The vertical columns, titled as above, are geographical divisions; and events are marked in their proper centuries and proper columns. Thus the rise of any fate, as that of Assyria, is marked in its proper geographical column, and in that place of the 21st century before Christ at which the beginning of its history is dated; from thence we trace its continuance to the end of the 7th century before Christ, when it became extinct. The building of Rome is marked about the middle of the 8th century before Christ. Its territory extends by degrees to the conquest of all Italy; next to Spain, Macedonia, &c. until it comes to extend from Britain to Egypt. It continues of this greatness until about the middle of the 5th century after Christ, when it begins to lose those provinces out of which the modern kingdoms of Europe have been formed in the order here set down. As the order in which states have risen or fallen, relatively to one another, appears on mere inspection, it will be more easily remembered than when it is conveyed in numbers alone.

The dates are taken chiefly from that comprehensive and useful work, Blair's Chronological Tables. Use has likewise been made of the Chart of Universal History, formed on a design like this, but differently executed. Compared to that chart, the present may be thought incomplete. Nor would it have been difficult for the gentleman who sketched it, to have filled it up with remarkable events, successions of kings, and lives of men; but he preferred clearness and simplicity, leaving to every person the filling up of his own plan with such articles as are most in the way of his curiosity and study. He has contented himself with a few specimens of this sort, in the succession of the Roman emperors, of the kings of England and France; and in the lives of one or two remarkable men, as in those of Tacitus the historian, and Attilla. One person may choose to fill his plan with the names of statesmen and warriors, another with scholars and men of letters. To attempt inferring all that deserve being recorded, would crowd and embarrass the whole.

As space is here employed to represent time, it is material that equal periods should be represented by equal spaces; and, if possible, that the parts of the same empire should be placed together. Both these circumstances are neglected in the Chart of Universal History.

THEORY.

5
New theory by Ander-
son.

In 1674, Mr Anderson above-mentioned published his treatise on the nature and effects of the gun; in which he proceeds on the principles of Galileo, and strenuously asserts, that the flight of all bullets is in the curve of a parabola; undertaking to answer all objections that could be brought to the contrary. The same thing was also undertaken by Mr Blondel, in a treatise published at Paris in 1683; where, after long discussion, the author concludes, that the variations from the air's resistance are so slight as scarce to merit notice. The same subject is treated of in the Philosophical Transactions, N^o 216. p. 68. by Dr Halley: and he also, swayed by the very great disproportion between the density of the air, and that of iron or lead, thinks it reasonable to believe, that the opposition of the air to large metal-shot is scarcely discernible; although in small and light shot he owns that it must be accounted for.

But though this hypothesis went on smoothly in speculation; yet Anderson, who made a great number of trials, found it impossible to support it without some new modification. For, though it does not appear that he ever examined the comparative ranges of either cannon or musquet shot, when fired with their usual velocities, yet his experiments on the ranges of shells thrown with small velocities (in comparison of those above-mentioned), convinced him that their whole tract was not parabolical. But instead of making the proper inferences from hence, and concluding the resistance of the air to be of considerable efficacy, he framed a new hypothesis; which was, that the shell or bullet, at its first discharge, flew to a certain distance in a right line, from the end of which line only it began to describe a parabola. And this right line, which he calls the *line of the impulse of the fire*, he supposes to be the same in all elevations. Thus, by assigning a proper length to this line of impulse, it was always in his power to reconcile any two shots made at different angles, let them differ as widely as we please to suppose. But this he could not have done with three shots; nor indeed doth he ever tell us the event of his experiments when three ranges were tried at one time.

6
Laws of the air's resistance laid down by Newton.

When Sir Isaac Newton's *Principia* was published, he particularly considered the resistance of the air to projectiles which moved with small velocities; but as he never had an opportunity of making experiments on those which move with such prodigious swiftness, he did not imagine that a difference in velocity could make such differences in the resistance as are now found to take place. Sir Isaac found, that, in small velocities, the resistance was increased in the duplicate proportion of the swiftness with which the body moved; that is, a body moving with twice the velocity of another of equal magnitude, would meet with four times as much resistance as the first, with thrice the velocity it would meet with nine times the resistance, &c.—This principle itself is now found to be erroneous with regard to military projectiles; though, if it had been properly attended to, the resistance of the air might even from thence have been reckoned much more considerable than was commonly done. So far, however, were those who treated this subject scientifically, from giving a proper allowance for the resistance of the atmosphere, that their theories differed most egregiously

7
Erroneous in military projectiles.

from the truth. Huygens alone seems to have attended to this principle: for, in the year 1690, he published a treatise on Gravity, in which he gave an account of some experiments tending to prove, that the track of all projectiles moving with very swift motions was widely different from that of a parabola. All the rest of the learned acquiesced in the justness of Galileo's doctrine, and very erroneous calculations concerning the ranges of cannon were accordingly given. Nor was any notice taken of these errors till the year 1716. At that time Mr Refsons, a French officer of artillery, distinguished by the number of sieges at which he had served, by his high military rank, and by his abilities in his profession, gave in a memoir to the Royal Academy, of which he was a member, importing, that, "although it was agreed, that theory joined with practice did constitute the perfection of every art; yet experience had taught him, that theory was of very little service in the use of mortars: That the works of M. Blondel had justly enough described the several parabolic lines, according to the different degrees of the elevation of the piece; but that practice had convinced him, there was no theory in the effect of gunpowder; for having endeavoured, with the greatest precision, to point a mortar agreeably to these calculations, he had never been able to establish any solid foundation upon them."

From the history of the academy, it doth not appear that the sentiments of Mr Refson's were at any time controverted, or any reason offered for the failure of the theory of projectiles when applied to use. Nothing farther, however, was done till the time of Benjamin Robins, who in 1742 published a treatise, entitled, *New Principles of Gunnery*, in which he hath treated particularly not only of the resistance of the atmosphere, but almost every thing else relating to the flight of military projectiles, and indeed advanced the theory of gunnery much nearer perfection than ever it was before.

The first thing considered by Mr Robins, and which is indeed the foundation of all other particulars relative to gunnery, is the explosive force of gunpowder. This he determined to be owing to an elastic fluid similar to our atmosphere, having its elastic force greatly increased by the heat. "If a red-hot iron (says he) be included in a receiver, and the receiver be exhausted, and gunpowder be then let fall on the iron, the powder will take fire, and the mercurial gage will suddenly descend upon the explosion; and though it immediately ascends again, it will never rise to the height it first stood at, but will continue depressed by a space proportioned to the quantity of powder which was let fall on the iron.—The same production likewise takes place when gunpowder is fired in the air: for if a small quantity of powder is placed in the upper part of a glass tube, the lower part of which is immersed in water, and the fluid be made to rise so near the top, that only a small portion of air is left in that part where the gunpowder is placed; if in this situation the communication of the upper part of the tube with the external air is closed, and the gunpowder fired, which may be easily done by means of a burning-glass, the water will in this experiment descend on the explosion, as the quicksilver did in the last; and will always continue depressed below the place at which it stood before

THEORY.

8
All these theories widely different from the truth.

9
Mr Robins first introduces a true theory.

10
His method of determining the force of gunpowder.

force

THEORY. fore the explosion. The quantity of this depression will be greater if the quantity of powder be increased, or the diameter of the tube be diminished.

“ When any considerable quantity of gunpowder is fired in an exhausted receiver, by being let fall on a red-hot iron, the mercurial gage instantly descends upon the explosion, and as suddenly ascends again. After a few vibrations, none of which (except the first) are of any great extent, it seemingly fixes at a point lower than where it stood before the explosion. But even when the gage has acquired this point of apparent rest, it still continues rising for a considerable time, although by such imperceptible degrees, that it can only be discovered by comparing its place at distant intervals: however, it will not always continue to ascend; but will rise slower and slower, till at last it will be absolutely fixed at a point lower than where the mercury stood before the explosion. The same circumstances nearly happen, when powder is fired in the upper part of an unexhausted tube, whose lower part is immerfed in water.

“ That the elasticity or pressure of the fluid produced by the firing of gunpowder is, *cæteris paribus*, directly as its density, may be proved from hence, that if in the same receiver a double quantity of powder be let fall, the mercury will subside twice as much as in the firing of a single quantity. Also the descents of the mercury, when equal quantities of powder are fired in different receivers, are reciprocally as the capacities of those receivers, and consequently as the density of produced fluid in each. But as, in the usual method of trying this experiment, the quantities of powder are so very small that it is difficult to ascertain these proportions with the requisite degree of exactness, I took a large receiver containing about 520 inches, and letting fall at once on the red-hot iron one drachm or the sixteenth part of an ounce avoirdupois of powder, the receiver being first nearly exhausted: the mercury, after the explosion, was subfided two inches exactly, and all the powder had taken fire. Then heating the iron a second time, and exhausting the receiver as before, two drachms were let down at once, which sunk the mercury three inches and three quarters; and a small part of the powder had fallen beside the iron, which (the bottom of the receiver being wet) did not fire, and the quantity which thus escaped did appear to be nearly sufficient, had it fallen on the iron, to have sunk the mercury a quarter of an inch more; in which case the two descents, viz. two inches and four inches, would have been accurately in the proportion of the respective quantities of powder; from which proportion, as was, they very little varied.

“ As different kinds of gunpowder produce different quantities of this fluid, in proportion to their different degrees of goodness, before any definite determination of this kind can take place, it is necessary to ascertain the particular species of powder that is proposed to be used. (Here Mr Robins determines in all his experiments to make use of government-powder, as consisting of a certain and invariable proportion of materials, and therefore preferable to such kinds as are made according to the fancy of private persons.)

“ This being settled, we must further premise these two principles: 1. That the elasticity of this fluid increases by heat and diminishes by cold, in the same

manner as that of the air; 2. That the density of this fluid, and consequently its weight, is the same with the weight of an equal bulk of air, having the same elasticity and the same temperature. Now from the last experiment it appears, that $\frac{1}{10}$ of an ounce avoirdupois or about 27 grains Troy of powder, sunk the gage, on its explosion, two inches; and the mercury in the barometer (standing at near 30 inches, $\frac{1}{2}$ ths of an ounce avoirdupois, or 410 grains Troy, would have filled the receiver with a fluid whose elasticity would have been equal to the whole pressure of the atmosphere, or the same with the elasticity of the air we breathe; and the content of the receiver being about 520 cubic inches, it follows, that $\frac{1}{2}$ ths of an ounce of powder will produce 520 cubic inches of a fluid possessing the same degree of elasticity with the common air; whence, an ounce of powder will produce near 575 cubic inches of such a fluid.

“ But in order to ascertain the density of this fluid, we must consider what part of its elasticity, at the time of this determination, was owing to the heat it received from the included hot-iron and the warm receiver. Now the general heat of the receiver being manifestly less than that of boiling water, which is known to increase the elasticity of the air to somewhat more than $\frac{1}{2}$ of its augmented quantity; I collect from hence and other circumstances, that the augmentation of elasticity from this cause was about $\frac{1}{2}$ of the whole: that is, if the fluid arising from the explosion had been reduced to the temperature of the external air, the descent of the mercurial gage, instead of two inches, would have been only $1\frac{1}{2}$ inch; whence 575, reduced in the proportion of five to four, becomes 460; and this last number represents the cubic inches of an elastic fluid equal in density and elasticity with common air, which are produced from the explosion of 1 ounce avoirdupois of gunpowder; the weight of which quantity of fluid, according to the usual estimation of the weight of air, is 131 grains; whence the weight of this fluid is $\frac{1}{4}$ ths of the nearly of the weight of the generating powder. The ratio of the bulk of gunpowder to the bulk of this fluid may be determined from considering that 17 drams avoirdupois of powder fill two cubic inches, if the powder be well shook together: therefore, augmenting the number last found in the proportion of 16 to 17, the resulting term 488 $\frac{1}{2}$ is the number of cubic inches of an elastic fluid, equal in density with the air produced from two cubic inches of powder: whence the ratio of the respective bulk of the powder, and of the fluid produced from it, is in round numbers as 1 to 244.”—This calculation was afterwards justified by experiments.

“ If this fluid, instead of expanding when the powder was fired, had been confined in the same space which the powder filled before the explosion; then it would have had, in that confined state, a degree of elasticity 244 times greater than that of common air; and this independent of the great augmentation this elasticity would receive from the action of the fire in that instant.

“ Hence, then, we are certain, that any quantity of powder fired in a confined space, which it adequately fills, exerts, at the instant of its explosion, against the sides of the vessel containing it, and the bodies it impels before it, a force at least 244 times greater than the

the elasticity of the common air, or, which is the same thing, than the pressure of the atmosphere; and this without considering the great addition which this force will receive from the violent degree of heat with which it is affected at that time.

“ To determine how far the elasticity of air is augmented when heated to the extremest degree of red-hot iron, I took a piece of a musquet-barrel about six inches in length, and ordered one end to be closed up entirely; but the other end was drawn out conically, and finished in an aperture of about $\frac{1}{4}$ of an inch in diameter. The tube thus fitted, was heated to the extremity of a red heat in a smith's forge; and was then immersed with its aperture downwards in a bucket of water, and kept there till it was cool; after which it was taken out carefully, and the water which had entered it in cooling was exactly weighed. The heat given to the tube at each time, was the beginning of what workmen call a *white heat*; and to prevent the rushing in of the aqueous vapour at the immersion, which would otherwise drive out great part of the air, and render the experiment fallacious, I had an iron wire filed tapering, so as to fit the aperture of the tube, and with this I always stopped it up before it was taken from the fire, letting the wire remain in till the whole was cool, when, removing it, the due quantity of water would enter. The weight of the water thus taken in at three different trials was 600 grains, 595 grains, and 600 grains, respectively. The content of the whole cavity of the tube was 796 grains of water; whence the spaces remaining unfilled in these three experiments were 186, 201, and 196 grains respectively. These spaces undoubtedly contained all the air which, when the tube was red-hot, extended thro' its whole concavity; consequently the elasticity of the air, when heated to the extreme heat of red-hot iron, was to the elasticity of the same air, when reduced to the temperature of the ambient atmosphere, as the whole capacity of the tube to the respective spaces taken up by the cooled air; that is, as 796 to 186, 201, 196; or, taking the medium of these three trials, as 796 to 194 $\frac{1}{2}$.

“ As air and this fluid appear to be equally affected by heat and cold, and consequently have their elasticities equally augmented by the addition of equal degrees of heat to each; if we suppose the heat with which the flame of fired powder is endowed, to be the same with that of the extreme heat of red-hot iron, then the elasticity of the generated fluid will be greater at the time of the explosion than afterwards, when it is reduced to the temperature of the ambient air, in the ratio of 796 to 194 $\frac{1}{2}$ nearly. It being allowed then, (which surely is very reasonable), that the flame of gunpowder is not less hot than red-hot iron, and the elasticity of the air, and consequently of the fluid generated by the explosion, being augmented in the extremity of this heat in the ratio of 194 $\frac{1}{2}$ to 796, it follows, that if 244 be augmented in this ratio, the resulting number which is 999 $\frac{1}{2}$, will determine how many times the elasticity of the flame of fired powder exceeds the elasticity of common air, supposing it to be confined in the same space which the powder filled before it was fired.—Hence then the absolute quantity of the pressure exerted by gunpowder at the moment of its explosion may be assigned; for, since the fluid then generated has an elasticity of 999 $\frac{1}{2}$, or in

round numbers 1000 times greater than that of the atmosphere, and since common air by its elasticity exerts a pressure on any given surface equal to the weight of the incumbent atmosphere with which it is in equilibrio, the pressure exerted by fired powder before it dilated itself is 1000 times greater than the pressure of the atmosphere; and consequently the quantity of this force, on a surface of an inch square, amounts to above six ton weight; which force, however, diminishes as the fluid dilates itself.

“ But though we have here supposed that the heat of gunpowder, when fired in any considerable quantity, is the same with iron heated to the extremity of red heat, or to the beginning of a white heat, yet it cannot be doubted but that the fire produced in the explosion is somewhat varied (like all other fires) by a greater or lesser quantity of fuel; and it may be presumed, that, according to the quantity of powder fired together, the flame may have all the different degrees, from a languid red heat, to that sufficient for the vitrification of metals. But as the quantity of powder requisite for the production of this last mentioned heat, is certainly greater than what is ever fired together for any military purpose, we cannot be far from our scope, if we suppose the heat of such quantities as are usually fired to be nearly the same with that of red-hot iron; allowing a gradual augmentation to this heat in larger quantities, and diminishing it when the quantities are very small.”

Having thus determined the force of the gunpowder, Mr Robins next proceeds to determine the velocity with which the ball is discharged. The solution of this problem depends on the two following principles. 1. That the action of the powder on the bullet ceases as soon as the bullet is got out of the piece. 2. That all the powder of the charge is fired and converted into elastic fluid before the bullet is sensibly moved from its place.

“ The first of these (says Mr Robins) will appear manifest when it is considered how suddenly the flame will extend itself on every side, by its own elasticity, when it is once got out of the mouth of the piece; for by this means its force will then be dissipated, and the bullet no longer sensibly affected by it.

“ The second principle is indeed less obvious, being contrary to the general opinion of almost all writers on this subject. It might however be sufficient for the proof of this position, to observe the prodigious compression of the flame in the chamber of the piece. Those who attend to this circumstance, and to the easy passage of the flame through the intervals of the grains, may soon satisfy themselves, that no one grain contained in that chamber can continue for any time uninfused, when thus surrounded and pressed by such an active fire. However, not to rely on mere speculation in a matter of so much consequence, I considered, that if part only of the powder is fired, and that successively; then by laying a greater weight before the charge, (suppose two or three bullets instead of one), a greater quantity of powder would necessarily be fired, since a heavier weight would be a longer time in passing through the barrel. Whence it should follow, that two or three bullets would be impelled by a much greater force than one only. But the contrary to this appears by experiment; for firing one, two, and

ous firing
of powder.

THEORY. and three bullets laid contiguous to each other with the same charge respectively, I have found that their velocities were not much different from the reciprocal of their subduplicate quantities of matter; that is, if a given charge would communicate to one bullet a velocity of 1700 feet in a second, the same charge would communicate to two bullets a velocity from 1250 to 1300 feet in a second, and to three bullets a velocity from 1050 to 1110 feet in the same time. From hence it appears, that, whether a piece is loaded with a greater or less weight of bullet, the action is nearly the same; since all mathematicians know, that if bodies containing different quantities of matter are successively impelled through the same space by the same power acting with a determined force at each point of that space; then the velocities given to these different bodies will be reciprocally in the subduplicate ratio of their quantities of matter. The excess of the velocities of the two and three bullets above what they ought to have been by this rule, (which are that of 1200 and 980 feet in a second) undoubtedly arises from the flame, which, escaping by the side of the first bullet, acts on the surface of the second and third.

14
Why some powder is blown out of the mouth of a cannon without being fired.

"Now, this excess has in many experiments been imperceptible, and the velocities have been reciprocally in the subduplicate ratios of the number of bullets, to sufficient exactness; and where this error has been greater, it has never arisen to an eighth part of the whole: but, if the common opinion was true, that a small part only of the powder fires at first, and other parts of it successively as the bullet passes through the barrel, and that a considerable part of it is often blown out of the piece without firing at all; then the velocity which three bullets received from the explosion ought to have been much greater than we have found it to be.—But the truth of this second postulate more fully appears from those experiments, by which it is shewn, that the velocities of bullets may be ascertained to the same exactness when they are acted on through a barrel of four inches in length only, as when they are discharged from one of four feet.

"With respect to the grains of powder which are often blown out unfired, and which are always urged as a proof of the gradual firing of the charge, I believe Diego Ufano, a person of great experience in the art of gunnery, has given the true reason for this accident; which is, that some small part of the charge is often not rammed up with the rest, but is left in the piece before the wad, and is by this means expelled by the blast of air before the fire can reach it. I must add, that, in the charging of cannon and small arms, especially after the first time, this is scarcely to be avoided by any method I have yet seen practised. Perhaps, too, there may be some few grains in the best powder, of such an heterogeneous composition as to be less susceptible of firing; which, I think, I have myself observed: and these, though they are surrounded by the flame, may be driven out unfired.

15
Demonstration of the force of fired powder on the ball. Plate CXLIV.
fig. 4.

"These postulates being now allowed to be just, let AB represent the axis of any piece of artillery, A the breech, and B the muzzle; DC the diameter of its bore, and DEGC a part of its cavity filled with powder. Suppose the ball that is to be impelled to lie with its hinder surface at the line GE; then the pressure exerted at the explosion on the circle of which

GE is the diameter, or, which is the same thing, the pressure exerted in the direction FB on the surface of the ball, is easily known from the known dimensions of that circle. Draw any line FH perpendicular to FB, and AI parallel to FH; and through the point H, to the asymptotes IA and AB, describe the hyperbola KHQ; then, if FH represents the force impelling the ball at the point F, the force impelling the ball at any other point as at M, will be represented by the line MN, the ordinate to the hyperbola at that point. For when the fluid impelling the body along has dilated itself to M, its density will be then to its original density in the space DEGC reciprocally as the spaces through which it is extended; that is, as FA to MA, or as MN to FH; but it has been shewn, that the impelling force or elasticity of this fluid is directly as its density; therefore, if FH represents the force at the point F, MN will represent the like force at the point M.

"Since the absolute quantity of the force impelling the ball at the point F is known, and the weight of the ball is also known, the proportion between the force with which the ball is impelled and its own gravity is known. In this proportion take FH to FL, and draw LP parallel to FB; then, MN the ordinate to the hyperbola in any point will be to its part MR, cut off by the line LP, as the impelling force of the powder in that point M to the gravity of the ball; and consequently the line LP will determine a line proportional to the uniform force of gravity in every point; whilst the hyperbola HNQ determines in like manner such ordinates as are proportional to the impelling force of the powder in every point; whence by the 39th Prop. of lib. 1. of Sir Isaac Newton's Principia, the areas FLPB and FHQB are in the duplicate proportion of the velocities which the ball would acquire when acted upon by its own gravity through the space FB, and when impelled through the same space by the force of the powder. But since the ratio of AF to AB and the ratio of FH to FL are known, the ratio of the area FLPB to the area FHQB is known; and thence its subduplicate. And since the line FB is given in magnitude, the velocity which a heavy body would acquire when impelled through this line by its own gravity is known; being no other than the velocity it would acquire by falling through a space equal to that line: find then another velocity to which this last mentioned velocity bears the given ratio of the subduplicate of the area FLPB to the area FHQB; and this velocity thus found is the velocity the ball will acquire when impelled thro' the space FB by the action of the inflamed powder.

"Now to give an example of this: Let us suppose AB, the length of the cylinder, to be 45 inches; its diameter DC, or rather the diameter of the ball, to be $\frac{1}{4}$ of an inch; and AF, the extent of the powder, to be $2\frac{1}{2}$ inches; to determine the velocity which will be communicated to a leaden bullet by the explosion, supposing the bullet to be laid at first with its surface contiguous to the powder.

"By the theory we have laid down, it appears, that at the first instant of the explosion the flame will exert, on the bullet lying close to it, a force 1000 times greater than the pressure of the atmosphere. The medium pressure of the atmosphere is reckoned equal

to a column of water 33 feet in height; whence, lead being to water as 11,345 to 1, this preffure will be equal to that of a column of lead 34.9 inches in height. Multiplying this by 1000, therefore, a column of lead 34900 inches (upwards of half a mile) in height, would produce a preffure on the bullet equal to what is exerted by the powder in the first instant of the explosion; and the leaden ball being $\frac{1}{2}$ of an inch in diameter, and consequently equal to a cylinder of lead of the same base half an inch in height, the preffure at first acting on it will be equal to 34900×2 , or 69800 times its weight: whence FL to FH as 1 to 69800; and FB to FA as $45 - 2\frac{1}{2}$; or $42\frac{1}{2}$ to $2\frac{1}{2}$; that is, as 339 to 21; whence the rectangle FLPB is to the rectangle AFHS as 339 to 21×69800 , that is, as 1 to 4324—And from the known application of the logarithms to the mensuration of the hyperbolic spaces it follows, that the rectangle AFHS is to the area FHQB as 43,429, &c.

is to the tabular logarithm of $\frac{AB}{AF}$; that is, of $\frac{15.7}{11.7}$ which is 1,2340579; whence the ratio of the rectangle FLPB to the hyperbolic area FHQB is compounded of the ratios of 1 to 4324—and of 1,2340579; which together make up the ratio of 1 to 12263, the subduplicate of which is the ratio of 1 to 110.7; and in this ratio is the velocity which the bullet would acquire by gravity in falling thro' a space equal to FB, to the velocity the bullet will acquire from the action of the powder impelling it thro' FB. But the space FB being $42\frac{1}{2}$ inches, the velocity a heavy body will acquire in falling through such a space is known to be what would carry it nearly at the rate of 15.07 feet in a second; whence the velocity to which this has the ratio of 1 to 110.7 is a velocity which would carry the ball at the rate of 1668 feet in one second. And this is the velocity which, according to the theory, the bullet in the present circumstances would acquire from the action of the powder during the time of its dilatation.

“Now this velocity being once computed for one case, is easily applied to any other; for if the cavity DEGC left behind the bullet be only in part filled with powder, then the line HF, and consequently the area FHQB will be diminished in the proportion of the whole cavity to the part filled. If the diameter of the bore be varied, the lengths AB and AF remaining the same, then the quantity of powder and the surface of the bullet which it acts on, will be varied in the duplicate proportion of the diameter, but the weight of the bullet will vary in the triplicate proportion of the diameter; wherefore the line FH, which is directly as the absolute impelling force of the powder, and reciprocally as the gravity of the bullet, will change in the reciprocal proportion of the diameter of the bullet. If AF, the height of the cavity left behind the bullet, be increased or diminished, the rectangle of the hyperbola, and consequently the area corresponding to ordinates in any given ratio, will be increased or diminished in the same proportion. From all which it follows, that the area FHQB, which is in the duplicate proportion of the velocity of the impelled body, will be directly as the logarithm $\frac{AB}{AF}$ (where AB represents the length of the barrel, and AF the length of the cavity left behind the bullet); also directly as the part of

that cavity filled with powder; and inversely, as the diameter of the bore, or rather of the bullet; likewise directly as AF, the height of the cavity left behind the bullet. Consequently the velocity being computed as above, for a bullet of a determined diameter, placed in a piece of a given length, and impelled by a given quantity of powder, occupying a given cavity behind that bullet; it follows, that, by means of these ratios, the velocity of any other bullet may be thence deduced; the necessary circumstances of its position, quantity of powder, &c. being given. Where note, That in the instance of this supposition, we have supposed the diameter of the ball to be $\frac{1}{2}$ of an inch; whence the diameter of the bore will be something more, and the quantity of powder contained in the space DEGC, will amount exactly to twelve penny-weight, a small wad of tow included.

“In order to compare the velocities communicated to bullets by the explosion, with the velocities resulting from the theory by computation; it is necessary that the actual velocities with which bullets move should be discovered. The only methods hitherto practised for this purpose, have been either by observing the time of the flight of a shot through a given space, or by measuring the range of a shot at a given elevation; and thence computing, on the parabolic hypothesis, what degree of velocity would produce this range.—The first method labours under this insurmountable difficulty, that the velocities of these bodies are often so swift, and consequently the time observed is so short, that an imperceptible error in that time, may occasion an error in the velocity thus found of 2, 3, 4, 5, or 600 feet, in a second. The other method is so fallacious, by reason of the resistance of the atmosphere (to which inequality the first is also liable), that the velocities thus assigned may not perhaps be the tenth part of the actual velocities fought.

“The simplest method of determining this velocity is by means of the instrument represented Plate CXLII. fig. 5. where ABCD represents the body of the machine composed of the three poles B, C, D, spreading at bottom, and joining together at the top A; being the same with what is vulgarly used in lifting and weighing very heavy bodies, and is called by workmen the *triangles*. On two of these poles, towards their tops, are screwed on the sockets RS; and on these sockets the pendulum EFGHIK is hung by means of its cross-piece EF, which becomes its axis of suspension, and on which it must be made to vibrate with great freedom. The body of this pendulum is made of iron, having a broad part at bottom, and its lower part is covered with a thick piece of wood GKI, which is fastened to the iron by screws. Something lower than the bottom of the pendulum there is a brace OP, joining the two poles to which the pendulum is suspended; and to this brace there is fastened a contrivance MNU, made with two edges of steel, bearing on each other in the line UN, something in the manner of a drawing-pen; the strength with which these edges press on each other being diminished or increased at pleasure by means of a screw Z going through the upper piece. There is fastened to the bottom of the pendulum a narrow ribbon LN, which passes between these steel edges, and which afterwards, by means of an opening cut in the lower piece of steel, hangs loosely down, as at W.

Method of
using the
machine.

"This instrument thus fitted, if the weight of the pendulum be known, and likewise the respective distances of its centre of gravity, and of its centre of oscillation from its axis of suspension, it will thence be known, what motion will be communicated to this pendulum by the percussion of a body of a known weight moving with a known degree of celerity, and striking it in a given point; that is, if the pendulum be supposed at rest before the percussion, it will be known what vibration it ought to make in consequence of such a determined blow; and, on the contrary, if the pendulum, being at rest, is struck by a body of a known weight, and the vibration, which the pendulum makes after the blow, is known, the velocity of the striking body may from thence be determined.

"Hence then, if a bullet of a known weight strikes the pendulum, and the vibration, which the pendulum makes in consequence of the stroke, be ascertained; the velocity, with which the ball moved, is thence to be known.

"Now the extent of the vibration, made by the pendulum after the blow, may be measured to great accuracy by the ribbon LN. For let the pressure of the edges UN on the ribbon be so regulated by the screw Z, that the motion of the ribbon between them may be free and easy, though with some minute resistance; then settling the pendulum at rest, let the part LN between the pendulum and the edges be drawn strait, but not strained, and fix a pin in that part of the ribbon which is then contiguous to the edges: let now a ball impinge on the pendulum; then the pendulum swinging back will draw out the ribbon to the just extent of its vibration, which will consequently be determined by the interval on the ribbon between the edges UN and the place of the pin.

"The weight of the whole pendulum, wood and all, was 56 lb. 3 oz. its centre of gravity was 52 inches distant from its axis of suspension, and 200 of its small swings were performed in the time of 253 seconds; whence its centre of oscillation (determined from hence) is 62 $\frac{3}{4}$ inches distant from that axis. The centre of the piece of wood GKI^H is distant from the same axis 66 inches.

"In the compound ratio of 66 to 62 $\frac{3}{4}$, and 66 to 52, take the quantity of matter of the pendulum to a 4th quantity, which will be 42 lb. $\frac{3}{4}$ oz. Now geometers will know, that if the blow be struck on the centre of the piece of wood GKI^H, the pendulum will resist to the stroke in the same manner as if this last quantity of matter only (42 lb. $\frac{3}{4}$ oz.) was concentrated in that point, and the rest of the pendulum was taken away: whence, supposing the weight of the bullet impinging in that point to be the $\frac{1}{10}$ of a pound, or the $\frac{1}{100}$ of this quantity of matter nearly, the velocity of the point of oscillation after the stroke will, by the laws observed in the congress of such bodies as rebound not from each other, be the $\frac{1}{10}$ of the velocity the bullet moved with before the stroke; whence the velocity of this point of oscillation after the stroke being ascertained, that multiplied by 505 will give the velocity with which the ball impinged.

"But the velocity of the point of oscillation after the stroke is easily deduced from the chord of the arch, through which it ascends by the blow; for it is a well-known proposition, that all pendulous bodies ascend

to the same height by their vibratory motion as they would do, if they were projected directly upwards from their lowest point, with the same velocity they have in that point: wherefore, if the versed sine of the ascending arch be found, (which is easily determined from the chord and radius being given), this versed sine is the perpendicular height, to which a body projected upwards with the velocity of the point of oscillation would arise; and, consequently, what that velocity is, can be easily computed by the common theory of falling bodies.

"For instance, the chord of the arch, described by the ascent of the pendulum after the stroke measured on the ribbon, has been sometimes 17 $\frac{1}{2}$ inches; the distance of the ribbon from the axis of suspension is 71 $\frac{1}{2}$ inches; whence reducing 17 $\frac{1}{2}$ in the ratio of 71 $\frac{1}{2}$ to 66, the resulting number, which is nearly 16 inches, will be the chord of the arch through which the centre of the board GKI^H ascended after the stroke: now the versed sine of the arch, whose chord is 16 inches, and its radius 66, is 1.93939; and the velocity, which would carry a body to this height, or, which is the same thing, the velocity which a body would acquire by descending through this space, is nearly that of 3 $\frac{1}{2}$ feet in 1".

"To determine then the velocity with which the bullet impinged on the centre of the wood, when the chord of the arch described by the ascent of the pendulum, in consequence of the blow, was 17 $\frac{1}{2}$ inches measured on the ribbon, no more is necessary than to multiply 3 $\frac{1}{2}$ by 505, and the resulting number 1641 will be the feet which the bullet would describe in 1", if it moved with the velocity it had at the moment of its percussion: for the velocity of the point of the pendulum, on which the bullet struck, we have just now determined to be that of 3 $\frac{1}{2}$ feet in 1"; and we have before shewn, that this is the $\frac{1}{10}$ of the velocity of the bullet. If then a bullet weighing $\frac{1}{10}$ of a pound strikes the pendulum in the centre of the wood GKI^H, and the ribbon be drawn out 17 $\frac{1}{2}$ inches by the blow; the velocity of the bullet is that of 1641 feet in 1". And since the length the ribbon is drawn is always nearly the chord of the arch described by the ascent, (it being placed so as to differ insensibly from those chords which most frequently occur), and these chords are known to be in the proportion of the velocities of the pendulum acquired from the strokes; it follows, that the proportion between the lengths of ribbon drawn out at different times, will be the same with that of the velocities of the impinging bullets; and consequently, by the proportion of these lengths of ribbon to 17 $\frac{1}{2}$, the proportion of the velocity with which the bullets impinge to the known velocity of 1641 feet in 1", will be determined.

"Hence then is shewn, in general, how the velocities of bullets of all kinds may be found out by means of this instrument; but that those who may be disposed to try these experiments may not have unforeseen difficulties to struggle with, we shall here subjoin a few observations, which it will be necessary for them to attend to, both to secure success to their trials, and safety to their persons.

"And first, that they may not conceive the piece of wood GKI^H to be an unnecessary part of the machine, we must inform them, that if a bullet impelled

18
Cautions to

in making
these experiments.

THEORY. by a full charge of powder should strike directly on the iron, the bullet would be beaten into shivers by the stroke, and these shivers will rebound back with such violence, as to bury themselves in any wood they chance to light on, as I have found by hazardous experience; and besides the danger, the pendulum will not in this instance ascertain the velocity of the bullet, because the velocity with which the parts of it rebound is unknown.

"The weight of the pendulum, and the thickness of the wood, must be in some measure proportioned to the size of the bullets which are used. A pendulum of the weight here described will do very well for all bullets under three or four ounces, if the thickness of the board be increased to seven or eight inches for the heaviest bullets; beech is the toughest and properest wood for this purpose.

"It is hazardous standing on the side of the pendulum, unless the board be so thick, that the greatest part of the bullet's force is lost before it comes at the iron; for if it strikes the iron with violence, the shivers of it, which cannot return back thro' the wood, will force themselves out between the wood and iron, and will fly to a considerable distance.

"As there is no effectual way of fastening the wood to the iron but by screws, the heads of which must come through the board; the bullets will sometimes light on those screws, from whence the shivers will disperse themselves on every side.

"When in these experiments so small a quantity of powder is used, as will not give to the bullet a velocity of more than 400 or 500 feet in 1"; the bullet will not stick in the wood, but will rebound from it entire, and (if the wood be of a very hard texture) with a very considerable velocity. Indeed I have never examined any of the bullets which have thus rebounded; but I have found them indented by the bodies they have struck against in their rebound.

"To avoid then these dangers, to the braving of which in philosophical researches no honour is annexed; it will be convenient to fix whatsoever barrel is used, on a strong heavy carriage, and to fire it with a little slow match. Let the barrel too be very well fortified in all its length; for no barrel (I speak of musket barrels) forged with the usual dimensions will bear many of the experiments without bursting. The barrel I have most relied on, and which I procured to be made on purpose, is nearly as thick at the muzzle as at the breech; that is, it has in each place nearly the diameter of its bore in thickness of metal.

"The powder used in these experiments should be exactly weighed: and that no part of it be scattered in the barrel, the piece must be charged with a ladle in the same manner as is practised with cannon; the wad should be of tow, of the same weight each time, and no more than is just necessary to confine the powder in its proper place: the length of the cavity left behind the ball should be determined each time with exactness; for the increasing or diminishing that space will vary the velocity of the shot, although the bullet and quantity of powder be not changed. The distance of the mouth of the piece from the pendulum ought to be such, that the impulse of the flame may not act on the pendulum; this will be prevented in a common

barrel charged with $\frac{1}{4}$ an ounce of powder, if it be at the distance of 16 or 18 feet: in larger charges the impulse is sensible farther off, I have found it to extend to above 25 feet; however, between 25 and 18 feet is the distance I have usually chosen."

With this instrument, or others similar to it, Mr Robins made a great number of experiments on barrels of different lengths, and with different charges of powder. He hath given us the results of 61 of these; and having compared the actual velocities with the computed ones, his theory appears to have come as near the truth as could well be expected. In seven of the experiments there was a perfect coincidence; the charges of powder being six or twelve pennyweights; the barrels 45, 24.312, and 7.06 inches in length. The diameter of the first (marked A) was $\frac{1}{4}$ of an inch; of the second (B) was the same; and of D, $\frac{8}{32}$ of an inch. In the rest of the experiments, another barrel (C) was used, whose length was 12.375 inches, and the diameter of its bore $\frac{1}{4}$ inches.---In 14 more of the experiments, the difference between the length of the chord of the pendulum's arch shewn by the theory and the actual experiment was one-tenth of an inch over or under. This shewed an error in the theory varying according to the different lengths of the chord from $\frac{1}{17}$ to $\frac{1}{27}$ of the whole; the charges of powder were the same as in the last.---In 16 other experiments, the error was two-tenths of an inch, varying from $\frac{1}{17}$ to $\frac{1}{27}$ of the whole; the charges of powder were 6, 8, 9, or 12 pennyweights.---In seven other experiments, the error was three-tenths of an inch, varying from $\frac{1}{17}$ to $\frac{1}{27}$ of the whole; the charges of powder six, or twelve, pennyweights. In eight experiments, the difference was four-tenths of an inch, indicating an error from $\frac{1}{17}$ to $\frac{1}{27}$ of the whole; the charges being 6, 9, 12, and 24 pennyweights of powder. In three experiments, the error was five-tenths, varying from $\frac{1}{17}$ to $\frac{1}{27}$ of the whole; the charges 8 and 12 pennyweights of powder.---In two experiments the error was six-tenths, in one case amounting to something less than $\frac{1}{17}$, in the other to $\frac{1}{27}$ of the whole; the charges 12 and 36 pennyweights of powder. By one experiment the error was seven, and by another eight, tenths; the first amounting to $\frac{1}{17}$ nearly, the latter to almost $\frac{1}{27}$ of the whole: the charges of powder 6 or 12 pennyweights. The last error, however, Mr Robins ascribes to the wind. The two remaining experiments varied from the theory by 1.3 inches, somewhat more than $\frac{1}{17}$ of the whole: the charges of powder were 12 pennyweights in each; and Mr Robins ascribes the error to the dampness of the powder. In another case, he ascribes an error of six-tenths to the blast of the powder on the pendulum.

From these experiments Mr Robins deduces the following conclusions. "The variety of these experiments, and the accuracy with which they correspond to the theory, leave us no room to doubt of its certainty.---This theory, as here established, supposes, that, in the firing of gunpowder, about $\frac{1}{10}$ of its substance is converted by the sudden inflammation into a permanently elastic fluid, whose elasticity, in proportion to its heat and density, is the same with that of common air in the like circumstances; it farther supposes, that all the force exerted by gunpowder in its

19

Mr Robins's ex-
periments.

20
His conclusions from
them.

most

THEORY. most violent operations, is no more than the action of the elasticity of the fluid thus generated; and these principles enable us to determine the velocities of bullets impelled from fire-arms of all kinds, and are fully sufficient for all purposes where the force of gunpowder is to be estimated.

"From this theory many deductions may be made, of the greatest consequence to the practical part of gunnery. From hence the thickness of a piece, which will enable it to confine, without bursting, any given charge of powder, is easily determined, since the effort of the powder is known. From hence appears the inconclusiveness of what some modern authors have advanced, relating to the advantages of particular forms of chambers for mortars and cannon; for all their laboured speculations on this head are evidently founded on very erroneous opinions about the action of fired powder. From this theory too we are taught the necessity of leaving the same space behind the bullet when we would, by the same quantity of powder, communicate to it an equal degree of velocity; since, on the principles already laid down, it follows, that the same powder has a greater or less degree of elasticity, according to the different spaces it occupies. The method which I have always practised for this purpose has been by marking the rammer; and this is a maxim which ought not to be dispensed with when cannon are fired at an elevation, particularly in those called by the French *batteries à ricochet*.

"From the continued action of the powder, and its manner of expanding described in this theory, and the length and weight of the piece, one of the most essential circumstances in the well directing of artillery may be easily ascertained. All practitioners are agreed, that no shot can be depended on, unless the piece be placed on a solid platform: for if the platform shakes with the first impulse of the powder, it is impossible but the piece must also shake; which will alter its direction, and render the shot uncertain. To prevent this accident, the platform is usually made extremely firm to a considerable depth backwards; so that the piece is not only well supported in the beginning of its motion, but likewise through a great part of its recoil. However, it is sufficiently obvious, that when the bullet is separated from the piece, it can be no longer affected by the trembling of the piece or platform; and, by a very easy computation, it will be found, that the bullet will be out of the piece before the latter hath recoiled half an inch: whence, if the platform be sufficiently solid at the beginning of the recoil, the remaining part of it may be much slighter; and hence a more compendious method of constructing platforms may be found out.

"From this theory also it appears how greatly these authors have been mistaken, who have attributed the force of gunpowder, or at least a considerable part of it, to the action of the air contained either in the powder, or between the intervals of the grains: for they have supposed that air to exist in its natural elastic state, and to receive all its addition of force from the heat of the explosion. But from what hath been already delivered concerning the increase of the air's elasticity by heat, we may conclude that the heat of the explosion cannot augment this elasticity to five times its common quantity; consequently the force

arising from this cause only cannot amount to more than the 200th part of the real force exerted on the occasion.

"If the whole substance of the powder was converted into an elastic fluid at the instant of the explosion, then from the known elasticity of this fluid assigned by our theory, and its known density, we could easily determine the velocity with which it would begin to expand, and could thence trace out its future augmentations in its progress through the barrel: but as we have shewn that the elastic fluid, in which the activity of the gunpowder consists, is only $\frac{1}{3}$ of the substance of the powder, the remaining $\frac{2}{3}$ will, in the explosion, be mixed with the elastic part, and will by its weight retard the activity of the explosion; and yet they will not be so completely united as to move with one common motion; but the unelastic part will be less accelerated than the rest, and some will not even be carried out of the barrel, as appears by the considerable quantity of unctuous matter which adheres to the inside of all fire-arms after they have been used.—These inequalities in the expansive motion of the flame oblige us to recur to experiments for its accurate determination.

"The experiments made use of for this purpose were of two kinds. The first was made by charging the barrel A with 12 penny-weights of powder, and a small wad of tow only; and then placing its mouth 19 inches from the centre of the pendulum. On firing it in this situation, the impulse of the flame made it ascend through an arch whose chord was 13.7 inches; whence, if the whole substance of the powder was supposed to strike against the pendulum, and each part to strike with the same velocity, that common velocity must have been at the rate of about 2650 feet in a second.—But as some part of the velocity of the flame was lost in passing through 19 inches of air; I made the remaining experiments in a manner not liable to this inconvenience.

"I fixed the barrel A on the pendulum, so that its axis might be both horizontal, and also perpendicular to the plane HK; or, which is the same thing, that it might be in the plane of the pendulum's vibration: the height of the axis of the piece above the centre of the pendulum was six inches; and the weight of the piece, and of the iron that fastened it, &c. was 12½ lb. The barrel in this situation being charged with 12 penny-weights of powder, without either ball or wad, only put together with the rammer; on the discharge the pendulum ascended through an arch whose chord was 10 inches, or reduced to an equivalent blow in the centre of the pendulum, supposing the barrel away, it would be 14.4 inches nearly.—The same experiment being repeated, the chord of the ascending arch was 10.1 inches, which, reduced to the centre, is 14.6 inches.

"To determine what difference of velocity there was in the different parts of the vapour, I loaded the piece again with 12 penny-weights of powder, and rammed it down with a wad of tow, weighing one penny-weight. Now, I conceived that this wad being very light, would presently acquire that velocity with which the elastic part of the fluid would expand itself when uncompressed; and I accordingly found, that the chord of the ascending arch was by

2r
Experiments for determining the velocity of fired gunpowder.

THEORY. this means increased to 12 inches, or at the centre to 17.3: whence, as the medium of the other two experiments is 14.5, the pendulum ascended through an arch 2.8 inches longer, by the additional motion of one penny-weight of matter, moving with the velocity of the swiftest part of the vapour; and consequently the velocity with which this penny-weight of matter moved, was that of about 7000 feet in a second.

"It will perhaps be objected to this determination, that the augmentation of the arch through which the pendulum vibrated in this case was not all of it owing to the quantity of motion given to the wad, but part of it was produced by the confinement of the powder, and the greater quantity thereby fired. But if it were true that a part only of the powder fired when there was no wad, it would not happen that in firing different quantities of powder without a wad the chord would increase and decrease nearly in the ratio of these quantities; which yet I have found it to do: for with nine pennyweights that chord was 7.3 inches, which with 12 pennyweights we have seen was only 10, and 10.1 inches; and even with three pennyweights the chord was two inches; deficient from this proportion by .5 only; for which defect too other valid reasons are to be assigned.

"And there is still a more convincing proof that all the powder is fired, although no wad be placed before the charge, which is, that the part of the recoil arising from the expansion of powder alone, is found to be no greater when it impels a leaden bullet before it, than when the same quantity is fired without any wad to confine it. We have seen that the chord of the arch through which the pendulum rose from the expansive force of the powder alone is 10, or 10.1; and the chord of that arch, when the piece was charged in the customary manner with a bullet and wad, I found to be the first time 22½, and the second 22¾, or at a medium 22.56. Now the impulse of the ball and wad, if they were supposed to strike the pendulum in the same place in which the barrel was suspended, with the velocity they had acquired at the mouth of the piece, would drive it through an arch whose chord would be about 12.3; as is known from the weight of the pendulum, the weight and position of the barrel, and the velocity of the bullet determined by our former experiments; whence, subtracting this number 12.3 from 22.56, the remainder 10.26 is nearly the chord of the arch which the pendulum would have ascended through from the expansion of the powder alone with a bullet laid before it. And this number, 10.26, differs but little from 10.1, which we have above found to be the chord of the ascending arch, when the same quantity of powder expanded itself freely without either bullet or wad before it.

"Again, that this velocity of 7000 feet in a second is not much beyond what the most active part of the flame acquires in expanding, is evinced from hence, that in some experiments a ball has been found to be discharged with a velocity of 2400 feet in a second; and yet it appeared not that the action of the powder was at all diminished on account of this immense celerity: consequently the degree of swiftness with which, in this instance, the powder followed the ball without losing any part of its pressure, must have been

much short of what the powder alone would have expanded with, had not the ball been there.

"From these determinations may be deduced the force of petards; since their action depends entirely on the impulse of the flame: and it appears that a quantity of powder properly disposed in such a machine, may produce as violent an effort as a bullet of twice its weight, moving with a velocity of 1400 or 1500 feet in a second.

"In many of the experiments already recited, the ball was not laid immediately contiguous to the powder, but at a small distance, amounting, at the utmost, only to an inch and a half. In these cases the theory agreed very well with the experiments. But if a bullet is placed at a greater distance from the powder, suppose at 12, 18, or 24 inches, we cannot then apply to this ball the same principles which may be applied to those laid in contact, or nearly so, with the powder; for when the surface of the fired powder is not confined by a heavy body, the flame dilates itself with a velocity far exceeding that which it can communicate to a bullet by its continued pressure: consequently, as at the distance of 12, 18, or 24 inches, the powder will have acquired a considerable degree of this velocity of expansion, the first motion of the ball will not be produced by the continued pressure of the powder, but by the actual percussion of the flame; and it will therefore begin to move with a quantity of motion proportioned to the quantity of this flame, and the velocities of its respective parts.

"From hence then it follows, that the velocity of the bullet, laid at a considerable distance before the charge, ought to be greater than what would be communicated to it by the pressure of the powder acting in the manner already mentioned: and this deduction from our theory we have confirmed by manifold experience; by which we have found, that a ball laid in the barrel A, with its hinder part 11½ inches from its breech, and impelled by twelve pennyweights of powder, has acquired a velocity of about 1400 feet in a second; when, if it had been acted on by the pressure of the flame only, it would not have acquired a velocity of 1200 feet in a second. The same we have found to hold true in all other greater distances, (and also in lesser, though not in the same degree), and in all quantities of powder: and we have likewise found, that these effects nearly correspond with what has been already laid down about the velocity of expansion and the elastic and inelastic parts of the flame.

"From hence too arises another consideration of great consequence in the practice of gunnery; which is, that no bullet should at any time be placed at a considerable distance before the charge, unless the piece is extremely well fortified: for a moderate charge of powder, when it has expanded itself through the vacant space, and reaches the ball, will, by the velocity each part has acquired, accumulate itself behind the ball, and thereby be condensed prodigiously; whence, if the barrel be not extremely firm in that part, it must, by means of this re-inforced elasticity, infallibly burst. The truth of this reasoning I have experienced in an exceeding good Tower-musket, forged of very tough iron; for, charging it with twelve pennyweights of powder, and placing the ball 16 inches from the breech, on firing it, the part of the barrel

22

locity when
laid at a dis-
tance from
the powder.

just

THEORY.

THEORY.

just behind the bullet was swelled out to double its diameter like a blown bladder, and two large pieces of two inches long were burst out of it.

" Having seen that the entire motion of a bullet laid at a considerable distance from the charge, is acquired by two different methods in which the powder acts on it; the first being the percussion of the parts of the flame with the velocity they had respectively acquired by expanding, the second the continued pressure of the flame through the remaining part of the barrel; I endeavoured to separate these different actions, and to retain that only which arose from the continued pressure of the flame. For this purpose I no longer placed the powder at the breech, from whence it would have full scope for its expansion; but I scattered it as uniformly as I could through the whole cavity left behind the bullet; imagining that by this means the progressive velocity of the flame in each part would be prevented by the expansion of the neighbouring parts: and I found, that the ball being laid 11½ inches from the breech, its velocity, instead of 1400 feet in a second, which it acquired in the last experiments, was now no more than 1100 feet in the second, which is 100 feet short of what according to the theory should arise from the continued pressure of the powder only.

" The reason of this deficiency was, doubtless, the intestine motion of the flame: for the accension of the powder thus distributed through so much larger a space than it could fill, must have produced many reverberations and pulsations of the flame; and from these internal agitations of the fluid, its pressure on the containing surface will (as is the case of all other fluids) be considerably diminished; and in order to avoid this irregularity, in all other experiments I took care to have the powder closely confined in as small a space as possible, even when the bullet lay at some little distance from it.

" With regard to the resistance of the air, which so remarkably affects all military projectiles, it is necessary to premise, that the greatest part of authors have established it as a certain rule, that while the same body moves in the same medium, it is always resisted in the duplicate proportion of its velocity; that is, if the resisted body move in one part of its track with three times the velocity with which it moved in some other part, then its resistance to the greater velocity will be nine times the resistance to the lesser. If the velocity in one place be four times greater than in another, the resistance of the fluid will be 16 times greater in the first than in the second, &c. This rule, however, though pretty near the truth when the velocities are confined within certain limits, is excessively erroneous when applied to military projectiles, where such resistances often occur as could scarcely be effected, on the commonly received principles, even by a treble augmentation of its density.

" By means of the machine already described, I have it in my power to determine the velocity with which a ball moves in any part of its track, provided I can direct the piece in such a manner as to cause the bullet to impinge on the pendulum placed in that part: and therefore, charging a musket-barrel three times successively with a leaden ball ½ of an inch in diameter, and about half its weight of powder; and taking

such precaution in weighing of the powder and placing it, that I was assured, by many previous trials, that the velocity of the ball could not differ by 20 feet in a second from its medium quantity; I fired it against the pendulum placed at 25, 75, and 125 feet distance from the mouth of the piece respectively; and I found that it impinged against the pendulum, in the first case, with a velocity of 1670 feet in a second; in the second case, with a velocity of 1550 feet in a second; and in the third case, with a velocity of 1425 feet in a second: so that, in passing through 50 feet of air, the bullet lost a velocity of 120 or 125 feet in a second; and the time of its passing through that space being about ⅓ of a second, the medium quantity of resistance must, in these instances, have been about 120 times the weight of the ball; which (as the ball was nearly ⅓ of a pound) amounts to about 10 lb avoirdupoise.

" Now, if a computation be made according to the method laid down for compressed fluids in the 38th proposition of Newton's *Principia*, supposing the weight of water to that of air as 850 to 1, it will be found, that the resistance to a globe of ½ of an inch diameter, moving with a velocity of about 1600 feet in a second, will not, on these principles, amount to any more than 4½ lb avoirdupoise; whence, as we know that the rules contained in that proposition are very accurate with regard to slow motions, we may hence conclude, that the resistance of the air in slow motions is less than that in swift motions, in the ratio of 4½ to 10; a proportion between that of 1 to 2, and 1 to 3.

" Again, I charged the same piece a number of times with equal quantities of powder, and balls of the same weight, taking all possible care to give to every shot an equal velocity; and, firing three times against the pendulum placed only 25 feet from the mouth of the piece, the medium of the velocities with which the ball impinged was nearly that of 1690 feet in a second: then removing the piece 175 feet from the pendulum, I found, taking the medium of five shots, that the velocity with which the ball impinged at this distance, was 1300 feet in a second; whence the ball, in passing through 150 feet of air, lost a velocity of about 390 feet in a second; and the resistance computed from these numbers, comes out something more than in the preceding instance, it amounting here to between 11 and 12 pounds avoirdupoise; whence, according to these experiments, the resisting power of the air to swift motions is greater than to slow ones, in a ratio which approaches nearer to that of 3 to 1 than in the preceding experiments.

" Having thus examined the resistance to a velocity of 1700 feet in a second, I next examined the resistance to smaller velocities: and for this purpose, I charged the same barrel with balls of the same diameter, but with less powder, and placing the pendulum at 25 feet distance from the piece, I fired against it five times with an equal charge each time: the medium velocity with which the ball impinged, was that of 1180 feet in a second; then, removing the pendulum to the distance of 250 feet, the medium velocity of five shots, made at this distance, was that of 950 feet in a second: whence the ball, in passing through 225 feet of air, lost a velocity of 230 feet in a second:

and

23
Of the resistance of the air to the motion of bullets.

THEORY. and as it passed through that interval in about $\frac{1}{4}$ th of a second, the resistance to the middle velocity will come out to be near $33\frac{1}{2}$ times the gravity of the ball, or 2 lb. 10 oz. avoirdupoise. Now, the resistance to the same velocity, according to the laws observed in slower motions, amounts to $\frac{1}{17}$ of the same quantity; whence, in a velocity of 1065 feet in a second, the resisting power of the air is augmented in no greater a proportion than that of 7 to 11; whereas we have seen in the former experiments, that to still greater degrees of velocity the augmentation approached very near the ratio of one to three.

"But farther, I fired three shot, of the same size and weight with those already mentioned, over a large piece of water; so that their dropping into the water being very discernible, both the distance and time of their flight might be accurately ascertained. Each shot was discharged with a velocity of 400 feet in a second; and I had satisfied myself by many previous trials of the same charge with the pendulum, that I could rely on this velocity to ten feet in a second. The first shot flew 313 yards in four seconds and a quarter, the second flew 319 yards in four seconds, and the third 373 yards in five seconds and an half. According to the theory of resistance established for slow motions, the first shot ought to have spent no more than 3.2 seconds in its flight, the second 3.28, and the third 4 seconds; whence it is evident that every shot was retarded considerably more than it ought to have been had that theory taken place in its motion; consequently the resistance of the air is very sensibly increased, even in such a small velocity as that of 400 feet in a second.

"As no large shot are ever projected in practice with velocities exceeding that of 1700 feet in a second, it will be sufficient for the purposes of a practical gunner to determine the resistance to all lesser velocities, which may be thus exhibited. Let AB be taken to AC, in the ratio of 1700 feet in a second to the given velocity to which the resisting power of the air is required. Continue the line AB to D, so that BD may be to AD, as the resisting power of the air to slow motions is to its resisting power to a velocity of 1700 feet in a second; then shall CD be to AD, as the resisting power of the air to slow motions is to its resisting power to the given velocity represented by AC.

"From the computations and experiments already mentioned, it plainly appears, that a leaden ball of $\frac{1}{2}$ of an inch diameter, and weighing nearly 1½ oz. avoirdupoise, if it be fired from a barrel of 45 inches in length, with half its weight of powder, will issue from that piece with a velocity which, if it were uniformly continued, would carry it near 1700 feet in a second.—If, instead of a leaden ball, an iron one, of an equal diameter, was placed in the same situation in the same piece, and was impelled by an equal quantity of powder, the velocity of such an iron-bullet would be greater than that of the leaden one in the subduplicate ratio of the specific gravities of lead and iron; and supposing that ratio to be as three to two, and computing on the principles already laid down, it will appear, that an iron-bullet of 24 lb. weight, shot from a piece of ten feet in length, with 16 lb. of pow-

der, will acquire from the explosion a velocity which, if uniformly continued, would carry it nearly 1650 feet in a second.

"This is the velocity, which, according to our theory, a cannon-ball of 24 lb weight is discharged with when it is impelled by a full charge of powder; but if, instead of a quantity of powder weighing two thirds of the ball, we suppose the charge to be only half the weight of it, then its velocity will on the same principles be no more than 1490 feet in a second. The same would be the velocities of every lesser bullet fired with the same proportions of powder, if the lengths of all pieces were constantly in the same ratio with the diameters of their bore: and although, according to the usual dimensions of the smaller pieces of artillery, this proportion does not always hold, yet the difference is not great enough to occasion a very great variation from the velocities here assigned; as will be obvious to any one who shall make a computation thereon. But in these determinations we suppose the windage to be no more than is just sufficient for putting down the bullet easily; whereas in real service, either through negligence or unskilfulness, it often happens, that the diameter of the bore so much exceeds the diameter of the bullet, that great part of the inflamed fluid escapes by its side; whence the velocity of the shot in this case may be considerably less than what we have assigned. However, this perhaps may be compensated by the greater heat which in all probability attends the firing of these large quantities of powder.

"From this great velocity of cannon-shot we may clear up the difficulty concerning the point-blank shot, which occasioned the invention of Anderfon's strange hypothesis *. Here our author was deceived by his not knowing how greatly the primitive velocity of the heaviest shot is diminished in the course of its flight by the resistance of the air. And the received opinion of practical gunners is not more difficult to account for; since, when they agree that every shot flies in a straight line to a certain distance from the piece, which imaginary distance they have called the *extent of the point-blank shot*, we need only suppose, that, within that distance which they thus determine, the deviation of the path of the shot from a straight line is not very perceptible in their method of pointing. Now, as a shot of 24 lb. fired with two thirds of its weight of powder will, at the distance of 500 yards from the piece, be separated from the line of its original direction by an angle of little more than half a degree; those who are acquainted with the inaccurate methods often used in the directing of cannon will easily allow, that so small an aberration may not be attended to by the generality of practitioners, and the path of the shot may consequently be deemed a straight line; especially as other causes of error will often intervene much greater than what arises from the incurvation of this line by gravity.

"We have now determined the velocity of the shot, both when fired with two thirds of its weight and with half its weight of powder respectively; and on this occasion I must remark, that on the principles of our theory, the increasing the charge of powder will increase the velocity of the shot, till the powder arrives at its usual increment. By increasing the quantity of powder, the velocity of the shot will not continually increase.

fig. 6.

rives at a certain quantity; after which, if the powder be increased, the velocity of the shot will diminish. The quantity producing the greatest velocity and the proportion between that greatest velocity, and the velocity communicated by greater and lesser charges, may be thus ascertained. Let AB represent the axis of the piece; draw AC perpendicular to it, and to the asymptotes AC and AB draw any hyperbola LF, and draw BF parallel to AC; find out now the point D, where the rectangle ADEG is equal to the hyperbolic area DEFB; then will AD represent that height of the charge which communicates the greatest velocity to the shot: whence AD being to AB as 1 to 2.71828, as appears by the table of logarithms, from the length of the line AD thus determined, and the diameter of the bore, the quantity of powder contained in this charge is easily known. If, instead of this charge, any other filling the cylinder to the height AI be used, draw IH parallel to AC, and thro' the point H, to the same asymptotes AC and AB describe the hyperbola HK; then the greatest velocity will be to the velocity communicated by the charge AI, in the subduplicate proportion of the rectangle AE to the same rectangle diminished by the trilinear space KKE.

"It hath been already shewn, that the resistance of the air on the surface of a bullet of $\frac{1}{4}$ of an inch diameter moving with a velocity of 1670 feet in a second, amounted to about 10 lb. It hath also been shewn, that an iron bullet weighing 24 lb. if fired with 16 lb. of powder (which is usually esteemed its proper battering charge) acquires a velocity of about 1650 feet in a second, scarcely differing from the other: whence, as the surface of this last bullet is more than 54 times greater than the surface of a bullet of $\frac{1}{4}$ of an inch diameter, and their velocities are nearly the same, it follows, that the resistance on the larger bullet will amount to more than 540 lb. which is near 23 times its own weight.

"The two last propositions are principally aimed against those theorists who have generally agreed in supposing the flight of shot and shells to be nearly in the curve of a parabola. The reason given by those authors for their opinion is the supposed inconsiderable resistance of the air; since, as it is agreed on all sides that the track of projectiles would be a perfect parabola if there was no resistance, it has from thence been too rashly concluded, that the interruption which the ponderous bodies of shells and bullets would receive from such a rare medium as air would be scarcely sensible, and consequently that their parabolic flight would be hereby scarcely affected.

"Now the prodigious resistance of the air to a bullet of 24 lb. weight, such as we have here established it, sufficiently confutes this reasoning; for how erroneous must that hypothesis be, which neglects, as inconsiderable, a force amounting to more than 20 times the weight of the moving body?" But here it is necessary to assume a few particulars, the demonstrations of which, on the commonly received principles, may be seen under the article PROJECTILES.

"1. If the resistance of the air be so small, that the motion of a projected body is in the curve of a parabola; then the axis of that parabola will be perpendicular to the horizon; and consequently the part of the curve in which the body ascends will be equal and simi-

lar to that in which it descends.

"2. If the parabola in which the body moves, be terminated on a horizontal plane; then the vertex of the parabola will be equally distant from its two extremities.

"3. Also the moving body will fall on that horizontal plane in the same angle, and with the same velocity with which it was first projected.

"4. If a body be projected in different angles, but with the same velocity; then its greatest horizontal range will be when it is projected in an angle of 45° with the horizon.

"5. If the velocity with which the body is projected be known, then this greatest horizontal range may be thus found. Compute, according to the common theory of gravity, what space the projected body ought to fall through to acquire the velocity with which it is projected: then twice that space will be the greatest horizontal range, or the horizontal range when the body is projected in an angle of 45° with the horizon.

"6. The horizontal ranges of a body, when projected with the same velocity at different angles, will be between themselves as the sines of twice the angle in which the line of projection is inclined to the horizon.

"7. If a body is projected in the same angle with the horizon, but with different velocities; the horizontal ranges will be in the duplicate proportion of those velocities.

"These postulates which contain the principles of the modern art of gunnery, are all of them false: for it hath been already shewn, that a musket-ball $\frac{1}{4}$ of an inch in diameter, fired with half its weight of powder, from a piece 45 inches long, moves with a velocity of near 1700 feet in a second. Now, if this ball flew in the curve of a parabola, its horizontal range at 45° would be found by the fifth postulate to be about 17 miles. But all the practical writers assure us, that this range is really short of half a mile. Diego Ufano assigns to an arquebus, four feet in length, and carrying a leaden ball of 1½ oz. weight (which is very near our dimensions), an horizontal range of 797 common paces, when it is elevated between 40 and 50 degrees, and charged with a quantity of fine powder equal in weight to the ball. Merfennus also tells us, that he found the horizontal range of an arquebus at 45° to be less than 400 fathom, or 800 yards; whence, as either of these ranges are short of half an English mile, it follows, that a musket shot, when fired with a reasonable charge of powder at the elevation of 45°, flies not $\frac{1}{14}$ part of the distance it ought to do if it moved in a parabola. Nor is this great contraction of the horizontal range to be wondered at, when it is considered, that the resistance of this bullet, when it first issues from the piece, amounts to 120 times its gravity, as hath been experimentally demonstrated, n° 23.

"To prevent objections, our next instance shall be in an iron bullet of 24 lb weight, which is the heaviest in common use for land-service. Such a bullet fired from a piece of the common dimensions with its greatest allotment of powder hath a velocity of 1650 feet in second, as already shewn. Now, if the horizontal range of this shot, at 45°, be computed

THEORY.

on the parabolic hypothesis by the fifth postulate, it will come out to be about 16 miles, which is between five and six times its real quantity; for the practical writers all agree in making it less than three miles.

"But farther, it is not only when projectiles move with these very great velocities, that their slight sensibly varies from the curve of a parabola; the same aberration often takes place in such as move slow enough to have their motion traced out by the eye: for there are few projectiles that can be thus examined, which do not visibly disagree with the first, second, and third postulate; obviously descending thro' a curve, which is shorter and less inclined to the horizon than that in which they ascended. Also the highest point of their flight, or the vertex of the curve, is much nearer the place where they fall to the ground than to that from whence they were at first discharged.

"I have found too by experience; that the fifth, sixth, and seventh postulates are exceedingly erroneous, when applied to the motions of bullets moving with small velocities. A leaden bullet $\frac{1}{2}$ of an inch in diameter, discharged with a velocity of about 400 feet in a second, and in an angle of $19^{\circ} 5'$ with the horizon, ranged on the horizontal plane no more than 448 yards: whereas its greatest horizontal range, being found by the fifth postulate, to be at least 1700 yards, the range at $19^{\circ} 5'$ ought by the sixth postulate to have been 1050 yards; whence, in this experiment, the range was not $\frac{1}{3}$ of what it must have been, had the commonly received theory been true."

From this and other experiments it is clearly proved, that the track described by the flight even of the heaviest shot, is neither a parabola, nor approaching to a parabola, except when they are projected with very small velocities. The nature of the curve really described by them is explained under the article PROJECTILES. But as a specimen of the great complication of that subject, we shall here insert an account of a very extraordinary circumstance which frequently takes place therein.

"As gravity acts perpendicularly to the horizon, it is evident, that if no other power but gravity deflected a projected body from its course, its motion would be constantly performed in a plane perpendicular to the horizon, passing through the line of its original direction: but we have found, that the body in its motion often deviates from this plane; sometimes to the right hand, and at other times to the left; and this in an incurved line, which is convex towards that plane: so that the motion of a bullet is frequently in a line having a double curvature, it being bent towards the horizon by the force of gravity, and again bent out of its original direction to the right or left by some other force: in this case no part of the motion of the bullet is performed in the same plane, but its track will lie in the surface of a kind of cylinder, whose axis is perpendicular to the horizon.

"This proposition may be indisputably proved by the experience of every one in the least conversant with the practice of gunnery. The same piece which will carry its bullet within an inch of the intended mark at 10 yards distance, cannot be relied on to 10 inches in 100 yards, much less to 30 inches in

300 yards. Now this inequality can only arise from the tract of the bullet being incurved sideways as well as downwards: for by this means the distance between that incurved line and the line of direction will increase in a much greater ratio than that of the distance; these lines being coincident at the mouth of the piece, and afterwards separating in the manner of a curve and its tangent, if the mouth of the piece be considered as the point of contact.—To put this matter out of all doubt, however, I took a barrel carrying a ball $\frac{1}{2}$ of an inch diameter, and fixing it on a heavy carriage, I satisfied myself of the steadiness and truth of its direction, by firing at a board $1\frac{1}{2}$ feet square, which was placed at 180 feet distance; for I found, that in 16 successive shot I missed the mark but once. Now, the same barrel being fixed on the same carriage, and fired with a smaller quantity of powder, so that the shock on the discharge would be much less, and consequently the direction less changed, I found, that at 760 yards distance, the ball flew sometimes 100 yards to the right of the line it was pointed on, and sometimes as much to the left. I found too, that its direction in the perpendicular line was not less uncertain, it falling one time above 200 yards short of what it did at another; although, by the nicest examination of the piece after the discharge, it did not appear to have started in the least from the position it was placed in.

"The reality of this doubly curved tract being thus demonstrated, it may perhaps be asked, What can be the cause of a motion so different from what has been hitherto supposed? And to this I answer, that the deflection in question must be owing to some power acting obliquely to the progressive motion of the body; which power can be no other than the resistance of the air. If it be farther asked, How the resistance of the air can ever come to be oblique to the progressive motion of the body? I farther reply, that it may sometimes arise from inequalities in the resisted surface; but that its general cause is doubtless a whirling motion acquired by the bullet about its axis: for by this motion of rotation, combined with the progressive motion, each part of the bullet's surface will strike the air very differently from what it would do if there was no such whirl; and the obliquity of the action of the air arising from this cause, will be greater as the motion of the bullet is greater in proportion to its progressive one.

"This whirling motion undoubtedly arises from the friction of the bullet against the sides of the piece: and as the rotatory motion will in some part of its revolution conspire with the progressive one, and in another part be equally opposed to it; the resistance of the air on the fore part of the bullet will be hereby affected, and will be increased in that part where the whirling motion conspires with the progressive one, and diminished where it is opposed to it: and by this means, the whole effort of the resistance, instead of being opposite to the direction of the body, will become oblique thereto, and will produce those effects already mentioned. If it was possible to predict the position of the axis round which the bullet should whirl, and if that axis was unchangeable during the whole flight of the bullet, then the aberration of the bullet by this oblique force would be in

THEORY. a given direction; and the incurvation produced there-

by, would regularly extend the same way from one end of its track to the other. For instance, if the axis of the whirl was perpendicular to the horizon, then the incurvation would be to the right or left. If that axis was horizontal, and perpendicular to the direction of the bullet, then the incurvation would be upwards or downwards. But as the first position of this axis is uncertain, and as it may perpetually shift in the course of the bullet's flight; the deviation of the bullet is not necessarily either in one certain direction, or tending to the same side in one part of its track that it does in another, but more usually is continually changing the tendency of its deflection, as the axis round which it whirls must frequently shift its position to the progressive motion by many inevitable accidents.

"That a bullet generally acquires such a rotatory motion, as here described, is, I think, demonstrable; however, to leave no room for doubt or dispute, I confirmed it, as well as some other parts of my theory, by the following experiments.

30
Machine
for measur-
ing the air's
resistance.

"I canfied the machine to be made, represented, Plate CXLII. fig. 7. BCDE, is a brass-barrel, moveable on its axis, and so adjusted by means of friction-wheels, not represented in the figure, as to have no friction worth attending to. The frame in which this barrel is fixed is so placed, that its axis may be perpendicular to the horizon. The axis itself is continued above the upper plate of the frame, and has fastened on it a light hollow cone, AFG. From the lower part of this cone, there is extended a long arm of wood, GH, which is very thin, and cut feather-edged. At its extremity, there is a contrivance for fixing on the body, whose resistance is to be investigated, (as here the globe P); and to prevent the arm GH from swaying out of its horizontal position by the weight of the annexed body P, there is a brace, AH, of fine wire, fastened to the top of the cone which supports the end of the arm.

"Round the barrel BCDE, there is wound a fine silk line, the turns of which appear in the figure; and after this line hath taken a sufficient number of turns, it is conducted nearly in a horizontal direction to the pulley L over which it is passed, and then a proper weight M is hung to its extremity. If this weight be left at liberty, it is obvious that it will descend by its own gravity, and will, by its descent, turn round the barrel BCDE, together with the arm GH, and the body P fastened to it. And whilst the resistance on the arm GH and on the body P is less than the weight M, that weight will accelerate its motion; and thereby the motion of GH and P will increase, and consequently their resistance will increase, till at last this resistance and the weight M become nearly equal to each other. The motion with which M descends, and with which P revolves, will not then sensibly differ from an equable one. Whence, it is not difficult to conceive, that, by proper observations made with this machine, the resistance of the body P may be determined. The most natural method of proceeding in this investigation, is as follows: Let the machine first have acquired its equable motion, which it will usually do in about five or six turns from the beginning; and then let it be observed, by counting a number of

turns, what time is taken up by one revolution of the body P: then taking off the body P and the weight M, let it be examined what smaller weight will make the arm GH revolve in the same time as when P was fixed to it: this smaller weight being taken from M, the remainder is obviously equal in effort to the resistance of the revolving body P; and this remainder being reduced in the ratio of the length of the arm to the semidiameter of the barrel, will then become equal to the absolute quantity of the resistance. And as the time of one revolution is known, and consequently the velocity of the revolving body, there is hereby discovered the absolute quantity of the resistance to the given body P moving with a given degree of celerity.

"Here, to avoid all objections, I have generally chose, when the body P was removed, to fix in its stead a thin piece of lead of the same weight, placed horizontally; so that the weight which was to turn round the arm GH, without the body P, did also carry round this piece of lead. But mathematicians will easily allow that there was no necessity for this precaution.—The diameter of the barrel BCDE, and of the silk string wound round it, was 2.06 inches. The length of the arm GH, measured from the axis to the surface of the globe P, was 49.5 inches. The body P, the globe made use of, was of pasteboard; its surface very neatly coated with marbled-paper. It was not much distant from the size of a 12 lb. shot, being in diameter 4.5 inches, so that the radius of the circle described by the centre of the globe was 51.75 inches. When this globe was fixed at the end of the arm, and a weight of half a pound was hung at the end of the string at M, it was examined how soon the motion of the descending weight M, and of the revolving body P, would become equable as to sense. With this view, three revolutions being suffered to elapse, it was found that the next 10 were performed in $27\frac{1}{4}$, 20 in less than $55''$, and 30 in $82\frac{1}{4}$; so that the first ten were performed in $27\frac{1}{4}$, the second in $27\frac{1}{4}$, and the third in $27\frac{1}{4}$.

"These experiments sufficiently evince, that even with half a pound, the smallest weight made use of, the motion of the machine was sufficiently equable after the first three revolutions.

"The globe above-mentioned being now fixed at the end of the arm, there was hung on at M a weight of $3\frac{1}{2}$ lb; and ten revolutions being suffered to elapse, the succeeding 20 were performed in $21\frac{1}{4}$. Then the globe being taken off, and a thin plate of lead, equal to it in weight, placed in its room; it was found, that instead of $3\frac{1}{2}$ lb. a weight of one pound would make it revolve in less time than it did before; performing now 20 revolutions after 10 were elapsed, in the space of 19".

"Hence then it follows, that from the $3\frac{1}{2}$ lb. first hung on, there is less than 1 lb. to be deducted for the resistance on the arm; and consequently the resistance of the globe itself is not less than the effort of $2\frac{1}{2}$ lb. in the situation M; and it appearing from the former measures, that the radius of the barrel is nearly $\frac{1}{10}$ of the radius of the circle, described by the centre of the globe; it follows, that the absolute resistance of the globe, when it revolves 20 times in $21\frac{1}{4}$, (about 25 feet in a second), is not less than the fiftieth part of two pounds and a quarter, or of 36 ounces;

THEORY. and this being considerably more than half an ounce, and the globe nearly the size of a twelve-pound shot, it irrefragably confirms a proposition I had formerly laid down from theory, that the resistance of the air to a twelve-pound iron shot, moving with a velocity of 25 feet in a second, is not less than half an ounce.

"The rest of the experiments were made, in order to confirm another proposition, namely, that the resistance of the air within certain limits is nearly in the duplicate proportion of the velocity of the resisted body. To investigate this point, there were successively hung on at M, weights in the proportion of the numbers 1, 4, 9, 16; and letting 10 revolutions first elapse, the following observations were made on the rest.—With $\frac{1}{2}$ lb. the globe went 20 turns in $54\frac{1}{2}$ s; with 2 lb. it went 20 turns in $27\frac{1}{2}$ s, with $4\frac{1}{2}$ lb. it went 30 turns in $27\frac{1}{2}$ s, and with 8 lb. it went 40 turns in $27\frac{1}{2}$ s.—Hence it appears, that to resistances proportioned to the numbers 1, 4, 9, 16, there correspond velocities of the resisted body in the proportion of the numbers 1, 2, 3, 4: which proves, with great nicety, the proposition above-mentioned.

"With regard to the rotatory motion, the first experiment was to evince, that the whirling motion of a ball combining with its progressive motion, would produce such an oblique resistance and deflective power as already mentioned. For this purpose a wooden ball of $4\frac{1}{2}$ inches diameter was suspended by a double string, about eight or nine feet long. Now, by turning round the ball and twisting the double string, the ball when left to itself would have a revolving motion given it from the untwisting of the string again. And if, when the string was twisted, the ball was drawn to a considerable distance from the perpendicular, and there let go; it would at first, before it had acquired its revolving motion, vibrate steadily enough in the same vertical plane in which it first began to move: but when, by the untwisting of the string, it had acquired a sufficient degree of its whirling motion, it constantly deflected to the right or left of its first track; and sometimes proceeded so far as to have its direction at right angles to that in which it began its motion; and this deviation was not produced by the string itself, but appeared to be entirely owing to the resistance being greater on the one part of the leading surface of the globe, than the other. For the deviation continued when the string was totally untwisted; and even during the time that the string, by the motion the globe had received, was twisting the contrary way. And it was always easy to predict before the ball was let go, which way it would deflect, only by considering on which side the whirl would be combined with the progressive motion; for on that side always the deflective power acted, as the resistance was greater here than on the side where the whirl and progressive motion were opposed to one another."

Though Mr Robins considered this experiment as an incontestable proof of the truth of his theory, he undertook to give ocular demonstration of this deflection of musket-bullets even in the short space of 100 yards.

"As all projectiles," says he, "in their flight, are acted upon by the power of gravity, the deflection of a bullet from its primary direction, supposes that deflection to be upwards or downwards in a vertical

plane; because, in the vertical plane, the action of gravity is compounded and entangled with the deflective force. And for this reason my experiments have been principally directed to the examination of that deflection which carries the bullet to the right or left of that plane in which it began to move. For if it appears at any time that the bullet has shifted from that vertical plane in which the motion began, this will be an incontestable proof of what we have advanced.—Now, by means of screens of exceeding thin paper, placed parallel to each other at proper distances, this deflexion in question may be many ways investigated. For by firing bullets which shall traverse these screens, the flight of the bullet may be traced; and it may easily appear whether they do or do not keep invariably to one vertical plane. This examination may proceed on three different principles, which I shall here separately explain.

"For first, an exactly vertical plane may be traced out upon all these screens, by which the deviation of any single bullet may be more readily investigated, only by measuring the horizontal distance of its trace from the vertical plane thus delineated; and by this means the absolute quantity of its aberration may be known. Or if the description of such a vertical plane should be esteemed a matter of difficulty and nicety, a second method may be followed; which is that of resting the piece in some fixed notch or socket, so that though the piece may have some little play to the right and left, yet all the lines in which the bullet can be directed shall intersect each other in the centre of that fixed socket: by this means, if two different shots are fired from the piece thus situated, the horizontal distances made by the two bullets on any two screens ought to be in the same proportion to each other as the respective distances of the screens from the socket in which the piece was laid. And if these horizontal distances differ from that proportion, then it is certain that one of the shot at least hath deviated from a vertical plane, although the absolute quantity of that deviation cannot hence be assigned; because it cannot be known what part of it is to be imputed to one bullet, and what to the other.

"But if the constant and invariable position of the notch or socket in which the piece was placed, be thought too hard an hypothesis in this very nice affair; the third method, and which is the simplest of all, requires no more than that two shot be fired through three screens without any regard to the position of the piece each time: for in this case, if the shots diverge from each other, and both keep to a vertical plane, then if the horizontal distances of their traces on the first screen be taken from the like horizontal distances on the second and third, the two remainders will be in the same proportion with the distances of the second and third screen from the first. And if they are not in this proportion, then it will be certain that one of them at least hath been deflected from the vertical plane; though here, as in the last case, the quantity of that deflexion in each will not be known.

"All these three methods I have myself made use of at different times, and have ever found the success of them agreeable to my expectation. But the most eligible method seemed to be a compound of the two last. The apparatus was as follows.—Two screens were set

Remarks.
of bullets to the right and left.
set

set up in the large walk in the charter-house garden; the first of them at 250 feet distance from the wall, which was to serve for a third screen; and the second 200 feet from the same wall. At 50 feet before the first screen, or at 300 feet from the wall, there was placed a large block weighing about 200 lb. weight, and having fixed into it an iron bar with a socket at its extremity, in which the piece was to be laid. The piece itself was of a common length, and bored for an ounce ball. It was each time loaded with a ball of 17 to the pound; so that the windage was extremely small, and with a quarter of an ounce of good powder. The screens were made of the thinnest isfine paper; and the resistance they gave to the bullet, (and consequently their probability of deflecting it) was so final, that a bullet lighting one time near the extremity of one of the screens, left a fine thin fragment of it towards the edge entire, which was so very weak that it was difficult to handle it without breaking. These things thus prepared, five shot were made with the piece rested in the notch above-mentioned; and the horizontal distances between the first shot, which was taken as a standard, and the four succeeding ones, both on the first and second screen and on the wall, measured in inches, were as follows:

	1st Screen.	2d Screen.	Wall.
1 to 2	1,75 R.	3,15 R.	16,7 R.
3	10 L.	15,6 L.	69,25 L.
4	1,25 L.	4,5 L.	15,0 L.
5	2,15 L.	5,1 L.	19,0 L.

“ Here the letters R and L denote that the shot in question went either to the right or left of the first.

“ If the position of the socket in which the piece was placed be supposed fixed, then the horizontal distances measured above on the first and second screen, and on the wall, ought to be in proportion to the distances of the first screen, the second screen, and the wall from the socket. But by only looking over these numbers, it appears, that none of them are in that proportion; the horizontal distance of the first and third, for instance, on the wall being above nine inches more than it should be by this analogy.

“ If, without supposing the invariable position of the socket, we examine the comparative horizontal distances according to the third method described above, we shall in this case discover variations still more extraordinary; for, by the numbers set down, it appears, that the horizontal distances of the second and third shot on the two screens, and on the wall, are as under.

1st Screen.	2d Screen.	Wall.
11.75	18.75	83.95

Here, if, according to the rule given above, the distance on the first screen be taken from the distances on the other two, the remainder will be 7, and 74.2: and these numbers, if each shot kept to a vertical plane, ought to be in the proportion of 1 to 5; that being the proportion of the distances of the second screen and of the wall from the first: but the last number 74.2 exceeds what it ought to be by this analogy by 39.2; so that between them there is a deviation from the vertical plane of above 39 inches, and this too in a transit of little more than 80 yards.

“ But farther, to shew that these irregularities do not depend on any accidental circumstance of the balls

firing or not firing the piece, there were five shots more made with the same quantity of powder as before; but with smaller bullets, which ran much looser in the piece. And the horizontal distances being measured in inches from the trace of the first bullet to each of the succeeding ones, the numbers were as under.

	1st Screen.	2d Screen.	Wall.
1 to 2	15.6 R.	31.1 R.	94.0 R.
3	6.4 L.	12.75 L.	23.0 L.
4	4.7 R.	8.5 R.	15.5 R.
5	12.6 R.	24.0 R.	63.5 R.

Here, again, on the supposed fixed position of the piece, the horizontal distance on the wall between the first and third will be found above 15 inches less than it should be if each kept to a vertical plane; and like irregularities, though smaller, occur in every other experiment. And if they are examined according to the third method set down above, and the horizontal distances of the third and fourth, for instance, are compared, those on the first and second screen, and on the wall, appear to be thus.

1st Screen.	2d Screen.	Wall.
11.1.	21.25.	38.5.

And if the horizontal distance on the first screen be taken from the other two, the remainders will be 10.15, and 27.4; where the least of them, instead of being five times the first, as it ought to be, is 23.35 short of it; so that here is a deviation of 23 inches.

“ From all these experiments, the deflection in question seems to be incontestably evinced. But to give some farther light to this subject, I took a barrel of the same bore with that hitherto used; and bent it at about three or four inches from its muzzle to the left, the bend making an angle of three or four degrees with the axis of the piece. This piece thus bent was fired with a loose ball, and the same quantity of powder hitherto used, the screens of the last experiment being still continued. It was natural to expect, that if this piece was pointed by the general direction of its axis, the ball would be canted to the left of that direction by the bend near its mouth. But as the bullet, in passing through that bent part, would, as I conceived, be forced to roll upon the right-hand side of the barrel, and thereby its left side would turn up against the air, and would increase the resistance on that side; I predicted to the company then present, that if the axis, on which the bullet whirled, did not shift its position after it was separated from the piece; then, notwithstanding the bend of the piece to the left, the bullet itself might be expected to incurve towards the right; and this, upon trial, did most remarkably happen. For, one of the bullets fired from this bent piece, passed through the first screen about 1½ inch distant from the trace of one of the shot fired from the straight piece in the last set of experiments. On the second screen, the traces of the same bullets were about three inches distant; the bullet from the crooked piece passing on both screens to the left of the other: but, comparing the places of these bullets on the wall, it appeared, that the bullet from the crooked piece, though it diverged from the track on the two screens, had now crossed that track, and was deflected considerably to the right of it; so that it was obvious, that though the bullet from the crooked piece might first be canted to the left, and had diverged from the track of the

THEORY.

THEORY.

other bullet with which it was compared, yet by degrees it deviated again to the right, and a little beyond the second screen crossed that track from which it before diverged, and on the wall was deflected 14 inches, as I remember, on the contrary side. And this experiment is not only the most convincing proof of the reality of this deflection here contended for; but is likewise the strongest confirmation that it is brought about in the very manner and by the very circumstances which we have all along described.

"I have only now to add, that as I suspected the consideration of the revolving motion of the bullet, compounded with its progressive one, might be considered as a subject of mathematical speculation, and that the reality of any deflecting force thence arising might perhaps be denied by some computists upon the principles hitherto received of the action of fluids; I thought proper to annex a few experiments, with a view of evincing the strange deficiency of all theories of this sort hitherto established, and the unexpected and wonderful varieties which occur in these matters: The proposition which I advanced for this purpose being, That two equal surfaces meeting the air with the same degree of obliquity, may be so differently resisted, that though in one of them the resistance is less than that of a perpendicular surface meeting the same quantity of air, yet in another it shall be considerably greater.

33
Strange
anomaly in
the resistance
of the
air.

"To make out this proposition, I made use of the machine already described; and having prepared a pasteboard pyramid, whose base was four inches square, and whose planes made angles of 45° with the plane of its base; and also a parallelogram four inches in breadth, and $5\frac{1}{2}$ in length, which was equal to the surface of the pyramid, the globe P was taken off from the machine, and the pyramid was first fixed on; and 2 lb. being hung at M, and the pyramid so fitted as to move with its vertex forwards, it performed 20 revolutions after the first ten were elapsed, in $33''$. Then the pyramid being turned, so that its base, which was a plane of four inches square, went foremost, it now performed 20 revolutions with the same weight in $38''\frac{1}{2}$.—After this, taking off the pyramid, and fixing on the parallelogram with its longer side perpendicular to the arm, and placing its surface in an angle of 45° with the horizon by a quadrant, the parallelogram, with the same weight, performed 20 revolutions in $43''\frac{1}{2}$.

"Now here this parallelogram and the surface of the pyramid are equal to each other, and each of them met the air in an angle of 45° ; and yet one of them made 20 revolutions in $33''$, whilst the other took up $43\frac{1}{2}$. And at the same time it appears, that a flat surface, such as the base of a pyramid, which meets the same quantity of air perpendicularly, makes 20 revolutions in $38''\frac{1}{2}$, which is the medium between the other two.

"But to give another, and still more simple, proof of this principle; there was taken a parallelogram four inches broad, and $8\frac{1}{4}$ long. This being fixed at the end of the arm, with its long side perpendicular thereto, and being placed in an angle of 45° with the horizon, there was a weight hung on at M of $3\frac{1}{2}$ lb. with which the parallelogram made 20 revolutions in $40''\frac{1}{2}$. But after this, the position of the parallelogram was

shifted, and it was placed with its shorter side perpendicular to the arm, though its surface was still inclined to an angle of 45° with the horizon; and now, instead of going slower, as might be expected from the greater extent of part of its surface from the axis of the machine, it went round much faster: for in this last situation it made 20 revolutions in $35''\frac{1}{2}$, so that there were $5''$ difference in the time of 20 revolutions; and this from no other change of circumstance than as the larger or shorter side of the oblique plane was perpendicular to the line of its direction."

These are the principal experiments made by Mr Robins, in confirmation of his theory, and which not only far exceed every thing that had been formerly done, but even bid fair for advancing the art of gunnery to its *ne plus ultra*. It must be observed, however, that in this art it is impossible we should ever arrive at absolute perfection; that is, it can never be expected that a gunner, by any method of calculation whatever, could be enabled to point his guns in such a manner, that the shot would hit the mark if placed any where within its range. Aberrations which can by no means be either foreseen or prevented, will take place from a great number of different causes. A variation in the density of the atmosphere, in the dampness of the powder, or in the figure of the shot, will cause variations in the range of the bullet, which cannot by any means be reduced to rules, and consequently must render the event of each shot very precarious. The resistance of the atmosphere simply considered, without any of those anomalies arising from its density at different times, is a problem, which, notwithstanding the labours of Mr Robins and others, hath not been completely solved; and indeed, if we consider the matter in a physical light, we shall find, that without some other data than those which are yet obtained, an exact solution of it is impossible.

It is an objection that hath been made to the mathematical philosophy, and to which in many cases it is most certainly liable, that it considers the *resistance* of matter more than its capacity of giving motion to other matter. Hence, if in any case matter acts both as a resisting and a moving power, and the mathematician overlooks its effort towards motion, founding his demonstrations only upon its property of resisting, these demonstrations will certainly be false, tho' they should be supported by all the powers of geometry. It is to an error of this kind that we are to attribute the great differences already taken notice of between the calculations of Sir Isaac Newton, with regard to the resisting force of fluids, and what actually takes place upon trial. These calculations were made upon the supposition that the fluid through which a body moved could do nothing else but resist it; yet it is certain, that the air (the fluid with which we have to do at present) proves a source of *motion*, as well as resistance, to all bodies which move in it.

To understand this matter fully, let ABC represent a crooked tube made of any solid matter, and *a, b*, two pistons which exactly fill the cavity. If the space between these pistons is full of air, it is plain they cannot come into contact with each other on account of the elasticity of the included air, but will remain at some certain distance as represented in the figure. If the piston *b* is drawn up, the air which presses in the direction

tion

THEORY. tion *Cb* acts as a resisting power, and the piston will not be drawn up with such ease as if the whole was in *vacuo*. But though the column of air pressing in the direction *Cb* acts as a resisting power on the piston *b*, the column pressing in the direction *Aa* will act as a moving power upon the piston *a*. It is therefore plain, that if *b* is moved upwards till it comes to the place marked *d*, the other will descend to that marked *c*. Now if we suppose the piston *a* to be removed, it is plain, that when *b* is pulled upwards to *d*, the air descending through the leg *AaCB* will press on the under side of the piston *b*, as strongly as it would have done upon the upper side of the piston *a*, had it been present. Therefore, though the air pressing down thro' the leg *CB* resists the motion of the piston *b* when drawn upwards, the air pressing down through the leg *AB* forwards it as much; and accordingly the piston *b* may be drawn up or pushed down at pleasure, and with very little trouble. But if the orifice at *A* is stopped, so that the air can only exert its resisting power on the piston *b*, it will require a considerable degree of strength to move the piston from *b* to *d*.

If now we suppose the tube to be entirely removed (which indeed answers no other purpose than to render the action of the air more evident), it is plain, that if the piston is moved either up or down, or in any other direction we can imagine, the air presses as much upon the back part of it, as it resists it on the fore part; and of consequence, a ball moving through the air with any degree of velocity, ought to be as much accelerated by the action of the air behind, as it is retarded by the action of that before.—Here then it is natural to ask, If the air accelerates a moving body as much as it retards it, how comes it to make any resistance at all? yet certain it is, that this fluid doth resist, and that very considerably. To this it may be answered, that the air is always kept in some certain state or constitution by another power which rules all its motions, and it is this power undoubtedly which gives the resistance. It is not to our purpose at present to inquire what that power is; but we see that the air is often in very different states: one day, for instance, its parts are violently agitated by a storm; and another, perhaps, they are comparatively at rest in a calm. In the first case, nobody hesitates to own, that the storm is occasioned by some cause or other, which violently resists any other power that would prevent the agitation of the air. In a calm, the case is the same; for it would require the same exertion of power to excite a tempest in a calm day, as to allay a tempest in a stormy one. Now it is evident, that all projectiles, by their motion, agitate the atmosphere in an unnatural manner; and consequently are resisted by that power, whatever it is, which tends to restore the equilibrium, or bring back the atmosphere to its former state.

If no other power besides that above-mentioned acted upon projectiles, it is probable, that all resistance to their motion would be in the duplicate proportion of their velocities; and accordingly, as long as the velocity is small, we find it generally is so. But when the velocity comes to be exceedingly great, other sources of resistance arise. One of these, is a subtraction of part of the moving power; which though not properly a *resistance*, or opposing another power to it, is an equivalent thereto. This subtraction arises from

the following cause. The air, as we have already observed, presses upon the hinder part of the moving body by its gravity, as much as it resists the forepart of it by the same property. Nevertheless, the velocity with which the air presses upon any body by means of its gravity, is limited; and it is possible that a body may change its place with so great velocity that the air hath not time to rush in upon the back part of it, in order to assist its progressive motion. When this happens to be the case, there is in the first place a deficiency of the moving power equivalent to 15 pounds on every square inch of surface; at the same time that there is a positive resistance of as much more on the forepart, owing to the gravity of the atmosphere, which must be overcome before the body can move forward.

This deficiency of moving power, and increase of resistance, do not only take place when the body moves with a very great degree of velocity, but in all motions whatever. It is not in all cases perceptible, because the velocity with which the body moves, frequently bears but a very small proportion to the velocity with which the air presses in behind it. Thus, supposing the velocity with which the air rushes into a vacuum to be 1200 feet in a second, if a body moves with a velocity of 30, 40, or 50 feet in a second, the force with which the air presses on the back part is but $\frac{1}{4}$, at the utmost less than that which resists on the forepart of it, which will not be perceptible: but if, as in the case of bullets, the velocity of the projectile comes to have a considerable proportion to the velocity wherewith the air rushes in behind it; then a very perceptible, and otherwise unaccountable resistance is observed, as we seen in the experiments already related by Mr Robins. Thus, if the air presses in with a velocity of 1200 feet in a second, if the body changes its place with a velocity of 600 feet in the same time, there is a resistance of 15 pounds on the fore part, and a pressure of only $7\frac{1}{2}$ on the back part. The resistance therefore not only overcomes the moving power of the air by $7\frac{1}{2}$ pounds, but there is a deficiency of other $7\frac{1}{2}$ pounds owing to the want of half the pressure of the atmosphere on the back part, and thus the whole loss of the moving power is equivalent to 15 pounds; and hence the exceeding great increase of resistance observed by Mr Robins beyond what it ought to be according to the common computations.—The velocity with which the air rushes into a vacuum is therefore a desideratum in gunnery. Mr Robin's supposes that it is the same with the velocity of sound; and that when a bullet moves with a velocity greater than that of 1200 feet in a second, it leaves a perfect vacuum behind it. Hence he accounts for the great increase of resistance to bullets moving with such velocities; but as he doth not take notice of the loss of the air's moving power, the anomalies of all lesser velocities are inexplicable on his principles. Nay, he even tell us, that Sir Isaac Newton's rule for computing resistances may be applied in all velocities less than 1100 or 1200 feet in a second, though this is expressly contradicted by his own experiments mentioned n^o 23.

Though for these reasons it is evident how great difficulties must occur in attempting to calculate the resistance of the air to military projectiles, we have not even yet discovered all the sources of resistance to these bodies when moving with immense velocities. Another

35.
It resists by its elasticity as well as gravity.

scribed; and perhaps somewhat of this kind, says Mr Robins, tho' not in the manner now practised, would be of all others the most perfect method for the construction of these kinds of barrels.

From the whirling motion communicated by the rifles, it happens, that when the piece is fired, that indented zone of the bullet follows the sweep of the rifles; and thereby, besides its progressive motion, acquires a circular motion round the axis of the piece; which circular motion will be continued to the bullet after its separation from the piece; and thus a bullet discharged from a rifled barrel is constantly made to whirl round an axis which is coincident with the line of its flight. By this whirling on its axis, the aberration of the bullet which proves so prejudicial to all operations in gunnery, is almost totally prevented. The reason of this may be easily understood from considering the slow motion of an arrow through the air. For example, if a bent arrow, with its wings not placed in some degree in a spiral position, so as to make it revolve round its axis as it flies through the air, were shot at a mark with a true direction, it would constantly deviate from it, in consequence of being pressed to one side by the convex part opposing the air obliquely. Let us now suppose this deflection in a flight of 100 yards to be equal to 10 yards. Now, if the same bent arrow were made to revolve round its axis once every two yards of its flight, its greatest deviation would take place when it had proceeded only one yard, or made half a revolution; since at the end of the next half revolution it would again return to the same direction it had at first; the convex side of the arrow having been once in opposite positions. In this manner it would proceed during the whole course of its flight, constantly returning to the true path at the end of every two yards; and when it reached the mark, the greatest deflection to either side that could happen would be equal to what it makes in proceeding one yard, equal to $\frac{1}{10}$ th part of the former, or 3.6 inches, a very small deflection when compared with the former one. In the same manner, a cannon-ball which turns not round its axis, deviates greatly from the true path, on account of the inequalities on its surface; which, although small, cause great deviations by reason of the resistance of the air, at the same time that the ball acquires a motion round its axis in some uncertain direction occasioned by the friction against its sides. But by the motion acquired from the rifles, the error is perpetually corrected in the manner just now described; and accordingly such pieces are much more to be depended on, and will do execution at a much greater distance, than the others.

The reasons commonly alleged for the superiority of rifle-barrels over common ones, are, either that the inflammation of the powder is greater, by the resistance which the bullet makes by being thus forced into the barrel, and that hereby it receives a much greater impulse; or that the bullet by the compounding of its circular and revolving motions, did as it were bore the air, and thereby flew to a much greater distance than it would otherwise have done; or that by the same boring motion it made its way through all solid substances, and penetrated into them much deeper than when fired in the common manner. But Mr Robins hath proved these reasons to be altogether

erroneous, by a great number of experiments made with rifle-barrelled pieces. "In these experiments," says he, "I have found that the velocity of the bullet fired from a rifled barrel was usually less than that of the bullet fired from a common piece with the same proportion of powder. Indeed it is but reasonable to expect that this should be the case; for if the rifles are very deep, and the bullet is large enough to fill them up, the friction bears a very considerable proportion to the effort of the powder. And that in this case the friction is of consequence enough to have its effects observed, I have discovered by the continued use of the same barrel. For the metal of the barrel being soft, and wearing away apace, its bore by half a year's use was considerably enlarged, and consequently the depth of its rifles diminished; and then I found that the same quantity of powder would give to the bullet a velocity near a tenth part greater than what it had done at first. And as the velocity of the bullet is not increased by the use of rifled barrels, so neither is the distance to which it flies, nor the depth of its penetration into solid substances. Indeed these two last suppositions seem at first sight too chimerical to deserve a formal confutation. But I cannot help observing that those who have been habituated to the use of rifled pieces are very excusable in giving way to these prepossessions. For they constantly found, that with them they could fire at a mark with tolerable success, though it were placed at three or four times the distance to which the ordinary pieces were supposed to reach. And therefore, as they were ignorant of the true cause of this variety, and did not know that it arose only from preventing the deflection of the ball; it was not unnatural for them to imagine that the superiority of effect in the rifled piece was owing either to a more violent impulse at first, or to a more easy passage through the air.

"In order to confirm the foregoing theory of rifle-barrelled pieces, I made some experiments by which it might be seen whether one side of the ball discharged from them uniformly keeps foremost during the whole course. To examine this particular, I took a rifled barrel carrying a bullet of six to the pound; but instead of its leaden bullet I used a wooden one of the same size, made of a soft springy wood, which bent itself easily into the rifles without breaking. And firing the piece thus loaded against a wall at such a distance as the bullet might not be shivered by the blow, I always found, that the same surface which lay foremost in the piece continued foremost without any sensible deflection during the time of its flight. And this was easily to be observed, by examining the bullet; as both the marks of the rifles, and the part that impinged on the wall, were sufficiently apparent. Now, as these wooden bullets were but the 16th part of the weight of the leaden ones; I conclude, that if there had been any unequal resistance or defective power, its effects must have been extremely sensible upon this light body, and consequently in some of the trials I made the surface which came foremost from the piece must have been turned round into another situation.

"But again, I took the same piece, and, loading it now with a leaden ball, I set it nearly upright, sloping it only three or four degrees from the perpendicular in the direction of the wind; and firing it in this situation, the bullet

PRACTICE

PRACTICE

bullet generally continued about half a minute in the air, it rising by computation to near three quarters of a mile perpendicular height. In these trials I found that the bullet commonly came to the ground to the leeward of the piece, and at such a distance from it, as nearly corresponded to the angle of its inclination, and to the effort of the wind; it usually falling not nearer to the piece than 100, nor farther from it than 150, yards. And this is a strong confirmation of the almost steady flight of this bullet, for about a mile and a half: for were the same trial made with a common piece, I doubt not but the deviation would often amount to half a mile, or perhaps considerably more; though this experiment would be a very difficult one to examine, on account of the little chance there would be of discovering where the ball fell.

