HOUSE is also used for a noble family; or a race of illustrious persons issued from the same stock. In this sense we say, the house or family of the Stuarts, the Bourbons, the house of Hanover, of Austria, of Lorraine, of Savoy, &c.

Cheap, easy, and expeditious Method of constructing Houses, which have been found to be very useful hospitals for the recovery of the sick, and therefore may probably make very wholesome places of residence for the healthy.—The first thing to be done is to choose a dry and airy situation, on a gravelly or chalky soil if possible; upon this lay down the plan of your building, making one end of it face that quarter from whence the purest and healthiest winds may be expected to blow, of a breadth that can be conveniently roofed. Then, if boarding does not come so cheap, drive stakes, at about six feet distance from each other, into the ground, so as to stand about six feet above it; and, interlacing them with wattles, coat the wattles on the side next the weather, with fresh straw; and make the roof in the same manner, but thicker, or of thatch in the usual way, with a hole at the very top of it, to open occasionally. Let the end of the building facing the wholesomest quarter lie open some feet back, so as to form a porch, where the convalescents may take the air without danger of any injury from the weather. A large chimney and kitchen grate may be erected at the other end. If the soil happens to be chalky or gravelly, you may hollow it four or five feet deep, within a foot or eighteen inches of the walls; but let the steps into this hollow lie far enough within the porch, that no water may get into it, and, if of chalk, the steps may not grow slippery in wet weather. From time to time open the vent-hole at the roof; by means of which all the unwholesome infectious air, as being warmer, and consequently lighter, than that which is pure and wholesome, will be driven out by the rushing in of the fresh air: a purpose, which the little openings, that may be left in the sides and roofs of such rude and hasty buildings, will, even of themselves, answer so well, as sufficiently to compensate any cold they may let in, even in the coldest months. Let the floor likewise be scraped three or four inches deep every five or six days, and what comes off removed to some distance. Halls of this kind, 50 feet long and 20 broad, cost but a trifle to build; yet,

with

with these precautions (even without the addition of clean straw for every new patient to lie on, inclosed in clean washed sacks fit for the purpose, which come infinitely cheaper than the bare cleaning of flock or even feather beds, supposing it possible to clean such beds), proved of infinitely more advantage in the recovery of sick soldiers, than the low-roofed rooms of the farm-houses of the Isle of Wight, or even the better accommodations of Carisbrooke castle in the same island, in which there prevailed four times the number of sick that there did in these temporary receptacles; which were first thought of by doctor Procklesby, on occasion of some terrible infections from confined animal-effluvia.

Is it not surprising, that we have not availed ourselves more of the above discovery in natural history, being, perhaps, the most important the moderns can boast of, in the most useful science, viz. the superior lightness of unwholesome and infectious air! The upper salhes in most houses, even of those who pretend to some knowledge in these matters, are generally immovable, by means of which no part of the foul air above the level of the lowest rail of the other salh's greatest rise, can escape by the window; and, if it escapes by the doors, it is generally for want of a vent in the highest part of the roof, merely to accumulate in the upper story of the house, and add to the infection, which the great quantities of old furniture usually stored up there are of themselves but too apt to create, when care is not frequently taken to open the windows of it. Thus, the chief benefit to be expected from lofty rooms is in a great measure lost. Whereas, were the upper salhes contrived to come down, all the air might be easily changed, and that almost insensibly, by letting them down an inch or two. Nay, the upper salh might be often let entirely down with less danger or inconvenience from cold, than the lower thrown up the tenth part of an inch, though the doing of the former would be attended with infinitely more advantage to the health of the inhabitants than the latter. It is, perhaps, on this principle, that we are to account for the good health enjoyed by the poor who live crowded in damp cellars, and often with great numbers of rabbits, poultry, and even swine about them. These cellars are open to the street, with doors reaching from the floor to the very ceiling, but never so close at bottom or at top as to prevent a free circulation of air; in consequence of which, that all-vivifying fluid, as fast as it is spoiled by passing through the lungs of the inhabitants and their stock, or is infected by their insensible perspiration, excrements, &c. is driven out and replaced by the fresh air.

HOUSE, in astrology, denotes the twelfth part of the heavens.

The division of the heavens into houses, is founded upon the pretended influence of the stars, when meeting in them, on all sublunary bodies. These influences are supposed to be good or bad; and to each of these houses particular virtues are assigned, on which astrologers prepare and form a judgment of their horoscopes. The horizon and meridian are two circles of the celestial houses, which divide the heavens into four equal parts, each containing three houses; six of which are above the horizon, and six below it; and six of these

are called *eastern*, and six *western houses*.

A scheme or figure of the heavens is composed of 12 triangles, also called *houses*, in which is marked the stars, signs, and planets, so inclosed in each of these circles. Every planet has likewise two particular houses, in which it is pretended that they exert their influence in the strongest manner; but the sun and moon have only one, the house of the former being Leo, and that of the latter Cancer.

The houses in astrology have also names given them according to their qualities. The first is the house of life: this is the ascendant, which extends five degrees above the horizon, and the rest below it. The second is the house of riches: the third, the house of brothers: the fourth, in the lowest part of the heavens, is the house of relations, and the angle of the earth: the fifth, the house of children: the sixth, the house of health: the seventh, the house of marriage, and the angle of the west: the eighth, the house of death: the ninth, the house of piety: the tenth, the house of offices: the eleventh, the house of friends: and the twelfth, the house of enemies.

Country-House, is the *villa* of the ancient Romans, the *quinta* of the Spaniards and Portuguese, the *closerie* and *cassine* of the French, and the *vigna* of the Italians.

It ought always to have wood and water near it; these being the principal beauties of a rural seat. The trees make a far better defence than hills, as they yield a cooling and healthy air, shade during the heat of summer, and very much break the severities of the winter season.

It should not be situated too low, on account of the moisture of the air; and, on the other hand, those built on places exposed to the winds are expensive to keep in repair. In houses not above two stories high, and upon a good foundation, the length of two bricks, or 18 inches, for the heading course, will be sufficient for the ground-work of any common structure; and six or seven courses above the earth, to a water-table; where the thickness of the walls are abated, or taken in, on either side the thickness of a brick, viz. two inches and a quarter. But for large and high houses of three, four, or five stories, with garrets, their walls ought to be three heading courses of bricks, or 28 inches at least, from the foundation to the first water-table; and at every a story a water-table, or taking in, on the inside, for the summers, girders, and joists to rest upon, laid into the middle, or one quarter of the wall at least, for the better bond. But as for the partition-wall, a brick and half will be sufficiently thick; and for the upper stories, a brick length or nine inch brick will suffice.

HOUSE-Breaking, or *Robbing*, is the breaking into and robbing a house in the day-time; the same crime being termed *BURGLARY*, when done by night: both are felony, without benefit of clergy.

HOUSEHOLD, the whole of a family considered collectively, including the mistress, children, and servants. But the household of a sovereign prince includes only the officers and domestics belonging to his palace.

The principal officers of his majesty's household are, the lord steward, lord chamberlain of the household, the groom of the stole, the master of the great wardrobe,

Household. robe, and the master of the horse.

The civil government of the king's house is under the care of the lord steward of the king's household; who, as he is the chief officer, all his commands are observed and obeyed. His authority extends over all the other officers and servants, except those of his majesty's chapel, chamber, and stable, and he is the judge of all crimes committed either within the court or the verge.

Under him are the treasurer of the household, the comptroller, cofferer, the master of the household, the clerks of the green-cloth, and the officers and servants belonging to the accounting-house, the marshalsea, the verge, the king's kitchen, the household kitchen, the acatery, bake-house, pantry, buttery, cellar, pastry, &c. Next to the lord steward is the lord chamberlain of the household, who has under him the vice-chamberlain, the treasurer, and comptroller of the chamber; 48 gentlemen of the privy chamber, 12 of whom wait quarterly, and two of them lie every night in the privy-chamber; the gentleman usher, the grooms of the great chamber, the pages of the presence-chamber; the mace-bearers, cup-bearers, carvers, musicians, &c. See *LORD CHAMBERLAIN of the Household*.

The groom of the stole has under him the 11 other lords of the bed-chamber, who wait weekly in the bed-chamber, and by turns lie there a-nights on a pallet-bed; and also the grooms of the bed-chamber, the pages of the bed-chamber and back-stairs, &c. See *Groom of the Stole*.

The master or keeper of the great wardrobe has under him a deputy, comptroller, clerk of the robes, brusher, &c. and a number of tradesmen and artificers, who are all sworn servants to the king.

The master of the horse has under his command the equerries, pages, footmen, grooms, coachmen, farriers, saddlers, and all the other officers and tradesmen employed in his majesty's stables.

Next to the civil list of the king's court, is the military, consisting of the band of gentlemen pensioners, the yeomen of the guard, and the troops of the household; of which the two first guard the king above stairs.

When the king dines in public, he is waited upon at table by his majesty's cup-bearers, carvers, and gentlemen sewers; the musicians playing all the time. The dinner is brought up by the yeomen of the guard, and the gentlemen sewers set the dishes in order. The carvers cut for the king, and the cup-bearers serve him the drink with one knee on the ground, after he has first tasted it in the cover.

House and Window Duty.—A branch of the king's extraordinary revenue *.—As early as the conquest mention is made in domesday book of fumage or fumage, vulgarly called *smoke-farthings*; which were paid by custom to the king for every chimney in the house. And we read that Edward the Black prince (soon after his successes in France) in imitation of the English custom, imposed a tax of a florin upon every hearth in his French dominions. But the first parliamentary establishment of it in England was by statute 13 & 14 Car. II. c. 10. whereby an hereditary revenue of 2s. for every hearth, in all houses paying to church and poor, was granted to the king for ever. And, by subsequent statutes, for the more regular assessment of this

tax, the constable and two other substantial inhabitants of the parish, to be appointed yearly, (or the surveyor appointed by the crown, together with such constable or other public officer) were, once in every year, empowered to view the inside of every house in the parish. But, upon the revolution, by stat 1. W. & M. c. 10. hearth-money was declared to be "not only a great oppression to the poorer sort, but a badge of slavery upon the whole people, exposing every man's house to be entered into and searched at pleasure, by persons unknown to him; and therefore, to erect a lasting monument of their majesties goodness, in every house in the kingdom the duty of hearth-money was taken away and abolished." This monument of goodness remains among us to this day: but the prospect of it was somewhat darkened, when in six years afterwards, by statute 7 W. III. c. 18. a tax was laid upon all houses (except cottages) of 2s. now advanced to 3s. *per* house, and a tax also upon all windows, if they exceeded nine, in such house. Which rates have been from time to time varied, being now extended to all windows exceeding six; and power is given to surveyors, appointed by the crown, to inspect the outside of houses, and also to pass through any house, two days in the year, into any court or yard to inspect the windows there.

HOUSING, or *HOUSE-LENE*, in the sea-language, a small line, formed of three fine strands, or twists of hemp, smaller than rope-yarn. It is chiefly used to seize blocks into their strops, to bind the corners of the sails, or to fasten the bottom of a sail to its bolt-rope, &c. See *BOLT-ROPE*.

HOWARD (*HENRY*), earl of Surry, a soldier and a poet, the son and grandson of two lord treasurers, dukes of Norfolk, was born probably about the year 1520, and educated in Windsor castle, with young Fitzroy, earl of Richmond, natural son to king H. VIII. Wood says, from tradition, that he was some time a student at cardinal college, Oxford. In his youth he became enamoured of the Fair Geraldine, whom his sonnets have immortalized. In 1532, Howard with his companion Richmond was at Paris, where they continued some time. The latter died in 1536; after which our young hero made a tour to Italy, and at Florence, like a true *amator*, published a challenge against all comers, whether Christians, Jews, Saracens, Turks, or cannibals, in defence of the beauty of his fair Geraldine; and was victorious in the tournament instituted by the grand duke on the occasion. The duke, we are told, was so charmed with his gallant exploits, that he would gladly have retained him at his court; but he rejected the invitation, being determined to maintain the superlative beauty of his Geraldine, in all the principal cities in Italy. This romantic resolution was however frustrated by the command of his sovereign, Henry VIII. to return to England.

In 1540, he signalized himself in a tournament at Westminster, against Sir John Dudley, Sir Thomas Seymour, and others. In 1542, he marched, under the command of his father, against the Scots; and in the same year was confined in Windsor castle for eating flesh in Lent, contrary to the king's proclamation. In 1544, on the expedition to Boulogne in France, he was appointed field-marshal of the English army; and after the taking of that town, in 1546, made captain-general.

Housing,
Howard.

Howard.

general of the king's forces in France. He was at this time knight of the garter. In the same year, attempting to intercept a convoy, he was defeated by the French, and soon after superseded in his command by the earl of Hertford.

Surry, after his return to England, conscious of his former services, and pensive under his disgrace, could not help reflecting on the king and council. This was his first step towards destruction. He had married Frances, the daughter of John earl of Oxford; and, after her death, is said to have made love to the princess Mary. For this the Seymours, rivals of the Norfolk family, and now in favour with the king, accused him of aspiring to the crown; adding, that he already presumed to quarter part of the royal arms with his own: but, whatever might be the pretence, the cause of his ruin was the jealousy and power of his enemies. In short, the destruction of the Howards being determined, Surry, and his father the duke of Norfolk, were committed to the tower, in December 1546; and on the 13th of January following, Surry was tried at Guild-hall by a common jury, and beheaded on Tower-hill on the 19th day of the same month, nine days before the death of the king, who thus, that the measure of his crimes might be full, finished his life with the murder of his best subject. The accusations brought against this amiable and innocent young nobleman on his trial, were so extremely ridiculous, that one is astonished how it was possible, even in the most despotic reign, to find a judge and jury so pusillanimously villainous as to carry on the farce of justice on the occasion. We boast of our excellent constitution, and our trial by juries; but this example may teach us, that our constitution and our juries are not incompatible with despotic monarchy. He was first interred in the church of All-hallows, Barkin, near Tower-hill; and afterwards, in the reign of king James I. removed to Farmingham in Suffolk, by his son Henry earl of Northampton.

As to the character of this unfortunate earl, all our poets have sung his praise. Mr Walpole begins his anecdotes of Surry with these words:—"We now emerge from the twilight of learning to an almost classic author, that ornament of a boisterous, yet not unpolished court, the earl of Surrey, celebrated by Drayton, Dryden, Fenton, Pope, illustrated by his own muse, and lamented for his unhappy death: a man (as Sir Walter Raleigh says), no less valiant than learned, and of excellent hopes." Leland calls him the conscript enroled heir of Sir Thomas Wyatt, the elder, in his learning and other excellent qualities; and the author of *The Art of English Poetry* says, that the earl of Surrey, and Sir Thomas Wyatt, may be justly called the reformers of our poetry and style. His poems were published in 1557, 12mo; and in 1565, 1574, 1585, 1587, 8vo. Several of the sonnets are by Sir Thomas Wyatt and others.

HOWARD (Charles), an able statesman and experienced seaman, was the son of lord William Howard, baron of Effingham, and born in 1536. He served under his father, who was lord high admiral of England, till the accession of queen Elizabeth. In January 1573, he succeeded his father in his title and estate: after which he successively became chamberlain of the household, and knight of the garter; and, in 1585, was

made lord high admiral, at that critical juncture when the Spaniards were sending their armada, in their opinion, to the assured conquest of this kingdom. When he received intelligence of the approach of the Spanish fleet, and saw the prodigious consequence it was to get out the few ships that were ready at Plymouth, he not only gave orders in every thing himself, but wrought also with his own hands, and the first night left the port with six ships. The next morning, though he had only 30 sail, and those the smallest of the fleet, he attacked the Spanish navy; but first dispatched his brother-in-law, Sir Edward Hobby, to the queen, to desire her to make the proper disposition of her land-forces for the security of the coast, and to hasten as many ships as possible to his assistance. His valour was conspicuously displayed in his repeated attacks of a superior enemy. The coolness of his temper was no less conspicuous; and it was owing to his magnanimity and prudence that the victory was so great. The queen expressed her sense of his merit in the most honourable terms; and granted him a pension for life. In 1596, he commanded in chief at sea, as Essex did by land, the forces sent against Spain, when his prudence and moderation were among the principal causes of the success the English met with in that great and glorious enterprise; so that, upon his return the next year, he was advanced to the dignity of earl of Nottingham. The next eminent service in which his Lordship was engaged was in 1599, when the Spaniards seemed to meditate a new invasion. Her majesty, who always placed her safety in being too quick for her enemies, drew together, in a fortnight's time, such a fleet, and such an army, as took away all appearance of success from her foreign and domestic enemies; and she gave the earl the sole and supreme command of both the fleet and army, with the title of *lord lieutenant general of all England*, an office unknown in succeeding times. When age and infirmity had unfitted him for action, he resigned his office, and spent the remaining part of his life in ease and retirement, till the time of his decease, which happened in 1624, in the 87th year of his age.

HOWE (John), a learned English nonconformist divine born in 1630. He became minister of Great Torrington in Devonshire, and was appointed household chaplain to Cromwell; but seems to have been free from the fanaticism then in fashion, as he offended Cromwell greatly by preaching against the notion of particular faith which the ministers of his court were great advocates for. When Oliver died, he continued chaplain to Richard; and when Richard was deposed, he returned to Torrington, where he continued till the act of uniformity took place and set him aside. He afterwards settled at Utrecht, until the declaration for liberty of conscience was published by king James II. under shelter of which he returned to London, where he died in 1705. He published a great number of sermons and religious works, which have been reprinted together in one volume folio.

Howe-Island, a small island of the South Sea, discovered by Captain Wallis, called by the inhabitants of the Society-Island *Mopeha*; lies in S. Lat. 16. 46. and W. Long. 154. 8.

HOWEL (James), a voluminous writer of the 17th century, supported himself many years by writing and translating

Howard.

Howe.

translating of books. Though he had been a zealous loyalist, he afterwards flattered Cromwell; yet on the restoration he was made historiographer to the king, being the first in England who enjoyed that title. He died in 1666.

HOWITZ, a kind of mortar, mounted upon a field-carriage like a gun. The difference between a mortar and a howitz is, that the trunnions of the first are at the end, and at the middle in the last. The invention of howitzes is of much later date than mortars, for they really had their origin from them. The constructions of howitzes are as various and uncertain as those of mortars, excepting the chambers, which are all cylindric. They are distinguished by the diameter of the bore; for instance, a ten inch howitz is that the diameter of which is 10 inches; and so of the smaller ones.

HOY, a small vessel, chiefly used in coasting, or carrying goods to or from a ship, in a road or bay, where the ordinary lighters cannot be managed with safety or convenience.

It would be very difficult to describe, precisely, the marks of distinction between this vessel and some others of the same size, which are also rigged in the same manner; because what is called a *hoy* in one place, would assume the name of a *sloop* or *snack* in another; and even the people who navigate these vessels, have, upon examination, very vague ideas of the marks by which they are distinguished from those abovementioned. In Holland, the hoy has two masts; in England, it has but one, where the main-mast is sometimes extended by a boom, and sometimes without it. Upon the whole, it may be defined a small vessel, usually rigged as a sloop, and employed for carrying passengers and luggage from one place to another, particularly on the sea-coast.

Hov, an island of Scotland, and one of the Orades. It is about 10 miles long; and that part called *Haes* is fruitful and pretty populous, and is a good place for fishing.

HOYE, a town of Germany, in Westphalia, and capital of a county of the same name. It is seated on the river Weser, and is subject to the elector of Hanover. E. Long. 9. o. N. Lat. 53. 5.

HUAHINE, one of the *Society-Islands*, in the South Sea, situated in S. Lat. 16. 43. W. Lon. 150. 52. and is about seven or eight leagues in compass. Its surface is hilly and uneven, and it has a safe and convenient harbour. It was first discovered by Captain Cook in 1769. It is divided by a deep inlet into two peninsulas connected by an isthmus, which is entirely overflowed at high water. From the appearance of its hills it may be concluded, that the country has at some period or other been the seat of a volcano. The summit of one of them had much the appearance of a crater, and a blackish spongy earth was seen upon one of its sides, which seemed to be lava; and the rocks and clay every where had a burnt appearance. The island is plentifully supplied with water by many rivulets which descend from the mountains and broken rocks. The inhabitants are nearly as fair as Europeans; and their conduct is bolder than that of the inhabitants of the other Society Islands. They are a stout large-made people, some of the tallest being six feet three inches in height; they are extremely indolent, and seem to have as little curiosity as fear. The dogs, however, in spite of their stupidity, are in great favour with all their

Vol. V.

women, "who could not have cared for them (says Mr Forster) with a more ridiculous affection if they had been European ladies of fashion." Here was seen a middle-aged woman, whose breasts were full of milk, offering them to a little puppy who had been trained up to suck them. The sight disgusted those who saw it so much, that they could not forbear expressing their dislike to it; but the woman smiled, and told them that she allowed young pigs to do the same. It appeared afterwards that this woman had lost her child. Some of the gentlemen were present at a dramatic entertainment on this island: the piece represented a girl running away from her parents; and seemed to be levelled at a female passenger who had come in Captain Cook's ship from O'Tahitee, and who happened to be present at the representation. It made such an impression on the girl, that the gentlemen could scarce prevail upon her to see the piece out, or to refrain from tears while it was acting. It concluded with the reception she was supposed to meet with from her friends, which was made out not to be a very agreeable one.—These people introduce extempore pieces upon occasion; and it is most probable that this was meant as a satire upon the girl abovementioned, and to discourage others from acting in the same manner.

HUBER (Ulric), one of the greatest civilians in the 17th century, was born at Dockum in 1636. He became professor of law at Franeker; and wrote, 1. *A treatise De jure civitatis*. 2. *Jurisprudentia Frisica*. 3. *Specimen philosophiæ civilis*. 4. *Institutiones historiciæ civilis*; and several other works which are esteemed. He died in 1694.

HUBERT (St), a town of the Netherlands, on the confines of Liege, with a very fine abbey, where they bring those that are bit by mad animals to be cured. E. Long. 5. 25. N. Lat. 34. 32.

HUBNER (John), a learned geographer of Germany, taught geography at Leipzig and Hamburg with extraordinary reputation; and died at Hamburg in 1732, aged 63. His principal work is *A Geographical treatise*, printed at Basil in 1746, in 6 vols 12mo.

HUDSON (Jeffery). See DWARF.

HUDSON (Henry), an eminent English navigator, who, about the beginning of the last century, undertook to find out a passage by the north-east or north-west to Japan and China. For this purpose he was four times fitted out: he returned three times unsuccessful; but in the last voyage, in 1610, being persuaded that the great bay to which his name has been since given, must lead to the passage he sought, he wintered there, to prosecute his discovery in the spring. But their distresses during the winter producing a mutiny among his men, when the spring arrived, they turned him, with his son and seven sick men, adrift in his own shallop, and proceeded home with the ship. As Hudson and his unhappy companions were never heard of afterward, it is to be supposed they all perished.

HUDSON (John), a very learned English critic, born in 1662. He distinguished himself by several valuable editions of Greek and Latin authors; and, in 1701, was elected head keeper of the Bodleian library at Oxford. In 1712, he was appointed principal of St Mary's Hall, through the interest of the famous Dr Ratcliffe: and it is said that the university

Hudson's
Bay.

of Oxford is indebted for the most ample benefactions of that physician to Dr Hudson's solicitations. He died in 1719, while he was preparing for publication a catalogue of the Bodleian library, which he had caused to be fairly transcribed in six folio volumes.

Hudson's Bay, a large bay of North America, lying between 51 and 69 degrees of latitude, discovered in 1610 by Henry Hudson. This intrepid mariner, in searching after a north-west passage to the South-seas, discovered three streights, through which he hoped to find out a new way to Asia by America. He sailed boldly into the middle of the new gulph, and was preparing to explore all its parts, when his treacherous crew put him into the long-boat, with seven others, and left him, without either arms or provisions, exposed to all the dangers both of sea and land. The barbarians, who refused him the necessaries of life, could not, however, rob him of the honour of the discovery; and the bay, which he first found out, will ever be called by his name.

Royal.

The miseries of the civil war which followed soon after, had, however, made the English forget this distant country, which had nothing to attract them. A succession of more quiet times had not yet induced them to attend to it; when Groseillers and Radisson, two French Canadians, having met with some discontent at home, informed the English, who were engaged in repairing the mischiefs of discord by trade, of the profits arising from furs, and of their claim to the country that furnished them. Those who proposed this undertaking shewed so much ability, that they were intrusted with the execution of it; and the first establishment they formed succeeded so well, that it surpassed their own hopes as well as their promises.

This success alarmed the French; who were afraid, and with reason, that most of the fine furs which they got from the northern parts of Canada would be carried to Hudson's bay. Their alarms were confirmed by the unanimous testimony of their *Coureur de Bois*, who, since 1656, had been four times as far as the borders of the streight. It would have been an eligible thing to have gone by the same road to attack the new colony; but the distance being thought too considerable, notwithstanding the convenience of the rivers, it was at length determined that the expedition should be made by sea. The fate of it was trusted to Groseillers and Radisson, who had been easily prevailed upon to renew their attachment to their country.

These two bold and turbulent men failed from Quebec in 1682, in two vessels ill equipped; and on their arrival, finding themselves not strong enough to attack the enemy, they were contented with erecting a fort in the neighbourhood of that they designed to have taken. From this time there began a rivalry between the two companies, one settled at Canada, the other in England, for the exclusive trade of the bay, which was constantly kept up by the disputes it occasioned; till at last, after each of their settlements had been frequently taken and recovered, all hostilities were terminated by the treaty of Utrecht, by which the whole was ceded to Great-Britain.

Hudson's Bay, properly speaking, is only a mart for trade. The severity of the climate having destroyed all the corn sown there at different times, has frustrated every hope of agriculture, and consequently

of population. Throughout the whole of this extensive coast, there are not more than ninety or a hundred soldiers, or factors, who live in four bad forts, of which York-fort is the principal. Their business is to receive the furs brought by the neighbouring savages in exchange for merchandise, of which they have been taught the value and use.

Though these skins are much more valuable than those which are found in countries not so far north, yet they are cheaper. The savages give to beaver-skins for a gun, two for a pound of powder, one for four pounds of lead, one for a hatchet, one for six knives, two for a pound of glass-beads, six for a cloth-coat, five for a petticoat, and one for a pound of snuff. Combs, looking-glasses, kettles, and brandy, sell in proportion. As the beaver is the common measure of exchange, by another regulation as fraudulent as the first, two otters skins and three martins are required instead of one beaver. Besides this oppression, which is authorized, there is another which is at least tolerated, by which the savages are constantly defrauded in the quality, quantity, and measure of what is given them, and by which they lose about one third of the value.

From this regulated system of imposition, it is easy to guess that the commerce of Hudson's bay is a monopoly. The capital of the company that is in possession of it was originally no more than 10,565 *l.* and has been successively increased to 104,146 *l.* This capital brings them in an annual return of forty or fifty thousand skins of beavers or other animals, upon which they make so exorbitant a profit, that it excites the jealousy and clamours of the nation. Two thirds of these beautiful furs are either consumed in kind in the three kingdoms, or made use of in the national manufactures. The rest are carried into Germany, where the nature of the climate makes them a valuable commodity.

This bay is about ten degrees in breadth: the entrance is six leagues broad; but is only to be attempted from the beginning of July to the end of September, and is even then rather dangerous. This danger arises from mountains of ice, some of which are said to be from 15 to 18 hundred feet thick, and which, having been produced by winters of five or six years duration in little gulphs constantly filled with snow, are forced out of them by north-west winds, or by some other extraordinary cause. The best way of avoiding them is to keep as near as possible to the northern coast, which must necessarily be less obstructed and most free, by the natural directions of both winds and currents.

The north-west wind, which blows almost constantly in winter, and very often in summer, frequently raises violent storms within the bay itself, which is rendered still more dangerous by the number of shoals that are found there. Happily, however, small groups of islands are met with at different distances, which are of a sufficient height to afford a shelter from the storm. Beside these small archipelagoes, there are in many places large piles of bare rock. Except the alga marina, the bay produces as few vegetables as the other northern seas.

Throughout all the countries surrounding this bay, the sun never rises nor sets without forming a great cone of light: this phenomenon is succeeded by the Aurora Borealis, which tinges the hemisphere with coloured

Hudson's
Bay.

River
||
Hue.

coloured rays of such a brilliancy, that the splendour of them is not effaced even by that of the full moon. Notwithstanding this, there is seldom a bright sky. In spring and autumn, the air is always filled with thick fogs, and in winter with an infinite number of small icicles. Though the heats in summer are pretty considerable for six weeks or two months, there is seldom any thunder or lightning.

One of the effects of the extreme cold or snow that prevails in this climate, is that of turning those animals white in winter which are naturally brown or grey. Nature has bestowed upon them all, soft, long, and thick furs, the hair of which falls off as the weather grows milder. In most of these quadrupeds, the feet, the tail, the ears, and, generally speaking, all those parts in which the circulation is slower because they are the most remote from the heart, are extremely short. Wherever they happen to be something longer, they are proportionally well covered. Under this gloomy sky, all liquors become solid by freezing, and break the vessels they are in. Even spirit of wine loses its fluidity. It is not uncommon to see fragments of large rocks loosened and detached from the great mass by the force of the frost. All these phenomena, common enough during the whole winter, are much more terrible at the new and full moon, which in these regions has an influence upon the weather, the causes of which are not known.

In this frozen zone, iron, lead, copper, marble, and a substance resembling sea-coal, have been discovered. In other respects, the soil is extremely barren. Except the coasts, which are for the most part marshy, and produce a little grass and some soft wood, the rest of the country affords nothing but very high moss, and a few weak shrubs very thinly scattered.

For an account of the inhabitants, see GREENLAND.

HUDSON'S-RIVER, a large river of North America, which rises on the east of Lake Ontario, and running by Albany, and on the back of the south part of New-England through part of New-York, falls into the bay of the sea beyond the west end of Long-Island, and below the town of New-York.

HUE and CRY, in law, the pursuit of a person who has committed felony on the high way.—Of this custom, which is of British origin, the following deduction is given by Mr Whitaker. "When it was requisite for the Britons to call out their warriors into the field, they used a method that was particularly marked by its expeditiousness and decisiveness, and remains partially among us to this moment. They raised a cry, which was immediately caught up by others, and in an instant transmitted from mouth to mouth thro' all the region. And, as the notice passed along, the warriors snatched their arms, and hurried away to the rendezvous. We have a remarkable description of the fact in Cæsar, and there see the alarm propagated in 16 or 17 hours through 160 miles in a line. And the same practice has been retained by the Highlanders to our own time. When the lord of a clan received intelligence of an enemy's approach, he immediately killed a goat with his own sword, dipped the end of a half-burnt stick in the blood, and then gave it and the notice of the rendezvous to be carried to the next hamlet. The former symbolically threatened fire and sword to all his followers that did not

instantly repair to the latter. The notice was dispatched from hamlet to hamlet with the utmost expedition. And in three or four hours the whole clan was in arms, and assembled at the place appointed. This was within these few years the ordinary mode by which the chieftains assembled their followers for war. The first person that received the notice, set out with it at full speed, delivered it to the next that he met, who instantly set out on the same speed, and handed it to a third. And, in the late rebellion of 1745, it was sent by an unknown hand through the region of Braidalbin; and, flying as expeditiously as the Gallick signal in Cæsar, traversed a tract of 32 miles in three hours. This quick method of giving a diffusive alarm is even preserved among ourselves to the present day; but is applied, as it seems from Cæsar's account above to have been equally applied among the Cæltæ, to the better purposes of civil polity. The *hustium* and clamour of our laws, and the *hue and cry* of our own times, is a well-known and powerful process for spreading the notice and continuing the pursuit of any fugitive felons. The cry, like the clamour of the Gauls or the summons of the Highlanders, is taken from town to town and from county to county; and a chain of communication is speedily carried from one end of the kingdom to the other.

HUESCA, an ancient and considerable town of Spain, in the kingdom of Arragon, with a bishop's see and an university. It is seated on the Huëla in a soil producing excellent wine, in W. Long. o. 13. N. Lat. 40. 2.

HUESCAR, or GUESCAR, a town of Spain in the kingdom of Granada, seated on a plain in W. Long. 1. 45. N. Lat. 37. 32.

HUESNE, or HUENA, a small island in the Baltic Sea, in the Sound, where was the famous observatory of Tycho Brahe. E. Long. 13. 5. N. Lat. 55. 54.

HUET (Peter Daniel), a very learned French writer, born at Caen in Normandy, on the 8th of February 1630. He discovered, from his infancy, a great inclination to the study of polite literature and the sciences, and at first applied himself to the law; but Des Cartes's principles, and Bochart's sacred geography, made him change his studies for those of philosophy, mathematics, the languages, and antiquities. His admiration for Bochart made him desirous of knowing him. He contracted a very strict friendship with him, and accompanied that learned man to Sweden. Here Christina would have engaged him in her service; but he, sensible of her inconstant temper, returned to France. All he brought with him was a copy of a MS. of Origen, which he transcribed at Stockholm. He refused several offers from Christina after she abdicated and went to Rome, and from Gustavus her successor. In 1670, Mr Bossuet being appointed by the king preceptor to the dauphin, his majesty chose Mr Huet for his colleague, with the title of *sub-preceptor to the prince*. It was he that formed the plan of the commentaries in *usum Delphini*, and directed the execution. His sentiments of piety determined him to enter into holy orders, which he did at the age of 46. Soon after this, he was presented by the king to the abbey of Aunay; and in 1685 was nominated to the bishopric of Soissons, which

Huesca

Huguenots.

he exchanged for the see of Avranches. After governing that diocese ten years, he resigned, and was made abbot of Fontenay near Caen. His love to his native place determined him to fix there. But lawsuits coming upon him, he retired to Paris, and lodged among the Jesuits in the *Maison Professe*, whom he had made heirs to his library. A severe distemper weakened his body extremely, but not the vivacity of his genius: he wrote his own life in a very elegant style; and died in 1721, aged 91. He was a man of very agreeable conversation; and of great probity, as well as immense erudition.—The following are the titles of his principal works. 1. *De Claris interpretibus, et de optimo genere interpretandi*. 2. An edition of Origen's commentaries on the holy Scriptures, in Greek and Latin. 3. A treatise on the origin of the Romans. 4. *Demonstratio evangelica*, folio. 5. *Quæstiones Aletane de concordia rationis et fidei*. 6. Of the situation of the terrestrial paradise, in French. 7. A history of the commerce and navigation of the ancients, which has been translated into English. 8. *Commentarius de rebus ad eam pertinentibus*. 9. *Huetiana*. 10. Latin and Greek verses, &c.

HUGHES (John), an ingenious and polite writer, was born in 1677. In the earliest parts of his youth he cultivated the sister-arts, poetry, drawing, and music, in each of which he by turns made a considerable progress; but followed those and his other studies only as agreeable amusements, under frequent confinement on account of his ill state of health. The lord Chancellor Cowper made him secretary for the commissions of the peace without his knowledge, and distinguished him with singular marks of his esteem. He continued in the same employment under the earl of Macclesfield, and held it to the day of his death; which happened in 1719, the very night in which his tragedy, intitled *The siege of Damascus*, was first acted. He was then 42. He translated Fontenelle's dialogues of the dead, Vertot's revolutions of Portugal, and the letters of Abelard and Eloisa. He gave a very accurate edition of Spencer's works, with his life, a glossary, and remarks; and wrote several papers in the *Tatler*, *Spectator*, and *Guardian*. Mr Duncombe, who married his sister, collected his poems and essays in 2 vols 12mo, in 1735.

HUGHLY, a town of Asia, in the kingdom of Bengal, seated on the most westerly branch of the river Ganges. It is of large extent, reaching about two miles along the river-side, and drives a great trade in all the commodities of that country; affording rich cargoes for 50 or 60 ships annually, besides what is brought on carriages to the neighbouring towns. Saltpetre is brought hither from Patna in vessels above 50 yards long and five broad. The inhabitants are chiefly Indians; but there are also Portuguese, English, and other Europeans. E. Long. 87. 55. N. Lat. 22. 0.

HUGO CAPET, chief of the third race of the kings of France, being count of Paris and Orleans: he was raised to the throne for his military valour and public virtues in 987. See FRANCE, n° 27.

HUGUENOTS, a name given by way of contempt to the Calvinists of France.

The name had its rise in the year 1560; but au-

thors are not agreed as to its origin. The most plausible opinion, however, is that of Pasquier, who observes, that at Tours, the place where they were first thus denominated, the people had a notion, that an apparition or hobgoblin, called king *Hugon*, strolled about the streets in the night-time; from whence, as those of the reformed religion met chiefly in the night to pray, &c. they called them *Huguenots*, that is, the disciples of king *Hugon*.

HULK, on old ship of war, fitted with an apparatus, to fix or take out the masts of his majesty's ships, as occasion requires. See Plate CLXI. fig. 7.

The mast of this vessel is extremely high, and withal properly strengthened by *sprouds* and *stays*, in order to secure what are called the *sheers*, which serve, as the arm of a crane, to hoist out or in the masts of any ship lying alongside. The sheers are composed of several long masts, whose heels rest upon the side of the hulk, and having their heads declining outward from the perpendicular, so as to hang over the vessel whose masts are to be fixed or displaced. The tackles, which extend from the head of the mast to the sheer-heads, are intended to pull in the latter towards the mast-head, particularly when they are charged with the weight of a mast after it is raised out of any ship, which is performed by strong tackles depending from the sheer-heads. The effort of these tackles is produced by two capsterns, fixed on the deck for this purpose.

HULK, is also a name bestowed on any old vessel laid by as unfit for further service. It is probably derived from the *οὐκαλῆς*, or vessels of burden, of the ancient Grecians.

HULL, in the sea-language, is the main body of a ship, without either masts, yards, sails, or rigging. Thus, *to strike a hull* in a storm, is to take in her sails, and to lash the helm on the lee-side of the ship; and *to hull*, or *lie a-hull*, is said of a ship whose sails are thus taken in, and helm lashed a-lee.

HULT, in geography. See KINGSTON upon Hull.

HUMAN, in general, is an appellation given to whatever relates to mankind: thus we say, the human soul, human body, human laws, &c.

HUMANITY, the peculiar nature of man, whereby he is distinguished from all other beings.

HUMANITIES, in the plural, signify grammar, rhetoric, and poetry, known by the name of *literæ humaniores*; for teaching of which, there are professors in the universities of Scotland, called *humanists*.

HUMBER, a river formed by the Trent, the Ouse, and several other streams united. It divides Yorkshire from Lincolnshire, and falls into the German Sea at Holderness.

HUME (David, esq.), a late celebrated philosopher and historian, was born in the fourth part of Scotland on the 26th of April O. S. in the year 1711. Being the younger son of a country gentleman of good family, but no great fortune, his patrimony was of consequence insufficient to support him. For this reason he was destined for the bar, and passed thro' his academical courses in the university of Edinburgh; but being more inclined to studies of a different nature, he never put on the gown, nor even took the introductory steps necessary for that purpose. The writings of Locke and Berkeley had directed the attention of

Hulk
Hume

Hume. of the generality of learned men towards metaphysics; and Mr Hume having early applied himself to studies of this kind, published in 1739 the two first volumes of his *Treatise of human nature*, and the third the following year. He had the mortification, however, to find his book generally decried; and to perceive, that the taste for systematic writing was now on the decline. He therefore divided this treatise into separate Essays and Dissertations, which he afterwards published at different times with alterations and improvements.

In 1742, Mr Hume published two small volumes, consisting of Essays moral, political, and literary. These were better received than his former publication; but contributed little to his reputation as an author, and still less to his profit; and his small patrimony being now almost spent, he accepted an invitation from the marquis of Anandale to come and live with him in England. With this nobleman he staid a twelvemonth, during which time his small fortune was considerably increased. He then received an invitation from General St Clair, to attend him as a secretary to his expedition, which was at first meant against Canada, but afterwards ended in an excursion against the coast of France. In 1747, he received an invitation from the general to attend him in the same station in his military embassy to the courts of Vienna and Turin. He then wore the uniform of an officer; and was introduced at these courts as aid-de-camp to the general, along with Sir Harry Erskine and captain Grant, afterwards general Grant. In 1749, he returned to Scotland, and lived two years with his brother at his country-house; where he composed the second part of his essays, called *Political Discourses*. And now the general approbation of his performances was indicated by a more extensive sale than formerly, and likewise by the numerous answers published by different persons in order to counteract their supposed pernicious tendency. In 1752, were published at Edinburgh his *Political Discourses*, the only work of his which was well received on its first appearance; and the same year, at London, his *Inquiry concerning the Principles of Morals*, which in his own opinion was incomparably the best of all his performances. This year also he was appointed librarian to the faculty of Advocates at Edinburgh; the principal advantage resulting from which employment was, that he had by that means the command of a large library. He then formed the plan of writing the *History of England*: but deeming the whole to be too extensive, he confined his history to that of Britain under the house of Stuart. The book was almost universally decried on its first appearance, and soon after seemed to sink in oblivion. Dr Herring, primate of England, and Dr Stone, primate of Ireland, were the only literati of the author's acquaintance who approved of the work, and sent him messages not to be discouraged.

Notwithstanding the approbation of these eminent men, however, Mr Hume's spirits were so much sunk by his bad success, that he had some thoughts of retiring to France, changing his name, and bidding adieu to his own country for ever; but his design was rendered impracticable by the breaking out of the war of 1755 between France and Britain. He then published his *Natural History of Religion*: to

which an answer was published, soon after its appearance, in the name of Dr Hurd, bishop of Litchfield and Coventry; of which, however, he hath since disclaimed being the sole author. In 1756, the second volume of the *History of the Stuarts* was published, two years after the appearance of the first. This was better received, and helped to retrieve the character of the former volume. Three years after, his *History of the House of Tudor* made its appearance; which was almost as ill received as the *History of the Stuarts* had been, the reign of Elizabeth being particularly obnoxious. The author, however, had now learned to despise popular clamours; and continued to finish at his leisure the more early part of the English history, which was published in 1761, and was received with tolerable success.

Mr Hume being now turned of fifty, and having obtained by the sale of his books a competent and independent fortune, retired into his native country of Scotland, determined never more to set his foot out of it. From this resolution, however, he was diverted by the earl of Hertford; whom he attended as secretary on his embassy to Paris in 1763. In 1765, the earl being appointed lord lieutenant of Ireland, Mr Hume was intrusted with the sole management of the business of the state till the arrival of the duke of Richmond towards the latter end of the year. In 1767, he returned to Edinburgh with a much larger income, procured to him by the earl of Hertford, than he formerly had; and now formed the same design he had formerly entertained, namely, of burying himself in his philosophical retreat. In this, however, he was again disappointed, by receiving an invitation from general Conway to be under secretary; and this invitation he was prevented from declining, both by the character of the person, and his connections with lord Hertford. In 1769, he returned to Edinburgh, possessed of L. 1000 a-year, healthy, and though somewhat stricken in years, yet having a prospect of long enjoying his ease, and of seeing the increase of his reputation. Of his last illness and character, he himself gives the following account. "In spring 1775, I was struck with a disorder in my bowels; which at first gave me no alarm, but has since, as I apprehend it, become mortal and incurable. I now reckon upon a speedy dissolution. I have suffered very little pain from my disorder; and what is more strange, have, notwithstanding the great decline of my person, never suffered a moment's abatement of my spirits; inso-much, that were I to name the period of my life which I should most chuse to pass over again, I might be tempted to point to this latter period. I possess the same ardour as ever in study, and the same gaiety in company. I consider, besides, that a man of sixty-five, by dying, cuts off only a few years of infirmities; and though I see many symptoms of my literary reputation's breaking out at last with additional lustre, I knew that I could have but few years to enjoy it. It is difficult to be more detached from life than I am at present.

"To conclude, historically, with my own character. I am, or rather was, (for that is the style I must now use in speaking of myself, which emboldens me the more to speak my sentiments); I was, I say, a man of mild dispositions, of command of temper, of an open,

Humerus
||
Humorus.

open, social, and cheerful humour, capable of attachment, but little susceptible of enmity, and of great moderation in all my passions. Even my love of literary fame, my ruling passion, never soured my temper, notwithstanding my frequent disappointments. My company was not unacceptable to the young and careless, as well as to the studious and literary; and as I took a particular pleasure in the company of modest women, I had no reason to be displeased with the reception I met with from them. In a word, though most men any wife eminent have found reason to complain of calumny, I never was touched, or even attacked, by her baleful tooth: and though I wantonly exposed myself to the rage of both civil and religious factions, they seemed to be disarmed in my behalf of their wonted fury. My friends never had occasion to vindicate any one circumstance of my character and conduct: not but that the zealots, we may well suppose, would have been glad to invent and propagate any story to my disadvantage, but they could never find any which they thought would wear the face of probability. I cannot say there is no vanity in making this funeral oration of myself, but I hope it is not a misplaced one; and this is a matter of fact which is easily cleared and ascertained."

His fears concerning the incurableness of his disorder proved too true. He died on the 25th of August 1776; and was buried in the Calton church-yard, Edinburgh, where a monument is erected to his memory.

HUMERUS, in anatomy. See **ANATOMY**, n° 48.
Luxation of the HUMERUS. See **SURGERY**.

HUMIDITY, that quality in bodies whereby they are capable of wetting other bodies. This differs very much from fluidity; and seems to be merely a relative thing, depending on the congruity of the component particles of the liquor to the pores of such particular bodies as it is capable of adhering to, penetrating a little into, or wetting. Thus, for instance, quicksilver is not a moist thing with regard to our hands or clothes; but may be called so in reference to gold, tin, or lead, to whose surfaces it will perfectly adhere, and render them soft and moist.

HUMILITY. See **MORALS**, n° 118.

HUMMING-BIRD. See **TROCHILUS**.

HUMOUR, in a general sense, denotes much the same with liquid or fluid. See **FLUID**.

HUMOUR. See **WIT**.

HUMPHREY (Dr Laurence), a very learned English divine in the 16th century, who, during the persecution under queen Mary, retired with other Protestant refugees to Zurich. He returned on the accession of queen Elizabeth; and was made president of Magdalene college, Oxford, dean of Gloucester, and then dean of Winchester. He was a great and general scholar, an able linguist, and a deep divine; and published, 1. *De religionis conservatione et reformatione, deque primatu regum*. 2. *De ratione interpretandi auctores*. 3. *Optimates; sive de nobilitate, ejusque origine*. 4. Sermons, and other works. He died in 1590.

HUMULUS, the **HOP**; a genus of the pentandria order, belonging to the diccæia class of plants. There is only one species, viz. the lupulus, which is sometimes found wild in hedges near houses and gardens,

but probably is not indigenous. The stalk is weak and climbing; it creeps up the support in a spiral, ascending always from the right hand to the left. The stalk and the leaves are rough to the touch: the upper leaves are heart-shaped, the lower ones divided into three lobes serrated on the edges, and grow in pairs on long footstalks. The male flowers grow on a distinct plant on branched peduncles; the females on peduncles in pairs of the form of a *Sporobolus* or cone, composed of large imbricated calyces containing each one or two seeds. For the culture and uses of hops, see the article **HOP**.

HUNDRED, **HUNDREDUM**, or *Centuria*, a part or division of a county; which was anciently so called from its containing an hundred families, or from its furnishing an hundred able men for the king's wars. After king Alfred's dividing this kingdom into counties, and giving the government of each county to a sheriff, these counties were divided into hundreds, of which the constable was the chief officer. The grants of hundreds were at first made by the king to particular persons: but they are not now held by grant or prescription, their jurisdiction being devolved to the county-court; a few of them only excepted, that have been by privilege annexed to the crown, or granted to some great subjects, and still remain in the nature of a franchise.

HUNDRED-COURT. This is only a larger **COURT-BARON**, being held for all the inhabitants of a particular hundred instead of a manor. The free suitors are here also the judges, and the steward the registrar, as in the case of a court-baron. It is likewise no court of record; resembling the former in all points, except that in point of territory it is of a greater jurisdiction. This is said by Sir Edward Coke to have been derived out of the county-court for the ease of the people, that they might have justice done them at their own doors, without any charge or loss of time: but its institution was probably co-eval with that of hundreds themselves, which were formerly observed to have been introduced tho' not invented by **ALFRED**, being derived from the polity of the ancient Germans. The *centeni*, we may remember, were the principal inhabitants of a district composed of different villages, originally in number an *hundred*, but afterwards only called by that name; and who probably gave the same denomination to the district out of which they were chosen. Cæsar speaks positively of the judicial power exercised in their hundred-courts and courts-baron, "*Principes regionum, atque pagorum*," (which we may fairly construe, the lords of hundreds and manors) "*inter suos jus dicunt, controversiasque minuunt*." And Tacitus, who had examined their constitution still more attentively, informs us not only of the authority of the lords, but that of the *centeni*, the hundredors, or jury; who were taken out of the common freeholders, and had themselves a share in the determination. "*Eliguntur in conciliis et principes, qui jura per pagos vicisque reddunt: centeni singulis, ex plebe comites, consilium simul et auctoritas adfunt*." This hundred-court was denominated *barreda* in the Gothic constitution. But this court, as causes are equally liable to removal from hence, as from the common court-baron, and by the same writs, and may also be reviewed by writ of false judgment, is therefore fallen into equal disuse

Hungary. diffuse with regard to the trial of actions.

HUNGARY, a kingdom of Europe, the greatest part of which was anciently called *Pannonia*. It had the name of *Hungary* from the Hunns, a Scythian or Tartar nation, who subdued it in the ninth century. It lies between the 18th and 22d degrees of east long. and betwixt the 45th and 49th degrees of north lat. being bounded to the north by the Carpathian mountains, which separate it from Poland; to the south by Servia, and the river Drave, which separates it from Slavonia; to the west by Moravia, Austria, and Stiria; and to the east by Walachia and Transylvania. It is about 240 miles in length, and 235 in breadth; and is divided into the Upper and Lower Hungary, the former being that part which lies towards the east, and the latter that which lies towards the west.

The northern parts of the kingdom are mountainous and barren, but healthy; the southern, on the contrary, are level, and exceeding fruitful, but not very healthy. The country along the Danube, from Preburg to Belgrade, for upwards of 200 miles, is one continued plain, and no soil can be more fertile; but the air, by reason of the many swamps and morasses, is not so wholesome as on the higher and drier grounds. Here are mines of gold, silver, copper, iron, lead, quicksilver, cinabar, antimony, yellow orpiment, sulphur, vitriol, marcasite, salt native and factitious, saltpetre, magnets, asbestos or stone-flax, marble of several colours, alabaster, with diamonds, and all sorts of precious stones. Corn is in such plenty, that it is sold for one sixth of its price in England. Their grapes are large and luscious; and their wines preferred to any in Europe. They have vast numbers of cattle and horses, the latter mostly mouse-coloured, with buffaloes, deer, wild-fowl, game, and fish, and many species of wild beasts, particularly chamois goats, bears, and lynxes. Of vegetables, besides vines, and the common sorts, here are tobacco, saffron, buck-wheat, millet, melons, and chefnuts. Here also are excellent warm baths, and springs of various kinds and qualities. The chief mountains of Hungary are the Crapack or Carpathian, which is the general name for all those that separate this kingdom from Poland, Moravia, Silesia, and some part of Austria. The sides of most of them are covered with wood, and their tops with snow. The chief rivers are the Danube, the Drave, the Save, the Wag or Waag, the Gran, the Teme, the Raab, and Theiss, all well stocked with fish. There are several lakes among the Carpathian mountains, and some also in the lowlands.

The inhabitants are a mixture of the descendants of the ancient Huns, Slavonians, Camani, Germans, Walachians, Greeks, Jews, Turks, and a wandering people called *Zigduns*, said to be of uncertain origin, but probably the same as those we call *gyffers*. The Hungarians are said to be of a sanguine choleric temper, and somewhat fierce, cruel, proud, and revengeful. They have been always reputed good soldiers, being much more inclined to arms, martial exercises, and hunting, than to arts, learning, trade, or agriculture. The nobility affect great pomp and magnificence, and are much addicted to feasting and carou-

ling. The men in general are strong and well proportioned. They shave their beards, but leave whifkers on the upper-lip; wearing fur caps on their heads, a close-bodied coat girt with a sash, with a short cloak or mantle over all, so contrived as to be buckled under the arm, and leave the right hand at liberty. Their horse are called *buffars*, and their foot *heydukes*. The former wear a broad-sword, or scymetar, and carry a hatchet or battle-ax. Their horses are fleet, but not near so large as the German horses, and therefore they stand up on their short stirrups when they strike. The heydukes usually wear feathers in their caps, according to the number of the enemies they pretend to have killed. Both horse and foot are an excellent militia, very good at a pursuit, or ravaging and plundering a country, but not equal to regular troops in a pitched battle. The women, when they go abroad, wear short cloaks and a veil.

There are four languages spoken in this country, viz. the Hungarian, which, like the people, is of Scythian origin, and has little or no affinity with any European tongue; the German, Slavonian, Wallachian, and Latin. The last is spoken, not only by the better sort, but also by the common people, though very corruptly. The people call *Zigduns* have also a particular jargon.—Christianity was planted in Hungary in the ninth and tenth centuries. In the sixteenth the reformation made a great progress in it; but at present, though the Roman-catholics hardly make a fourth part of the inhabitants, their religion is predominant, the Protestants enjoying only a bare toleration. Besides several sects of Protestants, there are also great numbers of the Greek church and Jews; the last pay double taxes of all kinds. Besides Jesuits colleges and other convents, there are several universities for the Roman-catholics. The Lutherans also and Calvinists have their gymnasia and schools, but under divers restrictions.

As to the traffic of this country, it is almost wholly in the hands of the Greeks and Jews. The exports consist chiefly of wine, horses, cattle, metals, minerals, saffron, wool, and leather. Hungary, in particular, furnishes Austria, and other countries west of it, with vast droves of cattle, as well as variety of excellent wines, of which those of Tokay are reckoned the best. The principal manufactures are those of copper, brass, iron, and other hard wares. Great quantities of brass and iron are exported, wrought and unwrought.

Hungary at first, like most other countries, was divided into many little principalities and states, which at length were united under one head, who had the title of *duke*. The last of these dukes was Geyfa: who, becoming a proselyte to Christianity, was baptized; after which he resigned the government to his son Stephen, who took the title of *king*, anno 1000. But as the throne was filled by election, though generally out of the same family, the disposal of the crown was disputed between the Turkish and German emperors for near 200 years: but after the year 1527, when Ferdinand archduke of Austria was advanced to the throne, the Austrians found means to influence the elections in such a manner, as to keep the crown in their

Hungary,
Hunger.

their family till 1687, when it was settled hereditarily on their heirs male; and now, in consequence of an act made by the diet at Presburg in 1723, in case of the failure of heirs-male, it is to descend to females. The states of the kingdom consist of the prelates, the barons, the gentry, and the royal towns. To the first class belong two archbishops, about a dozen bishops, near as many abbots and provosts, with the Pauline and Præmonstratensian Jesuits. To the second, the stadtholder or palatine, who represents the king; the court-judge; the ban or viceroy of Dalmatia, Croatia, and Slavonia; the Stadtholder of Transylvania; the great treasurer, the great cup-bearer, the steward of the household, the master of the horse, the lord chamberlain, the captain of the yeomen of the guards, and the grand-marshal of the courts, who are styled the great barons, together with the inferior bans or counts and barons. To the third class belong the gentry, some of whom have noble manors, and others only the privileges of nobles. To the fourth class belong the royal free cities, which are not subject to the counts, but hold immediately of the king. The gentry also, who hold of the archbishops and bishops, have the same privileges as the Hungarian nobility. The common people are vassals to the lords, on whose lands they live, whether these lands belong to the crown, the clergy, nobility, or gentry.

The ordinary revenue of this kingdom is said to exceed a million Sterling, arising from the mines, duties on cattle, royal demesnes, salt-works, contributions, customs, &c. The fortifications and garrisons constantly maintained on the frontiers, against the Turks, are a great expence to the government. Hungary can easily bring into the field 100,000 men, regulars and militia; for there are 50,000 in actual pay, and the provinces furnish the other 50,000 when they are wanted.

HUNGARY-Water, a distilled water prepared from the tops or flowers of rosemary; so denominated from a queen of Hungary, for whose use it was first made. See **PHARMACY**, n° 573.

HUNGER, an uneasy sensation occasioned by long abstinence from food when the body is in a healthy state.—Many speculations and conjectures have been formed concerning the cause of this sensation, but none of them in any degree satisfactory. The most ingenious and plausible is that of Dr Haller, viz. that as the liver is not then sustained by the stomach and intestines, it descends by its own weight, and, principally by means of its middle ligament, pulls the diaphragm along with it. It is in that place, therefore, that we have this uneasy sensation, and not at the superior orifice of the stomach as is generally thought.—But if this was the case, an empty stomach should always be accompanied with hunger, which does not hold in fact: because, in certain diseases, people will often fast a long time without any sensation of hunger; and on the contrary, there are cases where scarce any degree of repletion of the stomach and intestines can extinguish the desire of food. See (the *Index* subjoined to) **MEDICINE**.

When animals die for want of food, their death is not directly the consequence of hunger, *i. e.* it does not proceed from a deficiency of juices, but from a bad quality of them. The blood, being deprived of its

usual supplies of fresh chyle, contracts a putrescent disposition; from whence arises a fever of the putrid kind, and of a nature similar to the jail or hospital fever.

Preservatives against HUNGER and Thirst. There were some compositions in vogue among the ancients, for averting the direful effects of hunger and thirst; and were held by them to be extremely necessary in time of scarcity, long voyages, and warlike expeditions. Pliny says, that a small portion of some things allays the hunger and thirst, and preserves strength: such as butter, cheese made of mare's milk, and liquorice. The American Indians use a composition of the juice of tobacco, with calcined shells of snails, cockles, oysters, &c. which they make into pills, and dry in the shade. Whenever they go upon a long journey, and are likely to be destitute of provisions by the way, they put one of these pills between the lower lip and the teeth, and by swallowing what they suck from it, feel neither hunger, thirst, nor fatigue, for four or five days together.

The following composition is an extract from a manuscript scholium on a book of Heron in the Vatican library; and one much to the same effect, with some others, may be seen in Philo's fifth book of Military Affairs. It was reputed an exceeding nutritive medicament, and also very effectual for banishing thirst. Both the besiegers of cities, and the besieged, fed upon it, in time of extremity, and called it the *Epimædian Composition*, from the sea-onion, which was an ingredient in its composition. The process is thus:

The sea-onion being boiled, washed with water, and afterwards dried, it was cut into very thin slices, to which a fifth part of sesame was added, and a sixteenth of poppy; all which being mixed and worked up into a mass with honey, the whole was divided into portions about the bigness of a walnut, whereof two in the day, taken morning and evening, were sufficient to prevent hunger and thirst.

There was another way of preparing it, by taking a pint of sesame, the same quantity of oil, and two quarts of unshelled sweet almonds; when the sesame was dried, and the almonds ground and sifted, the sea-onions were to be peeled and sliced, the roots and leaves being cut off: then, pounding them in a mortar till reduced to a pap, an equal part of honey was to be added, and both worked up with the oil: afterwards all the ingredients were to be put into a pot on the fire, and stirred with a wooden ladle till thoroughly mixed. When the mass acquired a solid consistence, it was taken off the fire, and formed into lozenges; of which two only, as above, were very sufficient for a day's subsistence.

Avicenna relates, that a person, setting out upon a journey, drank one pound of oil of violets, mixed with melted beef-suet; and afterwards continued fasting for ten days together, without the least hunger. He says, that the oil of almonds and beef-suet will effect the same by their viscosity. Hence it was that this celebrated physician, who knew things more by unquestionable experiments than by idle speculations and conjectures, prescribed the following composition, which in time of famine, by sea or land, might be extremely serviceable:

“ Take of sweet almonds, unshelled, one pound; the
like

like quantity of melted beef-suet ; of oil of violets, two ounces ; a sufficient quantity of mucilage ; and of the roots of marsh-mallows, one ounce : let all together be brayed in a mortar, and made into bolusses about the bigness of a common nut. They must be kept so as to prevent their melting by the heat of the sun."—See also the article *Gum-Arabic*.

HUNNS, a fierce and savage nation, who formerly inhabited that part of Sarmatia bordering on the Paulus Meotis and the Tanais, the ancient boundary between Europe and Asia. Their country, as described by Procopius, lay north of mount Caucasus, which, extending from the Euxine to the Caspian Seas, parts Asiatic Sarmatia from Colchis, Iberia, and Albania ; lying on the isthmus between the two seas abovementioned. Here they resided, unknown to other nations, and themselves ignorant of other countries, till the year 376. At this time, an hind pursued by the hunters, or, according to some authors, an ox stung by a gad-fly, having passed the marsh, was followed by some Huns to the other side, where they discovered a country much more agreeable than their own. On their return, having acquainted their countrymen with what they had seen, the whole nation passed the marsh, and, falling upon the Alans who dwelt on the banks of the Tanais, almost exterminated them. They next fell upon the Othogoths, whom they drove out of their country, and forced to retire to the plains between the Boryllhenes and the Tanais, now known by the name of *Podolia*. Then attacking the Visigoths, they obliged them to shelter themselves in the most mountainous parts of their country ; till at last, the Gothic nations finding it impossible to withstand such an inundation of barbarians, obtained leave from the emperor Valens to settle in Thrace.

The Huns thus became masters of all the country between the Tanais and Danube in 376, where they continued quietly till the year 388, when great numbers of them were taken into the pay of Theodosius I. but, in the mean time, a party of them, called the *Nephthalite* or *White Huns*, who had continued in Asia, over-ran all Mesopotamia, and even laid siege to Edessa, where they were repulsed with great slaughter by the Romans. The European Huns frequently passed the Danube, committing the greatest ravages in the western empire ; sometimes they fell upon the eastern provinces, where they put all to fire and sword. They were often defeated and repulsed by the Romans, but the empire was now too weak to subdue or confine them from making excursions ; so that they continued to make daily encroachments, and became every day more formidable than before. In 441, the Huns, under Attila, threatened the western empire with total destruction. This monarch, having made himself master of all the northern countries from the confines of Persia to the banks of the Rhine, invaded Mæzia, Thrace, and Illyricum ; where he made such progress, that the emperor, not thinking himself safe in Constantinople, withdrew into Asia. Attila then broke into Gaul ; where he took and destroyed several cities, massacring the inhabitants with the greatest cruelty. At last he was driven out with great slaughter by Aetius the Roman general and Theodoric king of the Goths, and could never afterwards make any great progress. About the year 452 or 453 Attila died,

and his kingdom was immediately split into a number of small ones by his numerous children, who waged perpetual war with each other. The Huns then ceased to be formidable, and became daily less able to cope with the other barbarous nations whom Attila had kept in subjection. Still, however, their dominion was considerable ; and in the time of Charles the Great they were masters of Transylvania, Walachia, Servia, Carniola, Carinthia, and the greater part of Austria, together with Bosnia, Sclavonia, and that part of Hungary which lies beyond the Danube. In the year 776, while Charles was in Saxony, two princes of the Huns, Caganus and Jugunus, sent ambassadors to him, desiring his friendship and alliance. Charles received them with extraordinary marks of friendship, and readily complied with their request. However, they entered, not long after, into an alliance with Tassila duke of Bavaria, who had revolted from Charles, and raised great disturbances in Germany. Charles dissembled his resentment till he had entirely reduced Bavaria, when he resolved to revenge himself on the Huns for those succours they had underhand given to his enemy. Accordingly, he ordered levies to be made throughout his dominions ; and having by that means assembled a very numerous army, he divided it into two bodies, one of which he commanded himself, and the other he committed to the care of his generals. The two armies entered the country of the Huns at different places, ravaged their country far and near, burnt their villages, and took all their strong holds. This he continued for eight years, till the people were almost totally extirpated ; nor did the Huns ever afterwards recover themselves, or appear as a distinct nation.

There were two different nations that went by the name of *Huns* ; the *Nephthalite* or *White Huns*, and the *Sarmatian* or *Scythian Huns*. The former inhabited a rich country, bordering to the north on Persia, and at a great distance from the *Sarmatian* or *Scythian Huns*, with whom they had no intercourse, nor the least resemblance either in their persons or manners. They were a powerful nation, and often served against the Romans in the Persian armies ; but, in the reign of the emperor Zeno, being provoked by Perozes king of Persia laying claim to part of their country, they defeated the Persians in two pitched battles, slew their king, over-ran all Persia, and held it in subjection for the space of two years, obliging Cabades, the son and successor of Perozes, to pay them a yearly tribute. These Huns, called by the writers of those times the *white Huns*, did not wander, like the others, from place to place ; but, contented with their own country, which supplied them with all necessaries, they lived under a regular government, subject to one prince, and seldom made incursions, unless provoked, either into the Persian or Roman territories. They lived according to their own laws, and dealt uprightly with one another, as well as with the neighbouring people. Each of their great men used to choose 20 or more companions to enjoy with him his wealth, and partake of all his diversions ; but, upon his decease, they were all buried with him in the same grave. This custom favours of barbarity ; but, in every other respect, the *Nephthalite* were a far more civilized nation than the *Scythian Huns*, who, break-

Hunns
Hunting.

Hunting

ing into the empire, filled most of the provinces of Europe with blood and slaughter.

The latter were, according to Ammianus Marcellinus, a savage people, exceeding in cruelty the most barbarous nations. They began to practise their cruelty, says Jornandes, upon their own children the very first day they come into the world, cutting and mangling the cheeks of their males, to prevent the growth of hair, which they must have looked upon, contrary to the sentiments of other nations, as unbecoming and unmanly. They had, perhaps, in this practice another view, which Jornandes seems to insinuate elsewhere, viz. to strike terror into the enemy with their countenances, thus deformed and covered with scars. They had no other food but roots and raw meat, being quite unacquainted with the use of fire, and no houses at all, not even huts; but lived constantly exposed to the air in the woods, and on the mountains, where, from their infancy, they were inured to hunger, thirst, and all manner of hardships: nay, they had such an aversion to houses, which they called the *sepulchres of the living*, that, when they went into other countries, they could hardly be prevailed upon to come within the walls of any house, not thinking themselves safe when shut up and covered. They used even to eat and sleep on horseback, scarce ever dismounting; which, in all likelihood, induced Zosimus to write, that the Hunns could not walk. They covered their nakedness with goats skins, or the skins of a sort of mice sewed together. Day and night were indifferent to them, as to buying, selling, eating, and drinking. They had no law, nor any kind of religion; but complied with their inclinations, whatever they prompted them to, without the least restraint, or distinction between good and evil. In war, they began the battle with great fury, and an hideous noise: but, if they met with a vigorous opposition, their fury began to abate after the first onset; and, when once put in disorder, they never rallied, but fled in the utmost confusion. They were quite unacquainted with the art of besieging towns; and authors observe, that they never attacked the enemy's camp. They were a faithless nation, and thought themselves no longer bound by the most solemn treaties, than they found their advantage in observing them. Hence we often find them, upon the least prospect of obtaining more advantageous conditions, breaking into the Roman empire, in defiance of the most solemn oaths and engagements. Several corps of Huns, after their coming into Europe, served in the Roman armies against the Goths and other barbarous nations; nay, they were ready, for hire, to fight against each other, being blind to every other regard and consideration.

HUNGERFORD, a town of Berkshire, in England, seated on the river Kennet, in a low and watery soil, and noted for the best trouts and craw-fish in all England. W. Long. 1. 35. N. Lat. 26.

HUNNINGUEN, a town of Germany, in Alsace, and in Suintgaw, subject to the French; seated on the Rhine, and fortified by Vauban. E. Long. 11. 40. N. Lat. 47. 42.

HUNTING, the exercise or diversion of pursuing four-footed beasts of game. See the article **GAME**.

Four-footed beasts are hunted in the fields, woods,

and thickets, and that both with guns and gre-hounds.

Birds, on the contrary, are either shot in the air, or taken with nets and other devices, which exercise is called *fowling*; or they are pursued and taken by birds of prey, which is called *hawking*. See the articles **FOWLING**, **HAWKING**, **FALCONRY**, **SHOOTING**, **BIRD-CATCHING**, and **DECOY**.

The pursuing of four-footed beasts, as badgers, deer, does, roebucks, foxes, hares, &c. properly termed *hunting*, is a noble exercise, serving not only to recreate the mind, but to strengthen the limbs, whet the stomach, and cheer the spirits. However, all sorts of weather are not proper for hunting; high winds and rain being great obstacles to it. In the spring season, this diversion should be taken in the night-time with nets; in the summer, the morning is the most proper time for it; and in the winter, it should only be followed from nine in the morning till two in the afternoon. The general rule is, that you place yourself under the wind, where you design to wait for game.

F. de Launay, professor of the French laws, has an express treatise of hunting.—From those words of God to Adam, Gen. i. 26, and 28. and to Noah, Gen. ix. 2, 3. hunting was considered as a right devolved or made over to man; and the following ages appear to have been of the same sentiment. Accordingly we find, that among the more civilized nations, as the Persians, Greeks, and Romans, it made one of their genteeler diversions; and as to the wilder and more barbarous, it served them with food and necessities.—The Roman jurisprudence, which was formed on the manners of the first ages, made a law of it, and established it as a maxim, that as the natural right of things which have no master belongs to the first possessor, wild beasts, birds, and fishes, are the property of whomsoever can take them first.

But the northern nations of barbarians who over-ran the Roman empire, bringing with them a stronger taste for the diversion, and the people being now possessed of other and more easy means of subsistence from the lands and possessions of those they had vanquished, their chiefs and leaders began to appropriate the right of hunting, and, instead of a natural right, to make it a royal one.—Thus it continues to this day; the right of hunting, among us, belonging only to the king, and those who derive it from him.

The hunting used by the ancients, was much like that now practised for the rein-deer; which is seldom hunted at force, or with hounds; but only drawn with a blood-hound, and forestalled with nets and engines. Thus did they with all beasts; whence a dog is never commended by them for opening, before he has discovered where the beast lies. Hence, they were not in any manner curious as to the music of their hounds, or the composition of their kennel or pack, either for deepness, loudness, or sweetness of cry, which is a principal point in the hunting of our days.—Their huntsmen, indeed, were accustomed to shout and make a great noise, as Virgil observes in the third of his *Georgics*: *Ingentem clamore preme ad retia ceruum*. But that confusion was only to bring the deer to the nets laid for him.

The Sicilian way of hunting had something in it very

very extraordinary.—The nobles or gentry being informed which way a herd of deer passed, gave notice to one another, and appointed a meeting; every one bringing with him a cross-bow or long bow, and a bundle of staves shod with iron, the heads bored, with a cord passing through them all: thus provided, they came to the herd, and, casting themselves about in a large ring, surrounded the deer.—Then, each taking his stand, unbound his faggot, set up his stake, and tied the end of the cord to that of his next neighbour, at the distance of ten foot from one another.—Then taking feathers, died in crimson, and fastened on a thread, they tied them to the cord; so that with the least breath of wind, they would whirl round.—Which done, the persons who kept the stands withdrew, and hid themselves in the next covert. Then the chief ranger entering within the line with hounds to draw after the herd, roused the game with their cry; which flying towards the line, were turned off, and, still gazing on the shaking and shining feathers, wandered about as if kept in with a real wall or pale. The ranger still pursued, and calling every person by name, as he passed by their stand, commanded him to shoot the first, third, or sixth, as he pleased; and if any of them missed, or singled out another than that assigned him, it was counted a grievous disgrace. By such means, as they passed by the several stations, the whole herd was killed by the several hands. *Pier. Hieroglyphic. lib. vii. cap. 6.*

The gentlemen and masters of the sport have invented a new set of terms which may be called the *hunting language*. The principal are those which follow:

1. For beasts as they are in company.—They say, a *herd* of harts, and all manner of deer. A *boy* of roes. A *founder* of swine. A *roost* of wolves. A *riches* of martens. A *brace* or *leash* of bucks, foxes, or hares. A *couple* of rabbits or coneyes.

2. For their lodging.—A hart is said to *harbour*. A buck *lodges*. A roe *beds*. A hare *seats* or *forms*. A coney *sits*. A fox *kennels*. A marten *trees*. An otter *atches*. A badger *earths*. A boar *couches*.—Hence, to express their dislodging, they say, *Unharbour* the hart. *Rouse* the buck. *Start* the hare. *Bolt* the coney. *Unkennel* the fox. *Tree* the marten. *Vent* the otter. *Dig* the badger. *Rear* the boar.

3. For their noise at rutting time.—A hart *belletth*. A buck *growns* or *troats*. A roe *bellows*. A hare *beats* or *taps*. An otter *whines*. A boar *freams*. A fox *barks*. A badger *shrieks*. A wolf *howls*. A goat *rattles*.

4. For their copulation.—A hart or buck goes to *rut*. A roe goes to *tourn*. A boar goes to *brim*. A hare or coney goes to *buck*. A fox goes to *climkitting*. A wolf goes to *match* or *make*. An otter *hunteb* for his kind.

5. For the footing and treading.—Of a hart, we say the *stot*. Of a buck, and all fallow-deer, the *view*. Of all deer, if on the grass and scarce visible, the *foiling*. Of a fox, the *print*; and of other the like vermin, the *footing*. Of an otter, the *marks*. Of a boar, the *track*. The hare, when in open field, is said to *fore*; when the winds about to deceive the hounds, the *doubles*; when she beats on the hard highway, and her footing comes to be perceived, she *pricketh*: in snow, it is called the *trace* of the hare.

6. The tail of a hart, buck, or other deer, is called the *single*. That of a boar, the *sweath*. Of a fox, the *brush* or *drag*; and the tip at the end, the *chape*. Of a wolf, the *stern*. Of a hare and coney, the *scut*.

7. The ordure or excrement of a hart and all deer, is called *sewennets* or *sewennish*. Of a hare, *crotiles* or *crotisling*. Of a boar, *lesser*. Of a fox, the *billiting*; and of other the like vermin, the *suants*. Of an otter, the *spraints*.

8. As to the attire of deer, or parts thereof, those of a stag, if perfect, are the *bur*, the *pearls*, the little *knobs* on it, the *beams*, the *gutters*, the *antler*, the *sur-antler*, *royal*, *sur-royal*, and all at top the *croches*. Of the buck, the *bur*, *beam*, *brow-antler*, *black-antler*, *advancer*, *palm*, and *spellers*. If the croches grow in the form of a man's hand, it is called a *palméd head*. Heads bearing not above three or four, and the croches placed aloft, all of one height, are called *crowned heads*. Heads having double croches, are called *forked heads*, because the croches are planted on the top of the beam like forks.

9. They say, a *litter* of cubs, a *nest* of rabbits, a *squirrel's drag*.

10. The terms used in respect of the dogs, &c. are as follow.—Of gre-hounds, two make a *brace*; of hounds, a *couple*. Of gre-hounds, three make a *leash*; of hounds, a *couple* and *half*.—They say, *let slip* a gre-hound; and, *cast off* a hound. The string wherein a gre-hound is led, is called a *leash*; and that of a hound, a *horne*. The gre-hound has his *collar*, and the hound his *cuples*. We say a *kennel* of hounds, and a *pack* of beagles.

HUNTING, as practised among us, is chiefly performed with dogs; of which we have various kinds, accommodated to the various kinds of game, as *hounds*, *gre-hounds*, *blood-hounds*, *terriers*, &c. See CANIS, HOUND, &c.

In the kennels or packs they generally rank them under the heads of *enters*, *drivers*, *flyers*, *tyers*, &c.

On some occasions, nets, spears, and instruments for digging the ground, are also required: nor is the hunting-horn to be omitted.

The usual chases among us, are the *hart*, *buck*, *roe*, *hare*, *fox*, *badger*, and *otter*.—We shall here give something of what relates to each thereof: first premising an explanation of some general terms and phrases, more immediately used in the progress of the sport itself; what belongs to the several sorts of game in particular, being reserved for the respective articles.

When the hounds then, being cast off, and finding the scent of some game, begin to open and cry; they are said to *challenge*. When they are too busy ere the scent be good, they are said to *babble*. When too busy where the scent is good, to *barwl*. When they run it endwise orderly, holding in together merrily, and making it good, they are said to be in *full cry*. When they run along without opening at all, it is called *running mute*.

When spaniels open in the spring, or a gre-hound in the course, they are said to *lapse*.

When beagles bark and cry at their prey, they are said to *yearn*.

When the dogs hit the scent the contrary way, they are said to *draw amiss*.

When they take fresh scent, and quit the former chafe for a new one, it is called *hunting change*.

When they *hunt* the game by the heel or track, they are said to *hunt counter*.

When the chafe goes off, and returns again, traversing the same ground, it is called *hunting the foil*.

When the dogs run at a whole herd of deer, instead of a single one, it is called *running riot*.

Dogs set in readiness where the game is expected to come by, and cast off after the other hounds are passed, are called a *relay*. If they be cast off ere the other dogs be come up, it is called a *vauntail*.

When, finding where the chafe has been, they make a proffer to enter, but return, it is called a *blenish*.

A lesson on the horn to encourage the hounds, is named a *call*, or a *recheat*. That blown at the death of a deer, is called the *mort*. The part belonging to the dogs of any chafe they have killed, is the *reward*. They lay, *take off* a deer's skin; *strip* or *case* a hare, fox, and all sorts of vermin; which is done by beginning at the snout, and turning the skin over the ears down to the tail.

HUNTING is practised in a different manner, and with different apparatus, according to the nature of the beasts which are hunted, a description of whom may be found under their respective articles, *infra*.

With regard to the seasons, that for hart and buck-hunting begins a fortnight after midsummer, and lasts till Holy-rod day; that for the hind and doe, begins on Holy-rod day, and lasts till Candlemas; that for fox-hunting begins at Christmas, and holds till Lady-day; that for roe-hunting begins at Michaelmas, and ends at Christmas; hare-hunting commences at Michaelmas, and lasts till the end of February; and where the wolf and boar are hunted, the season for each begins at Christmas, the first ending at Lady-day, and the latter at the Purification.

When the sportsmen have provided themselves with nets, spears, and a hunting-horn to call the dogs together, and likewise with instruments for digging the ground, the following directions will be of use to them in the pursuit of each fort of game.

Badger-HUNTING. In doing this, you must seek the earths and burrows where he lies, and in a clear moonshine night go and stop all the burrows, except one or two, and therein place some sacks, fastened with drawing strings, which may shut him in as soon as he straieth the bag. Some use no more than to set a hoop in the mouth of the sack, and so put it into the hole; and as soon as the badger is in the sack and straieth it, the sack slippeth off the hoop and follows him into the earth, so he lies tumbling therein till he is taken. These sacks or bags being thus set, cast off the hounds, beating about all the woods, coppices, hedges, and tufts, round about, for the compals of a mile or two; and what badgers are abroad, being alarmed by the hounds, will soon betake themselves to their burrows: and, observe that he who is placed to watch the sacks, must stand close and upon a clear wind; otherwise the badger will discover him, and will immediately fly some other way into his burrow. But if the hounds can encounter him before he can take his sanctuary, he will then stand at a bay like a boar, and make good sport, grievously biting and clawing the dogs, for the manner of their fighting is lying on

their backs, using both teeth and nails; and by blowing up their flims defend themselves against all bites of the dogs, and blows of the men upon their noses as afore said. And for the better preservation of your dogs, it is good to put broad collars about their necks made of greys skins.

When the badger perceives the terriers to begin to yearn him in his burrow, he will stop the hole betwixt him and the terriers, and if they still continue baying, he will remove his couch into another chamber or part of the burrow, and so from one to another, barricading the way before them, as they retreat, until they can go no further. If you intend to dig the badger out of his burrow, you must be provided with the same tools as for digging out a fox; and besides, you should have a pail of water to refresh the terriers, when they come out of the earth to take breath and cool themselves. It will also be necessary to put collars of bells about the necks of your terriers, which making a noise may cause the badger to bolt out. The tools used for digging out of the badger, being troublesome to be carried on mens backs, may be brought in a cart. In digging, you must consider the situation of the ground, by which you may judge where the chief angles are; for else, instead of advancing the work, you will hinder it. In this order you may besiege them in their holds, or callles; and may break their platforms, parapets, casemates, and work to them with mines and countermines until you have overcome them.

Having taken a live and lusty badger, if you would make sport, carry him home in a sack and turn him out in your court-yard, or some other inclosed place, and there let him be hunted and worried to death by your hounds.

There are the following profits and advantages which accrue by killing this animal. Their flesh, blood; and grease, though they are not good food, yet are very useful for physicians and apothecaries for oils, ointments, salves, and powders for shortness of breath, the cough of the lungs, for the stone, sprained sinews, colic-aches, &c. and the skin being well dressed, is very warm and good for old people who are troubled with paralytic distempers.

Buck-HUNTING. Here the same hounds and methods are used as in running the stag; and, indeed, he that can hunt a hart or stag well, will not hunt a buck ill.

In order to facilitate the chase, the game-keeper commonly selects a fat buck out of the herd, which he shoots in order to maim him, and then he is run down by the hounds.

As to the method of hunting the buck. The company generally go out very early for the benefit of the morning. Sometimes they have a deer ready lodged; if not, the coverts are drawn till one is roused; or sometimes in a park a deer is pitched upon, and forced from the herd, then more hounds are laid on to run the chace. If you come to be at a fault, the old staunch hounds are only to be relied upon till you recover him again: if he be sunk, and the bounds thrust him up, it is called an *imprime*, and the company all found a recheat; when he is run down, every one strives to get in to prevent his being torn by the hounds, fallow-deer seldom or never standing at bay.

Hunting.

He that first gets in, cries hoo-up, to give notice that he is down and blows a death. When the company are all come in, they paunch him, and reward the hounds; and generally the chief person of quality amongst them *takes say*, that is, cuts his belly open, to see how fat he is. When this is done, every one has a chop at his neck; and the head being cut off, is shewed to the hounds, to encourage them to run only at male deer, which they see by the horns, and to teach them to bite only at the head: then the company all standing in a ring, one blows a single death; which being done, all blow a double recheat, and so conclude the chase with a general halloo of hoo-up, and depart the field to their several homes, or to the place of meeting; and the huntsman, or some other, hath the deer cast cross the buttocks of his horse, and so carries him home.

FOX-HUNTING makes a very pleasant exercise, and is either above or below ground.

1. Above ground. To hunt a fox with hounds, you must draw about groves, thickets, and bushes near villages. When you find one, it will be necessary to stop up his earth the night before you design to hunt, and that about midnight; at which time he is gone out to prey: this may be done by laying two white sticks across in his way, which he will imagine to be some gin or trap laid for him; or else they may be stopped up with black thorns and earth mixed together.

At first, only cast off your sure finders; and as the drag mends, add more as you dare trust them. The hound first cast off should be old and staunch; and when you hear such a hound call on merrily, you may cast off some others to him; and when they run it on the full cry, cast off the rest: thus you shall complete your pastime. The words of comfort are the same which are used in other chases. The hounds should be left to kill the fox themselves, and to worry and tear him as much as they please: some hounds will eat him with eagerness.

When he is dead, hang him at the end of a pike-staff, and halloo in all your hounds to bay him: but reward them with nothing belonging to the fox; for it is not good, neither will the hounds in common eat it.

2. Under ground. In case a fox does so far escape as to earth, countrymen must be got together with shovels, spades, mattocks, pickaxes, &c. to dig him out, if they think the earth not too great. They make their earths as near as they can in ground that is hard to dig, as in clay, stony ground, or amongst the roots of trees; and their earths have commonly but one hole, and that is straight a long way in before you come at their couch. Sometimes craftily they take possession of a badger's old burrow, which hath a variety of chambers, holes, and angles.

Now to facilitate this way of hunting the fox, the huntsman must be provided with one or two terriers to put into the earth after him, that is, to fix him into an angle; for the earth often consists of many angles: the use of the terrier is to know where he lies; for as soon as he finds him, he continues baying or barking, so that which way the noise is heard that way dig to him. Your terriers must be garnished with bells hung in collars, to make the fox bolt the sooner; besides, the collars will be some small defence to the terriers.

Hunting.

The instruments to dig withal are these: a sharp-pointed spade, which serves to begin the trench where the ground is hardest and broader tools will not so well enter; the round hollowed spade, which is useful to dig among roots, having very sharp edges; the broad flat spade to dig withal, when the trench has been pretty well opened, and the ground softer; mattocks and pickaxes to dig in hard ground, where a spade will do but little service; the coal-rake to cleanse the hole, and to keep it from stopping up; clamps, wherewith you may take either fox or badger out alive to make sport with afterwards. And it would be very convenient to have a pail of water to refresh your terriers with, after they are come out of the earth to take breath.

HARE-HUNTING. As, of all chases, the hare makes the greatest pastime, so it gives no little pleasure to see the craft of this small animal for her self-preservation. If it be rainy, the hare usually takes to the high-ways; and if she come to the side of a young grove, or spring, the seldom enters, but squats down till the hounds have over-shot her; and then she will return the very way she came, for fear of the wet and dew that hangs on the boughs. In this case, the huntsman ought to stay an hundred paces before he comes to the wood-side, by which means he will perceive whether she return as aforesaid; which if she do, he must halloo in his hounds, and call them back; and that presently, that the hounds may not think it the counter she came first.

The next thing that is to be observed, is the place where the hare sits, and upon what wind she makes her form, either upon the north or south wind; she will not willingly run into the wind, but run upon a-side, or down the wind; but if she form in the water, it is a sign she is foul and meafled: if you hunt such a one, have a special regard all the day to the brook-sides; for there, and near plashees, she will make all her crossings, doublings, &c.

Some hares have been so crafty, that as soon as they have heard the sound of a horn, they would instantly start out of their form, though it was at the distance of a quarter of a mile, and go and swim in some pool, and rest upon some rush-bed in the midst of it; and would not stir from thence till they have heard the sound of the horn again, and then have started out again, swimming to land, and have stood up before the hounds four hours before they could kill them, swimming and using all subtilties and crossings in the water. Nay, such is the natural craft and subtilty of a hare, that sometimes, after she has been hunted three hours, she will start a fresh hare, and squat in the same form. Others having been hunted a considerable time, will creep under the door of a sheep-cot, and hide themselves among the sheep; or, when they have been hard hunted, will run in among a flock of sheep, and will by no means be gotten out from among them, till the hounds are coupled up, and the sheep driven into their pens. Some of them (and that seems somewhat strange,) will take the ground like a coney, and that is called *going to the vault*. Some hares will go up one side of the hedge, and come down the other, the thickness of the hedge being the only distance between the courses. A hare
that

Hunting. that has been sorely hunted, has got upon a quickset hedge, and ran a good way upon the top thereof, and then leapt off upon the ground. And they will frequently betake themselves to furz-bushes, and will leap from one to the other, whereby the hounds are frequently in default.

Having found where a hare hath relieved in some pasture or corn-field, you must then consider the season of the year, and what weather it is: for if it be in the spring-time or summer, a hare will not then set in bushes, because they are frequently infested with pismires, snakes, and adders; but will set in corn-fields, and open places. In the winter-time, they set near towns and villages, in tufts of thorns and brambles, especially when the wind is northerly or southerly. According to the season and nature of the place where the hare is accustomed to sit, there beat with your hounds, and start her; which is much better sport than traying of her from her relief to her form.

After the hare has been started and is on foot, then step in where you saw her pass, and halloo in your hounds, until they have all undertaken it and go on with it in full cry: then recleave to them with your horn, following fair and softly at first, making not too much noise either with horn or voice; for at the first, hounds are apt to overhoot the chase through too much heat. But when they have run the space of an hour, and you see the hounds are well in with it, and stick well upon it, then you may come in nearer with the hounds, because by that time their heat will be cooled, and they will hunt more soberly. But above all things, mark the first doubling, which must be your direction for the whole day; for all the doublings that she shall make afterwards will be like the former; and according to the policies that you shall see her use, and the place where you hunt, you must make your compasses great or little, long or short, to help the defaults, always seeking the moistest and most commodious places for the hounds to scent in.

To conclude: Those who delight in hunting the hare, must rise early, lest they be deprived of the scent of her foot-steps.

Hart or Stag HUNTING. Gesner, speaking of hart-hunting, observes, that this wild, deceitful, and subtle beast frequently deceives its hunter, by windings and turnings. Wherefore, the prudent hunter must train his dogs with words of art, that he may be able to set them on and take them off again at pleasure.

First of all, he should encompass the beast in her own layer, and so unharbour her in the view of the dogs, that so they may never lose her slot or footing. Neither must he set upon every one, either of the herd or those that wander solitary alone, or a little one; but partly by sight, and partly by their footing and fumets, make a judgment of the game, and also observe the largeness of his layer.

The huntsman, having made these discoveries in order to the chase, takes off the couplings of the dogs; and some on horseback, others on foot, follow the cry, with the greatest art, observation, and speed; remembering and intercepting him in his subtle turnings and headings; with all agility leaping hedges, gates, pales, ditches; neither fearing thorns, down hills, nor woods, but mounting fresh horse, if the first

tire. Follow the largest head of the whole herd, which must be singled out of the chase; which the dogs perceiving, must follow; not following any other. The dogs are animated to the sport by the winding of horns, and the voices of the huntmen. But sometimes the crafty beast sends forth his little lquire to be sacrificed to the dogs and hunters, instead of himself, lying close the mean time. In this case, the huntsman must sound a retreat, break off the dogs, and take them in, that is, lead them again, until they be brought to the fairer game; which riseth with fear, yet still fiveth by sight, until he be wearied and breathless. The nobles call the beast a *wife hart*, who, to avoid all his enemies, runneth into the greatest herds, and so brings a cloud of error on the dogs, to obstruct their farther pursuit; sometimes also bearing some of the herd into his footings, that so he may the more easily escape, by amusing the dogs. Afterwards he betakes himself to his heels again, still running with the wind, not only for the sake of refreshment, but also because by that means he can the more easily hear the voice of his pursuers whether they be far from him or near to him. But at last being again discovered by the hunters and sagacious scent of the dogs, he flies into the herds of cattle, as cows, sheep, &c. leaping on a cow or ox, laying the fore-parts of his body thereon, that so touching the earth only with his hinder feet, he may leave a very small or no scent at all behind for the hounds to discern. But their usual manner is, when they see themselves hard beset and every way intercepted, to make force at their enemy with their horns, who first comes upon him, unless they be prevented by spear or sword. When the beast is slain, the huntsman with his horn windeth the fall of the beast; and then the whole company comes up, blowing their horns in triumph for such a conquest; among whom, the skillfullest opens the beast, and rewards the hounds with what properly belongs to them, for their future encouragement; for which purpose the huntmen dip bread in the skin and blood of the beast, to give to the hounds.

It is very dangerous to go in to a hart at bay; of which there are two sorts, one on land and the other in water. Now if the hart be in a deep water, where you cannot well come at him, then couple up your dogs; for should they continue long in the water, it would endanger their subrating or foundering. In this case, get a boat, and swim to him, with dagger drawn, or else with rope that has a noose, and throw it over his horns: for if the water be so deep that the hart swims, there is no danger in approaching him; otherwise you must be very cautious.

As to the land bay, if a hart be burnished, then you must consider the place; for if it be in a plain and open place, where there is no wood nor covert, it is dangerous and difficult to come in to him; but if he be on a hedge-side, or in a thicket, then, while the hart is staring on the hounds, you may come softly and covertly behind him, and cut his throat. If you miss your aim, and the hart turn head upon you, then take refuge at some tree; and when the hart is at bay, couple up your hounds; and when you see the hart turn head to fly, gallop in roundly to him, and kill him with your sword.

Directions at the Death of a Hart or Buck. The first

first ceremony, when the huntsman comes in to the death of a deer, is to cry "ware haunch," that the hounds may not break in to the deer; which being done, the next is the cutting his throat, and there bleeding the youngest hounds, that they may the better love a deer, and learn to leap at his throat: then the mort having been blown, and all the company come in, the best person who hath not taken say before, is to take up the knife that the keeper or huntsman is to lay across the belly of the deer, some holding by the fore-legs, and the keeper or huntsman drawing down the pizzle, the person who takes say, is to draw the edge of the knife leisurely along the middle of the belly, beginning near the brisket, and drawing a little upon it, enough in the length and depth to discover how fat the deer is; then he that is to break up the deer, first slits the skin from the cutting of the throat downwards, making the arber, that for the ordure may not break forth, and then he paunches him, rewarding the hounds with it.

In the next place, he is to present the same person who took say, with a drawn hanger, to cut off the head of the deer. Which being done, and the hounds rewarded, the concluding ceremony is, if it be a stag, to blow a triple mort; and if a buck, a double one; and then all who have horns, blow a recheat in concert, and immediately a general whoop, whoop.

OTTER-HUNTING is performed with dogs, and also with a sort of instruments called *otter-spears*; with which when they find themselves wounded, they make to land, and fight with the dogs, and that most furiously, as if they were sensible that cold water would annoy their green wounds.

There is indeed craft to be used in hunting them; but they may be caught in snares under water, and by river-sides: but great care must be taken, for they bite forely and venomously; and if they happen to remain long in the snare, they will not fail to get themselves free by their teeth.

In hunting them, one man must be on one side of the river, and another on the other, both beating the banks with dogs; and the beast not being able to endure the water long, you will soon discover if there be an otter or not in that quarter; for he must come out to make his spraints, and in the night sometimes to feed on grubs and herbs.

If any of the hounds finds out an otter, then view the soft grounds and moist places, to find out which way he bent his head: if you cannot discover this by the marks, you may partly perceive it by the spraints; and then follow the hounds, and lodge him as a hart or deer. But if you do not find him quickly, you may imagine he is gone to couch somewhere farther off from the river; for sometimes they will go to feed a considerable way from the place of their rest, choosing rather to go up the river than down it. The persons that go a-hunting otters, must carry their spears, to watch his vents, that being the chief advantage; and if they perceive him swimming under water, they must endeavour to strike him with their spears, and if they miss, must pursue him with the hounds, which, if they be good and perfectly entered, will go chanting and trailing along by the river side, and will beat every root of a tree, and oster-bed, and tuft of bulrushes; nay, they will sometimes take water, and

bait the beast, like a spaniel, by which means he will hardly escape.

ROE-BUCK HUNTING is performed divers ways, and very easily in the woods.

When chased, they usually run against the wind, because the coolness of the air refreshes them in their course; therefore the huntsmen place their dogs with the wind: they usually, when hunted, first take a large ring, and afterwards hunt the hounds. They are also often taken by counterfeiting their voice, which a skilful huntsman knows how to do by means of a leaf in his mouth. When they are hunted, they turn much and often, and come back upon the dogs directly; and when they can no longer endure, they take foil, as the hart does, and will hang by a bough in such a manner, that nothing of them shall appear above the water but their snout, and they will suffer the dogs to come just upon them before they will stir.

The venison of a roe-buck is never out of season, being never fat, and therefore they are hunted at any time; only that some favour ought to be shewn the doe while she is big with fawn, and afterwards till her fawn is able to shift for himself; but some roe-does have been killed with five fawns in their bellies.

He is not called, by the skilful in the art of hunting, a *great roe-buck*, but a *fair roe-buck*; the herd of them is called a *bevy*: and if he hath not bevy-grease upon his tail, when he is broken up, he is more fit to be dog's meat than man's meat. The hounds must be rewarded with the bowels, the blood, and feet flit afunder, and boiled all together; this is more properly called a *dose* than a *reward*.

HUNTING-MATCH. The first thing that is to be considered by one who designs to match his horse for his own advantage, and his horse's credit, is not to flatter himself with the opinion of his horse, by fancying that he is a swift, when he is but a slow galloper; and that he is a whole-running-horse (that is, that he will run four miles without a fob at the height of his speed) when he is not able to run two or three. Very probably some gentlemen are led into this error, by their being mistaken in the speed of their hounds, who, for want of trying them against other dogs that have been really fleet, have supposed their own to be so, when, in reality, they are but of a middling speed: and because their horse, when trained, was able to follow them all day, and upon any hour, to command them upon deep as well as light earths, have therefore made a false conclusion, that their horse is as swift as the best; but, upon trial against a horse that has been rightly trained after hounds that were truly fleet, have bought their experience perhaps full dear. Therefore it is advisable for all lovers of hunting to procure two or three couple of tried hounds, and once or twice a-week to follow after them at rain-scent; and when he is able to top them on all sorts of earth, and to endure heats and colds stoutly, then he may better rely on his speed and toughness.

That horse which is able to perform a hare-chase of five or six miles briskly and courageously, till his body be as it were bathed in sweat; and then, after the hare has been killed, in a nipping frosty morning, can endure to stand till the sweat be frozen on his back, so that he can endure to be pierced with the cold

Hunting.

cold as well as the heat; and then, even in that extremity of cold, to ride another chase as briskly and with as much courage as he did the former; that horse which can thus endure heats and colds, is most valued by sportsmen. Therefore, in order to make a judgment of the goodness of a horse, observe him after the death of the first hare, if the chase has been any thing brisk: if, when he is cold, he shirks up his body, and draws his legs up together, it is an infallible sign of want of vigour and courage: the like may be done by the slackening of his girths after the first chase, and from the dulness of his teeth, and the dulness of his countenance, all which are true tokens of faintness and being tired; and such a horse is not to be relied on, in case of a wager.

Here it will not be improper to take notice of the way of making matches in former times, and the modern way of deciding wagers. The old way of trial was, by running for many train-scents after hounds, as was agreed upon between the parties concerned, and a bell-course, this being found not so uncertain, but more durable than hare-hunting; and the advantage consisted in having the trains led on earth most suitable to the qualifications of the horses. But now others chuse to hunt the hare till such an hour, and then to run this wild-goose chase; a method of racing that takes its name from the manner of the flight of wild-geese, which is generally one after another; so the two horses, after running of twelvecore yards, had liberty, which horse soever could get the leading, to ride what ground he pleased, the hindmost horse being bound to follow him, within a certain distance agreed on by articles, or else to be whipped up by the triers or judges which rode by; and whichever horse could distance the other, won the match.

But this chase, in itself very inhuman, was soon found to be a very destructive to good horses, especially when two good horses were matched; for neither being able to distance the other, till both were ready to sink under their riders through weakness, oftentimes the match was vain to be drawn and left undecided, though both the horses were quite spoiled.

This brought up the custom of train-scents, which afterwards was changed to three heats and a straight course; and that the lovers of horses might be encouraged to keep good ones, plates have been erected in many places in England. The fewer of these before you come to the course, if your horse be fiery and mettled, the better; and the shorter the distance, the better. Also, above all things, be sure to make your bargain to have the leading of the first train; and then make choice of such grounds where your horse may best show his speed, and the fleetest dogs you can procure: give your hounds as much law before you as your triers will allow, and then, making a loose, try to win the match with a wind; but if you fail in this attempt, then bear your horse, and save him for the course; but if your horse be slow, but well-winded, and a true spurred nag, then the more train-scents you run before you come to the straight course, the better. But here you ought to observe to gain the leading of the first train; which in this case you must lead upon such deep earths, that it may not end near any light ground: for this is the rule received among horsemen; that the next train is to begin where the

last ends, and the last train is to be ended at the starting place of the course; therefore remember to end your last on deep earths, as well as the first.

HUNTINGDON, the county-town of Huntingdonshire in England, seated upon an easy ascent, on the north side of the river Ouse. It was made a free borough by king John, consisting of a mayor, 12 aldermen, burgesses, &c. by whom the two members of parliament are chosen. It had anciently 15 parishes, and has now but two; in one of which, called *St John's*, Oliver Cromwell was born, in 1599. Here was formerly a castle, built by William the Conqueror, which afterwards belonged to David, a prince of Scotland, with the title of *earl*; but Henry VIII. gave it to George Hastings, with the earldom annexed, in whose family it still continues. It stands in the great north road; and has a bridge built of free-stone over the Ouse, which is made navigable for small vessels as high as Bedford. It is the place where the assizes are kept, and where the county-jail stands. It has a good market-place, and several convenient inns, besides a grammar-school; and is very populous. W. Long. o. 15. N. Lat. 52. 23.

HUNTINGDONSHIRE, a county of England, bounded on the south by Bedfordshire; on the west by Northamptonshire, as also on the north; and by Cambridgeshire on the east. It is a good corn country; and abounds in pastures, especially on the eastern side, which is fenny. The rest is diversified by rising hills and shady groves, and the river Ouse waters the southern part.

The air of this county is in most parts pleasant and wholesome, except among the fens and meres, though they are not so bad as the hundreds of Kent and Essex. The soil is fruitful, and produces great crops of corn, and the hilly parts afford a fit pasture for sheep. They have great numbers of cattle; and plenty of water-fowl, fish, and turf for firing; which last is of great service to the inhabitants, there being but little wood, though the whole county was a forest in the time of Henry II. The only river besides the Ouse is the Nen, which runs through Whittlesey Mere.

HU-QUANG, a province of the kingdom of China, in Asia, which has a great river called *Tang*, and *Tschiang*, which runs cross it from east to west. It is divided into the north and south parts, the former of which contains eight cities of the first rank, and 60 of the second and third; and the latter, seven of the first rank, and five of the second and third. It is a flat, open country, watered every-where with brooks, lakes, and rivers, in which there are great numbers of fish. Here are plenty of wild-fowls; the fields nourish cattle without number, and the soil produces corn, and various kinds of fruits. There is gold found in the sands of the rivers; and in the mines they have iron, tin, &c. In short, there is such a variety of all sorts of commodities, that it is called *the magazine of the empire*.

HURA, the SAND-BOX-TREE; a genus of the monadelphica order, belonging to the monœcia class of plants. There is but one species, viz. the crepitans, a native of the West-Indies. It rises with a soft ligneous stem to the height of 24 feet, dividing into many branches, which abound with a milky juice, and have scars on their bark where the leaves have fallen

Hurdles fall off. The male-flowers come out from between the leaves upon foot-stalks three inches long; and are formed into a close spike or column, lying over each other like the scales of fish. The female-flowers are situated at a distance from them; and have a long funnel-shaped tube spreading at the top, where it is cut into 12 reflexed parts. After the flower, the germen swells, and becomes a round compressed ligneous capsule, having 12 deep furrows, each being a distinct cell, containing one large round compressed seed. When the pods are ripe, they burst with violence, and throw out their seeds to a considerable distance. It is propagated by seeds, raised on a hot-bed; and the plants must be constantly kept in a stove. The kernels are said to be purgative, and sometimes emetic.

HURDLES, in fortification, are made of twigs of willows or osiers interwoven close together, sustained by long stakes. They are made in the figure of a long square, the length being five or six feet, and the breadth three and an half. The closer they are wattled together, the better. They serve to render the batteries firm, or to consolidate the passage over muddy ditches; or to cover traverses and lodgements for the defence of the workmen against fire-works or stones thrown against them.

The Romans had a kind of military execution for mutineers, called *putting to death under the hurdle*. The manner of it was this: The criminal was laid at his length in a shallow water, under an hurdle, upon which was heaped stones, and so pressed down till he was drowned.

HURDLES, in husbandry, certain frames made either of split timber, or of hazle-rods wattled together, to serve for gates in inclosures, or to make sheep-folds, &c.

HURDS, or **HORDS**, of flax or hemp; the coarser parts separated in the dressings from the tear, or fine stuff. See **FLAX**.

HURL-BONE, in a horse, a bone near the middle of the buttock, very apt to go out of its sockets with a hurt or strain.

HURON, a vast lake of North-America, situated between 84° and 89° W. Long. and between 43° and 46° of N. Lat. from whence the country contiguous to it is called the *country of the Hurons*, whose language is spoken over a great extent in the southern parts of America.

HURRICANE, a general name for any violent storm of wind; but which is commonly applied to those storms which happen in the warmer climates, and which greatly exceed the most violent storms known in this country. The following description of them is given in the *Account of the European settlements in America*: "It is in the rainy season, principally in the month of August, more rarely in July and September, that they are assailed by hurricanes, the most terrible calamity to which they are subject from the climate. This destroys, at one stroke, the labour of many years, and frustrates the most exalted hopes of the planter; and often just at the moment when he thinks himself out of the reach of fortune. It is a sudden and violent storm of wind, rain, thunder, and lightning; attended with a furious swelling of the sea, and sometimes with an earthquake; in short, with every

circumstance which the elements can assemble that is terrible and destructive.

"First, they see, as a prelude to the ensuing havoc, whole fields of sugar-canes whirled into the air, and scattered over the face of the country. The strongest trees of the forest are torn up by the roots, and driven about like stubble. Their wind-mills are swept away in a moment. Their works, their fixtures, the ponderous copper-boilers and stills, of several hundred weight, are wrenched from the ground, and battered to pieces. Their houses are no protection: the roofs are torn off at one blast, whilst the rain, which in an hour rises five feet, rushes in upon them with an irresistible violence.

"There are signs, which the Indians of these islands taught our planters, by which they can prognosticate the approach of a hurricane. It comes on either in the quarters, or at the full or change of the moon. If it will come on at the full moon, you being at the change, observe these signs. That day you will see the sky very turbulent. You will observe the sun more red than at other times. You will perceive a dead calm, and the hills clear of all those clouds and mists which usually hover about them. In the clefts of the earth, and in the wells, you will hear a hollow rumbling sound, like the rushing of a great wind. At night the stars seem much larger than usual, and surrounded with a sort of burs. The north-west sky has a black and menacing look; and the sea emits a strong smell, and rises into vast waves, often without any wind. The wind itself now forsakes its usual steady easterly stream, and shifts about to the west; from whence it sometimes blows, with intermissions, violently and irregularly, for about two hours at a time. You have the same signs at the full of the moon. The moon itself is surrounded with a great bur, and sometimes the sun has the same appearance."

Hurricanes produce a most dangerous agitation in the sea, where the waves break and dash against each other with astonishing fury. During their continuance, the vessels which were anchored in the roads frequently cut their cables and put to sea, where they drive at the mercy of the winds and waves, after having struck their yards and top-masts. These destructive phænomena are now thought to arise from electricity, though the manner in which it acts in this case is by no means known. It seems probable, indeed, that not only hurricanes, but even the most gentle gales of wind, are produced by the action of the electric fluid; for which see the articles **WIND**, **WHIRLWIND**, &c.

HURST, **HYRST**, or **HERST**, are derived from the Saxon *hyrst*, i. e. a wood, or grove of trees. There are many places in Kent, Sussex, and Hampshire, which begin and end with this syllable; and the reason may be, because the great wood called *Andrefswald* extended through those countries.

HURST-CASTLE, a fortress of Hampshire in England, not far from Limington. It is seated on the extreme point of a neck of land which shoots into the sea, towards the isle of Wight, from which it is distant two miles.

HUSBAND, a man joined or contracted with a woman in marriage. See **MARRIAGE**.

HUSBANDRY, the business or employment of a farmer, or person who cultivates land. See **AGRICULTURE**.

HUSK, the same with what botanists call the *calix* or *cup* of a flower. See **CALIX**.

HUSO, in ichthyology. See **ACCIPENSER**.

HUSS (John), a celebrated divine and martyr, born at Hussenitz in Bohemia, in 1376. He was liberally educated in the university of Prague, and in 1400 was made minister of the church of Bethlehem in that city. He adopted the opinions of Wickliffe, and preached with great zeal against the errors of the church of Rome; for which he was sentenced to the stake by the council of Constance, in 1415. He was burned with much formality, after having been degraded; and his ashes were thrown into the Rhine. His writings, which are numerous and learned, were collected into a body, on the invention of **PRINTING**.

HUSSARS, are the national cavalry of Hungary and Croatia. Their regimentals consist in a rough furred cap, adorned with a cock's feather, (the officers either an eagle's, or a heron's;) a doublet, with a pair of breeches to which the stockings are fastened, and yellow or red boots: besides, they occasionally wear a short upper waistcoat edged with furs, and five rows of round metal-buttons; and in bad weather, a cloak. Their arms are a sabre, carbine, and pistols. They are irregular troops: hence, before beginning an attack, they lay themselves so flat on the necks of their horses, that it is hardly possible to discern their force; but, being come within pistol-shot of the enemy, they raise themselves with such surprising quickness, and begin the fight with such vivacity on every side, that, unless the enemy is accustomed to their method of engaging, it is very difficult for troops to preserve their order. When a retreat is necessary, their horses have so much fire, and are so indefatigable, their equipage so light, and themselves such excellent horsemen, that no other cavalry can pretend to follow them. They leap over ditches, and swim over rivers, with surprising facility. They never encamp, and consequently are not burthened with any camp-equipage, saving a kettle and a hatchet to every six men. They always lie in the woods, out-houses, or villages, in the front of the army. The emperor, queen of Hungary, and king of Prussia, have the greatest number of troops under this name in their service.

HUSSITES, the followers of John Huss, who was burnt for heresy. See **HUSS**.

It is evident in what the pretended heresy of John Huss and Jerome of Prague consisted, from the answer they made to the council, when they were admonished to conform to the sentiments of the church. "They were lovers (they said) of the holy gospel, and sincere disciples of Jesus Christ: that the church of Rome, and all other churches in the world, were widely departed from the apostolical tradition; that the clergy ran after riches and pleasures, lorded it over the people, affected the highest seats at entertainments, bred horses and dogs; and the revenues of the church, which belonged to the poor members of Christ, were consumed in vanity and wantonness: and that the priests were ignorant of the commands of God, or, if they did know them, paid but little regard to them."

Undimmed by the fate of their leader, the Hussites not only stuck to his doctrines, but, choosing John Zisca for their chief in Bohemia, they maintained a war for a long time against the emperor Sigismund with great success; and Procopius Holy, another of their leaders, conducted them with equal courage. The Hussites spread over all Bohemia and Hungary, and even Silesia and Poland; and there are some remains of them still subsisting in all these parts. The followers of Huss were also called *Calixtins*, *Taberites*, and *Bohemian Brethren*.

HUSTINGS (from the Saxon word *Husting*, i. e. *concilium*, or *curia*), a court held in Guild-hall before the lord-mayor and aldermen of London, and reckoned the supreme court of the city. Here deeds may be inrolled, outlawries sued out, and replevins and writs of error determined. In this court also is the election of aldermen, of the four members of parliament for the city, &c. This court is very ancient, as appears by the laws of Edward the Confessor. Some other cities have likewise had a court bearing the same name, as Winchester, York, &c.

HUSUM, a town of Denmark, in the duchy of Sleswick, and capital of a bailiwick of the same name, with a strong citadel, and a very handsome church. It is seated near the river Ow, on the German Sea; and is subject to the dukes of Holstein-Gottorp. E. Long. 9. 5. N. Lat. 54. 55.

HUTCHESON (Dr Francis), a very elegant writer and excellent philosopher, was the son of a dissenting minister in the north of Ireland, and was born on the 8th of August 1694. He early discovered a superior capacity; and having gone through a school-education, began his course of philosophy at an academy, whence he removed to the university of Glasgow, where he applied himself to all the parts of literature, in which his progress was suitable to his uncommon abilities.

He then returned to Ireland; and entering into the ministry, was just about to be settled in a small congregation of dissenters in the north of Ireland, when some gentlemen about Dublin, who knew his great abilities and virtues, invited him to take up a private academy there. He complied with the invitation, and met with much success. He had been fixed but a short time in Dublin, when his singular merits and accomplishments made him generally known; and his acquaintance was sought by men of all ranks, who had any taste for literature, or any regard for learned men. The late lord viscount Moleworth is said to have taken great pleasure in his conversation, and to have assisted him with his criticisms and observations upon his "Inquiry into the ideas of beauty and virtue," before it came abroad. He received the same favour from Dr Syngé, lord bishop of Elphin, with whom he also lived in great friendship. The first edition of this performance came abroad without the author's name, but the merit of it would not suffer him to be long concealed. Such was the reputation of the work, and the ideas it had raised of the author, that lord Granville, who was then lord lieutenant of Ireland, sent his private secretary to inquire at the bookseller's for the author; and when he could not learn his name, he left a letter to be conveyed to him: in consequence of which he soon became acquainted with

his

Hutchinson, his excellency, and was treated by him, all the time he continued in his government, with distinguishing marks of familiarity and esteem.

From this time his acquaintance began to be still more courted by men of distinction either for station or literature in Ireland. Archbishop King, the author of the celebrated book *De origine mali*, held him in great esteem; and the friendship of that prelate was of great use to him in screening him from two several attempts made to prosecute him, for daring to take upon him the education of youth, without having qualified himself by subscribing the ecclesiastical canons, and obtaining a licence from the bishop. He had also a large share in the esteem of the primate Bolter, who through his influence made a donation to the university of Glasgow of a yearly fund for an exhibitioner to be bred to any of the learned professions. A few years after his "Inquiry into the ideas of Beauty and Virtue," his "Treatise on the Passions" was published: both these works have been often reprinted; and always admired, both for the sentiment and language, even by those who have not assented to the philosophy of them, nor allowed it to have any foundation in nature. About this time he wrote some philosophical papers, accounting for laughter, in a different way from Hobbes, and more honourable to human nature: which papers were published in the collection called *Hibernicus's Letters*.

After he had taught in a private academy at Dublin for seven or eight years with great reputation and success, he was called, in the year 1729, to Scotland, to be a professor of philosophy in the university of Glasgow. Several young gentlemen came along with him from the academy, and his high reputation drew many more thither both from England and Ireland. Here he spent the remainder of his life in a manner highly honourable to himself, and ornamental to the university of which he was a member. His whole time was divided between his studies and the duties of his office; except what he allotted to friendship and society. A firm constitution and a pretty uniform state of good health, except some few slight attacks of the gout, seemed to promise a longer life; yet he did not exceed the 53d year of his age. He was married, soon after his settlement in Dublin, to Mrs Mary Wilson a gentleman's daughter in the county of Langford; by whom he left behind him one son, Francis Hutchinson, doctor of medicine. By this gentleman was published, from the original manuscript of his father, "A System of Moral Philosophy, in three books, by Francis Hutchinson, LL.D. at Glasgow, 1755," in two volumes, 4to.

HUTCHINSON (John), a philosophical writer, whose notions have made no inconsiderable noise in the world, was born in 1674. He served the duke of Somerset in the capacity of steward; and in the course of his travels from place to place employed himself in collecting fossils: we are told, that the large and noble collection bequeathed by Dr Woodward to the university of Cambridge, was actually made by him, and even unfairly obtained from him. When he left the duke's service to indulge his studies with more freedom, the duke, then master of the horse to George I. made him his riding surveyor, a kind of sinecure place of 200l. a-year with a good house in the Meuse. In

1724 he published the first part of *Moses's Principia*, in which he ridiculed Dr Woodward's Natural History of the Earth, and exploded the doctrine of gravitation established in Newton's Principia: in 1727, he published the second part of *Moses's Principia*, containing the principles of the Scripture philosophy. From this time to his death, he published a volume every year or two, which, with the MSS. he left behind, were published in 1748, in 12 vols. 8vo. On the Monday before his death, Dr Mead urged him to be bled; saying pleasantly, "I will soon fend you to *Moses*," meaning to his studies: but Mr Hutchinson taking it in the literal sense, answered in a muttering tone, "I believe, doctor, you will;" and was so displeased, that he dismissed him for another physician; but died a few days after, August 28th 1737. Singular as his notions are, they are not without some defenders, who have obtained the appellation of *Hutchinsonians*.

HUY, a town of the Netherlands in the bishopric of Liege, and capital of Condras. It is advantageously seated on the river Maese, over which there is a bridge. E. Long. 10. 22. N. Lat. 52. 31.

HUYGENS (Christian), one of the greatest mathematicians and astronomers of the 17th century, was the son of Constantine Huygens, lord of Zuylichem, who had served three successive princes of Orange in the quality of secretary; and was born at the Hague, in 1629. He discovered from his infancy an extraordinary fondness for the mathematics; in a little time made a great progress in them; and perfected himself in those studies under the famous professor Schooten, at Leyden. In 1649, he went to Holstein and Denmark, in the retinue of Henry count of Nassau; and was extremely desirous of going to Sweden, in order to see Des Cartes, but the count's short stay in Denmark would not permit him. He travelled into France and England; was, in 1663, made a member of the Royal Society; and, upon his return into France, M. Colbert, being informed of his merit, settled a considerable pension upon him to engage him to fix at Paris; to which Mr Huygens consented, and staid there from the year 1666 to 1681, where he was admitted a member of the Academy of Sciences. He loved a quiet and studious manner of life, and frequently retired into the country to avoid interruption, but did not contract that moroseness which is so frequently the effect of solitude and retirement. He was the first who discovered Saturn's ring, and a third satellite belonging to that planet, which had hitherto escaped the eyes of astronomers. He discovered the means of rendering clocks exact, by applying the pendulum, and rendering all its vibrations equal by the cycloid. He brought telescopes to perfection, made many other useful discoveries, and died at the Hague in 1695. He was the author of several excellent works. The principal of these are contained in two collections; the first of which was printed at Leyden in 1682, in quarto, under the title of *Opera varia*; and the second at Amsterdam in 1728, in two volumes quarto, intitled *Opera reliqua*.

HYACINTH, in natural history, a genus of pelucid gems, whose colour is red with an admixture of yellow.

The hyacinth, though less striking to the eye than
21 M 2 any

Huy
Hyacinth.

Hyacinth.
Hyacinthus

any other red gems, is not without its beauty in the finest specimens. It is found of various sizes, from that of a pin's head to the third of an inch in diameter. Like common crystal, it is sometimes found columnar, and sometimes in a pebble-form; and is always hardest and brightest in the larger masses.

Its colour is a dull or deadish red, with an admixture of yellow in it; and this mixed colour is found in all the variety of tints that a prevalence of the red or of the yellow in different degrees is capable of giving it.

Our jewellers allow all those gems to be hyacinths or jacinths, that are of a due hardness with this mixed colour; and as they are of very different beauty and value in their several degrees and mixture of colours, they divide them into four kinds; three of which they call *hyacinth*, but the fourth, very improperly, a *rub*. *1.* When the stone is in its most perfect state, and of a pure and bright flame-colour, neither the red nor the yellow prevailing, in this state they call it *hyacintha la belle*. *2.* When it has an over-proportion of the red, and that of a dusky colour than the fine high red in the former; and the yellow that appears in a faint degree in it is not a fine, bright, and clear, but a dusky brownish yellow; then they call it the *saffron hyacinth*. *3.* Such stones as are of a dead whitish yellow, with a very small proportion of red in them, they call *amber-hyacinth*. And, *4.* When the stone is of a fine deep red, blended with a dusky and very deep yellow, they call it a *rubacelle*. But though the over-proportion of a strong red in this gem has made people refer it to the class of rubies, its evident mixture of yellow shews that it truly belongs to the hyacinths.

The hyacinth *la belle* is found both in the East and West Indies. The oriental are the harder, but the American are often equal to them in colour. The *rubacelle* is found only in the East Indies, and is generally brought over among the rubies; but it is of little value: the other varieties are found in Silesia and Bohemia.

HYACINTHUS, **HYACINTH**; a genus of the monogynia order, belonging to the hexandria class of plants. There are six species; of which the most remarkable is the *orientalis*, or eastern hyacinth. Of this there are a great number of varieties, amounting to some hundreds, each of which differs from the rest in some respect or other. This plant hath a large, purplish, bulbous root, sending up several narrow erect leaves eight or ten inches long; the flower-stalk is upright, robust, and succulent, from 10 to 15 inches in height; adorned upward with many large funnel or bell-shaped flowers, swelling at the base, and cut half way into six parts; collected into a large pyramidal spike of different colours in the varieties; flowering in April or May.

These plants are cultivated with the greatest success in Holland, from whence great numbers are annually imported into Britain. Each variety is by the florists distinguished either by the name of the place where first raised, or the person who raised them, or the names of illustrious personages, as of kings, generals, poets, and celebrated ancient historians, gods, goddesses, &c. They are sold by all the seed-dealers. The prices are from three pence per root to five or ten

pounds or more; and some varieties are in such high esteem among the florists, that 20 or 30 *l.* will be given for a single bulb. They are hardy, and will prosper any where, though the fine kinds require a little shelter during the winter. They may be propagated either by seeds or off-sets from the roots.

The properties of a good oriental hyacinth are, a stem perfectly upright; of moderate length, and so strong and well-proportioned that it will sustain the weight of the florets without bending: the florets should be large, swelling below, expanded above, and numerous, 10 or 15 at least, but are often 20 or 30 in number; and should be placed equally round the stem, the pedicles on which they grow longer below than above, diminishing gradually in length upward in such a manner as to represent a pyramid, and each pedicle sufficiently strong to support the florets without drooping. The curious in these plants are careful never to plant the fine sorts two years together in the same bed of earth; for by planting them every year in a fresh bed, the beauty of the flowers is greatly improved.

HYADES, in astronomy, are seven stars in the bull's head, famous among the poets for the bringing of rain. Whence their name *Tades*, from the Greek, *υαδς*, "to rain." The principal of them is in the left eye, by the Arabs called *allebaran*.

The poets feign them the daughters of Atlas and Pleione. Their brother Hyas being torn to pieces by a lioness, they wept his death with such vehemence that the gods, in compassion to them, translated them into heaven, and placed them in the bull's forehead, where they continue to weep; this constellation being supposed to preface rain. Others represent the Hyades as Bacchus's nurses; and the same with the Dodonides, who fearing the resentment of Juno, and flying from the cruelty of king Lycurgus, were translated by Jupiter into heaven.

HYBERNACULUM, in botany, **WINTER-QUARTERS**; defined by Linnæus to be part of the plant which defends the embryo herb from injuries during the severities of the winter. See **BULBUS** and **GEMMA**.

HYBLA (anc. geog.) or **MEGARA**, which last name it took from the Megareans, who led thither a colony; called also *Hybla Parva*, and *Galeotis*. In Strabo's time Megara was extinct, but the name Hybla remained on account of its excellent honey named from it. It was situated on the east coast of Sicily between Syracuse and the Leontines. *Galeota*, and *Megarenseris* the names of the people, who were of a prophetic spirit, being the descendants of Galeus the son of Apollo. *Hybleus* the epithet.—The *Hyblæi colles*, small eminences at the springs of the Alabus near this place, were famous for their variety of flowers, especially thyme; the honey gathered from which was by the ancients reckoned the best in the world, excepting that of Hymettus in Attica. By the moderns it was called *Mel Passi*, for the same reason, namely, on account of its excellent honey, and extraordinary fertility, till it was overwhelmed by the lava of *Ætna*; and having then become totally barren, its name was changed to *Mal Passi*. In a second eruption, by a shower of ashes from the mountain, it soon reassumed its ancient beauty and fertility; and for many years was called *Bel*

Paffi: and last of all, in the year 1669, it was again laid under an ocean of fire, and reduced to the most wretched sterility; since which time it is again known by the appellation of *Mal Paffi*. However, the lava in its course over this beautiful country has left several little islands or hillocks, just sufficient to shew what it formerly was. These make a singular appearance in all the bloom of the most luxuriant vegetation, surrounded and rendered almost inaccessible by large fields of black and rugged lava.

HYBLA-Major, (anc. geog.) was situated in the trafficking between mount *Ætna* and the river *Symethus*. In *Paufanias's* time desolate.

HYBLA-Minor, or *Heræa*, (anc. geog.) an inland town of Sicily, situated between the rivers *Oanus* and *Herminius*; now *RAGUSA*.

HYBRIDA PLANTA, a monstrous production of two different species of plants, analogous to a mule among animals. The seeds of hybrid plants will not propagate.

HYÆNA, in zoology. See *CANIS*.

HYÆNIUS LAPIS, in natural history, the name of a stone said to be found in the eyes of the *Hyæna*. *Pliny* tells us, that those creatures were in old times hunted and destroyed for the sake of these stones, and that it was supposed they gave a man the gift of prophecy by being put under his tongue.

HYDATIDES, in medicine, little transparent vesicles or bladders full of water, sometimes found solitary, and sometimes in clusters upon the liver, and various other parts, especially in hydroypical cases.

HYDATOSCOPIA, called also *HYDROMANCY*, a kind of divination or method of foretelling future events by water.

HYDE (Edward), earl of Clarendon, and lord high chancellor of England, was descended from an ancient family in Cheshire, and born at Dinton near Hindon, in Wiltshire, in 1608. He was entered of *Magdalen-hall Oxford*, where, in 1625, he took the degree of A. B. and afterward studied the law in the *Middle-Temple*. In the parliament which begun at *Westminster April 10. 1640*, he served for *Wotton-Basset* in Wiltshire. But that parliament being soon after dissolved, he was chosen for *Salisbury* in *Cornwall* in the long parliament. His abilities were much taken notice of, and he was employed in several committees to examine into divers grievances; but at last being dissatisfied with the proceedings in the parliament, he retired to the king, and was made chancellor of the exchequer, a privy-counsellor, and knight. Upon the declining of the king's cause, he went to France, where, after the death of king *Charles I.* he was sworn of the privy-council to *Charles II.* In 1649, he and the lord *Cottington* were sent ambassadors extraordinary into Spain, and in 1657 he was constituted lord high chancellor of England. The year before the restoration, the duke of *York* falling in love with *Mrs Anne Hyde*, the lord chancellor's eldest daughter, resolved to marry her, which he performed; but carefully concealed it, both from the king and chancellor. Upon the restoration, he was chosen chancellor of the university of Oxford; and soon after created baron of Hindon, in Wiltshire, viscount *Cornbury* in Oxfordshire, and earl of *Clarendon* in Wiltshire; and, on the death of *Henry lord Falkland*, was made lord lieute-

nant of Oxfordshire. He took care neither to load the king's prerogative, nor encroach upon the liberties of the people; and therefore would not set aside the petition of right, nor endeavour to raise the star-chamber or high-commission courts again: nor did he attempt to repeal the bill for triennial parliaments; and when he might have obtained two millions for a standing revenue, he asked but one million two hundred thousand pounds *per annum*, which he thought would still put the king upon the necessity of having recourse to his parliament. In this just conduct he is said to have been influenced by the following incident, which happened some years before. When he first began to grow eminent in the law, he went down to visit his father in Wiltshire; who, one day as they were walking in the fields together, observed to him, that men of his profession were apt to stretch the prerogative too far, and to injure liberty; but charged him, if ever he came to any eminence in his profession, never to sacrifice the laws and liberty of his country to his own interest or the will of his prince: he repeated his advice twice; and immediately falling into a fit of an apoplexy, died in a few hours: and this circumstance had a lasting influence upon him. In 1662, he opposed a proposal for the king's marriage with the infant of Portugal, and the sale of *Dunkirk*: however, the following year, articles of high treason were exhibited against him by the earl of *Bristol*; but they were rejected by the house of lords. In 1664, he opposed the war with Holland. In August 1667, he was removed from his post of lord chancellor; and in November following impeached of high treason and other crimes and misdemeanors by the house of commons: upon which he retired into France, when a bill was passed for banishing him from the king's dominions. See *BRITAIN*, n^o 217, 217. He resided at *Rouen* in Normandy; and dying there in 1674, his body was brought to England and interred in *Westminster-abbey*. He wrote, 1. A history of the rebellion, 3 vols folio, and 6 vols octavo; a second part of which was lately bequeathed to the public by his lordship's descendant the late lord *Hyde* and *Cornbury*. 2. A letter to the duke of *York*, and another to the duchess of *York*, upon occasion of their embracing the *Romish* religion. 3. An answer to *Hobbes's Leviathan*. 4. A history of the rebellion and civil wars in Ireland, octavo; and some other works.

The reverend Mr *Granger*, in his *Biographical History of England*, observes, that "the virtue of the earl of Clarendon was of too stubborn a nature for the age of *Charles II.* Could he have been content, (says he,) to have enslaved millions, he might have been more a monarch than an unprincipled king. But he did not only look upon himself as the guardian of the laws and liberties of his country, but had also a pride in his nature that was above vice; and chose rather to be a victim himself, than to sacrifice his integrity. He had only one part to act, which was that of an honest man. His enemies allowed themselves a much greater latitude; they loaded him with calumnies, blamed him even for their own errors and misconduct, and helped to ruin him by such buffooneries as he despised. He was a much greater, perhaps a much happier man, alone and in exile, than *Charles the Second* upon his throne."

Hyde.

And the following character of this nobleman is given by Mr Walpole. "Sir Edward Hyde, (says he), who opposed an arbitrary court, and embraced the party of an afflicted one, must be allowed to have acted conscientiously. A better proof was his behaviour on the restoration, when the torrent of an insatuated nation intreated the king and his minister to be absolute. Had Clarendon sought nothing but power, his power had never ceased. A corrupted court and a blinded populace were left the causes of the chancellor's fall, than an ungrateful king, who could not pardon his lordship's having refused to accept for him the slavery of his country. Like justice herself, he held the balance between the necessary power of the supreme magistrate, and the interests of the people. This never-dying obligation his cotemporaries were taught to overlook and clamour against, till they removed the only man who, if he could, would have corrected his master's evil government. Almost every virtue of a minister made his character venerable. As an historian, he seems more exceptionable. His majesty and eloquence, his power of painting characters, his knowledge of his subject, rank him in the first class of writers; yet he has both great and little faults. Of the latter, his stories of ghosts and omens are not to be defended. His capital fault is his whole work being a laboured justification of king Charles. If he relates faults, some palliating epithet always slides in, and he has the art of breaking his darkest shades with gleams of light that take off all impression of horror. One may pronounce on my lord Clarendon, in his double capacity of statesman and historian, that he acted for liberty, but wrote for prerogative."

HYDE (Dr Thomas), professor of Arabic at Oxford, and one of the most learned writers of the 17th century, was born in 1636; and studied first at Cambridge, and afterwards at Oxford. Before he was 18 years of age, he was sent from Cambridge to London to assist Mr Brian Walton in the great work of the Polyglot Bible; and about that period undertook to transcribe the Persian Pentateuch out of the Hebrew characters, which archbishop Usher, who well knew the difficulty of the undertaking, pronounced to be an impossible task to a native Persian. After he had happily succeeded in this, he assisted in correcting several parts of Mr Walton's work, for which he was perfectly qualified. He was made archdeacon of Gloucester, canon of Christ-church, head keeper of the Bodleian library, and professor both of Hebrew and Arabic, in the university of Oxford. He was interpreter and secretary of the Oriental languages, during the reigns of Charles II. James II. and William III.; and was perfectly qualified to fill this post, as he could converse in the languages which he understood. There never was an Englishman in his situation of life who made so great a progress; but his mind was so engrossed by his beloved studies, that he is said to have been but ill qualified to appear to any advantage in common conversation. Of all his learned works, (the very catalogue of which, as observed by Anth. Wood, is a curiosity), his *Religio Veterum Perfarum* is the most celebrated. Dr Gregory Sharpe, the late learned and ingenious master of the temple, has collected several of his pieces formerly printed, and republished them, with some additional dissertations, and his

life prefixed, in two elegant volumes quarto. This great man died on the 18th of February, 1702. Among his other works are, 1. A Latin translation of Ulug Beig's observations on the longitude and latitude of the fixed stars; and, 2. A catalogue of the printed books in the Bodleian library.

HYDNUM, in botany; a genus of fungi, belonging to the cryptogamia class of plants. It is of the horizontal kind, echinated or beset with sharp-pointed fibres on its under part. One of the species, named the *imbricatum*, is a native of Britain, and is found in woods. It hath a convex hat, tiled, standing on a smooth pillar, of a pale flesh-colour, with white prickles. It is eaten in Italy, and is said to be of a very delicate taste.

HYDRA, in fabulous history, a serpent in the Marsh of Lerna, in Peloponnesus, represented by the poets with many heads, one of which being cut off, another immediately succeeded in its place, unless the wound was instantly cauterized. Hercules attacked this monster; and having caused Iolaus to hew down wood for flaming brands, as he cut off the heads he applied the brands to the wounds, by which means he destroyed the Hydra.

HYDRA, in astronomy. See there, n° 206.

HYDRAGOGUES, among physicians, remedies which evacuate a large quantity of water in dropsies. The word is formed of *hydr* water, and *agog* to draw or lead; but the application of the term proceeds upon a mistaken supposition, that every purgative had some particular humour which it would evacuate, and which could not be evacuated by any other. It is now, however, discovered, that all strong purgatives will prove *hydragogues*, if given in large quantity, or in weak constitutions. The principal medicines recommended as hydragogues, are the juice of elder, the root of iris, soldanella, mechoacan, jalap, &c.

HYDRANGEA, in botany; a genus of the digynia order, belonging to the decandria class of plants. There is but one species, viz. the arborecens, a native of North America, from whence it hath lately been brought to Europe, and is preserved in gardens, more for the sake of variety than beauty. It rises about three feet high; and hath many soft pithy stalks, garnished with two oblong heart-shaped leaves placed opposite. The flowers are produced at the top of the stalks in a corymbus. They are white, composed of five petals with ten stamina surrounding the style. It is easily propagated by parting the roots; the best time for which is the end of October. The plants thrive best in a moist soil, and require to be sheltered from severe frosts.

HYDRAULICS, the science of the motion of fluids, and the construction of all kinds of instruments and machines relating thereto. See HYDROSTATICS, chap. iv.

HYDRENTEROCELE, in surgery, a species of hernia, wherein the intestines descend into the scrotum, together with a quantity of water.

HYDROCELE, in surgery, denotes any hernia arising from water; but is particularly used for such a one of the serotum, which sometimes grows to the size of one's head, without pain, but exceeding troublesome to the patient. See SURGERY.

HYDROCEPHALUS, a preternatural distension

Hydnum

Hydrocephalus

of the head to an uncommon size by a stagnation and extravasation of the lymph; which, when collected in the inside of the cranium, is then termed *internal*; as that collected on the outside is termed *external*. See (the *Index* subjoined to) MEDICINE.

HYDROCHARIS, the *LITTLE WATER-LILY*; a genus of the decandria order, belonging to the diccia class of plants. There is only one species, a native of Britain, growing in flow streams and wet ditches. It hath kidney-shaped leaves, thick, smooth, and of a brownish green colour, with white blossoms. There is a variety with double flowers of a very sweet smell.

HYDROCOTYLE, *WATER-NAVELWORT*; a genus of the digynia order, belonging to the pentandria class of plants. There are several species, none of which are ever cultivated in gardens. One of them, a native of Britain, growing in marshy grounds, is supposed by the farmers to occasion the rot in sheep. The leaves have central leaf-stalks, with about five flowers in a rundle; the petals are of a reddish white.

HYDROGRAPHY, the art of measuring and describing the sea, rivers, canals, lakes, &c.—With regard to the sea, it gives an account of its tides, counter-tides, soundings, bays, gulphs, creeks, &c.; as also of the rocks, shelves, sands, shallows, promontories, harbours; the distance and bearing of one port from another; with every thing that is remarkable, whether out at sea or on the coast.

HYDROMANCY, a method of divination by water, practised by the ancients. See DIVINATION, n° 7.

HYDROMEL, honey diluted in nearly an equal weight of water. When this liquor has not fermented, it is called *simple hydromel*; and when it has undergone the spirituous fermentation, it is called the *vinous hydromel*, or *mead*.

Honey, like all saccharine substances, vegetable or animal, is susceptible of fermentation in general, and particularly of the spirituous fermentation. To induce this fermentation, nothing is necessary but to dilute it sufficiently in water, and to leave this liquor exposed to a convenient degree of heat. To make good vinous hydromel or mead, the whitest, purest, and best-tasted honey must be chosen; and this must be put into a kettle with more than its weight of water: a part of this liquor must be evaporated by boiling, and the liquor skimmed, till its consistence is such that a fresh egg shall be supported upon its surface without sinking more than half its thickness into the liquor; then the liquor is to be strained and poured through a funnel into a barrel: this barrel, which ought to be nearly full, must be exposed to a heat as equable as is possible, from 20 to 27 or 28 degrees of Mr Reaumur's thermometer, taking care that the bung-hole be slightly covered, but not closed. The phenomena of the spirituous fermentation will appear in this liquor, and will subsist during two or three months, according to the degree of heat; after which they will diminish and cease. During this fermentation, the barrel must be filled up occasionally with more of the same kind of liquor of honey, some of which ought to be kept apart on purpose to replace the liquor which flows out of the barrel in froth. When the fermentation ceases, and the liquor has become very vinous, the barrel is then to be put in a cellar and well closed. A year afterwards the mead

will be fit to be put into bottles.

The vinous hydromel or mead is an agreeable kind of wine: nevertheless it retains long a taste of honey, which is unpleasing to some persons; but this taste it is said to lose entirely by being kept a very long time.

The spirituous fermentation of honey, as also that of sugar, and of the most of vinous liquors, when it is very saccharine, is generally more difficultly effected, requires more heat, and continues longer than that of ordinary wines made from the juice of grapes; and these vinous liquors always preserve a saccharine taste, which shews that a part only of them is become spirituous.

HYDROMETER, an instrument to measure the gravity, density, velocity, force, &c. of water and other fluids. See **HYDROSTATICS**, n° 13.

HYDROMPHALUS, in medicine and surgery, a tumour in the navel, arising from a collection of water.

HYDROPHANE, in natural history: A genus of semi-pellucid gems, composed of crystal and earth; the latter ingredient being in large proportion, and mixed imperfectly, as in the chalcodony; and giving a general cloudiness or mistiness to the stone; but of such an imperfect and irregular admixture, as not to be capable of a polish like the chalcodony; and appearing of a dusky and foul surface till thrown into water, in which they become lucid and in some degree transparent, either in part or totally; also changing their colour, which returns to them on their being taken out of the water. To this genus belongs the oculus beli of authors, or whitish grey hydrophanes variegated with yellow, and with a black central nucleus; and the oculus mundi, or lapis mutabilis, which is likewise a whitish grey kind without veins.

HYDROPHOBIA, an aversion or dread of water: a terrible symptom of the *rabies canina*; and which has likewise been found to take in violent inflammations of the stomach and in hysterical fits. See (the *Index* subjoined to) MEDICINE.

HYDROPHYLACIA, a word used by Kircher and some others who have written in the same system, to express those great reservoirs of water which lie places in the Alps and other mountains for the supply of rivers which run through the several lower countries. This he makes to be one of the great uses of mountains in the œconomy of the universe.

HYDROPHYLLUM, *WATER-LEAF*; a genus of the monogynia order, belonging to the pentandria class of plants. There is only one species, viz. the Virginianum, or water-leaf of Morinus. It grows naturally in Canada and many other parts of America on moist spongy ground. The root is composed of many strong fleshy fibres, from which arise many leaves with footstalks five or six inches long, jagged into three, five, or seven lobes, almost to the midrib, indented on their edges. The flowers are produced in loose clusters hanging downward, are bell-shaped, and of a dirty white colour. It may be propagated by parting the roots; which ought to be done in autumn, that the plants may be well rooted before spring, otherwise they will require a great deal of water.

HYDROPS, in medicine, the same with **DRÖPSY**.

HYDROSCOPE, an instrument anciently used for the measuring of time.

The hydrocope was a kind of water-clock, consisting

Hydrometer

Hydroscope

ing of a cylindrical tube, conical at bottom: the cylinder was graduated, or marked out with divisions, to which the top of the water becoming successively

contiguous, as it trickled out at the vertex of the cone, pointed out the hour. See HYDROSTATICS, n° 41, 42.

Its nature and properties.

H Y D R O S T A T I C S;

A SCIENCE which treats of the weight, motion, and equilibria of liquid bodies. Under this head, not only accounts of the nature and properties of fluids in general are introduced, and the laws by which they act; but also the art of weighing solid bodies in fluids, in order to discover their specific gravities.

SECT. I. *Of FLUIDS in general.*

Fluid defined, &c.

SIR Isaac Newton's definition of a fluid is, That it is a body yielding to any force impressed, and which hath its parts very easily moved one among another. See FLUIDITY.

This definition supposes the motion spoken of produced by a partial pressure; for in the case of an incompressible fluid, it is demonstrated by Dr Keil, that under a total or an equal pressure, it would be impossible that the yielding body should move.

The original and constituent parts of fluids are by the moderns conceived to be particles small, smooth, hard, and spherical: according to which opinion, every particle is of itself a solid, or a fixed body; and, when considered singly, is no fluid, but becomes so only by being joined with other particles of the same kind. From this definition, it hath been concluded by some philosophers, that some substances, such as mercury, are essentially fluid, on account of the particular configuration of their particles; but later discoveries have evinced the fallacy of this opinion, and that fluidity is truly to be reckoned an effect of heat. See FLUIDITY.

That fluids have vacuities, will appear upon mixing salt with water, a certain quantity whereof will be dissolved, and thereby imbibed, without enlarging the dimensions. A fluid's becoming more buoyant, is a certain proof that its specific gravity is increased, and of consequence that many of its vacuities are thereby filled: after which it may still receive a certain quantity of other dissoluble bodies, the particles whereof are adapted to the vacancies remaining, without adding any thing to its bulk, though the absolute weight of the whole fluid be thereby increased.

This might be demonstrated, by weighing a phial of rain-water critically, with a nice balance: pour this water into a cup, and add salt to it; refund of the clear liquor what will again fill the phial; an increase of weight will be found under the same dimensions, from a repletion, as has been said, of the vacuities of the fresh water with saline particles.

And as fluids have vacuities, or are not perfectly dense; it is also probable, that they are compounded of small spheres of different diameters, whose interstices may be successively filled with apt materials for that purpose: and the smaller these interstices are, the greater will the gravity of the fluid always be.

For instance, suppose a barrel be filled with bullets in the most compact manner, a great many small-shot may afterwards be placed in the interstices of those

balls; the vacuities of the shot may then be replenished with a certain quantity of sea-sand; the interstices of the grains of the sand may again be filled with water; and thus may the weight of the barrel be greatly augmented, without increasing the general bulk.—Now this being true with regard to solids, is applicable also to fluids. For instance, river-water will dissolve a certain quantity of salt; after which it will receive a certain quantity of sugar; and after that, a certain quantity of alum, and perhaps other dissoluble bodies, and not increase its first dimensions.

The more perfect a fluid is, the more easily will it yield to all impressions, and the more easily will the parts unite and coalesce when separated. A perfect fluid is that whose parts are put into motion by the *least* force imaginable: an imperfect one is that whose parts yield to a *small* force, not the *least*. It is probable, that in nature there is no perfect fluid, the element of fire perhaps excepted; since we see that the mutual attraction of the parts of all the fluids, subject to our experiments, renders them cohesive in some degree; and the more they cling together, the less perfect their fluidity is. If, for instance, a glass be filled with water above the brim, it will visibly rise to a convex surface, which, was it a perfect fluid, free from either tenacity or cohesion, would be impossible.

Mercury, the most perfect fluid we know, is not exempt from this attraction; for, should the bottom of a flat glass, having a gentle rising toward the middle, be covered thin with quicksilver, a little motion of the machine will cause the fluid soon to separate from the middle, and lie round it like a ring, having edges of a considerable thickness.

But if a like quantity thereof be poured into a golden cup, it will, on the contrary, appear higher considerably on the sides than in the middle. Which may proceed in part, perhaps, from the gold's being of great density, and therefore capable of exerting thereon a greater degree of attraction than other metals. Probably too it may happen from its having pores of an apter disposition and magnitude to receive the minute mercurial particles, than those of iron and some other metals; and therefore the attraction of cohesion in this experiment may obtain also: and every one knows how easily these two bodies incorporate, and make a perfect *amalgama*. But the reason commonly given for the two phenomena is, that mercury, in the first case, attracts itself more than it does glass; and, in the last case, mercury attracts gold more than it does itself.

SIR Isaac Newton held all matter to be originally homogeneous; and that from the different modifications and texture of it alone, all bodies receive their various structure, composition, and form. In his definition of a fluid, he seems to imply, that he thought fluids to be composed of primary solids; and, in the beginning of his *Principia*, he speaks of sand and powders as of imperfect fluids.

Pressure of fluids.

3
Florentine experiment.

Borrelli has demonstrated, that the constituent parts of fluids are not fluid, but consistent bodies; and that the elements of all bodies are perfectly firm and hard. The incompressibility of water, proved by the Florentine experiment, is a sufficient evidence also, that each primary particle or spherule thereof is a perfect and impenetrable solid. Mr Locke too, in his *Essay on Human Understanding*, admits this to be so.

This famous experiment was first attempted by the great lord Verulam, who inclosed a quantity of water in lead, and found that it inclined rather to make its way through the pores of the metal, than be reduced into less compacts by any force that could be applied. The academics of Florence made this experiment afterwards more accurately with a globe of silver, as being a metal less yielding and ductile than gold. This being filled with water, and well closed, they found, by hammering gently thereon, that the sphericity of the globe was altered to a less capacious figure (as might geometrically be proved); but a part of the water always like dew came through its sides before this could be obtained. This has been attempted by Sir Isaac Newton, and so many competent judges, on gold and several other metals since, with equal success, that we do not hold any fluid in its natural state, except the air, to be either compressible or elastic.—In some experiments by Mr Canton, it hath been observed, that water is more or less compressed according to the different constitution of the atmosphere; whence it hath been concluded that the Florentine experiment was erroneous: but it will not follow, that water can be compressed by any artificial force, because nature hath a method of compressing it; any more than that solid metal can be compressed artificially, though we know that very slight degrees of heat and cold will expand or contract its dimensions. See WATER.

SECT. II. Of the Gravity and Pressure of Fluids.

4
Fluids press as much upward as downward.

ALL bodies, both fluid and solid, press downwards by the force of gravity: but fluids have this wonderful property, that their pressure upwards and sideways is equal to their pressure downwards; and this is always in proportion to their perpendicular height, without any regard to their quantity: for, as each particle is quite free to move, it will move towards that part or side on which the pressure is least. And hence, no particle or quantity of a fluid can be at rest, till it is every way equally pressed.

Plate CLII.
fig. 2.

To shew by experiment that fluids press upward as well as downward, let AB be a long upright tube filled with water near to its top; and CD a small tube open at both ends, and immersed into the water in the large one: if the immersion be quick, you will see the water rise in the small tube to the same height that it stands in the great one, or until the surfaces of the water in both are on the same level: which shews that the water is pressed upward into the small tube by the weight of what is in the great one; otherwise it could never rise therein, contrary to its natural gravity; unless the diameter of the bore were so small, that the attraction of the tube would raise the water; which will never happen, if the tube be as wide as that in a common barometer. And, as the water rises no higher in the small tube than till its

surface be on a level with the surface of the water in the great one, this shews that the pressure is not in proportion to the quantity of water in the great tube, but in proportion to its perpendicular height therein: for there is much more water in the great tube all around the small one, than what is raised to the same height in the small one as it stands in the great.

Take out the small tube, and let the water run out of it; then it will be filled with air. Stop its upper end with the cork C, and it will be full of air all below the cork: this done, plunge it again to the bottom of the water in the great tube, and you will see the water rise up in it to the height E. Which shews that the air is a body, otherwise it could not hinder the water from rising up to the same height as it did before, namely, to A; and in so doing, it drove the air out at the top; but now the air is confined by the cork C: And it also shews that the air is a compressible body; for if it were not so, a drop of water could not enter into the tube.

The pressure of fluids being equal in all directions, it follows, that the sides of a vessel are as much pressed by a fluid in it, all around in any given ring of points, as the fluid below that ring is pressed by the weight of all that stands above it. Hence the pressure upon every point in the sides, immediately above the bottom, is equal to the pressure upon every point of the bottom.—To shew this by experiment, let a hole be made at *e* Fig. 3. in the side of the tube AB close by the bottom; and another hole of the same size in the bottom at C; then pour your water into the tube, keeping it full as long as you choose the holes should run, and have two basons ready to receive the water that runs through the two holes, until you think there is an enough in each bason; and you will find by measuring the quantities, that they are equal. Which shews that the water run with equal speed through both holes; which it could not have done, if it had not been equally pressed through them both. For, if a hole of the same size be made in the side of the tube, as about *f*, and if all three are permitted to run together, you will find that the quantity run through the hole at *f* is much less than what has run in the same time thro' either of the holes C or *e*.

In the same figure, let the tube be re-curved from the bottom at C into the shape DE, and the hole at C be stopp'd with a cork. Then, pour water into the tube to any height, as Ag, and it will spout up in a jet EFG, nearly as high as it is kept in the tube AB, by continuing to pour in as much there as runs thro' the hole E; which will be the case whilst the surface Ag keeps at the same height. And if a little ball of cork G be laid upon the top of the jet, it will be supported thereby, and dance upon it. The reason why the jet rises not quite so high as the surface of the water Ag, is owing to the resistance it meets with in the open air: for, if a tube either great or small, was screwed upon the pipe at E, the water would rise in it until the surfaces of the water in both tubes were on the same level; as will be shewn by the next experiment.

Any quantity of a fluid, how small soever, may be made to balance and support any quantity, how great soever. This is deservedly termed the *hydrostatical paradox*; which we shall first shew by an experiment,

5
The hydrostatic paradox.

Pressure
of fluids.

Pressure
of fluids.

Plate
CLII.
fig. 4.

and then account for it upon the principle above mentioned, namely, that the *pressure of fluids is directly as their perpendicular height, without any regard to their quantity.*

Let a small glass tube DCG, open at both ends, and bended at B, be joined to the end of a great one AI at *cd*, where the great one is also open; so that these tubes in their openings may freely communicate with each other. Then pour water through a small necked funnel into the small tube at H; this water will run through the joining of the tubes at *cd*, and rise up into the great tube; and if you continue pouring until the surface of the water comes to any part, as A, in the great tube, and then leave off, you will see that the surface of the water in the small tube will be just as high at D; so that the perpendicular altitude of the water will be the same in both tubes, however small the one be in proportion to the other. This shews, that the small column DCG balances and supports the great column Aed; which it could not do if their pressures were not equal against one another in the recurved bottom at B.—If the small tube be made longer, and inclined in the situation GEF, the surface of the water in it will stand at F, on the same level with the surface A in the great tube: that is, the water will have the same perpendicular height in both tubes, although the column in the small tube is longer than that in the great one; the former being oblique, and the latter perpendicular.

Since then the pressure of fluids is directly as their perpendicular heights, without any regard to their quantities, it appears, that whatever the figure or size of vessels be, if they are of equal heights, and if the areas of their bottoms are equal, the pressures of equal heights of water are equal upon the bottoms of these vessels; even though the one should hold a thousand or ten thousand times as much water as would fill the other. To confirm this part of the hydrostatical paradox by an experiment, let two vessels be prepared of equal heights, but very unequal contents, such as AB fig. 5. and AB in fig. 6. Let each vessel be open at both ends, and their bottoms D *d*, D *d* be of equal widths. Let a brass bottom CC be exactly fitted to each vessel, not to go into it, but for it to stand upon; and let a piece of wet leather be put between each vessel and its brass bottom, for the sake of closeness. Join each bottom to its vessel by a hinge D, so that it may open like the lid of a box; and let each bottom be kept up to its vessel by equal weights E and E hung to lines which go over the pulleys F and F (whose blocks are fixed to the sides of the vessels at *f*) and the lines tied to hooks at *d* and *d*, fixed in brass bottoms opposite to the hinges D and D. Things being thus prepared and fitted, hold the vessel AB (fig. 6.) upright in your hands over a basin on a table, and cause water to be poured into the vessel slowly, till the pressure of the water bears down its bottom at the side *d*, and raises the weight E; and then part of the water will run out at *d*. Mark the height at which the surface H of the water stood in the vessel, when the bottom began to give way at *d*; and then, holding up the other vessel AB (fig. 5.) in the same manner, cause water to be poured into it at H; and you will see, that when the water rises to A in this vessel, just as high as it did in the former, its

bottom will also give way at *d*, and it will lose part of the water.

The natural reason of this surprising phenomenon is, that since all parts of a fluid at equal depths below the surface are equally pressed in all manner of directions, the water immediately below the fixed part B *f* (fig. 5.) will be pressed as much upward against its lower surface within the vessel, by the action of the column A *g*, as it would be by a column of the same height, and of any diameter whatever; (as was evident by the experiment with the tube, fig. 4.) and therefore, since action and reaction are equal and contrary to each other, the water immediately below the surface B *f* will be pressed as much downward by it, as if it was immediately touched and pressed by a column of the height *g* A, and of the diameter B *f*: and therefore, the water in the cavity BD *df* will be pressed as much downward upon its bottom CC, as the bottom of the other vessel (fig. 6.) is pressed by all the water above it.

To illustrate this a little farther, let a hole be made at *f* in the fixed top B *f*, and let a tube G be put into it; then, if water be poured into the tube A, it will (after filling the cavity B *d*) rise up into the tube G, until it comes to a level with that in the tube A; which is manifestly owing to the pressure of the water in the tube A, upon that in the cavity of the vessel below it. Consequently, that part of the top B *f*, in which the hole is now made, would, if corked up, be pressed upward with a force equal to the whole weight of all the water which is supported in the tube G: and the same thing would hold at *g*, if a hole were made there. And so, if the whole cover or top B *f* were full of holes, and had tubes as high as the middle one A *g* put into them, the water in each tube would rise to the same height as it is kept in the tube A, by pouring more into it, to make up the deficiency that it sustains by supplying the others, until they are all full; and then the water in the tube A would support equal heights of water in all the rest of the tubes. Or, if all the tubes except A, or any other one, were taken away, and a large tube equal in diameter to the whole top B *f* were placed upon it and cemented to it, and then if water were poured into the tube that was left in either of the holes, it would ascend through all the rest of the holes, until it filled the large tube to the same height that it stands in the small one, after a sufficient quantity had been poured into it: which shews, that the top B *f* was pressed upward by the water under it, and before any hole was made in it, with a force equal that wherewith it is now pressed downward by the weight of all the water above it in the great tube. And therefore, the reaction of the fixed top B *f* must be as great, in pressing the water downward upon the bottom CC, as the whole pressure of the water in the great tube would have been, if the top had been taken away, and the water in that tube left to press directly upon the water in the cavity BD *df*.

Perhaps the best machine in the world for demonstrating the upward pressure of fluids, is the hydrostatic bellows, which consists of two thick oval boards AB, EF, each about 16 inches broad, and 18 inches long: the sides are of leather, joined very close to the top and bottom by strong nails. CD is a pipe screwed into a piece of brass on the top-board

Fig. 5.

Fig. 5. 6.

6
The hydro-
static bel-
lows, fig. 7.

Pressure of fluids.

Specific gravity.

board at C. Let some water be poured into the pipe at D, which will run into the bellows, and separate the boards a little. Then lay three weights, each weighing 100 pounds, upon the upper board; and pour more water into the pipe, which will run into the bellows, and raise up the board with all the weights upon it; and if the pipe be kept full, until the weights are raised as high as the leather which covers the bellows will allow them, the water will remain in the pipe, and support all the weights, even though it should weigh no more than a quarter of a pound, and they 300 pounds: nor will all their force be able to cause them to descend and force the water out at the top of the pipe.

The reason of this will be made evident, by considering what has been already said of the result of the pressure of fluids of equal heights without any regard to their quantity. For, if a hole be made in the upper board, and a tube be put into it, the water will rise in the tube to the same height that it does in the pipe; and would rise as high (by supplying the pipe) as in many tubes as the board could contain holes. Now, suppose only one hole to be made in any part of the board, of an equal diameter with the bore of the pipe, and that the pipe holds just a quarter of a pound of water; if a person claps his finger upon the hole, and the pipe be filled with water, he will find his finger to be pressed upward with a force equal to a quarter of a pound. And as the same pressure is equal upon all equal parts of the board, each part, whose area is equal to the area of the hole, will be pressed upward with a force equal to that of a quarter of a pound: the sum of all which pressures against the under side of an oval board 16 inches broad, and 18 inches long, will amount to 300 pounds; and therefore so much weight will be raised up and supported by a quarter of a pound of water in the pipe.

7 How a man may raise himself upward by his breath.

Hence, if a man stands upon the upper board, and blows into the bellows through the pipe, he will raise himself upward upon the board: and the smaller the bore of the pipe is, the easier he will be able to raise himself. And then, by clapping his finger upon the top of the pipe, he can support himself as long as he pleases; provided the bellows be air-tight, so as not to lose what is blown into it.

8 How lead may be made to swim in water. Fig. 8.

Upon this principle of the upward pressure of fluids, a piece of lead may be made to swim in water, by immersing it to a proper depth, and keeping the water from getting above it. Let CD be a glass tube, open at both ends; and EFG a flat piece of lead, exactly fitted to the lower end of the tube, not to go within it, but for it to stand upon; with a wet leather between the lead and the tube, to make close work. Let this leaden bottom be half an inch thick, and held close to the tube by pulling the packthread IHL upward at L with one hand, whilst the tube is held in the other by the upper end C. In this situation, let the tube be immersed in water in the glass vessel AB, to the depth of six inches below the surface of the water at K; and then, the leaden bottom EFG will be plunged to the depth of somewhat more than eleven times its own thickness: holding the tube at that depth, you may let go the thread at L; and the lead will not fall from the tube, but will be kept to it by the upward pressure of the water below it occasioned by the height of the water at K above the level of the

lead. For as lead is 11.33 times as heavy as its bulk of water, and is in this experiment immersed to a depth somewhat more than 11.33 times its thickness, and no water getting into the tube between it and the lead, the column of water EabcG below the lead is pressed upward against it by the water KDEGL all around the tube; which water being a little more than 11.33 times as high as the lead is thick, is sufficient to balance and support the lead at the depth KE. If a little water be poured into the tube upon the lead, it will increase the weight upon the column of water under the lead, and cause the lead to fall from the tube to the bottom of the glass vessel, where it will lie in the situation b d. Or, if the tube be raised a little in the water, the lead will fall by its own weight, which will then be too great for the pressure of the water around the tube upon the column of water below it. But the following method of making an extremely heavy body float upon water is more elegant. Take a long glass tube, open at both ends; stopping the lower end with a finger, pour in some quicksilver at the other end, so as to take up about half an inch in the tube below. Immerse this tube, with the finger still at the bottom, in a deep glass vessel filled with water; and when the lower end of the tube is about seven inches below the surface, take away the finger from it, and then you will see the quicksilver not sink into the vessel, but remain suspended upon the tube, and floating, if we may so express it, upon the water in the glass-vessel.

In the same manner as an heavy body was made to swim on water, by taking away the upward pressure; so may a light body, like wood, be made to remain sunk at the bottom, by depriving it of all pressure from below: for if two equal pieces of wood be planed, surface to surface, so that no water can get between them, and then one of them (cd) be cemented to the inside of the vessel's bottom; then the other being placed upon this, and, while the vessel is filling, being kept down by a stick; when the stick is removed and the vessel full, the upper piece of wood will not rise from the lower one, but continue sunk under water, though it is actually much lighter than water; for as there is no resistance to its under surface to drive it upward, while its upper surface is strongly pressed down, it must necessarily remain at the bottom.

9 How light wood may be made to lie at the bottom of water.

SECT. III. Of the Specific Gravity of Bodies.

WHEN an unspungy or solid body sinks in a vessel of water, it removes a body of water equal to its own bulk, out of the place to which it descends. If, for instance, a copper ball is let drop into a glass of water, we well know, that if it sinks, it will take up as much room as a globe of water equal to itself in size took up before.

Let us suppose, that this watery globe removed by the ball were frozen into a solid substance, and weighed in a scale against the copper ball: now the copper ball being more in weight than the globe, it is evident that it will sink its own scale, and drive up the opposite, as all heavier bodies do when weighed against lighter; if, on the contrary, the copper ball be lighter than the water globe, the ball will rise. Again, then, let us suppose the copper ball going to be immersed in water; and that, in order to descend, it must displace a globe of water equal to itself in bulk. If the copper ball be heavier than the globe, its pressure will overcome the other's resistance, and it will sink to the bot-

10 Specific gravity.

Specific
gravities.Specific
gravities.

tom; but if the watery globe be heavier, its preffure upwards will be greater than that of the ball downward, and the ball will rise or swim. In a word, in proportion as the ball is heavier than the similar bulk of water, it will defend with greater force; in proportion as it is lighter, it will be raised more to the surface.

From all this we may deduce one general rule, which will measure the force with which any solid body tends to swim or sink in water; namely, *Every body immersed in water, loses just as much of its weight as equals the weight of an equal bulk of water.* Thus, for instance, if the body be two ounces, and an equal bulk of water be one ounce, the body when plunged will sink towards the bottom of the water with a weight of one ounce. If, on the contrary, the solid body be but one ounce, and the weight of an equal bulk of water be two ounces; the solid, when plunged, will remove but one ounce, that is, half as much water as is equal to its own bulk: so that, consequently, it cannot defend; for to do that, it must remove a quantity of water equal to its own bulk. Again, if the solid be two ounces, and the equal bulk of water two ounces, the solid, wherever it is plunged, will neither rise nor sink, but remain suspended at any depth.

Thus we see the reason why some bodies swim in water, and others sink. Bodies of large bulk and little weight, like cork or feathers, must necessarily swim, because an equal bulk of water is heavier than they; bodies of little bulk but great weight, like lead or gold, must sink, because they are heavier than an equal bulk of water. The bulk and the weight of any body considered together, is called its *specific gravity*; and the proportion of both in any body is easily found by water. A body of little bulk and great weight, readily sinks in water, and it is said to have *specific gravity*; a body of great bulk and little weight, loses almost all its weight in water, and therefore is said to have but little *specific gravity*. A woolpack has actually greater real gravity, or weighs more in air, than a cannon ball; but for all that, a cannon ball may have more *specific gravity*, and weigh more than the woolpack, in water. *Density* is a general term that means the same thing; *specific gravity* is only a relative term, used when solids are weighed in fluids, or fluids in fluids.

As every solid sinks more readily in water, in proportion as its *specific gravity* is great, or as it contains greater weight under a smaller bulk, it will follow, that the same body may very often have different *specific gravities*, and that it will sink at one time and swim at another. Thus a man, when he happens to fall alive into the water, sinks to the bottom; for the *specific gravity* of his body is then greater than that of water: but if, by being drowned, he lies at the bottom for some days, his body swells by putrefaction, which diffuses its parts; thus its *specific gravity* becomes less than that of water, and he floats upon the surface.

Several more important uses are the result of our being able exactly to determine the *specific gravities* of bodies. We can, by weighing metals in water, discover their adulterations or mixtures with greater exactness than by any other means whatsoever. By this means, the counterfeit coin, which may be offered us as gold, will be very easily distinguished, and

known to be a baser metal. For instance, if we are offered a brass counter for a guinea, and we suspect it; suppose, to clear our suspicions, we weigh it in the usual manner against a real guinea in the opposite scale, and it is of the exact weight, yet still we suspect it; What is to be done? To melt or destroy the figure of the coin would be inconvenient and improper: a much better and more accurate method remains. We have only to weigh a real guinea in water, and we shall thus find that it loses but a nineteenth part of its weight in the balance: We then weigh the brass counter in water, and we actually find it loses an eighth part of its weight by being weighed in this manner. This at once demonstrates, that the coin is made of a base metal, and not gold; for as gold is the heaviest of all metals, it will lose less of its weight by being weighed in water than any other.

This method Archimedes first made use of to detect a fraud with regard to the crown of Hiero king of Syracuse. Hiero had employed a goldsmith to make him a crown, and furnished him with a certain weight of gold for that purpose; the crown was made, the weight was the same as before, but still the king suspected that there was an adulteration in the metal. Archimedes was applied to; who, as the story goes, was for some time unable to detect the imposition. It happened, however, one day as the philosopher was stepping into a bath, that he took notice the water rose in the bath in proportion to the part of his body immersed. From this accident he received a hint; wherewith he was so transported, that he jumped out of the bath, and ran naked about the streets of Syracuse, crying in a wild manner, *I have found it! I have found it!*—In consequence of this speculation, he made two masses of the just weight of the crown; one of gold, the other of silver. These he severally let down carefully into a vessel of water, wherein the rise of the fluid might easily be determined by measure. Being of different *specific gravities*, they were consequently of different magnitudes, and on immersion took up the room of different quantities of water; by comparing whereof with their absolute gravities in the air, he became fully master of the relation, in point of weight, each of these metals had to water, and consequently to each other. He then served the crown in like manner; and by comparing his observations, he at length detected the cheat, and fairly assigned the quantities of gold and silver contained in the crown respectively.

