasses, the spirit will acquire a much greater vinosity and briskness, and approach much nearer to the nature of foreign spirits. Where the molasses spirit is brought to the common proof-strength, if it is found not to have a sufficient vinosity, it will be very proper to add some good dulcified spirit of nitre; and if the spirit be clean worked, it may, by this addition only, be made to pass on ordinary judges for French brandy. Great quantities of this spirit are used in adulterating foreign brandy, rum, and arrack. Much of it is also used alone in making cherry-brandy, and other drams by infusion; in all which many, and perhaps with justice, prefer it to foreign brandies. Molasses, like all other spirits, is entirely colourless when first extracted; but distillers always give it as nearly as possible the colour of foreign spirits.”

If these principles hold good, the imitation of foreign spirits of all kinds must be an easy matter. It will only cost the procuring of some of those substances from which the spirit is drawn; and distilling this with water, the essential oil will always give the flavour desired. Thus, to imitate Jamaica rum, it will only be necessary to procure some of the tops, or other useless parts, of the sugar-canes; from which an essential oil being drawn, and mixed with clean molasses spirit, will give it the true flavour. The principal difficulty must lie in procuring a spirit totally, or nearly, free of all flavour of its own. The spirit drawn from the refuse of a sugar-house is by our author commended as superior to that drawn from molasses: though even this is not entirely devoid of some kind of flavour of its own; nor indeed is that drawn from the best refined sugar entirely flavourless. It is very probable, therefore, that to procure an absolutely flavourless spirit is impossible. The only method, therefore, of imitating foreign spirits, is by choosing such materials as will yield a spirit flavoured as much like them as possible. The materials most recommended by our author in this case, and probably the best that can be used, are raisins. Concerning these he gives the following directions. “ In order to extract this spirit, the raisins must be infused in a proper quantity of water, and fermented in the manner already directed. When the fermentation is completed, the whole is to be thrown into the still, and the spirit extracted by a strong fire. The reason why we here direct a strong fire is, because by that means a greater quantity of the essential oil will come over the helm with the spirit, which will render it fitter for the distiller's purpose: for this spirit is commonly used to mix with common malt goods; and it is surprising how far it will go in this respect, ten gallons of it being often sufficient to give a determining flavour and agreeable vinosity to a whole piece of malt spirits. It

pure spirit.

Distillation.

Distillation.

is therefore well worth the distiller's while to endeavour at improving the common method of extracting spirits from raisins; and perhaps the following hint may merit attention. When the fermentation is completed, and the still charged with fermented liquor as above directed, let the whole be drawn off with as brisk a fire as possible; but, instead of the cask or can generally used by distillers for a receiver, let a large glass, called by chemists a *separating glass*, be placed under the nose of the worm, and a common receiver applied to the spout of the separating glass: by this means the essential oil will swim upon the top of the spirit, or rather low-wine, in the separating glass, and may be easily preserved at the end of the operation. The use of this limpid essential oil is well known to distillers; for in this resides the whole flavour, and consequently may be used to the greatest advantage in giving that distinguishing taste and true vinosity to the common malt spirits. After the oil is separated from the low-wine, the liquor may be rectified in balneo marie into a pure and almost tasteless spirit, and therefore well adapted to make the finest compound cordials, or to imitate or mix with the finest French brandies, arracks, &c. In the same manner a spirit may be obtained from cyder. But as its particular flavour is not so desirable as that obtained from raisins, it should be distilled in a more gentle manner, and carefully rectified according to the directions we have already given."

13
Directions
ordistilling
compound
spirits.

These directions may suffice for the distillation of any kind of simple spirits. The distillation of compound ones depends on the observation of the following general rules, which are very easy to be learned and practised.

1. The artist must always be careful to use a well cleansed spirit, or one freed from its own essential oil. For, as a compound water is nothing more than a spirit impregnated with the essential oil of the ingredients, it is necessary that the spirit should have deposited its own.

2. Let the time of previous digestion be proportioned to the tenacity of the ingredients, or the pondersity of their oil.

3. Let the strength of the fire also be proportioned to the pondersity of the oil intended to be raised with the spirit.

4. Let only a due proportion of the finest parts of the essential oil be united with the spirit; the grosser and less fragrant parts of the oil not giving the spirit so agreeable a flavour, and at the same time rendering it unlighty. This may in a great measure be effected by leaving out the faints, and making up to proof with fine soft water in their stead.

A careful observation of these four rules will render this part of distillation much more perfect than it is at present. Nor will there be any occasion for the use of burnt alum, white of eggs, infusions, &c. to fine down cordial waters; for they will presently be fine, sweet and pleasant tasted, without any further trouble. We shall now subjoin particular receipts for making some of those compound waters, or spirits, that are most commonly to be met with, and are in the most general estimation.

Strong Cinnamon-water. Take eight pounds of fine cinnamon bruised, 17 gallons of clean rectified spirit,

and two gallons of water. Put them into your still, and digest them 24 hours with a gentle heat; after which draw off 16 gallons with a pretty strong heat.—A cheaper spirit, but of an inferior quality, may be obtained, by using *casia lignea* instead of cinnamon. If you would dulcify your cinnamon water, take double-refined sugar in what quantity you please; the general proportion is about two pounds to a gallon; and dissolve it in the spirit, after you have made it up proof with clean water. One general caution is here necessary to be added; namely, that near the end of the operation, you carefully watch the spirit as it runs into the receiver, in order to prevent the faints from mixing with the goods. This you may discover by often catching some of it as it runs from the worm in a glass, and observing whether it is fine and transparent; for as soon as ever the faints begin to rise, the spirit will have an azure or bluish cast. As soon as this alteration in colour is perceived, the receiver must be immediately changed; for if the faints are suffered to mix themselves with the rest, the value of the goods will be greatly lessened.—Here we may observe, that the distillers call such goods as are made up proof, *double goods*; and those below proof, *single*.

Clove-water. Take of cloves bruised, four pounds; pimento, or all-spice, half a pound; proof spirit, 16 gallons. Digest the mixture 12 hours in a gentle heat, and then draw off 15 gallons with a pretty brisk fire. The water may be coloured red, either by a strong tincture of cochineal, alkanet, or corn-poppies flowers. It may be dulcified at pleasure with double-refined sugar.

Lemon-water. Take of dried lemon-peel, four pounds; clean proof spirit 10 gallons and a half, and one gallon of water. Draw off 10 gallons by a gentle fire, and dulcify with fine sugar.

Citron-water. Take of dry yellow rinds of citrons, three pounds; of orange-peel, two pounds; nutmegs bruised, three quarters of a pound; clean proof-spirit, ten gallons and a half; water, one gallon: digest with a gentle heat; then draw off ten gallons in balneo marie, and dulcify with fine sugar.

Aniseed-water. Take of aniseed bruised, two pounds; proof-spirit, 12 gallons and a half; water, one gallon: draw off ten gallons with a moderate fire.—This water should never be reduced below proof; because the large quantity of oil with which it is impregnated, will render the goods milky and foul when brought down below proof. But if there is a necessity for doing this, their transparency may be restored by filtration.

Orange-water. Take of the yellow part of fresh orange-peels, five pounds; clean proof-spirit, ten gallons and a half; water, two gallons: draw off ten gallons with a gentle fire.

Cedrat-water. The cedrat is a species of citron, and very highly esteemed in Italy where it grows naturally. The fruit is difficult to be procured in this country; but as the essential oil is often imported from Italy, it may be made with it according to the following receipt.—Take of the finest loaf-sugar reduced to powder, a quarter of a pound; put it into a glass mortar, with 120 drops of the essence of cedrat; rub them together with a glass pestle; and put them into a glass alembic, with a gallon of fine proof-spirits and a quart of water. Place the alembic in balneo marie,

14
Receipts for
a number of
compound
spirits.

and draw off one gallon, or till the faints begin to rise; and dulcify with fine sugar. This is reckoned the finest cordial yet known; it will therefore be necessary to be particularly careful that the spirit is perfectly clean, and, as much as possible, freed from any flavour of its own.

Orange Cordial-water, or Eau de Bigarade. Take the outer or yellow part of the peels of 14 bigarades, (a kind of oranges); half an ounce of nutmegs, a quarter of an ounce of mace, a gallon of fine proof-spirit, and two quarts of water. Digest all these together two days in a close vessel; after which draw off a gallon with a gentle fire, and dulcify with fine sugar. This cordial is greatly esteemed abroad, but is not so well known in this country.

Ros Solis. Take of the herb called *Ros Solis*, picked clean, four pounds; cinnamon, cloves, and nutmegs, of each three ounces and a half; marigold-flowers, one pound; caraway-seeds, ten ounces; proof-spirit, ten gallons; water, three gallons. Distill with a pretty strong fire, till the faints begin to rise. Then take of liquorice-root sliced, half a pound; raisins stoned, two pounds; red saunders, half a pound: digest these three days in two quarts of water; then strain out the clear liquor, in which dissolve three pounds of fine sugar, and mix it with the spirit drawn by distillation.

Ufquebaugh. Take of nutmegs, cloves, and cinnamon, of each two ounces; of the seeds of anise, caraway, and coriander, of each four ounces; liquorice-root sliced, half a pound. Bruise the seeds and spices; and put them, together with the liquorice, into the still with 11 gallons of proof-spirits, and two gallons of water. Distil with a pretty brisk fire till the faints begin to rise. But, as soon as the still begins to work, fasten to the nose of the worm two ounces of English saffron tied up in a cloth, that the liquor may run thro' it, and extract all its tincture; and in order to this, you should frequently press the saffron with your fingers. When the operation is finished, dulcify your goods with fine sugar.

Ratafia. Is a liquor prepared from different kinds of fruits, and is of different colours according to the fruits made use of. Of red ratafia there are three kinds, the fine, the dry or sharp, and the common. The fruits most proper for making red ratafia, are the black heart-cherry, the common red cherry, the black cherry, the mery or honey cherry, the strawberry, the raspberry, the red gooseberry, and the mulberry. These fruits should be gathered when in their greatest perfection, and the largest and most beautiful of them chosen for the purpose.—The following is a receipt for making red ratafia, fine and soft. Take of the black heart-cherries 24 pounds; black cherries, four pounds; raspberries and strawberries, of each three pounds. Pick the fruits from their stalks, and bruise them; in which state let them continue 12 hours: press out the juice; and to every pint of it add a quarter of a pound of sugar. When the sugar is dissolved, run the whole through the filtering bag, and add to it three quarts of clean proof-spirits. Then take of cinnamon, four ounces; of mace, an ounce; and of cloves, two drams. Bruise these spices; put them into an alembic with a gallon of clean proof-spirits and two quarts of water, and draw off a gallon with a brisk fire. Add as much of this spicy spirit to your ratafia as will render it agreeable to your palate; about one

fourth is the usual proportion.

Ratafia made according to the above receipt will be of a very rich flavour and elegant colour. It may be rendered more or less of a spicy flavour, by adding or diminishing the quantity of spirit distilled from the spices.—Some, in making ratafia, suffer the expressed juices of their fruits to ferment several days: by this means the vinosity of the ratafia is increased; but, at the same time, the elegant flavour of the fruits is greatly diminished. Therefore, if the ratafia is desired stronger or more vinous, it may be done by adding more spirits to the expressed juice; by which means the flavour of the fruits may be preserved, as well as the ratafia rendered stronger. It is also a method with some to tie the spices in a linen bag, and suspend them in the ratafia. But if this method is taken, it will be necessary to augment the quantity of spirit first added to the expressed juice. There is no great difference in the two methods of adding the spices, except that by suspending them in the ratafia the liquor is rendered less transparent.

Dry or sharp Ratafia. Take cherries and gooseberries, of each 30 pounds; mulberries, seven pounds; raspberries, ten pounds. Pick all these fruits clean from their stalks, &c. bruise them, and let them stand 12 hours; but do not suffer them to ferment. Press out the juice, and to every pint add three ounces of sugar. When the sugar is dissolved, run it through the filtering bag, and to every five pints of liquor, add four pints of clean proof-spirit; together with the same proportion of spirit drawn from the spices in the foregoing composition.

Common Ratafia. Take of nutmegs, eight ounces; bitter almonds, ten pounds; Lisbon sugar, eight pounds; ambergrease, ten grains: infuse these ingredients three days in ten gallons of clean proof-spirit, and filter thro' a flannel bag for use. The nutmegs and bitter almonds must be bruised, and the ambergrease rubbed with the Lisbon sugar in a marble mortar, before they are infused in the spirit.

Gold Cordial. Take of the roots of angelica, four pounds; raisins stoned, two pounds; coriander-seeds, half a pound; caraway-seeds and cinnamon, of each half a pound; cloves, two ounces; figs and liquorice-root, of each one pound; proof spirit, eleven gallons; water, two gallons. The angelica, liquorice, and figs, must be sliced before they are added. Digest two days; and draw off by a gentle heat till the faints begin to rise; hanging in a piece of linen, fastened to the mouth of the worm, an ounce of English saffron. Then dissolve eight pounds of sugar in three quarts of rose-water, and add to it the distilled liquor.—This liquor derives its name of *Gold Cordial*, from a quantity of leaf-gold being formerly added to it; but this is now generally disused, as it cannot possibly add any virtue.

Cardamum, or All-four. Take of pimento, caraway, and coriander seeds, and lemon-peel, each three pounds; of malt spirits, eleven gallons; water, three gallons. Draw off with a gentle fire, dulcify with common sugar, and make up to the strength desired with clear water.—This is a dram greatly used by the poorer sort of people in some countries.

Genoa. There was formerly sold in the apothecaries shops a distilled spirituous water of juniper; but the vulgar being fond of it as a dram, the distillers sup-

planted

Distinct
||
Distortion.

planted the apothecaries, and sold it under the name of *Geneva*. The common kind, however, is not made from juniper-berries, but from oil of turpentine; and indeed it is surprising, that people should accustom themselves to drink such liquors for pleasure.—The receipt for making this kind of spirit, sold in the gin-shops at London, is as follows. Take of the ordinary malt spirits, ten gallons; oil of turpentine, two ounces; bay-salt, three handfuls: Draw off by a gentle fire till the faints begin to rise; and make up your goods to the strength required with clear water.

The best kind is made by the following recipe.—Take of juniper-berries, three pounds; proof-spirit, ten gallons; water, four gallons: Draw off by a gentle fire till the faints begin to rise, and make up your goods to the strength required with clean water.

There is a sort of this liquor called *Holland's Geneva*, from its being imported from Holland, which is greatly esteemed.—The ingredients used by the Dutch, are the same with those given in the last recipe; only, instead of malt-spirits, they use French brandy. But from what has been already observed concerning the nature of these kinds of spirits, it is easy to see, that by the help of a well rectified spirit, *geneva* may be made in this country at least nearly equal to the Dutch, provided it is kept to a proper age; for all spirituous liquors contract a softness and mellowness by age, impossible to be imitated any other way.

DISTINCT SMALL-POX. See (the Index subjoined to) MEDICINE.

DISTINCTION, in logic, is an assemblage of two or more words, whereby disparate things, or their conceptions, are denoted.

DISTORTION, in medicine, is when any part of the human body remarkably deviates from its natural shape or position. Distortions of different parts may arise either from a convulsion or palsy; though sometimes a terrible distortion in the shape of the whole body hath arisen merely from carelessness and ill habits. Mr Winslow, in the Memoirs of the Academy of Sciences at Paris, gives a very remarkable account of a lady of quality, whom he had known to be perfectly straight for several years; but who taking afterwards to a sedentary course of life, got a custom of dressing herself very carelessly, and of leaning as the fat, either forwards, or to a side. It was not many months before she found it painful and troublesome to stand or sit upright; and soon afterwards she found an inequality in the lower part of the back-bone. Alarmed at this, she consulted the gentleman who gave the account. To prevent the increase of the malady, he ordered her to wear a particular sort of jumps instead of stays, and had a pad of a proper size applied: but this was soon neglected; and the consequence was, that in a little time the back-bone became more and more crooked, and at length bent itself sideways in two contrary directions, so as to represent the figure of the Roman S; and the lady, still refusing to take the proper measures, lost a fourth part of her height; and continued for the remainder of her life, not only crooked from right to left, and from left to right, but so oddly folded together, that the first of the false ribs on one side, approached very near the crest of the os ilium on that side, and the viscera of the lower belly became strangely pushed out of their regular places to

the opposite side; and the stomach itself was so strongly compressed, that whatever she swallowed seemed to her to fall into two separate cavities.

DISTRESS, in law, the seizing or distraining any thing for rent in arrear, or other duty unperformed.

The effect of this distress is to compel the party either to replevy the things distrained, and contest the taking, in an action of trespass against the distrainer; or rather to oblige him to compound and pay the debt or duty for which he was so distrained.

There are likewise compulsory distresses in actions, to cause a person appear in court; of which kind there is a distress personal of one's moveable goods, and the profits of his lands, for contempt in not appearing after summons: there is likewise distress real, of a person's immovable goods. In these cases none shall be distrained to answer for any thing touching their freedoms, but by the king's writ.

Distress may be either finite or infinite. Finite distress is that which is limited by law, in regard to the number of times it shall be made, in order to bring the party to a trial of the action. Infinite distress is that which is without any limitation, being made till the person appears: it is farther applied to jurors that do not appear; as, upon a certificate of affise, the process is *venire facias, habeas corpora*, and distress infinite.

It is also divided into grand distress, and ordinary distress: of these the former extends to all the goods and chattels that the party has within the county. A person, of common right, may distrain for rents and all manner of services; and where a rent is reserved on a gift in tail, lease for life, or years, &c. though there be no clause of distress in the grant or lease, so as that he has the reversion: but on a feoffment made in fee, a distress may not be taken, unless it be expressly reserved in the deed.

DISTRIBUTION, in a general sense, the act of dividing a thing into several parts, in order to the disposing each in its proper place.

DISTRIBUTION, in architecture, the dividing and disposing the several parts and pieces which compose a building, as the plan directs. See ARCHITECTURE.

DISTRIBUTION, in rhetoric, a kind of description, whereby an orderly division and enumeration is made of the principal qualities of the subject. David supplies us with an example of this kind, when, in the heat of his indignation against sinners, he gives a description of their iniquity: "Their throat is an open sepulchre; they flatter with their tongues; the poison of asps is under their lips; their mouth is full of cursing and lies; and their feet are swift to shed blood."

DISTRIBUTION, in printing, the taking a form asunder, separating the letters, and disposing them in the cases again, each in its proper cell. See PRINTING.

DISTRICT, in geography, a part of a province, distinguished by peculiar magistracies, or certain privileges; in which sense it is synonymous with hundred. See HUNDRED.

DISTRINGAS, in law, a writ commanding the sheriff, or other officer, that he distrain a person for debt to the king, &c. or for his appearance at a certain day.

DISTRINGAS Juratores, a writ directed to the sheriff, whereby he is commanded to distrain upon a jury to

Ditrihedria.

to appear, and to return info on their lands, &c. for non-appearance. This writ of distringas juratores issues for the sheriff to have their bodies in court, &c. at the return of the writ.

DITCH, a common fence or inclosure in marshes, or other wet land where there are no hedges. They allow these ditches six feet wide against highways that are broad; and against commons, five feet. But the common ditches about inclosures, dug at the bottom of the bank on which the quick is raised, are three feet wide at the top, one at the bottom, and two feet deep. By this means each side has a slope, which is of great advantage; for where this is neglected, and the ditches dug perpendicular, the sides are always washing down. Besides, in a narrow-bottomed ditch, if cattle get down into it, they cannot stand to turn themselves to crop the quick; but where the ditch is four feet wide, it should be two and a half deep; and where it is five wide, it should be three deep, and so in proportion.

DITCH-WATER is often used as an object for the microscope, and seldom fails to afford a great variety of animalcules. This water very often appears of a yellowish, greenish, or reddish colour; and this is wholly owing to the multitudes of animals of those colours which inhabit it. These animals are usually of the shrimp kind: and Swammerdam, who very accurately examined them, has called them, from the figure of their horns, *pulex aquaticus arborefcens*. They copulate in May or June; and are often so numerous at that season, that the whole body of the water they are found in, is seen to be of a red, green, or yellowish colour, according to the colours of their bodies. The green thin foam also, so frequently seen on the surface of standing waters in summer, is no other than a multitude of small animalcules of this or some of the other kinds. Dughill water is not less full of animals than that of ditches; and is often found so thronged with animalcules, that it seems altogether alive: it is then so very much crowded with these creatures, that it must be diluted with clear water before they can be distinctly viewed. There are usually in this fluid a sort of eels, which are extremely active; and besides these and many other of the common inhabitants of fluids, there is one species found in this, which seems peculiar to it: the middle part of them is dark, and beset with hairs, but the ends are transparent; their tails are tapering, with a long sprig at the extremity, and their motion is slow and waddling. See **ANIMALCULE**.

DITHYRAMBUS, in ancient poetry, a hymn in honour of Bacchus, full of transport and poetical rage.

This poetry owes its birth to Greece, and to the transport of wine; and yet art is not quite exploded, but delicately applied to guide and restrain the dithyrambic impetuosity, which is indulged only in pleasing flights. Horace and Aristotle tell us, that the ancients gave the name of dithyrambus to those verses wherein none of the common rules or measures were observed. As we have now no remains of the dithyrambus of the ancients, we cannot say exactly what their measure was.

DITONE, in music, an interval comprehending two tones. The proportion of the sounds that form the ditone is 4 : 5, and that of the semiditone is 5 : 6.

DITRIHEDRIA, in mineralogy, a genus of spars with twice three sides, or six planes, being formed of

two trigonal pyramids joined base to base, without any intermediate column. See **SPAR**.

The species of ditrihedria are distinguished by the different figures of these pyramids.

DITTANY, in botany. See **DICTAMNUS**.

DITTO, in books of accounts, usually written **D^o**, signifies the aforementioned. The word is corrupted from the Italian *detto*, "the said;" as in our law-phrase, "the said premises," meaning the same as were aforementioned.

DIVAL, in heraldry, the herb nightshade, used by such as blazon by flowers and herbs, instead of colours and metals, for fable or black.

DIVAN, a council-chamber, or court of justice, among the eastern nations, particularly the Turks.—The word is Arabic, and signifies the same with *sora* in the Turkish dialect.

DIVAN-BEGHI, the superintendent of justice in Persia, whose place is the last of the six ministers of the second rank, who are all under the athemadaler, or first minister. To this tribunal of the divan-beghi he appeals from sentences passed by the governors: he has a fixed stipend of 50,000 crowns for administering justice: all the sergeants, ushers, &c. of the court, are in his service: he takes cognizance of the criminal causes of the chams, governors, and other great lords of Persia, when accused of any fault. There are divan-beghis not only at court and in the capital, but also in the provinces and other cities of the empire. The alcoran is the sole rule of his administration of justice, which also he interprets at pleasure. He takes no cognizance of civil causes; but all differences arising between the officers of the king's household, and between foreign ministers, are determined by him.

DIVANDUROW, the name of seven islands which lie a league north of the Maldives, and twenty-four from the coast of Malabar, almost opposite to Cananor.

DIVER, in ornithology. See **COLYMBUS**.

DIVERGENT, or **DIVERGING**, **LINES**, in geometry, are those which constantly recede from each other.

DIVERGENT RAYS, in optics, are those which, going from a point of the visible object, are dispersed, and continually depart one from another, in proportion as they are removed from the object: in which sense it is opposed to convergent. See **OPTICS**.

DIVERSIFYING, in rhetoric, is of infinite service to the orator; it is an accomplishment essential to his character, and may fitly be called the subject of all his tropes and figures. Vossius lays down six ways of diversifying a subject. 1. By enlarging on what was briefly mentioned before. 2. By a concise enumeration of what had been insisted on at length. 3. By adding something new to what is repeated. 4. By repeating only the principal heads of what had been said. 5. By transposing the words and periods. 6. By imitating them.

DIVERSION, in military affairs, is when an enemy is attacked in one place where they are weak and unprovided, in order to draw off their forces from another place where they have made or intend to make an irruption. Thus the Romans had no other way in their power of driving Hannibal out of Italy, but by making a diversion in attacking Carthage.

DIVESTING, or **DIVESTITURE**, in law, is used for the act of surrendering one's effects.

Dittany
Divedling.

DIVIDEND, in arithmetic, the number proposed to be divided into equal parts *.

DIVIDEND OF STOCKS, is a share or proportion of the interest of stocks erected on public funds, as the South-sea, &c. divided among and paid to the adventurers half-yearly.

DIVINATION, the knowledge of things obscure, or future, which cannot be attained by any natural means.

It was a received opinion among the heathens, that the gods were wont to converse familiarly with some men, whom they endowed with extraordinary powers, and admitted to the knowledge of their councils and designs. Plato, Aristotle, Plutarch, Cicero, and others, divide divination into two sorts or species, viz. natural and artificial.

The former was so called, because not attained by any rules or precepts of art, but infused or inspired into the diviner, without his taking any further care about it than to purify and prepare himself for the reception of the divine afflatus. Of this kind were all those who delivered oracles, and foretold future events by inspiration, without observing external signs or accidents.

The second species of divination was called *artificial*, because it was not obtained by immediate inspiration, but proceeded upon certain experiments and observations arbitrarily instituted, and mostly superstitious. Of this sort there were various kinds, as by sacrifices, entrails, flame, cakes, flour, wine, water, birds, lots, verses, omens, &c.

In holy scripture we find mention made of nine different kinds of divination. The first performed by the inspection of planets, stars, and clouds : it is supposed to be the practice of this, whom Moses calls מְנַחֵם *menachem*, of אָנָן *anan*, "cloud," Dent. ch. xviii. v. 10. 2. Those, whom the prophet calls in the same place מְנַחֵם *menacheph*, which the vulgate and generality of interpreters render *augur*. 3. Those who in the same place are called מְנַחֵם *menacheph*, which the Sepuagint and vulgate translate *a man given to ill practices*. 4. Such authors, whom Moses in the same chapter, ver. 11. calls חֹבֵב *hobber*. 5. Those, who consult the spirits called *Python* ; or, as Moses expresses it in the same book, שְׂאֵל אוֹב, those who ask questions of *Python*. 6. Witches, or magicians, whom Moses calls יִדְּוֹנִי *judeoni*. 7. Those who consult the dead, *necromancers*. 8. The prophet Hosea, chap. iv. ver. 12. mentions such as consult slaves, שְׂאֵל מִלְּבַיִת : which kind of divination may be called *rhodomancy*. 9. The last kind of divination mentioned in scripture is *hepatoscopy*, or the consideration of the liver.

Divination of all kinds was necessarily made an occult science, which naturally remained in the hands of the priests and priestesses, the magi, the soothsayers, the augurs, the visionaries, the priests of the oracles, the false prophets, and other like professors, till the time of the coming of Jesus Christ. The light of the gospel, it is true, has dissipated much of this darkness ; but it is more difficult, than is commonly conceived, to eradicate from the human mind a deep-rooted superstition, even though the truth be set in the strongest light, especially when the error has been believed almost from the origin of the world : so we still find existing among us the remains of this pagan superstition,

in the following chimeras, which enthusiastic and designing men have formed into arts and sciences ; tho' it must be owned, to the honour of the 18th century, that the pure doctrines of Christianity, and the spirit of philosophy, which become every day more diffused, equally concur in banishing these visionary opinions. The vogue for these pretended sciences and arts, moreover, is past, and they can no longer be named without exciting ridicule in all sensible people. By relating them here, therefore, and drawing them from their obscurity, we only mean to show their futility, and to mark those rocks against which the human mind, without the assistance of a pilot, might easily run.

For the attaining of these supernatural qualifications, there are still existing in the world the remains of,

1. *Astrology* : a conjectural science which teaches to judge of the effects and influences of the stars ; and to predict future events by the situation of the planets and their different aspects. It is divided into *natural astrology*, or *meteorology* ; which is confined to the foretelling of natural effects, as the winds, rain, hail, and snow, frosts and tempests. In this consists one branch of the art of almanack-makers ; and by merely confronting these predictions in the calendar, with the weather each day produces, every man of sense will see what regard is to be paid to this part of astrology. The other part, which is called *judicial astrology*, is still far more illusive and rash than the former : and having been at first the wonderful art of visionaries, it afterwards became that of impostors ; a very common fate with all those chimerical sciences, of which we shall here speak. This art pretends to teach the method of predicting all sorts of events that shall happen upon the earth, as well such as relate to the public, as to private persons ; and that by the same inspection of the stars and planets, and their different constellations. The *cabala* signifies, in like manner, the knowledge of things that are above the moon, as the celestial bodies and their influences ; and in this sense it is the same with judicial astrology, or makes a part of it.

2. *Horsescopy*, which may also be considered as a part of astrology, is the art by which they draw a figure, or celestial scheme, containing the 12 houses, wherein they mark the disposition of the heavens at a certain moment ; for example, that at which a man is born, in order to foretell his fortune, or the incidents of his life. In a word, it is the disposition of the stars and planets at the moment of any person's birth. But as there cannot be any probable or possible relation between the constellations and the human race, all the principles they lay down, and the prophecies they draw from them, are chimerical, false, absurd, and a criminal imposition on mankind.

3. The art of *argury* consisted, among the ancient Romans, in observing the flight, the singing and eating of birds, especially such as were held sacred *.

4. The equally deceitful art of *haruspicy* consisted, on the contrary, in the inspection of the bowels of animals, but principally of victims ; and from thence predicting grand incidents relative to the republic, and the good or bad events of its enterprises.

5. *Aeromancy* was the art of divining by the air. This vain science has also come to us from the Pagans : but is rejected by reason as well as Christianity, as false and absurd.

6. *Pyromancy*

* See *Argury*

metic, 119 14.

Divination
||
Diving.

Diving.

6. *Pyromancy* is a divination made by the inspection of a flame, either by observing to which side it turns, or by throwing into it some combustible matter, or a bladder filled with wine, or any thing else from which they imagined they were able to predict.

7. *Hydromancy* is the supposed art of divining by water. The Persians, according to Varro, invented it; Pythagoras and Numa Pompilius made use of it; and we still admire like the wonderful prognosticators.

8. *Geomancy* was a divination made by observing of cracks or clefts in the earth. It was also performed by points made on paper, or any other substance, at a venture; and they judged of future events from the figures that resulted from thence. This was certainly very ridiculous; but it is nothing less so to pretend to predict future events by the inspection of the grounds of a dish of tea or coffee, or by cards, and many other like matters.—Thus have designing men made use of the four elements to deceive their credulous brethren.

9. *Chiromancy* is the art which teaches to know, by inspecting the hand, not only the inclinations of a man, but his future destiny also. The fools or impostors who practise this art pretend, that the different parts or the lines of the hand have a relation to the internal parts of the body, as some to the heart, others to the liver, spleen, &c. On this false supposition, and on many others equally extravagant, the principles of chiromancy are founded: and on which, however, several authors, as Robert Flud an Englishman, Artemidorus, M. de la Chambre, John of Indaginia, and many others, have wrote large treatises.

10. *Physiognomy*, or *physiognomancy*, is a science that pretends to teach the nature, the temperament, the understanding, and the inclinations of men, by the inspection of their countenances, and is therefore very little less frivolous than chiromancy; tho' Aristotle, and a number of learned men after him, have wrote express treatises concerning it.

DIVINE, something relating to God. The word is also used, figuratively, for any thing that is excellent, extraordinary, and that seems to go beyond the power of nature and the capacity of mankind. In which sense, the compass, telescope, clocks, &c. are said to be *divine inventions*: Plato is called the *divine author*, the *divine Plato*; and the same appellation is given to Seneca: Hippocrates is called, "the divine old man," *divinus senex*, &c.

DIVING, the art or act of descending under water to considerable depths, and abiding there a competent time.

The uses of *diving* are very considerable, particularly in the fishing for pearls, corals, sponges, &c. See *PEARL-Fishing*, &c.

There have been various methods proposed, and machines contrived, to render the business of diving more safe and easy. The great point is to furnish the diver with fresh air; without which, he must either make a short stay, or perish.

Those who dive for sponges in the Mediterranean, help themselves by carrying down sponges dipt in oil in their mouths. But considering the small quantity of air that can be contained in the pores of a sponge, and how much that little will be contracted by the

pressure of the incumbent water, such a supply cannot long subsist the diver. For it is found by experiment, that a gallon of air included in a bladder, and by a pipe reciprocally inspired and expired by the lungs, becomes unfit for respiration in little more than one minute of time. For though its elasticity be but little altered in passing the lungs, yet it loses its vivifying spirit, and is rendered effete.

In effect, a naked diver, Dr Halley assures us, without a sponge, cannot remain above a couple of minutes enclosed in water; nor much longer with one, without suffocating; nor, without long practice, near so long; ordinary persons beginning to rise in about half a minute. Besides, if the depth be considerable, the pressure of the water in the vessels makes the eyes blood-shot, and frequently occasions a spitting of blood.

Hence, where there has been occasion to continue long at the bottom, some have contrived double flexible pipes, to circulate air down into a cavity, inclosing the diver as with armour, both to furnish air, and to bear off the pressure of the water and give leave to his breast to dilate upon inspiration; the fresh air being forced down one of the pipes with bellows, and returning by the other of them, not unlike to an artery and vein.

But this method is impracticable when the depth surpasses three fathoms; the water embracing the bare limbs so closely as to obstruct the circulation of the blood in them; and withal pressing so strongly on all the junctures where the armour is made tight with leather, that, if there be the least defect in any of them, the water rushes in, and instantly fills the whole engine, to the great danger of the diver's life.

It is certain, however, that people, by being accustomed to the water from their infancy, will at length be enabled, not only to stay much longer under water than the time above-mentioned, but put on a kind of amphibious nature, so that they seem to have the use of all their faculties as well when their bodies are immersed in water, as when they are on dry land. Most savage nations are remarkable for this. According to the accounts of our late voyagers, the inhabitants of the South-sea islands are such expert divers, that when a nail or any piece of iron was thrown overboard, they would instantly jump into the sea after it, and never failed to recover it notwithstanding the quick descent of the metal. Even among civilized nations, many persons have been found capable of continuing an incredible length of time below water. The most remarkable instance of this kind is the famous Sicilian diver *Nicolo Pesce*. The authenticity of the account, indeed, depends entirely on the authority of F. Kircher. He assures us, that he had it from the archives of the kings of Sicily: but, notwithstanding this assertion, the whole hath so much of the marvellous in it, that we believe there are few who will not look upon it to have been exaggerated. "In the times of Frederic king of Sicily, (says Kircher), there lived a celebrated diver, whose name was *Nicholar*, and who, from his amazing skill in swimming, and his perseverance under water, was surnamed the *sibb*. This man had from his infancy been used to the sea; and earned his scanty subsistence by diving for corals and oysters, which he sold to the villagers on shore. His long acquaintance with the sea, at last, brought it to be almost his natu-

ral element. He was frequently known to spend five days in the midst of the waves, without any other provisions than the fish which he caught there and ate raw. He often swam over from Sicily into Calabria, a tempestuous and dangerous passage, carrying letters from the king. He was frequently known to swim among the gulphs of the Lipari islands, noway apprehensive of danger.

"Some mariners out at sea, one day observed something at some distance from them, which they regarded as a sea-monster; but upon its approach it was known to be Nicholas, whom they took into their ship. When they asked him whither he was going in so stormy and rough a sea, and at such a distance from land, he shewed them a packet of letters, which he was carrying to one of the towns of Italy, exactly done up in a leather bag, in such a manner as that they could not be wetted by the sea. He kept them thus company for some time on their voyage, conversing, and asking questions; and after eating an hearty meal with them, he took his leave, and, jumping into the sea, pursued his voyage alone.

"In order to aid these powers of enduring in the deep, nature seemed to have assisted him in a very extraordinary manner: for the spaces between his fingers and toes were webbed, as in a goose; and his chest became so very capacious, that he could take in, at one inspiration, as much breath as would serve him for a whole day.

"The account of so extraordinary a person did not fail to reach the king himself; who commanded Nicholas to be brought before him. It was no easy matter to find Nicholas, who generally spent his time in the solitudes of the deep; but, at last, after much searching, he was found, and brought before his majesty. The curiosity of this monarch had been long excited by the accounts he had heard of the bottom of the gulph of Charybdis; he now therefore conceived, that it would be a proper opportunity to have more certain information. He therefore commanded our poor diver to examine the bottom of this dreadful whirlpool; and as an incitement to his obedience, he ordered a golden cup to be flung into it. Nicholas was not insensible of the danger to which he was exposed; dangers best known only to himself; and therefore he presumed to remonstrate: but the hopes of the reward, the desire of pleasing the king, and the pleasure of shewing his skill, at last prevailed. He instantly jumped into the gulph, and was as instantly swallowed up in its bosom. He continued for three quarters of an hour below; during which time the king and his attendants remained on shore, anxious for his fate; but he at last appeared, holding the cup in triumph in one hand, and making his way good among the waves with the other. It may be supposed he was received with applause when he came on shore: the cup was made the reward of his adventure; the king ordered him to be taken proper care of; and, as he was somewhat fatigued and debilitated by his labour, after an hearty meal he was put to bed, and permitted to refresh himself by sleeping.

"When his spirits were thus restored, he was again brought to satisfy the king's curiosity with a narrative of the wonders he had seen; and his account was to the following effect. He would never, he said, have

Vol. IV.

obeyed the king's commands, had he been apprised of half the dangers that were before him. There were four things, he said, which rendered the gulph dreadful, not only to men, but to fishes themselves. 1. The force of the water bursting up from the bottom, which required great strength to resist. 2. The abruptness of the rocks that on every side threatened destruction. 3. The force of the whirlpool dashing against those rocks. And, 4. The number and magnitude of the polypous fish, some of which appeared as large as a man; and which, every where sticking against the rocks, projected their fibrous arms to entangle him. Being asked how he was able so readily to find the cup that had been thrown in, he replied, that it happened to be flung by the waves into the cavity of a rock against which he himself was urged in his descent. This account, however, did not satisfy the king's curiosity: being requested to venture once more into the gulph for further discoveries, he at first refused: but the king, desirous of having the most exact information possible of all things to be found in the gulph, repeated his solicitations; and, to give them still greater weight, produced a larger cup than the former, and added also a purse of gold. Upon these considerations the unfortunate diver once again plunged into the whirlpool, and was never heard of more."

To obviate the inconveniencies of diving to those who have not the extraordinary powers of the diver above-mentioned, different instruments have been contrived. The chief of these is the *diving-bell*; which is most conveniently made in form of a truncated cone, the smaller base being closed, and the larger open. It is to be poised with lead; and so suspended, that the vessel may sink full of air, with its open basis downward, and as near as may be in a situation parallel to the horizon, so as to close with the surface of the water all at once.

Under this coverle the diver sitting, sinks down with the included air to the depth desired; and if the cavity of the vessel can contain a tun of water, a single man may remain a full hour, without much inconvenience, at five or six fathoms deep. But the lower you go, still the included air contracts itself according to the weight of the water which compresses it: so that at 33 foot deep the bell becomes half full of water, the pressure of the incumbent water being then equal to that of the atmosphere; and at all other depths the space occupied by the compressed air in the upper part of the bell will be to the under part of its capacity filled with water, as 33 feet to the surface of the water in the bell below the common surface thereof. And this condensed air being taken in with the breath soon insinuates itself into all the cavities of the body, and has no ill effect, provided the bell be permitted to descend so slowly as to allow time for that purpose. One inconvenience that attends it, is found in the ears, within which there are cavities which open only outwards, and that by pores so small as not to give admission even to the air itself, unless they be dilated and distended by a considerable force. Hence, on the first descent of the bell, a pressure begins to be felt on each ear; which, by degrees, grows painful, till the force overcoming the obstacle, what constricts these pores yields to the pressure, and letting some condensed air slip in, presently ease ensues. The bell descending lower, the pain is renewed,

14 O

and

and again eased in the same manner.

But the greatest inconvenience of this engine, is, that the water entering it, contracts the bulk of air into so small a compass, that it soon heats and becomes unfit for respiration: so that there is a necessity for its being drawn up to recruit it; besides the uncomfortable abiding of the diver almost covered with water.

To obviate the difficulties of the diving-bell, Dr Halley, to whom we owe the preceding account, contrived some further apparatus, whereby not only to recruit and refresh the air from time to time, but also to keep the water wholly out of it at any depth. The manner in which this was effected, he relates in the following words.

"The bell I made use of was of wood, containing about 60 cubic feet in its concavity; and was of the form of a truncate cone, whose diameter at the top was three feet, and at the bottom five. This I coated with lead so heavy that it would sink empty; and I distributed the weight so about its bottom, that it would go down in a perpendicular direction, and no other. In the top I fixed a strong but clear glass, as a window, to let in the light from above; and likewise a cock to let out the hot air that had been breathed: and below, about a yard under the bell, I placed a stage which hung by three ropes, each of which was charged with about one hundred weight to keep it steady. This machine I suspended from the mast of a ship by a sprit, which was sufficiently secured by stays to the mast-head, and was directed by braces to carry it overboard clear of the ship's side, and to bring it again within board as occasion required.

"To supply air to this bell when under water, I caulked a couple of barrels of about 36 gallons each to be cased with lead, so as to sink empty; each of them having a bung-hole in its lowest parts to let in the water, as the air in them condensed on their descent; and to let it out again when they were drawn up full from below. And to a hole in the uppermost part of these barrels, I fixed a leathern trunk or hose well liquored with bees wax and oil, and long enough to fall below the bung-hole, being kept down by a weight appended: so that the air in the upper part of the barrels could not escape, unless the lower ends of these hose were first lifted up.

"The air-barrels being thus prepared, I fitted them with tackle proper to make them rise and fall alternately, after the manner of two buckets in a well; which was done with so much ease, that two men, with less than half their strength, could perform all the labour required: and in their descent they were directed by lines fastened to the under edge of the bell, the which passed through rings on both sides the leathern hose in each barrel; so that, sliding down by these lines, they came readily to the hand of a man who stood on the stage on purpose to receive them, and to take up the ends of the hose into the bell. Through these hose, as soon as their ends came above the surface of the water in the barrels, all the air that was included in the upper parts of them was blown with great force into the bell; whilst the water entered at the bung-holes below, and filled them: and as soon as the air of one barrel had been thus received, upon a signal given, that was drawn up, and at the same time the

other descended; and, by an alternate succession, furnished air so quick, and in so great plenty, that I myself have been one of five who have been together at the bottom in nine or ten fathom water, for above an hour and an half at a time, without any sort of ill consequence: and I might have continued there as long as I pleased, for any thing that appeared to the contrary. Besides, the whole cavity of the bell was kept entirely free from water, so that I sat on a bench which was diametrically placed near the bottom, wholly dressed, with all my cloaths on. I only observed, that it was necessary to be let down gradually at first, as about 12 feet at a time; and then to stop and drive out the air that entered, by receiving three or four barrels of fresh air before I descended further. But being arrived at the depth designed, I then let out as much of the hot air that had been breathed, as each barrel would replenish with cool, by means of the cock at the top of the bell; through whose aperture, though very small, the air would rush with so much violence, as to make the surface of the sea boil, and to cover it with a white foam, notwithstanding the weight of the water over us.

"Thus I found that I could do any thing that required to be done just under us; and that, by taking off the stage, I could, for a space as wide as the circuit of the bell, lay the bottom of the sea so far dry, as not to be over-shoes thereon. And, by the glass window, so much light was transmitted, that when the sea was clear, and especially when the sun shone, I could see perfectly well to write or read; much more to fasten or lay hold on any thing under us that was to be taken up. And, by the return of the air-barrels, I often sent up orders written with an iron pen, on small plates of lead, directing how to move us from place to place as occasion required. At other times, when the water was troubled and thick, it would be as dark as night below; but in such cases I have been able to keep a candle burning in the bell as long as I pleased, notwithstanding the great expence of air necessary to maintain flame.—By an additional contrivance, I have found it not impracticable for a diver to go out of an engine to a good distance from it, the air being conveyed to him with a continued stream, by small flexible pipes; which pipes may serve as a clue, to direct him back again, when he would return to the bell."

Plate XCIV. fig. 1. shews Dr Halley's diving bell, with the divers at work. DBLKRIMP represents the body of the bell. D, the glass which serves as a window. B, the cock for letting out the air which has been breathed. LM, the seats. C, one of the air-barrels. P, H, two of the divers. F, another diver at a distance from the bell, and breathing through the flexible tube K.—This diver is supposed to have a head-piece of lead, made to fit quite close about his shoulders: this head-piece was capable of containing as much air as would supply him for a minute or two. When he had occasion for more air, he turned a cock at F, by which means a communication was opened with the air in the bell, and thus he could receive a new supply at pleasure.

Since the invention of this diving machine, there has been one contrived by Mr Triewald, F. R. S. and military architect to the king of Sweden, which, for a single

Diving.

Fig. 2.

single person, is in some respects thought to be more eligible than Dr Halley's, and is constructed as follows. AB is the bell, which is sunk by lead weights DD hung to its bottom. This bell is of copper, and tinned all over in the inside, which is illuminated by three strong convex lenses, G, G, G, with copper lids H, H, H, to defend them. The iron ring or plate E serves the diver to stand on when he is at work; and is suspended at such a distance from the bottom of the bell by the chains F, F, F, that when the diver stands upright, his head is just above the water in the bell, where the air is much better than higher up, because it is colder, and consequently more fit for respiration. But as the diver must always be within the bell, and his head of course in the upper part, the inventor has contrived, that even there, when he has breathed the hot air as well as he can, he may, by means of a spiral copper tube *bc*, placed close to the inside of the bell, draw the cooler and fresher air from the lowermost parts: for which purpose, a flexible leather tube, about two feet long, is fixed to the upper end of the copper tube at *b*; and to the other end of this tube is fixed an ivory mouth-piece, by which the diver draws in the air.

Fig. 3.

The greatest improvement, however, which the diving bell ever has received, or probably can receive, is from Mr Spalding of Edinburgh. A section of his improved diving-bell is represented fig. 3. This construction is designed to remedy some inconveniences of Dr Halley's, which are very evident, and of very dangerous tendency. These are, 1. By Dr Halley's construction, the sinking or raising of the bell depends entirely on the people who are at the surface of the water; and as the bell even when in the water has a very considerable weight, the raising it not only requires a great deal of labour, but there is a possibility of the rope breaking by which it is raised, and thus every person in the bell would inevitably perish. 2. As there are, in many places of the sea, rocks which lie at a considerable depth, the figure of which cannot possibly be perceived from above, there is danger that some of their ragged prominences may catch hold of one of the edges of the bell in its descent, and thus overset it before any signal can be given to those above, which would infallibly be attended with the destruction of the people in the bell: and as it must always be unknown, before trial, what kind of a bottom the sea has in any place, it is plain, that, without some contrivance to obviate this last danger, the descent in Dr Halley's diving-bell is not at all eligible.

How these inconveniences are remedied by Mr Spalding's new construction will be easily understood from the following description.—ABCD represents a section of the bell, which is made of wood: *e, e*, are iron hooks, by means of which it is suspended by ropes QBFe, and QAERe, and QS, as expressed in the figure: *e, e*, are iron hooks, to which are appended lead weights, that keep the mouth of the bell always parallel to the surface of the water, whether the machine taken all together is lighter or heavier than an equal bulk of water. By these weights alone, however, the bell would not sink: another is therefore added, represented at L; and which can be raised or lowered at pleasure, by means of a rope passing over the pulley *s*, and fastened to one of the sides of the bell at

M. As the bell descends, this weight, called by Mr Spalding the *balance-weight*, hangs down a considerable way below the mouth of the bell. In case the edge of the bell is caught by any obstacle, the balance-weight is immediately lowered down so that it may rest upon the bottom. By this means the bell is lightened so that all danger of oversetting is removed; for, being lighter, without the balance-weight, than an equal bulk of water, it is evident that the bell will rise, as far as the length of the rope affixed to the balance-weight will allow it. This weight, therefore, will serve as a kind of anchor to keep the bell at any particular depth which the divers may think necessary; or by pulling it quite up, the descent may be continued to the very bottom.

By another very ingenious contrivance, Mr Spalding hath rendered it possible for the divers to raise the bell, with all the weights appended to it, even to the surface, or to stop at any particular depth, as they think proper; and thus they could still be safe, even though the rope designed for pulling up the bell was broke. For this purpose the bell is divided into two cavities, both of which are made as tight as possible. Just above the second bottom EF, are small slits in the sides of the bell; through which the water, entering as the bell descends, displaces the air originally contained in this cavity, which flies out at the upper orifice of the cock GH. When this is done, the divers turn the handle G, which stops the cock; so that if any more air was to get into the cavity AEFB, it could not longer be discharged through the orifice H as before. When this cavity is full of water, the bell sinks; but when a considerable quantity of air is admitted, it rises. If therefore the divers have a mind to raise themselves, they turn the small cock *g*, by which a communication is made between the upper and under cavities of the bell. The consequence of this is, that a quantity of air immediately enters the upper cavity, forces out a quantity of the water contained in it, and thus renders the bell lighter by the whole weight of the water which is displaced. Thus, if a certain quantity of air is admitted into the upper cavity, the bell will descend very slowly; if a greater quantity, it will neither ascend nor descend, but remain stationary; and if a larger quantity of air is still admitted, it will arise to the top. It is to be observed, however, that the air which is thus let out into the upper cavity must be immediately replaced from the air-barrel; and the air is to be let out very slowly, or the bell will rise to the top with so great velocity that the divers will be in danger of being shaken out of their seats. But, by following these directions, every possible accident may be prevented, and people may descend to great depths without the least apprehension of danger. The bell also becomes so easily manageable in the water, that it may be conducted from one place to another by a small boat with the greatest ease, and with perfect safety to those who are in it.

Instead of wooden seats used by Dr Halley, Mr Spalding makes use of ropes suspended by hooks *bbb*; and on these ropes the divers may sit without any inconvenience. I and K are two windows made of thick strong glass, for admitting light to the divers. N represents an air-cask with its tackle, and OCP the flex-

Diving.

ible pipe through which the air is admitted to the bell. In the ascent and descent of this cask the pipe is kept down by a small weight appended, as in Dr Halley's machine. R is a small cock by which the hot air is discharged as often as it becomes troublesome. Fig. 4. is a representation of the whole diving apparatus, which it is hoped will be readily understood without any further explanation. Two air-barrels are represented in this figure; but Mr Spalding is of opinion, that one capable of containing 30 gallons is sufficient for an ordinary machine.

Fig. 4.

We are told of another method put in practice by a gentleman of Devonshire. He has contrived a large ease of strong leather, perfectly water-proof, which may hold about half an hoghead of air. This is so contrived, that, when he shuts himself up in this case, he may walk at the bottom of the sea, and go into any part of a wrecked vessel, and deliver out the goods. This method, we are told, he has practised for many years, and has thus acquired a large fortune. It would be a considerable improvement on this machine to condense the air in it as much as possible before the diver descended; as he would thus be furnished with an atmosphere endued with elasticity sufficient to resist the weight of the water, which otherwise would squeeze his case into much less room than it originally took up. The condensed air also would serve for respiration a much longer time than that which is in its ordinary state.

DIVING-Bladder, a machine invented by Borelli, and by him preferred, though without any good reason, to the diving-bell. It is a globular vessel of brass or copper, about two feet in diameter, which contains the diver's head. It is fixed to a goat's-skin habit exactly fitted to his person. Within the vessel are pipes, by means of which a circulation of air is contrived; and the person carries an air-pump by his side, by which he can make himself heavier or lighter as fishes do, by contracting or dilating their air-bladder. By this means he thought all the objections to which other diving machines are liable were entirely obviated, and particularly that of want of air; the air which had been breathed, being, as he imagined, deprived of its noxious qualities by circulating through the pipes. These advantages, however, it is evident, are only imaginary. The diver's limbs, being defended from the pressure of the water only by a goat's skin, would infallibly be crushed if he descended to any considerable depth; and from the discoveries now made by Dr Priestley and others, it is abundantly evident, that air, which is once rendered foul by breathing, cannot in any degree be restored by circulation through pipes. Concerning the use of copper machines in general, Mr Spalding has favoured us with the following curious observation, namely, That when a person has breathed in them a few minutes, he feels in his mouth a very disagreeable brassy taste, which continues all the time he remains in the vessel; so that, on this account, copper seems by no means an eligible material. This taste most probably arises from the action of the alkalescent effluvia of the body upon the copper; for volatile alkali is a strong dissolvent of this metal: but how these effluvia volatilise the copper in such a manner as to make the taste of it sensible in the mouth, is not easy to say.

DIVINITY, properly signifies the nature, quality,

and essence of God.

DIVINITY, is also used in the same sense with theology.

DIVISIBILITY, that property by which the particles of matter in all bodies are capable of a separation or diffusion from each other.

The Peripatetics and Cartesians hold divisibility to be an affection of all matter. The Epicureans, again, allow it to agree to every physical continuum; but they deny that this affection agrees to all bodies, for the primary corpuscles or atoms they maintain to be perfectly insecable and indivisible.

As it is evident that body is extended, so it is no less evident that it is divisible: for since no two particles of matter can exist in the same place, it follows, that they are really distinct from each other; which is all that is meant by being divisible. In this sense the least conceivable particle must still be divisible, since it will consist of parts which will be really distinct. To illustrate this by a familiar instance. Let the least imaginable piece of matter be conceived lying on a smooth plain surface, it is evident the surface will not touch it every where: those parts therefore which it does not touch, may be supposed separable from the others, and so on, as far as we please; and this is all that is meant when we say matter is infinitely divisible.

The infinite divisibility of mathematical quantity is demonstrated thus geometrically. Suppose the line AD perpendicular to BF; and another, as GH, at a small distance from it, also perpendicular to the same line: with the centers CCC, &c. describe circles entering the line GH in the points *eee*, &c. Now the greater the radius AC is, the less is the part eH. But the radius may be augmented in infinitum; so long, therefore, the part eH may be divided into still less portions; consequently it may be divided in infinitum.

All that is supposed in strict geometry (says Mr Maclaurin) concerning the divisibility of magnitude, amounts to no more than that a given magnitude may be conceived to be divided into a number of parts equal to any given or proposed number. It is true, that the number of parts into which a given magnitude may be conceived to be divided, is not to be fixed or limited, because no given number is so great but a greater may be conceived and assigned: but there is not, therefore, any necessity of supposing the number of parts actually infinite; and if some have drawn very abstruse consequences from such a supposition, yet geometry ought not to be loaded with them.

How far matter may actually be divided, may in some measure be conceived from hence, that a piece of wire gilt with so small a quantity as eight grains of gold, may be drawn out to a length of 13,000 feet, the whole surface of it still remaining covered with gold. We have also a surprising instance of the minuteness of some parts of matter from the nature of light and vision. Let a candle be lighted, and placed in an open plain, it will then be visible two miles round; and consequently was it placed two miles above the surface of the earth, it would fill with luminous particles a sphere whose diameter was four miles, and that before it had lost any sensible part of its weight. A quantity of vitriol being dissolved, and mixed with 9000 times as much water, will tinge the whole; consequently will be divided into as many parts as there

Diving.

Pl. XCIII.
fig. 2.

Dividing,
Division.

are visible portions of matter in that quantity of water. There are perfumes, which, without a sensible diminution of their quantity, shall fill a very large space with their odoriferous particles; which must therefore be of an inconceivable smallness, since there will be a sufficient number in every part of that space, sensibly to affect the organ of smelling. Dr Keill demonstrates, that any particle of matter how small soever, and any finite space how large soever, being given, it is possible for that small particle of matter to be diffused through all that space, and to fill it in such a manner, as that there shall be no pore in it whose diameter shall exceed any given line. See EFFLUVIA.

The chief objections against the divisibility of matter in infinitum are, That an infinite cannot be contained by a finite; and that it follows from a divisibility in infinitum, either that all bodies are equal, or that one infinite is greater than another. But the answer to these is easy; for the properties of a determined quantity are not to be attributed to an infinite considered in a general sense; and who has ever proved that there could not be an infinite number of infinitely small parts in a finite quantity, or that all infinities are equal? The contrary is demonstrated by mathematicians in innumerable instances. See the article INFINITE, and 'S Gravesande Elem. Mathem. l. i. c. 4.

DIVISION, in general, is the separating a thing into two or more parts.

Mechanical Division, signifies that separation which is occasioned in the parts of a body by help of mechanical instruments.—The mechanical division of bodies does indeed separate them into smaller, homogeneous, similar parts; but this separation cannot extend to the primary integrant molecules of any body; and consequently is incapable of breaking what is properly called their *aggregation*: also, no union is formed betwixt the divided and dividing bodies, in which respect division essentially differs from dissolution.

Division is not properly a chemical operation. It is only employed preparatorily to facilitate other operations, and particularly solution. For this purpose it is very useful, as it increases the quantity of surface, and consequently the points of contact of any body.—Different methods are used to divide bodies according to their nature. Those which are tenacious and elastic, as horns and gums, require to be cut, rasped, or filed. Metals, because of their ductility, require the same treatment: but as they are also fusible, they may be quickly and conveniently reduced into grains small enough for most operations, by pouring them, when melted, into water. All brittle bodies may be reduced conveniently into fine parts by being bruised in a mortar with a pestle. Very hard bodies, such as glass, crystals, stones, particularly those of the vitrifiable kind, before they are pounded, ought to be plunged when red-hot into water, by which they are split and cracked, and rendered more easily pulverable. Bodies of this kind may also be bruised or ground by means of a hard and flat stone, upon which the matter is to be put, and bruised by another hard stone so small as to be held and moved upon the larger stone with the hand. The larger stone is called a *porphyry*, from its being generally of that kind of stone; and the operation is called *porphyrisation*. Instead of porphyrisation, a mill may be used, composed of a hard grit millstone,

moving round upon another stone of the same kind, which must be fixed: in the upper stone is a groove, or channel, through which the matter to be ground passes. By this method a substance may be more quickly reduced to a fine powder than by porphyrisation. But these mills can be only employed for considerable quantities of matter.

These methods of mechanically dividing bodies are attended with some practical inconveniences; the most considerable of which is, that some parts of the dividing instruments are always struck off, and mixed with the matter to be divided. This may greatly affect the operations. For instance, instruments of iron and copper furnish metallic colouring particles, and copper is very prejudicial to health. Porphyry is coloured by a reddish brown matter, which injures the colour of crystal-glasses, enamels, and porcelains made with matters ground upon this stone. These matters therefore must be cleaned after their porphyrisation, or else no instruments capable of injuring the intended operations ought to be employed. Thus, for the preparation of all medicines to be taken internally, no copper instruments, as mortars, pestles, &c. ought to be used; those made of iron are preferable; and, instead of porphyries, mortars, grinding-stones and mill-stones made of hard and white stones ought to be employed for substances which are to enter into the composition of enamels, crystal-glass, and porcelain, the whiteness of which is a most necessary quality.

DIVISION, in algebra. See ALGEBRA, n° 7.

DIVISION, in arithmetic. See ARITHMETIC, n° II.

DIVISION, in sea affairs, a select number of ships in a fleet or squadron of men of war, distinguished by a particular flag or pendant, and usually commanded by a general officer. A squadron is commonly ranged into three divisions, the commanding officer of which is always stationed in the centre.

When a fleet consists of 60 sail of the line, that is, of ships having at least 60 cannon each, the admiral divides it into three squadrons, each of which has its divisions and commanding officers. Each squadron has its proper colours, according to the rank of the admiral who commands it, and every division its proper mast. Thus the white flag denotes the first division of France; the white and blue the second; and the third is characterised by the blue. In Britain, the first admiral, or the admiral of the fleet, displays the union-flag at the main-top-mast-head; next follows the white flag with St George's cross; and afterwards the blue. The private ships carry pendants of the same colour with their respective squadrons, at the masts of their particular divisions; so that the last ship in the division of the blue squadron carries a blue pendant at her *mizen-top-mast-head*.

DIVISOR, in arithmetic. See ARITHMETIC, n° II.

DIVORCE, a breach or dissolution of the bond of marriage. See MARRIAGE; and Law, N° clx. 23.

Divorce is of two kinds: the one, a *vinculo matrimonii*, which alone is properly *divorce*; the other, a *mensa & thoro*, a separation from bed and board.

The woman divorced a *vinculo matrimonii*, receives all again that she brought with her: the other has a suitable separate maintenance allowed her out of her husband's effects.

The first only happens thro' some essential impediment

Division
||
Divorce.

Diuretis
Dobson.

ment, as confluency or affinity within the degrees forbidden, pre-contract, impotency, adultery, &c. of which impediments the canon law allows 14, comprehended in these verses:

*Error, conditio, visum, cognatio, crimen,
Cultus, disparitas, vis, ordo, ligamen, honestas,
Si sis affinis, si forte coire nequibus,
Si parochi & duplici desit presbitero testis,
Raptave sit mulier, nec parvi reddita tui.*

DIURESIS, from *υρος*, urine. An excretion of urine.

DIURETICS, (from *δια*, by, and *υρος*, urine), medicines which provoke a discharge by urine.

Celsus says every fragrant herb that is cultivated in a garden is diuretic. However numerous diuretic medicines may be, there are none else whose efficacy is so uncertain considered as diuretic. Honey and sugar increase the virtue of diuretics; they should be often used to be effectual, and the body should be kept cool. — If a medicine is designed to pass off by urine, walking gently in a cool air will assist it; but sweating or considerable warmth directs it to the skin, or at least restrains its efficacy. Medicines of the saline kind are diuretic or perspirative, according as the body is kept cool or warm.

In administering this kind of medicines, they are rarely given with respect to their operation as diuretics, but with respect to the habit or state of the patient's body, as appears from the different classes of medicines that come under this denomination; the chief of which remove impediments to, rather than promote the discharge of, urine.

The following different classes of medicines are used with a view to promote the discharge of urine. 1. Cordial nervous medicines. These accelerate the motion of the blood when too languid, and increase its fluidity, and thus increase this discharge. 2. Emollient balsamics. These relax and lubricate, so obtain a passage for what is too bulky. 3. Substances consisting of salts and mucilages. These guard against stricture in the vessels, and at the same time fit the matter to be discharged for a more easy exclusion. 4. Detergent balsamics. These rarify and scour away viscous or fabulous matter which obstructs the passages. 5. Alkaline and lixivious salts. These keep the fluids at least in a due state of tenuity for being excreted. 6. Acid and nitrous salts. These determine the serum to the kidneys, if not counteracted by heat. 7. Antispasmodics. These relieve by taking off a stricture in the kidneys.

DIURNAL, in astronomy, something relating to day; in opposition to *nocturnal*, which regards the night.

DIVUS, DIVA, in antiquity, appellations given to men and women who had been deified, or placed in the number of the gods. See DEIFICATION, &c.

Hence it is, that on medals struck for the consecration of an emperor, or empress, they give them the title of *divus*, or *diva*: for example, DIVUS JULIUS. DIVO ANTONINO PIO. DIVO PIO. DIVO CLAUDIO. DIVA FAUSTINA AUG. &c.

DIZZINESS, in medicine. See VERTIGO.

DO, in music, a note of the Italian scale, corresponding to *ut* of the common gamut. See MUSIC.

DOBCHICK, in ornithology. See COLYMBUS.

DOBSON (William), an eminent English portrait

and history painter, born at London in 1610. He served an apprenticeship with one Peck, a stationer and picture-dealer; and owed his improvement to the copying some pictures of Titian and Van Dyck, whose manner he always retained. He had farther obligations to the latter of these artists: for it is said, that a picture of his painting being exposed at a shop on Snow-hill, Van Dyck passing by was struck with it exceedingly; and inquiring after the author, found him at work in a poor garret. Van Dyck had the generosity to equip him in a manner suitable to his merit. He presented him to king Charles I. who took him under his protection, kept him with him at Oxford all the time his majesty continued in that city, and not only sat to him several times for his picture, but caused the prince of Wales, prince Rupert, and most of the lords of his court, to do so too. Mr Dobson, however, being somewhat loose and irregular in his way of life, was far from improving the many opportunities he had of making his fortune; and died very poor in 1647, at his house in St Martin's lane.

DOCIMASIA, in Greek antiquity, a probation of the magistrates and persons employed in public business at Athens. It was performed publicly in the forum, where they were obliged to give account of themselves and their past life before certain judges. Among several questions propounded to them, we find the following, Whether they had been dutiful to their parents, had served in the wars, and had a competent estate?

DOCIMASTIC ART, a name given to the art of assaying by operations in small, the nature and quantity of metallic or other matters which may be obtained from mineral or other compound bodies. See REFINING and METALLURGY.

DOCIMENUM MARMOR, a name given by the ancients to a species of marble of a bright and clear white, much used in large and sumptuous buildings, such as temples and the like. It had its name from *Docimeneos*, a city of Phrygia, afterwards called Synaia; near which it was dug, and from whence it was sent to Rome. It was accounted little inferior to the Parian in colour, but not capable of so elegant a polish; whence it was less used by the statuary, or in other smaller works. The emperor Adrian is said to have used this marble in building the temple of Jupiter; and many others of the great works of the Romans are of it.

DOCK, in botany. See LAPATHUM.

DOCK, in the manege, is used for a large case of leather, as long as the dock of a horse's tail, which serves it for a cover. The French call the dock *troussequeue*. It is made fast by straps to the crupper, and has leathern thongs that pass between his thighs, and along his flanks to the saddle-straps, in order to keep the tail tight, and to hinder it from whisking about.

Dock, in maritime affairs, a sort of broad and deep trench, formed on the side of a harbour, or on the banks of a river; and commodiously fitted either to build ships, or receive them to be repaired and *breamed* therein. These sorts of docks have generally strong flood-gates to prevent the flux of the tide from entering the dock while the ship is under repair. — There are likewise docks of another kind, called *wet docks*, where

Docimasia
Dock.

Dock
Doddridge.

where a ship can only be cleaned during the recesses of the tide, or in the interval between the time when the tide left her dry a-ground, and the period when it again reaches her by the return of the flood. Docks of the latter kind are not furnished with the usual flood-gates.

Dock-Yards, certain magazines containing all sorts of naval stores and timber for ship-building. In England, the royal dock yards are at Chatham, Portsmouth, Plymouth, Deptford, Woolwich, and Sheerness. His majesty's ships and vessels of war are generally moored at these ports during the time of peace; and such as want repairing are taken into the docks, examined, and refitted for service.

The principal dock-yards are governed by a commissioner, resident at the port; who superintends all the matters of the officers, artificers, and labourers, employed in the dock-yard, and ordinary. He also controls their payment therein; examines the accounts; contracts, and draws bills on the navy-office to supply the deficiency of stores; and, finally, regulates whatever belongs to the dock-yard, maintaining due order in the respective offices.

These yards are generally supplied from the northern crowns with hemp, pitch, tar, rosin, canvas, oak-plank, and several other species. With regard to the masts, particularly those of the largest size, they are usually imported from New-England.

DOCTOR, a person who has passed all the degrees of a faculty, and is empowered to teach or practise the same: thus we say, doctor in divinity, doctor in physics, doctor of laws.

The title of *doctor* seems to have been created in the XIIIth century, instead of *maister*; and established, with the other scholastic degrees of bachelors and licentiates, by Peter Lombard and Gilbert Porreus, then the chief divines of the university of Paris. Gratian did the same thing, at the same time, in the university of Bologna.

Doctor of the Law, a title of honour among the Jews. The investiture, if we may so say, of this order was performed by putting a key and table-book in their hands; which is what some authors imagine our Saviour had in view, Luke xi. 52. when, speaking of the doctors of the law, he says, "Wo unto you doctors of the law, for you have taken away the key of knowledge: you entered not in yourselves, and them that were entering you hindered."

DOCTOR, is also an appellation adjoined to several specific epithets, expressing the merit of some of the schoolmen: thus, Alexander Hales is called the irrefragable doctor; Thomas Aquinas, the angelic doctor; St Bonaventure, the seraphic doctor; John Duns Scotus, the subtle doctor; Raymond Lully, the illuminated doctor; Roger Bacon, the admirable doctor, &c.

DOCTORS-Commons. See COLLEGE of Civilians.

DOCUMENT, in law, some written monument produced in proof of any thing asserted.

DODDER, in botany. See CUSCUTA.

DODDRIDGE (Phillip), D. D. an eminent Presbyterian minister, was the son of Daniel Doddridge an oil-man in London, where he was born on the 26th of June 1702; and having completed the study of the classics in several schools, was, in 1719, placed under the tuition of the reverend Mr John Jennings, who kept

an academy at Kilworth in Leicestershire. He was first settled as a minister at Kilworth, where he preached to a small congregation in an obscure village: but, on Mr Jennings's death, succeeded to the care of his academy; and soon after was chosen minister of a large congregation of Dissenters at Northampton, to which he removed his academy, and where the number of his pupils encreased. He instructed his pupils with the freedom and tenderness of a father; and never expected nor desired that they should blindly follow his sentiments, but encouraged them to judge for themselves. He checked any appearance of bigotry and uncharitableness, and endeavoured to cure them by shewing what might be said in defence of those principles they disliked. He died at Lisbon, whither he went for the recovery of his health; and his remains were interred in the burying-ground belonging to the British factory there, and a handsome monument was erected to his memory in the meeting-house at Northampton, at the expence of the congregation, on which is an epitaph written by Gilbert West, esq. He wrote, 1. Free thoughts on the most probable means of reviving the dissenting interest; 2. The life of Colonel James Gardiner; 4. Sermons on the education of children; 4. The rise and progress of religion in the soul; 5. The Family Expositor, in 6 vols. 4to, &c. And since the author's death, a volume of his Hymns have been published, and his Theological Lectures. Several of his works have been translated into Dutch, German, and French.

DODECAGON, in geometry, a regular polygon consisting of twelve equal sides and angles.

DODECAHEDRON, in geometry, one of the platonic bodies, or regular solids, contained under twelve equal and regular pentagons.

DODECANDRIA, (from *dodekax*, twelve, and *andria*, a man;) the name of the eleventh class in Linnaeus's sexual system, consisting of plants with hermaphrodite flowers, that, according to the title, have twelve stamina or male organs. This class, however, is not limited with respect to the number of stamina. Many genera have sixteen, eighteen, and even nineteen stamina; the essential character seems to be, that, in the class in question, the stamina, however numerous, are inserted into the receptacle: whereas, in the next class, Icosandria, which is as little determined in point of number as the present, they are attached to the inside of the calix or flower-cup.

The orders in this class, which are six, are founded upon the number of the styles, or female organs. Asarabacca, mangostan, florax, purple loose-strife, wild Syrian rue, and purslane, have only one style; agrimony and heliopsis have two; burning thorny plant, and bastard rocket, three; *glinus*, five; *illicium*, eight; and horse-leek, twelve.

DODO, in ornithology. See DIDUS.

DODONIAN, *Dodoneus*, in antiquity, an epithet given to Jupiter, because he was worshipped in a temple built in the forest of Dodona, where was the most famous and (it is said) the most ancient oracle of all Greece. It is reported that the pigeons and the very oaks of the forest of Dodona spoke and delivered oracles. In the temple was a fountain, which the ancient naturalists assure us had a property of rekindling torches when newly extinguished.

Dodecagon
Dodonian.

Dodrans

Dogs.

DODRANS, in antiquity, three fourths of the as. See the article As.

DODSLEY (Robert), a late eminent bookseller, and ingenious writer, born at Mansfield in Nottinghamshire, in the year 1703. He was not indebted to education for his literary fame, being originally a livery servant; but his natural genius, and early passion for reading, soon elevated him to a superior station. He wrote an elegant little satirical farce called *The Toy-shop*, which was acted with applause in 1735, and which recommended him to the patronage of Mr Pope. The following year he produced the *King and Miller of Mansfield*. The profits of these two farces enabled him to commence bookseller, and his own merit procured him eminence in that profession. He wrote some other dramatic pieces, and published a collection of his works in one vol. 8vo. under the modest title of *Trifles*; which was followed by *Public Virtue*, a poem in 4to. Beside what he wrote himself, the public were obliged to him for exerting his judgment in the way of his business; he having collected several volumes of well chosen *Miscellaneous Poems* and *Fugitive Pieces*, whose brevity would else have endangered their being totally lost to posterity. He died in 1764.

DODWELL (Henry), a very learned controversial writer, born at Dublin, but of English extraction, in 1641. He wrote an incredible number of tracts: but his services were so little acknowledged, that bishop Burnet and others accuse him of doing more hurt than good to the cause of Christianity, by his indiscreet love of paradoxes and novelties, and thus exposing himself to the scoffs of unbelievers. His pamphlet on the immortality of the soul, gave rise to the well known controversy between Mr Collins and Dr Clark on that subject. He died in 1711.

DOESBURG, a town of the united provinces in the county of Zutphen, and province of Guelderland. It is small, but well peopled, and very strong, both by art and nature, having the river Yssel on one side, and a morass on the other, and is only to be approached by a narrow neck of land. E. Long. 5. 55. N. Lat. 52. 3.

DOG, in zoology: An animal remarkable for its natural docility, fidelity, and affection for its master; which qualities mankind are careful to improve for their own advantage. These useful creatures guard our houses, gardens, and cattle, with spirit and vigilance. By their help we are enabled to take not only beasts, but birds; and to pursue game both over land and through the waters. In some northern countries, they serve to draw sleds, and are also employed to carry burdens. In several parts of Africa, China, and by the West Indian negroes, dogs are eaten, and accounted excellent food. Nay, we have the testimony of Mr Forster, that dogs flesh, in taste, exactly resembles mutton*. They were also used as food by the Romans, and long before them by the Greeks, as we learn from several treatises of Hippocrates. In the present times, their skins, dressed with the hair on, are used in muffs, made into a kind of buskins for persons in the gout, and for other purposes. Prepared in another way, they are used for ladies gloves, and the linings of masks, being thought to make the skin peculiarly white and smooth. The French import many of these skins from Scotland, under a small duty. Here, when

tanned, they serve for upper leathers for neat pumps. Dogs skins dressed are exported under a small, and imported under a high, duty. The French import from Denmark large quantities of dogs hair, both white and black. The last is esteemed the best, and is worked up in the black list of a particular kind of woollen cloth; but is not used, as many have supposed, in making of hats, being entirely unfit for this purpose.

With regard to the qualities of dogs, which bred in the island of Britain are justly reckoned superior to the dogs bred in any other country. The swiftness of the greyhound is amazing: as are also the steadiness and perseverance of other hounds and beagles; the boldness of terriers in unearthing foxes, &c.; the sagacity of pointers and setting dogs, who are taught a language by signs as intelligible to sportsmen as speech; and the invincible spirit of a bull-dog, which can be quelled only by death.—All the nations in Europe not only do justice to the superior qualities of the British dogs, but adopt our terms and names, and thankfully receive the creatures as presents.—It is remarkable, however, that almost every kind of British dogs degenerate in foreign countries; nor is it possible to prevent this degeneracy by any art whatever.

For the natural history of the dog, see CANIS.

Chusing of Dogs. In order to chuse a dog and bitch for good whelps, take care that the bitch come of a generous kind, be well proportioned, having large ribs *Sportsman's* and flanks; and likewise that the dog be of a good *Dist.* breed and young, for a young dog and an old bitch breed excellent whelps.

The best time for hounds nitches, or bratchets, to be lined in, are the months of January, February, and March. The bitch should be used to a kennel, that she may like it after her whelping, and the ought to be kept warm. Let the whelps be weaned after two months old; and though it be some difficulty to chuse a whelp under the dam that will prove the best of the litter, yet some approve that which is last, and account him to be the best. Others remove the whelps from the kennel, and lay them severally and apart one from the other; then they watch which of them the bitch first takes and carries into her kennel again, and that they suppose to be the best. Others again imagine that which weighs least when it sucks to be the best: this is certain, that the lighter whelp will prove the swifter. As soon as the bitch has littered, it is proper to chuse them you intend to preserve, and drown the rest: keep the black, brown, or of one colour; for the spotted are not much to be esteemed, though of hounds the spotted are to be valued.

Hounds for chase are to be chosen by their colours. The white, with black ears, and a black spot at the setting on of the tail, are the most principal to compose a kennel of, and of good scent and condition. The black hound, or the black tanned, or the all liver-coloured, or all white: the true talbots are the best for the stronger line; the grizzled, whether mixed or unmixed, so they be shag-haired, are the best verminers, and a couple of these are proper for a kennel.—In short, take these marks of a good hound. That his head be of a middle proportion, rather long than round; his nostrils wide, his ears large, his back bowed; his fillet great, his haunches large, thighs well trussed, ham frait, tail big near the reins, the rest slender; the

Dog. the leg big, the sole of the foot dry, and in the form of that of a fox with large claws.

Keeping Dogs in health.—As pointers and spaniels, when good of their kinds and well broken, are very valuable to a sportsman, it is worth while to take some care to preserve them in health. This very much depends on their diet and lodging: frequent cleaning their kennels, and giving them fresh straw to lie on, is very necessary; or, in summer-time, deal-shavings, or sand, instead of straw, will check the breeding of fleas. If you rub your dog with chalk, and brush and comb him once or twice a-week, he will thrive much the better; the chalk will clear his skin from all greasiness, and he will be the less liable to be mangy. A dog is of a very hot nature: he should therefore never be without clean water by him, that he may drink when he is thirsty. In regard to their food, carion is by no means proper for them: it must hurt their sense of smelling, on which the excellence of these dogs greatly depends. Barley-meal, the dross of wheat flour, or both mixed together, with broth or skimmed milk, is very proper food. For change, a small quantity of greaves from which the tallow is pressed by the chandlers, mixed with their flour, or sheep's feet well baked or boiled, are a very good diet; and when you indulge them with flesh, it should always be boiled. In the season of hunting your dogs, it is proper to feed them in the evening before, and give them nothing in the morning you intend to take them out except a little milk. If you stop for your own refreshment in the day, you should also refresh your dogs with a little bread and milk. It has been already observed that dogs are of a hot constitution; the greatest relief to them in the summer, is twitch-grass, or dog-grass, which is the same thing. You should therefore plant some of it in a place where you can turn them into every morning: they will feed freely on it to be cured of the sickness they are subject to, and cured of any extraordinary heat of blood: but unless the grass be of this sort, it will have no effect.

Diseases of Dogs.—1. *Bites and Stings.* If dogs are bitten by any venomous creatures, as snakes, adders, &c. squeeze out the blood, and wash the place with salt and urine; then lay a plaster to it made of calaminet, pounded in a mortar, with turpentine and yellow wax, till it come to a scab. If you give your dog some of the juice of calaminet to drink in milk, it will be good; or an ounce of treacle dissolved in some sweet wine.

2. *Mange.* Dogs are subject to the mange from being fed too high, and allowed no exercise or an opportunity of refreshing themselves with dog-grass; or by being starved at home, which will cause them to eat the vilest stuff abroad, such as carrion, or even human excrement; or by want of water, and sometimes by not being kept clean in their kennel, or by foundering and melting in their grease. Either of these will heat the blood to a great degree, which will have a tendency to make them mangy. The cure may be effected by giving stone-brimstone powdered fine, either in milk or mixed up with butter, and rubbing them well every day for a week with an ointment made of some of the brimstone and pork-lard, to which add a small quantity of oil of turpentine.—Or, boil four ounces of quicksilver in two quarts of water to half the

quantity; bathe them every day with this water, and let them have some of it to lick till the cure is perfected. Or, a small quantity of trooper's ointment rubbed on the parts on its first appearance will cure it. It will also free lousy puppies from their lice. Or, take two ounces of euphorbium; flour of sulphur, Flanders oil of bays, and soft soap, each four ounces. Anoint and rub your dog with it every other day; give him warm milk, and no water. The cure will be performed in about a week. The following receipt is also said to be efficacious. Take two handfuls of wild cresses, and as much elecampane, and also of the leaves and roots of roerb and ferrel, and two pounds of the roots of fodels: boil all these well together in lee and vinegar; strain the decoction, and put into it two pounds of grey soap and when it is melted, rub the dog with it four or five days successively, and it will cure him.

3. *Poison.* If you suspect your dog to be poisoned with nux vomica, (the poison usually employed by the warreners, which causes convulsive fits and soon kills); the most effectual remedy, if immediately applied, is to give him a good deal of common salt; to administer which, you may open his mouth, and put a stick across to prevent his shutting it, whilst you cram his throat full of salt, at the same time holding his mouth upwards; and it will dissolve so that a sufficient quantity will be swallowed to purge and vomit him. When his stomach is sufficiently cleared by a free passage obtained by stool, give him some warm broth frequently, to prevent his expiring from faintness; and he will recover.

4. *Worms.* Dogs are very frequently troubled with worms; but more particularly whilst they are young. Any thing bitter is so nauseous to these worms, that they are very often voided by taking two or three purges of aloes; or (which is the same thing) Scots pills, four or five being a dose for a large dog: this is to be repeated two or three times in a week. If this do not succeed, you may give him an ounce of powder of tin mixed up with butter, in three doses; which seldom fails to cure. Or of the herb savin, dried and rubbed to powder, give about as much as will lie on a shilling for a dose; which will entirely destroy worms and their feed.

6. *Sore Feet.* A pointer ought not to be hunted oftener than two or three days in a week: and unless you take care of his feet, and give him good lodging as well as proper food, he will not be able to perform that through the season. You should therefore, after a hard day's hunting, wash his feet with warm water and salt; and when dry, wash them with warm broth, or beer and butter, which will heal their soreness, and prevent a settled stiffness from fixing.

7. *Strains, Blows, or small Wounds.* If your dog has received any little wounds by forcing thro' hedges, or gets any lameness from a blow or strain; bathe the wound or grieved part with salt and cold vinegar (for warming it only evaporates the fine spirit); and when dry, if a wound, you may pour in it a little friar's balsam, which will perform the cure sooner than any method hitherto experienced.

8. *Coughs and Colds.* Dogs are very subject to a cough, with an extraordinary choking, which is thought to arise generally from a cold or some inward disorder; and probably it is often occasioned by their eating of fish-bones. To guard against it, order your servants

Dog.
Sportsman's
Dist.

Dog.

Sportsm.
Dish.

to throw all such fish-bones where the dog can't get at them. But if the disorder be from a cold, let bleeding be repeated in small quantities, if necessary; but if it be what is called the *distemper* in dogs, and they appear to be very low in spirits, the bleeding is better omitted. Let meat-broth, or milk-broth warmed, be the principal part of his diet, using at the same time the following medicine. Take flour of sulphur, cold drawn linseed oil, and salt-petre, of each an ounce; divide it into four doses, giving him one dose every other day, and let him have plenty of clean straw to lie on; or one spoonful of honey daily.

Dog-Madness. Of this there are no less than seven sorts common among dogs. The chief causes are, high-feeding, want of exercise, fullness of blood, and costiveness. As for the two first, you must observe when you hunt them, that they should be better fed than when they rest; and let them be neither too fat nor too lean; but, of the two, rather fat than lean; by which means they will not only be preserved from madness, but also from the mange and scab: which diseases they will be subject to for want of air, water, or exercise; but if you have but the knowledge to keep them in an even temper, they may live long, and continue sound. As for water, they should be left to their own pleasure; but for exercise and diet, it must be ordered according to discretion, observing a medium. Give them once a week, especially in the heat of the year, five or six spoonfuls of salad oil, which will cleanse them: at other times, the quantity of a hazle-nut of mithridate is an excellent thing to prevent diseases. It is also very good to bleed them under the tongue, and behind the ears.

The symptoms of madness are many and easily discerned. When any dog separates himself contrary to his former use, becomes melancholy or droops his head, forbears eating, and as he runs snatches at every thing; if he often looks upwards, and his stern at his setting on be a little erect, and the rest hanging down; if his eyes be red, his breath strong, his voice hoarse, and he drivels and foams at the mouth; you may be assured he has this distemper.

The seven sorts of madness are as follow; of which the two first are incurable. 1. The hot burning madness. 2. The running madness. The animals labouring under these are peculiarly dangerous: for all things they bite and draw blood from, will have the same distemper; and they generally seize on all they meet with, but chiefly on dogs: their pain is so great, it soon kills them.—The five curable madnesses are,

3. *Sleeping madness*, so called from the dog's great drowsiness, and almost continual sleeping. This is caused by the little worms that breed in the mouth of the stomach, from corrupt humours, vapours, and fumes which ascend to the head: for cure of which, take six ounces of the juice of wormwood, two ounces of the powder of hartshorn burnt, and two drams of agaric; mix all these together in a little white-wine, and give it the dog to drink in a drenching horn.

4. *Dumb madness*, lies also in the blood, and causes the dog not to feed, but to hold his mouth always wide open, frequently putting his feet to his mouth, as if he had a bone in his throat: to cure this, take the juice of black hellebore, the juice of *spatula putrida*, and of rue, of each four ounces; strain them well, and put thereto two drams of unprepared scammony; and being

mixed well together, put it down the dog's throat with a drenching horn, keeping his head up for some time, lest he cast it out again; then bleed him in the mouth, by cutting two or three veins in his gums.

It is said that about eight drams of the juice of an herb called *hartshorn*, or *dog's-tooth*, being given to the dog, cures all sorts of madness.

5. *Lank madness*, is so called by reason of the dog's leanness and pining away. For cure give them a purge as before directed, and also bleed them: but some say there is no cure for it.

6. *Rheumatic or flavering madness*, occasions the dog's head to swell, his eyes to look yellow, and he will be always flavering and driveling at the mouth. To cure which, take four ounces of the powder of the roots of polipody of the oak, six ounces of the juice of fennel-roots, with the like quantity of the roots of mistletoe, and four ounces of the juice of ivy: boil all these together in white-wine, and give it to the dog as hot as he can take it, in a drenching horn.

7. *Falling madness*, is so termed because it lies in the dog's head, and makes him reel as he goes, and to fall down. For the cure, take four ounces of the juice of briony, and the same quantity of the juice of peony, with four drams of flavelace pulverized; mix these together, and give it the dog in a drenching horn; also let him bleed in the ears, and in the two veins that come down his shoulders; and indeed bleeding is necessary for all sorts of madness in dogs.

When a dog happens to be bit by a mad one, there is nothing better than their licking the place with their own tongues, if they can reach it; if not, then let it be washed with butter and vinegar made luke-warm, and let it afterwards be anointed with Venice turpentine; it is also good to piss often on the wound; but, above all, take the juice of the stalks of strong tobacco boiled in water, and bathe the place therewith; also wash him in sea-water, or water artificially made salt: give him likewise a little mithridate inwardly in two or three spoonfuls of sack, and so keep him apart; and if you find him after some time still to droop, the best way is to hang him.

Some have asserted their having cured several creatures that have been bit by mad dogs, with only giving them the middle yellow bark of buckthorn; which must be boiled in ale for a horse or cow, and in milk for a dog; but that it must be boiled till it is as bitter as you can take it.

As to the preventive of worming dogs, see WORMING.

Dog-Days. See CANICULA.

Dog-Fish, in ichthyology. See SQUALUS.

Dogs-Bane. See APOCYNUM.

Dog-Wood Tree. See PISCIDIA.

DOGE, the chief magistrate in the republic of Venice and Genoa.—The word properly signifies duke, being formed from the Latin *dux*; as *dogate*, and *dogato*, from *ducatus*, duchy.

This dignity is elective in both Venice and Genoa. In the first, it continues for life; at Genoa, it is only for two years. His title is Serenity; he is chief of the council, and mouth of the republic, he being to answer for her. The Venetians do not go into mourning at his death, he being only the phantom of majesty, as all the authority is vested in the republic; the doge only lends

Dog.

Sportsm.
Dish.

Dogger

Dols.

his name to the senate; the power is diffused through the whole body; though answers to foreign ambassadors, &c. are made in the name of the doge. The money is struck in his name, but does not bear his arms. All the magistrates rise and salute him when he comes into the council: but he rises to none but foreign ambassadors. He must not stir out of Venice, without leave of the counsellors, &c.

DOGGER, a Dutch fishing-vessel navigated in the German ocean. It is generally employed in the herring fishery, being equipped with two masts, viz. a main-mast and a mizen-mast, and somewhat resembling a *ketch*. See the Plates at the article *SHIP*.

DOGGER, in the English alum works, a name given by the workmen to a sort of stone found in the same mines with the true alum rock, and containing some alum, though not near so much as the right kind. The county of York, which abounds greatly with the true alum-rock, affords also a very considerable quantity of these doggers; and, in some places, they approach so much to the nature of the true rock, that they are wrought to advantage.

DOGMA, a principle, maxim, tenet, or settled opinion, particularly with regard to matters of faith and philosophy.

DOGMATICAL, something belonging to a doctrine or opinion. A dogmatical philosopher is one who asserts things positively; in opposition to a sceptic, who doubts of every thing.

DOGMATISTS, a sect of ancient physicians, of which Hippocrates was the first author. They are also called *logici*, logicians, from their using the rules of logic in subjects of their profession. They laid down definitions and divisions; reducing diseases to certain genera, and those genera to species, and furnishing remedies for them all; supposing principles, drawing conclusions, and applying those principles and conclusions to particular diseases under consideration: in which sense the dogmatists stand contradictorily from empirics and methodists. They reject all medicinal virtues that they think not reducible to manifest qualities: but Galen hath long ago observed of such men, that they must either deny plain matter of fact, or assign but very poor reasons and causes of many effects they pretend to explain.

DOLCE (Carlo, or Carlinio), a celebrated history and portrait painter, was born at Florence in 1616, and was the disciple of Vignali. This great master was particularly fond of representing pious subjects, though he sometimes painted portraits; and his works are easily distinguished by the peculiar delicacy with which he perfected all his compositions, by a pleasing tint of colour, and by a judicious management of the chiaro scuro. His performance was remarkably slow: and it is reported that his brain was fatally affected by seeing Luca Jordano dispatch more business in four or five hours, than he could have done in as many months. He died in 1686.

DOLE, in our ancient customs, signified a part or portion, most commonly of a meadow, where several persons have shares. It also still signifies a distribution or dealing of alms, or a liberal gift made by a great man to the people.

DOLE, in Scots law, signifies a malevolent intention. It is essential in every crime, that it be committed in-

tentionally, or by an act of the will; hence the rule, *Dolus crimis dolo contrahitur*.

DOLICHOS, KIDNEY-BEAN; a genus of the decandria order, belonging to the diadelphia class of plants. There are 25 species, the most remarkable of which are the following.

1. The lablab with a winding stalk, is a native of warm climates, where it is frequently cultivated for the table. Mr Hasselquist informs us, that it is cultivated in the Egyptian gardens, but is not a native of that country. The Egyptians make pleasant arbour with it in their houses and gardens, by supporting the stem and leading it where they think proper. They not only support it with sticks and wood, but tie it with cords; by which means the leaves form an excellent covering, and an agreeable shade.

2. The soja is a native of Japan, where it is termed *daidsu*; and, from its excellence, *mame*; that is, "the legumen or pod," by way of eminence. It grows with an erect, slender, and hairy stalk, to our height of about four feet. The leaves are like those of the garden kidney-bean*. The flowers are of a bluish white, and produced from the bosom of the leaves, and succeeded by * See Pha-
scelus.
brilliant hanging pods resembling those of the yellow lupine, which commonly contain two, sometimes three, large white seeds. There is a variety of this kind, with a small black fruit, which is used in medicine. Kempter affirms that the seeds of this when pounded, and taken inwardly, give relief in the asthma. This legumen is doubly useful in the Japanese kitchens. It serves for the preparation of a substance named *misso*, that is used as butter; and likewise a pickle celebrated among them under the name of *soju*, or *soy*. To make the first, they take a measure of mame, or the beans produced by the plant: after boiling them for a considerable time in water, and to a proper degree of softness, they beat or bray them into a soft pulp; incorporating with it, by means of repeated bruising, a large quantity of common salt, four measures in summer, in winter three. The less salt that is added, the substance is more palatable; but what it gains in point of taste, it loses in durability. They then add to this mixture a certain preparation of rice, to which they give the name of *koos*; and, having formed the whole into a compost, remove it into a wooden vessel which had lately contained their common ale or beverage named *sacki*. In about two months it is fit for use. The *koos* give it a grateful taste; and the preparing of it, like the polenta of the Germans, requires the skilful hand of an experienced master. For this reason there are certain people who make it their sole business to prepare the *koos*, and who sell it ready made for the purpose of making *misso*: a substance which cannot fail to be greatly valued in those countries, where butter from the milk of animals is unknown. To make *soju*, or *soy*, they take equal quantities of the same beans boiled to a certain degree of softness; of muggi, that is corn, whether barley or wheat, roughly ground; and of common salt. Having properly mixed the beans with the pounded corn, they cover up the mixture, and keep it for a day and a night in a warm place, in order to ferment; then, putting the mass into a pot, they cover it with the salt, pouring over the whole two measures and a half of water. This compound substance they carefully stir at least once a-day, if twice or thrice

the better, for two or three months: at the end of which time, they filtrate and expels the mafs, preferring the liquor in wooden veffels. The older it is, the better and the clearer; and if made of wheat inftead of barley, greatly blacker. The firft liquor being removed, they again pour water upon the remaining mafs; which, after ftirring for fome days, as before, they expels a fecond time, and thus obtain an inferior fort of foy.

3. The urens, or cow-itch, is alfo a native of warm climates. It hath a fibrous root, and an herbaceous climbing ftalk, which is naked, dividing into a great number of branches; and rifes to a great height when properly fupported. The leaves are alternate and trilobate, rifing from the ftem and branches about 12 inches diftant from each other. The footftalk is cylindrical, from 6 to 14 inches long. From the axilla of the leaf defends a pendulous folitary fpike, from 6 to 14 inches long, covered with long blood-coloured papilionaceous flowers, rifing by threes in a double alternate manner from fmall flefhy protuberances, each of which is a fhort pendunculus of three flowers. Thefe are fucceeded by leguminous, coriaceous pods, four or five inches long, crooked like an *Italic*; denfely covered with fharp hairs, which penetrate the fkin, and caufe great itching. This will grow in any foil, in thofe countries where it is a native: but is generally eradicated from all cultivated grounds; becaufe the hairs from the pods fly with the winds, and torment every animal they happen to touch. If it was not for this mifchievous quality, the beauty of its flowers would entitle it to a place in the beft gardens. It flowers in the cool months, from September to March, according to the fituation.

This plant has lately acquired a confiderable reputation as an anthelmintic. As fuch it is mentioned by Dr Macbride, in his “ Introduction to the theory and practice of Phyfic,” and by fome other authors. From the teftimonies of Mr Cochrane furgeon at Nevis, and Mr Bancroft author of a “ Natural hiftory of Guiana,” we are affured that it is ufed in thefe countries with the greateft fafety and efficacy. Mr Bancroft, after mentioning the frequency of diforders arifing from worms in that part of the world, and affigning fome reafons for them, proceeds as follows. “ But from whatever caufe thefe worms are produced, their number is fo great, that the ufual remedies are very infufficient for their deftruction; for which reafon the planters in general have recourfe to the cow-itch for that purpofe. From whence its ufe was firft fuggelted, I am uncertain; but its efficacy is indifputable. The part ufed is the fetaceous hairy fubftance growing on the outside of the pod, which is fcraped off, and mixed with common fyrup or molaffes, to the confiftence of a thin elecfuary; of which a tea-foonful to a child of two or three years old, and double the quantity to an adult, is given in the morning fafting, and repeated the two fucceeding mornings; after which a dofe of rhubarb is ufually fubjoined. This is the empirical practice of the planters, who ufually once in three or four months exhibit the cow-itch in this manner to their flaves in general, but efpecially to all their children without diftinction; and in this manner I have feen it given to hundreds, from one year old and upwards, with the moft happy fuccels. The patients, after

the fecond dofe, ufually difcharged an incredible number of worms, even to the amount of more than 20 at a time; fo that the ftools confifted of little elfe than thefe animals. But though thefe were indifputable proofs of its efficacy, I was far from being convinced of its fafety. I obferved that the fubftance given confifted of an afsemblage of fpiculae exquisitely fine, and fo acutely pointed, that, when applied to the fkin, they excited an intolerable itching, and even inflammation; from whence I apprehended dangerous confequences from their contact with the coats of the ftomach and inteftines. Indeed, when mixed with an elecfuary in the manner in which they are given, their elafticity is impaired, that they do not produce the fame fenfible irritation: but yet I could conceive no other quality on which their efficacy depended; efpecially after I had prepared both a tincture and decoction from the cow-itch, and given them to worm-patients without any fenfible advantage. Influenced by thefe fuggeltions, I particularly examined the ftate and condition of all fuch patients as I knew had taken the cow-itch; and yet can with the greateft truth declare, that, though prejudiced to its difadvantage, I was never able, either by my own obfervation or a diligent inquiry, to difcover a fingle inflance of any ill confequence refulting from its ufe; which has been fo extenfive, that feveral thoufands muft have taken it: and as no ill effects have been obferved, I think not only its efficacy, but fafety, are fufficiently evinced, to entitle it to general ufe; efpecially when we reflect on the uncertainty, and even danger, which attends other vermifuges. It is to be obferved, that this remedy is particularly defigned againft the long round worm. Whether it is equally deleterious to the afcarides, or whether it has ever been ufed againft them, is uncertain.

DOLLAR, a filver coin current in feveral parts of Germany and Holland. There are various fpecies of dollars; as the rix-dollar, the femi-dollar, the quarter-dollar, &c. See *MONEY-Table*.

DOLPHIN, in ichthyology. See *DELPHINUS*.

DOLPHIN of the *Maft*, a peculiar kind of wreath, formed of plaited cordage, to be faftened occasionally round the masts, as a fupport to the puddening, whofe ufe is to fustain the weight of the fore and main yards, in cafe the rigging, or chains, by which thofe yards are fufpended, fhould be fhut away in the time of battle; a circumftance which might render their faila ufelefs at a feafon when their affiftance is extremely neceffary. See the article *PUDDENING*.

DOM, or DON, a title of honour, invented and chiefly ufed by the Spaniards, fignifying *fir*, or *lord*.

This title, it feems, was firft given to Pelayo, in the beginning of the VIIth century. In Portugal no perfon can affume the title of *don*, without the permiffion of the king, fince it is looked upon as a mark of honour and nobility. In France it is fometimes ufed among the religious. It is an abridgment of *dominus*, from *dominus*.

DOM and *Son*, in old charters, fignifies full property and juriidiction.

DOMAIN, the inheritance, eftate, or poffeffion of any one. See *DEMESNE*.

DOMAT (John), a celebrated French lawyer born in 1625, who obferving the confufed ftate of the laws, digefted them in 4 vols 4to, under the title of “ The civil

Dome civil laws in their natural order: for which undertaking, Lewis XIV. settled on him a pension of 2000 **Domesday.** livres. Domat was intimate with the famous Pascal, who left him his private papers at his death: he himself died in 1696.

DOME, in architecture, a spherical roof, or a roof of a spherical form, raised over the middle of a building, as a church, hall, pavilion, vestibule, stair-case, &c. by way of crowning.

DOME, in chemistry, the upper part of furnaces, particularly portable ones. It has the figure of a hollow hemisphere or small dome. Its use is to form a space in the upper part of the furnace, the air of which is continually expelled by the fire: hence the current of air is considerably increased, which is obliged to enter by the ash-hole, and to pass through the fire, to supply the place of the air driven from the dome. The form of this piece renders it proper to reflect or reverberate a part of the flame upon the matters which are in the furnace, which has occasioned this kind of furnace to be called a *reverberating* one. See **FURNACE**.

DOME, or *Doon*, signifies judgment, sentence, or decree. The homagers oath in the black book of Hereford ends thus: "So help me God at his holy *dome*, and by my trowthe."

DOMENICHINO, a famous Italian painter, born of a good family at Bologna in 1581. He was at first a disciple of Calvart the Fleming; but soon quitted his school for that of the Caracci. He always applied himself to his work with much study and thoughtfulness; and never offered to touch his pencil but when he found a proper kind of enthusiasm upon him. His great skill in architecture also procured him the appointment of chief architect of the apostolical palace from Pope Gregory XV.; nor was he without a theoretical knowledge in music. He died in 1641.

DOMESDAY, or **DOOMSDAY**, **BOOK**, a most ancient record, made in the time of William I. surnamed the *Conqueror*, and containing a survey of all the lands of England. It consists of two volumes, a greater and a less. The first is a large folio, written on 382 double pages of vellum, in a small but plain character; each page having a double column. Some of the capital letters and principal passages are touched with red ink; and some have strokes of red ink run cross them, as if scratched out. This volume contains the description of 31 counties. The other volume is in quarto, written upon 450 double pages of vellum, but in a single column, and in a large but very fair character. It contains the counties of Essex, Norfolk, Suffolk, part of the county of Rutland included in that of Northampton, and part of Lancashire in the counties of York and Chester.

This work, according to the red book in the exchequer, was begun by order of William the Conqueror, with the advice of his parliament, in the year of our Lord 1080, and completed in the year 1086. The reason given for taking this survey, as assigned by several ancient records and historians, was, that every man should be satisfied with his own right, and not usurp with impunity what belonged to another. But, besides this, it is said by others, that now all those who possessed landed estates became vassals to the king, and paid him so much money by way of fee or homage in proportion to the lands they held. This ap-

pears very probable, as there was at that time extant a general survey of the whole kingdom, made by order of king Alfred.

For the execution of the survey recorded in *domesday* book, commissioners were sent into every county and shire; and juries summoned in each hundred, out of all orders of freemen, from barons down to the lowest farmers. These commissioners were to be informed by the inhabitants, upon oath, of the name of each manor, and that of its owner; also by whom it was held in the time of Edward the Confessor; the number of hides, the quantity of wood, of pasture, and of meadow-land; how many ploughs were in the demesne, and how many in the tenanted part of it; how many mills, how many fish-ponds or fisheries belonged to it; with the value of the whole together in the time of king Edward, as well as when granted by king William, and at the time of this survey; also whether it was capable of improvement, or of being advanced in its value: they were likewise directed to return the tenants of every degree, the quantity of lands then and formerly held by each of them, what was the number of villains or slaves, and also the number and kinds of their cattle and live stock. These inquiries being first methodized in the county, were afterwards sent up to the king's exchequer.

This survey, at the time it was made, gave great offence to the people; and occasioned a jealousy that it was intended for some new imposition. But notwithstanding all the precaution taken by the conqueror to have this survey faithfully and impartially executed, it appears from indubitable authority, that a false return was given in by some of the commissioners; and that, as it is said, out of a pious motive. This was particularly the case with the abbey of Croiland in Lincolnshire, the possessions of which were greatly underrated both with regard to quantity and value. Perhaps more of these pious frauds were discovered, as it is said Ralph Flambard, minister to William Rufus, proposed the making a fresh and more rigorous inquiry; but this was never executed.

Notwithstanding this proof of its falseness in some instances, which must throw a suspicion on all others, the authority of *domesday*-book was never permitted to be called in question; and always, when it hath been necessary to distinguish whether lands were held in ancient demesne, or in any other manner, recourse was had to *domesday*-book, and to that only, to determine the doubt. From this definitive authority, from which, as from the sentence pronounced at *domesday*, or the day of judgment, there could be no appeal, the name of the book is said to have been derived. But Stowe assigns another reason for this appellation; namely, that *domesday*-book is a corruption of *domus Dei* book; a title given it because heretofore deposited in the king's treasury, in a place of the church of Westminster or Winchester, called *domus Dei*. From the great care formerly taken for the preservation of this survey, we may learn the estimation in which its importance was held. The dialogue of Scaccarius says, "*Liber ille (domesday) sigilli regis comes est individuum in thesauro.*" Until lately it has been kept under three different locks and keys; one in the custody of the treasurer, and the others in that of the two chamberlains of the exchequer. It is now deposited in the chapter-house at Westminster.

minster, where it may be consulted on paying to the proper officers a fee of 6 s. 8 d. for a search, and fourpence per line for a transcript.

Besides the two volumes abovementioned, there is also a third made by order of the same king; and which differs from the others in form more than matter. There is also a fourth called *domefday*, which is kept in the exchequer; which, though a very large volume, is only an abridgement of the others. In the remembrancer's office in the exchequer, is kept a fifth book, likewise called *domefday*, which is the same with the fourth book already mentioned. King Alfred had a roll which he called *domefday*; and the *domefday*-book made by William the Conqueror referred to the time of Edward the Confessor, as that of king Alfred did to the time of Ethelred. The fourth book of *domefday* having many pictures and gilt letters in the beginning relating to the time of king Edward the Confessor, this had led some into a false opinion that *domefday*-book was composed in the reign of king Edward.

DOMESTIC, any man who acts under another, serving to compose his family; in which he lives, or is supposed to live, as a chaplain, secretary, &c. Sometimes domestic is applied to the wife and children; but very seldom to servants, such as footmen, lacques, porters, &c.

DOMICILE, in Scots law, is the dwelling-place where a person lives with an intention to remain.

DOMIFYING, in astrology, the dividing or distributing the heavens into 12 houses, in order to erect a theme, or horoscope, by means of six great circles, called *circles of position*.

There are various ways of domifying: that of Regiomontanus, which is the most common, makes the circles of position pass thro' the intersections of the meridian and the horizon: others make them pass through the poles of the zodiac.

DOMINANT, (from the Latin word *dominari*, to rule or govern), among musicians, is used either as an adjective or a substantive; but these different acceptations are far from being indiscriminate. In both senses it is explained by Rousseau as follows.

The *dominant* or sensible chord is that which is practised upon the dominant of the tone, and which introduces a perfect cadence. Every perfect major chord becomes a *dominant* chord, as soon as the seventh minor is added to it.

Dominant, (subst.) Of the three notes essential to the tone, it is that which is a fifth from the tonic. The tonic and the *dominant* fix the tone: in it they are each of them the fundamental found of a particular chord; whereas the mediant, which constitutes the mode, has no chord peculiar to itself, and only makes a part of the chord of the tonic.

M. Rameau gives the name of *dominant* in general to every note which carries a chord of the seventh; and distinguishes that which carries the sensible chord, by the name of a *tonic dominant*: but, on account of the length of the word, this addition to the name has not been adopted by artists: they continue simply to call that note a *dominant*, which is a fifth from the tonic; and they do not call the other notes which carry a chord of the seventh *dominants*, but *fundamentals*; which is sufficient to render their meaning plain, and prevents confusion.

A *dominant*, in that species of church-music which is called *plain-chant*, is that note which is most frequently repeated or beaten, in whatever degree it may be from the tonic. In this species of music there are *dominants* and *tonicks*, but no mediant.

DOMINATION, or **DOMINION**, in theology, the fourth order of angels, or blessed spirits, in the hierarchy, reckoning from the seraphim. See **ANGEL**.

DOMINGO, or **St DOMINGO**, the capital of the island of Hispaniola in the West Indies, is seated in that part belonging to the Spaniards on the south side of the island, and has a commodious harbour. The town is built in the Spanish manner, with a great square in the middle of it; about which are the cathedral, and other public buildings. From this square run the principal streets, in a direct line, they being crossed by others at right angles, so that the form of the town is almost square. The country on the north and east side is pleasant and fruitful; and there is a large navigable river on the west, with the ocean on the south. It is the fee of an archbishop, an ancient royal audience, and the seat of the governor. It has several fine churches and monasteries; and is so well fortified, that a fleet and army sent by Oliver Cromwel, in 1654, could not take it. The inhabitants are Spaniards, Negroes, Mulattoes, Mellices, and Albatares; of whom about a sixth part may be Spaniards. It had formerly about 2000 houses, but it is much declined of late years. The river on which it is seated is called *Ozama*. W. Long. 69. 30. N. Lat. 18. 25.

DOMINIC (de Gusman), founder of the Dominican order of monks, was born at Calahorra in Aragon, 1170. He preached with great fury against the Albigenses, when Pope Innocent III. made a croisade against that unhappy people; and was inquisitor in Languedoc, where he founded his order, and got it confirmed by the Lateran council in 1215. He died at Bologna in 1221, and was afterwards canonized. The dominican order has produced many illustrious men. See **DOMINICANS**.

DOMINICA, one of the Caribbee islands in the West Indies, about 39 miles long and 13 broad, situated between 61° and 62° W. Long. and between 15° and 16° of N. Lat. This island formerly belonged to the French, but was ceded to Britain by the treaty in 1763. It is very advantageous to the latter, as being situated between the French islands of Guadaloupe and Martinico, so that it is equally alarming to both; and its safe and commodious roads enable the British privateers to intercept, without risque, the navigation of France in her colonies, whenever a war happens between the two nations.

La DOMINICA, one of the **MARQUESAS** Islands in the South Sea.

DOMINICAL LETTER, popularly called *Sunday-Letter*, one of the seven letters A B C D E F G, used in almanacks, ephemerides, &c. to denote the Sundays throughout the year. See **ASTRONOMY**, n° 310. The word is formed from *dominica* or *dominicus dies*, Lord's-day, Sunday.

The dominical letters were introduced into the calendar by the primitive Christians, in lieu of the **NUNDINAL** letters in the Roman calendar.

DOMINICANS, an order of religious, called in France *Jacobins*, and in England *Black-friars* or *Preaching*

Dominion *Preaching-fratres*. This order, founded by St Dominic, was approved of by Innocent III. in 1215, and confirmed by a bull of Honorius III. in 1216. The design of their institution was to preach the gospel, convert heretics, defend the faith, and propagate Christianity. They embraced the rule of St Augustine, to which they added statutes and constitutions which had formerly been observed either by the Carthusians or Premontrean monks. The principal articles enjoined perpetual silence, abstinence from flesh at all times, wearing of woollen, rigorous poverty, and several other austerities. This order has spread into all the parts of the world. It produced a great number of martyrs, confessors, bishops; and they reckon three popes, 60 cardinals, 150 archbishops, and 800 bishops, of their order; besides the masters of the sacred palace, who have always been Dominicans. They are inquisitors in many places.

DOMINION, **DOMINIUM**, in the civil law, signifies the power to use or dispose of a thing as we please.

DOMINION, or *Domination*. See **DOMINATION**.

DOMINIS (Mark Anthony de), archbishop of Spalatro in Dalmatia at the close of the 15th and beginning of 16th centuries, was a man whose fickleness in religion proved his ruin. His preference, instead of attaching him to the church of Rome, rendered him disaffected to it. Becoming acquainted with our bishop Bedell, while chaplain to Sir Henry Wotton ambassador from James I. at Venice, he communicated his books *de republica ecclesiastica* to him; which were afterwards published at London, with Bedell's corrections. He came to England with Bedell; where he was received with great respect, and preached and wrote against the Romish religion. He is said to have had a principal hand in publishing father Paul's *History of the council of Trent*, at London, which was inscribed to James in 1619. But on the promotion of Pope Gregory XIV. who had been his school-fellow and old acquaintance, he was deluded by Gondomar the Spanish ambassador into the hopes of procuring a cardinal's hat, by which he fancied he should prove an instrument of great reformation in the church. Accordingly he returned to Rome in 1622, recanted his errors, and was at first well received: but he afterwards wrote letters to England, repenting his recantation; which being intercepted, he was imprisoned by Pope Urban VIII. and died in 1625. He was also the author of the first philosophical explanation of the rainbow, which before his time was accounted a prodigy.

DOMINIUM EMINENS, in Scots law, that power which the state or sovereign has over private property, by which the proprietor may be compelled to sell it for an adequate price where public utility requires *.

DOMINIUM DIRECTUM, in Scots law, the right which a superior retains in his lands, notwithstanding the feudal grant to his vassal. See **LAW**, N° clxvi. 1.

DOMINIUM UTILE, in Scots law, the right which the vassal acquires in the lands by the feudal grant from his superior. See **LAW**, N° clxvi. 1.