37
Balls from
rifled pieces
will at
length de-
viate from
their true
course.

“It must be observed, however, that though the bullet impelled from a rifle-barrelled piece keeps for a time to its regular track with sufficient nicety; yet if its flight be so far extended that the track becomes considerably incurvated, it will then undergo considerable deflections. This, according to my experiments, arises from the angle at last made by the axis on which the bullet turns, and the direction in which it flies: for that axis continuing nearly parallel to itself, it must necessarily diverge from the line of the flight of the bullet, when that line is bent from its original direction; and when it once happens that the bullet whirls on an axis which no longer coincides with the line of its flight, then the unequal resistance formerly described will take place, and the deflecting power hence arising will perpetually increase as the track of the bullet by having its range extended becomes more and more incurvated.—This matter I have experienced in a small rifle-barrelled piece, carrying a leaden ball of near half an ounce weight. For this piece, charged with one drachm of powder, ranged about 550 yards at an angle of 12 degrees with sufficient regularity; but being afterwards elevated to an angle of 24 degrees, it then ranged very irregularly, generally deviating from the line of its direction to the left, and in one case not less than 100 yards. This apparently arose from the cause above-mentioned, as was confirmed from the constant deviation of the bullet to the left; for by considering how the revolving motion was continued with the progressive one, it appeared that a deviation that way was to be expected.

“The best remedy I can think of for this defect, is the making use of bullets of an egg-like form instead of spherical ones. For if such a bullet hath its shorter axis made to fit the piece, and it be placed in the barrel with its smaller end downwards; then it will acquire by the rifles a rotation round its larger axis; and its centre of gravity lying nearer to its fore than its hinder part, its longer axis will be constantly forced by the resistance of the air into the line of its flight; as we see, that by the same means arrows constantly lie in the line of their direction, however that line be incurvated.

“But, besides this, there is another circumstance in the use of these pieces, which renders the flight of their bullets uncertain when fired at a considerable elevation. For I find by my experiments, that the velocity of a bullet fired with the same quantity of powder from a rifled barrel, varies much more from

itself in different trials, than when fired from a common piece.—This, as I conceive, is owing to the great quantity of friction, and the impossibility of rendering it equal in each experiment. Indeed, if the rifles are not deeply cut, and if the bullet is nicely fitted to the piece, so as not to require a great force to drive it down, and if leather or fustian well greased is made use of between the bullet and barrel, perhaps, by a careful attention to all these particulars, great part of the inequality in the velocity of the bullet may be prevented, and the difficulty in question be in some measure obviated: but, till this be done, it cannot be doubted, that the range of the same piece, at an elevation, will vary considerably in every trial; although the charge be each time the same. And this I have myself experienced, in a number of diversified trials, with a rifle-barrelled piece loaded at the breech in the English manner. For here the rifles being indented very deep, and the bullet so large as to fill them up completely; I found, that though it flew with sufficient exactness to the distance of four or five hundred yards; yet, when it was raised to an angle of about 12 degrees, (at which angle, being fired with one-fifth of its weight in powder, its medium range is nearly 1000 yards); in this case, I say, I found that its range was variable, although the greatest care was taken to prevent any inequalities in the quantity of powder, or in the manner of charging. And as, in this case, the angle was too small for the first-mentioned irregularity to produce the observed effects; they can only be imputed to the different velocities which the bullet each time received by the unequal action of the friction.”

Thus we see, that it is in a manner impossible entirely to correct the aberrations arising from the resistance of the atmosphere; as even the rifle-barrelled pieces cannot be depended upon for more than one half of their actual range at any considerable elevation. It becomes therefore a problem very difficult of solution, to know, even within a very considerable distance, how far a piece will carry its ball with any probability of hitting its mark, or doing any execution. The best rules hitherto laid down on this subject, are those of Mr Robins. The foundation of all his calculations, is the velocity with which the bullet flies off from the mouth of the piece. Mr Robins himself had not opportunities of making many experiments on the velocities of cannon-balls, and the calculations from smaller ones cannot always be depended upon. In the 68th volume of the Phil. Transf. Mr Hutton hath recited a number of experiments made on cannon carrying balls of 38
from one to three pounds weight. His machine for experiments on discovering the velocities of these balls was the same of cannon-balls
with that of Mr Robins, only of a larger size. His charges of powder were two, four, and eight ounces; and the results of 15 experiments which seem to have been the most accurate, are as follow.

Velocity with two ounces.	Velocity with four ounces.	Velocity with eight ounces.
702 feet in 1"	1069 feet in 1"	1419 feet in 1"
682	1020	1332
695	948	1443
703	973	1360
725	957	1412
5)3507	5)4965	5)6986
Mean velocities 701	993	1397

19 U

In

In another course, the mean velocities, with the same charges of powder, were 613, 873, 1162. "The mean velocities of the balls in the first course of experiments, says Mr Hutton, with two, four, and eight ounces of powder, are as the numbers 1, 1.414, and 1.993; but the subduplicate ratio of the weights (two, four, and eight) give the numbers 1, 1.414, and 2, to which the others are sufficiently near. It is obvious, however, that the greatest difference lies in the last number, which answers to the greatest velocity. It will fill be a little more in defect if we make the allowance for the weights of the balls; for the mean weights of the balls with the two and four ounces is 18½ ounces, but of the eight ounces it is 18½: diminishing therefore the number 1.993 in the reciprocal subduplicate ratio of 18½ to 18½, it becomes 1.985, which falls short of the number 2 by .015, or the 133d part of itself. A similar defect was observed in the other course of experiments; and both are owing to three evident causes, viz. 1. The less length of cylinder through which the ball was impelled; for with the eight-ounce charge, it lay three or four inches nearer to the muzzle of the piece than with the others. 2. The greater quantity of elastic fluid which escaped in this case than in the others by the windage. This happens from its moving with a greater velocity; in consequence of which, a greater quantity escapes by the vent and windage than in smaller velocities. 3. The greater quantity of powder blown out unfired in this case than in that of the lesser velocities; for the ball which was impelled with the greater velocity, would be sooner out of the piece than the others, and the more so as it had a less length of the bore to move through; and if powder fire in time, which cannot be denied, though indeed that time is manifestly very short, a greater quantity of it must remain unfired when the ball with the greater velocity issues from the piece, than when that which has the less velocity goes out, and fill the more so as the bulk of powder which was at first to be inflamed in the one case so much exceeded that in the others.

"Let us now compare the corresponding velocities in both cases. In the one they are, 701, 993, 1397; in the other, 613, 873, 1162. Now the ratio of the first two numbers, or the velocities with two ounces of powder, is that of 1 to 1.1436, the ratio of the next two is that of 1 to 1.1375, and the ratio of the last is that of 1 to 1.2022. But the mean weight of the shot for two and four ounces of powder, was 28½ ounces in the first course, and 18½ in this; and for eight ounces of powder, it was 28½ in the first, and 18½ in this. Taking therefore the reciprocal subduplicate ratios of these weights of shot, we obtain the ratio of 1 to 1.224 for that of the balls which were fired with two ounces and four ounces of powder, and the ratio of 1 to 1.241 for the balls which were fired with eight ounces. But the real ratios above found are not greatly different from these; and the variation of the actual velocities from this law of the weights of shot, inclines the same way in both courses of experiments. We may now collect into one view the principal inferences that have resulted from these experiments.

1. "It is evident from them, that powder fires almost instantaneously.

2. "The velocities communicated to balls or shot of the same weight with different quantities of powder, are nearly in the subduplicate ratio of these quantities; a very small variation in defect taking place when the

quantities of powder become great.

3. "When shot of different weights are fired with the same quantity of powder, the velocities communicated to them are nearly in the reciprocal subduplicate ratio of their weights.

4. "Shot which are of different weights, and impelled by different quantities of powder, acquire velocities which are directly as the square roots of the quantities of powder, and inversely as the square roots of the weights of the shot nearly."

The velocities of the bullets being thus found as Mr Ro-
nearly as possible, the ranges may be found by the fol-
lowing rules laid down by Mr Robins.

1. "Till the velocity of the projectile surpasses that of 1100 feet in a second, the resistance may be reckoned to be in the duplicate proportion of the velocity, and its mean quantity may be reckoned about half an ounce avoirdupois on a 12-pound shot moving with a velocity of about 25 or 26 feet in a second.

2. "If the velocity be greater than that of 1100 or 1200 feet in a second, then the absolute quantity of the resistance in these greater velocities will be near three times as great as it should be by a comparison with the smaller velocities.—Hence then it appears, that if a projectile begins to move with a velocity less than that of 1100 feet in 1", its whole motion may be supposed to be considered on the hypothesis of a resistance in the duplicate ratio of the velocity. And if it begins to move with a velocity greater than this last mentioned, yet if the first part of its motion, till its velocity be reduced to near 1100 feet in 1", be considered separately from the remaining part in which the velocity is less than 1100 feet in 1"; it is evident, that both parts may be truly assigned on the same hypothesis; only the absolute quantity of the resistance is three times greater in the first part than in the last. Wherefore, if the motion of a projectile on the hypothesis of a resistance in the duplicate ratio of the velocity be truly and generally assigned, the actual motions of resisted bodies may be thereby determined, notwithstanding the increased resistances in the great velocities. And, to avoid the division of the motion into two, I shall show how to compute the whole at one operation with little more trouble than if no such increased resistance took place.

"To avoid frequent circumlocutions, the distance to which any projectile would range in a vacuum on the horizontal plain at 45° of elevation, I shall call the potential random of that projectile; the distance to which the projectile would range in *vacuo* on the horizontal plane at any angle different from 45°, I shall call the potential range of the projectile at that angle; and the distance to which a projectile really ranges, I shall call its actual range.

"If the velocity with which a projectile begins to move is known, its potential random and its potential range at any given angle are easily determined from the common theory of projectiles; or more generally, if either its original velocity, its potential random, or its potential range, at a given angle, are known, the other two are easily found out.

"To facilitate the computation of resisted bodies, it is necessary, in the consideration of each resisted body, to assign a certain quantity, which I shall denominate F, adapted to the resistance of that particular projectile. To find this quantity F to any projectile given, we may proceed thus: First find, from the principles

30
Mr Ro-
bins's method of
finding the
ranges of
bullets.

See Pro-
jectile.

PRACTICE already delivered, with what velocity the projectile must move, so that its resistance may be equal to its gravity. Then the height, from whence a body must descend in a vacuum to acquire this velocity, is the magnitude of F sought. But the concise way of finding this quantity F to any shell or bullet is this: If it be of solid iron, multiply its diameter measured in inches by 300, the product will be the magnitude of F expressed in yards. If, instead of a solid iron-bullet, it is a shell or a bullet of some other substance; then, As the specific gravity of iron is to the specific gravity of the shell or bullet given, so is the F corresponding to an iron bullet of the same diameter, to the proper F for the shell or bullet given. The quantity F being thus assigned, the necessary computations of these resisted motions may be dispatched by the three following propositions, always remembering that these propositions proceed on the hypothesis of the resistance being in the duplicate proportion of the velocity of the resisted body. How to apply this principle, when the velocity is so great as to have its resistance augmented beyond this rate, shall be shewn in a corollary to be annexed to the first proposition.

Actual ranges expressed in F.	Corresponding potential ranges expressed in F.	Actual ranges expressed in F.	Corresponding potential ranges expressed in F.	Actual ranges expressed in F.	Corresponding potential ranges expressed in F.

PRACTICE "PROP. I. Given the actual range of a given shell or bullet at any small angle not exceeding 8° or 10° , to determine its potential range, and consequently its potential random and original velocity.

"Sol. Let the actual range given be divided by the F corresponding to the given projectile, and find the quote in the first column of the preceding Table. Then the corresponding number in the second column multiplied into F, will be the potential range sought; and thence, by the methods already explained, the potential random and the original velocity of the projectile is given.

"EXAM. An 18 pounder, the diameter of whose shot is about 5 inches, when loaded with 2lb. of powder, ranged at an elevation of $3^{\circ} 35'$, to the distance of 975 yards.

"The F corresponding to this bullet is 1500 yards, and the quote of the actual range by this number is 65; corresponding to which, in the second column, is 817; whence, 817 F, or 1225 yards, is the potential range sought; and this, augmented in the ratio of the sine of twice the angle of elevation to the radius, gives 10050 yards for the potential random; whence it will be found, that the velocity of this projectile was that of 984 feet in a second.

"Cor. 1st. If the converse of this proposition be desired; that is, if the potential range in a small angle be given, and thence the actual range be sought; this may be solved with the same facility by the same table. For if the given potential range be divided by its correspondent F, then opposite to the quote sought in the second column, there will be found in the first column a number, which multiplied into F will give the actual range required. And from hence it follows, that, if the actual range be given at one angle, it may be found at every other angle not exceeding 8° or 10° .

"Cor. 2d. If the actual range at a given small angle be given, and another actual range be given, to which the angle is sought; this will be determined by finding the potential ranges corresponding to the two given actual ranges; then the angle corresponding to one of these potential ranges being known, the angle corresponding to the other will be found by the common theory of projectiles.

"Cor. 3d. If the potential random deduced from the actual range by this proposition exceeds 13000 yards; then the original velocity of the projectile was so great as to be affected by the treble resistance described above; and consequently the real potential random will be greater than what is here determined. However, in this case, the true potential random may be thus nearly assigned. Take a 4th continued proportional to 13000 yards, and the potential random found by this proposition, and the 4th proportional thus found may be assumed for the true potential random sought. In like manner, when the true potential random is given greater than 13000 yards, we must take two mean proportionals between 13000 and this random*; and the first of these mean proportionals must be assumed instead of the random given, in every operation described in these propositions and their corollaries. And this method will nearly allow for the increased resistance in large velocities, the difference only amounting to a few minutes in the angle of direction of the projected body, which, provided that angle exceeds two

* The operations directed in this corollary are best performed by the table of logarithms.

PRACTICE or three degrees, is usually scarce worth attending to.

Of this process take the following example.

"A 24 pounder fired with 12 pounds of powder, when elevated at $7^{\circ} 15'$, ranged about 2500 yards. Here the F being near 1700 yards, the quote to be sought in the first column is 147, to which the number corresponding in the second column is 2,556; whence the potential range is near 4350 yards, and the potential random thence resulting 17400. But this being more than 13,000, we must, to get the true potential random, take a 4th continued proportional to 13000 and 17400; and this 4th proportional, which is about 31000 yards, is to be esteemed the true potential random sought; whence the velocity is nearly that of 1730 feet in a second.

"SCHOLIUM. This proposition is confined to small angles, not exceeding 8° or 10° . In all possible cases of practice, this approximation, thus limited, will not differ from the most rigorous solution by so much as what will often intervene from the variation of the density of the atmosphere in a few hours time; so that the errors of the approximation are much short of other inevitable errors, which arise from the nature of this subject.

"PROP. II. Given the actual range of a given shell or bullet, at any angle not exceeding 45° , to determine its potential range at the same angle; and thence its potential random and original velocity.

"SOL. Diminish the F corresponding to the shell or bullet given in the proportion of the radius to the cosine of $\frac{1}{2}$ of the angle of elevation. Then, by means of the preceding table, operate with this reduced F in the same manner as is prescribed in the solution of the last proposition, and the result will be the potential range sought; whence the potential random, and the original velocity, are easily determined.

"EXAM. A mortar for sea-service, charged with 30lb of powder, has sometimes thrown its shell, of $12\frac{1}{2}$ inches diameter, and of 231 lb. weight, to the distance of 2 miles, or 5450 yards. This at an elevation of 45° .

"The F to this shell, if it were solid, is 3825 yards; but as the shell is only $\frac{2}{3}$ of a solid globe, the true F is no more than 3060 yards. This, diminished in the ratio of the radius to the cosine of $\frac{1}{2}$ of the angle of elevation, becomes 2544. The quote of the potential range by this diminished F is 1,384; which sought in the first column of the preceding table gives 2,280 for the corresponding number in the second column; and this multiplied into the reduced F , produces 5800 yards for the potential range sought, which, as the angle of elevation was 45° , is also the potential random; and hence the original velocity of this shell appears to be that of about 748 feet in a second.

"COR. The converse of this proposition, that is, the determination of the actual range from the potential range given, is easily deduced from hence by means of the quote of the potential range divided by the reduced F ; for this quote searched out in the second column will give a corresponding number in the first column, which multiplied into the reduced F , will be the actual range sought.

Also, if the potential random of a projectile be given, or its actual range at a given angle of elevation; its actual range at any other angle of elevation, not greater than 45° , may hence be known. For the

PRACTICE potential random will assign the potential range at any given angle; and thence, by the method of this corollary, the actual range may be found.

"EXAM. A fit musket-bullet fired from a piece of the standard dimensions, with $\frac{7}{8}$ of its weight in good powder, acquires a velocity of near 900 feet in a second; that is, it has a potential random of near 8400 yards. If now the actual range of this bullet at 15° was sought, we must proceed thus:

"From the given potential random it follows, that the potential range at 15° is 4200 yards; the diameter of the bullet is $\frac{1}{4}$ of an inch; and thence, as it is of lead, its proper F is 3375 yards, which, reduced in the ratio of the radius to the cosine of $\frac{1}{2}$ of 15° , becomes 331 yards. The quote of 4200 by this number is 12.7 nearly; which, being sought in the second column, gives 3.2 nearly for the corresponding number in the first column; and this multiplied into 331 yards (the reduced F) makes 1059 yards for the actual range sought.

"EXAM. II. The same bullet, fired with its whole weight in powder, acquires a velocity of about 2100 feet in a second, to which there corresponds a potential random of about 45700 yards. But this number greatly exceeding 13,000 yards, it must be reduced by the method described in the third corollary of the first proposition, when it becomes 19700 yards. If now the actual range of this bullet at 15° was required, we shall from hence find, that the potential range at 15° is 9850 yards; which, divided by the reduced F of the last example, gives for a quote 2975; and thence following the steps prescribed above, the actual range of this bullet comes out 1396 yards, exceeding the former range by no more than 337 yards; whereas the difference between the two potential ranges is above ten miles. Of such prodigious efficacy is the resistance of the air, which hath been hitherto treated as too insignificant a power to be attended to in laying down the theory of projectiles!

"SCHOL. I must here observe, that as the density of the atmosphere perpetually varies, increasing and diminishing often by $\frac{1}{10}$ part, and sometimes more, in a few hours; for that reason I have not been over rigorous in forming these rules, but have considered them as sufficiently exact when the errors of the approximation do not exceed the inequalities which would take place by a change of $\frac{1}{10}$ part in the density of the atmosphere. With this restriction, the rules of this proposition may be safely applied in all possible cases of practice. That is to say, they will exhibit the true motions of all kinds of shells and cannon-shot, as far as 45° of elevation, and of all musket-bullets fired with their largest customary charges, if not elevated more than 30° . Indeed, if experiments are made with extraordinary quantities of powder, producing potential randoms greatly surpassing the usual rate; then in large angles some farther modifications may be necessary. And though, as these cases are beyond the limits of all practice, it may be thought unnecessary to consider them; yet, to enable those who are so disposed to examine these uncommon cases, I shall here insert a proposition, which will determine the actual motion of a projectile at 45° , how enormous soever its original velocity may be. But as this proposition will rather relate to speculative than practical

PRACTICE practical cases, instead of supposing the actual range known, thence to assign the potential random, I shall now suppose the potential random given, and the actual range to be thence investigated.

“PROP. III. Given the potential random of a given shell or bullet, to determine its actual range at 45°.

SOL. Divide the given potential random by the F corresponding to the shell or bullet given, and call the quotient q, and let l be the difference between the tabular logarithms of 25 and of q, the logarithm of 10 being supposed unity; then the actual range sought is $3.4 F + 2lF - \frac{11}{10} F$, where the double line of 2lF is to be thus understood; that if q be less than 25, it must be — 2lF; if it be greater, then it must be + 2lF. In this solution, q may be any number not less than 3, nor more than 2500.

“COR. Computing in the manner here laid down, we shall find the relation between the potential randoms, and the actual range at 45°, within the limits of this proposition, to be as expressed in the following table.

Potential Random.	Actual Range at 45°.
3 F	1.5 F
6 F	2.1 F
10 F	2.6 F
20 F	3.2 F
30 F	3.6 F
40 F	3.8 F
50 F	4.0 F
100 F	4.6 F
200 F	5.1 F
500 F	5.8 F
1000 F	6.4 F
2500 F	7.0 F

Whence it appears, that, when the potential random is increased from 3F to 2500F, the actual range is only increased from 1½ F to 7 F, so that an increase of 2497F in the potential random produces no greater an increase in the actual range than 5½ F, which is not its $\frac{1}{2500}$ part; and this will again be greatly diminished on account of the increased resistance, which takes place in great velocities. So extraordinary are the effects of this resistance, which we have been hitherto taught to regard as inconsiderable.

“That the justness of the approximations laid down in the 2d and 3d propositions may be easier examined; I shall conclude these computations by inserting a table of the actual ranges at 45° of a projectile, which is resisted in the duplicate proportion of its velocity. This table is computed by methods different from those hitherto described, and is sufficiently exact to serve as a standard with which the result of our other rules may be compared. And since whatever errors occur in the application of the preceding propositions, they will be most sensible at 45° of elevation, it follows, that hereby the utmost limits of those errors may be ascertained.

Potential Randoms.	Actual Range at 45°.
1 F	.0963 F
25 F	.2282 F
5 F	.4203 F
75 F	.8668 F
1.0 F	.7323 F

1.25 F	.860 F
1.5 F	.978 F
1.75 F	1.083 F
2.0 F	1.179 F
2.5 F	1.349 F
3.0 F	1.495 F
3.5 F	1.624 F
4.0 F	1.738 F
4.5 F	1.840 F
5.0 F	1.930 F
5.5 F	2.015 F
6.0 F	2.097 F
6.5 F	2.169 F
7.0 F	2.237 F
7.5 F	2.300 F
8.0 F	2.359 F
8.5 F	2.414 F
9.0 F	2.467 F
9.5 F	2.511 F
10.0 F	2.564 F
11.0 F	2.651 F
13.0 F	2.804 F
15.0 F	2.937 F
20.0 F	3.196 F
25.0 F	3.396 F
30.0 F	3.557 F
40.0 F	3.809 F
50.0 F	3.998 F

We have now only to consider that part of practical gunnery which relates to the proportions of the different parts of cannon, the metal of which they are made, &c.

Formerly the guns were made of a very great length, and were on that account extremely troublesome and unmanageable. The error here was first discovered by accident; for some cannon, having been cast by mistake two feet and an half shorter than the common standard, were found to be equally efficacious in service with the common ones, and much more manageable. This soon produced very considerable alterations in the form of the artillery throughout Europe; but in no country have greater improvements in this respect been made than in our own. For a long time brass, or rather a kind of bell-metal, was thought preferable to cast iron for making of cannon. The composition of this metal is generally kept a secret by each particular founder.

The author of the Military Dictionary gives the following proportions as the most common, viz. “To 240 lb. of metal fit for casting they put 68 lb. of copper, 52 lb. of brass, and 12 lb. of tin. To 4200 lb. of metal fit for casting the Germans put 3687½ lb. of copper, 204½ lb. of brass, and 307½ lb. of tin. Others use 100 lb. of copper, 6 lb. of brass, and 9 lb. of tin; while some make use of 100 lb. of copper, 10 lb. of brass, and 15 lb. of tin. This composition was both found to be very expensive, and also liable to great inconveniences in the using. A few years ago, therefore, a proposal was made by Mr Muller for using iron guns of a lighter construction than the brass ones, by which he supposed that a very great saving would be made in the expence; and likewise, that the guns of the Mr Muller’s new construction would be more manageable, and even less efficacious, than the old ones. “The reduction of the expence (says Mr Muller) of the very large artillery necessary for sea and land service, is to be considered un-

der two heads: the one, To diminish the weight; and the other, Not to use any brads field-artillery, but only iron, to lessen the great burden of our ships of war, and to carry larger calibers than those of other nations of the same rate. If the weights of our guns are diminished, they will require fewer hands to manage them, and of consequence a smaller number will be exposed to danger at a time: and if we carry larger calibers, our rates will be a match for larger ships.

"The advantage of using iron guns in the field instead of brads, will be that the expences are lessened in proportion to the cost of brads to that of iron, which is as 8 to 1.

"The only objection against iron is, its pretended brittleness: but as we abound in iron that is stronger and tougher than any brads, this objection is invalid. This I can assert; having seen some that cannot be broke by any force, and will flatten like hammered iron: if then we use such iron, there can be no danger of the guns bursting in the most severe action.

"Though brads guns are not liable to burst, yet they are sooner rendered unserviceable in action than iron. For by the softness of the metal, the vent widens so soon, and they are so liable to bend at the muzzle, that it would be dangerous to fire them; as we found by experience at Belleisle, and where we were obliged to take guns from the ships to finish the siege.

"These being undeniable facts, no possible reason can be assigned against using iron guns in both sea and land service, and thereby lessen the expences of artillery so considerably as will appear by the following tables.

Lengths and Weights of Iron Ship-Guns.

OLD PIECES. NEW PIECES.

Calib.	Length.	Weight.	Calib.	Length.	Weight.
	Ft. In.			Ft. In.	
3	4 6	7 1 7	3	3 6	3 3 0
4	6 0	12 2 13	6	4 4	7 2 0
6	7 0	17 1 14	9	5 0	11 1 0
9	7 0	23 2 2	12	5 6	15 0 0
12	9 0	32 3 3	18	6 4	22 2 0
18	9 0	41 1 8	24	7 0	30 0 0
24	9 0	48 0 0	32	7 6	40 0 0
32	9 6	53 3 23	42	8 4	52 2 0
42	10 0	55 1 12	48	8 6	60 0 0

"Guns of this construction appear sufficiently strong from the proof of two three-pounders made for Lord Egmont, and they even may be made lighter and of equal service.

Length and Weight of Battering Pieces.

PRACTICE

OLD BRASS.

Total 227.			Total 141.		

Diff. 72.

"That these guns are sufficiently strong, is evident from the former trial; besides, there are several 32 pounders of the same dimensions and weight now existing and serviceable, though cast in king Charles the Second's time.

N. B. These battering pieces may serve in gar-risons.

"It appears from these tables, that no proportion has been observed in any guns hitherto made, in respect to their length or weight, but merely by guess.

Some Examples to shew what may be saved by this Scheme.

The Royal George carries 100 brads guns, which weigh together 218.2 tons; the ton costs 130 pounds, workmanship included.

The expence of these guns is then 28366 pounds

A set of the iron guns of the same number and calibers, according to my construction, weighs 127.8 tons

The ton costs 16 pounds, and the whole set 2044.8 pounds

The Royal George carries then 90.4 tons more than is necessary, and the difference between the expence is 26321.2 pounds

That is, 12.5 times more than the new iron set costs: or 12 ships of the same rate may be fitted out at less charge.

A set of the { Old } iron guns for a { 204.4 } tons
 { New } first-rate weighs { 127.8 }

The difference between the weight of the old and new is 76.6 tons

The difference between the expence is then 1225.6 pounds

A set of brads battering pieces weighs 11.36 tons

A ton costs 130 pounds, and the set 1476.8 pounds

A set of the new weighs 7.55 tons

The ton costs 16 pounds, and the set 117.8 pounds

That is, the old set costs 11 times, and 632 over, more than the new set; or eleven sets of the new could be made at less expence than one of the old.

"This table shews what may be saved in the navy; and if we add those on board sloops, the different gar-risons, and the field-train, with the great expence of their

PRACTICE their carriage in the field, it may be found pretty near as much more.

This and other propofals for reducing the weight and expence of guns have been greatly attended to of late; and the Carron-company in Scotland have not only greatly improved those of the old construction, but a gun of a new construction hath been invented by Mr Charles Gascoigne director of that work, which promises to be of more effectual service than any hitherto made use of.—Fig. 9. represents the form and proportions of the guns made at Carron, and which serve for those of all sizes, from $\frac{1}{2}$ pounders and upwards. The proportions are measured by the diameters of the caliber, or bore of the gun, divided into 16 equal parts, as represented in the figure. The following are the names of the different parts of a cannon.

- A B, the length of the cannon.
- A E, the first reinforce.
- E F, the second reinforce.
- F B, the chafe.
- H B, the muzzle.
- A o, the cascabel, or pomiglon.
- A C, the breech.
- C D, the vent-field.
- F I, the chafe-girdle.
- r s, the base-ring and ogee.
- t, the vent-aftragal and fillets.
- p q, the first reinforce-ring and ogee.
- v w, the second reinforce-ring and ogee.
- x, the chafe-aftragal and fillets.
- z, the muzzle-aftragal and fillets.
- n, the muzzle-mouldings.
- m, the swelling of the muzzle.
- A i, the breech-mouldings.
- T T, the trunnions.

The dotted lines along the middle of the piece shew the dimensions of the calibre, and the dotted circle

As the breech of the cannon receives an equal impulse with the bullet from the action of the inflamed gunpowder, it thence follows, that, at the moment the bullet flies off, the piece itself pushes backward with very great force. This is called the *recoil* of the cannon; and if the piece is not of a very considerable weight, it would fly upwards, or to a side, with extreme violence. If again it was firmly fastened down, so that it could not move in the least, it would be very apt to burst, on account of the extreme violence with which the powder would then act upon it. For this reason it hath been found necessary to allow the recoil to take place, and consequently all large pieces of artillery are mounted upon carriages with wheels, which allow them to recoil freely; and thus they may be fired without any danger. There are several sorts of carriages for ordnance, viz. ballard carriages, with low wheels and high wheels; sea-carriages, made in imitation of those for ship-guns; and carriages for field-pieces, of which there are two kinds. The carriages must be proportioned to the pieces mounted on them. The ordinary proportion is for the carriage to have once and a half the length of the gun, the wheels to be half the length of the piece in height. Four times the diameter or caliber gives the depth of the planks in the fore end; in the middle, 3 $\frac{1}{2}$.

Fig. 11. shews Mr Gascoigne's newly-invented gun called a *carronade*; and which, in June 1779, of the Carronade. was by the king and council instituted a standard navy-gun, and 10 of them appointed to be added to each ship of war, from a first-rate to a sloop. Of this gun the Carron Company have published the following account.

"The carronade is made so short, that it is worked with its carriage in the ship's port; the trunnions lying immediately over the sill of the port: it is correctly bored; and the shot, being perfectly round, fills the caliber with such exactness, that the least possible of the impulse of the powder escapes, upon explosion, between the cylinder and the shot; which last also is thereby more truly directed in its flight. The bottom of the cylinder is a hemisphere, to which the end of the cartridge is not liable to stick, and in which the smallest charge of powder envelopes the shot, exhausting nearly the whole of its impelling force upon it: the trunnions are placed so as to lessen the recoil, and that the gun cannot rest against the sides of the carriage, and is balanced with the utmost facility. There are views cast upon the vent and muzzle, to point the gun quickly to an object at 250 and 500 yards distance. There is an handle A fixed upon the pommel-end of the gun, by which it is horizontally ranged and pointed; and there is a ring cast upon the cascabel, through which the breechin rope is reeved, the only rope used about these guns.

"The carronade is mounted upon a carriage B, with a perfectly smooth bottom of strong planks, without trucks; instead of which there is fixed on the bottom of the carriage, perpendicular from the trunnions, a gudgeon C of proper strength, with an iron washer D and pin E at the lower end thereof. This gudgeon is let into a corresponding groove F, cut in a second carriage

carriage

43
Proportions, &c. of the guns made at Carron.

PRACTICE

carriage G, called a *slide-carriage*; the waffer supported by the pin over-reaching the under-edges of the groove H. This *slide-carriage* is made with a smooth upper surface, upon which the gun-carriage is moved, and by the gudgeon always kept in its right station to the port; the groove in the *slide-carriage* being of a sufficient length to allow the gun to recoil, and be loaded within board. The *slide-carriage*, the groove included, is equally broad with the fore-part of the gun-carriage, and about four times the length; the fore-part of the *slide-carriage* is fixed by hinge-bolts I, to the quick-work of the ship below the port, the end lying over the fill, close to the outside plank, and the groove reaching to the fore end; the gudgeon of the gun-carriage, and consequently the trunnions of the gun, are over the fill of the port, when the gun is run out; and the port is made of such breadth, with its sides bevelled off within board, that the gun and carriage may range from bow to quarter. The *slide-carriage* is supported from the deck at the hinder end, by a wedge K, or step-floor; which being altered at pleasure, and the fore-end turning upon the hinge-bolts, the carriage can be constantly kept upon an horizontal plane, for the more easy and quick working of the gun when the ship lies along.

"The gun and carriages being in their places, the breechin rope, which must be strong and limber, is reeved through the ring on the breech, then led thro' an eye-bolt drove downwards, the eye standing upright upon the upper edge of each cheek of the gun-carriage; from these eye-bolts the ends of the breechin rope are seized down as usual to an eye-bolt driven into the quick-work on each side, in a line with the lower surface of the *slide-carriage*.

"The gun being mounted and ready for action, is loaded with $\frac{1}{16}$ th part of the weight of its ball in service charge of powder put into a woollen cartridge, and the end tied up with a worsted yarn, and placed next to the shot; and with a single ball, well rammed home upon the powder, without a wadding between them; the gun being then run out in the port, is ranged and elevated with great facility, by means of the handle on the pommel; and, by the views, very quickly pointed.—Upon discharge, the gun attempts to kick upwards, which being prevented by the waffer of the gudgeon bearing hard against the under part of the *slide-carriage*, the recoil takes place; and the gudgeon sliding backwards in the groove, (the waffer still bearing against an iron plate on the under edge of the groove,) till the gun is brought up by the breechin rope, as much re-action succeeds as slackens the rope, so that the gun and carriage may be instantly turned fore and aft by the handle, and loaded again.

"This gun has many singular advantages over the others of light construction.—It is so extremely light, that the smallest ships can carry almost any weight of shot, (the 12-pounder weighing under 500 wt. and the other calibers in proportion,) and that without being attended with the inconveniences imputed generally to light guns, since it cannot injure its carriage, or jump out of its station in the port upon recoil; and it will never heat.

"It can be easily managed and worked of all calibers, from the 12-pounders downwards with two hands,

and the 18 and 24-pounders with three hands. It may be readily ranged, pointed, and discharged, twice in three minutes, which doubles the strength of the ship against an enemy of equal force. It is wrought upon an horizontal plane to windward or to leeward, how much soever the ship lies along under a profluse of fail; and therefore, besides being hampered with no tackles or other ropes, except the breechin rope, it may be worked with as much ease and expedition in chace or in a gale of wind, as in lying to for action.—It can be ranged from bow to quarter, so as to bring a broadside to bear in a circuit of above 10 points of the compass on each side.—It is no more expensive in ammunition than the old guns of two-thirds less weight of shot; and it requires very few hands above the compliment necessary for navigating merchant-ships; and increases the strength of privateers crews, by exposing few hands at the guns, and augmenting the number at small arms.

"Though the carronade cannot, strictly speaking, throw its shot to an equal distance with a longer gun; yet, from the fitness of the shot to its cylinder, the powers of this gun will greatly surpass the expectations of such as are not intimately acquainted with the effects of the elastic force of fired powder, since, with a $\frac{1}{16}$ th part of the weight of its ball, at very small elevations, it will range its shot to triple the distance at which ships generally engage, with sufficient velocity for the greatest execution, and with all the accuracy in its direction that can be attained from guns of greater lengths.

"There have been two seeming disadvantages imputed to this gun, which it does not merit, viz. the nicety of fitting the shot to the bore of the gun, and its incapacity to hold more than two shot at one charge. But, as seamen have few opportunities of confirming themselves in just opinions by experiments made on shore, and cannot, in that case, be fully conversant with the subject; the following loose hints may not be inept towards removing these objections.

"It is an axiom in projectiles, That a shot cannot be impelled from a gun to any distance in a direction truly parallel to the axis of the cylinder of the piece, or what is commonly called *point-blank*, arising from several well-known causes: for, however just may be the cylinder, and however perfect and smooth may be the sphere of its corresponding shot, and admitting that the impulse of the powder acts through the centre of gravity of the shot, and also that the shot consequently leaves the piece in a direction parallel to the axis of its cylinder; yet is the shot no sooner discharged, but it becomes more or less infected by its gravity, and deflected, according to its velocity, by the resistance of the air and wind.

"These irregularities are of little importance in close sea-fights, and, being the effect of natural causes, are common to all. Besides these, the deviation of a shot from its true direction, is further augmented by the windage between the cylinder and its shot; but the greatest uncertainty in the flight of a shot, making allowance for the action of its gravity, and the air's resistance, springs from the defects of the shot itself. Round-shot for ship-guns, are seldom nicely examined; and, unless they are cast *solid and truly globular*, and free

46

to its use
answered.

Fig. 9.

PRACTICE free of all hollows, roughness, and other outside blemishes, and well fitted to the gun, it cannot even be discharged in the direction of the axis of the piece; to the disappointment of those that use such, and to the discredit of the gun-founder, however justly the piece is viewed, or disparaged; but, being impelled against the surface of the cylinder, bounds and rebounds from side to side, acquires a rotatory motion, and when cast hollow withal, and breaking within the cylinder before discharge, (which sometimes happens, especially with double charges) never fails to injure; and, when often repeated, may, at last, burst the very best guns.

—Round-shot should not be taken on board a ship, without being examined as to its shape and surface, gaged for its size to the caliber of the gun, and weighed that it be not above or below the standard more than half an ounce in the pound of its respective caliber: good shot then, being of the same importance to all guns, removes the first objection.

“If the direction of the flight of a shot to its object is affected by so many seeming trivial causes, how much more uncertain must it be, when two or more shot are discharged together from one gun? for the shot next the powder being impelled with more celerity than that immediately before it, strikes against it after discharge, and sometimes shivers itself to pieces, and never fails to change obliquely the direction of both; and this happens with round and double-headed, &c. and all double charges; and which, from their various figures, cannot reach an object at the same elevations with the round-shot; especially when these other shots are of greater weight than the round, which

is often the case. However frightful a broadside with double charges may appear at sea, more confusion is created by them, and more time lost, *within board*, by the strain and excessive recoil, than real damage done *without board* by the additional charge: for, upon a trial on shore, where the effect can be traced, it will be found, that, at 100 yards distance, more shot will take place within a small compass by single than by double charges; and the charges will be oftener repeated in a given time, without heating the gun: and these facts being established, remove also the second objection.”

The following account of the proof of one of these guns will perhaps serve to give a more adequate idea of the great usefulness of them, than any description:

“On Monday, Oct. 4, 1779, there was an experiment made at Carron, before the earl of Dunmore, &c. &c. with a 68-pounder Carronade, nearly of the weight of a British navy 12-pounder gun, and charged with the same quantity (viz. 6 lb.) of powder.—The carronade was mounted, on its proper carriages, into a port of the dimensions of a 74 gun ship's lower-deck port; was pointed without elevation, at a centre of eight inches diameter, marked on a bulk's head of the thickness of two feet five inches solid wood, at 163 yards distance; behind which, at 168 yards, there was another bulk's head of two feet four inches thick; and behind that again, at 170 yards distance, a bank of earth. The shot pierced the bulk's heads each time, and was buried from three to four feet into the bank, and the splinters were thrown about to a considerable distance on all sides.

1st shot struck	1 foot 7 inches below the horizontal line,	and 5 feet	—	from the mark.
2d ditto	ditto	—	—	—
3d d°. d°.	through the horizontal line	d°. and 3 d°.	4 inches	from d°.
4th d°. d°.	ditto	—	—	—
5th d°. d°.	ditto	d°. and 2 d°.	4 ditto	from d°.
6th d°. d°.	2 inches below	—	2 d°. 10 d°.	from d°.
7th d°. d°.	2 inches below	—	—	10 d°. from d°.
8th d°. d°.	2 inches below	—	—	7 d°. from d°.
9th d°. d°.	2 feet below	—	—	10 d°. from d°.
10th d°. d°.	3 inches below	—	1 foot 9 d°.	from d°.
		—	—	3 d°. from d°.

“The Carronade was laid each time by the views without an instrument; and the shot were all to the left of the mark, owing to a small error in disparting the views; the third, fourth, and fifth shot, made one fracture, as did also sixth, seventh, and eighth, and the sixth and eighth struck the same spot.

“The Carronade was easily worked with four men, and may be readily worked and discharged on board a ship twice a-minute with six men.—With six pound weight of powder the shot was impelled with a velocity of 1400 feet a second.”

We have already seen of how much consequence rifle-barrels are in order to bring the art of gunnery to perfection; as they enlarge the space in which the ball will fly without any lateral deflection to three or four times its usual quantity. This improvement, however, till very lately, only took place in musket-barrels. But in the beginning of the year 1774, Dr Lind, and Captain Alexander Blair of the 69th regiment of foot, invented a species of rifled field-pieces. They are made of cast iron; and are not bored like the common pieces, but have the rifles moulded on the core, after which they are cleaned out and finished

with proper instruments; but for the method of doing this, and of boring the ordinary pieces, see the articles ORDNANCE and RIFLE.

Guns of this construction, which are intended for the field, ought never to be made to carry a ball of above one or two pounds weight at milt; a leaden bullet of that weight being sufficient to destroy either man or horse.—A pound-gun, of this construction, of good metal, such as is now made by the Carron company, need not to weigh above an hundred pounds weight, and its carriage about another hundred. It can, therefore, be easily transported from place to place, by a few men; and a couple of good horses may transport six of these guns and their carriages, if put into a cart.

But, for making experiments, in order to determine the resistance which bodies moving with great velocities meet with from the air, a circumstance to which these guns are particularly well adapted, or for annoying an enemy's sappers that are carrying on their approaches towards a besieged place, a larger caliber may be used.

The length of the gun being divided into seven equal

47
Description

ordnance.

equal parts, the length of the first reinforce AB is two of these parts; the second BC, one and $\frac{1}{2}$ of the diameter of the caliber; the chafe CD, four wanting $\frac{1}{5}$ of the diameter of the caliber.

The distance from the hind-part of the base-ring A, to the beginning of the bore, is one caliber and $\frac{1}{2}$ of a caliber. The trunnions TT are each a caliber in breadth, and the same in length; their centres are placed three-sevenths of the gun's length from the hind part of the base-ring, in such a manner, that the axis of the trunnions passes through the centre line of the bore, which prevents the gun from kicking, and breaking its carriage. The length of the cascade is one caliber and $\frac{1}{2}$ of a caliber.

The vent should be placed about half an inch from the bottom of the chamber or bore, that the cartridge may be pricked, lest some of the bottoms of the cartridges should be left in when the gun is sponged, a circumstance which might retard the firing till the shot be again drawn (which is no easy matter), and the gun be cleaned out. From some experiments of colonel Desaguliers and Mr Muller, it has been imagined, that the powder never has so strong an effect as when it is fired close to the bottom of the bore; yet it is found, by the experiments of Count de la Lippe, to have the greatest effect when fired near to the middle of the charge. This he proved by firing it with tubes, introduced at a vent bored through the button and breech of the gun, of different lengths,

so as to reach the different parts of the powder. In the same manner, a musket or fowling-piece is found to push more when the touch-hole is placed at some little distance from the bottom of the bore; which arises from nothing but the powder's acting with more force, by being inflamed to greater advantage; consequently, in this case, the same quantity of powder will have a greater effect, than when the touch-hole is placed at the bottom of the bore, which may be of some use in hulbanding the powder.

The above dimensions are taken from some elegant $\frac{1}{2}$ pound guns, which were made for the prince of Asturias by the Carron company.

The rifles make one spiral turn in the length of the bore; but go no nearer to the breech, in their full size, than two calibers; and then terminate with a gentle slope in half a caliber more, so as not to prevent the cartridge with the powder from being easily sent home to the bottom of the gun, which would otherwise constantly happen with the flannel cartridges, and even sometimes with paper ones, if not made to enter very loosely. The shape of the rifles is semicircular, their breadth being equal to the diameter, which is $\frac{1}{2}$ of a caliber, and their depth equal to the semidiameter, or $\frac{1}{4}$ of a caliber.

The bullets, fig. 13, are of lead, having six knobs cast on them to fit the rifles of the gun. Being thus made of soft metal, they do not injure the rifles; and may also save an army the trouble of carrying a great quantity of shot about with them, since a supply of lead may be had in most countries from roofs, &c. which can be cast into balls as occasion requires. Lead likewise being of greater specific gravity than cast-iron, flies to a much greater distance.

Rifled ordnance of any caliber might be made to carry iron shot, for battering or for other purposes; provided holes, that are a little wider at their bottoms than at their upper parts, be cast in a zone round the ball, for receiving afterwards leaden knobs to fit the rifles of the cannon; by which means, the iron shot will have its intended line of direction preserved, without injuring the rifles more than if the whole ball was of lead, the rotatory motion round its axis, in the line of its direction, (which corrects the aberration), being communicated to it by the leaden knobs, following the spiral turn of the rifles in its progress out of the gun. It is particularly to be observed, that the balls must be made to go easily down into the piece, so that the cartridge with the powder and the bullet may be both sent home together, with a single push of the hand, without any wadding above either powder or ball; by which means, the gun is quickly loaded, and the ball flies farther than when it is forcibly driven into the gun, as was found from many experiments. The only reason why, in common rifled muzzles, the bullets are rammed in forcibly, is this, that the zone of the ball which is contiguous to the inside of the bore may have the figure of the rifles impressed upon it, in such a manner as to become part of a male screw, exactly fitting the indents of the rifle, which is not at all necessary in the present case, the figure of the rifles being originally cast upon the ball. These knobs retard the flight of the bullet in some degree; but this small disadvantage is fully made up by the ease with which the gun is loaded,

43.

telescope
belonging
to this
kind of
ordnance.

its service being nearly as quick as that of a common field-piece; and the retardation and quantity of the whirling motion which is communicated to the bullet being constantly the same, it will not in the least affect the experiments made with them, in order to determine the resistance of the air.

In order to hit the mark with greater certainty than can be done in the common random method, these guns are furnished with a sector, the principal parts of which are, 1. The limb, which is divided in such a manner as to shew elevations to 15 or 20 degrees. The length of the radius is five inches and an half, and its nonius is so divided as to shew minutes of a degree. 2. The telescope, AB, fig. 14. an achromatic refractor, is seven inches in length, (such as is used on Hadley's quadrants, that are fitted for taking distances of the moon from the sun or stars, in order to obtain the longitude at sea), having cross hairs in it. 3. The parallel cylindric bar, CD, is $\frac{1}{4}$ of an inch in diameter, having two rectangular ends EF, each half an inch square and an inch long. On one side of the end next the limb of the sector, is a mark corresponding to a similar one on the hinder cock of the gun, with which it must always coincide when placed on the gun. The length of the parallel bar, together with its ends, is 7 inches. This bar is fixed to the sector by means of two hollow cylinders, G, H, which allow the sector a motion round the bar. There is a finger-screw, a, upon the hollow cylinder G, which is slit, in order to tighten it at pleasure upon the bar. 4. The circular level I, fig. 14. and 15. for setting the plane of the sector always perpendicular when placed upon the gun, is $\frac{1}{4}$ of an inch in diameter. There is a small screw, d, to adjust the level at right angles to the plane of the sector. 5. The finger screw, b, for fixing the index of the sector at any particular degree of elevation proposed.

The line of collimation (that is, the line of vision cut by the intersecting point of the two cross-hairs in the telescope) must be adjusted truly parallel to the bar of the sector when at 0 degrees. This is done by placing the sector so that the vertical hair may exactly cover some very distant perpendicular line. If it again covers it when the sector is inverted, by turning it half round upon the bar, which has all the while been kept steady and firm, that hair is correct; if not, correct half the error by means of the small screws, c d e, fig. 14. and 16. at the eye-end of the telescope, and the other half by moving the bar; place it again to cover the perpendicular line, and repeat the above operation till the hair covers it in both positions of the sector. Then turn the sector, till the horizontal hair cover the same perpendicular line; and turning the sector half round on its bar, correct it, if wrong, in the same manner as you did the vertical hair.

N. B. Of the four small screws at the eye-end of the telescope, those at the right and left hand move whatever hair is vertical, and those at top or underneath move whatever hair is horizontal.

On the side of the gun upon the first reinforce, are cast two knobs, F, fig. 12. and 17. having their middle part distant from each other six inches, for fixing on the brass locks, A, fig. 17. and 18. which seize the rectangular ends of the parallel cylindric bar of the sector, when placed on the gun.

The next adjustment is to make the parallel bar, and line of collimation of the telescope, when set at 0 degrees, parallel to the bore of the gun, and consequently to the direction of the shot. The gun being loaded, the cartridge pricked, and the gun primed, place the sector in the cocks of the gun; and having first set the sector to what elevation you judge necessary, bring the intersection of the cross-hairs in the telescope, upon the center of the mark, the limb of the sector being set vertical by means of the circular level, and then take off the sector without moving the gun. Fire the gun; and if the bullet hits any where in the perpendicular line, passing through the centre of the mark, the line of collimation of the telescope and direction of the shot agree. But if it hit to the right of the mark, so much do they differ. In order to correct which, bring the gun into the same position it was in before firing, and secure it there. Then file away as much of the fore-cock, on the side next the gun, as will let the intersection of the cross-hair fall somewhere on the line passing perpendicularly through the point where the shot fell; and it is then adjusted in that position, so much being filed off the side of the cock at a, fig. 17. and 18. as will allow the side b to be screwed closer, that the ends of the parallel bar may have no shake in the cocks. To correct it in the other position, and so to find the true 0 degrees of the gun, that is, to bring the line of collimation of the telescope, parallel-bar, and bore of the gun, truly parallel to each other, repeat the above with the trunnions perpendicular to the horizon, the sector being turned a quarter round upon its bar, so as to bring its plane vertical. The deviation of the shot found in this way is corrected by deepening one of the cocks, so that the vertical hair of the telescope may be brought to cover the line passing perpendicularly through the point where the bullet hits; the gun being placed in the same position it was in before it was fired. This adjustment being repeated two or three times, and any error that remains being corrected, the gun is fit to be mounted on its carriage for service. It is to be observed, that this sector will fit any gun, if the cocks and rectangular ends, &c. of the parallel bar be of the above dimensions, and will be equally applicable to all such pieces whose cocks have been adjusted, as if it had been adjusted separately with each of them. And if the sector be set at any degree of elevation, and the gun moved so as to bring the intersection of the cross-hairs on the object to be fired at (the limb of the sector being vertical), the bore of the gun will have the same elevation above it, in the true direction of the shot, whatever position the carriage of the gun is standing in. A telescope with cross-hairs, fixed to a common rifled musket, and adjusted to the direction of the shot, will make any person, with a very little practice, hit an object with more precision than the most experienced marksman.

For garrison-service, or for batteries, the ship or ⁴⁹their carriage, with two iron staples on each side ⁴⁹rigs, to put through a couple of poles to carry these guns from place to place with more dispatch, are as proper as any. But, for the field, a carriage like that at fig. 19. where the shafts push in upon taking out the iron pins a b, and moving the cross bar A,

PRACTICE

upon which the breech of the gun rests, as far down as the shafts were pushed in, is the property, since the whole can then be carried like a hand-barrow, over ditches, walls, or rough ground, all which may be easily understood from the figure.

The principal advantage that will accrue from the use of rifled ordnance, is the great certainty with which any object may be hit when fired at with them, since the shot deviates but little from its intended line of direction, and the gun is capable of being brought to bear upon the object, with great exactness, by means of the telescope and cross-hairs.

50
Mortars de-
scribed.

THE other pieces of artillery commonly made use of are mortars, howitzers, and royals. The mortars are a kind of short cannon of a large bore, with chambers for the powder, and are made of brass or iron. Their use is to throw hollow shells filled with powder, which falling on any building, or into the works of a fortification, burst, and with their fragments destroy every thing near them. Carcasses are also thrown out of them; which are a sort of shells with five holes, filled with pitch and other materials, in order to set buildings on fire; and sometimes baskets full of stones, of the size of a man's fist, are thrown out of them upon an enemy placed in the covert-way in the time of a siege. Of late the ingenious General Desaguliers has contrived to throw bags filled with grape-shot, containing in each bag from 400 to 600 shot of different dimensions, out of mortars. The effect of these is tremendous to troops forming the line of battle, passing a defile, or landing, &c. the shot pouring down like a shower of hail on a circumference of above 300 feet.

Mortars are chiefly distinguished by the dimensions of their bore; for example, a 13-inch mortar is one the diameter of whose bore is 13 inches, &c.—The land-mortars are those used in sieges, and of late in battles. They are mounted on beds, and both mortar and bed are transported on block carriages. There is likewise a kind of land-mortars mounted on travelling carriages, invented by count Buckeburg, which may be elevated to any degree; whereas all the English mortars are fixed to an angle of 45°. This custom, however, does not appear to have any foundation in reason. In a siege, shells should never be thrown with an angle of 45 degrees, excepting one case only; that is, when the battery is so far off, that they cannot otherwise reach the works: for when shells are thrown out of the trenches into the works of a fortification, or from the town into the trenches, they should have as little elevation as possible, in order not to bury themselves, but to roll along the ground, whereby they do much more damage, and occasion a much greater consternation among the troops, than if they sunk into the ground. On the contrary, when shells are thrown upon magazines, or any other buildings, the mortars should be elevated as high as possible, that the shells may acquire a greater force in their fall, and consequently do more execution.

There are other kinds of mortars, called *partridge-mortars*, *hand-mortars*, and *firelock-mortars*; which last are also called *bombards*. The partridge-mortar is a common one, surrounded with 13 other little mortars bored round its circumference, in the body of the metal; the middle one is loaded with a shell, and the others with grenades. The vent of the large mortar

being fired, communicates its fire to the rest; so that both the shell and grenades go off at once. Hand-mortars were frequently used before the invention of cohorns. They were fixed at the end of a staff four feet and a half long, the other end being shod with iron to stick in the ground; and while the bombardier with one hand elevated it at pleasure, he fired it with the other. The firelock-mortars, or bombards, are small mortars fixed to the end of a firelock. They are loaded as all common firelocks are; and the grenade, placed in the mortar at the end of the barrel, is discharged by a flint-lock. To prevent the recoil hurting the bombardier, the bombard rests on a kind of halberd made for that purpose.

The chamber in mortars is the place where the powder is lodged. They are of different forms, and made variously by different nations; but the cylindric seems to be preferable to any other form.

The howitz is a kind of mortar mounted on a field-carriage like a gun: it differs from the common mortars in having the trunnions in the middle, whereas those of the mortar are at the end. The construction of howitzes is as various and uncertain as that of mortars, excepting that the chambers are all cylindric. They are distinguished by the diameter of their bore; for instance, a 10-inch howitz is that which has a bore of 10 inches diameter, and so of others. They were much more lately invented than mortars, and indeed are plainly derived from them.

Royals are a kind of small mortars, which carry a shell whose diameter is 5.5 inches. They are mounted on beds in the same way as other mortars.

Fig. 20. represents a mortar; and the names of its parts are as follow.

AB, the whole length of the mortar.

AC, the muzzle.

CD, chase.

DE, reinforce.

EF, breech.

GH, trunnions.

a, vent.

b, dolphins.

c d, vent-alstragal and fillets.

d e, breech-ring and ogee.

f g, reinforce-ring and ogee.

g h, reinforce-alstragal and fillets.

i k, muzzle-alstragal and fillets.

k l, muzzle-ring and ogee.

l m, muzzle mouldings.

n, shoulders.

Interior parts.

o, chamber.

p, bore.

q, mouth.

r, vent.

The mortar-beds are formed of very solid timber, and placed upon very strong wooden frames, fixed in such a manner, that the bed may turn round. The fore-part of these beds is an arc of a circle described from the centre on which the whole turns.

There are several instruments employed in the loading of cannon. The names of these are as follow:

1. The lantern or ladle, which serves to carry the powder

51
Howitzes
and royals.

52
Parts of a
mortar.

53
instru-
ments used
in loading
cannon.

powder into the piece, and which consists of two parts, viz. of a wooden box, appropriated to the caliber of the piece for which it is intended, and of a caliber and a half in length with its vent; and of a piece of copper nailed to the box, at the height of a half caliber.—This lantern must have three calibers and a half in length, and two calibers in breadth, being rounded at the end to load the ordinary pieces.

2. The rammer is a round piece of wood, commonly called a *box*, fastened to a stick 12 foot long, for the pieces from 12 to 33 pounders; and 10 for the 8 and 4 pounders; which serve to drive home the powder and ball to the breach.

3. The sponge is a long staff or rammer, with a piece of sheep or lamb-skin wound about its end, to serve for scouring the cannon when discharged, before it be charged with fresh powder; to prevent any spark of fire from remaining in her, which would endanger the life of him who should load her again.

4. Wad-few consists of two points of iron turned serpent-wise, to extract the wad out of the pieces when one wants to unload them, or the dirt which had chanced to enter into it.

5. The boteveux are sticks two or three feet long, and an inch thick, split at one end, to hold an end of the match twisted round it, to fire the cannon.

6. The priming-iron is a pointed iron rod, to clear the touch-hole of the pieces of powder or dirt; and also to pierce the cartridge, that it may sooner take fire.

7. The primer, which must contain a pound of powder at least, to prime the pieces.

8. The quoin of mire, which are pieces of wood with a notch on the side to put the fingers on, to draw them back or push them forward when the gunner points his piece. They are placed on the sole of the carriage.

9. Laden-plates, which are used to cover the touch-hole, when the piece is charged, lest some dirt should enter it and stop it.

Before charging the piece, it is well sponged, to clean it of all filth and dirt within-side; then the proper weight of gunpowder is put in and rammed down; care being taken that the powder be not bruised in ramming, which weakens its effect; it is then run over by a little quantity of paper, hay, or the like; and lastly, the ball is thrown in.

To point, level, or direct the piece, so as to play against any certain point, is done by the help of a quadrant with a plummet: which quadrant consists of two branches made of brass or wood; one about a foot long, eight lines broad, and one line in thickness; the other four inches long, and the same thickness and breadth as the former. Between these branches is a quadrant, divided into 90 degrees, beginning from the shorter branch, and furnished with thread and plummet.

The longest branch of this instrument is placed in the cannon's mouth, and elevated or lowered till the thread cuts the degree necessary to hit the proposed object. Which done, the cannon is primed, and then set fire to. The method by the sector however, proposed by Dr Lind, is certainly in all cases to be preferred.

A 24 pounder may very well fire 90 or 100 shots, every day in summer; and 60 or 75 in winter. In case of necessity, it may fire more. And some French of-

ficers of artillery assure, that they have caused such a piece to fire every day 150 shots in a siege.—A 16 and a 12 pounder fire a little more, because they are easier served. There have even been some occasions, where 200 shots have been fired from these pieces in the space of nine hours, and 138 in the space of five. In quick firing, tubes are made use of. They are made of tin, and their diameter is two tenths of an inch, being just sufficient to enter into the vent of the piece. They are about six inches long, with a cap above, and cut slanting below, in the form of a pen; the point is strengthened with some folder, that it may pierce the cartridge without bending. Through this tube is drawn a quick-match, the cap being fitted with mealed powder moistened with spirits of wine. To prevent the mealed powder from falling out by carriage, a cap of paper or flannel steeped in spirits of wine is tied over it. To range pieces in a battery, care must be taken to recognise well the ground where it is to be placed, and the avenues to it. The pieces must be armed, each with two lanterns or ladders, a rammer, a sponge, and two priming-irons. The battery must also be provided with carriages, and other implements, necessary to remount the pieces which the enemy should chance to dismount.

To serve expeditiously and safely a piece in a battery, it is necessary to have to each a sack of leather, large enough to contain about 20 pounds of powder to charge the lanterns or ladders, without carrying them to the magazine; and to avoid thereby making those trains of powder in bringing back the lantern from the magazine, and the accidents which frequently happen thereby.

A battery of three pieces must have 30 gabions, because six are employed on each of the two sides or epaulements, which make 12, and nine for each of the two merlons.

There ought to be two gunners and six soldiers to each piece, and four officers of artillery.

The gunner, posted on the right of the piece, must take care to have always a pouch-full of powder, and two priming irons; his office is to prime the piece, and load it with powder. The gunner on the left fetches the powder from the little magazine, and fills the lantern or ladle which his comrade holds; after which, he takes care that the match be very well lighted, and ready to set fire to the piece at the first command of the officer.

There are three soldiers on the right, and three on the left of the piece. The two first take care to ram and sponge the piece, each on his side. The rammer and sponge are placed on the left, and the lantern or ladle on the right. After having rammed well the wad put over the powder, and that put over the bullet, they then take each a handspike, which they pass between the foremost spokes of the wheel, the ends whereof will pass under the head of the carriage, to make the wheel turn round, leaning on the other end of the handspike, towards the embrasure.

It is the office of the second soldier on the right, to provide wad, and to put it into the piece, as well over the powder as over the bullet; and that of his comrade on the left, to provide 50 bullets, and, every time the piece is to be charged, to fetch one of them and put it into the piece after the powder has been rammed.

med. Then they both take each an handspike, which they pass under the hind part of the wheel, to push it in battery.

The officer of artillery must take care to have the piece diligently served.

In the night he must employ the gunners and soldiers, who shall relieve those who have served 24 hours to repair the embrasures.

If there be no water near the battery, care must be taken to have a cask filled with it, in which to dip the sponges and cool the pieces every 10 or 12 rounds.

The carriage for a mortar of 12 inches of diameter must be 6 foot long, the flasks 12 inches long and 10 thick. The trunnions are placed in the middle of the carriage.

The carriage of an 18 inch mortar must be 4 foot long; and the flasks 11 inches high, and 6 thick.

To mount the mortars of new invention, they use carriages of cast iron.

In Germany, to mount mortars from 8 to 9 inches, and carry them into the field, and execute them horizontally as a piece of cannon, they make use of a piece of wood 8 feet 2 inches long, with a hole in the middle to lodge the body of the mortar and its trunnions as far as their half diameter, and mounted on two wheels four feet high, to which they join a vantrain proportioned to it, and made like those which serve to the carriages of cannons.

Having mounted the mortar on its carriage, the next thing is to calibrate the bomb, by means of a great caliber, the two branches whereof embrace the whole circumference of the bomb: these two branches are brought on a rule where the different calibers are marked, among which that of the bomb is found.

If no defect be found in the bomb, its cavity is filled, by means of a funnel, with whole gunpowder; a little space or liberty is left, that when a fusee or wooden tube, of the figure of a truncated cone, is driven thro' the aperture, (with a wooden mallet, not an iron one, for fear of accident), and fastened with a cement made of quick-lime, ashes, brick-dust, and steel-slings worked together in a glutinous water, or of four parts of pitch, two of colophony, one of turpentine, and one of wax, the powder may not be bruised. This tube is filled with a combustible matter, made of two ounces of nitre, one of sulphur, and three or more of gunpowder dust well rammed. See FUZE.

This fusee set on fire, burns slowly till it reaches the gunpowder; which goes off at once, bursting the shell to pieces with incredible violence. Special care, however, must be taken, that the fusee be so proportioned, as that the gunpowder do not take fire ere the shell arrives at the destined place; to prevent which, the fusee is frequently wound round with a wet clammy thread.

Batteries consist,—1. Of an epaulment to shelter the mortars from the fire of the enemy. 2. Of platforms on which the mortars are placed. 3. Of small magazines of powder. 4. Of a boyau which leads to the great magazine. 5. Of ways which lead from the battery to the magazine of bombs. 6. Of a great ditch before the epaulment. 7. Of a berm or retraite.

The platforms for mortars of 12 inches must have 9 feet in length, and 6 in breadth.—The lambourds for

common mortars must be four inches thick; those of a concave chamber of 8 lb. of powder, 5 inches; those of 12 lb. 6 inches; those of 18 lb. 7 inches, or thereabouts. Their lengths at discretion, provided there be enough to make the platforms 9 feet long.—The forepart of the platform will be situated at two foot distance from the epaulment of the battery.—The bombardiers, to shelter themselves in their battery, and not be seen from the town besieged, raise an epaulment of 7 foot or more high, which epaulment has no embrasures.

To serve expeditiously a mortar in battery, there are required,—five strong handspikes; a dame or rammer, of the caliber of the conic chamber, to ram the wad and the earth; a wooden knife a foot long, to place the earth round the bomb; an iron scraper two feet long, one end whereof must be four inches broad and round-wise, to clean the bore and the chamber of the mortar, and the other end made in form of a spoon to clean the little chamber; a kind of brancard to carry the bomb, a shovel, and pick-ax.

The officer who is to mind the service of the mortar, must have a quadrant to give the degrees of elevation.

Five bombardiers, or others, are employed in that service; the first must take care to fetch the powder to charge the chamber of the mortar, putting his priming-iron in the touch-hole before he charges the chamber; and never going to fetch the powder before he has asked his officer at what quantity of powder he designs to charge, because more or less powder is wanted according to the distance where it is fired; the same will take care to ram the wad and earth, which another soldier puts in the chamber.

The soldier on the right will put again two shovels full of earth in the bottom of the bore, which should be likewise very well rammed down.

This done, the rammer or dame is returned into its place, against the epaulment on the right of the mortar: he takes an handspike in the same place to post himself behind the carriage of the mortar, in order to help to push it into battery: having laid down his handspike, he takes out his priming-iron, and primes the touch-hole with fine powder.

The second soldier on the right and left will have by that time brought the bomb ready loaded, which must be received into the mortar by the first soldier, and placed very strait in the bore or chase of the mortar.

The first, on the right, will furnish him with earth to put round the bomb, which he must take care to ram close with the knife given him by the second on the left.

This done, each shall take a handspike, which the two first, on the right and left, shall put under the pegs of retreat of the forepart, and the two behind under those of the hind-part; and they together push the mortar in battery.

Afterwards the officer points or directs the mortar.

During that time, the first soldier takes care to prime the touch-hole of the mortar, without ramming the powder; and the last on the right, must have the match ready to set fire to the fusee of the bomb on the right, while the first is ready with his on the left,

ABell Sculp.

The foremost soldiers will have their handspikes ready to raise the mortar upright, as soon as it has discharged; while the hindmost on the left shall, with the scraper, clean the bore and chamber of the mortar.

The magazine of powder for the service of the battery, shall be situated 15 or 20 paces behind, and covered with boards, and earth over it.—The loaded bombs are on the side of the said magazine, at five or six paces distance.

The officer who commands the service of the mortar, must take care to discover, as much as possible, with the eye, the distance of the place where he intends to throw his bomb, giving the mortar the degree of elevation, according to the judgment he has formed of the distance. Having thrown the first bomb, he must diminish or increase the degrees of elevation, according to the place upon which it shall fall. Several make use of tables to discover the different distances according to the differences of the elevations of the mortar, especially the degrees of the quadrant from 1 to 45; but these, from the principles already laid down, must be fallacious.

The petard is the next piece of artillery which deserves our attention, and is a kind of engine of metal, somewhat in shape of a high-crowned hat, serving to break down gates, barricades, draw-bridges, or the like works, which are intended to be surprized. It is very short, narrow at the breech, and wide at the muzzle, made of copper mixed with a little brass, or of lead with tin.

The petards are not always of the same height and bigness; they are commonly 10 inches high, 7 inches of diameter at top, and 10 inches at bottom. They weigh commonly 40, 45, and 50 pounds.

The madrier, on which the petard is placed, and where it is tied with iron circles, is of two feet for its greatest width, and of 18 inches on the sides, and no thicker than a common madrier. Under the madrier are two iron-bars passed crosswise, with a hook, which serves to fix the petard.

To charge a petard 15 inches high, and 6 or 7 inches of caliber or diameter at the bore, the inside must be first very well cleaned and heated, so that the hand may bear the heat; then take the best powder that may be found, throw over it some spirit of wine, and expose it to the sun, or put it in a frying-pan; and when it is well dried, 5 or 6 lb. of this powder is put into the petard, which reaches within three fingers of the mouth: the vacancies are filled with tow, and stopped with a wooden tampon; the mouth being strongly bound up with cloth tied very tight with ropes; then it is fixed on the madrier, that has a cavity cut in it to receive the mouth of the petard, and fastened down with ropes.

Some, instead of gun-powder for the charge, use one of the following composition, viz. gun-powder seven pounds, mercury sublimate one ounce, camphor eight ounces; or gun-powder six pounds, mercury sublimate three ounces, and sulphur three; or gun-powder six, beaten glass $\frac{1}{2}$ an ounce, and camphor $\frac{1}{2}$.

Before any of these pieces are appropriated for service, it is necessary to have each undergo a particular trial of its soundness, which is called a *proof*, to be made by or before one authorized for the purpose, called the *proof-master*.

To make a proof of the piece, a proper place is chosen, which is to be terminated by a mount of earth very thick to receive the bullets fired against it, that none of them may run through it. The piece is laid on the ground, supported only in the middle by a block of wood. It is fired three times: the first with powder of the weight of the bullet, and the two others with $\frac{1}{2}$ of the weight; after which a little more powder is put in to finge the piece; and after this, water, which is imprefsed with a sponge, putting the finger on the touch-hole, to discover if there be any cracks; which done, they are examined with the eat, which is a piece of iron with three grasps, disposed in the form of a triangle, and of the caliber of the piece; then it is visited with a wax-candle, but it is of very little service in the small pieces, because if they be a little long, the smoke extinguishes it immediately. See Plate xlii.

Besides the large pieces already mentioned, invented for the destruction of mankind, there are others called *small guns*, viz. muskets of ramparts, common muskets, fusils, carabines, musketoons, and pistols.

A musket, or musquet, is a fire-arm borne on the shoulder, and used in war, formerly fired by the application of a lighted match, but at present with a flint and lock. The common musket is of the caliber of 20 leaden balls to the pound, and receives balls from 22 to 24: its length is fixed to 3 feet 8 inches from the muzzle to the touch-pan.

A fusil, or fire-lock, has the same length and caliber; and serves at present instead of a musket.

A carabine is a small sort of fire-arm, shorter than a fusil, and carrying a ball of 24 in the pound, borne by the light-horse, hanging at a belt over the left shoulder. This piece is a kind of medium between the pistol and the musket; and bears a near affinity to the arquebuss, only that its bore is smaller. It was formerly made with a match-lock, but of late only with a flint-lock.

The musketoon is of the same length of the carabine, the barrel polished, and clean within. It carries five ounces of iron, or seven and a half of lead, with an equal quantity of powder.

The barrel of a pistol is generally 14 inches long.

G U N

GUN-POWDER, a composition of saltpetre, fulphur, and charcoal, mixed together, and usually granulated; which easily takes fire, and, when fired, rarifies, or expands with great vehemence, by means of its elastic force.

It is to this powder we owe all the action and effect

G U N

of guns, ordnance, &c. so that the modern military art, fortification, &c. in a great measure depend thereon.

Invention of GUN-POWDER. See GUN.

Method of making GUN-POWDER. Dr Shaw's receipt for this purpose is as follows: Take four ounces of

57
Of the petard.

58
Of small arms.

Gun-
powder.

of refined saltpetre, an ounce of brimstone, and six drams of small-coal: reduce these to a fine powder, and continue beating them for some time in a stone mortar, with a wooden pestle, wetting the mixture between whiles with water, so as to form the whole into an uniform paste, which is reduced to grains, by passing it through a wire-sieve fit for the purpose; and in this form being carefully dried, it becomes the common gun-powder.

For greater quantities, mills are usually provided; by means of which more work may be performed in one day, than a man can do in a hundred.

The nitre or saltpetre is refined thus: Dissolve four pounds of rough nitre as it comes to us from the Indies, by boiling it in as much water as will commodiously suffice for that purpose: then let it shoot for two or three days in a covered vessel of earth, with sticks laid across for the crystals to adhere to. These crystals being taken out, are drained and dried in the open air.

In order to reduce this salt to powder, they dissolve a large quantity of it in as small a proportion of water as possible; then keep it constantly stirring over the fire, till the water exhales, and a white dry powder is left behind.

In order to purify the brimstone employed, they dissolve it with a very gentle heat; then scum and pass it through a double strainer. If the brimstone should happen to take fire in the melting, they have an iron cover that fits on close to the melting vessel, and damps the flame. The brimstone is judged to be sufficiently refined if it melts, without yielding any fetid odour, between two hot iron-plates, into a kind of red substance.

The coal for the making of gun-powder is either that of willow, or hazel, well charred in the usual manner, and reduced to powder. And thus the ingredients are prepared for making this commodity: but as these ingredients require to be intimately mixed, and as there would be danger of their firing if beat in a dry form, the method is to keep them continually moist, either with water, urine, or a solution of sal ammoniac: they continue thus stamping them together for twenty-four hours, after which the mass is fit for corning and drying in the sun, or otherwise, so as sedulously to prevent its firing.

Different kinds of Gun-powder. The three ingredients of gun-powder are mixed in various proportions according as the powder is intended for muskets, great guns, or mortars: though these proportions seem not to be perfectly adjusted or settled by competent experience.

Semenowitz, for mortars, directs an hundred pounds of saltpetre, twenty-five of sulphur, and as many of charcoal; for great guns, an hundred pounds of saltpetre, fifteen pound of sulphur, and eighteen pound of charcoal; for muskets and pistols, an hundred pound of saltpetre, eight pound of sulphur, and ten pound of charcoal. Miethuis extols the proportion of one pound of saltpetre to three ounces of charcoal, and two or two-and-a-quarter of sulphur; than which, he affirms, no gun-powder can possibly be stronger. He adds, that the usual practice of making the gun-powder weaker for mortars than guns, is without any foundation, and renders the expence needlessly much

Gun-
powder.

greater: for whereas to load a large mortar, twenty-four pound of common powder is required, and consequently, to load it ten times, two hundred and forty pound, he shews, by calculation, that the same effect would be had by one hundred and fifty pound of the strong powder.

To increase the strength of powder, Dr Shaw thinks it proper to make the grains considerably large, and to have it well sifted from the small dust. We see that gun-powder, reduced to dust, has little explosive force; but when the grains are large, the flame of one grain has a ready passage to another, so that the whole parcel may thus take fire nearly at the same time, otherwise much force may be lost, or many of the grains go away as shot unfired.

It should also seem that there are other ways of increasing the strength of powder, particularly by the mixture of salt of tartar; but perhaps, adds the last-mentioned author, it were improper to divulge any thing of this kind, as gun-powder seems already sufficiently destructive.

Method of Trying and Examining Gun-powder. There are two general methods of examining gun-powder; one with regard to its purity, the other with regard to its strength. Its purity is known by laying two or three little heaps near each other upon white paper, and firing one of them. For if this takes fire readily, and the smoke rises upright, without leaving any dross or sculent matter behind, and without burning the paper, or firing the other heaps, it is esteemed a sign that the sulphur and nitre were well purified, that the coal was good, and that the three ingredients were thoroughly incorporated together: but if the other heaps also take fire at the same time, it is presumed, that either common salt was mixed with the nitre, or that the coal was not well ground, or the whole mass not well beat, and mixed together; and if either the nitre or sulphur be not well purified, the paper will be black or spotted.

In order to try the strength of gun-powder, there are two kinds of instruments in use; but neither of them appear so exact as the common method of trying with what velocity a certain weight of powder will throw a ball from a musket.

There has been much talk of a white powder, which, if it answered the character given it, might be a dangerous composition; for they pretend that this white powder will throw a ball as far as the black, yet without making a report: but none of the white powder we have seen, says Dr Shaw, answers to this character; being, as we apprehend, commonly made either with touchwood or camphor, instead of coal.

Under the article GUNNERY, the physical cause of the explosion of powder, and the force wherewith it expands, have been so fully considered, that it would be superfluous to add any thing here concerning them. Only we may observe, that though it is commonly made use of for military purposes only in small quantities, and confined in certain vessels; yet when large quantities are fired at once, even when unconfined, in the open air, it is capable of producing terrible destruction. The accounts of damage done by the blowing up of magazines, powder-mills, &c. are too numerous and well-known to be here taken notice of. The following is a relation of what even a moderate quantity of

of powder will accomplish, when fired in the open air. "The king of Navarre took Monfegur. Captain Milon inclosed 500 pounds of powder in a bag, which he found means to introduce, by a drain from the town, into the ditch between two principal gates; the end of the leader was hid in the grafs. Every thing being ready to play off this machine, the king gave us leave to go and fee its effects; which was furprising. For one of the gates was thrown into the middle of the town, and the other into the field fifty paces from the wall: all the vaults were destroyed, and a paffage was made in the wall for three men to enter abreast, by which the town was taken."—For further accounts of the force of large quantities of powder, fee the article MINES.

To recover damaged GUN-POWDER. The method of the powder-merchants is, to put part of the powder on a fail-cloth, to which they add an equal weight of what is really good; and with a fhovel mingle it well together, dry it in the fun, and barrel it up, keeping it in a dry and proper place. Others again, if it be very bad, restore it by moistening it with vinegar, water, urine, or brandy: then they beat it fine, scarce it, and to every pound of powder add an ounce, an ounce and a half, or two ounces, according as it is decayed, of melted falt-petre. Afterwards, these ingredients are to be moistened and mixed well, so that nothing can be discerned in the composition, which may be known by cutting the mafs; and then they granulate it as aforefaid. In case the powder be in a manner quite spoiled, the only way is to extract the falt-petre with water, according to the usual manner, by boiling, filtrating, evaporating, and crystallizing; and then with fresh sulphur and charcoal to make it up anew again.

In regard to the medical virtues of gun-powder, Boerhaave informs us, that the fume of it affords a very healthy fume in the height of the plague, because the explosive acid vapour of nitre and sulphur corrects the air; and that the same vapour, if received in a small clofe pent-up place, kills insects.

It is enacted by 5 and 11 of Geo. I. and 5 Geo. II. c. 20. that gun-powder be carried to any place in a covered carriage; the barrels being clofe-jointed; or in cafes and bags of leather, &c. And persons keeping more than 200 pounds weight of gun-powder at one time, within the cities of London and Westminster, or the suburbs, &c. are liable to forfeitures if it be not removed; and justices of peace may issue warrants to search for, seize, and remove the same.

GUN-Shot Wounds. See SURGERY.

GUNTER (Edmund), an excellent English mathematician and astronomer, was born in Hertfordshire in 1581, and studied at Westminster school; from whence he removed to Oxford, where he took the degree of master of arts in 1606, and afterwards entered into holy orders. In 1615, he took the degree of bachelor of divinity: but being pecuniary eminent for his knowledge in the mathematics, he had two years before been chosen professor of astronomy in Gresham college, London; where he distinguished himself by his lectures and writings. He invented a small portable quadrant; and also the famous line of proportions, which, after the inventor, is called *Gunter's Scale*. He likewise published *Canon Triangulorum*;

VOL. V.

and a work entitled, *Of the sector, cross-staff, and other instruments*. This last was published, with an English translation of his *Canon Triangulorum*, in 4to, by Samuel Foster, professor of Gresham college. Mr Gunter died at that college in 1626.

GUNTER'S-Line, a logarithmic line, usually graduated upon scales, sectors, &c.

It is also called the *line of lines*, and *line of numbers*; being only the logarithms graduated upon a ruler, which therefore serves to solve problems instrumentally in the same manner as logarithms do arithmetically. It is usually divided into an hundred parts, every tenth whereof is numbered, beginning with 1, and ending with 10: so that, if the first great division, marked 1, stand for one tenth of any integer, the next division, marked 2, will stand for two tenths; 3, three tenths, and so on; and the intermediate divisions will, in like manner, represent 100th-parts of the same integer. If each of the great divisions represent 10 integers, then will the lesser divisions stand for integers; and if the greater divisions be supposed each 100, the subdivisions will be each 10.

Use of GUNTER'S-Line. 1. *To find the product of two numbers.* From 1 extend the compasses to the multiplier; and the same extent, applied the same way from the multiplicand, will reach to the product. Thus if the product of 4 and 8 be required, extend the compasses from 1 to 4, and that extent laid from 8 the same way will reach to 32, their product. 2. *To divide one number by another.* The extent from the divisor to unity, will reach from the dividend to the quotient: thus, to divide 36 by 4, extend the compasses from 4 to 1, and the same extent will reach from 36 to 9, the quotient sought. 3. *To three given numbers, to find a fourth proportional.* Suppose the numbers 6, 8, 9: extend the compasses from 6 to 8; and this extent, laid from 9 the same way, will reach to 12, the fourth proportional required. 4. *To find a mean proportional between any two given numbers.* Suppose 8 and 32: extend the compasses from 8, in the left-hand part of the line, to 32 in the right; then bisecting this distance, its half will reach from 8 forward, or from 32 backward, to 16, the mean proportional sought. 5. *To extract the square-root of any number.* Suppose 25; bisect the distance between 1 on the scale and the point representing 25: then the half of this distance, set off from 1, will give the point representing the root 5. In the same manner, the cube root, or that of any higher power, may be found by dividing the distance on the line between 1 and the given number, into as many equal parts as the index of the power expresses; then one of those parts, set from 1, will find the point representing the root required.

GUNTER'S Quadrant, one made of wood, brass, &c. containing a kind of stereographic projection of the sphere, on the plane of the equinoctial; the eye being supposed placed in one of the poles.

GUNTER'S Scale, called by navigators simply the *gunter*, is a large plain scale, generally two foot long, and about an inch and a half broad, with artificial lines delineated on it, of great use in solving questions in trigonometry, navigation, &c.

GUN-WALE, or GUNNEL, is the uppermost wale of a ship, or that piece of timber which reaches on ei-

ther side from the quarter-deck to the forecable, being the uppermoft bend which finishes the upper works of the hull, in that part in which are put the stanchions which fupport the wafe-trees.

GURK, an epifcopal town of Carinthia in Germany, feated on the river Gurk, in E. Long. 14. 15. N. Lat. 47. 10.

GURNARD, in ichthyology. See TRIGLA.

GUST, a sudden and violent fquall of wind, buifing from the hills upon the fea, fo as to endanger the fhipping near the fhore. Thiefe are peculiar to fome coafts, as thofe of South Barbary and Guinea.

GUSTAVUS I. king of Sweden, fon of Eric de Vafa duke of Gripsholm. Chriftian II. king of Denmark having made himfelf mafter of the kingdom of Sweden, confined Gultavus at Copenhagen; but he making his efcape, wandered a long time in the forefts, till the cruelties of the tyrant having occafioned a revolution, he was firft declared governor of Sweden, and in 1513 elected king. This prince introduced Lutheranism into his dominions, which in a little time fpread itfelf all over the kingdom. He died in 1560; having made his kingdom hereditary, which was before elective. See SWEDEN.

GUSTAVUS *Adolphus*, furnamed *the Great*, king of Sweden, was born at Stockholm in 1594, and fucceeded his father Charles in 1611. He efpoufed the caufe of the Proteftants in Germany, who were oppreffed and almoft entirely ruined by the emperor Ferdinand. He was a great warrior, and gained many victories, of which an account is given under the article SWEDEN. He was at laft killed in the battle of Lutzen, where his troops got the victory, and defeated two of the emperor's armies.

GUTTA *ROSACEA*, in medicine, called alfo fimplly *Rofacea*, from the little red dots or fiery tubercles difperfed about the face and nofe. See (the *Index* fubjoined to) MEDICINE.

GUTTA *Serena*, a difeafe in which the patient, without any apparent fault in the eye, is deprived of fight. See (the *Index* fubjoined to) MEDICINE.

GUTTA, in architecture, are ornaments in the form of little cones ufed in the Doric cornice, or on the architrave underneath the triglyphs, representing a fort of drops or bells.

GUTTURAL, a term applied to letters or founds pronounced or formed as it were in the throat.

GUTTY, in heraldry, a term ufed when anything is charged or fprinkled with drops. In blazoning, the colour of the drops is to be named; as gutty of fable, of gules, &c.

GUY (Thomas), an eminent bookfeller, founder of the hofpital for fick and lame in Southwark bearing his name, was the fon of Thomas Guy lighterman and coal-dealer in Horfleydown, Southwark. He was put apprentice, in 1660, to a bookfeller in the porch of Mercer's chapel; and fet up trade with a flock of about 200 l. in the houfe that forms the angle between Cornhill and Lombard-ftreet. The Englifh Bibles being at that time very badly printed, Mr Guy engaged with others in a fcheme for printing them in Holland and importing them; but this being put a flop to, he contracted with the univerfity of Oxford for their privilege of printing them, and carried on a great bible-trade for many years to a confiderable advantage. Thus he

began to accumulate money, and his gains refted in his hands; for being a fingle man, and very penurious, his expences could not be great when it was his cuftom to dine on his fhop-counter with no other table-covering than an old newspaper: he was moreover as little fcrupulous about the ftyle of his apparel. The bulk of his fortune, however, was acquired by purchafing feamens tickets during queen Anne's wars, and by South-Sea-ftock in the memorable year 1720. To thefe what great events fpring from trivial caufes, it may be obferved, that the public owe the dedication of the greateft part of his immense fortune to charitable purpofes, to the indifcreet officioufnefs of his maid-fervant in interfering with the mending of the pavement before the door. Guy had agreed to marry her; and, preparatory to his nuptials, had ordered the pavement before his door, which was in a neglected ftate, to be mended, as far as to a particular ftone which he pointed out. The maid, while her mafter was out, innocently looking on the pavours at work, faw a broken place that they had not repaired, and mentioned it to them: but they told her that Mr Guy had directed them not to go fo far. Well, fays fhe, do you mend it, tell him I bade you, and I know he will not be angry. It happened, however, that the poor girl prefumed too much on her influence over her careful lover, with whom a few extraordinary fhillings expence turned the fcale totally againft her: the men obeyed, Guy was enraged to find his orders exceeded, his matrimonial fcheme was renounced, and fo he built hofpitals in his old age. In the year 1707 he built and furnifhed three wards on the north-fide of the outer court of St Thomas's Hofpital in Southwark, and gave 100 l. to it annually for eleven years preceding the erection of his own hofpital: and, fome time before his death, erected the ftately iron gate, with the large houfes on each fide, at the expence of about 3000 l. He was 76 years of age when he formed the defign of building the hofpital contiguous to that of St Thomas's, which bears his name, and lived to fee it roofed in; dying in the year 1724. The charge of erecting this vaft pile amounted to 18,793 l. and he left 219,499 l. to endow it; a much larger fum than had ever been dedicated to charitable ufes in this kingdom by any one man. He erected an alms-houfe with a library at Tanworth in Staffordfhire (the place of his mother's nativity, and for which he was reprefentative in parliament) for 14 poor men and women; and for their penfions, as well as for the putting out poor children apprentices, bequeathed 125 l. a year. Laftly, he bequeathed 1000 l. to every one who could prove themfelves in any degree related to him.

Guv, a rope ufed to keep fteady any weighty body whilft it is hoifting or lowering, particularly when the fhip is shaken by a tempeftuous fea.

Guv is likewise a large flack rope, extending from the head of the main-maft to the head of the fore-maft, and having two or three large blocks fattened to the middle of it. This is chiefly employed to fustain the tackle ufed to hoift in and out the cargo of a merchant fhip, and is accordingly removed from the maft-head as foon as the vefel is laden or delivered.

GUYON (Johanna Mary Bouriers de la Motie), a French lady, memorable for her writings, and for her fufferings in the caufe of Quietifm, was defcended from

Gyarus
||
Gymna-
sium.

a noble family, and born at Montargis in 1648. She gave some extraordinary symptoms of illumination from her earliest infancy, and tried to take the veil before she was of age to dispose of herself; but her parents obliged her to marry a gentleman to whom they had promised her. She was a widow at the age of 28; when distinguishing herself in, and making many converts to, the way of contemplation and prayer, known by the name of *quietism*, complaints were made of her spiritualism; and she confined by order of the king, and severely examined for eight months. She was discharged; but was afterwards involved in the persecution of the archbishop of Cambray, and thrown into the Bastille, where she underwent many examinations: but nothing being made out against her, she once more obtained her liberty, and lived private to her death in 1717. She spent her latter years in mystical reveries; covering her tables, ceilings, and every thing that would receive them, with the fallies of a visionary imagination. Her pious verses were collected after her death, in 5 vols, entitled *Cantiques spirituels, ou d'Emblèmes sur l'Amour Divin*. Her publications were, *Le moyen court et très facile de faire Oraisons*; and *Le Cantique des Cantiques de Salomon interprété, selon le sens mystique*; which were condemned by the archbishop of Paris.

GYARUS, (anc. geog.), one of the Cyclades, 12 miles in compass, lying to the east of Delos. It was a desert island, and allotted for a place of banishment by the Romans.

GYBING, the act of shifting any boom-fail from one side of the mast to the other.

In order to understand this operation more clearly, it is necessary to remark, that by a boom-fail is meant any fail whose bottom is extended by a boom, the fore-end of which is hooked to its respective mast; so as to swing occasionally on either side of the vessel, describing an arch, of which the mast will be the centre. As the wind or the course changes, it also becomes frequently necessary to change the position of the boom, together with its fail, which is accordingly shifted to the other side of the vessel as a door turns upon its hinges. The boom is pushed out by the effort of the wind upon the fail, and is restrained in a proper situation by a strong tackle communicating with the vessels stern, and called the *sheet*. It is also confined on the fore-part by another tackle, called the *guy*.

GYMNASIARCH, in antiquity, the director of the gymnasium. He had two deputies under him; the one called *xystarch*, who presided over the athletes, and had the oversight of wrestling; the other was *gymnastes*, who had the direction of all other exercises.

GYMNASIUM, in Grecian antiquity, a place fitted for performing exercises.—The word is Greek, formed of γυμνός, “naked;” by reason they anciently put off their clothes, to practise with the more freedom.

Gymnasia, according to Potter, were first used at Lacedæmon, but were afterwards very common in all parts of Greece; and imitated, very much augmented, and improved, at Rome. They were not single edifices, but a knot of buildings united, being sufficiently capacious to hold many thousands of people at once; and having room enough for philosophers, rhetoricians, and the professors of all other sciences to read their

lectures,—and wrestlers, dancers, and all others who had a mind, to exercise,—at the same time, without the least disturbance or interruption. They consisted of a great many parts; the chief of which were the porticoes, cleothesium, palastra, conislorium, &c.

Athens had several gymnasia, of which the lyceum, academia, and cynosarges, were those of most note.

The lyceum was seated on the banks of the river Ilissus; and received its name from Apollo, to whom it was dedicated. This was the place where Aristotle taught philosophy, walking there every day till the hour of anointing: whence he and his followers were named *Peripatetics*.

The academy was part of the Ceramicus without the city, where Plato lectured.

The cynosarges was allotted for the populace.

GYMNASTICS, the art of performing the several bodily exercises, as wrestling, running, fencing, dancing, &c.

That part of medicine which regulates the exercises of the body, whether for preserving or relieving health, is also termed *gymnastice*.

GYMNOPYRIS, in natural history, a name given by Dr Hill to the pyrite of a simple internal structure, and not covered with a crust. See PYRITES.

Of these there are only two species. 1. A green variously shaped kind. 2. A botryoid kind.

The first species is the most common of all the pyrites, and appears under a great diversity of shapes. It is very hard and heavy, very readily gives fire with steel, but will not at all ferment with aquafortis. The second species is very elegant and beautiful, and its usual colour is a very agreeable pale green; but what most distinguishes it from all other pyrites is, that its surface is always beautifully elevated into tubercles of various sizes, resembling a cluster of grapes.

GYMNOSOPHISTS, a sect of philosophers who clothed themselves no farther than modesty required. There were some of these sages in Africa; but the most celebrated clan of them was in India. The African gymnosophists dwelt upon a mountain in Ethiopia, near the Nile, without the accommodation either of house or cell. They did not form themselves into societies like those of India; but each had his private recess, where he studied, and performed his devotions by himself. If any person had killed another by chance, he applied to these sages for absolution, and submitted to whatever penances they enjoined. They observed an extraordinary frugality, and lived only upon the fruits of the earth. Lucan ascribes to these gymnosophists several new discoveries in astronomy.

As to the Indian gymnosophists, they dwelt in the woods, where they lived upon the wild products of the earth, and never drank wine nor married. Some of them practised physic, and travelled from one place to another; these were particularly famous for their remedies against barrenness. Some of them, likewise, pretended to practise magic, and to foretell future events.

In general, the gymnosophists were wise and learned men: their maxims and discourses, recorded by historians, do not in the least favour of a barbarous education; but are plainly the result of great sense and deep thought. They kept up the dignity of their

Gymnastics
||

sophists.

Gymno-
spermia,
Gymnotus.

character to so high a degree, that it was never their custom to wait upon anybody, not even upon princes themselves; for which reason Alexander, who would not condescend to visit them in person, sent some of his courtiers to them in order to satisfy his curiosity. Their way of educating their disciples is very remarkable: every day, at dinner, they examined them how they had spent the morning; and every one was obliged to shew, that he had discharged some good office, practised some virtue, or improved in some part of learning: if nothing of this appeared, he was sent back without his dinner. They held a transmigration of souls; and it is probable that Pythagoras borrowed his doctrine from them.

GYMNOSPERMIA, in botany, from *γυμνός*, *naked*, and *σπέρμα*, *seed*; the first order in Linnæus's class of didynamia. It comprehends those plants of that class which have naked seeds. The seeds are constantly four in number, except in one genus, viz. *phryma*, which is monospermous. See BOTANY, p. 1292.

GYMNOTUS, in ichthyology, a genus of fishes belonging to the order of apodes. They have two tentacula at the upper lip; the eyes are covered with the common skin; there are five rays in the membrane of the gills; the body is compressed, and carinated on the belly with a fin. There are five species; the most remarkable of which is the electricus. This species is peculiar to Surinam; and is found in the rocky parts of the river, at a great distance from the sea. The most accurate description we have of this fish is in the Phil. Transf. for 1775, where Alex. Garden, M. D. gives an account of three of them brought to Charleston in South-Carolina. The largest was about three feet eight inches in length, and might have been from 10 to 14 inches in circumference about the thickest part of its body. The head was large, broad, flat, and smooth; impressed here and there with holes, as if perforated with a blunt needle, especially towards the sides, where they were more regularly ranged in a line on each side. There were two nostrils on each side; the first large, tubular, and elevated above the surface; the others small, and level with the skin. The eyes were small, flattish, and of a bluish colour, placed about three quarters of an inch behind the nostrils. The whole body, from about four inches below the head, was clearly distinguished into four longitudinal parts or divisions. The upper part or back was of a dark colour, and separated from the other parts on each side by the lateral lines. These lines took their rise at the base of the head, just above the pectoral fins, and run down the sides, gradually converging as the fish grew smaller to the tail. The second division was of a lighter and clearer colour than the first, inclining to blue. It seemed to swell out on each side; but towards the under part it is again contracted and sharpened into the third part or *carina*. This part is easily distinguished from the other two by its thinness, its apparent laxness, and by the reticulated skin of a more grey and light colour, with which it is covered. The *carina* begins about six or seven inches below the base of the head; and, gradually deepening or widening as it goes along, reaches down to the tail, where it is thinnest. The fourth part is a long, deep, soft and wavy fin, which takes its rise about three or

four inches at most below the head; and thus runs down the sharp edge of the *carina* to the extremity of the tail. The situation of the anus was very singular; being an inch more forward than the pectoral fins. Externally it seemed to be a pretty large *rima*; but the formed excrements were only the size of a quill of a common dunghill-fowl. There were two pectoral fins situated just behind the head, scarcely an inch in length; of a very thin, delicate consistence, and orbicular shape. They seemed to be chiefly useful in supporting and raising the head of the fish when he came up to breathe; which he was obliged to do every four or five minutes. Across the body were a number of small bands, annular divisions, or rather *ringæ* of the skin. By means of these the fish seemed to partake of the vermicular nature, had the power of lengthening or shortening its body like a worm, and could swim backwards as well as forwards, which is another property of the vermicular tribe. Every now and then it laid itself on one side in the water, as if to rest.

This fish hath the astonishing property of giving the electric shock to any person, or number of persons, either by the immediate touch with the hand, or by the mediation of any metallic conductor; and the person who kept them, told Dr Garden, that they had this property much stronger when first caught than afterwards: "The person (says he) who is to receive the shock, must take the fish with both hands, at some considerable distance asunder, so as to form the communication, otherwise he will not receive it: at least I never saw any one shocked from taking hold of it with one hand only; though some have assured me, that they were shocked by laying one hand on it. I myself have taken hold of the largest with one hand often, without ever receiving a shock; but I never touched it with both hands, at a little distance asunder, without feeling a smart shock. I have often remarked, that when it is taken hold of with one hand, and the other is put into the water over its body, without touching it, the person received a smart shock; and I have observed the same effect follow, when a number joined hands, and the person at one extremity of the circle took hold of or touched the fish, and the person at the other extremity put his hand into the water, over the body of the fish. The shock was communicated through the whole circle, as smartly as if both the extreme persons had touched the fish. In this it seems to differ widely from the *torpedo* *, or else we are much misinformed of the manner in which the benumbing effect of that fish is communicated. The shock with our Surinam fish gives, seems to be wholly electrical; and all the phenomena or properties of it exactly resemble those of the electric *aura* of our atmosphere when collected, as far as they are discoverable from the several trials made on this fish. This stroke is communicated by the same conductors, and intercepted by the interposition of the same original electric, or electric *per se* as they are used to be called. The keeper of this fish informs me, that he caught them in Surinam river, a great way up, beyond where the salt-water reaches; and that they are a fresh-water fish only. He says, that they are eaten, and by some people esteemed a great delicacy. They live on fish, worms, or any animal-food if it is cut small.

* See *Torpedo*.

Gymnotus. small so that they can swallow it. When small fishes are thrown into the water, they first give them a shock, which kills or so stupifies them, that they can swallow them easily, and without any trouble. If one of these small fishes, after it is shocked, and to all appearance dead, be taken out of the vessel where the electrical fish is, and put into fresh water, it will soon revive again. If a larger fish than they can swallow be thrown into the water, at a time that they are hungry, they give him some smart shocks, till he is apparently dead, and then they try to swallow or suck him in; but, after several attempts, finding he is too large, they quit him. Upon the most careful inspection of such fish, I could never see any mark of teeth, or the least wound or scratch on them. When the electrical fish are hungry, they are pretty keen after their food; but they are soon satisfied, not being able to contain much at one time. An electrical fish of three feet and upwards in length cannot swallow a small fish above three or at most three inches and a half long. I am told, that some of these have been seen in Surinam river upwards of 22 feet long, whose stroke or shock proved instant death to any person that unluckily received it."

Several other accounts of this fish have been published by different persons, but none of them so full and distinct as the above. They all agree that the electric virtue of the fish is very strong. Mr Fermín in his natural history of Surinam, published in 1765, tells us, that one cannot touch it with the hands, or even with a stick, without feeling a horrible numbness in the arms up to the shoulders; and he farther relates, that, making 14 persons grasp each other by the hands, while he grasped the hand of the last with one of his, and with the other touched the eel with a stick, the whole number felt so violent a shock, that he could not prevail on them to repeat the experiment. V. Vanderlott, in two letters from Rio Essequibo dated in 1761, makes two species, the black and the reddish; though he acknowledges, that, excepting the difference of colour and degree of strength, they are not materially different. In most experiments with these animals, he remarked a surprising resemblance between them and an electrical apparatus: nay, he observed, that the shock could be given to the finger of a person held at some distance from the bubble of air formed by the fish when he comes to the surface of the water to breathe; and he concluded, that at such times the electrical matter was discharged from its lungs. He mentions another characterizing circumstance, which is, that though metals in general were conductors of its electric property, yet some were found to be sensibly better than others for that purpose. Of this property Dr Priestley takes notice, and says that a gold ring is preferable to any thing else. The same is likewise observed by Linnæus. Dr Priestley adds, that the sensation is strongest when the fish is in motion, and is transmitted to a great distance; so that if persons in a ship happen to dip their fingers or feet in the sea, when the fish is swimming at the distance of 15 feet from them, they are affected by it. He also tells us, that the *gymnotus* itself, notwithstanding all its electric powers, is killed by the lobster.

GYNECEUM, among the ancients, the apartment of the women, a separate room in the inner part of the

house, when they employed themselves in spinning, weaving, and needle-work.

GYNECOCRACY, denotes the government of women, or a state where women are capable of the supreme command. Such are Britain and Spain.

GYNDANDRIA, (from *γυνή*, a "woman;" and *ανδρ*, a "man.") The name of the 20th class in Linnæus's sexual system, consisting of plants with hermaphrodite flowers, in which the stamina are placed upon the style, or, to speak more properly, upon a pillar-shaped receptacle, resembling a style, which rises in the middle of the flower, and bears both the stamina and pistil; that is, both the supposed organs of generation. See BOTANY, p. 1292.

The flowers of this class, says Linnæus, have a monstrous appearance, arising, as he imagines, from the singular and unusual situation of the parts of fructification.

GYPSIES, or EGYPTIANS, in our statutes, a kind of impostors and jugglers, who disguising themselves in uncouth habits, smearing their faces and bodies, and framing to themselves a canting language, wander up and down, and under pretence of telling fortunes, curing diseases, &c. abuse the common people, trick them of their money, and steal all that they can come at. There are several statutes made again them.

Egyptians coming into England are to depart the realm in fifteen days, or be imprisoned, by 22 Hen. VIII. cap. 10. And by 1 & 2 P. & M. cap. 4. any person importing them into this kingdom, shall forfeit forty pounds; and if they remain here above one month, or if any person, fourteen years old, consort with them, they are guilty of felony, without benefit of clergy; 5 Eliz. cap. 20. And we are informed by Sir M. Hale, that at one Suffolk assizes, no less than thirteen Gypsies were executed upon these statutes, a few years before the Restoration. See also 39 Eliz. cap. 4. § 2. 17 & Geo II. cap. 5. § 2.

The origin of this tribe of vagabonds is somewhat obscure; at least, the reason of the denomination is so. It is certain, the ancient Egyptians had the character of great cheats, and were famous for the subtilty of their impostures; whence the name might afterwards pass proverbially into other languages, as it is pretty certain it did into the Greek and Latin: on else, the ancient Egyptians, being much versed in astronomy, which in those days was little else but astrology, the name was on that score assumed by these tellers of good fortune.

Be this as it will, there is scarce any country of Europe but has its Egyptians, though not all of them under that denomination: the Latins call them *Ægyptii*; the Italians, *Cingani* and *Cingari*; the Germans, *Zigeuner*; the French, *Bohémiens*; others, *Saracens*; and others, *Tartari*, &c.