Upon this difference in the weight of bodies in open air and water, the hydrostatic balance has been formed; which differs very little from a common balance, but that it hath an hook at the bottom of one scale, on which the weight we want to try may be hung by an horse-hair, and thus suspended in water, without wetting the scale from whence it hangs. First, the weight of the body we want to try is balanced against the parcel or weight in open air; then the body is suspended by the hook and horse-hair at the bottom of the scale in water, which we well know will make it lighter, and destroy the balance. We then can know how much lighter it will be, by the quantity of the weights we take from the scale to make it equipoise; and of consequence we thus precisely can find out its *specific gravity* compared to water (A). This is the most exact

gravities.

exact and infallible method of knowing the genuineness of metals, and the different mixtures with which they may be adulterated, and it will answer for all such bodies as can be weighed in water. As for those things that cannot be thus weighed, such as quicksilver, small sparks of diamond, and such like, as they cannot be suspended by an horse-hair, they must be put into a glass-bucket, the weight of which is already known: this, with the quicksilver, must be balanced by weights in the opposite scale, as before, then immersed, and the quantity of weights to be taken from the opposite scale will shew the specific gravity of the bucket and the quicksilver together: the specific gravity of the bucket is already known; and of consequence the specific gravity of the quicksilver, or any other similar substance, will be what remains.

As we can thus discover the specific gravity of different solids by plunging them in the same fluid, so we can discover the specific gravity of different fluids, by plunging the same solid body into them; for in proportion as the fluid is light, so much will it diminish the weight of the body weighed in it. Thus we may know that spirit of wine has less specific gravity than water, because a solid that will swim in water will sink in spirit; on the contrary, we may know that spirit of nitre has greater specific gravity than water, because a solid that will sink in water will swim upon the spirit of nitre. Upon this principle is made that simple instrument called an *hydrometer*, which serves to measure the lightness or weight of different fluids. For that liquors weigh very differently from each other is found by experience. Suppose we take a glass-vessel which is divided into two parts, communicating with each other by a small opening of a line and an half diameter. Let the lower part be filled up to the division with red wine, then let the upper part be filled with water. As the red-wine is lighter than water, we shall see it in a short time rising like a small thread up through the water, and diffusing itself upon the surface, till at length we shall find the wine and water have changed their places; the water will be seen in the lower half, and the wine in the upper half, of the vessel. Or take a small bottle AB, the neck of which must be very narrow, the mouth not more than $\frac{1}{2}$ of an inch wide; and have a glass-vessel CD, whose height exceeds that of the bottle about two inches. With a small funnel fill the bottle quite full of red-wine, and place it in the vessel CD, which is to be full of water. The wine will presently come out of the bottle, and rise in form of a small column to the surface of the water; and at the same time the water, entering the bottle, will supply the place of the wine; for water being specifically heavier than wine, must hold the lowest place, while the other naturally rises to the top. A similar effect will be produced if the bottle be filled with water, and the vessel with wine: for the bottle being placed in the vessel in an inverted position, the water will descend to the bottom of the vessel, and the wine will mount into the bottle.

In the same manner we may pour four different liquors, of different weights, into any glass-vessel, and they shall all stand separate and unmixed with each other. Thus, if we take mercury, oil of tartar, spirit of wine, and spirit of turpentine, shake them together in a glass, and then let them settle a few minutes,

each shall stand in its proper place, mercury at the bottom, oil of tartar next, spirit of wine, and then spirit of turpentine above all. Thus we see liquors are of very different densities; and this difference it is that the hydrometer is adapted to compare. In general, all vinous spirits are lighter than water; and the less they contain of water, the lighter they are. The hydrometer, therefore, will inform us how far they are genuine, by shewing us their lightness; for in pure spirit of wine it sinks less than in that which is mixed with a small quantity of water.

The hydrometer should be made of copper: for ivory imbibes spirituous liquors, and thereby alters their gravity; and glass requires an attention that is incompatible with expedition. The most simple hydrometer consists of a copper ball B b, to which is soldered a brass wire AB, one quarter of an inch thick. The upper part of this wire being filed flat, is marked *proof*, at m, fig. 2. because it sinks exactly to that mark in proof-spirits. There are two other marks at A and B, fig. 1. to shew whether the liquor be one-tenth above or below proof, according as the hydrometer sinks to A, or emerges to B, when a brass weight, as C or K, is screwed to its bottom c. There are other weights to screw on, which shew the specific gravity of different fluids, quite down to common water.

The round part of the wire above the ball may be marked so as to represent river-water when it sinks to RW, fig. 2. the weight which answers to that water being then screwed on; and when put into spring-water, mineral-water, sea-water, and water of salt springs, it will gradually rise to the marks SP, MI, SE, SA. On the contrary, when it is put into Bristol water, rain-water, port-wine, and mountain-wine, it will successively sink to the marks br, ra, po, mo. Instruments of this kind are sometimes called *areometers*.

There is another sort of hydrometer that is calculated to ascertain the specific gravity of fluids to the greatest precision possible, and which consists of a large hollow ball B, fig. 3. with a smaller ball b screwed on to its bottom, partly filled with mercury or small shot, in order to render it but little specifically lighter than water. The larger ball has also a short neck at C, into which is screwed the graduated brass-wire AC, which, by a small weight at A, causes the body of the instrument to descend in the fluid, with part of the stem.

When this instrument is swimming in the liquor contained in the jar ILMK, the part of the fluid displaced by it will be equal in bulk to the part of the instrument under water, and equal in weight to the whole instrument. Now, suppose the weight of the whole to be four thousand grains, it is then evident we can by this mean compare the different dimensions of four thousand grains of several sorts of fluids. For if the weight at A be such as will cause the ball to sink in rain-water till its surface come to the middle point of the stem 20; and after that, if it be immersed in common spring-water, and the surface be observed to stand at one-tenth of an inch below the middle point 20; it is apparent, that the same weight of each water differs only in bulk by the magnitude of one-tenth of an inch in the stem.

Now, suppose the stem to be ten inches long, and to weigh a hundred grains, then every tenth of an inch will

13
hydro-
er.

te
IV.

Plate
CLIV.
fig. 1.

will weigh one grain: and as the stem is of brafs, which is about eight times heavier than water, the same bulk of water will be equal to one-eighth of a grain, and consequently to the one-eighth of one four-thousandth part, that is, one thirty-two thousandth part of the whole bulk. This instrument is capable of still greater precision, by making the stem or neck consist of a flat thin slip of brafs, instead of one that is cylindrical: for by this means we increase the surface, which is the most requisite circumstance, and diminish the solidity, which necessarily renders the instrument still more accurate.

To adapt this instrument to all purposes, there should be two stems, to screw on and off, in a small hole at *a*. One stem should be a smooth thin slip of brafs, or rather steel, like a watch-spring set straight, similar to that we have just now mentioned; on one side of which is to be the several marks or divisions to which it will sink in different sorts of waters, as rain, river, spring, sea, and salt-spring waters, &c.; and on the other side you may mark the divisions to which it sinks in various lighter fluids, as hot Bath water, Bristol water, Lincomb water, Cheltenham water, port-wine, mountain, madeira, and other sorts of wines. But here the weight at *A* on the top must be a little less than before when it was used for heavier waters.

But in trying the strength of the spirituous liquors, a common cylindric stem will do best, because of its strength and steadiness: and this ought to be so contrived, that, when immersed in what is called proof-spirit, the surface of the spirit may be upon the middle point *20*; which is easily done by duly adjusting the small weight *A* on the top, and making the stem of such a length, that, when immersed in water, it may just cover the ball and rise to *a*; but, when immersed in pure spirit, it may rise to the top *A*. Then, by dividing the upper and lower parts *a 20* and *A 20*, into ten equal parts each, when the instrument is immersed into any sort of spirituous liquor, it will immediately show how much it is above or below proof.

Proof-spirit consists of half water and half pure spirit, that is, such as, when poured on gun-powder, and set on fire, will burn all away; and permits the powder to take fire and flash, as in open air. But if the spirit be not so highly rectified, there will remain some water, which will make the powder wet, and unfit to take fire. Proof-spirit of any kind weighs seven pounds twelve ounces per gallon.

The common method of shaking the spirits in a phial, and raising a head of bubbles, to judge by their manner of rising or breaking whether the spirit be proof, or near it, is very fallacious. There is no way so certain, and at the same time so easy and expeditious, as this by the hydrometer.

Yet, after all, we are not entirely to depend, and with geometrical certainty rely, upon either the hydrometer or the hydrostatic balance; for there are some natural inconveniences that disturb the exactness with which they discover the specific gravities of different bodies. Thus, if the weather be hotter at one time than another, all fluids will swell, and consequently they will be lighter than when the weather is cold: the air itself is at one time heavier than at another, and will buoy up bodies weighed in it; they will therefore appear lighter, and will of consequence

seem heavier in water. In short, there are many causes that would prevent us from making tables of the specific gravities of bodies, if rigorous exactness were only expected; for the individuals of every kind of substance differ from each other, gold from gold, and water from water. In such tables, therefore, all that is expected is to come as near the exact weight as we can; and from an inspection into several, we may make an average near the truth. Thus, Mulchenbroek's table makes the specific gravity of rain-water to be nearly eighteen times and an half less than that of a guinea; whereas our English tables make it to be but seventeen times and an half, nearly, less than the same. But though there may be some minute variation in all our tables, yet they in general may serve to conduct us with sufficient accuracy.

In constructing tables of specific gravities with accuracy, the gravity of water must be represented by unity or 1.000, where three ciphers are added, to give room for expressing the ratios of other gravities in decimal parts, as in the following table.

possible from a pipe whose-mouth is at the centre of the femicircle; because a perpendicular to its diameter (supposed parallel to the side of the vessel) drawn from that point, is the longest that can possibly be drawn from any part of the diameter to the circumference of the femicircle. Thus, if the vessel AB be full of water, the horizontal pipe D be in the middle of its side, and the femicircle *Nedcb* be described upon D as a centre, with the radius or semidiameter DgN, or Dfb, the perpendicular Dd to the diameter ND is the longest that can be drawn from any part of the diameter to the circumference *Nedcb*. And if the vessel be kept full, the jet G will spout from the pipe D, to the horizontal distance NM, which is double the length of the perpendicular Dd. If two other pipes, as C and E, be fixed into the side of the vessel at equal distances above and below the pipe D, the perpendiculars Cc and Ee, from these pipes to the femicircle, will be equal; and the jets F and H spouting from them will each go to the horizontal distance NK; which is double the length of either of the equal perpendiculars Cc or Dd.

19
How water
may be
conveyed
over hills
and val-
leys.

Fluids by their pressure may be conveyed over hills and valleys in bended pipes, to any height not greater than the level of the springs from whence they flow. This is what the ancients were ignorant of; and therefore they usually built *AQUEDUCTS* (vast rows of arches one above another, between two hills, at a vast expence of money, time, and labour,) in order to convey water over them, cross the valley, in a common channel. This is now done to equal advantage, and at much less expence, by a range of pipes laid down one hill and up the other. An instance whereof may be given by a bent tube or crane; into one of the equal legs whereof if water be poured, it will rise to the same level exactly in the other. The reason is obvious: In the leg A, (fig. 14.) there are, suppose, two ounces of water endeavouring by the power of gravity to descend with the force of 2; these will thrust forward, buoy up, and support an equal quantity of a like fluid in B; and the bottom of the machine C, against which both sides equally bear, will of consequence sustain a double pressure, or that of four ounces; and in the present case will pretty well represent the prop or fixed point of a balance-beam; as the equal fluid-columns AC, and BC, may be admitted to denote equal weights, suspended on the balance-arms, counterpoising each other. So that the rise of fluids to their first level, thus considered, is a case truly statical; and all their other motions proceed only from weight added.

20
The sy-
phon.

A *syphon*, generally used for decanting liquors, is a bended pipe, whose legs are of unequal lengths; and the shortest leg must always be put into the liquor intended to be decanted, that the perpendicular altitude of the column of liquor in the other leg may be longer than the column in the immersed leg, especially above the surface of the water. For, if both columns were equally high in that respect, the atmosphere, which presses as much upward as downward, and therefore acts as much upward against the column in the leg that hangs without the vessel, as it act downward upon the surface of the liquor in the vessel, would hinder the running of the liquor through the syphon, even though it were brought over the bended

part by suction. So that there is nothing left to cause the motion of the liquor, but the superior weight of the column, in the longer leg, on account of its having the greater perpendicular height.

Let D be a cup filled with water to C; and ABC Fig. 1 a syphon, whose shorter leg BCF is immersed in the water from C to F. If the end of the other leg were no lower than the line AC, which is level with the surface of the water, the syphon would not run, even though the air should be drawn out of it at the mouth A. For although the suction would draw some water at first, yet the water would stop at the moment the suction ceased; because the air would act as much upward against the water at A, as it acted downward for it by pressing on the surface at C. But if the leg AB comes down to G, and the air be drawn out at G by suction, the water will immediately follow, and continue to run until the surface of the water in the cup comes down to F; because, till then, the perpendicular height of the column BAG will be greater than that of the column CB; and, consequently, its weight will be greater, until the surface comes down to F; and then the syphon will stop, though the leg CF should reach to the bottom of the cup. For which reason, the leg that hangs without the cup is always made long enough to reach below the level of its bottom; as from d to E: and then, when the syphon is emptied of air by suction at E, the water immediately follows, and by its continuity brings away the whole from the cup; just as pulling one end of a thread will make the whole clue follow.

If the perpendicular height of a syphon, from the surface of the water to its bended top at B, be more than 33 feet, it will draw no water, even though the other leg were much longer, and the syphon quite emptied of air, because the weight of a column of water 33 feet high, is equal to the weight of as thick a column of air, reaching from the surface of the earth to the top of the atmosphere: so that there will then be an equilibrium; and consequently, though there would be weight enough of air upon the surface C to make the water ascend in the leg CB almost to the height B, if the syphon were emptied of air, yet the weight would not be sufficient to force the water over the bend; and therefore, it could never be brought into the leg BAG.

Mercury may be drawn through a syphon in the same manner as water; but then the utmost height of the syphon must always be less than 30 inches, as mercury is near 14 times heavier than water. That fluids are forced through the syphon by the pressure of the atmosphere, is proved experimentally by the air-pump; for, if a syphon immersed in a vessel of water be placed when running in the receiver, and the air extracted, the running will immediately cease. If the syphon is very small, however, this is not always the case; and the running of capillary syphons *in vacuo* is a circumstance very difficult to be explained. See *BAROMETER*, n° 10—13. and *SYPHON*.

There is a sort of syphon that will draw off water without having the air previously extracted from it: this consists of a capillary tube, about 1-10th of an inch bore, and acts by the attraction of cohesion: for the water being attracted by the leg immersed, is slowly

Hydraulics. slowly drawn up to the top of the syphon, and from thence gradually descends by its own gravity. From the same cause it is, that if one end of a piece of the lift of cloth be put into the water of a vessel, and the other end hang over its side, the water will be sucked up by the end of the lift in the vessel, which in this case acts as a bundle of very fine capillary tubes, and drop from the other end. This experiment with a capillary tube will succeed *in vacuo*.

Upon the principle of the syphon depend the experiments of *Tantalus's cup*, n° 38; the *Fountain at command*, n° 39; and the *inverted drinking glass*, n° 52. As to the last of these, it may be here observed, that if the paper was put dry on such a vessel empty, it would sink in the air, and fall away even by its own gravity; and if put on wet, it were to be doubted whether a very small weight added thereto would not separate it from the glass, so inconsiderable would the tenacity of the water be in this case. The paper therefore cannot be supposed to support the incumbent weight of water; and the true cause thereof must be this: The bottom and sides of the inverted glass-vessel being rigid, keep off the pressure of the air from the fluid above, whereas it hath liberty of access and freely acts thereon below: and that it does so, will in part appear to an observer by the concavity of the paper underneath. Could the air's pressure in this case be any-how admitted through the foot of the vessel inverted, without doubt the whole column would descend together. And the like would happen should the paper be removed; but for a different reason, viz. the large column of water in the mug, being composed of many collateral ones, which, being disposed as in a bundle, rest on the paper wherewith the vessel is covered, as on a common base; and these being all equally dense, and equally fluid, are all retained, and continued of the same length, by the general and uniform pressure of the air against the paper below; and so long as this continues, none of them getting the least advantage over the rest, they are all sustained in a body compact together. But when the paper is removed, it being scarce possible to hold the vessel so exactly level, but that some one or other of these smaller fluid columns will become longer, consequently heavier, than those adjacent, and, over-balancing the rest, will descend, and give the lighter fluid, the air, leave to rise into its place, even to the top of the glass; the general pressure whereof being there admitted, will soon cause the rest of them to move, and the whole quantity will then descend, seemingly together.

Again, should a vessel be but part filled with water, the same effect will follow to a certain degree. For instance, suppose we fill a long glass half with water, cover it with paper, and turn it down as before. Six inches suppose of water, endeavouring to descend, will by its weight rarely the air in the glass above it, perhaps a 60th part or more. The denser air without will then overpoise the air rarefied within; and therefore a certain quantity of water, equal to the difference of the two pressures, will in this case be thereby buoyed up and supported. But the air within the glass being dilated as aforesaid, the water suspended must be expected to hang something below the mouth of it; though not enough, perhaps, to over-

Vol. V.

come the tenacity of the water, and make it all descend.

Upon the principle of the syphon also we may easily account for *intermitting or reciprocating springs*. Let AA be part of a hill, within which there is a cavity BB; and from this cavity a vein or channel running in the direction of BCDE. The rain that falls upon the side of the hill will sink and strain through the small pores and crannies G, G, G, G; and fill the cavity K with water. When the water rises to the level HHC, the vein BCDE will be filled to C, and the water will run through CDF as through a syphon; which running will continue until the cavity be emptied, and then it will stop until the cavity be filled again.

We have seen that fluids led in pipes, will always rise to the level of the reservoir whence they are supplied; the rising column being pushed forward, and raised by another equally heavy, at the same time endeavouring to descend. A like effect might be expected from jets of water thus impelled, did not friction against the sides of the machines, and the resistance of the air, both lateral and perpendicular, generally prove an abatement, and prevent its rising so high as the head.

Where jets are executed in the best manner, and the friction spoken of is as much as possible removed, the impediment of the air only, through which they needs must beat in their rise, will cause them, according to experiment, to fall short of the height of the reservoirs, in the following proportions, viz.

80	101 : 4
85	109 : 1
90	117 : 0
95	125 : 1
100	133 : 4

Whence in general it may be observed:

That as often as a five-foot jet (to be taken in these matters as a standard,)

Shall be contained in the height of any jet proposed;

By so many inches multiplied into themselves, or squared,

The surface of the water in the reservoir which supplies it, ought to exceed that jet in height.

Thus, to obtain a jet of 30 feet, which contains five

Hydraulics. feet six times, the reservoir ought to be 36 inches, or a yard higher; and a jet of 60 feet may be had from a head higher by four times that difference, 144 inches, or four yards. So that jets done in the best manner fall short of the heights of their reservoirs, in a kind of subduplicate ratio of the heights to which they rise.

This great disproportion in the rise of jets must in general be owing to the resistance of the air they are made to move through; which has been shewn to be in proportion to the squares of their celerities respectively: nor can the acceleration of the falling water in the pipe, or the retardation of the rising stream by the action of gravity, be concerned at all in it; since these are probably adequate, and counterbalance each other every where in the same level.

The air's resistance being thus considerable, it will always be found necessary to increase the bore of the adjutage or spouting-pipe with the height of the reservoir: for if it be too small, the rising stream will want sufficient weight and power to divide the air; which being denser near the earth, a small stream of water, endeavouring to mount to a great height, will be dashed against it with so great violence, as to fall away in a mist and be wholly lost. And it may be observed, that the weightier any body is, the greater force it will have when in motion: since an ounce-ball fired from a musquet, will go much farther, and do greater execution, than will an equal weight of shot; and these again may be projected farther than so much lead rased into powder and fired off. A charge of water fired from a pistol would scarce wet a paper at the distance of six feet. Accordingly, should a cask of water be any where pierced with holes of two, four, six, eight, and twelve lines over, all in the same level, the larger bore will always be found to throw the water farthest.

It may be of use here to add Mr Marriote's proportions of the bores of the adjutages and pipes of conduct, who was very conversant in these things, and hath written very well on this subject.

N. B. The French divide their inch into 12 equal parts, which they call lines.

Heights of Reservoirs.	Diameters of fit Adjutages.	Diameter of the Pipes of Conduct.
FEET.	LINES.	LINES.
5	3, 4, 5, or 6	22
10	4, 5, or 6	25 INCHES.
15	5, or 6	27, or $2\frac{1}{2}$
20	6, or half an inch	30, or $2\frac{1}{2}$
25	Ditto	33, or $2\frac{1}{2}$
30	Ditto	36, or 3
40	7, or 8	51, or $4\frac{1}{4}$
50	8, or 10	65, or $5\frac{1}{2}$
60	10, or 12	72, or 6
80	12, or 14	84, or 7
100	12, 14, or 15	96, or 8

Hence it may be remarked, that there is a certain fit proportion to be observed between the adjutage whereby the jet is delivered, and the pipe conducting it from the head. In general, About five times the diameter of the adjutage for jets under half an inch, and six or seven times for all above, will size the pipes of conduct pretty well: not but it will always be an error on the right side, to have them rather larger than in strict-

ness they ought to be, that the jet may always be freely supplied with water, and in due time.

For a like reason, if there be occasion for a cock to be placed in any part of the pipe of conduct, particular care must be taken that it should be there bigger in proportion, that the water-way may not be pinched; but that the cavity be left at least equal to the bore of the rest of the pipe.

The bore of an adjutage cannot be too smooth or true. Those that are cylindrical are best; those that are bored conical work, because of the reflections of the water from the inclined sides of the machine, which in the hurry of the issuing stream will in them unavoidably be made.

When fluids are designed to be raised higher than the springs from whence they flow, forcing engines must be used; of which, and other hydraulic machines, we come now to give a particular account.

SECT. V. Hydraulic Engines.

The pump is at once the most common and most useful of all the hydraulic instruments. It was first invented by Ctesibius, a mathematician of Alexandria, 120 B. C. When the air's pressure came afterwards to be known, it was much improved, and it is now brought to a great degree of perfection.

Of this machine there are simply three kinds, viz. the sucking, the forcing, and the lifting-pump. By the two last, water may be raised to any height, with an adequate apparatus and sufficient power: by the former it may, by the general pressure of the atmosphere on the surface of the well-water, be raised no more than 33 feet, as was before hinted, though in practice it is seldom applied to the raising it much above 28; because from the variations observed on the barometer, it is apprehended that the air may, on certain occasions, be something lighter than 33 feet of water; and whenever that shall happen, for want of the due counterpoise, this pump may fail in its performance.

The common sucking-pump, with which we draw water out of wells, is an engine both pneumatic and hydraulic. It consists of a pipe open at both ends, in which is a moveable piston, bucket, or sucker, as big as the bore of the pipe in that part wherein it works; and is leathern round, so as to fit the bore exactly; and may be moved up and down, without suffering any air to come between it and the pipe or pump-barrel.

We shall explain the construction of this and the forcing-pump by pictures of glass models, in which both the action of the pistons and motion of the valves are seen.

Hold the model DCBL upright in the vessel of wa-
ter K, the water being deep enough to rise at least as high as from A to I. The valve *a* on the moveable bucket G, and the valve *b* on the fixed box H, (which box quite fills the bore of the pipe or barrel at H) will each lie close, by its own weight, upon the hole in the bucket and box, until the engine begins to work. The valves are made of brass, and covered underneath with leather for closing the holes the more exactly: and the bucket G is raised and depressed alternately by the handle E and rod D, the bucket being supported at B before the working begins.

Take hold of the handle E, and thereby draw up the

23

24
The common pump

Plate
CLIII.
fig. 3.

the bucket from B to C, which will make room for the air in the pump all the way below the bucket to dilate itself, by which its spring is weakened, and then its force is not equivalent to the weight or pressure of the outward air upon the water in the vessel K: and therefore, at the first stroke, the outward air will press up the water through the notched foot A, into the lower pipe, about as far as *e*: this will condense the rarefied air in the pipe between *e* and C to the same state it was in before; and then, as its spring within the pipe is equal to the force or pressure of the outward air, the water will rise no higher by the first stroke; and the valve *b*, which was raised a little by the dilation of the air in the pipe, will fall, and stop the hole in the box H; and the surface of the water will stand at *e*. Then depress the piston or bucket from C to B; and as the air in the part B cannot get back again through the valve *b*, it will (as the bucket descends) raise the valve *a*, and so make its way through the upper part of the barrel *d* into the open air. But upon raising the bucket G a second time, the air between it and the water in the lower pipe at *a* will be again left at liberty to fill a larger space; and so its spring being again weakened, the pressure of the outward air on the water in the vessel K will force more water up into the lower pipe from *e* to *f*; and when the bucket is at its greatest height C, the lower valve *b* will fall, and stop the hole in the box H as before. At the next stroke of the bucket or piston, the water will rise through the box H towards B; and then the valve *b*, which was raised by it, will fall when the bucket G is at its greatest height. Upon depressing the bucket again, the water cannot be pushed back through the valve *b*, which keeps close upon the hole whilst the piston descends. And upon raising the piston again, the outward pressure of the air will force the water up through H, where it will raise the valve, and follow the bucket to C. Upon the next depression of the bucket G, it will go down into the water in the barrel B; and as the water cannot be driven back through the now close valve *b*, it will raise the valve *a* as the bucket descends, and will be lifted up by the bucket when it is next raised. And now, the whole space below the bucket being full, the water above it cannot sink when it is next depressed; but upon its depression, the valve *a* will rise to let the bucket go down; and when it is quite down, the valve *a* will fall by its weight, and stop the hole in the bucket. When the bucket is next raised, all the water above it will be lifted up, and begin to run off by the pipe F. And thus, by raising and depressing the bucket alternately, there is still more water raised by it; which getting above the pipe F, into the wide top I, will supply the pipe, and make it run with a continued stream.

So, at every time the bucket is raised, the valve *b* rises, and the valve *a* falls; and at every time the bucket is depressed, the valve *b* falls, and *a* rises.

As it is the pressure of the air or atmosphere which causes the water to rise and follow the piston or bucket G as it is drawn up; and since a column of water 33 feet high is of equal weight with as thick a column of the atmosphere from the earth to the very top of the air; therefore, the perpendicular height of the piston or bucket from the surface of the water in the well

must always be less than 33 feet; otherwise the water will never get above the bucket. But, when the height is less, the pressure of the atmosphere will be greater than the weight of the water in the pump, and will therefore raise it above the bucket: and when the water has once got above the bucket, it may be lifted thereby to any height, if the rod D be made long enough, and a sufficient degree of strength be employed to raise it with the weight of the water above the bucket.

The force required to work a pump, will be as the height to which the water is raised, and as the square of the diameter of the pump-bore in that part where the piston works. So that, if two pumps be of equal heights, and one of them be twice as wide in the bore as the other, the widest will raise four times as much water as the narrowest; and will therefore require four times as much strength to work it.

The wideness or narrowness of the pump, in any other part besides that in which the piston works, does not make the pump either more or less difficult to work, except what difference may arise from the friction of the water in the bore; which is always greater in a narrow bore than in a wide one, because of the greater velocity of the water.

The pump-rod is never raised directly by such a handle as E at the top, but by means of a lever, whose longer arm (at the end of which the power is applied) generally exceeds the length of the shorter arm five or six times; and, by that means, it gives five or six times as much advantage to the power. Upon these principles, it will be easy to find the dimensions of a pump that shall work with a given force, and draw water from any given depth. But, as these calculations have been generally neglected by pump-makers (either for want of skill or industry) the following table was calculated by the late ingenious Mr Booth for their benefit. In this calculation, he supposed the handle of the pump to be a lever increasing the power five times; and had often found that a man can work a pump four inches diameter and 30 feet high, and discharge 27½ gallons of water (English wine-measure) in a minute. Now, if it be required to find the diameter of a pump that shall raise water with the same ease from any other height above the surface of the well; look for that height in the first column, and over-against it in the second you have the diameter or width of the pump, and in the third you find the quantity of water which a man of ordinary strength can discharge in a minute.

25
The forcing
pump,
Plate
CLIII.
fig. 4.

The *forcing-pump* raises water through the box H in the same manner as the sucking-pump does, when the plunger or piston *g* is lifted up by the rod *D d*. But this plunger has no hole thro' it, to let the water in the barrel BC get above it, when it is depressed to B, and the valve *b* (which rose by the ascent of the water through the box H when the plunger *g* was drawn up) falls down and stops the hole in H, the moment that the plunger is raised to its greatest height. Therefore, as the water between the plunger *g* and box H can neither get through the plunger upon its descent, nor back again into the lower part of the pump *L e*, but has a free passage by the cavity around H into the pipe MM, which opens into the air-vessel KK at P; the water is forced through the pipe MM by the descent of the plunger, and driven into the air-vessel; and in running up through the pipe at P, it opens the valve *a*; which shuts at the moment the plunger begins to be raised, because the action of the water against the under side of the valve then ceases.

The water, being thus forced into the air-vessel KK by repeated strokes of the plunger, gets above the lower end of the pipe GHI, and then begins to condense the air in the vessel KK. For, as the pipe GH is fixed air-tight into the vessel below F, and the air has no way to get out of the vessel but through the mouth of the pipe at I, and cannot get out when the mouth I is covered with water, and is more and more condensed as the water rises upon the pipe, the air then begins to act forcibly by its spring against the surface of the water at H: and this action drives the water up through the pipe IHGF, from whence it spouts in a jet S to a great height; and is supplied by alternately raising and depressing of the plunger *g*,

which constantly forces the water that it raises thro' the valve H, along the pipe MM, into the air-vessel KK.

The higher that the surface of the water H is raised in the air-vessel, the less space will the air be condensed into which before filled that vessel; and therefore the force of its spring will be so much the stronger upon the water, and will drive it with the greater force through the pipe at F: and as the spring of the air continues whilst the plunger *g* is rising, the stream or jet S will be uniform, as long as the action of the plunger continues; and when the valve *b* opens, to let the water follow the plunger upward, the valve *a* shuts, to hinder the water, which is forced into the air-vessel, from running back by the pipe MM into the barrel of the pump.

If there was no air-vessel to this engine, the pipe GHI would be joined to the pipe MMN at P; and then, the jet S would stop every time the plunger is raised, and run only when the plunger is depressed.

Of *lifting-pumps* there are several sorts; the most common is thus constructed. AB is the barrel, fixed in the frame KILM; which is also fixed immovable, with the lower part in the water that is to be pumped up. GEOHO is a frame with two strong iron rods, moveable through holes in the upper and lower parts of the pump, IK and LM. In the bottom of this frame is fixed an inverted piston BD, with its bucket and valve uppermost at D. From the top of the barrel there goes off a part KH, either fixed to the barrel, or moveable by a ball and socket (as here represented at F); but in either case so very exact and tight, that no water or air can possibly get into the barrel, as that would prevent the effect of the pump. In this part, at C, is fixed a valve opening upward.

When the piston frame is thrust down into the water, the piston D will descend, and the water beneath it rush up through the valve at D, and get above the piston; where, upon the frame's being lifted up, the piston will force the water through the valve C, into the cistern P, there to run off by the spout. It is to be remembered, that this sort of pump must be set so far in the water, that the piston may play below its surface. It appears by the above description, that this is only a different manner of constructing a forcing-pump.

By means of forcing-pumps, water may be raised to any height above the level of a river or spring; and machines may be contrived to work these pumps, either by a running stream, a fall of water, or by horses. An instance in each fort will be sufficient to shew the method.

1. By a running stream, or a fall of water. Let AA be a wheel, turned by the fall of water BB; and have any number of cranks (suppose six) as C, D, E, F, G, H, on its axis, according to the strength of the fall of water, and the height to which the water is intended to be raised by the engine. As the wheel turns round, these cranks move the levers *c, d, e, f, g, h*, up and down, by the iron rods *i, k, l, m, n, o*; which alternately raise and depress the pistons by the other iron pipes *p, q, r, s, t, u, v, w, x, y*, in 12 pumps; nine whereof, as L, M, N, O, P, Q, R, S, T, appear in the plate; the other three being hid behind the work at V. And as pipes may go from all these pumps, to convey

Engines.

Hydraulic
Engines.

vey the water (drawn up by them to a small height) into a close cistern, from which the main pipe proceeds, the water will be forced into this cistern by the descent of the pistons. And as each pipe, going from its respective pump into the cistern, has a valve at its end in the cistern, these valves will hinder the return of the water by the pipes; and therefore, when the cistern is once full, each piston upon its descent will force the water (conveyed into the cistern by a former stroke) up the main pipe, to the height the engine was intended to raise it: which height depends upon the quantity raised, and the power that turns the wheel. When the power upon the wheel is lessened by any defect of the quantity of water turning it, a proportionable number of the pumps may be laid aside, by disengaging their rods from the vibrating levers.

This figure is a representation of the engine erected at Blenheim for the duke of Marlborough, by the late ingenious Mr Aldersea. The water-wheel is $7\frac{1}{2}$ feet in diameter, according to Mr Switzer's account in his Hydraulics.

When such a machine is placed in a stream that runs upon a small declivity, the motion of the levers and action of the pumps will be but slow; since the wheel must go once round for each stroke of the pumps. But, when there is a large body of flow running water, a cog or spur wheel may be placed upon each side of the water-wheel AA, upon its axis, to turn a trundle upon each side; the cranks being upon the axis of the trundle. And by proportioning the cog-wheels to the trundles, the motion of the pumps may be made quicker, according to the quantity and strength of the water upon the first wheel; which may be as great as the workman pleases, according to the length and breadth of the float-boards or wings of the wheel. In this manner, the engine for raising water at London-Bridge is constructed in which the water-wheel is 20 feet diameter, and the floats 14 feet long.

ABCD is a wheel turned by water according to the order of the letters. On the horizontal axis are four small wheels, toothed almost half round; and the parts of their edges on which there are no teeth are cut down so as to be even with the bottoms of the teeth where they stand.

The teeth of these four wheels take alternately into the teeth of four racks, which hang by two chains over the pulleys Q and L; and to the lower ends of these racks there are four iron rods fixed, which go down into the four forcing-pumps, S, R, M, and N. And, as the wheels turn, the racks and pump-rods are alternately moved up and down.

Thus suppose the wheel G has pulled down the rack I, and drawn up the rack K by the chain: as the last tooth of G just leaves the uppermost tooth of I, the first tooth of H is ready to take into the lowermost tooth of the rack K, and pull it down as far as the teeth go; and then the rack I is pulled upward thro' the whole space of its teeth, and the wheel G is ready to take hold of it, and pull it down again, and so draw up the other.—In the same manner, the wheels E and F work the racks O and P.

These four wheels are fixed on the axle of the great wheel in such a manner, with respect to the positions of their teeth, that, whilst they continue turning round,

there is never one instant of time in which one or other of the pump-rods is not going down and forcing the water. So that, in this engine, there is no occasion for having a general air-vessel to all the pumps, to procure a constant stream of water flowing from the upper end of the main pipe.

From each of these pumps, near the lowest end, in the water, there goes off a pipe, with a valve on its farthest end from the pump; and these ends of the pipes all enter one close box, into which they deliver the water: and into this box, the lower end of the main conduct-pipe is fixed. So that, as the water is forced or pushed into the box, it is also pushed up the main pipe to the height that it is intended to be raised.

2. Where a stream or fall of water cannot be had, and gentlemen want to have water raised, and brought to their houses from a rivulet or spring; this may be effected by a horse-engine, working three forcing-pumps which stand in a reservoir filled by the spring or rivulet: the pistons being moved up and down in the pumps by means of a triple crank ABC, which, as it is turned round by the trundle G, raises and depresses the rods D, E, F. If the wheel has three times as many cogs as the trundle has staves or rounds, the trundle and cranks will make three revolutions for every one of the wheel: and as each crank will fetch a stroke in the time it goes round, the three cranks will make nine strokes for every turn of the great wheel.

The cranks should be made of cast iron, because that will not bend; and they should each make an angle of 120 with both of the others, as at *a, b, c*; which is (as it were) a view of their *radii* in looking endwise at the axis: and then there will be always one or other of them going downward, which will push the water forward with a continued stream into the main pipe. For, when *b* is almost at its lowest situation, and is therefore just beginning to lose its action upon the piston which it moves, *c* is beginning to move downward, which will by its piston continue the propelling force upon the water: and when *c* is come down to the position of *b*, *a* will be in the position of *c*.

The more perpendicularly the piston-rods move up and down in the pumps, the freer and better will their strokes be: but a little deviation from the perpendicular will not be material. Therefore, when the pumps D, E, and F, go down into a deep well, they may be moved directly by the cranks, as is done in a very good horse-engine of this sort at the late Sir James Creed's at Greenwich, which forces up water about 64 feet from a well under ground, to a reservoir on the top of his house. But when the cranks are only at a small height above the pumps, the pistons must be moved by vibrating levers, as in the above engine at Blenheim: and the longer the levers are, the nearer will the strokes be to a perpendicular.

Let us suppose, that in such an engine as Sir James Creed's, the great wheel is 12 feet diameter, the quantity of the trundle 4 feet, and the radius or length of each crank quantity of 9 inches, working a piston in its pump. Let there be three pumps in all, and the bore of each pump be four inches diameter. Then, if the great wheel has three horse-times as many cogs as the trundle has staves, the trun-

(2d) 18
A pump-
engine to
go by
horses.

Plate
CLIII.
fig. 6.

29

die

dle and cranks will go three times round for each revolution of the horses and wheel, and the three cranks will make nine strokes of the pumps in that time, each stroke being 18 inches (or double the length of the crank) in a four-inch bore. Let the diameter of the horse-walk be 18 feet, and the perpendicular height to which the water is raised above the surface of the well be 64 feet.

If the horses go at the rate of two miles an hour (which is very moderate walking) they will turn the great wheel 187 times round in an hour.

In each turn of the wheel the pistons make nine strokes in the pumps, which amount to 1683 in an hour.

Each stroke raises a column of water 18 inches long and four inches thick, in the pump barrels; which column, upon the descent of the piston, is forced into the main pipe, whose perpendicular altitude above the surface of the well is 64 feet.

Now, since a column of water 18 inches long, and 4 inches thick, contains 226.18 cubic inches, this number multiplied by 1683 (the strokes in an hour) gives 380661 for the number of cubic inches of water raised in an hour.

A gallon, in wine-measure, contains 231 cubic inches, by which divide 380661, and it quotes 1468 in round numbers, for the number of gallons raised in an hour; which, divided by 63, gives 26 $\frac{2}{3}$ hogheads. If the horses go faster, the quantity raised will be so much the greater.

In this calculation it is supposed that no water is wasted by the engine. But as no forcing engine can be supposed to lose less than a fifth part of the calculated quantity of water, between the pistons and barrels, and by the opening and shutting of the valves, the horses ought to walk almost 2 $\frac{1}{2}$ miles *per* hour to fetch up this loss.

A column of water 4 inches thick and 64 feet high, weighs 349 $\frac{1}{2}$ pounds avoirdupois, or 424 $\frac{1}{2}$ pounds troy; and this weight, together with the friction of the engine, is the resistance that must be overcome by the strength of the horses.

The horse-tackle should be so contrived, that the horses may rather push on than drag the levers after them. For, if they draw, in going round the walk, the outside leather-straps will rub against their sides and hams; which will hinder them from drawing at right angles to the levers, and so make them pull at a disadvantage. But if they push the levers before their breasts, instead of dragging them, they can always walk at right angles to these levers.

It is noways material what the diameter of the main or conduct pipe be: for the whole resistance of the water therein against the horses will be according to the height to which it is raised, and the diameter of that part of the pump in which the piston works, as we have already observed. So that by the same pump, an equal quantity of water may be raised in (and consequently made to run from) a pipe of a foot diameter, with the same ease as in a pipe of five or six inches: or rather with more ease, because its velocity in a large pipe will be less than in a small one, and therefore its friction against the sides of the pipe will be less also.

And the force required to raise water depends not

upon the length of the pipe, but upon the perpendicular height to which it is raised therein above the level of the spring. So that the same force, which would raise water to the height AB in the upright pipe AiklmnopgB, will raise it to the same height BHI in the oblique pipe AEEFGH. For the pressure of the water at the end A of the latter, is no more than its pressure against the end A of the former.

The weight or pressure of water at the lower end of the pipe, is always as the sine of the angle to which the pipe is elevated above the level parallel to the horizon. For, although the water in the upright pipe AB would require a force applied immediately to the lower end A equal to the weight of all the water in it, to support the water, and a little more to drive it up and out of the pipe; yet, if that pipe be inclined from its upright position to an angle of 80 degrees (as in A 80) the force required to support or to raise the same cylinder of water will then be as much less, as the sine 80 *b* is less than the radius AB; or as the sine of 80 degrees is less than the sine of 90. And so, decreasing as the sine of the angle of elevation lessens, until it arrives at its level AC or place of rest, where the force of the water is nothing at either end of the pipe. For, altho' the absolute weight of the water is the same in all positions, yet its pressure at the lower end decreases, as the sine of the angle of elevation decreases; as will appear plainly by a farther consideration of the figure.

Let two pipes, AB and AC, of equal lengths and bores, join each other at A; and let the pipe AB be divided into 100 equal parts, as the scale S is; whose length is equal to the length of the pipe.—Upon this length, as a radius, describe the quadrant BDC, and divide it into 90 equal parts or degrees.

Let the pipe AC be elevated to 10 degrees upon the quadrant, and filled with water: then, part of the water that is in it will rise in the pipe AB; and if it be kept full of water, it will raise the water in the pipe AB from A to *i*; that is, to a level *i* 10' with the mouth of the pipe at 10: and the upright line *a* 10, equal to A *c*, will be the sine of 10 degrees elevation; which being measured upon the scale S, will be about 17.4 of such parts as the pipe contains 100 in length: and therefore, the force or pressure of the water at A, in the pipe A 10, will be to the force or pressure at A in the pipe AB, as 17.3 to 100.

Let the same pipe be elevated to 20 degrees in the quadrant; and if it be kept full of water, part of that water will run into the pipe AB, and rise therein to the height A *k*, which is equal to the length of the upright line *b* 20, or to the sine of 20 degrees elevation; which, being measured upon the scale S, will be 34.2 of such parts as the pipe contains 100 in length. And therefore, the pressure of the water at A, in the full pipe A 20, will be to its pressure, if that pipe were raised to the perpendicular situation AB, as 34.2 to 100.

Elevate the pipe to the position A 30 on the quadrant, and if it be supplied with water, the water will rise from it, into the pipe AB, to the height A *l*, or to the same level with the mouth of the pipe at 30. The sine of this elevation, or of the angle of 30 degrees, is *c* 30; which is just equal to half the length

of the pipe, or to 50 of such parts of the scale as the length of the pipe contains 100. Therefore, the pressure of the water at A, in a pipe elevated 30 degrees above the horizontal level, will be equal to one half of what it would be if the same pipe stood upright in the situation AB.

And thus, by elevating the pipe to 40, 50, 60, 70, and 80 degrees on the quadrant, the sines of these elevations will be $d\ 40$, $e\ 50$, $f\ 60$, $g\ 70$, and $h\ 80$; which will be equal to the heights Am , Ar , As , At , and Av : and these heights measured upon the scale S will be 64.3, 76.6, 86.6, 94.0, and 98.5; which express the pressures at A in all these elevations, considering the pressure in the upright pipe AB as 100.

29	485	59	857	89	1000
30	500	60	866	90	1000

Because it may be of use to have the lengths of all the sines of a quadrant from 0 degrees to 90, we have given the foregoing Table, shewing the length of the sine of every degree in such parts as the whole pipe (equal to the radius of the quadrant) contains 1000. Then the sines will be integral or whole parts in length. But if you suppose the length of the pipe to be divided only into 100 equal parts, the last figure of each part or sine must be cut off as a decimal; and then those which remain at the left hand of this separation will be integral or whole parts.

Thus, if the radius of the quadrant (supposed to be equal to the length of the pipe AC) be divided into 1000 equal parts, and the elevation be 45 degrees, the sine of that elevation will be equal to 707 of these parts: but if the radius be divided only into

100 equal parts, the same sine will be only 70.7 or 70 $\frac{7}{10}$ of these parts. For, as 1000 is to 707, so is 100 to 70.7.

As it is of great importance to all engine-makers, to know what quantity and weight of water will be contained in an upright round pipe of a given diameter and height; so as, by knowing what weight is to be raised, they may proportion their engines to the force which they can afford to work them; we shall subjoin Tables shewing the number of cubic inches of water contained in an upright pipe of a round bore, of any diameter from one inch to six and a half, and of any height from one foot to two hundred: together with the weight of the said number of cubic inches, both in troy and avoirdupois ounces. The number of cubic inches divided by 231, will reduce the water to gallons in wine-measure; and, divided by 282, will reduce it to the measure of ale-gallons. Also, the troy ounces divided by 12, will reduce the weight to troy pounds; and the avoirdupois ounces divided by 16, will reduce the weight to avoirdupois pounds.

And here we must repeat it again, that the weight or pressure of the water acting against the power that works the engine, must always be estimated according to the perpendicular height to which it is to be raised, without any regard to the length of the conduct-pipe, when it has an oblique position, and as if the diameter of that pipe were just equal to the diameter of that part of the pump in which the piston works. Thus, by the following Tables, the pressure of the water, against an engine whose pump is of a $4\frac{1}{2}$ inch bore, and the perpendicular height of the water in the conduct pipe is 80 feet, will be equal to 8057.5 troy ounces, and to 884.82 avoirdupois ounces; which makes 671.4 troy pounds, and 553 avoirdupois.

EXAMPLE. Required the number of cubic inches, and the weight of the water, in an upright pipe 278 feet high, and $1\frac{1}{2}$ inch diameter.

Feet.	Cubic inches.	Troy oz.	Avoir. oz.
200	4241.1	2238.2	2457.8
70	1484.4	783.3	860.2
8	169.6	89.5	98.3
Ans. 278	5895.1	3111.0	3416.3

Here the nearest single decimal figure is only taken into the account; and the whole being reduced by division, amounts to 25 $\frac{1}{2}$ wine-gallons in measure; to 259 $\frac{1}{2}$ pounds troy, and to 213 $\frac{1}{2}$ pounds avoirdupois.

These tables were at first calculated to six decimal places for the sake of exactness: but in transcribing them there are no more than two decimal figures taken into the account, and sometimes but one; because there is no necessity for computing to hundredth-parts of an inch or of an ounce in practice.

Steam-
engine.
31
Engine for
raising wa-
ter by a
multiplying
wheel.
Plate CLVI
fig. 6.

Hydraulic
Engines.

Under the article *STEAM-Engine*, the reader will find a particular account of that useful invention, with a correct description and plate of it in its improved state.

THE *multiplying machine* has no dependence on the action of the atmosphere; but, by the weight of water only, and without pump-work of any kind, raises water sufficient to serve a gentleman's seat, with an overplus for fountains, fish-ponds, &c.

AB are two copper pans or buckets of unequal weight and size, suspended to chains, which alternately wind off and on the multiplying-wheel YZ; whereof the wheel Y is smaller in diameter, and Z larger; in proportion to the different lifts each is designed to perform.

When the buckets are empty, they are stopped level with the spring at X, whence they are both filled with water in the same time.

The greater of the two A, being the heavier when full, preponderates and descends ten feet, perhaps from C to D; and the lesser, B, depending on the same axis, is thereby weighed up or raised from E to F, suppose thirty feet.

Here, by particular little contrivances, opening the valves placed at bottom of each of these buckets, they both discharge their water in the same time, through apertures proportionable to their capacities; the smaller into the cistern W, whence it is conveyed for service by the pipe T, and the larger at D, to run waste by the drain below at H. The bucket B being empty, is so adjusted as then to overweigh; and descending steadily as it rose betwixt the guiding rods VV, brings or weighs up A to its former level at X, where both being again replenished from the spring, they thence proceed as before. And thus will they continue constantly moving (merely by their circumstantial difference of water-weight, and without any other assistance than that of sometimes giving the iron-work a little oil) so long as the materials shall last, or the spring supply water.

The steadiness of the motion is in part regulated by a worm turning a jack-fly, and a little simple wheel-work at LM; which communicating with the multiplying wheel axle at M, is thereby moved forward or backward as the buckets either rise or descend. But what principally keeps the whole movement steady, is the equilibrium preserved in the whole operation by a certain weight of lead, at the end of a lever of fit length, and fixed on one of the spindles of the wheel-work, the numbers whereof are so calculated as, during the whole performance up and down, to let it move no more than one-fourth of a circle, from G to K; by which contrivance, as more or less of the chains suspending the buckets come to be wound off their respective wheels Y and Z, this weight gradually falls in as a counter-balance, and so continues the motion equable and easy in all its parts.

The water raised by this machine is not above the hundredth part of what a water-wheel will expend, to raise an equal quantity. But where a fall, proportionable to the intended rise of water, cannot be had, with a convenient sewer to carry off the waste water over and above, this device cannot be well put in practice.

WATER may also be raised by means of a stream AB turning a wheel CDE, according to the order of the

letters, with buckets *a, a, a, a*, &c. hung upon the wheel by strong pins *b, b, b, b*, &c. fixed in the side of the rim: but the wheel must be made as high as the water is intended to be raised above the level of that part of the stream in which the wheel is placed. As the wheel turns, the buckets on the right hand go down into the water, and are thereby filled, and go up full on the left hand, until they come to the top at K, where they strike against the end *n* of the fixed trough M, and are thereby overlet, and empty the water into the trough; from which it may be conveyed in pipes to the place which it is designed for: and as each bucket gets over the trough, it falls into a perpendicular position again, and goes down empty, until it comes to the water at A, where it is filled as before. On each bucket is a spring *r*, which, going over the top or crown of the bar *m*, (fixed to the trough M), raises the bottom of the bucket above the level of its mouth, and so causes it to empty all its water into the trough.

Sometimes this wheel is made to raise water no higher than its axis; and then, instead of buckets hung upon it, its spokes, C, *d, e, f, g, h*, are made of a bent form, and hollow within; these hollows opening into the holes C, D, E, F, in the outside of the wheel, and also into those at O in the box N upon the axis. So that as the holes CD, &c. dip into the water, it runs into them; and as the wheel turns, the water rises in the hollow spokes *c, d*, &c. and runs out in a stream P from the holes at O, and falls into the trough Q, from whence it is conveyed by pipes. And this is a very easy way of raising water, because the engine requires neither men nor horses to turn it.

ENGINES for extinguishing fire are either forcing or Fire-lifting-pumps; and being made to raise water with great velocity, their execution in great measure depends upon the length of their levers, and the force wherewith they are wrought.

For example, AB is the common squirting fire-engine. D C is the frame of a lifting-pump, wrought by the levers E and F acting always together. During the stroke, the quantity of water raised by the piston N spouts with force through the pipe G, made capable of any degree of elevation by means of the yielding leather-pipe H, or by a ball and socket, capable of turning every way, screwed on the top of the pump. Between the strokes on this machine the stream is discontinued. The engine is supplied by water poured in with buckets above; the dirt and filth whereof are kept from choking the pump-work by help of the strainer IK.

A considerable improvement has since been made to these machines in order to keep them discharging a continual stream. In doing whereof it is not to be understood that they really throw out more water than do the squirting ones of the same size and dimensions with themselves; but that the velocity of the water, and of course the friction of all the parts, being less violent, the stream is more even and manageable, and may be directed hither or thither with greater ease and certainty than if it came forth only by fits and starts: The machine, thus improved, is therefore generally better adapted to the purpose intended than the former, especially in the beginning of these calamitous accidents.

Hydraulic
Engines.
Plate CLV.
fig. 16.

The stream is made continual from the spring of air confined in a strong metal vessel CC, in the fire-engine AB, fixed between the two forcing-pumps D and E, wrought with a common double lever FG moving on the centre H. The pistons in D and E both suck and force alternately, and are here represented in their different actions; as are also the respective valves at IK and LM.

The water to supply this engine, if there be no opportunity of putting the end of a sucking-pipe, occasionally to be screwed on, into a moat or canal, which would spare much hurry and labour in case of fire, is also poured into the vessel AB; and being strained through the wire-grate N, is, by the pressure of the atmosphere, raised through the valves K and M into the barrels of D or E, when either of their forcers ascend; whence again it will be powerfully pushed when they descend into the air-vessel CC, thro' the valves I and L by turns: by the force whereof the common air between the water and the top of the air-vessel O will from time to time be forcibly crowded into less room, and much compressed; and the air being a body naturally endowed with a strong and lively spring, and always endeavouring to dilate itself every way alike in such a circumstance, bears strongly both against the sides of the vessel wherein it is confined, and the surface of the water thus injected; and so makes a constant regular stream to rise through the metal pipe P into the leather one Q, screwed thereon; which being flexible, may be led about into rooms and entries, as the case may require.

Should the air contained in this vessel be compressed into half the space it took up in its natural state, the spring thereof will be much about doubled; and as before it equalled and was able to sustain the pressure of a single atmosphere, it having now a double force, by the power of that spring alone will throw water into air, of the common degree of density, about thirty feet high. And should this compressure be still augmented, and the quantity of air which at first filled the whole vessel be reduced into one-third of that space, its spring will be then able to resist, and consequently to raise the weight of a treble atmosphere; in which case, it will throw up a jet of water sixty feet high. And should so much water again be forced into the vessel as to fill three parts of the capacity, it will be able to throw it up about ninety feet high: and wherever the service shall require a still greater rise of water, more water must be thrust into this vessel; and the air therein being thus driven by main force into a still narrower compass, at each explosion, the gradual restitution thereof to its first dimensions is what regularly carries on the stream between the strokes, and renders it continual during the operation of the machine.

This experiment, in little, may be either made on the lifting or forcing pump, the nofels of which may be left large, on purpose for the reception of the small pipe F, reaching nearly to the valve at E, and occasionally to be screwed in. Between this pipe and the sides and top of the nosel H, a quantity of air will necessarily be lodged, which, when the forcer acts, will be compressed at every stroke by the rise of the water; more whereof will be pushed through E than can immediately get away through the pipe F, which

is to be always left in diameter than the opening of the valve at E. The degree of which condensation, and that of the restitution to its natural state of density, may be observed through the glass-machines to satisfaction.

ARCHIMEDES'S SCREW is a sort of spiral pump, and receives its name from its inventor. It consists of a long cylinder AB with a hollow pipe CD round it; and is placed in an oblique position, with the lower end in the water, the other end being joined to the lower end of the winch IK, supported by the upright piece IR.

When this screw is immersed in the water, it immediately rises in the pipe by the orifice C to a level with the surface of the water EF; and if the point in the spiral, which in the beginning of the motion is coincident with the surface of the water, happen not to be on the lower side of the cylinder, the water, upon the motion of the screw, will move on in the spiral till it come to the point on the other side that is coincident with the water. When it arrives at that point, which we will suppose to be O, it cannot afterwards possess any other part of the spiral than that on the lowest part of the cylinder: for it cannot move from O toward H or G, because they are higher above the horizon; and as this will be constantly the case after the water in the spiral has attained the point O, it is plain it must always be on the under side of the cylinder.

But because the cylinder is in constant motion, every part of the spiral screw, from O to D, will by degrees succeed to the under part of the cylinder. The water therefore must succeed to every part of it, from O to D, as it comes on the lower side; that is, it must ascend on the lower part of the cylinder through all the length of the pipe, till it come to the orifice at D, where it must run out, having nothing further to support it.

THERE is a simple and easy method of working two pumps at once, by means of the balance AB, having a large iron ball at each end, and placed in equilibrium on the two spindles C, as represented in the 6th figure. On the right and left are two boards I, nailed to two cross pieces, fastened to the axis of the machine. On these boards the person who is to work the pump stands, and supports himself by a cross piece nailed to the two posts ED, fig. 5. At the distance of ten inches on each side the axis, are fastened the pistons MN.

The man, by leaning alternately on his right and left foot, puts the balance in motion, by which the pumps OP are worked, and the water thrown into the pipe H, and carried to a height proportional to the diameter of the valves, and the force of the balance. There must be placed on each side an iron spring, as F and G, to return the balance, and prevent its acquiring too great velocity.

THE Chain-pump, AB, is ordinarily made from twelve to twenty-four feet long; and consists of two collateral square barrels, and a chain of pistons of the same form, fixed at proper distances thereon. The chain is moved in these round a coarse kind of wheelwork at either end of the machine, the teeth whereof are so made as to receive one half of the flat pistons, and let them fold in; and they take hold of the links as they rise in one of the barrels, and return by the other. The machine is wrought either by the turning

ments.

of one handle or two, according to the labour required, depending on the height to which the water is to be raised. A whole row of the pistons (which go free of the sides of the barrel by perhaps a quarter of an inch) are always lifting when the pump is at work; yet do they, by the general push in the ordinary way of working, as it is pretty brisk, commonly bring up a full bore of water in the pump. This machine is so contrived, that, by the continual folding in of the pistons, stones, dirt, and whatever happens to come in the way, may also be cleared; and therefore it is generally made use of to drain ponds, to empty sewers, and remove foul waters, in which no other pump could work.

37
The hy-
draulic
pump.
Plate CLIV
fig. 9.

This last machine to be described consists of five pieces of board, forming a sort of scoop, as B. The handle C is suspended by a rope fastened to three poles, placed in a triangle, and tied together at A.

The working of this machine consists entirely in balancing the scoop that contains the water, and directing it in such manner that the water may be thrown in any given direction. It is evident that the operation of this machine is so very easy, that it may rather be considered as an agreeable and salutary recreation than hard labour.

With this machine a man of moderate strength, by two strokes in four seconds, can draw half a cubic foot of water, that is, more than four hundred cubic feet in an hour.

This machine is frequently used by the Dutch in emptying the water from their dikes.

SECT. VI. Entertaining Experiments.

38
The sy-
phon dis-
cussed.
Tantalus's
p., &c.
Plate CLV

1. SEVERAL amusing appearances may be produced by disguising or diversifying a syphon. It may, for example, be disguised in a cup, from which no liquor will flow till the fluid is raised therein to a certain height; but when the efflux is once begun, it will continue till the vessel is emptied. Thus, fig. 11. is a cup, in the centre whereof is fixed a glass pipe A, continued through the bottom at B, over which is put another glass tube, made air-tight at top by means of the cork at C; but left so open at foot, by holes made at D, that the water may freely rise between the tubes as the cup is filled. Till the fluid in the cup shall have gained the top of the innermost pipe at A, no motion will appear: The air however from between the two pipes being in the mean time extruded, by the rise of the denser fluid, and passing down the inner tube, will get away at bottom; and the water, as soon as the top of the inclosed tube shall be covered thereby, will very soon follow, and continue to rise in this machine, as in the syphon, till the whole is run off.

This is called by some, a *Tantalus's cup*; and, to humour the thought, a hollow figure is sometimes put over the inner tube, of such a length, that when the fluid is got nearly up to the lips of the man, the syphon may begin to act and empty the cup.

This is in effect no other than if the two legs of the syphon were both within the vessel, as in fig. 12. into which the water poured will rise in the shorter leg of the machine, by its natural pressure upwards, to its own level; and when it shall have gained the bend of the syphon, it will come away by the longer leg, as already described. An apple, an orange, or any other

solid, may be put into the vessel, to raise the water, when it is near the bend, to set it a-running, by way of amusement.

Again, let the handle of the cup, fig. 8. be hollow; let the tube CD, screwed therein, communicate freely with the water poured into the cup, that it may rise equally in both. Being once above the level ED, it will overflow, and, descending through the cavity DB, will empty the cup of its liquor.

2. The device called the *fountain at command*, acts upon the same principle with the syphon in the cup. Let two vessels A and B be joined together by the pipe C, which opens into them both. Let A be opened at top, B close both at top and bottom, (save only a small hole at *b* to let the air get out of the vessel B,) and A be of such a size as to hold about six times as much water as B. Let a syphon DEF be soldered to the vessel D, so that the part DE may be within the vessel, and F without it; the end D almost touching the bottom of the vessel, and the end F below the level of D: the vessel B hanging to A by the pipe C (folded into both), and the whole supported by the pillars G and H upon the stand I. The bore of the pipe must be considerably less than the bore of the syphon.

39
The foun-
tain at com-
mand.
Plate CLIII
fig. 2.

The whole being thus constructed, let the vessel A be filled with water, which will run through the pipe C, and fill the vessel B. When B is filled above the top of the syphon at E, the water will run through the syphon, and be discharged at F. But as the bore of the syphon is larger than the bore of the pipe, the syphon will run faster than the pipe, and will soon empty the vessel B; upon which the water will cease from running through the syphon at F, until the pipe C refills the vessel B, and then it will begin to run as before. And thus the syphon will continue to run and stop alternately, until all the water in the vessel A has run through the pipe C.—So that, after a few trials, one may easily guess about what time the syphon will stop, and when it will begin to run; and then, to amuse others, he may call out "*stop*," or "*run*," accordingly.

3. This fig. represents a very pretty portable fountain, which, being charged with water, and inverted, will play a jet nearly as high as the reservoir, till the fluid is exhausted; and then turned up on the other end, the same thing will happen, and a real clepsydra, or water-clock, be thereby formed.

This device consists of two hollow vessels, A and B, communicating with each other only by the recurved tubes C and D; at the ends of which, E and F, are placed small adjutages to direct the jet. G and H are two open tubes, soldered into the bottom of the basins belonging to A and B, through which the water flows in, and fills those vessels to a certain height, that is, according to their length. They by their disposition also prevent the return of the water the same way, when the machine is turned upside down.

4. Provide a cylindric vessel of glass or china, ABCD, about a foot high, and four inches diameter. Make a hole in its bottom, in which glue a small glass-tube E, of about one-third of an inch diameter, and whose end has been partly closed in the flame of a lamp, so that it will not suffer the water to pass out but by drops, and that very slowly. Cover the top of the ves-
sel

ing experi-
ments.

Entertain-
ing experi-
ments.

fel with a circle of wood F, in the centre of which make a round hole about half an inch diameter.

Have a glass-tube GH, a foot high, and a quarter of an inch diameter; and at one end let it have a small glass globe I, to which you may hang a weight L, by which it is kept in *equilibrium*, on or near the surface of the water; or you may pour a small quantity of mercury into the tube, for the same purpose. Fill the vessel with water; put the tube in it, and over it place the cover F, through the hole of which the tube must pass freely up and down. Now, as the water drops gradually out of the vessel, the tube will continue to descend till it come to the bottom.

Therefore, paste on the tube a graduated paper, and put it in the vessel when nearly full of water. Hang a watch by it, set to a certain hour; and as the tube descends, mark the hours, with the half and quarter hours. If the vessel be sufficiently large, with regard to the hole at the bottom, it will go for 12 hours, a day, or as much longer as you please, and requires no other trouble than that of pouring in water to a certain height. Care must be had, however, that the water be clean; for if there be any sediment, it will in time stop the small hole at bottom, or at least render the motion of the water irregular.

The vessel may be of tin, but the pipe at bottom should be glass, that its small aperture may not alter by use. It is to be observed, that the tube of one of these clocks is not to be graduated by another: for though the vessel be of the same diameter at top, it may not be perfectly cylindrical throughout; nor is it easy to make the hole at the bottom of one vessel exactly of the same dimension with that of another.

42.
Clepsydra.
Plate CLVI.
fig. 7.

5. The hon. Mr Charles Hamilton has described a curious clepsydra or water-clock of new construction. An open canal *ee*, supplied with a constant and equal stream by the syphon *d*, has at each end *ff* open pipes of exactly equal bores, which deliver the water that runs along the canal *e*, alternately into the vessels *g* 1, *g* 2, in such a quantity as to raise the water from the mouth of the tantalus *t*, exactly in an hour. The canal *ee* is equally poised by the two pipes *f* 1, *f* 2, upon a centre *r*, the ends of the canal *e* are raised alternately, as the cups *z* *z* are depressed, to which they are connected by lines running over the pulleys *ll*. The cups *z* *z* are fixed at each end of the balance *mm*, which moves up and down upon its centre *v*. *n* 1, *n* 2, Are the edges of two wheels or pulleys, moving different ways alternately, and fitted to the cylinder *o* by oblique teeth both in the cavity of the wheel and upon the cylinder, which, when the wheel *n* moves one way, that is, in the direction of the minute-hand, meet the teeth of the cylinder and carry the cylinder with it, and, when *n* moves the contrary way, slip over those of the cylinder, the teeth not meeting, but receding from each other. One or other of these wheels *nn* continually moves *o* in the same direction, with an equable and uninterrupted motion. A fine chain goes twice round each wheel, having at one end a weight *x*, always out of water, which equi-ponderates with *y* at the other end, when kept floating on the surface of the water in the vessel *g*, which *y* must always be; the two cups *z* *z*, one at each end of the balance, keep it in *equilibrium*, till one of them is forced down by the weight and impulse of the water, which

it receives from the tantalus *t* *t*: each of these cups *z* *z*, has likewise a tantalus of its own *b*, *b*, which empties it after the water has done running from *g*, and leaves the two cups again in *equilibrium*; *q* is a drain to carry off the water. The dial-plate, &c. needs no description. The motion of the clepsydra is effected thus: As the end of the canal *ee*, fixed to the pipe *f* 1, is, in the figure, the lowest, all the water supplied by the syphon runs through the pipe *f* 1, into the vessel *g* 1, till it runs over the top of the tantalus *t*; when it immediately runs out at *i* into the cup *z*, at the end of the balance *m*, and forces it down; the balance moving on its centre *v*. When one side of *m* is brought down, the string which connects it to *f* 1, running over the pulley *l*, raises the end *f* 1, of the canal *e*, which turns upon its centre *r*, higher than *f* 2; consequently, all the water which runs through the syphon *d* passes through *f* 2 into *g* 2, till the same operation is performed in that vessel, and so on alternately. As the height the water rises in *g* in an hour, viz. from *i* to *t*, is equal to the circumference of *n*, the float *y* rising thro' that height along with the water, lets the weight *x* act upon the pulley *n*, which carries with it the cylinder *o*; and this, making a revolution, causes the index *k* to describe an hour on the dial-plate. This revolution is performed by the pulley *n* 1; the next is performed by *n* 2, whilst *n* 1 goes back, as the water in *g* 1 runs out through the tantalus; for *y* must follow the water, as its weight increases, out of it. The axis *a* always keeps moving the same way; the index *p* describes the minutes; each tantalus must be wider than the syphon, that the vessels *gg* may be emptied as low as *j*, before the water returns to them.

6. To the tube wherein the water is to rise, fit a spherical or lenticular head, AB, made of a plate of metal, and perforated at top with a great number of little holes. The water rising with vehemence towards AB, will be there divided into innumerable little threads, and afterwards broke, and dispersed into the finest drops.

7. To the tube AB, solder two spherical segments C and D, almost touching each other; with a screw E, which spreads the tube to contract or amplify the interstice or chink at pleasure. Others choose to make a smooth, even cleft, in form of a spherical or lenticular head, fitted upon the tube. The water spouting through the chink, or cleft, will expand itself in manner of a cloth.

8. Make a hollow globe A, of copper or lead, and of the size adapted to the quantity of water that comes from the pipe to which it is to be placed. Pierce a number of small holes thro' this globe, that all tend towards its centre; observing, however, that the diameters of all these holes, taken together, must not exceed that of the pipe at the part from whence the water flows. Annex to it a pipe B, of such height as you think convenient; and let it be screwed at C, to the pipe from whence the jet flows. The water that comes from the jet rushing with violence into the globe, will be forced out at the holes, with the direction in which they are made, and will produce a very pleasing sphere of water.

9. Procure a little figure made of cork, as AB, The which you may paint, or dress in a light stuff, after drauc your own fancy. In this figure you are to place danc, the small hollow cone C, made of thin leaf brads. When the figure is placed on the jet-d'eau that plays

in a perpendicular direction, it will remain suspended on the top of the water, and perform a great variety of motions.

If a hollow ball of copper, of an inch diameter, and very light, be placed on a similar jet, it will, in like manner, remain suspended, revolving on its centre, and spreading the water all round it, in the manner represented by fig. 14. or Plate CLVI. fig. 1.—But note, that as it is necessary the ball, &c. when on the defect, should keep the fame precise perpendicular wherein it rose (since otherwise it would miss the stream and fall downright,) such a fountain should only be played in a place free from wind.

47
the hemi-
cal
cascade.
CLV.
10.

10. Make a hollow leaden cone A, whose axis is one-third of the diameter of its base. The circle C, that forms its base, must be in proportion to the surface of water that flows from the jet on which it is to be placed, that it may flow from it equally on all sides. To the cone join the pipe B, which serves not only as a support, but is to be pierced with a number of holes, that it may supply the cone with a sufficient quantity of water. Screw the tube just mentioned to the top of that from whence the jet proceeds.—The water that rushes into the cone from the pipe, will run over its circumference, and form a hemispherical cascade. If this piece be so constructed that it may be placed in a reversed position, it will produce a fountain in the form of a vase, (see fig. 8.); and if there be a sufficient quantity of water, both these pieces may be placed on the same pipe, the fountain at top and the cascade underneath, which by their variety will produce a very pleasing appearance.

11. Let there be two portions of a hollow sphere, that are very shallow : and let them be joined together, that the circular space between them may be very narrow. Fix them vertically to a pipe from whence a jet proceeds. In that part by which the portions of the sphere are joined, there must be made a number of holes; then the water rushing into the narrow cavity will be forced out from the holes, and produce a regular figure of the sun, as in the plate. This piece requires a large quantity and force of water to make it appear to advantage.

CLV.
Several pieces of this sort may be placed over each other, in a horizontal direction, and so that the same pipe may supply them all with water (see fig. 7.) It is proper to observe, that the diameter of these pieces must continually diminish, in proportion to their distance from the bottom.

12. Make a hollow circle A, the sides of which are to be pierced with 12 or 15 holes, made in an inclined direction : or you may place the like number of small tubes round the circle. Fix this circle on the top of a jet, in such manner that it may turn freely round. The water rushing violently into the hollow circle will keep it in continual motion ; and at the same time forcing out of the holes or small tubes, will form a revolving figure with rays in different directions, as in the plate.

50
com-
cu jet
12.

13. Provide a strong copper vessel A, of such figure as you think convenient ; in which solder a pipe BE, of the same metal. Let there be a cock at H, which must be made so tight that no air can pass by it. The pipe BE must go very near the bottom of the vessel, but not touch it. There must be another pipe F, at whose

extremity G there is a very small hole : this pipe must be screwed into the former.

The vessel being thus disposed, take a good syringe ; and placing the end of it in the hole at G, open the cock, and force the air into the vessel ; then turn the cock and take out the syringe. Repeat this operation several times, till the air in the vessel be strongly condensed. Then fill the syringe with water, and force it into the vessel, in the same manner as you did the air ; and repeat this operation till you can force no more water into the vessel ; then shut the cock. This vessel will be always ready to perform an extempore jet d'eau : for, on turning the cock, the spring of the compressed air will force out the water with great violence, and the jet will continue, tho' constantly decreasing in force, till the water is all exhausted, or the air within the vessel is come to the same density with that without.

14. Let there be made a tin vessel, about six inches high, and three inches in diameter. The mouth of this vessel must be only one quarter of an inch wide ; and in its bottom make a great number of small holes, about the size of a common sewing needle. Plunge this vessel in water, with its mouth open ; and when it is full, cork it up and take it out of the water. So long as the vessel remains corked, no water whatever will come out, but as soon as it is uncorked, the water will issue from the small holes at its bottom. You must observe, that if the holes at the bottom of the vessel be more than one-sixth of an inch diameter, or if they be in too great number, the water will run out tho' the vessel be corked ; for then the pressure of the air against the bottom of the vessel will not be sufficient to confine the water.

An experiment similar to this is made with a glass filled with water, over which a piece of paper is placed. The glass is then inverted ; and the water, by the pressure of the air under it, will remain in the glass. That the paper, tho' the seeming, is not the real, support of the water, will appear from n° 20.

lating foun-
tain, fig. 10.

15. In this fountain the boxes CE and DYX being close, you see only the basin ABW, with a hole at B, through which the water that spouts out at B falls and runs down through the pipe WX into the box DYX, from whence it drives out the air, through the ascending pipe YZ, into the cavity of the box CE, where pressing upon the water contained in that box, it forces it out, through the spouting pipe OB, as long as there is any water in CE ; so that the continuance of the play is while the water in CE spouts out and falls down through the pipe WX, into the cavity DYX. The force of the jet is in proportion to the height of the pipe WX, or of the distance between the boxes CE and DY. The height of the water, measured from the basin ABW to the surface of the water in the lower box DYX, is always equal to the height, measured from the top of the jet to the surface of the water in the middle cavity CE. Now, since the surface CE is always falling, and the water DY is always rising, the height of the jet must continually decrease, till it is shorter by the depth of the cavity CE, which is emptying, added to the depth of the cavity DY, which is always filling ; and when the jet is fallen so low, it immediately ceases.

The method of preparing this fountain is as follows. First, pour water in at W, till you have filled the cavity

Entertain-
ing experi-
ments.

Entertain-
ing experi-
ments.

vity DXY: then turn the fountain over, and the water will run from the cavity DXY, into the cavity CE, which you will know to be full by the water's running out at B when it is held down. Set the fountain up again, and pour about a pint of water into the bafon ABW; and as soon as it has filled the pipe WX, the fountain will play, and continue as long as there is any water in CE. You may then empty the water left in the bafon into any other vefel, and invert the fountain; which, upon being placed again erect, will begin to play, when the water poured out of the bafon is put into it again. There are fountains of this fort that have four pipes, inftead of two, and by that means the water is forced up to twice the height it is in this. See alfo n^o 40.

54
The magi-
cal cascade,
fig. 9.

16. Procure a tin vefel ABC, five inches high and four in diameter; and let it be clofed at top. To the bottom of this vefel let there be foldred the pipe DE, of ten inches length and half an inch in diameter: this pipe muft be open at each end, and the upper end muft be above the water in the vefel. To the bottom alfo fix five or fix fmall tubes F, about one-eighth of an inch diameter. By thefe pipes the water contained in the vefel is to run flowly out.

Place this machine on a foot of tin bafon GH, in the middle of which is a hole of one quarter of an inch diameter. To the tube DE, fix fome pieces that may fupport the vefel over the bafon; and obferve that the end D, of the tube DE, muft be little more than one quarter of an inch from the bafon. There muft be alfo another vefel placed under the bafon, to receive the water that runs from it.

Now, the fmall pipes difcharging more water into the bafon than can run out at the hole in its centre, the water will rife in the bafon, above the lower end of the pipe DE, and prevent the air from getting into the vefel AB; and confequently the water will ceafe to flow from the fmall pipes. But the water continuing to flow from the bafon, the air will have liberty again to enter the vefel AB, by the tube DE, and the water will again flow from the fmall pipes. Thus they will alternately flop and flow, as long as any water remains in the vefel AB.

As you will eafily know, by obferving the rife of the water, when the pipes will ceafe to flow, and by the fall of it, when they will begin to run again, you may fafely predict the change; or you may command them to run or flop, and they will feem to obey your orders.

55
The illumi-
nated foun-
tain, fig. 4.

17. This fountain begins to play when certain candles placed round it are lighted, and flops when thofe candles are extinguiſhed. It is contructed as follows. Provide two cylindrical vefels, AB and CD. Connect them by tubes open at both ends, as HL, FB, &c. fo that the air may defcend out of the higher into the lower vefel. To thefe tubes fix candleſticks H, &c. and to the hollow cover CF, of the lower vefel, fit a fmall tube EF, furniſhed with a cock G, and reaching almoſt to the bottom of the vefel. In G let there be an aperture with a ſcrew, whereby water may be poured into CD.

Now, the candles at H, &c. being lighted, the air in the contiguous pipes will be thereby rarified, and the jet from the fmall tube EF will begin to play: as the air becomes more rarified, the force of the jet will

increase, and it will continue to play till the water in the lower vefel is exhauſted. It is evident, that as the motion of the jet is caufed by the heat of the candles, if they be extinguiſhed, the fountain muſt prefently flop.

18. The motion of the water in this fountain is produced by the heat of the fun, in the following manner. GNS is a thin hollow globe of copper, of 18 inches diameter, fupported by a ſmall inverted bafon, placed on a frame with four legs ABCD, which have between them, at the bottom, a bafon of two feet diameter. Through the leg C paffes a concealed pipe, which comes from G, the bottom of the infide of the globe: this pipe goes by HV, and joins the upright pipe uI, to make a jet at I. The ſhort pipe uI, which goes to the bottom of the bafon, has a valve at V, under the horizontal pipe H u, and another valve at V, above that horizontal pipe, under the cock at K. The ufe of this cock is to keep the fountain from playing in the day, till you think proper. The north pole N of the globe has a ſcrew that opens a hole, whereby water is poured into the globe.

The machine being thus prepared, and the globe half filled with water, let it be fet in an open place, when the heat of the fun, rarifying the air as it heats the copper, the air will prefs ſtrongly againſt the water, which coming down the pipe GCHVI, will lift up the valve V, and ſhut the valve u. The cock being opened, the water will ſpout out at I, and continue to play a long time, if the fun ſhine.

At night, when the air is condenſed, that which is on the outside of the vefel will prefs on the adjutage I, and ſhut the valve V; and at the ſame time preſſing on the water in the bafon DuH, which has been played in the day, will puſh it up, through the valve u, and pipe uHG, into the globe, fo as to fill it again, to the ſame height as at firſt. When the fun ſhines again on the globe, the fountain will play again, &c. A ſmall jet will play fix or eight hours.

If the globe be fet to the latitude of the place, and rectified before it be fixed, with the hour-lines or meridians drawn upon it, the hours marked, and the countries painted, as on the common globe, it will form a good dial; the fun then ſhining upon the ſame places in this globe, as it does on the earth itſelf. This fountain was invented by Dr Defaguliers.

19. There is a pretty contrivance, by which the ſpecific gravity of the body is ſo altered, that it rife and ſinks in water at our pleaſure. Let little images of men, vers.

about an inch high, of coloured glaſs, be beſpoke at a glaſs-houſe; and let them be made ſo as to be hollow within, but ſo as to have a ſmall opening into this hollow, either at the ſole of the foot or elfewhere. Let them be fet afloat in a clear glaſs-phial of water, filled within about an inch of the mouth of the bottle; then let the bottle have its mouth cloſed with a bladder, cloſely tied round its neck, ſo as to let no air eſcape one way or the other. The images themſelves are nearly of the ſame ſpecific gravity with water, or rather a little more light, and confequently float near the ſurface. Now when we prefs down the bladder, tied on at the top, into the mouth of the bottle, and thus prefs the air upon the ſurface of the water in the bottle; the water being preſſed will force into the hollow of the image through the little opening: thus the air within

Hydrothorax within the images will be pressed more closely together, and being also more filled with water now than before, the images will become more heavy, and will consequently descend to the bottom; but, upon taking off the pressure from above, the air within them will again

drive out the water, and they will rise to the same heights as before. If the cavities in some of the images be greater than those in others, they will rise and fall differently, which makes the experiment more amusing.

Hygrometer.

H Y G

HYDROTHORAX, a collection of water in the breast. See (the Index subjoined to) **MEDICINE**.

HYGINUS (Caius Julius), a grammarian, the freedman of Augustus, and the friend of Ovid, was born in Spain, or, according to others, in Alexandria. He wrote many books which are mentioned by ancient authors; all of which are lost, except some fables, and a work entitled *Astronomicum Poeticum*; and even these are come down to us very imperfect. The best edition of these remains is that of Munkler, published with some other pieces of antiquity in 2 vols 8vo, 1681, under the title of *Mythographi Latini*.

HYGROMETER, an instrument for measuring the degrees of dryness or moisture of the atmosphere, in like manner as the barometer and thermometer measure its different degrees of gravity or warmth.

Though every substance which swells in moist, and shrinks in dry weather, is capable of becoming an hygrometer; yet this kind of instrument is far from being as yet arrived at such a degree of perfection as the barometers and thermometers. There are three general principles on which hygrometers have been constructed. 1. The lengthening and shortening of strings by dryness and moisture, or their twisting and untwisting by the same. 2. The swelling and shrinking of solid substances by moisture or dryness; and, 3. By the increase or decrease of the weight of particular bodies whose nature is to absorb the humidity of the atmosphere.

1. On the first of these principles Mr Smeaton hath constructed an hygrometer greatly superior to any that had appeared before, and of which the following account is given in the 62d volume of the Philosophical Transactions.

“Having some years ago attempted to make an accurate and sensible hygrometer by means of a hempen cord of a considerable length, I quickly found, that, though it was more than sufficiently susceptible of every change in the humidity of the atmosphere, yet the cord was upon the whole in a continual state of lengthening. Though this change was the greatest at first, yet it did not appear probable that any given time would bring it to a certainty; and, furthermore, it seemed, that as the cord grew more determinate in mean length, the alteration by certain differences of moisture grew less. Now, as on considering wood, catgut, paper, &c. there did not appear to be a likelihood of finding any substance sufficiently sensible of differences of moisture that would be unalterable under the same degrees thereof; this led me to consider of a construction which would readily admit of an adjustment; so that, though the cord whereby the instrument is actuated may be variable in itself, both as to absolute length and difference of length under given degrees of moisture, yet that, on supposition of a material departure from its original scale, it might be readily restored thereto; and, in consequence, that any number of hygrometers similarly constructed, might,

VOL. V.

H Y G

like thermometers, be capable of speaking the same language.

“The two points of heat the more readily determinable in a thermometer, are the points of freezing and boiling water. In like manner, to construct hygrometers which shall be capable of agreement, it is necessary to establish two different degrees of a moisture which shall be as fixed in themselves, and to which we can have recourse as readily and as often as possible.

“One point is given by making the substance perfectly wet, which seems sufficiently determinable; the other is that of perfect dry, which I do not apprehend to be attainable with the same precision. A readiness to imbibe wet, so that the substance may be soon and fully saturated, and also a facility of parting with its moisture on being exposed to the fire to dry; at the same time, that neither immersion, nor a moderate exposition to the warmth of the fire, shall injure its texture; are properties requisite to the first mover of such an hygrometer, that in a manner exclude all substances that I am acquainted with, besides hempen and flaxen threads and cords, or substances compounded of them.

“Upon these ideas, in the year 1758, I constructed two hygrometers as nearly alike as possible, in order that I might have the means of examining their agreement or disagreement on similar or dissimilar treatment. The interval or scale between dry and wet I divided into 100 equal parts, which I call the degrees of this hygrometer. The point of 0 denotes perfect dry; and the numbers increase with the degrees of moisture to 100, which denotes perfect wet.

“On comparing them for some time, when hung up together in a passage or staircase, where they would be very little affected by fire, and where they would be exposed to as free an air as possible in the inside of the house, I found that they were generally within one degree, and very rarely differed two degrees; but as these comparisons necessarily took up some time, and were frequently interrupted by long absences from home, it was some years before I could form a tolerable judgment of them. One thing I soon observed, not altogether to my liking, which was, that the flaxen cords made use of seemed to make so much resistance to the entry of small degrees of moisture, (such as is commonly experienced within doors in the situation above-mentioned), that all the changes were comprised within the first 30° of the scale; but yet, on exposing them to the warm steam of a wash-house, the index quickly mounted to 100. I was therefore desirous of impregnating the cords with something of a saline nature, which should dispose them more forcibly to attract moisture; in order that the index might, with the ordinary changes of the moisture in the atmosphere, travel over a greater part of the scale of 100. How to do this in a regular and fixed quantity, was the subject of many experiments, and several years interrupted inquiry. At last I tried the one hereafter described, which seemed to answer my intention in a great measure; and the other

21 Q upon

upon the whole it does not appear probable that ever this instrument will be made capable of such an accurate agreement as the mercurial thermometers are, yet if we can reduce all the disagreements of an hygrometer within $\frac{1}{100}$ th part of the whole scale, it will probably be of use in some philosophical inquiries, in lieu of instruments which have not yet been reduced to any common scale at all.

" Fig. 1. and 2. ABC is an orthographic delineation of the whole instrument seen in front in its true proportion. DE is that of the profile, or instrument seen edgewise. FG in both represents a flaxen cord about 35 inches long, suspended by a turning peg F, and attached to a loop of brads-wire at A, which goes down into the box cover H, and defends the index, &c. from injury; and by a glass exposes the scale to view.

" Fig. 3. shews the instrument to a larger scale, the upright part being shortened, and the box-cover removed; in which the same letters represent the same parts as in the preceding figures; GI are two loops or long links of brads-wire, which lay hold of the index KL, moveable upon a small stud or centre K. The cord FG is kept moderately strained by a weight M of about half a pound avoirdupois.—It is obvious, that, as the cord lengthens and shortens, the extreme end of the index rises and falls, and successively passes over N 2 the scale disposed in the arch of a circle, and containing 100 equal divisions. This scale is attached to the brads sliding ruler QP, which moves upon the directing piece RR, fixed by screws to the board, which makes the frame or base of the whole; and the scale and ruler NQP is retained in any place nearer to, or further from, the centre K, as may be required by the screw S.

" Fig. 4. represents in profile the sliding piece and stud I (fig. 3.), which traverses upon that part of the index next the centre K; and which can, by the two screws of the stud, be retained upon any part of the index that is made parallel; and which is done for three or four inches from the centre, for that purpose. The stud is filed to the edges, like the fulcrum of a scale-beam; one being formed on the under-side, the other on the upper, and as near as may be to one another. An hook formed at the lower end of the wire-loops CI, retains the index, by the lowermost edge of the stud; while the weight M hangs by a small hook upon the upper edge: by these means the index is kept steady, and the cords strained by the weight, with very little friction or burthen upon the central stud K.

" Fig. 5. is a parallelogram of plate brads, to keep out dust, which is attached to the upper edge of the box-cover H; and serves to shut the part of the box-cover necessarily cut away, to give leave for the wire GI to traverse with the sliding stud nearer to or further from the centre of the index K; and where, in fig. 5. *a* is an hole of about an inch diameter, for the wire GI to pass through in the rising and falling of the index freely without touching; *b* is a slit of a lesser size, sufficient to pass the wire, and admit the cover to come off without deranging the cord or index; *cc* are two small screws applied to two slits, by which the plate slides lengthways, in order to adapt the hole *a* to the wire GI, at any place of the stud I upon the

index KL.

" 1. In this construction, the index KL being 12 inches long, 4 inches from the extreme end are filed so narrow in the direction in which it is seen by the eye, that any part of these four inches lying over the divisions of the scale, becomes an index thereto. The scale itself slides four inches, so as to be brought under any part of the four inches of the index attenuated as above-mentioned.

" 2. The position of the directing piece RR is so determined as to be parallel to a right line drawn thro' o upon the scale, and the centre K of the index; consequently, as the attenuated part of the index forms a part of a radius or right line from the same centre, it follows, that whenever the index points to o upon the scale, though the scale is moved nearer to or further from the centre of the index, yet it produces no change in the place to which the index points.

" 3. When the divided arch of the scale is at 10 inches from the centre, (that is, at its mean distance); then the centre of the arch and the centre of the index are coincident. At other distances, the extremes of which are eight or twelve inches, the centre of the divisions, and the centre of the index pointing thereto, not being coincident, the index cannot move over the spaces geometrically proportionable to one another in all situations of the scale, yet, the whole scale not exceeding 30° of a circle, it will be found on computation, that the error can never be so great as $\frac{1}{100}$ th part of the scale, or 1° of the hygrometer; which in this instrument being considered as indivisible, the mechanical error will not be sensible.

" The cord here made use of is flax, and between $\frac{3}{16}$ th and $\frac{1}{8}$ th of an inch in diameter; which can be readily ascertained by measuring a number of turns made round a pencil or small stick. It is a sort of cord used in London for making nets, and is of that particular kind called by net-makers *flaxen three-threads laid*. A competent quantity of this cord was boiled in one pound avoirdupois of water, in which was put two pennyweights troy of common salt; the whole was reduced by boiling to six ounces avoirdupois, which was done in about half an hour. As this ascertains a given strength of the brine, on taking out the cord; it may be supposed that every fibre of the cord is equally impregnated with salt. The cord being dried, it will be proper to stretch it; which may be done so as to prevent it from untwisting, by tying three or four yards to two nails against a wall, in an horizontal position, and hanging a weight of a pound or two to the middle, so as to make it form an obtuse angle. This done for a week or more in a room, will lay the fibres of the cord close together, and prevent its stretching so fast after being applied to the instrument, as it would otherwise be apt to do.

" The hygrometer is to be adjusted in the following manner. The box-cover being taken off to prevent its being spoiled by the fire, and choosing a day naturally dry, set the instrument nearly upright, about a yard from a moderate fire; so that the cord may become dry, and the instrument warm, but not so near as would spoil the finest linen by too much heat, and yet fully evaporate the moisture; there let the instrument stay till the index is got as low as it will go; now and then stroaking the cord betwixt the thumb

and

and finger downwards, in order to lay the fibres thereof close together; and thereby causing it to lengthen as much as possible. When the index is thus become stationary, which will generally happen in about an hour, more or less, as the air is naturally more or less dry, by means of the peg at top raise or depress the index, till it lies over the point *o*. This done, remove the instrument from the fire; and having ready some warm water in a tea-cup, take a middling camel's-hair pencil, and, dipping it in the water, gently anoint the cord till it will drink up no more, and till the index becomes stationary and water will have no more effect upon it, which will also generally happen in about an hour. If in this state the index lies over the degree marked 100, all is right; if not, slack the screw *S*, and slide the scale nearer to or further from the centre, till the point 100 comes under the index, and then the instrument is adjusted for use: but if the compass of the slide is not sufficient to effect this, as may probably happen on the first adjustment, slack the proper screws, and move the sliding studd *I* nearer to or further from the centre of the index, according as the angle formed by the index between the two points of dry or wet happens to be too small or too large for the scale."

1. On the second general principle, namely, that of the swelling of solid bodies by moisture, and their contraction by dryness, Mr De Lac's is the best. He makes choice of ivory for the construction of his hygrometer, because he finds, that, being once wetted, ivory regularly swells by moisture, and returns exactly to the same dimensions when the moisture is evaporated, which other bodies do not. This hygrometer is represented in fig. 6. *aab* is an ivory tube open at the end *aa*, and close at *b*. It is made of a piece of ivory taken at the distance of some inches from the top of a pretty large elephant's tooth, and likewise at the same distance from its surface, and from the canal which reaches to that point. (This particular direction is given, that the texture of the ivory in all different hygrometers may be the same, which is of great importance.) This piece is to be bored exactly in the direction of its fibres; the hole must be very straight, its dimensions $2\frac{1}{2}$ lines in diameter, and 2 inches 8 lines in depth from *aa* to *c*. Its bore is then to be exactly filled with a brass cylinder, which, however, must project somewhat beyond the ivory tube, and thus it is to be turned on a proper machine, till the thickness of the ivory is exactly $\frac{1}{2}$ of a line, except at the two extremities. At the bottom *b*, the tube ends in a point; and at the top *aa* it must for about two lines be left a little thicker, to enable it to bear the pressure of another piece put into it. Thus the thin or hygrometrical part of the tube will be reduced to $2\frac{1}{2}$ French inches, including the concavity of the bottom. Before this piece is used, it must be put into water, so that the external part alone may be wetted by it; and here it is to remain till the water penetrates to the inside, and appears in the form of dew, which will happen in a few hours. The reason of this is, that the ivory tube remains somewhat larger ever after it is wetted the first time.

For this hygrometer, a glass tube must be provided about 14 inches long, the lower end of which is shewn in *ddcc*. Its internal diameter is about $\frac{1}{4}$ of a line.

If now the ivory tube is exactly filled with mercury, and the glass one affixed to it, as the capacity of the former decreases by being dried, the mercury will be forced up into the glass one.

The piece *ffgg* is intended to join the ivory with the glass tube. It is of brass, shaped as in the figure. A cylindrical hole is bored through it, which holds the glass tube as tight as possible without danger of breaking it; and its lower part is to enter with some degree of difficulty into the ivory pipe. To hinder that part of the tube which incloses the brass piece from being affected by the variations of the moisture, it is covered with a brass vessel represented in *hhii*. The pieces must be united together with gum-lac or mastic.

The introduction of the mercury is the next operation. For this purpose, a slip of paper three inches wide is first to be rolled over the glass tube, and tied fast to the extremity nearest the ivory pipe. A horse-hair is then to be introduced to the tube, long enough to enter the ivory pipe by an inch, and to reach three or four inches beyond the extremity of the glass one. The paper which has been shaped round the tube must now be raised, and used as a funnel to pour the mercury into the instrument, which is held upright. The purest quicksilver is to be used for this purpose, and it will therefore be proper to use that revived from cinabar. It easily runs into the tube; and the air escapes by means of the horse hair, assisted with some gentle shakes. Fresh mercury must from time to time be supplied, to prevent the mercurial tube from being totally emptied; in which case, the mercurial pellicle which always forms by the contact of the air would run in along with it.

Some air-bubbles generally remain in the tube; they may be seen through the ivory pipe, which is thin enough to have some transparency. These being collected together by shaking, must be brought to the top of the tube, and expelled by means of the horse-hair. To facilitate this operation, some part of the mercury must be taken out of the tube, in order that the air may be less obstructed in getting out, and the horse-hair have a freer motion to assist it. Air, however, cannot be entirely driven out in this manner. It is the weight of the mercury with which the tube is for that reason to be filled, which in time completes its expulsion, by making it pass through the pores of the ivory. To hasten this, the hygrometers are put into a proper box. This is fixed nearly in a vertical direction to the saddle of a horse, which is set at trotting for a few hours. The shakes sometimes divide the column of mercury in the glass tube, but it is easily re-united with the horse-hair. When, upon shaking the hygrometer vertically, no small tremulous motion is any longer perceived in the upper part of the column, one may be sure that all the air is gone out.

The scale of this hygrometer may be adjusted, as soon as the air is gone out, in the following manner. The instrument is to be suspended in a vessel of water cooled with ice, fresh quantities of which are to be added as the former melts. Here it is to remain till it has sunk as low as it will sink by the enlargement of the capacity of the ivory tube, owing to the moisture it has imbibed. This usually happens in seven or eight hours, and is to be carefully noted. In two or

Hygrome-
ter.

three hours the mercury begins to ascend, because the moisture passes into the cavity, and forces it up. The lowest station of the mercury is then to be marked 0; and for the more accurate marking the degrees on the scale, M. De Luc always chose to have his hygrometrical tube made of one which had formerly belonged to a thermometer. The reason of this is, that in the thermometer the expansion of the mercury by heat had been already determined. The distance between the thermometrical points of melting ice and boiling water at 27 French inches of the barometer was found to be 1937 parts. The bulb of this preparatory thermometer was broke in a basin, in order to receive carefully all the mercury that it contained. This being weighed in nice scales amounted to 1428 grains. The hygrometer contained 460 grains of the same mercury. Now it is plain, that the extent of the degrees on the hygrometer, ought to be to that of the degrees on the preparatory thermometer as the different weights of the mercury contained in each; consequently 1428 : 460 :: 1937 : 624 nearly; and therefore the corresponding intervals ought to follow the same proportion; and thus the length of a scale was obtained, which might be divided into as many parts as he pleased.

Fig. 7. is a representation of De Luc's hygrometer when fully constructed. In elegance it far exceeds Smeaton's or any other, and probably also in accuracy; for by means of a small thermometer fixed on the board along with it, the expansion of the mercury by heat may be known with great accuracy, and of consequence how much of the height of the mercury in the hygrometer is owing to that cause, and how much to the mere moisture of the atmosphere.

3. On the third principle, namely, the alteration of the weight of certain substances by their attracting the moisture of the air, few attempts have been made, nor do they seem to have been attended with much success. Sponges dipped in a solution of alkaline salts, and some kinds of paper, have been tried. These are suspended to one end of a very accurate balance, and counterpoised by weights at the other, and shew the degrees of moisture or dryness by the ascent or descent of one of the ends. But, besides that such kinds of hygrometers are destitute of any fixed point from whence to begin their scale, they have another inconvenience (from which indeed Smeaton's is not free, and which has been found to render it erroneous), namely, that all saline substances are destroyed by long continued exposure to the air in very small quantities, and therefore can only imbibe the moisture for a certain time. Oil of vitriol hath therefore been recommended in preference to the alkaline or neutral salts. See CHEMISTRY, n° 105; and, indeed, for such as do not chuse to be at the trouble of constructing a hygrometer on the principles of Mr Smeaton or De Luc, this will probably be found the most easy and accurate. Fig. 8. represents an hygrometer of this kind. A is a small glass cup containing a small quantity of oil of vitriol, B an index counterpoising it, and C the scale; where it is plain, that as the oil of vitriol attracts the moisture of the air the scale will descend, which will raise the index, and *vice versa*. This liquid is exceedingly sensible of the increase or decrease of moisture. A single grain, after its full increase, has varied its

equilibrium so sensibly, that the tongue of a balance, only an inch and a half long, has described an arch one third of an inch in compass, (which arch would have been almost three inches if the tongue had been one foot), even with so small a quantity of liquor; consequently, if more liquor, expanded under a large surface, were used, a pair of scales might afford as nice an hygrometer as any kind yet invented.—A great inconvenience, however, is, that as the air must have full access to the liquid, it is impossible to keep out the dust, which, by continually adding its weight, must render the hygrometer false: add to this, that even oil of vitriol itself is by time destroyed, and changes its nature, if a small quantity of it is continually exposed to the air. So that of all the inventions that have hitherto appeared, De Luc's alone seems capable of being brought to the requisite perfection.

HYGROSCOPE. The same with HYGROMETER.

HYLA (anc. geog.), a river of Myfia Minor, famous for Hylas the favourite boy of Hercules, who was carried down the stream and drowned. It is said to run by Prusa; whence it seems to be the same with the *Rhyndacus*, which runs north-west into the Piontius.

HYLAS, in fabulous history, son of Theodamus, was ravished by the nymphs of a fountain as he was taking out some water for Hercules by whom he was beloved.

HYMEN, or HYMENÆUS, a fabulous divinity, the son of Bacchus and Venus Urania, was supposed by the ancients to preside over marriages; and accordingly was invoked in epithalamiums, and other matrimonial ceremonies, under the formula, *Hymen, o Hymenæe!*

The poets generally crown this deity with a chaplet of roses; and represent him, as it were, dissolved and enraptured with pleasures; dressed in a yellow robe, and shoes of the same colour; with a torch in his hand.—Catullus, in one of his epigrams, addresses him thus:

*Ginge tempora floribus,
Suaveolentis amaraci.*

It was for this reason, that the new-married couple bore garlands of flowers on the wedding-day: which custom also obtained among the Hebrews; and even among Christians, during the first ages of the church, as appears from Tertullian, *De corona militari*, where he says, *Coronant & nuptia sponsos*.—S. Chrysostom likewise mentions these crowns of flowers; and to this day the Greeks call marriage *σπονδαί*, in respect of this crown or garland.

HYMEN, in anatomy, a membrane in general; but by it is usually understood the membrane which appears in the form of a crescent, and is situated at the entrance of the vagina. When this membrane is ruptured, it is shrivelled up, and forms the carunculae myrtiliformes. It naturally shrinks with years, and often disappears before the age of 20, so can be no proof of virginity.

In some infants this membrane so closes up the urethra, that the urine cannot be voided: in others, the urine passes, but when the menses flow, they cannot be discharged, because of the imperforated hymen.

When the mark of perforation cannot be seen, the cure is thought to be impracticable; but when the puncture

Hygroscop
Hymen.

puncture of a lancet could not produce the desired effect, a trochar and canula hath succeeded, though a passage of four inches was perforated before the end was obtained.—In the memoirs of the Royal Academy of Sciences for 1756, we have an account of a conception without any perforation of the hymen.

HYMENÆAL, something belonging to marriage; so called from **HYMEN**. See **POSTRY**, n° 157.

HYMN, a song or ode in honour of God; or a poem, proper to be sung, composed in honour of some deity. See **SONG**, and **ODE**.—The word is Greek, *ᾠδή*, *hymn*, formed of the verb *ᾠδω*, *celebro*, “I celebrate.”—Isidore, on this word, remarks, that *hymn* is properly a song of joy, full of the praises of God: by which, according to him, it is distinguished from *threnia*, which is a mourning song, full of lamentation.

St Hilary, bishop of Poitiers, is said to have been the first that composed hymns to be sung in churches, and was followed by St Ambrose. Most of those in the Roman Breviary were composed by Prudentius. They have been translated into French verse by Messieurs de Port Royal.—In the Greek Liturgy there are four kinds of hymns; but the word is not taken in the sense of a praise offered in verse, but simply of a laud or praise. The angelic hymn, or *Gloria in excelsis*, makes the first kind; the *trifagion* the second; the *Cherubic hymn*, the third; and the hymn of *victory and triumph* called *ἐκτάσις*, the last.

The hymns or odes of the ancients, generally consisted of three stanzas or couplets; the first called *Strophe*, the second *antistrophe*, and the last *epode*.

HYMMETTUS (anc. geog.), a mountain of Attica near Athens, famous for its marble quarries, and for its excellent honey. *Hymettius* the epithet. Pliny says that the orator Crassus was the first who had marble columns from this place.

HYOIDES, in anatomy, a bone placed at the root of the tongue. See **ANATOMY**, n° 27.

HYOSCYAMUS, **HEMBANE**; a genus of the monogynia order, belonging to the pentandria class of plants. There are several species, one of which, viz. the niger, or common henbane, is a native of Britain. It grows on road-sides, and among rubbish. It is a biennial plant, with long fleshy roots which strike deep into the ground, sending out several large soft leaves, deeply slashed on their edges; the following spring the stalks come up, which are about two feet high, garnished with flowers standing on one side in a double row, sitting close to the stalks alternately. They are of a dark purplish colour, with a black bottom; and are succeeded by roundish capsules which open with a lid at the top, and have two cells filled with small irregular seeds.—The seeds, leaves, and roots of this plant, as well as of all other species of this genus, are poisonous: and many well attested instances of their bad effects are recorded; madness, convulsions, and death, being the common consequence. In a smaller dose, they occasion giddiness and stupor. It is said that the leaves scattered about a house will drive away mice.—The juice of the plant evaporated to an extract, is ordered by the Edinburgh college in some cases as a narcotic, in which respect undoubtedly it may be a powerful medicine if properly managed. The dose is from half a scruple to half a dram.—Goats are not fond of the plant; horses, cows, sheep, and swine,

refuse it.

HYO-THYROIDES, in anatomy, one of the muscles belonging to the os hyoides. See **ANATOMY**, *Table of the Muscles*.

HYPALLAGE, among grammarians, a species of hyperbaton, consisting in a mutual permutation of one case for another. Thus Virgil says, *Dare clasibus austros*, for *dare classes austris*; and again, *Necdum illis labra admoxi*, for *necdum illa labris admoxi*.

HYPANTE, or **HYPERPANTE**, a name given by the Greeks to the feast of the presentation of Jesus in the temple.—This word, which signifies *lowly* or *humble meeting*, was given to this feast from the meeting of old Simon and Anna the prophetess in the temple when Jesus was brought thither.

HYPATIA, a learned and beautiful lady of antiquity, the daughter of Theon a celebrated philosopher and mathematician, and president of the famous Alexandrian school, was born at Alexandria about the end of the fourth century. Her father, encouraged by her extraordinary genius, had her educated not only in all the ordinary qualifications of her sex, but caused her likewise to be instructed in the most abstruse sciences. She made such great progress in philosophy, geometry, astronomy, and the mathematics, that she passed for the most learned person of her time. At length she was thought worthy to succeed her father in that distinguished and important employment, the government of the school of Alexandria; and to teach out of that chair where Ammonius, Hierocles, and many other great men, had taught before; and this at a time too when men of great learning abounded both at Alexandria and in many other parts of the Roman empire. Her fame was so extensive, and her worth so universally acknowledged, that we cannot wonder if she had a crowded auditory. “She explained to her hearers, (says Socrates), the several sciences that go under the general name of philosophy; for which reason there was a confluence to her, from all parts, of those who made philosophy their delight and study.” One cannot represent to himself without pleasure, the flower of all the youth of Europe, Asia, and Africa, sitting at the feet of a very beautiful lady, (for such we are assured Hypatia was), all greedily swallowing instruction from her mouth, and many of them, doubtless, love from her eyes; though we are not sure that she ever listened to any solicitations, since Suidas, who talks of her marriage with Isidorus, yet relates at the same time that she died a maid.

Her scholars were as eminent as they were numerous; one of whom was the celebrated Synesius, who was afterwards bishop of Ptolemais. This ancient Christian Platonist every where bears the strongest, as well as the most grateful testimony of the virtue of his tutors; and never mentions her without the most profound respect, and sometimes in terms of affection coming little short of adoration. But it was not Synesius only, and the disciples of the Alexandrian school, who admired Hypatia for her virtue and learning: never was woman more caressed by the public, and yet never woman had a more unspotted character. She was held as an oracle for her wisdom, which made her consulted by the magistrates in all important cases; and this frequently drew her among the greatest concourse of men, without the least censure of her manners.

Hypatia
||
Hyperba-
ton.

In a word, when Nicephorus intended to pass the highest compliment on the princess Eudocia, he thought he could not do it better than by calling her another *Hypatia*.

While Hypatia thus reigned the brightest ornament of Alexandria, Orestes was governor of the same place for the emperor Theodosius, and Cyril was bishop or patriarch. Orestes having had a liberal education, could not but admire Hypatia; and as a wife governor frequently consulted her. This, together with an aversion which Cyril had against Orestes, proved fatal to the lady. Above 500 monks assembling, attacked the governor one day, and would have killed him, had he not been rescued by the townsmen; and the respect which Orestes had for Hypatia causing her to be traduced among the Christian multitude, they dragged her from her chair, tore her to pieces, and burned her limbs. Cyril is not clear from a suspicion of fomenting this tragedy. Cave indeed endeavours to remove the imputation of such an horrid action from the patriarch; and lays it upon the Alexandrian mob in general, whom he calls *levisimum hominum genus*, "a very trifling inconstant people." But though Cyril should be allowed neither to have been the perpetrator, nor even the contriver of it, yet it is much to be suspected that he did not discountenance it in the manner he ought to have done; which suspicion must needs be greatly confirmed by reflecting, that he was so far from blaming the outrage committed by the monks upon Orestes, that he afterwards received the dead body of Ammonius, one of the most forward in that outrage, who had grievously wounded the governor, and who was justly punished with death. Upon this riotous ruffian Cyril made a panegyric in the church where he was laid, in which he extolled his courage and constancy, as one that had contended for the truth; and changing his name to *Thaumastus*, or the "Admirable," ordered him to be considered as a martyr. "However, (continues Socrates), the wisest part of Christians did not approve the zeal which Cyril shewed on this man's behalf, being convinced that Ammonius had justly suffered for his desperate attempt."

HYPECOUM, *WILD CUMIN*; a genus of the dymnia order, belonging to the tetrandria class of plants. There are four species, all of them low herbaceous plants with yellow flowers. The juice of these plants is of a yellow colour, resembling that of celandine, and is affirmed by some eminent physicians to be as narcotic as opium. From the nectarium of the blossom the bees collect great quantities of honey. All the species are easily propagated by seeds.

HYPER, a Greek preposition frequently used in composition, where it denotes excess; its literal signification being *above*, or *beyond*.

HYPERBATON, in grammar, a figurative construction inverting the natural and proper order of words and sentences. The several species of the hyperbaton are, the anastrophe, the hysteron-proteron, the hypallage, synchysis, tmesis, parenthesis, and the hyperbaton strictly so called. See *ANASTROPHE*, &c.

HYPERBATON, strictly so called, is a long retention of the verb which completes the sentence, as in the following example from Virgil.

Interea Reges: ingenti mole Latinus

*Quadrifugo vehitur curru, cui tempora circum
Aurati bis sex radii fulgentia cingunt,
Solis avi specimen: bigis it Turnus in albis
Bino manu lato crispans hostilia ferro:
Hinc Pater Æneas, Romanæ stirpis origo,
Sideræo flagrans clypeo et celestibus armis;
Et juxta Ascanius, magnæ spes altera Romæ:
Procedunt Castris.*

HYPERBOLA, a curve formed by cutting a cone in a direction parallel to its axis. See *CONIC SECTIONS*.

HYPERBOLE, in rhetoric, a figure, whereby the truth and reality of things are excellently either enlarged or diminished. See *ORATORY*, n° 58.

An object uncommon with respect to size, either very great of its kind or very little, strikes us with surprise; and this emotion forces upon the mind a momentary conviction that the object is greater or less than it is in reality: the same effect, precisely, attends figurative grandeur or littleness; and hence the hyperbole, which expresses this momentary conviction. A writer, taking advantage of this natural delusion, enriches his description greatly by the hyperbole: and the reader, even in his coolest moments, relishes this figure, being sensible that it is the operation of nature upon a warm fancy.

It cannot have escaped observation, that a writer is generally more successful in magnifying by a hyperbole than in diminishing. The reason is, that a minute object contracts the mind, and fetters its powers of imagination; but that the mind, dilated and inflamed with a grand object, moulds objects for its gratification with great facility. Longinus, with respect to a diminishing hyperbole, cites the following ludicrous thought from a comic poet: "He was owner of a bit of ground not larger than a Lacedæmonian letter." But, for the reason now given, the hyperbole has by far the greater force in magnifying objects; of which take the following examples:

For all the land which thou seest, to thee will I give it, and to thy seed for ever. And I will make thy seed as the dust of the earth: so that if a man can number the dust of the earth, then shall thy seed also be numbered. *Gen. xiii. 15. 16.*

*Illæ vel intactæ segetibus per summa volaret
Gramina: nec teneras cursu læsisset aristas.*

Æneid. vii. 808.

— — — — — Atque imo barathri ter gurgite vastos
Sorbet in abruptum fluctus, rursusque sub auras
Erigit alternos, et sidera verberat unda.

Æneid. iii. 421.

— — — — — Horrificis juxta tonat Ætna ruinis,
Interdumque atram prorumpit ad æthera nubem,
Turbine fumantem piceo et candente favilla:
Attollitque globos flammæ, et sidera lambit.

Æneid. iii. 571.

Speaking of Polyphemus,

— — — — — Ipse arduus, atque pulsata
Sidera.

Æneid. iii. 619.

— — — — — When he speaks,
The air, a charter'd libertine, is still.

Henry V. act 1. sc. 1.

Now shield with shield, with helmet helmet clos'd,
To armour armour, lance to lance oppos'd,
Host against host with shadowy squadrons drew,
The founding darts in iron tempests flew,
Victors and vanquish'd join promiscuous cries,
And shilling shouts and dying groans arise;
With streaming blood the slippery fields are dy'd,
And slaughter'd heroes swell the dreadful tide.

Iliad iv. 508.

Quintilian is sensible that this figure is natural: "For, (says he), not contented with truth, we naturally incline to augment or diminish beyond it; and for that reason the hyperbole is familiar even among the vulgar and illiterate:" and he adds, very justly, "That the hyperbole is then proper, when the object of itself exceeds the common measure." From these premises, one would not expect the following inference, the only reason he can find for justifying this figure of speech, "Conceditur enim amplius dicere, quia dici quantum est, non potest: meliusque ultra quam citra fiat oratio." (We are indulged to say more than enough, because we cannot say enough; and it is better to be above than under.) In the name of wonder, why this slight and childish reasoning, when immediately before he had observed, that the hyperbole is founded on human nature? We could not resist this personal stroke of criticism; intended not against our author, for no human creature is exempt from error; but against the blind veneration that is paid to the ancient classic writers, without distinguishing their blemishes from their beauties.

Having examined the nature of this figure, and the principle on which it is erected; let us proceed to the rules by which it ought to be governed. And, in the first place, it is a capital fault, to introduce an hyperbole in the description of an ordinary object or event; for in such a case, it is altogether unnatural, being destitute of surprise, its only foundation. Take the following instance, where the subject is extremely familiar, viz. swimming to gain the shore after a shipwreck,

I saw him beat the surges under him,
And ride upon their backs: he trod the water;
Whose enmity he flung aside, and breast'd
The surge most swollen that met him: his bold head
'Bove the contentuous waves he kept, and oar'd
Himself with his good arms, in lusty strokes
To th' shore, that o'er his wave-born basis bow'd,
As stooping to relieve him. *Tempest*, act 2. sc. 1.

In the next place it may be gathered from what is said, that an hyperbole can never suit the tone of any dispiriting passion: sorrow in particular will never prompt such a figure, and for that reason the following hyperboles must be condemned as unnatural:

K. Rich. Aumerle, thou weep'st, my tender-hearted cousin!

We'll make foul weather with despid tears;
Our signs, and they, shall lodge the summer-corn,
And make a dearth in this revolving land.

Richard II. act 3. sc. 6.

Draw them to Tyber's bank, and weep your tears
Into the channel, till the lowest stream

Do kiss the most exalted shores of all.

Julius Cæsar, act 1. sc. 1.

Thirdly, A writer, if he wish to succeed, ought always to have the reader in his eye: he ought, in particular, never to venture a bold thought or expression, till the reader be warmed and prepared. For this reason, an hyperbole in the beginning of a work can never be in its place. Example:

Jam pauca aratro jugera regie

Moles relinquunt. *Horat. Carm. lib. 2. ode 15.*

In the fourth place, The nicest point of all, is to ascertain the natural limits of an hyperbole, beyond which being overstrained it has a bad effect. Longinus, (chap. iii.) with great propriety of thought, enters a caveat against an hyperbole of this kind: he compares it to a bow-string, which relaxes by overstraining, and produceth an effect directly opposite to what is intended. To ascertain any precise boundary, would be difficult, if not impracticable. We shall therefore only give a specimen of what may be reckoned overstrained hyperboles. No fault is more common among writers of inferior rank; and instances are found even among those of the finest taste; witness the following hyperbole, too bold even for an Hotspur.

Hotspur, talking of Mortimer:

In single opposition hand to hand,

He did confound the best part of an hour

In changing hardiment with great Glendower.

Three times they breath'd, and three times did they drink,

Upon agreement, of swift Severn's flood;

Who then affrighted with their bloody looks,

Ran fearfully among the trembling reeds,

And hid his crisp'd head in the hollow bank,

Blood-stained with these valiant combatants.

First Part Henry IV. act 1. sc. 4.

Speaking of Henry V.

England ne'er had a King until his time.

Virtue he had, deserving to command:

His brandish'd sword did blind men with its beams:

His arms spread wider than a dragon's wings:

His sparkling eyes, replete with awful fire,

More dazzled, and drove back his enemies,

Than mid-day sun fierce bent against their faces.

What should I say? his deeds exceed all speech:

He never lifted up his hand, but conquer'd.

First Part Henry VI. act 1. sc. 1.

Lastly, An hyperbole, after it is introduced with all advantages, ought to be comprehended within the fewest words possible: as it cannot be relished but in the hurry and swelling of the mind, a leisurely view dissolves the charm, and discovers the description to be extravagant at least, and perhaps also ridiculous. This fault is palpable in a sonnet which passeth for one of the most complete in the French language: Phillis, in a long and florid description, is made as far to outshine the sun as he outshines the stars:

Le silence regnoit sur la terre et sur l'onde,
L'air devenoit ferein et l'Olimp vermeil,

Hyperbo-
rean
||
Hyperia.

Et l'amoureux Zephir affranchi du foyel,
Reffusitoit les fleurs d'une haleine seconde.

L'Aurore deployoit l'or de sa tresse blonde,
Eet semoit de rubis le chemin du soleil ;
Enfin ce Dieu venoit au plus grand appareil
Qu'il soit jamais venu pour éclairer le monde :

Quand la jeune Philis au visage riant,
Sortant de son palais plus clair que l'orient,
Fit voir une lumiere et plus vive et plus belle.

Sacre flambeau du jour, n'en soiez point jaloux,
Vous parutes alors aussi peu devant elle,
Que les feux de la nuit avoient fait devant vous.

Malleville.

There is in Chaucer a thought expressed in a single line, which sets a young beauty in a more advantageous light than the whole of this much laboured poem :

Up rose the sun, and up rose Emelie.

HYPERBOREAN, in the ancient geography. The ancients denominated those people and places *Hyperborean*, which were to the northward of the Scythians. They had but very little acquaintance with these *Hyperborean* regions ; and all they tell us of them is very precarious, much of it false. Diodorus Siculus says, the *Hyperboreans* were thus called by reason they dwelt beyond the wind *Boreas* ; *υπερ* signifying " above, or beyond," and *βορρας*, *Boreas*, the " north wind." This etymology is very natural and plausible ; notwithstanding all that Rudbeck has said against it, who would have the word to be Gothic, and to signify *nobility*. Herodotus doubts, whether or no there were any such nations as the *Hyperborean*. Strabo, who professes that he believes there are, does not take *hyperborean* to signify *beyond Boreas* or the north, as Herodotus understood it : the preposition *υπερ*, in this case, he supposes only to help to form a superlative ; so that *hyperborean*, on his principle, means no more than *most northern* : by which it appears the ancients scarce knew themselves what the name meant.

HYPERCATALECTIC, in the Greek and Latin poetry is applied to a verse that has one or two syllables too much, or beyond the regular and just measure ; as,

Muse sorores sunt Minervæ :

Alfo,

Muse sorores Palladis lugent.

HYPERCRITIC, an over-rigid censor, or critic : one who will let nothing pass, but animadvert severely on the slightest fault. See *CRITICISM*. The word is compounded of *υπερ*, *super*, " over, above, beyond," and *κριτικος*, of *κρισις*, *judex*, of *κρινω*, *judico*, " I judge."

HYPERDULIA, in the Romish theology, is the worship rendered to the holy virgin. The word is Greek, *υπερδουλια*, composed of *υπερ*, *above*, and *δουλια*, *worship, service*. The worship offered to saints is called *dulia* ; and that to the mother of God, *hyperdulia*, as being superior to the former.

HYPERIA (anc. geog.), the seat of the Phæacians near the Cyclops, (Homer) : some commentators

take it to be Camarina in Sicily ; but, according to others, supposed to be an adjoining island, which they take to be Melita, lying in sight of Sicily. And this seems to be confirmed by Apollonius Rhodius. Whence the Phæacians afterwards removed to Corcyra, called *Scheria*, *Phæacia*, and *Maëris* ; having been expelled by the Phœnicians, who settled in Melita for commerce, and for commodious harbours, before the war of Troy. (Diodorus Siculus.)

HYPERICUM, St JOHN'S WORT ; a genus of the polyandria order, belonging to the polyadelphia class of plants.

Species. Of this genus there are 29 species, most of them hardy deciduous shrubs, and under-shrubby plants, adorned with oblong and oval simple foliage, and pentapetalous yellow flowers in clusters. The most remarkable are, 1. The *hircinum*, or Stinking St John's-wort. This rises three or four feet high, with several shrubby two-edged stalks from the root, branching by pairs opposite at every joint ; oblong, oval, close-fitting opposite leaves ; and, at the ends of all the young shoots, clusters of yellow flowers. Of this there are three varieties ; one with strong stalks, six or eight feet high, broad leaves, and large flowers ; the other with strong stalks, broad leaves, and without any disagreeable odour ; the third hath variegated leaves. All these varieties are shrubby ; and flower in June and July in such numerous clusters, that the shrubs appear covered with them ; and produce abundance of seed in autumn. 2. The *canariensis* hath shrubby stalks, dividing and branching six or seven feet high ; oblong, close-fitting leaves by pairs ; and, at the ends of the branches, clusters of yellow flowers appearing in June and July. 3. The *ascyron*, or dwarf American St John's-wort, hath spreading roots, sending up numerous, slender, square stalks, a foot long ; oval, spear-shaped, close-fitting, smooth leaves by pairs opposite ; and, at the ends of the stalks, large yellow flowers. 4. The *androsemum*, commonly called *tuslan*, or *park-leaves*, hath an upright under-shrubby stalk, two feet high, branching by pairs opposite ; and at the ends of the stalks, clusters of small yellow flowers appearing in July and August, and succeeded by roundish berry-like black capsules. This grows naturally in many parts of Britain. 5. The *balearicum*, or wart-leaved St John's-wort, is a native of Majorca ; and hath a shrubby stalk, branching two feet high, with reddish scarified branches, small oval leaves warted underneath, and large yellow flowers appearing great part of the year. 6. The *monogynum*, or one-styled *China hypericum*, hath a shrubby purplish stalk, about two feet high ; oblong, smooth, stiff, close-fitting leaves, of a shining green above, and white underneath ; clusters of small yellow flowers, with coloured cups, and only one style, flowering the greatest part of the year. 7. The *lasianthus*, or Surinam St John's-wort, hath shrubby stalks, branching a yard high ; spear-shaped serrated leaves ; hoary underneath, and yellow flowers from the axillæ of the stalks. It is a native of Surinam and Carolina.

Culture. The four first species are hardy, and will grow in any soil or situation ; the three last must be potted, in order to have shelter in the green-house in winter. The two first species propagate very fast by suckers, which are every year sent up plentifully from the

Hyperic

the root; and in autumn or spring may be readily slipped off from the old plants with roots to each, or the whole plant may be taken up and divided into as many parts as there are suckers and slips with roots, planting the strongest where they are to remain, and the weakest in nursery-rows, where they are to remain a year in order to acquire strength. They may also be propagated by seeds sown in autumn, in a bed of common earth, in drills an inch deep. The other two hardy sorts are also propagated by slipping the roots in autumn, or early in the spring; and may likewise be raised in great plenty from seeds. The three other species are propagated by layers and cuttings, planted in pots, and plunged in a hot-bed.

Properties. The tuffan hath long held a place in the medicinal catalogues; but its uses are very much undetermined. The leaves given in substance are said to destroy worms. By distillation they yield an essential oil. The flowers tinge spirits and oils of a fine purple colour. Cows, goats, and sheep, eat the plant; horses and swine refuse it. The dried plant boiled in water with alum, dyes yarn of a yellow colour; and the Swedes give a fine purple tinge to their spirits with the flowers.

HYPERIDES, an orator of Greece, was the disciple of Plato and Isocrates, and governed the republic of Athens. He defended with great zeal and courage the liberties of Greece; but was put to death by Antipater's order, 322 B. C. He composed many orations, of which only one now remains. He was one of the ten celebrated Greek orators.

HYPERMNESTRA, in fabulous history, one of the 50 daughters of Danaus king of Argos. She alone refused to obey the cruel order Danaus had given to all his daughters, to murder their husbands the first night of their marriage; and therefore saved the life of Lynceus, after she had made him promise not to violate her virginity. Danaus, enraged at her disobedience, confined her closely in prison, whence Lynceus delivered her some time after.

HYPERSARCOSIS, in medicine and surgery, an excess of flesh, or rather a fleshy excrescence, such as those generally arising upon the lips of wounds, &c.

HYPHEN, an accent or character in grammar, implying that two words are to be joined, or connected into one compound word, and marked thus -; as *pre-estallish'ded, five-leaved, &c.* Hyphens also serve to connect the syllables of such words as are divided by the end of the line.

HYPNOTIC, in the materia medica, such medicines as any way produce sleep, whether called *narcotics, hypnotics, opiates, or soporifics.*

HYPNOTICUS SERPENS, the *Sleep-snake*, in zoology, the name of an East-Indian species of serpent, called by the Ceylonese *nintipolong*, a word importing the same sense. It is of a deep blackish brown, variegated with spots of white, and is a very fatal kind in its poison; its bite always bringing on a sleep which ends in death.

HYPNUM, FEATHER-MOSS; a genus of the order of mosses, belonging to the cryptogamia class of plants. There are 46 species, all of them natives of Great Britain; none of them, however, have any remarkable property, except the proliiferum and parietinum. The

first is of a very singular structure, one shoot growing out from the centre of another; the veil is yellow and shining; the lid with a kind of long bill; the leaves not shining; sometimes of a yellowish, and sometimes of a deep green. This moss covers the surface of the earth in the thickest shades, through which the sun never shines, and where no other plant can grow. The second hath shoots nearly flat and winged, undivided for a considerable length, and the leaves shining; but the old shoots do not branch into new ones as in the preceding species. It grows in woods and shady places; and, as well as the former, is used for filling up the chinks in wooden houses.

HYPOBOLE. See ORATORY, n° 81.

HYPOCAUSTUM, among the Greeks and Romans, a subterraneous place, where was a furnace to heat the baths. The word is Greek, formed of the preposition *υπο*, under; and the verb *καίω*, to burn.—Another sort of hypocaustum was a kind of kiln to heat their winter-parlours. The remains of a Roman hypocaustum, or sweating-room, were discovered under ground at Lincoln in 1739. We have an account of these remains in the Philosophical Transactions, n° 461. § 29.—Among the moderns, the hypocaustum is that place where the fire is kept, which warms a stove or hot-house.

HYPOCHERIS, HAWK'S-EYE; a genus of the polygamia aequalis order, belonging to the syngenesia class of plants. There are four species; none of which have any remarkable property, except the maculata, or spotted hawk's-eye. It is a native of Britain, and grows on high grounds. The leaves are oblong, egg-shaped, and toothed; the stem almost naked, generally with a single branch; the blossoms yellow, opening at six in the morning, and closing at four in the afternoon. The leaves are boiled and eaten like cabbage. Horses are fond of this plant when green, but not when dry. Cows, goats, and swine eat it; sheep are not fond of it.

HYPOCHONDRIA, in anatomy, a space on each side the epigastric region, or upper part of the abdomen. See ANATOMY, n° 349, d.

HYPOCHONDRIAC PASSION, a disease in men, similar to the hysteric affection in women. See (the *Index* subjoined to) MEDICINE.

HYPOCISTIS, in the materia medica, an inspissated juice obtained from the cistle asarum, much resembling the true Egyptian acacia. They gather the fruit while unripe, and express the juice, which they reevaporate over a very gentle fire, to the consistence of an extract, and then form into cakes, and expose them to the sun to dry. It is an astringent of considerable power; is good against diarrhoeas and hæmorrhages of all kinds; and may be used in redellent gargarisms in the manner of the true acacia; but it is very rarely met with genuine in our shops, the German acacia being usually sold under its name.

HYPOGASTRIC, an appellation given to the intestinal branch of the iliac artery.

HYPOGASTRIUM, in anatomy, the middle part of the lower region of the belly. See ANATOMY, n° 349, d.

HYPOPYON, in medicine, a collection of purulent matter under the corner of the eye.

Hypothec
Hypothes.

HYPOTHEC, in law, a right of security established by law to creditors upon the goods and effects of their debtors, for the payment of certain debts.

HYPOTHENUSE, in geometry, the longest side of a right-angled triangle, or that which subtends the right-angle.

HYPOTASIS, a Greek term, literally signifying *substance*, or *substance*; used in theology for *person*.—The word is Greek, *υποταξις*; compounded of *υπο*, *sub*, “under;” and *ταξις*, *sto, existo*, “I stand, I exist;” q. d. *sub-sistentia*. Thus we hold, that there is but one nature or essence in God, but three *hypostases* or persons.

The term *hypostasis* is of a very ancient standing in the church. St Cyril repeats it several times, as also the phrase *union according to hypostasis*. The first time it occurs is in a letter from that father to Nestorius, where he uses it instead of *συνουσιαστων*, the word we commonly render *person*, which did not seem expressive enough. “The philosophers (says St Cyril) have allowed three *hypostases*: They have extended the Divinity to three *hypostases*: They have even sometimes used the word *trinity*: And nothing was wanting but to have admitted the consubstantiality of the three *hypostases*, to shew the unity of the divine nature, exclusive of all triplicity in respect of distinction of nature, and not to hold it necessary to conceive any respective inferiority of *hypostases*.”

This term occasioned great dissensions in the ancient church; first among the Greeks, and afterwards also among the Latins. In the council of Nice, *hypostasis* was defined to denote the same with *essence* or *substance*; so that it was hereby to say that Jesus Christ was of a different *hypostasis* from the Father; but custom altered its meaning. In the necessity they were under of expressing themselves strongly against the Sabellians, the Greeks made choice of the word *hypostasis*, and the Latins of *persona*; which change proved the occasion of endless disagreement. The phrase *τρεῖς υποστασεις*, used by the Greeks, scandalized the Latins, whose usual way of rendering *υποστασις* in their language was by *substantia*. The barrenness of the Latin tongue in theological phrases, allowed them but one word for the two Greek ones, *verba* and *υποστασις*; and thus disabled them from distinguishing *essence* from *hypostasis*. For which reason they chose rather to use the term *tres personae*, and *tres hypostases*.—An end was put to logomachias, in a synod held at Alexandria about the year 362, at which St Athanasius assisted; from which time the Latins made no great scruple of saying *tres hypostases*, nor the Greeks of *three persons*.

HYPOTHESIS, in general, denotes something supposed to be true, or taken for granted, in order to prove or illustrate a point in question. Hypotheses, however elegant or artful, ought to be first proved by repeated observations and constant experience, before they are received as truths.

HYPOTIPOSIS. See ORATORY, n° 91.

HYRCANIA (anc. geog.), a country of the farther Asia, lying to the south-east of the *Mare Hyrcanum* or *Caspium*; with Media on the west, Parthia on the south, and Margiana on the west. Famous for its tygers, (Virgil); for its vines, figs, and olives, (Strabo).

HYSSOPUS, *hyssop*; a genus of the gymno-

perma order, belonging to the didynamia class of plants. There are three species; but only one of them, viz. the *officinalis*, or common hyssop, is cultivated for use. This hath under-shrubby, low, bushy stalks, growing a foot and a half high; small, spear-shaped, close-fitting, opposite leaves, with several smaller ones rising from the same joint; and all the stalks and branches terminated by erect whorled spikes of flowers, of different colours in the varieties. They are very hardy plants; and may be propagated either by slips or cuttings, or by seeds. The leaves have an aromatic smell, and a warm pungent taste. Besides the general virtues of aromatics, they are particularly recommended in humoral astmas, coughs, and other disorders of the breast and lungs; and are said notably to promote expectoration.

HYSTERIC, or **HYSTERIC PASSION**. See (*Index* subjoined to) **MEDICINE**.

HYSTERON PROTERON, in grammar and rhetoric, a species of the hyperbaton, wherein the proper order of construction is so inverted, that the part of any sentence which should naturally come first is placed last: as in this of Terence, *Valet et vitit, for vivit et valet*; and in the following of Virgil, *Moriatur, & in media arma ruamus*, for *In media arma ruamus, & moriatur*.

HYSTRIX, in zoology, a genus of quadrupeds belonging to the order of glires, the characters of which are these: They have two fore-teeth, obliquely divided both in the upper and under jaw, besides eight grinders; and the body is covered with quills or prickles. There are four species, viz.

1. The *cristata*, or crested porcupine, has four toes on the fore-feet, five toes on the hind-feet, a crested head, a short tail, and the upper lip is divided like that of a hare. The length of the body is about two feet, and the height about two feet and a half. The porcupine is covered with prickles, some of them nine or ten inches long, and about $\frac{1}{2}$ of an inch thick. Like the hedge-hog, he rolls himself up in a globular form, in which position he is proof against the attacks of the most rapacious animals. The prickles are exceedingly sharp, and each of them has five large black and as many white rings, which succeed one another alternately from the root to the point. These quills the animal can erect or let down at pleasure; when irritated, he beats the ground with his hind-feet, erects his quills, shakes his tail, and makes a considerable rattling noise with his quills.

Most authors have asserted that the porcupine, when irritated, darts his quills to a considerable distance against the enemy, and that he will kill very large animals by this means. But M. Buffon, and some other late historians, assure that the animal possesses no such power. M. Buffon frequently irritated the porcupine, but never saw any thing like this darting of his quills. He says indeed, that when the creature was much agitated with passion, some of the quills which adhered but slightly to the skin, would fall off, particularly from the tail; and this circumstance, he imagines, has given rise to the mistake.

The porcupine, though originally a native of Africa and the Indies, can live and multiply in the more temperate climates of Spain and Italy. Pliny, and every other natural historian since the days of Aristotle,

tell

tells us, that the porcupine, like the bear, conceals itself during the winter, and that they bring forth their young in 80 days. But these circumstances remain to this day uncertain. It is remarkable, that although this animal be very common in Italy, no person has ever given us a tolerable history of it. We only know in general, that the porcupine, in a domestic state, is not a fierce or ill-natured animal; that with his fore-teeth, which are strong and sharp, he can cut through a strong board; that he eats bread, fruits, roots, &c.; that he does considerable damage when he gets into a garden; that he grows fat, like most animals, about the end of summer; and that his flesh is not bad food.

2. The *prehensilis*, or *cuandu*, has four toes on the fore-feet, five on the hind-feet, and a long tail. It is considerably less than the former species; being only 17 inches long from the point of the muzzle to the origin of the tail, which is nine inches long; the legs and feet are covered with long brownish hair;

the rest of the body is covered with quills interpersed with long hairs; the quills are about five inches long, and about $\frac{1}{4}$ of an inch in diameter. He feeds upon birds and small animals. He sleeps in the day like the hedge-hog, and searches for his food in the night. He climbs trees, and supports himself by twisting his tail round the branches. He is generally found in the high grounds of America from Brasil to Louisiana, and the southern parts of Canada. His flesh is esteemed very good eating.

3. The *dorsata* has four toes on the fore-feet, five on the hind-feet; and has quills only on the back, which are short, and almost hid among the long hair. He is about two feet long. He is a native of Hudson's-bay. The savages eat his flesh, and make use of his skin as a fur, after taking off the prickles.

4. The *macroura*, has five toes both on the hind and fore-feet; his tail is very long, and the prickles are elevated. He is a native of Africa and the East-Indies.

Hystrix
Jablonski.

I.

I, or *i*, the ninth letter and third vowel of the alphabet, is pronounced by throwing the breath suddenly against the palate, as it comes out of the larynx, with a small hollowing of the tongue, and nearly the same opening of the lips and talk as in pronouncing *a* or *e*. Its sound varies: in some words it is long, as *high*, *mind*, &c.; in others short, as *bid*, *hid*, *fin*, &c.; in others, again, it is pronounced like *y*, as in *collier*, *union*, &c.; and in a few, it sounds like *ee*, as in *machine*, *magazine*, &c. No English word ends in *i*, *e* being either added to it, or else the *i* turned into *y*.

But besides the vowel, there is the *jod* consonant; which, because of its different pronunciation, has likewise a different form, thus *j*, *j*. In English, it has the soft sound of *g*; nor is *j* used, but when *g* soft is required before vowels, where *g* is usually hard: thus we say, *jack*, *jet*, *join*, &c. instead of *gack*, *get*, *goin*, &c. which would be contrary to the genius of the English language.

I, used as a numeral, signifies no more than *one*, and stands for so many units as it is repeated times: thus **I**, one; **II**, two; **III**, three, &c.; and when put before a higher numeral, it subtrahes itself, as **IV**, four; **IX**, nine, &c. But when set after it, so many are added to the higher numeral, as there are **I**'s added: thus **VI** is 5+1, or six; **VII**, 5+2, or seven; **VIII**, 5+3, or eight. The ancient Romans likewise used **IO** for 500, **CIO** for 1000, **IOO** for 5000, **CCIOO** for 10,000, **IOOO** for 50,000, and **CCCCIOO** for 100,000. Farther than this, as Pliny observes, they did not go in their notation; but when necessary, repeated the last number, as **CCCCIOOO**, **CCCCIOOO**, for 200,000; **CCCCIOOO**, **CCCCIOOO**, **CCCCIOOO**, for 300,000; and so on.

The ancients sometimes changed *i* into *u*; as

ducimus for *decimus*; *maximus* for *maximus*, &c. — According to Plato, the vowel *i* is proper to express delicate but humble things, as in this verse in Virgil, which abounds in *i*'s, and is generally admired:

Accipiant inimicum imbrem, rimisque satiscunt.

I, used as an abbreviation, is often substituted for the whole word *Jesurus*, of which it is the first letter.

JABES-GALAAD, or **JABESH-GILEAD**, (anc. geogr.) a city of Judæa, lying beyond the river Jordan, called *Jabifur* and *Jabifsa* by Josephus; the metropolis of Gilead. In Jerome's time, a village on an eminence, six miles from Pella.

JABLONSKI (Daniel Ernest), a learned Polish Protestant divine, born at Dantzick in 1660. He became successively minister of Magdeburg, Lissa, Königsberg, and Berlin; and was at length ecclesiastical counsellor, and president of the academy of sciences at the latter. He took great pains to effect an union between the Lutherans and Calvinists; and wrote some works which are in good esteem, particularly Meditations on the origin of the Scriptures, &c. He died in 1741.

JABLONSKI (Theodore), counsellor of the court of Prussia, and secretary of the royal academy of sciences at Berlin, was also a man of distinguished merit. He loved the sciences, and did them honour, without that ambition which is generally seen in men of learning: it was owing to this modesty that the greatest part of his works were published without his name. He published in 1711, a French and German dictionary; a Course of Morality, in 1713; a Dictionary of Arts and Sciences, in 1721; and translated *Tacitus de moribus Germanorum* into High Dutch, in 1724.

JABNE (anc. geogr.), a town of Palestine, near Joppa; called *Jannia* or *Jannial*, by the Greeks and Romans. In *John* xv. it seems to be called *Jabneel*; but in 2 Chron. xxvi. *Jabne*. It was taken from the Philistines by Uzziah, who demolished its fortifications. Its port, called *Jannitarum portus*, lay between Joppa and Azotus.

JABOK (anc. geogr.), a river of the Peræa, the north boundary of the Amorites, running with an oblique course from the east into the river Jordan.

JACCA, an ancient town of Spain, in the kingdom of Arragon, with a bishop's see, and a fort; seated on a river of the same name, among the mountains of Jicca, which are part of the Pyrenees. W. Long. o. 19. N. Lat. 44. 22.

JACK, in mechanics, a well-known instrument of common use for raising great weights of any kind.

The common kitchen-jack is a compound engine, where the weight is the power applied to overcome the friction of the parts and the weight with which the spit is charged; and a steady and uniform motion is obtained by means of the fly.

JACK, in the sea-language, a sort of flag or colours, displayed from a mast erected on the outer end of a ship's bowsprit. In the British navy the jack is nothing more than a small union flag, composed of the intersection of the red and white crosses; but in merchant-ships this union is bordered with a red field. See the article *UNION*.

JACK-Flag, in a ship, that hoisted up at the sprit-sail top-mast head.

JACK-Daw, the English name of a species of corvus. See *CORVUS*.

This bird is very mischievous to the farmer and gardener; and is of such a thievish disposition, that he will carry away much more than he can make use of. There is a method of destroying them by a kind of springs much used in England; and is so useful, that it ought to be made universal.—A stake of about five feet long is to be driven firmly into the ground, and made so fast that it cannot move, and so sharp in the point that the bird cannot settle upon it. Within a foot of the top there must be a hole bored thro' it, of three quarters of an inch diameter; through this hole is to be put a stick of about eight inches long; then a horse-hair spring or noose is to be made fast to a thin hazel-wand, and this brought up to the place where the short stick is placed, and carried with it through the hole, the remainder being left open under that stick. The other end of the hazel rod is to be put through a hole in the stake near the ground, and fastened there. The stake is to be planted among the jack-daw's food, and he will naturally be led to settle on it; but finding the point too sharp, he will descend to the little cross stick. This will sink with his weight, and the spring will receive his leg, and hold him fast.

JACKALL, in zoology. See *CANIS*.

JACKSON (Thomas), an eminent English divine, was born at Witton in the bishopric of Durham in 1579, of a good family. He commenced doctor of divinity at Oxford in 1622; and at last was made chaplain in ordinary, prebendary of Winchester, and dean of Peterborough. He was a very great scholar; and died in 1640. His performance upon the Creed,

is a learned and valuable piece; which, with his other works, was published in 1673.

JACOB (Ben Hajim), a rabbi famous for the collection of the Masorah in 1525; together with the text of the bible, the Chaldaic paraphrase, and Rabbinical commentaries.

JACOB (Ben Naphthali), a famous rabbi of the 5th century; he was one of the principal massorets, and bred at the school of Tiberias in Palestine with Ben Afer, another principal massoret. The invention of points in Hebrew to serve for vowels, and of accents to facilitate the reading of that language, are ascribed to these two rabbis; and said to be done in an assembly of the Jews held at Tiberias, A. D. 476.

JACOB (Giles), an eminent law-writer, born at Romsey in the county of Southampton, in 1686. He was bred under a considerable attorney; and is principally known for his *Law Dictionary* in one vol. folio, which has been often printed; a new and improved edition having been lately given by counsellors Ruffhead and Morgan. Mr Jacob also wrote two dramatic pieces; and a *Postal Register*, containing the lives and characters of English dramatic poets. The time of his death is not known.

JACOBÆUS (Oliker), a celebrated professor of physic and philosophy at Copenhagen, was born in 1651 at Arhusen in the peninsula of Jutland, where his father was bishop. Christian V. intrusted him with the management of his grand cabinet of curiosities; and Frederic IV. in 1698, made him counsellor of his court of justice. He wrote many medical works, and some excellent poems.

JACOBINE MONKS, the same with *DOMINICANS*.

JACOBITES, a term of reproach bestowed on the persons who, vindicating the doctrines of passive obedience and non-resistance with respect to the arbitrary proceedings of princes, disavow the revolution in 1688, and assert the supposed rights and adhere to the interests of the late abdicated king James and his family.

JACOBITES, in church-history, a sect of Christians in Syria and Mesopotamia; so called, either from Jacob a Syrian who lived in the reign of the emperor Mauritius, or from one Jacob a monk who flourished in the year 550.

The Jacobites are of two sects, some following the rites of the Latin church, and others continuing separated from the church of Rome. There is also a division among the latter, who have two rival patriarchs. As to their belief, they hold but one nature in Jesus Christ; with respect to purgatory and prayers for the dead, they are of the same opinion with the Greeks and other eastern Christians: they consecrate unleavened bread at the eucharist, and are against confession, believing that it is not of divine institution.

JACOBUS, a gold coin, worth 25 shillings; so called from king James the first of England, in whose reign it was struck. See *COIN*.

We usually distinguish two kinds of *Jacobus*, the *old* and the *new*; the former valued at 25 shillings, weighing six pennyweight ten grains: the latter, called also *Carolus*, valued at 23 shillings; in weight five pennyweight twenty grains.

JACUÉLOT. See *JACUÉLOT*.

JACU.

Jaculator
||
Jago.

JACULATOR, or SHOOTING-FISH. See **CHETODON**.
JAFFA, the modern name of the city of **JOPPA** in Judæa.

JAFNAPATAN, a sea-port town, seated at the north-east end of the island of Ceylon in the East Indies. The Dutch took it from the Portuguese in 1658, and have continued in the possession of it since that time. They export from thence great quantities of tobacco, and some elephants, which are accounted the most docile of any in the whole world. E. Long. 80. 25. N. Lat. 9. 30.

JAGENDORF, a town and castle of Silesia, capital of a province of the same name, seated on the river Oppa. E. Long. 17. 47. N. Lat. 50. 4.

St JAGO, a large river of South America, which rises in the audience of Quito and Peru. It is navigable; and falls into the South Sea, after having watered a fertile country abounding in cotton-trees, and inhabited by wild Americans.

St Jago, the largest, most populous and fertile of the Cape Verd islands on the coast of Africa, and the residence of the Portuguese viceroy. It lies about 13 miles eastward from the island of Mayo, and abounds with high barren mountains; but the air, in the rainy season, is very unwholesome to strangers. Its produce is sugar, cotton, wine, and some excellent fruits. The animals are black cattle, horses, asses, deer, goats, hogs, civet-cats, and some very pretty green monkeys with black faces.

St JAGO, a handsome and considerable town of South America, the capital of Chili, with a good harbour, a bishop's see, and a royal audience. It is seated in a large and beautiful plain, abounding with all the necessities of life, at the foot of the Cordilleras, on the river Mapocho, which runs across it from east to west. Here are several canals and a dyke, by means of which they water the gardens and cool the streets.—It is very much subject to earthquakes. W. Long. 69. 35. S. Lat. 33. 40.

St JAGO de Cuba, a town of North America, situated on the southern coast of the island of Cuba in the bottom of a bay with a good harbour, and on a river of the same name. W. Long. 76. 44. N. Lat. 20. 0.

JAGO de los Caballeros, a town of America, and one of the principal of the island of Hispaniola. It is seated on the river Yague, in a fertile soil, but bad air. W. Long. 70. 5. N. Lat. 19. 40.

St JAGO del Entero, a town of South America, one of the most considerable of Tucuman, and the usual residence of the inquisitor of the province. It is seated on a large river, in a flat country, where there is game, tygers, guanacos, commonly called *camel sheep*, &c.

JAGO de la Vega, otherwise called *Spanish-town*, is the capital of the island of Jamaica, in America, where the assembly and the grand courts of justice are held. It is seated in a fine pleasant valley, on the banks of the Rio Cobre. It was once a large, populous place, containing 2000 houses, two churches, a monastery, and several private chapels; but it is now reduced to a small compass, and has only one fine church, and a chapel, with about 500 inhabitants. Being an inland place, its trade is small; but several wealthy merchants and gentlemen reside there, living in a gay manner. There are a great number of

coaches; and they have lately got a playhouse, with good actors. It is seated near the south-east part of the island, in W. Long. 76. 45. N. Lat. 18. 20.

JAQUAR, a name given to the Brazilian once, a species of **FELIS**.—It grows to the size of a wolf: its hair of a bright tawny colour; the breast and belly whitish; the tail shorter than the body, the upper part deep tawny, marked irregularly with black spots. It inhabits the hottest parts of South America from the Isthmus of Darien to Buenos Ayres; is fierce, and destructive to man and beast. Like the tiger, it plunges its head into the body of its prey, and sucks out the blood before it devours it; makes a great noise like the howling of a hungry dog; and is a very cowardly animal, easily put to flight either by the shepherd dogs or by a lighted torch, being very fearful of fire. It lies in ambush near the sides of rivers.—There is sometimes seen a singular combat between this animal and the crocodile: when the jaquar comes to drink, the crocodile, ready to surprise any animal that approaches, raises its head out of the water; the former strikes its claws into the eyes, the only penetrable part of this dreadful reptile, who immediately dives under water, pulling his enemy along with him, where they commonly both perish.

JAIL-FEVER, a very dangerous distemper of the contagious kind, arising from the putrescent disposition of the blood and juices. See (the *Index* subjoined to) **MEDICINE**.

JALAP, in botany and the materia medica, the root of a species of convolvulus or bind-weed. See **CONVOLVULUS**.

This root is brought to us in thin transverse slices from Xalapa, a province of New Spain. Such pieces should be chosen as are most compact, hard, weighty, dark-coloured, and abound most with circular fibres. Slices of bryony root are said to be sometimes mixed with jalap; but these may be easily distinguished by their whiter colour and less compact texture. Jalap has no smell, and very little taste upon the tongue; but when swallowed it affects the throat with a sense of heat, and occasions a plentiful discharge of saliva.—Taken in substance in a dose of about half a dram, (less or more according to the circumstances of the patient), in plethoric or cold phlegmatic habits, it proves an effectual and in general a safe purgative, performing its office mildly, seldom occasioning nausea or gripes which too frequently accompany the other strong cathartics. In hypochondriacal disorders, and hot bilious habits, it gripes violently if the jalap is good; but rarely takes due effect as a purge. An extract made by water purges almost universally, but weakly; and at the same time has a considerable effect by urine. The root remaining after this process, gripes violently. The pure resin prepared with spirit of wine occasions most violent gripings and other terrible symptoms, but scarce proves at all cathartic; triturated with sugar, or with almonds into the form of an emulsion, or dissolved in spirit and mixed with syrups, it purges plentifully in a small dose, without occasioning much disorder. The part of the jalap remaining after the separation of the resin yields to water an extract which has no effect as a cathartic, but operates powerfully by urine.—Hoffman particularly cautions against giving jalap to children; and assures us, that it will

Jaquar
||
Jalap.

will destroy appetite, weaken the body, and perhaps occasion even death: but herein he is contradicted by Geoffroy; who observes, that children whose vessels are lax, and the food soft and lubricating, bear these kinds of medicines better than adults.—Certain it is, however, that jalap, when given to children, most frequently proves emetic as well as cathartic.

JAMAICA, an island of the West Indies, the largest of the Antilles, lying between 17° and 19° N. Lat. and between 76° and 79° W. Long.; in length near 170 miles, and about 60 in breadth. It approaches in its figure to an oval. The windward passage right before it hath the island of Cuba on the west, and Hispaniola on the east, and is about 20 leagues in breadth.

This island was discovered by admiral Christopher Columbus in his second voyage, who landed upon it May 5. 1494; and was so much charmed with it, as always to prefer it to the rest of the islands; in consequence of which, his son chose it for his dukedom. It was settled by Juan de Esquivel A. D. 1509, who built the town, which, from the place of his birth, he called *Seville*, and 11 leagues farther to the east stood Melilla. Oritan was on the fourth side of the island, seated on what is now called *Blue Fields River*. All these are gone to decay; but St Jago, now Spanish Town, is still the capital. The Spaniards held this country 160 years, and in their time the principal commodity was cacao; they had an immense flock of horses, asses, and mules, and prodigious quantities of cattle. The English landed here under Penn and Venables, May 11, 1654, and quickly reduced the island. Cacao was also their principal commodity till the old trees decayed, and the new ones did not thrive; and then the planters from Barbadoes introduced sugar-canes, which hath been the great staple ever since.

The prospect of this island from the sea, by reason of its constant verdure, and many fair and safe bays, is wonderfully pleasant. The coast, and for some miles within, the land is low; but removing farther, it rises and becomes hilly. The whole isle is divided by a ridge of mountains running east and west, some rising to a great height: and these are composed of rock, and a very hard clay; through which, however, the rains that fall incessantly upon them, have worn long and deep cavities, which they call *gullies*. These mountains, however, are far from being unpleasant, as they are crowned even to their summits by a variety of fine trees. There are also about a hundred rivers that issue from them on both sides; and, though none of them are navigable for any thing but canoes, are both pleasing and profitable in many other respects. The climate, like that of all countries between the tropics, is very warm towards the sea, and in marshy places unhealthy; but in more elevated situations, cooler; and, where people live temperately, to the full as wholesome as in any part of the West Indies. The rains fall heavy for about a fortnight in the months of May and October; and as they are the cause of fertility, are styled seasons. Thunder is pretty frequent, and sometimes showers of hail: but ice or snow, except on the tops of the mountains, are never seen; but on them, and at no very great height, the air is exceedingly cold.

The most eastern parts of this ridge are famous under the name of the *Blue Mountains*. This great chain of rugged rocks defends the south side of the

island from those boisterous north-west winds, which might be fatal to their produce. Their streams, though small, supply the inhabitants with good water, which is a great blessing, as their wells are generally brackish. The Spaniards were persuaded that these hills abounded with metals: but we do not find that they wrought any mines; or if they did, it was only copper, of which they said the bells in the church of St Jago were made. They have several hot springs, which have done great cures. The climate was certainly more temperate before the great earthquake; and the island was supposed to be out of the reach of hurricanes, which since then it hath severely felt. The heat, however, is very much tempered by land and sea breezes; and it is asserted, that the hottest time of the day is about eight in the morning. In the night, the wind blows from the land on all sides, so that no ships can then enter their ports.

In an island so large as this, which contains above five millions of acres, it may be very reasonably conceived that there are great variety of soils. Some of these are deep, black, and rich, and mixed with a kind of potter's earth; others shallow and sandy; and some of a middle nature. There are many savannahs, or wide plains, without stones, in which the native Indians had luxuriant crops of maize, which the Spaniards turned into meadows, and kept in them prodigious herds of cattle. Some of these savannahs are to be met with even amongst the mountains. All these different soils may be justly pronounced fertile, as they would certainly be found, if tolerably cultivated, and applied to proper purposes. A sufficient proof of this will arise from a very cursory review of the natural and artificial produce of this spacious country.

It abounds in maize, pulse, vegetables of all kinds, meadows of fine grass, a variety of beautiful flowers, and as great a variety of oranges, lemons, citrons, and other rich fruits. Useful animals there are of all sorts, horses, asses, mules, black cattle of a large size, and sheep, the flesh of which is well tasted, though their wool is hairy and bad. Here are also goats and hogs in great plenty; sea and river fish; wild, tame, and water fowl. Amongst other commodities of great value, they have the sugar-cane, cacao, indigo, pimento, cotton, ginger, and coffee; trees for timber and other uses, such as mahogany, manchineel, white wood, which no worm will touch, cedar, olives, and many more. Besides these, they have fustick, red wood, and various other materials for dyeing. To these we may add a multitude of valuable drugs, such as guaiacum; china, sarsaparilla, cassia, tamarinds, vanillas, and the prickly pear or opuntia, which produces the cochineal; with no inconsiderable number of odoriferous gums. Near the coast they have salt-ponds, with which they supply their own consumption, and might make any quantity they pleased.

As this island abounds with rich commodities, it is happy likewise in having a number of fine and safe ports. Point Morant, the eastern extremity of the island, hath a fair and commodious bay. Passing on to the south, there is Port Royal: on a neck of land which forms one side of it, there stood once the fairest town in the island; and the harbour is as fine a one as can be wished, capable of holding a thousand large vessels, and still the station of our squadron. Old Harbour is also a convenient port, so is Maccary Bay; and

and there are at least twelve more between this and the western extremity, which is Point Negrillo, where our ships of war lie when there is a war with Spain. On the north side there is Orange Bay, Cold Harbour, Rio Novo, Montego Bay, Port Antonio one of the finest in the island, and several others. The north-west winds, which sometimes blow furiously on this coast, render the country on that side less fit for canes, but pimento thrives wonderfully; and certainly many other staples might be raised in small plantations, which are frequent in Barbadoes, and might be very advantageous here in many respects.

The town of Port Royal stood on a point of land running far out into the sea, narrow, sandy, and incapable of producing any thing. Yet the excellence of the port, the convenience of having ships of seven hundred tons coming close up to their wharfs, and other advantages, gradually attracted inhabitants in such a manner, that though many of their habitations were built on piles, there were near two thousand houses in the town in its most flourishing state, and which let at high rents. The earthquake by which it was overthrown happened on the 7th of June 1692, and numbers of people perished in it. This earthquake was followed by an epidemic disease, of which upwards of three thousand died: yet the place was rebuilt; but the greatest part was reduced to ashes by a fire that happened on the 9th of January 1703, and then the inhabitants removed mostly to Kingston. It was, however, rebuilt for the third time; and was rising towards its former grandeur, when it was overwhelmed by the sea, August 20. 1722. There is, notwithstanding, a small town there at this day. Hurricanes since that time have often happened, and occasioned terrible devastations; yet they have been less frequent and less violent of late years, and the climate is also said to be altered for the better.

In so large an island as this, it might be expected there should be a considerable number of great towns; which, however, there is not. The reason of this is very obvious; for the wealth of the inhabitants arising from their plantations, of which there are at present about five hundred, and each of these containing some hundreds of inhabitants, it appears from hence that every plantation forms a village, and accounts sufficiently for the disposal of the greatest part of the inhabitants. There are however some few towns; the largest of which is Kingston, which stands on the harbour of Port Royal, contains about 1600 houses, and is very populous. St Jago de la Vega, or, as it is usually called, *Spanish Town*, is properly the capital of the island, being the residence of the governor, the place where the assembly meets, and is also the seat of the principal courts of justice.

The administration of public affairs is by a governor and council of royal appointment, and the representatives of the people in the lower house of assembly. They meet at Spanish Town, and things are conducted with great order and dignity. The colony hath a considerable public revenue; of which the quit-rents, by a grant of the crown, make a part. Another branch arises from a tax or fine laid upon such as keep fewer than three white to 100 black servants. This is preferring the ease to the security of the community, in respect to which it would have operated much

more beneficially as a regulation. The island is divided into three counties, Middlesex, Surry, and Cornwall, containing 19 parishes, over each of which presides a magistrate styled a *justice*, but these parishes in point of size are a kind kind of hundreds. Yet is this fine country, upon the whole, but thinly peopled, and indifferently cultivated; for though near a fourth part of the lands are patented, yet not above a ninth part is actually under cultivation. The commerce of Jamaica is very considerable, not only with all parts of Great Britain and Ireland, but with Africa, North and South America, the West India islands, and the Spanish main, for the encouragement of which a late act was passed. The ships annually employed are upwards of 500 sail. The number of inhabitants is very uncertain; some say about 30,000 or perhaps more whites, and about 170,000 negroes.

The following account of the exports of this island, in 1770, will contribute more than all that hath been said, to shew the importance of Jamaica. They consisted in 2249 bales of cotton, which at 10 pounds per bale, the price in the island, amounts to 22,490 l.; 1873 hundred weight of coffee, at three pounds five shillings per hundred, 6088 l.; 2753 bags of ginger, at two pounds five shillings per bag, 6194 l.; 2211 hides, at seven shillings per hide, 773 l.; 15,796 hog-sheads of rum, at ten pounds per hoghead, 157,960 l. To Ireland, 679 hogheads, at ten pounds per hoghead, 6790 l. Mahogany, 15,282 pieces, and 8500 feet, 50,000 l. Of pimento, 2,089,734 pounds weight, 52,243 l. Sugar, 57,675 hogheads, 6425 weights, 52 barrels, at seventeen pounds ten shillings per hoghead, twelve pounds per tierce, and four pounds per barrel, amounting in the whole to 1,086,620 l. Sarsaparilla, 205 bags, at ten pounds per bag, 2250 l. Exports to Great Britain and Ireland 1,391,210 l. To North America, 146,324 l. To the other islands, 595 l. Total of the exports, 1,538,730 l.

JAMBI, or JAMBIS, a sea-port town and small kingdom of Asia, on the eastern coast of the island of Sumatra. It is a trading place. The Dutch have a fort here; and export pepper from thence, with the best sort of canes. E. Long. 103. 55. S. Lat. 0. 30.

IAMBIC, in ancient poetry, a sort of verse, so called from its consisting either wholly, or in great part, of iambus's. See IAMBUS.

Ruddiman makes two kinds of iambic, viz. dimeter and trimeter; the former containing four feet, and the latter six. And as to the variety of their feet, they consist wholly of iambus's, as in the two following verses of Horace:

Dim. ¹ ² ³ ⁴ ⁵ ⁶
Inar|sit a|fuo|fui|

Trim. *Suis | & ipsa Ro|ma viribus|ruit.*

Or, a dactylus, spondeus, anapestus, and sometimes tribrachys, obtain in the odd places; and the tribrachys also in the even places, excepting the last. Examples of all which may be seen in Horace; as,

Dimeter.

¹ ² ³ ⁴ ⁵ ⁶
Canid|a tra|stavit|dapes|

Vide|re prosper|ante domum|

Trimeter.

Prius|que cælum|sudet in|serui|maris|

Aliti-

*Alitibus alijs canibus hominid' Hecforem.
Pavidumque lep' aut advenam laqueogræm.*

JAMBLICUS, the name of two celebrated Platonic philosophers, one of whom was of Colchis, and the other of Apamea in Syria. The first, whom Julian equals to Plato, was the disciple of Anatolius and Porphyry, and died under the reign of the emperor Constantine.—The second also enjoyed great reputation. Julian wrote several letters to him, and it is said he was poisoned under the reign of Valens.—It is not known to which of the two we ought to attribute the works we have in Greek under the name of *Jamblicus*, viz. 1. The history of the life of Pythagoras, and the sect of the Pythagoreans. 2. An exhortation to the study of philosophy. 3. A piece against Porphyry's letter on the mysteries of the Egyptians.

IAMBUS, in the Greek and Latin prosody, a poetical foot, consisting of a short syllable followed by a long one; as in

ὄν, μέγ, υ', υ', υ', υ',
ὄν, μέγ, υ', υ', υ', υ',

Syllaba longa brevi subiecta vocatur iambus, as Horace expresses it; who also calls the iambus a swift, rapid foot, *pes citus*.

The word, according to some, took its rise from Iambus, the son of Pan and Echo, who invented this foot; or, perhaps, who only used sharp-biting expressions to Ceres, when afflicted for the death of Proserpine. Others rather derive it from the Greek ἰαμβικός, *venenum*, "poison;" or from ἰαμβίζω, *maledico*, "I rail, or revile;" because the verses composed of iam-bus's were at first only used in satire.

JAMES (St.), called the *Great*, the son of Zebedee, and the brother of John the evangelist, was born at Bethsaida, in Galilee. He was called to be an apostle, together with St John, as they were mending their nets with their father Zebedee, who was a fisherman; when Christ gave them the name of *Boanerges*, or *Sons of Thunder*. They then followed Christ, were witnesses with St Peter of the transfiguration on mount Tabor, and accompanied our Lord in the garden of olives. It is believed that St James first preached the gospel to the dispersed Jews; and afterwards returned to Judea, where he preached at Jerusalem, when the Jews raised up Herod Agrippa against him, who put him to a cruel death about the year 44. Thus St James was the first of the apostles who suffered martyrdom. St Clement of Alexandria relates, that his accuser was so struck with his constancy, that he became converted and suffered with him. There is a magnificent church at Jerusalem which bears the name of *St James*, and belongs to the Armenians. The Spaniards pretend, that they had St James for their apostle, and boast of possessing his body; but Baronius, in his *Annals*, refutes their pretensions.

JAMES (St.), called the *Less*, an apostle, the brother of Jude, and the son of Cleophas and Mary the sister of the mother of our Lord, is called in Scripture the *Just*, and the brother of Jesus, who appeared to him in particular after his resurrection. He was the first bishop of Jerusalem, when Ananias II. high priest of the Jews, caused him to be condemned, and delivered him into the hands of the people and the Pharisees, who threw him down from the steps of the temple, when a fuller dashed out his brains with a club, about

the year 62. His life was so holy, that Josephus considers the ruin of Jerusalem as a punishment inflicted on that city for his death. He was the author of the epistle which bears his name.

JAMES, the name of several kings of Scotland and of Great Britain. See (*Histories of*) SCOTLAND and BRITAIN.

JAMES I. king of Scotland, 1423, the first of the house of Stuart, was taken prisoner by the English in 1406, who were at war with Robert III. his father; and remained so till 1424, when he was set at liberty by John duke of Bedford regent of England during the minority of Henry VI. In 1437, this unfortunate prince was assassinated in his bed by the relations of those whom he had punished for mal-administration during his imprisonment.

JAMES II. king of Scotland, 1437, succeeded his father, being then but seven years of age; and was killed at the siege of Roxburgh in 1460, aged 29. This prince wrote, 1. A panegyric on his queen, before he was married to him. 2. Scotch sonnets: one of them, a lamentation while in England, is in manuscript in the Bodleian library, and bestows great praises on Gower and Chaucer. 3. *Rythmi Latini*. 4. On music.

JAMES III. king of Scotland, succeeded his father in 1460. He was a tyrannical prince; and having irritated his subjects, they rebelled against him, and he was slain by them in battle in 1488, aged 35.

JAMES IV. king of Scotland, succeeded his father in 1488. He was a pious and valiant prince; subdued his rebellious subjects; and afterwards, taking part with Louis XII. against Henry VIII. of England, he was slain in the battle of Flouden-Field in 1513, aged 41.

JAMES V. king of Scotland, in 1513, was but 18 months old when his father lost his life. When of age, he assisted Francis I. king of France, against the emperor Charles le Quint; for which service Francis gave him his eldest daughter in marriage, in 1535. This prince died in two years; and James married Mary of Lorraine, daughter of Claud duke of Guise, and widow of Louis d'Orleans, by whom he had only one child, the unfortunate Mary queen of Scots, born only eight days before his death, which happened December 13. 1542. This was the first prince of his family who died a natural death, since its elevation to the throne. He wrote the celebrated ballad called *Christ's Kirk on the Green*, and other little poems, which, at least, tradition reports to have been of his composition. They have a character of ease and libertinism, says Mr Walpole, which makes the tradition the more probable, and are to be found in a collection of Scottish poems called *The Evergreen*; the *Gaber-lunzie Man* is reckoned the best. There is something very ludicrous in the young woman's distress when she thought that her first favour had been thrown away on a beggar.