DOMITIAN, the Roman emperor, son to Vespasian, was the last of the 12 Cæsars. See (*History of*) **ROME**.

DONATION, an act whereby a person transfers to another either the property or the use of something as a free gift. In order to be valid, it supposes a capa-

city both in the donor and the donee; and requires consent, acceptance, and delivery, and by the French also registry.

DONATISTS, Christian schismatics in Africa, who took their name from their leader Donatus. A secret hatred against Cæcilian, elected bishop of Carthage about the year 311, excited Donatus to form this sect. He accused Cæcilian of having delivered up the sacred books to the Pagans; and pretended that his election was void, and all his adherents heretics. He taught that baptism administered by heretics was null, that every church but the African was become prostituted, and that he was to be the restorer of religion. Some accuse the Donatists of Arianism. Constantius and Honorius made laws for their banishment, and Theodosius condemned them to heavy mulcts.

DONATIVE, a gratuity, or present made to any person.

Donative among the Romans was properly a gift made to the soldiers, as *congiarium* was that made to the people.

DONATORY, in Scots law, that person to whom the king bestows his right to any forfeiture that has fallen to the crown.

DONATUS, a schismatic bishop of Carthage, founder of the sect of **DONATISTS**. His followers swore by him, and honoured him like a god. He died about 368.

DONATUS (*Ælius*), a famous grammarian, lived at Rome in 354. He was one of St Jerome's masters; and composed commentaries on Terence and Virgil, which are esteemed.

DONAWERT, a strong town of Germany, in the circle of Bavaria on the frontiers of Suabia. It has been taken and retaken several times in the wars of Germany; and was formerly an imperial city, but at present is subject to the duke of Bavaria. E. Long. 10. 32. N. Lat. 48. 32.

DONAX, a genus of insects belonging to the order of vermes testacea. It is an animal of the oyster kind; and the shell has two valves, with a very obtuse margin in the fore-part. There are 10 species, principally distinguished by the figure of their shells *.

DONCASTER, a market-town of Yorkshire, 30 miles south of York. E. Long. 1. 0. N. Lat. 53. 30. * Plate LXXXVII. fig. 6.

DONNE (Dr John), an excellent poet and divine of the 17th century. His parents were of the Romish religion, and used their utmost efforts to keep him firm to it; but his early examination of the controversy between the church of Rome and the Protestants, at last determined him to chuse the latter. He travelled into Italy and Spain; where he made many useful observations, and learned their languages to perfection. Soon after his return to England, Sir Thomas Egerton, keeper of the great seal, appointed him his secretary; in which post he continued five years. He marrying privately Anne the daughter of Sir George Moore then chancellor of the garter, and niece to the lord keeper's lady, was dismissed from his place, and thrown into prison. But he was reconciled to Sir George by the good offices of Sir Francis Wolley. In 1612, he accompanied Sir Robert Drury to Paris. During this time, many of the nobility solicited the king for some secular employment for him. But his majesty, who took pleasure in his conversation, had engaged him in writing

writing his *Pseudo Martyr*, printed at London in 1610; and was so highly pleased with that work, that in 1614 he prevailed with him to enter into holy orders; appointed him one of his chaplains, and procured him the degree of Doctor of Divinity from the university of Oxford. In 1619, he attended the earl of Doncaster in his embassy into Germany. In 1621, he was made dean of St Paul's: and the vicarage of St Dunstan in the west, in London, soon after fell to him; the avowal of it having been given to him long before by Richard earl of Dorset. By these and other preferments, he was enabled to be charitable to the poor, kind to his friends, and to make good provision for his children. He wrote, besides the above, 1. Devotions upon emergent occasions. 2. The ancient history of the Septuagint, translated from the Greek of Aristeus, quarto. 3. Three volumes of sermons, folio. 4. A considerable number of poems; and other works. He died in 1631; and was interred in St Paul's cathedral, where a monument was erected to his memory. His writings shew him to be a man of incomparable wit and learning; but his greatest excellence was satire. He had a prodigious richness of fancy, but his thoughts were much debased by his versification. He was, however, highly celebrated by all the great men of that age.

DONOR, in law, the person who gives lands or tenements to another in tail, &c.; as he to whom such lands, &c. are given, is the *donee*.

DOOMSDAY BOOK. See DOMESDAY BOOK.

DOOR, in architecture. See ARCHITECTURE, n° 81.

DORCHESTER, the capital of Dorsetshire, situated on the river Frome, six miles north of Weymouth: W. Long. 2. 35. N. Lat. 50. 40. It gives the title of marquis to the noble family of Pierpoint, dukes of Kingston; and sends two members to parliament.

DOR, the English name of the common black beetle. Some apply it also to the dusky beetle, that flies about hedges in the evening. See SCARABÆUS.

DOREE, or JOHN DOREE, in ichthyology. See ZEUS.

DORIA (Andrew), a gallant Genoese sea-officer, born in 1466. He entered into the service of Francis I. of France; but preserved that spirit of independence so natural to a sailor and a republican. When the French attempted to render Savona, long the object of jealousy to Genoa, its rival in trade, Doria remonstrated against the measure in a high tone; which bold action, represented by the malice of his courtiers in the most odious light, irritated Francis to that degree, that he ordered his admiral Barbezieux to fail to Genoa then in the hands of the French troops, to arrest Doria, and to seize his galleys. This rash order Doria got timely hints of; retired with all his galleys to a place of safety; and, while his resentment was thus raised, he closed with the offers of the emperor Charles V. returned his commission with the collar of St Michael to Francis, and hoisted the Imperial colours. To deliver his country, weary alike of the French and Imperial yoke, from the dominion of foreigners, was now Doria's highest ambition; and the favourable moment offered. Genoa was afflicted with the pestilence, the French garrison was greatly reduced and ill-paid, and the inhabitants were sufficiently disposed to second his views. He sailed to the harbour with 13 galleys, landed 500 men, and made himself master of the gates

and the palace with very little resistance. The French governor with his feeble garrison retired to the citadel, but was quickly forced to capitulate; when the people ran together, and levelled the citadel with the ground. It was now in Doria's power to have rendered himself the sovereign of his country; but, with a magnanimity of which there are few examples, he assembled the people in the court before the palace, disclaimed all pre-eminence, and recommended to them to settle that form of government they chose to establish. The people, animated by his spirit, forgot their factions, and fixed that form of government which has subsisted ever since with little variation. This event happened in 1528. Doria lived to a great age, respected and beloved as a private citizen; and is still celebrated in Genoa by the most honourable of all appellations, "The father of his country, and the restorer of its liberty."

DORIC, in general, any thing belonging to the Dorians, an ancient people of Greece, inhabiting near mount Parnassus.

DORIC Order. See ARCHITECTURE, n° 48.

DORIC *Dialect*, one of the five dialects or manners of speaking which were principally in use among the ancient Greeks.—It was first used by the Lacedaemonians, particularly those of Argos; afterwards it passed into Epirus, Libya, Sicily, and the islands of Rhodes, Crete, &c.

DORIC *Mode*, in music, the first of the authentic modes of the ancients. Its character is to be severe, tempered with gravity and joy; and is proper upon religious occasions, as also to be used in war. It begins *D, la, sol, re*. Plato admires the music of the Doric mode, and judges it proper to preserve good manners as being masculine; and on this account allows it in his commonwealth. The ancients had likewise their subdoric or hypodoric mode, which was one of the plagal modes. Its character was to be very grave and solemn; it began with *re*, a fourth lower than the doric.

DORING, or DARING, among sportsmen, a term used to express a method of taking larks, by means of a clap-net and a looking-glass. For this sport there must be provided four sticks very straight and light, about the bigness of a pike; two of these are to be four feet nine inches long, and all notched at the edges or the ends. At one end of each of these sticks there is to be fastened another of about a foot long on one side; and on the other side a small wooden peg about three inches long. Then four or more sticks are to be prepared, each of one foot length; and each of these must have a cord of nine feet long fastened to it at the end. Every one should have a buckle for the commodious fastening on to the respective sticks when the net is to be spread.—A cord must also be provided, which must have two branches. The one must have nine feet and a half, and the other ten feet long, with a buckle at the end of each; the rest, or body of the cord, must be 24 yards long. All these cords, as well the long ones as those about the sticks, must be well twisted and of the bigness of one's little finger. The next thing to be provided is a staff of four feet long, pointed at one end, and with a ball of wood at the other, for the carrying these conveniences in a sack or wallet.—There should also be carried, on this occasion, a spade to

DORIS Dorsal
Doronicum Dorsifolia.
 to level the ground where there may be any little irregularities; and two small rods, each 18 inches long, and having a small rod fixed with a pack-thread at the larger end of the other. To these are to be tied some pack-thread loops, which are to fasten in the legs of some larks; and there are to be reels to these, that the birds may fly a little way up and down. When all this is done, the looking-glass is to be prepared in the following manner. Take a piece of wood about an inch and an half thick, and cut it in form of a bow, so that there may be about nine inches space between the two ends; and let it have its full thickness at the bottom, that it may receive into it a false piece; in the five corners of which there are to be let in five pieces of looking-glasses. These are to be fixed, that they may dart their light upwards; and the whole machine is to be supported on a moveable pin, with the end of a long line fixed to it, and made in the manner of the children's play-thing of an apple and a plum-stone; so that the other end of the cord being carried through a hedge, the barely pulling it may set the whole machine of the glasses a-turning. This and the other contrivances are to be placed in the middle between the two nets. The larks fixed to the place, and termed *calls*, and the glittering of the looking-glasses as they whirl round in the sun, invite the other larks down; and the cord that communicates with the nets, and goes through the hedge, gives the person behind an opportunity of pulling up the nets, so as to meet over the whole, and take every thing that is between them. The places where this sort of sporting succeeds best are open fields remote from any trees and hedges, except one by way of shelter for the sportsman: and the wind should always be either in the front or back; for if it blows sideways, it prevents the playing of the net.

DORIS, a genus of insects, belonging to the order of vermes testacea. The body is oblong, flat beneath; creeping: mouth placed below; vent behind, surrounded with a fringe: two feelers, retractile. There are several species.—The argo, or lemon doris, has an oval body, convex, marked with numerous punctures, of a lemon colour, the vent beset with elegant ramifications. It inhabits different parts of our seas, called about Brightelmstone the *sea-lemon*. See Plate XCII.

DORMANT, in heraldry, is used for the posture of a lion, or any other beast, lying along in a sleeping attitude with the head on the fore-paws; by which it is distinguished from the *couchant*, where tho' the beast is lying, yet he holds up his head.

DORMER, in architecture, signifies a window made in the roof of an house, or above the entablature, being raised upon the rafters.

DORMITORY, a gallery in convents or religious houses, divided into several cells, in which the religious sleep or lodge.

DORONICUM, *LEOPARD'S BANE*; a genus of the polygamia superflua order, belonging to the syngenesia class of plants. There are three species, of which the only one worthy of notice is the pardalianches with obtuse heart-shaped leaves. It grows naturally in Hungary, and on the Helvetian mountains; but is frequently preferred in the English gardens. It hath thick fleshy roots, which divide into many knobs or knees, sending out strong fleshy fibres, which penetrate deep into the ground; from these arise, in the spring,

a cluster of heart-shaped leaves, which are hairy, and stand upon footstalks: between these arise the flower-stalks, which are channeled and hairy, near three feet high, putting out one or two smaller stalks from the side. Each stalk is terminated by one large yellow flower.—The plant multiplies very fast by its spreading roots; and the seeds, if permitted to scatter, will produce plants wherever they happen to fall; so that it very soon becomes a weed in the places where it is once established. It loves a moist soil, and shady situation. The roots were formerly used in medicines alexipharmics and purifiers of the blood; but their operation was so violent, that they are now entirely laid aside.

DORSAL, an appellation given to whatever belongs to the back. See **DORSUM**.

DORSET, (Thomas Sackville), Lord Buckhurst. See **SACKVILLE**.

DORSET (Charles Sackville), earl of. See **SACKVILLE**.

DORSETSHIRE, a county of England, bounded on the south by the English channel, on the north by Somersetshire and Wiltshire, on the east by Hampshire, and on the west by Devonshire and some part of Somersetshire. It is between 40 and 50 miles long from east to west, and 34 broad from south to north, and contains 34 hundreds, 22 market-towns, and 248 parishes. This county enjoys a mild, pleasant, and wholesome air, and a deep, rich, and fertile soil, finely diversified. Towards the north it is level, under the high lands that divide it from Somersetshire, where there are fine arable grounds that will yield large crops of different kinds of grain. But on the south, from the borders of Hampshire by the sea-coast, for an extent of almost 20 miles in length, and in some places four or five in breadth, is a heathy common, which renders this country less populous than it otherwise would be. From east to west run a ridge of hills called the *Dorset Downs*, abounding with sweet and short herbage, which nourishes a vast number of sheep equally esteemed for their flesh and fleece. The country is also very plentifully watered; and in all respects so well suited both for pleasure and profit, that it was distinguished by the Romans above all others. They had more stations and summer-camps in Dorsetshire, than in any other county. That the Saxons had the same regard for it, is evident from the number of palaces they had in it, the stately minsters they built, and the express directions they gave that their bodies should be interred in those monuments of their piety. This county yields many, and very valuable, commodities. The quarries in Purbeck and Portland supply stones of different qualities, suited to various uses, and in prodigious quantities, together with some very rich and beautiful marble. The best tobacco-pipe clay in England is also found in this county. Madder, hemp, and flax, also thrive in many places, grain of all sorts, &c.

DORSIFEROUS PLANTS, among botanists, such as are of the capillary kind, without stalks, and which bear their seeds on the back-side of their leaves.

DORSTENIA, *CONTRAYERVA*; a genus of the monogynia order, belonging to the tetrandria class of plants. There are four species, all of them low herbaceous plants, growing in the warm countries of America. The root is used in medicine. It is full of knots; an inch or two in length, about half an inch

Dorsum
||
Dose.

thick; externally of a reddish brown colour, and pale within: long, tough, slender fibres shoot out from all sides of it, which are generally loaded with small round knots. The root has a peculiar kind of aromatic smell, and a somewhat astringent, warm, bitterish taste, with a light and sweetish kind of acrimony when chewed. The fibres have little taste or smell; the tuberous part therefore should only be chosen.—*Contrayerva* is one of the mildest of those substances called *alexipharmics*: it is indisputably a good and useful diaphoretic. Its virtues are extracted both by water and rectified spirit, and do not arise by evaporation with either.—The plants cannot be propagated in this country without the greatest difficulty.

DORSUM, the **BACK**, in anatomy, comprehends all the posterior part of the trunk of the body from the neck to the buttocks. See **ANATOMY**, n° 28, &c.

DORT, or **DORDRECHT**, a city of Holland, which holds the first rank in the assembly of the States. It is seated in a small island formed by the rivers Meuse, Merue, Rhine, and Linghe. The Meuse, on which it stands, gives it a good harbour, and separates it from the islands of IJselmonde and Abblas. It is divided from Beyerland by a canal. The harbour is very commodious for the merchandizes which come down the Rhine and the Meuse, which keep it in a flourishing condition. Its strength consists in being surrounded with water. Its walls are old, and defended by round towers. It is very rich, and well built with brick, and had formerly the exclusive right of coining money. It is at present the staple town for wines, particularly Rhenish. It was detached from the main-land, in 1421, on the 17th of November, by a flood occasioned by the breaking down of the dyke, which overwhelmed 70 villages, and about 100,000 persons. However, by time and the industry of the inhabitants, a great part of the land is recovered. It has two principal canals, namely, the New and Old Haven, by which heavy-loaded vessels may enter into the city. Over the Old Haven is a large bridge well built with brick.

Dort was almost reduced to ashes in the year 1457; there being then consumed 2000 houses, with the halls, hospital, and church of Notre Dame: but they are now well provided with fire-engines and watchmen to prevent the like disaster. This city is famous for the meeting of the clergy called the Synod of Dort, in which the Calvinists obtained a sentence against the Arminians, who were called the *Remonstrants*. The dispute between the contending parties occasioned strange disorders, skirmishes, and murders, in most of the principal cities. Those ministers who would not subscribe to the decree of the synod were banished, of whom there were above 100. E. Long. 4. 36. N. Lat. 51. 39.

DORTMUND, a rich, populous, and imperial city of Germany, in the circle of Westphalia. It is pretty large, but not well built. Formerly it was one of the Hanse towns. Its territory also was formerly a county, and had lords of its own; but since 1504, it hath been possessed entirely by the city.

DORYPHORI, in antiquity, an appellation given to the lifeguardmen of the Roman emperors.

DOSE, in pharmacy, &c. the quantity of a medicine to be taken at one time. The word is formed from the Greek *dosis*, which signifies *gift*, or a thing

given; from *do*, *dos*, “I give.”

DOSITHEANS, in church-history, a sect among the Hebrews, being one of the branches of the Samaritans. See **SAMARITANS**.

They abstained from eating any creature that had life; and were so superstitious in keeping the sabbath, that they remained in the same place and posture wherein that day surprised them, without stirring till the next day. They married but once, and a great number never married. Dositheus, their founder, being disaffected among the Jews, retired to the Samaritans, who were reputed heretics, and invented another sect; and to make it more authentic, he went into a cave, where, by too long abstinence, he killed himself.—The name of *Dositheans* was also given to some of the disciples of Simon Magus.

DOTTRELE, in ornithology. See **CHARADRIUS**. **DOU**, or **DOW**, (Gerard), of Leyden, an excellent painter in the 17th century, was the disciple of Rembrandt; but his manner of working was very different from that of his master. He painted little figures in oil, which he finished as highly as if they had been as big as the life. He always drew after nature, and viewed his originals in a convex mirror; and, as he took a great deal of pains, his works seem almost as perfect as nature herself, without losing any thing of the freshness, union, or force of colouring, or of the *claro oscuro*. The common height of his pictures did not exceed a foot; yet his price was sometimes six hundred, sometimes eight hundred, and sometimes a thousand livres each picture, according to the time he spent about it, though he only reckoned after the rate of a live an hour.

DOUAY, a large and strong city of the French Netherlands, situated in E. Long. 3. 0. N. Lat. 50. 25. It was taken by the French in 1667; by the allies in 1710; and retaken by the French in 1712.

DOUBLE; two of a sort, one corresponding to the other.

DOUBLE Children, **DOUBLE Cats**, **DOUBLE Pearls**, &c. Instances of these are frequent in the *Philosoph. Transact.* and elsewhere. See **MONSTER**.

Sir John Floyer, in the same *Transactions*, giving an account of a *double turkey*, furnishes some reflections on the production of *double animals* in general. Two turkeys, he relates, were taken out of an egg of the common size, when the rest were well hatched, which grew together by the flesh of the breast-bone, but in all other parts were distinct. They seemed less than the ordinary size, as wanting bulk, nutriment, and room for their growth; which latter, too, was apparently the occasion of their cohesion. For, having two distinct cavities in their bodies, and two hearts, they must have arisen from two cicatriculas; and, consequently, the egg had two yolks; which is no uncommon accident. He mentions a dried *double chicken* in his possession, which, though it had four legs, four wings, &c. had but one cavity in the body, one heart, and one head; and, consequently, was produced from one cicatrícula.

So, *Paræus* mentions a *double infant*, with only one heart: in which case, the original or flamen of the infant was one, and the vessels regular; only, the nerves and arteries towards the extremities dividing into more branches than ordinary, produced *double parts*.

The

Dositheans
||
Doule.

Double.

The same is the case in the *double flowers* of plants, occasioned by the richness of the soil. So it is in the eggs of quadrupeds, &c.

There are, therefore, two reasons of duplicity in embryo's: 1. The conjoining or connexion of two perfect animals; and, 2. An extraordinary division and ramification of the original vessels, nerves, arteries, &c.

DOUBLE Employment, in music, a name given by M. Rameau to the two different manners in which the chord of the sub-dominant may be regarded and treated, viz. as the fundamental chord of the sixth super-added, or as the chord of the great sixth, inverted from a fundamental chord of the seventh. In reality, the chords carry exactly the same notes, are figured in the same manner, are employed upon the same chord of the tone, in such a manner, that frequently we cannot discern which of the two chords the author employs, but by the assistance of the subsequent chord, which resolves it, and which is different in these different cases.

To make this distinction, we must consider the diatonic progress of the two notes which form the fifth and the sixth, and which, constituting between them the interval of a second, must one or the other constitute the dissonance of the chord. Now, this progress is determined by the motion of the bass. Of these two notes, then, if the superior be the dissonance, it will rise by one gradation into the subsequent chord, the lower note will keep its place, and the higher note will be a super-added sixth. If the lower be the dissonance, it will descend into the subsequent chord, the higher will remain in its place, and the chord will be that of the great sixth. See the two cases of the *double employment* in Rousseau's Musical Dictionary, Plate D, fig. 12.

With respect to the composer, the use which he may make of the double-employment, is to consider the chord in its different points of view, that from thence he may know how to make his entrance to it, and his exit from it; so that having arrived, for instance, at the chord of the super-added sixth, he may resolve it as a chord of the great sixth, and reciprocally.

M. D'Alembert has shewn, that one of the chief uses of the double-employment is, that we be able to carry the diatonic succession of the gamut even to an octave, without changing the mode, at least whilst we rise; for in descending we must change it. Of this gamut and its fundamental bass, an example will be found in Rousseau's Musical Dictionary, Plate D, fig. 13. It is evident, according to the system of M. Rameau, that all the harmonic successions which result from it, are in the same tone: for, in strictness, no other chords are there employed but three, that of the tonic, that of the dominant, and that of the sub-dominant; as this last, in the double-employment, constitutes the seventh from the second note, which is employed upon the sixth.

With respect to what M. D'Alembert adds in his Elements of Music, p. 80. and which he repeats in the Encyclopédie, article *Double-emploi*, viz. that the chord of the seventh *re fa la ut*, though we should even regard it only as an inversion of *fa la ut re*, cannot be followed by the chord *ut mi sol ut*; "I cannot (says Rousseau) be of his opinion in this point.

"The proof which he gives for it is, that the dissonance *ut* of the first chord cannot be resolved in the second; and this is true, since it remains in its place: but in this chord of the seventh *re fa la ut*, inverted

Double.

from this chord of the super-added sixth *fa la ut re*, it is not the *ut*, but the *re*, which is the dissonance; which, of consequence, ought to be resolved in ascending upon *mi*, as it really does in the subsequent chord; so that this procedure in the bass itself is forced, which, from *re*, cannot without an error return to *ut*, but ought to ascend to *mi*, in order to resolve the dissonance.

"M. D'Alembert afterwards shews, that this chord *re fa la ut*, when preceded and followed by that of the tonic, cannot be authorized by the double-employment; and this is likewise very true; because this chord, tho' figured with a 7, is not treated as a chord of the seventh, neither when we make our entrance to it, nor our exit from it; or at least that it is not necessary to treat it as such, but simply as an inversion of the super-added sixth, of which the dissonance is the bass: in which case we ought by no means to forget, that this dissonance is never prepared. Thus, though in such a transition the double-employment is not in question, though the chord of the seventh be no more than apparent, and impossible to be resolved by the rules, this does not hinder the transition from being proper and regular, as I have just proved to theorists, and as I shall immediately prove to practical artists, by an instance of this transition; which certainly will not be condemned by any one of them, nor justified by any other fundamental bass except my own. (See the Musical Dictionary, Plate D, fig. 14.)

"I acknowledge, that this inversion of the chord of the sixth super-added, which transfers the dissonance to the bass, has been censured by M. Rameau. This author, taking for a fundamental chord the chord of the seventh, which results from it, rather chose to make the fundamental bass descend diatonically, and resolve one seventh by another, than to unfold this seventh by an inversion. I had dissipated this error, and many others, in some papers which long ago had passed into the hands of M. D'Alembert, when he was composing his Elements of Music; so that it is not his sentiment which I attack, but my own opinion which I defend."

For what remains, the double-employment cannot be used with too much reserve, and the greatest matters are the most temperate in putting it in practice.

DOUBLE Fichy, or *Fiché*, in heraldry, the denomination of a cross, when the extremity has two points; in contradistinction to *fiché*, where the extremity is sharpened away to one point.

DOUBLE Octave, in music, an interval composed of fifteen notes in diatonic progression; and which, for that reason, is called a *fifteenth*. "It is (says Rousseau) an interval composed of two octaves, called by the Greeks *disdiapason*.

It deserves however to be remarked, that in intervals less distant and compounded, as in the *third*, the *fifth*, the *simple octave*, &c. the lowest and highest extremes are included in the number from whence the interval takes its name. But, in the *double octave*, when termed a *fifteenth*, the simple number of which it is composed gives the name. This is by no means analogical, and may occasion some confusion. We should rather choose, therefore, to run any hazard which might occur from uniformly including all the terms of which the component intervals consist, and call the *double octave* a *fifteenth*, according to the general analogy. See **INTERVAL**.

Doublet.

DOUBLET, among lapidaries, implies a counterfeit stone composed of two pieces of crystal, and sometimes glass softened, together with proper colours between them; so that they make the same appearance to the eye, as if the whole substance of the crystal had been tinged with these colours.

The impracticability of imparting tinges to the body of crystals, while in their proper and natural state, and the softness of glass, which renders ornaments made of it greatly inferior in wear to crystal, gave inducements to the introduction of colouring the surface of crystal wrought in a proper form, in such a manner, that the surfaces of two pieces so coloured being laid together, the effect might appear the same as if the whole substance of the crystal had been coloured. The crystals, and sometimes white transparent glass so treated, were called *doublets*; and at one time prevailed greatly in use, on account of the advantages with respect to wear, such doublets had, when made of crystal, over glass, and the brightness of the colours which could with certainty be given to counterfeit stones this way, when coloured glass could not be procured, or at least not without a much greater expence. Doublets have not indeed the property which the others have, of bearing to be set transparent, as is frequently required in drops of ear-rings and other ornaments: but when mounted in rings, or used in such manner that the sides of the pieces, where the joint is made, cannot be inspected, they have, when formed of crystal, the title to a preference to the coloured glass; and the art of managing them is therefore, in some degree, of the same importance with that of preparing glass for the counterfeiting gems; and is therefore properly an appendage to it, as being entirely subservient to the same intention. The manner of making doublets is as follows:

Let the crystal or glass be first cut by the lapidaries in the manner of a brilliant, except that, in this case, the figure must be composed from two separate stones, or parts of stones, formed in the manner of the upper and under parts of a brilliant, if it was divided in an horizontal direction, a little lower than the middle. After the two plates of the intended stone are thus cut, and fitted so exactly that no division can appear when they are laid together, the upper part must be polished ready for setting; and then the colour must be put betwixt the two plates by this method. "Take of Venice or Cyprus turpentine two scruples; and add to it one scruple of the grains of mastich chosen perfectly pure, free from foulness, and previously powdered. Melt them together in a small silver or brass spoon ladle, or other vessel, and put to them gradually any of the coloured substances below mentioned, being first well powdered; stirring them together as the colour is put in, that they may be thoroughly commixed. Warm then the doublets to the same degree of heat as the melted mixture; and paint the upper surface of the lower part, and put the upper one instantly upon it, pressing them to each other, but taking care that they may be conjoined in the most perfectly even manner. When the cement or paint is quite cold and set, the redundant part of it, which has been pressed out of the joint of the two pieces, should be gently scraped off the side, till there be no appearance of any colour on the outside of the doublets; and they should then be

skillfully set; observing to carry the mounting over the joint, that the upper piece may be well secured from separating from the under one."

The colour of the ruby may be best imitated, by mixing a fourth part of carmine with some of the finest crimson lake that can be procured.

The sapphire may be counterfeited by very bright Prussian blue, mixed with a little of the abovementioned crimson lake, to give it a cast of the purple. The Prussian blue should not be very deep-coloured, or but little of it should be used: for otherwise, it will give a black shade that will be injurious to the lustre of the doublets.

The emerald may be well counterfeited by distilled verdigrease, with a little powdered aloes. But the mixture should not be strongly heated, nor kept long over the fire after the verdigrease is added: for the colour is to be soon impaired by it.

The resemblance of the garnet may be made by dragon's blood; which, if it cannot be procured of sufficient brightness, may be helped by a very small quantity of carmine.

The amethyst may be imitated by the mixture of some Prussian blue with the crimson lake; but the proportions can only be regulated by direction, as different parcels of the lake and Prussian blue vary extremely in the degree of strength of the colour.

The yellow topazes may be counterfeited by mixing the powdered aloes with a little dragon's blood, or by good Spanish anatto: but the colour must be very sparingly used, or the tinge will be too strong for the appearance of that stone.

The chrysolite, hyacinth, vinegar garnet, eagle marine, and other such weaker or more diluted colours, may be formed in the same manner, by lessening the proportions of the colours, or by compounding them together correspondently to the hue of the stone to be imitated; to which end it is proper to have an original stone, or an exact imitation of one, at hand when the mixture is made, in order to the more certain adapting the colours to the effect desired: and when these precautions are taken, and the operation well conducted, it is practicable to bring the doublets to so near a resemblance of the true stones, that even the best judges cannot distinguish them, when well set, without a peculiar manner of inspection.

There is, however, an easy method of distinguishing doublets, which is only to behold them betwixt the eye and light, in such position, that the light may pass through the upper part and corners of the stone; when it will easily be perceived that there is no colour in the body of the stone.

DOUBLETS, a game on dice within tables; the men, which are only 15, being placed thus: Upon the six, cinque, and quatre points, there stand three men a-piece; and upon the trey, duce, and ace, only two. He that throws highest hath the benefit of throwing first, and what he throws he lays down, and so doth the other: what the one throws, and hath not, the other lays down for him, but on his own account; and thus they do till all the men are down, and then they bear. He that is down first, bears first; and will doubtless win the game, if the other throws not doublets to overtake him: which he is sure to do, since he advances or bears as many as the doublets make, *viz.* eight for

two

Doublet,

Doubleing two fours.

||
Dover.

DOUBLING, in the military art, is the putting two ranks or files of soldiers into one. Thus, when the word of command is, *double your ranks*, the second, fourth, and sixth ranks march into the first, third, and fifth, so that the six ranks are reduced to three, and the intervals between the ranks become double what they were before.

DOUBLING, among hunters, who say that a hare doubles, when the keeps in plain fields, and winds about to deceive the hounds.

DOUBLING, in the menage, a term used of a horse, who is said to double his reins, when he leaps several times together, to throw his rider: thus we say, *the ramingue doubles his reins, and makes poutlevis*.

DOUBLING, in navigation, the act of sailing round, or passing beyond, a cape or promontory, so as that the cape or point of land separates the ship from her former situation, or lies between her and any distant observer.

DOUBLING-UPON, in naval tactics, the act of inelosing any part of a hostile fleet between two fires, or of cannonading it on both sides.

It is usually performed by the van or rear of that fleet which is superior in number, taking the advantage of the wind, or of its situation and circumstances, and tacking or veering round the van or rear of the enemy, who will thereby be exposed to great danger, and can scarcely avoid being thrown into a general confusion.

DOUBLON, or **DUBLON**, a Spanish and Portuguese coin, being the double of a **PISTOLE**.

DOUBTING, the act of with-holding our assent from any proposition, on suspicion that we are not thoroughly apprised of the merits thereof, or from not being able peremptorily to decide between the reasons for and against it.

Doubting is distinguished by the schoolmen into two kinds, *dubitatio sterilis*, and *dubitatio efficax*. The former is that where no determination ensues: in this manner the Sceptics and Academics doubt, who withhold their assent from every thing. See **SCPTICS**, &c.

The latter is followed by judgment, which distinguishes truth from falsehood: such is the doubting of the Peripatetics and Cartesianes. The last in particular are perpetually inculcating the deceitfulness of our senses, and tell us that we are to doubt of every one of their reports, till they have been examined and confirmed by reason. On the other hand, the Epicureans teach, that our senses always tell truth; and that, if you go ever so little from them, you come within the province of doubting. See **CARTESIANS**, **EPICUREANS**, &c.

DOUCINE, in architecture, a moulding concave above, and convex below, serving commonly as a cymation to a delicate corniche. It is likewise called **GULA**.

DOVE, in ornithology. See **COLUMBA**.

Dove-Tailing, in carpentry, is the manner of fastening boards together by letting one piece into another, in the form of the tail of a dove. The dove-tail is the strongest of the assemblages or jointings; because the tenon, or piece of wood which is put into the other, goes widening to the extreme, so that it cannot be drawn out again, by reason the extreme or tip is bigger than the hole.

DOVER, a borough and port town of England,

in the county of Kent, situated in E. Long. o. 25. N. Lat. 51. 10. It gives the title of *duke* to the dukes of Queensbury, a branch of the noble family of Douglas; and sends two members to parliament, styled *barons of the Cinque-ports*, whereof Dover is the chief.

By the Romans this town was named *Dubris*, and by the Saxons *Desfra*, probably from the British word *Dour*, which signifies water. The convenience of its situation drew the attention of the Roman governors, who ruled here while they possessed this part of the island; and there still remain indubitable testimonies of their care and respect for this important place. For the defence of the town, the Romans, or, according to some, Arviragus, a British king, their confederate, by cutting out walls with infinite labour in the solid rock, constructed a stony fortrefs; and, as its venerable remains still prove, erected also a light-house for the benefit of navigation. The Saxons, Danes, and Normans, had a very high opinion of this place; and when the barons invited over the young prince afterwards Lewis VIII. of France, his father Philip Augustus conceived a bad opinion of the expedition, because the castle and port of Dover were held for king John, though a great part of the kingdom had submitted to Lewis. In its most flourishing state, the fortrefs was impregnable, and the town a very opulent emporium. It had 21 wards, each of which furnished a ship for the public service, 10 gates, 7 parish-churches, many religious houses, hospitals, and other public edifices. The decay of the town was brought on by that of the harbour. To recover this, Henry VIII. spent no less than 63,000l. in constructing piers, and 5000l. in building a castle between this and Folkestone, called *Sandgate*; where the shore was flat, and the landing easy. Notwithstanding all this expence, however, it was again choaked up in the reign of Queen Elizabeth, by whom it was again cleared at a vast expence, so that ships of some hundred tons could enter it. Since that time it has again declined, notwithstanding of many efforts for its relief, and great assistance from time to time given by parliament for this purpose. As the haven, however, is still capable of receiving vessels of small-burden, and as the packets to France and Flanders are stationed here in time of peace, it is still a place of some consequence, and the people are active and industrious.

DOUGLAS (lord). See (*Hilory of*) **SCOTLAND**.

DOUGLAS (Gavin), bishop of Dunkeld in Scotland, was the third son of Archibald earl of Angus, and was born in the year 1474. Where he was educated, is not known; but it is certain that he studied theology: a study, however, which did not estrange him from the mules; for he employed himself at intervals in translating into beautiful verse the poem of Ovid *de Remedio Amoris*. The advantages of foreign travel, and the conversation of the most learned men in France and Germany to whom his merit procured the readiest access, completed his education. With his superior recommendations and worth it was impossible he could remain unnoticed. His first preferment was to be provost of the collegiate church of St Giles in Edinburgh; a place, at that time, of great dignity and revenue. In the year 1514, the queen mother, then regent of Scotland, appointed Douglas abbot of Aberbrothock, and soon after archbishop of St Andrews; but, the queen's power

Dover,
Douglas.

Douglas.

power not being sufficient to establish him in the possession of that dignity, he relinquished his claim in favour of his competitor Foreman, who was supported by the pope. In 1515, he was by the queen appointed bishop of Dunkeld; and that appointment was soon after confirmed by his holiness Leo X. Nevertheless it was some time before he could obtain peaceable possession of his see. The duke of Albany, who in this year was declared regent, opposed him because he was supported by the queen; and, in order to deprive him of his bishopric, accused him of acting contrary to law in receiving bulls from Rome. On this accusation he was committed to the castle of Edinburgh, where he continued in confinement above a year; but the regent and the queen being at last reconciled, he obtained his liberty, and was consecrated bishop of Dunkeld. In 1517, he attended the duke of Albany to France; but returned soon after to Scotland. In 1521, the disputes between the earls of Arran and Angus having thrown the kingdom into violent commotion, our prelate retired to England, where he became intimately acquainted with Polydore Virgil the historian. He died in London, of the plague, in 1522; and was buried in the Savoy. He wrote "The palace of Honour;" a most ingenious poem under the similitude of a vision; in which he paints the vanity and inconstancy of all worldly glory. It abounds with incidents, and a very rich vein of poetry. The palace of happiness, in the picture of Cebes, seems to be the ground-work of it.

"*Aurææ narraciones*:" A performance now lost; in which, it is said, he explained, in a most agreeable manner, the mythology of the poetical fictions of the ancients.

"*Comædiæ aliquot facræ*:" None of which are now to be found.

"Thirteen bukes of Eneades, of the famous poet Virgil, translated out of Latin verse into Scottish metre, every buke having its particular prologue. Imprinted at Lond. 1553, in 4to; and reprinted at Edinburgh 1710, in folio."

The last is the most esteemed of all his works. He undertook it at the desire of lord Henry Sinclair, a munificent patron of arts in those times; and he completed it in 18 months; a circumstance which his admirers are too fond of repeating to his advantage. David Hume of Godscroft, an author of uncommon merit, and an admirable judge of poetry, gives the following testimony in his favour. "He wrote, (says he), in his native tongue, divers things; but his chiefest work is his translation of Virgil, yet extant, in verse: in which he ties himself so strictly as is possible; and yet it is so well expressed, that whosoever will essay to do the like, will find it a hard piece of work to go through with it. In his prologues before every book where he hath his liberty, he sheweth a natural and ample vein of poetry, so pure, plentiful, and judicious, that I believe there is none that hath written before or since, but cometh short of him."

It has been said, that he compiled an historical treatise "*de rebus Scoticis*;" but no remain of it hath descended to the present times.

DOUGLAS, the principal town of the Isle of Man, and which has lately increased both in trade and buildings. The harbour, for ships of a tolerable burden, is

the safest in the island, and is much mended by a fine mole that has lately been built. It is seated on the eastern side. W. Long. 4. 25. N. Lat. 54. 7.

DOWAGER, a widow endowed, is a title applied to the widows of princes, dukes, earls, and persons of high rank only.

QUEEN DOWAGER, is the widow of the king, and as such enjoys most of the privileges belonging to her as queen consort: but it is not high treason to violate her chastity or conspire her death, because the succession is not endangered thereby; but no man can marry her without special license from the king, on pain of forfeiting his lands and goods. See QUEEN.

DOWN, a county of Ireland in the province of Ulster, bounded on the east and south by St George's channel; on the west by the county of Armagh; and on the north by the county of Antrim. It lies opposite to the Isle of Man, Cumberland, and Westmoreland; and the north part of it fronts the Mull of Galloway, in Scotland, and is about 44 miles from it. It is about 44 miles in length, and 30 in breadth. It sends 14 members to parliament, two for the county, and 12 for the following boroughs, Down-Patrick, Newry, Newtown, Killeleagh, Bangor, and Hillsborough.

This county is rough and full of hills, and yet the air is temperate and healthy. The soil naturally produces wood, unless constantly kept open and ploughed; and the low grounds degenerate into bogs and moss, where the drains are neglected. But by the industry of the inhabitants it produces good crops of corn, particularly oats; and, where marl is found, barley. This last is exported from Killogh to Dublin. The staple commodity of this county is the linen manufacture.

Downs, or *Down-Patrick*, a town of Ireland, in the county of Down, is one of the most ancient in that kingdom. It is a market-town and a bishoprick, said to be erected in the fifth century by St Patrick, but is now united to the see of Connor. Within 200 paces of the town, on the ascent of a hill, are the ruins of an old cathedral, remarkable for the tomb of St Patrick, the founder, in which they say the bodies of St Bridget and St Columb are also laid. The town which is seated on the fourth corner of Lough Coin, now called the *lake of Strangford*, is adorned with several handsome public buildings. Among the hills, and in many islands, are flights of swans and other water-fowl; and the Lough abounds with salmon, mullets, and other sea-fish. About a mile from this town is St Patrick's Well, which many people frequent to drink at some seasons of the year, and others to perform a penance enjoined them by the popish priests. The linen manufacture is carried on here, as it is in several places in this country. W. Long. 5. 50. N. Lat. 54. 23.

DOWNETON, or DUNKTON, a borough-town of Wiltshire, five miles south of Salisbury. It sends two members to parliament.

DOWNHAM, a market-town of Norfolk, 10 miles south of Lynn, famous for its good butter; there being 1000, and sometimes 2000, firkins bought here every Monday, and sent up the river Ouse to Cambridge, from whence it is conveyed to London in the Cambridge-waggons.

DOWNS, a famous road near Deal in Kent, where both the outward and homeward-bound ships frequent-

Dowager

DOWNS.

Dowry
||
Drabs.

ly make some stay; and squadrons of men of war rendezvous in time of war.

It affords excellent anchorage; and is defended by the castles of Deal, Dover, and Sandwich.

DOWRY, the money or fortune which the wife brings her husband in marriage: it is otherwise called *maritagium*, marriage-goods, and differs from dower.

DOXOLOGY, an hymn used in praise of the Almighty, distinguished by the title of *greater and lesser*.

The lesser doxology was anciently only a single sentence, without response, running in these words, *Glory be to the Father, and to the Son, and to the Holy Ghost, world without end, Amen.* Part of the latter clause, *As it was in the beginning, is now, and ever shall be*, was inserted some time after the first composition. Some read this ancient hymn, *Glory be to the Father, and to the Son with the Holy Ghost.* Others, *Glory be to the Father in or by the Son, and by the Holy Ghost.* This difference of expression occasioned no disputes in the church, till the rise of the Arian heresy; but when the followers of Arius began to make use of the latter as a distinguishing character of their party, it was entirely laid aside by the Catholics, and the use of it was enough to bring any one under suspicion of heterodoxy.

The doxology was used at the close of every solemn office. The western church repeated it at the end of every psalm, and the eastern church at the end of the last psalm. Many of their prayers were also concluded with it, particularly the solemn thanksgiving or consecration prayer at the eucharist. It was also the ordinary conclusion of their sermons.

The greater doxology, or angelic hymn, was likewise of great vogue in the ancient church. It began with these words, which the angels sang at our Saviour's birth, *Glory be to God on high, &c.* It was chiefly used in communion service, and in mens private devotions. Both the doxologies have a place in the church of England, the former being repeated after every psalm, and the latter used in the communion service.

• **DRABA**, in botany; a genus of the filiculosa order, belonging to the tetradynamia class of plants. There are six species; of which the only one worthy of notice is the verna, or early whitlow-grass. It hath naked stalks, with leaves a little serrated. The blossoms are white, and at night the flowers hang down. It grows on old walls and dry banks. It is one of the earliest flowering plants we have, and is good to eat as a salad. Goats, sheep, and horses eat it; cows are not fond of it; swine refuse it.

DRAWLING, in angling, is a method of catching barbels. Take a strong line of six yards; which, before you fasten it to your rod, must be put through a piece of lead, that if the fish bite, it may slip to and fro, and that the water may something move it on the ground; bait with a lobe worm well secured, and so by its motion the barbel will be enticed into the danger without suspicion. The best places are in running water near piles, or under wooden bridges, supported with oaks floated and slimy.

DRABS, in the salt-works, a kind of wooden boxes for holding the salt when taken out of the boiling pan; the bottoms of which are made shelving or inclining forwards, that the briny moisture of the salt may drain off.

Drac
||
Dracontium.

DRAC, an imaginary being, much dreaded by the country people in many parts of France. The dracs are supposed to be malicious, or at least tricksome, demons; but, which is very rare, if one of them happens to take a fancy to a man or woman, they are sure to be the better for it. They are still said to lay gold cups and rings on the surface over pits and rivers, as baits to draw women and children in; though their usual dwelling is some old empty house, whence they make excursions in human form, visible or invisible as best suits their purpose. The country-folks shudder at the very name of the drac. Some are positive that they have seen him; for happy indeed is that village in which there is not a house execrated as the lurking-place of this tremendous drac.

DRACHM, a Grecian coin, of the value of sevenpence three farthings. Drachm is also a weight used by our physicians; containing just 60 grains three scruples, or the eighth part of an ounce.

DRACO, an Athenian lawgiver, prior to Solon, so extremely severe, that he punished all faults, small or great, with death: hence his laws were proverbially said to have been written with blood. He flourished 624 B. C.

DRACO, the *Dragon*, in zoology, a genus belonging to the order of amphibia reptilia. The characters of which are these: it has four legs, a cylindrical tail, and two membranaceous wings, radiated like the fins of a fish, by which he is enabled to fly, but not to any great distance at a time. There are two species, 1. The volans, or flying dragon, with the wings entirely distinct from the fore-legs; it is found in Africa and the East Indies. 2. The præpox, with the wings fixed to the fore-legs; it is a native of America. They are both harmless creatures, and feed upon flies, ants, and small insects.

DRACO Volans, in meteorology, a fiery exhalation, frequent in marshy and cold countries.

It is most common in summer; and though principally seen playing near the banks of rivers, or in boggy places, yet sometimes mounts up to a considerable height in the air, to the no small terror of the amazed beholders; its appearance being that of an oblong, sometimes roundish, fiery body, with a long tail. It is entirely harmless, frequently sticking to the hands and cloaths of people, without injuring them in the least.

DRACO, in astronomy, a constellation of the northern hemisphere. See ASTRONOMY, n° 206.

DRACOCYPHALUM, **DRAGON'S HEAD**; a genus of the gymnospermia order, belonging to the didynamia class of plants. There are 13 species, most of them herbaceous, annual, or perennial, plants, from 18 inches to three feet high, garnished mostly with entire leaves, and whorled spikes of small monopetalous and ringent flowers of a blue, white, or purple colour. They are all easily propagated by seeds, which may be sown either in the spring or autumn, and after the plants are come up they will require no other culture but to be kept clear from weeds.

DRACONTIC MONTH, the time of one revolution of the moon from her ascending node, called *caput draconis*, to her return thither.

DRACONTIUM, **DRAGONS**; a genus of the polyandria order, belonging to the gynandria class of plants. There are five species, all natives of the Indies. The

Drains.

only one which makes any appearance is the pertusum, with leaves having holes, and a climbing stalk. This is a native of most of the West India islands. It hath trailing stalks which put out roots at every joint, that fasten to the trunks of trees, walls, or any support which is near them, and thereby rise to the height of 25 or 30 feet. The leaves are placed alternately upon long footstalks: they are four or five inches long, two and an half broad; and have several oblong holes in each, which at first sight appear as if eaten by insects, but they are natural to the leaves. The flowers are produced at the top of the stalk, which always swells to a much larger size in that part immediately under the stalk, than in any other: these are covered with an oblong spatula or hood of a whitish green colour, which opens longitudinally on one side, and shews the pistil, which is closely covered with flowers of a pale yellow, inclining to white. This plant is easily propagated by cuttings; which if planted in pots filled with poor sandy earth, and plunged into an hot-bed, will soon put out roots; but the plants are so tender, that they must be preserved in a stove.

DRACUNCULI, in medicine, small long worms which breed in the muscular parts of the arms and legs, called *Guinea worms*. The common way of getting out these worms is by the point of a needle; and to prevent their forming there again, the usual custom is to wash the parts with wine or vinegar, with alum, nitre, or common salt, or with a strong lixivium of oak-aloes, and afterwards anointing them with an ointment of the common kind used for scorbutic eruptions, with a small mixture of quicksilver.

DRACUNCULUS, in botany. See **ARUM**.

DRAGOMAN, **DROGMAN**, or *Druggerman*, a name given in the Levant to the interpreters kept by the ambassadors of Christian nations, residing at the Porte, to assist them in treating of their master's affairs.

DRAGON, in zoology. See **DRACO**.

DRAGON's-Blood, a red coloured, inodorous, and insipid resin, insoluble in water, but soluble in spirit of wine and in oils, to both which liquors it communicates a red colour. By fire it is fusible, inflammable, and emits an acid vapour like gum Benzoin. A solution of dragon's blood in spirit of wine is used for staining marble, to which it gives a red tinge, which penetrates more or less deeply according to the heat of the marble during the time of application. But, as it spreads at the same time that it sinks deep, for fine designs the marble should be cold. Mr du Fay says, that, by adding pitch to this solution, the colour may be rendered deeper.

DRAGON-Fish, or *Dragonet*, in ichthyology. See **CALLIONYMUS**.

DRAGON-Fls. See **LIBELLULA**.

DRAGONS, in botany. See **DRACONTIUM**.

DRAGONET, or *DRAGON-Fish*, in ichthyology. See **CALLIONYMUS**.

DRAGONNEE, in heraldry. A lion dragonée is where the upper half resembles a lion, the other half going off like the hinder part of a dragon. The same may be said of any other beast as well as a lion.

DRAGOON, in military affairs, a musqueteer, mounted on horseback, who sometimes fights or marches on foot, as occasion requires.

Menage derives the word *dragoon* from the Latin

draconarius, which in Vegetius is used to signify *soldier*. But it is more probably derived from the German *tragen*, or *dragen*, which signifies *to carry*; as being infantry carried on horseback.

Dragoons are divided into brigades, as the cavalry, and each regiment into troops; each troop having a captain, lieutenant, cornet, quarter-master, two sergeants, three corporals, and two drums. Some regiments have hautboys. They are very useful on any expedition that requires dispatch; for they can keep pace with the cavalry, and do the duty of infantry: they encamp generally on the wings of the army, or at the passes leading to the camp; and sometimes they are brought to cover the general's quarters: they march in the front and rear of the army.

DRAGS, in the sea-language, are whatever hangs over the ship in the sea, as shirts, coats, or the like; and boats, when towed, or whatever else that after this manner may hinder the ship's way when she sails, are called *drags*.

DRAINS, a name given, in the fen countries, to certain large cuts or ditches of 20, 30, nay sometimes 40 foot wide, carried through the marshy ground to some river or other place capable of discharging the water they carry out of the fen-lands.

An effectual method of drawing off the water from such grounds as are hurt by springs oozing out upon them, (usually distinguished by the name of *wet* or *spouting* ground, or *bogs*), has been a desideratum in agriculture. Mr Anderson is almost the only person who hath treated this matter scientifically, and his observations seem to be very rational and well founded.

"Springs (says he) are formed in the bowels of the earth, by water percolating through the upper strata where that is of a porous texture, which continues to descend downwards till it meets with a stratum of clay that intercepts it in its course; where, being collected in considerable quantities, it is forced to seek a passage through the porous strata of sand, gravel, or rock, that may be above the clay, following the course of these strata till they approach the surface of the earth, or are interrupted by any obstacle which occasions the water to rise upwards, forming springs, bogs, and the other phenomena of this nature; which being variously diversified in different circumstances, produce that variety of appearances in this respect that we often meet with.

"This being the case, we may naturally conclude, that an abundant spring need never be expected in any country that is covered to a great depth with sand without any stratum of clay to force it upwards, as is the case in the sandy deserts of Arabia, and the immeasurable plains of Libya: neither are we to expect abundant springs in any soil that consists of an uniform bed of clay from the surface to a great depth; for, it must always be in some porous stratum, that the water flows in abundance; and it can be made to flow horizontally in that, only when it is supported by a stratum of clay, or other substance that is equally impermeable by water. Hence the *rationale* of that rule so universally established in digging for wells, that if you begin with sand or gravel, &c. you need seldom hope to find water till you come to clay; and if you begin with clay, you can hope for none in abundance, till you reach to sand, gravel, or rock.

*Essays on
Agriculture,
Vol. I.
p. 119, &c.*

" It is necessary that the farmer should attend to this process of nature with care, as his success in draining bogs, and every species of damp and spouting ground, will in a great measure depend upon his thorough knowledge of this,—his acuteness in perceiving in every case the variations that may be occasioned by particular circumstances, and his skill in varying the plan of his operations according to these. As the variety of cases that may occur in this respect is very great, it would be a very tedious task to enumerate the whole, and describe the particular method of treating each; I shall, therefore, content myself with enumerating a few particular cases, to show in what manner the principles above established may be applied to practice.

Plate XCV. " Let fig. 5. represent a perpendicular section of a part of the earth, in which AB is the surface of the ground, beneath which are several strata of porous substances which allow the water to sink through them till it reaches the line CD, that is supposed to represent the upper surface of a solid bed of clay; above which lies a stratum of rock, sand, or gravel. In this case, it is plain, that when the water reaches the bed of clay, and can sink no farther, it must be there accumulated into a body; and seeking for itself a passage, it flows along the surface of the clay, among the sand or gravel, from D towards C; till at last it issues forth, at the opening A, a spring of pure water.

If the quantity of water that is accumulated between D and C is not very considerable, and the stratum of clay approaches near the surface; in that case, the whole of it will issue by the opening at A, and the ground will remain dry both above and below it. But, if the quantity of water is so great as to raise it to a considerable height in the bed of sand or gravel, and if that stratum of sand is not discontinued before it reaches the surface of the ground, the water, in this case, would not only issue at A, but would likewise ooze out in small streams thro' every part of the ground between A and a; forming a barren patch of wet sandy or gravelly ground upon the side of a declivity, which every attentive observer must have frequently met with.

To drain a piece of ground in this situation is, perhaps, the most unprofitable task that a farmer can engage in; not only because it is difficult to execute, but also because the soil that is gained is but of very little value. However, it is lucky, that patches of this kind are seldom of great breadth, although they sometimes run along the side of a declivity in a horizontal direction for a great length. The only effectual method of draining this kind of ground, is to open a ditch as high up as the highest of the springs at a, which should be of such a depth as not only to penetrate through the whole bed of sand or gravel, but also to sink so far into the bed of clay below, as to make a canal therein sufficiently large to contain and carry off the whole of the water. Such a ditch is represented by the dotted lines *aez*: but, as the expence of making a ditch of such a depth as this would suppose, and of keeping it afterwards in repair, is very great, it is but in very few cases that this mode of draining would be advisable; and never, unless where the declivity happens to be so small, as that a great surface is lost for little depth, as would have been the case here if

Vol. IV.

the surface had extended in the direction of the dotted line *a d*.

But, supposing that the stratum of clay, after approaching toward the surface at A, continued to keep at a little depth below ground; and that the soil which lay above it was of a sandy or spongy nature, so as to allow the water to penetrate it easily; even supposing the quantity of water that flowed from D to C was but very inconsiderable, instead of rising out at the spring A, it would flow forward along the surface of the clay among the porous earth that forms the soil, so as to keep it constantly drenched with water, and of consequence render it of very little value.

Wetness arising from this cause, is usually of much greater extent than the former: and, as it admits of an easy cure, it ought not to be one moment delayed; as a ditch of a very moderate depth opened at A, and carried through a part of the stratum of clay, (as represented by the dotted lines *A k f*), would intercept and carry off the whole of the water, and render the field as dry as could be desired. It is, therefore, of very great consequence to the farmer, accurately to distinguish between these two cases, so nearly allied to each other in appearance; and, as this can be easiest done by boring, every one who has much ground of this kind ought to provide himself with a set of boring-irons, which he will likewise find use for on other occasions.

" I might here enumerate a great variety of cases which might be reduced to the same head with the foregoing: but, as any attentive reader may, after what has been said, be able easily to distinguish these, I shall only in general observe, that every soil of a soft and porous texture, that lies upon a bed of hard clay, whatever its situation in other respects may be, will in some measure be subjected to this disease. And, if it is upon a declivity of any considerable length, the undermost parts of the field will be much damaged by it, unless ditches are thrown up across the declivity at proper distances from one another, to intercept the water in its descent.

It may not likewise be improper here to observe, that in cases of this nature, unless where the soil is of a very great depth, the malady will always be increased, by raising the ridges to a considerable height; as will appear evident by examining fig. 6. in which the line AB represents the surface of the field of this nature, and CD the surface of the bed of clay. Now, if this field were raised into high ridges, as at FFF, so that the furrows EEE descended below the surface of the clay, it is plain, that all the water that should sink through the middle of the ridge, would run along the surface of the clay, till it came to the sides of the ridge L L L L L L, which would thus be kept continually soaked with water. Whereas, if the ground had been kept level, as in the part of the field from G to H, with open furrows H, at moderate distances from each other, the water would immediately sink to the clay, and be carried off by the furrows, so as to damage the soil far less than when the ridges are high. If the soil is so thin as that the plough can always touch the clay, the ridges ought to be made narrow and quite flat, as from G to H: but, if there is a little greater depth of soil, then it ought to be raised into ridges of a moderate height, as from H to K, so

as to allow the bottom of the furrow to reach the clay: but neither is this necessary where the soil is of any considerable depth.

"I have seen some industrious farmers who, having ground in this situation, have been at the very great expence of making a covered drain in each furrow. But, had they rightly understood the nature of the discale, they never would have thought of applying such a remedy; as must appear evident at first sight to those who examine the figure. The success was what might be expected from such a foolish undertaking.

"These observations, it is hoped, will be sufficient as to the manner of treating wet, sandy, or porous soils. I now proceed to take notice of such as are of a stiff clayey nature, which are often very different in appearance, and require a different treatment from these.

Plate XCX.

"Suppose that (in fig. 7.) the stratum of sand or gravel DC should be discontinued, as at E, and that the stratum above it should be of a coherent clayey nature. In this case, the water that flowed towards E, being there pent in on every side, and being accumulated there in great quantities, it must at length force a passage for itself in some way; and pressing strongly upon the upper surface, if any one part is weaker than the rest, it there would burst forth and form a spring, (as suppose at A). But if the texture of every part of this stratum were equally strong, the water would squeeze thro' many small crannies, and would ooze out in numberless places, as between A and F, so as to occasion that kind of wetness that is known by the name of a *spouting clayey soil*.

"The cure, in this case, is much more easily effected than in any of the former; for, if a ditch of a considerable size is opened, as at A, towards the lowermost side of the spouting ground, so deep as to penetrate through the upper stratum of clay, and reach to the gravel, the water will rise up through it at first with very great violence, which will gradually decrease as the pressure from the water behind is diminished; and when the whole of the water, accumulated in this subterraneous reservoir, is run off, there being no longer any pressure upon the clay above it, the whole soon becomes as dry as could be desired, and continues so ever afterwards, if the ditch is always kept open. This I speak from experience, I having rendered some fields of this kind that were very wet, quite dry by this method of treating them.

"It will hardly be necessary for me here to put the farmer upon his guard, to be particularly careful in his observations, that he may distinguish between the wetness that is produced from this cause, and that which proceeds from the cause before-mentioned; because the treatment that would cure the one, would be of no use at all to the other. The attentive observer likewise will readily perceive, that if any field that is wet from this cause admits of being ploughed, it will be in equal danger of being hurt by being raised into high ridges, with the other kind of damp ground before-mentioned. For, as the depth of earth above the reservoir would be smaller in the deep furrows than any where else, there would, of consequence, be less resistance to the water in that place, so that it would arise there in greater abundance. And if, in this case, a farmer should dig a drain in each furrow, as a considerable quantity of water would rise into them, in some cases, the ground

might be improved, or even quite drained thereby, especially if they should have accidentally reached the gravel in any one place; altho' at an expence much greater than was necessary. I take notice of this circumstance in some measure to prevent the prejudice that some inattentive observers might entertain against what was said before of this method of draining, from their having accidentally seen some fields that may have been bettered by it.

"Bogs are only a variety of this last-mentioned kind of wet ground; and, therefore, ought in general to be drained after the same manner with them. Clay is a substance that strongly resists the entrance of water into it: but when it is long drenched with it, it is, in process of time, in some measure dissolved thereby; loses its original firmness of texture and consistence; and becomes a sort of semi-fluid mass, which is called a *bog*; and as these are sometimes covered with a strong scurf of a particular kind of grass, with very matted roots, which is strong enough to bear a small weight without breaking, although it yields very much, it is in these circumstances called a *swaggle*. But, whatever be the nature of the bog, it is invariably occasioned by water being forced up through a bed of clay, as just now described, and dissolving or softening, if you will, a part thereof. I say only a part; because whatever may be the depth of the bog or swaggle, it generally has a partition of solid clay between it and the reservoir of water under it, from whence it originally proceeds: for, if this were not the case, and the quantity of water were considerable, it would meet with no sufficient resistance from the bog, and would issue thro' it with violence, and carry the whole semi-fluid mass along with it. But, this would more inevitably be the case, if there was a crust at the bottom of the bog, and if that crust should ever be broken, especially if the quantity of water under it were very considerable: and as it is probable, that, in many cases of this sort, the water slowly dissolves more and more of this under-crust, I make no doubt, but that, in the revolution of many ages, a great many eruptions of this kind may have happened, although they may not have been deemed of importance enough to have the history of them transmitted to posterity. Of this kind, although formed of a different substance, I consider the flow of the Solway-moors in Northumberland to have been; which, upon the 16th of November 1771, burst its former boundaries, and poured forth a prodigious stream of semi-fluid matter, which in a short time covered several hundred acres of very fine arable ground. Nor will any one, who is acquainted with the nature of moors,—who knows its resemblance to clay in its quality of absorbing and retaining water, and its very easy diffusibility therein; be surpris'd at this; as, from all these properties, it is much better adapted for forming an extensive bog, and therefore in greater danger of producing an extensive desolation by an eruption of the water into it, than those that are formed of any kind of clay whatever.

If the bog, or swampy ground, is upon a declivity, the ditch ought to be carried across the field about the place where the lowest springs arise. But, if the surface of the ground is level or nearly so, as between A and B, and the springs break out in several places, *q q q q q q*, so as to form soft quagmires interperfed
through

through the whole of the field, it will be of little consequence in what part the drain is opened; for, if it is dug up so deep as to allow the water to rise in it with freedom, it will issue thro' that opening, and the field will be left perfectly dry.

"But, as it may frequently happen that the stratum of gravel shall be at a considerable depth beneath the surface of the earth, and as it may be sometimes even below the level of the place into which the drain must be emptied, it might sometimes be extremely difficult to make a ditch so deep as to reach the bed of sand or gravel. But, it is lucky for us, that this is not absolutely necessary in the present case; as a drain of two or three feet deep, as at D, will be equally effectual with one that should go to the gravel. All that is necessary in this case, is to sink pits (P) in the course of the drain, at a moderate distance from one another, which go so deep as to reach the gravel: for, as the water there meets with no resistance, it readily flows out at these openings, and is carried off by the drain without being forced up through the earth; so that the ground is left entirely dry ever after.

"I have likewise drained several fields in this way; and as I have generally found the appearances pretty much alike, I shall, for the information of the inexperienced reader, give a short account of them.

"If you attempt to make your pit in one of these soft quaggy places where the water is found in great abundance, you will meet with very great difficulty in forming it; for, as the substance of which it is composed is soft, it will always flow into the hole as fast as you dig it; on which account I would advise, not to attempt to make the pit in the swaggle, but as near it in the solid earth as you conveniently can. However, if it is pretty firm, and of no great extent, it is sometimes practicable to make a pit in the soft bog at the driest time of the year. This I have sometimes practised, which gave me an opportunity of observing the nature of these bogs more perfectly than I otherwise would have had. In the trials of this kind that I have made, this soft quaggy ground has seldom been above three or four feet deep, below which I have always found a stratum of hard tough clay usually mixed with stones; and so firm, that nothing but a mattock or pick-axe could penetrate it: and, as this is comparatively so much drier than the ground above it, an inexperienced operator is very apt to imagine that this is the bottom that he is in search of. In digging thro' this stratum, you will frequently meet with small springs oozing out in all directions; some of them that might fill the tube of a small quill, and others so small as to be scarce perceptible: but without regarding these, you must continue to dig on without intermission till you come to the main body of the reservoir, if I may so call it, that is contained in the rock, gravel, or sand; which you will generally find from two to four feet below the bottom of the swaggle, and which you will be in no danger of mistaking when you come to it: for, if there has been no opening made before that in the field, as soon as you break the crust immediately above the gravel or rock, the water bursts forth like a torrent, and on some occasions rises like a *jet d'eau*, to a considerable height above the bottom of the ditch; and continues to flow off with great impetuosity for some time, till the pent-up water being drained off, the

Drains.

violent boiling up begins to subside, and the strength of the current to abate; and, in a short time, it flows gently out like any ordinary spring:—allowing it to remain in this state, the quaggy earth begins to subside, and gradually becomes firmer and firmer every day; so that, in the space of a few months, those bogs which were formerly so soft as hardly to support the weight of a small dog, become so firm, that oxen and horses may tread upon them without any danger of sinking, at the very wettest season of the year. I have had a field of this nature, that, by having only one such pit as I have now described opened in it, was entirely drained to the distance of above a hundred yards around it in every direction. But, as it is possible that the stratum in which the water runs may be in some places interrupted, it will be in general expedient to make several of these pits, if the field is of great extent; always carrying the drain forward thro' the lowermost part of the field, or as near the quag as you conveniently can; and sinking a pit wherever you may judge it will be most necessary. But, if the stratum of gravel is not interrupted, there will be no violent burst of water at opening any of these after the first, as I have frequently experienced. To keep these wells from closing up after they are made, it is always expedient to fill them up with small stones immediately after they are made, which ought to rise to the height of the bottom of the drain.

"I have often imagined that the expence of digging these pits might be saved by boring a hole through this solid stratum of clay with a large wimble made on purpose; but, as I never experienced this, I cannot say whether or not it would answer the desired end exactly.

"If the whole field that is to be drained consists of one extensive bog, it will require a long time before the whole work can be entirely finished, as it will be impossible to open a drain through it till one part of it is first drained and becomes solid ground. In a situation of this kind, the undertaker, after having opened a drain to convey the water from the lowest part of the bog, must approach as near to the swampy ground as he can, and there make his first pit; which will drain off the water from the nearest parts of the bog. When this has continued open for some time, and that part of the bog is become so solid as to admit of being worked, let him continue the ditch as far forward thro' it as the situation it is in will admit of, and there sink another pit: and proceed gradually forward in the same manner; making cross cuts where necessary, till the whole be finished.

"In this manner may any bog, or track of spouting ground of this nature, be rendered dry at a very inconsiderable expence; and as there can be no other method of draining ground of this sort effectually, I recommend the study of it to the attention of every diligent farmer who may have occasion for it. Let him first be extremely cautious in examining all the circumstances of his particular fields, that he may be certain which of the classes above enumerated it may be ranked with; and, when he is perfectly sure of that, he may proceed without fear, being morally certain of success.

"There is, however, one kind of damp ground not yet particularly specified, that I have purposely omitted

Drains. ted taking notice of till this time, as I have never had any opportunity of examining particularly into the nature of it, nor of ascertaining by experience what is the most proper method of treating it.—The soil I have now particularly in my eye consists of a deep strong clay that does not vary its nature even on the surface, but in as far as manures may have rendered it more friable and tender: the colour usually inclines to a reddish cast, and, for the most part, it is situated upon the side of some declivity. This bed of clay reaches to a great depth, without any variation, and is intermixed with a considerable quantity of small round stones. Many soils of the sort now described, are apt to be continually moist and full of water during the winter season; but when the dry weather of summer sets in, the moisture is diminished, and the surface becomes hard, and it is rent into many large gaps which allow free admission to the sun and air, so as to scorch up almost every plant that is sowed upon it: and as these soils are usually in themselves naturally fertile when drained, it were to be wished that some method could be discovered that would be less expensive than what is usually practised with regard to some soils of this kind in Essex; where they make covered drains of two and a half feet deep, running diagonally through the whole field, at the distance of 20 feet from each other.”

Concerning the making of these drains we have the following directions in the *Georgical Essays*, by T. B. Bayley, Esq; of Hope near Manchester.—“First make the main drains down the slope or fall of the field. When the land is very wet, or has not much fall, there should, in general, be two of these to a statute acre; for the shorter the narrow drains are, the less liable they will be to accidents. The width of the trench for the main drains should be 30 inches at top, but the width at the bottom must be regulated by the nature and size of the materials intended to be used. If the drain is to be made of bricks 10 inches long, 3 inches thick, and 4 inches in breadth, then the bottom of the drain must be 12 inches; but if the common sale bricks are used, then the bottom must be proportionably contracted. In both cases there must be an interstice of one inch between the bottom brick and the sides of the trench, and the vacancy must be filled up with straw, rushes, or loose mould. For the purpose of making these drains, I order my bricks to be moulded 10 inches long, four broad, and three thick; which dimensions always make the best drain.

“The method I pursue in constructing my main drains is as follows.—When the ground is soft and spongy, the bottom of the drain is laid with bricks placed across. On these, on each side, two bricks are laid flat, one upon the other, forming a drain six inches high and four broad; which is covered with bricks, laid flat. When the bottom of the trench is found to be a firm and solid body, as clay or marle, the bottom of the drain does not then require being laid with bricks. In that case the sides are formed by placing one brick edgewise, instead of two laid flat.

“This latter method is much cheaper, and in such land equally durable with the other. When stones are used instead of bricks, the bottom of the drain should be about eight inches in width. And here it will be proper to remark, that, in all cases, the bottom of the main drains must be sunk four inches below the level of

the narrow ones, even at the point where the latter fall into them.

“The main drains should be kept open till the narrow ones are begun from them, after which they may be finished; but before the earth is returned upon the stones or bricks, it will be advisable to throw in straw, rushes, or brush-wood, to increase the freedom of the drain.

“The small narrow drains should be cut at the distance of 16 or 18 feet from each other; and should fall into the main drain at very acute angles, to prevent any stoppage. At the point where they fall in, and eight or ten inches above it, they should be made firm with brick or stone. These drains should be 18 inches wide at top, and 16 at bottom.”—Fig. 9. represents a field with drains laid out, according to Mr Bayley’s method. The black lines represent the main drains, and the dotted lines represent the narrow drains communicating with the former from all parts of the field.

Plate XCV.

DRAKE, in ornithology, the male of the duck kind. See **ANAS**.

DRAKE (Sir Francis), the renowned English admiral, was the son of Edmund Drake a sailor, and born near Tavistock in Devonshire, in the year 1545. He was brought up at the expense and under the care of Sir John Hawkins, who was his kinsman; and, at the age of 18, was purser of a ship trading to Biscay. At 20, he made a voyage to Guinea; and, at 22, had the honour to be made captain of the *Judith*. In that capacity he was in the harbour of St John de Ulloa, in the gulph of Mexico, where he behaved most gallantly in the glorious actions under Sir John Hawkins, and returned with him to England with great reputation, though not worth a groat. Upon this he projected a design against the Spaniards in the West Indies; which he no sooner published, than he had volunteers enough ready to accompany him. In 1570, he made his first expedition with two ships; and the next year with one only, in which he returned safe, if not with such advantages as he expected. He made another expedition in 1572, wherein he did the Spaniards some mischief, and gained considerable booties. In these expeditions he was much assisted by a nation of Indians, who then were, and have been ever since, engaged in perpetual wars with the Spaniards. The prince of these people was named *Pedro*; to whom Drake presented a fine cutlass from his side, which he saw the Indian greatly admired. *Pedro*, in return, gave him four large wedges of gold; which Drake threw into the common stock, saying, That he thought it but just that such as bore the charge of so uncertain a voyage on his credit, should share the utmost advantage that voyage produced. Then, embarking his men with all the wealth he had obtained, which was very considerable, he bore away for England, where he arrived in August 1573.

His success in this expedition, joined to his honourable behaviour towards his owners, gained him a high reputation; and the use he made of his riches, a still greater. For, fitting out three stout frigates at his own expence, he sailed with them to Ireland; where, under Walter earl of Essex, the father of the famous unfortunate earl, he served as a volunteer, and did many glorious actions. After the death of his noble patron, he returned into England; where Sir Christopher Hat-

ton

Drake.

ton introduced him to her majesty, and procured him countenance and protection at court. By this means he acquired a capacity of undertaking that grand expedition which will render his name immortal. The first thing he proposed was a voyage into the South Seas through the Straits of Magellan; which was what hitherto no Englishman had ever attempted. The project was well received at court: the queen furnished him with means; and his own fame quickly drew together a sufficient force. The fleet with which he sailed on this extraordinary undertaking, consisted only of five vessels, small when compared with modern ships, and no more than 164 able men. He sailed on the 13th of December 1577; and on the 25th fell in with the coast of Barbary, and on the 29th with cape Verd. On the 13th of March he passed the equinoctial, made the coast of Brazil on the 5th of April, and entered the River de la Plata, where he lost the company of two of his ships; but meeting them again, and taking out their provisions, he turned them adrift. On the 29th of May he entered the port of St Julian's, where he continued two months for the sake of laying in provisions: on the 20th of August he entered the Straits of Magellan, and on the 25th of September passed them, having then only his own ship. On the 25th of November he came to Machao, which he had appointed for a place of rendezvous in case his ships separated; but captain Winter, his vice admiral, having repassed the Straits, was returned to England. Thence he continued his voyage along the coasts of Chili and Peru, taking all opportunities of seizing Spanish ships, and attacking them on shore, till his men were fatigued with plunder; and then, coasting America to the height of 48 degrees, he endeavoured to find a passage that way back into our seas, but could not. However, he landed, and called the country *New Albion*, taking possession of it in the name and for the use of queen Elizabeth; and, having careened his ship, set sail from thence, on the 29th of September 1579, for the Moluccas. He is supposed to have chosen this passage round, partly to avoid being attacked by the Spaniards at a disadvantage, and partly from the latencies of the season, whence dangerous storms and hurricanes were apprehended. On the 13th of October he fell in with certain islands inhabited by the most barbarous people he had met with in all his voyage: on the 4th of November he had sight of the Moluccas; and, coming to Ternate, was extremely well received by the king thereof, who appears, from the most authentic relations of this voyage, to have been a wise and polite prince. On the 10th of December he made Celebes; where his ship unfortunately ran upon a rock, the 9th of January following; from which, beyond all expectation, and in a manner miraculously, they got off, and continued their course. On the 16th of March he arrived at Java Major; and from thence he intended to have directed his course to Malacca; but found himself obliged to alter his purpose; and to think of returning home. On the 25th of March 1580, he put this design in execution; and on the 15th of June he doubled the Cape of Good Hope, having then on board 57 men, and but three casks of water. On the 12th of July he passed the line, reached the coast of Guiney on the 16th, and there watered. On the 11th of September he made the island of Tercera; and on the 3d of November

entered the harbour of Plymouth. This voyage round the world was performed in two years and about ten months. Shortly after his arrival, the queen going to Deptford, went on board his ship; where, after dinner, she conferred on him the order of knighthood, and declared her absolute approbation of all he had done. She likewise gave directions for the preservation of his ship, that it might remain a monument of his own and his country's glory. This celebrated ship, which had been contemplated many years at Deptford, at length decaying, it was broke up, and a chair, made out of the planks, was presented to the university of Oxford; upon which the famous Abraham Cowley made the following verses:

"To this great ship, which round the world has run,
 "And match'd in race the chariot of the sun;
 "This Pythagorean ship (for it may claim,
 "Without presumption, to deserve a name,
 "By knowledge once, and transformation now).
 "In her new shape this sacred port allow,
 "Drake and his ship could not have wish'd, from fate,
 "An happier station, or more blest'st estate:
 "For, lo! a seat of endless rest is given,
 "To her in Oxford, and to him in heaven.

WORKS, Vol. II.

In the year 1585, he sailed with a fleet to the West Indies; and took the cities of St Jago, St Domingo, Carthagena, and St Augustin. In 1587, he went to Lisbon with a fleet of 30 sail; and, having intelligence of a great fleet assembled in the bay of Cadiz, which was to have made part of the armada, he with great courage entered that port, and burnt there upwards of 10,000 tons of shipping: which he afterwards merrily called *burning the king of Spain's beard*. In 1588, when the armada from Spain was approaching our coasts, Sir Francis Drake was appointed vice-admiral under Charles lord Howard of Effingham, high admiral of England, where fortune favoured him as remarkably as ever: for he made prize of a very large galleon, commanded by Don Pedro de Valdez, who was reputed the projector of this invasion. This affair happened in the following manner: On the 22d of July, Sir Francis observing a great Spanish ship floating at a distance from both fleets, sent his pinnace to summon the commander to yield. Valdez replied, with much Spanish solemnity, that they were 450 strong; that he himself was Don Pedro, and stood much upon his honour; and thereupon propounded several conditions, upon which he was willing to yield. But the vice-admiral replied, that he had no leisure to parley: but if he thought fit instantly to yield, he might; if not, he should soon find that Drake was no coward. Pedro, hearing the name of Drake, immediately yielded, and with 46 of his attendants came on board Drake's ship. This Don Pedro remained about two years Sir Francis Drake's prisoner in England; and, when he was released, paid him for his own and his captains liberties, a ransom of 3500l. Drake's soldiers were well recompensed with the plunder of this ship: for they found in it 55000 ducats of gold, which was divided among them.

A little before this formidable Spanish armament put to sea, the ambassador of his Catholic majesty had the confidence to propound to queen Elizabeth, in Latin verse, the terms upon which the might hope for peace; which, with an English translation by Dr Ful-

Drake.

Drasma.

ler, we will infer in this place, because Drake's expedition to the West Indies makes a part of this message. The verses are these:

*Te victo ne pergas bello defendere Belgas:
Quæ Dracus crispit nunc resistuntur oportet:
Quas pater evertit jubet te condere cellas:
Religio Papæ fac resistatur ad uaguem.*

"These to you are our commands,
"Send no help to th' Netherlands:
"Of the treasure took by Drake,
"Restitution you must make;
"And those abbeyes build anew,
"Which your father overthrow:
"If for any peace you hope,
"In all points restore the pope."

The queen's extempore return,

Ad Græcæ, bone rex, fient mandata calendar.

"Worthy king, know, this your will
"At Later-Lammas we'll fulfil.

In the year 1589, Sir Francis Drake commanded as admiral the fleet sent to restore Don Antonio king of Portugal, the command of the land-forces being given to Sir John Norris: but they were hardly got to sea, before the commanders differed, and so the attempt proved abortive. The war with Spain continuing, a more effectual expedition was undertaken by Sir John Hawkins and Sir Francis Drake, against their settlements in the West Indies, than had hitherto been made during the whole course of it: but the commanders here again not agreeing about the plan, this also did not turn out so successfully as was expected. All difficulties, before these two last expeditions, had given way to the skill and fortune of Sir Francis Drake; which probably was the reason, why he did not bear these disappointments so well as he otherwise would have done. A strong sense of them is supposed to have thrown him into a melancholy, which occasioned a bloody flux; and of this he died on board his own ship, near the town of Nombre de Dios in the West Indies, on the 28th of January 1595-6. His death was lamented by the whole nation, and particularly by his countrymen; who had great reason to love him from the circumstances of his private life, as well as to esteem him in his public character. He was elected burgess for the town of Boscine, alias Tintagal, in the county of Cornwall, in the 27th parliament of queen Elizabeth; and for Plymouth in Devonshire, in the 35th of the same reign. This town had very particular obligations to him: for, in the year 1587, he undertook to bring water into it, through the want of which, till then, it had been grievously distressed; and he performed it by conducting thither a stream from springs at eight miles distance, that is to say, in a straight line: for in the manner he brought it, the course of it runs upwards of 20 miles.

DRAKENBORCH (Arnold), professor of eloquence and history at Utrecht, made himself known by several works, and particularly by his Notes on Titus Livius and Silius Italicus; his fine editions of which are highly esteemed.

DRAMA, a poem containing some certain action, and representing a true picture of human life, for the delight and improvement of mankind.

The principal species of the drama are two, comedy and tragedy. Some others there are of less note, as pastoral, satire, tragi-comedy, opera, &c.*

* See the article Poetry.

DRAMATIC, an epithet given to pieces written for the stage. See **POETRY**, chap. ii.

DRANK, among farmers, a term used to denote wild oats, which never fail to infect worn-out lands; so that, when ploughed lands run to these weeds and thistles, the farmer knows it is high time to follow them, or else to sow them with hay-seed, and make pasture of them.

DRAPERY, in sculpture and painting, signifies the representation of the clothing of human figures, and also hangings, tapestry, curtains, and most other things that are not carnations or landscapes. See **PAINTING**, n° 10.; **CRAYON-Painting**, sect. ii.; and **DRAWING**, par. 8.

DRASTIC, in physic, an epithet bestowed on such medicines as are of present efficacy, and potent in operation; and is commonly applied to emetics and cathartics.

DRAVE, a large navigable river, which, taking its rise in the archbishopric of Saltzburg, in Germany, runs south-east through Stiria; and continuing its course, divides Hungary from Sclavonia, and falls into the Danube at Esseck.

DRAUGHT, in trade, called also *cloff* or *clouch*, is a small allowance on weighable goods, made by the king to the importer, or by the seller to the buyer, that the weight may hold out when the goods are weighed again.

The king allows 1 lb draught for goods weighing no less than 1 Cwt. 2 lb for goods weighing between 1 and 2 Cwt. 3 lb for goods weighing between 2 and 3 Cwt. 4 lb from 3 to 10 Cwt. 7 lb from 10 to 18 Cwt. 9 lb from 18 to 30 or upwards.

DRAUGHT-Hooks, are large hooks of iron, fixed on the cheeks of a cannon-carriage, two on each side, one near the trunnion hole, and the other at the train, distinguished by the name of *fore* and *hind draught-hooks*. Large guns have draught-hooks near the middle train; to which are fixed the chains that serve to keep the shafts of the limbers on a march. The fore and hind hooks are used for drawing a gun backwards or forwards, by men with strong ropes, called *draught-ropes*, fixed to these hooks.

DRAUGHT, the depth of a body of water necessary to float a ship; hence a ship is said to draw so many feet of water, when she is borne up by a column of water of that particular depth. Thus, if it requires a body of water whose depth is equal to 12 feet, to float or buoy up a ship on its surface, she is said to draw 12 feet water; and that this draught may be more readily known, the feet are marked on the stem and stern post, regularly from the keel upwards.

DRAUGHT-Horse, in farming, a sort of coarse-made horse, destined for the service of a cart or plough.

DRAWBACK, in commerce, certain duties, either of the customs or of the excise, allowed upon the exportation of some of our own manufactures; or upon certain foreign merchandize, that have paid duty on importation.

The oaths of the merchants importing and exporting are required to obtain the drawback on foreign goods, affirming the truth of the officers certificate on the entry, and the due payment of the duties: and these may be made by the agent or husband of any corporation or company; or by the known servant of any merchant,

Dramatic
||
Drawback.

merchant usually employed in making his entries, and paying his customs. In regard to foreign goods entered outward, if less quantity or value be fraudulently shipped out than what is expressed in the exporter's certificate, the goods therein mentioned, or their value, are forfeited, and no drawback to be allowed for the same. Foreign goods exported by certificate in order to obtain the draw-back, not shipped or exported, or re-landed in Great Britain, unless in case of distress to save them from perishing, are to lose the benefit of the draw-back, and are forfeited, or their value, with the vessels, horses, carriages, &c. employed in the re-landing thereof; and the persons employed in the re-landing them, or by whose privity they are re-landed, or into whose hands they shall knowingly come, are to forfeit double the amount of the drawback. Officers of the customs conniving at or assisting in any fraud relating to certificate goods, besides other penalties, are to forfeit their office, and suffer six months imprisonment without bail or mainprize; as are also masters, or persons belonging to the ships employed therein. Bonds given for the exportation of certificate-goods to Ireland must not be delivered up, nor drawback allowed for any goods, till a certificate under the hands and seals of the collector or comptroller, &c. of the customs be produced, testifying the landing.

DRAW-Bridge, a bridge made after the manner of a float, to draw up, or let down, as occasion serves, before the gate of a town or castle. See **BRIDGE**.

A draw-bridge may be made after several different ways; but the most common are made with plyers, twice the length of the gate, and a foot in diameter. The

inner square is traversed with a cross, which serves for a counterpoise; and the chains which hang from the extremities of the plyers to lift up or let down the bridge, are of iron or brass.

In navigable rivers it is sometimes necessary to make the middle arch of bridges with two moveable platforms, to be raised occasionally, in order to let the masts and rigging of ships pass through. This kind of draw-bridge is represented in Plate XCVI. where A B is the width of the middle arch; A L and B L, the two piers that support the draw-bridge NO, one of the platforms of which is raised, and the other let down, having the beam PQ for its piler. To NO are suspended two moveable braces EH, EH; which resting on the support E, press against the bracket M, and thereby strengthen the draw-bridge. These braces are conducted to the rest by means of the weight S, pulling the chain SLF.

DRAW-Net, a kind of net for taking the larger sort of wild-fowl, which ought to be made of the best sort of pack-thread, with wide meshes; they should be about two fathoms deep and six long, verged on each side with a very strong cord, and stretched at each end on long poles. It should be spread smooth and flat upon the ground; and strewed over with grass, sedge, or the like, to hide it from the fowl; and the sportsman is to place himself in some shelter of grass, fern, or some such thing.

DRAWING, in general, denotes the action of pulling out, or haling along; thus we read of tooth-drawing, wire-drawing, &c.

D R A W I N G,

THE art of representing the appearances of objects by imitation, or copying without the assistance of mathematical rules.

1. *Of the proper Materials for drawing, and the manner of using them.* The first thing necessary for a beginner is to furnish himself with proper materials, such as black-lead pencils, crayons * of black, white, or red chalk, crow-quill pens, a rule and compasses, camels-hair pencils, and Indian ink. He must accustom himself to hold the pencil farther from the point than one does a pen in writing; which will give him a better command of it, and contribute to render the strokes more free and bold. The use of the pencil is to draw the first sketches or outlines of the piece, as any stroke or line that is amiss may in this be more easily rubbed out than in any other thing; and when he has made the sketch as correct as he can with the pencil, he may then draw carefully the best outline he has got, with his crow-quill pen and (A) ink; after which he may discharge the pencil-lines, by rubbing the piece gently with the crumb of stale bread. Having thus got the outline clear, his next work is to shade the piece properly, either by drawing fine strokes with his pen where it requires to be shaded, or by washing it with his pencil and the Indian ink. As to his rule and

compasses, they are never or very rarely to be used, except in measuring the proportions of figures after he has drawn them, to prove whether they are right or not; or in houses, fortifications, and other pieces of architecture.

2. *Of drawing Lines, Squares, Circles, and other regular and irregular figures.* Having got all these implements in readiness, the first practice must be to draw straight and curve lines, with ease and freedom, upwards and downwards, sideways to the right or left, or in any direction whatsoever. He must also learn to draw, by command of hand, squares, circles, ovals, and other geometrical figures: for as the alphabet, or a knowledge of the letters, is an introduction to grammar; so is geometry to drawing. The practice of drawing these simple figures * till he is master of them, will enable him to imitate, with greater ease and accuracy, many things both in nature and art. And here it is proper to admonish him, never to be in a hurry; but to make himself perfectly master of one figure before he proceeds to another: the advantage, and even necessity, of this, will appear as he proceeds. Two observations more may be added: 1. That he accustom himself to draw all his figures very large, which is the only way of acquiring a free bold manner of design-
ing.

(A) The ink made use of for this purpose must not be common, but Indian ink; which is much softer than the other, and does not run: by mixing it with water, it may be made to any degree of strength, and used in a pen like common ink.

* See
Crayon-
Painting.

* See Plate
XCVI.

ing. 2. That he practise drawing till he has gained a tolerable mastery of his pencil, before he attempts to shadow any figure or object of any kind whatever.

3. *Of Light and Shade.* After the learner has made himself in some measure perfect in drawing outlines, his next endeavour must be to shade them properly. It is this which gives an appearance of substance, shape, distance, and distinction, to whatever bodies he endeavours to represent, whether animate or inanimate. The best rule for doing this is, to consider from what point, and in what direction, the light falls upon the objects which he is delineating, and to let all his lights and shades be placed according to that direction throughout the whole work. That part of the object must be lightest, which hath the light most directly opposite to it; if the light falls sideways on the picture, he must make that side which is opposite to it lightest, and that side which is farthest from it darkest. If he is drawing the figure of a man, and the light be placed above the head, then the top of the head must be made lightest, the shoulders next lightest, and the lower parts darker by degrees. That part of the object, whether in naked figures, or drapery, or buildings, that stands farthest out, must be made the lightest, because it comes nearest to the light; and the light loseth so much of its brightness, by how much any part of the body bends inward, because those parts that stick out hinder the lustre and full brightness of the light from striking on those parts that fall in. Titian used to say, that he knew no better rule for the distribution of lights and shadows, than his observations drawn from a bunch of grapes. Sattins and silks, and all other shining stuffs, have certain glancing reflections, exceeding bright, where the light falls strongest. The like is seen in armour, bras-pots, or any other glittering metal, where you see a sudden brightness in the middle or centre of the light, which discovers the shining nature of such things. Observe also, that a strong light requires a strong shade, a fainter light a fainter shade; and that an equal balance be preserved throughout the piece between the lights and shades. Those parts which must appear round, require but one stroke in shading, and that sometimes but very faint; such parts as should appear steep or hollow, require two strokes across each other, or sometimes three, which is sufficient for the deepest shade. Care must be also taken to make the outlines faint and small in such parts as receive the light; but where the shades fall, the outline must be strong and bold. The learner must begin his shadings from the top, and proceed downward, and use his utmost endeavours both by practice and observation to learn how to vary the shadings properly; for in this consists a great deal of the beauty and elegance of drawing. Another thing to be observed is, that as the human sight is weakened by distances, so objects must seem more or less confused or clear according to the places they hold in the piece: Those that are very distant,—weak, faint, and confused; those that are near and on the foremost ground,—clear, strong, and accurately finished.

4. *Of drawing Flowers, Fruits, Birds, Beasts, &c.* The learner may proceed now to make some attempts at drawing flowers, fruits, birds, beasts, and the like; not only as it will be a more pleasing employment, but as it is an easier task, than the drawing of hands and

feet, and other parts of the human body, which require not only more care, but greater exactness and nicer judgment. Very few rules or instructions are requisite upon this head; the best thing the learner can do is, to furnish himself with good prints or drawings by way of examples, and with great care and exactness to copy them. If it is the figure of a beast, begin with the forehead, and draw the nose, the upper and under jaw, and stop at the throat. Then go to the top of the head, and form the ears, neck, back, and continue the line till you have given the full shape of the buttock. Then form the breast, and mark out the legs and feet, and all the smaller parts. And, last of all, finish it with the proper shadows. It is not amiss, by way of ornament, to give a small sketch of landscape; and let it be suitable and natural to the place or country of the beast you draw. Much the same may be said with regard to birds. Of these, as well as beasts and other objects, the learner will find many examples among the plates given in this work.

5. *Of drawing Eyes, Ears, Legs, Arms, Hands, Feet, &c.* As to the drawing of eyes and ears, legs and arms, the learner will have very little more to do than to copy carefully the examples given in Plate XCVI. XCVII. But the actions and postures of the hands are so many and various, that no certain rules can be given for drawing them, that will universally hold good. Yet as the hands and feet are difficult members to draw, it is very necessary, and well worth while, to bestow some time and pains about them; carefully imitating their various postures and actions, so as not only to avoid all lameness and imperfection, but also to give them life and spirit. To arrive at this, great care, study, and practice, are requisite; particularly in imitating the best prints or drawings that can be got of hands and feet, (some good examples of which are given in Plate XCVII.); for, as to the mechanical rules of drawing them by lines and measures, they are not only perplexed and difficult, but also contrary to the practice of the best masters. One general rule, however, may be given, (which is universally to be observed in all subjects), and that is, Not to finish perfectly at first any single part, but to sketch out faintly, and with light strokes of the pencil, the shape and proportion of the whole hand, with the action and turn of it; and after considering carefully whether this first sketch be perfect, and altering it wherever it is amiss, you may then proceed to the bending of the joints, the knuckles, the veins, and other small particulars, which, when the learner has got the whole shape and proportion of the hand or foot, will not only be more easily but also more perfectly designed.

6. *Of drawing Faces.* The head is usually divided into four equal parts. (1.) From the crown of the head to the top of the forehead. (2.) From the top of the forehead to the eye-brows. (3.) From the eye-brows to the bottom of the nose. (4.) From thence to the bottom of the chin. But this proportion is not constant; those features in different men being often very different as to length and shape. In a well-proportioned face, however, they are nearly right. To direct the learner therefore in forming a perfect face, his first business is to draw a complete oval; in the middle of which, from the top to the bottom, draw a perpendicular line. Through the centre or middle of this

DRAW BRIDGE.

Plate XC VI

DRAWING.

J. Bell sculpt.

this line draw a diameter line, directly across from one side to the other of your oval. On these two lines all the features of your face are to be placed as follows. Divide your perpendicular line into four equal parts: the first must be allotted to the hair of the head; the second is from the top of the forehead to the top of the nose between the eye-brows; the third is from thence to the bottom of the nose; and the fourth includes the lips and chin. Your diameter line, or the breadth of the face, is always supposed to be the length of five eyes; you must therefore divide it into five equal parts, and place the eyes upon it so as to leave exactly the length of one eye betwixt them. This is to be understood only of a full front face; for if it turn to either side, then the distances are to be lessened on that side which turns from you, less or more in proportion to its turning. The top of the ear is to rise parallel to the eye-brows, at the end of the diameter line; and the bottom of it must be equal to the bottom of the nose. The nostrils ought not to come out further than the corner of the eye in any face; and the middle of the mouth must always be placed upon the perpendicular line. See Plate XCVI.

7. *Of drawing Human Figures.* When the learner is tolerably perfect in drawing hands, feet, heads, and faces, he may next attempt to draw the human figure at length. In order to which, let him first form his oval for the head; then draw a perpendicular line from the bottom of the head six times its length, (for the length of the head is one-seventh part of the length of the figure.)

The best proportioned figures of the ancients are 7 heads $\frac{1}{2}$ in height. If, therefore, the figure stands upright, draw a perpendicular line from the top of the head to the heel, which must be divided into two equal parts. The bottom of the belly is exactly the centre. Divide the lower part into two equal parts again, the middle of which is the middle of the knee. For the upper part of the figure, the method must be varied. Take off with your compasses the length of the face, (which is 3 parts in 4 of the length of the head); from the throat-pit to the pit of the stomach is one face, from thence to the navel is another, and from thence to the lower rim of the belly is a third. The line must be divided into seven equal parts. Against the end of the first division, place the breasts; the second comes down to the navel; the third, to the privities; the fourth to the middle of the thigh; the fifth, to the lower part of the knee; the sixth, to the lower part of the calf; and the seventh, to the bottom of the heel, the heel of the bearing leg being always exactly under the pit of the throat. But, as the essence of all drawing consists in making at first a good sketch, the learner must in this particular be very careful and accurate; he ought to draw no one part perfect or exact, till he see whether the whole draught be good; and when he has altered that to his mind, he may then finish one part after another as curiously as he can.

There are some who, having a statue to copy, begin with the head, which they finish, and then proceed in the same manner to the other parts of the body, finishing as they go: but this method generally succeeds ill; for if they make the head in the least too big, or too little, the consequence is a disproportion between all the parts, occasioned by their not having sketched the

whole proportionably at first. Let the learner remember, therefore, in whatever he intends to draw, first to sketch its several parts, measuring the distances and proportions between each with his finger or pencil, without using the compasses; and then judge of them by the eye, which by degrees will be able to judge of truth and proportion, and will become his best and principal guide. And let him observe, as a general rule, Always to begin with the right side of the piece he is copying: for by that means he will always have what he has done before his eyes; and the rest will follow more naturally, and with greater ease: whereas if he begin with the left side, his hand and arm will cover what he does first, and deprive him of the sight of it; by which means he will not be able to proceed with so much ease, pleasure, or certainty.

As to the order and manner of proceeding in drawing the human body, he must first sketch the head; then the shoulders in the exact breadth; then draw the trunk of the body, beginning with the arm-pits (leaving the arms till afterwards), and so draw down to the hips on both sides; and be sure he observe the exact breadth of the waist. When he has done this, let him then draw that leg which the body stands upon, and afterwards the other which stands loose; then the arms, and last of all the hands.

He must take notice also of the bowings and bendings that are in the body; making the part which is opposite to that which bends, correspond to it in bending with it. For instance: If one side of the body bend in, the other must stand out answerable to it; if the back bend in, the belly must stick out; if the knee bend out, the ham must fall in; and so of any other joint in the body. Finally, he must endeavour to form all the parts of the figure with truth, and in just proportion: not one arm or one leg bigger or less than the other; not broad Herculean shoulders, with a thin and slender waist; nor raw and bony arms, with thick and gouty legs: but let there be a kind of harmonious agreement amongst the members, and a beautiful symmetry throughout the whole figure.

We shall conclude this head by giving, from Frenoy, *The Measures of the Human Body.* The ancients have commonly allowed eight heads to their figures, though some of them have but seven: but we ordinarily divide the figures into ten faces; that is to say, from the crown of the head to the sole of the foot, in the following manner.

From the crown of the head to the forehead is the third part of a face.

The face begins at the root of the lowest hairs which are upon the forehead, and ends at the bottom of the chin.

The face is divided into three proportional parts; the first contains the forehead, the second the nose, and the third the mouth and chin.

From the chin to the pit betwixt the collar-bones, are two lengths of a nose.

From the pit betwixt the collar-bones to the bottom of the breast, one face.

From the bottom of the breast to the navel, one face.

From the navel to the genitals, one face.

From the genitals to the upper part of the knees, two faces.

The knee contains half a face.

From the lower part of the knee to the ankle, two faces.

From the ankle to the sole of the foot, half a face.

A man, when his arms are stretched out, is, from the longest finger of his right hand to the longest of his left, as broad as he is long.

From one side of the breasts to the other, two faces.

The bone of the arm called *humerus*, is the length of two faces, from the shoulder to the elbow.

From the end of the elbow to the root of the little finger, the bone called *cubitus*, with part of the hand, contains two faces.

From the box of the shoulder-blade to the pit betwixt the collar-bones, one face.

If you would be satisfied in the measures of breadth from the extremity of one finger to the other, so that this breadth should be equal to the length of the body, you must observe, that the boxes of the elbows with the *humerus*, and of the *humerus* with the shoulder-blade, bear the proportion of half a face, when the arms are stretched out.

The sole of the foot is the sixth part of the figure.

The hand is the length of the face.

The thumb contains a nose.

The inside of the arm, from the place where the muscle disappears, which makes the breast, called the *pectoral muscle*, to the middle of the arm, four noses.

From the middle of the arm to the beginning of the hand, five noses.

The longest toe is a nose long.

The two utmost parts of the teats and the pit betwixt the collar-bones of a woman, make an equilateral triangle.

For the breadth of the limbs, no precise measure can be given; because the measures themselves are changeable, according to the quality of the persons, and according to the movements of the muscles.

8. *Of Drapery.* In the art of cloathing the figures, or casting the drapery properly and elegantly upon them, many things are to be observed. 1. The eye must never be in doubt of its object; but the shape and proportion of the part or limb, which the drapery is supposed to cover, must appear; at least so far as art and probability will permit: and this is so material a consideration, that many artists draw first the naked figure, and afterwards put the draperies upon it. 2. The drapery must not fit too close to the parts of the body: but let it seem to flow round, and as it were to embrace them; yet so as that the figure may be easy, and have a free motion. 3. The draperies which cover those parts that are exposed to great light, must not be so deeply shaded as to seem to pierce them; nor should those members be crossed by folds that are too strong, lest by the too great darkness of their shades the members look as if they were broken. 4. The great folds must be drawn first, and then stroked into lesser ones: and great care must be taken that they do not cross one another improperly. 5. Folds in general should be large, and as few as possible. However, they must be greater or less according to the quantity and quality of the stuffs of which the drapery is supposed to be made. The quality of the persons is also to be considered in the drapery. If they are magistrates, their draperies ought to be large and ample; if country clowns or slaves, they ought to be coarse and short; if ladies or

nymphs, light and soft. 6. Suit the garments to the body, and make them bend with it, according as it stands in or out, straight or crooked; or as it bends one way or another; and the closer the garment fits to the body, the narrower and smaller must be the folds. 7. Folds well-imagined give much spirit to any kind of action; because their motion implies a motion in the acting member, which seems to draw them forcibly, and makes them more or less stirring as the action is more or less violent. 8. An artful complication of folds in a circular manner greatly helps the effect of fore-shortenings. 9. All folds consist of two shades, and no more; which you may turn with the garment at pleasure, shadowing the inner side deeper, and the outer more faintly. 10. The shades in silk and fine linen are very thick and small, requiring little folds and a light shadow. 11. Observe the motion of the air or wind, in order to draw the loose apparel all flying one way: and draw that part of the garment that adheres closest to the body, before you draw the looser part that flies off from it; lest, by drawing the looser part of the garment first, you should mistake the position of the figure, and place it awry. 12. Rich ornaments, when judiciously and sparingly used, may sometimes contribute to the beauty of draperies. But such ornaments are far below the dignity of angels or heavenly figures; the grandeur of whose draperies ought rather to consist in the boldness and nobleness of the folds, than in the quality of the stuff, or the glitter of ornaments. 13. Light and flying draperies are proper only to figures in great motion, or in the wind: but when in a calm place, and free from violent action, their draperies should be large and flowing; that, by their contrast and the fall of the folds, they may appear with grace and dignity. And thus much for drapery; an example or two of which are given in Plate XCVIII. But see farther the articles *CRAYON-PAINTING*, sect. ii.; and *PAINTING*, n^o 10.

9. *On the Passions.* The passions, says M. Le Brun, are motions of the soul, either upon her pursuing what she judges to be for her good, or shunning what she thinks hurtful to her; and commonly, whatever causes emotion of passion in the soul, creates also some action in the body. It is therefore necessary for a painter to know which are the different actions in the body that express the several passions of the soul, and how to delineate them.

M. Le Brun has been extremely happy in expressing many of the passions, and you cannot study any thing better than the examples which he has left us of them. A few of which are carefully copied in Plates XCV. and XCVIII. However, as M. De Piles justly observes, it is absurd as well as impossible to pretend to give such particular demonstrations of them as to fix their expression to certain strokes, which the painter should be obliged to make use of as essential and invariable rules. This, says he, would be depriving the art of that excellent variety of expression which has no other principle than diversity of imagination, the number of which is infinite. The same passion may be finely expressed several ways, each yielding more or less pleasure in proportion to the painter's understanding and the spectator's discernment.

Though every part of the face contributes towards expressing the sentiments of the heart, yet the eyebrow, according to M. Le Brun, is the principal seat

Placid or Fearless

Fear or Anger

A Well Deserve

of expression, and where the passions best make themselves known. It is certain, says he, that the pupil of the eye, by its fire and motion, very well shews the agitation of the soul, but then it does not express the kind or nature of such an agitation; whereas the motion of the eye-brow differs according as the passions change their nature. To express a simple passion, the motion is simple; to express a mixed passion, the motion is compound: if the passion be gentle, the motion is gentle; and if it be violent, the motion is too. We may observe farther, says he, that there are two kinds of elevation in the eye-brows. One, in which the eye-brows rise up in the middle; this elevation expresses agreeable sensations, and it is to be observed that then the mouth rises at the corners. Another, in which the eye-brows rise up at the ends, and fall in the middle; this motion denotes bodily pain, and then the mouth falls at the corners. In laughter, all the parts agree; for the eye-brows, which fall toward the middle of the forehead, make the nose, the mouth, and the eyes, follow the same motion. In weeping, the motions are compound and contrary; for the eye-brows fall toward the nose and over the eyes, and the mouth rises that way. It is to be observed also, that the mouth is the part of the face which more particularly expresses the emotions of the heart: for when the heart complains, the mouth falls at the corners; when it is at ease, the corners of the mouth are elevated; and when it has an aversion, the mouth shoots forward, and rises in the middle.

"The head, says M. De Piles, contributes more to the expression of the passions than all the other parts of the body put together. Those separately can only shew some few passions, but the head expresses them all. Some, however, are more peculiarly expressed by it than others: as humility, by hanging it down; arrogance, by lifting it up; languishment, by inclining it on one side; and obstinacy, when with a stiff and resolute air it stands upright, fixed, and stiff between the two shoulders. The head also best shews our supplications, threats, mildness, pride, love, hatred, joy, and grief. The whole face, and every feature, contributes something: especially the eyes; which, as Cicero says, are the windows of the soul. The passions they more particularly discover are, pleasure, languishing, scorn, severity, mildness, admiration, and anger; to which one might add joy and grief, if they did not proceed more particularly from the eye-brows and mouth; but when those two passions fall in also with the language of the eyes, the harmony will be wonderful. But though the passions of the soul are most visible in the lines and features of the face, they often require the assistance also of the other parts of the body. Without the hands, for instance, all action is weak and imperfect; their motions, which are almost infinite, create numberless expressions: it is by them that we desire, hope, promise, call, send back; they are the instruments of threatening, prayer, horror, and praise; by them we approve, condemn, refuse, admit, fear, ask; express our joy and grief, our doubts, regrets, pain, and admiration. In a word, it may be said, as they are the language of the dumb, that they contribute not a little to speak a language common to all nations, which is the language of painting. But to

say how these parts must be disposed for expressing the various passions, is impossible; nor can any exact rules be given for it, both because the task would be infinite, and because every one must be guided in this by his own genius and the particular turn of his own studies." See PAINTING, n° 15.

10. On drawing Landships, Buildings, &c. Of all the parts of drawing, this is the most useful and necessary, as it is what every man may have occasion for at one time or another. To be able, on the spot, to take the sketch of a fine building, or a beautiful prospect; of any curious production of art, or uncommon appearance in nature; is not only a very desirable accomplishment, but a very agreeable amusement. Rocks, mountains, fields, woods, rivers, cataracts, cities, towns, castles, houses, fortifications, ruins, or whatsoever else may present itself to view on our journeys or travels in our own or foreign countries, may be thus brought home, and preserved for our future use either in business or conversation. On this part, therefore, more than ordinary pains should be bestowed.

All drawing consists in nicely measuring the distances of each part of the piece by the eye. In order to facilitate this, let the learner imagine in his own mind, that the piece he copies is divided into squares. For example: Suppose or imagine a perpendicular and a horizontal line crossing each other in the centre of the picture you are drawing from; then suppose also two such lines crossing your own copy. Observe in the original, what parts of the design those lines intersect, and let them fall on the same parts of the supposed lines in the copy: We say, the supposed lines; because though engravers, and others who copy with great exactness, divide both the copy and original into many squares, as below: yet this is a method not to be

recommended, as it will be apt to deceive the learner, who will fancy himself a tolerable proficient, till he comes to draw after nature, where these helps are not to be had, when he will find himself miserably defective and utterly at a loss.

If he is to draw a landkip from nature, let him take his station on a rising ground, where he will have a large horizon; and mark his tablet into three divisions, downwards from the top to the bottom; and divide in his own mind the landkip he is to take, into three divisions also. Then let him turn his face directly opposite to the middle of the horizon, keeping his body fixed, and draw what is directly before his eyes upon the middle division of the tablet; then turn his head, but not his body, to the left hand, and delineate what he views there, joining it properly to what he had done before; and, lastly, do the same by what is to be seen upon his right hand, laying down every thing exactly both with respect to distance and proportion.

The best artists of late, in drawing their landships, make them shoot away one part lower than another. Those who make their landships mount up higher and

higher, as if they stood at the bottom of a hill to take the prospect, commit a great error: the best way is to get upon a rising ground, make the nearest objects in the piece the highest, and those that are farther off to shoot away lower and lower till they come almost level with the line of the horizon, lessening every thing proportionably to its distance, and observing also to make the objects fainter and less distinct the farther they are removed from the eye. He must make all his lights and shades fall one way; and let every thing have its proper motion: as, Trees shaken by the wind, the small boughs bending more, and the large ones less:

D R E

Dray
|
Dreams.

DRAY, a kind of cart used by brewers, for carrying barrels of beer, or ale; also a sledge drawn without wheels.

DRAY, among sportsmen, denotes squirrel-nests, built in the tops of trees.

DRAYTON (Michael), an eminent English poet, born of an ancient family in Warwickshire in 1563. His propensity to poetry was extremely strong, even from his infancy; and we find the most of his principal poems published, and himself highly distinguished as a poet, by the time he was about 30 years of age.—It appears from his poem of “Moses’s birth and miracles,” that he was a spectator at Dover of the famous Spanish armada, and it is not improbable that he was engaged in some military employment there. It is certain, that not only for his merit as a writer, but his valuable qualities as a man, he was held in high estimation, and strongly patronized by several personages of consequence; particularly by Sir Henry Goodere, Sir Walter Aston, and the Countess of Bedford; to the first of whom he owes himself indebted for great part of his education, and by the second he was for many years supported.

His poems are very numerous; and so elegant, that his manner has been copied by many modern writers of eminence since. Among these the most celebrated one is the *Poly-Albion*, a chorographical description of England, with its commodities, antiquities, and curiosities, in metre of 12 syllables; which he dedicated to prince Henry, by whose encouragement it was written: and whatever may be thought of the poetry, his descriptions are allowed to be exact. He was styled *poet laureat* in his time: which, as Ben Johnson was then in that office, is to be understood in a loose sense, of approbation as an excellent poet; and was bestowed on others as well as Drayton, without being confined strictly to the office known by that appellation. He died in 1631; and was buried in Westminster abbey, among the poets, where his bust is to be seen, with an epitaph penned by Ben Johnson.

DREAMS; those fancies or imaginations which occur to the minds of people when asleep.

The subject of dreaming hath been investigated by several philosophers, but hitherto with very little success.—Wolffius supposes that dreams take their rise entirely from the sensations; and that no dream arises in the human mind without a previous sensation, though perhaps such a slight one that it cannot easily be traced. This hypothesis is expressly adopted by Mr Forney, in an essay on dreaming, in the *Memoirs of the Academy of Sciences at Berlin*.—Mr Baxter, in his

water agitated by the wind, and dashing against ships or boats; or falling from a precipice upon rocks and stones, and spiring up again into the air, and sprinkling all about: clouds also in the air, now gathered with the winds; now violently condensed into hail, rain, and the like: Always remembering, that whatever motions are caused by the wind must be made all to move the same way, because the wind can blow but one way at once.

Finally, it must be observed, that in order to attain any considerable proficiency in drawing, a knowledge of **PERSPECTIVE** is absolutely necessary; see that article.

D R E

Dreams.

treatise of the Immateriality of the human Soul, attributes dreams to the action of some immaterial beings upon our soul.—Lastly, some modern physiologists reckon dreaming to be a species of *delirium*. Their account of the matter is as follows. The brain and nervous system, which are the only organs of sensation, are generally in two states, exceedingly different from one another, which may be expressed by the words *excitement* and *collapse*. The first of these denotes that state in which the nervous system is easily made sensible of the impressions of external objects, and then we are said to be awake. The second is, when external objects do not easily make these impressions: and of this state there are various degrees; drowsiness, sleep, fainting, and death. These do not indeed proceed in the order in which we have placed them. Sleep is of a quite different nature from fainting, or from that stupor and insensibility produced by a compression of the brain. But, whatever be the nature of sleep, it is certain that this state is attended with what we call a *collapse* of the brain; as external objects do not make the same impressions on the organs of sense when people are asleep, that they do when awake. Between the two states of sleeping and waking, a state of delirium always occurs; and this is most probably occasioned by the excitement of one part of the brain, and the collapse of another.—That one part of the brain is capable of being excited, while the other suffers a collapse, will be evident from considering what happens when we are just falling asleep. Every one must be sensible, that at that time we do not lose our senses all at once. The hearing will continue after the sight is lost; and, even while we are yet conscious of the place we are in, false imaginations of a nature similar to that of dreaming will occur to our minds. But when the brain is perfectly collapsed, sensation or imagination of every kind totally vanishes, and we are altogether unconscious of existence.