Münster, *Geogr. lib. iii. cap. 5.* relates, that they made their first appearance in Germany in 1417, exceedingly tawny and sun-burnt, and in pitiful array, though they affected quality, and travelled with a train of hunting-dogs after them, like nobles. The above date should probably have been 1517, as Münster himself owns he never saw any till 1524. He adds, that they had passports from king Sigismund of Bohemia, and other princes. Ten years afterwards, they came into France, and thence passed into England. Seve-

Gypses.

ral historians inform us, that when sultan Selim conquered Egypt in the year 1517, several of the natives refused to submit to the Turkish yoke; but, being at length subdued and banished, they agreed to disperse in small parties over the world, where their supposed skill in the black art gave them an universal reception in that age of superstition and credulity. In a few years, the number of their proselytes multiplied, and they became formidable to most of the states of Europe. Paquier, in his *Recherch. lib. iv. chap. 19.* relates a less probable origin of the Gypses, thus: On the 17th of April 1427, there came to Paris twelve penitents, or persons, as they said, adjudged to penance, viz. one duke, one count, and ten cavaliers or persons on horseback: they took on themselves the character of *Christians of the Lower Egypt*, expelled by the Saracens; who, having made application to the Pope, and confessed their sins, received for penance, that they should travel through the world for seven years, without ever lying on a bed. Their train consisted of 120 persons, men, women, and children; which were all that were left of 1200, who came together out of Egypt. They had lodgings assigned them in the chapel, and people went in crowds to see them. Their ears were perforated, and silver-buckles hung to them; their hair was exceedingly black, and frizzled; their women were ugly, thievish, and pretenders to telling of fortunes. The bishop soon afterwards obliged them to retire, and excommunicated such as had shewn them their hands.

By an ordonnance of the estates of Orleans in the year 1560, it was enjoined all these impostors, under the name of *Bohemians and Egyptians*, to quit the kingdom, on penalty of the galleys. Upon this they dispersed into lesser companies, and spread themselves over Europe. The first time we hear of them in England, was in the year 1530, when they were described by the statute already cited, 22 Hen. VIII. cap. 10. They were expelled from Spain in 1591.

Ralph. Volaterranus, making mention of them, affirms, that they first proceeded or strolled from among the Uxii, a people of Persia or Persia.

GYPsum, or PLASTER-STONE, in natural history, a genus of fossils, naturally and essentially simple, not inflammable nor soluble in water, and composed of flat small particles, which form bright, glossy, and in some degree transparent masses, not flexible or elastic, not giving fire with steel, nor fermenting with or being soluble in acid menstrua, and very easily calcined in the fire.

Of these gypsums, some are harder, others softer, and are of several colours, as white, grey, red, green, &c. sometimes distinct, and sometimes variously blended together.

The origin of all these gypsums is from the vitriolic acid and calcareous earth. See CHEMISTRY, n° 127. They are much used for stuccoing rooms, and for casting busts and statues; for which last purpose they are excellently adapted by the property they have of expanding when they set, or become solid, after being mixed with water. See PLASTER.

Gypsum by itself is very difficult of fusion: yet if a piece of forged iron is surrounded with gypsum in a crucible, and urged with a vehement heat, that metal, though otherwise unfusible, will be melted, and retain its malleability, though some say it assumes the nature of cast iron. Another very remarkable property of gypsum is, that when mixed with chalk, clay, limestone, and some other unfusible earths, they melt, in a heat not very great, into a yellowish glass. It is impossible, however, either to reduce this glass to a sufficient degree of fineness and transparency by itself, or by means of it to give a good yellow colour to other glass.

GYR-FALCO, in zoology, the name of a large and fierce species of falcon called in English the *jer-falcon*. See FALCO.

It is a very bold and daring bird, attacking all other fowl without reserve, particularly the heron and stork kinds. The other falcons are all afraid of this.

GYSHORN, a town of Germany in the duchy of Lunenburg, situated on the river Aller, in E. Long. 10. 45. N. Lat. 52. 50.

H.

H, The eighth letter and sixth consonant in our H, alphabet; though some grammarians will have it to be only an aspiration, or breathing. But nothing can be more ridiculous than to dispute its being a distinct sound, and formed in a particular manner by the organs of speech, at least in our language: witness the words *eat* and *beat*, *arm* and *harm*, *ear* and *hear*, *at* and *hat*, &c. as pronounced with or without the *h*.

It is pronounced by a strong expiration of the breath between the lips, closing, as it were, by a gentle motion of the lower jaw to the upper, and the tongue nearly approaching the palate.

There seems to be no doubt, but that our *h*, which is the same with that of the Romans, derived its figure

from that of the Hebrew ה. And, indeed, the Phœnicians, most ancient Greeks and Romans, used the same figure with our H, which in the series of all these alphabets keeps its primitive place, being the eighth letter.

H, used as a numeral, denotes 200; and with a dash over it, H, 200,000.

As an abbreviation, H was used by the ancients to denote *homo*, *hæres*, *hora*, &c. Thus H. B. stood for *heres bonorum*; and H. S. corruptly for L. L. S. *sesterc*; and H. A. for *Hadrianus*.

HAAG, or HAQ, a town of the duchy of Bavaria in Germany, seated on a hill on the west side of the river Inn, in E. Long. 12. 23. N. Lat. 48. 16.

HABAKKUK, one of the twelve lesser prophets, whose prophecies are taken into the canon of the Old Testa-

Gypsum
Gyhorn.

Testament. The name is wrote in the Hebrew with *h* *heth*; and signifies "a wrestler." There is no precise time mentioned in scripture when this Habakkuk lived; but from his predicting the ruin of the Jews by the Chaldeans, it may be concluded, that he prophesied before Zedekiah, or about the time of Manasseh. He is reported to have been the author of several prophecies which are not extant: but those that are indisputably his, are contained in three chapters. In these the prophet complains very pathetically of the disorders which he observed in the kingdom of Judæa. God reveals to him, that he would shortly punish them in a very terrible manner by the arms of the Chaldeans. He foretells the conquests of Nebuchadnezzar, his metamorphosis, and death. He foretells, that the vast designs of Jehoiakim would be frustrated. He speaks against a prince (probably the king of Tyre) who built with blood and iniquity; and he accuses another king (perhaps the king of Egypt) of having intoxicated his friend, in order to discover his nakedness. The third chapter is a song or prayer to God, whose majesty he describes with the utmost grandeur and sublimity of expression.

HABAT, a province of Asia, in Barbary, and in the kingdom of Fez. It is surrounded by the Mediterranean, the Straits of Gibraltar, and the Atlantic Ocean. The principal towns are Arzilla, Tetuan, and Ceuta; which last is in possession of the Spaniards.

HABDALA, a ceremony of the Jews observed on the evening of the sabbath, when every one of the family is come home. At that time they light a taper or lamp, with two wicks at least. The matter of the family then takes a cup, with some wine, mixed with fragrant spices, and having repeated a passage or two of scripture, as for example, "I will take the cup of salvation," &c. Psal. cxvi. "The Jews had light and gladness," &c. Eth. viii. he blesses the wine and spices. Afterwards he blesses the light of the fire; and then casts his eyes on his hands and nails, as remembering that he is going to work. The whole is intended to signify, that the sabbath is over, and is from that moment divided from the day of labour which follows. For this reason the ceremony is called *Habdala*, which signifies "distinction." After the ceremony is over, and the company breaks up, they wish one another, not "a good night," but "a good week."

HABES CORPUS, in law, is the great remedy in cases of *False Imprisonment*. The incapacity of the three other remedies referred to under that article, to give complete relief in every case, hath almost entirely antiquated them, and hath caused a general recourse to be had, in behalf of persons aggrieved by illegal imprisonment, to the present writ, the most celebrated in the English law. Of this there are various kinds made use of by the courts at Westminster, for removing prisoners from one court into another for the more easy administration of justice. Such is the *habeas corpus ad respondendum*, when a man hath a cause of action against one who is confined by the process of some inferior court; in order to remove the prisoner, and charge him with this new action in the court above. Such is that *ad satisfaciendum*, when a prisoner hath had judgment against him in an action, and the plaintiff is desirous to bring him up to some supe-

rior court to charge him with process of execution. Such also are those *ad prosequendum*, *testificandum*, *deliberandum*, &c.; which issue when it is necessary to remove a prisoner, in order to prosecute or bear testimony in any court, or to be tried in the proper jurisdiction wherein the fact was committed. Such is, lastly, the common writ *ad faciendum et recipiendum*, which issues out of any of the courts of Westminster-hall, when a person is sued in some inferior jurisdiction, and is desirous to remove the action into the superior court; commanding the inferior judges to produce the body of the defendant, together with the day and cause of his caption and detainer (whence the writ is frequently denominated an *habeas corpus cum causa*) to do and receive whatsoever the king's court shall consider in that behalf. This is a writ grantable of common right, without any motion in court; and it instantly supercedes all proceedings in the court below. But, in order to prevent the surreptitious discharge of prisoners, it is ordered by statute 1 & 2 P. & M. c. 13. that no *habeas corpus* shall issue to remove any prisoner out of any gaol, unless signed by some judge of the court out of which it is awarded. And, to avoid vexatious delays by removal of frivolous causes, it is enacted by statute 21 Jac. I. c. 23. that, where the judge of an inferior court of record is a barrister of three years standing, no cause shall be removed from thence by *habeas corpus* or other writ, after issue or demurrer deliberately joined: that no cause, if once remanded to the inferior court by writ of *procedendo* or otherwise, shall ever afterwards be again removed: and that no cause shall be removed at all, if the debt or damages laid in the declaration do not amount to the sum of five pounds. But an *expedient* having been found out to elude the latter branch of the statute, by procuring a nominal plaintiff to bring another action for five pounds or upwards, (and then by the course of the court the *habeas corpus* removed both actions together), it is therefore enacted by statute 12 Geo. I. c. 29. that the inferior court may proceed in such actions as are under the value of five pounds, notwithstanding other actions may be brought against the same defendant to a greater amount.

But the great and efficacious writ, in all manner of *Blackstone's* illegal confinement, is that of *habeas corpus ad subjiciendum*; directed to the person detaining another, and *ries* commanding him to produce the body of the prisoner, with the day and cause of his caption and detention, *ad faciendum, subjiciendum, et recipiendum*, to do, submit to, and receive whatsoever the judge or court awarding such writ shall consider in that behalf. This is a high prerogative writ, and therefore by the common law issuing out of the court of king's bench not only in term-time, but also during the vacation, by a *fiat* from the chief justice, or any other of the judges, and running into all parts of the king's dominions: for the king is at all times entitled to have an account, why the liberty of any of his subjects is restrained, wherever that restraint may be inflicted. If it issues in vacation, it is usually returnable before the judge himself who awarded it, and he proceeds by himself thereon; unless the term should intervene, and then it may be returned in court. Indeed, if the party were privileged in the courts of common pleas and exchequer, as being an officer or suitor of the court, an *habeas*

Habeas corpus.

habeas corpus ad subjiciendum might also have been awarded from thence; and, if the cause of imprisonment were palpably illegal, they might have discharged him: but, if he were committed for any criminal matter, they could only have remanded him, or taken bail for his appearance in the court of king's bench; which occasioned the common pleas to discountenance such applications. It hath also been said, and by very respectable authorities, that the like *habeas corpus* may issue out of the court of chancery in vacation: but, upon the famous application to lord Nottingham by Jenks, notwithstanding the most diligent searches, no precedent could be found where the chancellor had issued such a writ in vacation, and therefore his lordship refused it.

In the court of King's-bench it was, and is still, necessary to apply for it by motion to the court, as in the case of all other prerogative writs (*certiorari*, prohibition, *mandamus*, &c.) which do not issue as of mere course, without shewing some probable cause why the extraordinary power of the crown is called in to the party's assistance. For, as was argued by lord chief justice Vaughan, "it is granted on motion, because cause it cannot be had of course; and there is therefore no necessity to grant it: for the court ought to be satisfied that the party hath a probable cause to be delivered." And this seems the more reasonable, because (when once granted) the person to whom it is directed can return no satisfactory excuse for not bringing up the body of the prisoner. So that, if it issued of mere course, without shewing to the court or judge some reasonable ground for awarding it, a traitor or felon under sentence of death, a soldier or mariner in the king's service, a wife, a child, a relation, or a domestic, confined for insanity or other prudential reasons, might obtain a temporary enlargement by suing out an *habeas corpus*, though sure to be remanded as soon as brought up to the court. And therefore Sir Edward Coke, when chief justice, did not scruple, in 13 Jac. I. to deny a *habeas corpus* to one confined by the court of admiralty for piracy; there appearing, upon his own shewing, sufficient grounds to confine him. On the other hand, if a probable ground be shewn, that the party is imprisoned without just cause, and therefore hath a right to be delivered, the writ of *habeas corpus* is then a writ of right, which "may not be denied, but ought to be granted to every man that is committed, or detained in prison, or otherwise restrained, though it be by the command of the king, the privy-council, or any other."

In the articles LIBERTY and RIGHTS, we expatiated at large on the personal liberty of the subject. This was shewn to be a natural inherent right, which could not be surrendered or forfeited unless by the commission of some great and atrocious crime, and which ought not to be abridged in any case without the special permission of law. A doctrine coeval with the first rudiments of our constitution; and handed down to us from the Anglo-Saxons, notwithstanding all their struggles with the Danes, and the violence of the Norman conquest: asserted afterwards and confirmed by the conqueror himself and his descendants: and though sometimes a little impaired by the ferocity of the times, and the occasional despotism of jealous or

usurping princes, yet established on the firmest basis by the provisions of *magna charta*, and a long succession of statutes enacted under Edward III. To assert an absolute exemption from imprisonment in all cases, is inconsistent with every idea of law and political society; and in the end would destroy all civil liberty, by rendering its protection impossible: but the glory of the English law consists in clearly defining the times, the causes, and the extent, when, wherefore, and to what degree, the imprisonment of the subject may be lawful. This it is, which induces the absolute necessity of expelling upon every commitment the reason for which it is made; that the court, upon an *habeas corpus*, may examine into its validity; and according to the circumstances of the case may discharge, admit to bail, or remand the prisoner.

And yet, early in the reign of Charles I. the court of king's-bench, relying on some arbitrary precedents (and those perhaps misunderstood), determined * that they could not upon an *habeas corpus* either bail or deliver a prisoner, though committed without any cause assigned, in case he was committed by the special command of the king, or by the lords of the privy-council. This drew on a parliamentary inquiry, and produced the *petition of right*, 3 Car. I. which recites this illegal judgment, and enacts that no freeman hereafter shall be so imprisoned or detained. But when, in the following year, Mr Selden and others were committed by the lords of the council, in pursuance of his majesty's special command, under a general charge of "notable contempts and stirring up sedition against the king and government," the judges delayed for two terms (including also the long vacation) to deliver an opinion how far such a charge was bailable. And, when at length they agreed that it was, they however annexed a condition of finding sureties for the good behaviour, which still protracted their imprisonment; the chief justice Sir Nicholas Hyde, at the same time declaring †, that "if they were again remanded for that cause, perhaps the court would not afterwards grant a *habeas corpus*, being already made acquainted with the cause of the imprisonment." But this was heard with indignation and astonishment by every lawyer present; according to Mr Selden's own account of the matter, whose resentment was not cooled at the distance of four and twenty years.

These pitiful evasions gave rise to the statute 16 Car. I. c. 10. §. 8. whereby it is enacted, that if any person be committed by the king himself in person, or by his privy council, or by any of the members thereof, he shall have granted unto him, without any delay upon any pretence whatsoever, a writ of *habeas corpus*, upon demand or motion made to the court of king's bench or common-pleas; who shall therupon, within three court-days after the return is made, examine and determine the legality of such commitment, and do what to justice shall appertain, in delivering, bailing, or remanding such prisoner. Yet still in the case of Jenks, before alluded to, who in 1676 was committed by the king in council for a turbulent speech at Guildhall, new shifts and devices were made use of to prevent his enlargement by law; the chief justice (as well as the chancellor) declining to award a writ of *habeas corpus ad subjiciendum* in vacation, though

Habeas corpus.

Habeas
Corpus.Habeas
Habit.

though at last he thought proper to award the usual writs *ad deliberandum*, &c. whereby the prisoner was discharged at the Old Bailey. Other abuses had also crept into daily practice, which had in some measure defeated the benefit of this great constitutional remedy. The party imprisoning was at liberty to delay his obedience to the first writ, and might wait till a second and a third, called an *alias* and a *pluries*, were issued, before he produced the party: and many other vexatious shifts were practised to detain state-prisoners in custody. But whoever will attentively consider the English history may observe, that the flagrant abuse of any power, by the crown or its ministers, has always been productive of a struggle; which either discovers the exercise of that power to be contrary to law, or (if legal) restrains it for the future. This was the case in the present instance. The oppression of an obscure individual gave birth to the famous *habeas corpus* act, 31 Car. II. c. 2. which is frequently considered as another *magna carta* of the kingdom; and by consequence has also in subsequent times reduced the method of proceeding on these writs (though not within the reach of that statute, but issuing merely at the common law) to the true standard of law and liberty.

The statute itself enacts, 1. That the writ shall be returned and the prisoner brought up, within a limited time according to the distance, not exceeding in any case twenty days. 2. That such writs shall be endorsed, as granted in pursuance of this act, and signed by the person awarding them. 3. That on complaint and request in writing by or on behalf of any person committed and charged with any crime (unless committed for treason or felony expressed in the warrant, or for suspicion of the same, or as accessory thereto before the fact, or convicted or charged in execution by legal process) the lord chancellor or any of the twelve judges, in vacation, upon viewing a copy of the warrant, or affidavit that a copy is denied, shall (unless the party has neglected for two terms to apply to any court for his enlargement) award a *habeas corpus* for such prisoner, returnable immediately before himself or any other of the judges; and upon the return made shall discharge the party, if bailable, upon giving security to appear and answer to the accusation in the proper court of judicature. 4. That officers and keepers neglecting to make due returns, or not delivering to the prisoner or his agent within six hours after demand a copy of the warrant of commitment, or shifting the custody of a prisoner from one to another without sufficient reason or authority (specified in the act) shall for the first offence forfeit 100 l. and for the second offence 200 l. to the party grieved, and be disabled to hold his office. 5. That no person, once delivered by *habeas corpus*, shall be re-committed for the same offence, on penalty of 500 l. 6. That every person committed for treason or felony shall, if he requires it the first week of the next term or the first day of the next session of *oyer* and *terminer*, be indicted in that term or session, or else admitted to bail; unless the king's witnesses cannot be produced at that time: and if acquitted, or if not indicted and tried in the second term or session, he shall be discharged from his imprisonment for such imputed offence: but that no person,

Vol. V.

after the assizes shall be opened for the county in which he is detained, shall be removed by *habeas corpus*, till after the assizes are ended; but shall be left to the justice of the judges of assize. 7. That any such prisoner may move for and obtain his *habeas corpus*, as well out of the chancery or exchequer, as out of the king's bench or common pleas; and the lord chancellor or judges denying the same, on sight of the warrant or oath that the same is refused, forfeit severally to the party grieved the sum of 500 l. 8. That the writ of *habeas corpus* shall run into the counties palatine, cinque ports, and other privileged places, and the islands of Jersey and Guernsey. 9. That no inhabitant of England (except persons contracting, or convicted praying, to be transported; or having committed some capital offence in the place to which they are sent) shall be sent prisoner to Scotland, Ireland, Jersey, Guernsey, or any places beyond the seas, within or without the king's dominions: on pain that the party committing, his advisers, aiders, and assistants, shall forfeit to the party grieved a sum not less than 500 l. to be recovered with treble costs; shall be disabled to bear any office of trust or profit; shall incur the penalties of *præmunire*; and shall be incapable of the king's pardon.

This is the substance of that great and important statute: which extends (we may observe) only to the case of commitments for such criminal charge as can produce no inconvenience to public justice by a temporary enlargement of the prisoner; all other cases of unjust imprisonment being left to the *habeas corpus* at common law. But even upon writs at the common law it is now expected by the court, agreeable to ancient precedents and the spirit of the act of parliament, that the writ should be immediately obeyed, without waiting for any *alias* or *pluries*; otherwise an attachment will issue. By which admirable regulations, judicial as well as parliamentary, the remedy is now complete for removing the injury of unjust and illegal confinement. A remedy the more necessary, because the oppression does not always arise from the ill-nature, but sometimes from the mere inattention, of government. For it frequently happens in foreign countries, (and has happened in England during the temporary suspensions of the statute), that persons apprehended upon suspicion have suffered a long imprisonment, merely because they were forgotten.

HABICOT (Nicholas), a celebrated surgeon, born at Bonny in Gatiniois, acquired great reputation by his skill in his profession, and by his works; and died in 1624. He wrote a treatise on the plague, and several other curious works.

HABINGTON (William), an English poet and historian, was the son of Thomas Habington, Esq. He was born in 1605, at Hendlip in Worcestershire; and was educated at St Omers and at Paris. He died in 1654, and left several manuscripts in the hands of his son. His printed works are, 1. Poems under the title of *Cassura*. 2. The queen of Arragon, a tragi-comedy. 3. Observations upon History. 4. The history of Edward IV. king of England, written and published at the desire of Charles I. This work is composed in a very florid style.

HABIT, in philosophy, an aptitude or disposition either of mind or body, acquired by a frequent repetition

Habit
Hackney.

tion of the same act. See CUSTOM and HABIT.

HABIT is also used for a dress or garb, or the composition of garments, wherewith a person is covered; in which sense we say, the habit of an ecclesiastic, of a religious, &c. a military habit, &c.

HABIT and REPUTE, in Scots law, the common opinion of the people, among whom a person lives, with respect to any circumstance relating to him.

HABITUDE, among schoolmen, the respect or relation one thing bears to another. See RELATION.

HABSBURG, or HAPSBERG, an ancient castle of Switzerland, in the canton of Bern. It is the place where the ancient counts of Hapsburg resided, and is seated near the lake of Lucern, and to the east of the town of that name. E. Long. 8. 10. N. Lat. 47. 22.

HACHA, a sea-port town of South America, in Terra Firma, seated at the mouth of a river of the same name. Here the Spanish gallions touch at their arrival in South America, from whence expresses are sent to all the settlements to give them notice of it. W. Long. 72. 0. N. Lat. 11. 30.

HACKET (John), bishop of Litchfield and Coventry, was born in 1592. In 1623, he was made chaplain to James I. and prebendary of Lincoln: and soon after obtained the rectory of St Andrew's Holborn, with that of Cheam in Surrey; his patron telling him, he intended Holborn for wealth, and Cheam for health. In 1642 he was presented to a prebendary and rectory; but was deprived of the enjoyment of them, as well as of St Andrew's, by the ensuing troubles. He then lived retired at Cheam with little disturbance, until he recovered his preferments by the restoration of Charles II. by whom he was preferred to the see of Litchfield and Coventry in 1661. Finding the beautiful cathedral of Litchfield almost battered to the ground, he in eight years finished a complete church superior to the former, at his own expense of 20,000*l.* excepting 1000*l.* he had from the dean and chapter, with what he could procure from private benefactors. He laid out 1000*l.* on a prebendal house, his palaces at Litchfield and Ecclehall having been demolished during the civil wars: and beside these acts of munificence, left several other benefactions at his death in 1670. He published before he entered into orders, a comedy entitled *Lysola*, which was twice acted before king James I. After his death there appeared a "Century of his sermons on several remarkable subjects," in folio; and "The life of archbishop Williams," in folio, which was abridged in 1700 by Ambrose Philips.

HACKNEY-COACHES, those exposed to hire in the streets of London, and some other great cities, at rates fixed by authority. See COACH.—These first began to ply in the streets of London, or rather waited at inns, in the year 1625, and were only 20 in number; but in 1635 they were so much increased, that king Charles issued out an order of council for restraining them. In 1637, he allowed 50 hackney-coachmen, each of whom might keep 12 horses. In 1652, their number was limited to 200; and in 1654, it was extended to 300. In 1661, 400 were licensed; at 5*l.* annually for each. In 1694, 700 were allowed, and taxed by the 5 and 6 of W. & M. at 4*l.* per an-

num each. By 9 Anne cap. 23. 800 coaches were allowed in London and Westminster; but by 8 Geo. III. cap. 24. the number is increased to 1000, which are to be licensed by commissioners, and to pay a duty of 5*th.* per week to the king. On Sundays there were formerly only 175 hackney-coaches to ply, which were to be appointed by commissioners; but their number is now unlimited.

The fare of hackney coachmen in London, or within ten miles of the city, is 12 shillings and sixpence per day, allowing 12 hours per day. By the hour it is 1*s.* 6*d.* for the first, and 1*s.* for every hour after; and none are obliged to pay above 1*s.* for any distance not exceeding a mile and a half; or above 1*s.* 6*d.* for any distance not exceeding two miles. Where hackney coachmen refuse to go at, or exact more than, their limited hire, they are subject to a forfeit not under 10*s.* nor exceeding 3*l.* and which the commissioners have power to determine. Every hackney-coach must be provided with cheque strings, and every coachman plying without them incurs a penalty of 5*s.*—Drivers of hackney-coaches are to give way to persons of quality and gentlemen's coaches, under the penalty of 5*l.*

The duty arising from licences to hackney-coaches and chairs in London, forms a branch of the king's extraordinary and perpetual revenue*. This revenue is governed by commissioners of its own, and is in truth a benefit to the subject; as the expense of it is felt by no individual, and its necessary regulations have established a competent jurisdiction, whereby a very refractory race of men may be kept in some tolerable order.

HADDINGTON, a borough-town of Scotland, in East Lothian, which sends one member to parliament. It is surrounded with many seats of nobility and gentry. It is about 17 miles E. of Edinburgh. W. Long. 2. 25. N. Lat. 55. 50.

HADDOCK, the English name of a species of GADUS.

HADDON (Dr Walter), a great restorer of the learned languages in England, was born in 1516. He distinguished himself particularly by writing Latin in a fine style, which he acquired by a constant study of Cicero. He was a strenuous promoter of the reformation under king Edward; and was therefore thought a proper person to succeed bishop Gardiner in the mastership of Trinity-hall, Cambridge, on his deprivation. He lay concealed during the reign of queen Mary; but acquired the favour of Elizabeth, who constituted him one of the masters of the court of requests, and sent him one of the three agents to Bruges in 1566, to restore commerce between England and the Netherlands. He was also engaged with Sir John Cheke in drawing up in Latin that useful code of ecclesiastical law, published in 1571 by the learned John Fox, under the title of *Reformatio legum ecclesiasticarum*; his other works are collected and published under the title of *Incurabuntur*. He died in 1572.

HADERSLÉBEN, a sea-port town of Denmark, in the duchy of Sleswick, with a strong citadel, built upon a small island. It is seated on a bay of the Baltic Sea, and has a well-frequented harbour. E. Lon. 9. 35. N. Lat. 55. 24.

HADLEY,

Hackney
Haders-
leben.

* See REVENUE.

Hadley
Hæma-
topus.

HADLEY, a town in Suffolk, seated in a bottom on the river Preston. It consists of about 600 houses; with a very handsome church, a chapel of ease, and a Presbyterian meeting-house. The streets are pretty broad, but not paved. Large quantities of yarn are spun here for the Norwich manufacture; and this town had once a considerable woollen manufacture, which is now decayed. E. Lon. 1. o. N. Lat. 52. 7.

HADRIAN. See **ADRIAN**.

HÆMAGOGOS, among physicians, a compound medicus, consisting of feid and aromatic simples mixed with black hellebore, and prescribed in order to promote the menstria and hemorrhoidal fluxes; as also to bring away the lochia.

HÆMANTHUS, the BLOOD-FLOWER; a genus of the monogynia order, belonging to the hexandria class of plants.

Species. 1. The coccineus, with plain tongue-shaped leaves, rises about a foot high, with a stalk supporting a cluster of bright red tubulous flowers. It hath a large bulbous root, from which in the autumn comes out two broad flat leaves of a fleshy consistence, shaped like a tongue, which turn backward on each side, and spread on the ground, so that they have a strange appearance all the winter. In the spring these decay; so that from May to the beginning of August they are destitute of leaves. The flowers are produced in the autumn just before the leaves come out. 2. The carinatus with keel-shaped leaves, has a taller stalk and paler flowers than the former; its leaves are not flat, but hollowed like the keel of a boat. 3. The punicus, with large spear-shaped waved leaves, grows about a foot high, and hath flowers of a yellowish red colour. These are succeeded by berries, which are of a beautiful red colour when ripe.

Culture. All these plants are natives of the Cape of Good Hope, and do not propagate very fast in Europe, their roots seldom putting forth many off-sets. The best method of managing them is to have a bed of good earth in a bricked pit, where they may be covered with glasses, and in hard frosts with mats and straw. The earth in the frame should be two feet deep, and the frame should rise two feet above the surface, to allow height for the flower-stems to grow. The roots should be planted nine or ten inches asunder; and in winter, if they are protected from frost, and not suffered to have too much wet, but in mild weather exposed to the air, they will flower every year, and the flowers will be much stronger than with any other management. The third sort requires to be constantly kept in a dry stove.

HÆMATITES, or BLOOD-STONE, a hard mineral substance, red, black, or purple, but the powder of which is always red. It is found in masses sometimes spherical, semi-spherical, pyramidal, or cellular, that is like a honeycomb. It contains a large quantity of iron. Forty pounds of this metal have been extracted from a quintal of the stone; but the iron is of such a bad quality, that this ore is not commonly smelted. The great hardness of hæmatites renders it fit for burnishing and polishing metals.

HÆMATOPUS, the SEA-PYE, in ornithology, a genus belonging to the order of gallæ. The beak is compressed, with an equal wedge-shaped point; the nostrils are linear; and the feet have three toes without

nails. There is but one species, viz. the adalagus, a native of Europe and America. It feeds upon shell-fish near the sea-shore.

HÆMATOXYLUM, LOGWOOD, or *Campeachy Wood*; a genus of the monogynia order, belonging to the decandria class of plants.

Species. Of this genus there is only one species, viz. the campechianum, which grows naturally in the bay of Campeachy at Honduras, and other parts of the Spanish West-Indies*, where it rises from 16 to 24 feet high. The stems are generally crooked, and very deformed; and seldom thicker than a man's thigh. The branches which come out on each side are crooked, irregular, and armed with strong thorns, garnished with winged leaves, composed of three pair of obscure lobes indented at the top. The flowers come in a racemus from the wings of the leaves standing erect, and are of a pale yellowish colour, with a purple empalement. They are succeeded by flat oblong pods, each containing two or three kidney-seeds.

Culture. The seeds, which are frequently brought from America, will readily grow if sown upon a good hot-bed in this country, and will thrive very well if kept constantly in a good degree of heat in the back-stove.

Uses. The logwood is used in great quantities for dying purple, but especially black colours. All the colours, however, which can be prepared from it, are of a fading nature, and cannot by any art be made equally durable with those prepared from some other materials. Of all the colours prepared from logwood, the black is the most durable. Dr Lewis recommends it as an ingredient in making ink. "In dyeing cloth," (says he), vitriol and galls, in whatever proportions they are used, produce only browns of different shades: I have often been surprised that with these capital materials of the black dye I never could obtain any true blackness in white cloth, and attributed the failure to some unheeded mismanagement in the process, till I found it to be a known fact among the dyers. Logwood is the material which adds blackness to the vitriol and gall-brown; and this black dye, though not of the most durable kind, is the most common. On blue cloth a good black may be dyed by vitriol and galls alone; but even here, an addition of Logwood contributes not a little to improve the colour."—Mr Delaval, however, in his Essay on Colours, informs us, that with an infusion of galls and iron-silings, he not only made an exceeding black and durable ink, but also dyed linen cloth of a very deep black. See *COLOUR-MAKING*, n° 12, 13, 14.; *DYEING*, n° 17.; and *INK*. Logwood is also found to have a considerable astringent virtue as a medicine, and an extract of it is sometimes given with great success in diarrheas.

HÆMOPTYSIS, **HÆMPTYSIS**, or *Hæmoptis*; a spitting of blood. See (*Index* subjoined to) *MEDICINE*.

HÆMORRHOIDAL, an appellation given by anatomists to the arteries and veins going to the intestinum rectum.

HÆMORRHOIDS, or **PILES**, an hæmorrhage, or issue of blood from the hæmorrhoidal vessels. (See (*Index* subjoined to) *MEDICINE*.)

HAERLEM. See **HARLEM**.

HAG, in zoology. See **MYXINE**.

Hagai
Hague.Hague
Hall.

HAGAI, a canonical book of the Old Testament, so called from the prophet of that name, who, in all probability was born at Babylon, from whence he returned with Zerubbabel.

This prophet, by the command of God, exhorted the Jews, after their return from the captivity, to finish the rebuilding of the temple, which they had intermitted for 14 years. His remonstrances had the desired effect; and to encourage them to proceed in the work, he assured them from God, that the glory of this latter house should be greater than the glory of the former: which was accordingly fulfilled, when Christ honoured it with his presence; for, with respect to the building, this latter temple was nothing in comparison with the former.

HAGEDORN (Frederick de), a celebrated German poet, was born at Hamburg, where his father was resident for the king of Denmark, in 1708. He finished his studies at Jena; and, in 1728, published a number of poetical pieces in Germany, which were well received. He afterwards came to England, where he obtained the friendship of many of the learned; and, at his return, was made secretary to the English Hamburg company, a lucrative employment that left him sufficient time for cultivating the muses. In 1738, he published his Fables and Tales, the first collection of the kind of which Germany can boast. He afterwards published other pieces of poetry of different kinds, as Moral Poems, Epigrams, and five books of Songs: which of all his poetical pieces are most esteemed. He died in 1754.

HAGENAU, a town of Germany, and capital of a bailiwick of the same name, which was formerly imperial, but now belongs to the French. It was taken by them in 1673; the Imperialists retook it in 1702; after which it was several times taken and retaken by both parties; but at last the French got possession of it in 1706. It is divided by the river Motter into two parts; and is seated near a forest of its own name, in E. Long. 7. 53. N. Lat. 48. 49.

HAGIOGRAPHIA, or "holy writings;" a name given to a particular division of the Old Testament, as containing hymns to God, and moral precepts for the conduct of life. The books distinguished by this term were the Psalms, Proverbs, Ecclesiastes, and the Song of Solomon.

HAGUE, a town of the United Provinces, in Holland, situated in E. Long. 4. 10. N. Lat. 48. 49.—In Latin it is called *Haga Comitii*; in French, *La Haye*; in Dutch *der Haag*, or *'S-Graaenbuge*, i. e. the Earl's Grove or Wood, from the wood near which it is built, and in which the earls of Holland had a country-house. Though it sends no deputies to the states, it is one of the most considerable towns in Holland, pleasantly situated, and exceeding beautiful. It may indeed compare with almost any city in Europe, though geographers account it but a village. The inhabitants also breathe a better air than those of the other cities, as it stands on a dry soil, somewhat higher than the rest of the country. It has no gates or walls, but is surrounded by a moat over which there are many draw-bridges. Two hours are required to walk round it, and it contains about 40,000 or 50,000 souls. It is a place of much splendor and business, being the seat of the high colleges of the

republic and province of Holland, and the residence of the stadtholder and foreign ambassadors; and there are a great many fine streets and squares in it. In the inner court all the high colleges and courts of justice hold their assemblies: there also the foot-guards do duty, as the horse-guards in the outer, when the states are sitting. De Plaats is an open airy place, in form of a triangle, adorned with neat and beautiful buildings: the Vyverberg is an eminence, laid out into several fine shady walks, with the Vyver, a large basin of water, at the bottom: the Voorhout is the most celebrated part of the Hague, and consists of the mall, and three ways for coaches on each side, planted with trees, being much the same as St James's park at London: the palace of Opdam, or Wassenaar, is built in a very elegant taste: the prince and princess grafts are fine streets: the plain, in Dutch *Het Pleyn*, is a beautiful grove, laid out in several cross walks, and surrounded with stately houses. The Jewish synagogue is well worth being seen by a curious traveller; and also the palaces of the prince of Orange, the hotel of Spain, the new Voorhout, the mausoleum of the baron of Opdam in the great church, and the several hospitals. The environs of the Hague are exceedingly pleasant. Among other agreeable objects are the wood, with the palace of Orange at the extremity of it, called the *house in the wood*; the village of Scheveling; and the sand-hills along the north-sea; with the village of Voorburg, and the charming seats and fine gardens round it. Two miles from the Hague is Ryfwick, a village: and, a quarter of a mile from that, a noble palace belonging to the prince of Orange, famous for the treaty of peace concluded there in 1697. Loosduynen, where Margaret, countess of Henneburg, and daughter of Florence IV. count of Holland and Zealand, is said to have been delivered of 365 children at a birth, in 1276, is about five miles from the Hague. Five miles beyond Loosduynen, and not far from the beautiful village of Gravelande, is Honslardyck, another palace belonging to the prince of Orange, and one of the finest structures in the Low-Countries.

HAHN (Simon Frederick), a celebrated German historian. At ten years of age he was not only far advanced in the Latin, but understood several living languages. Four years after, he pronounced a speech on the origin of the cloyster at Bergen, the place of his birth, which was printed with some other pieces; and in 1708 he published a *Continuation of Meibomius's Chronicle of Bergen*. After having for several years given public lectures at Hall, he became, at the age of 24, professor of history at Helmstadt; and was at length counsellor, historiographer, and librarian, to the king of Great Britain, elector of Hanover. He died in 1729, aged 37.—Besides the above, and some other works, he wrote, 1. The first volume of the *History of the Empire*. 2. *Collectio monumentorum veterum et recentium ineditorum*, 2 vols 8vo.

HAIL, in natural history, a meteor generally defined frozen rain, but differing from it in that the hailstones are not formed of single pieces of ice, but of many little spherules agglutinated together. Neither are these spherules all of the same consistence; some of them being hard and solid like perfect ice; others soft, and mostly like snow hardened by a severe frost. Sometimes

Hail.

times the hailstone hath a kind of core of this soft matter; but more frequently the core is solid and hard, while the outside is formed of a softer matter. Hailstones assume various figures, being sometimes round, at other times pyramidal, crenated, angular, thin, and flat, and sometimes flattened, with six radii like the small crystals of snow.

Natural historians furnish us with various accounts of surprising showers of hail, in which the hailstones were of extraordinary magnitude. Mezeray, speaking of the war of Louis XII. in Italy, in the year 1510, relates, that there was for some time an horrible darkness, thicker than that of night; after which the clouds broke into thunder and lightning, and there fell a shower of hailstones, or rather (as he calls them) pebble-stones, which destroyed all the fish, birds, and beasts of the country.—It was attended with a strong smell of sulphur; and the stones were of a bluish colour, some of them weighing an hundred pounds. *Hist. de France*, Tom. II. p. 339.

At Lille in Flanders, in 1686, fell hailstones of a very large size; some of which contained in the middle a dark brown matter, which, thrown on the fire, gave a very great report. *Philosoph. Transact.* N° 203.

Dr Halley and others also relate, that in Cheshire, Lancashire, &c. April 29, 1697, a thick black cloud, coming from Carnarvonshire, disposed the vapours to congeal in such a manner, that for about the breadth of two miles, which was the limit of the cloud, in its progress for the space of 60 miles, it did inconceivable damage; not only killing all sorts of fowls and other small animals, but splitting trees, knocking down horses and men, and even ploughing up the earth; so that the hailstones buried themselves under ground an inch, or an inch and a half deep. The hailstones, many of which weighed five ounces, and some half a pound, and being five or six inches about, were of various figures; some round, others half round; some smooth, others embossed and crenated: the icy substance of them was very transparent and hard, but there was a snowy kernel in the middle of them.

In Hertfordshire, May 4. the same year, after a severe storm of thunder and lightning, a shower of hail succeeded, which far exceeded the former: some persons were killed by it, their bodies beat all black and blue; vast oaks were split, and fields of rye cut down as with a scythe. The stones measured from 10 to 13 or 14 inches about. Their figures were various, some oval, others picked, some flat. *Philosoph. Transact.* N° 229.

It is remarkable, that, far as we know, hail is a meteor which never produces any beneficial effect. The rain and dew invigorate and give life to the whole vegetable tribe; the frost, by expanding the water contained in the earth, pulverises and renders the soil fertile; snow covers and preserves the tender vegetables from being destroyed by too severe a frost. But hail does none of all these. In winter, it lies not sufficiently close to cover vegetables from the nipping frosts; and in spring and summer it not only has a chilling and blasting effect from its coldness, but often does great damage to the more tender plants by the weight of the stones, and in great hail-storms the damage done in this manner is prodigious.

Hail is one of the natural phenomena for which

it is almost impossible to account in any satisfactory manner. It is certain, that on the tops of mountains hailstones, as well as drops of rain, are very small, and continually increase in bulk till they reach the lower grounds. It would seem, therefore, that during their passage through the air, they attract the congealed vapour which increases them in size. But here we are at a loss how they come to be solid hard bodies, and not always soft, and composed of many small flats like snow. The flakes of snow, no doubt, increase in size as they descend, as well as the drops of rain or hail-stones; but why should the one be in soft crystals, and the other in large hard lumps, seeing both are produced from congealed vapour? Some modern philosophers ascribe the formation of hail to electricity. Signior Beccaria supposes hail to be formed in the higher regions of the air, where the cold is intense, and where the electric matter is very copious. In these circumstances, a great number of particles of water are brought near together, where they are frozen, and in their descent collect other particles, so that the density of the substance of the hailstone grows less and less from the centre; this being formed first in the higher regions, and the surface being collected in the lower. Agreeable to this, it is observed, that, in mountains, hail-stones, as well as drops of rain, are very small, there being but little space through which they can fall and increase their bulk. Drops of rain and hail also agree in this, that the more intense the electricity that forms them, the larger they are. Motion is known to promote freezing, and so the rapid motion of the electrified clouds may produce that effect. A more intense electricity also, he thinks, unites the particles of hail more closely than the more moderate electricity does those of snow. In like manner we see thunder-clouds more dense than those that merely bring rain; and the drops of rain are larger in proportion, though they fall not from so great a height.

HAILING, the salutation or accosting of a ship at a distance, either at sea, or in a harbour. The usual expression is, "Hoe, the ship ahoy!" To which the answers, "Holloa! Whence came ye? Where are ye bound? Good voyage! What cheer? All well! How fare ye?" &c.

HAILLAN (Bernard de Girard, lord of), a celebrated French historian. After having made some figure in the literary world, and as a translator, he applied himself to history with such success, that in 1571, Charles IX. made him historiographer of France. His history of France extends from Pharamon to the death of Charles VII. and is the first complete history of that kingdom composed in the French tongue. He was honoured by Henry III. with several marks of favour; and proposed to continue his history to the reign of Henry IV. but did not perform his promise. He died at Paris in 1610.

HAIMSUCKEN, see HAMBSECKEN.

HAINAN, a considerable island of Asia, situated in between 18° and 20° N. Lat. It belongs to China; and lies to the north of the Gulf of Cochinchina, and about twelve miles south from the province of Canton. It is about 400 miles in circumference. The soil of the northern parts is level, but the southern and eastern ones are mountainous; among which some

Hailing
Hainan.

of the valleys produce two crops of rice every year. The inhabitants are generally short, deformed savages, of a reddish colour. In the interior parts of the island they have not submitted to the Chinese; but they are great cowards, and 50 Chinese will put 100 of them to flight. There are mines of gold and lapis lazuli, which last is carried to Canton to paint the porcelain. This island produces the same fruits as China, besides sugar, tobacco, cotton, and indigo.

HAINAULT, a province of the Netherlands, belonging partly to France and partly to the house of Austria. It is bounded to the south by Champagne and Picardy, to the north by Flanders, to the east by the duchy of Brabant, the county of Namur, and the bishopric of Liege; and to the west by Artois and Flanders. Its extent from north to south is about 45 miles, and about 48 from east to west. The air is pleasant and temperate, and the soil fruitful: it abounds in rich pastures, corn-fields, woods, and forests, coal, iron, lead, beautiful marble, slate, and other useful stones: it is well watered by rivers and lakes, and breeds abundance of black cattle, and sheep, whose wool is very fine. Its principal rivers are the Schelde, the Selle, and the Dender. This province is reckoned to contain 24 walled towns, 950 villages, one duchy, and several principalities, earldoms, peerdoms, and baronies. The abbays in it are 27. For spiritual matters, the greater part of it is subject to the archbishop of Cambray, and the rest to the bishops of Liege and Arras. The states of the province consist of the clergy, nobility, and commoners. The clergy are the abbots, deputies of the chapters, and rural deans; but the chapters of St Waudru and St Germain, in Mons, send no deputies, as they contribute nothing to the public taxes. The nobility consist of the earls and barons, and all those who, by their birth, have a right to a seat in the assembly of the states. The commoners are composed of the deputies of the towns. The clergy in this county are uncommonly rich. The states meet only when they are summoned by the sovereign; but there is a standing committee at Mons, which meets weekly. This county had counts of its own, till the year 1436; when Philip the Good, duke of Burgundy, arrived to the possession of it, upon the death of Jaqueline, the heiress, without issue. The French acquired that part of it which they possess, partly by the peace of the Pyrenees, and partly by those of Nimegen and Renswyck. The arms of this county are quartered, and contain four lions, in a field *or*. For the government of it, there is a sovereign-council, at the head of which is the high-bailiff, who has very great authority: he represents the sovereign, is governor of Mons, and captain-general of the province.

* See *Antiquary*, n° 81.

HAIR, small filaments, issuing out of the pores of the skins of animals; and serving most of them as a tegument or covering*.—In lieu of hair, the nakedness of some animals is covered with feathers, wool, skins, &c. Hair is found on all parts of the human body, except the soles of the feet and the palms of the hands.—But it grows longest on the head, chin, breast, in the arm-pits, and about the privities.

The ancients held the hair a sort of excrement, fed only with excrementitious matters, and no proper part of a living body.—They supposed it generated of the

fuliginous parts of the blood, exhaled by the heat of the body to the surface, and there condensed in passing through the pores.—Their chief reasons were, that the hair being cut, will grow again apace, even in extreme old age, and when life is very low: that in hectic and consumptive people, where the rest of the body is continually emaciating and attenuating, the hair shall thrive: nay, and that it will grow again in dead carcasses.—They added, that hair does not feed and grow, like the other parts, by introluception, *i. e.* by a juice circulating within it; but, like the nails, by juxtaposition, each part next the root thrusting forward that immediately before it.

But the moderns are agreed, that every hair does properly and truly live, and receive nutriment to fill and distend it like the other parts: which they argue hence, that the roots do not turn grey in aged persons sooner than the extremities, but the whole changes colour at once, and the like is observed in boys, &c.; which shews that there is a direct communication, and that all the parts are affected alike.

It may be observed, however, that, in propriety, the life and growth of hairs is of a different kind from that of the rest of the body; and is not immediately derived therefrom, or reciprocated therewith.—It is rather of the nature of vegetation. They grow as plants do out of the earth; or as some plants shoot from the parts of others; from which though they draw their nourishment, yet each has, as it were, its several life and a distinct economy.—They derive their food from some juices in the body, but not from the nutritious juices of the body; whence they may live, tho' the body be starved.—Wulferus, in the *Philosophical Collections*, gives an account of a woman buried at Norimberg, whose grave being opened 43 years after her death, there was hair found issuing forth plentifully through the clefts of the coffin; inasmuch, that there was reason to imagine the coffin had some time been covered all over with hair.—The cover being removed, the whole corps appeared in its perfect shape; but, from the crown of the head to the sole of the foot, covered over with a thick-set hair, long and curled.—The sexton going to handle the upper part of the head with his fingers, the whole structure fell at once, leaving nothing in his hand but an bundle of hair: there was neither skull nor any other bone left; yet the hair was solid and strong enough.—Mr Arnold, in the same collection, gives a relation of a man hanged for theft, who, in a little time, while he yet hung upon the gallows, had his body strangely covered over with hair.—Some moderns, however, deny the authenticity of these and other similar instances.

The hairs ordinarily appear round or cylindrical; but the microscope also discovers triangular and square ones; which diversity of figure arises from that of the pores, to which the hairs always accommodate themselves. Their length depends on the quantity of the proper humour to feed them, and their colour on the quality of that humour: whence, at different stages of life, the colour usually differs. Their extremities split into two or three branches, especially when kept dry, or suffered to grow too long; so that what appears only a single hair to the naked eye, seems a brush to the microscope.

The hair of a mouse, viewed by Mr Derham with a micro-

Hair.

microscope, seemed to be one single transparent tube, with a pith made up of fibrous substances, running in dark lines, in some hairs transversely, in others spirally. The darker medullary parts or lines, he observes, were no other than small fibres convolved round, and lying closer together than in the other parts of the hair. They run from the bottom to the top of the hair; and, he imagines, may serve to make a gentle evacuation of some humour out of the body. Hence the hair of hairy animals, this author suggests, may not only serve as a fence against cold, &c. but as an organ of insensible perspiration.

Though the external surface of the body is the natural place for hairs, we have many well-attested instances of their being found also on the internal surface. Amatus Lusitanus mentions a person who had hair upon his tongue. Pliny and Valerius Maximus concur in their testimonies, that the heart of Aristomenes the Messenian was hairy. Celsus Rhodiginus relates the fame of Hermogenes the rhetorician; and Plutarch, of Leonidas the Spartan.—Hairs are said to have been frequently found in the breasts of women, and to have occasioned the dilemma called *trichiasis*; but some authors are of opinion, that these are small worms and not hairs. There have been, however, various and indisputable observations of hairs found in the kidneys, and voided by urine.

Hippocrates is of opinion, that the glandular parts are the most subject to hair; but bundles of hair have been found in the muscular parts of beef, and in such parts of the human body as are equally firm with that.—Hair has been often found in abscesses and imposthumations. Schultetus, opening the abdomen of a woman, found 12 pints of water, and a large lock or bundle of hair swimming loose in it. But of all the internal parts, there is none so much subject to an unnatural growth of hair as the ovaries of females, and that as well of the human species as of other animals. Of this Dr Tyson relates three remarkable instances; two of these were young women, and the other was a bitch. The animal had been much emaciated in its hinder parts; the hair was about an inch and an half long; but the most remarkable particular was, that hair was also found lying loose in the cavities of the veins. We have several instances of mankind being affected in the same manner. Cardan relates, that he found hair in the blood of a Spaniard; and Slonatus in that of a gentlewoman of Cracovia; and Schultetus declares from his own observation, that those people who are afflicted with the *plica polonica*, have very often hair in their blood.

Diseases of the Hair. Almost the only disease of the hair, besides the remarkable one called *plica polonica*, is its falling off, or *balbesci*. For this many remedies have been recommended, but scarce any of them can be depended upon. The juice of burdock, and the lixivial salts of vine-ashes, are said to be efficacious; also the powder of hermodactyls, and the decoction of boxwood. A remarkable instance of the efficacy of this last is given under the article *Buxus*.—Some authors give instances of the hair changing its colour in a short time, thro' grief, or by reason of a fright, &c.

Human-Hair makes a considerable article of trade; the goodness of it consists in its being neither too coarse nor too slender.

Hair that does not curl or buckle naturally, is made to do so by first boiling, and then baking it. Having sorted it, they next roll it carefully upon pipes hollowed in the middle; these they put into a pot or cauldron, and let them boil about two hours; then taking them out, they are dried and covered with papers; and, lastly, sent to the pally-cook, who bakes them in an oven, till the crull with which they are covered is about three fourths baked.

The hair of several other animals, as the beaver, hare, coney, &c. is also used in commerce, and especially in the manufacture of hats. See *HAT*.

Staining of Hair. Hair may be changed from a red, grey, or other disagreeable colour, to a brown or deep black, by a solution of silver. The liquors sold under the name of *hair-waters*, are at bottom no more than solutions of silver in aqua-fortis, largely diluted with water, with the addition perhaps of other ingredients, which contribute nothing to their efficacy. The solution should be fully saturated with the silver, that there may be no more acid in it than is necessary for holding the metal dissolved; and besides dilution with water, a little spirit of wine may be added for the further dulcification of the acid. It must be observed, that, for diluting the solution, distilled water, or pure rain-water, must be used; the common spring-waters turning it milky, and precipitating a part of the dissolved silver. It is to be observed also, that if the liquor touches the skin, it has the same effect on it as on the matter to be stained, changing the part moistened with it to an indelible black.—Hair may also be dyed of any colour in the same manner as wool*. * See *Dyeing*.

HAIR as an *Emblem of Dignity, or of Religion*. It was esteemed a notable honour among the ancient Gauls to have long hair, and hence came the appellation *Gallia comata*. For this reason Julius Cæsar, upon subduing the Gauls, made them cut off their hair as a token of submission.—It was with a view to this, that such as afterwards quitted the world to go and live in cloisters, procured their hair to be shaven off; to shew that they bid adieu to all earthly ornaments, and made a vow of perpetual subjection to their superiors.

Greg. of Tours assures us, that in the royal family of France, it was a long time the peculiar mark and privilege of kings and princes of the blood to wear long hair, artfully dressed and curled: every body else was obliged to be polled, or cut round, in sign of inferiority and obedience. Some writers assure us, that there were different cuts for all the different qualities and conditions; from the prince who wore it at full length, to the slave or villain who was quite cropt.—To cut off the hair of a son of France, under the first race of kings, was to declare him excluded from the right of succeeding to the crown, and reduced to the condition of a subject.

In the eighth century, it was the custom of people of quality to have their childrens hair cut the first time by persons they had a particular honour and esteem for; who, in virtue of this ceremony, were reputed a sort of spiritual parents or godfathers thereof: Tho' this practice appears to have been more ancient; inasmuch as we read, that Constantine sent the pope the hair of his son Heraclius, as a token that he desired him to be his adoptive father.

The parade of long hair became still more and more ob-

Hair.

Hair. obnoxious in the progress of Christianity, as something utterly inconsistent with the profession of persons who bore the cross. Hence numerous injunctions and canons to the contrary.—Pope Anicetus is commonly supposed to have been the first who forbade the clergy to wear long hair: but the prohibition is of an older standing in the churches of the east; and the letter wherein that decree is wrote, is of a much later date than that pope.—The clerical tonsure is related by Hildore Hispanensis, as of apostolical institution.

Long hair was anciently held so odious, that there is a canon still extant of the year 1096, importing, that such as wore long hair, should be excluded coming into church while living, and not be prayed for when dead.

We have a furious declamation of Luitprand against the emperor Phocas, for wearing long hair, after the manner of the other emperors of the east, all except Theophilus, who being bald, enjoined all his subjects to have their heads.

The French historians and antiquaries have been very exact in recording the head of hair of their several kings. Charlemagne wore it very short, his son shorter; Charles the bald had none at all. Under Hugh Capet it began to appear again; this the ecclesiastics took in dudgeon, and excommunicated all who let their hair grow. Peter Lombard expostulated the matter so warmly with Charles the Young, that he cut off his hair; and his successors for some generations wore it very short.—A professor of Utrecht, in 1650, wrote expressly on the question, Whether it be lawful for men to wear long hair? and concluded for the negative.—Another divine, named Reves, who had wrote for the affirmative, replied to him.

The Greeks, and after their example, the Romans, wore false hair. See *PERUKE*.

HAIR, in farriery, is generally called the *coat*; and, with regard to horses, deserves particular consideration.

The hair growing on the fetlock, serves as a defence to the prominent part of it, in travelling in stony ways, or in frosty weather: if the hair of a horse's neck, and the parts most uncovered, be close, smooth and sleek, it is an indication of his being in health and good case. In order to make the hair of an horse soft and sleek, he must be kept warm at heart, for the least inward cold will cause the hair to flare; also sweat him often, for that will loosen and raise the dust and filth that renders his coat foul; and when he is in the heat of a sweat, scrape off all the white foam, sweat, and filth, that is raised up, with an old sword-blade; and also when he is blooded, if you rub him all over with his own blood, repeating it two or three days, and curry and dress him well, it will make his coat shine as if covered with a fine varnish.

Hair falling from the main or tail, is caused either by his having taken some heat, which has engendered a dry mange; or from some surfeit which causes the evil humours to resort to those parts. To cure this, anoint the horse's mane and crest with black soap; make a strong lee of ashes, and wash it all over with it. But if a canker should grow on a horse's tail, which will eat away both flesh and bone; then put some oil of vitriol to it, and it will consume it: and if you find that the vitriol corrodes too much, you need only to

wet it with cold water, and it will put a stop to it.

If you would take away hair from any part of a horse's body, boil half a pound of lime in a quart of water, till a fourth part is consumed, to which add an ounce of orpiment; make this into a plaster, and lay it on.

HAIR, or *Down*, of Plants; a general term expressive of all the hairy and glandular appearances on the surface of plants, to which they are supposed by naturalists to serve the double purpose of defensive weapons and vessels of secretion.

These hairs are minute threads of greater or less length and solidity; some of them visible to the naked eye; whilst others are rendered visible only by the help of glasses. Examined by a microscope, almost all the parts of plants, particularly the young stalks or stems, appear covered with hairs.

Hairs on the surface of plants present themselves under various forms: in the leguminous plants, they are generally cylindric; in the mallow tribe, terminated in a point; in agrimony, shaped like a fish-hook; in nettle, awl-shaped and jointed; and in some compound flowers with hollow or funnel-shaped florets, they are terminated in two crooked points.

Probable as some experiments have rendered it, that the hairs on the surface of plants contribute to some organical secretion, their principal use seems to be to preserve the parts in which they are lodged from the bad effects of violent frictions, from winds, from extremes of heat and cold, and such like external injuries.

M. Guettard, who has established a botanical method from the form, situation, and other circumstances of the hairy and glandular appearances on the surface of plants, has demonstrated, that these appearances are generally constant and uniform in all the plants of the same genus. The same uniformity seems to characterize all the different genera of the same natural order.

The different sorts of hairs which form the down upon the surface of plants were imperfectly distinguished by Grew in 1682, and by Malpighi in 1686. Mr Guettard just mentioned, was the first who examined the subject both as a botanist and a philosopher; his observations were published in 1747.

HAKLUYT (Richard), a naval historian, is supposed to have been born in London about the year 1553, and descended of a genteel family in Herefordshire, as the name frequently occurs in the list of high sheriffs for that county, in former reigns. He was educated at Westminster school; and thence, in 1570, removed to Christ-church, Oxford; where he applied himself particularly to the study of cosmography, and read public lectures in that science.

Sir Edward Stafford being sent ambassador to France in 1583, Mr Hakluyt was one of his attendants, probably in the capacity of chaplain. He was at this time master of arts, and professor of divinity. In 1585 he obtained the royal mandate for the next vacant prebend of Bristol, to which preferment he succeeded during his residence at Paris. Constantly attentive to his favourite cosmographical inquiries, in searching the French libraries, he found a valuable history of Florida, which had been discovered about 20 years before, by Captain Loudonniere, and others: this he caused to be published, at his own expence, in the French language,

Hair,
Hakluyt.

Hakluyt
Halberstadt

language, and soon after revised and republished Peter Martyr's book *De orbe novo*. After five years residence in France, Mr Hakluyt returned to England in company with lady Sheffield, sister to the lord admiral Howard. In the year 1599 he published his Collection of Voyages in one folio volume, which in 1598 was republished in three. In 1605, our author was made prebendary of Westminster; which, with the rectory of Wetheringset in the county of Suffolk, seems to have been the summit of his preferment. He died in 1616, and was buried in Westminster abbey, bequeathing to his son Edmund his manor of Bridge-Place, and several houses in Tothill-street, Westminster. He was an indefatigable and faithful historian. His works are, 1. A collection of voyages and discoveries, a small volume. 2. History of Florida, above-mentioned. 3. The principal navigations, voyages, and discoveries of the English nation, made by sea or over land to the most and farthest distant quarters of the earth, at any time within the compass of these 1500 years, in 3 vols folio. 4. The discoveries of the world, from the first original to the year 1555, written in the Portugal tongue by Ant. Galvano; corrected, much amended, and translated into English, by Richard Hakluyt. 5. Virginia richly valued, by the description of the main land of Florida, her next neighbour, &c. written by a Portugal gentleman of Elvas, and translated by Richard Hakluyt. Besides these, he left several manuscripts, which were printed in Purchas's collection.

HALBERSTADT, a small-principality of Germany, bounded on the north-east by the duchy of Magdeburg, on the south by the principality of Anhalt, on the west by the diocese of Hildheim, on the east by part of the electorate of Saxony, and on the north by Brunswick Wolfenbüttele. It is near 40 miles in length and 30 in breadth. The soil in general is fertile in corn and flax; and there are some woods, though in general fuel is scarce. There are three large towns in it which send representatives to the diet, together with ten small ones, and 91 county-towns and villages. The number of the inhabitants is computed at about 200,000: the greatest part of them are Lutherans; but there are also Calvinists, Jews, and Roman Catholics. The manufactures are chiefly woollen (for the country produces a great number of sheep); the exports are grain, and a kind of beer called *brai-han*. The annual revenue arising from this principality, and the incorporated counties and lordships, is said to amount to 500,000 rix-dollars. Till the treaty of Westphalia in 1648, this country was a diocese, but was then transferred to the electoral house of Brandenburg as a temporal principality. It is entitled to a vote both in the diet of the empire, and that of the circle. The principal places are Halberstadt, Groningen, Ocherseben, Osterwick, &c.

HALBERSTADT, a city of Germany, in the circle of Lower Saxony, seated near the river Hotheln. It is a neat uniform place; and has some good churches and other handsome buildings, of which the cathedral is the chief. There is an inn in this place, which is looked upon to be the largest and to have the best accommodations of any in Europe. Before the Reformation, it was a bishop's see. E. Long. 11. 29. N. Lat. 52. 6.

Vol. V.

Halbert
Hale.

HALBERT, or HALBARD, in the art of war, a well-known weapon carried by the sergeants of foot and dragoons. It is a sort of spear, the shaft of which is about five feet long, and made of ash or other wood. Its head is armed with a steel point, not unlike the point of a two-edged sword. But, besides this sharp point which is in a line with the shaft, there is a cross piece of steel, flat and pointed at both ends; but generally with a cutting edge at one extremity, and a bent sharp point at the other; so that it serves equally to cut down, or to push withal. It is also useful in determining the ground between the ranks, and adjusting the files of a battalion. The word is formed of the German *hal* "hall," and *bard* "an hatchet." Vossius derives it from the German *hellebaert*, of *hel*, "clarus, splendens," and *baert*, "ax."

The halbert was anciently a common weapon in the army; where there were companies of halbardiers. It is said to have been used by the Amazons, and afterwards by the Rhætiens and Vindelicians about the year 570.

It was called the *Danish ax*, because the Danes bore an halbert on the left shoulder. From the Danes it was derived to the Scots; from the Scots to the English Saxons; and from them to the French.

HALCYON, in ornithology, a name given by the ancients to the alcedo or king's-fisher. See ALCEDO.

HALCYON-DAYS, in antiquity, a name given to seven days before and as many after the winter-solstice; by reason the halcyon, invited by the calmness of the weather, laid its eggs in nests built in the rocks, close by the brink of the sea, at this season.

HALDE (John Baptist du), a learned French Jesuit born at Paris in 1674. He was extremely well versed in Asiatic geography; and we have of his compilation a work intitled *Grand description de la Chine & de la Tartarie*, from original memoirs of the Jesuitical missionaries, in 4 vols, folio. He was also concerned in a collection of letters begun by father Gobien, called *Des lettres edifiantes*, in 18 vols; and published some Latin poems and orations. He died in 1743.

HALE, in the sea-language, signifies *pull*; as, To hale up, is to pull up; to hale in or out, is to pull in or out. To over-hale a rope, is to hale it too tiff, or to hale it the contrary way.

KEEL-HALE. See DUCKING.

HALE (Sir Matthew,) lord chief justice of the king's-bench in the reign of Charles II. was the son of Robert Hale, esq; a barrister of Lincoln's Inn, and was born in 1609. He was educated at Oxford, where he made a considerable progress in learning; but was afterwards diverted from his studies by the levities of youth. From these he was reformed by Mr John Glanvill, serjeant at law; and applying to the study of the law, entered into Lincoln's Inn. Noy, the attorney-general, took early notice of him, and directed him in his studies. Mr Selden also took much notice of him; and it was this acquaintance that first set Mr Hale on a more enlarged pursuit of learning, which he had before confined to his own profession. During the civil wars, he behaved so well as to gain the esteem of both parties. He was employed in his practice by all the king's party; and was appointed by the parliament one of the commissioners to treat with the

Hale.

king. The murder of king Charles gave him very sensible regret. However, he took the engagement; and was appointed, with several others, to consider of the reformation of the law. In 1653 he was by writ made sergeant at law, and soon after appointed one of the justices of the Common Pleas. Upon the death of Oliver Cromwell he refused to accept of the new commission offered him by Richard his successor. He was returned one of the knights of Gloucestershire in the parliament which called home Charles II. Soon after, he was made lord chief baron of the exchequer; but declined the honour of knighthood, till lord chancellor Hyde, sending for him upon business when the king was at his house, told his Majesty, that "there was his modest chief baron;" upon which he was unexpectedly knighted. He was one of the principal judges that sat in Clifford's Inn about settling the difference between landlord and tenant, after the fire of London, in which he behaved to the satisfaction of all parties concerned, and also in his post of chief baron acted with inflexible integrity. One of the first peers went once to his chamber, and told him, "That having a suit in law to be tried before him, he was then to acquaint him with it, that he might the better understand it when it should come to be tried in court." Upon which the lord chief baron interrupted him, and said, "He did not deal fairly to come to his chambers about such affairs; for he never received information of such causes but in open court, where both parties were to be heard alike." Upon which his Grace (for it was a duke) went away not a little dissatisfied, and complained of it to the king as a rudeness that was not to be endured: but his Majesty bid him content himself that he was used no worse; and said, "That he verily believed, he would have used him no better, if he had gone to solicit him in any of his own causes." Another remarkable incident happened in one of his circuits. A gentleman who had a trial at the assizes had sent him a buck for his table. When judge Hale therefore heard his name, he asked "if he was not the same person who had sent him the venison?" and finding that he was the same, told him, that "he could not suffer the trial to go on till he had paid him for his buck." The gentleman answered, that "he never sold his venison; and that he had done nothing to him, which he did not do to every judge who had gone that circuit;" which was confirmed by several gentlemen present. The lord chief baron, however, would not suffer the trial to proceed till he had paid for the present: upon which the gentleman withdrew the record. In short, he was, in 1671, advanced to be lord chief justice of the king's bench; but about four years after this promotion, his health declining, he resigned his post in February 1675-6, and died in December following. This excellent man, who was an ornament to the bench, to his country, and to human nature, wrote, 1. An essay on the gravitation and non-gravitation of fluid bodies. 2. Observations touching the Torricellian experiment. 3. Contemplations, moral and divine. 4. The life of Pomponius Atticus, with political and moral reflections. 5. Observations on the principles of natural motion. 6. The primitive origin of mankind. He also left a great number of manuscripts, in Latin and English, upon various subjects; among which are, his "Pleas of the Crown,"

Hales.

since published by Mr Emyln in two volumes folio; and his "Original institution, power, and jurisdiction of Parliaments."

HALES (Stephen), D. D. a celebrated divine and philosopher, was born in 1677. He was the sixth son of Thomas Hales, Esq; the eldest son of Sir Robert Hales created a baronet by king Charles II. and Mary the heirs of Richard Langley of Abbots-Wood in Hertfordshire. In 1696, he was entered a pensioner at Bennet-College, Cambridge; and was admitted a fellow in 1703, and became bachelor of divinity in 1711. He soon discovered a genius for natural philosophy. Botany was his first study; and he used frequently to make excursions among Gogmagog hills, in company with Dr Stukely, with a view of prosecuting that study. In these expeditions he likewise collected fossils and insects, having contrived a curious instrument for catching such of the latter as have wings. In company with this friend he also applied himself to the study of anatomy, and invented a curious method of obtaining a representation of the lungs in lead. They next applied themselves to the study of chemistry; in which, however, they did not make any remarkable discoveries.

In the study of astronomy Mr Hales was equally assiduous. Having made himself acquainted with the Newtonian system, he contrived a machine for shewing the phenomena on much the same principles with that afterwards made by Mr Rowley, and, from the name of his patron, called an *Orrery*.

About the year 1710, he was presented to the perpetual cure of Teddington near Twickenham, in Middlesex; and afterwards accepted of the living of Porlock in Somersetshire, which vacated his fellowship in the college, and which he exchanged for the living of Faringdon in Hampshire.

Soon after, he married Mary, the daughter and heiress of Dr Newce, who was rector of Haliham in Suffex, but resided at Much-Haddam in Hertfordshire.

On the 13th of March 1718, he was elected member of the Royal Society; and on the 5th of March, in the year following, he exhibited an account of some experiments he had lately made on the effect of the sun's warmth in raising the sap in trees. This procured him the thanks of the society, who also requested him to prosecute the subject. With this request he complied with great pleasure; and on the 14th of June 1725, exhibited a treatise in which he gave an account of his progress. This treatise being highly applauded by the society, he farther enlarged and improved it; and in April 1727 he published it under the title of *Vegetable Statics*. This work he dedicated to his late majesty king George the second, who was then prince of Wales; and he was, the same year, chosen one of the council of the Royal Society, Sir Hans Sloan being at the same annual election chosen their president. The book being well received, a second edition of it was published in 1731; in a preface to this edition Mr Hales promised a sequel to the work, which he published in 1733, under the title of *Statical essays*, &c.

In 1732, he was appointed one of the trustees for establishing a new colony in Georgia. On the 5th of July 1733, the university of Oxford honoured him with

with a diploma for the degree of doctor in divinity; a mark of distinction the more honourable, as it is not usual for one university to confer academical honours on those who were educated at another.

In 1734, when the health and morals of the lower and middling class of people were subverted by the excessive drinking of gin, he published, though without his name, "A friendly admonition to the drinkers of brandy and other spirituous liquors;" which was twice re-printed. The latter end of the same year he published a sermon which he preached at St Bride's before the rest of the trustees for establishing a new colony in Georgia. His text was, *Bear ye one another's burthens, and so fulfil the law of Christ*; Galatians vi. 2.

In 1739, he printed a volume in 8vo, intitled, *Philosophical experiments on sea-water, corn, flesh, and other substances*: this work, which contained many useful instructions for voyagers, was dedicated to the lords of the admiralty. The same year he exhibited to the Royal Society an account of some farther experiments towards the discovery of medicines for dissolving the stone in the kidneys and bladder, and preserving meat in long voyages; for which he received the gold medal of Sir Godfrey Copley's donation. The year following he published some account of "Experiments and observations on Mrs Stephens's medicines for dissolving the stone, in which their dissolvent power is inquired into and demonstrated."

In 1741, he read before the Royal Society an account of an instrument which he invented, and called a *ventilator*, for conveying fresh air into mines, hospitals, prisons, and the close parts of ships: he had communicated it to his particular friends some months before; and it is very remarkable that a machine of the same kind, for the same purpose, was in the spring of the same year invented by one Martin Tricwald, an officer in the service of the king of Sweden, called *captain of mechanics*, for which the king and senate granted him a privilege in October following, and ordered every ship of war in the service of that state to be furnished with one of them; a model also of this machine was sent into France, and all the ships in the French navy were also ordered to have a ventilator of the same sort.

It happened also, that about the same time an Sutton, who kept a coffee house in Aldersgate-street, invented a ventilator of another construction to draw off the foul air out of ships, by means of the cook-room fire: but poor Sutton had not interest enough to make mankind accept the benefit he offered them; though its superiority to Dr Hales's contrivance was evident, and among others Dr Mead and the late ingenious Mr Benjamin Robins gave their testimony in its favour. See *Air-Pipes*.

The public, however, is not less indebted to the ingenuity and benevolence of Dr Hales, whose ventilators came more easily into use for many purposes of the greatest importance to life, particularly for keeping corn sweet, by blowing through it fresh showers of air; a practice very soon adopted by France, a large granary having been made, under the direction of Duhamel, for the preservation of corn in this manner, with a view to make it a general practice.

In 1743, Dr Hales read before the Royal Society a description of a method of conveying liquors into the *abdomen* during the operation of tapping, and it was afterwards printed in their Transactions. In 1745, he published some experiments and observations on tar-water, which he had been induced to make by the publication of a work called *Siris*, in which the late learned and most excellent Dr Berkeley, bishop of Cloyne, had recommended tar-water as an universal medicine: on this occasion several letters passed between them on the subject, particularly with respect to the use of tar-water in the disease of the horned cattle.

In the same year he communicated to the public, by a letter to the editor of the Gentleman's Magazine, a description of a *back-heaver*, which will winnow and clean corn much sooner and better than can be done by the common method. He also, at the same time, and by the same channel, communicated to the public a cheap and easy way to preserve corn sweet in sacks; an invention of great benefit to farmers, especially to poor leasers, who want to keep small quantities of corn for some time, but have no proper granary or repository for that purpose. He also the same year took the same method to publish directions how to keep corn sweet in heaps without turning it, and to sweeten it when musty. He published a long paper, containing an account of several methods to preserve corn by ventilators; with a particular description of several sorts of ventilators, illustrated by a cut, so that the whole mechanism of them may be easily known, and the machine constructed by a common carpenter. He published also in the same volume, but without his name, a detection of the fallacious boasts concerning the efficacy of the liquid shell in dissolving the stone in the bladder. In 1746 he communicated to the Royal Society a proposal for bringing small passable stones soon, and with ease, out of the bladder; and this was also printed in their Transactions. In the Gentleman's Magazine for July 1747, he published an account of a very considerable improvement of his back-heaver, by which it became capable of clearing corn of the very small grain, seeds, blacks, smut-balls, &c. to such perfection as to make it fit for seed-corn. In 1748 he communicated to the Royal Society a proposal for checking, in some degree, the progress of fires, occasioned by the great fire which happened that year in Cornhill: And the substance of this proposal was printed in their Transactions. In the same year he also communicated to the Society two memoirs, which are printed in their Transactions; one on the great benefit of ventilators, and the other on some experiments in electricity.

In 1749 his ventilators were fixed in the Savoy prison, by order of the right hon. Henry Fox, esq; then secretary at war, afterwards lord Holland; and the benefit was so great, that though 50 or 100 in a year often died of the gaol-distemper before, yet from the year 1749 to the year 1752 inclusive, no more than four persons died, though in the year 1750 the number of prisoners was 240; and of those four, one died of the small-pox, and another of intemperance.

In the year 1750 he published some considerations on the causes of earthquakes; occasioned by the slight shocks felt that year in London. The substance of

Hales.

this work was also printed in the Philosophical Transactions. The same year he exhibited an examination of the strength of several purging waters, especially of the water of *Jessop's well*, which is printed in the Philosophical Transactions.

He had now been several years honoured with the esteem and friendship of his royal highness Frederick prince of Wales; who frequently visited him at Teddington, from his neighbouring palace at Kew, and took a pleasure in surprising him in the midst of those curious researches into the various parts of nature which almost incessantly employed him. Upon the prince's death, which happened this year, and the settlement of the household of the prince's dowager, he was, without his solicitation, or even knowledge, appointed clerk of the closet, or almoner to her royal highness.

In 1751 he was chosen by the college of physicians to preach the annual sermon called *Crowne's lecture*: Dr William Crowne having left a legacy for a sermon to be annually preached on "the wisdom and goodness of God displayed in the formation of man." Dr Hales's text was, *With the ancient is wisdom, and in length of days understanding*, Job xii. 12. This sermon, as usual, was published at the request of the college.

In the latter end of the year 1752, his ventilators, worked by a windmill, were fixed in Newgate, with branching trunks to 24 wards; and it appeared that the disproportion of those that died in the gaol before and after this establishment was as 16 to 7. He published also a farther account of their success, and some observations on the great danger arising from foul air, exemplified by a narrative of several persons seized with the gaol fever by working in Newgate.

On the death of Sir Hans Sloane, which happened in the year 1753, he was elected a member of the Academy of Sciences at Paris in his room. The same year he published in the Gentleman's Magazine some farther considerations about means to draw the foul air out of the sick rooms of occasional army-hospitals, and private houses in town. He also published many other curious particulars relative to the use and success of ventilators. The same year a description of a sea-gage, which the doctor invented to measure unfathomable depths, was communicated to the public in the same miscellany: this paper was drawn up about the year 1732 or 1733, by the doctor, for the late Colin Campbell, esq; who employed the ingenious Mr Hawksbee to make the machine it describes, which was tried in various depths, and answered with great exactness, yet was at last lost near Bermuda.

In 1754, he communicated to the Royal Society some experiments for keeping water and fish sweet with lime-water, an account of which was published in the Phil. Transf. He also continued to enrich their memoirs with many useful articles from this time till his death, particularly a method of forwarding the distillation of fresh from salt water by blowing flowers of fresh air up through the latter during the operation.

In 1757 he communicated to the editor of the Gentleman's Magazine, an easy method of purifying the air, and regulating its heat in melon-frames and green-houses, also further improvements in his method of distilling sea-water.

Hales

Hall-Beigh.

His reputation and the interest of his family and friends might easily have procured him farther preferment: but of farther preferment he was not desirous; for being nominated by his late majesty to a canony of Windfor, he engaged the prince to request his majesty to recall his nomination. That a man so devoted to philosophical studies and employments, and so conscientious in the discharge of his duty, should not desire any preferment which would reduce him to the dilemma either of neglecting his duty, or foregoing his amusement, is not strange: but that he would refuse an honourable and profitable appointment, for which no duty was to be done that would interrupt his habits of life, can scarce be imputed to his temperance and humility without impeaching his benevolence; for if he had no will of any thing more for himself, a liberal mind would surely have been highly gratified by the distribution of so considerable a sum as a canony of Windfor would have put into his power, in the reward of industry, the alleviation of distress, and the support of helpless indigence. He was, however, remarkable for social virtue and sweetness of temper; his life was not only blameless, but exemplary in a high degree; he was happy in himself, and beneficial to others, as appears by this account of his attainments and pursuits; the constant serenity and cheerfulness of his mind, and the temperance and regularity of his life, concurred, with a good constitution, to preserve him in health and vigour to the uncommon age of fourscore and four years.

He died at Teddington in 1761; and was buried, pursuant to his own directions, under the tower of the parish church, which he built at his own expence not long before his death.—Her royal highness the prince of Wales erected a monument to his memory in Westminster abbey.

HALESWORTH, a town of Suffolk in England, seated on a neck of land between two branches of the river Blith. It is a well frequented thriving place, and has a trade in linen-yarn and sail-cloth. It has one large church, and about 600 good houses; but the streets are neither wide nor paved. About the town is raised a great deal of hemp. E. Long. 1. 40. N. Lat. 52. 30.

HALF-BLOOD, in law, is where a man marries a second wife, the first being dead, and by the first venter has a son, and by his second venter has likewise a son; the two brothers, in this case, are but of half-blood. See **CONSANGUINITY** and **DESCENT**.

HALF-Merk; a noble, or 6s. 8 d.

HALF-Moon, in fortification; an outwork composed of two faces, forming a salient angle, whose gorge is in form of a crescent or half-moon, whence the name.

HALI-BEIGH, first dragoman or interpreter at the Grand Signior's court in the 17th century, was born of Christian parents in Poland; but having been taken by the Tartars when he was young, they sold him to the Turks, who brought him up in their religion in the seraglio. His name, in his native country, was Bobowski. He learnt many languages, and Sir Paul Ricaut owns he was indebted to him for several things which he relates in his *Present state of the Ottoman empire*. He held a great correspondence with the English, who persuaded him to translate some books into the Turkish language; aut

and he had a mind to return into the bosom of the Christian church, but died before he could accomplish the design. Dr Hyde published his book *Of the liturgy of the Turks, their pilgrimages to Mecca, their circumcision and visiting of the sick*. He translated the catechism of the church of England, and the bible, into the Turkish language. The MS. is lodged in the library of Leyden. He wrote likewise a Turkish grammar and dictionary.

HALIETUS, in ornithology. See **FALCO**.

HALIFAX, the capital of the province of Nova Scotia in America, situated in W. Long. 64. 30. N. Lat. 44. 45. It was founded in 1749, in order to secure the British settlements there from the attempts of the French and Indians. It was divided into 35 squares, each containing 16 lots of 40 by 60 feet; one established church, and one meeting-house, and a small number of houses out of the regular streets, which are 65 feet broad. The town was surrounded by picketings, and guarded by forts on the outside; but, since the commencement of the American troubles, it has been very strongly fortified. Along the river Chebucto, to the southward of the town, are buildings and fish-flakes for at least two miles, and to the northward on the river for about one mile. The plan, however, has been greatly improved by the earl of Halifax, who was the original contriver. The proclamation issued for this settlement, offered 50 acres of land to every soldier and sailor who would settle in that part of America, without paying any rent or doing any service for ten years, and no more than one shilling per annum for each 50 acres ever afterwards: to every soldier and sailor who had a wife and children, ten acres more were added for every individual of his family, and for every increase that should afterwards happen in the same proportion. To each subaltern officer, 80 acres, and 15 for each of his family; 200 acres to each ensign; 300 to each lieutenant; 400 to each captain; 600 to every officer in rank above a captain, and 30 for each of his family. The government also engaged to transport and maintain the new settlers for one year at its own expence, and to furnish them with such arms, provisions, utensils, implements, &c. as should be necessary to put them in a way to cultivate their lands, to build habitations, and to commence a fishery. The same conditions were likewise offered to all carpenters and other handicraftsmen; and furgeons were offered the same conditions with the ensigns.—This proclamation was published in March, and by the month of May 3700 persons had offered themselves. They accordingly embarked, and established themselves in the bay of Chebucto; calling their city *Halifax*, from the title of their patron. Before the end of October the same year, 350 comfortable wooden houses were built, and as many more during the winter.—The same year in which the settlers embarked, the government granted them 40,000*l*. for their expences. In 1750, they granted 57,582*l*. 17*s*. 3½*d*. for the same purpose; in 1751, 53,927*l*. 14*s*. 4*d*.; in 1752, 61,492*l*. 19*s*. 4½*d*.; in 1753, 94,615*l*. 12*s*. 4*d*.; in 1754, 58,447*l*. 2*s*.; and in 1755, 49,418*l*. 7*s*. 8*d*.

HALIFAX, earl of. See **SAVILLE**.

HALIFAX, a town in the west riding of Yorkshire in England, seated on the river Calder, in W. Long.

2. o. N. Lat. 53. 45. It has the title of an earldom, and is very eminent for the clothier trade. The parish is said to be the most populous, if not the most extensive, in England: for it is above 30 miles in circumference; and, besides the mother-church at Halifax, and 16 meeting-houses, has 12 chapels, two of which are parochial. What is a little singular, all the meeting-houses here, except the quakers, have bells and burying grounds. The woollens principally manufactured here, are kerseys and shalloons. Of the former it is affirmed, that one dealer hath sent by commission 60,000 pounds worth in a year to Holland and Hamburg; and of the latter, it is said, 100,000 pieces are made in this parish yearly. The inhabitants here, and in the neighbouring towns, are so entirely employed in these manufactures, that agriculture is but little minded. Most of their provisions of all sorts are brought from the north and east ridings, and from Lancashire, Cheshire, Nottinghamshire, and Warwickshire. The markets are very much crowded for the buying and selling provisions and manufactures. The cloths, at the first erecting of the woollen manufactures in these parts, having been frequently stolen off the tenters in the night, a law was made, by which the magistrates of Halifax were empowered to pass sentence on and execute all offenders, if they were taken in the fact, or owned it, or if the stolen cloth was found upon them, provided also the crime was committed, and the criminal apprehended, within the liberties of the forest of Hardwick. Those found guilty were executed in the following manner: an axe was drawn by a pulley to the top of a wooden engine, and fastened by a pin, which being pulled out, the axe fell down in an instant, and did its work. If they had stole an ox, horse, or any other beast, it was led with them to the scaffold, and there fastened by a cord to the pin, that held up the axe; and when the signal was given by the jurors, who were the first burghers within the several towns of the forest, the beast was driven away, and the pin plucked out, upon which the axe fell and did its office. This severe and summary course of justice, gave occasion to a litany, which is still much more frequent in the mouths of the beggars and vagrants of these parts, than is the common prayer, viz.

“From Hell, Hull, and Halifax, good Lord deliver us:”

though neither the engine, nor manner of proceeding against them, are now in use.

HALIOTIS, the **EAR-SHELL**, a genus of insects belonging to the order of vermes testacea. This is an animal of the snail-kind, with an open shell resembling an ear. There are seven species, distinguished by the figure of their shells. See **PLATE CLVIII**.

HALITZ, a town of Poland, and capital of a territory of the same name, in Red Russia, with a castle. It is seated on the river Neister. E. Long. 26. o. N. Lat. 49. 20.

HALL, in architecture, a large room at the entrance of a fine house and palace. Vitruvius mentions three kinds of halls; the tetrastyle, with four columns, supporting the platform or ceiling; the Corinthian, with columns all round let into the wall, and vaulted over; and the Egyptian, which had a peristyle of insulated Corinthian columns, bearing a second order with a ceiling.

The hall is properly the finest as well as first member of an apartment; and in the houses of ministers of state, magistrates, &c. is the place where they dispatch business, and give audience. In very magnificent buildings, where the hall is larger and loftier than ordinary, and placed in the middle of the house, it is called a *saloon*.

The length of a hall should be at least twice and a quarter its breadth; and in great buildings, three times its breadth. As to the height of halls, it may be two thirds of the breadth; and, if made with an arched ceiling, it will be much handfomer, and less liable to accidents by fire. In this case, its height is found by dividing its breadth into six parts, five of which will be the height from the floor to the under side of the key of the arch.

HALL (Joseph), an eminent prelate of the church of England, was born in 1574, and educated at Cambridge. He became professor of Rhetoric in that university, and then successively was made rector of Halsted in Suffolk, presented to the living of Waltham in Essex, made prebendary of Wolverhampton, dean of Worcester, bishop of Exeter, and lastly of Norwich.

His works testify his zeal against Popery, and are much esteemed. He lamented the divisions of the Protestants, and wrote something concerning the means of putting an end to them. July 1616, he attended the embassy of lord Doncaister into France, and upon his return was appointed by his majesty to be one of the divines who should attend him into Scotland. In 1618 he was sent to the synod of Dort with other divines, and pitched upon to preach a Latin sermon before that assembly. But being obliged to return from thence before the synod broke up, on account of his health, he was by the states presented with a gold medal. He wrote, 1. Miscellaneous epistles. 2. *Mundus alter et idem*. 3. A just censure of travellers. 4. The Christian Seneca. 5. Satires, in six books. 6. A century of meditations; and many other works, which, besides the above satires, make in all five volumes in folio and quarto. He died in 1656.

HALL (John), a poet of distinguished learning, was born at Durham, and educated at Cambridge, where he was esteemed the brightest genius in that university. In 1646, when he was but 19 years of age, he published his *Horæ Vacuæ*, or Essays; and the same year came out his poems. He translated from the Greek "Hierocles upon the golden verses of Pythagoras;" before which is an account of the ingenious translator and his works, by John Davies of Kidwelly. He died in 1656, aged 29.

HALLAGE, a fee or toll paid for cloth brought to be sold in Blackwell-hall, London.

HALLAMASS. See ALL-SAINTS.

HALLAND, a country of Sweden, in the island of Schonen, lying along the sea-coast, at the entrance of the Baltic Sea, and opposite to Jutland. It is 60 miles along the coast, but is not above 12 in breadth. Halmstadt is the capital town.

HALLATON, a town of Leicestershire, in England. It is seated on a rich soil, 12 miles south-east of Leicester, in E. Lon. o. 50. N. Lat. 52. 35.

HALLE, a little dismantled town of the Austrian Netherlands, in Hainault. The church of Notre

Dame contains an image of the Virgin Mary, held in great veneration. E. Lon. 3. 15. N. Lat. 50. 44.

HALLE, a handsome and considerable town of Germany, in the circle of Upper Saxony, and in the duchy of Magdeburg, with a famous university and salt-works. It belongs to the king of Prussia; and is seated in a pleasant plain on the river Sale, in E. Lon. 12. 33. N. Lat. 51. 36.

HALLE, a free and imperial town of Germany, in Suabia, famous for its salt-pits. It is seated on the river Kocher, among rocks and mountains, in E. Lon. 10. 50. N. Lat. 49. 6.

HALLEIN, a town of Germany, in the circle of Bavaria, and archbishopric of Salzburg; seated on the river Saltza, among the mountains, wherein are mines of salt, which are the chief riches of the town and country. E. Lon. 12. 15. N. Lat. 47. 33.

HALLELUJA, a word signifying "Praise the Lord." The singing halleluja (first introduced into the church-service by St Jerom), was a sort of invitational, or call to each other, to praise the Lord. St Austin says, that in some churches it was sung only on Easter-day, and the 50 days of Pentecost; but that even in those churches where it was most in use, it was never used in the time of Lent.

HALLER (Albert Van), an eminent physician, was born at Bern, on the 16th of October 1708. He was the son of an advocate, of considerable eminence in his profession. His father had a numerous family, and Albert was the youngest of five sons. From the first period of his education, he shewed a very great genius for literature of every kind; to forward the progress of his studies, his father took into his family a private tutor, named *Abraham Billod*; and such was the discipline exerted by this pedagogue, that the accidental sight of him, at any future period of life, excited in Haller very great uneasiness, and renewed all his former terrors.

According to the accounts which are given us, the progress of Haller's studies, at the earliest periods of life, was rapid almost beyond belief. When other children were beginning only to read, he was studying Bayle and Moreri; and at nine years of age he was able to translate Greek, and was beginning the study of Hebrew. Not long after this, however, the course of his education was somewhat interrupted by the death of his father; an event which happened when he was in the 13th year of his age. After this he was sent to the public school at Bern, where he exhibited many specimens of early and uncommon genius. He was distinguished for his knowledge in the Greek and Latin languages; but he was chiefly remarkable for his poetical genius: and his essays of this kind, which were published in the German language, were read and admired throughout the whole empire.

In the 16th year of his age, he began the study of medicine at Tubingen, under those eminent teachers Duvernoy and Camerarius; and continued there for the space of two years, when the great reputation of the justly celebrated Boerhaave drew him to Leyden. Nor was this distinguished teacher the only man from whose superior abilities he had there an opportunity of profiting. Ruych was still alive, and Albinus was rising into fame. Animated by such examples, he spent all the day, and the greatest part of the night, in the most

most intense study; and the proficiency which he made, gained him universal esteem both from his teachers and fellow-students.

From Holland, in the year 1727, he came to England. Here, however, his stay was but short; and it was rather his intention to visit the illustrious men of that period, than to prosecute his studies at London. He formed connexions with some of the most eminent of them. He was honoured with the friendship of Douglas and Chefelden; and he met with a reception proportioned to his merit from Sir Hans Sloane, president of the Royal Society. After his visit to Britain, he went to France; and there, under those eminent masters, Winslow and Le Drain, with the latter of whom he resided during his stay in Paris, he had opportunities of prosecuting anatomy, which he had not before enjoyed. But the zeal of our young anatomist was greater than the prejudices of the people at that period, even in the enlightened city of Paris, could admit of. An information being lodged against him to the police for dissecting dead bodies, he was obliged to cut short his anatomical investigations by a precipitate retreat. Still, however, intent on the farther prosecution of his studies, he went to Basil, where he became a pupil to the celebrated Bernoulli.

Thus improved and instructed by the lectures of the most distinguished teachers of that period, by uncommon natural abilities, and by unremitting industry, he returned to the place of his nativity in the 26th year of his age. Not long after this, he offered himself a candidate, first for the office of physician to an hospital, and afterwards for a professorship. But neither the character which he had before he left his native country, nor the fame which he had acquired and supported while abroad, were sufficient to combat the interest opposed to him. He was disappointed in both; and it was even with difficulty that he obtained, in the following year, the appointment of keeper of a public library at Bern. The exercise of this office was indeed by no means suited to his great abilities: but it was agreeable to him, as it afforded him an opportunity for that extensive reading by which he has been so justly distinguished.

The neglect of his merit which marked his first outset, neither diminished his ardour for medical pursuits, nor detracted from his reputation either at home or abroad. And soon after he was nominated a professor in the university of Gottingen, by king George II. The duties of this important office he discharged, with no less honour to himself than advantage to the public, for the space of seventeen years; and it afforded him an ample field for the exertion of those great talents which he possessed. Extensively acquainted with the sentiments of others respecting the economy of the human body, struck with the diversity of opinions which they held, and sensible that the only means of investigating truth was by careful and candid experiment, he undertook the arduous task of exploring the phenomena of human nature from the original source. In these pursuits he was no less industrious than successful, and there was hardly any function of the body on which his experiments did not reflect either a new or a stronger light. Nor was it long necessary for him, in this arduous undertaking, to labour alone. The example of the preceptor inspired his pupils with the spirit of in-

dustrious exertion. Zinn, Zimmerman, Caldani, and many others, animated by a generous emulation, laboured with indefatigable industry to prosecute and to perfect the discoveries of their great master. And the mutual exertion of the teacher and his students, not only tended to forward the progress of medical science, but placed the philosophy of the human body on a more sure, and an almost entirely new basis.

But the labours of Dr Haller, during his residence at Gottingen, were by no means confined to any one department of science. He was not more anxious to be an improver himself, than to instigate others to similar pursuits. To him, the Anatomical Theatre, the School of Midwifery, the Chirurgical Society, and the Royal Academy of Sciences, at Gottingen, owe their origin. Such distinguished merit could not fail to meet with a suitable reward from the sovereign under whose protection he then taught. The king of Great Britain not only honoured him with every mark of attention which he himself could bestow, but procured him also letters of nobility from the emperor. On the death of Dillenius, he had an offer of the professorship of botany at Oxford; the states of Holland invited him to the chair of the younger Albinus; the king of Prussia was anxious that he should be the successor of Maupertuis at Berlin. Marshal Keith wrote to him in the name of his sovereign, offering him the chancellorship of the university of Halle, vacant by the death of the celebrated Wolff. Count Orlov invited him to Russia, in the name of his mistress the empress, offering him a distinguished place at St Petersburg. The king of Sweden conferred on him an unsolicited honour, by raising him to the rank of knighthood of the order of the polar star; and the emperor of Germany did him the honour of a personal visit, during which he thought it no degradation of his character to pass some time with him in the most familiar conversation.

Thus honoured by sovereigns, revered by men of literature, and esteemed by all Europe, he had it in his power to have held the highest rank in the republic of letters. Yet, declining all the tempting offers which were made to him, he continued at Gottingen, anxiously endeavouring to extend the rising fame of that medical school. But after seventeen years residence in that university, an ill state of health rendering him less fit for the duties of the important office which he held, he solicited and obtained permission from the regency of Hanover to return to his native city of Bern. His fellow-citizens, who might at first have fixed him among themselves, with no less honour than advantage to their city, were now as sensible as others of his superior merit. A pension was settled upon him for life, and he was nominated at different times to fill the most important offices in the state. These occupations, however, did not diminish his ardour for useful improvements. He was the first president, as well as the greatest promoter, of the Oeconomical Society at Bern; and he may be considered as the father and founder of the Orphan-hospital of that city. Declining health, however, restrained his exertions in the more active scenes of life, and for many years he was confined entirely to his own house. Even this, however, could not put a period to his utility: for, with indefatigable industry he continued his favourite employment

Halley.

ployment of writing till within a few days of his death; which happened in the 70th year of his age, on the 12th of December 1777. His *Elementa Physicæ* and *Bibliotheca Medicinæ*, will afford, to latest posterity, undeniable proofs of his indefatigable industry, penetrating genius, and solid judgment. But he was not less distinguished as a philosopher, than beloved as a man; and he was not more eminent for his improvement in every department of medical science, than for his piety to God, and benevolence to all mankind.

HALLEY (Dr Edmund), an eminent astronomer, was the only son of a soap-boiler in London, and was born in 1656. He first applied himself to the study of the languages and sciences, but at length gave himself up wholly to that of astronomy. In 1676 he went to the island of St Helena to complete the catalogue of fixed stars, by the addition of those that lie near the south pole; and having delineated a planisphere, in which he laid them all down in their exact places, he returned to England in 1678. In the year 1680 he took what is called the *grand tour*, accompanied by his friend the celebrated Mr Nelson. In the mid-way between Calais and Paris, Mr Halley had a sight of a remarkable comet, as it then appeared a second time that year, in its return from the sun. He had the November before seen it in its descent; and now hastened to complete his observations upon it, in viewing it from the royal observatory of France. His design in this part of his tour was, to settle a friendly correspondence between the two royal astronomers of Greenwich and Paris, and in the mean time to improve himself under so great a master as Cassini. From thence he went to Italy, where he spent great part of the year 1681; but his affairs calling him home, he returned to England. In 1683, he published his *Theory of the variation of the magnetical compass*; in which he supposes the whole globe of the earth to be a great magnet, with four magnetical poles, or points of attraction: but afterwards thinking that this theory was liable to great exceptions, he procured an application to be made to king William, who appointed him commander of the Paramour pink, with orders to seek by observations the discovery of the rule of variations, and to lay down the longitudes and latitudes of his majesty's settlements in America.—He set out on this attempt on the 24th of November 1698: but having crossed the line, his men grew sickly; and his lieutenant mutinying, he returned home in June 1699. Having got the lieutenant tried and cashiered, he set sail a second time in September following, with the same ship, and another of less bulk, of which he had also the command. He now traversed the vast Atlantic ocean from one hemisphere to the other, as far as the ice would permit him to go; and having made his observations at St Helena, Brazil, Cape Verd, Barbadoes, the Madirras, the Canaries, the coast of Barbary, and many other latitudes, arrived in September 1700; and the next year published a general chart, shewing at one view the variation of the compass in all those places. Captain Halley, as he was now called, had been at home little more than half a year, when he was sent by the king to observe the course of the tides, with the longitude and latitude of the principal head-lands in the British channel; which having executed with his usual expedition and accu-

cy, he published a large map of the British channel. Soon after, the emperor of Germany resolving to make a convenient harbour for shipping in the Adriatic, Captain Halley was sent by queen Anne to view the two ports on the coast of Dalmatia. He embarked on the 22d of November 1702; passed over to Holland; and going through Germany to Vienna, he proceeded to Istria: but the Dutch opposing the design, it was laid aside; yet the emperor made him a present of a rich diamond-ring from his finger, and honoured him with a letter of recommendation, written with his own hand, to queen Anne. Presently after his return, he was sent again on the same business; when passing thro' Hanover, he supped with king George I. then electoral prince, and his sister the queen of Prussia. On his arrival at Vienna, he was the same evening presented to the emperor, who sent his chief engineer to attend him to Istria, where they repaired and added new fortifications to those of Trieste.

Mr Halley returned to England in 1703; and the same year was made professor of geometry in the university of Oxford, in the room of Dr Wallis, and had the degree of doctor of laws conferred on him by that university. He is said to have lost the professorship of astronomy in that city, because he would not profess his belief of the Christian religion. He was scarcely settled at Oxford, when he began to translate into Latin from the Arabic, *Apollonius de sectione rationis*; and to restore the two books *De sectione spatii* of the same author, which are lost, from the account given of them by Pappius; and he published the whole work in 1706. Afterwards he had a share in preparing for the press Apollonius's Conics; and ventured to supply the whole eighth book, the original of which is also lost. He likewise added Serenus on the section of the cylinder and cone, printed from the original Greek, with a Latin translation, and published the whole in folio. In 1713, he was made secretary of the Royal Society; in 1720, he was appointed the king's astronomer at the royal observatory at Greenwich, in the room of Mr Flamsteed; and, in 1729, was chosen as a foreign member of the Academy of Sciences at Paris. He died at Greenwich in 1742. His principal works are, 1. *Catalogus stellarum australium*. 2. *Tabule astronomice*. 3. An abridgment of the astronomy of comets, &c. We are also indebted to him for the publication of several of the works of the great Sir Isaac Newton, who had a particular friendship for him, and to whom he frequently communicated his discoveries.

HALLEY'S *Squadrant*. See *QUADRANT*.

HALLIARDS, the ropes or tackles usually employed to hoist or lower any sail upon its respective mast or stay. See *JEARS*.

HALMOTÉ, or HALIMOTÉ, is the same with what we now call a *court-baron*, the word implying a meeting of the tenants of the same hall or manor. The name is still retained at Luffton, and other places in Herefordshire. See *MORE*.

HALMSTADT. See *HELMSTADT*.

HALSTEAD, town of Essex, in England, seated on the river Coln, in E. Lon. o. 45. N. Lat; 51. 55. It has an old church, the steeple of which was once burnt down by lightning, but rebuilt at the expence of an individual, (Robert Filke, esq;).

THE
town

Halley

Hallstead.

Halo

Ham.

town consists of about 600 pretty good houses, and is situated on a rising ground, but the streets are not paved. The inhabitants are about 4000 in number. Here is a good manufactory of says, bays, callimancoes, &c. also a good free-school for 40 boys, and a very antique Bridewell.

HALO, or CORONA, in natural history, a coloured circle appearing round the body of the sun, moon; or any of the large stars. See CORONA.

HALT, in war, a pause or stop in the march of a military body.—Some derive the word from the Latin *haltus*, breath; it being a frequent occasion of halting to take breath: others from *alto*, because in halting they raised their pikes on end, &c.

HALTERISTÆ, in antiquity, a kind of players called *discus*; denominated from a peculiar kind of *discus* used by the Greeks *κάντις*, and by the Latins *Halter*. See DISCUS.

Some take the *discus* to have been a leaden weight or ball which the vaulters bore in their hands, to secure and keep themselves the more steady in their leaping. Others will have the *halter* to be a lump or mass of lead or stone, with an hold or handle fixed to it, by which it might be carried; and that the *halteristæ* were those who exercised themselves in removing these masses from place to place.

Hier. Mercurialis, in his treatise *De arte gymnastica*, l. iii. c. 12. distinguishes two kinds of *halteristæ*; for though there was but one *halter*, there were two ways of applying it. The one was to throw or pitch it in a certain manner; the other only to hold it out at arm's-end, and in this posture to give themselves divers motions, swinging the hand backwards and forwards, according to the engraven figures thereof given us by Mercurialis.—The *halter* was of a cylindrical figure, smaller in the middle, where it was held, by one diameter, than at the two ends. It was above a foot long, and there was one for each hand: it was either of iron, stone, or lead.

Galen, *De tuend. valetud.* lib. i. v. & vi. speaks of this exercise, and shews of what use it is in purging the body of peccant humours; making it equivalent both to purgation and phlebotomy.