JAMES I. king of England in 1603, and VI. of Scotland in 1567, son of Mary queen of Scots; whom he succeeded in Scotland, as he did Elizabeth in England. Strongly attached to the Protestant religion, he signalized himself in its support; which gave rise to the horrid conspiracy of the Papists to destroy him and all the English nobility by the Gunpowder Plot, discovered

vered November 5. 1605. The following year, a political test of loyalty was required, which secured the king's person, by clearing the kingdom of those disaffected Roman-Catholic subjects who would not submit to it. The chief glory of this king's reign consisted in the establishment of new colonies, and the introduction of some manufactures. The nation enjoyed peace, and commerce flourished during his reign. Yet his administration was despised both at home and abroad: for, being the head of the Protestant cause in Europe, he did not support it in that great crisis, the war of Bohemia; abandoning his son-in-law the elector Palatine; negotiating when he should have fought, deceived at the same time by the courts of Vienna and Madrid; continually sending illustrious ambassadors to foreign powers, but never making a single ally. He valued himself much upon his polemical writings; and so fond was he of theological disputations, that to keep them alive, he founded, for this express purpose, Chelsea-college; which was converted to a much better use by Charles II. His *Basilicon Doron*, Commentary on the Revelation, writings against Bellarmine, and his *Dæmonologia*, or doctrine of witchcraft, are sufficiently known. There is a collection of his writings and speeches in one folio volume. Several other pieces of his are extant; some of them in the Cabala, others in manuscript in the British Museum, and others in Howard's collection. He died in 1625, in the 59th year of his age, and 23d of his reign.

JAMES II. king of England, Scotland, &c. 1685, grandson of James I. succeeded his brother Char. II. It is remarkable, that this prince wanted neither courage nor political abilities whilst he was duke of York; on the contrary, he was eminent for both: but when he ascended the throne, he was no longer the same man. A bigot from his infancy to the Romish religion and to its hierarchy, he sacrificed every thing to establish them, in direct contradiction to the experience he had acquired, during the long reign of his brother, of the genius and character of the people he was to govern. Guided by the jesuit Peters his confessor, and the infamous chancellor Jeffries, he violated every law enacted for the security of the Protestant religion; and then, unable to face the resentment of his injured subjects, he fled like a coward, instead of disarming their rage by a dismissal of his Popish ministers and priests. He rather chose to live and die a bigot, or, as he believed, a saint, than to support the dignity of his ancestors, or perish beneath the ruins of his throne. The consequence was the revolution in 1689. James II. died in France in 1710, aged 68. He wrote Memoirs of his own life and campaigns to the restoration; the original of which is preserved in the Scotch college, at Paris. This piece is printed at the end of Ramsay's life of Marshal Turenne. 2. Memoirs of the English affairs, chiefly naval, from the year 1660 to 1673. 3. The royal sufferer, king James II. consisting of meditations, soliloquies, vows, &c. said to be composed by his majesty at St Germain. 4. Three letters; which were published by William Fuller, gent. in 1702, with other papers relating to the court of St Germain, and are said in the title-page to be printed by command.

JAMES (Thomas), a learned English critic and divine, born about the year 1571. He recommended

himself to the office of keeper of the public library at Oxford, by the arduous undertaking of publishing a catalogue of the MSS. in each college-library at both universities. He was elected to this office in 1602, and held it 18 years, when he resigned it to prosecute his studies with more freedom. In the convocation held with the parliament at Oxford in 1625, of which he was a member, he moved to have proper commissioners appointed to collate the MSS. of the fathers in all the libraries in England, with the Popish editions, in order to detect the forgeries in the latter; but this proposal not meeting with the desired encouragement, he engaged in the laborious task himself, which he continued until his death in 1629. He left behind him a great number of learned works.

JAMES (Richard), nephew of the former, entered into orders in 1615; but, being a man of humour, of three sermons preached before the university, one concerning the observation of Lent was without a text, according to the most ancient manner; another against the text; and the third beside it. About the year 1619, he travelled through Wales, Scotland, Shetland, into Greenland, and Russia, of which he wrote observations. He assisted Selden in composing his *Marmora Arundelliana*; and was very serviceable to Sir Robert Cotton, and his son Sir Thomas, in disposing and settling their noble library. He died in 1638; and has an extraordinary character given him by Wood for learning and abilities.

Knights of St JAMES, a military order in Spain, first instituted about the year 1170 by Ferdinand II. king of Leon and Galicia. The greatest dignity belonging to this order is that of Grand Master, which has been united to the crown of Spain. The knights are obliged to make proof of their descent from families that have been noble, for four generations, on both sides; they must likewise make it appear, that their said ancestors have neither been Jews, heretics, nor Saracens; nor have ever been called into question by the inquisition. The novices are obliged to serve six months in the galleys, and to live a month in a monastery; they observe the rules of St Austin, making no vows but of poverty, obedience, and conjugal fidelity.

JAMES's Powder, an antimonial medicine, somewhat of the nature of tartar emetic, prepared by the late Dr Robert James, physician in London, who died on the 23d of March 1776. His powder was found to be of considerable efficacy in some kinds of fevers; so that it is much to be regretted, that the inventor thought proper to conceal his method of preparing it even till his death.

JAMES-Town, in North America, was once the capital of Virginia, but now Williamsburg claims that honour. It is seated on a peninsula on the north side of James river; and consists of about 80 houses, chiefly for the entertainment of seafaring men; for the seat of the government, and the courts of justice, have been removed to Williamsburg, which is seven miles north of it. W. Long. 77. 30. N. Lat. 37. 0.

St JAMES's Day, a festival of the Christian church, observed on the 25th of July, in honour of St James the greater, son of Zebedee.

Epistle of St JAMES, a canonical book of the New Testament, being the first of the catholic or general epistles;

epistles; which are so called, as not being written to one but to several Christian churches.

This general epistle is addressed partly to the believing and partly to the infidel Jews; and is designed to correct the errors, soften the ungoverned zeal, and reform the indecent behaviour of the latter; and to comfort the former under the great hardships they then did, or shortly were to suffer, for the sake of Christianity.

JAMESONE (George), an excellent painter, justly termed the *Vandyke of Scotland*, was the son of Andrew Jamefone, an architect; and was born at Aberdeen, in 1586. He studied under Rubens, at Antwerp; and, after his return, applied with indefatigable industry to portraits in oil, though he sometimes practised in miniature, and also in history and landscapes. His largest portraits were somewhat less than life. His earliest works are chiefly on board, afterwards on a fine linen cloth smoothly primed with a proper tone to help the harmony of his shadows. His excellence is said to consist in delicacy and softness, with a clear and beautiful colouring; his shades not charged, but helped by varnish, with little appearance of the pencil. When king Charles I. visited Scotland in 1633, the magistrates of Edinburgh, knowing his majesty's taste, employed this artist to make drawings of the Scottish monarchs; with which the king was so pleased, that, inquiring for the painter, he sat to him, and rewarded him with a diamond-ring from his own finger. It is observable, that Jamefone always drew himself with his hat on, either in imitation of his master Rubens, or on having been indulged in that liberty by the king when he sat to him. Many of Jamefone's works are in both the colleges of Aberdeen; and the Sybils there he is said to have drawn from living beauties in that city. His best works are from the year 1630 to his death, which happened at Edinburgh in 1644.

JAMYN (Amadis), a celebrated French poet in the 16th century. He is esteemed the rival of Ronfard, who was his cotemporary and friend. He was secretary and chamber-reader in ordinary to Char. IX. and died about 1585. He wrote, 1. Poetical works, 2 vols. 2. Philosophical discourses to Pasicharis and Rodanthe, with seven academical discourses. 3. A translation of the Iliad of Homer, begun by Hugh Sabel, and finished by Jamyn; with a translation into French verse of the three first books of the Odyssey.

JANEIRO, a province of Brasil in South America, seated between the tropic of Capricorn, and 22° of S. Lat. It is bounded on the north by the province of Spirito Santo, on the east and south by the Atlantic Ocean, and on the west by the mountains which separate it from Guaira, in Spanish America. This is the most valuable province which the Portuguese are masters of; for they import from thence yearly great quantities of gold and precious stones, which they find in the mountains to a prodigious value.

JANICULUM, or JANICULARIS, a hill of Rome, added by Ancus Martius; the burial-place of Numa, and of Statius Cæcilius the poet: to the east and south, having the Tiber; to the west, the fields; to the north, a part of the Vatican. So called, either from an ancient city, (Virgil;) or because it was a *janua*, or gate, from which to issue out and make incursions on the Tuscan, (Verrius Flaccus.) Now called *Mons*

Aureus, corruptly *Montorius*, from its sparkling sands. From this hill, on account of its height, is the most extensive prospect of Rome: but it is less inhabited, because of its gross air; neither is it reckoned among the seven hills. Hitherto the people retired, and were hence afterwards recalled by Q. Hortensius the dictator, (Pliny.)

JANIZARIES, an order of infantry in the Turkish armies; reputed the grand seignior's foot-guards. Vossius derives the word from *geniziers*, which in the Turkish language signifies *novi homines* or *milites*. D'Herbelot tells us, that *jenitcheri* signifies a *new band*, or *troop*; and that the name was first given by Amurath I. called the *Conqueror*, who choosing out one fifth part of the Christian prisoners whom he had taken from the Greeks, and instructing them in the discipline of war and the doctrines of their religion, sent them to Hagi Bektasche (a person whose pretended piety rendered him extremely revered among the Turks), to the end that he might confer his blessing on them, and at the same time give them some mark to distinguish them from the rest of the troops.—Bektasche, after blessing them in his manner, cut off one of the sleeves of the fur-gown which he had on, and put it on the head of the leader of this new militia; from which time, viz. the year of Christ 1361, they have still retained the name *jenitcheri*, and the fur-cap.

As, in the Turkish army, the European troops are distinguished from those of Asia; the janizaries are also distinguished into *janizaries of Constantinople*, and of *Damascus*. Their pay is from two aspers to twelve *per diem*; for when they have a child, or do any signal piece of service, their pay is augmented.—Their dress consists of a dolymen, or long gown, with short sleeves, which is given them annually by the grand seignior on the first day of Ramazan. They wear no turban; but, in lieu of that, a kind of cap, which they call *zarcola*, and a long hood of the same stuff hanging on their shoulders. On solemn days they are adorned with feathers, which are stuck in a little case in the fore-part of the bonnet.—Their arms, in Europe, in time of war, are a sabre, a carabine or musquet, and a cartouch-box hanging on the left side. At Constantinople, in time of peace, they wear only a long staff in their hand. In Asia, where powder and firearms are more uncommon, they wear a bow and arrows, with a poinard, which they call *hanjare*.—Though the janizaries are not prohibited marriage, yet they rarely marry, nor then but with the consent of their officers; as imagining a married man to make a worse soldier than a bachelor.—It was Osman, or Ottoman, or, as others will have it, Amurath, who first instituted the order of janizaries. They were at first called *jaja*, that is, footmen, to distinguish them from the other Turks, the troops whereof consisted mostly of cavalry. The number of janizaries is generally above 40,000; divided into 162 companies or chambers called *odas*, in which they live together at Constantinople as in a convent. They are of a superior rank to all other soldiers, and are also more arrogant and factious, and it is by them that the public tranquillity is mostly disturbed. The government may therefore be said to be in the hands of the janizaries. They have, however, some good qualities: they are

employed to escort travellers, and especially ambassadors and persons of high rank, on the road; in which case, they behave with the utmost zeal and fidelity.

JANSEN (Cornelius), bishop of Ypres, one of the most learned divines of the 17th century, and principal of the sect called from his name *Janfenists*. He was born in Holland of Catholic parents, and studied at Louvain. Being sent to transact some business of consequence relating to the university, into Spain, the Catholicising, viewing with a jealous eye the intriguing policy of France, engaged him to write a book to expose the French to the pope as no good Catholics, since they made no scruple of forming alliances with Protestant states. Janfen performed this task in his *Mars Gallicus*; and was rewarded with a mitre, being promoted to the see of Ypres in 1635. He had, among other writings, before this, maintained a controversy against the Protestants upon the points of grace and predestination; but his *Augustinus* was the principal labour of his life, on which he spent above 20 years. See the next article.

JANSENISTS, in church-history, a sect of the Roman Catholics in France, who followed the opinions of Janfenius, bishop of Ypres, and doctor of divinity of the universities of Louvain and Douay, in relation to grace and predestination.

In the year 1640, the two universities just mentioned, and particularly father Molina and father Leonard Celsus, thought fit to condemn the opinions of the Jesuits on grace and free-will. This having set the controversy on foot, Janfenius opposed to the doctrine of the Jesuits the sentiments of St. Augustine; and wrote a treatise on grace, which he entitled *Augustinus*. This treatise was attacked by the Jesuits, who accused Janfenius of maintaining dangerous and heretical opinions; and afterwards, in 1642, obtained of pope Urban VIII. a formal condemnation of the treatise wrote by Janfenius: when the partisans of Janfenius gave out that this bull was spurious, and composed by a person entirely devoted to the Jesuits. After the death of Urban VIII. the affair of Janfenism began to be more warmly controverted, and gave birth to an infinite number of polemical writings concerning grace. And what occasioned some mirth, was the titles which each party gave to their writings: one writer published *The torch of St. Augustine*, another found *Snuffers for St. Augustine's torch*, and father Veron formed *A gag for the Janfenists*, &c. In the year 1650, 68 bishops of France subscribed a letter to pope Innocent X. to obtain an inquiry into and condemnation of the five following propositions, extracted from Janfenius's *Augustinus*: 1. Some of God's commandments are impossible to be observed by the righteous, even though they endeavour with all their power to accomplish them. 2. In the state of corrupted nature, we are incapable of resisting inward grace. 3. Merit and desert in a state of corrupted nature, does not depend on a liberty which excludes necessity, but on a liberty which excludes constraint. 4. The Semipelagians admitted the necessity of an inward preventing grace for the performance of each particular act, even for the beginning of faith; but they were heretics in maintaining that this grace was of such a nature, that the will of man was able either to resist or obey it. It is Semipelagianism to say, that Jesus Christ died, or shed

his blood, for all mankind in general.

In the year 1652, the pope appointed a congregation for examining into the dispute in relation to grace. In this congregation Janfenius was condemned; and the bull of condemnation, published in May 1653, filled all the pulpits in Paris with violent outcries and alarms against the heresy of the Janfenists. In the year 1656, pope Alexander VII. issued out another bull, in which he condemned the five propositions of Janfenius. However, the Janfenists affirm, that these propositions are not to be found in this book; but that some of his enemies having caused them to be printed on a sheet, inserted them in the book, and thereby deceived the pope. At last Clement XI. put an end to the dispute by his constitution of July 17. 1705; in which, after having recited the constitutions of his predecessors in relation to this affair, he declares, "That in order to pay a proper obedience to the papal constitutions concerning the present question, it is necessary to receive them with a respectful silence." The clergy of Paris, the same year, approved and accepted this bull, and none dared to oppose it.

This is the famous bull *Unigenitus*, so called from its beginning with the words *Unigenitus Dei Filius*, &c. which has occasioned so much confusion in France.

JANUARY, in chronology, the first month of the year, so called from JANUS, one of the ancient Roman deities, painted with two faces; one whereof was supposed to look towards the new year, and the other towards the old.—January was introduced into the year by Numa Pompilius; Romulus's year beginning in the month of March. The Christians heretofore fasted on the first of January, by way of opposition to the superstition of the heathens; who, in honour of Janus, observed this day with feasting, dancings, masquerades, &c.

JANUS, in heathen worship, the first king of Italy, who, it is said, received Saturn into his dominions, after his being driven from Arcadia by Jupiter. He tempered the manners of his subjects, and taught them civility; and from him they learned to improve the vine, to sow corn, and to make bread. After his death, he was adored as a god. Romulus caused a temple to be erected to him, the gates of which were open in time of war, and shut in time of peace. This temple was shut up, for the first time, in the reign of Numa; the second, after the first Punic war; and thrice under Augustus. Nero, Vespasian, and several others, observed the same ceremony; but we do not find that it was observed by the Christian emperors.

This deity was thought to preside over all new undertakings. Hence, in all sacrifices, the first libations of wine and wheat were offered to Janus, and all prayers prefaced with a short address to him. January, the first month of the year was dedicated to and named from him. At this festival, the Romans offered cakes of new meal and salt, with new wine and frankincense. Then the consuls for the new year solemnly entered on their office, all artificers and tradesmen began their works, quarrels were laid aside, mutual presents were made, and the day concluded with mirth and joy.

Janus was represented with two faces, either to denote his prudence, or that he views at once the past

and approaching years; he had a sceptre in his right hand, and a key in his left, to signify his extensive authority, and his invention of locks.

Tho' this is properly a Roman deity, the abbé la Pluche represents it as derived from the Egyptians, who made known the rising of the dog-star, which opened their solar year, with an image with a key in its hand, and two faces, one old and the other young, to typify the old and new year.

JAPAN, a general name for a great number of islands lying between the eastern coast of Asia and the western one of America, and which all together form a large and potent empire. They extend from the 30th to the 41st degree of latitude, and from the 130th to the 147th of east longitude.

Were South and North Britain divided by an arm of the sea, Japan might be most aptly compared to England, Scotland, and Ireland, with their respective smaller islands, peninsulas, bays, channels, &c. all under the same monarch.

The Europeans call the empire *Japan*; but the inhabitants *Nippon*, from the greatest island belonging to it; and the Chinese *Cippon*, probably on account of its eastern situation; these names signifying, in both languages, the *Basin* or *Foundation of the Sun*. It was first discovered by the Portuguese, some time betwixt the years 1535 and 1548.

Molt of the islands which compose it are surrounded with such high craggy mountains, and such shallow and boisterous seas, that sailing about them is extremely dangerous; and the creeks and bays are choked up with such rocks, shelves, and sands, that it looks as if Providence had designed it to be a kind of little world by itself. These seas have likewise many dangerous whirlpools, which are very difficult to pass at low water, and will suck in and swallow up the largest vessels, and all that comes within the reach of their vortex, dashing them against the rocks at the bottom; insomuch that some of them are never seen again, and others thrown upon the surface at some miles distance. Some of these whirlpools also make a noise terrible to hear.

The Chinese pretend that the Japan islands were first peopled by themselves: but it is more probable that the original inhabitants were a mixture of different nations, driven thither by those tempestuous seas, and at different times; and this conjecture is confirmed by the great difference observable between the present inhabitants, in regard to feature, complexion, shapes, habits, customs, and language, notwithstanding their having been so long united under one monarch.

As these islands lie in the fifth and sixth climates, they would be much hotter in summer than England, were not the heats refreshed by the winds which continually blow from the sea around them, and to which they are much exposed by the height of their situation: this circumstance, however, not only renders their winters excessive cold, but the seasons more inconstant. They have great falls of snow in winter, which are commonly followed by hard frosts. The rains in summer are very violent, especially in the months of June and July, which on that account are called *fat-suki*, or *water-months*. The country is also much subject to dreadful thunders and lightnings,

as well as storms and hurricanes, which frequently do a great deal of damage.

The soil, though naturally barren and mountainous, by the industry of the inhabitants, not only supplies them with every necessary of life, but also furnishes other countries with them; producing, besides corn, the finest and whitest rice, and other grains, with a great variety of fruits, and vast numbers of cattle of all sorts. Besides rice, and a sort of wheat and barley, with two sorts of beans, they have Indian wheat, millet, and several other kinds, in great abundance. Their seas, lakes, and rivers, abound with fish; and their mountains, woods, and forests, are well stocked with horses, elephants, deer, oxen, buffaloes, sheep, hogs, and other useful animals. Some of their mountains also are enriched with mines of gold, silver, and copper, exquisitely fine, besides tin, lead, iron, and various other minerals and fossils; whilst others abound with several sorts of marble and precious stones. Of these mountains, some may be justly ranked among the natural rarities of this country; one, in particular, in the great island of Nippon, is of such prodigious height as to be easily seen forty leagues off at sea, though its distance from the shore is about eighteen. Some authors think it exceeds the famous Peak of Teneriffe; but it may rather be called a cluster or group of mountains, among which are no less than eight dreadful volcanoes, burning with incredible fury, and often laying waste the country round about them: but, to make some amends, they afford great variety of medicinal waters, of different degrees of heat; one of these, mentioned by Varenus, is said to be as hot as burning oil, and to scorch and consume every thing thrown into it.

The many brooks and rivers that have their sources among the mountains, form a great number of delightful cascades, as well as some dreadful cataracts. Among the great variety of trees in the forests here, the cedars exceed all of that kind through India, for straightness, height, and beauty. They abound in most of the islands, especially the largest.

Their seas, besides fish, furnish them with great quantities of red and white coral, and some pearls of great value, besides a variety of sea-plants and shells; which last are not inferior to those that are brought from Amboyna, the Molucca and other eastern islands.

The vast quantity of sulphur, with which most of the Japan islands abound, makes them subject to frequent and dreadful earthquakes. The inhabitants are so accustomed to them, that they are scarcely alarmed at any, unless they chance to be very terrible indeed, and lay whole towns in ruins, which very often proves the case. On these occasions, they have recourse to extraordinary sacrifices, and acts of worship to their deities or demons, according to the different notions of each sect, and sometimes even proceed to offer human victims; but in this case they only take some of the vilest and most abandoned fellows they can meet with, because they are only sacrificed to the malevolent deities.

With respect to religion, that of the Japanese is allowed by all writers to have been downright heathenism and idolatry from time immemorial. They do not seem so much as to have any sort of notion of a Supreme Creator; but believe the world to have existed

from:

from eternity, and that the gods they worship were men or beings that lived on earth several thousands of years, and were afterwards, for their piety, mortification, and even by their voluntary death, raised to that height of power and dignity they have ever since enjoyed. They are divided, however, into various sects; probably according to the various nations that first settled there. One of them is called the *sect of Siutto*, which is that of their philosophers and moralists, whose professors, like the Chinese literati, despise all notions of public worship and popular superstition. Every person here is at liberty to choose what sect pleases him best, no compulsion being used by the government or by the parents. Most of the sects believe a future state of bliss or misery, though they are not agreed about the nature and duration of it: the generality, however, think that it will consist in a transmigration of the soul from one body to another, more or less excellent and happy, according to their behaviour in their late state; and that this revolution will continue, as well as the world, to eternal ages. All the different sects, or at least the priests and priestesses of them, however divided in other respects, agree in regarding the five following negative precepts as absolutely binding; 1. Not to kill, nor to eat any thing that is killed; 2. Not to steal; 3. Not to defile another man's bed; 4. Not to lie; 5. Not to drink wine. From the example of their two chief deities, Amida and Xaca, the Japanese have a notion of its being such a meritorious thing to dispatch one's self, that great numbers of them embrace, in the most public manner, a voluntary death, either by drowning, hanging, or flinging themselves down from a precipice, or by poison, dagger, or any other quick riddance. The followers of Xaca commonly drown themselves; but those of Amida shut themselves up in some close confined place, where they have just room to sit, and, being immured on every side, have only a little hole to breathe through by means of a small cane, and never cease calling on that deity till they expire.

There is not a country in all the east that abounds more with temples and monasteries than this: not only cities and towns, but plains and mountains, and even deserts, swarm with them; for the priests here, like those of the church of Rome, are either secular or regular. The former live in private houses of their own, allow themselves one or two wives, and live on the income and offerings made to their respective temples and deities, and are at their own liberty as to the practice of abstinence and other severities: the regulars live in communities, under their respective superiors, and lead more or less reclusive and austere lives, according to their sects. Some of the monasteries contain a thousand, or even more of them, who, besides a perpetual celibacy and other mortifications, are all bound to observe the five rules before mentioned. Both secular and regular are under the government of the dairo or high-priest, who is the head of all the religious and sects in the empire. Besides the multitude of idols in their temples, there is a great number of others set up in their other public buildings, in their piazzas and markets, streets, and even public roads.

The Japanese have as great variety of festivals as of sects and deities, which it would therefore be endless

to describe: they consist in general in the anniversary of their gods and of their dead relations.

Christianity, if Popery deserves that name, had once made a considerable progress in this country; but, about the year 1622, a dreadful persecution was raised against the missionaries, and all that adhered to them, occasioned partly by the indiscreet zeal of the former, partly by the jealousy of the unconverted nobles, but especially of the Japanese priests, who could not, without the greatest envy and regret, behold their old religion, with all its powerful attractions of profit, popular esteem, and respect, daily losing ground; but more particularly by the policy and treachery of the Dutch, who found effectual means to undermine them. All the Christian converts were put to death; and the Europeans, except the Dutch, forbid to come within the Japanese dominions under the severest penalties.

With respect to the government of these islands, it is and has been for a long time monarchical; though formerly it seems to have been split into a great number of petty kingdoms, which were at length all swallowed by one. The imperial dignity had been enjoyed, for a considerable time before the year 1500, by a regular succession of princes, under the title of *dairos*, a name supposed to have been derived from Dairo the head of that family. Soon after that epoch, such a dreadful civil war broke out, and lasted so many years, that the empire was quite ruined. During these distractions and confusions, a common soldier, by name Tayckoy, a person of obscure birth, but of an enterprising genius, found means to raise himself to the imperial dignity; having, in little more than three years time, by an uncommon share of good fortune subdued all his competitors and opponents, and reduced all their cities and castles. The dairo, not being in a condition to obstruct or put a stop to his progress, was forced to submit to his terms; and might perhaps have been condemned to much harder, had not Tayckoy been apprehensive lest his soldiers, who still revered their ancient natural monarch, should have revolted in his favour. To prevent this, he granted him the supreme power in all religious matters, with great privileges, honours, and revenues annexed to it; whilst himself remained invested with the whole civil and military power, and was acknowledged and proclaimed king of Japan. This great revolution happened in 1517, and Tayckoy reigned several years with great wisdom and tranquility; during which he made many wholesome laws and regulations, which still subsist, and are much admired to this day. At his death, he left the crown to his son Tayckoisama, then a minor; but the treacherous prince under whose guardianship he was left, deprived him of his life before he came of age. By this murder, the crown passed to the family of Jrjassama, in which it still continues. Tayckoy and his successors have contented themselves with the title of *cubo*, which, under the dairos, was that of prime minister, whose office is now suppressed; so that the cubo, in all secular concerns, is quite as absolute and despotic, and has as extensive a power over the lives and fortunes of all his subjects, from the petty kings down to the lowest persons, as ever the dairos had. The dairo resides constantly at Meaco, and the cubo at Jedo.

The Japanese traffic with the Chinese, Koreans, and people of Jetzo: but, of the European nations, the Dutch alone are suffered to trade with them; having declared, as some say, after the expulsion of the Portuguese, that they were no Christians; but more probably on the merit of supplanting and assisting in expelling the Portuguese: for it is impossible that the Japanese can be ignorant that the Dutch profess Christianity, as they trade to China; and we find the Japanese use as much caution in their commerce with the Dutch as if they were really Christians.

At the season that the Dutch fleet is expected, the governor of Nangasack places centinels on the hills to give notice of the approach of any ships. When they appear, a boat is sent off to every ship, with a waiter or officer; and as soon as the ships come to an anchor, an express is immediately dispatched to court, before whose return the Dutch may not dispose of any thing. In the mean time, the particulars of every ship's cargo are taken, with the name, age, stature, and office, of every man on board, which is translated and printed in the Japanese language. When the express is returned, the ships crew are permitted to come on shore, and are all multered before a Japanese commissary; and every person is called over aloud, and made to give an account of his age, quality, and office, to see if it agrees with the particulars given in by the Dutch: after this examination they are sent on board again, and the sails of the ship, with the guns, arms, ammunition, and helm, are brought on shore, and the hatches sealed down by a Japanese officer; nor can they be opened, whatever the ship's crew may want, without a permission from the governor, who always sends a person to see what is taken out, and seal them down again; nor dare the Dutch sailors light a candle or make any fire on board their ships, any more than on shore. The ships are allowed no communication with one another; nor is any officer or sailor suffered to go on shore, except the persons who are appointed to carry the company's present to the king at Jedo or Yeddo. His majesty having accepted the present, and prepared another for the company, the Dutch officer is conveyed to Nangasack under a strong guard as he came. This journey, and the transacting their mercantile affairs, usually take up about three months and a half.

The Dutch, who attend the king on this occasion, approach him on their knees, with their hands joined together, and carried to their foreheads, as the Japanese governors and ministers also do.

While the Dutch ships lie in the road, none of the Japanese are allowed to go on board them to trade with the sailors; and those that carry provisions on board are not suffered to take any money for them till the permission to trade comes from court, and then they deliver in their accounts and are paid. After this, the Japanese permit six persons from every vessel to come on shore, and buy and sell for themselves, and stay four days, either in Dinsia or in the city, as they see fit; when these six men return on board, six others are allowed to go on shore and traffic in the like manner, and so on.

The goods are generally paid in bullion or pieces of silver, of ten or five crowns value, or smaller pieces by weight; for they have no coin, except some little

pieces of copper.

After six weeks free trade, there is no further communication allowed of between the city of Nangasack and the Dutch in the island of Dinsia, or with the shipping; whereupon the fleet prepares to return, and the factory in Dinsia are confined to their little island again, until the season of the year for traffic returns.

With respect to the character of the Japanese, they are generally very active, and of a quick apprehension and good understanding, modest, patient, and courteous, and excelling all the Orientals in docility. They are so just in their dealings, that one may absolutely depend on their word; and, contrary to the Chinese, disdain to take the least advantage of those they deal with. They are all very industrious and laborious, and much given to study and reading. They affect a surprising neatness and decency in their eating, drinking, furniture, dress, and conversation; and have an abhorrence to intemperance, luxury, and defamation. Drunkenness and gluttony are as much detested by the rich and poor, as cheating and dishonesty. This is the bright side of their character. On the other hand, they are represented as proud, ambitious, cruel, and uncharitable; and so insensible of the miseries of their fellow-creatures, that they will suffer them to perish, rather than relieve them. They are likewise said to be so passionate and revengeful, that they will make away with themselves if they cannot find an opportunity of revenging an affront. They allow not only of polygamy, but also of fornication: but there is still a more heinous and unnatural vice laid to their charge, viz. that of sodomy, which is not only committed with impunity, both by priests and laity, but without either brand or disgrace. In their wars they are very fierce and cruel, seldom giving or asking for quarter; and when a town is taken, they commonly destroy it by fire and sword. Like the Chinese, they are so given to astrology, that they scarce undertake anything of moment, without consulting some pretender to that art. There is a vast number of universities dispersed all over the empire, in which the bonzas preside, richly endowed, finely situated, and accommodated with all the conveniences of life, as well as with large libraries.

The Japanese laws and punishments are severe beyond all justice; and may be justly said, like those of the Spartan Draco, to be written in blood. They have few, if any, written laws, the emperor's will being the supreme one, and next to it that of the kings and princes in their respective dominions. The very lords of every district, and even the heads of every family, have power of life and death over all that are under them, and try and condemn them according to their will. There is scarcely any crime so small, that is not punished with death, except the offender be a petty king or prince, and even these are not always exempted. Every petty larceny, insult, detraction, cheating of any kind, even at play, a lie or prevarication before a magistrate, are all capital, as well as the more heinous crimes of treason, murder, parricide, incest, rape, adultery. Their most common way of putting criminals to death, is by crucifixion with their heads downwards, boiling in oil, tearing them to pieces by horses, or cutting them in pieces by the hangman. For the highest crimes, not only the criminal, but his parents also, brothers, and even children, are all put

to death. The Japanefe have but very little skill in phyfic and furgery. In the cure of difeafes they depcnd much on their medicinal waters, and on certain roots and plants, particularly the root giufeng, brought from China. The operation of blood-letting is performed by pricking the belly with a fine needle, made either of gold or filver. By this acupuncture they not only afuage, but effectually cure, an endemic colicky diforder common among them, and called *fenki*. The other difeafes to which they are moft liable, are the dropfy, diarrhoea, fmall-pox, bloody-flux; but the gout, ftone, and gravel, are hardly known among them.

The Japanefe are much addicted to poetry, mufic, and painting; the firft is faid to be grand as to the ftyle and imagery, lofinelf, and cadence; but, like that of the Chinefe, is not eafily underftood or relifhed by the Europeans. The fame may be faid of their mufic, both vocal and instrumental; the beft of which, of either kind, would hardly be tolerable to a nice European ear. They are better painters than the Chinefe, but much inferior to the Europeans; moft of their performances in that kind, are either in water-colours on paper, fine leather, &c. or in their jappanning and fine porcelain-ware. What is moft to be admired in their paintings, is the fingular beauty of the colours, in many of which they greatly excel us.

They pretend, like the Chinefe, to have been the inventors of printing from time immemorial, and their method is the fame with theirs on wooden blocks; but they excel them in the neatnefs of cutting them, as well as in the goodnefs of their ink and paper. They likewife lay claim to the invention of gunpowder; and are vaftly fuperior to the Chinefe in the ufe of all forts of fire, efpecially of artillery, as well as the curiofity of their fire-works.

Their manner of writing is much the fame as that of the Chinefe, viz. in columns from top to bottom, and the columns beginning at the right and ending at the left hand. Their characters were alfo originally the fame, but now differ confiderably.

Their language hath fome affinity with the Chinefe, though it appears from its various dialects to have been a kind of compound of that and other languages, derived from the various nations that firft peopled thofe iflands. It is not only very regular, polite, elegant, and copious, but abounds with a great variety of fynonima, adapted to the nature of the fubject they are upon, whether fublime, familiar, or low; and to the quality, age, and fex, both of the fpeaker and perfon fpoken to.

The Japanefe are commonly very ingenious in moft handicraft trades; and excel even the Chinefe in feveral manufactures, particularly in the beauty, goodnefs, and variety of their filks, cottons, and other ftuffs, and in their japan and porcelain wares. No eaftern nation comes up to them in the tempering and fabricating of fcymitars, fwords, mufkets, and other fuch weapons.

The Japanefe architecture is much in the fame tafte and ftyle as that of the Chinefe, efpecially as to their temples, palaces, and other public buildings; but in private ones they affect more plainnefs and neatnefs than fhew: thefe laft, being moftly built of wood,

make their cities exceedingly liable to conflagrations, which, wherever they happen, generally reduce the greateft part of them to afhes, they having neither engines nor any other method of ftopping the progrefs of the flames. The gardens about their houfes are adorned with a variety of flowers, trees, verdure, baths, terraces, and other embellifhments. The furniture and decorations of the houfes of perfons of diftinction, confift in japan-work of various colours, curious paintings, beds, couches, fcreens, cabinets, tables, a variety of porcelain jars, vafes, tea-equipage, and other veffels and figures, together with fwords, guns, fcymitars, and other arms. Their retinues are more or lefs numerous and fplendid, according to their rank; but there are few of the lords who have lefs than 50 or 60 men richly clad and armed, fome on foot, but moft on horfeback. As for their petty kings and princes, they are feldom feen without 500 or 200 at leaft, when they either wait on the emperor, which is one half of the year, or attend him abroad. The Japanefe drefs is much like that of the Chinefe, only fomewhat more elegant and neat, and moft commonly of filk or cotton. They wear nothing on their heads either winter or fummer, though they fhave themfelves clofe all over, except one lock, which is left hanging on the top by way of ornament: but to guard themfelves from fun or rain, they always carry an umbrella in one hand; and, if rich enough, have them held over their heads by a fervant. The poorer fort have, inftead of that, either a fan or fhirt fcreen. The women of fafhion, efpecially the young ones, adorn themfelves with flowers, feathers, pearls, &c. but are feldom feen abroad, or even at home, to any but thofe of the family, without a veil.

The proper colour here for feftivals is black, for mourning white. Inftead of rifing at the approach of a fuperior, they fet themfelves down; and inftead of bowing or proftitating when they falute, they ftand upright. They choofe to have their teeth and nails of a fhining black, and to let the latter grow to an exceffive length. The chief food of the Japanefe is rice, pulfe, fruits, roots, herbs, eating very little flefh, and that only of fuch beafts as they take in hunting. Inftead of knives, forks, and fpoons, they make ufe of the fame forts of fmall fticks as the Chinefe. Their common drink is either water or tea; but they have other liquors, fome diftilled from rice or wheat, others made of their grains boiled with fugar or honey, or of fruits, or tapped from the palm, birch, and other trees.

After marriage, the wife is confined to her own apartment, from whence fhe hardly ever ftirs, except once a-year to the funeral-rites of her family; nor is fhe permitted to fee any man, except perhaps fome very near relation, and that as feldom as can be. The wives, as well as in China and other parts of the eaft, bring no portion with them, but are rather bought by the husband of their parents and relations. The bridegroom moft commonly fees his bride for the firft time upon her being brought to his houfe from the place of the nuptial ceremony: for in the temple where it is performed fhe is covered over with a veil, which reaches from the head to the feet. A husband can put his wives to a more or lefs fevere death, if they give him the leaft caufe of jealousy, by being feen barely to converse with

Japanning. another man, or suffering one to come into their apartment.

The Japanese, both poor and rich, make an annual procession to the sepulchres of their dead relations, with songs and music; carrying money, victuals, cloathing, &c. as presents to relieve their various wants in the other world.

When a prince or great man dies, there are commonly about 10, 20, or more youths of his household, and such as were his greatest favourites, who put themselves to a voluntary death, at the place where the body is buried or burned: as soon as the funeral pile, consisting of odoriferous woods, gums, spices, oils, and other ingredients, is set on fire, the relations and friends of the deceased throw their presents into it, such as cloaths, arms, victuals, money, sweet herbs, flowers, and other things which they imagine will be of use to him in the other world. Those of the middle or lower rank commonly bury their dead, without any other burning than that of some odoriferous woods, gums, &c. The sepulchres into which the bones and ashes of persons of rank are deposited, are generally very magnificent, and situated at some distance from the towns.

JAPAN Earth. See *TERRA Japonica*.

JAPANNING, the art of varnishing and drawing figures on wood, in the same manner as is done by the natives of Japan in the East Indies.

The substances which admit of being japanned are almost every kind that are dry and rigid, or not too flexible; as wood, metals, leather, and paper prepared.

Wood and metals do not require any other preparation, but to have their surface perfectly even and clean: but leather should be securely strained either on frames, or on boards; as its bending or forming folds would otherwise crack and force off the coats of varnish: and paper should be treated in the same manner, and have a previous strong coat of some kind of size; but it is rarely made the subject of japanning till it is converted into *papier maché*, or wrought by other means into such form, that its original state, particularly with respect to flexibility, is lost.

One principal variation from the method formerly used in japanning is, the using or omitting any priming or undercoat on the work to be japanned. In the older practice, such priming was always used; and is at present retained in the French manner of japanning coaches and snuff-boxes of the *papier maché*: but in the Birmingham manufacture here, it has been always rejected. The advantage of using such priming or undercoat is, that it makes a saving in the quantity of varnish used; because the matter of which the priming is composed fills up the inequalities of the body to be varnished; and makes it easy, by means of rubbing and water-polishing, to gain an even surface for the varnish: and this was therefore such a convenience in the case of wood, as the giving a hardness and firmness to the ground was also in the case of leather, that it became an established method; and is therefore retained even in the instance of the *papier maché*, by the French, who applied the received method of japanning to that kind of work on its introduction. There is nevertheless this inconvenience always attending the use of an undercoat of size, that the japan coats of varnish and colour

will be constantly liable to be cracked and peeled off by any violence, and will not endure near so long as the bodies japanned in the same manner, but without any such priming; as may be easily observed in comparing the wear of the Paris and Birmingham snuff-boxes; which latter, when good of their kind, never peel or crack, or suffer any damage, unless by great violence, and such a continued rubbing as wastes away the substance of the varnish; while the japan coats of the Parisian crack and fly off in flakes, whenever any knock or fall, particularly near the edges, exposes them to be injured. But the Birmingham manufacturers, who originally practised the japanning only on metals, to which the reason above given for the use of priming did not extend, and who took up this art of themselves as an invention, of course omitted at first the use of any such undercoat; and not finding it more necessary in the instance of *papier maché*, than on metals, continue still to reject it. On which account, the boxes of their manufacture are, with regard to the wear, greatly better than the French.

The laying on the colours in gum-water, instead of varnish, is also another variation from the method of japanning formerly practised: but the much greater strength of the work, where they are laid on in varnish or oil, has occasioned this way to be exploded with the greatest reason in all regular manufactures: however, they who may practise japanning on cabinets, or other such pieces as are not exposed to much wear and violence, for their amusement only, and consequently may not find it worth their while to encumber themselves with the preparations necessary for the other methods, may paint with water-colours on an undercoat laid on the wood, or other substance of which the piece to be japanned is formed; and then finish with the proper coats of varnish, according to the methods below taught: and if the colours are tempered with the strongest isinglass size and honey, instead of gum-water, and laid on very flat and even, the work will not be much inferior in appearance to that done by the other method, and will last as long as the old japan.

Of JAPAN Grounds.—The proper grounds are either such as are formed by the varnish and colour, where the whole is to remain of one simple colour; or by the varnish either coloured, or without colour, on which some painting or other decoration is afterwards to be laid. It is necessary, however, before we proceed to speak of the particular grounds, to shew the manner of laying on the priming or undercoat, where any such is used.

This priming is of the same nature with that called *clear-coating*, or vulgarly *clear-coaling*, practised erroneously by the *houle*-painters; and consists only in laying on and drying in the most even manner, a composition of size and whitening, or sometimes lime instead of the latter. The common size has been generally used for this purpose: but where the work is of a nicer kind, it is better to employ the glover's or the parchment size; and if a third of isinglass be added, it will be still better, and, if not laid on too thick, much less liable to peel and crack. The work should be prepared for this priming, by being well smoothed with the fish-skin or glass-shaver; and, being made thoroughly clean, should be brushed over once or twice with

anning. with hot size, diluted with two thirds of water, if it be of the common strength. The priming should then be laid on with a brush as even as possible; and should be formed of a size, whose confidence is betwixt the common kind and glue, mixed with as much whiting as will give it a sufficient body of colour to hide the surface of whatever it is laid upon, but not more.

If the surface be very clean, on which the priming is used, two coats of it, laid on in this manner, will be sufficient; but if, on trial with a fine rag wet, it will not receive a proper water polish, on account of any inequalities not sufficiently filled up and covered, two or more coats must be given it; and whether a greater or less number be used, the work should be smoothed, after the last coat but one is dry, by rubbing it with the Dutch rushes. When the last coat is dry, the water polish should be given, by passing over every part of it with a fine rag gently moistened, till the whole appear perfectly plain and even. The priming will then be completed, and the work ready to receive the painting or coloured varnish; the rest of the proceedings being the same in this case as where no priming is used.

When wood or leather is to be japanned, and no priming is used, the best preparation is to lay two or three coats of coarse varnish composed in the following manner:

“ Take of rectified spirit of wine one pint, and of coarse feed-lac and resin each two ounces. Dissolve the feed-lac and resin in the spirit; and then strain off the varnish.”

This varnish, as well as all others formed of spirit of wine, must be laid on in a warm place; and, if it can be conveniently managed, the piece of work to be varnished should be made warm likewise: and for the same reason all dampness should be avoided; for either cold or moisture chills this kind of varnish, and prevents its taking proper hold of the substance on which it is laid.

When the work is so prepared, or by the priming with the composition of size and whiting above described, the proper japan ground must be laid on, which is much the best formed of shell-lac varnish, and the colour desired, if white be not in question, which demands a peculiar treatment; or great brightness be not required, when also other means must be pursued.

The colours used with the shell-lac varnish may be any pigments whatever which give the tint of the ground desired; and they may be mixed together to form browns or any compound colours.

As metals never require to be undercoated with whiting, they may be treated in the same manner as wood or leather, when the under-coat is omitted, except in the instances particularly spoken of below.

White JAPAN Grounds.—The forming a ground perfectly white, and of the first degree of hardness, remains hitherto a desideratum, or matter sought for, in the art of japanning, as there are no substances which form a very hard varnish, but what have too much colour not to deprave the whiteness, when laid on of a due thickness over the work.

The nearest approach, however, to a perfect white varnish, already known, is made by the following composition.

“ Take flake white, or white lead, washed over and ground up with a sixth of its weight of starch, and then

dried; and temper it properly for spreading with the Japanning mastic varnish prepared as under the article VARNISH.

“ Lay these on the body to be japanned, prepared either with or without the under-coat of whiting, in the manner as above ordered; and then varnish it over with five or six coats of the following varnish:

“ Provide any quantity of the best feed-lac; and pick out of it all the clearest and whitest grains, reserving the more coloured and fouler parts for the coarse varnishes, such as that used for priming or preparing wood or leather. Take of this picked feed-lac two ounces, and of gum-animi three ounces; and dissolve them, being previously reduced to a gross powder, in about a quart of spirit of wine; and strain off the clear varnish.”

The feed-lac will yet give a slight tinge to this composition; but cannot be omitted where the varnish is wanted to be hard; though, when a softer will answer the end, the proportion may be diminished, and a little crude turpentine added to the gum-animi to take off the bitterness.

A very good varnish, free entirely from all bitterness, may be formed by dissolving as much gum-animi as the oil will take, in old nut or poppy oil; which must be made to boil gently when the gum is put into it. The ground of white colour itself may be laid on in this varnish, and then a coat or two of it may be put over the ground; but it must be well diluted with oil of turpentine when it is used. This, though free from brittleness, is nevertheless liable to suffer by being indented or bruised by any slight strokes; and it will not well bear any polish, but may be brought to a very smooth surface without, if it be judiciously managed in the laying it on. It is likewise somewhat tedious in drying, and will require some time where several coats are laid on; as the last ought not to contain much oil of turpentine.

Blue JAPAN Grounds.—Blue japan grounds may be formed of bright Prussian blue, or of verditer glazed over by Prussian blue, or of smalt. The colour may be best mixed with shell-lac varnish, and brought to a polishing state by five or six coats of varnish of feed-lac: but the varnish, nevertheless, will somewhat injure the colour by giving to a true blue a cast of green, and fouling in some degree a warm blue by the yellow it contains: where, therefore, a bright blue is required, and a less degree of hardness can be dispensed with, the method before directed in the case of white grounds must be pursued.

Red JAPAN Grounds.—For a scarlet japan ground, vermilion may be used: but the vermilion has a glaring effect, that renders it much less beautiful than the crimson produced by glazing it over with carmine or fine lake; or even with rose-pink, which has a very good effect used for this purpose. For a very bright crimson, nevertheless, instead of glazing with carmine, the Indian lake should be used, dissolved in the spirit of which the varnish is compounded, which it readily admits of when good: and, in this case, instead of glazing with the shell-lac varnish, the upper or polishing coats need only be used; as they will equally receive and convey the tinge of the Indian lake, which may be actually dissolved by spirit of wine: and this will be found a much cheaper method than the using carmine. If, nevertheless, the highest degree of brightness be re-

Japanning. quired, the white varnishes must be used.

Yellow JAPAN Grounds.—For bright yellow grounds, the king's yellow, or the turpeth mineral, should be employed, either alone or mixed with fine Dutch pink; and the effect may be still more heightened by dissolving powdered turmeric-root in the spirit of wine of which the upper or polishing coat is made; which spirit of wine must be strained from off the dregs, before the feed-lac be added to it to form the varnish.

The feed-lac varnish is not equally injurious here, and with greens, as in the case of other colours; because, being only tinged with a reddish yellow, it is little more than an addition to the force of the colours.

Yellow grounds may be likewise formed of the Dutch pink only; which, when good, will not be wanting in brightness, though extremely cheap.

Green JAPAN Grounds.—Green grounds may be produced by mixing the king's yellow and bright Prussian blue, or rather the turpeth mineral and Prussian blue; and a cheap, but fouler kind, by verdigrise with a little of the abovementioned yellows, or Dutch pink. But where a very bright green is wanted, the crystals of verdigrise, called *distilled verdigrise*, should be employed; and to heighten the effect, they should be laid on a ground of leaf-gold, which renders the colour extremely brilliant and pleasing.

They may any of them be used successfully with good feed-lac varnish, for the reason before given; but will be still brighter with white varnish.

Orange-coloured JAPAN Grounds.—Orange-coloured japan grounds may be formed by mixing vermilion or red-lead with king's yellow, or Dutch pink; or the orange-lake, which will make a brighter orange ground than can be produced by any mixture.

Purple JAPAN Grounds.—Purple japan grounds may be produced by the mixture of lake and Prussian blue; or a fouler kind, by vermilion and Prussian blue. They may be treated as the rest, with respect to the varnish.

Black JAPAN Grounds to be produced without Heat.—Black grounds may be formed by either ivory-black, or lamp-black: but the former is preferable, where it is perfectly good.

These may be always laid on with shell-lac varnish; and have their upper or polishing coats of common feed-lac varnish, as the tinge or foulness of the varnish can be here no injury.

Common black JAPAN Grounds on Iron or Copper, produced by means of Heat.—For forming the common black japan grounds by means of heat, the piece of work to be japanned must be painted over with drying oil; and, when it is of a moderate dryness, must be put into a stove of such degree of heat as will change the oil black, without burning it so as to destroy or weaken its tenacity. The stove should not be too hot when the work is put into it, nor the heat increased too fast; either of which errors would make it blister; but the slower the heat is augmented, and the longer it is continued, provided it be restrained within the due degree, the harder will be the coat of japan. This kind of varnish requires no polish, having received, when properly managed, a sufficient one from the heat.

The fine Tortoise-shell JAPAN Ground, produced by means of Heat.—The best kind of tortoise-shell ground

produced by heat is not less valuable for its great hardness, and enduring to be made hotter than boiling water without damage, than for its beautiful appearance. It is to be made by means of a varnish prepared in the following manner:

"Take of good linseed-oil one gallon, and of umbre half-a-pound: boil them together till the oil become very brown and thick: strain it then through a coarse cloth, and set it again to boil; in which state it must be continued till it acquire a pitchy consistence; when it will be fit for use."

Having prepared thus the varnish, clean well the iron or copper plate, or other piece which is to be japanned; and then lay vermilion tempered with shell-lac varnish, or with drying oil diluted with oil of turpentine, very thinly, on the places intended to imitate the more transparent parts of the tortoise-shell. When the vermilion is dry, brush over the whole with the black varnish, tempered to a due consistence with oil of turpentine; and when it is set and firm, put the work into a stove, where it may undergo a very strong heat, and must be continued a considerable time; if even three weeks or a month, it will be the better.

This was given amongst other receipts by Kunkel; but appears to have been neglected till it was revived with great success in the Birmingham manufactures, where it was not only the ground of snuff-boxes, dressing-boxes, and other such lesser pieces, but of those beautiful tea-waiters which have been so justly esteemed and admired in several parts of Europe where they have been sent. This ground may be decorated with painting and gilding, in the same manner as any other varnished surface, which had best be done after the ground has been duly hardened by the hot stove; but it is well to give a second annealing with a more gentle heat after it is finished.

Method of painting JAPAN Work.—Japan work ought properly to be painted with colours in varnish; though, in order for the greater dispatch, and, in some very nice works in small, for the freer use of the pencil, the colours are sometimes tempered in oil; which should previously have a fourth part of its weight of gum-animi dissolved in it; or, in default of that, of the gums sandarac or mastic. When the oil is thus used, it should be well diluted with spirit of turpentine, that the colours may be laid more evenly and thin; by which means, fewer of the polishing or upper-coats of varnish become necessary.

In some instances, water-colours are laid on grounds of gold, in the manner of other paintings; and are best, when so used, in their proper appearance, without any varnish over them; and they are also sometimes managed as to have the effect of embossed work. The colours employed in this way, for painting, are best prepared by means of isinglass size corrected with honey or sugar-candy. The body of which the embossed work is raised, need not, however, be tinged with the exterior colour; but may be best formed of very strong gum-water, thickened to a proper consistence by bole-armenian and whitening in equal parts; which being laid on in the proper figure, and repaired when dry, may be then painted with the proper colours tempered in the isinglass size, or in the general manner with shell-lac varnish.

Manner of Varnishing JAPAN Work.—The last and finishing part of japanning lies in the laying on and polishing the outer coats of varnish; which are necessary, as well in the pieces that have only one simple ground of colour, as with those that are painted. This is in general best done with common feed-lac varnish, except in the instances and on those occasions where we have already shewn other methods to be more expedient: and the same reasons which decide as to the fitness or impropriety of the varnishes, with respect to the colours of the ground, hold equally with regard to those of the painting: for where brightness is the most material point, and a tinge of yellow will injure it, feed-lac must give way to the whiter gums; but where hardness, and a greater tenacity, are most essential, it must be adhered to; and where both are so necessary, that it is proper one should give way to the other in a certain degree reciprocally, a mixed varnish must be adopted.

This mixed varnish, as we have already observed, should be made of the picked feed-lac. The common feed-lac varnish, which is the most useful preparation of the kind hitherto invented, may be thus made:

“Take of feed-lac three ounces, and put it into water to free it from the sticks and filth that are frequently intermixed with it; and which must be done by stirring it about, and then pouring off the water, and adding fresh quantities in order to repeat the operation, till it be freed from all impurities, as it very effectually may be by this means. Dry it then, and powder it grossly, and put it, with a pint of rectified spirit of wine, into a bottle, of which it will not fill above two-thirds. Shake the mixture well together; and place the bottle in a gentle heat, till the feed appear to be dissolved; the shaking being in the mean time repeated as often as may be convenient: and then pour off all that can be obtained clear by this method, and strain the remainder through a coarse cloth. The varnish thus prepared must be kept for use in a bottle well stopp’d.”

When the spirit of wine is very strong, it will dissolve a greater proportion of the feed-lac: but this will saturate the common, which is seldom of a strength sufficient for making varnishes in perfection. As the chilling, which is the most inconvenient accident attending those of this kind, is prevented, or produced more frequently, according to the strength of the spirit; we shall therefore take this opportunity of shewing a method by which weaker rectified spirits may with great ease, at any time, be freed from the phlegm, and rendered of the first degree of strength.

“Take a pint of the common rectified spirit of wine, and put it into a bottle, of which it will not fill above three parts. Add to it half an ounce of pearl-ashes, salt of tartar, or any other alkaline salt, heated red-hot, and powdered, as well as it can be without much loss of its heat. Shake the mixture frequently for the space of half an hour; before which time, a great part of the phlegm will be separated from the spirit, and will appear, together with the undissolved part of the salts, in the bottom of the bottle. Let the spirit then be poured off, or freed from the phlegm and salts, by means of a tritiorium or separating funnel;

and let half an ounce of the pearl-ashes, heated and powdered as before, be added to it, and the same treatment repeated. This may be done a third time, if the quantity of phlegm separated by the addition of the pearl-ashes appear considerable. An ounce of alum reduced to powder and made hot, but not burnt, must then be put into the spirit, and suffered to remain some hours; the bottle being frequently shaken: after which, the spirit, being poured off from it, will be fit for use.”

The addition of the alum is necessary, to neutralize the remains of the alkaline salt or pearl-ashes; which would otherwise greatly deprave the spirit with respect to varnishes and lacquer, where vegetable colours are concerned; and must consequently render another distillation necessary.

The manner of using the feed-lac or white varnishes is the same, except with regard to the substance used in polishing; which, where a pure white or great clearness of other colours is in question, should be itself white: whereas the browner sorts of polishing dust, as being cheaper, and doing their business with greater dispatch, may be used in other cases. The pieces of work to be varnished should be placed near a fire, or in a room where there is a store, and made perfectly dry; and then the varnish may be rubbed over them by the proper brushes made for that purpose, beginning in the middle, and passing the brush to one end; and then with another stroke from the middle, passing it to the other. But no part should be crossed or twice passed over, in forming one coat, where it can possibly be avoided. When one coat is dry, another must be laid over it; and this must be continued at least five or six times, or more, if on trial there be not a sufficient thickness of varnish to bear the polish, without laying bare the painting or the ground colour underneath.

When a sufficient number of coats is thus laid on, the work is fit to be polished: which must be done, in common cases, by rubbing it with a rag dipped in Tripoli or pumice-stone, commonly called *rotten stone*, finely powdered: but towards the end of the rubbing, a little oil of any kind should be used along with the powder; and when the work appears sufficiently bright and glossy, it should be well rubbed with the oil alone, to clean it from the powder, and give it a still brighter lustre.

In the case of white grounds, instead of the Tripoli or pumice-stone, fine putty or whiting must be used; both which should be washed over to prevent the danger of damaging the work from any sand or other gritty matter that may happen to be commixed with them.

It is a great improvement of all kinds of japan work, to harden the varnish by means of heat; which, in every degree that it can be applied short of what would burn or calcine the matter, tends to give it a more firm and strong texture. Where metals form the body, therefore, a very hot stove may be used, and the pieces of work may be continued in it a considerable time; especially if the heat be gradually increased: but where wood is in question, heat must be sparingly used, as it would otherwise warp or shrink the body, so as to injure the general figure.

Jaquelot

Jaher.

JAQUELOT (Isaac), a celebrated French Protestant divine, born in 1647 at Vally in Champagne, where his father was minister. The revocation of the edict of Nantz obliging him to quit France, he took refuge first at Heidelberg, and then at the Hague, where he procured an appointment in the Walloon church. Here he continued till that capital was taken by the king of Prussia, who, hearing him preach, made him his French minister in ordinary at Berlin; to which city he removed in 1702. While he lived at Berlin, he entered into a warm controversy with M. Bayle on the doctrine advanced in his dictionary favouring manichæism, which continued until death imposed silence on both parties: and it was in this dispute that M. Jaquelot openly declared in favour of the Remonstrants. He wrote, among other works, 1. *Dissertations sur l'existence de Dieu*. 2. *Dissertations sur le Messie*. 3. *Lettres à Messieurs les Prelats de l'Eglise Gallicane*. He was employed in finishing an important work upon the divine authority of the holy scriptures, when he died suddenly, in 1708, aged 61.

JAR, or **JARR**, an earthen pot or pitcher, with a big belly and two handles.—The word comes from Spanish *jarra*, or *jarro*, which signify the same.

JAR is used for a sort of measure or fixed quantity of divers things.—The jar of oil is from 18 to 26 gallons; the jar of green ginger, is about 100 pound weight.

JARCHI (Solomon), otherwise *Raschi* and *Isaaki Solomon*, a famous rabbi, born at Troyes in Champagne, who flourished in the 12th century. He was a perfect master of the talmud and gemara; and he filled the postils of the bible with so many talmudical reveries, as totally extinguished both the literal and moral sense of it. A great part of his commentaries are printed in Hebrew, and some have been translated into Latin by the Christians. They are all greatly esteemed by the Jews, who have bestowed on the author the title of *prince of commentators*.

JARIMUTH, **JARMUTH**, or *Jerimoth*, Josh. xv. a town reckoned to the tribe of Judah, four miles from Eleutheropolis, westward, (Jerome). Thought to be the same with Ramoth and Remeth, Joshua xix. and Nehem. x. 2. (Reland).

JARNAC, a town of France, in Orleanois and in Angumois, remarkable for a victory gained by Henry III. over the Huguenots in 1569. It is seated on the river Charente, in W. Long. o. 13. N. Lat. 45. 40.

JAROSLOW, a handsome town of Poland, in the palatinate of Russia, with a strong citadel. It is remarkable for its great fair, its handsome buildings, and a battle gained by the Swedes in 1656, after which they took the town. It is seated on the river Saine, in E. Long. 22. 23. N. Lat. 49. 58.

JASHER (The book of). This is a book which Joshua mentions, and refers to, in the following passage: "And the sun stood still, and the moon stayed, until the people had avenged themselves upon their enemies: is not this written in the book of Jasher?"

It is difficult to determine what this book of *Jasher*, or "the upright," is. St Jerom and the Jews believed it to be Genesis, or some other book of the Pentateuch, wherein God foretold he would do wonderful things in favour of his people. Huetius sup-

poses it was a book of morality, in which it was said that God would subvert the course of nature in favour of those who put their trust in him. Others pretend, it was public annals, or records, which were styled *justice* or *upright*, because they contained a faithful account of the history of the Israelites. Grotius believes, that this book was nothing else but a song, made to celebrate this miracle and this victory. This seems the more probable opinion, because the words cited by Joshua as taken from this work, "Sun, stand thou still upon Gibeon, and thou moon in the valley of Ajalon," are such poetical expressions as do not suit with historical memoirs; besides that in the 2d book of Samuel (i. 18.) mention is made of a book under the same title, on account of a song made on the death of Saul and Jonathan.

JASMINE. See **JASMINUM**.

Arabian JASMINE. See **NYCTANTHES**.

JASMINUM, **JASMINE**, or *Jessamine-tree*; a genus of the monogynia order, belonging to the dianthia class of plants.

Species. 1. The officialis, or common white jasmine, hath shrubby long slender stalks and branches, rising upon support 15 or 20 feet high, with numerous white flowers from the joints and ends, of a very fragrant odour. There is a variety with white-striped, and another with yellow-striped leaves. 2. The fruticans, or shrubby yellow jasmine, hath shrubby, angular, trailing stalks and branches, rising upon support eight or ten feet high; trifoliate and simple alternate leaves; with yellow flowers from the sides and ends of the branches, appearing in June; frequently producing berries of a black colour. This species is remarkable for sending up many suckers from its roots; often so plentifully as to overspread the ground, if not taken up annually. 3. The humilis, or dwarf yellow jasmine, hath shrubby firm stalks, and angular branches, of low, somewhat robust and bushy growth; broad, trifoliate, and pinnated leaves; and large yellow flowers in July, sometimes succeeded by berries. 4. The grandiflorum, or great-flowered Catalonian jasmine, hath a shrubby firm upright stem, branching out into a spreading head from about three to six or eight feet high, with large flowers of a bluish-red colour without, and white within, appearing from July to November. Of this there is a variety with semi-double flowers, having two series of petals. 5. The azoricum, or azorian white jasmine, hath shrubby, long slender stalks and branches, rising upon support 15 or 20 feet high, with pretty large flowers of a pure white colour; coming out in loose bunches from the ends of the branches, and appearing most part of the summer and autumn. 6. The odoratissimum, or most sweet-scented yellow Indian jasmine, hath a shrubby upright stalk branching erect, without support, six or eight feet high, with bright yellow flowers in bunches from the ends of the branches; flowering from July till October, and emitting a most fragrant odour.

Culture. The three first species are sufficiently hardy to thrive in this climate without any shelter. They may be easily propagated by layers and cuttings; and the striped varieties by grafting or budding on stocks of the common kind.—The other three species, which are tender, may also be increased by layers, or seeds,

Jasmine,

jasminum

seeds, or by grafting and budding them upon the common white and shrubby yellow jafmine. They require shelter in a green-house in winter, and therefore must always be kept in pots to move them out and in occasionally. The pots must be filled with light, rich earth, frequently watered in summer, and about once a week in winter, but always moderately during that season. Prune off all the decayed wood at any time when it appears, and shorten or retrench the rambling shoots as you see occasion, to preserve the heads somewhat regular; managing them in other respects as the common green-house plants.

JASON, the Greek hero who undertook the Argonautic expedition, the history of which is obscured by fabulous traditions, flourished about 937 B. C.

JASPER, in natural history, a genus of scrupi, of a complex irregular structure, of a great variety of colours, and emulating the appearance of the finer marbles, or semipellucid gems.

The great characteristic of jaspers is, that they all readily strike fire with steel, and make not the least effervescence with aquafortis.

Jaspers, though commonly reckoned among the precious stones, ought undoubtedly to be ranged among the scrupi; being only opaque crystalline masses, variously debased with an earthy admixture; and to this last ingredient it is that they owe all their variety of colours, as white, green, red, brown, and bluish.

The several kinds of nephritic stone, and the lapis divinus or jade, are all genuine jaspers; but the hard, bright, green jasper of the East Indies, seems to be the true kind. It is found in masses of various sizes and shapes: but the more usual standard as to size is between four and six inches in diameter; tho' there are masses of it found of a foot or more in diameter, and others no larger than a horse-bean. It is generally simple and unmixed: but if it be variegated at all, it is always with white; and this is disposed not in streaks or veins, but in clouds. It is capable of a very fine polish; and, when the white clouds are well disposed, is very beautiful; and, in pieces not too thick, is tolerably pellucid when held up against the light.

JASPONYX, in natural history, the purest horn coloured onyx, with beautiful green zones, which are composed of the genuine matter of the finest jaspers. See JASPER and GONYX.

JATROPHA, the CASSADA-PLANT; a genus of the monoclephia order, belonging to the monoclephia class of plants. There are seven species; the most remarkable of which is the manihot or manioc, the root of which is naturally poisonous, but may be deprived of that quality, and made into bread; and as such is used both in Africa and America, though it hath been disputed whether the plant is really a native of the latter country, or imported to it from Africa. The shrub rises seven or eight feet high, with a thin bark, that is grey, red, or violet, according to the different colours of the wood which it covers. The trunk and branches are filled with small prominences or knots, exhibiting the vestigia of the fallen leaves; for as the tree increases in height, the leaves relinquish the bottom of the branches, and are only to be found near the top. The wood is soft and brittle. The plant is better propagated by layers than from seed; at least,

little of the root proper for eating is to be obtained by the latter method. The principal root produces suckers, in number from four to seven, and of different length and thickness, according to the age of the tree and goodness of the soil. The bark of the roots is like that of the trunk, grey, when the wood is grey; red, when red; white, when white: but the inside or heart is always white, and of the consistence of turnip.

The roots of white manioc are ripe in eight months; those of the other kind require 14 or 18 months to attain their full size and maturity. When ripe, they are plucked out of the earth by tearing up the whole tree, which never fails to be accompanied by the root; and if in that operation any of the offsets should be separated from the main root, which is easily observed, they take them up with a hoe. It requires no great force to pluck up these shrubs; for, besides that the soil is of a soft nature, the roots do not penetrate very deep into it.

When plucked up, the negroes destined for this work grate or rasp the bark with a blunt knife, as is done to turnips, and then throw them into a tub full of water. They are then reduced to a powder or meal, resembling the coarse sawings of wood: this is effected by rubbing the root very forcibly against a copper file or grater, about 15 or 18 inches long, and 10 or 12 broad, that is fastened by small nails upon a plank of timber, three feet and a half long and one broad. The negro, who files, puts one end of the plank into a wooden trough or tub, and holds the other against his stomach; at his side is a basket, containing roots that are rasped, washed, and fit for being filed; one of these he takes in each hand, and passes it violently upon the file or grater, till it is reduced to a rough powder.

All the roots being grated in this manner, they take the powder and put it into a press, with a view to squeeze out the juice, which is regarded as a very strong poison, not only for men, but for beasts also, who drink of it, or chance to eat of these roots before the juice is expressed. It is remarkable, that animals which die in consequence of having swallowed any quantity of this substance, have their breasts prodigiously swelled, without any visible alteration on the noble parts. Some have hence argued, that the juice in question is not essentially a poison; but that possessing a superfluity of nourishment, it proves an overmatch to the digestive faculties, and thus proves mortal.

Besides this super-abundance of nourishment, says father Labat, a part of its malignity consists in its coldness, which stops the circulation, benumbs the animal-spirits, and at length causes death: hence the best antidote against this poison is heat and violent motion. The patient, after swallowing large quantities of oil, to excite a nausea and vomiting, is made to run as quick as he can, and drink plentifully of the strongest spirits; in fine, every method is used to excite violent heat, to rouse the spirits, and put the blood in motion.

Animals which have accustomed themselves insensibly to the juice of manioc, feel no inconvenience from the root of it, but rather the contrary. It is in this manner that the Turks, by a gradual and constant use,

use, have rendered opium a harmless and even exhilarating medicine.

The juice of manioc loses its malignity when heated. The natives of the West-Indies, who use it in all their sauces, feel no sort of inconvenience from it, because they never use it till after being boiled. Of the same juice they make starch, by drying it in the sun, where it becomes as white as snow, and is frequently made into cakes, which are as delicate as if made with the finest wheat-flour.

When the manioc is sufficiently pressed, they either make it into bread, called *caffada*, or into flour for preserving. For the first-mentioned purpose, they have a plate of iron, two feet broad and half an inch thick; this they place upon a tripod, or on stones, and kindle a fire below it. When sufficiently heated, so as not to admit of the touch, they lay on the whole surface about the thickness of three fingers of manioc, which has been previously pressed and sifted. The heap falls down in proportion as it roasts, and the parts join and incorporate. This compression and incorporation is aided by the person who roasts, slightly passing a piece of wood over the plate. When the side of the cake next the plate is sufficiently done, that is, adheres, and the colour, formerly very white, becomes red, it is turned; and the other side allowed to roast till the same symptoms appear. When roasted, it is laid in the sun for two or three hours, with a view to dissipate any poisonous humidity, which may still lurk in the root under this new form.

The inside of *caffada* is as white as snow, the sides of a pale gold colour; the substance, which is very nourishing, and of easy digestion, may be preserved seven or eight months, or more, provided it is kept dry and sometimes exposed to the sun. When dipped in water, or put in soup, *caffada* swells up to a great height, which seems to prove its great abundance in substance.

The other mode of preparation, however, is most common, as being more convenient for preserving, distributing to the negroes, and transporting from place to place. The manioc, in this case, is put into a pan or stove that is but slightly heated, where it is continually turned, like coffee-beans, with a small wooden instrument contrived for that purpose. This motion prevents it from sticking to the pan; so that, when dried and roasted, it has the appearance of thick red grains of salt. This mode of preparation is much more expeditious than the former. When dried, it is put in granaries, where it may be preserved whole years, if kept dry, or put into a stove every six months.

This substance may be eat quite dry, as crumbled bread, or as the Turks eat roasted rice. When moistened, it swells prodigiously.

This latter method of preparing manioc is never practised by the natives, who use only *caffada*, which they prepare once every day, or oftener, as occasion requires; for they eat it quite hot, as being then more delicate and agreeable to the taste. Before their intercourse with the Europeans had procured them iron plates, they made their *caffada* upon large flat stones, whose thickness they adjusted to that purpose. In default of copper files or grates, they made use of a plank of wood, in which were fixed very small sharp bits of

pebbles.

One sort of manioc is said to be exempt from the poisonous quality possessed by the juice of the others. It is called *camoniac*, that is, chief of manioc: in fact, its wood, leaves, and roots, are larger and thicker than the others, and it is eaten without danger, or any precaution; but as it is longer of growing and ripening, and the roots yield much less meal, because lighter and more spongy, it is generally neglected.

The small bits of manioc which have escaped the grater, and the clods which have not passed the sieve, are not useless. They are dried in the stove after the flour is roasted, and then pounded in a mortar to a fine white powder, with which they make soup. It is likewise used for making a kind of thick coarse *caffada*, which is roasted till almost burnt; of this, fermented with molasses and West-India potatoes, they prepare a much esteemed drink or beverage called *ouycou*. This liquor, the favourite drink of the natives, is sometimes made extremely strong, especially on any great occasion, as a feast; with this they get intoxicated, and, remembering their old quarrels, massacre and murder each other. Such of the inhabitants and workmen as have not wine, drink *ouycou*. It is of a red colour, strong, nourishing, refreshing, and easily inebriates the inhabitants, who soon accustom themselves to it as easily as beer. The leaves of manioc are used in both Indies, as those of spinnage are with us.

JAVA, a large island of the East Indies, lying between 105° and 116° E. Long. and from 6° to 8° S. Lat. extending in length 700 miles, and in breadth about 100. It is situated to the south of Borneo, and south-east from the peninsula of Malacca, having Sumatra lying before it, from which it is separated by a narrow passage, now so famous in the world by the name of the *Straits of Sunda*. The country is mountainous and woody in the middle; but a flat coast, full of bogs and marshes, renders the air unhealthful. It produces pepper, indigo, sugar, tobacco, rice, coffee, cocoa-nuts, plantains, cardamoms, and other tropical fruits. Gold also, but in no great quantities, hath been found in it. It is diversified by many mountains, woods, and rivers; in all which nature has very bountifully bestowed her treasures. The mountains are many of them so high as to be seen at the distance of three or four leagues. That which is called the *Blue Mountain* is by far the highest of them all, and seen the farthest off at sea. They have frequent and very terrible earthquakes in this island, which shake the city of Batavia and places adjacent, to such a degree, that the fall of the houses is expected every moment. The waters in the road are excessively agitated, inasmuch that their motion resembles that of a boiling pot; and in some places the earth opens, which affords a strange and terrible spectacle. The inhabitants are of opinion, that these earthquakes proceed from the mountain Parang, which is full of sulphur, saltpetre, and bitumen. The fruits and plants of this island are all in their several kinds excellent, and almost out of number. There are abundance of forests scattered over it, in which are all kinds of wild beasts, such as buffaloes, tigers, rhinoceroses, and wild horses, with an infinite variety of serpents, some of them of an enormous size. Crocodiles are prodigiously large in Java, and are found chiefly

chiefly the mouths of rivers; for, being amphibious animals, they delight mostly in marshes and savannahs. This creature, like the tortoise, lays its eggs in the hot sands, without taking any further care of them; and the sun hatches them at the proper season, when they run instantly into the water. There is, in short, no kind of animal wanting here: fowls they have of all sorts, and exquisitely good, especially peacocks, partridges, pheasants, wood-pigeons: and, for curiosity, they have the Indian bat, which differs little in form from ours; but its wings, when extended, measure a full yard, and the body of it is of the size of a rat. They have fish in great plenty, and very good; so that for the value of three-pence there may be enough bought to dine six or seven men. They have likewise a multitude of tortoises, the flesh of which is very little inferior to veal, and there are many who think it better.

It is said, that there are in the island upwards of 40 great towns, which, from the number of their inhabitants, would, in any other part of the world, merit the title of *cities*; and more than 4,500 villages, besides hamlets, and straggling houses, lying very near each other, upon the sea-coast, and in the neighbourhood of great towns: so that, upon a fair and moderate computation, there are within the bounds of the whole island, taking in persons of both sexes, and of all ranks and ages, more than thirty millions of souls; so that it is thrice as populous as France, which, though twice as big, is not computed to have more than twenty millions of inhabitants.

There are a great many princes in the island, of which the most considerable are, the emperor of Mataran, who resides at Katsafura, and the kings of Bantam and Japara. Upon the first of these many of the petty princes are dependant; but the Dutch are absolute masters of the greatest part of the island, particularly of the north coast, though there are some of the princes beyond the mountains, on the south coast, who still maintain their independency. The natives of the country, who are established in the neighbourhood of Batavia, and for a tract of about 40 leagues along the mountains of the country of Bantam, are immediately subject to the governor-general. The company send drovers, or commissaries, among them, who administer justice and take care of the public revenues.

The city of Batavia is the capital not only of this island, but of all the Dutch dominions in India. It is an exceeding fine city, situated in the latitude of 6° south, at the mouth of the river Jucatra, and in the bosom of a large commodious bay, which may be considered not only as one of the safest harbours in India, but in the world. The city is surrounded by a rampart, 21 feet thick, covered on the outside with stone, and fortified with 22 bastions. This rampart is environed by a ditch 45 yards over, and full of water, especially when the tides are high, in the spring. The avenues to the town are defended by several forts, each of which is well furnished with excellent brass cannon: no person is suffered to go beyond these forts without a passport. The river Jucatra passes through the midst of the town, and forms 15 canals of running water, all faced with free-stone, and adorned with trees that are ever green: over these canals are

56 bridges, besides those which lie without the town. The streets are all perfectly straight, and each, generally speaking, 30 feet broad. The houses are built of stone, after the manner of those in Holland. The city is about a league and a half in circumference, and has five gates; but there are ten times the number of houses without that there are within it. There is a very fine town-house, four Calvinist churches, besides other places of worship for all sorts of religions, a spin-huys or house of correction, an orphan-house, a magazine of sea-stores, several for spices, with wharfs and cord-manufactures, and many other public buildings. The garrison consists commonly of between 2000 and 3000 men. Besides the forts mentioned above, there is the citadel of Batavia, a very fine regular fortification, situated at the mouth of the river, and flanked with four bastions; two of which command the sea, and the other two the town. It is in this citadel that the governor-general of the Indies has his palace; over-against which is that of the director-general, who is the next person to the governor. The counsellors, and other principal officers of the company, have also their apartments there; as have likewise the physician, the surgeon, and the apothecary. There are in it, besides, arsenals and magazines, furnished with ammunition for many years. The city of Batavia is not only inhabited by Dutch, French, Portuguese, and other Europeans, established here on account of trade; but also by a vast number of Indians of different nations, Javanese, Chinese, Malaysians, Negroes, Amboynese, Armenians, natives of the isle of Bali, Mardiykers or Topasses, Macassers, Timors, Bougis, &c. Of the Chinese, there are, it is said, about 100,000 in the island; of which, near 30,000 resided in the city till the year 1740, when the Dutch, pretending that they were in a plot against them, sent a body of troops into their quarter, and demanded their arms, which the Chinese readily delivered up; and the next day the governor sent another body, with orders to murder and massacre every one of the Chinese, men, women, and children. Some relate there were 20,000, others 30,000, that were put to death, without any manner of trial: and yet the barbarous governor, who was the instrument of this cruel proceeding, had the assurance to embark for Europe, imagining he had amassed wealth enough to secure him against any prosecution in Holland; but the Dutch, finding themselves detected and abhorred by all mankind for this piece of tyranny, endeavoured to throw the odium of it upon the governor, though he had the hands of all the council of Batavia, except one, to the order for the massacre. The flates, therefore, dispatched a packet to the Cape of Good Hope, containing orders to apprehend the governor, and send him back to Batavia to be tried. He was accordingly apprehended at the Cape; but has never been heard of since. It is supposed, he was thrown over-board in his passage to Batavia, that there might be no farther inquiries into the matter; and, it is said, all the wealth this merciful gentleman had amassed, and sent over before him in four ships, was cast away in the passage.

Besides the garrison here, the Dutch, it is said, have about 15,000 men in the island, either Dutch, or formed out of the several nations they have enslaved;

Javelin
||
Iberis.

slaved; and they have a fleet of between 20 and 30 men of war, with which they give law to every power on the coast of Asia and Africa, and to all the European powers that visit the Indian Ocean, unless we should now except the British: it was, however, but a little before the revolution, that they expelled us from our settlement at Bantam.

JAVELIN, in antiquity, a sort of spear five feet and an half long; the shaft of which was of wood, with a steel point.—Every soldier in the Roman armies had seven of these, which were very light and slender.

JAVELLO (Chrysostome), a learned Italian Dominican of the 16th century, taught philosophy and theology at Bologna, and died about the year 1540. He wrote a work on philosophy, another on politics, and another on Christian economy, which are esteemed; with notes on Pomponatius, and other works, printed in 3 vols folio.

JAWER, a city of Silesia, capital of a province of the same name, with a citadel, and a large square surrounded with piazzas. It is 12 miles south-east of Lignitz, 30 south-west of Breslau, and 87 east of Prague. E. Longitude 16. 29. N. Lat. 50. 56.

JAUNDICE. See (the *Index* subjoined to) *MEDICINE*.

JAW, in anatomy. See there, n° 19, 25.

Locked JAW, in medicine. See (the *Index* subjoined to) *MEDICINE*.

JAY (Guy Michaele), a French gentleman, who distinguished himself by causing a polyglot bible to be printed at his own expence in 10 vols folio: but he ruined himself by that impression, first because he would not suffer it to appear under the name of cardinal Richelieu, who, after the example of cardinal Ximenes, was ambitious of eternizing his name by this means; and next, because he made it too dear for the English market; on which Dr Walton undertook his polyglot bible, which, being more commodious, reduced the price of Mr le Jay's. After the death of his wife, M. le Jay took orders, was made dean of Vezeley in the Nivernois, and Lewis XIV. gave him the post of counsellor of state.

JAZER, or **JASER**, (anc. geog.), a Levitical city in the territory of the Amorrites beyond Jordan, 10 miles to the west, or rather south-west, of Philadelphia, and 15 miles from Eschbon; and therefore situated between Philadelphia and Heshbon, on the east border of the tribe of Gad, supposed to be the *Jazorem* of Josephus. In Jeremiah xlviii. mention is made of the sea of Jazer, that is a lake; taken either for an effusion or overflowing of the Arnon, or a lake thro' which it passes, or from which it takes its rise.

IBERIS, *SCIATICA* CRESS, or *Candy-tuft*; a genus of the filiculosa order, belonging to the tetradynamia class of plants.

Species. 1. The umbellate, or common candy-tuft, hath herbaceous, short, round, and very brachy stalks of tufty growth, from about six to eight or ten inches high; small spear-shaped leaves, the lower ones serrated, the upper entire; and all the stalks and branches terminated by umbellate clusters of flowers of different colours in the varieties. 2. The amara, or bitter candy-tuft, hath stalks branching like the former, which rise from eight to ten or twelve inches high; small,

spear-shaped, and slightly indented leaves; and all the branches terminated by racemose bunches of white flowers in June and July. 3. The sempervirens, commonly called *tree candy-tuft*, hath low undershrubby stalks very brachy and bushy, rising to the height of 10 or 12 inches, with white flowers in umbels at the ends of the branches, appearing great part of the summer. 4. The sempervirens, or ever-flowering shrubby iberis, hath low undershrubby stalks very brachy, growing to the height of 18 inches, with white flowers in umbels at the ends of the branches, appearing at all times of the year.

Culture. The two first kinds, being hardy annuals, may be sowed in any common soil in the month of March, or from that time till midsummer, and will thus afford a succession of flowers from June to September, which are succeeded by great plenty of seeds. The other two are somewhat tender; and therefore must be planted in pots, in order to be sheltered from the winter frosts. They are easily propagated by slips or cuttings.

IBEX, in zoology. See *CAPRA*.

IBIS, in ornithology. See *TANTALUS*.

IBYCUS, a Greek lyric poet, of whose works there are only a few fragments remaining, flourished 550 B. C. It is said, that he was assassinated by robbers; and that, when dying, he called upon some cranes he saw flying to bear witness. Some time after, one of the murderers seeing some cranes, said to his companions, "There are the witnesses of Ibycus's death:" which being reported to the magistrates, the assassins were put to the torture, and having confessed the fact, were hanged. Thence arose the proverb *Ibyci Crues*.

ICE, in physiology, a solid, transparent, and brittle body, formed of some fluid, particularly water, by means of cold. See *FROST*.

The younger Lemery observes, that ice is only a re-establishment of the parts of water in their natural state; that the mere absence of fire is sufficient to account for this re-establishment; and that the fluidity of water is a real fusion, like that of metals exposed to the fire; differing only in this, that a greater quantity of fire is necessary to the one than the other. Galileo was the first that observed ice to be lighter than the water which composed it: and hence it happens, that ice floats upon water, its specific gravity being to that of water as eight to nine. This rarefaction of ice seems to be owing to the air-bubbles produced in water by freezing; and which, being considerably large in proportion to the water frozen, render the body so much specifically lighter: these air-bubbles, during their production, acquire a great expansive power, so as to burst the containing vessels, tho' ever so strong. See *CONGELATION*, *COLD*, &c.

M. Mairan, in a dissertation on ice, attributes the increase of its bulk chiefly to a different arrangement of the parts of the water from which it is formed; the icy skin on the water being composed of filaments which are found to be constantly and regularly joined at an angle of 60°; and which, by this angular disposition, occupy a greater volume than if they were parallel. He found the augmentation of the volume of water by freezing, in different trials, a 14th, an 18th, a 19th, and, when the water was previously purged

Iberis
||
Ice.

ged of air, only a 2d part: that ice, even after its formation, continues to expand by cold; for, after water had been frozen to some thickness, the fluid part being let out by a hole in the bottom of the vessel, a continuance of the cold made the ice convex; and a piece of ice which was at first only a 14th part specifically lighter than water, on being exposed some days to the frost, became a 12th part lighter. To this cause he attributes the bursting of ice on ponds.

Wax, resins, and animal-fats, made fluid by fire, instead of expanding like watery liquors, shrink in their return to solidity: for solid pieces of the same bodies sink to the bottom of the respective fluids; a proof that these bodies are more dense in their solid than in their fluid state. The oils which congeal by cold, as oil-olive, and the essential oil of aniseeds, appear also to shrink in their congelation. Hence, the different dispositions of different kinds of trees to be burst by, or to resist, strong frosts, are by some attributed to the juices with which the tree abounds; being in the one case watery, and in the other resinous or oily.

Ice-House, a building contrived to preserve ice for the use of a family in the summer-season.

Ice-houses are more generally used in warm countries than with us; particularly in Italy, where the meanest person who rents a house, has his vault or cellar for ice.

As to the situation, it ought to be placed upon a dry spot of ground; because wherever there is moisture, the ice will melt: therefore in all strong lands which retain the wet, too much pains cannot be taken to make drains all round them. The place should also be elevated, and as much exposed to the sun and air as possible.

As to the figure of the building, that may be according to the fancy of the owner; but a circular form is most proper for the well in which the ice is to be preserved, which should be of a size and depth proportionable to the quantity to be kept: for it is proper to have it large enough to contain ice for two years consumption; so that if a mild winter should happen, in which little or no ice is to be had, there may be a stock to supply the want. At the bottom of the well, there should be a space of about two feet deep, left to receive any moisture that may drain from the ice; over this space should be placed a strong wooden grate, and from thence a small drain should be laid under ground to carry off the wet. The sides of the well should be built with brick or stone, at least two bricks thick; for the thicker it is, the less danger there will be of the well being affected by any external cause. When the wall is brought up within three feet of the surface, there should be another outer arch or wall begun, which should be carried up to the height of the top of the intended arch of the well; and if there be a second arch turned over this wall, it will add to the goodness of the house: the roof must be high enough above the inner arch to admit of a door-way to get out the ice. If the building is to be covered with slates or tiles, reeds should be laid considerably thick under them, to keep out the sun and external air; and if these reeds are laid the thickness of six or eight inches, and plastered over with lime and hair, there will be no danger of the heat getting through them. The external wall may be built in what form the pro-

prietor pleases; and as these ice-houses are placed in gardens, they are sometimes so contrived as to have an handsome alcove-seat in front, with a small door behind it, through which a person might enter to take out the ice; and a large door on the other side, fronting the north, with a porch wide enough for a small cart to back, in order to shoot down the ice near the mouth of the well, which need not be more than two feet diameter, and a stone so contrived as to shut it up in the exactest manner: all the vacant space above and between this and the large door should be filled up with barley-straw. The building thus finished, should have time to dry before the ice is put into it.

It is to be observed, that upon the wooden grate, at the bottom of the well, there should be laid some small faggots; and if upon these a layer of reeds is placed smooth for the ice to lie upon, it will be better than straw, which is commonly used. As to the choice of the ice, the thinner it is, the easier it may be broken to powder; for the smaller it is broken, the better it will unite when put into the well. In putting it in, care must be taken to ram it as close as possible; and also to allow a vacancy of two inches, all round, next the side of the well, to give passage to any moisture occasioned by the melting of some of the ice. When the ice is put into the well, if a little salt-petre be mixed with it at every ten inches or a foot in thickness, it will cause it to unite more closely into a solid mass.

Ice-Island, a name given by sailors to a great quantity of ice collected into one huge solid mass, and floating about upon the seas near or within the Polar Circles.—Many of these fluctuating islands are met with on the coasts of Spitzbergen, to the great danger of the shipping employed in the Greenland fishery. Towards the South Pole, they are still more numerous and formidable; but for a particular account of these islands and their formation, see the articles *NORTH-SEA* and *SOUTH-SEA*.

ICELAND, a large island lying in the northern part of the Atlantic Ocean, between 63 and 68 degrees of north latitude, and between 10 and 26 degrees of west longitude, its greatest length being about 700 miles, and its breadth 300.

This country lying partly within the frigid zone, and being liable to be surrounded with vast quantities of ice which come from the Polar Seas, is on account of the coldness of its climate very inhospitable; but much more so for other reasons. It is exceedingly subject to earthquakes; and so full of volcanoes, that the little part of it which appears fit for the habitation of man seems almost totally laid waste by them. The best account that hath yet appeared of the island of Iceland is in a late publication intitled, “*Letters on Iceland, &c.*” written by Uno Von Troil, D.D. first chaplain to his Swedish majesty.” This gentleman failed from London on the 12th of July 1772, in company with Mr Banks, Dr Solander, and Dr James Lind of Edinburgh, in a ship for which L. 100 Sterling was paid every month. After visiting the western isles of Scotland, they arrived on the 28th of August at Iceland, where they cast anchor at Bessfæddur or Bessfættadr, lying in about 64° 6' N. Lat. in the western part of the island. The country had to them the most dismal appearance that can be conceived. “I-

General account of the country.

Iceland.

Imagine to yourself (says Dr Troil,) a country, which from one end to the other presents to your view only barren mountains, whose summits are covered with eternal snow, and between them fields divided by vitrified cliffs, whose high and sharp points seem to vie with each other to deprive you of the sight of a little grass which scantily springs up among them. These same dreary rocks likewise conceal the few scattered habitations of the natives, and no where a single tree appears which might afford shelter to friendship and innocence. The prospect before us, though not pleasing, was uncommon and surprising. Whatever presented itself to our view bore the marks of desolation; and our eyes, accustomed to behold the pleasing coasts of England, now saw nothing but the vestiges of the operation of a fire, Heaven knows how ancient!

"On our landing, we found two tracts of lava, called *gorde* and *hvaldeyr-brann*, (for what we and the Italians call *lava*, is called in Iceland *brann*, from *brinna*, "to flow"), of which the last was particularly remarkable, since we find there a whole field covered with lava, which must have been liquefied in the highest degree; and whole mountains of turf. Chance had directed us exactly to a spot on which we could better than on any other part of Iceland consider the operations of a fire which had laid waste a stretch of 10 or 12 miles (A).

2
Mount
Hecla de-
scribed.

"We had now seen almost all the effects of a volcano except the crater from whence the fire proceeded; and in order to examine this likewise, we undertook a journey of 12 days to mount Hecla itself. We travelled 50 or 60 miles, (300 or 360 English ones,) over an uninterrupted track of lava, and had at last the pleasure of being the first who ever reached the summit of this celebrated volcano. The reason that no one has been there before is partly founded in superstition, and partly in the extreme difficulty of the ascent before the last discharge of fire, which happened in 1766. This mountain has been more taken notice of than many others in the country of as great extent, partly from its having vomited fire more frequently, and partly from its situation, which exposes it to the sight of ships sailing to Greenland and North America. It is situated in the southern part of the island, about four miles from the sea-coast, and is divided into three points at the top; the highest of which is that in the middle; and is, according to an exact observation with Ramsden's barometer, 5000 feet higher than the sea. We made use of our horses, but were obliged to quit them at the first opening from which the fire had burst. This was a place surrounded with lofty glazed walls, and filled with high glazed cliffs, which I cannot compare with any thing I ever saw before.

"A little higher up, we found a large quantity of grit and stones; and still farther on, another opening, which, though not deep, descended lower down than that of the highest point. We thought we plainly observed marks of hot boiling water in this place. Not far from thence the mountains began to be covered with snow, some small spots excepted, which were bare. We could not at first discern the cause of this difference, but soon found that it proceeded from the

Iceland.

vapour which arose from the mountain. As we ascended higher, these spots became larger; and about 200 yards from the summit, we found a hole of about one yard and a half in diameter, from which so hot a steam exhaled, that it prevented us from ascertaining the degree of heat with the thermometer.

"The cold now began to be very intense, as Fahrenheit's thermometer, which was at 54 at the foot of the mountain fell to 24. The wind was also become so violent, that we were sometimes obliged to lie down, to avoid being thrown into the most dreadful precipices by its fury.

"We were now arrived at one of the highest summits, when our conductor who did not take great pleasure in the walk, endeavoured to persuade us that this was the highest part of the mountains. We had just finished our observations, and found by them that Ramsden's barometer stood at 24.238, and the thermometer fixed to it at 27, when happily the clouds divided, and we discovered a still higher summit. Here we experienced at one and the same time a high degree of heat and cold; for in the air Fahrenheit's thermometer was constantly at 24, and when we set it down on the ground it rose to 153. The barometer was here at 22.247.—We could not safely remain here for any long time, though we were very much inclined to it; and therefore descended, after having considered the last opening there, one of the sides of which was entirely overturned, and the other quite covered with ashes and grit. In our return we observed three considerable openings, in one of which every thing looked as red as brick. From another the lava had flowed in a stream of about 50 yards in breadth, and at some distance from thence the stream divided into three broad arms. Further on we found a large circular opening, at the bottom of which we observed a mountain in the form of a sugar-loaf, in throwing up of which the fire seemed to have exhausted itself.

"The mountain does not consist of lava, but chiefly of sand, grit, and ashes; which are thrown up with the stones partly melted and partly discoloured by the fire. We likewise found several sorts of pumice, and among them one piece with some sulphur in it. The pumice was sometimes so much burnt, that it was as light as tow; their form and colour was sometimes very fine, but at the same time so soft, that it was difficult to remove them from one place to another. Of the common lava we found both large pieces and small bits; as likewise a quantity of black Jasper burned at the extremities, and resembling trees and branches. Among the stones thrown out of the mountain we saw some slate of a strong red colour. In one place the lava had taken the form of chimney-stalks half-broken down.

"It scarcely ever happens that any of the Iceland Symptom³ volcanoes begin to throw out fire unexpectedly. For preceding the eruptions. besides a loud rumbling noise which is heard at a considerable distance, for several days preceding any eruption, and a roaring and cracking in the part from whence the fire is going to burst forth, many fiery meteors are observed, but unattended in general with any violent concussion of the earth, though sometimes earth-

(A) The miles mentioned by Dr Troil are always Swedish, ten and an half of which are equal to a degree on one of the great circles on the globe; and therefore one Swedish mile is nearly equal to six English miles. Ten or twelve such miles are, consequently, equal to 60 or 70 English ones.

Iceland.

earthquakes, of which the history of the country affords several instances, have accompanied these dreadful conflagrations.—It is likewise considered as a sign of an impending eruption, when small lakes, rivulets, and streams, dry up. Some persons believe, that it does not a little contribute to hasten the eruption, when the mountain is so covered with ice that the holes are stopped up through which the exhalations formerly found a free passage; and though it is by no means probable that this contributes much to it, it cannot be denied that the fire is generally contained in these mountains covered with ice, or, as the Icelanders call them, *jökuls*.

“The sign of an eruption going to take place immediately, is the burbling of the mafs of ice with a dreadful noise. Flames then burst forth, and lightning and balls of fire issue from the smoke. With the flames proceed a number of larger and smaller stones, which are sometimes thrown to an incredible distance. A round stone about a Swedish ell (two feet) in diameter was thrown from Hecla, in the last eruption, to the distance of near six English miles. Egbert Olafsen also relates, that at the last eruption of Kattlegiaa, another volcano, a stone which weighed 290 pounds was thrown to the distance of 24 English miles. A quantity of white pumice-stone is also thrown up, with the boiling waters; and it is conjectured with great probability that the latter proceed from the sea, as a quantity of salt sufficient to load several horses has frequently been found after the mountain has ceased to burn.—Then follow generally brown or black pumice stone, sand, ashes, and lava.

4
ices and
its form-
by the
ruptions.

“The lava is seldom found near the opening; but rather tufa, or loose ashes and grit; and indeed the greater part of the Icelandic mountains consist of this matter, which, when it is grown cold, generally takes an arched form. The upper crust frequently grows hard and solid, whilst the melted matter beneath it continues liquid; this forms great cavities, whose walls, bed, and roof, are of lava, and where great quantities of stalactite of lava are found. There are a great number of these caves in Iceland, some of which are very large, and are made use of by the inhabitants for sheltering their cattle. The largest in the island is 5034 feet long, from 50 to 54 in breadth, and between 34 and 36 in height.

“Among the traces left by the eruptions of the Iceland volcanoes, are some prodigious clefts, the largest of which is called *Almenneggia*, near the water of Thingalla in the south-western part of the island. It is 105 feet in breadth, and of great length. The direction of the chasm itself is from north to south. Its western wall, from which the other has been perpendicularly divided is 107 feet six inches in height, and consists of many strata (each of which is about 10 inches in height) of lava grown cold at different times, as may easily be discovered by the apparent crust which is full of blisters, of a darker brown, and not so much compressed as the remaining part of the mafs of lava. The eastern wall is only 45 feet 4 inches in height; and that part of it which is directly opposite to the highest part of the other side is no more than 36 feet five inches high.

“The eruptions of the Iceland volcanoes are no less terrible and destructive than those of Vesuvius and

Iceland.

Ætna. The first mentioned in the ancient records happened in the ninth century, immediately after the arrival of the Norwegians on the island; and produced a lava three miles in length, and two and a half in breadth. After this there is no mention made of eruptions till the year 1000, when Christianity was introduced. At a time when the chiefs of the country were assembled to consult about the reception of the Christian religion, information was brought that an eruption of fire had happened. The heathens considered this as a proof of the wrath of the gods, on which account they were resolved to refuse the new religion; but this resolution was over-ruled by one of the assembly asking, “On whom did the gods display their wrath, when those rocks on which we now stand were on fire?”—In 1311, 22 farms were destroyed by eruptions, and 70 more in 1366. Hecla destroyed two in 1374; seven in 1390; and 18 in one day in 1436. In the same manner five farms were destroyed in 1660, and many more in 1693. In 1727, 600 sheep and 150 horses were destroyed by the flood and pieces of ice which rushed down the side of a volcano during an eruption. In 1728, many farms were destroyed, and a large lake entirely dried up. Into this lake the streams of fire that rolled from the mountains flowed during some years, and formed a tract of lava four miles in length, and one and a half in breadth. In 1755 six parishes were destroyed; and, in the last eruption of Hecla, a tract of many miles was laid waste.

“In the eruption of 1755, a flash of lightning⁶ was sent to burst from the flame, and pierced through the cliffs which intercepted its way. The flame lightning in one place killed eleven horses, three of which were in a stable. A farmer was also killed by it near the door of his room: his upper cloaths, which were woollen, remained entirely unburnt; but his shirt and waistcoat, which were both of linen, were burnt; and when his clothes were pulled off, it was found that the flesh and skin on his right side were consumed to the very bones. The maid-servant who wanted to assist him in saving the cattle was likewise struck by the lightning; but did not die till some days after, during which time she suffered inexpressible torture. It is likewise said that her cloaths were singed by the glutinous fires which cleaved to her body.

7
Account of
some of which spout up into the air to a surprising height of
Iceland.

“Iceland abounds with hot and boiling springs, the some of which spout up into the air to a surprising height. All the jets d’eau which have been contrived with so much art, and at such an enormous expence, cannot by any means be compared with these wonders of nature in Iceland. The water-works at Herenhausen throw up a single column of water of half a quarter of a yard in circumference to a height of about 70 feet; those at the Winterkasten at Cassel, throw it up, but in a much thinner column, 130 feet; and the jet d’eau at St Cloud, which is thought the greatest of all the French water-works, casts up a thin column 80 feet into the air: but some springs in Iceland pour forth columns of water several feet in thickness to the height of many fathoms; and many affirm, of several hundred feet.

“These springs are unequal in their degrees of heat; but we have observed none under 188 degrees of Fahrenheit’s thermometer, in some it is 192, 193,

5
lory of
erup-
36.

212, and in one small vein of water 213 degrees. From some the water flows gently, and the spring is then called *laug*, a "bath;" from others it spouts with a great noise, and is then called *hver*, or *kittel*. It is very common for some of these spouting springs to close up, and others to appear in their stead. All these hot waters have an incrusting quality, so that we very commonly find the exterior surface from whence it bursts forth covered with a kind of rind, which almost resembles clafed work, and which we at first took for lime, but which was afterwards found by Mr Bergman to be of a filiceous or stony nature. In some places the water tastes of sulphur, in others not; but when drank as soon as it is cold, tastes like common boiled water. The inhabitants use it at particular times for dyeing; and were they to adopt proper regulations, it might be of still greater use. Victuals may also be boiled in it, and milk held over its steam becomes sweet: owing, most probably, to the excessive heat of the water, as the same effect is produced by boiling it a long time over the fire. They have begun to make salt by boiling sea-water over it, which when it is refined, is very pure and good. The cows which drink this hot water yield a great deal of milk. Egbert Olafsen relates, that the water does not become turbid when alkali is thrown into it, nor does it change the colour of syrup of violets. Horrebow asserts, that if you fill a bottle at one of the spouting springs, the water will boil over two or three times while the spring throws forth its water; and if corked too soon, the bottle will burst.

8
A particular description of one named *Geyser*.

"Among the many hot springs to be met with in Iceland, several bear the name of *geyser*; the following is a description of the most remarkable of that name, and in the whole island. It is about two days journey from Hecla, near a farm called *Haukadal*. Here a poet would have an opportunity of painting whatever nature has of beautiful and terrible, united in one picture, by delineating this surprising phenomenon. Represent to yourself a large field, where you see on one side, at a great distance, high mountains covered with ice, whose summits are generally wrapped in clouds, so that their sharp and unequal points become invisible. This loss, however, is compensated by a certain wind, which causes the clouds to link, and cover the mountain itself when its summit appears as it were to rest on the clouds. On the other side Hecla is seen, with its three points covered with ice, rising above the clouds, and with the smoke which ascends from it, forming other clouds at some distance from the real ones: and on another side is a ridge of high rocks, at the foot of which boiling water from time to time issues forth; and further on extends a marsh of about three English miles in circumference, where are 40 or 50 boiling springs, from which a vapour ascends to a prodigious height.—In the midst of these is the greatest spring *geyser*, which deserves a more exact and particular account. In travelling to the place about an English mile and an half from the *hver*, from which the ridge of rocks still divided us, we heard a loud roaring noise, like the rushing of a torrent precipitating itself from stupendous rocks. We asked our guide what it meant; he answered, it was *geyser* roaring; and we soon saw with our naked eyes what before seemed almost incredible.

"The depth of the opening or pipe from which the water gushes cannot well be determined; for sometimes the water sunk down several fathoms, and some seconds passed before a stone which was thrown into the aperture reached the surface of the water. The opening itself was perfectly round, and 19 feet in diameter, and terminated in a basin 59 feet in diameter. Both the pipe and the basin were covered with a rough staltic rind, which had been formed by the force of the water: the outermost border of the basin is nine feet and an inch higher than the pipe itself. The water here spouted several times a-day, but always by starts; and after certain intervals. The people who lived in the neighbourhood told us, that they rose higher in cold and bad weather than at other times; and Egbert Olafsen and several others affirm, that it has spouted to the height of 60 fathoms. Most probably they guessed only by the eye, and on that account their calculation may be a little extravagant; and indeed it is to be doubted whether the water was ever thrown up so high, though probably it sometimes mounts higher than when we observed it. The method we took to observe the height was as follows. Every one in company wrote down, at each time that the water spouted, how high it appeared to him to be thrown, and we afterwards chose the medium. The first column marks the spoutings of the water, in the order in which they followed one another; the second, the time when these effusions happened; and the third, the height to which the water rose; and the last, how long each spouting of water continued.

No	Time	Height	Duration
1	At VI 42 m.	30 feet	0 20 seconds
2	—51	6	0 20
3	—VII 16	6	0 10
4	—31	12	0 15
5	—51	60	0 6
6	—VIII. 17	24	0 30
7	—39	18	0 40
8	—36	12	0 40

The pipe was now for the first time full of water, which ran slowly into the basin.

9	—IX. 25	48	1 10
10	—X. 16	24	1 00

"At 35 minutes after twelve we heard as it were three discharges of a gun under ground, which made it shake: the water flowed over immediately, but instantly sunk again. At eight minutes after two, the water flowed over the border of the basin. At 15 minutes after three, we again heard several subterranean noises, though not so strong as before. At 43 minutes after four, the water flowed over very strongly during the space of a minute. In six minutes after, we heard many loud subterraneous discharges, not only near the spring, but also from the neighbouring ridge of rocks where the water spouted. At 51 minutes after six, the fountain spouted up to the height of 92 feet, and continued to do so for four minutes. After this great effort, it sunk down very low into the pipe, and was entirely quiet during several minutes; but soon began to bubble again: it was not, however, thrown up into the air, but only to the top of the pipe.

"The force of the vapours which throw up these waters is excessive; it not only prevents the stones which

Iceland.

which are thrown into the opening from sinking, but even throws them up to a very great height, together with the water. When the balon was full, we placed ourselves before the fun in such a manner that we could see our shadows in the water; when every one observed round the shadow of his own head (though not round that of the heads of others,) a circle of almost the same colours which compose the rainbow, and round this another bright circle. This most probably proceeded from the vapours exhaling from the water.

“ Not far from this place, another spring at the foot of the neighbouring ridge of rocks spouted water to the height of one or two yards each time. The opening through which this water issued, was not so wide as the other: we imagined it possible to stop up the hole entirely by throwing large stones into it, and even flattered ourselves that our attempt had succeeded: but, to our astonishment, the water gushed forth in a very violent manner. We hastened to the pipe, and found all the stones thrown aside, and the water playing freely through its former channel. In these large springs the waters were hot in the highest degree, and tasted a little of sulphur; but in other respects it was pure and clear. In the smaller springs of the neighbourhood the water was tainted: in some, it was as muddy as that of a clay-pit; in others, as white as milk; and, in some few, as red as blood.

9
count of
basaltic
pillars.

“ Iceland abounds with pillars of basalt, which the lower sort of people imagine have been piled upon each other by the giants, who made use of supernatural force to effect it. They have generally from three to seven sides; and are from four to six feet in thickness, and from 12 to 16 yards in length, without any horizontal divisions. But sometimes they are only from six inches to one foot in height, and they are then very regular, inasmuch that they are sometimes made use of for windows and door-posts. In some places they only peep out here and there among the lava, or more frequently among the tufa; in other places they are quite overthrown, and pieces of broken pillars only make their appearance. Sometimes they extend without interruption for two or three miles in length. In one mountain they have a singular appearance: on the top the pillars lie horizontally, in the middle they are sloping; the lowest are perfectly perpendicular; and in some parts they are bent into a semicircular figure. The matter of the Iceland basalt seems to be the same with that of STAFFA; though in some it is more porous, and inclines to a grey. Some we observed which were of a blackish grey, and composed of several joints. Another time we observed a kind of porous glassy stone, consequently a lava, which was so indistinctly divided, that we were for some time at a loss to determine whether it was basalt or not, though at last we all agreed that it was.”

10
count of
climate.

The climate of Iceland is not unwholesome or naturally subject to excessive colds, notwithstanding its northerly situation. There have been instances indeed of Fahrenheit's thermometer sinking to 24° below the freezing point in winter, and rising to 104° in summer. Since the year 1749, observations have been made on the weather; and the result of these ob-

Iceland.

servations hath been unfavourable, as the coldness of the climate is thought to be on the increase, and of consequence the country is in danger of becoming unfit for the habitation of the human race. Wood, which formerly grew in great quantities all over the island, cannot now be raised. Even the hardy firs of Norway cannot be reared in this island. They seemed indeed to thrive till they were about two feet high; but then their tops withered, and they ceased to grow. This is owing chiefly to the storms and hurricanes which frequently happen in the months of May and June, and which are very unfavourable to vegetation of every kind. In 1772, governor Thodal sowed a little barley, which grew very briskly; but, a short time before it was to be reaped, a violent storm so effectually destroyed it, that only a few grains were found scattered about. Besides these violent winds, this island lies under another disadvantage, owing to the floating ice already mentioned, with which the coasts are often beset. This ice comes on by degrees, always with an easterly wind, and frequently in such quantities as to fill up all the gulphs on the north-west side of the island, and even covers the sea as far as the eye can reach; it also sometimes drives to other shores. It generally comes in January, and goes away in March. Sometimes it only reaches the land in April; and, remaining there for a long time, does an incredible deal of mischief. It consists partly of mountains of ice, said to be sometimes 60 fathoms in height; and partly of field-ice, which is neither so thick nor so much dreaded. Sometimes these enormous masses are grounded in shoal water; and in these cases they remain for many months, nay years, undissolved, chilling the atmosphere for a great way round. When many such bulky and lofty ice-masses are floating together, the wood which is often found drifting between them, is so much chafed, and pressed with such violence together, that it sometimes takes fire; which circumstance has occasioned fabulous accounts of the ice being in flames.

11
Destructive
effects of
the ice.

In 1753 and 1754, this ice occasioned such a violent cold, that horses and sheep dropped down dead by reason of it, as well as for want of food; horses were observed to feed upon dead cattle, and the sheep eat of each other's wool. In 1755, towards the end of the month of May, the waters were frozen over in one night to the thickness of an inch and five lines. In 1756, on the 26th of June, snow fell to the depth of a yard, and continued falling through the months of July and August. In the year following it froze very hard towards the end of May and beginning of June, in the fourth part of the island, which occasioned a great scarcity of grass. These frosts are generally followed by a famine, many examples of which are to be found in the Icelandic chronicles. Besides these calamities, a number of bears annually arrive with the ice, which commit great ravages among the sheep. The Icelanders attempt to destroy these intruders as soon as they get sight of them. Sometimes they assemble together, and drive them back to the ice, with which they often float off again. For want of firearms, they are obliged to use spears on these occasions. The government also encourages the destruction of these animals, by paying a premium of 10 dollars

dollars for every bear that is killed, and purchasing the skin of him who killed it.

Thunder and lightning are seldom heard in Iceland, except in the neighbourhood of volcanoes. Aurora Borealis is very frequent and strong. It most commonly appears in dry weather; though there are not wanting instances of its being seen before or after rain, or even during the time of it. The lunar halo, which prognosticates bad weather, is likewise very frequent here; as are also perihelions, which appear from one to nine in number at a time. These perihelions are observed chiefly at the approach of the Greenland ice, when an intense degree of frost is produced, and the frozen vapours fill the air. Fire-balls, sometimes round, and sometimes oval, are observed, and a kind of *ignis fatuus* which attaches itself to men and beasts; and comets are also frequently mentioned in their chronicles. This last circumstance deserves the attention of astronomers.

Iceland, besides all the inconveniencies already mentioned, has two very terrible ones, called by the natives *Krida* and *Sissfædi*: the name of the first imports large pieces of a mountain tumbling down and destroying the lands and houses which lie at the foot of it: this happened in 1554, when a whole farm was ruined, and 13 people buried alive. The other word signifies the effects of a prodigious quantity of snow, which covers the tops of the mountains, rolling down in immense masses, and doing a great deal of damage: of this there was an instance in 1699, during the night, when two farms were buried, with all their inhabitants and cattle. This last accident Iceland has in common with all very mountainous countries, particularly Switzerland.

12
History of
the island.

At what time the island of Iceland was first peopled is uncertain. An English colony indeed is said to have been settled there in the beginning of the fifth century; but of this there are not sufficient proofs. There is, however, reason to suppose, that the English and Irish were acquainted with this country under another name, long before the arrival of the Norwegians; for the celebrated Bede gives a pretty accurate description of the island. But of these original inhabitants we cannot pretend to say any thing, as the Iceland chronicles go no farther back than the arrival of the Norwegians. What they relate is to the following purpose.

Naddodr, a famous pirate, was driven on the coast of Iceland in 861, and named the country *Snio-land*, "Snow-land," on account of the great quantities of snow with which he perceived the mountains covered. He did not remain there long; but, on his return, extolled the country to such a degree, that one Gardar Suafarlon, an enterprising Swede, was encouraged by his account to go in search of it in 864. He sailed quite round the island, and gave it the name of *Gardal-fjollunur*, or Garder's island. Having remained in Iceland during the winter, he returned in the spring to Norway, where he described the new-discovered island as a pleasant well-wooded country. This excited a desire in Floke, another Swede, reputed the greatest navigator of his time, to undertake a voyage thither. As the compass was then unknown, he took three ravens on board to employ them on the discovery. By the way he visited his friends at Ferro; and having

failed farther to the northward, he let fly one of his ravens, which returned to Ferro. Some time after, he dismissed the second, which returned to the ship again, as he could find no land. The last trial proved more successful; the third raven took his flight to Iceland, where the ship arrived a few days after. Floke staid here the whole winter with his company; and, because he found a great deal of floating ice on the north side, he gave the country the name of *Iceland*, which it has ever since retained.

When they returned to Norway in the following spring, Floke, and those that had been with him, made a very different description of the country. Floke described it as a wretched place; while one of his companions, named *Thorulfr*, praised it so highly, that he affirmed butter dropped from every plant; which extravagant commendation procured him the name of *Thorulfr-finnur*, or Butter-Thorulfr.

From this time there are no accounts of any voyages to Iceland, till Ingolf and his friend Leifr undertook one in 874. They spent the winter on the island, and determined to settle there for the future. Ingolf returned to Norway, to provide whatever might be necessary for the comfortable establishment of a colony, and Leifr in the mean time went to assist in the war in England. After an interval of four years, they again met in Iceland, the one bringing with him a considerable number of people, with the necessary tools and instruments for making the country habitable; and the other imported his acquired treasures. After this period, many people went there to settle; and, in the space of 60 years, the whole island was inhabited. The tyranny of Harold king of Norway contributed not a little to the population of Iceland; and so great was the emigration of his subjects, that he was at last obliged to issue an order that no one should sail from Norway to Iceland, without paying four ounces of fine silver to the king.

Besides the Norwegians, new colonies arrived from different nations, between whom wars soon commenced; and the Icelandic histories are full of the accounts of their battles. To prevent these conflicts for the future, a kind of chief was chosen in 928, upon whom great powers were conferred. This man was the speaker in all their public deliberations; pronounced sentence in difficult and intricate cases; decided all disputes; and published new laws, after they had been received and approved of by the people at large: but he had no power to make laws, without the approbation and consent of the rest. He therefore assembled the chiefs, whenever the circumstances seemed to require it; and, after they had deliberated among themselves, he represented the opinion of the majority to the people, whose assent was necessary before it could be considered as a law. His authority among the chiefs and leaders, however, was considerable, as he was chosen by them, and retained his place no longer than while he preserved their confidence.

This institution did not prove sufficient to restrain the turbulent spirits of the Icelanders. They openly waged war with each other; and, by their intestine conflicts, so weakened all parties, that the whole became at last a prey to a few arbitrary and enterprising men; who, as is too generally the case, wantonly

wantonly abused their power to the oppression of their countrymen, and the disgrace of humanity. Notwithstanding these troubles, however, the Icelanders remained free from a foreign yoke till 1261; when the greatest part of them put themselves under the protection of Hakans king of Norway, promising to pay him tribute upon certain conditions agreed on between them; and the rest followed their example in 1264. Afterwards, Iceland, together with Norway, became subject to Denmark. For a long time the care of the island was committed to a governor, who commonly went there once a year; though, according to his instructions, he ought to have resided in Iceland. As the country suffered incredibly through the absence of its governors, it was resolved a few years ago that they should reside there, and have their seat at Bessfærd, one of the old royal domains. He has under him a bailiff, two laymen, a sheriff, and 21 *sysselmen*, or magistrates who superintend small districts; and almost every thing is decided according to the laws of Denmark.

At the first settlement of the Norwegians in Iceland, they lived in the same manner as they had done in their own country, namely, by war and piracy. Their situation with regard to the kings of Norway, however, soon obliged them to apply to other states, in order to learn as much of the knowledge of government and politics as was necessary to preserve their colony from subjugation to a foreign yoke. For this purpose they often sailed to Norway, Denmark, Sweden, England, and Scotland. The travellers, at their return, were obliged to give an account to their chiefs of the state of those kingdoms through which they passed. For this reason, history, and what related to science, was held in high repute as long as the republican form of government lasted; and the great number of histories to be met with in the country, shew at least the desire of the Icelanders to be instructed. To secure themselves, therefore, against their powerful neighbours, they were obliged to enlarge their historical knowledge. They likewise took great pains in studying perfectly their own laws, for the maintenance and protection of their internal security. Thus Iceland, at a time when ignorance and obscurity overwhelmed the rest of Europe, was enabled to produce a considerable number of poets and historians. When the Christian religion was introduced about the end of the 10th century, more were found conversant in the law than could have been expected, considering the extent of the country, and the number of its inhabitants. Fishing was followed among them; but they devoted their attention considerably more to agriculture, which has since entirely ceased.

Two things have principally contributed towards producing a great change both in their character and way of life, viz. the progress of the Christian religion, and their subjection first to Norway, and afterwards to Denmark. For if religion, on one side, commanded them to desist from their ravages and warlike expeditions; the secular power, on the other, deprived them of the necessary forces for the execution of them: and, since this time, we find no farther traces of their heroic deeds, except those which are preserved in their histories.

The modern Icelanders apply themselves to fishing and breeding of cattle. They are middle-sized and well-made, though not very strong; and the women are in general ill-featured. Vices are much less common among them, than in other parts where luxury and riches have corrupted the morals of the people. Though their poverty disables them from imitating the hospitality of their ancestors in all respects, yet they continue to shew their inclination to: they cheerfully give away the little they have to spare, and express the utmost joy and satisfaction if you are pleased with their gift. They are uncommonly obliging and faithful, and extremely attached to government. They are very zealous in their religion. An Iceland never passes a river or any other dangerous place, without previously taking off his hat, and imploring the divine protection; and he is always thankful for the protection of the Deity, when he has passed the danger in safety. They have an inexpressible attachment to their native country, and are nowhere so happy. An Iceland therefore rarely settles in Copenhagen, tho' ever such advantageous terms should be offered him. On the other hand, we cannot ascribe any great industry or ingenuity to these people. They work on in the way to which they have all along been accustomed, without thinking of improvements. They are not cheerful in conversation, but simple and credulous; and have no aversion against a bottle, if they can find an opportunity. When they meet together, their chief pastime consists in reading their history. The master of the house makes the beginning, and the rest continue in their turns when he is tired. Some of them know these stories by heart; others have them in print, and others in writing. Besides this, they are great players at chess and cards, but only for their amusement, since they never play for money: which, however, seems to have been formerly in use among them; since, by one of their old laws, a fine is imposed upon those who play for money.

The modern Icelanders have made very little alteration in their dress from what was formerly in use. The men all wear a linen shirt next to the skin, with a short jacket, and a pair of wide breeches over it. When they travel, another short coat is put over all. The whole is made of coarse black cloth, called *wadmal*; but some wear clothes of a white colour. On their head they wear large three-cornered hats, and on their feet Iceland shoes and worsted stockings. Some of them indeed have shoes from Copenhagen; but, as they are rather too dear for them, they generally make their own shoes, sometimes of the hide of oxen, but more frequently of sheep's leather. They make them by cutting a square piece of leather, rather wider than the length of the foot; this they sew up at the toes, and behind at the heel, and tie it on with leather-thongs. These shoes are convenient enough where the country is level; but it would be very difficult for us who are not accustomed to walk with them amongst the rocks and stones, though the Icelanders do it with great ease.

The women are likewise dressed in black wadmal. They wear a bodice over their shifts, which are sewed up at the bosom; and above this a jacket laced before, with long narrow sleeves reaching down to the wrists.

Iceland.

14
Their dress.

Iceland.

wrists. In the opening on the side of the sleeve, they have buttons of chased silver, with a plate fixed to each button; on which the lover, when he buys them in order to present them to his mistress, takes care to have his name engraved along with hers. At the top of the jacket a little black collar is fixed, of about three inches broad, of velvet or silk, and frequently trimmed with gold cord. The petticoat is likewise of wadmal, and reaches down to the ankles. Round the top of it is a girdle of silver or some other metal, to which they fasten the apron, which is also of wadmal, and ornamented at top with buttons of chased silver. Over all this they wear an upper-dress nearly resembling that of the Swedish peasants; with this difference, that it is wider at bottom: this is close at the neck and wrists, and a hand's-breadth shorter than the petticoat. It is adorned with a facing down to the bottom, which looks like cut velvet, and is generally wove by the Icelandic women. On their fingers they wear gold, silver, or brass rings. Their head-dress consists of several cloths wrapped round the head almost as high again as the face. It is tied fast with a handkerchief, and serves more for warmth than ornament. Girls are not allowed to wear this head-dress till they are marriageable. At their weddings they are adorned in a very particular manner: the bride wears, close to the face, round her head-dress, a crown of silver gilt. She has two chains round her neck, one of which hangs down very low before, and the other rests on her shoulders. Besides these, she wears a lesser chain, from whence generally hangs a little heart, which may be opened to put some kind of perfume in it. This dress is worn by all the Icelandic women without exception: only with this difference, that the poorer sort have it of coarse wadmal, with ornaments of brass; and those that are in easier circumstances have it of broad cloth, with silver ornaments gilt.

35
Houses.

The houses of the Icelanders are very indifferent, but the worst are said to be on the south side of the island. In some parts they are built of drift-wood, in others of lava, almost in the same manner as the stone-walls we make for inclosures, with moss stuffed between the pieces of lava. In some houses the walls are wainscotted on the inside. The roof is covered with sods, laid over rafters, or sometimes over the ribs of whales; the walls are about three yards high, and the entrance somewhat lower. Instead of glass, the windows are made of the chorion and amnios of sheep, or the membranes which surround the womb of the ewe. These are stretched on a hoop, and laid over a hole in the roof. In the poorer sort of houses they employ for the windows the inner membrane of the stomach of animals, which is less transparent than the others.

36
Diet.

As the island of Iceland produces no kind of grain, the inhabitants of consequence have no bread but what is imported; and which being too dear for common use, is reserved for weddings and other entertainments. The following list of their viands is taken from Troil's Letters.

"1. Flour of *salgras*, (lichen islandicus, or rock-fossils). The plant is first washed, and then cut into small pieces by some; though the greater number dry it by fire or in the sun, then put it into a bag in which it is well beaten, and lastly work it into a flour by

flamping.

"2. Flour of *kompgrg*, (polygonum bistorta), is prepared in the same manner, as well as the two other sorts of wild corn *melur* (*Arundo arenaria*, and *Arundo foliorum lateribus convolutis*), by separating it from the chaff, pounding, and lastly grinding it.

"3. *Surt smorg*, (sour butter). The Icelanders seldom make use of fresh or salt butter, but let it grow sour before they eat it. In this manner it may be kept for 20 years, or even longer; and the Icelanders look upon it as more wholesome and palatable than the butter used among other nations. It is reckoned better the older it grows, and one pound of it then is valued as much as two of fresh butter.

"4. *Strug*, or whey boiled to the consistence of four milk, and preserved for the winter.

"5. Fish of all kinds, both dried in the sun and in the air, and either salted or frozen. Those prepared in the last manner are preferred by many.

"6. The flesh of bears, sheep, and birds, which is partly salted, partly hung or smoked, and some preserved in calks with sour or fermented whey poured over it.

"7. *Mjóst*, or whey boiled to cheese, which is very good. But the art of making other kinds of good cheese is lost, tho' some tolerably palatable is sold in the east quarter of Iceland.

"8. *Beina-strug*, bones and cartilages of beef and mutton, and likewise bones of cod, boiled in whey till they are quite dissolved: they are then left to ferment, and are eat with milk.

"9. *Skyr*. The curds from which the whey is squeezed are preserved in calks or other vessels; they are sometimes mixed with black crow-berries or juniper-berries, and are likewise eat with new milk.

"10. *Syra*, is four whey kept in calks, and left to ferment; which, however, is not reckoned fit for use till a year old.

"11. *Blanda*, is a liquor made of water, to which a twelfth part of *syra* is added. In winter, it is mixed with the juice of thyme, and of the black crow-berries.

"12. They likewise eat many vegetables, some of which grow wild, and some are cultivated; also shell-fish and mushrooms."

The Icelanders in general eat three meals a-day, at seven in the morning, two in the afternoon, and nine at night. In the morning and evening they commonly eat curds mixed with new milk, and sometimes with juniper or crow berries. In some parts, they also have pottage made of rock-grass, which is very palatable, or curdled milk boiled till it becomes of a red colour, or new milk boiled a long time. At dinner, their food consists of dried fish, with plenty of sour butter; they also sometimes eat fresh fish, and, when possible, a little bread and cheese with them. It is reported by some, that they do not eat any fish till it is quite rotten; this report perhaps proceeds from their being fond of it when a little tainted: they however frequently eat fish which is quite fresh, though, in the same manner as the rest of their food, often without salt.

Their common beverage is milk, either warm from the cow, or cold, and sometimes boiled: they likewise use butter-milk with or without water. On the coasts

Iceland.

celand.

coasts they generally drink blanda and four milk; which is sold after it is skimmed, at two fifths of a rixdollar per cask: some likewise send for beer from Copenhagen, and some brew their own. A few of the principal inhabitants also have claret and coffee. The common people sometimes drink a kind of tea, which they make from the leaves of the *dryas octopetala*, and the *veronica officinalis*.

17
employ-
ment, ma-
recurses,

On the coasts, the men employ themselves in fishing, both summer and winter. On their return home, when they have drawn and cleaned their fish, they give them to their wives, whose care it is to dry them. In the winter, when the inclemency of the weather prevents them from fishing, they are obliged to take care of their cattle and spin wool. In summer, they mow the grass, dig turf, provide fuel, go in search of sheep and goats that were gone astray, and kill cattle. They prepare leather with the *spiraea ulmaria* instead of bark. Some few work in gold and silver; and others are instructed in mechanics, in which they are tolerable proficient. The women prepare the fish, take care of the cattle, manage the milk and wool, sew, spin, and gather eggs and down. When they work in the evening, they use, instead of an hour-glass, a lamp with a wick made of epilobium dipt in train oil, which is contrived to burn four, six, or eight hours.

Among the common people of Iceland, time is not reckoned by the course of the sun, but by the work they have done, and which is prescribed by law. According to this prescription, a man is to mow as much hay in one day as grows on 30 fathoms of manured soil, or 40 fathoms of land which has not been manured; or he is to dig 700 pieces of turf eight feet long and three broad. If as much snow falls as reaches to the horses bellies, a man is required daily to clear a piece of ground sufficient for 100 sheep. A woman is to rake together as much hay as three men can mow, or to weave three yards of wadmal a-day.

The wages of a man are fixed at four dollars, and 12 yards of wadmal; and those of a woman at two dollars, and five yards of wadmal. When men are sent a-fishing out of the country, there is allowed to each man by law, from the 25th of September to the 14th of May, six pounds of butter, and 18 pounds of dried fish every week. This may seem to be too great an allowance; but it must be remembered that they have nothing else to live upon. When they are at home, and can get milk, &c. every man receives only five pounds of dried fish and three quarters of a pound of butter a-week.

18
diseases.

The food and manner of life of the Icelanders by no means contribute to their longevity. It is very rare indeed to see an inhabitant of Iceland exceed the age of 50 or 60; and the greater part are attacked by grievous diseases before middle age. Of these the scurvy and elephantiasis or prophy are the worst. They are also subject to the gout in their hands, owing to their frequent employment in fishing, and handling the wet fishing-tackle in cold weather. St Anthony's fire, the jaundice, pleurisy, and lowness of spirits, are frequent complaints in this country. The small-pox is also exceedingly fatal, and not long ago destroyed 16,000 persons. By these diseases, and the frequent famines with which the country has been afflicted, the

Vol. V.

inhabitants are reduced to a much fewer number than they formerly were, inasmuch that it is computed they do not in all exceed 60,000.

The exports of Iceland consist of dried fish, salted mutton and lamb, beef, butter, tallow, train-oil, coarse woollen cloth, stockings, gloves, raw wool, sheep-skins, lamb-skins, fox-furs of various colours, eider down, feathers, and formerly sulphur; but there is no longer a demand for this mineral. On the other hand, the Icelanders import timber, fishing-lines and hooks, tobacco, bread, horse-shoes, brandy, wine, salt, linen, a little silk, and a few other necessaries, as well as superfluities for the better sort. The whole trade of Iceland is engrossed by a monopoly of Danes, indulged with an exclusive charter. This company maintains factories at all the harbours of Iceland, where they exchange their foreign goods for the merchandize of the country; and, as the balance is in favour of the Icelanders, pay the overplus in Danish money, which is the only current coin in this island. All their accounts and payments are adjusted according to the number of fish: two pounds of fish are worth two skillings in specie, and 48 fish amount to one rixdollar. A Danish crown is computed at 30 fish: what falls under the value of 12 fish, cannot be paid in money; but must be bartered either for fish or roll-tobacco, an ell of which is equal to one fish. The weights and measures of the Icelanders are nearly the same with those used in Denmark.

The Icelanders being neither numerous nor warlike, and altogether unprovided with arms, ammunition, garrisons, or fleets, are in no condition to defend themselves from invasion; but depend entirely on the protection of his Danish majesty, to whom they are subject.

The revenues which he draws from this island consist of the income of divers estates, as royal demesne, amounting to about 8000 dollars per annum; of the money paid by the company for an exclusive trade, to the value of 20,000 dollars; and of a fixed proportion in the tythes of fish, paid in some particular districts.

ICENI, the ancient name of the people of Suffolk, Norfolk, Cambridgeshire, and Huntingdonshire, in England.

ICH-DIEK. See HERALDRY, chap. iv. sect. 2.

ICHNEUMON, in zoology. See VIVERRA.

ICHNEUMON, is also the name of a genus of flies of the hymenoptera order. It has no tongue; the antennæ have above 30 joints; the abdomen, in most of the species, is petiolated; and it has a sting in the tail inclosed in a double-valved cylindrical sheath. There are 77 species, principally distinguished by their colour.—These flies are sometimes at great pains to destroy and carry the caterpillars in whose bodies they intend to lay their eggs, to places where it is proper those eggs should be hatched. There is one species, whose worm produced from the egg can never succeed, unless it is both bred in the body of a caterpillar, and also have that habitation buried under ground. For this purpose, the parent-fly, when the time of laying her eggs is come, forms a hole in the ground, which she covers with a little clod of earth, that no dust may fall in to fill it up; when this is done, she goes out in quest of a caterpillar proper for her

and reve-
nue.

Ichthography.
Ichthogloss.

purpose. Dr Lister assures us, that he has often seen one of these flies seize a caterpillar much larger than herself; and though this has been at a considerable distance from her hole, she has with great labour dragged the creature to it. As soon as she has arrived there with her load, she takes off the little pellet of earth from the mouth of the hole, and going down to see that all is ready for the reception of the new guest, she returns out of it and draws in the caterpillar, which she leaves there after giving it such wounds as, though they do not cause immediate death, yet disable the creature so as to make its escape impracticable. When the creature is thus lodged, she deposits her eggs in the flesh; after which she stops up the orifice of the hole very firmly with several pellets of dirt, and with dust carefully rammed in between, and will even fly up into gummy and resinous trees in order to get a cement to hold all firmly together. When the hole is thus filled up even with the surface of the rest of the ground, she draws a leaf or two to the place, and laying them over the mouth flies away. There is after this no more care taken; but the young worms are hatched from the eggs, and feed on the flesh of the caterpillar till they are fully grown. They then change into the nymph-state, and come out of that in form of their parent-flies, in which state they usually make their way out of the ground. Some of these ichneumons make the bodies of other smaller flies the places of hatching their eggs. They may be often met with flying with one of these small flies in their legs, the head of it being held close to their bellies. If they are watched on this occasion, they will usually be found to carry those flies to certain holes in the ground resembling worm-holes. The first that they carry serves as a nidus for their eggs: the rest are for food to the young ones while in the state of worms; these being too voracious to be subsisted long on the body of one fly, and therefore their parents carry them more every day. The old ones on this occasion crawl backwards into the holes, dragging the flies in after them. When their young worms have fed sufficiently, they are converted into nymphæ; the cases of which are made up of the wings, legs, and other hard parts of the flies they had been feeding upon.

ICHTHOGRAPHY, in perspective, the view of any thing cut off by a plane, parallel to the horizon, just at the base of it.—The word is derived from the Greek *ichthos*, *footstep*, and *graphein*, *I write*, as being a description of the footsteps or traces of a work.

Among painters it signifies a description of images or of ancient statues of marble and copper, of busts and semi-busts, of paintings in fresco, mosaic works, and ancient pieces of miniature.

ICHOGLANS, the grand signior's pages serving in the seraglio.—These are the children of Christian parents, either taken in war, purchased, or sent in presents from the viceroys and governors of distant provinces; they are the most sprightly, beautiful, and well-made that can be met with; and are always re-

viewed and approved of by the grand signior himself, before they are admitted into the seraglios of Pera, Constantinople, or Adrianople, being the three colleges where they are educated, or fitted for employments, according to the opinion the court entertains of them.

ICHOR, properly signifies a thin watery humour like serum; but is sometimes used for a thicker kind flowing from ulcers, called also *sanies*.

ICHTHYOCOLLA, ISINGLASS, a preparation from the fish known by the name of *hufo*. See ACCIPENSER. The word is Greek, formed of *ichthys*, *fish*, and *colla*, *glue*.—The method of making Isinglass was long a secret in the hands of the Russians; but hath lately been discovered, and the following account of it published by Humphrey Jackson, Esq. in the 63d volume of the Philosophical Transactions.

"All authors who have hitherto delivered processes for making ichthyocolla, fish-glue, or isinglass, have greatly mistaken both its constituent matter and preparation.

"To prove this assertion, it may not be improper to recite what Pomet says upon the subject, as he appears to be the principal author whom the rest have copied. After describing the fish, and referring to a cut engraved from an original in his custody, he says: 'As to the manner of making the isinglass, the sinewy parts of the fish are boiled in water, till all of them be dissolved that will dissolve; then the gluey liquor is strained, and set to cool. Being cold, the fat is carefully taken off, and the liquor itself boiled to a just consistency, then cut to pieces, and made into a twist, bent in form of a crescent, as commonly sold, then hung upon a string, and carefully dried.'

"From this account, it might be rationally concluded, that every species of fish which contained gelatinous principles would yield isinglass: and this parity of reasoning seems to have given rise to the hasty conclusions of those, who strenuously vouch for the extraction of isinglass from sturgeon; but as that fish is easily procurable, the negligence of ascertaining the fact by experiment seems inexcusable.

"In my first attempt to discover the constituent parts and manufacture of isinglass, relying too much upon the authority of some chemical authors whose veracity I had experienced in many other instances, I found myself constantly disappointed. Glue, not isinglass, was the result of every process; and although, in the same view, a journey to Russia proved fruitless, yet a steady perseverance in the research proved not only successful as to this object, but, in the pursuit, to discover a refinous matter plentifully procurable in the British fisheries, which has been found by ample experience to answer similar purposes. It is now no longer a secret, that our (A) lakes and rivers in North America are stocked with immense quantities of fish, said to be the same species with those in Muscovy, and yielding the finest isinglass, the fisheries

Jehor.
Ichthyocolla.

(A) As the lakes of North America lie nearly in the same latitude with the Caspian Sea, particularly lake Superior, which is said to be of greater extent, it was conjectured they might abound with the same sorts of fish; and, in consequence of public advertisements distributed in various parts of North America, offering premiums for the fowls of sturgeon and other fish, for the purpose of making isinglass, several specimens of fine isinglass, the produce of fish taken in these parts, have been lately sent to England, with proper attestations as to the unlimited quantity which may be procured.

fisheries whereof, under due encouragement, would double the supply all Europe with this valuable article.

"No artificial heat is necessary to the production of isinglass, neither is the matter dissolved for this purpose; for, as the continuity of its fibres would be destroyed by solution, the mals would become brittle in drying, and snap short asunder, which is always the case with glue, but never with isinglass. The latter, indeed, may be resolved into glue with boiling water; but its fibrous recombination would be found impracticable afterwards, and a fibrous texture is one of the most distinguishing characteristics of genuine isinglass.

"A due consideration that an imperfect solution of isinglass, called *fining* by the brewers, possessed a peculiar property of clarifying malt-liquors, induced me to attempt its analysis in cold subacid menstrua. One ounce and an half of good isinglass, steeped a few days in a gallon of stale beer, was converted into good fining, of a remarkable thick consistence: the same quantity of glue, under similar treatment, yielded only a mucilaginous liquor, resembling diluted gum-water, which, instead of clarifying beer, increased both its tenacity and turbidness, and communicated other properties in no respect corresponding with those of genuine fining. On commixing three spoonfuls of the solution of isinglass with a gallon of malt liquor, in a tall cylindrical glass, a vast number of curdly masses became presently formed, by the reciprocal attraction of the particles of isinglass, and the feculencies of the beer, which, increasing in magnitude and specific gravity, arranged themselves accordingly, and fell in a combined state to the bottom, through the well-known laws of gravitation; for, in this case, there is no elective attraction, as some have imagined, which bears the least affinity with what frequently occurs in chemical decompositions.

"If what is commercially termed *long* or *short stapled isinglass* be steeped a few hours in fair cold water, the entwined membranes will expand, and reassume their original beautiful (a) hue, and, by a dexterous address, may be perfectly unfolded. By this simple operation, we find that isinglass is nothing more than certain membranous parts of fishes, divested of their native mucosity, rolled and twisted into the forms abovementioned, and dried in the open air.

"The founts, or air-bladders, of fresh-water fish in general, are preferred for this purpose, as being the most transparent, flexible, delicate substances. These constitute the finest sorts of isinglass; those called *book* and *ordinary staple*, are made of the intestines, and probably of the peritonæum of the fish. The belluga yields the greatest quantity, as being the largest and most plentiful fish in the Muscovy rivers; but the founts of all fresh-water fish yield, more or less, fine isinglass, particularly the smaller sorts, found in prodigious quantities in the Caspian Sea, and several hundred miles beyond Astracan, in the Wolga, Yaik, Don, and even as far as Siberia, where it is called *kle* or *kla* by the natives, which implies a glutinous matter; it is the basis of the Russian glue, which is preferred to all other kinds for its strength.

"The founts, which yields the finer isinglass, consist

of parallel fibres, and are easily rent longitudinally; but the ordinary sorts are found composed of double membranes, whose fibres cross each other obliquely, resembling the coats of a bladder: hence the former are more readily pervaded and divided with subacid liquors; but the latter, through a peculiar kind of interwoven texture, are with great difficulty torn asunder, and long resist the power of the same menstruum; yet, when duly resolved, are found to act with equal energy in clarifying liquors.

"Isinglass receives its different shapes in the following manner:

"The parts of which it is composed, particularly the founts, are taken from the fish while sweet and fresh, slit open, washed from their slimy *forders*, divested of every thin membrane which envelops the fount, and then exposed to stiffen a little in the air. In this state, they are formed into rolls about the thickness of a finger, and in length according to the intended size of the staple: a thin membrane is generally selected for the centre of the roll, round which the rest are folded alternately, and about half an inch of each extremity of the roll is turned inwards. The due dimensions being thus obtained, the two ends of what is called *short-staple* are pinned together with a small wooden peg; the middle of the roll is then pressed a little downwards, which gives it the resemblance of a heart-shape; and thus it is laid on boards, or hung up in the air to dry. The founts, which compose the long-staple, are larger than the former; but the operator lengthens this sort at pleasure, by interfolding the ends of one or more pieces of the fount with each other. The extremities are fastened with a peg, like the former; but the middle part of the roll is bent more considerably downwards; and, in order to preserve the shape of the three obtuse angles thus formed, a piece of round stick, about a quarter of an inch diameter, is fastened in each angle with small wooden pegs, in the same manner as the ends. In this state, it is permitted to dry long enough to retain its form, when the pegs and sticks are taken out, and the drying completed; lastly, the pieces of isinglass are colligated in rows, by running packthread through the peg-holes, for convenience of package and exportation.

"The membranes of the book sort, being thick and refractory, will not admit a similar formation with the preceding: the pieces therefore, after their sides are folded inwardly, are bent in the centre, in such manner that the opposite sides resemble the cover of a book, from whence its name; a peg being run across the middle, fastens the sides together, and thus it is dried like the former. This sort is interleaved, and the pegs run across the ends, the better to prevent its unfolding.

"That called *cake-isinglass*, is formed of the bits and fragments of the staple sorts, put into a flat metalline pan, with a very little water, and heated just enough to make the parts cohere like a pancake, when it is dried; but frequently it is overheated, and such pieces, as before observed, are useless in the business of fining. Experience has taught the consumers to reject them.

(a) If the transparent isinglass be held in certain positions to the light, it frequently exhibits beautiful prismatic colours.

Ichthy-
colla.

"Isinglass is best made in the summer, as frost gives it a disagreeable colour, deprives it of weight, and impairs its gelatinous principles; its fashionable forms are unnecessary, and frequently injurious to its native qualities. It is common to find oily putrid matter, and *exuvie* of insects, between the implicated membranes, which, through the inattention of the cellarman, often contaminate wines and malt-liquors in the act of clarification. These peculiar shapes might, probably, be introduced originally with a view to conceal and disguise the real substance of isinglass, and preserve the monopoly; but, as the mask is now taken off, it cannot be doubted to answer every purpose more effectually in its native state, without any subsequent manufacture whatever, especially to the principal consumers, who hence will be enabled to procure sufficient supply from the British colonies. Until this laudable end can be fully accomplished, and as a species of isinglass, more easily produceable from the marine fisheries, may probably be more immediately encouraged, it may be manufactured as follows:

"The sounds of cod and ling bear great analogy with those of the *accipenser* genus of Linnaeus and Arctedi; and are in general so well known, as to require no particular description. The Newfoundland and Iceland fishermen split open the fish, as soon as taken, and throw the back bones, with the sounds annexed, in a heap; but previous to incipient putrefaction, the sounds are cut out, washed from their slimy, and salted for use. In cutting out the sounds, the intercostal parts are left behind, which are much the best; and the Iceland fishermen are so sensible of this, that they beat the bone upon a block with a thick stick, till the pockets, as they term them, come out easily, and thus preserve the sound entire. If the sounds have been cured with salt, that must be dissolved by steeping them in water, before they are prepared for isinglass; the fresh sound must then be laid upon a block of wood, whose surface is a little elliptical, to the end of which a small hair-brush is nailed, and with a saw-knife the membranes on each side of the sound must be scraped off. The knife is rubbed upon the brush occasionally, to clear its teeth; the pockets are cut open with cissars, and perfectly cleansed of the mucous matter with a coarse cloth; the sounds are afterwards washed a few minutes in lime-water in order to absorb their oily principle, and lastly in clear water. They are then laid upon nets, to dry in the air; but if intended to resemble the foreign isinglass, the sounds of cod will only admit of that called *book*, but those of ling both shapes. The thicker the sounds are, the better the isinglass, colour excepted; but that is immaterial to the brewer, who is its chief consumer.

"This isinglass resolves into fining, like the other sorts, in subacid liquors, as stale beer, cyder, old hock, &c. and in equal quantities produces similar effects upon turbid liquors, except that it falls speedier and closer to the bottom of the vessel, as may be demonstrated in tall cylindrical glasses; but foreign isinglass retains the consistency of fining preferably in warm weather, owing to the greater tenacity of its native mucilage.

"Vegetable acids are, in every respect, best adapted to fining; the mineral acids are too corrosive, and even insalubrious, in common beverage.

Ichthy-
logy,
Ichthy-
phagi.

"It is remarkable, that, during the conversion of isinglass into fining, the acidity of the menstruum seems greatly diminished, at least to taste, not on account of any alkaline property in the isinglass, probably, but by its enveloping the acid particles. It is likewise reducible into jelly with alkaline liquors, which indeed are solvents of all animal matters; even cold lime-water dissolves it into a pulpy *magma*. Notwithstanding this is inadmissible as fining, on account of the menstruum, it produces admirable effects in other respects: for, on commixture with compositions of plaster, lime, &c. for ornamenting walls exposed to vicissitudes of weather, it adds firmness and permanency to the cement; and if common brick-mortar be worked up with this jelly, it soon becomes almost as hard as the brick itself: but, for this purpose, it is more commodiously prepared, by dissolving it in cold water, acidulated with vitriolic acid; in which case, the acid quits the jelly, and forms with the lime a *felenitic* mass, while, at the same time, the jelly being deprived in some measure of its moisture, through the formation of an indissoluble concrete amongst its parts, soon dries, and hardens into a firm body; whence its superior strength and durability are easily comprehended.

"It has long been a prevalent opinion, that sturgeon, on account of its cartilaginous nature, would yield great quantities of isinglass; but, on examination, no part of this fish, except the inner coat of the sound, promised the least success. This being full of *rugae*, adheres so firmly to the external membrane, which is useless, that the labour of separating them supercedes the advantage. The intestines, however, which in the larger fish extend several yards in length, being cleansed from their mucus, and dried, were found surprisingly strong and elastic, resembling cords made with the intestines of other animals, commonly called *cat-gut*, and, from some trials, promised superior advantages when applied to mechanic operations."

Isinglass is sometimes used in medicine; and may be given in a thin acrimonious state of the juices, after the same manner as the vegetable gums and mucilages, regard being had to their different disposition to putrefaction.

ICHTHYOLOGY, the science of fishes, or that part of zoology which treats of fishes. See FISH, and ZOOLOGY, n° 10.

ICHTHYOPHAGI, FISH-EATERS, a name given to a people, or rather to several different people, who lived wholly on fishes. The word is Greek, compounded of *εχθρο*, *pisciv*, "fish," and *φαγειν*, *edere*, "to eat."

The Ichthyophagi spoken of by Ptolemy are placed by Sanfon in the provinces of Nanquin and Xanton. Agatharides calls all the inhabitants between Carmania and Gedrosia by the name *Ichthyophagi*.

From the accounts given us of the Ichthyophagi by Herodotus, Strabo, Solinus, Plutarch, &c. it appears indeed that they had cattle, but that they made no use of them excepting to feed their fish withal. They made their houses of large fish-bones, the ribs of whales serving them for their beams. The jaws of these animals served them for doors; and the mortars wherein they pounded their fish, and baked it at the sun, were nothing else but their vertebrae.

ICH.

ichthy-
peria
entity.

Ides,
Idiocy.

ICHTHYPERIA, in Natural history, a name given by Dr Hill to the bony palates and mouths of fishes, usually met with either fossil, in single pieces, or in fragments. They are of the same substance with the bony part; and are of very various figures, some broad and short, others longer and slender; some very gibbous, and others plainly arched. They are likewise of various sizes, from the tenth of an inch to two inches in length, and an inch in breadth.

ICONOCLASTES, or ICONOCLASTÆ, breakers of images; a name which the church of Rome gives to all who reject the use of images in religious matters.—The word is Greek, formed from *εἰκων*, *imago*, and *κλαστός*, *rumpere*, “to break.”

In this sense, not only the reformed, but some of the eastern churches are called *Iconoclastes*, and esteemed by them heretics, as opposing the worship of the images of God and the saints, and breaking their figures and representations in churches.

ICOSAHEDRON, in geometry, a regular solid, consisting of 20 triangular pyramids, whose vertexes meet in the centre of a sphere supposed to circumscribe it; and therefore have their height and bases equal: wherefore the solidity of one of these pyramids multiplied by 20, the number of bases, gives the solid contents of the icosahedron.

ICOSANDRIA, (from *είκοσι*, “twenty,” and *ανδρ*, “a man, or husband;” the name of the 12th class in Linnæus’s sexual method, consisting of plants with hermaphrodite flowers, which are furnished with 20 or more stamina, that are inserted into the inner side of the calyx or petals. See BOTANY, p. 1292.

ICTINUS, a celebrated Greek architect who lived about 430 B. C. built several magnificent temples, and among others that of Minerva at Athens.

IDA, (anc. geog.) a mountain situated in the heart of Crete where broadest; the highest of all in the island; round, and in compass 60 stadia, (Strabo); the nursing-place of Jupiter, and where his tomb was visited in Varro’s time. Another *Ida*, a mountain of Mysia, or rather a chain of mountains (Homer, Virgil), extending from Zeleia on the south of the territory of Cygicus to Lectum the utmost promontory of Troas. The top was called *Gargara*, (Homer, Strabo); and celebrated by the poets for the judgment of Paris on the beauty of the three goddesses, Minerva, Juno, and Venus, to the last of whom he gave the preference.

IDALIUM, (anc. geog.) a promontory on the east side of Cyprus. Now *Capo di Griego*; with a high rugged eminence rising over it, in the form of a table. It was sacred to Venus; and hence the epithet *Idalia* given her by the poets. The eminence was covered with a grove; and in the grove was a little town, in Pliny’s time extinct. *Idalia*, according to Bochart, denotes the place or spot sacred to the goddess.

IDEA, the reflex perception of objects, after the original perception or impression has been felt by the mind. See METAPHYSICS, *passim*; and LOGIC, Part I.

IDENTITY, denotes that by which a thing is itself, and not any thing else; in which sense identity differs from *similitude*, as well as *diversity*. See METAPHYSICS, n° 105;—120.

IDES, in the ancient Roman calendar, were eight days in each month; the first of which fell on the 15th of March, May, July, and October; and on the 13th day of the other months.—The origin of the word is contested. Some will have it formed from *idui*, “to see;” by reason the full moon was commonly seen on the day of the ides; others from *idus*, “species, figure;” on account of the image of the full moon then visible; others from *idulium*, or *ovis idalis*, a name given by the Hetrurians to a victim offered on that day to Jupiter; others from the Hetrurian word *iduo*, i. e. *divido*; by reason the ides divided the moon into two nearly equal parts.

The ides came between the KALENDS and the NONES; and were reckoned backwards. Thus they called the 14th day of March, May, July, and October, and the 12th of the other months, the *pridie idus*, or the day before the ides; the next preceding day they called the *tertia idus*; and so on, reckoning always backwards, till they came to the NONES. This method of reckoning time is still retained in the chancery of Rome, and in the calendar of the Breviary.—The ides of May were consecrated to Mercury: the ides of March were ever esteemed unhappy, after Cæsar’s murder on that day: the time after the ides of June was reckoned fortunate for those who entered into matrimony: the ides of August were consecrated to Diana, and were observed as a feast-day by the slaves. On the ides of September, auguries were taken for appointing the magistrates, who formerly entered into their offices on the ides of May, afterwards on those of March.

IDIOCY, a defect of understanding. Both idiocy and LUNACY excuse from the guilt of crimes; (see CRIME, *par. ult.*) For the rule of law as to lunatics, which also may be easily adapted to idiots, is, that *furiosus furorẽ solum punitur*. In criminal cases, therefore, idiots and lunatics are not chargeable for their own acts, if committed when under these incapacities; no, not even for treason itself. Also, if a man in his sound memory commits a capital offence, and before arraignment for it he becomes mad, he ought not to be arraigned for it; because he is not able to plead to it with that advice and caution that he ought. And if, after he has pleaded, the prisoner becomes mad, he shall not be tried: for how can he make his defence? If, after he be tried and found guilty, he loses his senses before judgment, judgment shall not be pronounced; and if, after judgment, he becomes of nonsane memory, execution shall be stayed: for, peradventure, says the humanity of the English law, had the prisoner been of sound memory, he might have alleged something in stay of judgment or execution. Indeed, in the bloody reign of Henry VIII. a statute was made, which enacted, that if a person, being *compos mentis*, should commit high treason, and after fall into madness, he might be tried in his absence, and should suffer death, as if he were of perfect memory. But this savage and inhuman law was repealed by the statute 1 & 2 Ph. & M. c. 10. For, as is observed by Sir Edward Coke, “the execution of an offender is for example, *ut pœna ad paucos, metus ad omnes perveniat*; but so it is not when a madman is executed; but should be a miserable spectacle, both against law, and of extreme inhumanity and cruelty, and can be no

Idiocy.

no example to others." But if there be any doubt whether the party be *compos* or not, this shall be tried by a jury. And if he be so found, a total idiocy, or absolute insanity, excuses from the guilt, and of course from the punishment, of any criminal action committed under such deprivation of the senses: but if a lunatic hath lucid intervals of understanding, he shall answer for what he does in those intervals, as if he had no deficiency. Yet, in the case of absolute madmen, as they are not answerable for their actions, they should not be permitted the liberty of acting unless under proper control; and, in particular, they ought not to be suffered to go loose, to the terror of the king's subjects. It was the doctrine of our ancient law, that persons deprived of their reason might be confined till they recovered their senses, without waiting for the forms of a commission or other special authority from the crown: and now, by the vagrant acts, a method is chalked out for imprisoning, chaining, and sending them to their proper homes.

The matrimonial contract likewise cannot take place in a state of idiocy. It was formerly adjudged, that the issue of an idiot was legitimate, and his marriage valid. A strange determination! since consent is absolutely requisite to matrimony, and neither idiots nor lunatics are capable of consenting to any thing. And therefore the civil law judged much more sensibly, when it made such deprivations of reason a previous impediment, though not a cause of divorce if they happened after marriage. And modern resolutions have adhered to the sense of the civil law, by determining that the marriage of a lunatic, not being in a lucid interval, was absolutely void. But as it might be difficult to prove the exact state of the party's mind at the actual celebration of the nuptials, upon this account, (concurring with some private family-reasons *) the statute 15 Geo. II. c. 30. has provided, that the marriage of lunatics and persons under phrenzies (if found lunatics under a commission, or committed to the care of trustees under any act of parliament) before they are declared of sound mind by the lord chancellor, or the majority of such trustees, shall be totally void.

Idiots, and persons of nonsane memory, as well as infants, and persons under durels, are not totally disabled either to convey or purchase, but *sub modo* only. For their conveyances and purchases are voidable, but not actually void. The king, indeed, on behalf of an idiot, may avoid his grants or other acts. But it hath been said, that a *non compos* himself, though he be afterwards brought to a right mind, shall not be permitted to allege his own insanity in order to avoid such grant: for that no man shall be allowed to fluster himself, or plead his own disability. The progress of this notion is somewhat curious. In the time of Edward I. *non compos* was a sufficient plea to avoid a man's own bond: and there is a writ in the register for the alienor himself to recover lands aliened by him during his insanity; *dum fuit non compos mentis sue, ut dicitur, &c.* But under Edward III. a scruple began to arise, whether a man should be permitted to *blenish* himself, by pleading his own insanity: and, afterwards, a defendant in assize having pleaded a release by the plaintiff since the last continuance, to which the plaintiff replied (*ore tenus*, as the manner then was) that he was

out of his mind when he gave it, the court adjourned the assize; doubting, whether as the plaintiff was sane both then and at the commencement of the suit, he should be permitted to plead an intermediate deprivation of reason; and the question was asked, how he came to remember to release, if out of his senses when he gave it? Under Henry VI. this way of reasoning (that a man shall not be allowed to disable himself, by pleading his own incapacity, because he cannot know what he did under such a situation) was seriously adopted by the judges in argument; upon a question, whether the heir was barred of his right of entry by the feoffment of his insane ancestor. And from these loose authorities, which Fitzherbert does not scruple to reject as being contrary to reason, the maxim that a man shall not fluster himself hath been handed down as settled law: though later opinions, feeling the inconvenience of the rule, have in many points endeavoured to restrain it. And, clearly, the next heir, or other person interested, may, after the death of the idiot or *non compos*, take advantage of his incapacity and avoid the grant. And so too, if he purchases under this disability, and does not afterwards upon recovering his senses agree to the purchase, his heir may either waive or accept the estate at his option. In like manner, an infant may waive such purchase or conveyance, when he comes to full age; or, if he does not then actually agree to it, his heirs may waive it after him. Persons also, who purchase or convey under durels, may affirm or avoid such transaction, whenever the durels is ceased. For all these are under the protection of the law; which will not suffer them to be imposed upon thro' the imbecility of their present condition; so that their acts are only binding, in case they be afterwards agreed to when such imbecility ceases. Yet the guardians or committees of a lunatic, by the statute 11 Geo. III. c. 20. are empowered to renew in his right, under the directions of the court of chancery, any lease for lives or years, and apply the profits of such renewal for the benefit of such lunatic, his heirs, or executors *.

IDIOM, among grammarians, properly signifies the peculiar genius of each language, but is often used in a synonymous sense with dialect.

IDIOPATHY, in physic, a disorder peculiar to a certain part of the body, and not arising from any preceding disease, in which sense it is opposed to sympathy. Thus, an epilepsy is idiopathic when it happens merely through some fault in the brain; and sympathetic when it is the consequence of some other disorder.

IDIOSYNCRASY, among physicians, denotes a peculiar temperament of body, whereby it is rendered more liable to certain disorders than persons of a different constitution usually are.

IDLENESS, a reluctance in people to be employed in any kind of work.

Idleness in any person whatsoever is a high offence against the public economy. In China it is a maxim, that if there be a man who does not work, or a woman that is idle, in the empire, somebody must suffer cold or hunger: the produce of the lands not being more than sufficient, with culture, to maintain the inhabitants; and therefore, though the idle person may shift off the want from himself, yet it must in the end fall somewhere. The court also of Arcopagus at

Athens punished idlers, and exerted a right of examining every citizen in what manner he spent his time; the intention of which was, that the Athenians, knowing they were to give an account of their occupations, should follow only such as were laudable, and that there might be no room left for such as lived by unlawful arts. The civil law expelled all sturdy vagrants from the city: and, in our own law, all idle persons or vagabonds, whom our ancient statutes describe to be "such as wake on the night, and sleep on the day, and haunt customable taverns, and ale-houses, and routs about; and no man wot from whence they come, ne whether they go;" or such as are more particularly described by statute 17 Geo. II. c. 5. and divided into three classes, *idle and disorderly persons*, *rogues and vagabonds*, and *incorrigible rogues*;—all these are offenders against the good order, and blemishes in the government, of any kingdom. They are therefore all punished, by the statute last mentioned; that is to say, idle and disorderly persons with one month's imprisonment in the house of correction; rogues and vagabonds with whippings, and imprisonment not exceeding six months; and incorrigible rogues with the like discipline, and confinement not exceeding two years: the breach and escape from which confinement in one of an inferior class, ranks him among incorrigible rogues; and in a rogue (before incorrigible) makes him a felon, and liable to be transported for seven years. Persons harbouring vagrants are liable to a fine of forty shillings, and to pay all expences brought upon the parish thereby: in the same manner as, by our ancient laws, whoever harboured any stranger for more than two nights, was answerable to the public for any offence that such his inmate might commit.

IDOL, in pagan theology, an image, or fancied representation of any of the heathen gods.—This image, of whatever materials it consisted, was, by certain ceremonies called *consecration*, converted into a god. While under the artificer's hands, it was only a mere statue. Three things were necessary to turn it into a god; proper ornaments, consecration, and oration. The ornaments were various, and wholly designed to blind the eyes of the ignorant and stupid multitude, who are chiefly taken with shew and pageantry. Then followed the consecration and oration, which were performed with great solemnity among the Romans.

IDOLATRY, or the worship of idols, may be distinguished into two sorts. By the first, men adore the works of God, the sun, the moon, the stars, angels, demons, men and animals: by the second, men worship the work of their own hands, as statues, pictures, and the like: and to these may be added a third, that by which men have worshipped the true God under sensible figures and representations. This indeed may have been the case with respect to each of the above kinds of idolatry; and thus the Israelites adored God under the figure of a calf.

The stars were the first objects of idolatrous worship, on account of their beauty, their influence on the productions of the earth, and the regularity of their motions, particularly the sun and moon, which are considered as the most glorious and resplendent images of the Deity: afterwards, as their sentiments became more corrupted, they began to form images,

and to entertain the opinion, that by virtue of consecration, the gods were called down to inhabit or dwell in their statues. Hence Arnobius takes occasion to rally the pagans for guarding so carefully the statues of their gods, who, if they were really present in their images, might have their worshippers the trouble of securing them from thieves and robbers.

As to the adoration which the ancient pagans paid to the statues of their gods, it is certain, that the wiser and more sensible heathens considered them only as simple representations or figures designed to recal to their minds the memory of their gods. This was the opinion of Varro and Seneca: and the same sentiment is clearly laid down in Plato, who maintains, that images are inanimate, and that all the honour paid to them has respect to the gods whom they represent. But as to the vulgar, they were stupid enough to believe the statues themselves to be gods, and to pay divine worship to stocks and stones.

Soon after the flood, idolatry seems to have been the prevailing religion of all the world; for wherever we cast our eyes at the time of Abraham, we scarcely see any thing but false worship and idolatry. And it appears from Scripture, that Abraham's forefathers, and even Abraham himself, were for a time idolaters.

The Hebrews were indeed expressly forbidden to make any representation of God; they were not so much as to look upon an idol: and from the time of the Maccabees to the destruction of Jerusalem, the Jews extended this precept to the making the figure of any man: by the law of Moses, they were obliged to destroy all the images they found, and were forbidden to apply any of the gold or silver to their own use, that no one might receive the least profit from any thing belonging to an idol. Of this the Jews, after they had smited for their idolatry, were so sensible, that they thought it unlawful to use any vessel that had been employed in sacrificing to a false god, to warm themselves with the wood of a grove after it was cut down, or to shelter themselves under its shade.

But the preaching of the Christian religion, wherever it prevailed, entirely rooted out idolatry; as did also that of Mahomet, which is built on the worship of one God. It must not, however, be forgotten, that the Protestant Christians charge those of the church of Rome with paying an idolatrous kind of worship to the pictures or images of saints and martyrs: before these, they burn lamps and wax-candles; before these, they burn incense, and, kneeling, offer up their vows and petitions: they, like the Pagans, believe that the saint to whom the image is dedicated, presides in a particular manner about its shrine, and works miracles by the intervention of its image; and that if the image was destroyed or taken away, the saint would no longer perform any miracle in that place.

IDYLLION, in ancient poetry, is only a diminutive of the word *εἶνος*, and properly signifies any poem of moderate extent, without considering the subject. But as the collection of Theocritus's poems were called *idyllia*, and the pastoral pieces being by far the best in that collection, the term *idyllion* seems to be now appropriated to pastoral pieces.

JEARS, or GEERS, in the sea-language, an assemblage.

blage of tackles, by which the lower yards of a ship are hoisted along the mast to their usual station, or lowered from thence as occasion requires; the former of which operations is called *swaying*, and the latter *striking*.

JEBUSÆI, one of the seven ancient people of Canaan, descendants of Jebusi, Canaan's son; so warlike and brave, as to have flooded their ground, especially in Jebus, afterwards called *Jerusalem*, down to the time of David. Judges i. 21. 1 Sam. v. 6.

JEDBURGH, a town of Scotland, capital of Tiviotdale or Roxburghshire. It is well-built and populous, with a handsome church and town-hall, and a good market for corn and cattle. It gives the title of *lord* to the marquis of Lothian's eldest son, and is the seat of the sheriff's court and presbytery.

JEDDO, the capital town or city of the islands of Japan, where the emperor resides. It is open on all sides, having neither walls nor ramparts; and the houses are built with earth, and boarded on the outside to prevent the rain from destroying the walls. In every street there is an iron gate, which is shut up in the night; and a kind of custom-house or magazine, to put merchandizes in. It is a large place, being nine miles in length and six in breadth, and contains 1,000,000 of inhabitants. A fire happened in 1658, which, in the space of 48 hours, burnt down 100,000 houses, and in which a vast number of the inhabitants perished. The emperor's palace and all the rest were reduced to ashes; but they are all rebuilt again. The royal palace is in the middle of the town; and is defended with walls, ditches, towers, and bastions. Where the emperor resides, there are three towers nine stories high, each covered with plates of gold; and the hall of audience is said to be supported by pillars of massy gold. Near the palace are several others, where the relations of the emperor live. The empress has a palace of her own, and there are 20 small ones for the concubines. Besides, all the vassal kings have each a palace in the city, with a handsome garden, and stables for 2000 horses. The houses of the common sort are nothing but a ground-floor, and the rooms are parted by folding-screens; so that they can make the rooms larger or smaller at pleasure. It is seated in an agreeable plain, at the bottom of a fine bay; and the river which crosses it, is divided into several canals. E. Long. 140. 0. N. Lat. 35. 32.

JEFFERY. See **GEOFFREY**.

JEFFREYS (lord George), baron Wem, commonly called *Judge Jeffreys*, was the sixth son of John Jeffreys, Esq; of Acton in Denbighshire; and was educated at Westminster-school, whence he removed to the Inner Temple, where he applied himself to the study of the law. Alderman Jeffreys, who was probably related to him, introduced him among the citizens of London; and he being a merry bottle-companion, soon came into great business, and was chosen their recorder. He was afterwards chosen solicitor to the duke of York; and in 1680 was knighted, and made chief-justice of Chester. At length, resigning the recordership, he obtained the post of chief-justice of the king's-bench, and, soon after the accession of James II. the great seal. During the reign of king Charles II. he shewed himself a bitter enemy to

Jeffreys.

those dissenting ministers who, in that time of persecution, were tried by him: he was one of the greatest advisers and promoters of all the oppressions and arbitrary measures carried on in the reign of James II.; and his sanguinary and inhuman proceedings against Monmouth's unhappy adherents in the west will ever render his name infamous. Whenever the prisoner was of a different party, or he could please the court by condemning him, instead of appearing according to the duty of his office, as his counsel, he would scarce allow him to speak for himself; but would load him with the grossest and most vulgar abuse, browbeat, insult, and turn to ridicule the witnesses that spoke in his behalf; and even threaten the jury with fines and imprisonment, if they made the least hesitation about bringing in the prisoner guilty. Yet it is said, that when he was in temper, and matters perfectly indifferent came before him, no one became a feat of justice better. Nay, it even appears, that, when he was under no state-influence, he was sometimes inclined to protect the natural and civil rights of mankind, of which the following instance has been given:—The mayor and aldermen of Bristol had been used to transport convicted criminals to the American plantations, and sell them by way of trade. This turning to good account, when any pilferers or petty rogues were brought before them, they threatened them with hanging; and then some officers who attended, earnestly persuaded the ignorant intimidated creatures to beg for transportation, as the only way to save them; and in general their advice was followed. Then, without more form, each alderman in course took one, and sold him for his own benefit; and sometimes warm disputes arose between them about the next turn. This infamous trade, which had been carried on many years, coming to the knowledge of the lord chief justice, he made the mayor descend from the bench, and stand at the bar in his scarlet and furr, with his guilty brethren the aldermen, and plead as common criminals. He then obliged them to give securities to answer informations; but the proceedings were stopped by the Revolution.