On a subject so obscure, and so much out of the reach of investigation, as that of dreaming, it is difficult to advance any thing satisfactory. All the above-mentioned hypotheses, however, seem to be exceedingly imperfect.—It may be granted Wolffius and Forney, that dreams will arise from certain impressions made either on the external or internal parts of the body. But these impressions by no means produce any thing like the sensations we have from similar ones made upon us while we are awake. Thus, if a person whose digestion is not very good, goes soon to bed after eating a large supper, it is not improbable that he will dream of being oppressed with a great weight, by a monster, being suffocated, &c. These

dreams

Dreams.

dreams undoubtedly arise from the uneasy sensations produced in the stomach from too great a quantity of food; but if the person was awake, such sensations would produce only a sickness and uneasiness at stomach. If dreams, therefore, in all cases, proceed from sensations, we must also say, that in sleep the laws of sensation itself are altered; that those connections which we look upon to be the most constant and invariable, are not so in reality; and thus we are led into a greater difficulty than before. For example, there is no sensation more invariable, than that, when a man's stomach is oppressed, he should feel what we call *sickness*. This sensation happening in the time of sleep, according to Wolfius, produces a dream. Very true, it will do so; but why does not the man dream that he is sick? What connection is there between *sickness*, the waking sensation, and being oppressed by a weight, suffocated by a monster, &c. the sleeping ones?—This difficulty seems insurmountable on the hypothesis of Wolfius and Forney.

Mr Baxter's supposition is, in its very nature, *incapable* of proof. We are by no means ascertained of the existence of any immaterial beings, created ones at least, that can have access to our souls: and though we were, the ridiculous fancies that sometimes occur in dreams are too absurd to be supposed the work of any rational being; much less of those who possess an higher rank in the creation than ourselves.—It must also be observed, that the method which this author takes to prove his hypothesis can never be conclusive, even though every thing he contends for should be granted. He insists that the phantasm, or what is properly called the *vision*, in dreams, is not the work of the soul itself, and cannot be the effect of mechanical causes; therefore, according to him, it must be the effect of *immechanical*, or *immaterial*, agents operating upon the soul.—That it is not the work of the soul itself, may readily be granted; and likewise that it is not the effect of such mechanical causes as we are acquainted with: but from thence it will not follow, that it must necessarily be the effect of immaterial causes, unless we were perfectly well acquainted with the extent of all mechanical powers whatever. Nay, in many instances, such as that above-mentioned, we are certain that dreams not only may be, but actually are, the effects of mechanical causes, though we should never be able to investigate them.

The third hypothesis seems also inadequate to solve the phenomena of dreaming. If this depended on a partial excitement of the brain, our ideas ought to be just, as far as that excitement could reach. Thus, supposing that part of the brain on which sight depends, to be quite collapsed; and that on which hearing depends, to be in some measure excited; the person, tho' deprived of sight, would hear sounds confusedly: but still they would only be such sounds as were actually produced by external objects; and no reason can be assigned why he should imagine he heard sounds which never existed.—Besides, in dreaming, it is very manifest, that the excitement of the brain is not *partial*, but *false*. No person in his dreams imagines himself deaf, dumb, or blind. He imagines that he sees, hears, walks, reasons; nay, sometimes that he sleeps and dreams; which a partial excitation of the brain can never account for.

Before any thing can be conjectured with probabi-

Dreams.

lity concerning the phenomena of dreaming, it is necessary to investigate in some measure the nature of sleep.—On this subject it may be observed, that by whatever means sleep is produced, whether naturally by fatigue, artificially by compressing the brain, &c.; and however different these kinds of sleep may be from one another, one general effect still remains the same; namely, that the external senses are abolished, and the person becomes totally unconscious of whatever passes around him. From this general effect, which in all cases is constant and invariable, sleep may be defined, "a state in which all communication is cut off between our sentient principle and this visible world."—That the sentient and vital principle hath its residence in the brain, is an opinion which in all ages hath been esteemed very probable. If the comparison can be allowed, it might here be said, that the brain, with regard to sensation, hath the same relation to the nerves, that a pond or reservoir of water hath to a number of small streams that flow into it and out from it.—In the brain there seems to be a kind of general repository of some part of those sensations we have formerly felt; but in what manner this repository is formed, we know not. Certain it is, that there the ideas are treasured up in such a manner as to be at times, and indeed most commonly, imperceptible to ourselves. Thus, there are many things we have done, many people we have been acquainted with, and many places we have been in, of which we are just now quite insensible, and will remain so till some circumstance or other brings them to our remembrance. For example: Suppose a man has been intimately acquainted with two others who were companions, and lodged in the same house; he goes into another country, and being engaged in new pursuits, forgets both so completely, that for a considerable time he hath perhaps never thought of them at all. But if he should unexpectedly meet with one of these friends in the street, he will instantly remember the other who is at a distance; and this very circumstance will bring a train of thoughts into his mind, which produces the remembrance of many things that otherwise perhaps would never have been thought of. Now, if we consider what passes with regard to our own minds and intellectual faculties, we shall readily be convinced, that every thing we do remember, occurs only in consequence of some external circumstance. If a person gave us a slight offence yesterday, to-day perhaps we do not think of it, even though we see the person; but if he offends again, though in another manner, the offence of yesterday instantly occurs to our minds. A thousand other instances of the like kind might be added; so many indeed, that some have doubted whether we ever do forget any thing so completely that it could not be brought to our remembrance by a proper combination of external circumstances.

The only things we can think of, are the present and the past. When we think of what is to come, we must combine ideas from the present and the past. If, therefore, our memory depends on a certain combination of external circumstances immediately present to our view, it must necessarily follow, that the more a person is kept in perfect solitude, or removed from every thing that can affect his senses, the more he will be inclined to sleep. And, indeed, as far as this experiment can

be

Dreams.

be tried, it will most commonly be found successful. For, let a person who has slept his usual time through the night be put to bed at noon-day, in a dark room, where there is nothing either to amuse or disturb him, and he will almost certainly fall asleep in a short time. Hence it would seem, that by whatever means our sensations of what is present, or our external senses, are suspended; by the same, our memory must also be extinguished, and we become absolutely unconscious of existence, or fall asleep.

This state of the body, therefore, may be produced in three different ways. 1. By a removal of all such objects as by their appearance make a strong impression on the nervous system. 2. By compressing or otherwise injuring the brain, so that the vital principle cannot receive the sensations from the nerves. 3. By injuring the extremities of the nerves in such a manner, that they cannot receive any sensation from the impression of external objects.

The first and the last of these are the common methods by which natural sleep is produced. But, before we can fully investigate our subject, another question remains to be discussed; namely, From whence are the sentient extremities of the nerves supplied with that fluid which is the immediate instrument of sensation?

Under the article *Blood*, it hath been shewn, that, in respiration, there is a certain quantity of a subtle fluid received from the air, which is absolutely necessary to life. Of this fluid there is undoubtedly a considerable waste somewhere or other; because respiration cannot be interrupted even for a very short time, without a total destruction of life. The arterial blood, which receives this subtle vivifying spirit, shews that it hath done so by its florid red colour, which distinguishes it from that of the veins. During the course of the circulation, that spirit, or whatever it is, which gives the arterial blood its florid colour, is dissipated, and the blood returned by the veins makes a quite different appearance. It would seem probable, therefore, that this very volatile part is absorbed by the nerves, which every where accompany the blood-vessels.—If this is the case, we must easily see the reason why a state of sleep so readily follows immoderate fatigue, watching, &c.; namely, because these things occasion a constant drain of the vital principle from the blood, which at last becoming greater than the supply afforded by respiration, the blood becomes deprived of a part of that principle which ought to be retained in it, and which consequently cannot be bestowed on the nerves without great uneasiness and inconvenience. In such cases, therefore, unless the external impressions are very strong, the absorption of the vital principle by the nervous system will not go on; and the consequence of this must be, that the person will very soon fall asleep, for the reasons already given.—Hence we see, why any thing that impedes the circulation also produces a tendency to sleep. Of this we have a remarkable instance in the effects of cold. The first symptom of death in those who are about to perish with cold, is a drowsiness, which soon increases to such a degree that it cannot be resisted. The person sits down, as he imagines, to take a short nap, but never awakes.—In the same way we may account for that kind of sleep called *fainting*, which usually follows excessive evacua-

Dreams.

tions or fatigue of any kind. By these the circulation of the blood is disturbed, or perhaps its quantity lessened in such a manner, that the extreme parts of the nerves cannot receive a sufficient supply of vital fluid to enable them to perform their functions. The external senses therefore cease; and though former sensations remain in the memory, yet as no external circumstance can be perceived, which only can call the memory into action, a state of total insensibility generally ensues.

This hypothesis proceeds upon a principle somewhat different from those laid down by the generality of physiologists. Those who allow the nervous fluid to be secreted from the blood by the brain, generally suppose that it is sent out from thence to all parts of the body; but the idea that any quantity of the nervous or vital fluid is absorbed from the blood by the extremities of the nerves, seems not to have occurred. It is certain, however, that we have the same evidence of this absorption by the extremities of the nerves that there is of the secretion in the brain. The blood, on this supposition, contains the vital principle; but all the blood is not sent to the brain. The greater part of it is sent to other parts of the body. There doth not seem to be any essential difference between the blood brought back from the brain, and that returned by the veins from other parts of the body. Both of them have evidently suffered a loss of their most subtle part. In the first it is not disputed that the volatile part lost by the blood is received by the brain; but what becomes of that which is lost by the blood sent to all the other parts of the body? We can here give no other answer, than that in all probability it is taken up by the extremities of the nerves, and supplies them with the powers necessary for sensation, and the regulation of the body. Hence we see the reason why depriving any part of the body, of the blood it contained, deprives it also of sensation; namely, because there is then no source whence the extremities of the nerves can be supplied with the sentient principle.

If what is now advanced can be admitted with any degree of probability, the explication of the phenomena of dreaming, as far as an explanation can reasonably be expected, will not be difficult. According to this hypothesis, as long as a certain motion is communicated, by the impression of external objects, from the sentient extremities of the nerves to the brain, so long we continue sensible of the existence of the objects around us, or are said to be *awake*. When, from a deficiency of the vital fluid in the extremities of the nerves, from a compression of the brain, or from any other cause, the above-mentioned motion ceases, we are insensible of our existence, and are said to be *asleep*. In sleep therefore the nervous fluid, which lies between the extreme parts of the nerves and the brain, is either deficient in quantity, or remains at rest, or its influx into the brain is interrupted. When we are awake, the communication is free, the fluid in sufficient quantity, and liable to be set in motion by every slight impulse. Of these impulses therefore we are sensible, and our sensations are uniform and regular. When external objects cease to be perceived, still the nerves contain a quantity of the fluid we have mentioned, and which is very easily set in motion. If irregular motions hap-

pen

Dreams:

pen in it from any internal cause, the consequence must be a multitude of confused and irregular sensations, which we call *dreaming*.

This may be illustrated by the following examples. There is no sense we exercise so much as that of sight; and it is the one of which we can most easily deprive ourselves at pleasure. By means of this sense every person has it in his power to dream when he pleases; and to do so, he needs only to shut his eyes. No person can shut his eyes even for a few moments, but he will be sensible of a great number of faint confused images presenting themselves before him; and these he cannot possibly remove, till he opens his eyes, or falls asleep altogether. It can scarce be doubted, that these images are occasioned by the great mobility and subtilty of the fluid contained in the optic nerve. Though the regular motion produced in it by the impulse of the light ceases when the eye-lids are shut, yet an irregular one continues from some internal causes, and this motion occasions the confused sensation already mentioned. The appearance of such images we do not indeed in the present instance call *dreams*, because our other senses are awake; but if these individual sensations were to occur while we were asleep, undoubtedly they would be called by that name; and from what is already observed, they seem plainly to be of the same nature in both cases.

With regard to the other senses, it is not in our power to hinder the operation of external objects upon them, as we can do with our sight; but there is no reason to suppose that dreams might not be produced by them in the very same manner that they are by our faculty of vision, provided we could as easily suspend the operation of external objects upon them.—We have an evidence of the truth of this supposition in the case of fainting; which is generally preceded by a noise in the ears. In many diseases also, particularly nervous ones, the *tinnitus aurium*, or noise in the ears, is a very troublesome symptom.

The sense of feeling is less liable to deception while we are awake than any of the rest; nevertheless there is one case which may be referred to that of dreaming, and which has been very often taken notice of. It is an imagination common to people who have lost a limb, that they still feel a pain in it, though many years after it has been separated from their body. If this imagination occurred only in the time of sleep, we would have no hesitation in calling it a dream; but as it occurs while the persons are awake, it hath been explained without thinking of any connection between it and the phenomenon of dreaming. It is certain, however, that whatever explains the one, will explain the other also. In the case of the amputated limb, the sensation arises from some injury offered to the nerve which had formerly gone to that limb. This produces a certain motion in the nervous fluid, that is propagated along the nerves to the brain, upon which the imagination that the limb still remains immediately takes place. In like manner, if, during the time of sleep, a similar motion shall occur, a similar imagination or dream will be the consequence.—It must be observed, however, that, in dreaming, our sense of feeling is much more obscure than those of seeing and hearing. We dream that we see objects and hear sounds pretty distinctly; while we scarce *feel* any thing we imagine

ourselves to touch, or carry in our hands; and as for the senses of taste and smell, they are scarce ever exercised in dreaming.

Dreams have in all ages been reckoned by the vulgar to have something portentous in them, and to prefigure future events. Indeed, there are few things about which the superstition of mankind hath more exercised itself than the interpretation of dreams. If the abovementioned solution of this phenomenon is allowed, it may readily be granted, that dreams may prefigure diseases, or changes of the weather, because the nervous system is very apt to be influenced by alterations in our atmosphere; and no alteration in our health can possibly take place without producing some change in the nervous system. But how they can prefigure events entirely unconnected with our bodies, doth not appear; or rather it appears very plain that naturally they cannot; though the sacred writers give us many instances of the knowledge of future events being conveyed to mankind in dreams, by a supernatural influence. From the solution of this phenomenon we have just now given, it appears, how imaginations resembling dreams may occur as well when we are awake as when we are asleep; and that they actually do so, we have many melancholy instances in hypochondriac and mad people.

DRELCOURT (Charles), minister of the reformed church at Paris, was born at Sedan, in 1595, where his father enjoyed a considerable post. He had all the qualifications that compose a respectable clergyman; and though he defended the Protestant cause against the Romish religion, was much esteemed even among the Catholics. He is best known in England by his *Consolations against the fears of death*, which work was translated, and is often printed. He married the daughter of a rich merchant at Paris, by whom he had 16 children; his third son, professor of physic at Leyden, was physician to the prince and princess of Orange, before their accession to the crown of England: Bayle has given him a high character. Mr Drelcourt died in 1660.

DRENCH, among farriers, a physical potion for horses. The ingredients for this purpose are to be beat coarsely, and either mingled with a decoction, or with wine. Then let all infuse about a quarter of an hour; and give it to the horse with a horn, after he has been tied up two hours to the rack.

DRESDEN, the capital city of the electorate of Saxony, in Germany. It is seated on the river Elbe, which divides it into two parts. One part is called *Old Dresden*, and the other the *New Town*, in the German language, *New Stadt*. They are joined together by a stone bridge, supported by 19 piers, and 630 paces in length. As this bridge was too narrow for the crowds of people that were continually passing and repassing, king Augustus, in 1730, caused two walks for foot-passengers to be built, one on each side, in a very wonderful manner, the one for those that go into the city, and the other for those that return back. These are bordered with iron palisadoes, of curious workmanship. Upon this bridge a gilded crucifix is placed. Dresden is surrounded by strong and handsome fortifications; and might boast that it never had been taken, nor yet besieged: but this glory was put to an end on December 19. 1745, by the king of Prussia; who

who then became master of it, and entered it in triumph the next day.

All the houses of this city are built with square free stone, and are almost all of the same height. They have stone from the neighbourhood of Pirna, about 10 miles from this city, which is readily brought down the Elbe. They have lately finished a large handsome church for the Roman Catholics, which is placed between the Elbe, the bridge, and the castle. In general the houses are high and strong; the streets wide, straight, well paved, clean, and well illuminated in the night; and there are large squares, disposed in such a manner, that Dresden may pass for one of the handsomest cities in the world.

Though this city lies in a low situation, yet it hath agreeable prospects. It is supplied with a prodigious quantity of provisions, not only out of the neighbourhood, but from Bohemia, which are brought every market-day, which is once a-week. The Dresden china-ware, or rather porcelain, has been noted some time for a curious manufacture. E. Long. 13. 34. N. Lat. 51. 12.

DRESSING of HEMP and Flax. See **FLAX-Dressing**.

DRESSING of Meats, the preparing them for food, by means of culinary fire.

The design of dressing, is to loosen the compages or texture of the flesh, and dispose it for dissolution and digestion in the stomach. Flesh not being a proper food without dressing, is alleged as an argument that man was not intended by nature for a carnivorous animal.

The usual operations are roasting, boiling, and stewing.—In roasting, it is observed, meat will bear a much greater and longer heat than either in boiling or stewing; and in boiling, greater and longer than in stewing. The reason is, that roasting being performed in the open air, as the parts being externally to warm, they extend and dilate, and so gradually let out part of the rarified included air, by which means the internal succussions, on which the dissolution depends, are much weakened and abated. Boiling being performed in water, the pressure is greater, and consequently the succussions to lift up the weight are proportionably strong; by which means the coction is hastened: and even in this way there are great differences; for the greater the weight of water, the sooner is the business done.

In stewing, though the heat be infinitely short of what is employed in the other ways, the operation is much more quick, because performed in a close vessel, and full; by which means the succussions are oftener repeated, and more strongly reverberated. Hence the force of Papin's digester; and hence an illustration of the operation of digestion.

Boiling, Dr Cheyne observes, draws more of the rank, strong juices from meat, and leaves it less nutritive, more diluted, lighter, and easier of digestion: roasting, on the other hand, leaves it fuller of the strong nutritive juices, harder to digest, and needing more dilution. Strong, grown, and adult animal food, therefore, should be boiled; and the younger, and tenderer, roasted.

DRESSING, in surgery, the treatment of a wound, or any disordered part. The apparatus of dressing con-

sists of drossils, tents, plasters, compresses, bandages, bands, ligatures, and strings. See **SURGERY**.

DREXELIUS (Jeremiah), a Jesuit celebrated for his piety and writings, was born at Ausburg, and became preacher in ordinary to the elector of Bavaria. He wrote several pious and practical pieces, which have been printed together in two volumes folio; and died in 1638.

DREVET (Peter), an eminent French engraver, was a member of the royal academy of painting and sculpture; and died at Paris in 1739, at 42 years of age. His portraits are neat and elegant; but laboured to the last degree. They are copied from Rigaud and other French masters; and abound in all that flatter and licentious drapery so opposite to the simple and chaste ideas of true taste. He chiefly excels in copying Rigaud's frippery, lace, silk, fur, velvet, and other ornamental parts of dress.—His father was excellent in the same art.

DREUX, a town in the Isle of France, remarkable for its antiquities; and for the battle which was fought in December 1562, between the Papists and the Protestants, wherein the former gained the victory. Some think it took its name from the priests of Gaul, called the *Druids*, in the times of Paganism. It consists of two parishes, St Stephen's and Notre Dame, called the *great church*, which is pretty well built. It is seated on the river Blaise, at the foot of a mountain, on which is a ruined castle. E. Long. 1. 27. N. Lat. 48. 44.

DRIFT, in navigation, the angle which the line of a ship's motion makes with the nearest meridian, when she drives with her side to the wind and waves, and is not governed by the power of the helm: it also implies the distance which the ship drives on that line.

A ship's way is only called *drift* in a storm; and then, when it blows so vehemently as to prevent her from carrying any sail, or at least restrains her to such a portion of sail as may be necessary to keep her sufficiently inclined to one side, that she may not be dismasted by her violent labouring produced by the turbulence of the sea.

DRIFT, in mining, a passage cut out under the earth betwixt shaft and shaft, or turn and turn; or a passage or way wrought under the earth to the end of a meer of ground, or part of a meer.

DRIFT-Sail, a sail used under water, veered out right a-head by sheets, as other sails are. It serves to keep the ship's head right upon the sea in a storm, and to hinder her driving too fast in a current.

DRILL, in mechanics, a small instrument for making such holes as punches will not conveniently serve for. Drills are of various sizes, and are chiefly used by smiths and turners.

DRILL, or *Drill-Box*, a name given to an instrument for sowing land in the new method of horse-hoeing husbandry. See **AGRICULTURE**.

DRILL-Sowing, a method of sowing grain or seed of any kind, so that it may all be at a proper depth in the earth, which is necessary to its producing healthful and vigorous plants. For this purpose a variety of drill-ploughs have been invented and recommended; but from the expence attending the purchase, and the extreme complication of their structure, there is not an instrument of that kind, as yet discovered, that is likely to

Drill.

to be brought into general use. This method, however, is greatly recommended in the Geographical Essays, where we have the following observations and experiments.—“ Grain sown by the hand, and covered by the harrows, is placed at unequal depths; the seeds consequently sprout at different times, and produce an unequal crop. When barley is sown late, and a drought succeeds, the grain that was buried in the moisture of the earth soon appears, while such as was left near the surface lies baking in the heat of the sun, and does not vegetate till plentiful rains have moistened the soil. Hence an inequality of the crop, an accident to which barley is particularly liable. The same observation, but in a more striking manner, may be made upon the sowing of turnips. It frequently happens that the husbandman is obliged to sow his seed in very dry weather, in hopes that rain will soon follow; and either rolls or covers it with a bush-harrow. We will suppose, that, contrary to his expectations, the dry weather continues. The seed, being near the surface, cannot sprout without rain. The husbandman is mortified at his disappointment, but is soon satisfied and made easy by a perfect acquiescence in what he thinks is the will of Providence. The scourge that he feels must not be placed to the dispensation of Providence, but has its source in the ignorance of the man himself. Had he judiciously buried the seed in the moist part of the soil with the drill-plough, or harrowed it well with the common harrow, his seed would have vegetated in due season, and bountifully repaid him for his toil.

“ In the year 1769, a 15 acre clove was prepared for turnips. The land was in fine condition as to lightness, and had been well manured. On the 24th of June, 14 acres were sown with turnip-seed broad-cast, and harrowed in with a bush-harrow. The remaining acre was sown the same day with the drill-plough, allowing 14 inches between the rows, and the flares being set near two inches deep. At the time of sowing, the land was extremely dry, and the drought continued from the time of sowing to the 5th of July; so that the broad-cast did not make its appearance till about the 8th of that month, at which time the drill turnips were in rough leaf, having appeared upon the surface the sixth day after sowing.

“ In the driest seasons, at the depth of two inches or less, we are sure of finding a sufficiency of moisture to make the seed germinate. When that is once accomplished, a small degree of moisture will carry on the work of vegetation, and bring the tender plants forward to the surface. When extreme dry weather obliges the broad-cast farmer to sow late, he has no opportunity of sowing a second time if the fly should get into the field. The drill secures him in some degree against that misfortune, by giving him a full command over the seasons.

“ The excellence of the drill-plough is not confined to turnip-seed; it is an useful instrument for sowing all kinds of grain. By burying the seed at an equal depth, it secures an equal crop in all circumstances of the weather. But this is not the only consideration to the cultivator. It saves near one half of his seed, which is an object of importance to the tillage farmer.

“ In the spring of the year 1769, an acre of barley was sown in equidistant rows with the drill-plough, in

a field which was sown with the same grain and upon the same day broad-cast.—The broad-cast took three bushels per acre; the drill required only six pecks. The drills were eight inches asunder, and the seed was lodged about two inches within the soil. The drill acre was finished within the hour, and the moist distilling eye could not discover a single grain upon the surface.

“ In the course of growing, the drill barley seemed greener and bore a broader leaf than the broad-cast. When the ears were formed throughout the field, the ear of the drill barley was plainly distinguished to be near half an inch longer than the broad-cast, and the grains seemed fuller and better fed.

“ Drill-sowing, however, though it may be recommended as a most rational and judicious practice, has many difficulties to overcome, and perhaps will never be brought into general use. A proper instrument is wanting that would come cheap to the farmer, and have the requisites of strength and simplicity to recommend it. The present instruments cannot by any means be put into the hands of common servants. Should we ever be so happy as to see this objection removed, it is probable that all kinds of grain will be cultivated in drills. Corn growing in that manner has a freer enjoyment of air, and the farmer has an opportunity of hand-hoeing and weeding without injury to the growing crop. This is an object of the utmost consequence in the cultivation of beans and winter corn.

“ The best instrument for drilling of grain is the invention of the ingenious Mr Crick, and made by Mr Crichton coach-maker in Edinburgh. It works with four coulters, and the price is 12 l. With it, one man, a horse and a boy, can easily sow four acres a-day.”

DRINK, a part of our ordinary food in a liquid form. See Food.

The general use of drink is, to supply fluid; facilitate solution; in consequence of that, to expedite the evacuation of the stomach, and promote the progress of the aliment through the intestines: for, by the contraction of the longitudinal fibres of the stomach, the pylorus is drawn up, and nothing but fluid can pass; which, by its bulk, makes a hurried progress through the intestines, and so determines a greater excretion by stool, as less then can be absorbed by the lacteals. Hence a large quantity of common water has been found purgative; and, *ceteris paribus*, that aliment which is accompanied with the largest proportion of drink, makes the largest evacuation by stool. Here a question has arisen, about where the feculent part of the aliment is first remarkably collected. It is commonly thought to be in the great guts: but undoubtedly it often begins in the lower part of the ileum, especially when the drink is in small proportion, and when the progress of the aliment is slow; for when the contents of the guts are very fluid, they are quickly pushed on, and reach the great guts before they deposit any feculency. Another effect of drink is, to facilitate the mixture of the lymph, resultant from every part of the system, with the chyle. In the blood-vessels, where all must be kept fluid in order to proper mixture, drink increases the fluidity, and gives tension, by its bulk, without concomitant acrimony or too much elasticity; and so strength and oscillatory motion: hence

Drill,
Drink.Collected
the Mat.
Med.

drink contributes to sanguification, as sometimes food gives too dense a nutriment to be acted upon by the solids; and hence also we can see how drink promotes the secretions. These are the effects of drink in general: but what has been said must be taken with some limitations; for the more liquid the food, it is sooner evacuated, and less nourishment is extracted. Hence drink is, in some degree, opposed to nourishment; and so, *ceteris paribus*, those who use least drink are most nourished.

All the effects of drink above mentioned are produced by simple water; and it may be said, that other liquors are fit for drink in proportion to the water they contain. Water, when used as drink, is often impregnated with vegetable and farinaceous substances; but, as drinks, these impregnations are of little consequence: they add, indeed, a little nourishment; but this is not to be regarded in a healthy state. Sometimes we impregnate water with the *fructus acido-dulces*; and then, indeed, it acquires other qualities, of considerable use in the animal economy. All drinks, however, may be reduced to two heads: first, pure water, or where the additional substance gives no additional virtue; secondly, the *fermentata*. Of the first we have already spoken; and the latter have not only the qualities of the first, but also qualities peculiar to themselves.

Fermented liquors are more or less poignant to the taste, and better calculated to quench thirst. Thirst may be owing to various causes: first, to defect of fluid in the system, which occasions a scanty secretion in the mouth, fauces, and stomach; the dryness of the mouth and fauces will also in this case be increased, by their continual exposure to the perpetual flux and reflux of the evaporating air. Secondly, thirst depends on a large proportion of solid viscid food: thirdly, on an alkalescent aliment, especially if it has attained any thing of the putrefactive taint: fourthly, on the heat of the system; but this seems to operate in the same manner as the first cause, giving a sense of dryness from its dissipation of the fluids. The fermented liquors are peculiarly adapted for obviating all these causes; stimulating the mouth, fauces, and stomach, to throw out the saliva and gastric liquor by their poignancy: by their acceffyency they are fitted to destroy alkalescent acrimony, to quench thirst from that cause: by their fluidity they dilute viscid food; though here, indeed, they answer no better than common water. In two ways they promote the evacuation by stool, and progress through the intestines: first, by their fluidity and bulk; secondly, by their acceffyency, which, uniting with the bile, forms the peculiar stimulus formerly mentioned. Carried into the blood-vessels, in so far as they retain any of the saline nature, they stimulate the excretories, and promote urine and sweat; correcting thus alkalescency, not only by mixture, but dissipation of the degenerated fluids.

Many physicians, in treating of fermented liquors, have only mentioned these qualities, rejecting their nutritious virtue, which certainly ought to be taken in; though by expediting the evacuation by stool they make less of the nutritious parts of the aliment to be taken up, and by stimulating the excretories make these nutritious parts to be for a shorter time in the system. All these, and many more effects, arise from fermented

liquors. Their acceffyency sometimes promotes the disease of acceffyency, by increasing that of vegetables, acting as a ferment, and so producing flatulency, purging, cholera, &c: so that, with vegetable aliment, as little drink is necessary, the most innocent is pure water; and it is only with animal food that fermented liquors are necessary. In warmer climates, *fermentata* would seem necessary to obviate alkalescency and heat. But it should be considered, that though fermented liquors contain an acid, yet they also contain alcohol; which, though it adds stimulus to the stomach, yet is extremely hurtful in the warmer climates, and wherever alkalescency prevails in the system. Nature, in these climates, has given men an appetite for water impregnated with acid fruits, *e.g.* sherbet; but the use of this needs caution, as in these countries they are apt to shun animal food, using too much of the vegetable, and often thus causing dangerous refrigerations, choleras, diarrheas, &c.

Of varieties of fermented liquors. We shall only mention here the chief heads on which these varieties depend. First, they are owing to the quality of the subject, as more or less viscid; and to its capacity also of undergoing an active fermentation, although perhaps the more viscid be more nutritious. Hence the difference between ales and wines; by the first meaning fermented liquors from *farinacea*, by the second from the fruits of plants. It depends, secondly, on the acerbity, acidity, nature, and maturation, of the fruit. Thirdly, the variety depends on the conduct of the fermentation. In general, fermentation is progressive, being at first active and rapid, detaching the fixed air or *gas sylvestre*, at the same time acquiring more acid than before. These qualities of flatulency and acidity remain for some time; but as the fermentation goes on, the liquor becomes more perfect, no air is detached, and alcohol is produced; so that fermented liquors differ according to the progress of the fermentation, and have different effects on the system. When fermentation is stopped before it comes to maturity, though naturally it proceeds in this way, yet by addition of new ferment it may again be renewed with a turbid intestine motion.

DRIVERS, among sportsmen, a machine for driving pheasant-powts, consisting of good strong ozier wands, such as the basket-makers use; these are to be set in a handle, and twisted or bound with small oziers in two or three places. With this instrument the sportsman drives whole eyes of young powts into his nets. See the next article.

DRIVING, among sportsmen, a method of taking pheasant powts. It is thus: The sportsman finds out the haunts of these birds; and having fixed his nets there, he calls upon them together by a pheasant-call, imitating the voice of the dam; after this he makes a noise with his driver, which will make them run a little way forward in a cluster; and this he is to repeat till he has made sure of them, which an expert sportsman never fails to do, by driving them into his nets.

DRIVING, in metallurgy, is said of silver, when, in the operation of refining, the lead being burnt away, the remaining copper rises upon its surface in red fiery bubbles.

DRIVING, in the sea-language, is said of a ship, when an anchor being let fall will not hold her fast, nor prevent

vent her failing away with the wind or tide. The best help in this case is to let fall more anchors, or to veer out more cable; for the more cable she has out, the safer the rides. When a ship is a-hull, or a-try, they say, she drives to leeward.

DROGHEDA, by the English called *Tredah*, a town of Ireland, in the province of Leinster and county of Louth, and situated on a bay of the same name, in W. Long. 6. 17. N. Lat. 53. 45. It was formerly very remarkable for its situation and strength. In consequence of this it was much distinguished by the old English monarchs. Edward II. granted it a market and fair; and to these were added other great privileges in succeeding ages, particularly the right of coinage. It was bravely defended against the rebels in 1641. After the cessation of arms it was taken by the duke of Ormond and the earl of Inchiquin; but was retaken by Cromwell in 1649. At this time it suffered so much, that for a long time after it remained almost in ruins. The buildings were exceedingly shattered; and the town being taken by storm, not only the garri-son, but the inhabitants, men, women, and children, were mostly put to the sword. By degrees, however, it recovered, and is at present a large and populous place. It is a town and county; and as such sends two representatives to parliament. It has a great share of inland trade, and an advantageous commerce with England: and tho' the port is but indifferent, and narrow at its entrance, with a bar, over which ships of burden cannot pass but at high water, yet a great deal of business is done; so that, from a low and declining port, it is now become rich and thriving.

Drogheda is perhaps one of the strongest instances that can be mentioned of the inestimable benefit of a river in any degree navigable: for though the Boyne is not capable of carrying vessels bigger than barges, or pretty large boats, yet the convenience that this affords of conveying coals by water-carriage through a great extent of country, introduced a correspondence between this place and Whitehaven in Cumberland, to which the revival of its commerce has been in a great measure owing.

DROITWITCH, a town of Worcestershire in England, noted for excellent white salt made from the salt springs in its neighbourhood. W. Long. 2. 16. N. Lat. 52. 20.

DROMEDARY. See CAMELUS.

DRONE, in the history of insects, a kind of male bee, larger than the common working or honey-bees: it is so called from its idleness, as never going abroad to collect either honey or wax. See APIS and BEE.

DRONE-FLY, a two-winged insect, extremely like the common drone-bee, whence also the name.

DROPS, in meteorology, small spherical bodies which the particles of fluids spontaneously form themselves into when let fall from any height. This spherical figure, the Newtonian philosophers demonstrate to be the effect of corporeal attraction; for considering that the attractive force of one single particle of a fluid is equally exerted to an equal distance, it must follow that other fluid particles are on every side drawn to it, and will therefore take their places at an equal distance from it, and consequently form a round superficies. See the articles ATTRACTION, FLUID, and RAIN.

DROPS, in medicine, a liquid remedy, the dose of

which is estimated by a certain number of drops.

English Drops, Gutta Anglicana, a name given to a chemical preparation esteemed of great virtue against vapours and lethargic affections, and purchased at 5000l. by king Charles II. from the inventor Dr Goldard. The medicine appeared to be only a spirit drawn by the retort from raw silk, and afterwards rectified with oil of cinnamon, or any other essential oil; and was in reality no better than the common sal volatile oleosum, or any of the volatile spirits impregnated with an essential oil, except that it was less disagreeable than any of them to the taste.

Palsy Drops. See PHARMACY, n° 443.

Drops of Life. Ibid, n° 575.

DROPSY, in medicine, an unnatural collection of water in any part of the body. See (the *Index* subjoined to) MEDICINE.

DROPWORT, in botany. See FILIPENDULA.

Water Dropwort, in botany. See OENANTHE.

DROSERA, *ROS SOLIS*, or *Sun-Dew*, in botany; a genus of the pentagynia order, belonging to the pentandria class of plants. There are three species, which grow naturally in boggy places in many parts of the kingdom. They seem to receive the name of *sun-dew* from a very striking circumstance in their appearance. The leaves, which are circular, are fringed with hairs supporting small drops or globules of a pellucid liquor like dew, which continue even in the hottest part of the day and in the fullest exposure to the sun. The whole plant is acrid, and sufficiently caustic to erode the skin: but some ladies know how to mix the juice with milk, so as to make it an innocent and safe application to remove freckles and sun-burn. The juice that exudes from it unmixed, will destroy warts and corns. The plant hath the same effect upon milk that the common butterwort hath; and like that too is supposed to occasion the rot in sheep.

DROWNING, signifies the extinction of life by a total immersion in water.

In some respects, there seems to be a great similarity between the death occasioned by immersion in water, and that by strangulation, suffocation by fixed air, apoplexies, epilepsies, sudden faintings, violent shocks of electricity, or even violent falls and bruises. Physicians, however, are not agreed with regard to the nature of the injury done to the animal system in any or all of these accidents. It is indeed certain, that in all the cases above-mentioned, particularly in drowning, there is very often such a suspension of the vital powers as to us hath the appearance of a total extinction of them; while yet they may be again set in motion, and the person restored to life, after a much longer submersion than hath been generally thought capable of producing absolute death. It were to be wished, however, that as it is now universally allowed, that drowning is only a *suspension* of the action of the vital powers, physicians could as unanimously determine the means by which these powers are suspended; because on a knowledge of these means, the methods to be used for recovering drowned persons must certainly depend.

Dr de Haen, who hath written a treatise on this subject, ascribes this diversity of opinion among the physicians to their being so ready to draw general conclusions from a few experiments. Some, having never found water in the lungs, have thought that it never

Drowning. was there; and others, from its presence, have drawn a contrary conclusion. Some have ascribed the death which happens in cases of drowning, to that species of apoplexy which arises from a great fullness of the stomach. But this opinion our author rejects, because in 13 dogs which he had drowned and afterwards dissected, no signs of such a fullness appeared. Another reason is drawn from the want of the common marks of apoplexy on the dissection of the brain; and from the actual presence of water in the lungs. He is of opinion, that the death of drowned persons happens in consequence of water getting into the lungs, and stopping the blood in the arteries. He then discusses the question how far the blowing of air into the lungs is useful in recovering drowned people. If their death is to be ascribed to the water entering the lungs, this practice, he observes, must be hurtful, as it will increase the pressure on the blood-vessels, or may even force the water into them; which, on the authority of Lewis's experiments, he alleges is possible. But, in spite of this reasoning, he asserts, that from experience it has been found useful. He allows, that the practice of suspending drowned people by the feet must be hurtful, by determining the blood too much to the head; but he observes, that remedies in some respects hurtful may be used when the advantages derived from them preponderate; and is of opinion, that the practice above-mentioned may be useful by agitating the viscera against each other, and thus renewing their motions. Cutting the larynx in order to admit air more freely to the lungs, he reckons to be of little or no use; but acknowledges, however, that it may sometimes prove beneficial on account of the irritation occasioned by the operation.

Dr Cullen, in his Letter to Lord Cathcart concerning the recovery of persons drowned and seemingly dead, tells us, that "From the dissection of drowned men, and other animals, it is known, that very often the water does not enter into the cavity of the lungs, nor even into the stomach, in any quantity to do hurt to the system; and, in general, it is known, that, in most cases, no hurt is done to the organisation of the vital parts. It is therefore probable, that the death which ensues, or seems to ensue, in drowned persons, is owing to the stoppage of respiration, and to the ceasing, in consequence, of the circulation of the blood, whereby the body loses its heat, and, with that, the activity of the vital principle."

In the Phil. Transf. Vol. LXVI. Mr Hunter gives the following theory. The loss of motion in drowning, seems to arise from the loss of respiration; and the immediate effect this has upon the other vital motions of the animal, at least this privation of breathing; appears to be the first cause of the heart's motion ceasing. It is most probable therefore, Mr Hunter observes, that the restoration of breathing is all that is necessary to restore the heart's motion; for if a sufficiency of life still remains to produce that effect, we may suppose every part equally ready to move the very instant in which the action of the heart takes place, their actions depending so much upon it. What makes it very probable, that the principal effect depends upon throwing air into the lungs, is, that children in the birth, when too much time has been spent after the loss of that life which is peculiar to the fetus, lose altogether the disposition for the new life. In such cases there is a to-

tal suspension of the actions of life; the child remains to all appearance dead; and would die, if air was not thrown into its lungs, and the first principle of action by that means restored. To put this in a clearer light, Mr Hunter gives the result of some experiments made on a dog in 1755.—A pair of double bellows were provided, which were so constructed, that, by one action, air was thrown into the lungs, and by the other the air was sucked out which had been thrown in by the former, without mixing them together. The muzzle of these bellows was fixed into the trachea of a dog, and by working them he was kept perfectly alive. While this artificial breathing was going on, the sternum was taken off, so that the heart and lungs were exposed to view. The heart then continued to act as before, only the frequency of its action was greatly increased. Mr Hunter then stopped the motion of the bellows; and observed that the contraction of the heart became gradually weaker and less frequent, till it left off moving altogether; but, by renewing the operation, the motion of the heart also revived, and soon became as strong and frequent as before. This process was repeated upon the same dog ten times; sometimes stopping for five, eight, or ten minutes. Mr Hunter observed, that, every time he left off working the bellows, the heart became extremely turgid with blood, and the blood in the left side became as dark as that in the right, which was not the case when the bellows were working. These situations of the animal, he observes, seem to be exactly similar to drowning.

From these different views of this matter, physicians have differed considerably in their account of the methods to be followed in attempting the recovery of drowned persons. De Haen recommends agitation of all kinds; every kind of stimulus applied to the mouth, nose, and rectum; bleeding; heat, both by warm cloths and warm water; blowing air into the trachea; stimulants, such as blisters, warm affusions, &c. applied to the head, ankles, thighs, pit of the stomach, and other parts.

Doctor Cullen's observations on this subject are as follow.—"With respect to the particular means to be employed for the recovery of drowned persons, it is to be observed, in the first place, That such as were recommended and practised, upon a supposition that the suffocation was occasioned by the quantity of water taken into the body, and therefore to be evacuated again, were very unhappily advised. The hanging up of persons by the heels, or setting them upon the crown of the head, or rolling the body upon a cask, were generally practised, upon a supposition altogether false; or upon the supposition of a case which, if real, is apprehended to be irrecoverable. At the same time, these practices were always attended with the danger of bursting some vessels in the brain or lungs, and of rendering thereby some cases incurable, that were not so from the drowning alone. All such practices, therefore, are now very properly disapproved of and forbid.

"In those cases in which the body has not been long in the water, and in which therefore the natural heat is not entirely extinguished, nor the irritability of the moving fibres very greatly impaired, it is possible that a good deal of agitation of the body may be the only means necessary to restore the action of the vital or-

Drowning. gans; but in other cases, where the heat and irritability have ceased to a greater degree, it is to me very doubtful, if much agitation can be safe, and if any degree of it can be useful, till the heat and irritability are in some measure restored. In all cases, any violent concussion cannot be safe, and, I believe, is never necessary. It may be proper here to observe also, that, in transporting the body from the place where it is taken out of the water, to the place where it may be necessary for applying the proper means of its recovery, all postures exposing to any improper compression, as that of the body's being carried over a man's shoulder, are to be avoided. The body is to be kept stretched out, with the head and upper parts a little raised; and care is to be taken to avoid the neck's being bent much forward. In this manner, laid upon one side, and upon some straw in a cart, it may be most properly conveyed; and the agitation which a pretty brisk motion of the cart may occasion, will, in most cases, do no harm.

"From the account I have given above of the causes, or of the appearances, of death, in drowned persons, it is evident, that the first step to be taken for their recovery is to restore the heat of the body, which is absolutely necessary to the activity of the moving fibres. For this purpose, the body, as soon as possible, is to be stripped of its wet clothes, to be well dried, and to be wrapped up in dry, and (if possible) warm, coverings: and it is to be wished, in all cases, as soon as the report of a person's being drowned is heard, that blankets should be immediately carried to the water-side; so that, as soon as the body is got out of the water, the change of covering just now mentioned may be instantly made; or, if the body has been naked when drowned, that it may be immediately dried, and defended against the cold of the air. Besides covering the body with blankets, it will be further of advantage, if it can be done without loss of time, to cover the drowned body with a warm shirt or waistcoat immediately taken from a living person.

"When, at the time of a person's being drowned, it happens that the sun shines out very hot, I think there can be no better means of recovering the heat, than by exposing the naked body, in every part, to the heat of the sun; while, at the same time, all other means necessary or useful for the recovery of life are also employed.

"When the heat of the sun cannot be employed, the body should be immediately transported to the nearest house that can be got convenient for the purpose: The fittest will be one that has a tolerably large chamber, in which a fire is ready, or can be made; and, if possible, the house should afford another chamber, in which also a fire can be provided.

"When the drowned body is brought into such house, and care is at the same time taken that no more people are admitted than are absolutely necessary to the service of the drowned person, every endeavour must be immediately employed for recovering the heat of the body, and that by different measures, as circumstances shall direct.

"If, in the neighbourhood of the place, there be any brewery, distillery, dyery, or fabric which gives an opportunity of immediately obtaining a quantity of warm water and a convenient vessel, there is nothing more

proper than immersing the body in a warm bath. Even where a sufficient quantity of warm water cannot be had at once, the bath may be still practised, if the accident has happened in or very near a town or village, when a great many fires may be at once employed in heating small quantities of water; for in this way the necessary quantity may be soon obtained. To encourage this practice, it is to be observed, That one part of boiling water is more than sufficient to give the necessary heat to two parts of spring or sea water, as it is not proper to apply the bath at first very warm, nor even of the ordinary heat of the human body, but somewhat under it; and, by the addition of warm water, to bring it gradually to a heat very little above it.

"If the drowned body be of no great bulk, it may be conveniently warmed by a person's lying down in bed with it, and taking it near to their naked body, changing the position of it frequently, and at the same time chaffing and rubbing with warm cloths the parts which are not immediately applied to their warm body.

"If none of these measures can be conveniently practised, the body is to be laid upon a bed before a moderate fire, and frequently turned, to expose the different parts of it; and thus, by the heat of the fire gradually applied, and by rubbing the body well with coarse towels, or other cloths well warmed, pains are to be taken for restoring its heat. This will be promoted by warm cloths applied and frequently renewed under the hands and arm-pits; and by hot bricks, or bottles of warm water, laid to the feet.

"In the practice of rubbing, it has been proposed to moisten the cloths applied with camphorated spirits, or other such stimulating substances: but I think this must prove an impediment to the rubbing; and I would not recommend any practice of this kind, except, perhaps, the application of the vinous spirit of sal ammoniac to the wrists and ankles only.

"For recovering the heat of the body, it has been proposed, to cover it all over with warm grains, ashes, sand, or salt; and where these, sufficiently warm, are ready at hand, they may be employed; but it is very seldom they can be obtained, and the application might often interfere with other measures that may be necessary. All therefore that I can propose, with respect to the use of these, is to observe, that bags of warm and dry salt may be amongst the most convenient applications to the feet and hands of drowned persons; and the quantity necessary for this purpose may be got pretty quickly by heating the salt in a frying-pan over a common fire.

"While these measures are taking for recovering the heat, means are at the same time to be employed for restoring the action of the moving fibres. It is well known, that the intestines are the parts of the body which, both from their internal situation and peculiar constitution, retain the longest their irritability; and therefore, that, in drowned persons, stimulants applied may have more effect upon the intestines than upon other parts. The action, therefore, of the intestines is to be supported or renewed as soon as possible; as the restoring and supporting the action of such a considerable portion of moving fibres as those of the intestines, must contribute greatly to restore the activity of the whole system.

"For exciting the action of the intestines, the most proper

Drowning.

Drowning. proper mean is, the application of their ordinary stimulus of dilatation; and this is most effectually applied, by forcing a quantity of air into them by the fundement. Even the throwing in cold air has been found useful: but it will certainly be better if heated air can be employed; and further, if that air can be impregnated with something which, by its acrimony, also may be powerful in stimulating the intestines.

"From all these considerations, the smoke of burning tobacco has been most commonly applied, and has upon many occasions proved very effectual. This will be most properly thrown in by a particular apparatus, which, for other purposes as well as this, should be in the hands of every surgeon; or at least should, at the public expence, be at hand in every part of the country where drownings are likely to happen. With regard to the use of it, I have to observe, that till the tobacco is kindled in a considerable quantity, a great deal of cold air is blown through the box and tube; and as that, as hinted above, is not so proper, care should be taken to have the tobacco very well kindled, and to blow through it very gently, till the heated smoke only passes through. If, upon certain occasions, the apparatus referred to should not be at hand, the measure however may be executed by a common tobacco pipe, in the following manner: A common glyster-pipe that has a bag mounted upon it, is to be introduced into the fundement, and the mouth of the bag is to be applied round the small end of a tobacco-pipe. In the bowl of this, tobacco is to be kindled; and, either by a playing card made into a tube and applied round the mouth of the bowl, or by applying upon this the bowl of another pipe that is empty and blowing through it, the smoke may be thus forced into the intestines, and, in a little time, in a considerable quantity.

"If none of these means for throwing in the smoke can be employed, it may be useful to inject warm water to the quantity of three or four English pints. This may be done by a common glyster-bag and pipe, but better by a large syringe; and it may be useful to dissolve in the water some common salt, in the proportion of half an ounce to an English pint; and also, to add to it some wine or brandy.

"While these measures for recovering the heat of the body and the activity of the moving fibres are employed, and especially after they have been employed for some time, pains are to be taken to complete and finish the business, by restoring the action of the lungs and heart.

"On this subject, I am obliged to my learned and ingenious colleague, Doctor Monro, who has made some experiments for ascertaining the best manner of inflating the lungs of drowned persons. By these experiments he finds it may be more conveniently done by blowing into one of the nostrils, than by blowing into the mouth. For blowing into the nostril, it is necessary to be provided with a wooden pipe, fitted at one extremity for filling the nostril, and at the other for being blown into by a person's mouth, or for receiving the pipe of a pair of bellows, to be employed for the same purpose. Doctor Monro finds, That a person of ordinary strength can blow into such a pipe, with a sufficient force to inflate the lungs to a considerable degree; and thinks the warm air from the

lungs of a living person will be most conveniently employed at first; but when it is not soon effectual in restoring the respiration of the drowned person, and that a longer continuance of the inflation is necessary, it may be proper to employ a pair of bellows, large enough at once to contain the quantity of air necessary to inflate the lungs to a due degree.

"Whether the blowing-in is done by a person's mouth, or by bellows, Doctor Monro observes, that the air is ready to pass by the gullet into the stomach; but that this may be prevented, by pressing the lower part of the larynx backwards upon the gullet. To persons of a little knowledge in anatomy, it is to be observed, that the pressure should be only upon the cricoid cartilage, by which the gullet may be straitened, while the passage through the larynx is not interrupted.

When, by blowing thus into the nostril, it can be perceived, by the raising of the chest or belly, that the lungs are filled with air, the blowing in should cease; and, by pressing the breast and belly, the air received into the lungs should be again expelled; then the blowing and expulsion should be again repeated; and thus the practice is to be continued, so as to imitate, as exactly as possible, the alternate motions of natural respiration.

"It is hardly necessary to observe, that when the blowing into the nostril is practised, the other nostril and the mouth should be accurately closed.

"If it should happen, that, in this practice, the air does not seem to pass readily into the lungs, Doctor Monro informs me, it is very practicable to introduce directly into the glottis and trachea a crooked tube, such as the catheter used for a male adult. For this he offers the following directions: The surgeon should place himself on the right side of the patient; and, introducing the forefinger of his left hand at the right corner of the patient's mouth, he should push the point of it behind the epiglottis; and using this as a directory, he may enter the catheter, which he holds in his right hand, at the left corner of the patient's mouth, till the end of it is passed beyond the point of his forefinger; and it is then to be let fall, rather than pushed into the glottis; and through this tube, by a proper syringe applied to it, air may be with certainty blown into the lungs. I observe, that some such measure had been proposed by Mons. Le Cat in France; but I have not learned that it has ever been put in practice, and I am afraid it may be attended with several difficulties, and must be left to the discretion of surgeons, who may be properly provided and instructed for this purpose.

"For throwing air with more certainty into the lungs, it has been proposed to open the windpipe in the same manner as is done in the operation which the surgeons call *bronchotomy*, and by this opening to blow into the lungs; and when the blowing into the nostril does not seem to succeed, and a skilful operator is at hand, I allow that the measure may be tried; but I can hardly suppose, that it will be of any advantage when the blowing in by the nostril has entirely failed.

"It is to be hoped, that by blowing into the lungs one way or other, even a quantity of water which had been taken into the lungs may be again washed out; and the same seems to be the only effectual means of washing out that frothy matter which is found to fill the lungs of drowned persons, and which proves, if I

mistake

Drowning. mistake not, the most common cause of their mortal suffocation. This practice, therefore, is to be immediately entered upon, and very assiduously continued for an hour or two together.

"I have now mentioned the measures chiefly to be pursued and depended upon for the recovery of drowned persons; but must still mention some others that may prove considerable helps to it.

"One of these is, the opening the jugular veins to relieve the congestion, which almost constantly occurs in the veins of the head, and is probably a frequent cause of the death of drowned persons. For relieving this congestion, the drawing some blood from the jugulars, very early, may certainly be of service; and it will be particularly indicated by the livid and purple colour of the face. It may even be repeated, according to the effect it seems to have in taking off that suffusion; but when the drowned person is in some measure recovered, and some motion of the blood is restored, it will be proper to be very cautious in making this evacuation, and at least to take care not to push it so far as to weaken too much the recovering, but still weak, powers of life.

"Another measure for recovering the activity of the vital principle, is the application of certain stimulants to the more sensible parts of the body, such as holding the quick-lime spirit of sal ammoniac to the nose, or putting a little of it upon a rag into the nostrils. It has been usual to pour some liquids into the mouth; but it is dangerous to pour in any quantity of liquid, till it appear that the power of swallowing is in some measure restored.

"When a surgeon is at hand, and is provided with proper apparatus, a crooked pipe may be introduced into the gullet; and by this a gill or two of warm wine may be poured down into the stomach, and probably with advantage. But when no such apparatus is at hand, or surgeon to employ it, and the power of swallowing is still doubtful, the trial of pouring liquids into the mouth should be made by a small quantity of warm water alone; and when, from such trial, the power of swallowing shall appear to be recovered, it may then be allowable to favour the further recovery of the person, by pouring in some wine or brandy.—In short, till some marks of the recovery of swallowing and respiration appear, it will not be safe to apply any stimulants to the mouth, excepting that of a few drops of some acrid substance to the tongue, and which are not of bulk enough to slide back upon the glottis: I can think of no stimulant, more conveniently and safely to be applied to the mouth and nostrils, than a moderate quantity of tobacco-smoke blown into them.

"Though I do not imagine that drowned persons are ever hurt by the quantity of water taken into their stomach, yet, as a stimulus applied to the stomach, and particularly as the action of vomiting proves a stimulus to the whole system, I can have no objection to the French practice of throwing in an emetic as soon as any swallowing is restored. For this purpose, I would successively throw in some tea-spoonfuls of the ipecacuanha wine; and, when it does not interfere with other necessary measures, the fauces may be gently irritated by an oiled feather thrust into them.

"With regard to the stimulants, I must conclude with observing, That when a body has lain but for a

short time in the water, and that therefore its heat and irritability are but little impaired, the application of stimulants alone has been often found effectual for the recovery; but, on the contrary, when the body has lain long in the water, and the heat of it is very much extinguished, the application of any other stimulants than that of tobacco-smoke to the intestines can be of very little service; and the application of others ought never to interfere with the measures for recovering heat and the motion of respiration.

"With respect to the whole of these practices, I expect, from the principles upon which they are in general recommended, it will be understood, that they are not to be soon discontinued, though their effects do not immediately appear. It is obvious, that, in many cases, it may be long before the heat of the body, and the activity of the vital principle, can be restored, although, in a longer time, it may very possibly be accomplished. In fact, it has often happened, that those means, employed for one hour, have not succeeded, the same continued for two or more hours, have, at length, had the wished for effects. It should therefore be a constant rule, in this business, that the proper means should be employed for several hours together; unless it happen, that, while no symptoms of returning life appear, the symptoms of death shall, at the same time, go on constantly increasing.

"In the whole of the above I have kept in view chiefly the case of drowned persons: but it will be obvious, that many of the measures proposed will be equally proper and applicable in other cases of suffocation; as those from strangling, the damps of mines, the fumes of charcoal, &c.; and a little attention to the difference of circumstances will lead to the measures most proper to be employed."

Mr Hunter, in the before-mentioned paper, differs pretty considerably from De Haen and Dr Cullen. He observes, that when assistance is soon called in after immersion, blowing air into the lungs will in some cases effect a recovery; but when any considerable time has been lost, he advises stimulant medicines, such as the vapour of volatile alkali, to be mixed with the air; which may easily be done, by holding spirits of hartshorn in a cup under the receiver of the bellows. And, as applications of this kind to the olfactory nerves tend greatly to rouse the living principle, and put the muscles of respiration into action, it may probably, therefore, be most proper to have air impregnated in that manner thrown in by the nose. To prevent the stomach and intestines from being too much distended by the air so injected, the larynx is directed to be gently pressed against the œsophagus and spine.

While this business is going on, an assistant should prepare bed-cloaths, carefully brought to a proper degree of heat. Heat our author considers as congenial with the living principle; increasing the necessity of action, it increases action; cold, on the other hand, lessens the necessity, and of course the action is diminished; to a due degree of heat, therefore, the living principle, he thinks, owes its vigour. From experiments, he says, it appears to be a law in animal bodies, that the degree of heat should bear a proportion to the quantity of life; as life is weakened, this proportion requires great accuracy, while greater powers of life allow it greater latitudes.

After

Drowning.

After these and several other observations on the same subject, our author proceeds to more particular directions for the management of drowned people.

If bed-cloaths are put over the person, so as scarce to touch him, steams of volatile alkali, or of warm balsams, may be thrown in, so as to come in contact with many parts of the body. And it might probably be advantageous, Mr Hunter observes, to have steams of the same kind conveyed into the stomach. This, we are told, may be done by a hollow bougie, and a syringe; but the operation should be very speedily performed, as the instrument, by continuing long in the mouth, might produce sickness, which our author says he would always wish to avoid.

Some of the warm stimulating substances, such as juice of horse-radish, pepper-mint water, and spirits of harts-horn, are directed to be thrown into the stomach in a fluid state, as also to be injected by the anus. Motion possibly may be of service; it may at least be tried; but as it hath less effect than any other of the usually prescribed stimuli, it is directed to be the last part of the process.

The same care in the operator, in regulating the proportion of every one of these means, is here directed, as was formerly given for the application of heat. For every one of them, our author observes, may possibly have the same property of destroying entirely the feeble action which they have excited, if administered in too great a quantity: instead, therefore, of increasing and hastening the operations on the first signs of returning life being observed, as is usually done, he desires they may be lessened; and advises their increase to be afterwards proportioned, as nearly as possible, to the quantity of powers as they arise.

When the heart begins to move, the application of air to the lungs should be lessened, that, when the muscles of respiration begin to act, a good deal may be left for them to do.

Mr Hunter absolutely forbids blood-letting in all such cases; for, as it not only weakens the animal principle, but lessens life itself, it must consequently, he observes, lessen both the powers and dispositions to action. For the same reason, he is against introducing any thing into the stomach that might produce sickness or vomiting; and, on the same principle, he says, we should avoid throwing tobacco fumes, or any other such articles, up by the anus, as might tend to an evacuation that way.

The following is a description of instruments recommended for such operations by our author.

First, A pair of bellows, so contrived, with two separate cavities, that, by opening them when applied to the nostrils or mouth of a patient, one cavity will be filled with common air, and the other with air sucked out from the lungs, and by shutting them again, the common air will be thrown into the lungs, and that sucked out of the lungs discharged into the room. The pipe of these should be flexible; in length a foot, or a foot and an half; and, at least, three eighths of an inch in width. By this the artificial breathing may be continued, while the other operations, the application of the stimuli to the stomach excepted, are going on, which could not be conveniently done if the muzzle of the bellows were introduced into the nose. The end next the nose should be double, and applied to both

nostrils. *Secondly*, A syringe, with a hollow bougie, or flexible catheter, of sufficient length to go into the stomach, and convey any stimulating matter into it, without affecting the lungs. *Thirdly*, a pair of small bellows, such as are commonly used in throwing fumes of tobacco up by the anus.

Notwithstanding the differences in theory, however, between the physicians above-mentioned, it is certain, that within these few years great numbers of drowned people have been restored to life by a proper use of the remedies we have enumerated, and societies for the recovery of drowned persons have been instituted in different places. The first society of this kind was instituted in Holland, where, from the great abundance of canals and inland seas, the inhabitants are particularly exposed to accidents by water. In a very few years 150 persons were saved from death by this society; and many of these had continued upwards of an hour without any signs of life, after they had been taken out of the water. The society was instituted at Amsterdam in 1767: and, by an advertisement, informed the inhabitants of the United Provinces of the methods proper to be used on such occasions; offering rewards at the same time to those who should, with or without success, use those methods for recovering persons drowned and seemingly dead. The laudable and humane example of the Dutch was followed in the year 1768 by the magistrates of health in Milan and Venice; afterwards by the magistrates of Hamburg in the year 1771, by those of Paris in the year 1772, and by the magistrates of London in 1774.

DRUG, a general term for goods of the druggist and grocery kinds, especially those used in medicine and dyeing. See MATERIA MEDICA, PHARMACY, and DYEING.

DRUGGET, in commerce, a stuff sometimes all wool, and sometimes half wool half thread, sometimes corded, but usually plain. Those that have the wool of wool, and the warp of thread, are called *threaded druggets*; and those wrought with the shuttle on a loom of four marches, as the serges of Mouni, Beauvois, and other like stuffs corded, are called *corded druggets*. As to the plain, they are wrought on a loom of two marches, with the shuttle, in the same manner as cloth, camblets, and other like stuffs not corded.

DRUIDS, the priests among the ancient Britons and Gauls.—The word is formed from the Celtic, *deru*, an oak; because they held that tree in the highest veneration.

Their antiquity is esteemed equal to that of the Brachmans of India, the Magi of Persia, and the Chaldees of Babylon. And whoever considers the surprising conformity of their doctrine, will find sufficient reason to think that they all derived it from the same hand, we mean from Noah and his immediate descendants, who carried it with them at their dispersion; for it cannot be supposed that the British druids derived their doctrine from any foreign sect, to whom they were absolutely unknown.

But the druids were not contented with the power annexed to the priesthood: they introduced religion into every transaction both public and private, so that nothing could be done without their approbation; and by this means their authority was rendered almost absolute. They elected the annual magistrates of every district,

Drowning
||
Druids.

district, who should have enjoyed during that term the supreme authority, and sometimes the title of *kings*: but they could not even call a council without their approbation and advice; so that, notwithstanding their pretended authority, they were in reality the creatures and slaves of the druids.

They exercised the same arbitrary power in their courts of justice; and whoever refused to submit to their decisions, were excluded from the public sacrifices, which was considered as the greatest punishment that could be inflicted. It must, however, be acknowledged, that their administration of justice has always been celebrated for its impartiality. The sole management and instruction of youth was also committed to them, except the training them up in the art of war; for both they and their disciples were not only exempted from going to war, but likewise from all kind of tribute.

Their garments were remarkably long; and, when employed in religious ceremonies, they always wore a white surplice. They generally carried a wand in their hands; and wore a kind of ornament enshased in gold about their necks, called the *druid's egg*. Their necks were likewise decorated with gold chains, and their hands and arms with bracelets: they wore their hair very short, and their beards remarkably long.

They were all subordinate to a chief or sovereign pontiff, styled the *arch-druid*, chosen from among their fraternity by a plurality of voices; but, in case of a competition too powerful to be decided by a majority, the contest was determined by the sword. He enjoyed his supremacy for life, had power to inspect the conduct of kings, and either to elect or depose whenever he pleased.

It was one of the maxims of their religion, not to commit any thing to writing; but deliver all their mysteries and learning in verses composed for that purpose; and these were in time multiplied to such a number, that it generally took up 20 years to learn them all by heart. By this means their doctrines appeared more mysterious by being unknown to all but themselves; and having no books to recur to, they were the more careful to fix them in their memory.

But what had still a more direct tendency to impose on the public, was their pretended familiar intercourse with the gods. And in order at once to conceal their own ignorance, and render the imposition less susceptible of detection, they boasted of their great skill in magic, and cultivated several branches of the mathematics, particularly astronomy. The latter they carried to some degree of perfection; for they were able to foretell the times, quantities, and durations, of eclipses: a circumstance which could not fail of attracting reverence from an ignorant multitude, who were persuaded that nothing less than a supernatural power was sufficient to make such astonishing predictions. They also studied natural philosophy, and practised physic.

They worshipped the Supreme Being under the name of *Efus*, or *Hesus*, and the symbol of the oak; and had no other temple than a wood or a grove, where all their religious rites were performed. Nor was any person admitted to enter that sacred recess, unless he carried with him a chain, in token of his absolute dependence on the Deity. Indeed, their whole religion originally consisted in acknowledging, that the Supreme

Being, who made his abode in these sacred groves, governed the universe; and that every creature ought to obey his laws, and pay him divine homage.

They considered the oak as the emblem, or rather the peculiar residence, of the Almighty; and accordingly chaplets of it were worn both by the druids and people in their religious ceremonies, the altars were strewed with its leaves and encircled with its branches. The fruit of it, especially the milletoe, was thought to contain a divine virtue, and to be the peculiar gift of heaven. It was therefore sought for on the sixth day of the moon with the greatest earnestness and anxiety; and when found was hailed with such raptures of joy, as almost exceeds imagination to conceive. As soon as the druids were informed of this fortunate discovery, they prepared every thing ready for the sacrifice under the oak, to which they fastened two white bulls by the horns; then the arch-druid, attended by a prodigious number of people, ascended the tree, dressed in white; and with a consecrated golden knife, or pruning hook, cropped the milletoe, which he received in his sagum or robe, amidst the rapturous exclamations of the people. Having secured this sacred plant, he descended the tree; the bulls were sacrificed; and the Deity invoked to bless his own gift, and render it efficacious in those distempers in which it should be administered.

The consecrated groves, in which they performed their religious rites, were fenced round with stones, to prevent any person's entering between the trees, except through the passages left open for that purpose, and which were guarded by some inferior druids, to prevent any stranger from intruding into their mysteries. These groves were of different forms; some quite circular, others oblong, and more or less capacious as the numbers of votaries in the districts to which they belonged were more or less numerous. The area in the centre of the grove was encompassed with several rows of large oaks set very close together. Within this large circle were several smaller ones surrounded with large stones; and near the centre of these smaller circles, were stones of a prodigious size, and convenient height, on which the victims were slain and offered. Each of these being a kind of altar, was surrounded with another row of stones, the use of which cannot now be known, unless they were intended as inclosures to keep the people at a convenient distance from the officiating priest. Nor is it unreasonable to suppose, that they had other groves appointed for secular purposes, and perhaps planted with oaks as the others were, that the sacred trees might strike the members of such courts and councils with awe, and prevent all quarrels and indecent expressions.

While the religion of the druids continued pure and unmixed with any foreign customs, they offered only oblations of fine flour sprinkled with salt, and adored the Supreme Being in prayers and thanksgivings. But after they had for some time carried on a commerce with the Phenicians, they lost their original simplicity, adored a variety of gods, adopted the barbarous custom of offering human victims, and even improved on the cruelty of other nations; using these unfortunate mortals for the purposes of divination, with such barbarous cruelty as is shocking to human nature to relate. Practices like these soon rendered them so deaf to voice

Druids
||
Drummond

voice of humanity, that on extraordinary occasions they erected a monstrous hollow pile of oil, which they filled with these unhappy wretches, and burnt them to their gods. Criminals were indeed chosen for this barbarous sacrifice; but, in want of these, the innocent became victims of a cruel superstition.

We have already mentioned, that in their sacred groves were several large stones, supposed to be the altars on which they offered their victims. Some of these stones are still remaining in England, Wales, Ireland, and the island of Anglesey; and are of such an amazing magnitude, that the bringing and rearing them was thought by the superstitious to have been the work of those demons supposed to attend on that manner of worship.

Temples they had none before the coming of the Romans, nor in all probability for a long time after: for with regard to those vast piles of stones still remaining, they seem rather to have been funeral monuments than places of worship; especially as all the ancient writers agree that their religious ceremonies were always performed in their consecrated groves. Accordingly Tacitus, speaking of the descent of the Romans, tells us, that their first care was to destroy those groves and woods which had been polluted with the blood of so many human victims.

One of the chief tenets taught by the druids was the immortality of the soul, and its transmigration from one body to another; a doctrine which they considered as proper to inspire them with courage, and a contempt of death. They also instructed their disciples in several traditions concerning the stars and their motions, the extent of the world, the nature of things, and the power of the immortal gods. But as they never committed any of their tenets to writing, in order at once to conceal their mysterious learning from the vulgar, and exercise the minds of their disciples, the greatest part of them are now irrecoverably buried in oblivion.

DRUM, is a martial musical instrument in form of a cylinder, hollow within, and covered at the two ends with vellum, which is stretched or slackened at pleasure by the means of small cords or sliding knots: it is beat upon with sticks. Drums are sometimes made of brass, but most commonly they are of wood.—The drum is by Le Clerc said to have been an Oriental invention, and to have been brought by the Arabians, or perhaps rather the Moors, into Spain.

Kettle Drums, are two sorts of large basons of copper or brass, rounded in the bottom, and covered with vellum, or goat-skin, which is kept fast by a circle of iron round the body of the drum, with a number of screws to screw up and down. They are much used among the horse; as also in operas, oratorios, concerts, &c.

DRUM, or *Drummer*, he that beats the drum; of whom each company of foot has one, and sometimes two. Every regiment has a drum-major, who has the command over the other drums. They are distinguished from the soldiers, by cloaths of a different fashion: their post, when a battalion is drawn up, is on the flanks, and on a march it is betwixt the divisions.

DRUM of the *Ear*, the same with the *Tympanum*. See ANATOMY, n° 405.

DRUMMOND (William), a polite writer, born in Scotland, in 1585, was the son of Sir John Drum-

mond, gentleman-usher to king James VI. He had his education at Edinburgh; and afterwards being sent into France, studied the civil law at Bourges: but his genius leading him to polite literature, he returned to Scotland, and retired to his agreeable seat at Hawthornden. Here he spent his time in reading Greek and Latin authors, and obliged the world with several fine productions. He wrote his *Cypress Grove*, a piece of excellent prose, after a dangerous fit of sickness; and about this time his *Flowers of Sion*, in verse. But an accident befel him, which obliged him to quit his retirement; and that was the death of an amiable lady he was just going to be married to. This affected him so deeply, that he went to Paris and Rome, between which two places he resided eight years. He travelled also through Germany, France, and Italy: where he visited universities; conversed with learned men; and made a choice collection of the best ancient Greek, and of the modern Spanish, French, and Italian books. He then returned to his native country, where a civil war was just ready to break out: upon which he retired again, and in this retirement is supposed to have written his *History of the five James's*, successively kings of Scotland, which was not published till after his death. Besides this, he composed several other tracts against the measures of the covenanters and those engaged in the opposition of Charles I. In a piece called *Irene*, he harangues the king, nobility, and clergy, about their mutual mistakes, fears, and jealousies: he lays before them the consequences of a civil war, from indisputable arguments and the histories of past times. The great marquis of Montrose wrote a letter to him, desiring him to print this *Irene*, as the best means to quiet the minds of a distracted people: he likewise sent him a protection dated August 1645, immediately after the battle of Killyth, with a letter, in which he commends Mr Drummond's learning and loyalty. Mr Drummond wrote other things also with the same view of promoting peace and union, of calming the disturbed minds of the people, of reasoning the better sort into moderation, and checking the growing evils which would be the consequence of their obstinacy. He died in the year 1649, having married a wife five years before, by whom he had some children: William, who was knighted in Charles the II'd's time; Robert; and Elizabeth, who was married to Dr Henderfon a physician at Edinburgh. He had a great intimacy and correspondence with the two famous English poets, Michael Drayton and Ben Jonson; the latter of whom travelled from London on foot, to see him at his seat at Hawthornden. His works consisted of several things in verse and prose; an edition of which, with his life prefixed, was printed in folio at Edinburgh, 1711.

DRUNKENNESS, a well known disorder in the brain, occasioned by drinking too freely of spirituous liquors. Drunkenness appears in different shapes, in different constitutions: some it makes gay, some sullen, and some furious.

The ancient Lacedaemonians used to make their slaves frequently drunk, to give their children an aversion and horror for the same. The Indians hold drunkenness a species of madness; and in their language, the same term (*rangam*), that signifies drunkard, signifies also a phrenetic.

Drunkenness, by the law of England, is looked up-

Drum-
mond,
Drunkenn-
ess.

Drunk-
ness,
Drupa.

on as an aggravation rather than an excuse for any criminal behaviour. A drunkard, says Sir Edward Coke, who is *voluntarius demon*, hath no privilege thereby; but what hurt or illsoever he doth, his drunkenness doth aggravate it: *nam omne crimen ebrietas, et incendit, et delegit*. It hath been observed that the real use of strong liquors, and the abuse of them by drinking to excess, depend much upon the temperature of the climate in which we live. The same indulgence which may be necessary to make the blood more in Norway, would make an Italian mad. A German therefore, says the president Montesquieu, drinks thro' custom founded upon constitutional necessity; a Spaniard drinks through choice, or out of the mere wantonness of luxury; and drunkenness, he adds, ought to be more severely punished where it makes men mischievous and mad, as in Spain and Italy, than where it only renders them stupid and heavy, as in Germany and more northern countries. And accordingly, in the warmer climate of Greece, a law of Pittacus enacted, "that he who committed a crime when drunk, should receive a double punishment;" one for the crime itself, and the other for the ebriety which prompted him to commit it. The Roman law indeed made great allowances for this vice: *per vinum delapsi capitalis pœna remittitur*. But the law of England, considering how easy it is to counterfeit this excuse, and how weak an excuse it is (though real), will not suffer any man thus to privilege one crime by another.

For the offence of drunkenness a man may be punished in the ecclesiastical court, as well as by justices of peace by statute. And by 4 *Jac. I. c. 5.* and 21 *Jac. I. c. 7.* if any person shall be convicted of drunkenness by the view of a justice, oath of one witness, &c. he shall forfeit 5s. for the first offence, to be levied by distress and sale of his goods; and for want of a distress, shall sit in the stocks six hours: and, for the second offence, he is to be bound with two sureties in 10l. each, to be of good behaviour, or to be committed. And he who is guilty of any crime thro' his own voluntary drunkenness, shall be punished for it as if he had been sober. It has been held that drunkenness is a sufficient cause to remove a magistrate: and the prosecution for this offence by the statute of 4 *Jac. I. c. 5.* was to be, and still may be, before justices of peace in their sessions by way of indictment, &c. Equity will not relieve against a bond, &c. given by a man when drunk, unless the drunkenness is occasioned through the management or contrivance of him to whom the bond is given.

DRUPA, or DRUPPEA, in botany, a species of *pericarpium*, or seed-vessel, which is succulent or pulpy, has no valve or external opening like the capsule and pod, and contains within its substance a stone or nut. The cherry, plumb, peach, apricot, and all other stone-fruit, are of this kind.

The term, which is of great antiquity, is synonymous to Tournefort's *fructus molliis ossiculo*, "soft fruit with a stone;" and to the *prunus* of other botanists.

The stone, or nut, which, in this species of fruit, is surrounded by the soft pulpy flesh, is a kind of ligneous or woody cup, which contains a single kernel or seed.

This definition, however, will not apply to every seed-vessel denominated *drupa* in the *Genera Plantarum*. The almond is a *drupa*, so is the seed-vessel of the elm-

tree and the genus *rumpia*; though far from being pulpy or succulent, the first and third are of a substance like leather, the second like parchment. The same may be said of the walnut, pistachia-nut, *guettarda*, *quifqualis*, jack-in-a-box, and some others.

Again, the seeds of the elm, *schrebera*, *flagellaria*, and the mango-tree, are not contained in a stone. The seed-vessel of burr-reed is dry, shaped like a top, and contains two angular stones.

This species of fruit, or more properly seed-vessel, is commonly roundish, and, when seated below the calyx or receptacle of the flower, is furnished, like the apple, at the end opposite to the foot-stalk, with a small umbilicus or cavity, which is produced by the swelling of the fruit before the falling off of the flower-cup.

DRUSIUS (John), a Protestant writer of great learning, born at Oudenarde in Flanders in 1555. He was designed for the study of divinity; but his father being outlawed, and deprived of his estate, they both retired to England, where the son became professor of the Oriental languages at Oxford: but, upon the pacification of Ghent, they returned to their own country, where Drusus was also appointed professor of the Oriental languages. From thence he removed to Friesland, where he was admitted Hebrew professor in the university of Franeker; the functions of which he discharged with great honour till his death in 1616. His works shew him to have been well skilled in Hebrew; and the States General employed him in 1600, to write notes on the most difficult passages in the Old Testament, with a pension of 400 florins a-year: but being frequently disturbed in this undertaking, it was not published till after his death. He held a vast correspondence with the learned; for besides letters in Hebrew, Greek, and other languages, there were found 2300 Latin letters among his papers. He had a son John, who died in England at 21, and was a prodigy for his early acquisition of learning; he wrote Notes on the Proverbs of Solomon, with many letters and verses in Hebrew.

DRYADS, in the heathen theology, a sort of deities, or nymphs, which the ancients thought inhabited groves and woods. They differed from the Hamadryades, these latter being attached to some particular tree, with which they were born, and with which they died; whereas the Dryades were goddesses of trees and woods in general.

DRYDEN (John), one of the most eminent English poets of the 17th century, descended of a genteel family in Huntingdonshire, was born in that county at Oldwinle 1631, and educated at Westminster school under Dr Busby. From thence he was removed to Cambridge in 1650, being elected scholar of Trinity college, of which he appears by his *epithalamia Cantabrigiense*. 4to, 1662, to have been afterwards a fellow. Yet, in his earlier days, he gave no extraordinary indications of genius; for, even the year before he quitted the university, he wrote a poem on the death of Lord Hastings, which was by no means a preface of that amazing perfection in poetical powers which he afterwards possessed.

On the death of Oliver Cromwell he wrote some heroic stanzas to his memory; but, on the Restoration, being desirous of ingratiating himself with the new

Drusus
||
Dryden.

court, he wrote, first a poem intitled *Astræa Redux*, and afterwards a panegyric to the king on his coronation. In 1662, he addressed a poem to the Lord Chancellor Hyde; presented on New Year's day; and in the same year a satire on the Dutch. In 1668, appeared his *Annus Mirabilis*, which was an historical poem in celebration of the duke of York's victory over the Dutch. These pieces at length obtained him the favour of the crown; and Sir William Davenant dying the same year, Mr Dryden was appointed to succeed him as poet laureat. About this time also his inclination to write for the stage seems first to have shewn itself. For besides his concern with Sir William Davenant in the alteration of Shakespeare's *Tempest*, in 1669 he produced his *Wild Gallants* a comedy. This met with very indifferent success; yet the author, not being discouraged by its failure, soon published his *Indian Emperor*. This, finding a more favourable reception, encouraged him to proceed; and that with such rapidity, that, in the key to the duke of Buckingham's *Rehearsal*, he is recorded to have engaged himself by contract for the writing of four plays per year; and indeed, in the years 1679 and 1680, he appears to have fulfilled that contract. To this unhappy necessity that our author lay under, are to be attributed all those irregularities, those bombastic flights, and sometimes even puerile exuberances, for which he has been so severely criticized; and which, in the unavoidable hurry in which he wrote, it was impossible he should find time either for lopping away or correcting.

In 1675, the earl of Rochester, whose envious and malevolent disposition would not permit him to see growing merit meet with its due reward, and was therefore sincerely chagrined at the very just applause with which Mr Dryden's dramatic pieces had been received, was determined, if possible, to shake his interest at court; and succeeded so far as to recommend Mr Crowne, an author by no means of equal merit, and at that time of an obscure reputation, to write a masque for the court, which certainly belonged to Mr Dryden's office as poet laureat.—Nor was this the only attack, nor indeed the most potent one, that Mr Dryden's justly acquired fame drew on him. For, some years before, the duke of Buckingham, a man of not much better character than Lord Rochester, had most severely ridiculed several of our author's plays in his admired piece called the *Rehearsal*. But, though the intrinsic wit which runs through that performance cannot even to this hour fail of exciting our laughter, yet at the same time it ought not to be the standard on which we should fix Mr Dryden's poetical reputation, if we consider, That the pieces there ridiculed are not any of those looked on as the *chef d'oeuvres* of this author, that the very passages burlesqued, are frequently, in their original places, much less ridiculous, than when thus detached, like a rotten limb, from the body of the work; and exposed to view with additional distortions, and divested of that connection with the other parts, which, while it preserved, gave it not only symmetry but beauty; and lastly, that the various inimitable beauties, which the critic has sunk in oblivion, are infinitely more numerous than the deformities which he has thus industriously brought forth to our more immediate inspection.

Mr Dryden, however, did not suffer these attacks

to pass with impunity; for, in 1679, there came out an *Essay on Satire*, said to be written jointly by that gentleman and the earl of Mulgrave, containing some very severe reflections on the earl of Rochester and the duchess of Portsmouth, who, it is not improbable, might be a joint instrument in the above-mentioned affront shewn to Mr Dryden; and in 1681 he published his *Abraham and Achitaphel*, in which the well-known character of *Zimri*, drawn for the duke of Buckingham, is certainly severe enough to repay all the ridicule thrown on him by that nobleman in the character of *Bayes*.—The resentment shewn by the different peers was very different. Lord Rochester, who was a coward as well as a man of the most depraved morals, basely hired three ruffians to cudgel Dryden in a coffeehouse; but the duke of Buckingham, as we are told, in a more open manner, took that talk upon himself; and at the same time presented him with a purse containing no very trifling sum of money; telling him, That he gave him the beating as a punishment for his impudence, but bestowed the gold on him as a reward for his wit.

In 1680 was published a translation of *Ovid's Epistles* in English verse, by several hands, two of which, together with the preface, were by Mr Dryden; and in 1682, came out his *Religio Laici*, designed as a defence of revealed religion, against Deists, Papists, &c. Soon after the accession of king James II. our author changed his religion for that of the church of Rome, and wrote two pieces in vindication of the Romish tenets, viz. *A Defence of the papers* written by the late king, found in his strong box; and the celebrated poem, afterwards answered by Lord Halifax, entitled the *Hind and the Panther*.—By this extraordinary step he not only engaged himself in controversy, and incurred much censure and ridicule from his contemporaries wits; but, on the completion of the Revolution, being, on account of his newly-chosen religion, disqualified from bearing any office under the government, he was stripped of the laurel, which, to his still greater mortification, was bestowed on Richard Flecknoe, a man to whom he had a most settled aversion. This circumstance occasioned his writing the very severe poem, called *Mac Flecknoe*.

Mr Dryden's circumstances had never been affluent; but now being deprived of this little support, he found himself reduced to the necessity of writing for mere bread. We consequently find him from this period engaged in works of labour as well as genius, viz. in translating the works of others; and to this necessity perhaps our nation stands indebted for some of the best translations extant. In the year he lost the laurel, he published the life of *St Francis Xavier* from the French. In 1693, came out a translation of *Juvenal and Persius*; in the first of which he had a considerable hand, and of the latter the entire execution. In 1695 was published his prose version of *Presnos's art of painting*; and the year 1697 gave the world that translation of *Virgil's* works entire, which still does, and perhaps ever will, stand foremost among the attempts made on that author. The *petite pieces* of this eminent writer, such as prologues, epilogues, epitaphs, elegies, songs, &c. are too numerous to specify here, and too much dispersed to direct the reader to. The greatest part of them, however, are to be found in a collection of miscellanies, in 6 vols 12mo. His last work is what is called his *Fables*,

Dryden.

Fables, which consists of many of the most interesting stories in Homer, Ovid, Boccace, and Chaucer, translated or modernized in the most elegant and poetical manner; together with some original pieces, among which is that amazing ode on St *Cæcilia's* day, which, though written in the very decline of the author's life, and at a period when old age and distrefs conspired as it were to damp his poetic ardor and clip the wings of fancy, yet possesses so much of both, as would be sufficient to have rendered him immortal, had he never written a single line besides.

Dryden married the lady Elizabeth Howard, sister to the earl of Berkshire, who survived him eight years; though for the last four of them she was a lunatic, having been deprived of her senses by a nervous fever.—By this lady he had three sons; *Charles*, *John*, and *Henry*. Of the eldest of these, there is a circumstance related by Charles Wilson, Esq; in his Life of Congresses, which seems so well attested, and is itself of so very extraordinary a nature, that we cannot avoid giving it a place here.—Dryden, with all his understanding, was weak enough to be fond of judicial astrology, and used to calculate the nativity of his children. When his lady was in labour with his son *Charles*, he being told it was decent to withdraw, laid his watch on the table, begging one of the ladies then present, in a most solemn manner, to take exact notice of the very minute that the child was born; which she did, and acquainted him with it. About a week after, when his lady was pretty well recovered, Mr Dryden took occasion to tell her that he had been calculating the child's nativity; and observed, with grief, that he was born in an evil hour: for Jupiter, Venus, and the Sun, were all under the earth, and the lord of his ascendant afflicted with a hateful square of Mars and Saturn. If he lives to arrive at the 8th year, says he, “he will go near to die a violent death on his very birth-day; but if he should escape, as I see but small hopes, he will in the 23d year be under the very same evil direction; and if he should escape that also, the 33d or 34th year is, I fear”—here he was interrupted by the immoderate grief of his lady, who could no longer hear calamity prophesied to befall her son. The time at last came, and August was the inauspicious month in which young Dryden was to enter into the 8th year of his age. The court being in progress, and Mr Dryden at leisure, he was invited to the country-seat of the earl of Berkshire, his brother-in-law, to keep the long vacation with him in Charlton in Wilts; his lady was invited to her uncle Mordaunt's, to pass the remainder of the summer. When they came to divide the children, lady Elizabeth would have him take *John*, and suffer her to take *Charles*; but Mr Dryden was too absolute, and they parted in anger; he took *Charles* with him, and she was obliged to be content with *John*. When the fatal day came, the anxiety of the lady's spirits occasioned such an effervescence of blood, as threw her into so violent a fever, that her life was despaired of, till a letter came from Mr Dryden, reproving her for her womanish credulity, and assuring her that her child was well; which recovered her spirits, and in six weeks after she received an eclatification of the whole affair. Mr Dryden, either through fear of being reckoned superstitious, or thinking it a science beneath his study, was extremely cautious of letting any one know

Dryden.

that he was a dealer in astrology; therefore could not excuse his absence, on his son's anniversary, from a general hunting-match which Lord Berkshire had made, to which all the adjacent gentlemen were invited. When he went out, he took care to fet the boy a double exercise in the Latin tongue, which he taught his children himself, with a strict charge not to stir out of the room till his return; well knowing the task he had set him would take up longer time. *Charles* was performing his duty, in obedience to his father: but, as ill fate would have it, the flag made towards the house; and the noise alarming the servants, they hasted out to see the sport. One of them took young Dryden by the hand, and led him out to see it also; when, just as they came to the gate, the flag being at bay with the dogs, made a bold push, and leaped over the court-wall, which was very low and very old; and the dogs following, threw down a part of the wall 10 yards in length, under which *Charles Dryden* lay buried. He was immediately dug out; and after six weeks languishing in a dangerous way, he recovered. So far Dryden's prediction was fulfilled. In the 23d year of his age, *Charles* fell from the top of an old tower belonging to the Vatican at Rome, occasioned by a swimming in his head, with which he was seized, the heat of the day being excessive. He again recovered, but was ever after in a languishing sickly state. In the 33d year of his age, being returned to England, he was unhappily drowned at Windsor. He had with another gentleman swam twice over the Thames; but returning a third time, it was supposed he was taken with the cramp, because he called out for help, though too late. Thus the father's calculation proved but too prophetic.

At last, after a long life, harassed with the most laborious of all fatigues, viz. that of the mind, and continually made anxious by distrefs and difficulty, our author departed this life on the first of May 1701.—The day after Mr Dryden's death, the dean of Westminster sent word to Mr Dryden's widow, that he would make a present of the ground, and all other abbey-fees for the funeral: the Lord Halifax likewise sent to the lady Elizabeth, and to Mr Charles Dryden, offering to defray the expences of our poet's funeral, and afterwards to bestow 500l. on a monument in the abbey; which generous offer was accepted. Accordingly, on Sunday following, the company being assembled, the corpse was put into a velvet hearse, attended by 18 mourning coaches. When they were just ready to move, Lord Jefferys, son of Lord Chancellor Jefferys, a name dedicated to infamy, with some of his rakish companions riding by, asked whose funeral it was; and being told it was Mr Dryden's, he protested he should not be buried in that private manner; that he would himself, with the lady Elizabeth's leave, have the honour of the interment, and would bestow 1000l. on a monument in the abbey for him. This put a stop to their procession; and the Lord Jefferys, with several of the gentlemen, who had alighted from their coaches, went up stairs to the lady, who was sick in bed. His Lordship repeated the purport of what he had said below; but the lady Elizabeth refusing her consent, he fell on his knees, vowing never to rise till his request was granted. The lady under a sudden surprise fainted away; and Lord Jefferys pretending to have

Dryden.

have obtained her consent, ordered the body to be carried to Mr Ruffell's an undertaker in Cheapside, and to be left there till further orders. In the mean time the abbey was lighted up, the ground opened, the choir attending, and the bishop waiting some hours to no purpose for the corpse. The next day Mr *Charles Dryden* waited on my Lord Halifax and the bishop; and endeavoured to excuse his mother, by relating the truth. Three days after, the undertaker, having received no orders, waited on the Lord Jefferys; who pretended that it was a drunken frolic, that he remembered nothing of the matter, and he might do what he pleased with the body. Upon this, the undertaker waited upon the lady Elizabeth, who desired a day's respite, which was granted. Mr *Charles Dryden* immediately wrote to the Lord Jefferys, who returned for answer, that he knew nothing of the matter, and would be troubled no more about it. Mr *Dryden* hereupon applied again to Lord Halifax, and the bishop of Rochester; who absolutely refused to do any thing in the affair.

In this distress, Mr Garth, who had been Mr Dryden's intimate friend, sent for the corpse to the college of physicians, and proposed a subscription; which succeeding, about three weeks after Mr Dryden's decease, Dr Garth pronounced a fine Latin oration over the body, which was conveyed from the college, attended by a numerous train of coaches to Westminster-abbey, but in very great disorder. At last the corpse arrived at the abbey, which was all unlighted. No organ played, no anthem sung; only two of the singing boys preceding the corpse, who sung an ode of Horace, with each a small candle in their hand. When the funeral was over, Mr *Charles Dryden* sent a challenge to Lord Jefferys; who refusing to answer it, he sent several others, and went often himself; but could neither get a letter delivered, nor admittance to speak to him: which so incensed him, that finding his Lordship refused to answer him like a gentleman, he resolved to watch an opportunity, and brave him to fight, though with all the rules of honour; which his Lordship hearing, quitted the town, and Mr *Charles* never had an opportunity to meet him, though he sought it to his death, with the utmost application.

Mr Dryden had no monument erected to him for several years; to which Mr Pope alludes in his epitaph intended for Mr Rowe, in this line,

Beneath a rude and nameless stone he lies.

In a note upon which, we are informed, that the tomb of Mr Dryden was erected upon this hint by Sheffield duke of Buckingham, to which was originally intended this epitaph:

This *Sheffield* rais'd.—The sacred dust below
Was *Dryden* once; the rest who does not know.

Which was since changed into the plain inscription now upon it, *viz.*

J. DRYDEN,
Natus Aug. 9, 1631.
Mortuus Maii 1, 1701.

Johannes Sheffield, dux Buckinghamiussis fecit.

Mr Dryden's character has been very differently drawn by different hands, some of which have exalted it to the highest degree of commendation, and others debased it by the severest censure.—The latter, however, we must charge to that strong spirit of party

which prevailed during great part of Dryden's time, and ought therefore to be taken with great allowances. Were we indeed to form a judgment of the author from some of his dramatic writings, we should perhaps be apt to conclude him a man of the most licentious morals; many of his comedies containing a great share of looseness, even extending to obscenity: But if we consider, that, as the poet tells us,

Those who live to please, must please to live;

if we then look back to the scandalous licence of the age he lived in, the indigence which at times he underwent, and the necessity he consequently lay under of complying with the public taste however depraved; we shall surely not refuse our pardon to the compelled writer, nor our credit to those of his cotemporaries who were intimately acquainted with him, and who have assured us there was nothing remarkably vicious in his personal character.

From some parts of his history he appears unsteady, and to have too readily temporized with the several revolutions in church and state. This however might in some measure have been owing to that natural timidity and diffidence in his disposition, which almost all the writers seem to agree in his possessing. Congreve, whose authority cannot be suspected, has given us such an account of him, as makes him appear no less amiable in his private character as a man, than he was illustrious in his public one as a poet. In the former light, according to that gentleman, he was humane, compassionate, forgiving, and sincerely friendly. Of an extensive reading, a tenacious memory, and a ready communication: gentle in the correction of the writings of others, and patient under the reprehension of his own deficiencies: easy of access himself, but slow and diffident in his advances to others; and of all men the most modest and the most easy to be discountenanced in his approaches either to his superiors or his equals. As to his writings, he is perhaps the happiest in the harmony of his numbers, of any poet who ever lived either before or since his time, not even Mr Pope himself excepted. His imagination is ever warm, his images noble, his descriptions beautiful, and his sentiments just and becoming. In his prose he is poetical without bombast, concise without pedantry, and clear without prolixity. His dramatic have, perhaps, the least merit of all his writings. Yet there are many of them which are truly excellent; though he himself tells us that he never wrote any thing in that way to please himself but his *All for Love*. This last, indeed, and his *Spanish Friar*, may be reckoned two of the best plays our language has been honoured with.

DUBLIN, a city of Ireland, in the province of Leinster, and capital of the whole kingdom, situated on the river Liffy, in W. Long. 6. 32. N. Lat. 53. 10. It is certainly a very ancient place, since we find it mentioned by Ptolemy under the name of *Eblana*, which he probably wrote *Deblana*. The Irish call it *Bala-deigh*, that is, "The town founded upon hurdles or piles." It is said to have been in the hands of the English as early as the days of king Edgar. We are assured, however, that it was, long after, in the hands of the Danes, or some other northern Nation, who introduced fortifications and trade into this country. They certainly made choice of and esteemed it for its port, which was a very good one for any vessels then in use;

Dryden,
Dublin.

Dublin,
Dubos.

use; and for this reason, and because it was but 60 miles from the coast of Wales, it came to be preferred by the English when this part of Ireland was reduced under their power. It has gradually, therefore, under the auspices of several princes, acquired almost all the advantages of which any city can boast. It is supposed to have been a bishop's see in the fifth century. The first archbishop was Gregory, in the year 1152; and the bishopric of Glendaloch was annexed to it in 1214, when Henry de Loundres, or Henry of London, was archbishop. He made it a place of strength by building the castle; which still remains the centre of the British force in this place, by the addition of barracks. An university was erected here by the authority of the Pope in 1320; but that not taking effect, queen Elizabeth, in 1591, founded and endowed Trinity college, which has continued ever since, and produced many learned men. This city is the seat of government; the lord lieutenant, lord deputy, or lords justices, residing here. Here also are kept the sovereign courts of law and equity, and the records of the kingdom; and here likewise is held the parliament. As a city or corporation, its chief magistrate is styled *lord mayor*, and wears a collar of SS, both bestowed by Charles II. Succeeding monarchs have confirmed these favours, and most extensive privileges have been granted to the citizens; their liberties also, or corporate jurisdiction, being very large. Besides all this, Dublin may be considered as the centre of the inland trade, and is without doubt the place of the amplest foreign commerce in the island. For the accommodation of merchants, they have a tholse or exchange; a custom-house for the receipt of the revenue; and commissioners for the management of it. The city has increased prodigiously of late. From 1682, to 1752, the number of houses were completely doubled; and the number of inhabitants is now reckoned at 150,000.—Since the introduction of large vessels that draw a great deal of water, the harbour of Dublin is but indifferent; for all along this coast, from Wexford, there lie shoals of sand, divided into the south, middle, and north grounds; and at the mouth of the harbour there is a bar, occasioned by two banks of sand, called the *south* and *north bulls*, stretching from the opposite sides of the haven, upon which at high water there is no more than 17 feet, and at low water it is impossible to go over it. Besides, when the tide is out, except in two places, ships lie dry. Great pains and much money have been employed with a view to remove these inconveniencies, but hitherto not with any great success; yet, notwithstanding all these obstructions, the merchants of Dublin extend their correspondence daily, and probably one half of the foreign commerce of Ireland is carried on at this port.

DUBOS (John Baptist), a learned and ingenious French author, born at Beauvais in 1670. He finished his studies at Paris, and at length was intrusted with the management of several important affairs in Italy, England, and Holland. At his return to Paris, he had a prebendary given him; afterwards he had a pension of two thousand livres, and the abbey of Notre Dame at Reffons, near Beauvais. He died at Paris, when perpetual secretary of the French academy, on the 23d of March 1742. His principal works are, 1. *Critical Reflections on Poetry and Painting*, in three

volumes duodecimo. 2. *A critical History of the French Monarchy in Gaul*, two volumes 4to.

DUCAI, in general, something belonging to a duke. See Duke.

DUCAS, a learned Greek, who wrote an history of what passed under the last emperors of Constantinople, till the ruin of that city. This work, which is esteemed, was printed at the Louvre in 1649, with the Latin translation and notes of Bouilland.

DUCAT, a coin current in Germany, and other countries abroad, of different values.

DUCATON, a silver coin, likewise current in several parts of Europe.

DUCHAL (James), D. D. a late pious and learned dissenting minister, was born in Ireland, and finished his studies at the university of Glasgow; which afterwards, from a regard to his merit, conferred on him the degree of doctor of divinity. He resided 10 or 11 years at Cambridge, as the pastor of a small congregation there; where he enjoyed his beloved retirement, the advantage of books and of learned conversation, which he improved with the greatest diligence. On Mr Abernethy's removal from Antrim, he succeeded him there; and on that gentleman's death, he succeeded him as minister of the dissenting meeting-house in Wood-street, Dublin. In this situation he continued till his death, which happened on the 4th of May 1761, when he had completed his 64th year. He published a volume of excellent discourses on the presumptive arguments in favour of the Christian religion, and many occasional tracts; and after his death were published a number of his sermons, in three volumes 8vo.

DUCENARIUS, in Roman antiquity, a military officer who had the command of 200 men.

DUCHY, in geography, an appellation given to the dominions of a duke.

DUCK, in ornithology. See ANAS, and DECOY.

This fowl is furnished with a peculiar structure of vessels about the heart, which enables it to live a considerable time under water, as is necessary for it in diving. This made Mr Boyle think it a more proper subject for experiments with the air-pump than any other bird. A full grown duck being put into the receiver of an air-pump, of which she filled one third part, and the air exhausted, the creature seemed to bear it better for the first moments than a hen or other such fowl; but, after about a minute, she shewed great signs of uneasiness, and in less than two minutes her head fell down, and she appeared dying, till revived by the letting in of the air. Thus, whatever facility of diving this and other water-fowl may have, it does not appear that they can subsist, without air for respiration, any longer than other animals. A young callow duck was afterwards tried in the same manner, and with the same success, being reduced very near death in less than two minutes. But it is observable, that both birds swelled very much on pumping out the air, so that they appeared greatly larger to the spectators, especially about the crop; it not being intended that any water-fowl should live in an exceedingly rarefied air, but only be able to continue occasionally some time under water. Nature, though she has provided them with the means of this, has done nothing for them in regard to the other.

The strongest instance of these creatures being calculated

Ducal
Duck.

Duck,
Ducking.

culated to live almost in any situation, we have in the accounts of the blind ducks in the Zirchuitzer lake in Carniola. It is supposed that this lake communicates with another lake under ground in the mountain Savornie, and fills or empties itself according to the fullness or emptiness of that lake; the water of the upper lake running off, and that in vast quantities, by holes in the bottom. The ducks, which are here always in great numbers, are often carried down along with the water, and forced into the subterraneous lake to which it retires. In this unnatural habitation, many of these creatures undoubtedly perish, but some remain alive. These become blind, and lose all their feathers; and in the next filling of the lake, both they and vast numbers of fish are thrown up with the water. At this time they are fat, but make a strange appearance in their naked state, and are easily caught, by reason of their want of sight. In about a fortnight they recover their sight and feathers; and are then of the size of a common wild-duck, but of a black colour, with a white spot in their forehead. When opened, on being taken at their first coming up in their blind state, their stomachs are found full of small fishes, and somewhat resembling weeds. From this it seems, that they cannot be absolutely blind; but that the degree of light to which they have been accustomed in their subterraneous habitation, was sufficient to enable them to procure food for themselves; and their blindness, on coming again into open day-light, is no other than that of a man who has been long in the dark, on having in an instant a large blaze of candles set under his eyes.

DUCK (Stephen), originally a thresher in a barn, was born about the beginning of the present century. By his poetical talents he first attracted the notice of some gentlemen at Oxford; and being recommended to Queen Caroline, he, under her patronage, took orders, and was preferred to the living of Byfleet in Surrey. His abilities were, however, much more conspicuous in his primitive station, than in his advancement; though, it is said, he was not disliked as a preacher. Falling at length into a low-spirited melancholy way, probably owing to his change of life, and cessation from his usual labour, he in a fit of lunacy flung himself into the Thames, in 1756.

DUCKING, plunging in water, a diversion anciently practised among the Goths by way of exercise; but among the Celts, Franks, and ancient Germans, it was a sort of punishment for persons of scandalous lives.—At Marfeilles and Bourbon their men and women of scandalous life are condemned to the *cale*, as they call it; that is, to be shut up naked to the shift in an iron cage fastened to the yard of a shallop, and ducked several times in the river. The same is done at Thoulouse to blasphemers.

DUCKING, a sort of marine punishment, inflicted by the French, on those who have been convicted of desertion, blasphemy, or exciting sedition. It is performed as follows: The criminal is placed astride of a short thick batten, fastened to the end of a rope, which passes through a block hanging at one of the yard-arm. Thus fixed, he is hoisted suddenly up to the yard, and the rope being slackened at once, he is plunged into the sea. This chastisement is repeated several times conformable to the purport of the sentence pronounced against the culprit, who has at that time

several cannon-shot fastened to his feet during the punishment; which is rendered public by the firing of a gun, to advertise the other ships of the fleet thereof, that their crews may become spectators.

DUCKING-*Stool*. See CASTIGATORY.

DUCKUP, at sea, is a term used by the steer's-man, when the main-fail, fore-fail, or sprit-fail, hinders his seeing to steer by a land-mark: upon which he calls out, *Duckup the clew-lines of these sails*; that is, hale the fails out of the way. Also when a shot is made by a chace-piece, if the clew of the sprit-fail hinders the sight, they call out, *Duckup*, &c.

DUCT, in general, denotes any tube or canal. It is a term much used by anatomists.

DUCTILITY, in physics, a property possessed by certain solid bodies, which consists in their yielding to percussion, or pressure, and in receiving different forms without breaking.

Some bodies are ductile both when they are hot and when they are cold, and in all circumstances. Such are metals, particularly gold and silver. Other bodies are ductile only when heated to a sufficient degree; such as wax and other substances of that kind, and glass. Other bodies, particularly some kinds of iron, called by the workmen *red-short*, brass, and some other metallic mixtures, are ductile only when cold, and brittle when hot. The degrees of heat requisite to produce ductility in bodies of the first kind, vary according to their different natures. In general, the heat of the body must be such as is sufficient to reduce it to a middle state betwixt solidity and perfect fusion. As wax, for instance, is fusible with a very small heat, it may be rendered ductile by a still smaller one; and glass, which requires a most violent heat for its perfect fusion, cannot acquire its greatest ductility until it is made perfectly red-hot, and almost ready to fuse. Lastly, some bodies are made ductile by the absorption of a fluid. Such are certain earths, particularly clay. When these earths have absorbed a sufficient quantity of water, to bring them into a middle state betwixt solidity and fluidity, that is to the consistence of a considerably firm paste, they have then acquired their greatest ductility. Water has precisely the same effect upon them in this respect, that fire has upon the bodies above mentioned.

DUDLEY (Edmund), an eminent lawyer and able statesman in the reign of Henry VII.; who with Sir Richard Empson, another lawyer of the same complexion, assisted in filling that rapacious monarch's coffers by arbitrary prosecutions of the people on old penal statutes. They were beheaded on the accession of Henry VIII. to pacify the clamours of the people for justice.

DUDLEY, (John), duke of Northumberland, son of the above, a statesman; memorable in the English history for his unsuccessful attempt to place the crown on the head of his daughter-in-law, lady Jane Grey, who fell a victim to his ambition; was born in 1502, and beheaded in 1553. See (*History of*) ENGLAND. Ambrose his eldest son was a brave general and able statesman under queen Elizabeth; and received the appellation of the *good earl of Warwick*. Henry, the duke's second son, was killed at the siege of St Quintin. Robert, the third son, a man of bad character, was created earl of Leicester; and was one of queen Elizabeth's favourites. His fourth son was the unfortunate lord Guildford Dudley, whose only crime was his being the husband

Ducking
Dudley.

Dudley,
Duel.

husband of lady Jane Grey, for which he was beheaded in 1554.

DUDLEY (Sir Robert), as he was called in England, and, as he was styled abroad, *earl of Warwick and duke of Northumberland*, was the son of Robert above mentioned, by the lady Douglas Sheffield; and was born at Sheen in Surry, in 1573, where he was carefully concealed, to prevent the queen's knowledge of the earl's engagements with his mother. He studied at Oxford; when his father, dying, left him the bulk of his estate. He was at this time one of the finest gentlemen in England; and having a particular turn to navigation, fitted out a small squadron at his own expence, with which he sailed to the river Orinocoque, and took and destroyed nine sail of Spanish ships. In 1595, he attended the earl of Essex, and the lord high admiral of England, in their expedition against the Spaniards; when, for his gallant behaviour at the taking of Cadiz, he received the honour of knighthood. He now endeavoured to prove the legitimacy of his birth, in order to be entitled to his hereditary honours. But being overpowered by the interest of the countess dowager of Leicester, he applied for a licence to travel; and being well received at the court of Florence, resolved to continue there, notwithstanding his receiving a letter of recall; on which his whole estate was seized by king James I. and vested in the crown. He discovered at the court of Cosmo II. great duke of Tuscany, those great abilities for which he had been admired in England, and was at length made chamberlain to his serene highness's consort. He there contrived several methods of improving shipping; introduced new manufactures; and by other services obtained for him a reputation, that at the desire of the archduchess, the emperor Ferdinand, in 1620, created him a duke of the holy Roman empire. He afterwards drained a vast tract of morafs between Pisa and the sea; and raised Leghorn, which was then a mean, pitiful place, into a large and beautiful town, improving the haven by a mole, which rendered it both safe and commodious; and having engaged his highness to declare it a free port, he, by his influence and correspondence, drew many English merchants to settle and set up houses there, which was of very great service to his native country, as well as to the Spaniards. He was also the patron of learned men, and held a high place himself in the republic of letters. His most celebrated work is his *Del Arcano del Mare*, in two volumes, folio.

DUEL, a single combat, at a time and place appointed, in consequence of a challenge. This custom came originally from the northern nations, among whom it was usual to decide all their controversies by arms. Both the accuser and accused gave pledges to the judges on their respective behalf; and the custom prevailed so far amongst the Germans, Danes, and Franks, that none were excused from it but women, sick people, cripples, and such as were under 21 years of age, or above 60. Even ecclesiastics, priests, and monks, were obliged to find champions to fight in their stead. The punishment of the vanquished was either death, by hanging or beheading; or, mutilation of members, according to the circumstances of the case. Duels were at first admitted not only on criminal occasions, but on some civil ones for the maintenance of rights to estates, and the like: in latter times, however, be-

fore they were entirely abolished, they were restrained to these four cases. 1. That the crime should be capital. 2. That it should be certain the crime was perpetrated. 3. The accused must by common fame be supposed guilty. And, 4. The matter not capable of proof by witnesses.

DUEL, at present, is used for single combat on some private quarrel; and must be premeditated, otherwise it is called a *rencontre*. If a person is killed in a duel, both the principals and seconds are guilty whether the seconds engage or not. (See the article MURDER.) It is also a very high offence to challenge a person either by word or letter, or to be the messenger of a challenge. (See LAW, N^o cxxxv. 20.) The severe edicts made by Lewis XIV. against duels have in a great measure put a stop to the practice in France.

The general practice of duelling, in this last sense, took its rise in the year 1527, at the breaking up of a treaty between the emperor Charles V. and Francis I. The former desired Francis's herald to acquaint his sovereign, that he would henceforth consider him not only as a base violator of public faith, but as a stranger to the honour and integrity becoming a gentleman. Francis, too high-spirited to bear such an imputation, had recourse to an uncommon expedient to vindicate his character. He instantly sent back the herald with a *cartel* of defiance, in which he gave the emperor the lie in form, challenged him to single combat, requiring him to name the time and place of the encounter, and the weapons with which he chose to fight. Charles, as he was not inferior to his rival in spirit or bravery, readily accepted the challenge; but after several messages concerning the arrangement of all the circumstances relative to the combat, accompanied with mutual reproaches bordering on the most indecent scurrility, all thoughts of this duel, more becoming the heroes of romance than the two greatest monarchs of their age, were entirely laid aside.

The example of two personages so illustrious, drew such general attention, and carried with it so much authority, that it had considerable influence in introducing an important change in manners all over Europe. Duels, as has already been observed, had been long permitted by the laws of all the European nations; and, forming a part of their jurisprudence, were authorized by the magistrate on many occasions, as the most proper method of terminating questions with regard to property, or of deciding in those which regarded crimes. But single combats being considered as solemn appeals to the omniscience and justice of the Supreme Being, they were allowed only in public causes, according to the prescription of law, and carried on in a judicial form*. Men, accustomed to this manner of decision in courts of justice, were naturally led to apply it to personal and private quarrels. Duels, which at first could be appointed by the civil judge alone, were fought without the interposition of his authority, and in cases to which the laws did not extend. The transaction between Charles and Francis strongly countenanced this practice. Upon every affront or injury which seemed to touch his honour, a gentleman thought himself entitled to draw his sword, and to call on his adversary to make reparation. Such an opinion, introduced among men of fierce courage, of high spirit, and of rude manners, where offence was often given, and revenge was always prompt, produced most fatal

Duel.

Ducro,
Dugdale.

consequences. Much of the best blood in Christendom was shed; many useful lives were lost; and, at some periods, war itself hath hardly been more destructive than these contests of honour. So powerful, however, is the dominion of fashion, that neither the terror of penal laws, nor reverence for religion, have been able entirely to abolish a practice unknown among the ancients, and not justifiable by any principle of reason; though at the same time it must be admitted, that to this absurd custom we must ascribe, in some degree, the extraordinary gentleness and complaisance of modern manners, and that respectful attention of one man to another, which at present render the social intercourses of life far more agreeable and decent than among the most civilized nations of antiquity.

DUERO, or **DURO**, a large river, which, rising in Old Castile in Spain, runs from east to west, crosses the province of Leon; and, after dividing Portugal from Spain by a southerly course, turns westward, crosses Portugal, and falls into the Atlantic Ocean at Porto-Porto.

DUGDALE (Sir William), an eminent English historian, antiquarian, and herald, born in Warwickshire in 1605. He was introduced into the herald's office by Sir Christopher Hatton; and ascended gradually through all the degrees, until he became garter principal king at arms. His chief work is the *Monasticon Anglicanum*, in three vols folio; containing the charters and descriptions of all the English monasteries, adorned with engravings: in the former part of which work he was assisted by Mr Roger Dodsworth. Nor are his Antiquities of Warwickshire less esteemed. He wrote likewise, among other things of less note, the History of St Paul's Cathedral; a History of Embanking and Draining; a Baronage of England; and completed the second volume of Sir Henry Spelman's Councils, with a second part of his Glossary. He died in 1686. His son, Sir John, was Norroy king at arms, and published a Catalogue of English Nobility: his daughter Elizabeth married the famous Elias Ashmole.