HALTWHISTLE, a town of Northumberland, in England, situated in E. Lon. 2. 02 N. Lat. 55. 0. It is pretty well built, and affords good entertainment for travellers.

HALYMOTE, properly signifies an holy or ecclesiastical court. See HALMOTE.

There is a court held in London by this name before the Lord-Mayor and sheriffs, for regulating the bakers. It was anciently held on Sunday next before St Thomas's day, and for this reason called the *Halymote*, or *Holy-court*.

HALYWERCFOLK, in old writers, were persons who enjoyed land, by the pious service of repairing some church, or defending a sepulchre.

This word also signified such persons in the diocese of Durham, as held their lands to defend the corps of St Cuthbert, and who from thence claimed the privilege of not being forced to go out of the bishopric.

HAM is a Saxon word used for "a place of dwelling;" a village or town; hence the termination of some of our towns, *Nottingham, Buckingham, &c.*

VOL. V.

Also a home close, or little narrow meadow, is called a *ham*.

HAM, in cookery, the leg of a hog, seasoned and dried.

To salt a ham in imitation of those of Westphalia: Let the ham be of young pork; sprinkle it with salt for one day, that it may fetch out the blood; then wipe it dry, and rub it with the following mixture: Take a pound of brown sugar, half a pound of salt-petre, half a pint of bay-falt, and three pints of common falt; stir these together in an iron-pan over the fire till they are pretty hot, and then rub the leg of pork with it: let it lie three weeks in this salting, frequently turning it, and then dry it in a chimney.

HAM, a city of Germany, in the circle of Westphalia, capital of the county of Mark, and subject to the king of Prussia. It is seated on the river Lippe, on the frontiers of Munster. The adjacent country abounds in corn, hemp, and flax; and the inhabitants get a good deal of money by travellers. It was formerly a hanse-town, but is now reduced. E. Lon. 7. 53. N. Lat. 51. 42.

HAM, a town of Picardy, in France, seated on the river Somme, among marshes. It has three parishes, and there is here a round tower whose walls are 36 feet thick. It was taken by the Spaniards in 1557, but restored by treaty. E. Lon. 3. 9. N. Lat. 49. 45.

HAMADAN. See AMADAN.

HAMADRYADS, in Heathen theology, certain rural deities; being nymphs of the woods, whose fate depended upon certain trees, together with which they were supposed both to be born and to die.

HAMAH, a town of Turkey in Asia, in Syria, situated in E. Lon. 36. 15. N. Lat. 35. 15. By some travellers it is corruptly called *Amarl* and *Amant*. Some mistake it for the ancient Apamea; but this is now called *Afamiyah*, and is situated a day's journey from Hamah. Hamah is situated among hills, and has a castle seated on a hill. It has all along been a considerable place, and in the 13th century had princes of its own. It is very large, and being seated on the ascent of a hill, the houses rise above one another, and make a fine appearance. It is, however, like most other towns under the Turkish government, going to decay. Many of the houses are half ruined; but those which are still standing, as well as the mosques and castle, have their walls built of black and white stones, disposed in such manner as to form various figures. The river Asi, the ancient Orontes, runs by the side of the castle, and fills the ditches round it, which are cut very deep into the rock. This river, leaving the castle, passes through the town from south to north, and has a bridge over it, though it is pretty broad. In its course through the town it turns 18 great wheels, called by the natives *saki*, which raise great quantities of water to a considerable height, and throw it into canals supported by arches, by which means it is conveyed into the gardens and fountains. There are some pretty good bazars or market-places in Hamah, where there is a trade for linen, which is manufactured there, and sent to Tripoli to be exported into Europe.

HAMAMELIS, WITCH HAZEL; a genus of the digynia order, belonging to the tetrandria class of plants. There is but one species, a native of Virgi-

nia

Ham

Hamamelis.

Hambden,
Hamburg.

nia. It hath a shrubby or woody stem, branching three or four feet high; oval, indented, alternate leaves, resembling those of common hazel; and flowers growing in clusters from the joints of the young branches, but not succeeded by seeds in this country.—The plant is hardy, and is admitted as a variety in our gardens; but its flowers are more remarkable for their appearing in November and December, when the leaves are fallen, than for their beauty.—It may be propagated either by seeds or layers.

HAMBDEN (John), a celebrated patriot, descended of the ancient family of Hambden in Buckinghamshire, was born in 1594. From the university he went to the inns of court, where he made a considerable progress in the study of the law. He was chosen to serve in the parliament which began at Westminster February 5th 1626; and served in all the succeeding parliaments in the reign of Charles I. In 1636 he became universally known, by his refusal to pay ship-money, as being an illegal tax; upon which he was prosecuted, and his carriage throughout this transaction gained him a great character. When the long parliament began, the eyes of all men were fixed on him as their *pater patriæ*. On January 3d 1642, the king ordered articles of high treason and other misdemeanours to be prepared against Lord Kimbolton, Mr Hambden, and four other members of the House of Commons, and went to that house to seize them: but they were then retired. Mr Hambden afterwards made a speech in the house to clear himself of the charge laid against him. In the beginning of the wars he commanded a regiment of foot, and did good service to the parliament at the battle of Edge-hill. He received a mortal wound in an engagement with Prince Rupert, in Chalgrave-field in Oxfordshire, and died in 1643. He is said to have had the air of Socrates to a great degree, of interrogating, and, under the notion of doubts, insinuating objections, so that he infused his own opinions into those from whom he pretended to learn and receive them. He was, say his panegyrista, a very wise man, and of great parts; and possessed of the most absolute spirit of popularity to govern the people, that ever was in any country: He was master over all his appetites and passions, and had thereby a very great ascendancy over other men's: He was of an industry and vigilance never to be tired out, of parts not to be imposed upon by the most subtle, and of courage equal to his best parts.

HAMBURG, an imperial city of Germany, seated in E. Lon. 9. 40. N. Lat. 54. 0. Its name is derived from the old German word *Hamme*, signifying a wood, and *Burg*, a castle; and stands on the north-side of the river Elbe. This river is not less than four miles broad opposite the city. It forms two spacious harbours, and likewise runs through most part of it in canals. It flows above Hamburg many miles; but when the tide is accompanied with north-west winds, a great deal of damage is done by the inundations occasioned thereby. There are a great many bridges over the canals, which are mostly on a level with the streets, and some of them have houses on both sides. In the year 833, Ludovicus Pius erected Hamburg first into a bishopric, and afterwards into an archbishopric; and Adolphus III. duke of Saxony, among

many other great privileges, granted it the right of Hamburg-fishing in the Elbe, eight miles above and below the city. The kings of Denmark, since they have succeeded to the counts of Holstein, have continually claimed the sovereignty of this place, and often compelled the citizens to pay large sums to purchase the confirmation of their liberties. Nay, it has more than once paid homage to the king of Denmark; who, notwithstanding, keeps a minister here with credentials, which is a sort of acknowledgment of its independency and sovereignty. Though Hamburg has been constantly summoned to the diet of the empire ever since the year 1618, when it was declared a free imperial city, by a decree of the aulic council; yet it waxes this privilege, in order to keep fair with Denmark. The emperor several other emperors, and the privilege is now exercised silver money; and the emperor Frederic I. exempted the citizens from paying any tolls on the Elbe. By their situation among a number of poor princes, the Hamburgers are continually exposed to their rapaciousness, especially that of the Danes, who have extorted vast sums from them. The city is very populous, in proportion to its bulk; for though one may walk with ease round the ramparts in two hours, yet it contains, exclusive of Jews, at least 100,000 inhabitants. Here are a great many charitable foundations, the regulations of which are greatly admired by foreigners. All persons found begging in the streets are committed to the house of correction to hard labour, such as the rasing of Brazil and other kinds of wood. There is an hospital into which unmarried women may be admitted for a small sum, and comfortably maintained during the residue of their lives. The number of hospitals in this place is greater in proportion to its bigness, than in any other Protestant city in Europe. The revenue of the orphan-house alone is said to amount to between 50 and 60,000 l. There is a large sumptuous hospital for receiving poor travellers that fall sick. In one of their work-houses or houses of correction, those who have not performed their task are hoisted up in a basket over the table in the common-hall while the rest are at dinner, that they may be tantalized with the sight and smell of what they cannot taste. The established religion of Hamburg is Lutheranism; as for the Calvinists and the Roman-catholics, they go to the ambassadors chapels to celebrate their divine service and worship. They have here what they call a *private confession*, previous to the holy communion, which differs in nothing from that of the church of England, and the absolution is the same, only the poorest of the people here are forced to give a fee to the priest on these occasions. Their churches, which are ancient large fabrics, are open thoroughfares, and in some of them there are book-sellers shops. The pulpit of St Catharine's is of marble, curiously carved and adorned with figures and other ornaments of gold; and its organ, reckoned one of the best in Europe, has 6000 pipes. The cathedral is very ancient, and its tower leans as if just going to fall; yet, on account of the singularity and beauty of its architecture, the danger attending it has been hitherto overlooked. There is still a dean and chapter belonging to this church; though secularized; from whose court there lies no appeal, but to the imperial chamber

Hamburg.

chamber at Wetzlar. The chapter consists of a provost, dean, 13 canons, eight minor canons, and 30 *vicarii immunes*, besides others who are under the jurisdiction of the city. The cathedral, with the chapter, and a number of houses belonging to them, are under the immediate protection of his Britannic majesty as duke of Bremen, who disposes of the prebends that fall in six months of the year, not successively, but alternately with the chapter. Hamburg is almost of a circular form, and six miles in compass. It has six gates, and three entrances by water, viz. two from the Elbe and one from the Alster, being divided into the old and new; which are strongly fortified with moats, ramparts, bastions, and out-works. The ramparts are very lofty, and planted with trees; and of such a breadth, that several carriages may go a-breast. In the new town, towards Altena, are several streets of mean houses inhabited by Jews. Through that entrance from the Elbe called the *lower Basin*, pass all ships going to or coming from sea. Every morning at the opening of it is seen a multitude of boats and small barks, whose cargoes consist of milk, fruits, and all kinds of provisions, rushing in at the same time. There are some fine chimneys here, especially those of St Nicholas, which play every morning early, at one o'clock in the afternoon, and on all festivals and solemnities. The other public structures in this city, besides the churches, make no great appearance: however, the yard, arsenal, and two armories, are well worth seeing. There are several convents or cloisters still remaining; which having been secularized, are now possessed by the Lutherans. One of them holds its lands by this tenure, "That they offer a glass of wine to every malefactor who is carried by it for execution." There is a fine exchange, though inferior to that of London. It is the custom of Hamburg, that a citizen, when he dies, must leave the tenth of his estate to the city; and foreigners, not naturalized, must pay a certain sum annually for liberty to trade. The common carts here are only a long pulley laid upon an axle-tree between two wheels, and drawn not by horses, but by men, of whom a dozen or more are sometimes linked to these machines, with flings across their shoulders. Such of the senators, principal elders, divines, regular physicians, and graduates in law, as assist at funerals, have a fee. The hangman's house is the common prison for all malefactors; on whom sentence is always passed on Friday, and on Monday they are executed. As, by their laws, no criminal is punishable unless he plead guilty, they have five different kinds of torture to extort such confession. The government of this city is lodged in the senate and three colleges of burghers. The former is vested with almost every act of sovereignty, except that of laying taxes and managing the finances, which are the prerogatives of the latter. The magistracy is composed of four burgo-masters, four syndics, and 24 aldermen, of whom some are lawyers and some merchants. Any person elected into the magistracy, and declining the office, must depart the place. No burgher is admitted into any of the colleges, unless he dwells in a house of his own within the city, and is possessed of 1000 rix-dollars in specie, over and above the sum for which the house may be mortgaged; or 2000 in moveable goods, within the jurisdiction of the same. For the admini-

Hamburg.

stration of justice, here are several inferior courts, from which an appeal lies to the Obergericht, or high court, and from that to the aulic council and other imperial colleges. For naval causes here is a court of admiralty, which, jointly with the city-treasury, is also charged with the care of the navigation of the Elbe, from the city to the river's mouth. In consequence of this, 100 large buoys, some white, others black, are kept constantly floating in the river in summer; but in winter, instead of some of them, there are machines, like those called *ice-beacons*, to point out the shoals and flats. Subordinate to the admiralty is a company of pilots; and at the mouth of the Elbe is, or at least ought to be, a vessel always riding, with pilots ready to put on board the ships. At the mouth of the river also is a good harbour, called *Cuxhaven*, belonging to Hamburg; a light-house; and several beacons, some of them very large. For defraying the expence of these, certain tolls and duties were formerly granted by the emperors to the city. Besides the Elbe, there is a canal by which a communication is opened with the Trave, and thereby with Lubeck and the Baltic, without the hazard, trouble, and expence of going about by the Sound. The trade of Hamburg is exceeding great, in exporting all the commodities and manufactures of the several cities and states of Germany, and supplying them with whatever they want from abroad. Its exports consist of linens of several sorts and countries; as lawns, diapers, Onaburgs, dowlas, &c. linen-yarn, tin-plates, iron, brass and steel wire, clap-board, pipe-staves, waincot-boards, oak-plank and timber, kid-skins, corn, beer in great quantities, with flax, honey, wax, aniseed, linseed, drugs, wine, tobacco, and metals. Its principal imports are the woollen manufactures and other goods of Great Britain, to the amount of several hundred thousand pounds a-year: they have also a great trade with Spain, Portugal, and Italy, which is carried on mostly in English bottoms, on account of their Mediterranean passes. Their whale-fishery is also very considerable, 50 or 60 ships being generally sent out every year in this trade. Add to these a variety of manufactures, which are performed here with great success; the chief of which are, sugar-baking, calico-printing, the weaving of damasks, brocades, velvets, and other rich silks. The inland trade of Hamburg is superior to that of any in Europe, unless perhaps we should except that of Amsterdam and London. There is a paper published here at stated times, called the *Preis-Courant*, specifying the course of exchange, with the price which every commodity and merchandise bore last upon the exchange. There is also a board of trade, erected on purpose for the advancing every project for the improvement of commerce. Another great advantage to the merchants is, the bank established in 1619, which has a flourishing credit. To supply the poor with corn at a low price, here are public granaries, in which great quantities of grain are laid up. By charters from several emperors, the Hamburgers have a right of coinage, which they actually exercise. The English merchants, or *Hamburg company*, as it is called, enjoy great privileges; for they hold a court with particular powers, and a jurisdiction among themselves, and have a church and minister of their own.—This city has a district belonging to it of considerable extent, which abounds with excellent pa-

Hamburg
Hamilton.

flures, intermixed with several large villages and noblemens seats. A small bailiwick, called *Bergedorf*, belongs to this city and Lubeck.—Though Hamburg has an undoubted right to a seat in the diet of the empire, yet as she pays no contributions to the military chest in time of war, and is also unwilling to draw upon herself the resentment of Denmark, she makes no use of that privilege. There is a *schola illustis* or gymnasium here, well endowed, with fix able professors, who read lectures in it as at the universities. There are also several free schools, and a great number of libraries, public and private. The public cellar of this town has always a prodigious stock and vent of old hock, which brings in a considerable revenue to the state. Besides the militia, or trained bands, there is an establishment of regular forces, consisting of 12 companies of infantry, and one troop of dragoons, under the commandant, who is usually a foreigner, and one who has distinguished himself in the service. There is also an artillery company, and a night-guard; the last of which is posted at night all over the city, and calls the hours.

HAMEL (John Baptiste du), a very learned French philosopher and writer in the 17th century. At 18 he wrote a treatise, in which he explained in a very simple manner, Theodosius's three books of Spherics; to which he added a tract upon trigonometry, extremely periphrastic, and designed as an introduction to astronomy. Natural philosophy, as it was then taught, was only a collection of vague, knotty, and barren questions; when our author undertook to establish it upon right principles, and published his *Astronomia Physica*. In 1666 Mr Colbert proposed to Lewis XIV. a scheme, which was approved of by his majesty, for establishing a royal academy of sciences; and appointed our author secretary of it. He published a great many books; and died at Paris in 1706, of mere old age, being almost 83. He was regius professor of philosophy, in which post he was succeeded by M. Varignon. He wrote Latin with purity and elegance.

HAMELIN, a strong town of Germany, in the duchy of Calemberg in Lower Saxony. It is situated at the extremity of the duchy of Brunswick, to which it is the key, near the confluence of the rivers Hamel and Weser, in E. Long. 9. 55. N. Lat. 52. 13.

HAMESECKEN. BURGLARY, or *Nothurnal House-breaking*, was by the ancient English law called *Hame-secken*, as it is in Scotland to this day.—Violating the privilege of a man's house in Scotland is as severely punished as ravishing a woman.

HAMILTON, a town of Scotland, in Clydesdale, seated on the river Clyde, eleven miles south-east of Glasgow; from whence the noble family of Hamilton take their name, and title of duke. The town is seated in the middle of a very agreeable plain; and on the west of the town this family has a large park, which is near seven miles in circumference, inclosed with a high wall, full of deer and other game. The rivulet called *Avon* runs through the park, and falls into the river Clyde, over which last there is a bridge of free-stone. W. Lon. 3. 50. N. Lat. 55. 40. The original name of this place, or the lands about it, was *Cadzow* or *Cadyow*, a barony granted to an ancestor of the noble owner, on the following oc-

Hamilton

caſion. In the time of Edward II. lived *Sir Gilbert de Hamilton*, or *Hampton*, an Englishman of rank; who happening at court to speak in praise of Robert Bruce, received on the occasion an insult from John de Spenser, chamberlain to the king; whom he fought and slew. Dreading the resentment of that potent family, he fled to the Scottish monarch; who received him with open arms, and established him at the place possessed by the duke of Hamilton. In after-times the name was changed from *Cadzow* to *Hamilton*; and in 1445 the lands were erected into a lordship, and the then owner Sir James sat in parliament as lord Hamilton. The same nobleman founded the collegiate church at Hamilton in 1451, for a provost and several prebendaries. The endowment was ratified at Rome by the pope's bull, which he went in person to procure.—Hamilton-house, or palace, is at the end of the town; a large disagreeable pile, with two deep wings at right angles with the centre: the gallery is of great extent; and furnished, as well as some other rooms, with most excellent paintings.

HAMILTON (Anthony, count), descended from a noble family in Scotland, was born in Ireland, and settled in France. He wrote several poetical pieces; and was the first who composed romances in an agreeable taste, without imitating the burlesque of Scarron. He is also said to be the author of the *Memoirs of the count de Grammont*, one of the best written pieces in the French language. His works were printed in 6 vols 12mo. He died at St Germain-en-Laye, in 1720.

HAMILTON (George), earl of Orkney, and a brave warrior, was the fifth son of William earl of Selkirk, and early betook himself to the profession of arms. Being made colonel in 1689-90, he distinguished himself by his bravery at the battle of the Boyne; and soon after, at those of Aghrim, Steinkirk, and Landen, and at the sieges of Athlone, Limerick, and Namur. His eminent services in Ireland and Flanders, through the whole course of that war, recommended him so highly to king William III. that, in 1696, he advanced him to the dignity of a peer of Scotland, by the title of *earl of Orkney*; and his lady, the sister of Edward viscount Wiltshire, afterwards earl of Jersey, had a grant made to her, under the great seal of Ireland, of almost all the private estates of the late king James, of very considerable value.

Upon the accession of queen Anne to the throne, he was promoted to the rank of major-general in 1702, and the next year to that of lieutenant-general, and was likewise made knight of the thistle. His lordship afterwards served under the great duke of Marlborough; and contributed by his bravery and conduct to the glorious victories of Blenheim and Malplaquet, and to the taking several of the towns in Flanders.

In the beginning of 1710, his lordship, as one of the 16 peers of Scotland, voted for the impeachment of Dr Sacheverel; and the same year was sworn of the privy-council, and made general of the foot in Flanders. In 1712, he was made colonel of the royal regiment of fusiliers, and served in Flanders under the duke of Ormond. In 1714, he was appointed gentleman-extraordinary of the bed chamber to king George I. and afterwards governor of Virginia. A2
length

Hamlet
Hammond.

length he was appointed constable, governor, and captain of Edinburgh castle, lord lieutenant of the county of Clydesdale, and field-marshal. He died at his house in Albemarle-street, in 1737.

HAMLET, HAMEL, or Hampfel, (from the Saxon *Ham*, i. e. *Donus*, and the German *Let*, i. e. *Membrum*), signifies a little village, or part of a village or parish; of which three words the first is now only used, tho' Kitchen mentions the two last. By Spelman there is a difference between *villam integram*, *villam dimidiam*, and *hamletum*; and Stowe expounds it to be the seat of a freeholder. Several county-towns have hamlets, as there may be several hamlets in a parish; and some particular places may be out of a town or hamlet, though not out of the county.

HAMMOCK, on shipboard, a piece of canvas six feet long and three feet wide, gathered together at the two ends, and hung horizontally under the deck lengthwise, for the sailors to sleep therein. There are usually from 14 to 20 inches in breadth allowed between-decks for every hammock in a ship of war: this space, however, must in some measure depend on the number of the crew, &c. in proportion to the room of the vessel. In the time of battle the hammocks, together with their bedding, are all firmly corded, and fixed in the nettings on the quarter-deck, or wherever the men are too much exposed to the view or fire of the enemy.

HAMMER, a well-known tool used by mechanics, consisting of an iron-head, fixed crosswise upon a handle of wood. There are several sorts of hammers used by blacksmiths; as, 1. The hand-hammer, which is of such weight that it may be wielded or governed with one hand at the anvil. 2. The up-hand sledge, used with both hands, and seldom lifted above the head. 3. The about-sledge, which is the biggest hammer of all, and held by both hands at the farthest end of the handle; and being swung at arms-length over the head, is made to fall upon the work with as heavy a blow as possible. There is also another hammer used by smiths, called a *rivetting-hammer*; which is the smallest of all, and is seldom used at the forge, unless upon small work.—Carpenters and joiners have likewise hammers accommodated to their several purposes.

HAMMOND (Henry), D. D. one of the most learned English divines in the 17th century, was born in 1605. He studied at Oxford, and in 1629 entered into holy orders. In 1633 he was inducted into the rectory of Penshurst in Kent. In 1643 he was made archdeacon of Chichester. In the beginning of 1645 he was made one of the canons of Christ-church, Oxford, and chaplain in ordinary to king Charles I. who was then in that city; and he was also chosen public orator of the university. In 1647, he attended the king in his confinement at Woodrow, Cavesham, Hampton-Court, and the Isle of Wight, where he continued till his majesty's attendants were again put from him. He then returned to Oxford, where he was chosen sub-dean; and continued there till the parliament visitors first ejected him, and then imprisoned him for several weeks in a private house in Oxford. During this confinement he began his Annotations on the New Testament. At the opening of the year 1660, when every thing wisely tended to the restora-

tion of the royal family, the doctor was desired by the bishops to repair to London, to assist there in the composition of the breaches of the church, his station in which was designed to be the bishopric of Worcester; but on the 4th of April he was seized by a fit of the stone, of which he died on the 25th of that month, aged 55. Besides the above work, he wrote many others; all of which have been published together in four volumes folio.

HAMMOND (Anthony, esq;) an ingenious English poet, descended from a good family of Somersham Place in Huntingdonshire, was born in 1608. After a liberal education at St John's college, Cambridge, he was chosen member of parliament, and soon distinguished himself as a fine speaker. He became a commissioner of the royal navy, which place he quitted in 1712. He published "A miscellany of original poems by the most eminent hands," in which himself, as appears by the poems marked with his own name, had no inconsiderable share. He wrote the life of Walter Moyle, esq; prefixed to his works. He was the intimate friend of that gentleman, and died about the year 1726.

HAMMOND (Mr.), known to the world by the *Love-Elegies*, which, some years after his death, were published by the earl of Chesterfield, was the son of a merchant in London, and preferred to a place about the person of the late prince of Wales, which he held till an unfortunate accident deprived him of his senses. The cause of this calamity was a passion he entertained for a lady, who would not return it: upon which he wrote those love-elegies which have been so much celebrated for their tenderness. The editor observes, that he composed them before he was 21 years of age: a period, says he, when fancy and imagination commonly riot at the expense of judgment and correctness. He was sincere in his love as in his friendship; and wrote to his mistress as he spoke to his friends, nothing but the genuine sentiments of his heart. Tibullus seems to have been the model our author judiciously preferred to Ovid; the former writing directly from the heart to the heart, the latter too often yielding and addressing himself to the imagination. Mr Hammond died in the year 1743, at Stow, the seat of lord Cobham, who honoured him with a particular intimacy.

HAMPSHIRE, a county of England, bounded on the west by Dorsetshire and Wiltshire, on the north by Berkshire, on the east by Surrey and Sussex, and on the south by the English channel. It extends 64 miles in length from north to south, and 36 in breadth from east to west. It is divided into 39 hundreds, and 253 parishes; in which are one city, 18 market-towns, and about 180,000 inhabitants. It sends 26 members to parliament; viz. two for the county, two for the city of Winchester the capital, and two for each of the following boroughs, Southampton, Portsmouth, Yarmouth, Petersfield, Newport, Stockbridge, Newton, Christchurch, Lymington, Whitchurch, and Andover.—The air is very pure and pleasant, especially upon the downs, on which vast flocks of sheep are kept and bred. In the champaign part of the county, where it is free of wood, the soil is very fertile, producing all kinds of grain. The county is extremely well wooded and watered; for besides many woods on private estates,

Hammond's
Hamphire.

Hampshire
Hampton.

flates, in which there are vast quantities of well-grown timber, there is the new forest of great extent, belonging to the crown, well stored with venerable oaks. In these woods and forests, great numbers of hogs run at large, and feed on the acorns; and hence it is that the Hampshire bacon so far excels that of most other countries. The rivers are the Avon, Anton, Arle, Test, Stowre, and Itchin; besides several smaller streams, all abounding in fish, especially trout. As its sea-coast is of a considerable extent, it possesses many good ports and harbours, and is well supplied with salt-water fish. Much honey is produced in the county, and a great deal of mead and metheglin made. Here is also plenty of game, and on the downs is most delightful hunting. The manufacture of cloth and kerseys in this county, though not so extensive as that of some others, is yet far from being inconsiderable, and employs great numbers of the poor, as well as contributes to the enriching of the manufacturers by what is sent abroad.

NEW HAMPSHIRE, a province of North America, in New England. It is bounded on the north by Nova Scotia, on the east by the Ocean, on the south by Massachusetts's bay, and on the west by New-York. Before the commencement of the American war, it was ruled by a governor and council appointed by the king, and a house of representatives. As it is a very proper country for furnishing naval stores, great part of its timber was appointed for masts and yards to the royal navy.

HAMPSTEAD, a pleasant village of Middlesex, five miles north of London. As the air is exceeding good, the place is well furnished with fine seats built in an elegant manner, and much resorted to in the summer-time by all sorts of people. As for the medicinal waters formerly in request, they are now much neglected. In Henry VIII's time it was chiefly inhabited by laundresses, who washed for the Londoners.

HAMPTON, a town of Gloucestershire in England, seated on the Cotswold hills, and had formerly a nunnery. W. Long. 2. 15. N. Lat. 51. 38.

HAMPTON-Court, a town of Middlesex in England, seated on the river Thames, 12 miles west of London, and two from Kingstown. It is chiefly famous for the royal palace there, which is the finest in Britain. It was built by cardinal Wolsey, who had 280 silk beds for strangers only, and furnished it richly with gold and silver plate. The buildings, gardens, and the two parks, to which William III. made considerable additions, are about four miles in circumference, and are watered on three sides by the Thames. The inward court, built by king William, forms a piazza, the pillars of which are so low, that it looks more like a cloyster than a palace; however, the apartments make ample amends, being extremely magnificent, and more exactly disposed than in any other palace in the world, and adorned with most elegant furniture. Since the accession of his present majesty, however, this palace hath been much neglected, as the king has generally made choice of Richmond for his summer retreat. Those inimitable paintings by Raphael Urbin called the *caroons*, which were placed there by king William, have been removed to the queen's palace at Westminster. For these pieces Lewis XV. is said to have offered 100,000*l*.

Hanau
Handel.

HANAU, a town of Germany, and capital of a county of the same name, is pleasantly situated on the river Kenzig near its confluence with the Mayne. The river divides it into the old and new towns, both of which are fortified. The new town, which was built at first by French and Flemish refugees, who had great privileges granted them, is regular and handsome. The castle in which the counts used to reside, and which stands in the old town, is fortified, and has a fine flower-garden with commodious apartments, but makes no great appearance. The Jews are tolerated here, and dwell in a particular quarter. The magistracy of the new town, and the disposal of all offices in it, belong to the French and Dutch congregations. Here is an university, with several manufactures, particularly of that of roll tobacco, and a very considerable traffic. E. Long. 9. 0. N. Lat. 49. 58.

HANAU-Munzenberg, a county of Germany. The greatest part of it is surrounded by the electorate of Mentz, the bishopric of Fulda, the lordships of Reineck, Isenburg, and Solms; as also by the territories of Hesse-Homburg, Burg-Friedburg, and Frankfurt. Its length is near 40 miles, but its greatest breadth not above 12. It is exceeding fertile in corn, wine, and fruits; yielding also salt springs, with some copper, silver, and cobalt. The chief rivers are, the Mayne, the Kinzege, and the Nidda. The prevailing religion is Calvinism, but Lutherans and Catholics are tolerated. The country is populous, and trade and manufactures flourish in it. In 1736, the whole male line of the counts of Hanau failing in John Reinard, William VIII. landgrave of Hesse Cassel, by virtue of a treaty of mutual succession between the families of Hanau and Hesse Cassel, took possession of the county, satisfaction having been first made to the house of Saxony for their claims; and in the year 1754 transferred it to prince William, eldest son to the then hereditary prince Frederic, afterwards landgrave. The revenues of the last count, arising from this and other territories, are said to have amounted to 500,000 florins. The principal places are Hanau, Bergen, Steinau, and Glenhausen.

HAND, in anatomy, the extreme part of the arm. Anaxagoras is represented by ancient authors, as maintaining, that man owes all his wisdom, knowledge, and superiority over other animals, to the use of his hands.—Galen puts the thing another way: man, according to him, is not the wisest creature because he has hands; but he had hands given him because he was the wisest creature.

HAND, in the manege, a measure of four inches, or of a clenched fist, by which the height of a horse is computed.

HAND-Breadth, a measure of three inches.

HANDEL (George Frederic), a most eminent master and composer of music, was born at Hall, a city of Upper Saxony in Germany. His father was a physician and surgeon of that place, and was upwards of 60 years of age when Handel was born. During his infancy young Handel is said to have amused himself with musical instruments, and to have made considerable progress before he was seven years of age, without any instructions. His propensity for music at last became so strong, that his father, who designed him for the study of the civil law, thought proper to forbid him,

Handel.

him, even at this early period of life, to touch a musical instrument, and would suffer none to remain in his house. Notwithstanding this prohibition, however, Handel found means to get a little clavier privately conveyed to a room in the uppermost story of the house, to which room he constantly stole when the family were asleep; and thus made such advances in his art, as enabled him to play on the harpsichord. He was first taken notice of by the duke of Saxe Weissenfels on the following occasion. His father went to pay a visit to another son by a former wife, who was valet de chambre to the duke, and resided at his court. Young Handel, being then in his seventh year, earnestly desired permission to go along with him; but being refused, he followed the chaise on foot, and overtook it, the carriage being probably retarded by the roughness of the way. His father at first chid him for his disobedience, but at last took him into the chaise along with him. While he was in the duke's court, he still continued to hew the same inclination for music: it was impossible to keep him from harpsichords; and he used sometimes to get into the organ-loft at church, and play after service was over. On one of these occasions, the duke happening to go out later than usual, found something so uncommon in Handel's manner of playing, that he inquired of his valet who it was; and receiving for answer that it was his brother, he desired to see him. This nobleman was so much taken with the musical genius shewn by young Handel, that he persuaded his father to let him follow the bent of his inclination. He made the boy a present; and told him, that if he minded his studies, no encouragement should be wanting.

On his return to Hall, Handel was placed under one Zackaw, the organist of the cathedral church; and our young musician was even then able to supply his master's place in his absence. At nine years of age he began to compose church-services for voices and instruments, and continued to compose one such service every week for three years successively. At the age of 14, he far excelled his master, as he himself owned; and he was sent to Berlin, where he had a relation in some place about the court, on whose care and fidelity his parents could rely. The opera was then in a flourishing condition, being encouraged by the grandfather of the present king of Prussia, and under the direction of many eminent persons from Italy, among whom were Buononcini and Attilio. Buononcini, being of a haughty disposition, treated Handel with contempt; but Attilio behaved to him with great kindness, and he profited much by his instructions. His abilities soon recommended him to the king, who frequently made him presents, and at last proposed to send him into Italy under his own patronage, and to take him under his immediate protection as soon as his studies should be completed. But Handel's parents not thinking proper to submit their child to the caprice of the king, declined the offer; upon which it became necessary for him to return to Hall.

Handel having now obtained ideas in music far exceeding every thing that could be found in Hall, continued there very unwillingly, and it was resolved to send him into Italy: but as the expence of this journey could not then be spared, he went to Hamburg, where the opera was little inferior to that of Berlin. Soon

Handel.

after his arrival in this city, his father died; and his mother being left in narrow circumstances, her son thought it necessary to procure some scholars, and to accept a place in the orchestra, by which means, instead of being a burden, he became a great relief to her.

At this time, the first harpsichord in Hamburg was played by one Kefer, a man who also excelled in composition; but he, having involved himself in some debts, was obliged to abscond. Upon this vacancy, the person who had been used to play the second harpsichord claimed the first by right of succession: but he was opposed by Handel, who founded a claim to the first harpsichord upon his superior abilities. After much dispute, in which all who supported or directed the opera engaged with much vehemence, it was decided in favour of Handel; but this good success had almost cost him his life. His antagonist resented the supposed affront so much, that, as they were coming out of the orchestra together, he made a push at Handel's breast with a sword; which must undoubtedly have killed him, had there not fortunately been a music-book in the bosom of his coat.

Handel, though yet but in his 15th year, became composer to the house; and the success of *Almeria*, his first opera, was so great, that it ran 30 nights without interruption. Within less than a twelvemonth after this, he set two others, called *Florinda* and *Norene*, which were received with the same applause. During his stay here, which was about four or five years, he also composed a considerable number of sonatas, which are now lost. Here his abilities procured him the acquaintance of many persons of note, particularly the prince of Tuscany, brother to John Gaston de Medicis the grand duke. This prince pressed him to go with him to Italy, where he assured him that no convenience should be wanting; but this offer Handel thought proper to decline, being resolved not to give up his independency for any advantage that could be offered him.

In the 19th year of his age, Handel took a journey to Italy on his own bottom; where he was received with the greatest kindness by the prince of Tuscany, and had at all times access to the palace of the grand duke. His Serene Highness was impatient to have something composed by so great a master; and notwithstanding the difference between the style of the Italian music and the German, to which Handel had hitherto been accustomed, he set an opera called *Roderigo*, which pleased so well, that he was rewarded with 100 sequins, and a service of plate. After staying about a year in Florence, he went to Venice, where he is said to have been first discovered at a masquerade. He was playing on a harpsichord in his visor, when Searlatti, a famous performer, cried out, that the person who played could be none but the famous Saxon or the devil. But a story similar to this is reported of many eminent persons whose abilities have been discovered in disguise. Here he composed his opera called *Agrippina*, which was performed 27 nights successively, with the most extravagant applause.

From Venice, our musician proceeded to Rome, where he became acquainted with cardinal Ottoboni and many other dignitaries of the church, by which means he was frequently attacked on account of his religion; but Handel declared he would live and die in the

Handel.

the religion in which he had been educated, whether it was true or false. Here he composed an oratorio called *Resurrection*, and 150 cantatas, besides some sonatas, and other music. Ottoboni also contrived to have a trial of skill between him and Dominici Scarlatti, who was considered as the greatest master on that instrument in Italy. The event is differently reported. Some say that Scarlatti was victorious, and others give the victory to Handel; but when they came to the organ, Scarlatti himself ascribed the superiority to Handel.

From Rome, Handel went to Naples; after which, he paid a second visit to Florence; and at last, having spent six years in Italy, set out for his native country. In his way thither, he was introduced at the court of Hanover with so much advantage by the baron Kilmanseck, that his Electoral Highness offered him a pension of 1500 crowns a-year as an inducement for him to continue there. This generous offer he declined on account of his having promised to visit the court of the Elector Palatine, and likewise to come over to England in compliance with the repeated invitations of the duke of Manchester. The elector, however, being made acquainted with this objection, generously ordered him to be told, that his acceptance of the pension should neither restrain him from his promise nor resolution; but that he should be at full liberty to be absent a year or more if he chose it, and to go wherever he thought fit. Soon after, the place of master of the chapel was bestowed upon Handel; and our musician having visited his mother, who was now extremely old and blind, his old master Zackaw, and staid some time at the court of the Elector Palatine, set out for England, where he arrived in 1710.

At that time operas were a new entertainment in England, and were conducted in a very absurd manner: but Handel soon put them on a better footing; and set a drama called *Rinaldo*, which was performed with uncommon success. Having staid a year in England, he returned to Hanover; but in 1712 he again came over to England; and the peace of Utrecht being concluded a few months afterwards, he composed a grand *Te Deum* and *Gabriel* on the occasion. He now found the nobility very desirous that he should resume the direction of the opera house in the Hay-market; and the queen having added her authority to their solicitations, and conferred on him a pension of L. 200 a-year, he forgot his engagements to the elector of Hanover, and remained in Britain till the death of the queen in 1714. On the arrival of king Geo. I. Handel, conscious of his ill behaviour, durst not appear at court; but he was extricated from his dilemma by the baron Kilmanseck. Having engaged several of the English nobility in his behalf, the baron persuaded the king to a party of pleasure on the water. Handel was apprised of the design, and ordered to prepare some music for the occasion. This he executed with the utmost attention, and on the day appointed it was performed and conducted by himself. The king with pleasure and surprise inquired whose it was, and how the entertainment came to be provided without his knowledge. The baron then produced the delinquent; and asked leave to present him to his Majesty as one too sensible of his fault to attempt an excuse, but sincerely desirous to atone for it. This

intercession was accepted, Handel was restored to favour, his water-music was honoured with the highest approbation, and the king added a pension of L. 200 a-year to that formerly bestowed on him by queen Anne; which he soon after increased to L. 400, on his being appointed to teach the young princesses music.

In the year 1715, Handel composed his opera of *Admetus*; but from that time to the year 1720 he composed only *Teseo* and *Pastor Fido*, Buononcini and Attilio being then composers for the operas. About this time a project was formed by the nobility for erecting a kind of academy at the Hay-market, with a view of securing to themselves a constant supply of operas to be composed by Handel, and performed under his direction. No less than L. 50,000 was subscribed for this scheme, of which the king himself subscribed L. 1000, and it was proposed to continue the undertaking for 14 years. Handel went over to Dresden in order to engage singers, and returned with Senesino and Durisanti. Buononcini and Attilio had still a strong party in their favour, but not equal to that of Handel; and therefore in 1720 he obtained leave to perform his opera of *Radamisso*. The house was so crowded, that many fainted through excessive heat; and forty shillings were offered by some for a seat in the gallery, after having in vain attempted to get one elsewhere. The contention, however, still ran very high between Handel's party and that of the two Italian masters; and at last it was determined that the rivals should be jointly employed in making an opera, in which each should take a distinct act, and he who by the general suffrage was allowed to have given the best proof of his abilities should be put in possession of the house. This opera was called *Muzio Scaevola*, and Handel set the last act. It is said that Handel's superiority was owned even in the overture before it; but when the act came to be performed, there remained no pretence of doubt or dispute. The academy was now therefore firmly established, and Handel conducted it for nine years with great success; but about that time an irreconcilable enmity took place between Handel himself and Senesino. Senesino accused Handel of tyranny, and Handel accused Senesino of rebellion. The merits of the quarrel are not known: the nobility, however, became mediators for some time; and having failed in that good design, they became parties in the quarrel. Handel was resolved to dismiss Senesino, and the nobility seemed also resolved not to permit him to do so. The haughtiness of Handel's temper would not allow him to yield, and the affair ended in the total dissolution of the academy.

Handel now found that his abilities, great as they were, could not support him against the powerful opposition he met with. After the dismissal of Senesino, his audience insensibly dwindled away, and Handel entered into an agreement with Mr Keidegger to carry on operas in conjunction with him. New singers were engaged from Italy; but the offended nobility raised a subscription against him, to carry on operas in the play-house in Lincoln's-Inn fields. Handel bore up four years against this opposition; three in partnership with Keidegger, and one by himself: but though his musical abilities were superior to those of his antagonists, the astonishing powers of the voice of Farinelli, whom the opposite party had engaged, determined the victory

Handel.

Handel. tory against him. At last Handel, having spent all he was worth in a fruitless opposition, thought proper to desist. His disappointment had such an effect upon him, that for some time he was disordered in his understanding, and at the same time his right arm was rendered useless by a stroke of the palsy. In this deplorable situation, it was thought necessary that he should go to the baths of Aix-la-Chapelle; and from them he received such extraordinary and sudden relief, that his cure was looked upon by the nuns as miraculous.

In 1736, Handel again returned to England; and soon after his return his *Alexander's* feast was performed with applause at Covent-Garden. The success and splendor of the Hay-market was by this time so much reduced by repeated mismanagements, that lord Middlesex undertook the direction of it himself, and once more applied to Handel for composition. He accordingly composed two operas called *Farinondo*, and *Alessandro Severo*, for which in 1737 he received L. 1000. In 1738 he received L. 1500 from a single benefit, and nothing seemed wanting to retrieve his affairs, excepting such concessions on his part as his opponents had a right to expect. These concessions, however, he could not be prevailed upon to make; and that he might no longer be under obligations to act as he was directed by others, he refused to enter into any engagements upon subscription. After having tried a few more operas at Covent-Garden without success, he introduced another species of music called *oratorios*, which he thought better suited to the native gravity of an English audience. But as the subjects of these pieces were always taken from sacred history, it was by some thought to be a profanation to set them to music and perform them at a playhouse. In consequence of this prejudice, the oratorios met with very indifferent success; and in 1741 Mr Handel found his affairs in such a bad situation, that he was obliged to quit England, and go to Dublin.

He was received in Ireland in a manner suitable to his great merit; and his performing his oratorio called the *Messiah*, for the benefit of the city-prison, brought him into universal favour. In nine months time he had brought his affairs into a better situation; and on his return to England in 1742, he found the public much more favourably disposed. His oratorios were now performed with great applause: his *Messiah*, which before had been but coldly received, became a favourite performance; and Handel, with a generous humanity, determined to perform it annually for the benefit of the foundling hospital, which at that time was only supported by private benefactions. In 1743, he had a return of his paralytic disorder; and in 1751 became quite blind by a *gutta serena* in his eyes. This last misfortune for some time sunk him into the deepest despondency; but at last he was obliged to acquiesce in his situation, after having without any relief undergone some very painful operations. Finding it now impossible to manage his oratorios alone, he was assisted by Mr Smith, who at his request frequently played for him, and conducted them in his stead; and with this assistance they were continued till within eight days of his death. During the latter part of his life, his mind was often disordered; yet at times it appears to have resumed its full vigour, and he composed several songs, choruses, &c. which from their dates may

Vol. V.

be considered almost as the last sounds of his dying voice. From about October 1758 his health declined very fast; his appetite, which had been remarkably keen, and which he had gratified to a great degree, left him; and he became sensible of the approach of death. On the 6th of April 1759, his last oratorio was performed, at which he was present, and died on the 14th of the same month. On the 20th he was buried by the right reverend Dr Pearce, bishop of Rochester, in Westminster abbey; where, by his own order, and at his own expence, a monument was erected to his memory.

With regard to the character of this most eminent musician, he is universally allowed to have been a great epicure. In his temper he was very haughty, but was seldom or never guilty of mean actions. His pride was uniform; he was not by turns a tyrant and a slave. He appears to have had a most extravagant love for liberty and independence; inasmuch, that he would, for the sake of liberty, do things otherwise the most prejudicial to his own interest. Nay, so far is he said to have carried this principle, that, merely for the sake of preserving his independence, he often refused the highest favours from the ladies; though others ascribe this to a very different cause. Certain it is, that he never shewed the least attachment to the fair sex. He was liberal even when poor, and remembered his former friends when he was rich. His musical powers can perhaps be best expressed by Arbuthnot's reply to Pope, who seriously asked his opinion of him as a musician; "Conceive (said he) the highest you can of his abilities, and they are much beyond any thing you can conceive."

HANDS, in heraldry, are borne in coat-armour dexter and sinister; that is, right and left, expanded or open. These are the most necessary parts of the human body, as they serve to express all actions, and even our very thoughts and designs; thus, joining of hands is an universal token of friendship, and clapping of hands a general mark of applause.

HANGING, a common method of inflicting death on criminals, by suspending them by the neck. Physicians are not agreed as to the manner in which death is brought on by hanging. De Haen hanged three dogs, whom he afterwards opened. In one, nothing remarkable appeared in the lungs. In another, from whom half an ounce of blood was taken from the jugular vein, the dura and pia mater were of the natural appearance; but the lungs were much inflamed. In the third, the meninges were found, and there was no effusion of blood in the ventricles of the brain, but the left lobe of the lungs was turgid with blood. Wepfer, Littraeus, Alberti, Bruhierius, and Boerhaave, affirm that hanged animals die apoplectic. Their arguments for this are chiefly drawn from the livid colour of the face; from the turgescence of the vessels of the brain; the inflammation of the eyes; and from the sparks of fire which those who have survived hanging allege they have seen before their eyes. On the contrary, Bonetus, Petit, Haller, and Lancisi, from observing that death is occasioned by any small body falling into the glottis, have ascribed it to the stoppage of respiration. Others, deeming both these causes ill-founded, have ascribed it to a luxation of the vertebrae of the neck.—De Haen adduces the authority of many eminent au-

Hands,
Hanging.

thors to prove the possibility of recovering hanged persons; and observes, in general, that with bleeding in the jugular vein, and anointing the neck with warm oil, the same remedies are to be employed in this case as for the recovery of drowned people. See DROWNING.

HANGINGS, denote any kind of drapery hung up against the walls or wainscoting of a room.

Paper Hangings. See *PAPER-Hangings*.

Wool Hangings. See *TAPESTRY*.

HANGCLIFF, a remarkable point of land on the east coast of the largest of the Shetland Islands. It is frequently the first land seen by ships in northern voyages. Captain Phipps determined its situation to be in W. Long. $0^{\circ} 56' 30''$. N. Lat. $60^{\circ} 9'$.

HANNIBAL, a famous Carthaginian general, of whose exploits an account is given under the articles CARTHAGE and ROME. After having had the misfortune to lose a sea-fight with the Rhodians, through the cowardice of Apollonius one of the admirals of Antiochus the Great, he was forced to fly into Crete, to avoid falling into the hands of the Romans. On his arrival in this island, he took sanctuary among the Gortynii; but as he had brought great treasure along with him, and knew the avarice of the Cretans, he thought proper to secure his riches by the following stratagem. He filled several vessels with melted lead, just covering them over with gold and silver. These he deposited in the temple of Diana, in the presence of the Gortynii, with whom, he said, he trusted all his treasure: Justin tells us, that he left this with them as a security for his good behaviour, and lived for some time very quietly in these parts. He took care, however, to conceal his riches in hollow statues of brass; which, according to some, he always carried along with him; or, as others will have it, exposed in a public place, as things of little value. At last he retired to the court of Prusias king of Bithynia, where he found means to unite several of the neighbouring states with that prince into a confederacy against Eumenes king of Pergamus, a professed friend to the Romans; and during the ensuing war gave Eumenes several defeats, more through the force of his own genius, than the valour of his troops. The Romans having received intelligence of the important services performed by Hannibal, immediately dispatched T. Quintius Flaminius as an ambassador to Prusias, in order to procure his destruction. At his first audience, he complained of the protection given to that famous general, representing him "as the most inveterate and implacable enemy the Romans ever had; as one who had ruined both his own country and Antiochus, by drawing them into a destructive war with Rome."—Prusias, in order to ingratiate himself with the Romans, immediately sent a party of soldiers to surround Hannibal's house, that he might find it impossible to make his escape. The Carthaginian, having before discovered that no confidence was to be reposed in Prusias, had contrived seven secret passages from his house, in order to evade the machinations of his enemies, even if they should carry their point at the Bithynian court. But guards being posted at these, he could not fly, though, according to Livy, he attempted it. Perceiving, therefore, no possibility of escaping, he had recourse to poison, which he had long reserved for such a melancholy occasion. Then taking it in his hand,

Hannibal.

"Let us (said he) deliver the Romans from the diffidence with which they have long been tortured, since they have not patience to wait for an old man's death. Flaminius will not acquire any reputation or glory by a victory gained over a betrayed and defenceless person. This single day will be a lasting testimony of the degeneracy of the Romans. Their ancestors gave Pyrrhus intelligence of a design to poison him, that he might guard against the impending danger, even when he was at the head of a powerful army in Italy; but they have deputed a person of consular dignity to excite Prusias impiously to murder one who has taken refuge in his dominions, in violation of the laws of hospitality." Then having denounced dreadful imprecations against Prusias, he drank the poison, and expired at the age of 70 years. Cornelius Nepos acquaints us, that he put an end to his life by a subtle poison which he carried about with him in a ring. Plutarch relates, that, according to some writers, he ordered a servant to strangle him with a cloak wrapped about his neck; and others say, that, in imitation of Midas and Themistocles, he drank bull's blood.

With respect to the character of this general, it appears to have been in military affairs what Demosthenes was in oratory, or Newton in mathematics; namely, absolutely perfect, in which no human wisdom could discover a fault, and to which no man could add a perfection. Rollin hath contrasted his character with that of Scipio Africanus. He enumerates the qualities which make a complete general; and having then given a summary of what historians have related concerning both commanders, is inclined to give the preference to Hannibal. "There are, however, (he says) two difficulties which hinder him from deciding; one drawn from the characters of the generals whom Hannibal vanquished; the other from the errors he committed. May it not be said, (continues our author,) that those victories which made Hannibal so famous were as much owing to the imprudence and temerity of the Roman generals, as to his bravery and skill? When a Fabius and a Scipio were sent against him, the first stopped his progress, the other conquered him."

These reasons have been answered by Mr Hooke, who hath taken some pains to vindicate Hannibal's character, by fully and fairly comparing it with that of Scipio Africanus, and other Roman commanders. "I do not see (says he) why these difficulties should check our author's inclination to declare in favour of the Carthaginian. That Fabius was not beaten by Hannibal, we cannot much wonder, when we remember how steadily the old man kept to his resolution never to fight with him. But from Fabius's taking this method to put a stop to the victories of the enemy, may we not conclude that he knew no other, and thought Hannibal an overmatch for him? And why does our author forget Publius Scipio (Africanus's father), a prudent and able general, whom Hannibal vanquished at the Ticin? Livy relates some victories of Hannibal over the celebrated Marcellus; but neither Marcellus nor any other general ever vanquished Hannibal before the battle of Zama, if we may believe Polybius, (lib. xv. c. 16.). Terentius Varro, indeed, is represented as a headstrong rash man; but the battle

Hannibal
Hanover.

Hanover,
Hanfe.

battle of Cannæ was not lost by his imprudence. The order in which he drew up his army is no where condemned; and Chevalier Folard thinks it excellent. And as to the conduct of the battle, Æmilius Paulus, a renowned captain, and a disciple of Fabius, had a greater share in it than his colleague. The imprudence with which Varro is taxed, was his venturing, contrary to his colleague's advice, with above 90,000 men to encounter in a plain field, an enemy who had only 50,000, but was superior in horse. And does not the very advice of Æmilius, and the charge of temerity on Varro for not following it, imply a confession of Hannibal's superiority in military skill, over Æmilius as well as Varro? It ought likewise to be observed, that Hannibal's infantry had gained the victory over the Roman infantry, before this latter suffered any thing from the Carthaginian cavalry. It was otherwise when Scipio gained the victory at Zama. His infantry would probably have been vanquished but for his cavalry. Hannibal, with only his third line of foot (his Italian army), maintained a long fight against Scipio's three lines of foot; and seems to have had the advantage over them, when Masinissa and Lælius, with the horse, came to their assistance. Polybius indeed says, that Hannibal's Italian forces were equal in number to all Scipio's infantry; but this is contradicted by Livy, and is not very probable. The authority of Polybius, who was an intimate friend of Scipio Æmilianus, is, I imagine, of little weight in matters where the glory of the Scipios is particularly concerned. His partiality and flattery to them are, in many instances, but too visible."

Our author then proceeds to shew, that Hannibal was not guilty of any of the faults laid to his charge as a general; and having contrasted the moral characters of the two generals with each other, makes it evident, that as a man, as well as a general, Hannibal had greatly the advantage of his rival. See *Hooke's Roman history*, vol. iv. p. 151. & seq.

HANNO, general of the Carthaginians, was commanded to sail round Africa. He entered the ocean through the Straits of Gibraltar, and discovered several countries. He would have continued his navigation, had it not been for want of provisions. He wrote an account of his voyage, which was often quoted, but not much credited. Sigismund Gelenius published it in Greek at Basil, by Frobenius, in 1533. He lived, according to Pliny, when the affairs of the Carthaginians were in the most flourishing condition; but this is a very indeterminate expression.

HANOVER, a city of Germany, and capital of an electorate of the same name, of which the king of Great Britain is elector.—Though the house of Hanover is the last that hath been raised to the electoral dignity in the empire, it may vie with any in Germany for the antiquity and nobleness of its family. It is likewise very considerable for the extent of its territories, which at present are, The duchy of Calenberg, in which are the cities of Hanover, Calenberg, Hameln, Neustadt, Göttingen, &c.; the duchy of Grubenhagen, the county of Diepholt, the county of Illo, in the bishopric of Hildesheim; the bailiages of Coldingen, Luther, Badenborg, and Westerhoven, with the right of protection of the city of Hildesheim; and the county of Danneberg, ceded by the dukes of

Wolfenbüttele to the dukes of Lüneburg, as an equivalent for their pretensions on the city of Brunfwic. The elector possesses likewise the county of Delmenhorst, and the duchies of Bremen and Verden, sold by the king of Denmark in 1715: the right of possessing alternatively the bishopric of Osnabrück belongs solely to the electoral branch; but if it shall happen to fail, the dukes of Wölffenbüttele are to enjoy the same right.

In consideration of the great services performed by Ernest Augustus, duke of Brunfwic-Hanover, in the wars which the emperor Leopold had with Louis XIV. that emperor conferred the dignity of an elector of the holy Roman empire upon him and his heirs male, of which he received the investiture on the 19th of December 1692. This new creation met with great opposition both in the electoral college and the college of princes; but at last, by a conclusion of the three colleges on the 30th of January 1708, it was unanimously determined, that the electoral dignity should be confirmed to the duke of Hanover and his heirs male; but it was added, that if, while that electoral dignity subsisted, the Palatine electorate should happen to fall into the hands of a Protestant prince, the first Catholic elector should have a supernumerary vote.

The princes of this house have their seat in the college of princes, immediately after those of the electoral houses; each branch having a vote. The elector, besides his seat in the electoral college, was invested with the office of arch standard-bearer of the empire; but this being disputed with him by the duke of Wirtemberg, the elector Palatine having obtained the office of arch-treasurer, yielded that of arch-treasurer to the elector of Hanover, who was confirmed in this dignity by a decree of the diet of the 13th of January 1710. For the administration of the government, the elector has a council of state, a council of war, the court of justice, the chancery, the justice of the court, and a consistory. But for making new laws, or establishing new taxes, the consent of the states, which are composed of the nobility, clergy, and burghers, is required.

The city of Hanover is agreeably situated in a sandy plain on the river Leye, in E. Long. to 5. N. Lat. 22. 5. It is a large well-built town, and pretty well fortified. The established religion is the Lutheran; but the Catholics are tolerated, and have a handsome church. It has suffered greatly by the French, who got possession of it in 1757, but were soon after driven out. It is noted for a particular kind of beer, reckoned excellent in these parts. This city was the residence of the elector before he ascended the throne of Great Britain. The palace makes no great show outwardly, but within it is richly furnished. The regency of the country is administered in the same manner as if the sovereign was present.

HANSE, or HANS, an ancient name for a society or company of merchants; particularly that of certain cities in Germany, &c. hence called *Hanse-towns*. See *Hanse-Towns*.—The word *hanse* is obsolete High Dutch or Teutonic; and signifies "alliance, confederacy, association," &c. Some derive it from the two German words, *am-see*, that is, "on the sea" by reason the first hanse towns were all situated on the sea-coast: whence the society is said to have been first

called *am see steden*, that is, "cities on the sea;" and afterwards, by abbreviation, *hansee*, and *hanse*.

HANSE TOWNS. The hanseatic society was a league between several maritime cities of Germany, for the mutual protection of their commerce. Bremen and Amsterdam were the two first that formed it; whose trade received such advantage by their fitting out two men of war in each to convoy their ships, that more cities continually entered into the league: even kings and princes made treaties with them, and were often glad of their assistance and protection; by which means they grew so powerful both by sea and land, that they raised armies as well as navies, enjoyed countries in sovereignty, and made peace or war, though always in defence of their trade, as if they had been an united state or commonwealth.

At this time also abundance of cities, though they had no great interest in trade, or intercourse with the ocean, came into their alliance for the preservation of their liberties: so that in 1200 we find no less than 72 cities in the list of the towns of the Hanse; particularly Bremen, Amsterdam, Antwerp, Rotterdam, Dort, Bruges, Ostend, Dunkirk, Middleburg, Calais, Rouen, Rochelle, Bourdeaux, St Malo, Bayonne, Bilbao, Lisbon, Seville, Cadiz, Carthage, Barcelona, Marseilles, Leghorn, Naples, Messina, London, Lubec, Rostock, Stralsund, Stetin, Wismar, Königsberg, Dantzic, Elbing, Marienburg.

The alliance was now so powerful, that their ships of war were often hired by other princes to assist them against their enemies. They not only aided, but often defeated, all that opposed their commerce; and, particularly in 1358, they took such revenge of the Danish fleet in the Sound, for having interrupted their commerce, that Waldemar III. then king of Denmark, for the sake of peace, gave them up all Schonen for 16 years; by which they commanded the passage of the Sound in their own right.—In 1428 they made war on Erick king of Denmark with 250 sail, carrying on board 12,000 men. These so ravaged the coast of Jutland, that the king was glad to make peace with them.

Many privileges were bestowed upon the hanse towns by Lewis XI. Charles VIII. Lewis XII. and Francis I. kings of France; as well as by the emperor Charles V. who had divers loans of money from them; and by king Henry III. who also incorporated them into a trading body, in acknowledgment for money which they had advanced to him, as well as for the good services they did him by their naval forces in 1206.

These towns exercised a jurisdiction among themselves; for which purpose they were divided into four colleges or provinces, distinguished by the names of their four principal cities, viz. Lubec, Cologne, Brunswick, and Dantzic, wherein were held their courts of judicature. They had a common stock or treasury at Lubec, and power to call an assembly as often as necessary.—They kept magazines or warehouses for the sale of their merchandises in London, Bruges, Antwerp, Berg in Norway, Revel in Livonia, Novogorod in Muscovy, which were exported to most parts of Europe, in English, Dutch, and Flemish bottoms. One of their principal magazines was at London, where a society of German merchants was formed, called the *sheephead company*. To this company great

privileges were granted by Edward I. but revoked by act of parliament in 1552 in the reign of Edward VI. on a complaint of the English merchants that this company had so engrossed the cloth-trade, that, in the preceding year, they had exported 50,000 pieces, while all the English together had shipped off but 1100. Queen Mary, who ascended the throne the year following, having resolved to marry Philip the emperor's son, suspended the execution of the act for three years: but after that term, whether by reason of some new statute, or in pursuance of that of king Edward, the privileges of that company were no longer regarded, and all efforts of the hanse-towns to recover this loss were in vain.

Another accident that happened to their mortification was while queen Elizabeth was at war with the Spaniards. Sir Francis Drake happening to meet 60 ships in the Tagus, laden with corn belonging to the hanse-towns, took out all the corn as contraband goods which they were forbid to carry by their original patent. The hanse towns having complained of this to the diet of the empire, the queen sent an ambassador thither to declare her reasons. The king of Poland likewise interested himself in the affair, because the city of Dantzic was under his protection. At last, though the queen strove hard to preserve the commerce of the English in Germany, the emperor excluded the English company of merchant-adventurers, who had considerable factories at Stade, Embden, Bremen, Hamburg, and Elbing, from all trade in the empire. In short, the hanse-towns, in Germany in particular, were not only in so flourishing, but in so formidable a state, from the 14th to the 16th centuries, that they gave umbrage to all the neighbouring princes, who threatened a strong confederacy against them; and, as the first step towards it, commanded all the cities within their dominion or jurisdiction to withdraw from the union or hanse, and be no farther concerned therein. This immediately separated all the cities of England, France, and Italy, from them. The hanse, on the other hand, prudently put themselves under the protection of the empire: and as the cities just now mentioned had withdrawn from them; so they withdrew from several more, and made a decree among themselves, that none should be admitted into their society but such as stood within the limits of the German empire, or were dependent thereon; except Dantzic, which continued a member, though in nowise dependent on the empire, only it had been summoned formerly to the imperial diet. By this means they maintained their confederacy for the protection of their trade, as it was begun, without being any more envied by their neighbours. Hereby likewise they were reduced to Lubec, Bremen, Hamburg, and Dantzic; in the first of which they kept their register, and held assemblies once in three years at least. But this hanse or union has for some time been dissolved; and now every one of the cities carries on a trade separately for itself, according to the stipulation in such treaties of peace, &c. as are made for the empire betwixt the emperor and other potentates.

HARANGUE, a modern French name for a speech or oration made by an orator in public.—Menage derives the word from the Italian *arenga*, which signifies the same; formed, according to Ferrari, from *arringo*,
“a

Harbour
Hardouin.

"a just, or place of jutting." Others derive it from the Latin *ara*, "altar;" by reason the first harangues were made before altars: whence the verse of Juvenal, *Aul. Lugdunensis rhetor discitur ad aram.*

The word is also frequently used in an ill sense, viz. for a too pompous, prolix, or unseasonable speech or declamation.

HARBOUR, a general name given to any sea-port or haven; as also to any place convenient for mooring shipping, although at a great distance from the sea. The qualities requisite in a good harbour are, that the bottom be entirely free from rocks or shallows; that the opening be of sufficient extent to admit the entrance or departure of large ships, without difficulty; that it should have good anchoring-ground, and be easy of access; that it should be well defended from the violence of the wind and sea; that it should have room and convenience to receive the shipping of different nations, and those which are laden with different merchandises; that it be furnished with a good light-house, and have variety of proper rings, posts, moorings, &c. in order to remove or secure the vessels contained therein; and, finally, that it have plenty of wood, and other materials for firing, besides hemp, iron, mariners, &c.

HARBURG, a small town of Germany in the circle of Lower Saxony, and duchy of Luneburg, seated on the river Elbe over against Hamburg. It was surrounded with walls in 1355; and 30 years after, a strong castle, which still remains, was built by the bishop. E. Long. 9. 41. N. Lat. 53. 51.

HARDENING, the giving a greater degree of hardness to bodies than they had before.

There are several ways of hardening iron and steel, as by hammering them, quenching them in cold water, &c. See **STEEL**.

Case HARDENING. See **CASE-HARDENING**.

HARDERWICK, a town of the United Provinces in Dutch Guelderland. It is a well-built town, and the chief of the sea-ports of this province. It has several good buildings, particularly the great church, which is much admired. In 1643, the public school here was turned into an university. The French did it a great deal of damage in 1672, since which time it has been on the decline. E. Long. 5. 37. N. Lat. 52. 14.

HARDNESS, a quality of certain bodies, which consists in an intimate union and strong adhesion of their integrant parts, which cannot therefore be easily disjoined.—We cannot precisely determine what disposition of parts occasions the greatest hardness; but this probably depends on the perfection and extent of the contact of these parts: and this quality depends essentially upon their figure, which we do not know.—The hardest of bodies which we do know, are vitrifiable stones; and amongst these the hardest are also the most pure and homogeneous, that is, diamonds. Not any one of all known bodies is perfectly hard. This quality belongs undoubtedly to the primary or elementary particles of matter, which of all beings we know the least of.

HARDOUIN (John), a learned French Jesuit in the beginning of the 18th century, known by the remarkable paradoxes he advanced in his writings; this in particular, That all the works of the ancient pro-

fane writers, except Cicero's works, Virgil's Georgics, Horace's satires and epistles, and Pliny's natural history, are mere forgeries. He died at Paris in 1729, aged 83. His principal works are, 1. An edition of Pliny's natural history, with notes, which is much esteemed. 2. An edition of the councils, which made much noise. 3. Chronology restored by medals, 4to. 4. A commentary on the New Testament, folio; in which he pretends that our Saviour and his apostles preached in Latin, &c.

HARDWICKE. See **YORK**.

HARE, in zoology. See **LEPUS**.

The hare is a beast of venery, or of the forest, but peculiarly so termed in the second year of her age. There are reckoned four sorts of them, from the place of their abode: some live in the mountains, some in the fields, some in marshes, and some wander about every where. The mountain-hares are the swiftest, the field-hares are not so nimble, and those of the marshes are the slowest: but the wandering hares are the most dangerous to follow; for they are cunning in the ways and mazes of the fields, and, knowing the nearest ways, run up the hills and rocks, to the confusion of the dogs, and the discouragement of the hunters. See the article **HUNTING**.

HARE-LIP, in surgery. See **SURGERY**.

HARFLUER, an ancient town of France, [in Normandy; but is now a poor place, on account of its fortifications being demolished, and its harbour choked up. It was taken by the English, by assault, in the year 1415. It is seated on the river Lizarda, near the Seine, five miles from Havre de Grace, forty north-west of Rouen, and one hundred and six north-west of Paris. E. Lon. o. 17. N. Lat. 49. 30.

HARIOT, or **HERIOT**, in law, a due belonging to a lord at the death of his tenant, consisting of the best beast, either horse, or cow, or ox, which he had at the time of his death; and in some manors the best goods, piece of plate, &c. are called harlots.

HARIOT (Thomas), See **HARRIOT**.

HARLECH, a town of Merionethshire, in north Wales. It is seated on a rock, on the sea-shore; and is but a poor place, though the shire-town, and sends a member to parliament. It had formerly a strong, handsome castle, which was a garrison for Charles I. in the civil wars, for which reason it was afterwards demolished by the parliament. W. Long. 4. o. N. Lat. 54. 47.

HARLEIAN COLLECTION.—A most valuable collection of useful and curious manuscripts, begun near the end of the last century, by Robert Harley of Brampton Bryan, esq. in Herefordshire, afterwards earl of Oxford and lord high-treasurer; and which was conducted upon the plan of the great Sir Robert Cotton. He published his first considerable collection in August 1705, and in less than ten years he got together near 2500 rare and curious MSS. Soon after this, the celebrated Dr George Hicks, Mr Anstis garter king at arms, bishop Nicolson, and many other eminent antiquaries, not only offered him their assistance in procuring MSS. but presented him with several that were very valuable. Being thus encouraged to perseverance by his success, he kept many persons employed in purchasing MSS. for him abroad, giving them written instructions for their

Harleian.

Harlem
Harley.

their conduct. By these means the MS. library was, in the year 1721 increased to near 6000 books, 14,000 original charters, and 500 rolls.

On the 21st of May 1724, lord Oxford died; but his son Edward, who succeeded to his honours and estate, still farther enlarged the collection; so that when he died, June 16th 1741, it consisted of 8000 volumes, several of them containing distinct and independent treatises, besides many loose papers which have been since sorted and bound up in volumes; and above 40,000 original rolls, charters, letters patents, grants, and other deeds and instruments of great antiquity.

The principal design of making this collection was the establishment of a MS. English historical library, and the rescuing from destruction such national records as had eluded the diligence of preceding collectors: but lord Oxford's plan was more extensive; for his collection abounds also with curious MSS. in every science.—This collection is now in the British Museum; and an enumeration of its contents may be seen in the Annual Register, vi. 140, &c.

HARLEM, a town of the United Provinces, in Holland, situated on the river Sparen, in E. Lon. 5. 17. N. Lat. 53. 22. It is a large and populous city, and stands near a lake of the same name, with which it has a communication as well as with Amsterdam and Leyden, by means of several canals. Schemes have been often formed for draining of this lake, but were never put in execution. To the south of the town lies a wood, cut into delightful walks and vistas. The town is famous for the siege which it held out against the Spaniards for ten months in 1573; the townsmen, before they capitulated, being reduced to eat the vilest animals, and even leather and grass. The inhabitants corresponded with the prince of Orange for a considerable time by means of carrier-pigeons. Harlem, as is well known, claims the invention of printing; and in fact, the first essays of the art are indisputably to be attributed to Laurentius, a magistrate of that city. [See LAURENTIUS, and (*History of*) PRINTING.] Before the Reformation, Harlem was a bishop's see; and the Papists still greatly outnumber the Protestants. An academy of sciences was founded here in 1752. Vast quantities of linen and thread are bleached here; the waters of the lake having a peculiar quality, which renders them very fit for that purpose.—A sort of phrensy with regard to flowers, particularly tulips, once prevailed here, in consequence of which the most beautiful sorts were bought and sold at an extravagant price.

HARLEQUIN, a buffoon or merry-andrew; but the word is now used for a person of extraordinary agility, dressed in party-coloured clothes, the principal character in a pantomime entertainment.

HARLEY (Robert), earl of Oxford and Mortimer, was the eldest son of Sir Edward Harley, and born in 1661. At the Revolution, Sir Edward and his son raised a troop of horse at their own expence; and after the accession of king William and queen Mary, he obtained a seat in parliament. His promotions were rapid: in 1702, he was chosen speaker of the house of commons; in 1704, he was sworn of queen Anne's privy council, and the same year made secretary of state; in 1706, he acted as one of the commissioners for the treaty of Union; and in 1710, was

appointed a commissioner of the treasury, and chancellor and under-treasurer of the exchequer. A daring attempt was made on his life, March 8. 1711, by the marquis of Guiscard a French papist; who, when under an examination before a committee of the privy council, stabbed him with a penknife. Of this wound, however, he soon recovered; and was the same year created earl of Oxford, and lord high treasurer, which office he resigned just before the queen's death. He was impeached of high treason in 1715, and committed to the tower; but was cleared by trial, and died in 1724. His character has been variously represented, but cannot be here discussed. He was not only an encourager of literature, but the greatest collector in his time of curious books and MSS. his collection of which makes a capital part of the British Museum. See *HARLEIAN Collection*.

HARLING. See *HERLING*.

HARLINGEN, a sea-port town of the United Netherlands, in West Friesland. It stands on the coast of the Zuyder sea, at the mouth of a large canal, in E. Long. 5. 25. N. Lat. 53. 12. It was only a hamlet till about the year 1234, when it was destroyed by the sea; and being afterwards rebuilt, became a considerable town. In 1579, it was considerably enlarged by the care of William prince of Orange. It is now very well fortified, and is naturally strong, as the adjacent country can very easily be laid under water. The city is square; and the streets are handsome, straight, and clean, with canals in the middle of them. It has five gates; four towards the land, and one towards the sea; but though the harbour is good, yet vessels of great burthen cannot get into it until they are lightened, for want of water. The admiralty college of Friesland has its seat here. The manufactures are salt, bricks, and tiles; a considerable trade is also carried on in all sorts of linen cloth, and the adjacent country yields abundance of corn and good pastures.

HARLOT, a woman given to incontinency, or that makes a habit or a trade of prostituting her body.—The word is supposed to be used for the diminutive *whorelet*, a "little whore."—Others derive it from *Arletta*, mistress to Robert duke of Normandy, and mother to William the Conqueror: Camden derives it from one *Arlotha*, concubine to William the Conqueror: Others from the Italian *Arletta*, "a proud whore."

HARMONIA, in fabulous history, the wife of Cadmus, both of whom were turned into serpents. See *CADMUS*.

Though many of the ancient authors make Harmonia a princess of divine origin, there is a passage in Athenæus from Euhemerus, the Vanini of his time, which tells us, that she was by profession a player on the flute, and in the service of the prince of Sidon previous to her departure with Cadmus. This circumstance, however, might encourage the belief, that, as Cadmus brought letters into Greece, his wife brought *harmony* thither; as the word *αρμονια*, *harmonia*, has been said to have no other derivation than from her name: which makes it very difficult to ascertain the sense in which the Greeks made use of it in their music; for it has no roots by which it can be decomposed, in order to deduce from them its etymology. The common account of the word, however, that is given

Harling
Harmonia.

† See
Harmony.

Harmonica. given by lexicographers, and generally adopted by the learned, does not confirm this opinion. It is generally derived from *αρμόζω*, and this from the old verb *Ἀρμω ἀπτο, to fit or join*.

HARMONICA. This word, when originally appropriated by Dr Franklin to that peculiar form or mode of musical glasses, which he himself, after a number of happy experiments, had constituted, was written *Armonica*. In this place, however, we have ventured to restore it to its native plenitude of sound, as we have no antipathy against the moderate use of aspirations. It is derived from the Greek word *ἀρμονία*. The radical word is *ἄρμω, to suit or fit one thing to another*. By the word *ἀρμονία*, the Greeks expressed aptitudes of various kinds; and from the use which they made of that expression, we have reason to conclude, that it was intended to import the highest degree of refinement and delicacy in those relations which it was meant to signify. Relations or aptitudes of sound, in particular, were understood by it; and in this view, Dr Franklin could not have selected a name more expressive of its nature and genius, for the instrument which we are now to describe; as, perhaps, no musical tone can possibly be finer, nor consequently susceptible of juster concords, than those which it produces.

In an old English book, whose title we cannot at present recollect, and in which a number of various amusements were described, we remember to have seen the elements or first approaches to music by glasses. That author enjoins his pupil to choose half a dozen of such as are used in drinking; to fill each of them with water in proportion to the gravity or acuteness of the sound which he intended it should produce; and, having thus adjusted them one to another, he might entertain the company with a church-tune. These, perhaps, were the rude and barbarous hints which Mr Puckeridge afterwards improved. But, for a farther account of him, of the state in which he left the instrument, and of the state to which it has afterwards been carried, we must refer our readers to the following extracts from Dr Franklin's letters, and from others who have written upon the same subject.

The Doctor, in his letter to Father Beccaria, has given a minute and elegant account of the *Harmonica*. Nor does it appear that his successors have either more sensibly improved, or more accurately delineated, that angelic instrument. The detail of his own improvements, therefore, shall be given in his own words.

"Perhaps (says he) it may be agreeable to you, as you live in a musical country, to have an account of the new instrument lately added here to the great number that charming science was possessed of before: As it is an instrument that seems peculiarly adapted to Italian music, especially that of the soft and plaintive kind, I will endeavour to give you such a description of it, and of the manner of constructing it, that you or any of your friends may be enabled to imitate it, if you incline so to do, without being at the expence and trouble of the many experiments I have made in endeavouring to bring it to its present perfection.

"You have doubtless heard the sweet tone that is drawn from a drinking-glass, by pressing a wet finger round its brim. One Mr Puckeridge, a gentleman

from Ireland, was the first who thought of playing tunes formed of these tones. He collected a number of glasses of different sizes; fixed them near each other on a table; and tuned them, by putting into them water, more or less, as each note required. The tones were brought out by pressing his fingers round their brims. He was unfortunately burnt here, with his instrument, in a fire which consumed the house he lived in. Mr E. Delaval, a most ingenious member of our Royal Society, made one in imitation of it, with a better choice and form of glasses, which was the first I saw or heard. Being charmed with the sweetness of its tones, and the music he produced from it, I wished to see the glasses disposed in a more convenient form, and brought together in a narrower compass, so as to admit of a greater number of tones, and all within reach of hand to a person sitting before the instrument; which I accomplished, after various intermediate trials, and less commodious forms, both of glasses and construction, in the following manner.

"The glasses are blown as near as possible in the form of hemispheres, having each an open neck or socket in the middle. The thickness of the glass near the brim is about the tenth of an inch, or hardly quite so much, but thicker as it comes nearer the neck; which in the largest glasses is about an inch deep, and an inch and a half wide within; these dimensions lessening as the glasses themselves diminish in size, except that the neck of the smallest ought not to be shorter than half an inch.—The largest glass is nine inches diameter, and the smallest three inches. Between these there are 23 different sizes, differing from each other a quarter of an inch in diameter. To make a single instrument, there should be at least six glasses blown of each size; and out of this number one may probably pick 37 glasses (which are sufficient for three octaves with all the semitones) that will be each either the note one wants, or a little sharper than that note, and all fitting so well into each other as to taper pretty regularly from the largest to the smallest. It is true, there are not 37 sizes; but it often happens that two of the same size differ a note or half a note in tone, by reason of a difference in thickness, and these may be placed one in the other without sensibly hurting the regularity of the taper form.

"The glasses being chosen, and every one marked with a diamond the note you intend it for, they are to be tuned by diminishing the thickness of those that are too sharp. This is done by grinding them round from the neck towards the brim, the breadth of one or two inches as may be required; often trying the glass by a well-tuned harpichord, comparing the note drawn from the glass by your finger, with the note you want, as sounded by that string of the harpichord. When you come near the matter, be careful to wipe the glass clean and dry before each trial, because the tone is something flatter when the glass is wet than it will be when dry;—and grinding a very little between each trial, you will thereby tune to great exactness. The more care is necessary in this, because, if you go below your required tone, there is no sharpening it again but by grinding somewhat off the brim, which will afterwards require polishing, and thus increase the trouble.

"The glasses being thus tuned, you are to be pro-

provided with a case for them, and a spindle on which they are to be fixed. My case is about three feet long, eleven inches every way wide within at the biggest end, and five inches at the smallest end; for it tapers all the way, to adapt it better to the conical figure of the set of glasses. This case opens in the middle of its height, and the upper part turns up by hinges fixed behind. The spindle is of hard iron, lies horizontally from end to end of the box within, exactly in the middle, and is made to turn on brass gudgeons at each end. It is round, an inch diameter at the thickest end, and tapering to a quarter of an inch at the smallest.—A square shank comes from its thickest end through the box, on which shank a wheel is fixed by a screw. This wheel serves as a fly to make the motion equable, when the spindle, with the glasses, is turned by the foot like a spinning wheel. My wheel is of mahogany, 18 inches diameter, and pretty thick, so as to conceal near its circumference about 25 lb of lead.—An ivory pin is fixed in the face of this wheel, about four inches from the axis. Over the neck of this pin is put the loop of the string that comes up from the moveable step to give it motion. The case stands on a neat frame with four legs.

“To fix the glasses on the spindle, a cork is first to be fitted in each neck pretty tight, and projecting a little without the neck, that the neck of one may not touch the inside of another when put together, for that would make a jarring. These corks are to be perforated with holes of different diameters, so as to suit that part of the spindle on which they are to be fixed. When a glass is put on, by holding it stiffly between both hands, while another turns the spindle, it may be gradually brought to its place. But care must be taken that the hole be not too small, lest in forcing it up the neck should split; nor too large, lest the glass, not being firmly fixed, should turn or move on the spindle, so as to touch or jar against its neighbouring glass. The glasses thus are placed one in another; the largest on the biggest end of the spindle, which is to the left hand: the neck of this glass is towards the wheel; and the next goes into it in the same position, only about an inch of its brim appearing beyond the brim of the first; thus proceeding, every glass when fixed shows about an inch of its brim (or three quarters of an inch, or half an inch, as they grow smaller) beyond the brim of the glass that contains it; and it is from these exposed parts of each glass that the tone is drawn, by laying a finger on one of them as the spindle and glasses turn round.

“My largest glass is G a little below the reach of a common voice, and my highest G, including three complete octaves.—To distinguish the glasses more readily to the eye, I have painted the apparent parts of the glasses within-side, every semitone white, and the other notes of the octave with the seven prismatic colours, viz. C, red; D, orange; E, yellow; F, green; G, blue; A, indigo; B, purple; and C, red again;—so that the glasses of the same colour (the white excepted) are always octaves to each other.

“This instrument is played upon, by sitting before the middle of the set of glasses, as before the keys of a harpicoord, turning them with the foot, and wetting them now and then with a sponge and clean water. The fingers should be first a little soaked in water, and

quite free from all greasiness; a little fine chalk upon them is sometimes useful, to make them catch the glass and bring out the tone more readily. Both hands are used, by which means different parts are played together.—Observe, that the tones are best drawn out when the glasses turn from the ends of the fingers, not when they turn to them.

“The advantages of this instrument are, that its tones are incomparably sweet beyond those of any other; that they may be swelled and softened at pleasure by stronger or weaker pressures of the finger, and continued to any length; and that the instrument, being once well-tuned, never again wants tuning.”

Such was the state in which this learned and ingenious author found, and such the perfection to which he carried, that celestial instrument of which we now treat. We call it *celestial*; because, in comparison with any other instrument which we know, the sounds that it produces are indeed heavenly. Some of them, however, are still constructed in the same imperfect manner as the instrument of Mr Puckeridge. They are contained in an oblong chest; their positions are either exactly or nearly rectilinear; the artificial semitones by which the full notes are divided, form another parallel line; but the distances between each of them are much greater than those between the notes of the natural scale, as they take their places, not directly opposite to the notes which they are intended to heighten or depress, but in a situation between the highest and lowest, to show, that, in ascending, they are sharps to the one, and in descending, flats to the other. This structure, however, is doubly inconvenient; for it not only increases the labour and difficulty of the performer, but renders some musical operations impracticable, which upon the *Harmonica*, as constituted by Dr Franklin, may be executed with ease and pleasure. In this fabric, if properly formed and accurately tuned, the instrument is equally adapted to harmony and melody. But as no material structure could ever yet be brought to the perfection even of human ideas, this instrument still in some measure retains the perverse nature of its original lamina. Hence it is not without the utmost difficulty that the glasses can be tuned by grinding, and the least conceivable redundancy or defect renders the discord upon this instrument more conspicuous and intolerable than upon any other. Hence likewise that inexpressible delicacy to be observed in the manner of the friction by which the sound is produced: for if the touch be too gentle, it cannot extort the tone; and if too strong, besides the mellow and delicate sound which ought to be heard, we likewise perceive the finger jarring upon the glass, which, mingled with those softer sounds by which the senses had been soothed, gives a feeling similar to iron grating upon iron, but more disagreeable. In wind-instruments the operation of the tongue, in harpsichords the stroke of the quill, and on the violin the motion of the bow, gives that strong and sensible interruption of sound which may be called *articulation*, and which renders the rhythm or measure of an air more perceptible: but, upon the glasses, the touch of the finger is too soft to divide the notes with so much force; so that, unless the mind be steadily attentive, they seem to melt one into another, by which means the idea of rhythm is almost lost. There is no way of performing a slur, but by for-

forbearing to stop the first sound, when that which is immediately subsequent commences. Thus, when the slur is of any length, and regularly defends or rises by the interval of a second, all the notes in the slur must be heard together, and produce no agreeable dissonance; yet if it rises or defends by perfect chords, the effect is pleasing. The open shake, or trill, is another unhappy operation upon musical glasses; which can only be performed by the alternate pulsations of two continued sounds, differing from each other only by a note or semitone. But, as these pulsations, thus managed, cannot be distinct, the result is far from being pleasant; nor is there any succedaneum for the close shake, which in the violin is performed by alternately depressing the string to the finger-board, and suffering it to rise without entirely removing the finger from it, and which, by giving the note that tremulous sound produced by the human voice affected with grief, is a grace peculiarly adapted to pathetic and plaintive airs.

We proceed, however, to a farther account of the same instrument, extracted from the Annual Register, vol. iv. p. 149.

" Besides those tones (says the author of that account) which every elastic string produces by a vibration of all its parts, it is capable of another set of tones, in which only a part of the string is supposed to vibrate. These sounds are produced by the lightest touches, either by air, as in Oswald's lyre, or by rubbing the bow in the softest manner on the string of a fiddle.

" Analogous to these sounds are those produced by bells; in those last, besides those tones produced by their elliptical vibrations, there are a set of tones which may be brought by gently rubbing their edges, and in which the whole instrument does not appear to vibrate in all its parts as before.

" Take, for instance, a bell finely polished at the edges; or, what will perhaps be more convenient, a drinking-glass: let the edges be as free from any thing oily as possible; then, by moistening the finger in water (I have found alum-water to be best), and rubbing it circularly round the edge of the glass, you will at length bring out the tone referred to.

" This note is possessed of infinite sweetness; it has all the excellencies of the tone of a bell, without its defects. It is loud, has a sufficient body, is capable of being swelled and continued at pleasure; and, besides, has naturally that vibratory softening, which musicians endeavour to imitate, by mixing with the note to be played, a quarter-tone from below.

" To vary these tones, nothing more is required than to procure several bells or glasses of different tones, tuned as nearly as possible, which may be done by thinning the edges of either: or, for immediate satisfaction, the glasses may be tuned by pouring in water; the more water is poured in, the graver the tone will be.

" Let us suppose then a double octave of those glasses, thus tuned, to be procured. Any common tune may be executed by the fingers rubbing upon each glass successively; and this I have frequently done without the least difficulty, only choosing those tones which are slow and easy. Here then are numbers of delicate tones, with which musicians have been,

will very lately, unacquainted; and the only defect is, that they cannot be made to follow each other with that celerity and ease which is requisite for melody. In order to remedy this, I took a large drinking-glass, and by means of a wheel and gut, as in the electrical machine, made it to turn upon its axis with a moderately quick but equable motion; then moistening the finger as before, nothing more was required than merely to touch the glass at the edge, without any other motion, in order to bring out the tone.

" Instead of one glass only turning in this manner, if the whole number of glasses were to fixed as to keep continually turning, by means of a wheel, it follows, that upon every touch of the finger a note would be expressed; and thus, by touching several glasses at once, an harmony of notes might be produced, as in an harpsichord.

" As I write rather to excite than satisfy the curious, I shall not pretend to direct the various ways this number of glasses may be contrived to turn; it may be sufficient to say, that if the glasses are placed in the segment of a circle, and then a strap, as in a cutler's wheel, be supposed to go round them all, the whole number will by this means be made to turn, by means of a wheel.

" Instead of the finger, I have applied moistened leather to the edge of the glass, in order to bring out the tone: but, for want of a proper elasticity, this did not succeed. I tried cork, and this answered every purpose of the finger; but made the tone much louder than the finger could do. Instead, therefore of the finger, if a number of corks were so contrived as to fall with a proper degree of pressure on the edge of the glass, by means of keys like the jacks of an organ, it is evident, that in such a case a new and tolerably perfect instrument would be produced; not so loud indeed as some, but infinitely more melodious than any.

" The mouths of the glasses or bells used in this experiment should not resemble the mouth of a trumpet, but should rather come forward with a perpendicular edge. The corks used in this case should be smooth, even free from those blemishes which are usually found in them, and at the same time the more elastic the better."

In the two accounts here given seems to be comprehended every thing valuable which has been said upon the subject. It remains, however, our permanent opinion, that the form and structure designed and constituted by Dr Franklin is by much the most eligible; nor can we admit, that a cork, however successfully applied, will produce the same mellowness and equability of tone in general, with the finger. It appears to us, that, by this kind of voluntary attrition, a note may be sunk or swelled with much more art and propriety than by the substitution of any thing else extrinsic to the hand; and when chords are long protracted, that degree of friction, which renders every found in the chord sensible to the ear, without harshness, must be the most agreeable. For this reason, likewise, we should recommend alum-water in preference to chalk.

From what has already been said, it will easily be perceived, that this instrument requires to be tuned with the nicest degree of delicacy which the laws of temperament will possibly admit. For these laws the reader will naturally have recourse to the article Music $\frac{7}{12}$, $\frac{1}{2}$ Chap. vii. art. 64.

Harmonica

in this Dictionary; where, from M. D'Alembert, is given a plain and satisfactory account, both of the method proposed by Rameau, and of that established in common practice, without anticipating the experience and taste of the reader, by dictating which of these plans is preferable. To those who have occasion to tune the instrument, it may likewise be useful to peruse the detached article TEMPERAMENT in this Work. Without recapitulating the different rules of alteration prescribed in these accounts, we shall presuppose the reader acquainted with them; and proceed to describe how, under their influence, the *Harmonica* may be tuned. But it is previously expedient to observe, that the same rules which conduct the process of tuning a harpsichord, will be equally effectual in tuning the *Harmonica*; with this only difference, that greater delicacy in adjusting the chords should, if practicable, be attempted.

There are different notes from whence the procedure of tuning may commence. *La* or *A*, which is the key that pretty nearly divides the harpsichord, is chosen by some; this *la* in common spinets is 24 natural keys from the bottom, and 13 from the top; and the *ut* above it, or second C upon the G cleff, by others. This last we should rather advise, because we imagine those intervals which we have called *seconds major* to be more just through the whole octave, when the course of tuning is begun by a natural semitone. The initiate, therefore, may begin by tuning the second *ut* of his *Harmonica*, or C above the treble cleff, in unison with its correspondent C upon the harpsichord or any other instrument in concert-pitch; then, descending to its octave below, adjust it with the *ut* above, till every pulsation if possible be lost, and the sounds rendered scarcely distinguishable when simultaneously heard. To the lowest note of this octave he must tune the *sol* or G immediately above it by a fifth, still observing the laws of temperament: To this G, the *re*, or D immediately above it, by the same chord: To the *re*, or D above, its octave below: To this, by a fifth, the *la* or A immediately above it: To *la*, the *mi* or E ascending in the same proportion: To *mi*, its octave below: To this, the *fi* or B immediately above it by a fifth: To the first *ut*, or C, which was tuned, the *fa* or F immediately below by the same chord.

That the practitioner may be still more secure in the justice and propriety of his procedure, he may try the thirds of the notes already adjusted, and alter, as much as is consistent with the fifths and octaves, such among these thirds as may seem grating and disagreeable to his ear. Thus far having accomplished his operation, he may tune all the other natural notes whether above or below by octaves. His next concern is with the semitones. And here it will be suggested by common sense, that as in all instruments with fixed scales the sharp of a lower must likewise answer for the flat of a higher tone, the semitone ought as nearly as possible to divide the interval. He may begin with *la* or A sharp, which *la* in its natural state is a third minor beneath the *ut* or C, from whence he began in the natural scale. This semitone should correspond with the F natural immediately above by a fifth. To it may be tuned the *re* or D sharp immediately below by a similar chord: To D sharp, its octave above: To *fi* or B natural, immediately above the *la* or A first mentioned, may be

adjusted the F or *fa* sharp immediately above it: To *ut* sharp its octave below: To that octave, the C or *ut* sharp above by a fifth: To the C sharp, its octave below: To this, by a fifth, the G or *sol* sharp above. Between this G sharp and the D sharp immediately above it, the fifth will probably be too sharp; but if the others are justly tuned, that discord will not be extremely offensive; and it is a necessary consequence of temperament. The rest of the sharps and flats, like their naturals, whether ascending or descending, may be tuned by their octaves.

The notes, with their chords, may be expressed by letters and figures, thus; where, however, it must be observed, that the higher notes of any chord are marked with larger capitals. It should likewise be remarked, that the figures are not expressive of the different ratios which the notes bear one to another, considered with respect to their vibrations; but only significant of their nominal distances, according to the received denominations of the intervals. Cc \acute{c} G \acute{c} D \acute{c} D \acute{c} A \acute{c} E Ee \acute{e} B Cr. The sharps and flats thus, A \sharp F \sharp , A \times D \times , D \times D \times , B \sharp F \sharp , F \sharp F \sharp , F \times C \times , C \times C \times , c \times G \times . In running over the sharps and flats as the naturals, it will likewise be necessary to try the thirds, and to alter such as may offend the ear; which, if cautiously done, will not sensibly injure the other chords.—Though this article has been protracted to a length which we did not originally intend, we have however the satisfaction to find, that it comprehends every thing essential; so that any person who understands the nature of chords, and the practical principles of music as universally taught, may not only be able to tune his instrument, but to acquire its whole manœuvre, without the least assistance from a master.

On Plate CLIX. is represented an instrument of this kind, made by Mr Dobb of St Paul's Church-yard, London.

HARMONIC. As an adjective, it signifies in general any thing belonging to harmony; though, in our language, the adjective is more properly written *harmonic*. In this sense it may be applied to the *harmonic* divisions of a monochord; or, in a word, to consonances in general. As a substantive neuter, it imports all the concomitant or accessory sounds which, upon the principles resulting from the experiments made on sonorous bodies, attend any given sound whatever, and render it appetible. Thus all the aliquot parts of a musical string produce *harmonic* sounds, or *harmonics*.

HARMONY. The sense which the Greeks gave to this word in their music, is so much less easy to be determined, because, the word itself being originally a substantive proper, it has no radical words by which we might analyse it, to discover its etymology. In the ancient treatises which remain to us, *harmony* appears to be that department whose object is the agreeable succession of sounds, merely considered as high or low; in opposition to the two others called *rhythmica* and *metrica*, which have their principle in time and measure. This leaves our ideas concerning that aptitude of sound vague and undetermined; nor can we fix them without studying for that purpose all the rules

Harmony. of the art: and even after we have done so, it will be very difficult to distinguish *harmony* from melody, unless we add to the last the ideas of rhythmus and measure; without which, in reality, no melody can have a distinguishing character: whereas harmony is characterized by its own nature, independent of all other quantities except the chords or intervals which compose it.

It appears by a passage of Nicomachus, and by others, that they likewise gave the name of *harmony* to the chord of an octave, and to concerts of voices and instruments, which performed in the distance of an octave one from the other, and which is more commonly called *antiphone*.

Harmony, according to the moderns, is a succession of chords agreeable to the laws of modulation. For a long time this *harmony* had no other principle but such rules as were almost arbitrary, or solely founded on the approbation of a practised ear, which decided concerning the agreeable or disagreeable succession of chords, and whose determinations were at last reduced to calculation. But Father Merfenne and M. Saver having found, that every found, however simple in appearance, was always accompanied with other sounds less sensible, which constitute with itself a perfect chord-major; with this experiment M. Rameau set out, and upon it formed the basis of his harmonic system, which he has extended to a great many volumes, and which at last M. D'Alembert has taken the trouble of explaining to the public.

Signior Tartini, taking his route from an experiment which is newer and more delicate, yet not less certain, has reached conclusions similar enough to those of Rameau, by pursuing a path whose direction seems quite opposite. According to M. Rameau, the treble is generated by the bass; Signior Tartini makes the bass result from the treble. One deduces *harmony* from melody, and the other supposes quite the contrary. To determine from which of the two schools the best performances are likely to proceed, no more is necessary than to investigate the end of the composer, and discover whether the air is made for the accompaniments, or the accompaniments for the air. At the word *SYSTEM* in Rousseau's Musical Dictionary, is given a delineation of that published by Signior Tartini. Here he continues to speak of M. Rameau, whom he has followed through this whole work, as the artist of greatest authority in the country where he writes.

He thinks himself obliged, however, to declare, That this system, however ingenious it may be, is far from being founded upon nature; an affirmation which he incessantly repeats: "That it is only established upon analogies and congruities, which a man of invention may overturn to-morrow, by substituting others more natural: that, in short, of the experiments from whence he deduces it, one is detected fallacious, and the other will not yield him the consequences which he would extort from it. In reality, when this author took it in his head to dignify with the title of *demonstration* the reasonings upon which he established his theory, every one turned the arrogant pretence into ridicule. The Academy of Sciences loudly disapproved a title so ill-founded, and so gratuitously assumed; and M. Etienne, of the Royal Society at Montpellier, has shewn him, that even to begin with this proposition, That

according to the law of nature, sounds are represented by their octaves, and that the octaves may be substituted for them, there was not any one thing demonstrated, or even firmly established, in his pretended demonstration." He returns to his system.

"The mechanical principle of reference prevents us with nothing but independent and solitary chords; it neither prescribes nor establishes their succession. Yet a regular succession is necessary; a dictionary of selected words is not an oration, nor a collection of legitimate chords a piece of music: there must be a meaning, there must be connections in music as well in language: it is necessary that what has preceded should transmit something of its nature to what is subsequent, so that all the parts conjoined may form a whole, and be stamped with the genuine character of unity.

"Now, the complex sensation which results from a perfect chord, must be resolved into the simple sensation of each particular sound which composes it, and into the sensation of each particular interval which forms it, ascertained by comparison one with another. Beyond this there is nothing sensible in any chord; from whence it follows, that it is only by the relation between sounds, and by the analogy between intervals, that the connection now in question can be established; and this is the genuine, the only source, from whence flow all the laws of *harmony* and modulation. If, then, the whole of *harmony* were only formed by a succession of perfect chords-major, it would be sufficient to proceed by intervals similar to those which compose such a chord; for then some one or more sounds of the preceding chord being necessarily protracted in that which is subsequent, all the chords would be found sufficiently connected, and the *harmony* would, at least in this sense, be one.

"But besides that these successions must exclude all melody by excluding the diatonic series which forms its foundation, it would not arrive at the real end of the art; because, as music is a system of meanings like a discourse, it ought like a discourse to have its periods, its phrases, its suspenses, its cadences, its punctuation of every kind; and because the uniformity of a harmonical procedure implies nothing of all this. Diatonic procedures require that major and minor chords should be intermixed; and the necessity of dissonances has been felt in order to distinguish the phrases, and render the cadences sensible. Now, a connected series of perfect chords-major, can neither be productive of perfect chords-minor nor of dissonances, nor can sensibly mark any musical phrase, and the punctuation must there be found entirely defective.

"M. Rameau being absolutely determined, in his system, to deduce from nature all the *harmony* practised among us, had recourse, for this effect, to another experiment of his own invention, of which I have formerly spoken, and which by a different arrangement is taken from the first. He pretended, that any simple sound whatever afforded in its multiples a perfect minor or flat chord, of which it was the dominant or fifth, as it furnished a perfect chord-major by the vibration of its aliquot parts, of which it is the tonic or fundamental sound. He has affirmed as a certain fact, that a vocal string caused two others lower than itself to vibrate through their whole ex-

Harmony. tent, yet without making them produce any sound, one to its twelfth major and the other to its seventeenth; and from this joined to the former fact, he has very ingeniously deduced, not only the application of the minor mode and of dissonances in *harmony*, but the rules of harmonic phrases and of all modulation, such as they are found at the words *Chord, Accompaniment, Fundamental Bass, Cadence, Dissonance, Modulation*.

"But first, (continues Rousseau) the experiment is false. It is discovered, that the strings tuned beneath the fundamental sound do not entirely vibrate when this fundamental sound is given; but that they are divided in such a manner as to return its unison alone, which of consequence can have no harmonics below. It is moreover discovered, that the property of strings in dividing themselves, is not peculiar to those which are tuned by a twelfth and seventeenth below the principal sound; but that oscillations are likewise produced in the lower strings by all its multiples. Whence it follows, that the intervals of the twelfth and seventeenth below, not being singular phenomena of their kind, nothing can be concluded in favour of the perfect minor chord which they represent.

"Though the truth of this experiment were granted, even this would by no means remove the difficulty. If, as M. Rameau alleges, all harmony is derived from the resonance of sonorous bodies, it cannot then be derived only from the vibrations of such bodies as do not refund. In reality, it is an extraordinary theory, to deduce from bodies that do not refund the principles of *harmony*; and it is a position in natural philosophy no less strange, that a sonorous body should vibrate without refunding, as if found itself were any thing else but the air impelled by these vibrations. Moreover, sonorous bodies do not only produce, besides the principal sound, the other tones which with itself compose a perfect chord; but an infinite number of other sounds, formed by all the aliquot parts of the bodies in vibration, which do not enter into that perfect harmony. Why then should the former sounds produce consonances, and why should the latter not produce them, since all of them equally result from nature?

"Every sound exhibits a chord truly perfect, since it is composed of all its harmonics, and since it is by them that it becomes a sound. Yet these harmonics are not heard, and nothing is distinguished but a simple sound, unless it be exceedingly strong: whence it follows, that the only good harmony is an unison; and that as soon as the consonances can be distinguished, the natural proportion being altered, the *harmony* has lost its purity.

"That alteration is in this case produced two different ways. First, by causing certain harmonics to refund, and not the others, the proportion of force which ought to prevail in all of them is altered, for producing the sensation of a single sound; whence the unity of nature is destroyed. By doubling these harmonics, an effect is exhibited similar to that which would be produced by suppressing all the others; for in that case we cannot doubt, but that, along with the generating sound, the tones of the other harmonics which were permitted to sound would be heard: whereas, in leaving all of them to their natural operations,

they destroy one another, and conspire together in *Harmony*, forming and strengthening the simple sensation of the principal sound. It is the same effect which the full sound of a stop in the organ produces, when, by successively removing the stopper or register, the third and fifth are permitted to sound with the principal; for then that fifth and third, which remained absorbed in the other sounds, are separately and disagreeably distinguished by the ear.

"Moreover, the harmonics which we cause to sound have other harmonics pertaining to themselves, which cannot be such to the fundamental sound. It is by these additional harmonics that the sounds which produce them are distinguished with a more sensible degree of harshness; and these very harmonics which thus render the chord perceptible, do not enter into its *harmony*. This is the reason why the most perfect chords are naturally displeasing to ears whose relish for harmony is not sufficiently formed; and I have no hesitation in thinking, that even the octave itself might be displeasing, if the mixture of male and female voices did not inure us to that interval from our infancy.

"With dissonance it is still worse; because, not only the harmonics of the sound by which the discord is produced, but even the sound itself is excluded from the natural harmony of the fundamental: which is the cause why discord is always distinguished amongst all the other sounds in a manner shocking to the sense.

"Every key of an organ, with the stop fully opened, gives a perfect chord with its third-major, which are not distinguished from the fundamental sound, if the hearer is not extremely attentive, and if he does not sound the whole stop in succession; but these harmonic sounds are never absorbed in the fundamental, but on account of the prodigious noise, and by such a situation of the registers as may cause the pipes which produce the fundamental sound to conceal by their force the other sounds which produce these harmonics. Now, no person observes, nor can observe, this continual proportion in a concert; since, by the manner of inverting the *harmony*, its greatest force must in every instant be transferred from one part to another; which is not practicable, and would destroy the whole melody.