However, the brutality Jeffreys commonly shewed on the bench, where his voice and visage were equally terrible, at length exposed him to a severe mortification. A scrivener of Wapping having a cause before him, one of the opponent's counsel said he was a strange fellow, and sometimes went to church, and sometimes to conventicles; and it was thought he was a trimmer. At this the chancellor fired: "A trimmer? (said he); I have heard much of that monster, but never saw one. Come forth, Mr Trimmer, and let me see your shape." He then treated the poor fellow so roughly, that, on his leaving the hall, he declared he would not undergo the terrors of that man's face again to save his life, and he should certainly retain the frightful impressions of it as long as he lived. Soon after, the prince of Orange coming, the lord-chancellor, dreading the public repentment, disguised himself in a seaman's dress, in order to leave the kingdom; and was drinking in a cellar, when this scrivener coming into the cellar, and seeing again the face which had filled him with such horror, started; on which, Jeffreys, fearing he was known, feigned a cough, and turned to the wall with his pot of beer in his hand.

But

But Mr Trimmer going out, gave notice that he was there; and the mob rushing in, seized him, and carried him before the lord-mayor, who sent him with a strong guard to the lords of the council, by whom he was committed to the Tower, where he died in 1689. — It is remarkable, that the late countess of Pomfret met with very rude insults from the populace on the western road, only because she was grand-daughter of the inhuman Jeffries.

JEHOVAH, one of the scripture-names of God, signifying the Being who is self-existent and gives existence to others.

So great a veneration had the Jews for this name, that they left off the custom of pronouncing it, whereby its true pronunciation was forgotten. They call it *tetragrammaton*, or “the name with four letters;” and believe, that whoever knows the true pronunciation of it cannot fail to be heard by God.

JEJUNUM, in anatomy, the name of one of the small intestines. See *ANATOMY*, n° 354. g.

JELLY. See *GELLY*, and *CHEMISTRY*, n° 521.

JEMTERLAND, a province of Sweden, bounded on the north by Angermania, on the east by Medelpadia, on the south by Helsingia, and on the west by Norway. It is full of mountains; and the principal towns are Refundt, Lich, and Docra.

JENA, a strong town of Germany, in the circle of Upper Saxony, and in Thuringia, with an university. It is seated on the river Sala, in E. Long. 2. 59. N. Lat. 51. o.

JENCAPORE, a town of Asia, in Indostan, and in the dominions of the Great Mogul, capital of a territory of the same name. It is seated on the river Chaul, in E. Long. 76. 25. N. Lat. 30. 30.

JENISA, a river of the Russian empire, that runs from north to south through Siberia, and falls into the Frozen Ocean.

JENISKOL, a town of the Russian empire, in Siberia, seated on the river Jenif. It is large, populous, and pretty strong; and there are villages for several miles round it. It is subject to the Tungusians, who are pagans, and chiefly live on the above river. They pay a tribute to the emperor for every bow, reckoning a man and a woman for one. The climate is extremely cold; and no other fruits grow there but black and red currants, strawberries, and gooseberries. Corn, butchers meat, and wild fowls, are very cheap. E. Lon. 86. 25. N. Lat. 58. 40.

JENCOPING, a town of Sweden, in the province of Smland, seated on the south side of the lake Welter, with a strong citadel. The houses are all built with wood. E. Long. 14. 20. N. Lat. 57. 22.

JENKIN (Robert), a learned English divine in the 18th century, was bred at Cambridge, became master of St John's college, and wrote several books much esteemed, viz. 1. An historical examination of the authority of General Councils, 4to. 2. The reasonableness and certainty of the Christian religion, 2 vols 8vo. 3. *Defensio S. Augustini*. This book is written against M. le Clerc. 4. Remarks on some books lately published, viz. Mr Whiston's eight sermons, Locke's paraphrase, &c. 5. A translation from the French of the life of Apollonius Tyaneus.

JENKINS (Henry). See *LONGEVITY*.

JENKINS (Sir Leoline), a learned civilian and able

VOL. V.

statesman of the last century, born in Glamorganshire about the year 1623. Being rendered obnoxious to the parliament during the civil war by adhering to the king's cause, he consulted his safety by flight; but returning on the restoration, he was admitted an advocate in the court of arches, and succeeded Dr Exton as judge. When the queen-mother Henrietta died in 1669 at Paris, her whole estate, real and personal, was claimed by her nephew Lewis XIV.: upon which Dr Jenkins's opinion being called for and approved, he went to Paris, with three others joined with him in a commission, and recovered her effects; for which he received the honour of knighthood. He officiated as one of the mediators at the treaty of Nimeguen, in which tedious negotiation he was engaged about four years and a half; and was afterwards made a privy-counsellor and secretary of state. He died in 1685; and as he never married, bequeathed his whole estate to charitable uses: he was to great a benefactor to Jesus-college Oxford, that he is generally looked on as the second founder. All his letters and papers were collected and printed in 1724, in 2 vols folio.

JENNY-WREN, a name given by writers on long-birds to the wren. See *WREN*.

JEFOAILE, (compounded of three French words, *Jay faille*, “I have failed”), a term in law, used for an oversight in pleading or other proceedings at law.

The shewing of these defects or oversights was formerly often practised by the counsel; and when the jury came into court in order to try the issue, they said, This inquest you ought not to take; and after verdict they would say to the court, To judgment you ought not to go. But several statutes have been made to avoid the delays occasioned by such suggestions; and a judgment is not to be stayed after verdict for mistaking the Christian or surname of either of the parties, or in a sum of money, or in the day, month, year, &c. where the same are rightly named in any preceding record.

JEREMIAH (*the Prophecy of*), a canonical book of the Old Testament. This divine writer was of the race of the priests, the son of Hilkiah of Anathoth, of the tribe of Benjamin. He was called to the prophetic office when very young, about the 13th year of Josiah, and continued in the discharge of it about 40 years. He was not carried captive to Babylon with the other Jews, but remained in Judea to lament the desolation of his country. He was afterwards a prisoner in Egypt with his disciple Baruch, where it is supposed he died in a very advanced age. Some of the Christian fathers tell us he was stoned to death by the Jews, for preaching against their idolatry; and some say he was put to death by Pharaoh Hophrah, because of his prophecy against him. Part of the prophecy of Jeremiah relates to the time after the captivity of Israel, and before that of Judah, from the first chapter to the 44th; and part of it was in the time of the latter captivity, from the 44th chapter to the end. The prophet lays open the sins of Judah with great freedom and boldness, and reminds them of the severe judgments which had befallen the ten tribes for the same offences. He passionately laments their misfortune, and recommends a speedy reformation to them. Afterwards he predicts the grievous calamities that were approaching, particularly the 70 years captivity in Chaldaea. He like-

wife foretells their deliverance and happy return, and the recompence which Babylon, Moab, and other enemies of the Jews, should meet with in due time. There are likewise several intimations in this prophecy concerning the kingdom of the Messiah; also several remarkable visions, and types, and historical passages relating to those times. The 52d chapter does not belong to the prophecy of Jeremiah, which probably was added by Ezra, and contains a narrative of the taking of Jerusalem, and of what happened during the captivity of the Jews, to the death of Jeconias. St Jerom has observed upon this prophet, that his style is more easy than that of Isaiah and Hosea; that he retains something of the rusticity of the village where he was born; but that he is very learned and majestic, and equal to those two prophets in the sense of his prophecy.

JERICOHO, or HIERICHUS, (anc. *geog.*) a city of Judea; situated between Jordan and Jerusalem, at the distance of 150 stadia from the latter, and 60 from the former. Josephus says the whole space from Jerusalem is desert and rocky, and equally barren and uncultivated from Jericho to the lake Asphaltites; yet the places near the town and above it are extremely fertile and delicious, so that it may be justly called a *divine plain*, surpassing the rest of the land of Canaan, no unfruitful country, and surrounded by hills in the manner of an amphitheatre. It produces opobalsamum, myrobalsams, and dates; from the last of which it is called the *city of palm-trees*, by Moses.

JERIMOTH. See JARIMUTH.

JEROME (St), in Latin *Hieronymus*, a famous doctor of the church, and the most learned of all the Latin fathers, was the son of Eusebius; and was born at Stridon, a city of the ancient Pannonia, about the year 340. He studied at Rome under Donatus, the learned grammarian. After having received baptism, he went into Gaul, and there transcribed St Hilary's book de *Synodus*. He then went into Aquileia, where he contracted a friendship with Heliodorus, who prevailed on him to travel with him into Thrace, Pontus, Bithynia, Galatia, and Cappadocia. In 372 St Jerome retired into a desert in Syria, where he was persecuted by the orthodox of Melitius's party, for being a Sabellian, because he made use of the word *Hypostasis*, which had been used by the council of Rome in 369. This obliged him to go to Jerusalem; where he applied himself to the study of the Hebrew language, in order to receive a more perfect knowledge of the Holy Scriptures; and about this time he consented to be ordained, on condition that he should not be confined to any particular church. In 381, he went to Constantinople to hear St Gregory of Nazianzen; and the following year returned to Rome, where he was made secretary to pope Damasus. He then instructed many Roman ladies in piety and the knowledge of the sciences, which exposed him to the calumnies of those whom he zealously reprov'd for their irregularities; and pope Siricius not having all the esteem for him which his learning and virtue justly entitled him to, this learned doctor left Rome, and returned to the monastery of Bethlehem, where he employed himself in writing against those whom he called *heretics*, especially against Vigilantius and Jovinian. He had a quarrel with John of Jerusalem, and Rufinus, about the Origenists. He was the first who wrote against Pelagius; and died on

the 30th of September, 420, at about 80 years of age. There have been several editions of his works; the last, which is that of Verona, is in 11 vols folio. His principal works are, 1. A Latin version of the Holy Scriptures, distinguished by the name of the *Vulgate*. 2. Commentaries on the Prophets, Ecclesiastes, St Matthew's Gospel, and the Epistle to the Galatians, Ephesians, Titus, and Philemon. 3. Polemical treatises against Montanus, Helvidius, Jovinian, Vigilantius, and Pelagius. 4. Several letters. 5. A treatise on the lives and writings of the ecclesiastical authors who had flourished before his time.—St Jerome's style is lively and animated, and sometimes sublime.

JEROME of Prague, so called from the place of his birth, in Bohemia. He was neither a monk nor clergyman, but had a learned education. Having embraced the opinions of John Hus, he began to propagate them in the year 1480. In the mean time the council of Nice kept a watchful eye over him, and considering him as a dangerous person, cited him to appear before them and give an account of his faith. In obedience to this citation, he went to Constance; but on his arrival, in 1415, finding Hus in prison, he set out for his own country. Being seized however on the way, imprisoned, and examined, he was so intimidated, that he retracted, and pretended to approve of the condemnation of Wickliff's and Hus's opinions; but on the 26th of May, 1416, he condemned that recantation in these terms: "I am not ashamed to confess here publicly my weakness. Yes, with horror I confess my base cowardice. It was only the dread of the punishment by fire which drew me to consent, against my conscience, to the condemnation of the doctrine of Wickliff and Hus." Accordingly sentence was passed on him; in pursuance of which he was delivered to the secular arm, and burnt in 1416. He was a person of great parts, learning, and elocution.

JERSEY, an island in the English channel, believed to be the island called in the Itinerary *Cesarea*, in succeeding times *Augia*, by us *Gersey*, more frequently *Jersey*. It is situated 25 leagues south from the continent of Britain; five leagues west from Cape Carteret in Normandy; three leagues south from Sarke; seven leagues, according to the common computation, south-east from Guernsey, but in reality not so much; and nine leagues south from Alderney. It is of an oblong figure, measuring 12 miles from west to east, and six from north to south; in circumference between 35 and 36; and, in point of extent, nearly equal to, or rather somewhat larger than, Guernsey: elevated like that; but on the opposite side declining from south to north, the cliffs on that side which looks towards Guernsey being 40 or 50 fathom in height, whereas on the south it is in a manner level with the sea. Hence the distance between St Peter's and St Helier's is really seven leagues, though the islands have not above four leagues of sea between them. The people of Jersey think, that from this elevation, they have a great advantage in point of climate; that their summers are warmer, and that their corn and fruits ripen better. The country is beautifully diversified with little hills, warm valleys, and, towards the sea, with pleasant plains. The soil also varies very much; in some places gravelly, in others sandy: but the greatest part is a deep, rich, fertile mould; and there is hardly any part of the island that

that can be styled barren. It is also thought to be better watered than Guernsey, abounding every where with rills, rivulets, and living springs; so that there are between 30 and 40 corn-mills driven by water, exclusive of seven fulling, and several windmills. The produce of this island is much the same with that of Guernsey; their pasture is so sweet, that no country in Europe can boast of richer milk or finer butter; and they have grain of all kinds, and particularly a sort of wheat called *froment-tremais*, from its being sown in the latter end of May, and reaped in the beginning of August. But what chiefly distinguishes this island at present, is its orchards; which are very well fenced, regularly planted, and yield commonly immense quantities of fruit.

On the south of the island the sea seems to have encroached upon the land, (which, as we have before observed, declines on that side), and to have swallowed upwards of six square miles, making a very beautiful bay of between two and three miles broad, and near the same in depth. In the east corner of this bay stands the town of St Helier, very happily situated, having a prospect open to the sea and Mount Elisabeth Castle (which, since it was repaired and the works augmented in the reign of Charles II. entirely occupies a rocky isle, which the sea, when it devoured the soil, could not digest), covered with hills to the north, with meadows between them and the town, through which runs a copious and delightful stream that waters the place as well as can be wished. The streets are open and well-built, with a handsome square in the centre, and well accommodated in point of markets, and every thing that can contribute to the convenience of the inhabitants, of whom there may be about 2000. There has been of late years a pier raised; which is a great advantage to the port, and of course not a little to the benefit of the town. But the principal haven is on the other side, in the western corner of the bay, which receives its name from it, being called *St Aubin's*. It is about half the size of St Helier, chiefly occupied by merchants and masters of ships; and most of the buildings being new, make a very neat and elegant figure. A little to the eastward of the town a rock rises up in the sea, upon which the fort of St Aubin is erected; to which the inhabitants having joined a strong, well-built pier, their haven is now equally secured against the fury of the winds, and the insults of an enemy. Within the pier, a sixth-rate just floats at a dead neap, and a vessel of 200 tons at all times; but ships of superior size must lie without, in the road, where there is good anchoring; and the whole bay being a fine, clean, hard sand, renders the intercourse between the two towns, which are about three miles distant, perfectly easy. There are, besides these, several other havens of less note; as, St Brelade's Bay, at the back of St Aubin's; the great bay of St Ouen, which takes in the greatest part of the west side of the island, where the largest ships may ride in 12 and 15 fathom, safe from all but east winds. La Crevaile is a port only for boats; Greve de Lecq and port St John are also small havens on the north side, where is likewise Bonnevuit. On the east there is the bay of St Catherine, and the harbour of Rosel; to the south of which lies the famous Mount Orgueil Castle, formerly Castle Courray, upon a solid rock, which was entirely covered with its

out-works; once the glory of this isle, and still majestic though in decay. To the south-west lies the haven de la Chauffée. The last we shall mention is the port de Pas, a very little to the eastward of St Aubin's bay. All these are covered with breast-works, well defended by cannon.

The state of things and the occupations of the people are very much changed from what they were a century past, or a very little more. The country then was in a manner altogether arable or pasture, and the people in general applied themselves to agriculture: whereas now every house has its orchards; and these orchards are so fenced with strong and thick mounds of earth and stone, frequently surmounted by hedges, and sometimes by trees, that it has been thought, not by transient spectators, but even on reflection affirmed by the most competent judges, these inclosures, together with larger or lesser roads, take up not less than a third part of the surface of the island; and they have such an abundance of fruit, that it is believed in a good year they make between 20,000 and 30,000 hog-heads of cyder; and if we consider that this is the common drink of the inhabitants, we may easily acquiesce in the account. Their great manufacture is the same with that of Guernsey, the working up of their own wool, and that which by two acts of parliament they are allowed to import from England, which is 4000 tods; and some say that 10,000 pair of stockings, of all sorts and sizes, are brought weekly to the market of St Helier. In ancient times they depended greatly upon their fishery, in which they are much inferior at present to Guernsey: but whereas they had formerly larger ships, and a greater share of commerce, that is now in the hands of the people of Jersey, who send annually 30 stout ships to the Newfoundland fishery; and in time of peace, great quantities of tobacco are smuggled from thence into France. For the defence of the island they have two troops of horse, five regiments of infantry, and a fine train of artillery, exclusive of what is in their several castles, and on the redoubts and breast-works upon their coasts, amounting in the whole to 115 18-pounders, given by King William to the island in 1692. There are always regular troops in Elizabeth Castle and in Fort St Aubin; and in time of war, they have commonly a body of forces from England. The whole number of inhabitants is computed at about 25,000, all of whom are (except a very few) natives of the place.

The island of Jersey, with those of Guernsey, Sark, Alderney, and their appendages, were parcel of the duchy of Normandy, and were united to the crown of England by the first princes of the Norman line. They are governed by their own laws, which are for the most part the dual customs of Normandy, being collected in an ancient book of customs intitled *Le grand coutumier*. The king's writ, or process from the courts of Westminster, is here of no force; but his commission is. They are not bound by any common acts of our parliaments, unless particularly named. All causes are originally determined by their own officers, the bailiffs and jurats of the islands. But an appeal lies from them to the king and counsel in the last resort.

NEW JERSEY, or, as it is commonly called, *the Jerseys* (being two provinces united into one government),

Jersey,
Jerusalem.

ment), one of the British colonies in North America. They lie from 39 to 41 degrees of north latitude, and from 74 to 75 degrees 30 minutes longitude west from London. In length 150 miles, in breadth in some places about 100. Bounded on the north by New York, on the east by the Atlantic, on the south by Delaware Bay, on the west by Pennsylvania. This situation, and their having on all sides either the sea or cultivated countries, accounts for the mildness of the climate, which is equally serene and pleasant. The soil is almost every-where deep and fertile, producing vast quantities of excellent wheat and all other kinds of grain in abundance, a variety of rich fruits, fine timber-trees fit for building, and prodigious quantities of cattle of all sorts. Abounding also in copper and iron ores, which are very rich. The inhabitants live here much at their ease, and with little labour, enjoying not only all the necessaries but most of the conveniences of life, from whence this country hath not been improperly styled the *Garden of America*. It is a royal government, the governor being assisted by a council of 12 which compose the upper house, as the representatives of the people do the lower house of assembly, and are in number 24. In East Jersey, the capital is Perth Amboy, which hath a fine port, notwithstanding which Elizabeth-Town is much larger. In West Jersey they have two ports, Burlington and Salem. The commodities of the Jerseys are the same with those of New York, and the number of inhabitants is said to be 60,000.

The duke of York, as proprietor of the province last mentioned, by a deed, dated the 24th of June 1664, granted the southern part of it to Sir George Carteret and Lord Berkeley of Stratton, which part was called *New Jersey*. Ten years after this the two lords proprietors, with the consent of the duke, divided this country into East Jersey under Sir George Carteret, and West Jersey under Lord Berkeley. The duke of York, notwithstanding this, refused for a short space the government of West Jersey; but by a new deed, in the year 1680, revived and confirmed the former division, by which West Jersey was restored to lord Berkeley. These proprietors afterwards assigned their rights to others; and the inhabitants frequently falling out with the governors they sent over, and the assignees of the original proprietors disagreeing amongst themselves, the latter, by a solemn act, April 17th, 1702, resigned both provinces to the queen, reserving however the property in the soil, &c. Since this period it hath been a royal government, though sometimes the same person hath been governor of New York and the Jerseys. The exports, 1769, amounted to no more than 2531 l. all for the British or foreign West Indies. In 1770, there were entered inwards two ships and 41 sloops; cleared outwards two ships and 47 sloops.

JERUSALEM, a very famous and ancient city, capital of Judea or Palestine, now a province of Turkey in Asia. According to Manetho, an Egyptian historian, it was founded by the shepherds who invaded Egypt in an unknown period of antiquity†. According to Josephus, it was the capital of Melchisedek's kingdom, called *Salem* in the book of Genesis: and the Arabians assert, that it was built in honour of Melchisedek by 12 neighbouring kings; which when they

had done, he called it *Jerusalem*. We know nothing of it with certainty, however, till the time of king David, who took it from the Jebusites, and made it the capital of his kingdom, which it ever after continued to be. It was first taken in the days of Jehoash, by Hazael the king of Syria, who slew all the nobility, but did not destroy their city. It was afterwards taken by Nebuchadnezzar king of Babylon, who destroyed it, and carried away the inhabitants. Seventy years after, permission was granted by Cyrus king of Persia to the Jews to rebuild their city, which was done; and it continued the capital of Judæa, (though frequently suffering much from the Grecian monarchs of Syria and Egypt,) till the time of Vespasian emperor of Rome, by whose son Titus it was totally destroyed*. It was, however, rebuilt by Adrian; and seemed likely to have recovered its former grandeur, being surrounded with walls, and adorned with several noble buildings; the Christians also being permitted to settle in it. But this was a short-lived change; so that when the empress Helena, mother of Constantine the Great, came to visit this city, she found it in the most forlorn and ruinous situation. Having formed a design of restoring it to its ancient lustre, she caused, with a great deal of cost and labour, all the rubbish that had been thrown upon those places where our Saviour had suffered, been buried, &c. to be removed. In doing this, they found the cross on which he died, as well as those of the two malefactors who suffered with him; and, as the writers of those times relate, discovered by a miracle that which had borne the Saviour of mankind. She then caused a magnificent church to be built, which inclosed as many of the scenes of our Saviour's sufferings as could conveniently be done, and adorned the city with several other buildings. The emperor Julian is said to have formed a design of rebuilding the temple of Jerusalem, and of restoring the Jewish worship. This scheme was contrived on purpose to give the lie to our Saviour's prophecy concerning the temple and city of Jerusalem, namely, that the first should be totally destroyed, without one stone being left upon another; and that Jerusalem should be trodden down of the Gentiles till the times of the Gentiles were fulfilled. In this attempt, however, according to the accounts of the Christian writers of that age, the emperor was frustrated by an earthquake and fiery eruption from the earth, which totally destroyed the work, consumed the materials which had been collected, and killed a great number of the workmen.

This event hath been the subject of much dispute. Mr Warburton, who hath published a treatise expressly on the truth of this fact, hath collected the following testimonies in favour of it. The first is that of Ammianus Marcellinus, who tells us, "Julian (having been already thrice consul) taking Sallust, prefect of the several Gauls, for his colleague, entered a fourth time on this high magistracy; and although his sensibility of the many and great events which this year was likely to produce made him very anxious for the future, yet he both pushed on the various and complicated preparatives for this expedition with the utmost application, and, having an eye in every quarter, and being desirous to eternize his reign by the greatness of his achievements, he projected to rebuild

Jerusalem.

* See *Jeru.*† See *Egypt*,
no 2.

Jerusalem. rebuild at an immense expence the proud and magnificent temple of Jerusalem; which, (after many combats, attended with much bloodshed on both sides, during the siege by Vespasian) was with great difficulty taken and destroyed by Titus. He committed the conduct of this affair to Alympius of Antioch, who had formerly been lieutenant in Britain. When therefore this Alympius had set himself to the vigorous execution of his charge, in which he had all the assistance that the governor of the province could afford him, horrible balls of fire breaking out near the foundations, with frequent and reiterated attacks, rendered the place from time to time inaccessible to the scorched and blasted workmen; and the victorious element continuing, in this manner, obstinately and resolutely bent, as it were, to drive them to a distance, Alympius thought best to give over the enterprise."

The next testimony is that of Gregory Nazianzen. Speaking of the emperor Julian, he says, "After having run through a course of every other tyrannical experiment against the faith, and upon trial despising all of them as trifling and contemptible, he at last brought down the whole body of the Jews upon us; whom, for their ancient turn to seditious novelties, and an inveterate hatred of the Christian name, he chose as the fittest instrument for his machinations. These, under a show of great good-will, which hid his secret purpose, he endeavoured to convince from their sacred books and traditions, which he took upon him to interpret, that now was come the time foretold, when they should return to their own land, rebuild their temple, and restore the law to its ancient force and splendor. When these things had been thoroughly insinuated, and heartily entertained, (for deceit finds easy admittance when it flatters our passions), the Jews set upon the work of rebuilding with great attention, and pushed on the project with the utmost labour and application. But when, now driven from their work by a violent whirlwind and a sudden earthquake, they fled together for refuge to a certain neighbouring church, (some to deprecate the impending mischief; others, as is natural in such cases, to catch at any help that presents itself; and others again, enveloped in the crowd, were carried along with the body of those who fled), there are who say, the church refused them entrance; and that when they came to the doors which were wide open but a moment before, they found them on a sudden closed by a secret and invisible hand; a hand accustomed to work these wonders by the terror and confusion of the impious, and for the security and comfort of godly men. This, however, is now invariably affirmed and believed by all, that as they strove to force their way in by violence, the fire which burst from the foundations of the temple, met and stopped them. One part it burnt and destroyed, and another it desperately maimed, leaving them a living monument of God's commination and wrath against sinners. Thus the affair passed; and, let no man continue incredulous concerning this or the other miraculous works of God. But still the thing most wonderful and illustrious was, a light which appeared in the heavens, of a cross within a circle. That name and figure which impious men before esteemed so dishonourable upon

earth, was now raised on high, and equally objected to the common view of all men; advanced by God himself as the trophy of his victory over unbelievers; of all trophies the most exalted and sublime. Nay further, they who were present, and partakers of the miracle we are now about to speak of, shew to this very day the sign or figure of the cross which was then marked or impressed upon their garments. For at that time, as these men, (whether such as were of us, or strangers) were shewing these marks, or attending to others who shewed them, each presently observed the wonder, either on himself or his neighbour; having a radiant mark on his body or on his garment, in which there is something that, in art and elegance, exceeded all painting or embroidery."

Notwithstanding these testimonies, however, this fact hath been strenuously contested by others; and indeed it must be owned that the testimonies above mentioned are by no means unexceptionable. In the last particularly, the propensity to the marvellous is so exceedingly great, that every one must at first sight be struck with it. It is true indeed, the most miraculous part of it, as it seemed to be to Gregory, namely, the appearance of crosses upon the garments and bodies of some of the people who were struck, may be explained upon a natural principle; since we are assured that lightning will sometimes produce effects of this kind*: but even this is no decisive proof of the authenticity of the relation; though it cannot by any means discredit it, as some think. On the whole, however, it is not a matter of any consequence whether this event happened with the circumstances abovementioned or not. If Julian did make any attempt to rebuild the temple, it is certain that something obstructed the attempt, because the temple was never actually rebuilt. If he made no such attempt, the prophecy of our Saviour still holds good; and it surely cannot be thought to detract from the merit of a prophecy, that no body ever attempted to elude it, or prove it to be a falsehood.

Jerusalem continued in the hands of the eastern emperors till the reign of the Caliph Omar, who reduced it under his subjection. The Saracens continued in possession of it till the year 1099, when it was taken by the crusaders. They founded a new kingdom, of which Jerusalem was the capital, which lasted 88 years under nine kings. At last this kingdom was utterly ruined by Saladin; and though the Christians once more got possession of the city, they were again obliged to relinquish it. In 1217, the Saracens were expelled by the Turks, who have ever since continued in possession of it.

The city of Jerusalem, in its most flourishing state, was divided into four parts, each inclosed with its own walls; viz. 1. The old city of Jebus, which stood on mount Zion, where the prophets dwelt, and where David built a magnificent castle and palace, which became the residence both of himself and successors; on which account it was emphatically called, *the city of David*. 2. The lower city, called also *the daughter of Zion*, being built after it; on which stood the two magnificent palaces which Solomon built for himself and his queen; that of the Maccabean princes; and the stately amphitheatre built by Herod, capable of containing 80,000 spectators; the strong citadel, built

Jerusalem.

* See Lightning.

Jerusalem. built by Antiochus, to command and overtop the temple, but afterwards razed by Simon the Maccabæe, who recovered the city from the Syrians; and lastly, a second citadel, built by Herod, upon a high and craggy rock, and called by him *Antonia*. 3. The new city, mostly inhabited by tradesmen, artificers, and merchants; and, 4. Mount Moriah, on which was built the so famed temple of Solomon, described in the sixth and seventh chapters of the second book of Kings; and, since then, that rebuilt by the Jews on their return from Babylon, and afterwards built almost anew and greatly adorned and enriched by Herod.

Some idea of the magnificence of this temple may be had from the following considerations. 1. That there were no less than 163,300 men employed in the work. 2. That notwithstanding that prodigious number of hands, it took up seven whole years in building. 3. That the height of this building was 120 cubits, or 82 yards, rather more than less; and the courts round it about half as high. 4. That the front, on the east side, was sustained by ramparts of square stone, of vast bulk, and built up from the valley below, which last was 300 cubits high, and being added to that of the edifice amounted to 420 cubits; to which, if we add, 5. The height of the principal tower above all the rest, viz. 60; will bring it to 480 cubits, which, reckoning at two feet to a cubit will amount to 960 feet; but, according to the length of that measure, as others reckon it, viz. at two feet and an half, it will amount to 1200 feet; a prodigious height this from the ground, and such as might well make Josephus say, that the very design of it was sufficient to have turned the brain of any but Solomon. 6. These ramparts, which were raised in this manner, to fill up the prodigious chasm made by the deep valley below, and to make the area of a sufficient breadth and length for the edifice, were 1000 cubits in length at the bottom, and 800 at the top, and the breadth of them 100 more. 7. The huge buttresses which supported the ramparts were of the same height, square at the top, and 50 cubits broad, and jutted out 150 cubits at the bottom. 8. The stones, of which they were built, were, according to Josephus, 40 cubits long, 12 thick, and 8 high, all of marble, and so exquisitely joined, that they seemed one continued piece, or rather polished rock. 9. According to the same Jewish historian, there were 1453 columns of Parian marble, and twice that number of pilasters; and of such thickness, that three men could hardly embrace them, and their height and capitals proportionable, and of the Corinthian order. But it is likely Josephus hath given us these two last articles from the temple of Herod, there being nothing like them mentioned by the sacred historians, but a great deal about the prodigious cedars of Lebanon used in that noble edifice, the excellent workmanship of them adapted to their several ends and designs, together with their gildings and other curious ornaments. The only thing more we shall venture to add is, what is affirmed in Scripture, that all the materials of this stupendous fabric were finished and adapted to their several ends before they were brought to Jerusalem, that is, the stones in their quarries, and the cedars in Lebanon; so that their was no noise of ax, hammer, or any tool, heard in the rearing of it.

At present Jerusalem is called by the Turks *Cud-sembaric*, and *Coudsheriff*; and is reduced to a poor thinly-inhabited town, about three miles in circumference, situated on a rocky mountain, surrounded on all sides, except the north, with steep ascents and deep valleys; and these again environed with other hills, at some distance from them. In the neighbourhood of the city there grow some corn, vines, olives, &c. The stately church erected by the empress Helena, on mount Cavalry, is still standing. It is called the *church of the sepulchre*; and is kept in good repair by the generous offerings of a constant concourse of pilgrims, who annually resort to it, as well as by the contributions of several Christian princes. The walls of this church are of stone, and the roof of cedar; the east end incloses Mount Calvary, and the west the holy sepulchre: the former is covered with a noble cupola, open at top, and supported by 16 massive columns. Over the high altar, at the east end, is another stately dome. The nave of the church constitutes the choir; and in the inside-aisles are shewn the places where the most remarkable circumstances of our Saviour's passion was transacted, together with the tombs of Godfrey and Baldwin, the two first Christian kings of Jerusalem. In the chapel of the crucifixion, is shewn the very hole in the rock in which the cross is said to have been fixed. The altar in this chapel hath three crosses on it; and is richly adorned, particularly with four lamps of immense value that hang before it, and are kept constantly burning. At the west end is that of the sepulchre, which is hewn in that form out of the solid rock, and hath a small dome supported by pillars of porphyry. The cloister round the sepulchre is divided into sundry chapels, appropriated to the several sorts of Christians who reside there; as Greeks, Armenians, Maronites, Jacobites, Copts, Abyssines, Georgians, &c. and on the north-west side of it are the apartments of the Latins, who have the care of the church, and are forced to reside constantly in it; the Turks keeping the keys of it, and not suffering any of them to go out, but obliging them to receive their provisions in at a wicket. At Easter there are some grand ceremonies performed in the church, representing our Lord's passion, crucifixion, death, and resurrection, at which a vast concourse of pilgrims commonly assist. For a particular account of them, we refer the reader to doctors Shaw and Pococke.

On Mount Moriah, on the south-east part of the city, is an edifice called *Solomon's Temple*, standing on or near the same spot as the ancient; but when or by whom erected is uncertain. In the midst of it is a Turkish mosque, where the Jewish sanctum sanctorum is supposed to have stood. The building, which Dr Pococke thinks must have been formerly a Christian church, is held in the utmost veneration by the Turks.

The city is now under the government of a sangiac, who resides in a house said to have been that of Pontius Pilate, over-against the castle of Antonia built by Herod the Great. Many of the churches erected in memory of some remarkable gospel-transaction, have been since converted into mosques; into some of which money will procure admittance, but not into others. Both the friars and other Christians are kept so poor by the tyranny of the government, that the chief sup-

port and trade of the place consists in providing strangers with food and other accommodations, and selling them beads, relics, and other trinkets, for which they are obliged to pay considerable sums to the sangiac, as well as to his officers; and those are seldom so well contented with their usual duties, but they frequently extort some fresh ones, especially from the Franciscans, whose convent is the common receptacle for all pilgrims, and for which they have considerable allowances from the pope, and other crowned heads, besides the presents which strangers generally make them at their departure. The most remarkable antiquities in the neighbourhood of Jerusalem are, 1. The pools of Bethesda and Gihon; the former 120 paces long, 40 broad, and at least eight deep, but now without water; and the old archives, which it still discovers at the well end, are quite dammed up: the other, which is about a quarter of a mile without Bethlehem-gate, is a very lately relic, 106 paces long, and 60 broad, lined with a wall and plaster, and still well stored with water. 2. The tomb of the Virgin Mary, in the valley of Jehoshaphat, into which one descends by a magnificent flight of 47 steps. On the right hand as one goes down, is also the sepulchre of St Ann the mother, and on the left that of Joseph the husband, of that virgin-mother: some add likewise that of Jehoiakim her father. In all these are erected altars for priests of all sorts to say mass, and the whole is cut into the solid rock. 3. The tomb of king Jehoshaphat, cut likewise into the rock, and divided into several apartments; in one of which is his tomb, which is adorned with a stately portico and entablature over it. 4. That commonly called *Abfalom's pillar or place*, as being generally supposed to be that which he is said to have erected in his life-time to perpetuate his memory, as he had no male-issuë. The place, however, both within and without, hath more the resemblance of a sepulchre than any thing else: though we do not read that he was buried there, neither do the people here affirm that he was. There is a great heap of stones about it, which is continually increasing; the superstitious Jews and Turks always throwing some as they pass, in token of their abhorrence of Abfalom's unnatural rebellion against so good and holy a parent. The structure itself is about 20 cubits square, and 60 high, rising in a lofty square, adorned below with four columns of the Ionic order, with their capitals, entablatures, &c. to each front. From the height of 20 to 40 cubits, it is somewhat less, and quite plain, excepting a small fillet at the upper end; and from 40 to the top it changes into a round, which grows gradually into a point, the whole cut out of the solid rock. There is a room within, considerably higher than the level of the ground without, on the sides of which are niches, probably to receive coffins. 5. A little eastward of this is that called the *tomb of Zechariah*, the son of Barachiah, whom the Jews slew between the temple and the altar, as is commonly supposed. This fabric is all cut out of the natural rock, 18 feet high, and as many square; and adorned with Ionic columns on each front, cut out likewise of the same rock, and supporting a cornice. The whole ends in a pointed top, like a diamond. But the most curious, grand, and elaborate pieces, in this kind, are the grotts without the walls of Jerusalem, styled the *royal sepulchres*;

but of what kings is not agreed on. They consist of a great number of apartments, some of them spacious, all cut out of the solid marble rock; and may justly be pronounced a royal work, and one of the most noble, surprising, and magnificent. For a particular account of them we must refer the reader, for want of room, to Pococke's Travels. In the neighbourhood of Jerusalem is a spot of ground, about 30 yards long and 15 broad, now the burying-place of the Armenians, which is shewn as the *Aceldama*, or *Field of Blood*, formerly the *Potter's Field*, and since styled *Campo Sancto*, or the *Holy Field*, purchased with the price of Judas's treason, for the burial of strangers. It is walled round, to prevent the Turks abusing the bones of Christians; and one half of it is taken up by a building in the nature of a charnel-house. Besides the above, a great many other antiquities in the city and its environs are shewn to strangers; there being scarce any place or transaction mentioned either in the Old or New Testament, but they shew the very spot of ground where the one stood, and the other was done; not only here, but all over Judæa.

JESI, an ancient town of Italy, in the territory of the church, and in the marca or march of Ancona, with a bishop's see. It is seated on a mountain, near a river of the same name, in E. Long. 12. 20. N. Lat. 43. 50.

JESSO, *Jenso*, or *Tadsjo*, a large island of Asia to the north of Niphon, and said to be governed by a prince tributary to the empire of Japan; but is very little known to the Europeans, so that nothing can be said with certainty concerning it.

JESSES, ribbons that hang down from garlands or crowns in falconry; also short straps of leather fastened to the hawk's legs, and so to the vervels.

JESUITS, or the *Society of Jesus*; a famous religious order of the Romish church, founded by Ignatius Loyola. See IGNATIUS.—The plan which this fanatic formed of its constitution and laws was suggested, as he gave out, and as his followers still teach, by the immediate inspiration of heaven. But notwithstanding this high pretension, his design met at first with violent opposition. The pope, to whom Loyola had applied for the sanction of his authority to confirm the institution, referred his petition to a committee of cardinals. They represented the establishment to be unnecessary as well as dangerous, and Paul refused to grant his approbation of it. At last, Loyola removed all his scruples by an offer which it was impossible for any pope to resist. He proposed, that besides the three vows of poverty, of chastity, and of monastic obedience, which are common to all the orders of regulars, the members of his society should take a fourth vow of obedience to the pope, binding themselves to go whither-soever he should command for the service of religion, and without requiring any thing from the holy see for their support. At a time when the papal authority had received such a shock by the revolt of so many nations from the Romish church; at a time when every part of the popish system was attacked with so much violence and success, the acquisition of a body of men, thus peculiarly devoted to the see of Rome, and whom it might set in opposition to all its enemies, was an object of the highest consequence. Paul instantly perceiving this, confirmed the institution of the Jesuits.

Foundation
of the order.

Confirmed
by the
pope, and
from what
motives.

Jesuits.

Suits by his bull, granted the most ample privileges to the members of the society, and appointed Loyola to be the first general of the order. The event hath fully justified Paul's discernment, in expecting such beneficial consequences to the see of Rome from this institution. In less than half a century, the society obtained establishments in every country that adhered to the Roman-catholic church: its power and wealth increased amazingly; the number of its members became great; their character as well as accomplishments were still greater; and the Jesuits were celebrated by the friends and dreaded by the enemies of the Romish faith as the most able and enterprising order in the church.

The constitution and laws of the society were perfected by Laynez and Aquaviva, the two generals who succeeded Loyola, men far superior to their master in abilities and in the science of government. They framed that system of profound and artful policy which distinguishes the order. The large infusion of fanaticism mingled with its regulation should be imputed to Loyola its founder. Many circumstances concurred in giving a peculiarity of character to the order of Jesuits, and in forming the members of it not only to take greater part in the affairs of the world than any other body of monks, but to acquire superior influence in the conduct of them.

³
The object
of the or-
der singu-
lar.

The primary object of almost all the monastic orders is to separate men from the world, and from any concern in its affairs. In the solitude and silence of the cloister, the monk is called to work out his own salvation by extraordinary acts of mortification and piety. He is dead to the world, and ought not to mingle in its transactions. He can be of no benefit to mankind but by his example and by his prayers. On the contrary, the Jesuits are taught to consider themselves as formed for action. They are chosen soldiers, bound to exert themselves continually in the service of God, and of the pope his vicar on earth. Whatever tends to instruct the ignorant, whatever can be of use to reclaim or to oppose the enemies of the holy see, is their proper object. That they may have full leisure for this active service, they are totally exempted from those functions the performance of which is the chief business of other monks. They appear in no processions; they practise no rigorous austerities; they do not consume one half of their time in the repetition of tedious offices: but they are required to attend to all the transactions of the world, on account of the influence which these may have upon religion; they are directed to study the dispositions of persons in high rank, and to cultivate their friendship; and by the very constitution as well as genius of the order, a spirit of action and intrigue is infused into all its members.

⁴
Peculiar-
ities in its
policy.

As the object of the society of Jesuits differed from that of the other monastic orders, the diversity was no less in the form of its government. The other orders are to be considered as voluntary associations, in which whatever affects the whole body is regulated by the common suffrage of all its members. The executive power is vested in the persons placed at the head of each convent or of the whole society; the legislative authority resides in the community. Affairs of moment, relating to particular convents, are determi-

ned in conventual chapters; such as respect the whole order are considered in general congregations. But Loyola, full of the ideas of implicit obedience, which he had derived from his military profession, appointed that the government of his order should be purely monarchical. A general, chosen for life by deputies from the several provinces, possessed power that was supreme and independent, extending to every person and to every case. He, by his sole authority, nominated provincials, rectors, and every other officer employed in the government of the society, and could remove them at pleasure. In him was vested the sovereign administration of the revenues and funds of the order. Every member belonging to it was at his disposal; and by his uncontrollable mandate he could impose on them any talk, or employ them in what service he pleased. To his commands they were required to yield not only outward obedience, but to resign up to him the inclinations of their own wills and the sentiments of their own understandings. They were to listen to his injunctions as if they had been uttered by Christ himself. Under his direction they were to be mere passive instruments, like clay in the hands of the potter, on like dead carcasses incapable of resistance. Such a singular form of policy could not fail to impress its character on all the members of the order, and to give a peculiar force to all its operations. There is not, in the annals of mankind, any example of such a perfect despotism, exercised not over monks shut up in the cells of a convent, but over men dispersed among all the nations of the earth.

Jesuits.

⁵
Power of
the general

As the constitutions of the order vest in the general such absolute dominion over all its members, they carefully provide for his being perfectly informed with respect to the character and abilities of his subjects. Every novice who offers himself as a candidate for entering into the order, is obliged to manifest his conscience to the superior, or a person appointed by him; and is required to confess not only his sins and defects, but to discover the inclinations, the passions, and the bent of his soul. This manifestation must be renewed every six months. The society, not satisfied with penetrating in this manner into the innermost recesses of the heart, directs each member to observe the words and actions of the novices: they are constituted spies upon their conduct, and are bound to disclose every thing of importance concerning them to the superior. In order that this scrutiny into their character may be as complete as possible, a long novitiate must expire, during which they pass through the several gradations of ranks in the society; and they must have attained the full age of thirty-three years, before they can be admitted to take the final vows, by which they become professed members. By these various methods, the superiors, under whose immediate inspection the novices are placed, acquire a thorough knowledge of their dispositions and talents. In order that the general, who is the soul that animates and moves the whole society, may have under his eye every thing necessary to inform or direct him, the provincials and heads of the several houses are obliged to transmit to him regular and frequent reports concerning the members under their inspection. In these they descend into minute details with respect to the character of each person, his abilities natural or acquired, his temper, his experience

Jesuits. rience in affairs, and the particular department for which he is best fitted. These reports, when digested and arranged, are entered into registers kept of purpose, that the general may, at one comprehensive view, survey the state of the society in every corner of the earth : observe the qualifications and talents of its members ; and thus choose, with perfect information, the instruments which his absolute power can employ in any service for which he thinks meet to define them.

6 As it was the professed intention of the order of Jesuits to labour with unwearied zeal in promoting the salvation of men, this engaged them of course in many active functions. From their first institution, they considered the education of youth as their peculiar province ; they aimed at being spiritual guides and confessors ; they preached frequently in order to instruct the people ; they set out as missionaries to convert unbelieving nations. The novelty of the institution, as well as the singularity of its objects, procured the order many admirers and patrons. The governors of the society had the address to avail themselves of every circumstance in its favour, and in a short time the number as well as influence of its members increased wonderfully. Before the expiration of the sixteenth century, the Jesuits had obtained the chief direction of the education of youth in every catholic country in Europe. They had become the confessors of almost all its monarchs ; a function of no small importance in any reign, but, under a weak prince, superior even to that of minister. They were the spiritual guides of almost every person eminent for rank or power. They possessed the highest degree of confidence and interest with the papal court, as the most zealous and able champions for its authority. The advantages which an active and enterprising body of men might derive from all these circumstances are obvious. They formed the minds of men in their youth. They retained an ascendancy over them in their advanced years. They possessed, at different periods, the direction of the most considerable courts in Europe. They mingled in all affairs. They took part in every intrigue and revolution. The general, by means of the extensive intelligence which he received, could regulate the operations of the order with the most perfect discernment ; and, by means of his absolute power, could carry them on with the utmost vigour and effect.

7 Together with the power of the order, its wealth continued to increase. Various expedients were devised for eluding the obligation of the vow of poverty. The order acquired ample possessions in every catholic country ; and by the number as well as magnificence of its public buildings, together with the value of its property, moveable or real, it vied with the most opulent of the monastic fraternities. Besides the sources of wealth common to all the regular clergy, the Jesuits possessed one which was peculiar to themselves. Under pretext of promoting the success of their missions, and of facilitating the support of their missionaries, they obtained a special licence from the court of Rome to trade with the nations which they laboured to convert. In consequence of this, they engaged in an extensive and lucrative commerce both in the East and West Indies. They opened warehouses in different parts of Europe, in which they vended their com-

modities. Not satisfied with trade alone, they imitated the example of other commercial societies, and aimed at obtaining settlements. They acquired possession accordingly of a large and fertile province in the southern continent of America, and reigned as sovereigns over some hundred thousand subjects.

Unhappily for mankind, the vast influence which the order of Jesuits acquired by all these different means, has been often exerted with the most pernicious effect. Such was the tendency of that discipline observed by the society in forming its members, and such the fundamental maxims in its constitution, that every Jesuit was taught to regard the interest of the order as the capital object to which every consideration was to be sacrificed. This spirit of attachment to their order, the most ardent perhaps that ever influenced any body of men, is the characteristic principle of the Jesuits, and serves as a key to the genius of their policy as well as the peculiarities in their sentiments and conduct.

As it was for the honour and advantage of the society that its members should possess an ascendant over persons in high rank or of great power ; the desire of acquiring and preserving such a direction of their conduct with greater facility, has led the Jesuits to propagate a system of relaxed and pliant morality, which accommodates itself to the passions of men, which justifies their vices, which tolerates their imperfections, which authorises almost every action that the most audacious or crafty politician would wish to perpetrate.

As the prosperity of the order was intimately connected with the preservation of the papal authority, the Jesuits, influenced by the same principle of attachment to the interests of their society, have been the most zealous patrons of those doctrines which tend to exalt ecclesiastical power on the ruins of civil government. They have attributed to the court of Rome a jurisdiction as extensive and absolute as was claimed by the most presumptuous pontiffs in the dark ages. They have contended for the entire independence of ecclesiastics on the civil magistrates. They have published such tenets concerning the duty of opposing princes who were enemies of the catholic faith as countenanced the most atrocious crimes, and tended to dissolve all the ties which connect subjects with their rulers.

As the order derived both reputation and authority from the zeal with which it stood forth in defence of the Romish church against the attacks of the reformers, its members, proud of this distinction, have considered it as their peculiar function to combat the opinions and to check the progress of the Protestants. They have made use of every art, and have employed every weapon against them. They have set themselves in opposition to every gentle or tolerating measure in their favour. They have incessantly stirred up against them all the rage of ecclesiastical and civil persecution.

Monks of other denominations have indeed ventured to teach the same pernicious doctrines, and have held opinions equally inconsistent with the order and happiness of civil society. But they, from reasons which are obvious, have either delivered such opinions with greater reserve, or have propagated them with less success. Whoever recollects the events which have

Jesuits.

9

effects of
these on
civil so-
ciety.]

Jesuits.

happened in Europe during two centuries, will find that the Jesuits may justly be considered as responsible for most of the pernicious effects arising from that corrupt and dangerous casuistry, from those extravagant tenets concerning ecclesiastical power, and from that intolerant spirit, which have been the disgrace of the church of Rome throughout that period, and which have brought so many calamities upon civil society.

9
Some advantages resulting from the institution of this order.

But, amidst many bad consequences flowing from the institution of this order, mankind, it must be acknowledged, have derived from it some considerable advantages. As the Jesuits made the education of youth one of their capital objects, and as their first attempts to establish colleges for the reception of students were violently opposed by the universities in different countries, it became necessary for them, as the most effectual method of acquiring the public favour, to surpass their rivals in science and industry. This prompted them to cultivate the study of ancient literature with extraordinary ardour. This put them upon various methods for facilitating the instruction of youth; and, by the improvements which they made in it, they have contributed so much towards the progress of polite learning, that on this account they have merited well of society. Nor has the order of Jesuits been successful only in teaching the elements of literature; it has produced likewise eminent masters in many branches of science, and can alone boast of a greater number of ingenious authors than all the other religious fraternities taken together.

10
Settlement in Paraguay

But it is in the new world that the Jesuits have exhibited the most wonderful display of their abilities, and have contributed most effectually to the benefit of the human species. The conquerors of that unfortunate quarter of the globe had nothing in view but to plunder, to enslave, and to exterminate its inhabitants. The Jesuits alone have made humanity the object of their settling there. About the beginning of the last century, they obtained admission into the fertile province of Paraguay, which stretches across the southern continent of America, from the bottom of the mountains of Potosi to the confines of the Spanish and Portuguese settlements on the banks of the river de la Plata. They found the inhabitants in a state little different from that which takes place among men when they first begin to unite together; strangers to the arts, subsisting precariously by hunting or fishing, and hardly acquainted with the first principles of subordination and government. The Jesuits set themselves to instruct and to civilize these savages. They taught them to cultivate the ground, to rear tame animals, and to build houses. They brought them to live together in villages. They trained them to arts and manufactures. They made them taste the sweets of society, and accustomed them to the blessings of security and order. These people became the subjects of their benefactors, who have governed them with a tender attention, resembling that with which a father directs his children. Respected and beloved almost to adoration, a few Jesuits presided over some hundred thousand Indians. They maintained a perfect equality among all the members of the community. Each of them was obliged to labour, not for himself alone, but for the public. The produce of their fields, together with the fruits of their industry of every species, were deposited in common storehouses, from which

each individual received every thing necessary for the supply of his wants. By this institution, almost all the passions which disturb the peace of society, and render the members of it unhappy, were extinguished. A few magistrates, chosen by the Indians themselves, watched over the public tranquillity, and secured obedience to the laws. The sanguinary punishments frequent under other governments were unknown. An admonition from a Jesuit, a slight mark of infamy, or, on some singular occasion, a few lashes with a whip, were sufficient to maintain good order among these innocent and happy people.

But, even in this meritorious effort of the Jesuits for the good of mankind, the genius and spirit of their order have mingled and are discernible. They plainly aimed at establishing in Paraguay an independent empire, subject to the society alone, and which, by the superior excellence of its constitution and police, could scarcely have failed to extend its dominion over all the southern continent of America. With this view, in order to prevent the Spaniards or Portuguese in the adjacent settlements from acquiring any dangerous influence over the people within the limits of the province subject to the society, the Jesuits endeavoured to inspire the Indians with hatred and contempt of these nations. They cut off all intercourse between their subjects and the Spanish or Portuguese settlements. They prohibited any private trader of either nation from entering their territories. When they were obliged to admit any person in a public character from the neighbouring governments, they did not permit him to have any conversation with their subjects; and no Indian was allowed even to enter the house where these strangers resided, unless in the presence of a Jesuit. In order to render any communication between them as difficult as possible, they industriously avoided giving the Indians any knowledge of the Spanish or of any other European language; but encouraged the different tribes which they had civilized to acquire a certain dialect of the Indian tongue, and laboured to make that the universal language throughout their dominions. As all these precautions, without military force, would have been insufficient to have rendered their empire secure and permanent, they instructed their subjects in the European arts of war. They formed them into bodies of cavalry and infantry, completely armed and regularly disciplined. They provided a great train of artillery, as well as magazines stored with all the implements of war. Thus they established an army so numerous and well-appointed, as to be formidable in a country where a few sickly and ill-disciplined battalions composed all the military force kept on foot by the Spaniards or Portuguese.

Such were the laws, the policy, and the genius of this formidable order; of which, however, a perfect knowledge has only been attainable of late. Europe had observed, for two centuries, the ambition and power of the order. But while it felt many fatal effects of these, it could not fully discern the causes to which they were to be imputed. It was unacquainted with many of the singular regulations in the political constitution or government of the Jesuits, which formed the enterprising spirit of intrigue that distinguished its members, and elevated the body itself to such a height of power. It was a fundamental maxim with the

Jesuits.

11
Downfall of the order in Europe

the Jesuits, from their first institution, not to publish the rules of their order. These they kept concealed as an impenetrable mystery. They never communicated them to strangers, nor even to the greater part of their own members. They refused to produce them when required by courts of justice; and, by a strange solicitude in policy, the civil power in different countries authorized or connived at the establishment of an order of men, whose constitution and laws were concealed with a solicitude which alone was a good reason for having excluded them. During the persecutions lately carried on against them in Portugal and France, the Jesuits have been so inconsiderate as to produce the mysterious volumes of their institute. By the aid of these authentic records, the principles of their government may be delineated, and the sources of their power investigated with a degree of certainty and precision which, previous to that event, it was impossible to attain.

The pernicious effects, however, of the spirit and constitution of this order, rendered it early obnoxious to some of the principal powers in Europe, and gradually brought on its downfall. The emperor Charles V. saw it expedient to check its progress in his dominions; it was expelled England, by proclamation 2 James I. in 1604; Venice, in 1606; Portugal, in 1759; France, in 1764; Spain and Sicily, in 1767; and totally suppressed and abolished by the late Pope Clement XIV. in 1773.

JESUS the Son of Sirach, a native of Jerusalem, composed, about 200 B. C. the book of Ecclesiasticus, called by the Greeks *ἡσυχαστικός*, "replenished with virtue;" who also quote it under the title of the *Wisdom of Solomon the Son of Sirach*. His grandson, who was also of the same name, and a native of Jerusalem, translated it from the Hebrew into Greek about 121 B. C. We have this Greek version, but the Hebrew text is lost.

JESUS CHRIST, the Son of God, and Saviour of mankind, descended from heaven, and took upon him the human nature in Judæa, towards the conclusion of the reign of Herod the Great, king of that country. The place of his birth was Bethlehem, a flourishing city of Judah; but the year in which he was born is not precisely ascertained. The most general opinion is, that it happened about the year of Rome 748 or 749, and about 18 months before the death of Herod. Four inspired writers have transmitted to us an account of the life of Jesus Christ. They mention particularly his birth, lineage, family, and parents; but say very little concerning his infancy and earlier youth. Herod being informed that the Messiah, or king of the Jews, so much spoken of by the prophets, was now born, being afraid that his kingdom should now be taken away, contrived how to destroy his supposed rival: but Christ, being carried, while very young, into Egypt, escaped the cruelty of the tyrant; who, being determined to make sure work, made a general massacre of the infants about Bethlehem, from the age of two years and under.

After the death of Herod, our Saviour was brought back to Judæa; but we are totally ignorant of what his employment was during the interval between his return thither, and the time of his entering upon the ministry. We know only, that when he was but

12 years of age, he disputed in the temple with the most learned of the Jewish doctors; whom he surprised with his knowledge, and the answers he gave to their questions. After this, as the scripture tells us, he continued with his parents, and was subject to them, till he entered upon his ministry. It is said, indeed, though upon no sure foundation, that during this period he followed the trade of his father, who was a carpenter. In the 30th year of his age, he began his public ministry; to which the attention of the people was drawn by the preaching of John, a prophet miraculously inspired of God to proclaim the existence of the Saviour, as now descended upon earth, and visible to the eyes of all; and by this prophet Christ himself was baptized in the waters of Jordan, that he might not, in any point, neglect to answer the demands of the Jewish law.

It is not necessary here to enter into a particular detail of the life and actions of Jesus Christ. Every one knows, that his life was one continued scene of the most perfect sanctity, and the purest and most active virtue; not only without spot, but also beyond the reach of suspicion. And it is also well known, that by miracles of the most stupendous kind, and not more stupendous than salutary and beneficent, he displayed to the universe the truth of that religion which he brought with him from above, and demonstrated the reality of his divine commission in the most illustrious manner. For the propagation of his religion through the country of Judæa, our Saviour chose 12 apostles; whom, however, he sent out only once, and after their return kept them constantly about his person. But, besides these, he chose other 70, whom he dispersed throughout the country.

There have been many conjectures concerning the reason why the number of apostles was fixed at 12, and that of the other teachers at 70. The first, however, was, according to our Saviour's own words (Matt. xix. 28.), an allusion to the 12 tribes of Israel, thereby intimating that he was the king of these 12 tribes; and as the number of his other messengers answers evidently to that of the senators who composed the Sanhedrim, there is a high degree of probability in the conjecture of those who think that Christ by this number designed to admonish the Jews, that the authority of their Sanhedrim was now at an end, and that all power with respect to religious matters was vested in him alone. His ministry, however, was confined to the Jews; nor, while he remained upon earth, did he permit his apostles or disciples to extend their labours beyond this favoured nation. At the same time, if we consider the illustrious acts of mercy and benevolence that were performed by Christ, it will be natural to conclude, that his fame must soon have spread abroad in other countries. Indeed this seems probable from a passage in scripture, where we are told that some Greeks applied to the apostle Philip in order to see Jesus. We learn also from authors of no small note, that Abgarus† king of Edessa, being seized with a severe and dangerous illness, wrote to our Lord, imploring his assistance; and that Jesus not only sent him a gracious answer, but also accompanied it with his picture, as a mark of his esteem for that pious prince. These letters are still extant; but by the judicious part of mankind are universally looked upon

† See Abgarus.

Jesús,
Jet.Jet
Jewel.

as spurious; and indeed the late Mr Jones, in his treatise entitled *A new and full method of settling the canonical authority of the New Testament*, hath offered reasons which seem almost unanswerable against the authenticity of the whole transaction.

The preaching of our Saviour, and the numberless miracles he performed, made such an impression on the body of the Jewish nation, that the chief-priests and leading men, jealous of his authority, and provoked at his reproaching them with their wicked lives, formed a conspiracy against him. For a considerable time their designs proved abortive; but at last, Jesus, knowing that he had fulfilled every purpose for which he came into the world, suffered himself to be taken through the treachery of one of his disciples, named *Judas Iscariot*, and was brought before the Sanhedrim. In this assembly he was accused of blasphemy; and being afterwards brought before Pilate the Roman governor, where he was accused of sedition, Pilate was no sooner sat down to judge in this cause, than he received a message from his wife, desiring him to have nothing to do with the affair, having that very day had a frightful dream on account of our Saviour, whom she called *that just man*. The governor, intimidated by this message, and still more by the majesty of our Saviour himself, and the evident falsehood of the accusations brought against him, was determined if possible to save him. But the clamours of an enraged populace, who at last threatened to accuse Pilate himself as a traitor to the Roman emperor, got the better of his love of justice, which indeed on other occasions was not very fervent.

Our Saviour was now condemned by his judge, though contrary to the plainest dictates of reason and justice; was executed on a cross between two thieves, and very soon expired. Having continued three days in a state of death, he rose from the dead, and made himself visible to his disciples as formerly. He conversed with them 40 days after his resurrection, and employed himself during that time in instructing them more fully concerning the nature of his kingdom; and having manifested the certainty of his resurrection to as many witnesses as he thought proper, he was, in the presence of many of his disciples, taken up into heaven, there to remain till the end of the world. See *CHRISTIANITY*.

JET, in natural history, a kind of fossil substance, the characters of which are these.—It is a solid, dry, opaque, inflammable body, found in large detached masses of a fine and regular structure, having a grain like that of wood, splitting more easily in an horizontal than in any other direction; very light, and moderately hard; not fusible, but readily inflammable, and burning a long time with a fine greenish white flame.

Jet is a substance concerning which many erroneous opinions have been entertained, and which hath been very little understood, even in Britain, where the finest in the world is produced; having been usually confounded with a thing greatly inferior to it in value, the common cannel-coal; so that many believe there is no other jet than that substance: they are, however, easily distinguished from each other by the following characters.—Jet is always found in detached masses lodged in other strata; but cannel-coal constitutes

whole strata of itself. Jet has the grain of wood, and splits horizontally with much greater ease than in any other direction; cannel-coal has no particular direction, and splits any way with equal ease. Jet is but moderately hard; cannel-coal not less so than many stones: jet, when set on fire, flames a long time; cannel-coal but a little while.—Jet is found in Italy, Germany, and the East Indies; but nowhere in such plenty as in England. It is very common in Yorkshire and the other northern counties, and is found in many of the clay-pits about London. By the ancients it was used in medicine, and celebrated as an emollient and discutient; but the modern practice takes no notice of it.

JET-d'Eau, a French term, frequently also used with us, for a fountain that casts up water to a considerable height in the air. See *HYDROSTATICS*, n° 22.; and *ICELAND*, n° 7, 8.

JETTY-HEAD, a name usually given, in the royal dock-yards, to that part of a wharf which projects beyond the rest; but more particularly the front of a wharf, whose side forms one of the cheeks of a dry or wet dock.

JEWEL, any precious stone, or ornament beset with them. See *DIAMOND*, *RUBY*, &c.

JEWEL (John), a learned English writer and bishop, was born in 1522, and educated at Oxford. In 1540 he proceeded A. B. became a noted tutor, and was soon after chosen rhetoric lecturer in his college. In February 1544, he commenced A. M. He had early imbibed Protestant principles, and inculcated the same to his pupils; but this was carried on privately till the accession of king Edward VI. in 1546, when he made a public declaration of his faith, and entered into a close friendship with Peter Martyr, who was made professor of divinity at Oxford. In 1550, he took the degree of B. D. and frequently preached before the university with great applause. At the same time he preached and catechised every other Sunday at Sunningwell in Berkshire, of which church he was rector. Upon the accession of queen Mary to the crown in 1553, he was one of the first who felt the rage of the storm then raised against the reformation; for before any law was made, or order given by the queen, he was expelled Corpus Christi college by the fellows, by their own private authority; but he continued in Oxford, till he was called upon to subscribe to some of the Popish doctrines under the severest penalties, which he submitted to. However, this did not procure his safety; for he was obliged to fly, and, after encountering many difficulties, arrived at Frankfurt, in the 2d year of queen Mary's reign, where he made a public recantation of his subscription to the Popish doctrines. Thence he went to Strasbourg, and afterwards to Zurich, where he attended Peter Martyr, in whose house he resided. He returned to England in 1558, after queen Mary's death; and, in 1559, was consecrated bishop of Salisbury. This promotion was given him as a reward for his great merit and learning; and another attestation of these was given him by the university of Oxford, who, in 1565, conferred on him in his absence the degree of D. D. In this character he attended the queen to Oxford the following year, and presided at the divinity-disputations held before her majesty on that occasion. He had

had before greatly distinguished himself by a sermon preached at St Paul's-cross, presently after he was made a bishop, wherein he gave a public challenge to all the Roman-catholics in the world, to produce but one clear and evident testimony out of any father or famous writer, who flourished within 600 years after Christ, for any one of the articles which the Romanists maintain against the church of England; and, two years afterwards, he published his famous apology for this church. In the mean time, he gave a particular attention to his diocese; where he began in his first visitation, and perfected in his last, such a reformation, not only in his cathedral and parochial churches, but in all the churches of his jurisdiction, as procured him and the whole order of bishops due reverence and esteem. For he was a careful overlooker and strict observer, not only of all the flocks, but also of the pastors, in his diocese: and he watched so narrowly upon the proceedings of his chancellor and archdeacons, and of his stewards and receivers, that they had no opportunities of being guilty of oppression, injustice, or extortion, nor of being a burthen to the people, or a scandal to himself. To prevent these and the like abuses, for which the ecclesiastical courts are often too justly censured, he sat often in his consistory-court, and saw that all things were carried rightly there: he also sat often as assitant on the bench of civil justice, being himself a justice of the peace. Amidst these employments, however, the care of his health was too much neglected; to which, indeed, his general course of life was totally unfavourable. He rose at four o'clock in the morning; and, after prayers with his family at five, and in the cathedral about six, he was so fixed to his studies all the morning, that he could not without great violence be drawn from them. After dinner, his doors and ears were open to all suitors; and it was observed of him as of Titus, that he never sent any sad from him. Suitors being thus dismissed, he heard, with great impartiality and patience, such causes debated before him, as either devolved to him as a judge, or were referred to him as an arbitrator; and if he could spare any time from these, he reckoned it as clear gain to his study. About nine at night he called all his servants to an account how they had spent the day, and then went to prayers with them. From the chapel he withdrew again to his study till near midnight, and from thence to his bed; in which when he was laid, the gentleman of his bed-chamber read to him till he fell asleep. This watchful and laborious life, without any recreation at all, except what his necessary refreshment at meals and a very few hours of rest afforded him, wasted his life too fast. He died at Monkton-Farley, in 1571, in the 50th year of his age. He wrote, 1. A view of a seditious bull sent into England by pope Pius V. in 1569. 2. A treatise on the Holy Scriptures. 3. An exposition of St Paul's two epistles to the Thessalonians. 4. A treatise on the sacrament. 5. An apology for the national church. 6. Several sermons, controversial treatises, and other works.

“This excellent prelate (says the rev. Mr Granger) was one of the greatest champions of the reformed religion, as he was to the church of England what Bellarmine was to that of Rome. His admirable Apology was translated from the Latin by Anne, the

second of the four learned daughters of Sir Anthony Coke, and mother of Sir Francis Bacon. It was published, as it came from her pen, in 1564, with the approbation of the queen and the prelates. The same Apology was printed in Greek at Constantinople, under the direction of St Cyril the patriarch. His Defence of his Apology, against Harding and other Popish divines, was in such esteem, that queen Elizabeth, king James I. king Charles I. and four successive archbishops, ordered it to be kept chained in all parish churches for public use.

JEWEL-Blocks, in the sea-language, a name given to two small blocks which are suspended at the extremity of the main and fore-top-mast yards, by means of an eye-bolt driven from without into the middle of the yard-arm, parallel to its axis. The use of these blocks is, to retain the upper-part of the top-mast studding-sails beyond the skirts of the top-sails, so that each of those sails may have its full force of action, which would be diminished by the encroachment of the other over its surface. The *balliards*, by which those studding-sails are hoisted, are accordingly passed through the jewel-blocks; whence, communicating with a block on the top-mast head, they lead downwards to the top or decks, where they may be conveniently hoisted. See **SAIL**.

JEWS, a name derived from the patriarch Judah, and given to the descendants of Abraham by his eldest son Isaac, who for a long time possessed the land of Palestine in Asia, and are now dispersed through all nations in the world.

The history of this people, as it is the most singular, so is it also the most ancient in the world; and the greatest part being before the beginning of profane history, depends entirely on the authenticity of the Old Testament, where it is only to be found.—To repeat here what is said in the sacred writings would both be superfluous and tedious, as those writings are in every persons hands, and may be consulted at pleasure. It seems most proper therefore to commence the history of the Jews from their return to Jerusalem from Babylon, and the rebuilding of their city and temple under Ezra and Nehemiah, when the scripture leaves off any farther accounts, and profane historians begin to take notice of them.

Cyrus the Great, king of Persia, having conquered Babylon and almost all the western parts of Asia, perceiving the desolate and ruinous condition in which the province of Palestine lay, formed a design of restoring the Jews to their native country, and permitting them to rebuild Jerusalem and re-establish their worship. For this purpose he issued out a decree in the first year of his reign, about 536 B. C. by which they were allowed not only to return and rebuild their city, but to carry along with them all the sacred vessels which Nebuchadnezzar had carried off, and engaged to defray the expence of building the temple himself. This offer was gladly embraced by the more zealous Jews of the tribes of Judah, Benjamin, and Levi; but many more, being no doubt less sanguine about their religion, chose to stay where they were.

In 534 B. C. the foundations of the temple were laid, and matters seemed to go on prosperously, when the undertaking was suddenly obstructed by the Samaritans. These came at first expressing an earnest desire

Cyrus publishes a decree for rebuilding Jerusalem.

Jews.

desire to assist in the work, as they worshipped the same God with the Jews; but the latter refused their assistance, as they knew they were not true Israelites, but the descendants of those heathens who had been transplanted into the country of the ten tribes after their captivity by Shalmanezar. This refusal proved the source of all that bitter enmity which afterwards took place between the Jews and Samaritans; and the immediate consequence was, that the latter made all the opposition in their power to the going on of the work. At last, however, all obstacles were surmounted, and the temple finished as related in the books of Ezra and Nehemiah. The last of these chiefs died about 409 B. C. after having restored the Jewish worship to its original purity, and reformed a number of abuses which took place immediately on its commencement.

2
The temple
&c. finished

But though the Jews were now restored to the free exercise of religion, they were neither a free nor a powerful people as they had formerly been. They were few in number, and their country only a province of Syria, subject to the kings of Persia. The Syrian governors conferred the administration of affairs upon the high-priests; and their accepting this office, and thus deviating from the law of Moses, must be considered as one of the chief causes of the misfortunes which immediately befel the people, because it made room for a set of men who aspired at this high office merely through ambition or avarice, without either zeal for religion, or love for their country. It besides made the high-priethood capable of being disposed of at the pleasure of the governors, whereas the Mosaic institution had fixed it unalienably in the family of Aaron.—Of the bad effects of this practice a fatal instance happened in 373 B. C. Bagoses, governor of Syria, having contracted an intimate friendship with Jeshua the brother of Johanan the high-priest, promised to raise him to the pontifical office a few years after his brother had been invested with it. Jeshua came immediately to Jerusalem, and acquainted his brother with it. Their interview happened in the inner court of the temple; and a scuffle ensuing, Jeshua was killed by his brother, and the temple thus polluted in the most scandalous manner. The consequence to the Jews was, that a heavy fine was laid on the temple, which was not taken off till seven years after.

3
Admini-
stration of
affairs con-
ferred on
the high-
priests.

The first public calamity which befel the Jews nation after their restoration from Babylon, happened in the year 351 B. C.; for having some how or other disobliterated Darius Ochus king of Persia, he besieged and took Jericho, and carried off all the inhabitants captives. From this time they continued faithful to the Persians, inasmuch that they had almost drawn upon themselves the displeasure of Alexander the Great. That monarch having resolved upon the siege of Tyre, and being informed that the city was wholly supplied with provisions from Judea, Samaria, and Galilee, sent to Jaddua, then high-priest, to demand of him that supply which he had been accustomed to pay to the Persians. The Jewish pontiff excused himself on account of his oath of fidelity to Darius; which so provoked Alexander, that he had no sooner completed the reduction of Tyre than he marched against Jerusalem. The inhabitants then, being with good rea-

son thrown into the utmost consternation, had recourse to prayers; and Jaddua is said, by a divine revelation to have been commanded to go and meet Alexander. He obeyed accordingly, and set out on his journey, dressed in his pontifical robes, at the head of all his priests in their proper habits, and attended by the rest of the people dressed in white garments. Alexander is said to have been seized with such awful respect on seeing this venerable procession, that he embraced the high-priest, and paid a kind of religious adoration to the name of God engraven on the front of his mitre. His followers being surprised at this unexpected behaviour, the Macedonian monarch informed them, that he paid that respect not to the priest, but to his God, as an acknowledgment for a vision which he had been favoured with at Dia; where he had been promised the conquest of Persia, and encouraged in his expedition by a person of much the same aspect and dressed in the same habit with the pontiff before him. He afterwards accompanied Jaddua into Jerusalem, where he offered sacrifices in the temple. The high-priest shewed him also the prophecies of Daniel, wherein the destruction of the Persian empire by himself is plainly set forth; in consequence of which the king went away highly satisfied, and at his departure asked the high-priest if there was nothing in which he could gratify himself or his people. Jaddua then told him, that, according to the Mosaic law, they neither sowed nor ploughed on the seventh year; therefore would esteem it an high favour if the king would be pleased to remit their tribute in that year. To this request the king readily yielded; and having confirmed them in the enjoyment of all their privileges, particularly that of living under their own laws, he departed.

Whether this story deserves credit or not (for the whole transaction is not without reason called in question by some), it is certain that the Jews were much favoured by Alexander; but with him their good fortune seemed also to expire. The country of Judea being situated between Syria and Egypt, became subject to all the revolutions and wars which the ambitious successors of Alexander waged against each other.

5
Miserable
state of the
Jews after
Alexander's
death.

At first it was given, together with Syria and Phenicia, to Leomedon the Mitylenian one of Alexander's generals; but he being soon after stripped of the other two by Ptolemy, Judea was next summoned to yield to the conqueror. The Jews scrupled to break their oath of fidelity to Leomedon; and were of consequence invaded by Ptolemy at the head of a powerful army. The open country was easily reduced; but the city being strongly fortified both by art and nature, threatened a strong resistance. A superstitious fear of breaking the sabbath, however, prevented the besieged from making any defence on that day; of which Ptolemy being informed, he caused an assault to be made on the sabbath, and easily carried the place. At first he treated them with great severity, and carried 100,000 men of them into captivity; but reflecting soon after on their known fidelity to their conquerors, he restored them to all the privileges they had enjoyed under the Macedonians. Of the captives he put some into garrisons, and others he settled in the countries of Libya and Cyrene. From those who settled in the latter of these countries descended

Jews. fceded the Cyrenean Jews mentioned by the writers of the New Testament.

Five years after Ptolemy had subdued Judea, he was forced to yield it to Antigonus, referring to himself only the cities of Ace, Samaria, Joppa, and Gaza; and carrying off an immense booty, together with a great number of captives, whom he settled at Alexandria and endowed with considerable privileges and immunities.—Antigonus behaved in such a tyrannical manner, that great numbers of his Jewish subjects fled into Egypt, and others put themselves under the protection of Seleucus, who also granted them considerable privileges. Hence this nation came gradually to be spread over Syria, and Asia Minor; while Judea seemed to be in danger of being depopulated, till it was recovered by Ptolemy in 92. The affairs of the Jews then took a more prosperous turn, and continued in a thriving way till the reign of Ptolemy Philopator, when they were grievously oppressed by the incursions of the Samaritans, at the same time that Antiochus Theos, king of Syria, invaded Galilee. Ptolemy, however, marched against Antiochus, and defeated him; after which, having gone to Jerusalem to offer sacrifices, he ventured to profane the temple itself by going into it. He penetrated thro' the two outer courts; but as he was about to enter the sanctuary, he was struck with such dread and terror that he fell down half-dead. A dreadful persecution was then raised against the Jews, who had attempted to hinder him in his impious attempt; but this persecution was stopped by a still more extraordinary accident related under the article ΕΥΡΥ, n° 30. and the Jews again received into favour.

⁶ About the year 204 B. C. the country of Judea was subdued by Antiochus the Great; and on this occasion the loyalty of the Jews to the Egyptians failed them, the whole nation readily submitting to the king of Syria. This attachment pleased the Syrian monarch, that he sent a letter to his general, wherein he acquainted him that he designed to restore Jerusalem to its ancient splendor, and to recall all the Jews that had been driven out of it: that out of his singular respect to the temple of God, he granted them 20,000 pieces of silver, towards the charges of the victims, frankincense, wine, and oil; 1400 measures of fine wheat; and 375 measures of salt, towards their usual oblations: that the temple should be thoroughly repaired at his cost; that they should enjoy the free exercise of their religion; and restore the public service of the temple, and the priests, Levites, singers, &c. to their usual functions: that no stranger, or Jew that was unpurified, should enter farther into the temple than was allowed by their law; and that no flesh of unclean beasts should be brought into Jerusalem, not even their skins: and all these under the penalty of paying 3000 pieces of silver into the treasury of the temple. He further granted an exemption of taxes for three years to all the dispersed Jews that should come within a limited time to settle in the metropolis; and that all who had been sold for slaves within his dominions should be immediately set free.

⁷ This sudden prosperity proved of no long duration. About the year 176, a quarrel happened between Onias at that time high priest, and one Simon, governor of the temple, which was attended with the most

fatal consequences. The causes of this quarrel are unknown. The event, however, was, that Simon finding he could not get the better of Onias, informed Apollonius governor of Cœlosyria and Palestine, that there was at that time in the temple an immense treasure, which at his pleasure might be seized upon for the use of the king of Syria. Of this the governor instantly sent intelligence to the king, who dispatched one Heliodorus to take possession of the supposed treasure. This person, through a miraculous interposition, as the Jews pretend, failed in his attempt of entering the temple; upon which Simon accused the high-priest to the people, as the person who had invited Heliodorus to Jerusalem. This produced a kind of civil war, in which many fell on both sides. At last Onias having complained to the king, Simon was banished; but soon after, Antiochus Epiphanes having ascended the throne of Syria, Jason, the high-priest's brother, taking advantage of the necessities of Antiochus, purchased from him the high-priesthood at the price of 350 talents, and obtained an order that his brother should be sent to Antioch, there to be confined for life.

Jason's next step was to purchase liberty, at the price of 150 talents more, to build a gymnasium at Jerusalem similar to those which were used in the Grecian cities; and to make as many Jews as he pleased free citizens of Antioch. By means of these powers he became very soon able to form a strong party in Judea; for his countrymen were exceedingly fond of the Grecian customs, and the freedom of the city of Antioch was a very valuable privilege. From this time there arose a general apostasy took place; the service of the temple was neglected, and Jason abandoned himself without remorse to all the impieties and absurdities of paganism.

⁸ A general apostasy takes place.

He did not, however, long enjoy his ill-acquired dignity. Having sent his brother Menelaus with the usual tribute to Antiochus, the former took the opportunity of supplanting Jason in the same manner that he had supplanted Onias. Having offered for the high-priesthood 300 talents more than his brother had given, he easily obtained it, and returned with his new commission to Jerusalem. He soon got himself a strong party; but Jason proving too powerful, forced Menelaus and his adherents to retire to Antioch. Here, the better to gain their point, they acquainted Antiochus that they were determined to renounce their old religion, and wholly conform themselves to that of the Greeks: which so pleased the tyrant, that he immediately gave them a force sufficient to drive Jason out of Jerusalem; who thereupon took refuge among the Ammonites.

Menelaus being thus freed from his rival, took care to fulfil his promise to the king with regard to the apostasy, but forgot to pay the money he had promised. At last he was summoned to Antioch; and finding nothing but the payment of the promised sum would do, sent orders to his brother Lyfimachus to convey to him as many of the sacred utensils belonging to the temple as could be spared. As these were all of gold, the apostate sum raised a sufficient sum from them, not only to satisfy the king, but also to bribe the courtiers in his favour. But his brother Onias, who had been all this time confined at Antioch, getting intelligence of the sacrilege, made such bitter complaints, that an insurrection

Jews.

Jews.

urrection was ready to take place among the Jews at Antioch. Menelaus, in order to avoid the impending danger, bribed Andronicus, governor of the city, to murder Onias. This produced the most vehement complaints as soon as Antiochus returned to the capital, (he having been absent for some time in order to quell an insurrection in Cilicia); which at last ended in the death of Andronicus, who was executed by the king's order. By dint of money, however, Menelaus still found means to keep up his credit; but was obliged to draw such large sums from Jerusalem, that the inhabitants at last massacred his brother Lyfimachus, whom he had left governor of the city in his absence. Antiochus soon after took a journey to Tyre; upon which the Jews sent deputies to him, both to justify the death of Lyfimachus, and to accuse Menelaus of being the author of all the troubles which had happened. The apostate, however, was never at a loss while he could procure money. By means of this powerful argument he pleaded his cause so effectually, that the deputies were not only cast, but put to death; and this unjust sentence gave the traitor such a complete victory over all his enemies, that from thenceforth he commenced a downright tyrant. Jerusalem was destitute of protectors; and the sanhedrim, if there were any zealous men left among them, were so much terrified, that they durst not oppose him, though they evidently saw that his design was finally to eradicate the religion and liberties of his country.

In the mean time, Antiochus was taken up with the conquest of Egypt, and a report was some how or other spread that he had been killed at the siege of Alexandria. At this news the Jews imprudently shewed some signs of joy; and Jason thinking this a proper opportunity to regain his lost dignity, appeared before Jerusalem at the head of about 1000 resolute men. The gates were quickly opened to him by some of his friends in the city; upon which Menelaus retired into the citadel, and Jason, minding nothing but his resentment, committed the most horrid butcheries. At last he was obliged to leave both the city and country, on the news that Antiochus was coming with a powerful army against him; for that prince, highly provoked at this rebellion, and especially at the rejoicings the Jews had made on the report of his death, had actually resolved to punish the city in the severest manner. Accordingly, about 170 B. C. having made himself master of the city, he behaved with such cruelty, that within three days they reckoned no fewer than 40,000 killed, and as many sold for slaves. In the midst of this dreadful calamity, the apostate Menelaus found means not only to preserve himself from the general slaughter, but even to regain the good graces of the king, who, having by his means plundered the temple of every thing valuable, returned to Antioch in a kind of triumph. Before he departed, however, he put Judea under the government of one Philip, a barbarous Phrygian; Samaria under that of Andronicus, a person of a similar disposition; and left Menelaus, the most hateful of all the three, in possession of the high-priesthood.

Though the Jews suffered exceedingly under these tyrannical governors, they were still reserved for greater calamities. About 168 B. C. Antiochus having been most severely mortified by the Romans, took it into

his head to wreck his vengeance on the unhappy Jews. For this purpose he dispatched Apollonius at the head of 22,000 men, with orders to plunder all the cities of Judea, to murder all the men, and sell the women and children for slaves. Apollonius accordingly came with his army, and to outward appearance with a peaceable intention; neither was he suspected by the Jews, as he was superintendent of the tribute in Palestine. He kept himself inactive till the next sabbath, when they were all in a profound quiet; and then, on a sudden, commanded his men to arms. Some of them he sent to the temple and synagogues, with orders to cut in pieces all whom they found there; whilst the rest going through the streets of the city massacred all that came in their way; the superstitious Jews not attempting to make the least resistance for fear of breaking the Sabbath. He next ordered the city to be plundered and set on fire, pulled down all their stately buildings, caused the walls to be demolished, and carried away captive about 10,000 of those who had escaped the slaughter. From that time the service of the temple was totally abandoned; that place having been quite polluted, both with the blood of multitudes who had been killed, and in various other ways. The Syrian troops built a large fortress on an eminence in the city of David; fortified it with a strong wall and stately towers, and put a garrison in it to command the temple over-against which it was built, so that the soldiers could easily see and fallily out upon all those who attempted to come into the temple; so many of whom were continually plundered and murdered by them, that the rest, not daring to stay any longer in Jerusalem, fled for refuge to the neighbouring nations.

Antiochus, not yet satiated with the blood of the Jews, resolved either totally to abolish their religion, or destroy their whole race. He therefore issued out a decree that all nations within his dominions should forsake their old religion and gods, and worship those of the king under the most severe penalties. To make his orders more effectual, he sent overseers into every province to see them strictly put in execution; and as he knew the Jews were the only people who would disobey them, special directions were given to have them treated with the utmost severity. Athens, an old and cruel minister, well versed in all the pagan rites, was sent into Judea. He began by dedicating the temple to Jupiter Olympius, and setting up his statue on the altar of burnt-offerings. Another lesser altar was raised before it, on which they offered sacrifices to that false deity. All who refused to come and worship this idol were either massacred, or put to some cruel tortures till they either complied or expired under the hands of the executioners. At the same time, altars, groves, and statues, were raised every where through the country, and the inhabitants compelled to worship them under the same severe penalties; while it was instant death to observe the sabbath, circumcision, or any other institution of Moses.

At last, when vast numbers had been put to cruel deaths, and many more had saved their lives by their apostasy, an eminent priest, named *Mattathias*, began to signalize himself by his bravery and zeal for religion. He had for some time been obliged to retire to Modin his native place, in order to avoid the persecution which raged at Jerusalem. During his recess

27 The temple profaned, and the Jewish religion abolished.

9 Jerusalem taken by Epiphanes.

10 His monstrous cruelty.

22 Restored by Mattathias.

there, Apelles, one of the king's officers, came to oblige the inhabitants to comply with the abovementioned orders. By him Mattathias and his sons were addressed in the most earnest manner, and had the most ample promises made them of the king's favour and protection if they would renounce their religion. But Mattathias answered, that though the whole Jewish nation, and the whole world, were to conform to the king's edict, yet both he and his sons would continue faithful to their God to the last minute of their lives. At the same time perceiving one of his countrymen just going to offer sacrifices to an idol, he fell upon him and instantly killed him, agreeable to the law of Moses in such cases. Upon this his sons, fired with the same zeal, killed the officer and his men; overthrew the altar and idol; and, running about the city, cried out, that those who were zealous for the law of God should follow them; by which means they quickly saw themselves at the head of a numerous troop, with whom they soon after withdrew into some of the deserts of Judea. They were followed by many others, so that in a short time they found themselves in a condition to resist their enemies; and having considered the danger to which they were exposed by their scrupulous observance of the Sabbath, they resolved to defend themselves, in case of an attack, upon that day as well as upon any other.

In the year 167 B. C. Mattathias finding that his followers daily increased in number, began to try his strength by attacking the Syrians and apostate Jews. As many of these as he took he put to death, but forced a much greater number to fly for refuge into foreign countries; and having soon struck his enemies with terror, he marched from city to city, overturned the idolatrous altars, opened the Jewish synagogues, made a diligent search after all the sacred books, and caused fresh copies of them to be written; he also caused the reading of the Scriptures to be resumed, and all the males born since the persecution to be circumcised. In all this he was attended with such success, that he had extended his reformation through a considerable part of Judea within the space of one year; and would probably have completed it, had he not been prevented by death.

Mattathias was succeeded by his son Judas, surnamed *Maccabeus*, the greatest uninspired hero of whom the Jews can boast. His troops amounted to no more than 6000 men; yet with these he quickly made himself master of some of the strongest fortresses of Judea, and became terrible to the Syrians, Samaritans, and apostate Jews. In one year he defeated the Syrians in five pitched battles, and drove them quite out of the country; after which he purified the temple, and restored the true worship, which had been interrupted for three years and a half. Only one obstacle now remained, viz. the Syrian garrison abovementioned, which had been placed over-against the temple, and which Judas could not at present reduce. In order to prevent them from interrupting the worship, however, he fortified the mountain on which the temple stood, with an high wall and strong towers round about, leaving a garrison to defend it; making some additional fortifications at the same time to Bethzura, a fortress at about 20 miles distance.

In the mean time Antiochus being on his return from an unsuccessful expedition into Persia, received

the disagreeable news that the Jews had all to a man revolted, defeated his generals, driven their armies out of Judea, and restored their ancient worship. This threw him into such a fury, that he commanded his charioteer to drive with the utmost speed, threatening utterly to extirpate the Jewish race, without leaving a single person alive. These words were scarce uttered, when he was seized with a violent pain in his bowels, which no remedy could cure or abate. But notwithstanding this violent shock, suffering himself to be hurried away by the transports of his fury, he gave orders for proceeding with the same precipitation in his journey. But while he was thus hastening forward, he fell from his chariot, and was so bruised by the fall, that his attendants were forced to put him into a litter. Not being able to bear even the motion of the litter, he was forced to halt at a town called *Tabe* on the confines of Persia and Babylonia. Here he kept his bed, suffering inexpressible torments, occasioned chiefly by the vermin which bred in his body, and the itech, which made him insupportable even to himself. But the torments of his mind, caused by his reflecting on the former actions of his life, surpassed by many degrees those of his body. Polybius, who in his account of this prince's death agrees with the Jewish historians, tells us, that the uneasiness of his mind grew at last to a constant delirium or state of madness, by reason of several spectres and apparitions of evil geni or spirits, which he imagined were continually reproaching him with the many wicked actions of which he had been guilty. At last, having languished for some time in this miserable condition, he expired, and by his death freed the Jews from the most inveterate enemy they had ever known.

Notwithstanding the death of Antiochus, however, the war was still carried on against the Jews; but through the valour and good conduct of Judas, the Syrians were constantly defeated, and in 163 B. C. a peace was concluded upon terms very advantageous to the Jewish nation. This tranquillity, however, was of no long continuance; the Syrian generals renewed their hostilities, and were attended with the same ill success as before. Judas defeated them in five engagements; but in the sixth was abandoned by all his men except 800, who, together with their chief, were slain in the year 161 B. C.

The news of the death of Judas threw his countrymen into the utmost consternation, and seemed to give new life to all their enemies. He was succeeded, however, by his brother Jonathan; who conducted matters with no less prudence and success than Judas had done, till he was treacherously seized and put to death by Tryphon, a Syrian usurper, who shortly after murdered his own sovereign. The traitor immediately prepared to invade Judea; but found all his projects frustrated by Simon, Jonathan's brother. This pontiff repaired all the fortresses of Judea, and furnished them with fresh garrisons, took Joppa and Gaza, and drove out the Syrian garrison from the fortress of Jerusalem; but was at last treacherously murdered by a son-in-law named Ptolemy, about 135 B. C.

Simon was succeeded by son Hyrcan; who not only shook off the yoke of Syria, but conquered the Samaritans, demolished their capital city, and became master of all Palestine, to which he added the provinces

of Samaria and Galilee; all which he enjoyed till within a year of his death, without the least disturbance from without, or any interval discord. His reign was no less remarkable on the account of his great wisdom and piety at home, than his conquests abroad. He was the first since the captivity who had assumed the royal title; and he raised the Jewish nation to a greater degree of splendor than it had ever enjoyed since that time. The author of the fourth book of the Maccabees also informs us, that in him three dignities were centered which never met in any other person, namely, the royal dignity, the high-priesthood, and the gift of prophecy. But the instances given of this last are very equivocal and suspicious. The last year of his reign, however, was embittered by a quarrel with the pharisees; and which proceeded such a length as was thought to have shortened his days. Hyrcan had always been a great friend to that sect, and they had hitherto enjoyed the most honourable employments in the state; but at length one of them, named *Eleazar*, took it into his head to question Hyrcan's legitimacy, alleging, that his mother had formerly been a slave, and consequently that he was incapable of enjoying the high-priesthood. This report was credited, or pretended to be so, by the whole sect; which irritated the high-priest to such a degree, that he joined the sadducees, and could never afterwards be reconciled to the pharisees, who therefore raised all the troubles and seditions they could during the short time he lived.

Hyrcan died in 107 B. C. and was succeeded by his eldest son Aristobolus, who conquered Iturea, but proved a most cruel and barbarous tyrant, polluting his hands with the blood even of his mother and one of his brothers, keeping the rest closely confined during his reign, which, however, was but short. He was succeeded in 105 by Alexander Jannæus, the greatest conqueror, next to king David, that ever sat on the Jewish throne. He was hated, however, by the pharisees, and once in danger of being killed in a tumult excited by them; but having caused his guards to fall upon the mutinous mob, they killed 6000 of them, and dispersed the rest. After this, finding it impossible to remain in quiet in his own kingdom, he left Jerusalem, with a design to apply himself wholly to the extending of his conquests; but while he was busied in subduing his foreign enemies, the pharisees raised a rebellion at home. This was quashed in the year 86 B. C. and the rebels were treated in the most inhuman manner. The faction, however, was by this means so thoroughly quelled, that they never dared to lift up their heads as long as he lived; and Alexander having made several conquests in Syria, died about 79 B. C.

The king left two sons, Hyrcanus and Aristobolus; but bequeathed the government to his wife Alexandra as long as she lived: but as he saw her greatly afraid, and not without reason, of the resentment of the pharisees, he desired his queen, just before his death, to send for the principal leaders of that party, and pretend to be entirely devoted to them; in which case, he assured her, that they would support her and her sons after her in the peaceable possession of the government. With this advice the queen complied; but found herself much embarrassed by the turbulent pharisees, who, after several exorbitant demands, would at last be contented with nothing less than the total

extermination of their adversaries the sadducees. As the queen was unable to resist the strength of the pharisaic faction, a most cruel persecution immediately took place against the sadducees, which continued for four years; until at last, upon their earnest petition, they were dispersed among the several garrisons of the kingdom, in order to secure them from the violence of their enemies. A few years after this, being seized with a dangerous sickness, her youngest son Aristobolus collected a strong party in order to secure the crown to himself; but the queen, being displeased with his conduct, appointed her other son Hyrcanus, whom she had before made high-priest, to succeed her also in the royal dignity. Soon after this she expired, and left her two sons competitors for the crown. The pharisees raised an army against Aristobolus, which almost instantly deserted to him, so that Hyrcanus found himself obliged to accept of peace upon any terms; which, however, was not granted, till the latter had abandoned all title both to the royal and pontifical dignity, and contented himself with the enjoyment of his peculiar patrimony as a private person.

But this deposition did not extinguish the party of Hyrcanus. A new cabal was raised by Antipater an Idumæan proselyte, and father of Herod the Great; who carried off Hyrcanus into Arabia, under pretence that his life was in danger if he remained in Judea. Here he applied to Aretas king of that country, who undertook to restore the deposed monarch; and for that purpose invaded Judea, defeated Aristobolus, and kept him closely besieged in Jerusalem. The latter had recourse to the Romans; and having bribed Scaurus, one of their generals, he defeated Aretas with the loss of 7000 of his men, and drove him quite out of the country. The two brothers next fell presents to Pompey, at that time commander in chief of all the Roman forces in the east, and whom they made the arbitrator of their differences. But he, fearing that Aristobolus, against whom he intended to declare, might obstruct his intended expedition against the Nabatheans, dismissed them with a promise, that as soon as he had subdued Aretas, he would come into Judea and decide their controversy.

This delay gave such offence to Aristobolus, that he suddenly departed for Judea without even taking leave of the Roman general, who on his part was no less offended at this want of respect. The consequence was, that Pompey entered Judea with those troops with which he had designed to act against the Nabatheans, and summoned Aristobolus to appear before him. The Jewish prince would gladly have been excused; but was forced by his own people to comply with Pompey's summons, to avoid a war with that general. He came accordingly more than once or twice to him, and was dismissed with great promises and marks of friendship. But at last Pompey insisted, that he should deliver into his hands all the fortified places he possessed; which let Aristobolus plainly see that he was in the interest of his brother, and upon this he fled to Jerusalem with a design to oppose the Romans to the utmost of his power. He was quickly followed by Pompey; and to prevent hostilities was at last forced to go and throw himself at the feet of the haughty Roman, and to promise him a considerable sum of money as the reward of his forbearance. This submission

Jews.

million was accepted; but Gabinius, being sent with some troops to receive the stipulated sum, was repulsed by the garrison of Jerusalem, who shut the gates against him, and refused to fulfil the agreement. This disappointment so exasperated Pompey, that he immediately marched with his whole army against the city.

The Roman general first sent proposals of peace; but finding the Jews resolved to stand out to the last, he began the siege in form. As the place was strongly fortified both by nature and art, he might have found it very difficult to accomplish his design, had not the Jews been suddenly seized with a qualm of conscience respecting the observance of the sabbath-day. From the time of the Maccabees they had made no scruple of taking up arms against an offending enemy on the sabbath; but now they discovered, that tho' it was lawful on that day to stand on their defence in case they were actually attacked, yet it was unlawful to do any thing towards the preventing of those preparatives which the enemy made towards such future assaults. As therefore they never moved an hand to hinder the erection of mounds and batteries, or the making of breaches in their walls on the sabbath, the besiegers at last made such a considerable breach on that day, that the garrison could no longer resist them. The city was therefore taken in the year 63 B. C. 12,000 of the inhabitants were slaughtered, and many more died by their own hands; while the priests, who were offering up the usual prayers and sacrifices in the temple, chose rather to be butchered along with their brethren, than suffer divine service to be one moment interrupted. At last, after the Romans had satiated their cruelty with the death of a vast number of the inhabitants, Hyrcanus was restored to the pontifical dignity with the title of *prince*; but forbid to assume the title of *king*, to wear a diadem, or to extend his territories beyond the limits of Judea. To prevent future revolts, the walls were pulled down; and Scaurus was left governor with a sufficient force. But before he departed, the Roman general gave the Jews a still greater offence than almost any thing he had hitherto done; and that was by entering into the most sacred recesses of the temple, where he took a view of the golden table, candlestick, censers, lamps, and all the other sacred vessels; but out of respect to the Deity, forbore to touch any of them, and when he came out commanded the priests immediately to purify the temple according to custom.

Pompey having thus subdued the Jewish nation, set out for Rome, carrying along with him Aristobulus and his two sons Alexander and Antigonus, as captives to adorn his future triumph. Aristobulus himself and his son Antigonus were led in triumph; but Alexander found means to escape into Judea, where he raised an army of 10,000 foot and 1500 horse, and began to fortify several strong holds, from whence he made incursions into the neighbouring country. As for Hyrcanus, he had no sooner found himself freed from his rival brother, than he relapsed into his former indolence, leaving the care of all his affairs to Antipater, who, like a true politician, failed not to turn the weakness of the prince to his own advantage and the aggrandizing of his family. He foresaw, however, that he could not easily compass his ends, unless he ingratiated himself with the Romans; and therefore spared neither pains nor

cost to gain their favour. Scaurus soon after received from him a supply of corn and other provisions, without which his army, which he had led against the metropolis of Arabia, would have been in danger of perishing; and after this, he prevailed on the king to pay 300 talents to the Romans, to prevent them from ravaging his country. Hyrcanus was now in no condition to face his enemy Alexander; and therefore had again recourse to the Romans, Antipater at the same time sending as many troops as he could spare to join them. Alexander ventured a battle; but was defeated with considerable loss, and besieged in a strong fortress named *Alexandrión*. Here he would have been forced to surrender; but his mother, partly by her address, and partly by the services she found means to do the Roman general, prevailed upon him to grant her son a pardon for what was past. The fortresses were then demolished, that they might not give occasion to fresh revolts; Hyrcanus was again restored to the pontifical dignity; and the province was divided into five several districts, in each of which a separate court of judicature was erected. The first of these was at Jerusalem, the second at Gadara, the third at Amath, the fourth at Jericho, and the fifth at Sephoris in Galilee. Thus was the government changed from a monarchy to an aristocracy, and the Jews now fell under a set of domineering lords.

Soon after this, Aristobulus found means to escape from his confinement at Rome, and raised new troubles in Judea, but was again defeated and taken prisoner: his son also renewed his attempts; but was in like manner defeated, with the loss of near 10,000 of his followers; after which Gabinius, having settled the affairs of Judea to Antipater's mind, resigned the government of his province to Crassus. The only transaction during his government was his plundering the temple of all its money and sacred utensils, amounting in the whole to 10,000 Attic talents, *i. e.* above two millions of our money. After this sacrilege, Crassus set out on his expedition against Parthia, where he perished; and his death was by the Jews interpreted as a divine judgment for his impiety.

The war between Cæsar and Pompey afforded the Jews some respite, and likewise an opportunity of ingratiating themselves with the former, which the politic Antipater readily embraced. His services were rewarded by the emperor. He confirmed Hyrcanus in his priesthood, added to it the principality of Judea to be entailed on his posterity for ever, and restored the Jewish nation to their ancient rights and privileges; ordering at the same time a pillar to be erected, whereon all these grants, and his own decree, should be engraved, which was accordingly done; and soon after, when Cæsar himself came into Judea, he granted liberty also to fortify the city, and rebuild the wall which had been demolished by Pompey.

During the lifetime of Cæsar, the Jews were so highly favoured, that they could scarcely be said to feel the Roman yoke. After his death, however, the nation fell into great disorders; which were not finally quelled, till Herod, who was created king of Judea by Marc Anthony in 40 B. C. was fully established on the throne by the taking of Jerusalem by his allies the Romans in 37 B. C. The immediate consequence of this was another cruel pillage and massacre: then fol-

lowed the death of Antigonus the son of Aristobolus, who had for three years maintained his ground against Herod, put to death his brother Phasael, and cut off Hyrcanus's ears, in order the more effectually to incapacitate him for the high-priesthood.

23
His tyranny
and cruelty.

The Jews gained but little by this change of matters. The new king proved one of the greatest tyrants mentioned in history. He began his reign with a cruel persecution of those who had sided with his rival Antigonus; great numbers of whom he put to death, seizing and confiscating their effects for his own use. Nay, such was his jealousy in this last respect, that he caused guards to be placed at the city-gates, in order to watch the bodies of those of the Antonian faction who were carried out to be buried, lest some of their riches should be carried along with them. His jealousy next prompted him to decoy Hyrcanus, the banished pontiff, from Parthia, where he had taken refuge, that he might put him to death, tho' contrary to his most solemn promises. His cruelty then fell upon his own family. He had married Mariamne, the daughter of Hyrcanus; whose brother, Aristobolus, a young prince of great hopes, was made high-priest at the intercession of his mother Alexandra. But the tyrant, conscious that Aristobolus had a better right to the kingdom than himself, caused him soon after to be drowned in a bath. The next victim was his beloved queen Mariamne herself. Herod had been summoned to appear first before Marc Anthony, and then before Augustus, in order to clear himself from some crimes laid to his charge. As he was, however, doubtful of the event, he left orders, that in case he was condemned, Mariamne should be put to death. This, together with the death of her father and brother, gave her such an aversion for him, that she shewed it on all occasions. By this conduct the tyrant's resentment was at last so much inflamed, that having got her falsely accused of infidelity, she was condemned to die, and executed accordingly. She suffered with great resolution; but with her ended all the happiness of her husband. His love for Mariamne increased so much after her death, that for some time he appeared like one quite distracted. His remorse, however, did not get the better of his cruelty. The death of Mariamne was soon followed by that of her mother Alexandra, and this by the execution of several other persons who had joined with her in an attempt to secure the kingdom to the sons of the deceased queen.

Herod, having now freed himself from the greatest part of his supposed enemies, began to shew a greater contempt for the Jewish ceremonies than formerly; and introduced a number of heathenish games, which made him odious to his subjects. Ten bold fellows at last took it into their heads to enter the theatre where the tyrant was celebrating some games, with daggers concealed under their clothes, in order to stab him or some of his retinue. In case they should miscarry in the attempt, they had the desperate satisfaction to think, that, if they perished, the tyrant would be rendered still more odious by the punishment inflicted on them. They were not mistaken: for Herod being informed of their design by one of his spies, and causing the assassins to be put to a most excruciating death, the people were so much exasperated against the informer, that they cut and tore him to pieces, and cast his flesh

to the dogs. Herod tried in vain to discover the authors of this affront; but at last having caused some women to be put to the rack, he extorted from them the names of the principal persons concerned, whom he caused immediately to be put to death with their families. This produced such disturbances, that, apprehending nothing less than a general revolt, he set about fortifying Jerusalem with several additional works, rebuilding Samaria, and putting garrisons into several fortresses in Judea. Notwithstanding this, however, Herod had shortly after an opportunity of regaining the affections of his subjects in some measure, by his generosity to them during a famine; but as he soon relapsed into his former cruelty, their love was again turned into hatred, which continued till his death.

Herod now, about 23 B. C. began to adorn his cities with many stately buildings. The most remarkable and magnificent of them all, however, was the temple at Jerusalem, which he is said to have raised to a higher pitch of grandeur than even Solomon himself had done. Ten thousand artificers were immediately set to work, under the direction of 1000 priests, the best skilled in carving, masonry, &c. all of whom were kept in constant pay. A thousand carts were employed in fetching materials; and such a number of other hands were employed, that every thing was got ready within the space of two years. After this they set about pulling down the old building, and rearing up the new one with the same expedition: so that the *holy place*, or temple properly so called, was finished in a year and an half; during which we are told that it never rained in the day-time, but only in the night. The remainder was finished in somewhat more than eight years. The *temple*, properly so called, or holy place, was but 60 cubits high, and as many in breadth; but in the front he added two wings or shoulders which projected 20 cubits more on each side, and which in all made a front of 120 cubits in length, and as many in height; with a gate 70 cubits high and 20 in breadth, but open and without any doors. The stones were white marble, 25 cubits in length, 12 in height, and nine in breadth, all wrought and polished with exquisite beauty; the whole resembling a stately palace, whose middle being considerably raised above the extremities of each face, made it afford a beautiful vista at a great distance, to those who came to the metropolis. Instead of doors, the gates closed with very costly veils, enriched with a variety of flowering of gold, silver, purple, and every thing that was rich and curious; and on each side of the gates were planted two stately columns, from whose cornices hung golden festoons and vines, with their clusters of grapes, leaves, &c. curiously wrought. The superstructure, however, which was probably reared on the old foundation without sufficient additions, proved too heavy, and sunk down about 20 cubits; so that its height was reduced to 100. This foundation was of an astonishing strength and height, of which an account is given under the article JERUSALEM. The platform was a regular square of a fadde or furlong on each side. Each front of the square had a spacious gate or entrance, enriched with suitable ornaments; but that on the west had four gates, one of which led to the palace, another

24
Rebuilds
the temple.

another to the city, and the two others to the suburbs and fields. This inclosure was surrounded on the outside with a strong and high wall of large stones, well cemented; and on the inside, had on each front a stately piazza or gallery, supported by columns of such a bigness, that three men could but just embrace them, their circumference being about 27 feet. There were in all 162 of them, which supported a cedar ceiling of excellent workmanship, and formed three galleries, the middlemost of which was the largest and highest, it being 45 feet in breadth and 100 in height, whereas those on each side were but 30 feet wide and 50 in height.

The piazzas and court were paved with marble of various colours; and, at a small distance from the galleries, was a second inclosure, surrounded with a flight of beautiful marble rails, with stately columns at proper distances, on which were engraven certain admonitions in Greek and Latin, to forbid strangers, and those Jews that were not purified, to proceed farther under pain of death. This inclosure had but one gate on the east side; none on the west; but on the north and south it had three, placed at equal distances from each other.

A third inclosure surrounded the temple properly so called, and the altar of burnt-offerings; and made what they called the court of the Hebrews, or Israelites. It was square like the rest: but the wall on the outside was surrounded by a flight of 14 steps, which hid a considerable part of it; and on the top was a terrace, of about 12 cubits in breadth, which went quite round the whole inclosure. The east side had but one gate; the west none; and the north and south four, at equal distances. Each gate was ascended by five steps more, before one could reach the level of the inward court; so that the wall which inclosed it appeared within to be but 25 cubits high, though considerably higher on the outside. On the inside of each of those gates were raised a couple of spacious square chambers, in form of a pavilion, 30 cubits wide and 40 in height, each supported by columns of 12 cubits in circumference.

This inclosure had likewise a double flight of galleries on the inside, supported by a double row of columns; but the western side was only one continued wall, without gates or galleries. The women had likewise their particular courts separate from that of the men, and one of the gates on the north and south leading to it.

The altar of burnt-offerings was likewise high and spacious, being 40 cubits in breadth, and 15 in height. The ascent to it was, according to the Mosaic law, smooth, and without steps; and the altar of unleavened stones. It was surrounded, at a convenient distance, with a low wall or rail, which divided the court of the priests from that of the lay Israelites; so that these last were allowed to come thus far to bring their offerings and sacrifices; though none but the priests were allowed to come within that inclosure.

Herod caused a new dedication of this temple to be performed with the utmost magnificence; and presented to it many rich trophies of his former victories, after the custom of the Jewish monarchs.

This, and many other magnificent works, however, did not divert the king's attention from his usual jealousies and cruelty. His sister Salome, and one of his sons named *Antipater*, taking advantage of this disposition, prompted him to murder his two sons by Marianna, named *Alexander* and *Arifobulus*, who had been educated at the court of Augustus in Italy, and were justly admired by all who saw them. His cruelty soon after broke out in an impotent attempt to destroy the Saviour of the world, but which was attended with no other consequence than the destruction of 2000 innocent children of his own subjects. His misery was almost brought to its summit by the discovery of Antipater's designs against himself; who was accordingly tried and condemned for treason. Something still more dreadful, however, yet awaited him; he was seized with a most loathsome and incurable disease, in which he was tormented with intolerable pains, so that his life became a burden. At last he died, to the great joy of the Jews, five days after he had put Antipater to death, and after having divided his kingdom among his sons in the following manner.—Archelaus had Judea; Antipas, or Herod, was tetrarch of Galilee and Peraea; and Philip had the regions of Trachonitis, Gaulon, Batanea, and Panias, which he erected likewise into a tetrarchy. To his sister Salome he gave 50,000 pieces of money, together with the cities of Jamnia, Azotus, and Phaelias; besides some considerable legacies to his other relations.

The cruelty of this monster accompanied him to his grave; nay, he in a manner carried it beyond the grave. Being well apprised that the Jews would rejoice at being freed from such a tyrant, he bethought himself of the following infernal stratagem to damp their mirth. A few days before his death, he summoned all the heads of the Jews to repair to Jericho under pain of death; and, on their arrival, ordered them all to be shut up in the circus, giving at the same time strict orders to his sister Salome and her husband to have all the prisoners butchered as soon as his breath was gone out. "By this means, (said he,) I shall not only damp the people's joy, but secure a real mourning at my death." These cruel orders, however, were not put in execution. Immediately after the king's death, Salome went to the Hippodrome, where the heads of the Jews were detained, caused the gates to be flung open, and declared to them, that now the king had no farther occasion for their attendance, and that they might depart to their respective homes; after which, and not till then, the news of the king's death was published. Tumults, seditions, and insurrections, quickly followed. Archelaus was opposed by his brethren, and obliged to appear at Rome before Augustus, to whom many complaints were brought against him. After hearing both parties, the emperor made the following division of the kingdom: Archelaus had one-half, under the title of *ethnarch*, or governor of a nation; together with a promise that he should have the title of *king*, as soon as he shewed himself worthy of it. This ethnarchy contained Judea Propria, Idumea, and Samaria: but this last was exempted from one-fourth of the taxes paid by the rest, on account of the peaceable behaviour of the inhabitants during the late tumults. The remainder:

25
His death.

New division of the kingdom by Augustus.

Jews.

remainder was divided between Philip and Herod; the former of whom had Trachonitis, Batanea, and Auranitis, together with a small part of Galilee; the latter had the rest of Galilee, and the countries beyond the Jordan: Salome had half a million of silver, together with the cities of Jamnia, Azotus, Phasaelis, and Afcalon.

For some years Archelans enjoyed his government in peace; but at last, both Jews and Samaritans, tired out with his tyrannical behaviour, joined in a petition to Augustus against him. The emperor immediately summoned him to Rome, where, having heard his accusation and defence, he banished him to the city of Vienne in Dauphiny, and confiscated all his effects. Judea being by this sentence reduced to a Roman province, was ordered to be taxed; and Cyrenius the governor of Syria, a man of consular dignity, was sent thither to see it put in execution: which having done, and sold the palaces of Archelaus, and seized upon all his treasure, he returned to Antioch, leaving the Jews in no small ferment on account of this new tax.

Thus were the seeds of dissension sown between the Jews and Romans, which ended in the most lamentable catastrophe of the former. The Jews, always impatient of a foreign yoke, knew from their prophecies, that the time was now come when the Messiah should appear. Of consequence, as they expected him to be a great and powerful warrior, their rebellious and seditious spirit was heightened to the greatest degree; and they imagined they had nothing to do but take up arms, and victory would immediately declare on their side. From this time, therefore, the country was never quiet; and the insatuated people, while they rejected the true Messiah, gave themselves up to the direction of every impostor who chose to lead them to their own destruction. The governors appointed by the Romans were also frequently changed, but seldom for the better. About the 16th year of Christ, Pontius Pilate was appointed governor; the whole of whose administration, according to Josephus, was one continued scene of venality, rapine, tyranny, and every wicked action; of racking and putting innocent men to death, untried and uncondemned; and of every kind of savage cruelty. Such a governor was but ill calculated to appease the ferments occasioned by the late tax. Indeed Pilate was so far from attempting this, that he greatly inflamed them by taking every occasion of introducing his standards with images and pictures, consecrated shields, &c. into their city; and at last attempting to drain the treasury of the temple, under pretence of bringing an aqueduct into Jerusalem. The most remarkable transaction of his government, however, was his condemnation of Jesus Christ: seven years after which he was removed from Judea; and in a short time Agrippa the grandson of Herod the Great, was promoted by Caius to the regal dignity. He did not, however, long enjoy this honour; for, on his coming into Judea, having raised a persecution against the Christians, and blasphemously suffering himself to be styled a God by some deputies from Tyre and Sidon, he was miraculously struck with a disease, which soon put an end to his life. The sacred historian tells us, that he was

eaten of worms; and Josephus, that he was seized with most violent pains in his heart and bowels; so that he could not but reflect on the baseness of those flatterers, who had but lately complimented him with a kind of divine immortality, that was now about to expire in all the torments and agonies of a miserable mortal.

On the death of Agrippa, Judea was once more reduced to a province of the Roman empire, and had new governors appointed over it. These were Ventidius, Felix, Festus, Albinus, and Gessius Florus. Under their government the Jewish affairs went on from bad to worse; the country swarmed with robbers and assassins; the latter committing every-where the most unheard-of cruelties under the pretence of religion; and about 64 A. C. were joined by 18,000 workmen, who had been employed in further repairing and beautifying the temple. About this time also, Gessius Florus, the last and worst governor the Jews ever had, was sent into the country. Josephus seems at a loss for words to describe him by, or a monster to compare him to. His rapines, cruelties, conniving for large sums with the banditti, and, in a word, his whole behaviour, were so open and barefaced, that he was looked upon by the Jews more like a bloody executioner sent to butcher, than a magistrate to govern them. In this distracted state of the country, many of the inhabitants forsook it to seek for an asylum somewhere else; while those who remained, applied themselves to Cestius Gallus, governor of Syria, who was at Jerusalem at the passover; beseeching him to pity their unhappy state, and free them from the tyranny of a man who had totally ruined their country. Florus, who was present when these complaints were brought against him, made a mere jest of them; and Cestius, instead of making a strict inquiry into his conduct, dismissed the Jews with a general promise that the governor should behave better for the future; and set himself about computing the number of Jews at that time in Jerusalem, by the number of lambs offered at that festival, that he might send an account of the whole to Nero. By his computation, there were at that time in Jerusalem 2,556,000; tho' Josephus thinks they rather amounted to 3,000,000.

In the year 67 began the fatal war with the Romans, which was ended only by the destruction of Jerusalem. The immediate cause was the decision of a contest with the Syrians concerning the city of Cæsarea. The Jews maintained that this city belonged to them, because it had been built by Herod; and the Syrians pretended that it had always been reckoned a Greek city, since even that monarch had reared temples and statues in it. The contest at last came to such a height, that both parties took up arms against each other. Felix put an end to it for a time, by sending some of the chiefs of each nation to Rome, to plead their cause before the emperor, where it hung in suspense till this time, when Nero decided it against the Jews. No sooner was this decision made public, than the Jews in all parts of the country flew to arms; and, tho' they were every-where the sufferers, yet, from this fatal period, their rage never abated. Nothing was now to be heard of but robberies, murders,

and every kind of cruelty. Cities and villages were filled with dead bodies of all ages, even sucking babes. The Jews, on their part, spared neither Syrians nor Romans, where they got the better of them; and this proved the destruction of great numbers of their peaceful brethren: 20,000 were massacred at Cæsarea, 50,000 at Alexandria, 2000 at Ptolemais, and 3,500 at Jerusalem.

32
they de-
cided
Cælius
allus.

A great number of assassins, in the mean time, having joined the factions Jews in Jerusalem, they beat the Romans out of Antonia, a fortress adjoining to the temple, and another called *Masada*; and likewise out of the towers called *Phasael* and *Mariamne*, killing all who opposed them. The Romans were at last reduced to such straits, that they capitulated on the single condition that their lives should be spared; notwithstanding which, they were all massacred by the furious zealots: and this treachery was soon revenged on the faithful Jews of Scythopolis. These had offered to assist in reducing their factious brethren; but, their sincerity being suspected by the townsmen, they obliged them to retire into a neighbouring wood, where, on the third night, they were massacred to the number of 13,000, and all their wealth carried off. The rebels, in the mean time, crossed the Jordan, and took the fortresses of Machæron and Cyprus; which last they razed to the ground, after having put all the Romans to the sword.—This brought Cælius Gallus, the Syrian governor, into Judæa with all his forces; but the Jews, partly by treachery and partly by force, got the better of him, and drove him out of the country with the loss of 5000 men.

33
Vespasian
not against
em.

All this time such dreadful dissensions reigned among the Jews, that great numbers of the better sort, foreseeing the sad effects of the resentment of the Romans, left the city as men do a sinking vessel; and the Christians, mindful of their Saviour's prediction, retired to Pella, a city on the other side of Jordan, whither the war did not reach. Miserable was the fate of such as either could not, or would not, leave that devoted city. Vespasian was now ordered to leave Greece where he was at that time, and to march with all speed into Judæa. He did so accordingly at the head of a powerful army, ordering his son Titus in the mean time to bring two more legions from Alexandria; but before he could reach that country, the Jews had twice attempted to take the city of Ascalon, and were each time repulsed with the loss of 10,000 of their number. In the beginning of the year 68, Vespasian entered Galilee at the head of an army of 60,000 men all completely armed and excellently disciplined. He first took and burnt Gadara; then he laid siege to Jotapa, and took it after a stout resistance; at which he was so provoked, that he caused every one of the Jews to be massacred or carried into captivity, not one being left to carry the dreadful news to their brethren. Forty thousand perished on this occasion; only 1200 were made prisoners, among whom was Josephus the Jewish historian. Japha next shared the same fate, after an obstinate siege; all the men being massacred, and the women and children carried into captivity. A week after this the Samaritans, who had assembled on Mount Gerizzim, were almost all put to the sword, or perished. Joppa fell the next victim

Jews.

to the Roman vengeance. It had been formerly laid waste by Cælius; but was now reoppressed and fortified by the seditious Jews who infested the country. It was taken by storm, and shared the same fate with the rest. Four thousand Jews attempted to escape, by taking to their ships; but were driven back by a sudden tempest, and all of them were drowned or put to the sword. Tarichea and Tiberias were next taken, but part of their inhabitants were spared on account of their peaceable dispositions. Then followed the sieges of Gamala, Gischala, and Itabyr. The first was taken by storm, with a dreadful slaughter of the Jews; the last by stratagem. The inhabitants of Gischala were inclineable to surrender: but a seditious Jew of that town, named *John*, the son of Levi, head of the faction, and a vile fellow, opposed it; and, having the mob at his beck, overawed the whole city. On the sabbath he begged of Titus to forbear hostilities till to-morrow, and then he would accept his offer; but instead of that, he fled to Jerusalem with as many as would follow him. The Romans, as soon as they were informed of his flight, pursued, and killed 6000 of his followers on the road, and brought back near 3000 women and children prisoners. The inhabitants then surrendered to Titus, and only the factious were punished; and this completed the reduction of Galilee.

34
Different
factions
among the
Jews.

The Jewish nation by this time was divided into two very opposite parties: the one foreseeing that this war, if continued, must end in the total ruin of their country, were for putting an end to it by submitting to the Romans; the other, which was the remains of the faction of Judas Gaulonites, breathed nothing but war and confusion, and opposed all peaceable measures with invincible obstinacy. This last, which was by far the most numerous and powerful, consisted of men of the vilest and most profligate characters that can be paralleled in history. They were proud, ambitious, cruel, rapacious, and committed the most horrid and unnatural crimes under the mask of religion. They affirmed every where, that it was offering the greatest dishonour to God to submit to any earthly potentate; much less to Romans and to heathens. This, they said, was the only motive that induced them to take up arms, and to bind themselves under the strictest obligations not to lay them down till they had either totally extirpated all foreign authority, or perished in the attempt.—This dreadful dissension was not confined to Jerusalem, but had infected all the cities, towns, and villages, of Palestine. Even houses and families were so divided against each other, that, as our Saviour had expressly foretold, a man's greatest enemies were often those of his own family and household. In short, if we may believe Josephus, the zealots acted more like incarnate devils than like men who had any sense of humanity left them.—This obliged the contrary party likewise to rise up in arms in their own defence against those miscreants; from whom, however, they suffered much more than they did even from the exasperated Romans.—The zealots began their outrages by murdering all that opposed them in the countries round about. Then they entered Jerusalem; but met with a stout opposition from the other party headed by Ananias, who had lately been high-priest. A fierce engage-

ment.

Jews.

ment ensued between them; and the zealots were driven into the inner cincture of the temple, where they were closely besieged. John of Gischala above mentioned, who had pretended to side with the peaceable party, was then sent with terms of accommodation; but, instead of advising the besieged to accept of them, he persuaded them still to hold out, and call the Idumeans to their assistance. They did so, and procured 20,000 of them to come to their relief; but these new allies were refused admittance into the city. On that night, however, there happened such a violent storm, accompanied with thunder, lightning, and an earthquake, that the zealots from within the inner court saw the bolts and hinges of the temple-gates without being heard, forced the guards of the besiegers, sallied into the city, and let in the Idumeans. The city was instantly filled with butcheries of the most horrid kind. Barely to put any of the opposite party to death, was thought too mild a punishment; they must have the pleasure of murdering them by inches: so that they made it now their diversion to put them to the most exquisite tortures that could be invented; nor could they be prevailed upon to dispatch them till the violence of their torments had rendered them quite incapable of feeling them. In this manner perished 12,000 persons of noble extraction, and in the flower of their age; till at last the Idumeans complained so much against the putting such numbers to death, that the zealots thought proper to erect a kind of tribunal, which, however, was intended not for judgment, but condemnation; for the judges having once acquitted a person who was manifestly innocent, the zealots not only murdered him in the temple, but deposed the new-created judges as persons unfit for their office.

The zealots, after having exterminated all those of any character or distinction, began next to wreak their vengeance on the common people. This obliged many of the Jews to forsake Jerusalem, and take refuge with the Romans, though the attempt was very hazardous; for the zealots had all the avenues well guarded, and failed not to put to death such as fell into their hands. Vespasian in the mean time staid at Cæsarea an idle spectator of their outrages; well knowing that the zealots were fighting for him, and that the strength of the Jewish nation was gradually wasting away. Every thing succeeded to his wish. The zealots, after having massacred or driven away the opposite party, turned their arms against each other. A party was formed against John, under one Simon who had his head-quarters at the fortrefs of Massada. This new miscreant plundered, burned, and massacred, wherever he came, carrying the spoil into the fortrefs above-mentioned. To increase his party, he caused a proclamation to be published, by which he promised liberty to the slaves, and proportionable encouragement to the freemen who joined him. This stratagem had the desired effect, and he soon saw himself at the head of a considerable army. Not thinking himself, however, as yet master of force sufficient to besiege Jerusalem, he invaded Idumea with 20,000 men. The Idumeans opposed him with 25,000; and a sharp engagement ensued, in which neither party was victorious. But Simon, soon after, having corrupted the Idumean general, got their army

delivered up to him. By this means he easily became master of the country; where he committed such cruelties, that the miserable inhabitants abandoned it to seek for shelter in Jerusalem.

In the city, matters went in the same way. John tyrannized in such a manner, that the Idumeans revolted, killed a great number of his men, plundered his palace, and forced him to retire into the temple. In the mean time the people, having taken a notion that he would fall out in the night and set fire to the city, called a council, in which it was resolved to admit Simon with his troops, in order to oppose John and his zealots. Simon's first attempt against his rival, however, was ineffectual, and he was obliged to content himself with besieging the zealots in the temple. In the mean time the miseries of the city were increased by the starting up of a third party headed by one Eleazar, who seized on the court of the priests, and kept John confined within that of the Israelites. Eleazar kept the avenues so well guarded, that none were admitted to come into that part of the temple but those who came thither to offer sacrifices; and it was by these offerings chiefly that he maintained himself and his men. John by this means found himself hemmed in between two powerful enemies, Simon below, and Eleazar above. He defended himself, however, against them both with great resolution; and when the city was invested by the Romans, having pretended to come to an agreement with his rivals, he found means totally to cut off or force Eleazar's men to submit to him, so that the factions were again reduced to two.

The Romans, in the year 72, began to advance towards the capital. In their way they destroyed many thousands, wasting the country as they went along; and in the year 73 arrived before the walls of Jerusalem, under Titus afterwards emperor. As he was a man of an exceedingly merciful disposition, and greatly desired to spare the city, he immediately sent offers of peace; but these were rejected with contempt, and he himself put in great danger of his life, so that he resolved to begin the siege in form. In the mean time, Simon and John renewed their hostilities with greater fury than ever. John now held the whole temple, some of the out-parts of it, and the valley of Cedron. Simon had the whole city to range in; in some parts of which John had made such devastations, that they served them for a field of battle, from which they sallied unanimously against the common enemy whenever occasion served; after which they returned to their usual hostilities, turning their arms against each other, as if they had sworn to make their ruin more easy to the Romans. These drew still nearer to the walls, having with great labour and pains levelled all the ground between Scopas and them, by pulling down all the houses and hedges, cutting down the trees, and even cleaving the rocks that stood in their way, from Scopas to the tomb of Herod, and Bethara or the pool of serpents; in which work so many hands were employed, that they finished it in four days.

Whilst this was doing, Titus sent the besieged some offers of peace; and Josephus was pitched upon to be the messenger of them: but they were rejected with indignation. He sent a second time Nicanor and Josephus with fresh offers, and the former received a

wound in his shoulder; upon which Titus resolved to begin the assault in good earnest, and ordered his men to rase the suburbs, cut down all the trees, and use the materials to raise platforms against the wall. Every thing was now carried on with invincible ardour; the Romans began to play their engines against the city with all their might. The Jews had likewise their machines upon the walls, which they plied with uncommon fury: they had taken them lately from Cestius; but were so ignorant in their use, that they did little execution with them, till they were better instructed by some Roman deserters: till then, their chief success was rather owing to their frequent sallies; but the Roman legions, who had all their towers and machines before them, made terrible havock. The least stones they threw were near 100 weight; and these they could throw the length of a quarter of a mile against the city, and with such a force, that they could do mischief on those that stood at some distance behind them. Titus had reared three towers 50 cubits high; one of which happening to fall in the middle of the night, greatly alarmed the Roman camp, who immediately ran to arms at the noise of it; but Titus, upon knowing the cause, dismissed them, and caused it to be set up again. These towers, being plaited with iron, the Jews tried in vain to set fire to them, but were at length forced to retire out of the reach of their shot; by which the battering-rams were now at full liberty to play against the wall. A breach was soon made in it, at which the Romans entered; and the Jews, abandoning this last inclosure, retired behind the next. This happened about the 28th of April, a fortnight after the beginning of the siege.

John defended the temple and the castle of Antonia, and Simon the rest of the city. Titus marched close to the second wall, and plied his battering-rams so furiously, that one of the towers, which looked towards the north, gave a prodigious shake. The men who were in it, made a signal to the Romans, as if they would surrender; and, at the same time, sent Simon word to be ready to give them a warm reception. Titus, having discovered their stratagem, plied his work more furiously, whilst the Jews that were in the tower set it on fire, and flung themselves into the flames. The tower being fallen, gave them an entrance into the second inclosure, five days after gaining the first; and Titus, who was bent on saving the city, would not suffer any part of the wall or streets to be demolished; which left the breach and lanes so narrow, that when his men were furiously repulsed by Simon, they had not room enough to make a quick retreat, so that there was a number of them killed in it. This oversight was quickly rectified; and the attack renewed with such vigour, that the place was carried four days after their first repulse.

The famine, raging in a terrible manner in the city, was soon followed by a pestilence; and as these two dreadful judgments increased, so did the rage of the factious, who, by their intestine feuds, had destroyed such quantities of provision, that they were forced to prey upon the people with the most unheard-of cruelty. They forced their houses; and, if they found any victuals in them, they butchered them for not appropriating them of it; and, if they found nothing but bare walls, which was almost every where the case, they

VOL. V.

put them to the most severe tortures, under pretence that they had some provision concealed. "I should (says Josephus) undertake an impossible task, were I to enter into a detail of all the cruelties of those impious wretches; it will be sufficient to say, that I do not think, that since the creation any city ever suffered such dreadful calamities, or abounded with men so fertile in all kind of wickedness."

Titus, who knew their miserable condition, and was still willing to spare them, gave them four days to cool; during which he caused his army to be mulctured, and provisions to be distributed to them in sight of the Jews, who looked upon the walls to see it. Josephus was sent to speak to them afresh, and to exhort them not to run themselves into an inevitable ruin by obstinately persisting in the defence of a place which could hold out but a very little while, and which the Romans looked upon already as their own. But this stubborn people, after many bitter invectives, began to dart their arrows at him; at which, not at all discouraged, he went on with greater vehemence: but all the effect it wrought on them was, that it prevailed on great numbers to steal away privately to the Romans, whilst the rest became only the more desperate and resolute to hold out to the last, in spite of Titus's merciful offers.

To hasten therefore their destined ruin, he caused the city to be surrounded with a strong wall, to prevent either their receiving any succours or provision from abroad, or their escaping his resentment by flight. This wall, which was near 40 stades or five miles in circuit, was yet carried on with such speed, and by so many hands, that it was finished in three days; by which one may guess at the ardour of the besiegers to make themselves masters of the city.

There was now nothing to be seen thro' the streets of Jerusalem, but heaps of dead bodies rotting above ground, walking skeletons, and dying wretches. As many as were caught by the Romans in their sallies, Titus caused to be crucified in sight of the town, to inject a terror among the rest: but the zealots gave it out, that they were those who fled to him for protection; which when Titus understood, he sent a prisoner with his hands cut off to undeceive, and assure them, that he spared all that voluntarily came over to him; which encouraged great numbers to accept his offers, tho' the avenues were closely guarded by the factious, who put all to death who were caught going on that errand. A greater mischief than that was, that even those who escaped safe to the Roman camp were miserably butchered by the soldiers, from a notion which these had taken that they had swallowed great quantities of gold; inasmuch that two thousand of them were ripped up in one night, to come at their supposed treasure. When Titus was apprised of this barbarity, he would have condemned all those butchering wretches to death; but they proved so numerous, that he was forced to spare them, and contented himself with sending a proclamation thro' his camp, that as many as should be suspected thenceforward of that horrid villany, should be put to immediate death: yet did not this deter many of them from it, only they did it more privately than before; so greedy were they of that bewitching metal. All this while the defection increased still more thro' the inhumanity of the faction

within, who made the miseries and dying groans of their starving brethren the subject of their cruel mirth, and carried their barbarity even to the sheathing of their swords in sport in those poor wretches, under pretence of trying their sharpnels.

When they found therefore, that neither their guards nor severities could prevent the people's flight, they had recourse to another stratagem equally impious and cruel; which was, to hire a pack of vile pretenders to prophecy, to go about and encourage the despairing remains of the people to expect a speedy and miraculous deliverance; and this imposture proved a greater expedient with that insatuated nation, than their other precautions.

Nothing could be more dreadful than the famished condition to which they were now reduced. The poor, having nothing to trust to but the Romans mercy or a speedy death, ran all hazards to get out of the city; and if in their flight, and wandering out for herbs or any other sustenance, they fell into the hands of any of Titus's parties sent about to guard the avenues, they were unmercifully scourged and crucified if they made the least resistance. The rich within the walls were now forced, tho' in the most private manner, to give half, or all they were worth, for a measure of wheat, and the middling sort for one of barley. This they were forced to convey into some private place in their houses, and to feed upon it as it was, without daring to pound or grind it, much less to boil or bake it, lest the noise or smell should draw the rapacious zealots to come and tear it from them. Not that these were reduced to any real want of provisions, but they had a double end in this barbarous plunder; to wit, the starving what they cruelly styled all useless persons, and the keeping their own stores in reserve. It was upon this sad and pinching juncture, that an unhappy mother was reduced to the extremity of butchering and eating her own child.

When this news was spread thro' the city, the horror and consternation were as universal as they were inexpressible. It was then that they began to think themselves forsaken by the Divine Providence, and to expect the most terrible effects of his anger against the poor remains of their nation; insomuch that they began to envy those that had perished before them, and to wish their turn might come before the sad expected catastrophe. Their fears were but too just; since Titus, at the very first hearing of this inhuman deed, swore the total extirpation of city and people. "Since," (said he,) they have so often refused my proffers of pardon, and have preferred war to peace, rebellion to obedience, and famine, such a dreadful one especially, to plenty, I am determined to bury that cursed metropolis under its ruins, that the sun may never shoot his beams on a city where the mothers feed on the flesh of their children, and the fathers, no less guilty than they, choose to drive them to such extremities, rather than lay down their arms."

This dreadful action happened about the end of July, by which time the Romans, having pursued their attacks with fresh vigour, made themselves masters of the fortress Antonia; which obliged the Jews to set fire to those stately galleries which joined it to the temple, lest they should afford an easy passage to the besiegers into this last. About the same time Titus,

with much difficulty, got materials for raising new mounds and terraces, in order to hasten the siege, and save, if possible, the sad remains of that once glorious structure; but his pity proved still worse and worse belowed on those obstinate wretches, who only became the more furious and desperate by it. Titus at length caused fire to be set to the gates, after having had a very bloody encounter, in which his men were repulsed with loss. The Jews were so terrified at it, that they suffered themselves to be devoured by the flames, without attempting either to extinguish them, or save themselves. All this while Josephus did not cease exhorting the insatuated people to surrender, to represent to them the dreadful consequences of an obstinate resistance, and to assure them that it was out of mere compassion to them that he thus hazarded his own life to save theirs: he received one day such a wound in his head by a stone from the battlements, as laid him for dead on the ground. The Jews sallied out immediately, to have seized on his body; but the Romans proved too quick and strong for them, and carried him off.

By this time the two factions within, but especially that of John, having plundered rich and poor of all they had, fell also on the treasury of the temple, whence John took a great quantity of golden utensils, together with those magnificent gifts which had been presented to that sacred place by the Jewish kings, by Augustus, Livia, and many other foreign princes, and melted them all to his own use. The repositories of the sacred oil which was to maintain the lamps, and of the wine which was reserved to accompany the usual sacrifices, were likewise seized upon, and turned into common use; and the last of this to such excess, as to make himself and his party drunk with it. All this while, not only the zealots, but many of the people, were still under such an insatiation, that tho' the fortress Antonia was lost, and nothing left but the temple, which the Romans were preparing to batter down, yet they could not persuade themselves, that God would suffer that holy place to be taken by heathens, and were still expecting some sudden and miraculous deliverance. Even that vile monster John, who commanded them, either seemed confident of it, or else endeavoured to make them think him so. For, when Josephus was sent for the last time to upbraid his obstinately exposing that sacred building, and the miserable remains of God's people, to sudden and sure destruction, he only answered him with the bitterest invectives; adding, that he was defending the Lord's vineyard, which he was sure could not be taken by any human force. Josephus in vain reminded him of the many ways by which he had polluted both city and temple; and in particular of the seas of blood which he caused to be shed in both those sacred places, and which, he assured him from the old prophecies, were a certain sign and forerunner of their speedy surrender and destruction. John remained as inflexible as if all the prophets had assured him of a deliverance; till at length Titus, foreseeing the inevitable ruin of that stately edifice, which he was still extremely desirous to save, vouchsafed even himself to speak to them, and to persuade them to surrender. But the factious, looking upon this condescension as the effects of his fear rather than generosity, only grew the more

more furious upon it, and forced him at last to come to those extremities, which he had hitherto endeavoured to avoid. That his army, which was to attack the temple, might have the freer passage towards it thro' the castle Antonia, he caused a considerable part of the wall to be pulled down, and levelled; which proved so very strong, that it took him up seven whole days, by which time they were far advanced in the month of July.

45
the daily
sacrifice in-
terrupted.

It was on the 17th day of that month, as all Josephus's copies have it, that the daily sacrifice ceased for the first time since its restoration by the brave Judas Maccabeus, there being no proper person left in the temple to offer it up. Titus caused the factious to be severely upbraided for it; exhorted John to set up whom he would to perform that office, rather than suffer the service of God to be set aside; and then challenged him and his party to come out of the temple, and fight on a more proper ground, and thereby save that sacred edifice from the fury of the Roman troops. When nothing could prevail on them, they began to set fire again to the gallery which yielded a communication between the temple and the castle Antonia. The Jews had already burnt about 20 cubits of it in length; but this second blaze, which was likewise encouraged by the besieged, consumed about 14 more; after which, they beat down what remained standing. On the 27th of July, the Jews, having filled part of the western portico with combustible matter, made a kind of flight; upon which, some of the forwardest of the Romans having scaled up to the top, the Jews set fire to it, which flamed with such sudden fury, that many of the former were consumed in it, and the rest, venturing to jump down from the battlements, were, all but one, crushed to death.

On the very next day, Titus having set fire to the north gallery, which inclosed the outer court of the temple, from fort Antonia to the valley of Cedron, got an easy admittance into it, and forced the besieged into that of the priests. He tried in vain six days to batter down one of the galleries of that precinct with an helepolis: he was forced to mount his battering-rams on the terrace, which was raised by this time; and yet the strength of this wall was such, that it eluded the force of these also, tho' others of his troops were busy in sapping it. When they found that neither rams nor sapping could gain ground, they betought themselves of scaling; but were vigorously repulsed in the attempt, with the loss of some standards, and a number of men. When Titus therefore found, that his desire of saving that building was like to cost so many lives, he set fire to the gates, which, being plated with silver, burnt all that night, whilst the metal dropt down in the melting. The flame soon communicated itself to the porticoes and galleries; which the besieged beheld without offering to stop it, but contented themselves with sending whole volleys of impotent curses against the Romans. This was done on the eighth of August; and, on the next day, Titus, having given orders to extinguish the fire, called a council, to determine whether the remainder of the temple should be saved or demolished. That general was still for the former, and most of the rest declared for the latter; alleging, that it was no longer a temple, but a scene of war and slaughter, and that the Jews would

Jews.

never be at rest as long as any part of it was left standing: but when they found Titus stiffly bent on preserving so noble an edifice, against which, he told them, he could have no quarrel, they all came over to his mind. The next day, August the 10th, was therefore determined for a general assault: and the night before the Jews made two desperate sallies on the Romans; in the last of which, the best, being timely succoured by Titus, beat them back into their inclosure.

But whether this last Jewish effort exasperated the besiegers, or, which is more likely, as Josephus thinks, pushed by the hand of Providence, one of the Roman soldiers, of his own accord, took up a blazing fire-brand, and, getting on his comrade's shoulders, threw it into one of the apartments that surrounded the sanctuary, thro' a window. This immediately set the whole north-side in a flame up to the third story, on the same fatal day and month in which it had been formerly burnt by Nebuchadnezzar. Titus, who was gone to rest himself a while in his pavilion, was awaked at the noise, and ran immediately to give orders to have the fire extinguished. He called, prayed, threatened, and even cased his men, but in vain; the confusion was so great, and the soldiers so obstinately bent upon destroying all that was left, that he was neither heard nor minded. Those that flocked thither from the camp, instead of obeying his orders, were busy, either in killing the Jews, or in increasing the flames. When Titus observed that all his endeavours were vain, he entered into the sanctuary and the most holy place, in which he found still such sumptuous utensils and other riches as even exceeded all that had been told him of it. Out of the former he saved the golden candlestick, the table of shew-bread, the altar of perfumes, all of pure gold, and the book or volume of the law, wrapped up in a rich gold tissue: but in the latter he found no utensils, because, in all probability, they had not made a fresh ark, since that of Solomon had been lost. Upon his coming out of that sacred place, some other soldiers set fire to it, and obliged those that had staid behind to come out; they all fell foul on the plunder of it, tearing even the gold plating off the gates and timber-work, and carried off all the costly utensils, robes, &c. they found, inasmuch that there was not one of them who did not enrich himself by it.

An horrid massacre followed soon after, in which a great many thousands perished; some by the flames, ⁴⁷ A dreadful massacre, others by the fall from the battlements, and a greater number by the enemy's sword, which destroyed all it met with, without distinction of age, sex, or quality. Among them were upwards of 6000 persons who had been seduced thither by a false prophet, who promised them, that they should find a speedy and miraculous relief there on that very day. Some of them remained five whole days on the top of the walls, and afterwards threw themselves on the general's mercy; but were answered that they had outstaid the time, and were led to execution. The Romans carried their fury to the burning of all the treasure-houses of the place, tho' they were full of the richest furniture, plate, vestments, and other things of value, which had been laid up in those places for security. In a word, they did not cease burning and butchering.

46
the gates
of the
temple set
a fire.

till they had destroyed all, except two of the temples, and that part of the court which was destined for the women.

In the mean time the seditious made such a vigorous push, that they escaped the fury of the Romans, at least for the present, and retired into the city. But here they found all the avenues so well guarded, that there was no possibility left for them to get out; which obliged them to secure themselves as well as they could on the south-side of it, from whence Simon, and John of Gischala, sent to desire a parley with Titus. They were answered, that though they had been the cause of all this bloodshed and ruin, yet they should have their lives spared, if they laid down their arms, and surrendered themselves prisoners. To this they replied, that they had engaged themselves, by the most solemn oaths, never to surrender; and therefore, only begged leave to retire into the mountains with their wives and children: which inference so exasperated the Roman general, that he caused an herald to bid them stand to their defence; for that not one of them should be spared, since they had rejected his last offers of pardon. Immediately after this, he abandoned the city to the fury of the soldiers, who fell forthwith on plundering, setting fire every where, and murdering all that fell into their hands; whilst the factious, who were left, went and fortified themselves in the royal palace, where they killed 8000 Jews, who had taken refuge there.

In the mean time, great preparations were making for a vigorous attack on the upper city, especially on the royal palace; and this took them up from the 20th of August to the 7th of September, during which time great numbers came and made their submission to Titus. The warlike engines then played so furiously on the factious, that they were taken with a sudden panic; and, instead of fleeing into the towers of Hippicos, Phafael, or Mariamne, which were yet untaken and so strong, that nothing but famine could have reduced them, they ran like madmen towards Siloah, with a design to have attacked the wall of circumvallation, and to have escaped out of the city; but, being there repulsed, they were forced to go and hide themselves in the public finks and common sewers, some one way and some another. All whom the Romans could find were put to the sword, and the city was set on fire. This was on the eighth of September, when the city was taken and entered by Titus. He would have put an end to the massacre; but his men killed all, except the most vigorous, whom they shut up in the porch of the women, just mentioned. Fronto, who had the care of them, reserved the youngest and most beautiful for Titus's triumph; and sent all that were above seventeen years of age into Egypt, to be employed in some public works there; and a great number of others were sent into several cities of Syria, and other provinces, to be exposed on the public theatres, to exhibit fights, or be devoured by wild beasts. The number of those prisoners amounted to 97,000, besides about 11,000 more, who were either starved thro' neglect, or starved themselves through fullness and despair.—The whole number of Jews who perished in this war is computed at upwards of 1,400,000.

Besides these, however, a vast number perished in

caves, woods, wildernesses, common-sewers, &c. of whom no computation could be made. Whilst the soldiers were still busy in burning the remains of the city, and visiting all the hiding-places, where they killed numbers of poor creatures who had endeavoured to evade their cruelty, the two grand rebels Simon and John were found, and referred for the triumph of the conqueror. John, being pinched with hunger, soon came out; and having begged his life, obtained it; but was condemned to perpetual imprisonment. Simon, whose retreat had been better stored, held out till the end of October. The two chiefs, with 700 of the handsomest Jewish captives, were made to attend the triumphal chariot; after which Simon was dragged through the streets with a rope about his neck, severely scourged, and then put to death; and John was sent into perpetual imprisonment.—Three castles still remained untaken, namely, Herodion, Machæron, and Massada. The two former capitulated; but Massada held out. The place was exceedingly strong both by nature and art, well stored with all kinds of provisions, and defended by a numerous garrison of zealots, at the head of whom was one Eleazar, the grandson of Judas Gaulonites, formerly mentioned. The Roman general having in vain tried his engines and battering-rams against it, bethought himself of surrounding it with a high and strong wall, and then ordered the gates to be set on fire. The wind pushed the flames so fiercely against the Jews, that Eleazar in despair persuaded them first to kill their wives and children, and then to choose ten men by lot, who should kill all the rest; and lastly one out of the surviving ten to dispatch them and himself; only this last man was ordered to set fire to the place before he put an end to his own life. All this was accordingly done; and on the morrow, when the Romans were preparing to scale the walls, they were greatly surprised neither to see nor hear any thing move. On this they made such an hideous outcry, that two women, who had concealed themselves in an aqueduct, came forth and acquainted them with the desperate catastrophe of the besieged.

Thus ended the Jewish nation and worship; nor have they ever since been able to regain the smallest footing in the country of Judea, nor indeed in any other country on earth, though there is scarce any part of the globe where they are not to be found. They continue their vain expectations of a Messiah to deliver them from the low estate into which they are fallen; and, notwithstanding their repeated disappointments, there are few who can ever be persuaded to embrace Christianity. Their ceremonies and religious worship ought to be taken from the law of Moses; but they have added a multitude of absurdities not worth the inquiring after. In many countries, and in different ages, they have been terribly massacred, and in general have been better treated by the Mahometans and Pagans than by Christians. Since the revival of arts and learning, however, they have felt the benefit of that increase of humanity which hath taken place almost all over the globe. It is said, that in this country the life of a Jew was formerly at the disposal of the chief lord where they lived, and likewise all his goods. Now, however, the case is altered, and they enjoy the protection of government. A Jew may

may be a witness by our law, being sworn on the Old Testament, and taking the oaths of allegiance.

Jew's Ears, in botany. See **TREMELLA**.

JEZIDES, among the Mahometans; a term of familiar import with heretics among Christians.

The Jezides are a numerous sect inhabiting Turkey and Persia, so called from their head Jezid, an Arabian prince, who slew the sons of Ali, Mahomet's father-in-law; for which reason he is reckoned a parricide, and his followers heretics. There are about 20,000 Jezides in Turkey and Persia; who are of two sorts, black and white. The white are clad like Turks; and distinguished only by their shirts, which are not slit at the neck like those of others, but have only a round hole to thrust their heads through. This is in memory of a golden ring, or circle of light, which descended from heaven upon the neck of their cheq, the head of their religion, after his undergoing a fast of forty days. The black Jezides, though married, are the monks or religious of the order; and these are called *Fakirs*.

The Turks exact excessive taxes from the Jezides, who hate the Turks as their mortal enemies; and when, in their wrath, they curse any creature, they call it *mussulman*: but they are great lovers of the Christians, being more fond of Jesus Christ than of Mahomet, and are never circumcised but when they are forced to it. They are extremely ignorant, and believe both the bible and the koran without reading either of them: they make vows and pilgrimages, but have no places of religious worship.

All the adoration they pay to God consists of some fogs in honour of Jesus Christ, the virgin, Moses, and sometimes Mahomet; and it is a principal point of their religion never to speak ill of the devil, lest he should resent the injury, if ever he should come to be in favour with God again, which they think possible; whenever they speak of him, they call him the *angel Peacock*. They bury their dead in the first place they come at, rejoicing as at a festival, and celebrating the entry of the deceased into heaven. They go in companies like the Arabians, and change their habitations every fifteen days. When they get wine, they drink it to excess; and it is said, that they sometimes do this with a religious purpose, calling it the blood of Christ. They buy their wives; and the market-price is two hundred crowns for all women, handsome or not, without distinction.

JEZRAEL, or **JEZREEL**, a town in the north of Samaria, towards mount Carmel, where stood a palace of the kings of Israel, 1 Kings xxi. 18. On the borders of Galilee (Joshua xix.) said to be one of the towns of Issachar.—The valley of Jezreel (Judges vi. 17.) was situated to the north of the town, running from west to east for ten miles; between two mountains; the one to the north, commonly called *Hermom*, near mount Tabor; the other *Gilboa*: in breadth two miles.

It, an island of France, in Provence, and the most eastern of the three before the harbour of Marseilles. It is very well fortified, and its port one of the best in the Mediterranean.

IGIS, a town of the country of the Grisons, in Caddes, with a magnificent castle, in which is a cabinet of curiosities, and a handsome library; 23 miles

south-west of Chorra; and 23 south of Glaris. E. lon. 9. o. N. lat. 49. 10.

Iglaw,
Ignatius.

IGLAW, a considerable and populous town of Germany, in Moravia, where they have a manufactory of good cloth, and excellent beer. It is seated on the river Iglau, 40 miles west of Brin, and 80 south-east of Prague. E. long. 15. 5. N. lat. 49. 10.

IGNATIUS LOYOLA, (canonized), the founder of the well-known order of the **JESUITS**, was born at the castle of Loyola, in Biscay, 1491; and became first page to Ferdinand V. king of Spain, and then an officer in his army. In this last capacity, he glorified himself by his valour; and was wounded in both legs at the siege of Pompeluna, in 1521. To this circumstance the Jesuits owe their origin; for, while he was under cure of his wound, a *Life of the saints* was put into his hands, which determined him to forsake the military for the ecclesiastical profession. His first devout exercise was to dedicate himself to the blessed virgin as her knight: he then went a pilgrimage to the Holy Land; and on his return to Europe, he continued his theological studies in the universities of Spain, though he was then 33 years of age. After this he went to Paris; and in France laid the foundation of this new order, the institutes of which he presented to Pope Paul III. who made many objections to them, but at last confirmed the institution in 1540. The founder died in 1555, and left his disciples two famous books; 1. *Spiritual exercises*; 2. *Constitutions or rules of the order*. But it must be remembered, that though these avowed institutes contain many privileges obnoxious to the welfare of society, the most diabolical are contained in the private rules intitled *Monita secreta*, which were not discovered till towards the close of the last century; and most writers attribute these, and even the constitutions, to Laynez, the second general of the order.

IGNATIUS (St), surnamed *Theophrastus*, one of the apostolical fathers of the church, was born in Syria, and educated under the apostle and evangelist St John, and intimately acquainted with some other of the apostles, especially St Peter and St Paul. Being fully instructed in the doctrines of Christianity, he was, for his eminent parts and piety, ordained by St John, and confirmed, about the year 67, bishop of Antioch, by those two apostles, who first planted Christianity in that city, where the disciples also were first called *Christians*. Antioch was then not only the metropolis of Syria, but a city the most famous and renowned of any in the east, and the ancient seat of the Roman emperors, as well as of their viceroys and governors. In this important seat he continued to sit somewhat above 40 years, both an honour and safeguard of the Christian religion, till the year 107, when Trajan the emperor, flushed with a victory which he had lately obtained over the Scythians and Daci, about the ninth year of his reign, came to Antioch to make preparations for a war against the Parthians and Armenians. He entered the city with the pomp and solemnities of a triumph; and, as his first care usually was about the concerns of religion, he began presently to inquire into that affair. Christianity had by this time made such a progress, that the Romans grew jealous and uneasy at it. This prince, therefore, had already commenced a persecution against the Christi-

ans in other parts of the empire, which he now resolved to carry on here. However, as he was naturally of a mild disposition, tho' he ordered the laws to be put in force against them if convicted, yet he forbade them to be fought after.

In this state of affairs, Ignatius, thinking it more prudent to go himself than stay to be sent for, of his own accord presented himself to the emperor, and, it is said, there passed a long and particular discourse between them, wherein the emperor expressing a surprize how he dared to transgress the laws, the bishop took the opportunity to assert his own innocence, and to explain and vindicate his faith with freedom. The issue of this was, that he was cast into prison, and this sentence passed upon him. That, being incurably over-run with superstition, he should be carried bound by soldiers to Rome, and there thrown as a prey to wild beasts.

He was first conducted to Seleucia, a port of Syria, at about 16 miles distance, the place where Paul and Barnabas set sail for Cyprus. Arriving at Smyrna in Ionia, he went to visit Polycarp bishop of that place, and was himself visited by the clergy of the Asian churches round the country. In return for that kindness, he wrote letters to several churches, as the Ephesians, Magnesians, and Trallians, besides the Romans, for their instruction and establishment in the faith; one of these was addressed to the Christians at Rome, to acquaint them with his present state, and passionate desire not to be hindered in that course of martyrdom which he was now hastening to accomplish.

His guard, a little impatient of their stay, set sail with him for Troas, a noted city of the lesser Phrygia, not far from the ruins of old Troy; where, at his arrival, he was much refreshed with the news he received of the persecution ceasing in the church of Antioch: hither also several churches sent their messengers to pay their respects to him; and hence too he dispatched two epistles, one to the church of Philadelphia, and the other to that of Smyrna; and, together with this last, as Eusebins relates, he wrote privately to Polycarp, recommending to him the care and inspection of the church of Antioch.

From Troas they sailed to Neapolis, a maritime town in Macedonia; thence to Philippi, a Roman colony, where they were entertained with all imaginable kindness and courtesy, and conducted forwards on their journey, passing on foot through Macedonia and Epirus, till they came to Epidaurium, a city of Dalmatia; where again taking shipping, they sailed through the Adriatic, and arrived at Rhegium, a port-town in Italy; directing their course thence through the Tyrrhenian sea to Putcoli, whence Ignatius desired to proceed by land, ambitious to trace the same way by which St Paul went to Rome: but this wish was not complied with; and, after a stay of 24 hours, a prosperous wind quickly carried them to the Roman port, the great harbour and station for their navy, built near Ostia, at the mouth of the Tyber, about 16 miles from Rome; whither the martyr longed to come, as much desirous to be at the end of his race, as his keepers, weary of their voyage, were to be at the end of their journey.

The Christians at Rome, daily expecting his arrival, were come out to meet and entertain him, and

accordingly received him with a mixture of joy and sorrow; but when some of them intimated, that possibly the populace might be taken off from desiring his death, he expressed a pious indignation, entreating them to cast no rubs in his way, nor do any thing that might hinder him, now he was hastening to his crown. There are many such expressions as this in his epistle to the Romans, which plainly shew that he was highly ambitious of the crown of martyrdom. Yet it does not appear that he rashly fought or provoked danger. Among other expressions of his ardor for suffering, he said, that the wild beasts had feared and refused to touch some that had been thrown to them, which he hoped would not happen to him. Being conducted to Rome, he was presented to the prefect, and the emperor's letters probably delivered concerning him. The interval before his martyrdom was spent in prayers for the peace and prosperity of the church. That his punishment might be the more pompous and public, one of their solemn festivals, the time of their Saturnalia, and that part of it when they celebrated their Sigillaria, was pitched on for his execution; at which time it was their custom to entertain the people with the bloody conflicts of gladiators, and the hunting and fighting with wild beasts. Accordingly, on the 13th kal. January, i. e. December 20. he was brought out into the amphitheatre, and the lions being let loose upon him, quickly dispatched their meal, leaving nothing but a few of the hardest of his bones. These remains were gathered up by two deacons who had been the companions of his journey; and being transported to Antioch, were interred in the cemetery, without the gate that leads to Daphne; whence, by the command of the emperor Theodosius, they were removed with great pomp and solemnity to the Tycheon, a temple within the city, dedicated to the public genius of it, but now consecrated to the memory of the martyr.

St Ignatius stands at the head of those Antient fathers, who have occasionally delivered their opinions in defence of the true divinity of Christ, whom he calls the *Son of God, and his eternal Word*. He is also reckoned the great champion of the doctrine of the episcopal order, as distinct and superior to that of priest and deacon. And one, the most important, use of his writings respects the authenticity of the holy Scriptures, which he frequently alludes to, in the very expressions as they stand at this day.—Archbishop Usher's edition of his works printed in 1647, is thought the best; yet there is a fresher edition extant at Amsterdam, where, beside the best notes, there are the dissertations of Usher and Pearson.

St IGNATIUS' *Bean*, the seed of a fruit of the gourd kind. The best account of the plant that has yet appeared, is that sent by father Camelli to Ray and Peltiver, and published in the philosophical transactions for the year 1699: he observes, that it grows in the Philippine islands, and winds itself about the tallest trees to the top; that it has large, ribbed, bitter leaves, a flower like that of the pomegranate, and a fruit larger than a melon. Some resemble the fruit to a pomegranate, probably from misapplying Camelli's words. The fruit is covered with a thin, glossy, blackish, green, and as it were marbled-shell, under which is lodged

gnatus
ignition.

loded another of a stony hardness: within this is contained a soft, yellow, bitterish pulp, in which lie the seeds or beans, to the number commonly of 24, each covered with a silvery down.

The same gentleman gives an account of the virtues attributed to these seeds by the Indians; but experience has shewn that they are dangerous. König relates, that a person, by drinking some of a spirituous tincture of them instead of aqua vitæ, was thrown into strong convulsions; and Dr Grim, that a dram of the seed in substance occasioned, for a time, a total deprivation of the senses. Others mention violent vomitings and purgings from its use. Neumann hath observed intermitting fevers removed by drinking, on the approach of a paroxysm, an infusion of some grains of the bean made in carduus water: We are not, however from hence to look upon this medicine as a universal febrifuge, or to use it indiscriminately.

These beans (for so custom requires that we should call them) are about the size of a moderately large nutmeg; in figure somewhat roundish, but extremely irregular, scarcely any two being entirely alike, full of unequal depressions and prominences; in colour, externally yellowish brown, but when the outer skin is taken off, of a blackish brown, and in part quite blackish; in consistence hard and compact as horn, so as not to be reducible into a powdery form but by cutting or rasping: for all their hardness, however, they are not proof against worms. When fresh, they have somewhat of a musky smell, which by age is lost: their taste is very bitter, resembled by some to that of centauria.

Four drams of these beans, boiled in water, gave just two drams of gummy extract; after which, rectified spirit of wine scarcely took up half a grain. Half an ounce, treated first with spirit, gave two scruples and a half of a gummy one. The spirituous extract made at first is of a yellowish colour, and the watery greenish. They are both bitter: the spirituous impresses at first a very agreeable bitterness, somewhat like that of peach-kernels; which going off, leaves in the month a strong bitter. The distilled liquors have no taste or smell.

IGNAVUS, the SLOTH, in zoology. See BRADYPUS.

IGNIS-FATUUS, a kind of light, supposed to be of an electric nature, appearing frequently in mines, marshy places, and near stagnating waters. It was formerly thought, and is still by the superstitious believed, to have something ominous in its nature, and to preface death and other misfortunes. There have been instances of people being decoyed by these lights into marshy places, where they have perished; whence the names of *Ignis-fatuus*, *Will-with-a-wisp*, and *Jack-with-a-lantern*, as if this appearance was an evil spirit which took delight in doing mischief of that kind. For a further account of the nature and properties of the *ignis-fatuus*, see the articles LIGHT and METEOR.

IGNITION, properly signifies the setting fire to any substance; but the sense is commonly restrained to that kind of burning which is not accompanied with flame, such as that of charcoal, cinders, metals, stones, and other solid substances.

The effects of ignition are first to dissipate what is called the *phlogiston* of the ignited substance, after

which it is reduced to ashes. Vitrification next follows; and lastly, the substance is totally dissipated in vapour. All these effects, however, depend on the presence of the air; for *in vacuo* the phlogiston of any substance cannot be dissipated. Neither can a body which is totally destitute of phlogiston be ignited in such a manner as those which are not deprived of it: for as long as the phlogiston remains, the heat is kept up in the body by the action of the external air upon it; but when the phlogiston is totally gone, the air always destroys, instead of augmenting the heat. Philosophers have therefore been greatly embarrassed in explaining the phenomena of ignition. It hath been found a matter of no small difficulty to determine how far the air, and how far the phlogiston, is concerned in this operation; but as these inquiries cannot be entered into without first determining the nature of the PHLOGISTON, we must refer to that article for an account of the different theories of ignition.

IGNORAMUS, in English law, a phrase which signifies "We are ignorant." This is used, when the grand jury impanelled on the inquisition of criminal causes reject the evidence as too weak to make good the presentment or indictment brought against a person, so as to bring him upon his trial by a petty jury; in which case they indorse this word on the back of the bill of indictment. In consequence of this, all further proceedings against the party accused are stopped, and the supposed offender is delivered without further answer.

IGNORANCE, the privation or absence of knowledge. The causes of ignorance, according to Locke, are chiefly these three. 1. Want of ideas. 2. Want of a discoverable connection between the ideas we have. 3. Want of tracing and examining our ideas. See METAPHYSICS, n^o 195—205.

IGNORANCE, or mistake, in law, a defect of will, whereby a person is excused from the guilt of a crime, when, intending to do a lawful act, he does that which is unlawful. For here the deed and the will acting separately, there is not that conjunction between them which is necessary to form a criminal act. But this must be an ignorance or mistake of fact, and not an error in point of law. As if a man intending to kill a thief or house-breaker in his own house, by mistake kills one of his own family, this is no criminal action: but if a man thinks he has a right to kill a person excommunicated or outlawed wherever he meets him, and does so; this is wilful murder. For a mistake in point of law, which every person of discretion not only may, but is bound and presumed to know, is, in criminal cases, no sort of defence. *Ignorantia juris quod quisque tenetur scire, neminem excusat*, is as well the maxim of our own law as it was of the Roman.

IGUANA, in zoology, a species of LACERTA.

IHOR, JOHOR, or Jor, a town of Asia, in Malacca, and capital of a province of the same name in the peninsula beyond the Ganges. It was taken by the Portuguese in 1603, who destroyed it, and carried off the cannon; but it has since been rebuilt, and is now in possession of the Dutch. E. Long. 3^o. 55. N. Lat. 1. 15.

JIB, the foremost sail of a ship, being a large stay-sail extended from the outer end of the bowsprit prolonged by the jib-boom, towards the fore-top-mast-head

Ignoramus
jib.

Jib. head. See SAIL.

The jib is a bit of great command with any side-wind, but especially when the ship is *close-hauled*, or has the wind upon her beam; and its effort in *casting* the ship, or turning her head to leeward, is very powerful, and of great utility, particularly when the ship is working through a narrow channel.

Jib-Boom. a boom run out from the extremity of the bowsprit, parallel to its length, and serving to extend the bottom of the jib, and the stay of the fore-top-gallant mast. This boom, which is nothing more than a continuation of the bowsprit forward, to which it may be considered as a top-mast, is usually attached to the bowsprit by means of two large boom-irons, or by one boom-iron, and a cap on the outer end of the bowsprit; or, finally, by the cap without, and a strong lashing within, instead of a boom-iron, which is generally the method of securing it in small merchant-ships. It may therefore be drawn in upon the bowsprit as occasion requires; which is usually practised when the ship enters a harbour, where it might very soon be broke or carried away, by the vessels which are moored therein, or passing by under sail.

JIG. See MUSIC, n° 252.

JIN. See GENII.

IKENILD STREET, one of the four famous ways which the Romans made in England, called *Stratum Icenorum*, because it began in the country of the *Iceni*, who inhabited Norfolk, Suffolk, and Cambridgeshire.

ILA, or **ISLA**, one of the western isles of Scotland, lying to the west of Jura, from which it is separated by a narrow channel. It extends 24 miles in length from north to south, and is 18 in breadth from east to west. On the east side, it is full of mountains covered with heath; to the southward, the land is tolerably well cultivated. In some parts the inhabitants have found great plenty of limestone, and lead-mines are worked in three different places. The only harbour in Isla is at Lochdale, near the north end of the island. Here are several rivers and lakes well stored with trout, eels, and salmon. In the centre is Loch Finlagan, about three miles in circuit, with the little isle of that name in the middle. Here the great Macdonald, lord of the isles, once resided in all the pomp of royalty; but his palaces and offices are now in ruins. Here he held his supreme court of judicature, consisting of fourteen judges, to which there was an appeal from all the lesser tribunals. Instead of a throne, Macdonald stood on a stone seven feet square, in which there was an impression made to receive his feet; here he was crowned and anointed by the bishop of Argyle and seven inferior priests, in presence of the chieftains, to whom he took a solemn oath, importing, that he would maintain their rights and possessions, and do justice to all his vassals. There are several forts built on the isles in fresh-water lakes, and divers caverns in different parts of the island, which have been used occasionally as places of strength. The air of Isla is not so salubrious as that of Jura, because it is more low and marshy; nevertheless, the people enjoy a good share of health: they are all Protestants, and have a variety of churches and chapels. The property of the island is at present vested in Campbell of Shawfield. On the coast of Isla are several small isles, such as Texa, Ouerfa, and Nave; nay, the natives

pretend that there is an island four miles in length about 30 leagues to the south-west of Isla. They say, it was discovered by the master of an English ship, who found it a low flat, covered with long grafs, and watered by a river, on the east side of which he saw great heaps of fish bones. A great number of seals lay basking on the rocks, and the cliffs were covered with sea-fowl. Finding many planks and boards which the sea had cast on the shore, he ordered his men to raise a pile about two stories, as a land-mark for mariners. After his departure, the inhabitants of Collonay, in fair weather, discerned from the top of an eminence an object which they supposed to be land; which, however, vanished, by next winter, when in all probability the pile was blown down by a storm.