DUKE is either the title of a sovereign prince, as the duke of Savoy, Parma, &c. the grand duke of Tuscany, Muscovy, &c.; or it is the title of honour and nobility next below princes. The commanders of armies in time of war, the governors of provinces and wardens of marches in times of peace, were called *duces* under the later emperors. The Goths and Vandals divided all Gaul into duchies and counties, the governors of which they sometimes call *duces*, and sometimes *comites*. In France, under the second race of kings, though they retained the name and form of ducal government, there were scarce any dukes except those of Burgundy, Aquitain, and France.

In Britain, a duke, though, in respect of his title of nobility*, he is inferior in point of antiquity to many others, yet is superior in rank to all of them; his being the first title of dignity after the royal family. Among the Saxons, the Latin name of dukes, *duces*, is very frequent; and signified, as among the Romans, the commanders or leaders of their armies. But after the Norman conquest, which changed the military polity of the nation, the kings themselves continuing for many generations *dukes* of Normandy, they would not honour any subject with that title till the time of Edward III.; who claiming to be king of France, and

thereby losing the ducal in the royal dignity, in the 11th year of his reign created his son, Edward the black prince, duke of Cornwall; and many, of the royal family especially, were afterwards raised to the same honour. However, in the reign of Queen Elizabeth, A. D. 1572, the whole order became utterly extinct; but it was revived about 50 years afterwards by her successor, who was remarkably prodigal of honours, in the person of George Villiers duke of Buckingham.

A duke is created by patent, circumscribed of sword, mantle of state, imposition of a cap and coronet of gold on his head, and a verge of gold put into his hand. His title is Grace; and, in the style of the heralds, Most high, potent, high-born, and noble prince.

DULCIFYING, in chemistry, is the sweetening any matter impregnated with salts, by frequently washing it in pure water.

DULL, in the menage. The marks of a dull horse, called by the French *marquis de ladre*, are white spots round the eye and on the tip of the nose, upon any general colour whatsoever. Though the vulgar take these spots for signs of stupidity, it is certain they are great marks of the goodness of a horse; and the horses that have them are very sensible and quick upon the spur.

DULLART (Heiman), a Dutch painter and poet. He was a pupil to Rembrandt, for whose works the few he left are often mistaken. He died in 1684.

DUMBNESS, the privation of the faculty of speech. The most general, or rather the sole cause of dumbness, is the want of the sense of hearing. The use of language is originally acquired by imitating articulate sounds. From this source of intelligence, deaf people are entirely excluded: they cannot acquire articulate sounds by the ear: unless, therefore, articulation be communicated to them by some other medium, these unhappy people must for ever be deprived of the use of language; and as language is the principal source of knowledge, whoever has the misfortune to want the sense of hearing, must remain in a state little superior to that of the brute creation. Deafness has in all ages been considered as such a total obstruction to speech, or written language, that an attempt to teach the deaf to speak or read has been uniformly regarded as impracticable, till Doctor Wallis and some others have of late shewn, that although deaf people cannot learn to speak or read by the direction of the ear, there are other sources of imitation, by which the same effect may be produced. The organs of hearing and of speech have little or no connection. Persons deprived of the former generally possess the latter in such perfection, that nothing further is necessary, in order to make them articulate, than to teach them how to use these organs. This indeed is no easy task; but experience shews that it is practicable. Mr THOMAS BRAIDWOOD, of Edinburgh, is perhaps the first who ever brought this surprising art to any degree of perfection. He began with a single pupil in 1764; and for some years past, he has taught many people born deaf, to speak distinctly, to read, to write, to understand figures, the principles of religion and morality, &c. This, at first sight, may appear to be altogether incredible; but the fact is certain. Mr Braidwood has, at present, a considerable number of deaf pupils, some of them above 20 years of age, all making a rapid

Dulcifying
Dumbness.

* See Nobility.

Dumbness. pid and amazing progress in those useful branches of education.

Mr Braidwood's principal difficulty, after he had discovered this art, was to make people believe in the practicability of it. He advertised in the public papers; he exhibited his pupils to many noblemen and gentlemen; still he found the generality of mankind unwilling to believe him. A remarkable instance of this incredulity occurred some years ago. A gentleman in England sent a deaf girl of his to Mr Braidwood's care. A year or two afterwards, Mr Braidwood wrote to the father, that his daughter could speak, read, and write distinctly. The father returned an answer, begging Mr Braidwood's excuse, as he could not believe it; however, he desired a friend of his, who was occasionally going to Edinburgh, to call at Mr Braidwood, and inquire into the truth of what he had wrote him: he did so; conversed with Mr Braidwood, saw the young lady, heard her read, speak, and answer any questions he put to her. On his return, he told the father the surprising progress his child had made; but still the father thought the whole an imposition: the girl herself wrote to her father, but he looked upon the letter as a forgery. About this time the father died; and the mother sent an uncle and cousin of the deaf lady's from Shrewsbury, in order to be satisfied of the truth. When they arrived, Mr Braidwood told the girl her uncle and cousin were in the parlour; and desired her to go and ask them how they did, and how her mother and other friends did. The friends were astonished, and could hardly credit their own ears and eyes.

We have conversed with Mr Braidwood, concerning the nature and method of teaching this wonderful art: he seems to be very desirous of communicating and transmitting his discovery to posterity; but says, and, from the nature of the thing, we believe it to be true, that he cannot communicate it so fully in writing as to enable any other person to teach it. The first thing in the method is, to teach the pupil to pronounce the simple sounds of the vowels and consonants. We have even seen him performing this operation; but are unable to give a clear idea of it. He pronounces the sound of *a* slowly, pointing out the figure of the letter at the same time; makes his pupil observe the motion of his mouth and throat; he then put his finger into the pupil's mouth, depresses or elevates the tongue, and makes him keep the parts in that position; then he lays hold of the outside of the windpipe, and gives it some kind of squeeze, which it is impossible to describe: all the while he is pronouncing *a*, the pupil is anxiously imitating him, but at first seems not to understand what he would have him to do. In this manner he proceeds, till the pupil has learned to pronounce the sounds of the letters. He goes on in the same manner to join a vowel and a consonant, till at length the pupil is enabled both to speak and read.

That Mr Braidwood is capable of teaching his pupils not only the mere *pronunciation*, but also to understand the *meaning* of what they read, may be ascertained by a conversation with any of his pupils. Of this Mr Pennant gives a remarkable instance in a young lady of about 13 years of age, who had been some time under the care of Mr Braidwood. "She readily apprehended (says he) all I said, and returned me answers

with the utmost facility. She read; she wrote well. Her reading was not by rote. She could clothe the same thoughts in a new set of words, and never vary from the original sense. I have forgot the book she took up, or the sentences she made a new version of; but the effect was as follows:

"*Original passage.* Lord Bacon has divided the whole of human knowledge into history, poetry, and philosophy; which are referred to the three powers of the mind, memory, imagination, and reason.

"*Version.* A nobleman has parted the total or all of man's study, or understanding, into An account of the life, manners, religion or customs of any people or country; verse, or metre; moral or natural knowledge: which are pointed to the three faculties of the soul or spirit; the faculty of remembering what is past, thought or conception, and right judgment."

It is altogether in vain for us to attempt to say any more concerning the mode of operation. Mr Braidwood undertakes every deaf person, who is not at the same time foolish or idiotical. The greatest misfortune is, that this art is confined to a single man, and that his pupils must live in the house with him for some years. The expence necessarily attending education of this kind, excludes all but people in opulent circumstances from deriving any advantage from it. Mr Braidwood says, that the only way for preserving the art, and communicating it to a number, is to take people in the way of apprentices: this he is unable to do at his own expence. What a pity, that such a curious and useful art should live and die with a single man! There are many sums mortified in this kingdom, both by government and private persons, for less important purposes, than the preservation and extension of the art of raising a great number of our fellow-creatures from the rank of brutes, to that of reasonable beings and useful members of society.

Periodical DUMBNESS. In the Ephemerides of the Curious, we have an account of a periodical dumbness, which had continued for more than 15 years, and had not gone off at the time the account was wrote. The person was son to an inn-keeper at Jelsing in the duchy of Wirtemberg in Germany. He was one night taken so ill after supper, that he could neither stand nor sit. He continued, for about an hour, oppressed with sickness to such a degree as to be in danger of suffocation. At the expiration of this time he grew better; but, during three months, he was much dejected, melancholy, and, at times, fearful. He was then suddenly struck dumb, and became unable to pronounce the least word, or form the least sound, though he could speak very articulately before. The loss of speech was at first instantaneous, and continued only a few minutes; but the duration of it began to lengthen every day; so that it soon amounted to half an hour, two hours, three hours, and at last to 23 hours, yet without any order. At last the return of speech kept so constant and regular an order, that, for 14 years together, he could not speak except from noon, during the space of one entire hour, to the precise moment of one o'clock. Every time he lost his speech, he felt something rise from his stomach to his throat. Excepting this loss of speech, he was afflicted with no other disorder of any animal function. Both his internal and external senses continued sound: he heard always perfectly well, and answered

Dunfermline
line
Dunbarton.

answered the questions proposed to him by gestures or writing. All suspicion of deceit was removed by his keeping exactly the same hour, though he had no access to any instruments by which time can be measured.

DUMFERMLINE, a parliament-town of Scotland, situated in the county of Fife, 15 miles north-west of Edinburgh: W. Long. 30. 20. N. Lat. 56. 15. Here was formerly a magnificent abbey and palace of the kings of Scotland, in which the princefs Elizabeth, daughter of king James VI. and mother of the princefs Sophia, from whom the present royal family are descended, was born.

DUMFRIES, a county of Scotland, comprehending Annandale, Wachopdale, and Niddisdale, extends in length from west to east about 50 miles, and is about 34 miles in breadth where broadest. It is bounded on the west by Galloway and Kyle; on the east by Solway frith, and the marches between Scotland and England; on the north by part of Clydesdale, Tweeddale, and Teviotdale; and on the south by the Irish sea. The country is rough and mountainous, not so well adapted for corn as for pasture; and, of consequence, innumerable flocks of sheep and herds of black cattle are bred in this county, and fattened for exportation to England. The face of the country is bare and brown, almost destitute of wood, and very deficient in fuel; yet the valleys being watered and fertilized by abundance of streams, produce good corn.—In the division called *Niddisdale*, are mines of lead, and, as it is said, of silver and gold also; but the two last mentioned are not worked.

DUMFRIES, the capital of the above-mentioned county, is a large flourishing town, situated at the mouth of the river Nid, in W. Long. 3. 20. N. Lat. 54. 45. The houses are well built and commodious, the streets open and spacious: The town has an old castle in tolerable repair; four gates; a stately church; an exchange for the merchants; a tolbooth; a large market-place with a curious cross; and a noble bridge of free-stone over the river, consisting of 13 arches, with a gate in the middle as a boundary between the shire of Dumfries and the stewartry of Galloway. This town gives the title of earl to the chief of the family of Crichton; it is the seat of a presbytery and provincial synod, and carries on a considerable foreign trade.

DUMONT (Francis), a Frenchman; compiler of a general collection of treaties of commerce, alliance, and peace, between the powers of Europe. This collection, with Barbeyrac's, containing the treaties B. C. makes 16 vols folio, very useful for historical writers. Dumont retired to Holland in 1720. The time of his death is uncertain.

DUMOSÆ, (from *dumus*, a bush), an order of plants in the *Fragmenta methodi naturalis* of Linnæus, containing the following genera, viz. *Viburnum*, *Tinus*, *Opulus*, *Sambucus*, *Rondeletia*, *Bellonia*, *Cassine*, *Ilex*, *Tomax*, &c.

DUNBAR, a town of Scotland, in the shire of Mid-Lothian, memorable for the victory obtained by Oliver Cromwell over the Scots in 1650. W. Long. 2. 22. N. Lat. 55. 58.

DUNBARTON, the chief town of Lenox or Dunbarton-shire in Scotland, situated in W. Long. 4. 32. N. Lat. 56. 30. It is remarkable for nothing but its castle. This is a steep rock, rising up in two points,

and every where inaccessible, except by a very narrow passage or entry, fortified with a strong wall or rampart. Within this wall is the guard-house, with lodgings for the officers; and from hence a long flight of stone-steps ascends to the upper part of the castle, where there are several batteries mounted with cannon, the wall being continued almost round the rock. In the middle of this upper part where the rock divides, there are commodious barracks with a deep well, in which there is always plenty of water. Here likewise are the remains of a gateway and prodigious high wall, at the top of which there was a wooden bridge of communication from one rock to another. This gateway was sometimes blocked up during the intestine commotions of Scotland, so that garrisons of different factions possessed different parts of the castle, and each had a gate towards the water. The castle stands in the angle formed at the conflux of the Clyde and Leven; so that it is wholly surrounded by water, except a narrow isthmus, and even this is overflowed at every spring-tide: nor is there any hill or eminence within a Scots mile of this fortress. It commands the navigation of the Clyde; and, being deemed the key of the western Highlands, is kept in some repair, and garrisoned with invalids, under the command of a governor and some subaltern officers. The government of it is worth 365 *l.* a-year.

DUNCANNON, a fort in the county of Wexford, and province of Leinster, in Ireland, seated on the river Rofs. It commands the river, inasmuch that no ship can pass to Waterford or Rofs without its permission. Here are barracks for three companies of foot. W. Long. 6. 30. N. Lat. 52. 10.

DUNCARDS, **DUNKARDS**, or *Dumplings*, a religious sect in Pennsylvania, in America. A German hermit, who settled on the spot where Ephrata is now built, was the founder of this extraordinary sect. The fame of his solitude inspired some of his countrymen with curiosity; and the simplicity of his life, with the piety of his conversation, induced them to join, and imitate him. A people who leave their native country to enjoy liberty of conscience, can bear all subsequent mortifications. The Germans of both sexes, who joined the hermit, soon accustomed themselves to his way of thinking, and consequently to his manner of living; industry became part of their duty, and divided their time with devotion. Their gains are thrown into one common stock, which supplies all their exigencies, private as well as public: their females are cloistered up by themselves in a separate part of the town, the situation of which is delightful, and screens them from the north wind. It is triangular, and fenced round with thick rows of apple, beech, and cherry trees, besides having an orchard in the middle. The houses, which are of wood, are mostly three stories high; and every person has a separate apartment, that he may not be disturbed in his devotions. The women never see the men but at public worship, or when it is necessary to consult upon matters of public economy; and the number of both may be about 300. Their garb is the most simple that can be well imagined, being a long white woollen gown in winter, and linen in the summer, with a cap, which serves them for a hat, like that of a capuchin behind, and fastened round the waist with a belt. Under the gown, they wear a waistcoat of the same

same materials, a coarse shirt, trowsers, and shoes. The dress of the women is the same: only, instead of trowsers, they wear petticoats; and when they leave their nunnery (for such it is), they muffle up their faces in their capuchins. The diet of the Dunkards consists of vegetables; but it is no principle with them to abstain from animal-food, only they think that such abstinence is most agreeable to a Christian life. This temperance emaciates their bodies, and, as the men indulge their beards to grow to their full length, gives them a hollow, ghastly appearance. Their beds are no better than benches; a little wooden block serves them for a pillow; and they celebrate public worship twice every day, and as often every night. But though such modes of life appear absurd and impracticable, the Dunkards are far from being extravagant. Their chapel is very decent; and they have, upon a fine stream, a grist-mill, a paper-mill, an oil-mill, and a mill for pearl-barley, all of them most ingeniously constructed by themselves: they have even a printing-press; and they are, especially the nuns, extremely ingenious in working, and in embellishments; which they perform with a variety of beautiful colours, with gilding, in imitation of the initials in ancient manuscripts; and they stick them up, by way of ornament, in their churches and cells. By those different manufactures, the public stock of this ascetic people is well supplied, as no denomination of Christians can be their enemies, their religious tenets being mingled with the absurdities of all. Notwithstanding the two sexes live separate from one another in their town, yet the Dunkards are far from being averse to matrimony. In that case, the parties must indeed leave the town; but they are supplied out of the public fund with whatever is necessary for their settling elsewhere. This they generally do as near as they can to Ephrata, to which they send their children for education. The Dunkards administer baptism by dipping or plunging, but to adult persons only: they hold free-will; and think that the doctrine of original sin, as to its effect upon Adam's posterity, is absurd and impious: they disclaim violence, even in cases of self-defence; and suffer themselves to be defrauded or wronged, rather than go to law: they are superstitious to the last degree in observing their sabbath; and all their prayers and preachings, during their worship, are extempore: humility, chastity, temperance, and other Christian virtues, are commonly the subjects of their discourses; and they imagine, that the souls of dead Christians are employed in converting those of the dead who had no opportunity of knowing the gospel: they deny the eternity of hell-torments; but believe in certain temporary ones, that will be inflicted on infidels and obdurate persons who deny Christ to be their only Saviour; but they think, that at a certain period all will be admitted to the endless fruition of the Deity.

DUNDEE, the ALLECTUM or *Taidonum* of the ancients; a well-built, flourishing town of Scotland, in the shire of Angus or Forfar, and ranking the 3d of the royal boroughs. It is seated on the north-side of the river Tay, about eight miles from its mouth, in W. Long. 2. 48. N. Lat. 56. 26. Its situation for commerce is very advantageous: trading vessels of the largest burden can get into its harbour; and on the key there are three very convenient and handsome

warehouses, built in 1756; as well as good room for ship-building, which is carried on to a considerable extent. The houses are built of stone, generally four stories high. The market-place, or high-street, in the middle of the town, is a very spacious square, from whence branch out the four principal streets; which, with several lesser ones, have been all lately well paved. On the south-side of the market-place, stands the town-house, an elegant structure, finished in the year 1734: it contains the guild-hall, the court-room, a finely painted mason-ledge, the post-office, the bank, and vaulted repositories for the records. At the east end of the high-street, there is a fine new edifice, erected principally for a trades-hall, but designed also to answer occasionally for a theatre. Three established churches, besides several chapels and meeting-houses, having been found insufficient for the number of inhabitants, a new church has been lately built, which is reckoned one of the most elegant in the kingdom.—Here is also a magnificent square Gothic tower or steeple, now standing by itself, but which formerly made part of a venerable and superb building of churches in the form of a cross, erected by David earl of Huntingdon brother to William I. of Scotland, and dedicated to the Virgin Mary. This he did on his return from the third crusade, (in which, with 500 of his countrymen, he had accompanied Richard I. of England, anno 1189), in gratitude for his deliverance from several imminent dangers; and particularly from shipwreck, by which he had nearly perished when in sight of this place. At the same time he changed the name of the town from *Allectum* to *Dei Donum*, from which its present name is thought by many to be derived; and under this new name we find it increasing considerably in the 13th century. The destruction of the churches adjoining to this tower, was the work of Edward I. of England, that barbarous destroyer of Scottish monuments and records. He was so exasperated at the inhabitants standing out against him, and aiding his inveterate foe the famous Wallace, that he set fire both to the churches and to the town itself; the flames destroying all but a part on the east end, now called the *old kirk*. The town suffered very much about the middle of the last century. For just six years after it had been taken by storm by Montrose, it was besieged in form by General Monk: and although it made a gallant defence under major-general Lumden, it was at last, on the 1st of September 1651, carried by force, when all that were in arms were put to the sword; and so great were the riches of the town, all the neighbouring gentlemen with their best effects having retired to it as a place of safety, that every private soldier in general Monk's army had near 60 pounds Sterling to his share of the plunder. This is reckoned the greatest loss ever Scotland sustained at one stroke, there being above 60 vessels in the harbour at that time. To enable the inhabitants to recover from this calamity, and to repair their harbour and other public works, Charles II. granted them an excise of one third of an English penny upon every gallon of ale or beer sold in town for 25 years, which has been continued by five subsequent acts, and is highly serviceable. At present Dundee is in a very flourishing condition. The shipping are reckoned near 100 sail; and the manufactures go on briskly. These consist

Dung
Dunkirk.

consist of linen (especially osnaburghs), sail-cloth, cordage, threads, thread-stocks, buckrams (a new work in Scotland), tanned leather, shoes, and hats; not only sufficient for their own consumpt, but for exportation in considerable quantities. An excellent sugar-house has also now subsisted for about 10 years, and does considerable business. The Osnaburgh trade is undoubtedly the staple, of which there have been above four millions of yards stamped here annually of late. Their coloured threads have been long famous; and are manufactured to a considerable amount. The number of inhabitants is reckoned near 16,000.

DUNG, in husbandry. See AGRICULTURE, n° 21.
DUNG-Bird. See UPURA.

DUNG Meers, in husbandry, places where soils and dungs are mixed and digested together. These consist of pits, prepared at the bottom with stone and clay, that they may hold water, or the moisture of the dung; and ought to be so situated, that the sinks and drips of the houses and barns may run into them. Into these pits they cast refuse, fodder, litter, dung, weeds, &c. where they lie and rot together, till the farmer have occasion for them.

DUNG Worms, a species of fly-worms, of a short and somewhat flat body, found in great plenty among cow-dung in the months of September and October.

DUNGANNON, the chief town of the county of Tyrone, in the province of Ulster, in Ireland. It is seated on a hill, and is a place of some strength.

DUNGARVON, a town of Ireland, in the county of Waterford. It stands on a bay of the same name, has a commodious harbour for ships, and is a walled town with a castle. W. Long. 7. 55. N. Lat. 51. 57.

DUNKELD, a town of Scotland, in the shire of Perth, pleasantly situated on the north side of the river Tay. It was formerly a bishop's see, and the remains of the cathedral are still visible. It is the chief market-town of the Highlands. W. Long. 3. 18. N. Lat. 56. 36.

DUNKIRK, a maritime town of the French Netherlands, situated in E. Long. 2. 28. N. Lat. 51. 10. and is the most easterly harbour on the side of France which is next to Great Britain.—It was originally a mean hamlet, consisting only of a few fishermens huts: but a church being built there, it was from that, and from its situation, which is a sandy eminence, called *Dunkirk*; *dun* signifying, in the old Gallic language, a hill; and *kirk* being the old Flemish name for church.

About the year 960, Baldwin, earl of Flanders, thinking the situation convenient, enlarged it into a kind of town, and surrounded it with of wall. In the year 1322, Robert of Flanders, who held it as an appendage, built a castle for its defence; which was afterwards demolished by the revolvers of Flanders. Robert of Bar erected a fortification round it, the remains of which are visible on the side next the harbour. The emperor Charles V. who held it as part of Flanders, built another castle to defend the harbour: but this was also demolished soon afterwards. In 1558, the French, under marshal de Thermes, took Dunkirk by storm, and almost ruined the place; the Spaniards recovered it again in about a fortnight, and put all the French to the sword.

During a peace procured for the Dunkirkers by Philip II. of Spain, they rebuilt their town with greater

splendor than before, and the inhabitants for a long time subsisted by privateers fitted out against the Dutch; and at length, growing rich by these hostilities, they fortified their town and harbour, and fitted out no less than 15 ships of war at their own charge.

In 1634, the Dunkirkers agreed with the inhabitants of Bergues, to dig a canal, at their joint expence, for a communication between the two towns; which was some time afterwards effected. By this time, Dunkirk was become the best harbour the Spaniards possessed in Flanders, which induced many foreigners to settle there; and it being necessary to enlarge the town for their accommodation, a new fortified wall was built at a considerable distance from the former. In 1646, it was besieged and taken by the prince of Condé. In 1652, it was retaken by the archduke Leopold, then governor of the Netherlands. France entering into a treaty with England in 1655, the Dunkirkers, with views of pecuniary advantage, fitted out privateers against both those powers: the consequence of which was, that the French, assisted by Cromwell, attacked and took it; and it was put into the hands of the English, in consequence of a treaty between them and the French. To the English it was even then of very great importance; for, during the war in which it was taken, the Dunkirkers had made prizes of no less than 250 of their ships, many of which were of great value. They therefore improved the fortifications, and built a citadel: yet they kept it only four years; for in 1662, two years after the restoration, Charles II. sold this valuable acquisition to France, for the paltry sum of 500,000*l.* In consequence of this sale, the town was taken possession of for the French king Lewis XIV. by the count d'Elstrades, on the 29th of November 1662. Lewis having acquainted the celebrated engineer Monsieur Vauban, that he intended to make Dunkirk one of the strongest places in Europe, Vauban drew up a plan with that view, which was gradually executed. An arsenal was erected, large enough to contain all the stores necessary for fitting out and maintaining a large fleet of men of war; the fortifications on the land-side were constructed in a manner that was thought to render them impregnable; and towards the sea, the entrance of the harbour being properly formed, it was fortified by the jetties, and the two forts called *Green Fort* and the *Fort of Good Hope* at their extremities; the famous Ribbank was also erected on one side of the jetties, and Fort Galliard on the other, to secure the town. These works were all completed in 1683; and in 1685, the whole circumference of the bastion was faced with masonry, and the keys completely formed: at the same time care was taken to build at the entrance of this bastion a sluice, almost 45 feet wide, that the ships within might be constantly afloat. In 1689, the fort called the *Cornichon*, and some other works, were completed. But though 30 years had been now employed in improving the fortifications of Dunkirk, it was not yet in the state in which Lewis intended to put it; and therefore, in 1701, he caused a new ribbank to be built, called *Fort Blanc*.

At the treaty of Utrecht, it having been made appear, that the privateers of Dunkirk had, during the war then closing, taken from the English no less than 1614 prizes, valued at 1,334,375*l.* Sterling, it was stipulated, that the fortifications of the city and port

Dunkirk

of Dunkirk should be entirely demolished, and the harbour filled up, so as never to be an harbour again.

The treaty, of which this demolition of Dunkirk was an article, was signed on the 28th of April 1713; but the demolition did not take place till the September following, when the queen deputed colonel Armstrong and colonel Clayton to oversee the execution of the treaty as far as concerned the works and harbour of Dunkirk.

Under the inspection of these gentlemen, the places of arms were broken down, the ditches filled up, and the demi-lunes, bastions, and covered way, totally destroyed; the citadel was razed, and the harbour and basin filled up; the jetties were also levelled with the strand, and all the forts which defended the entrance into the harbour were demolished. A large dam, or bar, was also built across the mouth of the harbour between the jetties and the town, by which all communication between the harbour and the canal, which formed its entrance, was entirely cut off. The sluices were also broken up, and the materials of them broken to pieces.

But this was no sooner done, than Lewis XIV. ordered 30,000 men to work incessantly upon a new canal, the canal of Mardick, which in a short time they accomplished; by which the harbour was rendered almost as commodious as ever: but in 1717 this likewise was rendered unserviceable.

In the year 1720, during a great storm, the sea broke up the bar or dam, and restored to the Dunkirkers the use of the harbour in a very considerable degree.

In the year 1740, when Great Britain was engaged in a war with Spain, Lewis XV. set about improving the advantage which Dunkirk had derived from the storm in 1720, by restoring the works, and repairing the harbour. He rebuilt the jetties, and erected new forts in the place of those which had been destroyed; and soon afterwards he espoused the cause of Spain, and became a principal in the war against us.

But at the peace of Aix-la-Chapelle in 1748, it was stipulated, that all the works towards the sea should be destroyed a second time; yet, before the declaration of the last war, the place was in as good a state of defence towards the sea as it was at any time during the war which was concluded by the treaty of Aix-la-Chapelle.

DUNS, a market-town of Scotland, in the shire of Mers, seated in W. Long. 2. 15. N. Lat. 55. 42.

DUNS SCOTUS (John), a Franciscan friar, commonly called *doctor subtilis*, was born in the year 1274; but whether in England, Scotland, or Ireland, hath long been a matter of dispute among the learned of each nation. Dempster, Mackenzie, and other Scottish writers, assert positively that he was born at Duns, a town in Scotland, about fifteen miles from Berwick; and, to secure him more effectually, Mackenzie makes him defended from the Dunses in the Mers. Mac Caghwel, an Irish author, who wrote the life of this Scotus, proves him to have been born at Down in the province of Ulster in Ireland: but Leland, Bale, Camden, and Pits, assure us, that he was born at Dunstan in the parish of Emildune, near Alnwick in Northumberland; and this opinion is rendered probable by the following conclusion of his manuscript works in the

library of Merton college in Oxford—"Here end the writings of that subtle doctor of the university of Paris, John Duns, who was born in a certain village, in the parish of Emildune, called *Dunston*, in the county of Northumberland." We are told, that, when a boy, he became accidentally known to two Franciscan friars; who, finding him to be a youth of very extraordinary capacity, took him to their convent at New-castle, and afterwards persuaded him to become one of their fraternity. From thence he was sent to Oxford, where he was made fellow of Merton college and professor of divinity; and Mackenzie says, that not less than 30,000 students came to Oxford to hear his lectures. His fame was now become so universal, that the general of his order commanded him to go to Paris, that the students of that university might also profit from his lectures. He went to Paris in the year 1304, where he was honoured first with the degree of bachelor, then of doctor of divinity, and in 1307 was appointed regent of the divinity schools: during his residence here, the famous controversy about the *Immaculate conception of the virgin Mary* arose. Albertus Magnus maintained that she was born in original sin. Scotus advanced 200 arguments in support of the contrary opinion, and convinced the university of Paris that she was really conceived immaculate. This important nonsense, however, continued to be disputed till the year 1496, after the council of Basil, when the university of Paris made a decree, that no student, who did not believe the *immaculate conception*, should be admitted to a degree. Our author had not been above a year at Paris, when the same general of the Franciscans ordered him to remove to Cologne; where he was received with great pomp and ceremony by the magistrates and nobles of that city, and where he died of an apoplexy soon after his arrival, in the year 1308, in the 34th year of his age. Some writers have reported, that Scotus was buried in an epileptic fit; and that, upon removing his bones, he appeared to have turned himself in his coffin. This *doctor subtilis* was doubtless one of the first wranglers of his time, admirably well versed in scholastic divinity, and a most indefatigable scribbler; but the misfortune is, that all his huge volumes do not contain a single page worth the perusal of a rational being. He was the author of a new sect of schoolmen called *Scotists*; who opposed the opinions of the Thomists, so called from St Thomas Aquinas. The reader will find a more particular account of Scotus in the Franciscan Martyrology, published at Paris in 1638.—He was a most voluminous writer; his works making 12 vols folio, as published at Lyons by Luke Wadding, 1639.

DUNSTABLE, a town in Bedfordshire, with a market on Wednesdays. It is seated on a chalky hill; and has ponds in the street, which are never dry, tho' only supplied with rain water. It is remarkable for several good inns, it being a great thoroughfare on the northern road. It consists of four streets, intersecting each other at right angles; and in the centre stood one of those beautiful crosses of queen Eleanor, which was destroyed by the enthusiasts in the time of the civil wars. W. Long. 0. 29. N. Lat. 51. 50.

DUNSTAN (canonized), archbishop of Canterbury, in the reign of king Edwy, who was obliged to banish him for his overbearing insolence. He was an encourager

Duo
||
Duppa.

encourager of learning, and an author of some note for the age he lived in. He died about 988. There are many legendary stories about his contests with the devil.

DUO, in music, a song or composition, to be performed in two parts only, one sung, the other played on an instrument, or by two voices.

Duo is also when two voices sing different parts, as accompanied with a third which is a thorough bass. It is seldom that unisons and octaves are used in duos, except at the beginning and end.

DUODECIMA, in music, is the twelfth, or the fifth doubled.

DUODENUM. See **ANATOMY**, n° 354, g.
DUPIN (Lewis Ellis), a learned doctor of the Sorbonne, and one of the greatest critics of his time, especially in ecclesiastical matters, was born at Paris in 1657. When he published the first volume of his *Bibliothèque Universelle des Auteurs Ecclesiastiques*, in 1686, the liberty with which he treated some ecclesiastical writers, gave such offence, that M. de Harlay, archbishop of Paris, obliged Dupin to retract many propositions, and suppress the work. He was nevertheless suffered to continue it, by altering the title from *Bibliothèque Universelle*, to *Bibliothèque Nouvelle*. This great undertaking, continued in several successive volumes, though sufficient to occupy the life of an ordinary man, did not hinder M. Dupin from obliging the world with several other works. He was a man of prodigious reading; and had an easy, happy way of writing, with an uncommon talent at analysing the works of an author; which makes his Ecclesiastical Bibliothèque so valuable. M. Dupin was professor of philosophy in the royal college; but was banished some time from the chair to Chatelleraut, on account of the famous *Cas de Conscience*; but was restored, and died in 1719.

DUPLE, among mathematicians, denotes the ratio of 2 to 1. Thus the ratio of 8 to 4 is duple, or as 2 to 1.

Sub-Duple Ratio, is just the reverse of the former, or as 1 to 2. Such is 4 to 8, or 6 to 12.

DUPPLICATE, among lawyers, denotes a copy of any deed, writing, or account. It is also used for the second letters-patent, granted by the lord chancellor in a case wherein he had before done the same. Also a second letter written and sent to the same party and purpose as a former, for fear of the first's miscarriage, is called a *duplicate*.

DUPPLICATE Proportion, or Ratio. See **RATIO**.
DUPPLICATION, in general, signifies the doubling of any thing, or multiplying of it by 2: also the folding of any thing back again on itself.

DUPPLICATE, among anatomists, a term used to denote the folds of any membrane, or vessel: thus we say, the *duplicatures of the intestines, peritoneum, &c.*

DUPONDUS, in antiquity, the weight of two pounds: also a piece of money equal to two asses in value.

DUPPA (Brian), a learned English bishop born in 1589 at Lewisham in Kent, of which place his father was then vicar. In 1634, he was instituted chancellor of the church at Sarum, and soon after made chaplain to Charles I. He was appointed tutor to Charles

prince of Wales, and his brother James duke of York; was made bishop of Chichester; and in 1641 translated to Salisbury, though the confusions that followed deprived him of all benefit from his promotion. Charles I. held him in high esteem, and he is said to have assisted the king in composing the *Eikon Basilike*. On the Restoration he was made bishop of Winchester, and lord high almoner; but died in 1662. He bequeathed large sums to charitable purposes; and published a few sermons, with other religious pieces.

DURANDUS (William), born at Poumoisson in Provence, in the 13th century, was one of the most knowing lawyers of his time. Pope Martin made him one of his nuncios, and then bishop of Mende and Langue-doc. His *Speculum Juris* gave him the name of *Speculator*; his second piece was *Rationale divinorum officiorum*, containing eight books. He wrote several others.

DURATION. See **METAPHYSICS**, n° 60, 61.
DURATION, as marked by certain periods and measures, is what we most properly call *time*. See **TIME**.

DURATION of Action, according to Aristotle, is confined to a natural day in tragedy; but the epopea, according to the same critic, has no fixed time.*

DURER (Albert), descended of an Hungarian family, and born at Nuremberg in 1471, was one of the best engravers and painters of his age. He was at the same time a man of letters and a philosopher; and he was an intimate friend of Erasmus, who revised some of the pieces which he published. He was a man of business also, and for many years the leading magistrate of Nuremberg. Though not the inventor, he was one of the first improvers of the art of engraving; and he bethought himself of working also in wood, for expedition, having an inexhaustible fund of designs. In many of those prints which he executed on copper, the engraving is elegant to a great degree. His *Hell-Scene* particularly, which was engraved in the year 1513, is as highly finished a print as ever was engraved, and as happily executed. In his wooden prints too we are surprised to see so much meaning in so early a master; the heads so well marked, and every part so well executed.—This artist seems to have understood the principles of design. His composition, too, is often pleasing; and his drawing generally good. But he knows very little of the management of light; and still less of grace: and yet his ideas are purer and more elegant than we could have supposed from the awkward archetypes which his country and education afforded. In a word, he was certainly a man of a very extensive genius; and, as Vafari remarks, would have been an extraordinary artist, if he had had an Italian instead of a German education. His prints are very numerous. They were much admired in his own life-time, and eagerly bought up; which put his wife, who was a teasing woman, upon urging him to spend more time upon engraving than he was inclined to do. He was rich; and chose rather to practise his art as an amusement, than as a business. He died in the year 1527.

D'URFEY (Thomas), an eminent English satirist and songster, whose name, though as well known as that of any writer extant, yet there are very few particulars of his life to be collected. He was born in Devonshire; but when, where, or of what family, are all uncertain. He was bred to the law, which he for-

Durandus
D'Ursey.

* See Poetry
chap. ii.

fook for the more agreeable employment of writing plays and songs; and the latter he had so happy a talent both of writing and singing, that he received many favours from persons of quality on that account. Even crowned heads did not disdain his company. The writer of the *Guardian*, No 67, tells us, he has remembered to have seen Charles II. leaning on Tom D'Urfey's shoulder more than once, humming over a song with him. This indeed was not extraordinary in so merry a monarch; but even the phlegmatic king William could relax his muscles on hearing him sing. He was certainly, by all accounts, a cheerful, honest, good-natured man: but as this character does not include prudence, D'Urfey grew poor as he grew old; and prevailing on the managers of the play-house to act his comedy of the *Plotting Sisters* for his benefit, Mr Addison wrote the abovementioned paper in the *Guardian*, and with another, No 82, representing him in a good-humoured light, to procure him a full house. He died very old, in 1723.

DURHAM, (bishopric of), one of the counties of England. It lies between Cumberland and Yorkshire, being bounded on the west by part of Cumberland and Westmoreland, and on the east washed by the German ocean. It is 39 miles long and about 35 broad, of a triangular shape, the basis being formed by the sea-coast; and contains 52 parishes, four wakes, one city, eight market-towns, a considerable number of villages and villas, and about 100,000 inhabitants. The climate varies in different parts. Towards the west, among the inland hills, the air is keen, pure, and penetrating; on the sea-side more soft, though not so wholesome. The county is watered by 16 rivers, some of which are navigable by boats and lighters; and most of them abound with trout, pike, and salmon. The face of the country is agreeably diversified with hill and dale, wood and water; and, except in the western part, where there is a great number of naked hills, it generally exhibits the appearance of extraordinary cultivation and fertility. The soil in the hilly parts is barren; but the plains are remarkably fruitful. It produces corn and cattle in great abundance and perfection. The mountains yield iron, vitriol, and a considerable quantity of lead; and almost every part of the bishopric affords plenty of coal, which employs a great number of hands and vessels.

Durham is a county palatine, governed by the bishop, who had formerly great prerogatives. He had power to create barons, appoint judges, convoke parliaments, raise taxes, and coin money. The courts of justice were kept in his name; and he granted pardons for trespasses, alienations, rapes, murders, and felonies of every denomination. He erected corporations, granted markets and fairs, created officers by patent, was lord admiral of the seas and waters within the county palatine: great part of the lands were held of the see *in capite*. In a word, he exercised all the power and jurisdiction of a sovereign prince. How and at what period these prerogatives were obtained, it is not easy to determine. Malmesbury says, the lands were granted by king Alfred, who likewise made the church a sanctuary for criminals. This see was anciently called the *patrimony of St Cuthbert*, who had been bishop of Lindisfarne or Holy Island near Berwick. His bones being transferred to Durham, were long esteemed as precious relics; and the people of the county con-

sidered themselves as Halwerd men, exempted from all other but holy work, that is, the defence of St Cuthbert's body. Certain it is, they pretended to hold their lands by this tenure; and refused to serve out of the county either for the king or bishop: but king Edward I. broke through these privileges, and curtailed the prerogatives of the bishops, which were still further abridged by Henry VIII. Nevertheless, the bishop is still earl of Sadberg, a place in this county, which he holds by barony. He is sheriff paramount, and appoints his own deputy, who makes up his audit to him, instead of accounting to the exchequer. He has all the forfeitures upon outlawries; and he and his temporal chancellor act as justices of the peace for the county palatine, which comprehends Creke in Yorkshire, Bedlington, Northam, and Holy Island, in Northumberland, the inhabitants of these places having the benefit of the courts at Durham. The judges of assize, and all the officers of the court, have still their ancient salaries from the bishop; and he constitutes the standing officers by his letters patent. He has the power of presiding in person in any of the courts of judicature. Even when judgment of blood is given; this prelate may fit in court in his purple robes, tho' the canons forbid any clergyman to be present in such cases: hence the old saying, *Solum Dunelmensis solus jus dicit et ense*. It was not till the reign of Charles II. that the bishopric sent representatives to parliament. At present it sends only four; two knights for the shire, and two burgesses for the city.

DURHAM, the capital of the above mentioned county, is situated in W. Long. 1. 14. N. Lat. 54. 50. It stands on a hill almost surrounded by the river Wre; and is considerable for its extent and the number of its inhabitants, as well as for being the see and seat of the bishop, who is lord paramount. It stands about 280 miles north from London; being remarkable for the salubrity of its air, and the abundance and cheapness of its provisions. These circumstances have induced a great deal of good company to take up their residence at Durham, which is still further animated by the presence and court of the bishop and his clergy. The town is said to have been built about 70 years before the Norman conquest, on occasion of bringing hither the body of St Cuthbert. It was first incorporated by king Richard I. but queen Elizabeth extended its privileges. At length, in the year 1684, it obtained a charter; in consequence of which, it is now governed by a mayor, 12 aldermen, 12 common council men, with a recorder, and inferior officers. These can hold a court-leet and court-baron within the city; but under the style of the bishop, who as count palatine appoints a judge, steward, sheriffs, and other inferior magistrates. The mayor and aldermen also keep a *pie pouldres* court at their fairs, and pay a yearly toll to the bishop. They have a weekly market on Saturday, and three annual fairs. Durham is about a mile in length, and as much in breadth, resembling the figure of a crab, the market-place exhibiting the body, and the claws being represented by the streets, which bend according to the course of the river, that almost surrounds one part of the city. They are, moreover, dark and narrow; and some of them lying on the acclivity of a steep hill, are very difficult and dangerous to wheel-carriages. The houses are in general strong

Durham.

built, but neither light nor elegant. The most remarkable edifices are the cathedral with six other churches, three standing in the city, and as many in the suburbs; the college; the castle, or bishop's palace; the tolbooth near St Nicholas's church; the cros and conduit in the market-place; with two bridges over the Elvet. The cathedral was begun by bishop Carlepho in the 11th century. It is a large, magnificent, Gothic structure, 411 feet long, and 80 in breadth, having a cros aisle in the middle 170 feet in length, and two smaller aisles at each end. On the south-side is a fine cloister; on the east, the old library, the chapter-house, and part of the deanery; on the west, the dormitory, under which is the treasury and a chantry; and on the west side is the new library, an elegant building begun by dean Sudbury about 70 years ago, on the spot where stood the old refectory of the convent. The middle tower of the cathedral is 212 feet high. The whole building is arched and supported by huge pillars. Several of the windows are curiously painted; and there is a handsome screen at the entrance into the choir. Sixteen bishops are interred in the chapter-house, which is 75 feet long and 33 broad, arched over-head, with a magnificent feat at the upper end for the interment of the bishops. The confistory is kept in the chapel or west aisle called *Galilee*, which was built by bishop Pudsey, and had formerly 16 altars for women, as they were not allowed to advance farther than the line of marble by the side of the font; here likewise are deposited the bones of the venerable Bede, whose elogium is written on an old parchment scroll that hangs over his tomb. The long cros aisle, at the extremity of the church, was formerly distinguished by nine altars, four to the north, and four to the south, and the most magnificent in the middle dedicated to the patron St Cuthbert, whose rich shrine was in this quarter, formerly much frequented by pilgrims. The church is possessed of some old records relating to the affairs of Scotland, the kings of which were great benefactors to this cathedral. The ornaments here used for administering the divine offices, are said to be richer than those of any other cathedral in England. Before reformation, it was distinguished by the name *ecclesia sancta Mariæ et sancti Cuthberti*; but it obtained the appellation of *ecclesia cathedralis Christi et beata Mariæ*, in the reign of Henry VIII. who endowed the deanery with 12 prebendaries, 12 minor canons, a deacon, sub-deacon, 16 lay singing men, a schoolmaster and usher, a master of the choir, a divinity reader, eight alms-men, 18 scholars, 10 choiristers, two vergers, two porters, two cooks, two butlers, and two sacristans. On the south-side of the cathedral, is the college; a spacious court formed by the houses of the prebendaries, who are richly endowed and extremely well lodged. Above the college-gate, at the east end, is the exchequer; and at the west, a large hall for entertaining strangers, with the granary and other offices of the convent. The college-school, with the master's house, stands on the north side of the cathedral. Between the churchyard and castle, is an open area called the *palace-green*; at the west end of which stands the shire-hall, where the assizes and sessions are held for the county. Hard by is the library built by bishop Cosin; together with the exchequer raised by bishop Nevil, in which are kept the offices belonging to the county-palatine court.

There is an hospital on the east, endowed by bishop Cosin, and at each end of it are two schools founded by bishop Langley. On the north, is the castle built by William the Conqueror, and afterwards converted into the bishop's palace, the outward gate of which is at present the county-goal.

The city consists of three manors; the bishop's manor containing the city liberties and the bailey, held of him by the service of castle-guard; the manor of the dean and chapter, consisting of the Elvet's cros gate, south-gate street; and the manor of Gilligate, formerly belonging to the dissolved hospital of Kepyar in this neighbourhood, but granted by Edward VI. to John Cockburn, lord of Ormilton, and late in the possession of John Tempett, Esq. The bishopric of Durham is one of the best in England, not only on account of its ample revenues and prerogatives, but because living is remarkably cheap in this county, and the bishop has a great number of rich benefices in his gift.

In the neighbourhood of this city is Nevil's cros, famous for the battle fought in the year 1346, against David II. king of Scotland, who was defeated and taken.

DURY (John), a Scots divine, who travelled much, and laboured with great zeal to reunite the Lutherans with the Calvinists. His discouragements in this scheme started another still more impracticable; and this was to reunite all Christians by means of a new explication of the Apocalypse, which he published at Frankfurt in 1674. He enjoyed then a comfortable retreat in the country of Hesse; but the time of his death is unknown: his letter to Peter du Moulin concerning the state of the churches of England, Scotland, and Ireland, was printed at London in 1658, by the care of du Moulin, and is esteemed to be curious.

DUSSELDORP, a city of Westphalia in Germany, and capital of the duchy of Berg. It is situated at the conflux of the river Duffel with the Rhine, in E., Long. 6. 20. N. Lat. 51. 15.

DUTCHY. See DUCHY.

DUTY, in general, denotes any thing that one is obliged to perform.

DUTY, in a moral sense; see MORAL Philosophy, n° 73, &c.

DUTY, in polity and commerce, signifies the impost laid on merchandizes, at importation or exportation, commonly called the duties of customs; also the taxes of excise, stamp-duties, &c. See CUSTOMS, EXCISE, &c.

The principles on which all duties and customs should be laid on foreign merchandizes which are imported into these kingdoms, are such as tend to cement a mutual friendship and traffick between one nation and another; and therefore due care should be taken in the laying of them, that they may answer for good an end, and be reciprocal in both countries: they should be so laid as to make the exports of this nation at least equal to our imports from those nations wherewith we trade, so that a balance in money should not be issued out of Great Britain, to pay for the goods and merchandizes of other countries; to the end that no greater number of our landholders and manufacturers should be deprived of their revenues arising from the product of the lands, and the labour of the people, by foreign importations, than are maintained by exportations to such countries. These are the national principles on which

Duty
Duty.

all

Duty
Dwarf.

all our treaties of commerce with other countries ought to be grounded.

DURY, in the military art, is the exercise of those functions that belong to a soldier: with this distinction, that mounting guard and the like, where there is no enemy directly to be engaged, is called duty; but their marching to meet and fight an enemy is called going on service.

DUUMVIRATE, the office or dignity of the duumviri. See the next article.

The duumvirate lasted till the year of Rome 388, when it was changed into a decemvirate.

DUUMVIRI, in Roman antiquity, a general appellation given to magistrates, commissioners, and officers, where two were joined together in the same functions.

DUUMVIRI Capitales were the judges in criminal causes: from their sentence it was lawful to appeal to the people, who only had the power of condemning a citizen to death. These judges were taken from the body of the decurions; they had great power and authority, were members of the public council, and had two lictors to walk before them.

DUUMVIRI Municipales, were two magistrates in some cities of the empire, answering to what the consuls were at Rome: they were chosen out of the body of the decurions; their office lasted commonly five years, upon which account they were frequently termed *quinquinales magistratus*. Their jurisdiction was of great extent: they had officers walking before them, carrying a small switch in their hands; and some of them assumed the privilege of having lictors, carrying axes and the fasces, or bundles of rods, before them.

DUUMVIRI Navales, were the commissaries of the fleet, first created at the request of M. Decius, tribune of the people, in the time of the war with the Samnites. The duty of their office consisted in giving orders for the fitting of ships, and giving their commissions to the marine officers, &c.

DUUMVIRI Sacrorum, were magistrates created by Tarquinius Superbus, for the performance of the sacrifices, and keeping of the sybils books. They were chosen from among the patricians, and held their office for life: they were exempted from serving in the wars, and from the offices imposed on the other citizens, and without them the oracles of the sybils could not be consulted.

DUVELAND, or **DIVELAND**, one of the islands of Zealand, in the United Provinces, lying eastward of Schonen, from which it is only separated by a narrow channel.

DWAL, in heraldry, the herb nightshade, used by such as blazon with flowers and herbs, instead of metals and colours, for fable or black.

DWARF, in general, an appellation given to things greatly inferior in size to that which is usual in their several kinds: thus there are dwarfs of the human species, dwarf-dogs, dwarf-trees, &c.

The Romans were passionately fond of dwarfs, whom they called *nani* or *nane*, inasmuch that they often used artificial methods to prevent the growth of boys designed for dwarfs, by inclosing them in boxes, or by the use of tight bandages. Augustus's niece, Julia, was extremely fond of a dwarf called Sonopas, who was only two feet and an hand-breadth high.—We

have many other accounts of human dwarfs, but most of them deformed in some way or other besides the smallness of their size. Many relations also concerning dwarfs we must necessarily look upon to be fabulous, as well as those concerning giants.—The following history, however, which we have reason to look upon as authentic, is too remarkable not to be acceptable to the generality of our readers.

Jeffery Hudfon, the famous English dwarf, was born at Oakham in Rutlandshire in 1619; and about the age of seven or eight, being then but 18 inches high, was retained in the service of the duke of Buckingham, who resided at Burleigh on the Hill. Soon after the marriage of Charles I. the king and queen being entertained at Burleigh, little Jeffery was served up to table in a cold pye, and presented by the duchess to the queen, who kept him as her dwarf. From 7 years of age till 30, he never grew taller; but after 30, he shot up to three feet nine inches, and there fixed. Jeffery became a considerable part of the entertainment of the court. Sir William Davenant wrote a poem called *Jeffreidos*, on a battle between him and a turkey-cock; and in 1636 was published a very small book, called the *New Year's Gift*, presented at court by the lady Parvula to the lord Minimus (commonly called Little Jeffery) her majesty's servant, &c. written by Microphilus, with a little print of Jeffery prefixed. Before this period, Jeffery was employed on a negotiation of great importance: he was sent to France to fetch a midwife for the queen; and on his return with this gentleman, and her majesty's dancing-master, and many rich presents to the queen from her mother Mary de Medicis, he was taken by the Dunkirkers. Jeffery, thus made of consequence, grew to think himself really so. He had borne with little temper the teasing of the courtiers and domestics, and had many squabbles with the king's gigantic porter. At last, being provoked by Mr Crofts, a young gentleman of family, a challenge ensued: and Mr Crofts coming to the rendezvous armed only with a squirt, the little creature was so enraged, that a real duel ensued; and the appointment being on horseback with pistols, to put them more on a level, Jeffery, with the first fire, shot his antagonist dead. This happened in France, whither he had attended his mistress in the troubles. He was again taken prisoner by a Turkish rover, and sold into Barbary. He probably did not remain long in slavery: for at the beginning of the civil war, he was made a captain in the royal army; and in 1644 attended the queen to France, where he remained till the Restoration. At last, upon suspicion of his being privy to the Popish plot, he was taken up in 1682, and confined in the Gatehouse, Westminster, where he ended his life, in the 63d year of his age.

DWINA, the name of two large rivers; one of which rises in Lithuania, and, dividing Livonia from Courland, falls into the Baltic sea a little below Riga: the other gives name to the province of Dwina, in Russia, discharging itself into the White Sea, a little below Archangel.

DYE, in architecture, any square body, as the trunk or notched part of a pedestal: or it is the middle of the pedestal, or that part included between the base and the cornice; so called because it is often made in the form of a cube or dye *.

Dwarf
Dye.

* See Architecture, n^o 66.

Dyer.

DYER, a person who professes the art of dyeing all manner of colours. See DYEING.

DYER (Sir James), an eminent English lawyer, chief judge of the court of common pleas in the reign of queen Elizabeth. He died in 1581; and about 20 years after, was published his large collection of *Reports*, which have been highly esteemed for their succinctness and solidity: he also left other writings behind him, relative to his profession.

DYER (John), the son of Robert Dyer, Esq; a Welsh solicitor of great capacity, was born in 1700, and edu-

cated a painter; for which purpose he travelled to Rome, where he collected materials for his instructive poem called the *Ruins of Rome*: his ill health and literary turn, however, induced him to turn clergyman; and he obtained the living of Coningsby in Lincolnshire, where he resided until his death. He distinguished himself by his poems of *Grangar Hill*, the *Ruins of Rome* above-mentioned, and the *Fleece*, published in 1757, which his bad health hardly permitted him to finish.

DYER'S *Weed*, in botany. See RESEDA.

Dyer's.

D Y E I N G,

IN the utmost latitude of the word, may be defined, The art of tingeing cloth, stuff, or other matter, with a permanent colour, which penetrates the substance thereof.—It is, however, commonly restrained to the art of tingeing silk, wool, cotton, and linen, with different colours; and, as such, is practised as a trade by those who do not meddle with any of the other branches, as staining of leather, &c.

Antiquity
of the art,
&c.

The dyeing art is of great antiquity; as appears from the traces of it in the oldest sacred, as well as profane, writers. The honour of the invention is attributed to the Tyrians; though what lessens the merit of it is, that it is said to have owed its rise to chance. The juices of certain fruits, leaves, &c. accidentally crushed, are supposed to have furnished the first hint: Pliny assure us, that even in his time the Gauls made use of no other dyes: it is added, that coloured earthen, and minerals, washed and soaked with rain, gave the next dyeing materials.—But purple, an animal juice, found in a shell-fish called *murex**, *conchylium*, and *purpura*, seems from history to have been prior to any of them. This indeed was reserved for the use of kings and princes; private persons were forbidden by law to wear the least scrap of it. The discovery of its tingeing quality is said to have been taken from a dog, which having caught one of the purple-fishes among the rocks, and eaten it up, stained his mouth and beard with the precious liquor; which struck the fancy of a Tyrian nymph so strongly, that she refused her lover Hercules any favours till he had brought her a mantle of the same colour.

* See Mus-
tex.

Pliny seems to ascribe the invention of the art of dyeing wool to the Lydians of Sardis: "*Inficere lanas Sardibus Lydi*," where the word *incipere* must be understood. But a modern critic suspects a false reading here; and, not without reason, for *Lydi*, substitutes *Lydda*, the name of a city on the coast of Phœnicia, where the chief mart of the purple dye was.

After the Phœnicians, the Sardinians seem to have arrived at the greatest perfection in the dyeing art; in so much, that *βαμμα Σαρδινιακον*, *Sardinian dye*, passed into a proverb among the Greeks. Till the time of Alexander, we find no other sort of dye in use among the Greeks but purple and scarlet.—It was under the successors of that monarch, that these people applied themselves to the other colours; and invented, or at least perfected, blue, yellow, green, &c.—For the ancient purple, it has been long lost; but the perfection to which the moderns have carried the other colours, abundantly indemnifies them of the loss. It is still,

however, greatly to be doubted whether the permanency of the modern colours at all equals that of the ancient ones; though it is certain, that the former greatly exceed them in brightness.

SECT. I. Theory of Dyeing.

BEFORE we can enter into any consideration of the true theory of dyeing, it is necessary to make the following observation concerning the practice, namely, That salts are almost the only means we are acquainted with by which any colouring substance can be made to fix itself upon those matters which are the common subjects of dyeing. A solution of cochineal, for instance, will of itself impart no permanent colour to a piece of woollen cloth put into it. The red colour of the cochineal will indeed stain the cloth while it remains immersed in the solution; but as soon as it is taken out and washed, this temporary stain will immediately vanish, and the cloth become as white as before. If now the cloth is dipped in the solution of any saline substance, alkalies alone excepted, and then immersed in the solution of cochineal for some time, it will come out permanently coloured; nor will the colour be discharged even by washing with soap and water. If a quantity of salt is added to the solution of cochineal, and the cloth put in without being impregnated with any saline substance, the effect will be the same; the cloth will come out coloured; only in this last case, it must be well dried before washing it with soap, or moist of the colour will be discharged.

Salts the
only means
of fixing
colours.

By comparing this with what is delivered under the article *COLOUR-Making*, n° 13, 14, we shall be able to form a pretty rational theory of dyeing. It is there remarked, that a saline substance, (solution of tin in aqua regia), had a surprising power of coagulating the colouring matter of certain solutions, such as cochineal, Brazil-wood, logwood, &c. If therefore a piece of cloth is previously impregnated with this solution, and put into the colouring one, it is plain that some part of the colouring matter will be coagulated by the solution remaining in the cloth, in the very same manner that it would have been if a small quantity of the saline solution had been poured into the other. The cloth therefore will take up a part of the colouring matter, which cannot be discharged but by entirely discharging the solution of tin. This, however, seems to unite itself with the cloth very firmly, so that scarce a particle of colour will be discharged by washing in plain water, or even with soap; nor can the whole be taken out, without boiling the cloth in a solution of fixed alkali.

They operate
by coagulation.

THEORY. alkali.

Though solution of tin produces this coagulation in the most remarkable manner, it is not to be doubted that the same power is possessed in some degree by most of the neutrals and imperfect salts. Alum possesses it very considerably, though not so much as solution of tin; and hence that salt is very much used in dyeing, as well as sugar of lead, which also has a very strong power of coagulation. The process of dyeing, therefore, seems to be most analogous to that of the coagulation or curdling of milk. Before it has suffered this change, the milk is easily miscible with water; but after it is once coagulated, the curd, or caseous part, is very difficultly soluble in any liquid whatever. In like manner, the colouring matter in the solution of cochineal, before the cloth is put in, is easily soluble in water, and may be diffused through any quantity of fluid: but no sooner is the cloth dipped in it, than the saline substance contained in the cloth coagulates that part of the colouring matter which lies in immediate contact with it; and, as all the fluid successively comes into contact with it, the whole of the colour is by degrees coagulated and deposited on the cloth.

⁴ Hypotheses concerning the adhesion of the colour.

To account for the strong adhesion of the colour to the dyed cloth, several hypotheses have been formed. One is, That the fibres of wool, silk, &c. are hollow tubes; and that the colouring matter enters them; and, after being there coagulated, shews itself through the fine transparent sides of the tubes.—Another considers these filaments as solid lengthwise, but having all round their sides an infinite number of small pores like the extremities of the fine absorbing and exhaling vessels of the human body. In these pores, according to the hypothesis, the colour is lodged; and as the pores are placed exceedingly close to one another, the fine threads appear to our eyes of one uniform colour.—A third is, That the fibres are solid, or at least with respect to us may be considered as such. The saline substance, whatever it is, that is employed to make the colour strike, sinks into the surface, partly corrodes and unites itself with it into a third kind of substance no longer soluble in plain water, nor even easily by soap, but which still preserves its coagulating quality. According to this hypothesis, the dye lies entirely on the outside of the stuff, and continues as long as the effect of the salt continues upon the fibres of the matter to be dyed.

Concerning the truth of these hypotheses, or indeed any others that can be invented, it is impossible to bring any decisive proof. It seems, however, more probable that the process of dyeing is accomplished by a coagulation of the colouring matter itself, rather than by any agglutination of it to the fibres by means of a vitriolated tartar, as Mr Hellot supposes. According to this gentleman's theory, a vitriolated tartar is generated in every process for dyeing, and proceeds from the acid of the alum and alkaline basis of the tartar used in the preparations, or in some of the dyeing ingredients themselves. He supposes that the pores of the stuff are cleaned and enlarged by the preparatory salts, and by the boiling water, in such a manner as to receive the colouring particles, which particles are afterwards detained by the contraction of the pores occasioned by cold; and further, that these pores are lined with a saline crust of tartar or vitriolated tartar.

⁵ Mr Hellot's hypothesis disproved.

On this theory, the translator of the Chemical Dictionary has the following observations. "Mr Hellot has not shown that pure fixed alkali is incapable of producing the effects which he attributes to his tartar and vitriolated tartar; and both these salts, though they are difficult of solution, and require a great quantity of water for this purpose, will yet dissolve at last; and therefore, if the colouring particles were fixed chiefly by means of these salts, they might be washed out by a large quantity of water; which we find to be contrary to experience.

⁶ Another hypothesis.

"We shall find it more difficult to substitute a true theory, than to refute that of Mr Hellot. Many experiments ought to be previously made. Nevertheless it may be observed, That the colorific particles of most substances used in dyeing seem to be insoluble in water, in spirit of wine, and even in alkaline lixiviums: that their diffusion thro' these liquids is caused merely by their adhesion to certain gummy and resinous particles: and that they may be disengaged from those gummy and resinous matters, by applying a piece of stuff to which they have a greater adhesive power, which seems to be the case of the root-coloured and blue dyes; or by applying another substance to which these particles have a greater power of adhesion; such as the earth of alum, in those dyes where that salt is used, together with some other substance, as fixed or volatile alkali, capable of decomposing alum; or as the ferruginous earth of the green vitriol in black dyes, to which the colorific particles of the galls adhere; which earths are capable of applying themselves and of adhering to the stuffs. The separation of the colouring particles from the gummy and resinous matters is probably facilitated by the addition of acids and neutral salts, which may coagulate in some measure the vegetable matters, and leave the colorific particles disengaged; so that they may apply themselves to the stuff, or to the earths above-mentioned."

But, in whatever way the salts used in dyeing do act, it is certain they are capable, except in a very few instances, of fixing and giving a lustre and permanency to the colour which otherwise could never be obtained. The exception to this general rule most commonly known, is that of indigo. This is a fine blue fecula produced by fermentation from the leaves of the Indian plant called *anil*. It is very difficult of solution; however, it may be dissolved by alkaline salts, concentrated oil of vitriol, orpiment, or combinations of sulphur with quicklime. If a quantity of indigo is dissolved in a fixed alkali, (for volatile alkalis will not dissolve it), the solution is always green, which is the natural colour produced in all vegetable blues by the alkali: but if any piece of stuff is put into this solution, though it remains green while immersed in the liquid, the moment it comes in contact with the air, the dissolving power of the alkali is totally destroyed; the indigo is precipitated upon the cloth, resumes its native colour, and dyes the cloth blue.

⁷ Exceptions to the general rule.

The cause of this precipitation is very difficult to be investigated. Perhaps it may be owing to an attraction of fixed air by the alkali from the atmosphere, which renders the salt unable to dissolve the indigo any longer. The adhesion of the colour seems merely owing to an attraction between it and the cloth; for the alkaline salt can contribute nothing to this, but would.

would rather have the contrary effect. Perhaps, however, the great solvent power possessed by alkaline salts, by perfectly clearing away every kind ofordes, may bring the indigo and cloth into nearer contact with each other, than when it is dissolved in any other way; and consequently the attraction will in these cases be the stronger. This seems to have some probability; for when indigo is dissolved in vitriolic acid, as in dyeing Saxon blue, the colour is much more easily discharged.

Another exception is in the juices of some vegetables, such as the nuts of the anacardium. This produces, without addition, a most deep and lasting black, never to be washed out or discharged by any means whatever. Several other plants are to be found in different parts of the world, which give an indelible black stain upon linen without addition; and the colouring matter of these seems to adhere by means of a very tenacious gluten, with which it is mixed, and which, when once thoroughly dried, can never be again dissolved. In this respect, these black staining colours seem analogous to the *purpura* of the ancients; which stained indelibly without addition, and was of an exceedingly viscous and adhesive nature.

SECT. II. Practice of Dyeing.

§ 1. Of the colouring materials, and ingredients for fixing the colours.

8
True and
false dyes.

THE materials for dyeing different colours are so many and various, that an enumeration of them all is scarce to be expected. The same difference, however, takes place among the materials for dyeing which we have observed to take place among those for COLOUR-MAKING. Some ingredients produce durable colours, which cannot be discharged either by exposure to the air, or by washing with soap; others, though they may be made to stand the action of soap pretty well, cannot by any means be enabled to resist the action of the air. These are distinguished by the different names of *true* and *false*, *permanent* and *fading*, &c.; nor is there any method yet discovered of giving the false colours an equal degree of durability with the true ones. This hath been attempted by mixing a permanent and a fading colour together; in which case it was thought that the former would impart somewhat of its durability to the latter: but this hath always been found to misgive; the fading colour soon flying off, and leaving the permanent one behind. The same hath also been attempted by dyeing a piece of stuff partially with a fading colour, and then completing the dye with a permanent one. In this case, it was hoped, that the fading colour being covered over, and defended from the injuries of the air, by the permanent one, would necessarily become equally durable, or at least remain a much longer time than if the stuff was dyed with it alone. But this also hath been found ineffectual; and the fading colour hath been dissipated as soon when covered with a permanent one, as when left without any such cover.—Solution of tin in aqua regia will give most of these fading colours an high degree of beauty, and some share of durability, though even that is not able to make them equal to the others.—The most permanent dyes we have are cochineal and gum lac for fine reds and scarlets: indigo and woad for blue; and,

when mixed in different proportions with cochineal, or lac, for purple and violet colours. Weld, and some other vegetables, for yellow; and madder for coarse reds, purples, and blacks.—The fading colours are much more numerous. In this class are included Brazil-wood, logwood, peach-wood, red-wood, fustic, turmeric root, annatto, archil, &c. &c.

With regard to the salts made use of in dyeing, it hath been but too often customary to jumble together such a quantity of different ones, that it was not only impossible to know in what particular salt the virtue resided, but often the efficacy of the whole hath been totally destroyed, and the colour entirely spoiled by such injudicious management. It is proper, therefore, where a mixture of two or more salts is intended to be made for dyeing, first to try the change of colour produced by each of the salts upon the colouring substance. If the colours are nearly alike, the mixture may be safely made as to that particular. But if the two colours produced by the different salts are very different from one another, to mix them together must be very injudicious. Thus, suppose you want to dye scarlet, solution of tin in aqua regia produces the necessary change of colour on the decoction of cochineal, and converts it into a high flame-colour, which shews it to be a proper ingredient; but, to the solution of tin, it would surely be the greatest absurdity to add a quantity of saccharum saturni, the effect of which is to change the colour of cochineal to a dull purple. But, tho' the salts taken separately should produce a colour nearly similar, another thing must be regarded, namely, whether they can be mixed with safety to one another. It is the nature of many salts to destroy one another whenever they come into perfect contact by being dissolved in water. Thus, solution of tin and saccharum saturni destroy one another; and so do solution of tin, and tartar, or cream of tartar. To mix these together must therefore be absurd; and yet we find this last mixture ordered in almost every receipt for dyeing scarlet. It is also to be observed, that a mixture of different salts ought never to be made, out of a notion that the colour will keep the better on that account; for most commonly it will keep the worse. A single salt will answer for this purpose, better than a hundred. A mixture should only be made where it is necessary to produce the colour desired; and if a dyer proceeds in this simple manner, he may not only attain to great perfection in the art from his own experience without being taught by others, but even make considerable discoveries; as dyeing is at present far enough from being brought to perfection.—The salts chiefly to be used in dyeing are fixed alkalies; solutions of tin in the vitriolic and marine acids, and in aqua regia; sugar of lead; cream of tartar; alum; oil of vitriol; and solution of iron in the acetic acid. By means of these, almost all kinds of colours may be dyed at an easy rate, and with very little trouble.

§ 2. Of the manner of using the ingredients, and of producing the different colours.

As the art of dyeing is, by the principles above laid down, reduced to a great degree of simplicity, almost all the directions for the practice will be contained in the following general rule.

Having cleaned the substance to be dyed as well as possible, and made choice of the salt proper for producing

10
General
rule for dye-
ing all col-
ours.

cing the colour desired, dissolve the salt in water, and steep the substance in that solution for 24 hours. Then take it out; and, without wringing, hang it up to dry, but without heat: and for this it will be proper to allow a pretty long time; for the more perfectly the salt penetrates the cloth, the more durable will the colour be. Having then prepared a coloured solution or decoction, put the cloth into it. The less heat that is applied during the time the cloth remains in the dye, the finer the colour will be, but the longer time will be required for completing the operation. If time cannot be spared, so that a strong heat must be applied, it will be necessary to roll the cloth during the time of dyeing, or the colour will be in danger of proving unequal.—After the dyeing is completed, rinse the cloth in cold water, but do not wring it severely; and then hang it up to dry.

In this way may be dyed a great variety of colours, on wool, silk, cotton, and linen, without any variation in the process. Solution of tin in the vitriolic acid will produce all degrees of red, from the palest pink or rose-colour, to the highest crimson and scarlet; and that on all the above-mentioned substances without exception.—A method of producing these fine colours upon cotton and linen, as well as wool, hath been a great desideratum in dyeing; but by the abovementioned solution these substances may be dyed of the most beautiful red, crimson, and scarlet colours, as any one may very readily satisfy himself by a trial.—The same thing may be done by solution of tin in aqua regia; but unless the nitrous acid prevails greatly in the mixture, the colours produced by this last will incline more to the purple than the former. With solution of tin in the marine acid, they incline remarkably to purple, and are likewise deficient in lustre. The two first solutions therefore are capital ingredients in dyeing red.

The same preparations will also serve for dyeing all other colours, blue and green only excepted. Thus, a piece of cloth prepared with solution of tin in the vitriolic acid, if boiled in a decoction of cochineal, will come out of a scarlet colour; if with turmeric, weld, fustic, or many of the common yellow flowers, it will come out of different degrees of yellow; with Brazil-wood, peach-wood, &c. it will give a fine purplish crimson; with logwood, a fine deep purple, &c.; and by combining these together in different ways, an infinity of different shades may be produced.

For the coarse reds produced from madder, the solutions of tin are not found, to answer. The proper salts for these are alum and cream of tartar. In dyeing with madder, it is always necessary, more than when any other ingredient is used, to let the heat be gentle; because the root, besides the red colour it contains, has also a great quantity of brownish matter in it, which is extracted by strong boiling, and debascs every colour with which it is mixed. Sugar of lead produces a purple with this root; which, however, will be brightened by an addition of alum and sal ammoniac. A dark purple may also be produced from madder by mixing alum with a little solution of iron in the vegetable acids, particularly the aceticus. With regard to blue colours, they are only to be dyed by means of indigo. This substance may be dissolved, as we have already observed, by alkaline salts, concentrated acids, and orpiment. The first of these produces the common blues;

the second, the Saxon blue; and the third, the blue which is used in callico-printing.—The method of dyeing the common blue requires only the stuff to be dipped in a solution of indigo in the alkaline salt; and if the liquor is hot, the dyeing will be over almost instantaneously. For cotton and linen, another method hath been used. Lime is added to the pot-ash, and the strength of the alkali being by this means increased, the indigo is very soon dissolved. Some raisins are now to be beat in a brags or marble mortar to a pulp, and thrown into the solution of the indigo as soon as taken off the fire. It soon throws up a copper-coloured scum to the surface; and the cotton being now put into the liquor, receives the colour in an instant. This is a very beautiful blue; but in what manner the raisins act, is a matter which yet remains to be determined. If a piece of cloth is dipped in a solution of copper in the nitrous acid, and then boiled in logwood, it will come out of a purplish blue colour. This dye, however, has very little beauty or durability, and is therefore scarce worthy of notice.

Common green vitriol or copperas is thought to improve blue colours in general; but on what foundation, is not very apparent. By means of it, however, the colour of Prussian blue may be struck upon cloth in such a manner as to produce a temporary stain of exceeding great beauty; and could any method of fixing this colour be fallen upon, it would undoubtedly be a most valuable acquisition. The method is, to digest some Prussian blue in fixed alkali till the colour is extracted. In this solution dip the cloth intended to be dyed, and dry it; then let it lie for a little time in a weak solution of copperas, and it will immediately become of a most beautiful blue colour. This colour, however, is discharged by washing with soap, and even with simple water.

A receipt was published by Mr Woulfe, in the Philosophical Transactions, for an improved method of dyeing the Saxon blue; which is done by dissolving indigo in concentrated oil of vitriol. The only improvement in Mr Woulfe's process, consisted in digesting the oil of vitriol and indigo in the heat of boiling water instead of a sand-heat, because the latter was often found to spoil the colour. After the indigo is dissolved, the solution may be weakened at pleasure with water; and any piece of stuff then dipped in it will imbibe the colour, in proportion to the strength of the solution. This dye is very beautiful; but will neither keep its colour, nor stand washing with soap: unless great care is taken, it is also very apt to prove unequal.

Green colours are to be produced only by a mixture of blue and yellow; for there is no ingredient yet discovered, that will, by itself, give a good green dye. Sap-green will indeed communicate its own colour to cloth of any kind, and for that purpose is used in some places; but the colours dyed with this ingredient are by no means eligible. It is common first to dye the cloth blue with indigo, and then yellow with any yellow colouring ingredient; by which means a green colour is produced. For the dyeing of Saxon green, however, it is necessary to produce a particular kind of yellow from indigo. This is obtained by dissolving indigo in spirit of nitre. Mr Woulfe recommends an ounce and an half of powdered indigo to be mixed with two ounces of spirit of nitre diluted with four times its quantity

quantity of water. The mixture is then to stand for a week; and, at the end of that space, must be digested in a sand-heat for an hour or more; after which, four ounces more of water is to be added: the solution, when filtered, will be of a fine yellow colour.—Strong spirit of nitre is apt to set fire to indigo; for which reason, as well as to hinder the mixture from frothing up, it must be diluted with water. Two ounces and an half of strong spirit of nitre will set fire to one ounce and an half of indigo; but if the acid is highly concentrated, a less quantity will serve.

If the indigo be digested 24 hours after the spirit of nitre is poured on it, it will froth and boil over; but, after standing a week or less, it has not that property.

One part of the solution of indigo in the acid of nitre, mixed with four or five parts of water, will dye silk or cloth of the palest yellow colour, or of any shade to the deepest, and that by letting them boil more or less in the colour. The addition of alum is useful, as it makes the colour more lasting. According as the solution boils away, more water must be added.

None of the colour in the operation separates from the water, but what adheres to the silk or cloth; of consequence, this colour goes far in dyeing.

Cochineal, Dutch litmus, archil, cudbear, and many other colouring substances, treated in this manner, will all dye silk and wool of a yellow colour.

The indigo which remains undissolved in making Saxon blue, and collected by filtration, if digested with spirit of nitre, dyes silk and wool of all shades of brown inclining to a yellow.

Cloth and silk may be dyed green with indigo; but they must first be boiled in the yellow dye, and then in the blue.

Black colours are dyed by preparing the cloth with any solution of iron, (but that in the acetic acid is best,) and then boiling it in a decoction of any astringent vegetable. Those chiefly made use of for the purposes of dyeing, are galls, fumach, logwood, and madder. Of these the last is the most durable; though galls will also produce a pretty lasting colour, if properly managed. Logwood dyes a very pretty, but fading, black colour. It appears, however, from some experiments made by Mr Clegg, that, by a proper preparation of the cloth with fixed alkaline salts, black colours dyed with logwood might be improved both as to beauty and durability.—"I took (says he) two vessels, containing equal measures of a strong astringent liquor, composed of galls and logwood: into one vessel I put a small quantity of pearl-ashes; the other remained as a standard. Pieces of linen and cotton cloth, after maceration in these liquors, were thrown together into a strong solution of copperas; they were soon after taken out, and washed in cold water. When dry, the pieces prepared in ashes were, all of them, much deeper than the others.

"I made use of different kinds of pearl and pot ashes, as well as many kinds of astringents: the ashes had the same effect whatever astringent was made use of, and the strongest alkali always produced the deepest colour; and though ashes, used with an astringent, always gave a deeper colour than the same astringent without ashes, yet logwood, which without ashes gave not so deep a colour as galls with them, gave a much deeper black than galls with the same addition.

"There was a remarkable difference in this case between lime and ashes in their effect upon logwood; with lime it gave no blackness, but with ashes it produced a deeper black than any other astringent I made use of.

"Being desirous of trying the duration of colours produced by astringents, in which different quantities of pearl-ashes had been dissolved; in two pints of river water I boiled one ounce of logwood during ten minutes; I then added half an ounce of Aleppo galls, and boiled them together ten minutes longer; the liquor having stood to cool, was decanted off, and divided into six equal quantities. N° 1 remained as a standard; into N° 2, I put six grains of fine pearl-ashes; N° 3, twelve grains; N° 4, eighteen grains; N° 5, twenty-four grains; N° 6, thirty grains. To fix drops of each of these liquors, I added two drops of a saturated solution of copperas. N° 2 and 3 struck a deep black; N° 1 and 4, black, but inferior to 2 and 3; N° 5, a brown black; N° 6, brown.

"From this experiment it appears, that N° 5 and 6 were spoiled by an over proportion of ashes.—All these colours were tried by writing with them on paper, and the writings have now been exposed six months to the air. In N° 5 and 6, the blackness is quite destroyed; N° 4 is something faded; N° 1, 2, 3, remain nearly as they were, N° 2 and 3 being still superior to the standard."

The finest blacks are first dyed blue, with indigo; and afterwards black with solution of iron, and some astringent vegetable, according to the directions already given.

These are the best methods for producing permanent colours of all kinds. As it is necessary, however, often to give another colour to stuffs which have been already dyed, it is plain, that it is as necessary for a dyer to know how to discharge colours, as how to make the cloth imbibe them.—Concerning this, it is only necessary to observe, that alkaline salts are in general the best, and, where the colours are well dyed, the only means of discharging them. If a piece of cloth is dyed with logwood, and the colour struck upon it with alum, that colour will be nearly discharged by oil of vitriol, or any other strong acid; but if solution of tin has been employed in striking the colour, acids have then no effect, and alkalis only can be employed. Neither will they discharge the colour totally, but the stuff must be bleached for some time to get out the remainder. If alkaline salts cannot be employed with safety to the stuff, it is then impossible to dye it any other colour than black; unless it be dyed a compound colour, of which the original one is a component part.

Concerning the weight that colours give to silk, (in which it is most taken notice of, being sold by weight, and a commodity of great price), it is observed, that one pound of raw silk loatheth four ounces by washing out the gums and the natural furies; that the same scoured silk may be raised to above thirty ounces from the remaining twelve, if it be dyed black with some materials. Of all the materials used in dyeing, especially of black, nothing increases weight so much as galls, by which black silks are restored to as much weight as they lost by washing out their gum: nor is it counted extraordinary, that blacks should gain about four or six ounces in the dyeing upon each pound. Next to the galls, old fustic increases the weight about $1\frac{1}{2}$ in 12; madder, about

17

about one ounce; weld, half an ounce. The blue vats in deep blues of the fifth stall, give no considerable

weight; neither do logwood, cochineal, nor even copers, where galls are not.

Dynasty
E.

DYEING of Hats. See HATS.

DYEING of Leather. See LEATHER.

DYEING, or Staining, of paper, wood, bone, marble, &c. See BONE, MARBLE, PAPER, WOOD, &c.

DYNASTY, among ancient historians, signifies a race or succession of kings of the same line or family. Such were the dynasties of Egypt. The word is formed from the Greek *δυναστία*, of *δυναστω*, to be powerful, or king.

The Egyptians reckon 30 dynasties within the space of 36,525 years; but the generality of chronologers look upon them as fabulous. And it is very certain, that these dynasties are not continually successive, but collateral.

DYSCRACY, among physicians, denotes an ill habit or state of the humours, as in the scurvy, jaundice, &c.

DYSENTERY, in medicine, a diarrhoea or flux, wherein the stools are mixed with blood, and the bowels miserably tormented with gripes. See (the *Index* subjoined to) MEDICINE.

DYSENTERIC FEVER. *Ibid.*

DYSERT, a parliament-town of Scotland, in the county of Fife, situated on the northern shore of the

frith of Forth, about 111 miles north of Edinburgh.

DYSOREXY, among physicians, denotes a want of appetite, proceeding from a weakly stomach.

DYSPEPSY, a difficulty of digestion.

DYSPNOEA, a difficulty of breathing, usually called *asthma*.

DYSURY, in medicine, a difficulty of making urine, attended with a sensation of heat and pain. See (the *Index* subjoined to) MEDICINE.

DYTISCUS, WATER-BEETLE, in zoology, a genus of insects of the order of the coleoptera; the antennæ of which are slender and setaceous, and the hind feet are hairy and formed for swimming. There are 23 species, distinguished by their antennæ, the colour of the elytra, &c.

DYVOUR, in Scots law; otherwise *Bare-man*: A person who, being involved in debt, and unable to pay the same,—for avoiding imprisonment and other pains, makes cession of his effects in favour of his creditors; and does his *devoir* and duty to them, proclaiming himself bare man and indigent, and becoming debt-bound to them of all that he has. The word is used in the same sense as *BANKRUPT*: see that article; and *LAW*, N^o clxxxv. 11, 12. clxxii. 10, 11, 12, &c.

E.

E, THE second vowel, and fifth letter, of the alphabet. The letter E is most evidently derived from the old character 𐤂 in the ancient Hebrew and Phœnician alphabets, inverted by the Greeks to this position E, and not from the Hebrew He ה . From the same origin is also derived the Saxon *e*, which is the first letter in their alphabet that differs from the Latin one. It is formed by a narrower opening of the larynx than the letter A; but the other parts of the mouth are used nearly in the same manner as in that letter.

It has a long and short found in most languages. The short found is audible in *bed, fret, den*, and other words ending in consonants: its long found is produced by a final *e*, or an *e* at the end of words; as in *glebe, bere, hire, scene, sphere, interfere, reverse, sincere*, &c. in most of which it sounds like *ee*; as also in some others by coming after *i*, as in *believe, chief, grief, reprieve*, &c. and sometimes this long found is expressed by *ee*, as in *bleed, beer, creed*, &c. Sometimes the final *e* is silent, and only serves to lengthen the sound of the preceding vowel, as in *rage, rage, stage, bug, huge*, &c. The found of *e* is obscure in the following words, *aven, heaven, bounden, fire, massacre, maigre*, &c.

The Greeks have their long and short *e*, which they call *epsilon* and *eta*. The French have at least six kinds

of *e*'s: the Latins have likewise a long and short *e*; they also write *e* instead of *a*, as *dicem* for *dicam*, &c. and this is, no doubt, the reason why *a* is so often changed into *e*, in the preter tense, as, *ago, egi; facio, feci*, &c.

As a numeral, E stands for 250, according to the verse,

E, quoque ducentos et quingenta tenet.

In music it denotes the tone *e-la-mi*. In the calendar it is the fifth of the dominical letters. And in sea-charts it distinguishes all the easterly points: thus, E alone denotes east; and E. by S. and E. by N. East by South, and East by North.

EACHARD (John), an English divine of great learning and wit in the 17th century, bred at Cambridge, author (in 1670) of *The Grounds and Occasions of the Contempt of the Clergy and Religion inquired into*. In 1675 he was chosen master of Catharine-hall upon the decease of Dr John Lightfoot; and the year following was created D.D. by royal mandate. He died in 1696.

EACHARD (Laurence), an eminent English historian of the 18th century, nearly related to Dr John Eachard. He was the son of a clergyman, who, by the death of his elder brother, became master of a good estate in Suffolk. He was educated in the university of Cambridge, entered into holy orders, and was presented to the living of Welton and Elkinton in Lincolnshire,

Eagle
||
Ear.

where he spent above 20 years of his life, and distinguished himself by his writings, especially his History of England, which was attacked by Dr Edmund Calamy, and by Mr John Oldmixon. His "General Ecclesiastical History from the Nativity of Christ to the first Establishment of Christianity by Human Laws under the emperor Constantine the Great," has passed through several editions. He was installed archdeacon of Stowe and prebend of Lincoln in 1712. He died in 1730.

EAGLE, in ornithology. See **FALCO**.

Eagle, in heraldry, is accounted one of the most noble bearings in armoury; and, according to the learned in this science, ought to be given to none but such as greatly excel in the virtues of generosity and courage, or for having done singular services to their sovereigns; in which cases they may be allowed a whole eagle, or an eagle naissant, or only the head or other parts thereof, as may be most agreeable to their exploits.

The eagle has been borne, by way of ensign or standard, by several nations. The first who seem to have assumed the eagle, are the Persians; according to the testimony of Xenophon. Afterwards, it was taken by the Romans; who, after a great variety of standards, at length fixed on the eagle, in the second year of the consulate of C. Marius: till that time, they used indifferently wolves, leopards, and eagles, according to the humour of the commander.

The Roman eagles, it must be observed, were not painted on a cloth, or flag: but were figures in relief, of silver or gold, borne on the tops of pikes; the wings being displayed, and frequently a thunder-bolt in their talons. Under the eagle on the pike, were piled bucklers, and sometimes crowns. Thus much we learn from the medals.

EAGLE, in astronomy. See there, n° 203, 206.

EAGLE-Stone. See **ETITES**.

Black Eagle, an order of knighthood, instituted by the elector of Brandenburg, in 1701, on his being crowned king of Prussia.

The knights of this order wear an orange-coloured ribband suspending a black eagle.

White Eagle, a like order in Poland, instituted in 1325, by Uladislaus V. on occasion of the marriage of his son Casimir to the daughter of the great duke of Lithuania.

The knights of this order wear a chain of gold, suspending a silver eagle crowned.

EAGLET, a diminutive of eagle, properly signifying a young eagle. In heraldry, when there are several eagles on the same escutcheon, they are termed *eaglets*.

EAR, in anatomy. See there, n° 405.

EAR, in music, denotes a kind of internal sense, whereby we perceive and judge of harmony and musical sounds. See **MUSIC**.

In music we seem universally to acknowledge something like a distinct sense from the external one of hearing; and call it a *good ear*. And the like distinction we should probably acknowledge in other affairs, had we got distinct names to denote these powers of perception by. Thus a greater capacity of perceiving the beauties of painting, architecture, &c. is called a *fine taste*.

EAR is also used to signify a long cluster of flowers, or seeds, produced by certain plants; usually called by botanists, *spica*. The flowers and seeds of wheat, rye, barley, &c. grow in ears. The same holds of the flowers of lavender, &c. We say the *stem* of the ear, i. e. its tube, or straw: the knot of the ear; the lobes, or cells wherein the grains are inclosed: the beard of the ear, &c.

EAR-Ach. See (the *Index* subjoined to) **MEDICINE**.
EAR-Pick, an instrument of ivory, silver, or other metal, somewhat in form of a probe, for cleansing the ear.

The Chinese have a variety of these instruments, with which they are mighty fond of tickling their ears; but this practice, Sir Hans Sloane observes, must be very prejudicial to so delicate an organ, by bringing too great a flow of humours on it.

EAR-Ring. See **PENDENT**.

EAR-Wax. See **Ear-WAX**.

EARWIG, in zoology. See **FORFICULA**.

EARING, in the sea-language, is that part of the bolt-rope which at the four corners of the sail is left open, in the shape of a ring. The two uppermost parts are put over the ends of the yard-arms, and so the sail is made fast to the yard; and into the lowermost earings, the sheets and tacks are seized or bent at the clew.

EARL, a British title of nobility, next below a marquis, and above a viscount.

The title is so ancient, that its original cannot be clearly traced out. This much, however, seems tolerably certain, that among the Saxons they were called *ealdormen*, quasi elder men, signifying the same with *senior* or *senator* among the Romans; and also *shiremen*, because they had each of them the civil government of a several division or shire. On the irruption of the Danes they changed their names to *eorles*, which, according to Camden, signified the same in their language. In Latin they are called *comites*, (a title first used in the empire), from being the king's attendants; a *societate nomen sumperunt, regis enim tales sibi associant*. After the Norman conquest they were for some time called *counts*, or *countesses*, from the French; but they did not long retain that name themselves, tho' their shires are from thence called *counties* to this day. It is now become a mere title: they have nothing to do with the government of the county; which is now entirely devolved on the sheriff, the earl's deputy, or *vicecomes*. In writs, commissions, and other formal instruments, the king, when he mentions any peer of the degree of an earl, usually styles him "trusty and well-beloved *cousin*;" an appellation as ancient as the reign of Henry IV; who being either by his wife, his mother, or his sisters, actually related or allied to every earl in the kingdom, artfully and constantly acknowledged that connexion in all his letters and other public acts: from whence the usage has descended to his successors, though the reason has long ago failed.

An earl is created by cincture of sword, mantle of state put upon him by the king himself, a cap and a coronet put upon his head, and a charter in his hand. All the earls of England are denominated from some shire, town, or place, except three; two of whom, viz. earl Rivers, and earl Paulet, take their denomination from illustrious families: the third is not only honorary as

Ear
||

all the rest, but also officary, as the earl-marshal of England.

EARL Marshal of England, is a great officer who had anciently several courts under his jurisdiction, as the court of chivalry, and the court of honour. Under him is also the herald's office or college of arms. He hath some pre-eminence in the court of Marshalsea, where he may sit in judgment against those who offend within the verge of the king's court. The office is of great antiquity in England, and anciently of greater power than now; and has been for several ages hereditary in the most noble family of Howard.

EARNEST, *ἄρρηκτος*, money advanced to bind the parties to the performance of a verbal bargain. By the civil law, he who recedes from his bargain loses his earnest, and if the person who received the earnest give back, he is to return the earnest double. But with us, the person who gave it, is in strictness obliged to abide by his bargain; and in case he decline it, is not discharged upon forfeiting his earnest, but may be sued for the whole money stipulated.

EARTH, among ancient philosophers and chemists, one of the four elements of which the whole system of nature was thought to be composed. See **ELEMENT**; and **CHEMISTRY**, n° 10.

EARTH, in astronomy and geography, one of the primary planets; being this terraqueous globe which we inhabit.

The cosmogony, or knowledge of the original formation of the earth, the materials of which it was composed, and by what means they were disposed in the order in which we see them at present, is a subject which, though perhaps above the reach of human sagacity, has exercised the wit of philosophers in all ages. To recount the opinions of all the eminent philosophers of antiquity upon this subject would be very tedious: it may therefore suffice to observe, that, ever since the subject began to be canvassed, the opinions of those who have treated it may be divided into two classes. 1. Those who believed the earth, and whole visible system of nature, to be the Deity himself, or connected with him in the same manner that a human body is with its soul. 2. Those who believed the materials of it to have been eternal, but distinct from the Deity, and put into the present order by some power either inherent in themselves, or belonging to the Deity. Of the first opinion were Xenophanes, the founder of the *elastic* sect, Strato of Lampascus, the *Pepipatetics*, &c.

The second opinion, namely, that the substance of the earth or universe (for it is impossible to speak of the one without the other) was eternal, though not the form, was most generally held among the ancients. From that established axiom, that "nothing can be produced from nothing," they concluded that *creation* was an impossibility; but at the same time they thought they had good reason to believe the world had not been always in its present form. They who held this opinion may again be divided into two classes: first, those who endeavoured to account for the generation of the world, or its reduction into the present form, by principles merely mechanical, without having recourse to any assistance from divine power; and secondly, those who introduced an intelligent mind as the author and disposer of all things. To the first of these classes be-

longed the cosmogony of the Babylonians, Phœnicians, and Egyptians; the particulars of which are too absurd to deserve notice. Of the same opinion also were most of the poets; the philosophers Thales, Anaximander, Anaximenes, Anaxagoras, &c. The latter attempted to reform the philosophy of his master Anaximenes by introducing an intelligent principle into the world, distinct from matter; thus making his intelligent principle, or God, the soul of the world. Diogenes of Apollonia supposed air, which he made the first principle of all things, to be ended with reason: His manner of philosophizing differed very little from that of Des Cartes. "All things, (says he,) being in motion, some became condensed, and others rarefied. In those places where condensation prevailed, a whirling motion, or vortex, was formed; which by its revolution drew in the rest, and the lighter parts flying upwards formed the sun."

The most remarkable of the atheistic systems, however, was the atomic one, supposed to have been invented by Democritus; though Laertius attributes it to Leucippus, and some make it much older. According to this system, the first principles of all things were an infinite multitude of atoms, or indivisible particles of different sizes and figures; which, moving fortuitously, or without design, from all eternity, in infinite space, and encountering with one another, became variously entangled during their conflict. This first produced a confused chaos of all kinds of particles; which afterwards, by continual agitation, striking and repelling each other, disposed themselves into a vortex, or vortices, where, after innumerable revolutions, and motions in all possible directions, they at last settled into their present order.

The hypothesis of Democritus agrees in the main with that of Epicurus as represented by Lucretius; excepting that no mention is made of those vortices, which yet were an essential part of the former. To the two properties of magnitude and figure which Democritus attributed to his atoms, Epicurus added a third, namely, weight; and without this, he did not imagine they could move at all. The system of Democritus necessarily introduced absolute fatal necessity; which Epicurus not choosing to agree to, he invented a third motion of the atoms, unknown to those who had gone before him. His predecessors allowed them to have a perpendicular and reflexive motion: but Epicurus, though he allowed these motions to be absolutely necessary and unavoidable, asserted that the atoms could also of themselves decline from the right line; and from this declination of the atoms, he explained the free-will of man.—The most material difference between the two systems, however, was, that Epicurus admitted no principle but the atoms themselves; whereas Democritus believed them to be animated.

Of those who held two distinct and coeternal principles, *viz.* God and Matter, we shall only take notice of the opinions of Pythagoras, Plato, and Aristotle, as being the most remarkable. Pythagoras is said to have asserted two substantial self-existent principles: a *monad*, or unity; and a *dyad*, or duality. The meaning of these terms is now somewhat uncertain. Some think, that by the monad, he meant the Deity; and, by the dyad, matter. Others think, that the Pythagoric mo-

nads were atoms. The dyad is sometimes thought to signify a demon or evil principle; but Porphyry's interpretation, which seems the most probable, is as follows. The cause, says he, of that sympathy, harmony, and agreement which is in things, and of the conservation of the whole, which is always the same and like itself, was by Pythagoras called *unity*; that unity which is in the things themselves, being but a participation of the first cause: but the reason of difference, inequality, and constant irregularity in things, was by him called a *dyad*. This philosopher held numbers to be the principles of all things, and from them he accounted for the production of the world in the following manner. He supposed that the monad and dyad were the two sources of numbers, from whence proceeded points; from points, lines; from lines, plane figures; from planes, solids; from solids, sensible bodies. The elements of sensible bodies are four; but besides these, there was a fifth (never yet discovered.) The four elements which manifest themselves to our senses are fire, air, earth, and water. These are in a perpetual change, and from them the world was formed; which is animated, intelligent, and spherical; containing, in the midst of it, the earth, a globe and inhabited body. The world, he said, began from fire, and the fifth element; and that as there were five figures of solid bodies, called mathematical or regular, the earth was made of the cube, fire of the pyramid or tetrahedron, the air of the octahedron, water of the icosahedron, and the sphere of the universe of the dodecahedron.—This method of philosophizing, which has no manner of foundation in nature, was adopted by Plato and Aristotle; and hence proceeded all the absurdities concerning ideas, forms, qualities, &c. with which the Aristotelian philosophy was loaded.

For a long time, however, the philosophy of Aristotle prevailed, and the world was thought to be upheld by forms, qualities, and other unintelligible and imaginary beings.—At last the French philosopher, Descartes, superseded the Aristotelian, by introducing the atomic, or Democritic, and Epicurean philosophy†. The Cartesian system was quickly superseded by the Newtonian; which still continues, though considerably different from what it was left by that great man.—His opinions, indeed, concerning the cosmogony seem to have been in a fluctuating state; and hence he delivers himself in such a manner, that he hath often incurred the charge of contradicting himself.—He maintained, for instance, that matter was infinitely divisible, and the mathematical demonstrations of this proposition are well known. Notwithstanding this, however, when he comes particularly to speak of the original construction of the world, he seems to retract this opinion, and adopt the atomic philosophy. He tells us, that it seems probable, that in the beginning God formed matter in *solid, massy, impenetrable, particles, &c.**; and that of these particles, endowed with various powers of attraction and repulsion, the present system of nature is formed. His primary laws of nature are only three in number, and very simple. The first is, that all matter has a tendency to continue in that state in which it is once placed, whether of rest or motion. If it is at rest, for example, it will continue at rest for ever, without beginning motion of itself; but if it is once set in motion, by any cause whatever, it

will for ever continue to move in a right line, until something either stops it altogether, or forces it to move in another direction. 2. That the change of motion is always equivalent to the moving force employed to produce it, and in the direction of the right line in which it is impeded; that is, if a certain force produces a certain motion, double that force will produce double that motion, &c. 3. Reaction is always contrary and equal to action; or the actions of two bodies upon one another are always equal and contrary to one another.

From these three laws, together with the two contrary forces of attraction and repulsion, Sir Isaac Newton and his followers have attempted to explain all the phenomena of nature. When they come to explain the nature of the attractive and repulsive forces, however, they are exceedingly embarrassed. Sir Isaac hath expressed himself in two different ways concerning them. In his Principia, he pretty positively determines them to be owing to a cause that is not material; and in his Queries, he supposes they may be effects of some subtle matter which he calls *ether*. This disagreement with himself hath produced no small disagreement among his followers. One party, laying hold of his assertions in the Principia, determine the world to be upheld by *immaterial* powers; while the other, neglecting the Principia, and taking notice only of the Queries at the end of the Optics, strenuously maintain, that attraction and repulsion are owing to the action of some exceedingly fine and subtle ether.—The first of these suppositions, it is argued, necessarily involves us in one of the following dilemmas. 1. If the attractive and repulsive forces are not material, they must either be occasioned by spiritual beings, or they must be *qualities* of matter. If they are occasioned by the action of immaterial beings, these beings must either be created or uncreated. If they are produced by the action of created beings, we run into the supposition of some of the ancient heathens, that the world is governed by demons or subordinate intelligences; and thus may make an easy transition to polytheism. If attraction and repulsion are the immediate action of the Deity himself, we run into the doctrine of making God the soul of the world.—This last hypothesis hath been most strenuously adopted by Mr Baxter in his treatise of the Immateriality of the human Soul. Mr Boscovich, Mr Mitchel, and Dr Priestley, have likewise adopted the hypothesis of immaterial powers to such a degree, that, according to them, the whole world consists of nothing else but *attractions and repulsions* mixed with *physical* nious. *points**. 2. If we suppose the attractive and repulsive powers to be only *properties, qualities, or laws*, impressed on matter by the Deity, we might as well have been contented with the occult qualities of Aristotle.—If attraction and repulsion are occasioned by the action of mere matter, and all the powers in nature are only material, the charge is incurred of making nature direct itself in such a manner, that there is no occasion for the interposition, or even the existence, of a Deity at all.

Thus we see, the Newtonian cosmogony must incline either to the Platonic and Aristotelian, or to the Atomic or Epicurean; according to the hypothesis we lay down concerning the nature of attraction. Des Cartes's system was plainly a revival of that of Democri-

tus and Epicurus, with some corrections and improvements. It was farther improved and corrected by Mr Hutchinson, who added to it the authority of Revelation. The created agents he chose in his cosmogony were fire, light, and air. These, we see, have indeed a very considerable share in the operations of nature; but unless we explain the manner in which they operate, our knowledge is not at all increased, and we might as well have been contented with the Newtonian attraction and repulsion, or even the occult qualities of Aristotle. Attempts have indeed been made to solve the phenomena of nature, from the action of these three agents, both by Hutchinson himself, and many of his followers.—These attempts, however, have always proved unsuccessful. Some phenomena indeed may be explained pretty plausibly from the known action of these three; but when we come to speak of what may be called the *nicer operations* of nature, such as the growth of plants and animals, we are utterly at a loss. A short account of the Hutchinsonian cosmogony is given under the article *DELUGE*, par. 6.

9
A deficiency
of active
principles
in all the
theories yet
invented.

The manifest deficiency of active principles in all the theories of the earth that have yet been invented, hath occasioned a constant search after others which should be able, by their superior activity, to fill up the blank which necessarily remained in the system.—Pythagoras, Plato, and Aristotle, being unable to account for the formation of the earth from their four elements, called in the assistance of a *fifth*, which was never yet discovered. Epicurus, finding the motions attributed to his atoms by Democritus to be insufficient, had recourse to an imaginary, and on his own principles *impossible*, declination of the atoms. Descartes finding the atoms themselves insufficient, asserted that they were not atoms, but might be broken into smaller parts, and thus constitute matter of various degrees of subtilty*. The Newtonian philosophers have found Des Cartes's system insufficient; but being greatly distressed in their attempts to solve all the phenomena of nature by mere attraction and repulsion, have been obliged to call in the action of *mind* to their assistance. The Hutchinsonians were hardly put to it in accounting for every thing by the action of fire, light, and air, when luckily the discoveries in electricity came to their assistance. It must be owned, that this fluid does indeed come in like a kind of fifth element, which in many cases appears to be the animating principle of nature. For some time past, almost all the remarkable phenomena in nature have been explained by electricity, or the action of the electric fluid. But unless this action is explained, we are got no farther than we were before. To say any thing is done by electricity, is not more intelligible than to say it was done by attraction. If we explain an effect by a material cause, it ought to be done upon mechanical principles. We ought to be sensible how one part of matter acts upon another part in such a manner as to produce the effect we desire to explain. The electrical philosophers, however, have not yet been able to investigate the manner in which this subtle fluid operates; and hence the many discoveries in electricity have not contributed to throw that light on the theory of the earth, which perhaps they may do hereafter. With some philosophers, however, the electric fluid itself, and indeed all the powers of nature, seem in danger of being superseded by a prin-

* See
Astronomy,
p. 77.

ciple, at present very little known, called the *phlogiston*.—Thus, Mr Henly tells us*, that Mr Clarke, an ingenious gentleman in Ireland, hath discovered all the different kinds of air produced from metals, &c. by Dr Priestley, to be only *phlogistic vapours* arising from these substances. Dr Priestley himself supposes, that the electric light is a modification of *phlogiston*; and consequently thinks it probable, that all light is a modification of the same. Fire or flame is thought to be a chemical combination of air with the phlogiston; and phlogiston is thought to give the elasticity to air, and every other elastic fluid, &c.—Be this as it will, however, the late discoveries in electricity have tended very much to change the form of the Newtonian philosophy, and to introduce that *materialism* into our theories of the natural phenomena which is by some people so much complained of.

From this general history of the different agents which philosophers have chosen to account for the original formation of the earth, and for its preservation in the present form, it appears, that scarce any advance in true knowledge hath yet been made. All the agents have been prodigiously defective; electricity itself, as far as yet known, not excepted. But, before entering into a particular consideration of those theories which seem most worthy of notice, it will be necessary to point out the principal difficulties which stand in the way of one who attempts to give a complete theory of the earth.

1. The earth, although pretty much of a spherical figure, is not completely so; but protuberates considerably about the equatorial parts, and is proportionally flattened at the poles, as is undeniably proved by the observations of modern mathematicians*. The question here is, Why the natural cause which gave the earth so much of a spherical figure, did not make it a complete and exact sphere?

2. The terraqueous globe consists of a vast quantity of water as well as dry land. In many places, such as the Isthmus of Darien, a narrow neck of land is interposed betwixt two vast oceans. These beat upon it on either side with vast force; yet the Isthmus is never broke down nor diminished. The cause is the same with the Isthmus of Suez which joins Asia and Africa, and with that which joins the Morea or ancient Peloponnesus to the continent. The difficulty is, By what natural power or law are these narrow necks of land preserved amidst the waters which threaten them on both sides with destruction?

3. The surface of the earth is by no means smooth and equal; but in some places raised into enormous ridges of mountains, and in others sunk down in such a manner as to form deep valleys. These mountains, though they have been exposed to all the injuries of the weather for many thousand years, exhibit no signs of decay. They still continue of the same size as before, though vast quantities of earth are frequently washed down from them by the rains, which, together with the force of gravity, tending to level and bring them on an equality with the plains on which they stand, we might reasonably think, ought by this time to have rendered them smaller than before. It must therefore be inquired into, By what natural cause the mountains were originally formed, and how they come to preserve their size without any remarkable diminution?

Earth.

4. The internal parts of the earth are still more wonderful than the external. The utmost industry of man, indeed, can penetrate but a little way into it. As far as we can reach, however, it is found to be composed of dissimilar strata lying one upon another, not commonly in a horizontal direction, but inclined to the horizon at different angles. These strata seem not to be disposed either according to the laws of gravity or according to their density, but as it were by chance. Beddes, in the internal parts of the earth are vast chasms and vacuities. By what means were these strata originally deposited, the fissures and chasms made, &c.?

5. In many places of the earth, both on the surface, and at great depths under it, vast quantities of marine productions, such as shells, &c. are to be met with. Sometimes these shells are found in the midst of solid rocks of marble and limestone. In the very heart of the hardest stones also, small vegetable substances, as leaves, &c. are sometimes to be found. The question is, By what means were they brought thither?

These are some of the most striking difficulties which present themselves to one who undertakes to write a natural history or theory of the earth. The most remarkable attempts to produce a theory of this kind are those of Burnet, Woodward, Whiston, and Buffon.

¹²
Dr Burnet's
theory.

According to Dr Burnet, the earth was originally a fluid mass, or chaos, composed of various substances differing both in density and figure. Those which were most heavy sunk to the centre, and formed there a hard solid body: those which were specifically lighter remained next above; and the waters, which were lightest of all, covered the earth all round. The air, and other ethereal fluids, which are still lighter than water, floated above it, and surrounded the globe also. Between the waters, however, and the circumambient air, was formed a coat of oily and unctuous matters lighter than water. The air at first was very impure, and must necessarily have carried up with it many of those earthy particles with which it was once blended: however, it soon began to purify itself, and deposit those particles upon the oily crust abovementioned; which, soon uniting together, the earth and oil became the crust of vegetable earth, with which the whole globe is now covered. His account of the destruction of the primeval world by the flood, by the falling down of the shell of earth into the waters of the abyss, is given under the article DELUGES. It only remains then to give his account of the manner in which he relieves the earth from this universal destruction; and this he does as follows. These great masses of earth, says he, falling into the abyss, drew down with them vast quantities also of air; and by dashing against each other, and breaking into small parts by the repeated violence of the shock, they at length left between them large cavities filled with nothing but air. These cavities naturally offered a bed to receive the influent waters; and in proportion as they filled, the face of the earth became once more visible. The higher parts of its broken surface, now become the tops of mountains, were the first that appeared; the plains soon after came forward; and at length the whole globe was delivered from the waters, except the places in the lowest situations; so that the ocean and seas are still a part of the ancient abyss, that have had no place to which they might return. Islands and rocks are frag-

Earth.

ments of the earth's former crust; continents are larger masses of its broken substance; and all the inequalities that are to be found on the surface of the present earth are effects of the confusion into which both earth and water were at that time thrown.

¹³
Dr Woodward's.

Dr Woodward begins with asserting, that all terrene substances are disposed in beds of various natures, lying horizontally one over the other, somewhat like the coats of an onion: that they are replete with shells, and other productions of the sea; these shells being found in the deepest cavities, and on the tops of the highest mountains. From these observations, which are warranted by experience, he proceeds to observe, that these shells, and extraneous fossils, are not productions of the earth, but are all actual remains of those animals which they are known to resemble; that all the strata or beds of the earth lie under each other in the order of their specific gravity, and that they are disposed as if they had been left there by subsiding waters. All this he very confidently affirms, tho' daily experience contradicts him in some of them; particularly, we often find layers of stone over the lightest soils, and the softest earth under the hardest bodies. However, having taken it for granted, that all the layers of the earth are found in the order of their specific gravity, the lightest at top, and the heaviest next the centre, he consequently asserts, that all the substances of which the earth is composed, were originally in a state of dissolution. This dissolution he supposes to have taken place at the flood: but being aware of an objection, that the shells, &c. supposed to have been deposited at the flood are not dissolved, he exempts them from the solvent power of the waters, and endeavours to shew that they have a stronger cohesion than minerals; and that, while even the hardest rocks are dissolved, bones and shells may remain entire.

¹⁴
Mr Whiston's.

Mr Whiston supposes the earth to have been originally a comet; and considers the Mosaic account of the creation as commencing at the time when the Creator placed this comet in a more regular manner, and made it a planet in the solar system. Before that time, he supposes it to have been a globe without beauty or proportion; a world in disorder, subject to all the vicissitudes which comets endure; which, according to the present system of philosophy, must be alternately exposed to the extremes of heat and cold. These alternations of heat and cold, continually melting and freezing the surface of the earth, he supposes to have produced, to a certain depth, a chaos resembling that described by the poets, surrounding the solid contents of the earth, which still continued unchanged in the midst; making a great burning globe of more than 2000 leagues in diameter. This surrounding chaos, however, was far from being solid: he resembles it to a dense, though fluid atmosphere, composed of substances mingled, agitated, and shocked against each other; and in this disorder he supposes the earth to have been just at the eve of the Mosaic creation. But upon its orbit being then changed, when it was more regularly wheeled round the sun, every thing took its proper place, every part of the surrounding fluid then fell into a certain situation according as it was light or heavy. The middle, or central part, which always remained unchanged, still continued so; retaining a part of that heat which it received in its primeval approaches to-

Earth.

towards the fun; which heat he calculates may continue about 6000 years. Next to this fill the heavier parts of the chaotic atmosphere, which serve to sustain the lighter: but as in descending they could not entirely be separated from many watery parts, with which they were intimately mixed, they drew down these also along with them; and these could not mount again after the surface of the earth was consolidated: they therefore surrounded the heavy first-descending parts in the same manner as these surrounded the central globe. Thus the entire body of the earth is composed next the centre of a great burning globe: next this is placed an heavy terrene substance that encompasses it; round which is circumsfled a body of water. Upon this body of waters is placed the crust of earth on which we inhabit: so that, according to Mr Whiston, the globe is composed of a number of coats, or shells, one within the other, all of different densities. The body of the earth being thus formed, the air, which is the lightest substance of all, surrounded its surface; and the beams of the sun darting through, produced the light, which, we are told by Moses, first obeyed the Divine command.

The whole oeconomy of the creation being thus adjusted, it only remained to account for the ridings and depressions on the surface of the earth, with the other seeming irregularities of its present appearance. The hills and valleys are by him considered as formed by their pressing upon the internal fluid which sustains the external shell of earth, with greater or less weight: those parts of the earth which are heaviest sink the lowest into the subjacent fluid, and thus become valleys: those that are lightest rise higher upon the earth's surface, and are called *mountains*.

Such was the face of nature before the deluge: the earth was then more fertile and populous than it is at present; the life of men and animals was extended to ten times its present duration; and all these advantages arose from the superior heat of the central globe, which has ever since been cooling. As its heat was then in its full power, the genial principle was also much greater than at present; vegetation and animal increase were carried on with more vigour; and all nature seemed teeming with the seeds of life. But as these advantages were productive only of moral evil, it was found necessary to destroy all living creatures by a flood; and in what manner this punishment was accomplished, according to Mr Whiston, is particularly taken notice of under the article *DELUGE*.