"When we play upon the organ, every key in the bass causes to refund the perfect chord major; but because that bass is not always fundamental, and because the music is often modulated in a perfect minor chord, this perfect chord-major is rarely struck with the right hand; so that we hear the third minor with the major, the fifth with the triton, the seventh redundant with the octave, and a thousand other cacophonies, which, however, do not much disgust our ears, because habit renders them tractable; but it is not to be imagined that an ear naturally just would prove so patient of discords, when first exposed to the test of this *harmony*.

"M. Rameau pretends, that trebles composed with a certain degree of simplicity naturally suggest their own basses; and that any man having a just, though unpractised ear, would spontaneously sing that bass. This is the prejudice of a musician, refuted by universal experience. Not only would he, who has never heard either bass or *harmony*, be of himself incapable

Harmony.

Harmony.

of finding either the *bass* or the *harmony* of M. Rameau, but they would be displeasing to him if he heard them, and he would greatly prefer the simple unison.

“When we consider, that, of all the people upon earth, who have all of them some kind of music and melody, the Europeans are the only people who have a *harmony* consisting of chords, and who are pleased with this mixture of sounds; when we consider that the world has endured for so many ages, whilst, of all the nations which cultivated the fine arts, not one has found out this *harmony*: that not one animal, not one bird, not one being in nature, produces any other chord but the unison; nor any other music but melody: that the eastern languages, so sonorous, so musical; that the ears of the Greeks, so delicate, so sensible, practised and cultivated with so much art, have never conducted this people, luxurious and enamoured of pleasure as they were, towards this *harmony* which we imagined so natural: that without it their music produced such astonishing effects; that with it ours is so impotent: that, in short, it was reserved for the people of the north, whose gross and callous organs of sensation are more affected with the noise and clamour of voices, than with the sweetness of accents and the melody of inflections, to make this grand discovery, and to vend it as the essential principle upon which all the rules of the art were founded; when, in short, attention is paid to all these observations, it is very difficult not to suspect that all our *harmony* is nothing but a Gothic and barbarous invention, which would never have entered into our minds, had we been truly sensible to the genuine beauties of art, and of that music which is unquestionably natural.

“M. Rameau asserts, however, that *harmony* is the source of the most powerful charms in music. But this notion is contradictory both to reason and to matter of fact. To fact it is contradictory; because, since the invention of counter-point, all the wonderful effects of music have ceased, and it has lost its whole force and energy. To which may be added, that such beauties as purely result from harmony are only perceived by the learned; that they affect none with transport but such as are deeply conversant in the art: whereas the real beauties of music, resulting from nature, ought to be, and certainly are, equally obvious to the adept and the novice. To reason it is contradictory; since harmony affords us no principle of imitation by which music, in forming images and expressing sentiments, can rise above its native excellence till it becomes in some measure dramatic or imitative, which is the highest pitch of elevation and energy to which the art can aspire; since all the pleasures which we can receive from the mere mechanical influence of sounds are extremely limited, and have very little power over the human heart.”

Thus far we have heard M. Rousseau, in his observations on *harmony*, with patience; and we readily grant, that the *system of harmony* by M. Rameau is neither demonstrated, nor capable of demonstration. But it will not follow, that any man of invention can so easily and so quickly subvert those aptitudes and analogies on which the system is founded. Every hypothesis is admitted to possess a degree of probability proportioned to the number of phenomena for which it offers a satisfactory solution. The first experiment of M. Ra-

meau is, that every sonorous body, together with its principal sound and its octave, gives likewise its twelfth and seventeenth major above; which being approximated as much as possible, even to the chords immediately represented by them, return to the third, fifth, and octave, or, in other words, produce perfect harmony. This is what nature, when solicited, spontaneously gives; this is what the human ear, unprepared and uncultivated, imbibes with ineffable avidity and pleasure. Could any thing which claims a right to our attention, and acceptance from nature, be impressed with more genuine or more legible signatures of her function than this? We do not contend for the truth of M. Rameau's second experiment. Nor is it necessary we should. The first, expanded and carried into all its consequences, resolves the phenomena of harmony in a manner sufficient to establish its authenticity and influence. The difficulties for which it affords no solution are too few and too trivial either to merit the regard of an artist or a philosopher, as M. D'Alembert in his *elements* has clearly shown. The facts with which M. Rousseau confronts this principle, the armies of multiplied harmonics generated in *inquitum*, which he draws up in formidable array against it, only show the thin partitions which sometimes may divide philosophy from whim. For, as bodies are infinitely divisible, according to the philosophy now established, or as, according to every philosophy, they must be indefinitely divisible, each infinitesimal of any given mass, which are only harmonics to other principal sounds, must have fundamental tones and harmonics peculiar to themselves; so that, if the reasoning of Rousseau has any force against M. Rameau's experiment, the ear must be continually distracted with a chaos of inappreciable harmonics, and melody itself must be lost in the confusion. But the truth of the matter is, that, by the wise institution of nature, there is such a conformity established between our senses and their proper objects, as must prevent all these disagreeable effects. Rousseau and his opponent are agreed in this, that the harmonics conspire to form one predominant sound; and are not to be detected but by the nicest organs, applied with the deepest attention. It is equally obvious, that, in an artificial harmony, by a proper management of this wise precaution of nature, dissonances themselves may be either entirely concealed, or considerably softened. So that, since by nature sonorous bodies in actual vibration are predisposed to exhibit perfect harmony; and since the human ear is, by the same wise regulation, fabricated in such a manner as to perceive it; the harmonical chaos of M. Rousseau may be left to operate on his own brain, where it will probably meet with the warmest reception it can expect to find. Nor does it avail him to pretend, that before the harmonics can be distinguished, sonorous bodies must be impelled with a force which alters the chords, and destroys the purity of the harmony; for this position is equally false both in theory and practice. In theory, because an impulse, however forcible, must proportionally operate on all the parts of any sonorous body, so far as it extends: in practice, because the human ear actually perceives the harmony to be pure. What effects his various manoeuvres upon the organ may have, we leave to such as have leisure and curiosity enough to try the experiments: but it is

† M. Rousseau was alive when this article was written.

Harmony.

apprehended, that when tried, their results will leave the system of Rameau, particularly as remodelled by D'Alembert, in its full force.

Of all the whims and paradoxes maintained by this philosopher, none is more extravagant than his assertion, that every chord, except the simple unison, is displeasing to the human ear: nay, that we are only reconciled to octaves themselves by being inured to hear them from our infancy. Strange, that nature should have fixed this invariable proportion between male and female voices, whilst at the same time she inspired the hearers with such violent prepossessions against it as were invincible but by long and confirmed habit! The translator of *D'Alembert's Elements*, as given under the article *Music* in this Dictionary, has been at peculiar pains to investigate his earliest recollections upon this subject; and has had such opportunities, both of attending to his original perceptions, and of recognizing the fidelity of his memory, as are not common. He can remember, even from a period of early childhood, to have been pleased with the simplest kinds of artificial harmony; to have distinguished the harmonics of sonorous bodies with delight; and to have been struck with horror at the sound of such bodies as, by their structure, or by the cohesion of their parts, exhibited these harmonics false. This is the chief, if not the only cause, of the tremendous and disagreeable sensation which we feel from the sound of the Chinese gong. The same horrible cacophony is frequently, in some degree, produced by a drum unequally braced: from this sound the translator often remembers to have started and screamed, when carried through the streets of the town in which he was born in the arms of his nursery-maid; and as he is conscious, that the acoustic organs of many are as exquisite as his own, he cannot doubt but they may have had the same sensations, though perhaps they do not recollect the facts. So early and so nicely may the sensations of harmony and discord be distinguished. But after all, it seems that *harmony* is no more than a modern invention, and, even at this late period, only known to the Europeans. We should, however, be glad to know, from what oracle our philosopher learned, that harmony was not known to antiquity. From what remains of their works, no proof of his position can be derived; and we have at least mentioned one probability against it in our notes to the Preliminary Discourse to the article *Music*, (see Note n.) But though Rousseau's mighty objections were granted, that harmony can only be endured by such ears as are habitually formed and cultivated; that the period of its prevalence has been short, and the extent of its empire limited to Europe; still his conclusion, that it is a Gothic and barbarous invention, is not fairly deducible even from these premises. Must we affirm, that epic poetry has no foundation in nature, because, during the long interval which happened from the beginning of the world to the destruction of Troy, no epic poem seems to have appeared? Or because a natural and mellifluous verification is less relished by an unpolished taste, than the uncouth rhymes of a common ballad, shall we infer, that the power of numbers is merely supposititious and arbitrary? On the contrary, we will venture to affirm, that though harmony cannot, as Rameau supposes, be mathematically demonstrated

Harmony.

from the nature and vibrations of sonorous bodies; yet the idea of its constituent parts, and of their coalescence, is no less established, no less precise and definite, than any mode or property of space or quantity to be investigated by geometrical researches or algebraical calculations. It is certain, that the mimetic or imitative power of music chiefly consists in melody; but from this truth, however evident, it cannot be fairly deduced, that harmony is absolutely unfeeling of imitation. Perhaps every musical sound, even to the most simple, and all modulations of sound, are more or less remotely connected with some sentiment or passion of the human heart. We know, that there are instinctive expressions of pain or pleasure in their various modes and degrees, which, when uttered by any sensitive, and perceived by any conscious being, excite in the mind of the percipient a feeling sympathetic with that by which they are prompted. We likewise know from experience, that all artificial sounds modulated in the same manner, have similar, though not equal, effects. We have seen, that, in order to render harmony compatible with itself, the melody of each part must be congenial; and, for that reason, one kindred melody result from the whole. So far, therefore, as any composer has it in his power to render the general melody homogeneous; so far the imitation may be preserved, and even heightened: for such objects as are majestic and august, or the feelings which they excite, are more aptly expressed by a composition of kindred sounds, than by any simple tone whatever. They who suppose the mimetic powers of music to be consummated in the imitation of mere unmeaning sounds or degrees of motion, must entertain limited and unworthy ideas of its province. It is naturally a representative almost of every sentiment or affection of the soul; and, when this end is gained, the art must have reached its highest perfection, and produced its noblest effects. But these effects, however sensible among the ancients, may in us be superseded by other causes which remain yet unexplored. Theatrical performances are likewise, by them, said to have produced the most wonderful effects; yet these we do not recognize amongst ourselves, tho' we have dramatic entertainments perhaps not inferior to theirs.

Rousseau proceeds to tell us, that among the ancients, the *enharmonic* species of music was sometimes called *harmony*.

Direct HARMONY, is that in which the bass is fundamental, and in which the upper parts preserve among themselves, and with that fundamental bass, the natural and original order which ought to subsist in each of the chords that compose this harmony.

Inverted HARMONY, is that in which the fundamental or generating sound is placed in some of the upper parts, and when some other sound of the chord is transferred to the bass beneath the others.

HARMONY of the Spheres, or *Celestial HARMONY*, a sort of music much talked of by many of the ancient philosophers and fathers, supposed to be produced by the sweetly tuned motions of the stars and planets. This harmony they attributed to the various proportionate impressions of the heavenly globes upon one another, acting at proper intervals. It is impossible, according to them, that such prodigious large bodies, moving with so much rapidity, should be silent: on the contrary,

trary,

trary, the atmosphere, continually impelled by them, must yield a set of sounds proportionate to the impression it receives; consequently, as they do not all run the same circuit, nor with one and the same velocity, the different tones arising from the diversity of motions, directed by the hand of the Almighty, must form an admirable symphony or concert.

They therefore supposed, that the moon, as being the lowest of the planets, corresponded to *mi*; Mercury, to *fa*; Venus to *sol*; the Sun, to *la*; Mars, to *si*; Jupiter, to *ut*; Saturn, to *re*; and the orb of the fixed stars, as being the highest of all, to *mi*, or the octave.

HAROLD, the name of two English kings. See ENGLAND, n° 76, 82.

HARP, a musical instrument of the stringed kind, of a triangular figure, and held upright between the legs of the performer.

There is some diversity in the structure of harps. That called the *triple harp* has three rows of strings or chords, which in all make 78, or four octaves; the second row makes the half turn, and the third is unison with the first. There are two rows of pins on the right side, called *buttons*, that serve to keep the strings tight in their holes; which are fastened at the other end to three rows of pins on the upper side called the *keys*. This instrument is struck with the fingers and thumbs of both hands: its music is like that of the spinet, whence some have called it the *inverted spinet*. There are among us two sorts of this instrument, viz. the Irish harp, which is stringed with wire; and the Welsh harp, stringed with gut.

As to ancient harps, two are represented on Plate CL.—Fig. 26. is a *trigonum* or triangular harp. It is taken from an ancient painting in the museum of the king of Naples, in which it is placed on the shoulder of a little dancing cupid, who supports the instrument with his left hand, and plays upon it with his right. The trigonum is mentioned by Athenæus, lib. iv. and by Julius Pollux, lib. iv. cap. 9. According to Athenæus, Sophocles calls it a *Phrygian instrument*; and one of his dipnosophists tells us, that a certain musician, named *Alexander Alexandrinus*, was such an admirable performer upon it, and had given such proofs of his abilities at Rome, that he made the inhabitants *μουσικισται*, musically mad.

Fig. 25. is the Theban harp, according to a drawing made by J. Bruce, esq; from an ancient painting in one of the sepulchral grottos of the first kings of Thebes. "The performer is clad in a habit made like a shirt, such as the women still wear in Abyssinia, and the men in Nubia. This seems to be white linen or muslin, with narrow stripes of red. It reaches down to his ancles; his feet are without sandals and bare; his neck and arms are also bare; his loose wide sleeves are gathered above his elbows; and his head is close shaved. His left hand seems employed in the upper part of the instrument among the notes in *alto*, as if in an *arpeggio*; while, stooping forwards, he seems with his right hand to be beginning with the lowest string, and promising to ascend with the most rapid execution: this action, so obviously rendered by an indifferent artist, shews that it was a common one in his time; or, in other words, that great hands were then frequent, and consequently that music was well

understood, and diligently followed.

"If we allow the performer's stature to be about five feet ten inches, then we may compute the harp in its extreme length to be something less than six feet and a half. It seems to support itself in *equilibrio* on its foot or base, and needs only the player's guidance to keep it steady. It has 13 strings; the length of these, and the force and liberty with which they are treated, shew that they are made in a very different manner from those of the lyre. (See LYRE.)

"This instrument is of a much more elegant form than the triangular Grecian harp. It wants the forepiece of the frame, opposite to the longest string; which certainly must have improved its tone, but must likewise have rendered the instrument itself weaker, and more liable to accidents if carriage had not been so convenient in Egypt. The back part is the sounding board, composed of four thin pieces of wood, joined together in form of a cone, that is, growing wider towards the bottom; so that, as the length of the string increases, the square of the correspondent space, in the sounding board, in which the tone is to undulate, always increases in proportion.

"Besides that the whole principles upon which the harp is constructed are rational and ingenious, the ornamental parts are likewise executed in the very best manner; the bottom and sides of the frame seem to be finereed, or inlaid, probably with ivory, tortoiseshell, and mother-of-pearl, the ordinary produce of the neighbouring seas and deserts. It would be even now impossible to finish an instrument with more taste and elegance.

"Besides the elegance of its outward form, we must observe, likewise, how near it approached to a perfect instrument; for it wanted only two strings of having two complete octaves in compass. Whether these were intentionally omitted or not, we cannot now determine, as we have no idea of the music or taste of that time; but if the harp be painted in the proportions in which it was made, it might be demonstrated that it could scarce bear more than the 13 strings with which it was furnished. Indeed the cross-bar would break with the tension of the four longest, if they were made of the size and consistence and tuned to the pitch that ours are at present.

"I look upon this instrument then, as the Theban harp, before and at the time of Sesostris, who adorned Thebes, and probably caused it to be painted there, as well as the other figures in the sepulchre of his father, as a monument of the superiority which Egypt had in music at that time over all the barbarous nations that he had seen or conquered.

"We know, about the time of Sesostris, if, as Sir Isaac Newton supposes, this prince and Sefac were the same, that in Palestine the harp had only ten strings; but as David, while he played upon it, both danced and sung before the ark, it is plain, that the instrument upon which he played could have been but of small volume, we may suppose little exceeding in weight our guitar; though the origin of this harp was probably Egyptian, and from the days of Moses it had been degenerating in size, that it might be more portable in the many peregrinations of the Israelites."

To the above account by Mr Bruce, Dr Burney *History of Music*, number p. 225. subscribes the following observations. "The number of

Harp. of strings, the size and form of this instrument, and the elegance of its ornaments, awaken reflections, which to indulge would lead us too far from our purpose, and indeed out of our depth. The mind is wholly lost in the immense antiquity of the painting in which it is represented. Indeed the time when it was executed is so remote, as to encourage a belief, that arts after having been brought to great perfection, were again lost, and again invented long after this period.—

“With respect to the number of strings upon this harp, if conjectures may be allowed concerning the method of tuning them, two might be offered to the reader's choice. The first idea that presented itself at the sight of 13 strings was, that they would furnish all the semitones to be found in modern instruments within the compass of an octave, as from C to c, D to d, or E to e. The second idea is more Grecian, and conformable to antiquity; which is, that if the longest string represented *Proslabanomenos*, or D, the remaining 12 strings would supply all the tones, semitones, and quarter-tones, of the diatonic, chromatic, and enharmonic genera of the ancients, within the compass of an octave: but for my part I would rather incline to the first arrangement, as it is more natural, and more conformable to the structure of our organs, than the second. For with respect to the genera of the Greeks, though no historic testimony can be produced concerning the invention of the diatonic and chromatic, yet ancient writers are unanimous in ascribing to Olympus the Phrygian the first use of the enharmonic: and though in the beginning the melody of this genus was so simple and natural as to resemble the wild notes and rude essays of a people not quite emerged from barbarism; yet in after-times it became overcharged with finical fopperies, and fanciful beauties, arising from such minute divisions of the scale as had no other merit than the great difficulty of forming them.

“It seems a matter of great wonder, with such a model before their eyes as the Theban harp, that the form and manner of using such an instrument should not have been perpetuated by posterity; but that, many ages after, another of an inferior kind, with fewer strings, should take place of it. Yet if we consider how little we are acquainted with the use and even construction of the instruments which afforded the greatest delight to the Greeks and Romans, or even with others in common use in a neighbouring part of Europe only a few centuries ago, our wonder will cease; especially if we reflect upon the ignorance and barbarism into which it is possible for an ingenious people to be plunged by the tyranny and desolation of a powerful and cruel invader.”

Bell-HARP, a musical instrument of the string kind, thus called from the common players on it swinging it about, as a bell on its bair.

It is about three feet long; its strings, which are of no determinate number, are of brass or steel wire, fixed at one end, and stretched across the sound-board by screws fixed at the other. It takes in four octaves, according to the number of the strings, which are struck only with the thumbs, the right hand playing the treble, and the left hand the base: and in order to draw the sound the clearer, the thumbs are armed with a little wire pin. This may perhaps be the lyra,

or cythara of the ancients; but we find no mention made of it under the name it now bears, which must be allowed to be modern.

HARP of Æolus. See ACOUSTICS, n° 10.

HARFAGIUS. See ARFAGIUS.

HARPALUS, a Greek astronomer, who flourished about 480 B. C. corrected the cycle of eight years invented by Cleostratus; and proposed a new one of nine years, in which he imagined the sun and moon returned to the same point. But Harpalus's cycle was afterwards altered by Meton, who added ten full years to it. See ASTRONOMY, n° 304.

HARPIES, among the ancient poets, fabulous impure monsters, said to be the daughters of Neptune and Terra. Virgil mentions three of them, Aello, Ocyete, and Celæno; they are described to be fowls, with the face of a virgin, bears ears, their bodies like vultures, and hands like their crooked talons.

HARPING IRON. See HARPOON.

HARPINGS, the fore-parts of the whales which encompass the bow of a ship, and are fastened to the stem, being thicker than the after part of the whales, in order to reinforce the ship in this place, where she sustains the greatest shock of resistance in plunging into the sea, or dividing it, under a great pressure of sail.

HARPOCRATES, in Pagan theology, was the son of Isis, and esteemed the god of silence. He was represented under the form of a young man half naked, crowned with an Egyptian mitre, holding in his left hand a cornucopia, and a finger of the other placed on his lips as recommending silence.

HARPOCRATION, (Valerius), a celebrated ancient rhetorician of Alexandria, who has left us an excellent *Lexicon upon the ten orators of Greece*. Aldus first published this lexicon in the Greek at Venice in 1603. Many learned men have laboured upon it; but the best edition was given by James Gronovius at Leyden in 1696.

HARPSICORD, the most harmonious of all the musical instruments of the string-kind. It is played on after the manner of the organ, and he is furnished with a set, and sometimes with two sets of keys; the touching or striking of these keys moves a kind of little jacks, which also move a double row of chords or strings, of brass or iron, stretched over four bridges on the table of the instrument.

HARPOON, or **HARPING-IRON**, a spear or javelin used to strike the whales in the Greenland fishery.

The harpoon, which is sometimes called the *harping-iron*, is furnished with a long staff, having at one end a broad and flat triangular head sharpened at both edges, so as to penetrate the whale with facility: to the head of this weapon is fastened a long cord, called the *whale line*, which lies carefully coiled in the boat, in such a manner, as to run out without being interrupted or entangled. See WHALE-FISHERY.

HARQUEBUSS, a piece of fire-arms, of the length of a musket, usually cocked with a wheel. It carried a ball that weighed one ounce seven-eighths.

There was also a larger sort, called the great harquebuss, used for the defence of strong places, which carried a ball of about three ounces and a half; but they are now but little used, except in some old castles, and by the French in some of their garrisons.

HAR-

Harquebuss.
Harprocration.

Harrier
||
Harriot.

HARRIER, a kind of hound, endowed with an admirable gift of smelling, and very bold in the pursuit of his game.

HARRINGTON (Sir John), an ingenious English poet, was the son of John Harrington, esq; who was committed to the tower by queen Mary for holding a correspondence with her sister Elizabeth; who, when she came to the crown, stood godmother to this son. Before he was 30, he published a translation of Ariosto's Orlando Furioso, a work by which he was principally known; for though he afterwards published some epigrams, his talent did not seem to have lain that way. He was created knight of the bath by James I.; and presented a MS. to prince Henry, levelled chiefly at the married bishops. He is supposed to have died about the latter end of James's reign.

HARRINGTON (James), a most eminent English writer in the 17th century, bred at Oxford, travelled into Holland, France, Denmark and Germany, and learned the languages of those countries. Upon his return to England, he was admitted one of the privy-chamber extraordinary to king Cha. I. He served the king with great fidelity, and made use of his interest with his friends in parliament to procure matters to be accommodated with all parties. The king loved his company except when the conversation happened to turn upon commonwealths. He found means to see the king at St James's; and attended him on the scaffold, where, or a little before, he received a token of his majesty's affection. After the death of king Charles, he wrote his *Oceana*; a kind of political romance, in imitation of Plato's Commonwealth, which he dedicated to Oliver Cromwell. It is said, that when Oliver perused it, he declared, that "the gentleman had wrote very well, but must not think to cheat him out of his power and authority; for that what he had won by the sword, he would not suffer himself to be scribbled out of." This work was attacked by several writers, against whom he defended it. Beside his writings to promote republican principles, he instituted likewise a nightly meeting of several ingenious men in the New Palace-Yard, Westminster; which club was called the *Rota*, and continued till the secluded members of parliament being restored by general Monk, all their models vanished. In 1661, he was committed to the tower for treasonable designs and practices; and chancellor Hyde, at a conference with the lords and commons, charged him with being concerned in a plot. But a committee of lords and commons could make nothing of that plot. He was conveyed to St Nicolas' island, and from thence to Plymouth, where he fell into an uncommon disorder of the imagination. Having obtained his liberty by means of the earl of Bath, he was carried to London, and died in 1677. He published, besides the above works, several others, which were first collected by Toland, in one volume folio, in 1700; but a more complete edition was published, in 1737, by the reverend Dr Birch.

HARRIOT (Thomas), a celebrated algebraist, was born at Oxford in 1560, where he was also educated. In 1579, he completed his bachelor's degree; and, being already distinguished for his mathematical learning, was soon after recommended to Sir Walter

VOL. V.

Raleigh, as a proper person to instruct him in that science. He was accordingly received into the family of that gentleman; who, in 1585, sent him with the colony, under Sir Richard Grenville, to Virginia; of which country, having remained there about a year, he afterwards published a topographical description. About the year 1588, Mr Harriot was introduced by his patron Sir Walter Raleigh, to Henry Percy earl of Northumberland, who allowed him a pension of 120*l. per annum*. He spent many years of his life in Sion college; where he died in July 1621, of a cancer in his lip, and was buried in the church of St Christopher, where a handsome monument was erected to his memory. Anthony Wood tells us he was a deist, and that the divines looked upon his death as a judgement. Be his religious opinions what they might, he was doubtless one of the first mathematicians of the age in which he lived, and will always be remembered as the inventor of the present improved method of algebraical calculation. His improvements in algebra were adopted by Des Cartes, and for a considerable time imposed upon the French nation as his own invention; but the theft was at last detected, and exposed by Dr Wallis, in his History of Algebra, where the reader will find our author's invention accurately specified. His works are, 1. A brief and true report of the new-found land of Virginia; of the commodities there found, and to be raised, &c. 2. *Artis analyticae praxis ad equationes algebraicas nova expedita, et generali methodo resolvendas, e posthumis Thomae Harrioti*, &c. 3. *Ephemeris clyometrica*. Manuscript, in the library of Sion college. He is said to have left several other manuscripts which are probably lost.

HARRISON (John), a most accurate mechanic, the celebrated inventor of the famous *time-keeper* for ascertaining the longitude at sea, and also of the compound, or, as it is commonly called, the *gridiron pendulum*; was born at Foulby, in the parish of Wragby, near Pontefract in Yorkshire, in 1693. The vigour of his natural abilities, if not even strengthened by the want of education, which confined his attention to few objects, at least amply compensated the deficiencies of it; as fully appeared from the astonishing progress he made in that branch of mechanics to which he devoted himself. His father was a carpenter, in which profession the son assisted; occasionally also, according to the miscellaneous practice of country artists, surveying land, and repairing clocks and watches. He was, from his early childhood, attached to any machinery moving by wheels, as appeared while he lay sick of the small-pox about the 6th year of his age, when he had a watch placed open upon his pillow to amuse himself by contemplating on the movement. In 1700, he removed with his father to Barrow in Lincolnshire; where, though his opportunities of acquiring knowledge were very few, he eagerly improved every incident from which he might collect information; frequently employing all, or great part of his nights, in writing, or drawing; and he always acknowledged his obligations to a clergyman who came every Sunday to officiate in the neighbourhood, who lent him a MS. copy of professor Saunderson's Lectures; which he carefully and neatly transcribed, with all the diagrams. His native genius exerted

20 E

itself

Harriot.
Harrison.

itself superior to these folitary disadvantages; for in the year 1726, he had constructed two clocks, mostly of wood, in which he applied the escapement and compound pendulum of his own invention: these surpassed every thing then made, scarcely erring a second in a month. In 1728, he came up to London with the drawings of a machine for determining the longitude at sea, in expectation of being enabled to execute one by the the board of longitude. Upon application to Dr Halley, he referred him to Mr George Graham; who, discovering he had uncommon merit, advised him to make his machine before he applied to the board of longitude. He returned home to perform this task; and 1735, came to London again with his first machine; with which he was sent to Lisbon the next year for a trial of its properties. In this short voyage, he corrected the dead reckoning about a degree and a half; a success that proved the means of his receiving both public and private encouragement. About the year 1739, he completed his second machine, of a construction much more simple than the former, and which answered much better: this, though not sent to sea, recommended Mr Harrison yet stronger to the patronage of his private friends and of the public. His third machine, which he produced in 1749, was still less complicated than the second, and superior in accuracy, as erring only three or four seconds in a week. This he conceived to be the *ne plus ultra* of his attempts; but in an endeavour to improve pocket-watches, he found the principles he applied, to surpass his expectations so much, as to encourage him to make his fourth time-keeper, which is in the form of a pocket watch, about six inches diameter. With this time-keeper his son made two voyages, the one to Jamaica, and the other to Barbadoes: in both which experiments it corrected the longitude within the nearest limits required by the act of the 12th of queen Anne; and the inventor therefore, at different times, though not without infinite trouble, received the proposed reward of 20,000*l*. These four machines were given up to the board of longitude. The three former were not of any use, as all the advantages gained by making them were comprehended in the last: they were worthy, however, of being carefully preserved as mechanical curiosities, in which might be traced the gradations of ingenuity executed with the most delicate workmanship; whereas they now lie totally neglected, in the royal observatory at Greenwich. The fourth machine, emphatically distinguished by the name of *The time-keeper*, has been copied by the ingenious Mr Kendal; and that duplicate, during a three years circumnavigation of the globe in the southern hemisphere by captain Cook, answered as well as the original. The latter part of Mr Harrison's life was employed in making a fifth improved time-keeper on the same principles with the preceding one; which, at the end of a ten weeks trial, in 1772, at the king's private observatory at Richmond, erred only 4½ seconds. Within a few years of his death, his constitution visibly declined; and he had frequent fits of the gout, a disorder that never attacked him before his 77th year: he died at his house in Red-Lion Square, in 1776, aged 83. The reclusive manner of his life in the unremitted pursuit of his favourite object, was by no means calculated to qualify

him as a man of the world; and the many discouragements he encountered in soliciting the legal reward of his labours, still less disposed him to accommodate himself to the humours of mankind. In conversing on his profession, he was clear, distinct, and modest; yet, like many other mere mechanics, found a difficulty in delivering his meaning by writing; in which he adhered to a peculiar and uncouth phraseology. This was but too evident in his *Description concerning such mechanis as will afford a nice or true mensuration of time*, &c. 8vo. 1775; which his well-known mechanical talents will induce the public to account for from his unacquaintance with letters, from his advanced age, and attendant mental infirmities; among which may be reckoned his obdurate refusal to accept of any assistance whatever in this publication. This small work includes also an account of his new musical scale; or mechanical division of the octave, according to the proportion which the radius and diameter of a circle have respectively to the circumference. He had in his youth been the leader of a distinguished band of church-fingers; had a very delicate ear for music; and his experiments on sound, with a most curious monochord of his own improvement, are reported to have been not less accurate than those he was engaged to for the mensuration of time.

HARROW, in agriculture. See there, n° 89.

HART, a stag, or male deer, in the sixth year. See CERVUS.

HART's Horns, in pharmacy, the whole horns of the common male deer, as separated from the head, without farther preparation.

The chemical analysis of hart's-horn is sufficiently known: it yields a water highly impregnated with a volatile salt, which is called *spirit of hart's-horn*, with a fetid oil, and a volatile salt, by the common distillation in a retort.—The salt of hart's-horn, when pure, differs in nothing from other purified volatile alkalies. See CHEMISTRY, n° 329—336; VOLATILE Alkali; and Alkaline SPIRITS.

HARTFORDSHIRE, a county of England, deriving its name from Hartford, the capital; and that from the harts with which it anciently abounded, being then over-run with woods. It is bounded on the east by Essex, on the west by Bedfordshire and Buckinghamshire, on the south by Middlesex, and on the north by Cambridgeshire. This county is much indented by those that surround it: the longest part is about 30 miles, the broadest about 24, and 130 in compass; in which are contained about 451,000 acres, 18 market-towns, 120 parishes, and above 95,000 inhabitants, who send six members to parliament, viz. two for the shire, two for Hartford, and two for St Alban's. Before the reign of queen Elizabeth, one sheriff served both for this shire and Essex; but in the ninth year of her reign, it had one allotted for itself. With regard to ecclesiastical jurisdiction, it belongs partly to the diocese of Lincoln, and partly to that of London.

Though the soil in general, especially in the Chiltern and southern parts, is but very indifferent, and much inferior to that of the neighbouring counties; yet the air is so much superior, that lands in this shire generally sell at three or four years purchase more than in many others, on that account. But it must be

Hartford
Hartlepool.

owned, that the foil of Hartfordshire has been much improved of late, by draining, sowing grafs-seeds, and other methods. There are few or no manufactures in the county; but its markets are much frequented, in consequence of its being near London, for malt and all sorts of grain, which, with the many thoroughfares through it, make ample amends.

HARTFORD, the capital of the county of the same name, signifying, as is commonly thought, the "ford of harts," stands on the river Lea, in W. Long. 7°. N. Lat. 51. 45. In William the Conqueror's time, as we find in doomsday-book, there were 26 burgesses in it. It has a castle upon the Lea, supposed to have been built by Edward the Elder, which Edward III. granted to his son John duke of Lancaster, together with the town and honour of Hartford, that (as it is expressed in the grant) he might keep a house suitable to his quality and have a decent habitation. Here the East-Saxon kings often kept their court; and here, in 673, was held a synod. King Edward the Elder built a village for his tenants, and fortified it with a wall of turf for their defence, which is what was originally meant by a burgh, whence the houses were called *burgages*, and the inhabitants *burgher* or *burgesses*. The manor of this town was an honour and a royal manor, and even the town and castle were held of the king *in capite*; of the latter of which the sheriffs of Hartfordshire and Essex were usually governors. The manor was granted by queen Elizabeth to lord Burleigh, whose descendants still possess it. The town sent members to parliament in Edward I.'s time, but after the seventh of Henry V. the bailiff and burgesses petitioned the parliament to be excused on account of their poverty. It has had several charters and grants of privileges from different kings, particularly several fairs and markets. In Henry VII.'s reign, the standards of weights and measures were ordered to be kept here. Here was anciently a monastery; founded by a nephew of William the Conqueror's, and five churches, which are now reduced to two. As the town is remarkable for its pleasant dry situation and wholesome air, the governors of Christ's-hospital have fitted up a large building for the reception of their sickly or supernumerary children. It is governed at present by a mayor, high-steward, recorder, nine aldermen, a town-clerk, chamberlain, 10 capital burgesses, and 16 assistants; and it has two sergeants at mace. Its markets are very considerable for wool, wheat, and malt; of which, especially the last, great quantities are conveyed to London by the river Lea. The town has had a great many benefactors; but to particularize them and their benefactions, would require more room than we can allow. It gives the title of earl to the noble family of Seymour-Conway.

HARTLAND, a town in Devonshire, near the Bristol channel, with a market on Saturdays, much frequented by the people of Cornwall, who come hither in boats. It gives its name to a point, called *Hartland Point*, at the entrance of Bristol channel. W. Lon. 4. 45. N. Lat. 51. 9.

HARTLEPOOL, a sea-port town in the county of Durham. It is commodiously seated on a promontory, and is almost encompassed by the sea. It is an ancient corporation, governed by a mayor and alder-

men, with other subordinate officers. It is at present a pretty large, but poor place. It depends chiefly on the fishing trade; and its harbour is much frequented by colliers passing to and from Newcastle. W. Lon. o. 55. N. 54. 40.

HARTLEY (David), M. A. born at Ilingworth, where his father was curate, received his academical education at Jesus college, Cambridge, of which he was a fellow. He first began to practise physic at Newark, in Nottinghamshire; from whence he removed to St Edmund's Bury, in Suffolk. After this, he settled for some time in London; and lastly went to live at Bath, where he died in 1757, aged 53, leaving two sons and a daughter. He published "A view of the present evidence for and against Mrs Stephens's * medicines as a solvent for the stone, containing 155 cases, with some experiments and observations;" London, 1739.

* See Stephens's Medicines.

He is said to have also written against Dr Warren, of St Edmund's Bury, in defence of inoculation; and some letters of his are to be met with in the Philosophical Transactions.—The doctor was certainly a man of learning, and reputed a good physician; but too fond of nostrums.

But his most considerable literary production is a work entitled, "Observations on man, his frame, his duty, and his expectations, in two parts;" London, 1749, 2 vols, 8vo. The first part contains observations on the frame of the human body and mind, and on their mutual connexions and influences. The second part contains observations on the duty and expectations of mankind.

HARTMAN (John Adolphus), a learned divine and historian, was born at Munster in 1680. After being a Jesuit for several years, he became a Calvinist, at Cassel, in 1715, and soon after was made professor of philosophy and poetry, and in 1722 professor of history and eloquence at Marburg, where he died in 1744. The most esteemed of his works are, 1. The state of the sciences at Hesse, in German. 2. *Historia Hassiaca*, 3 vols. 3. *Præcepta eloquentiæ rationalis*, &c.

He ought not to be confounded with *George Hartman*, a German mathematician, who, in 1540, wrote a book on perspective; nor with *Wolfgang Hartman*, who, in 1506, composed the Annals of Augsburg.

HARUSPICES, pretenders to divination by certain signs, or omens, among the Romans.—The Roman haruspices were at first all taken from Etruria, where their art had most credit. Afterwards young Romans were sent into Etruria, in order to be brought up in the science. It consisted in foretelling future events by attending to various circumstances of the victims. First, It was an ill omen when the victim would not come to the altar without dragging, when it broke its rope, fled away, avoided the stroke, struggled much after it, made a great bellowing, was long a-dying, or bled but little. Secondly, Prefaces were drawn from inspecting the noble parts of the victim when opened; as the heart, lungs, spleen, and especially the liver. If all these were found, if the top of the liver was large and well-made, and if its fibres were strong, it presaged well for the affair in question. Thirdly, Knowledge was also drawn by the haruspices from the manner in which the fire consumed the

Hartley
Haruspices.

victim. If the flame brightened immediately, was pure and clear, rose up in a pyramid without noise, and did not go out till the victim was consumed, these were happy signs. Fourthly, The smoke also was considered, whether it whirled about in curls, or spread itself to the right or the left, or gave a smell different from the common one of broiled meat. Fifthly, it was a lucky omen if the incense they burned melted all at once, and gave a most agreeable smell.

HARSPICY. See **HARSPICES** and **DIVINATION**.
HARVEY (Dr William), an eminent English physician in the 17th century, was incorporated Doctor of physic in Cambridge, afterwards admitted into the college of physicians in London, and was appointed lecturer of anatomy and chirurgery in that college. In these lectures he opened his discovery relating to the circulation of the blood; which, after a variety of experiments, he communicated to the world in his *Exercitationes anatomicae de motu cordis et sanguinis*. He was physician to king James I. and to king Charles I. and adhered to the royal cause. His works have eternized his memory. In 1651, he published his *Exercitationes de generatione animalium*, a very curious work; but it would have been more so, had not his papers been destroyed during the civil wars. In 1654, he was chosen president of the college of physicians in his absence: but his age and weakness were so great, that he could not discharge the duty of that office; and, therefore, desired them to choose Dr Pringle. As he had no children, he settled his paternal estate upon the college. He had three years before built a combination-room, a library, and a museum; and in 1656 he brought the deeds of his estate, and presented them to the college. He was then present at the first feast, instituted by himself, to be continued annually, together with a commemoration speech in Latin, to be spoken on the 18th of October, in honour of the benefactors to the college; he having appointed a handsome stipend for the orator, and also for the keeper of the library and museum, which are still called by his name. He died in 1657.

This great physician had the happiness, in his lifetime, to find the clamours of ignorance, envy, and prejudice, against his doctrine, totally silenced, and to see it universally established. It has, by length of time, been more and more confirmed, and every man now sees and knows it from his own experience. It appears to be of the utmost importance in medicine; as it is perhaps impossible to define health and sickness in fewer words, than that the one is a free, and the other an obstructed, circulation.—Dr Harvey was not only an excellent physician, but an excellent man; his modesty, candour, and piety, were equal to his knowledge; the farther he penetrated into the wonders of nature, the more he was inclined to venerate the Author of it.

HARVEST, the time or season of the year in which the corn is ripe, and fit to be taken into barns.

HARVEST-Fly, in zoology, a large four-winged fly of the cicada kind, very common in Italy, and erroneously supposed to be a grasshopper. See **CICADA**.

HARWICH, a town of Essex, in England, situated in E. Lon. 1. 25. N. Lat. 52. 3. It is not large, but is neat and well-built, and is walled and paved with a sort of petrified clay that falls from the cliffs

in the neighbourhood. The harbour or bay is very large, safe, and deep; and is commanded by a strong fort on the Suffolk side, though not in that county. Here is a dock belonging to the government, with all conveniences for building, cleaning, and refitting men of war. A little way from the town, on a high hill called *Beacon-hill*, is a very fine light-house, which is seen at a very great distance, and is very useful on this dangerous coast. At this place the packet-boats that pass between England, Holland, and Germany, are stationed, and the town is much benefited by the passengers. The government, by a charter from king James I. is vested in a mayor, eight aldermen, 24 capital burgesses, the electors, and recorder. The town has also an admiralty jurisdiction within its liberties, and the return of all writs, fines, &c.

HASLEMERE, a town of Surry, in England, seated on the edge of the county next Hampshire, and sends two members to parliament. This borough is governed by a constable; has one church, and about 100 low brick houses in two paved streets. The number of inhabitants is computed at about 4000. W. Lon. 0. 30. N. Lat. 51. 4.

HASSELLT, a handsome town of the United Provinces, in Overijssel, seated on the river Wecht, in E. Lon. 6. 5. N. Lat. 23. 46.

HASSELLT, a town of Germany, in the circle of Westphalia, and in the territory of Liege, situated on the river Demer, in E. Lon. 4. 49. N. Lat. 50. 55.

HASSIDEANS, or **ASSIDEANS**. See **ASSIDEANS**.
HASSOCK, a balm made of rushes, to kneel or rest the feet upon in churches.

HASP and **STAPLE**, in Scots law, the symbol commonly used in burgh tenements for entering and infesting an heir, by delivering into his hands the hasp and staple of the door.

HASTATED LEAF. See **BOTANY**, p. 2196.

HASTINGS, a town of Suffex, in England, situated in E. Lon. 0. 36. N. Lat. 50. 50.—This town is remarkable for a battle fought in its neighbourhood, between Harold king of England, and William duke of Normandy, on the 15th of October 1066, in which the former was defeated and killed, and by his death, William, surnamed the *Conqueror*, became king of England. See **ENGLAND**, n° 85.—The night before the battle, the aspect of things was very different in the two camps. The English spent the time in riot, jollity, and disorder; the Normans in silence and prayer, and in the other duties of religion. The next day both armies prepared for battle. The duke divided his army into three lines: the first, headed by Montgomery, consisted of archers and light-armed infantry: the second, commanded by Martel, was composed of his bravest battalions, heavy-armed, and ranged in close order: his cavalry, at whose head he placed himself, formed the third line; and were so disposed, that they stretched beyond the infantry; and flanked each wing of the army. He ordered the signal of battle to sound; and the whole army, moving at once, and singing the hymn or song of Roland the famous peer of Charlemagne, advanced, in order and with alacrity, towards the enemy.

Harold had seized the advantage of a rising ground, and having besides drawn some trenches to secure his flanks, he resolved to stand upon the defensive, and to avoid

avoid all action with the cavalry, in which he was inferior. The Kentish men were placed in the van, a post which they had always claimed as their due; the Londoners guarded the standard; and the king himself, accompanied by his two valiant brothers, Gurth and Leofwin, dismounting from horseback, placed himself at the head of his infantry, and expressed his resolution to conquer or to perish in the action. The first attack of the Normans was desperate, but was received with equal valour by the English: and after a furious combat, which remained long undecided, the former, overcome by the difficulty of the ground, and hard pressed by the enemy, began first to relax their vigour; then to give ground; and confusion was spreading among the ranks, when William, who found himself on the brink of destruction, hastened, with a select band, to the relief of his dismayed forces. His presence restored the action; the English were obliged to retreat with loss; and the duke, ordering his second line to advance, renewed the attack with fresh forces and with redoubled courage. Finding that the enemy, aided by the advantage of ground, and animated by the example of their prince, still made a vigorous resistance, he tried a stratagem, which was very delicate in its management, but which seemed advisable in his desperate situation, when, if he gained not a decisive victory, he was totally undone: he commanded his troops to make a hasty retreat, and to allure the enemy from their ground by the appearance of flight. The artifice succeeded against these unexperienced troops, who, heated by the action, and sanguine in their hopes, precipitantly followed the Normans into the plain. William gave orders, that at once the infantry should face about upon their pursuers, and the cavalry make an assault upon their wings, and both of them pursue the advantage which the surprize and terror of the enemy must give them in that critical and decisive moment. The English were repulsed with great slaughter, and drove back to the hill; where being rallied again by the bravery of Harold, they were able, notwithstanding their loss, to maintain the post and continue the combat. The duke tried the same stratagem a second time with the same success; but even after this double advantage, he still found a great body of the English, who, maintaining themselves in firm array, seemed determined to dispute the victory to the last extremity. He ordered his heavy-armed infantry to make the assault upon them; while his archers, placed behind, should gall the enemy, who were exposed by the situation of the ground, and who were intent in defending themselves against the swords and spears of the assailants. By this disposition he at last prevailed; Harold was slain by an arrow, while he was combating with great bravery at the head of his men. His two brothers shared the same fate: and the English, discouraged by the fall of these princes, gave ground on all sides, and were pursued with great slaughter by the victorious Normans. A few troops, however, of the vanquished dared still to turn upon their pursuers; and taking them in deep and miry ground, obtained some revenge for the slaughter and dishonour of the day. But the appearance of the duke obliged them to seek their safety by flight, and darkness saved them from any farther pursuit by the enemy.

Thus was gained by William, Duke of Normandy, the great and decisive victory of Hastings, after a battle which was fought from morning till sunset, and which seemed worthy, by the heroic feats of valour displayed by both armies, and by both commanders, to decide the fate of a mighty kingdom. William had three horses killed under him; and there fell near fifteen thousand men on the side of the Normans. The loss was still more considerable on that of the vanquished; besides the death of the king and his two brothers. The dead body of Harold was brought to William, and was generously restored without ransom to his mother.

The town of Hastings is the chief of the cinque-ports; and was formerly obliged to find 21 ships, within 40 days after the king's summons, well furnished and armed for service, and to maintain the crews a fortnight at its own charge. It sends two members to parliament, and supplies London with abundance of fish. It lies between a high cliff towards the sea, and a high hill on the land-side, having two streets, and two parish-churches. About the year 1377 this town was burnt by the French; and, when it was rebuilt, it was divided into two parishes. There was a castle on the hill which overlooked the town, but it is now in ruins.

HAT, a covering for the head, worn by the men in most parts of Europe. Those most in esteem are made of the pure hair of the castor or beaver; for they are also made of the hair or wool of divers other animals, and that by much the same process.

Hats are said to have been first seen about the year 1400; at which time they became of use for country wear, riding, &c.—Father Daniel relates, that when Charles II. made his public entry into Rouen in 1449, he had on a hat lined with red-velvet, and surmounted with a plume or tuft of feathers.—He adds, that it is from this entry, at least under this reign, that the use of hats and caps is to be dated, which henceforward began to take place of the chaperons and hoods that had been wore before.

In progress of time, from the laity, the clergy likewise took the habit; but it was looked on as a crying abuse, and several regulations were published, forbidding any priest, or religious person, to appear in a hat without cornets; and enjoining them to keep to the use of chaperons, made of black cloth, with decent cornets: if they were poor, they were at least to have cornets fastened to their hats, and this upon pain of suspension and excommunication.—Indeed the use of hats is said to have been of a longer standing among the ecclesiastics of Brittany by 200 years, and especially among the canons: but these were no other than a kind of caps; and it was from hence arose the square caps worn in colleges, &c. Lobineau * observes, that a bishop of Dol, in the 12th century, zealous for good, order, allowed the canons alone to wear such hats; enjoining, that if any other person should come with them to church, divine service should immediately stand still.

Method of Making Hats. To make the beaver-hats, they tear off the long and short hair from the skin, with knives suitable to the occasion: after which they proportion the quantity of the several sorts of beaver-hair, by mixing one third of the dry castor to two thirds.

* Tom. I. P. 845.

thirds of *old-coat*, which is a term for a skin that has been worn some time by the Indians of America, who catch and sell them to the Europeans. The hair, so mixed, is carded and weighed out into parcels, according to the size and thickness of the hat intended. The stuff is now laid on the hurdle, with an instrument called a *bow*, resembling that of a violin, but larger; whose string being worked with a small bow-flick, and made to play on the furs, they fly, and mix themselves together, the dust and filth at the same time passing through the chinks. Instead of a bow, some hat-makers use a searce of hair, through which they pass the stuff. Thus hats are formed of an oval figure, ending with an acute angle at the top: with what stuff remains, they strengthen them where slenderest, yet designedly make them thicker in the brim near the crown, than towards the circumference, or in the crown itself. They next harden the stuff, so managed, into more compact flakes, by pressing down a hardened leather upon it. This done, they are carried to the bason; upon which laying one of the hardened hats, they sprinkle it over with water, and mould it; and the heat of the fire, with the water and pressing, embody the stuff into a slight hairy sort of felt: after which, turning up the edges all round over the mould, they lay it by, and proceed with another; which being in like manner reduced to the same consistence and form, they are both joined together, so as to make them meet in an angle at top, making only one conical cap. The next process is to remove the hat to a trough, resembling a mill-hopper, which is a copper kettle filled with water and grounds, kept hot for the purpose; and, after being dipped in the kettle, the hat is laid on the sloping side, called the *plank*. Here they proceed to work it, by rolling and unrolling it again and again, one part after another, first with the hand, and afterwards with a small wooden roller, taking care to dip it from time to time; till at length, by thus fulling and thickening it four or five hours, it is brought to the dimensions intended. In this violent labour, the workmen usually guard their hands with thick leather, which they call *gloves*. The hat thus wrought into the form of a conical cap, is reduced into proper shape on a block of the size of the intended crown, by tying it round with a string, called a *commander*; after which, with a bent iron called a *flamper*, they gradually beat down the commander all round, till it has reached the bottom of the block, and what remains at the bottom below the string forms the brim. In this station it is set to dry; and is afterwards singed, by holding it over the blaze of a fire made of straw or shavings: it is then rubbed with pumice-stone, to take off the coarser nap; then rubbed over with seal-skin, to lay the nap still finer; and, lastly, carded with a fine card, to raise the fine cotton with which the hat is to appear when finished: then sitting it to the block, they tie it, cut round the edges, and deliver it to the dyers. The dye being completed, the hat is dyed by being hung in the roof of a stove heated with a charcoal-fire: and, when dry, it is stiffened with melted glue, or rather gum senega, which is smeared over the hat with a brush, and rubbed in with the hand. Then, having spread a cloth over the steaming bason, which is a little fire-place raised about three feet high, with an iron plate laid over it, exactly

covering the fire, the hat is laid upon the cloth, with the brim downwards, the cloth being first sprinkled with water, to raise a strong steam, to force in the stiffening. When it is moderately hot, the workman strikes gently on the brim, with the flat of his hand, to make the joinings incorporate and bind so as not to appear, turning it from time to time, and at last letting it on the crown. And when it has been sufficiently steamed and dried, it is put again on the block, brushed, ironed, well smoothed, and fitted for lining.

Hats make a considerable article in commerce: England supplies Spain, Portugal, Italy, and Germany, with extraordinary quantities of them; and as our manufacturers have the reputation of making the best hats in Europe, their importation is prohibited.

Hats are also made for womens wear, of chips, straw, or cane, by plating, and sewing the plats together; beginning with the centre of the crown, and working round till the whole is finished. Hats for the same purpose are also wove and made of horse-hair, silk, &c.

HAT is also figuratively used for the dignity of cardinal, or a promotion to that dignity. In this sense they say, "to expect the hat; to claim, or have pretensions to, the hat," &c.

Pope Innocent IV. first made the hat the symbol or cognizance of the cardinals, enjoining them to wear a red hat at the ceremonies and processions, in token of their being ready to spill their blood for Jesus Christ.

Dyeing of Hats. The instructions of Mr Colbert direct hats to be first strongly galled, by boiling them a long time in a decoction of galls with a little logwood, that the dye may penetrate the better into their substance; after which a proper quantity of vitriol, and decoction of logwood, with a little verdigrease, are added, and the hats continued in this mixture also for a considerable time. They are afterwards to be put in a fresh liquor of logwood, galls, vitriol, and verdigrease; and where the hats are of great price, or of a hair which difficultly takes the dye, the same process is to be repeated a third time. For obtaining the most perfect colour, the hair or wool is to be dyed blue, previously to its being formed into hats.—The present practice is more compendious, and affords, as we may daily see, a very good black. According to Dr Lewis, it does not materially differ from that of the *Encyclopédie*, which is as follows.

An hundred pounds of logwood, 12 pounds of gum, and six pounds of galls, are boiled in a proper quantity of water for some hours; after which, about six pounds of verdigrease, and ten of green vitriol, are added, and the liquor kept just simmering, or of a heat a little below boiling. Ten or twelve dozen of hats are immediately put in, each on its block, and kept down by cross bars for about an hour and an half: they are then taken out and aired, and the same number of others put in their room. The two sets of hats are thus dipped and aired alternately, eight times each; the liquor being refreshed each time with more of the ingredients, but in less quantity than at first.

This process (says Dr Lewis) affords a very good black on woollen and silk stuffs as well as on hats, as we may see in the small pieces of both kinds which are sometimes dyed by the hatters. The workmen lay great stress upon the verdigrease, and affirm that they can-

Hatch
Hatching.

cannot dye a black hat without it: it were to be wished that the use of this ingredient were more common in the other branches of the black dye; for the hatters dye, both on silk and woollen, is reckoned a finer black than what is commonly produced by the woollen and silk dyes.

HATCH, or **HATCHWAY**, a square or oblong opening in the **DECK** of a ship, of which there are several, forming the passages from one deck to another, and into the hold, or lower apartments. See Plate LXXXVIII. where **A** represents the main hatchway of the lower deck; **NN** the fore-hatchway; and **OO** the after-hatchway.—There are likewise hatches of a smaller kind, called *scuttles*. See **UU** in the same figure; as also the article **SCUTTLE**.—Hatches is also, though improperly, a name applied by sailors to the covers or lids of the hatchway.

HATCHES, in mining, a term used in Cornwall, to express any of the openings of the earth either into mines or in search of them. The fruitless openings are called *effay-hatches*; the real mouths of the veins, *tin hatches*; and the places where they wind up the buckets of ore, *wind hatches*.

HATCHES also denote flood-gates set in a river, &c. to stop the current of the water, particularly certain dams or mounds made of rubbish, clay, or earth, to prevent the water that issues from the stream-works and tin-washes in Cornwall from running into the fresh rivers.

HATCHET, a small light sort of an axe, with a basil-edge on its left side, and a short handle, as being to be used with one hand.—Hatchets are used by various artificers, and more particularly in hewing of wood.

HATCHING, the maturing fecundated eggs, whether by the incubation and warmth of the parent bird, or by artificial heat, so as to produce young chickens alive.

The art of hatching chickens by means of ovens has long been practised in Egypt; but it is there only known to the inhabitants of a single village named *Berne*, and to those that live at a small distance from it. Towards the beginning of autumn they scatter themselves all over the country; where each person among them is ready to undertake the management of an oven, each of which is of a different size; but, in general, they are capable of containing from forty to fourscore thousand eggs. The number of these ovens placed up and down the country is about 386, and they usually keep them working for about six months: as, therefore, each brood takes up in an oven, as under a hen, only 21 days, it is easy in every one of them to hatch eight different broods of chickens. Every *Bermean* is under the obligation of delivering to the person who intrusts him with an oven, only two thirds of as many chickens as there have been eggs put under his care; and he is a gainer by this bargain, as more than two thirds of the eggs usually produce chickens. In order to make a calculation of the number of chickens yearly so hatched in Egypt, it has been supposed that only two thirds of the eggs are hatched, and that each brood consists of at least 30,000 chickens; and thus it would appear, that the ovens of Egypt give life yearly to at least 92,640,000 of these animals.

This useful and advantageous method of hatching

eggs has been lately discovered in France, by the ingenious Mr Reaumur; who, by a number of experiments, has reduced the art to certain principles. He found by experience, that the heat necessary for this purpose is nearly the same with that marked 32 on his thermometer, or that marked 96 on Fahrenheit's. This degree of heat is nearly that of the skin of the hen, and, what is remarkable, of the skin of all other domestic fowls, and probably of all other kinds of birds. The degree of heat which brings about the development of the cygnet, the gosling, and the turkey-pout, is the same as that which fits for hatching the canary-long-flier, and, in all probability, the smallest humming-bird: the difference is only in the time during which this heat ought to be communicated to the eggs of different birds; it will bring the canary bird to perfection in 11 or 12 days, while the turkey-pout will require 27 or 28.

After many experiments, Mr Reaumur found, that stoves heated by means of a baker's oven, succeeded better than those made hot by layers of dung: and the furnaces of glass-houses and those of the melters of metals, by means of pipes to convey heat into a room, might, no doubt, be made to answer the same purpose. As to the form of the stoves, no great nicety is required. A chamber over an oven will do very well. Nothing more will be necessary but to ascertain the degree of heat; which may be done by melting a lump of butter of the size of a walnut, with half as much tallow, and putting it into a phial. This will serve to indicate the heat with sufficient exactness: for when it is too great, this mixture will become as liquid as oil; and when the heat is too small, it will remain fixed in a lump: but it will flow like a thick syrup, upon inclining the bottle, if the stove be of a right temper. Great attention therefore should be given to keep the heat always at this degree, by letting in fresh air if it be too great, or shutting the stove more close if it be too small: and that all the eggs in the stove may equally share the irregularities of the heat, it will be necessary to shift them from the sides to the centre; thereby imitating the hens, who are frequently seen to make use of their bills, to push to the outer parts those eggs that were nearest to the middle of their nests, and to bring into the middle such as lay nearest the sides.

Mr Reaumur has invented a sort of low boxes, without bottoms, and lined with furs. These, which he calls *artificial-parents*, not only shelter the chickens from the injuries of the air, but afford a kindly warmth, so that they presently take the benefit of their shelter as readily as they would have done under the wings of a hen. After hatching, it will be necessary to keep the chickens, for some time, in a room artfully heated and furnished with these boxes; but afterwards they may be safely exposed to the air in the court-yard, in which it may not be amiss to place one of these artificial-parents to shelter them if there should be occasion for it.

As to the manner of feeding the young brood, they are generally a whole day after being hatched, before they take any food at all; and then a few crumbs of bread may be given them for a day or two, after which they will begin to pick up insects and grubs for themselves.

But to save the trouble of attending them, capons may

Hatching.

Hatching
Havana.

may be taught to watch them in the same manner as hens do. Mr Reaumur affures us, that he has seen above 200 chickens at once, all led about and defended only by three or four such capons. Nay, cocks may be taught to perform the same office; which they, as well as the capons, will continue to do all their lives after.

HATCHING, or **HACHING**, in designing, &c. the making of lines with a pen, pencil, graver, or the like; and the intersecting or going across those lines with others drawn a contrary way, is called *counter-hatching*. The depths and shadows of draughts are usually formed by hatching.

Hatching is of singular use in heraldry, to distinguish the several colours of a shield, without being illumined: thus, gules or red is hatched by lines drawn from the top to the bottom; azure, by lines drawn across the shield; and so of other colours.

HATCHMENT, in heraldry, the coat-of-arms of a person dead, usually placed on the front of a house, whereby may be known what rank the deceased person was of when living: the whole distinguished in such a manner as to enable the beholder to know, whether he was a bachelor, married man, or widower; with the like distinctions for women.

HATFIELD, a town in Hertfordshire in England. The kings of England had formerly a royal palace here, where Edward VI. was educated. King James I. exchanged the manor with Sir Robert Cecil, afterwards earl of Salisbury, for Theobalds, in the parish of Cheshunt in this country; and the lordship still remains in that noble family, who have a very fine seat here. The rectory, which is in that earl's gift, is reckoned worth 800 pounds a-year. W. Long. O. 12. N. Lat. 51. 42.

HATFIELD-BROAD-OAK, a town of Essex in England, seated on a branch of the river Lea, in E. Long. O. 13. N. Lat. 51. 58.

HATTEM, a town of the United Provinces in the duchy of Guelderland, seated on the river Uffel, in E. Lon. 6. O. N. Lat. 53. 30.

HATTOCK, a shock of corn containing twelve sheaves; others make it only three sheaves laid together.

HATUAN, a town and fort of Upper Hungary in the county of Novigrod. It was taken by the Imperials in 1685. It is seated on a mountain, in E. Long. 19. 48. N. Lat. 47. 52.

HAVANNA, a sea-port town of America, in the island of Cuba, and on the north-west part of it, opposite to Florida. It is famous for its harbour, which is so large that it may hold 1000 vessels; and yet the mouth is so narrow, that only one ship can enter at a time. This is the place where all the ships that come from the Spanish settlements rendezvous on their return to Spain. It is near two miles in circumference; and contains about 10,000 inhabitants, consisting of Spaniards, Mulattoes, and Negroes. The entrance into the harbour is well defended by forts and platforms of great guns; and the bishop of St Jago resides here, as well as most men of fashion and fortune belonging to the island. It was taken by the British in 1762; but restored to the Spaniards by the treaty of peace in 1763. W. Long. 84. 10. N. Lat. 23. O.

HAVEL, a river of Brandenburg, which proceeds

from a lake in the duchy of Mecklenburg, and running thro' the middle Marche, and thro' Brandenburg and other towns, runs north, and falls into the Elbe.

HAVELBERG, a town of Germany, in the circle of Lower Saxony, and in the electorate of Brandenburg, with a bishop's see, secularized in favour of the house of Brandenburg. It is seated on the river Havel, in E. Long. 12. 43. N. Lat. 53. 4.

HAVEN, a sea-port or harbour. See **HARBOUR**.

HAVERCAMP (Sigibert), a celebrated Dutch scholar and critic, professor of history, eloquence, and the Greek tongue, at Leyden. He was particularly skilled in medals; and was the author of some esteemed works in that way, beside giving good and elegant editions of several Greek and Latin authors. He died at Leyden in 1742, aged 58.

HAVERFORD-WEAST, a town of Pembrokehire in South Wales, seated in W. Long. 5. N. Lat. 51. 50. It is a town and county of itself; and stands commodiously on the side of a hill, and on a creek of Milford-haven, over which there is a stone bridge. It is a large handsome place, with several good houses, and contains three parish-churches. It has also a considerable trade, with several vessels belonging to it; and sends one member to parliament. The assizes and county-gaol are kept here; and it had once a wall and castle, now demolished.

HAVERILL, a town of England, in the county of Suffolk, where there is a considerable manufactory of checks, cottons, and stuffs. By the ruins of a church and castle still to be seen, it appears to have been formerly a place of much greater consequence than at present. It has now only about 300 poor clay-houses, and one wide street not paved.

HAUL, an expression peculiar to seamen, implying to pull a single rope, without the assistance of blocks or other such mechanical powers. When a rope is otherwise pulled, as by the application of tackles, or the connection with blocks, &c. the term is changed into *hoisting*.

To *HAUL the Wind*, is to direct the ship's course nearer to that point of the compass from which the wind arises. Thus, supposing a ship to sail south-west, with the wind northerly, and some particular occasion requires to haul the wind more westward; to perform this operation, it is necessary to arrange the sails more obliquely with her keel; to brace the yards more forward, by slackening the starboard, and pulling in the larboard braces, and to haul the lower sheets further aft; and finally, to put the helm a-port, i. e. over to the larboard side of the vessel. As soon as her head is turned directly to the westward, and her sails are trimmed accordingly, she is said to have hauled the wind four points; that is to say, from south-west to west. She may still go two points nearer to the direction of the wind, by disposing her sails according to their greatest obliquity, or, in the sea-phraze, by *trimming all sharp*; and in this situation she is said to be close hauled, as sailing west north-west.

HAUNCH, or **HANCH**, the *Hip*, or that part of the body between the last ribs and the thigh.

The haunches of a horse are too long, if when standing in the stable he limps, with his hind-legs farther back than he ought; and when the top or onset of his tail is not in a perpendicular line to the tip of his

Havelberg
Hanch.

Havre
Hautc.

his hocks, as it always does in horses whose haunches are of a just length. There are some horses, which though they have too long haunches, yet commonly walk well: such are good to climb hills, but are not at all sure upon a descent; for they cannot ply their hams, and never gallop slowly, but always nearly upon a full speed. The art of riding the great horse has not a more necessary lesson than that of putting a horse upon his haunches; which, in other words, is called *coupling him well*, or putting him well together, or compact. A horse that cannot bend or lower his haunches, throws himself too much upon his shoulder, and lies heavy upon the bridle.

HAVRE de GRACE, a sea-port town of France, and capital of a district of the same name, is seated in the province of Normandy, on the English channel, in a large plain at the mouth of the river Seine. It is a small fortified town, nearly of a square figure, divided into two parts by the harbour, surrounded with a wall and other works, and defended by a very strong citadel. It is one of the most important places in France, on account of its foreign trade and convenient harbour; for which reason it was made a distinct government from the rest of Normandy. It was surprised in 1562, by the Protestants, who delivered it to queen Elizabeth; but it was lost next year. In 1694 it was bombarded by the English, and also in the year 1758. E. Long. c. 11. N. Lat. 49. 29.

HAURIANT, in heraldry, a term peculiar to fishes; and signifies their standing upright, as if they were refreshing themselves by sucking in the air.

HAUTE FEUILLE (John), an ingenious mechanic born at Orleans in 1647. Though he embraced the state of an ecclesiastic, and enjoyed several benefices, he applied almost his whole life to mechanics, in which he made a great progress. He had a particular taste for clock-work, and made several discoveries in it that were of singular use. It was he who found out the secret of moderating the vibration of the balance by means of a small steel-spring, which has since been made use of. This discovery he laid before the members of the Academy of Sciences in 1674; and these watches are, by way of eminence, called *pendulum-watches*; not that they have real pendulums, but because they nearly approach to the justness of pendulums. M. Huygens perfected this happy invention; but having declared himself the inventor, and obtained from Lewis XIV. a patent for making watches with spiral springs, the abbé Feuille opposed the registering of this privilege, and published a piece on the subject against M. Huygens. He wrote a great number of other pieces, most of which are small pamphlets consisting of a few pages, but very curious; as, 1. His perpetual pendulum, quarto. 2. New inventions, quarto. 3. The art of breathing under water, and the means of preserving a flame shut up in a small place. 4. Reflections on machines for raising water. 5. His opinion on the different sentiments of Mallebranche and Regis relating to the appearance of the moon when seen in the horizon. 6. The magnetic balance. 7. A plaacet to the king on the longitude. 8. Letter on the secret of the longitude. 9. A new system on the flux and reflux of the sea. 10. The means of making sensible experiments that prove the motion of the earth; and many other pieces. He

VOL. V.

died in 1724.

HAUTBOY, a musical instrument of the wind kind, shaped much like the lute; only that it spreads and widens towards the bottom, and is sounded thro' a reed. The treble is two feet long; the tenor goes a fifth lower, when blown open: it has only eight holes; but the bass, which is five feet long, has eleven.

The word is French, *haut bois*, q. d. *high wood*; and is given to this instrument because the tone of it is higher than that of the violin.

HAW, a sort of berry, the fruit of several species of *mespilus*, thence denominated *hawthorn*. See *MESPILUS*.

HAW, among farriers, an excrescence resembling a gristle, growing under the nether eye-lid and eye of a horse, which, if not timely removed, will put it quite out. See *FARRIER*, § xi. 15.

Haw, a small parcel of land so called in Kent, as a *Hemphaw*, or *Beanhaw*, lying near the house, and inclosed for these uses. But Sir Edward Coke, in an ancient plea concerning Feverham in Kent, says *Hawes* are houses.

Haw-Finch. See *LOXIA*.

HAWGH, or *HOWGH*, signifies a green plot in a valley, as they use it in the north of England.

HAWK, in ornithology. See *FALCO*.

HAWKERS, anciently were fraudulent persons, who went about from place to place buying and selling brass, pewter, and other merchandize, which ought to be uttered in open market. In this sense the word is mentioned *anno 25 Hen. VIII. c. 6.* and 33 *ejusdem, c. 4.*—The appellation *hawkers* seems to have arisen from their uncertain wandering, like those who with hawks seek their game where they can find it.

HAWKERS, is also now applied to those who go up and down London streets crying new books, and selling them by retail. The women who furnish the hawkers, i. e. sell the papers by wholesale from the press, are called *mercuries*.

HAWKING, the exercise of taking wild-fowl by means of hawks. The method of reclaiming, training, and bringing up a hawk to this exercise, is called *falconry*. See *FALCONRY*.

There are only two countries in the world where we have any evidence that the exercise of hawking was very anciently in vogue. These are, Thrace and Britain. In the former, it was pursued merely as the diversion of a particular district, if we may believe Pliny†, whose account is rendered obscure by the darkness of his own ideas of the matter. The primitive Britons, with a fondness for the exercise of hunting, had also a taste for that of hawking; and every chief among them maintained a considerable number of birds for that sport. It appears also from a curious passage in the poems of Ossian*, that the same diversion was fashionable at a very early period in Scotland. The poet tells us, that a peace was endeavoured to be gained by the proffer of 400 managed steeds, 100 foreign captives, and “100 hawks with fluttering wings, that fly ‘across the sky.” To the Romans this diversion was scarce known in the days of Vespasian; yet it was introduced immediately afterwards. Most probably they adopted it from the Britons; but we certainly know that they greatly improved it by the introduction of spaniels into the island. In this state it appears among

the Roman Britons in the sixth century. Gildas, in a remarkable passage in his first epistle, speaks of Maglocunus, on his relinquishing the sphere of ambition, and taking refuge in a monastery; and proverbially compares him to a dove, that hastens away at the noisy approach of the dogs, and with various turns and windings takes her flight from the talons of the hawk.

In after-times, hawking was the principal amusement of the English: a person of rank scarce stirred out without his hawk on his hand; which, in old paintings, is the criterion of nobility. Harold, afterwards king of England, when he went on a most important embassy into Normandy, is painted embarking with a bird on his fist, and a dog under his arm: and in an ancient picture of the nuptials of Henry VI. a nobleman is represented in much the same manner; for in those days, it was thought sufficient for noblemen to *visit their born, and to carry their hawk fair, and leave study and learning to the children of mean people.* The former were the accomplishments of the times; Spenser makes his gallant Sir Trillem boast,

Ne is there hawk which mantleth her on perch,

Whether high towing, or descending low,

But I the measure of her flight doe feare,

And all her prey, and all her diet know. B. vi. Canto 2.

In short, this diversion was, among the old English, the pride of the rich, and the privilege of the poor; no rank of men seems to have been excluded the amusement: we learn from the book of St Alban's, that every degree had its peculiar hawk, from the *emperor down to the holy-water clerk.* Vast was the expence that sometimes attended this sport. In the reign of James I. Sir Thomas Monson is said to have given 1000*l.* for a cast of hawks: we are not then to wonder at the rigour of the laws that tended to preserve a pleasure that was carried to such an extravagant pitch. In the 34th of Edward III. it was made felony to steal a hawk; to take its eggs, even in a person's own ground, was punishable with imprisonment for a year and a day, besides a fine at the king's pleasure: in queen Elizabeth's reign, the imprisonment was reduced to three months; but the offender was to find security for his good behaviour for seven years, or lie in prison till he did. Such was the envious state of the times of old England: during the whole day the gentry were given to the fowls of the air, and the beasts of the field; in the evening, they celebrated their exploits with the most abandoned and brutish foolishness; at the same time, the inferior rank of people, by the most unjust and arbitrary laws, were liable to capital punishments, to fines, and loss of liberty, for destroying the most noxious of the feathered tribe.

According to Olearius, the diversion of hawking is more followed by the Tartars and Persians, than ever it was in any part of Europe. *Il n'y avoit point de butte (says he) qui n'eust son aigle ou son faucon.*

The falcons or hawks that were in use in these kingdoms, are now found to breed in Wales, and in North-Britain and its isles. The peregrine falcon inhabits the rocks of Caernarvonshire. The same species, with the gyrfalcon, the gentill, and the goshawk, are found in Scotland, and the lammer in Ireland.

We may here take notice, that the Norwegian breed was, in old times, in high esteem in England: they

were thought bribes worthy a king. Geoffrey Fitz-pierre gave two good Norway hawks to king John, to obtain for his friend the liberty of exporting 100 wt. of cheese; and Nicholas the Dane was to give the king a hawk every time he came into England, that he might have free liberty to traffic throughout the king's dominions.

They were also made the tenures that some of the nobility held their estates by, from the crown. Thus Sir John Stanley had a grant of the Isle of Man from Henry IV. to be held of the king, his heirs and successors, by homage and the service of two falcons, payable on the day of his or their coronation. And Philip de Halting held his manor of Combertoun in Cambridgeshire, by the service of keeping the king's falcons.

Hawking, though an exercise now much disused among us, in comparison of what it anciently was, does yet furnish a great variety of significant terms, which still obtain in our language. Thus, the parts of a hawk have their proper names.—The legs, from the thigh to the foot, are called *arms*; the toes, the *petty-fingers*; the claws, the *pouncers*.—The wings are called the *ails*; the long feathers thereof, the *beams*; the two longest, the *principal feathers*; those next thereto, the *flags*.—The tail is called the *train*; the breast-feathers, the *mails*; those behind the thigh, the *pendant feathers*.—When the feathers are not yet full grown, they are said to be *unfeathered*; when they are complete, they are *summed*.—The craw, or crop, is called the *gorge*.—The pipe next the fundament, where the feces are drawn down, is called the *pannel*.—The slimy substance lying in the pannel, is called the *glut*.—The upper and crooked part of the bill is called the *beak*; the netter-part, the *clap*; the yellow part between the beak and the eyes, the *sear* or *seer*; the two small holes therein, the *naris*.

As to her furniture:—The leathers, with bells buttoned on her legs, are called *bowits*.—The leathern thong, whereby the falconer holds the hawk, is called the *leafe*, or *leash*; the little straps, by which the leafe is fastened to the legs, *jesses*; and a line or pack-thread fastened to the leafe, in disciplining her, a *creance*.—A cover for her head, to keep her in the dark, is called a *hood*; a large wide hood, open behind, to be wore at first, is called a *ruster hood*. To draw the strings, that the hood may be in readines to be pulled off, is called *unstriking the hood*.—The blinding a hawk just taken, by running a thread through her eye-lids, and thus drawing them over the eyes, to prepare her for being hooded, is called *feeling*.—A figure or resemblance of a fowl, made of leather and feathers, is called a *lure*.—Her resting-place, when off the falconer's fist, is called the *perch*.—The place where her meat is laid, is called the *hack*; and that wherein she is fed, while her feathers fall and come again, the *men*.

Something given a hawk, to cleanse and purge her gorge, is called *casting*.—Small feathers given her to make her cast, are called *plumage*.—Gravel given her to help to bring down her stomach, is called *rangle*.—Her throwing up filth from the gorge after casting, is called *gleaming*.—The purging of her greale, &c. *enfeaming*.—A being stuffed is called *gurgiting*.—The inserting a feather in her wing, in lieu of a broken one, is called *imping*.—The giving her a leg, wing, or pinion of a

fowl

Biogr. Brit.
ant. Causton.

Hawking. fowl to pull at, is called *tiring*.—The neck of a bird the hawk preys on, is called the *inke*.—What the hawk leaves of her prey, is called the *pill*, or *pelf*.

There are also proper terms for her several actions.—When the flutters with her wings, as if striving to get away, either from perch or fist, she is said to *bate*.—When, standing too near, they fight with each other, it is called *erabbling*.—When the young ones quiver, and shake their wings in obedience to the elder, it is called *courving*.—When she wipes her beak after feeding, she is said to *seak*.—When the sleeps, she is said to *jouk*.—From the time of exchanging her coat, till the turn white again, is called her *internewing*.—Treading is called *cawking*.—When she stretches one of her wings after her legs, and then the other, it is called *mantling*.—Her dung is called *muting*; when she mutes a good way from her, she is said to *slice*; when she does it directly down, instead of yerking backwards, she is said to *slime*; and if it be in drops, it is called *dropping*.—When she as it were squeezes, it is called *smiting*.—When she raises and shakes herself, she is said to *rouze*.—When, after mantling, she crosses her wings together over her back, she is said to *swable*.

When a hawk seizes, she is said to *bind*.—When, after seizing, she pulls off the feathers, she is said to *plume*.—When she raises a fowl aloft, and at length descends with it to the ground, it is called *trussing*.—When, being aloft, she defends to strike her prey, it is called *flooping*.—When she flies too far from the game, she is said to *rake*.—When, forsaking her proper game, she flies at pyes, crows, &c. that chance to cross her, it is called *check*.—When, missing the fowl, she betakes herself to the next check, she is said to *fly on head*.—The fowl or game she flies at is called the *quarry*.—The dead body of a fowl killed by the hawk, is called a *pelt*.—When she flies away with the quarry, she is said to *carry*.—When in flooping she turns two or three times on the wing, to recover herself ere she seizes, it is called *canceling*.—When she hits the prey, yet does not truss it, it is called *ruff*.—The making a hawk tame and gentle, is called *reclaiming*.—The bringing her to endure company, *manning* her.---An old staunch hawk, used to fly and set example to a young one, is called a *make-hawk*.

The reclaiming, manning, and bringing up a hawk to the sport, is not easy to be brought to any precise set of rules.---It consists in a number of little practices and observances, calculated to familiarize the falconer to his bird, to procure the love thereof, &c. See the article *FALCONRY*.

When your hawk comes readily to the lure, a large pair of luring-bells are to be put upon her; and the more giddy-headed and apt to rake out your hawk is, the larger must the bells be. Having done this, and the being sharp-set, ride out in a fair morning, into some large field, uncumbered with trees or wood, with your hawk on your fist; then having loosened her hood, whistle softly, to provoke her to fly; unhood her, and let her fly with her head into the wind; for by that means she will be the better able to get upon the wing, and will naturally climb upwards, flying a circle. After she has flown three or four turns, then lure her with your voice, calling the lure about your head, having first tied a pullet to it; and if your fal-

con come in, and approach near you, cast out the lure into the wind, and, if she stoop to it, reward her.

You will often find, that when the flies from the fist, she will take stand on the ground: this is a fault which is very common with foar-falcons. To remedy this, fright her up with your wand; and when you have forced her to take a turn or two, take her down to the lure, and feed her. But if this does not do, then you must have in readiness a duck sealed, so that she may see no way but backwards, and that will make her mount the higher. Hold this duck in your hand, by one of the wings near the body; then lure with the voice, to make the falcon turn her head; and when she is at a reasonable pitch, cast your duck up just under her; when, if she strike, stoop, or truss the duck, permit her to kill it, and reward her by giving her a reasonable gorge. After you have practised this two or three times, your hawk will leave the stand, and, delighted to be on the wing, will be very obedient.

It is not convenient, for the first or second time, to shew your hawk a large fowl; for it frequently happens, that they escape from the hawk, and she, not recovering them, rakes after them: this gives the falconer trouble, and frequently occasions the loss of the hawk. But if she happens to pursue a fowl, and, being unable to recover it, gives it over, and comes in again directly, then cast out a sealed duck; and if she stoop and truss it across the wings, permit her to take her pleasure, rewarding her also with the heart, brains, tongue, and liver. But if you have not a quick duck, take her down with a dry lure, and let her plume a pullet and feed upon it. By this means a hawk will learn to give over a fowl that rakes out, and, on hearing the falconer's lure, will make back again, and know the better how to hold in the head.

Some hawks have a disdainful coyness, proceeding from their being high fed: such a hawk must not be rewarded, though she should kill: but you may give her leave to plume a little; and then taking a sheep's heart cold, or the leg of a pullet, when the hawk is busy in pluming, let either of them be conveyed into the body of the fowl, that it may favour of it; and when the hawk has eaten the heart, brains, and tongue of the fowl, take out what is inclosed, call her to your fist, and feed her with it: afterwards give her some of the feathers of the fowl's neck, to scower her, and make her cast.

If your hawk be a stately high-flying one, she ought not to take more than one flight in a morning; and if she be made for the river, let her not fly more than twice: when she is at the highest, take her down with your lure; and when she has plumed and broken the fowl a little, feed her, by which means you will keep her a high-flyer, and fond of the lure.

HAWKWOOD (Sir John), a famous English general, was the son of a tanner at Heddingham-Sibill in Essex, where he was born in the reign of Edward III. He was bound apprentice to a taylor in London; but being fortunately pressed into the army, was sent abroad, where his genius soon expanded itself, and surmounted the narrow prejudices which adhered to his birth and occupation. He signalized himself as a soldier in France and Italy, and particularly at Pisa

Hawke
Hay.

and Florence. He commanded with great ability and success in the army of Galeacio duke of Milan; and was in such high esteem with Barnabas his brother, that he gave him Domitia his natural daughter in marriage, with an ample fortune. He died at Florence, full of years and military fame, in 1394. See (History of) ITALY.

HAWSE, or HAUSE, is generally understood to imply the situation of the cables before the ship's stem, when she is moored with two anchors out from forward, viz. one on the starboard, and the other on the larboard-bow. Hence it is usual to say, *she has a clear hawse, or a foul hawse*. It also denotes any small distance *a-head* of a ship, or between her head and the anchors employed to ride her; as, "He has *" anchored in our hawse, The brig fell athwart our " hawse," &c.*

A ship is said to ride with a clear hawse, when the cables are directed to their anchors, without lying athwart the stem; or crossing, or being twisted round each other by the ship's winding about, according to the change of the wind, tide, or current.

A foul hause, on the contrary, implies that the cables lie across the stem, or bear upon each other, so as to be rubbed and chafed by the motion of the vessel.—The hawse accordingly is foul, by having either a cross, an elbow, or a round turn. If the larboard cable, lying across the stem, points out on the starboard side, while the starboard cable at the same time grows out on the larboard side, there is a cross in the hawse. If, after this, the ship, without returning to her former position, continues to wind about the same way, so as to perform an entire revolution, each of the cables will be twisted round the other, and then directed out from the opposite bow, forming what is called a round turn. An elbow is produced when the ship stops in the middle of that revolution, after having had a cross: or, in other words, if she rides with her head northward with a clear hawse, and afterwards turns quite round so as to direct her head northward again, she will have an elbow.

HAUSE-Holes, certain cylindrical holes cut through the bows of a ship on each side of the stem, through which the cables pass in order to be drawn into or let out of the vessel as occasion requires. They are fortified on each side by a name

HAWSE-Pieces, a name given to the foremost timbers of a ship, whose lower ends rest on the knuckle-timber, or the foremost of the cant-timbers. They are generally parallel to the stem, having their upper ends sometimes terminated by the lower part of the beak-head; and otherwise, by the top of the bow, particularly in small ships and merchantmen.

HAWSER, a large rope which holds the middle degree between the *cable* and *tow-line*, in any ship whereto it belongs, being a size smaller than the former, and as much larger than the latter.

HAY, any kind of grass cut and dried for the food of cattle.

The time of mowing grass for hay must be regulated according to its growth and ripeness; nothing being more prejudicial to the crop than mowing it too soon; because the sap is not then fully come out of the root, and when made into hay the grass shrinks away to nothing. It must not, however, be let stand

too long till it have shed its seeds. When the tops of the grass look brown, and begin to bend down, and the red honeyfuckle flowers begin to wither, you may conclude it ripe for mowing.

Sain-Foin HAY, is of several sorts, which may be distinguished by the following terms, viz. 1. The virgin. 2. The blossomed. 3. The full-grown. And, 4. The threshed hay. The first of these is beyond comparison the best. It must be cut before the blossoms generally appear; for when it stands till it is full blown, the most spirituous and nourishing parts of its juice are spent, the sap is much impoverished, and the saint-foin can never recover that richness it had in its virgin-state. But this fine hay cannot well be had of uncultivated saint-foin, because that may not be much above an handful high when it is in a condition to be cut; it would then make a very light crop, and would be a great while before it sprang up again: but the rich will have two or three tuns to an acre, and spring again immediately for a second crop; so that little or none in quantity would be lost by so great an improvement of its quality.

The second sort is that cut in the flower, which, though much inferior to the virgin-hay, far exceeds any other kind as yet commonly propagated in Britain; and if it be a full crop, it may amount to three tuns an acre. This is that saint-foin which is commonly made; and the larger it is, the more nourishing it is for horses.

The next sort of saint-foin is the full grown, cut when the blossoms are gone or going off: this also is good hay, though it falls short by many degrees of the goodness of the other two sorts; but it makes a greater crop than either of them, because it grows to its full bulk, and shrinks little in drying.

The last sort is the threshed hay; which, when not damaged by wet weather, has been found more nourishing to horses than coarse water-meadow hay; and, when it is cut small by an engine, is good for cattle, and much better than the chaff of corn. The best time to cut it, is when the greatest part of the seed is well filled; the first-blown ripe, and the last-blown beginning to be full.

The goodness of the hay depends greatly upon the manner of ordering it. The best hay in all England is made of saint-foin, without ever spreading it. This method, though it be longer before it be finished, costs less labour than the other. If saint-foin be laid up pretty green, it will take no damage, provided it be set in small round ricks, with a large basket drawn up in the middle of each, to have a vent-hole through which the superfluous moisture of the hay may transpire. As soon as its heating is over, these ricks ought to be thatched; and all saint-foin ricks, that are made when the hay is full dried in the cocks, ought to be thatched immediately after the making them. That which is laid up moist dried, will come out of the rick of a green colour; but that which has been much heated in the rick, will be brown.

The feed affords the owner another opportunity of making a profit of his saint-foin: but this, if the hoeing husbandry were general, would not be vendible in great quantities for planting; because the ordinary crop of an acre will produce seed enough to drill an hundred acres, which would not want planting for a long

Hay.

Hay
Hazard.

long time. The other use then of this feed is for provender; and it has been affirmed by some who have made trials of it, that three bushels of good fair-foin seed given to horses, will nourish them as much as four bushels of oats; and when well ordered, it is so sweet, that most sorts of cattle are greedy of it.

HAY-MAKING. See AGRICULTURE, n^o 152, *et seq.*

HAY, a town in Brecknockshire, in Wales, seated near the confluence of the rivers Wyc and Dulas. It was a town of good note in the time of the Romans; it being then fortified with a castle and a wall, which were ruined in the rebellion of Owen Glendower. It is at present a pretty good town; and the market is large for corn, cattle, and provisions. W. Long. o. 56. N. Lat. 52. 10.

HAYNAULT. See HAINAULT.

HAYS, particular nets for taking rabbits, hares, &c. common to be bought in shops that sell nets, and they may be had larger or shorter as you think fit; from 15 to 20 fathom is a good length, and for depth a fathom.

As rabbits often straggle abroad about mid-day for fresh grass, where you perceive a number gone forth to any remote brakes or thickets, pitch two or three of these hays about their burrows; lie close there: but in case you have not nets enough to enclose all their burrows, some may be stopped up with stones, &c. Then set out with the coney dog to hunt up and down at a good distance, and draw on by degrees to the man who is with you, and lies close by the hay, who may take them as they bolt into it.

HAYWARD, the person who keeps the common herd or cattle of a town. He is appointed by the lord's court; and his office is to see that the cattle neither break nor crop the hedges of inclosed grounds.

HAYWARD (Sir John), an eminent English historian and biographer, in the beginning of the 17th century, was educated in the university of Cambridge, where he took the degree of doctor of laws. In 1610, he was appointed one of the historiographers of a college then at Chelsea; and, in 1619, received the honour of knighthood. He wrote, 1. The lives of the three Norman kings of England, William I. and II. and Henry I. 2. The first part of the life and reign of king Henry IV. 3. The life and reign of king Edward VI.; and several theological works. He died in 1627.

HAZÆL, an officer belonging to Benhadad king of Syria, caused that prince to be put to death, and reigned in his stead. He defeated Joram, Jehu, and Jehoahaz, kings of Israel; and, after his death, was succeeded by Benhadad his son, 852 B. C.

HAZARD, a game on dice, without tables, is very properly so called; since it speedily makes a man, or undoes him.

It is played with only two dice; and as many may play at it as can stand round the largest round table.

Two things are chiefly to be observed, viz. main and chance; the latter belonging to the castor, and the former, or main, to the other gamesters. There can be no main thrown above nine, nor under five; so that five, six, seven, eight, and nine, are the only mains flung at hazard. Chances and nicks are from four to ten: thus four is a chance to nine, five to eight, six to seven, seven to fix, eight to five; and

nine and ten a chance to five, six, seven, and eight: in short, four, five, six, seven, eight, nine, and ten, are chances to any main, if any of these nick it not. Now nicks are either when the chance is the same with the main, as five and five, or the like; or fix and twelve, seven and eleven, eight and twelve. Here observe, that twelve is out to nine, seven, and five; eleven is out to nine, eight, six, and five: and ames-ace and duce-ace, are out to all mains whatever.

HAZLE, or HAZEL, in botany. See CORYLUS.

The kernels of the fruit have a mild, farinaceous, oily taste, agreeable to most palates. Squirrels and mice are fond of them, as well as some birds, such as jays, nutcrackers, &c. A kind of chocolate has been prepared from them, and there are infusions of their having been formed into bread. The oil expressed from them is little inferior to the oil of almonds; and is used by painters, and by chemists, for receiving and retaining odours. The charcoal made of the wood is used by painters in drawing.—Some of the Highlanders, where superstition is not totally subsided, look upon the tree itself as unlucky; but are glad to get two of the nuts naturally conjoined, which is a good omen. These they call *cho-chomblaich*, and carry them as an efficacious charm against witchcraft.

Evelyn tells us, that no plant is more proper for thickening of copses than the hazle, for which he directs the following expeditious method. Take a pole of hazle (ash or poplar may also be used) of 20 or 30 feet in length, the head a little lopped, into the ground, giving it a chop near the ground to make it succumb; this fastened to the earth with a hook or two, and covered with some fresh mould at a competent depth, (as gardeners lay their carnations), will produce a great number of suckers, and thicken and furnish a copse speedily.

HAZLE-EARTH, or Hazley-earth, a kind of red loam, which is said to be an excellent mixture with other sorts of earth; uniting what is too loose, cooling what is too hot, and gently entertaining the moisture.

HEAD, in anatomy. See ANATOMY, Part I. chap. ii.

HEAD-ACH, a most troublesome sensation in the head, produced by various causes, and attended with different symptoms, according to its different degrees and the place where it is seated. See (the *Index* subjoined to) MEDICINE.

Dragon's HEAD, in astronomy, is the ascending node of the moon or other planet.

HEAD of a Ship, an ornamental figure erected on the continuation of a ship's stem, as being expressive of her name, and emblematical of war, navigation, commerce, &c.

HEAD, is also used in a more enlarged sense to signify the whole front or forepart of the ship including the bows on each side: the head therefore opens the column of water through which the ship passes when advancing. Hence we say, head-fails, head-sea, head-way, &c.

Thus, fig. 1. Plate CLIX. represents one side of the fore-part or head of a 74 gun-ship, together with part of the bow, keel, and gunnel. The names of the several pieces, exhibited therein, are as follow:

A A Fore-part of the keel, with *aa* the two false keels

Hazle,
Head.

Head. keels beneath it.

a C The stem.

a a The cat-head.

b b The supporter of the cat-head.

c c The knight-head, or bollard-timber, of which there is one on each side, to secure the inner end of the bowprit.

d d The haufe-holes.

e e The naval-hoods, i. e. thick pieces of plank laid upon the bow to strengthen the edges of the haufe-holes.

f The davit-chock, by which the *davit* is firmly wedged while employed to fift the anchor.

g The bulk-head, which terminates the fore-castle on the fore-side, being called the *beak-head bulk-head* by shipwrights.

H The gun-ports of the lower deck.

b The gun-ports of the upper deck and fore-castle.

I, I, The channels, with their dead-eyes and chain-plates.

i The gripe, or fore-foot, which unites the keel with the stem, forming a part of either.

k k These dotted lines represent the thickness and descent of the different decks from the fore-part of the ship towards the middle. The lowest of the three dotted lines l expresses the convexity of the beams, or the difference between the height of the deck in the middle of its breadth, and at the ship's side. This is also exhibited more clearly in the *MIDSHIP-Frame*; where the red curve of the beam is delineated. N. B. These lines must be always parallel to the lines which terminate the gun-ports above and below.

m m The timbers of the head, and part of the bow-sprit.

X The rails of the head which lie across the timbers.

Q Z Fore-part of the main-wale.

R X Fore-part of the channel-wale.

U C The load water-line.

Fig. 2. represents a head-view of a ship, with the projection of her principal timbers, and all her planks laid on one side.

It is evident that the fore-part of a ship is called its *head*, from the affinity of motion and position it bears to a fish, and in general to the horizontal situation of all animals whilst swimming.

By the *HEAD*; the state of a ship, which is laden deeper at the fore-end than the after-end.

HEAD-Fast, a rope employed to fasten a ship to a wharf, chain, or buoy, or to some other vessel alongside.

HEAD-Land, a name frequently given to a cape, or promontory.

HEADMOST, the situation of any ship or ships which are the most advanced in a fleet, or line of battle.

HEAD-Rope, that part of the bolt-rope which terminates any of the principal sails on the upper edge, which is accordingly sewed thereto. See the article *BOLT-ROPE*.

HEAD-Sail, a general name for all those sails which are extended on the fore-mast and bowprit, and employed to command the fore-part of the ship: such are the fore-sail, fore-top-sail, fore-top-gallant-sail, jib, fore-stay-sail, and the sprit-sail with its top-sail.

This term is used in opposition to *after-sails*, viz. all those which are extended on the mizen-mast, and on the stays between the mizen and main masts.

HEAD To-wind; the situation of a ship or boat, when her head is turned to windward.

HEAD-Way, the motion of advancing at sea. It is generally used when a ship first begins to advance; or when it is doubtful whether the ship is in a state of rest or motion. It is in both senses opposed to retreating, or moving with the stern foremoit. See the article *STERN-WAY*.

HEALTH, is a right disposition of the body, and of all its parts; consisting in a due temperature, a right conformation, just connection, and ready and free exercise of the several vital functions.

Health admits of latitude, as not being the same in all subjects, who may yet be said to enjoy health.

That part of medicine, which shews the means of preserving health, is termed *hygiene*. See *MEDICINE*.

The Greeks and Romans deified Health, representing it under the figure of a woman, whom they supposed to be the daughter of *Æsculapius*. We find the name of the goddess *Salus*, or Health, on many medals of the Roman emperors, with different inscriptions; as, *SALUS PUBLICA*, *SALUS REPUBLICÆ*, *SALUS AUGUSTI*, &c.

Methods of preserving the HEALTH of Mariners. See *MARINER*.

HEAM, in beasts, is the same with the secundines or after-birth in women.

HEARING. See *ANATOMY*, n° 405.

HEARNE (Thomas), a celebrated antiquarian, eminent for his writings and editions of MSS. His father was parish-clerk of Little Waltham in Berkshire, where he was born in 1680. He had a liberal education by the patronage of a neighbouring gentleman; and even from a boy discovered a strong propensity to the study of antiquities. He did great services to the Bodleian library, and died in 1735.

HEARSE, among sportsmen, a hind of the second year of her age.

HEART, in anatomy. See there, n° 382 [385].

Several ingenious persons have from time to time attempted to make estimates of the force of the blood in the heart and arteries; who have as widely differed from each other, as they have from the truth, for want of a sufficient number of data to argue upon. This set the truly ingenious Dr Hales upon making proper experiments, in order to ascertain the force of the blood in the veins and arteries of several animals.

If, according to Dr Keil's estimate, the left ventricle of a man's heart throws out in each systole an ounce or 1.638 cubic inches of blood, and the area of the orifice of the aorta be = 0.4187, then dividing the former by this, the quotient 3.9 is the length of the cylinder of blood which is formed in passing through the aorta in each systole of the ventricle; and in the seventy-five pulses of a minute, a cylinder of 292.5 inches in length will pass: this is at the rate of 1462 feet in an hour. But the systole of the heart being performed in one third of this time, the velocity of the blood in that instant will be thrice as much, viz. at the rate of 4386 feet in an hour, or 73 feet in a minute. And if the ventricle throws out one ounce in a pulse, then in the seventy-five pulses of a minute, the quantity

Head
||
Heart.

Heart
||
Heat.

quantity of blood will be equal to 4.4lb 11 oz. and, in thirty-four minutes, a quantity equal to a middle-sized man, viz. 158 lb. will pass through the heart. But if, with Dr Harvey and Dr Lower, we suppose two ounces of blood, that is, 3.276 cubic inches, to be thrown out at each systole of the ventricle, then the velocity of the blood in entering the orifice of the aorta will be double the former, viz. at the rate of 146 feet in a minute, and a quantity of blood equal to the weight of a man's body will pass in half the time, viz. 17 minutes.

If we suppose, what is probable, that the blood will rise 7+ $\frac{1}{2}$ feet high in a tube fixed to the carotide artery of a man, and that the inward area of the left

ventricle of his heart is equal to fifteen square inches; these multiplied into 7+ $\frac{1}{2}$ feet, give 1350 cubic inches of blood, which presses on that ventricle, when it first begins to contract, a weight equal to 15.5 pounds.

What the doctor thus calculates, from supposition, with regard to mankind, he actually experimented upon horses, dogs, fallow-dees, &c. by fixing tubes in orifices opened in their veins and arteries; by observing the several heights, to which the blood rose in these tubes, as they lay on the ground; and by measuring the capacities of the ventricles of the heart, and orifices of the arteries. And, that the reader may the more readily compare the said estimates together, he has given a table of them, ranging in the following order.

Heart
||
Heat.

The several animals.	Weight of each.	Height of the blood in the tube from the jugular vein.	Height of the blood in the tube fixed to arteries.	Capacity of the left ventricle of the heart.	Area of the orifice of the aorta.	Velocity of the blood in the aorta.	Quantities of blood equal to the weight of the animal, in what time.	How much in a minute.	Weight of the blood contained by the left ventricle contracting.	N ^o of pulsations in a minute.	Area of transverse section of descending aorta.	Area of the transverse section of ascending aorta.

HEARTBURNING, or PYROISIS. See (the *Index* subjoined to) MEDICINE.

HEARTH, that part of the pavement of a room on which the fire is immediately placed.

HEARTH-Money. See CHIMNEY-Money.

HEAT, in physiology, is used in a double sense, either as that peculiar sensation which is felt on the approach of burning bodies; or the cause of that sensation, in which last sense it is synonymous with FIRE.

The disputes which were formerly carried on with regard to the nature of heat, namely, whether we were to account it merely an effect of motion in the parts of terrestrial bodies, or of a fluid *per se*, seem now to be generally determined in favour of the latter opinion. The electric fluid and elementary fire are commonly thought to be the same, for which opinion some proofs are adduced under the article ELECTRICITY. The

discovery made by Dr Black that heat is capable of remaining in many bodies in a *latent* state, also confirms this opinion considerably*. The consequence* See *Evaporation*, *Cold*, and *Congelation*. of this discovery, however, undoubtedly is, That what we call *heat* or *fire*, depends not on the *presence* or *absence* of that fluid distinguished by the name of *elementary fire*, but on its action; just as the phenomena of electricity depend not on the presence or absence of the electric fluid, which is equally present at all times and in all places, but on its action.—Another inference, easily deducible from this principle is, That as the electric fluid is by its different manner of action capable of producing two different and seemingly opposite effects, distinguished by the names of *positive* and *negative* electricity; so doth the same fluid, acting as elementary fire, produce two different and seemingly opposite effects, called *heat* and *cold*.—This assertion will.

Heat owing to the action of a fluid.

Heat.

will not be thought paradoxical, when we consider that ocular demonstration may be given us, that a substance (namely, vapour), exceedingly cold to the touch, shall yet contain as much heat, as would be sufficient to heat the water of which it is composed, red hot, did the nature of water permit it to endure an heat of this kind.

See EVAPORATION, n^o 9.

Dr Martin's opinions concerning heat.

The philosophers of this country who have most recently treated the subject of heat scientifically are, Dr Martin of St Andrews, Dr Black of Edinburgh, and Dr Irvin of Glasgow. Dr Martin, in an essay on the various degrees of heat in bodies, endeavours to shew, that what we call *heat*, depends not entirely upon the quantity of elementary fire which is poured upon the body *ab extra*; but upon certain circumstances arising from the constitution of the body itself, and its situation with regard to others. "We all find (says he) our great heats to be in these places that lie low, and have a great height of atmosphere above them, and surrounded by eminences and rising grounds. If you ascend on high to the tops of very elevated mountains, you are chilled with cold, and you find everlasting snows, that after thousands of summers have scarce ever been thawed, though every day exposed to the direct rays of the sun, which in some places are darted perpendicularly upon them. So necessary, it seems, is a long and direct passage through all or the greatest part of the depth of our atmosphere, or the assistance of its pressure, or the reflections of rays from the earth's own surface, to invigorate those rays, and to give them strength for warming terrestrial bodies. To which too the particular sulphureous nature of the low parts of the atmosphere may not a little contribute.

"But what if the real solar heat, both in itself, and what it can communicate to us and other planetary bodies (while it is not concentrated by burning-glasses, or strengthened by other assistances), be vastly less than is commonly reckoned? All the natural heat we meet with here on the earth we are ready to ascribe to the heat of the sun, which perhaps has but a small share in it, overlooking a source of heat, which, though often spoke of by the theorists of the earth, is seldom considered in that advantageous light I would choose to take it. Every body has felt or heard, that the temperature of the air in mines or other places deep under ground is warm, or at least very tolerable; and we know from the nicest observations, that in the cave of the Observatory at Paris, only about 90 feet under ground, the heat keeps the thermometer at 53°; and that without any assistance from the sun, it being never sensibly increased by the most scorching seasons beyond its heat in the most severe winters that have been felt there.—And the same constant and unalterable degree of heat was observed by Mr Boyle, in a cave cut deep into the earth. And great and even troublesome heats are said to be observed at greater depths, and increasing in proportion to these depths; though I could wish that these heats had been more regularly measured and ascertained than what I find they have yet been. So that it would seem the body of the earth has a very great proper internal heat independent on the sun, and very much beyond what he without the intervention of our atmosphere could communicate to it; so great as, within 90 feet of its

surface, to raise the thermometer 93 divisions above Fahrenheit's cold mixture (of snow and spirit of nitre), or 453 divisions above what Mr Amontons reckoned the lowest degree of heat*. This heat of the earth at its surface is something less; and beyond that, its force decreases indeed very fast, so as to leave the air at a small height above it a good deal colder; and which we find on the very high hills to be excessively cold, and not to be much warmed by the additional heat of the sun's direct rays, if they be but little altered by the earth's surface and atmosphere.—So then the sun, though it be not the sole or chief fountain, is as it were the great regulator of motion, heat, and life, to the inhabitants of this system."