ILCHESTER, a town of Somersetshire in England, seated on the river Yeovil. It is a place of great antiquity, as appears by the Roman coins which are sometimes dug up. It once had 16 churches, but now has only two. It is a corporation, and sends two members to parliament; here the county-gaol is kept. W. Long. 2. 45. N. Lat. 51. 5.

ILERDA, (anc. geog.) the capital of the Illegertes; situated on an eminence between the rivers Sicoris and Cinga; an unhappy city, often besieged, and often taken, because lying exposed to the incursions from Gaul; and under Gallienus it was destroyed by the Germans. Now **LERIDA**, in Catalonia, on the river Segra.

ILEX, the **HOLM**, or **Holly-tree**, a genus of the tetragynia order, belonging to the tetrandria class of plants.

There are several species of this genus; but the most remarkable is the aquifolium, or common holly. Of this there are a great number of varieties with variegated leaves, which are propagated by the nursery-gardeners for sale, and some years past were in very great esteem, but at present are but little regarded, the old taste of filling gardens with thorn evergreens being pretty well abolished; however, in the disposition of clumps, or rather plantations, of evergreen trees and shrubs, a few of the most lively colours may be admitted, which will have a good effect in the winter-season, if they are properly disposed.

The best of these varieties are the painted lady holly, British holly, Bradley's best holly, phyllis or cream-holly, milkmaid holly, Pritchett's best holly, gold-edged hedgehog holly, Cheyne's holly, glory-of-the-west holly, Broaderick's holly, Partridge's holly, Herefordshire white holly, Blind's cream holly, Longstaff's holly, Eales's holly, silver-edged hedgehog holly. All these variegates are propagated by budding or grafting them upon stocks of the common green holly: there is also a variety of the common holly with smooth leaves; but this is frequently found intermixed with the prickly-leaved on the same tree, and often on the same branch there are both sorts of leaves.

The common holly grows naturally in woods and forests in many parts of England, where it rises from 20 to 30 feet high, and sometimes more, but their ordinary height is not above 25 feet: the stem by age becomes large, and is covered with a greyish smooth bark; and those trees which are not lopped or browsed by cattle, are commonly furnished with branches the greatest part of their length, so form a sort of cone; the branches

Ilchester.

Illex.

the branches are garnished with oblong oval leaves, of a lucid green on their upper surface, but are pale on their under, having a strong midrib: the edges are indented and waved, with sharp thorns terminating each of the points, so that some of the thorns are raised upward, and others are bent downward, and being very stiff they are troublesome to handle. The leaves are placed alternate on every side of the branches; and from the base of their footstalks come out the flowers in clusters, standing on very short footstalks; each of these sustain five, six, or more flowers. They are of a dirty white, and appear in May; but are succeeded by roundish berries, which turn to a beautiful red about Michaelmas, and continue on the trees, if they are not destroyed, till after Christmas.

The common holly is a very beautiful tree in winter; therefore deserves a place in all plantations of evergreen trees and shrubs, where its shining leaves and red berries make a fine variety; and if a few of the best variegated kinds are properly intermixed, they will enliven the scene. It is propagated by seeds, which never come up the first year, but lie in the ground as the haws do; therefore the berries should be buried in the ground one year, and then taken up and sown at Michaelmas, upon a bed exposed only to the morning sun; the following spring the plants will appear, which must be kept clean from weeds; and if the spring should prove dry, it will be of great service to the plants if they are watered once a week; but they must not have it oftener, nor in too great quantity, for too much moisture is very injurious to these plants when young. In this feed-bed the plants may remain two years; and then should be transplanted in the autumn, into beds at about six inches asunder, where they may stand two years longer; during which time they must be constantly kept clean from weeds, and if the plants have thriven well, they will be strong enough to transplant where they are designed to remain: for when they are transplanted at that age, there will be less danger of their failing, and they will grow to a larger size than those which are removed when they are much larger; but if the ground is not ready to receive them at that time, they should be transplanted into a nursery in rows at two feet distance, and one foot asunder in the rows, in which place the plants may remain two years longer; and if they are designed to be grafted or budded with any of the variegated kinds, that should be performed after the plants have grown one year in the nursery: but the plants so budded or grafted should continue two years after in the nursery, that they may make good shoots before they are removed; though the plain ones should not stand longer than two years in the nursery, because when they are older they do not transplant so well. The best time for removing hollies is in the autumn, especially in dry land; but where the soil is cold and moist, they may be transplanted with great safety in the spring, if the plants are not too old, or have not stood long unremoved, for if they have, there is great doubt of their growing when removed.

Uses. Sheep in the winter are fed with croppings of holly. Birds eat the berries. The bark fermented and afterwards washed from the woody fibres, makes the common bird-lime. The plant makes an impenetrable fence, and bears cropping; however, it is not found in

all respects to answer for this purpose equally well with the hawthorn. The wood is used in finicering, and is sometimes stained black to imitate ebony. Handles for knives and cogs for mill-wheels are made of it. It is also made into hones for whetting of razors. Mr Miller says, he has seen the floor of a room laid with compartments of holly and mahogany, which had a very pretty effect.

ILFRACOMB, a town of Devonshire, seated on the Severn fea, almost opposite to Swansea in Glamorganshire, with a good harbour. W. Long. 4. 15. N. Lat. 51. 15.

ILIAD, the name of an ancient epic poem, the first and finest of those composed by Homer.

The poet's design in the Iliad was to shew the Greeks, who were divided into several little states, how much it was their interest to preserve a harmony and good understanding among themselves: for which end he sets before them the calamities that befel their ancestors from the wrath of Achilles; and his misunderstanding with Agamemnon; and the advantages that afterwards accrued to them from their union. The Iliad is divided into 24 books or rhapsodies, which are marked with the letters of the alphabet.

ILIUM, LIOS, or *Ilios*, (anc. geog.) a name for the city of Troy, but most commonly used by the poets, and distinguished by the epithet *Vetus*; at a greater distance from the sea than what was afterwards called *Ilium Novum*, and thought to be the *Iliumfluvii* Pagus of Strabo. New or modern Ilium was a village nearer the sea, with a temple of Minerva; where Alexander, after the battle of Granicus, offered gifts, and called it a city, which he ordered to be enlarged. His orders were executed by Lyfimachus, who encompassed it with a wall of 40 stadia. It was afterwards adorned by the Romans, who granted it immunities as to their mother-city. From this city the *Iliad* of Homer takes its name, containing an account of the war carried on between the Greeks and Trojans on account of the rape of Helen; a variety of disasters being the consequence, gave rise to the proverb *Ilios Malorum*.

ILKUCH, a royal town of Poland, in the palatinate of Cracow, remarkable for its silver-mines mixed with lead. It is seated in a barren and mountainous country, in E. Long. 20. o. N. Lat. 50. 26.

ILLECEBRUM, in botany, a genus of the monogynia order, belonging to the pentandria class of plants. There are several species, of which the most remarkable are the paronychia and the capitatum. Both these have trailing stalks near two feet long, which spread on the ground, garnished with small leaves like those of knot-grass. The heads of the flowers come out from the joints of the stalks, having neat silvery bractea surrounding them, which make a pretty appearance. Their flowers appear in June, and there is generally a succession of them for at least two months; and when the autumn proves warm, they will ripen their seeds in October. They are propagated by seeds which should be sown in a bed of light earth in the beginning of April: the plants will come up in May, when they should be kept clean from weeds till they are fit to remove. Some should be planted in small pots, and the rest in a warm border, observing to water and shade them till they have taken new root.

These plants are sometimes killed in severe winters; for which reason it is directed to plant some of them in pots, that they may be sheltered during that season.

ILLINOIS, a people of North America. inhabiting a country lying near a large lake of the same name, (called also *Michigan*), formed by the river St. Laurence. The country is fertile; and the people plant Indian corn, on which they chiefly subsist. They are civil, active, lively, and robust; and are much less cruel in their dispositions than the other Indian nations. They are, however, said to be great libertines, and to marry a number of wives; but some of their villages have embraced Christianity.

ILLICIUM, a genus of the octagynia order, belonging to the dodecandria class of plants. There is only one species, viz. the anisatum, a native of the woods of China and Japan. It rises with an erect branched stem to the height of a cherry-tree; and is covered with an ash-coloured bark, under which is another bark that is green, fleshy, somewhat mucous, and of an aromatic taste, combined with a small degree of astringency. The wood is hard and brittle; the pith small in quantity, fungous, and of a green herbaceous colour. The leaves resemble those of laurel; the flowers, in some sort, those of narcissus. These last generally stand single, are of a pale white, and consist of 16 petals, which differ in their form. The extremity of the flower-stalk being continued into the *germen*, or seed-bud of the flower, forms eight conjoined capsules, or one deeply divided into eight parts. Of these capsules, some frequently decay; the rest inclose each a single seed, somewhat resembling that of palma christi, and which, when the hardish corticle that closely covers and involves it is broken, exhibits a kernel that is white, fleshy, soft, and of a vapid taste. The bonzes, or priests of China and Japan, infuse into the inhabitants a superstitious belief, that the gods are delighted with the presence of this tree. Hence, they generally place before their idols garlands and bundles made of the branches. A similar opinion the Bramins inculcate into the Indians, of the Malabar fig, or *ficus religiosa*. The bark of the anise-tree, reduced to powder, and equally burnt, the public watchmen in Japan, by a very curious contrivance described by Kempfer, render useful in the measuring of time during the darkness of the night. The same powder is frequently burnt in brazen vessels on the Japanese altars, as incense is in other countries, from a belief that the idols in whose honour the ceremony is performed are greatly refreshed with the agreeable fragrantcy of its odour. It is remarkable, that a branch of this tree being added to a decoction of the poisonous fish, termed by the Dutch *de opblaaser*, (a fish the most delicate, if the poisonous matter be first properly expelled), increases its noxious quality, and exasperates the poison to an astonishing degree of activity and power.

ILLUMINATING, a kind of miniature-painting much practised in Britain about the 12th and 13th centuries, and of which many curious specimens are still remaining, particularly in the Harleian collection. From this word is derived the modern one of *limning*. It was chiefly used as we use copperplates, in illustrating and adorning the bible and other books. This art was much practised by the clergy, and even by some in the highest stations in the church. "The fa-

mous Osmund (says Brompton), who was consecrated bishop of Salisbury A. D. 1076, did not disdain to spend some part of his time in writing, binding, and illuminating books." Mr Strutt hath given the public an opportunity of forming some judgment of the degree of delicacy and art with which these illuminations were executed, by publishing prints of a prodigious number of them, in his *Regal and ecclesiastical antiquities of England, and View of the customs, &c. of England*. In the first of these works we are presented with the genuine portraits, in miniature, of all the kings, and several of the queens, of England, from Edward the Confessor to Henry VII. mostly in their crowns and royal robes, together with the portraits of many other eminent persons of both sexes.

The illuminators and painters of this period seem to have been in possession of a considerable number of colouring materials, and to have known the arts of preparing and mixing them, so as to form a great variety of colours. In the specimens of their miniature-paintings that are still extant, we perceive not only the five primary colours, but also various combinations of them. There is even some appearance, that they were not ignorant of the art of painting in oil, from the following precept of Henry III. "Pay out of our treasury, to Odo the goldsmith, and Edward his son, one hundred and seventeen shillings and ten pence, for oil, varnish, and colours bought, and pictures made, in the chamber of our queen at Westminster, between the octaves of the Holy Trinity, in the twenty-third year of our reign, and the feast of St Barnabas the apostle, in the same year, which is fifteen days." This was a considerable sum (equal in quantity of silver to 17 pounds 14 shillings of our money, and in efficacy to 88 pounds) to be expended in painting one chamber in so short a time.

ILLYRICA, (anc. geog.) a country extending from the Adriatic to Pannonia. Its boundaries are variously assigned. Pliny makes it extend in length from the river Arsa to the Drinius, thus including Liburnia to the west, and Dalmatia to the east; which is also the opinion of Ptolemy, who settles its limits from mount Scardus and the Upper Mæsia on the east to Istria in the west. The country is now called *Sclavonia*.

ILLYRIUS, (Matthias, Flaccus, or Francowitz), one of the most learned divines of the Augsburg confession, born in Istria, anciently called *Illyria*, in 1520. He is said to have been a man of vast genius, extensive learning, of great zeal against Popery; but of such a restless and passionate temper, as overbalanced all his good qualities, and occasioned much disturbance in the Protestant church. He published a great number of books, and died in 1575.

IMAGE, in a religious sense, is an artificial representation or similitude of some person or thing, used either by way of decoration and ornament, or as an object of religious worship and adoration; in which last sense, it is used indifferently with the word *Idol*.

IMAGE, in optics, a figure in the form of any object, made by the rays of light issuing from the several points of it, and meeting in so many other points, either at the bottom of the eye, or on any other ground, or in any transparent medium, where there is no surface to reflect them. Thus we are said to see all objects

jects by means of their images formed in the eye.

IMAGINATION, a power or faculty of the mind, whereby it conceives and forms ideas of things communicated to it by the outward organs of sense. See METAPHYSICS; and MORALS, n° 184.

Force of IMAGINATION. See MONSTER.

IMAN, a name applied by the Mahometans to him who is head of the congregations in their mosques; and, by way of eminence, to him who has the supreme authority both in respect to spirituals and temporals.

IMMAUS, (anc. geog.), the largest mountain of Asia, (Strabo); and a part of Taurus, (Vast); from which the whole of India runs off into a vast plain, resembling Egypt. It extends far and wide through Scythia, as far as to the Mare Glaciale, dividing it into the Hither or *Scythia intra Immaum*, and into the Farther or *Scythia extra Immaum*, (Ptolemy); and also stretching out along the north of India to the eastern ocean, separates it from Scythia. It had various names according to the different countries it ran through: Ptolemy thinks it is the *Sephar* of Scripture.

IMBECILITY, a languid, infirm state of body, which, being greatly impaired, is not able to perform its usual exercises and functions.

IMBIING, the action of a dry porous body, that absorbs or takes up a moist or fluid one: thus, sugar imbibes water; a sponge, the moisture of the air, &c.

IMBRICATED, among botanists. See BORANY, p. 1298, n° 142.

IMITATION, derived from the Latin *imitare*, to represent, or repeat, a sound or action, either exactly, or nearly in the same manner, as they were originally exhibited.

IMITATION, in music, admits of two different senses. Sound and motion are either capable of imitating themselves by a repetition of their own particular modes; or of imitating other objects of a nobler and more abstracted nature. Nothing perhaps is so purely mental, nothing so remote from external sense, as not to be imitable by music. But as the description of this in M. Rousseau, article *Imitation*, is nobly animated, and comprehends all that is necessary to be said on the subject, we translate it as follows.

“Dramatic or theatrical music (says he), contributes to imitation no less than painting or poetry: it is in this common principle that we must investigate both the origin and the final cause of all the fine arts; as M. le Batteux has shown †. But this imitation is not equally extensive in all the imitative arts. Whatever the imagination can represent to itself is in the department of poetry. Painting, which does not present its pictures to the imagination immediately, but to external sense and to one sense alone, paints only such objects as are discoverable by sight. Music might appear subjected to the same limits with respect to the ear; yet it is capable of painting every thing, even such images as are objects of ocular perception alone: by a magic almost inconceivable, it seems to transform the ears into eyes, and endow them with the double function of perceiving visible objects, by the mediums of their own; and it is the greatest miracle of an art, which can only act by motion, that it can make that

very motion represent absolute quiescence. Night, sleep, silence, solitude, are the noble efforts, the grand images, represented by a picturesque music. We know that noise can produce the same effect with silence, and silence the same effect with noise; as when one sleeps at a lecture insidiously and monotonically delivered, but wakes the instant when it ends. But music acts more intimately upon our spirits, in exciting by one sense dispositions similar to those which we find excited by another; and, as the relation between these images cannot be sensible unless the impression be strong, painting, when divested of this energy, cannot restore to music that assistance in imitations which she borrows from it. Though all nature should be asleep, he who contemplates her does not sleep; and the art of the musician consists in substituting, for this image of insensibility in the object, those emotions which its presence excites in the heart of the contemplator. He not only ferments and agitates the ocean, animates the flame to conflagration, makes the fountain murmur in his harmony, calls the rattling shower from heaven, and swells the torrent to resistless rage; but he paints the horrors of a boundless and frightful desert, involves the subterranean dungeon in tenfold gloom, soothes the tempest, tranquillizes the disturbed elements, and from the orchestra diffuses a recent fragrance through imaginary groves; nay, he excites in the soul the same emotions which we feel from the immediate perception and full influence of these objects.”

Under the word *Harmony*, Rousseau has said, that no assistance can be drawn from thence, no original principle which leads to musical imitation; since there cannot be any relation between chords and the objects which the composer would paint, or the passions which he would express. In the article *Melody*, he imagines he has discovered that principle of imitation which harmony cannot yield, and what resources of nature are employed by music in representing these objects and these passions.

It is hoped, however, that, in our article of *Melody*, we have shown upon what principle musical imitation may be compatible with harmony; though we admit, that from melody it derives its most powerful energy, and its most attractive graces. Yet we must either be deceived beyond all possibility of cure, or we have felt the power of imitative harmony in a high degree. We are certain that the fury, the impetuosity, the rapid vicissitudes, of a battle, may be successfully and vividly represented in harmony. We have participated the exultation and triumph of a conquest, inspired by the sound of a full chorus. We have felt all the solemnity and grandeur of devotion from the slow movement, the deep chords, the swelling harmony, of a sentimental composition played upon the organ. Nor do we imagine harmony less capable of representing the tender depression, the fluctuating and tremulous agitation, of grief. As this kind of imitation is the noblest effort of music, it is astonishing that it should have been overlooked by M. D'Alembert. He has indeed apologized, by informing us, that his treatise is merely elementary: but we are uncertain how far this apology ought to be regarded as sufficient, when it is at the same time considered, that he has given an account of imitation in its mechanical, or what Rousseau calls its

Immaculate
||
Immunity.

technical, sense; which, however, to prevent ambiguity, we should rather choose to call *myself*, or *anacaphidist*. To Rousseau's account of the word in this acceptance, we return.

"Imitation (says he), in its technical sense, is a reiteration of the same air, or of one which is similar, in several parts where it is repeated by one after the other, either in unison, or at the distance of a fourth, a fifth, a third, or any other interval whatever. The imitation may be happily enough pursued even though several notes should be changed; provided the same air may always be recognized, and that the composer does not deviate from the laws of proper modulation. Frequently, in order to render the imitation more sensible, it is preceded by a general rest, or by long notes which seem to obliterate the impression formerly made by the air till it is renewed with greater force and vivacity by the commencement of the imitation. The imitation may be treated as the composer chooses; it may be abandoned, resumed, or another begun at pleasure; in a word, its rules are as much relaxed as those of the fugue are severe: for this reason, it is despised by the most eminent masters; and every imitation of this kind too much affected, almost always betrays a novice in composition."

IMMACULATE, something without stain, chiefly applied to the conception of the holy virgin. See CONCEPTION *Immaculate*.

IMMATERIAL, something devoid of matter, or that is pure spirit: thus God, angels, and the human soul, are immaterial beings.

IMMEDIATE, whatever is capable of producing an effect without the intervention of external means; thus we say, an immediate cause, in opposition to a mediate or remote one.

IMMENSITY, an unlimited extension, or which no finite and determinate space, repeated ever so often, can equal.

IMMER, the most easterly island of all the New Hebrides in the South Sea. It lies about four leagues from TANNA, and seems to be about five leagues in circumference; it is of a considerable height, with a flat-top.

IMMERSION, that act by which any thing is plunged into water or other fluid.

It is used in chemistry for a species of calcination, when any body is immersed in a fluid to be corroded: or it is a species of lotion; as when a substance is plunged into any fluid, in order to deprive it of a bad quality, or communicate to it a good one.

IMMERSION, in astronomy, is when a star or planet is so near the sun with regard to our observations, that we cannot see it; being, as it were, enveloped and hid in the rays of that luminary. It also denotes the beginning of an eclipse of the moon, or that moment when the moon begins to be darkened, and to enter into the shadow of the earth.

IMMORTAL, that which will last to all eternity, as having in it no principle of alteration or corruption: thus God and the human soul are immortal. See SOUL.

IMMUNITY, a privilege or exemption from some office, duty, or imposition, as an exemption from tolls, &c.

Immunity is more particularly understood of the liberties granted to cities and communities.

IMOLA, a town of Italy, in the territory of the church, and in Romagna, with a bishop's see. It is a very handsome populous place; and is seated on the river Santarno, in E. Long. 11. 43. N. Lat. 44. 28.

IMPALE, in heraldry, is to conjoin two coats of arms pale-wise. Women impale their coats of arms with those of their husbands. See HERALDRY, p. 3589, 3610.

To impale cities, camps, fortifications, &c. is to inclose them with palisadoes.

To **IMPALE**, or **Empale**, signifies also to put to death by spitting on a stake fixed upright.

IMPALPABLE, that whole parts are so extremely minute, that they cannot be distinguished by the senses, particularly by that of feeling.

IMPANATION, a term used by divines to signify the opinion of the Lutherans with regard to the eucharist, who believe that the species of bread and wine remain together with the body of our Saviour after consecration.

IMPANELLING, in law, signifies the writing down or entering into a parchment, list, or schedule, the names of a jury summoned by the sheriff to appear for such public services as juries are employed in.

IMPARLANCE, in law, a petition in court for a day to consider or advise what answer the defendant shall make to the plaintiff's action; and is the continuance of the cause till another day, or a longer time given by the court.

IMPASTATION, the mixture of various materials of different colours and consistencies, baked or bound together with some cement, and hardened either by the air or by fire.

IMPATIENS, TOUCH-ME-NOT, and *Balsamine*; a genus of the monogamia order, belonging to the syn-genefia class of plants.

Species. 1. The noli-me-tangere, or common yellow balsamine, is a native of Britain, but is cultivated in many gardens for curiosity. It hath a fibrous root, an upright, jointed, succulent, stalk, about 18 inches high, with alternate oval leaves; and from the axillas of the stalks, long, slender, branching footstalks, each sustaining many yellow flowers; succeeded by taper capsules, that burst open and dart forth their seeds with great velocity, whence its name. 2. The balsamina, or balsam, is a native of India. It hath a fibrous root, an upright, thick, succulent stalk, branching all around a foot and an half or two feet high; with long, spear-shaped, sawed leaves, the upper ones alternate; and from the joints of the stalk and branches clusters of short foot-stalks, each sustaining one large irregular flower, of different colours in the varieties; flowering from June or July till September.

Culture. The first species is very hardy, and will grow freely from the seeds in any common border; but the second requires artificial warmth. The seeds will indeed grow in the full ground, but rarely before the month of May; and more freely then, if covered with a hand-glass, &c. But the plants raised by artificial heat will flower five or six weeks sooner than those raised in the natural ground. The seeds ought therefore always to be sowed on a hotbed in March or April, and the plants continued therein till June, and if the frames be deep they will then be drawn up to the length of two or three feet; after which they may

Imola
||
Impatiens.

impeach-
ment
||
imperfect.

be planted in pots, which must likewise be continued in the hot-bed till the plants have taken fresh root.

IMPEACHMENT, an accusation and profecution for treason and other crimes and misdemeanours. Any member of the lower house of parliament may impeach any one belonging either to that body, or to the house of lords. The method of proceeding is to exhibit articles on the behalf of the commons, by whom managers are appointed to make good their charge. These articles are carried to the lords, by whom every person impeached by the commons is always tried; and if they find him guilty, no pardon under the great seal can be pleaded to such an impeachment. 12 Will. III. cap. ii.

IMPENETRABILITY, in philosophy, that property of body, whereby it cannot be pierced by another: thus, a body which fills a space as to exclude all others, is said to be impenetrable.

IMPERATIVE, one of the moods of a verb, used when we would command, intreat, or advise: thus, *go read, take pity, be advised*, are imperatives in our language. But in the learned languages, this mood has a peculiar termination to distinguish it from others, as *io, or ito, "go;" lege, or legito, "read," &c.* and not only so, but the termination varies, according as you address one or more persons, as *audi* and *audite*; ακούω, ακούετε, ακούστω, &c.

IMPERATOR, in Roman antiquity, a title of honour conferred on victorious generals by their armies, and afterwards confirmed by the senate.

IMPERATORIA, **MASTERWORT**; a genus of the digynia order, belonging to the pentandria class of plants.—There is but one species, viz. the ostruthium, a native of the Austrian and Styrian Alps, and other mountainous places of Italy. Mr Lightfoot also informs us, that he has found it in several places on the banks of the Clyde in Scotland; but whether indigenous or not, is uncertain. The root is as thick as a man's thumb, running obliquely in the ground; it is fleshy, aromatic, and has a strong acrid taste, biting the tongue like pellitory of Spain: the leaves arise immediately from the root; they have long foot-stalks, dividing into three very short ones at the top, each sustaining a trilobate leaf, indented on the border. The footstalks are deeply channelled, and, when broken, emit a rank odour. The flower-stalks rise about two feet high, dividing into two or three branches, each being terminated by a pretty large umbel of white flowers whose petals are split; these are succeeded by oval compressed seeds, somewhat like those of dill, but larger.—The plant is cultivated in gardens for the sake of its roots, which are used in medicine. It may be propagated either by seeds, or by parting the roots in autumn. They thrive best in a shady situation.—The root has a flavour similar to that of angelica, and is esteemed a good sudorific. There are instances of its having cured the ague when the bark had failed. It should be dug up in winter, and a strong infusion made in wine.

IMPERFECT, something that is defective, or that wants some of the properties found in other beings of the same kind.

IMPERFECT Tense, in grammar, a tense that denotes some preterite case, or denotes the thing to be at that time present and not quite finished; as *scri-*

bebam, "I was writing."

IMPERIAL, something belonging to an emperor, or empire. See **EMPEROR**, and **EMPIRE**.—Thus we say, his *imperial majesty, the imperial crown, imperial arms, &c.*

IMPERIAL Crown. See **HERALDRY**, p. 3606.

IMPERIAL Chamber, is a sovereign court, established for the affairs of the immediate states of the empire. See **CHAMBER**.

IMPERIAL Cities, in Germany, are those which own no other head but the emperor.

These are a kind of little commonwealths; the chief magistrate whereof does homage to the emperor, but in other respects, and in the administration of justice, is sovereign.

Imperial cities have a right of coining money, and of keeping forces and fortified places. Their deputies assist at the imperial diets, where they are divided into two branches, that of the Rhine, and that of Suabia. There were formerly 22 in the former, and 37 in the latter; but there are now only 48 in all.

IMPERIAL Diet, is an assembly or convention of all the states of the empire. See **DIET**.

IMPERIALI (John Baptist), a celebrated physician of Vicenza, where he was born in 1568. He composed several esteemed works both in prose and verse, written in good Latin; and died in 1623.

IMPERSONAL VERB, in grammar, a verb to which the nominative of any certain person cannot be prefixed; or, as others define it, a verb destitute of the two first and primary persons, as *deceit, oportet, &c.* The impersonal verbs of the active voice end in *t*, and those of the passive in *tur*; they are conjugated thro' the third person singular of almost all the tenses and moods: they want the imperative, instead of which we use the present of the subjunctive; as *punitur, pugnetur, &c.* nor, but a few excepted, are they to be met with in the supines, participles, or gerunds.

IMPERVIOUS, a thing not to be pervaded or passed through, either by reason of the closeness of its pores, or the particular configuration of its parts.

IMPETUS, in mechanics, the force with which one body strikes or impells another.

IMPLICATION, in law, is where something is implied that is not expressed by the parties themselves in their deeds, contracts, or agreements.

To IMPLY, or CARRY, in Music. These we have used as synonymous terms in that article. They are intended to signify those sounds, which ought to be the proper concomitants of any note, whether by its own nature, or by its position in artificial harmony. Thus every note, considered as an independent sound, may be said to *carry* or *imply* its natural harmonics, that is to say, its octave, its twelfth, and its seventeenth; or, when reduced, its eighth, its fifth, and its third. But the same sound when considered as constituting any part of harmony, is subjected to other laws and different limitations. It can then only be said to *carry* or *imply* such simple sounds, or complications of sound, as the preceding and subsequent chords admit or require. For these the laws of melody and harmony must be consulted. See **MELODY**, and **HARMONY**.

IMPORTATION in commerce, the bringing merchandize into a kingdom from foreign countries; in

Imperial
||
Importation.

Importation.

in contradistinction to exportation. See EXPORTATION.

We shall here give some of the principal laws relating to the importation of goods into this kingdom. Goods imported without entry or paying customs, are forfeited; and the lord-treasurer, the barons of the exchequer, or chief magistrates of the place where the offence was committed, or next adjoining to it, may grant a warrant to any person, who, with the assistance of a constable, may break open doors, chests, &c. and take thence any prohibited or unaccustomed goods; but this is to be done within one month after the offence was committed. But if false information is given, the person wrongfully accused may recover costs and damages.

No ship or vessel arriving from beyond sea is to be above three days in failing from Gravesend to the place of discharge on the river Thames, unless hindered by contrary winds or other impediment. And no ship bound for the port of London is to touch or stay at any place adjoining to any shore, between Gravesend and Chester-quay. True entries are to be made of all such ships lading, upon oath of the master or purser for that voyage; also where she took in her lading, where she was built, how manned, who were the owners, and who the master during the voyage. In all out-ports, ships are to come directly to the place of unlading, and make true entries as aforesaid, upon penalty of the forfeiture of 100 l.

After any ship is cleared, and the watchmen and tidemen discharged from their attendance, if there be found on board any concealed goods that have not paid the duty inwards, the master, or other person taking charge of the ship, shall forfeit 100 l.

Porters, carmen, watermen, &c. assisting in lading unaccustomed goods, shall on conviction, for the first offence, be committed to the next jail till they find security for their good behaviour; and for their second offence they are to be committed to prison for two months, without bail or mainprize, or till they are discharged by the court of exchequer, or each of them pay 5 l. to the sheriff of the county.

No merchant-denizen shall cover a stranger's goods, but shall, by himself or agent, sign one of his bills of every entry, with the mark, number, and contents of every parcel of goods, without which no entry shall pass. And no children of aliens under the age of 21 years, shall have entry made in their names, nor be permitted to trade.

Merchants, trading into the port of London, shall have free liberty to lade and unlade their goods at any of the lawful quays between the tower and London-bridge, from sun-rising to sun-setting, from September 10. to March 10.; and between six o'clock in the morning and six in the evening, from March 10. to September 10.; giving notice thereof to the respective officers appointed to attend the lading and unlading of goods. And such officers as shall refuse to be present shall forfeit 5 l. for every default.

To prevent combination between importers, and seizers of goods unlawfully imported or exported, none shall seize them but the officers of the customs, or such as shall be authorized so to do by the lord-treasurer, under-treasurer, or a special commission from his majesty under the great privy-seal.

If any feizer of prohibited or unaccustomed goods does not make due prosecution thereof, it is lawful for the custom-house officers, or others deputed thereto, to make seizure of such goods; and they shall be, in law, adjudged the first true informers and feizers, and have the benefit thereof, notwithstanding any law and statute to the contrary.

All foreign goods permitted to be landed by bills at sight, bills at view or sufferance, shall be landed at the most convenient quays and wharfs, as the officers of the customs shall direct; and there, or at the king's store-house of the respective ports, shall be measured, weighed, numbered, &c. by the officers appointed, who shall perfect the entry, and subscribe their names to it, and the next day make their report to the customer, collector, or comptroller; or, in default thereof, shall forfeit 100 l.

Any merchant who shall import goods, shall have liberty to break bulk in any lawful port or quay, the master or purser first making oath of the true contents of the ship's lading. No English merchant shall put on shore in Scotland or Ireland, any merchandize of the growth or produce of any of his majesty's plantations, unless the same have been first landed in England, Wales, or Berwick, and paid the duties with which they are chargeable, under the penalty of forfeiting the ship and goods, three-fourths to the king, and one-fourth to the informer or him that shall sue for the same: but if a ship be disabled, or driven into any port of Ireland, and unable to proceed on her voyage, her goods may be put on shore, under the hands of the principal officers of the customs there residing, till the goods can be put on board some other vessel, to be transported to some part of England or Wales.

Natives of England or Ireland may import into England, directly from Ireland, any hemp, flax, thread, yarn and linen, of the growth and manufacture of Ireland, custom-free; the chief officer so importing bringing a certificate from the chief office in Ireland, expressing the particulars of the goods, with the names and places of abode of the exporters thence, and of such as have sworn that the said goods are *bona fide* of the growth and manufacture of that kingdom, and who they are consigned to in England; and the chief officer shall make oath, that the said goods are the same that are on board by virtue of that certificate.

IMPOST, in law, signifies in general a tribute or custom, but is more particularly applied to signify that tax which the crown receives for merchandizes imported into any port or haven.

IMPOSTHUME, in surgery, &c. See ABSCESS.

IMPOTENCE, or IMPOTENCY, in general, denotes want of strength, power, or means, to perform any thing.

Divines and philosophers distinguish two sorts of impotency; natural, and moral. The first is a want of some physical principle, necessary to an action; or where a being is absolutely defective, or not free and at liberty to act: The second only imports a great difficulty; as a strong habit to the contrary, a violent passion, or the like.

Impotency is more particularly used for a natural inability to coition. Impotence with respect to men

Importation
||
Impotence.

impregnation is the same as sterility in women; that is, an inability of propagating the species. There are many causes of impotence; as, a natural defect in the organs of generation, which seldom admits of a cure: accidents, or diseases; and in such cases the impotence may, or may not, be remedied, according as these are curable or otherwise.—The most common causes are, early and immoderate venery, or the venereal disease. We have instances, however, of unfitness for generation in men by an impediment to the ejection of the semen in coition, from a wrong direction which the orifice at the *verumontanum* got, whereby the seed was thrown up into the bladder. M. Petit cured one patient under such a difficulty of emission, by making an incision like to that commonly made in the great operation for the stone.

IMPREGNATION, the getting a female with child. See PREGNANCY.

The term *impregnation* is also used, in pharmacy, for communicating the virtues of one medicine to another, whether by mixture, coction, digestion, &c.

IMPRESSING SEAMEN. The power of impressing sea-faring men for the sea-service by the king's commission, has been a matter of some dispute, and submitted to with great reluctance; though it hath very clearly and learnedly been shewn by Sir Michael Foster, that the practice of impressing, and granting powers to the admiralty for that purpose, is of very ancient date, and hath been uniformly continued by a regular series of precedents to the present time: whence he concludes it to be part of the common law. The difficulty arises from hence, that no statute has expressly declared this power to be in the crown, though many of them very strongly imply it. The statute 2 Ric. II. c. 4. speaks of mariners being arrested and retained for the king's service, as of a thing well known, and practised without dispute; and provides a remedy against their running away. By a later statute, if any waterman, who uses the river Thames, shall hide himself during the execution of any commission of pressing for the king's service, he is liable to heavy penalties. By another, (*5 Eliz. c. 5.*) no fisherman shall be taken by the queen's commission to serve as a mariner; but the commission shall be first brought to two justices of the peace, inhabiting near the sea-coast where the mariners are to be taken, to the intent that the justices may choose out and return such a number of able-bodied men, as in the commission are contained, to serve her majesty. And, by others, especial protections are allowed to seamen in particular circumstances, to prevent them from being impressed. Ferry-men are also said to be privileged from being impressed, at common law. All which do most evidently imply a power of impressing to reside somewhere; and, if any where, it must, from the spirit of our constitution, as well as from the frequent mention of the king's commission, reside in the crown alone.—After all, however, this method of manning the navy is to be considered as only defensible from public necessity, to which all private considerations must give way.

The following persons are exempted from being impressed: Apprentices for three years; the master, mate, and carpenter, and one man for every 100 tons, of vessels employed in the coal-trade; all under 18 years of age, and above 55; foreigners in merchant-ships

and privateers; landmen betaking themselves to sea for two years; seamen in the Greenland fishery, and harpooners, employed, during the interval of the fishing season, in the coal-trade, and giving security to go to the fishing next season.

IMPRESSION is applied to the species of objects which are supposed to make some mark or impression on the senses, the mind, and the memory. The Peripatetics assert, that bodies emit species resembling them, which are conveyed to the common *sensorium*, and they are rendered intelligible by the active intellect; and, when thus spiritualized, are called *expressions*, or *express species*, as being expressed from the others.

IMPRESSION also denotes the edition of a book, regarding the mechanical part only; whereas *edition*, besides this, takes in the care of the editor, who corrected or augmented the copy, adding notes, &c. to render the work more useful.

IMPRISONMENT, the state of a person restrained of his liberty, and detained under the custody of another.

No person is to be imprisoned but as the law directs, either by the command or order of a court of record, or by lawful warrant; or the king's process, on which one may be lawfully detained. And at common law, a person could not be imprisoned unless he were guilty of some force and violence, for which his body was subject to imprisonment, as one of the highest executions. Where the law gives power to imprison, in such case it is justifiable, provided he that does it in pursuance of a statute, exactly pursues the statute in the manner of doing it; for otherwise it will be deemed false imprisonment, and of consequence it is unjustifiable. Every warrant of commitment for imprisoning a person, ought to run, "Till delivered by due course of law," and not "Until farther order;" which has been held ill: and thus it also is, where one is imprisoned on a warrant not mentioning any cause for which he is committed. See ARREST and COMMITMENT.

False IMPRISONMENT. Every confinement of the person is an imprisonment, whether it be in a common prison, or in a private house, or in the stocks, or even by forcibly detaining one in the public streets. Unlawful or false imprisonment, consists in such confinement or detention without sufficient authority: which authority may arise either from some process from the courts of justice; or from some warrant from a legal power to commit, under his hand and seal, and expressing the cause of such commitment; or from some other special cause warranted, for the necessity of the thing, either by common law, or act of parliament; such as the arresting of a felon by a private person without warrant, the impressing of mariners for the public service, or the apprehending of waggoners for misbehaviour in the public highways. False imprisonment also may arise by executing a lawful warrant or process at an unlawful time, as on a Sunday; or in a place privileged from arrests, as in the verge of the king's court. This is the injury. The remedy is of two sorts; the one removing the injury, the other making satisfaction for it.

The means of removing the actual injury of false imprisonment, are four-fold, 1. By writ of MAINPRIZE. 2. By writ *De Odio et Atia*. 3. By writ *De Homine Replegiando*.

Impression
||
Imprisonment.

Impromptu *Replegiando*. 4. By writ of *HABEAS Corpus*. See those articles.

Impurity.

The *satisfactory* remedy for this injury of false imprisonment, is by an action of trespass *vi et armis*, usually called an *action of false imprisonment*; which is generally, and almost unavoidably, accompanied with a charge of assault and battery also: and therein the party shall recover damages for the injuries he has received; and also the defendant is, as for all other injuries committed with force, or *vi et armis*, liable to pay a fine to the king for the violation of the public peace.

IMPROMPTU, or **IMPROMPTU**, a Latin word frequently used among the French, and sometimes in English, to signify a piece made off-hand, or *extempore*, without any previous meditation, by mere force and vivacity of imagination.—Many authors pique themselves on their *impromptu's*, which yet were done at leisure and in cold blood.

IMPROBATION, in Scots law, the name of an action brought for setting any deed or writing aside upon the head of forgery.

IMPROPRIATION, in ecclesiastical law. See **APPROPRIATION**.

IMPURITY, in the law of Moses, is any legal defilement. Of these there were several sorts. Some were voluntary, as the touching a dead body, or any animal that died of itself, or any creature that was esteemed unclean; or the touching things holy, by one who was not clean, or was not a priest; the touching one who had a leprosy, one who had a gonorrhœa, or who was polluted by a dead carcase, &c. Sometimes these impurities were involuntary; as when any one inadvertently touched bones, or a sepulchre, or any thing polluted; or fell into such diseases as pollute, as the leprosy, &c.

The beds, clothes, and moveables, which had touched any thing unclean, contracted also a kind of impurity, and in some cases communicated it to others.

These legal pollutions were generally removed by bathing, and lasted no longer than the evening. The person polluted plunged over head in the water, and either had his clothes on when he did so, or washed himself and his clothes separately. Other pollutions continued seven days, as that which was contracted by touching a dead body. That of women in their monthly courses lasted till this was over with them. Other impurities lasted 40 or 50 days; as that of women who were lately delivered, who were unclean 40 days after the birth of a boy, and 50 after the birth of a girl. Others again lasted till the person was cured.

Many of these pollutions were expiated by sacrifices; and others by a certain water or lye, made with the ashes of a red heifer, sacrificed on the great day of expiation. When the leper was cured, he went to the temple, and offered a sacrifice of two birds, one of which was killed and the other set at liberty. He who had touched a dead body, or had been present at a funeral, was to be purified with the water of expiation, and this upon pain of death. The woman who had been delivered, offered a turtle and a lamb for her expiation; or if she was poor, two turtles or two young pigeons.

These impurities, which the law of Moses has expressed with the greatest accuracy and care, were only

figures of other more important impurities, such as the sins and iniquities committed against God, or faults committed against our neighbour. The fables and prophecies of the Old Testament were sensible of this; and our Saviour, in the gospel, has strongly inculcated, that they are not outward and corporeal pollutions which render us unacceptable to God, but such inward pollutions as infect the soul, and are violations of justice, truth, and charity.

IMPUTATION, in general, the charging something to the account of one, which belonged to another: thus, the assertors of original sin maintain, that Adam's sin is imputed to all his posterity.

In the same sense, the righteousness and merits of Christ are imputed to true believers.

INACCESSIBLE, something that cannot be come at, or approached, by reason of intervening obstacles, as a river, rock, &c. It is chiefly used in speaking of heights and distances. See **GEOMETRY**.

INACHUS, founder of the kingdom of Argos, 1856 B. C. See **ARGOS**.

INALIENABLE, that which cannot be legally alienated or made over to another: thus the dominions of the king, the revenues of the church, the estates of a minor, &c. are inalienable, otherwise than with a reserve of the right of redemption.

INANIMATE, a body that has either lost its soul, or that is not of a nature capable of having any.

INANITION, among physicians, denotes the state of the stomach when empty, in opposition to repletion.

INARCHING, in gardening, is a method of grafting, commonly called *grafting by approach*; and is used when the stock intended to graft on, and the tree from which the graft is to be taken, stand so near, or can be brought so near, that they may be joined together. The branch to be inarched is to be fitted to that part of the stock where it is to be joined; the rind and wood are to be paired away on one side for the length of three inches, and the stock or branch where the graft is to be united must be served in the same manner, so that the two may join equally, and the sap meet. A little tongue is then to be cut upwards in the graft, and a notch made in the stock to admit it; so that, when they are joined, the tongue will prevent their slipping, and the graft will more closely unite to the stock. Having thus brought them exactly together, they must be tied with some bals, or worsted, or other soft tying; and then the place must be covered with some grafting clay, to prevent the air from drying the wound, and the wet from rotting the stock. A stake must be fixed in the ground, to which both the stock and the graft must be tied to prevent the winds from displacing them. When they have remained in this state for four months, they will be sufficiently united, and the graft may then be cut off from the mother-tree, observing to slope it close to the stock; and at this time there should be fresh clay laid all round the part. This operation should be performed in April or May, that the graft may be perfectly united to the stock before the ensuing winter.

Inarching is chiefly practised upon oranges, myrtles, jessamines, walnuts, firs, and some other trees which do not succeed well in the common way of grafting. But it is a wrong practice when orange-trees are de-

imputation
inarching.

inauguration
Incense.

designed to grow large, for these are seldom long-lived after the operation.

INAUGURATION, the coronation of an emperor or king, or the consecration of a prelate: so called from the ceremonies used by the Romans, when they were received into the college of augurs.

INCA, or **YNCA**, a name given by the natives of Peru to their kings and the princes of the blood. Pedro de Cieca, in his Chronicle of Peru, gives the origin of the incas; and says, that that country was, for a long time, the theatre of all manner of crimes, of war, dissention, and the most dreadful disorders, till at last two brothers appeared, one of whom was called *Mangocapa*; of this person, the Peruvians relate many wonderful stories. He built the city of Cusco, made laws, established order and harmony by his wife regulations; and he and his descendants took the name of *incas*, which signifies king or great lord. These incas became so powerful, that they rendered themselves masters of all the country from Paillo to Chili, and from the river Maule on the south to the river Augasmago on the north; these two rivers forming the bounds of their empire, which extended above thirteen hundred leagues in length. This they enjoyed till the divisions between Inca Guascar and Atabalipa; which the Spaniards laying hold of, made themselves masters of the country, and destroyed the empire of the incas. See **PERU**.

INCAMERATION, a term used in the chancery of Rome, for the uniting of lands, revenues, or other rights, to the pope's domain.

INCANTATION, denotes certain ceremonies, accompanied with a formula of words, and supposed to be capable of raising devils, spirits, &c. See **CHARM**, &c.

INCAPACITY, in the canon-law, is of two kinds: 1. The want of a dispensation for age in a minor, for legitimization in a bastard, and the like: this renders the provision of a benefice void in its original. 2. Crimes and heinous offences, which annul provisions at first valid.

INCARNATION, in theology, the act whereby the second Person of the Holy Trinity assumed the human nature, viz. a true body and reasonable soul, in order to accomplish the redemption of fallen mankind.

INCARNATIVES, in surgery, medicines which assist nature in filling up wounds or ulcers with flesh; or rather remove the obstructions thereto.

INCENSE, or **FRANKINCENSE**, in the materia medica, &c. a dry resinous substance, known among authors by the names *THUS* and *OLIBANUM*.

Incense is a rich perfume, with which the Pagans, and the Roman-Catholics still, perfume their temples, altars, &c.—The word comes from the Latin *incensum*, q. d. *burnt*; as taking the effect for the thing itself.

The burning of incense made part of the daily service of the ancient Jewish church. The priests drew lots to know who should offer it: the destined person took a large silver dish, in which was a censor full of incense; and being accompanied by another priest carrying some live coals from the altar, went into the temple. There, in order to give notice to the people, they struck upon an instrument of brass placed

Vol. V.

between the temple and the altar; and being returned to the altar, he who brought the fire left it there, and went away. Then the offerer of incense having said a prayer or two, waited the signal, which was the burning of the holocaust; immediately upon which he set fire to the incense, the whole multitude continuing all the time in prayer. The quantity of incense offered each day, was half a pound in the morning, and as much at night.

One reason of this continual burning of incense might be, that the multitude of victims that were continually offered up, would have made the temple smell like a slaughter-house, and consequently have inspired the comers rather with disgust and aversion, than awe and reverence, had it not been overpowered by the agreeable fragrance of those perfumes.

INCEST, the crime of venereal commerce between persons who are related in a degree: wherein marriage is prohibited by the law of the country.

Some are of opinion, that marriage ought to be permitted between kinsfolks, to the end that the affection so necessary in marriage might be heightened by this double tie: yet the rules of the church have formerly extended this prohibition even to the seventh degree; but time has now brought it down to the third or fourth degree.

Most nations look on incest with horror, Persia and Egypt alone excepted. In the history of the ancient kings of those countries we meet with instances of the brother's marrying the sister; the reason was, because they thought it too mean to join in alliance with their own subjects, and still more so to have married into any foreign family.

INCEST Spiritual, a crime committed in like manner between persons who have a spiritual alliance by means of baptism or confirmation.

Spiritual incest is also understood of a vicar, or other beneficiary, who enjoys both the mother and daughter; that is, holds two benefices, the one whereof depends upon the collation of the other.

Such a spiritual-incest renders both the one and the other of these benefices vacant.

INCH, a well-known measure of length; being the twelfth part of a foot, and equal to three barley-corns in length.

INCH of Candle, (sale by). See **CANDLE**.

INCHANTMENT. See **WITCHCRAFT**.

INCIDENCE, denotes the direction in which one body strikes on another. See **OPTICS** and **MECHANICS**.

Angle of INCIDENCE. See **ANGLE**.

INCIDENT DILIGENCE, in Scots law, a warrant granted by a lord ordinary in the court of session, for citing witnesses for proving any point, or for production of any writing necessary for preparing the cause for a final determination, or before it goes to a general proof.

INCISIVE, an appellation given to whatever cuts or divides: thus, the foreteeth are called *dentes incisivi*, or cutters; and medicines of an attenuating nature, *incidenti*, or incisive medicines.

INCLE, a kind of tape made of linen yarn.

INCLINATION, is a word frequently used by mathematicians, and signifies the mutual approach, tendency, or leaning of two lines or two planes to-

22 D

wards

Incest
Inclination.

Inclined
||
Incus.

wards each other, so as to make an angle.

INCLINED PLANE, in mechanics, one that makes an oblique angle with the horizon. See **MECHANICS**.

INCOGNITO, or **INCOG**, is applied to a person who is in any place where he would not be known: but it is more particularly applied to princes, or great men, who enter towns, or walk the streets, without their ordinary train or the usual marks of their distinction and quality.

INCOMBUSTIBLE, something that cannot be burnt, or consumed by fire. See **ASBESTUS**.

INCOMMENSURABLE, a term in geometry, used where two lines, when compared to each other, have no common measure, how small soever, that will exactly measure them both. And in general, two quantities are said to be incommensurable, when no third quantity can be found that is an aliquot part of both.

INCOMMENSURABLE Numbers, are such as have no common divisor that will divide them both equally.

INCOMPATIBLE, that which cannot subsist with another without destroying it: thus cold and heat are incompatible in the same subject, the strongest overcoming and expelling the weakest.

INCORPORATION, in pharmacy, is much the same as imputation, being a reduction of dry substances to the consistence of a paste, by the admixture of some fluid: thus pills, boles, troches, and plasters, are made by incorporation. Another incorporation is when things of different consistencies are by digestion reduced to one common consistence.

INCORPORATION, or **Body-Corporate**. See **CORPORATION**.

INCRASSATING, in pharmacy, &c. the rendering of fluids thicker by the mixture of other substances less fluid, or by the evaporation of the thinner parts.

INCUBATION, the action of a hen, or other fowl, brooding on her eggs. See **HATCHING**.

INCUBUS, **NIGHT-MARE**, a disease consisting in an oppression of the breast, so very violent, that the patient cannot speak or even breathe. The word is derived from the Latin *incubare*, to "lie down" on any thing and press it: the Greeks call it *spanaxine*, q. d. *fallator*, "leaper," or one that rusheth on a person.

In this disease the senses are not quite lost, but drowned and astonished, as is the understanding and imagination; so that the patient seems to think some huge weight thrown on him, ready to strangle him. Children are very liable to this distemper; so are fat people, and men of much study and application of mind; by reason the stomach in all these finds some difficulty in digestion. See (*Index* subjoined to) **MEDICINE**.

INCUMBENT, a clerk or minister who is resident on his benefice; he is called *incumbent*, because he does, or at least ought to bend his whole study to discharge the cure of his church.

INCURVATION of the **RAYS** of **LIGHT**, their bending out of a rectilinear straight course, occasioned by refraction. See **OPTICS**.

INCUS, in anatomy, a bone of the internal ear, somewhat resembling one of the anterior dentes mo-

lars. See **ANATOMY**, n° 405. c.

INDEFEASIBLE, a term in law for what cannot be defeated or made void; as an indefeasible estate of inheritance, &c.

INDEFEASIBLE Right to the Throne. See **HEREDITARY Right**.

INDEFINITE, that which has no certain bounds, or to which the human mind cannot affix any.

INDEFINITE, in grammar, is understood of nouns, pronouns, verbs, participles, articles, &c. which are left in an uncertain indeterminate sense, and not fixed to any particular time, thing, or other circumstance.

INDELIBLE, something that cannot be cancelled or effaced.

INDEMNITY, in law, the saving harmless; or a writing to secure one from all damage and danger that may ensue from any act.

INDENTED, in heraldry, is when the outline of an ordinary is notched like the teeth of a saw.

INDEPENDENTS, a sect of Protestants in Britain and Holland, so called from their independency on other churches, and their maintaining, that each church or congregation has sufficient power to act and perform every thing relating to religious government within itself, and is no way subject or accountable to other churches or their deputies.

They therefore disallow parochial and provincial subordination, and form all their congregations upon a scheme of co-ordinancy. But though they do not think it necessary to assemble synods, yet if any be held, they look upon their resolutions as prudential counsels, but not as decisions to which they are obliged to conform.

The present Independents differ from the Presbyterians only in their church-government; in being generally more attached to the doctrines distinguished by the term *orthodoxy*, such as original sin, election, reprobation, &c.; and in administering the Lord's Supper at the close of the afternoon's service. See **PRESBYTERIANS**.

The several sects of Baptists are all Independents with respect to church-government; and, like them, administer the Lord's Supper in the evening; whereas the Presbyterians administer it after the forenoon's service. See **ANABAPTISTS**.

INDETERMINATE, in general, an appellation given to whatever is not certain, fixed, and limited; in which sense it is the same with *indefinite*.

INDEX, in arithmetic and algebra, shews to what power any quantity is involved, and is otherwise called its *exponent*. See **ALGEBRA**, n° 9.

Expurgatory INDEX, a catalogue of prohibited books in the church of Rome.

The first catalogues of this kind were made by the inquisitors; and these were afterwards approved of by the council of Trent, after some alteration was made in them by way of retrenchment or addition. Thus an index of heretical books being formed, it was confirmed by a bull of Clement VIII. in 1595, and printed with several introductory rules; by the fourth of which, the use of the scriptures in the vulgar tongue if forbidden to all persons without a particular licence; and by the tenth rule it is ordained, that no book shall be printed at Rome, without the approbation of the Pope's vicar, or some person delegated by the Pope;

indefeasible
||
Index.

India II. Indictment. nor in any other places, unless allowed by the bishop of the diocese, or some person deputed by him, or by the inquisitor of heretical practice.

The Trent index being thus published, Philip II. of Spain ordered another to be printed at Antwerp, in 1571, with considerable enlargements. Another index was published in Spain in 1584; a copy of which was snatched out of the fire when the English plundered Cadiz. Afterwards there were several expurgatory indexes printed at Rome and Naples, and particularly in Spain.

INDIA PROPER, or HITHER INDIA, a large peninsula in Asia, bounded on the north by Ubec Tartary and Thibet; on the east, by another part of Thibet, the kingdom of Afem, Ava, and Pegu; on the south, by the bay of Bengal and the Indian ocean; and by the same ocean and Persia, on the west; situated between 66° and 92° of east longitude, and between 7° and 40° of north latitude: being about 2000 miles in length from north to south, and 1500 miles in breadth from east to west where broadest; though the southern part of the peninsula is not 300 miles broad. All the country within these limits is either subject or tributary to the great Mogul. It is frequently called *Indoflan*; a name supposed to be derived from the river Indus, on its western frontiers: it is also called the *Mogulflan*, from the imperial family now upon the throne, who trace their pedigree from Tamerlane, a Mogul Tartar. See *MOGULS*.

INDIA *beyond the Ganges*, is a country bounded by Thibet and Boutan on the north; by China, Tonquin, and Cochinchina, on the east; by the Indian Ocean, on the south; and by the hither India, the bay of Bengal, and the straits of Malacca, on the west: it is situated between 92° and 104° of east longitude, and between the equator and 30° degrees of north latitude: being near 2000 miles in length from north to south, but of a very unequal breadth; in which limits are comprehended the kingdoms of Afem, Ava, Pegu, Laos, Siam, Cambodia, and Malacca, governed by as many Indian princes; only the Dutch have usurped the dominion of Malacca.

INDIAN *Berry*. See *COCCULUS*.

INDIAN *Ink*. See *INK*.

INDICATION, in phisic, whatever serves to direct the physician how to act.

INDICATIVE, in grammar, the first mood or manner of conjugating a verb, by which we simply affirm, deny, or ask something: as, *amant*, they love; *non amant*, they do not love; *amantne*? do they love?

INDICTION, in chronology, a cycle of 15 years. See *CYCLE*.

INDICTMENT, in law, one of the modes of prosecuting an offender. See *PROSECUTION*.

If English law, it is a written accusation of one or more persons of a crime or misdemeanor, preferred to, and presented upon oath by, a grand jury. To this end, the sheriff of every county is bound to return to every session of the peace, and every commission of *oyer and terminer*, and of general gaol-delivery, twenty-four good and lawful men of the county, some out of every hundred, to inquire, present, do, and execute all those things, which on the part of our lord the king shall then and there be commanded them.

They ought to be freeholders; but to what amount is Indictment. uncertain: which seems to be *casus omisus*, and as proper to be supplied by the legislature as the qualifications of the petit jury; which were formerly equally vague and uncertain, but are now settled by several acts of parliament. However, they are usually gentlemen of the best figure in the county. As many as appear upon this pannel, are sworn upon the grand jury, to the amount of twelve at the least, and not more than twenty-three; that twelve may be a majority. Which number, as well as the constitution itself, we find exactly described so early as the laws of King Ethelred: *Exeant seniores duodecim thani, et Wilk. II. praefectus cum eis, et jurent super sanctuarium quod Ang. Lex. eis in manus datur, quod nolint ullum innocentem accusare, nec aliquem noxium celare.* 117.

In the time of King Richard I. (according to Hoveden), the process of electing the grand jury, ordained by that prince, was as follows: Four knights were to be taken from the county at large, who chose two more out of every hundred; which two associated to themselves ten other principal freemen, and those twelve were to answer concerning all particulars relating to their own district. This number was probably found too large and inconvenient; but the traces of this institution still remain, in that some of the jury must be summoned out of every hundred. This grand jury are previously instructed in the articles of their inquiry, by a charge from the judge who presides upon the bench. They then withdraw to sit and receive indictments, which are preferred to them in the name of the king, but at the suit of any private prosecutor; and they are only to hear evidence on behalf of the prosecution: for the finding of an indictment is only in the nature of an inquiry or accusation, which is afterwards to be tried and determined; and the grand jury are only to inquire upon their oaths, whether there be sufficient cause to call upon the party to answer it. A grand jury, however, ought to be thoroughly persuaded of the truth of an indictment, so far as their evidence goes; and not to rest satisfied merely with remote probabilities: a doctrine that might be applied to very oppressive purposes.

The grand jury are sworn to inquire only for the body of the county, *pro corpore comitatus*; and therefore they cannot regularly inquire of a fact done out that county for which they are sworn, unless particularly enabled by act of parliament. And to so high a nicety was this matter anciently carried, that where a man was wounded in one county, and died in another, the offender was at common law indictable in neither, because no complete act of felony was done in any one of them: but by statute 2 and 3 Ed. VI. c. 24. he is now indictable in the county where the party died. And, by statute 2 Geo. II. c. 21. if the stroke or poisoning be in England, and the death upon the sea or out of England, or *vice versa*, the offenders, and their accessories, may be indicted in the county where either the death, poisoning, or stroke, shall happen. And so in some other cases; as, particularly, where treason is committed out of the realm, it may be inquired of in any county within the realm, as the king shall direct, in pursuance of statutes 26 Hen. VIII. c. 13. 33.; Hen. VIII. c. 23. 35.; Hen. VIII. c. 2. 5. 6.; Edw. VI. c. 11. And

Indictment. counterfeiters, wafers, or minishers, of the current coin, together with all manner of felons and their accessories, may, by statute 26 Hen. VIII. c. 6. (confirmed and explained by 34 and 35 Hen. VIII. c. 26. § 75. 76.) be indicted and tried for those offences, if committed in any part of Wales, before the justices of gaol-delivery and of the peace, in the next adjoining county of England, where the king's writ runneth; that is, at present in the county of Hereford or Salop; and not, as it should seem, in the county of Chelster or Monmouth: the one being a county palatine where the king's writ did not run; and the other a part of Wales, in 26 Hen. VIII. Murders also, whether committed in England or in foreign parts, may, by virtue of the statute 33 Hen. VIII. c. 23. be inquired of and tried by the king's special commission in any shire or place in the kingdom. By statute 10 and 11 W. III. c. 25. all robberies, and other capital crimes, committed in Newfoundland, may be inquired of and tried in any county in England. Offences against the black act, 9 Geo. I. c. 22. may be inquired of and tried in any county of England, at the option of the prosecutor. So felonies in destroying turnpikes, or works upon navigable rivers, erected by authority of parliament, may, by statutes 8 Geo. II. c. 20. and 13 Geo. III. c. 84. be inquired of and tried in any adjacent county. By statute 26 Geo. II. c. 19. plundering or stealing from any vessel in distress or wrecked, or breaking any ship contrary to 12 Ann. ft. 2. c. 18. may be prosecuted either in the county where the fact is committed, or in any county next adjoining; and if committed in Wales, then in the next adjoining English county: by which is understood to be meant, such English county as, by the statute 26 Hen. VIII. above mentioned, had before a concurrent jurisdiction of felonies committed in Wales. Felonies committed out of the realm, in burning or destroying the king's ships, magazines, or stores, may, by statute 12 Geo. III. c. 24. be inquired of and tried in any county of England, or in the place where the offence is committed. By statute 13 Geo. III. c. 63. misdemeanors committed in India may be tried upon information or indictment in the court of king's-bench in England; and a mode is marked out for examining witnesses by commission, and transmitting their depositions to the court. But, in general, all offences must be inquired into, as well as tried, in the county where the fact is committed. Yet if larciny be committed in one county, and the goods carried into another, the offender may be indicted in either; for the offence is complete in both. Or he may be indicted in England for larciny in Scotland, and carrying the goods with him into England, or *vice versa*; or for receiving in one part of the united kingdom goods that have been stolen in another. But for robbery, burglary, and the like, he can only be indicted where the fact was actually committed: for though the carrying away and keeping of the goods is a continuation of the original taking, and is therefore larciny in the second county, yet it is not a robbery or burglary in that jurisdiction. And if a person be indicted in one county for larciny of goods originally taken in another, and be thereof convicted, or stands mute, he shall not be admitted to his clergy; provided the original taking be attended with such

circumstances as would have ousted him of his clergy Indictment. by virtue of any statute made previous to the year 1691.

When the grand jury have heard the evidence, if they think it a groundless accusation, they used formerly to endorse on the back of the bill, *Ignoramus*; or, We know nothing of it: intimating, that though the facts might possibly be true, that truth did not appear to them. But now they assent in English more absolutely, *Not a true bill*; or (which is the better way) *Not found*; and then the party is discharged without farther answer. But a fresh bill may afterwards be preferred to a subsequent grand jury. If they are satisfied of the truth of the accusation, they then endorse upon it, "A true bill;" anciently, *Billa vera*. The indictment is then said to be found, and the party stands indicted. But to find a bill, there must at least twelve of the jury agree: for so tender is the law of England of the lives of the subjects, that no man can be convicted at the suit of the king of any capital offence, unless by the unanimous voice of twenty-four of his equals and neighbours; that is, by twelve at least of the grand jury, in the first place, assenting to the accusation; and afterwards by the whole petit jury, of twelve more, finding him guilty upon his trial. But if twelve of the grand jury assent, it is a good presentment, though some of the rest disagree. And the indictment, when so found, is publicly delivered into court.

Indictments must have a precise and sufficient certainty. By statute 1 Hen. V. c. 5. all indictments must set forth the Christian name, surname, and addition of the state and degree, mystery, town, or place, and the county of the offender; and all this to identify his person. The time and place are also to be ascertained, by naming the day and township in which the fact was committed: though a mistake in these points is in general not held to be material, provided the time be laid previous to the finding of the indictment, and the place to be within the jurisdiction of the court; unless where the place is laid, not merely as a *venue*, but as part of the description of the fact. But sometimes the time may be very material, where there is any limitation in point of time assigned for the prosecution of offenders; as by the statute 7 Will. III. c. 3. which enacts, that no prosecution shall be had for any of the treasons or misprisons therein mentioned, (except an assassination designed or attempted on the person of the king), unless the bill of indictment be found within three years after the offence committed: and, in case of murder, the time of the death must be laid within a year and a day after the mortal stroke was given. The offence itself must also be set forth with clearness and certainty; and in some crimes particular words of art must be used, which are so appropriated by the law to express the precise idea which it entertains of the offence, that no other words, however synonymous they may seem, are capable of doing it. Thus, in treason, the facts must be laid to be done "treasonably, and against his allegiance;" anciently, *proditorie et contra ligeantie sue debitum*; else the indictment is void. In indictments for murder, it is necessary to say that the party indicted "murdered," not "killed" or "slew," the other; which, till the late statute, was expressed in Latin by the word *murdravit*.

dravit. In all indictments for felonies, the adverb "feloniously," *felonice*, must be used; and for burglaries also, *burglariter*, or, in English, "burglariously;" and all these to ascertain the intent. In rapes, the word *rapuit*, or "ravished," is necessary, and must not be expressed by any periphrasis, in order to render the crime certain. So in larcinies also, the words *felonice cepit et asportavit*, "feloniously took or carried away," are necessary to every indictment; for these only can express the very offence. Also, in indictments for murder, the length and depth of the wound should in general be expressed, in order that it may appear to the court to have been of a mortal nature: but if it goes through the body, then its dimensions are immaterial; for that is apparently sufficient to have been the cause of the death. Also, where a limb, or the like, is absolutely cut off, there such description is impossible. Lastly, in indictments, the *value* of the thing which is the subject or instrument of the offence, must sometimes be expressed. In indictments for larcinies this is necessary, that it may appear whether it be grand or petit larciny; and whether intitled or not to the benefit of clergy. In homicides of all sorts it is necessary; as the weapon with which it is committed is forfeited to the king as a deadend. For the manner of process upon an indictment, see PROCESS.

INDICTMENT, in Scots law, the name of the summons, or libel, upon which criminals are cited before the court of judicatory to stand trial. See LAW, Part III. n° clxxxvi. 44.

Plea to INDICTMENT. See PLEA.

INDIES, East and West. See INDIA, and AMERICA.

INDIGESTION, in medicine, a crudity, or want of due coction, either in the food, an humour of the body, or an excrement. See ANOREXIA, APEPSIA, and (*Index* subjoined to) MEDICINE.

INDIGETES, a name which the ancients gave to some of their gods.—There are various opinions about the signification of this word; some maintaining it was given to all the gods in general; others only to the semi-gods, or great men deified. Others say, it was given to such gods as were originally of the country, or rather such as were the gods of the country that bore this name. Others, again, hold that it was ascribed to such gods as were patrons and protectors of particular cities.

INDIGO, a dye prepared from the leaves and small branches of the *Indigofera Tinctoria*. See INDIGOFERA.

INDIGOFERA, the INDIGO PLANT; a genus of the decandria order, belonging to the diadelphica class of plants.—There are five species; the most remarkable of which is the *tinctoria*, a native of the warm parts of Asia, Africa, and America, and from which the Indigo dye is made. The root of this plant is three or four lines thick, and more than a foot long, of a faint smell something like parsley. From this root issues a single stem nearly of the same thickness, about two feet high, straight, hard, almost woody, covered with a bark slightly split, of a grey ash-colour towards the bottom, green in the middle, reddish at the extremity, and without appearance of pith in the inside. The leaves, ranged in pairs around the stalk, are of an oval form, smooth, soft to the touch, fur-

rowed above, of a deep green on the under-side, and connected by a very short peduncle. From about one-third of the stem to the extremity there are ears that are loaded with very small flowers from a dozen to 15, but destitute of smell. The pistil, which is in the midst of each flower, changes into a pod, in which the seeds are inclosed.

This plant requires a smooth rich soil, well tilled, and not too dry. The seed of it, which, as to figure and colour, resembles gun-powder, is sowed in little furrows that are about the breadth of the hoe, two or three inches deep, at a foot's distance from each other, and in a straight line as possible. Continual attention is required to pluck up the weeds, which would soon choke the plant. Though it may be sown in all seasons, the spring is commonly preferred. Moisture causes this plant to shoot above the surface in three or four days. It is ripe at the end of two months. When it begins to flower, it is cut with pruning-knives; and cut again at the end of every six weeks, if the weather is a little rainy. It lasts about two years, after which term it degenerates; it is then plucked up, and planted afresh. As this plant soon exhausts the soil, because it does not absorb a sufficient quantity of air and dew to moisten the earth, it is of advantage to the planter to have a vast space which may remain covered with trees, till it becomes necessary to fell them in order to make room for the indigo.

Indigo is distinguished into two kinds, the *true* and the *bastard*. Though the first is sold at a higher price on account of its superiority, it is usually advantageous to cultivate the other, because it is heavier. The first will grow in many different soils; the second succeeds best in those which are most exposed to the rain. Both are liable to great accidents. Sometimes the plant becomes dry, and is destroyed by an insect frequently found on it; at other times, the leaves, which are the valuable part of the plant, are devoured in the space of 24 hours by caterpillars. This last misfortune, which is but too common, has given occasion to the saying, "that the planters of indigo go to bed rich, and rise in the morning totally ruined."

This production ought to be gathered in with great precaution, for fear of making the farina that lies on the leaves, and is very valuable, fall off by shaking it. When gathered, it is thrown into the sleeping-vat, which is a large tub filled with water. Here it undergoes a fermentation, which in 24 hours at furthest is completed. A cock is then turned, to let the water run into the second tub, called the *mortar* or *pounding tub*. The sleeping-vat is then cleaned out, that fresh plants may be thrown in; and thus the work is continued without interruption.

The water which has run into the pounding-tub is found impregnated with a very subtle earth, which alone constitutes the dregs or blue substance that is the object of this process, and which must be separated from the useless salt of the plant, because this makes the dregs swim on the surface. To effect this, the water is forcibly agitated with wooden buckets, that are full of holes and fixed to a long handle. This part of the process requires the greatest precautions. If the agitation be discontinued too soon, the part that

Indigofera
Indostan.

that is used in dying, not being sufficiently separated from the salt, would be lost. If, on the other hand, the dye were to be agitated too long after the complete separation, the parts would be brought together again, and form a new combination; and the salt reacting on the dregs, would excite a second fermentation, that would alter the dye, spoil its colour, and make what is called *burnt indigo*. These accidents are prevented by a close attention to the least alterations that the dye undergoes, and by the precaution which the workmen take to draw out a little of it from time to time in a clean vessel. When they perceive that the coloured particles collect by separating from the rest of the liquor, they leave off shaking the buckets, in order to allow time to the blue dregs to precipitate to the bottom of the tub, where they are left to settle till the water is quite clear.—Holes made in the tub, at different heights, are then opened one after another, and this useless water is let out.

The blue dregs remaining at the bottom having acquired the consistence of a thick muddy liquid, cocks are then opened, which draw it off into the settler. After it is still more cleared of much superfluous water in this third and last tub, it is drained into sacks; from whence, when water no longer filters through the cloth, this matter, now become of a thicker consistence, is put into chests, where it entirely loses its moisture. At the end of three months the indigo is fit for sale.

It is used, in washing, to give a blueish colour to linen: painters also employ it in their water-colours; and dyers cannot make fine blue without indigo. The ancients procured it from the East-Indies; in modern times, it has been transplanted into America. The cultivation of it, successfully attempted at different places, appears to be fixed at Carolina, St. Domingo, and Mexico. That which is known under the name of *Guatemala indigo*, from whence it comes, is the most perfect of all.

INDIVIDUAL, a particular being of any species, or that which cannot be divided into two or more beings equal or alike.

The usual division in logic is made into *genera*, or into *genus's*; those *genera* into *species*; and those *species* into *individuals*.

INDIVISIBLE, among metaphysicians.—A thing is said to be absolutely *indivisible*, that is a simple being, and consists of no parts into which it may be divided. Thus, God is *indivisible* in all respects; as is also the human mind; not having extension, or other properties of body.

INDIVISIBLES, in geometry, the elements or principles into which any body or figure may be ultimately resolved; which elements are supposed to be infinitely small: thus, a line may be said to consist of points, a surface of parallel lines, and a solid of parallel and similar surfaces.

INDORSEMENT, in law, any thing written on the back of a deed; as a receipt for money received.

There is likewise an *indorsement*, by way of assignment, on bills of exchange and notes of hand; which is done by writing a person's name on the back thereof.

INDOSTAN, PROPER INDIA, or the *Empire of*

the *Great Mogul*; a country of Asia, bounded on the west by Persia, on the south by the western peninsula of India, on the east by the eastern peninsula, and on the north by several kingdoms of Independent Tartary, and comprehending a considerable part of the ancient India; more, indeed, than the ancient Greeks and Romans ever had any distinct knowledge of.

The period in which the country of Indostan was originally peopled is now totally unknown. The aversion which the Indians themselves have to discover their history to foreigners, has involved it in deep obscurity; and what can be collected from the historians of Greece and Rome, does little more than let us know that such a people as the Indians existed in their days. The only light we have to direct us on this obscure subject, is derived from an historical poem founded upon fact, and translated into the Persian language in the reign of Mohammed Akbar, who died in the 1605th year of the Christian era; and even this account is exceedingly barren of interesting particulars: so that, till the time of the invasion of the Moguls, the history of Indostan affords nothing either instructing or amusing; for which reason, it more properly comes under the articles *MOGUL*, and *MOGUL'S Empire*.

In almost all ages, the inhabitants of this country have been remarkable for their riches, their sloth, and their effeminacy; which have rendered them a prey to many barbarous invaders, who in their turn have degenerated and been subdued by others. Their sloth and effeminacy seems in a great measure to be owing to their system of religion; though no doubt some natural causes, such as the climate, &c. also concur. The Indians are directed by their religion to esteem absolute inactivity or idleness the summit of all earthly, and indeed heavenly happiness; since, according to them, their great god Brama himself hath been eternally doing nothing, and will continue to eternity in the same state of inactivity. In consequence of this principle, they carry their inactivity to a surprizing and almost incredible height; they yield to every oppressor, and suffer themselves to be tyrannized over by foreign as well as domestic despots.—A great part of the country is now subject to the English East-India Company: but for a full account of the extent of their jurisdiction, as well as the dispositions, manners, customs, &c. of the inhabitants, see the articles abovementioned; also *BRAMA*, *BRACHMAN*, and *BRAMIN*.

INDUCTION. See *LOGIC*, n° 98, 99; and *ORATORY*, n° 32.

INDUCTION, in law, is putting a clerk or clergyman in possession of a benefice or living to which he is collated or presented. See the article *PARSON*.—Induction is performed by a mandate from the bishop to the arch-deacon, who usually issues out a precept to other clergymen to perform it for him. It is done by giving the clerk corporal possession of the church, as by holding the ring of the door, tolling a bell, or the like; and is a form required by law, with intent to give all the parishioners due notice, and sufficient certainty of their new minister, to whom their tithes are to be paid. This therefore is the investiture of the temporal part of the benefice, as institution

Indostan
Induction

Indulgence is of the spiritual. And when a clerk is thus presented, instituted, and inducted into a rectory, he is then, and not before, in full and complete possession; and is called in law *persona impersonata*, or *person impersonae*.

INDULGENCES, in the Romish church, are a remission of the punishment due to sins, granted by the church, and supposed to save the sinner from Purgatory.

According to the doctrine of the Romish church, all the good works of the saints over and above those which were necessary towards their own justification, are deposited, together with the infinite merits of Jesus Christ, in one inexhaustible treasury. The keys of this were committed to St Peter, and to his successors the popes, who may open it at pleasure, and by transferring a portion of this superabundant merit to any particular person, for a sum of money, may convey to him either the pardon of his own sins, or a release for any one in whom he is interested, from the pains of Purgatory. Such indulgences were first invented in the 11th century, by Urban II. as a recompense for those who went in person upon the glorious enterprise of conquering the Holy Land. They were afterwards granted to those who hired a soldier for that purpose; and in process of time were bestowed on such as gave money for accomplishing any pious work enjoined by the Pope.

The power of granting indulgences has been greatly abused in the church of Rome. Pope Leo X. in order to carry on the magnificent structure of St Peter's at Rome, published indulgences, and a plenary remission to all such as should contribute money towards it. Finding the project take, he granted to Albert elector of Mentz, and archbishop of Magdeburg, the benefit of the indulgences of Saxony and the neighbouring parts, and farmed out those of other countries to the highest bidders; who, to make the best of their bargain, procured the ablest preachers to cry up the value of the ware. The form of these indulgences was as follows. "May our Lord Jesus Christ have mercy upon thee, and absolve thee by the merits of his most holy passion. And I, by his authority, that of his blessed apostles Peter and Paul, and of the most holy Pope, granted and committed to me in these parts, do absolve thee, first, from all ecclesiastical censures, in whatever manner they have been incurred; then from all thy sins, transgressions, and excesses, how enormous soever they may be, even from such as are referred for the cognizance of the holy see, and as far as the keys of the holy church extend: I remit to you all punishment which you deserve in Purgatory on their account; and I restore you to the holy sacraments of the church, to the unity of the faithful, and to that innocence and purity which you possessed at baptism; so that when you die, the gates of punishment shall be shut, and the gates of the paradise of delight shall be opened: and if you shall not die at present, this grace shall remain in full force when you are at the point of death. In the name of the Father, and of the Son, and of the Holy Ghost."

The terms in which the retailers of indulgences, described their benefits and the necessity of purchasing them, are so extravagant, that they appear almost incredible. If any man (said they) purchases letters of

indulgence, his soul may rest secure with respect to its salvation. The souls confined in purgatory, for whose redemption indulgences are purchased, as soon as the money tinkles in the chest, instantly escape from that place of torment, and ascend into heaven. That the efficacy of indulgences was so great, that the most heinous sins, even if one should violate (which was impossible) the mother of God, would be remitted and expiated by them, and the person be freed both from punishment and guilt. That this was the unspeakable gift of God, in order to reconcile men to himself. That the crosses erected by the preachers of indulgences was equally efficacious with the crosses of Christ itself. "Lo! the heavens are open; if you enter not now, when will you enter? For twelve pence you may redeem the soul of your father out of purgatory; and are you so ungrateful, that you will not rescue your parent from torment? If you had but one coat, you ought to strip yourself instantly, and sell it, in order to purchase such benefits," &c.

It was this great abuse of indulgences that contributed not a little to the first reformation of religion in Germany, where Martin Luther began first to declaim against the preachers of indulgences, and afterwards against indulgences themselves: but since that time the popes have been more sparing in the exercise of this power: however, they still carry on a great trade with them to the Indies, where they are purchased at two rials a-piece, and sometimes more.

The pope likewise grants indulgences to persons at the point of death; that is, he grants them, by a brief, power to choose what confessor they please, who is authorized thereby to absolve them from all their sins in general.

INDULT, in the church of Rome, the power of presenting to benefices granted to certain persons by the pope. Of this kind is the indult of kings and sovereign princes in the Romish communion, and that of the parliament of Paris granted by several popes. By the concordat for the abolition of the pragmatic sanction, made between Francis I. and Leo X. in 1516, the French king has the power of nominating to bishoprics, and other consistorial benefices, within his realm. At the same time, by a particular bull, the pope granted him the privilege of nominating to the churches of Britany and Provence. In 1648 pope Alexander VIII. and in 1668 Clement IX. granted the king an indult for the bishoprics of Metz, Toul, and Verdun, which had been yielded to him by the treaty of Munster; and in 1668 the same pope Clement IX. granted him an indult for the benefices in the counties of Roussillon, Artois, and the Netherlands. The cardinals likewise have an indult granted them by agreement between pope Paul IV. and the sacred college in 1555, which is always confirmed by the popes at the time of their election. By this treaty the cardinals have the free disposal of all the benefices depending on them, and are empowered likewise to bestow a benefice in *commendam*.

INDULTO, a duty, tax, or custom, paid to the king of Spain for all such commodities as are imported from the West Indies in the galleons.

INDUS, a large river of Asia, which rises in the mountains which separate Tartary from India, and discharges itself into the Indian ocean.

INERTIA.

Indult
||
Indus.

INERTIA OF MATTER, in philosophy, is defined by Sir Isaac Newton to be a passive principle by which bodies persist in their motion or rest, receive motion in proportion to the force impressing it, and resist as much as they are resisted. It is also defined by the same author to be a power implanted in all matter, whereby it resists any change endeavoured to be made in its state. See **MECHANICS**.

IN ESSE is applied to things which are actually existing.

Authors make a difference between a thing *in esse*, and a thing *in posse*: a thing that is not, but may be, they say is *in posse*; or *potentia*; but a thing apparent and visible, they say is *in esse*, that is, has a real being *eo instanti*, whereas the other is casual, and at best but a possibility.

INFALLIBLE, something that cannot err, or be deceived.

One of the great controversies between the Protestants and Papists, is the infallibility which the latter attribute to the pope; though, in fact, they themselves are not agreed on that head, some placing this pretended infallibility in the pope and a general council.

INFAMY, in law, is a term which extends to forgery, perjury, gross cheats, &c. by which a person is rendered incapable of being a witness or juror, even though he is pardoned for his crimes.

INFANCY, the first part of life.—Fred. Hoffman says, that the human species are *infants* until they begin to talk, and *children* to the age of puberty.—Anatomy discovers to us, that during infancy there is much imperfection in the human frame; *e. g.* its parts are disproportioned, and its organs incapable of those functions which in future life they are designed to perform. The head is larger in proportion to the bulk of the body than that of an adult. The liver and pancreas are much larger in proportion than in advanced life; their secretions are more in quantity also. The bile is very inert; the heart is stronger and larger than in future life; the quantity of blood sent through the heart of an infant, in a given time, is also more in proportion than in adults. Though these circumstances have their important usefulness, yet the imperfection attending them subjects this age to many injuries and dangers from which a more perfect state is exempted. Dr Percival observes, in his *Essays Med. and Exp.* that of all the children who are born alive, two thirds do not live to be two years old.

Infants have a larger proportion of brain than adults, hence are more subject to nervous disorders; and hence the diagnostics of diseases are in many respects obscure or uncertain, as particularly those taken from the pulse, which, from the irritability of the tender bodies of infants, is suddenly affected by a variety of accidents too numerous, and seemingly too trivial to gain our attention. However, no very great embarrassment arises to the practitioner from hence; for the disorders in this state are generally acute, less complicated than those in adults, and are more easily discovered than is generally apprehended.—See (the *Index* subjoined to) **MEDICINE**.

INFANT, denotes a young child. See **INFANCY**.

INFANT, in law, is a person under 21 years of age; whose capacities, incapacities, and privileges, are various.

1. In *criminal matters*. The law of England does in some cases privilege an infant under the age of 21, as to common misdemeanours; so as to escape fine, imprisonment, and the like: and particularly in the cases of omission, as not repairing a bridge, or a high way, and other similar offences; for not having the command of his fortune till the age of 21, he wants the capacity to do those things which the law requires. But where there is any notorious breach of the peace, a riot, battery, or the like, (which infants when full-grown are at least as liable as others to commit); for those, an infant above the age of 14 is equally liable to suffer, as a person of the full age of 21.

With regard to capital crimes, the law is still more minute and circumspect; distinguishing with greater nicety the several degrees of age and discretion. By the ancient Saxon law, the age of twelve years was established for the age of possible discretion, when first the understanding might open: and from thence till the offender was 14, it was *etate pubertati proxima*, in which he might, or might not, be guilty of a crime, according to his natural capacity or incapacity. This was the dubious stage of discretion: but, under twelve, it was held, that he could not be guilty in will, neither after fourteen could he be supposed innocent, of any capital crime which he in fact committed. But by the law, as it now stands, and has stood at least ever since the time of Edward III. the capacity of doing ill, or contracting guilt, is not so much measured by years and days, as by the strength of the delinquent's understanding and judgment. For one lad of 11 years old may have as much cunning as another of 14; and in these cases our maxim is, that *malitia supplet etatem*. Under seven years of age, indeed, an infant cannot be guilty of felony; for then a felonious discretion is almost an impossibility in nature: but at eight years old, he may be guilty of felony. Also, under 14, though an infant shall be *prima facie* adjudged to be *doli incapax*; yet if it appear to the court and jury, that he was *doli capax*, and could discern between good and evil, he may be convicted and suffer death. Thus a girl of 13 has been burnt for killing her mistress: and one boy of ten, and another of nine years old, who had killed their companions, have been sentenced to death, and he of ten years actually hanged; because it appeared upon their trials, that the one hid himself, and the other hid the body he had killed; which hiding manifested a consciousness of guilt, and a discretion to discern between good and evil. And there was an instance in the last century, where a boy of eight years old was tried at Abingdon for firing two barns; and, it appearing that he had malice, revenge, and cunning, he was found guilty, condemned, and hanged accordingly. Thus also, in very modern times, a boy of ten years old was convicted on his own confession of murdering his bedfellow; there appearing in his whole behaviour plain tokens of a mischievous discretion; and, as the sparing this boy merely on account of his tender years might be of dangerous consequence to the public, by propagating a notion that children might commit such atrocious crimes with impunity, it was unanimously agreed by all the judges, that he was a proper subject of capital punishment. But, in all such cases, the evidence of that

Blackst.
Comment.

that malice, which is to supply age, ought to be strong and clear beyond all doubt and contradiction.

2. In *civil* matters. The ages of male and female are different for different purposes. A male at 12 years old may take the oath of allegiance; at 14 is at the years of discretion, and therefore may consent or disagree to marriage, may choose his guardian, and, if his discretion be actually proved, may make his testament of his personal estate; at 17 may be an executor; and at 21 is at his own disposal, and may alienate his lands, goods, and chattels. A female also at seven years of age may be betrothed or given in marriage; at nine is entitled to dower; at 12 is at years of maturity, and therefore may consent or disagree to marriage, and, if proved to have sufficient discretion, may bequeath her personal estate; at 14 is at years of legal discretion, and may choose a guardian; at 17 may be executrix; and at 21 may dispose of herself and her lands. So that full age in male or female is 21 years, which age is completed on the day preceding the anniversary of a person's birth; who till that time is an infant, and so styled in law. Among the ancient Greeks and Romans, women were never of age, but subject to perpetual guardianship, unless when married, *nisi convenissent in manum viri*: and, when that perpetual tutelage wore away in process of time, we find that, in females as well as males, full age was not till 25 years. Thus by the constitution of different kingdoms, this period, which is merely arbitrary, and *juris positum*, is fixed at different times. Scotland agrees with England in this point; (both probably copying from the old Saxon constitutions on the continent, which extended the age of minority *ad annum vigintiunum primum, et eo usque juvenes sub tutelam reponunt*): but in Naples persons are of full age at 18; in France, with regard to marriage, not till 30; and in Holland at 25.

The very disabilities of infants are privileges; in order to secure them from hurting themselves by their own improvident acts. An infant cannot be sued but under the protection, and joining the name, of his guardian; for he is to defend him against all attacks as well by law as otherwise: but he may sue either by his guardian, or *prochein amy*, his next friend who is not his guardian. This *prochein amy* may be any person who will undertake the infant's cause; and it frequently happens, that an infant, by his *prochein amy*, institutes a suit in equity against a fraudulent guardian.

With regard to estates and civil property, an infant hath many privileges. In general, an infant shall lose nothing by nonclaim, or neglect of demanding his right; nor shall any other *laches* or negligence be imputed to an infant, except in some very particular cases.

It is generally true, that an infant can neither alienate his lands, nor do any legal act, nor make a deed, nor indeed any manner of contract, that will bind him. But still to all these rules there are some exceptions: part of which were just now mentioned in reckoning up the different capacities which they assume at different ages: and there are others, a few of which it may not be improper to recite, as a general specimen of the whole. And, first, it is true, that infants cannot alienate their estates: but infant-trustees, or mortgagees, are enabled to convey, under the direction of the court of chancery or exchequer, or other courts of equity, the estates they hold in trust or mortgage, to such person

as the court shall appoint. Also it is generally true, that an infant can do no legal act: yet an infant, who has an advowson, may present to the benefice when it becomes void. For the law in this case dispenses with one rule, in order to maintain others of far greater consequence: it permits an infant to present a clerk (who, if unfit, may be rejected by the bishop), rather than either suffer the church to be unserved till he comes of age, or permit the infant to be debarred of his right by lapse to the bishop. An infant may also purchase lands, but his purchase is incomplete: for, when he comes to age, he may either agree or disagree to it, as he thinks prudent or proper, without alleging any reason; and so may his heirs after him, if he dies without having completed his agreement. It is, farther, generally true, that an infant, under 21, can make no deed but what is afterwards voidable: yet in some cases he may bind himself apprentice by deed indentured or indentures, for seven years; and he may by deed or will appoint a guardian to his children, if he has any. Lastly, it is generally true, that an infant can make no other contract that will bind him: yet he may bind himself to pay for his necessary meat, drink, apparel, physic, and such other necessities; and likewise for his good teaching and instruction, whereby he may profit himself afterwards.

INFANTE, and INFANTA, all the sons and daughters of the kings of Spain and Portugal, except the eldest; the princes being called *infantes*, and the princesses *infantas*.

INFANTRY, in military affairs, the whole body of foot-soldiers, whether independent companies or regiments.—The word takes its origin from one of the *infantas* of Spain, who, finding that the army commanded by the king her father had been defeated by the Moors, assembled a body of foot-soldiers, and with them engaged and totally routed the enemy. In memory of this event, and to distinguish the foot-soldiers, who were not before held in much consideration, they received the name of *infantry*.

Heavy-armed INFANTRY, among the ancients, were such as wore a complete suit of armour, and engaged with broad shields and long spears. They were the flower and strength of the Grecian armies, and had the highest rank of military honour.

Light-Armed INFANTRY, among the ancients, were designed for skirmishes, and for fighting at a distance. Their weapons were arrows, darts, or slings.

Light INFANTRY, among the moderns, have only been in use since the year 1656. They have no camp-equipage to carry, and their arms and accoutrements are much lighter than those of the infantry. Light infantry are the eyes of a general, and the givers of sleep and safety to an army. Wherever there is found light cavalry, there should be light infantry. They should be accustomed to the pace of four miles an hour, as their usual marching pace, and to be able to march at five miles an hour upon all particular occasions. Most of the powers on the continent have light infantry.

INFATUATE, to prepossess any one in favour of some person or thing that does not deserve it, so far as that he cannot easily be disabused.—The word *infatuate* comes from the Latin *fatuus*, "fool," of *fieri*, "to speak out," which is borrowed from the Greek

Infection
||
Infinitesimals.

Infinity
||
Information.

propheta, whence *propheta*, which signifies the same with *vates* in Latin, or *prophet* in English; and the reason is, because their prophets or priests used to be seized with a kind of madness or folly, when they began to make their predictions, or deliver oracles.

The Romans called those persons *insatiati*, who fancied they had seen visions, or imagined the god Faunus, whom they called *Fatuu*, had appeared to them.

INFECTION, among physicians. See **CONTAGION**.

INFECTMENT, in Scots law, the solemnity of the delivery of an heritable subject to the purchaser.

INFIBULATION, in surgery, an operation which is the reverse of circumcision; for it confines the prepuce so over the glans penis, that it cannot be drawn back. The operation is thus performed. Extend the skin which is above the glans, and with ink mark the part on each side through which the perforation is to be made; then let it retract itself. If the marks recur upon the glans, too much of the skin hath been taken up, and the marks must be made nearer to the end of the prepuce, but only so as that they may not return upon the glans, and thus the feat of the fibula is determined. Then a needle, armed with a waxed thread, is passed through, and moved backward and forward every day, until a cicatrix is formed. After this the fibula is fixed.

Thus the ancient Romans were used to preserve their singing boys from all premature and preposterous ideal venery, and so preserve their voices longer. The fibula seems to have been a kind of ring.

INFINITE, that which has neither beginning nor end: in which sense God alone is infinite.

Infinite is also used to signify that which has had a beginning, but will have no end, as angels and human souls. This makes what the schoolmen call *infinitum a parte post*; as, on the contrary, by *infinitum a parte ante*, they mean that which has an end but had no beginning.

INFINITE Quantities. The very idea of magnitudes infinitely great, or such as exceed any assignable quantities, does include a negation of limits; yet if we nearly examine this notion, we shall find that such magnitudes are not equal among themselves, but that there are really, besides infinite length and infinite area, three several sorts of infinite solidity; all of which are *quantitates sui generis*, and that those of each species are in given proportions.

Infinite length, or a line infinitely long, is to be considered either as beginning at a point, and so infinitely extended one way, or else both ways from the same point; in which case the one, which is a beginning infinity, is the one half of the whole, which is the sum of the beginning and ceasing infinity; or, as may be said, of infinity *a parte ante* and *a parte post*, which is analogous to eternity in time and duration, in which there is always as much to follow as is past, from any point or moment of time; nor doth the addition or subtraction of finite length, or space of time, alter the case either in infinity or eternity, since both the one or the other cannot be any part of the whole.

INFINITESIMALS, among mathematicians, are denoted to be infinitely small quantities.

In the method of infinitesimals, the element, by which

any quantity increases or decreases, is supposed to be infinitely small; and is generally expressed by two or more terms, some of which are infinitely less than the rest, which being neglected as of no importance, the remaining terms form what is called the *difference of the proposed quantity*. The terms that are neglected in this manner, as infinitely less than the other terms of the element, are the very same which arise in consequence of the acceleration, or retardation, of the generating motion, during the infinitely small time in which the element is generated; so that the remaining terms express the elements that would have been produced in that time, if the generating motion had continued uniform: therefore those differences are accurately in the same ratio to each other as the generating motions or fluxions. And hence, though in this method infinitesimal parts of the elements are neglected, the conclusions are accurately true without even an infinitely small error, and agree precisely with those that are deduced by the method by fluxions.*

INFINITY. See **METAPHYSICS**, n° 66—69.

INFIRMARY, a kind of hospital, where the weak and sickly are properly taken care of.

INFLAMMABILITY, that property of bodies which disposes them to kindle or catch fire. See **FIRE**, **FLAME**, **PHLOGISTON**, &c.

INFLAMMATION, in medicine and surgery, a redness and swelling of any part of the body, attended with heat, pain, and symptoms of fever. See (the *Index* subjoined to) **MEDICINE**.

INFLAMMATION of Oils by concentrated Acids. See **CHEMISTRY**, n° 219.

INFLECTED RAYS. See **INFLECTED RAYS**.

INFLECTION, or *Point of INFLECTION*, in the higher geometry, is a point where a curve begins to bend a contrary way.

INFLECTION, in grammar, the variation of nouns and verbs, by declension and conjugation.

INFLUENCE, a quality supposed to flow from the heavenly bodies, either with their light or heat; to which astrologers idly ascribe all sublunary events.

INFORMATION, in law, is nearly the same in the crown-office, as what in other courts is called a *declaration*. See **PROSECUTION**.

Informations are of two sorts; first, those which are partly at the suit of the king, and partly at that of a subject; and secondly, such as are only in the name of the king. The former are usually brought upon penal statutes, which inflict a penalty upon conviction of the offender, one part to the use of the king, and another to the use of the informer. By the statute 31 Eliz. c. 5. no prosecution upon any penal statute, the suit and benefit whereof are limited in part to the king and in part to the prosecutor, can be brought by any common informer after one year is expired since the commission of the offence; nor on behalf of the crown, after the lapse of two years longer; nor, where the forfeiture is originally given only to the king, can such prosecution be had after the expiration of two years from the commission of the offence.

The informations that are exhibited in the name of the king alone, are also of two kinds: first, those which are truly and properly his own suits, and filed *ex officio* by his own immediate officer, the attorney-

general: secondly, those in which, though the king is the nominal prosecutor, yet it is at the relation of some private person or common informer; and they are filed by the king's coroner and attorney in the court of king's bench, usually called the *master of the crown-office*, who is for this purpose the standing officer of the public. The objects of the king's own prosecutions, filed *ex officio*, by his own attorney-general, are properly such enormous misdemeanors, as peculiarly tend to disturb or endanger his government, or to molest or affront him in the regular discharge of his royal functions. For offences so high and dangerous, in the punishing or preventing of which a moment's delay would be fatal, the law has given to the crown the power of an immediate prosecution, without waiting for any previous application to any other tribunal: which power, thus necessary, not only to the ease and safety, but even to the very existence, of the executive magistrate, was originally reserved in the great plan of the English constitution; wherein provision is wisely made for the due preservation of all its parts. The objects of the other species of informations, filed by the master of the crown-office upon the complaint or relation of a private subject, are any gross and notorious misdemeanors, riots, batteries, libels, and other immoralities of an atrocious kind, not peculiarly tending to disturb the government (for those are left to the care of the attorney-general), but which, on account of their magnitude or pernicious example, deserve the most public animadversion. And when an information is filed, either thus, or by the attorney-general *ex officio*, it must be tried by a petit jury of the county where the offence arises: after which, if the defendant be found guilty, he must resort to the court for his punishment. See a history and vindication of this made of prosecution in the work quoted on the margin, vol. iv. p. 309.—312.

INFRACTION, a term chiefly used to signify the violation of a treaty.

INFRA-SCAPULARIS, in anatomy. See **ANATOMY**, *Table of the Muscles*.

INFRA-Spinatus, in anatomy. See **ANATOMY**, *ibid*.

INFULA, in antiquity, a broad kind of fillet, made of white wool, which the priests used to tie round their heads.

INFUNDIBULIFORM, in botany, an appellation given to such monopetalous or one-leaved flowers as resemble a funnel in shape, or which have a narrow tube at one end, and gradually widen towards the limb or mouth.

INFUSION, in chemistry, taken in its most general sense, consists in placing compound bodies in a liquor intended to be impregnated with some of their principles, either without heat, or with a heat less than that of the boiling liquor.

From this definition we may see that *infusion* is one of the principal operations of the analysis by menstrua, in the same manner in which decoction is, of which *infusion* may be considered as the first degree.

Infusion may be made in watery, spirituous, oily, acid, or alkaline liquors, according to the nature of the matters to be infused, and of the principles intended to be extracted. It is nevertheless practised upon vegetable matters only; and almost always for

the preparation of remedies, which are also called *infusions*.

Aromatic plants, and other odoriferous vegetable matters, are generally infused, when their odoriferous principle is to be preserved, in which their virtue consists, and which is at the same time so volatile as to be dissipated and lost by the heat of ebullition. To preserve still better these volatile principles, the smallest heat requisite for the extraction ought to be employed; and these *infusions* ought to be made in matraffes, or other vessels, which may be exactly closed.

The principles extracted by *infusion* are different according to the menstruum employed. Pure water may be impregnated with the odoriferous principle, or *spiritus rectior*, with saline, saponaceous, mucilaginous, extractive principles. Spirit of wine dissolves the *spiritus rectior*, the essential oils, though resinous matters the base of which is an oil of the nature of essential oils, and the greatest part of the saponaceous extractive matter. Those *infusions* made by spirit of wine are particularly called *tinctures*, especially in pharmacy. Oils dissolve the *spiritus rectior*, and any oily matter. Acids and alkalis dissolve the earthy substances of vegetables, and almost all their other principles: but they disguise them, alter them, and change considerably their virtues by the combination. They are therefore not much used for these kinds of extractions.

INGELSHEIM, a town of Germany, in the palatinate of the Rhine, remarkable for having been the residence of the emperors; seated on the river Salva, on an eminence, from whence there is a charming prospect. E. Long. 8. 5. N. Lat. 49. 58.

INGENUOUS, in a general sense, signifies *open, fair, and candid*.

INGENUUS, (*ingenuus*), in Roman antiquity, an appellation given to persons born of free parents, who had never been slaves: for the children of the *liberti*, or persons who had obtained their liberty, were called *libertini*, not *ingenui*; this appellation of *ingenuus* being reserved for their children, or the third generation.

INGLUVIES, the crop or craw of granivorous birds, serving for the immediate reception of the food, where it is macerated for some time, before it is transmitted to the true stomach.

INGOLSTADT, a handsome town of Germany, and the strongest in Bavaria, with a famous university, and a handsome church. The houses are built with stone, and the streets large. It is seated on the Danube, in E. Long. 11. 10. N. Lat. 48. 42.

INGOT, a mass of gold, or silver, melted down, and cast in a mould, but not coined or wrought.

INGRAFTING, in gardening. See **GRAFTING**.

INGRESS, in astronomy, signifies the sun's entering the first scruple of one of the four cardinal signs, especially Aries.

INGRIA, a province of the Russian empire, lying on the gulph of Finland, being about 130 miles in length, and 50 in breadth. It abounds in game and fish; and here are a great number of elks, which come

Ingroff
Ingulphus.

Inhaler
Inhumation.

in troops from Finland in the spring and autumn. It was conquered by the czar Peter the Great, and Peterburgh is the capital town. It is bounded by the river Nieva, and the gulph of Finland, on the north; by Great Novogorod, on the east and south; and by Livonia, on the west.

INGROSSER, one who buys up great quantities of any commodity, before it comes to market, in order to raise the price.

INGUEN, in anatomy, the fame with what is otherwise called *groin*, or *pubes*.

INGULPHUS, abbot of Croyland, and author of the history of that abbey, was born in London about A. D. 1030. He received the first part of his education at Westminister; and when he visited his father, who belonged to the court of Edward the Confessor, he was so fortunate as to engage the attention of queen Edgitha. That amiable and learned princess took a pleasure in examining our young scholar on his progress in grammar, and in disputing with him in logic; nor did the ever dismiss him without some present as a mark of her approbation. From Westminister he went to Oxford, where he applied to the study of rhetoric, and of the Aristotelian philosophy, in which he made greater proficiency than many of his contemporaries. When he was about 21 years of age, he was introduced to William duke of Normandy, (who visited the court of England, A. D. 1051,) and made himself so agreeable to that prince, that he appointed him his secretary, and carried him with him into his own dominions. In a little time he became the prime favourite of his prince, and the dispenser of all preferments, humbling some, and exalting others, at his pleasure; in which difficult station, he confesseth, he did not behave with a proper degree of modesty and prudence. This excited the envy and hatred of many of the courtiers; to avoid the effects of which, he obtained leave from the duke to go in pilgrimage to the Holy Land, which was then become fashionable. With a company of 30 horsemen, he joined Sigfrid duke of Mentz, who, with many German nobles, bishops, clergy, and others, was preparing for a pilgrimage to Jerusalem. When they were all united, they formed a company of no fewer than 7000 pilgrims. In their way they spent some time at Constantinople, performing their devotions in the several churches. In their passage through Lycia, they were attacked by a tribe of Arabs, who killed and wounded many of them, and plundered them of a prodigious mass of money. Those who escaped from this disaster, at length reached Jerusalem, visited all the holy places, and bedewed the ruins of many churches with their tears, giving money for their reparation. They intended to have bathed in Jordan; but being prevented by the roving Arabs, they embarked on board a Genoese fleet at Joppa, and landed at Brundisium, from whence they travelled through Apulia to Rome. Having gone through a long course of devotions in this city, at the several places distinguished for their sanctity, they separated, and every one made the best of his way into his own country. When Ingulph and his company reached Normandy, they were reduced to 20 half-starved wretches, without money, cloaths, or horses: A faithful picture of the foolish disastrous journeys into the Holy Land, so common in those

times. Ingulph was now so much disgusted with the world, that he resolved to forsake it, and became a monk in the abbey of Fontenelle in Normandy; in which, after some years, he was advanced to the office of prior. When his old master was preparing for his expedition into England, A. D. 1066, he was sent by his abbot, with 100 merks in money, and 12 young men, nobly mounted and completely armed, as a present from their abbey. Ingulph having found a favourable opportunity, presented his men and money to his prince, who received him very graciously; some part of the former affection for him reviving in his bosom. In consequence of this he raised him to the government of the rich abbey of Croyland in Lincolnshire, A. D. 1076, in which he spent the last 34 years of his life, governing that society with great prudence, and protecting their possessions from the rapacity of the neighbouring barons by the favour of his royal master. The lovers of English history and antiquities are much indebted to this learned abbot, for his excellent history of the abbey of Croyland, from its foundation, A. D. 664, to A. D. 1091, into which he hath introduced much of the general history of the kingdom, with a variety of curious anecdotes that are nowhere else to be found. Ingulph died of the gout, at his abbey, A. D. 1109, in the 79th year of his age.

INHALER, in medicine, a machine for breathing in warm steams into the lungs, recommended by Mr Mudge in the cure of the catarrhus cough. The body of the instrument holds about a pint; and the handle, which is fixed to the side of it, is hollow. In the lower part of the vessel, where it is soldered to the handle, is a hole, by means of which, and three others on the upper-part of the handle, the water, when it is poured into the *inhaler*, will rise to the same level in both. To the middle of the cover a flexible tube about five or six inches long is fixed, with a mouth-piece of wood or ivory. Underneath the cover there is a valve fixed, which opens and shuts the communication between the upper and internal part of the *inhaler* and the external air. When the mouth is applied to the end of the tube in the act of inspiration, the air rushes into the handle, and up through the body of warm water, and the lungs become, consequently, filled with hot vapours. In expiration, the mouth being still fixed to the tube, the breath, together with the steam on the surface of the water in the *inhaler*, is forced up through the valve in the cover. In this manner, therefore, the whole act of respiration is performed through the *inhaler*, without the necessity, in the act of expiration, of either breathing through the nose, or removing the pipe from the mouth. See (the *Index* subjoined to) MEDICINE.

INHERITANCE, a perpetual right or interest in lands, invested in a person and his heirs. See DESCENT.

INHIBITION, in Scots law, a diligence obtained at the suit of a creditor against his debtor, prohibiting him from selling or contracting debts upon his estate to the creditor's prejudice.

INHUMATION, in chemistry, a method of digesting substances, by burying the vessel in which they are contained in horse-dung or earth.

INJECTION, the forcibly throwing certain liquid medicines into the body by means of a syringe, tube, clyster-pipe, or the like.

Anatomical Injection, the filling the vessels of a human, or other animal body, with some coloured substance, in order to make their figures and ramifications visible. The best account of the method of injecting the vessels of animals, is that by the late Dr Monro, published in the *Medial Essays*, vol. i. p. 79.

"The instrument with which the liquor is commonly thrown into the vessels is a tight easy going syringe of brass, to which several short pipes are fitted, and can be fixed by screws, the other extremities of these pipes being of different diameters without any screw, that they may slide into other pipes, which are so exactly adapted to them at one end, that when they are pressed a little together, nothing can pass between them: and because their cohesion is not so great as to resist the pushing force of the injection, which would drive off this second pipe, and spoil the whole operation; therefore the extremity of this second sort of pipes, which receives the first kind, is formed on the outside into a square, bounded behind and before by a rising circle, which hinders the key that closely grasps the square part from sliding backwards or forwards; or a bar of brass must stand out from each side of it to be held with the fingers. The other extremity of each of these second sort of pipes is of different diameter; and near it a circular notch, capable of allowing a thread to be sunk into it, is formed; by this, the thread tying the vessel at which the injection is to be made, will not be allowed to slide off.

"Besides this form described, common to all this second sort of pipes, we ought to have some of the larger ones, with an additional mechanism, for particular purposes; as, for instance, when the larger vessels are injected, the pipe fastened into the vessel ought either to have a valve or a stop-cock, that may be turned at pleasure, to hinder any thing to get out from the vessel by the pipe; otherwise, as the injection, in such a case, takes time to coagulate, the people employed in making the injection must either continue all that while in the same posture; or, if the syringe is too soon taken off, the injected liquor runs out, and the larger vessels are emptied. When the syringe is not large enough to hold at once all the liquor necessary to fill the vessels, there is a necessity of filling it again. If, in order to do this, the syringe was to be taken off from the pipe fixed in the vessel, some of the injection would be lost, and what was exposed to the air would cool and harden; therefore some of the pipes ought to have a reflected curve tube coming out of their side, with a valve so disposed, that no liquor can come from the straight pipe into the crooked one, but, on the contrary, may be allowed to pass from the crooked to the straight one: the injector then, taking care to keep the extremity of the reflected pipe immersed in the liquor to be injected, may, as soon as he has pushed out the first syringeful, fill it again by only drawing back the sucker; and, repeating this quickly, will be able to throw several syringe-fuls into the vessels.

"All these different sorts of pipes are commonly made of brass.

"The liquors thrown into the vessels with a design to fill the small capillary tubes, are either such as will incorporate with water, or such as are oily; both kinds have their advantages and inconveniences, which I shall mention in treating of each, and shall conclude with that which I have found by experience to succeed best.

"All the different kinds of glue, or ichtyocolla, syths, common glue, &c. dissolved and pretty much diluted, mix easily with the animal-fluids, which is of great advantage, and will pass into very small vessels of a well-chosen and prepared subject, and often answer the intention sufficiently, where the design is only to prepare some very fine membrane, on which no vessels can be expected to be seen so large as the eye can discover whether the transverse sections of the vessels would be circular, or if their sides are collapsed. But when the larger vessels are also to be prepared, there is a manifest disadvantage to the usefulness and beauty of the preparation; for if nothing but the glutinous liquor is injected, one cannot keep a subject so long as the glue takes of becoming firm; and therefore, in dissecting the injected part, several vessels will probably be cut and emptied. To prevent this, one may indeed either soak the part well in alcohol, which coagulates the glue; but then it becomes so brittle, that the least handling makes it crack; and if the preparation is to be kept, the larger vessels appear quite shrivelled, when the watery part of the injection is evaporated: or the efflux of the injection may be prevented, by carefully tying every vessel before we are obliged to cut it; still, however, that does not hinder the vessels to contract when the glue is drying. If, to obviate these difficulties, the glutinous liquor should first be injected in such quantity as the capillary vessels will contain, and the common oily or waxy injection is pushed in afterwards to keep the larger vessels distended, the wax is very apt to harden before it has run far enough; the two sorts of liquors never mix to mix irregularly, and the whole appears interrupted and broken by their soon separating from each other; which is still more remarkable afterwards, when the watery particles are evaporated.

"Spirits of wine coloured mixes with water and oils, and so far is proper to fill the very smaller vessels with; but, on the other hand, it coagulates any of the liquors it meets, which sometimes block up the vessels so much, that no more injection will pass; then it scarce will suspend some of the powders that prove the most durable colours; and as it entirely evaporates, the vessels must become very small; and the small quantity of powder left, having nothing to serve for connecting its particles together, generally is seen so interrupted, that the small ramifications of vessels rather have the appearances of random scratches of a pencil, than of regular continued canals.

"Melted tallow, with a little mixture of oil of turpentine, may sometimes be made to fill very small vessels, and keeps the larger ones at a full stretch; but where any quantity of the animal liquors are still in the vessels, it is liable to stop too soon, and never can be introduced into numbers of vessels which other liquors enter; and it is so brittle, that very little handling,

ling.

Injection. ling makes it crack, and thereby renders the preparation very ugly (A).

"The method I have always succeeded best with, in making what may be called *subtile* or *fine injections*, is, first to throw in coloured oil of turpentine, in such a quantity as might fill the very small vessels; and, immediately after, to push the common coarse injection into the larger ones. The oil is subtile enough to enter rather smaller capillary tubes than any colouring can; its resinous parts, which remain after the spiritous are evaporated, give a sufficient adhesion to the particles of the substance with which it is coloured, to keep them from separating, and it intimately incorporates with the coarser injection; by which, if the injection is rightly managed, it is impossible for the sharpest eye to discover that two sorts have been made use of (B).

"All the liquors with which the vessels of animals are artificially filled, having very faint, and near the same colours, would not at all appear in the very small vessels, because of their becoming entirely diaphanous, without a mixture of some substance to impart its colour to them; and where several sorts of even the larger vessels of any part were filled, one sort could not be distinguished from another, unless the colour of each was different; which has likewise a good effect in making preparations more beautiful. Wherefore anatomists have made use of a variety of such substances, according to their different fancies or intentions; such as gamboge, saffron, ink, burnt ivory, &c. which can be easily procured from painters. My design being only to consider those that are fit to be mixed with the injecting liquors proposed to fill capillary vessels, which is scarce ever to be done in any other, except the branches of the arteries and of some veins, I shall confine myself to the common colours employed to these last named two sorts of vessels, which colours are red, green, and sometimes blue, without mentioning the others which require very little choice.

"Anatomists have, I imagine, proposed to imitate the natural colours of the arteries and veins in a living creature, by filling the arteries with a red substance, and the veins with a blue or green: from which, however, there are other advantages, such as the strong reflection which such bodies make of the rays of light, and the unaptness most such bodies have to transmit these same rays, without at least a considerable reflection of the rays peculiar to themselves; or, in other words, their unfitness to become completely pellucid; without which, the very fine vessels, after being injected, would still be imperceptible. The animal or vegetable substances made use of for colouring injections, such as cochineal, laque, *rad. anchuse*, brazil-wood, indigo, &c. have all one general fault of being liable to run into little knots which stop some of the vessels; their colour fades sooner when kept dry; they more easily yield their tincture when the parts are preserved in a liquor; and rats, mice, and insects, will take

them for food: for which reasons, though I have frequently succeeded in injecting them, I rather prefer the mineral kind, such as minium or vermilion for red; of which this last is, in my opinion, the best, because it gives the brightest colour, and is commonly to be bought finely levigated. The green-coloured powder generally used is verdigrease; but I rather chuse that preparation of it called *distilled verdigrease*, because its colour is brighter, and it does not so often run into small knots as the common verdigrease, but dissolves in the oily liquors.

"The method of preparing the injection composed of these materials, is to take, for the fine one, a pound of clear oil of turpentine, which is gradually poured on three ounces of vermilion, or distilled verdigrease finely powdered, or rather well levigated by grinding on marble; stir them well with a small wooden spatula till they are exactly mixed, then strain all through a fine linen rag. The separation of the grosser particles is, however, rather better made, by pouring some ounces of the oil upon the powder, and, after stirring them together strongly, stop rubbing with the spatula for a second or so, and pour off into a clean vessel the oil with the vermilion or verdigrease suspended in it; and continue this sort of operation till you observe no more of the powder come off; and all that remains is granulated. The coarser injection is thus prepared: Take tallow, 1 pound; wax, bleached white, 5 ounces; salad oil, 3 ounces; melt them in a skillet put over a lamp; then add Venice turpentine, 2 ounces; and as soon as this is dissolved, gradually sprinkle in of vermilion or verdigrease prepared, 3 ounces; then pass all through a clean, dry, warmed linen-cloth, to separate all the grosser particles; and, when you design to make it run far into the vessels, some oil of turpentine may be added immediately before it is used.

"The next thing to be considered, and indeed what chiefly contributes to the success of injections, is the choice and preparation of the subject whose vessels are to be filled.

"In chusing a fit subject, take these few general rules: 1. The younger the creature to be injected is, the injection will, *ceteris paribus*, go farthest, and *vice versa*. 2. The more the creature's fluids have been dissolved and exhausted in life, the success of the operation will be greater. 3. The less solid the part designed to be injected is, the more vessels will be filled. 4. The more membranous and transparent parts are, the injection shows better; whereas, in the solid very hard parts of a rigid old creature, that has died with its vessels full of thick strong blood, it is scarce possible to inject great numbers of small vessels.

"Therefore, in preparing a subject for injecting, the principal things to be aimed at are, To dissolve the fluids, empty the vessels of them, relax the solids, and prevent the injection's coagulating too soon. To an-

(A) Rigierus (*introduc. in notitiam rerum natur.* &c. 4to, Hagae, 1743, titul. *Balsamum*) gives Ruysch's method of injecting and preserving animals, which, he says, Mr Blumentrost, president of the Petersburg academy, assured him was copied from the receipt given in Ruysch's own hand-writing to the Czar. According to this receipt, melted tallow, coloured with vermilion, to which, in the summer, a little white wax was added, was Ruysch's injecting *ceracea materies*.

(B) Mr Ranby's injecting matter, as published by Dr Hales, (*Hæmaph. Ex. 21.*), is white rosin and tallow, of each two ounces, melted and strained through linen; to which was added three ounces of vermilion, or finely ground indigo, which was first well rubbed with eight ounces of turpentine varnish.

answer all these intentions, authors have proposed to inject tepid or warm water by the arteries, till it returns clear and untinted by the veins, and the vessels are thereby so emptied of blood, that all the parts appear white; after which, they push out the water by forcing in air; and, lastly, by pressing with their hands, they squeeze the air also out. After this preparation, one can indeed inject very subtly; but generally there are inconveniencies attend it. For in all the parts where there is a remarkable *tunica cellulosa*, it never misses to be full of the water, which is apt to spoil any parts designed to be preserved either wet or dry; and some particles of the water seldom miss to be mixed in the larger as well as smaller vessels with the oily injection, and make it appear discontinued and broken: wherefore it is much better to let this injection of water alone, if it can be possibly avoided, and rather to macerate the body or part to be injected a considerable time in water, made so warm (c) as one can hold his hand easily in it; taking care to keep it of an equal warmth all the time, by taking out some of the water as it cools, and pouring in hot water in its place; by which the vessels will be sufficiently softened and relaxed, the blood will be melted down, and the injection can be in no danger of hardening too soon; whereas, if the water is too hot, the vessels shrink, and the blood coagulates. From time to time we squeeze out the liquids as much as possible at the cut vessel by which the injection is to be thrown in (d). The time this maceration is to be continued, is always in proportion to the age of the subject, the bulk and thickness of what we design to inject, and the quantity of blood we observe in the vessels, which can only be learned by experience; at least, however, care ought to be taken, that the whole subject, or part macerated, is perfectly well warmed all through; and that we continue the pressure with our hands, till no more blood can be brought away, whatever position we put the subject in.

When the syringe, injections, and subject, are all in readiness, one of the second sort of pipes is chosen, as near to the diameter of the vessel by which the injection is to be thrown as possible; for if the pipe is too large, it is almost needless to tell it cannot be introduced. If the pipe is much smaller than the vessel, it is scarce possible to tie them so firmly together, but, by the wrinkling of the coats of the vessel, some small passage will be left, by which part of the injection will spring back on the injector, in the time of the operation, and the nearest vessels remain afterwards undistended, by the loss of the quantity that oozes out. Having chosen a fit pipe, it is introduced at the cut orifice of the vessel, or at an incision made in the side of it; and then a waxed thread being brought round the vessel, as near to its coats as possible, by the help of a needle, or a flexible eyed probe, the surgeon's knot is made with the thread, and it is drawn as firmly as the thread can allow; taking care that it

shall be sunk into the circular notch of the pipe all round, otherwise it will very easily slide off, and the pipe will be brought out probably in the time of the operation, which ruins it.

"If there have been large vessels cut, which communicate with the vessels you design to inject, or if there are any others proceeding from the same trunk, which you do not resolve to fill, let them be all carefully now tied up, to save the injected liquor, and make the operation succeed better in the view you then have."

"When all this is done, both sorts of injections are to be warmed over a lamp, taking care to stir them constantly, lest the colouring powder fall to the bottom and burn (e). The oil of turpentine needs be made no warmer than will allow the finger to remain in it, if the subject has been previously well warmed in water; when the maceration has not been made, the oil ought to be scalding hot, that it may warm all the parts which are designed to be injected. The coarse injection ought to be brought near to a boiling. In the mean time, having wrapt several folds of linen round the parts of the syringe which the operator is to grip, and secured the linen with thread, the syringe is to be made very hot by sucking boiling water several times up (f), and the pipe within the vessel is to be warmed by applying a sponge dipped in boiling water to it (g).

"After all is ready, the syringe being cleared of the water, the injector fills it with the finer injection; and then introducing the pipe of the syringe into that in the vessel, he presses them together, and either with one hand holds this last pipe firm, with the other grips the syringe, and with his breast pushes the sucker; or, giving the pipe in the vessel to be held by an assistant, in any of the ways mentioned in the description of these sorts of pipes, he grips the syringe with one hand, and pushes the sucker with the other, and consequently throws in the injection, which ought to be done slowly, and with no great force, but proportioned to the length and bulk of the part to be injected and strength of the vessels. The quantity of this fine injection to be thrown in is much to be learned by use. The only rule I could ever fix to myself in this matter, was to continue pushing till I was sensible of a stop which would require a considerable force to overcome. But this will not hold where all the branches of any vessel are not injected; as for instance, when the vessels of the thorax only are to be injected: for the aorta bears too great a proportion to the branches sent from it, and therefore less fine injection is requisite here. As soon as that stop is felt, the sucker of the syringe is to be drawn back, that the nearest large vessels may be emptied. Then the syringe is taken off, emptied of the fine injection, and filled with the coarser, which is to be pushed into the vessels quickly and forcibly, having always regard to the strength and firmness of the vessels, bulk, &c. of the part. Continue to thrust the sucker, till a full stop, or a sort of push back-

wards,

(c) Ruysch orders a previous maceration for a day or two in cold water; which must have a better effect in melting the blood than warm water has.

(d) When Ruysch intended to inject the whole body, he put one pipe upwards, and another downwards, in the descending aorta.

(e) Ruysch melts his tallow by the heat of warm water, into which he puts the vessel containing the injection.

(f) He warms his syringe by laying it on hot coals.

(g) He warms his pipe, by putting the body, after the pipe is fixed in the vessel, into hot water. When this is to be done, a cork ought to be put into the pipe, to prevent the water getting into the vessel that is to be injected.

wards is felt, when you must beware of thrusting any more, otherwise some of the vessels will be burst, and the whole, or a considerable share of the preparation you designed, will be spoiled by the extravasation; but rather immediately stop the pipe by the turn-cock, and take out the syringe to clean it, and allow sufficient time for the coarse injection to coagulate fully, before any part is dissected. Ruysch, immediately after throwing in the injection, put the body into cold water, and stirred it continually for some time, to prevent the vermilion to separate from the tallow.

INJURY, any wrong done to a man's person, reputation, or goods. See ASSAULT.

INK, a black liquor used in writing, generally made of an infusion of galls, copperas, and gum-arabic.

The properties which this liquid ought to have, are,
1. To flow freely from the pen, and sink a little into the paper, that the writing be not easily discharged.
2. A very deep black colour, which should be as deep at first as at any time afterwards.
3. Durability, so that the writing may not be subject to decay by age.
4. Ink should be destitute of any corrosive quality, that it may not destroy the paper, or go through it in such a manner as to render the writing illegible. No kind of ink, however, hath yet appeared which is possessed of all these qualities. The ink used by the ancients was possessed of the second, third, and fourth qualities above-mentioned, but wanted the first. Dr Lewis hath discovered its composition from some passages in ancient authors. "Pliny and Vitruvius, (says he), expressly mention the preparation of foot, or what we now call *lamp-black*, and the composition of writing-ink from lamp-black and gum. Dioscorides is more particular, setting down the proportions of the two ingredients, viz. three ounces of the foot to one of the gum. It seems the mixture was formed into cakes or rolls; which being dried in the sun, were occasionally tempered with water, as the cakes of Indian ink are among us for painting."

In Mr Delaval's Treatise on Colours, p. 37. he acquaints us, that with an infusion of galls and iron filings, he had not only made an exceedingly black and durable ink, but by its means, without the addition of any acid, dyed silk and woollen cloth of a good and lasting black. This kind of ink, however, tho' the colour is far superior to that of any other, hath the inconvenience of being very easily discharged, either by the smallest quantity of any acid, or even by simple water; because it doth not penetrate the paper in such a manner as is necessary to preserve it from the instantaneous action of the acid or of the water. During the action of the infusion of galls upon the iron in making this kind of ink, a very considerable effervescence takes place, and a quantity of air is discharged, the nature of which hath not yet been examined.

The materials usually employed for the making of ink are, common green vitriol, or copperas, and galls; but almost all of them are deficient in durability, which is a property of such importance, that Dr Lewis hath thought the subject of ink-making not unworthy of his attention. From experiments made by that author, he infers, that the decay of ink is chiefly owing to a deficiency of galls; that the galls are the most perish-

able ingredient, the quantity of these, which gives the greatest blackness at first, (which is about equal parts with the vitriol), being insufficient to maintain the colour: that for a durable ink, the quantity of galls cannot be much less than three times that of the vitriol; that it cannot be much greater, without lessening the blackness of the ink: that by diminishing the quantity of water, the ink was rendered blacker and more durable; that distilled water, rain water, and hard spring-water, had the same effects: that white-wine produced a deeper black colour than water; that the colour produced by vinegar was deeper than that by wine; that proof-spirit extracted only a reddish brown tinge: that the last-mentioned tincture sunk into, and spread upon, the paper; and hence the impropriety of adding spirit of wine to ink, as is frequently directed, to prevent mouldiness or freezing: that other astringents, as oak-bark, bistort, sloe-bark, &c. were not so effectual as galls, nor gave so good a black; the colour produced by most of these, excepting oak-bark, being greenish: that the juice of sloes did not produce a black colour with martial vitriol; but that, nevertheless, the writing made with it became black, and was found to be more durable than common ink: that inks made with saturated solutions of iron in nitrous, marine, or acetic acids, in tartar, or in lemon-juice, were much inferior to the ink made with martial vitriol: that the colour of ink was depraved by adding quicklime, which was done with an intention of destroying any superabundant acid which might be supposed to be the cause of the loss of the colour of ink: that the best method of preventing the effects of this superabundant acid is probably by adding pieces of iron to engage it; and that this conjecture was confirmed by an instance the author had heard, of the great durability of the colour of an ink in which pieces of iron had been long immerged: and lastly, that a decoction of logwood used instead of water, sensibly improved both the beauty and deepness of the black, without disposing it to fade. The same author observes, that the addition of gum-arabic is not only useful, by keeping the colouring matter suspended in the fluid, but also by preventing the ink from spreading, by which means a greater quantity of it is collected on each stroke of the pen. Sugar, which is sometimes added to ink, was found to be much less effectual than gums, and to have the inconvenience of preventing the drying of the ink. The colour of ink is found to be greatly injured by keeping the ink in vessels made of copper or of lead, and probably of any other metal, excepting iron, which the vitriolic acid can dissolve.

The foregoing experiments point out for the best proportions of the ingredients for ink, One part of green vitriol, one part of powdered logwood, and three parts of powdered galls. The best menstruum appears to be vinegar or white-wine, though for common use water is sufficient. If the ink be required to be of a full colour, a quart, or at most three pints, of liquor, may be allowed to three ounces of galls, and to one ounce of each of the other two ingredients. Half an ounce of gum may be added to each pint of the liquor. The ingredients may be all put together at once in a convenient vessel, and well shaken four or five times each day. In 10 or 12 days the ink will be fit for use, though it will improve by

remaining longer on the ingredients. Or it may be made more expeditiously, by adding the gum and vitriol to a decoction of galls and logwood in the menstrum. To the ink, after it has been separated from the feculencies, some coarse powder of galls, from which the fine dust has been sifted, together with one or two pieces of iron, may be added, by which its durability will be secured.

In some attempts made by the Doctor to endow writing ink with the great durability of that of the ancients, as well as the properties which it hath at present, he first thought of using animal-glues, and then of oily matters. "I mixed both lamp-black (says he) and ivory-black with solution of gum arabic, made of such consistence as just to flow sufficiently from the pen. The liquors wrote of a fine black colour; but when dry, part of the colour could be rubbed off, especially in moist weather, and a pencil dipped in water washed it away entirely.

"I tried solutions of the animal-glues, with the same effect. Isinglass or fish-glue being the most difficultly dissoluble of these kinds of bodies, I made a decoction of it in water, of such strength, that the liquor concreted into a jelly before it was quite cold: with this jelly, kept fluid by sufficient heat, I mixed some ivory-black: characters drawn with this mixture on paper bore rubbing much better than the others, but were discharged without much difficulty by a wet pencil.

"It was now suspected, that the colour could not be sufficiently fixed on paper without an oily cement. As oils themselves are made miscible with watery fluids by the intervention of gum, I mixed some of the softer printers varnish, after-mentioned, with about half its weight of a thick mucilage of gum arabic, working them well together in a mortar, till they united into a smooth uniform mass: this was beaten with lamp-black, and some water added by little and little, the rubbing being continued till the mixture was diluted to a due consistence for writing. It wrote freely, and of a full brownish-black colour: the characters could not be discharged by rubbing, but water washed them out, though not near so readily as any of the foregoing. Instead of the printers varnish or boiled oil, I mixed raw linseed oil in the same manner with mucilage and lamp-black; and on diluting the mixture with water, obtained an ink not greatly different from the other.

"Though these oily mixtures answered better than those with simple gums or glues, it was apprehended that their being dischargeable by water would render them unfit for the purposes intended. The only way of obviating this imperfection appeared to be, by using a paper which should admit the black liquid to sink a little into its substance. Accordingly I took some of the more sinking kinds of paper, and common paper made damp as for printing; and had the satisfaction to find, that neither the oily nor the simple gummy mixtures spread upon them so much as might have been expected, and that the characters were as fixed as could be desired, for they could not be washed out without rubbing off part of the substance of the paper itself.

"All these inks must be now and then stirred or shaken during the time of use, to mix up the black powder, which settles by degrees to the bottom: those

Vol. V.

with oil must be well shaken also, though not used, once a-day, or at least once in three or four days, to keep the oil united with the water and gum; for if once the oil separates, which it is apt to do by standing at rest for some days, it can no longer be mixed with the thin fluid by any agitation. But though this imperfect union of the ingredients renders these inks less fit for general use than those commonly employed, I apprehend there are many occasions in which these kinds of inconveniences will not be thought to counterbalance the advantage of having writings which we may be assured will be as lasting as the paper they are written upon. And indeed the inconvenience may be in a great measure obviated by using cotton in the ink-stand, which, imbibing the fluid, prevents the separation of the black powder diffused through it.

"All the inks, however, made on the principle we are now speaking of, can be discharged by washing, unless the paper admits them to sink into its substance. The ancients were not insensible of this imperfection; and sometimes endeavoured to obviate it, according to Pliny, by using vinegar, instead of water, for tempering the mixture of lamp-black and gum. I tried vinegar, and found it to be of some advantage, not as giving any improvement to the cement, but by promoting the sinking of the matter into the paper. As this washing out of the ink may be prevented, by using a kind of paper easy enough to be procured, it is scarcely to be considered as an imperfection; and indeed, on other kinds of paper, it is an imperfection only so far as it may give occasion to fraud, for none of these inks are in danger of being otherwise discharged than by design. The vitriolic inks themselves, and those of printed books and copperplates, are all dischargeable; nor can it be expected of the ink-maker to render writings secure from frauds.

"But a further improvement may yet be made, namely, that of uniting the ancient and modern inks together; or using the common vitriolic ink instead of water, for tempering the ancient mixture of gum and lamp-black. By this method it should seem that the writings would have all the durability of those of former times, with all the advantage that results from the vitriolic ink fixing itself in the paper. Even where the common vitriolic mixture is depended on for the ink, it may in many cases be improved by a small addition of the ancient composition, or of the common Indian ink which answers the same purpose: when the vitriolic ink is dilute, and flows so pale from the pen, that the fine strokes, on first writing, are scarcely visible, the addition of a little Indian ink is the readiest means of giving it the due blackness. By this admixture it may be presumed also that the vitriolic ink will be made more durable, the Indian ink in some measure covering it, and defending it from the action of the air. In all cases, where Indian ink or other similar compositions are employed, cotton should be used in the ink-stand, as already mentioned, to prevent the settling of the black powder."

Indian Ink, a valuable black for water-colours, brought from China and other parts of the East Indies, sometimes in large rolls, but more commonly in small quadrangular cakes, and generally marked with Chinese characters. Dr Lewis, from experiments made on this substance, hath shewn that it is composed

Ink.

of fine lamp-black and animal-glue : and accordingly, for the preparation of it, he defires us to mix the lamp-black with as much melted glue as is sufficient to give it a tenacity proper for being made into cakes ; and these when dry, he tells us, answered as well as those imported from the East Indies, both with regard to the colour, and the freedom of working. Ivory-black, and other charcoal-blacks, levigated to a great degree of fineness, answered as well as the lamp-black ; but in the state in which ivory-black is commonly sold, it proved much too gritty, and separated too hastily from the water.

Printing Ink, is totally different from Indian ink, or that made use of in writing. It is an oily composition, of the confidence of an ointment : the method of preparing it was long kept a secret by those whose employment it was to make it, and who were interested in concealing it ; and even yet is but imperfectly known. The properties of good printing-ink are, to work clean and easily, without daubing the types, or tearing the paper ; to have a fine black colour ; to wash easily off the types ; to dry soon ; and to preserve its colour, without turning brown. This last, which is a most necessary property, is effectually obtained by setting fire to the oil with which the printing ink is made for a few moments, and then extinguishing it by covering the vessel (A). It is made to wash easily off the types, by using soap as an ingredient ; and its working clean depends on its having a proper degree of strength, which is given by a certain addition of rosin. A good deal, however, depends on the proportion of the ingredients to each other ; for if too much soap is added, the ink will work very foul, and daub the types to a great degree. The same thing will happen from using too much black, at the same time that both the soap and black hinder the ink from drying ; while too much oil and rosin tear the paper, and hinder it from washing off.—The following receipt has been found to make printing ink of a tolerable good quality. “ Take a Scots pint of linseed oil, and let it over a pretty brisk fire in an iron or copper vessel capable of holding three or four times as much. When it boils strongly, and emits a thick smoke, kindle it with a piece of paper, and immediately take the vessel off the fire. Let the oil burn for about a minute ; then extinguish it by covering the vessel ; after it has grown pretty cool, add two pounds of black rosin, and one pound of hard soap cut into thin slices. If the oil is very hot when the soap is added, almost the whole mixture will run over the vessel. The mixture is then to be set again over the fire ; and when the ingredients are thoroughly melted, a pound of lamp-black, previously put through a lawn sieve, is to be stirred into it. The whole ought then to be ground on a marble stone, or in a mill like the levigating mill described under the article *CHEMISTRY*, n° 97.”

Though the above receipt is greatly superior to any that hath been hitherto published, all of which are capitally deficient in not mentioning the necessary ingredients of rosin and soap ; yet it must be acknowledged, that ink made in this manner is inferior in point of colour, and is likewise more apt to daub the types and make an indistinct impression, than such

Ink.

as is prepared by some of those who make the manufacture of this commodity their employment ; so that either a variation in the proportion of the ingredients, a nicety in the mixture, or some additional ingredient, seems necessary to bring it to the requisite perfection.

Ink for the Rolling Press, is made of linseed oil burnt in the same manner as that for common printing-ink, and then mixed with Francfort-black, and finely ground. There are no certain proportions which can be determined in this kind of ink ; every workman adding oil or black to his ink, as he thinks proper, in order to make it suit his own taste.—Some, however, mix a portion of common boiled oil which has never been burnt : but this must necessarily be a bad practice, as such oil is apt to go through the paper ; a fault very common in prints, especially if the paper is not very thick. No soap is added ; because the ink is not cleared off from the copperplates with alkaline ley as in common printing, but with a brush dipped in oil.

INK is also an appellation given to any coloured liquor used in writing, whether red, yellow, green, &c. Many different kinds of these inks may be prepared by the directions given under the article *COLOUR-MAKING*, which it would be superfluous here to repeat.

Sympathetic Ink, a liquor with which a person may write, and yet nothing appear on the paper after it is dry, till some other means are used, such as holding the paper to the fire, rubbing it over with some other liquor, &c.

These kinds of ink may be divided into seven classes, and that with respect to the means used to make them visible ; viz. 1. Such as become invisible by passing another liquor over them, or by exposing them to the vapour of that liquor. 2. Those that do not appear so long as they are kept close, but soon become visible on being exposed to the air. 3. Such as appear by stirring or sifting some very fine powder of any colour over them. 4. Those which become visible by being exposed to the fire. 5. Such as become visible by heat, but disappear again by cold or the moisture of the air. 6. Those which become visible by being wetted with water. 7. Such as appear of various colours, red, yellow, blue, &c.

I. The first class contains four kinds of ink, viz. solutions of lead, bismuth, gold, and green vitriol. The first two become visible in the same manner, viz. by the contact of sulphureous liquids or fumes. For the first, a solution of common sugar-of-lead in water will answer as well as more troublesome preparations. If you write with this solution with a clean pen, the writing when dry will be totally invisible : but if it be wetted with a solution of *hepar sulphuris*, or of orpiment, dissolved by means of quick-lime ; or if it be exposed to the strong vapours of these solutions, but especially to the vapour of volatile tincture of sulphur ; the writing will appear of a brown colour, more or less deep according to the strength of the sulphureous fume. By the same means, what is wrote with the solution of bismuth in spirit of nitre will appear of a deep black.

The sympathetic ink prepared from gold, depends on

(A) This is mentioned by Dr Lewis in his *Philosophical Commerce of Arts* ; but he seems not to have been acquainted with the method of giving it the other necessary properties.

Ink. on the property by which that metal precipitates from its solvent on the addition of a solution of tin. If you write with a solution of gold in *aqua regia*, and let the paper dry gently in the shade, nothing will appear for the first seven or eight hours. Dip a pencil or a small fine sponge in the solution of tin, and drawing it lightly over the invisible characters, they will immediately appear, of a purple colour.

Characters wrote with a solution of green vitriol carefully deperated, will likewise be invisible when the paper is dry; but if wetted with an infusion of galls, they will immediately appear as if wrote with common ink. If, instead of this infusion, a solution of the phlogisticated alkali, impregnated with the colouring matter Prussian blue is made up of, the writing will appear of a very deep blue.

II. To the second class belong the solutions of all those metals which are apt to attract phlogiston from the air, such as lead, bismuth, silver, &c. The sympathetic ink of gold already mentioned belongs also to this class; for if the characters wrote with it are long exposed to the air, they become by degrees of a deep violet colour, nearly approaching to black. In like manner, characters wrote with a solution of silver in *aqua fortis* are invisible when newly dried, but being exposed to the sun, appear of a grey colour like slate. To this class also belong solutions of lead in vinegar; copper in *aqua fortis*; tin in *aqua regia*; emery, and some kinds of pyrites, in spirit of salt; mercury, in *aqua fortis*; or iron, in vinegar. Each of these has a particular colour when exposed to the air; but they have the disfigureable property of corroding the paper, so that after some time the characters appear like holes cut out of the paper.

III. The third class of sympathetic inks contains such liquids as have some kind of glutinous viscosity, and at the same time are long a drying; by which means, though the eye cannot discern the characters wrote with them upon paper, the powders strewn upon them immediately adhere, and thus make the writing become visible. Of this kind are urine, milk, the juices of some vegetables, weak solutions of the deliquescent salts, &c.

IV. This class, comprehending all those that become visible by being exposed to the fire, is very extensive, as it contains all those colourless liquids in which the matter dissolved is capable of being reduced, or of reducing the paper, into a sort of charcoal by a small heat. A very easily procured ink of this kind is oil of vitriol diluted with as much water as will prevent it from corroding the paper. Letters wrote with this fluid are perfectly invisible when dry, but instantly appear as black as if wrote with the finest ink on being held near the fire. Juice of lemons or onions, a solution of sal-ammoniac, green vitriol, &c. will answer the same purpose, though not so easily, or with so little heat.

V. The fifth class comprehends only solutions of Regulus of Cobalt in spirit of salt; for the properties of which, see CHEMISTRY, n° 259.

VI. This class comprehends such inks as become visible when characters wrote with them are wetted with water. They are made of all such substances as deposit a copious sediment when mixed with water, dissolving only imperfectly in that fluid. Of this kind

are dried alum, sugar-of-lead, vitriol, &c. We have therefore only to write with a strong solution of these salts upon paper, and the characters will be invisible when dry; but when we apply water, the small portion of dried salt cannot again be dissolved in the water. Hence the insoluble part becomes visible on the paper, and shews the characters wrote in white, grey, brown, or any other colour which the precipitate assumes.

VII. Characters may be made to appear of a fine crimson, purple, or yellow, by writing on paper with solution of tin in *aqua regia*, and then passing over it a pencil dipt in a decoction of cochineal, Brazil-wood, logwood, yellow-wood, &c.—For an account of the nature of all these sympathetic inks, however, and the principles on which they are made, see the articles CHEMISTRY and COLOUR-MAKING, *passim*.

INLAND, a name for any part of a country at a distance from the sea.

INLAND Navigation. See CANAL.

INLAND Trade, that kind of trade carried on between the different parts of the same kingdom, whether over land, or by means of inland navigation.

INN, a place appointed for the entertainment and relief of travellers.

Inns are licensed and regulated by justices of the peace, who oblige the landlord to enter into recognizances for keeping good order. If a person who keeps a common inn, refuses to receive a traveller into his house as a guest, or to find him victuals and lodging on his tendering a reasonable price for them, he is liable to an action of damages, and may be indicted and fined at the king's suit. The rates of all commodities sold by inn-keepers, according to our ancient laws, may be assailed: and inn-keepers not selling their hay, oats, beans, &c. and all manner of victuals at reasonable prices, without taking any thing for litter, may be fined and imprisoned, &c. by 21 Jac. I. c. 21. Where an inn-keeper harbours thieves, persons of infamous character, or suffers any disorders in his house, or sets up a new inn where there is no need of one, to the hindrance of ancient and well-governed inns, he is indictable and fineable; and by statute, such inn may be suppressed. Action upon the case lies against any inn-keeper, if a theft be committed on his guest by a servant of the inn, or any other person not belonging to the guest; though it is otherwise where the guest is not a traveller, but one of the same town or village, for there the inn-keeper is not chargeable; nor is the master of a private tavern answerable for a robbery committed on his guest: it is said, that even tho' the travelling guest does not deliver his goods, &c. into the inn-keeper's possession, yet if they are stolen, he is chargeable. An inn-keeper is not answerable for any thing out of his inn, but only for such as are within it; yet, where he of his own accord puts the guest's horse to graze, and the horse is stolen, he is answerable, he not having the guest's orders for putting such horse to graze. The inn-keeper may justify the stopping of the horse, or other thing of his guest, for his reckoning, and may detain the same till it be paid. Where a person brings his horse to an inn, and leaves him in the stable, the inn-keeper may detain him till such time as the owner pays for his keeping; and

Innocent's.

and if the horse eats out as much as he is worth, after a reasonable appraisement made, he may sell the horse and pay himself: but when a guest brings several horses to an inn, and afterwards takes them all away except one, this horse so left may not be sold for payment of the debt for the others; for every horse is to be sold, only to make satisfaction for what is due for his own meat.

INNS of Court, are colleges in London, for the study of the laws of England, with all conveniencies for the lodging and entertainment of the professors and students.

In these colleges, there are not only such students as study the laws of this kingdom, in order to render themselves capable of practising in the courts of law at Westminster; but also such other gentlemen of fortune as apply themselves to this study, in order to know and vindicate their rights, and to render themselves more serviceable to their country.

Our inns of court, which are numerous, and justly famed for the production of men of learning, are governed by masters, principals, benchers, stewards, and other officers; and have public halls for exercises, readings, &c. which the students are obliged to attend and perform for a certain number of years, before they can be admitted to plead at the bar. These societies have not, however, any judicial authority over their members; but instead of this, they have certain orders among themselves, which have, by consent, the force of laws: for lighter offences, persons are only *excommunicated*, or put out of commons; for greater, they lose their chambers, and are expelled the college: and when once expelled out of one society, they are never received by any of the others. The gentlemen in these societies may be divided into benchers, outer-barristers, inner-barristers, and students.

The four principal inns of court are the Inner-temple, Middle-temple, Lincoln's-inn, and Gray's-inn; the other inns are the two Serjeant's-inns; and the others, which are less considerable, are Clifford's-inn, Symond's-inn, Clement's-inn, Lion's-inn, Furnival's-inn, Staple's-inn, Thavie's-inn, Barnard's-inn, and New-inn. These are mostly taken up by attorneys, solicitors, &c.; but they belong to the inns of court, who send yearly some of their barristers to read to them.

INNATE IDEAS, those supposed to be stamped on the mind, from the first moment of its existence, and which it constantly brings into the world with it: a doctrine which Mr Locke has taken great pains to refute.

INNERKEITHING. See **INVERKEITHING**.

INNERLOCHY, or **FORT-WILLIAM**, a fortress lately erected in the Highlands of Scotland, at the mouth of a large lake in the county of Lochaber, 28 miles S. W. of Lochness, and 100 N. W. of Edinburgh. W. Long. 5. 15. N. Lat. 56. 55.

INNISKILLING, a strong town of Ireland, in the county of Fermanagh, and province of Ulster. The inhabitants distinguished themselves in favour of king William soon after the revolution, against king James's party. It is seated between two lakes, in W. Long. 5. 50. N. Lat. 54. 20.

INNOCENT'S DAY, a festival of the Christian church, observed on December 28th, in memory of

the massacre of the innocent children by the command of Herod king of Judaea. See *JESUS CHRIST*; and *Jews*, n° 24. par. ult. The Greek church in their kalendar, and the Abyssinians of Ethiopia in their offices, commemorate 14,000 infants on this occasion.

INNOMINATA OSSA, in anatomy. See there, n° 38. a, b.

INOCULATION, or **BUDDING**, in gardening, is commonly practised upon all sorts of stone-fruit; as nectarines, peaches, apricots, plumbs, cherries, as also upon oranges and jasmines: and indeed this is preferable to any sort of grafting for most sorts of fruit. The method of performing it is as follows: You must be provided with a sharp pen-knife with a flat haft, which is to raise the bark of the stock to admit the bud; and some found bafs-mat, which should be soaked in water, to increase its strength, and render it more pliable: then having taken off the cuttings from the trees you would propagate, you must choose a smooth part of the stock, about five or six inches above the surface of the ground, if designed for dwarfs; but if for standards, they should be budded six feet above-ground. Then with your knife make an horizontal cut across the rind of the stock, and from the middle of that cut make a slit downwards, two inches in length, that it may be in the form of a T; but you must be careful not to cut too deep, lest you wound the stock: then having cut off the leaf from the bud, leaving the foot-stalk remaining, you should make a cross cut, about half an inch below the eye, and with your knife slit off the bud, with part of the wood to it: this done, you must with your knife pull off that part of the wood which was taken with the bud, observing whether the eye of the bud be left to it or not; for all those buds which lose their eyes in stripping, are good for nothing: then having gently raised the bark of the stock with the flat haft of your pen-knife clear to the wood, thrust the bud therein, observing to place it smooth between the rind and wood of the stock, cutting off any part of the rind belonging to the bud, that may be too long for the slit made in the stock; and so having exactly fitted the bud to the stock, tie them closely round with bafs-mat, beginning at the under-part of the slit, and so proceeding to the top, taking care not to bind round the eye of the bud, which should be left open.

When your buds have been inoculated three weeks or a month, those which are fresh and plump you may be sure are joined; and at this time you should loosen the bandage, which if it be not done in time, will injure if not destroy the bud. The March following cut off the stock sloping, about three inches above the bud, and to what is left fasten the shoot which proceeds from the bud: but this must continue no longer than one year; after which the stock must be cut off close above the bud. The time for inoculating is from the middle of June to the middle of August: but the most general rule is, when you observe the buds formed at the extremity of the same year's shoot, which is a sign of their having finished their spring growth. The first sort commonly inoculated is the apricot; and the last the orange-tree, which should never be done till the latter end of August. And in doing this work, you should always make choice of cloudy weather; for if it be done in the middle of the day,

Innominate,
Inoculation.

day, when the weather is hot, the shoots will perish so fast, as to leave the buds destitute of moisture.

INOCULATION, in medicine, the art of transplanting the small-pox from one person to another, by impregnating the blood of the sound person with the various matter from a pustule taken from the other. See (the *INDEX* subjoined to) **MEDICINE**.

INOSULATION, in anatomy. See **ANASTOMOSIS**.

IMPROMPTU, or **IMPROMPTU**. See **IMPROMPTU**.

INQUEST, in Scots law, the same with **JURY**.

INQUISITION, in the church of Rome, a tribunal in several Roman Catholic countries, erected by the popes for the examination and punishment of heretics.

This court was founded in the twelfth century by father Dominic and his followers, who were sent by pope Innocent III. with orders to excite the Catholic princes and people to extirpate heretics, to search into their number and quality, and to transmit a faithful account thereof to Rome. Hence they were called *inquisitors*; and this gave birth to the formidable tribunal of the inquisition, which was received in all Italy, and the dominions of Spain, except the kingdom of Naples and the Low Countries.

This diabolical tribunal takes cognizance of heresy, Judaism, Mahometanism, Sodomy, and polygamy; and the people stand in so much fear of it, that parents deliver up their children, husbands their wives, and masters their servants, to its officers, without daring in the least to murmur. The prisoners are kept for a long time, till they themselves turn their own accusers, and declare the cause of their imprisonment; for they are neither told their crime, nor confronted with witnesses. As soon as they are imprisoned, their friends go into mourning, and speak of them as dead, not daring to solicit their pardon, lest they should be brought in as accomplices. When there is no shadow of proof against the pretended criminal, he is discharged, after suffering the most cruel tortures, a tedious and dreadful imprisonment, and the loss of the greatest part of his effects. The sentence against the prisoners is pronounced publicly, and with extraordinary solemnity. In Portugal, they erect a theatre capable of holding 3000 persons; in which they place a rich altar, and raise seats on each side in the form of an amphitheatre. There the prisoners are placed; and over-against them is a high chair, whither they are called, one by one, to hear their doom, from one of the inquisitors.

These unhappy people know what they are to suffer, by the cloaths they wear that day. Those who appear in their own cloaths, are discharged upon payment of a fine: those who have a *santo benito*, or strait yellow coat without sleeves, charged with St Andrew's crosses, have their lives, but forfeit all their effects: those who have the resemblance of flames, made of red serge, sewed upon their *santo benito*, without any crosses, are pardoned, but threatened to be burnt if ever they relapse: but those who, besides these flames, have on their *santo benito* their own picture, surrounded with figures of devils, are condemned to expire in the flames. The inquisitors, who are ecclesiastics, do not pronounce the sentence of death; but form and read an act, in which they say, that

the criminal being convicted of such a crime, by his own confession, is with much reluctance delivered to the secular power to be punished according to his demerits: and this writing they give to the seven judges who attend at the right side of the altar, who immediately pass sentence. For the conclusion of this horrid scene, see *ACT of Faith*.

INSCRIBED, in geometry. A figure is said to be inscribed in another, when all its angles touch the side or planes of the other figure.

INSCRIPTION, a title or writing carved, engraved, or affixed to any thing, to give a more distinct knowledge of it, or to transmit some important truth to posterity.

The inscriptions mentioned by Herodotus and Diodorus Siculus, sufficiently shew that this was the first method of conveying instruction to mankind, and transmitting the knowledge of history and sciences to posterity: thus the ancients engraved upon pillars both the principles of sciences, and the history of the world. Pisistratus carved precepts of husbandry on pillars of stone; and the treaties of confederacy between the Romans and Jews, were engraved on plates of brass. Hence, antiquarians have been very curious in examining the inscriptions on ancient ruins, coins, medals, &c.

Academy of INSCRIPTIONS. See **ACADEMY**.

INSECTS, **INSECTA**, in natural history, a smaller sort of animals, commonly supposed to be exanguinous; and distinguished by certain incisions, cuttings, or indentings in their bodies. The word is originally Latin, formed of *in*, and *seco*, "I cut;" the reason of which is, that in some of this tribe, as ants, the body seems to be cut or divided into two; or because the bodies of many, as worms, caterpillars, &c. are composed of divers circles, or rings, which are a sort of incisure.

By some natural historians, this class of animals is considered as the most imperfect of any, while others prefer them to the larger animals. One mark of their imperfection is said to be, that many of them can live a long time, though deprived of those organs which are necessary to life in the higher ranks of nature. Many of them are furnished with lungs and an heart, like the nobler animals; yet the caterpillar continues to live, though its heart and lungs, which is often the case, are entirely eaten away.—It is not, however, from their conformation alone that insects are inferior to other animals, but from their instincts also. It is true, that the ant and the bee present us with striking instances of assiduity; yet even these are inferior to the marks of sagacity displayed by the larger animals. A bee taken from the swarm is totally helpless and inactive, incapable of giving the smallest variation to its instincts. It has but one single method of operating; and if put from that, it can turn to no other. In the pursuits of the honey, there is something like choice; but in the labours of the bee, the whole appears like necessity and compulsion.—All other animals are capable of some degree of education; their instincts may be suppressed or altered; the dog may be taught to fetch and carry, the bird to whistle a tune, and the serpent to dance: but the insect has only one invariable method of operating; no arts can turn it from its instincts; and indeed its

Inferbed
Insects.

life

Insects.

life is too short for instruction, as a single season often terminates its existence.—Their amazing number is also an imperfection. It is a rule that obtains through all nature, that the nobler animals are slowly produced, and that nature acts with a kind of dignified economy; but the meaner births are lavished in profusion, and thousands are brought forth merely to supply the necessities of the more favourite part of the creation. Of all productions in nature, insects are by far the most numerous. The vegetables which cover the surface of the earth bear no proportion to the multitudes of insects; and though, at first sight, herbs of the field seem to be the parts of organized nature produced in the greatest abundance, yet, upon more minute inspection, we find every plant supporting a mixture of scarce perceptible creatures, that fill up the compass of youth, vigour, and age, in the space of a few days existence.—In Lapland, and some parts of America, the insects are so numerous, that if a candle is lighted they swarm about it in such multitudes, that it is instantly extinguished by them; and in these parts of the world, the miserable inhabitants are forced to smear their bodies and faces with tar, or some other unctuous composition, to protect them from the stings of their minute enemies.

On the other hand, Swammerdam argues for the perfection of insects in the following manner. “After an attentive examination (says he) of the nature and anatomy of the smallest as well as the largest animals, I cannot help allowing the least an equal, or perhaps a superior, degree of dignity. If, while we dissect with care the larger animals, we are filled with wonder at the elegant disposition of their parts, to what an height is our astonishment raised, when we discover all these parts arranged, in the least, in the same regular manner! Notwithstanding the smallness of ants, nothing hinders our preferring them to the largest animals, if we consider either their unwearied diligence, their wonderful strength, or their inimitable propensity to labour. Their amazing love to their young is still more unparalleled among the larger classes. They not only daily carry them to such places as may afford them food; but if by accident they are killed, and even cut into pieces, they will with the utmost tenderness carry them away piecemeal in their arms. Who can shew such an example among the larger animals which are dignified with the title of *perfect*? Who can find an instance in any other creature that can come in competition with this?”

On this dispute it is only necessary to observe, that the wisdom of the Creator is so conspicuous in all his works, and such surprising art is discovered in the mechanism of the body of every creature, that it is very difficult, if not impossible, to say where it is most, and where it is least, to be observed.—The nature and properties of insects are certainly very wonderful. Many particulars relating to them may be found under different articles of this work; but those who desire to see this subject treated in a full and ample manner, must have recourse to the works of Reaumur and Swammerdam.

Of the Kinds of INSECTS, and where the Collector for the Cabinet may find them. Insects in general are known to most people, the systematic distinctions but too few; nor have we any English names for the greatest

part of them. The general denominations of beetles, butterflies, moths, flies, bees, wasps, and a few other common names, are all that our language supplies. It would, therefore, be in vain to enumerate the immense variety of genera and species to any person unskilled in the science of entomology: we may, however, give directions under general names where to find each kind.

The class of insects is divided by Linnæus into seven orders. See ZOOLOGY.

I. The COLEOPTERA, (from *κορυνη*, a sheath, and *πτερον*, a wing,) are such insects as have crustaceous elytra or shells, which shut together, and form a longitudinal suture down the back of the insect; as the beetle, (*buprestis ignita*), fig. 11. Many of them (as the scarabæus or chafer, dermestes or leather-eater, hisper or mimic-beetle, staphylinus or rove-beetle, &c.) are found in and under the dung of animals, especially of cows, horses, and sheep. Some (as *lucanus* or stag-beetle, *cerambyx* or capricorn beetle, *dermestes*, &c.) are found in rotten and half-decayed wood, and under the decayed bark of trees. Others (as *hispæa*, *silpha* or carrion-beetle, *staphylinus*, &c.) on the carcases of animals that have been dead four or five days; on moist bones that have been gnawed by dogs or other animals; on flowers having a fetid smell; and on several kinds of fungous substances, particularly the rotten and most stinking. Others (as *byrrhus*, *curculio* or weevil, *bruchus* or feed-beetle, &c.) may be found in a morning about the bottoms of perpendicular rocks and sand-banks, and also upon the flowers of trees and herbaceous plants. Many kinds (as *gyrinus* or whirl-beetle, *dytiscus* or water-beetle, &c.) may be caught in rivers, lakes, and standing pools, by means of a thread-net, with small meshes, on a round wire-hoop, fixed at the end of a long pole. In the middle of the day, when the sun shines hot, some (as the *coccinella* or lady-fly, *buprestis* or burn-cow, *chrysomela* or golden honey-beetle, *cantharis* or soft-winged beetle, *elater* or spring-beetle, *negydalis* or clipt-winged beetle, &c.) are to be seen on plants and flowers, blighted trees and shrubs. Others (as *lampyris* or glow-worm, &c.) frequent moist meadows, and are best discovered at night, by the shining light which they emit. A great variety fit close on the leaves of plants, particularly of the burdock, elecampane, coltsfoot, dock, thistle, and the like, (as the *castrida* or tortoise-beetle, &c.); or feed on different kinds of tender herbs (as the *meloe* or blister-beetle.) Numbers (as the *tenebrio* or stinking-beetle,) may be found in houses, dark cellars, damp pits, caves, and subterraneous passages; or on umbelliferous flowers, (as the *cerambyx*, *pinus*, &c.); or on the trunks as well as on the leaves of trees, in timber-yards, and in the holes of decayed wood. Some (as the *leptura* or wood-beetle, *cicindela* or glossy-beetle, &c.) inhabit wild commons, the margins of pools, marshes, and rivulets; and are likewise seen creeping on flags, reeds, and all kinds of water-plants. Multitudes (as the *carabus* or ground-beetle) live under stones, moss, rubbish, and wrecks near the shores of lakes and rivers. These are found also in bogs, marshes, moist places, pits, holes of the earth, and on stems of trees; and in an evening they crawl plentifully along path-ways after a shower of rain. Some (as the *forficula* or earwig) may be discovered

Insects.

Plate
CLIV.Lettisome's
Naturalist's
Companion,
p. 2, &c.

in the hollow stems of decayed umbelliferous plants, and on many forts of flowers and fruits.

II. HEMIPTERA, (from *hemis*, half, and *pteron*, a wing,) have their upper wings usually half crustaceous and half membranaceous, not divided by a longitudinal suture, but incumbent on each other; as the *cimex*, fig. 12. Some of these (as the *blatta* or cockroach) are found about bake-houses, &c.; others (as the *mantis* or camel-cricket, *gyllis* or locust, *fulgora*, *cadada*, or flea-locust, *cimex* or bug, &c.) on grafs, and all kinds of wild-herbage. Some (as *notonecta* or boat-fly, *nepa* or water-scorpion, &c.) frequent rivers, lakes, and standing pools.

III. LEPIDOPTERA, (from *lepis*, a scale, and *pteron*, a wing,) are insects having four wings, covered with fine scales in the form of powder or meal; as in the butterfly, (*papilio antiopa*), fig. 13. In the day, when the sun is warm, butterflies are seen on many sorts of trees, shrubs, plants, and flowers. Moths may be seen in the day-time, sitting on pales, walls, trunks of trees, in shades, out-houses, dry holes, and crevices; on fine evenings, they fly about the places they inhabit in the day-time: some (as the *sphinx* or hawk-moth,) are seen flying in the day-time over the flowers of honey-suckles and other plants with tubular flowers. Insects of this species seldom sit to feed, but continue vibrating on the wing, while they thrust the tongue or proboscis into the flowers.

IV. NEUROPTERA, (from *neuron*, a nerve, and *pteron*, a wing,) have four membranous transparent naked wings, generally like network; as in the *panorpa coa*, fig. 14. Of these, some (as the *myrmelion*, *temerobius* or pearl-fly, *raphidia* or camel-fly, &c.) are found in woods, hedges, meadows, sand-banks, walls, pales, fruits, and umbelliferous flowers. Others (as *libellula* or dragon-fly, *ephemera* or may-fly, *phryganea* or spring-fly, &c.) fly about lakes and rivers in the day.

V. HYMENOPTERA, (from *hymen*, a membrane, and *pteron*, a wing,) are insects with four membranous wings, tail furnished with a sting; as in the *tenthredo*, fig. 15. These, including wasps, bees, &c. frequent hedges, shrubs, flowers, and fruits.

VI. DIPTERA, (from *diu*, two, and *pteron*, a wing,) are such as have only two wings, and poisers; as in the fly, fig. 16. Flies of various kinds constitute this class; of which some (as *asflar* or gad-fly, *musca* or fly, *tubanus* or whame,) fly about the tops of trees, little hills, horses, cows, sheep, ditches, dunghills, and every offensive object. Others (as *tipula*, *conops*, *asilus* or wasp-fly, &c.) are found on all sorts of flowers, particularly those of a fetid smell.

VII. APTEA (from *a*, without, and *pteron*, a wing, insects having no wings. This last division contains scorpions, spiders, crabs, lobsters, &c.

Of Catching and Preserving Insects for Collections. In the following directions, we shall relate the methods of killing them the most readily, and with the least pain, as the pursuit of this part of natural history hath been often branded with cruelty; and however reasonably the naturalist may exculpate himself by pleading the propriety of submitting to an evil which leads to useful discoveries, yet for wanton cruelty there never can be a just pretext:

—The poor beetle that we tread upon,

In corp'ral sufferance feels a pang as great
As when a giant dies.

1. The first class, consisting of beetles (*coleoptera*), are hard-winged. Many kinds fly about in the day, others in the evening, some at night only. They may be caught with a gauze-net, or a pair of forceps covered with gauze. When they are taken, stick a pin thro' the middle of one of the hard wings, and pass it thro' the body. They may be killed instantly, by immersion in hot water, as well as in spirit of wine; then stick them on a piece of cork, and afterwards carefully place their legs in a creeping position, and let them continue exposed to the air until all the moisture is evaporated from their bodies. Beetles may also be preserved in spirit of wine, brandy, or rum, closely corked up.

2. Insects of the second class (*hemiptera*) may be killed in the same manner as beetles, and likewise by means of a drop of the ethereal oil of turpentine applied to the head; or in the manner to be described under the next class for killing moths.

3. The division of butterflies and moths, (*lepidoptera*), as well as all flies within membranaceous wings, should be caught with a gauze net, or a pair of gauze forceps; when taken in the forceps, run a pin through the thorax or shoulders, between the forewings. After this is done, take the pin by the head, and remove the forceps, and with the other hand pinch the breast of the insect, and it will immediately die: the wings of butterflies should be expanded, and kept so by the pressure of small slips of paper for a day or two. Moths expand their wings when at rest, and they will naturally take that position.

The larger kinds of these insects will not so readily expire by this method, as by sticking them upon the bottom of a cork exactly fitted to the mouth of a bottle, into which a little sulphur had been put, and by gradually heating the bottle, till an exhalation of the sulphur take place, when the insect instantly dies, without injuring its colours or plumage.

The best method of having the most perfect butterflies, is to find out, if possible, the larva or caterpillar of each, by examining the plants, shrubs, or trees, they usually feed upon, or by beating the shrubs and trees with long poles, and thereby shaking the caterpillars into a sheet spread underneath to receive them; to put them into boxes covered with thin canvas, gauze, or cat-gut, and to feed them with the fresh leaves of the tree or herb on which they are found; when they are full grown, they will go into the pupa or chrysalis state, and require then no other care till they come out perfect butterflies, at which time they may be killed, as before directed. Sometimes these insects may be found hanging to walls, pales, and branches of trees, in the chrysalis state.

Moths might likewise be procured more perfect, by collecting the caterpillars, and breeding them in the same manner as butterflies. As the larvae or caterpillars cannot be preserved dry, nor very well kept in spirit, it would be satisfactory if exact drawings could be made of them while they are alive and perfect. It may be necessary to observe, that in breeding these kinds of insects, some earth should be put into the boxes, as likewise some rotten wood in the corners; because, when the caterpillars change into the pupa-

Insects.

or chrysalis state, some go into the earth, and continue under ground for many months before they come out into the moth state; and some cover themselves with a hard shell, made up of small pieces of rotten wood.