Mr Buffon's theory differs very widely from all the rest. He begins with attempting to prove, that this world which we inhabit is no more than the ruins of a world. "The surface of this immense globe, says he, exhibits to our observation, heights, depths, plains, seas, marshes, rivers, caverns, gulfs, volcanoes; and, on a cursory view, we can discover in the disposition of these objects neither order nor regularity. If we penetrate into the bowels of the earth, we find metals, minerals, stones, bitumens, sands, earths, waters, and matter of every kind, placed as it were by mere accident, and without any apparent design. Upon a nearer and more attentive inspection, we discover funk mountains, caverns filled up, shattered rocks, whole countries swallowed up, new islands emerged from the ocean, heavy substances placed above light ones, hard bodies

inclosed within soft bodies: in a word, we find matter in every form, dry and humid, warm and cold, solid and brittle, blended in a chaos of confusion, which can be compared to nothing but a heap of rubbish, or the ruins of a world."

When taking a particular survey of the external surface of the globe, he begins with the ocean, and the motion communicated to it by the influence of the sun and moon which produces the tides.—"In examining the bottom of the sea, (says he), we perceive it to be equally irregular as the surface of the dry land. We discover hills and valleys, plains and hollows, rocks and earths of every kind; we discover likewise, that islands are nothing but the summits of vast mountains, whose foundations are buried in the ocean. We find other mountains whose tops are nearly on a level with the surface of the water; and rapid currents which run contrary to the general movement. These currents sometimes run in the same direction; at other times their motion is retrograde; but they never exceed their natural limits, which seem to be as immutable as those which bound the efforts of land-rivers. On one hand we meet with tempestuous regions, where the winds blow with irresistible fury; where the heavens and the ocean, equally convulsed, are mixed and confounded in the general shock; violent intestine motions, tumultuous swellings, water-spouts, and strange agitations, produced by volcanoes, whose mouths, though many fathoms below the surface, vomit forth torrents of fire; and push, even to the clouds, a thick vapour, composed of water, sulphur, and bitumen; and dreadful gulfs or whirlpools, which seem to attract vessels for no other purpose than to swallow them up. On the other hand we discover vast regions of an opposite nature, always smooth and calm, but equally dangerous to the mariner. To conclude, directing our eyes toward the southern or northern extremities of the globe, we discover huge masses of ice, which, detaching themselves from the polar regions, advance, like floating mountains, to the temperate climates, where they dissolve and vanish from our view. The bottom of the ocean and the shelving sides of rocks produce plentiful crops of plants of many different species: its soil is composed of sand, gravel, rocks, and shells; in some places it is a fine clay, in others a compact earth: and in general, the bottom of the sea has an exact resemblance to the dry land which we inhabit.

"Let us next take a view of the dry land. Upon an attentive observation of this, we will find, that the great chains of mountains lie nearer the equator than the poles; that in the old continent their direction is more from east to west than from south to north; and that, on the contrary, in the new continent they extend more from north to south than from east to west. But what is still more remarkable, the figure and direction of these mountains, which have a most irregular appearance, correspond so wonderfully, that the prominent angles of one mountain are constantly opposite to the concave angles of the neighbouring mountain, and of equal dimensions, whether they be separated by an extensive plain or a small valley. I have further remarked, that opposite hills are always nearly of the same height; and that mountains generally occupy the middle of continents, islands, and promontories, dividing them by their greatest lengths. I have likewise

Earth.

traced the courses of the principal rivers, and find that their direction is nearly perpendicular to the sea-coasts into which they empty themselves; and that, during the greatest part of their courses they follow the direction of the mountains from which they derive their origin. The sea-coasts are generally bordered with rocks of marble, and other hard stones; or rather with earth and sand accumulated by the waters of the sea, or brought down and deposited by rivers. In opposite coasts, separated only by small arms of the sea, the different strata or beds of earth are of the same materials. I find that volcanoes never exist but in very high mountains; that a great number of them are entirely extinguished; that some are connected to others by subterranean passages, and their eruptions not unfrequently happen at the same time. There are similar communications between certain lakes and seas. Some rivers suddenly disappear, and seem to precipitate themselves into the bowels of the earth. We likewise find certain mediterranean or inland seas, that constantly receive from many and great rivers prodigious quantities of water, without any augmentation of their bounds; probably discharging by subterraneous passages all those extraneous supplies. It is likewise easy to distinguish lands which have been long inhabited, from those new countries where the earth appears in a rude state, where the rivers are full of cataracts, where the land is nearly overflowed with water or burnt up with drought, and where every place capable of producing trees is totally covered with wood.

"Proceeding in our examination, we discover that the upper stratum of the earth is universally the same substance: that this substance, from which all animals and vegetables derive their growth and nourishment, is nothing but a composition of the decayed parts of animal and vegetable bodies, reduced into such small particles that their former organic state is not distinguishable. Penetrating a little deeper, we find the real earth, beds of sand, limestone, clay, shells, marble, gravel, chalk, &c. These beds are always parallel to each other, and of the same thickness throughout their whole extent. In neighbouring hills, beds or strata of the same materials are uniformly found at the same levels, though the hills be separated by large and deep valleys. Strata of every kind, even of the most solid rocks, are uniformly divided by perpendicular fissures. Shells, skeletons of fishes, marine plants, &c. are often found in the bowels of the earth, and on the tops of mountains, even at the greatest distances from the sea. These shells, fishes, and plants, are exactly similar to those which exist in the ocean. Petrified shells are to be met with almost every where in prodigious quantities; they are not only inclosed in rocks of marble and limestone, as well as in carths and clays, but are actually incorporated and filled with the very substances in which they are inclosed. In fine, I am convinced, from repeated observation, that marbles, limestones, chalks, marls, clays, sand, and almost all terrestrial substances, wherever situated, are full of shells and other spoils of the ocean."

From these positions, which he lays down as facts, Mr Buffon draws the following conclusions:

1. The changes which the earth has undergone within these last 2000 or 3000 years must be inconsiderable, when compared with the great revolutions

that took place in those ages immediately succeeding the creation. The reason he gives for this assertion is, that terrestrial substances could not acquire solidity but by the continued action of gravity: hence, the earth must have been originally much softer than it is now, and therefore more apt to be changed by causes which cannot now affect it.

2. It seems an uncontrovertible fact, that the dry land which we now inhabit, and even the summits of the highest mountains, were formerly covered with the waters of the sea; for shells and other marine bodies are still found upon the very tops of mountains.

3. The waters of the sea have remained for a long track of time upon the surface; because in many places, such immense banks of shells have been discovered, that it is impossible for a great multitude of animals could exist at the same time.

4. From this circumstance it likewise appears, that, although the materials on the surface of the earth were then soft, easily disunited, moved, and transported by the waters, yet these transportations could not be suddenly effected: they must have been gradual and successive, as sea-bodies are sometimes found more than 1000 feet below the surface; and such a thickness of earth, or stone, could not be accumulated in a short time.

5. It is impossible these effects could be owing to the universal deluge. For, though we should suppose that all the shells in the bottom of the ocean should be deposited upon the dry land; yet, besides the difficulty of establishing this supposition, it is plain, that as shells are found incorporated in marble, and in the rocks of the highest mountains, we must suppose these rocks and marbles to have been formed all at the very instant when the deluge took place; and that before this grand revolution, there were neither mountains, nor marbles, nor rocks, nor clays, nor matter of any kind similar to what we are now acquainted with; as they all, with few exceptions, contain shells, and other productions of the ocean. Besides, at the time of the universal deluge, the earth must have acquired a considerable degree of solidity, by the action of gravity for more than 16 centuries. During the short time the deluge lasted, therefore, it is impossible that the waters should have overturned and dissolved the whole surface of the earth to the greatest depths.

6. It is certain, (for what reason he does not mention), that the waters of the sea have, at some period or other, remained for a succession of ages upon what we now know to be dry land; and consequently that the vast continents of Asia, Europe, Africa, and America, were then the bottom of an immense ocean, replete with every thing which the present ocean produces.

7. It is likewise certain, that the different strata of the earth are horizontal and parallel to each other. This parallel situation must therefore be owing to the operation of the waters, which have gradually accumulated the different materials, and given them the same position which the water itself invariably assumes.

8. It is certain that these strata must have been gradually formed, and are not the effect of any sudden revolution; because nothing is more frequent than strata composed of heavy materials placed above light ones; which never could have happened, if, according to some authors, the whole had been blended and dissolved

Earth.

ved by the deluge, and afterwards precipitated.

9. No other cause than the motion and sediments of water could possibly produce the regular position of the various strata of which the superficial part of this earth consists. The highest mountains are composed of parallel strata, as well as the lowest valleys. Of course, the formation of mountains cannot be attributed to the shocks of earthquakes, or to the eruptions of volcanoes. Such small eminences as have been raised by volcanoes or convulsions of the earth, instead of being composed of parallel strata, are mere masses of weighty materials, blended together in the utmost confusion.

Having now, as he thinks, *proved*, that the dry and habitable part of the earth has remained for a long time under the waters of the sea, and consequently must have undergone the same changes that now take place at the bottom of the sea, he proceeds to inquire what these changes are.

10. The ocean, since the creation of the world, has been constantly agitated by the tides, occasioned by the action of the sun and moon; and this agitation is greater in the equatorial than in the other parts of the globe, because the action of the sun and moon is there strongest.

11. The earth performs a rapid motion on its axis; and consequently its parts have a centrifugal force, which is also greatest at the equator.

12. From the combined action of the two last mentioned causes, the tides, and the motion of the earth, it may be fairly concluded, that although this globe had been originally a perfect sphere, its diurnal motion, and the ebbing and flowing of the tides, must necessarily, in a succession of time, have elevated the equatorial parts, by gradually carrying mud, earth, sand, shells, &c. from other climates, and depositing them at the equator.

13. On this supposition, the greatest inequalities on the surface of the earth ought to be found, and in fact are found, in the neighbourhood of the equator.

14. As the alternate motion of the tides has been constant and regular since the existence of the world, it is natural to think, that, at each tide, the water carries from one place to another a small quantity of matter, which falls to the bottom as a sediment, and forms those horizontal and parallel strata that every where appear. Here it may indeed be objected, that as the flux is equal to, and regularly succeeded by, the reflux, the two contrary motions will balance each other; and whatever is brought in by the flux will be carried back by the reflux. The motion of the ocean, therefore, could never be the cause of the formation even of parallel strata; much less of mountains, and all the inequalities to be observed in this globe. To this Mr Buffon replies, that the alternate motion of the waters is by no means equal; for the sea has a continual motion from east to west: the agitations occasioned by the winds likewise produce great inequalities in the tides. It must also be acknowledged, that, by every motion of the sea, particles of earth and other matter must be carried from one place and deposited in another; and that these collections of matter must assume the form of parallel and horizontal strata. Lastly, this objection is obviated by a well known fact. On all coasts where the ebbing and flowing of the sea is discernible, numberless materials are brought in by the flux, which

are not carried back by the reflux. The sea gradually increases on some places and recedes from others; narrowing its limits by depositing earth, sand, shells, &c. which naturally take a horizontal position. These materials when accumulated, and elevated to a certain degree, gradually shut out the water, and remain for ever in the form of dry land.

15. The possibility of a mountain's being formed at the bottom of the sea by the motion and sediments of the water, will appear from the following considerations. On a coast which the sea washes with violence during the flow of tide, some part of the earth must be carried off at every stroke of the waves. Even where the sea is bounded by rock, it is a known fact, that the rock itself is greatly wasted by the water; and consequently that small particles are carried off by the retreat of every wave. Those particles of earth or stone are necessarily transported to some distance. Whenever the agitation of the water ceases, the particles are precipitated in the form of a sediment, and lay the foundation of a first stratum, which is either horizontal or inclined, according to the situation of the surface on which they fall. This stratum is soon succeeded by another, produced by the same cause; and thus a considerable quantity of matter will be amassed, and deposited in parallel beds. In process of time this gradually accumulating mass will become a mountain in the bottom of the sea, exactly resembling, both in external and internal structure, those mountains which we see on the dry land. If there happened to be shells in that part of the bottom of the sea where we have supposed the sediments to be deposited, they will be covered, filled, and incorporated with the deposited matter, and form a part of the general mass. These shells will be lodged in different parts of the mountain, corresponding to the times in which they were deposited: those which lay at the bottom before the first stratum was formed, will occupy the lowest stratum; the others will be found in places more elevated.

16. It has been imagined that the agitation of the sea, produced by the winds and tides is only superficial, and does not affect the bottom, especially where it lies very deep. But it ought to be remembered, that whatever be the depth, the whole mass is put in motion by the tides at the same time; and that, in a fluid globe, this motion would be communicated even to the centre. The attractive power, which occasions the flux and reflux, is penetrating. It acts equally upon every particle of the mass; so that the quantity of its force at different depths may be determined by calculation. We cannot therefore hesitate in pronouncing, that the tides, the winds, and all other causes of motion in the sea, must produce heights and inequalities in its bottom; and that these heights must uniformly be composed of regular strata either horizontal or inclined. The heights thus produced will gradually augment; like the waves which formed them, they will mutually respect each other; and if the extent of the base be great, in a course of years they will form a vast chain of mountains.

17. Whenever eminences are formed, they interrupt the uniform motion of the waters, and produce currents. Between two neighbouring heights in the bottom of the ocean there must be a current which will follow their common direction, and, like a river, cut a channel, the angles of which will be alternately opposite

Earth.

Earth.

sites through the whole extent of its course. These heights must continually increase; for, during the flow, the water will deposit its ordinary sediment upon their ridges; and the waters which are impelled by the current will force along, from great distances, quantities of matter, which will subside between the hills, and, at the same time, scoop out a valley with corresponding angles at their foundation. Now, by means of these different motions and sediments, the bottom of the ocean, though formerly smooth, must soon be furrowed and interspersed with hills and chains of mountains, as we actually find it at present. The soft materials of which the eminences were originally composed, would gradually harden by their own gravity. Such of them as consisted of sandy and crystalline particles, would produce those enormous masses of rock and flint, in which we find crystals and other precious stones. Others, composed of stony particles mixed with shells, give rise to those beds of limestone and marble in which vast quantities of sea-shells are still found incorporated.

18. These causes, as before observed, act with greater force under the equator than in other climates; for there the tides are higher, and the winds more uniform. The mountains of Africa and Peru are the highest in the world; often extending through whole continents, and stretching to great distances under the waters of the ocean. The mountains of Europe and Asia, which extend from Spain to China, are not so high as those of Africa and South America. According to the relations of voyagers, the mountains of the north are but small hills, when compared with the mountains of the equatorial regions. Those prodigious chains of mountains which run from east to west in the old continent, and from north to south in the new, must have been formed by the general motion of the tides. But the origin of the less considerable hills must be ascribed to particular motions occasioned by winds, currents, and other irregular agitations of the sea.

Having thus discussed some very important points respecting the theory of the earth, our author now proceeds to answer other questions which seem still more difficult of solution.

19. But how has it happened that this earth, which we and our ancestors have inhabited for ages, which, from time immemorial, has been an immense continent, dry, compact, and removed from the reach of water, should, if formerly the bottom of an ocean, be now exalted to such a height above the waters, and so completely separated from them. Since the waters remained so long upon the earth, why have they now deserted it? What accident, what cause, could introduce a change so great? A little reflection, says he, will furnish us with at least plausible solutions to these seemingly so difficult questions. We daily observe the sea gaining ground on certain coasts, and losing it on others. We know that the ocean has a general and uniform motion from east to west: that it makes violent efforts against the rocks and low grounds which encircle it; that there are whole provinces which human industry can hardly defend against the fury of the waves; and that there are instances of islands which have but lately emerged from the waters, and of regular inundations. History informs us of inundations and deluges of a more extensive nature. Ought not all this to convince us, that the surface of the earth has experienced very great re-

Earth.

volutions, and that the sea may have actually given up possession of the greatest part of the ground which it formerly occupied? For example, let us suppose, that the old and new worlds were formerly but one continent; and that, by a violent earthquake, the ancient Atlantis of Plato was sunk. The consequence of this mighty revolution must necessarily be, that the sea would rush in from all quarters, and form what is now called the *Atlantic ocean*; and vast continents, perhaps those we now inhabit, would of course be left dry. This great revolution might be effected by the sudden failure of some immense cavern in the interior parts of the globe, and an universal deluge would infallibly succeed.

20. But, however conjectures of this kind may stand, it is certain that such a revolution hath happened: and we may even believe that it hath happened naturally; for if a judgment of the future is to be formed from the past, we have only to attend carefully to what passes before our eyes. It is a fact established by the repeated observation of voyagers, that the ocean has a constant motion from east to west. This motion, like the trade-winds, is not only perceived between the tropics, but through the whole temperate climates, and as near the poles as navigators have approached. As a necessary consequence of this motion, the Pacific Ocean must make continual efforts against the coasts of Tartary, China, and India; the Indian-ocean must act against the east coast of Africa; and the Atlantic must in a similar manner act against all the eastern coasts of America. Hence the sea must have gained, and will always continue to gain, on the east, and to lose on the west. This of itself would be sufficient to prove the possibility of the change of the sea into land, and land into sea. If such is the natural effect of the sea's motion from east to west, may it not reasonably be supposed, that Asia, and all the eastern continent, is the most ancient country in the world; and that Europe, and part of Africa, especially the west parts of these continents, as Britain, France, Spain, &c. are countries of a more recent date?

21. The cause of the perpendicular fissures with which the earth abounds, is easily investigated. As various materials constituting the different strata were transported by the waters, and deposited in the form of sediments, they would at first be in a very diluted state, and would gradually harden and part with the superfluous quantity of moisture they contained. In process of time, drying, they would naturally contract and split at irregular distances. These fissures necessarily assumed a perpendicular direction: because in this direction the action of gravity of one particle upon another is equal to nothing; but it acts directly opposite to this description, in a horizontal situation: the diminution in bulk could have no sensible effect but in a vertical line. The contraction of the parts in drying, therefore, and not the contained water forcing an issue, as has been alleged by some, is the cause of perpendicular fissures; for it may be often remarked, that the sides of those fissures, through their whole extent, correspond exactly as the two sides of a split piece of wood.

22. Perpendicular fissures vary greatly as to the extent of their openings. Some are about half an inch or an inch; others a foot or two feet; some extend several fathoms, and give rise to those vast precipices which

16
How the
earth was
deserted by
the ocean,
and left
dry.

Earth.

which so frequently occur between opposite parts of the same rocks, in the Alps and other high mountains. It is plain, that the fissures, the openings of which are small, have been occasioned solely by drying. But those which extend several feet are partly owing to another cause; namely, the sinking of the foundation upon one side, while that of the other remains firm. If the base sinks but a line or two, when the height is considerable, an opening of several feet, or even fathoms, will be the consequence. When rocks are founded on clay or sand, they sometimes slip a little to one side; and the fissures are of course augmented by this motion.

23. The large openings, however, and prodigious cuts, which are to be met with in rocks and mountains, are to be ascribed to another cause. They could be produced no other way than by the sinking of immense subterraneous caverns, that were unable any longer to sustain their incumbent load. But these cuts or intervals in mountains are not of the same nature with the perpendicular fissures: they appear to have been ports opened by the hand of nature for the communication of nations. This seems to be the intention of all large openings in chains of mountains, and of those straits by which different parts of the ocean are connected; as the straits of Thermopylæ, of Gibraltar, &c. the gaps or ports in mount Caucasus, the Cordilleras, &c.

24. But the greatest changes upon the surface of the earth are occasioned by rains, rivers, and torrents from the mountains. These derive their origin from vapours raised by the sun from the surface of the ocean, and which are transported by the winds through every climate. The progress of these vapours, which are supported by the air, and transported at the pleasure of the winds, is interrupted by the tops of the mountains, where they accumulate into clouds, and fall down in the form of rain, dew, or snow. At first, these waters descended into the plains without any fixed course; but they gradually hollowed out proper channels for themselves. By the power of gravity they ran to the bottom of the mountains; and penetrating or dissolving the lower grounds, they carried along with them sand and gravel, cut deep furrows in the plains, and thus opened passages to the sea, which always receives as much water by rivers as it loses by evaporation. The windings in the channels of rivers have uniformly corresponding angles on their opposite banks; and as mountains and hills, which may be regarded as the banks of the valleys by which they are separated, have likewise sinuosities with corresponding angles, this circumstance seems to demonstrate, that the valleys have been gradually formed by currents of the ocean, in the same manner as the channels of rivers have been produced. Rivers produce considerable changes on the surface of the earth; they carry off the soil, wear away the most solid rocks, and remove every thing that opposes their passage. The waters of the clouds also, which descend upon the mountains, by continually washing away some part of the earth, tend to level them with the plains; and would undoubtedly do so, if time enough were allowed for that purpose.

25. From what has been advanced, we may conclude, that the flux and reflux of the ocean have produced all the mountains, valleys, and other inequalities on the

surface of the earth: that currents of the sea have scooped out the valleys, elevated the hills, and bestowed on them the corresponding directions: that the same waters of the ocean, by transporting and depositing earth, &c. have given rise to the parallel strata: that the waters from the heavens gradually destroy the effects of the sea, by continually diminishing the heights of the mountain, filling up the valleys, and chocking up the mouths of rivers; and by reducing every thing to its proper level, they will in time restore the earth to the sea, which by its natural operations will again create new continents interperfed with mountains and valleys, and every way similar to those which we now inhabit.

Thus far our author preserves some degree of plausibility in his reasoning; but in his account of the original formation of the earth, he certainly goes to the utmost verge of *probability*, or perhaps of *possibility*, in his suppositions. According to him, all the planets in our system were originally parts of the sun himself. They were detached from his body all at once by a mighty stroke of a comet. The possibility of driving off such a quantity of matter from the sun by a single stroke, he labours hard to prove; but this is far from being the greatest difficulty in his system.—“To this theory, says he, it may be objected, that if the planets had been driven off from the sun by a comet, in place of describing circles round him, they must, according to the law of projectiles, have returned to the same place from whence they had been forced; and therefore, that the projectile force of the planets cannot be attributed to the impulse of a comet.

“I reply, that the planets issued not from the sun in the form of globes, but in the form of torrents; the motion of whole anterior particles behaved to be accelerated by those behind, and the attraction of the anterior particles would also accelerate the motion of the posterior; and that this acceleration, produced by one or both of these causes, might be such as would necessarily change the original motion arising from the impulse of the comet; and that, from this cause, might result a motion similar to what takes place in the planets; especially when it is considered, that the shock of the comets removes the sun out of its former situation. This reasoning may be illustrated by an example. Suppose a musket-ball discharged from the top of a mountain, and that the force of the powder was sufficient to send it beyond a semidiameter of the earth: it is certain that this ball would revolve round the earth, and return at every revolution to the place from whence it had been discharged. But, instead of a musket-ball, if a rocket were employed, the continued action of the fire would greatly accelerate the original impulsive motion. This rocket would by no means return to the same point like the ball; but, *celeriter paribus*, would describe an orbit, the perigee of which would be more or less distant from the earth in proportion to the greatness of the change produced in its direction by the accelerating force of the fire. In the same manner, if the original projectile force impressed by the comet on the torrent of solar matter was accelerated, it is probable, that the planets formed by this torrent acquired their circular or elliptical movements around the sun.”

In like manner, he accounts for the formation and

Earth.

77
Buffon's account of the formation of the planets.

Earth.

Earth.

circulation of the secondary planets. The revolutions of the primaries on their axes, he accounts for from the obliquity of the original stroke impressed by the comet. The oblate spheroidal figure of the earth is easily deduced from its diurnal motion, and the fluidity of the whole at its first formation. The flattening at the poles he estimates at about one 230th part of the whole. As this computation differs considerably from the account given by the mathematicians who were sent to different parts of the world on purpose to determine the figure of the earth, and who made the flatness at the poles equal to one 175th part of the whole, he supposes this difference to have arisen from changes that have since taken place on the surface of the earth, occasioned by the causes already mentioned. He then proceeds to account for the formation of all things, in the following manner.—“ It is therefore evident, that the earth assumed its figure when in a melted state: and, to pursue our theory, it is natural to think, that the earth, when it issued from the sun, had no other form but that of a torrent of melted and inflamed matter: that this torrent, by the mutual attraction of its parts, took on a globular figure, which its diurnal motion changed into a spheroid: that when the earth cooled, the vapours, which are expanded like the tail of a comet, gradually condensed, fell down in the form of water upon the surface, depositing at the same time a slimy substance mixed with sulphur and salts; part of which was carried by the motion of the waters into the perpendicular fissures of the strata, and produced metals; and the rest remained on the surface, and gave rise to the vegetable mould, which abounds in different places, with more or less of animal or vegetable particles, the organization of which is not obvious to the senses.

“ Thus the interior parts of the globe were originally composed of vitrified matter; and, I believe, they are so at present. Above this vitrified matter were placed those bodies which the fire had reduced to the smallest particles, as sands, which are only portions of glass; and above these, pumice-stones, and the scorias of melted matter, which produced the different clays. The whole was covered with water to the depth of 500 or 600 feet, which originated from the condensation of the vapours when the earth began to cool. This water deposited a stratum of mud, mixed with all those matters which are capable of being sublimed or exhaled by fire: and the air was formed of the most subtle vapours, which, from their levity, rose above the water.

“ Such was the condition of the earth when the tides, the winds, and the heat of the sun, began to introduce changes on its surface. The diurnal motion of the earth, and that of the tides, elevated the waters in the equatorial regions, and necessarily transported thither great quantities of slime, clay, and sand; and by thus elevating those parts of the earth, they perhaps sunk those under the poles about two leagues, or a 230th part of the whole, as was formerly remarked: for the waters would easily reduce into powder pumice-stones, and other spongy parts of the vitrified matter upon the surface; and by this means excavate some places and elevate others, which, in time, would produce islands and continents, and all those inequalities on the surface, which are more considerable towards

the equator than towards the poles. The highest mountains lie between the tropics and the middle of the temperate zones, and the lowest from the polar circles towards the poles. Indeed, both the land and sea have most inequalities between the tropics, as is evident from the incredible number of islands peculiar to those regions.”

From the preceding extracts, the theories of Drs Burnet and Woodward, as well as Mellis Whifton and Buffon, will be easily understood; but the deficiency of all of them must be exceedingly obvious even to the most superficial reader. They all assume only the powers of attraction and repulsion as agents; without considering, that these two powers, or indeed any other two with which we are acquainted, could only have composed matters nearly similar to each other. If the original particles of matter are homogeneous, and endowed with similar powers, all the matter we see ought to be homogeneous also. But this is far from being the case. Some parts of it we see are exceedingly hard, others proportionably soft. The parts of some bodies attract each other violently; those of others have hardly any attraction for each other, but are separable by the smallest force. And though it should be granted, that the powers of attraction and repulsion were originally different in different parts of matter, we have still to explain by what means the similar parts of matter found out each other in such a chaos as the earth originally was. This seems an insuperable difficulty in the systems of Drs Burnet and Woodward; and is equally, though less conspicuously so, in those of Whifton and Buffon.

Mr Whifton's system has another and very remarkable defect. He supposes the earth to have been originally a comet, and at a certain time to have become a planet: but he forgets to tell us by what means this comet was originally formed, or what kind of bodies the comets are. Yet certainly this theory of the comet was as necessary to his system, as the theory of the earth itself: for all the substances now existing on the earth must originally have existed in the comet; and if the natural powers were known which made a distinction between one substance and another in the comet, we would also know those which distinguished terrestrial substances from one another. But though even this great deficiency should be overlooked, the supposition of a chaos or original confusion of any kind involves us in the greatest difficulties. If the whole surface of the earth consisted of a chaos of melted matter, we cannot reasonably think it would have appeared otherwise when cool than the lavas of burning mountains do just now; and this is a consequence of his system which Mr Whifton seems to have entirely overlooked.

Mr Buffon's theory is liable to the same difficulties with the rest. He places his chaos in the sun, and therefore ought to have given a theory of the sun before he gave one of the earth. It ought also to have been shewn for what purpose the sun was created when he had nothing to shine upon, or what probability there is that comets existed when there were no planets. His account of the formation of the planets by the stroke of a comet, is just within the verge of possibility; but his account of the formation of mountains by the motion of the winds and tides, is certainly inconsistent with the common principles of mechanics. Though it should

Deficiency of Mr Whifton's theory.

21
Of Mr Buffon's.

Earth.

be granted, that water can dissolve every terrestrial substance when vitrified by a heat 10,000 times greater than our hottest furnaces, ²² the sun must necessarily be; and though the water should let fall this matter as a sediment in what quantities and forms we think proper to imagine, it is impossible any of it could be thrown two or three miles above the surface of the water, in order to form those high mountains which are to be met with in different parts of the world. It is indeed very plain, that though by the motion of the waters their sediment might be collected in great heaps, it could never reach higher than their surface. The mountain, once formed, must then be for ever covered with water; for the sediment would take up precisely the same bulk when a mountain that it did when in a state of dissolution, and the water could never retire from it as he supposes. If the waters retired into vast subterraneous caverns, according to another of Mr Buffon's suppositions, they must have remained for ever in these caverns, from whence they could not have returned to effect those wonderful changes he ascribes to them. But what in the strongest manner shews the fallacy of Mr Buffon's hypothesis, is the analogy he draws between mountains on dry land, and islands in the sea. The islands, he says, are only the tops of great mountains in the ocean. If therefore the ocean had for a series of many ages covered the present habitable part of the world, as our author supposes, we should undoubtedly find many mountains upon the dry land, the tops of which had formerly been islands. But no such thing is to be found. There is not on earth a mountain with a top broad and flat like the island of Great Britain or Ireland, or even like islands of much less consideration.

These, and many other objections that will naturally occur to an attentive reader, shew the extreme difficulties under which the hypothesis of Mr Buffon labours, as well as others. These difficulties arise, in the first place, from their assuming too few natural powers. ²³ Though it is certain that the powers of attraction and repulsion exist in nature, it is no less certain that there are many others. One very remarkable power entirely different from those of attraction and repulsion, may be called the power of *assimilation* or *transmutation*. By this, each animal, and each plant, changes the nutritious particles thrown into its stomach, or which it meets with in the earth, into a substance of its own peculiar kind. Thus, a stalk of wheat, by means of its roots, always assimilates the nutritious particles of the ground into that particular grain we call wheat, and no other. This power naturalists have not been able to explain on the principles of attraction and repulsion, or any others with which we are acquainted; and therefore it may justly be called one of the primary laws of this earth at least, whether we understand the manner in which it operates or not.—Another power which seems to be diffused throughout this terraqueous globe, and common to all substances, water alone excepted, is that of multiplying themselves, or producing others of the same species. With regard to plants and animals, this is exceedingly evident; but may be disputed in the case of minerals. It is certain, however, that mines which have been exhausted, will in time be again replenished with ore; that spars and crystals, if broken or cut while their connection with

Earth.

the earth remains, will protrude a substance similar to the rest, as certainly as the wounded body of an animal will protrude flesh of a kind similar to what was taken away. The earth itself is capable of this multiplication. We see how it hath a tendency to ascend, and cover stones, &c. which lie a long time on its surface; and thus does this element, seemingly the most sluggish of all others, swallow up every thing that lies for some time undisturbed upon it. Hence we now meet with many monuments of antiquity below ground, which formerly were undoubtedly above it. Yet we have no right from thence to conclude, that there was at that time any considerable difference between the height of the dry-land above the water and what it is now. This multiplication of earth is chiefly owing to vegetation; which continually produces a new crust on the top, and thus tends to bury all such matters as rest upon the surface. This crust, however, does not produce a continual increase in the height of the dry land; for whatever quantity the vegetables add to the surface, they take from the under parts by the suction of their roots. Thus the ground becomes more porous, and the weight of ancient buildings, bones, &c. gradually forcing them downwards, they are at last buried under ground to a considerable depth.—Hence it is easy to account for the sinking of the marine bodies that are to be found at different depths in the earth, even supposing them to have been left on its surface by the deluge. Mr Buffon's objection, drawn from the great quantities of shells, seems but very weak: for it is certain, that marine animals, both of the crustaceous and other kinds, are found in the sea at this day in amazing quantities; and there is no bed of shells so large, that we can reasonably think it *impossible* for all the animals to have existed in it at once.

With regard to the strata, it seems undeniable that they may be produced from natural causes. Clay will sometimes be consolidated into stone; flint, marble, and limestone, are all found to grow naturally in the earth; so that we cannot draw any conclusion from the order in which we now find them. Though we find a bed of shells, then, in the heart of a solid rock, this makes no difficulty in the theory of the earth; since we know that the rock hath by some natural cause been consolidated around them. In fact, this is not so wonderful, as what is related by Mr Price in his treatise of minerals, mines, &c. *viz.* That at the town of Redruth in Cornwall, "some labourers being put to clear and level the street for a pavement, they found a piece of hard stone in the ground, with abundance of common small pins of brass interperfed in and throughout the stone, in such manner and form, that all those who saw it afterwards, were convinced it was not done artificially, but that the stone was formed and produced by petrification, subsequent to the time the pins were dropped into the ground. Doctor Plot, in his Natural History of Staffordshire, says, that near Newcastle under Lyne, there was found a stone with a man's skull, teeth and all, inclosed in it."—From these and other facts in some measure similar, this author concludes, that "every earth or clay, in some places, may be converted into stone in process of time, at such a depth where it is undisturbed by being never lacerated nor molested, and also where it abounds with an uncommon quantity of juices of a lapidescent quality: but

²² A number of natural powers besides attraction and repulsion proved to exist.

²³ Appearance of shells at great depths accounted for.

²⁴ Changes may naturally happen in the strata of the earth.

Earth.

Earth.

but this property being extenuated or destroyed, the earthy stones may not improbably again return to their primitive clay. Thus we see some sorts of stone, when dug out of the ground and exposed to the air for a considerable time, do moulder again into earth, at least in appearance; while others, of an earth-like quality, are indurated, and become more compact and durable by lying above ground."

25
No sufficient proof of extraordinary changes on the surface of the earth.

With regard to the extraordinary changes which Mr Buffon and others imagine to have taken place on the surface of the earth, they do not appear to have any solid foundation. Changes, no doubt, have happened in particular parts; new islands have been thrown up from the bottom of the sea by the force of subterraneous fire, and others have been swallowed up. But these appear to be merely the effects of volcanoes, which are common in many parts of the world; and we are not warranted to conclude, because we see a small volcanic island arise, and another swallowed up, that this has been the case with the whole habitable world.—An imperfect theory hath indeed been suggested by Sir William Hamilton, Mr Brydson, and others, concerning the use of volcanoes and subterraneous fires; from whence it might seem probable, though they do not indeed say so in direct terms, that all the dry land was originally thrown up from the bottom of the sea by the force of these fires. Sir William Hamilton, in his letter to Doctor Maty, broaches this theory in the following words. "I am myself convinced, that the whole circuit, so far as I have examined, within the boundaries marked in the map, (extending at least 50 Italian miles in length, and 30 in breadth where broadest,) is wholly and totally the production of subterraneous fires; and that most probably the sea formerly reached the mountains that lie behind Capua and Caserta, and are a continuation of the Apennines. If I may be allowed to compare small things with great, I imagine the subterraneous fires to have worked in this country under the bottom of the sea, as moles in a field, throwing up here and there a hillock; and that the matter thrown out of some of these hillocks formed into settled volcanoes, filling up the space between the one and the other, has composed this part of the continent, and many of the islands adjoining.

"From the observations I have made upon Mount Ætna, Vesuvius, and the neighbourhood, I dare say, that, after a careful examination, most mountains that are, or have been, volcanoes, would be found to owe their existence to subterraneous fire; the direct reverse of what I find the commonly received opinion.—Nature, though varied, is certainly in general uniform in her operations; and I cannot conceive, that two such considerable volcanoes as Ætna and Vesuvius, should have been formed otherwise than every other considerable volcano of the known world. I do not wonder that so little progress hath been made in the improvement of natural history, and particularly in that branch of it which regards the theory of the earth: nature acts slowly; it is difficult to catch her in the fact."

"From repeated observations I have made in the neighbourhood of Vesuvius, I am sure that no virgin soil is to be found there; and that all is composed of different strata of erupted matter, even to a great depth below the level of the sea. In short, I have not any doubt in my own mind but that this volcano took its

rise from the bottom of the sea; and as the whole plain between Vesuvius and the mountains behind Caserta, which is the best part of Campagna Felice, is (under its good soil) composed of burnt matter, I imagine the sea to have washed the feet of those mountains, until the subterraneous fires began to operate, at a period certainly of a most remote antiquity.

"The soil of the Campagna Felice is very fertile; I saw the earth opened in many places. The stratum of good soil was in general four or five feet thick; under which was a deep stratum of cinders, pumice, fragments of lava, and such burnt matter as abounds near Mount Vesuvius and all volcanoes. The mountains at the back of Caserta are mostly of a sort of limestone, and very different from those formed by fire; though Signior Van Vitelli, the celebrated architect, has assured me, that in the cutting of the famous aqueduct of Caserta through these mountains, he met with some soils that had evidently been formed by subterraneous fires. The high grounds which extend from Castell-a-Mare to the point of Minerva towards the island of Caprea, and from the promontory that divides the bay of Naples from that of Salerno, are of limestone. The plain of Sorrento, that is bounded by these high grounds, beginning at the village of Vico, and ending at that of Massa, is wholly composed of the same sort of tufa as that about Naples; except that the cinders or pumice-stones intermixed in it, are larger than in the Naples tufa. I conceive, then, that there has been an explosion in this spot from the bottom of the sea. This plain, as I have remarked to be the case with all soils produced by subterraneous fire, is extremely fertile; whilst the ground about it, being of another nature, is not so. The island of Caprea does not shew any signs of having been formed by subterraneous fire; but is of the same nature as the high grounds last mentioned, from whence it has been probably detached by earthquakes, or the violence of the waves. Roviigliano, an island, or rather a rock, in the bay of Castell-a-Mare, is likewise of limestone, and seems to have belonged to the original mountains in its neighbourhood: in some of these mountains also, there are petrified fish and fossil shells, which I never have found in the mountains which I suppose to have been formed by explosion. Bracini, however, in his account of the eruption of 1613, says, that he found many sorts of sea-shells on Vesuvius after that eruption; and P. Ignatio, in his account of the same eruption, says, that he and his companions picked up many shells likewise at that time upon the mountain: this circumstance would induce one to believe, that the water thrown out of Vesuvius during that formidable eruption, came from the sea."

This may serve to shew upon what grounds the volcanic theory stands; but though we should admit it in its utmost extent, the theory of the earth can receive but very little assistance from it. Mr Hamilton himself does not say that *all* the mountains have been volcanoes, or that *all* the soil throughout the different quarters of the world hath been thrown up from the bottom of the sea. If, therefore, there remains but one mountain in the whole world which never was a volcano, we shall be as much difficulties to account for the production of that one, as though there were ever so many; and at any rate our theory will be absolutely useless, because what will account for the origin of that

27
Insufficiency of the volcanic theory.

mountain

Earth.

mountain, will also account for the origin of others. If we go a step beyond Mr Hamilton, and say, that there are no mountains whatever that have not been originally volcanoes, but that all the dry land is the production of subterraneous fire, our difficulties are so far from being removed, that they are greatly increased. The lavas and volcanic ashes, though in time they become covered with an exceedingly fertile soil, remain absolutely barren for a great number of years, inasmuch that, by the adopters of the volcanic hypothesis, the period at which Moses fixes the creation is reckoned by far too late to have given time for covering the many lavas of Italy and Sicily with the depth of earth they just now have upon them. The whole world therefore must have remained for many ages in a state of absolute sterility; and by what means vegetation first began, or in what corner of the world, remains to be inquired into.

19
Centrifugal
force not
the cause of
the earth's
spheroidal
figure.

Without entering further into the theories either of Mr Hamilton, or any other person, it is easy to see, that all of them are insufficient to solve the difficulties mentioned n° 11. It is common to account for the spheroidal figure of the earth, from the greater centrifugal force of the equatorial parts than of the polar ones; but this explication can by no means be deemed sufficient. The globe we inhabit is composed of two very different kinds of matter, earth and water. The former has a very considerable power of cohesion, besides the gravitating power; the latter has very little cohesion, and its parts may be separated from each other by whatever will overcome its weight. It follows, therefore, that the solid parts of the earth, resisting, by their cohesion, the centrifugal force more than the water, ought not to dilate so much. The waters of the ocean therefore ought, about the equator, to swell up and overflow the land; and this they ought to do at this present moment as much as at the first creation. That this ought to be the case, is evident from the phenomena of the tides. It is not to be doubted but that the attraction of the moon affects the solid earth as well as the sea; but because of the greater cohesion of the former, it cannot yield as the ocean does, and therefore the waters are raised to some height above it. The height to which the waters would have covered the equatorial parts by the centrifugal force, must have been equal to the depression at the poles; which, according to Mr Buffon, is about 17 miles, according to other mathematicians 25 or 26 miles.

The other difficulties are so totally inexplicable, that Buffon, who seems to exert himself as much as possible in order to remove them, is obliged at last to own, that the earth is in a perishing state; that the hills will be levelled, and the ocean at last cover the whole face of the earth; a prophecy which wears no very favourable aspect to the inhabitants of this globe. — For these imaginations, however, there does not seem to be the smallest foundation in nature. The mountains have continued what they were, from the earliest accounts of time, without any signs of decay. Mount *Ætna*, besides the waste common to it with other mountains, hath been exhausting itself by throwing out incredible quantities of its own substance; yet it still seems to be what it was called by Pindar 2200 years ago, the *pillar of heaven*. It seems extremely probable therefore, that there are powers in the system of nature

29
Natural
powers for
preserving
the moun-
tains.

which tend to preserve, and are capable of counteracting those which tend to destroy, the mountains; and perhaps the late discovery concerning the attraction of mountains may some time or other throw some light on the nature of these powers. See *MOUNTAIN*.

Earth.

The like may be said of the isthmuses or narrow necks of land which in some parts of the world join different countries together; such as the isthmus of Darien, of Suez, the Morea, &c. Though the ocean seems to beat on these with great violence, they are never diminished in bulk, or washed away, as, according to Buffon's theory, they ought to be. It is plain, therefore, that there is in nature some power by which these narrow necks of land are preserved from the fury of the ocean; for history does not afford one instance of any neck of land of this kind being broken down by the sea. — The difficulties with regard to the strata and shells seem insolvable by any other means than supposing that there are in the terrestrial matter several distinct powers, by which the strata of any particular kind are occasionally transformed into others; and that the shells and other marine bodies were originally deposited on the surface by the deluge. The volcanic hypothesis, by which some attempt to account for the appearance of these bodies, will in no shape answer the purpose. By the explosions of a volcano, shells, mud, sand, &c. might be indiscriminately thrown up, and scattered irregularly about; but we could never find the large beds of shells which are frequently to be met with of a considerable extent, in different parts of the earth.

With regard to any degree of certainty, it is scarcely to be hoped for on this subject. The common notion of the earth's being originally a chaos, seems neither to have a foundation in reason, nor in the Mosaic account of the creation. It is surely inconsistent with the wisdom ascribed to the Deity, to think that he would create this visible system in confusion, and then employ it to put itself in order. It seems more probable, that the earth was originally created with the inequalities of surface we see it have, and that the natural powers for preserving it were afterwards superadded. Thus, according to Moses, the first natural agent created, or produced, by directing matter to move in a certain manner, was *light*. This, we know, was absolutely necessary for the evaporation of the water which took place on the second day. Moses tells us, that the earth was originally covered with water: and we see a natural reason why it should be so; namely, that the evaporation by the atmosphere might more easily take place. When this was done, there being then no more occasion for the waters in that diffused state, they were commanded to retire into the place appointed for them, and thus formed the ocean. Whether this was done by the action of gravity then first taking place, or by any other means, we have it not in our power to know, nor will our speculations on this subject probably be attended with much benefit. We see, however, that the Mosaic account of the creation is perfectly consistent with itself, and free from those difficulties with which other systems are clogged. It is impossible to shew, how, by any natural power, a confused mass of matter, such as the chaos of the ancient poets, of Drs Burnet and Woodward, the hollow globe of Mr Hutchinson, the comet of Mr Whiston, or the vitrified.

30
And
isthmuses.

31
Notion of
chaos
ought not
to be adopt-
ed.

Earth. vitrified matter of Mr Buffon, could put itself in the order in which we see it. The sacred historian simply tells us, that God created the heavens and the earth; that the heavens gave no light, and the earth was covered with water. He first commanded the light to shine, then the air to take up what quantity of water he thought proper for the purposes of vegetation. After this, the dry land was made to appear; and the different powers of vegetation already taken notice of, were given to it. Next the sun and moon were created as subordinate agents, to do what we are told the deity had done before by his own immediate action, namely, to *divide the light from the darkness*, &c. Then followed the formation of animals and of man.

32
Mosaic account of the creation perfectly consistent.

According to this account, it would appear, that what we call the *laws of nature*, were given to preserve the earth in that shape which the Deity thought proper to give it originally by his own power; and by no means to form it in any particular way, much less to put it out of the form which he had already given it: and thus the world, according to the best accounts we have, is very little altered in its appearance; and, according to what we can judge, will continue unaltered for ever, unless the Creator thinks proper to interpolate in such a manner as to supersede all the laws he hath given it, and change it into some other form.

33
Objections to the Mosaic chronology.

From some observations of Mr Hamilton and others, objections have been drawn, as hath been already mentioned, to the Mosaic chronology. These objections are in substance as follows. In pits, and other natural and artificial openings of the ground, in the neighbourhood of Vesuvius and Ætna, several beds of lava have been discovered at considerable depths below each other. These beds of lava in some places are covered with successive strata of vegetable mould. From this disposition of materials, Sir William concludes that the world must have been created at a much more remote period than is generally believed. The different strata of lava found below ground, he observes, must have proceeded from an equal number of eruptions from the mountain; and, such of them as are covered with vegetable soil must have remained at least 1000 years on the surface before they could acquire a soil sufficient for the purposes of vegetation. Ten or twelve successive strata overlaid with soil, have already been discovered in the bowels of the earth; and it has been strongly asserted, that, by digging deeper, many more might have been found. Now, allowing 1000 years for each stratum of lava, which the supporters of this theory affirm to be too little, the antiquity of the earth cannot be less than 12,000 years, which is more than double its age according to the Mosaic account.

The principal fact in this theory is, that 1000 years are necessary to the production of a soil sufficient for the nourishment and growth of vegetables upon volcanic lavas. This notion is confirmed by a conjecture of the Canonico Recupero, that streams of lava in Sicily have lain for centuries without acquiring a vegetable mould; and by some obscure accounts, that these lavas have proceeded from eruptions of Ætna above 1000 years ago. The following considerations, however, will render this theory at least extremely dubious.

34
Answered.

Sir William informs us, that some lavas are very solid, and resist the operation of time much longer than another kind, which, he says, "is farinaceous, the par-

ticles separating as they force their way out, just like meal coming from under the grindstones. A stream of lava of this sort, (he justly observes) being less compact, and containing more earthy particles, would certainly be much sooner fit for vegetation than one composed of the more perfect vitrified matter." He has not, however, ventured to determine whether these lavas found below ground were of the former or latter quality; a circumstance which materially affects the justness of his calculation.

That soil gradually increases by decayed vegetables, and the sediment deposited by snow and rain, is an undeniable fact. The thickness or thinness of soil indicates a greater or less time of accumulation. But Sir William has not informed us of the dimensions of his subterraneous vegetable strata; a circumstance of great moment in instituting a calculation of their different eras.

Besides, eruptions of volcanoes are often accompanied with incredible quantities of ashes, which fall thick upon all the ground for many miles round, intended by nature, it would appear, quickly to repair the barrenness occasioned by the lava. The muddy water sometimes thrown out may co-operate powerfully with the ashes in producing the same happy effect.

But Sir William has furnished us with facts of a more important nature. The town of Herculaneum was destroyed by an eruption in the 97th year of the Christian æra. There are evident marks, says he, that the matter of six eruptions has taken its course over Herculaneum; for each of the six strata of lava is covered with a vein of good soil. Here we have Sir William's own authority for six strata of *good soil*, accumulated in less than 1700 years; which, supposing them to be all of equal thickness, instead of 1000 years, leaves not 300 to the production of each.

From the same authority we learn, that the crater on the top of the Monte Nuovo, or New Mountain, which was thrown up by subterraneous fire no farther back than the year 1538, is now covered with shrubs.

There is not on record any eruption from the great crater of Vesuvius from the year 1139 to 1631, a period of only 492 years. But, Bracini, who descended into it not long before the 1631, tells us, "that the crater was five miles in circumference, and about 1000 paces deep. Its sides were covered with brushwood, and at the bottom there was a plain on which cattle grazed. In the woody parts, boars frequently harboured," &c.

The correspondence of these facts, related by Sir William himself, with his favourite notion that 1000 years are necessary for the production of a vegetable soil, we leave the reader to determine; and shall conclude with a few remarks of a different kind.

The appearance of a stratum of lava below ground, though not covered with vegetable soil, our author considers as demonstrative evidence, that such stratum formerly lay above the surface, and was thrown out by an eruption. This inference, however, seems not altogether just. Nothing, with propriety, receives the denomination of an eruption, unless when lava or other matter is vomited from the crater, or from some new opening made in the mountain. But it deserves notice, that, in the environs of volcanoes, earthquakes are frequent.

Earth.

quent. That these violent concussions are the genuine produce of subterranean fire expanding itself in every direction, and making strong efforts against every substance which resists the natural tendency of its course, is a fact that cannot admit of doubt. It is no less certain, that these frequent concussions shake and dislocate the internal parts of the earth. They cannot fail to shatter and disarrange the natural direction of the original strata; and, of course, they must give rise to many subterraneous cavities and fissures. The nearer the great furnace, which confines the fury of the flames, the greater and more frequent will be the cavities. Every earthquake occasioned by a volcano is nothing else than an effort of the burning matter to enlarge the boundaries by which it is usually limited. If the quantity of matter and degree of inflammation require a space greatly superior to the internal cavities, an eruption above the surface is an infallible consequence. But, when the quantity of matter, or the expansive force occasioned by the degree of inflammation, is insufficient to raise the lava to the top of the mountain, an earthquake may be produced; and the lava, without ever appearing above the surface, may run below ground in plentiful streams, and fill up all the subterraneous cavities and channels. These internal strata of lava may often lie so deep as to be below the level of the sea. In this manner, we conceive it to be not only possible, but extremely probable, that beds of lava, having no covering of vegetable soil, may be found at great depths, although they never were above the surface.

It is much more reasonable to conclude, that lavas with a layer of soil were produced by eruptions, and once lay above the surface, till covered by the operation of time, or subsequent streams from the mouth of the volcano. But, even in this case, the argument is not altogether complete; for, as above remarked, earthquakes, with which countries adjacent to volcanoes are perpetually infested, often sink large tracts of land to great depths.

The other parts of the theory of the earth regard the situation of the different parts of its surface with respect to each other; its annual motion round the sun as a planet; its diurnal motion round its axis; and the different strata whereof it is composed, as far as it hath been hitherto found practicable to penetrate into it: for all which, see the articles GEOGRAPHY, ASTRONOMY, MINES, STRATA, &c.

Smell and Bath of the EARTH. See AGRICULTURE, n° 11.

Bread made of EARTH. See BREAD.

EARTH-FLAX. See AMIANTHUS.

EARTH-Nuts, or Ground-Nuts, the roots of the *ARACHIS hypogæa* of LINNÆUS. They are composed of several small round bulbs or knobs; whence they were termed by *Dodonæus, terre glandes*, or *earth-nuts*. They are esteemed an excellent food by the Siberians. In Holland likewise, they are sold in the markets and used for food. The native country of this plant seems to be Africa; though, at present, all the American settlements abound with it; but many persons who have resided in that country affirm that they were originally brought by the slaves from Africa. The plant multiplies very fast in a warm country; but being very impatient of cold, it cannot be propagated in the open air in Britain. The seeds must therefore be planted in

a hot-bed in the spring of the year; and when the weather proves warm, they may be exposed to the open air by degrees. The branches of the plant trail upon the ground; and the flowers, which are yellow, are produced single upon long footstalks; and as soon as the flower begins to decay, the germ is thrust under ground, where the pod is formed and ripened; so that unless the ground is opened, they never appear: the roots are annual, but the nuts or seeds sufficiently stock the ground in a warm country where they are not carefully taken up.

EARTH-Nuts, or Pig-nuts. See BUNIVM.

EARTH-Pucerons, in natural history, a name given by authors to a species of puceron very singular in its place of abode. In the month of March, if the turf be raised in several places in any dry pasture, there will be found, under some parts of it, clusters of ants; and, on a farther search, it will be usually found, that these animals are gathered about some pucerons of a peculiar species. These are large, and of a greyish colour, and are usually found in the midst of the clusters of ants.

The common abode of the several other species of pucerons is on the young branches or leaves of trees; as their only food is the sap or juice of vegetables, probably these *earth* kinds draw out those juices from the roots of the grasses, and other plants, in the same manner that the others do from the other parts. The ants that conduct us to these, are also our guides where to find the greater part of the others: the reason of which is, that as these creatures feed on the saccharine juices of plants, they are evacuated from their bodies in a liquid form, very little altered from their original state; and the ants, who love such food, find it ready prepared for them, in the excrements which these little animals are continually voiding *. It has been supposed by some, that these were the common pucerons of other kinds, which had crept into the earth to preserve themselves from the rigour of the winter. But this does not appear to be the case; for they are usually met with in places very distant from trees or plants, on which they should be supposed before to have fed; and it is very certain, that though many of these insects are killed by the cold, yet many escape, and are found very early in the spring, sucking the buds of the peach-tree. There is no doubt of these creatures being in a feeding condition when underground; because otherwise the ants would have no temptation to follow them: and it is equally certain, that the several species of the pucerons, like those of the caterpillar kinds, have each their peculiar herbs on which they feed, as many of them will die of hunger rather than feed on any others; and it is not at all likely, that these *earth* pucerons had been used to feed on leaves of trees and plants, and had left that food for the roots of grass.

EARTH-Worms. See LUMBRICUS.

EARTHQUAKE, in natural history, a sudden and violent concussion of the earth, generally attended with strange noises under-ground or in the air; often destroying whole cities at once, throwing down rocks, altering the course of rivers, and producing the most terrible devastations.

Though there is hardly any country known in which shocks of an earthquake have not at some time or other been felt, yet there are some much more subject to them

* See *Aphis*, and *Honey-dew*.

Earth-

quake.

What countries are most subject to earthquakes.

them than others. It hath been observed, that northern countries in general are less subject to earthquakes than those situated near the equator, or in the southern latitudes; but this does not hold universally. The islands of Japan, which are situated pretty far north, are nevertheless exceedingly liable to these destructive phenomena. Islands, in general, are also more subject to earthquakes than continents; but neither does this hold without exceptions. Some particular parts of continents, and some particular islands, are more subject to them than others lying in the neighbourhood, and differing very little from them in external appearance. Thus, Portugal is more subject to earthquakes than Spain, and the latter much more than France; Mexico and Peru more than the other countries of America, and Jamaica more than the other Caribbee Islands. Earthquakes are frequent, tho' not often violent, in Italy; but in Sicily they are often terribly destructive. Asia Minor hath been remarkably subject to them from the remotest antiquity, and the city of Antioch in particular hath suffered more from earthquakes than any other in that country. The same phenomena are said also to occur very frequently in the north-eastern extremities of Asia, even in very high latitudes.

History of the phenomena incomplete.

Though there are no phenomena in nature more calculated to impress the human mind with terror, and consequently to be well remembered and taken notice of, than earthquakes, yet the philosophy of them is but lately arrived at any degree of perfection; and even at this day, the history of earthquakes is very incomplete. The destruction occasioned by them engrosses the mind too much to admit of philosophical speculations at the time they happen: the same thing prevents the attentive consideration of the alterations that take place in the atmosphere after the earthquake is over, and which might probably throw some light on the causes which produced it; and the suddenness of its coming on prevents an exact attention to those slight appearances in the earth or air, which, if carefully observed, might serve as warnings to avoid the destruction.—From what observations have been made, however, the following phenomena may be deduced, and reckoned pretty certain.

Account of the phenomena as far as yet ascertained.

1. Where there are any volcanoes or burning mountains, earthquakes may reasonably be expected more frequently than in other countries.

2. If the volcano hath been for a long time quiet, a violent earthquake is to be feared, & *vice versa*. But to this there are many exceptions.

3. Earthquakes are generally preceded by long droughts; but they do not always come on as soon as the drought ceases.

4. They are also preceded by electrical appearances in the air; such as the aurora borealis, falling stars, &c.: but this does not hold universally.

5. A short time before the shock, the sea swells up and makes a great noise; fountains are troubled, and send forth muddy water; and the beasts seem frightened, as if sensible of an approaching calamity.

6. The air at the time of the shock is generally calm and serene; but afterwards commonly becomes obscure and cloudy.

7. The shock comes on with a rumbling noise, sometimes like that of carriages; sometimes a rushing noise

like wind, and sometimes explosions like the firing of cannon are heard. Sometimes the ground heaves perpendicularly upwards, and sometimes rolls from side to side. Sometimes the shock begins with a perpendicular heave, after which the other kind of motion commences. A single shock is but of very short duration, the longest scarcely lasting a minute; but they frequently succeed each other at short intervals for a considerable length of time.

8. During the shock, chasms are made in the earth; from which sometimes flames, but oftener great quantities of water, are discharged. Flame and smoke are also emitted from places of the earth where no chasms can be perceived. Sometimes these chasms are but small; but, in violent earthquakes, they are not unfrequently so large, that whole cities sink down into them at once.

9. The water of the ocean is affected even more than the dry-land. The sea swells to a prodigious height; much more than we could suppose it raised by the mere elevation of its bottom by the shock. Sometimes it is divided to a considerable depth; and great quantities of air, flame, and smoke, are discharged from it. The like irregular agitations happen to the waters of ponds, lakes, and even rivers.

10. The shock is felt at sea as well as on land. Ships are affected by a sudden stroke, as if they run aground or struck upon a rock.

11. The effects of earthquakes are not confined to one particular district or country, but often extend to very distant regions; though no earthquake hath yet been known extensive enough to affect the whole world at one time. In those places also where the shock is not felt on dry land, the irregular agitation of the waters abovementioned is perceived very remarkably.

All these positions are verified by the accounts of those earthquakes which have been particularly described by witnesses of the best character. In 1692, an earthquake happened in Jamaica, attended with almost all the terrible circumstances above mentioned. In two minutes, it destroyed the town of Port Royal, at that time the capital of the island; and sunk the houses in a gulph 40 fathoms deep. It was attended with an hollow rumbling noise like that of thunder: the streets rose like the waves of the sea; first lifting up the houses, and then immediately throwing them down into deep pits. All the wells discharged their waters with the most violent agitation. The sea burst over its bounds, and deluged all that stood in its way. The fissures of the earth were in some places so great, that one of the streets appeared twice as broad as formerly. In many places it opened and closed again; and continued this agitation for some time. Of these openings, great numbers might be seen at once. In some of them, the people were swallowed up at once; in others, the earth caught them by the middle, and crushed them to death; while others, more fortunate, were swallowed up in one chasm, and thrown out alive by another. Other chasms were large enough to swallow up whole streets; and others, still more formidable, spouted up immense quantities of water, drowning such as the earthquake had spared. The whole was attended with stench and offensive smells, the noise of falling mountains at a distance, &c.; and the sky, in a minute's time, was turned dull and reddish, like a glowing oven. Yet, as great a sufferer as Port-Royal was, more houses were left

Earth-quake.

Account of the earthquake in Jamaica in 1692.

Earth-
quake.

left standing therein, than on the whole island beside. Scarce a planting-house, or sugar-house, was left standing in all Jamaica. A great part of them were swallowed up, houses, people, trees, and all, in one gap: in lieu of which, afterwards appeared great pools of water; which, when dried up, left nothing but sand, without any mark that ever tree or plant had grown thereon. The shock was so violent, that it threw people down on their knees or their faces as they were running about for shelter. Several houses were flung some yards out of their places, and yet continued standing. One Hopkins had his plantation removed half a mile from the place where it stood, without any considerable alteration. All the wells in the island, as well as those of Port-Royal, from one fathom to six or seven deep, threw their water out at the top with great violence. Above 12 miles from the sea, the earth gaped and spouted out, with a prodigious force, vast quantities of water into the air: yet the greatest violences were among the mountains and rocks; and it is a general opinion, that the nearer the mountains, the greater the shock; and that the cause thereof lay among them. Most of the rivers were stopped up for 24 hours, by the falling of the mountains; till, swelling up, they made themselves new tracks and channels; tearing up, in their passage, trees, &c. After the great shock, those people who escaped got on board ships in the harbour, where many continued above two months; the shocks all that time being so violent, and coming so thick, sometimes two or three in an hour, accompanied with frightful noises like a rushing wind, or a hollow rumbling thunder, with brimstone-blasts, that they durst not come ashore. The consequence of the earthquake was a general sickness, from the noisome vapours belched forth, which swept away above 3000 persons.

5
Of the
earthquake
in Calabria
in 1638.

A still more terrible account, if possible, is that given by Kircher, of the earthquake which happened in Calabria in the year 1638. This instance is an exception to the second general position above laid down. In Italy, there had been an eruption of Mount Vesuvius, five years before; and in Sicily there had been an eruption of Ætna, only two years before this earthquake. The event, however, plainly shewed, that the cause of the earthquake, whatever it was, had a connection not only with Mount Ætna, which lies in the neighbourhood, but also with the volcano of Stromboli, which is 60 miles distant. "On the 24th of March, (says Kircher,) we lunched (in a small boat) from the harbour of Messina in Sicily, and arrived the same day at the promontory of Pelorus. Our destination was for the city of Euphemia in Calabria; but on account of the weather, we were obliged to continue three days at Pelorus. At length, wearied with the delay, we resolved to prosecute our voyage; and, although the sea seemed more than usually agitated, yet we ventured forward. The gulf of Charybdis, which we approached, seemed whirled round in such a manner as to form a vast hollow, verging to a point in the centre. Proceeding onward, and turning my eyes to mount Ætna, I saw it cast forth large volumes of smoke, of mountainous sizes, which entirely covered the island, and blotted out even the shores from my view. This, together with the dreadful noise, and the sulphureous stench, which was strongly perceived, filled me with

Earth-
quake.

apprehensions that some more dreadful calamity was impending. The sea itself seemed to wear a very unusual appearance; those who have seen a lake in a violent shower of rain all covered over with bubbles, will have some idea of its agitations. My surprise was still increased by the calmness and serenity of the weather; not a breeze, not a cloud, which might be supposed to put all nature thus into motion. I therefore warned my companions, that an earthquake was approaching; and, after some time, making for the shore with all possible diligence, we landed at Tropæa. But we had scarce arrived at the Jesuits college in that city, when our ears were stunned with an horrid sound, resembling that of an infinite number of chariots driven fiercely forward, the wheels rattling, and the thongs cracking. Soon after this, a most dreadful earthquake ensued; so that the whole track upon which we stood seemed to vibrate, as if we were in the scale of a balance that continued wavering. This motion, however, soon grew more violent; and being no longer able to keep my legs, I was thrown prostrate upon the ground. After some time, however, finding that I remained unhurt amidst the general concussion, I resolved to venture for safety; and running as fast as I could, reached the shore. I did not search long here, till I found the boat in which I had landed, and my companions also. Leaving this seat of desolation, we prosecuted our voyage along the coasts; and the next day came to Rouchetta, where we landed, although the earth still continued in violent agitations. But we were scarce arrived at our inn, when we were once more obliged to return to our boat; and in about half an hour, we saw the greatest part of the town, and the inn at which we had set up, dashed to the ground, and burying all its inhabitants beneath its ruins. Proceeding onward in our little vessel, we at length landed at Lopizium, a castle mid-way between Tropæa and Euphemia the city to which we were bound. Here, wherever I turned my eyes, nothing but scenes of ruin and horror appeared; towns and castles levelled to the ground; Stromboli, though at 60 miles distance, belching forth flames in an unusual manner, and with a noise which I could distinctly hear. But my attention was quickly turned from more remote, to contiguous, danger. The rumbling found of an approaching earthquake, which by this time we were grown acquainted with, alarmed us for the consequences. It every moment seemed to grow louder, and to approach more near. The place on which we stood now began to shake most dreadfully; so that, being unable to stand, my companions and I caught hold of whatever shrub grew next us, and supported ourselves in that manner. After some time, the violent paroxysm ceasing, we again stood up, in order to prosecute our voyage to Euphemia, which lay within sight. In the mean time, while we were preparing for this purpose, I turned my eyes towards the city; but could see only a frightful dark cloud, that seemed to rest upon the place. This the more surprised us, as the weather was so very serene. We waited, therefore, till the cloud was passed away: then turning to look for the city, it was totally sunk; and nothing but a dismal and putrid lake was to be seen where it stood."

In 1693 an earthquake happened in Sicily, which may justly be accounted one of the most terrible of

Earth-
quake.6
Of the
earthquake
in Sicily in
1693.

which we have any account. It shook the whole island: and not only that, but Naples and Malta shared in the shock. It was impossible for any body, in this country, to keep on their legs on the dancing earth; nay, those that lay on the ground were tossed from side to side, as on a rolling billow: high walls leaped from their foundations several paces, &c. The mischief it did is amazing: almost all the buildings in the countries were thrown down. Fifty-four cities and towns, beside an incredible number of villages, were either destroyed or greatly damaged. We shall only instance the fate of Catania, one of the most famous, ancient, and flourishing cities in the kingdom; the residence of several monarchs, and an university. This once famous city had the greatest share in the tragedy. Father Anthon. Serrovita, being on his way thither, and at the distance of a few miles, observed a black cloud like night hovering over the city; and there arose from the mouth of Montgibello, great spires of flame, which spread all around. The sea all of a sudden began to roar, and rise in billows; and there was a blow, as if all the artillery in the world had been at once discharged. The birds flew about alighted; the cattle in the fields ran crying, &c. His and his companions horses stopped short, trembling; so that they were forced to alight. They were no sooner off, but they were lifted from the ground above two palms; when, casting his eyes towards Catania, he with amazement saw nothing but a thick cloud of dust in the air. This was the scene of their calamity: for of the magnificent Catania, there was not the least footstep to be seen. S. Bonajutus assure us, that of 18900 inhabitants, 18000 perished therein.

7
Phenomena
of the great
earthquake
Novem. 1.
1755.8
At Lisbon.

The great earthquake, however, which happened on the 1st of November 1755, affords the clearest example of all the phenomena above-mentioned; having been felt violently in many places both on land and at sea, and extended its effects to the waters in many other places where the shocks were not perceived. At Lisbon in Portugal, its effects were most severe. In 1750, there had been a sensible trembling of the earth felt in this city: for four years afterwards, there had been an excessive drought; inasmuch, that some springs, formerly very plentiful of water, were dried, and totally lost: the predominant winds were north and north-east, accompanied with various, though very small, tremors of the earth. The year 1755 proved very wet and rainy, the summer cooler than usual; and for 40 days before the earthquake, the weather was clear, but not remarkably so. The last day of October, the sun was obscured, with a remarkable gloominess in the atmosphere. The first of November, early in the morning, a thick fog arose, which was soon dissipated by the heat of the sun; no wind was stirring, the sea was calm, and the weather as warm as in June or July in this country. At 35 minutes after nine, without the least warning, except a rumbling noise not unlike the artificial thunder in our theatres, a most dreadful earthquake shook, by short but quick vibrations, the foundations of all the city, so that many buildings instantly fell. Then, with a scarce perceptible pause, the nature of the motion was changed, and the houses were tossed from side to side, with a motion like that of a waggon violently driven over rough stones. This second shock laid almost the whole city in ruins, with prodigious slaughter

Earth-
quake.

of the people. The earthquake lasted in all about six minutes. At the moment of its beginning, some persons on the river, near a mile from the city, heard their boat make a noise as if it had run aground, though they were then in deep water; and at the same time they saw the houses falling on both sides of the river. The bed of the river Tagus was, in many places, raised to its surface. Ships were drove from their anchors, and jostled together with great violence; nor did their masters know whether they were afloat or aground. A large new quay sunk to an unfathomable depth, with several hundreds of people who were upon it; nor was one of the dead bodies ever found. The bar was at first seen dry from shore to shore: but suddenly the sea came rolling in like a mountain; and about Belem Castle, the water rose 50 feet almost in an instant. About noon, there was another shock; when the walls of several houses that yet remained, were seen to open from top to bottom more than a quarter of a yard, and afterwards closed again so exactly that scarce any mark of the injury was left.

At Colares, about 20 miles from Lisbon, and two miles from the sea, on the last day of October, the weather was clear, and uncommonly warm for the season: about four o'clock in the afternoon there arose a fog, which came from the sea, and covered the valleys; a thing very unusual at that season of the year. Soon after, the wind changing to the east, the fog returned to the sea, collecting itself, and becoming exceeding thick. As the fog retired, the sea rose with a prodigious roaring.—The first of November, the day broke with a serene sky, the wind continuing at east: but, about nine o'clock, the sun began to grow dim; and about half an hour after was heard a rumbling noise like that of chariots, which increased to such a degree, that it became equal to the explosions of the largest cannon. Immediately a shock of an earthquake was felt, which was quickly succeeded by a second and third; and at the same time several light flames of fire issued from the mountains, resembling the kindling of charcoal. In these three shocks, the walls of the buildings moved from east to west. In another situation, from whence the sea-coast could be discovered, there issued from one of the hills called the *Fojo*, a great quantity of smoke, very thick, but not very black. This still increased with the fourth shock, and afterwards continued to issue in a greater or less degree. Just as the subterraneous rumblings were heard, the smoke was observed to burst forth at the *Fojo*; and the quantity of smoke was always proportioned to the noise. On visiting the place from whence the smoke was seen to arise, no signs of fire could be perceived near it.

At Oporto (near the mouth of the river Douro), the earthquake began about 40 minutes past nine. The sky was very serene; when a dreadful hollow noise like thunder, or the rattling of coaches at a distance, was heard, and almost at the same instant the earth began to shake. In the space of a minute or two, the river rose and fell five or six feet, and continued to do so for four hours. It ran up at first with so much violence, that it broke a ship's hawser. In some parts the river opened, and seemed to discharge vast quantities of air; and the agitation in the sea was so great about a league beyond the bar, that air was supposed to have been discharged there also.

ELECTRICITY

Earth-
quake.11
At St Ubes

St Ubes, a sea-port town, about 20 miles south of Lisbon, was entirely swallowed up by the repeated shocks, and the vast surf the sea. Huge pieces of rock were detached at the same time from the promontory at the west end of the town, which consists of a chain of mountains containing fine Jasper of different colours.

12
At Ayamonte in Spain.

The same earthquake was felt all over Spain, except in Catalonia, Arragon, and Valencia.—At Ayamonte, (near where the Guadiana falls into the Bay of Cadiz), a little before 10 o'clock on the first of November, the earthquake was felt; having been immediately preceded by a hollow rushing noise. Here the shocks continued for 14 or 15 minutes, damaged almost all the buildings, throwing down some, and leaving others irreparably shattered. In little more than half an hour after, the sea and river, with all the canals, overflowed their banks with great violence, laying under water all the coasts of the islands adjacent to the city and its neighbourhood, and flowing into the very streets. The water came on in vast black mountains, white with foam at the top, and demolished more than one half of a tower at the bar named *de Canala*. In the adjacent strands every thing was irrecoverably lost; for all that was overflowed sunk, and the beach became a sea, without the least resemblance of what it was before. Many persons perished: for, although they got aboard some vessels, yet part of these foundered; and others being forced out to sea, the unhappy passengers were so terrified, that they threw themselves over board. The day was serene, and not a breath of wind stirring.

13
At Cadiz.

At Cadiz, some minutes after nine in the morning the earthquake began, and lasted about five minutes. The water of the cisterns under ground washed backwards and forwards, so that a great froth arose. At ten minutes after eleven, a wave was seen coming from the sea, at eight miles distance, at least 60 feet higher than usual. It dashed against the west part of the town, which is very rocky. Though these rocks broke a good deal of its force, it at last came upon the city walls, beat in the breast-work, and carried pieces of the building of eight or ten ton weight to the distance of 40 or 50 yards.—When the wave was gone, some parts that are deep at low water, were left quite dry; for the water returned with the same violence with which it came. At half an hour after 11 came a second wave, and after that four other remarkable ones; the first at ten minutes before twelve; the second, half an hour before one; the third, ten minutes after one; and the fourth, ten minutes before two. Similar waves, but smaller, and gradually lessening, continued with uncertain intervals till the evening.

14
At Gibraltar.

At Gibraltar, the earthquake was not felt till after ten. It began with a tremulous motion of the earth, which lasted about half a minute. Then followed a violent shock; after that, a trembling of the earth for five or six seconds; then another shock not so violent as the first, which went off gradually as it began. The whole lasted about two minutes. Some of the guns on the battery were seen to rife, others to sink, the earth having an undulating motion. Most people were seized with giddiness and sickness; and some fell down: others were stupified; and many that were walking or riding felt no motion in the earth, but were sick. The sea rose six feet every 15 minutes; and then fell so low, that boats, and all the small craft near the shore, were left a-

ground, as were also numbers of small fish. The flux and reflux lasted till next morning, having decreased gradually from two in the afternoon.

Earth-
quake.

At Madrid the earthquake came on at the same time as at Gibraltar, and lasted about six minutes. At first every body thought they were seized with a swimming in their heads; and afterwards, that the houses were falling. It was not felt in coaches, nor by those who walked on foot, except very slightly; and no accident happened, except that two lads were killed by the fall of a stone-crook from the porch of a church.

Malaga (a sea-port on the Mediterranean) felt a violent shock; the bells rung in the steeples; the water of a well overflowed, and as suddenly retired.

Saint Lucar (at the mouth of the Guadalquivir) was violently shocked, and the sea broke in and did a great deal of mischief.

At Seville, (16 leagues above the mouth of the Guadalquivir), several houses were shaken down; the famous tower of the cathedral called *la Giralda* opened in the four sides; and the waters were so violently agitated, that all the vessels in the river were driven ashore.

In Africa, the earthquake was felt almost as severely as it had been in Europe. Great part of the town of Algiers was destroyed. At Arzilla, (a town in the kingdom of Fez), about ten in the morning, the sea suddenly rose with such impetuosity, that it lifted up a vessel in the bay, and dropped it with such force on the land, that it was broke to pieces; and a boat was found two musket-shot within land from the sea. At Fez, and Mequinez, great numbers of houses fell down, and a multitude of people were buried in the ruins.

16
At Arzilla in Africa.

At Morocco, by the falling down of a great number of houses, many people lost their lives: and about eight leagues from the city, the earth opened and swallowed up a village with all the inhabitants, who were known by the name of the *sons of Besumba*, to the number of about 8000 or 10,000 persons, together with all their cattle, &c.; and, soon after, the earth closed again in the same manner as before.

17
At Morocco.

At Salle, a great deal of damage was done. Near a third part of the houses were overthrown; the waters rushed into the city with great rapidity, and left behind them great quantities of fish.

18
At other places on the African coast.

At Tangier, the earthquake began at ten in the morning, and lasted 10 or 12 minutes. The sea came up to the walls (a thing never heard of before); and went down immediately with the same rapidity with which it arose, leaving a great quantity of fish behind it: these commotions were repeated 18 times, and lasted till six in the evening.

At Tetuan, the earthquake began at the same time it did at Tangier, but lasted only seven or eight minutes. There were three shocks, so extremely violent, that it was feared the whole city would be destroyed.

In the city of Funchal, in the island of Madeira, a shock of this earthquake was first perceived at 38 minutes past nine in the morning. It was preceded by a rumbling noise in the air, like that of empty carriages passing hastily over a stone pavement. The observer felt the floor immediately to move with a tremulous motion, vibrating very quickly. The shock continued more than a minute; during which space, the vibrations, though continual, were weakened and increased

19
In the island of Madeira.

in

Earth-quake.

Earth-quake.

in force twice very sensibly. The increase after the first remission of the shock, was the most intense. The noise in the air accompanied the shock during the whole of its continuance, and lasted some seconds after the motion of the earth had ceased; dying away like a peal of distant thunder rolling through the air. At three quarters past eleven, the sea, which was quite calm, it being a fine day, and no wind stirring, retired suddenly some paces; then rising with a great swell without the least noise, and as suddenly advancing, overflowed the shore, and entered the city. It rose 15 feet perpendicular above the high-water mark, although the tide, which flows there seven feet, was then at half ebb. The water immediately receded; and after having fluctuated four or five times between high and low water mark, it subsided, and the sea remained calm as before. In the northern part of the island the inundation was more violent, the sea there retiring above 100 paces at first, and suddenly returning, overflowed the shore, forcing open doors, breaking down the walls of several magazines and storehouses, leaving great quantities of fish ashore and in the streets of the village of Machico. All this was the effect of one rising of the sea, for it never afterwards flowed high enough to reach the high-water mark. It continued, however, to fluctuate here much longer before it subsided than at Funchal; and in some places farther to the westward, it was hardly, if it all, perceptible.

These were the phenomena with which this remarkable earthquake was attended in those places where it was violent. The effects of it, however, reached to an immense distance; and were perceived chiefly by the agitations of the waters, or some slight motion of the earth. The utmost boundaries of this earthquake to the south are unknown; the barbarity of the African nations rendering it impossible to procure any intelligence from them, except where the effects were dreadful. On the north, however, we are assured, that it

20
Effects of it
in Norway
and Sweden.

reached as far as Norway and Sweden. In the former, the waters of several rivers and lakes were violently agitated. In the latter, shocks were felt in several provinces, and all the rivers and lakes were strongly agitated, especially in Dalecarlia. The river Dala suddenly overflowed its banks, and as suddenly retired. At the same time a lake at the distance of a league from it, and which had no manner of communication with it, bubbled up with great violence. At Fahlun, a town in Dalecarlia, several strong shocks were felt.

21
In Germany.

In many places of Germany the effects of the earthquake were very perceptible. Throughout the duchy of Holstein, the waters were violently agitated, particularly those of the Elbe and Trave. In Brandenburg, the water of a lake called *Lilsee*, ebbed and flowed six times in half an hour, with a dreadful noise, the weather being then perfectly calm. The same agitation was observed in the waters of the lakes called *Muplgeß* and *Netzo*; but at this last place they also emitted an intolerable stench.

22
In Holland.

In Holland, the agitations were more remarkable. At Alphen on the Rhine between Leyden and Woerden, in the afternoon of the first of November, the waters were agitated to such a violent degree, that buoys were broken from their chains, large vessels snapped their cables, smaller ones were thrown out of the wa-

ter upon the land, and others lying on land were set afloat. At Amsterdam, about eleven in the forenoon, the air being perfectly calm, the waters were suddenly agitated in their canals, so that several boats broke loose; chandeliers were observed to vibrate in the churches; but no motion of the earth, or concussion of any building, was observed. At Harlem, in the forenoon, for near four minutes together, not only the water in the rivers, canals, &c. but also all kinds of fluids in smaller quantities, as in coolers, tubs, backs, &c. were surprisingly agitated, and dashed over the sides, though no motion was perceptible in the vessels themselves. In these small quantities also the fluid apparently ascended prior to its turbulent motion; and in many places, even the rivers and canals rose 12 inches perpendicular. At Leyden, between half an hour after 10 and 11 in the forenoon, the waters rose suddenly in some of the canals, and made several very sensible undulations, so that the boats were strongly agitated. The same motion was perceived in the water of the backs of two brew-houses.

Round the island of Corfica, the sea was violently agitated, and most of the rivers of the island overflowed their banks.—In the city of Milan in Italy, and throughout that district, shocks were felt. At Turin in Savoy, there was felt a very violent shock.

23
In Italy and
Switzerland.

In Switzerland, many rivers turned suddenly muddly without rain. The lake of Neuchâtel swelled to the height of near two feet above its natural level, for the space of a few hours.—An agitation was also perceived in the waters of the lake of Zurich.

24
At Antigua
and Barbadoes.

At the island of Antigua, there was such a sea without the bar as had not been known in the memory of man; and after it, all the water at the wharfs, which used to be six feet deep, was not two inches.—At Barbadoes, about two in the afternoon, the sea ebbed and flowed in a surprising manner. It ran over the wharfs and streets into the houses, and continued thus ebbing and flowing till ten at night.

The agitation of the waters was perceived in great numbers of places in Great Britain and Ireland.—Accounts of the most remarkable of them follow. At Barlborough in Derbyshire, between 11 and 12 in the forenoon, in a boat-house on the west side of a large body of water called *Pibley Dam*, supposed to cover at least 30 acres of land, was heard a surprising and terrible noise; a large swell of water came in a current from the south, and rose two feet on the sloped dam-head at the north end of the water. It then subsided; but returned again immediately, though with less violence. The water was thus agitated for three quarters of an hour; but the current grew every time weaker and weaker, till at last it entirely ceased.

25
In England.

At Busbridge in Surrey, at half an hour after ten in the morning, the weather being remarkably still, without the least wind, in a canal near 700 feet long and 58 feet broad, with a small spring constantly running through it, a very unusual noise was heard at the east end, and the water there observed to be in great agitation. It raised itself in a heap or ridge in the middle; and this heap extended lengthwise about 30 yards, rising between two or three feet above the usual level. After this, the ridge heeled or vibrated towards the north side of the canal with great force, and flowed above eight feet over the grass walk on that side. On

its

Earth-
quake.

its return back into the canal, it again ridged in the middle, and then heeled with yet greater force to the fourth side, and flowed over its grass walk. During this latter motion, the bottom on the north side was left dry for several feet. This appearance lasted for about a quarter of an hour, after which the water became smooth and quiet as before. During the whole time, the sand at the bottom was thrown up and mixed with the water; and there was a continual noise like that of water turning a mill.

At Cobham in Surrey, between 10 and 11 o'clock, a person was watering a horse at a pond fed by springs. Whilst the animal was drinking, the water suddenly ran away from him, and moved towards the fouth with such swiftness, that the bottom of the pond was left bare. It returned again with such impetuosity, that the man leaped backwards to secure himself from its sudden approach. The ducks were alarmed at the first agitation, and instantly flew all out of the pond.

At Dunfall in Suffolk, the water of a pond rose gradually for several minutes in the form of a pyramid, and fell down like a water-spout. Other ponds in the neighbourhood had a smooth flux and reflux from one end to the other.

Near the city of Durham, about half an hour after ten, a gardener was alarmed by a sudden rushing noise from a pond, as if the head of the pond had been broken down: when, casting his eye on the water, he saw it gradually rise up, without any fluctuating motion, till it reached a grate which stood some inches higher than the common water level. After this it subsided, and then swelled again; thus continuing to rise and fall during the space of six or seven minutes, making four or five returns in the space of one minute. The pond was about 40 yards long, and 10 broad.

At Early Court, Berks, about 11 o'clock, as a gardener was standing by a fish pond, he felt a violent trembling of the earth, which lasted about a minute. Immediately after, he observed a motion of the water from the south to the north end of the pond, leaving the bottom at the south end altogether dry for about six feet. It then returned, and flowed at the south end, rising three feet up the slope bank; and immediately after returned to the north bank, rising there also about three feet. In the time between the flux and reflux, the water swelled up in the middle of the pond, collected in a ridge about 20 inches higher than the level on each side, and boiled like a pot. This agitation from south to north lasted about four minutes.

At Eaton-bridge, Kent, in a pond about an acre in size, a dead calm, and no wind stirring, some persons heard a noise, and imagining something had been tumbling in, ran to see what was the matter. On their arrival at the pond, to their surprise they saw the water open in the middle, so that they could see a post a good way down, almost to the bottom. The water in the mean time dashed up over a bank two feet high, and perpendicular to the pond. This was repeated several times with a great noise.

At Eyam bridge, Derbyshire, (in the Peak), the overseer of the lead-mines sitting in his writing-room about 11 o'clock, felt a sudden shock, which very sensibly raised him up in his chair, and caused several pieces of plaster to drop from the sides of the room. The roof was so violently shaken, that he imagined the

engine shaft had been falling in. Upon this he immediately ran to see what was the matter, but found every thing in perfect safety. At this time two miners were employed in carting, or drawing along the drifts of the mines, the ore, and other materials, to be raised up at the shafts. The drift in which they were working was about 120 yards deep, and the space from one end to the other 50 yards or upwards. The miner at the end of the drift had just loaded his cart, and was drawing it along; but he was suddenly surprised by a shock, which so terrified him, that he immediately quitted his employment, and ran to the west end of the drift to his partner, who was no less terrified than himself. They durst not attempt to climb the shaft, lest that should be running in upon them: but while they were consulting what means they should take for their safety, they were surprised by a second shock more violent than the first; which frightened them so much, that they both ran precipitately to the other end of the drift. They then went down to another miner who worked about 12 yards below them. He told them that the violence of the second shock had been so great, that it caused the rocks grind upon one another. His account was interrupted by a third shock, which, after an interval of four or five minutes, was succeeded by a fourth; and, about the same space of time after, by a fifth; none of which were so violent as the second. They heard, after every shock, a loud rumbling in the bowels of the earth, which continued about half a minute, gradually decreasing, or seeming to remove to a greater distance.

At Shireburn castle, Oxfordshire, at a little after ten in the morning, a very strange motion was observed in the water of a moat which encompasses the house. There was a pretty thick fog, not a breath of air, and the surface of the water all over the moat as smooth as a looking-glass, except at one corner, where it flowed into the shore, and retired again successively, in a surprising manner. In what manner it began to move is uncertain, as nobody observed the beginning of its motion. The flux and reflux, when seen, were quite regular. Every flood began gently; its velocity increased by degrees, when at last it rushed in with great impetuosity, till it had attained its full height. Having remained for a little time stationary, it then retired, ebbing gently at first, but afterwards sinking away with great swiftness. At every flux, the whole body of water seemed to be violently thrown against the bank; but neither during the time of the flux nor that of the reflux, did there appear even the least wrinkle of a wave on the other parts of the moat. Lord Viscount Parker, who had observed this motion, being desirous to know whether it was universal over the moat, sent a person to the other corner of it, at the same time that he himself stood about 25 yards from him, to examine whether the water moved there or not. He could perceive no motion there, or hardly any: but another, who went to the north-east corner of the moat, diagonally opposite to his lordship, found it as considerable there as where he was. His lordship imagining, that in all probability the water at the corner diagonally opposite to where he was would sink as that by him rose, he ordered the person to signify by calling out, when the water by him began to sink, and when to rise. This he did; but, to his lordship's great

Earth-
quake.

Earth-
quake.

great surprize, immediately after the water began to rise at his own end, he heard his voice calling that it began to rise with him also; and in the same manner he heard that it was sinking at his end, soon after he perceived it to sink by himself. A pond just below was agitated in a similar manner; but the risings and sinkings of it happened at different times from those at the pond where lord Parker stood.

At White Rock in Glamorganshire, about two hours ebb of the tide, and near three quarters after six in the evening, a vast quantity of water rushed up with a prodigious noise; floated two large vessels, the least of them above 200 tons; broke their moorings, drove them across the river, and had like to have overtaken them. The whole rise and fall of this extraordinary body of water did not last above ten minutes, nor was it felt in any other part of the river, so that it seemed to have gushed out of the earth at that place.

26
In Scot-
land.

At Loch Lomond in Scotland, about half an hour after nine in the morning, all of a sudden, without the least gust of wind, the water rose against its banks with great rapidity, but immediately subsided, till it was as low in appearance as any body then present had ever seen it in the greatest summer-drought. Instantly it returned towards the shore, and in five minutes time rose again as high as before. The agitation continued at the same rate till 15 minutes after ten the same morning; taking five minutes to rise, and as many to subside. From 15 minutes after 10 till 11, the height of every rise came somewhat short of that immediately preceding, taking five minutes to flow, and as many to ebb, till the water was entirely settled. The greatest perpendicular height of this swell was two feet four inches.

In Loch Nefs, about half an hour after nine, a very great agitation was observed in the water. About ten the river Oich, which runs on the north side of Fort Augustus, into the head of the loch, was observed to swell very much, and run upwards from the loch with a pretty high wave, about two or three feet higher than the ordinary surface. The motion of the wave was against the wind, and it proceeded rapidly for about 200 yards up the river. It then broke on a shallow, and flowed three or four feet on the banks, after which it returned gently to the loch. It continued ebbing and flowing in this manner for about an hour, without any such remarkable waves as the first; but about 11 o'clock, a wave higher than any of the rest came up, and broke with so much force on the low ground on the north side of the river, that it run up on the grafs upwards of 30 feet from the river's bank.

27
In Ireland.

At Cork, in Ireland, about 36 minutes after nine, shocks of an earthquake were plainly felt, at about half a minute's interval. At Kinsale, between two and three in the afternoon, the weather being very calm, and the tide near full, a large body of water suddenly poured into the harbour with such rapidity, that it broke the cables of two floops, each moored with two anchors, and of several boats lying between Sicily and the town. They were driven up and down the harbour with prodigious velocity. But, just at the time that a great deal of mischief was apprehended by all the vessels running foul of each other, an eddy whirled them round several times, and then hurried them back again with the same rapidity as before. This was se-

Earth-
quake.

veral times repeated; and while the current rushed up at one side of the harbour, it poured down with equal violence at the other. A vessel that lay all this time in the pool did not seem to be any ways affected by it; nor was the violence of the currents much perceived in the deeper parts of the harbour, but raged with most violence on the flats. The bottom of the harbour, which is muddy, was much altered; the mud being washed from some places, and deposited in others. The perpendicular rise of the water at one quay was measured, and found to be five feet and an half; and is said to have been much higher at another, where it overflowed, and poured into the market-place with such rapidity, that some people who were on the quay immediately ran off, and yet could not prevent themselves from being overtaken and innerfed knee-deep in the water. The agitations extended several miles up the river; but, as in the harbour, were most perceived in the shallowest places. The successive risings and fallings of the water continued about ten minutes, and then the tide returned to its natural course. Between six and seven in the evening, the water rose again, tho' not with so great violence as before, and it continued to ebb and flow alternately till three in the morning. The waters did not rise gradually at first; but, with a hollow and horrid noise, rushed in like a deluge, rising six or seven feet in a minute, and as suddenly subsiding. They were as thick as puddle, very black, and stank intolerably.—From different accounts it appeared, that the water was affected in a similar manner all along the coast to the westward of Kinsale.

29

In France, shocks were perceived in several places; In France as at Bayonne, Bourdeaux, and Lyons. Commotions of the waters also were observed at Angoulême, Blesville, Havre de Grace, &c. but not attended with the remarkable circumstances above-mentioned.

These are the most striking phenomena with which the earthquake of Nov. 1. 1755 was attended on the surface of the earth. Those which happened below ground cannot be known but by the changes observed in springs, &c. which were in many places very remarkable.—At Colares, on the afternoon of the 31st of October, the water of a fountain was greatly decreased: on the morning of the first of November it ran very muddy; and, after the earthquake, returned to its usual state both as to quantity and clearness. On the hills, numbers of rocks were split; and there were several rents in the ground, but none considerable. In some places where formerly there had been no water, springs burst forth, which continued to run.—Some of the largest mountains in Portugal were impetuously shaken as it were from their foundation; most of them opened at their summits, split and rent in a wonderful manner, and huge masses of them were thrown down into the subjacent valleys.—From the rock called *Pedra de Alvidar*, near the hill Fojo, a kind of parapet was broken off, which was thrown up from its foundation in the sea.—At Varge, on the river Macaas, at the time of the earthquake, many springs of water burst forth, some spouted to the height of 18 or 20 feet, throwing up sand of various colours, which remained on the ground. A mountainous point, seven or eight leagues from St Ubes, cleft asunder, and threw off several vast masses of rock.—In Barbary, a large hill was rent in two; the two halves fell different ways, and buried two large towns.

earth itself.

Earth-
quake.

towns. In another place, a mountain burst open, and a stream issued from it as red as blood. At Tangier, all the fountains were dried up, so that there was no water to be had till night.—A very remarkable change was observed on the medicinal waters of Toplitz, a village in Bohemia famous for its baths. These waters were discovered in the year 762; from which time the principal spring of them had constantly thrown out hot water in the same quantity, and of the same quality. On the morning of the earthquake, between 11 and 12 in the forenoon, the principal spring cast forth such a quantity of water, that in the space of half an hour all the baths ran over. About half an hour before this great increase of the water, the spring flowed turbid and muddy; then having stopped entirely for a minute, it broke forth again with prodigious violence, driving before it a considerable quantity of reddish ocher. After this it became clear, and flowed as pure as before. It still continues to do so; but the water is in greater quantity, and hotter, than before the earthquake. At Angoulême in France, a subterraneous noise like thunder was heard; and presently after, the earth opened, and discharged a torrent of water mixed with red sand. Most of the springs in the neighbourhood sunk in such a manner, that for some time they were thought to be quite dry. In Britain, no considerable alteration was observed in the earth, except that, near the lead mine abovementioned in Derbyshire, a cleft was observed about a foot deep, six inches wide, and 150 yards in length.

Effects of
the earth-
quake at
sea.

At sea, the shocks of this earthquake were felt most violently.—Off St Lucar, the captain of the Nancy frigate felt his ship so violently shaken, that he thought she had struck the ground; but, on heaving the lead, found he was in a great depth of water. Captain Clark from Denia, in Lat. 36. 24. between nine and ten in the morning, had his ship shaken and strained as if she had struck upon a rock, so that the seams of the deck opened, and the compass was overturned in the binnacle. The master of a vessel bound to the American islands, being in N. Lat. 25°, W. Long. 40°, and writing in his cabin, heard a violent noise, as he imagined, in the steerage; and while he was asking what the matter was, the ship was put into a strange agitation, and seemed as if he had been suddenly jerked up and suspended by a rope fastened to the mast-head. He immediately started up with great terror and astonishment; and looking out at the cabin-window, saw land, as he took it to be, at the distance of about a mile. But, coming upon the deck, the land was no more to be seen, but he perceived a violent current cross the ship's way to the leeward. In about a minute, this current returned with great impetuosity, and at a league's distance he saw three craggy-pointed rocks throwing up water of various colours resembling fire. This phenomenon, in about two minutes, ended in a black cloud, which ascended very heavily. After it had risen above the horizon, no rocks were to be seen; though the cloud, still ascending, was long visible, the weather being extremely clear.—Between nine and ten in the morning, another ship, 40 leagues west of St Vincent, was so strongly agitated, that the anchors, which were lashed, bounced up, and the men were thrown a foot and an half perpendicularly up from the deck. Immediately after this, the ship sunk in the water as

Earth-
quake.

low as the main chains. The lead shewed a great depth of water, and the line was tinged of a yellow colour and smelt of sulphur. The shock lasted about ten minutes, but they felt smaller ones for the space of 24 hours.

These are the phenomena which attended this most remarkable earthquake in many parts of the world. We have accounts of its effects over the space of 4,000,000 square miles, and undoubtedly it would be felt in a small degree much farther to the southward than we can have any account of.—To explain the phenomena of earthquakes, various hypotheses have been invented. Till lately, the hypothesis of the modern philosophers was much the same with that of the ancients. Anaxagoras supposed the cause of earthquakes to be subterraneous clouds bursting out into lightning, which shook the vaults that confined them. Others imagined, that the arches, which had been weakened by continual subterraneous fires, at length fell in: Others derived these accidents from the rarefied steam of waters, heated by some neighbouring fires; and some, among whom was Epicurus, and several of the Peripatetic school, ascribed these terrible accidents to the ignition of certain inflammable exhalations.

Hypothesis
concerning
the cause of
earth-
quakes.

This last hypothesis has been adopted by many of the most celebrated moderns, as Gassendus, Kircher, Schottus, Varenus, Des Cartes, Du Hamel, Honorius Fabri, &c. The philosopher last mentioned indeed supposed, that waters prodigiously rarefied by heat might sometimes occasion earthquakes. The others supposed, as their hypothesis necessarily requires, that there are many and vast cavities underground which have a communication with one another; some of which abound with waters; others with vapours and exhalations, arising from inflammable substances, as nitre, bitumen, sulphur, &c. These combustible exhalations they supposed to be kindled by a subterraneous spark, or by some active flame gliding through a narrow fissure from without, or by the fermentation of some mixture; and when this happened, they must necessarily produce pulses, tremors, and ruptures at the surface, according to the number and diversity of the cavities, and the quantity and activity of the inflammable matter. This hypothesis is illustrated by a variety of experiments, such as mixtures of iron-slings and brimstone buried in the earth, gun-powder confined in pits, &c. by all which a shaking of the earth will be produced.

Dr Woodward suggests another hypothesis. He supposes that the subterraneous heat or fire, which is continually elevating water out of the abyss, which, according to him, occupies the centre of the earth, to furnish rain, dew, springs, and rivers, may be stopped in some particular part. When this obstruction happens, the heat causes a great swelling and commotion in the waters of the abyss: and at the same time, making the like effort against the superincumbent earth, that agitation and concussion of it is occasioned which we call an earthquake.

Mr Amontons of the Royal Academy of Sciences suggests an hypothesis entirely different from any of the abovementioned ones. According to the received philosophical principles, which suppose the atmosphere to be about 45 miles high, and that the den-

Woodward.Hypothesis
of Mr A.

Earth-
quake.Earth-
quake.

ty of the air increases in proportion to the absolute height of the superincumbent column of fluid; it is shewn, that at the depth of 43,528 fathoms below the surface of the earth, air is but one fourth lighter than mercury. Now, this depth of 43,528 fathoms is only a 74th part of the semi-diameter of the earth. And the vast sphere beyond this depth, in diameter 6,451,538 fathoms, may probably be only filled with air; which will be here greatly condensed, and much heavier than the heaviest bodies we know of in nature. But it is found by experiment, that the more air is compressed, the more does the same degree of heat increase its spring, and the more capable does it render it of a violent effect; and that, for instance, the degree of heat of boiling water increases the spring of the air above what it has in its natural state, in our climate, by a quantity equal to a third of the weight wherewith it is pressed. Whence we may conclude, that a degree of heat, which on the surface of the earth will only have a moderate effect, may be capable of a very violent one below. And as we are assured, that there are in nature degrees of heat much more considerable than that of boiling water, it is very possible there may be some, whose violence, further assisted by the exceeding weight of the air, may be more than sufficient to break and overturn this solid orb of 43,528 fathoms; whose weight, compared to that of the included air, would be but a trifle.

34
All these
hypotheses
rejected by
Dr Stukely.

Though none of these hypotheses were sufficient for explaining the phenomena of earthquakes in a satisfactory manner, one or other of them continued to be adopted by almost all philosophers, till the year 1749. In the month of March that year, an earthquake was felt at London and several other places in Britain. Dr Stukely, who had been much engaged in electrical experiments, began to suspect that phenomena of this kind ought to be attributed not to vapours or fermentations generated in the bowels of the earth, but to electricity. In a paper published by him on this subject, he rejects all the above-mentioned hypotheses for the following reasons.

1. That there is no evidence of any remarkable cavernous structure of the earth; but that, on the contrary, there is rather reason to presume that it is in a great measure solid, so as to leave little room for internal changes and fermentations within its substance; nor do coal-pits, he says, when on fire, ever produce any thing resembling an earthquake.

2. In the earthquake at London, in March 1749, there was no such thing as fire, vapour, smoke, smell, or an eruption of any kind observed, though the shock affected a circuit of 30 miles in diameter. This consideration alone of the extent of surface shaken by an earthquake, he thought sufficient to overthrow the supposition of its being owing to the expansion of any subterraneous vapours. For as small fire-balls bursting in the air propagate a sulphureous smell to the distance of several miles, it cannot be supposed, that so immense a force acting instantaneously on that compass of ground should never break the surface of it, nor become discoverable either to the sight or the smell: besides, that the operation of such a fermentation would be many days in continuance, and the evaporation of so much inflammable matter would require a long space of time. That such an effect, therefore, should be produced in-

stantaneously, can be accounted for by electricity only; which acknowledges no sensible transition of time, no bounds.

3. If vapours, and subterraneous fermentations, explosions, and eruptions, were the cause of earthquakes, they would absolutely ruin the whole system of springs and fountains, wherever they had once been; which is contrary to fact, even when they have been frequently repeated. Even in the earthquake in Asia Minor, A. D. 17, which destroyed 13 great cities, and shook a mass of earth 300 miles in diameter, nothing suffered but the cities; neither the springs nor the face of the country being injured, which indeed remains the same to this day.

4. That any subterraneous power sufficient to move 30 miles in diameter, as in the earthquake which happened at London, must be lodged at least 15 or 20 miles below the surface; and therefore must move an inverted cone of solid earth, the base of which is 30 miles in diameter, and the axis 15 or 20; an effect impossible to any natural power whatever, except electricity. So in Asia Minor, such a cone must have been 300 miles in the diameter of the base, and 200 in the axis; which not all the gun-powder that has been made since the invention of it, much less any vapours generated so far below the surface, could possibly effect.

5. A subterraneous explosion will not account for the manner in which ships, far from land, are affected during an earthquake: which seem as if they struck upon a rock, or as if something thumped against their bottoms. Even the fishes are affected. A subterraneous explosion could only produce a gradual swell, and not give so quick an impulse to the water as would make it feel like a stone.

From comparing these circumstances, the Doctor says, he had always thought that an earthquake was a shock of the same kind as those which commonly occur in electrical experiments. And this hypothesis was confirmed by the phenomena attending earthquakes; particularly those of 1749 and 1750, which gave rise to his publication.

The weather, for five or six months before, had been uncommonly warm; the wind south and south-west, without rain; so that the earth must have been in a state peculiarly ready for an electrical shock. The flat country of Lincolnshire had been under an exceeding great drought. The uncommonness of the first of these circumstances, he remarks, is the reason why earthquakes are less frequently experienced in the northern than in the southern regions of the world, where the warmth and dryness of the air, so necessary to electricity, are more usual: And the latter shows how fit the dry surface was for an electrical vibration; and (which is of great importance) that earthquakes reach but little below the surface of the earth.

Before the earthquake at London, all vegetables had been uncommonly forward. And electricity is well known to quicken vegetation. The aurora borealis had been frequent about that time; and, just before the earthquake, had been twice repeated in such colours as had never been seen before. It had also removed southerly, contrary to what is common in England; so that the Italians, and those among whom earthquakes were frequent, actually foretold the earthquake. The year had been remarkable for fire-balls,

light-

od of account-
ing for
earth-
quakes.

Earth-quake.

lightning, and coruscations; and these are rightly judged to be meteors of an electrical nature.

In these circumstances of the earth and air, nothing, he says, is wanting to produce an earthquake, but the touch of some non-electric body; which must necessarily be had *ab extra*, from the region of the air or atmosphere. Hence he infers, that, if a non-electric cloud discharge its contents upon any part of the earth, in that highly electrical state, an earthquake must necessarily ensue. As the discharge from an excited tube produces a commotion in the human body, so the discharge of electric matter from the compass of many miles of solid earth, must needs be an earthquake; and the snap from the contact, the horrid uncouth noise attending it.

The Doctor had been informed, by those who were up and abroad the night preceding the earthquake, and early in the morning, that coruscations in the air were extremely frequent; and that a little before the earthquake, a large and black cloud suddenly covered the atmosphere, which probably occasioned the shock by the discharge of a shower.

A sound was observed to roll from the Thames towards Temple Bar before the houses ceased to nod, just as the electrical snap precedes the shock. This noise (which generally precedes earthquakes) the Doctor thought could be accounted for only on electrical principles: for, in a subterraneous eruption, the direct contrary would happen.

The flames and sulphureous smells, which are sometimes observed in earthquakes, might, he thought, be more easily accounted for, on the supposition of their being electrical phenomena, than from their being occasioned by eruptions from the bowels of the earth.

So also the suddenness and expedition of the concussion, it being felt at the same instant over a surface of 4000 square miles; and the little damage also which earthquakes generally occasion; sufficiently point out what sort of a motion it is: not a convulsion of the bowels of the earth; but an uniform vibration along its surface, like that of a musical string or a glass when rubbed on the edge with one's finger.

The circumstance of earthquakes chiefly affecting the sea-coast, places along rivers, (and, adds Doctor Priestley, eminences) is a farther argument of their being electrical phenomena. This is illustrated by a particular account of the direction in which the earthquake was conveyed.

The last argument he uses is taken from the effects which it had on persons of weak constitutions, who were, for a day or two after it happened, troubled with pains in the back, rheumatisms, hysterics, and nervous disorders; just in the same manner as they would have been after an actual electrification: to some these disorders proved fatal.

As to the manner in which the earth and atmosphere are put into this state, which prepares them to receive such a shock, and whence the electric matter comes, the Doctor does not pretend to determine; but thinks it as difficult to be accounted for, as magnetism, gravitation, and many other secrets of nature.

The same hypothesis was advanced by Signior Beccaria, without knowing any thing of Doctor Stukeley's discoveries. But this learned Italian imagined the electric matter which occasions earthquakes, to be

lodged deep in the bowels of the earth, agreeably to his hypothesis concerning lightning.

Now, as it appears that the quantity of electric matter in the simplest thunder-forms is so inconceivably great, that it is impossible to be contained by any cloud or number of clouds; and as, during the progress of a thunder-form which he observed, though the lightning frequently struck to the earth, the same clouds were the next moment ready to make a still greater discharge; it was evident, that they must have received at one place, the moment a discharge was made from them in another. Let us suppose these clouds ever so great, if the lightning proceeded only from them, the quantity must be lessened by every discharge; and no recruits that any new clouds might bring can bear any proportion to the discharge which must ensue from the collision of so great a number as combine to form a thunder-form. It seems therefore most likely, that the electric matter is continually darting from the clouds in one place, at the same time that it is discharged from the earth in another; and, consequently, that the clouds serve as conductors to convey the electric fluid from those places of the earth which are overloaded with it, to those which are exhausted.

This theory being admitted, there will, he thinks, be little difficulty in attributing earthquakes to the same cause. For if the equilibrium of the electric matter be by any means lost in the bowels of the earth; so that the best method of restoring it shall be by the fluid bursting into the air, and traversing several miles of the atmosphere, to come at the place where it is wanted; it may be easily imagined, that violent concussions will be given to the earth by the sudden passage of so powerful an agent. This, in his opinion, was confirmed by the flashes of light, exactly resembling lightning, which have been frequently seen to rush from the top of Mount Vesuvius, at the time that ashes and other light matters have been carried out of it into the air, and dispersed uniformly over a large tract of country. And it is well known, that volcanoes have a near connexion with earthquakes.

A rumbling noise like thunder, and flashes of light rising from the ground, have been generally observed to attend earthquakes. And lightning itself has been known to be attended with small shakings of the earth. So also *ignes fatui*, in mines, he looked upon as an argument that the electric fluid was sometimes collected in the bowels of the earth.

Dr Priestley, in his *Hist. of Electricity*, observes upon these theories, that a more probable hypothesis may perhaps be formed out of both of them. "Suppose (says he) "the electric matter to be, some way or other, accumulated on one part of the surface of the earth, and, "on account of the dryness of the season, not easily to "diffuse itself; it may, as Signior Beccaria supposes, "force its way into the higher regions of the air, "forming clouds in its passage, out of the vapours "which float in the atmosphere, and occasion a sudden "shower, which may further promote the passage "of the fluid. The whole surface, thus unloaded, will "receive a concussion, like any other conducting substance, on parting with, or receiving, a quantity of "the electric fluid. The rushing noise will likewise "sweep over the whole extent of the country. And, "upon this supposition also, the fluid, in its discharge

Earth-quake.

37
Of Dr Priestley.36
Hypothesis
of S. Beccaria.

Earth-quake.

"from the country, will naturally follow the course of the rivers, and also take the advantage of any eminences to facilitate its ascent into the higher regions of the air."

The Doctor, making experiments with a battery on the passage of the electrical fluid over different conducting substances, and, among these, over water;—and remarking a resemblance between its passage over the surface of the water, and that which Doctor Stukeley supposed to sweep the surface of the earth, when a considerable quantity of it is discharged to the clouds during an earthquake; immediately suspected that the water over which it passed, and which was visibly thrown into a tremulous motion, must receive a concussion resembling that which is given to the waves of the sea on such an occasion.

To try this, he himself and others present put their hands into the water at the time that the electrical flash passed over its surface; and they felt a sudden concussion given to them, exactly like that which is supposed to affect ships at sea during an earthquake. This percussion was felt in various parts of the water, but was strongest near the place where the explosion was made. The same experiment, with a little variation, being afterwards made with a single jar, at some distance below the surface of the water, produced the like effect, though in a weaker degree. "This similarity in the effect," the Doctor observes, "is a considerable evidence of a similarity in the cause."

"Pleased with this resemblance of the earthquake, (says he) I endeavoured to imitate that great natural phenomenon in other respects: and, it being frosty weather, I took a plate of ice, and placed two sticks, about three inches high, on their ends, so that they would just stand with ease; and upon another part of the ice, I placed a bottle, from the cork of which was suspended a brass ball with a fine thread. Then, making the electrical flash pass over the surface of the ice, which it did with a very loud report, the nearer pillar fell down, while the more remote stood; and the ball, which had hung nearly still, immediately began to make vibrations about an inch in length, and nearly in a right line from the place of the flash."

"I afterwards diversified this apparatus, erecting more pillars, and suspending more pendulums, &c. sometimes upon bladders stretched on the mouth of open vessels, and at other times on wet boards swimming in a vessel of water. This last method seemed to answer the best of any: for the board representing the earth, and the water the sea, the phenomena of them both during an earthquake may be imitated at the same time; pillars, &c. being erected on the board, and the electric flash being made to pass either over the board, over the water, or over them both."

Deficiency of all these hypotheses. These three hypotheses concerning the cause of earthquakes, tho' somewhat differing from one another, yet agree in the main; but, if a particular solution of the phenomena is required, every one of them will be found deficient.

If, according to Dr Stukeley's hypothesis, the electric matter is lodged only on the surface of the earth, or but at a small depth below; how are we to account for those violent effects which often take place in the

bowels of the earth. In the earthquake at Lisbon, a large quay sunk to an unfathomable depth. We are certain, that the cause of the earthquake must have been below this depth however great it was, and have opened the earth for an immense way downwards. At the same time an hill in Barbary clave asunder, and the two halves of it fell different ways. This shews, that the cause of the earthquake operated not on the surface of the hill, but on the solid foundation and contents of it; nor can it be explained by any superficial action whatever. From what the miners at Eyam bridge in Derbyshire observed, it is also evident, that the shock was felt at the depth of 396 feet below the surface of the ground more than at the surface itself; and consequently there is all the reason in the world to think that the cause lay at a depth vastly greater.

Again, tho' the earthquake at London was supposed to begin with a black cloud and shower; yet in that of 1755, the effects of which were incomparably greater, the air was calm and serene almost in every place where it was felt. It doth not appear that there is at any time a considerable difference between the electricity of the atmosphere and that of the earth, or indeed that there can be so. For, if the earth is electrified *plus*, and the atmosphere *minus*, there are innumerable points on the surface of the earth which must be imperceptibly drawing off the superfluous electric matter into the air. The vapours also, with which the atmosphere abounds, would always be ready in the same service; and thus thunder and lightning might indeed sometimes be produced, but not earthquakes. But lastly, neither the air nor the earth does always show any remarkable signs of electricity before earthquakes happen. For, the summer before the earthquake at Manchester in 1777, there had scarce been any thunder, lightning, or other signs of electricity in the atmosphere, and vegetation had been extremely backward; and, according to the best accounts, the weather continued remarkably fine.