This opinion hath also been adopted by others, but will probably never come into general credit. We certainly perceive the sun to be the force and fountain of heat to the surface of the earth at least, as much as we perceive a common fire to be the source of heat to a person who stands before it. Nor is the sun's heat increased or diminished, except by those very circumstances which increase or diminish the heat of a common fire. Though a person should stand directly before the fire, yet if a strong blast of air rushes into the room at the same time, he will not find himself warm; but it would be a very erroneous conclusion to infer from thence, that the heat of the fire was less than what people commonly supposed. If he excludes the blast of air by shutting the room-door, he will find the heat greatly increased, though he comes no nearer the fire than before; and if he causes any substance capable of reflecting the light strongly to be placed at a small distance behind him, such as a large piece of tinned iron, he will then very probably feel the heat intolerable in that very place where it was disagreeably cold before. Now the circumstances which increase or diminish the heat of the sun are quite similar to those above-mentioned. On the top of an high mountain the air has free access on all sides, except the small point of earth where the person stands; the rest of the earth also is at too great a distance to have any effect in diminishing the cold by its reflective power; and as in these high regions there are commonly violent winds, the cold is thereby greatly increased. But when we descend into the plain, the air has much less access. The immense body of the earth effectually shelters us from the air on one side, at the same time that by its reflection it acts like the piece of metal above-mentioned; while its inequalities in a great measure shelter us from the winds all around; and hence the heat at the foot of a mountain may be intolerable, while the cold is equally so at the top. It will now follow, that *heat* is not properly speaking the mere presence of the rays of the sun, but their action after a certain manner, without interruption from any other substance; and that *cold* is not any privation or absence of these rays, but is occasioned by whatever prevents them from acting in the manner above-mentioned; and if there is any substance in nature which constantly tends to prevent that action, such a substance is *cold* in the abstract. A substance of this kind is our atmosphere, or some principle in it*; tho' very possibly that principle, as already hinted, may be no other than elementary fire itself acting in a different manner.

With regard to the opinions of Dr Black and Irvin

Heat.

Heat.

vin upon this subject, it is impossible to give such a full account as could be wished; because the gentlemen have not thought proper to publish their sentiments to the world. From what we have been able to collect, however, and which is authenticated by Dr Black himself, his general opinion is, that heat is a substance *per se*: that when this substance is present in any terrestrial body, in a certain degree, that body is sensibly hot; when a lesser quantity of heat is present, the substance is cold: but there is no such thing as a positive cold; and all those degrees of cold known to us, even the most violent, are only smaller degrees of heat; and of this heat the sun is to us the only source and fountain. For his opinions concerning sensible and latent heat, see the articles CONGELATION, EVAPORATION, and FLUIDITY.

Dr Cleghorn's account of Dr Irvin's opinions.

Dr Irvin hath attempted to give a solution of the phenomena of latent heat; and though he hath not yet published this explanation himself, an account of it hath appeared in an inaugural dissertation *De igne*, published at Edinburgh, by Dr Cleghorn, in 1779. The substance of what this gentleman hath delivered, is as follows:

"Heat is occasioned by a certain fluid, and not by motion alone, as some eminent writers have imagined: because, 1. Those who have adopted the hypothesis of motion, could never even prove the existence of that motion for which they contended; and though it should be granted, the phenomena could not from it be explained. 2. If heat depended on motion, it would instantaneously pass through an elastic body; but we see that heat passes through bodies slowly like a fluid. 3. If heat depended on vibration, it ought to be communicated from a given vibration in proportion to the quantity of matter, which is found not to hold true in fact. On the other hand, there are numberless arguments in favour of the opinion that heat proceeds from elementary fire. 1. Mr Locke hath observed, that when we perceive a number of qualities always existing together, we may gather from thence, that there is really some substance which produces these qualities. 2. The hypothesis of elementary fire is simple, and agreeable to the phenomena. 3. From some experiments made by Sir Isaac Newton it appears, that bodies acquire heat and cold *in vacuo*, until they become of the same temperature with the atmosphere; so that heat exists in the absence of all other matter, and is therefore a substance by itself.

"Our senses are no just measures of the degrees of heat and cold*:—but the thermometer truly shews the increase or diminution of heat in the same body, while it preserves the same form; but this it will only do within certain limits. For when fluids are on the point of freezing, they contract irregularly, and expand in the same manner when brought near the boiling point. The thermometer, however, cannot shew the absolute quantity of heat contained in any body, because the beginning of the thermometrical scale by no means denotes the total absence of heat. For the same reason, it cannot even shew us the proportion between the quantities of heat contained in two different bodies; but Dr Black hath discovered a very ingenious and accurate method of shewing this last.

"It is universally known, that when two substances of different temperatures are mixed together, the

one loses and the other acquires heat, till they both appear of the same temperature. Let, therefore, any quantity of water be mixed with an equal bulk of any other substance, either hotter or colder than itself, and observe what happens on the mixture. If the one gains as much as the other loses, both of them contain the same quantity of heat, when in their natural state; but if the one gains more than the other loses, then their natural quantities of heat differ in the same proportion.

"If any body, heated beyond the common temperature of the air, is exposed to it, the heat flows out from it into the atmosphere, and disposes itself equally around, till the air becomes of the same temperature with itself. The same happens to bodies suspended *in vacuo*. Hence it is justly concluded, there exists between the particles of heat a repulsive power, by which they mutually recede from each other.

"Notwithstanding this repulsive power, however, the quantities of heat contained in different substances even of the same temperature, are found to be altogether different. This is sufficiently proved by some experiments made by Fahrenheit and Boerhaave, and still further confirmed by others made by the learned Dr Black. He took equal bulks of water and mercury; and having heated the mercury 50° above the other, mixed them together as quick as possible. The temperature of the mixture was 20 degrees above the original temperature of the water. Again, having made the water 50° hotter than the mercury, the temperature of the mixture was 30° above the original temperature of the mercury. Hence it appears that the quantity of heat in water is to that in mercury when both are of an equal temperature, as 3 to 2. By similar experiments he hath also determined the quantities of heat contained in a great many different bodies; so that now it appears that the quantity of heat is scarce ever the same in any two different bodies; and hence we may conclude, that terrestrial bodies have a power of attracting heat, and that this power is different in different substances.

"From these principles it evidently follows, that heat is distributed among bodies directly in proportion to their attracting powers, and inversely according to the repulsive power between the particles of heat themselves.—Such is the distribution of heat among bodies in the neighbourhood of each other; and which is called the equilibrium of heat, because the thermometer shews no difference of temperature among them. For, seeing the heat is distributed according to the attracting power of each, the thermometer having also a proper attractive power of its own, can shew no difference in the quantity of heat contained in each; for which reason, all bodies in the neighbourhood of each other are soon reduced to the same temperature. Hence we can neither assent to the opinion of Boerhaave, who supposed that heat was distributed among bodies in proportion to their bulks; nor to the hypotheses of others, who imagined that they were heated in proportion to their densities. For the thermometer shews only the quantity of heat *going out* of a body, not that which is really contained in it; and both the above-mentioned hypotheses are overturned by the experiments already recited.

"This equilibrium of heat may be broken while the quantity of heat in the different bodies remains

Heat.

* See Cold, no 1.

the flame. For seeing the heat is distributed through all bodies directly in proportion to their attraction of it, and inversely in proportion to the repulsion of the igneous particles; if in any body the former is diminished, or the latter augmented, the fire will flow out of the body until the equilibrium is again restored, and then the heat is said to be *generated*. On the contrary, if the attraction of any body towards heat is augmented, or the repulsion between its particles diminished, then heat will flow into the body, and cold is said to be generated.—This is explained by an experiment of Dr Cullen's. A thermometer suspended in the receiver of an air-pump, descended some degrees while the air was exhausting, but quickly recovered the temperature of the external atmosphere; and when the air was again admitted, it ascended beyond the temperature of the external air. While the air was exhausting, the thermometer descended, because the air which remained being rarified, the repulsion between the particles of fire contained in it was diminished, and therefore the heat flowed out from the thermometer; but being allowed to remain for a short time *in vacuo*, it acquired the temperature of the external air, and the equilibrium was restored. When the external air was admitted, then that which had remained in the receiver, and acquired the temperature of the external air, being suddenly compressed, the repulsion between the igneous particles was increased, and the heat entering into the thermometer caused it rise. From other experiments also it appears, that the temperature of the air becomes hotter by condensation, and colder by rarefaction; the reason of which is manifest from the principles already laid down.

“Fluidity and evaporation are justly reckoned general effects of heat; for there is scarce any body which cannot be liquefied, and even carried off into vapour by an intense heat. The fluidity of water is universally known to depend on heat. Mercury likewise, by an intense cold, may be deprived of its fluidity*. Air is a kind of vapour which always becomes denser by a diminution of its heat; and it is not improbable, that by a very great diminution of its heat the air itself might become solid; and this conclusion is confirmed by the analogy of other vapours.

“These phenomena may be explained from the principles already laid down. For the particles of all solids are connected by the attraction of cohesion; of which, as well as of every other attraction, the nature is such, that if any new attraction is induced, the former is weakened. As much heat, therefore, may be added to a body as may increase its power of attracting heat to such a degree, that the attraction of cohesion will be totally dissolved, and the particles will easily slide over one another, in which case the body becomes fluid. If the fire is still kept up, that fluid becomes rarer, the heat communicates the repulsion between its own particles to those of the fluid, which is now raised in vapour. Again, this vapour by a diminution of the heat is converted into a fluid, and by a still farther diminution remains perpetually contracted into the form of a solid.

“If indeed such is the power of bodies to attract heat, and such the nature of heat as has been already laid down, we might conclude *a priori*, that the force by which any substance attracts heat would be increa-

sed while it was melting, or going off in vapour; that is, that liquefaction or evaporation would produce cold: and on the other hand, that when vapour was reduced into a liquid, or any fluid congealed into a solid, its power of attracting heat would be diminished; and therefore heat, according to the common phrase, would be *generated*. For when, by the solution of the body, the attraction of cohesion is taken away, the attraction of the body for heat is increased. And when evaporation takes place, the body, and therefore the heat which is in it, becomes more rare; the consequence of which is, that the repulsive power between the particles of fire is diminished, the equilibrium is taken off, and the heat enters the vapour on all sides.

“The learned philosopher Dr Black was the first who demonstrated experimentally that heat entered bodies in great quantity while they liquefy or are converted into vapour; and that the same quantity flowed out of them again while they were condensing into fluids, or congealing into solids; and from this principle he hath explained a great number of phenomena, in which heat or cold were formerly said to be *generated*. The heat, as long as it is inherent in these bodies, he calls *latent*; because, while it enters the body, it does not change its sensible temperature; nor, after it has entered, does it affect the thermometer; and he was of opinion, that upon a certain quantity of latent heat the states of fluidity and vapour principally depended.

“But an ingenious physician (Dr Irvin, professor of chemistry at Glasgow,) having made many experiments in order to find out the quantity of heat contained in different bodies, according to Dr Black's method, hath observed, that the same body, under different forms, shews different dispositions with respect to heat; that ice, for instance, mixed with mercury 20 degrees colder than itself, lessened the cold of the mixture in a smaller degree, or imparted to it a smaller quantity of heat than water mixed with mercury 20 degrees colder than itself. Hence that learned gentleman hath concluded, that the great quantity of heat which is found to enter into bodies while they evaporate, or are reduced to a fluid state, is absorbed by them because of their change of form, and consequently of their disposition towards heat; and hence that the entrance of the heat is not to be accounted the *cause*, but the *effect* or *consequence*, of fluidity or vapour. This opinion indeed seems more probable, and agreeable to the principles already laid down, than the other. But we must carefully remember, that the thermometer can only measure that quantity of heat which flows out from bodies, not that which enters into them. If, therefore, a quantity of heat in vapour affects the thermometer less than an equal quantity in water, we are thence to conclude, that vapour has a stronger attraction for heat than water, and therefore the thermometer attracts a smaller quantity of heat from it than from water. When melting ice absorbs a great quantity of heat, which yet does not affect the thermometer; and when water converted into ice, throws out a great quantity of heat upon the thermometer or other bodies around it; these phenomena are easily explained from the greater attraction which water has for heat.

“The increase of the attraction which water has
for

Heat.

Heat.

for heat, arises from the solution of its attraction of cohesion, as appears probable from analogy. But heat rushes into vapour, because it is distributed among bodies directly in proportion to their attractive powers, and inversely in proportion to the repulsive power between its own particles. When water is converted into vapour, its parts are removed to a distance from each other, and consequently the particles of heat. The repulsion between the latter, therefore, is diminished; the heat flows into the vapour, until the repulsion between its particles with respect to the attracting power of the body becomes the same as before; whence we plainly see the reason why vapour absorbs the greater quantity of heat in proportion as it is more expanded.

"That heat accompanies the rays of the sun, is beyond all doubt; but whether the sun communicates heat to the rays of light, or whether they attract it from the air, is with me a matter of uncertainty. If heat is derived from the sun, how comes it to pass that the earth is no hotter after having received such an immense quantity of heat for so many ages? If the heat is communicated from the earth to the air, and is not again carried off from thence, why is the atmosphere so cold in its upper parts; or why has not the equilibrium of heat yet pervaded the whole atmosphere? If the rays of light have received heat from the sun himself, why does not an equal quantity of heat accompany the same quantity of light at all different distances from the earth?—These, and other objections, shew, that heat does not flow from the sun; and some of them plainly shew, that heat is attracted from the atmosphere; which thought we shall now prosecute a little farther.

"Heat is of such a nature, as I have already shewn, that, when accumulated, it diffuses itself all around, and joins with bodies in proportion to their attractive powers; but if the rays of light are collected into a focus in the air, and no more heat is added to the air, the quantity of heat in the collected rays is not increased in proportion to their own attraction, more than of the air in proportion to its attraction. But if they are *in equilibrio* as to their heat, before the collection by the focus, this shews, that heat has entered the rays of light from the atmosphere, seeing their temperature increases by condensation. But that the rays of the sun really do attract heat from the atmosphere, seems to be proved by the observations of De Luc; who hath observed, that the heat is very much, and very suddenly, decreased before sun-rising; which shews, that the rays of the sun, sweeping along at a small distance above the earth, abstracted the heat from that part of the atmosphere, which therefore flowed from the lower parts to supply the place of that which was taken away."

From this last paragraph it seems natural to conclude, that the sun, instead of being the source of heat, is really a source of cold; and the atmosphere the only reservoir of heat to us. But, on this supposition, it seems difficult to conceive how the heat of the atmosphere could remain the same in quantity, even for a single moment. The rays of the sun, it is said, cool the atmosphere, and carry off its heat; while they sweep along it at a little distance from the surface of the earth. But this they are perpetually doing. While the sun, for instance, is shining directly

upon Britain, his rays are cooling the atmosphere above America. But these rays which thus pass through the atmosphere without touching the earth's surface, fly into the most remote regions of space, and consequently must carry the heat of our atmosphere along with them, where it must be for ever lost to us. Thus the general quantity of heat would be perpetually diminishing; and in such a number of ages as have intervened from the beginning of the world, it must have been totally diffipated, or diffused through spaces to which our earth and its atmosphere bear not the proportion of 1 to 10,000,000,000.

His explanation of Dr Black's principle of latent heat is, perhaps, equally liable to objection. We shall for a moment allow, that the absorption of heat is the *consequence*, and not the *cause*, of fluidity and vapour: but what then is the *cause*? It seems undeniable, that the cause is a quantity of heat, greater than what the body is naturally fitted to contain, forced upon it *ab extra*: but this heat, the moment it enters the body, is to appearance lost and annihilated, while the body changes its form. How is it possible, then, to assign another cause for the change of form in the body, than its absorption of the quantity of heat which was forced upon it *ab extra*?—To say that the body now attracts heat from the atmosphere in greater quantity than it did before, and which enters it copiously, cannot be admitted. The body did not originally *attract* the heat; it was plainly forced upon it; a quantity of heat entered it, and changed its form. This quantity therefore remains within the body, and neither attracts nor repels that which is in the atmosphere. The body can attract no more, unless that which has already entered was to be thrown out; and therefore the coldness of vapour cannot be owing to its attraction of heat from the atmosphere: neither is it owing to its attracting heat more than water does; for vapour may be heated in such a manner, that it will part with heat as readily as water, or any other substance whatever.—Nor does the experiment adduced in favour of this doctrine seem conclusive. Ice communicates less heat to mercury 20 degrees colder than itself, than water does; but for this two reasons may be assigned. 1. When bodies are intensely heated, they part with their heat very readily, and in great quantity; but as the heat decreases, it also flies off, or is communicated to surrounding bodies more slowly and with more difficulty than before. Water always contains a greater quantity of heat than ice, and therefore ought to part with an equal quantity of heat more readily and easily than ice does. 2. When water is cooled to 32 degrees, it freezes; when just above 32 degrees, it becomes fluid; and, with every degree of heat superior to that, evaporates. If water heated to 212 degrees, or near it, is placed within the receiver of an air-pump, and the air exhausted, a great quantity of steam issues from it, and the heat of the water suddenly decreases to 98 or 100 degrees. Hence it is plain, that 112 degrees of the heat of boiling water is contained, not in the water itself, but in the steam detained among its particles by the pressure of the atmosphere. Had this water, therefore, been mixed with mercury much colder than itself, a quantity of the steam would have been condensed by the coldness of the metal. But steam cannot be condensed

without giving out, not only its sensible heat, but that which is *latent* also; and hence we may easily see why water communicates degrees of heat so much greater in proportion than ice does.

Lastly, The principle on which the whole doctrine is founded, does not seem to agree either with the phenomena of nature, or with the conclusions which must be drawn from itself. It is said, that fire tends to diffuse itself equally on all bodies in the neighbourhood of one another. But does this hold in fact? Heat has a disposition to ascend; and that not only in the atmosphere, but *in vacuo*, and through solid bodies. If a bar of iron, red-hot at one end, is set to cool with its red part undermost, the heat will ascend farther and quicker through it, than it will descend if the iron is placed the contrary way. The argument, therefore, for the repulsive power between the particles of heat does not hold, nor that for the attraction between the particles of heat and those of other matter. Though different bodies contain different quantities of heat, this difference may be occasioned otherwise than by attraction. We have already seen, that a certain quantity of heat absorbed by water in the state of ice, is the cause of its fluidity. The same is the case with mercury; but the latter can remain fluid with much less heat than water can. It must, however, be admitted, that the substances we call *water* and *mercury* are only so in consequence of the action of heat. Thus, water deprived of a certain quantity of heat, is no longer *water*, but a kind of glass; and mercury is no longer *mercury*, but a solid metal. Now, let us suppose, that ice at 32 degrees is applied to a quantity of mercury at 32; we know that the ice is only water deprived of a quantity of its natural heat, and of consequence it ought to have a violent attraction for that quantity which has been forced from it. The mercury has a great deal of heat to spare, yet the ice attracts none from it; neither will the fluid water attract heat from mercury of the same temperature, though the one is said to attract it more strongly than the other. That water should be heated by mercury hotter than itself, is not wonderful; nor can we account this an effect of attraction, because the superfluous quantity of heat would not remain in the mercury, though the water was not applied to it.

9
Explana-
tion of the
phenomena
of heat on
other prin-
ciples.

From these, and a multitude of other considerations, we would conclude, that heat itself, and not the attractive and repulsive power supposed by Dr Cleghorn and others, is the active principle which has so great a share in the operations of nature. The principles on which the actions of heat depend, may perhaps be explained in a less exceptionable manner, from the following propositions.

1. It is in all cases observed, That when light proceeds in considerable quantity from a point, diverging as the radii of a circle from its centre, there a considerable degree of heat is found to exist, if an opaque body, having no great reflective power, is brought near that point.

2. This action of the light, therefore, may be accounted the ultimate cause of heat, without having recourse to any farther suppositions; because nothing else besides this action is evident to our senses.

3. If the point from which the rays are emitted is placed in a transparent medium, such as air or water,

that medium, without the presence of an opaque body, will not be heated.

4. Another cause of heat, therefore, is the resistance of the parts of that body on which which the light falls, to the action mentioned in Prop. 1. Where this resistance is weak, as in the cases just mentioned, the heat is either nothing, or very little.

5. If a body capable of reflecting light very copiously is brought near the lucid point, it will not be heated *.

* See
the article
BURN-
ING-Glass.

6. A penetration of the light, therefore, into the substance of the body, and likewise a considerable degree of resistance on the part of that body to the action of the light, are the requisites to produce heat.

7. Those bodies ought to conceive the greatest degrees of heat, into whose substance the light can best penetrate, *i. e.* which have the least reflective power, and which most strongly resist its action; which is evidently the case with black and solid substances.

8. By heat all bodies are expanded in their dimensions every way, and that in proportion to their bulk and the quantity of heat communicated to them.

9. This expansion takes place not only by an addition of *sensible* heat, but likewise of that which is *latent*. Of this last we have a remarkable instance in the case of snow mixed with spirit of nitre. The spirit of nitre contains a certain quantity of latent heat, which cannot be separated from it without effecting a change on the spirit itself; so that, if deprived of this heat, it would no longer be spirit of nitre.— Besides this, it contains a quantity of sensible heat, of a great part of which it may be deprived, and yet retain its characteristic properties as nitrous acid. When it is poured upon snow, the latter is immediately melted by the action of the latent heat in the acid. The snow cannot be melted or converted into water, without imbibing a quantity of latent heat, which it receives immediately from the acid which melts it. But the acid cannot part with this heat without decomposition; to prevent which, its sensible heat occupies the place of that which has entered the snow and liquefied it. The mixture then becomes exceedingly cold, and the heat forces into it from all the bodies in the neighbourhood; so that, by the time it has recovered that quantity of sensible heat which was lost, or arrived at the temperature of the atmosphere around it, it will contain a considerably larger quantity of heat than it originally did, and is therefore observed to be expanded in bulk. Another instance of this expansive power of latent heat is in the case of steam, which always occupies a much larger space than the substance from which it was produced; and this whether its temperature is greater or less than the surrounding atmosphere.

10. The difference between latent and sensible heat, then, as far as we can perceive, is, that the expansive power of the first is directed only against the particles of which the body is composed; but that of the second is directed also against other bodies. Neither doth there seem to be any difference at all between them farther than in quantity. If water, for instance, hath but a small quantity of heat, its parts are brought near each other, it contracts in bulk, and feels cold. Still, however, some part of the heat is detained among the aqueous particles, which prevents the fluid from

from congealing into a solid mass. But, by a continuation of the contracting power of the cold, the particles of water are at last brought so near each other that the internal or *latent* heat is forced out. By this discharge a quantity of air is also produced, the water is congealed, and the ice occupies a greater space than the water did; but then it is full of air-bubbles, which are evidently the cause of its expansion. The heat then becomes *sensible*, or, as it were, lies on the outside of the matter; and consequently is easily dissipated into the air, or communicated to other bodies. Another way in which the latent heat may be extricated is by a constant addition of sensible heat. In this case the body is first raised into vapour, which for some time carries off the redundant quantity of heat. But as the quantity of this heat is continually increased, the texture of the vapour itself is at last totally destroyed. It becomes too much expanded to contain the heat, which is therefore violently thrown out on all sides into the atmosphere, and the body is said to burn, or be on fire. See *FLAME* and *IGNITION*.

11. Hence it follows, that those bodies which have the least share of latent heat, appear to have the greatest quantity of sensible heat; but this is only in appearance, for the great quantity they seem to contain is owing really to their inability to contain it. Thus, if we can suppose a substance capable of transmitting heat through it as fast as it received it; if such a substance was set over a fire, it would be as hot as the fire itself, and yet the moment it was taken off, it would be perfectly cool, on account of its incapacity to detain the heat among the particles of which it was composed.

12. The heat, therefore, in all bodies, consists in a certain violent action of the elementary fire within them tending from a centre to a circumference, and thus making an effort to separate the particles of the body from each other, and thereby to change its form or mode of existence. When this change is effected, bodies are said to be dissipated in vapour, calcined, vitrified, or burnt, according to their different natures.

13. Inflammable bodies are such as are easily raised in vapours; that is, the fire easily penetrates their parts, and combines with them in such quantity, that, becoming exceedingly light, they are carried up by the atmosphere. Every succeeding addition of heat to the body increases also the quantity of latent heat in the vapour, till at last, being unable to resist its action, the heat breaks out all at once, the vapour is converted into flame, and is totally decomposed. See the article *FLAME*, and Prop. 10.

14. Uninflammable bodies are those which have their parts more firmly connected, or otherwise disposed in such a manner, that the particles of heat cannot easily combine with them or raise them into vapour.

15. Heat therefore being only a certain mode of the action of elementary fire, it follows, that the capacity of a body for containing it, is only a certain constitution of the body itself, or a disposition of its parts which can allow the elementary fire contained in it to exert its expansive power upon them without being dissipated on other bodies. Those substances which allow the expansive power of the fire to operate on their own particles are said to contain a great deal of

heat; but those which throw it away from themselves upon other bodies, though they feel very hot, yet philosophically speaking they contain very little.

16. What is called the *quantity* of heat contained in any substance, if we would speak with the strictest propriety, is only the apparent force of its action either upon the parts of the body itself, or upon other bodies in its neighbourhood. The expansive force of the elementary fire contained in any body upon the parts of that body is the *quantity* of *latent* heat contained in it; and the expansive force of the fire exerted upon other bodies which touch or come near it, is the *quantity* of *sensible* heat it contains.

17. If what we call heat consists only in a certain action of that fluid called *elementary fire*, namely, its expansion, or acting from a centre to a circumference, it follows, that if the same fluid act in a manner directly opposite to the former, or press upon the particles of a body as from a circumference to a centre, it will then produce effects directly opposite to those of heat, i. e. it will then be absolute *cold*, and produce all the effects already attributed to *COLD*. See that article.

18. If heat and cold then are only two different modifications of the same fluid, it follows, that if a hot body and a cold one are suddenly brought near each other, the heat of the one ought to drive before it a part of the cold contained in the other, i. e. the two portions of elementary fire acting in two opposite ways, ought in some measure to operate upon one another as any two different bodies would when driven against each other. When a hot and a cold body therefore are brought near each other, that part of the cold body farthest from the hot one ought to become colder than before, and that part of the hot body farthest from the cold one ought to become hotter than before.

19. For the same reason, the greatest degree of cold in any body ought to be no obstacle, or at least very little, to its conceiving heat, when put in a proper situation. Cold air, cold fuel, &c. ought to become as intensely heated, and very nearly as soon, as that which is hotter.

The two last propositions are of great importance. When the first of them is thoroughly established, it will confirm beyond a doubt, that cold is a *positive* as well as heat; and that each of them has a separate and distinct power, of which the action of its antagonist is the only proper limit; i. e. that heat can only limit the power of cold, and *vice versa*. A strong confirmation of this proposition is the experiment related by M. Geoffroy; an account of which is given under the article *COLD*, n° 5. Another, but not so well authenticated, is related under the article *CONGELATION*, n° 11.—Dr. Lavoisier's observation also, mentioned by Dr. Cleghorn affords a pretty strong proof of it; for if the lower parts of the atmosphere are cooled by the passage of the sun's rays at some distance above, and it hath been already shewn that they do not *attract* the heat from the lower parts, it follows, that they must *expel* part of the cold from the upper regions.—The other proposition, when fully established, will prove, that heat and cold are really convertible into one another; which indeed seems not improbable, as we see that fires will burn with the greatest fierceness during the time of intense frosts, when the coldest air is admitted

Heat.

mitted to them; and even in those dismal regions of Siberia, when the intense cold of the atmosphere is sufficient to congeal quicksilver, it cannot be doubted that fires will burn as well as in this country; which could not happen if heat was a fluid *per se*, and capable of being carried off, or absolutely diminished in quantity, either in any part of the atmosphere itself, or in such terrestrial bodies as are used for fuel.

This theory of heat, if found admissible by philosophers, would introduce a greater simplicity into natural philosophy, and explain the phenomena of nature in a manner much more easy and less liable to objection, than hath yet been done: we would then see the phenomena of attraction, repulsion, electricity, fire, light, ignition, &c. &c. to be only as many different effects of one ethereal fluid, which the Deity hath appointed to be the first of all secondary causes, and to alter, modify, compound, and separate, the different parts of terrestrial substances, as we daily see done by the different natural agents.

HEAT of Burning Bodies. See IGNITION.

HEAT of Chemical Mixtures. This is a phenomenon necessarily resulting from the change of form produced in the different substances which are mixed together; and the manner in which it happens may be easily understood from the example of oil of vitriol and water. If equal quantities of concentrated vitriolic acid and water are mixed together, a very great degree of heat immediately takes place; inasmuch, that if the vessel which contains the mixture is made of glass, it will probably break; and after it is cold, the mixture will be found to have shrunk in its dimensions, or will occupy less space than the bulk of the water and acid taken separately. In this case we know that the water, while in its fluid state, hath as much latent heat as it can contain; *i. e.* the elementary fire within it expands, or separates its parts from each other, as much as is consistent with the constitution of the body. If any more is added, it cannot be absorbed, or direct its force upon the particles of the water without raising them in vapour: of consequence, part of this additional expansive power will be employed in the formation of vapour, and the rest will be discharged upon the neighbouring bodies; *i. e.* will be converted into *sensible* heat. The vitriolic acid, in its concentrated state, contains a great quantity of latent heat which is necessary to preserve its fluidity. But when it is mixed with the fluid water, the latent heat contained in the latter is abundantly sufficient for both: of consequence, the great expansive power in the oil of vitriol itself becomes now totally useless, and therefore exerts its force upon the neighbouring bodies; and when the mixture returns to the original temperature of the oil of vitriol and water, it shews a loss of substance by its diminution in bulk. This may serve to explain all cases in chemistry where heat or cold is produced: and it will generally be found, that where bodies, by being mixed together, produce heat, they shrink in their dimensions; but when they produce cold, they are enlarged.

HEAT of Climates. See HEAT, n° 2; and AMERICA, n° 3...24.

Methods of Measuring HEAT. See THERMOMETER.

Expansion of Metals by HEAT. See PYROMETER.

Degrees of HEAT which Animals are capable of bear-

ing. The ancients were of opinion that all countries lying within the tropics were uninhabitable by reason of their heat; but time has discovered their mistake, and it is now found that no part of the world is too hot for mankind to live in. The learned professor Boerhaave, in his chemistry, relates certain experiments made with great accuracy by the celebrated Fahrenheit, and others, at his desire, on this subject, in a sugar-baker's office; where the heat, at the time of making the experiments, was up to 146 degrees of Fahrenheit's thermometer. A sparrow, subjected to air thus heated, died, after breathing very laboriously, in less than seven minutes. A cat resisted this great heat somewhat above a quarter of an hour; and a dog about 28 minutes, discharging, before his death, a considerable quantity of a ruddy-coloured foam, and exhaled a stench so peculiarly offensive, as to throw one of the assistants into a fainting fit. This dissolution of the humours, or great change from a natural state, the professor attributes not to the heat of the stove alone, which would not have produced any such effect on the flesh of a dead animal; but likewise to the vital motion, by which a still greater degree of heat, he supposes, was produced in the fluids circulating through the lungs, in consequence of which the oils, salts, and spirits of the animal became so highly exalted.

Messieurs Du-Hamel and Tillet having been sent into the province of Augemois, in the years 1760 and 1761, with a view of endeavouring to destroy an insect which consumed the grain of that province, effected the same in the manner related in the Memoirs for 1761, by exposing the affected corn, with the insects included in it, in an oven, where the heat was sufficient to kill them without injuring the grain. This operation was performed at Rochefoucault, in a large public oven, where, for economical views, their first step was to assure themselves of the heat remaining in it, on the day after bread had been baked in it. This they did, by conveying in a thermometer on the end of a shovel, which, on its being withdrawn, indicated a degree of heat considerably above that of boiling water; but M. Tillet, convinced that the thermometer had fallen several degrees in drawing to the mouth of the oven, and appearing under some embarrassment on that head, a girl, one of the attendants on the oven, offered to enter, and mark with a pencil the height at which the thermometer stood within the oven. The girl smiled on M. Tillet's appearing to hesitate at this strange proposition; and entering the oven, with a pencil given her for that purpose, marked the thermometer, after staying two or three minutes, standing at 100 degrees of Reaumur's scale, or, to make use of a scale better known in this country, at near 260 degrees of Fahrenheit's. M. Tillet began to express an anxiety for the welfare of his female assistant, and to press her return. This female salamander, however, assuring him that she felt no inconvenience from her situation, remained there 10 minutes longer; that is, near the time when Boerhaave's cat parted with her nine lives, under a much less degree of heat; when the thermometer standing at 288 degrees, or 76 degrees above that of boiling water, she came out of the oven, her complexion indeed considerably heightened, but her respiration by no

Heat.

Heat.

means quick or laborious. After M. Tillet's return to Paris, these experiments were repeated by Monsr. Marantin, *commisnaire de guerre*, at Rochefoucault, an intelligent and accurate observer, on a second girl belonging to the oven; who remained in it, without much inconvenience, under the same degree of heat, as long as her predecessor; and even breathed in air heated to about 325 degrees, for the space of five minutes.

M. Tillet endeavoured to clear up the very apparent contrariety between these experiments and those made under the direction of Boerhaave, by subjecting various animals, under different circumstances, to great degrees of heat. From his experiments, in some of which the animals were swaddled with clothes, and were thereby enabled to resist for a much longer time the effects of the extraordinary heat, he infers, that the heat of the air received into the lungs was not, as was supposed by Boerhaave, the only or principal cause of the anxiety, laborious breathing, and death, of the animals on whom his experiments were made; but that the hot air, which had free and immediate access to every part of the surface of their bodies, penetrated the substance on all sides, and brought on a fever, from whence proceeded all the symptoms: on the contrary, the girls at Rochefoucault, having their bodies in great measure protected from this action by their clothes, were enabled to breathe the air, thus violently heated, for a long time without great inconvenience. In fact, we should think too, that the bulk of their bodies, though not thought of much consequence by M. Tillet, appears to have contributed not a little to their security. In common respiration, the blood, in its passage through the lungs, is cooled by being brought into contact with the external inspired air: In the present experiments, on the contrary, the vessels and vessels of the lungs receiving at each inspiration an air heated to 300 degrees, must have been continually cooled and refreshed, as well as the subcutaneous vessels, by the successive arrival of the whole mass of blood contained in the interior parts of the body, whose heat might be supposed at the beginning of the experiment not to exceed 100 degrees. Not to mention, that M. Tillet's two girls may not possibly have been subjected to so great a degree of heat as that indicated by the thermometer; which appears to us to have always remained on the shovel, in contact with the earth.

These experiments soon excited other philosophers to make similar ones, of which some very remarkable ones are those of Dr Dobson at Liverpool, who gives the following account of them in the *Philosophical Transactions*, vol. lxx.

"I. The sweating-room of our public hospital at Liverpool, which is nearly a cube of nine feet, lighted from the top, was heated till the quicksilver stood at 224° on Fahrenheit's scale, nor would the tube of the thermometer indeed admit the heat to be raised higher. The thermometer was suspended by a string fixed to the wooden frame of the sky-light, and hung down about the centre of the room. Myself and several o-

thers were at that time inclosed in the stove, without experiencing any oppressive or painful sensation of heat proportioned to the degree pointed out by the thermometer. Every metallic about us soon became very hot.

"II. My friend Mr Park, an ingenious furgeon of this place, went into the stove heated to 202°. After ten minutes, I found the pulse quickened to 120. And to determine the increase of the animal-heat, another thermometer was handed to him, in which the quicksilver already stood at 98°; but it rose only to 99½, whether the bulb of the thermometer was inclosed in the palms of the hands, or received in the mouth (A). The natural state of this gentleman's pulse is about 65.

"III. Another gentleman went through the same experiment in the same circumstances, and with the same effects.

"IV. One of the porters to the hospital, a healthy young man, and the pulse 75, was inclosed in the stove when the quicksilver stood at 210°; and he remained there, with little inconvenience, for 20 minutes. The pulse, now 164, and the animal-heat, determined by another thermometer as in the former experiments, was 101½.

"V. A young gentleman of a delicate and irritable habit, whose natural pulse is about 80, remained in the stove ten minutes when heated to 224°. The pulse rose to 145, and the animal-heat to 102°. This gentleman, who had been frequently in the stove during the course of the day, found himself feeble, and disposed to break out into sweats for 24 hours after the experiment.

"VI. Two small tin vessels, containing each the white of an egg, were put into the stove heated to 224°. One of them was placed on a wooden seat near the wall, and the other suspended by a string about the middle of the stove. After ten minutes, they began to coagulate; but the conglutination was sensibly quicker and firmer in that which was suspended, than in that which was placed on the wooden seat. The progress of the coagulation was as follows: it was first formed on the sides, and gradually extended itself; the whole of the bottom was next coagulated; and last of all, the middle part of the top.

"VII. Part of the shell of an egg was peeled away, leaving only the film which surrounds the white; and part of the white being drawn out, the film sunk so as to form a little cup. This cup was filled with some of the *albumen ovi*, which was consequently detached as much as possible from every thing but the contact of the air and of the film which formed the cup. The lower part of the egg stood upon some light tow in a common gallipot, and was placed on the wooden seat in the stove. The quicksilver in the thermometer still continued at 224°. After remaining in the stove for an hour, the lower part of the egg which was covered with the shell, was firmly coagulated; but that which was in the little cup, was fluid and transparent. At the end of another hour it was still fluid, except on the edges where it was thinnest; and here it was still transparent; a sufficient proof that

Heat.

(A) The scale of the thermometer, which was suspended by the string about the middle of the room, was of metal; this was the only one I could then procure, on which the degrees ran so high as to give any scope to the experiment. The scale of the other thermometer, which was employed for ascertaining the variations in the animal-heat, was of ivory.

it was dried, not coagulated.

"VIII. A piece of bees-wax, placed in the same situation with the *albumen ovi* of the preceding experiment, and exposed to the same degree of heat in the stove, began to melt in five minutes: another piece suspended by a string, and a third piece put into the tin vessel and suspended, began likewise to liquefy in five minutes."

Even these experiments, though more accurate than the former, do not shew the utmost degrees of heat which the human body is capable of enduring. Some others, still more remarkable, (as in them the body was exposed to the heat without clothes), by Drs Fordyce and Blagden, are also recorded in the Philosophical Transactions. They were made in rooms heated by stoves in the floor, and by pouring upon it boiling water. There was no chimney in them, nor any vent for the air, excepting through crevices at the door. In the first room were placed three thermometers, one in the hottest part of it, another in the coolest part, and a third on the table, to be used occasionally in the course of the experiment. Of these experiments, the two following may be taken as a specimen.

"About three hours after breakfast, Dr Fordyce having taken off all his clothes, tied his shirt, and being furnished with wooden shoes tied on with lilt, went into one of the rooms, where he staid five minutes in a heat of 90°, and begun to sweat gently. He then entered another room, and stood in a part of it heated to 110°. In about half a minute his shirt became so wet, that he was obliged to throw it aside, and then the water poured down in streams over his whole body. Having remained in this heat for ten minutes, he removed to a part of the room heated 120°; and after staying there 20 minutes, found that the thermometer placed under his tongue, and held in his hand, stood just at 100°, and that his urine was of the same temperature. His pulse had gradually risen to 145 pulsations in a minute. The external circulation was greatly increased, the veins had become very large, and an universal redness had diffused itself all over the body, attended with a strong feeling of heat; his respiration, however, was little affected. He concluded this experiment by plunging in water heated to 100°; and after being wiped dry, was carried home in a chair; but the circulation did not subside for two hours.

"Dr Blagden took off his coat, waistcoat, and shirt, and went into one of the rooms, as soon as the thermometer had indicated a degree of heat above that of boiling water. The first impression of this hot air upon his body was exceedingly disagreeable, but in a few minutes all his uneasiness was removed by the breaking out of a sweat. At the end of 12 minutes he left the room very much fatigued, but no otherwise disordered. His pulse beat 136 in a minute, and the thermometer had risen to 220 degrees."

In others of these experiments it was found, that a heat even of 260° of Fahrenheit's thermometer could be submitted to with tolerable ease. But it must be observed, that in these great heats every piece of metal they carried about with them become intolerably hot. Small quantities of water placed in metalline vessels quickly boiled; but in a common earthen ves-

sel it required an hour and an half to arrive at a temperature of 140°, nor could it ever be brought near the boiling point. Neither durst the people, who with impunity breathed the air of this very hot room at 264 degrees, bear to put their fingers into the boiling water which indicated only a heat of 212°. So far from this, they could not bear the touch of quicksilver heated only to 120°, and could but just bear spirit of wine at 130°.

Animal-Heat. Of this there are various degrees; some animals preserving a heat of 100° or more in all the different temperatures of the atmosphere; others keep only a few degrees warmer than the medium which surrounds them; and in some of the more imperfect animals, the heat is scarcely one degree above the air or water in which they live.

The phenomenon of animal-heat hath, from the earliest ages, been the subject of philosophical discussion; and, like most other subjects of this nature, its cause is not yet ascertained. The best treatises that have appeared on the subject are those of Dr Dugud Leslie, published in 1778; and Mr Adair Crawford, in 1779. From the first of these performances, the following account of the different opinions on this subject is extracted.

"The ancients possessed not the requisites for minutely investigating the science of nature; and, prone to superstition, attributed every phenomenon which excluded their investigation, to the influence of a supernatural power. Hippocrates, the father and founder of medicine, accounted animal-heat a mystery, and bestowed on it many attributes of the deity. In treating of that subject, he says in express terms, "what we call heat, appears to me to be something immortal, which understands, sees, hears, and knows every thing present and to come."—Aristotle seems to have considered the subject particularly, but nothing is to be met with in his works that can be said to throw light upon it.—Galen tells us that the dispute between the philosophers and physicians of his time was, "whether animal-heat depended on the motion of the heart and arteries; or whether, as the motion of the heart and arteries was innate, the heat was not also innate." Both these opinions, however, he rejects; and attempts a solution of the question on his favourite system, namely, the peripatetic philosophy: but his leading principles being erroneous, his deductions are of course inadmissible.

"To enter into a minute detail of all the opinions ² offered by the moderns on the cause of animal-heat, ³ ~~derms~~ would far exceed our limits. Most of them, however, may be referred to one or other of the three general causes of heat, viz. mixture, fermentation, and mechanical means, each of which we shall particularly consider.

"1. *Chemical mixture.* When chemical philosophy first came into vogue, and prevailed in the theory as well as practice of medicine, almost every operation in the animal machine was said to be the effect of ferment or mixture. From observing, that on the mixing of certain bodies far below the temperature of the human body, a degree of heat sometimes rising to actual inflammation was produced; they, without further investigation, pronounced mixture the sole cause of animal heat. Various, however, were the opinions, ⁴ not

¹ Opinions of the ancients concerning animal-heat.

Heat.

not only respecting the place where the mixture happened, but also concerning the nature of the fluids of which it consisted. Van Helmont, Sylvius, and several others, supposed that the mixture took place in the intestinal tube; and ascribed it to an effervescence between the pancreatic juice and the bile. Others discovered acids in one place, and alkalies in another; but the general opinion for near two centuries was, That acceſcent fluids taken in, meeting with others of an alkaline nature already prepared in the body, gave rise to the degree of heat peculiar to animals. But those who are in the least acquainted with the laws of the animal economy, need not be told that these opinions are mere conjectures, founded on facts gratuitously assumed. No experiments have shewn either an acceſcent or alkaleſcent in the bile that is ſufficient to unite with the other animal juices, and generate the heat of animals. But though we should admit the supposition in its full extent, still it would by no means be ſufficient to account for the ſtability of animal heat in different climates and seasons; its equality all over the body when in health; its partial increase in topical inflammations; or hardly indeed for any one phenomenon attending its production.

“ Since, then, it appears that the fluids supposed to be mixed, the place in which the mixture is made, and every other circumstance relating to it, are neither aſcertained nor ſecounded by analogy, none will, we preſume, hesitate to reject every hypothesis of the cause of animal-heat founded on the effects of mixture.

“ 2. *Fermentation.* When a more accurate and extensive knowledge of the various operations of nature had convinced phyſiologiſts of the abſurdity of explaining the vital functions of animals, and the ſeveral changes which take place in the living body by the effects of chemical mixture, fermentation was ſubſtituted in its ſtead. All had obſerved, that fermentation was generally accompanied by heat; and few were ignorant, that that identical proceſs, or one extremely ſimilar to it, was conſtantly going forward in living animals; and it was not without ſome appearance of truth, that phyſiologiſts attributed animal-heat to that cauſe.

“ Formerly there were various modifications of this opinion; but of late it has been chiefly confined to one ſpecies of fermentation, viz. the putrefactive, which indeed is more conſentaneous to experience and found philoſophy. For although animal-ſubſtances are either directly or indirectly produced from vegetables, as all animals live on vegetables, or on animals that have lived on them; and though they may be ultimately reſolved into the ſame principles; yet they are certainly combined in a different manner: for they conſtitute compounds, the natures of which are eſſentially different; and of the three ſtages of fermentation, the vinous, acetous, and putrid, the laſt is the only one to which they ſhew a tendency. Milk indeed tends to the acetous, and even to the vinous fermentation; but as it can hardly be conſidered as perfectly animalized, it ought not to be conſidered as an exception to the general poſition. And though it be readily admitted, that animal matter is extremely apt to putrefy, and that even in the living body there is a tendency to that proceſs; yet it may be ſhewn, that the degree to which it

VOL. V.

takes place can have little or no ſhare in generating the heat of animals. In the firſt place, the effect of any degree of putrefaction in producing heat, is to this day ſo ill aſcertained, that, with many ingenious philoſophers it is altogether problematical, whether or not animal ſubſtances, during the putrefactive proceſs, do ever generate heat. Neither M. Beaume nor Dr Pearſon, who made ſeveral accurate experiments with a view to aſcertain this point, could, by the aſſiſtance of the moſt ſenſible thermometers, diſcover the leaſt difference betwixt the temperature of the putrefying mixtures, and the ſurrounding medium; and were the putrefaction of animal-ſubſtances really attended with the generation of heat, we might expect to find it greater in proportion to the bulk of the putrefying maſs.

This, however, is not the caſe; for it has often been found, that the largeſt maſſes of animal matter, ſuch as the carcaſe of a large whale, laid out and expoſed to the air in ſuch a putrid condition as to affect all the neighbourhood with an intolerable ſtench, did not to the perſons handling it feel ſenſibly hotter than the circumambient air. But what at once overturns every thing that can be advanced in favour of the generation of animal-heat on the principles of putrefaction is, that heat is far more conſiderable in a living than in a dead body; and no rational phyſiologiſt will deny, that the putrid fermentation is going forward more rapidly in the latter than in the former.

“ 3. *The mechanical generation of heat.* This opinion firſt took took its riſe from an obſervation, that animal-heat generally keeps pace with the ſtate of the circulation: while the action of the heart and arteries continues unimpaired, a high degree of animal-heat is produced; but when that action becomes more languid, the heat of the animal is diminiſhed alſo. This, till very lately, was the favourite opinion of phyſicians, and was introduced immediately after Harvey had diſcovered the circulation of the blood, and indeed ſeems to be ſupported by many ſtriking facts. Phyſiologiſts looked upon it as a matter almoſt capable of mathematical demonſtration; yet they could not agree whether the heat of animals is occaſioned by the friction of the blood againſt the veſſels which contain it, or by the internal friction and agitation of the particles among one another. Various hypotheſes accordingly were framed, and many ingenious arguments brought in ſupport of them: but all ſuppoſitions of the mechanical kind are overthrown by ſome thermometrical obſervations of De Haen and others, from which it appeared, that the heat of the body was ſometimes greater than is uſual with healthy people, at the time the perſon was juſt expiring, when the action of the veſſels was very weak; nay, even after he was dead, when it had entirely ceaſed. The above-mentioned phyſician relates two very remarkable caſes of this kind. In the one, he found that the temperature of his patient, which during the courſe of an inflammatory fever had never exceeded 103 degrees, at the time he expired, and for two minutes after, ſtood at 106. From the other it appeared, that the heat of a perſon who was dying of a lingering diſtemper, roſe in the laſt agony from 100 to 101, and continued there ſtationary for two hours; and, even at the expiration of 15 hours, had only fallen to 85°, though the ſurrounding medium did not exceed 60°. The examples alſo of thoſe who

are suffocated by fixed air, entirely overturn not only the mechanical system, but almost every other which hath yet appeared on the subject. [See the article *Blood*, n° 31.]

³
Dr Cullen's
opinion,
with ob-
jections.

*Instit. of
Medicine*,
p. 124.

"One or other of the abovementioned hypotheses continued to be adopted by physicians, till Dr Cullen attempted a solution on a new set of principles; but, attentive to the diffidence with which novel opinions ought to be broached, he delivered his as little more than a mere conjecture. 'May it not (says he) be supposed, That there is some circumstance in the vital principle of animals, which is in common to those of the same class, and of like economy; and which determines the effect of motion upon the vital principle to be the same, though the motion acting upon it may be in different circumstances?'—The doctor was driven to this supposition from the difficulty he found in explaining how so many animals of a different age, size, and temperament, should possess very nearly the same degree of heat; and in which it is impossible to shew, that the motion of the blood in all its circumstances, is exactly the same; or that in the different animals in which the degree of heat is considerably different, the motion of the circulating mass is, in each, correspondent to the difference of temperature. But, granting that the degree of heat does not always obtain in an exact ratio with the motion of the blood, and that this is an insuperable objection to its mechanical generation, yet there appear no plausible grounds for supposing that the effect of motion may be the same, while the motion acting upon it is in different circumstances. By this Dr Cullen means, That the different temperature of different animals is owing to a difference of the vital principle, inasmuch that the velocity of the blood may be the same in a frog as in a man; and yet, in consequence of the different vital principle, the heat produced may be different. The facts upon which he seems to lay the greatest stress are, That neither where the surrounding medium considerably surpasses the temperature of the living body, nor where it is far below it, is there any sensible change in the heat of animals. These, and some similar facts, in appearance countenance his hypothesis; yet we have no solid reason for imagining the principle of life to be different in different animals. And how are we to conceive, that the same degree of motion should in one class of animals always produce a certain degree of heat, and in another class as regularly a different one? A proposition of such a nature should, no doubt, require the most obvious facts and conclusive arguments to establish it; but, in the present instance, we do not perceive any probable reason, even from analogy. Besides, to say that the principle of life can generate heat or cold, independent of chemical or mechanical means, is contrary to experience, and seems in itself absurd.

"In the 66th volume of the Philosophical Transactions, Dr Hunter, after reciting some experiments concerning animal-heat, asserts, That certain animals entirely destitute of nerves, are endowed with a power of generating their own heat; and this he brings as an *argumentum crucis* against those who account the nervous system the seat of animal-heat. If this is really a fact, it must, no doubt, have all the weight he ascribes to it; but it is plain that no stress can be

laid upon it, unless it was better ascertained, which it is evident it never can be. For though we can positively assert that nerves exist where we see them, yet we cannot affirm with equal certainty that they do not also exist where we are not able to discover them. For all anatomists allow, that there are thousands of nervous filaments so finely interwoven into the composition of the more perfect animals of every size, that they elude not only the knife and naked eye, but even the best optical instruments hitherto invented. Since then we admit the presence of nerves in one tribe of animals, though we can only perceive them in their effects; what solid reason have we to deny them in another, in which we have the very same evidence, viz. certain indications of sense and motion?

"Another theory, and perhaps the best supported which hath yet appeared on the subject, is that of Dr Black's. That excellent chemist having observed, That not only breathing animals are of all others the warmest, but also that there subsists such a close and striking connexion between the state of respiration and the degree of heat in animals, that they appear to be in an exact proportion to one another, was led to believe, that animal-heat depends on the state of respiration; that it is all generated in the lungs by the action of the air upon the principle of inflammability, in a manner little dissimilar to what he supposed to occur in actual inflammation; and that it is thence diffused by means of the circulation over the rest of the vital system.

"This opinion is supported by many forcible arguments. 1. It is pretty generally known to naturalists, that a quantity of mephitic phlogisticated air is constantly exhaling from the lungs of living animals.—Since, therefore, atmospheric air, by passing through the lungs, acquires the very same properties as by passing through burning fuel, or by being exposed to any other process of phlogistication, it is obvious, that the change which the common air undergoes in both cases, must be attributed to one and the same cause, viz. its combination with phlogiston. 2. It has likewise been urged in favour of the same hypothesis, That the celerity with which the principle of inflammability is separated in respiration, is very closely connected with the degree of heat peculiar to each animal. Thus, man, birds, and quadrupeds, vitiate air very fast; serpents, and all the amphibious kind, very slowly; and the latter are of a temperature inferior to the former, and breathe less frequently. 3. The most cogent arguments that have been brought in support of this opinion are, That no heat is generated till the function of respiration is established; and that the *fœtus in utero* derives all its heat from the mother."

Upon this theory our author makes the following observations, which we shall give in his own words.

"These arguments may, perhaps, on a superficial view of the question, appear conclusive; but a sound reasoner, who shall coolly and impartially weigh every circumstance, will, I am confident, allow that they only afford a very ambiguous and imperfect evidence of the doctrine they are meant to establish: and the subsequent animadversions on Dr Black's theory at large, will, it is hoped, suffice to shew, that it is not only founded on dubious and controvertible principles, but that

Heat.

Dr Black's
opinion.

⁵
Objections

thiaz

that it is, in every point of light, clogged with unmountable difficulties.

"I. Many and various are the proofs which evince the improbability of the lungs being the source or elaboratory of animal-heat: for, though it be granted, that there subsists a very striking connexion between the state of respiration and the degree of heat in animals, and that they are even in proportion to one another; yet it by no means ensues, that the former is positively the cause of the latter. For, were that really the case, it is obvious, that those animals which are destitute of the organs of respiration would generate no heat. That, however, is not true in fact: for those fishes which are even destitute of gills, appear from various experiments to be warmer than the ordinary temperature of the element in which they live; an irrefragable proof that the function of respiration is not absolutely necessary to the production of heat in animals.

"II. If the heat of living animals be generated solely in the lungs, two things necessarily follow: the first, That it can only be communicated to the other parts of the body through the channel of the arterial system; the second, That the heat must decrease as it recedes from its supposed centre. And a clear and satisfactory evidence of both these points will, no doubt, be deemed requisite to render Dr Black's opinion in any degree probable. So far, however, are we from meeting with those positive and convincing proofs which we had reason to expect, that we are not prevented with a single plausible argument in favour of either of the points. On the contrary, it is more conformable to facts, that the venal blood is, if not warmer, at least as warm as the arterial. Dr Stevenson, an ingenious and accurate physiologist, with a view to ascertain this matter, laid bare the jugular vein and carotid artery of a calf, and then tied and cut them off at once, in order to let equal quantities of blood flow, in a given time, into vessels of an equal capacity, in each of which he had placed a well-adjusted thermometer; the result of the experiment was, That the thermometer immersed in the venous blood rose several degrees above that placed in the arterial. But though it is probable that there is not such a difference as that experiment seems to make, yet several reasons incline me to think, that the venous blood, instead of being colder, as Dr Black maintains, is in fact somewhat warmer, than the arterial; and what entirely overturns his opinion is, That no experiment, though many have been made, has ever shewn that the temperature of the blood is higher in the left ventricle of the heart than in the right, which must necessarily be the case, were all the heat of the animal-body generated in the lungs.

"III. Having thus rendered it improbable that the generation of animal-heat should be entirely confined to the lungs, we shall venture a step farther, and endeavour to shew, that the vital fluid, so far from acquiring all its heat in the pulmonary system, communicates no inconsiderable portion of what it had received in the course of the circulation to the air alternately entering into that organ and issuing from it. Various are the arguments which tend to evince this opinion. Were the blood heated in the lungs, we should certainly need less of their function in a warm

than in a cold atmosphere; but we are taught by experience, that when the air is extremely hot, and we wish to be cooled, we breathe full and quick; and that when it is intensely cold, our respiration is slow and languid; which, were the blood heated in the lungs by the action of the air upon it, surely should not be the case. It is therefore more consonant with reason and experience, that the air which we inspire, by carrying off a quantity of evolved phlogiston from the lungs, rather contributes to diminish than increase the heat of breathing animals. Respiration, for this reason, has been very properly compared, by an ingenious physiologist, Dr Duncan of Edinburgh, to the blowing of bellows on a hot body. In both cases a considerable degree of heat is communicated to the air: but in neither can the air be said to generate any heat; for if it did, the heat of breathing animals should increase in proportion to the quantity of air inhaled, and a piece of inert matter heated to a certain degree should become hotter by ventilation.

"IV. The *fœtus in utero*, according to Dr Black's hypothesis, generates no heat. The arguments by which he supports that position, how ingenious soever they may be, seem not sufficiently cogent to produce conviction; and as the question from its nature hardly admits of any direct experiment, our reasoning upon it must necessarily be analogical. Hence arises our embarrassment; for, as the discovering of analogies depends on the quickness and fertility of fancy, and the truth of all analogical ratiocination on the acuteness and nicety of judgment, two powers of the soul seldom united in an eminent degree, we cannot wonder that arguments of this kind, which to one man seem unanswerable, should to another appear futile.

"The only plausible objection to the generation of heat in the *fœtus*, is, the supposition that it would in a short time accumulate in such a manner as to become incompatible with life.

"This argument, however, is more specious than solid; for, granting that the circulation which is carried on between the *fœtus* and the mother, transmits very nearly the temperature of her blood, that by no means entirely supercedes the necessity of heat being generated in it. Various reasons lead to this opinion.—It is an axiom, that heat decreases as it recedes from the source from which it sprang. Now, if we admit for a moment Dr Black's opinion, and believe the heat of animals to be generated solely in the lungs, is it not obvious, that before it reaches the uterus, passes through the very minute tubes by which that organ is connected to the placenta, circulates through the umbilical vessels, and pervades the extreme parts of the *fœtus*, it must be too much diminished to support that equilibrium which obtains in every part of the living system. Besides, as the *fœtus in utero* may properly enough be accounted a part of the mother, the same objections that are brought against the generation of heat in it would hold equally good against the production of heat in any part or organ of her body, except the lungs. But such a multitude of accurate thermometrical observations have evinced the partial increase of heat in local inflammations, that no room is left to doubt, that in every individual part of the vital frame heat is generated; and if the *fœtus* be, from any cause whatever, liable to topical inflammation,

Heat.

Heat.

6
Dr Duguid's theory.

mation, a thing which no physiologist has ever pretended to deny, what shadow of reason is there for doubting that such affections are accompanied with the same effects before as after birth, and consequently with a partial increase of heat?"

Our author having now, as he supposes, refuted the opinions of others, after shewing that heat though generated cannot accumulate in the fetus, proceeds to lay down his own theory, which depends on the following principles.

1. That the blood does contain phlogiston.
2. That this phlogiston is evolved, extricated, or brought into a state of activity and motion by the action of the blood vessels to which it is subjected in the course of circulation.

3. That the evolution of phlogiston is a cause which throughout nature produces heat, whether that heat be apparently excited by mixture, fermentation, percussion, friction, inflammation, ignition, or any similar cause.

4. That this heat, which must be produced in consequence of the evolution of the phlogiston from the blood of different animals, is in all probability equal to the highest degree of heat which these animals in any case possess.

7
Objections to it.

The first and second of these propositions will readily be granted: but the third is liable to a very great objection, namely, that from putrefying bodies, phlogiston is evolved in quantity sufficient to reduce to their metallic form the calces of some metals exposed to the vapour, as Dr Duguid hath acknowledged; yet he himself affirms, that no sensible heat is produced by putrefying animal-substances. To this he is obliged to reply, that phlogiston is extricated more slowly from mixtures undergoing the putrid fermentation, than from such as are undergoing the vinous and acetous ones; and that the volatile alkali produced from putrefying substances likewise hinders the action of the phlogiston. But the first part of this answer is not proved, and is what he himself calls only a *probable conjecture*. Neither doth the second appear to be well founded: for putrefying substances, urine excepted, afford but little volatile alkali; and even putrid urine itself, which affords such a large portion, is not colder than other putrid matters.

It is however needless to insist farther on this theory, since his fundamental principle, namely, That the venous blood is warmer than the arterial, hath been shewn to be false by Mr Adair Crawford, of whose hypothesis we must now give an account.

8
Mr Crawford's theory.

This gentleman, who, in his general doctrine of heat, seems to agree with Dr Irvin of Glasgow, begins with an explanation of his terms. The words *heat* and *fire*, he tells us, are ambiguous. *Heat* in common language has a double signification. It is used indiscriminately to express a sensation of the mind, and an unknown principle, whether we call it a *quality* or a *substance*, which is the exciting cause of that sensation. The latter, he, with Dr Irvin, calls *absolute heat*; the former, *sensible heat*. The following are the general facts upon which his experiments are founded.

1. Heat is contained in great quantities in all bodies when at the common temperature of the atmosphere.

2. Heat has a constant tendency to diffuse itself over all bodies, till they are brought to the same de-

gree of sensible heat.

3. If the parts of the same homogeneous body have the same degree of sensible heat, the quantities of absolute heat will be proportionable to the bulk or quantity of matter. Thus the quantity of absolute heat contained in two pounds of water, must be conceived to be double of that which is contained in one pound, when at the same temperature.

4. The mercurial thermometer is an accurate measure of the comparative quantities of absolute heat which are communicated to the same homogeneous bodies or separated from them, as long as such bodies continue in the same form. If therefore the sensible heat of a body, as measured by the mercurial thermometer, were to be diminished the one half, or the one third, or in any given proportion, the absolute heat would be diminished in the same proportion.

5. The comparative quantities of absolute heat which are communicated to different bodies, or separated from them, cannot be determined in a direct manner by the thermometer. Thus, if the temperature of a pound of mercury be raised one degree, and that of a pound of water one degree, as indicated by the thermometer, it does not by any means follow, that equal quantities of absolute heat have been communicated to the water and the mercury. [See HEAT and THERMOMETER.]—If a pint of mercury at 100° be mixed with an equal bulk of water at 50°, the change produced in the heat of the mercury will be to that produced in the water, as three to two: from which it may be inferred, that the absolute heat of a pint of mercury is to that of an equal bulk of water, as two to three; or, in other words, that the comparative quantities of their absolute heats are reciprocally proportionable to the changes which are produced in their sensible heats, when they are mixed together at different temperatures. This rule, however, does not apply to those mixtures which generate sensible heat or cold by chemical action.

From the above position, says Mr Crawford, it follows, that equal weights of heterogeneous substances, as air and water, having the same temperature, may contain unequal quantities of absolute heat. There must, therefore, be certain essential differences in the nature of bodies, in consequence of which some have the power of collecting and retaining the element of fire in greater quantities than others, and these differences he calls throughout his treatise the *capacities* of bodies for containing heat.

Having premised these general facts, our author gives an account of a number of experiments made, in order to ascertain the quantity of absolute heat contained in different bodies. These experiments were made by mixing the bodies to be examined with water, heated to different degrees; and by the temperature of the mixture, he found the proportion of the capacity of the bodies for containing heat, to water, and, of consequence, to one another. Thus he found the capacity of wheat for containing heat to be to that of water, as 1 to 2.9; and, of consequence, the absolute heats of the two substances to be in the same proportion. The absolute heat of oats to that of water he found as 1 to 2.7; of barley, as 1 to 2.4; of beans, as 1 to 1.6; of flesh, as 1 to 1.3; of milk, as 1 to 1.1; and of a mixture of venous and arterial blood

blood from a sheep, as 25.4 to 24.4. By other experiments he determined, that the absolute heat of venous blood was to that of water, only as 100 to 112, whereas the absolute heat of arterial blood was to that of water, as 100 to 97.08.

By experiments made with air of different kinds contained in bladders, and immersed in water, he found that the absolute heat of atmospheric air was exceedingly great, being to that of water as 18.6 to 1; that of dephlogisticated air was still greater, being to the heat of common atmospheric air as 4.6 to 1. The heat of phlogisticated and fixed air was much less; that of the latter, particularly, being to the heat of atmospheric air only as 1 to 67.

From other experiments made on metals, Mr Crawford concludes, that the absolute heat of tin, in its metallic state, is to that of water as 1 to 14.7; but the heat of calcined tin is to that of water as 1 to 10.4. In like manner, the heat of iron was to that of water only as 1 to 8; but that of the calx of iron was to the heat of water as 1 to 3.1, &c. And from these experiments he is of opinion, that the more phlogiston that is added to any body, the less is its capacity for containing heat.

From these experiments our author deduces the following theory of animal-heat.—“It has been proved, that the air, which is expired from the lungs of animals, contains less absolute heat than that which is inhaled in inspiration. It has been shown, particularly, that, in the process of respiration, atmospheric air is converted into fixed air; and that the absolute heat of the former is to that of the latter, as 67 to 1.

“Since, therefore, the fixed air which is exhaled by expiration is found to contain only the one sixtieth part of the heat which was contained in the atmospheric air previous to inspiration, it follows, that the latter must necessarily deposit a very great proportion of its absolute heat in the lungs. It has moreover been shown, that the absolute heat of florid arterial blood is to that of venous as $11\frac{1}{2}$ to 10. And hence, as the blood, which is returned by the pulmonary vein to the heart, has the quantity of its absolute heat increased, it is evident that it must have acquired this heat in its passage through the lungs. We may conclude, therefore, that in the process of respiration, a quantity of absolute heat is separated from the air and absorbed by the blood.

“That heat is separated from the air in respiration, is farther confirmed by the experiment with phlogisticated air; from which, compared with Dr Priestley’s discoveries, it is manifest, that the power of any species of air in supporting animal-life, is nearly in proportion to the quantity of absolute heat which it contains, and is consequently proportionable to the quantity which it is capable of depositing in the lungs.

“The truth of this conclusion will perhaps appear in a clearer light from the following calculation, by which we may form some idea of the quantity of heat yielded by atmospheric air when it is converted into fixed air, and also of that which is absorbed during the conversion of venous into arterial blood.

“We have seen, that the same heat, which raises atmospheric air one degree, will raise fixed air nearly 67 degrees; and consequently, that the same

heat, which raises atmospheric air any given number of degrees, will raise fixed air the same number of degrees multiplied by 67. In the Peterburgh experiment of freezing quicksilver, the heat was diminished 200 degrees below the common temperature of the atmosphere. We are therefore certain, that atmospheric air, when at the common temperature of the atmosphere, contains at least 200 degrees of heat. Hence, if a certain quantity of atmospheric air, not in contact with any body that would immediately carry off the heat, should suddenly be converted into fixed air, the heat which was contained in the former would raise the latter 200 degrees multiplied by 67, or 13400 degrees. And the heat of red hot iron being 1050, it follows that the quantity of heat, which is yielded by atmospheric air when it is converted into fixed air, is such, (if it were not dissipated), as would raise the air so changed to more than 12 times the heat of red-hot iron.

“If, therefore, the absolute heat which is disengaged from the air in respiration, were not absorbed by the blood, a very great degree of sensible heat would be produced in the lungs.

“Again, it has been proved, that the same heat which raises venous blood 115 degrees, will raise arterial only 100 degrees; and consequently, that the same heat, which raises venous blood any given number of degrees, will raise arterial a less number, in the proportion of 100 to 115, or 20 to 23. But we know that venous blood contains at least 230 degrees of heat. Hence, if a certain quantity of venous blood, not in contact with any body that would immediately supply it with heat, should suddenly be converted into arterial, the heat which was contained in the former would raise the latter only $\frac{23}{115}$ of 230 degrees, or 200 degrees; and consequently the sensible heat would suffer a diminution, equal to the difference between 230 and 200, or 30 degrees. But the common temperature of blood is 96; when, therefore, venous blood is converted into arterial in the lungs, if it were not supplied by the air with a quantity of heat proportionable to the change which it undergoes, its sensible heat would be diminished 30 degrees, or it would fall from 96 to 66.

“That a quantity of heat is detached from the air, and communicated to the blood, in respiration, is moreover supported by the experiments with metals and their calces: from which it appears, that when bodies are joined to phlogiston, they lose a portion of their absolute heat; and that, when the phlogiston is again disengaged, they reabsorb an equal portion of heat from the surrounding bodies.

“Now it has been demonstrated by Dr Priestley, that in respiration, phlogiston is separated from the blood and combined with the air. During this process, therefore, a quantity of absolute heat must necessarily be disengaged from the air, by the action of the phlogiston; the blood, at the same moment, being left at liberty to unite with that portion of heat which the air had deposited.

“And hence animal-heat seems to depend upon a process similar to a chemical elective attraction. The air is received into the lungs, containing a great quantity of absolute heat. The blood is returned from the

the extremities, highly impregnated with phlogiston. The attraction of the air to the phlogiston, is greater than that of the blood. This principle will, therefore, leave the blood to combine with the air. By the addition of the phlogiston, the air is obliged to deposit a part of its absolute heat; and as the capacity of the blood is at the same moment increased by the separation of the phlogiston, it will instantly unite with that portion of heat which had been detached from the air.

"We learn from Dr Priestley's experiments with respect to respiration, that arterial blood has a strong attraction to phlogiston: it will consequently, during the circulation, imbibe this principle from those parts which retain it with least force, or from the putrescent parts of the system: and hence the venous blood, when it returns to the lungs, is found to be highly impregnated with phlogiston. By this impregnation, its capacity for containing heat is diminished. In proportion, therefore, as the blood, which had been dephlogisticated by the process of respiration, becomes again combined with phlogiston in the course of the circulation, it will gradually give out that heat which it had received in the lungs, and diffuse it over the whole system.

"Thus it appears, that, in respiration, the blood is continually discharging phlogiston and absorbing heat; and that, in the course of the circulation, it is continually imbibing phlogiston and emitting heat.

"It may be proper to add, that as the blood, by its impregnation with phlogiston, has its capacity for containing heat diminished; so on the contrary, those parts of the system from which it receives this principle, will have their capacity for containing heat increased, and will consequently absorb heat.

"Now if the changes in the capacities, and the quantities of matter changed in a given time, were such, that the whole of the absolute heat separated from the blood were absorbed, it is manifest that no part of the heat which is received in the lungs would become sensible in the course of the circulation.

"That this, however, is not the case, will, I think, be evident from the following considerations:

"We know that sensible heat is produced by the circulation of the blood; and we have proved by experiment, that a quantity of absolute heat is communicated to that fluid in the lungs, and is again disengaged from it in its progress through the system. If, therefore, the whole of the absolute heat, which is separated from the blood, were absorbed by those parts of the system from which it receives the phlogiston, it would be necessary to have recourse to some other cause, to account for the sensible heat which is produced in the circulation. But, by the rules of philosophising, we are to admit no more causes of natural things than such as are both true and sufficient to explain the appearances; for nature delights in simplicity, and affects not the pomp of superfluous causes.

"We may, therefore, safely conclude, that the absolute heat which is separated from the air in respiration, and absorbed by the blood, is the true cause of animal-heat.

"It must nevertheless be granted, that those parts of the system which communicate phlogiston to the

blood, will have their capacity for containing heat increased; and therefore, that a part of the absolute heat which is separated from the blood will be absorbed.

"But from the quantity of heat, which becomes sensible in the course of the circulation, it is manifest that the portion of heat which is thus absorbed is very inconsiderable.

"It appears, therefore, that the blood, in its progress through the system, gives out the heat which it had received from the air in the lungs: a small portion of this heat is absorbed by those particles which impart the phlogiston to the blood; the rest becomes redundant, or is converted into moving and sensible heat."

Mr Crawford's theory, which doth not essentially differ from Dr Black's, seems to be the best that hath yet appeared. There is, however, one difficulty which seems common to them all, and which, even on Mr Crawford's principles, seems not to admit of solution. The subject still uncertain.

If animal-heat entirely depends on something peculiar to a living body, why doth it sometimes continue after life hath ceased? If heat depends on the evolution of phlogiston by the action of the blood-vessels, according to Dr Dugud, why should it remain when these vessels cease to act, as, according to Dr Dugud himself, it sometimes doth? If, according to Mr Crawford, it is every moment attracted from the air, why is it not always in proportion to the respiration? Or, if fixed air contains such a small proportion of absolute heat as, by Mr Crawford's experiments, it seems to do, why doth it impart such a strong and lasting degree of heat to the bodies of those who are killed by it? See the article BLOOD, n^o 31. The conjecture mentioned under that article, n^o 32, is therefore still probable, namely, that animal-heat is occasioned by the elastic principle of fixed air; tho' in what manner it is occasioned, seems to be problematical.

Internal HEAT of the Earth. That there is a very considerable degree of heat always felt in digging to great depths in the earth, is agreed upon by all naturalists: but the quantity of this heat hath seldom been measured in any part; much less is it known, whether, in digging to an equal depth in different parts of the earth, the heat is found always the same. In digging mines, wells, &c. they find that at a little depth below the surface it feels cold. A little lower it is colder still, as being beyond any immediate influence of the sun's rays; inasmuch, that water will freeze almost at any season of the year: but when we go to the depth of 40 or 50 feet, it begins to grow warm, so that no ice can bear it; and then the deeper we go, still the greater the heat, until at last respiration grows difficult, and the candles go out.

This heat of the earth hath been variously explained. Some have had recourse to an immense body of fire lodged in the centre of the earth, which they consider as a central sun, and the great principle of the generation, vegetation, nutrition, &c. of fossil and vegetable bodies. But Mr Boyle, who had been at the bottom of some mines himself, suspects that this degree of heat, at least in some of them, may arise from the peculiar nature of the minerals generated therein. To confirm this, he inclines a mineral of a vitriolic kind, dug up in large quantities in many parts of England, which by the bare affusion of common water will grow

Heat.

so hot, that it will almost take fire.—These hypotheses are liable to the following objections. 1. If there is within the earth a body of actual fire, it seems difficult to shew why that fire should not consume and moulder away the outer shell of earth, till either the earth was totally destroyed, or the fire extinguished. 2. If the internal heat of the earth is owing to the action of water upon mineral substances, that action thro' time must have ceased, and the heat have totally vanished; but we have no reason to think, that the heat of the earth is any thing less just now than it was a thousand years ago. The phenomenon is easily explained by the propositions laid down under the article HEAT. If heat is nothing else than a certain mode of action in the ethereal fluid, or the matter of light, by which it flows out from a body in all directions as radii drawn from the centre to the circumference of a circle; it will then follow, that if an opaque body absorbs any considerable quantity of light, it must necessarily grow hot. The reason of this is plain. The body can hold no more than a certain quantity of ethereal matter; if more is continually forcing itself in, that which has already entered must go out. But it cannot easily get out, because it is hindered by the particles of the body among which it is detained. It makes an effort therefore in all directions to separate these particles from each other; and hence the body expands, and the effort of the fluid to escape is felt when we put our hands on the body, which we then say is hot. Now as the earth is perpetually absorbing the ethereal matter, which comes from the sun in an immense stream, and which we call his *light*, it is plain, that every pore of it must have been filled with this matter long ago. The quantity that is lodged in the earth, therefore, must be continually endeavouring to separate its particles from each other, and consequently must make it hot. The atmosphere, which is perpetually receiving that portion of the ethereal matter which issues from the earth, counteracts the force of the internal heat, and cools the external surface of the earth, and for a considerable way down; and hence the earth for 20 or 30 feet down, shews none of that heat which is felt at greater depths. See HEAT.

HEAT, in medicine. Great heats are not so much the immediate, as the remote, cause of a general sickness, by relaxing the fibres, and disposing the juices to putrefaction; especially among soldiers and persons exposed the whole day to the sun: for the greatest heats are seldom found to produce epidemic diseases, till the perspiration is stopped by wet clothes, fogs, dews, damps, &c.; and then some bilious or putrid distemper is the certain consequence, as fluxes and ardent intermitting fevers. Nevertheless, it must be allowed, that heats have sometimes been so great as to prove the more immediate cause of particular disorders; as when centinels have been placed without cover, or frequent reliefs in scorching heats; or when troops march or are exercised in the heat of the day; or when people imprudently lie down and sleep in the sun. All these circumstances are apt to bring on distempers, varying according to the season of the year. In the beginning of summer, these errors produce inflammatory fevers; and in autumn, a remitting fever or dysentery. To prevent, therefore, the effects of immoderate heats, commanders have found it expedient so to order the

marches, that the men come to their ground before the heat of the day; and to give strict orders, that none of them sleep out of their tents, which, in fixed encampments, may be covered with boughs to shade them from the sun. It is likewise a rule of great importance to have the soldiers exercised before the cool of the morning is over; for by that means not only the sultry heats are avoided, but the blood being cooled, and the fibres braced, the body will be better prepared to bear the heat of the day. Lastly, in very hot weather, it has often been found proper to shorten the centinels duty, when obliged to stand in the sun.

HEATH, in botany. See ERICA.

Berry-bearing HEATH. See EMPETRUM.

HEATHENS, in matters of religion. See PAGANS.

HEAVEN, literally signifies the expanse of the firmament, surrounding our earth, and extended every way to an immense distance.

The Hebrews acknowledged three heavens: the first the aerial heaven, in which the birds fly, the winds blow, and the showers are formed; the second, the firmament, in which the stars are placed; the third, the heaven of heavens, the residence of the Almighty, and the abode of saints and angels.

Heaven is considered by Christian divines and philosophers, as a place in some remote part of infinite space, in which the omnipresent Deity is said to afford a nearer and more immediate view of himself, and a more sensible manifestation of his glory, than in the other parts of the universe. This is often called the *empyrean*, from that splendor with which it is supposed to be invested; and of this place the inspired writers give us the most noble and magnificent descriptions.

The Pagans considered heaven as the residence only of the celestial gods, into which no mortals were admitted after death, unless they were deified. As for the souls of good men, they were consigned to the *elysian fields*. See ELYSIAN-FIELDS.

HEBDOMARY, a solemnity of the ancient Greeks, in honour of Apollo, in which the Athenians sung hymns to his praise, and carried in their hands branches of laurel. The word signifies the *seventh day*, this solemnity being observed on the seventh day of every lunar month.

HEBE, in fabulous history, the daughter of Juno without a father, was the goddess of Youth, and cup-bearer to Jupiter; who afterwards displaced her, and put Ganymede in her room. When Hercules was made a god, she was married to him, and then the restored Iolaus to his former youth. See IOLAUS.

HEBER, the son of Salah, and father of Peleg, from whom the Hebrews derived their name, according to Josephus, Eusebius, Jerome, Bede, and most of the interpreters of the sacred writings; but Huet bishop of Avranches, in his Evangelical Demonstration, has attempted to prove, that the Hebrews took their name from the word *heber*, which signifies *beyond*, because they came from beyond the Euphrates. Heber is supposed to have been born 2281 years B. C. and to have lived 464 years.

HEBRAISM, an idiom, or manner of speaking, peculiar to the Hebrew language. See the next article.

Heath

Hebraism.

HEBREW, or HEBREW Language, that spoken by the ancient Jews, and wherein the old Testament is wrote.

This appears to be the most ancient of all the languages in the world, at least we know of none older; and some learned men are of opinion, that this is the language in which God spoke to Adam in Paradise.

The books of the Old Testament are the only pieces to be found, in all antiquity, written in pure Hebrew; and the language of many of these is extremely sublime: it appears perfectly regular, and particularly so in its conjugations. Indeed, properly speaking, it has but one conjugation; but this is varied in each seven or eight different ways, which has the effect of so many different conjugations, and affords a great variety of expressions to represent by a single word the different modifications of a verb, and many ideas which in the modern and in many of the ancient and learned languages cannot be expressed without a periphrasis.

The primitive words, which are called *roots*, have seldom more than three letters or two syllables.

In this language there are 22 letters, only five of which are usually reckoned vowels, which are the same with ours, viz. *a, e, i, o, u*; but then each vowel is divided into two, a long and a short, the found of the former being somewhat grave and long, and that of the latter short and acute: it must however be remarked, that the two last vowels have sounds that differ in other respects besides quantity and a greater or less elevation. To these 10 or 12 vowels may be added others, called *semi-vowels*, which serve to connect the consonants, and to make the easier transitions from one to another. The number of accents in this language are, indeed, prodigious: of these there are near 40, the use of some of which, notwithstanding all the inquiries of the learned, are not yet perfectly known. We know, in general, that they serve to distinguish the sentences like the points called *commas, semicolons, &c.* in our language; to determine the quantity of the syllables; and to mark the tone with which they are to be spoken or sung. It is no wonder, then, that there are more accents in the Hebrew than in other languages, since they perform the office of three different things, which in other languages are called by different names.

HEBREWS, the descendants of Heber, commonly called *Jews*. See *HEBER* and *JEWS*.

HEBREWS, or *Epistle to the HEBREWS*, a canonical book of the New Testament.

Though St Paul did not prefix his name to this epistle, the concurrent testimony of the best authors ancient and modern afford such evidence of his being the author of it, that the objections to the contrary are of little or no weight.

The Hebrews, to whom this epistle was wrote, were the believing Jews of Palestine; and its design was to convince them, and by their means all the Jewish converts whosoever dispersed, of the insufficiency and abolishment of the ceremonial and ritual law.

HEBRIDES, the general name of some islands lying to the north-west of Scotland, of which kingdom they constitute a part. They are situated between the 55th and 59th degrees of latitude, are supposed to be

about 300 in number, and to contain 48,000 inhabitants. The names of the largest are *SKIE, MULK, ILAY, and ARRAN*. Of these islands Mr Pennant hath given the following history.

"The leisure of a calm gave ample time for reflection on the history and great events of the islands now in view, and of the others the objects of the voyage. In justice to that able and learned writer, the rev. Dr John Macpherison, late minister of Slate in Skie, let me acknowledge the assistance I receive from his ingenious essay on this very subject: for his labours greatly facilitate my attempt; not undertaken without consulting the authors he refers to; and adding numbers of remarks overseen by him, and giving a considerable continuation of the history. It would be an ostentatious task to open a new quarry, when such heaps of fine materials lie ready to my hand.

"All the accounts left us by the Greek and Roman writers are enveloped with obscurity; at all times brief, even in their descriptions of places they had easiest access to, and might have described with the most satisfactory precision; but in remote places, their relations furnish little more than hints, the food for conjecture to the visionary antiquary.

"That Pytheas, a traveller mentioned by Strabo, had visited Great Britain, I would wish to make only *apocryphal*. He asserts, that he visited the remoter parts; and that he had also seen Thule, the land of romance amongst the ancients: which all might pretend to have seen; but every voyager, to swell his fame, made the island he saw last, the Ultima Thule of his travels. If Pytheas had reached these parts, he might have observed, floating in the seas, multitudes of gelatinous animals, the *medusæ* of Linnaeus, and out of these have formed his fable: he made his *THULE a composition of neither earth, sea, nor air; but like a composition of them all*; then, catching his simile from what floated before him, compares it to the *lungs* of the sea, the Aristotelian idea of these bodies; and from him adopted by naturalists, successors to that great philosopher. Strabo very justly explodes these absurd tales; yet allows him merit in describing the climate of the places he had seen. As a farther proof of his having visited the Hebrides, he mentions their unfriendly sky, that prohibits the growth of the finer fruits; and that the natives are obliged to carry their corn under shelter, to beat the grain out, lest it should be spoiled by the defect of sun and violence of the rains. This is the probable part of his narrative; but when the time that the great geographer wrote is considered, at a period that these islands had been neglected for a very long space by the Romans, and when the difficulties of getting among a fierce and unfriendly nation must be almost insuperable, doubts innumerable, respecting the veracity of this relation, must arise. All that can be admitted in favour of him, is, That he was a great traveller: and that he might have either visited Britain, from some of the nations commercing with our isle; or received from them accounts, which he afterwards dressed out, mixed with the ornaments of fable. A traffic must have been carried on with the very northern inhabitants of our islands in the time of Pytheas; for one of the articles of commerce mentioned by Strabo, the ivory bits, were made either of the teeth of the walrus, or of a species of whale native of the northern seas.

"The

Tour in
Scotland,
ii. 200.

"The geographer Mela, who flourished in the reign of Claudius, is the next who takes notice of our lesser islands. He mentions the Orades as consisting of 30; the *Æmodæ* of seven. The Romans had then made a conquest of the former, and might have seen the latter; but, from the words of the historian, it is probable that the Shetland islands were those intended; for he informs us, that the "*Æmodæ* were carried out over against Germany;" the site of the Hebrides will not admit this description, which agrees very well with the others; for the ancients extended their Germany, and its imaginary islands, to the extreme north.

"Pliny the elder is the next that mentions these remote places. He lived later than the preceding writers, and of course his information is fuller: by means of intervening discoveries, he has added ten more to the number of the Orades; is the first writer that mentions the *Hæbudes*, the islands in question; and joins in the same line the *Æmodæ*, or, as it is in the best editions more properly written, the *Acmodæ*, or extreme point of the Roman expeditions to the north, as the Shetland isles in the highest probability were. Pliny and Mela agree in the number of the *Æmodæ*, or *Acmodæ*: the former makes that of the *Hæbudes* 30; an account extremely near the truth, deducting the little isles, or rather rocks, that surround most of the greater, and many of them too indistinct as scarcely to be remarked, except on an actual survey.

"Solinus succeeds Pliny. If he, as is supposed, was cotemporary with Agricola, he has made very ill use of the light he might have received from the expeditions of that great general: his officers might have furnished the historian with better materials than those he has communicated. He has reduced the number of the *Hæbudes* to five. He tells us, that "the inhabitants were unacquainted with corn: that they lived only on fish and milk: that they had one king, as the islands were only separated from each other by narrow straits: that their prince was bound by certain rules of government, to do justice; and was prevented by poverty from deviating from the true course, being supported by the public, and allowed nothing that he could call his own, not even a wife; but then he was allowed free choice, by turns one out of every district, of any female that caught his affection; which deprived him of all ambition about a successor.

"By the number of these islands, and by the minute attention given by the historian to the circumstance of their being separated from each other by very narrow straits, I should imagine, that which is now called the *Long island*, and includes Lewis, North Uist, Benbecula, South Uist, and Barra, to have been the five *Hæbudes* of Solinus; for the other great islands, such as Skie, &c. are too remote from each other to form the preceding very characteristic description of that chain of islands. These might naturally fall under the rule of our petty prince; almost the only probable part of Solinus's narrative.

"After a long interval appears Ptolemy, the Egyptian geographer. He also enumerates five *Ebudæ*; and has given each a name: the western, *Ebudæ*; the eastern, *Ricina*, *Maleos*, *Epidium*. Camden conjectures them to be the modern Skie, Lewis, Rathay or Raeline, Mull, and Ilay: and I will not controvert

his opinion.

"The Roman historians give very little light into the geography of these parts. Tacitus, from whom most might have been expected, is quite silent about the names of places; notwithstanding, he informs us, that a fleet by the command of Agricola performed the circumnavigation of Britain. All that he takes notice of is the discovery and the conquest of the Orkneys: it should seem, that with the biographers of an ambitious nation, nothing seemed worthy of notice, but what they could dignify with the glory of victory.

"It is very difficult to assign a reason for the change of name from *Ebudæ* to *Hebrides*: the last is modern; and seems, as the annotator on Dr Macpheron supposes, to have arisen from the error of a transcriber, who changed the *u* into *ri*.

"From all that has been collected from the ancients, it appears, that they were acquainted with little more of the Hebrides than the bare names: it is probable, that the Romans, either from contempt of such barren spots, from the dangers of seas, the violence of the tides, and horrors of the narrow sounds, in the inexperienced ages of navigation, never attempted their conquest, or saw more of them than what they had in sight during the few circumnavigations of Great Britain, which were expeditions more of ostentation than of utility.

"The inhabitants had probably for some ages their own governors; one little king to each island, or to each groupe as necessity required. It is reasonable to suppose, that their government was as much divided as that of Great Britain, which, it is well known, was under the direction of numbers of petty princes before it was reduced under the power of the Romans.

"No account is given in history of the time these islands were annexed to the government of Scotland. If we may credit our Saxon historians, they appear to have been early under the dominion of the Picts; for Bede and Adamnanus informs, that soon after the arrival of St Columba in their country, Brudeus, a Pictish monarch, made the saint a present of the celebrated island of Iona.

"But neither the holy men of this island, nor the natives of the rest of the Hebrides, enjoyed a permanent repose after this event.

"The first invasion of the Danes does not seem to be easily ascertained. It appears that they ravaged Ireland, and the isle of Rathay, as early as the year 735. In the following century, their expeditions became more frequent: Harold Harfager, or the *light-haired*, pursued, in 875, several petty princes, whom he had expelled out of Norway; who had taken refuge in the Hebrides, and molested his dominions by perpetual descents from those islands. He seems to have made a rapid conquest: he gained as many victories as he fought battles; he put to death the chief of the pirates, and made an indiscriminate slaughter of their followers. Soon after his return, the islanders repossessed their ancient seats: and, in order to repress their insults, he sent Ketil the *fat-nosed*, with a fleet and some forces for that purpose. He soon reduced them to terms, but made his victories subservient to his own ambition: he made alliances with the *reguli* he had

Hebrides.

subdued; he formed intermarriages, and confirmed to them their old dominions. This effected, he sent back the fleet to Harold; openly declared himself independent; made himself prince of the Hebrides; and caused them to acknowledge him as such, by the payment of tribute and the badges of vassalage. Ketil remained, during life, master of the islands; and his subjects appear to have been a warlike set of freebooters, ready to join with any adventurers. Thus when Eric, son of Harold Harfager, after being driven out of his own country, made an invasion of England, he put with his fleet into the Hebrides, received a large reinforcement of people fired with the hopes of prey, and then proceeded on his plan of rapine. After the death of Ketil, a kingdom was in after-times composed out of them, which, from the residence of the little monarch in the isle of Man, was styled that of *Man*. The islands became tributary to that of Norway for a considerable time, and princes were sent from thence to govern; but at length they again shook off the yoke. Whether the little potentates ruled independent, or whether they put themselves under the protection of the Scottish monarchs, does not clearly appear; but it is reasonable to suppose the last, as Donald-bane is accused of making the Hebrides the price of the assistance given him by the Norwegians against his own subjects. Notwithstanding they might occasionally seek the protection of Scotland, yet they never were without princes of their own: policy alone directed them to the former. From the chronicles of the kings of Man we learn, that they had a succession of princes.

"In 1089 is an evident proof of the independency of the islanders on Norway; for, on the death of Lagman, one of their monarchs, they sent a deputation to O'Brian king of Ireland, to request a regent of royal blood to govern them during the minority of their young prince. They probably might in turn compliment in some other respects their Scottish neighbours: the islanders must have given them some pretence to sovereignty; for,

"In 1093, Donald-bane, king of Scotland, calls in the assistance of Magnus the Barefooted, king of Norway, and bribes him with the promise of all the islands. Magnus accepts the terms; but at the same time boasts, that he does not come to invade the territories of others, but only to resume the ancient rights of Norway. His conquests are rapid and complete; for, besides the islands, by an ingenious fraud he adds Cantyre to his dominions.

"The Hebrides continued governed by a prince dependent on Norway, a species of viceroy appointed by that court; and who paid, on assuming the dignity, ten marks of gold, and never made any other pecuniary acknowledgment during life: but if another viceroy was appointed, the same sum was exacted from him. These viceroys were sometimes Norwegians, sometimes natives of the isles. In 1097 we find, that Magnus deputed a nobleman of the name of Ingemund: in after-times we learn, that natives were appointed to that high office. Thus were the Hebrides governed, from the conquest by Magnus, till the year 1263, when Acho, or Haquin, king of Norway, by an unfortunate invasion of Scotland, terminating in his defeat at Largs, so weakened the powers of his

Hebrides.

kingdom, that his successor Magnus IV. was content to make a cession of the islands to Alexander III.; but not without stipulating for the payment of a large sum, and of a tribute of a hundred marks for ever, which bore the name of the *annual of Norway*. Ample provision was also made by Magnus in the same treaty, for the security of the rights and properties of his Norwegian subjects, who chose to continue in the isles; where many of their posterity remain to this day.

"Notwithstanding this revolution, Scotland seems to have received no real acquisition of strength. The islands still remained governed by powerful chieftains, the descendants of Somerled, thane of Heregaidel, or Argyle, who, marrying the daughter of Olave, king of Man, left a divided dominion to his sons Dugal and Reginald: from the first were descended the Macdougals of Lorn; from the last, the powerful clan of the Macdonalds. The lordship of Argyle, with Mull, and the islands north of it, fell to the share of the first; Ilay, Cantyre, and the southern isles, were the portion of the last: a division that formed the distinction of the Sudereys and Nordereys, [as farther noticed in the article *IONA*.]

"These chieftains were the scourges of the kingdom: they are known in history but as the devastators of a tempest; for their paths were marked with the most barbarous desolation. Encouraged by their distance from the seat of royalty, and the turbulence of the times, which gave their monarchs full employ, they exercised a regal power, and often assumed the title; but are more generally known in history by the style of the *lord of the isles*, or the earls of Rofs; and sometimes by that of the *Great Macdonald*.

"Historians are silent about their proceedings, from the retreat of the Danes, in 1263, till that of 1335, when John, lord of the isles, withdrew his allegiance. In the beginning of the next century his successors were so independent, that Henry IV. entered into a formal alliance with the brothers Donald and John. This encouraged them to commit fresh hostilities against their natural prince. Donald, under pretence of a claim to the earldom of Rofs, invaded and made a conquest of that county; but penetrating as far as the shire of Aberdeen, after a fierce but undecided battle with the royal party, thought proper to retire, and in a little time to swear allegiance to his monarch James I. But he was permitted to retain the county of Rofs, and assume the title of earl. His successor, Alexander, at the head of 10,000 men, attacked and burnt Inverness; at length, terrified with the preparations made against him, he fell at the royal feet, and obtained pardon as to life, but was committed to strict confinement.

"His kinsman and deputy, Donald Balloch, representing the imprisonment of his chieftain, excited another rebellion, and destroyed the country with fire and sword: but on his flight was taken and put to death by an Irish chieftain, with whom he fought protection.

"These barbarous inroads were very frequent with a set of banditti, who had no other motive in war but the infamous inducement of plunder.

"In the reign of James II. in the year 1461, Donald, another petty tyrant, an earl of Rofs, and lord of the isles, renewed the pretence of independency; fur-

surprised the castle of Inverness; forced his way as far as Athol; and obliged the earl and countess, with the principal inhabitants, to seek refuge in the church of St Bridget, in hopes of finding security from his cruelty by the sanctity of the place: but the barbarian and his followers set fire to the church, put the ecclesiastics to the sword, and, with a great booty, carried the earl and countess prisoners to his castle of Claig, in the island of Ilay. In a second expedition, immediately following the first, he suffered the penalty of his impiety: a tempest overtook him, and overwhelmed most of his associates; and he, escaping to Inverness, perished by the hands of an Irish harper: his surviving followers returned to Ilay, conveyed the earl and countess of Athol to the sanctuary they had violated, and expiated their crime by restoring the plunder, and making large donations to the shrine of the offended saint.

"John, successor to the last earl of Ross, entered into alliance with Edward IV. and sent ambassadors to the court of England, where Edward empowered the bishop of Durham and earl of Winchester to conclude a treaty with him, another Donald Balloch, and his son and heir John. They agreed to serve the king with all their power, and to become his subjects: the earl was to have a hundred marks sterling for life in time of peace, and two hundred pounds in time of war; and these island allies, in case of the conquest of Scotland, were to have confirmed to them all the possessions benorth of the Scottish sea; and in case of a truce with the Scottish monarch, they were to be included in it. But about the year 1476, Edward, from a change of politics, courted the alliance of James III. and dropt his new allies. James, determined to subdue this rebellious race, sent against them a powerful army, under the earl of Athol; and took leave of him with this good wish, *Furth, Fortune, and fill the fetters*; as much as to say, "Go forth, be fortunate, and bring home many captives;" which the family of Athol have used ever since for its motto. Ross was terrified into submission; obtained his pardon; but was deprived of his earldom, which by act of parliament was then declared unalienably annexed to the crown: at the same time the king restored to him Knapdale and Cantyre, which the earl had resigned; and invested him anew with the lordship of the isles, to hold them of the king by service and relief.

"Thus the great power of the isles was broken: yet for a considerable time after, the petty chieftains were continually breaking out into small rebellions, or harassed each other in private wars; and tyranny seems but to have been multiplied. James V. found it necessary to make the voyage of the isles in person, in 1536; seized and brought away with him several of the most considerable leaders; and obliged them to find security for their own good behaviour, and that of their vassals. The names of these chieftains were (according to Lindesey), *Mydyart, Mac-connel, Mac-loyd of the Lewis, Mac-niel, Mac-lane, Mac-intosh, John Mydyart, Mac-kay, Mac-kenzie*, and many others: but by the names of some of the above, there seem to have been continental as well as insular male-

contents. He examined the titles of their holdings; and finding several to have been usurped, re-mitted their lands to the crown. In the same voyage he had the glory of causing a survey to be taken of the coasts of Scotland, and of the islands, by his pilot Alexander Lindesey; which were published in 1583, at Paris, by Nicholas de Nicholas, geographer to the French monarch.

"The troubles that succeeded the death of James occasioned a neglect of these insulated parts of the Scottish dominions, and left them in a state of anarchy. In 1614, the Mac-donalds made a formidable insurrection, oppugning the royal grant of Cantyre to the earl of Argyle and his relations. The petty chieftains continued in a sort of rebellion; and the sword of the greater, as usual in weak government, was employed against them: the encouragement and protection given by them to pirates, employed the power of the Campbells during the reign of James VI. and the beginning of that of Charles I. (A).

"But the turbulent spirit of the old times continued even to the present age. The heads of Clans were by the divisions, and a false policy that predominated in Scotland during the reign of William III. flattered with an unreal importance: instead of being treated as bad subjects, they were courted as desirable allies: instead of feeling the hand of power, money was allowed to bribe them into the loyalty of the times. They would have accepted the subsidies, notwithstanding they detested the prince that offered them. They were taught to believe themselves of such consequence, that in these days turned to their destruction. Two recent rebellions gave legislature a late experience of the folly of permitting the feudal system to exist in any part of its dominions. The act of 1748, for abolishing heretable jurisdictions, at once deprived the chieftains of all power of injuring the public by their commotions. Many of these *Reguli* second this effort of legislature, and neglect no opportunity of rendering themselves hateful to their unhappy vassals, the former instruments of their ambition."

"The situation of these islands in the great Atlantic ocean renders the air cold and moist in the greater part of them. In the most northerly isles the sun, at the summer solstice, is not above an hour under the horizon at midnight, and not longer above it at mid-day in the depth of winter. The soil of the Hebrides varies also in different isles, and in different parts of the same island: some are mountainous and barren, producing little else than heath, wild myrtle, fern, and a little grass; while others, being cultivated and manured with sea-weed, yield plentiful crops of oats and barley.

"Lead mines have been discovered in some of these islands, but not worked to much advantage; the people being unskilful, and fuel extremely scarce: others have been found to contain quarries of marble, limestone, and free-stone; and many are deluged with iron, talc, crystals, and many curious pebbles, some of which emulate the Brazilian topaz.

"With respect to vegetables, over and above the plentiful harvests of corn that the natives earn from

(A) In the beginning of the last century the islanders were continually harassing Ireland with their plundering incursions, or landing there to support rebellions: at length it was made treason to receive these Hebridian Redshanks, as they were styled.

Hebrides.

agriculture, and the pot-herb and roots that are planted in gardens for the sustenance of the people, these islands produce spontaneously a variety of plants and simples, used by the islanders in the cure of their diseases; but there is hardly a shrub or tree to be seen, except in a very few spots, where some gentlemen have endeavoured to rear them with much more trouble than success.

"The animals, both of the land and sea, domestic and wild, quadrupeds, fowls, and fishes, found in and about these islands, are of the same species, size, and configuration, with those of the ORKNEYS.

"The people inhabiting these islands are of the same race with those who live in the Highlands of Scotland; speak the same language, wear the same habit, and observe the same customs. [See the article HIGHLANDS.]

"The commodities which may be deemed the staples of this country, are black cattle, sheep, and fish, which they sell to their fellow-subjects of Scotland. Part of the wool they work up into knit-stockings, coarse cloth, and that variegated stuff called *tartan*. They likewise salt mutton in the hide, and export it in boats, or barklings, to different parts of the main land. Cod, ling, mackerel, whiting, haddock, and soles, are here caught in abundance, together with a small red cod, remarkably voracious, of a very delicate flavour: there are likewise two kinds of white fish, which seem to be peculiar to this coast, known by the names of *lithe* and *cea*, esteemed good eating: but the greatest treasure the ocean pours forth, is the prodigious quantity of herrings, which, at one season of the year, swarm in all the creeks and bays along the western shore of Scotland. These are counted the largest, fattest, and finest herrings caught in any part of the northern seas. This fishery employs a great number of hands, and brings a considerable advantage to the kingdom. The fish are caught, cured, barrelled up, and exported: but whether from want of skill, or a proper salt for pickling, the Scotch-cured herrings of this coast, though superior to all others in their natural state, are counted inferior to those which are dressed and pickled by the Dutch fishermen.

"How mean and contracted soever the commerce and produce of these islands may be at present, they are, perhaps, more capable of improvement, in both articles, than any part of the British dominions in Europe. The inhabitants are so little skilled in husbandry, that the soil, though generally good in the low grounds, yields nothing but scanty crops of oats and barley; and great tracts of land lie altogether uncultivated. If a very small number of judicious farmers would settle in some of the most considerable islands, they would soon raise such harvests as would enrich themselves; employ and maintain all the idle people, a great number of whom are obliged to repair to foreign countries for subsistence; afford sufficient bread for the inhabitants, and even supply the barren parts of the opposite continent. The soil, in many places, would produce wheat, and in almost every where would give good pasturage, inasmuch that, with proper culture, the people might provide hay and fodder for their cattle, which, during the severity of the winter, die in great numbers for want of provision. Improvements of this

Hebrides.

kind would be the more easily made, as the sea-shore abounds with shells for lime, and sea weeds for manure; and the labourers would be easily subsisted by the fish that swarm, not only in the ocean which surrounds these islands, but likewise in the numerous lakes and rivers of fresh water. Martin declares, that he knew 100 families in this country maintained by as many little farms, the rent of each not exceeding 5 s. one sheep, and a few pecks of oats.