4. The fourth class of insects (*neuroptera*) may be killed with spirit of wine, oil of turpentine, or by the fumes of sulphur.

5. Those of the next class (*hymenoptera*) may be killed in the same manner. A pin may be run thro' one of their wing-shells and body.

6. Insects of the sixth class (*diptera*) may likewise be killed by spirit, or by fumes of sulphur.

7. Those of the last division (*aptera*) are in general subjects which should be kept in spirit.

When in search of insects, we should have a box suitable to carry in the pocket, lined with cork at the bottom and top to stick them upon, until they are brought home. If this box be strongly impregnated with camphor, the insects soon become stupified, and are thereby prevented from fluttering and injuring their plumage. Besides a gauze forceps, the collector should have a large musquito gauze-net, and also a pin-cushion with three or four different sizes of pins, to suit the different sizes of insects.

In hot climates, insects of every kind, but particularly the larger, are liable to be eaten by ants and other small insects; especially before they are perfectly dry: to avoid this, the piece of cork on which our insects are stuck in order to be dried, should be suspended from the ceiling of a room, by means of a slender string or thread; besmear this thread with bird-lime, or some adhesive substance, to intercept the rapacious vermin of these climes in their passage along the thread.

After our insects are properly dried, they may be placed in the cabinet or boxes where they are to remain: these boxes should be kept dry; and also made to shut very close, to prevent small insects from destroying them; the bottoms of the boxes should be covered with pitch, or green wax, over which paper may be laid; or, which is better, lined with cork, well impregnated with a solution of corrosive sublimate mercury in a saturated solution of crude sal-ammoniac in water, an ounce of which will dissolve 20 scruples of the sublimate.

The finest collections have been ruined by small insects, and it is impossible to have our cabinets too secure. Such insects as are thus attacked may be fumigated with sulphur, in the manner described for killing moths; if this prove ineffectual, they may be immersed in spirit of wine, without much injuring their fine plumage or colours, and afterwards let them be sprinkled about their bodies and insertions of the wings with the solution above-mentioned. But baking the insects in an oven, in the manner described for BIRDS (under that article), is the most effectual method of extirpating these enemies; however, the utmost caution is requisite in this process, in regulating the heat of the oven.

N. B. All kinds of insects having no wings, may be preserved in spirits, brandy, or rum; except crabs, lobsters, and the like, which may conveniently be preserved dry.

INSECTS giving root to Plants. Of this we have an account, by Mr Fourgeroux, in the Memoirs of the A-

Insects.

cademy of Sciences for 1769. The plants, of which Mr Fourgeroux gives an account, are perfectly the reverse of the worm-plant of China, described by Mr Reaumur in the year 1726. For, in that case, a worm fixes its snout into the extremity of the plant, and derives nourishment from it. But the plants, of which an account is here given, derive their nourishment from the animals.

The greatest part of the animal-plants which he has seen, grow, he tells us, on the chrysalis of a species of cicada. The plant growing on these insects has got the generic name of *clavaria*, because its stalks and branches, when it has any, are terminated by tubercles, which give the appearance of little clubs. The root of this plant, in general, covers the body of the insect, and sometimes is even extended over its head. When these productions have for some time been preserved in spirits, the plant and animal may be separated from each other without hurting either. Small grooves, formed by the rings of the animal, may be observed running cross the roots of the plant: but no vestige can be found of the root's having any where penetrated the body of the insect. These plants produce fibres differing in length and number. The fibres are terminated by tubercles, which, before the plant arrives at maturity, are solid; but, after that period, they are found punctured, probably by worms which have suffered a metamorphosis upon escaping from them.

According to Mr Fourgeroux, plants grow, not only on the chrysalis of the cicada, but upon the cicada itself. He saw one of this kind upon a cicada brought from Cayenne. The plant, in this case, differed from the *clavaria* already mentioned. It was a species of fungus, composed of long, white, silky fibres, covering the body of the insect, and extending from seven to eight lines above and below its belly.

The author has found the *clavaria* growing upon worms. He has found it chiefly upon worms, which suffering a metamorphosis, become afterwards a small species of May-bug. This chrysalis, he observes, is very different from that of the cicada; and, even in its worm-state, may easily be distinguished from it.

After describing these different species of animal-plants, the author next proceeds to offer his opinion upon this subject. He first considers what had been said by Dr Watson, in the Philosophical Transactions, concerning the vegetating-fly of the Caribbee islands *. Dr Watson's account of these flies is, that they bury themselves about the month of May, and begin to be metamorphosed in June; and that the little plant which grows upon them resembles a branch of coral, is about three inches in height, and carries small protuberances, where worms are generated, which are again converted into flies. The author imagines, that, in this account, Dr Watson has been deceived by the worms, which he has already observed will eat into the *clavaria*, and undergo a change in the holes which they have there made. Mr Fourgeroux is rather inclined to adopt the opinion of Dr Hill, founded upon observations made at Martinico. There the cicade are very frequent; and, during their chrysalis state, bury themselves among dead leaves, to wait their metamorphosis. Dr Hill imagines, that the seeds of the *clavaria* are then attached to them, and are afterwards developed, much in the same manner as the fungus ex pede equino

* See
Vegetabil
FLY.

Insects
||
Inspiration.

equino grows upon the hoofs of dead horses.

It may appear astonishing, that the clavaria should attach itself so constantly to the nymphæ of the cicadæ in America, as it is not observed to do so in other countries. For this Mr Fourgeroux attempts to account, from viewing the clavaria as a parasite peculiar to this species of insect; from the great number of the nymphæ of cicadæ which abound in America; and from the circumstances of the climate and soil, which may render this phenomenon very common there, although it be not observed in Europe.

A. Med.
m. ii. 371.

INSECTS blown from the *Nefe*. Of this we are furnished with many accounts in the works of medical authors. The fact is confirmed by Dr Monro *, who has received at different times some of these insects from different persons. They were all of the scolopendra kind, though not exactly answering to any description of Linnaeus. One of these he received from Mr Hill furgeon in Dumfries. It was an inch and a half long; and lived some hours after it was discharged, creeping about slowly on a table. It was then put into ardent spirits, soon after which it died.

INSERTION, in anatomy, the close conjunction of the vessels, tendons, fibres, and membranes of the body with some other parts.

INSIPID, an appellation given to things without taste.

INSOLATION, in chemistry, the suffering matters to stand and digest in the heat of the sun, instead of that of a furnace.

INSOLVENT, a term applied to persons unable to pay their debts.

Trial by INSPECTION, or *EXAMINATION*, is when, for the greater expedition of a cause, in some point or issue, being either the principal question, or arising collaterally out of it, but being evidently the object of sense, the judges of the court, upon the testimony of their own senses, shall decide the point in dispute. For, where the affirmative or negative of a question is matter of such obvious determination, it is not thought necessary to summon a jury to decide it; who are properly called in to inform the conscience of the court of dubious facts: and therefore, when the fact, from its nature, must be evident to the court either from ocular demonstration or other irrefragable proof, there the law departs from its usual resort, the verdict of 12 men, and relies on the judgment of the court alone. As in case of a suit to reverse a fine for non-age of the cognizor, or to set aside a statute or recognizance entered into by an infant; here, and in other cases of the like sort, a writ shall issue to the sheriff, commanding him that he constrain the said party to appear, that it may be ascertained by the view of his body by the king's justices, whether he be of full age or not: *Ut per aspectum corporis sui constare poterit iussurarii nostris, si prædictus an sit plene ætatis necne*. If, however, the court has, upon inspection, any doubt of the age of the party, (as may frequently be the case), it may proceed to take proofs of the fact; and particularly may examine the infant himself upon an oath of *voir dire, veritatem dicere*; that is, to make true answers to such questions as the court shall demand of him: or the court may examine his mother, his godfather, or the like.

INSPIRATION, among divines, implies the con-

Vol. V.

veying of certain extraordinary and supernatural notions or motions into the soul.

Inspiration
||
Instauration.

Some authors reduce the inspiration of the sacred writers to a particular care of providence, which prevented any thing they had said from failing or coming to nought; maintaining, that they never were really inspired, either with knowledge or expression.

According to M. Simon, inspiration is no more than a direction of the Holy Spirit, which never permitted the sacred writers to be mistaken.

It is a common opinion, that the inspiration of the Holy Spirit regards only the matter, not the style or words; which seems to fall in with M. Simon's doctrine of direction.

Among the heathens, the priests and priestesses were said to be divinely inspired when they gave oracles.

The poets, too, laid claim to it; and to this end always invoked Apollo and the muses at the beginning of any great work.

INSPIRATION, in physic, is understood of that action of the breast, by which the air is admitted within the lungs; in which sense, inspiration is a branch of respiration, and stands opposed to **EXPIRATION**.

This admission of the air depends immediately on its spring or elasticity, at the time when the cavity of the breast is enlarged by the elevation of the thorax and abdomen, and particularly by the motion of the diaphragm downwards: so that the air does not enter the lungs, because they are dilated; but those dilate, because the air enters within them. Nor is it the dilatation of the breast which draws in the air, as is commonly thought, tho' this is a condition absolutely necessary to inspiration; but an actual intrusion of the air into the lungs. See **RESPIRATION**.

INSPISSATING, in pharmacy, an operation whereby a liquor is brought to a thicker consistence, by evaporating the thicker parts.

INSBRUCK, a city of Germany, in the circle of Austria, and capital of the county of Tyrol, and formerly the residence of the archdukes of Austria. It is seated in a pleasant valley, in E. long. 11. 27. N. Lat. 47. 3.

INSTALLATION, the act of giving visible possession of an order, rank, or office, by placing in the proper seat. See **INSTALLMENT**.

INSTALLMENT, a settling or installing any person in a dignity. The word is derived from the Latin *in*, and *stallum*, a term used for a seat in church, in the choir, or a seat or bench in a court of justice, &c. Though Vossius is of opinion the word is of German origin.

INSTALLMENT is chiefly used for the induction of a dean, prebendary, or other ecclesiastical dignitary, into the possession of his stall, or proper seat, in the cathedral church to which he belongs. This is sometimes also called *installation*.

INSTALLMENT is likewise used for the ceremony, whereby the knights of the garter are placed in their rank, in the chapel of St George at Windsor.

INSTANT, a part of duration in which we perceive no succession; or it is that which takes up the time only of one idea in our minds.

INSTAURATION, the re-establishment or re-auration of a religion, a church, or the like, to its

Instep
Insurance.

former state. The word is by some derived from the old Latin *insaurum*, which signified the "stock" of things necessary for the tilling and managing of grounds; as cattle, tools, harness, &c. But the word *insaurum* is only of the middle age: *insauratio* is of much greater antiquity, and by some derived from *insar*, "like;" as importing a thing's being brought to its former likeness or appearance. See RESTAURATION.

INSTEP, in the manege, is that part of a horse's hind leg which reaches from the ham to the pastern-joint.

INSTINCT, a natural disposition or sagacity whereby animals are endued; by virtue whereof they are enabled to provide for themselves, know what is good for them, and determined to preserve and propagate their species.

INSTINCT bears some analogy to reason, and supplies the defect of it in brutes. See BRUTE.

INSTITUTES, in literary history, a book containing the elements of the Roman law.

The institutes are divided into four books; and contain an abridgement of the whole body of the civil law, being designed for the use of students. See Law, n° 6,—11. and 43, 44.

INSTITUTE, in Scots law. When by disposition or deed of entail a number of persons are called to the succession of an estate one after another, the person first named is called the *institute*, the others *substitutes*.

INSTITUTION, in general, signifies the establishing or founding something.—In the canon and common law, it signifies the investing a clerk with the spiritualities of a rectory, &c. which is done by the bishop, who uses the following formula: "I institute you rector of such a church with the cure of souls, and receive your care and mine."

INSTITUTIONS, in literary matters, denote a system of the elements or rules of any art or science.

Thus physical, or medicinal institutions, are such as teach the necessary præcognita to the practice of medicine, or the cure of diseases.

INSTRUMENT, in general, whatever is subservient to a cause in producing any effect.

Natural INSTRUMENT, in Scots law, any fact certified in writing, under the hand of a notary-public.

INSULAR, any thing belonging to an island.—Insular situations are productive of many happy consequences to the inhabitants, both with respect to the climate, security, and convenience for commerce; for a particular account of which, see ISLAND and COAST.

INSULATED, in architecture, an appellation given to such columns as stand alone, or free from any contiguous wall, like an island in the sea; whence the name.

INSULATED, in electrical experiments. When any body is prevented from communicating with the earth by the interposition of an electric body, it is said to be *insulated*. See ELECTRICITY, n° 20.

INSURANCE, in law and commerce, a contract, whereby one party engages to pay the losses which the other may sustain, for a stipulated premium or consideration. The most common sorts are, Insurance against the dangers of the seas, insurance against fire, insurance of debts, and insurance of lives.

Insurance.

I. *INSURANCE against Loss at Sea*, is a most beneficial institution, for promoting the security of trade, and preventing the ruin of individuals; and is now conducted by a regular system of rules, established by the interposition of the legislature, the decision of the courts of justice, and the practice of merchants.

It is carried on to the best advantage by public companies, or by a considerable number of private persons, each of whom only engages for a small sum, on the same vessel. There are two public companies established by authority of parliament, viz. the London and Royal Exchange Insurance-Companies. For procuring subscription by private persons, brokers are generally employed, who extend the policy or contract of insurance, procure subscriptions, and assist at settling losses. They are entitled to an allowance for their trouble, generally 5 per cent. on premiums, and 2 per cent. on losses.

The parties who engage to pay the damage are called the *insurers* or *under-writers*; the parties for whose security they engage are called the *insured*. The premium is understood to be paid when the insurance is made; but, if it be not paid, the insurers have a preferable right on the subject insured.

On this subject, we shall consider, What is necessary to render an insurance valid:—When the risk commences, and when it terminates:—What constitutes a total or a partial loss:—What proof of loss is necessary:—and, How the loss is adjusted.

First, In order to render an insurance valid, the insured must have property really at stake; the voyage must take place under the circumstances agreed on; the dangers insured against must not be contrary to law; and a candid account must be given of circumstances which enhance the danger.

1. The condition of possessing property was required by 19 Geo. II. c. 37. to prevent ships from being fraudulently destroyed when insured above their value; and to discourage a practice which had become common, of converting policies to the purpose of mere wagers. In transactions of this kind, as the insured had no property, and could claim no indemnification for partial damage; so the insurers, having lost their wager by the ship's being lost, could claim no abatement, though part was saved: accordingly, the policies contained clauses of interest or no interest, free from average, and without benefit of salvage. All such policies are declared invalid.

This restriction does not extend to privateers, nor to ships trading to the Spanish or Portuguese plantations.

Insurances are commonly made as interest shall appear; and it is incumbent on the insured to prove the value of his property. The value of the goods may be proved by the invoices; and the coquet must be produced, if required, to instruct that the goods were actually shipped. It is admitted to value the ship at prime cost and charges, deducting the freights that have been drawn since purchased, if the proprietors choose to stand to that rule; but they are not restricted to it. Sometimes the value of the ship or goods is expressed in the policy; and this value must be admitted, although it be higher than the true one: but it is incumbent on the insured to prove that he had property

property at stake; and, if the property be trifling in comparison of the sum insured, the insurance will be set aside, as an evasion of the statute.

Expected profits, and bounty on the whale-fishery, if specified in the policy, may be insured.

When the value is less than the sum insured, the owners may claim a return of premium for the excess.

If there be several policies on the same subject, of different dates, the earlier one is valid, and the others must be vacated. If they be of the same date, they must be vacated in equal proportions.

When a policy is vacated, in whole, or in part, the under-writers have a right to retain $\frac{1}{2}$ per cent. for their trouble.

In the case of a cargo intended for A, but afterwards sent to B, both expected it, and insured, and B claimed for the value on its being lost. The under-writers answered, that it was a double insurance, and they ought only to pay their proportion. Judgment was given, finding them liable for the whole, and reserving to them any demand competent against the underwriters who insured for A.

Fraudulently to cast away or destroy a ship insured above its value, is felony.

2. If the ship does not proceed on the voyage, or if, being warranted to depart with convoy, it departs without convoy, the insurance must be vacated.

If the extent of a trading voyage be uncertain, the longest one in contemplation is described in the policy, and it is agreed that part of the premium shall be returned if the voyage be shortened. In like manner, in time of war, when insurance is made without condition of convoy, it is agreed that part of the premium be returned in case it fail with convoy.

When a ship is warranted to depart with convoy, it is understood from the usual place of convoy, (*e. g.* the Downs,) and it is insured till it arrive there.

The common proof of failing with convoy is the production of failing orders; but, if a ship be prevented by the weather from receiving the failing orders, other proof may be admitted.

A ship was insured from the Thames to Halifax, warranted to sail from Portsmouth with convoy. The convoy had failed before the ship arrived there, and the underwriters declined to insure it, without convoy, for the rest of the voyage. They were found liable to return part of the premium, retaining only in proportion to the accustomed rate from London to Portsmouth. This decision seems to establish the following principle, that, when the voyage performed is only part of that described in the policy, and when the risk can be proportioned, the underwriters are bound to return part of the premium, though there be no agreement for that purpose.

But, if a ship, insured only against the hazards of the sea, be taken by the enemy, the insured have no right to claim a return of premium, though the capture happen soon, under pretence that little sea-hazard was incurred.

If a ship deviates from the voyage described in the policy without necessity, it sets aside the insurance. An intention to deviate is not sufficient to set it aside; there must be an actual deviation; and, even in that case, the insurers are liable for damages sustained be-

fore deviation.

It is no deviation to go out of the way to the accustomed place of convoy, nor to the nearest place where necessary repairs may be had. Deviation, for the purpose of smuggling, if without the knowledge of the owners, does not set aside the insurance, nor when the master is forced by the crew to return.

In insurances to the East-Indies, and home, the insurers are understood to take the risk of detention in the country, and of country voyages.

3. Insurance of prohibited goods, against the risk of seizure by the government, is unlawful, and invalid. The insurers, insured, brokers, and all accessories, are liable to the fine of 500*l*.

4. If the insured have any information of more than common danger, they must reveal every such circumstance to the insurers, otherwise the policy is set aside.

This rule is established for the preservation of good faith; and there are several strong decisions in support of it. If a ship be spoke to leaky at sea, or if there be a report of its being lost, these circumstances must be communicated to the insurers. Even the concealment of a false report of loss vitiates the insurance; and, if the ship be afterwards lost, though in a different manner, the insured will recover nothing. In a voyage from Carolina to London, another ship had failed to days after that which was insured, and arrived seven days before the insurance was made; and the concealment of this circumstance, though the fact was not proved to the satisfaction of the jury, was considered as sufficient to set it aside. Also, since the commencement of the American war, a ship being insured from Portugal, by the month, without condescending on the voyage, sailed for North-America, and was taken by a provincial privateer. The insurers refused to pay, because the hazardous destination was concealed; and it was only upon proof of the insured being equally ignorant of it, that they were found liable.

But the insured are not obliged to take notice of general perils, which the insurers are understood to have in contemplation; dangerous navigation, West-Indian hurricanes, enterprizes of the enemy, and the like.

Insurance is not set aside by a mistake in the name of the ship or master, or the like.

Insurance may be made on an uncertain ship; on any ship that the goods may be loaded on; on any ship that A shall sail in from Virginia. In this last case, the policy is not transferred to a ship which A goes on board during the voyage.

Secondly, If a ship be insured at and from a port, the insurance commences immediately if the ship be there, or at its arrival there. If it be damaged when preparing for a voyage, the insurers are liable; but not if the voyage be laid aside for several years, with consent of the owners. Insurance from a port commences when the ship breaks ground; and, if it set sail, and be driven back and lost in the port, the insurers are liable.

Insurance on goods generally continues till they be landed; but, if they be sold after the ship's arrival, and freight contracted to another port, the insurance is concluded. Goods sent on board another ship or

lighter are not at the risk of the insurer; but goods sent ashore in the long-boat are.

Insurance on freight commences when the goods are put on board.

Goods from the East-Indies, insured to Gibraltar, and to be re-shipped from thence to Britain, were put on board a store-ship at Gibraltar, to wait an opportunity of re-shipping, and were lost: The custom of putting goods aboard a store-ship being proved, the insurers were found liable.

Loss of sails ashore, when the ship is repairing, is comprehended within the insurance. What is necessarily understood, is insured, as well as what is expressed; the essential means, and intermediate steps, as well as the end. Ships performing quarantine are at the risk of the insurer.

Thirdly, The insurers are liable for a total loss when the subject perishes through any of the perils insured against. Baratry, though it properly signifies running away with the ship, extends to any kind of fraud in the master or mariners. Insurance against detention of princes does not extend to ships that are seized for transgressing the laws of foreign countries.

The insurers are also liable for a total loss, when damage is sustained, and the remaining property abandoned or vested in the insurers.

If a ship be stranded, or taken, and kept by the enemy, or detained by any foreign power, or seized for the service of the government, the proprietors have a right to abandon.

But, if a ship be taken by the enemy, and be retaken, or makes its escape, before action against the insurers; have the insured a right to abandon, or must they only claim for the damages sustained as an average loss? There are opposite decisions, according as the circumstances of the case were strong. When the ship was long detained, the goods perishable, the voyage intirely lost, or so disturbed, that the pursuit of it was not worth the freight, or when the damage exceeds half the value of the thing, they have been found intitled to abandon; (Goss against Withers, 2 Burr., 683.). But, if the voyage be completed with little trouble or delay, they are not intitled; (Hamilton against Mendez, 2 Burr., 1198.).

The insured cannot claim, as for a total loss, on an offer to abandon, when the loss is, in its nature, only partial; for, if this were permitted, they might devolve the loss occasioned by bad markets on the insurers.

And, in all cases, the insured have their option to abandon, or not. They may retain their property if they please, and claim for an average loss; and they must make their option before they claim.

If the goods be so much damaged, that their value is less than the freight, the insurers are accountable as for a total loss.

The insurers are liable for general average, when the property is charged with contribution; and for particular average, when the property is damaged, or part of it destroyed.

If the damage be sustained through the fault of the ship, the owners of the goods may have recourse, either against the master or insurers; and, if the insurers be charged, they stand in the place of the owners, and have recourse against the master.

In order to prevent the insurers from being troubled with frivolous demands for average, it is generally stipulated, that none shall be charged under 5 per cent. or some other determined rate; and corn, flax, fruit, fish, and like perishable goods, are warranted free from average, unless general, or the ship be stranded.

In order to encourage every effort to save the ship, the insurers are liable for charges laid out with that design, although the subject perish. Thus, they may be charged with more than the sum insured.

In case of goods being damaged, the proportion of the sum insured, for which the underwriters are liable, is regulated by the proportion of the prices which the sound and damaged goods fetch at the port of destination. The prime cost of the goods is not considered, nor the necessity of immediate sale, in consequence of damage. Although the damaged goods sell above prime cost, the insurers are liable.

Fourthly, If a ship be lost, and the crew saved, the loss is proved by the evidence of the crew.

If damage be sustained, the extent is proved by an examination of the subject damaged, at the ship's arrival; and the cause by the evidence of the crew.

If the ship be stranded, evidence must be taken at the place where stranded.

Documents of loss must be laid before the underwriters, with all convenient speed; and, if these be sufficiently clear, the loss should be immediately settled. The underwriters generally grant their notes at a month or six weeks date for their proportions.

If a ship be not heard of for a certain time, it is presumed lost; and the underwriters are liable to pay the sums insured, the property being abandoned to them in the event of the ship's return. Six months are allowed for a voyage to any part of Europe, a year to America, and two years to the East Indies.

By the ordinance of Hamburg, if a ship be three months beyond the usual time of performing a voyage, the underwriters may be decreed to pay 92 per cent. on an abandon. If they decline it, they are allowed 14 months more, and then they must pay the full value.

A ship insured against the hazards of the sea, but not against the enemy, if never heard of, is presumed lost at sea.

Fifthly, In order that the manner of settling losses may be understood, we must explain what is meant by covering property. We mentioned already, that insurances for greater sums than the insured had really at stake, were contrary to law: but some latitude is allowed in that respect; for if the owner were to insure no more than the exact value of his property, he would lose the premium of insurance, and the abatement, if any was agreed on.

For example, if he has goods on board to the value of 100 l. and insures the same at 5 per cent. to abate 2 per cent. in case of loss; then, if a total loss happens, he recovers 98 l. from the insurers, of which 5 l. being applied to re-place the premium, the nett sum saved is only 93 l.: but, if the value on board be only 93 l. and the sum insured 100 l. he would be fully indemnified for the loss; and his property, in that case, is said to be covered.

To find how much should be insured to cover any sum, subtract the amount of the premium and abatement

Insurance. ment (if any), from 100*l.* As the remainder is to 100*l.* so is the value, to the sum which covers it.

Insurance
} Integral.

In case of a total loss, if the sum insured be not greater than that which covers the property, the insurers must pay it all. If greater, they pay what covers the property, and return the premium on the overplus.

Partial losses are regulated by this principle, that whereas the owner is not fully indemnified, in case of a total loss, unless he covers his property, therefore he should only be indemnified for a partial loss in the same proportion; and, if it be not fully insured, he is considered as insurer himself, for the part not covered, and must bear a suitable proportion of the loss. Therefore the value of the property is proved, and the sum required to cover it computed. If that sum be all insured, the underwriters pay the whole damage; if only part be insured, they pay their share, which is computed by the following rule: As the sum which covers the property is to the sum insured, so is the whole damage to the part for which the insurers are liable.—For example, if the value of the property be 360*l.* the sum insured 300*l.* the premium 8 *per cent.* and abatement 2 *per cent.*; then the sum which should be insured to cover the property is 400*l.*; and, if damage be sustained to the extent of 200*l.* the owners will recover 150*l.*

If a voyage is insured out and home, the premium outward must be considered as part of the value on the homeward property, and the sum necessary to cover it computed accordingly. For example, to insure 100*l.* out and home, at 5 *per cent.* each voyage, abatement 2 *per cent.* we compute thus:

93 : 100 :: L. 100 : L. 107 : 10 : 6, to be insured outward, premium on L. 107 : 10 : 6 onwards, at 5 *per cent.* L. 5 : 7 : 6; 93 : 100 :: L. 105 : 7 : 6 : L. 113 : 6*s.* to be insured home; the premium on which is L. 5 : 13 : 6; and, if the ship be lost on the homeward voyage,

 II. *Insurance against Fire.* There are several offices in Britain for this purpose, of which the fire-office is the most considerable. Insurances are divided into common, hazardous, and doubly hazardous, according to the nature of the subject insured. When the sum insured is high, there is a higher premium *per cent.* demanded; and money, papers, jewels, pictures, and gun-powder, are not comprehended. If a subject be wrong described, in order that it may be insured at a lower premium, the policy is void. The benefit of a policy is transferred, by indorsement, to the representatives of the person in whose favour it was made; and it may be transferred to other houses when the insured changes his habitation. If insurance be made on the same subject in different offices, it must be specified, by indorsement, on the policy; and, in case of loss, the offices pay proportionally. The insurers

pay all expences in attempts to extinguish fire, or save goods, though not successful. If the value of a subject be insured in part, and damage be sustained, the insurers pay the whole, if it does not exceed the sum insured.

III. *Insurance of Debts.* See BOTTOMRY.

IV. In virtue of *INSURANCES for Lives*, when the person dies, a sum of money becomes payable to the person on whose behalf the policy of insurance was granted. The principal insurance office of this kind, is that of the amicable society for a perpetual assurance, kept in Serjeant's inn, Fleet-street, London.

In this office, after paying the charges of the policy, and 10*s.* entrance-money, each person pays 5*l.* *per annum*, by quarterly payments; and from these payments, the dividends, which usually amount 100*l.* and upwards, are to arise. All persons admitted are to be between the ages of 12 and 45, and in a good state of health. Any person is allowed to have two or three insurances or numbers on the same life, whereby such person will be intitled to a claim on each number so insured; and every claimant is empowered to put in a new life in the room of one deceased, within 12 kalendar months next after the end of the current year. By becoming members of this society, clergymen, physicians, lawyers, tradesmen, and all whose income ceases at the time of their death, may, in all probability, leave to their families a claim of not less than 100*l.* for every 5*l.* annually paid in.—The value of insurances upon lives, depends upon the probability of the continuance of any proposed life or lives, during any proposed term. Any questions of this kind may be determined from Dr Halley's table, and from the principles of the doctrine of chances. But, as far as we can learn of the practice on such occasions, the premiums paid to insurers are generally higher than any computation founded on observations concerning the probabilities of human life will warrant. Thus it is not unusual to make a person pay 5 *per cent.* for the insurance of his life for a twelve-month; that is, in case the person dies within the year, the insurer is to pay 100*l.* for every 5*l.* received. Now it appears from Dr Halley's table, which estimates the probability of life low enough, that 5 *per cent.* is an adequate value only for a life of an advanced age, such as 64.

Re-Insurance is a second contract, made by an insurer, to transfer the risk he has engaged for to another. It is in general forbidden by 19 Geo. II. c. 37. but is permitted to the representatives of an insurer, in case of his death, or to his assignees, in case of his bankruptcy; and it must be mentioned in the policy that it is a re-insurance.

INTAGLIOS, precious stones on which are engraved the heads of great men, inscriptions, and the like; such as we frequently see set in rings, seals, &c.

INTEGER, in arithmetic, a whole number, in contradistinction to a fraction.

INTEGRAL, or INTEGRANT, in philosophy, appellations given to parts of bodies which are of a similar nature with the whole: thus filings of iron have the same nature and properties as bars of iron.

Bodies may be reduced into their integrant parts by triture or grinding, limation or filing, solution, amalgamation, &c. See GRINDING, &c.

Integuments
||
Interdict.

INTEGUMENTS, in anatomy, denote the common coverings which invest the body ; as the cuticula, cutis, &c. See **ANATOMY**.

INTEGUMENT, is also extended to the particular membranes which invest certain parts of the body ; as the coats or tunics of the eye.

INTENDANT, one who has the conduct, inspection, and management of any thing. See **SUPER-INTENDANT**.

This is a title frequent among the French : they have *intendants of the marine*, who are officers in the sea-ports, whose business it is to take care the ordinances and regulations relating to sea-affairs be observed : *intendants of the finances*, who have the direction of the revenues : *intendants of provinces*, who are appointed by the king to take care of the administration of justice, policy, and finances in the provinces : also *intendants of buildings, of houses, &c.*

INTENDMENT, in law, is the intention, design, or true meaning, of a person or thing, which frequently supplies what is not fully expressed : but tho' the intent of parties in deeds and contracts is much regarded by the law, yet it cannot take place against the rules of law.

INTENDMENT of Crimes ; this, in case of treason, where the intention is proved by circumstances, is punishable in the same manner as if it was put in execution. So, if a person enter a house in the night-time, with an intent to commit burglary, it is felony ; also, an assault, with an intent to commit a robbery on the highway, is made felony, and punished with transportation, 7 Geo. II. c. 21.

INTENT, in the civil law, signifies to begin, or commence, an action or process.

INTENTION, in medicine, that judgment, or method of cure, which a physician forms to himself from a due examination of symptoms.

INTENTION, in physics, the increase of the power, or energy of any quality, as heat, cold, &c. By which it stands opposed to *remission*, which signifies its decrease or diminution.

INTENTION, in metaphysics, denotes an exertion of the intellectual faculties with more than ordinary vigour ; when the mind with earnestness fixes its view on any idea, considers it on all sides, and will not be called off by any solicitation.

INTERCALARY, an appellation given to the odd day inserted in leap-year ; which was so called from *calo, calare*, " to proclaim," it being proclaimed by the priests with a loud voice.

INTERCOLUMNIATION, in architecture, denotes the space between two columns, which is always to be proportioned to the height and bulk of the columns.

INTERCOSTAL, in anatomy, an appellation given to such muscles, nerves, arteries, and veins, as lie between the ribs.

INTERDICT, an ecclesiastical censure, by which the church of Rome forbids the performance of divine service in a kingdom, province, town, &c. This censure has been frequently executed in France, Italy, and Germany ; and in the year 1170, pope Alexander III. put all England under an interdict, forbidding the clergy to perform any part of divine service, except baptizing of infants, taking confessions, and giving ab-

solution to dying penitents. But this censure being liable to the ill consequences of promoting libertinism and a neglect of religion, the succeeding popes have very seldom made use of it.

There was also an interdict of persons, who were deprived of the benefit of attending on divine service. Particular persons were also anciently interdicted of fire and water, which signified a banishment for some particular offence : by their censure no person was allowed to receive them, or allow them fire or water ; and being thus wholly deprived of the two necessary elements of life, they were doubtless under a kind of civil death.

INTEREST, is the premium or money paid for the loan or use of other money. See **ARITHMETIC**, n^o 20.

Many good and learned men have in former times very much perplexed themselves and other people by raising doubts about the legality of interest in *foro conscientie*. It may not be amiss here to inquire upon what grounds this matter does really stand.

The enemies to interest in general make no distinction between that and usury, holding any increase of money to be indefensibly usurious. And this they ground as well on the prohibition of it by the law of Moses among the Jews, as also upon what is laid down by Aristotle ; That money is naturally barren ; and to make it breed money is preposterous, and a perversion of the end of its institution, which was only to serve the purposes of exchange, and not of increase. Hence the school-divines have branded the practice of taking interest, as being contrary to the divine law both natural and revealed ; and the canon law has prescribed the taking any the least increase for the loan of money as a mortal sin.

But, in answer to this, it may be observed, that the Mosaic precept was clearly a political, and not a moral, precept. It only prohibited the Jews from taking usury from their brethren the Jews ; but in express words permitted them to take it of a stranger : which proves that the taking of moderate usury, or a reward for the use, for so the word signifies, is not *malum in se*, since it was allowed where any but an Israelite was concerned. And as to Aristotle's reason, deduced from the natural barrenness of money, the same may with equal force be alleged of houses, which never breed houses ; and twenty other things, which nobody doubts it is lawful to make profit of, by letting them to hire. And though money was originally used only for the purposes of exchange, yet the laws of any state may be well justified in permitting it to be turned to the purposes of profit, if the convenience of society (the great end for which money was invented) shall require it. And that the allowance of moderate interest tends greatly to the benefit of the public, especially in a trading country, will appear from that generally acknowledged principle, that commerce cannot subsist without mutual and extensive credit. Unless money therefore can be borrowed, trade cannot be carried on : and if no premium were allowed for the hire of money, few persons would care to lend it ; or at least the ease of borrowing at a short warning (which is the life of commerce) would be entirely at an end. Thus, in the dark ages of monkish superstition and civil tyranny, when interest was laid under a total interdict,

Interest.

terdict, commerce was also at its lowest ebb, and fell entirely into the hands of the Jews and Lombards: but when mens minds began to be more enlarged, when true religion and real liberty revived, commerce grew again into credit; and again introduced with itself its inseparable companion, the doctrine of loans upon interest.

And, really, considered abstractedly from this its use, since all other conveniences of life may be either bought or hired, but money can only be hired, there seems no greater impropriety in taking a recompense or price for the hire of this, than of any other convenience. If one borrow 100*l.* to employ in a beneficial trade, it is but equitable that the lender should have a proportion of the gains. To demand an exorbitant price is equally contrary to conscience, for the loan of a horse, or the loan of a sum of money: but a reasonable equivalent for the temporary inconvenience which the owner may feel by the want of it, and for the hazard of his losing it entirely, is not more immoral in one case than it is in the other. And indeed the absolute prohibition of lending upon any, even moderate interest, introduces the very inconvenience which it seems meant to remedy. The necessity of individuals will make borrowing unavoidable. Without some profit by law, there will be but few lenders: and those principally bad men, who will break thro' the law, and take a profit; and then will endeavour to indemnify themselves from the danger of the penalty, by making that profit exorbitant. Thus, while all degrees of profit were discontinued, we find more complaints of usury, and more flagrant instances of oppression than in modern times when money may be easily had at a low interest. A capital distinction must therefore be made between a moderate and exorbitant profit; to the former of which we usually give the name of *interest*, to the latter the truly odious appellation of *usury*: the former is necessary in every civil state; if it were but to exclude the latter, which ought never to be tolerated in any well-regulated society. For, as the whole of this matter is well summed up by Grotius, "if the compensation allowed by law does not exceed the proportion of the hazard run, or the want felt, by the loan, its allowance is neither repugnant to the revealed nor to the natural law; but if it exceeds those bounds, it is then oppressive usury; and tho' the municipal laws may give it impunity, they never can make it just."

We see, that the exorbitance or moderation of interest, for the money lent, depends upon two circumstances; the inconvenience of parting with it for the present, and the hazard of losing it entirely. The inconvenience to individual lenders can never be estimated by laws; the rate therefore of general interest must depend upon the usual or general inconvenience. This results entirely from the quantity of specie or current money in the kingdom: for, the more specie there is circulating in any nation, the greater superfluity there will be, beyond what is necessary to carry on the business of exchange and the common concerns of life. In every nation, or public community, there is a certain quantity of money thus necessary; which a person well skilled in political arithmetic might perhaps calculate as exactly, as a private banker can the demand for running cash in his own shop: all above this necessary

quantity may be spared, or lent, without much inconvenience to the respective lenders; and the greater this national superfluity is, the more numerous will be the lenders, and the lower ought the rate of the national interest to be: but where there is not enough, or barely enough, circulating cash, to answer the ordinary uses of the public, interest will be proportionably high; for lenders will be but few, as few can submit to the inconvenience of lending.

So also the hazard of an entire loss has its weight in the regulation of interest: hence, the better the security, the lower will the interest be; the rate of interest being generally in a compound ratio, formed out of the inconvenience, and the hazard. And as, if there were no inconvenience, there should be no interest but what is equivalent to the hazard; so, if there were no hazard, there ought to be no interest, save only what arises from the mere inconvenience of lending. Thus, if the quantity of specie in a nation be such, that the general inconvenience of lending for a year is computed to amount to three *per cent.* a man that has money by him will perhaps lend it upon good personal security at five *per cent.* allowing two for the hazard run; he will lend it upon landed security, or mortgage, at four *per cent.* the hazard being proportionably less; but he will lend it to the state, on the maintenance of which all his property depends, at three *per cent.* the hazard being none at all.

But sometimes the hazard may be greater, than the rate of interest allowed by law will compensate. And this gives rise to the practice, 1. Of bottomry, or *respondentia*. 2. Of policies of insurance. See BOTTOMRY, and INSURANCE.

Upon the two principles of inconvenience and hazard, compared together, different nations have at different times established different rates of interest. The Romans at one time allowed *centesime*, one *per cent.* monthly, or twelve *per cent.* *per annum*, to be taken for common loans; but Justinian reduced it to *trienter*, or one third of the *as* or *centesima*, that is, four *per cent.*; but allowed higher interest to be taken of merchants, because there the hazard was greater. So too Grotius informs us, that in Holland the rate of interest was then eight *per cent.* in common loans, but twelve to merchants. Our law establishes one standard for all alike, where the pledge or security itself is not put in jeopardy; lest, under the general pretence of vague and indeterminate hazards, a door should be opened to fraud and usury: leaving specific hazards to be provided against by specific insurances, or by loans upon *respondentia*, or bottomry. But as to the rate of legal interest, it has varied and decreased for 200 years past, according as the quantity of specie in the kingdom has increased by accessions of trade, the introduction of paper-credit, and other circumstances. The statute 37 Hen. VIII. c. 9. confined interest to ten *per cent.* and so did the statute 13 Eliz. c. 8. But as, through the encouragements given in her reign to commerce, the nation grew more wealthy; so, under her successor, the statute 21 Jac. 1. c. 17. reduced it to eight *per cent.*; as did the statute 12 Car. II. c. 13. to six: and lastly, by the statute 12 Ann. st. 2. c. 16. it was brought down to five *per cent.* yearly, which is now the extremity of legal interest that can be taken. But yet, if a contract which carries interest be made in a foreign

Interjection
||
Interpreter.

foreign country, our courts will direct the payment of interest according to the law of that country in which the contract was made. Thus Irish, American, Turkish, and Indian interest, have been allowed in our courts to the amount of even 12 *per cent.* For the moderation or exorbitance of interest depends upon local circumstances; and the refusal to enforce such contracts would put a stop to all foreign trade. And, by stat. 14 Geo. III. c. 79. all mortgages and other securities upon estates or other property in Ireland or the plantations, bearing interest not exceeding six *per cent.* shall be legal; though executed in the kingdom of Great Britain: unless the money lent shall be known at the time to exceed the value of the thing in pledge; in which case also, to prevent usurious contracts at home under colour of such foreign securities, the borrower shall forfeit treble the sum so borrowed.

INTERJECTION, in grammar, an indeclinable part of speech, signifying some passion or emotion of the mind. See **GRAMMAR**.

INTERIM, a name given to a formulary, or kind of confession of the articles of faith, obtruded upon the Protestants after Luther's death by the emperor Charles V. when he had defeated their forces; so called because it was only to take place in the *interim* (mean time) till a general council should have decided all points in dispute between the Protestants and Romanists. It retained most of the doctrines and ceremonies of the Romanists, excepting that of marriage, which was allowed to the clergy, and communion to the laity under both kinds. Most of the Protestants rejected it. There were two other interims; one of Leipfic, the other of Franconia.

INTERLOCUTOR, in Scots law. The sentence or judgment of a court of law, is commonly called an *interlocutor* before decree is extracted.

INTERLOPERS, are properly those who, without due authority, hinder the trade of a company or corporation lawfully established, by dealing in the same way.

INTERLUDE, an entertainment exhibited on the theatre between the acts of a play, to amuse the spectators while the actors take breath and shift their dresses, or to give time for changing the scenes and decorations.

INTERMITTENT, or **INTERMITTING**, *Fever*, such fevers as go off and soon return again, in opposition to those which are continual. See (the *Index* subjoined to) **MEDICINE**.

INTERPOLATION, among critics, denotes a spurious passage inserted into the writings of some ancient author.

INTERPOSITION, the situation of a body between two others, so as to hide them, or prevent their action.

The eclipse of the sun is occasioned by an interposition of the moon between the sun and us; and that of the moon by the interposition of the earth between the sun and moon. See **ECLIPSE**.

INTERPRETER, a person who explains the thoughts, words, or writings, of some other, which before were unintelligible.—The word *interpreter*, according to Isidore, is composed of the preposition *inter*, and *partes*, as signifying a person in the middle betwixt two parties, to make them mutually under-

stand each others thoughts: others derive it from *inter*, and *præ*, i. e. *sidejussor*; q. d. a person who serves as security between two others who do not understand one another.

There have been great debates about interpreting Scripture. The Romanists contend, that it belongs absolutely to the church: adding, that where the is silent, reason may be consulted; but where the speaks, reason is to be disregarded. The Protestants generally allow reason the sovereign judge, or interpreter; though some among them have a strong regard to synods, and others to the authority of the primitive fathers. Lastly, others have recourse to the Spirit within every person to interpret for them; which is what Bochart calls *arbitrius et personalis*.

INTERREGNUM, the time during which the throne is vacant in elective kingdoms; for in such as are hereditary, like ours, there is no such thing as an interregnum.

INTERREX, the magistrate who governs during an interregnum.

This magistrature was established in old Rome, and was almost as ancient as the city itself: after the death of Romulus there was an interregnum of a year, during which the senators were each interrex in their turn, five days a-piece.

After the establishment of consuls and a commonwealth, though there were no kings, yet the name and function of *interrex* was still preserved: for, when the magistrates were absent, or there was any irregularity in their election, or they had abdicated, so that the comitia could not be held; provided they were unwilling to create a dictator, they made an interrex, whose office and authority was to last five days; after which they made another. To the interrex was delegated all the regal and consular authority, and he performed all their functions. He assembled the senate, held comitia or courts, and took care that the election of magistrates was according to rules. Indeed at first it was not the custom of the interrex to hold comitia, at least we have no instance of it in the Roman history. The patricians alone had the right of electing an interrex; but this office fell with the republic, when the emperors made themselves masters of every thing.

INTERROGATION, or *Point of INTERROGATION*, in grammar, a character of this form (?) serving to denote a question.

INTERVAL, the distance or space between two extremes, either in time, or place. The word comes from the Latin *intervallum*, which, according to Isidore, signifies the space *inter fossam & murum*, "between the ditch and the wall:" others note, that the stakes or piles, driven into the ground in the ancient Roman bulwarks, were called *valla*; and the interstices or vacancy between them, *intervalla*.

INTERVAL, in music. The distance between any given sound and another, strictly speaking, is neither measured by any common standard of extension nor duration; but either by immediate sensation, or by computing the difference between the numbers of vibrations produced by two or more sonorous bodies, in the act of sounding, during the same given time. As the vibrations are slower and fewer during the same instant, for example, the sound is proportionally lower or graver; on the contrary, as during the same period the vibrations

Interregnum
||
Interval.

tions increase in number and velocity, the sounds are proportionably higher or more acute. An interval in music, therefore, is properly the difference between the number of vibrations produced by one sonorous body of a certain magnitude and texture and of those produced by another of a different magnitude and texture in the same time.

Intervals are divided into consonant and dissonant. A consonant interval is that whose extremes, or whose highest and lowest sounds, when simultaneously heard, coalesce in the ear, and produce an agreeable sensation called by Lord Kaimes a *tertium quid*. A dissonant interval, on the contrary, is that whose extremes, simultaneously heard, far from coalescing in the ear, and producing one agreeable sensation, are each of them plainly distinguished from the other, produce a grating effect upon the sense, and repel each other with an irreconcilable hostility. In proportion as the vibrations of different sonorous bodies, or of the same sonorous body in different modes, more or less frequently coincide during the same given time, the chords are more or less perfect, and consequently the intervals more or less consonant. When these vibrations never coincide at all in the same given time, the discord is consummate, and consequently the interval absolutely dissonant.

Intervals are not only divided according to their natures, but also with respect to their degrees. In this view, they are either enharmonic, chromatic, or diatonic. Of these therefore in their order, from the least to the greatest.

An enharmonic interval is what they call the *eighth part of a tone*, or the difference between a major and minor semitone generally distinguished by the name of a *comma*. Commas, however, are of three different kinds, as their quantities are more or less; but since these differences cannot be ascertained without long and intricate computations, it is not necessary for us to attempt an investigation, whose pursuit is so unpleasant, and whose result attended with so little utility. It has by musicians been generally called the *eighth part of a tone*; but they ought to have considered, that a comma is by no means the object of auricular perception, and that its estimate can only be formed by calculation. For a more minute disquisition of this matter, our readers may consult the article *COMMA* in the Musical Dictionary, or the article *MUSIC* in this Work, Notes *n* and *s*. A chromatic interval consists properly of a minor semitone, but may also admit the major. A diatonic interval consists of a semitone-major at least, but may consist of any number of tones within the octave. When an octave higher or lower is assumed, it is obvious that we enter into another scale which is either higher or lower, but still a repetition of the former degrees of sound.

Intervals again are either simple or compound. All the intervals within any one octave are simple; such as the second major or minor, the third, the fourth, the fifth, the sixth, the seventh, &c. of these afterwards. All intervals whose extremes are contained in different octaves, such as the ninth, the tenth, the eleventh, the twelfth, the thirteenth, the fourteenth, the fifteenth, &c. may be termed *compound intervals*.

The semitone either exactly or nearly divides the tone into two equal parts. In the theory of harmo-

nical computation three kinds of semitones are recognised, *viz.* the greatest, the intermediate, and the smallest semitone. But in practice, to which these explanations are chiefly adapted, the semitone is only distinguished into major and minor. The semitone major is the difference between the third major and the fourth, as E F. Its ratio is as 15 to 16, and it forms the least of all diatonic intervals.

The semitone minor consists of the difference between the third major and minor: it may be marked in the same degree by a sharp or a flat, and it only forms a chromatic interval; its ratio is as 24 to 25.

Though some distinction is made between these semitones by the manner of marking them, yet on the organ and harpsichord no distinction can be made; nor is there any thing more common for us than to say, that D sharp in rising is E flat in descending, and so through the whole diatonic above or below; besides, the semitone is sometimes major and sometimes minor, sometimes diatonic and sometimes chromatic, according to the different modes in which we compose or practise; yet in practice these are called *semitones* minor, which are marked by sharps or flats, without changing the degree; and semitones major are those which form the interval of a second.

With respect to the three semitones recognised in theory, the greatest semitone is the difference between a tone major and a semitone minor; and its ratio is as 25 to 27. The intermediate semitone is the difference between a semitone major and a tone major; and its ratio is as 128 to 135. In a word, the small semitone consists of the difference between the greatest and the intermediate semitone; and its ratio is as 125 to 128.

Of all these intervals, there is only the semitone major, which is sometimes admitted as a second in harmony.

The interval of a tone which characterises the diatonic species of composition, is either major or minor. The former consists of the difference between the fourth and fifth; and its ratio is as 8 to 9: and the latter, whose ratio is as 9 to 10, results from the difference between the third minor and the fourth.

Seconds are distinguished into four kinds; two of which are not in practice sufficiently momentous to be mentioned. The second major is synonymous with the interval of a tone; but as that tone may be either major or minor, its ratio may be either as 8 to 9, or as 9 to 10.

The second minor consists of the distance from B to C, or from E F; and its ratio is as 15 to 16.

The third is so called, because it consists of two gradations, or three diatonic sounds, as from G to B ascending, or from A to C, inclusive of the extremes; of which the first is a third major, composed of two full tones, and its ratio as 4 to 5; the second, a third minor consisting of a tone and a semitone major, and its ratio as 5 to 6.

The fourth has by some been reckoned an imperfect, but more justly by others a perfect, chord. It consists of three diatonic degrees, but takes its name from the four different sounds of which it is formed; or, in other words, the number by which it is denominated includes the extremes. It is composed of a tone major, a tone minor, and a semitone major, as from C to F ascending; its ratio as 3 to 4.

Interval.

The fifth next to the octave, is perhaps the most perfect interval, as least susceptible of alteration. The number from whence it assumes its name likewise includes its extremes. It consists of two tones major, one minor, and a semitone major, as from A to E ascending; its ratio is as 2 to 3.

The sixth is not found among the natural order of consonances, but only admitted by combination. It is not here necessary to mention its various distinctions and uses, as we only give an account of intervals in general.

The sixth major consists of four tones and a semitone major, as from G to E ascending; its ratio is as 3 to 5. The sixth minor contains three tones and two semitones major, as from E to C ascending; its ratio is as 5 to 8.

The seventh, as a reduplication of the second, is a dissonance. When major, it consists diatonically of five tones, three major, and two minor, and a major semitone, as from C to B ascending; its ratio is as 8 to 15.

When minor, it consists of four tones, three major and one minor, and two major semitones, as from E to D ascending; its ratio is as 5 to 9.

The octave is the most perfect of all chords, and in many cases hardly to be distinguished by the ear from an unison; that is to say, from that coincidence of sound produced by two musical strings, whose matter, lengths, diameters, and tensions, are the same. As the vibrations of two strings in unison during any given time, are precisely coincident; so whilst the lowest extreme of the octave vibrates once, the highest vibrates twice; and consequently its ratio is as 1 to 2, as from c to C ascending. It consists of six full tones and two semitones major. Its name is derived from the Latin *octo*, "eight;" because that number likewise includes its extremes. It may likewise be divided into twelve semitones. It contains the whole diatonic scale; and every series above or below consists only of the same returning sounds. From whence the natures, distances, and powers, of every interval greater than the octave, as the ninth, the tenth, the eleventh, the twelfth, the thirteenth, the fourteenth, the fifteenth, the triple octave, &c. may easily be computed.

During our past observations upon the term *interval*, we have either wholly neglected our faithful associate M. Rousseau, or only maintained a distant and momentary intercourse with him. We now propose to pay him a more permanent and familiar visit; but as he is engaged in the dispute between the Pythagoreans and Aristoxenians, we think it more advantageous to decline the controversy, and to follow him, after having escaped the fray, like a gentleman and a scholar. Having put the partizans of Aristoxenus to silence, let us, with him, forsake the lists of combat, nor stain his triumph by insulting the falling champions.

"We divide, (says he), as did the ancients, intervals into consonant and dissonant. The consonances are perfect or imperfect *; dissonances are either such by nature, or become such by accident. There are only two intervals naturally dissonant, viz. the second and seventh, including their octaves or replications; nay, still these two may be reduced to one a-

lone, as the seventh is properly no more than a replication of the second; for B, the seventh above the lowest C, where we have generally begun the scale, is really an octave above B, the note immediately below that C; and consequently the interval between these lower sounds is no more than that of a second major, to which all dissonances may therefore be ultimately reduced, whether considered as major or minor; but even all the consonances may become dissonant by accident. See DISCORD.

"Besides, every interval is either simple or reduplicated. Simple intervals are such as the limits of a single octave comprehend. Every interval which surpasses this extent is reduplicated; that is to say, compounded of one or more octaves, and of the simple interval whose replication it is.

"Simple intervals are likewise divided into direct and inverted. Take any simple interval whatever for a direct one; the quantity which, added to itself, is required to complete the octave, will be found an inverted interval; and the same observation holds reciprocally true of such as are inverted.

"There are only six kinds of simple intervals; of which three contain such quantities, as, added to the other three, are required to complete the octave; and of consequence likewise the one must be inversions of the other. If you take at first the smallest intervals, you will have, in the order of direct intervals, the second, the third, and fourth; for inverted, the seventh, the sixth, and fifth. Suppose these to be direct, the others will be inverted; every thing here is reciprocal.

"To find the name of any interval whatever, it is only necessary to add the denomination of unity to the degree which it contains. Thus the interval of one degree shall give a second; of two, a third; of three, a fourth; of seven, an octave; of nine, a tenth, &c. But this is not sufficient to determine an interval with accuracy; for under the same name it may be either major or minor, true or false, diminished or redundant.

"The consonances which are imperfect, and the two natural dissonances, may be major or minor; which, without changing their degree, occasions in the interval the difference of a semitone: so that if, from a minor interval, we still deduce a semitone, it becomes an interval diminished; if, by a semitone, we increase a major interval, it becomes an interval redundant.

"The perfect consonances are by their nature invariable. When their intervals are such as they ought to be, we call them *just*, or *true*: and if we dilate or contract this interval by a semitone, the consonance is termed *false*, and becomes a dissonance; *redundant*, if the semitone be added; *diminished*, if it be abstracted. We improperly give the name of a *false fifth* to the fifth diminished; this is taking the genus for the species: the fifth redundant is every jot as false as the diminished, it is even more so in every respect."

In the Musical Dictionary, plate C, fig. 2. may be seen a table of all the simple intervals practicable in Music, with their names, their degrees, their values and their ratios.

Having ascertained the distinction between major and minor intervals, it is only necessary to add, that these

Interval.

Consonance

Intestate
||
Intrigue.

these may be natural or artificial. Of the natural we have already given some account, by ascertaining the distances and ratios of such as have been mentioned. Of the artificial, we may observe, that they are such as change their position from what it naturally is in the diatonick scale, to what the convenience of composition or transposition requires it to be. A note thus artificially heightened by a semitone, together with the character which expresses that elevation, is called a *sharp*; on the contrary, a note artificially depressed by a semitone, together with the character by which that depression is signified, is called a *flat*. The character which restores a note thus depressed or raised to its primary state, is called a *natural*. Major or minor intervals, as they prevail, characterise the major or minor mode. See *MODE*.

This subject is sufficiently explained in the article *MUSIC*, Chap. IV.

INTESTATE, in law, a person that dies without making a will.

INTESTINES, in anatomy. See there, n° 354.

INTESTINAL, something belonging to or seated in the intestines.

INTONATION, in music, the action of founding the notes in the scale with the voice, or any other given order of musical tones. Intonation may be either true or false, either too high or too low, either too sharp or too flat; and then this word *intonation*, attended with an epithet, must be understood concerning the manner of performing the notes.

In executing an air, to form the sounds, and preserve the intervals as they are marked with justness and accuracy, is no inconsiderable difficulty, and scarcely practicable, but by the assistance of one common idea, to which, as to their ultimate test, these sounds and intervals must be referred. these common ideas are those of the key, and the mode in which the performer is engaged; and from the word *tone*, which is sometimes used in a sense almost identical with that of the key, the word *intonation* may perhaps be derived. It may also be deduced from the word *diatonic*, as in that scale it is most frequently conversant; a scale which appears most convenient and most natural to the voice. We feel more difficulty in our intonation of such intervals as are greater or lesser than those of the diatonick order; because, in the first case, the glottis and vocal organs are modified by gradations too large; or too complex, in the second.

INTRENCHMENT, in the military art, any work that fortifies a post against an enemy who attacks. It is generally taken for a ditch or trench with a parapet. Intrenchments are sometimes made of fascines with earth thrown over them, of gabions, hogheads, or bags filled with earth, to cover the men from the enemy's fire.

INTRIGUE, an assemblage of events or circumstances, occurring in an affair, and perplexing the persons concerned in it. In this sense, it is used to signify the nodus or plot of a play or romance; or that point wherein the principal characters are most embarrassed through the artifice and opposition of certain persons, or the unfortunate falling out of certain accidents and circumstances.

In tragedy, comedy, or an epic poem, there are always two designs. The first and principal is that of

the hero of the piece: the second contains the designs of all those who oppose him. These opposite causes produce opposite effects, to wit, the efforts of the hero for the execution of his design, and the efforts of those who thwart it. As those causes and designs are the beginning of the action, so these efforts are the middle, and there form a knot or difficulty which we call the *intrigue*, that makes the greatest part of the poem. It lasts as long as the mind of the reader or hearer is suspended about the event of those opposite efforts: the solution or catastrophe commences when the knot begins to unravel and the difficulties and doubts begin to clear up.

The intrigue of the *Iliad* is twofold. The first comprehends three days fighting in Achilles's absence, and consists on the one side in the resistance of Agamemnon and the Greeks, and on the other in the inexorable temper of Achilles. The death of Patroclus unravels this intrigue, and makes the beginning of a second. Achilles resolves to be revenged, but Hector opposes his design; and this forms the second intrigue, which is the last day's battle.

In the *Æneid* there are also two intrigues. The first is taken up in the voyage and landing of Æneas in Italy; the second is his establishment there: the opposition he met with from Juno in both these undertakings, forms the intrigue.

As to the choice of the intrigue, and the manner of unravelling it, it is certain they ought both to spring naturally from the ground and subject of the poem. Bossu gives us three manners of forming the intrigue of a poem: the first is that already mentioned; the second is taken from the fable and design of the poet; in the third the intrigue is so laid, as that the solution follows from it of course.

INTRINSIC, a term applied to the real and genuine values and properties, &c. of any thing, in opposition to their *extrinsic* or *apparent* values.

INTRODUCTION, in general, signifies any thing which tends to make another in some measure known before we have leisure to examine it thoroughly; and hence it is used on a great variety of occasions. Thus we speak of the introduction of one person to another; the introduction to a book, &c.—It is also used to signify the actual motion of any body out of one place into another, when that motion has been occasioned by some other body.

INTRODUCTION, in oratory. See *ORATORY*, n° 26.

INTUITION, among logicians, the act whereby the mind perceives the agreement or disagreement of two ideas, immediately by themselves, without the intervention of any other; in which case the mind perceives the truth as the eye does the light, only by being directed towards it. See *LOGIC*, n° 25. 27.

INVECTED, in heraldry, denotes a thing fluted or furrowed. See *HERALDRY*, Plate CXLIV. fig. 1. (A.)

INVECTIVE, in rhetoric, differs from reproach, as the latter proceeds from a friend, and is intended for the good of the person reproved; whereas the invective is the work of an enemy, and entirely designed to vex and give uneasiness to the person against whom it is directed.

INVEGES (Augustin), a learned Sicilian Jesuit, wrote in Italian an History of the city of Palermo,

Intrigue
||
Inveges.

Inverary and other works, which are esteemed. He died in 1677, aged 82.

INVERARY, a parliament town of Scotland, in Argyleshire, seated on Loch-fa in W. Long. 5. 0. N. Lat. 47. 3.—Here is a castle, the principal feat of the dukes of Argyle, chief of the Campbells. It was built by duke Archibald; is quadrangular, with a round tower at each corner; and in the middle rises a square one glazed on every side to give light to the staircase and galleries, which has from without a most disagreeable effect. This castle is built of a coarse *lapis ollaris* brought from the other side of Loch-fa; and is of the same kind with that found in Norway, of which the king of Denmark's palace is built. The founder of the castle designed to have built a new town on the west side of the little bay on which the house stands: he finished a few houses, a custom-house, and an excellent inn; but his death put a stop to the conclusion of the plan; which, when brought to perfection, will give the place a very different appearance from what it now bears; the old town being composed of the most wretched hovels that can be imagined.

INVERKEITHING, a parliament-town of Scotland, in the county of Fife, situated on the northern shore of the Frith of Forth, in W. Long. 3. 15. N. Lat. 56. 5. It was much favoured by William, who granted its first charter. He extended its liberties considerably, and in the time of David I. it became a royal residence. The Moubrays had large possessions here, which were forfeited in the reign of Robert II. The Franciscans had a convent in this town; and, according to Sir Robert Sibbald, the Dominicans had another.

INVERLOCHY, or **FORT WILLIAM**, a fortress erected in the Highlands of Scotland in king William's time. Even prior to that, however, there had been a small fortress erected by general Monk. The present fort is a triangle, has two bastions, and is capable of admitting a garrison of 800 men. It was well defended in 1746 against the rebels, who raised the siege with much disgrace. It was also attempted by those of 1715, but without success. The fort lies on a narrow arm of the sea called *Lochiel*, which extends some miles higher up the country, making a bend to the north; and extends likewise westward towards the isle of Mull, or near 24 Scotch miles.

This fort on the west, Fort Augustus in the centre, and Fort George on the east, form what is called the *chain* from sea to sea. This space is called *glen-more*, or the *great glen*, which, including water and land, is almost a level of 70 miles. There is in fact little land, but what is divided by a frith, loch, or river; except two miles which lie between Loch-och and Loch-lochy, called *Lagan-achadrom*. By means of Fort-George all entrance up the Frith towards Inverness is prevented. Fort-Augustus curbs the inhabitants midway, and Fort-William is a check to any attempts in the west. Detachments are made from all these garrisons to Inverness, Bernera barracks opposite to the isle of Skie, and castle Duart in the isle of Mull. Other small parties are also scattered in huts throughout the country, to prevent the stealing of cattle.—Fort William is surrounded by vast mountains, which occasions almost perpetual rain. Beneath soars above the rest,

and ends in a point laid to be 1450 yards above the level of the sea. The fort stands in W. Long. 5. 15. N. Lat. 56. 55.

INVERNESS, a town of Scotland, and capital of a county of the same name, finely seated on the river Ness, over which there is a stone bridge of seven arches, in W. Long. 4°. N. Lat. 57. 36. It is large, well built, and very populous, being the last town of any note in Britain. As there are always regular troops in its neighbourhood, there is a great air of politeness, a plentiful market, and more money and business stirring than could have been expected in such a remote part of the island. The country in the neighbourhood is remarkably well cultivated; and its produce clearly shews, that the soil and climate are not despicable. There is a profitable salmon-fishery; which, however, might be improved in many respects. They have also some branches both of the woollen and linen manufacture; and, in consequence of their excellent military roads, a great proportion of inland trade. But, besides all this, Inverness is a port with 20 creeks dependent upon it, part on the Murray Frith to the east, and part on the north of the town, reaching even the fourth border of the county of Caithness; yet the foreign commerce here is far from being extensive. There are indeed some few merchants in the town, and some few ships belonging to it; but they are small in size, as well as few in number. The harbour too is none of the best, which induced the inhabitants to apply to the legislature upwards of 40 years ago, when they obtained a grant for 19 years; which, by another law, was continued for the space of 21 years farther; and, in consequence of this, they have made, and are still making, very considerable improvements.

INVERNESS-SHIRE, a county of Scotland, adjoining to Ross and Cromarty on the north; to Murray-land on the east, of which it includes a part; to Lorn, Braidalbin, and Athol, on the south; and on the west is washed by the Atlantic ocean. It extends 60 miles in length from east to west, and 55 where broadest, from south to north. It produces plenty of iron ore, has large woods of fir and oak, plenty of pasturage, and some corn. Here also is plenty of deer, hares, partridges, growle, and all sorts of game, whether fowls or quadrupeds. The hills and mountains feed numerous flocks of black cattle: the rivers and lakes, of which there is a great number, afford abundance of salmon, eels, and trout; and for sea-fish, there is hardly a district in Scotland so well provided.

INVERSE, is applied to a manner of working the rule of three. See **ARITHMETIC**, n° 13.

INVERSE, in music. See **INVERTED**.

INVERTED, in music, is derived from the Latin preposition *in*, and *vertere*, “to turn any thing a contrary way.” The analogy of this term, and its use in music, will appear more obvious from the sequel.

It signifies a change in the order of the notes which form a chord, or in the parts which compose harmony: which happens by substituting in the bass, those sounds which ought to have been in the upper part: an operation not only rendered practicable, but greatly facilitated, by the resemblance which one note has to another in different octaves; whence we derive the power of exchanging one octave for another with so much pro-

propriety and success, or by substituting in the extremes those which ought to have occupied the middle station; and *vice versa*.

It is certain, that in every chord there must be a fundamental and natural order, which is the same with that of its generation: but the circumstances of succession, taste, expression, the beauty of melody, and variety, the approximation of harmony, frequently oblige the composer to change that order by inverting the chords, and of consequence the disposition of the parts.

As three things may be arranged in six different orders, and four things in twenty-four; it would seem at first, that a perfect chord should be susceptible of six inversions, and a dissonant chord of twenty-four; since one is composed of four and the other of three sounds, and since inversion consists only in a transposition of octaves. But it must be observed, that in harmony all the different dispositions of acuter sounds are not reckoned as inversions, whilst the same sounds remain in the lower parts. Thus, these two orders of the perfect chord *ut mi sol*, or C E G, and *ut sol mi*, or C G E, are only taken for the same inversion, and only bear the same name; this reduces the whole of inversions of which a perfect chord is susceptible to three; that is to say, to as many inversions as the chord contains different sounds: for the replications of the same sound are here reckoned as nothing.

Every time, therefore, when the fundamental bass is heard in the lowest parts, or if the fundamental bass be retrenched, every time when the natural order is preserved in the chords, the harmony is direct. As soon as that order is changed, or as soon as the fundamental sounds, without being in the lower parts, are heard in some of the others, the harmony is *inverted*. It is an inversion of the chord, when the fundamental sound is transposed; it is likewise an inversion of the harmony, when the treble or any other part moves as the bass ought to have done.

Every where, where a direct chord can be well placed, its inversions will likewise be so with respect to the harmony; for it is still the same fundamental succession. Thus, at every note of the fundamental bass, it is in the power of the composer to arrange the chord at his pleasure, and of consequence every moment to produce different inversions; provided that he does not change the regular and fundamental succession; provided also, that the dissonances may always be prepared and resolved in the same parts where they are first heard, that the sensible note may always ascend, and that such false relations may be avoided as would be too harsh upon the ear in the same part. This is the key of these mysterious distinctions which composers have made between those chords where the treble is syncopated, and those in which the bass ought to be syncopated; as, for instance, between the ninth and the second: it is thus that in the first the chord is direct, and the dissonance in the treble; in the others, the chord is reversed, and the dissonance in the bass.

With respect to chords by supposition, greater precaution is necessary in inverting them. As the sound which they add to the bass is absolutely foreign to the harmony; it is often only tolerable there, on account of its vast distance from the other sounds, which renders the dissonance less harsh. But if these added

sounds should happen to be transposed in the higher parts, as it sometimes does; if this transposition be not performed with much art, it may produce a very bad effect; and never can this be happily practised without taking away some other sound from the chord. See, at the article *Accord* in the Musical Dictionary, the cases when *inversion* may be practised, and the choice of such as are proper.

The perfect knowledge of *inversion* depends on art and study alone: the choice is a different matter; to this an ear and a taste are necessary; experience of the different effects are likewise indispensable; and though the choice of inversions be indifferent with respect to the foundation of the harmony, it is by no means such in regard of the effect and expression. It is certain, that the fundamental bass is formed to support the harmony, and to prevail beneath. Every time therefore when the order is changed and the harmony inverted, there ought to be good reasons for it: without which, the composer will fall into the vice of our more recent music, where the melody of the treble is often like what the bass should be, and the bass always like that of the treble, where every thing is confounded, reversed, disordered, without any other reason than to subvert the established order, and to spoil the harmony.

INVESTIGATION, properly denotes the searching or finding out any thing by the tracks or prints of the feet; whence mathematicians, schoolmen, and grammarians, come to use the term in their respective researches.

INVESTING A PLACE, is when a general, having an intention to besiege it, detaches a body of horse to possess all the avenues; blocking up the garriſon, and preventing relief from getting into the place, till the army and artillery are got up to form the siege.

INVESTITURE, in law, a giving livery of seisin or possession. There was anciently a great variety of ceremonies used upon investitures; as at first they were made by a certain form of words, and afterwards by such things as had the greatest resemblance to the thing to be transferred: thus, where lands were intended to pass, a turf, &c. was delivered by the grantor to the grantee. In the church, it was customary for princes to make investiture of ecclesiastical benefices, by delivering to the persons they had chosen, a pastoral staff and a ring.

INULA, ELECAMpane; a genus of the polygamia superflua order, belonging to the syngenesia class of plants. There are 22 species, of which the helennium, or common elecampane, is the most remarkable. It is a native of Britain; but is cultivated in gardens for the sake of the root, which is used in medicine. The root is perennial, thick, branching, and of a strong odour. The lower leaves are eight or nine inches long, and four broad in the middle, rough on their upper side, but downy on the under side. The stalks rise about four feet high, and divide toward the top into several smaller branches, garnished with oblong oval leaves indented on their edges, ending in acute points. Each branch is crowned with one large yellow radiated flower, succeeded by narrow four-cornered seeds, covered with down. It may be propagated in autumn by seeds or offsets.

Medicinal Uses, &c. The root of elecampane, e-
spe.

Inundate specially when dry, has an agreeable aromatic smell; its taste, on chewing, is glutinous, and as it were somewhat rancid; in a little time it discovers an aromatic bitterness, which by degrees becomes considerably acrid and pungent. It possesses the general virtues of alexipharmacs; and is principally recommended for promoting expectoration in humoral asthma and coughs. Liberally taken, it is said to excite urine, and to loosen the belly. In some parts of Germany, large quantities of this root are candied, and used as a stomachic for strengthening the tone of the viscera in general, and for attenuating tenacious juices. Spirituous liquors extract its virtues in greater perfection than watery ones. The former scarce elevate any thing in distillation: with the latter an essential oil arises, which concretes into white flakes; this possesses at first the flavour of the elecampane, but is very apt to lose it in keeping. Outwardly applied, a decoction of it is said to cure the itch. The root bruised and macerated in urine with balls of ashes and whortleberries, dyes a blue colour.

INUNDATÆ, the name of the 15th order in Linneus's fragments of a natural method; consisting of plants which grow in the water. See **BOTANY**, p. 1307.

INVOCATION, in theology, the act of adoring God, and especially of addressing him in prayer for his assistance and protection. See the articles **ADORATION** and **PRAYER**.

The difference between the invocation of God and of the saints, as practised by the Papists, is thus explained in the catechism of the council of Trent. "We beg of God, (says the catechism,) to give us good things, and to deliver us from evil; but we pray to the saints, to intercede with God and obtain those things which we stand in need of. Hence we use different forms in praying to God, and to the saints: to the former we say, *hear us, have mercy on us*; to the latter we only say, *pray for us*." The council of Trent expressly teaches, that the saints who reign with Jesus Christ offer up their prayers to God for men; and condemn those who maintain the contrary doctrine. The Protestants reject and censure this practice as contrary to scripture, deny the truth of the fact, and think it highly unreasonable to suppose that a limited finite being should be in a manner omnipresent, and at one and the same time hear and attend to the prayers that are offered to him in England, China, and Peru; and from thence infer, that if the saints cannot hear their requests, it is inconsistent with common sense to address any kind of prayer to them.

INVOCATION, in poetry, an address at the beginning of a poem, wherein the poet calls for the assistance of some divinity, particularly of his muse, or the deity of poetry.

INUNDATION, a sudden overflowing of the dry land by the waters of the ocean, rivers, lakes, springs, or rain. See all these articles.

INVOICE, an account in writing of the particulars of merchandize, with their value, custom, charges, &c. transmitted by one merchant to another in a distant country.

INVOLUCRUM, among botanists. See **BOTANY**, p. 1293.

INVOLUTION, in algebra. See **ALGEBRA**, n° 9.

JOAB, general of the army of king David, defeated the Syrians and the other enemies of David, and took the fort of Zion from the Jebusites, who, thinking it impregnable, committed it to the care of the lame and blind, whom they placed on the walls. He signalized himself in all David's wars, but was guilty of basely murdering Abner and Amasa. He procured a reconciliation between Abalom and David; and afterwards slew Abalom, contrary to the express orders of the king. He at length joined Adonijah's party; and was put to death by the order of Solomon, 1014 B. C.

JOACHIMITES, in church-history, the disciples of Joachim a Cistercian monk, who was an abbot of Flora in Calabria, and a great pretender to inspiration.

The Joachimites were particularly fond of certain ternaries: The Father, they said, operated from the beginning till the coming of the Son; the Son, from that time to theirs, which was the year 1260; and from that time the Holy Spirit was to operate in his turn. They also divided every thing relating to men, to doctrine, and the manner of living, into three classes, according to the three persons in the Trinity: The first ternary was that of men; of whom the first class was that of married men, which lasted during the whole period of the Father; the second was that of clerks, which had lasted during the time of the Son; and the last was that of the monks, in which there was to be an uncommon effusion of grace by the Holy Spirit: The second ternary was that of doctrine, viz. the Old Testament, the New, and the everlasting Gospel; the first they ascribed to the Father, the second to the Son, and the third to the Holy Spirit: A third ternary consisted in the manner of living, viz. under the Father, men lived according to the flesh; under the Son, they lived according to the flesh and the spirit; and under the Holy Ghost, they were to live according to the spirit only.

JOAN (Pope), called by Platina *John VIII.* is said to have held the holy see between Leo IV. who died in 855, and Benedict III. who died in 858. Marianus Scotus says, she sat two years five months and four days. Numberless have been the controversies, fables, and conjectures, relating to this pope. It is said that a German girl, pretending to be a man, went to Athens, where she made great progress in the sciences; and afterward came to Rome in the same habit. As she had a quick genius, and spoke with a good grace in the public disputations and lectures, her great learning was admired, and every one loved her extremely; so that after the death of Leo, she was chosen pope, and performed all offices as such. Whilst she was in possession of this high dignity, she was got with child; and as she was going in a solemn procession to the Lateran church, she was delivered of that child, between the Coliseum and St Clement's church, in a most public street, before a crowd of people, and died on the spot, in 857. By way of embellishing this story, may be added the precaution reported to have been afterward taken to avoid such another accident. After the election of a pope, he was placed on a chair with an open seat, called the *groping chair*, when

Involution
Joan.

when a deacon came most devoutly behind and satisfied himself of the pontiff's sex by feeling. This precaution, however, has been long deemed unnecessary, because the cardinals now always get bastards enough to establish their virility before they arrive at the pontificate.

JOAN *d'Arc*, or the Maid of Orleans, whose heroic behaviour in reanimating the expiring valour of the French nation, though by the most superstitious means, (pretending to be inspired), deserved a better fate. She was burnt by the English as a sorceress, in 1421, aged 24. See FRANCE, n° 60.

JOANNA (St), one of the Comora islands in the Indian ocean, E. Long. 44. 25. S. Lat. 12. 0. The north side shoots out into two points, 26 miles asunder, between which there is a great bay. This island is a proper place of refreshment for the East India ships, whose crews, when ill of the scurvy, soon recover by the use of limes, lemons, and oranges, and from the air of the land. The island abounds with horned cattle, goats, fowls, rice, pepper, cocoa-nuts, plantains, bananas, oranges, lemons, limes, pine-apples, guavas, plums, yams, and potatoes. They have likewise honey and sugar-canes; and the soil is so rich, that it seems proper for any other vegetables: all these, except the cocoa-nuts, may be gathered at pleasure. The prospect of the country is exceeding beautiful, and may be called without exaggeration a *terrestrial paradise*; every valley being a delightful grove, and the hills covered with variety of evergreen trees, combined with water-falls and cascades, render it impossible that they should receive any addition from art. The town where the king resides is at the east side of the island; and though it is three quarters of a mile in length, it does not contain above 200 houses. However, the villages are thick, and there are cottages almost every where. Their principal houses are built with stone, with a quadrangle in the middle, and are only one story high. All the other houses, or rather huts, are slightly composed of plastered reeds; and yet the mosques are tolerable structures, very neat and clean in the inside. The horned cattle are a kind of buffaloes, having a large hump on their shoulders, which is very delicious eating. They have neither horses nor asses, nor beasts of prey; but they have monkeys of several sorts, and bats as large as a weasel; they have also various sorts of birds not yet distinguished by any particular name.

JOB, or *Book of Job*, a canonical book of the Old Testament, containing a narrative of a series of misfortunes which happened to a man whose name was *Job*, as a trial of his virtue and patience; together with the conferences he had with his cruel friends on the subject of his misfortunes, and the manner in which he was restored to ease and happiness. This book is filled with those noble, bold, and figurative expressions, which constitute the very soul of poetry.

Many of the Jewish rabbins pretend that this relation is altogether a fiction: others think it a simple narrative of a matter of fact, just as it happened: while a third sort of critics acknowledge, that the groundwork of the story is true, but that it is wrote in a poetical strain, and decorated with peculiar circum-

stances, to render the narration more profitable and entertaining.

The time is not set down in which Job lived. Some have thought that he was much antienter than Moses, because the law is never cited by Job or his friends, and because it is related that Job himself offered sacrifices. Some imagine that this book was wrote by himself; others say, that Job wrote it originally in Syriac or Arabic, and that Moses translated it into Hebrew: but the rabbins generally pronounce Moses to be the author of it, and many Christian writers are of the same opinion.

JOBBER, in law, a person that buys and sells cattle for others. Hence stock-jobbers are persons who buy and sell stocks for other persons.

JOBERT (Lewis), a pious and learned jesuit, born at Paris in 1647. He distinguished himself as a preacher; and besides several other tracts wrote a treatise entitled *La Science des Medailliers*, which is in good esteem. He died in 1719; and the best edition of this work is that of Paris in 1739, 2 vols 12mo.

JOELLE (Stephen), lord of Limodin, was born at Paris in 1532; and distinguished himself so greatly by his poetical talents, that he was reckoned one of the Pleiades celebrated by Ronfard. He is said to be the first Frenchman who wrote plays in his own language according to the ancient form. He was remarkably ready at composition, writing without study or labour; and was well skilled in polite arts and genteel exercises. In his younger years he embraced the reformed religion, and wrote a satire on the *mafs* in 100 Latin verses; yet all of a sudden returned to that *mafs* again. He died in 1579, very poor.

JOEL, the son of Phathuel, and the second of the lesser prophets, 800 B. C. foretold the captivity of Babylon, the descent of the Holy Ghost on the apostles, and the last judgment. His prophecy is in Hebrew, and contains only three chapters. The style is strong, expressive, and figurative.

JOHN (St), the BAPTIST, the fore-runner of Jesus Christ, was the son of Zacharias and Elizabeth. He retired into a desert, where he lived on locusts and wild honey; and about the year 29 began to preach repentance, and to declare the coming of the Messiah. He baptized his disciples, and the following year Christ himself was baptized by him, in the river Jordan. Some time after, having reproved Herod Antipas, who had a criminal correspondence with Herodias his brother Philip's wife, he was cast into prison, where he was beheaded. His head was brought to Herodias, who, according to St Jerome, pierced his tongue with the bodkin she used to fasten up her hair, to revenge herself after his death for the freedom of his reprofs.

JOHN (St), the apostle, or the evangelist, was the brother of St James the Great, and the son of Zebedee. He quitted the business of fishing to follow Jesus, and was his beloved disciple. He was witness to the actions and miracles of his Master; was present at his transfiguration on mount Tabor; and was with him in the garden of Olives. He was the only apostle who followed him to the cross; and to him Jesus left the care of his mother. He was also the first apostle who knew him again after his resurrection. He preached

John.

preached the faith in Asia; and principally resided at Ephesus, where he maintained the mother of our Lord. He is said to have founded the churches of Smyrna, Pergamus, Thyatira, Sardis, Philadelphia, and Laodicea. He is also said to have preached the gospel amongst the Parthians, and to have addressed his first epistle to that people. It is related, that, when at Rome, the emperor Domitian caused him to be thrown into a caldron of boiling oil, when he came out unhurt; on which he was banished to the isle of Patmos, where he wrote his Apocalypse. After the death of Domitian, he returned to Ephesus, where he composed his Gospel, about the year 96; and died there, in the reign of Trajan, about the year 100, aged 94.

Gospel of St JOHN, a canonical book of the New Testament, containing a recital of the life, actions, doctrine, and death, of our Saviour Jesus Christ, written by St John the apostle and evangelist.

St John wrote his Gospel at Ephesus, after his return from the isle of Patmos, at the desire of the Christians of Asia. St Jerome says, he would not undertake it, but on condition that they should appoint a public fast to implore the assistance of God; and that, the fast being ended, St John, filled with the Holy Ghost, broke out into these words, "In the beginning was the Word," &c. The ancients assign two reasons for this undertaking: the first is, because, in the other three Gospels, there was wanting the history of the beginning of Jesus Christ's preaching, till the imprisonment of John the Baptist, which therefore he applied himself particularly to relate. The second reason was, in order to remove the errors of the Corinthians, Ebionites, and other sects.

Revelation of St JOHN. See APOCALYPSE.

JOHN of Salisbury, bishop of Chartres in France, was born at Salisbury in Wiltshire, in the beginning of the 12th century. Where he imbibed the rudiments of his education, is unknown; but we learn, that in the year 1136, being then a youth, he was sent to Paris, where he studied under several eminent professors, and acquired considerable fame for his application and proficiency in rhetoric, poetry, divinity, and particularly in the learned languages. Thence he travelled to Italy; and, during his residence at Rome, was in high favour with pope Eugenio III. and his successor Adrian IV. After his return to England, he became the intimate friend and companion of the famous Thomas BECKET, archbishop of Canterbury, whom he attended in his exile, and is said to have been present when that haughty prelate was murdered in his cathedral. What preferment he had in the church during this time, does not appear; but in 1176 he was promoted by king Henry II. to the bishopric of Chartres in France, where he died in 1182.

This John of Salisbury was really a phenomenon. He was one of the first restorers of the Greek and Latin languages in Europe; a classical scholar, a philosopher, a learned divine, and an elegant Latin poet. He wrote several books; the principal of which are, his *Life of St Thomas of Canterbury*, a collection of letters, and *Polycation*.

Pope JOHN XXII. a native of Cahors, before called

James d'Esse, was well skilled in the civil and canon law; and was elected pope after the death of Clement V. on the 7th of August 1316. He published the constitutions called *Clementines*, which were made by his predecessor; and drew up the other constitutions called *Extravagantes*. Lewis of Bavaria being elected emperor, John XXII. opposed him in favour of his competitor; which made much noise, and was attended with fatal consequences. That prince, in 1329, caused the antipope Peter de Corbiera, a cordelier, to be elected, who took the name of Nicholas V. and was supported by Michael de Cefenne, general of his order; but that antipope was the following year taken and carried to Avignon, where he begged pardon of the pope with a rope about his neck, and died in prison two or three years after. Under this pope arose the famous question among the cordeliers, called *the bread of the cordeliers*; which was, Whether those monks had the property of the things given them, at the time they were making use of them? for example, Whether the bread belonged to them when they were eating it, or to the pope, or to the Roman church? This frivolous question gave great employment to the pope; as well as those which turned upon the colour, form, and stuff of their habits, whether they ought to be white, grey, or black; whether the cowl ought to be pointed or round, large or small; whether their robes ought to be full, short, or long; of cloth, or of serge, &c. The disputes on all these minute trifles were carried so far between the minor brothers, that some of them were burned upon the occasion. He died at Avignon in 1334, aged 90.

JOHN, king of England. See ENGLAND, n° 133, 144.

JOHN of Gaunt, duke of Lancaster, a renowned general, father of Henry IV. king of England, died in 1438.

JOHN of Leyden, otherwise called *Buccold*. See ANABAPTISTS.

JOHN Sobieski of Poland, one of the greatest warriors in the 17th century, was, in 1665, made grand-marshal of the crown; and, in 1667, grand-general of the kingdom. His victories obtained over the Tartars and the Turks procured him the crown, to which he was elected in 1674. He was an encourager of arts and sciences, and the protector of learned men. He died in 1696, aged 72.

St JOHN's Day, the name of two Christian festivals; one observed on June 24th, kept in commemoration of the wonderful circumstances attending the birth of John the Baptist; and the other on December 27th, in honour of St John the evangelist.

St JOHN's Wort. See HYPERICUM.

JOHN's (St), an island of the East-Indies, in Asia, and one of the Philippines, east of Mindanayo, from which it is separated by a narrow strait. E. Long. 125. 25. N. Lat. 7. 0.

JOHN's (St), an island of North-America, in the bay of St Lawrence, having New-Scotland on the south and west, and Cape Breton on the east. The English got possession of it when Louisbourg was surrendered to them, on July 26, 1758.

JOHNSON (Ben), one of the most considerable dramatic poets of the last age, whether we consider the number or the merit of his productions. He was born

John
||
Johnson.

born at Westminster in 1574, and was educated at the public school there under the great Camden. He was descended from a Scots family; and his father, who lost his estate under Queen Mary, dying before our poet was born, and his mother marrying a bricklayer for her second husband, Ben was taken from school to work at his father-in-law's trade. Not being captivated with this employment, he went into the Low Countries, and distinguished himself in a military capacity.

On his return to England, he entered himself at St John's college, Cambridge; and having killed a person in a duel, was condemned, and narrowly escaped execution. After this he turned actor; and Shakespeare is said to have first introduced him to the world, by recommending a play of his to the stage, after it had been rejected. His Alchymist gained him such reputation, that in 1619 he was, at the death of Mr Daniel, made poet-laureat to King James I. and master of arts at Oxford.

As we do not find Johnson's economical virtues any where recorded, it is the less to be wondered at, that after this we find him petitioning king Charles, on his accession, to enlarge his father's allowance of 100 marks into pounds; and quickly after we learn, that he was very poor and sick, lodging in an obscure alley: on which occasion it was, that Charles, being prevailed on in his favour, sent him ten guineas; which Ben receiving, said, "His majesty has sent me ten guineas, because I am poor, and live in an alley; go and tell him, that his soul lives in an alley."

He died in August 1637, aged 63 years, and was buried in Westminster-Abbey.—The most complete edition of his works was printed in 1756, in 7 vols. 8vo.

JOHNSON (Samuel), an English divine, remarkable for his learning, and headiness in suffering for the principles of the revolution in 1688. He was born in 1649; and, entering into orders, obtained in 1670 the rectory of Corringham in the hundreds of Essex, worth no more than L. 80 a-year; which was the only church-preference he ever had. The air of this place not agreeing with him, he was obliged to place a curate on the spot, at the expence of half his income, while he settled at London; a situation much more to his liking, as he had a strong propensity to politics. The times were turbulent: the duke of York declaring himself a Papist, his succession to the crown began to be warmly opposed; and Mr Johnson, who was naturally of no submissive temper, being made chaplain to lord William Russell, engaged the ecclesiastical champion for passive obedience Dr Hicks, in a treatise intitled *Julian the apostate*, &c. published in 1682. He was answered by Dr Hicks in a piece intitled *Jovian*, &c. To which he drew up, and printed, a reply, under the title of *Julian's arts to undermine and extirpate Christianity*, &c.; but by the advice of his friends suppressed the publication. For this unpublished work he was committed to prison; but not being able to procure a copy, the court prosecuted him for writing the first tract, condemned him to a fine of 500 marks, and to lie in prison until it was paid. By the assistance of Mr Hamden, who was his fellow-prisoner, he was enabled to run into farther troubles; for on the encampment of the army on

Vol. V.

Hounslow-heath, in 1686, he printed and dispersed, *A humble and hearty address to all the Protestants in the present army*; for this he was sentenced to a second fine of 500 marks, to be degraded from the priesthood, to stand twice in the pillory, and to be whipped from Newgate to Tyburn. It happened luckily, that, in the degradation, they omitted to strip him of his cassock; which circumstance, slight as it may appear, rendered his degradation imperfect, and afterwards preserved his living to him. Intercession was made to get the whipping omitted; but James replied, "That since Mr Johnson had the spirit of martyrdom, it was fit he should suffer;" and he bore it with firmness, and even with alacrity. On the Revolution, the parliament resolved the proceedings against him to be null and illegal; and recommended him to the king, who offered him the rich deanery of Durham: but this he refused, as inadequate to his services and sufferings, which he thought to merit a bishopric. The truth was, he was passionate, self-opiniated, and turbulent; and though, through Dr Tillotson's means, he obtained a pension of 300 l. a-year, with other gratifications, he remained discontented; pouring forth all his uneasiness against a standing army, and the great favours shewn to the Dutch. He died in 1703, and his works were afterwards collected in one volume folio.

JOHNSON (John), a learned divine, born in 1662. He was zealous for the Revolution, and preached a noted sermon at Feverham on the occasion, from the words, "Remember Lot's wife;" wherein he set forth the great danger of looking back, and vindicated the liturgy against Mr Baxter and others. He published *The Clergyman's Vade Mecum*, and *A Collection of Ecclesiastical Laws* as a continuation of it; but catching the infection spread by Dr Sachaivel, he, on the accession of Geo. I. to the amazement of all his old friends, entertained unfavourable thoughts of the Protestant succession, and refused to read the usual prayers for the king. Being prosecuted, however, he thought proper to submit; and died vicar of Cranbrook in Kent, in 1725.

JOIGNY, a town of France, in Champagne, and in the diocese of Sens, with a very handsome castle. It consists of three parishes, and is pleasantly situated on the river Yonne, in E. Long. 3. 25. N. Lat. 47. 56.

JOINERY, the art of working in wood, or of fitting various pieces of timber together. It is called by the French *menuiserie*, "small work;" to distinguish it from carpentry, which is employed about large and less curious works.

JOINT, in general, denotes the juncture of two or more things. The joints of the human body are called by anatomists *articulations*. See ANATOMY, n° 2. b, c, d, e, f.

The suppleness to which the joints may be brought by long practice from the time of infancy, is very surprising. Every common posture-master shews us a great deal of this; but one of the most wonderful instances we ever had of it, was in a person of the name of Clark, and famous for it in London, where he was commonly known by the name of *Clark the posture-master*. This man had found the way, by long practice, to distort many of the bones, of which nobody

before had ever thought it possible to alter the position. He had such an absolute command of his muscles and joints, that he could almost disjoint his whole body; so that he once imposed on the famous Mullens by his distortions, in such a manner, that he refused to undertake his cure: but, to the amazement of the physician, no sooner had he given over his patient, than he saw him restore himself to the figure and condition of a proper man, with no distortion about him.

JOINTURE, in law, generally signifies a settlement of lands and tenements, made on a woman in consideration of marriage.

JOINVILLE (John Sire de), an eminent French statesman of the 13th century, who was seneschal or high-steward of Champagne, and one of the principal lords in the court of Lewis IX. He attended that monarch in all his expeditions; and had so much confidence placed in him, that all matters of justice in the palace were referred to his decision, and the king undertook nothing of consequence without consulting him. He wrote the history of St Lewis in French, which is a very curious and interesting piece; and died about the year 1318. The best edition of this work is that of Du Cange, in folio, with learned remarks.

JOINVILLE, an ancient and considerable town of France, in Champagne, with the title of a principality, and a large magnificent castle. It is situated on the river Marne, in E. Long. 5. 10. N. Lat. 48. 20.

JOISTS, or **JOYSTS**, in architecture, those pieces of timber framed into the girders and summers, on which the boards of the floor are laid.

IOLAUS, in fabulous history, the son of Iphicles, assisted Hercules in overcoming the hydra, by procuring and lighting firebrands, as fast as Hercules cut off its heads. As a reward for this piece of service, Hercules prevailed on Hebe to restore him to youth, when decrepited with age.

JOLI, or **JOLY**, (Claudius), a worthy parish-priest, and an excellent scholar, descended from a family eminent for learning and piety; was born at Paris in 1607. He applied himself first to the law, and pleaded for some time at the bar: but inclining afterwards to the church, he entered into orders, and in 1631 obtained a canonry in the cathedral church of Notre Dame at Paris; the duties of which office he discharged with an exactness beyond all example as long as he lived. Discovering at the same time occasionally a capacity for state-affairs, the duke de Longueville, the French plenipotentiary for negotiating a general peace, took Joly with him to Munster, where he proved a good assistant. On his return, he resumed his former employments with his usual zeal. In 1671 he was made precentor in his church; and several times official of Paris, without his seeking; always behaving, as an ecclesiastical magistrate, with perfect integrity, and testifying a sincere love for justice. He died in 1700, and left many works; in which, as in as many mirrors, his true character fully appears.

JOLI (Guy), king's counsellor to the Chatelet, and syndic of the revenues of the Hotel de Ville at Paris, attached himself for a long time to cardinal de Retz in the capacity of secretary. Beside other tracts, he wrote *Memoirs* from 1648 to 1665, including those

of Cardinal de Retz; a translation of which into English was published in 1755.

JONA, or **IONA**, the most celebrated of all the Hebrides, called also *St Columb-kill*, from St Columba *, who came hither from Ireland, and here lies buried. The island stretches two miles in length from south to north in the neighbourhood of Mull, and is about a mile broad from east to west. One end of it is rocky and barren; the other, plain, arable, and fruitful. Columba having converted the northern Picts by his preaching, their king is said to have bestowed upon him this island, where he erected two churches and two monasteries, and instituted a seminary that soon became famous for learning and sanctity. These foundations were richly endowed by the kings of Scotland and lords of the isles: Jona became the cathedral of the bishop of the isles; and, on account of its supposed sanctity, was chosen as a burying-place for kings, heroes, and churchmen. St Mary's church in this island is built in form of a cross, in the Gothic manner; on each side of the choir are two chapels, having, at the entrance, large pillars carved in basso-relievo: the steeple, doors, and windows, are adorned with curious fret-work; the altar is large, magnificent, and composed of fine polished marble.

Within the church several abbots are interred, and among these M'likeich, whose statue of black marble appears as big as the life, in an episcopal habit, with the mitre and crozier; the rest are represented in the same manner, and some distinguished by Latin inscriptions. Behind the church are the ruins of a cloister, library, and hall; in which last there used to be public disputations. At the west end of the church, in a little cell, we find the tomb of Columba, but undistinguished by any inscription. Hard by stands the cross of St Martin, an entire porphyry stone, eight feet high above the ground, standing on a pedestal, and exhibiting on the east side the figure of a tree, and on the west a large crucifix. At a little distance from hence we see the ruins of Dun-ni Manich, or Monks Fort, built of stone and lime; which seems to have been a kind of raised bastion, on which the monks enjoyed the cool air, and a prospect of the whole country. A little farther westward lie the black stones, so called, not for their colour, which is grey, but on account of the dreadful vengeance which was said to overtake all those who swore an oath on these stones and were afterwards guilty of perjury. Kneeling on these stones with uplifted hands, Macdonald, lord of the isles, confirmed the grants of lands to his adherents and vassals, solemnly swearing before witnesses, that he would never revoke the rights and privileges he then bestowed.

The other church in Jona is called *St Ouran's*, from the patron to which it is dedicated. The stateliest tomb in this church belongs to the laird of M'Kinnon. On the wall above appears a crucifix, engraved with the family-arms underneath. On the tomb-stone lies a statue as big as the life in armour, a ship under sail, a lion at the head, and another at the feet, with this inscription, *Hic est abbas Lachlan Much-fingon, et ejus filius, Abbatas de I. Etatis in Dno. Mo. CCCC. ann.* But the most remarkable spot is the cemetery on the south side, in which the king and chieftains lie buried under shrines. Each particular vault was distinguished

* See Hebrides, and Columba.

Jona
||
Jonas.Jonas
||
Jones.

ed by an inscription; but these are now not legible. In that on the right hand, four kings of Ireland were interred; on the left, eight kings of Norway lie buried; and in the middlemost, eight and forty kings of Scotland. Here are likewise the tombs of Macdonald of Ila, Gilbred, and Paul Sporran, ancient tribes of the same name; the Macleans of Duart, Lochbuy, and Coll, Macalister, likewise a branch of the Macdonalds, Mac-ourey of Ulway, and several distinguished clergymen; one of which exhibits this inscription, *Hic jacet Johanner Turnbull, quondam episcopus Cantuariensis*. All these monuments are of laymen,^a adorned with statues in armour, and armorial ensigns engraven in stone.

About a quarter of a mile farther south, is the church of Ronad, the burying-place of several abbesses; one of whom is thus inscribed: *Hic jacet Dna. Anna Tarleti, filia quondam priorisse de Jona, quæ obiit anno Mo. Christi, animam Abraham commendamus*. If this inscription be true, the prioresses in those days did not live a life of celibacy; though indeed a little alteration in the punctuation and orthography will destroy this supposition; for example, *Hic jacet Dna. Anna, Tarleti filia, quondam priorisse de Jona, &c.* In the middle of a long pavement belonging to the adjoining nunnery, stands another stone cross, called *Maclean's cross*, like that which we have already described. On the shore is a small dock dug to preserve the curich or boat, made of timber covered with hides, in which Columba is said to have transported himself and eighteen ecclesiastics from Ireland. One copy of this apostle's life, written in the Irish character, which by the by is no other than the old Saxon, was in the possession of John Macneil in the isle of Barra; and another in the hands of Macdonald of Benbecula. The monastery of Jona furnished divers bishops to the dioceses of Scotland and England; among others, the famous Aidanus, bishop of Lindisfarn, now Holy Island.

JONAH, or *Prophecy of JONAH*, a canonical book of the Old Testament; in which it is related, that Jonah (about 771 B. C.) was ordered to go and prophesy the destruction of the Ninevites, on account of their wickedness. But the prophet, instead of obeying the divine command, embarked for Tarshish; when, a tempest arising, the mariners threw him into the sea: he was swallowed by a great fish; and after being three days and nights in its belly, was cast upon the land. Hereupon being sensible of his past danger and surprising deliverance, he betook himself to the journey and embassy to which he was appointed; and arriving at Nineveh the metropolis of Assyria, he, according to his commission, boldly laid open their sins and miscarriages, and proclaimed their sudden overthrow: upon which the whole city, by prayer and fasting, and a speedy repentance, happily averted the divine vengeance, and escaped the threatened ruin. Jonah upon this, fearing to pass for a false prophet, retired to a hill at some distance from the city; where God, by a miracle, condescended to shew him the unreasonableness of his discontent.

JONAS (Justinus), a Protestant divine, born at North Haufen, in Thuringia, in 1493. He was one of Luther's most zealous disciples. He contracted a strict friendship with Melancthon; became principal of the

college of Wittenburg, and afterwards dean of the university of that city. He wrote a treatise in favour of the marriage of priests, and other works; and died in 1555.

JONAS (Arnagrinus), a learned Icelsander, acquired great reputation by his skill in the sciences, and particularly in astronomy. He was coadjutor to Guudebran de Thorlac, bishop of Hols, in Iceland. He refused that bishopric, after the death of Guudebran; and died in 1649. He wrote several works; the principal of which are, *Idea vera Magistratus*, and his history and description of Iceland.

JONATHAN, the son of Saul, celebrated in Sacred history for his valour, and his friendship for David against the interest of his own house. Slain in battle, 1055 B. C.

JONATHAN Maccabæus, brother of Judas, a renowned general of the Jews. He forced Bacchides the Syrian general, who made war with the Jews, to accept a peace; conquered Demetrius Soter, and afterwards Apollonius, that prince's general; but, being ensnared by Tryphon, was put to death, 144 B. C.

JONES (Inigo), a celebrated English architect, was the son of a cloth-worker of London, and was born in 1572. He was at first put apprentice to a joiner; but early distinguished himself by his inclination to drawing or designing, and was particularly taken notice of for his skill in landscape-painting. This afterwards recommended him to the favour of William earl of Pembroke, who sent him abroad with a handsome allowance in order to perfect himself in that branch. He was no sooner at Rome, than he found himself in his proper sphere: he felt that nature had not formed him to decorate cabinets, but to design palaces. He dropt the pencil, and conceived Whitehall. In the state of Venice he saw the works of Palladio, and learned how beautiful taste may be exerted on a less theatre than the capital of an empire. How his abilities distinguished themselves in a spot where they certainly had no opportunity to act, we are not told, though it would not be the least curious part of his history; certain it is, that, on the strength of his reputation at Venice, Christian IV. invited him to Denmark, and appointed him his architect; but on what buildings he was employed in that country, we are yet to learn. James I. found him at Copenhagen, and queen Anne took him in the quality of her architect to Scotland. He served prince Henry in the same capacity, and the place of surveyor-general of the works was granted to him in reversion. On the death of that prince, with whom at least all his lamented qualities did not die, Jones travelled once more into Italy, and, assisted by ripeness of judgment, perfected his taste. To the interval between these voyages Mr Walpole is inclined to assign those buildings of Inigo, which are less pure, and border too much upon the bastard style, which one may call *king James's gothic*. Inigo's designs of that period are not gothic; but have a littleness of parts, and a weight of ornaments, with which the revival of the Grecian taste was encumbered, and which he shook off in his grander designs. The surveyor's place fell, and he returned to England; and, as if architecture was not all he had learned at Rome, with an air of Roman disinterestedness he gave up the profits of his office,

which he found extremely in debt; and prevailed upon the comptroller and paymaster to imitate his example, till the whole arrears were cleared.

In 1620, he was employed in a manner very unworthy of his genius: king James set him upon discovering, that is, guessing, who were the founders of Stouchege. His ideas were all Romanized; consequently, his partiality to his favourite people, which ought rather to have prevented him from charging them with that mass of barbarous clumsiness, made him conclude it a Roman temple.

In the same year Jones was appointed one of the commissioners for the repair of St Paul's; but which was not commenced till the year 1633, when Laud, then bishop of London, laid the first stone, and Inigo the fourth. In the restoration of that cathedral, he made two capital faults. He first renewed the sides with very bad Gothic; and then added a Roman portico, magnificent and beautiful indeed, but which had no affinity with the ancient parts that remained, and made his own Gothic appear ten times heavier. He committed the same error at Winchester, thrusting a screen in the Roman or Grecian taste into the middle of that cathedral. Jones indeed was by no means successful when he attempted Gothic. The chapel of Lincoln's-Inn has none of the characteristics of that architecture. The cloyster beneath seems oppressed by the weight of the building above.

The authors of the life of Jones place the erecting of the Banqueting-house in the reign of king Charles; but it appears, from the accounts of Nicholas Stone, that it was begun in 1619, and finished in two years—a small part of the pile designed for the place of our kings; but so complete in itself, that it stands a model of the most pure and beautiful taste. Several plates of the intended palace at Whitehall have been given; but Mr Walpole thinks, from no finished design. The four great fronts are evidently made up from general hints; nor could such a source of invention and taste as the mind of Inigo, ever produce so glorious a success. The whole fabric, however, was so glorious an idea, that one forgets for a moment (says Mr Walpole), in the regret for its not being executed, the confirmation of our liberties, obtained by a melancholy scene that passed before the windows of that very Banqueting-house.

In 1623 he was employed at Somerset-house, where a chapel was to be fitted up for the Infanta, the intended bride of the prince. The chapel is still in being. The front to the river, part only of what was designed, and the water-gate, were erected afterwards on the designs of Inigo, as was the gate at York-stairs.

On the accession of Charles, Jones was continued in his posts under both king and queen. His fee as surveyor, was eight shillings and four-pence a-day, with an allowance of 46l. a-year for house-rent, besides a clerk, and incidental expences. What greater rewards he had, are not upon record.

During the prosperous state of the king's affairs, the pleasures of the court were carried on with much taste and magnificence. Poetry, painting, music, and architecture, were all called in to make them rational amusements. Mr Walpole is of opinion, that the celebrated festivals of Louis XIV. were copied

from the shews exhibited at Whitehall, in his time the most polite court in Europe. Ben Johnson was the laureat; Inigo Jones the inventor of the decorations; Lanieri and Perabosco composed the symphonies; the king, the queen, and the young nobility, danced in the interludes. We have accounts of many of those entertainments, called *maquers*; they had been introduced by Anne of Denmark.

Lord Burlington had a folio of the designs for these solemnities, by Inigo's own hand, consisting of habits, masks, scenes, &c. The harmony of these masks was a little interrupted by a war that broke out between the composers, Inigo and Ben; in which, whoever was the aggressor, the turbulent temper of Johnson took care to be most in the wrong. Nothing exceeds the grossness of the language that he poured out, except the badness of the verses that were the vehicle. There he fully exerted all the brutal abuse which his contemporaries were willing to think wit, because they were afraid of it; and which only seems to shew the arrogance of the man, who presumed to satirize Jones and rival Shakspear.

The works of Inigo Jones are not scarce; Surgeon's-hall is one of his best works. One of the most admired is the Arcade of Covent-garden, and the Church: "Two structures, (says Mr Walpole), of which I want taste to see the beauties. In the arcade there is nothing remarkable; the pilasters are as arant and homely stripes as any plasterer would make. The barn-roof over the portico of the church strikes my eyes with as little idea of dignity or beauty, as it could do if it covered nothing but a barn. It must be owned, that the defect is not in the architect, but in the order. —Who ever saw a beautiful Tuscan building? Would the Romans have chosen that order for a temple?" The expence of building that church was 4500 l.

Ambresbury in Wiltshire was designed by Jones, but executed by his scholar Webb. Jones was one of the first that observed the same diminution of pilasters as in pillars. Lindsey-house in Lincoln's-Inn Fields, which he built, owes its chief grace to this singularity. In 1618 a special commission was issued to the lord chancellor, the earls of Worcester, Pembroke, Arundel, and others, to plant, and reduce to uniformity, Lincoln's-Inn Fields, as it shall be drawn by way of map, or ground-plot, by Inigo Jones, surveyor-general of the works. That square is laid out with a regard to so trifling a singularity, as to be of the exact dimensions of one of the pyramids: this would have been admired in those ages when the Keep at Kenilworth Castle was erected in the form of an horse-fetter, and the Escurial in the shape of St Laurence's gridiron.

Colehill in Berkshire, the seat of Sir Matthew Pleydell, built in 1650, and Cobham-hall in Kent, were Jones's. He was employed to rebuild Calle Ashby, and finished one front: but the civil war interrupted his progress there and at Stoke-park in Northamptonshire. Shaftsbury-house, now the London Lying-in hospital, on the east side of Aldersgate-street, is a beautiful front. The Grange, the seat of the lord chancellor Henley in Hampshire, is entirely of this matter. It is not a large house, but by far one of the best proofs of his taste. The hall, which opens to a small vestibule with a cupola, and the stair-
case

Jonian.
Jonk.

cafe adjoining, are beautiful models of the purest and most classic antiquity. The gate of Deaufort-garden at Chelsea, designed by Jones, was purchased by lord Burlington, and transported to Chiswick. He drew a plan for a palace at Newmarket; but not that wretched hovel that stands there at present. One of the most beautiful of his works is the Queen's house at Greenwich. The first idea of the hospital is said to have been taken by his scholar Webb, from his papers.

Inigo tasted early the misfortunes of his master. He was not only a favourite, but a Roman catholic: in 1646, he paid 545 l. for his delinquency and sequestration. Whether it was before or after this fine, it is uncertain, that he and Stone the mason buried their joint flock in Scotland-yard; but an order being published to encourage the informers of such concealments, and four persons being privy to the spot where the money was hid, it was taken up, and reburied in Lambeth-marsh.

Grief, misfortunes, and age, put an end to his life at Somerset-house, July 21. 1651.

Several of his designs have been published by Mr Kent, Mr Colin Campbell, and Mr Isaac Ware. He left in MS. some curious notes on Palladio's architecture, which are inserted in an edition of Palladio published in 1714.

IONIA (anc. geog.), a district of the Hither Asia, a great colony of Greeks, led thither after that of Æolia. It consisted of twelve cities, ten of which were on the continent, and two on the islands of Samos and Chios; extending from Phocæa to Miletus, inclusive from north to south, according to Herodotus, Strabo, and Mela: Though Ptolemy confines it between the Hermus to the north, and the Meander to the south. *Jones* or *Jaones* the people, (Homer) taking name from *Javan* their progenitor: A soft and luxurious nation. Plato banishes from his republic the Ionian music, as too effeminate. The *Attagen Ionicus*, (Horace, Martial), was a bird in esteem for its flavour with persons who loved good eating.—The *Ionian* sea was that part of the Mediterranean extending between Epirus and Peloponnesus to the east, and Magna Græcia and part of Sicily to the west.

IONIC ORDER. See ARCHITECTURE, p. 352.

Ionian *Dialect*, in grammar, a manner of speaking peculiar to the people of Ionia.

IONIC SECT was the first of the ancient sects of philosophers; the others were the Italic and Eleatic. The founder of this sect was Thales, who, being a native of Miletus in Ionia, occasioned his followers to assume the appellation of *Ionian*: Thales was succeeded by Anaximander, and he by Anaximenes, both of Miletus; Anaxagoras Clazomenius succeeded them, and removed his school from Asia to Athens, where Socrates was his scholar. It was the distinguishing tenet of this sect, that water was the principle of all natural things.

JONK, or JONQUE, in naval affairs, is a kind of small ship, very common in the East Indies. These vessels are about the bigness of our fly-boats; and differ in the form of their building, according to the different methods of naval architecture used by the nations to which they belong. Their sails are frequently made of mats, and their anchors are made of wood.

JONSTON (John), a learned Polish naturalist and physician, born in 1603. He travelled all over Europe, and procured esteem every-where by his knowledge; afterward he bought the estate of Ziebendorf in the duchy of Lignitz in Silesia, where he spent the remainder of his days. He wrote a natural history of birds, fish, quadrupeds, insects, serpents, and dragons, in folio; a piece upon the Hebrew and Greek festivals, a thaumatography, and some poems. He died in 1675.

JOPPE (anc. geogr.), a town of Samaria, on the Mediterranean, situate in a plain (1 Macc. x.), in the tribe of Ephraim (Josh. xvi.). Here Andromeda is fabled to have been bound and exposed to the sea-monster, and delivered by Perseus. Now *Jaffa*, a port-town of Palestine. E. Long. 36. o. N. Lat. 32. 20.

JORDANO (Luca), an eminent Italian painter, was born at Naples in 1632. He became very early a disciple of Joseph Ribera; but going afterwards to Rome, he attached himself to the manner of Pietro da Cortona, whom he assisted in his great works. Some of his pictures being seen by Charles II. king of Spain, he engaged him in painting the Escorial; in which task he acquitted himself as a great painter. The king shewed him a picture of Bassani, expressing his concern that he had not a companion: Luca painted one so exactly in Bassani's manner, that it was taken for a performance of that master; and for this service he was knighted, and gratified with several honourable and valuable employments. The great works he executed in Spain, gave him still greater reputation when he returned to Naples; so that though he was a very quick workman, he could not supply the eager demands of the citizens. No one, not even Tintoret, ever painted so much as Jordano; and his generosity carried him so far as to present altar-pieces to churches that were not able to purchase them. His labours were rewarded with great riches; which he left to his family, when he died, in 1705.

JORDANS (James), one of the most eminent painters of the Flemish school, was born at Antwerp in 1593. He learned the principles of his art from Adam Van Ort, whose daughter he married; which connexion hindered him from gratifying his inclination of visiting Italy. He improved most under Rubens; for whom he worked, and from whom he drew his best principles: his taste directed him to large pieces; and his manner was strong, true, and sweet. A great number of altar-pieces painted by him are preserved in the churches in the Netherlands, which maintain the reputation of this artist. He died in 1678.

JORTIN (John), a very learned and ingenious English clergyman, was born in Huntingdonshire, about the year 1701. Having some private fortune of his own, and being of a peculiar disposition that could not solicit promotion, he remained long without preferment. In 1738, lord Winchelsea gave him the living of Eastwell in Kent; but the place not agreeing with his health, he soon resigned it. Archbishop Herring, who had a great value for him, about the year 1751 presented him to the living of St Dunstan's in the East; and bishop Obedilston in 1762 gave him that of Kensington, with a prebend in St Paul's cathedral, and made him archdeacon of London. His temper,

Johnston
Jortin.

Joseph
||
Jotapata.

temper, as well as his aspect, was rather morose and saturnine; but in company that he liked, he was at all times facetious, yet still with a mixture of *sal censura superiorum*. His sermons were sensible and argumentative; and would have made more impression on his hearers, had he been more attentive to the advantages flowing from a good delivery: but he appeared to greater advantage as a writer. His remarks on ecclesiastical history, his fix dissertations, his life of Erasmus, and his sermons, were extremely well received by the public. He died in the year 1770.

JOSEPH, the son of Jacob; memorable for his chastity, and the honours conferred on him at the court of Egypt, &c. He died in 1635 B. C. aged 110.

JOSEPHUS, the celebrated historian of the Jews, was of noble birth, by his father Mattathias descended from the high-priests; and by his mother of the blood-royal of the Maccabees; he was born A. D. 37, under Caligula, and lived under Domitian. At 16 years of age he betook himself to the sect of the Essenes, and then to the Pharisees; and having been successful in a journey to Rome, upon his return to Judaea he was made captain-general of the Galileans. Being taken prisoner by Vespasian, he foretold his coming to the empire, and his own deliverance by his means. He accompanied Titus at the siege of Jerusalem, and writ his "Wars of the Jews," which Titus ordered to be put in the public library. He afterwards lived at Rome, where he enjoyed the privileges of a Roman citizen, and where the emperors loaded him with favours, and granted him large pensions. Besides the above work, he wrote, 1. Twenty books of Jewish antiquities, which he finished under Domitian. 2. Two books against Appian. 3. An elegant discourse on the martyrdom of the Maccabees. 4. His own life. These works are excellently written in Greek.

JOSHUA, the renowned general of the Jews, who conducted them through the wilderness, &c. died in 1424 B. C. aged 110.

JOSHUA, a canonical book of the Old Testament, containing a history of the wars and transactions of the person whose name it bears. This book may be divided into three parts: the first of which is a history of the conquest of the land of Canaan; the second, which begins at the 12th chapter, is a description of that country, and the division of it among the tribes; and the third, comprised in the two last chapters, contains the renewal of the covenant he caused the Israelites to make, and the death of their victorious leader and governor. The whole comprehends a term of 17, or, according to others, of 27 years.

JOSIAH, king of Judah; the destroyer of idolatry, and the restorer of the true worship, an excellent magistrate, and a valiant general, was slain in battle, 609 B. C.

JOTAPATA (anc. geogr.), a town of the Lower Galilee, distant 40 stadia from Gabara: a very strong place, situate on a rock, walled round, and encompassed on all hands with mountains, so as not to be seen but by those who came very near. It was with great difficulty taken by Vespasian, being defended by Josephus, who commanded in it; when taken, it was ordered to be razed.

JOUBERT (Lawrence), counsellor and physician

Joubert
||
Journal.

to the king of France, chancellor and judge of the university of Montpellier, was born at Valence in Dauphiny in 1530. He became the disciple of Rondelet at Montpellier; and at his death succeeded to the regius professorship of that university, where he had given abundant proofs of his merit, and strengthened his reputation by the lectures he read in that capacity, as well as by the works he published. Henry III. who passionately wished to have children, sent for him to Paris, in hopes by his assistance to render his marriage fruitful; but he was disappointed, without any loss of repute to Joubert. Much offence was indeed taken at a piece he published under the title of *Vulgar errors*, in which he treated of virginity and generation more plainly than had ever before been done in the French language. But, though he had promised something more on the same subject, he was so piqued at the clamour raised against it, that the public saw no more, of six parts promised, than the first, and part of the second, though they were greatly called for. He died in 1582; and his son Isaac translated some of his Latin paradoxes into French.

JOVIAN, the Roman emperor, elected by the army, after the death of Julian the apostate, in 363. He at first refused, saying he would not command idolatrous soldiers; but, upon an assurance that they would embrace Christianity, he accepted the throne, and immediately shut all the Pagan temples, and forbid their sacrifices. But he did not long enjoy the dignity to which his merit had raised him; being suffocated in his bed by the fumes of a fire that had been made to dry the chamber, in 364, the 33d of his age, and the eighth month of his reign. See CONSTANTINOPLE, n° 71-73.

JOVIUS (Paul), in Italian *Giovio*, a celebrated historian, was born at Como in Italy, in the year 1483. As his father died in his infancy, he was educated by his eldest brother Benedict Jovius, under whom he became well skilled in classical learning; and then went to Rome, for the sake of enjoying the benefit of the Vatican library. He there wrote his first piece, *De piscibus Romanis*, which he dedicated to cardinal Lewis of Bourbon. He received a pension of 500 crowns for many years from Francis I. king of France, whose favour he secured by his flatteries. But, in the following reign, having disgusted the confiable Montmorency, his name was struck out of the list of pensioners. Jovius did not suffer his spirits to sink under this misfortune: he had obtained a high reputation in the learned world by his writings; and having always shewed great respect to the house of Medicis, on whose praises he had expatiated in his works, he applied to Clement VII. and obtained the bishoprick of Nocera. His principal piece is his history, which is that of his own time throughout the world, beginning with 1494, and extending to the year 1544. This was the chief business of his life. For he formed the plan of it in the year 1515; and continued upon it till his death, which happened at Florence in 1552. It is printed in three volumes folio. He is allowed to have been a man of wit as well as learning; he was master of a bright and polished style, and has many curious observations: but being a venal writer, his histories are not much credited.

JOURNAL, or DAY-BOOK. See BOOK-KEEPING.

JOUR-

JOURNAL, in navigation, a sort of diary, or daily register of the ship's course, winds, and weather; together with a general account of whatever is material to be remarked in the period of a sea-voyage.

In all sea-journals, the day, or what is called the *24 hours*, terminates at noon, because the errors of the dead-reckoning are at that period generally corrected by a solar observation. The daily compact usually contains the state of the weather; the variation, increase, or diminution of the wind; and the suitable shifting, reducing, or enlarging the quantity of sail extended; as also the most material incidents of the voyage, and the condition of the ship and her crew; together with the discovery of other ships or fleets, land, shoals, breakers, soundings, &c. *

See Na-
tion.

JOURNAL, is also a name common for weekly essays, news-papers, &c. as the Grays-Inn journal, the Westminster journal, &c.

JOURNAL, is also used for the titles of several books which come out at stated times, and give abstracts, accounts, &c. of the new books that are published, and the new improvements daily made in arts and sciences; as the *Journal de Savans*, &c.

JOURNEY, a tract of ground passed over in travelling by land; properly as much as may be passed over in one day.

Management of a Horse on a Journey. See **HORSE**.

JOURNEYMAN, properly one who works by the day only; but the word is now used for any one who works under a master, either by the day, the year, or the piece.

JOUVENET (John), a celebrated French painter, was born at Rouen in 1644; where his father, who was a painter, bred him up to the same profession: but his greatest improvement was confessedly derived from the instructions of Nicholas Poussin, and studying the works of that master. He acquired so good a knowledge of design, as qualified him for employment in several grand works in the palaces at Paris and Trianon; in many of the churches and convents; and in the hospital of invalids, where he painted the twelve apostles, each figure being 14 feet high. He was esteemed to have a ready invention, to be correct in his designs, and to have a taste for grandeur in his compositions: it is observed of this artist, that being deprived of the use of his right hand by a paralytic disorder, he nevertheless continued to paint with his left. He died in the year 1717.

JOY, that affection of the mind consequent on being put in possession of what we have desired. For the effects of joy in the animal œconomy, see (the *Index* subjoined to) **MEDICINE**.

IPEACUANHA, in the materia medica, a West-Indian root, of which there are two kinds, distinguished by their colour, and brought from different places; but both possessing the same virtues, tho' in a different degree. The one is grey, and brought from Peru; the other is brown, and is brought from the Brasils; and these are indiscriminately sent into Europe under the general name of *ipeacuanha*.

These two sorts have been by some supposed to be the roots of two different plants: but this is a mistake; the only difference is, that one grows in a different place, and in a richer and moister soil, and is better

supplied with juices than the other.

Ipeacuanha is an excellent, mild, and safe emetic; it is also a noble restringent; and, given in doses too small to vomit, is the greatest of all remedies for a dysentery. Small doses are also an excellent remedy in diarrhoeas of a more simple kind; and in the fluxus albus we hardly know a better medicine.

IPICRATES, general of the Athenians, had that command conferred upon him at 20 years of age, and became famous for the exactness of his military discipline. He made war on the Thracians; restored Scythia, who was an ally of the Athenians; attacked the Lacedæmonians; and, on many other occasions, gave signal proofs of his conduct and courage. Many ingenious repartees have been mentioned of this general: a man of good family with no other merit than his nobility, reproaching him one day for the meanness of his birth, he replied, "I shall be the first of my race, and thou the last of thine." He died 380 B. C.

IPOMEA, *QUAMOILIT*, or *Scarlet Convolvulus*; a genus of the monogynia order, belonging to the pentandria class of plants. There are several species; but not more than one, (the coccinea), cultivated in our gardens. This hath long, slender, twining stalks, rising upon support six or seven feet high. The leaves are heart-shaped, pointed, and angulated at the base, and from the sides of the stalks and branches arise many slender footstalks; each supporting several large and beautiful funnel-shaped and scarlet flowers. There is a variety with orange-coloured flowers. Both of them are annual, rising from seed in spring, flowering in July and August, ripening their seeds in September and October, and totally perishing in a short time after. They are tender, and must be brought up in a hot-bed till the latter end of May or beginning of June, when they may be planted out to adorn the borders, or some may be planted in pots to move occasionally to adorn any particular place; but in either case, there must be sticks for them to twine upon.

IPSWICH, the capital of the county of Suffolk in England, seated in E. Long. 1. 6. N. Lat. 52. 12. The name comes from the Saxon *Gyfeþwick*, that is, a town situated upon the Gyppen, now called *Orwell*. It had once 21 churches, but now has only 12. It was plundered by the Danes in 991, and afterwards besieged by king Stephen. It had charters and a mint in the reign of king John, but its last charter was from Charles II. The remains of a wall and six or seven religious houses are still to be seen. Though it is not in so flourishing a state as formerly when the harbour was more commodious, yet it is still a large well-built town. Besides the churches already mentioned, it has several meeting-houses, two chapels, a town-hall, council-chamber, a large market-place with a cross in the middle of it, a shire-hall for the county-sessions, a library, several hospitals, a free-school, a handsome stone bridge over the river, stately shambles in the market-place built by cardinal Wolsey, who was a native of the town and a butcher's son, and who also began to build a college here on the ruins of a small college of black canons, which still bears his name, though it was never finished. Here are also several alms-houses, three charity-schools, and a convenient key and custom-house. By virtue of Charles II.'s charter,

Ipſwich,
Ireland.

charter, the town is governed by two bailiffs, a recorder, 12 portmen, of whom the bailiffs are two, a town-clerk, two coroners, and 24 common-council. The bailiffs and 24 of the portmen are justices of the peace. The town enjoys a great many privileges, as paſſing fines and recoveries, trying criminal, and even crown and capital cauſes among themſelves, ſettling the aſſize of bread, wine, and beer. No freeman is obliged to ſerve on juries out of the town, or bear any office for the king, except that of the ſheriff, or to pay tolls or duties in any other part of the kingdom. They have an admiralty juriſdiction beyond Harwich on the Eſſex coaſt, and on both ſides the Suffolk coaſt, by which they are intitled to all goods caſt on ſhore. The bailiffs even hold an admiralty-court beyond Landguard fort. By a trial in king Edward III.'s time, it appears that the town had a right to the cuſtom-duties for all goods coming into Harwich-haven. They claim a right alſo to all waives and ſtrays, &c. The manufactures of the town are chiefly woollen and linen cloth. It has ſtill a conſiderable foreign trade. The tide riſes pretty high, and brings great ſhips within a ſmall diſtance of the town. They export a great deal of corn to London, and ſometimes to Holland. Formerly, they had a great trade in ſhip-building; but that having declined, they now ſend great quantities of timber to the king's yard at Chatham. It has ſeveral great fair for cattle, cheeſe, and butter; and is admirably ſituated for the trade to Greenland, becauſe the ſame wind that carries them out of the river will carry them to Greenland. It is worth remarking, that it is one of the beſt places in England for perſons in narrow circumſtances, houſe-rent being eaſy, provisions cheap and plentiful, the paſſage by land or water to London, &c. convenient, and the company of the place good. It gives title of viſcount, as well as Thetford, to the duke of Grafton.

IRELAND, one of the Britanniſh iſlands, ſituated between the 5th and 10th degrees of weſt longitude, and between the 51ſt and 56th of north latitude, extending in length about 300 miles, and about 150 in breadth.

The ancient hiſtory of this iſland is involved in ſo much obſcurity, that it has been the object of contention among the antiquarians for upwards of a century and an half. The Irifh hiſtorians pretend to very great antiquity. According to them, the iſland was firſt inhabited about 322 years after the flood. At that time Partholanus the ſon of Scara landed in Munſter on the 14th of May with 1000 ſoldiers, and ſome women, from Greece. This voyage he had undertaken on account of his having killed his father and mother in his native country. The ſame hiſtorians inform us, that a great number of lakes broke out in Ireland during the reign of Partholanus, which had no exiſtence when he came into the iſland, with many other particulars not worth mentioning; but the moſt ſurpriſing circumſtance is, that about 300 years after the arrival of this Grecian colony, all of them periſhed by a plague, not a ſingle perſon remaining to tell the fate of the reſt; in which caſe, it is wonderful how the catastrophe ſhould have been known.

After the extinction of this firſt colony, Ireland remained a perfect wilderneſs for 30 years; when ſno-

ther colony arrived from the eaſt, under the direction of one Nemedius. He ſet fail from the Euxine ſea with 30 tranſports, each manned with 40 heroes; and at laſt arrived on the coaſts of Ireland, after a very tedious and ſtrange navigation. During his reign alſo many lakes were formed in the country, which had no exiſtence before; the moſt material circumſtance, however, was an unſucceſſful war in which he was engaged with ſome African pirates, who in the end enſlaved his people. The victors proved ſuch inſupportable tyrants, that the Irifh found themſelves under a neceſſity of quitting the iſland altogether. They embarked on board a fleet of 1130 ſhips, under the command of three grandſons of Nemedius, viz. Simon Breac, To Chath, and Briatan Maol. The firſt returned to Greece, the ſecond failed to the northern parts of Europe, and the third landed in the north of Scotland, and from him the iſland of Britain is ſaid to have taken its name, and the Welch their origin.

About 216 years after the death of Nemedius, the descendants of Simon Breac returned from Greece into Ireland. They were conducted by five princes of great reputation, who divided the iſland into five kingdoms, nearly equal in ſize. Theſe kingdoms were called *Munſter, Leinſter, Connaught, Meath, and Ulſter*; and the ſubjects of theſe kings are called by the Irifh hiſtorians, *Firbolgs*.

The Firbolgs were in proceſs of time expelled or totally ſubdued, after the loſs of 100,000 men in one battle, by the *Tuath de Dannans*, a nation of necromancers who came from Attica, Bæotia, and Achaia, into Denmark; from Denmark to Scotland; and from Scotland to Ireland. Theſe necromancers were ſo completely ſkilled in their art, that they could even reſtore the dead to life, and bring again into the field thoſe warriors who had been ſlain the day before. They had alſo ſome curioſities which poſſeſſed a wonderful virtue. Theſe were a ſword, a ſpear, a cauldron, and a marble chair; on which laſt were crowned firſt the kings of Ireland, and afterwards thoſe of Scotland. But neither the powerful virtues of theſe Daniſh curioſities, nor the more powerful ſpells of the magic art, were able to preſerve the *Tuath de Dannans* from being ſubdued by the Gadelians when they invaded Ireland.

The Gadelians were defended from one Gathelus, from whom they derived their name. He was a man of great conſequence in Egypt, and intimately acquainted with Moſes the Jewiſh legiſlator. His mother was ſcota, the daughter of Pharaoh, by Nihil the ſon of a Scythian monarch cotemporary with Nimrod. The Gadelians, called alſo *Scots*, from ſcota above-mentioned, conquered Ireland about 1300 B. C. under Heber and Heremon, two ſons of Mileſius king of Spain, from whom were defended all the kings of Ireland down to the Engliſh conqueſt, and who are therefore ſtyled by the Irifh hiſtorians, princes of the *Mileſian race*.

From this period the Irifh hiſtorians trace a gradual refinement of their countrymen from a ſtate of the groſſeſt barbarity, until a monarch, named *Ollam Fodla*, eſtabliſhed a regular form of government, erected a grand ſeminary of learning, and inſtituted the *Fer*, or triennial convention of provincial kings, prieſts, and poets, at Feamora or Tara in Meath, for the eſta-
ment

hiſtorians.

Ireland.

ment of laws and regulation of government. But whatever were the institutions of this monarchy, it is acknowledged that they proved insufficient to withstand the wildness and disorder of the times. To Kimbath, one of his successors, the annalists give the honour of reviving them, besides that of regulating Ulster, his family-province, and adorning it with a stately palace at Eamannia near Armagh. His immediate successor, called *Hugony*, is still more celebrated for advancing the work of reformation. It seems, that, from the earliest origin of the Irish nation, the island had been divided into the five provincial kingdoms above-mentioned, and four of these had been subject to the fifth, who was nominal monarch of the whole island. These four, however, proved such obnoxious disturbers of the peace, that Hugony, to break their power, parcelled out the country into 25 dynasties, binding them by oath to accept no other monarch but one of his own family. This precaution proved ineffectual. Hugony himself died a violent death, and all his successors for a series of ages were assassinated, scarcely with one exception.

About 100 B. C. the pentarchal government was restored, and is said to have been succeeded by a considerable revolution in politics. The Irish bards had for many ages dispensed the laws, and the whole nation submitted to their decisions; but as their laws were exceedingly obscure, and could be interpreted only by themselves, they took occasion from thence to oppress the people, until at last they were in danger of being totally exterminated by a general insurrection. In this emergency they fled to Convochar-Mac-Nessa, the reigning monarch, who promised them his protection in case they reformed; but at the same time, in order to quiet the just complaints of his people, he employed the most eminent among them to compile an intelligible, equitable, and distinct, body of laws, which were received with the greatest joy, and dignified with the name of *celestial decisions*. These decisions seem to have produced but very little reformation among the people in general. We are now presented with a new series of barbarities, murders, factions, and anarchy; and in this disordered situation of affairs it was, according to the Irish historians, that the chieftain mentioned by Tacitus addressed himself to Agricola, and encouraged him to make a descent on Ireland. This scheme happened not to suit the views of the Roman general at that time, and therefore was not adopted; and so confident are these historians of the strength of their country even in its then distracted state, that they treat the notion of its being subdued by a Roman legion and some auxiliaries (the force proposed to Agricola), as utterly extravagant; acquainting us at the same time, that the Irish were so far from dreading a Roman invasion, that they failed to the assistance of the Picts, and having made a successful incursion into South Britain, returned home with a considerable booty.

In the same state of barbarity and confusion the kingdom of Ireland continued till the introduction of Christianity by St Patrick, about the middle of the fifth century. This missionary, according to the adversaries of the Irish antiquity, first introduced letters into Ireland, and thus laid the foundations of a future civilization. On the other hand, the advocates for that

antiquity maintain, that the Irish had the knowledge of letters, and had made considerable progress in the arts, before the time of St Patrick; tho' they allow, that he introduced the Roman character, in which his copies of the Scripture and liturgies were written. To enter into this dispute would be contrary to our plan. It is sufficient to observe, that, excepting by some of the Irish themselves, the history already given is generally reckoned entirely fabulous, and thought to have been invented after the introduction of Christianity. An origin of the Irish nation hath been found out much nearer than Asia, Greece, or Egypt; namely, the island of Britain, from whence it is now thought that Ireland was first peopled. A dispute hath arisen concerning the place from whence the first emigrants from Britain set sail for Ireland. The honour of being the mother-country of the Irish hath been disputed between the North and South Britons. Mr Macpherson has argued strenuously for the former, and Mr Whitaker for the latter. For an account of their dispute, however, we must refer to the works of these gentlemen. Mr Whitaker claims the victory, and challenges to himself the honour of being the first who clearly and truly demonstrated the origin of the Irish.

The name of Ireland, according to Mr Whitaker, is obviously derived from the word *Jar*, or *Eir*, which in the Celtic language signifies "well." This word was sometimes pronounced *Iver*, and *Hiver*; whence the names of *Iris*, *Ierna*, *Juerna*, *Iverna*, *Hibernia*, and *Ireland*; by all of which it hath at some time or other been known.

About 350 B. C. according to the same author, the Belgæ crossed the channel, invaded Britain, and seized the whole extended line of the southern coast, from Kent to Devonshire. Numbers of the former inhabitants, who had gradually retired before the enemy, were obliged at last to take shipping on the western coast of England, and passed over into the uninhabited isle of Ireland. These were afterwards joined by another body of Britons driven out by the Belgæ under Divitiacus, about 100 B. C. For two centuries and a half afterwards, these colonies were continually reinforced with fresh swarms from Britain; as the populousness of this island, and the vicinity of that invited them to settle in the one, or the bloody and successive wars in Britain during this period naturally induced them to relinquish the other: and the whole circuit of Ireland appears to have been completely peopled about 150 years after Christ; and as the inhabitants had all fled equally from the dominion of the Belgæ, or for some other cause left their native country, they were distinguished among the Britons by one general and very apposite name, viz. that of *Scuitæ*, or *Scots*, "the wanderers, or refugees."

Mr Whitaker also informs us, "that in the times of the Romans Ireland was inhabited by 18 tribes; of one upon the northern and three on the southern shore; seven upon the western, six on the eastern, and one in the centre.

"Along the eastern coast, and the Vergivian or internal ocean, were ranged the Damnii, the Voluntii, and the Eblani, the Cascii, the Menapii, and the Coriandii. The first inhabited a part of the two counties of Antrim and Down, extending from Fair-head, the most north-easterly extremity of the island, to Slannum

Early history of Ireland by Mr Whitaker.

Names and situation of the tribes by which it was inhabited.

" Upon the southern shore and along the verge of the Cantabrian ocean, lay the Brigantes, the Vodiae, and the Ibernii. The first owned the rest of Wexford and all Waterford: extending to the Blackwater, Aven-More, or Dabrona, on the south-west; having the great mouth of the Barrow within their territories, and Brigantia, Waterford, or some town near it, for their first city; and giving name of *Brigas* to the Suir or Swire, their liminary stream on the north, and the appellation of *Bergie* to their own part of the county of Wexford. The Vodiae possessed the shire of Corke from the Blackwater to the Ban, the river of Kinsale, and the Dobona or Dubana of the ancients; and affixed the name of *Vodium Promontorium* to the point of Balcotton island. And the Ibernii inhabited the remainder of Corke, and all that part of Kerry which lies to the south-east of Dingle-found; having Rufina or Ibaune for their capital, the Promontorium Austrinum or Misen-Head about the middle of their dominions, and the river Ibernus or Dingle-found for their northern barrier; and leaving their names to the three divisions of Ibaune, Beare, and Iveragh.

" Upon the western shore of the island and along the Great Britannie or Atlantic ocean, were the Lucanii or Lucenii, the Velaborii, the Cangani, the Auterii, the Nagnatae, the Hardinii, and Venicnii. The Lucenii inhabited the peninsula of land that lies along the river Ibernus or Dingle-found, and perhaps some adjoining parts of Kerry. The Velaborii ranged along the small remainder of the latter, and over the whole of Limerick to the Senus or Shannon; having the Durus or Casheen flowing through their dominions, and Regia, Limeric, or some town near it, for their metropolis. And the latter was probably that city near Limerick, the site of which is still famous, and retains the appellation of *Cathair*, or the fortrefs; and where

the remains of streets, and other marks of a town, may yet be traced. The Cangani lived in the county of Clare: Macolicum near the Shannon, perhaps Feakle or Melic, being their principal town; a headland in the Bay of Galway, near Glaniny, being denominated *Benifannum Promontorium*; and the adjoining isles of Arran, called *Insula Cangane*. The Auterii were settled in the county of Galway; winding along the deep reefs of the Sinus Auloba or Bay of Galway; stretching towards the north as far the Libnius, or the river that bounds the shire in that part; and possessing the small portion of Mayo, which lies to the south of it. And these were subject to Auterium, anciently Aterith, and now Athenree; and have left their name to the division of Athenree. The Nagnatae occupied the rest of the large county of Mayo, all Sligo and all Roscommon, all Letrim as far as Lough Allin on the south-east, and all Fermanagh to Ballyshannon and Lough Erne; being bounded by the Rhebius or river of Ballyshannon, and the Lake Rhebius or Lough Erne; having a deep bay, called *Magnus Sinus*, that curves along Mayo, Sligo, and Letrim counties; and acknowledging Nagnat, Necmaht, or Alnecmaht, the town of the Nagnatae, for their capital. And the Hardinii and Venicnii were confederated together under the title of the *Venicnian Nations*, extended from Ballyshannon to the North-Cape, and possessed all Donnegalle, except the two whole divisions of Raphoe and Enis-Owen, and the eastern part of Killmacrenn. The Venicni lay along the immediate margin of the shore, giving name to the Promontorium Venicnium or Cape Horn, and to the Insula Venicnia or North-Arran Island. And their metropolis Rheba was seated upon the lake Rhebius, and in the country of the Hardinii on the south-east.

" Upon the northern shore and along the margin of the Deucalædonian ocean, were only the Robogdii; inhabiting the rest of Donnegalle, all Derry, and all Antrim to the Fair-Head, and the Damni; and giving their own name to the former and the division of Raphoe. And they had the rivers Vidua or Shipharbour, Argita or Lough Swilly, Darabouna or Lough Foile, and Banna or Ban, in their territories; and acknowledged Robogdium, Robogh, or Raphoe, for their chief city.

" The central regions of the island, all Tyrone, the remainder of Fermanagh and Letrim, all Monaghan, and the rest of Ardmagh; all Cavan, all Longford, and all West-Meath; all the King's and Queen's county, all Kilkenny, and all Tipperary; were planted by the Scoti. The Shannon, Lough Allin, and Lough Erne, were their great boundaries on the west; the Barrow, Boyne, and Lough Neagh, on the east; the Swire and Blackwater on the south; and a chain of mountains on the north. And the two greatest of their towns were Rheba, a city seated, like the Rheba of the Venicnians, upon the lake and river Rhebius, but on a different part of them, and somewhere in the north of Cavan; and Ibernia, a town placed a little to the east of the Shannon, and somewhere in the county of Tipperary."

But whether we are to receive as truth the accounts given by Mr Whitaker, those of the Irish annalists, or any other, it is certain, that, till little more than a century ago, Ireland was a scene of confusion and

saughter

Ireland.

slaughter. The Irish historians acknowledge this, as we have already seen. Very few of their monarchs escaped a violent death. The histories of their kings indeed amount to no more than this, viz. that they began to reign in such a year, reigned a certain number of years, and were slain in battle by the valiant prince who succeeded to the throne. The introduction of Christianity seems to have mended the matter very little, or rather not at all. The same wars between the chiefs continued; and the same murders and treacheries took place among the inhabitants, till they were invaded by the Danes or Normans, about the end of the eighth century. At this time, we are told, that the monarchical power was weak, by reason of the factious and assuming disposition of the inferior dynasties; but that the evils of the political constitution had considerably subsided by the respect paid to religion and learning. The first invasions of the Danes were made in small parties for the sake of plunder, and were repelled by the chieftain whose dominions were invaded. Other parties appeared in different parts of the island, and terrified the inhabitants by the havoc they committed. These were in like manner put to flight, but never failed to return in a short time; and in this manner was Ireland harried for the space of 20 years, before the inhabitants thought of putting an end to their intestine contests, and uniting against the common enemy. The northern pirates, either by force or treaty, gradually obtained some small settlements on the island; till at length Turges, or Turgeus, a warlike Norwegian, landed with a powerful armament in the year 815. He divided his fleet and army, in order to strike terror in different quarters. His followers plundered, burned, and massacred, without mercy, and persecuted the clergy in a dreadful manner on account of their religion. The Danes already settled in Ireland, flocked to the standard of Turgeus, who thus was enabled to seat himself in Armagh, from which he expelled the clergy, and seized their lands. The Irish, in the mean time, were infatuated by their private quarrels; till at last, after some ill-conducted and unsuccessful efforts, they sunk into a state of abject submission, and Turgeus was proclaimed monarch of the whole island, in 845.

The new king proved such a tyrant, that he soon became intolerable. A conspiracy was formed against him; and he was seized by Melachline prince of Meath, in a time of apparent peace. An universal insurrection ensued; the Danes were massacred or dispersed; their leader condemned to death for his cruelties, and drowned in a lake. The foreigners, however, were not exterminated, but the remains of them were allowed to continue on the island as subjects or tributaries to some particular chieftains. A new colony soon arrived, but under pretence of peaceable intentions, and a design of enriching the country by commerce. The Irish, through an insatiable policy, suffered them to become masters of Dublin, Limerick, Waterford, and other maritime places, which they enlarged and fortified with such works as had till then been unknown in Ireland. The Danes did not fail to make use of every opportunity of enlarging their territories, and new wars quickly ensued. The Irish were sometimes victorious, and sometimes not; but were never able to drive out their enemies, so that they continued

to be a very distinguished and powerful *sept*, or tribe, in Ireland. The wars with the Danes were no sooner at an end, than the natives, as usual, turned their arms against each other. The country was harassed by the competitions of the chiefs; laws and religion lost their influence, and the most horrid licentiousness and immorality prevailed. Thus the whole island seemed ready to become a prey to the first invader, when an attempt was made upon it by Magnus king of Norway. This attempt miscarried, through his own rashness; for, having landed without opposition, he advanced into the country without the least apprehension. The consequence of this was, that he was surrounded and cut in pieces with all his followers. His death, however, proved of little benefit to Ireland; the same disorders which had gradually reduced the kingdom to a state of extreme weakness, still continued to operate, and to facilitate the success of the English invasion, which happened in the reign of Henry II.

The first motives which induced this monarch to think of an expedition against Ireland are not well known. It was supposed that he had been provoked by some assistance which the Irish princes had given to the French; but, whatever might be in this, it is certain that the design was conceived soon after he ascended the throne; and his flatterers soon furnished him with sufficient reasons for considering the Irish as his subjects. It was affirmed, that they had originally possessed themselves of their country by permission of Gurguntius a British king; and that, as descendants of the Britons, they were the natural and rightful subjects of the English monarch. It was also suggested, that the renowned king Arthur, Egred the Northumbrian prince, and Edgar one of the Saxon kings of England, had all led their armies into Ireland, and there made valuable acquisitions, which their successor was in honour bound to recover and maintain. All these suggestions, however, or whatever else had occurred to himself, seemed yet insufficient to Henry; and therefore he took the most effectual method to ensure his reputation, namely, by an application to the pope. To him he represented, that the inhabitants of Ireland were sunk into the most wretched state of corruption, both with regard to morals and religion; that Henry, zealous for the honour and enlargement of God's kingdom, had conceived the pious design of erecting it in this unhappy country; was ready to devote himself and all his powers to this meritorious service; implored the benediction of the pontiff; and requested his permission and authority to enter Ireland, to reduce the disobedient and corrupt, to eradicate all sin and wickedness, to instruct the ignorant, and spread the blessed influence of the gospel in all its purity and perfection; promising at the same time to pay a yearly tribute to St Peter from the land thus to be reduced to his obedience, and to the holy see. Adrian, the reigning pope, rejoiced at this application which tended so much to the advancement of his own power. A bull was therefore immediately formed, conformable to the most sanguine wishes of Henry, which was sent to England without delay, together with a ring, the token of his investiture as rightful sovereign of Ireland. But whatever inclination the king of England or the pope might at this time (A. D. 1156) have

7
State of
Ireland at
that time.

for the subjection of Ireland, the situation of the English affairs obliged him to defer it for some time.

The state of Ireland, as we have already observed, was at this time extremely favourable for an invasion. The monarch enjoyed little more than a titular dignity, being harassed by a faction, and opposed by powerful rivals. A number of chieftains who assumed the title and rights of royalty, paid a precarious tribute to their superior, and united, if they were disposed to unite, with him, rather as his allies than his subjects. In Ulster, the family of the northern *Hi Nial*, as it was called, exercised an hereditary jurisdiction over the counties now called *Tirone*, *Derry*, and *Donnegal*. They also claimed a right of supremacy over the lords of Fermanagh, Antrim, and Arglai, which included the counties of Armagh, Monaghan, Louth, and some adjacent districts: while Dunleve, prince of Uldagh (now Down), disputed the superiority of this family, and affected an independent state. In Munster, reigned the descendants of Brien, a famous sovereign of former times, impatient to recover the honours of their family; but at last, being confined by powerful rivals to the territory of North Munster, they were obliged to leave the family of Mac Arthy sovereigns of Desmond, the southern division. In Connaught, the princes known by the name of *O'Connor*, were acknowledged sovereigns of the eastern territory. Tiernan O'Ruarc, an active and restless military chief, had the supremacy in Breffney, containing the modern county of Leitrim, and some adjacent districts. Meath, or the southern *Hi-Nial*, was subject to the family of Clan-Colman, Murchard O'Malachlyn, and his successors. Leinster, divided into several principalities, was subject to Dermot, a fierce, haughty, and oppressive tyrant. His father had governed with great cruelty. Seventeen of his vassal lords had been either put to death, or had their eyes put out, by his order in one year; and Dermot seemed to inherit too great a portion of the same temper. His stature and bodily strength made him admired by the inferior orders of his subjects, and these he was careful to protect and favour. His donations and endowments of religious houses recommended him to the clergy; but his tributary chieftains felt the weight of his pride and tyranny, and to them his government was extremely odious.

The chief competitors for the rank of monarch of Ireland, in the mean time, were, the heirs of the two houses of O'Connor, and the northern *Hi-Nial*. Torlogh O'Connor was in possession; but he was not generally recognised, and was opposed by his rival O'Lochlan: notwithstanding which, he maintained his dignity with magnificence and vigour, till a decisive victory gained by him over O'Brien raised O'Lochlan's jealousy so much, that he obliged him, in a convention of the states, to allow him the sovereignty of the northern division. In consequence of this partition, it was resolved to transfer the territory of O'Ruarc to a person more inclined to the interests of the two sovereigns. An expedition was accordingly undertaken; O'Ruarc was surprised, defeated, and driven from his dominions. Dermot, who had conceived an unlawful passion for Dervorgah, the wife of O'Ruarc, took the opportunity of her husband's distresses, to carry her off in triumph. O'Ruarc conceived the most implacable re-

Ireland.

sentment against Dermot; and therefore applying himself to Torlogh, promised an inviolable attachment to his interest; and prevailed on him not only to re-instate him in his possessions, but to revenge the insult offered by Dermot, and to restore his wife. By means of such a powerful ally, O'Ruarc found frequent opportunities of harassing his antagonist till the death of Torlogh, which happened in 1156, upon which O'Lochlan succeeded to the sovereignty. Dermot was the first to acknowledge the authority of this new sovereign, by whose means he hoped to be able to revenge himself on O'Ruarc. He soon found, however, that he had acted too precipitately. His patron, having treacherously seized and put out the eyes of Dunleve prince of Down, the neighbouring chieftains took arms, in order to secure themselves from his barbarity. O'Lochlan was defeated and killed; upon which the monarchy devolved on Roderic the son of the late Torlogh O'Connor.

The new prince had acquired the reputation of valour, and was determined to establish this reputation by some remarkable exploit in the beginning of his reign. Having therefore engaged in his service the Ostmen, or descendants of the Danes, he marched against Dermot as the chief partizan of his fallen rival. The king of Leinster was seized with the utmost consternation; and in despair set fire to his own town of Ferns, lest the enemy should have the satisfaction of spoiling it. Roderic still advanced, attended by O'Ruarc, Dermot's implacable enemy, and soon over-ran the whole province. All the inferior lords at once acknowledged Roderic's authority. Dermot was deposed, as a man utterly unworthy of his station; another of his family was raised to the throne; and the unfortunate prince, finding it impossible to stay with safety in Ireland, embarked with 60 of his followers for England, and soon arrived at the port of Bristol, with a design to solicit assistance from king Henry.

8
Dermot,
an exiled
prince, so-
licits assis-
tance from
Henry II.

In England, Dermot's character was unknown, and he was regarded as an injured prince driven from his throne by an iniquitous confederacy. The clergy received him as the benefactor of their order, and entertained him in the monastery of Angustines with great hospitality. Having learned that Henry was then in Aquitaine, he immediately went thither, and in a very abject manner implored his assistance, promising to acknowledge him as his liege lord, and to hold his dominions, which he was thus confident of regaining, in vassalage to Henry and his heirs.

Though nothing could be more flattering to the ambition of the king of England than this servile address, yet the situation of his own affairs rendered it impossible for him at that time to reap from it any of the advantages with which it flattered him. He therefore dismissed the Irish prince with large presents, and a letter of credence addressed to all his subjects; notifying his grace and protection granted to the king of Leinster; and declaring, that whosoever within his dominions should be disposed to aid the unfortunate prince in the recovery of his kingdom, might be assured of his free licence and royal favour.

Dermot returned to England highly pleased with the reception he had met with; but notwithstanding the king's letter, none of the English seemed to be disposed to try their fortunes in Ireland. A month

land.

elapsed without any prospect of success, so that Dermot began to despair. At last, however, he persuaded, with great promises, Richard Earl of Chepstow, or, as it was formerly called, *Strigul*; a nobleman of considerable influence in Wales, but of broken fortune, to assist him with a considerable force to be transported next spring into Ireland. Overjoyed at this first instance of success, he advanced into South Wales, where, by the influence of the bishop of St David's, he procured many other friends. Robert Fitz-Stephen, a brave and experienced officer, covenanted with him to engage in his service with all his followers, and Maurice Fitz-Gerald his maternal brother; while Dermot, on his part, promised to cede to the two principal leaders, Fitz-Stephen and Fitz-Gerald, the entire dominion of the town of Wexford, with a large adjoining territory, as soon as, by their assistance, he should be reinstated in his rights.

The Irish prince having now accomplished his purpose, set sail for Ireland in the winter of 1169, and recovered a small part of his dominions even before the arrival of his new allies; but being attacked with a superior force by his old enemies Roderic and O'Ruarc, he found himself obliged to feign submission till the English allies came to his assistance. The expected succours arrived in the month of May 1170, in a creek called the *Bann*, near the city of Wexford. Robert Fitz-Stephen commanded 30 knights, 60 men in armour, and 300 archers. With these came Harvey of Mountmorres, nephew to earl Richard. He had no military force along with him; but came solely with a view of discovering the nature of the country, and reporting it to his uncle. Maurice of Pendergast commanded 10 knights and 200 archers: and thus the English force which was to contend with the whole strength of Ireland, amounted to no more than 600 men.

10
Their suc-
cess.

Trusting as this assistance may seem, it nevertheless changed the face of affairs almost instantaneously. Numbers of Dermot's subjects, who had abandoned him in his distress, now flocked to his standard. Wexford was immediately attacked, and surrendered in a few days; Fitz-Stephen and Fitz-Gerald were jointly invested with the lordship of this city and its domain; and Harvey of Mountmorres was declared lord of two considerable districts on the coast. After three or four weeks spent in feasting and rejoicing, a new expedition was undertaken against the prince of Ossory, (a district of Leinster), who had not only revolted from Dermot, but put out the eyes of one of his sons, and that with such cruelty, that the unhappy youth expired under the operation. The allied army was now increased to 3000 men, who were opposed by the prince of Ossory at the head of 5000, strongly entrenched among woods and morasses. By the superior conduct of the English troops, however, the Irish were decoyed from their advantageous situation, and thus were entirely defeated. The English were for keeping the field till they had totally reduced their enemies: but Dermot, accustomed only to ravage and plunder, contented himself with destroying the country; and a sudden reverse of fortune seemed ready to take place. The prince of Ossory, though defeated, still appeared in arms, and only waited for an opportunity of again opposing the enemy in the field.

Maurice Pendergast also joined him with his whole troop, being provoked by Dermot, who had refused him leave to return to Wales. This defection, however, was in part supplied by the arrival of Fitz-Gerald with 10 knights, 30 horsemen, and 100 archers. Pendergast in a short time repented of his new alliance, and retired into Wales; so that the prince was obliged to make his submission to Dermot, which the latter with some reluctance accepted.

In the mean time, Roderic having settled all his other affairs, advanced against the allies with a powerful army. Dermot was thrown into despair; but, encouraged by Fitz-Stephen, he encamped in a very strong situation, where he was soon besieged by Roderic. The latter, however, dreading the valor of the English, condescended to treat, first with them, and then with Dermot, in order to detach them from the interests of each other: but as this proceeded evidently from fear, his offers were rejected by both parties; upon which he began to prepare for battle: but at the very time when the engagement should have commenced, either through the suggestions of his clergy, or of his own fears, Roderic entered into a new negotiation; which at last terminated in a peace. The terms were, that Dermot should acknowledge the supremacy of Roderic, and pay him such service as the monarchs of Ireland had usually received from inferior princes; and as a security for his faithful performance of this article, he delivered up his favourite son as an hostage to Roderic: but in order to establish this accommodation on the firmest basis, the latter obliged himself to give his daughter in marriage to the young prince as soon as Leinster should be reduced, and the peace of the island effectually restored. By a secret article, Dermot engaged to dismiss the British forces immediately after the settlement of his own province, and in the mean time not to bring over any further reinforcements from England.

11
Peace con-
cluded.

Thus ended the first British expedition into Ireland; the consequences of which were so little dreaded at that time by the natives, that their historians, though they dwell upon the provincial wars and contests in other parts of the island, speak of the settlement of the Welshmen in Leinster with a careless indifference. But though the settlement of this colony seemed very little alarming to the generality, it could not escape the observation of discerning persons, that a man of Dermot's character would not long keep his treaties; and that on the first emergency he would have recourse to his former allies, who thus would establish themselves more and more, till at last they would reduce the country entirely under their subjection. These reflections, if any such were then made, were in a short time verified. Dermot was scarce settled in his own dominions, when he began to aspire at the sovereignty, and form schemes for dethroning Roderic. He applied to Fitz-Stephen and Fitz-Gerald; by whom he was again directed to apply to Richard earl of Chepstow, more commonly known by the name of *Strongbow*, on account of his feats of archery. Richard was very much inclined to accept of his invitation; but thought it incumbent upon him first to obtain the consent of king Henry. The king, however, did not incline that his subjects should make conquests for themselves in any other country, and therefore

12.
New machinations
of Dermot.

Ireland. therefore dismissed Richard with an equivocal answer; but the latter being willing to understand his sovereign's words in the most favourable sense, immediately set about the necessary preparations for his expedition. In May 1711, Raymond le Gros, Richard's domestic friend, and the near relation of Fitz-Stephen and Fitz-Gerald, landed at a place called *Donnally*, near Waterford, with 10 knights and 70 archers; and along with them came Hervey of Mountmorres, attended by a small train. The English immediately intrenched themselves, and erected a temporary fort for themselves: which proved a very necessary precaution; for the natives, justly attributing this new debarkation to the practices of Dermot, instantly formed a tumultuous army, and marched to expel the invaders. The English prepared to meet them; but when they perceived the great superiority of the enemy, they thought proper to retire to their fort. Here, however, they must have been totally cut off, had they not luckily collected a numerous herd of cattle from the neighbouring country for their subsistence. These they drove with fury among the Irish, who were thus put into the utmost confusion. The invaders seized the favourable moment; and, falling upon their disordered enemies, put them to flight, and drove great numbers of them into the sea, where they perished. Seventy prisoners were taken, all of them principal citizens of Waterford; who, though they offered large sums for their ransom, and even that the city should be delivered up to the English, were all barbarously put to death. This success and cruelty so intimidated the Irish, that they suffered these merciless invaders to maintain their station unmolested, and wait for the arrival of their associates.

Richard in the mean time having assembled his vassals, led them through Wales, where he was joined by great numbers of other adventurers; but, when just on the point of embarking, was surprised by a positive command from the king, to desist from his intended enterprise, on pain of forfeiture of his lands and honours. He was now, however, too much interested in his scheme to retract; and therefore pretended to disbelieve the authenticity of the royal mandate. On the eve of the feast of St. Bartholomew, he landed at Waterford with 200 knights and 1200 infantry, all chosen and well appointed soldiers. They were immediately joined by Raymond and his troop; and the very next day it was resolved to make an attempt upon Waterford. The city was taken by storm, and a dreadful massacre ensued; to which the cruel Dermot had the merit of putting an end. The marriage of Richard with Eva, the daughter of Dermot, was solemnized without delay, and a scene of joy and festivity succeeded the calamities of war.

A new expedition was now undertaken against Dublin; the inhabitants of which had either manifested some recent disaffection to Dermot, or had never been thoroughly forgiven for their old defection. Roderic advanced against the allied army with a formidable body, consisting, as is said, of 30,000 men; but, fearing to come to a general engagement, he contented himself with some slight skirmishes; after which, great part of his vassals forced him to dismiss them, and Dublin was left to its fate. The inhabitants were treated very severely; how-

ever, a considerable body of them, with Heculph, their governor, had the good fortune to gain some vessels lying in the harbour, and made their escape to the northern islands. Earl Richard was now invested with the lordship of Dublin; and appointed Milo de Cogan, a brave English knight, his governor; while he himself, in conjunction with the forces of Dermot, over-ran the country of Meath, committing every where the most horrid cruelties. Roderic, in the mean time, unable to oppose them in the field, sent deputies to Dermot, commanding him to retire, and putting him in mind that his son was in his hands, and must answer with his life for the breach of those treaties which his father made so little scruple to violate. Natural affection, however, had very little place in the breast of Dermot. He expressed the utmost indifference about his son; and, with the greatest arrogance, claimed the sovereignty of all Ireland: Roderic, provoked at this answer, cut off the young prince's head.

This piece of impotent cruelty served only to make the king odious to his own subjects, while Dermot and his English allies committed every where the greatest devastations, and threatened to subdue the whole island. This indeed they would probably have accomplished, had not the extraordinary success of Strongbow alarmed king Henry; who, fearing that he might render himself totally independent on the crown of Britain, issued his royal edict, strictly forbidding any English vessel from passing into Ireland with men, arms, or provisions; and commanding all his subjects at that time resident in Ireland, of whatever rank or degree, to return to their country before the ensuing feast of Easter, on pain of forfeiting their lands, and being declared traitors.

Our adventurers were plunged into the greatest distress by this peremptory edict. They now found themselves cut off from all supplies in the midst of their enraged enemies, and in danger of being forsaken by those who had attached themselves to them during their success. Raymond was dispatched with a most submissive message to the offended monarch; but before he received any favourable answer, every thing was thrown into confusion by the death of Becket*, so that the king had neither leisure nor inclination to attend to the affairs of Ireland. About the same time the death of Dermot their great ally seemed almost to give a finishing stroke to the English affairs.

An universal defection took place among their associates; and before they had time to concert any proper measures, Heculph, who had formerly escaped from Dublin, appeared before that city with a formidable body of troops armed after the Danish manner. A furious attack ensued; which at last ended in the defeat and captivity of Heculph, who was immediately put to death. This danger, however, was soon followed by one still greater. Roderic had formed a powerful confederacy with many of the Irish chieftains, and the kings of the northern isles, in order to extirpate the English totally from the island. The harbour of Dublin was blocked up by a fleet of 30 ships from the northern isles; while the confederated Irish took their stations in such a manner as to surround the city, and totally cut off all supplies of provisions. In two month's time the English were reduced to great straits.

Distress of the English.

Ireland.

straits. On the first alarm, Richard had sent for assistance to Fitzstephen; who having weakened his own force, in order to serve the earl, the people of Wexford had risen and besieged Fitzstephen in his fort called *Garrig* near that city. A messenger now arrived, informing Strongbow that his friend was in the utmost danger, and must fall into the hands of his enemies if not assisted within three days; upon which a council of war was called, in order to deliberate on the measures necessary to be pursued in this desperate emergency. It was soon resolved to enter into a treaty with Roderic upon any terms that were not totally servile or oppressive. Laurence prelate of Dublin was appointed to carry the terms; which were, that Richard proposed to acknowledge Roderic as his sovereign, and to hold the province of Leinster as his vassal, provided he would raise the siege. Laurence soon returned with an answer, probably of his own framing; namely, that Dublin, Waterford, Wexford, and all the forts possessed by the British, should be immediately given up; and that the earl and his associates, should depart with all their forces by a certain day, leaving every part of the island free from their usurpations, and absolutely renouncing all their pretended claims. On these conditions they were to be spared; but the least reluctance or delay would determine the besiegers to storm the city.

These terms, though they contained nothing insolent or unreasonable, considering the present situation of the English, were yet intolerable to our indigent adventurers. After some time spent in silence, Milo de Cogan, suddenly starting up, declared his resolution to die bravely rather than submit to the mercy of barbarians. The spirit of desperate valour was instantly caught by the whole assembly; and it was resolved to risk their whole fortune on one desperate effort, by sallying out against the enemy, and to make their attack upon that quarter where Roderic himself commanded. Accordingly, having persuaded a body of the townsmen to take part in this desperate enterprise, they marched out against their enemies, who expected nothing less than such a sudden attack. The besiegers were secure and careless, without discipline or order; in consequence of which, they were unable to sustain the furious assault of the English. A terrible slaughter ensued, and the Irish instantly fled in the greatest confusion; their monarch himself escaping only by mixing half naked with the crowd. The other chieftains who were not attacked caught the panic, and broke up their camps with precipitation; while the victors returned from the pursuit to plunder, and among other advantages gained as much provision as was sufficient to support them for a whole year.

Strongbow being thus relieved from his distresses, committed the government of Dublin to Milo de Cogan, while he proceeded immediately to Wexford in order to relieve Fitzstephen: but in this he was disappointed; for that brave officer, having often repulsed his enemies, was at last treacherously deceived into submission and laid in irons. Strongbow, however, continued to advance; and was again attacked by the Irish, whom he once more defeated. On his arrival at Wexford, he found it burnt to the ground; the enemy having retired with Fitzstephen and the rest of the prisoners to Holy Island, a small island in

the middle of the harbour, from whence they sent a deputation, threatening to put all the prisoners to death if the least attempt was made to molest them in their present situation. The earl then proceeded to Waterford, and from thence to Ferns; where he for some time exercised a regal authority, rewarding his friends and punishing his enemies. A more important object, however, soon engaged his attention. The king of England having settled his affairs as well as he could, now determined to conquer Ireland for himself. A summons was instantly dispatched to earl Richard, expressing the greatest resentment at his presumption and disobedience, and requiring his immediate presence in England. The earl found himself under a necessity of obeying; and having made the best dispositions the time would permit for the security of his Irish possessions, embarked for England, and met the king at Newham near Gloucester. Henry at first affected great displeasure; but soon allowed himself to be pacified by a surrender of the city of Dublin, and a large territory adjacent, together with all the maritime towns and forts acquired by Strongbow; while on his part he consented that the earl should have all his other possessions granted in perpetuity, to be held of the king and his heirs. The other adventurers made their peace in a similar manner; while the Irish chieftains, instead of uniting in the defence of their country, only thought how to make the most of the approaching invasion, or at least how to avert the threatened evils from their own particular districts. They saw the power of their own sovereign on the point of total dissolution; and they saw it with indifference, if not with an envious and malignant satisfaction. Some were even ready to prevent their invader, and to submit before he appeared on the coast. The men of Wexford, who had possessed themselves of Fitzstephen, resolved to avert the consequences of their late perfidy and cruelty, by the forwardness of their zeal for the service of the king of England, and the readiness of their submissions. Their deputies cast themselves at Henry's feet; and, with the most passionate expressions of obedience, humbly intreated that he would accept them as his faithful vassals, ready to resign themselves, their lands, and possessions, to his absolute disposal. "They had already, (they said), endeavoured to approve their zeal by seizing Robert Fitzstephen, a traitor to his sovereign, who had lately entered their territory by force of arms without any due warrant or fair pretence, had slaughtered their people, seized their lands, and attempted to establish himself independent of his liege lord. They kept him in chains, and were ready to deliver him to the disposal of his sovereign."—The king received them with expressions of the utmost grace and favour; commended their zeal in repressing the unwarrantable attempts of Fitzstephen; declared that he should soon inquire into his crimes, and the wrongs they had sustained, and inflict condign punishment for every offence committed by his undutiful subjects.—Thus were the Irishmen dismissed in the utmost joy and exultation; and the artifice of Henry, while it inspired these men with dispositions favourable to his interests, proved also the most effectual means of saving Fitzstephen from their cruelty.