For these reasons, Dr Stukeley's hypothesis seems not to be satisfactory. That of Signior Beccaria is not indeed liable to the above-mentioned objections; but seems highly improbable, on another account. The atmosphere is known to be a substance through which the electric matter makes its way with the utmost difficulty. It is a vastly worse conductor than water, or than moist earth. If therefore the equilibrium of this fluid is lost in the bowels of the earth, it is impossible to give a reason why it should not rather go to the places where it is wanted through the earth itself, than through the atmosphere. Besides, if this was the case, the shock of an earthquake could only be felt at those places where the electric fluid issued from the earth, and where it entered. All the intermediate places ought to be free from any shock, and to be sensible only of a violent concussion in the atmosphere; but of this we have no example in any history of earthquakes whatever.

Dr Priestley's hypothesis is liable to the same objections with that of Dr Stukeley; for any superficial operation will never account for those effects above mentioned, which take take at great depths below the surface. His experiment cannot be admitted as any way conclusive with regard to the cause of earthquakes, because no quantity of electric fire is seen to pass

Earth-quake.

pass over the earth and sea, like the flash attending the explosion of an electric battery; and the force of his earthquake, (being but just able to throw down a tick that could hardly stand by itself) seems by far too little. The utmost force of electricity which man can raise, is indeed very trifling, when compared with the great operations of nature: but it is certain, that the force of an electric battery is by no means contemptible; and was its whole power to be employed in producing an imitation of an earthquake, it certainly would do much more than throw down a small tick. The bad success of this experiment therefore shows, that the Doctor's theory is erroneous: for, almost the whole of his electric power was spent another way; and we cannot suppose, that any considerable part of the force which produces earthquakes is spent any other way than in the very production of the earthquake itself.

If it is attempted to give an explanation of the phenomena of earthquakes, which shall be free from the objections abovementioned, and from all others, it will be necessary, in the first place, to consider those parts of the system of nature which seem to be most affected during the terrible phenomena we treat of. These parts are, the air, the solid earth, and the water. Of these the two former are electric *per se*; the latter is a conductor, though a bad one *. Hence it follows,

1. That in proportion to the quantity of earth which is mixed with any quantity of water, that mixture will approach nearer to the nature of an electric *per se*, and *vice versa*.

2. It also follows, that whatever quantity of electricity is communicated to the solid earth, will be quickly taken off from it by the water which is mixed with it, in the same manner that the electric matter is carried off from an excited globe by a metallic conductor.

3. The whole earth is moist, and therefore in some degree a conductor. Nevertheless, as earth of all kinds, when perfectly dry, is found to be an electric capable of receiving a charge like glass, it is therefore possible, that the electric power of the earth may be excited to such a degree, that the moisture of the solid parts cannot easily contain the quantity of electricity communicated.

4. In this case, the earth must either give undoubted signs of its being excited in the same manner that other excited electrics do, or the electricity must be discharged somewhere else.

5. To receive any superfluous quantity of electric matter that may be communicated to the solid earth, the waters of the ocean are always ready. These, being a much better conductor than earth, must be a principal mean of preserving the equilibrium of electricity in the different parts of the earth; and hence we see a natural reason why the waters of the ocean should cover so large a proportion of the globe as they are known to do. See OCEAN.

6. It is known, that fire is also a conductor of electricity. Therefore, wherever a quantity of electric matter is collected in any part of the solid earth, if it can neither be conveniently received by the moisture which the earth naturally contains, nor by the ocean in its neighbourhood, it will discharge itself by any volcano that happens to be in an active state, near the place where that collection of electric matter is.

7. It is also found, that the electric fluid, being violently resisted by the superincumbent atmosphere, hath always a tendency to discharge itself in those places where that resistance is least. The tops of very high mountains, therefore, where the weight of the atmosphere is greatly diminished, will also afford a ready passage for the electric fluid when it is collected in very great quantity in the bowels of the earth.

8. If, from some natural causes, the electric matter shall happen to be collected in the bowels of the earth in any particular place; and at the same time such obstacles are thrown in its way, that it can neither discharge itself into the ocean, nor into the atmosphere, by the tops of high mountains, nor by the more open passages of volcanoes; the most terrible consequences must ensue: the matter being pent up, and the cause by which it is collected continuing still to act, its impulse becomes at last irresistible. It then flies against every obstacle with inconceivable violence. It breaks out in all those places where there is the least resistance, and therefore the shock is directed a great number of different ways at once. Houses, steeples, trees, &c. by their height take off somewhat of the pressure of the atmosphere; and therefore the electric matter flies against them very violently. The houses and other buildings being bad conductors, are thrown down; the trees affording a readier passage to the fluid are not hurt, though even they also are sometimes split. The height of the mountains renders them the objects of the destructive force of this fluid much more than any buildings whatever. Hence they are often rent, and rocks thrown down from them. The water contained in the solid parts of the earth, being a conductor of electricity, becomes overloaded with it; and, when it can receive no more, is forced to yield to the impulse of the rest, and therefore is thrown out of the earth in great quantities. For the same reason, the waters on the surface of the earth are most violently agitated. The small quantities contained in wells are thrown out at the tops of them: The rivers and lakes, which contain too great a quantity of water to be thrown off from the earth, rise in billows: The ocean itself, receiving more electric matter than can immediately be dispersed through the whole body of water, or evaporate into the atmosphere, retreats from the land, and is raised in vast mountains. The solid earth itself, being unable either to conduct the fluid quietly to those parts where it is wanted, or to retain it, is violently shaken, or rent in multitudes of places; and this not only on the surface, but to great depths. The electricity being now in some measure discharged from the earth, the ocean rushes forward with fury to discharge in its turn the excess of electric matter it just before received from the earth. If there are volcanoes in the neighbourhood, the violent discharge of electricity is sure to manifest itself by setting them in a flame; and thus, till the equilibrium is restored, all nature seems to be threatened with dissolution.—Even in those places where the force of the electric fluid is not able to shake the solid parts of the earth, it manifests its power by agitating the waters in the manner above described. Water being a much better conductor of electricity than earth, this subtle fluid, as soon as it can get out from the solid earth, flies to the water. The consequence is, that the water immediately swells up, and

Earth-quake.

and is attracted by whatever part of the earth has less electricity than itself. Hence those strange irregular motions of the waters in different places, so particularly observed at the time of the earthquake at Lisbon; and which it seems impossible to account for from any other cause than an immediate discharge of electric matter from the earth into them.

9. As it is impossible that any part of the earth can be electrified without communicating a proportionable share of electricity to the animals that live upon it, and have a constant communication with it, it thence follows, that there can be no considerable commotion in the electric matter lodged in the bowels of the earth, without affecting that which is contained in the bodies of the animals. Hence the brutes, who seem to be more sensible of such commotions than we, run about, and shew signs of fear, before the earthquake comes on; and hence the giddiness, sickness, &c. which the human race are subject to during the time of the shock, even though they do not feel it, as was the case at Gibraltar.

10. As the atmosphere hath a communication with the earth, it is scarce to be supposed that the earth can, for any length of time, contain a considerable quantity of electric matter, without communicating to the atmosphere a proportionable quantity. Before an earthquake, therefore, we must suppose the electricity of the earth and air to be in perfect equilibrio. Hence the weather is serene, there is no wind, nor any other sign in the atmosphere, of the terrible catastrophe that is about to ensue. But the moment the discharge is made from the earth, the equilibrium between the terrestrial and atmospherical electricity is broken; the air either begins to receive the fluid from the earth, or the earth from the air. As there is not then time for the collection of thunder-clouds by which the electricity may be brought down in sudden flashes of lightning, the fluid breaks through the substance of the air itself with dismal and horrid noises, which always accompany an earthquake. That this is the case, seems highly probable from an experiment of M. de Romas, when, having brought down a vast quantity of electric matter from the clouds by means of a kite, he heard the noise it made in the air, like the continual blowing of a small forge bellows. In general, there is a considerable change of weather takes place at the time of an earthquake, tho' not always. In the earthquake which happened in England in 1777, there was no remarkable change of weather there; but, soon after, there was a great deal of thunder and lightning in the southern parts of Scotland: which seems to indicate, that the electric fluid discharged from the earth in England had taken its course northward, and produced the phenomena before mentioned in Scotland.

33
Ultimate
cause of all
the pheno-
mena.

Having thus explained all the phenomena attending earthquakes, it remains only to shew by what means the equilibrium of electricity can be broken in the bowels of the earth in such a manner as to produce these phenomena. The ultimate cause of this is mentioned under the article *AURORA BOREALIS*, n° 5. It is there shown, that the warmth of the sun must necessarily bring down to the earth much greater quantities of electric matter in the regions within the tropics, than in the northern and southern climates. It is impossible,

Earth-quake.

as is there also observed, that there can be a perpetual accumulation of electricity in one part of the earth, unless there is a passage for it into the atmosphere through some other. Hence, if the electric matter descends from the air into one place of the earth, it must necessarily ascend from the earth into the air in some other place. There must be therefore a continual current of electricity through the bowels of the earth, beginning at the equator, and extending northward and southward to both poles. While this current has a free passage from the earth in the northern and southern regions, every thing goes on quietly; and whatever storms may happen in the atmosphere, the solid earth cannot be affected. Innumerable circumstances, however, may tend to hinder this discharge, and consequently to accumulate the electric matter in particular places. One very obvious cause of this kind, is an excessive frost taking place in any part of the earth whence the electric matter was wont to be discharged. This renders the air itself so electric, that it cannot receive the fluid; at the same time that the water on the surface of the earth, being hard frozen, becomes electric also, and incapable of conducting. Very dry seasons likewise contribute to produce the same effect; and thus the accumulation of electricity in the warmer climates becomes prodigiously great.

It must here be observed, that, with regard to the operations of nature, we cannot always reason analogically from our electric experiments.—If a quantity of electricity is collected in any substance by artificial means, that quantity is taken off in a moment by the touch of any metallic substance, or other good conductor. As the whole earth, therefore, is filled with a conducting substance, namely water, it may very naturally be asked, Why does not the superfluous quantity of electric matter collected in one place, immediately disperse itself through all other parts of the earth by means of the water with which it abounds?—To obviate this difficulty, however, it needs only be remembered, that as the earth is quite full of electric matter all round, no quantity can enter any particular part, without being resisted by the rest which is diffused through the whole globe. This resistance will be proportioned to the facility with which it can escape at other places; and this it never can do, unless the earth is in a proper condition for emitting, and the atmosphere for receiving, it. The pressure, therefore, upon the accumulated quantity of electric matter soon becomes exceedingly great, and its disposition to burst out with violence is every day increased. At last, as the sun still continues to occasion the descent of more and more of the electric fluid, that particular part of the earth becomes fully charged. The consequence of this is, that the waters of fountains become foul; the electric matter being lodged in great quantity in the water, forces it into unusual agitations, by which the earth is mixed with it. The ocean, for the same reason, is raised in huge billows, &c.; and these appearances prognosticate the shock, in the same manner that slight flashes from the knob of an electrified bottle pronounce a discharge of all the electricity contained in it.

Besides the earthquakes above described, whose cause seems to depend entirely on a collection of electric matter in the bowels of the earth, there are others frequently felt in the neighbourhood of volcanoes, which

which are plainly owing to the efforts of the burning matter to discharge itself. These, however, are but slight, and seldom extend to any considerable distance from the burning mountain. For a particular account of them, see the article *VOLCANO*.

EASEL, PIECES, a denomination given by painters to such pieces as are contained in frames, in contradistinction from those painted on ceilings, &c.

EASEMENT, in law, a privilege or convenience which one neighbour has of another, whether by charter or prescription, without profit: such are a way through his lands, a sink, or the like. These, in many cases, may be claimed.

EASING, in the sea-language, signifies the slackening a rope, or the like: thus, to ease the bow-line or sheet, is to let them go slack; to ease the helm, is to let the ship go more large, more before the wind, or more larboard.

EAST, one of the four cardinal points of the world; being that point of the horizon, where the sun is seen to rise when in the equinoctial.

EASTER, a festival of the Christian church, observed in memory of our Saviour's resurrection.

The Greeks call it *pascha*, the Latins *pascha*, an Hebrew word signifying *passage*, applied to the Jewish feast of the passover. It is called *easter* in English, from the goddess Eostre, worshipped by the Saxons with peculiar ceremonies in the month of April.

The Asiatic churches kept their easter upon the very same day the Jews observed their passover; and others, on the first Sunday after the first full moon in the new year. This controversy was determined in the council of Nice; when it was ordained, that easter should be kept upon one and the same day, which should always be a Sunday, in all Christian churches in the world. For the method of finding easter by calculation, see *ASTRONOMY*, n° 308.

EASTER Island, an island in the South Sea, lying in N. Lat. 27. 5. W. Long. 109. 46. It is thought to have been first discovered in 1686 by one DAVIS an Englishman, who called it Davis's Land. It was next visited by Commodore Roggewein, a Dutchman, in 1722; who gave it the name of *Easter Island*, and published many fabulous accounts concerning the country and its inhabitants. It was also visited by a Spanish ship in 1770, the captain of which gave it the name of *St Carlos*. The only authentic accounts of this island, however, which have yet appeared, are those published by Captain Cook and Mr Forster, who visited it in the month of March 1774.—According to these accounts, the island is about 10 or 12 leagues in circumference, and of a triangular figure; its greatest length from north-west to south-east is about four leagues, and its greatest breadth two. The hills are so high, that they may be seen at the distance of 15 or 16 leagues. The north and east points of the island are of a considerable height; between them, on the south-east side, the shore forms an open bay, in which Captain Cook thinks the Dutch anchored in 1722. He himself anchored on the west side of the island, three miles northward from the fourth point. This, he says, is a good road with easterly winds; but a dangerous one when the wind blows from the contrary quarter, as the other on the south-east side must be with easterly winds: so that there is no good accommodation to be had for

shipping round the whole island.

The island itself is extremely barren; and bears evident marks not only of a volcanic origin, but of having been not very long ago entirely ruined by an eruption. As they approached the fourth point, Mr Forster informs us, that they observed the shore to rise perpendicularly. It consisted of broken rocks, whose cavernous appearance, and black or ferruginous colour, seemed to indicate that they had been thrown up by subterraneous fire. Two detached rocks lie about a quarter of a mile off this point: one of them is singular on account of its shape, and represents a huge column or obelisk; and both these rocks were inhabited by multitudes of sea-fowls. On landing and walking into the country, they found the ground covered with rocks and stones of all sizes, which appeared to have been exposed to a great fire, where they seemed to have acquired a black colour and porous texture. Two or three shrivelled species of grasses grew among these stones, and in some measure softened the desolate appearance of the country. The farther they advanced, the more ruinous the face of the country seemed to be. The roads were intolerably rugged, and filled with heaps of volcanic stones, among which the Europeans could not make their way but with the greatest difficulty; but the natives leaped from one stone to another with surprising agility and ease. As they went northward along the island, they found the ground hill of the same nature; till at last they met with a large rock of black melted lava, which seemed to contain some iron, and on which was neither soil nor grass, nor any mark of vegetation. Notwithstanding this general barrenness, however, there are several large tracts covered with cultivated soil, which produces potatoes of a gold yellow colour, as sweet as carrots, plantains, and sugar-canes. The soil is a dry hard clay; and the inhabitants use the grass which grows between the stones in other parts of the island as a manure, and for preserving their vegetables when young, from the heat of the sun.

The most remarkable curiosity belonging to this island is, a number of Colossal statues; of which, however, very few remain entire. These statues are placed only on the sea-coast. On the east side of the island were seen the ruins of three platforms of stonework, on each of which had stood four of these large statues; but they were all fallen down from two of them, and one from the third: they were broken or defaced by the fall. Mr Wales measured one that had fallen, which was 15 feet in length, and six broad over the shoulders: each statue had on its head a large cylindric stone of a red colour, wrought perfectly round. Others were found that measured near 27 feet, and upwards of eight feet over the shoulders; and a still larger one was seen standing, the shade of which was sufficient to shelter all the party, consisting of near 30 persons, from the rays of the sun. The workmanship is rude, but not bad, nor are the features of the face ill formed; the ears are long, according to the distortion practised in the country, and the bodies have hardly any thing of a human figure about them. How these islanders, wholly unacquainted with any mechanical power, could raise such stupendous figures, and afterwards place the large cylindric stones upon their heads, is truly wonderful! The most probable conjecture seems to be, that the stone is facitious; and that each

EsAes.

each figure was gradually erected, by forming a temporary platform round it, and raising it as the work advanced: but they are at any rate very strong proofs of the ingenuity and perseverance of the islanders in the age when they were built, as well as that the ancestors of the present race had seen better days than their descendants enjoy. The water of this island is in general brackish, there being only one well that is perfectly fresh, which is at the east end of the island: and whenever the natives repair to it to slake their thirst, they wash themselves all over; and if there is a large company, the first leaps into the middle of the hole, drinks, and washes himself without ceremony; after which another takes his place, and so on in succession. This custom was much disapproved by their new friends, who stood greatly in need of this valuable article, and did not wish to have it contaminated by such ablutions.

The people are of a middle size. In general, they are rather thin; go entirely naked; and have punctures on their bodies, a custom common to all the inhabitants of the South-Sea Islands. Their greatest singularity is the size of their ears, the lobe of which is stretched out so that it almost rests on their shoulder; and is pierced with a very large hole, capable of admitting four or five fingers with ease. The chief ornaments for their ears are the white down of feathers and rings which they wear in the inside of the hole, made of the leaf of the sugar-cane, which is very elastic, and for this purpose is rolled up like a watch-spring. Some were seen clothed in the same cloth used in the island of Otaheite, tinged of a bright orange-colour with turmeric; and these our voyagers supposed to be chiefs. Their colour is a chestnut-brown; their hair black, curling, and remarkably strong; and that on the head as well as the face is cut short. The women are small, and slender-limbed: they have punctures on the face, resembling the patches sometimes used by European ladies; they paint their face all over with a reddish brown ruddle, and above this they lay a fine orange-colour extracted from turmeric-root; the whole is then variegated with streaks of white shell-lime. But the most surprising circumstance of all with regard to these people, is the apparent scarcity of women among them. The nicest calculation that could be made, never brought the number of inhabitants in this island to above 700, and of these the females bore no proportion in number to the males. Either they have but few females; or else their women were restrained from appearing during the stay of the ship, notwithstanding, the men shewed no signs of a jealous disposition, or the women any scruples of appearing in public: in fact, they seemed to be neither reserved nor chaste; and the large pointed cap which they wore, gave them the appearance of professed wantons: but as all the women who were seen were liberal of their favours, it is more than probable, that all the married and modest ones had concealed themselves from their impetuous visitors, in some inscrutable parts of the island; and what further strengthens this supposition is, that heaps of stones were seen piled up into little hillocks, which had one steep perpendicular side, where a hole went under ground. The space within, says Mr Forster, could be but small; and yet it is probable, that these cavities served, together with their miserable huts, to give shel-

ter to the people at night; and they may communicate with natural caverns, which are very common in the lava currents of volcanic countries. The few women that appeared, were the most lascivious of their sex that perhaps have been ever noticed in any country, and shame seemed to be entirely unknown to them.

EATON, a town of Buckinghamshire, situated on the north side of the Thames, opposite to Windsor, and famous for its collegiate school, founded by king Henry VI. being a seminary for king's college Cambridge, the fellows of which are all from this school.

EAU DE CARMES. See PHARMACY, n° 571.

EAU DE LUCE. See CHEMISTRY, n° 335. and PHARMACY, n° 671.

EAVES, in architecture, the margin or edge of the roof of an house; being the lowest tiles, slates, or the like, that hang over the walls, to throw off water to a distance from the wall.

EAVES-DROPPERS, are such persons as stand under the eaves, or walls, and windows of a house, by night or day, to hearken after news, and carry it to others, and thereby cause strife and contention in the neighbourhood. They are called *evil members of the commonwealth*, by the stat. of West. 1. c. 33. They may be punished, either in the court-leet, by way of presentment and fine; or in the quarter-sessions, by indictment, and binding to good behaviour.

EBBING of the TIDES. See TIDE.

EBDOMARIUS, in ecclesiastical writers, an officer formerly appointed weekly to superintend the performance of divine service in cathedrals, and prescribe the duties of each person attending in the choir, as to reading, singing, praying, &c.

EBENUS, the EBONY-TREE; a genus of the decandria order, belonging to the diadelphia class of plants. There is but one species, the cretica, a native of the island of Crete, and some others in the Archipelago. It rises with a shrubby stalk three or four feet high; which puts out several side-branches garnished with hoary leaves at each joint, composed of five narrow spear-shaped lobes, which join at their tails to the footstalk, and spread out like the fingers of a hand. The branches are terminated by thick spikes of large purple flowers, which are of the butterfly or peabloom kind. The plants may be propagated from seeds sown in the autumn. In this country, the plants must be protected during the winter, as they are unable to bear the cold.

EBION, the author of the heresy of the EBIONITES, was a disciple of Cerinthus, and his successor. He improved upon the errors of his master, and added to them new opinions of his own. He began his preaching in Judea: he taught in Asia, and even at Rome: his tenets infected the isle of Cyprus. St John opposed both Cerinthus and Ebion in Asia; and it is thought, that this apostle wrote his gospel, in the year 97, particularly against this heresy.

EBIONITES, in church history, heretics of the first century, so called from their leader EBION. They, as well as the Nazarenes, had their origin from the circumcised Christians, who had retired from Jerusalem to Pella during the war between the Jews and Romans; and made their first appearance, after the destruction of Jerusalem, about the time of Domitian, or a little before.

Eaton
||
Ebionites.

Ebony
Eccly-
nefsis.

They held the fame ceremonies with the Nazarenes, united the ceremonies of the Mosaic institution with the precepts of the gospel, observed both the Jewish sabbath and Christian Sunday, and in celebrating the eucharist made use of unleavened bread. They abstained from the flesh of animals, and even from milk. In relation to Jesus Christ, some of them held that he was born like other men, of Joseph and Mary, and acquired sanctification only by his good works. Others of them allowed, that he was born of a virgin; but denied that he was the Word of God, or had any existence before his human generation. They said, he was indeed the only true Prophet; but yet a mere man, who, by his virtue, had arrived at being called *Christ*, and the *Son of God*. They also supposed, that Christ and the devil were two principles, which God had opposed to each other. Of the New Testament they only received the gospel of St Matthew, which they called the *gospel according to the Hebrews*.

EBONY. See **EBENUS**.—This wood is exceedingly hard, heavy, and susceptible of a very fine polish; on which account it is used in Mosaic and inlaid works, toys, &c. The best is of a jet black, free of veins and rind, very massive, astringent, and of a sharp pungent taste.

The cabinet-makers, inlayers, &c. make pear-tree and other woods pass for ebony, by ebonying, or giving it the black colour. This some do by a few washes of a hot decoction of galls, and when dry adding writing ink thereon, and polishing it with a stiff brush and a little hot wax. Others heat, or burn their wood black.

EBRO, anciently **IBERUS**, a large river of Spain, which, taking its rise in Old Castile, runs thro' Biscay and Arragon, passes by Saragosa, and, continuing its course thro' Catalonia, discharges itself with great rapidity into the Mediterranean, about 20 miles below the city of Tortosa.

EBULLITION, the same with **BOILING**. The word is also used in a synonymous sense with **EFFERVESCENCE**.

ECHELLENSIS (Abraham), a learned Maronite, whom the president le Jai employed in the edition of his Polyglott Bible. Gabriel Sionita, his countryman, drew him to Paris, in order to make him his fellow-labourer in publishing that bible. They fell out: Gabriel complained to the parliament, and cruelly defamed his associate; their quarrel made a great noise. The congregation de *propaganda fide* associated him, 1536, with those whom they employed in making an Arabic translation of the scripture. They recalled him from Paris, and he laboured in that translation at Rome in the year 1652. While he was professor of the Oriental languages at Rome, he was pitched upon by the great duke Ferdinand II. to translate from Arabic into Latin the 5th, 6th, and 7th books of Apollonius's Conics; in which he was assisted by John Alphonso Borelli, who added commentaries to them. He died at Rome in 1664.

ECCHYMOISIS, from εκχυω, to pour out, or from εκς, out of, and χυμα, juice. It is an effusion of humours from their respective vessels, under the integuments; or, as Paulus Aegineta says, "When the flesh is bruised by the violent collision of any object, and its small veins broken, the blood is gradually discharged

from them." This blood, when collected under the skin, is called an *ecchymosis*, the skin in the mean time remaining entire; sometimes a tumour is formed by it, which is soft and livid, and generally without pain. If the quantity of blood is not considerable, it is usually resorbed; if much, it suppurates; it rarely happens that any further inconvenience follows; though, in case of a very bad habit of body, a mortification may be the result, and in such a case regard must be had thereto.

ESCLAIRCISSEMENT. See **ESCLAIRCISSEMENT**.

ECCLESIASTES, a canonical book of the Old Testament, the design of which is to shew the vanity of all sublunary things.

It was composed by Solomon; who enumerates the several objects on which men place their happiness, and then shews the insufficiency of all worldly enjoyments.

The Talmudists make king Hezekiah to be the author of it; Grotius ascribes it to Zorobabel, and others to Isaiah; but the generality of commentators believe this book to be the produce of Solomon's repentance, after having experienced all the follies and pleasures of life.

ECCLESIASTICAL, an appellation given to whatever belongs to the church: thus we say, ecclesiastical polity, jurisdiction, history, &c.

ECCLESIASTICAL Courts. In the time of the Anglo-Saxons there was no sort of distinction between the lay and the ecclesiastical jurisdiction: the county-court was as much a spiritual as a temporal tribunal: the rights of the church were ascertained and asserted at the same time, and by the same judges, as the rights of the laity. For this purpose the bishop of the diocese, and the alderman, or in his absence the sheriff of the county, used to sit together in the county-court, and had there the cognizance of all causes as well ecclesiastical as civil; a superior deference being paid to the bishop's opinion in spiritual matters, and to that of the lay-judges in temporal. This union of power was very advantageous to them both: the presence of the bishop added weight and reverence to the sheriff's proceedings; and the authority of the sheriff was equally useful to the bishop, by enforcing obedience to his decrees in such refractory offenders as would otherwise have despised the thunder of mere ecclesiastical censures.

But so moderate and rational a plan was wholly inconsistent with those views of ambition that were then forming by the court of Rome. It soon became an established maxim in the papal system of policy, that all ecclesiastical persons and all ecclesiastical causes should be solely and entirely subject to ecclesiastical jurisdiction only: which jurisdiction was supposed to be lodged in the first place and immediately in the Pope, by divine indefeasible right and investiture from Christ himself, and derived from the Pope to all inferior tribunals. Hence the canon law lays it down as a rule, that "*sacerdotes a regibus honorandi sunt, non judicandi*"; and places an emphatical reliance on a fabulous tale which it tells of the emperor Constantine. That when some petitions were brought to him, imploring the aid of his authority against certain of his bishops accused of oppression and injustice, he caused (says the holy canon)

Ecclesiastical
ment
EcclesiasticalBlack's
Comment.

the petitions to be burnt in their presence, dismissing them with this validation; "*Ite, et inter vos causas vestras discutite, quia dignum non est ut nos judicemus Deos.*"

It was not, however, till after the Norman conquest, that this doctrine was received in England; when William I. (whose title was warmly espoused by the monasteries which he liberally endowed, and by the foreign clergy, whom he brought over in shoals from France and Italy, and planted in the best preferments of the English church), was at length prevailed upon to establish this fatal encroachment, and separate the ecclesiastical court from the civil: whether actuated by principles of bigotry, or by those of a more refined policy, in order to discountenance the laws of king Edward abounding with the spirit of Saxon liberty, is not altogether certain. But the latter, if not the cause, was undoubtedly the consequence, of this separation: for the Saxon laws were soon overborne by the Norman justiciaries, when the county-court fell into disrepute by the bishop's withdrawing his presence, in obedience to the charter of the conqueror; which prohibited any spiritual cause from being tried in the secular courts, and commanded the suitors to appear before the bishop only, whose decisions were directed to conform to the canon law.

King Henry the first, at his accession, among other restorations of the laws of king Edward the Confessor, revived this of the union of the civil and ecclesiastical courts. Which was, according to Sir Edward Coke, after the great heat of the conquest was past, only a restitution of the ancient law of England. This however was ill relished by the Popish clergy, who, under the guidance of that arrogant prelate archbishop Anselm, very early disapproved of a measure that put them on a level with the profane laity, and subjected spiritual men and causes to the inspection of the secular magistrates: and therefore, in their synod at Westminster, 3 Hen. I. they ordained, that no bishop should attend the discussion of temporal causes; which soon dissolved this newly effected union. And when, upon the death of king Henry the first, the usurper Stephen was brought in and supported by the clergy, we find one article of the oath which they imposed upon him was, that ecclesiastical persons and ecclesiastical causes should be subject only to the bishop's jurisdiction. And as it was about that time that the contest and emulation began between the laws of England and those of Rome, the temporal courts adhering to the former, and the spiritual adopting the latter, as their rule of proceeding; this widened the breach between them, and made a coalition afterwards impracticable; which probably would else have been effected at the general reformation of the church.

Ecclesiastical Courts are various; as the ARCHDEACON'S, the CONSISTORY, the COURT of ARCHES, the PECULIARS, the PREROGATIVE, and the great court of appeal in all ecclesiastical causes, viz. the Court of DELEGATES. See these articles.

As to the method of proceeding in the spiritual courts, it must (in the first place) be acknowledged to their honour, that though they continue to this day to decide many questions which are properly of temporal cognizance, yet justice is in general so ably and impartially administered in those tribunals, (especially of

the superior kind,) and the boundaries of their power are now so well known and established, that no material inconvenience at present arises from this jurisdiction still continuing in the ancient channel. And, should any alteration be attempted, great confusion would probably arise, in overturning long established forms, and new-modelling a course of proceedings that has now prevailed for seven centuries.

The establishment of the civil-law process in all the ecclesiastical courts was indeed a masterpiece of papal discernment, as it made a coalition impracticable between them and the national tribunals, without manifest inconvenience and hazard. And this consideration had undoubtedly its weight in causing this measure to be adopted, though many other causes concurred. In particular, it may be here remarked, that the pandects, or collections of civil law, being written in the Latin tongue, and referring so much to the will of the prince and his delegated officers of justice, sufficiently recommended them to the court of Rome, exclusive of their intrinsic merit. To keep the laity in the darkest ignorance, and to monopolize the little science which then existed entirely among the monkish clergy, were deep-rooted principles of papal policy. And, as the bishops of Rome affected in all points to mimic the imperial grandeur, as the spiritual prerogatives were moulded on the pattern of the temporal, so the canon-law process was formed on the model of the civil law; the prelates embracing, with the utmost ardor, a method of judicial proceedings, which was carried on in a language unknown to the bulk of the people, which banished the intervention of a jury (that bulwark of Gothic liberty), and which placed an arbitrary power of decision in the breast of a single man.

The proceedings in the ecclesiastical courts are therefore regulated according to the practice of the civil and canon laws; or rather to a mixture of both, corrected and new-modelled by their own particular usages, and the interposition of the courts of common law. For, if the proceedings in the spiritual court be ever so regularly consonant to the rules of the Roman law, yet if they be manifestly repugnant to the fundamental maxims of the municipal laws, to which, upon principles of sound policy, the ecclesiastical process ought in every state to conform; (as if they require two witnesses to prove a fact, where one will suffice at common law); in such cases, a prohibition will be awarded against them. But, under these restrictions, their ordinary course of proceeding is, first, by *citation*, to call the party injuring before them. Then by *libel*, (*libellus*, a little book,) or by articles drawn out in a formal *allegation*, to set forth the complainant's ground of complaint. To this succeeds the *defendant's answer* upon oath; when, if he denies or extenuates the charge, they proceed to *proofs* by witnesses examined, and their depositions taken down in writing by an officer of the court. If the defendant has any circumstances to offer in his defence, he must also propound them in what is called his *defensive allegation*, to which he is entitled in his turn to the *plaintiff's answer* upon oath, and may from thence proceed to *proofs* as well as his antagonist. The canonical doctrine of *purgation*, whereby the parties were obliged to answer upon oath to any matter, however criminal, that might be objected against them, (though long ago over-ruled in the court of

chancery, the genius of the English law having broken through the bondage imposed on it by its clerical chancellors, and asserted the doctrines of judicial as well as civil liberty) continued till the middle of the last century, to be upheld by the spiritual courts; when the legislature was obliged to interpose, to teach them a lesson of similar moderation. By the statute of 13 Car. II. c. 12. it is enacted, that it shall not be lawful for any bishop, or ecclesiastical judge, to tender or administer to any person whatsoever, the oath usually called the oath *ex officio*, or any other oath whereby he may be compelled to confess, accuse, or purge himself of any criminal matter or thing, whereby he may be liable to any censure or punishment. When all the pleadings and proofs are concluded, they are referred to the consideration, not of a jury, but of a single judge; who takes information by hearing advocates on both sides, and thereupon forms his *interlocutory decree* or *definitive sentence*, at his own discretion: from which there generally lies an *appeal*, in the several stages mentioned in the articles above referred to; tho' if the same be not appealed from him in 15 days, it is final, by the statute 25 Hen. VIII. c. 19.

But the point in which these jurisdictions are the most defective, is that of enforcing their sentences when pronounced; for which they have no other process, but that of *excommunication*; which would be often despised by obdurate or profligate men, did not the civil law step in with its aid. See EXCOMMUNICATION.

ECCLESIASTICAL Corporations, are where the members that compose them are *spiritual* persons. They were erected for the furtherance of religion and perpetuating the rights of the church. See CORPORATIONS.

ECCLESIASTICAL State. See CLERGY.

ECCLESIASTICUS, an apocryphal book, generally bound up with the scriptures, so called, from its being read in the church, *ecclesia*, as a book of piety and instruction, but not of infallible authority.

The author of this book was a Jew, called *Jesús the son of Sirach*. The Greeks call it the *Wisdom of the son of Sirach*.

ECCOPROTICS, in pharmacy. See CATHARTICS, and EVACUANTS.

ECHAPE, in the menage, a horse begot between a stallion and a mare of different breeds and countries.

ECHAPER, in the menage, a gallicism used in the academies, implying to give a horse head, or to put on at full speed.

ECHENEIS, in ichthyology, a genus belonging to the order of thoracici. The head is fat, naked, depressed, and marked with a number of transverse ridges; it has ten rays in the branchiostegic membrane; and the body is naked. There are two species, viz. 1. The remora, or sucking-fish, with a forked tail, and 18 friz on the head. It is found in the Indian ocean. 2. The neureutes, with an undivided tail, and 24 friz on the head. It is likewise a native of the Indian ocean. See Plate CII.

ECHVIN, in the French and Dutch polity, a magistrate elected by the inhabitants of a city or town, to take care of their common concerns, and the decoration and cleanliness of the city.

At Paris, there is a prévôt, and four echevins; in other towns, a mayor and echevins. At Amsterdam, there are nine echevins; and, at Rotterdam, seven.

In France, the echevins take cognizance of rents, taxes, and the navigation of rivers, &c. In Holland, they judge of civil and criminal causes; and if the criminal confesses himself guilty, they can see their sentence executed without appeal.

ECHINATE, or ECHINATED, an appellation given to whatever is prickly, thereby resembling the hedgehog.

ECHINITES, in natural history, the name by which authors call the fossil centronia, frequently found in our chalk-pits. See CENTRONIA.

ECHINI MARINI. See ECHINUS.

ECHINUS, in zoology, a genus of insects belonging to the order of vermes mollusca. The body is roundish, covered with a bony crust, and often beset with moveable prickles; and the mouth is below, and consists of five valves. 1. The specimen on Plate CI. is the esculentus, or eatable echinus. It is of a hemispherical form, covered with sharp strong spines, above half an inch long; commonly of a violet colour; moveable; adherent to small tubercles elegantly disposed in rows. These are their instruments of motion by which they change their place. This species is taken in dredging, and often lodges in cavities of rocks just within low water mark. They are eaten by the poor in many parts of England, and by the better sort abroad. In old times they were a favourite dish. They were dressed with vinegar, honied wine or mead, parsley or mint; and thought to agree with the stomach. They were the first dish in the famous supper of Lentulus, when he was made *flamen Martialis*, or priest of Mars. By some of the concomitant dishes, they seem designed as a whet for the second course, to the holy peronages, priests and vestals invited on that occasion. Many species of shell-fish made part of that entertainment. 2. The lacunosus, or oval echinus, is of an oval depressed form; on the top it is of a purple colour, marked with a quadrefoil, and the spaces between tuberculated in waved rows; the lower side fluted, and divided by two smooth spaces. Length, four inches. When clothed, it is covered with short thickset bristles mixed with very long ones.—There are 15 other species, all natives of the sea.

ECHINUS, in architecture, a member or ornament near the bottom of the Ionic, Corinthian, and Composite capitals.

ECHIU, VIPER'S BUGLOSS; a genus of the monogynia order, belonging to the pentandria class of plants. There are seven species, three of which are natives of Britain. None of them have any remarkable property, except that the flowers of one species (the vulgar) are very grateful to bees. It is a native of many parts of Britain. The stem is rough with hairs and tubercles. The leaves are spear-shaped, and rough with hair. The flowers come out in lateral spikes. They are first red, afterwards blue; sometimes purple or white.—Cows and sheep are not fond of the plant; horses and goats refuse it.

ECHO, or ЕСНО, a sound reflected or reverberated, from a solid, concave, body, and so repeated to the ear*. The word is formed from the Greek *ἠχώ*, * See Acoustic, n° 27.
sound, which comes from the verb *ἠχάω*, *sona*.

The ancients being wholly unacquainted with the true cause of the echo, ascribed it to several causes sufficiently whimsical. The poets, who were not the

worst of their philosophers, imagined it to be a person of that name metamorphosed, and that she affected to take up her abode in particular places; for they found by experience, that she was not to be met with in all. (See below, *ЕCHO* in *fabulous history*.) But the moderns, who know found to consist in a certain tremor or vibration in the sonorous body communicated to the contiguous air, and by that means to the ear, give a more consistent account of echo.

For a tremulous body, striking on another solid body, it is evident, may be repelled without destroying or diminishing its tremor; and consequently a sound may be redoubled by the reflection of the tremulous body, or air.

But a simple reflexion of the sonorous air, is not enough to solve the echo: for then every plain surface of a solid hard body, as being fit to reflect a voice or sound, would redouble it; which we find does not hold.

To produce an echo, therefore, it should seem that a kind of concameration or vaulting were necessary, in order to collect, and by collecting to heighten and increase, and afterwards reflect, the sound; as we find is the case in reflecting the rays of light, where a concave mirror is required.

In effect, as often as a sound strikes perpendicularly on a wall, behind which is any thing of a vault or arch, or even another parallel wall; so often will it be reverberated in the same line, or other adjacent ones.

For an echo to be heard, therefore, it is necessary the ear be in the line of reflection: for the person who made the sound to hear its echo, it is necessary he be perpendicular to the place which reflects it: and for a manifold or tautological echo, it is necessary there be a number of walls, and vaults or cavities, either placed behind or fronting each other.

A single arch or concavity, &c. can scarce ever stop and reflect all the sound; but if there be a convenient disposition behind it, part of the sound propagated thither, being collected and reflected as before, will present another echo: or, if there be another concavity, opposed at a due distance to the former, the sound reflected from the one upon the other will be tossed back again by this latter, &c.

Many of the phenomena of echos, are well considered by the bishop of Leighs, &c. who remarks, that any sound, falling either directly or obliquely on any dense body of a smooth, whether plain or arched, superficies, is reflected, or echos, more or less. The surface, says he, must be smooth; otherwise the air, by reverberation, will be put out of its regular motion, and the sound thereby broken and extinguished. He adds, that it echos more or less, to show, that when all things are as before described, there is still an echoing, tho' it be not always heard; either because the direct sound is too weak to beat quite back again to him that made it; or that it does return to him, but so weak, that it cannot be discerned; or that he stands in a wrong place to receive the reflected sound, which passes over his head, under his feet, or on one side of him; and which therefore may be heard by a man standing in the place where the reflected sound does come, provided no interrupted body intercepts it, but not by him that first made it.

Echos may be produced with different circumstan-

ces. For, 1. A *plane* obstacle reflects the sound back in its due tone and loudness; allowance being made for the proportionable decrease of the sound, according to its distance.

2. A *convex* obstacle reflects the sound somewhat smaller and somewhat quicker, though weaker, than otherwise it would be.

3. A *concave* obstacle echos back the sound, bigger, slower, and also inverted; but never according to the order of words.

Nor does it seem possible to contrive any single echo, that shall invert the sound, and repeat backwards; because, in such case, the word last spoken, that is, which last occurs to the obstacle, must be repelled first; which cannot be. For where in the mean time should the first words hang and be concealed; or how, after such a pause, be revived, and animated again into motion?

From the determinate concavity or arches of the reflecting bodies, it may happen that some of them shall only echo back one determinate note, and only from one place.

4. The echoing body being removed farther off, it reflects more of the sound than when nearer; which is the reason why some echos repeat but one syllable, some one word, and some many.

5. Echoing bodies may be so contrived and placed, as that reflecting the sound from one to the other, either directly and mutually, or obliquely and by succession, out of one sound, a multiple echo or many echos shall arise.

Add, that a multiple echo may be made, by so placing the echoing bodies at unequal distances, that they may reflect all one way, and not one on the other; by which means, a manifold successive sound will be heard: one clap of the hands, like many; or *ha*, like a laughter; one single word, like many of the same tone and accent; and so one viol, like many of the same kind, imitating each other.

Lastly, echoing bodies may be so ordered, that, from any one sound given, they shall produce many echos different both as to tone and intention. By which means a musical room may be so contrived, that not only one instrument playing therein, shall seem many of the same fort and size, but even a concert of different ones, only by placing certain echoing bodies fo, that any note played, shall be returned by them in 3ds, 5ths, and 8ths.

Echo, is also used for the place where the repetition of the sound is produced or heard.

Echos are distinguished into divers kinds, viz.

1. *Singles*, which return the voice but once. Whereof some are *tonical*, which only return a voice when modulated into some particular musical tone: Others, *polysyllabical*, which return many syllables, words, and sentences. Of this last kind is that fine echo in Woodstock-park, which Doctor Plot assures us, in the day-time, will return very distinctly seventeen syllables, and in the night twenty.

2. *Multiple, or tautological*; which return syllables and words the same oftentimes repeated.

In echos, the place where the speaker stands is called the *centrum phonicum*; and the object or place that returns the voice, the *centrum phonocampiticum*.

At the sepulchre of Metella, wife of Crassus, was an echo, which repeated what a man said, five times.

Authors

Echo
||
Eclectics.

Authors mention a tower at Cyzicus, where the echo repeated seven times. One of the finest echoes we read of is that mentioned by Barthius, in his notes on Statius's *Thebais*, lib. vi. 30. which repeated the words a man uttered 17 times: it was on the banks of the Naba, between Coblentz and Bingen. Barthius assures us, he had proved what he writes; and had told 17 repetitions. And whereas, in common echoes, the repetition is not heard till some time after hearing the word spoke, or the notes sung; in this, the person who speaks, or sings, is scarce heard at all; but the repetition most clearly, and always in surprising varieties; the echo seeming sometimes to approach nearer, and sometimes to be further off. Sometimes the voice is heard very distinctly, and sometimes scarce at all. One hears only one voice, and another several: one hears the echo on the right, and the other on the left, &c. At Milan in Italy, is an echo which reiterates the report of a pistol 56 times; and if the report is very loud, upwards of 60 reiterations may be counted. The first 20 echoes are pretty distinct; but as the noise seems to fly away, and answer at a greater distance, the reiterations are so doubled, that they can scarce be counted.

ECHO, in architecture, a term applied to certain kinds of vaults and arches, most commonly of the elliptic and parabolic figures, used to redouble sounds, and produce artificial echoes.

ECHO, in poetry, a kind of composition wherein the last words or syllables of each verse contain some meaning, which, being repeated apart, answers to some question or other matter contained in the verse; as in this beautiful one from Virgil:

*Cruclis mater magis, an puer improbus ille?
Improbus ille puer, crudelis in quoque mater.*

The elegance of an echo consists in giving a new sense to the last words; which reverberate, as it were, the motions of the mind, and by that means affect it with surprise and admiration.

ECHO, in fabulous history, a nymph in love with Narcissus; but being despised by him, pined herself to death, having nothing but her voice left.

ECHOMETER, among musicians, a kind of scale or rule, with several lines thereon, serving to measure the duration and length of sounds, and to find their intervals and ratios.

ECKIUS (John), an eminent and learned divine, professor in the university of Ingoldstadt, memorable for the opposition he gave to Luther, Melancthon, Caralotadius, and other leading Protestants in Germany. He wrote many polemical tracts; and among the rest, a *Manual of Controversies*, printed in 1535, in which he discourses upon most of the heads contested between the Protestants and Papists. He was a man of uncommon learning, parts, and zeal, and died in 1543.

ECLECTICS, ancient philosophers, who, without attaching themselves to any particular sect, selected whatever appeared to them the best and most rational, from each.

Potamon of Alexandria was the first of the eclectics: he lived in the reigns of Augustus and Tiberius; and being tired with the scepticism of the Pyrrhonians, he resolved upon a scheme that would allow him to believe something, but without being so implicit as to swallow

any entire hypothesis.

ECLIPSE, in astronomy, the deprivation of the light of the sun, or of some heavenly body, by the interposition of another heavenly body between our sight and it. See ASTRONOMY, n^o 227.

ECLIPTIC, in astronomy, a great circle of the sphere, supposed to be drawn through the middle of the zodiac, making an angle with the equinoctial of about 23° 30', which is the sun's greatest declination; or, more strictly speaking, it is that path or way among the fixed stars, that the earth appears to describe to an eye placed in the sun. See ASTRONOMY.

Some call it *via Solis*, "the way of the sun;" because the sun in his apparent annual motion never deviates from it, as all the other planets do more or less. It is called *ecliptic*, by reason 'all eclipses happen when the planets are in, or near, its Node.

ECLIPTIC, in geography, a great circle on the terrestrial globe, not only answering to, but falling within, the plane of the celestial ecliptic. See GEOGRAPHY.

ECLOGUE, in poetry, a kind of pastoral composition, wherein shepherds are introduced conversing together.

The word is formed from the Greek *εχλον*, choice; so that, according to the etymology, *eclogue* should be no more than a select or choice piece; but custom has determined it to a farther signification, viz. a little elegant composition in a simple, natural style and manner.

Idyllion and eclogue, in their primary intention, are the same thing: thus, the idyllia, *ιδυλλια*, of Theocritus, are pieces wrote perfectly in the same vein with the *eclogæ* of Virgil. But custom has made a difference between them, and appropriated the name *eclogue*, to pieces wherein shepherds are introduced speaking; *idyllion*, to those wrote like the eclogue, in a simple natural style, but without any shepherds in them.

ECLUSE, a small but strong town of the Dutch Low Countries, in the county of Flanders, with a good harbour and sluices. The English besieged it in vain in 1405, and the people of Bruges in 1436. But the Dutch, commanded by Count Maurice of Nassau, took it in 1644. It is defended by several forts, and stands near the sea. E. Long. 3. 10. N. Lat. 50. 25.

ECPHRACTICS, in medicine, remedies which attenuate and remove obstructions. See ATTENUANTS, and DEOBSTRUENTS.

ECTHESIS, in church-history, a confession of faith, in the form of an edict, published in the year 639, by the emperor Heraclius, with a view to pacify the troubles occasioned by the Eutychian heresy in the eastern church. However, the same prince revoked it, on being informed that pope Severinus had condemned it, as favouring the Monothelites; declaring at the same time, that Sergius, patriarch of Constantinople, was the author of it.

ECTHILIPSIS, among Latin grammarians, a figure of prosody whereby the *m* at the end of a word, when the following word begins with a vowel, is elided, or cut off, together with the vowel preceding it, for the sake of the measure of the verse: thus they read *muli'* *ille*, for *multum ille*.

ECTROPIUM, in surgery, is when the eye-lids are inverted, or retracted, so that they show their internal or red surface, and cannot sufficiently cover the eye.

ECTYLOTICS, in pharmacy, remedies proper for

Eclipse
||
Ectropium.

^{Edin.} confuming callosities.
^{Edinburgh.} ECU, or ESCU, a French crown; for the value of which, see MONEY.

EDDISH, or EADISH, the latter pasture, or grags that comes after mowing or reaping; otherwise called *eagragh*, or *earsh*, and *etch*.

EDDOES, or EDDERS, in botany; the American name of the ARUM perigrinum.

EDDY TIDE, or EDDY WATER, among seamen, is where the water runs back contrary to the tide; or that which hinders the free passage of the stream, and so causes it to return again.

EDDY-Wind is that which returns or is beat back from a sail, mountain, or any thing that may hinder its passage.

EDELINCK (Gerard), a famous engraver, born at Antwerp, where he was instructed in drawing and engraving. He settled at Paris, in the reign of Lewis XIV. who made him his engraver in ordinary. Edelinck was also counsellor in the Royal Academy of Painting. His print of the Holy Family, copied from Raphael, those of Alexander visiting the family of Darius, and the Penitent Magdalen, from le Brun, are particularly admired. His works are particularly esteemed for the neatness of the engraving, the brilliant cast, and the prodigious ease apparent in the execution; and to this facility is owing the great number of plates we have of his, among which are excellent portraits of a great number of illustrious men of his time. He died in 1707, in an advanced age, at the Hotel Royal at the Gobelins, where he had an apartment. He had a brother named John, who was a skilful engraver, but died young.

EDGINGS, in gardening, the series of small but durable plants, set round the edges or borders of flowerbeds, &c. The best and most durable of all plants for this use, is box; which, if well planted, and rightly managed, will continue in strength and beauty for many years. The seasons for planting this, are the autumn, and very early in the spring; and the best species for this purpose is the dwarf Dutch box.

Formerly, it was also a very common practice to plant borders, or edgings, of aromatic herbs; as thyme, favory, hyssop, lavender, and the like: but these are all apt to grow woody, and to be in part, or wholly, destroyed in hard winters. Daisies, thrift, or sea july-flower, and chamomile, are also used by some for this purpose: but they require yearly transplanting, and a great deal of trouble, else they grow out of form; and they are also subject to perish in very hard seasons.

EDICT, in matters of polity, an order or instrument, signed and sealed by a prince, to serve as a law to his subjects. We find frequent mention of the edicts of the prætor, the ordinances of that officer in the Roman law. In the French law, the edicts are of several kinds: some importing a new law or regulation; others, the erection of new offices; establishments of duties, rents, &c.; and sometimes articles of pacification. In France, edicts are much the same as a proclamation is with us: but with this difference, that the former have the authority of a law in themselves, from the power which issues them forth; whereas the latter are only declarations of a law, to which they refer, and have no power in themselves.

EDINBURGH, a city of Mid-Lothian in Scot-

land, and capital of the whole kingdom; situated in ^{Edinburgh.} W. Long. 3°. N. Lat. 56°.

The origin of the name of *Edinburgh*, like that of most other cities, is obscure and uncertain. Some think it is derived from *Edh*, supposed to be a king of the Picts; others from *Edwin*, a Saxon prince of Northumberland, who, about the year 617, over-ran great part of the Pictish territories: others chose to derive it from two Gaelic words, *Dun Edin*, which signify the face of a hill.—The name *Edinburgh* itself, however, seems to have been unknown in the time of the Romans. The most ancient title by which we find this city distinguished, is that of *Castell Mynydd Agned*; which, in the British language, signifies “the fortress of the hill of St Agnes.” Afterwards it was named *Castrum Puellarum*, because the Pictish princesses were educated in the castle (a necessary protection in those barbarous ages) till they were married.—The ages in which these names were given, cannot indeed now be exactly ascertained; but the town certainly cannot boast of very great antiquity, since, as Mr Whitaker informs us, the celebrated king Arthur fought a battle on the spot where it is situated, towards the end of the fifth century.

The Romans, during the time they held the dominion of part of this island, divided their possessions into six provinces. The most northerly of these was called *Valentia*, which comprehended all the space between the walls of ADRIAN and SEVERUS. Thus, Edinburgh, lying on the very out-skirts of that province which was most exposed to the ravages of the barbarians, became perpetually subject to wars and devastations; by means of which, the time of its first foundation cannot now be guessed at.

The castle is certainly very ancient. It continued in the hands of the Saxons or English from the invasion of *Ola* and *Ebysa* in the year 452, till the defeat of Egfrid king of Northumberland in 685 by the Picts, who then repossessed themselves of it. The Saxon kings of Northumberland reconquered it in the 9th century, and it was retained by their successors till the year 956, when it was given up to Indulphus king of Scotland. In 1093 it was unsuccessfully besieged by the usurper Donald Bane. Whether the city was at that time founded or not, is uncertain. Most probably it was: for as protection from violence was necessary in those barbarous ages, the castle of Edinburgh could not fail of being an inducement to many people to settle in its neighbourhood; and thus the city would gradually be founded, and increase.—In 1128, king David I. founded the Abbey of Holyroodhouse, for certain canons regular; and granted them a charter, in which he styled the town, *Burgo meo de Edwinesburg*, “my borough of Edinburgh.” By the same charter he granted these canons 40 shillings yearly out of the town revenues; and likewise 48 shillings more, from the same, in case of the failure of certain duties payable from the king’s revenue; and likewise one half of the tallow, lard, and hides, of all the beasts killed in Edinburgh.

In 1174, the castle of Edinburgh was surrendered to Henry II. of England, in order to purchase the liberty of king William I. who had been defeated and taken prisoner by the English. But when William recovered his liberty, he entered into an alliance with Henry, and

¹ Origin of the name.

² Time of its foundation uncertain.

³ Castle surrendered to the English.

Edinburgh. and married his cousin Ermengarde; upon which the castle was refortified, as part of the queen's dowry.

In 1215, this city was first distinguished by having a parliament and provincial fynod held in it.—In 1296, the castle was besieged and taken by Edward I. of England; but was recovered from the English in 1313 by Randolph earl of Moray, who was afterwards regent of Scotland during the minority of king David II. At last king Robert destroyed this fortress, as well as all others in Scotland, lest they should afford shelter to the English in any of their after incursions into Scotland.—It lay in ruins for a considerable number of years; but was afterwards rebuilt by Edward III. of England, who placed a strong garrison in it. In 1341 it was retaken by stratagem, and the English were finally driven out of the kingdom.

⁴ Towards the end of the 14th century, the city of Scotland began to be considered as the capital of Scotland. King Robert I. in 1329, had bestowed upon the burghesses, the town of Edinburgh, with the harbour and mills of Leith. His great grandson, John earl of Carrick, who afterwards assumed the name of Robert III. conferred on all the burghesses of Edinburgh the singular privilege of building houses to themselves within the castle, without any other limitation than that they should be persons of good fame.—In 1461, the inhabitants received Henry VI. of England when exiled, with such humanity, that, in requital, he granted them liberty to trade in all the English ports, subject only to the duties which were paid by the citizens of London; but as Henry was never restored to the throne, this grant proved of no use.

⁵ Till the year 1542, nothing remarkable occurs in the history of Edinburgh. At that time a war was commenced with Henry VIII. of England through the treachery of cardinal Beaton. An English fleet of 200 sail entered the Forth; and having landed their forces, quickly made themselves masters of the towns of Leith and Edinburgh. They next attacked the castle, but were repulsed from it with loss; and by this they were so enraged, that they not only destroyed the towns of Edinburgh and Leith, but laid waste the country for a great way round.—These towns, however, speedily recovered from their ruinous state; and, in 1547, Leith was again burned by the English after the battle of Pinkie, but Edinburgh was spared.

Several disturbances happened in this capital at the time of the reformation; but nothing of consequence till the year 1570.—A civil war had commenced a few years before, on occasion of queen Mary's forced resignation. The regent, who was one of the contending parties, bought the castle from the perfidious governor for 5000*l.* and the priory of Pittenweem. He did not, however, long enjoy the fruits of this infamous bargain. Sir William Kirkcaldy, the new governor, a man of great integrity and bravery, declared for the queen. The city in the mean time was sometimes in the hands of one party, and sometimes of another; during which contentions, the inhabitants, as may easily be imagined, suffered extremely. In the year 1570 above-mentioned, queen Elizabeth sent a body of 1000 foot and 300 horse, under the command of Sir William Drury, to assist the king's party. The castle was summoned to surrender; and several skirmishes happened during the space of two years, in which a kind of pre-

datory war was carried on. At last a truce was agreed on till the month of January 1573; and this opportunity the earl of Morton, now regent, made use of to build two bulwarks across the high-street, nearly opposite to the tolbooth, to defend the city from the fire of the castle.

On the first of January, early in the morning, the governor began to cannonade the city. Some of the cannon were pointed against the fish-market; and the bullets falling among the fishes, scattered them about in a surprising manner; and even drove them up so high in the air, that they fell down upon the tops of the houses. This unusual spectacle having brought a number of people out of their houses, some of them were killed, and others dangerously wounded. Some little time afterwards, several houses were set on fire by shot from the castle, and burned to the ground; which greatly enraged the people against the governor.—A treaty was at last concluded between the leaders of the opposite factions; but Kirkcaldy refused to be comprehended in it. The regent therefore solicited the assistance of queen Elizabeth, and Sir William Drury was again sent into Scotland with 1500 foot, and a train of artillery. The castle was now besieged in form, and batteries raised against it in different places. The governor defended himself with great bravery for 33 days; but finding most of the fortifications demolished, the well choked up with rubbish, and all supplies of water cut off, he was obliged to surrender. The English general, in the name of his mistress, promised him honourable treatment; but the queen of England shamefully gave him up to the regent, by whom he was hanged.

Soon after this, the spirit of fanaticism which some how or other succeeded the reformation, produced violent commotions, not only in Edinburgh, but thro' the whole kingdom. The foundation of these disturbances, and indeed of most others which have ever happened in Christendom on account of religion, was that pernicious maxim of Popery, that the church is independent of the state. It is not to be supposed that this maxim was at all agreeable to the sovereign; but such was the attachment of the people to the doctrines of the clergy, that king James found himself obliged to compound matters with them. This, however, answered the purpose but very indifferently; and at last such furious uproars were excited, that the king thought proper to declare Edinburgh an unfit place of residence for the court, or the administration of justice. In consequence of this declaration, he commanded the college of justice, the inferior judges, and the nobility and barons, to retire from Edinburgh; and not to return without express license. This unexpected declaration threw the whole town into consternation, and brought back the magistrates and principal inhabitants to a sense of their duty. With the clergymen it was far otherwise. They rallied against the king in the most furious manner; and endeavouring to persuade the people to take up arms, the magistrates were ordered to imprison them; which, however, they escaped by a timely flight. A deputation of the most respectable burghesses was then sent to the king at Linlithgow, with a view to mitigate his resentment. But he refused to be pacified; and, on the last day of December 1596, entered the town between two rows of his soldiers.

teous.

diers who lined the streets, while the citizens were commanded to keep within their houses. A convention of the estates was held in the tolbooth, before whom the magistrates made the most abject submissions, but all in vain. The convention declared one of the late tumults, in which an attack had been made upon the king's person, to be high treason; and ordained that, if the magistrates did not find out the authors, the city itself should be subjected to all the penalties due to that crime. It was even proposed to raze the town to the foundation, and erect a pillar on the spot where it had stood, as a monument of its crimes. The inhabitants were now reduced to the utmost despair; but queen Elizabeth interposing in behalf of the city, the king thought proper to abate somewhat of his rigour. A criminal prosecution, however, was commenced, and the town council were commanded to appear at Perth by the first of February. On their petition, the time for their appearance was prolonged to the first of March; and the attendance of 13 of the common-council was declared sufficient, provided they had a proper commission from the rest. The trial commenced on the fifth day of the month; and one of the number having failed in his attendance, the cause was immediately decided against the council: they were declared rebels, and their revenues forfeited.

8
Received
again into
favour.

For 15 days the city continued in the utmost confusion; but at last, on their earnest supplication, and offering to submit entirely to the king's mercy, the community were restored, on the following conditions, which they had formerly proffered: That they should continue to make a most diligent search for the authors of the tumult, in order to bring them to condign punishment; that none of the seditious ministers should be allowed to return to their charges, and no others admitted without his majesty's consent; and that in the election of their magistrates, they should present a list of the candidates to the king and his lords of council and session, whom his majesty and their lordships might approve or reject at pleasure. To these conditions, the king now added some others; *viz.* that the houses which had been possessed by the ministers should be delivered up to the king; and that the clergymen should afterwards live dispersed through the town, every one in his own parish: That the town-council house should be appointed for accommodating the court of exchequer; and that the town should become bound for the safety of the lords of session from any attempts of the burghesses, under a penalty of 40,000 merks; and lastly, that the town should immediately pay 20,000 merks to his majesty.

Upon these terms a reconciliation took place. The king, in a short time, suffered the degraded ministers to be replaced, and nothing remarkable happened till the reign of king Charles I. It was in the city of Edinburgh that the disturbances about religion commenced; which ended not but with the death of that unhappy monarch, and the total subversion of the British constitution. Here the covenants were framed, and the rest of those violent and enthusiastical measures concerted, an account of which is given under the article BRITAIN, n° 76. *et seq.*

From this time, to the present, the history of Edinburgh scarce affords any thing worthy of notice, except the remarkable execution of John Porteous, captain of

the city-guard, in 1736. This was conducted in a tumultuous manner, but at the same with such impene- trable secrecy as must render it memorable to the latest posterity. The origin of the whole affair was the execution of a smuggler in the grays-market. Some dis- turbance being raised on this occasion, captain Porteous ordered his men to fire among the mob which usually assembles in such cases. By the discharge of their mus- kets six people were killed, and eleven dangerously wounded: and for this offence, Porteous was prosecuted at the city's expense; and after trial, sentenced to die. King George II. happening to be at that time in Hanover, queen Caroline was regent in his absence, who reprieved the criminal. This highly en- raged the people; who, considering the unprovoked cruelty of Porteous, (or perhaps for some other rea- sons), did not think him a proper object of mercy. On the night before that on which his execution should have taken place according to his sentence, a number of people assembled from different quarters variously disguised. They surprised and disarmed the town- guard, and took possession of the city-gates to prevent the entrance of troops who were quartered in the sub- urbs. They then proceeded to the prison; the doors of which, being too strong to be broke open, they burnt, and dismissed all the prisoners, Porteous alone excepted. The magistrates endeavoured to disperse them; but they were pelted with stones, and threaten- ed to be fired upon. General Moyle was requested by the member of parliament for the city, to send a body of troops to the assistance of the magistrates; but this he refused, because no written order could be procured for that purpose. In the mean time, Porteous was conducted to the Grays-market, near to the place where the people had been killed: there the ringleaders of the affair, having broke open a shop, and paid for a coil of ropes, hanged him upon a dyer's sign-post; after which, the whole body dispersed without committing any other disorder.

This was highly resented, and considered as an in- sult to government. A pardon was promised to the of- fenders provided they would discover their accomplices; and a reward of 200 l. was offered for every per- son so discovered: but notwithstanding all the inquiry that could be made, there hath not, to this day, trans- pired the least intelligence concerning the matter, nor even the name of a single person who had a hand in it. The vengeance of government then fell upon the magistrates of Edinburgh. The lord provost was taken into custody, and confined almost three weeks before he was admitted to bail. He was then ordered to at- tend the house of lords, along with four bailies of Edin- burgh, and three of the lords of judicatory. These last, after some debate, were ordered to attend the bar in their robes. The house first took into considera- tion the legality of the sentence by which Porteous had been condemned. Both the sentence of the court, and the verdict of the jury, were censured by some of the members, and a motion was made to declare them er- roneous; but, by a majority of voices, both the sen- tence and verdict were fully justified. A bill was then brought in for imprisoning the provost of Edinburgh for a full year, disabling him for ever from bearing any public office in that city, or any other in Great Britain; for abolishing the city-guard, and taking

punished.

down the gate at the Netherbow-port. This bill passed the house of lords without any amendment. When sent down to the house of commons, the imprisonment of the provost, the abolishing of the city-guard, and the taking down of the gate, were left out; and in place of these, a fine of 2000 l. was imposed on the city, to be applied to the use of Porteous's widow: and with this amendment the bill passed with the majority of a single voice.—To prevent such catastrophes in time coming, the town-council enacted, that, on the first appearance of an insurrection, the chief officers in the different societies and corporations should repair to the council, to receive the orders of the magistrates for the quelling of the tumult, under penalty of 8 l. 6 s. 8 d. for each omission.

13
Taken by
the High-
landers in
1745.

In 1745, the city was invested by the Pretender's army; and on the 17th of September, the Netherbow-gate being opened to let a coach pass, a party of Highlanders, who had reached the gate undiscovered, rushed in, and took possession of the city. The inhabitants were commanded to deliver up their arms at the palace of Holyroodhouse; a certain quantity of military stores were required from the city, under pain of military execution; and an assessment of 2 s. 6 d. upon the pound was imposed upon the *real* rents within the city and liberties, for defraying that expence.

The Pretender's army guarded all the avenues to the castle; but no signs of hostility ensued till the 25th of the month, when the garrison being alarmed from some unknown cause, a number of cannon were discharged at the guard placed at the West-port, but with very little effect. This gave occasion to an order to the guard at the weigh-house, to prevent all intercourse between the city and castle; and then the governor acquainted the provost by letter, that unless the communication was preserved, he would be obliged to dislodge the guard by means of artillery. A deputation was next sent to the Pretender; acquainting him with the danger the city was in, and intreating him to withdraw the guard. With this he refused to comply; and the Highland centinels firing at some people who were carrying provisions into the castle, a pretty smart cannonading ensued, which set on fire several houses, killed some people, and did other damage. The Pretender then consented to dismiss the guard, and the cannonading ceased.—After the battle of Culloden, the provost of Edinburgh was obliged to stand a very long and severe trial, first at London and then at Edinburgh, for not defending the city against the rebels; which, from the situation and extent of the walls, every one must have seen to be impossible. At last, however, he was exculpated; and, since that time, no other differences have happened between the government and magistrates of Edinburgh.

The rebellion in 1745 put a temporary stop to the existence of the city of Edinburgh as a body corporate. The time for electing magistrates happened while the town was in possession of the rebels, so that the election could not be held; and thus, for a whole year, Edinburgh was left destitute of any civil government.—Application, however, was made to the king for restoring the government. He was graciously pleased to grant their request, and the election of magistrates proceeded accordingly. The following year they addressed his majesty on the suppression of the re-

strates elec-
ted.

bellion, and presented the duke of Cumberland with the freedom of the city inclosed in a gold box.—Since that time, the city hath remained free from every kind of trouble; hath flourished in a remarkable manner; and been enlarged and embellished with many new and fine buildings, of which an account is given in the subsequent description.

15
Description
of the
town.

Edinburgh is situated upon a steep hill, rising from east to west, and terminating in a high and inaccessible rock, upon which the castle stands. At the east end or lower extremity of this hill, stands the abbey of Holyrood-house, or king's palace, distant from the castle upwards of a mile; and betwixt which, along the top of the ridge, and almost in a straight line, runs the high-street. On each side, and parallel to this ridge or hill, is another ridge of ground lower than that in the middle, and which does not extend so far to the east; that on the south being intercepted by Salisbury-rocks, and Arthur's-seat, a hill of about 650 feet of perpendicular height; and that on the north by the Calton-hill, considerably lower than Arthur's-seat: so that the situation of this city is most singular and romantic; the east or lower part of the town lying between two hills; and the west or higher part rising up towards a third hill, little inferior in height to the highest of the other two, upon which, as has been observed, the castle is built, and overlooks the town.

The buildings of the town terminate at the distance of about 200 yards from the castle-gate; which space affords a most delightful as well as convenient and healthful walk to the inhabitants. The prospect from this spot is perhaps the finest any where to be met with, for extent, beauty, and variety.

In the valley or hollow betwixt the mid and south ridge, and nearly parallel to the high-street, is another street called the Cowgate; and the town has now extended itself over most part of that south ridge also. Betwixt the mid and north ridge was a loch, which, till of very late, terminated the town on that side. From the high-street towards the loch on the north, and Cowgate on the south, run narrow cross streets or lanes, called *wynds* and *cliffers*, which grow steeper and steeper the farther west or nearer the castle; so that, were it not for the closeness and great height of the buildings, this city, from its situation and plan, might naturally be expected to be the best aired, as well as the cleanliest, in Europe. The first, notwithstanding these disadvantages, it enjoys in an eminent degree; but we cannot compliment it upon the latter, notwithstanding every possible means has been used by the magistrates for that purpose.

The steepness of the ascent makes the access to the high-street from the north and south very difficult; and has no doubt greatly retarded the enlargement of this city. To remedy this inconvenience on the north, and with a view to extend the town on that quarter, a most elegant bridge has been thrown over the north loch, which joins the north ridge to the middle of the high-street, by so easy an ascent as one in sixteen; and in pursuance of the design, a plan of a new town to the north was fixed upon, and has for several years past been carrying into execution with an elegance and taste that does honour to this country.

The gradual increase of the city of Edinburgh may

in some degree be underflood from the traces of its ancient walls that still remain. James II. in 1450, first bestowed on the community the privilege of fortifying the city with a wall, and empowered them to levy a tax upon the inhabitants for defraying the expence. When the city was first fortified, the wall reached no farther than the present water-houfe, or refervoir, on the caſtle-hill: from thence to the foot of Halkerſton's wynd, juſt below the new-bridge, the city was defended by the north-loch; an inconfiderable morafs, which, being formerly overflowed, formed a ſmall lake, that hath ſince been drained. From this place to the foot of Leith-wynd, it doth not appear how the city was fortified, but from the foot of Leith-wynd to the netherbow-port, it was defended only by a range of houſes; and when theſe became ruinous, a wall was built in their place. The original wall of Edinburgh, therefore, began at the foot of the north-caſt rock of the caſtle. Here it was ſtrengthened by a ſmall fortrefs, the ruins of which are ſtill to be ſeen, and are called the *well-houſe tower*, from their having a ſpring in their neighbourhood. When it came oppoſite to the refervoir, it was carried quite acroſs the hill, having a gate on the top for making a communication between the town and caſtle. In going down the hill, it went ſlanting in an oblique direction to the firſt angle in going down the weſt-bow; where was a gate named the *Upper-bow port*, one of the hooks of which ſtill remains. Thence it proceeded eaſtward in ſuch a manner, as would have cut off not only all the Cowgate, but ſome part of the parliament-houſe; and being continued as far as the mint-cloſe, it turned to the north-eaſt, and connected itſelf with the buildings on the north-ſide of the high ſtreet, where was the original *Netherbow port*, about 50 yards weſt from that which afterwards went by the ſame name.

Soon after the building of this wall, a new ſtreet was formed on the outſide of it, named the *Cowgate*, which in the 16th century became the reſidence of the nobility, the ſenators of the college of juſtice, and other perſons of the firſt diſtinction. After the fatal battle of Flowden, however, the inhabitants of the Cowgate became very anxious to have themſelves defended by a wall as well as the reſt. The wall of the city was therefore extended to its preſent limits. This new wall begins on the ſouth-eaſt ſide of the rock on which the caſtle is built, and to which the town-wall comes quite cloſe. From thence it deſcends obliquely to the weſt port; then aſcends part of a hill on the other ſide, called the *High Riggs*; after which, it runs eaſtwards, with but little alteration in its courſe, to the Briſto and Potter-row ports, and from thence to the Pleaſance. Here it takes a northerly direction, which it keeps from thence to the Cowgate-port; after which the incloſure is completed to the Netherbow by the houſes of St Mary wynd. The original Netherbow-port being found not well adapted for defence was pulled down, and a new one built in 1571 by the adherents of queen Mary. In 1606, the late handſome building was erected about 50 yards below the place where the former ſtood. It was two ſtories high, and had an elegant ſpire in the middle; but being thought to encumber the ſtreet, and the whole building being in a crazy ſituation, it was pulled down

by order of the magiſtrates in 1764.

In the original wall of Edinburgh there was, as has been already obſerved, a port on the caſtle-hill. On the extension of the wall, after building the houſes in the Cowgate, this gate was pulled down. That in the upper or weſt bow, ſtood for a much longer time, and was pulled down within the memory of ſome perſons ſtill living. Beſides theſe, there was a third, about 50 yards above the head of the Canongate; but whether there were any more, is uncertain. The ports or gates of the new walls are, 1. The *Weſt-port*, which is ſituated at the extremity of the Graſs-market; beyond which lies a ſuburb of the town and a borough of regality, called *Portborough*. Next to this is a wicket, ſtruck out of the town-wall in 1744, for the purpoſe of making an eaſier communication between the town and the public walks in the meadows, than by Briſto-port. The next to this is *Briſto-port*, built in 1515; beyond which lies a ſuburb called *Briſto-ſtreet*. At a ſmall diſtance from Briſto, is the *Potterrow-port*, which took this name from a manuſactory of earthen ware in the neighbourhood. Formerly it was called *Kirk of Field Port*. Between this and the Cowgate port ſtood another, called *St Mary Wynd Port*, which extended from eaſt to weſt acroſs the foot of the Pleaſance, and which was demoliſhed only ſince the middle of the laſt century.—Cloſe to the place where this port was, ſtands the *Cowgate-port*; which opens a communication between the Cowgate and St Mary's Wynd, and the Pleaſance.—The *Netherbow-port* has been already ſpoke of.—At the foot of Leith-wynd was another gate, known by the name of *Leith-wynd port*; and within it was a wicket giving acceſs to the church of Trinity College, and which ſtill remains. At the foot of Halkerſton's wynd was another, which, as well as the former, was built about the year 1560. Both were pulled down ſome years ago.—Another ſtill remains at the foot of the Canongate, known by the name of the *Water-gate*.

For 250 years the city of Edinburgh occupied the ſame ſpace of ground, and it is but very lately that its limits have been ſo conſiderably enlarged. In the middle of the 16th century, it is deſcribed as extending in length about an Italian mile, and about half as much in breadth; which answers very nearly to its preſent limits, the late enlargements only excepted.—This ſpace of ground, however, was not at that time occupied in the manner it is at preſent. The houſes were neither ſo high nor ſo crowded upon each other as they are now. This was a conſequence of the number of inhabitants increaſing, which has occaſioned the railing of the houſes to ſuch an height as is perhaps not to be paralleled in any other part of the world. Till the time of the Reformation, the burying ground of the city extended over all the ſpace occupied by the Parliament-square, and from thence to the Cowgate. The lands lying to the ſouthward of the Cowgate were chiefly laid out in gardens belonging to the convent of Black-friars, and the church of St Mary in the Field. Theſe extended almoſt from the Pleaſance to the Potterrow-port. From the Briſto to the Weſt Port, the ground was laid out in gardens belonging to the Gray-friars. The magiſtrates, on their application to queen Mary, obtained a grant of the Gray-friars gardens for a burying place; for which it was given as a reaſon, that they

Edinburgh. they were somewhat distant from the town. Here, however, it must be understood, that these gardens were distant from the houses, and not without the walls; for they had been enclosed by them long before.—In the time of James I. the houses within the walls seem to have been in general, if not universally, covered with thatch or broom; and not above 20 feet high. Even in the year 1621, these roofs were so common, that they were prohibited by act of parliament, in order to prevent accidents from fire.—In the middle of the last century, there were neither courts nor squares in Edinburgh. The Parliament *close* or square is the oldest of this kind in the city. Milne's square, James's court, &c. were built long after; and Argyle's and Brown's squares within these 30 years.

New Town. The *New Town* was projected in the year 1752; but as the magistrates could not then procure an extension of the royalty, the execution of the design was suspended for some time. In 1767, an act was obtained, by which the royalty was extended over the fields to the northward of the city; upon which, advertisements were published by the magistrates, desiring proper plans to be given in. Plans were given in accordingly, and that designed by Mr James Craig architect was adopted. Immediately afterwards, people were invited to purchase lots from the town-council; and such as purchased, became bound to conform to the rules of the plan. In the mean time, however, the town-council had secretly reserved to themselves a privilege of departing from their own plan; which they afterwards made use of in such a manner as produced a law-suit. According to the plan held forth to the purchasers, a canal was to be made through that place where the north-loch had been, and the bank on the north side of it laid out in terraces: but, instead of this, by an act of council, liberty was reserved to the town to build upon this spot; and therefore, when many gentlemen had built genteel houses in the new town, on faith of the plan, they were surprised to find the spot appointed for terraces and a canal, beginning to be covered with mean irregular buildings, and work-houses for tradesmen. This deviation was immediately complained of; but as the magistrates shewed no inclination to grant any redress, a prosecution was commenced against them before the Lords of Session. In that court the cause was given against the pursuers, who thereupon appealed to the House of Lords. Here the sentence of the court of session was reversed, and the cause remitted to the consideration of their lordships. At last, after an expensive contest, matters were accommodated. The principal term of accommodation was, that some part of the ground was to be laid out in terraces and a canal; but the time of disposing it in that manner, was referred to the lord president of the court of session and the lord chief baron of the exchequer.—The fall of the bridge proved a very considerable disadvantage to the new town; as it necessarily induced a suspicion that the passage, by means of the bridge, could never be rendered safe. An oversight of the magistrates proved of more essential detriment. A piece of ground lay to the southward of the old town, in a situation very proper for building. This the magistrates had an opportunity of purchasing for 1200*l.*; which, however, they neglected, and it was bought by a private person, who

immediately feued it out in lots for building. The magistrates then foresaw the consequence, namely, that this spot being free from the duties to which the royalty of Edinburgh is subject, people would chuse to reside there rather than in the new town. Upon this they offered the purchaser 2000*l.* for the ground for which he had paid 1200*l.*; but as he demanded 20,000*l.* the bargain was not concluded.—Notwithstanding these discouragements, the new town hath made a very considerable progress; and from the advantages of its situation, and its being built according to a regular plan, it hath undoubtedly a superiority over any city in Britain. By its situation, however, it is remarkably exposed to storms of wind, which, at Edinburgh, sometimes rage with uncommon violence.

The most remarkable public buildings of Edinburgh are,

1. *The Castle.* This stands on a high rock, accessible only on the east side. On all others it is very steep, and in some places perpendicular. It is about 300 feet high from its base: so that, before the invention of artillery, it might well have been deemed impregnable; though the event showed that it was not.—The entry to this fortress is defended by an outer barrier of palliades; within this is a dry ditch, draw-bridge, and gate, defended by two batteries which flank it; and the whole is commanded by an half-moon mounted with brass cannon, carrying balls of 12 pounds. Beyond these are two gate-ways, the first of which is very strong, and has two portcullises. Immediately beyond the second gateway, on the right hand, is a battery mounted with brass cannon, carrying balls of 12 and 18 pounds weight. On the north side are a mortar and some gun batteries.—The upper part of the castle contains several half-moon batteries, a chapel, a parade for exercise, and a number of houses in the form of a square, which are laid out in barracks for the officers. Besides this there are other barracks, which are able to contain 1000 men; a powder-magazine bomb-proof; a grand arsenal, capable of containing 8000 stand of arms; and other apartments for the same use, which can contain 22,000 more: so that 30,000 stand of arms may be conveniently lodged in this castle.—On the east side of the square above-mentioned, were formerly royal apartments, in one of which king James VI. was born, and which is still shewn to those who visit the castle. In another, the regalia of Scotland were deposited on the 26th of March 1707, and are said to be still kept there; but they are never shewn to any body.

The castle is defended by a company of invalids, and four or five hundred men belonging to some marching regiment, though it can accommodate 1000, as above-mentioned; and this number has been sometimes kept in it. It hath a governor, fort-major, gunner, store-master, &c. &c.—Its natural strength of situation was not able to render it impregnable, even before the invention of artillery, as we have already observed. Much less would it be able to secure it against the attacks of a modern army well provided with cannon. It could not, in all probability, withstand, even for a few hours, a well directed bombardment; for no part but the powder-magazine is capable of resisting these destructive machines; and the splinters from the

19
Account of
the public
buildings,
&c.

Edinburgh. rock on which the castle is built, could not fail to render them still more formidable. Besides, the water of the well, which is very bad, and drawn up from a depth of 100 feet, is apt to subside on the continued discharge of artillery, which produces a concussion in the rock.

2. *The palace of Holyrood-house* is of a quadrangular form, and bears some resemblance to that of Hampton court. In the centre is a court surrounded with piazzas. The front is two stories high; the roof flat; but at each end the front projects, and is ornamented with circular towers at the angles. Here the building is much higher, and the rest of the palace is three stories in height. Over the door of the front is a clock and small cupola, the roof of which is an imperial crown in stone-work. The north-west towers were built by James V. for his own residence: his name is still to be seen below a niche in one of these towers. During the minority of queen Mary, this palace was burned by the English; but soon after repaired, and enlarged beyond its present size. At that time it consisted of five courts, the most westerly of which was the largest. It was bounded on the east by the front of the palace, which occupied the same space it does at present; but the building itself extended further to the south. At the north-west corner was a strong gate, with Gothic pillars, arches, and towers, part of which was but lately pulled down.—Great part of the palace was burnt by Cromwell's soldiers; but it was repaired, and altered into the present form, after the Restoration. The fabric was planned by Sir William Bruce, a celebrated architect, and executed by Robert Mylne, mason.—The only apartments worthy of notice, are those now possessed by the duke of Hamilton, heritable keeper of the palace. In the second floor are queen Mary's apartments; in one of which her own bed remains. It is of crimson damask, bordered with silk tassels and fringes, but now almost reduced to rags. Close to the floor of this room is a piece of waincot which hangs upon hinges, and communicates with a trap-stair that goes down into the apartment below. Through this passage the conspirators rushed in who murdered David Rizzio; and towards the outer door are shewn some large dusky spots in the floor, said to be occasioned by his blood, which could not be washed out.—The environs of the palace afford an asylum for insolvent debtors; and adjoining to it is an extensive park, all of which is a sanctuary.

3. *Heriot's Hospital* owes its foundation to one George Heriot a goldsmith, who, in the days of James VI. acquired by his business (being goldsmith to the king and queen) a large fortune. At his death, he left the magistrates of Edinburgh 23,625 l. 10s. "for the maintenance, relief, and bringing up of so many poor and fatherless boys, freemens sons of the town of Edinburgh," as the above sum should be sufficient for. This hospital is finely situated on the west end of the fourth ridge, almost opposite to the castle, and is perhaps the most magnificent building of the

kind in Edinburgh. It was founded in July 1628, according to a plan (as is reported) of Inigo Jones; but the work being interrupted by the civil wars, it was not finished till the year 1650. The expense of the building is said to have been upwards of 30,000 l.*; and the hospital is still possessed of an income of about 1800 l. a-year; though this cannot be absolutely ascertained, as the rents are paid in grain, and of course must be fluctuating.—When Cromwell took possession of Edinburgh after the battle of Dunbar, he quartered his sick and wounded soldiers in this hospital. It was applied to the same purpose till the year 1658, when general Monk, at the request of the governors, removed the soldiers; and on the 11th of April 1659, it was opened for the reception of boys, 30 of whom were admitted into it. The August after, they were increased to 40; and in 1661, to 52. In 1753 they were raised to 130, and in 1763 to 140; but the number has since that time decreased.—In this hospital the boys are instructed in reading, writing, arithmetic, and a knowledge of the Latin tongue. With such as chuse to follow any kind of trade, an apprentice-fee of 30 l. is given when they leave the hospital; and those who chuse an academical education, have an annuity of 10 l. a-year bestowed on them for four years.

4. *Watson's Hospital* is an institution of the same kind with Heriot's; but the building is much less magnificent. The funds are also less. They were in all 12,000 l. left by George Watson in 1723 for endowing an hospital; which, however, was not carried into execution till the year 1738, when the above-mentioned sum, with the interest accumulated during that time, amounted to 20,000 l. About 60 boys are at present educated in Watson's hospital. On their being put out apprentices, 20 l. of apprentice-fee is paid with them; or if they chuse to go to college, they receive 10 l. for five years. On their attaining the age of 25 years, if they have behaved properly, and not contracted marriage without consent of the governors, they receive a bounty of 50 l. The funds of this hospital amount to 17000 l. a-year.

5. *The Orphan Hospital* was planned in 1732 by Andrew Gairdner merchant, and other inhabitants. It was promoted by the society for propagating Christian knowledge, by other societies, voluntary subscriptions, and a collection at the church-docks.—In 1733, the managers hired a house, took in 30 orphans, maintained them, gave them instructions in reading and writing, and taught them the weaving business. In 1735, they were erected into a body corporate by the town of Edinburgh; and, in 1742, obtained a charter of erection from his late majesty, appointing most of the great officers of state in Scotland, and the heads of the different societies in Edinburgh, members of this corporation; with powers to them to hold real property to the amount of 10000 l. a-year. The revenue is inconsiderable; but the institution is supported by the contributions of charitable persons, and

* It is to be observed, that money then bore 10 l. per cent. interest.—The above sums are taken from Mr Arnott's History of Edinburgh, who subjoins the following note. "Where Maitland had collected his most erroneous account of George Heriot's effects, we do not know. He makes the sum received, out of Heriot's effects, by the governors of the hospital, to be 43,608 l. 11 s. 3 d. being almost the double of what they really got. This blunder has been the cause of many unjust murmurings against the magistrates of Edinburgh, and even the means of spiriting up law-suits against them."

Edinburgh. and collections at the church-doors. Into this hospital orphans are received from any part of the kingdom. None are admitted under seven, nor continued in it after 14, years of age. About 100 orphans are maintained in it.

6. *The Merchants Maiden Hospital* was established by voluntary contribution about the end of the last century, for the maintenance of young girls, daughters of the merchants burghesses of Edinburgh. The governors were erected into a body corporate, by act of parliament, in 1707. The annual revenue amounts to 1350l. Seventy girls are maintained in it; who, upon leaving the house, receive 3l. 6s. 8d. excepting a few who are allowed 8l. 6s. 8d. out of the funds of the hospital. The profits arising from work done in the house are also divided among the girls, according to their industry.

7. *The Trades Maiden Hospital* was founded in the year 1704 by the incorporations of Edinburgh, for the maintenance of the daughters of decayed members, on a plan similar to that of the merchants hospital. To this, as well as to the former, one Mrs Mary Erskine, a widow gentlewoman, contributed so liberally, that she was by the governors styled *joint foundress* of the hospital. Fifty girls are maintained in the house, who pay of entry-money 1l. 13s. 4d.; and, when they leave it, receive a bounty of 5l. 11s. 1½d. The revenues are estimated at 600l. a-year.

8. *The Trinity Hospital*. This was originally founded and amply endowed by king James II's queen. At the Reformation, it was stripped of its revenues; but the regent afterwards bestowed them on the provost of Edinburgh, who gave them to the citizens for the use of the poor. In 1585, the town-council purchased from Robert Pont, at that time provost of Trinity college, his interest in these subjects; and the transaction was afterwards ratified by James VI. The hospital was then repaired, and appointed for the reception of poor old burghesses, their wives, and unmarried children, not under 50 years of age. In the year 1700, this hospital maintained 54 persons; but, since that time, the number has decreased.—The revenue consists in a real estate of lands and houses, the gross rent of which is 762l. a-year; and 5500l. lent out in bonds at 4 per cent.

Besides these charitable institutions, there are also three charity work-houses; one belonging to the town, another to the Canonage, and the third to the West-kirk parish. They maintain, in all, about 900 men, women, and children.

9. *The Royal Infirmary* was first thought of by the college of physicians in 1725. A filling company happening to be dissolved at that time, the partners contributed some of their stock towards the establishment of the infirmary. A subscription was also set on foot, and application made to the general assembly to recommend the same throughout their jurisdiction. This was readily complied with, and the assembly passed an act for that purpose; but very little regard was paid to it by the clergy. Notwithstanding this, however, 2000l. being procured, a small house was opened for the reception of the sick poor in August 1729. In 1736, the contributors towards the infirmary were erected into a body corporate by royal statute; and after this the contributions increased very considerably: by which

means, the managers were enabled to enlarge their scheme from time to time; and at last to undertake the present magnificent structure, the foundation of which was laid in 1738. During 25 years, when this institution was in its infancy, Lord Hopetoun bestowed upon it an annuity of 400l. In 1750, Doctor Archibald Ker bequeathed to this corporation an estate of 200l. a-year in the island of Jamaica. In 1755, the lords of the treasury made a donation to it of 8000l. which had been appointed for the support of invalids. In return for this, the managers of the infirmary constantly keep 60 beds in readiness for the reception of sick soldiers. This year also sick servants began to be admitted into the infirmary, and a ward was fitted up for their reception.

This institution, however, was more indebted to George Drummond, Esq; than to any other person. He was seven times chosen lord provost of Edinburgh, and always directed his attention to the improvement of the city, particularly to that of the royal infirmary. So sensible were the managers of their obligations to him, that, in their hall, they erected a bust of him with this inscription, "George Drummond, to whom this country is indebted for all the benefit which it derives from the Royal Infirmary."—In 1748, the stock of the infirmary amounted to 5000l.; in 1755, to 7076l. besides the estate left by Doctor Ker; in 1764, to 23,426l.; and in 1778, to 27,074l.

The royal infirmary is attended by two physicians chosen by the managers, who visit their patients daily in presence of the students. All the members of the college of surgeons are also obliged to attend in rotation, according to seniority. If any surgeon declines attendance, he is not allowed to appoint a deputy; but the patients are committed to the care of one of four assistant surgeons, chosen annually by the managers.—From the year 1762 to 1769, there were admitted 6261 patients; which number added to 109 who were in the hospital at the commencement of the year 1762, made, in all, 6370. Of these, 4394 were cured; 358 died; the rest were either relieved, dismissed incurable, for irregularities, or by their own desire, or remained in the hospital.—From 1770 to 1775, the patients annually admitted into the infirmary were, at an average, 1567; of whom 63 died. In 1776, there were admitted 1668, of whom 57 died; and in 1777, the number admitted was 1593, and of deaths 52.

The building consists of a body and two wings, each of them three stories high, with an attic story and garrets, and a very elegant front. The body is 210 feet long, and 36 broad in the middle, but at the ends only 24 feet broad. The wings are 70 feet long, and 24 broad. In the centre is a large stair-case, so wide that sedan chairs may be carried up. In the different wards, 228 patients may be accommodated, each in a different bed. There are cold and hot baths for the patients, and also for the citizens; and to these last the patients are never admitted.

10. *The Bridge*. The first stone of this building was laid by provost Drummond in 1763; but the contract for building it was not signed till August 21st 1765. The architect was Mr William Mylne, who agreed with the town-council of Edinburgh to finish the work for 10,140l. and to uphold it for 10 years. It was also to be finished before Martinmas 1769; but, on the 3d

Edinburgh.

of August that year, when the work was nearly completed, the vaults and side-walls on the south fell down, and five people were buried in the ruins. This misfortune was occasioned by the foundation having been laid, not upon the solid earth, but upon the rubbish of the houses which had long before been built on the north side of the high-street, and which had been thrown out into the hollow to the northward. Of this rubbish, there were no less than eight feet between the foundation of the bridge and the solid earth. Besides this deficiency in the foundation, an immense load of earth which had been laid over the vaults and arches in order to raise the bridge to a proper level, had no doubt contributed to produce the catastrophe above-mentioned.—The bridge was repaired, by pulling down some parts of the side-walls, and afterwards rebuilding them; strengthening them in others with chain-bars; removing the quantity of earth laid upon the vaults, and supplying its place with hollow arches, &c. The whole was supported at the south end by very strong buttresses and counterforts on each side; but on the north it has only a single support.—The whole length of the bridge, from the High-street in the Old Town, to Prince's-street in the New, is 1125 feet; the total length of the piers and arches is 310 feet. The width of the three great arches, is 72 feet each; the piers 13 feet and an half; the small arches, each 20 feet. The height of the great arches, from the top of the parapet to the base, 68 feet; the breadth of the bridge within wall over the arches, 40 feet; and the breadth at each end, 50 feet.

11. *The Register Office.* This work was first suggested by the late earl of Morton, lord-register of Scotland, with a view to prevent the danger which attended the usual method of keeping the public records. In former times, indeed, these suffered from a variety of accidents. Edward I. carried off or destroyed most of them, in order to prevent any marks of the former independency of the nation from remaining to posterity. Afterwards Cromwell spoiled this nation of its records, most of which were sent to the tower of London. At the time of the Restoration, many of them were sent down again by sea; but one of the vessels was shipwrecked, and the records brought by the other have ever since been left in the greatest confusion.—The earl of Morton, taking this into consideration, obtained from his majesty a grant of 12,000*l.* out of the forfeited estates, for the purpose of building a register-office, or house for keeping the records, and disposing them in proper order. The foundation was laid on the 27th of June 1774, by Lord Frederic Campbell, lord-register; Mr Montgomery of Stanhope, lord advocate; and Mr Miller of Barskimming, lord justice-clerk; three of the trustees appointed by his majesty for executing the work. The ceremony was performed under a discharge of artillery, in presence of the judges of the courts of session and exchequer, and in the sight of a multitude of spectators. A brass plate was put into the foundation-stone, with the following inscription: *CONSERVANDIS TABULIS PUBLICIS POSITUM EST, ANNO MDCC LXXIV, MUNIFICENTIA OPTIMI ET PIENTISSIMI PRINCIPIS GEORGI TERTII.* In a glass vase hermetically sealed, which is also placed in the foundation-stone, are deposited specimens of the different coins of his present majesty.

Edinburgh.

The front of the building directly faces the bridge, extends from east to west 200 feet, and is 40 feet back from the line of Prince's-street. In the middle of the front is a small projection of three windows in breadth. Here is a pediment, having in its centre the arms of Great Britain, and the whole is supported by four Corinthian pilasters. At each end is a tower projecting beyond the rest of the building, having a Venetian window in front, and a cupola on the top. The front is ornamented from end to end with a beautiful Corinthian entablature. In the centre of the building is a dome of wooden work covered with lead. The inside forms a saloon 50 feet diameter, and 80 high, lighted at top by a copper window 15 feet in diameter. The whole number of apartments is 97; all of which are vaulted beneath, and warmed with fire-places. The building is executed according to a plan of Mr Adams architect; and when finished, may vie with any modern building whatsoever. The whole expence is estimated at 25,000*l.*

12. *The Theatre.* Entertainments of the dramatic kind came very early into fashion in this country. They were at first only representations of religious subjects, and peculiarly designed to advance the interests of religion; the clergy being the composers, and Sunday the principal time of exhibition. In the sixteenth century, the number of play-houses was so great, that it was complained of as a nuisance, not only in Edinburgh, but throughout the kingdom. They soon degenerated from their original institution; and the plays, instead of being calculated to inspire devotion, became filled with all manner of buffoonery and indecency.—After the reformation, the presbyterian clergy complained of these indecencies; and being actuated by a spirit of violent zeal, anathematized every kind of theatrical representation whatever. King James VI. compelled them to pass from their censures against the stage; but, in the time of Charles I. when fanaticism was carried to the utmost length at which perhaps it was possible for it to arrive, it cannot be supposed that stage-plays would be tolerated. On the Restoration, when people were ready to fall into the other extreme, stage-plays were not only revived, but many improvements made, among which that of introducing women on the stage was none of the least.—It seems, however, that amusements of this kind were again introduced at Edinburgh about the year 1684, when the duke of York kept his court there. His residence at Edinburgh drew off one half of the London company, and plays were acted in Edinburgh for some little time. The misfortunes attending the duke of York, however, and the establishment of the presbyterian religion (the genius of which is unfavourable to amusements of this kind), soon put a stop to the progress of the stage, and no theatrical exhibition was heard of in Edinburgh till after the year 1715. The first adventurer was Signora Violante, an Italian, remarkable for feats of strength, tumbling, &c. In this way the first exhibited in a house at the foot of Carrubber's close, which has since been employed by different sectaries for religious purposes. Meeting with good success, the soon invited a company of comedians from London; and these being also well received, Edinburgh continued for some years to be entertained with the performances of a strolling company, who visited it annually. Becoming at last, however,

Edinburgh. however, obnoxious to the clergy, they were, in 1727, prohibited by the magistrates from acting within their jurisdiction. But this interdict was suspended by the court of session, and the players continued to perform as usual.

Still, however, theatrical entertainments were but rare. The town was visited by itinerant companies only once in two or three years. They performed in the *Taylor's hall* in the Cowgate; which, when the house was full, would have drawn (at the rate of 2s. 6d. for pit and boxes, and rs. 6d. for the gallery) 40l. or 45l. a night. About this time an act of parliament was passed, prohibiting the exhibition of plays, except in a house licensed by the king. Of this the presbytery of Edinburgh immediately laid hold; and at their own expence brought an action on the statute against the players. The cause was, by the court of session, decided against the players; who thereupon applied to parliament for a bill to enable his majesty to license a theatre in Edinburgh. Against this bill, petitions were presented, in 1739, to the house of commons, by the magistrates and town-council, the principal and professors of the university, and the dean of guild and his council; in consequence of which, the affair was dropped. All this opposition, however, contributed in reality to the success of the players; for the spirit of party being excited, a way of evading the act was easily found out, and the house was frequented more than usual, inasmuch that Taylor's-hall was found insufficient to contain the number of spectators.

The comedians now fell out among themselves, and a new play-house was erected in the Canongate in the year 1746. The consequence of this was, that the old one in Taylor's-hall became entirely deserted, and through bad conduct the managers of the new theatre soon found themselves greatly involved: at last, a riot ensuing, through dissensions among the performers, the play-house was totally demolished.---When the extension of the royalty, over the spot where the new town is built, was obtained, a clause was likewise added to the bill, enabling his majesty to license a theatre in Edinburgh. This was obtained, and thus the opposition of the clergy for ever silenced: but the success of the theatre has not been great; nor is it at present on a respectable footing, mostly owing to the embarrassed circumstances of the managers; who, paying no less than 500 guineas per annum to Mr Ross the patentee, are unable to decorate the theatre as it ought to be, to retain good actors, or to provide a suitable wardrobe.---The Edinburgh theatre, internally, is simple, commodious, and elegant: externally, it hath neither beauty nor elegance; and is situated in such a manner as to obstruct the view of the register-office, which is, without exception, the handsomest building about Edinburgh.

13. *The Concert-Hall* is situated in Niddry's-wynd, a central part of the town, and was built in 1762. The plan was drawn by Sir Robert Mylne (architect of Blackfriars bridge), after the model of the great opera theatre at Parma. The musical room is of an oval form, the ceiling being a concave elliptical dome, lighted from the top by a lantern. The seats are ranged in the form of an amphitheatre; and are capable of containing 500 persons, besides leaving a large area in the middle of the room. The orchestra is at the upper end, and is terminated by an elegant organ.

The musical society was first instituted in the year 1728. Before that time, several gentlemen had formed a weekly club at a tavern kept by one Steil, a great lover of music, and a good singer of Scots songs. Here the common entertainment consisted in playing on the harpichord and violin the concertos and sonatas of Handel, just then published.---The meeting, however, soon becoming numerous, they instituted, in the year above-mentioned, a society of 70 members, for the purpose of holding a weekly concert. The affairs of the society are regulated by a governor, deputy-governor, treasurer, and five directors, who are annually chosen by the members. The meetings have been continued ever since that time on much the same footing as at first, and the number of members is now increased to 200.

14. *The Church of St Giles* is a beautiful Gothic building, measuring in length 206 feet. At the west end, its breadth is 110; in the middle, 129; and at the east end, 76 feet. It has a very elevated situation, and is adorned with a lofty square tower, encircled at top with ornaments of open figured stone-work, like those that adorn the circlet of an imperial crown. From the sides and corners of the tower, rich arches of stone-work; which, meeting with each other in the middle, complete the figure of an imperial crown, the top of which terminates in a pointed spire. The whole height of this tower is 161 feet.

This is the most ancient church in Edinburgh. From a passage in an old author called *Simeon Dunelmensis*, some conjecture it to have been built before the year 854; but we do not find express mention made of it before 1359. The tutelar saint of this church, and of Edinburgh, was St Giles, a native of Greece. He lived in the sixth century, and was descended of an illustrious family. On the death of his parents, he gave all his estate to the poor; and travelled into France, where he retired into a wilderness near the conflux of the Rhone with the sea, and continued there three years. Having obtained the reputation of extraordinary sanctity, various miracles were attributed to him; and he founded a monastery in Languedoc, known long after by the name of *St Giles's*.---In the reign of James II. Mr Preston of Gorton, a gentleman whose descendants still possess an estate in the county of Edinburgh, got possession of the arm of this saint; and the relique he bequeathed to the church of Edinburgh. In gratitude for this donation, the magistrates granted a charter in favour of Mr Preston's heirs, by which the nearest heir of the name of Preston was entitled to carry it in all processions. At the same time, the magistrates obliged themselves to found an altar in the church of St Giles's, and appoint a chaplain for celebrating an annual mass for the soul of Mr Preston; and likewise, that a tablet, containing his arms, and an account of his pious donation, should be put up in the chapel.---St Giles's was first simply a parish-church, of which the bishop of Lindisfarne, or Holy Island, in the county of Northumberland, was patron. He was succeeded in the patronage by the abbot and canons of Dunfermline, and they by the magistrates of Edinburgh. In 1466, it was erected into a collegiate church by James III.---At the Reformation, the church was, for the greater convenience, divided into several parts. The four principal ones are
appro-

Edinburgh. appropriated to divine worship, the lesser ones to other purposes. The chief of these divisions is called the *New Church*. In it are the king's seat, those of the provost and magistrates, &c. At the same time also, the religious utensils belonging to this church were seized by the magistrates. They were,—St Giles's arm, enshrined in silver, weighing five pounds three ounces and an half; a silver chalice, or communion-cup, weighing 23 ounces; the great *eucharist* or communion cup, with *golden eweik and stones*; two cruets of 25 ounces; a golden bell, with a heart of four ounces and a half; a golden unicorn; a golden pix, to keep the host; a small golden heart, with two pearls; a diamond ring; a silver chalice, patine, and spoon, of 32 ounces and a half; a communion table-cloth of gold brocade; *St Giles's coat*, with a little piece of red velvet which hung at his feet; a round silver *eucharist*; two silver censers, of three pounds fifteen ounces; a silver ship for incense; a large silver cross, with its base, weighing sixteen pounds thirteen ounces and a half; a triangular silver lamp; two silver candlesticks, of seven pounds three ounces; other two, of eight pounds thirteen ounces; a silver chalice gilt, of 20½ ounces; a silver chalice and cross, of 75 ounces; besides the priests robes, and other vestments, of gold brocade, crimson velvet embroidered with gold, and green damask.—These were all sold, and part of the money applied to the repairs of the church; the rest was added to the funds of the corporation.—The other presbyterian churches in Edinburgh are, the Trinity-college church; the Old and New Gray-friars; the Tron-church; Lady Yester's; Canongate; St Cuthbert's; Chapel of Ease; Lady Glenorchy's; and the Earle church.

15. *The English Chapel*. This building stands near the Cowgate-port, and was begun on the 3d of April 1771. The foundation-stone was laid by general Oughton, with the following inscription: "E. difficili fac. Ecclesie Episc. Angliæ, primum posuit lapidem, J. Adolphus Oughton, in architectoni- cæ Scotiæ repub. Curio maximus, militum præfec- tus, regnante Georgio III. tertio Apr. die A. D. "MDCC LXXI."—It is a plain, handsome building, neatly fitted up in the inside, and resembling in form the church of St Martin's in the Fields, London. It is 90 feet long, 75 broad, and ornamented with a neat spire of a considerable height. The spire is furnished with an excellent bell, formerly belonging to the chapel-royal at Holyrood-house. This is permitted to be rung for assembling the congregation; an indulgence which is not granted to the presbyterians in England. This building has already cost 6000l. besides 800l. for the area: It still wants two porticoes; one of which, on the south, is meant to consist of lofty Corinthian pillars, supporting a pediment; and the expenses of these are estimated at 1000l. more.

Besides the above-mentioned places appointed for religious worship, there were formerly a number of others, which are now either disused, or entirely ruined. The principal of these are,

16. *Church of St Mary in the field, and Monastery of Black-friars*.—The church of St Mary was a large handsome building, in which a provost and ten prebendaries officiated. It is probable, that both the church and convent were founded in the reign of Alexander II. in 1230. The convent was built almost on the same

spot where the high-school stands at present. The Edinburgh church stood where the college does now. The convent and church, with the houses of the provost and prebendaries, occupied almost all the space between the Cowgate and Potterrow. The lane, now called *Black-friar's wynd*, was also the property of these ecclesiastics, and took its name from them. The monastery was burned down in 1528, but was rebuilt at the Reformation; soon after which, the ecclesiastics were stripped of all their possessions. The magistrates obtained them from James VI.; and were also empowered to dispose of them, and apply the feu-tenths towards building and endowing an hospital at Trinity-college church. The lands formerly belonging to this church of St Mary, and monastery of Black-friars, are now chiefly occupied by the college, high-school, church of Lady Yester, royal infirmary, and surgeons-hall.

17. *St Mary's Chapel*. This chapel was founded by Elizabeth countess of Rois in 1505, and stands near the middle of Niddry's wynd. It was dedicated "To God, and the Virgin Mary his mother." About the year 1600, one Chalmers, a macer before the court of session, acquired a right to this chapel; and, in 1618, the corporations of wrights and masons, now known by the name of the "United Incorporations of Mary's Chapel," purchased the subject which they still possess, and where they hold the meetings of the corporations.

18. *Hospital of our Lady*. This was founded, near the foot of Leith wynd, in 1479, by Thomas Spens bishop of Aberdeen, for the maintenance of 12 poor men. These poor men, however, must certainly have been maintained by the contributions of the public; for the rents with which the hospital was endowed, did not exceed 121. sterling. At the Reformation, the town-council of Edinburgh became proprietors of this hospital. In 1619, it was converted into a work-house, and had the name of *Paul's work* bestowed upon it, which name it still retains.—At the same time, the council brought five men from Holland to instruct indigent boys and girls in the manufacture of coarse woollen stuffs. The manufacture, however, did not succeed; upon which it was converted into a *correction-house*. At last it was sold to one Mr McDowal, who carries on in it a considerable manufacture of broad cloths.

19. *St Thomas's Hospital* was founded by George Creichton bishop of Dunkeld, in the reign of James V. The building joined immediately to the Water-gate upon the west. It was dedicated to God, the Virgin Mary, and all the saints. Among the charitable purposes for which it was instituted, one was, That prayers might be said in it for the soul of the founder, and of the king of the Scots, as well as some other persons mentioned in the institution. The patronage was vested in the founder himself, and a certain number of his heirs named by him. In 1617, the hospital was disposed of by the chaplains and beadmen, with consent of the patron, to the bailies of the Canongate, to be used as an hospital for the poor of that district. In 1634, the patronage was sold to the kirk-session; but still with a view to the same charitable purposes. By degrees, the revenues of it came to be entirely embezzled. In 1747, the building was converted into coach-houses; and, in 1778, having become ruinous, it was entirely pulled down, and rebuilt as private houses.

20. *Monastery of St Catherine of Sienna.* This lay on the south side of the meadows, and was founded by lady St Clair of Roslin. It was a monastery of Dominican nuns; but, at the Reformation, the magistrates seized the revenues of the monastery, and cruelly turned out the poor women to the wide world; nor would they, till compelled by queen Mary, allow them the smallest subsistence even out of their own funds. The neighbourhood of this monastery is now called the *Sheens*; probably a corruption of the word *Sienna*.

21. *Chapels of St Leonards, and St Mary of Placentia.* The first of these stood on the east side of the road to Dalkeith. The lands belonging to it were, by king James VI. granted to the magistrates of the Canongate for the support of Thomas's hospital. The land in its neighbourhood still bears the name of *St Leonard's hill*. A part of it belongs to the quakers, who use it for a burying ground; another part is used for burying children who have died without baptism, and persons who have put an end to their own life.—Nigher to the city, at a small distance from the south-east angle of the town-wall, stood a priory of nuns dedicated to *St Mary of Placentia*. This street still bears the name of the *Plasants*, or *Plasance*; probably corrupted from *Placentia*.

22. *Monastery of Holy-rood House.* This was founded by king David I. in 1128, and called *Holy-rood House*, in memory, as is said, of his deliverance from an enraged hart, by the miraculous interposition of a cross from heaven. This monastery he gave to the canons regular of St Augustine; on whom he also bestowed the church of Edinburgh castle, with those of St Cuthbert's, Corstorphin, and Libberton, in the shire of Mid-Lothian, and of Airth in Stirlingshire; the priories of St Mary's in Galloway, of Blantyre in Clydesdale, of Rowadill in Ross, and three others in the Western Isles. To them he also granted the privilege of erecting a borough between the town of Edinburgh and the church of Holy-rood House. From these canons it had the name of the *Canongate*, which it still retains. In this new borough they had a right to hold markets. They had also portions of land in different parts, with a most extensive jurisdiction, and right of trial by duel, and fire and water ordeal. They had also certain revenues payable out of the exchequer, and out of other funds, with fishings, and the privilege of erecting mills on the water of Leith, which still retain the name of *Canon-mills*. Other grants and privileges were bestowed by succeeding sovereigns; so that it was deemed the richest religious foundation in Scotland. At the Reformation, its annual revenues were, 442 bolls of wheat, 640 bolls of bear, 560 bolls of oats, 500 capons, two dozen of hens, as many salmon, 12 loads of salt; besides a great number of swine, and about 250*l.* sterling in money. At the Reformation, the superiority of North Leith, part of the Pleasance, the barony of Broughton, and the Canongate, was vested in the earl of Roxburgh; and were purchased from him by the town-council of Edinburgh in 1636. In 1544, the church suffered considerably by the invasion of the English; but was speedily repaired. At the Restoration, king Charles II. ordered the church to be set apart as a chapel-royal, and prohibited its use as a common parish-church for the future. It was then fitted up in a very elegant manner. A throne

was erected for the sovereign, and 12 stalls for the knights of the order of the thistle; but as mals had been celebrated in it in the reign of James VII. and it had an organ, the presbyterians, at the revolution, entirely destroyed its ornaments, and left nothing but the bare walls.—Through time, the roof of the church became ruinous; on which the duke of Hamilton represented its condition to the barons of exchequer, and craved that it might be repaired. This request was complied with: but the architect and mason who were employed, covered the roof with thick flag-stones, which soon impaired the fabric; and on the 2d of December 1768, the roof of the church fell in. Since that time, no attempt has been made to repair it, and it is now entirely fallen to ruin.

23. *The Observatory.* The scheme of building an observatory was first adopted in the year 1736; but the disturbance occasioned by the Porteous mob, prevented any thing from being done towards the execution of it at that time. The earl of Morton afterwards gave 100*l.* for the purpose of building an observatory, and appointed Mr M'Laurin professor of mathematics, together with the principal and some professors of the university, trustees for managing the sum. Mr M'Laurin added to the money above-mentioned, the profits arising from a course of lectures which he read on experimental philosophy, which, with some other small sums, amounted in all to 300*l.*; but Mr M'Laurin dying, the design was dropped.—Afterwards the money was put into the hands of two persons who became bankrupt; but a considerable dividend being obtained out of their effects, the principal and interest, about the year 1776, amounted to 400*l.* A plan of the building was made out by Mr Craig architect; and the foundation-stone was laid by Mr Stodart, lord provost of Edinburgh, on the 25th of August 1776. About this time, however, Mr Adam architect happening to come to Edinburgh, conceived the idea of giving the whole the appearance of a fortification, for which its situation on the top of the Calton-hill was very much adapted. Accordingly a line was marked out for inclosing the limits of the observatory with a wall constructed with buttresses and embrasures, and having Gothic towers at the angles. Thus the money designed for the work was totally exhausted, and the observatory still remains unfinished; nor is there any appearance of its being soon completed, either by voluntary subscription, or any other way.