"The commerce of these islands might be extended in such a manner as to render them a staple of trade, and an excellent nursery for seamen. They are furnished with an infinite number of bays, creeks, and harbours, for the convenience of navigation: the inhabitants are numerous, strong, active, and every way qualified for the life of a mariner. The sea affords myriads of fish for exportation: the lands might afford plenty of pasturage for black cattle, horses, and sheep, as well as plenteous harvests of corn, and other grain: woollen and linen manufactures might be prosecuted to great advantage, where labour is cheap and provisions are reasonable. The islands afford good stone and lime; and some parts of the opposite main land, timber for building: they have plenty of fuel, not only for the ordinary purposes of life, but also for salt-pans, which might be erected on different parts of the coast; and for burning sea-ware for the use of a glass or soap manufacture. Finally, the situation of these islands is so commodious for trade, that the navigator is immediately in the open sea, and almost in the neighbourhood of Denmark, Sweden, Hamburg, Holland; nay, with a favourable wind, he can reach the coasts of France and Spain in a week's sailing; if he is bound for the British plantations, or indeed for any part of the known globe, he is at once disencumbered of the land, and prosecutes his voyage thro' the open sea without obstruction or difficulty."

New Hebrides, a cluster of islands lying in the Great South Sea, or Pacific Ocean. The northern islands of this archipelago were first discovered by that great navigator Quiros in 1606, and, not without reason, considered as a part of the southern continent, which at that time, and till very lately, was supposed to exist. They were next visited by M. de Bougainville in 1768, who, besides landing on the island of Lepers, did no more than discover that the land was not connected, but composed of islands, which he called the *Great Cyclades*. Captain Cook, besides ascertaining the extent and situation of these islands, added the knowledge of several in this group which were before unknown: he explored the whole cluster; and thinking himself thereby entitled to affix to them a general appellation, he named them the *New Hebrides*. They are situated between latitudes of 14 deg. 25 min. and 20 deg. 4 min. south; and between 166 deg. 41 min. and 170 deg. 21 min. east longitude; and extend one hundred and twenty-five leagues in the direction of north-north-west, and south-south-east. The most northern part of this archipelago was called by M. de Bougainville the *Peak of the Etioile*. The whole cluster consists of the following islands; some of which have received names from the different European navigators; others retain the names which they bear

polis.

bear among the natives, viz. Tierra del Esperitu Santo, Mallicollo, St Bartholomew, Isle of Lepers, Aurora, Whitfuntide, Ambrym, Immer, Apee, Three Hills, Sandwich, Montagu, Hinchinbrook, Shepherd, Eoramanga, Ironan, Annatom, and Tanna.

HEBRON (anc. geog.), a very ancient city situated in the hilly country of the tribe of Judah to the south. Its more ancient name was *Kiriath Arba*, or *Cariath Arba*. In antiquity this city vied with the most ancient cities of Egypt, being seven years prior to Zoan, translated *Tanis* by the seventy. Josephus makes it not only older than Tanis, but even than Memphis. It stood to the west of the lake Asphaltites, and was for some time the royal residence of David. After the captivity, it fell into the hands of the Edomites, as did all the fourth country of Judaea.

HECATE, in Pagan worship, a goddess called *Luna* in heaven, *Diana* on earth, and *Hecate* in the infernal regions. But others represent her as a distinct deity. She was the goddess of the infernal regions, and of inevitable fate. She presided over streets and highways, for which reason she was called *Tricia*; and the doors of houses being under her protection, she was called *Proptylea*. She was also famous for her skill in poisonous roots and herbs, incantments, and magical arts, in the practice of which her name was constantly invoked.

HECATOMB, HECATOMBE, in antiquity, a sacrifice of 100 beasts of the same kind, at 100 altars, and by 100 priests or sacrificers.—The word is formed of the Greek *εκατομβη* which properly signifies a sumptuous or magnificent sacrifice.—Others derive it from the Greek *εκατον, centum*, “a hundred, and *εως, bos*, “bullock,” &c.; on which footing the hecatomb should be a sacrifice of 100 bullocks.—Others derive the word from *εκατον, and πους, pes*, “foot;” and on that principle hold, that the hecatomb might consist of only 25 four-footed beasts. They add, that it did not matter what kind of beasts were chose for victims, provided the quota of feet were but had.

Pythagoras is said to have sacrificed a hecatomb to the muses, of 100 oxen, in joy and gratitude for his discovering the demonstration of the 47th proposition of the first book of Euclid, viz. that, in a rectangled triangle, the square of the hypothenuse is equal to the squares of the two other sides.

For the origin of hecatombs: Strabo relates, that there were 100 cities in Laconia, and that each city used to sacrifice a bullock every year for the common safety of the country; whence the institution of the celebrated sacrifice of 100 victims, called *hecatombs*. Others refer the origin of hecatombs to a plague, where-with the 100 cities of Peloponnesus were afflicted; for the removal whereof, they jointly contributed to so splendid a sacrifice.

Julius Capitolinus relates, that for a hecatomb they erected 100 altars of turf, and on these sacrificed 100 sheep, and 100 hogs. He adds, that when the emperors offered sacrifices of this kind, they sacrificed 100 lions, 100 eagles, and 100 other beasts of the like kind.

HECATOMPOLIS, (anc. geog.), a surname of the island of Crete, from its 100 cities. The territory of Laconia also had anciently this name, for the same reason; and the custom of these 100 cities was to fa-

crifice a hecatomb annually.

HECATOMPYLOS, (anc. geog.) the metropolis of Parthia, and royal residence of Arsaces, situated at the springs of the Araxes. Thebes, in Egypt, had also the same name, from its 100 gates.

HECK, an engine to take fish. A salmon heck is a grate for catching that sort of fish.

HECTIC FEVER. See (the *Index* subjoined to) MEDICINE.

HECTOR, the son of Priam and Hecuba, and the father of Altyanax, is celebrated for the valour with which he defended the city of Troy against the Greeks. He was killed by Achilles, who dragged his body, fastened to his chariot, thrice round the walls of Troy, and afterwards restored it to Priam for a large ransom. See *Troy*.

HERERA, Ivy, in botany, a genus of the monogynia order, belonging to the pentandria class of plants.

Species. 1. The helix, or common ivy, grows naturally in many parts of Britain; and, where it meets with any support, will rise to a great height, sending out roots on every side, which strike into the joints of walls or the bark of trees. If there is no support, they trail on the ground, and take root all their length, so that they closely cover the surface, and are difficult to eradicate. While these stalks are fixed to any support, or trail upon the ground, they are slender and flexible; but when they have reached to the top of their support, they shorten and become woody, forming themselves into large bushy heads, and their leaves are larger, more of an oval shape, and not divided into lobes like the lower leaves, so that it hath a quite different appearance. There are two varieties of this species, one with silver-striped leaves, the other with yellowish leaves on the top of the branches; and these are sometimes admitted into gardens. 2. The quinquifolia, or Virginia creeper, is a native of all the northern parts of America. It was first brought to Europe from Canada; and has been long cultivated in the British gardens, chiefly to plant against walls or buildings to cover them: which these plants will do in a short time; for they will shoot almost 20 feet in one year, and will mount up to the top of the highest building: but as the leaves fall off in autumn, the plants make but an indifferent appearance in winter, and therefore are proper only for such situations as will not admit of better plants; for this will thrive in the midst of cities, and is not injured by smoke or the closeness of the air.

Culture. The first species is easily propagated by its trailing branches, and will thrive in almost any soil or situation. The second may be propagated by cuttings; which if planted in autumn in a shady border will take root, and by the following autumn will be fit to plant in those places where they are designed to remain.

Uses. The roots of the ivy are used by leather-cutters to whet their knives upon. Apricots and peaches covered with ivy during the month of February, have been observed to bear fruit plentifully. The leaves have a nauseous taste; Haller says, they are given to children in Germany as a specific for the atrophy. The common people of England apply them to issues; and an ointment made from them is in great esteem among the

Hecatomb-
pylos
||
Hedera.

*Hederaceæ,
Hedges.*

the Highlanders of Scotland as a ready cure for burns. The berries have a little acidity. When fully ripe, a dose of them has been recommended in the plague. In warm climates, a refinous juice exudes from the stalks, which is said to be a powerful resolvent and discutient, and an excellent ingredient in plasters and ointments adopted for those purposes. Horses and sheep eat the plant; goats and cows refuse it.—Cæsar Baubine and Tournefort mention a sort of ivy that grows in many of the islands of the Archipelago, to which they have given the name of the *poet's ivy*, because the ancients are said to have made crowns of this plant for adorning the brows of their poets. By others it is called *hedera dionysia*, because they made use of the same sort of ivy in their public rejoicings and feasts in honour of Bacchus. The berries are of a fine gold colour, whence this species has been termed by others *chrysocarpus*.

HEDERACEÆ, (from *hedera* “ivy.”) The name of the 46th order in Linnæus’s fragments of a natural method, consisting of ivy, and a few other genera nearly from their general habit and appearance seem nearly allied to it. See BOTANY, p. 1315.

HEDGES, in agriculture, are either planted to make fences round inclosures, or to divide the several parts of a garden. When they are designed as outward fences, they are planted either with hawthorn, crabs, or black-thorn; but those hedges which are planted in gardens, either to surround wilderness-quarters, or to screen the other parts of a garden from sight, are planted according to the fancy of the owner; some preferring ever-greens, in which case the holly is best; next the yew, then the laurel, laurustinus, phillyrea, &c. Others prefer the beech, the hornbeam, and the elm.

Before planting, it is proper to consider the nature of the land, and what sort of plants will thrive best in it; and also, what is the soil from whence the plants are to be taken. As for the size, the sets ought to be about the thickness of one’s little finger, and cut within about four or five inches of the ground; they ought to be fresh taken up, straight, smooth, and well rooted. Those plants that are raised in the nursery, are to be preferred.

In planting outside hedges, the turf is to be laid, with the grass-side downwards, on that side of the ditch the bank is designed to be made; and some of the best mould should be laid upon it to bed the quick, which is to be set upon it a foot asunder. When the first row of quick is set, it must be covered with mould; and when the bank is a foot high, you may lay another row of sets against the spaces of the former, and cover them as you did the others: the bank is then to be topped with the bottom of the ditch, and a dry or dead-hedge laid, to shade and defend the under-plantation. Stakes should then be driven into the loose earth, so low as to reach the firm ground: these are to be placed at about two feet and a half distance: and in order to render the hedge yet stronger, you may edder it, that is, bind the top of the stakes with small long poles, and when the eddering is finished, drive the stakes anew.

The quick must be kept constantly weeded, and secured from being cropped by cattle; and in February it will be proper to cut it within an inch of the ground, which will cause it strike root afresh, and help it much

in the growth.

The crab is frequently planted for hedges; and if the plants are raised from the kernels of the small wild crabs, they are much to be preferred to those raised from the kernels of all sorts of apples without distinction; because the plants of the true small crab never shoot so strong as those of the apples, and may therefore be better kept within the proper compals of an hedge.

The black-thorn, or sloe, is frequently planted for hedges: and the best method of doing it, is to raise the plants from the stones of the fruit, which should be sown about the middle of January, if the weather will permit, in the place where the hedge is intended; but when they are kept longer out of the ground, it will be proper to mix them with sand, and keep them in a cool place. The same fence will do for it when sown, as when it is planted.

The holly is sometimes planted for hedges; but where it is exposed, there will be great difficulty in preventing its being destroyed: otherwise, it is by far the most beautiful plant; and, being an ever-green, will afford much better shelter for cattle in winter than any other sort of hedge. The best method of raising these hedges, is to sow the stones in the place where the hedge is intended; and, where this can be conveniently done, the plants will make a much better progress than those that are transplanted: but these berries should be buried in the ground several months before they are sown. The way to do this, is to gather the berries about Christmas, when they are usually ripe, and put them into large flower-pots, mixing some sand with them; then dig holes in the ground, into which the pots must be sunk, covering them over with earth, about ten inches thick. In this place they must remain till the following October, when they should be taken up, and sown in the place where the hedge is intended to be made. The ground should be well trenched, and cleared from the roots of all bad weeds, bushes, trees, &c. Then two drills should be made, at about a foot distance from each other, and about two inches deep, into which the seeds should be scattered pretty close, lest some should fail. When the plants grow up, they must be carefully weeded: and if they are designed to be kept very neat, they should be cut twice a year, that is in May and in August; but if they are only designed for fences, they need only be sheered in July. The fences for these hedges, while young, should admit as much free air as possible: the best sort are those made with posts and rails, or with ropes drawn through holes made in the posts; and if the ropes are painted over with a composition of melted pitch, brown Spanish colour and oil, well mixed, they will last several years.

Hedges for ornament in gardens are sometimes planted with ever-greens, in which case the holly is preferable to any other: next to this, most people prefer the yew; but the dead colour of its leaves renders those hedges less agreeable. The laurel is one of the most beautiful ever-greens; but the shoots are so luxuriant that it is difficult to keep it in any tolerable shape; and as the leaves are large, to prevent the disagreeable appearance given them by their being cut through with the sheers, it will be the best way to prune them with a knife, cutting the shoots just down to a leaf. The laurustinus is a very fine plant

Hedges.

Hedges.

plant for this purpose; but the same objection may be made to this as to the laurel: this, therefore, ought only to be pruned with a knife in April, when the flowers are going off; but the new shoots of the same spring fruit by no means be shortened. The small-leaved and rough-leaved *laurulus* are the best plants for this purpose. The true *phillyrea* is the next best plant for hedges, which may be led up to the height of 10 or 12 feet; and if they are kept narrow at the top, that there may be not too much width for the snow to lodge upon them, they will be close and thick, and make a fine appearance. The *ilex*, or ever-green oak, is also planted for hedges, and is a fit plant for those designed to grow very tall.—The deciduous plants usually planted to form hedges in gardens are, The hornbeam, which may be kept neat with less trouble than most other plants. The beech, which has the same good qualities as the hornbeam; but the gradual falling of its leaves in winter causes a continual litter. The small-leaved English elm is a proper tree for tall hedges, but these should not be planted closer than eight or ten feet. The lime-tree has also been recommended for the same purpose; but after they have stood some years, they grow very thin at bottom, and their leaves frequently turn of a black disagreeable colour.

Many of the flowering shrubs have also been planted in hedges, such as roses, honeysuckles, sweet-briar, &c. but these are difficult to train; and if they are cut to bring them within compass, their flowers, which are their greatest beauty, will be entirely destroyed.

Mr Anderson who hath treated the subject of hedging very particularly, is of opinion, that some other plants besides those abovementioned, might be usefully employed in the construction of hedges. Among these he reckons the common willow. This, he says, by no means requires the wetness of soil which is commonly supposed. "It is generally imagined, (says he,) that the willow can be made to thrive no where except in wet or boggy ground: but this is one of those vulgar errors, founded upon inaccurate observation, too often to be met with in subjects relating to rural affairs; for, experience has sufficiently convinced me, that this plant will not only grow, but thrive, in any rich well-cultivated soil, (unless in particular circumstances that need not here be mentioned), even altho' it be of a very dry nature. It could not, however, in general, be made to thrive, if planted in the same manner as thorns; nor would it, in any respect, be proper to train it up for a fence in the same way as that plant. The willow, as a fence, could seldom be successfully employed, but for dividing into separate inclosures any extensive field of rich ground: and, as it is always necessary to put the soil into as good order as possible before a hedge of this kind is planted in it, the easiest method of putting it into the necessary high tilth, will be to mark off the boundaries of your several fields in the winter, or early in the spring, with a design to give a complete fallow to a narrow ridge, six or eight feet broad, in the middle of which the hedge is intended to be planted the ensuing winter. This ridge ought to be frequently ploughed during the summer-season, and in autumn to be well manured with dung, or lime, or both, (for it cannot be made too rich) and be neatly formed into a ridge before winter.

Hedges.

"Having prepared the ground in this manner, it will be in readiness to receive the hedge, which ought to be planted as early in winter as can be got conveniently done; as the willow is much hurt by being planted late in the spring. But before you begin to make a fence of this kind, it will be necessary to provide a sufficient number of plants: which will be best done by previously rearing them in a nursery of your own, as near the field to be inclosed as you can conveniently have it; for, as they are very bulky, the carriage of them would be troublesome if they were brought from any considerable distance. The best kinds of willow for this use, are such as make the longest and strongest shoots, and are not of a brittle nature. All the large kinds of hoop-willows may be employed for this use; but there is another kind with stronger and more taper shoots, covered with a dark green bark when young, which, upon the older shoots, becomes of an ash-gray, of a firm texture, and a little rough to the touch. The leaves are not so long, and a great deal broader than those of the common hoop-willow, pretty thick, and of a dark-green colour. What name this species is usually known by, I cannot tell; but, as it becomes very quickly of a large size at the root, and is strong and firm, it ought to be made choice of for this purpose in preference to all other kinds that I have seen. The shoots ought to be of two or three years growth before they can be properly used, and should never be less than eight or nine feet in length. These ought to be cut over close by the ground immediately before planting, and carried to the field at their whole length. The planter having stretched a line along the middle of the ridge which was prepared for their reception, begins at one end thereof, thrusting a row of these plants firmly into the ground, close by the side of the line, at the distance of 18 or 20 inches from one another; making them all slant a little to one side in a direction parallel to the line. This being finished, let him begin at the opposite end of the line, and plant another row in the intervals between the plants of the former row; making these incline as much as the others, but in a direction exactly contrary; and then, plaiting these basket-ways, work them into lozenges like a net, fastening the tops by plaiting the small twigs with one another, which with very little trouble may be made to bind together very firmly. The whole, when finished, assumes a very beautiful net-like appearance, and is even at first a tolerable good defence: and, as these plants immediately take root and quickly increase in size, it becomes, after a few years, a very strong fence which nothing can penetrate. This kind of hedge I myself have employed; and find that a man may plant and twist properly about a hundred yards in a day, if the plants be laid down to his hand: and, in a situation such as I have described, I know no kind of fence which could be reared at such a small expence, so quickly become a defence, and continue so long in good order. But it will be greatly improved by putting a plant of *eglantine* between each two plants of willow, which will quickly climb up and be supported by them; and, by its numerous prickles would effectually preserve the defenceless willow from being browsed upon by cattle.

"As it will be necessary to keep the narrow ridge, upon..

Hedges.

upon which the hedge is planted in culture for one year at least, that the plants of eglantine may not be choked by weeds, and that the roots of the willow may be allowed to spread with the greater ease in the tender mold produced by this means, it will be proper to stir the earth once or twice by a gentle horse-hoe in the beginning of summer; and, in the month of June, it may be sowed with turnips, or planted with coleworts, which will abundantly repay the expence of the fallow."

The same author also gives the following useful directions for planting hedges in situations very much exposed to the weather, and recovering them when on the point of decaying. "Those who live in an open uncultivated country, have many difficulties to encounter, which others who inhabit more warm and sheltered regions never experience; and, among these difficulties, may be reckoned that of hardly getting hedges to grow with facility. For, where a young hedge is much exposed to violent and continued gusts of wind, no art will ever make it rise with so much freedom, or grow with such luxuriance, as it would do in a more sheltered situation and favourable exposure.

"But, although it is impossible to rear hedges, in this situation, to so much perfection as in the others, yet they may be reared even there, with a little attention and pains, so as to become very fine fences.

"It is advisable, in all cases, to plant the hedges upon the face of a bank; but it becomes absolutely necessary in such an exposed situation as that I have now described: for the bank, by breaking the force of the wind, screens the young hedge from the violence of the blast, and allows it to advance, for some time at first, with much greater luxuriance than it otherwise could have done.

"But, as it may be expected soon to grow as high as the bank, it behoves the provident husbandman to prepare for that event, and guard, with a wise foresight, against the inconvenience that may be expected to arise from that circumstance.

"With this view, it will be proper for him, instead of making a single ditch, and planting one hedge, to raise a pretty high bank, with a ditch on each side of it, and a hedge on each face of the bank; in which situation, the bank will equally shelter each of the two hedges, while they are lower than it; and, when they at length become as high as the bank, the one hedge will in a manner afford shelter to the other, so as to enable them to advance with much greater luxuriance than either of them would have done singly.

"To effectuate this still more perfectly, let a row of service-trees be planted along the top of the bank, at the distance of 18 inches from each other, with a plant of eglantine between each two services. This plant will advance, in some degree, even in this exposed situation; and, by its numerous shoots, covered with large leaves, will effectually screen the hedge on each side of it, which, in its turn, will receive some support and shelter from them, so that they will be enabled to advance all together, and form, in time, a close, strong, and beautiful fence.

"The *service* is a tree but little known in Scotland; although it is one of those that ought perhaps to be often cultivated there in preference to any other tree whatever, as it is more hardy, and, in an exposed situ-

ation, affords more shelter to other plants than almost any other tree I know: for it sends out a great many strong branches from the under part of the stem, which, in time, assume an upright direction, and continue to advance with vigour, and carry many leaves to the very bottom, almost as long as the tree exists; so that, if it is not pruned, it rises a large cloe bush, till it attains the height of a forest-tree.

"It is of the same genus with the rawn-tree—and has a great resemblance to it both in flower and fruit; its branches are more waving and pliant—its leaves undivided, broad and round, somewhat resembling the elm, but white and mealy on the under side. It deserves to be better known than it is at present.

"But if, from the poorness of the soil in which your hedge is planted, or from any other cause, it should so happen, that, after a few years, the hedge becomes sickly, and the plants turn poor and stunted in appearance, the easiest and only effectual remedy for that disease, is to cut the stems of the plants clean over, at the height of an inch or two above the ground; after which they will send forth much stronger shoots than they ever would have done without this operation. And, if the hedge be kept free of weeds, and trained afterwards in the manner above described, it will, in almost every case, be recovered, and rendered fresh and vigorous.

"This amputation ought to be performed in autumn, or the beginning of winter; and, in the spring, when the young buds begin to show themselves, the stumps ought to be examined with care, and all the buds be rubbed off, excepting one or two of the strongest and best placed, which should be left for a stem. For, if the numerous buds that spring forth round the stem are allowed to spring up undisturbed, they will become in a few years as weak and stunted as before; and the hedge will never afterwards be able to attain any considerable height, strength, or healthfulness.—I have seen many hedges, that have been repeatedly cut over, totally ruined by this circumstance not having been attended to in proper time.

"If the ground for 16 or 20 feet on each side of the hedge be fallowed at the time that this operation is performed, and get a thorough dressing with rich manures, and be kept in high order for some years afterwards by good culture and meliorating crops, the hedge will prosper much better than if this had been omitted, especially if it has been planted on the level ground, or on the bank of a shallow ditch.

"It sometimes happens, that a hedge may have been long neglected, and be in general in a healthy state, but full of gaps and openings, or so thin and straggling, as to form but a very imperfect sort of fence. On these occasions, it is in vain to hope to fill up the gaps by planting young quicks; for these would always be outgrown, choked, and starved, by the old plants: nor could it be recovered by cutting clear over by the roots, as the gaps would still continue where they formerly were. The only methods that I know of rendering this a fence are, either to mend up the gaps with dead wood, or to *plash* the hedge; which last operation is always the most eligible, where the gaps are not too large to admit of being cured by this means.

"The operation I here call *plashing*, may be defined,

Hedges.

fined, "a wattling made of living wood." To form this, some stems are first selected, to be left as stakes at proper distances, the tops of which are all cut over at the height of four feet from the root. The straggling side-branches of the other part of the hedge are also lopped away. Several of the remaining plants are then cut over, close by the ground, at convenient distances; and the remaining plants are cut perhaps half through, so as to permit them to be bent to one side. They are then bent down almost to a horizontal position, and interwoven with the upright stakes, so as to retain them in that position. Care ought to be taken, that these be laid very low, at those places where there were formerly gaps; which ought to be farther strengthened by some dead stakes or truncheons of willows, which will frequently take root in this case, and continue to live. And sometimes a plant of egantine will be able to overcome the difficulties it there meets with, strike root, and grow up so as to strengthen the hedge in a most effectual manner.

"The operator begins at one end of the field, and proceeds regularly forward, bending all the stems in one direction, so that the points rise above the roots of the others, till the whole wattling is completed to the same height as the uprights.

"An expert operator will perform this work with much greater expedition, than one who has not seen it done could easily imagine. And, as all the diagonal wattlings continue to live and send out shoots from many parts of their stems, and as the upright shoots that rise from the stumps of those plants that have been cut over quickly rush up through the whole hedge, these serve to unite the whole into one entire mass, that forms a strong, durable, and beautiful fence.

"This is the best method, of recovering an old neglected hedge, that hath as yet come to my knowledge.

"In some cases it happens that the young shoots of a hedge are killed every winter; in which case it soon becomes dead and unsightly, and can never rise to any considerable height. A remedy for this disease may therefore be wished for.

"Young hedges are observed to be chiefly affected with this disorder; and it is almost always occasioned by an injudicious management of the hedge, by means of which it has been forced to send out too great a number of shoots in summer, that are thus rendered so small and weakly as to be unable to resist the severe weather in winter.

It often happens that the owner of a young hedge, with a view to render it very thick and close, cuts it over with the shears a few inches above the ground the first winter after planting; in consequence of which, many small shoots spring out from each of the stems that has been cut over.—Each of which, being afterwards cut over in the same manner, sends forth a still greater number of shoots, which are smaller and smaller in proportion to their number.

"If the soil in which the hedge has been planted is poor, in consequence of this management, the branches, after a few years, become so numerous, that the hedge is unable to send out any shoots at all, and the utmost exertion of the vegetative powers enables it only to put forth leaves. These leaves are renewed in a sickly state for some years, and at last cease to grow at all—the dry-stems become covered with fog, and the hedge

perishes entirely.

"But if the soil be very rich, notwithstanding this great multiplication of the stems, the roots will still have sufficient vigour to force out a great many small shoots, which advance to a great length, but never attain a proportional thickness. And, as the vigour of the hedge makes them continue to vegetate very late in autumn, the frosts come on before the tops of these dangling shoots have attained any degree of woody firmness, so that they are killed almost entirely by it; the whole hedge becomes covered with these long dead shoots, which are always disagreeable to look at, and usually indicate the approaching end of the hedge.

"The causes of the disorder being thus explained, it will readily occur, that the only radical cure is amputation; which, by giving an opportunity to begin with training the hedge anew, gives us also an opportunity of avoiding the errors that occasioned it. In this case, care ought to be taken to cut the plants as close to the ground as possible, as there the stems will be less numerous than at any greater height. And particular attention ought to be had to allow very few shoots to arise from the stems that have been cut over, and to guard carefully against shortening them.

"But as the roots, in the case here supposed, will be very strong, the shoots that are allowed to spring from the stems will be very vigorous, and there will be some danger of their continuing to grow later in the season than they ought in safety to do; in which case, some part of the top of the shoot may perhaps be killed the first winter, which ought if possible to be prevented. This can only be effectually done by giving a check to the vegetation in autumn, so as to allow the young shoots to harden in the points before the winter approaches. If any of the leaves or branches of a tree are cut away while it is in the state of vegetation, the whole plant feels the loss, and it suffers a temporary check in its growth in proportion to the loss that it thus sustains. To check, therefore, the vigorous vegetation at the end of autumn, it will be prudent to choose the beginning of September for the time of lopping off all the supernumerary branches from the young hedge, and for clipping off the side-branches that have sprung out from it; which will, in general, be sufficient to give it such a check in its growth at that season, as will prevent any of the shoots from advancing afterwards. If the hedge is extremely vigorous, a few buds may be allowed to grow upon the large stumps in the spring, with a view to be cut off at this season, which will tend to stop the vegetation of the hedge still more effectually.

"By this mode of management, the hedge may be preserved entire through the first winter. And, as the shoots become less vigorous every successive season, there will be less difficulty in preserving them at any future period. It will always be proper, however, to trim the sides of a very vigorous hedge for some years while it is young, about the same season of the year, which will tend powerfully to prevent this malady. But when the hedge has advanced to any considerable height, it will be equally proper to clip it during any of the winter-months, before Candlemas."

HEDGE-HOG. See ERINACEUS.

HEDYSARUM, in botany, a genus of the decandria order, belonging to the diadelphia class

of plants. There are 49 species of this plant, of which the most remarkable are, 1. The movens, or moving plant, a native of the East Indies, where it is called *burrum chundalli*. The seeds of it were sent to Edinburgh by Mr Kerr, and the plant is now growing in the botanical garden there. It arrives at the height of four feet, and in autumn produces bunches of yellow flowers. The root is annual or biennial. It is a trifolious plant, and the lateral leaves are smaller than those at the end, and all day long they are in constant motion without any external impulse. They move up and down and circularly. This last motion is performed by the twisting of the footstalks; and while the one leaf is rising, its associate is generally descending. The motion downwards is quicker and more irregular than the motion upwards, which is steady and uniform. These motions are observable for the space of 24 hours in the leaves of a branch which is lopped off from the shrub if it is kept in water. If from any obstacle the motion is retarded, upon the removal of that obstacle it is resumed with a greater degree of velocity. This species was unknown to Linnæus.—2. The coronarium, or common biennial French honeysuckle, hath large deeply-striking biennial roots; upright, hollow, smooth, very branchy stalks, three or four feet high, garnished with pinnated leaves; and from the places of the leaves proceed long spikes of beautiful red flowers, succeeded by jointed seed-pods.

Culture. The first species being a native of hot climates, requires the common culture of tender exotics; the second is easily raised from seed in any of the common borders, and is very ornamental.

HEEL, in anatomy. See there, n° 65.

HEEL of a Horse, the lower hinder-part of the foot comprehended between the quarters and opposite to the toe. The heel of a horse should be high and large, and one side of it should not rise higher than the other upon the pattern. To recover the heels of a horse that is hoof-bound, you should take out his sole and keep his heels very wide, by which they will be restored in a month.

HEEL of a Horseman. This being the part that is armed with the spur, the word is used for the spur itself; as, "This horse understands the heel well." To ride a horse from one heel to another, is to make him go sideways, sometimes to one heel and sometimes to another.

HEEL, in the sea-language. If a ship leans on one side, whether she be a-ground or a-float, then it is said she heels a-starboard, or a-port; or that she heels off-wards, or to the shore; that is, inclines more to one side than to another.

HEELER, or Bloody-HEEL-Cock, a fighting cock, that strikes or wounds much with his spurs.

The masters know such a cock, even while a chicken, by the striking of his two heels together in his going.

HEEM, (John David,) an able painter, born at Utrecht in 1604. He excelled in painting flowers, fruit, vases, and instruments of music, which he performed in such a perfect manner, that a person was apt to attempt taking them in his hand. His colouring is agreeable, and the insects in his pictures appear alive. He died at Antwerp in 1674.

Cornelius de HEEM, his son, was also a good paint-

er, though inferior to his father.

HEEMSKIRK. See HEMSKIRK.

HEGIRA, in chronology, a celebrated epocha among the Mahometans.

The event which gave rise to this epocha was the flight of Mahomet from Mecca, with his new profelytes, to avoid the persecution of the Coraichites; who, being then most powerful in the city, could not bear that Mahomet should abolish idolatry, and establish his new religion. This flight happened in the fourteenth year after Mahomet had commenced prophet: he retired to Medina, which he made the place of his residence. See ARABIA, n° 44.

HEIDENHEIM, a town of Germany, in Swabia, and in the territory of Brentzhall, with a handsome palace or castle, belonging to the house of Wirtemberg. E. Long. 10. 19. N. Lat. 48. 37.

HEIDLEBERG, a considerable and populous town of Germany, capital of the Lower Palatinate, with a celebrated university. It is noted for its great ton, which holds 800 hogheads, generally kept full of good Rhenish wine. It stands in a pleasant rich country, and was a famous seat of learning: but it has undergone so many calamities, that it is nothing now to what it was formerly. It was first reduced to a heap of ruins in 1622, by the Spaniards; and the rich library was transported partly to Vienna, and partly to the Vatican at Rome. After this it enjoyed the benefits of peace, till the Protestant electoral house became extinct, and a bloody war ensued, in which not only the castle was ruined, but the tombs and bodies of the electors were shamefully violated and pillaged. This happened in 1693; and the people of the Palatinate were obliged to leave their dwellings, and to go for refuge into foreign countries. To add to these misfortunes, the elector resided at Mannheim, and carried most of the people of distinction along with him, so that it is uncertain whether Heidelberg will ever recover itself or not, though they have begun to rebuild some of the fortifications. The great ton was broke to pieces in 1693 by the French, and at great expence in 1729 was repaired. The town stands on the river Neckar, over which there is a handsome bridge. E. Long. 8. 48. N. Lat. 49. 25.

HEIGHT, in general, signifies the difference between the ground and the top of any object measured perpendicularly.

Methods of measuring HEIGHTS. See GEOMETRY, TRIGONOMETRY, BAROMETER, MOUNTAIN, and (BAROMETER in the APPENDIX.)

HEILA, a town of Royal Prussia, in Cassubia, seated at the mouth of the river Vistula, on the Baltic Sea, and subject to Poland, 12 miles north of Dantzick. E. Long. 19. 25. N. Lat. 54. 53.

HEILEGEN-HAVE, a sea-port town of Germany, in Lower Saxony, and in Wageria, seated on the Baltic Sea, over-against the island of Termeren. E. Long. 11. 15. E. Lat. 57. 30.

HEINECCIUS (John Gotlieb), one of the greatest civilians of the 18th century, was born at Eisenberg, in the principality of Altenburg, in 1681. After having studied at Gosslar and Leipzick, he was designed for the ministry, and began to preach; but disliking that profession, he laid it aside, and applied himself entirely to the study of philosophy and the civ-

Hinetken,
Heinfius.

vil law. In 1710, he became professor of philosophy at Hall; and in 1721, he was made professor of civil law, with the title of *counsellor of the court*. His great reputation made the states of Friesland invite him to Franeker in 1724; but three years after, the king of Prussia prevailed on him to accept of a professorship of law at Francfort on the Oder, where he distinguished himself till the year 1733. Becoming again professor at Hall, he remained there till his death, which happened in 1741, notwithstanding his being invited to Marburg, Denmark, and three academies in Holland. He wrote many works, all of them much esteemed. The principal are, 1. *Antiquitatum Romanarum jurisprudentiam illustrantium syntagma*. It was this excellent abridgement that gave rise to his reputation in foreign countries. 2. *Elementa juris civilis secundum ordinem institutionum & pandectarum*. 3. *Fundamenti styli cultioris*. There are few works so useful as this for forming a Latin style. 4. *Elementa philosophiæ rationalis & moralis, quibus præmissa historia philosophica*. 5. *Historia juris civilis Romanæ & Germanicæ*. 6. *Elementa juris naturæ & gentium*, &c.

HEINETKEN (Christian), an extraordinary child, the prodigy of the North, was born at Lubeck in 1721. He spoke his maternal tongue fluently at 10 months. At one year old, he knew the principal events of the pentateuch; in two months more, he was master of the entire history of the Old and New Testaments; at two years and an half, he answered the principal questions in geography and in ancient and modern history; and he spoke Latin and French with great facility before the commencement of his fourth year. His constitution was so delicate, that he was not weaned till a few months before his death. M. Martini of Lubeck published a pamphlet in 1730, in which he endeavoured to give natural reasons for the extraordinary capacity of this infant, who died in his fifth year.

HEINSIUS (Daniel), professor of politics and history at Leyden, and librarian to the university there, was born at Gand in Flanders in 1580. He became a scholar to Joseph Scaliger at Leyden, and was indebted to the encouragement and care of that great man, for the perfection to which he attained in literature, and which at the beginning of his life there was little reason to hope from him. He distinguished himself as a critic by his labours on many classical authors; and was highly honoured as well abroad as at home: Gustavus Adolphus king of Sweden gave him a place among his counsellors of state; the republic of Venice made him a knight of the order of St Mark; and pope Urban VIII. made him great offers, if he would come, as he expressed it, "to rescue Rome from barbarism." He died in 1666, leaving several works of his own, both in poetry and prose.

HEINSIUS (Nicholas), the son of Daniel Heinfius, was born at Leyden; and became as great a Latin poet, and a greater critic than his father. His poems have been several times printed, but the best edition is that of Amsterdam in 1666. He gave editions of several of the classics, with notes; his Claudian is dedicated in a Latin poem to queen Christina of Sweden, and his Ovid to Thuanus. At his death, which happened in 1681, he disclaimed all his works, and expressed the utmost regret at having left behind him fo

Heir
||
Helena.

many "monuments of his vanity," as he called them. He was as much distinguished by his great employments in the state, as by his talents, learning, and good qualities.

HEIR, in law, signifies the person who succeeds another by descent to lands, tenements, and hereditaments, being an estate of inheritance, or an estate in fee; because nothing passes by right of inheritance but in fee. See the articles CONSANGUINITY, DESCENT, FEE, SUCCESSION; and LAW, N^o lxxvi. & clxxx. et seq.

HEIR Apparent, is a person so called in the lifetime of his ancestor, at whose death he is heir at law.

HEIRESS, a female heir to one who has an estate in lands, &c. See HEIR.

Stealing an HEIRESS. See FORCIBLE Marriage.

HEIRSHIP MOVEABLES, in Scots law, the best of certain kinds of moveables, which the heir of line is intitled to take, besides the heritable estate. See LAW, N^o clxxx. 7.

HELENA, or St HELENA, an island in the Atlantic Ocean, belonging to the English East India company, and situated in W. Long. 6. 30. S. Lat. 16°. The greatest length of the island is about eight miles, and its circumference about 20. It hath some high mountains, particularly one called *Diana's peak*, which is covered with woods to the very top. Other hills there are which bear evident marks of a volcanic origin; and some have huge rocks of lava, and a kind of half-vitrified flags. The country, according to Mr Förster, has a fine appearance; the soil is in many places a rich mould, from six to ten inches deep, and a variety of plants thrive in it luxuriantly. He found many plants here which he had not observed in other parts of the world. Among these were some called by the natives *cabbage-trees*, *gum-trees*, and *red wood*. The former thrive in moist places; but the latter are always found on the ridges of hills where the soil is dry. The cabbage-tree has rather large leaves; but after many inquiries Mr Förster could not find that it was used for any other purpose than that of fuel, and no reason could be assigned why it had obtained that name. It must not be confounded with the cabbage-tree of America, India, and the South Seas, which is a species of palm.

The island is laid out entirely in gardens and pasturage. Peaches are the only European fruits that thrive here. Cabbages and other greens which thrive extremely well are devoured by caterpillars; and every species of corn is destroyed by rats. All the pastures were over-run with furze; which, though in our country a very useless and even pernicious plant, was of singular advantage to the inhabitants of St Helena. Before the introduction of that plant, the ground was parched by the intense heat, and all kinds of grass and herbage were shrivelled up. But the furze-bushes, which thrive as it were in despite of the sun, preserved a degree of moisture in the ground; by which means the grass sprung up vigorously, and the country became covered with a rich and beautiful sod. The furze is now no longer wanted, and the people assiduously root it out for fuel. The number of people on St Helena does not exceed 2000 persons, including 500 soldiers, and 600 slaves; and it is said that the number of females born on the island considerably exceeds that of the males. By the arrival of the In-

Helena
Helenium.

dia ships which they supply with refreshments, they are in return provided with all sorts of manufactures and other necessities; and the Company annually order one or two of their ships to touch there in their way to India, in order to fend them a sufficient quantity of European goods and provisions. Many of their slaves are employed in catching fish, which are very plentiful; and, by the help of these, together with their poultry, cattle, roots, and salt provisions, they subsist through the year. Their life (says Mr Forster) seems to pass along very happily; free from the multitude of cares which distress their countrymen in England, and blessed with quiet and content.

St Helena was first discovered by the Portuguese in 1502, on St Helen's day; whence its name. They stocked it with different kinds of useful animals; but whether they ever settled a colony on it or not, is uncertain. The Portuguese having either abandoned, or never taken possession of it, the Dutch became its masters; and kept possession of it till the year 1600, when they were driven out by the English. In 1673, the Dutch took it by surprise; but a short time after it was recovered by the brave captain Munden, who also took three Dutch East India men then lying in the harbour. On this occasion the Hollanders had fortified the landing-place, of which there is only one on the island; and erected batteries of great guns to prevent a descent: but the English having knowledge of a small creek, where only two men abreast could creep up, climbed to the top of the rock in the night; and appearing the next morning behind the batteries, the Dutch were so terrified, that they threw down their arms, and surrendered at discretion. This creek has been since fortified, and a battery of large cannon placed at the entrance of it; so that now the island is rendered perfectly secure against all regular approaches or sudden attacks.

HELEN, (in fab. hist.) the daughter of Tyndarus and Leda, was married to Menelaus king of Sparta, but was stolen from him by Theseus, 1235 B. C. She was restored soon after; but carried off again by Paris, the Trojan prince; which occasioned the famous Trojan war. See Troy.

HELENIUM, BASTARD SUN-FLOWER; a genus of the polygamia superflua order, belonging to the syngenesia class of plants.

Species. 1. The autumnale, with spear-shaped narrow leaves. 2. The latifolium, with pointed, spear-shaped, fawed leaves.—Both these are natives of North America, where they grow wild in great plenty. They rise to the height of seven or eight feet in good ground. The roots, when large, send up a great number of stalks, which branch toward the top; the upper part of the stalk sustains one yellow flower shaped like the sun-flower, but much smaller, having long rays, which are jagged pretty deep into four or five segments.

Culture. These plants may be propagated by seeds, or by parting their roots; the latter is generally practised in this country. The best season to transplant and part the old roots is in October when their leaves are past, or in the beginning of March just before they begin to shoot. They delight in a soil rather moist than dry, provided it is not too strong, or does not hold the wet in winter.

Heliza
Heliasta.

HELEPOLIS, in the ancient art of war, a machine for battering down the walls of a place besieged, the invention of which is ascribed to Demetrius Poliorcetes.—Diodorus Siculus says, that each side of the Helepolis was 405 cubits in breadth, and 90 in height; that it had nine stages, and was carried on four strong solid wheels eight cubits in diameter; that it was armed with large battering rams, and had two roofs capable of supporting them; that in the lower stages there were different sorts of engines for casting stones; and in the middle they had large catapultas for discharging arrows, and smaller ones in those above, with a number of expert men for working all these machines.

HELIÆA, in Grecian antiquity, was the greatest and most frequented court in Athens for the trial of civil affairs. See HELIASTÆ.

HELIACAL, in astronomy, a term applied to the rising and setting of the stars; or, more strictly speaking, to their emergence out off, and immersion into, the rays and superior-splendor of the sun.—A star is said to rise heliacally, when, after having been in conjunction with the sun, and on that account invisible, it comes to be at such a distance from him, as to be seen in the morning before sun-rising; the sun, by his apparent motion, receding from the star towards the East. On the contrary, the heliacal setting is, when the sun approaches so near a star as to hide it with his beams, which prevent the fainter light of the star from being perceived; so that the terms *apparition* and *occultation* would be more proper than *rising* and *setting*.

HELIANTHUS, the GREAT SUNFLOWER; a genus of the polygamia frustanea order, belonging to the syngenesia class of plants. There are 12 species, most of which are now very common in our gardens, tho' all of them are natives of America. They are all very hardy, and will prosper in almost any soil or situation. They may be propagated either by seeds, or by parting their roots.

HELIASTÆ, in antiquity, the judges of the court HELIÆA. They were so called, according to some authors, from a Greek word which signifies *to assemble in a great number*; and, according to others, from another word which signifies *the sun*, because they held their assemblies in an open place. They composed not only the most numerous, but likewise the most important of the Athenian tribunals; for their province was either to explain the obscure laws, or to give new vigour and authority to those which had been violated. The Themiothetæ convoked the assembly of the Heliastæ, which sometimes amounted to 1000, sometimes to 1500 judges. Mr Blanchard is of opinion, that, to make this number, the Themiothetæ sometimes summoned those of each tribe who had last quitted the public offices which they had exercised in another court.

However that may be, it appears that the assemblies of the Heliastæ were not frequent, as they would have interrupted the jurisdiction of the stated tribunals, and the common course of affairs.

The Themiothetæ paid to each member of this assembly, for his attendance, three oboli: which are equal to two Roman sesterces, or to half a drachma. Hence Aristophanes terms them *the brothers of the triobolus*.

Heliaſtae. *tribolus*. They were likewise condemned to pay a fine if they came too late; and if they did not preſent themſelves till after the orators had begun to ſpeak, they were not admitted. Their attendance was required out of the public treaſury, and their pay was called *niſthor heliaſtius*.

The aſſembly met, at firſt, according to Ariſtophanes, at the riſing of the fun. If the judges were obliged to meet under cover on account of froſt and ſnow, they had a fire; but there is not a paſſage in any ancient author which informs us of the place where theſe aſſemblies were held, either in the rigorous or in the mild ſeaſons. We only learn that there was a double incloſure around the aſſembly, that it might not be diſturbed. The firſt was a kind of arbor-work, from ſpace to ſpace, ſeparated by doors, over which were painted in red the ten or twelve firſt letters of the Greek alphabet, which directed the entrance of the officers who compoſed the tribunal, each of them entering under the letter which diſtinguiſhed his tribe. The beaſtles of the court, to whom they ſhewed the wands which had been ſent them by the Theſmothetæ as a ſummons to meet, examined its mark, to ſee if it was authentic, and then introduced them. The ſecond incloſure, which was at the diſtance of 20 feet from the former, was a rope, or cord; that the people who ſtood round the firſt incloſure, and were deſirous to ſee what paſſed within the ſecond, might not be prevented from gratifying their curioſity at a proper diſtance. Thus the attention of the judges was not interrupted by the concourſe of the multitude, many of whom were heated by views of intereſt or of party.

To each of the members of the aſſembly were diſtributed two pieces of copper; one of which was perforated, not, certainly, that it might be diſtinguiſhed from the other by feeling; for theſe aſſemblies met at the riſing, and were diſſolved at the ſetting of the fun. Thoſe pieces of copper had been ſubſtituted for little ſea-ſhells, which were at firſt in uſe. The king was preſent at the aſſembly, at whoſe command it had been ſummoned. The Theſmothetæ read the names of thoſe who were to compoſe it, and each man took his place as he was called. The Theſmothetæ were then ſent for, whoſe function it was to obſerve prodigies, and to ſuperintend the ſacrifices; and if they gave their function, the deliberations were begun. It is well known, that the officers called *Exegetæ* were often corrupted by thoſe who were intereſted in the debates of the aſſembly; and that they excited ſuch tumults as were raiſed by the Roman tribunal in the popular aſſemblies convoked by the conſuls.

Of all the monuments which remain relating to the Heliaſtæ, the moſt curious is the oath which thoſe judges took before the Theſmothetæ: Demotheſthenes hath preſerved it in his oration againſt Timocrates, who having been bribed by thoſe who had been intruſted with the effects taken on board a veſſel of Naucratis, and reſuſed to give an account of them, got a law paſſed, by which an enlargement was granted to priſoners for public debts, on giving bail. Demotheſthenes, in making his oration againſt that law, ordered the oath of the Heliaſtæ to be read aloud, as a perpetual auxiliary to his arguments, and happily calculated to intereſt the multitude and inflame their

paſſions. This oath we ſhall quote, that our readers may know how reſpectable a tribunal that of the Heliaſtæ was, and the importance of their deciſions.

“ I will judge according to the laws and decrees of the people of Athens, and of the ſenate of 500.
“ I will never give my vote for the eſtabliſhment of a tyrant, nor of an oligarchy. Nor will I ever give my approbation to an opinion prejudicial to the liberty, or to the union, of the people of Athens.
“ I will not ſecond thoſe perſons who may propoſe a reduction of private debts, or a diſtribution of the lands or houſes of the Athenians. I will not recall exiles, nor endeavour to procure a pardon for thoſe who ſhall be condemned to die. Nor will I force thoſe to retire whom the laws and the ſuffrages of the people ſhall permit to remain in their country.
“ I will not give my vote to any candidate for a public function, who gives not an account of his conduct in the office which he has preſervingly filled; nor will I preſume to ſolicit any truſt from the commonwealth, without ſubjecting myſelf to this condition, which I mean as obligatory to the nine archons, to the chief of religious matters, to thoſe who are balloted on the ſame day with the nine archons, to the herald, the ambaffador, and the other officers of their court. I will not ſuffer the ſame man to hold the ſame office twice, or to hold two offices in the ſame year. I will not accept any preſent, either myſelf or by another, either directly or indirectly, as a member of the Heliaſtic aſſembly.
“ I ſolemnly declare that I am 30 years old. I will be equally attentive and impartial to the accuſer and the accuſed; I will give my ſentence rigorouſly according to evidence. Thus I ſwear, by Jupiter, by Neptune, and by Ceres, to act. And if I violate any of my engagements, I imprecate, from theſe deities, ruin on myſelf and my family. And I requeſt them to grant me every kind of proſperity, if I am faithful to my oath.”

The reader ſhould perſuade what follows this oath, to ſee with what eloquence Demotheſthenes avails himſelf of it, and how he applies its principles to the cauſe which he defends.

Here we have one of the motives of the meeting of this aſſembly. Ariſtotle informs us of another; which was, by the public authority, deputed to them, to elect a magiſtrate in the room of one dead. It is ſurpriſing, that Pauſanias, who enters ſo often into details, gives us no particular account of this aſſembly. All that he ſays of it is, that the moſt numerous of the Athenian aſſemblies was called *Helicæ*.

We are told by Diogenes Laertius, in his life of Solon, that it was before one of theſe Heliaſtic aſſemblies that Piſiſtratus preſented himſelf, covered with wounds and contuſions, (for thus he had treated himſelf and the mules which drew his car,) to excite the indignation of the people againſt his pretended enemies, who, jealous, as he alleged, of the popularity he had acquired by aſſerting the rights of his poorer fellow-citizens, in oppoſition to the men in power, had attacked him while he was hunting, and had wounded him in that barbarous manner. His deſign ſucceeded; a guard was appointed him, by the aſſiſtance of which he acquired the ſovereignty or tyranny of Athens, and kept it 33 years. The power of the aſſembly

assembly appeared remarkable on that occasion; for Solon, who was present, opposed it with all his efforts, and did not succeed.

As to the manner in which the judges gave their suffrages, there was a sort of vessel, covered with an osier mat, on which were placed two urns, the one of copper, the other of wood. In the lid of these urns there was an oblong hole, which was large at the top, and grew narrower downwards, as we see in some old boxes of our churches. The suffrages which condemned the accused person, were thrown into the wooden urn, which was termed *kyrios*. That of copper, named *akynos*, received those which absolved him.

Aristotle observes, that Solon, whose aim was to make his people happy, and who found an aristocracy established by the election of the nine archons, (annual officers, whose power was almost absolute,) tempered their sovereignty, by instituting the privilege of appealing from them to the people, who were to be assembled by lot to give their suffrage; after having taken the oath of the Heliastra, in a place near the Panathenæum; where Hippias had, in former days, calmed a sedition of the people, and bound them to unanimity by an oath. It has likewise been remarked, that the god Apollo was not invoked in the oath of the Heliastra, as in the oaths of the other judges. We have observed, that he who took the oath of the Heliastra, engaged that he would not be corrupted by solicitation or money. Those who violated this part of their oath, were condemned to pay a severe fine. The decemvirs at Rome made such corruption a capital crime. But Aconius remarks, that the punishment denounced against them was mitigated in later times; and that they were expelled the senate, or banished for a certain time, according to the degree of their guilt.

HELICON, (anc. geog.), a mountain on the borders of Bœotia and Phocis; of fertile soil, covered with woods, and very extensive, its north side touching Phocis, and partly its west side, quite to Mychos, its utmost port-town. There also we have the river Helicon; which sinking in the earth rises again at some distance under a new name, *Baphyræ*. This mountain is the poets' sport and delight: *Heliconius* the epithet; *Heliconiades*, and *Heliconides*, the muses.

HELICTERES, the SCREW-TREE; a genus of the decandria order, belonging to the gynandria class of plants. There are four species, all natives of warm climates. They are shrubby plants, rising from five to fourteen feet in height, adorned with flowers of a yellow colour. They are propagated by seeds; but are tender, and in this country must be kept in a stove during the winter.

HELIOCENTRIC LATITUDE of a Planet, the inclination of a line drawn between the centre of the sun, and the centre of a planet, to the plane of the ecliptic.

HELIOCENTRIC PLACE of a Planet, the place of the ecliptic wherein the planet would appear to a spectator placed at the centre of the sun.

HELIOCOMETES, a phenomenon sometimes observed about sunset; being a large luminous tail or column of light proceeding from the body of the sun, and dragging after it, not unlike the tail of a comet; whence the name.

HELIODORUS of PHOENICIA, bishop of Trica in Thessaly, better known by the romance he composed in his youth, entitled *Æthiopica*, and relating the amours of Theagenes and Chariclea. Some say he was deposed by a lynod, because he would not consent to the suppressing of that romance; the fable has a moral tendency, and particularly inculcates the virtue of chastity. As it was the first of this species of writing, he is styled the *Father of Romances*. He was also a good Latin poet. He lived in the 4th century.

HELIOPOLIS, (anc. geog.), so called by Herodotus and Diodorus Siculus, by Moses *On*, and in Jeremiah *Bethfemes*; a city of Egypt, to the south-east of the Delta, and east of Memphis; of a very old standing, its origin terminating in fable. Here stood the temple of the sun, held in religious veneration. The city stood on an extraordinary mount, but in Strabo's time was desolate. It gave name to the *Nomos Heliopolites*.—There was another *Heliopolis* in Cœlosyria, near the springs of the Orontes; so called from the worship of the sun, which was in great vogue over all Syria.

HELIOSCOPE, in optics, a sort of telescope, peculiarly fitted for viewing the sun, without hurting the eyes. See TELESCOPE.

As the sun may be viewed through coloured glasses, without hurt to the eyes, if the object and eye glasses of a telescope be made of coloured glass, as red or green, such a telescope will become an helioscope.

But Mr Huygens only used a plain glass, blacked at the flame of a candle on one side, and placed between the eye-glass and the eye; which answers the design of an helioscope very well.

HELIOSTATATA, in optics, an instrument invented by the late learned Dr 'S. Gravelande; who gave it this name from its fixing, as it were, the rays of the sun in an horizontal direction across the dark chamber all the while it is in use. See OPTICS.

HELIOTROPIUM, TURNSOLE; a genus of the monogynia order, belonging to the pentandria class of plants. There are a number of species, all of them natives of warm countries. Only one, called the *tricoccum*, grows in Europe; and is a native of France, Spain, and Italy. It is only remarkable for the property of its berries, of which an account is given under COLOUR-Making, n° 35.

HELIX, in anatomy. See there, n° 405.

HELIX, the *Snail*, in zoology, a genus belonging to the order of vermes testacea. The shell consists of one spiral, brittle, and almost diaphanous valve; and the aperture is narrow. There are 60 species, principally distinguished by the figure of their shells. They are of various sizes, from that of a small apple to less than half a pea. Some of them live on land, frequenting woods and gardens, or inhabiting clefts of rocks and dry sand-banks. Others of them are aquatic, inhabiting ponds, deep rivers, and the ocean. The principal species are,

1. The *Janthina*, with a violet-coloured shell, is remarkable for the extreme thinness of its texture, which breaks with least pressure, and seems therefore entirely calculated to keep the open sea, or at least to shun rocky shores. It inhabits the seas of Europe, especially the Mediterranean; those of Asia and Africa; and

Helix,
Hell.

and also the ocean. The living animal, when touched, exudes a juice, which stains the hands of a violet colour. Dr Hawkefworth, in his account of Cooke's voyage, mistakes this shell for that which yielded the *purpura* of the ancients. But whoever looks into Pliny, can never have the least idea that the thin shell aforementioned could be the same with it. They had several shells which yielded the purple dye: but these were all rock-shells *, and very different, both in figure and hardness, from the little helix jacintha; which is not calculated for the neighbourhood of rocks, as already mentioned. Vid. *Plin.* lib. v. cap. 1. and lib. ix. cap. 60, 61. See also Don Ant. Ulloa's voyage to South America, book iv. ch. 8.

2. The pomatia, or exotic snail, with five spires, most remarkably ventricose, and fasciated with a lighter and a deeper brown, is a native of France, where it inhabits the woods; but has been naturalized in England, where it inhabits the woods of the southern counties. It was introduced, as it is said, by Sir Kenelm Digby; whether for medical purposes, or as food, is uncertain: tradition says, that to cure his beloved wife of a decay was the object.—They are quite confined to our southern counties. An attempt was made to bring them into Northamptonshire, but they would not live there.—These are used as a food in several parts of Europe during lent; and are preserved in an escargatoire, or a large place boarded in, with a floor covered half a foot deep with herbs, in which the snails nestle and fatten *.—They were also a favourite dish with the Romans, who had their *cochlearia*, a nursery similar to the above. Fulvius Hirpinus † was the first inventor of this luxury, a little before the civil wars between Cæsar and Pompey. The snails were fed with bran and foddin wine. If we could credit Varro ‡, they grew so large, that the shells of some would hold ten quarts! People need not admire the temperance of the supper of the younger Pliny §, which consisted of only a lettuce a-piece, three snails, two eggs, a barley-cake, sweet wine and snow,—in case his snails bore any proportion in size to those of Hirpinus.—Its name is derived not from any thing relating to an orchard, but from *opusculum*, an *operculum*, it having a very strong one. This seems to be the species described by Pliny, lib. viii. c. 39. which he says was scarce; that it covered itself with the opercle, and lodged under ground; and that they were at first found only about the maritime Alps, and more lately near Velitæ. [See Plate CLVIII. the figure half the natural size.]

3. The hortensis, or garden-snail, is in form like the last, but lesser, and not umbilicated and clouded, or mottled with browns.—These are often used with success in consumptive cases.

HELL, the place of divine punishment after death. As all religions have supposed a future state of existence after this life, so all have their hell or place of torment in which the wicked are supposed to be punished. The hell of the ancient heathens was divided into two mansions; the one called *Elysium*, on the right hand, pleasant and delightful, appointed for the souls of good men; the other called *Tartara*, on the left, a region of misery and torment, appointed for the wicked. The latter only was hell, in the present restrained sense of the word. See *ELYSIUM*.

HELL, the place of divine punishment after death. As all religions have supposed a future state of existence after this life, so all have their hell or place of torment in which the wicked are supposed to be punished. The hell of the ancient heathens was divided into two mansions; the one called *Elysium*, on the right hand, pleasant and delightful, appointed for the souls of good men; the other called *Tartara*, on the left, a region of misery and torment, appointed for the wicked. The latter only was hell, in the present restrained sense of the word. See *ELYSIUM*.

The philosophers were of opinion, that the infernal regions were at an equal distance from all the parts of the earth; nevertheless it was the opinion of some, that there were certain passages which led thither, as the river Lethe near the Syrtis, and the Acherusian cave in Epirus. At Hermione it was thought, that there was a very short way to hell; for which reason the people of that country never put the fare into the mouths of the dead to pay their passage.

The Jews placed hell in the centre of the earth, and believed it to be situated under waters and mountains. According to them, there are three passages leading to it: the first is in the wilderness, and by that Korah, Dathan, and Abiram, descended into hell; the second is in the sea, because Jonah, who was thrown into the sea, cried to God out of the belly of hell; the third is in Jerusalem, because it is said the fire of the Lord is in Zion, and his furnace is in Jerusalem. They likewise acknowledged seven degrees of pain in hell, because they find this place called by seven different names in scripture. Though they believed that infidels, and persons eminently wicked, will continue for ever in hell; yet they maintained, that every Jew who is not infected with some heresy, and has not acted contrary to the points mentioned by the rabbins, will not be punished therein for any other crimes above a year at most.

The Mahometans believe the eternity of rewards and punishments in another life. In the Koran it is said, that hell has seven gates, the first for the Mussulmans, the second for the Christians, the third for the Jews, the fourth for the Sabians, the fifth for the Magians, the sixth for the Pagans, and the seventh for the hypocrites of all religions.

Among Christians, there are two controverted questions in regard to hell; the one concerns locality, the other the duration of its torments. The locality of hell, and the reality of its fire, began first to be controverted by Origen. That father, interpreting the scripture account metaphorically, makes hell to consist, not in external punishments, but in a consciousness or sense of guilt, and a remembrance of past pleasures. Among the moderns, Mr Whiston advanced a new hypothesis. According to him, the comets are so many hells appointed in their orbits alternately to carry the damned into the confines of the sun, there to be scorched by its violent heat, and then to return with them beyond the orb of Saturn, there to starve them in these cold and dismal regions. Another modern author, not satisfied with any hypothesis hitherto advanced, assigns the sun to be the local hell. As to the second question, viz. the duration of hell-torments, we have Origen again at the head of those who deny that they are eternal; it being that father's opinion, that not only men, but devils, after a due course of punishment suitable to their respective crimes, shall be pardoned and restored to heaven. The chief principle upon which Origen built his opinion, was the nature of punishment, which he took to be emendatory, applied only as a physic for the recovery of the patient's health. The chief objection to the eternity of hell-torments among modern writers, is the disproportion between temporary crimes and eternal punishments. Those who maintain the affirmative, ground their opinions on scripture-accounts, which represent

Hell.

* See *Bucinum* and *Murex*.* *Addison's Trav.* 272.† *Pliny*, l. x. c. 56.‡ *L. iii.* c. 14.§ *Epist.* xv.

Hellanicus represent the pains of hell under the figure of a worm which never dies, and a fire which is not quenched; as also upon the words, "These shall go away into everlasting punishment, but the righteous into life eternal."

HELLANICUS of Mitylene, a celebrated Greek historian, born before Herodotus, flourished about 480 B. C. He wrote a history of the ancient kings and founders of cities, but which hath not come down to us.

HELLAS, (anc. geog.), an appellation comprising, according to the more ancient Greeks and Romans, Achaia and Peloponnesus, but afterwards restrained to Achaia. It was bounded on the west by the river Achelous, on the north by mounts Othrys and Ossa, on the east by the Egean sea, and on the south by the Saronic and Corinthian bays, and by the isthmus which joins it to Peloponnesus. It was called *Hellas*, from *Hellen* the son of Deucalion; or from *Hellas*, a district of Thessaly; whence *Hellene*, the gentilitious name, denoting *Greeks*. Now called *Livadia*.

HELLEBORUS, HELLEBORE; a genus of the polygynia order, belonging to the polyandria class of plants.

Species. The most remarkable species of this plant is the niger, commonly called *Christmas rose*. It hath roots composed of many thick fleshy spreading fibres, crowned by a large cluster of lobbed leaves, consisting each of seven or eight obtuse fleshy lobes, united to one foot-stalk; and between the leaves several thick fleshy flower-stalks three or four inches high, surmounted by large beautiful white flowers of five roundish petals, and numerous filaments, appearing in winter, about or soon after Christmas.

Culture. This plant may be propagated either by seeds or parting the roots. It prospers in the open borders, or may be planted in pots to move when in bloom in order to adorn any particular place; but it always flowers fairest and most abundantly in the front of a warm sunny border. The plants may be removed, and the roots divided for propagation, in September, October, or November; but the sooner in autumn it is done, the stronger will the plants flower at their proper season.

Uses. The root of this plant was anciently used as a cathartic. The taste of it is acrid and bitter. Its acrimony, as Dr Grew observes, is first felt on the tip of the tongue, and then spreads itself immediately to the middle, without being much perceived in the intermediate part. On chewing the root for a few minutes, the tongue seems benumbed, and affected with a kind of paralytic stupor, as when burnt by eating any thing too hot. The fibres are more acrimonious than the head of the root from whence they issue. Black hellebore root, taken from 15 to 30 grains, proves a strong cathartic; and, as such, has been celebrated for the cure of maniacal and other disorders proceeding from what the ancients called the *atrabilis*; in which cases, medicines of this kind are doubtless occasionally of use, though they are by no means possessed of any specific power. It does not however appear, that our black hellebore acts with so much violence as that of the ancients; whence many have supposed it to be a different species of plant: and indeed the descriptions which the ancients have left us of their hellebore, do

not agree with those of any of the sorts usually taken notice of by modern botanists. Another species has been discovered in the Eastern countries, which Tournefort distinguishes by the name of *helleborus niger orientalis, amplifolius folio, caule præalto, flore purpurascente*, and supposes to be the true ancient hellebore, from its growing in plenty about mount Olympus, and in the island of Anticyra, celebrated of old for the production of this antimaniacal drug: he relates, that a scruple of this sort, given for a dose, occasioned convulsions.—Our hellebore is at present looked upon principally as an alterative; and in this light is frequently employed, in small doses, for attenuating viscid humours, promoting the uterine and urinary discharges, and opening inveterate obstructions of the remoter glands. It often proves a powerful emmenagogue in plethoric habits, where steel is ineffectual or improper. In some parts of Germany, a species of black hellebore has been made use of, which frequently produced violent, and sometimes deleterious, effects. It appears to be the fetid kind of Linnaeus, called in English *settlewort, fetterwort, or bastard hellebore*. The roots of this may be distinguished from those of the true kind, by their being less black.

HELLEN, the son of Deucalion, is said to have given the name of Hellenists to the people before called *Greeks*, 1521 B. C. See GREECE.

HELLENISM, in matters of language, a phrase in the idiom, genius, or construction of the Greek tongue.

This word is only used when speaking of the authors who, writing in a different language, express themselves in a phraseology peculiar to the Greek.

HELLENISTIC LANGUAGE, that used by the Grecian Jews who lived in Egypt and other parts where the Greek tongue prevailed. In this language it is said the Septuagint was written, and also the books of the New Testament; and that it was thus denominated to shew that it was Greek filled with Hebraisms and Syriacisms.

HELLESPONT, the entrance of the streights which divides Asia from Europe, and passes from the Archipelago to Constantinople. It is now called the *Dardanelles*, and is about two miles wide.

HELM, a long and flat piece of timber, or an assemblage of several pieces, suspended along the hind-part of a ship's stern-post, where it turns upon hinges to the right or left, serving to direct the course of the vessel, as the tail of a fish guides the body.

The helm is usually composed of three parts, viz. the rudder, the tiller, and the wheel, except in small vessels, where the wheel is unnecessary.

As to the form of the rudder, it becomes gradually broader in proportion to its distance from the top, or to its depth under the water. The *back*, or inner part of it, which joins to the stern-post, is diminished into the form of a wedge throughout its whole length, so as that the rudder may be more easily turned from one side to the other, where it makes an obtuse angle with the keel. It is supported upon hinges; of which those that are bolted round the stern-post to the after-extremity of the ship, are called *googings*, and are furnished with a large hole on the after-part of the stern-post. The other parts of the hinges, which are bolted to the back of the rudder, are called *pintles*, being strong cylindrical pins, which enter into the googings, and

Hellen
||
Helm.

and rest upon them. The length and thickness of the rudder is nearly equal to that of the stern-post.

The rudder is turned upon its hinges by means of a long bar of timber, called the *tiller*, which is fixed horizontally in its upper end within the vessel. The movements of the tiller to the right and left, accordingly, direct the efforts of the rudder to the government of the ship's course as she advances; which, in the sea language, is called *steering*. The operations of the tiller are guided and assisted by a sort of tackle, communicating with the ship's side, called the *tiller-rope*, which is usually composed of untarred rope-yarns for the purpose of traversing more readily through the blocks or pulleys.

In order to facilitate the management of the helm, the tiller-rope, in all large vessels, is wound about a wheel, which acts upon it with the powers of a crane or windlass. The rope employed in this service being conveyed from the fore-end of the tiller *k*, to a single block *i*, on each side of the ship†, is farther communicated to the wheel, by means of two blocks suspended near the mizen-mast, and two holes immediately above, leading up to the wheel, which is fixed upon an axis on the quarter-deck, almost perpendicularly over the fore-end of the tiller. Five turns of the tiller-rope are usually wound about the barrel of the wheel; and, when the helm is amidship, the middle turn is nailed to the top of the barrel, with a mark by which the helmsman readily discovers the situation of the helm, as the wheel turns it from the starboard to the larboard side. The spokes of the wheel generally reach about eight inches beyond the rim or circumference, serving as handles to the person who steers the vessel. As the effect of a lever increases in proportion to the length of its arm, it is evident that the power of the helmsman to turn the wheel will be increased according to the length of the spokes beyond the circumference of the barrel.

When the helm, instead of lying in a right line with the keel, is turned to one side or the other, as in BD, fig. 1. it receives an immediate shock from the water, which glides along the ship's bottom in running *ast* from A to B; and this fluid pushes it towards the opposite side, whilst it is retained in this position: so that the stern, to which the rudder is confined, receives the same impression, and accordingly turns from B to *b* about some point *c*, whilst the head of the ship passes from A to *a*. It must be observed, that the current of water falls upon the rudder obliquely, and only strikes it with that part of its motion which acts according to the sine of incidence, pushing it in the direction NP, with a force which not only depends on the velocity of the ship's course, by which this current of water is produced, but also upon the extent of the sine of incidence. This force is by consequence composed of the square of the velocity with which the ship advances, and the square of the sine of incidence, which will necessarily be greater or smaller according to circumstances; so that if the vessel runs three or four times more swiftly, the absolute shock of the water upon the rudder will be nine or sixteen times stronger under the same incidence: and, if the incidence is increased, it will yet be augmented in a greater proportion, because the square of the sine of incidence is more enlarged. This impression, or, what is the

same thing, the power of the helm, is always very feeble, when compared with the weight of the vessel; but as it operates with the force of a long lever, its efforts to turn the ship are extremely advantageous. For the helm being applied to a great distance from the centre of gravity G, or from the point about which the vessel turns horizontally, if the direction PN of the impression of the water upon the rudder be prolonged, it is evident that it will pass perpendicularly to R, widely distant from the centre of gravity G: thus the absolute effort of the water is very powerful. It is not therefore surprising, that this machine impresses the ship with a considerable circular movement, by pushing the stern from B to *b*, and the head from A to *a*; and even much farther whilst she sails with rapidity, because the effect of the helm always keeps pace with the velocity with which the vessel advances.

Amongst the several angles that the rudder makes with the keel, there is always one position more favourable than any of the others, as it more readily produces the desired effect of turning the ship, in order to change her course. To ascertain this, it must be considered, that if the obliquity of the rudder with the keel is greater than the obtuse angle ABD, so as to diminish that angle, the action of the water upon the rudder will increase, and at the same time oppose the course of the ship in a greater degree; because the angle of incidence will be more open, so as to present a greater surface to the shock of the water, by opposing its passage more perpendicularly. But at that time the direction NP of the effort of the helm upon the ship will pass, with a smaller distance from the centre of gravity G towards R, and less approach the perpendicular NL, according to which it is absolutely necessary that the power applied should act with a greater effect to turn the vessel. Thus it is evident, that if the obtuse angle ABD is too much inclosed, the greatest impulse of the water will not counterbalance the loss sustained by the distance of the direction NP from NL, or by the great obliquity which is given to the same direction NP of the absolute effort of the helm with the keel AB. If, on the contrary, the angle ABD is too much opened, the direction NP of the force of the action of the helm will become more advantageous to turn the vessel, because it will approach nearer the perpendicular NL; so that the line prolonged from NP will increase the line GR, by removing R to a greater distance from the centre of gravity G: but then the helm will receive the impression of the water too obliquely, for the angle of incidence will be more acute; so that it will only present a small portion of its breadth to the shock of the water, and by consequence will only receive a feeble effort. By this principle it is easy to conceive, that the greatest distance GR from the centre of gravity G, is not sufficient to repair the diminution of force occasioned by the too great obliquity of the shock of the water. Hence we may conclude, that when the water either strikes the helm too directly, or too obliquely, it loses a great deal of the effect it ought to produce. Between the two extremes there is therefore a mean position, which is the most favourable to its operations.

The diagonal NP of the rectangle IL represents the absolute direction of the effort of the water upon the helm. NI expresses the portion of this effort which is

opposed to the ship's head-way, or which pushes her altern, in a direction parallel to the keel. It is easily perceived, that this part NI of the whole power of the helm contributes but little to turn the vessel; for, if IN is prolonged, it appears that its direction approaches to a very small distance GV from the centre of gravity G; and that the arm of the lever $BN=GV$, to which the force is applied, is not in the whole more than equal to half the breadth of the rudder: but the relative force NL, which acts perpendicular to the keel, is extremely different. If the first NI is almost useless, and even pernicious, by retarding the velocity; the second NL is capable of a very great effect, because it operates at a considerable distance from the centre of gravity G of the ship, and acts upon the arm of a lever GE, which is very long. Thus it appears, that between the effects NL and NI, which result from the absolute effort NP, there is one which always opposes the ship's course, and contributes little to her motion of turning; whilst the other produces only this movement of rotation, without operating to retard her velocity.

Geometricians have determined the most advantageous angle made by the helm with the line prolonged from the keel, and fixed it at $54^{\circ} 44'$, presuming that the ship is as narrow at her floating-line, or at the line described by the surface of the water round her bottom, as at the keel. But as this supposition is absolutely false, inasmuch as all vessels augment their breadth from the keel upward to the extreme breadth, where the floating-line or the highest water-line is terminated; it follows, that this angle is too large by a certain number of degrees. For the rudder is impressed by the water, at the height of the floating-line, more directly than at the keel, because the fluid exactly follows the horizontal outlines of the bottom: so that a particular position of the helm might be supposed necessary for each different incidence which it encounters from the keel upwards. But as a middle position may be taken between all these points, it will be sufficient to consider the angle formed by the sides of the ship, and her axis, or the middle-line of her length, at the surface of the water, in order to determine afterwards the mean point, and the mean angle of incidence.

It is evident that the angle $54^{\circ} 44'$ is too open, and very unfavourable to the ship's head-way, because the water acts upon the rudder there with too great a sine of incidence, as being equal to that of the angle which it makes with the line prolonged from the keel below: but above, the shock of the water is almost perpendicular to the rudder, because of the breadth of the bottom, as we have already remarked. If then the rudder is only opposed to the fluid, by making an angle of 45° with the line prolonged from the keel, the impression, by becoming weaker, will be less opposed to the ship's head-way, and the direction NP of the absolute effort of the water upon the helm drawing nearer to the lateral perpendicular, will be placed more advantageously, for the reasons above-mentioned. On the other hand, experience daily testifies, that a ship steers well when the rudder makes the angle DBE equal to 35° only.

It has been already remarked, that the effect of moving the wheel to govern the helm increases in pro-

portion to the length of the spokes; and so great is the power of the wheel, that if the helmsman employs a force upon its spokes equivalent to 30 pounds, it will produce an effect of 90 or 120 pounds upon the tiller. On the contrary, the action of the water is collected into the middle of the breadth of the rudder, which is very narrow in comparison with the length of the tiller; so the effort of the water is very little removed from the fulcrum B upon which it turns; whereas the tiller forms the arm of a lever 10 or 15 times longer, which also increases the power of the helmsman in the same proportion that the tiller bears to the lever upon which the impulse of the water is directed. This force then is by consequence 10 or 15 times stronger; and the effort of 30 pounds, which at first gave the helmsman a power equal to 90 or 120 pounds, becomes accumulated to one of 900 or 1800 pounds upon the rudder. This advantage then arises from the shortness of the lever upon which the action of the water is impressed, and the great comparative length of the tiller, or lever, by which the rudder is governed; together with the additional power of the wheel that directs the movements of the tiller, and still farther accumulates the power of the helmsman over it. Such a demonstration ought to remove the surprise with which the prodigious effect of the helm is sometimes considered, from an inattention to its mechanism: for we need only to observe the pressure of the water, which acts at a great distance from the centre of gravity G, about which the ship is supposed to turn, and we shall easily perceive the difference there is between the effort of the water against the helmsman, and the effect of the same impulse against the vessel. With regard to the person who steers, the water acts only with the arm of a very short lever NB, of which B is the fulcrum: on the contrary, with regard to the ship, the force of the water is impressed in the direction NP, which passes to a great distance from G, and acts upon a very long lever EG, which renders the action of the rudder extremely powerful in turning the vessel; so that, in a large ship, the rudder receives a shock from the water of 2700 or 2800 pounds, which is frequently the case when the sails at the rate of three or four leagues by the hour; and this force being applied in E, perhaps 100 or 110 feet distant from the centre of gravity G, will operate upon the ship, to turn her about, with 270,000 or 308,000 pounds; whilst, in the latter case, the helmsman acts with an effort which exceeds not 30 pounds upon the spokes of the wheel.

After what has been said of the helm, it is easy to judge, that the more a ship increases her velocity with regard to the sea, the more powerful will be the effect of the rudder, because it acts against the water with a force, which increases as the square of the swiftness of the fluid, whether the ship advances or retreats; or, in other words, whether she has head-way or stern-way; with this distinction, that in these two circumstances the effects will be contrary. For if the vessel retreats, or moves altern, the helm will be impressed from L to N; and instead of being pushed, according to NP, it will receive the effort of the water from N towards R; so that the stern will be transported to the same movement, and the head turned in a contrary direction.

When the helm operates by itself, the centre of rotation.

Helmet
|
Helos.

tation of the ship, and her movement, are determined by estimating the force of this machine; that is to say, by multiplying the surface of the rudder by the square of the ship's velocity.

There are several terms in the sea-language relating to the helm; as, *Bear up the helm*; that is, Let the ship go more large before the wind. *Helm a mid ship*, or *right the helm*: that is, Keep it even with the middle of the ship. *Port the helm*, Put it over the left side of the ship. *Starboard the helm*, Put it on the right side of the ship.

HELMET, an ancient defensive armour worn by horsemen both in war and in tournaments. It covered both the head and face, only leaving an aperture in the front secured by bars, which was called the *visor*.

In achievements, it is placed above the escutcheon for the principal ornament, and is the true mark of chivalry and nobility. Helms vary according to the different degrees of those who bear them. They are also used as a bearing in coats of arms. See HERALDRY.

HELMINTHOLITHUS, in natural history, a name given by Linnæus to petrified bodies resembling worms.

Of these he reckons four genera. 1. Petrified lithophyta, found in the mountains of Sweden. 2. Petrified shells. 3. Petrified zoophytes. 4. Petrified reptiles.

HELMONT (John Baptist Van), a celebrated Flemish gentleman, was born at Brussels in 1577. He acquired much skill in natural philosophy, physic, and chemistry, that he was accounted a magician, and thrown into the inquisition: but having with difficulty justified himself, as soon as he was released he retired to Holland; where he died in 1644. He published, 1. *De magnetica corporum curatione*. 2. *Febrium doctrina inaudita*. 3. *Ortus medicine*. 4. *Paradoxa de aquis spadanis*; and other works, printed together in one volume folio.

HELMONT, a small town in the Netherlands, in Dutch Brabant, and capital of the district of Peelsand, with a good castle. It is seated on the river Aa, in E. Long. 5. 37. N. Lat. 51. 31.

HELMSTADT, a town of Germany, in the duchy of Brunswick, built by Charlemagne, in E. Long. 11. 10. N. Lat. 52. 20.

HELMSTADT, a strong maritime town of Sweden, and capital of the province of Holland, seated near the Baltic sea; in E. Long. 21. 5. N. Lat. 56. 44.

HELOISE, famous for her unfortunate affection for her tutor Abelard, and for her Latin letters to him after they had retired from the world. She died abbess of Paraclet in 1163. See ABELARD.

HELOS, (sæc. geog.), a maritime town of Laconia, situated between Trifafius and Acra; in Pausanias's time in ruins. The district was called *Holotea*, and the people *Holotes*, *Holotes*, *Helei*, and *Heleates*, by Stephanus; and *Ilotes*, by Livy. Being subdued by the Lacedæmonians, they were all reduced to a state of public slavery, or made the slaves of the public, on these conditions, viz. that they could neither recover their liberty nor be sold out of the territory of Sparta. Hence the term *ilacrum*, in Harpocration, for being in a state of slavery; and hence also the Lacedæmonians called the slaves of all nations whatever

helotes. *Holotius* is the epithet.

HELOTS, in Grecian antiquity, the slaves of the Spartans. See HELOS.—The freemen of Sparta were forbidden the exercise of any mean or mechanical employment, and therefore the whole care of supplying the city with necessaries devolved upon the Helots.

HELSINBURG. See ELISMURG.

HELSINGIA, a province of Sweden, bounded on the north by Jemterland and Medelpadia; on the east by the Bothnic gulf, and on the south and west by Dalecarlia and Geftricia. It is full of mountains and forests, and the inhabitants are almost constantly employed in hunting and fishing. It has no cities: the principal towns are Hudwickvald, Alta, and Dilbo.

HELSINGIC CHARACTER, a peculiar kind of character found inscribed on stones in the province of Helgingia. The Runic and Heltingic characters may be easily transformed into each other.

HELSTON, a town of Cornwall in England, seated on the river Lowed, in W. Long. 5. 45. N. Lat. 50. 8. It contains about 400 houses, is well inhabited, and sends two members to parliament. The steeple with its spire, which is about 90 feet high, is a notable sea-mark. A little below the town is a harbour where several tin-ships take in their lading, and here is the largest market-house in the county. The inhabitants neither pay to the church nor poor, these being supported by the revenues of the town.

HELVETIUS (Adrian), an eminent physician, born in Holland. After having studied physic at Leyden, he went to Paris, where he acquired great reputation in his profession. He introduced in France the use of ipecacuanha in the cure of dysenteries, a remedy which he at first kept secret; but was ordered to make it public, and on that account received a gratification from the king of 1000 louis d'ors. He was made inspector-general of the hospitals in Flanders, physician to the duke of Orleans, regent of France, &c.; and died at Paris, in 1727, aged 65. He wrote a treatise on the most common diseases, and the remedies proper for their cure, (the best edition of which is that of 1724, in two volumes octavo); and other works.

HELVETIUS (John), son of the former, was born in 1685. He was bred to physic; in which line he became eminent both as a practitioner and a writer, but is best known by his famous philosophical work entitled *L'Esprit*. He died in 1755.

HELVICUS (Christopher), professor of divinity, Greek, and the Oriental tongues, in the university of Gissen, died in the flower of his age in 1617; after having published several books, and projected more. The Hebrew language was so familiar to him, that he spoke it as fluently as his mother tongue. He was not only a good grammarian, but also an able chronologist. His chronological tables have been greatly esteemed, though they are not free from errors.

HELVOET-SLUYS, a sea-port town of the United Netherlands, seated on the island of Voorn, in the province of Holland, and where the English packet-boats always go. It is but a small place, consisting only of a handsome quay, and two or three little streets. But it is very well fortified, and esteemed the safest harbour in the country. The largest men of war may come up to the middle of the town; and yet

Hellets

Helvoet-
Sluys.

Hemlar
||
Hemina.

it has but very little trade, because the merchants choose to live higher up the country. E. Long. 4. o. N. Lat. 51. 44.

HEMELAR (John), an eminent antiquary, and canon of Antwerp, in the 17th century, was born at the Hague; and wrote a work, entitled, *Expositio Numismatum imperatorum Romanorum à Julio Cesare ad Heraclium*; which is very scarce, though it has had several editions.

HEMATH, or HAMATH, (anc. geog.), the name of a city (whose king was David's friend, 2 Sam. ix.) to the south of Lebanon; from which a territory was called *Nemath*, on the north of Canaan and south of Syria, as appears by the spies, Numb. xiii. 1 Kings viii. Ezek. xlvii. Whether one or more cities and districts of this name lay in this tract, neither interpreters nor geographers are agreed. The eastern part was called *Hemath-zoba*, 2 Chron. viii. unless we suppose that there was a city in *Zoba* of this name fortified by Solomon. In defining the boundary of Palestine, it is often said, *from the entering of Hamath*; as a province to be entered into through a strait or defile. And if there was such, the next question is, From what metropolis it was called *Hemath*. Antioch, capital of Syria, is supposed to be called *Hemath* or *Amatha*, (Jonathan, Targum, &c.); and again, *Epiphania*, (Josephus.) Both were to the north of Lebanon; consequently not the *Hemath* of Scripture, the immediate boundary of Palestine to the north, and lying to the south of Lebanon.

HEMATITES. See HEMATITES.

HEMEROBIOUS, in zoology, a genus of insects of the neuroptera order, the characters of which are these. The mouth is furnished with two teeth; the palpi are four; the wings are deflected, but not plaited; and the antennæ are bristly, and longer than the breast. There are 15 species, principally distinguished by their colours.

HEMEROCALLIS, DAY-LILY, or *lily-asphodel*; a genus of the monogynia order, belonging to the hexandria class of plants.

Species. 1. The flava, or yellow day-lily, hath strong fibrous roots, sending up large hollow keel-shaped leaves, two feet long, upright, leafless, firm stalks, two feet high; dividing at top into several foot-stalks, each terminated by one large lilaceous yellow flower of an agreeable odour. Of this there is a variety called the *hemerocallis minor*, or small yellow day-lily. 2. The fulva, reddish, or copper-coloured day-lily, hath roots composed of strong fleshy fibres and large oblong tubes; radical, keel-shaped, hollow, pointed leaves, a yard long, reflexed at top; with leafless stalks three or four feet high, and large copper-coloured lilaceous flowers. These have large stamina, charged with a kind of brown-coloured farina; which, on being touched or smelled to, is discharged in great plenty all over the hands or face.

Culture. Both these species are hardy, and will thrive any where. They may be easily propagated by parting their roots in autumn, or almost any time after flowering or before they begin to flower.

HEMI, a word used in the composition of divers terms, signifying the same with *femi*, or *demi*, viz. "one half."

HEMINA, in Roman antiquity, a liquid measure,

which, according to Arbuthnot, was equal to half a Hemiplegia wine-pint English measure; its contents being 2.818 solid inches.

Hemp.

HEMIPLEGIA, or HEMIPLEXIA, among physicians, a palsy of one half of the body. See (the *Index* subjoined to) MEDICINE.

HEMISPHERE, in geometry, the half of a globe or sphere, when it is supposed to be cut thro' its centre in the plane of one of its great circles.

HEMISPHERE, is also used to denote a projection of half the terrestrial globe, or half the celestial sphere, on a plane, and frequently called *planisphere*.

HEMISTICH, in poetry, denotes half a verse, or a verse not completed.

Of this there are frequent examples in Virgil's *Æneid*; but whether they were left unfinished by design or not, is disputed among the learned: such are, *Ferro accincta vocat*, *Æn. II. v. 614.* And, *Italiam non sponte sequor*, *Æn. IV. v. 361.*

In reading common English verses, a short pause is required at the end of each hemistich or half-verse.

HEMITRITÆUS, in medicine, a kind of fever, denoting the same as semi-tertian, returning twice every day. The word is Greek, and compounded of *hemitritus*, "half," and *tertius*, "third, or tertian."

HEMLOCK, in botany. See CICUTA and CONIUM.

HEMOIPTOTON. See ORATORY, n° 77.

HEMP, in botany. See CANNABIS.

The raising and dressing of hemp scarcely differs from the raising and dressing of flax, but in the following particulars.

Hemp requires a light, free, dusty, and even a sandy warm soil; which if not naturally rich, must be made so by manure. New broke-up ground does not answer for hemp, producing it thin and poor upon the stalk. Hemp does well to follow beans. The ground should be ploughed and harrowed three or four times, a fortnight or three weeks intervening between each time. In some parts of Lincoln and Holland, the soil is naturally so free and rich, that it will produce hemp constantly year after year without manure. The leaves which fall off the stalk help to manure the ground. It is frequently sown with a view to clear the ground of weeds; which it does most effectually, growing fast, and soon checking every weed but mungwort, which is picked out with a fork.

It is sown about the first of May; so thin, that about four pecks are sufficient for an English acre; and the ground must then be covered as much as possible to preserve the seed from the birds, who are very fond of it.

The *taper-topped* stalk which does not bear the pods, is called the *female*; though in fact it is the *male*, scattering from its bloom a small dust, which impregnates the pods of the *bushy-topped*; which last is commonly, tho' improperly, called the *male* or *carle* hemp.

When hemp is the object of the farmer more than a crop of seed, the whole should be pulled when the stalk begins to grow yellow, and the earth remaining about the roots should be beat off to prevent more growth; but if the seed is wanted in its greatest perfection, the stalks bearing the pods must be pulled before the uppermost pod begins to open; the earth should

Hemp
Henoticon.

should not be beat off from the roots; it should be flaked in sheaves upon the field, to dry and win as corn; and the top of these flaked should be covered with undergrowth or the like, to preserve the seed from the birds.

Hemp is sooner watered than flax, and the canals must be deeper.

In keeping the seed, care must be taken to preserve it from rats, mice, and such like vermin, who are all fond of it.

It is dressed as coarse flax, but is sooner dressed; and its greater length requires more care, and renders it more troublesome in the handling, especially in the skutching of it by the water lint-mills with horizontal skutchers, when it must be folded double. What is too coarse and strong in the stalk for the hand or foot machines, may be broke and peeled by the hand. See FLAX.

HEMP-*Agri-mony*, a species of EUPATORIUM.—It has a very bitter taste. A decoction of the roots operates as a violent emetic and cathartic, and is sometimes taken by the lower class of people to cure the jaundice, dropsy, and cachexy; but is a rough medicine, and ought to be used with caution. Boerhaave made use of an infusion of this plant to foment ulcers and putrid sores. Tournefort informs us, that the Turks cure the scurvy with it. An ounce of the juice, or a dram of the extract, is a dose.

HEMPSTEAD, a town of Hertfordshire in England, seated among the hills on a branch of the river Coln. W. Long. 0. 40. N. Lat. 51. 44.

HEN, in ornithology. See PHASIANUS.

Guinea-HEN. See NUMIDA.

HEN-Bane. See HYOSCIAMUS.

HENDECAGON, in geometry, a figure that hath 11 sides and as many angles.

HENLEY, a town of Oxfordshire in England, seated on the river Thames, over which there is a handsome bridge. It sends malt, corn, and other things, to London in barges. W. Long. 0. 40. N. Lat. 51. 34.

HENLEY, a town of Warwickshire in England, seated on the river Alne, in W. Long. 1. 45. N. Lat. 52. 18.

HENNA, or ALHENNA. See LAWSONIA.

HENNEBERG, a county of Germany, in the circle of Franconia. It is bounded on the north by Thuringia, on the west by Hesse, on the south by the bishopric of Wertzburg, and on the east by that of Bamberg. It abounds in mountains and woods; and it is populous, and pretty fertile. Mainingen is the capital town.

HENNEBERG, a town of Germany, in the circle of Franconia, which gives title to a county of the same name, with a castle. E. Long. 9. 17. N. Lat. 50. 40.

HENNEBON, a town of France in Bretagne, in the diocese of Vannes. It is inhabited by rich merchants, and is seated on the river Blavet, in W. Long. 2. 13. N. Lat. 47. 48.

HENOTICON, in church-history, a decree or edict of the emperor Zeno, made at Constantinople in the year 482, by which he pretended to reconcile all parties under one faith. It is generally agreed, that Peter, patriarch of Alexandria, and Acacius, pa-

triarh of Constantinople, were the authors of this decree; and that their design was to compliment the emperor with a right of prescribing regulations in matters of faith. The emperor, by this decree, arrogated to himself the right of being head of the church. Pope Simplicius, however, in the year 483, condemned the henoticon, and cited Acacius to appear before him at Rome; but it was not entirely suppressed till the year 518.

HENRY, or CAPE-HENRY, the south cape of Virginia, at the entrance of Chesapeake-bay. W. Long. 74. 50. N. Lat. 37. 0.

HENRY, the name of several emperors of Germany, and kings of England and France. See ENGLAND, FRANCE, and GERMANY.

HENRY IV. emperor of Germany in 1056, styled *the Great*, was memorable for his quarrels with pope Gregory II. whom at one time he deposed, for having presumed to judge his sovereign; but at another, dreading the effects of the papal anathemas, he had the weakness to submit to the most humiliating personal solicitations and penances to obtain absolution, which impolitic measure increased the power of the Pope, and alienated the affections of his subjects: thus circumstanced, he reassumed the hero, but too late; marched with an army to Rome, expelled Gregory, deposed him, and set up another Pope. Gregory died soon after: but Urban II. and Pascal II. successively, excited his ambitious sons, Conrad and Henry, to rebel against him, and the latter was crowned emperor by the title of Henry V. in 1106; and he had the inhumanity to arrest his father, and to deprive him, not only of all his dignities, but even of the necessities of life. The unfortunate Henry IV. was reduced to such extremities, (after having fought 62 battles in defence of the German empire), that he solicited the bishop of Spire to grant him an under-chamber's place in his cathedral, but was refused. He died the same year, at Liege, aged 55, a martyr to the ignorance and superstition of the age, and to his own blind confidence in favourites and mistresses.

HENRY IV. king of France (in 1589) and Navarre, justly styled *the Great*, was the son of Anthony de Bourbon, chief of the branch of Bourbon, (so called from a sieve that name which fell to them by marriage with the heiress of the estate). His mother was the daughter of Henry de Albert, king of Navarre; a woman of a masculine genius; intrepid, simple and rustic in her manners, but deeply versed in politics, and a zealous protestant. Foreseeing that her party would want such a protector (for her husband was a weak indolent prince), she undertook the care of the education of the young hero: his diet was coarse; his clothes neat, but plain; he always went bare-headed; she sent him to school with the other children of the same age, and accustomed him to climb the rocks and neighbouring mountains, according to the custom of the country. He was born in 1553; and in 1569, the 16th year of his age, he was declared the Defender and Chief of the Protestants at Rochelle. The peace of St Germain, concluded in 1570, recalled the lords in the Protestant interest to court; and in 1572 Henry was married to Margaret de Valois, sister to Charles IX. king of France. It was in the midst of the rejoicings for these nuptials, that the horrid massacre of Paris took

Henry.

took place. Henry was reduced, by this infernal stroke of false policy, to the alternative of changing his religion or being put to death : he chose the former, and was detained prisoner of state three years. In 1587, he made his escape; put himself at the head of the Huguenot party; exposing himself to all the risks and fatigues of a religious war, often in want of the necessaries of life, and enduring all the hardships of the common soldier : but he gained a victory this year at Courtras, which established his reputation in arms, and endeared him to the Protestants. On the death of Henry III. religion was urged as a pretext for one half of the officers of the French army to reject him, and for the leaguers not to acknowledge him. A phantom, the cardinal de Bourbon, was set up against him; but his most formidable rival was the duke de Mayenne: however, Henry, with few friends, fewer important places, no money, and a very small army, supplied every want by his activity and valour. He gained several victories over the duke; particularly that of Ivry in 1590, memorable for his heroic admonition to his soldiers: "If you love your ensigns, rally by my white plume, you will always find it in the road to honour and glory." Paris held out against him, notwithstanding his successes: he took all the suburbs in one day; and might have reduced the city by famine, if he had not humanely suffered his own army to relieve the besieged; yet the bigotted friars and priests in Paris all turned soldiers, except four of the Mendicant order; and made daily military reviews and processions, the sword in one hand and the crucifix in the other, on which they made the citizens swear rather to die with famine than to admit Henry. The scarcity of provisions in Paris at last degenerated to an universal famine; bread had been sold, whilst any remained, for a crown the pound, and at last it was made from the bones of the charnel-house of St Innocents; human flesh became the food of the obstinate Parisians, and mothers eat the dead bodies of their children. In fine, the duke of Mayenne, seeing that neither Spain nor the league would ever grant him the crown, determined to assist in giving it to the lawful heir. He engaged the states to hold a conference with the chiefs of both parties; which ended in Henry's abjuration of the Protestant religion at St Dennis, and his consecration at Chartres in 1593. The following year Paris opened its gates to him; in 1596, the duke of Mayenne was pardoned; and in 1598, peace was concluded with Spain. Henry now shewed himself doubly worthy of the throne, by his encouragement of commerce, the fine arts, and manufactures, and by his patronage of men of ingenuity and sound learning of every country: but though the fermentations of Romish bigotry were calmed, the heaven was not destroyed; scarce a year passed without some attempt being made on this real father of his people; and at last the monster Ravillac stabbed him to the heart in his coach, in the streets of Paris, on the 14th of May 1610, in the 57th year of his age and 22d of his reign.

HENRY VIII. king of England, was the second son of Henry VII. by Elizabeth the eldest daughter of Edward IV. He was born at Greenwich, on the 28th of June 1491. On the death of his brother Arthur, in 1502, he was created prince of Wales;

and the following year betrothed to Catharine of Aragon, prince Arthur's widow, the Pope having granted a dispensation for that purpose. Henry VIII. acceded to the throne, on the death of his father, the 22d of April 1509, and his marriage with Catharine was solemnized about two months after. In the beginning of his reign he left the government of his kingdom entirely to his ministers; and spent his time chiefly in tournaments, balls, concerts, and other expensive amusements. We are told that he was so extravagant in his pleasures, that, in a very short time, he entirely dissipated 1,800,000*l.* which his father had hoarded. This will seem less wonderful, when the reader is informed, that gaming was one of his favourite diversions. Nevertheless he was not so totally absorbed in pleasure, but he found leisure to sacrifice, to the resentment of the people, two of his father's ministers, Empson and Dudley. A house in London, which had belonged to the former of these, was in 1510 given to Thomas Wolsey, who was now the king's almoner, and who from this period began to insinuate himself into Henry's favour. In 1513, he became prime minister, and from that moment governed the king and kingdom with absolute power. In this year Henry declared war against France, gained the battle of Spurs, and took the towns of Terouenne and Tournay; but before he embarked his troops, he beheaded the earl of Suffolk, who had been long confined in the tower. In 1521, he sacrificed the duke of Buckingham to the resentment of his prime minister Wolsey, and the same year obtained from the Pope the title of *Defender of the Faith*.

Henry, having been 18 years married, grew tired of his wife, and in the year 1527 resolved to obtain a divorce; but after many fruitless solicitations, finding it impossible to persuade the Pope to annul his marriage with Catharine, he espoused Ann Bullen in the year 1531. During this interval his favourite Wolsey was disgraced, and died; Henry threw off the Papal yoke, and burnt three Protestants for heresy. In 1535, he put to death Sir Thomas More, Fisher, and others, for denying his supremacy, and suppressed all the lesser monasteries.

His most sacred majesty, having now possessed his second queen about five years, fell violently in love with lady Jane Seymour. Ann Bullen was accused of adultery with her own brother, and with three other persons: she was beheaded the 19th of May, 1536. He married Jane Seymour the day following. In 1537, he put to death five of the noble family of Kildare, as a terror to the Irish, of whose disloyalty he had some apprehensions; and in the year following he executed the marquis of Exeter, with four other persons of distinction, for the sole crime of corresponding with cardinal Pole. In 1538 and 1539, he suppressed all the monasteries in England, and seized their revenues for his own use. The queen having died in childbed, he this year married the princess Ann of Cleves; but disliking her person, immediately determined to be divorced; and his obsequious parliament and convocation unanimously pronounced the marriage void, for reasons too ridiculous to be recited: but this was not all; Henry was so incensed with his minister and quondam favourite, Cromwell, for negotiating this match, that he revenged himself

Henry.

by the hand of the executioner. Yet this was not the only public murder of the year 1540. A few days after Cromwell's death, several persons were burnt for denying the king's supremacy, and other articles of heresy.

His majesty being once more at liberty to indulge himself with another wife, fixed upon Catharine Howard, niece to the duke of Norfolk. She was declared queen in August 1540; but they had been privately married some time before. Henry, it seems, was so entirely satisfied with this lady, that he daily blessed God for his present felicity; but that felicity was of short duration: he had not been married above a year, before the queen was accused of frequent prostitution, both before and since her marriage: she confessed her guilt, and was beheaded in February 1542. In July 1543, he married his sixth wife, the Lady Catharine Parr, the widow of John Nevill lord Latimer, and lived to the year 1547, without committing any more flagrant enormities: but finding himself now approach towards dissolution, he made his will; and, that the last scene of his life might resemble the rest, he determined to end the tragedy with the murder of two of his best friends and most faithful subjects, the duke of Norfolk, and his son the earl of Surrey. The earl was beheaded on the 19th of January; and the duke was ordered for execution on the 29th, but fortunately eluded by the king's death on the 28th. They were condemned without the shadow of a crime; but Henry's political reason for putting them to death, was his apprehension, that, if they were suffered to survive him, they would counteract some of his regulations in religion, and might be troublesome to his son. Henry died on the 28th of January 1547, in the 56th year of his age, and was buried at Windsor.

As to his character, it is pretty obvious from the facts above related. Lord Herbert palliates his crimes, and exaggerates what he calls his *virtues*. Bishop Burnet says, "he was rather to be reckoned among the great than the good princes." He afterwards acknowledges, that "he is to be numbered among the ill princes;" but adds, "I cannot rank him with the worst." Sir Walter Raleigh, with infinitely more justice, says, "If all the pictures and patterns of a merciless prince were lost to the world, they might again be painted to the life out of the history of this king." He was indeed a merciless tyrant, a scurvy politician, a foolish bigot, a horrible assassin. See ENGLAND, n° 212—230.

HENRY of Huntingdon, an English historian, of the 12th century, was canon of Lincoln, and afterwards archdeacon of Huntingdon. He wrote, 1. A history of England, which ends with the year 1154. 2. A continuation of that of Bede. 3. Chronological tables of the kings of England. 4. A small treatise on the contempt of the world. 5. Several books of epigrams and love-verses. 6. A poem on herbs; all which are written in Latin.—His invocation of Apollo and the goddesses of Tempe, in the exordium of his poem on herbs, may not be unacceptable as a specimen of his poetry.

Vatum magnæ parant, herbarum Phœbe reperto,
Vosque, quibus parcant Tempe juvosa Deæ!
Si mihi ferat prius hedera forente parafitis,
Ecce meos flores, ferat parante fero.

HENRY of Susa, in Latin, de Seguso, a famous civilian and canonist of the 13th century, acquired such reputation by his learning, that he was called the *source and splendor of the laws*. He was archbishop of Emburn about the year 1258, and cardinal bishop of Ostia in 1262. He wrote *A summary of the canon and civil laws*; and *A commentary on the book of the decretals*, composed by order of Alexander IV.

HENRY (Philip), a pious and learned nonconformist minister, was the son of Mr John Henry, page of the back-stairs to James duke of York, and was born at Whitehall in 1631. He was admitted into Westminster school at about 12 years of age; became the favourite of Dr Busby, and was employed by him, with some others, in collecting materials for the Greek grammar he afterwards published. From thence he removed to Christ-church, Oxford; where, having obtained the degree of master of arts, he was taken into the family of judge Puleston, at Emeral in Flintshire, as tutor to his sons, and to preach at Worthenbury. He soon after married the only daughter and heiress of Mr Daniel Matthews of Broad-oak near Whitchurch, by whom he became possessed of a competent estate. When the king and episcopacy were restored, he refused to conform, was ejected, and retired with his family to Broad-oak; here, and in the neighbourhood, he spent the remainder of his life, about 28 years, relieving the poor, employing the industrious, instructing the ignorant, and exercising every opportunity of doing good. His moderation in his nonconformity was eminent and exemplary; and upon all occasions he bore testimony against uncharitable and schismatical separation. In church-government he wished for archbishop Usher's reduction of episcopacy. He thought it lawful to join in the common-prayer in public assemblies; which, during the time of his silence and restraint, he commonly attended with his family, with reverence and devotion.