Henry, having completed the preparations necessary

for his expedition, embarked at Milford with several of his barons, 400 knights, and about 4000 soldiers, on board a fleet of 240 sail. He landed at Waterford on the scaft of St Luke in October 1172; with a professed defign not to conquer, but to take poffeffion of a kingdom already his own, as being granted him by the pope. Most of the Irish indeed feemed to be of the fame opinion, and therefore fubmitted without the leaft refiftance. Strongbow fet them an example, by making a formal furrender of Waterford, and doing homage to the king for the territory of Leinfiter. Fitz-Stephen was delivered up, with many accusations of tyranny and injuftice. He was at firft fent to prifon; but foon purchafed his liberty, by furrendering Wexford, and doing homage for the reft of his poffeffions to the king. The prince of Desmond was the firft Irish chieftain who fubmitted. On the very day after the king's arrival, he attended his court, refigned the city of Corke, did him homage, and ftipulated to pay a tribute for the reft of his territory. An Englifh governor and garrifon were immediately appointed to take poffeffion of his capital; and the king difplayed his power and magnificence by marching to Lifmore, where he chofe a fituation and gave the neceffary orders for building a fort. The prince of Thomond next fubmitted and did homage. He was followed by the princes of Offory, Decies, and all the inferior chiefs of Munfter.

The king, after having provided for the fecurity of all his newly acquired territories, and put garrifons in the cities of Limerick, Corke, Waterford, and Wexford, proceeded to take poffeffion of Dublin, which had been furrendered by Strongbow. The neighbouring lords took the opportunity of fubmitting as he advanced. O'Carrol of Argial, a chieftain of great confequence, repaired to his camp, and engaged to become his tributary; and even O'Ruarc, whom Roderic had made lord of a confiderable part of Meath, voluntarily fubmitted to the new fovereign.

22
Roderic
ftill holds
out.

Roderic, though furprifed at the defection of fo many of his allies, ftill determined to maintain his own dignity, and at leaft preferve his province of Connaught, fcing he could no longer call himfelf monarch of the whole ifland. With this defign he entrenched himfelf on the banks of the Shannon; and now, when difencumbered from a crowd of faithlefs and difcontented followers, he appears to have acted with a fpirit and dignity becoming his ftation. Hugh de Lacy and William Fitz-Andelm were commiffioned by the king to reduce him: but Roderic was too ftrong to be attacked with any probability of fuccefs by a detachment from the Englifh army; and he at leaft affected to believe, that his fituation was not yet fo totally defperate as to reduce him to the neceffity of refigning his dignity and authority, while his own territory remained inviolate, and the brave and powerful chiefs of Ulfter ftill kept retired in their own diftricts without any thoughts of fubmiffion. Henry in the mean time attempted to attach the Irish lords to his interefts by elegant and magnificent entertainments, fuch as to them appeared quite aftonifhing. Some hiftorians pretend that he eftablifhed the Englifh laws in all thofe parts which had fubmitted to his jurifdiction; but this muft appear extremely improbable, when we confider how tenacious a rude and barbarous people are of their an-

Ireland.

cient laws and cuftoms. The Irish lords had been accuftomed to do homage to a fuperior; and they had made no fubmiffion to Henry which they had not formerly done to Roderic, and probably thought their fubmiffion to the king of England more honourable than that to their Irish monarchs; and it cannot be fuppofed, that a wife and politic monarch, fuch as Henry undoubtedly was, fhould form at once fuch an extravagant fcheme as altering the laws of a great number of communities, none of which he had fubdued by force of arms. By his tranfactions both with the natives and adventurers, however, Henry had attained the abfolute dominion of feveral maritime cities and their dependencies; fo that he had both a confiderable number of real fubjects, and a large extent of territory, in the ifland. To thefe fubjects indeed Henry granted the Englifh laws; and gave the city of Dublin by charter to the inhabitants of Briftol, to be held of him and his heirs, with the fame liberties and free cuftoms which they enjoyed at Briftol, and throughout all his land. And, by another charter, executed foon after, he confirmed to his burgefles of Dublin all manner of rights and immunities throughout his whole land of England, Normandy, Wales, and Ireland, wherever they and their effects fhall be, to be fully and honourably enjoyed by them as his free and faithful fubjects. And as it was not eafy to induce his Englifh fubjects immediately to fettle in thefe maritime towns, he permitted the Oftmen to take poffeffion of Waterford; and to them he granted a particular right of denization, whereby they were invefted with the rights and privileges of free fubjects, and for the future to be governed by the laws of his realm. For the better execution of thefe new laws, the king alfo made a divifion of the diftricts now fubject to him into fhires or counties; which was afterwards improved and enlarged, as the extension of the Englifh fettlements and the circumftances of the country required. Sheriffs were appointed both for the counties and cities, with itinerant judges, and other minifters of juftice, and officers of ftate, and every appendage of Englifh government and law. To complete the whole fyftem, a chief governor, or representative of the king, was appointed. His bufinefs was to exercife the royal authority, or fuch parts of it as might be committed to him in the king's abfence; and, as the prefent ftate of Ireland, and the apprehenfions of war or infurrections, made it neceffary to guard againft fudden accidents, it was provided, That in cafe of the death of any chief governor, the chancellor, treafurer, chief-juftices, and chief baron, keeper of the rolls, and king's ferjeant at law, fhould be empowered, with confent of the nobles of the land, to elect a fucceffor, who was to exercife the full power and authority of this office, until the royal pleafure fhould be further known.

But while Henry was thus regulating the government of his new dominions, he received the unwelcome news, that two cardinals, Albert and Theodine, delegated by the pope, had arrived in Normandy the year before, to make inquiry into the death of Becket; that having waited the king's arrival until their patience was exhausted, they now fummoned him to appear without delay, as he would avert the dreadful fentence of excommunication, and preferve his dominions

23

Henry
obliged to
leave Ire-
land.

nions from a general intestine. Such denunciations were of too great consequence to admit of his longer stay in Ireland; he therefore ordered his forces and the officers of his household to embark without delay, reserving three ships for the conveyance of himself and his immediate attendants. Having therefore but a short time to secure his Irish interests, he addressed himself to the original English adventurers, and by grants and promises laboured to detach them from Strongbow, and to bind them firmly to himself. To make amends for what he had taken from Fitz-Stephen, he granted him a considerable district in the neighbourhood of Dublin, to be held by knight's service; at the same time entrusting the maritime towns to his own immediate dependants. Waterford was committed to Humphrey de Bohun, Robert Fitz-Bernard, and Hugh de Guadville, with a train of 20 knights. In Wexford were stationed William Fitz-Andelm, Philip of Hastings, and Philip de Braosa, with a like number of attendants. Hugh de Lacy had a grant of all the territory of Meath, where there was no fortified place, and where of consequence no particular reservation was necessary, to be held of the king and his heirs, by the service of 50 knights, in as full a manner as it had been enjoyed by any of the Irish princes. He also constituted him lord governor of Dublin, with a guard of 20 knights. Robert Fitz-Stephen and Maurice Fitz-Gerald were appointed his coadjutors, with an equal train; and these, with others of the first adventurers, were thus obliged, under the pretence of an honourable employment, to reside at Dublin, subject to the immediate inspection of de Lacy, in whom Henry seems to have placed his chief confidence. Lands were assigned in the neighbourhood of each city for the maintenance of the knights and soldiers. Orders were given to build a castle in Dublin, and fortresses in other convenient places; and to John de Courcey, a baron distinguished by his enterprising genius and abilities for war, was granted the whole province of Ulster, provided he could reduce it by force of arms.

Henry was no sooner gone, than his barons began to contrive how they might best strengthen their own interests, and the Irish how they might best shake off the yoke to which they had so readily submitted. De Lacy parcelled out the lands of Meath to his friends and adherents, and began to erect forts to keep the old inhabitants in awe. This gave offence to O'Ruarc, who still enjoyed the eastern part of this territory as a tributary prince. He repaired to Dublin, in order to obtain redress from Lacy for some injuries real or pretended; but, as the parties could not come to an agreement, another conference was appointed on a hill called *Taragh*. Both parties came with a considerable train of armed followers; and the event was a scuffle, in which O'Ruarc and several of his followers were killed, and which served to render the English not a little odious to the natives.

This spirit of disaffection had soon after an opportunity of shewing itself on the rebellion of king Henry's sons, of which an account is given under the article ENGLAND, n° 110, & seq. The king had been obliged to weaken his forces in Ireland, by withdrawing several of his garrisons. The soldiers who remained were also discontented with their general

Hervey of Mountmorres, on account of his severity in discipline, and restraining them from plunder, to which they imagined themselves intitled on account of the deficiencies of their pay. Raymond le Gros, the second in command, was much more beloved by the soldiery; and to such a height had the jealousies between the commanders arisen, that all effectual opposition to the Irish chieftains was prevented; and the event might have been fatal to the English interest, had not Henry found out a remedy. He summoned earl Richard to attend him at Rouen in Normandy, and communicated his intentions of committing the affairs of Ireland to his sole direction. The earl expressed the utmost readiness to serve his master; but observed, that he had already experienced the envy and malignity of his secret enemies; that if he should appear in such a distinguished character as that of the king's deputy in Ireland, their insidious practices would be renewed, and his conduct misrepresented. He therefore requested that a colleague might be appointed in the commission; and recommended Raymond as a person of approved loyalty and abilities, as well as highly acceptable to the soldiery. The king replied, with an affected air of regard and confidence, that he had his free consent to employ Raymond in any service he should deem necessary; not as a colleague, but as an assistant; but that he relied entirely on the earl himself, and implicitly trusted every thing to his direction. To reward his services, he granted him the town of Wexford, together with a fort erected at Wicklow; and then dismissed him with the most gracious expressions of favour.

The earl landed at Dublin, where he was received with all the respect due to the royal commission. He signified the king's pleasure, that Robert Fitz-Bernard, with the garrison of Waterford, should instantly embark and repair to Normandy; that Robert Fitz-Stephen, and Maurice Pendergast, should attend the service of their sovereign in England; and, agreeably to the king's instructions, took on him the custody of the cities of Dublin, Waterford, and Wexford. Hugh de Lacy, and Milo de Cogan, were, with the other lords, commanded to repair to England for the service of the king; by which the earl's forces were considerably weakened, and he soon found himself under a necessity of appointing Raymond to the chief command. The new general proved successful in some enterprizes against the rebellious Irish; but having presumed upon his merits to demand in marriage Basilila the earl's sister, Richard refused his consent, and Raymond retired into Wales.

Thus the supreme command again devolved upon Hervey of Mountmorres; who, being sensible that his character had suffered much from a comparison with that of Raymond, determined to emulate his successes by some bold attempt against the rebels. A detachment of 400 of his men, however, had the misfortune to be surprized and cut off by the enemy; and this success served as a signal for a general revolt. Several of the Leinster chieftains, who had lately made their revolt of submissions, and bound themselves to the service of the king Henry, now openly disclaimed all engagements. Even Donald Kevanagh, son to the late king Dermot, who had hitherto adhered to the English in their greatest difficulties, now declared against them, and

claimed a right to the kingdom of Leinster; while Roderic, on his part, was active in uniting the princes of Ulster, the native lords of Meath, and other chiefs, against their common enemy. This produced the immediate recall of Raymond; and Richard no longer refused his consent to the marriage with his sister, which was solemnized immediately on Raymond's arrival. The very next morning, the bridegroom was obliged to take the field against Roderic, who had committed great devastations in Meath. By the vigorous conduct of the English commander, however, he was not only prevented from doing farther mischief, but at last convinced of the folly of resistance; and therefore determined to make a final submission. Yet, conscious of his dignity, he disdained to submit to a subject; and therefore, instead of treating with earl Richard, he sent deputies directly to the king. The deputies were, Catholien archbishop of Tuam, the abbot of St Brandon, and *Master Lawrence*, as he is styled, chancellor of the king of Connaught.

The terms of this submission, by which Henry became sole monarch of Ireland, were as follow: Roderic consented to do homage and pay tribute, as liege-man to the king of England; on which condition he was allowed to hold the kingdom of Connaught, as well as his other lands and sovereignties, in as ample a manner as he had enjoyed them before the arrival of Henry in Ireland. His vassals were to hold under him in peace, as long as they paid their tribute and continued faithful to the king of England; in which Roderic was to enforce their due obedience, and for this purpose to call to his assistance the English government, if necessary. The annual tribute to be paid was every 10th merchantable hide, as well from Connaught, as from the rest of the island; excepting those parts under the immediate dominion of the king of England and his barons, viz. Dublin and Meath with their appurtenances, Wexford and all Leinster, and Waterford with its lands as far as Dungarvan inclusive; in all which districts Roderic was not to interfere, nor claim any power or authority. The Irish who had fled from these districts were to return, and either pay their tribute, or perform the services required by their tenures, at the option of their immediate lords; and, if refractory, Roderic, at the requisition of their lords, was to compel them to return. He was to take hostages from his vassals, such as he and his liege-lord should think proper; and on his part to deliver either these or others to the king, according to the royal pleasure. His vassals were to furnish hawks and hounds annually to the English monarch; and were not to detain any tenant of his immediate demesnes in Ireland, contrary to his royal pleasure and command. This treaty was solemnly ratified in a grand council of prelates and temporal barons, among whom we find the archbishop of Dublin one of the subscribing witnesses. As metropolitan of Leinster, he was now become an English subject, and was probably summoned on this occasion as one obliged to attend, and who had a right to assist in the king's great council. It is also observable, that Henry now treated with Roderic not merely as a provincial prince, but as monarch of Ireland. This is evidently implied and supposed in the articles; although his monarchical powers and privileges were

little more than nominal, frequently disregarded and opposed by the Irish toparchs. Even by their submissions to Henry, many of them in effect disavowed and renounced the sovereignty of Roderic; but now his supremacy seems to be industriously acknowledged, that the present submission might appear virtually the submission of all the subordinate princes, and thus the king of England be invested with the sovereignty of the whole island. The marks of sovereignty, however, were no more than homage and tribute: in every other particular, the regal rights of Roderic were left inviolate. The English laws were only to be enforced in the English pale: and, even there, the Irish tenant might live in peace, as the subject of the Irish monarch; bound only to pay his quota of tribute, and not to take arms against the king of England.

But though the whole island of Ireland thus became subject to the king of England, it was far from being settled in tranquillity, or indeed from having the situation of its inhabitants mended almost in any degree. One great occasion of disturbance was, that the English laws were confined only to those parts which had been subdued by force of arms; while the chieftains that had only submitted to pay tribute, were allowed to retain the ancient Irish laws within the limits of their own jurisdictions. By these old Irish laws, many crimes accounted capital with us, such as robbery, murder, &c. might be compensated by a sum of money. Hence it happened, that very unequal punishments were inflicted for the same offence. If one Englishman killed another, he was punished with death; but if he killed an Irishman, he was punished only by a fine. If an Irishman, on the other hand, killed an Englishman, he was certainly punished with death: and as in times of violence and outrage, the crime of murder was very frequent, the circumstance just mentioned tended to produce an implacable hatred between the original inhabitants and the English. As the Irish laws were thus more favourable to the barbarity natural to the tempers of some individuals, many of the English were also tempted to lay aside the manners and customs of their countrymen altogether, and to associate themselves with the Irish, that, by becoming subject to their laws, they might thus have an opportunity of gratifying their brutal inclinations with less controul than formerly; and in process of time, these *degenerate English*, as they were called, proved more bitter enemies to their countrymen than even the Irish themselves.

Another cause of the distresses of Ireland was, the great power of the English barons, among whom Henry had divided the greatest part of his Irish dominions. The extent of their authority only inflamed them with a desire for more; and, instead of contributing their endeavours to increase the power of their sovereign, or to civilize the barbarous people over whom they were placed, they did every thing in their power to counteract and destroy each other. Henry himself, indeed, seems to have been infected with a very fatal jealousy in this respect; for, though the abilities and fidelity of Raymond had abundantly manifested themselves, the king never could allow himself to continue him in the government of the island: and the consequence of degrading him never failed to be a scene of uproar and confusion. To these two reasons

29
Causes of
the subse-
quent dis-
tresses of
Ireland.

Ireland.

we must likewise add another; namely, that in those parts of the kingdom where the Irish chieftains enjoyed the sovereignty, they were at full liberty to make war upon each other as formerly, without the least restraint. This likewise induced many of the English to degenerate, that they might have an opportunity of sharing the plunder got by these petty wars; so that on the whole, the island was a perpetual scene of horror, almost unequalled in the history of any country.

30
Fitz-Andelm's bad government.

After the death of earl Richard, Raymond was immediately elected to succeed him; but was superseded by the king, who appointed William Fitz-Andelm, a nobleman allied to Raymond, to succeed in his place. The new governor had neither inclination nor abilities to perform the task assigned to him. He was of a rapacious temper, sensual and corrupt in his manners; and therefore only studied to enrich himself. The native Irish, provoked by some depredations of the English, commenced hostilities; but Fitz-Andelm, instead of repressing these with vigour in the beginning, treated the chieftains with affected courtesy and flattery. This they had sufficient discernment to see, and to despise; while the original adventurers had the burden of the whole defence of the *English pale*, as the English territories were called, thrown upon them, at the same time that the bad conduct of the governor was the cause of perpetual disorders. The consequence of this was, that the lords avowed their hatred of Fitz-Andelm: the soldiers were mutinous, ill-appointed, and unpaid; and the Irish came in crowds to the governor with perpetual complaints against the old adventurers, which were always decided against the latter; and this decision increased their confidence, without lessening their disaffection.

In this unfavourable state of affairs, John de Courcy, a bold adventurer, who had as yet reaped none of the benefits he expected, resolved to undertake an expedition against the natives, in order to enrich himself with their spoils. The Irish at that time were giving no offence; and therefore pleaded the treaty lately concluded with King Henry: but treaties were of little avail, when put in competition with the necessities of an indigent and rapacious adventurer. The consequence was, that the flame of war was kindled through the whole island. The chieftains took advantage of the war with the English, to commence hostilities against each other. Desmond and Thomond, in the southern province, were distracted by the jealousies of contending chiefs, and the whole land was wasted by unnatural and bloody quarrels. Treachery and murder were revenged by practices of the same kind, in such a manner as to perpetuate a succession of outrages the most horrid, and the most disgraceful to humanity. The northern province was a scene of the like enormities; though the new English settlers, who were considered as a common enemy, ought to have united the natives among themselves. All were equally strangers to the virtues of humanity; nor was religion, in the form it then assumed, capable of restraining these violences in the least.

31
He is superseded by Hugh de Lacey.

Ireland was thus in a short time reduced to such a state, that Henry perceived the necessity of recalling Fitz-Andelm, and appointing another governor. He was recalled accordingly; and Hugh de Lacey ap-

pointed to succeed him. He left his government without being regretted, and is said by the historians of those times to have done only one good action during the whole course of his administration. This action was nothing more important, than the removing of a relic, called the *staff of Jesus*, from the cathedral of Armagh to that of Dublin: probably that it might be in greater safety, as the war raged violently in Ulster. De Lacey, however, was a man of a quite different disposition, and every way qualified for the difficult government with which he was invested: but at the same time, the king, by investing his son John with the lordship of Ireland, gave occasion to greater disturbances than even those which had already happened.

Ireland.

The nature of this lordship hath been much disputed; but the most probable opinion is, that the king's son was now to be invested with all the rights and powers which had formerly belonged to Roderic, who was allowed the title of *king of Ireland*. It doth not appear, indeed, that Henry had any right to deprive Roderic of these powers, and still less had he to dispose of any of the territories of those chieftains who had agreed to become his tributaries; which nevertheless he certainly did, and which failed not to be productive of an immediate war with these chiefs.

32
Prince John made lord of Ireland.

The new governor entered on his office with all that spirit and vigour which was necessary; but being misrepresented to the king by some factious barons, he was in a short time recalled, and two others, totally unfit for the government, appointed in his room. This error was soon corrected, and Lacey was replaced in three months. The same jealousy which produced his first degradation, soon produced a second; and Philip de Braosa, or *Philip of Worcester*, as he is called, a man of a most avaricious disposition, was appointed to succeed him. This governor behaved in such a manner, that his superstitious subjects expected every moment that the vengeance of heaven would fall upon him, and deliver them from his tyranny. His power, however, was of short duration; for now prince John prepared to exercise the authority with which his father had invested him in Ireland. He was attended by a considerable military force: his train was formed of a company of gallant Normans in the pride of youth; but luxurious, insolent, and followed by a number of Englishmen, strangers to the country they were to visit, desperate in their fortunes, accustomed to a life of profligacy, and filled with great expectations of advantage from their present service. The whole assembly embarked in a fleet of 60 ships; and arrived at Waterford after a prosperous voyage, filling the whole country with the greatest surprise and expectation.

The young prince had not yet arrived at the years³³ of discretion; nor indeed, from his subsequent conduct, doth it appear that his disposition was such as qualified him in the least for the high dignity to which he was raised. The hardy Welshmen who first migrated into Ireland, immediately waited upon him to do him homage; but they were disagreeable to the gay courtiers, and to the prince himself, who minded nothing but his pleasures. The Irish Lords were at first terrified by the magnificent representation of the force of the English army; and being reconciled to submission by the dignity of the prince's station, hastened in crowds to Waterford to do him homage.

Ireland.

Ireland.

They exhibited a spectacle to the Norman courtiers, which the latter did not fail to treat with contempt and ridicule. The Irish Lords, with uncouth attire, thick bushy beards, and hair standing on end, advanced with very little ceremony; and, according to their own notions of respect, offered to kiss the young prince. His attendants stepped in, and prevented this horrid violation of decorum by thrusting away the Irishmen. The whole assembly burst into peals of laughter, pulled the beards, and committed several other indignities on the persons of their guests; which were immediately and severely repented. The chieftains left the court, boiling with indignation; and meeting others of their countrymen halting to do homage to the prince, they informed them of the reception they themselves had met with. A league was instantly formed to extirpate the English, and the whole nation flew to arms; while John and his courtiers, instead of opposing the enemy, employed themselves in harassing and oppressing those who were under their immediate jurisdiction. The country was therefore over-run by the barbarians, agriculture entirely neglected, and a dreadful famine threatened to follow the calamities of war.

34
A general
revolt.

This terrible desolation had continued for eight months before the king was fully acquainted with it. He then determined to recal his son; but was at a loss whom he should name for his successor. Lacey had been murdered by an Irish peasant, and the king was at last obliged to have recourse to John de Courcey, whose boisterous valour seemed now to be absolutely necessary to prevent the English from being totally exterminated. The new governor was obliged at first to act on the defensive; but as his enemies soon forgot their league, and began their usual hostilities against each other, he was at last enabled to maintain his authority of the English government, and to support their acquisitions in Ireland, though not to extend them.

35
Suppressed
by John de
Courcey.

36
Miserable
state of Ire-
land under
Richard I.

In this situation were the affairs of Ireland when Henry II. died, and was succeeded by his son Richard I. The new king was determined on an expedition to the holy land, which left him no leisure to attend to the affairs of Ireland. John, by virtue of the powers granted him by his father, took upon him the management of Irish affairs; and immediately degraded de Courcey from his government, appointing in his place Hugh de Lacey the younger. De Courcey, provoked at this indignity, retired into Ulster, where he was immediately engaged in a furious war with the natives, and at last almost entirely detached himself from the English government. The greatest confusion ensued; Hugh de Lacey was recalled from his government, and William Petit, earl marshal of England, appointed in his place. Petit's administration proved more unfortunate than that of any of his predecessors. Confederacies every where took place against the English; the latter were every where defeated, their towns taken; and their power would certainly have been annihilated, had not the Irish, as usual, turned their arms against each other.

37
Somewhat
better under
John.

In this desperate situation matters continued during the whole reign of king Richard, and part of the reign of John, while the distresses of the country were increased by the dissensions and disaffection of the Eng-

lish lords, who aspired at independency, and made war upon each other like Irish chieftains. The prudent conduct of a governor named *Meiler Fitz-Henry*, however, at last put an end to these terrible commotions; and about the year 1208, the kingdom was more quiet than it had been for a long time before. In 1210, John came over to Ireland in person with an army, with a design, as he said, to reduce his refractory nobles to a sense of their duty. More than 20 Irish chiefs waited upon him immediately to do him homage; while three of the English barons, Hugh and Walter de Lacy, and William de Braosa, fled to France. The king, at the desire of his Irish subjects, granted them, for their information, a regular code and charter of laws, to be deposited in the exchequer of Dublin, under the king's seal. For the regular and effectual execution of these laws, besides the establishment of the king's courts of judicature in Dublin, there was now made a new and more ample division of the king's lands of Ireland into counties, where the sheriffs, and many other officers, were appointed. These counties were, Dublin, Meath, Kildare, Argial, now called *Louth*, Katherlagh, Kilkenny, Wexford, Waterford, Cork, Kerry, Limerick, Tipperary; which marks the extent of the English dominions at this time as confined to a part of Leinster and Munster, and to those parts of Meath and Argial which lie in the province of Ulster, as now defined. Before his departure, the king gave liberty to John de Grey, bishop of Norwich, whom he appointed governor, to coin money of the same weight with that of England; and which, by royal proclamation, was made current in England as well as Ireland.

This ecclesiastical governor is said to have managed affairs so happily, that, during the violent contests between John and his barons, Ireland enjoyed an unusual degree of tranquillity. We are not to imagine, however, that this unhappy country was at this or indeed any other period, till the end of Queen Elizabeth's reign, perfectly free from disorders, only they were confined to those districts most remote from the English government. In 1219, the commotions were renewed, through the immeasurable ambition and contentions of the English barons, who despised all controul, and oppressed the inhabitants in a terrible manner. The disorders in England during the reign of Henry III. encouraged them to despise the royal authority; they were ever the secret enemies, and sometimes the avowed adversaries, of each other; and in many places where they had obtained settlements, the natives were first driven into insurrections by their cruelty, and then punished with double cruelty for their resistance. The English laws, which tended to punish the authors of these outrages, were scorned by an imperious aristocratic faction, who, in the phrenzy of rapine and ambition, trampled on the most salutary institutions. In 1228, a remonstrance was presented to the king against this dangerous neglect and suspension of the laws; which he answered by a mandate to the chief governor, directing that the whole body of nobility, knights, free tenants, and bailiffs of the several counties, should be convened; that the charter of English laws and customs received from king John, and to which they were bound by oath, should be read over in their presence; that they should be directed

for

39
Relapses
into its former
state
under Hen-
ry III.

for the future strictly to observe and adhere to these; and that proclamation should be made in every county of Ireland, strictly enjoining obedience, on pain of forfeiture of lands and tenements. How little effect was produced by this order, we may learn from another, dated in 1246; where the barons are commanded, for the peace and tranquillity of the land, to permit it to be governed by the laws of England.

39
Excessive
depravation
of manners.

Nothing indeed can be conceived more terrible than the state of Ireland during the reign of Henry III. People of all ranks appear to have been sunk in the lowest degree of depravity. The powerful English lords not only subverted the peace and security of the people, by refusing to admit the salutary laws of their own country, but behaved with the utmost injustice and violence to the natives who did not enjoy the benefits of the English constitution. The clergy appear to have been equally abandoned with the rest: nor indeed could it be otherwise; for, through the partialities of Henry himself, the neglected, the worthless, and the depressed among the English clergy, found refuge in the church of Ireland. What were the manners of these clergy, will appear from the following petition of a widow to king Edward I.

"Margaret le Blunde, of Cashel, petitions our lord the king's grace, that she may have her inheritance which she recovered at Chonnell before the king's judges, &c. against David Macmackerwayt bishop of Cashel.

"Item, the said Margaret petitions redress on account that her father was killed by the said bishop.

"Item, for the imprisonment of her grandfather and mother, whom he shut up and detained in prison until they perished by famine, because they attempted to seek redress for the death of their son, father of your petitioner, who had been killed by the said bishop.

"Item, for the death of her six brothers and sisters, who were starved to death by the said bishop, because he had their inheritance in his hands at the time he killed their father.

"And it is to be noted, that the said bishop had built an abbey in the city of Cashel, on the king's lands granted for this purpose, which he hath filled with robbers, who murder the English, and depopulate the country; and that when the council of our lord the king attempts to take cognizance of the offence, he fulminates the sentence of excommunication against them.

"It is to be noted also, that the said Margaret has five times crossed the Irish sea. Wherefore, the petitions for God's sake, that the king's grace will have compassion, and that she may be admitted to take possession of her inheritance.

"It is further to be noted, that the aforesaid bishop hath been guilty of the death of many other Englishmen besides that of her father; and that the aforesaid Margaret hath many times obtained writs of our lord the king, but to no effect, by reason of the influence and bribery of the said bishop.

"She further petitions, for God's sake, that she may have costs and damages, &c."

40
Little alleviation under Edward I.

Matters continued in the same deplorable state during the reign of Edward I. with this additional grievance, that the kingdom was infested by invasions of the Scots. The English monarch indeed possessed all

that prudence and valour which were necessary to have reduced the island to a state of tranquillity; but his project of conquering Scotland left him but little leisure to attend to the distracted state of Ireland. Certain it is, however, that the grievous distress of that country gave him great uneasiness; so that he transmitted his mandate to the prelates of Ireland, requiring them to interpose their spiritual authority for composing the public disorders. About the same time, the Irish who lay contiguous to the English, and who dwelt among them, presented a petition to the king, offering to pay him 8000 merks, upon condition that they were admitted to the privileges of English subjects. To this petition he returned a favourable answer; but his good intentions were defeated by the licentious nobility, who knew that these laws would have circumscribed their rapacious views, and controuled their violence and oppression. Petitions of the same kind were several times repeated during this reign, but as often defeated; though some means were used for the peace of the kingdom, such as the frequent calling of parliaments, appointing sheriffs in some new counties, &c.

These means were not altogether without effect. They served to give some check to the disorders of the realm, though by no means to terminate or subdue them. The incursions of the natives were repressed, and the English lords began to live on better terms with each other; and, in 1311, under Edward II. the most powerful of them were reconciled by the marriage of Maurice and Thomas Fitz John, afterwards the heads of the illustrious houses of Desmond and Kildare, to two daughters of the earl of Ulster. But just at this happy period, when the nation seemed to have some prospect of tranquillity, more dreadful calamities than any hitherto related were about to take place. The Scots had just recovered their liberty under Robert Bruce, and were now in no danger of being again enslaved by a foreign power. Edward, the king's brother, as a recompence for his services, demanded a share of the royal authority. This was refused by Robert, and Edward was for the present satisfied by being declared heir apparent to the crown. But the king, wisely considering the necessity of finding out some employment for a youth of such an aspiring and ambitious disposition, pointed out to his brother the island of Ireland, the conquest of which would be easy, on account of the distracted state in which it almost always was, and which would make him an independent sovereign. This proposal was eagerly embraced by Edward, and every thing necessary for the expedition immediately got ready. On the 25th of May 1315, he landed on the north-eastern coast of Ireland with 6000 men, to assert his claim to the sovereignty of this kingdom. The Irish lords of Ulster, who had invited and encouraged him to this enterprise, were now prepared to receive their new monarch, stocked with eagerness to his standard, and prepared to wreak their vengeance on the common enemy. Their progress was marked by desolation and carnage. The English settlers were slaughtered, or driven from their possessions, their castles levelled with the ground, and their towns set on fire. The English lords were neither prepared to resist the invasion, nor sufficiently united among themselves. The consequence was, that the

41
Invasion of
the Scots
in the
reign of
Edward II.

the enemy for some time met with no interruption. An intolerable scarcity of provisions, however, prevented Bruce from pursuing his advantages; and tho' his brother landed in Ireland with a powerful army, the famine prevented him from being of any essential service. The forces which he left behind him, however, proved of considerable advantage; and by means of this reinforcement, he was enabled to take the city of Carrickfergus.

The terrible devastations committed by Bruce and his associates, now induced some English lords to enter into an association to defend their possessions, and repel these invaders. For this purpose, they raised a considerable body of forces; which coming to an engagement with Fedlim prince of Connaught, one of Bruce's principal allies, entirely defeated and killed him with 8000 of his men. This defeat, however, had very little effect on the operations of Bruce himself. He ravaged the country to the walls of Dublin, traversed the district of Ossory, and penetrated into Munster, destroying every thing with fire and sword. The English continued to augment their army, till at last it amounted to 30,000 men; and then Bruce, no longer able to oppose such a force, found it necessary to retire into the province of Ulster. His retreat was effected with great difficulty; and during the time of his inactivity, the distresses of his army increased to such a degree, that they are said to have fed upon the bodies of their dead companions. At last an end was put to the sufferings and the life of this adventurer in the battle of Dundalk, in 1318, where he was defeated and killed by the English under Sir Robert Birmingham. A brave English knight, named *Maupas*, had rushed forward to encounter Bruce himself, and both antagonists had killed each other; the body of *Maupas* being found, after the battle, stretched upon that of Bruce. The king of Scotland had been advancing with powerful succours to his brother; but Edward, confident of victory, refused to wait his arrival; and Robert, on hearing of his brother's death, instantly retired.

The defeat of the Scottish invaders did not put an end to the disturbances of this unhappy country. The contentions of the English with one another, of the Irish with the English, and among themselves, still kept the island in a state of the utmost barbarity and confusion. An attempt was made indeed, in the reign of Edward II. to establish an university in Dublin; but for want of proper encouragement the institution for some time languished, and then expired amidst the confusion and anarchy of the country. The reign of Edward III. proved not much more favourable than preceding times had been. He was too much taken up with the idea of conquering France, to pay much regard to the interests of Ireland. The unhappy people, indeed, sensible of their own miseries, petitioned the king to admit all his subjects in Ireland to a participation of the English laws; but the petition being delivered as usual to the chief governor, and laid before the parliament, it was either clandestinely defeated or openly rejected. A new scene of tumult and bloodshed immediately ensued; which at last produced an order from the king, prohibiting all Irishmen, or Englishmen married and having estates in Ireland, from bearing any public office whatever.—

This, instead of having a tendency to promote peace, made the disorders much greater than before; and at last produced a remonstrance from the states met at Kilkenny, in which they grievously complain not only of the disorders of the kingdom, but also of the conduct of the king himself in the edict abovementioned: and to this remonstrance the king thought proper to give a gracious and condescending answer, in order to procure for Ireland the succours he wanted in his expedition against France.

It is not to be supposed, that mere promises, assisted by any vigorous exertion, could make the least alteration in the state of a kingdom involved in so much misery. The disorders, however, at last became insupportable to the inhabitants themselves; and a parliament was summoned in 1367, the result of which was the famous statute of Kilkenny. The preamble to this act recites, that the English had become more Irish in their language, names, apparel, and manner of living; had rejected the English laws, and submitted to those of the Irish, with whom they had united by marriage-alliance, to the ruin of the common-wealth.—It was therefore enacted, that marriage, nurture of infants, &c. with the Irish, should be considered and punished as high treason.—Again, if any man of English race shall use an Irish name, the Irish language, or the Irish apparel, or any mode or custom of the Irish, the act provides, that he shall forfeit lands and tenements, until he hath given security in the court of chancery to conform in every particular to the English manners; or if he have no lands, that he shall be imprisoned till the like security be given. The Breton law was pronounced to be a pernicious custom and innovation lately introduced among the English subjects; and it was therefore ordained, that in all their controversies they should be governed by the common law of England; and that whoever should submit to the Irish jurisdiction, should be adjudged guilty of high treason. As the English had been accustomed to make war or peace with the bordering Irish at pleasure, they were now expressly prohibited from levying war without special warrant from the state.—It was also made highly penal for the English to permit their Irish neighbours to graze their lands, to present them to ecclesiastical benefices, or to receive them into monasteries or religious houses; to entertain their bards, who perverted their imaginations by romantic tales; or their news-tellers, who seduced them by false reports.—It was made felony to impose or cede any forces upon the English subject against his will. And as the royal liberties and franchises were become sanctuaries for malefactors, express power was given to the king's sheriffs to enter into all franchises, and there to apprehend felons and traitors.—Lastly, because the great lords, when they levied forces for the public service, acted with partiality, and laid unequal burthens upon the subjects, it was ordained that four wardens of the peace in every county should adjudge what men and armour every lord or tenant should provide.—The statute was promulged with particular solemnity; and the spiritual lords, the better to enforce obedience, denounced an excommunication on those who should presume to violate it in any instance.

This statute, it is evident, could not tend to promote the peace of the kingdom. This could only have

44
Statute of
Kilkenny.

have been done by removing the animosity between the native Irish and English; but so far was the statute of Kilkenny from having any tendency of this kind, that it manifestly tended to increase the hatred between them. During the whole of this reign, therefore, the state of the Irish government continued to be greatly disordered and embroiled. The English interest gradually declined; and the connections of the king's subjects with the original inhabitants, occasioned by their vicinity and necessary intercourse, in despite of all legal injunctions, obliged the king to relax the severity of the statutes of Kilkenny, in cases where they proved impracticable, or oppressive in the execution. The perpetual hostility, however, in which the different parties lived, proved an effectual bar to the introduction of those arts which contribute to the comfort and refinement of mankind. Even foreign merchants could not venture into such a dangerous country without particular letters of protection from the throne. The perpetual succession of new adventurers from England, led by interest or necessity, served only to inflame dissension, instead of introducing any essential improvement. Lawyers sent from England were notoriously insufficient, if not corrupt; and, as such, had frequently been the objects of complaint. The clergy were a mean grovelling race, totally influenced by the crown. Even prelates were commonly made the inferior agents of government in collecting forces, and raising war against the Irish enemy; but were not to be enticed into this service, except by remittances from the exchequer. Attendance in parliament they dreaded as the greatest hardship; and either resorted to mean excuses to avert the penalty of absence, or sued to the king to be exempted by patent from contributing or assenting to those laws by which they were to be governed.

In this deplorable situation the kingdom continued till the time of Henry VII. who laid the foundation of the future civilization of the Irish, as he also did of the English nation. This he effected by enacting some salutary laws, and appointing faithful and active governors to see them put in execution. Of these governors Sir Edward Poyning's contributed more than any other to the tranquillity of the state. During his administration was enacted the law known by the name of *Poyning's Law*, and which hath since been the subject of much political debate. The purport of it was, That no parliament should be held in that island without first giving notice to the king of England, and acquainting him with the acts to be passed in that parliament; neither should any act passed, or any parliament held, without the approbation of the king and council, be deemed valid. Thus was the power of the turbulent barons greatly broken; and the governor, not having it in his power to assemble parliaments when he pleased, became a person of much less consequence. The whole Irish legislation also became dependent on that of England, and hath ever since continued to be so.

From this time we may date the revival of the English power in Ireland; which from the Scottish war in the time of Edward II. had gradually declined into a miserable and precarious state of weakness. The authority of the crown, which had at last been defied, insulted, and rejected, even in the English territory, was

restored and confirmed, and the rebellions vigorously opposed and suppressed. The feignory of the British crown over the whole body of the Irish, which in former reigns seemed to have been totally forgotten, was now formally claimed and asserted, and some of the most ferocious chieftains by their marriage-connections became the avowed friends of the English power. An ignominious tribute, called the *Black Rent*, was indeed still paid to some chieftains; but their hostilities were opposed and chastised, and even in their own districts they were made to feel the superiority of English government.

During the reign of Henry VIII. the Irish affairs were neglected; and the disorders, which had only been checked, and never thoroughly eradicated, returned as usual. They were further promoted by the innovations in religion which the king introduced, and which were exceedingly disagreeable both to English and Irish. The Reformation, however, continued to make some progress, though slowly, during the reign of Edw. VI. and even in the reign of queen Mary; for as the persecution did not reach thither, many Protestants fled to Ireland in order to avoid the queen's cruelty. The machinations of the Spaniards against queen Elizabeth excited the Irish to fresh insurrections. The king of Spain, indeed, not only encouraged the natives in those insurrections, but actually sent over troops to assist them in driving out the English altogether. This they had well nigh effected; but the Spaniards, upon seeing an army of Irish defeated by an handful of their enemies, were so much provoked, that they surrendered all the places they had made themselves masters of, and even offered to assist the English in reducing the rebels; though it was not thought proper to accept of their assistance. The consequence of this was, that the Irish, abandoned by these allies, were unable to carry on the war; and the grand rebel O'Neal of Tir-owen, or Tirone, after much treachery, evasion, and many pretended submissions, was at last obliged to submit in good earnest. He fell upon his knees before the deputy, and petitioned for mercy with an air and aspect of distress. He subscribed his submission in the most ample manner and form. He implored the queen's gracious commiseration; and humbly sued to be restored to his dignity, and the state of a subject, which he had justly forfeited. He utterly renounced the name of *O'Neal*, which he had assumed on account of the great veneration in which it was held among the Irish. He abjured all foreign power, and all dependency except on the crown of England; resigned all claim to any lands excepting such as should be conferred upon him by letters patent; promising at the same time to assist the state in abolishing all barbarous customs, and establishing law and civility among his people. The lord deputy, on the part of the queen, promised a full pardon to him and all his followers; to himself the restoration of his blood and honours, with a new patent for his lands, except some portions reserved for certain chieftains received into favour, and some for the use of English garrisons.

No insurgent now remained in this kingdom who had not obtained or sued for mercy. Many, indeed, were driven by necessity to the continent, and earned a subsistence by serving in the armies of Spain; and thus a race of Irish exiles was trained to arms, filled with a

malignant resentment against the English. Thus the honour of reducing all the enemies of the crown of England in this island, after a continued contest for 440 years, was reserved for the arms of Elizabeth. The ghastliness of famine and desolation was now somewhat enlivened by the restoration of tranquillity. Indeed, from the most authentic accounts, the prices of provisions were so high, that, considering the value of money at that time, it is surprising how the inhabitants could subsist. From an account of the rates of provisions taken by the mayor of Dublin in 1602, it appears, That wheat had risen from 36s. to 9 l. the quarter; barley-malt from 10s. to 43s. the barrel; oat-malt from 5s. to 22s. the barrel; pease from 5s. to 40s. the peck; oats from 3s. 4 d. to 20s. the barrel; beef from 26s. 8 d. to 8 l. the carcass; mutton from 3s. to 26s. the carcass; veal from 10s. to 29s. the carcass; a lamb from 12 d. to 6s.; a pork from 8s. to 20s.

Under James I. Ireland began to assume a different appearance. That monarch valued himself upon promoting the arts of peace, and made it his study to civilize his barbarous Irish subjects. By repeated conspiracies and rebellions, a vast tract of land had escheated to the crown in six northern counties, Tyrconnel, now called *Donnegal*, Tirone, Derry, Farmanagh, Cavan, and Armagh, amounting to about 500,000 acres; a tract of country covered with woods, where rebels and banditti found a secure refuge, and which was declined to lie waste without the timely interposition of government. James resolved to dispose of these lands in such a manner as might introduce all the happy consequences of peace and cultivation. He caused surveys to be taken of the several counties where the new settlements were to be established; described particularly the state of each; pointed out the situations proper for the erections of towns and castles; delineated the characters of the Irish chieftains, the manner in which they should be treated, the temper and circumstances of the old inhabitants, the rights of the new purchasers, and the claims of both; together with the impediments to former plantations, and the methods of removing them.

At his instances it was resolved, that the persons to whom lands were assigned should be either new undertakers from Great Britain, especially from Scotland, or *servitors*, as they were called; that is, men who had for some time served in Ireland, either in civil or military offices; or old Irish chieftains or captains. Among the last were included even those Irish who had engaged in the rebellion of Tirone, and still harboured their secret discontents. To gain them, if possible, by favour and lenity, they were treated with particular indulgence. Their under-tenants and servants were allowed to be of their own country and religion; and, while all the other planters were obliged to take the oath of allegiance, they were tacitly excepted. The servitors were allowed to take their tenants either from Ireland or Britain, provided no Popish recusants were admitted. The British undertakers were confined to their own countrymen.

In the plantations which had been formerly attempted, the Irish and English had been mixed together, from a fond imagination that the one would have learned civility and industry from the other. But expe-

rience had now discovered, that this intercourse served only to make the Irish envy the superior comforts of their English neighbours, and to take the advantage of a free access to their houses to steal their goods and plot against their lives. It was therefore deemed necessary to plant them in separate quarters; and in the choice of these situations, the errors of former times were carefully corrected. The original English adventurers, on their first settlement in Ireland, were captivated by the fair appearance of the plain and open districts. Here they erected their castles and habitations; and forced the old natives into the woods and mountains, their natural fortresses. There they kept themselves unknown, living by the milk of their kine, without husbandry or tillage; there they increased to incredible numbers by promiscuous generation; and there they held their assemblies, and formed their conspiracies without discovery. But now the northern Irish were placed in the most open and accessible parts of the country, where they might lie under the close inspection of their neighbours, and be gradually habituated to agriculture and the mechanic arts. To the British adventurers were assigned places of the greatest strength and command; to the servitors, stations of the greatest danger, and greatest advantage to the crown: but as this appeared a peculiar hardship, they were allowed guards and entertainment, until the country should be quietly and completely planted.

The experience of ages had shewn the inconvenience of enormous grants to particular lords, attended with such privileges as obstructed the administration of civil government: and, even in the late reign, favourite undertakers had been gratified with such portions of land as they were by no means able to plant. But, by the present scheme, the lands to be planted were divided in three different proportions; the greatest to consist of 2000 English acres, the least of 1000, and the middle of 1500. One half of the escheated lands in each county was assigned to the smallest, the other moiety divided between the other proportions; and the general distributions being thus ascertained, to prevent all disputes between the undertakers, their settlements in the respective districts were to be determined by lot. Estates were assigned to all, to be held of them and their heirs. The undertakers of 2000 acres were to hold of the king *in capite*; those of 1500 by knights service; those of 1000 in common socage. The first were to build a castle, and inclose a strong court-yard, or *barrow*, as it was called, within four years; the second, to finish an house and bawn within two years; and the third, to inclose a bawn; for even this rude species of fortification was accounted no inconsiderable defence against an Irish enemy. The first were to plant upon their lands, within three years, 48 able men of English or Scottish birth, to be reduced to 20 families; to keep a demesne of 600 acres in their own hands; to have four free-farmers on 120 acres each; six lease-holders, each on 100 acres; and on the rest, eight families of husbandmen, artificers, and cottagers. The others were under the like obligations proportionably. All were, for five years after the date of their patents, to reside upon their lands either in person, or by such agents as should be approved by the state, and to keep a sufficient quantity of arms for their defence. The British and servitors were not to

alienate

alienate their lands to mere Irish, or to demise any portions of them to such persons as should refuse to take the oaths to government; they were to let them at determined rents, and for no shorter term than 21 years or three lives. The houses of their tenants were to be built after the English fashion, and united together in towns or villages. They had power to erect manours, to hold courts baron, and to create tenures. The old natives, whose tenures were granted in fee-simple, to be held in socage, were allowed the like privileges. They were enjoined to let their lands at certain rents, and for the like terms as the other undertakers; to take no Irish exactions from their inferior tenants, and to oblige them to forsake their old Scythian custom of wandering with their cattle from place to place for pasture, or *creaghting*, as they called it, to dwell in towns, and conform to the English manner of tillage and husbandry. An annual rent from all the lands was reserved to the crown for every 60 English acres, six shillings and eight pence from the undertakers, ten shillings from servitors, and 13 shillings and four pence from Irish natives. But for two years they were exempt from such payments, except the natives, who were not subject to the charge of transportation. What gave particular credit to this undertaking, was the capital part which the city of London was persuaded to take in it. The corporation accepted of large grants in the county of Derry; they engaged to expend L. 20,000 on the plantation, to build the cities of Derry and Colerain, and stipulated for such privileges as might make their settlements convenient and respectable. As a competent force was necessary to protect this infant plantation, the king, to support the charge, instituted the order of baronets, an hereditary dignity, to be conferred on a number not exceeding 200; each of whom, on passing his patent, was to pay into the exchequer such a sum as would maintain 30 men in Ulster, for three years, at 8*d.* daily pay.

But scarcely had the lands been allotted to the different patentees, when considerable portions were reclaimed by the clergy as their rightful property. And so far had the estates of the northern bishops been embarrassed, both by the usurpations of the Irish lords, and the claims of patentees, that they scarcely afforded a competent, much less an honourable provision for men of worth and learning, while the state of the parochial clergy was still more deplorable. Most of the northern churches had been either destroyed in the late wars, or fallen to ruin; the benefices were small, and either shamefully kept by the bishops in the way of commendam or sequestration; or filled with ministers as scandalous as their income. The wretched flock was totally abandoned; and for many years Divine Service had not been used in any parish-church of Ulster, except in cities and great towns. To remedy these abuses, and to make some proper provision for the instruction of a people immersed in lamentable ignorance, the king ordained, that all ecclesiastical lands should be restored to their respective sees and churches, and that all lands should be deemed ecclesiastical from which bishops had in former times received rents or pensions: that compositions should be made with the patentees for the site of cathedral churches, the residences of bishops and dignitaries, and other church-

lands which were not intended to be conveyed to them; who were to receive equivalents if they compounded freely; or else to be deprived of their patents as the king was deceived in his grant, and the possessions restored to the church. To provide for the inferior clergy, the bishops were obliged to resign all their impropriations, and relinquish the tithes paid them out of parishes, to the respective incumbents; for which ample recompence was made out of the king's lands. Every proportion allotted to undertakers was made a parish, with a parochial church to each. The incumbents, besides their tithes and duties, had glebe-lands assigned to them of 60, 90, or 120 acres, according to the extent of their parishes. To provide for a succession of worthy pastors, free-schools were endowed in the principal towns, and considerable grants of lands conferred on the university of Dublin, which had been re-established by queen Elizabeth, together with the advowson of six parochial churches, three of the largest, and three of the middle proportion in each county.

Such was the general scheme of this famous northern plantation, so honourable to the king, and of such consequence to the realm of Ireland. Its happy effects were immediately perceived, although the execution by no means corresponded with the original idea. Buildings were slowly erected; British tenants were difficult to be procured in sufficient numbers; the old natives were at hand, offered higher rents, and were received into those districts from which it was intended to exclude them. In this particular, the Londoners were accused of being notoriously delinquent. They acted entirely by agents; their agents were interested and indolent, and therefore readily countenanced this dangerous intrusion of the natives; an error of which sufficient cause was afterwards found to repent. For the present, however, a number of loyal and industrious inhabitants was poured into the northern counties, considerable improvements made by the planters, and many towns erected. To encourage their industry, and advance his own project, the king was pleased to incorporate several of these towns, so that they had a right of representation in the Irish parliament.

The only disturbance that now ensued was from the Popish party, who never could bear to see the Protestant religion established in preference to their own, while they had power to resist. After numberless ineffectual machinations and complaints, their fury broke out in a terrible massacre of the new English settlers in the year 1641*. The affairs of Britain were at that time in such confusion, that the rebellion could not be quelled in less than ten years; during which time the country was reduced to a most deplorable situation. It recovered again under Cromwell, Charles II. and the short reign of James II. On the accession of William III. matters were once more thrown into confusion by an attempt made in favour of the exiled monarch, who came over thither in person, and whose bad success is related under the article *BRITAIN*, n° 309.—325. Since that time, Ireland hath recovered from the miserable situation to which it was so long reduced. As yet, however, it is far from being in such a flourishing state as either South or North Britain. The great obstacle to the improvement of

49
State of Ireland since that time.

* See *Britain*, n° 103, —106.

⁴⁶ the kingdom is the extreme poverty and oppression of the common people. The produce of the kingdom, either in corn or cattle, is not above two thirds at most of what by good cultivation it might yield. The high roads throughout the southern and western parts are lined with beggars, who live in huts or cabbins without chimnies, or any covering capable of defending the wretched inhabitants from the cold, wind, and rain. "It is a scandal (says a judicious traveller, who lately visited Ireland,) to the proprietors of this fertile country, that there is not the greatest plenty of good corn and hay in it; but some of the best land in the king's dominions is suffered to be torn in pieces, and cultivated in the vilest manner, by a set of abject miserable occupiers; who are absolutely no better than slaves to the despicable, lazy, and oppressive subordinate landlords."

⁵⁰ Climate, &c. of Ire-
land. Ireland enjoys a peculiar blessing in not producing or nourishing any venomous creature. Mr O'Halloran says, that even frogs were never known to live there before the reign of William III. Indeed, it is not improbable but the breed of them might have come from France in the suite of James II.

The climate of Ireland would almost perfectly agree with that of England, were the soil equally improved, being abundantly fruitful both in corn and grafs, especially the latter; in consequence of which, an infinite number of black cattle and sheep are bred, particularly in the province of Connaught. Few countries produce finer grain than that which grows in the improved parts of this kingdom. The northern and eastern counties are best cultivated and inclosed, and the most populous.

Ireland is known to have many rich mines; and there is no inconsiderable prospect of gold and silver in some parts of the kingdom. No country in the world abounds more in beautiful lakes, both fresh and salt-water ones; and it is also plentifully watered with many beautiful rivers. The commodities which Ireland exports, as far as her present trade will permit, are hides, tallow, beef, butter, cheese, honey, wax, hemp, metals, and fish: wool and glass were, till December 23, 1779, prohibited; but her linen trade is of late grown of very great consequence. England, in the whole, is thought to gain yearly by Ireland upwards of 1,400,000l. and in many other respects she must be of very great advantage to that kingdom. Formerly, indeed, she was rather a burden to her elder sister, than any benefit; but the times are changed now, and improve every day.

⁵¹ Linen manufacture early introduced. Mr O'Halloran says, the linen manufacture was carried on in Ireland in very early days, to a great extent; and Gratianus Lucius quotes a description of the kingdom, printed at Leyden in 1627, in which the author tells us, "That this country abounds with flax, which is sent ready spun in large quantities to foreign nations. Formerly, (says he,) they wove great quantities of linen, which was mostly consumed at home, the natives requiring above 30 yards of linen in a shirt or shift." So truly expensive was the Irish fashion of making up shirts, on account of the number of plaits and folds, that, in the reign of Henry VIII. a statute passed, by which they were forbidden, under a severe penalty, to put more than seven yards of linen in a shirt or shift.

We may form some idea of what the trade of Ireland must have been in former times, when, so late as the reign of Brien Boru, who died in 1014, notwithstanding the ravages and distresses which a Danish war, of above 200 years continuance, must have produced throughout the kingdom, the annual duties arising from goods imported into the single port of Limerick, and paid in red wine, amounted to 365 pipes! Even so lately as the last century, it is scarcely credible what riches this city derived from the bare manufacture of shoes, which were exported in amazing quantities; whereas now, instead of shoes and boots, we see the raw hides shipped off for foreign markets.

No country in the world seems better situated for a maritime power than Ireland, where the ports are convenient to every nation in Europe, and the havens safe and commodious. The great plenty of timber, the superior excellence of the oak, and the acknowledged skill of her ancient artisans, in wood-works, are circumstances clearly in her favour. That the Irish formerly exported large quantities of timber, is manifest from the churches of Gloucester, Westminster-monastery and palace, &c. being covered with Irish oak.

⁵² Government, population, &c. The government of the kingdom is in the hands of a viceroy, or lord-lieutenant, who lives in very great splendour. In his absence there are lords-justices, (styled their *excellencies*) generally three in number, viz. lord-primate, lord high chancellor, and the speaker of the house of commons. The parliament of Ireland meet every other Winter, or oftener, according to exigencies. Their only power consists in proposing bills, which are subject to the privy-council of England, and in a negative voice to any amendments. As to civil magistrates and the distribution of justice, they are here on the same footing as in England.

Ireland is divided into four large provinces, and those again into 32 counties, as follows:

I. U L S T E R.

Counties.	House.	Extent, &c.
1. Antrim	20738	Length 68 } miles { 460cir-
2. Armagh	13125	Breadth 98 } cumfer.

In 1731, while the duke of Dorset was lord-lieutenant, the inhabitants were numbered, and it was found that the four provinces contained as follows :

Connaught	21604	} Protestants { Papists
Leinster	203087	
Munster	115130	
Ulster	360632	
	700453	

There are 44 charter working-schools at present in Ireland, wherein 2025 boys and girls are maintained and educated. These schools are maintained by an annual bounty of 1000l. by a tax upon hawkers and pedlars, and by subscriptions and legacies. The children admitted, are those born of Popish parents, or such as would be bred Papists if neglected, and are of sound limbs. Their age must be from six to ten; the boys at 16, and the girls at 14, are apprenticed into Protestant families. The first school was opened in 1734. Five pounds are given to every person educated in these schools, upon his or her marrying a Protestant. An English act of parliament, lately tolerated the Catholic religion in Ireland, and by that means has relieved thousands of useful subjects.

The return of houses in Ireland for the year 1754, was 395,439; and for the year 1766, it was 424,046. Supposing therefore the numbers to have increased at the same rate, the number of houses now cannot be less than 454,130; which, allowing five persons to a family, will make the number of inhabitants 2,260,650: but as the return of houses by hearth-collectors is rather under than above the truth, and as there are many families in every parish, who are by law excused from that tax, and therefore not returned, the number on a moderate estimate will be 2,500,000. Sir W. Petty reckoned 160,000 cabins without a chimney; and if there be an equal number of such houses now, the number of people will be above 3,000,000. Mr Molyneux says, "Ireland has certainly been better inhabited for-

merly; for on the wild mountains between Ardmach and Dundalk, are observable the marks of the plough, as they are also on the mountains of Altmore. The same has been observed in the counties of Londonderry and Donnegal. Mountains that are now covered with bogs have been formerly ploughed; for when you dig five or six feet deep, you discover a proper soil for vegetation, and find it ploughed into ridges and furrows: a plough was found in a very dead bog near Donnegal; and an hedge, with some wattles, standing under a bog that was five or six feet in depth. The stump of a large tree was found in a bog ten feet deep at Castle-Forbes; the trunk had been burnt, and some of the cinders and ashes still were lying on the stump. Mr Molyneux further says, that on the top of an high mountain, in the north, there were then remaining the streets and other marks of a large town.

Beauty seems to be more diffused in England, among the lower ranks of life, than in Ireland; which may, however, be attributed to the mere modes of living. In England, the meanest cottager is better fed, better lodged, and better dressed, than the most opulent farmers here, who, unaccustomed to what our peasants reckon the comforts of life, know no luxury but in deep potatoes of aquavite.

From this circumstance, we may account for a fact reported by the officers of the army here. They say, that the young fellows of Ireland, who offer to enlist, are more generally below the given height, than in England. There can be no appeal from their testimony; for they were Irish, and the standard is an infallible test. No reason, indeed, can be given why the causes which promote or prevent the growth of other animals, should not have similar effects upon the human species. In England, where there is no stint of provisions, the growth is not checked; but, on the contrary, it is extended to the utmost bound of nature's original intention: whereas, in Ireland, where food is neither in the same quantity nor of the same quality, the body cannot expand itself, but is dwarfed and stunted in its dimensions. The gentlemen of Ireland are full as tall as those of England; the difference then, between them and the commonality, can only proceed from the difference of food.

The inhabitants, in general, of this kingdom, are very far from what they have too often and unjustly been represented by those of our country who never saw them, a nation of wild Irish. Miserable and oppressed, as by far too many of them are, an Englishman will find as much civility in general, as amongst the same class in his own country; and, for a small pecuniary consideration, they will exert themselves to please you as much as any people, perhaps, in the king's dominions. Poverty and oppression will naturally make mankind sour, rude, and unfociable, and eradicate, or at least suppress, all the more amiable principles and passions of humanity. But it should seem unfair and ungenerous to judge of, or decide against, the natural disposition of a man reduced by indigence and oppression almost to desperation. Let commerce, agriculture, and arts, but call forth the dormant activity of their genius, and rouse the native spirit of enterprise, which now lies torpid within them; let liberal laws unsettle their minds, and plenty cheer their tables, they will soon shew themselves deservng to rank

53
Appear-
ance and
character of
the inhabi-
tants.

The bogs wherewith Ireland is in some places overgrown, are not injurious to health, as is commonly imagined; the watery exhalations from these are neither so abundant, nor so noxious, as those from marshes, which become prejudicial from the various animal and vegetable substances which are left to putrify as soon as the waters are exhaled by the sun. Bogs are not, as one might suppose from their blackness, masses of putrefaction; but on the contrary, they are of such a texture, as to resist putrefaction above any other substance we know of. A shoe, all of one piece of leather, very neatly stitched, was taken out of a bog some years ago, yet entirely fresh;—from the very fashion of which, there is scarce room to doubt, that it had lain there some centuries. Butter, called *rouskin*, hath been found in hollowed trunks of trees, where it had been hid so long, that it was become hard and almost friable, yet not devoid of usefulness; that the length of time it had been buried was very great, we learn from the depth of the bog, which was ten feet, that had grown over it. But the common phenomenon of timber-trees dug out of these bogs, not only found, but also embalmed as afterwards to defy the injuries of time, demonstrate the antiseptic quality of them.

The horns of the moose-deer must have lain many centuries in a bog; for the Irish histories do not recognize the existence of the animal whereon they grew. Indeed, human bodies have, in many places, been dug up entire, which must have lain there for ages.

The growth of bogs, however, is variable in different places, from the variety of conditions in the situation, soil, humidity, and quantity of vegetable food; in some places it is very rapid, in others very slow; and therefore their altitudes cannot afford any certain measure of time.

In the manufacturing counties of the north, peat-fuel has become so scarce, that turbaries lett from five to eight guineas an acre. In some places they are so eradicated, there does not remain a trace of them, the ground being now converted into rich meadows and sweet pastures.

If we trust to authorities, we must conclude that Ireland was not originally inferior to England, either in the fertility of the soil, or salubrity of the climate. When this country shall have felt the happy effects of the late indulgences of the British parliament, by repealing several acts which restrained the trade of this kingdom with foreign ports, and allowing the exportation of woollen manufactures and glass, and shall have received further indulgences from the same authority; and when the spirit of industry shall be infused, in consequence of it, into the common people; their country will not be inferior to any other on the globe, under the same parallel. It is very difficult to say, whether foreign or domestic causes have operated most powerfully in laying waste this fruitful country; which, by being relieved from their late unnatural prohibitions, will be enabled to furnish a grand proportion of supplies to Great Britain, and will unavoidably become of vast importance by its reciprocal trade, in restraining the increase of that of France, who cannot carry on this important branch of traffic without the assistance of Irish wool. The wool of France is

short and coarse, being, in the language of the manufacturers, neither fine in the thread nor long in the staple. This obliges them to have recourse to the wool of Ireland, which possesses both these qualities. Assisted by a pack of Irish wool, the French are enabled to manufacture two of their own; which they will no longer be able to procure, as the Irish will now work up their own wool, which they used to export; great part of which found its way to France, and enabled them to supply other markets to the great prejudice of Britain. The happy effects of it have been already felt; for, notwithstanding it was so late as December 23. 1779, that the royal assent was given to the taking off their restraints on woollen exports, it appears, that on January 10, following, an export-entry was made at the custom-house of Dublin, of 1300 yards of serge for a foreign market, by William Worthington, Esq.

IRENÆUS (St.), bishop of Lyons, was born in Greece about the year 120. He was the disciple of Pappias and St Polycarp, by whom, it is said, he was sent into Gaul in 157. He stopped at Lyons, where he performed the office of a priest; and in 178 was sent to Rome, where he disputed with Valentinius, and his two disciples Florinus and Blastus. At his return to Lyons, he succeeded Photinus, bishop of that city; and suffered martyrdom in 202, under the reign of Severus. He wrote many works in Greek, of which there only remains a barbarous Latin version of his five books against heretics, some Greek fragments in different authors, and pope Victor's letter mentioned by Eusebius. The best editions of his works are those of Erasmus, in 1526; of Grabe, in 1702; and of Father Massuet, in 1710. St Irenæus's style is close, clear, and strong, but plain and simple. Dodwell has composed six curious dissertations on the works of St Irenæus.

He ought not to be confounded with St Irenæus the deacon, who in 275 suffered martyrdom in Tuscany, under the reign of Aurelian; nor with St Irenæus, bishop of Sirmich, who suffered martyrdom on the 25th of March 304, during the persecution of Dioclesian and Maximianus.

IRENE, empress of the east, celebrated for her valour, wit, and beauty; but detestable for her cruelty, having sacrificed her own soul to the ambition of reigning alone. She died in 803.

IRIS, the RAINBOW. See RAINBOW.

IRIS, in anatomy. See there, n^o 406, m.

IRIS, the *Flower de Luce*, or Flag-flower, &c. in botany, a genus of the monogynia order, belonging to the hexandria class of plants.

There are 21 species, all herbaceous flowering perennials, both of the fibrous, tuberous, and bulbous rooted kind, producing thick annual stalks from 3 or 4 inches to a yard high, terminated by large hexapetalous flowers, having three of the petals reflexed quite back and three erect; most of which are very ornamental, appearing in May, June, and July.

Culture. All the species are easily propagated by offsets from the roots, which should be planted in September, October, or November, though almost any time from September to March will do. They may also be raised from seed, which is the best method for procuring varieties. It is to be sown in autumn, soon after it ripens, in a bed or border of common earth,

Iron
Iroquois.

earth, and raked in. The plants will rise in the spring, and are to be transplanted next autumn.

Properties. The roots of the Florentine white iris, when dry, are supposed to have a pectoral virtue. They have an agreeable smell, resembling that of violets; and hence are used in perfumes, and in flavouring of liquors. When recent, they have a bitter, acrid, nauseous taste; and when taken into the body, prove strongly cathartic; on which account they have been recommended in dropfies, in the dose of three or four scruples.—The juice of the species called *bastard acorus*, or *yellow flag-flower*, is also very acrid, and hath been found to produce plentiful evacuations from the bowels when other means had failed. For this purpose, it may be given in doses of 80 drops every hour or two; but the degree of its acrimony is so uncertain, that it can hardly ever come into general use. The fresh roots have been mixed with the food of swine bitten by a mad-dog, and they escaped the disease, when others, bitten by the same dog, died raving mad. Goats eat the leaves when fresh; but cows, horses, and swine, refuse them. Cows will eat them when dry. The roots are used in the island of Jura for dying black.

IRON, a metal of a white, livid, greyish colour; extremely hard; and, next to platinum, the most difficult to be fused. See METAL; METALLURGY; and CHEMISTRY, n° 145, 202, 242, 279, 382. See also COLOUR-Making, n° 13, 32; and DYEING, n° 17.

From some observations made by Mr King on a petrification found on the coast of East Lothian in Scotland, he hath concluded, that iron greatly promotes petrification*. He hath likewise observed, that solutions of iron may be of considerable efficacy in preventing the destruction of stones by the sun and air. See the articles STONE, PETRIFICATION; also ROCK, MARBLE, MOUNTAIN, &c.

IRON-Sick, in the sea-language, is said of a ship or boat, when her bolts or nails are so eaten with rust, and so worn away, that they occasion hollows in the planks, whereby the vessel is rendered leaky.

IRON-Wood, in botany. See the article SIDEROXylum.

IRON-Work, in botany. See the article SIDERITIS.

IRONY, in rhetoric, is when a person speaks contrary to his thoughts, in order to add force to his discourse; whence Quintilian calls it *diverſiflouiūm*.

Thus, when a notorious villain is scornfully complimented with the titles of a very honest and excellent person; the character of the person commended, the air of contempt that appears in the speaker, and the exorbitancy of the commendations, sufficiently discover the dissimulation of irony.

Ironical exhortation is a very agreeable kind of trope; which, after having set the inconveniences of a thing in the clearest light, concludes with a feigned encouragement to pursue it. Such is that of Horace, when, having beautifully described the noise and tumults of Rome, he adds ironically,

“Go now, and study tuneful verse at Rome!”

IROQUOIS, the name of five nations in North America, in alliance with the British colonies. They are bounded by Canada on the north, by the British plantations of New York and Pensilvania on the east and south, and by the lake Ontario on the west.

IRRADIATION, the act of emitting subtle effluvia, like the rays of the sun, every way. See EFFLUVIA.

IRREGULAR, something that deviates from the common forms or rules: thus, we say an irregular fortification, an irregular building, an irregular figure, &c. See the articles FORTIFICATION, &c.

IRREGULAR, in grammar, such inflections of words as vary from the general rules; thus we say, irregular nouns, irregular verbs, &c.

The distinction of irregular nouns, according to Mr Ruddiman, is into three kinds, viz. variable, defective, and abundant; and that of irregular verbs into anomalous, defective, and abundant.

IRROMANGO, or ERRAMONGO, one of the new Hebrides islands, is about 24 or 25 leagues in circuit; the middle of it lies in E. Long. 169. 19. S. Lat. 18. 54. The inhabitants are of the middle size, and have a good shape and tolerable features. Their colour is very dark; and they paint their faces, some with black, and others with red pigment: their hair is curly and crisp, and somewhat woolly. Few women were seen; and those very ugly: they wore a petticoat made of the leaves of some plant. The men were quite naked, excepting a belt tied about the waist, and a piece of cloth, or a leaf, used for a wrapper. No canoes were seen in any part of the island. They live in houses covered with thatch; and their plantations are laid out by line, and fenced round. An unlucky scuffle between the British sailors and these people, in which four of the latter were desperately wounded, prevented captain Cook from being able to give any particular information concerning the produce, &c. of this island.

IRTIS, a large river of Asia, in Siberia, which rises among the hills of the country of the Kalmucks, and, running north-east, falls into the Ob by near Tobolsk. It abounds with fish, particularly sturgeon, and delicate salmon.

IRVIN, a sea-port town of Scotland, in the bailiwick of Cunningham; seated at the mouth of a river of the same name on the Frith of Clyde; in W. Long. 2. 55. N. Lat. 55. 36.

ISAAC, the Jewish patriarch, and example of filial obedience, died 1716, B. C. aged 180.

ISAAH, the first of the four greater prophets, was the son of Amos; and was of royal blood, his father being brother to Azariah king of Juda. He prophesied under the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, from the 785th to the 681st year before the Christian æra; when king Manasseh caused him to be put to death in a very advanced age. His prophecies are in Hebrew; his style is noble, sublime, and florid: he speaks so clearly of Christ, and of the great circumstances of his life and death, that he appears to be rather an evangelist and an historian who relates what has already happened, than a man who foretels what was not to be accomplished till several ages were passed.

ISÆUS, a Greek orator, born at Colchis, in Syria, was the disciple of Lyfias, and the master of Demosthenes; and taught eloquence at Athens, about 344 years B. C. Sixty-four orations are attributed to him; but he composed no more than 50, of which only 10 are now remaining. He took Lyfias for his model, and so well imitated his style and elegance, that.

Irradiation
Iffus.

Phil. Trans.
LXIX. 35.
1 seq.

that we might easily confound the one with the other, were it not for the figures which Iſæus firſt introduced into frequent uſe. He was alſo the firſt who applied eloquence to politics, in which he was followed by his diſciple Demoiſthenes.

He ought not to be confounded with Iſæus, another celebrated orator, who lived at Rome in the time of Pliny the Younger, about the year 97.

ISATIS, woad; a genus of the ſiliqueoſa order, belonging to the tetradynamia claſs, of plants. There are four ſpecies; but the only one worthy of notice is the tinctoria, or common woad, which is cultivated in ſeveral parts of Britain for the purpoſes of dyeing; being uſed as a foundation for many of the dark colours. See *COLOUR-Making*, n° 37; and *WOAD*.

The plant is biennial; the lower leaves are of an oblong oval figure, and pretty thick conſiſtence, ending in obtuſe roundiſh points; they are entire on their edges, and of a lucid green. The ſtalks riſe four feet high, dividing into ſeveral branches, garniſhed with arrow-shaped leaves fitting cloſe to the ſtalks; the branches are terminated by ſmall yellow flowers, in very cloſe cluſters, which are compoſed of four ſmall petals, placed in form of a croſs, which are ſucceeded by pods ſhaped like a bird's tongue, which, when ripe, turn black, and open with two valves, having one cell, in which is ſituated a ſingle ſeed.

This ſort is ſown upon freſh land which is in good heart, for which the cultivators of woad pay a large rent. They generally chooſe to have their lands ſituated near great towns, where there is plenty of dreſſing; but they never ſtay long on the ſame ſpot: for the beſt ground will not admit of being ſown with woad more than twice; and if it is often repeated, the crop ſeldom pays the charges of culture, &c. Thoſe who cultivate this commodity have gangs of people who have been bred to the employment; ſo that whole families travel about from place to place, wherever their principal fixes on land for the purpoſe. As the goodneſs of woad conſiſts in the ſize and fatneſs or thickneſs of the leaves, the only method to obtain this, is by ſowing the ſeed upon ground at a proper ſeaſon, and allowing the plants proper room to grow; as alſo to keep them clean from weeds, which, if permitted to grow, will rob the plants of their nourishment. After having made choice of a proper ſpot of land, which ſhould not be too light and ſandy, nor over ſtiff and moiſt, but rather a gentle hazel loam, whoſe parts will eaſily ſeparate, the next is to plough this up juſt before winter, laying it in narrow high ridges, that the froſt may penetrate through the ridges to mellow and ſoften the clods; then in the ſpring plough it again croſſwiſe, laying it again in narrow ridges. After it has lain for ſome time in this manner, and the weeds begin to grow, it ſhould be well harrowed to deſtroy them: this ſhould be repeated twice while the weeds are young; and, if there are any roots of large perennial weeds, they muſt be harrowed out, and carried off the ground. In June the ground ſhould be a third time ploughed, when the furrows ſhould be narrow, and the ground ſtirred as deep as the plough will go, that the parts may be as well ſeparated as poſſible; and when the weeds appear again, the ground ſhould be well harrowed to deſtroy them. Toward the end of July, or the beginning of Auguſt, it ſhould

be ploughed the laſt time, when the land ſhould be laid ſmooth; and when there is a proſpect of ſhowers, the ground muſt be harrowed to receive the ſeeds, which ſhould be ſown in rows with the drill-plough, or in broad-caſt after the common method; but it will be proper to ſleep the ſeeds one night in water before they are ſown, which will prepare them for vegetation: if the ſeeds are ſown in drills, they will be covered with an inſtrument fixed to the plough for that purpoſe, but thoſe which are ſown broad-caſt in the common way muſt be well harrowed in. If the ſeeds are good, and the ſeaſon favourable, the plants will appear in a fortnight, and in a month or five weeks will be fit to hoe; for the ſooner this is performed when the plants are diſtinguiſhable, the better they will thrive, and the weeds being then young will be ſoon deſtroyed. The method of hoeing theſe plants is the ſame as for turneps: with this difference only, that theſe plants need not be thinned ſo much; for at the firſt hoeing, if they are ſeparated to the diſtance of four inches, and at the laſt to ſix inches, it will be ſpace enough for the growth of the plants; and if this is carefully performed, and in dry weather, moſt of the weeds will be deſtroyed: but as ſome of them may eſcape in this operation, and young weeds will riſe, ſo the ground ſhould be a ſecond time hoed in the beginning of October, always chooſing a dry time for this work; at this ſecond operation, the plants ſhould be ſingled out to the diſtance they are to remain. After this, if carefully performed, the ground will be clean from weeds till the ſpring, when young weeds will come up: therefore about the middle of March will be a good time to hoe the ground again; for while the weeds are young, it may be performed in leſs than half the time it would require if the weeds were permitted to grow large, and the ſun and wind will much ſooner kill them: this hoeing will alſo ſtir the ſurface of the ground, and greatly promote the growth of the plants; if this is performed in dry weather, the ground will be clean till the firſt crop of woad is gathered, after which it muſt be again well cleaned; if this is carefully repeated after the gathering each crop, the land will always lie clean, and the plants will thrive the better. The expence of the firſt hoeing will be about ſix ſhillings per acre, and for the after hoeings half that price will be ſufficient, provided they are performed when the weeds are young, for if they are ſuffered to grow large, it will require more labour, nor can it be ſo well performed.

If the land, in which this ſeed is ſown, ſhould have been in culture before for other crops, ſo not in good heart, it will require dreſſing before it is ſown, in which caſe rotten ſtable-dung is preferable to any other; but this ſhould not be laid on till the laſt ploughing, juſt before the ſeeds are ſown, and not ſpread till the land is ploughed, that the ſun may not exhale the goodneſs of it, which in ſummer is ſoon loſt when ſpread on the ground. The quantity ſhould not be leſs than 20 loads to each acre, which will keep the ground in heart till the crop of woad is ſpent.

The time for gathering of the crop is according to the ſeaſon: but it ſhould be performed as ſoon as the leaves are fully grown, while they are perfectly green; for when they begin to change pale, great part of their goodneſs is over, for the quantity will be leſs, and

and the quality greatly diminished.

If the land is good, and the crop well husbanded, it will produce three or four gatherings; but the two first are the best. These are commonly mixed together in the manufacturing of it: but the after crops are always kept separate; for if these are mixed with the other, the whole will be of little value. The two first crops will sell from 25 to 30 l. a ton; but the latter will not bring more than 7 or 8 l. and sometimes not so much. An acre of land will produce a ton of wood, and in good seasons near a ton and an half.

When the planters intend to save the seeds, they cut three crops of the leaves, and then let the plants stand till the next year for seed; but if only one crop is cut, and that only of the outer leaves, letting all the middle leaves stand to nourish the stalks, the plants will grow stronger, and produce a much greater quantity of seeds.

These feeds are often kept two years, but it is always best to sow new seeds when they can be obtained. The feeds ripen in August; and when the pods turn to a dark colour, the feeds should be gathered. It is best done by reaping the stalks in the same manner as wheat, spreading the stalks in rows upon the ground: and in four or five days the feeds will be fit to thresh out, provided the weather is dry; for if it lies long, the pods will open and let out the feeds.

There are some of the woad planters, who feed down the leaves in winter with sheep; which is a very bad method: for all plants which are to remain for a future crop, should never be eaten by cattle, for that greatly weakens the plants; therefore those who eat down their wheat in winter with sheep are equally blameable.

ISATIS, in zoology, a synonyme of the *Lagopus*. See CANIS.

ISAURA, (anc. geog.), a strong city at mount Taurus, in Isauria: twice demolished: first by Perdiccas, or rather by the inhabitants, who, through despair, destroyed themselves by fire, rather than fall into the hands of the enemy; again, by Servilius, who thence took the surname *Iauricus*. Strabo says, there were two *Isaurus*, the old and the new, but so near, that other writers took them but for one.

ISAURIA, (anc. geog.) a country touching Pamphylia and Cilicia on the north, rugged and mountainous, situate almost in mount Taurus, and taking its name from *Isaura*.

ISCHIUM, in anatomy, one of the bones of the pelvis. See ANATOMY, n° 40.

ISCHURY, a disease consisting of an entire suppression of urine. See (the *Index* subjoined to) MEDICINE.

ISCLASTICS, a kind of games, or combats, celebrated in Greece and Asia, in the time of the Roman emperors.

The victor at these games had very considerable privileges conferred on him, after the example of Augustus and the Athenians, who did the like to conquerors at the olympic, pythian, and isthmian games. They were crowned on the spot immediately after their victory, had pensions allowed them, were furnished with provisions at the public cost, and were carried in triumph to their country.

ISCHIA, an Island of Italy, in the kingdom of

Naples, about 15 miles in circumference, lying on the coast of the Terra di Lavoro, from which it is three miles distant. It is full of agreeable valleys, which produce excellent fruits. It hath also mountains on which grow vines of an excellent kind: likewise fountains, rivulets, and fine gardens.

ISCHIA, a town of Italy, and capital of an island of the same name, with a bishop's see, and a strong fort. Both the city and fortrefs stand upon a rock, which is joined to the island by a strong bridge; the rock is about seven furlongs in circumference. The city is like a pyramid of houses piled upon one another, which makes a very singular and striking appearance. At the end of the bridge next the city are iron gates, which open into a subterraneous passage, through which they enter the city. They are always guarded by soldiers who are natives of the island. E. Long. 13. 55. N. Lat. 40. 50.

ISENACH, a town of Germany, in the circle of Upper Saxony, from whence one of the Saxon princes takes the title of *duke*. There are iron mines in the neighbourhood. E. Long. 9. 17. N. Lat. 51. 0.

ISENBURG, a large town of Germany, capital of a county of the same name, with a handsome castle, seated on the river Seine, in E. Long. 7. 14. N. Lat. 50. 28. The county belongs to the elector of Treves.

ISENGHEIN, a town of the Austrian Netherlands, with the title of a *principality*, seated on the river Mandera, in E. Long. 3. 18. N. Lat. 50. 44.

ISH, in Scots law, signifies *expiry*. Thus we say "the *ish* of a lease." It signifies also *to go out*; thus we say "free *ish* and entry" from and to any place.

ISIA, feasts and sacrifices anciently solemnized in honour of the goddess Isis.

The *isha* were full of abominable impurities; and for that reason, those who were initiated were obliged to take an oath of secrecy: they were held for nine days successively; but were so abominable, that the senate abolished them at Rome, under the consulship of Piso and Gabinus.

ISENARTS, or EISENARTS, a considerable town of Germany in Austria, and in Styria; famous for its iron mines. E. Long. 15. 25. N. Lat. 46. 56.

ISERNIA, a town of Italy, in the kingdom of Naples, and in the county of Molise, with a bishop's see. It is seated at the foot of the Appenines, in E. Long. 14. 20.

ISIDORUS, called DAMIATENSIS, or PELUSIOTAS, from his living in a solitude near that city, was one of the most famous of all St Chrysostom's disciples, and flourished in the time of the general council held in 421. We have 2012 of his epistles in five books. They are short, but well written in Greek. The best edition is that of Paris, in Greek and Latin, printed in 1638, in folio.

ISIGNI, a town of France, in Lower Normandy, with a small harbour, and well known on account of its salt-works, its cyder, and its butter. W. Long. 0. 50. N. Lat. 49. 20.

ISIS, an Egyptian goddess, whose worship was so infamous, that the priests were forbid to speak any thing of it; and the senate did often prohibit its practice.

practice in Rome. She is pictured with a *sistrum* in her hand, a musical instrument not much unlike a cymbal; and was often called *Terra*, from whence she is represented as having many breasts. Some historians say she was queen of Egypt, and reigned there with her husband Osiris, A. M. 2500.

ISINGLASS. See ICHTHYOCOLLA.

ISLAND, a tract of dry land encompassed with water; in which sense it stands contradicting with the word CONTINENT, or TERRA FIRMA.

Several naturalists are of opinion, that the islands were formed at the deluge; others think, that there have been new islands formed by the casting up of vast heaps of clay, mud, sand, &c.; others think they have been separated from the continent by violent storms, inundations, and earthquakes. These last have observed, that the East-Indies, which abound in islands more than any other part of the world, are likewise more annoyed with earthquakes, tempests, lightnings, volcanos, &c. than any other part. Others again conclude, that islands are as ancient as the world, and that there were some at the beginning; and, among other arguments, support their opinion from Gen. x. 5. and other passages of Scripture.

Varenius thinks that there have been islands produced each of these ways. St Helena, Ascension, and other steep rocky islands, he supposes to have become so by the sea's overflowing their neighbouring champaigns: but by the heaping up huge quantities of sand, and other terrestrial matter, he thinks the islands of Zealand, Japan, &c. were formed. Sumatra and Ceylon, and most of the East-India islands, he thinks, were rent off from the main land; and concludes, that the islands of the Archipelago were formed in the same way, imagining it probable that Deucalion's flood might contribute towards it. The ancients had a notion that Delos, and a few other islands, rose from the bottom of the sea; which, how fabulous soever it may appear, agrees with later observations. Seneca takes notice, that the island Therasia rose thus out of the Ægean sea in his time, of which the mariners were eye-witnesses.

It is indeed very probable, that many islands have existed not only from the deluge, but from the creation of the world; and we have undoubted proofs of the formation of islands in all the different ways above-mentioned. Another way, however, in which islands are frequently formed in the South Sea, is by the coralline insects: (See CORALLINA.) On this subject the following curious dissertation by Alexander Dalrymple, Esq; hath appeared in the Philosophical Transactions for the year 1767.

"These islands are generally long and narrow: they are formed by a narrow bar of land, inclosing the sea within it; generally, perhaps always, with some ingress at least to the tide; commonly with an opening capable of receiving a canoe, and frequently sufficient to admit even larger vessels.

"The origin of these islands will explain their nature. What led me first to this deduction was an observation of Abdul Roobin, a Sooloo pilot, that all the islands lying off the north-east coast of Borneo had shoals to the eastward of them.

"These islands being covered to the westward by Borneo, the winds from that quarter do not attack

them with violence. But the north-east winds, tumbling in the billows from a wide ocean, heap up the coral with which those seas are filled. This, obvious after storms, is perhaps at all other times imperceptibly effected.

"The coral banks, raised in the same manner, become dry. These banks are found of all depths, at all distances from shore, entirely unconnected with the land, and detached from each other: although it often happens that they are divided by a narrow gut without bottom.

"Coral banks also grow, by a quick progression, towards the surface; but the winds, heaping up the coral from deeper water, chiefly accelerate the formation of these into shoals and islands. They become gradually shallower; and, when once the sea meets with resistance, the coral is quickly thrown up by the force of the waves breaking against the bank; and hence it is, that, in the open sea, there is scarce an instance of a coral bank having so little water that a large ship cannot pass over, but it is also so shallow that a boat would ground on it.

"I have seen these coral banks in all the stages; some in deep water, others with few rocks appearing above the surface; some just formed into islands, without the least appearance of vegetation; and others from such as have a few weeds on the highest part, to those which are covered with large timber, with a bottomless sea at a pistol-shot distance.

"The loose coral, rolled inward by the billows in large pieces, will ground; and the reflux being unable to carry them away, they become a bar to coagulate the sand, always found intermixed with coral; which sand, being easily raised, will be lodged at top. When the sand-bank is raised by violent storms beyond the reach of common waves, it becomes a resting-place to vagrant birds, whom the search of prey draws thither. The dung, feathers, &c. increase the soil, and prepare it for the reception of accidental roots, branches, and seed, cast up by the waves, or brought thither by birds. Thus islands are formed: the leaves and rotten branches intermixing with the sand, form in time a light black mould, of which in general these islands consist; more sandy as less woody; and, when full of large trees, with a greater proportion of mould.

"Cocoa nuts, continuing long in the sea without losing their vegetative powers, are commonly to be found in such islands; particularly as they are adapted to all soils, whether sandy, rich, or rocky.

"The violence of the waves within the tropics, must generally be directed to two points, according to the monsoons.

"Hence the islands formed from coral banks must be long and narrow, and lie nearly in a meridional direction. For even supposing the banks to be round, as they seldom are when large, the sea, meeting most resistance in the middle, must heave up the matter in greater quantities there than towards the extremities; and, by the same rule, the ends will generally be open, or at least lowest. They will also commonly have soundings there, as the remains of the bank, not accumulated, will be under water.

"Where the coral banks are not exposed to the common monsoon, they will alter their direction; and

Island.

and be either round, extend in the parallel, or be of irregular forms, according to accidental circumstances.

"The interior parts of these islands being sea, sometimes form harbours capable of receiving vessels of some burthen, and, I believe, always abound greatly with fish; and, such as I have seen, with turtle-grais and other sea-plants, particularly one species, called by the Sooolos *gammye*, which grows in little globules, and is somewhat pungent, as well as acid, to the taste.

"It need not be repeated, that the ends of those islands only are the places to expect foundings; and they commonly have a shallow spit running out from each point.

"Abdul Roobin's observation points out another circumstance, which may be useful to navigators; by consideration of the winds to which any islands are most exposed, to form a probable conjecture which side has deepest water; and from a view which side has the shoals, an idea may be formed which winds rage with most violence."

Islands from their situation enjoy many great advantages, the principal of which are these. In the first place, many benefits are derived to the inhabitants of an island from its unity. The very largest country on a continent is still but a part, which implies dependence, and is necessarily attended with a train of imperfections; from all of which, by the unerring and unalterable laws of nature, the people who live in an island are or may be entirely free. All countries on the continent are exposed to continual dangers, against which their inhabitants must be perpetually upon their guard. This renders a large military force requisite. It involves them in continual negotiations, leagues, and alliances; all of which, however, cannot exempt them from frequent wars, or the miseries that attend them, and which have commonly bad effects on their internal policy. In the next place, the climate is generally mild and salubrious from the vapours of the surrounding sea, which according to the latitude abates the violence of heat, and moderates the rigour of cold, both which are sensibly and constantly less than on continents under the same elevation of the pole. We have a remarkable instance of this, in the islands called anciently *Stachades*, in the modern Latin *Insule Arcarum*, by us the islands of *Hieres*. They are three in number, lying in 43° north latitude, before the port of Toulon. In them, the fruits of France and Italy arrive at the highest perfection, and all the medical herbs of Italy, Greece, and Egypt, grow wild. Yet the climate is wonderfully temperate and pleasant in all seasons*.—There is also commonly a greater variety, and always a greater fertility, in the soil, occasioned chiefly by the warmth of the circumambient air, frequent showers, and, in consequence of both, being continually impregnated with vegetable salts. Another considerable advantage arises from its accessibility on every side, by which it is open to receive supplies from other countries, and has the convenience of exporting its commodities and manufactures to all markets, and, in comparison of the continent, at all seasons. The opposite sides of an island may in regard to commerce be considered as two countries; each has its ports, its proper commodities, its proper correspondencies; in con-

Island.

sequence of which, it promotes the cultivation, and procures vent for the manufactures, of a large district behind it; while the intermediate midland space finds a profit in that inland trade, which these two districts supply. The winds contrary on one side are favourable on the other; and the sea, the common road to both coasts, is continually ploughed by vessels outward and homeward bound, which keeps up that active and enterprising spirit which characterizes islanders. An island has at once the most extensive and the most effectual frontier, and this on all sides, subsisting for ever, without repairs, and without expence: and, which is still more, derives from this very frontier a great part of the subsistence of its inhabitants, and a valuable article in its commerce, from its fisheries. It is commonly said the sea is a mine, but in truth it is better; its treasures are more lasting and more certain, procured by labour solely, and fit for use or for sale as soon as procured, quickly consumed, and thereby the source of continual employment to a stout, hardy, laborious race of men, who likewise find employment for numbers, and are in various respects otherwise beneficial members of the community. The defence of this natural barrier, which, as we have said, costs nothing; but on the contrary yields much, is not only permanent, but in every respect more to be relied on than any that could be raised by the skill and industry of men at the greatest expence. All these blessings and benefits are infused by the lesson that Nature dictates, some would say the law which she prescribes, to the inhabitants of every island, to place all their hopes in the assiduous cultivation of their own country, to bend all their endeavours to raising and extending their commerce, and to put their trust in Providence, and in the safeguard which she directs; men accustomed to robust and hardy exercises, and in what necessarily arises from their way of life, a naval force. The first inhabitants come in vessels, are for a time dependent on the country from whence they came, arrive at independence by enlarging their correspondence: and thus commerce is natural and essential to the people of an island; which is the reason that they thrive so long as they possess it, and gradually decline in the same proportion in which that decays.

ISLAND of Ice. See ICE-Island.

Floating ISLANDS. Histories are full of accounts of floating islands; but the greatest part of them are either false or exaggerated. What we generally see of this kind is no more than the concretion of the lighter and more viscous matter floating on the surface of the water in lakes; and, with the roots of the plants, forming congeries of different sizes, which, not being fixed to the shore in any part, are blown about by the winds, and float on the surface. These are generally found in lakes, where they are confined from being carried too far; and, in process of time, some of them acquire a very considerable size. Seneca tells us of many of these floating islands in Italy; and some later writers have described not a few of them in other places. But, however true these accounts might have been at the time when they were written, very few proofs of their authenticity are now to be found; the floating islands having either disappeared again, or been fixed to the sides in such a manner as to make a part of the shore. Pliny tells us of a great island

* See

no 6.—23

Island
 Trinic.

which at one time swam about in the lake Cutilia in the country of Reatinum, which was discovered to the old Romans by a miracle; and Pomponius tells us, that in Lydia there were several islands to loose in their foundations, that every little accident shook and removed them.

ISLAND (or *Iceland*) *Crystal*, a body famous among the writers on optics, for its property of a double refraction; but named very improperly, as it has none of the distinguishing properties of crystal, and is plainly a body of another class. Dr Hill has determined it to be a genus of spars, which he has called, from their figure, *paralleloipedia*, and of which he has described several species; all of which, as well as some other bodies of a different genus, have the same properties. It is always found in form of an oblique paralleloiped with six sides; and is found of various sizes, from a quarter of an inch to three inches or more in diameter. It is pellucid, and not much less bright than the purest crystal; and its planes are all tolerably smooth, tho', when nicely viewed, they are found to be waved with crooked lines made by the edges of imperfect plates. What appears very singular in the structure of this body is, that all the surfaces are placed in the same manner, and consequently it will split off into thin plates either horizontally or perpendicularly; but this is found, on a microscope examination, to be owing to the regularity of figure, smoothness of surface, and niceness of joining, in the small paralleloiped concretions of which the whole is composed. It is very soft, and easily scratched with the point of a pin. It will not give fire on being struck against steel; and ferments and is totally dissolved in aquafortis. It was first discovered in Iceland, from whence it has its name; but has been found in France, Germany, and many other places. In England, fragments of other spars are often mistaken for it; many of them having in some degree the same properties. For an account of the singular refractive property of this substance, see (*the Index* subjoined to) **OPTICS**.

ISLE-ADAM, a town of France, with a handsome castle, and the title of a baron; seated on the river Oise, three miles from Beaumont, and 20 from Paris. E. Long. 2. 13. N. Lat. 49. 7.

ISLE-de-Dieu, a small island of France in the sea of Gascony, and on the coast of Poitou, from which it is 14 miles. W. Long. 2. 5. N. Lat. 46. 45.

ISLE-de-France, is one of the 12 general governments of France; bounded on the north by Picardy; on the west by Normandy, on the south by the government of Orleannois, and on the east by that of Champagne. It is about 90 miles in length, and as much in breadth; and is watered by the rivers Seine, Marne, Oise, and Aisne. The air is temperate, and the soil fertile; and it abounds in wine, corn, and fruits. It contains 10 small districts, and Paris is the capital city.

ISNY, an imperial town of Germany, in Suabia, and in Algow; seated on the river Iny, in E. Long. 9. 10. N. Lat. 47. 33.

ISNIC, a town of Turkey in Asia, and in Natolia, with a Greek archbishop's see. It is the ancient Nice, famous for the first general council held here in 325. There is now nothing remaining of its ancient splendor but an aqueduct. The Jews inhabit the greatest part

of it; and it is seated in a country fertile in corn and Isochronal excellent wine. E. Long. 30. 9. N. Lat. 47. 15.

ISOCHRONAL, is applied to such vibrations of a pendulum, as are performed in the same space of time; as all the vibrations or swings of the same pendulum are, whether the arches it describes are shorter or longer.

ISOCHRONAL-Line, that in which a heavy body is supposed to descend without any acceleration.

ISOCRATES, one of the greatest orators of Greece, was born at Athens, 436 B. C. He was the son of Theodorus, who had enriched himself by making musical instruments, and gave his son a liberal education. Isocrates was the disciple of Prodicus, Gorgias, and other great orators. He endeavoured at first to declaim in public, but without success; he therefore contented himself with instructing his scholars and making private orations. He always shewed great love for his country; and being informed of the loss of the battle of Chereonea, he abstained four days from eating, and died, aged 98. There are still extant 21 of his discourses or orations, which are excellent performances, and have been translated from the Greek into Latin by Wolfius. Isocrates particularly excelled in the justness of his thoughts, and the elegance of his expressions. There are also nine letters attributed to him.

ISOLA, a town of Italy, in the kingdom of Naples, and in the Farther Calabria, with a bishop's see. It is a sea-port town, and is seated 15 miles south-east of St Severina. E. Long. 7. 33. N. Lat. 39. 1.

ISOPERIMETRICAL FIGURES, in geometry, are such as have equal perimeters or circumferences.

ISOCELES TRIANGLE, in geometry, one that has two equal sides,

ISPAHAN, or, as the Persians pronounce it, *Spau-hawn*, the capital of Persia, is situated in the province of Irac, Agemi, or Persia Proper, upon the ruins, as generally supposed, of the ancient Hecatompylos, or, as others think, of the Aspa of Ptolemy. Most of the Eastern astronomers and geographers place it in N. Lat. 32. 25. E. Long. 86. 40. It stands in a very extensive plain, surrounded by mountains; and has eight districts belonging to it, that contain about 400 towns and villages. The fertility of the soil, the mildness of the seasons, and the fine temperature of the air, all conspire to render Isphahan one of the most charming and delightful cities in the world. It is unanimously agreed, that the present city is of no great antiquity; and the two parts into which it is divided, preserve the names of two contiguous towns, from the junction of which it was formed. The inhabitants of these, notwithstanding their neighbourhood, bear an inveterate antipathy to each other; which they discover on all public occasions. Spauhawn owes the glory it now possesses to the great Shah Abas; who, after the conquest of the kingdoms of Lar and Ormus, charmed with the situation of this place, made it the capital of his empire, between the years 1620 and 1628. The mountains, with which this city is surrounded, defend it alike from the sultry heats of summer, and the piercing winds of the winter-season; and the plain on which it stands, is watered by several rivers, which contribute alike to its ornament and use. Of these rivers,

the.

Ispahan.

the Zenderoud, after being joined by the Mahmood, passes by Spauhawn; where it has three fine bridges over it, and is as broad as the Seine at Paris. The waters of these united streams are sweet, pleasant, and wholesome, almost beyond comparison; as, indeed, are all the springs found in the gardens belonging to the houses of Spauhawn. The extent of Spauhawn is very great; not less, perhaps, than 20 miles within the walls, which are of earth, poorly built, and so covered with houses and shaded with gardens, that in many places it is difficult to discover them. The Persians are wont to say, *Spauhawn nisfigehon*, i. e. Spauhawn is half the world. Sir John Chardin says, that tho' some reckoned 11,000,000 of inhabitants in it, he did not himself look upon it as more populous than London. At a distance, the city is not easily distinguished; for many of the streets being adorned with plantains, and every house having its garden, the whole looks like a wood. The streets in general are neither broad nor convenient; there being three great evils which attend them: the first is, that being built on common sewers, these are frequently broke up, which is very dangerous, considering that most people are on horseback; the second is, that there are many wells or pits in them, which are not less dangerous; the third arises from the people's emptying all their ordure from the tops of their houses: this last, indeed, is in some measure qualified by the dryness of the air, and by its being quickly removed by the peasants, who carry it away to dung their grounds. Some reckon eight, and others ten gates, besides posterns; but all agree that there is no difficulty of entering at any hour of the day or night. The three principal suburbs annexed to it are, Abbas-abad, built by Shah Abbas, and belonging to the people of Tauris; Julfa, inhabited by a colony of Armenians, called by some *New Julfa*, to distinguish it from the ancient city of that name, situated in Armenia, upon the Araxes, whence the original inhabitants of New Julfa were brought; and Ghebr-Abad, or, as the Arabs pronounce it, Kebr-Abad, the street of the magians, occupied entirely by the professors of magism, or the religion of the ancient Persians. The river Zenderoud separates the city of Ispahan and Abbas-Abad, from Julfa and Ghebr-Abad. This city has suffered greatly since the commencement of the dreadful rebellion in 1721; the whole kingdom from that period, till a few years ago, having been almost a continued scene of blood, ravages, and confusion. A celebrated modern traveller, who was on the spot, tells us, that the inhabitants of Julfa, not many years before the above revolution happened, amounted to 30,000 souls; had 13 churches; and above 100 priests; and paid the Persian court 200 tomans yearly for the free exercise of their religion: that some of the streets were broad and handsome, and planted with trees, with canals and fountains in the middle; others narrow and crooked, and arched a top; others again, though extremely narrow, as well as turning and winding many ways, were of an incredible length, and resembled so many labyrinths: that, at a small distance from the town, there were public walks, adorned with rows of plane-trees on each side, ways paved with stones, fountains, and cisterns: that there were above 100 caravanseras for the use of merchants and travellers, many of which were built by the kings and prime

nobility of Persia: that, as little rain fell there, the streets were frequently full of dust, which rendered the city disagreeable during a considerable part of the summer; that the citizens, however, to make this inconvenience more tolerable, used to water them when the weather was warmer than usual: that there was a castle in the eastern part of the town, which the citizens looked upon as impregnable, in which the public money, and most of the military stores, were said to be kept: that, notwithstanding the baths and caravanseras were almost innumerable, there was not one public hospital: that most of the public buildings were rather neat than magnificent, though the great meydan or market-place, the royal palace (which is three quarters of a league in circumference), and the alley denominated *Toher-bag*, adjoining to it, made a very grand appearance: that the former contained the royal mosque; the building denominated *kayserich*, where all sorts of foreign commodities were exposed to sale; and the miut, styled by the Persians *feraa khoneh*, where the current-money of the kingdom was coined: that, besides the native Persians, there were then in Ispahan above 10,000 Indians, all supported by trade; 20,000 Georgians, Circassians, and Tartars of Daghestan or Lefgees, with a considerable number of English, Dutch, Portuguese, and a few French: that the Capuchins, discalceated or bare-footed Carmelites, Jesuits, Dominicans, and Austin friars, had likewise their convents here, though they were unable to make any converts; and that there were above 100 mosques and public colleges. But since the fatal period above-mentioned, the suburb of Julfa was almost totally abandoned by the Armenians. The government of Ispahan, 23 leagues long and as many broad, comprehending several districts, most of them formerly well peopled, appeared not many years ago little better than a desert; most of the inhabitants of that fertile and delightful tract being fled and dispersed. Multitudes of them had taken a precarious refuge in the mountains of Loristan, lying between Ispahan and Sufter, whose lands were left untilld, and their houses mouldered into ruins. In short, all the distresses of an unsuccessful war, or the invasion of a barbarous enemy, could not have plunged the people of Ispahan into greater misery than the victories of their tyrannical king, Nadir Shah, who seemed more solicitous to humble his own subjects than his enemies. As this was the case before the death of that usurper, in what condition must we suppose Ispahan and the rest of Persia to be in now, as the kingdom hath been ever since, till very lately, desolated by a civil war occasioned by several competitors for the crown? Whoever desires to be more fully informed in relation to the state of the city before the troubles, may consult Sir John Chardin, Mr Tavernier, M. le Brun, and Dr Kempter, who is much later than the others.

ISPIDA, in ornithology. See ALCEDO.

ISRAEL, a name given by the Deity to the patriarch Isaac, and often used for the whole nation of the Jews.

Kingdom of ISRAEL, that of the ten tribes after their revolt from the house of David; called also the kingdom of *Ephraim* and of *Samaria*; extending both on this and on the other side of Jordan; and from Syria, thro' Galilee, to the borders of Benjamin; com-

Issachar prising the tribes of Dan and Simeon, and the west of Judah, quite to the borders of Egypt. Issus.

ISSACHAR, one of the divisions of Palestine by tribes; lying to the south of Zabulon, so as by a narrow slip to reach the Jordan, between Zabulon and Manasseh, Josh. xix. But whether it reached to the sea, is a question; some holding that it did: an assertion not easy to be proved, as Joshua makes no mention of the sea in this tribe, nor does Josephus extend it farther than to mount Carmel; and in Josh. xvii. 10. After is said to touch Manasseh on the north, which could not be if Issachar extended to the sea.

ISSOUDUN, a considerable town of France, in Berry. It carries on a great trade in wood, cattle, cloth, hats, and stockings; is seated partly on a plain, and partly on an eminence. E. Long. 2. 5. N. Lat. 46. 57.

ISSUE, in law. See PLEA and Issue.

ISSUES, in surgery, are little ulcers made designedly by the surgeon in various parts of the body, and kept open by the patient, for the preservation and recovery of his health.

ISSUS, now AJAZO, a town of Cilicia in Natolia, with a harbour on the Levant Sea, a little to the north of Scanderoon. E. Long. 36. 25. N. Lat. 36. 56.

Near this place, in a difficult pass between the mountains and the sea, Alexander the Great fought his second battle with Darius. One great cause of the defeat which the Persians received here was the bad conduct of their monarch, who led his numerous forces into a narrow place, where they had not room to act. Alexander was so much surprised when he first received the news that Darius was behind him, that he could scarce believe it to be true: but when he was thoroughly satisfied of the fact, and that Darius had again passed the river Pinarus, he called a council of war, wherein, without asking any body's advice, he only told them, that he hoped they would remember their former actions; and that they, who were always conquerors, were about to fight people who were always beat. He further observed, that Darius seemed to be infuriated, since he had with such expedition quitted an open and champaign country, where his numbers might have acted with advantage, to fight in a place inclosed, where the Macedonian phalanx might be well drawn up, and where his numbers could only incommode him. He then made the necessary dispositions for repassing the mountains, posted guards where he found them necessary, and then commanded his troops to refresh themselves, and to take their rest till morning.

At break of day he began to repass the mountains, obliging his forces to move in close order where the road was narrow, and to extend themselves as they had more room; the right wing keeping always close to the mountain, and the left to the sea-shore. On the right there was a battalion of heavy-armed troops, besides the targeteers under the command of Nicanor the son of Parmenio. Next these, extending to the phalanx, were the corps of Cœnus and Perdicas; and on the left, the respective bodies commanded by Amyntas, Ptolemy, and Meleager. The foot appointed to support them were commanded by Craterus; but the whole left wing was committed to Parmenio, with strict orders not to decline from the sea-shore, lest the

Persians should surround them. Darius ordered 20,000 foot and 30,000 horse to retire, finding that he already wanted room to draw up the rest. His first line consisted of 30,000 Greek mercenaries, having on their right and left 60,000 heavy-armed troops, being the utmost the ground would allow. On the left, towards the mountain, he posted 20,000 men, which, from the hollow situation of the place, were brought quite behind Alexander's right wing. The rest of his troops were formed into close and useless lines behind the Greek mercenaries, to the number in all of 600,000 men. When this was done, he suddenly recalled the horse who had retired, sending part of them to take post on his right against the Macedonians commanded by Parmenio; and the rest he ordered to the left towards the mountain: but, finding them unserviceable there, he sent the greatest part of them to the right; and then took upon himself, according to the custom of the Persian kings, the command of the main body. As soon as Alexander perceived that the weight of the Persian horse was disposed against his left wing, he dispatched, with as much secrecy as he could, the Thessalian cavalry thither, and supplied their places on the right by some brigades of horse from the van, and light-armed troops. He also made such dispositions, that, notwithstanding the mighty advantage of the hollow mountain, the Persians could not surround him. But, as these precautions had considerably weakened the centre of his army, he ordered those advanced posts on the enemy's left, of which he was most apprehensive, to be attacked at the very beginning of the fight; and when they were easily driven from them, he recalled as many troops as were necessary to strengthen his centre.

When all things were in order, Alexander gave strict command, that his army should march very slowly. As for Darius, he kept his troops fixed in their posts, and in some places threw up ramparts; whence the Macedonians rightly observed, that he thought himself already a prisoner. Alexander at the head of the right wing engaged first, and without any difficulty broke and defeated the left wing of Darius. But, endeavouring to pass the river Pinarus after them, his troops in some measure losing their order, the Greek mercenaries fell upon them in flank, and made them fight, not only for victory, but for their lives. Ptolemy the son of Seleucus, and 120 Macedonians of some rank, were killed upon the spot. But the foot next to Alexander's right wing coming in seasonably to its relief, fell upon the mercenaries in flank, amongst whom a dreadful carnage was made; they being in a manner surrounded by the horse and light-armed troops, which at first pursued the left wing, and the foot that had now passed the river. The Persian horse on the right still fought gallantly; but, when they were thoroughly informed of the rout of their left wing, of the destruction of the Greek mercenaries, and that Darius himself was fled, they began to break, and betake themselves to flight also. The Thessalian cavalry pursued them close at the heels; the narrow craggy roads incommoded them exceedingly, so that vast numbers of them perished. As for Darius, he fled, soon after the left wing was broken, in a chariot with a few of his favourites: as far as the country was plain and

and open, he escaped well enough; but, when the roads became rocky and narrow, he quitted it, and, mounting an horse, rode all the night: his chariot, in which were his cloak and his bow, fell into the hands of Alexander, who carried them back to his camp.

In respect to the battle of Iffus, Diodorus informs us, that Alexander looked every-where about for Darius; and, as soon as he discovered him, with his handful of guards attacked him and the flower of the Persian army which was about him; being as desirous of obtaining this victory by his personal valour, as of subduing the Persian empire by the courage of his soldiers. But when Oxathres, the brother of Darius, saw Alexander's design, and how fiercely he fought to accomplish it, he threw himself, with the horse who were about him, between his brother's chariot and the enemy, where an oblique fight was maintained, till the dead bodies rose like an entrenchment about the chariot of Darius. Many of the Persian nobility were slain, and Alexander himself was wounded in the thigh. At last, the horses in the chariot of Darius started, and became so unruly, that the king himself was forced to take the reins; the enemy, however, pressed so hard upon him, that he was constrained to call for another chariot, and mounted it in great danger. This was the beginning of the rout, which soon after became general. According to this author, the Persians lost 300,000 foot, and 10,000 horse; the Macedonians 200,000 foot, and 150 horse.

Justin informs us, that the Persian army consisted of 400,000 foot, and 100,000 horse. He says, that the battle was hard fought, that both the kings were wounded, and that the Persians still fought gallantly when their king fled, but that they were afterwards speedily and totally routed: he is very particular as to their loss, which he says amounted to 61,000 foot, 10,000 horse, and 40,000 taken prisoners; of the Macedonians he says there fell no more than 130 foot, and 150 horse. Curtius says, that of the Persians there fell 100,000 foot, and 10,000 horse: of Alexander's army 504, he says, were wounded; 32 foot and 150 horse killed. That we may not suspect any error in transcribers, his own observation confirms the fact: *Tantulo impendio ingens victoria fletit*, "So small was the cost of so great a victory."

ISTHMA, or ISTHMIAN Games; one of the four solemn games which were celebrated every fifth year in Greece. They had their name from the Isthmus of Corinth, where they were celebrated. In their first institution, according to Pausanias, they consisted only of funeral rites and ceremonies in honour of Melicertes: but Theseus afterwards, as Plutarch informs us, in emulation of Hercules, who had appointed games at Olympia in honour of Jupiter, dedicated those to Neptune, his reputed father; who was regarded as the particular protector of the Isthmus and commerce of Corinth. The same trials of skill were exhibited here as at the other three sacred games; and particularly those of music and poetry. These games, in which the victors were only rewarded with garlands of pine-leaves, were celebrated with great magnificence and splendour as long as paganism continued to be the established religion of Greece; nor were they omitted even when Corinth was sacked and burned by Mummius the Roman general; at which

time the care of them was transferred to the Sicyonians, but was restored again to the Corinthians when their city was rebuilt.

ISTHMUS, a narrow neck, or slip of ground, which joins two continents: or joins a peninsula to the terra firma, and separates two seas. See PENINSULA.

The most celebrated isthmuses are those of Panama, or Darien, which joins North and South America; that of Suez, which connects Asia and Africa; that of Corinth, or Peloponnesus, in the Morea; that of Crim-Tartary, otherwise called *Taurica Chersonesus*; that of the peninsula Romania, and Erisso, or the isthmus of the Thracian Chersonesus, 12 furlongs broad, being that which Xerxes undertook to cut through. The ancients had several designs of cutting the isthmus of Corinth, which is a rocky hillock, about ten miles over; but they were all in vain, the invention of sluices being not then known. There have been attempts too for cutting the isthmus of Suez, to make a communication between the Red sea and the Mediterranean: but these also failed; and in one of them, a king of Egypt is said to have lost 120,000 men.

ISTRIA, a peninsula of Italy, in the territory of Venice, lying in the north part of the Adriatic sea. It is bounded by Carniola on the north; and on the south, east, and west, by the sea. The air is unwholesome, especially near the coast; but the soil produces plenty of wine, oil, and pastures; there are also quarries of fine marble. One part of it belongs to the Venetians, and the other to the house of Austria. Cabo d'Istria is the capital town.

ITALIAN, the language spoken in Italy. See the article LANGUAGE.

This tongue is derived principally from the Latin; and of all the languages formed from the Latin, there is none which carries with it more visible marks of its original than the Italian. It is accounted one of the most perfect among the modern tongues, containing words and phrases to represent all ideas, to express all sentiments, to deliver one's self on all subjects, to name all the instruments and parts of arts, &c. It is, however, complained, that it has too many diminutives and superlatives, or rather augmentatives; but without any great reason: for if these words convey nothing farther to the mind than the just ideas of things, they are no more faulty than our pleonasm and hyperboles. The language corresponds to the genius of the people: they are slow and thoughtful; and accordingly their language runs heavily, though smoothly, and many of their words are lengthened out to a great degree. They have a great taste for music; and, to gratify their passion this way, have altered abundance of their primitive words, leaving out consonants, taking in vowels, softening and lengthening out their terminations for the sake of the cadence. Hence the language is extremely musical, and succeeds better than any other in operas, and some parts of poetry; but it fails in strength and nerves: hence also a great part of its words borrowed from the Latin became so far disguised, that they are not easily known again.

ITALY, one of the finest countries of Europe, lying between 7 and 10 degrees of E. Long. and between 37 and 46 degrees of N. Lat. On the north,

north-

Italy.

north-west, and north-east, it is bounded by France, Switzerland, the country of the Grisons, and Germany; on the east, by the Adriatic sea, or gulf of Venice; and on the south and west, by the Mediterranean; its figure bearing some resemblance to that of a boot. Its length from Aosta, at the foot of the Alps in Savoy, to the utmost verge of Calabria, is about 600 miles; but its breadth is very unequal, being in some places near 400 miles, in others not above 25 or 30.

Its different names.

Italy was anciently known by the names of *Saturnia*, *Oenotria*, *Heperia*, and *Ausonia*. It was called *Saturnia* from Saturn; who, being driven out of Crete by his son Jupiter, is supposed to have taken refuge here. The names of *Oenotria* and *Ausonia*, it borrowed from its ancient inhabitants the Oenotrians and Ausones; and that of *Heperia*, or *Wesperia*, was given it by the Greeks, from its situation with respect to Greece. The name of *Italia*, or *Italy*, which, in process of time, prevailed over all the rest, is by some derived from Italus, a king of the Siculi: by others, from the Greek word *Italos*, signifying an ox; this country abounding, by reason of its rich pastures, with oxen of an extraordinary size and beauty. All these names were originally peculiar to particular provinces of Italy, but afterwards applied to the whole country.

Division in ancient times.

This country was in ancient times, like most others, divided into a great number of petty states and kingdoms. In after-times, when the Gauls settled in the western, and many Greek colonies in the eastern parts, it was divided, with respect to its inhabitants, into three great parts, viz. *Gallia Cisalpina*, *Italy* properly so called, and *Magna Græcia*. The most western and northern parts of Italy were in great part possessed by the Gauls: and hence took the name of *Gallia*, with the epithets of *Cisalpina* and *Citerior*, because they lay on the side of the Alps next to Rome; and *Transalpina*, with relation to the Roman gown or dress which the inhabitants used; but this last epithet is of a much later date than the former. This appellation was antiquated in the reign of Augustus, when the division of Italy into eleven provinces, introduced by that prince, took place. Hence it is that the name of *Cisalpine Gaul* frequently occurs in the authors who flourished before, and scarce ever in those who wrote after the reign of Augustus. This country extended from the Alps and the river Varus, parting it from *Transalpine Gaul*, to the river Aesius; or, as Pliny will have it, to the city of Ancona, in the ancient Picenum. On the north, it was divided from *Rætia* by the Alps, called *Alpes Rætice*; and from *Illyricum* by the river *Formio*: but on this side, the borders of Italy were, in Pliny's time, extended to the river *Arbia* in *Istria*. On the south, it reached to the *Ligustic sea*, and the *Apennines* parting it from *Etruria*; so that under the common name of *Cisalpine Gaul* were comprehended the countries lying at the foot of the Alps, called by Pliny and Strabo the *Subalpine countries*, *Liguria*, *Gallia Cispadana*, and *Transpadana*. *Italy*, properly so called, extended, on the coast of the Adriatic, from the city of Ancona to the river Trento, now the *Fortore*; and, on the Mediterranean, from the *Macra* to the *Silarus*, now the *Sile*. *Magna Græcia* comprised *Apulia*, *Lucania*,

Italy.

and the country of the *Brutii*. It was called *Greece*, because most of the cities on the coast were Greek colonies. The inhabitants gave it the name of *Great*, not as if it was larger than Greece, but merely out of ostentation, as Pliny informs us.

All these countries were inhabited by a great number of different nations settled at different times, and from many different parts. The names of the most remarkable of them were the *Aborigines*, or those whose origin was utterly unknown, and consequently were thought to have none; the *Sabines*, *Hetrurians* or *Tuscan*, the *Umbri*, *Samnites*, *Campani*, *Apulii*, *Calabrii*, *Lucanii*, the *Brutii*, and the *Latins*. From a colony of the latter proceeded the Romans, who gradually subdued all these nations one after another, and held them in subjection for upwards of 700 years. Subdued by the Romans.

All these nations were originally brave, hardy, temperate, and well skilled in the art of war; and the Romans much more so than the rest. Their subjection to Rome, however, insured them to slavery; their oppression by the emperors broke their spirit; and the vast wealth which was poured into the country from all parts of the world, during the time of the Roman prosperity, corrupted their manners, and made them degenerate from their former valour. Of this degeneracy the barbarous nations of the north took the advantage to invade the empire in innumerable multitudes. Though often repelled, they never failed to return; and it was found necessary to take great numbers of them into the Roman service, in order to defend the empire against the rest of their countrymen. In the year 476, the *Heruli*, presuming on the services they had done the empire, demanded a third part of the lands of Italy; and being refused, chose one *Odoacer*, a man of low birth, but of great valour and experience, for their king; and having totally destroyed the remains of the Roman empire, proclaimed *Odoacer* king of Italy. The new monarch, however, did not think proper to alter the Roman form of government, but suffered the people to be governed by the senate, consuls, &c. as before. He enjoyed his dignity in peace till the year 488, when *Zeno*, emperor of Constantinople, being hard pressed by *Theodoric* king of the *Ostrogoths*, advised him to turn his arms against *Odoacer*, whom he could easily overcome, and thus make himself sovereign of one of the finest countries in the world.

By the Heruli.

Theodoric accepted the proposal with great joy, and set out for Italy, attended by an infinite number of people, carrying with them their wives, children, the Ostrogoths, and effects, on waggons. Several Romans of great distinction attended him in this war; while, on the other hand, many of his countrymen chose to remain in *Thrace*, where they became a separate nation, and lived for a long time in amity with the Romans. The *Goths*, being destitute of shipping, were obliged to go round the *Adriatic*. Their march was performed in the depth of winter; and, during the whole time, a violent famine and plague raged in their army. They were also opposed by the *Cepidæ* and *Sarmatians*; but at last, having defeated these enemies, and overcome every other obstacle, they arrived in Italy in the year 489. *Theodoric* advanced to the river *Sontius*, now *Zonzo*, near *Aquileia*, where he halted for some time to refresh his troops. Here he was met by *Odoacer*

at

Italy.

at the head of a very numerous army, but composed of many different nations commanded by their respective chiefs, and consequently without sufficient union or zeal for the common cause. Theodoric therefore gained an easy victory, cut many of his enemies in pieces, and took their camp. Odoacer retired to the plains of Verona, and encamped there at a small distance from the city; but Theodoric pursued him close, and soon forced him to a second engagement. The Goths obtained another victory; but it cost them dear. Odoacer's men made a much better resistance than before, and great numbers fell on both sides. The victory, however, was so far decisive, that Odoacer was obliged to fluit himself up in Ravenna; so that Theodoric having now no enemy to oppose him in the field, besieged and took several important places, and among the rest Milan and Pavia. At the same time, Tufa, commander in chief of Odoacer's forces, deserted to the enemy with the greatest part of the troops he had with him, and was immediately employed in conjunction with a Gothic officer in pursuit of his sovereign. Odoacer had left that city, and was advanced as far as Faenza, where he was closely besieged by Tufa; but the traitor, declaring again for his old master, joined him with all his troops, and delivered up several officers that had been appointed by Theodoric to serve under him. These were sent in irons to Ravenna; and Odoacer being joined by Frideric, one of Theodoric's allies, with a considerable body of troops, once more advanced against his enemies. He recovered all Liguria, took the city of Milan, and at last besieged Theodoric himself in Pavia. The Goths, having brought all their families and effects along with them, were greatly distressed for want of room; and must have undoubtedly submitted, if their enemies had continued to agree among themselves. The quarrels of his followers proved the ruin of Odoacer. Theodoric, finding that the enemy remitted the vigour of their operations, applied for succours to Alaric king of the Visigoths, who had settled in Gaul. As the Visigoths and Ostrogoths were originally one and the same nation, and the Visigoths had received among them, some years before, a great number of Ostrogoths, under the conduct of Videmir, cousin-german to Theodoric, the supplies were readily granted. The inaction of the enemy gave these succours time to arrive; upon which Theodoric instantly joined them, and, marching against his enemies, gave them a total overthrow. Odoacer again took refuge in Ravenna, but was closely besieged by Theodoric in 490. The siege lasted three years; during which Odoacer defended himself with great bravery, and greatly annoyed the besiegers with his sallies. Theodoric, however, impatient of delay, leaving part of his army to blockade the city, marched with the rest against the strong holds which Odoacer had garrisoned. All these he reduced with little difficulty; and in 492 returned to the siege of Ravenna. The besieged were now reduced to great straits both by the enemy without and a famine within, the price of wheat being risen to fix pieces of gold per bushel. On the other hand, the Goths were quite worn out with the fatigues of such a long siege; so that both parties being willing to put an end to the war, Odoacer sent John bishop of Ravenna to Theodoric with terms of accommodation.

Jornandes informs us, that Odoacer only begged his life; which Theodoric bound himself, by a solemn oath, to grant him: but Procopius says, that they agreed to live together on equal terms. This last seems very improbable: but whatever were the terms of the agreement, it is certain that Theodoric did not keep them; for having a few days after invited Odoacer to a banquet, he dispatched him with his own hand. All his servants and relations were massacred at the same time; except his brother Aemulphus, and a few more, who had the good luck to make their escape, and retired beyond the Danube.

Thus Theodoric became master of all Italy, and took upon himself the title of *king* of that country, as Odoacer had done before; though, with a pretended deference to the emperor of Constantinople, he sent messengers asking liberty to assume that title after he had actually taken it. Having secured his new kingdom as well as he could by foreign alliances, Theodoric next applied himself to legislation, and enacted many salutary laws besides those of the Romans which he retained. He chose Ravenna for the place of his residence, in order to be near at hand to put a stop to the incursions of the barbarians. The provinces were governed by the same magistrates that had presided over them in the times of the emperors, viz. the *consulares*, *correctores*, and *praesides*. But besides these, he sent, according to the custom of the Goths, inferior judges, distinguished by the name of *counts*, to each city. These were to administer justice, and to decide all controversies and disputes. And herein the polity of the Goths far excelled that of the Romans. For in the Roman times a whole province was governed by a consularis, a corrector, or a praeses, who resided in the chief city, and to whom recourse was to be had, at a great charge, from the most remote parts: but Theodoric, besides these officers, appointed, not only in the principal cities, but in every small town and village, inferior magistrates of known integrity, who were to administer justice, and by that means save those who had law-suits the trouble and expence of recurring to the governor of the whole province; no appeals to distant tribunals being allowed, but in matters of the greatest importance, or in cases of manifest injustice.

Under the administration of Theodoric Italy enjoyed as great happiness as had been experienced under the very best emperors. As he had made no alteration in the laws except that abovementioned, so he contented himself with the same tributes and taxes that had been levied by the emperors; but was, on all occasions of public calamity, much more ready to remit them than most of the emperors had been. He did not treat the natives as those of the other Roman provinces were treated by the barbarians who conquered them. These stripped the ancient proprietors of their lands, estates, and possessions, dividing them among their chiefs; and giving to one a province with the title of *duke*, to another a frontier country with the title of *marquis*; to some a city with the title of *count*, to others a castle or village with the title of *baron*. But Theodoric, who piqued himself upon governing after the Roman manner, and observing the Roman laws and institutions, left every one in the full enjoyment of his ancient property. As to religion, though he himself, like most of his countrymen, professed the tenets of Arius, he

allowed his subjects to profess the orthodox doctrine without molestation, giving liberty even to the Goths to renounce the doctrines in which they had been educated, and embrace the contrary opinions. In short, his many virtues, and the happiness of his subjects, are celebrated by all the historians of those times. The end of his reign, however, was sullied by the death of the celebrated philosopher Boethius, and his father-in-law Symmachus. They were both beleagued in Pavia, on an unjust suspicion of treason; and scarce was the sentence put in execution when the king repented, and abandoned himself to the most pungent sorrow. The excess of his grief affected his understanding; for, not long after, the head of a large fish being served up to supper, he fancied the head of the fish to be that of Symmachus threatening him in a ghastly manner. Hereupon, seized with horror and amazement, he was carried to his bed-chamber, where he died in a few days, on the 2d of September 526.

After the death of Theodoric, the kingdom devolved to Athalaric his grandson; who being at that time only eight years of age, his mother Amalasuntha took upon her the regency. Her administration was equally upright with that of Theodoric himself; but the barbarians of whom her court was composed, finding fault with the encouragement she gave to learning, forced her to abandon the education of her son, who thereupon plunged into all manner of wickedness, and behaved to his mother with the greatest arrogance; and the faction finding themselves thus strengthened, at last commanded the queen to retire from court.

Amalasuntha, exerting her authority, seized three of the ringleaders of the sedition, whom she confined in the most remote parts of Italy. But these maintaining a secret correspondence with their friends and relations, never ceased to stir up the people against her; inasmuch, that the queen, apprehending that the faction might in the end prevail, wrote to the emperor Justinian, begging leave to take refuge in his dominions. The emperor readily complied with her request, offering a noble palace at Durazzo for her habitation; but the queen having in the mean time caused the three ringleaders to be put to death, and no new disturbances arising thereupon, she did not accept of the emperor's offer. In 533, Athalaric having contracted a lingering distemper by his riotous living and debaucheries, Amalasuntha, to avoid the calamities with which Italy was threatened in case of his death, formed a design of delivering it up to Justinian; but before her scheme was ripe for execution, Athalaric died. Upon which the queen took for her colleague one Theodotus her cousin; obliging him, however, to swear that he would suffer her to enjoy and exercise her former power. This he very readily did; but soon forgot his promise; and, when she took the liberty to remind him of it, caused her to be seized and confined in an island of the lake Bolsena in Tuscany. But as Theodotus had great reason to believe that this conduct would be resented by Justinian, he obliged her to write to him that no injury or injustice had been done her. Along with this letter he sent one written by himself, and filled with heavy complaints against Amalasuntha. The emperor, however, was so far from giving credit to what Theodotus urged against her, that he openly espoused her cause, wrote her a most affectionate letter, and as-

sured her of his protection. But before this letter could reach her, the unhappy princess was strangled in the bath by the friends of those whom in the reign of her son he had deservedly put to death for raising disturbances in the state.

On the news of Amalasuntha's death, Justinian resolved upon an immediate war with the Goths; and, to facilitate the enterprise, used his utmost endeavours to induce the Franks to assist him. To his solicitations he added a large sum of money; which last was very acceptable to his new allies. They promised to assist the emperor to the utmost of their power; but, instead of performing their promise, while Justinian's arms were employed against the Goths, Thierri, the eldest son of Clovis, seized on several cities of Liguria, the Alpes Cottiae, and great part of the present territory of Venice, for himself. Justinian, however, found sufficient resources in the valour of Belisarius, notwithstanding the defection of his treacherous allies. This celebrated general was vested with the supreme command, and absolute authority. His instructions were to pretend a voyage to Carthage, but to make an attempt upon Sicily; and, if he thought he could succeed in the attempt, to land there; otherwise to sail for Africa, without discovering his intentions. Another general, named *Mundus*, commander of the troops in Illyricum, was ordered to march into Dalmatia, which was subject to the Goths, and attempt the reduction of Salona, the better to open a passage into Italy. This he accomplished without difficulty, and Belisarius made himself master of Sicily sooner than he himself had expected. The island was reduced on the last of December 535; upon which Belisarius, without loss of time, passed over to Reggio, which opened its gates to him. From Reggio he pursued his march to Rome, the provinces of Abrutium, Lucania, Puglia, Calabria, and Samnium, readily submitting to him. The city of Naples endured a siege; but Belisarius entered in thro' an aqueduct, and gave it up to be plundered by his soldiers.

Theodotus, alarmed at these successes, and having neither capacity nor inclination to carry on the war, sent ambassadors to Justinian with proposals of peace. He agreed to renounce all pretensions to the island of Sicily; to send the emperor yearly a crown of gold weighing 300 pounds; to supply him with 3000 men whenever he should think proper to demand them. Several other articles were contained in the proposal, which amounted to the owning of Justinian for his lord, and that he held the crown of Italy only through his favour. As he apprehended, however, that these offers might not yet be satisfactory, he recalled his ambassadors for further orders. They were now desired to inform Justinian, that Theodotus was willing to resign the kingdom to him, and content himself with a pension suitable to his quality. But he obliged them by an oath not to mention this proposal, till they found that the emperor would not accept of the offer. The first proposals were accordingly rejected as they had supposed; upon which the ambassadors produced the second, signed by Theodotus himself, who, in his letter to the emperor, told him among other things, that being unacquainted with war, and addicted to the study of philosophy, he preferred his quiet to a kingdom. and imagining the war already finished, answered the king in a most obliging manner, extolling his wisdom, and giving him, besides what he demanded, the greatest honours of the empire. The agreement being confirmed by mutual oaths, lands were assigned to Theodotus out of the king's domain, and orders were dispatched to Belisarius to take possession of Italy in his name.

In the mean time a body of Goths having entered Dalmatia, with a design to recover the city of Salonæ, were encountered by an inferior army of Romans, commanded by the son of Mundus abovementioned. The Goths proved victorious; and the young general of the Romans was killed, and most of his army cut in pieces. Mundus marched against the enemy to revenge the death of his son; but met with no better success, his troops being defeated, and he himself killed in the engagement. Upon this the Romans abandoned Salonæ and all Dalmatia; and Theodotus, elated with his success, refused to fulfill the articles of the treaty. Justinian dispatched Constantianus, an officer of great valour and experience, into Illyricum, with orders to raise forces there, and to enter Dalmatia; at the same time he wrote to Belisarius to pursue the war with the utmost vigour.

The Goths were now reduced to the greatest straits. Constantianus drove them out of Dalmatia; and Belisarius having reduced all the provinces which compose the present kingdom of Naples, advanced towards Rome. The chief men of the nation, finding their king incapable of preventing the impending ruin, assembled without his consent, and dispatched ambassadors to Belisarius with proposals of peace. These proposals were rejected; and Belisarius returned for answer that he would hearken to no terms, nor sheath his sword, till Italy was rennexed to the empire to which it belonged. The Goths finding Theodotus still inactive, unanimously deposed him; and chose in his stead one Vitiges, a man of great valour, but of a mean descent. Theodotus fled to Ravenna; but the new king dispatched after him a messenger, who soon overtook him and cut off his head.

Vitiges began his government by writing a circular letter, in which he exhorted his countrymen to exert their ancient courage, and fight bravely for their lives and liberties. He then marched with what forces he could collect towards Rome; but not thinking himself able to defend that city against the Roman forces, he abandoned it to Belisarius, and arriving at Ravenna was joined by the Goths from all parts, so that he soon found himself at the head of a considerable army. Belisarius in the mean time entered Rome without opposition, on the 9th or 10th of December 537. The Gothic garrison retired by the Porta Flaminia, while Belisarius entered by the Porta Anagnina. Leudaris, governor of the city, who staid behind, was sent, together with the keys, to the emperor. Belisarius immediately applied himself to the repairing of the walls and other fortifications; filled the granaries with corn, which he caused to be brought from Sicily; and stored the place with provisions, as if he had been preparing for a siege; which gave no small uneasiness to the inhabitants, who chose rather that their city should lie open to every invader, than that they should be liable to the calamities of a siege. While Belisarius

Vol. V.

was thus employed at Rome, the city of Benevento, with great part of the territory of Samnium, was delivered up to him: at the same time the cities of Narnia, Spoleto, and Perugia, revolting from the Goths, received Roman garrisons; as did most of the cities of Tuscany.

In the mean time, Vitiges having collected an army of 150,000 men, resolved to march directly to Rome, and engage Belisarius; or if he declined an engagement, to lay siege to the city. But apprehending that the Franks, who were in confederacy with the emperor, might fall upon him at the same time, he sent ambassadors to them, with offers of all the Gothic possessions in Gaul, besides a considerable sum of money, provided they joined him against the emperor. The Franks with their usual treachery consented to the proposal, received the money and the territories agreed on, and then refused to fulfill the terms of the treaty. Vitiges, however, began his march to Rome, leaving behind him all the fortified towns on the road, the reduction of which he knew would cost him too much trouble. Belisarius, whose army, reduced by the many towns he had garrisoned, did not now amount to above 5000 men, dispatched messengers to Constantianus in Tuscany; and to Belias, by nation a Goth, but of the emperor's party, in Umbria, with orders to join him with all possible expedition; writing at the same time to the emperor himself for supplies, in the most pressing manner. Constantianus joined him pursuant to his orders; and soon after, Belias, who, falling in with part of the enemy's vanguard, killed a considerable number of them, and put the rest to flight. Belisarius had built a fort upon a bridge about a mile from Rome, and placed a strong garrison in it to dispute the passage with the enemy; but the garrison, seized with a panic at the approach of the Goths, abandoned their post in the night, and fled into Campania. Early in the morning, Vitiges passed over great part of his army, and marched on till he was met by Belisarius, who, knowing nothing of what had happened, came with 1000 horse to view the ground about the bridge. He was greatly surprised when he beheld the enemy marching up against him: however, lest he should heighten their courage by his flight or retreat, he stood his ground, and received the enemy at the head of his small body, exposing himself, without his usual prudence and discretion, to the greatest dangers. Being known by some fugitives, and discovered to the enemy, they all aimed at him alone, which made his own men the more solicitous to defend him; so that the whole contest was for some time about his person. At last the Goths were driven back to their camp, which the Romans with great temerity attempted to force. In this attempt, however, they met with such a vigorous resistance, that they soon abandoned the enterprize, and retired with precipitation to a neighbouring eminence; whence they were forced down by the enemy, put to flight, and pursued to the very gates of the city. Here they were in greater danger than ever; for those within, fearing that the enemy might in that confusion enter with them, refused to admit them. The general himself cried out earnestly to them, telling who he was, and commanding them to open the gates; but as they had been informed by those who first fled, that he was slain,

slain, and they could not distinguish him on account of the blood and dust with which his face was covered, they gave no ear to what he said. In this extremity, having encouraged his men, who were now driven into a narrow compass, to make a last effort, he put himself at their head, and attacked the enemy with such fury, that the Goths, imagining fresh troops were falling out upon them, began to give ground, and at last retired to their camp. The Roman general did not pursue them; but entered the city, where he was received with loud acclamations.

19
Rome be-
sieged by
the Goths.

A few days after, the city was closely invested by Vitiges; who, to distress the inhabitants, pulled down the aqueducts by which water was conveyed into the city, and which had been built at an immense charge by the Roman emperors. Belisarius on his part omitted nothing for his defence; inasmuch that the cowardly citizens assembled in a tumultuous manner, and rallied at the general on account of his supposed temerity. Vitiges, to encourage this mutinous disposition, dispatched ambassadors to the senate with proposals of peace. These ambassadors, however, were dismissed without any answer, and the siege was begun with great vigour. Belisarius made a gallant defence; and in seven months is said to have destroyed 40,000 of the Goths. About this time he received a supply of 1600 archers from the emperor; and these, in several successful sallies, are said to have killed 4000 more of the enemy.

The Romans, elated with their successes, now became impatient for an engagement; and at last, notwithstanding all the remonstrances of their general, forced him to lead them out against the enemy. The success was answerable to the rash attempt. The Romans were defeated, with the loss of some of their bravest officers, and a great many of their common soldiers; after which they contented themselves with falling out in small parties, which they commonly did with the greatest success.

But though the Romans had the satisfaction of thus cutting off their enemies, they were most grievously afflicted with a famine and plague; inasmuch that the inhabitants, no longer able to bear their calamities, were on the point of forcing Belisarius to venture a second battle, when a seasonable supply of troops, viz. 3000 Iasurians, 800 Thracian horse, and 1300 horse of other nations, together with 500 Italians who joined them by the way, arrived at Rome. Belisarius immediately sallied out by the Flaminian gate, and fell upon the Goths in order to give his allies time to enter by the opposite side of the city, which they did without the loss of a man.—The Goths, hearing of the arrival of these troops, and their numbers being magnified as is usual in such cases, began to despair of becoming masters of the city; especially as the famine and plague raged with great violence in their camp, and their army was much reduced. Ambassadors were therefore dispatched to Belisarius with proposals of peace; but the only thing they could obtain was a cessation of arms for three months, during which time they might send ambassadors to the emperor. The negotiations with the emperor, however, proved unsuccessful; and the siege was pursued with great vigour till Vitiges received the news of the taking of Rimini by the Romans. As this city

was but a day's journey from Ravenna, the Goths were so much alarmed, that they immediately raised the siege of Rome, after it had continued a year and nine days. Belisarius fell upon their rear as they passed the bridge of the Tiber, and cut great numbers of them in pieces, while others, struck with a panic, threw themselves into the river and were drowned.

Italy.
19
The siege
raised.

The first enterprize of Vitiges, after raising the siege of Rome, was an attempt upon Rimini: but while he was employed in this siege, the Romans made themselves masters of Milan; upon which a Gothic general named *Uraia*, was immediately dispatched with a powerful army to retake it. In the mean time, however, a supply of 7000 Romans arrived from the emperor, under the command of Narfes, a celebrated general. The immediate consequence of this was the raising of the siege of Rimini; for Vitiges, perceiving the two Roman armies coming against him, and concluding, from the many fires they made, that they were much more numerous than they really were, fled in such haste, that the greatest part of the baggage was left behind. The confusion of the Goths was so great, that had not the garrison been extremely feeble, they might have easily cut them off in their retreat, and thus put an end to the war at once. The success of the Romans, however, was now retarded by some misunderstandingings between the two generals; so that, though Belisarius made himself master of Urbinum and Urbiventum, while Narfes reduced some other places; yet the important city of Milan was suffered to fall into the hands of the Goths, who massacred all the inhabitants that were able to bear arms, to the number of 300,000, and sold the women for slaves. The city was also totally demolished; and this disaster made such an impression on the mind of Justinian, that he immediately recalled Narfes, and gave the command of his troops to Belisarius.

20
Milan tak-
en by the
Goths.

Vitiges, who had promised himself great advantages from the disagreement of the two generals, was much disappointed by the recall of Narfes; and therefore, dreading the power of Belisarius when at the head of a formidable army, thought of engaging in alliance with some foreign prince. In his choice, however, he was somewhat at a loss. He knew the treachery of the Franks, and therefore did not apply to them. He applied to the Lombards; but, though tempted by the offer of a large sum of money, they continued inviolably attached to the Roman interest. At last he found means to persuade Chosroes king of Persia to make war upon Justinian, which he thought would infallibly procure the recall of Belisarius. But the Roman general, understanding his design, pushed on the war in the most vigorous manner; while in the mean time, the treacherous Franks, thinking both na-
tions sufficiently weakened by their mutual hostilities, resolved to attack both, and seize upon the country for which they contended. Accordingly, Theodebert, unmindful of the oaths he had taken both to the Goths and Romans, passed the Alps at the head of 150,000, or, as some will have it, 200,000 men, and entered Liguria. As no hostilities were committed by them on their march, the Goths concluded that they were come to their assistance; and therefore took care to supply them with provisions. Thus they crossed the Po without opposition; and having secured

21
Italy inva-
ded by the
Franks.

the

Italy.

the bridge, marched towards the place where a body of Goths were encamped; who, looking upon them as friends, admitted them without hesitation. But they were soon convinced of their mistake; for the Franks falling unexpectedly upon them, drove them out of the camp with great laughter, and seized on their baggage and provisions. A body of Romans that lay at a small distance from the Goths, concluding that they had been defeated by Belisarius, advanced with great joy to meet *him* as they imagined; but the Franks falling unawares upon them, treated them as they had done the Goths, and made themselves masters of their camp. Thus they acquired a very considerable booty and store of provisions: but the latter being soon consumed, and the country round about quite exhausted, vast numbers of the Franks perished; so that Theodebert at last found himself obliged to return. In his way he destroyed Genoa, and several other places, and arrived in his own dominions loaded with booty.

22
Success of
Belisarius.

In the mean time, Belisarius was making great progress. He took the cities of Auximum and Fesulae, after an obstinate siege; the inhabitants of the former having for some time fed on grass before they would surrender. After this he invested Ravenna, the capital of all the Gothic dominions in Italy. The place was defended by a very numerous garrison, commanded by the king in person, who exerted all his bravery in the defence of his metropolis. As the siege, however, was pushed on with great vigour, it was evident that the city must at last submit; and the great successes of the Romans began to give jealousy to the neighbouring potentates. Theodebert king of the Franks offered to assist Vitiges with an army of 500,000 men; but Belisarius, being informed of this negotiation, sent ambassadors to Vitiges, putting him in mind of the treachery of the Franks, and assured him that the emperor was ready to grant him very honourable terms. The king, by the advice of his counsellors, rejected the alliance of the Franks, and sent ambassadors to Constantinople; but in the mean time, Belisarius, in order to bring the citizens to his own terms, bribed one of them to set fire to a magazine of corn, by which means the city was soon straitened for want of provisions. But, notwithstanding this disaster, they still continued to hold out, till the arrival of the ambassadors from Constantinople, who brought very favourable terms. These were, That the country beyond the Po, with respect to Rome, should remain to the Goths; but that the rest of Italy should be yielded to the emperor, and the royal treasure of the Goths should be equally divided between him and the king. To these conditions, however, Belisarius positively refused to assent; being desirous of leading captive the king of the Goths, as he had formerly done the king of the Vandals, to Constantinople. He therefore pursued the siege with more vigour than ever, without hearkening to the complaints of his soldiers and officers, who were quite tired out with the length of the siege: he only obliged such of the officers as were of opinion that the town could not be taken, to express their opinion in writing, that they might not deny it afterwards.

The Goths were as weary of the siege as the Romans; but, fearing lest Justinian should transplant

Italy.

them to Thrace, formed a resolution, without the consent of their king, of surrendering to Belisarius himself, and declaring him emperor of the west. To this they were the more encouraged by the refusal of Belisarius to agree to the terms proposed by the emperor, from whence they concluded that he designed to revolt, and make himself emperor of Italy. Of this, however, Belisarius had no design; but thought proper to accept of the title, in order to accelerate the surrender of the city, after acquainting his principal officers with what had passed. Vitiges at last discovered the plot; but finding himself in no condition to oppose it, he commended the resolution of his people, and even wrote to Belisarius, encouraging him to take upon him the title of *king*, and assuring him of his assistance. Hereupon Belisarius pressed the Goths to surrender; which, however, they still refused, till he had taken an oath that he would treat them with humanity, and maintain them in the possession of all their rights and privileges. Upon this he was admitted into the city, where he behaved with great moderation towards the Goths; but seized on the royal treasure, and secured the person of the king. The Roman army, when it entered Ravenna, appeared so very inconceivable, that the Gothic women, on beholding it, could not forbear spitting in the faces of their husbands, and reviling them as cowards.

23
Ravenna reduced,
and Vitiges
taken prisoner.

The captivity of Vitiges, and the taking of Ravenna, did not put an end to the war. Belisarius was soon after recalled to take the command of the army in the east. The Goths were greatly surprised that he should leave his new kingdom out of regard to the orders of the emperor; but, after his departure, chose one Ildebal, a man of great experience in affairs both civil and military, for their king. He revived the drooping spirits of his countrymen, defeated the Romans, and reduced all the province of Venetia; but was in a short time murdered, and Eraric, a Rugian, succeeded to the throne. He was scarce invested with the sovereignty, when his subjects began to think of deposing him, and raising Totila to the throne; which the latter accepted, upon condition that they previously dispatched Eraric. This was accordingly done; after which Totila was proclaimed king of Italy, in the year 542.

The new king proved a very formidable enemy to the Romans, who now lost ground every-where. They made an attempt on the city of Verona; in which they miscarried through their own avarice, having disputed about the division of the plunder till the opportunity of taking the town was past. They were next defeated in two bloody engagements; the consequence of which was, that the Goths made themselves masters of all the strong places in Tuscany. From thence marching into Campania and Samnium, they reduced the strong town of Beneventum, and laid siege to Naples. During the siege of this last place, several detachments were sent from the king's army, which took Cumæ, and recovered all Brutia, Lucania, Apulia, and Calabria, where they found considerable sums which had been gathered for the emperor's use. The Romans, in the mean time, disheartened by their losses, and deprived of those sums which should have paid their wages, refused to take the field. A considerable fleet was therefore sent by Justinian to the re-

25
Rome be-
sieged.

lief of Naples: but Totila, having timely notice of this design, manned, with incredible expedition, a great number of light vessels; which, falling unexpectedly on the Roman fleet, took or sunk every ship, and made prisoners of all on board, excepting a few who escaped in their boats. A similar fate attended another fleet dispatched from Sicily for the same purpose. They put to sea in the depth of winter; and, meeting with a violent storm, were driven ashore near the enemy's camp; who sunk the ships, and made what slaughter they pleased of the seamen and soldiers. Upon this second disaster, the Neapolitans, despairing of further relief, submitted to Totila; who granted them honourable terms, and treated them with great humanity. As they had been long pinched with famine, Totila, apprehending they might endanger their lives by indulging their appetites too much at first, placed guards at the gates to prevent their going out, taking care at the same time to supply them sparingly with provisions, but increasing their allowance every day. Being thus by degrees restored to their former strength, he ordered the gates to be set open, and gave every one full liberty to stay in the city, or remove, as he thought fit. The garrison he treated with extraordinary kindness. They were first supplied with ships to carry them to Constantinople; but the king having discovered that their real design was to sail to Rome, in order to reinforce the garrison of that city, (which they knew he was soon to besiege,) he was so far from punishing them as they expected, that he furnished them with horses, waggons, and provisions, and ordered a body of Goths to escort them to Rome by land, as the winds had proved unfavourable for their passage by sea.

Totila having thus become master of Naples and most of the other fortresses in these parts, began to think of reducing Rome also. He first attempted to persuade the citizens to a surrender: but finding his persuasions ineffectual, he sent a detachment of his army into Calabria to reduce Otranto, which had not yet submitted; after which, he marched with the rest of his forces against the towns in the neighbourhood of Rome. The city of Tibur, now Tivoli, about 18 miles from Rome, was betrayed to him, and all the inhabitants, together with their bishop, put to the sword. Several other strong holds in the neighbourhood of that city he took by storm; so that Rome was in a manner blocked up by land, all communication with the neighbouring country being cut off.

Justinian, in the mean time, being greatly perplexed by the bad news he every day received from Italy, recalled Belisarius from Persia, notwithstanding the success which attended him there. To save Rome, however, was now impossible even for Belisarius himself. As soon as he arrived in Italy, finding himself unable either to relieve the towns which were besieged, or to stop the progress of the Goths, he dispatched letters to Justinian, informing him, that being destitute of men, arms, and money, it was impossible for him to prosecute the war; upon which the emperor ordered new levies to be made, all the veterans being engaged in the Persian war. In the mean time, however, Totila pursued his good fortune; took the cities of Firmum, Asculum, Auximum, Spoletum, &c. and at length advanced to Rome, which he invested on all

sides. As he drew near the city, two officers, whom Belisarius had sent into the city, ventured to make a sally, though contrary to the express orders of their general, thinking they should surprise the Goths; but they were themselves taken in an ambuscade, and most of their men being cut in pieces, narrowly escaped falling into the hands of the enemy. Belisarius made several attempts to relieve the city: but all of them, however well concerted, by some accident or other proved unsuccessful; which gave him so much uneasiness, that he fell into a feverish disorder, and was for some time thought to be in danger of his life. The city was soon reduced to great straits: a dreadful famine ensued; and the unhappy citizens having consumed every thing that could be supposed to give them nourishment, even the grass that grew near the walls, were obliged to feed on their own excrements. Many put an end to their lives, in order to free themselves from the intolerable calamities they suffered. The rest addressed their governor Bessas in the most pathetic manner, intreating him to supply them with food; or if that was not in his power, either to give them leave to go out of the town, or to put an end to their miseries by putting them to death. Bessas replied, that to supply them with food was impossible, to let them go unsafe, and to kill them impious. In the end, however, he suffered those who were willing to retire, to leave the city, upon paying him a sum of money; but most of them either died on the road, or were cut in pieces by the enemy. At last, the besieged, unable to bear their miseries any longer, began to mutiny, and to press their governor to come to an agreement with Totila. This, however, he still refused; upon which, four of the Isaurians who guarded one of the gates, went privately to the camp of Totila, and offered to admit him into the city. The king received this proposal with great joy; and sending four Goths of great strength and intrepidity into the town along with them, he silently approached the gates in the night-time with his whole army. The gates were opened by the Isaurians, as they had promised; and upon the first alarm, Bessas with most of the soldiers and officers, fled out of the town. The inhabitants took sanctuary in the churches; and only 60 of them and 26 soldiers were killed after the town was taken. Totila, however, gave his soldiers full liberty to plunder the city: which they did for several days together, stripping the inhabitants of all their wealth, and leaving nothing in their houses but naked walls; by which means many persons of distinction were reduced to beg their bread from door to door. In the house of Bessas was found an immense treasure, which he had scandalously amassed during the siege, by selling to the people, at an exorbitant price, the corn which had been stored up for the use of the garrison.

Totila, thus become master of Italy, sent ambassadors to Justinian with very respectful letters, desiring to live on the same terms with him that Theodoric had done with his predecessor Anastasius, promising in that case to respect him as his father, and to assist him, when he pleased, with all his force, against any other nation whatever. On the contrary, if the emperor rejected his offers, he threatened to level Rome with the ground, to put the whole senate to the sword, and carry the war into Illyricum. The emperor returned no other

26
And taken.

other

Italy.

ther answer, than that he referred the whole to Belisarius, who had full power to manage all things of that nature. Upon this Totila resolved to destroy the city; and had actually thrown down a third part of the wall, when he received a letter from Belisarius, dissuading him from his intention. After having seriously considered this letter, Totila thought proper to alter his resolution with regard to the destruction of the city; but sent every one of the inhabitants into Lucania, without leaving a single person in the metropolis. Belisarius hearing of this, immediately returned to the capital, and undertook to repeople and repair it. He cleared the ditch which had been filled by Totila, but was for the present obliged to fill up the breaches in the walls with stones loosely heaped upon one another; and in this situation the city was again attacked by the Goths. Belisarius, however, had taken care to supply the inhabitants with plenty of provisions, so that they were now in no danger of suffering by famine; and the assaults of the enemy were vigorously repelled notwithstanding the bad situation of the fortifications, so that Totila at last abandoned the enterprize.

27
Belisarius
recalled.

In the mean time the Persians gained great advantages over the Romans in the East, so that there was a necessity for recalling Belisarius a second time. He was no sooner gone, than Totila renewed his efforts with greater vigour than ever; and at the same time the Franks, concluding that both Romans and Goths would be much weakened by such a destructive war, seized upon Venetia which belonged to both nations, and made it a province of the French empire. Totila did not oppose them; but having obtained a reinforcement of 6000 Lombards, returned immediately before Rome, fully intent on making himself master of that metropolis. Having closely invested it by sea and land, he hoped in a short time to reduce it by famine: but against this the governor wisely provided, by causing corn to be sown within the walls; so that he could probably have defied the power of Totila, had not the city been again betrayed by the Isaurians, who opened one of the gates, and admitted the enemy.

Thus the empire of the Goths was a third time established in Italy; and Totila, immediately on his becoming master of Rome, dispatched ambassadors to Justinian, offering to assist him as a faithful ally against any nation whatever, provided he would allow him the quiet possession of Italy. But Justinian was so far from hearkening to this proposal, that he would not even admit the ambassadors into his presence; upon which Totila resolved to pursue the war with the utmost vigour, and to make himself master, not only of those places which the Romans possessed in Italy, but in Sicily also. This he fully accomplished, when Narfes, who had formerly been joined in the command with Belisarius, was appointed general, with absolute and uncontrouled authority. But while this general was making the necessary preparations for his expedition, Totila, having equipped a fleet of 300 galleys, sent them to pillage the coasts of Greece, where they got an immense booty. They made a descent on the island of Corfu; and having laid it waste, they sailed to Epirus, where they surprised and plundered the cities of Nicopolis and Anchialus, taking many ships on the coast, among which were some laden with provisions for the army of Narfes. After these

28
Narfes sent
into Italy.

successes they laid siege to Ancona in Dalmatia: but, being defeated both by sea and land, Totila once more sent ambassadors to Constantinople, offering to yield Sicily and all Dalmatia, to pay an annual tribute for Italy, and to assist the Romans as a faithful ally in all their wars; but Justinian, bent upon driving the Goths out of Italy, would not even suffer the ambassadors to appear in his presence.

Totila, finding that no terms could be obtained, began to levy new forces, and make great preparations by sea and land. He soon reduced the islands of Corfica and Sardinia; but this was the last of his successes. Narfes arrived in Italy with a very formidable army; and an immense treasure to pay the troops their arrears, the want of which had been one great cause of the bad success of Belisarius in his last expedition. He immediately took the road to Rome; while Totila assembled all his forces, in order to decide the fate of Italy by a general engagement. The battle proved very obstinate; but at last the Gothic cavalry being put to the rout, and retiring in great confusion among the infantry, the latter were thereby thrown into such disorder, that they could never afterwards rally. Narfes, observing their confusion, encouraged his men to make a last effort; which the Goths not being able to withstand, betook themselves to flight, with the loss of 6000 men killed on the spot. Totila finding the day irrecoverably lost, fled with only five horsemen for his attendants; but was pursued and mortally wounded by a commander of one of the bodies of barbarians who followed Narfes. He continued his flight, however, for some time longer; but was at last obliged to halt in order to get his wound dressed, soon after which he expired.

29
Who de-
feats and
kills Totila.

This disaster did not yet entirely break the spirit of the Goths. They chose for their king one Teia, deservedly esteemed one of the most valiant men of their nation, and who had on several occasions distinguished himself in a most eminent manner. All the valour and experience of Teia, however, were now insufficient to stop the progress of the Romans. Narfes made himself master of a great number of cities, and of Rome itself, before the Goths could assemble their forces. The Roman general next proceeded to invest Comæ, which Teia determined at all events to relieve, as the royal treasure was lodged in that city. This brought on an engagement, which, if Procopius is to be credited, proved one of the most bloody that ever was fought. The Roman army consisted of vast multitudes brought from different nations: the Goths were few in comparison; but, animated by despair, and knowing that all was at stake, they fought with the utmost fury. Their king placed himself in the first rank, to encourage his men by his example; and is said to have given such proofs of his valour and conduct as equalled him to the most renowned heroes of antiquity. The Romans discovering him, and knowing that his death would probably put an end to the battle, if not to the war itself, directed their whole force against him, some attacking him with spears, and others discharging against him showers of darts and arrows. Teia maintained his ground with great intrepidity, received the mislive weapons on his shield, and killed a great number of the enemy with his own hand. When his shield was so loaded with darts that

30
And Teia.

he

Italy.

Italy.

he could not easily wield it, he called for another. Thus he shifted his shield three times; but as he attempted to change it another time, his breast being necessarily exposed for a moment, a dart struck him in that moment with such force, that he immediately fell down dead in the place where he had stood from the beginning of the battle, and upon heaps of the enemy, whom he had killed. The Romans, seeing him fall, cut off his head and exposed it to the sight of the Goths, not doubting that they would be immediately disheartened and retire. In this, however, they were disappointed. The Goths maintained the fight with great vigour, till night put an end to the engagement. The next day the engagement was renewed early in the morning, and continued till night; but on the third day, the Goths despairing of being able to overcome an enemy so much superior to them in numbers, sent deputies to Narfes, offering to lay down their arms, provided such of them as chose to remain in Italy were allowed to enjoy their estates and possessions, without molestation, as subjects of the empire, and those who were willing to retire elsewhere, were suffered to carry with them all their goods and effects. To these terms Narfes readily assented; and thus the empire of the Goths in Italy was finally destroyed, the country now becoming a province of the eastern Roman empire.

31
The end of
the empire
of the
Goths in
Italy.

In this conquest, Narfes had been assisted, as already observed, by many barbarous nations, among whom were the Lombards, at that time settled in Pannonia. On the conclusion of the war, they were dismissed with rich presents, and the nation for some time continued faithful allies to the Romans. In the mean time Justinian dying, Narfes, who governed Italy with an absolute sway, was accused to the emperor Justin II. and to the empress Sophia, of aspiring at the sovereignty of the country. Herenpon he was recalled, and Longinus sent to succeed him. As Narfes was an eunuch, the empress is reported to have said, that his employment at Constantinople should be to distribute in the apartment of her women the portion of wool which each was to spin. Narfes, enraged at this sarcasm, replied, that he should begin such a web as the should never be able to finish; and immediately dispatched messengers to Alboinus king of the Lombards, inviting them into Italy. Along with the messengers he sent some of the best fruits the country afforded, in order to tempt him the more to become master of such a rich kingdom.

31
Narfes in-
vites the
Lombards.

Alboinus, highly pleased with the opportunity of invading a country with which his subjects were already well acquainted, began, without loss of time, to make the necessary preparations for his journey. In the month of April 568, he set out with his whole nation, men, women, and children; carrying with them all their moveables. This promiscuous multitude arrived by the way of Istria; and advancing through the province of Venetia, found the whole country abandoned, the inhabitants having fled to the neighbouring islands in the Adriatic. The gates of Aquileia were opened by the few inhabitants who had courage to stay: most of them, however, had fled with all their valuable effects; and among the rest the Patriarch Paulinus, who had carried with him all the valuable sacred utensils of the churches. From Aquileia, Alboinus proceeded to

Forum Julii, of which he likewise became master without opposition. Here he spent the winter; during which time he erected Friuli into a dukedom, which has continued ever since. In 569, he made himself master of Trivigi, Oderzo, Monte Selce, Vicenza, Verona, and Trent; in each of which cities he left a strong garrison of Lombards under the command of an officer, whom he distinguished by the title of *duke*; but these dukes were only officers and governors of cities, who bore the title no longer than the prince thought proper to continue them in their command or government. Padua and some other cities Alboinus left behind him without attempting to reduce them, either because they were too well garrisoned, or because they lay too much out of his way. In 570, he entered Liguria. The inhabitants were so terrified at his approach, that they left their habitations with such of their effects as they could carry off, and fled into the most mountainous and inaccessible parts of the country. The cities of Brelcia, Barga-³²mo, Lodi, Como, and others quite to the Alps, being left almost without inhabitants, submitted of course; after which he reduced Milan, and was thereupon proclaimed king of Italy.

32
Who re-
duce the
greatest
part of I-
taly.

But though the Lombards had thus conferred the title of king of Italy on their sovereign, he was by no means possessed of the whole country, nor indeed was it ever in the power of the Lombards to get possession of the whole. Alboinus having made himself master of Venetia, Liguria, Emilia, Hetruria, and Umbria, applied himself to legislation and the civilisation of his subjects. But before he could make any progress in this work, he was taken off by the treachery of his wife; and Clephis, one of the nobles, chosen king in his stead. Clephis rebuilt some cities which had been ruined during the wars between the Goths and Romans, and extended his conquests to the very gates of Rome; but as he behaved both to the Romans and Lombards with the greatest cruelty, he was murdered, after a short reign of 18 months. His cruelty gave the Lombards such an aversion against regal power, that they changed their form of government, being governed only by their dukes for the space of ten years. During this interregnum, they proved successful in their wars with the Romans, and made themselves masters of several cities: but perceiving that their kingdom, thus divided, could not subsist, they resolved once more to submit to the authority of one man; and accordingly, in 585, Autharis was chosen king of the Lombards.

The great object of ambition to the new race of Lombard monarchs was the conquest of all Italy; and this proved at last the ruin of their empire by Charles the Great, as related under the article FRANCE, n° 21. As the Lombards, however, had not been possessed of the whole territory of Italy, so the whole of it never came into the possession of Charlemagne: neither, since the time of the Goths, hath the whole of this country been under the dominion of any single state. Some of the southern provinces were still possessed by the emperors of Constantinople; and the liberal grants of Pepin and Charlemagne himself to the pope, had invested him with a considerable share of temporal power. The territories of the pope indeed were supposed to be held in vassalage from France; but this the popes them-

33
Subdued by
Charles-
magne.

Italy.

34
extent of
his Italian
dominions

selves appeared stiffly denied. The indisputed territory of Charlemagne in Italy, therefore, was restricted to Piedmont, the Milanese, the Mantuan, the territory of Genoa, Parma, Modena, Tuscany, Bologna, the dukedoms of Friuli, Spoleto, and Benevento; the last of which contained the greatest part of the present kingdom of Naples.

The feudal government which the Lombards had introduced into Italy, naturally produced revolts and commotions, as the different dukes inclined either to change their masters, or to set up for themselves. Several revolts indeed happened during the life of Charlemagne himself; which, however, he always found means to crush: but after his death, the sovereignty of Italy became an object of contention between the kings of France and the emperors of Germany. That great monarch had divided his extensive dominions among his children; but they all died during his lifetime, except Lewis, whom he associated with himself in the empire, and who succeeded to all his dominions after his death. From this time we may date the troubles with which Italy was so long overwhelmed; and of which, as they proceeded from the ambition of those called kings of Italy and their nobles, of the kings of France, and of the emperors of Germany, it is difficult to have any clear idea. The following short sketch, however, may perhaps give some satisfaction on this perplexed subject.

35
history of
the distur-
bances in I-
taly after
the time of
Charle-
magne.

At the time Lewis the son of Charlemagne was declared emperor of the West, Italy was held by Bernard the son of Pepin, brother to Lewis. Though this Bernard bore the title of *king*, yet he was only accounted a vassal of the emperor. His ambition, however, soon prompted him to rebel against his uncle; but being abandoned by his troops, he was taken prisoner, had his eyes pulled out, and died three days after. As the disturbances still continued, and the nobles of Lombardy were yet very refractory, Lothaire, eldest son to the emperor, was, in the year 823, sent into Italy; of which country he was first crowned king at Rome, and afterwards emperor of the West, during his father's life-time. But though his abilities were sufficient to have settled every thing in a state of tranquillity, his unbounded ambition prompted him to engage in rebellion against his father; whom he more than once took prisoner; though in the end he was obliged to submit, and ask pardon for his offences, which was obtained only on condition of his not passing the Alps without leave obtained from his father.

In the mean time, the Saracens, taking advantage of these intestine wars, landed on the coasts of Italy, and committed such ravages, that even the bishops were obliged to arm themselves for the defence of the country. Lothaire, however, after returning from his unnatural war with his father, was so far from attempting to put an end to these ravages, or to restore tranquillity, that he seized on some places belonging to the see of Rome, under pretence that they were part of his kingdom of Lombardy; nor would he forbear these encroachments, till expressly commanded to do so by his father. After having embroiled himself, and almost lost all his dominions, in a war with his brothers after the death of Lewis, and declared his son, also called *Lewis*, king of Italy, this ambitious prince

died, leaving to Lewis the title of *emperor*, as well as *king of Italy*, with which he had before invested him.