24. *The College* was founded in 1581; the town-council having at that time got a legacy of 8000 merks, left for this purpose by Robert Reid bishop of Orkney. James VI. endowed it with certain church-lands in the counties of Lothian and Fife; and, considering himself as its patron, ordered it to be called *King James's college*. From time to time it has received many donations from well disposed people.—In this university all the different branches of medicine, as well as of theology, law, &c. are taught in the most perfect manner. The first medical professors instituted at Edinburgh, were Sir Robert Sibbald and Doctor Archibald Pitcairn, in the year 1685 *. These, however, were only titular professors. The college of physicians, although they possessed an exclusive right of practising, were debarred from teaching in Edinburgh; and for 30 years afterwards, a summer-lecture

* See Cor.
LEGE of
Physicians.

Edinburgh. on the official plants, and the dissection of a human body once in two or three years, completed the whole course of medical education at Edinburgh.---In 1720, an attempt was made to teach the different branches of physic regularly; which succeeded so well, that, ever since, the reputation of the university, as a school for medicine, hath been constantly increasing, both in the island of Britain, and even among distant nations.---The medical classes are opened on the last Wednesday of November; and from that time to the beginning of May, five lectures are given weekly by each professor, Christmas week only excepted.---The following is a list of the present professors in the university of Edinburgh, with the salary belonging to each.

THEOLOGY.

	L.	s.	d.
William Robertson, D. D. principal of the university, and primary professor of divinity.	111	2	0½
Robert Hamilton, D. D. professor of divinity.	161	2	0½

Dugald Stewart, M. A. professor of			

mathematics and astronomy

113 6 5½ Edinburgh.

John Bruce, M. A. professor of Logic, and dean of the faculty of arts 52 4 8
N. B. The salary of the king's physician is divided among those gentlemen who have no salaries as professors.

The college is endowed with a very fine library. It was founded in 1580 by Mr Clement Little, advocate, who bequeathed it to the town-council. They ordered a house to be built for it in the neighbourhood of St Giles's church, where it was for some time kept under the care of the eldest minister of Edinburgh, but was afterwards removed to the college. This collection is enriched, as well as others of a similar kind, by receiving a copy of every book entered in Stationer's hall, according to the statute for the encouragement of authors. Besides this, the only fund it has is the money paid by all the students at the university, except those of divinity, upon their being matriculated; and a sum of 51. given by each professor at his admission. The amount of these sums is uncertain.

The advocates library is a better collection than the former. It was founded, in 1682, by Sir George Mackenzie, lord advocate. Besides 30,000 printed volumes in all languages, here are also a very valuable collection of manuscripts of different kinds, prints, medals, coins, &c. The faculty have also in their possession an entire mummy, preserved in its original chest. This was presented by the earl of Morton, who bought it at the price of 300l.

25. *The High School.* The earliest institution of a grammar-school in Edinburgh seems to have been about the year 1519. The whole expence bestowed upon the first building of this kind amounted only to about 401. Sterling. Another building, which had been erected for the accommodation of the scholars in 1578, continued, notwithstanding the great increase of their number, to be used for that purpose till 1777. The foundation of the present new building was laid on the 24th of June that year by Sir William Forbes, Grand Master of the Free Masons. The total length of this building is 120 feet from south to north; the breadth in the middle 36, at each end 38 feet. The great hall where the boys meet for prayers, is 68 feet by 30. At each end of the hall is a room of 32 feet by 20, intended for libraries. The building is two stories high, the one 18, the other 17, feet in height. The expence of the whole when finished is reckoned at 3000 l.

26. *The exchange.* The foundation of this building was laid by Provost Drummond on the 13th of September 1753. It is a large and elegant building, of a square figure, with a court in the centre. The principal part forms the north side of the square, and extends 111 feet in length, and 51 in breadth. Pillars and arches supporting a platform run along the south front which faces the square, and forms a piazza. In the centre, four Corinthian pillars, whose bases rest upon the platform, support a pediment on which the arms of the city are engraved. This building on the south side is 60 feet high; but on the north, upwards of 100; owing to the extreme inequality of the ground on which it is built. The whole expence amounted to 31,457 l.

With regard to the political constitution of Edinburgh, the town-council have the direction of all public

lic affairs. The ordinary council consists only of 25 persons; but the *council ordinary and extraordinary*, of 33. The whole is composed of merchants and tradesmen, whose respective powers and interests are so interwoven, that a balance is preserved between the two bodies. The members of the town-council are partly elected by the members of the 14 incorporations, and they partly choose their own successors. The election is made in the following manner. First, a list or *leet* of six persons is made out by each incorporation; from which number, the deacon belonging to that incorporation must be chosen. These lists are then laid before the ordinary council of 25, who "shorten the leets," by expunging one half of the names from each; and from the three remaining ones the deacon is to be chosen. When this election is over, the new deacons are presented to the ordinary council, who choose six of them to be members of their body, and the six deacons of last year then walk off. The council of 25 next proceed to the election of three merchant and two trades counsellors. The members of council, who now amount to 30 in number, then make out *leets*, from which the lord provost, dean of guild, treasurer, and bailies, must be chosen. The candidates for each of these offices are three in number; and the election is made by the 30 members of council already mentioned, joined to the eight *extraordinary* council-deacons.

The lord provost of Edinburgh is high sheriff, coroner, and admiral, within the city and liberties, and the town, harbour, and road of Leith. He has also a jurisdiction in matters of life and death. He is preses of the convention of royal boroughs. Colonel of the trained bands, commander of the city-guard, and of Edinburgh jail. In the city he has the precedence of all the great officers of state, and of the nobility; walking on the right hand of the king, or of his majesty's commissioner; and has the privilege of having a sword and mace carried before him. Formerly he was also an officer in the Scots parliament. The magistrates are sheriffs-depute and justices of the peace; and the town-council are patrons of all the churches in Edinburgh, patrons of the university, and electors of the city's representative in parliament; and have the right of presenting to all offices of trust, honour, or profit, belonging to the city. They have besides a very ample jurisdiction both civil and criminal. The town-council are superiors of the Canongate, Portsburgh, and Leith; and appoint over these certain of their own number, who are called *baron bailies*; but the person who presides over Leith has the title of *admiral*, because he hath there a jurisdiction over maritime affairs. The baron-bailies appoint one or two of the inhabitants of their respective districts to be their substitutes, and these are called *resident bailies*. They hold courts in absence of the baron-bailies, for petty offences, and discussing civil causes of little moment.

No city in the world affords greater security to the inhabitants in their persons and properties, than Edinburgh. Robberies are here very rare, and a street-murder is unknown in the memory of man, so that a person may walk the streets at any hour of the night in perfect security. This is in a great measure owing to the *town-guard*. This institution originated from the consideration into which the citizens were thrown after the battle at Flodden. At that time, the town-council

commanded the inhabitants to assemble in defence of the city, and every fourth man to be on duty each night. This introduced a kind of personal duty for the defence of the town, called *watching and warding*; by which the trading part of the inhabitants were obliged in person to watch alternately, in order to prevent or suppress occasional disturbances. This, however, becoming in time extremely inconvenient, the town-council, in 1648, appointed a body of 60 men to be raised; the captain of which was to have a monthly pay of 11 l. 2 s. 3 d. two lieutenants of 2 l. each, two sergeants of 1 l. 5 s. and the private men of 15 s. each. No regular fund, however, was established for defraying this expence; the consequence of which was, that the old method of watching and warding was resumed; but the people on whom this service devolved, were now become so relaxed in their discipline, that the magistrates were threatened with having the king's troops quartered in the city if they did not appoint a sufficient guard. On this, 40 men were raised in 1679, and in 1682 the number was increased to 108. After the revolution, the town-council complained of the guard as a grievance, and requested parliament that it might be removed. Their request was immediately granted, and the old method of watching and warding was renewed. This, however, was now so intolerable, that the very next year they applied to parliament for leave to raise 126 men for the defence of the city, and to tax the citizens for their payment. This being granted, the corps was raised, which still continues under the name of the *town-guard*. The number of private men is about 75. They are paid chiefly by a tax on the trading people; these being the only persons formerly subject to watching and warding. This tax, however, amounts only to 1250 l. and as the expence of the guard amounts to 1400 l. the magistrates are obliged to defray the additional charge by other means.

The number of inhabitants in the city of Edinburgh is somewhat uncertain, and has been very variously calculated. By a survey made in the year 1775, it appears that the number of families in the city, Canongate and other suburbs, and the town of Leith, amounted to 13,806. The difficulty therefore is to fix the number of persons in a family. Dr Price fixes this number at $4\frac{1}{10}$; Mr Maitland, at $5\frac{1}{2}$; and Mr Arnot, at 6: so that, according to this last gentleman, the whole number of inhabitants is 82,836; to which he thinks 1400 more may be added for those in the garrison, hospitals, &c. There are, in Edinburgh, 14 incorporations, capable of choosing their own deacons, viz. The royal college of surgeons; the corporations of goldsmiths, skinners, furriers, hammermen, wrights and mafons, tailors, bakers, butchers, shoemakers, weavers, wankers, bonnet-makers, and merchant-company. The revenue of the city, arising partly from duties of different kinds, and partly from landed property, is estimated at about 10,000 l. per annum. As Edinburgh is not properly a seaport, it hath never been remarkable for trade. Its principal support arises from the supreme courts of justice, which are held there, and from the college. The exports and imports must all go and come by the town of Leith. See the article LEITH.

EDITOR, a person of learning, who has the care
15 F 2 of

Edinburgh,
Editor.

Edmund
Edwards.

of an impression of any work, particularly that of an ancient author: thus, Erasmus was a great editor; the Louvain doctors, Scaliger, Petavius, F. Sirmond, bishop Walton, Mr Hearne, Mr Ruddiman, &c. are likewise famous editors.

EDMUND I. and II. See (*History of*) ENGLAND.

EDUCATION, the instructing children, and youth in general, in such branches of knowledge and polite exercises as are suitable to their genius and station.

Education is a very extensive subject, that has employed the thoughts and pens of the greatest men: Locke, the archbishop of Cambray, Tanaquil Faber, M. Croufaz, Rollin, and Rousseau, may be consulted on this head.

The principal aim of parents should be, to know what sphere of life their children are designed to act in; what education is really suitable to them; what will be the consequence of neglecting that; and what chance a superior education will give them, for their advancement in the world. Their chief study should be to give their children such a degree of knowledge as will qualify them to fill some certain post or station in life: in short, to fit them for an employment suited to their condition and capacity, such as will make them happy in themselves and useful to society.

EDULCORATION, properly signifies the rendering substances more mild. Chemical edulcoration consists almost always in taking away acids and other saline substances; and this is effected by washing the bodies to which they adhere in a large quantity of water. The washing of diaphoretic antimony, powder of algaroth, &c. till the water comes off quite pure and insipid, are instances of chemical edulcoration.—In pharmacy, juleps, potions, and other medicines, are said to be *edulcorated*, by adding sugar, or syrup.

EDWARD, the name of several kings of England. See (*History of*) ENGLAND.

EDWARDS (George), fellow of the royal and antiquarian societies, was born at Stratford, a hamlet belonging to Westham in Essex, on the 3^d of April 1694. After having spent some time at school, he was put apprentice to a tradesman in Fenchurch-Street. His master, who was eminent both for his piety and skill in the languages, treated him with great kindness; but about the middle of his apprenticeship, an accident happened which totally put a stop to the hopes of young Edwards's advancing himself in the way of trade. Dr Nicolas, a person of eminence in the physical world, and a relation of his master's, happened to die. The Doctor's books were removed to an apartment occupied by Edwards, who eagerly employed all his leisure-hours, both in the day and great part of the night, in perusing those which treated of natural history, sculpture, painting, astronomy, and antiquities. The reading of these books entirely deprived him of any inclination for mercantile business he might have formerly had, and he resolved to travel into foreign countries. In 1716, he visited most of the principal towns in Holland, and in about a month returned to England. Two years after, he took a voyage to Norway, at the invitation of a gentleman who was disposed to be his friend, and who was nephew to the master of the ship in which he embarked. At this time Charles XII. was besieging Frederickshall; by which means our young naturalist was hindered from making such excursions into the coun-

try as otherwise he would have done, for the Swedes were very careful to confine such strangers as could not give a good account of themselves. But notwithstanding all his precaution, he was confined by the Danish guard, who supposed him to be a spy employed by the enemy to get intelligence of their designs. However, by obtaining testimonials of his innocence, a release was granted.

In 1718 he returned to England, and next year visited Paris by the way of Dieppe. During his stay in this country he made two journeys of 100 miles each; the first to Chalons in Champagne, in May 1720; the second on foot, to Orleans and Blois: but an edict happening at that time to be issued for securing vagrants, in order to transport themselves to America, as the banks of the Mississippi wanted population; our author narrowly escaped a western voyage.

On his arrival in England, Mr Edwards closely pursued his favourite study of natural history, applying himself to drawing and colouring such animals as fell under his notice. A strict attention to natural, more than picturesque beauty, claimed his earliest care: birds first engaged his particular attention; and, having purchased some of the best pictures of these subjects, he was induced to make a few drawings of his own; which were admired by the curious, who encouraged our young naturalist to proceed, by paying a good price for his early labours.

Among his first patrons and benefactors may be mentioned James Theobalds, Esq; of Lambeth; a gentleman zealous for the promotion of science. Our artist, thus unexpectedly encouraged, increased in skill and assiduity; and procured, by his application to his favourite pursuit, a decent subsistence, and a large acquaintance. However, he remitted his industry in 1731; when, in company with two of his relations, he made an excursion to Holland and Brabant, where he collected several scarce books and prints, and had an opportunity of examining the original pictures of several great masters at Antwerp, Brussels, Utrecht, and other cities.

In December 1733, by the recommendation of the great Sir Hans Sloane, Bart. president of the college of physicians, he was chosen librarian, and had apartments in the college. This office was peculiarly agreeable to his taste and inclination, as he had the opportunity of a constant recourse to a valuable library, filled with scarce and curious books on the subjects of natural history, which he so assiduously studied. By degrees he became one of the most eminent ornithologists in this or any other country. His merit is so well known in this respect, as to render any eulogium on his performances unnecessary: but it may be observed, that he never trusted to others what he could perform himself; and often found it so difficult to give satisfaction to his own mind, that he frequently made three or four drawings to delineate the object in its most lively character, attitude, and representation.

In 1743, the first volume of the *History of Birds* was published in quarto. His subscribers exceeding even his most sanguine expectations, a second volume appeared in 1747. The third volume was published in 1750. In 1751, the fourth volume came from the press. This volume being the last he intended to publish at that time, he seems to have considered it as the most

perfect

perfect of his productions in natural history; and therefore devoutly offered it up to the great God of nature, in humble gratitude for all the good things he had received from him in this world.

Our author, in 1758, continued his labours under a new title, viz. *Gleanings of Natural History*. A second volume of the *Gleanings* was published in 1760. The third part, which made the seventh and last volume of his works, appeared in 1764.

Thus our author, after a long series of years, the most studious application, and the most extensive correspondence to every quarter of the world, concluded a work which contains engravings and descriptions of more than 600 subjects in natural history, not before described or delineated. He likewise added a general index in French and English; which was afterwards perfected, with the Linnæan names, by that great naturalist Linnæus himself, who frequently honoured him with his friendship and correspondence.

Some time after Mr Edwards had been appointed library-keeper to the royal college of physicians, he was, on St Andrew's day, in the year 1750, presented with an honorary compliment by the president and council of the royal society, with the gold medal, the donation of Sir Godfrey Copley, Bart. annually given on that day to the author of any new discovery in art or nature, in consideration of his natural history just then completed. A copy of this medal he had afterwards engraved, and placed under the title in the first volume of his history. He was a few years afterwards elected fellow of the royal society, and of the society of antiquaries, London; and also a member of many of the academies of sciences and learning in different parts of Europe. In compliment to these honorary distinctions from such learned bodies, he presented elegant coloured copies of all his works, to the royal college of physicians, the royal society, the society of antiquarians, and to the British museum; also to the royal academy of sciences at Paris, from whom he received the most polite and obliging letter of thanks by their then secretary Monsieur Desouchy.

His collection of drawings, which amounted to upwards of 900, were purchased by the earl of Bute. They contain a great number of British as well as foreign birds, and other animals hitherto not accurately delineated or described.

After the publication of the last work, being arrived at his 70th year, he found his sight begin to fail, and his hand lost its wonted steadiness. He retired from public employment to a little house which he purchased at Plaistow; previous to which, he disposed of all the copies, as well as plates, of his works. The conversation of a few select friends, and the perusal of a few select books, were the amusement of the evening of his life; and now and then he made an excursion to some of the principal cities in England, particularly to Bristol, Bath, Exeter, and Norwich.

Some years before his death, the alarming depredations of a cancer, which baffled all the efforts of physical skill, deprived him of the sight of one of his eyes: he also suffered much from the stone, a complaint to which at different periods of his life he had been subject. Yet it has been remarked, that, in the severest paroxysms of misery, he was scarcely known to utter a single complaint.

Having completed his 80th year, emaciated with age and sickness, he died on the 23^d of July 1773, deservedly lamented by a numerous acquaintance.

EEL, in ichthyology, a species of *MURÆNA*.

EEL-Fishing. See *BOBBING* and *SNIGGLING*.

The silver-eel may be caught with several sorts of baits; as powdered-beef, garden-worms, minnows, hens-guts, fish-garbage, &c. The most proper time for taking them is in the night, fastening your line to the bank-sides, with your laying-hook in the water: or a line may be thrown with good store of hooks, baited and plumbed, with a float to discover where the line lies, that they may be taken up in the morning.

Microscopic EELS in four Paste. See *ANIMALCULE*, n^o 8.

EELS in *Vinegar*, are similar to those in four paste. The taste of vinegar was formerly thought to be occasioned by the biting of these little animals, but that opinion has been long ago exploded. Mentzelius says, he has observed the actual transformation of these little creatures into flies: but as this hath never been observed by any other person, nor is there an instance of such a transformation in any other animalcule, it seems probable that Mentzelius hath been mistaken in his observations.

EEL-Spear, a forked instrument with three or four jagged teeth, used for catching of eels: that with the four teeth is best, which they strike into the mud at the bottom of the river, and if it strike against any eels it never fails to bring them up.

EFFARE, or EFFRAYE, in heraldry, a term applied to a beast rearing on its hind-legs, as if it were frightened or provoked.

EFFECT, in a general sense, is that which results from, or is produced by, any cause. See *CAUSE*.

EFFERVESCENCE, an intestine motion excited betwixt the parts of two bodies of different natures, when they reciprocally dissolve each other. Effervescences are commonly attended with bubbles, vapours, small jets of the liquid, and a hissing noise; and these phenomena are occasioned by the air which at that time disengages itself. Sometimes also they are accompanied with a great degree of heat, the cause of which is not so well known. See *DISSOLUTION*.

Formerly the word *fermentation* was also applied to effervescences; but now that word is confined to the motion naturally excited in animal and vegetable matters, and from which new combinations among their principles take place.

EFFIGY, the portrait, figure, or exact representation of a person.

EFFLORESCENCE, among physicians, the same with exanthema. See *EXANTHEMA*.

EFFLORESCENCE, in chemistry, denotes the formation of a kind of mealy powder on the surface of certain bodies. Efflorescence is occasioned either by decomposition or drying. The efflorescence which happens to cobalt and martial pyrites is of the first, and that observed on the crystals of marine alkali, Glauber's salt, &c. of the latter kind. An efflorescence is sometimes also a species of crystallization, the nature of which is not well understood; as, the beautiful vegetations which shoot up from vitriolated tartar acidulated either with the vitriolic or nitrous acids, the saline spi-
culæ

culæ which are observed to shoot from salt butter, &c. **EFFLORESCENTIA**, in botany, (from *effloresco* to bloom); the precise time of the year and month in which every plant shews its first flowers.

Some plants flower twice a-year, as is common between the tropics; others oftener, as the monthly rose. The former are called by botanists *bifera*; the latter, *multifera*.

The time of flowering is determined by the degree of heat which each species requires. Mezeron and snow-drop produce their flowers in February; primrose, in the beginning of March; the greater number of plants, during the month of May; corn, and other grain, in the beginning of June; the vine, in the middle of the same month; several compound flowers, in the months of July and August; lastly, meadow-saffron flowers in the month of October, and announces the speedy approach of winter.

Grafs of Parnassus always flowers about the time of cutting down the hay; and in Sweden, the different species of thistle, mountain-lettuce, fuccory, and balfam, seldom flower till after the summer solstice: the country-men even know, as by a calendar, that the solstice is past, when these plants begin to produce their flowers.

The temperature of the seasons has a mighty influence both in accelerating and retarding the flowering of plants. All plants are earlier in warm countries: hence such as are cultivated out of their native soil, never flower, till the heat of the climate or situation into which they are removed, is equal to that under the influence of which they produced flowers in their own country. For this reason, all exotics from warm climates are later in this country than many plants which it naturally produces.

In general, we may observe, that the plants of the coldest countries, and those produced on the mountains in all climates, being of equal temperature, flower about the same time, viz. during our spring in Europe.

Plants that grow betwixt the tropics, and those of temperate climates, flower during our summer.

Plants of temperate climates, situated under the same parallel of latitude with certain parts of Europe, but removed much farther to the west, such as Canada, Virginia, and Mississippi, do not produce flowers till autumn.

Plants of temperate climates in the opposite hemisphere to Europe, flower during our winter, which is the summer of these regions.

Linnaeus and Adanson have given a sketch of the different times in which plants flower at Upsal and Paris.

EFFLUVIUM, in physiology, a term much used by philosophers and physicians, to express the minute particles which exhale from most, if not all, terrestrial bodies, in form of insensible vapours. See *PERSPIRATION*, *VAPOUR*, *SMELL*, and the *Index* subjoined to *MEDICINE*.

EFFUSION, in a general sense, the pouring out of any thing liquid, and that with some violence.

EFT, in zoology, the English name of the common lizard. See *LACERTA*.

EGERIA, or *ÆGERIA*, a nymph held in great veneration by the Romans. Numa Pompilius made

the people believe that he had composed the laws and religious ceremonies of Rome by her advice and assistance.

EGG, in physiology, a body formed in certain females, in which is contained an embryo or fetus of the same species, under a cortical surface or shell. The exterior part of an egg is the shell; which in a hen, for instance, is a white, thin, and friable cortex, including all the other parts. The shell becomes more brittle by being exposed to a dry heat. It is lined every where with a very thin but a pretty tough membrane, which dividing at, or very near, the obtuse end of the egg, forms a small bag, where only air is contained. In new-laid eggs this follicle appears very little, but becomes larger when the egg is kept.

Within this are contained the albumen or white, and the vitellus or yolk; each of which have their different virtues.

The albumen is a cold, viscous, white liquor in the egg, different in consistence in its different parts. It is observed, that there are two distinct albumens, each of which is inclosed in its proper membrane. Of these one is very thin and liquid: the other is more dense and viscous, and of a somewhat whiter colour; but, in old and stale eggs, after some days incubation, inclining to a yellow. As this second albumen covers the yolk on all sides, so it is itself surrounded by the other external liquid. The albumen of a fecundated egg, is as sweet and free from corruption, during all the time of incubation, as it is in new-laid eggs; as is also the vitellus. As the eggs of hens consist of two liquors separated one from another; and distinguished by two branches of umbilical veins, one of which goes to the vitellus, and the other to the albumen; so it is very probable that they are of different natures, and consequently appointed for different purposes.

When the vitellus grows warm with incubation, it becomes more humid, and like melting wax, or fat; whence it takes up more space. For as the fetus increases, the albumen insensibly wastes away, and condenses: the vitellus, on the contrary, seems to lose little or nothing of its bulk when the fetus is perfected, and only appears more liquid and humid when the abdomen of the fetus begins to be formed.

The chick in the egg is first nourished by the albumen; and when this is consumed, by the vitellus, as with milk. If we compare the chalazæ to the extremities of an axis passing through the vitellus, which is of a spherical form, this sphere will be composed of two unequal portions, its axis not passing through its centre; consequently, since it is heavier than the white, its smaller portion must always be uppermost in all positions of the egg.

The yellowish white round spot, called *cicatricula*, is placed on the middle of the smaller portion of the yolk; and therefore, from what has been said in the last paragraph, must always appear on the superior part of the vitellus.

Not long before the exclusion of the chick, the whole yolk is taken into its abdomen; and the shell, at the obtuse end of the egg, frequently appears cracked some time before the exclusion of the chick. The chick is sometimes observed to perforate the shell with its beak. After exclusion, the yolk is gradually wasted,

Eggs
||
Egypt.

ed, being conveyed into the small-guts by a small duct.

Eggs differ very much according to the birds that lay them, according to their colour, form, bigness, age, and the different way of dressing them: those most used in food are hens eggs; of which, such as are new-laid are best.

As to the preservation of eggs, it is observed that the egg is always quite full when it is first laid by the hen; but from that time it gradually becomes less and less so, to its decay: and however compact and close its shell may appear, it is nevertheless perforated with a multitude of small holes, though too minute for the discernment of our eyes, the effect of which is a daily decrease of matter within the egg, from the time of its being laid; and the perspiration is much quicker in hot weather than in cold.

To preserve the egg fresh, there needs no more than to preserve it full, and stop its transpiration; the method of doing which is, by stopping up those pores with matter which is not soluble in watery fluids: and on this principle it is, that all kinds of varnish, prepared with spirit of wine, will preserve eggs fresh for a long time, if they are carefully rubbed all over the shell: tallow, or mutton-fat, is also good for this purpose; for such as are rubbed over with this, will keep as long as those coated over with varnish.

For the chemical principles of eggs, and the various uses to which the eggs themselves may be applied, see the articles ALBUMEN, VITELLUS, CEMENT, CLARIFICATION, VARNISH, the *Index* subjoined to MEDICINE, &c.

Artificial Method of Hatching Eggs. See HATCHING.

EGINA. See *ÆGINA*.

EGINHART, secretary to the emperor Charles the Great, was a German. He is the most ancient historian of that nation, and wrote very eloquently for a man of the 9th century. It is said, that he insinuated himself so well into the favour of Imma, daughter to Charles the Great, that he obtained from her whatever he desired. Charles the Great, having found out the intrigue, did not do as Augustus, who is thought to have banished Ovid because he believed him to be too much favoured by Julia; for he married the two lovers together, and gave them a fine estate in land.

EGLANTINE, in botany. See ROSA.

EGRA, a town of Bohemia, formerly imperial, but now subject to the house of Austria. It contains a great number of able artificers, and is famous for its mineral waters. Wallenstein, the emperor's general, was assassinated here, in 1634. The French became masters of this town in 1741; but afterwards being blocked up, they were forced to capitulate on September 7th, 1743. It is looked upon as a town of the greatest consequence in Bohemia, except Prague. It is seated on a river of the same name, in E. Long. 12. 30. N. Lat. 50. 21.

EGYPT, an extensive country of Africa, lying between 30° and 36° of east longitude, and between 21° and 31° of north latitude; and bounded by the Mediterranean on the north; by the Red-sea and Isthmus of Suez, which divide it from Arabia, on the east; by Abyssinia or Ethiopia, on the south; and by the deserts of Barca and Nubia, on the west; being 600 miles

in length from north to south, and from 100 to 200 in breadth from east to west.

As a nation, the Egyptians may with justice lay claim to as high antiquity as any in the world. The country was most probably peopled by Mizraim the son of Ham, and grandson of Noah.—By its ancient inhabitants it was called *Chemias*, and is still called *Chemi* in the language of the *Copts* or native Egyptians; and this name it is supposed to have received from Ham the son of Noah. In scripture, we find it most generally named *Mizraim*; though in the Psalms it is styled the *land of Ham*.—To us it is best known by the name *Egypt*, the etymology of which is more uncertain.—Some derive it from *Ægyptus*, a supposed king of the country: others say it signifies no more than “the land of the *Copts*,” *Aia* in Greek signifying a country, and *Ægyptos* being easily softened into *Ægyptus*.—The most probable opinion, however, seems to be, that it received this name from the blackness of its soil, and the dark colour both of its river and inhabitants: for such a blackish colour is by the Greeks called *ægyptios*, from *gypti*, and *ægypti*, a vulture; and by the Latins, *subvulturius*. For the same reason, other names of a similar import have been given to this country by the Greeks; such as *Aeria*, and *Melambolus*: the river itself was called *Melo* or *Melas*; by the Hebrews, *Shihor*; and by the Ethiopians, *Siris*; all of which signify “black.”

Ancient Egypt is by some divided into two parts, the upper and lower Egypt: by others into three, the upper Egypt, properly so called, or *Thebais*; the middle Egypt, or *Heptanomis*; and the lower Egypt, the best part of which was the *Delta*, or that space encompassed by the branches of the Nile. See THEBAIS, &c.

The Egyptians, like the Chinese, pretend to an excessive antiquity, pretending to have records for ten, twenty, or even fifty thousand years. Thus their history is so much involved in obscurity and fable, that for many ages it must be passed over in silence.—The first mortal king whom the Egyptians own to have reigned in that country, was *Menes* or *Menar*. At what time he reigned, it would be to very little purpose to inquire. He had been preceded, however, by a set of *immortals*, who it seems left him the kingdom in a very bad situation: for the whole country, except Thebais, was a morass; the people also were entirely destitute of religion, and every kind of knowledge which could render their life comfortable and happy. Menes diverted the course of the Nile, which before that time had washed the foot of a sandy mountain near the borders of Libya, built the city of Memphis, instructed his subjects, and did other things of a similar kind which are usually attributed to the founders of kingdoms.

From the time of Menes, the Egyptian chronology is filled with a list of 330 kings, who reigned 1400 years, but did nothing worthy of notice.—The first distinct piece of history we find concerning Egypt, is the irruption of the *Shepherds*, by whom the country was subdued; but whether this revolution happened during the vast interval of indolence above-mentioned, or before or after, cannot be known. The affair is thus related by Manetho. It happened, in the reign of Timaüs king of Egypt, that God being displeased with the Egyptians, they suffered a great revolution: for a multitude of men, ig-
noble

Egypt.

Different
names.

Invaded by the shepherds.

noble in their race, took courage, and, pouring from the east into Egypt, made war with the inhabitants; who submitted to them without resistance. The shepherds, however, behaved with the greatest cruelty; burnt the cities, threw down the temples of the gods, and put to death the inhabitants, carrying the women and children into captivity. This people came from Arabia, and were called *Hyksos*, or *king-shepherds*. They held Egypt in subjection for 259 years; at the end of which period, they were obliged by a king of Upper Egypt, named *Amosis*, or *Thebanosis*, to leave the country. This prince's father had, it seems, gained great advantages over them, and flung them up in a place called *Abaris*, or *Avaris*, containing 10,000 acres of land. Here they were closely besieged by Amosis, with an army of 400,000 men; but at last the king, finding himself unable to reduce them by force, proposed an agreement, which was readily accepted. In consequence of this agreement, the shepherds withdrew from Egypt with their families, to the number of 240,000; and, taking the way of the desert, entered Syria: but, fearing the Assyrians, who were then very powerful, and masters of Asia, they entered the land of Judæa, and built there a city capable of holding so great a multitude, and called it *Jerusalem*.

As this account seems to bear some faint resemblance to the departure of the Israelites under Moses, some chronologers have supposed them to be the same event. This, however, is strenuously opposed by others; but to decide the question seems impossible. In these early ages, however, it would seem that the kingdom of Egypt had been very powerful, and its dominion very widely extended, since we find it said, that the *Babryans* revolted from Olymndyas another Egyptian king of very high antiquity, and of whose wealth the most marvellous accounts are given.

After an unknown interval of time from this monarch, reigned Sesostris. He was the first great warrior whose conquests are recorded with any degree of distinctness. In what age of the world he lived, is uncertain. Some chronologers, among whom is Sir Isaac Newton, are of opinion, that he is the Sefac, or Shishak, who took Jerusalem in the reign of Rehoboam the son of Solomon. Others, however, place him much earlier; and Mr Whiston will have him to be the Pharaoh who refused to part with the Israelites, and was at last drowned in the Red Sea. His reign is reckoned the most extraordinary part of the Egyptian history; and the following seems to be the least fabulous account that can be got of it. The father of Sesostris was told in a dream, by the god Vulcan, that his son, who was then newly born, or perhaps still unborn, should be lord of the whole earth. His father, upon the credit of this vision, got together all the males in the land of Egypt that were born on the same day with Sesostris; appointed nurses and proper persons to take care of them, and had them treated like his own child; being persuaded that they who had been the constant companions of his youth would prove the most faithful ministers and soldiers. As they grew up, they were inured to laborious exercises; and, in particular, were never permitted to taste any food till they had performed a course of 180 furlongs, upwards of 22 of our miles. When the old king imagined they were sufficiently educated in the martial

way he designed them to follow, they were sent by way of trial of their abilities against the Arabians. In this expedition Sesostris proved successful, and in the end subdued that people who had never before been conquered. He was sent to the westward, and conquered the greatest part of Africa; nor could he be stopped in his career, till he arrived at the Atlantic ocean. Whilst he was on this expedition, his father died; and then Sesostris resolved to fulfil the prediction of Vulcan, by actually conquering the whole world. As he knew that this must take up a long time, he prepared for his journey in the best manner possible. The kingdom he divided into 36 provinces, and endeavoured to secure the affections of the people by gifts both of money and land. He forgave all who had been guilty of high treason, and discharged the debts of all his soldiers. He then constituted his brother Arais, the supreme regent; but forbade him to use the diadem, and commanded him to offer no injury to the queen or her children, and to abstain from the royal concubines. His army consisted of 600,000 foot, 24,000 horse, and 27,000 chariots. Besides these land-forces, he had at sea two mighty fleets; one, according to Diodorus, of 400 sail. Of these fleets, one was designed to make conquests in the west, and the other in the east; and therefore the one was built on the Mediterranean, and the other on the Red Sea. The first of these conquered Cyprus, the coast of Phœnicia, and several of the islands called *Cyclades*: the other conquered all the coasts of the Red Sea; but its progress was stopped by shoals and difficult places which the navigators could not pass, so that he seems not to have made many conquests by sea.

With the land-forces Sesostris marched against the Ethiopians and Troglodites; whom he overcame, and obliged them to pay him a tribute of gold, ebony, and ivory. From thence he proceeded as far as the promontory of Dira, which lay near the straits of Babel-mandel, where he set up a pillar with an inscription in sacred characters. He then marched on to the country where cinnamon grows, or at least to some country where cinnamon at that time was brought, probably some place in India; and here he in like manner set up pillars, which were to be seen for many ages after. As to his farther conquests, it is agreed by almost all authors of antiquity, that he over-ran and pillaged the whole continent of Asia, and some part of Europe. He crossed the Ganges, and erected pillars on its banks; and from thence he is said to have marched eastward to the very extremity of the Asiatic continent. Returning from thence, he invaded the Scythians and Thracians; but all authors do not agree that he conquered them. Some even affirm, that he was overthrown by them with great slaughter, and obliged to abandon a great part of his booty and military stores. But, whether he had good or bad success in these parts, it is a common opinion that he settled a colony in Colchis. Herodotus, however, who gives the most particular account of the conquests of this monarch, does not say whether the colony was designedly planted by Sesostris; or whether part of his army loitered behind the rest, and took up their residence in that region. From his own knowledge, he asserts, that the inhabitants of that country were undoubtedly of Egyptian descent. This was evident from the personal

Egypt.

fonal resemblance they bore to the Egyptians, who were swarthy-complexioned and frizzle-haired; but more especially from the conformity of their customs, particularly circumcision.

The utmost boundary of this mighty monarch's conquests, however, was in the country of Thrace; for beyond this country his pillars were no where to be seen. These pillars he was accustomed to set up in every country which he conquered, with the following inscription, or one to the same purpose: "Sesostris, king of kings, and lord of lords, subdued this country by the power of his arms." Besides these, he left also statues of himself; two of which, according to Herodotus, were to be seen in his time, the one on the road between Ephesus and Phocæa, and the other between Smyrna and Sardis: they were armed after the Ethiopian and Egyptian manner, holding a javelin in one hand, and a bow in the other. Across the breast they had a line drawn from one shoulder to the other, with the following inscription; "This region I obtained by these my shoulders." They were mistaken for images of Memnon.

The reason given by Sesostris for his returning into Thrace from Thrace, and thus leaving the conquest of the world unfinished, was, the want of provisions for his army, and the difficulty of the passes. Most probably, however, his return was hastened by the intelligence he received from the high priest of Egypt, concerning the rebellious proceedings of his brother; who, encouraged by his long absence, had assumed the diadem, violated the queen, and also the royal concubines. On receiving this news, Sesostris hastened from Thrace; and, at the end of nine years, came to Pelusium in Egypt, attended by an innumerable multitude of captives taken from many different nations, and loaded with the spoils of Asia. The treacherous brother met him at this city; and it is said, with very little probability, that Sesostris accepted of an invitation to an entertainment from him. At this he drank freely, together with the queen and the rest of the royal family. During the continuance of the entertainment, Armais caused a great quantity of dried reeds to be laid round the apartment where they were to sleep; and as soon as they were retired to rest, set fire to the reeds. Sesostris perceiving the danger he was in; and that his guards, overcharged with liquor, were incapable of assisting him; rushed through the flames, and was followed by his wife and children. In thanksgiving for this wonderful deliverance, he made several donations to the gods, particularly to Vulcan the god of fire. He then took vengeance on his brother Armais, said to be the Danaus of the Greeks, who, being on this occasion driven out of Egypt, withdrew into Greece.

Sesostris now laid aside all thoughts of war; and applied himself wholly to such works as might tend to the public good, and his own future reputation. In order to prevent the incursions of the Syrians and Arabians, he fortified the east side of Egypt with a wall which ran from Pelusium through the desert to Heliopolis, for 187½ miles. He raised also an incredible number of vast and lofty mounds of earth, to which he removed such towns as had before been situated too low, in order to secure them from the inundations of the Nile. All the way from Memphis to the sea he dug canals which branched out from the Nile, and not

Egypt.

only made an easier communication between different places, but rendered the country in a great measure impassable to an enemy. He erected a temple in every city in Egypt, and dedicated it to the supreme deity of the place; but in the course of such a great undertaking as this necessarily must have been, he took care not to employ any of his Egyptian subjects. Thus he secured their affection, and employed the vast multitude of captives he had brought along with him; and to perpetuate the memory of a transaction so remarkable, he caused to be inscribed on all these temples, "No one native laboured hereon." In the city of Memphis, before the temple of Vulcan, he raised six gigantic statues, each of one stone. Two of them were 30 cubits high, representing himself and his wife. The other four were 20 cubits each, and represented his four sons. These he dedicated to Vulcan in memory of his abovementioned deliverance. He raised also two obelisks of marble 120 cubits high, and charged them with inscriptions, denoting the greatness of his power, his revenues, &c.

The captives taken by Sesostris are said to have been treated with the greatest barbarity, so that at last they resolved at all events to deliver themselves from a servitude so intolerable. The Babylonians particularly were concerned in this revolt, and laid waste the country to some extent; but being offered a pardon, and a place to dwell in, they were pacified, and built for themselves a city which they called *Babylon*. Towards the conquered princes who waited on him with their tribute, the Egyptian monarch behaved with unparalleled insolence. On certain occasions he is said to have unharnessed his horses, and, yoking kings together, made them draw his chariot. One day, however, observing one of the kings who drew his chariot to look back upon the wheels with great earnestness, he asked what made him look so attentively at them. The unhappy prince replied, "O king, the going round of the wheel puts me in mind of the vicissitudes of fortune: for as every part of the wheel is uppermost and lowermost by turns, so it is with men; who one day sit on a throne, and on the next are reduced to the vilest degree of slavery." This answer brought the insulting conqueror to his senses; so that he gave over the practice, and thenceforth treated his captives with great humanity. At length this mighty monarch lost his sight, and laid violent hands on himself.

After the death of Sesostris, we meet with another chasm of an indeterminate length in the Egyptian history. It concludes with the reign of Amasis or Amosis; who being a tyrant, his subjects joined Actisanes the king of Ethiopia, to drive him out. Thus Actisanes became master of the kingdom; and after his death follows another chasm in the history, during which the empire is said to have been in a state of anarchy for five generations.---This period brings us down to the times of the Trojan war. The reigning prince in Egypt was at that time called *Cetes*; by the Greeks, *Proteus*. The priests reported that he was a magician; and that he could assume any shape he pleased, even that of fire. This fable, as told by the Greeks, drew its origin from a custom among the Egyptians, perhaps introduced by Proteus. They were used to adorn and distinguish the heads of their kings with the representations of animals or vegetables, or

2
His great
works.

⁷ **Egypt.** even with burning incense, in order to strike the beholders with the greater awe. Whilst Proteus reigned, Paris or Alexander, the son of Priam king of Troy, was driven by a storm on the coasts of Egypt, with Helen, whom he was carrying off from her husband. But when the Egyptian monarch heard of the breach of hospitality committed by Paris, he seized him, his mistress, and companions, with all the riches he had brought away with him from Greece. He detained Helen, with all the effects belonging to Menelaus her husband, promising to restore them to the injured party whenever they were demanded; but commanded Paris and his companions to depart out of his dominions in three days, on pain of being treated as enemies. In what manner Paris afterwards prevailed upon Proteus to restore his mistress, we are not told; neither do we know any thing further of the transactions of this prince's reign nor of his successors, except what has entirely the air of fable, till the days of *Sabbaco* the Ethiopian, who again conquered this kingdom. He began his reign with an act of great cruelty, causing the conquered prince to be burnt alive: nevertheless, he no sooner saw himself firmly established on the throne of Egypt, than he became a new man; so that he is highly extolled for his mercy, clemency, and wisdom. He is thought to have been the *So* mentioned in scripture, and who entered into a league with Hoshea king of Israel against *Shalmaneser* king of Assyria. He is said to have been excited to the invasion of Egypt by a dream or vision, in which he was assured, that he should hold that kingdom for 50 years. Accordingly, he conquered Egypt, as had been foretold; and at the expiration of the time above-mentioned, he had another dream, in which the tutelar god of Thebes acquainted him, that he could no longer hold the kingdom of Egypt with safety and happiness, unless he massacred the priests as he passed through them with his guards. Being haunted with this vision, and at the same time abhorring to hold the kingdom on such terms, he sent for the priests, and acquainted them with what seemed to be the will of the gods. Upon this it was concluded, that it was the pleasure of the Deity that *Sabbaco* should remain no longer in Egypt; and therefore he immediately quitted that kingdom, and returned to Ethiopia.

⁹ **Remarkable story of Sethon.** Of *Asiath*, who was *Sabbaco's* immediate successor, we have no particulars worth notice. After him reigned one *Sethon*, who was both king and priest of Vulcan. He gave himself up to religious contemplation; and not only neglected the military class, but deprived them of their lands. At this they were so much incensed, that they entered into an agreement not to bear arms under him; and, in this state of affairs, *Sennacherib* king of Assyria arrived before Pelusium with a mighty army. *Sethon* now applied to his soldiers, but in vain: they unanimously persisted in refusing to march under his banner. Being therefore destitute of all human aid, he applied to the god Vulcan, and requested him to deliver him from his enemies. Whilst he was yet in the temple of that god, it is said, he fell into a deep sleep; during which, he saw Vulcan standing at his side, and exhorting him to take courage. He promised, that if *Sethon* would but go out against the Assyrians, he should obtain a complete victory over them. Encouraged by this assurance, the king assem-

bled a body of artificers, shop-keepers, and labourers; and, with this undisciplined rabble, marched towards Pelusium. He had no occasion, however, to fight; for the very night after his arrival at Pelusium, an innumerable multitude of field-rats entering the enemies' camp, gnawed to pieces their quivers, bowstrings, and shield-straps. Next morning, when *Sethon* found the enemy disarmed, and on that account beginning to fly, he pursued them to a great distance, making a terrible slaughter. In memory of this extraordinary event, a statue of *Sethon* was erected in the temple of Vulcan, holding in one hand a rat, and delivering these words: "Whosoever beholdeth me, let him be pious."

Soon after the death of *Sethon*, the form of government in Egypt was totally changed. The kingdom was divided into twelve parts, over which as many of the chief nobility presided. This division, however, subsisted but for a short time. *Plammitichus*, one of the twelve, dethroned all the rest, 15 years after the division had been made. The history now begins to be divested of fable, and from this time may be accounted equally certain with that of any other nation. The vast conquests of *Sesotris* were now no longer known; for *Plammitichus* possessed no more than the country of Egypt itself. It appears, indeed, that none of the successors of *Sesotris*, or even that monarch himself, had made use of any means to keep in subjection the countries he had once conquered. Perhaps, indeed, his design originally was rather to pillage than to conquer; and therefore, on his return, his vast empire vanished at once. *Plammitichus*, however, endeavoured to extend his dominions by making war on his neighbours; but by putting more confidence in foreign auxiliaries than in his own subjects, the latter were so much offended, that upwards of 200,000 fighting men emigrated in a body, and took up their residence in Ethiopia.—To repair this loss, *Plammitichus* earnestly applied himself to the advancement of commerce; and opened his ports to all strangers, whom he greatly caressed, contrary to the cruel maxims of his predecessors, who refused to admit them into the country. He also laid siege to the city of *Azotus* in Syria, which held out for 29 years against the whole strength of the kingdom; from which we may gather, that, as a warrior, *Plammitichus* was by no means remarkable. He is reported to have been the first king of Egypt that drank wine. He also sent to discover the springs of the Nile; and is said to have attempted to discover the most ancient nation in the world by the following method. Having procured two newly born children, he caused them to be brought up in such a manner, that they never heard a human voice. He imagined that these children would naturally speak the original language of mankind: therefore, when, at two years of age, they pronounced the Phrygian word *beccos*, (or some sound resembling it), which signifies bread, he concluded that the Phrygians were the most ancient people in the world.

Nechus, the son and successor of *Plammitichus*, is the *Pharaoh-Necho* of scripture, and was a prince of an enterprising and warlike genius. In the beginning of his reign, he attempted to cut through the isthmus of Suez, between the Red Sea and the Mediterranean; but, through the invincible obstacles which nature has thrown in the way of such undertakings, he was obli-

Egypt.

god to abandon the enterprise, after having lost 120,000 men in the attempt. After this, he sent a ship, manned with some expert Phœnician mariners, on a voyage to explore the coasts of Africa. Accordingly, they performed the voyage; sailed round the continent of Africa; and after three years returned to Egypt, where their relation was deemed incredible. See AFRICA.

12

is wars
and Nebu-
chadnezzar.

The most remarkable wars in which this king was engaged, are recorded in the sacred writings. He went out against the king of Assyria, by the divine command, as he himself told Josiah; but being opposed by this king of Judæa, he defeated and killed him at Megiddo; after which he set up, in that country, king Jehoiakim, and imposed on him an annual tribute of 100 talents of silver and one talent of gold. He then proceeded against the king of Assyria; and weakened him so much, that the empire was soon after dissolved. Thus he became master of Syria and Phœnicia; but, in a short time, Nebuchadnezzar king of Babylon came against him with a mighty army. The Egyptian monarch, not daunted by the formidable appearance of his antagonist, boldly ventured a battle; but was overthrown with prodigious slaughter, and Nebuchadnezzar became master of all the country to the very gates of Pelusium.

13

Apries a
martial and
successful
prince.

The reign of Apries, the *Pharaoh-Hopbra* of scripture, presents us with a new revolution in the Egyptian affairs. He is represented as a martial prince, and in the beginning of his reign very successful. He took by storm the rich city of Sidon; and having overcome the Cypriots and Phœnicians in a sea-fight, returned to Egypt laden with spoil. This success probably incited Zedekiah king of Judæa to enter into an alliance with him against Nebuchadnezzar king of Babylon. The bad success of this alliance was foretold by the prophet Jeremiah; and accordingly it happened. For Nebuchadnezzar having fat down with his army before Jerusalem, Apries marched from Egypt with a design to relieve the city; but no sooner did he perceive the Babylonians approaching him, than he retreated as fast as he could, leaving the Jews exposed to the rage of their merciless enemies; who were thereupon treated as Jeremiah had foretold; and by this step Apries brought upon himself the vengeance denounced by the same prophet.—The manner in which these predictions were fulfilled, is as follows. The Cyrenæans, a colony of the Greeks, being greatly strengthened by a numerous supply of their countrymen under their third king *Battus* styled the happy, and encouraged by the Pythian oracle, began to drive out their Libyan neighbours, and share their possessions among themselves. Hereupon Andican king of Libya sent a submissive embassy to Apries, and implored his protection against the Cyrenæans. Apries complied with his request, and sent a powerful army to his relief. The Egyptians were defeated with great slaughter; and those who returned complained that the army had been sent off by Apries in order to be destroyed, and that he might tyrannize without controul over the remainder of his subjects. This thought catching the attention of the giddy multitude, an almost universal defection ensued. Apries sent one Amasis, a particular friend, in whom he thought he could confide, to bring back his people to a sense of their duty. But by this friend he was betrayed; for Amasis, taking the opportunity of the present ferment, caused himself to be

14

kiah.

15

His subjects
revolt.

proclaimed king. Apries then dispatched one Patabemis, with orders to take Amasis, and bring him alive before him. This he found impossible, and therefore returned without his prisoner; at which the king was so enraged, that he commanded Patabemis's nose and ears to be cut off. This piece of cruelty completed his ruin; for when the rest of the Egyptians who continued faithful to Apries beheld the inhuman mutilation of so worthy and noble a person as Patabemis was, they to a man deserted Apries, and went over to Amasis.

Both parties now prepared for war; the usurper having under his command the whole body of native Egyptians; and Apries only those Ionians, Carians, and other mercenaries whom he could engage in his service. The army of Apries amounted only to 30,000; but, though greatly inferior in number to the troops of his rival, as he well knew that the Greeks were much superior in valour, he did not doubt of victory. Nay, so far was Apries puffed up with this notion, that he did not believe it was in the power, even of any God, to deprive him of his kingdom. The two armies fought, and drew up in order of battle near Memphis. A bloody engagement ensued; in which, tho' the army of Apries behaved with the greatest resolution, they were at last overpowered with numbers, and utterly defeated, the king himself being taken prisoner. Amasis now took possession of the throne without opposition. He confined Apries in one of his palaces, but treated him with great care and respect. The people, however, were implacable, and could not be satisfied while he enjoyed his life. Amasis, therefore, at last found himself obliged to deliver him into their hands. Thus the prediction received its final completion: Apries was delivered up to those who sought his life; and who no sooner had him in their power, than they strangled him, and laid his body in the sepulchre of his ancestors.

16
Apries de-
feated and
taken pri-
soner by
Amasis.

During these intestine broils, which must have greatly weakened the kingdom, it is probable that Nebuchadnezzar invaded Egypt. He had been for 13 years before this employed in besieging Tyre, and at last had nothing but an empty city for his pains. To make himself some amends, therefore, he entered Egypt, miserably harassed the country, killed and carried away great numbers of the inhabitants, so that the country did not recover from the effects of this incursion for a long time after. In this expedition, however, he seems not to have aimed at any permanent conquest, but to have been induced to it merely by the love of plunder, and of this he carried with him an immense quantity to Babylon.

17
Egypt in-
vaded by
Nebuchad-
nezzar.

During the reign of Amasis, Egypt is said to have been perfectly happy, and to have contained 20,000 populous cities. That good order might be kept among such vast numbers of people, Amasis enacted a law, by which every Egyptian was bound once a-year to inform the governor of his province by what means he gained his livelihood; and if he failed of this, to put him to death. The same punishment he decreed to those who could not give a satisfactory account of themselves.

This monarch was a great favourite of the Greeks, and married a woman of Grecian extract. To many Greek cities, as well as particular persons, he made

18
Happy ad-
ministra-
tion of
Amasis.

EGYPT.

considerable presents. Beside these, he gave leave to the Greeks in general to come into Egypt, and settle either in the city of Naucratis, or carry on their trade upon the sea-coasts; granting them also temples, and places where they might erect temples to their own deities. He received also a visit from Solon the celebrated Athenian lawgiver, and reduced the island of Cyprus under his subjection.

19
Offends
Cambyzes
king of
Persia.

This great prosperity, however, ended with the death of Amasis, or indeed before it. The Egyptian monarch had some how or other incensed Phanes king of Persia. The cause of the quarrel is uncertain; but whatever it was, the Persian monarch vowed the destruction of Amasis. In the mean time Phanes of Halicarnassus, commander of the Grecian auxiliaries in the pay of Amasis, took some private disgust; and leaving Egypt, embarked for Persia. He was a wife and able general, perfectly well acquainted with every thing that related to Egypt; and had great credit with the Greeks in that country. Amasis was immediately sensible how great the loss of this man would be to him, and therefore sent after him a trusty eunuch with a swift galley. Phanes was accordingly overtaken in Lycia, but not brought back; for, making his guard drunk, he continued his journey to Persia, and presented himself before Cambyzes, as he was meditating the destruction of the Egyptian monarchy.

20
And Poly-
crates ty-
rant of
Samos.

At this dangerous crisis, also, the Egyptian monarch imprudently made Polycrates the tyrant of Samos his enemy. This man had been the most remarkable, perhaps, of any recorded in history, for an uninterrupted course of success, without the intervention of one single unfortunate event. Amasis, who was at this time in strict alliance with Polycrates, wrote him a letter, in which, after congratulating him on his prosperity, he told him that he was afraid lest his successes were too many, and he might be suddenly thrown down into the greatest misery. For this reason he advised him voluntarily to take away something from his own happiness; and to cast away that which would grieve him most if he was accidentally to lose it. Polycrates followed his advice, and threw into the sea a signet of inestimable value. This, however, did not answer the intended purpose. The signet happened to be swallowed by a fish, which was taken a few days afterwards, and thus was restored to Polycrates. Of this Amasis was no sooner informed, than, considering Polycrates as really unhappy, and already on the brink of destruction, he resolved to put an end to the friendship which subsisted between them. For this purpose he dispatched an herald to Samos, commanding him to acquaint Polycrates, that he renounced his alliance, and all the obligations between them; that he might not mourn his misfortunes with the sorrow of a friend. Thus Amasis left Polycrates at liberty to act against him, if he chose to do so; and accordingly he offered to assist Cambyzes with a fleet of ships in his Egyptian expedition.

21
Egypt in-
vaded by
Cambyzes.

Amasis had not, however, the misfortune to see the calamities of his country. He died about 525 years before Christ, after a reign of 44 years; and left the kingdom to his son Psammenitus, just as Cambyzes was approaching the frontiers of the kingdom. The new prince was scarce seated on the throne, when the Persians appeared. Psammenitus drew together what forces

EGYPT.

he could, in order to prevent them from entering the kingdom. Cambyzes, however, immediately laid siege to Pelusium, and made himself master of it by the following stratagem: he placed in the front of his army a great number of cats, dogs, and other animals that were deemed sacred by the Egyptians. He then attacked the city, and took it without opposition; the garrison, which consisted entirely of Egyptians, not daring to throw a dart or shoot an arrow against their enemies, lest they should kill some of the holy animals.

22
Crucity
defeat of
the Egypt-
ians.

Cambyzes had scarce taken possession of the city, when Psammenitus advanced against him with a numerous army. But, before the engagement, the Greeks who served under Psammenitus, to show their indignation against their treacherous countryman Phanes, brought his children into the camp, killed them in the presence of their father and of the two armies, and then drank their blood. The Persians, enraged at so cruel a sight, fell upon the Egyptians with the utmost fury, put them to flight, and cut the greatest part of them in pieces. Those who escaped, fled to Memphis, where they were soon after guilty of a horrid outrage. Cambyzes sent a herald to them in a ship from Mitylene: but no sooner did they see her come into the port, than they flocked down to the shore, destroyed the ship, and tore to pieces the herald and all the crew; afterwards carrying their mangled limbs into the city, in a kind of barbarous triumph. Not long after, they were obliged to surrender; and thus Psammenitus fell into the hands of his inveterate enemy, who was now enraged beyond measure at the cruelties exercised upon the children of Phanes, the herald, and the Mitylenæan sailors.

23
Their
dreadful
punishment
by Cam-
byzes.

The rapid success of the Persians struck with such terror the Libyans, Cyrenæans, Barchanæ, and other dependents or allies of the Egyptian monarch, that they immediately submitted. Nothing now remained but to dispose of the captive king, and revenge on him and his subjects the cruelties which they had committed. This the merciless victor executed in the severest manner. On the 10th day after Memphis had been taken, Psammenitus and the chief of the Egyptian nobility were ignominiously sent into one of the suburbs of that city. The king being there seated in a proper place, saw his daughter coming along in the habit of a poor slave with a pitcher to fetch water from the river, and followed by the daughters of the greatest families in Egypt, all in the same miserable garb, with pitchers in their hands, drowned in tears, and loudly bemoaning their miserable situation. When the fathers saw their daughters in this distress, they burst into tears, all but Psammenitus, who only cast his eyes on the ground and kept them fixed there. After the young women, came the son of Psammenitus, with 2000 of the young nobility, all of them with bits in their mouths, and halters round their necks, led to execution. This was done to expiate the murder of the Persian herald and the Mitylenæan sailors; for Cambyzes caused ten Egyptians of the first rank to be publicly executed for every one of those that had been slain. Psammenitus, however, observed the same conduct as before, keeping his eyes steadfastly fixed on the ground, though all the Egyptians around him made the loudest lamentations. A little after this he saw an intimate friend and

com-

Egypt.

companion, now advanced in years, who, having been plundered of all he had, was begging his bread from door to door in the suburbs. As soon as he saw this man, Ptolemy wept bitterly; and calling out to him by his name, struck himself on the head as if he had been frantic. Of this the spies who had been sent over him to observe his behaviour, gave immediate notice to Cambyfes, who thereupon sent a messenger to inquire the cause of such immoderate grief. Ptolemy answered, That the calamities of his own family confounded him, and were too great to be lamented by any outward signs of grief; but the extreme distress of a bosom friend gave more room for reflection, and therefore extorted tears from him. With this answer Cambyfes was so affected, that he sent orders to prevent the execution of the king's son; but these came too late, for the young prince had been put to death before any of the rest. Ptolemy himself was then sent for into the city, and restored to his liberty: and, had he not shewed a desire of revenge, might perhaps have been trusted with the government of Egypt; but being discovered hatching schemes of that kind, he was seized, and condemned to drink bull's blood.

24
Egypt becomes a province of the Persian and afterwards of the Grecian empire.

The Egyptians were now reduced to the lowest degree of slavery. Their country became a province of the Persian empire: the body of Amasis their late king, was taken out of his grave; and after being mangled in a shocking manner, was finally burnt. But what seemed more grievous than all the rest, their god Apis was slain, and his priests ignominiously scourged; and this inspired the whole nation with such an hatred to the Persians, that they could never afterwards be reconciled to them. As long as the Persian empire subsisted, the Egyptians could never shake off their yoke. They frequently revolted indeed, but were always overthrown with prodigious loss. At last they submitted, without opposition, to Alexander the Great: after his death, Egypt again became a powerful kingdom; though since the conquest of it by Cambyfes to the present time, it hath never been governed but by foreign princes, agreeable to the prophecy of Ezekiel, "There shall be no more a prince of the land of Egypt."

25
Assigned to Ptolemy Lagus, who assumes the title of king.

On the death of Alexander the Great, Egypt, together with Libya, and that part of Arabia which borders on Egypt, were assigned to Ptolemy Lagus as governor under Alexander's son by Roxana, who was but newly born. Nothing was farther from the intention of this governor, than to keep the provinces in trust for another. He did not, however, assume the title of king, till he perceived his authority so firmly established that it could not be shaken; and this did not happen till 19 years after the death of Alexander, when Antigonus and Demetrius had unsuccessfully attempted the conquest of Egypt.

From the time of his first establishment on the throne, Ptolemy, who had assumed the title of *Soter*, reigned 20 years; which added to the former 19, make up the 39 years which historians commonly allow him to have reigned alone.—In the 39th year of his reign, he made one of his sons, named *Philadelphus*, partner in the empire; declaring him his successor, to the prejudice of his eldest son named *Ceraunus*; being excited thereto by his violent love for *Berenice* Philadelphus's mother. When the succession was thus settled, Ceraunus im-

mediately quitted the court; and fled at last into Syria, where he was received with open arms by Seleucus Nicator, whom he afterwards murdered.

The most remarkable transaction of this reign was the embellishing of the city of Alexandria, which Ptolemy made the capital of his new kingdom, and of which an account is given under the article *ALEXANDRIA*. About 284 years before Christ, died Ptolemy Soter, in the 41st year of his reign, and 84th of his age. He was the best prince of his race; and left behind him an example of prudence, justice, and clemency, which few of his successors chose to follow. Besides the provinces originally assigned to him, he had added to his empire those of *Cælo-Syria*, *Ethiopia*, *Pamphylia*, *Lycia*, *Caria*, and some of the *Cyclades*. His successor, Ptolemy Philadelphus, added nothing to the extent of the empire; nor did he perform any thing worthy of notice except embellishing further the city of Alexandria, and entering into an alliance with the Romans. In his time, one Magas, the governor of Libya and Cyrene, revolted; and held these provinces as an independent prince, notwithstanding the utmost efforts of Ptolemy to reduce him. At last an accommodation took place; and a marriage was proposed between *Berenice*, the only daughter of Magas, and Ptolemy's eldest son. The young prince was to receive all her father's dominions by way of dowry, and thus they would again be brought under the dominion of Ptolemy's family. But before this treaty could be put in execution, Magas died; and then *Apamea*, the prince's mother, did all she could to prevent the match. This, however, she was not able to do; though her efforts for that purpose produced a destructive war of four years continuance with Antiochus Theus king of Syria, and the acting of a cruel tragedy in the family of the latter. See *SYRIA*.

26
Succeeded by Philadelphus.

About 246 years before Christ, Ptolemy Philadelphus died; and was succeeded by his eldest son Ptolemy, who had been married to *Berenice* the daughter of Magas, as above related. In the beginning of his reign, he found himself engaged in a war with Antiochus Theus king of Syria. From this he returned victorious, and brought with him 2500 statues and pictures, among which were many of the ancient Egyptian idols, which had been carried away by Cambyfes into Persia. These were restored by Ptolemy to their ancient temples; in memory of which favour, the Egyptians gave him the surname of *Euergetes*, or the Beneficent. In this expedition, he greatly enlarged his dominions, making himself master of all the countries that lie between mount *Taurus* and the confines of *India*. An account of these conquests was given by himself, inscribed on a monument, to the following effect. "Ptolemy Euergetes, having received from his father the sovereignty of Egypt, Libya, Syria, Phœnice, Cyprus, Lycia, Caria, and the other *Cyclades*, assembled a mighty army of horse and foot, with a great fleet, and elephants, out of *Trogloditia* and *Ethiopia*; some of which had been taken by his father, and the rest by himself, and brought from thence, and trained up for war: with this great force he sailed into Asia; and having conquered all the provinces which lie on this side the *Euphrates*, *Cilicia*, *Pamphylia*, *Jonia*, the *Hellepont*, and *Thrace*, he crossed that river with all the forces of the conquered countries, and the kings

27
Ptolemy Euergetes a great conqueror.

Egypt. of those nations, and reduced Mesopotamia, Babylonia, Susia, Persia, Media, and all the country as far as Bactria."

On the king's return from this expedition, he passed through Jerusalem, where he offered many sacrifices to the God of Israel, and ever afterwards expressed a great favour for the Jewish nation. At this time, the Jews were tributaries to the Egyptian monarchs, and paid them annually 20 talents of silver. This tribute, however, Onias, who was then high priest, being of a very covetous disposition, had for a long time neglected to pay, so that the arrears amounted to a very large sum. Soon after his return, therefore, Ptolemy sent one of his courtiers named *Athenion* to demand the money, and desired him to acquaint the Jews that he would make war upon them in case of a refusal. A young man, however, named *Joseph*, nephew to Onias, not only found means to avert the king's anger, but even got himself chosen his receiver-general, and by his faithful discharge of that important trust, continued in high favour with Ptolemy as long as he lived.

Ptolemy Euergetes, having at last concluded a peace with Seleucus the successor of Antiochus Theus king of Syria, attempted the enlargement of his dominions on the south side. In this he was attended with such success, that he made himself master of all the coasts of the Red Sea, both on the Arabian and Ethiopian sides, quite down to the straits of Babel-mandel. On his return he was met by ambassadors from the Achæans, imploring his assistance against the Etolians and Lacedæmonians. This the king readily promised them: but they having in the mean time engaged Antigonus king of Macedon to support them, Ptolemy was so much offended, that he sent powerful succours to Cleomenes king of Sparta; hoping, by that means, to humble both the Achæans and their new ally Antigonus. In this, however, he was disappointed; for Cleomenes, after having gained very considerable advantages over the enemy, was at last entirely defeated in the battle of Sellasia, and obliged to take refuge in Ptolemy's dominions. He was received by the Egyptian monarch with the greatest demonstrations of kindness; a yearly pension of 24 talents was assigned him, with a promise of restoring him to the Spartan throne; but before this could be accomplished, the king of Egypt died, in the 27th year of his reign, and was succeeded by his son Ptolemy Philopator.

Thus we have seen the Egyptian empire brought to a very great height of power; and had the succeeding monarchs been careful to preserve that strength of empire transmitted to them by Euergetes, it is very probable that Egypt might have been capable of holding the balance against Rome, and, after the destruction of Carthage, prevented that haughty city from becoming mistress of the world. But after the death of Ptolemy Euergetes, the Egyptian empire, being governed only by weak or vicious monarchs, quickly declined, and from that time makes no conspicuous figure in history. Ptolemy Philopator began his reign with the murder of his brother; after which, giving himself up to all manner of licentiousness, the kingdom fell into a kind of anarchy. Cleomenes, the Spartan king, still resided at court; and being now unable to bear the dissolute manners which prevailed there, he pressed Philopator to give him the assistance he had

promised for restoring him to the throne of Sparta. This he the rather insisted upon, because he had received advice that Antigonus king of Macedon was dead, that the Achæans were engaged in a war with the Etolians, and that the Lacedæmonians had joined the latter against the Achæans and Macedonians. Ptolemy, when afraid of his brother Magas, had indeed promised to assist the king of Sparta with a powerful fleet, hoping by this means to attach him to his own interest; but now when Magas was out of the way, it was determined by the king, or rather his ministers, that Cleomenes should not be assisted, nor even allowed to leave the kingdom; and this extravagant resolution produced the desperate attempt of Cleomenes, of which an account is given in the history of SPARTA.

Of the disorders which now ensued in the government, Antiochus, king of Syria, surnamed *the Great*, took the advantage, and attempted to wrest from Ptolemy the provinces of Cælo-Syria and Palestine: but in this he was finally disappointed; and might easily have been totally driven out of Syria, had not Ptolemy been too much taken up with his debaucheries to think of carrying on the war. The discontent occasioned by this piece of negligence soon produced a civil war in his dominions, and the whole kingdom continued in the utmost confusion till his death, which happened in the 17th year of his reign, and 37th of his age.

During the reign of Philopator happened a very extraordinary event with regard to the Jews, which is mentioned in the Maccabees *. The king of Egypt, while on his Syrian expedition, had attempted to enter the temple of Jerusalem; but being hindered by the Jews, he was filled with the utmost rage against the whole nation. On his return to Alexandria, he resolved to make those who dwelt in that city feel the first effects of his vengeance. He began with publishing a decree, which he caused to be engraved on a pillar erected for that purpose at the gate of his palace, excluding all those who did not sacrifice to the gods worshipped by the king. By this means the Jews were debarred from suing to him for justice, or obtaining his protection when they happened to stand in need of it. By the favour of Alexander the Great, Ptolemy Soter, and Euergetes, the Jews enjoyed, at Alexandria, the same privileges with the Macedonians. In that metropolis the inhabitants were divided into three ranks or classes. In the first were the Macedonians, or original founders of the city, and along with them were enrolled the Jews. In the second were the Mercenaries who had served under Alexander; and in the third, the native Egyptians. Ptolemy now, to be revenged of the Jews, ordered, by another decree, that they should be degraded from the first rank, and enrolled among the native Egyptians. By the same decree it was enacted, that all of that nation should appear at an appointed time before the proper officers, in order to be enrolled among the common people; that at the time of their enrollment they should have the mark of an ivy leaf, the badge of Bacchus, impressed with a hot iron on their faces; that all who were thus marked, should be made slaves; and lastly, that if any one should stand out against this decree, he should be immediately put to death. That he might not, however, seem an enemy to the whole nation, he declared, that those who sacrificed to his gods should enjoy their for-

men privileges, and remain in the same state. Yet, notwithstanding this tempting offer, 300 only, out of many thousand Jews who lived in Alexandria, could be prevailed upon to abandon their religion in order to save themselves from slavery.

The apostates were immediately excommunicated by their brethren: and this their enemies construed as done in opposition to the king's order; which threw the tyrant into such a rage, that he resolved to extirpate the whole nation, beginning with the Jews who lived in Alexandria and other cities of Egypt, and proceeding from thence to Judæa and Jerusalem itself. In consequence of this cruel resolution, he commanded all the Jews that lived in any part of Egypt to be brought in chains to Alexandria, and there to be shut up in the Hippodrome, which was a very spacious place without the city, where the people used to assemble to see horse-races and other public diversions. He then sent for Hermon, master of the elephants; and commanded him to have 500 of these animals ready against the next day, to let loose upon the Jews in the Hippodrome. But when the elephants were prepared for the execution, and the people were assembled in great crowds to see it, they were, for that day, disappointed by the king's absence. For, having been late up the night before with some of his debauched companions, he did not awake till the time for the show was over, and the spectators returned home. He therefore ordered one of his servants to call him early on the following day, that the people might not meet with a second disappointment. But when the person awaked him according to his order, the king was not yet returned to his senses; having withdrawn, exceedingly drunk, only a short time before. As he did not remember the order, he therefore fell into a violent passion, and threatened with death the servant who had awaked him; and this caused the show to be put off till the third day. At last the king came to the Hippodrome, attended with a vast multitude of spectators; but when the elephants were let loose, instead of falling upon the Jews, they turned their rage against the spectators and soldiers, and destroyed great numbers of them. At the same time, some frightful appearances which were seen in the air, so terrified the king that he commanded the Jews to be immediately set at liberty, and restored them to their former privileges. No sooner were they delivered from this danger, than they demanded leave to put to death such of their nation as had abandoned their religion; and this being granted, they dispatched the apostates without excepting a single man.

Philopator was succeeded by Ptolemy Epiphanes; and he, after a reign of 24 years, by Ptolemy Philometor. In the beginning of his reign, a war commenced with the king of Syria, who had seized on the provinces of Cæle-Syria and Palestine in the preceding reign. In the course of this war, Philometor was either voluntarily delivered up to Antiochus, or taken prisoner. But, however this was, the Alexandrians despairing of his ever being able to recover his liberty, raised to the throne his brother Ptolemy, who took the name of Euergetes II. but was afterwards called *Physcon*, or the *great-bellied*, on account of the prominent belly which by his gluttony and luxury he had acquired. He was scarce seated on the throne, however,

when Antiochus Epiphanes, returning into Egypt, drove out Physcon, and restored the whole kingdom, except Pelusium, to Philometor. His design was to kindle a war betwixt the two brothers, so that he might have an opportunity of seizing the kingdom for himself. For this reason he kept to himself the city of Pelusium; which being the key of Egypt, he might at his pleasure re-enter the country. But Philometor, apprised of his design, invited his brother Physcon to an accommodation; which was happily effected by their sister *Cleopatra*. In virtue of this agreement, the brothers were to reign jointly, and to oppose to the utmost of their power Antiochus, whom they considered as a common enemy. On this the king of Syria invaded Egypt with a mighty army, but was prevented by the Romans from conquering it.

The two brothers were no sooner freed from the apprehensions of a foreign enemy, than they began to quarrel with each other. Their differences soon came to such a height, that the Roman senate interposed. But before the ambassadors employed to inquire into the merits of the cause could arrive in Egypt, Physcon had driven Philometor from the throne, and obliged him to quit the kingdom. On this the dethroned prince fled to Rome, where he appeared meanly dressed, and without attendants. He was very kindly received by the senate; who were so well satisfied of the injustice done him, that they immediately decreed his restoration. He was reconducted accordingly; and, on the arrival of the ambassadors in Egypt, an accommodation between the two brothers was negotiated. By this agreement, Physcon was put in possession of Libya and Cyrene, and Philometor of all Egypt and the island of Cyprus; each of them being declared independent of the other in the dominion allotted to them. The treaty, as usual, was confirmed with oaths and sacrifices, and was broken almost as soon as made. Physcon was dissatisfied with his share of the dominions; and therefore sent ambassadors to Rome, desiring that the island of Cyprus might be added to his other possessions. This could not be obtained by the ambassadors; and therefore Physcon went to Rome in person. His demand was evidently unjust; but the Romans, considering that it was their interest to weaken the power of Egypt as much as possible, without further ceremony adjudged the island to him.

Physcon set out from Rome with two ambassadors; and arriving in Greece on his way to Cyprus, he raised there a great number of mercenaries, with a design to sail immediately to that island and conquer it. But the Roman ambassadors telling him, that they were commanded to put him in possession of it by fair means, and not by force, he dismissed his army, and returned to Alexandria. Their design was to bring the two brothers to an interview on the frontiers of their dominions, and there to settle matters in an amicable manner. But the ambassador who went to Alexandria, found Philometor very averse from compliance with the decree of the senate. He put off the ambassador so long, that Physcon sent the other also to Alexandria, hoping that the joint persuasions of the two would induce Philometor to comply. But the king, after entertaining them at an immense charge for 40 days, at last plainly refused to submit, and told the ambassadors

that he was resolved to adhere to the first treaty. With this answer the Roman ambassadors departed, and were followed by others from the two brothers. The senate, however, not only confirmed their decree in favour of Phyfcon, but renounced their alliance with Philometor, and commanded his ambassador to leave the city in five days.

In the mean time, the inhabitants of Cyrene, having heard unfavourable accounts of Phyfcon's behaviour during the short time he reigned in Alexandria, conceived so strong an aversion against him, that they resolved to keep him out of their country by force of arms. On receiving intelligence of this resolution, Phyfcon dropped all thoughts of Cyprus for the present; and hastened with all his forces to Cyrene, where he soon got the better of his rebellious subjects, and established himself in the kingdom. His vicious and tyrannical conduct, however, soon estranged from him the minds of his subjects, in such a manner, that some of them entering into a conspiracy against him, fell upon him one night as he was returning to his palace, wounded him in several places, and left him for dead on the spot. This he laid to the charge of his brother Philometor; and as soon as he was recovered, took another voyage to Rome. Here he made his complaints to the senate, and shewed them the scars of his wounds, accusing his brother of having employed the assassins from whom he received them. Though Philometor was known to be a man of a most humane and mild disposition, and therefore very unlikely to have been concerned in so black an attempt; yet the senate, being offended at his refusing to submit to their decree concerning the island of Cyprus, hearkened to this false accusation; and carried their prejudice so far, that they not only refused to hear what his ambassadors had to say, but ordered them immediately to depart from the city. At the same time, they appointed five commissioners to conduct Phyfcon into Cyprus, and put him in possession of that island, enjoining all their allies in those parts to supply him with forces for that purpose.

Phyfcon having by this means got together an army which seemed to him to be sufficient for the accomplishment of his design, landed in Cyprus; but being there encountered by Philometor in person, he was entirely defeated, and obliged to shelter himself in a city called *Lapitha*. Here he was closely besieged, and at last obliged to surrender. Every one now expected that Phyfcon would have been treated as he deserved; but his brother, instead of punishing, restored him to the government of Libya and Cyrene, adding some other territories instead of the island of Cyprus, and promising him his daughter in marriage. Thus an end was put to the war between the two brothers; for the Romans were ashamed any longer to oppose a prince who had given such a signal instance of his justice and clemency.

On his return to Alexandria, Philometor appointed one Archias governor of Cyprus. But he, soon after the king's departure, agreed with Demetrius king of Syria, to betray the island to him for 500 talents. The treachery was discovered before it took effect; and the traitor, to avoid the punishment due to his crime, laid violent hands on himself. Ptolemy being offended with Demetrius for this attempt on Cyprus, joined Attalus king of Pergamus, and Ariarathes king of

Cappadocia, in setting up a pretender to the crown of Syria. This was Alexander Balas; to whom he even gave his daughter Cleopatra in marriage, after he had placed him on the throne of Syria. But he, notwithstanding these and many other favours, being suspected of having entered into a plot against his benefactor, Ptolemy became his greatest enemy; and marching against him, routed his army in the neighbourhood of Antioch. He did not, however, long enjoy his victory; for he died in a few days after the engagement, of the wounds he had received.

On the death of Philometor, Cleopatra the queen designed to secure the throne for her son. But some of the principal nobility declaring for Phyfcon, a civil war was about to ensue, when matters were compromised on condition that Phyfcon should marry Cleopatra, that he should reign jointly with her during his life, and declare her son by Philometor heir to the crown. These terms were no sooner agreed upon than Phyfcon married Cleopatra, and, on the very day of the nuptials, murdered her son in her arms.—This was only a prelude to the cruelties which he afterwards practised on his subjects. He was no sooner seated on the throne, than he put to death all those who had shewn any concern for the murder of the young prince. He then wrecked his fury on the Jews, whom he treated more like slaves than subjects, on account of their having favoured the cause of Cleopatra. His own people were treated with little more ceremony. Numbers of them were every day put to death for the smallest faults, and often for no fault at all, but merely to gratify his inhuman temper. His cruelty towards the Alexandrians is particularly mentioned under the article ALEXANDRIA.—In a short time, being wearied of his queen, who was also his sister, he divorced her; and married her daughter, who was also called *Cleopatra*, and whom he had previously ravished. In short, his behaviour was so exceedingly wicked, that it soon became quite intolerable to his subjects; and he was obliged to fly to the island of Cyprus with his new queen, and *Memphis*, a son he had by her mother.

On the flight of the king, the divorced queen was placed on the throne by the Alexandrians; but Phyfcon, fearing lest a son whom he had left behind should be appointed king, sent for him into Cyprus, and caused him to be assassinated as soon as he landed. This provoked the people against him to such a degree, that they pulled down and dashed to pieces all the statues which had been erected to him in Alexandria. This the tyrant supposed to have been done at the instigation of the queen, and therefore resolved to revenge it on her by killing his own son whom he had by her. He therefore, without the least remorse, caused the young prince's throat to be cut; and having put his mangled limbs into a box, sent them as a present to his mother Cleopatra. The messenger with whom this box was sent, was one of his guards. He was ordered to wait till the queen's birth-day, which approached, and was to be celebrated with extraordinary pomp; and in the midst of the general rejoicing, he was to deliver the present.

The horror and detestation occasioned by this unexampled piece of cruelty cannot be expressed. An army was soon raised, and the command of it given to one *Marsyas*, whom the queen had appointed general, and enjoined to take all the necessary steps for the de-

fence of the country. On the other hand, Phylcon, having hired a numerous body of mercenaries, sent them, under the command of one *Hogelochus*, against the Egyptians. The two armies met on the frontiers of Egypt, on which a bloody battle ensued; but at last the Egyptians were entirely defeated, and Mariyas was taken prisoner. Every one expected that the captive general would have been put to death with the severest torments: but Phylcon, perceiving that his cruelties only exasperated the people, resolved to try whether he could regain their affections by lenity; and therefore pardoned Mariyas, and set him at liberty.—Cleopatra, in the mean time, being greatly distressed by this overthrow, demanded assistance from Demetrius king of Syria, who had married her eldest daughter by Philometor, promising him the crown of Egypt for his reward. Demetrius accepted the proposal without hesitation, marched with all his forces into Egypt, and there laid siege to Ptolemais. But he being no less hated in Syria than Phylcon was in Egypt, the people of Antioch, taking advantage of his absence, revolted against him, and were joined by most of the other cities in Syria. Thus Demetrius was obliged to return; and Cleopatra, being now in no condition to oppose Phylcon, fled to Ptolemais, where her daughter the queen of Syria at that time resided. Phylcon was then restored to the throne of Egypt, which he enjoyed without further molestation till his death; which happened at Alexandria, in the 29th year of his reign, and 67th of his age.

To Phylcon succeeded Ptolemy Lathyrus, about 122 years before Christ; but he had not reigned long, before his mother, finding that he would not be entirely governed by her, by false surmises stirred up the Alexandrians, who drove him from the throne, and placed on it his youngest brother Alexander. Lathyrus after this was obliged to content himself with the government of Cyprus, which he was permitted to enjoy in quiet. Ptolemy Alexander, in the mean time, finding he was to have only the shadow of sovereignty, and that his mother Cleopatra was to have all the power, stole away privately from Alexandria. The queen used every artifice to bring him back, as well knowing that the Alexandrians would never suffer her to reign alone. At last her son yielded to her intreaties; but soon after, understanding that she had hired assassins to dispatch him, he caused her to be murdered.

The death of the queen was no sooner known to the Alexandrians, than, disdaining to be commanded by a parricide, they drove out Alexander, and recalled Lathyrus.—The deposed prince for some time led a rambling life in the island of Cos; but having got together some ships, he, the next year, attempted to return into Egypt. But, being met by *Tyrribus*, Lathyrus's admiral, he was defeated, and obliged to fly to Myra in Lycia. From Myra he steered his course towards Cyprus, hoping that the inhabitants would place him on the throne, instead of his brother. But *Chareas*, another of Lathyrus's admirals, coming up with him while he was ready to land, an engagement ensued, in which Alexander's fleet was dispersed, and he himself killed.

During these disturbances, *Apion* king of Cyrenaiica, the son of Ptolemy Phylcon by a concubine, having maintained peace and tranquillity in his dominions

Vol. IV.

during a reign of 21 years, died, and by his will left his kingdom to the Romans; and thus the Egyptian empire was considerably reduced and circumscribed.

Lathyrus being now delivered from all competitors, turned his arms against the city of Thebes, which had revolted from him. The king marched in person against the rebels; and, having defeated them in a pitched battle, laid close siege to their city. The inhabitants defended themselves with great resolution for three years. At last, however, they were obliged to submit, and the city was given up to be plundered by the soldiery. They left every where the most melancholy monuments of their avarice and cruelty; so that Thebes, which till that time had been one of the most wealthy cities of Egypt, was now reduced so low that it never afterwards made any figure.

About 76 years before Christ, Ptolemy Lathyrus was succeeded by Alexander II. He was the son of the Ptolemy Alexander for whom Lathyrus had been driven out; and had met with many adventures. He was first sent by Cleopatra into the island of Cos, with a great sum of money, and all her jewels; as thinking that was the safest place where they could be kept. When Mithridates king of Pontus made himself master of that island, the inhabitants delivered up to him the young Egyptian prince, together with all the treasures. Mithridates gave him an education suitable to his birth; but he, not thinking himself safe with a prince who had shed the blood of his own children, fled to the camp of Sylla the Roman dictator, who was then making war in Asia. From that time he lived in the family of the Roman general, till news was brought to Rome of the death of Lathyrus. Sylla then sent him to Egypt to take possession of the throne. But, before his arrival, the Alexandrians had chosen Cleopatra for their sovereign. To compromise matters, however, it was agreed, that Ptolemy should marry her, and take her for his partner in the throne. This was accordingly done; and 19 days after the marriage, the unhappy queen was murdered by her husband, who for 15 years afterwards shewed himself such a monster of wickedness, that a general insurrection at last ensued among his subjects, and he was obliged to fly to Pompey the Great, who was then carrying on the war against Mithridates king of Pontus. But Pompey refusing to concern himself in the matter, he retired to the city of Tyre, where he died some months after.

When he was forced to shut himself up in the city of Tyre, Alexander had sent ambassadors to Rome, in order to influence the senate in his favour. But, dying before the negotiation was finished, he made over by his last will all his rights to the Roman people, declaring them heirs to his kingdom; not out of any affection to the republic; but with a view to raise disputes between the Romans and his rival Auletes, whom the Egyptians had placed on the throne. The will was brought to Rome, where it occasioned warm debates. Some were for taking immediate possession of the kingdom. Others thought that no notice should be taken of such a will, because Alexander had no right to dispose of his dominions in prejudice of his successor, and to exclude from the crown those who were of the royal blood of Egypt. Cicero represented, that such a notorious imposition would debase the majesty of the Roman people, and involve them in endless wars

and disputes; that the fruitful fields of Egypt would be a strong temptation to the avarice of the people, who would insist on their being divided among them; and lastly, that by this means the bloody quarrels about the Agrarian laws would be revived. These reasons had some weight with the senate; but what chiefly prevented them from seizing on Egypt at this time was, that they had lately taken possession of the kingdom of Bithynia in virtue of the will of Nicomedes, and of Cyrene and Libya by the will of Apion. They thought therefore, that if they should, on the like pretence, take possession of the kingdom of Egypt, this might too much expose their design of setting up a kind of universal monarchy, and occasion a formidable combination against them.

50
Character
of Auletes
the new
king.

Auletes, who was now raised to the throne by the Egyptians, is said to have surpassed all the kings that went before him in the effeminacy of his manners. The name *Auletes*, which signifies the *flute-player*, was given him because he piqued himself on his skill in performing upon that instrument, and was not ashamed even to contend for the prize in the public games. He took great pleasure in imitating the manners of the Bacchanals; dancing in a female dress, and in the same measures that they used during the solemnity of their god Bacchus; and hence he had the surname of the *New Dionysius* or *Bacchus*. As his title to the crown was disputable, (he being only the son of a concubine), the first care of Auletes was to get himself acknowledged by the Romans, and declared their ally. This was obtained by applying to Julius Cæsar, who was at that time consul, and immensely in debt. Cæsar being glad of such an opportunity of raising money, made the king of Egypt pay pretty dear for his alliance. Six thousand talents, a sum equal to 1,162,500 pounds Sterling, were paid partly to Cæsar himself, and partly to Pompey, whose interest was necessary for obtaining the consent of the people. Though the revenues of Egypt amounted to twice this sum, yet Auletes found it impossible for him to raise it without severely taxing his subjects. This occasioned a general discontent; and while the people were almost ready to take up arms, a most unjust decree passed at Rome for seizing the island of Cyprus. When the Alexandrians heard of the intentions of the republic, they pressed Auletes to demand that island as an ancient appendage of Egypt; and, in case of a refusal, to declare war against that haughty and imperious people, who, they now saw, though too late, aimed at nothing less than the sovereignty of the world. With this request the king refused to comply; upon which his subjects, already provoked beyond measure at the taxes with which they were loaded, flew to arms, and surrounded the palace. The king had the good luck to escape their fury, and immediately leaving Alexandria, set sail for Rome.

52
Is driven
from the
throne, and
flies to
Rome.

In his way to that city, he landed on the island of Rhodes, where the famous Cato at that time was, being on his way to Cyprus, to put the unjust decree of the senate in execution. Auletes, desirous to confer with a man of his prudence, immediately sent to acquaint him with his arrival. He imagined, that, upon this notice, Cato would immediately come and wait upon him; but the proud Roman told the messenger, that if the king of Egypt had any thing to say to Cæ-

to, he might, if he thought proper, come to his house. Accordingly the king went to pay him a visit; but was received with very little ceremony by Cato, who did not even vouchsafe to rise out of his seat when he came into his presence. When Auletes had laid his affairs before this haughty republican, he was blamed by him for leaving Egypt, the richest kingdom in the world, in order to expose himself, as he laid, to the indignities he would meet with at Rome. There, Cato told him, that nothing was in request but wealth and grandeur. All the riches of Egypt, he said, would not be sufficient to satisfy the avarice of the leading men in Rome. He therefore advised him to return to Egypt; and strive, by a more equitable conduct, to regain the affections of his people. He even offered to reconduct him thither, and employ his good offices in his behalf. But though Ptolemy was sensible of the propriety of this advice, the friends he had with him dissuaded him from following it, and accordingly he set out for Rome.

Egypt.

53
Cato's ad-
vice to him.

On his arrival in this metropolis, the king found, to his great concern, that Cæsar, in whom he placed his greatest confidence, was then in Gaul. He was received, however, by Pompey with great kindness. He assigned him an apartment in his own house, and omitted nothing that lay in his power to serve him. But, notwithstanding the protection of so powerful a man, Auletes was forced to go from house to house like a private person, soliciting the votes of the senators. After he had spent immense treasures in procuring a strong party in the city, he was at last permitted to lay his complaints before the senate; and at the same time there arrived an embassy from the Alexandrians, consisting of 100 citizens, to acquaint the senate with the reasons of their revolt.

54
Infamous
conduct of
Auletes.

When Auletes first set out for Rome, the Alexandrians, not knowing what was become of him, placed on the throne his daughter Berenice; and sent an embassy into Syria to Antiochus Asiaticus, inviting him into Egypt to marry the queen, and reign in partnership with her. Antiochus was dead before the arrival of the ambassadors; upon which the same proposal was made to his brother Seleucus, who readily accepted it. This Seleucus is described by Strabo as monstrously deformed in body, and still more so in mind. The Egyptians nicknamed him *Cybil-facter*, or the *Scullion*; a name which seemed more fit for him than any other. He was scarce settled on the throne, when he gave a signal instance of his sordid and avaricious temper. Ptolemy the first had caused the body of Alexander the Great to be deposited in a coffin of massy gold. This the king seized upon; and by that means provoked his wife Berenice to such a degree, that she caused him to be murdered. She then married one Archelaus, high priest of Comana in Pontus, who pretended to be the son of Mithridates the Great; but was, in fact, only the son of that monarch's general.

55

ders him.

Auletes was not a little alarmed on hearing of these transactions, especially when the ambassadors arrived, who he feared would overturn all the schemes he had laboured so much to bring about. The embassy was headed by one Dion, a celebrated academic philosopher, who had many powerful friends at Rome. But Ptolemy found means to get both him and most of his followers assassinated; and this intimidated the rest to such a de-

gree, that they durst not execute their commission, or, for some time, even demand justice for the murder of their colleagues.

The report of so many murders, however, at last spread a general alarm. Auletes, sure of the protection of Pompey, did not scruple to own himself the perpetrator of them. Nay, though an action was commenced against one Alcitus an assassin who had stabbed Dio the chief of the embassy abovementioned, and the crime was fully proved; yet he was acquitted by the venal judges, who had all been bribed by Ptolemy. In a short time, the senate passed a decree, by which it was enacted, that the king of Egypt should be restored by force of arms. All the great men in Rome were ambitious of this commission; which they well knew, would be attended with immense profit. Their contests on this occasion took up a considerable time; and at last a prophecy of the Sybil was found out, which forbade the assisting an Egyptian monarch with an army. Ptolemy therefore, wearied out with so long a delay, retired from Rome, where he had made himself generally odious, to the temple of Diana at Ephesus, there to wait the decision of his fate. Here he remained a considerable time: but as he saw that the senate came to no resolution, tho' he had solicited them by letters so to do; at last, by Pompey's advice, he applied to Gabinius the proconsul of Syria. This Gabinius was a man of a most infamous character, and ready to undertake any thing for money. Therefore, tho' it was contrary to an express law for any governor to go out of his province without positive orders from the senate and people of Rome, yet Gabinius ventured to transgress this law, upon condition of being well paid for his pains. As a recompence for his trouble, however, he demanded 10,000 talents; that is, 1,937,500 pounds Sterling. Gabinius, glad to be restored on any terms, agreed to pay the abovementioned sum; but Gabinius would not stir till he had received one half of it. This obliged the king to borrow it from a Roman knight named *Caius Rabirius Posthumus*; Pompey interposing his credit and authority for the payment of the capital and interest.

Gabinius now set out for Egypt, attended by the famous Mark Anthony, who at this time served in the army under him. He was met by Archelaus, who since the departure of Auletes had reigned in Egypt jointly with Berenice, at the head of a numerous army. The Egyptians were utterly defeated, and Archelaus taken prisoner in the first engagement. Thus Gabinius might have put an end to the war at once; but his avarice prompted him to dismiss Archelaus on his paying a considerable ransom; after which, pretending that he had made his escape, fresh sums were demanded from Ptolemy for defraying the expences of the war. For these sums Ptolemy was again obliged to apply to Rabirius, who lent him what money he wanted at a very high interest. At last, however, Archelaus was defeated and killed, and thus Ptolemy again became master of all Egypt.

No sooner was Auletes firmly settled on the throne, than he put to death his daughter Berenice, and oppressed his people with the most cruel exactions, in order to procure the money he had been obliged to borrow while in a state of exile. These oppressions and exactions the cowardly Egyptians bore with great pa-

tience, being intimidated by the garriſon which Gabinius had left in Alexandria. But neither the fear of the Romans, nor the authority of Ptolemy, could make them put up an affront offered to their religion. A Roman soldier happened to kill a cat, which was an animal held sacred and even worshipped by the Egyptians; and no sooner was this supposed sacrilege known, than the Alexandrians made a general insurrection, and, gathering together in crowds, made their way through the Roman guards, dragged the soldier out of his house, and, in spite of all opposition, tore him in pieces.

Notwithstanding the heavy taxes, however, which Ptolemy laid on his people, it doth not appear that he had any design of paying his debts. Rabirius, who, as we have already observed, had lent him immense sums, finding that the king affected delays, took a voyage to Egypt, in order to expostulate with him in person. Ptolemy paid very little regard to his expostulations; but excused himself on account of the bad state of his finances. For this reason he offered to make Rabirius collector-general of his revenues, that he might in that employment pay himself. The unfortunate creditor accepted the employment for fear of losing his debt. But Ptolemy, soon after, upon some frivolous pretence or other, caused him and all his servants to be closely confined. This base conduct exasperated Pompey as much as Rabirius; for the former had been in a manner security for the debt, as the money had been lent at his request, and the business transacted at a country-house of his near Alba. However, as Rabirius had reason to fear the worst, he took the first opportunity of making his escape, glad to get off with life from his cruel and faithless debtor. To complete his misfortunes, he was prosecuted at Rome as soon as he returned. 1. For having enabled Ptolemy to corrupt the senate with sums lent him for that purpose. 2. For having debased and dishonoured the character of a Roman knight, by farming the revenues, and becoming the servant of a foreign prince. 3. For having been an accomplice with Gabinius, and sharing with him the 10,000 talents which that proconsul had received for his Egyptian expedition. By the eloquence of Cicero he was acquitted, and one of the best orations to be found in the writings of that author was composed on this occasion. Gabinius was also prosecuted; and, as Cicero spoke against him, he very narrowly escaped death. He was, however, condemned to perpetual banishment, after having been stripped of all he was worth. He lived in exile till the time of the civil wars, when he was recalled by Cæsar, in whose service he lost his life.

Auletes enjoyed the throne of Egypt about four years after his re-establishment; and at his death left his children, a son and two daughters, under the tuition of the Roman people. The name of the son was *Ptolemy*, those of the daughters were *Cleopatra* and *Arsinoë*. This was the Cleopatra who afterwards became so famous, and had so great a share in the civil wars of Rome. As the transactions of the present reign, however, are so closely connected with the affairs of Rome, that they cannot be well understood without knowing the situation of the Romans at that time, we refer for an account of them to the *History of Rome*.

65
State of Egypt till its conquest by the Khalif of Cairwan.

With Cleopatra ended the family of Ptolemy Lagus, the founder of the Grecian empire in Egypt, after it had held that country in subjection for the space of 294 years. From this time Egypt became a province of the Roman empire, and continued subject to the emperors of Rome or Constantinople. In the year 642, it was conquered by the Arabs under Amru Ebn Al As, one of the generals of the Khalif Omar. In the year 889, an independent government was set up in this kingdom by Ahmed Ebn Tolun, who rebelled against Al Mokhadi khalif of Bagdad. It continued to be governed by him and his successors for 27 years, when it was again reduced by Al Moctafi khalif of Bagdad. In about 30 years after, we find it again an independent state, being joined with Syria under Mahomet Ebn Taj, who had been appointed governor of these provinces. This government, however, was also but short-lived; for in the year 968 it was conquered by Jawhar, one of the generals of Moez Ledinillah, the Fatemite khalif of Cairwan in Barbary *.

* See Barbary, n^o 34-66

Moez takes possession of his new kingdom.

No sooner was Moez informed of the success of his general, than he prepared with all expedition to go and take possession of his new conquest. Accordingly he ordered all the vast quantities of gold which he and his predecessors had amassed, to be cast into ingots of the size and figure of the millstones used in hand-mills, and conveyed on camels backs into Egypt. To shew that he was fully determined to abandon his dominions in Barbary, and to make Egypt the residence of himself and his successors, he caused the remains of the three former princes of his race to be removed from Cairwan in Barbary, and to be deposited in a lately mosque erected for that purpose in the city of Cairo in Egypt. This was a most effectual method to induce his successors to reside in Egypt also, as it was become an established custom and duty among those princes frequently to pay their respectful visits to the tombs of their ancestors.

67
Will not suffer prayers to be said for the Khalif of Bagdad.

To establish himself the more effectually in his new dominions, Moez suppressed the usual prayers made in the mosques for the khalifs of Bagdad, and substituted his own name in their stead. This was complied with, not only in Egypt and Syria, but even throughout all Arabia, the city of Mecca alone excepted. The consequence was, a schism in the Mahomedan faith, which continued upwards of 200 years, and was attended with continual anathemas, and sometimes destructive wars between the khalifs of Bagdad and of Egypt.—Having fully established himself in his kingdom, he died in the 45th year of his age, three years after he had left his dominions in Barbary; and was succeeded by his son Abu Al Mansur Barar, surnamed Aziz Billah.

68
Unsuccessful expedition into Syria.

The new khalif succeeded to the throne at the age of 21, and committed the management of affairs entirely to the care of Jawhar, his father's long experienced general and prime minister. In 978, he sent this famous warrior to drive out Al Aftekin, the emir of Damafcus. The Egyptian general accordingly formed the siege of that place; but at the end of two months, was obliged to raise it, on the approach of an army of Karmatians under the command of Al Hakem. As Jawhar was not strong enough to venture an engagement with these Karmatians, it was impossible for him to hinder them from effecting a junction with the

forces of Al Aftekin. He therefore retreated, or rather fled, towards Egypt with the utmost expedition; but being overtaken by the two confederate armies, he was soon reduced to the last extremity. He was, however, permitted to resume his march, on condition that he passed under Al Aftekin's sword and Al Hakem's lance; and to this disgraceful condition Jawhar found himself obliged to submit. On his arrival in Egypt, he immediately advised Al Aziz to undertake an expedition in person into the east, against the combined army of Turks, Karmatians, and Damascenes, under the command of Al Aftekin and Al Hakem. The khalif followed his advice; and advancing against his enemies, overthrew them with great slaughter. Al Aftekin himself escaped out of the battle; but was afterwards taken and brought to Al Aziz, who made him his chamberlain, and treated him with great kindness. Jawhar, in the mean time, was disgraced on account of his bad success; and in this disgrace he continued till his death, which happened in the year of our Lord 990, and of the Hegira 381.

This year Al Aziz having received advice of the death of Saado'dawla prince of Aleppo, sent a formidable army under the command of a general named *Manjubekin*, to reduce that place. Lulu, who had been appointed guardian to Saado'dawla's son, finding himself pressed by the Egyptians, who carried on the siege with great vigour, demanded assistance from the Greek emperor. Accordingly, he ordered a body of troops to advance to Lulu's relief. Manjubekin, being informed of their approach, immediately raised the siege, and advanced to give them battle. An obstinate engagement ensued, in which the Greeks were at last overthrown with great slaughter. After this victory, Manjubekin pushed on the siege of Aleppo very briskly; but finding the place capable of defending itself much longer than he at first imagined, and his provisions beginning to fail, he raised the siege. The khalif upon this sent him a very threatening letter, and commanded him to return before Aleppo. He did so; and continued the siege for 13 months, during all which time it was defended by Lulu with incredible bravery. At last, the Egyptians hearing that a numerous army of Greeks was on their way to relieve the city, they raised the siege, and fled with the utmost precipitation. The Greeks then took and plundered some of the cities which Al Aziz possessed in Syria; and Manjubekin made the best of his way to Damafcus, where he set up for himself. Al Aziz being informed of this revolt, marched in person against him with a considerable army; but being taken ill by the way, he expired, in the 21st year of his reign, and 42d of his age.

Al Aziz was succeeded by his son Abu Al Mansur, surnamed Al Hakem; who, being only 11 years of age, was put under the tuition of an eunuch of approved integrity.

This reign is remarkable for nothing so much as the madness with which the khalif was seized in the latter part of it. This manifested itself first by his issuing many preposterous edicts; but at length grew to such a height, that he fancied himself a god, and found no fewer than 16,000 persons who owned him as such. These were mostly the Derarians, a new sect sprung up about this time, who were so called from their chief,

Egypt.

69
Aleppo besieged without success.

70
Strange madness of the Khalif Al Hakem.

Mo.

Egypt.

Mohammed Ebn Ishmael, furnished Darari. He is supposed to have inspired the mad khalif with this impious notion; and, as Darari set up for a second Moses, he did not scruple to assert that Al Hakem was the great Creator of the universe. For this reason, a zealous Turk stabbed him in the khalif's chariot. His death was followed by a three days uproar in the city of Cairo; during which, Darari's house was pulled down, and many of his followers massacred. The sect, however, did not expire with its author. He left behind him a disciple named Hamza, who, being encouraged by the mad khalif, spread it far and wide through his dominions. This was quickly followed by an abrogation of all the Mahomedan fasts, festivals, and pilgrimages, the grand one to Mecca in particular; so that the zealous Mahometans were now greatly alarmed, as justly supposing that Al Hakem designed entirely to suppress the worship of the true God, and introduce his own in its place. From this apprehension, however, they were delivered by the death of the khalif; who was assassinated, by a contrivance of his own sister, in the year 1020.

Al Hakem was succeeded by his son Al Taher, who reigned 15 years; and left the throne to a son under seven years of age, named Al Mostanser Billah.—In the year 1041, a revolt happened in Syria; but Al Mostanser having sent a powerful army into that country, under the command of one *Anshetkin*, he not only reduced the rebels, but considerably enlarged the Egyptian dominions in Syria.

71 Al Mostanser attempts the conquest of Bagdad.

72 Khalif of Bagdad assisted by Togrol Beg.

In 1054, a Turk named Al Bassafiri, having quarrelled with the vizir of Al Kayem khalif of Bagdad, fled to Egypt, and put himself under the protection of Al Mostanser. The latter, imagining this would be a favourable opportunity for enlarging his dominions, and perhaps seizing on the city of Bagdad, supplied Bassafiri with money and troops. By this assistance, he was enabled to possess himself of Arabian Irak, and ravaged that province to the very gates of Bagdad. On this, Al Kayem wrote to Togrol Beg, or Tangrolipix, the Turkish sultan, who possessed very extensive dominions in the east, to come to his assistance. The sultan immediately complied with his request, and soon arrived at Bagdad with a formidable army and 18 elephants. Of this Bassafiri gave notice to Al Mostanser, and intreated him to exert himself further for his support against so powerful an enemy. This was accordingly done, but nothing worthy of notice happened till the year 1058. At this time Bassafiri having found means to excite Ibrahim the Sultan's brother to a revolt, Togrol Beg was obliged to employ all his force against him. This gave Bassafiri an opportunity of seizing on the city of Bagdad itself; and the unfortunate khalif, according to some, was taken prisoner, or, according to others, fled out of the city. Bassafiri, on his entry, caused Al Mostanser to be immediately proclaimed khalif in all quarters of the city. Al Kayem's vizir he caused to be led on a camel through the streets of Bagdad, dressed in a woollen gown, with a high red bonnet, and a leathern collar about his neck; a man lashing him all the way behind. Then being sewed up in a bull's hide, with the horns placed over his head, and hung upon hooks, he was beaten without ceasing till he died. The imperial palace was plundered, and the khalif himself detained a close prisoner.

This success was but short-lived; for, in 1059, Togrol Beg defeated his brother Ibrahim, took him prisoner, and strangled him with a bow-string. He then marched to Bagdad, which Bassafiri thought proper to abandon at his approach. Here the khalif Al Kayem was delivered up by Mahras, the governor of a city called *Haditha*, who had the charge of him. The khalif was immediately restored to his dignity; which Bassafiri no sooner understood, than he again advanced towards the city. Against him Togrol Beg sent a part of his army under some of his generals, while he himself followed with the rest. A battle ensued, in which the army of Bassafiri was defeated, and he himself killed. His head was brought to Togrol Beg, who caused it to be carried on a pike through the streets of Bagdad.

Thus the hopes of Al Mostanser were entirely frustrated; and from this period we may date the declension of the Egyptian empire under the khalifs. They had made themselves masters of almost all Syria; but no sooner was Bassafiri's bad success known, than the younger part of the citizens of Aleppo revolted, and set up Mahmud Azzo'dawla, who immediately laid siege to the citadel. Al Mostanser sent a powerful army against him, which Azzo'dawla entirely defeated, and took the general himself prisoner; and soon after this, he made himself master both of the city and citadel, with all their dependencies. In his new dominions he behaved with the greatest cruelty, destroying every thing with fire and sword, and making frequent incursions into the neighbouring provinces, which he treated in the same manner.

This disaster was soon followed by others still more terrible. In 1066, a famine raged over all Egypt and Syria, with such fury, that dogs and cats were sold for four or five Egyptian dinars each, and other provisions in proportion. Multitudes of people died in Cairo for want of food. Nay, so great was the scarcity, that the vizir had but one servant left who was able to attend him to the khalif's palace, and to whom he gave the care of his horse when he alighted at the gate. But, at his return, he was surprised to find that the horse had been carried off, killed, and eaten, by the famished people. Of this he complained to the khalif; who caused three of them, who had carried off the horse, to be hanged. Next day, however, he was still more surprised to hear, that all the flesh had been picked off the bones of the three unhappy criminals, so that nothing but the skeletons were left. And to such a degree of misery were the inhabitants, not only in Cairo, but through all Egypt, reduced, that the carcases of those who died were sold for food at a great price, instead of being buried. All this time the khalif shewed the greatest kindness and beneficence towards his unhappy subjects, inasmuch, that of 10,000 horses, mules, and camels, which he had in his stables when the famine began, he had only three left when it was removed.

77 The famine was followed by a plague; and this by an invasion of the Turks under Abu Ali Al Hafan the Turks. Naserod'dawla, the very general who had been sent against the rebel Azzo'dawla and defeated by him. He began with besieging the khalif in his own palace; and the unhappy prince, being in no condition to make resistance, was obliged to buy himself off at the expense of every thing valuable that was left in his exchequer.

hausted capital and treasury. This, however, did not hinder these merciless plunderers from ravaging all the lower Egypt from Cairo to Alexandria, and committing the most horrid cruelties through that whole tract. — This happened in the years 1067 and 1068; and in 1069 and 1070, there happened two other revolts in Syria: so that this country was now almost entirely lost.

In 1095 died the khalif Al Mostanser, having reigned 60 years; and was succeeded by his son Abul Kasem, surnamed Al Mottali. — The most remarkable transaction of this prince's reign, was his taking the city of Jerusalem from the Turks in 1098: but this success was only of short duration; for it was, the same year, taken by the crusaders.

78
Jerusalem
taken.

From this time to the year 1164, the Egyptian history affords little else than an account of the intestine broils and contests between the vizirs or prime ministers, who were now become so powerful, that they had in a great measure stripped the khalifs of their civil power, and left them nothing but a shadow of spiritual dignity. These contests at last gave occasion to a revolution, by which the race of Fatemite khalifs was totally extinguished. This revolution was accomplished in the following manner. — One *Shawer*, having overcome all his competitors, became vizir to Al Aded, the eleventh khalif of Egypt. He had not been long in possession of this office, when Al Dargam, an officer of rank, endeavoured to deprive him of it. Both parties quickly had recourse to arms; and a battle ensued, in which Shawer was defeated, and obliged to fly to Nuroddin prince of Syria, by whom he was graciously received, and who promised to reinstate him in his office of vizir. As an inducement to Nuroddin to assist him more powerfully, Shawer told him that the crusaders had landed in Egypt, and made a considerable progress in the conquest of it. He promised also, that, in case he was reinstated in his office, he would pay Nuroddin annually the third part of the revenues of Egypt; and would, besides, defray the whole expence of the expedition.

As Nuroddin bore an implacable hatred to the Christians, he readily undertook an expedition against them, for which he was to be so well paid. He therefore sent an army into Egypt under the command of Shawer and a general named *Asadoddin*. Dargam, in the mean time, had cut off so many generals whom he imagined favourable to Shawer's interest, that he thereby weakened the military force of the kingdom, and in a great measure deprived himself of the power of resistance. He was therefore easily overthrown by Asadoddin, and Shawer reinstated in the office of vizir. The faithless minister, however, no sooner saw himself firmly established in his office, than he refused to fulfil his engagements to Nuroddin by paying the stipulated sums. Upon this, Asadoddin seized Pelusium and some other cities. Shawer then entered into an alliance with the Crusaders, and Asadoddin was besieged by their combined forces in Pelusium. Nuroddin, however, having invaded the Christian dominions in Syria, and taken a strong fortress called *Harem*, Shawer and his confederates thought proper to hearken to some terms of accommodation, and Asadoddin was permitted to depart for Syria.

In the mean time, Nuroddin, having subdued the greatest part of Syria and Mesopotamia, resolved to

make Shawer feel the weight of his repentment, on account of his perfidious conduct. He therefore sent back Asadoddin into Egypt with a sufficient force, to compel Shawer to fulfil his engagements: but this the vizir took care to do before the arrival of Asadoddin; and thus, for the present, avoided the danger. It was not long, however, before he gave Nuroddin fresh occasion to send this general against him. That prince had now driven the crusaders almost entirely out of Syria, but was greatly alarmed at their progress in Egypt; and consequently offended at the alliance which Shawer had concluded with them, and which he still persisted in observing. This treaty was also thought to be contrived on purpose to prevent Shawer from being able to fulfil his promise to Nuroddin, of sending him annually a third of the revenues of Egypt. Nuroddin therefore again dispatched Asadoddin into Egypt, in the year 1166, with a sufficient force, and attended by the famous Salahaddin, or Saladin, his own nephew. They entered the kingdom without opposition, and totally defeated Shawer and the crusaders. They next made themselves masters of Alexandria; and, after that, overran all the Upper Egypt. Saladin was left with a considerable garrison in Alexandria; but Asadoddin was no sooner gone, than the crusaders laid siege to that city. This at last obliged Asadoddin to return to its relief. The great losses he had sustained in this expedition probably occasioned his agreeing to a treaty with Shawer, by which he engaged to retire out of Egypt, upon being paid a sum of money.

Asadoddin was no sooner gone, than Shawer entered into a fresh treaty with the Franks. By this new alliance he was to attack Nuroddin in his own dominions, as he was at that time engaged in quelling some revolters, which would effectually prevent his sending any more forces into Egypt. This treaty provoked the Syrian prince, that he resolved to suspend his other conquests for some time, and exert his whole strength in the conquest of Egypt.

By this time the crusaders had reduced Pelusium, and made a considerable progress in the kingdom, as of the crusaders. 80
and as in some other countries, through the divisions which reigned among the Mahometan princes. In such places as they conquered, they put almost every body to the sword, Christians as well as Mahometans; selling their prisoners for slaves, and giving up the towns to be plundered by the soldiers. From Pelusium they marched to Cairo; which was then in no posture of defence, and in the utmost confusion, by reason of the divisions which reigned in it. Shawer, therefore, as soon as he heard of their approach, caused the ancient quarter called *Mess* to be set on fire, and the inhabitants to retire into the other parts. He also prevailed upon the khalif to solicit the assistance of Nuroddin; which the latter was indeed pretty much inclined of himself to grant, as it gave him the fairest opportunity he could have wished for, both of driving the crusaders out of Egypt, and of seizing the kingdom to himself. For this purpose he had already raised an army of 60,000 horse under his general Asadoddin; and, on the receipt of Al Aded's message, gave them orders to set out immediately. The crusaders were now arrived at Cairo; and had so closely besieged that place, that neither Shawer nor the khalif knew any thing of the approach of the Moslem army which was hastening to their relief. The vizir

Egypt.

Egypt.

vizir therefore, finding it impossible to hold out long against the enemy, had recourse to his old subterfuge of treaties and high promises. He sent the enemy 100,000 dinars, and promised them 500,000 more, if they would raise the siege; which they, dreading the approach of Afadoddin, very readily accepted.

81
They are
repulsed by
the army of
Nuroddin
prince of
Damascus.

The army of Nuroddin now approached the capital by hasty marches, and were every where received with the greatest demonstrations of joy. Afadoddin, on his arrival at Cairo, was invited by Al Aded to the royal palace, where he was entertained in the most magnificent manner, and received several presents; nor were Saladin and the other principal officers less magnificently treated. Shaver also, conscious of his perfidious conduct, was no less assiduous in attending punctually upon him. But having invited the general and some others to an entertainment, he had formed a scheme of having them seized and murdered. The plot, however, being discovered, Shaver himself had his head cut off, and Afadoddin was made vizir in his stead. He did not, however, long enjoy his new dignity; for he died two months and five days after his instalment, being succeeded in his office of vizir by his nephew Saladin.

82
Saladin be-
comes vizir
of Egypt.

The new vizir was the youngest of all the grandees who aspired to that office, but had already given some signal proofs of his valour and conduct. What determined the khalif to prefer him to all the rest is not known; but it is certain that some of them were highly displeased with his promotion, and even publicly declared that they would not obey him. In order to gain these to his interest, therefore, Saladin found it necessary to distribute among them part of the vast treasures left by his uncle; by which means he soon governed Egypt without controul, as had been customary with the vizirs for some time before. Soon after his being installed into the office of vizir, he gave a total defeat to the negroes who guarded the royal palace, and had opposed his election; by which means, and a strong garrison he had placed in the castle of Cairo, his power became firmly established. Though he had not the least intention of continuing in his allegiance to Nuroddin, he did not think it prudent at first to declare himself. He sent for his father, however, and the rest of his family, who were in Nuroddin's dominions, in order, as he said, to make them partakers of his grandeur and happiness. Nuroddin did not think proper to deny this request; though, being already jealous of the great power of Saladin, he insisted that his family should consider him only as one of his generals in Egypt.

83
Seizes the
effects of
the khalif.

A good understanding subsisted between Nuroddin and Saladin for some time, which did not a little contribute to raise the credit of the latter with the Egyptians. In 1169, Nuroddin sent him orders to omit the name of Al Aded, the khalif of Egypt, in the public prayers, and substitute that of the khalif of Bagdad in its place. This was at any rate a dangerous attempt; as it might very readily produce a revolt in favour of Al Aded; or if it did not, it gave Saladin an opportunity of engrossing even that small remnant of power which was left to the khalif. Al Aded, however, was not sensible of his disgrace; for he was on his death-bed, and past recovery, when Nuroddin's orders were executed. After his death, Saladin seized on all his wealth and valuable effects; which consisted of

jewels of prodigious size, sumptuous furniture, a library containing 100,000 volumes, &c. His family he caused to be closely confined in the most private and retired part of the palace; and either manumitted his slaves, or kept them for himself, or disposed of them to others.

Saladin was now arrived at the highest pitch of wealth, power, and grandeur. He was, however, obliged to behave with great circumspection with regard to Nuroddin; who still continued to treat him as his vassal, and would not suffer him to dispute the least of his commands. He relied for advice chiefly on his father Ayub; who was a consummate politician, and very ambitious of seeing his son raised to the throne of Egypt. He therefore advised Saladin to continue steadfast in his resolutions; and, whilst he amused Nuroddin with feigned submissions, to take every method in his power to secure himself in the possession of so valuable a kingdom. Nuroddin himself, however, was too great a master in the art of dissimulation to be easily imposed on by others; and therefore, though he pretended to be well pleased with Saladin's conduct, he was all this time raising a powerful army, with which he was fully determined to invade Egypt the following year. But while he meditated this expedition, he was seized with a quinzy at the castle of Damascus, which put an end to his life, in the year 1173.

84
Aspires to
the crown.

Saladin, though now freed from the apprehensions of such a formidable enemy, dared not venture to assume the title of *Sovereign*, while he saw the successor of Nuroddin at the head of a very powerful army, and no less desirous than able to dispossess him. For this reason his first care was to secure to himself an asylum, in case he should be obliged to leave Egypt altogether. For this purpose he chose the kingdom of Nubia; but having dispatched his brother Malek Turanash thither, at the head of a considerable army, the latter was so much struck with the sterility and desolate appearance of the country, that he returned without attempting any thing. Saladin then sent his brother into Arabia Felix, in order to subdue that country, which had been for some time held by Abdalnabi an Arabian prince. Malek entered the country without opposition; and having brought Abdalnabi to a general action, entirely defeated him, took him prisoner, and threw him into irons. He then over-ran and reduced under subjection to Saladin great part of the country, taking no fewer than 80 castles or fortresses of considerable strength.

85
Subdues A-
rabia Felix.

After this good fortune, Saladin, now sure of a convenient place of refuge in case of any misfortune, assumed the title of *Sultan* or sovereign of Egypt; and was acknowledged as such by the greater part of the states. The zeal of the Egyptians for the Fatemite khalifs, however, soon produced a rebellion. One *Al Kanz*, or *Kanzanaddoula*, governor of a city in Upper Egypt, assembled a great army of blacks, or rather swarthy natives; and marching directly into the lower country, was there joined by great numbers of other Egyptians. Against them Saladin dispatched his brother Malek, who soon defeated and entirely dispersed them. This, however, did not prevent another insurrection under an impostor, who pretended to be David the son of Al Aded the last Fatemite khalif, and had collected a body of 100,000 men. But be-

fore

86

the title of
sultan.

Egypt.

fore these had time to do any great damage, they were surprised by the sultan's forces, and entirely defeated. Above 3000 were publicly hanged, and a vast number perished in the field, inasmuch that it was thought scarce a fourth part of the whole body escaped.

About this time Saladin gained a considerable advantage over the crusaders, commanded by William II. king of Sicily. That prince had invaded Egypt with a numerous fleet and army, with which he laid close siege to Alexandria both by sea and land. Saladin, however, marched to the relief of the city with such surprising expedition, that the crusaders were seized with a sudden panic, and fled with the utmost precipitation, leaving all their military engines, stores, and baggage behind.

87
Saladin
made sovereignty of
Damascus.

In the year 1175, the inhabitants of Damascus begged of Saladin to accept the sovereignty of that city and its dependencies; being jealous of the minister, who had the tuition of the reigning prince, and who governed all with an absolute sway. The application was no sooner made, than the sultan set out with the utmost celerity to Damascus, at the head of a chosen detachment of 700 horse. Having settled his affairs in that city, he appointed his brother Saif Al Islam governor of it; and set out for Hems, to which he immediately laid siege. Having made himself master of this place, he then proceeded to Hamah. The city very soon surrendered, but the citadel held out for some time. Saladin pretended that he accepted the sovereignty of Damascus and the other places he had conquered, only as deputy to Al Malec Al Saleh, the successor of Nurroddin, and who was then under age; and that he was desirous of sending Azzoddin, who commanded in the citadel, with a letter to Aleppo, where the young prince resided. This so pleased Azzoddin, that he took the oath of fidelity to Saladin, and immediately set out with the sultan's letter. He had not, however, been long at Aleppo before he was by the minister's orders thrown into prison; upon which, his brother, who had been appointed governor of the citadel Hamah in his absence, delivered it up to Saladin without further ceremony. The sultan then marched to Aleppo, with a design to reduce it; but, being vigorously repulsed in several attacks, he was at last obliged to abandon the enterprise. At the same time, Kamschlegin, Al Malec's minister or vizir, hired the chief of the Batainils, or Assassins*, to murder him. Several attempts were made in consequence of this application; but all of them, happily for Saladin, miscarried.

* See Assassins.

After raising the siege of Aleppo, Saladin returned to Hems, which place the crusaders had invested. On his approach, however, they thought proper to retire; after which, the sultan made himself master of the strong castle belonging to that place, which, before, he had not been able to reduce. This was soon followed by the reduction of Baalbec; and these rapid conquests so alarmed the ministers of Al Malec, that, entering into a combination with some of the neighbouring princes, they raised a formidable army with which they designed to crush the sultan at once. Saladin, fearing the event of a war, offered to cede Hems and Hamah to Al Malec, and to govern Damascus only as his lieutenant: but these terms being rejected, a battle ensued; in which the allied army was utterly defeated, and the shattered remains of it shut up in the

88
Defeats his
enemies.

city of Aleppo. This produced a treaty, by which Saladin was left master of all Syria, excepting only the city of Aleppo and the territory belonging to it.

In 1176 Saladin returned from the conquest of Syria, and made his triumphal entry into Cairo. Here, having rallied himself and his troops for some time, he began to encompass the city with a wall 29,000 cubits in length, but which he did not live to finish. Next year he led a very numerous army into Palestine against the crusaders. But here his usual good fortune failed him. His army was entirely defeated. Forty thousand of his men were left dead on the field; and the rest fled with so much precipitation, that, having no towns in the neighbourhood where they could shelter themselves, they traversed the vast desert between Palestine and Egypt, and scarce stopped till they reached the capital itself. The greatest part of the army by this means perished; and as no water was to be had in the desert abovementioned, almost all the beasts died of thirst, before the fugitives arrived on the confines of Egypt. Saladin himself seemed to have been greatly intimidated; for in a letter to his brother Al Malek, he told him, that "he was more than once in the most imminent danger; and that God, as he apprehended, had delivered him from thence, in order to reserve him for the execution of some grand and important design."

In the year 1182, the sultan set out on an expedition to Syria with a formidable army, amidst the acclamations and good wishes of the people. He was, however, repulsed with loss both before Aleppo and Al Mawfel, after having spent much time and labour in besieging these two important places.

In the mean time, a most powerful fleet of European ships appeared on the Red Sea, which threatened the cities of Mecca and Medina with the utmost danger. The news of this armament no sooner reached Cairo, than Abu Beer, Saladin's brother, who had been left viceroy in the sultan's absence, caused another to be fitted out with all speed under the command of Lulu, a brave and experienced officer; who quickly came up with them, and a dreadful engagement ensued. The Christians were defeated after an obstinate resistance, a vast number of their men were killed in the engagement, and all the prisoners butchered in cold blood. This proved such a terrible blow to the Europeans, that they never more ventured on a like attempt.

90
The Christians
receive a
great defeat
at sea.

In 1183, Saladin continued to extend his conquests. The city of Amida in Mesopotamia surrendered to him in eight days; after which, being provoked by some violence committed by the prince of Aleppo, he resolved at all events to make himself master of that place. He was now attended with better success than formerly; for as his army was very numerous, and he pushed on the siege with the utmost vigour, Amaddodn the prince capitulated, upon condition of being allowed to possess certain cities in Mesopotamia which had formerly belonged to him, and being ready to attend the sultan on whatever expedition he pleased. After the conquest of Aleppo, Saladin took three other cities, and then marched against his old enemies the Crusaders. Having sent out a party to reconnoitre the enemy, they fell in with a considerable detachment of Christians; whom they easily defeated, taking about 100 prisoners, with the loss of only a single man on their

their side. The sultan, animated by this first instance of success, drew up his forces in order of battle, and advanced against the Crusaders, who had assembled their whole army at Sepphoris in Galilee. On viewing the sultan's troops, however, and perceiving them to be greatly superior in strength to what they had at first apprehended, they thought proper to decline an engagement, nor could Saladin with all his skill force them to it. But though it was found impossible to bring the Crusaders to a decisive engagement, Saladin found means to harass them greatly, and destroyed great numbers of their men. He carried off also many prisoners, dismantled three of their strongest cities, laid waste their territories, and concluded the campaign with taking another strong town.

92
Christians
totally de-
feated.

For three years Saladin continued to gain ground on the Crusaders, yet without any decisive advantage; but in 1187, the fortune of war was remarkably unfavourable to them. The Christians now found themselves obliged to venture a battle, by reason of the cruel ravages committed in their territories by Saladin, and by reason of the encroachments he daily made on them. Both armies therefore being resolved to exert their utmost efforts, a most fierce and bloody battle ensued. Night prevented victory from declaring on either side, and the fight was renewed with equal obstinacy next day. The victory was still left undecided; but, the third day, the sultan's men finding themselves surrounded by the enemy on all sides but one, and there also hemmed in by the river Jordan, so that there was no room to fly, fought like men in despair, and at last gained a most complete victory. Vast numbers of the Christians perished on the field. A large body found means to retire in safety to the top of a neighbouring hill covered with wood; but being surrounded by Saladin's troops, who set fire to the wood, they were all obliged to surrender at discretion. Some of them were butchered by their enemies as soon as they delivered themselves into their hands, and others thrown into irons. Among the latter were the king of Jerusalem himself, Arnold prince of Al Shawbec and Al Carac, the masters of the Templars and Hospitalers, with almost the whole body of the latter. So great was the consternation of the Christians on this occasion, that one of Saladin's men is said to have taken 30 of them prisoners, and tied them together with the cord of his tent, to prevent them from making their escape. The masters of the Templars and Hospitalers, with the knights acting under them, were no sooner brought into Saladin's presence, than he ordered them all to be cut in pieces. He called them *Assajins*, or *Batanists*; and had been wont to pay 50 dinars for the head of every Templar or Hospitaler that was brought him. After the engagement, Saladin feasted himself in a magnificent tent, placing the king of Jerusalem on his right hand, and Arnold prince of Al Shawbec and Al Carac on his left. Then he drank to the former, who was at that time ready to expire with thirst, and at the same time offered him a cup of snow-water. This was thankfully received; and the king immediately drank to the prince of Al Carac, who sat near him. But here Saladin interrupted him with some warmth: "I will not, says he, suffer this cursed rogue to drink; as that, according to the laudable and generous custom of the Arabs, would secure to him his life." Then,

Vol. IV.

turning towards the prince, he reproached him with having undertaken the expedition while in alliance with himself, with having intercepted an Egyptian caravan in the time of profound peace, and massacring the people of which it was composed, &c. Notwithstanding all this, he told him, he would grant him his life, if he would embrace Mahometanism. This condition, however, was refused; and the sultan, with one stroke of his scymitar, cut off the prince's head. This greatly terrified the king of Jerusalem; but Saladin assured him he had nothing to fear, and that Arnold had brought on himself a violent death by his want of common honesty.

93
His further
conquests.

The Crusaders being thus totally defeated and dispersed, Saladin next laid siege to Tiberias, which capitulated in a short time. From thence he marched towards Acca or Ptolemais, which likewise surrendered after a short siege. Here he found 4000 Mahometan prisoners in chains, whom he immediately released. As the inhabitants enjoyed at present a very extensive trade, the place being full of merchants, he found there not only vast sums of money, but likewise a great variety of wares exceedingly valuable, all which he seized and applied to his own use. About the same time his brother Al Malec attacked and took a very strong fortress in the neighbourhood; after which the sultan divided his army into three bodies, that he might with the greater facility over-run the territories of the Christians. Thus, in a very short time, he made himself master of Neapolis, Cæsarea, Sepphoris, and other cities in the neighbourhood of Ptolemais, where his soldiers found only women and children, the men having been all killed or taken prisoners. His next conquest was Joppa, which was taken by storm after a vigorous resistance. Every thing being then settled, and a distribution made of the spoils and captives, Saladin marched in person against Tebrien, a strong fortress in the neighbourhood of Sidon; which was taken by assault, after it had sustained a siege of six days. No sooner was he master of this place, than he ordered the fortress to be razed, and the garrison put to the sword. From Tebrien the victorious sultan proceeded to Sidon itself; which, being deserted by its prince, surrendered almost on the first summons. Berytus was next invested, and surrendered in seven days. Among the prisoners Saladin found in this place the prince of a territory called *Hobeil*, who by way of ransom delivered up his dominions to him, and was of consequence released. About the same time, a Christian ship, in which was a nobleman of great courage and experience in war, arrived at the harbour of Ptolemais, not knowing that it was in the hands of Saladin. The governor might easily have secured the vessel; but neglecting the opportunity, she escaped to Tyre, where the abovementioned nobleman, together with the prince of Hobeil, contributed not a little to retrieve the affairs of the Christians, and enable them to make a stand for four years after.

Saladin in the mean time went on with his conquests. Having made himself master of Acalon after a siege of 14 days, he next invested Jerusalem. The garrison was numerous, and made an obstinate defence; but Saladin having at last made a breach in the walls by sapping, the besieged desired to capitulate. This was at first refused, upon which the Christian ambaf-

94
Jerusalem
taken.

fador made the following speech. " If that be the case, know, O sultan, that we who are extremely numerous, and have been restrained from fighting like men in despair only by the hopes of an honourable capitulation, will kill all our wives and children, commit all our wealth and valuable effects to the flames, massacre 5000 prisoners now in our hands, leave not a single beast of burden or animal of any kind belonging to us alive, and level with the ground the rock you esteem sacred, together with the temple Al Akfa. After this we will fall out upon you in a body; and doubt not but we shall either cut to pieces a much greater number of you than we are, or force you to abandon the siege." This desperate speech had such an effect upon Saladin, that he immediately called a council of war, at which all the general officers declared, that it would be most proper to allow the Christians to depart unmolested. The sultan therefore allowed them to march out freely and securely with their wives, children, and effects; after which he received ten dinars from every man capable of paying that sum, five from every woman, and two from every young person under age. For the poor who were not able to pay any thing, the rest of the inhabitants raised the sum of 30,000 dinars.

Most of the inhabitants of Jerusalem were escorted by a detachment of Saladin's troops to Tyre; and soon after, he advanced with his army against that place. As the port was blocked up by a squadron of five men of war, Saladin imagined that he should easily become master of it. But in this he found himself mistaken. For, one morning by break of day, a Christian fleet fell upon his squadron, and entirely defeated it; nor did a single vessel escape their pursuit. A considerable number of the Mahometans threw themselves into the sea during the engagement; most of whom were drowned, though some few escaped. About the same time Saladin himself was vigorously repulsed by land; so that, after calling a council of war, it was thought proper to raise the siege.

In 1188, Saladin, though his conquests were not so rapid and considerable as hitherto, continued still superior to his enemies. He reduced the city of Laodicea and some others, together with many strong castles; but met also with several repulses. At last he took the road to Antioch; and having reduced all the fortresses that lay in his way, many of which had been deemed impregnable, Bohemond prince of Antioch was so much intimidated, that he desired a truce for seven or eight months. This Saladin found himself obliged to comply with, on account of the prodigious fatigues his men had sustained, and because his auxiliaries now demanded leave to return home.

95
Crusaders
retrieve
their affairs.

All these heavy losses of the Christians, however, proved in some respects an advantage, as they were thus obliged to lay aside their animosities, which had originally proved the ruin of their affairs. Those who had defended Jerusalem, and most of the other fortresses taken by Saladin, having retreated to Tyre, formed there a very numerous body. This proved the means of preserving that city, and also of re-establishing their affairs for the present. For, having received powerful succours from Europe, they were enabled in 1189 to take the field with 30,000 foot and 2000 horse. Their first attempt was upon Alexandria; from whence they dislodged a strong party of

Mahometans, and made themselves masters of the place with very little loss. They next laid siege to Ptolemais; of which Saladin had no sooner received intelligence, than he marched to the relief of the place. After several skirmishes with various success, a general engagement ensued, in which Saladin was defeated with the loss of 10,000 men. This enabled the Christians to carry on the siege of Ptolemais with greater vigour; which place, however, they were not able to reduce for the space of two years.

This year the sultan was greatly alarmed by an account that the emperor of Germany was advancing to Constantinople with an army of 260,000 men, in order to assist the other Crusaders. This prodigious armament, however, came to nothing. The multitude was so reduced with sickness, famine, and fatigue, that scarce 1000 of them reached the camp before Ptolemais. The siege of that city was continued, though with bad success on the part of the Christians. They were repulsed in all their attacks, their engines were burnt with naphtha, and the besieged always received supplies of provisions in spite of the utmost efforts of the besiegers; at the same time that a dreadful famine and pestilence raged in the Christian camp, which sometimes carried off 200 people a-day.

In 1191, the Christians received powerful succours Richard I. of England arrives in Asia.

Philip II. of France, and Richard I. of England (from his great courage surnamed *Cœur de Lion*), arrived before the camp at Ptolemais. The latter was esteemed the bravest and most enterprising of all the generals the Crusaders had, and the spirits of his soldiers were greatly elated by the thoughts of acting under such an experienced commander. Soon after his arrival, the English sunk a Mahometan ship of vast size, having on board 650 soldiers, a great quantity of arms and provisions, going from Berytus to Ptolemais. Of the soldiers and sailors who navigated this vessel, only a single person escaped; who being taken prisoner by the English, was dispatched to the sultan with the news of the disaster. The besieged still defended themselves with the greatest resolution; and the king of England happening to fall sick, the operations of the besiegers were considerably delayed. On his recovery, however, the attacks were renewed with such fury, that the place was every moment in danger of being taken by assault. This induced them to send a letter to Saladin, informing him, that if they did not receive succours the very next day, they would be obliged to submit. As this town was the sultan's principal magazine of arms, he was greatly affected with the account of their distress, especially as he found it impossible to relieve them. The inhabitants, therefore, found themselves under a necessity of surrendering the place. One of the terms of the capitulation was, that the Crusaders should receive a very considerable sum of money from Saladin, in consequence of their delivering up the Mahometan prisoners they had in their hands. This article, Saladin refused to comply with; and in consequence of his refusal, Richard caused 3000 of those unfortunate men to be slaughtered at once.

After the reduction of Ptolemais, the king of England, now made generalissimo of the Crusaders, took the road to Afcalon, in order to besiege that place; after which, he intended to make an attempt upon Jerusalem itself. Saladin proposed to intercept his passage,

Egypt.

97
Defeats Sa-
ladin.

lage, and placed himself in the way with an army of 300,000 men. On this occasion was fought one of the greatest battles of that age. Saladin was totally defeated, with the loss of 40,000 men; and Aſcalon soon fell into the hands of the Crusaders. Other sieges were afterwards carried on with success, and Richard even approached within sight of Jerusalem, when he found, that, by reason of the weakened state of his army, and the divisions which prevailed among the officers who commanded it, he should be under the necessity of concluding a truce with the sultan. This was accordingly done in the year 1192; the term was, three years, three months, three weeks, three days, and three hours; soon after which the king of England set out on his return to his own dominions.

In 1193, Saladin died, to the inexpressible grief of all true Mahometans, who held him in the utmost veneration. His dominions in Syria and Palestine were shared out, among his children and relations, into many petty principalities: his son Othman succeeded to the crown of Egypt; but as none of his successors possessed the enterprising genius of Saladin, the history from that time to the year 1250 affords nothing remarkable. At this time the reigning sultan Malek Al Salek was dethroned and slain by the *Mamlucs* or *Mamelucs*, as they are called, a kind of mercenary soldiers who served under him. In consequence of this revolution, the Mamelucs became masters of Egypt, and chose a sultan from among themselves.—These Mamelucs were originally young Turks or Tartars, sold to private persons by the merchants, from whom they were bought by the sultan, educated at his expence, and employed to defend the maritime places of the kingdom. The reason of this institution originally was, that the native Egyptians were become so cowardly, treacherous, and effeminate, from a long course of slavery, that they were unfit for arms. The Mamelucs, on the contrary, made most excellent soldiers; for, having no friends but among their own corps, they turned all their thoughts to their own profect. When they had got possession of the government, therefore, as they neither understood nor valued any thing besides the art of war, every species of learning decayed in Egypt, and a great degree of barbarism was introduced. Neither was their empire of long duration, notwithstanding all their martial abilities. The reason of this was, that they were originally only a small part of the sultan of Egypt's standing forces. As a numerous standing army was necessary in a country where the fundamental maxim of government was, that every native must be a slave, they were at first at a loss how to act; being justly suspicious of all the rest of the army. At last they resolved to buy Christian slaves, and educate them in the same way that they themselves had formerly been. These were commonly brought from Circassia, where the people, though they professed Christianity, made no scruple of selling their children. When they were completed in their military education, these soldiers were disposed of through all the fortresses erected in the country to bridle the inhabitants; and because in their language such a fort was called *Borge*, the new militia obtained the name of *Borgites*. By this expedient the Mamelucs imagined they would be able to secure themselves in the sovereignty. But in this they were mistaken. In process of

99
Mamlucs
become mas-
ters of E-
gypt.

time, the old Mamelucs grew proud, insolent, and lazy; and the Borgites, taking advantage of this, rose upon their masters, deprived them of the government, and transferred it to themselves about the year 1382.

The Borgites, as well as the former, assumed the name of *Mamelucs*; and were famous for their valour, and ferocity of conduct. They were almost perpetually engaged in wars either foreign or domestic, and their dominion lasted till the year 1517, when their kingdom was invaded by Selim the Turkish sultan. The Mamelucs defended themselves with incredible valour; notwithstanding which, being overpowered by numbers, they were defeated in every engagement. The same year, their capital, the city of Cairo, was taken, with a terrible slaughter of those who defended it. The sultan was forced to fly; and, having collected all his force, ventured another battle. The most romantic efforts of valour, however, were insufficient to cope with the innumerable multitude which composed the Turkish army. Most of his men were cut in pieces, and the unhappy prince himself was at last obliged to take shelter in a marsh. He was dragged from his hiding place, where he had stood up to the shoulders in water, and soon after put to death. With him ended the glory, and almost the existence, of the Mamelucs, who were now every where searched for and cut in pieces.

This was the last great revolution in the Egyptian affairs; a revolution very little to the advantage of the natives, who may well doubt whether their ancient or modern conquerors have behaved with the greater degree of barbarity. Selim gave a specimen of his government, the very day after his being put in full possession of it by the death of Tuman Bey the unfortunate sultan above mentioned. Having ordered a theatre to be erected with a throne upon it on the banks of the Nile, he caused all the prisoners, upwards of 30,000 in number, to be beheaded in his presence, and their bodies thrown into the river. The rest of the Turkish government hath been conformable to such a beginning; and the inhabitants are still oppressed by exactions, and reduced to the lowest degree of slavery.

With regard to the country of Egypt, it is difficult to say any thing with certainty; for not only is there a prodigious difference between the accounts of the ancient and modern historians, but the latter differ very widely from one another. According to the former, the country abounded with grain of all sorts, especially rice. The most fertile parts were the Delta, now called *Al Feyyum*. The capital of this district is by the natives said to have been built by the patriarch Joseph, to whom they own themselves obliged for the improvement of this territory. Before his time it was nothing but a standing pool; but that patriarch, by cutting canals, particularly the great one which reaches from the Nile to the lake Mæris, drained it of the water, and, clearing it of the weeds and rushes, made it fit for tillage. It still continues to be the most fertile and best cultivated part of the kingdom. The great fertility of Egypt was attributed, and very justly, to the annual overflowing of the Nile; for the overflowing of grounds with water is found to be a very good method of fertilizing them *. The sources of this river were unknown to the ancients. They even thought it im-

Account of
the river
Nile.

possible to discover them. It is now, however, known, that the Nile arises in Ethiopia or Abyssinia. It enters Egypt almost under the tropic of Cancer, violently pouring down no less than seven cataracts from a very considerable height, and making a noise that may be heard several miles off. Having passed through the Upper and Middle Egypt, a little below the ancient Memphis, it divided itself into two large arms, which afterwards formed seven channels, by which it was discharged into the sea. These seven mouths are much spoken of by ancient historians. They were called the *Canopic*, the *Heracleotic*, *Bolbitic*, *Sabennyitic*, *Phatnic* or *Pathmetic*, the *Mendesian* *Tanitic* or *Saitic*, and the *Pelusiatic*; all of which had their names from cities standing on their several branches. Besides these, there were two Pseudoformata, or false mouths, named *Pi-neptimi* and *Diocles*, which were too small for large vessels. But the greater part of these mouths have been since stopped up, and others formed; so that above thirty channels are now reckoned, through which the waters of the Nile empty themselves into the sea, especially at the time of its overflowing, the greater part of them becoming dry when the waters retire. The two chief, and indeed the only considerable branches of the Nile at present are those of *Rosetta* or *Rafhid* to the west, and *Damietta* or *Dinwyet* to the east.

105
Its annual
inundation.

Concerning the annual inundation of the Nile, ancient and modern writers agree pretty well. It begins to rise about the summer solstice, and continues to do so for about 100 days after; then it gradually decreases for as many more, till it retires within its banks, and does not overflow till the next year. If the river does not rise to the height of 15 or 16 cubits at least, the country is not covered with water, and a scarcity ensues. No notice is taken of the rising of the river till the end of June; by which time it is usually risen to the height of six or eight *pikes*, (a Turkish measure of about 26 inches). Then the public criers proclaim it through all the cities; and in the same manner continue every day to give an account of its gradual progress. After it has risen to the height of 16 pikes, they cut down the dam of a great canal which passes through the middle of the city of Cairo, and let in the water on their lands. If the river want but an inch of this height, they will not cut the dam; because, in such a case, no tribute is due to the prince for the lands that should have been watered by them, the produce being then scarce sufficient to maintain the tillers. For this reason, if the bashaw or governor of Egypt cut this dam before the river has risen to the height above mentioned, he is answerable for the consequence, and must pay the Turkish emperor his tribute, whether the year prove plentiful or not. If the water rises to the height of 23 or 24 pikes, it is thought to be the most favourable; but if it exceeds that, it does a great deal of mischief, by overthrowing houses, drowning cattle, &c.

106
Account of
the Nile-
sacs.

In order to judge more exactly of the rise and fall of the water, pillars are erected on its banks, and marked with proper divisions. A very ancient one, said to be erected for this purpose by the emperor Heraclius, is still to be seen in the castle of old Cairo. The present *nilemeter*, or *mikyas*, as the Arabs call it, is in the same castle. It is a large square reservoir, round which runs a handsome gallery sustained by 12 marble

pillars, with a ballustrade to lean on, when one looks into the water. Through this basin runs a canal drawn from the river. In the middle is an octagonal pillar of white marble divided into 22 equal parts: the first is divided into 24 inches; but the second is not; tho' all the rest have these subdivisions.

As it is impossible, however, that the Nile can of itself overflow every spot of land which requires its assistance, the inhabitants have been obliged to cut a vast number of canals and trenches from one end of Egypt to the other, to convey the water to those places where it is wanted. Every town and village has its canal; which is opened at the most proper time, and the water conducted to the most distant places. These canals are not permitted to be opened all at once; because, if this was done, some lands would have too much, and others too little, water. They begin to open them first in upper Egypt, and then gradually lower, according to the public regulations made for that purpose. By this means, the water is so carefully husbanded, that it answers the purposes of the whole country; which is so large, and the canals so numerous, that, it is thought, scarce a tenth part of the waters of the river enter the sea during the first three months of its overflowing. As some places, however, lie too high to be overflowed in this manner, they are for this reason obliged to raise the water to cover them by engines. Formerly, they made use of Archimedes's screw, from thence commonly called the *Egyptian pump*; but now they generally use wheels, which draw up the water in earthen pots, and are moved by oxen. There is also a vast number of wells, from whence water is drawn in the same manner for the gardens and fruit-trees; so that there are reckoned to be 200,000 oxen daily employed in this labour throughout the kingdom; without reckoning the men who draw water in wicker-baskets so close that not a drop runs through.

Egypt.

107
Method of
distributing
the water.

The accounts given by the ancients of the fertility of Egypt, almost exceed the bounds of credibility. The mud or slime brought down by the river, according to them, was in quantity sufficient to serve for manure to the whole kingdom. They had not the toil of digging, ploughing, or breaking of clods. When the waters were retired, they needed only to mix a little sand with the earth to abate its strength; the mud brought down by the Nile making the soil, it seems, too rich; after which, they sowed their seed, and reaped the most plentiful crops.—We can scarce doubt that this formerly hath been true in some degree, seeing we find it attested by all the historians of antiquity, that, in the time of the Romans, their city was chiefly supplied with corn from Egypt. From the way in which it is spoke of in the sacred writings also, we must certainly look upon Egypt to have anciently been a very plentiful country. Now, however, the case is prodigiously altered. The inhabitants are scarce one twentieth part of what they formerly were, and every spot is cultivated as much as before; yet the country very seldom produces enough to support them. The waters of the Nile now bring down none of that mud spoke of by the ancients. They continue clear from the beginning of their rise till they have arrived at the height of 17 feet and upwards. Then they bring down a quantity of reddish coloured loam, which indeed

108
Prodigious
fertility of

gypt.

109
Modern E-
gypt not so
fertile.

proves

Egypt.

proves an excellent manure. It is very probable, therefore, that the sources from whence the waters of the Nile received the black mud, have long since been exhausted; and the inhabitants not adverting to this change, and neglecting to manure their lands properly, the ground hath been exhausted by continual cultivation, and fallen short of its ancient fertility*.—What fertility this country still possesses, must be derived from the waters of the river, seeing less crops are always produced when the waters of the Nile rise to the least height. One thing which contributes greatly to the variation of quantity in the waters of the Nile, and consequently of the fertility of the country, is the blowing of the north-wind. This makes a kind of bar across the mouths of the river, and hinders the waters from flowing with such swiftness into the sea as they otherwise would do: and therefore it is observed, that when the wind blows from any other quarter, the waters decrease as much in one day, as they do in four when it blows from the north; and hence, in such cases, the fertility of Egypt is greatly diminished.—The ancients were ignorant of the causes of this inundation, which seemed to them the more unaccountable, as it overflowed in the summer-time, when other rivers are generally at the lowest. But it has long since been known to be occasioned by the great rains which fall in Ethiopia in April and May, and swell the river to such a degree, that it almost lays that country entirely under water. At the same time, it rains with equal regularity in the East Indies, and the rivers Indus and Ganges overflow their banks at the same time with the Nile.

Whatever may have been the cause with the fertility of ancient Egypt, it is certain, that such monuments of the power and wealth of its ancient monarchs remain, that we cannot doubt of its having been anciently very populous.—The most remarkable of these are the pyramids; which, on many accounts, may be reckoned the most wonderful structures in the world. There are many of them in the different parts of Egypt; but those which have been chiefly taken notice of and described by travellers, stand on the west side of the Nile, not far from the ancient Memphis. The number of these pyramids is about 20; of which three, standing almost together, are most remarkable, and have been most frequently described. The others lie scattered in the Libyan desert, and are lesser models of these three, though some of them also are very considerable.—The builders of these pyramids are unknown. Josephus supposes them to have been erected by the Israelites during their heavy oppression by Pharaoh. Others pretend, that they were built by the patriarch Joseph, for granaries to lay up the corn of the seven plentiful years: both of which opinions, however, seem to be improbable. It is much more likely, that they were erected as monuments for the dead.

The first of these pyramids is situated on a rocky hill, in the sandy desert of Libya, about a quarter of a mile from the plains of Egypt; above which, the rock rises 100 feet or more, with a gentle and easy ascent. Upon this advantageous rise and solid foundation is the pyramid erected; the height of the situation adding to the beauty of the work, and the solidity of the rock affording it a stable support. The north side, near the basis, being measured by a radius of 10 feet in length, taking two several stations, was found by Mr Greaves

to be 693 English feet. The other sides were examined by a line, for want of an even level, and a convenient distance to place the instruments. The altitude, if measured by its perpendicular, is 481 feet; but if it be taken as the pyramid ascends inclining, then it is equal, in respect of the lines subtending the several angles, to the latitude of the basis. Whereby it appears, that though several of the ancients have excessively magnified the height of these pyramids, yet the biggest of them falls short of the height of St Paul's church in London: which, from the ground to the top of the lantern only, is no less than 470 feet. If we imagine on the sides of the basis, which is perfectly square, four equilateral triangles mutually inclining till they meet in a point (for so the top seems to those who stand below), then we shall have a just idea of the true dimensions and figure of this pyramid; the area of whose basis contains 480,249 square feet, or something more than 11 English acres of ground: a proportion so monstrous, that did not the ancients attest as much, and some of them more, it might appear incredible.

The ascent to the top of the pyramid is contrived by steps, the lowermost of which is near four feet in height, and three in breadth; and running about the pyramid in a level, made a narrow walk, when the stones were entire, on every side. The second step is like the first, benching in near three feet. In the same manner is the third row placed on the second; and the rest in order, like so many stairs, rising one above another to the top; which ends not in a point, as mathematical pyramids do, but in a little flat or square of 13,280 English feet broad, and consisting of nine stones, besides two which are wanting at the corners. This pyramid, by reason of the stones being worn by the weather, cannot be conveniently ascended, except on the south side, or at the north-east angle. The steps are made of massy and polished stones (said to have been hewn out of the Arabian mountains, which bound the upper Egypt on the east); and are so vast, that the breadth and depth of every step is one single stone. It is also to be observed, that the steps are not all of equal depth; for some are near four feet, and others not quite three, diminishing the higher one ascends: and the breadth of them is proportionable to their depth; so that a right line, extended from the basis to the top, will equally touch the outward angle of every step. The number of these steps is not mentioned by any of the ancients; but modern travellers differ very much in their computation. Mr Greaves and two others counted them very carefully, and found them to be 207; though one of them, in descending, reckoned 208.

The entrance into the pyramid is by a square narrow passage, which opens in the midst of the north side on the 16th step, or ascending 38 feet, on an artificial bank of earth. The stone that is over it is near 12 feet long, and above 8 feet wide. This entry goes declining with an angle of 26 degrees, and is in breadth exactly 3,463 English feet, and in length 92 feet and an half. The structure of it has been the labour of an exquisite hand, as appears by the smoothness and evenness of the work, and close knitting of the joints; a property long since observed by Diodorus to have run through the whole fabric of this pyramid. At the end of this passage there is another like the former, but which goes on a little rising: at the meeting of these

two.

112
Account of
the pyramids.

two passages, the one descending and the other ascending, the lowermost stone of the roof, perpendicular to it, forms a sharp ridge, between which and the sand there is sometimes not a foot space to pass through; so that a man must slide on his belly close to the ground, and yet grate his back against the above-mentioned stone, unless he be very slender. However, this difficulty is occasioned chiefly by the sand which the wind drives into this place; for if the passage be cleared, it is of the same dimensions there as at the entrance. There being no window or other opening in this pyramid to admit the light, it may easily be conceived, that those who would view the inside must carry lights with them.

Having passed this strait, on the right hand there is an ugly broken hole of about 89 feet in length, the height and breadth various, and not worthy consideration: whether this part be decayed by time, or has been dug away for curiosity, or in hopes of discovering some hidden treasure, is uncertain. On the left hand, adjoining to the narrow entrance, climbing up a steep and massy stone 8 or 9 feet in height, one enters on the lower end of the first gallery; the pavement of which rises with a gentle acclivity, consisting of a smooth polished marble, and, where not smeared with dust and filth, appearing of a white and alabaster colour; the sides and roof of unpolished stone, not so hard and compact as that of the pavement: the breadth of this gallery is almost 5 feet, the height about as much, and the length 110 feet. At the end of it, there are two passages; one low and horizontal, or level with the ground; and the other high and rising like the former. At the entry of the lower passage, on the right hand, is the well mentioned by Pliny, which is circular, and a little above 3 feet diameter: the sides are lined with white marble, and the descent is by fixing the hands and feet in little open spaces cut in the sides within, opposite and answering to one another in a perpendicular; which is the contrivance for descending into most of the wells and cisterns at Alexandria. This well might lead to the vault above-mentioned; but it is now almost stopped up with rubbish, and not above 20 feet deep.

Leaving the well, and going straight on to the distance of 15 feet, one enters another passage opening against the former, and of the same dimensions, the stones of which are very massy, and exquisitely joined. This passage runs in a level 110 feet, and leads to an arched vault, or chamber, standing due east and west, having a sepulchral smell, and half full of rubbish; its length is not quite 20 feet, its breadth about 17, and its height less than 15; the walls are entire, and plastered over with lime; the roof is covered with large smooth stones, not lying flat, but shelving, and meeting above in an angle. On the side of this room, in the middle of it, Greaves says, there seems to have been a passage leading to some other place; but neither Thevenot nor Le Brun could discover any such.

Returning back through the narrow horizontal passage, you climb over it, and enter into the other or second gallery on the left, divided from the first gallery by the wall, in which is the entrance to the last-mentioned passage. This second gallery rises with an angle of 26 degrees, and is in length 154 feet from the well below; but if measured on the pavement, somewhat less, by reason of a little vacuity of about 15 feet,

before described, between the well and the square-hole: the height of it is about 26 feet, and the breadth 6.87 feet; of which one half is to be allowed for the way in the middle, there being a stone bench on each side of the wall, of one foot and $\frac{1}{1000}$ in breadth, and as much in depth. On the top of these benches, near the angle where they close with the wall, are little spaces, cut in right-angled parallel figures, set in each side opposite to one another; intended, no question, for some other end than ornament. The stone of which this gallery is built, is a white and polished marble, very evenly cut in large tables; and the joints are so close, that they are scarce discernable by a curious eye: but what adds grace to the whole structure, though it makes the passage the more slippery and difficult, is the acclivity and rising of the ascent. However, the going up is not a little facilitated by certain holes made in the floor, about six hands-breadth from one another, into which a man may set his feet, while he holds by the bench with one hand. In the ranging of the marble tables in both the side-walls, there is one piece of architecture very graceful; and that is, that all the courses, which are but seven, do set and flag over one another about three inches, the bottom of the upper course oversetting the higher part of the next below it in order as they descend.

Having passed this gallery, one enters another square hole of the same dimensions with the former, which leads into two small antichambers or closets, lined with a rich and speckled kind of Thebaic marble. The first of these is almost equal to the second, which is of an oblong figure; one side containing seven feet, and the other three and a half; the height is ten feet, and the floor level. On the east and west sides, within two feet and a half of the top, which is somewhat larger than the bottom, are three semicircular cavities, or little seats.

The inner antichamber is separated from the former by a stone of red speckled marble, which hangs in two mortises (like the leaf of a sluice), between two walls, more than three feet above the pavement, and wanting two of the roof. From this second closet you enter another square hole, over which are five lines cut parallel and perpendicular; besides which no other sculptures or engravings are observed in the whole pyramid. The square passage is of the same wideness with the rest, being all of Thebaic marble, exquisitely cut, and landing you at the north end of a very sumptuous and well proportioned room. The distance from the end of the second gallery to this entry, running upon the same level, is 24 feet. This chamber stands as it were in the heart and centre of the pyramid, equidistant from all the sides, and almost in the middle between the basis and the top. The floor, the sides, and the roof of it, are all made of vast tables of Thebaic marble, most exquisitely polished; which, if they were not obscured by the smoke of torches, would appear glittering and shining. From the top of it descending to the bottom, there are about six ranges of stone, all of which being respectively sized to an equal height very gracefully run round the room in one altitude. The stones which cover this chamber are of a stupendous length, like as many huge beams lying flat and traversing the room, and supporting the prodigious mass of building above. Of these there are nine which cover the roof; two

Egypt.

two of them are less by half in breadth than the rest; the one at the east end, and the other at the west. The length of the chamber on the south side, most accurately taken at the joint or line where the first and second row of stones meet, is 34.38 English feet; the breadth on the west side, at the joint where the first and second row of stones meet, is 1.719 feet; and the height 19½ feet.

Within this room stands the monument of *Cheops*, or *Chenosis*, of one piece of marble, hollow within, and founding like a bell. It is of the same kind of stone with which the whole room is lined; being a speckled marble with white, black, and red spots. The figure of the tomb is like an altar, or two cubes finely set together; it is cut smooth and plain, without any sculpture or engraving. The outward superficies is in length seven feet three inches and a half, and in depth three feet three inches and three quarters. The hollow inside is in length, on the west side, 6.488 feet; in breadth, at the north end, 2.218 feet; and in depth, 2.860 feet. As this monument could not have been brought hither through the above-mentioned narrow passages, it is supposed to have been raised and placed there before the roof of the chamber was closed. It stands exactly in the meridian, or due north and south, and equidistant from all the sides of the chamber, except the east, from whence it is twice as far removed as from the rest. Under it there is a little hollow space dug away, and a large stone in the pavement removed at the angle next adjoining to it: which hath probably been done in hopes of finding some treasure hidden there; it being a superstitious prodigality practised by the ancients, and continued to this day in the East Indies, to conceal money in their sepulchres. In the south and north sides of the chamber there are two inlets opposite to one another, seven tenths of a foot broad, four tenths of a foot deep, evenly cut, and running in a straight line six feet and further into the thickness of the wall: that on the south side is larger and somewhat round, not so long as the former, and by the thickness within seems to have been made use of for setting of lamps upon it. This is all that is to be seen within this first pyramid. The only thing more to be observed is a surprising echo, which Plutarch takes notice of, and says, that it answers four or five times; but a late traveller (Lucas) assures us that it answers ten or twelve times very distinctly.

The second pyramid stands at a small distance southward from the former. Mr Greaves assures us, that it is of the same dimensions. It has no passage into it; and is built of white stones, not near so large as the first. The sides rise not with steps like the first, but are smooth and equal; the whole fabric, except where it is opposed to the south, being very entire, and free from any deformed breaches. The third pyramid is much less than the two foregoing ones, measuring only 300 feet on each side. It is built of a clear and white stone, somewhat brighter than that of which the second is built. Besides these, there is also a fourth; which, had it been finished, would not have fallen short of the grandeur of the first. It has 148 steps like the first. The platform is not even, the stones being set together without order, which shews that it has not been finished; and yet it is much more ancient than any of the rest, as is evident by the stones,

Egypt.

which are all worn out and crumbled into sand. It has a passage into it which leads into some halls and galleries like those of the first.

Besides these, there are many other monuments of the grandeur of the ancient Egyptian monarchs; some of which are mentioned under the article ARCHITECTURE, n° 4. and others under those of THEBES, MÆRIS, SYENE, &c.

With regard to the inhabitants of Egypt, it hath already been observed, that they are much less numerous than formerly; owing, no doubt, to the rigour of the Turkish government. The descendants of the original Egyptians are an ill-looking slovenly people, immersed in indolence, and are distinguished by the name of *Coptis*; in their complexions they are rather sun-burnt than swarthy or black. Their ancestors were once Christians, and in general they still pretend to be of that religion; but Mahometanism is the prevailing worship of Egypt. Those who inhabit the villages and fields, at any considerable distance from the Nile, consist of Arabs or their descendants, who are of a deep swarthy complexion; and they are represented by the best travellers, as still retaining the patriarchal method of tending their flocks, and many of them without any fixed place of abode. The Turks, who reside in Egypt, retain all their Ottoman pride and insolence, and the Turkish habit, to distinguish themselves from the Arabs and Copts, who dress very plain, their chief finery being an upper garment of white linen, and linen drawers; but their ordinary dress is of blue linen, with a long cloth coat, either over or under it. The Christians and Arabs of the meaner kind content themselves with a linen or woollen wrapper, which they fold, blanket-like, round their body. The Jews wear blue leather slippers, the other natives of the country wear red, and the foreign Christians yellow. The dress of the women is tawdry and unbecoming; but their cloaths are silk when they can afford it; and such of them as are not exposed to the sun, have delicate complexions and features. The Copts in general are excellent accountants, and many of them live by teaching the other natives to read and write. All Egypt is over-run with jugglers, fortune-tellers, mountebanks, and travelling sleight-of-hand men.

To what we have already said concerning the religion of Egypt, it is proper to add, that the bulk of the Mahometans are enthusiasts, and have among them their santos or fellows who pretend to a superior degree of holiness, and without any ceremony intrude into the best houses, where it would be dangerous to turn them out. The Egyptian Turks mind religious affairs very little; and it would be hard to say what species of Christianity is professed by the Christian Copts, which are here numerous; but they profess themselves to be of the Greek church, and enemies to that of Rome. In religious, and indeed in many civil matters, they are under the jurisdiction of the patriarch of Alexandria, who by dint of money generally purchases a protection at the Ottoman court.

The Coptic is the most ancient language of Egypt. This was succeeded by the Greek, about the time of Alexander the Great; and that by the Arabic, upon the commencement of the khalifate, when the Arabs dispossessed the Greeks of Egypt. The Arabic, or Arabesque, as it is called, is still the current language

113
Learning.

guage, but the Coptic and modern Greek continue to be spoken.

Though it is past dispute, that the Greeks derived all their knowledge from the ancient Egyptians, yet scarce a vestige of it remains among their descendants. This is owing to the bigotry and ignorance of their Mahometan masters; but here it is proper to make one observation which is of general use. The khalifs or Saracens who subdued Egypt, were of three kinds. The first, who were the immediate successors of Mahomet, made war, from conscience and principle, upon all kinds of literature, excepting the Alcoran; and hence it was, that, when they took possession of Alexandria, which contained the most magnificent library the world ever beheld, its valuable manuscripts were applied for some months in cooking their victuals, and warming their magnificent baths. The same fate attended upon the other Egyptian libraries. The khalifs of the second race were men of taste and learning, but of a peculiar strain. They bought up all the manuscripts that survived the general conflagration, relating to astronomy, medicine, and some useless parts of philosophy: but they had no taste for the Greek arts of architecture, sculpture, painting, or poetry; and learning was confined to their own courts and colleges, without ever finding its way back to Egypt. The lower race of khalifs, especially those who called themselves *Mamelucks*, disgraced human nature; and the Turks have rivetted the chains of barbarous ignorance which they imposed. All the learning, therefore, possessed by the modern Egyptians, consists in arithmetical calculations for the dispatch of business, the jargon of astrology, a few nostrums in medicine, and some knowledge of Arabesque and the Mahometan religion.

114
Manufactures.

Modern geographers mention little of Egyptian manufactures at this time: but captain Norden, who travelled to that country, at the expense of his present Danish majesty's grandfather, about the year 1737, has been pretty explicit on the subject of commerce; and from him we learn that the Egyptians export prodigious quantities of unmanufactured as well as prepared flax, thread, cotton, and leather of all sorts, callicoos, yellow wax, sal armoniac, saffron, sugar, fenna, cassia. They trade with the Arabs for coffee, drugs, spices, callicoos, and other merchandizes, which are landed at Suez, from whence they send them to Europe. Several European states have consuls resident in Egypt. But the customs of the Turkish government are managed by Jews. A number of English vessels arrive yearly at Alexandria, some of which are laden on account of the owners, but most of them are hired and employed as carriers to the Jews, Armenians, and Mahometan traders. Captain Norden seems to think, that the English consul and merchants make no great figure in Alexandria, but that they are in much less danger and less troubled than the French.

115
Constitution, &c.

The constitution and government of this country seem to be but little known to modern times. It is certain that Egypt is subject to the Turks, and that even the meanest Janizary is respected by the natives. A viceroy is sent to Egypt, under the title of *pasha* or *bashaw* of Cairo, and is one of the greatest officers of the Ottoman empire; but as the interior parts of Egypt are almost inaccessible to strangers, we know little of their government and laws. It is generally agreed,

that the pacha is very careful how he provokes the little princes, or rather heads of clans, who have parcelled out Egypt among themselves, and whom he governs chiefly by playing one against another. He has however a large regular army, and a militia, which serve as nurseries from whence the Ottoman troops are recruited. The keeping up this army employs his chief attention. It has sometimes happened that those pashas have employed their arms against their masters; they are sometimes displaced by the Porte, upon complaints from those petty princes. Captain Norden and Dr Pocock have given us the best, and indeed a very unfavourable, account of those princes, who are called the *Schechs* of the Bedouins, or wandering Arabs, who are sometimes too powerful to receive laws from the Turkish government. A certain number of beys, or beys, are appointed over the provinces of Egypt, under the pasha. Though these beys are designed to be clerks upon him, yet they often assume independent powers.

The revenues are very inconsiderable, when compared to the natural riches of the country and the despotism of its government. Some say that they amount to 1,000,000 Sterling, but that two-thirds of the whole is spent in the country.

EGYPTIANS, or GYPSIES. See GYPSIES.

EJACULATOR, in anatomy, a name applied to two muscles of the penis from their office in the ejection of the seed. See ANATOMY, *Table of the Muscles*.

EICK. See BRUGES.

EIDER-DUCK. See ANAS.

EJECTA, a term used by lawyers for a woman deflowered, or cast from the virtuous.

EJECTION, in the animal economy, evacuation, or the discharging any thing through some of the excretories, as by stool, vomit, &c.

EJECTION, in Scots law, is the turning out the possessor of any heritable subject by force; and is either *legal* or *illegal*. Legal ejection is where a person having no title to possess, is turned out by the authority of law. Illegal ejection, is one person's violently turning another out of possession without lawful authority.

EJECTMENT, in English law, a writ, or action, which lies for the lessee for years, on his being ejected, or put out of his land, before the expiration of his term, either by the lessor, or a stranger. It may also be brought by the lessor against the lessee, for rent in arrears, or holding over his term, &c. Ejectment of late years is become an action in the place of many real actions, as writs of right, formedons, &c. which are very difficult, as well as tedious and expensive; and this is now the common action for trial of titles, and recovering of lands, &c. illegally held from the right owner: yet where entry is taken away by disseints, fines, recoveries, disseins, &c. an ejectment shall not be brought; whereby we find, that all titles cannot be tried by this action.

The method of proceeding in the action of ejectment is to draw up a declaration, and feign therein a lease for three, five, or seven years, to him that would try the title; and also feign a casual ejector, or defendant; and then deliver the declaration to the ejector, who serves a copy of it on the tenant in possession, and gives notice, at the bottom, for him to appear and defend his title; or that he the feigned defendant will suffer judgment by default, whereby the true tenant will be turned

turned out of possession : to this declaration the tenant is to appear at the beginning of next term by his attorney, and consent to a rule to be made defendant, instead of the casual ejector, and take upon him the defence, in which he must confess lease, judgment, entry, and ouster, and at the trial stand upon the title only : but in case the tenant in possession does not appear, and enter into the said rule in time, after the declaration served, then, on affidavit being made of the service of the declaration, with the notice to appear as aforesaid, the court will order judgment to be entered against the casual ejector by default; and thereupon the tenant in possession, by writ *habere facias possessionem*, is turned out of his possession. On the trial in ejectment, the plaintiff's title is to be set forth from the person last seized in fee of the lands in question, under whom the lessor claims down to the plaintiff, proving the deeds, &c. and the plaintiff shall recover only according to the right which he has at the time of bringing his action. And here, another who hath title to the land, upon a motion made for that purpose, may be defendant in the action with the tenant in possession, to defend his title; for the possession of the lands is primarily in question, and to be recovered, which concerns the tenant, and the title thereto is tried collaterally, which may concern some other.

ELÆAGNUS, OLEASTER, or Wild Olive; a genus of the monogynia order, belonging to the tetrandria class of plants. There are three species: 1. The spinosa, or eastern broad-leaved olive with a large fruit, is a native of the Levant and some parts of Germany. The leaves are about two inches long, and one and a half broad in the middle. They are placed alternate, and of a silver colour: at the footstalk of every leaf there comes out a pretty long sharp thorn, which are alternately longer: the flowers are small, the inside of the empalement is yellow, and they have a strong scent when fully open. 2. The inermis, without thorns, is that kind commonly preserved in the gardens of this country. The leaves are more than three inches long, and half an inch broad, and have a shining appearance like satin. The flowers come out at the footstalks of the leaves, sometimes singly, at other times two, and sometimes three, at the same place. The outside of the empalement is silvery and fluted; the inside of a pale yellow, and having a very strong scent. The flowers appear in July, and are sometimes succeeded by fruit. 3. The latifolia with oval leaves, is a native of Ceylon and some other parts of India. In this country it rises with a woody stem to the height of eight or nine feet, dividing into many crooked branches, garnished with oval and silvery leaves, which have several irregular spots of a dark colour on the surface. They are placed alternately on the branches, and continue all the year.

Culture, &c. The two first may be propagated by laying under the young shoots in autumn. They will take root in one year; when they may be cut off from the old trees, and either transplanted into a nursery for two or three years to be trained up, or into places where they are to remain. The proper time for this is in the beginning of March or early in the autumn. They should be placed where they may be screened from high winds; for they grow very freely, and are apt to be split by the wind if they are too much ex-

posed. The third sort is too tender to endure the open air of this country; and therefore must be kept in a warm stove, except during a short time in the warmest part of summer.

From the flowers of these plants an aromatic and cordial water has been drawn, which is said to have been successfully used in putrid and pestilential fevers. The genus *elæagnus* is not to be confounded with the oleaster or wild olive of Gerard, Parkinson, and Ray. The last is only a particular species of olive, called by Tournefort and Caspar Bauhine, *olea sylvestris* *.

Elaeothium
||
Elasticity.

* See *Olea*.

ELÆOTHESIUM, in antiquity, the anointing room, or place where those who were to wrestle, or had bathed, anointed themselves. See **Gymnasium**.

ELAPHEBOLIUM, in Grecian antiquity, the ninth month of the Athenian year, answering to the latter part of February and beginning of March. It consisted of 30 days; and took its name from the festival elaphebolia, kept in this month, in honour of Diana the huntress; on which occasion, a cake made in the form of a deer, was offered to her.

ELASMIS, in natural history, a genus of talcs, composed of small plates in form of spangles; and either single, and not farther fissile; or, if complex, only fissile to a certain degree, and that in somewhat thick laminae.—Of these talcs there are several varieties, some with large and others with small spangles, which differ also in colour and other peculiarities.

ELASTIC, in natural philosophy, an appellation given to all bodies endowed with the property of elasticity. See **ELASTICITY**.

ELASTIC Fluids. See **AIR**, **ELECTRICITY**, **GAS**, and **VAPOUR**.

ELASTICITY, or **ELASTIC Force**, that property of bodies wherewith they restore themselves to their former figure, after any external pressure.

The cause or principle of this important property elasticity, or springiness, is variously assigned. The Cartesians account for it from the materia subtilis making an effort to pass through pores that are too narrow for it. Thus, say they, in bending, or compressing, a hard elastic body, *e. gr.* a bow, its parts recede from each other on the convex side, and approach on the concave: consequently the pores are contracted or straitened on the concave side; and if they were before round, are now, for instance, oval: so that the materia subtilis, or matter of the second element, endeavouring to pass out of those pores thus straitened, must make an effort, at the same time, to restore the body to the state it was in when the pores were more patent and round, *i. e.* before the bow was bent: and in this consists its elasticity.

Other later and more wary philosophers account for elasticity much after the same manner as the Cartesians; with this only difference, that in lieu of the subtle matter of the Cartesians, these substitute **ETHER**, or a fine ethereal medium that pervades all bodies.

Others, setting aside the precarious notion of a materia subtilis, account for elasticity from the great law of nature **ATTRACTION**, or the cause of the **COHESION** of the parts of solid and firm bodies. Thus, say they, when a hard body is struck or bent, so that the component parts are moved a little from each other, but not quite disjoined or broke off, or separated so far as to

Elasticity. be out of the power of that attracting force whereby they cohere; they must certainly, on the cessation of the external violence, spring back to their former natural state.

Others resolve elasticity into the pressure of the atmosphere: for a violent tension, or compression, tho' not so great as to separate the constituent particles of bodies far enough to let in any foreign matter, must yet occasion many little vacuola between the separated surfaces; so that upon the removal of the force they will close again, by the pressure of the aerial fluid upon the external parts. See *ATMOSPHERE*.

Lastly, others attribute the elasticity of all hard bodies to the power of resiliency in the air included within them; and so make the elastic force of the air, the principle of elasticity in all other bodies.

The *ELASTICITY of Fluids* is accounted for from their particles being all endowed with a centrifugal force; when Sir Isaac Newton, prop. 23. lib. 2. demonstrates, that particles, which mutually avoid or fly off from one another by such forces as are reciprocally proportioned to the distances of their centre, will compose an elastic fluid, whose density shall be proportional to its compression; and *vice versa*, if any fluid be composed of particles that fly off and avoid one another, and hath its density proportional to its compression, then the centrifugal forces of those particles will be reciprocally as the distances of their centres.

ELASTICITY of the Air, is the force wherewith that element dilates itself, upon removing the force whereby it was before compressed.*

The elasticity or spring of the air, was first discovered by Galileo. Its existence is proved by this experiment of that philosopher: An extraordinary quantity of air, being intruded by means of a syringe into a glass or metal ball, till such time as the ball, with this accession of air, weigh considerably more in the balance than it did before; upon opening the mouth thereof, the air rushes out, till the ball sink to its former weight. From hence we argue, that there is just as much air gone out, as compressed air had been crowded in. Air, therefore, returns to its former degree of expansion, upon removing the force that compressed or resisted its expansion; consequently it is endowed with an elastic force. It must be added, that as the air is found to rush out in every situation or direction of the orifice, the elastic force acts every way, or in every direction.

The elasticity of the air makes a considerable article in *PNEUMATICS*.

The cause of the elasticity of the atmosphere hath been commonly ascribed to a repulsion between its particles; but this can give us only a very slight idea of the nature of its elasticity. The term *repulsion*, like that of *attraction*, requires to be defined, and in all probability will be found in most cases to be the effect of the action of some other fluid. Thus, we find, that the elasticity of the atmosphere is very considerably affected by heat. Thus, supposing a quantity of air heated to such a degree as is sufficient to raise Fahrenheit's thermometer to 212, it will then occupy a considerable space. If it is cooled to such a degree as to sink the thermometer to 0, it will shrink up into less than half the former bulk. The quantity of repulsive

power therefore acquired by the air, while passing from one of these states to the other, is evidently owing to the heat added to or taken away from it. Nor have we any reason to suppose, that the quantity of elasticity or repulsive power it still possesses is owing to any other thing than the fire contained in it. The supposing repulsion to be a primary cause independent of all others, hath given rise to many erroneous theories, and been one very great mean of embarrassing philosophers in their accounting for the phenomena of *ELECTRICITY*.

ELATER, in zoology, a genus of insects, belonging to the order of coleoptera. The feelers are setaceous. There are 38 species, distinguished by their colour, &c.

ELATERIUM. See *PHARMACY*, n° 602.

ELBE, a large river in Germany, which, rising on the confines of Silesia, runs through Bohemia, Saxony, and Brandenburg; and afterwards dividing the duchy of Lunenburg from that of Mecklenburg, as also the duchy of Bremen from Holstein, it falls into the German ocean, about 70 miles below Hamburg. It is navigable for great ships higher than any river in Europe.

ELCESAITES, in church-history, ancient heretics, who made their appearance in the reign of the emperor Trajan, and took their name from their leader Elecebi. The elecsaites kept a mean between the Jews, Christians, and Pagans; they worshipped but one God, observed the Jewish sabbath, circumcision, and the other ceremonies of the law. They rejected the Pentateuch, and the prophets; nor had they any more respect for the writings of the apostles, particularly those of St Paul.

ELDERS, or *SENIORS*, in Jewish history, were persons the most considerable for age, experience, and wisdom. Of this sort were the 70 men whom Moses associated to himself in the government of his people; such, likewise, afterwards were those who held the first rank in the synagogue, as presidents.

In the first assemblies of the primitive Christians, those who held the first place were called *elders*. The word *presbyter*, often used in the New Testament, is of the same signification: hence the first councils of Christians were called *presbyteria*, or *councils of elders*.

ELDER is also a denomination preferred in the presbyterian discipline. See *PRESBYTERIAN*.

ELDER, or *Alder*, in botany. See *ALNUS*.

ELECAMPANE, in botany. See *INULA*.

ELECT, among ecclesiastical writers, those whom God has chosen, or predestinated to be saved. See *PREDESTINATION*.

ELECTION, the choice that is made of a person, or thing, in preference of any other.

ELECTION, in theology, signifies the choice which God makes of angels and men for the objects of his grace and mercy. See *GRACE*, and *PREDESTINATION*.

ELECTION, in British polity, is the people's choice of their representatives in parliament. (See *PARLIAMENT*.) In this consists the exercise of the democratical part of our constitution: for in a democracy there can be no exercise of sovereignty but by suffrage, which is the declaration of the people's will. In all democracies, therefore, it is of the utmost importance to regulate by whom, and in what manner, the suffra-

Comment.

ges are to be given. And the Athenians were so justly jealous of this prerogative, that a stranger, who interfered in the assemblies of the people, was punished by their laws with death; because such a man was esteemed guilty of high treason, by usurping those rights of sovereignty to which he had no title. In Britain, where the people do not debate in a collective body, but by representation, the exercise of this sovereignty consists in the choice of representatives. The laws have therefore very strictly guarded against usurpation or abuse of this power, by many salutary provisions; which may be reduced to these three points, 1. The qualifications of the electors. 2. The qualifications of the elected. 3. The proceedings at elections.

(1.) As to the qualifications of the electors. The true reason of requiring any qualification, with regard to property, in voters, is to exclude such persons as are in so mean a situation, that they are esteemed to have no will of their own. If these persons had votes, they would be tempted to dispose of them under some undue influence or other. This would give a great, an artful, or a wealthy man, a larger share in elections than is consistent with general liberty. If it were probable that every man would give his vote freely, and without influence of any kind; then, upon the true theory and genuine principles of liberty, every member of the community, however poor, should have a vote in electing those delegates, to whose charge is committed the disposal of his property, his liberty, and his life. But, since that can hardly be expected in persons of indigent fortunes, or such as are under the immediate dominion of others, all popular states have been obliged to establish certain qualifications; whereby some, who are suspected to have no will of their own, are excluded from voting, in order to set other individuals, whose wills may be supposed independent, more thoroughly upon a level with each other.

And this constitution of suffrages is framed upon a wiser principle, with us, than either of the methods of voting, by centuries or by tribes, among the Romans. In the method by centuries, instituted by Servius Tullius, it was principally property, and not numbers, that turned the scale: in the method by tribes, gradually introduced by the tribunes of the people, numbers only were regarded, and property entirely overlooked. Hence the laws passed by the former method had usually too great a tendency to aggrandize the patricians or rich nobles; and those by the latter had too much of a levelling principle. Our constitution steers between the two extremes. Only such are entirely excluded, as can have no will of their own: there is hardly a free agent to be found, but what is entitled to a vote in some place or other in the kingdom. Nor is comparative wealth, or property, entirely disregarded in elections; for though the richest man has only one vote at one place, yet, if his property be at all diffused, he has probably a right to vote at more places than one, and therefore has many representatives. This is the spirit of our constitution: not that we assert it is in fact quite so perfect as we have here endeavoured to describe it; for, if any alteration might be wished or suggested in the present frame of parliaments, it should be in favour of a more complete representation of the

people.

But to return to the qualifications; and first those of electors for knights of the shire. 1. By statute 8 Hen. VI. c. 7. and 10 Hen. VI. c. 2. (amended by 14 Geo. III. c. 58.) the knights of the shire shall be chosen of people, whereof every man shall have freehold to the value of forty shillings by the year within the county; which (by subsequent statutes) is to be clear of all charges and deductions, except parliamentary and parochial taxes. The knights of shires are the representatives of the landholders, or landed interest of the kingdom: their electors must therefore have estates in lands or tenements, within the county represented. These estates must be freehold, that is, for term of life at least; because beneficial leases for long terms of years were not in use at the making of these statutes, and copyholders were then little better than villeins, absolutely dependent upon their lords. This freehold must be of 40 shillings annual value; because that sum would then, with proper industry, furnish all the necessities of life, and render the freeholder, if he pleased, an independent man: For bishop Fleetwood, in his *chronicon preciosum*, written at the beginning of the present century, has fully proved 40 shillings in the reign of Henry VI. to have been equal to 12 pounds *per annum* in the reign of queen Anne; and, as the value of money is very considerably lowered since the bishop wrote, we may fairly conclude, from this and other circumstances, that what was equivalent to 12 pounds in his days, is equivalent to 20 at present. The other less important qualifications of the electors for counties in England and Wales may be collected from the statutes cited below (A); which direct, 2. That no person under 21 years of age shall be capable of voting for any member. This extends to all sorts of members as well for boroughs as counties; as does also the next, *viz.* 3. That no person convicted of perjury, or subornation of perjury, shall be capable of voting in any election. 4. That no person shall vote in right of any freehold, granted to him fraudulently to qualify him to vote. Fraudulent grants are such as contain an agreement to reconvey, or to defeat, the estate granted; which agreements are made void, and the estate is absolutely vested in the person to whom it is so granted. And, to guard the better against such frauds, it is farther provided, 5. That every voter shall have been in the actual possession, or receipt of the profits, of his freehold to his own use for 12 calendar months before; except it came to him by descent, marriage, marriage-settlement, will, or promotion to a benefice or office. 6. That no person shall vote in respect of an annuity or rent-charge, unless registered with the clerk of the peace 12 calendar months before. 7. That in mortgaged or trust estates, the person in possession, under the above-mentioned restrictions, shall have the vote. 7. That only one person shall be admitted to vote for any one house or tenement, to prevent the splitting of freeholds. 9. That no estate shall qualify a voter, unless the estate has been assessed to some land-tax aid, at least 12 months before the election. 10. That no tenant by copy of court-roll shall be permitted to vote as a freeholder. Thus much for the electors in counties.

As

(A) 7 and 8 Will. III. c. 25. 10 Ann. c. 23. 2 Geo. II. c. 21. 18 Geo. II. c. 18. 31 Geo. II. c. 14. 3 Geo. III. c. 24.

are supposed to be the mercantile part or trading interest of this kingdom. But as trade is of a fluctuating nature, and seldom long fixed in a place, it was formerly left to the crown to summon, *pro re nata*, the most flourishing towns to send representatives to parliament. So that as towns increased in trade, and grew populous, they were admitted to a share in the legislature. But the misfortune is, that the deserted boroughs continued to be summoned, as well as those to whom their trade and inhabitants were transferred; except a few which petitioned to be eased of the expence, then usual, of maintaining their members: four shillings a-day being allowed for a knight of the shire, and two shillings for a citizen or burgess; which was the rate of wages established in the reign of Edward III. Hence the members for boroughs now bear above a quadruple proportion to those for counties; and the number of parliament men is increased since Fortescue's time, in the reign of Henry VI. from 300 to upwards of 500, exclusive of those for Scotland. The universities were, in general, not empowered to send burgesses to parliament; though once, in 28 Edw. I. when a parliament was summoned to consider of the king's right to Scotland, there were issued writs, which required the university of Oxford to send up four or five, and that of Cambridge two or three, of their most discreet and learned lawyers for that purpose. But it was king James the first, who indulged them with the permanent privilege to send constantly two of their own body; to serve for those students who, though useful members of the community, were neither concerned in the landed nor the trading interest; and to protect in the legislature the rights of the republic of letters. The right of election in boroughs is various, depending entirely on the several charters, customs, and constitutions of the respective places; which has occasioned infinite disputes: tho' now, by statute 2 Geo. II. c. 24. the right of voting for the future, shall be allowed according to the last determination of the house of commons concerning it; and, by statute 3 Geo. III. c. 15. no freeman of any city or borough (other than such as claim by birth, marriage, or servitude) shall be entitled to vote therein, unless he hath been admitted to his freedom 12 calendar months before.

(2.) Next, as to the qualifications of persons to be elected members of the house of commons. Some of these depend upon the law and custom of parliaments, declared by the house of commons; others upon certain statutes. And from these it appears, 1. That they must not be aliens born, or minors. 2. That they must not be any of the 12 judges, because they sit in the lords' house; nor of the clergy, for they sit in the convocation; nor persons attainted of treason or felony, for they are unfit to sit any where. 3. That sheriffs of counties, and mayors and bailiffs of boroughs, are not eligible in their respective jurisdictions, as being returning officers; but that sheriffs of one county are eligible to be knights of another. 4. That, in strictness, all members ought to have been inhabitants of the places for which they are chosen: but this,

having been long disregarded, was at length entirely repealed by statute 14 Geo. III. c. 58. 5. That no persons concerned in the management of any duties or taxes created since 1692, except the commissioners of the treasury, nor any of the officers following, (*viz.* commissioners of prizes, transports, sick and wounded, wine-licences, navy, and victualling; secretaries or receivers of prizes; comptrollers of the army-accounts; agents for regiments; governors of plantations, and their deputies; officers of Minorca or Gibraltar; officers of the excise and customs; clerks or deputies in the several offices of the treasury, exchequer, navy, victualling, admiralty, pay of the army or navy, secretaries of state, salt, stamps, appeals, wine-licences, hackney-coaches, hawkers, and pedlars) nor any persons that hold any new office under the crown created since 1705, are capable of being elected, or sitting as members. 6. That no person having a pension under the crown during pleasure, or for any terms of years, is capable of being elected or sitting. 7. That if any member accepts an office under the crown, except an officer in the army or navy accepting a new commission, his seat is void; but such member is capable of being re-elected. 8. That all knights of the shire shall be actual knights, or such notable esquires and gentlemen as have estates sufficient to be knights, and by no means of the degree of yeomen. This is reduced to a still greater certainty, by ordaining, 9. That every knight of a shire shall have a clear estate of freehold or copyhold to the value of 600*l.* *per annum*, and every citizen and burgess to the value of 300*l.*: except the eldest sons of peers and of persons qualified to be knights of shires, and except the members for the two universities: which somewhat balances the ascendancy which the boroughs have gained over the counties, by obliging the trading interest to make choice of landed men: and of this qualification the member must make oath, and give in the particulars in writing, at the time of his taking his seat. But, subject to these standing restrictions and disqualifications, every subject of the realm is eligible of common right: though there are instances, wherein persons in particular circumstances have forfeited that common right, and have been declared ineligible *for that parliament*, by a vote of the house of commons; or *for ever*, by an act of the legislature. But it was an unconstitutional prohibition, which was grounded on an ordinance of the house of lords, and inserted in the king's writs, for the parliament holden at Coventry, 6 Hen. IV. that no apprentice or other man of the law should be elected a knight of the shire therein: in return for which, our law-books and historians have branded this parliament with the name of *parliamentum indoctum*, or the lack-learning parliament; and Sir Edward Coke observes with some spleen, that there was never a good law made thereat.

(3.) The third point, regarding elections, is the method of proceeding therein. This is also regulated by the law of parliament, and the several statutes referred to in the margin below, (B); all which we shall blend together, and extract out of them a summary account of the method of proceeding to elections.

As

(B) 7 Hen. IV. c. 15. 8 Hen. VI. c. 7. 23 Hen. VI. c. 14. 1 W. & M. ft. 1. c. 2. 2 W. & M. ft. 1. c. 7. 5 & 6 W. & M. c. 20. 7 W. III. c. 4. 7 & 8 W. III. c. 7. and c. 25. 10 & 11 W. III. c. 42. 14 Geo. III. c. 15.

Election.

Election.

As soon as the parliament is summoned, the lord chancellor (or if a vacancy happens during the sitting of parliament, the speaker, by order of the house, and without such order if a vacancy happens by death in the time of a recess for upwards of 20 days) sends his warrant to the clerk of the crown in chancery; who thereupon issues out writs to the sheriff of every county, for the election of all the members to serve for that county, and every city and borough therein. Within three days after the receipt of this writ, the sheriff is to send his precept, under his seal, to the proper returning officers of the cities and boroughs, commanding them to elect their members: and the said returning officers are to proceed to election within eight days from the receipt of the precept, giving four days notice of the same; and to return the persons chosen, together with the precept, to the sheriff.

But elections of knights of the shire must be proceeded to by the sheriffs themselves in person, at the next county-court that shall happen after the delivery of the writ. The county-court is a court held every month or oftener by the sheriff, intended to try little causes not exceeding the value of 40s. in what part of the county he pleases to appoint for that purpose: but for the election of knights of the shire, it must be held at the most usual place. If the county-court falls upon the day of delivering the writ, or within six days after, the sheriff may adjourn the court and election to some other convenient time, not longer than 16 days, nor shorter than 10; but he cannot alter the place, without the consent of all the candidates: and, in all such cases, 10 days public notice must be given of the time and place of the election.

And, as it is essential to the very being of parliament that elections should be absolutely free, therefore all undue influences upon the electors are illegal, and strongly prohibited. For Mr Locke ranks it among those breaches of trust in the executive magistrate, which, according to his notions, amount to a dissolution of the government, "if he employs the force, "treasure, and offices of the society to corrupt the representatives, or openly to pre-engage the electors, "and prescribe what manner of persons shall be chosen: For thus to regulate candidates and electors, "and new-model the ways of election, what is it, (says he,) but to cut up the government by the roots, and "poison the very fountain of public security?" As soon, therefore, as the time and place of election, either in counties or boroughs, are fixed, all soldiers quartered in the place are to remove, at least one day before the election, to the distance of two miles or more; and not to return till one day after the poll is ended. Riots likewise have been frequently determined to make an election void. By vote also of the house of commons, to whom alone belongs the power of determining contested elections, no lord of parliament, or lord lieutenant of a county, hath any right to interfere in the election of commons; and, by statute, the lord warden of the cinque ports shall not recommend any members there. If any officer of the excise, customs, stamps, or certain other branches of the revenue, presumes to intermeddle in elections, by persuading any voter or dissuading him, he forfeits 100l. and is disabled to hold any office.

Thus are the electors of one branch of the legislature

secured from any undue influence from either of the other two, and from all external violence and compulsion. But the greatest danger is that in which themselves co-operate, by the infamous practice of bribery and corruption. To prevent which, it is enacted, that no candidate shall, after the date (usually called the *te/le*) of the writs, or after the vacancy, give any money or entertainment to his electors, or promise to give any, either to particular persons, or to the place in general, in order to his being elected: on pain of being incapable to serve for that place in parliament. And if any money, gift, office, employment, or reward be given, or promised to be given, to any voter, at any time, in order to influence him to give or withhold his vote, as well he that takes as he that offers such bribe forfeits 500l. and is for ever disabled from voting and holding any office in any corporation; unless, before conviction, he will discover some other offender of the same kind, and then he is indemnified for his own offence. The first instance that occurs, of election bribery, was so early as 13 Eliz. when one Thomas Longe (being a simple man, and of small capacity to serve in parliament) acknowledged that he had given the returning officer and others of the borough for which he was chosen, four pounds to be returned member, and was for that premium elected. But for this offence the borough was amerced, the member was removed, and the officer fined and imprisoned. But, as this practice hath since taken much deeper and more universal root, it hath occasioned the making of these wholesome statutes; to complete the efficacy of which, there is nothing wanting but resolution and integrity to put them in strict execution.

Undue influence being thus guarded against, the election is to be proceeded to on the day appointed; the sheriff or other returning officer first taking an oath against bribery, and for the due execution of his office. The candidates likewise, if required, must swear to their qualification, and the electors in counties to theirs; and the electors both in counties and boroughs are also compellable to take the oath of abjuration, and that against bribery and corruption. And it might not be amiss, if the members elected were bound to take the latter oath, as well as the former; which, in all probability, would be much more effectual, than admitting it only to the electors.

The election being closed, the returning officer in boroughs returns his precept to the sheriff, with the persons elected by the majority; and the sheriff returns the whole, together with the writ for the county and the knights elected thereupon, to the clerk of the crown in chancery; before the day of meeting, if it be a new parliament, or within 14 days after the election, if it be an occasional vacancy; and this under penalty of 500l. If the sheriff does not return such knights only as are duly elected, he forfeits, by the old statutes of Henry VI. 100l.; and the returning officer in boroughs for a like false return, 40l.; and they are besides liable to an action, in which double damages shall be recovered, by the later statutes of king William: and any person bribing the returning officer shall also forfeit 300l. But the members returned by him are the sitting members, until the house of commons, upon petition, shall adjudge the return to be false and illegal. The form and manner of proceeding upon such petition

petition are now regulated by statute 10 Geo. III. c. 16. (amended by 11 Geo. III. c. 42. and made perpetual by 14 Geo. III. c. 15.) which directs the method of choosing by lot a select committee of 15 members, who are sworn well and truly to try the same, and a true judgment to give, according to the evidence.

ELECTION of *Scott Peers*. See LORDS.

ELECTOR, a person who has a right to elect or chuse another to an office, honour, &c. See ELECTION.

Elector is particularly, and by way of eminence, applied to those princes of Germany in whom lies the right of electing the emperor: being all sovereign princes, and the principal members of the empire.

The electoral college, consisting of all the electors of the empire, is the most illustrious and august body in Europe. Bellarmine and Baronius attribute the institution of it to pope Gregory V. and the emperor Otho III. in the tenth century; of which opinion are the generality of historians, and particularly the canonists: however, the number of electors was unsettled, at least, till the 13th century. In 1356 Charles IV. by the golden bull, fixed the number of electors to seven; three ecclesiastics, viz. the archbishops of Mentz, Treves, and Cologne; and four seculars, viz. the king of Bohemia, count Palatine of the Rhine, duke of Saxony, and marquis of Brandenburg. In 1648 this order was changed, the duke of Bavaria being put in the place of the count Palatine, who having accepted the crown of Bohemia was outlawed by the emperor; but being at length restored, an eighth electorate was created for the duke of Bavaria. In 1692, a ninth electorate was created, by the emperor Leopold, in favour of the duke of Hanover, of the house of Brunswic Lunenburg.

There is this difference between the secular and ecclesiastical electors, that the first have an active and passive voice, that is, may chuse and be chosen; the last, an active only. The three archbishops are to be 30 years old, before they can be advanced to the dig-

nity; the seculars, 18, before they can perform the office themselves. These last have each their vicars, who officiate in their absence.

Besides the power of choosing an emperor, the electors have also that of capitulating with and deposing him; so that, if there be one suffrage wanting, a protest may be entered against the proceedings. By the right of capitulation, they attribute to themselves great privileges, as making of war, coining, and taking care of the public interest and security of the states; and the emperor promises, upon oath, to receive the empire upon these conditions.

The electors have precedence of all other princes of the empire, even of cardinals and kings; and are addressed under the title of *electoral highness*.

Their several functions are as follow. The elector of Mentz is chancellor of Germany, convokes the states, and gives his vote before any of the rest. The elector of Cologne is grand chancellor of Italy, and consecrates the emperor. The elector of Treves is chancellor of the Gauls, and confers imposition of hands upon the emperor. The count Palatine of the Rhine is great treasurer of the empire, and presents the emperor with a globe at his coronation. The elector of Bavaria is great master of the imperial palace, and carries the golden apple. The marquis of Brandenburg is grand chamberlain, and puts the ring on the emperor's finger. The elector of Saxony is grand marshal, and gives the sword to the emperor. The king of Bohemia is grand butler, and puts Charlemagne's crown on the emperor's head. Lastly, the elector of Hanover, now king of Great Britain, is arch-treasurer, though first created under the title of *standard-bearer* of the empire.

ELECTORATE, a term used as well to signify the dignity of, as the territories belonging to, any of the electors of Germany; such are Bavaria, Saxony, &c. See ELECTOR.

ELECTRIC FLUID. See ELECTRICITY.

E L E C T R I C I T Y,

IN general, signifies the operations of a very subtle fluid, in most cases invisible, but which sometimes becomes the object of our sight and other senses, discovering itself to be one of the chief agents employed in producing the phenomena of nature.

SECT. I. History of Electricity.

THO' it is certain that, ever since the creation of the world, the fluid we speak of hath had the same share in all the natural operations that it hath just now; yet the discovery of its action, and even of its existence, is, comparatively speaking, of a very late date. Thales the Milesian, who lived about 600 years before Christ, was the first that observed the electrical properties of amber. Of these indeed, he knew no more than that this substance would attract light bodies when it was rubbed. For 300 years after his time, we hear nothing farther concerning this subject. Theophrastus then tells us, that the *hyrcurium* (the same substance now called the *tourmalin*), has the property of attracting light bodies, as well as amber. From this time,

there is a chasm in the history of electricity for no less than 1900 years. Indeed, it is scarce to be supposed that during this long interval any person applied himself to the investigation of the subject; as, for the greatest part of it, science of every kind was almost totally extinguished. The electrical properties of *jets*, however, and, according to Mr Bose, of the *agate*, were some way or other discovered during the abovementioned period. But it was not till the beginning of the 17th century, that the subject of electricity became properly a distinct science, and the foundation was laid of those discoveries which have since taken place.

The first who can properly be called an *electrician*, was Dr William Gilbert, who, in the year 1600, of Doctor Gilbert. wrote a book de *Magnete*, which contains a variety of electrical experiments. All these, however, considered only the attractive property of certain substances, which, from their agreement in this respect with amber (in Latin *electrum*, were called *electric*. Dr Gilbert's merit consists in his having been at great pains to find out a number of such substances, and thus considerably enlarging the number of electrics.

Electricity
when first
mentioned.

Till the year 1670, it doth not appear that any farther discoveries were made; except some trifling additions to the catalogue of electricities. About this time, Mr Boyle applied himself to the study of electricity. He enlarged the catalogue of electricities; and found that their electric properties were increased by wiping and warming them before they were rubbed. He observed also, that all kinds of bodies were attracted promiscuously; and imagined that they were attracted *in vacuo* as well as in air. This last position, however, is denied by Mr Beccaria; and we shall afterwards show that Mr Boyle must necessarily have been mistaken. He also observed the electric light, though only in the instance of some diamonds.

3
Discoveries
of Otto
Guericke
and Sir Isaac
Newton.

Otto Guericke, however, who was cotemporary with Mr Boyle, improved the science much farther. He made use of a sulphur globe, whirled on an axis much in the same way with our present glass globes. Thus he could excite a vastly greater power of electricity than any of his predecessors, and try all their experiments to much more advantage. He discovered electric repulsion; and not only saw the electric light more clearly than Mr Boyle, but heard the hissing sound with which it is emitted. He also made another remarkable discovery, but which has since been very generally overlooked; namely, that a feather, when repelled by an excited electric, always keeps the same face towards the body which repels it, as the moon does to the earth. See ASTRONOMY, n° 101.

The next discovery of any moment was made by Sir Isaac Newton; who observed, that the electric attraction and repulsion penetrated through glass; and it is much to be regretted that this accurate philosopher did not apply himself to the study of electricity with greater assiduity.

4
Remark-
able disco-
very by Mr
Hauksbee.

In 1709, a treatise was written on electricity by Mr Hauksbee; who not only far excelled all his predecessors and cotemporaries, but also made some discoveries which well deserve the attention of the most expert electricians at this day. Besides a variety of new experiments made upon electric attraction and repulsion, as well as the light emitted by electric bodies; he found a method of rendering opaque bodies transparent by means of electricity. He lined more than half the inside of a glass globe with sealing wax; and having exhausted the globe, he put it in motion; when applying his hand to excite it, he saw the shape and figure of all the parts of his hand distinctly and perfectly, on the concave superficies of the wax within, just as if only pure glass without any wax at all had been interposed between his eye and his hand. The lining of wax, where it was spread the thinnest, would but just allow the light of a candle through it in the dark; but in some places the wax was at least an eighth part of an inch thick. Yet, even in these places, the light and figure of his hand were as distinguishable through it as any where else. The sealing-wax did not adhere to the glass in all places; but this made no difference with regard to the transparency. Pitch answered the purpose equally well with sealing-wax.

Mr Hauksbee also made a farther improvement, by using a glass globe, which acts much more powerfully than a sulphur one. After his death, however, not only the use of glass globes, but even the study of electricity itself, seems to have been pretty generally laid

aside for some time. The reason of this was, that the recent discoveries of Sir Isaac Newton engrossed the attention of philosophers to such a degree, that they had no leisure for any thing else. After the death of that great man, however, the science of electricity began to revive; and, in 1729, a capital discovery was made by Mr Stephen Grey. This was the distinction between conductors and non-conductors of electricity. As the discovery was entirely accidental, and attended with several curious circumstances, we shall here give some account of it. In the month of February 1729, Mr Grey, after some fruitless attempts to excite an electric power in metals, recollected a suspicion he had for some time entertained, that as a glass tube, when excited in the dark, communicated its light to various bodies, it might at the same time possibly communicate to them an electricity; that is, a power of attracting light bodies; which, as yet, was all that was understood by the word *electricity*. For this purpose he provided himself with a glass tube, three feet five inches long, and near one inch and two-tenths in diameter. To each end was fitted a cork; to keep the dust out when the tube was not in use. His first experiments were made with a view to determine whether the tube would attract equally well with the ends shut, as with them open. In this respect there was no difference; but he found that the corks attracted and repelled light substances as well, and rather better than the tube itself. He then fixed an ivory ball upon a stalk of fir about four inches long; and thrusting the end of the stalk into one of the corks, he found the ball endowed with a strong attractive and repulsive virtue. This experiment he repeated in many different ways; fixing the ball upon long sticks, and upon pieces of brass and iron wire, always with the same success; but he constantly observed, that the ball at the end attracted more vigorously, than that part of the wire nearest the tube.

5
Difference
between e-
lectricities and
conductors
discovered
by Mr
Grey.

The inconvenience of using long wires in this manner, put Mr Grey upon trying whether the ball might be suspended by a pack-thread with a loop on the tube, with equal success; and the event fully answered his expectation. Having thus suspended bodies of the greatest length he conveniently could, to his tube, he ascended a balcony 26 feet high, and fastening a string to his tube, found that the ball would attract light bodies on the ground below. This experiment succeeded in the greatest heights to which he could ascend; after which, he attempted to carry the electricity horizontally. His first attempt miscarried, because he suspended his line, which was intended to carry the electricity horizontally, by a pack-thread; and thus the fluid got off from it: but though Mr Grey knew this was the case, he could not at that time think of any method to prevent it.

On the 30th of June 1729, Mr Grey paid a visit to Mr Wheeler, in order to give him a specimen of his experiments; but told him of the unsuccessful attempt he had made to carry the electric fluid horizontally. Mr Wheeler proposed to suspend the conducting line by *silk*, instead of *pack-thread*. For this advice he could give no reason, but that the silk thread was *smaller* than the other; however, with it they succeeded perfectly well. Their first experiment was in a matted gallery at Mr Wheeler's house, on the 2d of July 1729. About four feet from the end of the gallery they fastened

History.

History.

stened a line across the place. The middle of this line was silk, the rest pack-thread. Over the silken part they laid one end of the conducting line, to which was fastened the ivory ball, and which hung down about nine feet below the line stretched across the gallery. The conducting line was 80½ feet in length, and the other end of it was fastened by a loop to the electric tube. Upon rubbing the tube, the ivory ball attracted and repelled light substances as the tube itself would have done. They next contrived to return the line, so that the whole length of it amounted to 147 feet; which also answered pretty well. But, suspecting that the attraction would be stronger without doubling or returning the line, they made use of one carried straight forward for 124 feet; and, as they expected, found the attraction in this manner stronger than when the line had been doubled. Thus they proceeded with till their experiments; still adding more conducting line, at last their silk-string broke with the weight. This they endeavoured to supply, first with a small iron-wire, and then with a brass one. The result of these experiments, however, soon convinced them that the silk refused to conduct the electric fluid, not on account of its *smallness*, as they had supposed, but on account of some difference in the matter. The wires were smaller than the silk-thread, yet the electricity was effectually carried off by them. They had recourse, therefore, to thicker lines of silk; and, thus conveyed the electric matter to the distance of 765 feet; nor did they perceive the virtue to be at all diminished by the distance to which it was carried.

This discovery of the non-conducting power of silk, was quickly followed by a discovery of the same power in many other substances: and thus in fact, the foundation of almost all the subsequent improvements in electricity was laid; tho' in this science, as well as in most others, few discoveries have been made by reasoning, but many by accident. Mr Grey continued to study electricity as long as he lived; and has given a set of experiments, of which Dr Priestley says, "It is not easy to know what to make of them." He imagined that he had discovered in all electric substances a *perpetual attractive power*, which required no kind of excitation either by heating, rubbing, or any kind of attrition. He took 19 different substances, which were either rosin, gum-lac, shell-lac, bees-wax, sulphur, pitch, or two or three of these differently compounded. These he melted in a spherical iron ladle; except the sulphur, which was best done in a glass vessel. When these were taken out of the ladle, and their spherical surfaces hardened, he says they would not attract till the heat was abated, or till they came to a certain degree of warmth; that there was then a small attraction, which increased till the substance was cold, when it was very considerable. The manner in which he kept these substances in a state of attraction was, by wrapping them in any thing which would preserve them from the external air. At first, for the smaller bodies he used white paper, and for the larger ones white flannel; but afterwards, he found that black worsted stockings would do as well. When thus wrapped up, they were put into a large firm box, where they remained till he had occasion to use them. Thus prepared, they retained their attractive virtue for four months. These experiments are similar to some others lately made and

published as new discoveries.

Some other experiments were made by Mr Grey, with regard to the attraction of electric bodies *in vacuo*; and in this he determined with Mr Boyle against the opinion of Mr Beccaria abovementioned. But the most remarkable experiments mentioned by Mr Grey, are his imitations of the planetary motions. "I have lately made, (says he), several new experiments upon the projectile and pendulous motions of small bodies by electricity; by which small bodies may be made to move about large ones, either in circles or ellipses; and those either concentric or eccentric to the centre of the large body about which they move, so as to make many revolutions about them. And this motion will constantly be the same way that the planets move about the sun, *viz.* from the right hand to the left, or from west to east. But these little planets, if I may so call them, move much faster in their apogee than in the perigee parts of their orbits; which is directly contrary to the motion of the planets about the sun." The manner in which these experiments were made, as delivered by him on his death-bed to Dr Mortimer, was as follows: "Place a small iron globe, (said he), of an inch or an inch and an half in diameter, on the middle of a circular cake of rosin, seven or eight inches in diameter, gently excited; and then a light body suspended by a very fine thread, five or six inches long, held in the hand over the centre of the cake, will, of itself, begin to move in a circle round the iron globe, and constantly from west to east. If the globe is placed at any distance from the centre of the circular cake, it will describe an ellipse, which will have the same eccentricity as the distance of the globe from the centre of the cake. If the cake of rosin be of an elliptical form, and the iron globe be placed in the centre of it, the light body will describe an elliptical orbit of the same eccentricity with the form of the cake. If the globe be placed in or near one of the foci of the elliptical cake, the light body will move much swifter in the apogee than in the perigee of its orbit. If the iron globe is fixed on a pedestal an inch from the table, and a glass hoop, or a portion of a hollow glass cylinder excited, be placed round it, the light body will move as in the circumstances mentioned above, and with the same varieties." He said, moreover, that the light body would make the same revolutions, only smaller, round the iron globe placed on the bare table, without any electrical body to support it: but he acknowledged that he had not found the experiment succeed if the thread was supported by any thing but a human hand, though he imagined any other animal substance would have answered the purpose.

These experiments occasioned a great deal of speculation. Dr Mortimer was the only person who was able to repeat them with success, and he only when nobody but himself was present. It was therefore generally supposed that both he and Mr Grey had been deceived: but from some experiments to be related hereafter, it seems probable that the success of Mr Grey and Dr Mortimer was owing to their having performed their experiments with candle-light; and the failure of the others, to their having attempted them by day-light. Notwithstanding which, it is more than probable that Mr Grey has been deceived in a number of particulars; for no motion can be performed by an artificial excitation of the

electricity
discovered
by Mr Du
Fay.

the electric fluid, but what is attended with much irregularity.

Soon after Mr Grey's discovery of the difference between conductors and non-conductors of electricity, Mr Du Fay discovered the difference between positive and negative, or, as they were for some time called, the *vitreous* and *refinous* electricities. This discovery was quite accidental. It was made in consequence of his casually observing, that a piece of leaf-gold repelled by an excited glass tube, and which he meant to chafe about the room with a piece of excited gun copal, instead of being repelled by it as it was by the glass tube, it was eagerly attracted. The fame was the case with sealing-wax, sulphur, rosin, and a number of other substances. He discovered also, that it was impossible to excite a tube in which the air was condensed.

In the year 1742, the use of glass globes was again introduced by Mr Bosc, professor of philosophy at Wittenburgh; though some attribute this to Christian Augustus Hansen, professor of mathematics at Leipzig. He added also a prime conductor, which consisted of a tube of iron or tin. It was at first supported by a man standing upon cakes of rosin; but afterwards suspended by silk lines horizontally before the globe. A bundle of thread was put into the end next to the globe, which not only prevented any injury to the glass, but rendered the electricity stronger.

9
Electrical
shock discovered.

The most remarkable discovery that hath yet been made in the science of electricity, was in the end of the year 1745, and beginning of 1746. This was the method of giving the electric shock, or the accumulation of the power of electricity in a vial. This had its name of the *Leyden vial*, from Mr Cunæus, a native of Leyden, who exhibited it as he was repeating some experiments made by Messrs Muschenbroek and Allamand, professors in the university of that city. He was not, however, the inventor. The merit of this discovery (if any merit can arise from a discovery made by accident) belongs to Mr Van Kleit, dean of the cathedral at Camin. On the 4th of November 1745, he sent the following account of it to Dr Lieberkuhn at Berlin: "When a nail, or a piece of thick brass wire, &c. is put into a small apothecary's vial, and electrified, remarkable effects follow: but the vial must be very dry, or warm. I commonly rub it over before-hand with a finger, on which I put some powdered chalk. If a little mercury or a few drops of spirit of wine are put into it, the experiment succeeds the better. As soon as this phial and nail are removed from the electrifying glass, or the prime conductor to which it hath been exposed is taken away, it throws out a pencil of flame so long, that with this burning machine in my hand, I have taken above 60 steps in walking about my room. When it is electrified strongly, I can take it into another room, and there fire spirits of wine with it. If, while it is electrifying, I put my finger, or a piece of gold which I hold in my hand, to the nail, I receive a shock which stuns my arms and shoulders.

"A tin tube, or a man placed upon electrics, is electrified much stronger by this means than in the common way. When I present this vial and nail to a tin tube, which I have, 15 feet long, nothing but experience can make a person believe how strongly it is

electrified. Two thin glasses have been broken by the shock of it."

Soon after this, a method of giving the shock was discovered in Holland by Mr Cunæus, in the following manner. M. Muschenbroek and his friends, observing that electrified bodies exposed to the common atmosphere, which is always replete with conducting particles of various kinds, soon lost their electricity, and were capable of retaining but a small quantity of it; imagined, that, were the electrified bodies terminated on all sides by original electrics, they might be capable of receiving a stronger power, and retaining it for a longer time. Glass being the most convenient electric for this purpose, and water the most convenient non-electric, they first made these experiments with water in glass bottles: but no considerable discovery was made, till Mr Cunæus, happening to hold his glass vessel in one hand, and endeavouring to disengage it from the conductor with the other, (when he imagined the water had received as much electricity as the machine could give it), was surprised with a sudden shock in his arms and breast, which he had not in the least expected.

The discovery of such a terrible effect of the electric power, immediately raised the attention of all the philosophers in Europe. Many of them greatly exaggerated their accounts; either from a natural timidity, or their love of the marvellous. Mr Muschenbroek, who tried the experiment with a very thin glass bowl, told Mr Reamur in a letter wrote soon after the experiment, That he felt himself struck in his arms, shoulder, and breast, so that he lost his breath; and was two days before he recovered from the effects of the blow and the terror. He added, that he would not take a second shock for the whole kingdom of France. Mr Allamand, who made the experiment with a common beer-glass, said, that he lost his breath for some moments; and then felt such an intense pain all along his right arm, that he was apprehensive of bad consequences, but it soon after went off without any inconvenience, &c. Other philosophers, on the contrary, shewed their heroism and magnanimity, by receiving a number of electric shocks as strong as they could possibly make them. Mr Bosc abovementioned, wished that he might die by the electric shock, in order to furnish, by his death, an article for the memoirs of the academy of Sciences at Paris.

"But, (adds Dr Priestley, from whom this account is taken), it is not given to every electrician to die in so glorious a manner as the justly envied Richman."

From the time of this discovery, electricity became the general subject of conversation. A great number of people all over Europe, got their livelihood by going about and shewing the phenomena of it; and, at the same time, the passion for the marvellous strongly discovered itself in some effects of electricity, pretended to be found out in Italy and Germany. It was asserted by Signior Pivati at Venice, and after him by Verati at Bologna, Mr Bianchi at Turin, and Mr Winckler at Leipzig, that if odiferous substances were confined in glass vessels, and the vessels excited, the odours and other medicinal virtues would transpire through the the glass, infect the atmosphere of the conductor, and communicate the virtue to all persons in contact with it; also, that those substances, held in the hands of persons electrified, would communicate their virtues to

10
Behaviour
of different
philosophers
on this occasion.

11
Incredible
powers attributed to
electricity.

them; so that the medicines might be made to operate without being taken into the stomach. They even pretended to have wrought many cures by the help of electricity applied in this way. To see the wonderful effects of these *medicated tubes*, as they were called, Mr Nollet travelled into Italy, where he visited all the gentlemen who had published any account of these experiments. But tho' he engaged them to repeat their experiments in his presence, and upon himself; and though he made it his business to get all the information he could concerning them; he returned fully convinced, that in no instance had odours been found to transpire through the pores of excited glass, and that no drugs had ever communicated their virtues to people who had only held them in their hands while they were electrified. He was convinced, however, that, by continued electrification without drugs, several persons had found considerable relief in various disorders; particularly, that a paralytic person had been cured at Geneva, and that one who was deaf of an ear, another who had a violent pain in his head, and a woman with a disorder in her eyes, had been cured at Bologna; so that from this time we may date the introduction of electricity into the medicinal art. See (the *Index* subjoined to) MEDICINE.

Another wonderful experiment was the *beatification* of Mr Boze; which other electricians, for a long time, endeavoured to repeat after him, but to no purpose. His description of this remarkable experiment was, that if, in electrifying, large globes were employed, and the electrified person stood upon large cakes of pitch, a lambent flame would by degrees arise from the pitch, and spread itself around his feet; that from thence it would be propagated to his knees and body, till at last it ascended to his head; that then, by continuing the electrification, the person's head would be surrounded by a glory such as is in some measure represented by painters in their ornamenting the heads of saints. Dr Watson took the utmost pains to repeat this experiment. He underwent the operation several times, and was supported during the time of it by solid electrics three feet high. Being electrified very strongly, he felt a kind of tingling on the skin of his head, and in many other parts of his body. The sensation resembled what would arise from a vast number of insects crawling over him at the same time. He constantly observed the sensation to be the greatest in those parts of his body which were nearest to any non-electric; but no light appeared upon his head, tho' the experiment was several times made in the dark, and with some continuance. At last the doctor wrote to Mr Boze himself, and his answer shewed that the whole had been a trick. Mr Boze acknowledged that he had made use of a suit of armour, which was decked with many bullions of steel, some pointed like nails, others like wedges, and some pyramidal; and that when the electrification was very vigorous, the edges of the helmet would dart forth rays something like those which are painted on the heads of saints.

12
Identity of
electric fluid
with light-
ning suspec-
ted by Dr
Franklin.

The identity of the electrical matter with lightning is a discovery that hath been of more practical use to mankind than any other. From almost the first discovery of the electric light, and the crackling with which it is emitted, a similarity between it and the phenomena of thunder and lightning had been observed. This

is taken notice of by Dr Wall, one of the first who viewed the electric light in any perfect manner. The Abbe Nollet, Mr Winckler, and others, also enumerated many resemblances between the phenomena of electricity and those of thunder; but they did not think of any method by which their suspicions could be brought to the test of experience. This was first proposed by Dr Franklin in 1750. He had before discovered the effects of pointed bodies in drawing off the electric matter more powerfully than others. This was suggested to him by one Mr Thomas Hopkinson, who electrified an iron ball of three or four inches diameter with a needle fastened to it, expecting to draw a stronger spark from the point of it; but was surprised to find little or none. Dr Franklin, improving on this hint, supposed that pointed rods of iron, fixed in the air when the atmosphere was loaded with lightning, might draw from it the matter of the thunder-bolt, without noise or danger, into the body of the earth. His account of this supposition is given by himself in the following words. "The electric fluid is attracted by points. We do not know whether this property be in lightning; but since they agree in all the particulars in which we can already compare them, it is not improbable, that they agree likewise in this; let the experiment be made."

This suspicion of Dr Franklin's was verified in 1752, and the discovery is perhaps the only one in the whole science that hath not been the result of accident. The most active persons were two French gentlemen, Messrs Dalibard and Delor. The former prepared his apparatus at Marly la Ville, situated five or six leagues from Paris; the other at his own house, on some of the highest ground in that capital. Mr Dalibard's machine consisted of an iron rod 40 feet long, the lower extremity of which was brought into a centry-box, where the rain could not come; while on the outside it was fastened to three wooden posts by long silken strings defended from the rain. This machine happened to be the first that was favoured with a visit of the ethereal fire. Mr Dalibard himself was not at home; but, in his absence, he had entrusted the care of his apparatus to one Coiffier a joiner, who had served 14 years among the dragoons, and on whose courage and understanding he could depend. This artisan had all the necessary instructions given him; and was desired to call some of his neighbours, particularly the curate of the parish, whenever there should be any appearance of a thunder-storm. At length the long expected event arrived. On Wednesday the 10th of May 1752, between two and three in the afternoon, Coiffier heard a pretty loud clap of thunder. Immediately he ran to the machine, taking with him a vial furnished with a brass wire; and presenting the wire to the end of the rod, a small spark issued from it with a snap like that which attends a spark from an electrified conductor. Stronger sparks were afterwards drawn in the presence of the curate and a number of other people. The curate's account of them was, that they were of a blue colour, an inch and an half in length, and smelled strongly of sulphur. In making them, he received 3 strokes on his arm a little below the elbow; but he could not tell whether it came from the brass wire inserted into the vial, or from the bar. He did not attend to it at the time; but the pain continuing, he un-

13
His suspi-
cion veri-
fied.

covered

History.

History.

covered his arm when he went home in the presence of Coiffier. A mark was perceived round it, such as might have been made by a blow with the wire on his naked skin.

About a month after this, Dr Franklin himself had an opportunity of verifying his own hypothesis. He was waiting for the erection of a spire in the city of Philadelphia, not imagining that a pointed rod of a moderate height could answer the purpose. At last it occurred to him, that by means of a common kite he could have a readier access to the high regions of the atmosphere than any other way whatever. Preparing, therefore, a large silk handkerchief, and two cross sticks of a proper length on which to extend it, he took the opportunity of the first approaching thunder-storm to take a walk into a field where there was a shed convenient for his purpose. But dreading the ridicule which too commonly attends unsuccessful attempts in science, he communicated his intention to nobody but his son, who assisted him in raising the kite. A considerable time elapsed before there was any appearance of success. One very promising cloud had passed over the kite without any effect; when, just as he was beginning to despair, he observed some loose threads of the hempen string to stand erect and avoid one another just as if they had been suspended by the conductor of a common electrical machine. On this he presented his knuckle to a key which was fastened to the string, and thus obtained a very evident electric spark. Others succeeded even before the string was wet; but when the rain had begun to descend, he collected electric fire pretty copiously. He had afterwards an insulated iron rod to draw the lightning into his house; and performed almost every experiment with real lightning that had before been done with the artificial representations of it by electrical machines.

14
Danger of
making ex-
periments
with light-
ning.

Thus a new field was opened for philosophers; but it was soon found, that experiments of this kind were not always to be made without danger. This very year, 1752, the Abbe Nollet published some cautions to those who tried experiments on lightning. He had been informed by letters from Florence and Bologna, that some people there had received violent shocks while they drew sparks from an iron bar electrified by thunder. One of his correspondents informed him, that once, as he was endeavouring to fasten a small chain with a copper ball at one of its extremities to a great chain which communicated with the bar at the top of the building, there came a flash of lightning which he did not see, but which affected the chain with a noise like that of wild-fire. The observer instantly received such a shock, that the ball fell out of his hands, and he was struck backwards four or five paces.

15
Professor
Richman
killed by
lightning.

The greatest influence of the danger of these experiments, however, was the death of Mr Richman professor at Petersburg above-mentioned. This happened on the 6th of August 1753, as he was making experiments on lightning drawn into his own room. He had provided himself with an instrument for measuring the quantity of electricity communicated to his apparatus; and as he stood with his head inclined to it, Mr Solokow an engraver, who was near him, observed a globe of blue fire, as big as his fist, jump from the instrument, which was about a foot distant, to Mr Richman's

head. The professor was instantly dead, and Mr Solokow was also much hurt. The latter, however, could give no particular account of the way in which he was affected; for, at the time the professor was struck, there arose a sort of steam or vapour, which entirely benumbed him, and made him sink down to the ground, so that he could not even remember to have heard the clap of thunder, which was a very loud one. The globe of fire was attended with an explosion like that of a pistol; the instrument for measuring the electricity (called by the professor an *electrical gnomon*), was broken to pieces, and the fragments thrown about the room. Upon examining the effects of the lightning in the professor's chamber, they found the door-case half split through, and the door torn off and thrown into the room. They opened a vein in the body twice, but no blood followed; after which, they endeavoured to recover life by violent friction, but in vain: upon turning the corpse with the face downwards during the rubbing, an inconsiderable quantity of blood ran out of the mouth. There appeared a red spot on the forehead, from which spirted some drops of blood through the pores, without wounding the skin. The shoe belonging to the left foot was burst open, and uncovering the foot at that part, they found a blue mark; from whence it was concluded, that the electric matter having entered at the head, made its way out again at that foot. Upon the body, particularly on the left side, were several red and blue spots resembling leather shrunk by being burnt. Many more also became visible over the whole body, and particularly over the back. That upon the forehead changed to a brownish red, but the hair of the head was not singed. In the place where the shoe was unripped, the stocking was entire; as was the coat every where, the waistcoat only being singed on the forepart where it joined the hinder; but there appeared on the back of Mr Solokow's coat long narrow streaks, as if red-hot wires had burned off the nap, and which could not well be accounted for.

When the professor's body was opened next day, the cranium was very entire, having neither fissure nor contra-fissure: the brain was found; but the transparent pellicles of the wind-pipe were excessively tender, and easily rent. There was some extravasated blood in it, as also in the cavities below the lungs. Those of the breast were quite sound; but those towards the back of a brownish black colour, and filled with more of the blood above mentioned. The throat, the glands, and the small intestines, were all inflamed. The singed leather-coloured spots penetrated the skin only. In 48 hours the body was so much corrupted that they could scarce get it into a coffin.

Since the discovery of the identity of lightning and the electric matter, long rods of iron or other metal have been made use of with a view to protect buildings from the danger of strokes of lightning. A considerable dispute has been carried on whether these rods ought to be pointed or not; but a committee of the royal society have very lately determined it in favour of the former.

For some time, the science of electricity seems to have been at a stand. Numberless improvements indeed have been made upon what was before discovered, but scarce any thing new hath been added. The only