The new emperor applied himself to the restoration of tranquillity in his dominions, and driving out the Saracens from those places which they had seized in Italy. This he fully accomplished, and obliged the infidels to retire into Africa; but in 875, he died, without naming any successor. After his death, some of the Italian nobles, headed by the duke of Tuscany, represented to the pope, that as Lewis had left no successor, the regal dignity, which had so long been usurped by foreigners, ought now to return to the Italians. The pope, however, finding that Charles the Bald, king of France, had such an ambition for the imperial crown, that he would stick at nothing to obtain it, resolved to gratify him, though at as high a price as possible. He accordingly crowned him emperor and king of Lombardy, on condition of his owning the independency of Rome, and that he himself only held the empire by the gift of the pope. This produced a conspiracy among the discontented nobles; and at the same time the Saracens, renewing their incursions, threatened the ecclesiastical territories with the utmost danger. The pope solicited the emperor's assistance, with the greatest earnestness; but he died before any thing effectual could be done: after which, being distressed by the Saracens on one hand, and the Lombard nobles on the other, the unhappy pontiff was forced to fly into France. Italy now fell into the utmost confusion and anarchy; during which time many of the nobles and states of Lombardy assumed an independency, which they have ever since retained.

In 879, the pope was reconducted to Italy with an army by Boson son-in-law to Lewis II. of France: but though he inclined very much to have raised this prince to the dignity of king of Italy, he found his interest insufficient for that purpose, and matters remained in their former situation. The nobles, who had driven out the pope, were now indeed reconciled to him: but notwithstanding this reconciliation, the state of the country was worse than ever; the great men renouncing the authority of any superior, and every one claiming to be sovereign in his own territories. To add to the calamities, which ensued through the ambition of these despots, the Saracens committed every where the most terrible ravages; till at last the Italian nobles, despising the kings of the Carolingian race, who had weakened themselves by their mutual dissensions, began to think of throwing off even all nominal submission to a foreign yoke, and retaining the imperial dignity among themselves. Thus they hoped, that, by being more united among themselves, they might be more able to resist the common enemy. Accordingly, in 885, they went to pope Adrian, and requesting him to join them in asserting the independency of Italy, they obtained of him the two following decrees, viz. That the popes, after their election, might be consecrated without waiting for the presence of the king or his ambassadors; and that, if Charles the Great died without sons, the kingdom of Italy, with the title of *emperor*, should be conferred on some of the Italian nobles.

These decrees were productive of the worst consequences imaginable. The emperor complained of be-
ing

Italy.

ing deprived of his right; and the dissensions between the Italian nobles themselves became more fatal than ever. The two most powerful of these noblemen, Berengarius duke of Friuli, and Guido or Vido duke of Spoleto, entered into an agreement, that, on the death of the emperor, the former should seize on the kingdom of Italy, and the latter on the kingdom of France. Berengarius succeeded without opposition, but Vido was disappointed, the French having already chosef Endes or Otho for their king. Upon this he returned to Italy, and turned his arms against Berengarius. Vido proved victorious in an engagement, and drove his rival into Germany; where he fought the assistance of Arnolphus, who had succeeded to the crown after the death of Charles. Having thus obtained the kingdom of Italy, Vido employed his time in reforming the abuses of the state, and confirming the grants formerly given to the pope out of gratitude for his having sanctified his usurpation and declared him lawful king of Italy. This tranquillity, however, was of short duration. Arnolphus sent an army into Italy; the Saracens from Spain ravaged the northern parts of the country, and, getting possession of a castle near the Alps, held it for many years after, to the great distress of the neighbouring parts, which were exposed to their continual incursions; and at the same time Benevento was besieged and taken by the forces of the eastern emperor, so that Vido found his empire very considerably circumscribed in its dimensions.

The new king, distressed by so many enemies, associated his son Lambert with him in the government, and bribed the Germans to return to their own country. In 893, however, they again invaded Italy; but were suddenly obliged to leave the country, after having put Berengarius in possession of Pavia. In the mean time, Vido died, and his son Lambert drove out Berengarius: but having joined a faction, headed by one Sergius, against pope Formosus, the latter offered the kingdom of Italy to Arnolphus; who thereupon entered the country with an army, besieged and took Rome, massacring the faction of Sergius with the most unrelenting cruelty.

Arnolphus thus master of Italy, and crowned emperor by the pope, began to form schemes of strengthening himself in his new acquisitions by putting out eyes of Berengarius: but the latter, having timely notice of this treachery, fled to Verona; and the Italians, were so provoked at this and the other cruelties of Arnolphus, that they drove him out of the country. His departure occasioned the greatest confusion at Rome. Formosus died soon after; and the successors to the papal dignity, having now no army to fear, excited the greatest disturbances. The body of Formosus was dug up and thrown into the Tiber by one pope, while that pope was strangled, and Formosus's body buried again in the Vatican, by order of another. At last the coronation of Arnolphus was declared void, the Sergian faction entirely demolished, and the abovementioned decrees of Adrian annulled; it being now determined that the elected popes should not be consecrated but in presence of the emperor or his ambassadors.

During these confusions Lambert enjoyed the kingdom in quiet; but the nobles, hating him on account of his arbitrary and tyrannical government, began

again to think of Berengarius. In the mean time, however, another faction offered the crown to Lewis king of Arles. This new competitor entered Italy with an army in 899; but was forced by Berengarius to renounce his claim upon oath, and to swear, that he would never again enter Italy, even though he should be invited to be crowned emperor.—This oath, however, was soon forgot. Lewis readily accepted of another invitation, and was crowned king of Italy at Pavia in 901. The following year he forced Berengarius to fly into Bavaria; but having unadvisedly disbanded his army, as thinking himself now securely seated on the throne, Berengarius, who watched every opportunity, surprised him at Verona, and put out his eyes.

Thus Berengarius at last became king of Italy without a rival; and held his kingdom for 20 years afterwards, without any opposition from his subjects, who at last became sensible of the mischiefs arising from civil discords. He was not yet, however, without troubles. The Hungarians invaded Italy with a formidable army, and advanced within a small distance of Pavia. Berengarius armed the whole force of his dominions; and came against them with such a multitude, that the Hungarians retired without venturing an engagement. A great many of their men were lost in passing a river; upon which they sent deputies to Berengarius, offering to restore all their booty, and never to come again into Italy, provided they were allowed a safe retreat. These conditions were imprudently denied; upon which the Hungarians attacked the army of Berengarius in despair, and defeated them with great slaughter. After this they over-ran the whole country, and plundered the towns of Treviso, Vicenza, and Padua, without resistance, the inhabitants flying every where into fortified places. This devastation they continued for two years; nor could their departure be procured without paying them a large sum of money: which, however, proved of little avail; for the following year they returned, and ravaged the territory of Friuli without controul. Scarcely were these invaders departed, when the Saracens, who had settled at the foot of the Alps, invaded Apulia and Calabria, and made an irruption as far as Acqui in the neighbourhood of Pavia; while the inhabitants, instead of opposing them, fled to some forts which had been erected in the time of the first irruption of the Hungarians. In 912, however, John, presbyter of Ravenna, having attained the papal dignity by means of Theodora, wife of Adelbert count of Tuscany, applied himself to regulate the affairs of the church, and to repress the insults of the Saracens. While he was considering on the most proper methods of effecting this, one of the Saracens, who had received an injury from his countrymen, fled to Rome, and offered to deliver the Italians from their invasions, if the Pope would but allow him a small body of men. His proposals being accepted, 60 young men were chosen, all well armed; who being conducted by the Saracen into by-paths, attacked the infidels as they were returning from their inroads, and several times defeated great parties of them. These losses affecting the Saracens, a general alliance was concluded amongst all their cities; and having fortified a town on the Garigliano, they abandoned the rest,

Italy.

rest, and retired thither. Thus they became much more formidable than before; which alarming the pope, he consulted with Atenulphus prince of Benevento and Capua, sending at the same time ambassadors to Constantine the Greek emperor, inviting him to an alliance against the infidels. The Saracens, unable to withstand such a powerful combination, were besieged in their city: where being reduced to great straits, they at last set fire to it, and sallied out into the woods; but being pursued by the Italians, they were all cut off to a man.

In this expedition it is probable that Berengarius gave great assistance; for this very year, 915, he was crowned emperor by the pope. This gave displeasure to many of the ambitious nobles; conspiracies were repeatedly formed against him; in 922, Rodolphus king of Burgundy was crowned sole king of Italy; and in 924, Berengarius was treacherously assassinated at Verona; of which disturbances, the Hungarians taking the advantage, plundered the cities of Mantua, Brescia, and Bergamo. Marching afterwards to Pavia, they invested it closely on all sides; and about the middle of March 925, taking advantage of the wind, they set fire to the houses next the walls, and during the confusion broke open the gates, and, getting possession of the city, treated the inhabitants with the greatest barbarity. Having burnt the capital of the kingdom, they next proceeded to Placenza, where they plundered the suburbs; and then returned to Pannonia, laden with booty.

The affairs of Italy now fell into the utmost confusion. A faction was formed against Rodolphus in favour of Hugh count of Arles. The latter prevailed, and was crowned king at Pavia in 927. The Italians, however, soon repented of their choice. The Romans first invited him to be their governor, and then drove him out with disgrace; at the same time choosing a consul, tribunes, &c. as if they had designed to assert their ancient liberty. One faction, in the mean time, offered the crown to Rodolphus, and the other to Arnold duke of Bavaria, while the Saracens took this opportunity to plunder the city of Genoa.

Hugh, in the mean time, was not inactive. Having collected an army, he marched directly against Arnold, and entirely defeated him. Rodolphus delivered him from all apprehensions on his part, by entering into an alliance with him, and giving his daughter Adelaide in marriage to Lotharius, Hugh's son. Being thus free from all danger from foreign enemies, he marched against the Romans; but with them he also came to an agreement, and even gave his daughter in marriage to Alberic, whom they had chosen consul. In the mean time the country was infested by the Hungarians and Saracens, and at the same time depopulated by a plague. Endless conspiracies were formed against Hugh himself; and at last, in 947, he was totally deprived of the regal power by Berengarius, grandson to the first king of that name; soon after which he retired into Burgundy, and became a monk.

Though Berengarius was thus possessed of the supreme power, he did not assume the title of king till after the death of Lotharius, which happened in 950; but, in the mean time, Italy was invaded by Henry duke of Bavaria, and the Hungarians. The former

Vol. V.

took and plundered the city of Aquileia, and ravaged the neighbouring country; after which he returned without molestation into Germany: the latter made a furious irruption, and Berengarius being unable to oppose them, was at last obliged to purchase their departure by money. In raising the sum agreed upon, however, Berengarius is said to have been more oppressive than even the Hungarians themselves. Every individual, without distinction of age or sex, was obliged to pay so much for their head; not excepting even the poor. The churches were likewise robbed; by which means the king raised an immense sum of money, 10 bushels of which he gave to the Hungarians, but kept the much greater part to himself.

Berengarius, not yet satisfied, wanted to be put in possession of Pavia, which was held by Adelaide, the widow of Lotharius. In order to obtain his purpose, he proposed a marriage between her and his son Adelbert. This proposal was rejected; upon which Berengarius besieged and took the city. The queen was confined in a neighbouring castle, from whence she made her escape by a contrivance of her confessor. With him, and one female attendant, she concealed herself for some days in a wood; but, being obliged to remove from thence for want of food, she applied for protection to Adelard bishop of Reggio. By him she was recommended to his uncle Atho, who had a strong castle in the neighbourhood of Canzoa. Here she was quickly besieged by Berengarius; upon which messengers were dispatched to Otho king of Germany, acquainting him, that, by expelling Berengarius, and marrying Adelaide, he might easily obtain the kingdom of Italy. This proposal he readily accepted, and married Adelaide; but allowed Berengarius to retain the greatest part of his dominions, upon condition of his doing homage for them to the kings of Germany. He deprived him, however, of the dukedom of Friuli, and marquise of Verona, which he gave to Henry duke of Bavaria.

Berengarius thus freed from all apprehension, not only oppressed his subjects in a most tyrannical manner, but also revolted against Otho himself. This at last procured his ruin: for, in 961, Otho returned with an army into Italy, where he was crowned king by the archbishop of Milan; and the year following was crowned emperor by the pope. On this occasion he received the imperial crown from his holiness, and killed his feet with great humility: after which they both went to the altar of St Peter, and bound themselves by a solemn oath, the pope to be always faithful to the emperor, and to give no assistance to Berengarius or Adelbert his enemies; and Otho, to consult the welfare of the church, and to restore to it all its patrimony granted by former emperors. Otho, besides this, bestowed very rich presents on the church of St Peter. He ordained that the election of popes should be according to the canons; that the elected pope should not be consecrated till he had publicly promised, in presence of the emperor's commissaries, to observe every thing formerly specified with regard to the rights of the emperors; that these commissaries should constantly reside at Rome, and make a report every year how justice was administered by the judges; and, in case of any complaints, the commissaries should lay them before the pope; but if he neglected to intimate them, the

Italy. imperial commissaries might then do what they pleased.

Thus we see that Otho, however much he might allow the pope's supremacy in spiritual matters, plainly assumed the sovereignty in temporal to himself; and thus Italy was for upwards of 300 years accounted a part of the German empire. The popes, however, by no means relished this superiority of the emperor. The latter was hardly departed, when the pope (John XII.) broke the oath which he had just before sworn with so much solemnity; and entered first into an alliance with Adelbert count of Tuscany to expel the Germans, and then solicited the Hungarians to invade Italy. This treachery was soon punished by Otho. He returned with part of his army, and assembled a council of bishops. As the pope did not appear, Otho pretended great concern for his absence. The bishops replied, that the consciousness of his guilt made him afraid to shew himself. The emperor then inquired particularly into his crimes; upon which the bishops accused him of filling the palace with lewd women, of ordaining a bishop in a stable, castrating a cardinal, drinking the devil's health, &c. As the pope still refused to appear in order to justify himself from these charges, he was formally deposed; and Leo the chief secretary, though a layman, elected in his stead.

39
He deposes
the pope.

The new pope, in compliment to the emperor, granted a bull, by which it was ordained that Otho and his successors should have a right of appointing the popes and investing archbishops and bishops; and that none should dare to consecrate a bishop without leave obtained from the emperor. Thus were the affairs of the Italians still kept in the utmost confusion even during the reign of Otho I. who appears to have been a wise and active prince. He was no sooner gone, than the new pope was deposed, all his decrees annulled, and John replaced. The party of Leo was now treated with great cruelty: but John was soon stopped in his career; for about the middle of May the same year (964) in which he had been restored, being surprised in bed with a Roman lady, he received a blow on the head from the devil (according to the authors of those times) of which he died eight days after. After his death a cardinal-deacon, named *Benedict*, was elected by the Romans, but deposed by Otho, and banished to Hamburg.

40
The Ita-
lians revolt,
but are re-
duced.

The emperor was scarce returned to Germany, when his sickle Italians revolted, and sent for Adelbert who had fled to Corsica. But being soon reduced, they continued quiet for about a year; after which they revolted again, and imprisoned the pope. Otho, however, provoked at their rebellious disposition, soon returned, and punished the rebels with great severity; after which he made several laws for the better regulation of the city of Rome, granted several privileges to the Venetians, and caused his son Otho, then only 13 years of age, to be crowned emperor.

This ceremony being over, Otho dispatched an ambassador to Nicephorus, emperor of Constantinople, demanding his step-daughter Theophania in marriage for the young emperor; but upon this alliance being rejected, and that not without circumstances of the most atrocious perfidy, Otho instantly invaded the countries of Apulia and Calabria, and entirely defeated

the Greek army in those parts. In the mean time, however, Nicephorus being killed, and his throne usurped by John Zimisceus, Otho immediately entered into an alliance with the latter, and easily obtained Theophania for his son. She was crowned with great solemnity on the 8th of April 969: at the same time it is pretended by some authors, that the Greeks renounced their rights to Calabria and Apulia; though this is denied by others. After the celebration of this marriage, the emperor undertook an expedition against the Saracens, who still resided at the foot of the Alps; but being informed of the death of several nobles in Germany, he thought proper to return thither, where he died of an apoplexy in the year 973.

41
State of
Italy at the
death of
Otho.

At the time of Otho's death Italy was divided into the provinces of Apulia, Calabria, the dukedom of Benevento, Campania, Terra Romana, the dukedom of Spoleto, Tuscany, Romagna, Lombardy, and the marquises of Acona, Verona, Friuli, Treviso, and Genoa. Apulia and Calabria were still claimed by the Greeks; but all the rest were either immediately subject to, or held of, the kings of Italy. Otho conferred Benevento (including the ancient Samnium) on the duke of that name. Campania and Lucania he gave to the dukes of Capua, Naples, and Salerno. Rome with its territory, Ravenna with the exarchate, the dukedom of Spoleto, with Tuscany, and the marquise of Ancona, he granted to the pope; and retained the rest of Italy under the form of a kingdom. Some of the cities were left free, but all tributary. He appointed several hereditary marquises and counties, but reserved to himself the sovereign jurisdiction in their territories. The liberty of the cities consisted in a freedom to choose their own magistrates, to be judged by their own laws, and to dispose of their own revenues, on condition that they took the oath of allegiance to the king, and paid the customary tribute. The cities that were not free were governed by the commissaries, or lieutenants of the emperor; but the free cities were governed by two or more consuls, afterwards called *podestates*, chosen annually, who took the oath of allegiance to the emperor, before the bishop of the city, or the emperor's commissary. The tribute exacted was called *foderum, parata, et mansuetudine*. By the *foderum* was meant a certain quantity of corn which the cities were obliged to furnish to the king, when marching with an army, or making a progress through the country; though the value of this was frequently paid in money. By the *parata* was understood the expence laid out in keeping the public roads and bridges in repair; and the *mansuetudine* included those expences which were required for lodging the troops, or accommodating them in their camp. Under pretence of this last article the inhabitants were sometimes stripped of all they possessed, except their oxen, and feed for the land. Besides regulating what regarded the cities, Otho distributed honours and possessions to those who had served him faithfully. The honours consisted in the titles of *duke, marquis, count, captain, vavasor, and valvasin*; the possessions were, besides land, the duties arising from harbours, ferries, roads, fish-ponds, mills, salt-pits, the uses of rivers, and all pertaining to them, and such like. The dukes, marquises, and counts, were those who received dukedoms, marquises, and coun-

ties,

Italy.

ties, from the king in fiefs; the captains had the command of a certain number of men by a grant from the king, duke, marquis, or count; the valvafors were fubordinate to the captains, and the valvafins to them.

42
Great di-
urbances
happen on
the death of
Otho I.

No fooner was the death of Otho I. known in Italy, than, as if they had been now freed from all reſtraint, the nobles declared war againſt each other: ſome cities revolted, and choſe to themſelves conſuls; while the dominions of others were ſeized by the nobles, who confirmed their power by erecting citadels. Rome eſpecially was haraſſed by tumults, occaſioned chiefly by the ſeditious practices of one Cincius, who preſſed his fellow-citizens to reſtore the ancient republic. As the pope continued firm in the intereſts of the emperor, Cincius cauſed him to be ſtrangled by one Franco a cardinal deacon; who was ſoon after rewarded with the pontificate, and took upon him the name of *Boniface VII.* Another Pope was choſen by the faction of the count of Tufcany; who being approved by the emperor, drove Cincius and Boniface out of the city. Diſturbances of a ſimilar kind took place in other cities, though Milan continued quiet and loyal in the midſt of all this uproar and conſuſion.

In the mean time Boniface fled for refuge to Conſtantinople, where he excited the emperor to make war againſt Otho II. In 979 an army was accordingly ſent into Italy, which conquered Apulia and Calabria; but the next year Otho entered Italy with a formidable army, and, having taken a ſevere revenge on the authors of the diſturbances, drove the Greeks entirely out of the provinces they had ſeized. Having then cauſed his ſon Otho III. at that time a boy of ten years of age, to be proclaimed emperor, he died at Rome in the year 983. Among the regulations made by this emperor, one is very remarkable, and muſt give us a ſtrange idea of the inhabitants of Italy at that time. He made a law, That no Italian ſhould be believed upon his oath; and that in any diſpute which could not be decided otherwiſe than by witneſſes, the parties ſhould have recourſe to a duel.

Otho III. ſucceeded to the empire at twelve years of age; and, during his minority, the diſturbances in Italy revived. Cincius, called alſo *Crefcentius*, renewed his ſcheme of reſtoring the republic. The pope (John XV.) oppoſing his ſchemes, was driven out of the city; but was ſoon after recalled, on hearing that he had applied to the emperor for aſſiſtance. A few years after Crefcentius again revolted, and expelled Gregory V. the ſucceſſor of John XV.; raiſing to the papal dignity a creature of his own, under the name of *John XVI.* Otho, enraged at this inſult, returned to Rome with a powerful army in 998, beſieged and took it by aſſault; after which he cauſed Crefcentius to be beheaded, and the pope he had ſet up to be thrown headlong from the caſtle of St Angelo, after having his eyes pulled out, and his noſe cut off. Four years after, he himſelf died of the ſmall-pox; or, according to ſome, was poiſoned by the widow of Crefcentius, whom he had debauched under a promiſe of marriage, juſt as he was about to puniſh the Romans for another revolt.

Otho was ſucceeded in the imperial throne by Henry duke of Bavaria, and grandſon to Otho II. Henry had no ſooner ſettled the affairs of Germany, than he

Italy.

found it neceſſary to march into Italy againſt Ardouin marquis of Ivrea, who had aſſumed the title of *King of Italy.* Him he defeated in an engagement, and was himſelf crowned king of Italy at Pavia in 1005; but, a few years after, a new conteſt aroſe about the papal chair, which again required the preſence of the emperor. Before he arrived, however, one of the competitors (*Benedict VIII.*) had got the better of his rival, and both Henry and his queen received the imperial crown from his hands. Before the emperor entered the church, the pope propoſed to him the following queſtion: "Will you obſerve your fidelity to me and my ſucceſſors in every thing?" To which, tho' a kind of homage, he ſubmitted, and answered in the affirmative. After his coronation, he confirmed the privileges beſtowed on the Roman ſee by his predeceſſors, and added ſome others of his own; ſtill, however, reſerving for himſelf the ſovereignty and the power of ſending commiſſaries to hear the grievances of the people. Having repelled the incuſions of the Saracens, reduced ſome more rebellions of his ſubjects, and reduced the greateſt part of Apulia and Calabria, he died in the year 1024.

The death of this emperor was, as uſual, followed by a competition for the crown. Conrad being choſen emperor of Germany, was declared king of Italy by the archbiſhop of Milan; while a party of the nobles made offer of the crown to Robert king of France, or his ſon Hugh. But this offer being declined, and likewiſe another to William duke of Guienne, Conrad enjoyed the dignity conferred on him by the archbiſhop without moleſtation. He was crowned king of Italy at Monza, in 1026; and the next year he received the imperial crown from pope John XX. in preſence of Canute the Great, king of England, Denmark, and Norway, and Rodolph III. king of Burgundy. His reign was ſimilar to that of his predeceſſors. The Italians revolted, the pope was expelled, the malcontents were ſubdued, and the pope reſtored; after which the emperor returned to Germany, and died in 1039.

Under Henry III. who ſucceeded Conrad, the di-
ſturbances were prodigiouſly augmented. Pope Syl-
vester II. was driven out by Benedict; who in his
turn was expelled by John biſhop of Sabinum, who
aſſumed the title of *Sylveſter III.* Three months af-
ter, Benedict was reſtored, and excommunicated his ri-
vals; but ſoon after reſigned the pontificate for a ſum
of money. In a ſhort time he reclaimed it; and thus
there were at once three popes, each of whom was
ſupported on a branch of the papal revenue, while all
of them made themſelves odious by the ſcandalous lives
they led. At laſt a prieſt called *Gratian* put an end
to this ſingular triumvirate. Partly by artifice, and
partly by preſents, he perſuaded all the three to
renounce their pretentions to the papacy; and the
people of Rome, out of gratitude for ſo ſignal a ſer-
vice to the church, choſe him pope, under the name
of *Gregory VI.* Henry III. took umbrage at this
election, in which he had not been conſulted, and
marched with an army into Italy. He depoſed Gre-
gory, as having been guilty of ſimony; and filled the
papal chair with his own chancellor, Heidiger, biſhop
of Bamberg, who aſſumed the name of *Clement II.*
and afterwards conſecrated Henry and the empreſs
Agnes.

Agnes. This ceremony being over, and the Romans having sworn never to elect a pope without the approbation of the reigning emperor, Henry proceeded to Capua, where he was visited by Drago, Rainulphus, and other Norman adventurers; who, leaving their country at different times, had made themselves masters of great part of Apulia and Calabria, at the expense of the Greeks and Saracens. Henry entered into treaty with them; and not only solemnly invested them with those territories which they had acquired by conquest, but prevailed on the pope to excommunicate the Beneventines, who had refused to open their gates to him, and bestowed that city and its dependencies, as fiefs of the empire, upon the Normans, provided they took possession by force of arms. The emperor was scarce returned to Germany, when he received intelligence of the death of Clement II. He was succeeded in the apostolic see by Damasus II.; who also dying soon after his elevation, Henry nominated Bruno bishop of Toul, to the vacant chair. This Bruno, who was the emperor's relation, immediately assumed the pontificals; but being a modest and pious prelate, he threw them off on his journey, by the persuasion of a monk of Cluny, named Hildebrand, afterwards the famous Gregory VII. and went to Rome as a private man. "The emperor alone," said Hildebrand, "has no right to create a pope." He accompanied Bruno to Rome, and secretly retarded his election, that he might arrogate to himself the merit of obtaining it. The scheme succeeded to his wish: Bruno, who took the name of *Leo IX.* believing himself indebted to Hildebrand for the pontificate, favoured him with his particular friendship and confidence; and hence originated the power of this enterprising monk, of obscure birth, but boundless ambition, who governed Rome so long, and whose zeal for the exaltation of the church occasioned so many troubles to Europe.

Leo, soon after his elevation, waited on the emperor at Worms, to crave assistance against the Norman princes, who were become the terror of Italy, and treated their subjects with great severity. Henry furnished the Pope with an army; at the head of which he marched against the Normans, after having excommunicated them, accompanied by a great number of bishops and other ecclesiastics, who were all either killed or taken prisoners, the Germans and Italians being totally routed. Leo himself was led captive to Benevento, which the Normans were now masters of, and which Henry had granted to the pope in exchange for the fief of Bamberg in Germany; and the apostolic see is to this day in possession of Benevento, by virtue of that donation. The Normans, however, who had a right to the city by a prior grant, restored it, in the mean time, to the princes of Lombardy; and Leo was treated with so much respect by the conquerors, that he revoked the sentence of excommunication, and joined his sanction to the imperial investiture for the lands which they held in Apulia and Calabria. Leo died soon after his release; and the emperor, about the same time, caused his infant son, afterwards the famous Henry IV. to be declared king of the Romans, a title still in use for the acknowledged heir of the empire. Gebhard, a German bishop, was elected pope, under the name of *Victor II.* and confirmed

46
Henry IV.
declared
king of the
Romans.

by the address of Hildebrand, who waited on the emperor in person for that purpose, though he disdained to consult him beforehand. Perhaps Hildebrand would not have found this task so easy, had not Henry been involved in a war with the Hungarians; who pressed him hard, but whom he obliged at last to pay a large tribute, and furnish him annually with a certain number of fighting men.

As soon as the emperor had finished this war, and others to which it gave rise, he marched into Italy to inspect the conduct of his sister Beatrice, widow of Boniface marquis of Mantua, and made her prisoner. She had married Gozelo, duke of Lorraine, without the emperor's consent; and contracted her daughter Matilda, by the marquis of Mantua, to Godfrey duke of Spoleto and Tuscany, Gozelo's son by a former marriage. This formidable alliance justly alarmed Henry: he therefore attempted to dissolve it, by carrying his sister into Germany, where he died soon after his return, in the 39th year of his age, and the 16th of his reign.

This emperor, in his last journey to Italy, concluded an alliance with Contarini, doge of Venice. That republic was already rich and powerful, though it had only been enfranchised in the year 998, from the tribute of a mantle of cloth of gold, which it formerly paid, as a mark of subjection, to the emperors of Constantinople. Genoa was the rival of Venice in power and in commerce, and was already in possession of the island of Corsica, which the Genoese had taken from the Saracens. These two cities ingrossed at this time almost all the trade of Europe. There was no city in any respect equal to them either in France or Germany.

Henry IV. was only five years old at his father's death. The popes made use of the respite given them by his minority, to shake off in a great measure their dependence upon the emperors. After a variety of contests about the pontificate, Nicholas II. a creature of Hildebrand's, was elected; who, among others, passed the following celebrated decree, viz. That, for the future, the cardinals only should elect the pope; and that the election should afterwards be confirmed by the rest of the clergy and the people, "saving the honour (adds he) due to our dear son Henry, now king; and who, if it please God, shall be one day emperor, according to the right which we have already conferred upon him." After this he entered into a treaty with the Norman princes above-mentioned; who, though they had lately sworn to hold their possessions from the emperor, now swore to hold them from the pope; and hence arose the pope's claim of sovereignty over the kingdom of Naples and Sicily.

Thus was the power of the German emperors in Italy greatly diminished, and that of the popes proportionally exalted; of which Henry soon had sufficient evidence. For, having assumed the government into his own hands in the year 1072, being then 22 years of age, he was summoned by Alexander II. to appear before the tribunal of the holy see, on account of his loose life, and to answer the charge of having exposed the investiture of bishops to sale; at the same time that the pope excited his German subjects to rebel against him. The rebels, however, were defeated, and peace was restored to Germany: but soon after, Hildebrand above-mentioned, being elected

emperor.

to.

Italy.

to the pontificate under the name of *Gregory VII.* openly assumed the superiority over every earthly monarch whatever. He began with excommunicating every ecclesiastic who should receive a benefice from the hands of a layman, and every layman who should take upon him to confer such a benefice. Henry, instead of resenting this insolence, submitted, and wrote a penitential letter to the pope: who, upon this, condescended to take him into favour, after having severely reprimanded him for his loose life; of which the emperor now confessed himself guilty.

The quarrel between the church and the emperor was, however, soon brought to a crisis by the following accident. Solomon, king of Hungary, being deposed by his brother Geysa, had fled to Henry for protection, and renewed the homage of Hungary to the empire. Gregory, who favoured Geysa, exclaimed against this act of submission, and said in a letter to Solomon, "You ought to know that the kingdom of Hungary belongs to the Roman church; and learn that you will incur the indignation of the holy see, if you do not acknowledge that you hold your dominions of the pope and not of the emperor." Henry, though highly provoked at this declaration, thought proper to treat it with neglect; upon which Gregory resumed the dispute about investitures. The predecessors of Henry had always enjoyed the right of nominating bishops and abbots, and of giving them investiture by the cross and the ring. This right they had in common with almost all princes. The predecessors of Gregory VII. had been accustomed, on their part, to send legates to the emperors, in order to treat their assistance, to obtain their confirmation, or desire them to come and receive the papal sanction; but for no other purpose. Gregory, however, sent two legates to summon Henry to appear before him as a delinquent, because he still continued to bestow investitures, notwithstanding the apostolic decree to the contrary; adding, that if he should fail to yield obedience to the church, he must expect to be excommunicated and dethroned. Incensed at this arrogant message from one whom he considered as his vassal, Henry dismissed the legates with very little ceremony, and in 1706 convoked an assembly of all the princes and dignified ecclesiastics at Worms; where, after mature deliberation, they concluded, that Gregory having usurped the chair of St Peter by indirect means, infected the church of God with a great many novelties and abuses, and deviated from his duty to his sovereign in several scandalous attempts, the emperor, by that supreme authority derived from his predecessors, ought to divest him of his dignity, and appoint another in his place. In consequence of this determination, Henry sent an ambassador to Rome, with a formal deprivation of Gregory; who, in his turn, convoked a council, at which were present 110 bishops, who unanimously agreed that the pope had just cause to depose Henry, to dissolve the oath of allegiance which the princes and states had taken in his favour, and to prohibit them from holding any correspondence with him on pain of excommunication, which was immediately fulminated against the emperor and his adherents.

"In the name of Almighty God, and by our authority, (said Gregory), I prohibit Henry, the son of our emperor Henry, from governing the Teutonic

kingdom, and Italy: I release all Christians from their oath of allegiance to him; and strictly forbid all persons from serving or attending him as king!" The circular letters written by this pontiff breathe the same spirit with his sentence of deposition. He there repeats, several times, that "bishops are superior to kings, and made to judge them?" expressions alike artful and presumptuous, and calculated for bringing in all the churchmen of the world to his standard.

Gregory knew well what consequences would follow the thunder of the church. The German bishops came immediately over to his party, and drew along with them many of the nobles: the flame of civil war still lay smothering, and a bull properly directed was sufficient to set it in a blaze. The Saxons, Henry's old enemies, made use of the papal displeasure as a pretence for rebelling against him. Even Guelph, to whom the emperor had given the duchy of Bavaria, supported the malcontents with that power which he owed to his sovereign's bounty: nay, those very princes and prelates who had assisted in deposing Gregory, gave up their monarch to be tried by the pope; and his holiness was solicited to come to Augsbourg for that purpose.

Willing to prevent this odious trial at Augsbourg, Henry took the unaccountable resolution of suddenly passing the Alps at Tirol, accompanied only by a few domestics, to ask absolution of pope Gregory his oppressor; who was then in Canzoza, on the Appennine mountains; a fortress belonging to the counts or dukes Matilda, abovementioned. At the gates of this place the emperor presented himself as an humble penitent. He alone was admitted without the outer court; where, being stripped of his robes, and wrapped in sack-cloth, he was obliged to remain three days, in the month of January, bare-footed and fasting, before he was permitted to kiss the feet of his holiness; who all that time was shut up with the devout Matilda, whose spiritual director he had long been, and, as some say, her gallant. But be that as it may, her attachment to Gregory, and her hatred to the Germans, was so great, that she made over all her estates to the apostolic see; and this donation is the true cause of all the wars which since that period have raged between the emperors and the popes. She possessed in her own right, great part of Tuscany, Mantua, Parma, Reggio, Placentia, Ferrara, Modena, Verona, and almost the whole of what is now called the *patriarchy of St Peter*, from Viterbo to Orvieto; together with part of Umbria, Spoleto, and the Marche of Ancona.

The emperor was at length permitted to throw himself at the pontiff's feet; who condescended to grant him absolution, after he had sworn obedience to him in all things, and promised to submit to his solemn decision at Augsbourg: so that Henry got nothing but disgrace by his journey; while Gregory, elated by his triumph, and now looking upon himself (not altogether without reason) as the lord and master of all the crowned heads in Christendom, said in several of his letters, that it was his duty "to pull down the pride of kings."

This extraordinary accommodation gave much disgust to the princes of Italy. They never could forgive the insolence of the pope, nor the abject humility of the emperor. Happily however for Henry, their indignation

dignation at Gregory's arrogance overbalanced their detestation of his meanness. He took advantage of this temper; and by a change of fortune, hitherto unknown to the German emperors, he found a strong party in Italy, when abandoned in Germany. All Lombardy took up arms against the pope, while he was raising all Germany against the emperor. Gregory, on the other hand, made use of every art to get another emperor elected in Germany; and Henry, on his part, left nothing undone to persuade the Italians to elect another pope. The Germans chose Rhodolph, duke of Suabia, who was solemnly crowned at Mentz; and Gregory, hesitating on this occasion, behaved truly like the supreme judge of kings. He had deposed Henry, but still it was in his power to pardon that prince: he therefore affected to be displeased that Rodolph was consecrated without his order; and declared, that he would acknowledge as emperor and king of Germany, him of the two competitors who should be most submissive to the holy see.

Henry, however, trusting more to the valour of his troops, than to the generosity of the pope, set out immediately for Germany, where he defeated his enemies in several engagements: and Gregory, seeing no hopes of submission, thundered out a second sentence of excommunication against him, confirming at the same time the election of Rodolph, to whom he sent a golden crown, on which the following well-known verse, equally haughty and puerile, was engraved:

Petra dedit Petrus, Petrus diadema Rodolpho.

This donation was also accompanied with a most enthusiastic anathema against Henry. After depriving him of *strength in combat*, and condemning him *never to be victorious*, it concludes with the following remarkable apostrophe to St Peter and St Paul: "Make all men sensible, that as you can bind and loose every thing in heaven, you can also upon earth take from or give to every one, according to his deserts, empires, kingdoms, principalities—let the kings and the princes of the age, then instantly feel your power, that they may not dare to despise the orders of your church; let your justice be so speedily executed upon Henry, that nobody may doubt but he falls by your means, and not by chance."

In order to avoid the effects of this second excommunication, Henry assembled at Brixen, in the county of Tirol, about 20 German bishops: who acting also for the bishops of Lombardy, unanimously resolved, that the pope, instead of having power over the emperor, owed him obedience and allegiance; and that Gregory VII. having rendered himself unworthy of the papal chair by his conduct and rebellion, ought to be deposed from a dignity he so little deserved. They accordingly degraded Hildebrand; and elected in his room Guibert, archbishop of Ravenna, a person of undoubted merit, who took the name of *Clement III.* Henry promised to put the new pope in possession of Rome; but he was obliged, in the mean time, to employ all his forces against his rival Rodolph, who had re-assembled a large body of troops in Saxony. The two armies met near Mersburg, and both fought with great fury; but the fortune of the day seemed inclined to Rodolph, when his hand was cut off by the famous Godfrey of Bouillon, then in the service of Henry, and afterwards renowned for his conquest of Jerusalem.

Discouraged by the misfortune of their chief, the rebels immediately gave way; and Rodolph perceiving his end approaching, ordered the hand that was cut off to be brought him, and made a speech to his officers on the occasion, which could not fail to have an influence on the emperor's affairs. "Behold, (said he), the hand with which I took the oath of allegiance to Henry; and which oath, at the infliction of Rome, I have violated, in perfidiously aspiring at an honour that was not my due."

Thus delivered from this formidable antagonist, Henry soon dispersed the rest of his enemies in Germany, and set out for Italy in order to settle Clement in the papal chair. But the gates of Rome being shut against him, he was obliged to attack it in form. The siege continued upwards of two years; Henry, during that time, being obliged to quell some insurrections in Germany. The city was at length carried by assault, and with difficulty saved from being pillaged; but Gregory was not taken: he retired into the castle of St Angelo, and thence desired and excommunicated the conqueror. The new pope was, however, consecrated with the usual ceremonies; and expressed his gratitude by crowning Henry, with the concurrence of the Roman senate and people. Mean while the siege of St Angelo was going on; but the emperor being called about some affairs into Lombardy, Robert Guiscard took advantage of his absence to release Gregory, who died soon after at Salerno. His last words, borrowed from the Scripture, were worthy of the greatest saint: "I have loved justice, and hated iniquity; therefore I die in exile!"

Henry, however, did not enjoy all the advantages which might have been expected from the death of Gregory. The subsequent popes trod in the paths of their predecessor. In 1101, Pascal II. excited young Henry to rebel against his father. The emperor did all in his power to dissuade him from proceeding to extremities, but in vain. The young prince persisted in his rebellious intentions; and having by feigned submissions prevailed on the emperor to disband his army, he treacherously seized and confined him. Henry, however, found means to escape from his confinement, and attempted to engage all the sovereigns of Europe in his quarrel; but before any thing effectual could be done, he died at Liege in the year 1106.

The dispute about investitures was not terminated by the deposition and death of Henry IV. His son Henry V. pursued the very same conduct for which he had deposed his father. Pascal opposed him with violence: upon which Henry gave him an invitation into Germany, to end the dispute in an amicable manner. Pascal did not think proper to accept of this invitation; but put himself under the protection of Philip I. king of France, who undertook to mediate between the contending parties. His mediation, however, proved ineffectual, and Henry was prevented by the wars in Hungary and Poland from paying any further attention to the affair of investitures. At last, having settled his affairs in Germany, he took a resolution of going to Rome, in order to settle the dispute personally with the pope. To give his arguments the greater weight, however, he marched at the head of an army of 80,000 men. Pascal received him with great appearance of friendship, but would not renounce

the claim of investitures; and Henry finding himself deceived in his expectations, ordered the pope to be seized. The consul put the citizens in arms to defend the pope, and a battle was fought within the walls of Rome. The slaughter was so great, that the waters of the Tiber were tinged with blood. The Romans were defeated, and Pascal was taken prisoner. The latter renounced his right of investiture; solemnly swore never to resume it, and broke his oath as soon as Henry was gone, by fulminating the sentence of excommunication against him. In 1114 died the countess Matilda, who had bequeathed all her dominions to the pope, as we have already observed; but Henry thinking himself the only lawful heir, alleged, that it was not in Matilda's power to alienate her estates, which depended immediately on the empire. He therefore set out for Lombardy, and sent ambassadors to the pope, beseeching him to revoke the sentence of excommunication abovementioned. Pascal, however, would not even favour the ambassadors with an audience; but, dreading the approach of Henry himself, he took refuge among the Norman princes in Apulia. Henry arrived at Rome in 1117; but being soon after obliged to leave it in order to settle some affairs in Tuscany, the pope returned to Rome, but died in a few days. On the third day after his decease, cardinal Cajetan was elected his successor, without the privy of the emperor, under the name of *Gelasius II.* The new pope was instantly deposed by Henry; who set up the archbishop of Prague, under the name of *Gregory VIII.* Gelasius, though supported by the Norman princes, was obliged to take refuge in France, where he died; and the archbishop of Vienna was elected by the cardinals then present, under the name of *Calixtus II.*

The new pope attempted an accommodation with Henry; which not succeeding, he excommunicated the emperor, the antipope, and his adherents. He next set out for Rome, where he was honourably received; and Gregory VIII. was forced to retire to Sutri, a strong town garrisoned by the emperor's troops. Here he was besieged by Calixtus and the Norman princes. The city was soon taken, and Gregory thrown into prison by his competitor; but at last, the states of the empire, being quite wearied out with such a long quarrel, unanimously supplicated Henry for peace. He referred himself entirely to their decision; and a diet being assembled at Wurtzburg, it was decreed, that an embassy should be immediately sent to the pope, desiring that he would convoke a general council at Rome, by which all disputes might be determined. This was accordingly done, and the affair of investitures at length regulated in the following manner, viz. That the emperor should leave the communities and chapters at liberty to fill up their own vacancies, without bestowing investitures with the cross and ring; that he should restore all that he had unjustly taken from the church; that all elections should be made in a canonical manner, in presence of the emperor or his commissaries; and whatever disputes might happen, should be referred to the decision of the emperor, assisted by the metropolitan and his suffragans; that the person elected should receive from the emperor the investiture of the fiefs and secular rights, not with the cross, but with the

sceptre; and should pay allegiance to him for these rights only.

After the death of Henry, the usual disorders took place in Italy; during which, Roger duke of Apulia conquered the island of Sicily, and assumed the right of creating popes, of whom there were two at that time, viz. Innocent II. and Anacletus. Roger drove out the former, and Lothario emperor of Germany the latter, forcing Roger himself at the same time to retire into Sicily. The emperor then conducted Innocent back to Rome in triumph, and having subdued all Apulia, Calabria, and the rest of Roger's Italian dominions, erected them into a principality, and bestowed it, with the title of *duke*, upon Renaud a German prince, and one of his own relations.

In the reign of Conrad III. who succeeded Lothario, the celebrated factions called the *Guelphs* and *Gibelines**, arose, which for many years deluged the cities of Italy with blood. They took their origin during a civil war in Germany, in which the enemies of the emperor were styled *Guelphs*, and his friends *Gibelines*; and these names were quickly received in Italy as well as other parts of the emperor's dominions. Of this civil war many of the cities in Italy took the advantage to set up for themselves; neither was it in the power of Conrad, who during his whole reign was employed in unsuccessful crusades, to reduce them; but, in 1158, Frederic Barbarossa, successor to Conrad, entered Italy at the head of a very numerous and well disciplined army. His army was divided into several columns for the convenience of entering the country by as many different routes. Having passed the Alps, he reduced the town of Brescia; where he made several salutary regulations for the preservation of good order and military discipline. Continuing to advance, he besieged Milan, which surrendered at discretion. He was crowned king of Lombardy at Monza; and having made himself master of all the other cities of that country, he ordered a minute inquiry to be set on foot concerning the rights of the empire, and exacted homage of all those who held of it, without excepting even the bishops. Grievances were redressed; magistracies reformed; the rights of regality discussed and ascertained; new laws enacted for the maintenance of public tranquillity and the encouragement of learning, which now began to revive in the school of Bologna; and, above all, subvassals were not only prohibited from alienating their lands, but also compelled, in their oath to their lords paramount, to except the emperor nominally, when they swore to serve and assist them against all their enemies. The pope took umbrage at this behaviour towards the ecclesiastics: but Frederic justified what he had done, telling his deputies it was but reasonable they should do homage for the fiefs they possessed; as Jesus Christ himself, though the lord of all the sovereigns upon earth, had deigned to pay for himself and St Peter the tribute which was due to Cæsar.

Frederic having sent commissaries to superintend the election of new magistrates at Milan, the inhabitants were so much provoked at this infringement of their old privileges, that they insulted the imperialists, revolted, and refused to appear before the emperor's tribunal. This he highly resented, and resolved to chastise them severely: for which purpose he sent

Italy.

for a reinforcement from Germany, which soon after arrived with the empress, while he himself ravaged Liguria, declared the Milanese rebels to the empire, and plundered and burnt the city of Crema which was in alliance with that of Milan.

In the mean time, pope Adrian IV. dying, two opposite factions elected two persons known by the names of *Victor II.* and *Alexander III.* The emperor's allies necessarily acknowledged the pope chosen by him; and those princes who were jealous of the emperor, acknowledged the other. *Victor II.* Frederick's pope, had Germany, Bohemia, and one half of Italy, on his side; while the rest submitted to Alexander III. The emperor took a severe revenge on his enemies; Milan was razed from the foundation, and salt strewed on its ruins; Brescia and Piacentia were dismantled; and the other cities which had taken part with them, were deprived of their privileges. Alexander III. however, who had excited the revolt, returned to Rome after the death of his rival; and at his return the civil war was renewed. The emperor caused another pope, and after his death a third, to be elected. Alexander then fled to France, the common asylum of every pope who was oppressed by the emperors; but the flames of civil discord which he had raised, continued daily to spread. In 1168, the cities of Italy, supported by the Greek emperor and the king of Sicily, entered into an association for the defence of their liberties; and the pope's party at length prevailed. In 1176, the imperial army, worn out by fatigues and diseases, was defeated by the confederates, and Frederick himself narrowly escaped. About the same time, he was defeated at sea by the Venetians; and his eldest son Henry, who commanded his fleet, fell into the hands of the enemy. The pope, in honour of this victory, sailed out into the open sea, accompanied by the whole senate; and after having pronounced a thousand benedictions on that element, threw into it a ring as a mark of his gratitude and affection. Hence the origin of that ceremony which is annually performed by the Venetians, under the notion of espousing the Adriatic. These misfortunes disposed the emperor towards a reconciliation with the pope: but, reckoning it below his dignity to make an advance, he rallied his troops, and exerted himself with so much vigour in repairing his loss, that the confederates were defeated in a battle; after which he made proposals of peace, which were now joyfully accepted, and Venice was the place appointed for a reconciliation. The emperor, the pope, and a great many princes and cardinals, attended; and there the emperor, in 1177, put an end to the dispute, by acknowledging the pope, kissing his feet, and holding his stirrup while he mounted his mule. This reconciliation was attended with the submission of all the towns of Italy which had entered into an association for their mutual defence. They obtained a general pardon, and were left at liberty to use their own laws and forms of government, but were obliged to take the oath of allegiance to the emperor as their superior lord. Calixtus, the antipope, finding himself abandoned by the emperor in consequence of this treaty, made also his submission to Alexander, who received him with great humanity; and in order to prevent, for the future, those disturbances which had so often attended the

lections of the popes, he called a general council, in which it was decreed, that no pope should be deemed duly elected, without having two thirds of the votes in his favour.

The affairs of Italy being thus settled, Barbarossa returned to Germany; and having quieted some disturbances which had arisen during his absence in Italy, at last undertook an expedition into the Holy Land; where having performed great exploits, he was drowned as he was swimming in the river Cydnus, in the year 1190. He was succeeded by his son Henry VI. who at the same time became heir to the dominions of Sicily by the right of his wife, daughter of William king of that country. After settling the affairs of Germany, the new emperor marched with an army into Italy, in order to be crowned by the pope, and to recover the succession of Sicily, which was usurped by Tancred his wife's natural brother. For this purpose, he endeavoured to conciliate the affections of the Lombards, by enlarging the privileges of Genoa, Pisa, and other cities, in his way to Rome; where the ceremony of the coronation was performed by Celestin III. on the day after Easter in the year 1191. The pope, then in the 86th year of his age, had no sooner placed the crown upon Henry's head than he kicked it off again, as a testimony of the power residing in the sovereign pontiff to make and unmake emperors at his pleasure.

The coronation being over, Henry prepared for the conquest of Naples and Sicily; but in this he was opposed by the pope: for though Celestin considered Tancred as an usurper, and desired to see him deprived of the crown of Sicily, which he claimed as a fief of the see, yet he was much more averse to the emperor's being put in possession of it, as that would render him too powerful in Italy for the interest of the church. Henry, however, without paying any regard to the threats and remonstrances of his holiness, took almost all the towns of Campania, Calabria, and Apulia; invested the city of Naples; and sent for the Genoese fleet, which he had before engaged, to come and form the blockade by sea: but before its arrival, he was obliged to raise the siege, in consequence of a dreadful mortality among his troops: and all future attempts upon Sicily were ineffectual during the life of Tancred.

The whole reign of Henry from this time seems to have been a continued train of the most abominable perfidies and cruelties. Having treacherously seized and imprisoned Richard I. of ENGLAND, in the manner related under that article, n° 128,—130. he had no sooner received the ransom paid for his royal captive, than he made new preparations for the conquest of Sicily. As Tancred died about this time, the emperor, with the assistance of the Genoese, accomplished his purpose. The queen dowager surrendered Salerno, and her right to the crown, on condition that her son William should possess the principality of Tarentum; but Henry no sooner found himself master of the place, than he ordered the infant-king to be castrated, to have his eyes put out, and to be confined in a dungeon. The royal treasure was transported to Germany, and the queen and her daughter confined in a convent.

In the mean time, the empress, though near the age

of 50, was delivered of a son, named *Frederic*; and Henry soon after assembled a diet of the princes of Germany, to whom he explained his intentions of rendering the imperial crown hereditary, in order to prevent those disturbances which usually attended the election of emperors. A decree passed for this purpose; and *Frederic*, yet in his cradle, was declared king of the Romans. Soon after, the emperor being solicited to undertake a crusade, obeyed the injunctions of the pope, but in such a manner as to make it turn out to his own advantage. He convoked a general diet at Worms, where he solemnly declared his resolution of employing his whole power, and even of hazarding his life, for the accomplishment of so holy an enterprise; and he expatiated upon the subject with so much eloquence, that almost the whole assembly took the cross. Nay, such multitudes from all the provinces of the empire enlisted themselves, that Henry divided them into three large armies; one of which, under the command of the bishop of Mentz, took the route of Hungary, where it was joined by Margaret, queen of that country, who entered herself in this pious expedition, and actually ended her days in Palestine: the second was assembled in Lower Saxony, and embarked in a fleet furnished by the inhabitants of Lubec, Hamburg, Holstein, and Friesland: and the emperor in person conducted the third into Italy, in order to take vengeance on the Normans in Naples and Sicily, who had risen against his government.

The rebels were humbled; and their chiefs were condemned to perish by the most excruciating tortures. One Jorndani, of the house of the Norman princes, was tied naked on a chair of red-hot iron, and crowned with a circle of the same burning metal, which was nailed to his head. The empress shocked at such cruelty, renounced her faith to her husband, and encouraged her countrymen to recover their liberties. Resolution sprung from despair. The inhabitants betook themselves to arms; the empress *Constantia* headed them; and Henry, having dismissed his troops, no longer thought necessary to his bloody purposes, and sent them to pursue their expedition to the Holy Land, was obliged to submit to his wife, and to the conditions which she was pleased to impose on him in favour of the Sicilians. He died at Messina in 1197, soon after this treaty; and, as was supposed, of poison administered by the empress.

62
Disturbances in the beginning of the reign of *Frederic II.*

The emperor's son *Frederic* had already been declared king of the Romans, and consequently became emperor on the death of his father; but as *Frederic II.* was yet a minor, the administration was committed to his uncle the duke of Suabia, both by the will of Henry and by an assembly of the German princes. Other princes, however, incensed to see an elective empire become hereditary, held a new diet at Cologne, and chose *Otho* duke of Brunswick, son of Henry the Lion. *Frederic's* title was confirmed in a third assembly, at Arnburg; and his uncle, Philip duke of Suabia, was elected king of the Romans, in order to give greater weight to his administration. These two elections divided the empire into two powerful factions, and involved all Germany in ruin and desolation. *Innocent III.* who had succeeded *Celestin* in the papal chair, threw himself into the scale of *Otho*, and excommunicated Philip and all his adherents. This able

Italy.

and ambitious pontiff was a sworn enemy of the house of Suabia; not from any personal animosity, but out of a principle of policy. That house had long been terrible to the popes, by its continual possession of the imperial crown; and the accession of the kingdom of Naples and Sicily, made it still more to be dreaded: *Innocent*, therefore, gladly seized the present favourable opportunity for divesting it of the empire, by supporting the election of *Otho*, and sowing divisions among the Suabian party. *Otho* was also patronised by his uncle, the king of England; which naturally inclined the king of France to the side of his rival. Faction clashed with faction; friendship, with interest; caprice, ambition, or resentment, gave the sway; and nothing was beheld on all hands, but the horrors and the miseries of civil wars.

Meanwhile, the empress *Constantia* remained in Sicily, where all was peace, as regent and guardian for her infant son, *Frederic II.* who had been crowned king of that island, with the consent of pope *Celestin III.* But she also had her troubles. A new investiture from the holy see being necessary, on the death of *Celestin*, *Innocent III.* his successor, took advantage of the critical situation of affairs for aggrandizing the papacy, at the expense of the kings of Sicily. They possessed, as has been already observed, the privilege of filling up vacant benefices, and of judging all ecclesiastical causes in the last appeal: they were really popes in their own island, though vassals of his holiness. *Innocent* pretended that these powers had been surreptitiously obtained; and demanded, that *Constantia* should renounce them in the name of her son, and do liege, pure and simple homage for Sicily. But before any thing was settled relative to this affair, the empress died, leaving the regency of the kingdom to the pope; so that he was enabled to prescribe what conditions he thought proper to young *Frederic*. The troubles of Germany still continued; and the pope redoubled his efforts, to detach the princes and prelates from the cause of Philip, notwithstanding the remonstrances of the king of France, to whom he proudly replied, "Either Philip must lose the empire, or I the papacy." But all these dissensions and troubles in Europe, did not prevent the formation of another crusade, or expedition into Asia, for the recovery of the Holy Land. Those who took the cross were principally French and Germans: Baldwin, count of Flanders, was their commander; and the Venetians, as greedy of wealth and power as the ancient Carthaginians, furnished them with ships, for which they took care to be amply paid both in money and territory. The Christian city of Zara, in Dalmatia, had withdrawn itself from the government of the republic: the army of the cross undertook to reduce it to obedience; and it was besieged and taken, notwithstanding the threats and excommunications of the pope.

While the crusaders were spreading desolation thro' the east, Philip and *Otho* were in like manner desolating the west. At length Philip prevailed; and *Otho*, obliged to abandon Germany, took refuge in England. Philip, elated with success, confirmed his election by a second coronation, and proposed an accommodation with the pope, as the means of finally establishing his throne; but before it could be brought about, he fell a sacrifice to private revenge,

Italy.

being affianced by the count Palatine of Bavaria, whose daughter he had promised to marry, and afterwards rejected. Otho returned to Germany on the death of Philip; married that prince's daughter; and was crowned at Rome by pope Innocent III. after yielding to the holy see the long disputed inheritance of the counts Matilda, and confirming the rights and privileges of the Italian cities. But these concessions, as far at least as regarded the pope, were only a sacrifice to present policy; Otho, therefore, no sooner found himself in a condition to act offensively, than he resumed his grant; and, in 1210, not only recovered the possessions of the empire, but made hostile incursions into Apulia, ravaging the dominions of young Frederic, king of Naples and Sicily, who was under the protection of the holy see. For this reason he was excommunicated by Innocent, and Frederic, now 17 years of age, was elected emperor by a diet of the German princes. Otho, however, on his return to Germany, finding his party still considerable, and not doubting but he should be able to humble his rival by means of his superior force, entered into an alliance with his uncle, John king of England, against Philip Augustus king of France, A. D. 1213. The unfortunate battle of Bouvines, where the confederates were defeated, completed the fate of Otho. He attempted to retreat into Germany, but was prevented by young Frederic; who had marched into the empire at the head of a powerful army, and was every where received with open arms. Thus abandoned by all the princes of Germany, and altogether without resource, Otho retired to Brunswick, where he lived four years as a private man, dedicating his time to the duties of religion.

Frederic II. being now universally acknowledged emperor, was crowned at Aix-la-Chapelle in 1215, with great magnificence; when, in order to preserve the favour of the pope, he added to the other solemnities of his coronation, a vow to go in person to the Holy Land.

The bad success of this expedition hath been already taken notice of, under the article *CROISADE*. The emperor had, on various pretences, refused to go into the east; and in 1225, the pope, incensed at the loss of Damietta, wrote a severe letter to him, taxing him with having sacrificed the interests of Christianity by delaying so long the performance of his vow, and threatening him with immediate excommunication if he did not instantly depart with an army into Asia. Frederic, exasperated at these reproaches, renounced all correspondence with the court of Rome; renewed his ecclesiastical jurisdiction in Sicily; filled up vacant sees and benefices; and expelled some bishops, who were creatures of the pope, on pretence of their being concerned in practices against the state.

The pope at first threatened the emperor with the thunder of the church, for presuming to lift up his hand against the sanctuary; but finding Frederic not to be intimidated, he became sensible of his own impudence in wantonly incurring the resentment of so powerful a prince, and thought proper to soothe him by submissive apologies and gentle exhortations. They were accordingly reconciled, and conferred together at Veroli in 1226; where the emperor, as a proof of his sincere attachment to the church, published some very

Italy.

severe edicts against heresy, which seem to have authorised the tribunal of the inquisition. A solemn assembly was afterwards held at Ferentino, where both the pope and the emperor were present, together with John de Brienne, titular king of Jerusalem, who was come to Europe to demand succours against the sultan of Egypt. John had an only daughter, named *Yolanda*, whom he proposed as a wife to the emperor, with the kingdom of Jerusalem as her dower, on condition that Frederic should, within two years, perform the vow he had made to lead an army into the holy land. Frederic married her on these terms, because he chose to please the pope; and since that time the kings of Sicily have taken the title of *king of Jerusalem*. But the emperor was in no hurry to go and conquer his wife's portion, having business of more importance on his hands at home. The chief cities of Lombardy had entered into a secret league, with a view to renounce his authority. He convoked a diet at Cremona, where all the German and Italian noblemen were summoned to attend. A variety of subjects were there discussed; but nothing of consequence was settled. An accommodation, however, was soon after brought about by the mediation of the pope; who, as umpire of the dispute, decreed, that the emperor should lay aside his resentment against the confederate towns, and that the towns should furnish and maintain 400 knights for the relief of the holy land.

Peace being thus concluded, Honorius reminded the emperor of his vow: Frederic promised compliance; but his holiness died before he could see the execution of a project which he seemed to have so much at heart. He was succeeded in the papal chair by Gregory IX. brother of Innocent III.; who, pursuing the same line of policy, urged the departure of Frederic for the holy land; and finding the emperor still backward, declared him incapable of the imperial dignity, as having incurred the sentence of excommunication. Frederic, incensed at such insolence, ravaged the patrimony of St Peter; and was actually excommunicated. The animosity between the Guelphs and Ghibellines revived; the pope was obliged to quit Rome; and Italy became a scene of war and desolation, or rather of an hundred civil wars; which, by inflaming the minds and exciting the resentment of the Italian princes, accustomed them but too much to the horrid practices of poisoning and assassination.

During these transactions, Frederic, in order to remove the cause of all these troubles, and gratify the prejudices of a superstitious age, by the advice of his friends, resolved to perform his vow; and he accordingly embarked for the Holy Land, leaving the affairs of Italy to the management of Renaldo duke of Spoleto. The pope prohibited his departure before he should be absolved from the censures of the church; but Frederic went in contempt of the church, and succeeded better than any person who had gone before him. He did not indeed desolate Asia, and gratify the barbarous zeal of the times by spilling the blood of infidels; but he concluded a treaty with Miliden, sultan of Egypt and master of Syria; by which the end of his expedition seemed fully answered. The sultan ceded to him Jerusalem and its territory, as far as Joppa; Bethlem, Nazareth, and all the country between Jerusalem and Ptolemais; Tyre, Sidon, and the

Italy. the neighbouring territories : in return for which, the emperor granted the Saracens a truce of ten years ; and, in 1230, prudently returned to Italy, where his presence was much wanted.

Frederic's reign, after his return from the east, was one continued quarrel with the popes. The cities of Lombardy had revolted during his absence, at the instigation of Gregory IX. ; and before they could be reduced, the same pontiff excited the emperor's son Henry, who had been elected king of the Romans, to rebel against his father. The rebellion was suppressed, the prince was confined, and the emperor obtained a complete victory over the associated towns. But his troubles were not yet ended. The pope excommunicated him anew, and sent a bull, filled with the most absurd and ridiculous language, into Germany, in order to sow division between Frederic and the princes of the empire.

Frederic retorted in the same strain, in his apology to the princes of Germany, calling Gregory the *Great Dragon*, the *Antichrist*, &c. The emperor's apology was sustained in Germany ; and finding he had nothing to fear from that quarter, he resolved to take ample vengeance on the pope and his associates. For that purpose he marched to Rome, where he thought his party was strong enough to procure him admission ; but this favourite scheme was defeated by the activity of Gregory, who ordered a crusade to be preached against the emperor, as an enemy of the Christian faith ; a step which incensed Frederic so much, that he ordered all his prisoners, who wore the cross, to be exposed to the most cruel tortures. The two factions of the Guelphs and Ghibellines continued to rage with greater violence than ever, involving cities, districts, and even private families, in troubles, divisions, and civil butchery ; no quarter being given on either side. Meanwhile Gregory IX. died, and was succeeded in the see of Rome by Celestin IV. and afterwards by Innocent IV. formerly cardinal Fiesque, who had always expressed the greatest regard for the emperor and his interests. Frederic was accordingly congratulated upon this occasion : but having more penetration than those about him, he sagely replied, " I feel little reason to rejoice ; the cardinal was my friend, but the pope will be my enemy." Innocent soon proved the justice of this conjecture. He attempted to negotiate a peace for Italy ; but not being able to obtain from

Frederic his exorbitant demands, and in fear for the safety of his own person, he fled into France, assembled a general council at Lyons, and, in 1245, deposed the emperor.

Conrad, the emperor's second son, had already been declared king of the Romans, on the death of his brother Henry, which soon followed his confinement : but the empire being now declared vacant by the pope, the German bishops, (for none of the princes were present), at the instigation of his holiness, proceeded to the election of a new emperor ; and they chose Henry landgrave of Thuringia, who was styled in derision, *The king of priests*. Innocent now renewed the crusade against Frederic. It was proclaimed by the preaching friars, since called *Dominicans*, and the minor friars, known by the name of *Cordeliers* or *Franciscans*. The pope, however, did not confine himself to these measures only, but engaged in conspiracies

against the life of an emperor, who had dared to resist the decree of a council, and oppose the whole body of monks and zealots. Frederic's life was several times in danger from plots, poisonings, and assassinations ; which induced him, it is said, to make choice of Mahometan guards, who, he was certain, would not be under the influence of the prevailing superstition.

About this time the landgrave of Thuringia dying, the same prelates who had taken the liberty of creating one emperor made another ; namely, William count of Holland, a young nobleman of twenty years of age, who bore the same contemptuous title with his predecessor. Fortune, which had hitherto favoured Frederic, seemed now to desert him. He was defeated before Parma, which he had long besieged ; and to complete his misfortune, he soon after learned, that his natural son Entius, whom he had made king of Sardinia, was worsted and taken prisoner by the Bolognese.

In this extremity, Frederic retired to his kingdom of Naples, in order to recruit his army ; and there died of a fever, in the year 1250. After his death, the affairs of Germany fell into the utmost confusion, and Italy continued long in the same distracted state in which he had left it. The clergy took arms against the laity ; the weak were oppressed by the strong ; and all laws divine and human were disregarded. After the death of Frederic's son Conrad who had assumed the imperial dignity as successor to his father, and the death of his competitor William of Holland, a variety of candidates appeared for the empire, and several were elected by different factions ; among whom was Richard earl of Cornwall, brother to Henry II. king of England : but no emperor was properly acknowledged till the year 1273, when Rodolph, count of Hapsburg, was unanimously raised to the vacant throne. During the interregnum which preceded the election of Rodolph, Denmark, Holland, and Hungary, entirely freed themselves from the homage they were wont to pay to the empire ; and much about the same time several German cities erected a municipal form of government, which still continues. Lubec, Cologne, Brunswick, and Dantzic, united for their mutual defence against the encroachments of the great lords, by a famous association, called the *Hanseatic league* ; and these towns were afterwards joined by eighty others, belonging to different states, which formed a kind of commercial republic. Italy also, during this period, assumed a new plan of government. That freedom for which the cities of Lombardy had so long struggled, was confirmed to them for a sum of money : they were emancipated by the fruits of their industry. Sicily likewise changed its government and its prince ; of which revolution a particular account is given under the article SICILY.

From the time of Frederic II. we may date the ruin of the German power in Italy. The Florentines, the Pisans, the Genoese, the Lucans, &c. became independent, and could not again be reduced. The power of the emperor, in short, was in a manner annihilated, when Henry VII. undertook to restore it in the beginning of the 14th century. For this purpose a diet was held at Frankfurt, where proper supplies being granted for the emperor's journey, well known by the name of the *Roman expedition*, he set out for

Expedition
of Henry
VII. into
Italy.

Italy.

Italy.

Italy, accompanied by the dukes of Austria and Bavaria, the archbishop of Trier, the bishop of Liege, the counts of Savoy and Flanders, and other noblemen, together with the militia of all the imperial towns. Italy was still divided by the factions of the Guelphs and Ghibelines, who butchered one another without humanity or remorse. But their contest was no longer the same: it was not now a struggle between the empire and the priesthood, but between faction and faction, inflamed by mutual jealousies and animosities. Pope Clement V. had been obliged to leave Rome, which was in the anarchy of popular government. The Colonnas, the Ursini, and the Roman barons, divided the city; and this division was the cause of a long abode of the popes in France, so that Rome seemed equally lost to the popes and the emperors. Sicily was in the possession of the house of Arragon, in consequence of the famous massacre called the *Sicilian vespers*, which delivered that island from the tyranny of the French*. Carobert, king of Hungary, disputed the kingdom of Naples with his uncle Robert, son of Charles II. of the house of Anjou. The house of Este had established itself at Ferrara; and the Venetians wanted to make themselves masters of that country. The old league of the Italian cities no longer subsisted. It had been formed with no other view than to oppose the emperors; and since they had neglected Italy, the cities were wholly employed in aggrandizing themselves, at the expence of each other. The Florentines and the Genoese made war upon the republic of Pisa. Every city was also divided into factions within itself. In the midst of these troubles Henry VII. appeared in Italy in the year 1311, and caused himself to be crowned king of Lombardy at Milan. But the Guelphs had concealed the old iron crown of the Lombard kings, as if the right of reigning were attached to a small circlet of metal. Henry ordered a new crown to be made, with which the ceremony of inauguration was performed.

Cremona was the first place that ventured to oppose the emperor. He reduced it by force, and laid it under heavy contributions. Parma, Vicenza, and Placentia, made peace with him on reasonable conditions. Padua paid 100,000 crowns, and received an imperial officer as governor. The Venetians presented Henry with a large sum of money, an imperial crown of gold enriched with diamonds, and a chain of very curious workmanship. Brescia made a desperate resistance, and sustained a very severe siege; in the course of which the emperor's brother was slain, and his army diminished to such a degree, that the inhabitants marched out under the command of their prefect, Thibault de Drussati, and gave him battle: but they were repulsed with great loss, after an obstinate engagement; and at last obliged to submit, and their city was dismantled. From Brescia Henry marched to Genoa, where he was received with expressions of joy, and splendidly entertained. He next proceeded to Rome; where, after much bloodshed, he received the imperial crown from the hands of the cardinals. Clement V. who had originally invited Henry into Italy, growing jealous of his success, had league with Robert king of Naples, and the Ursini faction, to oppose his entrance into Rome. He en-

tered it in spite of them, by the assistance of the Colonnas. Now master of that ancient city, Henry appointed it a governor; and ordered, that all the cities and states of Italy should pay him an annual tribute. In this order he comprehended the kingdom of Naples, to which he was going to make good his claim of superiority by arms, when he died at Benevento in 1313, as is commonly supposed, of poison given him by a Dominican friar, in the consecrated wine of the sacrament.

The efforts of Henry VII. were unable to restore the imperial power in Italy. From this time the authority of the emperor in that country consisted in a great measure in the convenience which the Ghibelines found in opposing their enemies under the sanction of his name. The power of the pope was much of the same nature. He was less regarded in Italy than in any other country in Christendom. There was indeed a great party who called themselves *Guelphs*; but they affected this distinction only to keep themselves independent of the imperialists; and the states and princes who called themselves *Guelphs* paid little more acknowledgement to his holiness, than sheltering themselves under his name and authority. The most desperate wars were carried on by the different cities against each other; and in these wars Castruccio Castracani, and Sir John Hawkwood an Englishman, are celebrated as heroes. A detail of these transactions would furnish materials for many volumes; and after all seems to be but of little importance, since nothing material was effected by the utmost efforts of valour, and the belligerent states were commonly obliged to make peace without any advantage on either side. By degrees, however, this martial spirit subsided; and in the year 1492, the Italians were so little capable of resisting an enemy, that Charles VIII. of France conquered the whole kingdom of Naples in six weeks, and might easily have subdued the whole country had it not been for his own imprudence. Another attempt on Italy was made by Lewis XII. and a third by Francis I. But for an account of the bad success of these expeditions, see the article FRANCE n° 68—75. In the reigns of Lewis XIII. and XIV. an obstinate war was carried on between the French and Spaniards, in which the Italian states bore a very considerable share. The war concluded in 1660, with very little advantage to the French, who have been always unsuccessful in their Italian wars. The like bad success attended them in that part of the world, in the war which commenced between Britain and Spain in the year 1740. But the particulars of these wars with regard to the different states of Italy, naturally fall to be considered under the history of those states into which the country is now divided; viz. Sardinia, Milan or the Milanese, Genoa, Venice, Tuscany or Florence, Lucca, St Marino, Parma, Mantua, Modena, Rome, and Naples.

The air of Italy is very different, according to the different situations of the several countries contained in Italy. In those on the north of the Apennines it is more temperate, but on the south it is generally very warm. The air of the Campagna of Rome, and of the Ferrarese, is said to be unhealthy; which is owing to the lands not being duly cultivated, nor the marshes drained. That of the other parts is generally pure, dry, and

State of
Italy since
that time.69
Air, &c. of.

Italy.

and healthy. In summer, the heat is very great in the kingdom of Naples; and would be almost intolerable, if it was not somewhat alleviated by the sea-breezes. The soil of Italy in general is very fertile, being watered by a great number of rivers. It produces a great variety of wines, and the best oil in Europe; excellent silk in abundance; corn of all sorts, but not in such plenty as in some other countries; oranges, lemons, citrons, pomegranates, almonds, raisins, sugar, mulberry-trees without number, figs, peaches, nectarines, apricots, pears, apples, filberts, chestnuts, &c. Most of these fruits were at first imported by the Romans from Asia Minor, Greece, Africa, and Syria, and were not the natural products of the soil. The tender plants are covered in winter on the north side of the Apennines, but on the fourth side they have no need of it. This country also yields good pasture; and abounds with cattle, sheep, goats, buffaloes, wild boars, mules, and horses. The forests are well stored with game; and the mountains yield not only mines of iron, lead, alum, sulphur, marble of all sorts, alabaster, jasper, porphyry, &c. but also gold and silver; with a great variety of aromatic herbs, trees, shrubs, and ever-greens, as thyme, lavender, laurel, and bays, wild olive-trees, tamarinds, juniper, oaks, and pines.

A very extensive trade is carried on in many places in Italy, particularly at Leghorn, Genoa, Bologna, Venice, and Naples; the country having a great variety of commodities and manufactures for exportation, especially wine, oil, perfumes, fruits, and silks. Travellers also bring large sums of money into Italy, besides what they lay out in pictures, curiosities, relics, antiquities, &c.

The Italians are generally well proportioned, tho' their complexions are none of the best. As to dress, they follow the fashions of the countries on which they border, or to which they are subject, namely, those of France, Spain, and Germany. With respect to their genius and taste in architecture, painting, carving, and music, they are thought to excel greatly, and to leave the other nations of Europe far behind them: but their music seems too soft and effeminate to deserve all the praise bestowed on it; and their houses are far inferior to those of England in respect of convenience. No country hath produced better politicians, historians, poets, painters, and sculptors, we mean since the revival of the arts and sciences, exclusive of those of ancient times. The Italians are very affable, courteous, ingenious, sober, and ready-witted; but extremely jealous, vindictive, lascivious, ceremonious, and superstitious. In respect to jealousy, indeed, we are told, that a very extraordinary change hath lately taken place; and that the Italians are now no less indulgent and complaisant to their wives, than the most polite husbands in France itself. In their tempers, the Italians seem to be a good medium between the French and Spaniards; neither so gay and volatile as the one, nor so grave and solemn as the other. Boiled snails, served up with oil and pepper, or fried in oil, and the hinder parts of frogs, are reckoned dainty dishes. Kites, jackdaws, hawks, and magpies, are also eaten, not only by the common people, but the better sort. Wine is drank here both in summer and winter cooled by ice or snow. The women affect yellow hair, as the Roman ladies and

courtezans formerly did. They also use paint and waxes, both for their hands and faces. The day here is reckoned from sun-set to sun-set, as the Athenians did of old.

ITCH, a cutaneous disease, appearing in small watery pustules on the skin; commonly of a mild nature, though sometimes attended with obdurate and dangerous symptoms. See (the *Index* subjoined to) MEDICINE.

ITCH-Infest. See ACARUS.

ITEA, in botany, a genus of the monogynia order, belonging to the pentandria class of plants. There is but one species, a native of North-America. It grows by the sides of rivers, and in other parts where the ground is moist. It rises to the height of eight or 10 feet, sending out many branches garnished with spear-shaped leaves placed alternately, and slightly sawed on their edges, of a light green colour. At the extremity of the branches are produced fine spikes of white flowers three or four inches long, standing erect. When these shrubs are in vigour, they will be entirely covered with flowers, so that they make a beautiful appearance during the flowering season, which is in July. They are propagated by layers, and are not injured by the cold of this climate; but are apt to die in summer, if they are planted on a dry gravelly soil. The shoots should be laid down in autumn, and will be rooted in one year.

ITHACA (anc. geogr.), an island in the Ionian Sea on the coast of Epirus; the country of Ulysses near Dulichium, with a town and port situated at the foot of mount Neius. According to Ptolemy, it is about 25 miles in compass; according to Artemidorus, only 10; and is now found to be only eight miles round. It is now uninhabited, and called *Jathaco*.

ITINERARY, ITINERARIUM; a journal, or an account of the distances of places. The most remarkable is that which goes under the names of *Antoninus* and *Ethicus*; or, as Barthius found in his copy, *Antoninus Ethicus*; a Christian writer, posterior to the times of Constantine. Another, called *Hierosolymitanum*, from Bourdeaux to Jerusalem, and from Heraclea through Aulona and Rome to Milan, under Constantine.—*Itinerarium* denotes a day's march.

ITIUS PORTUS (anc. geogr.), the *crux geographorum*, such being the difficulty of ascertaining its position. It would be endless to recite the several opinions concerning it, with the several reasons advanced in support of them. Three ports are mentioned by Cæsar; two without any particular name, viz. the Higher and the Lower, with respect to the *Portus Itius*. Calais, Boulogne, St Omer, and Whitland, have each in their turn had their several advocates. Cæsar gives two distinctive characters or marks which seem to agree equally to Boulogne and Whitland, namely, the shortness of the passage, and the situation between two other ports; therefore nothing can with certainty be determined about the situation of the *Portus Itius*.

ITTIGIUS (Thomas), a learned professor of divinity at Leipsic, and son of John Ittigius, professor of physic in the same university. He first published *A treatise upon burning mountains*; after which he became a minister, and exercised that function in various churches.

Itch
Ittigius.

70
prefs, dis-
olution,
&c. of the
inhabitants.

churches there. He furnished several papers in the *Leipscig acts*, besides publishing some historical works and dissertations. He died in 1710.

ITZEHOA, an ancient and handsome town of Germany, in the circle of Lower Saxony, and duchy of Holstein. It belongs to the king of Denmark, and is seated on the river Stoor, in E. Long. 9. 25. N. Lat. 54. 8.

JUAN (St) DE LA FRONTERA, a town of South-America, in Chili, in the province of Chiquito, near the lake Guanacho. The territory of this town is inhabited by 20,000 native Americans, who are tributary to Spain. It contains mines of gold, and produces a kind of almonds that are very delicate. It is seated at the foot of the Andes, in W. Long. 66. 35. S. Lat. 23. 25.

JUAN de Porto Rico, an island of America, and one of the Caribbees, being 100 miles in length, and 50 in breadth. It belongs to the Spaniards; and is full of very high mountains, and extremely fertile valleys, interspersed with woods, and well watered with springs and rivulets. It produces sugar, rum, ginger, corn, and fruits; partly proper to the climate, and partly introduced from Spain. Besides, there are so many cattle, that they often kill them for the sake of the skins alone. Here are a great number of uncommon trees, and there is a little gold in the north part of the island. It is commonly said that the air is healthy; and yet the earl of Cumberland, when he had taken this island, lost most of his men by sickness, and for that reason was forced to abandon it. This happened in the reign of queen Elizabeth. It is subject to storms and hurricanes, like the rest of these islands. It lies to the east of Hispaniola, at the distance of 50 miles.

JUAN de Porto Rico, the capital town of the island of Porto Rico, with a good harbour defended by several forts, and a bishop's see. It is seated on the north coast of the island, in W. Long. 65. 35. N. Lat. 18. 30.

JUAN Fernandez, an island in the great South Sea, in S. Lat. 33. 40. and W. Long. 78. 30. from London. It was formerly a place of resort for the buccaniers who annoyed the western coast of the Spanish continent. They were led to resort hither from the multitude of goats which it nourished; to deprive their enemies of which advantage, the Spaniards transported a considerable number of dogs, which increasing greatly, have almost extirpated the goats, who now only find security among the steep mountains in the northern parts, which are inaccessible to their pursuers. There are instances of two men living, at different times, alone on this island for many years; the one a Musquito Indian; the other Alexander Selkirk, a Scotchman, who was, after five years, taken on board an English ship, which touched here in about 1710, and brought back to Europe. From the history of this recluse, Daniel de Foe is said to have conceived the idea of writing the adventures of Robinson Crusoe. This island was very propitious to the remains of commodore Anson's squadron in 1741, after having been buffeted with tempests, and debilitated by an inveterate scurvy, during a three months passage round Cape Horn: they continued here three months; during which time the dying crews, who on their arrival could

scarcely with one united effort heave the anchor, were restored to perfect health. Captain Carteret, in the *Swallow*, in 1767, having met with many difficulties and impediments in his passage into the South Sea, by the Straits of Magellan, attempted to make this island in order to recruit the health of his men; but he found it fortified by the Spaniards, and therefore chose rather to proceed to the island of Mafafuero. But M. de Bougainville, that same year, is said to have touched here for refreshments, although in the narrative of the voyage the fact is cautiously suppressed. This island is not quite 15 miles long, and about six broad; its only safe harbour is on the north side. It is said to have plenty of excellent water, and to abound with a great variety of esculent vegetables highly antiscorbutic; besides which, commodore Anson sowed a variety of garden-seeds, and planted the stones of plums, apricots, and peaches, which he was many years afterwards informed had thriven greatly; and now doubtless furnish a very valuable addition to the natural productions of this spot. Vast shoals of fish of various kinds frequent this coast, particularly cod of a prodigious size; and, it is said, in not less abundance than on the banks of Newfoundland. There are but few birds here, and those few are of species well known and common.

JUAN Blanco. See PLATINA.

JUBILEE, a time of public and solemn festivity among the ancient Hebrews. This was kept every 50th year: it began about the autumnal equinox, and was proclaimed by sound of trumpet throughout all the country. At this time all slaves were released, all debts annihilated, and all lands, houses, wives and children, however alienated, were restored to their first owners. During this whole year all kind of agriculture was forbidden; and the poor had the benefit of the harvest, vintage, and the other productions of the earth, in the same manner as in the sabbatic or seventh year. As this was designed to put the Israelites in mind of their Egyptian servitude, and to prevent their imposing the like upon their brethren, it was not observed by the Gentile profelytes.

The Christians, in imitation of the Jews, have likewise established *jubilees*, which began in the time of pope Boniface VIII. in the year 1300, and are now practised every 25 years: but these relate only to the pretended forgiveness of sins, and the indulgences granted by the church of Rome; together with the privilege of performing a thousand frolics in masquerade. The ceremony of the *jubilee* observed at Rome, begins in the following manner: The pope goes to St Peter's church, to open the holy gate, which is walled up, and opened only on this occasion; and, holding a golden hammer in his hand, he knocks at the gate three times, repeating these words, *Aperite mihi portas justitie, &c.* "Open to me the gates of righteousness; I will go into them, and I will praise the Lord, (Psalm cxviii. 19.)" Upon which the masons fall to work, and break down the wall that stops up the gate: which done, the pope kneels down before it, and the penitentiaries sprinkle him with holy water. Then, taking up the cross, he begins to sing *Te Deum*; and enters the church, followed by the clergy. In the mean time, three cardinal-legates are sent to open the three other holy gates which are in the

Jucatan
Judæa.

the churches of St John of Lateran, St Paul, and St Mary the Greater. When the holy year is expired, the holy gates are shut in this manner: The pope, after he has blessed the stones and mortar, lays the first stone, and leaves there 12 boxes of gold and silver medals; after which the holy gates are walked up as before, and continue so till the next jubilee.

JUCATAN, or YUCATAN, a large province of North-America, in New Spain, which is a peninsula. It is over-against the island of Cuba, and contains a large quantity of timber, proper for building ships; as also sugar, cassia, and Indian corn. The original inhabitants are few, they having been very ill used by the Spaniards. Merida is the capital town. It is a flat, level country; and is very unhealthy, which may be owing to the frequent inundations.

JUDAH, the fourth son of Jacob, and father of the chief of the tribes of the Jews, distinguished by his name, and honoured by giving birth to the Messiah, died 1636 B. C.

JUDAH *Hakkadosh*, or the Saint, a rabbi celebrated for his learning and riches, lived in the time of the emperor Antoninus, and was the friend and preceptor of that prince. Leo of Modena, a rabbi of Venice, tells us, that rabbi Judah, who was very rich, collected about 26 years after the destruction of the temple, in a book which he called the *Misna*, the constitutions and traditions of the Jewish magistrates who preceded him. But as this book was short and obscure, two Babylonish rabbis, Rabbena and Ase, collected all the interpretations, disputes, and additions, that had been made until their time upon the *Misna*, and formed the book called the *Babylonish Talmud* or *Gemara*; which is preferable to the Jerusalem Talmud, composed some years before by rabbi Jochanan of Jerusalem. The *Misna* is the text of the Talmud; of which we have a good edition in Hebrew and Latin by Surenhusius, with notes, in 3 vols folio. It were to be wished the fame had been done to the *Gemara*.

The kingdom of JUDAH was of small extent, compared with that of the kingdom of Israel; consisting only of two tribes, Benjamin and Judah: its east boundary, the Jordan; the Mediterranean its west, in common with the Danites, if we except some places recovered by the Philistines, and others taken by the kings of Israel: on the south, its limits seem to have been contracted under Hadad of the royal progeny of Edom, (1 Kings xi. 14.)

Tribe of JUDAH, one of the 12 divisions of Palestine by tribes, (Josh. xv.) having Idumea on the south, from the extremity of the Lacus Asphaltites, also the Wilderness of Zin, Cadesbarnea, and the brook or river of Egypt; on the east, the said lake; on the west, the Mediterranean; and on the north, the mouth of the said lake; where it receives the Jordan, Bethfemes, Thimna, quite to Ekron on the sea.

JUDEA, (anc. geog.) taken largely, either denotes all Palestine, or the greater part of it; and thus it is generally taken in the Roman history: Ptolemy, Rutilius, Jerome, Origen, and Eusebius, take it for the whole of Palestine. Here we consider it as the third part of it on this side the Jordan, and that the southern part, distinct from Samaria and Galilee; under which notion it is often taken, not only in Josephus, but also in the New Testament. It con-

tained four tribes; Judah, Benjamin, Dan, and Simeon, together with Philistia and Idumea; so as to be comprised between Samaria on the north, Arabia Petrea on the south, and to be bounded by the Mediterranean on the west, and by the Lacus Asphaltites, with part of Jordan, on the east. Josephus divides it into 11 toparchies; Pliny into 10; by which it has a greater extent than that just mentioned. See PALESTINE.

JUDAISM, the religious doctrines and rites of the Jews.

JUDAS MACCABEUS, a celebrated general of the Jews, renowned for his many victories over his enemies, at last slain in battle, 261 B. C. See (*History of the Jews*, n° 13.

JUDE (St), brother of St James the younger, and son of Joseph, (Mat. xiii. 55.) He preached in Mesopotamia, Arabia, Syria, Idumea; and died in Berytus for the confession of Christ. He writ that epistle which goes under his name, and after the death of most of the apostles. He was cruelly put to death for reproving the superstition of the Magi.

JUDE, or the *General Epistle of Jude*, a canonical book of the New Testament, written against the heretics, who, by their disorderly lives and impious doctrines, corrupted the faith and good morals of the Christians. St Jude draws them in lively colours, as men given up to their passions, full of vanity, conducting themselves by worldly wisdom, and not by the spirit of God.

JUDENBURG, a handsome and considerable town of Germany, in the circle of Austria, and capital of Upper Styria, with a handsome castle; the public buildings with the square are very magnificent. It is seated on the river Meur. E. Long. 15. 20. N. Lat. 47. 20.

JUDEX (Matthew), one of the principal writers of the centuries of Magdeburg, was born at Tiptewolde in Misnia, in 1528. He taught theology with great reputation; but met with many disquiets in the exercise of his ministry from party-feuds. He wrote several works, and died in 1564.

JUDGE, a chief magistrate of the law, appointed to hear causes, to explain the laws, and to pass sentence.

Book of JUDGES, a canonical book of the Old Testament, so called from its relating the state of the Israelites under the administration of many illustrious persons who were called *judges*, from being both the civil and military governors of the people, and who were raised up by God upon special occasions, after the death of Joshua, till the time of their making a king. In the time of this peculiar polity, there were several remarkable occurrences, which are recorded in this book. It acquaints us with the gross impiety of a new generation which sprung up after the death of Joshua; and gives us a short view of the dispensations of heaven towards this people, sometimes relieving and delivering them, and at others severely chastising them by the hands of their enemies.

JUDGMENT, among logicians, a faculty or rather act of the human soul, whereby it compares its ideas, and perceives their agreement or disagreement. See METAPHYSICS, n° 242—245; and LOGIC, Part II.

JUDGMENT, in law, is the sentence pronounced by the

Judicial
Judgment.

the court upon the matter contained in the record. Judgments are of four sorts. First, where the facts are confessed by the parties, and the law determined by the court; as in case of judgment upon *demurrer*: secondly, where the law is admitted by the parties, and the facts disputed; as in a case of judgment on *verdict*: thirdly, where both the fact and the law arising thereon are admitted by the defendant; which is the case of judgments by *confession* or *default*: or, lastly, where the plaintiff is convinced that either fact, or law, or both, are insufficient to support his action, and therefore abandons or withdraws his prosecution; which is the case in judgments upon a *nonsuit* or *retreat*.

The judgment, though pronounced or awarded by the judges, is not their determination or sentence, but the determination and sentence of the *law*. It is the conclusion that naturally and regularly follows from the premises of law and fact, which stand thus: Against him who hath rode over my corn, I may recover damages by law; but A hath rode over my corn; therefore I shall recover damages against A. If the major proposition be denied, this is a demurrer in law: if the minor, it is then an issue of fact: but if both be confessed (or determined) to be right, the conclusion or judgment of the court cannot but follow. Which judgment or conclusion depends not therefore on the arbitrary caprice of the judge, but on the settled and invariable principles of justice. The judgment, in short, is the remedy prescribed by law for the redress of injuries; and the suit or action is the vehicle or means of administering it. What that remedy may be, is indeed the result of deliberation and study to point out; and therefore the style of the judgment is, not that it is decreed or resolved by the court, for then the judgment might appear to be their own; but, "it is considered," *confideratum est per curiam*, that the plaintiff do recover his damages, his debt, his possession, and the like: which implies that the judgment is none of their own; but the act of law, pronounced and declared by the court, after due deliberation and inquiry. See *Blackst. Comment. iii. 396*.

JUDGMENT, in criminal cases, is the next stage of prosecution, after TRIAL and CONVICTION are past, in such crimes and misdemeanors as are either too high or too low to be included within the benefit of clergy. For when, upon a capital charge, the JURY have brought in their VERDICT guilty in the presence of the prisoner; he is either immediately, or at a convenient time soon after, asked by the court, if he has any thing to offer why judgment should not be awarded against him. And in case the defendant be found guilty of a misdemeanor, (the trial of which may, and does usually, happen in his absence, after he has once appeared), a *capias* is awarded and issued, to bring him in to receive his judgment; and, if he absconds, he may be prosecuted even to outlawry. But whenever he appears in person, upon either a capital or inferior conviction, he may at this period, as well as at his arraignment, offer any exceptions to the indictment, in arrest or stay of judgment: as for want of sufficient certainty in setting forth either the person, the time, the place, or the offence. And, if the objections be valid, the whole proceedings shall be set aside; but the party may be indicted again. And we may take

notice, 1. That none of the statutes of *jeoffails*, for amendment of errors, extend to indictments or proceedings in criminal cases; and therefore a defective indictment is not aided by a verdict, as defective pleadings in civil cases are. 2. That, in favour of life, great strictness has at all times been observed, in every point of an indictment. Sir Matthew Hale indeed complains, "that this strictness is grown to be a blemish and inconvenience in the law, and the administration thereof: for that more offenders escape by the over easy ear given to exceptions in indictments, than by their own innocence; and many times gross murders, burglaries, robberies, and other heinous and crying offences, remain unpunished by these unseemly niceties: to the reproach of the law, to the shame of the government, to the encouragement of villany, and to the dishonour of God." And yet, notwithstanding this laudable zeal, no man was more tender of life than this truly excellent judge.

A pardon also may be pleaded in arrest of judgment: and it has the same advantage when pleaded here, as when pleaded upon ARRAIGNMENT; viz. the saving the ATTAINDER, and, of course, the CORRUPTION of blood: which nothing can restore but parliament, when a pardon is not pleaded till after sentence. And certainly, upon all accounts, when a man hath obtained a pardon, he is in the right to plead it as soon as possible. See PARDON.

Praying the benefit of clergy may also be ranked among the motions in arrest of judgment. See Benefit of CLERGY.

If all these resources fail, the court must pronounce that judgment which the law hath annexed to the crime. Of these some are capital, which extend to the life of the offender, and consist generally in being hanged by the neck till dead; though in very atrocious crimes other circumstances of terror, pain, or disgrace, are superadded: as, in treasons of all kinds, being drawn or dragged to the place of execution; in high treason affecting the king's person or government, embowelling alive, beheading, and quartering; and in murder, a public dissection. And, in case of any treason committed by a female, the judgment is to be burned alive. But the humanity of the English nation has authorized, by a tacit consent, an almost general mitigation of such parts of these judgments as favour of torture or cruelty: a sledge or hurdle being usually allowed to such traitors as are condemned to be drawn; and there being very few instances (and those accidental or by negligence) of any person's being embowelled or burned, till previously deprived of sensation by strangling. Some punishments consist in exile or banishment, by abjuration of the realm, or transportation to the American colonies: others in loss of liberty, by perpetual or temporary imprisonment. Some extend to confiscation, by forfeiture of lands, or moveables, or both, or of the profits of lands for life: others induce a disability, of holding offices or employments, being heirs, executors, and the like. Some, though rarely, occasion a mutilation or dismembering, by cutting off the hand or ears: others fix a lasting stigma on the offender, by sitting the nostrils, or branding in the hand or face. Some are merely pecuniary, by stated or discretionary fines: and lastly, there are others, that consist principally in their

Judgment
Ives.

their ignominy, though most of them are mixed with some degree of corporal pain; and these are inflicted chiefly for such crimes, as either arise from indigence, or render even opulence disgraceful. Such as whipping, hard labour in the house of correction, the pillory, the stocks, and the ducking-stool.

Diffusing as this catalogue may seem, it will afford pleasure to a British reader, and do honour to the British laws, to compare it with that shocking apparatus of death and torment to be met with in the criminal codes of almost every other nation in Europe. And it is moreover one of the glories of our law, that the nature, tho' not always the quantity or degree, of punishment is ascertained for every offence; and that it is not left in the breast of any judge, nor even of a jury, to alter that judgment, which the law has beforehand ordained, for every subject alike, without respect of persons. For, if judgments were to be the private opinions of the judge, men would then be slaves to their magistrates; and would live in society, without knowing exactly the conditions and obligations which it lays them under. And besides, as this prevents oppression on the one hand; so, on the other, it stifles all hopes of impunity or mitigation, with which an offender might flatter himself if his punishment depended on the humour or discretion of the court. Whereas, where an established penalty is annexed to crimes, the criminal may read their certain consequence in that law, which ought to be the unvaried rule, as it is the inflexible judge, of his actions.

JUDGMENT of God, (Judicium Dei), in law, a term applied to the trial by combat, by ordeal, &c. See the articles DUEL, COMBAT, ORDEAL, &c.

JUDICIAL COMBAT. See BATTLE.

JUDOIGNE, a town of the Austrian Netherlands, in Brabant. Near this town the duke of Marlborough gained that signal victory over the French in 1706, called the *battle of Ramillies*. It is seated on the river Gete, 13 miles south-east of Louvain, and 16 north of Namur.

IVES, or *YVES*, (St.), a celebrated bishop of Chartres, born in the territory of Beauvais in the 11th century. His merit procured his election to the see of Chartres in 1092, or 1093, under the pontificate of Urban II. who had deposed Geoffroy his predecessor for sundry accusations against him. Ives particularly signalized himself by his zeal against Philip I. who had put away his wife Bertha of Holland, and had taken Bertrade of Montford, wife of Fouques count of Anjou. Afterward he devoted himself wholly to the functions of his ministry; made several religious foundations; and died in 1115. Pope Pius V. permitted the monks of the congregation of Lateran, to celebrate the festival of St Ives on the 20th of May. We have a collection of decrees of his compiling, *Exceptiones ecclesiasticarum regularum*, a *Chronicon*, and 22 sermons; all very valuable pieces, which were collected and published in one volume folio, in 1647, by John Baptist Souciet, canon of Chartres.

IVES (St.), a sea-port town of Cornwall, in England, seated on a bay of the same name; which being unsafe, it is only frequented by fishermen, for the taking of pilchards. However, it is a corporation, and sends two members to parliament. W. Long. 6. 15. N. Lat.

50. 15.

VOL. V.

Ives
Juglans.

IVES (St.), a town of Huntingdonshire, in England. It is an ancient, large, and handsome place, seated on the river Ouse, over which is a fine stone bridge. Here was a priory, which is now in ruins. It has one large church, two dissenting, and a Popish meeting, with about 500 houses; the streets are pretty wide, and tolerably well paved. W. Long. o. 7. N. Lat. 52. 20.

JUGERUM, in Roman antiquity, a square of 120 Roman feet; its proportion to the English acre being as 10,000 to 16,097.

JUGLANS, a genus of the polyandria order, belonging to the monœcia class of plants. There are five species, the most remarkable of which is the regia or common walnut. This rises 50 feet high or more, with a large upright trunk, branching into a very large spreading head, with large pinnated leaves, of two or three pair of oval, smooth, somewhat serrated lobes, terminated by an odd one; and monœcious flowers, succeeded by clusters of large green fruit, inclosing furrowed nuts of different shapes and sizes in the varieties, ripening in September and October. Other two species, called the *nigra* and *alba*, or black and white Virginian walnut, are also cultivated in this country, though they are less proper for fruit, having very small kernels.

Culture. All the sorts are propagated by planting their nuts, which will grow in any common soil. The nuts, being procured in the proper season, in their outer covers or husks if possible, they should be preserved in dry sand until February, and then planted. After two years growth in the seed-bed, they are to be taken out, and planted in the nursery, where they must remain till grown five or six feet high, when they must be transplanted where they are finally to remain; but if intended for timber as well as fruit-trees, they ought to be finally transplanted when they have attained the height of three or four feet.

Uses. The fruit is used at two different stages of growth; when green to pickle; and, when ripe, to eat raw. As a pickle, the nuts may be used when about half or three-fourths grown, before the outer coat or shell becomes hard; such nuts should be chosen as are most free from specks, and for this purpose they must be gathered by hand. Walnuts are ready for pickling in July and August. They are fully ripe in September and October; and are then commonly beat down with long poles, especially on large trees; for, as the walnuts grow mostly at the extremities of the branches, it would be troublesome and tedious to gather them by hand. As soon as gathered, lay them in heaps a few days to heat and sweat, to cause their outer husks, which adhere closely, to separate from the shell of the nuts; then clean them from the rubbish, and deposit them in some dry room for use, covering them over close with dry straw half a foot thick, and they will keep three or four months. They are always readily sold at market, especially in London; where, at their first coming in, they are sold with the husks on, by the sack or bushel; but afterwards are bought clean, and sold both by measure and by the thousand. The wood of the walnut-tree is also very valuable; not indeed where strength is necessary, it being of a very brittle nature; but the cabinet-makers and joiners esteem it highly for several sorts of household

furniture and other light works; for, being beautifully veined, it takes a fine polish, and the more knotty it is, the more it is valued for particular purposes. Walnut-trees are also well adapted for planting round the borders of orchards, where, by their large spreading heads, they will also guard the lesser fruit-trees from boisterous winds. The kernels of the nuts are similar in quality to almonds; but are not, like them, used in medicine.

JUGORA, a considerable province of Muscovy, depending on the government of Archangel. It has the title of a duchy; and is inhabited by a kind of Tartars, who are very savage, and much of the same disposition with the Samoides.

IVICA, or **YVICA**, the name of an island in the Mediterranean. See **YVICA**.

JUICE, denotes the sap of vegetables, or the liquors of animals. See **ANATOMY**, **BLOOD**, **PLANTS**, **SAP**, &c.

The juices of several plants are expressed to obtain their essential salts, and for several medicinal purposes, with intention either to be used without further preparation, or to be made into syrups and extracts. The general method of extracting these juices is, by pounding the plant in a marble mortar, and then by putting it into a press. Thus is obtained a muddy and green liquor; which generally requires to be clarified, as we shall soon observe. The juices of all plants are not extracted with equal ease. Some plants, even when fresh, contain so little juice, that water must be added while they are pounded, otherwise scarcely any juice would be obtained by expression. Other plants, which contain a considerable quantity of juice, furnish by expression but a small quantity of it, because they contain also much mucilage, which renders the juice so viscid that it cannot flow. Water must also be added to these plants to obtain their juice. The juices thus obtained from vegetables by a mechanical method, are not, properly speaking, one of their principles, but rather a collection of all the proximate principles of plants which are soluble in water; such as the saponaceous extractive matter, the mucilage, the odoriferous principle, all the saline and saccharine substances; all which are dissolved in the water of the vegetation of the plants. Besides all these matters, the juice contains some part of the refinous substance, and the green colouring matter, which in almost all vegetables is of a refinous nature. These two latter substances, not being soluble in water, are only interposed between the parts of the other principles which are dissolved in the juice, and consequently disturbs its transparency. They nevertheless adhere together in a certain degree, and so strongly in most juices, that they cannot be separated by filtration alone. When therefore these juices are to be clarified, some previous preparations must be used by which the filtration may be facilitated. Juices which are acid, and not very mucilaginous, are spontaneously clarified by rest and gentle heat. The juices of most antiscorbutic plants abounding in saline volatile principles, may be disposed to filtration merely by immersion in boiling water; and as they may be contained in closed bottles while they are thus heated in a water-bath, their saline volatile part, in which their medicinal qualities chiefly consist, may thus be preserved. Fermentation is also an effectual method of

clarifying juices which are susceptible of it; for all liquors which have fermented, clarify spontaneously after fermentation. But this method is not used to clarify juices, because many of them are susceptible of only an imperfect fermentation, and because the qualities of most of them are injured by that process. The method of clarification most generally used, and indispensably necessary for those juices which contain much mucilage, is boiling with the white of an egg. This matter, which has the property of coagulating in boiling water, and of uniting with mucilage, does accordingly, when added to the juice of plants, unite with, and coagulate, their mucilage, and separates it from the juice in form of scum, together with the greatest part of the refinous and earthy matters which disturb its transparency. And as any of these refinous matters which may remain in the liquor, after this boiling with the whites of eggs, are no longer retained by the mucilage, they may easily be separated by filtration. See **FILTRATION**.

The juices, especially before they are clarified, contain almost all the same principles as the plant itself; because in the operation by which they are extracted, no decomposition happens, but every thing remains, as to its nature, in the same state as in the plant. The principles contained in the juice are only separated from the grosser oily, earthy, and refinous parts, which compose the solid matter that remains under the press. These juices, when well prepared, have therefore the same medicinal qualities as the plants from which they are obtained. They must evidently differ from each other as to the nature and proportions of the principles with which they are impregnated, as much as the plants from which they are extracted differ from each other in those respects.

Most vegetable juices coagulate when they are exposed to the air, whether they are drawn out of the plant by wounds, or naturally run out; tho' what is called *naturally running out*, is generally the effect of a wound in the plant, from a sort of canker, or some other internal cause. Different parts of the same plant yield different juices. The same veins in their course through the different parts of the plant yield juices of a different appearance. Thus the juice in the root of the cow parsnep is of a brimstone colour; but in the stalk it is white.

Among those juices of vegetables which are clammy and readily coagulate, there are some which readily break with a whey. The great wild lettuce, with the smell of opium yields the greatest plenty of milky juice of any known British plant. When the stalk is wounded with a knife, the juice flows readily out like a thick cream, and is white and ropy; but if these wounds are made at the top of the stalks, the juice that flows out of them is dashed with a purple tinge, as if cream had been sprinkled over it with a few drops of red wine. Some little time after letting this out, it becomes much more purple, and thickens; and finally, the thicker part of it separates, and the thin whey swims at top. The whey or thin part of this separated matter is easily pressed out from the curd by squeezing between the fingers, and the curd will then remain white; and on washing with water, it becomes like rags. The purple whey, for in this is contained all the colour, soon dries into a purple cake, and

and may be crumbled between the fingers into a powder of the same colour. The white curd being dried and kept for some time, becomes hard and brittle. It breaks with a shining surface like resin, and is inflammable; taking fire at a candle, and burning all away with a strong flame. The same thick part being held over a gentle heat, will draw out into tough long threads, melting like wax. The purple cake made from the whey is quite different from this; and when held to a candle scarce flames at all, but burns to a black coal. The whole virtue of the plant seems also to consist in this thin part of its juice: for the coagulum or curd, though looking like wax or resin, has no taste at all; whereas the purple cake made from the serum is extremely bitter, and of a taste somewhat resembling that of opium.

Of the same kind with the wild lettuce are the throotwort, spurge, and many other plants. These are all replete with a milky juice which separates into curds and whey like that already described. But this, though a common law of nature, is not universal; for there are many plants which yield the like milky juices, without any separation ensuing upon their extravasation. The white juice of the *Ionchus* never separates, but dries into an uniform cake: the common red wild poppy bleeds freely with a milky juice; and the heads or capsules of seed bleed not less freely than the rest of the plant, even after the flower is fallen. This juice, on being received into a shell or other small vessel, soon changes its white to a deep yellow colour, and dries it into a cake which seems resinous and oily, but no whey separates from it. The *tragopogon*, or goat's-beard, when wounded, bleeds freely a milky juice; it is at first white, but becomes immediately yellow, and then more and more red; till at length it is wholly of a dusky red. It never separates, but dries together into one cake; and is oily and resinous, but of an insipid taste. The great bindweed also bleeds freely a white juice; the flowers, as well as the stalks and leaves, affording this liquor. It is of a sharp taste; and as many of the purging plants are of this class, it would be worth trying whether this milk is not purgative.

These juices, as well as the generality of others which bleed from plants, are white like milk; but there are some of other colours. The juice of the greatcelandine is of a fine yellow colour; it flows from the plant of the thickness of cream, and soon dries into a hard cake, without any whey separating from it. Another yellow juice is yielded by the seed-vessels of the yellow centaury in the month of July, when the seeds are full grown. This is very clammy; it soon hardens altogether into a cake without any whey separating from it. It sticks to the fingers like birdlime, is of the colour of pale amber, and will never become harder than soft wax, if dried in the shade; but if laid in the sun, it immediately becomes hard like resin. These cakes burn like wax, and emit a very pleasant smell. The great angelica also yields a yellowish juice on being wounded; and this will not harden at all, but if kept several years will still be soft and clammy, drawing out into threads, or half melted resin.

Another kind of juices very different from all these, are those of a gummy nature. Some of these remain

liquid a long time, and are not to be dried without the assistance of heat; the others very quickly harden of themselves, and are not inflammable. The gum of the juice of rhubarb-leaves soon hardens; and is afterwards soluble in common water, and sparkles when put into the flame of a candle. The clusters of the common honeysuckle are full of a liquid gum. This they frequently throw out, and it falls upon the leaves, where it retains its own form. The red hairs of the *ros folis* are all terminated by large bladders of a thin watery fluid. This is also a liquid gum; it sticks to the fingers, draws out into long threads, and stands the force of the sun all day. In the centre of each of these dew-drops there is a small red bladder, which stands immediately on the summit of the red hair, and contains a purple juice which may be squeezed out of it. The *pinguicula*, or butter-wort, has also a gummy matter on its leaves in much greater quantity than the *ros folis*.

Some plants yield juices which are manifestly of an oily nature. These, when rubbed, are not at all of a clammy nature, but make the fingers glib and slippery, and do not all harden on being exposed to the air. If the stalk of elecampane be wounded, there flows out an oily juice swimming upon a watery one. The stalks of the hemlock also afford a similar oily liquor swimming upon the other; and in like manner the white mullein, the berries of ivy, the bay, juniper, dog-berry tree, and the fruit of the olive, when wounded, shew their oil floating on the watery juice. Some of these oily juices, however, harden into a kind of resin. Our ivy yields such a juice very abundantly; and the juice of the small purple-berried juniper is of the same kind, being hard and fat, and not very gummy. If the bark of the common ivy is wounded in March, there will ooze out a tough and greasy matter of a yellowish colour, which, taken up between the fingers, feels not at all gummy or sticking, but melts in handling into a sort of oil, which, in process of time, hardens and crusts upon the wounds, and looks like brown sugar. It burns with a lasting flame, and smells very strong. The tops of the wild lettuce, and the leaves growing near the tops, if examined with a magnifying glass, shew a great number of small bladders, or drops of an oily juice of a brownish colour, hardening into a kind of resin; they are easily wiped off when of any size, and are truly an oily-juice a little hardened. It is probable also, that the fine blue flour or powder, called the *bloom*, upon the surface of our common plums, is no other than such an oily juice exuding from their pores in small particles, and hardening into a sort of resin.

JUJUBES, in the *matéria medica*, the name of a fruit of the pulpy kind, produced on a tree which *Linnaeus* makes a species of *rhamnus*. See *RHAMNUS*.

The jujubes have been made a general ingredient in pectoral decoctions; but they are now seldom used on these occasions, and are scarce at all heard of in prescription, or to be met with in our shops.

JULEP, in pharmacy, a medicine composed of some proper liquor and a syrup or sugar, of extemporaneous preparation, without decoction. See *PHARMACY*, n^o 917, &c.

JULIAN, the famous Roman emperor, styled the *Apollate*, because he professed the Christian religion

Julian.

before he ascended the throne, but afterwards openly embraced Paganism, and endeavoured to abolish Christianity. He made no use of violence, however, for this purpose; for he knew that violent measures had always rendered it more flourishing: he therefore behaved with a politic mildness to the Christians; recalled all who had been banished on account of religion under the reign of Constantius; and undertook to convert them by his caresses, and by temporal advantages and mortifications covered over by artful pretences: but he forbade Christians to plead before courts of justice, or to enjoy any public employments. He even prohibited their teaching polite literature; well knowing the great advantages they drew from profane authors in their attacks upon Paganism and irreligion. Though he on all occasions shewed a sovereign contempt for the Christians, whom he always called *Galileans*, yet he was sensible of the advantage they obtained by their virtue and the purity of their manners; and therefore incessantly proposed their example to the Pagan priests. At last, however, when he found that all other methods failed, he gave public employments to the most cruel enemies of the Christians, when the cities in most of the provinces were filled with tumults and seditions, and many of them were put to death: Though it has been pleaded by Julian's apologists, that the behaviour of the Christians furnished sufficient pretence for most of his proceedings against them, and the animosities among themselves furnished him with the means; that they were continually prone to sedition, and made a merit of insulting the public worship; and, finally, that they made no scruple of declaring, that want of numbers alone prevented them from engaging in an open rebellion. Historians mention, that Julian attempted to prove the falsehood of our Lord's prediction with respect to the temple of Jerusalem; and resolved to have that edifice rebuilt by the Jews, about 300 years after its destruction by Titus: but all their endeavours served only the more perfectly to verify what had been foretold by Jesus Christ; for the Jews, who had assembled from all parts to Jerusalem, digging the foundations, flames of fire burst forth, and consumed the workmen *. However, the Jews, who were obstinately bent on accomplishing that work, made several attempts; but it is said, that all who endeavoured to lay the foundations perished by these flames, which at last obliged them entirely to abandon the work. Julian being mortally wounded in a battle with the Persians, it is said, that he then caught in his hand some of the blood which flowed from his wound, and throwing it towards heaven, cried, "Thou Galilean hast conquered." But notwithstanding this popular report, Theodoret relates, that Julian discovered a different disposition, and employed his last moments in conversing with Maximus the philosopher, on the dignity of the soul. He died the following night, aged 32. For a particular account of his reign and exploits, see (*History of*) CONSTANTINOPLE, n^o 7. 33.—70.

* See Jerusalem.

No prince was ever more differently represented by different authors; on which account it is difficult to form a true judgement of his real character. It must, however, be acknowledged, that he was learned, liberal, temperate, brave, vigilant, and a lover of justice: but, on the other hand, he had apostatized to

Paganism; was an enemy to the Christian religion; and was, in fact, a persecutor, though not of the most sanguinary class. We have several of his discourses or orations; some of his letters; a treatise, intitled *Misopogon*, which is a satire on the inhabitants of Antioch; and some other pieces, all written in an elegant style. They were published in Greek and Latin by father Petau, in 1630, in quarto; and of which Spanheimius gave a fine edition in folio, in 1696. His most famous work was that composed against the Christians, of which there are some fragments in Cyrill's refutation of it.

JULIAN Period, in chronology, a period so called, as being adapted to the Julian year.

It is made to commence before the creation of the world. Its principal advantage lies here, that the same years of the cycles of the sun, moon, and indiction, of which three cycles it was made to consist by Joseph Scaliger in 1580, belonging to any year of this period, will never fall together again till after the expiration of 7980 years. There is taken for the first year of this period that which hath the first of the cycle of the sun, the first of the cycle of the moon, and the first of the indiction cycle, and so reckoning on.

The first year of the Christian era is always, in our systems of Chronology, the 4714th of the Julian period.

To find what year of the Julian period any given year of Christ answers to; To the given year of Christ add 4713, because so many years of the Julian period were expired A. D. 1; and the sum gives the year of the Julian period sought.

On the contrary, having the year of the Julian period given, to find what year of Christ answers thereto; From the year of the Julian period given subtract 4713, and the remainder will be the year sought.

JULIAN (St.), a harbour on the south of Patagonia, in South America, where ships usually touch that are bound to the south seas. S. Lat. 48. 15.

JULIERS, a duchy in the circle of Westphalia, in Germany, seated between the rivers Maese and Rhine, and bounded by Prussian Guelderland on the north, by the electorate of Triers on the south, by the electorate of Cologne on the east, and by the Netherlands on the west. It is about 60 miles long, and 30 broad; and is a very plentiful country, abounding in cattle, corn, and fine meadows, and is well supplied with wood; but it is most remarkable for a fine breed of horses, and woad for dying, which is gathered here in abundance. The chief towns are Juliers, Aix-la-Chapelle, Duren, Munster-Eifel, Bedbur, Wesenburgh, and Lafteren. It is subject to the elector Palatine, with the consent of the kings of Prussia and Poland.

JULIERS, a city, capital of the duchy of Juliers in Westphalia; some think this city was founded by Julius Cæsar, or Julia Agrippina; but this is much questioned by others, because it is not mentioned before Antoninus's Itinerary and Theodosius's Tables. The town is small, but well fortified, and neatly built; the houses are of brick, and the streets broad and regular. The citadel is large and very strong, containing a palace of the ancient dukes, and a spacious piazza. In the suburbs there is a monastery of Carthusians, nobly

Julian.
Juliers.

Julio

Juncus.

nobly endowed by several dukes of Juliers. The town is but poorly inhabited, though they have a fine woolen manufactory in this country, and likewise another of linen. It was taken by Prince Maurice of Nassau in 1610, and by the Spaniards in 1622. It is seated on the river Roer, in E. Lon. 6. 35. N. Lat. 50. 55.

JULIO ROMANO. See ROMANO.

JULIUS CESAR. See CESAR.

JULIUS II. (Julian de la Rovere) pope, remarkable for his warlike disposition, and his political negotiations: by the latter, he engaged the principal powers of Europe to league with him against the republic of Venice, called the *league of Cambray*, signed in 1508. The Venetians having purchased peace by the cession of part of Romania, Julius turned his arms against Louis XII. king of France, and appeared in person, armed cap-a-pie, at the siege of Mirandola; which place he took by assault in 1511. But proceeding to excommunicate Louis, the king wisely turned his own weapons against him, by calling a general council at Pisa: at which the pope refusing to appear, was declared to be suspended from the holy see; and Louis, in his turn, excommunicated the pope, who died soon after in 1512. He built the famous church of St Peter at Rome, and was a patron of the polite arts.

JULIUS POLLUX. See POLLUX.

JULY, the seventh month of the year; during which the sun enters the sign Leo. The word is derived from the Latin *Julius*, the surname of C. Caesar the dictator, who was born in it. Mark Antony first gave this month the name *July*, which before was called *Quintilis*, as being the fifth month of the year in the old Roman kalendar established by Romulus, which begun in the month of March. For the same reason, August was called *Sextilis*; and September, October, November, and December, still retain the name of their first rank:

Que sequitur, numero turba notata suo. OVID. Fast.

On the 19th day of this month the dog-days are commonly supposed to begin; when, according to Hippocrates and Pliny, the fea boils, wine turns sour, dogs go mad, the bile is increased and irritated, and all animals decline and languish.

JUMIEGE, a town of Normandy, in France, and in the territory of Caux, with a celebrated Benedictine abbey. It is seated on the river Seine, in E. Lon. 0. 55. N. Lat. 49. 25.

JUNCTURE, in composition, See ORATORY, n° 46.

JUNCUS, the RUSH; a genus of the monogynia order, belonging to the hexandria class of plants. There are many species, which are universally known, being very troublesome weeds, and difficult to be eradicated. The pith of two kinds, called the *conglomeratus* and *effusus*, or round-headed and soft rushes, are used for wicks to lamps and rush-lights. The *conglomeratus*, and *aculus* or marine rush, are planted with great care on the banks of the sea in Holland, in order to prevent the water from washing away the earth; which would otherwise be removed every tide, if it were not for the roots of those rushes, which fasten very deep in the ground, and mat themselves near the surface in such a manner as to hold the earth closely together. Therefore, whenever the inhabitants

perceive that the roots of these rushes are destroyed, they are very assiduous in repairing them. In the summer-time, when the rushes are fully grown, they are cut and tied up in bundles, which are dried, and afterwards carried into the larger towns and cities, where they are wrought into baskets, and several other useful things, which are frequently sent into England. These sorts do not grow so strong in this country as on the Maese, where they sometimes arrive at the height of four feet and upwards.

A species of rush termed *juncus odoratus*, "sweet rush, or camel's hay," is sometimes brought to us from Turkey and Arabia, tied up in bundles about a foot long. The stalk, in shape and colour, somewhat resembles a barley-straw; it is full of fungous pith like that of our common rushes: the leaves are like those of wheat, and surround the stalk with several coats, as in the reed. The flowers are of a carnation colour, striped with a lighter purple. The whole plant, when in perfection, has a hot, bitterish, not unpleasant, aromatic taste, and a very fragrant smell: by long keeping it loses greatly its aromatic flavour. Distilled with water, it yields a considerable quantity of an essential oil. It was formerly often used in medicine as an aromatic, and in obstructions of the viscera, &c. but is very little employed at present.

JUNE, the sixth month of the year, during which the sun enters the sign of Cancer. The word comes from the Latin *Junius*, which some derive à *Junone*. Ovid, in the 6th of his *Fasts*, makes the goddess say,

Junius à nostro nomine nomen habet.

Others rather derive it à *junioribus*, this being for young people, as the month of May was for old ones. *Junius est juvenum, qui suit ante senum.* In this month is the summer solstice.

JUNGERMANNIA, a genus of the order of algæ, belonging to the cryptogamia class of plants. There are 29 species, all natives of Britain, growing in woods, shady places, by the sides of ditches, &c. Many of them are beautiful objects for the microscope.

JUNIPERUS, the JUNIPER TREE; a genus of the monadelphica order, belonging to the dioecia class of plants.

Species. 1. The *communis*, or common juniper, grows naturally in many parts of Britain, upon dry barren commons, where it seldom rises above the height of a low shrub. Mr Evelyn assures us, that "the juniper, though naturally of the growth of England, is very little known in many parts of the country: for it grows naturally only in dry, chalky, or sandy land; and, where the soil is opposite to this, the plant is rarely found. Those who have been used to see it in its wild state, on sandy barren commons, &c. will have little inducement to plant it; as there they will see it procumbent, seldom shewing a tendency to aspire: but when planted in a good soil, it will rise to the height of 15 or 16 feet, and produce numerous branches from the bottom to the top, forming a well-looking bushy plant. These branches are exceeding tough, and covered with a smooth bark of a reddish colour, having a tinge of purple. The leaves are narrow and sharp-pointed, growing by threes on the branches: their upper surface has a greyish streak down the middle; but

June

Juniperus.

branchy the whole length, with the branches growing more erect, and leaves, flowers, and fruit, like the former. But Mr Miller affirms the Swedish juniper to be a distinct species. A prostrate and very dwarfish variety is mentioned by Mr Lightfoot, under the name of *dwarf Alpine juniper*. It is frequently found in the mountains in the highlands of Scotland, and has broader and thicker leaves than the former; the berries are also larger, or more oval than spherical. 2. The *oxycedrus*, or Spanish juniper, rises from 10 to 15 feet high, closely branched from bottom to top; having short, awl-shaped, spreading leaves by threes, and small dioecious flowers, succeeded by large reddish-brown berries. 3. The *thurifera*, or blue-berried Spanish juniper, grows 20 feet high or more, branching in a conic form, with acute imbricated leaves growing by fours, and small dioecious flowers, succeeded by large blue flowers. 4. The *Virginiana*, or Virginia cedar, grows 30 or 40 feet high, branching from bottom to top in a conic manner, small leaves by threes adhering at their base; the younger ones imbricated, and the old ones spreading; with dioecious flowers, succeeded by small blue berries. 5. The *Lycia*, or Lycian cedar, grows 20 feet high, branching erect; garnished with small obtuse oval leaves, every-where imbricated; having dioecious flowers, succeeded by large oval brown berries. It is a native of Spain and Italy. 6. The *Phœnicia*, or Phœnician cedar, grows about 20 feet high, branching pyramidally; adorned with ternate and imbricated obtuse leaves; and dioecious flowers, succeeded by small yellowish berries. It is a native of Portugal. 7. The *Bermudiana*, or Bermudian cedar, grows 20 or 30 feet high, has small acute leaves by threes below, the upper ones awl-shaped, acute, and decurrent, by pairs or fours, spreading outward, and dioecious flowers, succeeded by purplish berries. It is a native of Bermudas. 8. The *Sabina*, or savin tree; of which there are the following varieties, viz. spreading, upright, and variegated savin. The first grows three or four feet high, with horizontal and very spreading branches; with short, pointed, decurrent, erect, opposite leaves; and dioecious flowers, succeeded by bluish berries, but very rarely producing either flowers or fruit. The second grows eight or ten feet high, with upright branches, dark-green leaves like the former, and dioecious flowers, succeeded by plenty of berries. The third has the ends of many of the shoots and young branches variegated with white, and the leaves finely striped; so that it makes a beautiful appearance.

Culture. The propagation of all the junipers is by seed, and of the savins by layers and cuttings; but these last may also be raised from the berries, if they can be procured. They may all be sowed in beds of common light earth; except the cedar of Bermudas, which must be sowed in pots, to have shelter in winter. When the hardy kinds have had two or three years growth in the seed-bed, they may be planted out in autumn or in spring, in nursery-rows two feet asunder,

there to remain till of due size for final transplantation into the shrubbery. The Bermudas cedar must be sheltered under a frame for the first year or two; when they must be separated into small pots, to be sheltered also in winter for three or four years, till they have acquired some size and strength; then turned out into pots in the full ground, where they are to remain in a warm situation; though a shelter of mats for the first winter or two during hard frosts will be of great service. The season for transplanting all the sorts is either in autumn, October or November, or in March, and early in April.

Uses, &c. Juniper-berries have a strong, not disagreeable smell; and a warm, pungent, sweet taste; which, if they are long chewed, or previously well bruised, is followed by a bitterish one. The pungency seems to reside in the bark; the sweet in the juice; the aromatic flavour in oily vesicles spread through the substance of the pulp, and distinguishable even by the eye; and the bitter in the seeds. The fresh berries yield, on expression, a rich, sweet, honey-like aromatic juice; if previously pounded so as to break the seeds, the juice proves tart and bitter.—These berries are useful carminatives and stomachics: for these purposes a spirituous water and essential oil are prepared from them, and they are also ingredients in various medicines. The liquor remaining after the distillation of the oil passed through a strainer, and gently exhaled to the consistence a rob, proves likewise a medicine of great utility, and in many cases is perhaps preferable to the oil or the berry itself. Hoffman is expressly of this opinion, and recommends the rob of juniper in debility of the stomach and intestines, and says it is particularly serviceable to old people who are subject to these disorders, or labour under a difficulty with regard to the urinary secretion. This rob is of a dark brownish-yellow colour, a balsamic sweet taste, with a little of the bitter, more or less, according as the seeds in the berry have been more or less bruised. The Swedes prepare an extract from the berries, probably of the nature of the rob above mentioned, which some people eat for breakfast. In Germany the berries are bruised and put into the fauce made use of for a wild boar; and are frequently also eaten with other pork, to give it a wild-boar flavour. In Carniola and some other districts, the inhabitants make a kind of wine of them steeped in water; but it is difficult to prevent this liquor from growing sour. Thrushes and grouse feed on the berries, and disseminate the seed in their dung.—It is remarkable that the berries of the juniper are two years in ripening. They sometimes appear in an uncommon form; the leaves of the cup grow double the usual size, approaching, but not closing; and the three petals fit exactly close, so as to keep the air from the *tipule juniperi* which inhabit them.—The whole plant has a strong aromatic smell. The wood when burnt emits a fragrant odour like incense. It is of a reddish colour, very hard and durable; and, when large enough, is used in marquetry and vaneeing, and in making cups, cabinets, &c. From the clefts of the bark, in warm climates, there sometimes exudes a resinous gum called by the Arabs *Sandaracha* *. This resin, or as it is * See Sandaracha. improperly called gum, is brought to us from Africa, where

where the trees grow very large, and in great numbers.—Grafts will not grow beneath juniper, but this tree itself is said to be destroyed by the meadow-oat. The oil of juniper mixed with that of nuts makes an excellent varnish for pictures, wood-work, and preserving iron from rusting. The resin powdered and rubbed into paper prevents the ink from sinking through it, for which it is frequently used under the name of *POUNCE*.—The charcoal made from this wood endures longer than any other, inasmuch that live embers are said to have been found in the ashes, after being a year covered.

JUNIUS (Adrian), one of the most learned men of the age in which he lived, was born at Horn in Holland in 1511. He travelled into all parts of Europe, and practised physic with reputation in England; where, among other works, he composed a Greek and Latin Lexicon, to which he added above 6500 words; an Epithalamium on the marriage of queen Mary with king Philip of Spain; and *Animadversa & de Coma Commentarius*, which is the most applauded of all his works. He died in 1575.

JUNIUS (Francis), professor of divinity at Leyden, was born at Bourges in 1545, of a noble family, and studied some time at Lyons. Bartholomew Aneau, who was principal of the college in that city, gave him excellent instructions with regard to the right method of studying. He was remarkable for being proof against all temptations to lewdness; but a libertine too far overpowered him by his sophistry, that he made him an atheist: however, he soon returned to his first faith; and, averse as he was to unlawful love, he had no aversion to matrimony, but was married no less than four times. He was employed in public affairs by Henry IV.; and at last was invited to Leyden to be professor of divinity, which employment he discharged with honour, till he was snatched away by the plague in 1602. Du Pin says, he was a learned and judicious critic. He wrote, in conjunction with Emmanuel Tremellius, a Latin version of the Hebrew text of the Bible. He also published Commentaries on a great part of the Holy Scriptures; and many other works, all in Latin.

JUNIUS (Francis), or *Francis du Jon*, the son of the preceding, was born at Heidelberg, in 1589. He at first designed to devote himself to a military life; but after the truce concluded in 1609, he applied himself entirely to study. He came to England in 1620, and lived 30 years in the earl of Arundel's family. He was greatly esteemed, not only for his profound erudition, but also for the purity of his manners; and was so passionately fond of the study of the Northern languages, that, being informed there were some villages in Friesland where the ancient language of the Saxons was preserved, he went and lived two years in that country. He returned to England in 1675; and after spending a year at Oxford, retired to Windsor, in order to visit Vossius, at whose house he died in 1677. The university of Oxford, to which he bequeathed his manuscripts, erected a very handsome monument to his memory. He wrote, 1. *De Pictura Veterum*, which is admired by all the learned; the best edition of it is that of Rotterdam in 1694. He published the same work at Lon-

don, in English. 2. An explication of the old Gothic manuscript, called the *Silver one*, because the four Gospels are there written in silver Gothic letters; this was published with notes by Thomas Marechal, or Marthal. 3. A large Commentary on the Harmony of the four Gospels by Tatian, which is still in manuscript. 4. A Glossary in five languages, in which he explains the origin of the Northern languages; published at Oxford in 1745, in folio, by Mr Edward Lee.

JUNK, in the sea-language, old cables cut into short pieces, and given to boatwains for making swabs, plats, and nippers; as also to the ship-carpenters, and to poor people, to be pricked into oakum, for caulking ships, &c.

JUNO, in pagan worship, was the sister and wife of Jupiter, and the goddess of kingdoms and riches; and also styled the *queen of heaven*: she presided over marriage and child-birth, and was represented as the daughter of Saturn and Rhea. She married Jupiter; but was not the most compliant wife; for, according to Homer, that god was sometimes obliged to make use of all his authority to keep her in due subjection; and the same author observes, that on her entering into a conspiracy against him, he punished her by suspending her in the air with two anvils fastened to her feet, and golden manacles on her hands, which all the other deities looked on without a possibility of helping her. However, her jealousy made her frequently find opportunities of interrupting her husband in the course of his amours, and prompted her to punish with unrelenting fury Europa, Semele, Io, Latona, and the rest of his mistresses. Jupiter himself having conceived without any commerce with a female, Juno, in revenge, conceived Vulcan by the wind, Mars by touching a flower pointed out to her by the goddess Flora, and Hebe by eating greedily of lettuces.

Juno, as the queen of heaven, preferred great state: her usual attendants were Terror and Boldness, Castor, Pollux, and 14 nymphs; but her most faithful attendant was the beautiful Iris, or the rainbow. Homer describes her in a chariot adorned with precious stones, the wheels of which were of ebony, and which was drawn by horses with reins of gold. But she is more commonly painted drawn by peacocks. She was represented in her temple at Corinth, seated on a throne, with a crown on her head, a pomegranate in one hand, and in the other a sceptre with a cuckoo on its top. This statue was of gold and ivory.

Some mythologists suppose, that Juno signifies the air: others, that she was the Egyptian Isis; who being represented under various figures, was by the Greeks and Romans represented as so many distinct deities.

JUNTO, in matters of government, denotes a select council for taking cognizance of affairs of great consequence, which require secrecy.

In Spain and Portugal, it signifies much the same with convention, assembly, or board among us: thus we meet with the *junto* of the three estates, of commerce, of tobacco, &c. See **BOARD**, &c.

IVORY, in natural history, &c. a hard, solid, and firm substance, of a white colour, and capable of a very good polish. It is the tusk of the elephant*; and is hollow from the base to a certain height, the cavity being filled up with a compact medullary substance, * See *Elephant*.
seeming

seeming to have a great number of glands it it. It is observed, that the Ceylon ivory, and that of the island of Achem, do not become yellow in the wearing, as all other ivory does; for this reason the teeth of these places bear a larger price than those of the coast of Guinea.

Hardening, Softening, and Staining, of IVORY. See BONES and HORNS.

JUPITER, in pagan worship, the greatest of their deities, was the son of Saturn and Rhea. That goddess perceiving that her husband devoured her children as fast as she brought them forth; and being in pain for Jupiter, she substituted a stone in his room, which Saturn immediately swallowed. He was educated on mount Ida by the Corybantes. Virgil tells us, that he was fed by the bees; out of gratitude for which, he changed them from an iron to a golden colour. Some say, that his nurses were Amalthæa and Melissa, who gave him goats milk and honey; and others, that Amalthæa was the name of the goat which nourished him, and which, as a reward for her great services, was changed into a constellation. According to others, he was fed by wild pigeons, who brought him ambrosia from Oceanus; and by an eagle, who carried nectar in his beak from a steep rock: for which he rewarded the former, by making them the foretellers of winter and summer; and the last, by giving him immortality, and making him his thunderbearer. When grown up, he defeated the Titans, dethroned his father Saturn, and divided his kingdom with his two brothers; Jupiter had the earth, Neptune the sea, and Pluto hell. Jupiter had several wives: the first of whom, named *Metis*, he is said to have devoured when big with child, by which he himself became pregnant; and Minerva issued out of his head, completely armed and fully grown. His second was Themis; the name of his third is not known; his fourth was the celebrated Juno, whom he deceived under the form of a cuckoo, which to shun the violence of a storm fled for shelter to her lap. He was the father of the Muses and Graces; and had a prodigious number of children by his mistresses. He metamorphosed himself into a satyr to enjoy Antiope; into a bull, to carry off Europa; into a swan, to abuse Leda; into a shower of gold, to corrupt Danaë; and into several other forms to gratify his passions. He had Bacchus by Semele, Pallas by Thetis, Diana and Apollo by Latona; and was the father of Mercury and the other gods.

He had a multiplicity of names, either from the places where he was worshipped, or the attributes ascribed to him; and is usually represented seated on a throne of ivory or gold, surrounded with clouds, vested in a purple robe, grasping his thunder in the right hand and holding a sceptre in his left, with the eagle at his feet.

The ridiculous stories which the poets had published concerning this god, served as a foundation to the religion of the heathens; but some persons of a graver character endeavour to explain them, either by allegories, or the principles of natural philosophy.

JURA, one of the Hebrides, or Western Islands of Scotland, lying opposite to Knapdale in Argyleshire, is supposed to be about 34 miles long, and 10 broad. It is the most rugged of all the Hebrides; and is com-

posed chiefly of vast mountains, naked, and without a possibility of cultivation. Some of the south and western sides only are improvable, and in good seasons as much bear and oats are raised as will maintain the inhabitants; though by the distillation, as Mr Pennant supposes, of their grain, they sometimes want. Bear produces four or five fold, and oats three fold. Sloes are the only fruits of the island. An acid for punch is here made from the berries of the mountain-ash; and a kind of spirit is also distilled from them. Necessity hath instructed the inhabitants in the use of native dyes. Thus, the juice of the tops of heath boiled, supplies them with a yellow; the roots of the white water-lily, with a dark-brown; those of the yellow water-lily, with a black; and the gallum verum, *ru* of the islanders, with a very fine red, not inferior to madder. On the hills is some pasture for cattle; and the produce, when Mr Pennant visited the island, amounted to about 300 or 400 head of black cattle, sold annually, at 3l. each, to graziers who come for them; about 100 horses, also sold annually; a few sheep with fleeces of a most excellent quality, and great numbers of goats. The other animals of Jura are about 100 stags; though these must formerly have been much more numerous, as the original name of the island was *Deir-ay*, or the *isle of deer*, so called by the Norwegians on account of the abundance of deer found in it. Here also Mr Pennant had some obscure account of a worm that, in a less pernicious degree, resembles the *furia infernalis* * of Linnaeus. The *fillan*, a little worm of Jura, small as a thread, and not an inch in length, insinuates itself under the skin, causes a redness and great pain, flies swiftly from place to place; but is cured by a poultice of cheese and honey. Of the mountains of Jura, those from their shape called the *paps*, are the most remarkable. There are only three very large ones; the biggest, called *Beinn-an-oir*, or the mountain of gold, lies farthest to the north; the second is called *Beinn-sheunta*, or the *ballowed mountain*; and the third, *Beinn-a-chaolais*, or the *mountain of the sound*, is the least of the three. Mr Pennant ascended the first with great labour and difficulty. It is composed of vast stones, covered with mosses near the base; but all above, bare and unconnected with each other. The whole, he says, seems a *cairn*, the work of the sons of Saturn. The grandeur of the prospect from the top abundantly made amends for the fatigue of ascending the mountain. Jura itself afforded a stupendous scene of rock, varied with innumerable little lakes. From the west side of the hill ran a narrow stripe of rock terminating in the sea, and called the *slide of the old hag*. To the south appeared Ilay extended like a map beneath his feet; and beyond that the north of Ireland; to the east two other islands, Cantyre, Arran, and the frith of Clyde bounded by Ayrshire; an amazing tract of mountains to the north-east as far as *Ben-lomond*; *Skarba* finished the northern view; and over the western ocean were scattered Colonsay and Oransay, Mull, Iona, and its neighbouring isles; and still further, the long extents of Tirey and Col, just apparent. The other paps are seen very distinctly, but all of them inferior in height. Mr Banks and his friends mounted that to the south, and found the height to be 2359 feet; but this is far overtopped by *Beinn-an-oir*. The stones of this mountain are

* See *Furia*, in the APPENDIX.

white, a few red, quartz, and composed of small grains; but some are *brecciated*, or filled with crystalline kernels of an amethystine colour. The other stones of the island are, a cinerous slate, veined with red, and used here as a whet-stone; a micaceous sand-stone; and between the small isles and Ardfin, a micaceous quartz rock-stone. On the west side of the island there is an anchoring-place called *Whitfarlan*; towards the north end is a bay called *Da'f yaul*; and on the same coast is formed another riding-place for vessels among several small islands. Between the north end of Jura and the small isle of Skarba, there is a famous whirlpool, called *Cory-Vrekan*, from Breacan, son to a king of Denmark, who perished in this gulph. His body being cast ashore on the north side of Jura, was buried in a cave, and his grave is still distinguished by a tombstone and altar. In this vortex, which extends about a mile in breadth, the sea begins to boil and ferment with the tide of flood, increasing gradually to a number of whirlpools, which, in the form of pyramids, spout up the water with a great noise, as high as the mast of a small vessel, agitated into such a foam as makes the sea appear white even at the distance of two leagues. About half flood the violence begins to decrease, and continues to do so till about half an hour after high-water: then it boils as before, till within an hour of low-water, when the smallest fishing-boat may cross it without danger.

Jura is furnished with many rivulets and springs of excellent water, and the air is remarkably healthy; its salubrity being increased by the high situation, perpetually fanned by breezes. It is, however, but ill-peopled; and did not contain above 700 or 800 inhabitants at the time it was visited by Mr Pennant. The women are prolific, and very often bear twins. The inhabitants live to a great age, and are liable to few distempers. Men of 90 can work; and there was then living a woman of 80, who could run down a sheep. Then inhabitants are all Protestants, but addicted to some superstitions. The parish is supposed to be the largest in Great Britain, and the duty the most dangerous and troublesome: it consists of Jura, Oranay, Colonsay, Skarba, and several little isles divided by narrow and dangerous sounds; forming a length of not less than 60 miles; supplied by only one minister and an assistant.

The very old-clans of Jura are the *Mac-ilvays*, and the *Mac-rainers*: but it seems to have changed masters more than once. In 1549, Donald of Cantyre, Macguillayne of Doward, Macguillayne of Kinloch-buy, and Mac-duffie of Colonsay, were the proprietors: Mac-lean of Mull had also a share in 1586. At present it belongs to the duke of Argyle, Mr Maeneil of Colonsay, and Mr Campbell of Shawfield.

IVREA, an ancient and strong town of Italy, in Piedmont, and capital of Canaveze, with a strong fort, a bishop's see, the title of a marquise, and an ancient castle. It is subject to the king of Sardinia, and seated on the river Doria between two hills, in E. Long. 7. 48. N. Lat. 45. 12.

JURIEU (Peter), an eminent French Protestant divine, called ironically by the papists the *Goliath* of the Protestants, was born in 1637. He was educated in England under his maternal uncle Peter du Moulin, and took orders in the English church: but, returning

to succeed his father as pastor of a reformed congregation at Mer in the diocese of Blois, he was made professor of divinity and Hebrew at Sedan, where he acquired great reputation. This university being taken from the Protestants, a professorship of divinity was founded for him at Rotterdam; and he was also appointed minister of the Walloon church in the same town: being now in a place of liberty, he gave full scope to an imagination naturally warm, and applied himself to study the book of Revelation, of which he fancied he had by a kind of inspiration discovered the true meaning; a notion that led him to many enthusiastic conjectures. He was moreover so unfortunate as to quarrel with his best friends for opposing his visionary opinions, which produced violent disputes between him and Messrs Bayle and de Beauval. He died in 1713; and left a great number of esteemed works behind him.

JURISCONSULTUS, (*ICtus*), among the Romans, was a person learned in the law; a master of the Roman jurisprudence; who was consulted on the interpretation of the laws and customs, and on the difficult points in law-suits. The fifteen books of the digests were compiled wholly from the answers or reports of the ancient jurisconsulti. Tribonianus, in destroying the 2000 volumes from whence the code and digest were taken, has deprived the public of a world of things, which would have given them light into the ancient office of the jurisconsulti. We should scarce have known any thing beyond their bare names, had not Pomponius, who lived in the second century, taken care to preserve some circumstances of their office.

The Roman jurisconsulti seem to have been the same with our chamber-counsellors, who arrived at the honour of being consulted, through age and experience, but never pleaded at the bar. Their pleading advocates, or lawyers, never became jurisconsulti. See ADVOCATE.

In the times of the commonwealth, the advocati had by much the more honourable employment, as being in the ready way to attain the highest preferments. They then despised the jurisconsulti, calling them in derision *formularii* and *legulei*, as having invented certain forms and monosyllables, in order to give their answers the greater appearance of gravity and mystery. But in process of time they became so much esteemed, that they were called *prudentes* and *sapientes*, and the emperors appointed the judges to follow their advice. Augustus advanced them to be public officers of the empire; so that they were no longer confined to the petty councils of private persons.—Bern. Rutilius has written the lives of the most famous jurisconsulti who have lived within these 2000 years.

JURISPRUDENCE, the science of what is just or unjust; or the knowledge of laws, rights, customs, statutes, &c. necessary for the administration of justice. See LAW.

JURY, a certain number of men sworn to inquire into and try a matter of fact, and to declare the truth upon such evidence as shall appear before them.

Juries are, in these kingdoms, the supreme judges in all courts and in all causes in which either the life, property, or reputation, of any man is concerned: this is the distinguishing privilege of every Briton, and one

Jury
Justel.

of the most glorious advantages of our constitution; for as every one is tried by his peers, the meanest subject is as safe and as free as the greatest. See the article TRIAL.

JURY-MAST, whatever is set up in room of a mast that has been lost in a storm or in an engagement, and to which a lesser yard, ropes, and sails, are affixed.

JUS CORONÆ. See HEREDITARY Right, and SUCCESSION.

Jus Deliberandi, in Scots law, that right which an heir has, by law, of deliberating for a certain time whether he will represent his predecessor. See LAW, N° clxxx. 23.

Jus Devolutum, in Scots law, the right of the church, of presenting a minister to a vacant parish, in case the patron shall neglect to use that right within the time limited by law. See LAW, N° clix. 9.

Jus Mariti, in Scots law, the right the husband acquires to his wife's moveable estate, in virtue of the marriage. See LAW, N° clx. 7.—11.

Jus Relictæ, in Scots law, the right the wife has in the goods in communion, in case of the previous decease of the husband. See LAW, *ibid*.

Jus Præventivis, in Scots law, the preferable right of jurisdiction acquired by a court, in any cause to which other courts are equally competent, by having exercised the first act of jurisdiction. See LAW, N° clvi. 5.

JUST, a sportive kind of combat on horseback, man against man, armed with lances. The word is by some derived from the French *jouffe*, of the Latin *juxta*, because the combatants fought near one another. Salmassius derives it from the modern Greek *zoustra*, or rather *zeugma*, which is used in this sense by Nicephorus Gregorius. Others derive it from *jussa*, which in the corrupt age of the Latin tongue was used for this exercise, by reason it was supposed a more just and equal combat than the tournament.

The difference between jists and tournaments consists in this, that the latter is the genus, of which the former is only a species. Tournaments included all kinds of military sports and engagements made out of gallantry and diversion: Jists were those particular combats where the parties were near each other, and engaged with lance and sword. Add, that the tournament was frequently performed by a number of cavaliers, who fought in a body: The jist was a single combat of one man against another.—Though the jists were usually made in tournaments, after a general encounter of all the cavaliers, yet they were sometimes singly, and independent of any tournament. See TOURNAMENT.

He who appeared for the first time at a jist, forfeited his helm or casque, unless he had forfeited before at a tournament.

JUSTEL (Christopher), a learned counsellor, and secretary to the French king, was born at Paris, in 1580, and applied himself to the study of ecclesiastical history. He maintained a correspondence with the most learned men of his time, as archbishop Usher, Sir Henry Spelman, Blondel, &c. till his death, which happened in 1649. He wrote, 1. The code of the canons of the church universal, and the councils of Africa, with notes. 2. A genealogical history of the house of Auvergne. And, 3. Collections of Greek

and Latin canons, from several manuscripts, which formed the *Bibliotheca juris canonici veteris*, published in 2 vols folio, by William Voet and our author's son.

JUSTEL (Henry), son of the foregoing, was born at Paris in 1620. He became secretary and counsellor to the king; and was as distinguished for his own learning, as remarkable for encouraging it in others. He came to London in 1681, on the persecution of the Protestants; and was made keeper of the royal library at St James's: which office he held till his death in 1693, when he was succeeded by the famous Dr Bentley. He wrote several books, the titles of which may be seen in the Catalogue of the Bodleian library.

JUSTICE, in a moral sense, is one of the four cardinal virtues, which gives every person his due.

JUSTICE, in a legal sense, a person deputed by the king to administer justice to his subjects, whose authority arises from his deputation, and not by right of magistracy.

Fountain of JUSTICE, one of the characters or attributes of the king. See PREROGATIVE.

By the fountain of justice the law does not mean the *author* or *original*, but only the *distributor*. Justice is not derived from the king, as from his *free gift*; but he is the steward of the public, to dispense it to whom it is *due*. He is not the spring, but the reservoir; from whence right and equity are conducted, by a thousand channels, to every individual. The original power of judicature, by the fundamental principles of society, is lodged in the society at large: but as it would be impracticable to render complete justice to every individual, by the people in their collective capacity, therefore every nation has committed that power to certain select magistrates, who with more ease and expedition can hear and determine complaints; and in England this authority has immemorially been exercised by the king or his substitutes. He therefore has alone the right of erecting courts of judicature: for, though the constitution of the kingdom hath entrusted him with the whole executive power of the laws, it is impossible, as well as improper, that he should personally carry into execution this great and extensive trust: it is consequently necessary, that courts should be erected, to assist him in executing this power; and equally necessary, that, if erected, they should be erected by his authority. And hence it is, that all jurisdictions of courts are either mediately or immediately derived from the crown, their proceedings run generally in the king's name, they pass under his seal, and are executed by his officers.

It is probable, and almost certain, that in very early times, before our constitution arrived at its full perfection, our kings in person often heard and determined causes between party and party. But at present, by the long and uniform usage of many ages, our kings have delegated their whole judicial power to the judges of their several courts; which are the grand depository of the fundamental laws of the kingdom, and have gained a known and stated jurisdiction, regulated by certain and established rules, which the crown itself cannot now alter but by act of parliament. And, in order to maintain both the dignity and independence of the judges in the superior courts, it is enacted by the statute 13 W. III. c. 2. that their commissions

missions shall be made (not, as formerly, *durante bene placito*, but) *quandiu bene se gesserint*, and their salaries ascertained and established; but that it may be lawful to remove them on the address of both houses of parliament. And now, by the noble improvements of that law in the statute of 1 Geo. III. c. 23. enacted at the earnest recommendation of the king himself from the throne, the judges are continued in their offices during their good behaviour, notwithstanding any demise of the crown (which was formerly held immediately to vacate their seats), and their full salaries are absolutely secured to them during the continuance of their commissions; his majesty having been pleased to declare, that "he looked upon the independence and uprightness of the judges, as essential to the impartial administration of justice; as one of the best securities of the rights and liberties of his subjects; and as most conducive to the honour of the crown."

In criminal proceedings, or prosecutions for offences, it would still be a higher absurdity, if the king personally sat in judgment; because in regard to these he appears in another capacity, that of *prosecutor*. All offences are either against the king's peace, or his crown and dignity; and are so laid in every indictment. For though in their consequences they generally seem (except in the case of treason and a very few others) to be rather offences against the kingdom than the king; yet, as the public, which is an invisible body, has delegated all its power and rights, with regard to the execution of the laws, to one visible magistrate, all affronts to that power, and breaches of those rights, are immediately offences against him, to whom they are so delegated by the public. He is therefore the proper person to prosecute for all public offences and breaches of the peace, being the person injured in the eye of the law. And this notion was carried so far in the old Gothic constitution, (wherein the king was bound by his coronation oath to conserve the peace), that in case of any forcible injury offered to the person of a fellow-subject, the offender was accused of a kind of perjury, in having violated the king's coronation oath; *dicebatur fregisse juramentum regis juratum*. And hence also arises another branch of the prerogative, that of *pardoning* offences; for it is reasonable, that he only who is injured should have the power of forgiving. See PARDON.

In this distinct and separate existence of the judicial power, in a peculiar body of men, nominated indeed, but not removable at pleasure, by the crown, consists one main preservative of the public liberty; which cannot subsist long in any state, unless the administration of common justice be in some degree separated both from the legislative and also from the executive power. Were it joined with the legislative, the life, liberty, and property, of the subject would be in the hands of arbitrary judges, whose decisions would be then regulated only by their own opinions, and not by any fundamental principles of law; which, though legislators may depart from, yet judges are bound to observe. Were it joined with the executive, this union might soon be an over-balance for the legislative. For which reason, by the statute of 16 Car. I. c. 10. which abolished the court of star-chamber, effectual care is taken to remove all judicial power out of the hands of the king's privy-council; who, as then was evident

from recent instances, might soon be inclined to pronounce that for law, which was most agreeable to the prince or his officers. Nothing therefore is more to be avoided in a free constitution, than uniting the provinces of a judge and a minister of state. And indeed, that the absolute power, claimed and exercised in a neighbouring nation, is more tolerable than that of the eastern empires, is in a great measure owing to their having vested the judicial power in their legislatures, a body separate and distinct from both the legislative and executive: and, if ever that nation recovers its former liberty, it will owe it to the efforts of those assemblies. In Turkey, where every thing is centered in the sultan or his ministers, despotic power is in its meridian, and wears a more dreadful aspect.

A consequence of this prerogative is the legal ubiquity of the king. His majesty, in the eye of the law, is always present in all his courts, though he cannot personally distribute justice. His judges are the mirror by which the king's image is reflected. It is the regal office, and not the royal person, that is always present in court, always ready to undertake prosecutions, or pronounce judgment, for the benefit and protection of the subject. And from this ubiquity it follows, that the king can never be nonsuit; for a nonsuit is the desertion of the suit or action by the non-appearance of the plaintive in court. For the same reason also, in the forms of legal proceedings, the king is not said to appear by his attorney, as other men do; for he always appears, in contemplation of law, in his own proper person.

From the same original, of the king's being the fountain of justice, we may also deduce the prerogative of issuing proclamations, which is vested in the king alone. See PROCLAMATION.

JUSTICIA, MALABAR-NUT; a genus of the monogynia order, belonging to the diandra class of plants. There are 19 species, all of them natives of the East Indies, growing many feet high; some adorned with fine large leaves, others with small narrow ones, and all of them with monopetalous ringent flowers. Only two species are cultivated in our gardens, viz. the *adhatoda* or common Malabar-nut, and the *hyssopifolia* or snap-tree. The first groweth or twelve feet high, with a strong woody stem, branching out widely all around; having large, lanceolate, oval leaves, placed opposite; and from the ends of the branches short spikes of white flowers, with dark spots, having the helmet of the corolla concave. The second hath a shrubby stem branching from the bottom pyramically three or four feet high; spear-shaped, narrow, entire leaves, growing opposite; and white flowers, commonly by threes, from the sides of the branches; succeeded by capsules, which burst open with elastic force for the discharge of the seeds; whence the name of *snap-tree*. Both species flower here in summer, but never produce any fruit. They are propagated by layers and cuttings, and require the same treatment with other tender exotics.

JUSTICIAR, in the old English laws, an officer instituted by William the Conqueror, as the chief officer of state, who principally determined in all cases civil and criminal. He was called in Latin *Capitalis Justiciarius totius Angliæ*. For **JUSTICIAR** in Scotland, see LAW, N^o clvi. 10.—12.

Justiciary JUSTICIARY, or Court of JUSTICIARY, in Scotland. See LAW, N° clvi. 10—12.

JUSTIN, a celebrated historian, lived, according to the most probable opinion, in the second century, under the reign of Antoninus Pius. He wrote, in elegant Latin, an abridgement of the history of Trogus Pompeius; comprehending the actions of almost all nations, from Ninus the founder of the Assyrian empire, to the emperor Augustus. The original work, to the regret of the learned, is lost: this abridgement, being written in a polite and elegant style, was probably the reason why that age neglected the original. The best editions of Justin are, *ad usum Delphini*, in 4to, and *cum notis variorum et Gronovii*, in 8vo.

JUSTIN (St.) commonly called *Justin Martyr*, one of the earliest and most learned writers of the eastern church, was born at Neapolis, the ancient Sechem of Palestine. His father Priscus, a Gentile Greek, brought him up in his own religion, and had him educated in all the Grecian learning. To complete his studies he travelled to Egypt; and followed the sect of Plato, with whose intellectual notions he was much pleased. But one day, walking by the sea-side, wrapt in contemplation, he was met by a grave ancient person, of a venerable aspect; who, falling into discourse with him, turned the conversation by degrees from the excellence of Platonism to the superior perfection of Christianity; and reasoned so well, as to raise in him an ardent curiosity to inquire into the merits of that religion; in consequence of which inquiry, he was converted about the year 132. On his embracing that religion, he quitted neither the profession nor the habit of a philosopher: but a persecution breaking out under Antoninus, he composed *An apology for the Christians*; and afterwards presented another to the emperor Marcus Aurelius, in which he vindicated the innocence and holiness of the Christian religion, against Crescens, a Cynic philosopher, and other calumniators. He did honour to Christianity by his learning and the purity of his manners; and suffered martyrdom in 167. Besides his two Apologies, there are still extant his *Dialogue with Trypho*, a Jew; two treatises addressed to the Gentiles, and another on the unity of God. Other works are also ascribed to him. The best editions of St Justin are those of Robert Stephens, in 1551 and 1571, in Greek and Latin: that of Morel, in Greek and Latin, in 1656; and that of Don Prudentius Marandus, a learned Benedictine, in 1742, in folio. His style is plain, and void of all ornament.

JUSTINIAN I. son of Justin the elder, was made Cæsar and Augustus in 527, and soon after emperor. He conquered the Persians by Belisarius his general, and exterminated the Vandals; regained Africa; subdued the Goths in Italy; defeated the Moors; and restored the Roman empire to its primitive glory. See (History of) CONSTANTINOPLE, n° 98, 102. and ITALY, n° 12. &c.

The empire being now in the full enjoyment of a profound peace and tranquillity, Justinian made the best use of it, by collecting the immense variety and number of the Roman laws into one body. To this end, he selected ten of the most able lawyers in the empire; who, revising the Gregorian, Theodosian,

and Hermogenian codes, compiled one body, called *Justinian's Codex Justinianus*. This may be called the *statute law*, as consisting of the rescripts of the emperors. But the reduction of the other part was a much more difficult task: it was made up of the decisions of the judges and other magistrates, together with the authoritative opinions of the most eminent lawyers; all which lay scattered, without any order, in no less than 2000 volumes and upwards. These were reduced to the number of 50; but ten years were spent in the reduction. However, the design was completed in the year 529, and the name of *Digests* or *Pandects* given to it. Besides these, for the use chiefly of young students in the law to facilitate that study, Justinian ordered four books of institutes to be drawn up, containing an abstract or abridgement of the text of all the laws: and, lastly, the laws of modern date, posterior to that of the former, were thrown into one volume in the year 529, called the *Novelle*, or New Code.

This emperor died in the year 565, aged 83, in the 39th of his reign, after having built a great number of churches; particularly the famous Sancta Sophia at Constantinople, which is esteemed a masterpiece of architecture.

JUSTINIANI (St Laurence), the first patriarch of Venice, was born there, of a noble family, in 1381. He was a very pious prelate, and died in 1485; he left several pieces of piety, which were printed together at Lyons in 1568, in one volume folio, with his life prefixed by his nephew. Clement VII. beatified him in 1524, and he was canonized by Alexander VIII. in 1690.

JUSTINIANI (Bernard), was born at Venice in 1408. He obtained the senator's robe at the age of 19, served the republic in several embassies, and was elected procurator of St Mark in 1474. He was a learned man, and wrote the *history of Venice*, with some other works of considerable merit; and died in 1498.

JUSTINIANI (Augustin), bishop of Nebo, one of the most learned men of his time, was descended from a branch of the same noble family with the foregoing; and was born at Genoa in 1480. He assisted at the fifth council of Lateran, where he opposed some articles of the concordat between France and the court of Rome. Francis I. of France made him his almoner; and he was for five years regius professor of Hebrew at Paris. He returned to Genoa in 1522, where he discharged all the duties of a good prelate; and learning and piety flourished in his diocese. He perished at sea in his passage from Genoa to Nebbio, in 1536. He composed several pieces; the most considerable of which is, *Psalterium Hebræum, Græcum, Arabicum, et Chaldeum, cum tribus Latinis interpretationibus et glossis*. This was the first psalter of the kind printed; and there is also ascribed to the same prelate a translation of Maimonides's *Mores Neochim*.

JUTES, the ancient inhabitants of Jutland in Denmark.

JUTLAND, a large peninsula, which makes the principal part of the kingdom of Denmark. It is bounded on the south-east by the duchy of Holstein, and is surrounded on the other sides by the German ocean.

Justinia ni
Jutland.

JUVENAL, ocean and the Baltic sea. It is about 180 miles in length from north to south, and 50 in breadth from east to west. The air is very cold, but wholesome; and the soil is fertile in corn and pastures, which feed a great number of bees, that are sent to Germany, Holland, and elsewhere. This was anciently called the *Cimbrian Chersonesus*, and is supposed to be the country from whence the Saxons came into England. It is divided into two parts, called *North* and *South Jutland*: the latter is the duchy of Slefwick, and lies between North Jutland and the duchy of Holstein; and the duke of that name is in possession of part of it, whose capital town is Gottorp, for which reason the sovereign is called the *duke of Holstein Gottorp*.

JUVENAL (Decius Junius), the celebrated Roman satyrift, was born about the beginning of the emperor Claudius's reign, at Aquinum in Campania. His father was probably a freed-man, who, being rich, gave him a liberal education, and, agreeably to the taste of the times, bred him up to eloquence; in which he made a great progress, first under Fronto the grammarian, and afterwards, as is generally conjectured, under Quintilian; after which he attended the bar, and made a distinguished figure there for many years by his eloquence. In the practice of this profession he had improved his fortune and interest at Rome before he turned his thoughts to poetry, the very style of which, in his satires, speaks a long habit of declamation; *subactum redolent declamatores*, say the critics. It is said, he was above 40 years of age when he recited his first essay to a small audience of his friends; but, being encouraged by their applause, he ventured a greater publication: which reaching the ears of Paris, Domitian's favourite at that time, though but a pantomime player, whom our satyrift had severely insulted, that minion made his complaint to the emperor; who sent him thereupon into banishment, under pretence of giving him the command of a cohort in the army, which was quartered at Pentapolis, a city upon the frontiers of Egypt and Libya.

After Domitian's death, our satyrift returned to Rome, sufficiently cationed, not only against attacking the characters of those in power, under arbitrary princes, but against all personal reflections upon the great men then living; and therefore he thus wisely concludes the debate he is supposed to have maintained for a while, with a friend, on this head, in the first satire, which seems to be the first that he wrote after his banishment:

*Experiar quid concedatur in illos
Quorum Flaminia tegitur cinis atque Latina.*

"I will try what liberties I may be allowed with those whose ashes lie under the Flaminian and Latin ways," along each side of which the Romans of the first quality used to be buried.—It is believed that he lived till the reign of Adrian, in 128. There are still extant 16 of his satires, in which he discovers great wit, strength, and keenness in his language: but his style is not perfectly natural, and the obscenities with which these satires were filled render the reading of them dangerous to youth.

JUVENCUS (Caius Vetticius Aquilinus), one of the first of the Christian poets, was born of an illustrious family in Spain. About the year 320 he put

the life of Jesus Christ into Latin verse, of which he composed four books. In this work he followed almost word for word the text of the four evangelists: but his verses are written in a bad taste; and his Latin is not pure.

JUXON (Dr William), born at Chichester in 1682, was bred at Merchant-Taylor's school, and from thence elected into St John's college, Oxford, of which he became president. King Charles I. made him bishop of London; and, in 1635, promoted him to the post of lord high treasurer of England. The whole nation, and especially the nobility, were greatly offended at this high office being given to a clergyman; but he behaved so well in the administration, as soon put a stop to all the clamour raised against him. This place he held no longer than the 17th of May 1641, when he prudently resigned the staff, to avoid the storm which then threatened the court and the clergy. In the following February, an act passed depriving the bishops of their votes in parliament, and incapacitating them from any temporal jurisdiction. In these leading steps, as well as the total abolition of the episcopal order which followed, he was involved with his brethren; but neither as bishop nor as treasurer was a single accusation brought against him in the long parliament. During the civil wars, he resided at his palace at Fulham, where his meek, inoffensive, and genteel behaviour, notwithstanding his remaining steady in his loyalty to the king, procured him the visits of the principal persons of the opposite party, and respect from all. In 1648, he attended on his majesty at the treaty in the isle of Wight; and, by his particular desire, waited upon him at Cotton-house, Westminster, the day after the commencement of his trial; during which he frequently visited him in the office of a spiritual father, and his majesty declared he was the greatest comfort to him in that afflictive situation. He likewise attended his majesty on the scaffold, where the king taking off his cloak and George, gave him the latter: after the execution, our pious bishop took care of the body, which he accompanied to the royal chapel at Windsor, and stood ready with the common-prayer book in his hands, to perform the last ceremony for the king; but was prevented by colonel Whichot, governor of the castle.—He continued in the quiet possession of Fulham-palace till the ensuing year 1649, when he was deprived, having been spared longer than any of his brethren. He then retired to his own estate in Gloucestershire, where he lived in privacy, till the restoration, when he was presented to the see of Canterbury; and in the little time he enjoyed it, expended, in buildings and reparations at Lambeth-palace and Croydon-house, near 15,000 l. He died in 1663; having bequeathed 7000 l. to St John's college, and to other charitable uses near 5000 l. He published a *Sermon on Luke xviii. 31.* and *Some considerations upon the act of uniformity.*

IVY, in botany. See *HEDERA*.

IXIA, in botany, a genus of the monogynia order, belonging to the triandria class of plants. There are several species, consisting of herbaceous, tuberous, and bulbous-rooted flowery perennials, from one to two feet high, terminated by hexpetalous flowers of different colours. They are propagated by off-sets, which should be taken off in summer at the decay of the leaves:

JUXON,
IXIA.

leaves: but as all the plants of this genus are natives of warm climates, few of them can bear the open air of this country in winter.

IXION, in fabulous history, king of the Lapithæ, married Dia the daughter of Deionius, to whom he refused to give the customary nuptial presents. Deionius in revenge took from him his horses: when Ixion, dissembling his resentment, invited his father-in-law to a feast, and made him fall through a trap-door into a burning furnace, in which he was immediately consumed. Ixion being afterwards flung with remorse for his cruelty, ran mad; on which Jupiter, in compassion, not only forgave him, but took him up into heaven, where he had the impiety to endeavour to corrupt Juno. Jupiter, to be the better assured of his guilt, formed a cloud in the resemblance of the goddess, upon which Ixion begat the centaurs: but boasting of his happiness, Jove hurled him down to Tartarus, where he lies fixed on a wheel encompassed with serpents, which turns without ceasing.

JYNX, in ornithology, a genus of birds belonging to the order of accipitres. Of this genus there is only one known species, called, from its singular manner of twisting its head about, *wry-neck*. "Nature, (says Mr Pennant), by the elegance of its penciling the colours of this bird, hath made ample amends for their want of splendor. Its plumage is marked with the plainest kinds. A list of black and ferruginous strokes divides the top of the head and back. The sides of the head and neck are ash-coloured, beautifully traversed with fine lines of black and reddish brown. The quill-feathers are dusky; but each web is marked with rust-

coloured spots. The chin and breast are of a light yellowish brown, adorned with sharp pointed bars of black. The tail consists of ten feathers, broad at their ends and weak; of a pale ash colour, powdered with black and red, and marked with four equidistant bars of black. The tongue is long and cylindric; for the same use as that of the woodpecker. The toes are also disposed the same way. The bill is short, weak, and a little arcuate. The irides are of a yellowish hazel.

"The wry-neck we believe to be a bird of passage, appearing here in the spring before the cuckoo. The Welsh consider it as the forerunner or servant of that bird, and call it *Gwas y gog*, or the cuckoo's attendant: the Swedes regard it in the same light. The food of this species is insects; but chiefly ants, for on examination we found the stomach of one filled with their remains. As the tongue of this bird, like that of the ant-bear or tamandua, is of an enormous length; it possibly not only makes use of it to pick those insects out of their retreat, but like that quadruped may lay it across their path, and when covered with ants draw it into its mouth. Its weight is one ounce and a quarter: the length seven inches; the breadth 11. It takes its name from a manner it has of turning its head back to the shoulders; especially when terrified: it has also the faculty of erecting the feathers of the head like those of the jay. Its note is like that of the kestrel, a quick-repeated squeak. Its eggs are white, and have so thin a shell that the yolk may be seen through it. This bird builds in the hollows of trees, making its nest of dry grass, in which we have counted nine