HENRY (Matthew), an eminent dissenting minister and author, was the son of the former, and was born in the year 1662. He continued under his father's care till he was 18 years of age; in which time he became well skilled in the learned languages, especially in the Hebrew, which his father had rendered familiar to him from his childhood; and from first to last the study of the scriptures was his most delightful employment. He completed his education in an academy kept at Islington by Mr Doolittle, and was afterwards entered in Gray's-Inn for the study of the law; where he became well acquainted with the civil and municipal law of his own country, and from his application and great abilities it was thought he would have become very eminent in that profession. But at length, resolving to devote his life to the study of divinity, in 1686 he retired into the country, and was chosen pastor of a congregation at Chester, where he lived about 25 years, greatly esteemed and beloved by his people. He had several calls from London, which he constantly declined; but was at last prevailed upon to accept an unanimous invitation from a congregation at Hackney. He wrote, 1. Expositions of the Bible, in 5 vols. folio. 2. The life of Mr Philip Henry. 3. Directions for daily communion with God. 4. A method for prayer. 5. Four discourses against vice and immorality. 6. The communicant's companion. 7. Family hymns. 8. A scrip-

Hepar
||
Hepatica.

scriptural catechism; and, 9. A discourse concerning the nature of schism. He died of an apoplexy at Nantwich, when upon a journey, in 1714; and was interred at Trinity-church, in Chester.

HEPAR SULPHURIS, or LIVER of SULPHUR, a combination of alkaline salt and sulphur. See CHEMISTRY, n° 321—325.

By means of the fume arising on the decomposition of *hepar sulphuris* by an acid, Mr Bergman hath found a method of imitating the hot or sulphureous mineral waters, to as great perfection as the cold ones are now imitated by fixed air. The process consists simply in adding the vitriolic acid to *hepar sulphuris*, and impregnating water with the peculiar species of air that arises from this mixture; in the same manner as when water is impregnated with the fixed air arising from the mixture of that or any other acid with chalk. This *hepatic air*, as the author calls it, is very readily absorbed by water; to which it gives the smell, taste, and all the other sensible qualities of the sulphureous waters. A Swedish *cantharus* of distilled water, containing 12½ Swedish cubic inches, will absorb about 60 cubic inches of this hepatic air; and on dropping into it the *nitrous acid*, it will appear, that a real sulphur is contained, in a state of perfect solution, in this water, to the quantity of eight grains. It does not appear that any other acid, except what the author calls the *dephlogisticated marine acid*, will produce this effect.—When any particular sulphureous water is to be imitated, we scarce need to observe, that the saline, or other contents peculiar to it, are to be added to the artificial *hepatic water*. Instead of the liver of sulphur, the operator may use a mixture of three-parts of filings of iron and two-parts of sulphur melted together.

It may, perhaps, be thought, that water thus prepared, does not differ from that in which a portion of the *hepar sulphuris* has been dissolved: but it appears evidently to differ from it in this material circumstance;—that in the solution of *hepar sulphuris*, the sulphur is held in solution by the water, through the means of the *alkali* combined with it: whereas, in M. Bergman's process, it does not appear probable that the *hepar sulphuris* rises substantially in the form of air; for, in that case, its presence in the hepatic water might be detected by means of the weakness of the acids (even the *phlegmic*), which would precipitate the sulphur from it. Nor can it be supposed that any portion or constituent part of the *alkali* itself (except a part of its remaining fixed air) can come over. The water, therefore, must owe its impregnation to the sulphur, raised, in some peculiar manner, into the state of an elastic vapour; permanent, when the experiment is made in quicksilver; but condensable in water, and rendered soluble in that fluid through the means of some unknown principle combined with it, and which the author supposes to be the matter of heat, combined with it through the medium of *phlogiston*.

HEPATIC, in medicine and anatomy, any thing belonging to the liver.

HEPATIC Air. See *HEPAR SULPHURIS*.

HEPATIC Aloes, the inspissated juice of a species of *ALOES*.

HEPATIC Water. See *HEPAR SULPHURIS*.

HEPATICA, in botany, a species of *ANEMONE*.

HEPATITIS, in medicine, an inflammation of the liver. See (the *Index* subjoined to) *MEDICINE*.

HEPHÆSTIA, in Grecian antiquity, an Athenian festival in honour of Vulcan, the chief ceremony of which was a race with torches. It was performed in this manner: The antagonists were three young men, one of whom, by lot, took a lighted torch in his hand, and began his course; if the torch was extinguished before he finished the race, he delivered it to the second: and he in like manner to the third: the victory was his who first carried the torch lighted to the end of the race; and to this successive delivering of the torch, we find many allusions in ancient writers.

HEPTACHORD, in the ancient poetry, signified verses that were sung or played on seven chords, that is, on seven different notes. In this sense it was applied to the lyre when it had but seven strings. One of the intervals is also called an *heptachord*, as containing the same number of degrees between the extremes.

HEPTAGON, in geometry, a figure consisting of seven sides, and as many angles. In fortification, a place is termed an *heptagon*, that has seven bastions for its defence.

HEPTAGONAL NUMBERS, in arithmetic, a sort of polygonal numbers, wherein the difference of the terms of the corresponding arithmetical progression is 5. One of the properties of these numbers is, that if they be multiplied by 40, and 9 be added to the product, the sum will be a square number.

HEPTANDRIA, in botany, (from *ἑπτα*, *septem*, and *ἄνδρα*, *a man*;) the seventh class in Linnæus's sexual method, consisting of plants with hermaphrodite flowers, which have seven flamina, or male-organs. The orders are four, derived from the number of styles or female-organs.

HEPTANGULAR, in geometry, an appellation given to figures which have seven angles.

HEPTARCHY, a government of seven persons; also a state or country divided into seven kingdoms, and governed by seven independent princes; in which sense it is particularly applied to the government of South-Britain, when divided among the Saxons. See ENGLAND, n° 43.

HERACLEA, an ancient city of Turkey in Europe, and in Romania, with the see of an archbishop of the Grecian church, and a sea-port. It was a very famous place in former times, and there are still some remains of its ancient splendor. Theodore Lascaris took it from David Comnenus, emperor of Trebizond; when it fell into the hands of the Genoese, but Mahomet II. took it from them; since which time it has been in the possession of the Turks. It is near the sea. E. Lon. 27. 48. N. Lat. 40. 27.

HERACLEONITES, a sect of Christians, the followers of Heracleon, who refined upon the Gnostic divinity, and maintained that the world was not the immediate production of the Son of God, but that he was only the occasional cause of its being created by the demiurgus. The Heracleonites denied the authority of the prophecies of the Old Testament, maintaining that they were mere random sounds in the air; and that St John the Baptist was the only true voice that directed to the Messiah.

HERACLEUM, *MADNESS*; a genus of the digynia order,

Hepatitis
||
Heracleum

order, belonging to the pentandria class of plants. -- There are five species, of which the most remarkable is the *Spondylium*, or cow-parfip. This is common in many parts of Britain, and other northern parts of Europe and Asia. -- Gmelin, in his *Flora Siberica*, p. 214, tells us, that the inhabitants of Kamtschatka, about the beginning of July, collect the foot-stalks of the radical leaves of this plant, and, after peeling off the rhind, dry them separately in the sun, and then, tying them in bundles, dry them carefully in the shade: in a short time afterwards, these dried stalks are covered over with a yellow saccharine efflorescence, tasting like liquorice; and in this state they are eaten as a great delicacy. -- The Russians not only eat the stalks thus prepared, but procure from them a very intoxicating spirit. They first ferment them in water with the greater bilberries, (*vaccinium uliginosum*), and then distill the liquor to what degree of strength they please; which Gmelin says is more agreeable to the taste than spirits made from corn. This may therefore prove good succedaneum for whisky; and prevent the consumption of much barley, which ought to be applied to better purposes. -- Swine and rabbits are very fond of this plant. In the county of Norfolk it is called *bog-weed*.

HERACLIDÆ, in antiquity, the descendants of Hercules. The Heraclidæ were expelled from Peloponnesus, by Euristheus king of Mycenæ, after the death of Hercules.

Return of the HERACLIDÆ into Peloponnesus, is a celebrated epocha in the ancient chronology. -- The time of this return is differently assigned; by reason authors mistake the divers attempts they made to return, for the return itself. The first attempt was 20 years before the taking of Troy: the second was 100 years later, or 80 years after the taking of Troy. This last is supposed to have succeeded; at least, according to Petavius, who mentions only these two. Scaliger distinguishes three attempts; and fixes the first 50 years later than Petavius, viz. 30 years after the taking of Troy. He says nothing of the second, which was unfortunate like the first; but places the third in the same year with Petavius. As it occasioned a world of changes and revolutions in the affairs of Greece, inasmuch that scarce a state or people but were turned upside down thereby, the return of the Heraclidæ is the epocha of the beginning of profane history: all the time that preceded it is reputed fabulous. Accordingly, Ephorus, Cumanus, Callisthenes, and Theopompus, only begin their histories from hence.

HERACLIDES of PONTUS, a Greek philosopher, the disciple of Speusippus, and afterwards of Aristotle, flourished about 336 B. C. His vanity prompted him to desire one of his friends to put a serpent into his bed just as he was dead, in order to raise a belief that he was ascended to the heavens among the gods; but the cheat was discovered. All his works are lost.

HERACLITUS, a famous Ephesian philosopher, who flourished about the 69th Olympiad, in the time of Darius Hytaspes. He is said to have continually

bewailed the wicked lives of men, and, as often as he came among them, to have fallen a-weeping; contrary to Democritus, who made the follies of mankind a subject of laughter. He retired to the temple of Diana, and played at dice with the boys there; saying to the Ephesians who gathered round him, "Worshippers of men, what do ye wonder at? Is it not better to do thus than to govern you?" Darius wrote to this philosopher to come and live with him; but he refused the offer: at last, out of hatred to mankind, he retired to the mountains, where he contracted a dropsy by living on herbs, which destroyed him at 60 years of age. His writings gained him so great reputation, that his followers were called *Heraclitians*. Laertius speaks of a treatise upon nature, divided into three books, one concerning the universe, the second political, the third theological, which he deposited in the temple of Diana.

HERACLIUS, emperor of the east, a renowned warrior, died A. D. 641. He carried on long and bloody wars with the Saracens, by whom he was almost always defeated. See ARABIA, n° 67--93.

HERALD, says Verstegan, is derived from the Saxon word *Herehault*, and, by abbreviation, *Heral*, which in that language signifies the champion of an army; and, growing to be a name of office, it was given to him who, in the army, had the special charge to denounce war, to challenge to battle and combat, to proclaim peace, and to execute martial messages. But the business of heralds with us is as follows, viz. To marshal, order, and conduct all royal calvacades, ceremonies at coronations, royal marriages, installations, creations of dukes, marquises, earls, viscounts, barons, baronets, and dubbing of knights; embassies, funeral processions, declarations of war, proclamations of peace, &c.: To record and blazon the arms of the nobility and gentry; and to regulate any abuses therein 'till the English dominions, under the authority of the Earl-Marshal, to whom they are subservient. The office of Windsor, Chester, Richmond, Somerset, York, and Lancaster heralds, is to be assistants to the kings at arms, in the different branches of their office; and they are superior to each other, according to creation, in the above order.

Heralds were formerly held in much greater esteem than they are at present; and were created and christened by the king, who, pouring a cold-cup of wine on their head, gave them the herald-name: but this is now done by the earl-marshal. They could not arrive at the dignity of herald without having been seven years purfuitant; nor could they quit the office of herald, but to be made king at arms.

The office and dignity of a herald was first instituted by Ancus Martius, fourth king of the Romans, as Livy declares; but some writers ascribe its origin to Numa Pompilius, and that he ordained a college of heralds. Richard III. was the first who formed them, in this kingdom, into a college; and afterwards great privileges were granted them by Edward VI. and Philip and Mary.

Heraclides
Herald.

HERALDRY,

Definition
origin, &c.
of Heraldry.

A SCIENCE which teaches how to blazon, or explain in proper terms, all that belongs to coats-of-arms; and how to marshal, or dispose regularly, divers arms on a field. It also teaches whatever relates to the marshalling of solemn calvacades, processions, and other public ceremonies at coronations, installations, creations of peers, nuptials, christening of princes, funerals, &c.

Arms, or coats-of-arms, are hereditary marks of honour, made up of fixed and determined colours and figures, granted by sovereign princes, as a reward for military valour, a shining virtue, or a signal public service; and which serve to denote the descent and alliance of the bearer, or to distinguish states, cities, societies, &c. civil, ecclesiastical, and military.

Thus heraldry is the science, of which *arms* are the proper object; but yet they differ much both in their origin and antiquity. Heraldry, according to Sir George Mackenzie, "as digested into an art, and subjected to rules, must be ascribed to Charlemagne and Frederick Barbarossa, for it did begin and grow with the feudal law." Sir John Ferne is of opinion, that we did borrow *arms* from the Egyptians; meaning, from their hieroglyphicks. Sir William Dugdale mentions, that arms, as marks of honour, were first used by great commanders in war, necessity requiring that their persons should be notified to their friends and followers. The learned Alexander Nisbet, in his excellent system of heraldry, says, that arms owe their rise and beginning to the light of nature; and that signs and marks of honour were made use of in the first ages of the world, and by all nations, however simple and illiterate, to distinguish the noble from the ignoble. We find in Homer, Virgil, and Ovid, that their heroes had divers figures on their shields, whereby their persons were distinctly known. Alexander the Great, desirous to honour those of his captains and soldiers who had done any glorious action, and also to excite an emulation among the rest, did grant them certain badges to be borne on their armour, pennons, and banners; ordering, at the same time, that no person or potentate, through his empire, should attempt or presume to give or tolerate the bearing of those signs upon the armour of any man, but it should be a power reserved to himself; which prerogative has been claimed ever since by all other kings and sovereign princes within their dominions.

After these and many other different opinions, all that can be said with any certainty is, that, in all ages, men have made use of figures of living creatures, or symbolical signs, to denote the bravery and courage either of their chief or nation, to render themselves the more terrible to their enemies, and even to distinguish themselves or families, as names do individuals. The famous C. Agrippa, in his treatise of the vanity of sciences, cap. 81. has collected many instances of these marks of distinction, anciently borne by kingdoms and states that were any way civilized, viz.

The Egyptians	} bore	an Ox,
The Athenians		an Owl,
The Goths		a Bear,
The Romans		an Eagle,
The Franks		a Lion,
The Saxons		a Horse.

Hereditary
arms, &c.

The last is still borne in the arms of his present Britannic Majesty. As to hereditary arms of families, William Camden, Sir Henry Spelman, and other judicious heralds, agree, that they began no sooner than towards the latter end of the 11th century. According to Father Menestrier's opinion, a French writer whose authority is of great weight in this matter, Henry l'Oiseleur (the Falconer) who was raised to the imperial throne of the West in 920, by regulating tournaments in Germany gave occasion to the establishment of family-arms, or hereditary marks of honour, which undeniably are more ancient and better observed among the Germans than in any other nation. Moreover, this last author asserts, that with tournaments first came up coats-of-arms; which were a sort of livery, made up of several lills, fillets, or narrow pieces of stuff of divers colours, from whence came the fess, the bend, the pale, &c. which were the original charges of family-arms; for they who never had been at tournaments, had not such marks of distinction. They who insisted themselves in the Croisades, took up also several new figures hitherto unknown in armorial ensigns; such as alerions, bezants, escalop-shells, martlets, &c. but more particularly crosses, of different colours for distinction's sake. From this it may be concluded, that heraldry, like most human inventions, was insensibly introduced and established; and that, after having been rude and unsettled for many ages, it was at last methodised, perfected, and fixed, by the Croisades and tournaments.

These marks of honour are called *arms*, from their being principally and first worn by military men at war and tournaments, who had them engraved, embossed, or depicted on shields, targets, banners, or other martial instruments. They are also called *coats-of-arms*, from the custom of the ancients embroidering them on the coats they wore over their arms, as heralds do to this day.

Arms are distinguished by different names, to denote the causes of their bearing; such as,

A R M S

Of Dominion,	Of Patronage,
Of Pretension,	Of Family,
Of Concession,	Of Alliance,
Of Community,	Of Succession.

Arms of *dominion* or sovereignty are those which emperors, kings, and sovereign states, do constantly bear; being, as it were, annexed to the territories, kingdoms, and provinces, they possess. Thus the three lions are the arms of England, the fleurs-de-lis those of France, &c.

Arms of *pretension* are those of such kingdoms, pro-

Different
forts of
Arms.

Of the
Shield, &c.

provinces, or territories, to which a prince or lord has some claim, and which he adds to his own, although the said kingdoms or territories be possessed by a foreign prince or other lord. Thus the kings of England have quartered the arms of France with their own, ever since Edward III. laid claim to the kingdom of France, which happened in the year 1330, on account of his being son to Isabella, sister to Charles the Handsome, who died without issue.

Arms of *concession* or augmentation of honour, are either entire arms, or else one or more figures, given by princes as a reward for some extraordinary service. We read in history, that Robert Bruce, king of Scotland, allowed the earl of Winton's ancestor to bear, in his coat-armour, a crown supported by a sword, to shew that he, and the clan Scaton, of which he was the head, supported his tottering crown. The late Queen Anne granted to Sir Cloudesly Shovel, rear-admiral of Great Britain, a chevron between two fleurs-de-lis in chief, and a crescent in base, to denote three great victories he had gained; two over the French, and one over the Turks.

Arms of *community*, are those of bishoprics, cities, universities, academies, societies, companies, and other bodies corporate.

Arms of *patronage*, are such as governors of provinces, lords of manors, patrons of benefices, &c. add to their family-arms, as a token of their superiority, rights, and jurisdiction. These arms have introduced into heraldry, castles, gates, wheels, ploughs, rakes, harrows, &c.

Arms of *family*, or *paternal-arms*, are those that belong to one particular family, that distinguish it from others, and which no person is suffered to assume without committing a crime, which sovereigns have a right to restrain and punish.

Arms of *alliance*, are those which families, or private persons, take up and join to their own, to denote the alliances they have contracted by marriage. This sort of arms is either impaled, or borne in an *escutcheon of pretence*, by those who have married themselves.

Arms of *succession*, are such as are taken up by them who inherit certain estates, manors, &c. either by will, entail, or donation, and which they either impale or quarter with their own arms; which multiplies the titles of some families out of necessity, and not through ostentation, as many imagine.

These are the eight classes under which the divers sorts of arms are generally ranged; but there is a sort which blazoners call *assumptive arms*, being such as are taken up by the caprice or fancy of upstarts, though of ever so mean extraction, who, being advanced to a degree of fortune, assume them without a legal title. This, indeed, is a great abuse of heraldry; and common only in Britain, for on the continent no such practice takes place.

We now proceed to consider the essential and integral parts of arms, which are these:

The ESCUTCHEON, The CHARGES,
The TINCTURES, The ORNAMENTS.

C H A P. I.

Of the SHIELD or ESCUTCHEON.

THE *Shield*, or *Escutcheon*, is the field or ground whereon are represented the figures that make up a

coat of arms: for these marks of distinction were put on bucklers or shields, before they were placed on banners, standards, flags, and coat-armour; and wherever they may be fixed, they are still on a plane or superficies, whose form resembles a shield.

Shields, in heraldry called *escutcheons*, or *feutcheons*, from the Latin word *feutum*, have been, and still are, of different forms, according to different times and nations. Amongst ancient shields, some were almost like a horse-shoe, such as is represented by n^o 1. in the figure of Escutcheons; others triangular, somewhat rounded at the bottom, as n^o 2. The people who inhabited Mesopotamia, now called *Diarbeck*, made use of this sort of shield, which, it is thought, they had of the Trojans. Sometimes the shield was heptagonal, that is, had seven sides, as n^o 3.—The first of this shape is said to have been used by the famous triumvir M. Antony. That of knights-banneret was square, like a banner, as n^o 4. As to modern escutcheons, those of the Italians, particularly of ecclesiastics, are generally oval, as n^o 5. The English, French, Germans, and other nations, have their escutcheons formed different ways, according to the carver's or painter's fancy; see the various examples contained from n^o 6—16 of the figure. But the escutcheon of maids, widows, and of such as are born ladies, and are married to private gentlemen, is in the form of a lozenge. See n^o 17—20. Sir George Mackenzie mentions one Muriel, countess of Strathern, who carried her arms in a lozenge, anno 1284, which shews how long we have been versant in heraldry.

Armourists distinguish several parts or points in escutcheons, in order to determine exactly the position of the bearings they are charged with; they are here denoted by the first nine letters of the alphabet, ranged in the following manner:

- A—the dexter chief.
- B—the precise middle chief.
- C—the sinister chief.
- D—the honour point.
- E—the fess point.
- F—the navril point.
- G—the dexter base.
- H—the precise middle base.
- I—the sinister base.

The knowledge of these points is of great importance, and ought to be well observed, for they are frequently occupied with several things of different kinds. It is necessary to observe, that the dexter-side of the escutcheon is opposite to the left hand, and the sinister side to the right hand of the person that looks on it.

C H A P. II.

Of TINCTURES, FURS, LINES, and DIFFERENCES.

SECT. I. Of Tinctures.

By *tinctures* is meant that variable hue of arms which is common both to shields and their bearings. According to the French heralds, there are but seven tinctures in armory; of which two are metals, the other five are colours.

The Metals are,
Gold, } termed { Or.
Silver, } { Argent.
20 M 2

The

The
Tinctures.

The Colours are

Blue,	} termed {	<i>Azure.</i>
Red,		<i>Gules.</i>
Green,		<i>Vert.</i>
Purple,		<i>Purpure.</i>
Black,		<i>Sable.</i>

When natural bodies, such as animals, plants, celestial bodies, &c. are introduced into coats of arms, they frequently retain their natural colours, which is expressed in this science by the word *proper*.

Besides the five colours abovementioned, the English writers on heraldry admit two others, viz.

Orange,	} termed {	<i>Tenny.</i>
Blood-colour,		<i>Sanguine.</i>

But these two are rarely to be found in British bearings.

These tinctures are represented in engravings and drawings (the invention of the ingenious Silvester Petra Sancta, an Italian author of the last century), by dots and lines, as in fig. ii. n^o 1—9.

Or is expressed by dots.

Argent needs no mark, and is therefore plain.

Azure, by horizontal lines.

Gules, by perpendicular lines.

Vert, by diagonal lines from the dexter chief to the sinister-base points.

Purpure, by diagonal lines from the sinister-chief to the dexter-base points.

Sable, by perpendicular and horizontal lines crossing each other.

Tenny, by diagonal lines from the sinister-chief to the dexter-base points, traversed by horizontal lines.

Sanguine, by lines crossing each other diagonally from dexter to sinister, and from sinister to dexter.

Sir George Mackenzie observes, that "some fantastic heralds have blazoned not only by the ordinary colours and metals, but by flowers, days of the week, parts of a man's body, &c. and have been condemned for it by the heralds of all nations. "Yet the English have so far owned this fancy," (the most judicious of them, as Mr Cartwright and others, reprobate it as absurd,) "that they give it for a rule, that the coats of sovereigns should be blazoned by the planets, those of noblemen by precious stones; and have suited them in the manner here set down:

" Or	Topaz	Sol
" Argent	Pearl	Luna
" Sable	Diamond	Saturn
" Gules	Ruby	Mars
" Azure	Sapphire	Jupiter
" Vert	Emerald	Venus
" Purpure	Amethyst	Mercury
" Tenny	Jacinth	Dragon's-head
" Sanguine	Sardonix	Dragon's-tail.

"But I crave leave to say, that these are but mere fancies, and are likewise unfit for the art, for these reasons: 1st, The French (from whom the English derive their heraldry, not only in principles, but in words of the French language,) do not only not use these different ways of blazoning, but treat them *en ridicule*. 2^{dly}, The Italian, Spanish, and Latin heralds use no such different forms, but blazon by the ordinary metals and colours. 3^{dly}, Art

The Furs.

"should imitate nature; and as it would be an unnatural thing in common discourse not to call red *red*, because a prince wears it, so it is unnatural to use these terms in heraldry, and it may fall out to be very ridiculous in some arms; for instance, if a prince had for his arms an *asi couchant* under his burden *gules*, how ridiculous would it be to say he had an *asi couchant Mars*?—A hundred other examples might be given; but it is enough to say, that this is to confound colours with charges, and the things that are borne with colours. 4^{thly}, It makes the art unpleasant, and deters gentlemen from studying it, and strangers from understanding what our heraldry is; nor could the arms of our princes and nobility be translated in this disguise into Latin or any other language. But that which convinces most that this is an error is, because it makes that great rule unnecessary, whereby colour cannot be put upon colour, nor metal upon metal; but this cannot hold but where metals and colours are expressed."

The English heralds give different names to the roundlet (n^o 10), according to its colour. Thus, if it is

Or,	} it is called a {	<i>Bezant.</i>
Argent,		<i>Plate.</i>
Azure,		<i>Hurt.</i>
Gules,		<i>Torteau.</i>
Vert,		<i>Pomey.</i>
Purpure,		<i>Golpe.</i>
Sable,		<i>Pellet.</i>
Tenny,		<i>Orange.</i>
Sanguine,		<i>Guze.</i>

The French, and all other nations, do not admit such a multiplicity of names to this figure; but call them *Bezants*, after an ancient coin struck at Constantinople, once *Byzantium*, if they are Or and Torteaux; if of any other tincture, expressing the same.

SECT. II. Of Furs.

Furs represent the hairy skin of certain beasts, prepared for the doublings or linings of robes and garments of state; and as shields were anciently covered with furred skins, they are therefore used in heraldry not only for the linings of the mantles, and other ornaments of the shields, but also in the coats of arms themselves.

There are three different kinds in general use, viz.

1. *Ermine*; which is a field argent, powdered with black spots, their tails terminating in three hairs. (Fig. ii. n^o 11.)

2. *Counter-ermine*, where the field is sable, and the powdering white. (n^o 12.)

3. *Vair* (n^o 15.), which is expressed by blue and white skins, cut into the forms of little bells, ranged in rows opposite to each other, the base of the white ones being always next to that of the blue ones. *Vair* is usually of six rows; if there be more or fewer, the number ought to be expressed; and if the colours are different from those abovementioned, they must likewise be expressed.

The English multiply the furs, as well as the names of the tinctures, though no other nation has adopted such varieties. Thus they give us,

1. *White*, which is the natural colour of the ermine; but

Of Lines. but it is used on no other occasion but in the descriptions of mantles.

2. *Ermines*, which is the same with contra-ermine.

3. *Ermineois*; the field is Or, the powdering Sable, (n^o 13.). For the use of this fur Guillim cites Bara, p. 14. but no such fur is to be found in Bara.

4. *Pean*; the field is Sable, the powdering Or, (n^o 14.) The French use no such term; but they call all furs or doublings *des pannes*, or *pennes*, which term has possibly given rise to this mistake, and many others, in those who do not understand the French language.

5. *Erminites*; the same as Ermine, with the addition of a red hair on each side of the black. Sir Geo. Mackenzie calls these distinctions "but fancies, for "Erminites signifies properly little Ermines."

6. *Counter-vair*; when the bells of the same tincture are placed base against base, and point against point, (n^o 16.).

7. *Potent-counter-potent*, anciently called *Vairy-cuppy*, as when the field is filled with crutches or potents counter-placed, (n^o 17.).

It may not be improper to observe, that the use of the tinctures took its rise from the several colours used by warriors whilst they were in the army, which S. de Petra Sancta proves by many citations. And because it was the custom to embroider gold and silver on silk, or silk on cloth of gold and silver, the heralds did therefore appoint, that in imitation of the clothes so embroidered, colour should never be used upon colour, nor metal upon metal.

SECT. III. Of the Lines used in the Parting of Fields.

ESCUTCHEONS are either of one tincture, or more than one: those that are of one only, that is, when some metal, colour, or fur, is spread all over the surface or field, such a tincture is said to be predominant. But in such as have on them more than one, as most have, the field is divided by lines, which, according to their divers forms, receive various names.

Lines may be either straight or crooked. Straight lines are carried evenly through the escutcheon; and are of four different kinds, viz. a perpendicular line, |; a horizontal, —; a diagonal dexter, \; a diagonal sinister, /.

Crooked lines are those which are carried unevenly through the escutcheon with rising and falling. French armorists reckon 11 different sorts of them; Guillim admits of seven only; but there are 14 distinct kinds, the figures and names of which are as in fig. i. (A), n^o 1—14. viz.

1. The engrailed. 2. The invected. 3. The wavy. 4. The embattled, or crenelle. 5. The nebule. 6. The raguly. 7. The indented. 8. The dancette. 9. The dove-tail. 10. The grafted. 11. The embattled a-ronde. 12. The battled embattled. 13. The patee or dove-tail. 14. Champaine.

The principal reason why lines are thus used in heraldry, is to difference bearings which would be otherwise the same; for an escutcheon charged with a chief engrailed, differs from one charged with a chief

wavy, as much as if the one bore a cross and the other a saltier.

As the forementioned lines serve to divide the field, it must be observed, that if the division consists of two equal parts made by the perpendicular-line, it is called *parted per pale*; by the horizontal-line, *parted per fess*; by the diagonal-dexter, *parted per bend*; by the diagonal-sinister, *parted per bend-sinister*; examples of which will be given in the sequel of this treatise.

If a field is divided into four equal parts by any of these lines, it is said to be *quartered*, which may be done two ways, viz.

Quartered or parted *per cross*; which is made by a perpendicular and horizontal line, which, crossing each other at the centre of the field, divide it into four equal parts called *quarters*. See Plate CXLIV. under fig. i. (A).

Quartered or parted *per saltier*; which is made by two diagonal lines, dexter and sinister, that cross one another in the centre of the field, and likewise divide it into four equal parts. *Ibid.*

The escutcheon is sometimes divided into a greater number of parts, in order to place in it the arms of the several families to which one is allied; and in this case it is called a *genealogical achievement*. These divisions may consist of 6, 8, 12, and 16, quarters, [as under fig. i. (A.)] and even sometimes of 20, 32, 64, and upwards; there being examples of such divisions frequently exhibited at pompous funerals. An extraordinary instance of this kind was lately exhibited at the pompous funeral of the late worthy viscounts Townshend, whose corps was brought from Dublin castle in Ireland, to Rainham-hall in Norfolk, one of the principal tenants on horseback carrying before the hearse a genealogical banner, containing the quarterings of his lordship's and her ladyship's family, to the amount of upwards of 160 coats. Sir George Booth, the present-rector of the valuable living of Ashton under Line, bears six distinct coats-of-arms in his shield, viz. those for Booth, Barton, Venables, Mountfort, Ashton, Egerton; and has besides a right to 37 other coats: but Sir William Dugdale very justly objects to so many arms being clustered together in one shield or banner, on account of the difficulty of discerning and knowing asunder one coat-of-arms from another.

SECT. IV. Of the Differences of Coats-of-Arms.

ARMORISTS have invented divers differences, or characteristic marks, whereby bearers of the same coat-of-arms are distinguished each from others, and their nearness to the principal bearer demonstrated. According to J. Guillim, these differences are to be considered either as ancient or modern.

ART. I. OF ANCIENT DIFFERENCES.

THOSE he calls *ancient differences* consist in *bordures* (A); which is a bearing that goes all round, and parallel to the boundary of the escutcheon, in form of a hem, and always contains a fifth part of the field in breadth. Bordures were used in ancient times for the distinguishing not only of one nation or tribe from another, but also to note a diversity between particular persons descended of one family and from the same parents.

(A) Bordures are still introduced into English coats-of-arms, but for particular reasons, which heralds can best explain. They are by the French frequently taken for a principal figure, and numbered among the rest of the ordinaries.

Differences.

parents. This distinction, however, was not expressly signified by unvariable marks; nor were bordures always appropriated to denote the different degrees of consanguinity: for, as Sir Henry Spelman observes in his *Alphesia*, p. 140, ancient heralds, being fond of peripetuous differences, often inverted the paternal tincture, or sometimes inserted another charge in the escutcheon, such as bends, crozets, cantons, or the like; which irregularity has, I suppose, induced modern armorists to invent and make use of others."

There are bordures of different forms and tinctures, as in the examples, fig. iii.

N^o 1. is "Sable, a Bordure Argent;" borne by the right hon. Sackville Tufton, Earl of Thanet.—When a bordure is plain, you are not to mention it, as it is always understood so in heraldry, though it be not expressed; but if it has any other form, you are to signify it.

2. "Gules, a Bordure engrailed Argent;" borne by the right hon. Charles Gray, lord Gray.—This is called *engrailed*, from the French word *engrêlé*, which signifies a thing the hail has fallen upon and broken off the edges, leaving it with little semicircles struck out of it.

3. "Gules, a Bordure engrailed Or;" borne by the right hon. George Talbot, earl of Shrewsbury.—You must observe, that, in a bordure or ordinary formed of these lines, the points are represented on all sides towards the field, and the semicircles turned towards the bordure or ordinary.

4. "Argent, a Bordure indented Azure."—This is quite contrary to the last; for, as the other turns its points from the bordure into the field, so contrarywise this does; by the inversion of the points from the field into the bordure. Such a charge, or any other formed of these lines, is seldom to be met with in English coats-of-arms.

5. "Gules, a Bordure indented Argent."—The word *indented* requires very little explanation, the signification being obvious to all persons, from its figure, which is composed of tracis resembling teeth, called in Latin *dentes*.

6. "Azure, a Bordure Ermine."

7. "Vert, a Bordure Vair."

8. "Ermine, a Bordure compony, or gobony, Or and Sable."—This is so termed from its being composed of small and equal pieces. J. Guillim calls this bordure *gabonated*, which implies the same meaning; but the word being obsolete, is not used by modern heralds.

9. "Quarterly, Azure and Gules, a Bordure compony Argent and Azure;" borne by his grace Henry Somerset, duke of Beaufort, &c.

10. "Azure, a Bordure counter-compony Argent and Gules."—Observe, that the counter-compony does always consist of two tracis, and no more.

11. "Or, a Bordure chequy Argent and Sable."—This has a great resemblance with the last bordure, having only one tract more; therefore you must take care, before you blazon, to number them, or else you may easily err in taking the one for the other.

12. "Gules, a Bordure Argent charged with eight Trefoils slipped proper, that is, Vert."—All nations use few terms in blazoning bordures; but English armorists, in order, possibly, to raise the dignity of this

science, have perplexed it, and rendered it unintelligible to all foreigners, by introducing into it several mythical names, among which may be reckoned the following ones, viz. They call a bordure, if charged with eight plants, fruits, flowers, or leaves, *verdoy* of such vegetables; or *enlauron* of such birds, *enmury* of beasts, *perlesow* of furs, and *entoyre* of inanimate things of what kind soever.

13. "Gules on a Bordure Azure, eight Stars Or."

14. "Argent, a Bordure compony of the last and Gules, the first charged with Roses of the second, barbed and seeded proper."—This bordure is borne by his grace Charles Lennox, duke of Richmond, &c.

15. "Ermine, within a Bordure engrailed Gules;" the coat-of-arms of the right hon. Henry-Benedict Barnewall, viscount Kingsland, &c. of Ireland.—This ancient and noble family is of French extraction, and allied to the dukes of Little-Bretagne, where the name continues still in great repute.

16. "Argent, a Bordure Sable charged with eight Bescants;" borne by the right hon. ——— Cole, lord Ranelagh, of Ireland.

17. "Party per pale Argent and Gules, a Bordure charged with eight Escalops counterchanged;" the coat-of-arms of the right hon. William Maule, earl of Panmure, &c. of Ireland. This very ancient family is originally French, and derives its surname from the town and lordship of Maule in Normandy, where the same arms are still to be seen in the parish-church.

18. "Azure, a Bordure quarterly, the first and fourth Ermine, the second and third counter-compony Argent and Azure."

19. "Purpure, a Bordure compony Or and Gules, each of the last charged with a Bescant."

20. "Quarterly Or and Gules, within a Bordure Vert, charged with eight Escalops Or."

We shall conclude this head with observing, that a bordure is never of metal upon metal, and seldom of colour upon colour, but rather of the tincture which the principal bearing or charge is of. Thus Sir ——— Dalziel of Glenae, whose predecessor was a younger brother of the noble family of Carnwath, has, within a Bordure Argent, the paternal coat of the ancient name of Dalziel, viz. "Sable, a hanged man with his arms extended, Argent;" formerly they carried him hanging on a gallows. This bearing, though so very singular for a coat-of-arms, was given as a reward to one of the ancestors of the late Robert Dalziel, earl of Carnwath, to perpetuate the memory of a brave and hazardous exploit performed in taking down from a gallows the body of a favourite and near relation of king Kenneth II. hung up by the Picts, which story is thus related by Alexander Nisbett: "The king being exceedingly grieved that the body of his minion and kinsman should be so disgracefully treated, he proffered a great reward to any of his subjects who would adventure to rescue his corpse from the disgrace his cruel enemies had unjustly put upon it: but when none would undertake this hazardous enterprise, at last a valorous gentleman came and said to the king, *Dalziel*, which signifies, "I dare;" and he did actually perform that noble exploit to the king's satisfaction and his own immortal honour, and in memory of it got the aforesaid remarkable bearing; and afterwards his posterity took the word *Dalziel* for their surname, and the

Modern
Differences

the interpretation of it, *I dare*, continues even to this day to be the motto of that noble family." We can have no better proof of the truth of this tradition than this, that the heads of this ancient family have, for many ages, carefully retained this bearing without any alteration or addition.

ART. 2. OF MODERN DIFFERENCES.

The modern differences, which the English have adopted, not only for the distinguishing of sons issued out of one family, but also to denote the difference and subordinate degrees in each house from the original ancestors, are nine, viz.

Plate
CXLIV.
under fig. i.
(A.)

For the heir or first son, the Label. 2d son, the Crescent. 3d son, the Mullet. 4th son, the Martlet. 5th son, the Annulet. 6th son, the Flower-de-luce. 7th son, the Rose. 8th son, the Cross-moline. 9th son, the Double Quarter-foil.

By these differences, the six sons of Thomas Beauchamp, the 15th earl of Warwick, who died in the 34th year of king Edward III. are distinguished in an old window of the church of St Mary at Warwick; so that although they are called *modern differences*, their usage with the English is ancient.

It must be observed, that, of all the forementioned marks of distinction, none but the label is affixed on the coats-of-arms belonging to any of the royal family; which the introducers of this peculiarity have, however, thought proper to difference by additional pendants and distinct charges on them.

Plate
CXLV.

As to the distinction to be made in the arms of the offspring belonging to each of the above-mentioned brothers, it is expressed by figures on the top and margin of the table contained in fig. iv. For instance, The heir or first son of the second house, beareth a crescent charged with a label during his father's life only. The second son of the second house, a crescent charged with another crescent. The third son of the second house, a crescent charged with a mullet. The fourth son of the second house, a crescent charged with a martlet. The fifth son of the second house, a crescent charged with an annulet. The sixth son of the second house, a crescent charged with a flower-de-luce; and so on of the other sons, taking care to have them of a different tincture.

In what part of the escutcheon these differences should be borne is not certain; for Guillim, Morgan, and others, give us many different examples of their position. The honour-point would be the properest place, if the arms would admit of it; but that is not always the case, as that part may be charged with some figure in the paternal coat, which cannot with propriety receive the difference. There are instances where these are borne as perfect coats of arms, as the examples subjoined to the Table of Houses sufficiently shew, which are to be blazoned thus:

The first is "Azure, a Label argent."—When such a label is borne as a difference, the pendants, according to G. Leigh, signify that he is but the third person; the dexter pendant referring to his father, the sinister to his mother, and the middle one to himself.

The second is "Argent, a Label of five points Azure;" borne by the name of Hentington. If a label has more or less than three pendants or points,

they are to be expressed as in the foregoing example.

The third is "Azure, a Crescent argent," borne by the name of Lucy.—The reason G. Leigh assigns for the second son's having a crescent for a difference, is to shew that he should increase the family by adding to it riches and reputation.

The fourth is "Argent, a Mullet Sable, on a Chief Azure, a Fleur-de-lis Or;" borne by the name of Rogers, in Gloucestershire.—A mullet or spur was appointed for the third son's difference, as the last-mentioned author says, to shew that he should follow chivalry.

The fifth is "Azure, a Fleur-de-lis Argent;" borne by the Right-hon. Henry Digby, baron Digby of Gresham, in King's county, Ireland.

These few examples, among many more that might be given, demonstrate the impropriety of adopting these *modern differences*, as they are called, for marks of cadency to distinguish the different branches of a family: for it is impossible to distinguish the uncle or grand-uncle, from the nephew or grand-nephew, if each of them are second, third, or fourth sons; and in the course of succession these differences would multiply to such a number, that it would be impossible to delineate them distinctly in most cases. But as they are given by most of the English writers on heraldry, though no foreign nation uses them, it was thought proper to insert them here.

Sisters, except of the blood-royal, have no other mark of difference in their coats-of-arms, but the form of the escutcheon, (as observed before); therefore they are permitted to bear the arms of their father, even as the eldest son does after his father's decease. The reason of which is by Guillim said to be, that when they are married, they lose their surname, and receive that of their husbands.

Next to these diminutions G. Leigh, J. Guillim, and after them Dr Harris in his *Lexicon Technicum*, set forth at large divers figures, which they pretend were formerly added to the coats of such as were to be punished and branded for cowardice, fornication, slander, adultery, treason, or murder, for which they give them the name of *abatements of honour*; but as they produce but one instance of such whimsical bearings, we have not inserted them here. Besides, arms, being marks of honour, they cannot admit of any note of infamy; nor would anybody now-a-days bear them, if they were so branded. It is true, a man may be degraded for divers crimes, particularly high treason; but in such cases the escutcheon is reversed, trod upon, and torn in pieces, to denote a total extinction and suppression of the honour and dignity of the person to whom it belonged.

C H A P. III.

Of the CHARGES.

ARMORISTS call a charge whatsoever is contained in the field, whether it occupy the whole, or only a part thereof. All charges are distinguished by the names of *honourable ordinaries*, *sub-ordinaries*, and *common charges*.

Honourable ordinaries, the principal charges in heraldry, are made of lines only, which, according to their

Modern
Differences

Honourable
Ordinaries.

their disposition and form, receive different names. Sub-ordinaries are ancient heraldic figures frequently used in coats-of-arms, and which are distinguished by terms appropriated to each of them.

Common charges are composed of natural, artificial, and even chimerical things, such as planets, creatures, vegetables, instruments, &c.

SECT. I. Of Honourable Ordinaries.

THE most judicious armorsmiths admit only of nine honourable ordinaries, viz.

The Chief	The Bar
The Pale	The Chevron
The Bend	The Crois
The Bend sinister	and
The Fels	The Saltier.

Of these, but six have diminutives, which are called as follows: That of the chief is a *fillet*: The pale has a *pallet* and *endorse*; the bend, a *bendlet*, *cofs*, and *ribband*: The bend-sinister has the *scarpe* and *bâton*; the bar, the *closet* and *barulet*; the chevron a *chevronel* and *couple-cloze*. All which shall be treated of in order.

ART. I. Of the CHIEF.

THE chief is an ordinary determined by an horizontal line, which, if it is of any other form but straight, must be expressed. It is placed in the upper part of the escutcheon, and containeth in depth the third part of the field. Its diminutive is a *fillet*, the content of which is not to exceed one fourth of the chief, and standeth in the lowest part thereof. This ordinary is subject to be charged with variety of figures; and may be indented, wavy, nebule, &c. as in the examples, fig. v.

Plate
CXLV.

N^o 1. is "Or, a Chief indented Azure;" borne by the right hon. Edmund Butler, viscount Mountgarret, &c. of the kingdom of Ireland. This great and illustrious family of the Butlers, so renowned for the many valiant and loyal persons it has produced, is descended from the ancient counts of Brion in Normandy; but since king Henry II. conferred the office of chief butler of Ireland upon one of the family, he and his successors have assumed the name of *Butler*.

2. "Azure a Chief engrailed Or."
3. "Argent, a Chief invected Vert."
4. "Vert, a Chief undy Or."
5. "Azure, a Chief nebule Argent."
6. "Or, a Chief chequy Azure and Argent."
7. "Ermine, a Chief quarterly Or and Gules;" borne by the name of Peckham.

8. "Argent, a Chief Sable, in the lower part thereof a Fillet of the Field."

9. "Azure, fretty Argent, a Chief Or;" borne by the right hon. Hayes St Leger, viscount Doneraile, &c. of the county of Cork in Ireland. This ancient and noble family is of French extraction; and is descended from Sir Robert Sent Legère, knight, who, in 1066, accompanied William duke of Normandy in his expedition into England; and the family have a tradition, that he, with his own hand, supported the said duke when he quitted the ship to land in Suffex.

10. "Argent, on a Chief engrailed Azure, a Tortoise passant Or;" borne by the name of *Bidgood*.

11. "Argent, on a Chief Gules, two Spur-revels Or;" borne by the right hon. John St John, lord St John of Blethoe, &c. Of this ancient family, which derive their surname from a place called *St John* in Normandy, was John de St John, Esq. who having a principal employment in the army of the Norman duke, attended him in his expedition into England.

12. "Argent, on a Chief Vert, two Spears Heads erect of the Field, the points imbrued Gules;" borne by the Right Hon. George Brodrick, Viscount Midleton, &c. of the kingdom of Ireland. This family is lineally descended from George de Brodrick, who came into England in the reign of William II.

13. "Or, on a Chief Sable, three Escalops of the field;" for the name of *Graham*; and borne quartered in the arms of his Grace William Graham, duke, marquis, and earl of Montrose, &c. with Argent three Roses Gules. According to the Scots writers, this great and noble family is descended from the renowned Grame or Grame, who, in the year 404, was general of king Fergus II.'s army, and, in 420, forced his way through the wall built by the Romans between the rivers Forth and Clyde to keep out the Scots from molesting them in their possessions, and the said breach has ever since been called *Grame's dike*.

14. "Argent, on a Chief indented Gules, three Crofses pattee of the Field;" borne by the right hon. John Perceval, earl of Egmont, &c. This very ancient and noble family is supposed, from circumstances little short of positive proof, to have sprung from a younger branch of the sovereign dukes of Bretagne in France, of the same name. They were transplanted into Normandy before the conquest, possessed of great estates and power, and invested with the office of chief butler. Upon the Norman invasion, two of this family came over into England with the Conqueror, from one of which the descent of the present earl of Egmont is deduced by the clearest and most indisputable proofs of historians and records.

15. "Azure, on a Chief indented Or, three Spur-revels Gules;" borne by the right hon. Charles Moore, earl of Drogheda, &c. of the kingdom of Ireland. This noble family, which is of French extraction, came into England soon after the conquest, and made their first residence in the manor of Moore-court, in the county of Kent.

16. "Ermine, on a Chief indented Azure, three ducal coronets Or;" borne by the name of *Lyton*.

17. "Azure, on a Chief Or, three Martlets Gules;" for the name of *Wray*; and borne by Sir Cecil Wray, Bart. of Lincolnshire.

18. "Ermine, on a Chief Gules; five Lozenges of the first;" borne by the name of *Dixin*.

19. "Argent, fretty Gules, on a Chief of the second, three Leopard's Faces Or;" borne by the right hon. Henry Liddel, lord Ravenworth. This noble lord is descended from the ancient lords of Liddlecaille, in the county of Durham, where they have been proprietors of great-coal-mines time out of mind.

20. "Ermine, a Chief party per pale Azure and Or; on the dexter the Sun in its splendor, on the sinister a Crois pattee Gules." The arms of the bishopric of Raphoe, in the kingdom of Ireland.

Fig. 6.
PALES &c.

Of the
Pale.

Of the
Bend.

ART. II. Of the PALE.

THE Pale is an ordinary, consisting of two perpendicular lines drawn from the top to the base of the Escutcheon, and contains the third middle part of the field. Its diminutives are, The pallet, which is the half of the pale; and the endorfe, which is the fourth part of a pale. This ordinary and the pallet may receive any charge, but the endorfe should not be charged. The endorfe, besides, is never used, according to J. Leigh, but to accompany the pale in pairs, as cotices do the bend; but Sir John Ferne is of a different opinion.

EX. 1. "Gules, a Pale Or;" by the name of *Grand-main*.

2. "Party per Pale Argent and Gules, a Pale counterchanged."

3. "Argent, a Pale between two Endorfes Gules."

4. "Party per Pale, 1/3, Paly of fix Argent and Sable, 2d, Azure;" borne by the name of *Trenchard*.

5. "Paly of fix Or and Azure."

6. "Argent, three Pallets undy Sable;" by the name of *Downer*.

7. "Party per Pale, Argent and Gules;" borne by the right hon. John Waldegrave, earl Waldegrave, &c. This noble earl is descended from John de Waldegrave, who was sheriff of London in the year 1205, in the seventh year of king John.

8. "Party per Pale indented, Or and Gules;" borne by the right hon. Thomas Bermingham, baron of Athenry, in the kingdom of Ireland. Of this ancient and noble family, which are of English extraction, and took their name from the town of Bermingham in the county of Warwick, was William de Bermingham, who was possessed of the town of that name in the reign of Henry II. which continued in that family till the reign of Henry VIII.

9. "Quarterly per Pale dove-tail, Gules and Or;" borne by the right hon. Thomas Bromley, lord Montfort, &c. This noble lord is maternally descended from Sir Walter Bromleghe, of Bromleghe, in the county of Stafford, who flourished in the reign of king John. Sir Thomas Bromley, another of his lordship's ancestors, was constituted lord high chancellor of England, 21 Elizabeth; in which post he died, 29 Elizabeth.

10. "Argent, a Pale fretty counterfairy Sable."

11. "Argent, a Pale lozengy Sable;" borne by the name of *Savage*.

12. "Argent, a Pale indented Vert;" borne by the name of *Dixon*.

13. "Argent, on a Pale engrailed Sable, three Crescents Or;" borne by the name of *Afley*.

14. "Ermine, on a Pale engrailed azure, three Lion's Heads couped Or;" borne by the name of *Avery*.

15. "Vert, on a Pale radiant Or, a Lion rampant Sable;" borne by the right hon. James O'Hara, lord Tyrawley, &c. in the kingdom of Ireland. This noble lord is descended from Milesius king of Spain, by his eldest son Hiberius, who, with his brother Heremon, established a colony in Ireland. Sir Charles O'Hara, father to the present lord, was created baron of Tyrawley by queen Anne, Jan. 10. 1706, being at that time a lieutenant-general, and colonel of the

Vol. V.

royal regiment of fusileers: and the next year was made general in Spain, where this son, lord James, was wounded at the battle of Almanza.

16. "Azure, a Pallet Argent."

17. "Vert, an Endorfe Or."

18. "Argent, on two Pallets Sable, six Crofs-croffets fitchy Or;" borne by the name of *Belunes*, of the county of Salop.

19. "Argent, two Endorfes Gules, in Chief three Mulletts Sable;" borne by the name of *Vautort*.

20. "Azure, on a Pale walled with three pieces on each side Or, an Endorfe Sable;" borne by the name of *Sublet de Noyers*, a family of distinction in France.

ART. III. Of the BEND and BEND-SINISTER.

THE Bend is an ordinary formed by two diagonal lines, drawn from the dexter-chief to the sinister-base; and contains the fifth part of the field in breadth, if uncharged; but if charged, then the third. Its diminutives are, The bendlet, which is the half of a bend; the coft or cotice, when two of them accompany a bend, which is the fourth part of a bend; and the riband, the moiety of a coft, or the eighth part of the field.

There is also the bend-sinister, which is of the same breadth as the bend, but drawn the contrary way: this is subdivided into a scarpe, which is the half of the bend, and into a bâton, which is the fourth part of the bend, but does not extend itself to the extremities of the field, there being part of it seen at both ends. See the examples, fig. vii.

EX. 1. "Argent, a Bend wavy Sable;" borne by the right hon. John Wallop, earl of Portsmouth, &c. This noble earl is descended from the Wallops of Hampshire, a Saxon family, who were possessed of lands to a considerable value in the county at the time of the conquest.

2. "Checky Or, and Azure, a Bend Ermine;" borne by the right hon. John Ward, viscount Dudley and Ward, &c. The ancestors of this noble lord were anciently of the county of Norfolk, of which was Simon Ward, who had large possessions in the reign of Edward I. and was in France and Scotland in the reigns of king Edward II. and III.

3. "Azure, a Bend engrailed Argent, between two Cotices Or;" borne by the right hon. Matthew Fortescue, lord Fortescue, as also by the right hon. Hugh Fortescue-Aland, baron Fortescue, in the kingdom of Ireland, this last nobleman bearing a crescent in his arms for difference. The family of Fortescue is descended from Sir Richard le Forte, a person of extraordinary strength and courage, who accompanied William duke of Normandy in his invasion of England; and bearing a strong shield before the duke, at the battle of Hastings, had three horses killed under him, and from that signal event the name and motto of the family were assumed; for the Latin word *scutum*, or the old French word *esue* (a shield) being added to *forte* (strong), compose their name; and the motto is, *Fortescutum salus ducum*.

4. "Sable, a Bend Argent between two Cotices indented Or;" borne by the name of *French*.

5. "Paly of fix Or and Sable, a Bend counterchanged;" borne by the right hon. Frederick Calvert, baron Baltimore. The original of this family is from an ancient and noble house of that surname in the earl-

20 N

dom

Plate

Plate
CXLVI.

Of the
Bend, &c.The Fess
and Bar.

dom of Flanders, whereof Sir George Calvert, knight, among other honourable employments, was secretary of state to king James I. by whom he was created a baron, Feb. 20. 1624, and from whom he had a grant to him, and his heirs, of the province of Maryland and Avalon in America.

6. "Party per Bend crenelle Argent and Gules;" borne by the right hon. Edmund Boyle, earl of Cork and Orrery, &c. in the kingdom of Ireland. This noble lord is said to be descended from Sir Philip Boyle, a knight of Arragon, who, in the reign of king Henry VI. tilted at a tournament with Sir Joseph Atkley, knight of the Garter.

7. "Argent, three Bendlets *enhanfed* Gules," as the English express it, but the phrase *enhanfed* is used by no other nation. The proper blazon of this arms is, Parted per bend, 1st bendy of six gules, and argent; 2d of the last. Borne by the right hon. William Byron, lord Byron. From Doomsday-book it appears, that this family was possessed of numerous manors and lands in the reign of the Conqueror; and that Sir John Byron, one of his lordship's ancestors, attended king Edward III. in his wars in France.

8. "Ermine, a Bend voided Gules;" borne by the name of *Ireton*.

9. "Argent three Bendlets wavy Azure;" borne by the name of *Wilbraham*.

10. "Bendy of six pieces Argent and Azure". Observe, that when the field is filled with an equal number of bendlets of metal and colour, it is called *bendy*; but if the number of them is unequal, they are to be blazoned by the name *bendlets*, and their number specified.

11. "Party per Bend Azure and Argent, two Bendlets engrailed counterchanged;" borne by the name of *Frenee*.

12. "Quarterly, Or and Gules, a Bend over-all Vair;" borne by his grace Lionel Cranfield Sackville, duke of Dorset and earl of Middlesex, &c. The ancestors of this family were lords of the town and feignory of Sackville in Normandy, and came over with the Conqueror when he invaded England in 1066.

13. "Gules on a Bend Argent, three Trefoils slipped proper;" borne by the right hon. George William Hervey, earl of Bristol, &c. This noble lord derives his pedigree from Robert Fitz-Hervey, a younger son of Hervey duke of Orleans, who came over from France with William the Conqueror.

14. "Argent, on a bend Gules cotised Sable, three pairs of Wings conjoined of the first;" borne by the right hon. Richard Wingfield, viscount Powerscourt, in the kingdom of Ireland. This noble lord is denominated from the manor of Wingfield in Suffolk, where they had a feat before the Norman conquest, called *Wingfield-castle*.

15. "Gules, on a Bend contre Ermine cotised Or, three Boars Heads couped Argent;" borne by the right hon. George Edgcumbe, lord Edgcumbe, &c. The ancestors of this noble lord received their name from the manor of Edgcumbe in Devonshire. One of this lord's ancestors was Sir Richard Edgcumbe, who came over to England with the earl of Richmond, having a great share in the victory he obtained over king Richard III. at Bosworth, by which the earl made his way to the throne of England.

16. "Argent, a Bend-sinister Gules."

17. "Or, a Bendlet Gules."

18. "Argent, a Ribband Gules.—The name of this bearing corresponds well with its form, being both long and narrow, which is the shape of a ribband.

19. "Azure, a Scarpe Or."—This bearing, as Guillim observes, is that kind of ornament called now a-days a *Scarf*, which is used by officers on duty, and usually worn after the same manner.

20. This contains three Batons. The first is comonly ermine and azure; set over the royal arms, for his grace William Fitzroy duke of Cleveland. The second is comonly argent and azure; set over the royal arms, for his grace Augustus Henry Fitzroy, duke of Grafton. The third is Gules, charged with three roses argent, seeded and barbed proper; set over the royal arms, for his grace George Beauclerk, duke of St Albans. The grandfathers of these noble dukes being natural fons of king Charles II. is what entitles them to the royal arms.

ART. IV. Of the Fess and Bar.

THE Fess is an ordinary which is produced by two parallel lines drawn horizontally across the centre of the field, and contains in breadth the third part thereof. Some English writers say it has no diminutive, for the bar is a distinct ordinary of itself.

The Bar, according to their definition, is formed of two lines, and contains but the fifth part of the field: which is not the only thing wherein it differs from the fess; for there may be more than one in an escutcheon, placed in different parts thereof, whereas the fess is limited to the centre-point; but in this the French differ from them. The bar has two diminutives: the *barulet*, which contains the half of the bar; and the *clofet*, which is the half of the barulet. When the shield contains a number of bars of metal and colour alternate, of even number, that is called *barry* of so many pieces, expressing their number. See the examples, Fig. viii.

N^o 1. is "Argent, a Fess indented Sable;" borne Plate by the right hon. John Weir, earl Delawarr, &c. This CXLVI. noble family is descended from the Weirs, a great family in the west of England; but in the reign of Edward II. they appear to have been seized of manors and lands in the county of Warwick. Sir Thomas de Weir, knight, one of his lordship's ancestors, being at the battle of Cressly, and there taking John the French king prisoner, had granted him, for that remarkable action, an augmentation to his achievement, viz. a crampette or, distinguished by the chape of a sword in the middle; the chape being given him by the said king, as an acknowledgment of his becoming his prisoner: his cognizance was a rose parted per pale, argent, and gules; which two badges are still borne in the achievement of the present lord Delawarr.

2. "Argent, a Fess wreathed Azure and Gules;" borne by the right hon. John Carmichael, earl of Hyndford. Of this ancient family, which is said to assume their surname from the lands of Carmichael, in the county of Lanark, in Scotland, where they still have their chief seat, was Sir John Carmichael, who accompanied Archibald, earl of Douglas, to the assistance

and Bar.

affluence of Charles VI. of France, againſt the Engliſh; and ſignalizing his valour at the battle of Baughey in April 1421, and breaking his ſpear when the French and Scots got the victory, had thereupon added to his paternal coat, a dexter arm holding a broken ſpear, which is now the creſt of the family.

3. "Party per Fefs Or and Argent, a Fefs nebule Gules;" borne by the name of *Antefeld*.

4. "Party per Fefs indented Or and Azure;" borne by the name of *Saunders*.

5. "Checky Or and Azure on a Fefs Gules, a Creſcent argent for difference;" borne by the right hon. Hugh Clifford, lord Clifford, of Chudley. This noble lord is deſcended from Walter de Clifford, of Clifford-caſtle, in the county of Hereford, who came over into England with the Conqueror; of which family was fair Roſamond, miſtreſs to king Henry II.

6. "Argent on a Fefs Azure three Lozenges Or;" borne by the right hon. Baſil Fielding, earl of Denbigh and Deſmond, &c. This noble earl is deſcended from the earls of Hapsburg, in Germany. Geoffrey earl of Hapsburg, being oppreſſed by Rodolph emperor of Germany, came over into England, and one of his ſons ſerved king Henry III. in his wars, whoſe anceſtors laying claim to the territories of Lauffenburg and Rhin-Filding, in Germany, he took the name of *Fielding*.

7. "Or, on a Fefs Gules, three Fleur-de-lis of the firſt;" borne by the name of *Lennard*. This is in the firſt and fourth quarters of the right hon. Thomas Barret Lennard lord Dacre's arms.

8. "Ermine, on a Fefs Gules, a Lion paſſant Or;" borne by the right hon. John Proby, baron Caryſfort, &c. in the kingdom of Ireland.

9. "Sable, a Fefs Ermine, between three Creſcents Or;" borne by the right hon. George-William Coventry, earl of Coventry, &c. This noble earl is deſcended from John Coventry, a native of the city of Coventry, and afterwards mercer and lord mayor of London, in the reign of Henry V.; from whom deſcended Thomas Coventry, one of the juſtices of the court of common-pleas, in the reign of queen Elizabeth; whoſe fon Thomas was recorder of London, and afterwards lord keeper of the great ſeal in the reign of king Charles I.

10. "Sable, a Fefs checky, Or and Azure, between three Beſants;" borne by the right hon. Ridgeway Pitt, earl and baron of Londonderry, &c." Of this noble family, which were anciently of Bandſort, in the county of Dorſet, was Thomas Pitt, eſq; who, in the reign of Queen Anne, was made governor of fort St George in the Eaſt Indies, where he reſided many years, and purchaſed a diamond, which he fold to the king of France for 125,000l. Sterling, weighing 136 carats, and commonly known at this day by the name of *Pitt's diamond*.

11. "Or, on a Fefs Sable, between three Muſcovy Ducks proper, a Roſe of the Field;" borne by the right hon. John Bateman, viſcount Bateman, &c. Of this noble family, which was anciently ſeated at Halebrook, near St Omers in Flanders, was Giles Bateman, eſq; whoſe fon was a merchant of London, and was father to Sir James Bateman, knight, who, in 1712, was choſen member of parliament for Ilcheſter in the county of Somerſet, and re-choſen in 1713.

12. "Sable, on a Fefs Argent, between three Leopards paſſant guardant Or, three Eſcalops Gules;" borne by the right hon. Wills Hill, earl of Hillsborough, &c. Of this family, which, in the reign of Queen Elizabeth, were of note in the county of Downe, was Sir Moſes Hill, who, during O'Neill's rebellion, was one of thoſe gentlemen who ſociated under the earl of Eſſex to ſuppreſs it; and afterwards ſerved under Arthur, lord Chicheſter, lord deputy, and by king James I. was appointed provost-mariſhal of the whole province of Ulſter in Ireland.

13. "Gules, two Bars Or;" borne by the right hon. Simon Harcourt, earl of Harcourt, &c. This noble earl is deſcended from the Harcourts of Normandy, who took their name from a place called *Harcourt*, in that province, where the family uſually reſided. Gervaiſe, count de Harcourt, with his two ſons Jeffrey and Arnold, came over with the conqueror, when he invaded England, in 1066.

14. "Ermine, two Bars Gules;" borne by the right hon. Thomas Nugent, earl of Weiſtmeath, and baron Delvin.

15. "Argent, two Bars indented Sable;" borne by the right hon. Godart Ginkle, earl of Athlone. Godart, who was the firſt earl, was deſcended of a very ancient family in the united provinces of Holland, where he was baron de Reede and Ginkle, &c. In 1691, he was a lieutenant-general of king William's forces in Ireland; where, in June the ſame year, he took Ballymore for the Engliſh; and, in July following, the Iriſh town of Athlone, which laſt exploit is one of the greateſt recorded in hiſtory.

16. "Argent, three Bars gemels Gules;" borne by the right hon. Richard Barry, earl of Barrymore, &c. This noble family, who have been renowned for their loyalty and valour, are ſaid to derive their ſurname from the iſland of Barry, in the county of Glamorgan, in Wales; and from their riches and eſtates have been called by the people *Barrymore*, or the Great Barry.

17. "Or, a Fefs-couped Gules, between two Lions paſſant Sable;" borne by the right hon. Samuel Maſham, lord Maſham, &c. This noble lord is deſcended from Sir John Maſham, who flouriſhed in the reign of king Henry VI. and was buried at Thorneham, in the county of Suffolk, in 1455.

18. "Argent, a Lion rampant guardant Gules, debruſed by a Fefs Azure, between three Etoiles iſſuing out of as many Creſcents of the ſecond;" borne by the right hon. Robert Dillon, earl of Roſcommon, &c. in the kingdom of Ireland. This noble family is derived from Logan, ſurnamed *Dilune* or *Delion*, which ſignifies brave and valiant, to whom the duke of Aquitaine gave his daughter in marriage, in whole right, after her father's death, he became prince and ſovereign of Aquitaine, which continued in his poſterity till Henry II. married Alionora, daughter and heir to William V. duke of Aquitaine, and about 1172 obtained that principality by ſuperior force; and, to prevent any diſturbance, brought Sir Henry Delion or Dillon, and his brother Thomas, then infants, to England, their father being ſlain.

19. "Or, two Bars Azure, a Chief quarterly of the ſecond and Gules, the 1ſt and 4th charged each with two Fleur-de-lis of France; the 2d and 3d with

a Lion of England;" borne by his grace John Manners, duke of Rutland, marquis of Granby, &c. This chief was anciently Gules; and the charge thereon is an honorary augmentation, shewing his grace's descent from the blood royal of king Edward IV.

20. "Barry of ten pieces Argent and Azure, over all six Escutcheons; 3, 2, 1, Sable, each charged with a Lion rampant of the first, armed, and langued Gules, a Croiscent for difference;" borne by the right hon. James Cecil, earl of Salisbury, &c. This noble earl is descended from the famous *William Cecil* lord Burleigh, statesman in the reigns of Edward VI. and Elizabeth. This great man left two sons, Thomas and Robert, who were both made earls in one day, May 4. 1603. Robert, the younger son, ancestor of the present noble lord, was created earl of Salisbury in the morning; and Thomas, the eldest, earl of Exeter in the afternoon.

ART. V. Of the CHEVERON.

THE Cheveron, which represents two rafters of a house well jointed together, or a pair of compasses half open, takes up the fifth part of the field with the English, but the French give it the third. Its diminutives are, The cheverlon, which contains the half of a cheveron; and the couple-cloze, which is the half of a cheverlon, that is, its breadth is but the fourth part of a cheveron. Leigh observes, that this last diminutive is never borne but in pairs, or with a cheveron between two of them. The French have but one diminution of this ordinary called *Etaie*, containing the third part of its breadth.

Examples of cheverons are given in fig. ix. viz.

1. "Argent, a Cheveron Gules between three Torseaux;" borne by the right hon. Bennet Sherard, earl of Harborough, &c. This noble earl is lineally descended from Scherard, who was possessed of manors and lands to a great value in the counties of Cheshire and Lancashire in the reign of William the Conqueror. Geoffrey, another of this earl's ancestors, was three times sheriff of Rutlandshire, in the reigns of king Edward IV. and king Richard III.

2. "Sable, a Cheveron between three Estoiles Argent;" borne by the right hon. Marmaduke Langdale, lord Langdale. This noble lord is descended from the Langdales of Yorkshire, who resided at the town of Langdale, from whence they took their name, in the reign of king John; but his ancestor, who makes the greatest figure in history, is Sir Marmaduke Langdale, who raised forces in the north of England in defence of king Charles I. was victorious in numberless battles and sieges, and when his Majesty, by the united forces of England and Scotland, was at length overpowered, he attended king Charles II. in his exile, and returned to England with his Majesty at the restoration.

3. "Sable, a Cheveron between three Leopards Heads Or;" borne by the right hon. William Wentworth, earl of Strafford, &c. All genealogists agree, that the name of *Wentworth* is of Saxon original, and taken from the manor of Wentworth in Yorkshire, where, in the reign of William the Conqueror, lived Reginald de Wentworde, as it is spelt in doomsday-book.

4. "Argent, a Cheveron between three Grif-

fons passant Sable, a Croiscent for difference;" borne by the right hon. Hensage Finch, earl of Ailesford, &c. This family is descended from Herbert Fitz-Herbert, earl of Pembroke, and chamberlain to king Henry I. They took the name of *Finch* in the reign of king Edward I. One of the ancestors of the present earl was the right hon. Hensage Finch, earl of Nottingham, who was constituted lord high-chancellor of England in 1675; and lord high-steward on the trials of Philip earl of Pembroke, and William viscount Stafford, in 1680.

5. "Azure, a Cheveron Ermine, between three Escalops Argent;" borne by the right hon. George Townshend, viscount Townshend, &c. This family is of Norman extraction, and came into England about the time of the conquest. Charles, lord viscount Townshend, grandfather of the present viscount, was appointed principal secretary of state in the reign of king George I. in 1720, and continued so to the end of his majesty's reign; when, upon resigning the seals, they were returned to him again by his late majesty king George II. who continued him in that honourable office to the year 1730.

6. "Azure, a Cheveron between three Mulletts Or;" borne by the right hon. John Chetwind, viscount Chetwind, &c. of the kingdom of Ireland. Of this family, which hath been of great antiquity in the county of Salop, taking their surname from Chetwynd in that county, was Adam de Chetwynd, who married Agnes daughter of John lord Lovel, baron of Dockinges, and lord of Minster Lovel in Oxfordshire; and by her had issue Sir John de Chetwynd, who, in the 37th of Henry III. had a charter of free-warren thro' all his demesne in the counties of Salop, Stafford, and Warwick.

7. "Argent, a Cheveron Gules, between three square Buckles Sable;" borne by the right hon. Matthew Ducie-Morton, lord Ducie, &c. This noble lord is descended from the Ducies in Normandy. After they came into England, king Edward I. conferred on them the lordship of Morton in Staffordshire, and several other lordships and manors, which the family enjoyed for many years. Sir Robert Ducie, one of his lordship's ancestors, was lord-mayor of London in the reign of king Charles I. and though he lent his majesty L. 80,000, which was lost by the king's being driven out of London, he died, however, worth L. 400,000.

8. "Argent, a Cheveron Checky Gules, and of the Field, between three Bugle-horns fringed Sable, garnished of the second;" borne by the right hon. lord Hugh Semple, lord Semple. The principal family of this name was Semple of Elliotston in Renfrew, where they had large possessions and offices, as stewards and bailiffs under the family of Stewart, proprietors of that county before they came to the crown. The first lord Semple was Sir Robert, who, being much in favour with king James IV. was by him created lord Semple in 1489.

9. "Argent, a Cheveron engrailed between three Lions passant Sable;" borne by the right hon. and the reverend Philip Smythe, viscount Strangford. One of this lord's ancestors was John Smythe, esq; who acquired a considerable estate whilst he was farmer of the customs in the reign of Henry VIII. He left two sons,

sons, John and Sir Thomas, which last was sent ambassador by king James I. to the emperors of Russia.

10. "Quarterly Argent and Azure, a Cheveron engrailed counter-changed;" borne by the name of *Chamber*.

11. "Party per Cheveron engrailed Gules and Argent, three Talbotts Heads erased counter-changed;" borne by the right hon. Anthony Duncombe, lord Feverham, &c. His lordship is descended from the Duncombes of Barley-end in Buckinghamshire. Sir Charles Duncombe, uncle to the present lord, was lord-mayor of London in 1709; and this nobleman was created lord Feverham and baron of Downton in Wiltshire, June 23, 1744.

12. "Paly of six, Argent and Gules, on a Cheveron Azure, three Crofs-croffets Or;" borne by the right hon. George Carpenter, baron Carpenter, of Killaghy in Ireland. This ancient and noble family are of great antiquity in the county of Hereford, and have been lords of the manor of the Home in the parish of Delwyn, near Weobly, for above 300 years. George, the first lord Carpenter, was so created May 4. 1719.

13. "Azure, on a Cheveron Or, between three Befsants, a Bay Leaf Proper;" borne by the right hon. James Hope, earl of Hopeton, &c. This noble family is descended from Henry Hope, a native of Holland, who, about two centuries ago, came over and settled in Scotland. Charles Hope, esq; father of the present earl, was created an earl by queen Anne, April 15. 1703.

14. "Vert, on a Cheveron between three Unicorns Heads erased Argent, horned and maned Or, three Mulletts Sable;" borne by the name of *Ker*, being the 1st and 4th quarters in the arms of his grace John Ker, duke of Roxburgh, &c. This ancient family is said to come from Normandy. John Ker, marquis of Beaumont and Cesford, the first duke of Roxburgh, was so created April 27. 1707.

15. "Azure, on a Cheveron Or, between three Bears Heads couped Argent, muzzled Gules, a Roebuck's Head erased, between two Hands holding Daggers all proper;" borne by the right hon. Donald Mackay, lord Reay. This family is said to derive their descent from Alexander, a younger son of Ochonacker, who, about the end of the twelfth century, came from Ireland; and the fourth in descent from him was Donald of Strathavern, whose son was named *Mac More*: and from him began the surname of *Mac T, Mackie, or Mackay*. Donald, the first lord of this family, was created baronet in 1625, and on June 20. 1628, was created baron Reay of the county of Caithness, by Charles I.

16. "Ermine, on a Cheveron Azure, three Foxes Heads erased Or, and in a Canton of the second a Fleur-de-lis of the third;" borne by the right hon. Stephen Fox, earl of Ilchester, &c. Of the family of Fox there have been many persons of note living in the counties of Dorset, Somerset, Wilts, and Hants, particularly Richard Fox, bishop of Winchester. His lordship was created lord Ilchester and baron Strangeways, May 11. 1741, 14 Geo. II. and earl of Ilchester in June 1756.

17. "Or, two Cheveronels Gules;" borne by the right hon. John Monfon, lord Monfon. This noble lord is descended from John Monfon, who flourished in

the reign of king Edward III. from whom descended another John, who attended king Henry V. in his wars in France. Sir John Monfon, bart. father of the present lord, was created lord Monfon, May 28, 1728.

18. "Or, on a Fefs, between two Cheveronels Sable, three Crofs-croffets of the first;" borne by the right hon. George Walpole, earl of Orford, &c. This family took their name from Walpole in Norfolk, where they resided before the conquest. Sir Robert Walpole was, in king George II.'s reign, elected knight of the garter in 1726, and created earl of Orford, February 9. 1741-2.

19. "Azure, three Cheveronels interlaced Or, and a Chief of the last;" borne by the name of *Fitz-Hugh*.

20. "Argent, three Cheveronels Gules, in Chief a Label Azure;" borne by the right hon. William Wildman Barrington, viscount Barrington, &c. This family is of Norman extraction; in which duchy, whilst it continued annexed to the English crown, there were to be seen the remains of a castle bearing the name of *Chute* or *Shute*, and formerly in the family, with other monuments in several towns of that duchy. John Shute, the late viscount Barrington, was in 1708 made a commissioner of the customs, and succeeded to the estates of Francis Barrington, Esq; and of John Wildman of the county of Berks, who made him their heir; and, in pursuance of the will of the former, he took the name and arms of *Barrington*. On June 11, 1720, he was created viscount Barrington, with a reverend grant of the office of master of the rolls in Ireland.

ART. VI. Of the Cross.

THE *Crofs* is an ordinary formed by the meeting of two perpendicular with two horizontal lines in the fefs-point, where they make four right-angles; the lines are not drawn throughout, but discontinued the breadth of the ordinary, which takes up only the fifth part of the field when not charged; but if charged, then the third. It is borne as well engrailed, indented, &c. as plain.

There is so great a variety of crosses used in heraldry, that it would be a very difficult task to treat of them all. Guillim has mentioned 39 different sorts; De la Colombiere, 72; Leigh, 46; and Upton declares he dares not ascertain all the various crosses borne in arms, for that they are almost innumerable: therefore, as all their forms cannot be expected here, we will only take notice of such as are most commonly seen at present in coats-of-arms. See Fig. x.

The first is "Quarterly, Ermine and Azure, a ^{plate} Crofs Or;" borne by his grace Thomas Osborne duke of Leeds, &c. This noble duke is descended from the honourable family of the Osbornes of Ashford, in the county of Kent; Sir Thomas Osborne, the grandfather to the present duke, was advanced to the peerage by king Charles II.

2. "Gules, a Crofs engrailed Argent, a Lozenge in the dexter-chief of the second;" borne by the right hon. Edward Leigh, lord Leigh. This family took their surname from the town of High-Leigh in Cheshire, where they resided before the Norman Conquest. Sir Thomas Leigh, the first lord of this family, was created

Of
the Crofs.

created baron Leigh of Stonely, by king Charles I. on July 1, 1643.

3. "Gules, a Crofs Argent fretty Azure;" borne by the right hon. Nicholas Taaffe, viscount Taaffe, of Corran, &c. in Ireland. Of this noble and ancient family was Richard Taaffe, who lived in 1282; as in 1306 did John Taaffe, who was archbishop of Armagh; and, in 1479, the order of the Garter being established in Ireland, Sir Nicholas Taaffe was one of the first members; and John, his son and heir, was created a baron and viscount by Charles I. August 1, 1628.

4. "Sable, a Crofs raguly Or;" borne by the name of *Stowary*.

5. "Argent, on a Crofs Sable a Leopard's-face Or;" borne by his grace Henry Brydges duke of Chandos, &c. The ancestors of this noble family took their name from the city of Bruges in Flanders; and one of them came over with William the Conqueror, and had a considerable share in the victory obtained near Hastings in Suffex, 1066. James, the father of the present duke, was created viscount Wilton and earl of Caernarvon, October 19, 1714; and marquis of Cearnarvon and duke of Chandos, — 30, 1719.

6. "Or, on a Crofs Sable, a patriarchal Crofs of the Field;" borne by the right hon. Thomas Vesey, baron of Knapton in the kingdom of Ireland. The truly noble family of Vescey or Vesey, derives its origin from Charles the Great, king of France, and emperor of the west, who died at Aix-la-Chapelle in Germany, Jan. 28, 814. His lordship's father was created a peer April 10, 1750.

7. "Argent, on a Crofs Gules, five Escalops Or;" borne by the right hon. William Villiers earl of Jersey, &c. This noble earl is descended from the family of Villiers in Normandy, some whom came over to England with the Conqueror; several manors and lands in England being soon after granted to Pagan de Villiers, one of this earl's ancestors. The first peer of this family was created a baron and viscount, March 20, 1690.

8. "Sable, on a Crofs within a Bordure engrailed Or, five Pellets;" borne by the right hon. Francis Greville, earl of Brooke and Warwick, &c. The ancestors of this noble family are of Norman extraction, and came over with William the Conqueror, who conferred manors and land on them in England, of a considerable value; and at length they obtained the government of the castle of Warwick, the present seat of the family. Sir Fulke, the first peer of this family, was created baron Brooke by king James I. Jan. 9, 1620.

9. "Argent, a Crofs bottonny Sable;" borne by the name of *Winwood*.

10. "Or, a Crofs-croset Gules;" borne by the name of *Taddington*.

11. "Azure, a Crofs potent fitchy Or." This ensign is said to have been borne by Ethelred king of the West-Saxons; and crofses of this sort are frequently met with in coats-of-arms.

12. "Party per pale, Gules and Argent; a Crofs potent quadrate in the centre, between four Crofses patee counter-changed;" the arms of the episcopal see of Litchfield and Coventry. This see was originally fixed at Litchfield; from thence removed to Chester,

and from both to Coventry. It contains the whole county of Stafford, except two parishes; all Derbyshire; the better part of Warwickshire, and near half Shropshire; divided into the four archdeaconries of Coventry, Stafford, Derby, and Salop. The parishes are 557 in number; but, including chapels, they amount to 643.

13. "Azure, a Crofs moline Argent;" borne by his grace William Henry Bentick, duke of Portland, &c. This noble duke is descended from a very ancient and distinguished family in the United Provinces of Holland, of which was William Bentick, Esq. who, in his youth was page of honour to William prince of Orange, afterwards William III. king of Great Britain, and, on the accession of William and his consort, was made groom of the stole, privy-purse to his majesty, lieutenant-general of his majesty's army, &c. and also created baron of Cirencester, viscount Woodstock, and earl of Portland, April 19, 1689.

14. "Argent, a Crofs patee Sable;" borne by the name of *Rice*.

15. "Sable, a Crofs patee Argent;" borne by the name of *Maplefen*.

16. "Azure, a Crofs flowery Or;" borne by the name of *Cheney*.—This is said to have also been the arms of Edwine, the first Christian king of Northumberland.

17. "Argent, fix Crofs crosetts fitchy 3, 2, 1, Sable, on a Chief Azure, two Mulletts pierced Or;" borne by his grace Henry Clinton, duke of Newcastle, &c. This noble family is descended from Jeffrey de Clinton, lord chamberlain and treasurer to king Henry I. grandson to William de Tankerville, chamberlain of Normandy; from whom descended William de Clinton, chief justice of Chester, governor of Dover castle, lord Warden of the king's forests south of Trent. Edward, lord Clinton, another of this noble earl's ancestors, was constituted lord high-admiral of England for life, in the reign of queen Elizabeth, who created him earl of Lincoln, May 4, 1572.

18. "Gules, a Cheveron between ten Crofses patee, six above and four below, Argent;" borne by the right hon. Frederick-Augustus Berkeley, earl of Berkeley, &c. This noble family is descended from Robert Fitz-Harding, who obtained a grant of Berkeley-castle in Gloucestershire, which the family still inherits, and from whence they obtained the surname of *Berkeley*, from Henry duke of Normandy, afterwards king of England; the said Robert Fitz-Harding was descended from the royal line of the kings of Denmark.

19. "Azure, three Mulletts Or, accompanied with seven Crofs-crosetts fitchy Argent, three in Chief, one in Fess, two in Flanks, and the last in Base;" borne by the right hon. James Somerville, lord Somerville. The first of this name on record is Sir Walter de Somerville, lord of Wichnere, in the county of Stafford, who came to England with William the Conqueror. About the beginning of the reign of king William, in 1170, the Somervilles were possessed of a fair estate in the county of Lanark and elsewhere.

20. "Gules, three Crofses reercedlee, voided Or, a Chief varyy ermine and centre ermine;" borne by the

OF
the Crofs.

CROOKS.

the right hon. John-Peyto Verney, baron Willoughby de Broke. This noble lord is descended from William de Verna, who flourished in the reign of king Henry I. 1419.

ART. VII. Of the SALTIER.

THE Saltier, which is formed by the bend and bend-finister crossing each other in right angles, as the interfecting of the pale and fess forms the cross, contains the fifth part of the field, but if charged then the third. In Scotland, this ordinary is frequently called a *St Andrew's cross*. It may, like the others, be borne engrailed, wavy, &c. as also between charges or charged with any thing. See examples, fig. xi.

Plate
CXLVII.

Nº 1. is "Argent, a Saltier Gules;" borne by his grace James Fitz-Gerald, duke of Leinster, &c. This noble lord is descended from Otho, or Other, a rich and powerful lord in the time of king Alfred, descended from the dukes of Tuscany; who passing from Florence into Normandy, and thence into England, there the family flourished, until Richard Strongbow, earl of Pembroke, their kinsman, engaged them to partake in his expedition to Ireland, in which Maurice Fitz-Gerald embarked, and was one of the principal conquerors of that kingdom, for which he was rewarded with a great estate in lands in the province of Leinster, and particularly the barony of Offaley, and the castle of Wicklow; and died, covered with honours, in the year 1177, 24 Henry II.

2. "Gules, a Saltier Argent, between twelve Cross crosslets Or;" borne by the right hon. Other-Lewis Windfor Hickman, earl of Plymouth, &c. This noble earl is descended from Robert Fitz-Hickman, lord of the manor of Bloxham, Oxfordshire, in the 56 Hen. III. 1272; and he is maternally descended from the noble family of the Windfors, who were barons of the realm at the time of the conquest.

3. "Vert, a Saltier wavy Ermine;" borne by the name of *Wakeman* of Beckford, in Gloucestershire.

4. "Ermine, a Saltier counter-compony Or and Gules;" borne by the name of *Umslon*.

5. "Argent, a Saltier Azure with a Bezant in the centre;" borne by the right hon. Philip Yorke, earl of Hardwicke, &c. He was in October 1733 constituted lord chief-justice of the king's bench, and November 23, in the same year, created baron Hardwicke of Hardwicke.

6. "Argent on a Saltier Gules an Escallop Or;" the arms of the bishoprick of Rochester—This Diocese, the least in England, comprehends only a small part of Kent, in which there are 150 churches and chapels; and the two parishes in Iselham in Cambridgeshire, and Frekenham in Suffolk. It has only one archdeacon, that of Rochester. For many years it was in the immediate patronage of the archbishop of Canterbury.

7. "Party per Saltier, Azure and Argent, on a Saltier Gules a Crescent of the second for difference;" quartered by the right hon. William Hall Gage, viscount Gage, of Castle-Island in Ireland. This noble family is of Norman extraction, and derives descent from de Gage or Gage, who attended William I. in his expedition to England: and, after the conquest thereof, was rewarded with large grants of lands in the forest of Dean, and county of Gloucester, near which forest

he fixed his residence, by building a seat at Clerenwell, in the same place where the house of Gage now stands: he also built a great house in the town of Cirencester, at which place he died, and was buried in the abbey there. Sir Thomas Gage, the eighth baronet, and father to the present lord Gage, was created baron of Castle-Bar, and viscount Gage, 1721.

8. "Gules, on a Saltier Argent, a Rose of the first barbed and feeded proper;" borne by the right hon. George Neville, lord Abergavenny, premier baron of England.

9. "Or, on a Saltier Azure, nine Lozenges of the first;" the paternal arms of the right hon. John Dalrymple, earl of Stair, &c. Of this family, which took their surname from the barony of Dalrymple, lying on the river Dnn in Ayrshire, Scotland, was Adam de Dalrymple, who lived in the reign of Alexander III.

10. "Argent, on a Saltier engrailed Sable, nine Annulets Or;" borne by the name of Leak.

11. "Gules, a Saltier between four Crescents Or;" borne as the 2d and 3d quarters in the coat-of-arms of the right hon. Charles Kinnaird, lord Kinnaird. George Kinnaird, esq; one of the present lord's ancestors, being of great service to king Charles II. during the usurpation of Oliver Cromwell, he was by that prince, at his restoration, made one of the privy-council; and December 28. 1682, created a baron.

12. "Argent, a Saltier engrailed between four Roses Gules;" for Lennox; and borne as 1st and 4th quarters in the coat-of-arms of the right hon. Francis Napier, lord Napier. This family is said to be descended from the ancient thanes or stewards of Lennox in Scotland, but took their surname of Napier from the following event. King David II. in his wars with the English, about the year 1344, convocating his subjects to battle, the earl of Lennox sent his second son Donald, with such forces as his duty obliged him; and, coming to an engagement, where the Scots gave ground, this Donald, taking his father's standard from the bearer, and valiantly charging the enemy with the Lennox men, the fortune of the battle changed, and they obtained the victory; whereupon every one advancing, and reporting their acts, as the custom was, the king declared they had all behaved valiantly, but that there was one among them who had *na pier*, that is, no equal; upon which the said Donald took the name of Napier, and had, in reward for his good services, the lands of Gosfield, and other estates in the county of Fife.

13. "Gules, a Saltier Or, surmounted of another Vert;" for the name of *Andrews*; and borne by Sir William Andrews, bart. of Denton in Northamptonshire, who is descended from Sir Robert Andrews of Normandy, knight, who came into England with William the Conqueror. Sir William Andrews, the first baronet of this family, was created December 11, 1641.

14. "Azure, a Saltier quarterly quartered Or and Argent." The arms of the episcopal see of Bath and Wells.—The diocese of Bath and Wells contains all Somersetshire, except a few churches in Bristol. And in it there are three archdeacons, viz. those of Wells, Bath, and Taunton. The number of the parishes is 388, though, according to some, the total number of the churches and chapels amounts to 503.

15. "Party per Saltier Argent and Gules, a Saltier counter-changed."

16. "Party per Pale indented Argent and Sable, a Saltier counter-changed;" borne by the name of *Scote*.

17. "Argent, three Saltiers couped and engrailed Sable;" borne by the name of *Benton*.

18. "Argent, a Saltier Gules, and a Chief Ermine;" borne by the right hon. Francis Thomas Fitz-Maurice, earl of Kerry, &c. This very ancient and noble family is a branch of the family of Kildare, who are originally descended from the great duke of Tufcaney, and of which was Otho, a noble baron of Italy, whose son Walter, attending the Norman Conqueror into England, was made constable of the castle of Windsor. Raymond, one of the present earl's ancestors, had a principal hand in the reduction of Ireland to the subjection of Henry II. and Dermoid Mac-Carty, king of Cork, fought his aid against his son Cormac O'Lehanagh, which he undertook, and delivered the king from his rebellious son; for which that prince rewarded him with a large tract of land in the county of Kerry, where he settled his son Maurice, who gave his name to the county, which he called *Clan Maurice*, and is enjoyed by the present earl of Kerry, who is viscount Clan Maurice. Thomas the first earl, and father of the last, was the 21st lord Kerry, who was created earl, January 17. 1722.

19. "Sable, a Saltier Argent, on a Chief Azure, three Fleurs-de-lis Or;" borne by the right hon. John Fitz-Patrick, earl of Upper Ossory, and baron of Gowran in Ireland. This most ancient and princely family is descended from Heremon, the first monarch of the Milesian race in Ireland; and after they had assumed the surname of Fitz-Patrick, they were for many ages kings of Ossory, in the province of Leinster. John, the first earl of this family, succeeded his father Richard as lord Gowran, June 9. 1727, was created earl, October 5. 1751, and died 1758.

20. "Party per Pale Argent and Gules, three Saltiers counter-changed;" borne by the name of *Lane*. These arms are also borne, without the least alteration, by the name of *Kingsfinan*; for which similitude we can no otherwise account, than by supposing there has been some mistake made through many transcriptions.

SECT. II. Of Sub-Ordinaries.

BESIDES the honourable ordinaries and the diminutions already mentioned, there are other heraldic figures, called *sub-ordinaries*, or *ordinaries* only, which, by reason of their ancient use in arms, are of worthy bearing, viz. The Gyron, Franc-quarter, Canton, Pairle, Fret, Pile, Orle, Inescutcheon, Treffure, Anulet, Flanches, Flagues, Voiders, Billet, Lozenge, Guts, Fusil, Rustre, Mascle, Papillone, and Diaper. See Plate CXLIV. fig. i. (A.)

The Gyron is a triangular figure formed by two lines, one drawn diagonally from one of the four angles to the centre of the shield, and the other is drawn either horizontal or perpendicular, from one of the sides of the shield, meeting the other line at the centre of the field.

Gyronny is said, when the field is covered with fix, eight, ten, or twelve gyrons in a coat-of-arms: but a French author would have the true gyronny to consist

of eight pieces only, as in the fig. which represents the coat-of-arms of the right hon. John Campbell, earl of London, &c. whose ancestor was created baron of London in 1604 by James VI. and earl of the fame place, May 12. 1633, the 9th of Charles I.

The Franc-quarter is a square figure, which occupies the upper dexter quarter of the shield. It is but rarely carried as a charge. *Silvestra Petra Sancta* has given us a few instances of its use.

The Canton is a square part of the escutcheon, somewhat less than the quarter, but without any fixed proportion. It represents the banner that was given to ancient knights-bannerets, and, generally speaking, possesses the dexter-chief-point of the field, as in the fig.; but should it possess the sinister-corner, which is but seldom, it must be blazoned a canton-sinister.

James Coats reckons it as one of the nine honourable ordinaries, contrary to most heralds opinion. It is added to coats-of-arms of military men as an augmentation of honour: thus John Churchill, baron of Eymouth in Scotland, and one of the ancestors of the present duke of Marlborough, being lieutenant general to king James II. received from him a canton argent, charged with the red cross of England, added to his paternal coat, "which is Sable, a lion rampant Argent."

The pairle is a figure formed by the conjunction of the upper half of the saltier with the under half of the pale.

The fret is a figure representing two little sticks in saltier, with a mascle in the centre interlaced. J. Gibbon terms it the *heralds true-lovers knot*; but many dissent from his opinion.

Fretty is said when the field or bearings are covered with a fret of fix, eight, or more pieces, as in the fig. The word *fretty* may be used without addition, when it is of eight pieces; but if there be less than that number, they must be specified.

The pile, which consists of two lines, terminating in a point, is formed like a wedge, and is borne engrailed, wavy, &c. as in the fig. It issues in general from the chief, and extends towards the base, yet there are some piles borne in bend, and issuing from other parts of the field, as may be seen in Plate CXLVII. fig. xii. n° 12, &c.

The Orle is an ordinary composed of two lines going round the shield, the same way as the bordure, but its breadth is but one half of the latter, and at some distance from the brim of the shield, as in the fig.

The Inescutcheon is a little escutcheon borne within the shield; which, according to Guillim's opinion, is only to be so called when it is borne single in the fess-point or centre; see the fig. on Plate CXLIV. but modern heralds, with more propriety, give the name of *inescutcheon* to such as are contained in Plate CXLVII. fig. xii. n° 2. and call that which is fixed on the fess-point *escutcheon of pretence*, which is to contain the arms of a wife that is an heiress, as mentioned above.

The Treffure is an ordinary commonly supposed to be the half of the breadth of an orle, and is generally borne flowery and counter-flowery, as it is also very often double, and sometimes treble. See the fig. (Plate CXLIV.). This double treffure makes part of the arms of Scotland, as marshalled in the royal achievement.

Sub-Ordinaries.

Sub-Ordinaries.

chievement, Plate CXLIX. fig. xxi. n^o 7. and was granted to the Scots kings by Charlemagne, being then emperor and king of France, when he entered in a league with Achaus king of Scotland, to shew that the French lilies should defend and guard the Scottish lion.

The Annulet, or ring, is a well-known figure, and is frequently to be found in arms through every kingdom in Europe.

The Flanches are formed by two curved lines, or semicircles, being always borne double. See the figure. G. Leigh observes, that on two such Flanches two sundry coats may be borne.

Plate CXLIX.

The Flaques resemble the flanches, except that the circular lines do not go so near the centre of the field; (see the figure). J. Gibbon would have these two ordinaries to be both one, and wrote *flank*; alleging, that the two other names are but a corruption of this last: but as G. Leigh and J. Guillim make them two distinct and subordinate ordinaries, we have inserted them here as such.

The Voiders are by Guillim considered as a subordinate ordinary, and are not unlike the flaques, (see the figure,) but they occupy less of the field.

The Billet is an oblong square figure, twice as long as broad. Some heralds imagine, that they represent bricks for building; others more properly consider them as representing folded paper or letters.

The Lozenge is an ordinary of four equal and parallel sides, but not rectangular; two of its opposite angles being acute, and the other two obtuse. Its shape is the same with those of our window-glasses, before the square came so much in fashion. See the figure.

Cuts, or drops, are round at bottom, waved on the sides, and terminate at the top in points. Herald's have given them different names according to their different tinctures: thus if they are

Yellow	} they are called	{ d' Or
White		{ de Eau
Red		{ de Sang
Blue		{ de Larmes
Green		{ de Vert
Black		{ de Pois

The fustil is longer than the lozenge, having its upper and lower part more acute and sharp than the other two collateral middle parts, which acuteness is occasioned by the short distance of the space between the two collateral angles; which space, if the fustil is rightly made, is always shorter than any of the four equal geometrical lines wherewith it is composed. See the fig. *iiid*.

The Rustre is a lozenge pierced round in the middle; (see the figure.) They are called by the Germans, *rusten*. Menestrier gives an example of them in the arms of Lebarat in France, argent three rustres azure.

The Mascle is pretty much like a lozenge, but voided or perforated through its whole extent, shewing a narrow border, as in the figure. Authors are divided about its resemblance; some taking it for the mesh of a net, and others for the spots of certain flints found about Rohan; and as no writer has given a clearer account in support of this last opinion than Colombiere, author of *La Science Heraldique*, we shall transcribe it for the satisfaction of the curious.

"Rohan (says he) bears Gules, nine Mascles Or, VOL. V.

3, 3, 3. Opinions have varied very much about the original of the mascles or meshes, as being somewhat like the meshes of nets: but for my own part, having often observed that those things which are remarkable and singular in some countries, have sometimes occasioned the lords thereof to represent them in their escutcheons, and to take them for their arms, I am of opinion, that the lords of Rohan, who, I believe, are the first that bore these figures in their arms, tho' descended from the ancient kings and princes of Bretagne, took them, because in the most ancient viscounty of Rohan, afterwards erected into a duchy, there are abundance of small flints, which being cut in two, this figure appears on the inside of them; as also the carps, which are in the fish-ponds of that duchy, have the same mark upon their scales; which, being very extraordinary and peculiar to that country, the ancient lords of the same had good reason, upon observing that wonder, to take those figures for their arms, and to transmit them to their posterity, giving them the name of *mascles*, from the latin word *macula*, signifying a spot; whence some of that house have taken for their motto, *Sine macula macula*, that is, A mascle without a spot."

Papillon is an expression used for a field or charge that is covered with figures like the scales of a fish. Mons. Baron gives as an example of it the arms of Monti Gueules Papelone d'Argent. The proper term for it in English would be *scallop-work*.

Diapering is said of a field or charge shadowed with flourishes or foliage with a colour a little darker than that on which it is wrought. The Germans frequently use it; but it does not enter into the blazoning or description of an arms, it only serves to embellish the coat.

If the fore-mentioned ordinaries have any attributes, that is, if they are engrailed, indented, wavy, &c. they must be distinctly specified, after the same manner as the honourable ordinaries.

See examples of sub-ordinaries, &c. fig. xii.

Plate CXLVII.

1. "Gules, an Orle Ermine;" borne by the name of *Hunframville*.

2. "Argent, three Inescutcheons Gules;" borne by the name of *Hay*, the 2d and 3d quarters in the coat-of-arms of the right hon. Thomas Hay, earl of Kinnoul, &c.—The first of the name of Hay that bore these arms, got them, as Mr Nisbet observes, because he and his two sons, after having defeated a party of the Danes at the battle of Luncarty, anno 942, were brought to the king with their shields all stained with blood.

3. "Argent, a Fret Sable;" borne by the right hon. Lionel Talmash, earl of Dyfart, &c. This family was advanced to the peerage by king Charles I. in 1646.

4. "Or, fretty of Gules, a Canton Ermine;" borne by the right hon. Henry Noel, earl of Gainfborough, &c. This nobleman is descended from — Noel, who came into England with William the Conqueror, and, in consideration of his services, obtained a grant of several manors and lands of very great value. Sir Edward, who was knighted by king James on his accession to the throne, and created a baronet June 29, 1611, was the first advanced to the honour of baron Noel, March 23, 1616.

5. "Girony of eight Pieces Or and Sable;" the 20 O 11

1st and 4th quarters of the coat-of-arms of the right hon. John Campbell, earl of Breadalbane, &c. This ancient and noble family is descended, in a regular succession, from Duncan the first Lord Campbell, ancestor of the family of Argyll. John, the first earl, in consideration of his personal merit, was, from a baronet, created lord Campbell, viscount Glenorchie, and earl of Breadalbane, Jan. 28. 1677, by Charles II.

6. "Lozeagy Argent and Gules;" borne by the right hon. George Fitz-William, earl Fitz-William, &c. This noble earl is descended from Sir William Fitz-William, marshal of the army of William the Conqueror at the battle of Hastings in Suffex, by which victory that prince made his way to the throne.

7. "Sable, a Mascle within a Tressure flowery Argent;" borne by the name of *Hoblethorne*.

8. "Gules, three Mulletts Or, within a Bordure of the latter, charged with a double Tressure flowery and counter flowery with Fleurs-de-lis of the first;" borne by the right hon. William Sutherland, earl of Sutherland, &c. According to the traditional account of some Scottish writers, this family, in the peerage, is older than any in North-Britain, if not in all Europe; the title of *earl* being conferred on one of their ancestors in 1057.

9. "Azure, a Pile Ermine," for the name of *Wyche*; and is quartered as first and fourth in the coat-of-arms of Sir Cyril Wyche, bart. his majesty's resident at the Hans-Towns.

10. "Or, on a Pile engrailed Azure, three Crosseslets fitchy of the first;" borne by the name of *Rigdon*.

11. "Or, on a Pile Gules three Lions of England between six Fleurs-de-lis Azures;" the first and fourth quarters of his grace Edward Seymour, duke of Somerset, &c. granted him by king Henry VIII. on his marriage with the lady Jane Seymour.

12. "Ermine, two Piles issuing from the dexter and sinister sides, and meeting in Base Sable;" for the name of *Holles*.

13. "Argent, three Piles, one issuing from the Chief between the others reversed, Sable;" for the name of *Hulfe*, and borne by Sir Edward Hulfe, bart. of Lincoln's-inn fields, Middlesex.

14. "Azure, a Pile wavy bendways Or;" borne by the name of *Alldham*.—There is no mention made of its issuing out of the dexter-corner of the escutcheon, for this is sufficiently determined by the term *bendways*.

15. "Or, three Piles in Bend, each point ensigned with a Fleur-de-lis Sable;" borne by the name of *Norton*.

16. "Argent, three Piles meeting near the point of the Base Azure;" borne by the name of *Bryan*.

17. "Party per Pale and per Bend Or and Azure counter-changed;" borne by the name of *Johnson*.—This bearing is equal to two gyrons; see p. 3596. col. 1.

18. "Party per Pale and per Cheveron Argent and Gules counter-changed."

19. "Party per Pale chappé Or and Vert counter-changed." This is a bearing seldom to be met with.

20. "Party per Fefs Gules and Argent, a Pale counter-changed;" borne by the name of *Lavider*.

SECT. III. OF COMMON CHARGES borne in coats-of-arms.

It has been already observed, that in all ages men have made use of the representation of living creatures, and other symbolical signs, to distinguish themselves in war; and that these marks, which were promiscuously used for hieroglyphs, emblems, and personal devices, gave the first notion of heraldry. But nothing shews the extent of human wit more, than the great variety of these marks of distinction, since they are composed of all sorts of figures, some natural, others artificial, and many chimerical; in allusion, it is to be supposed, to the state, quality, or inclination of the bearer.

Hence it is, that the sun, moon, stars, comets, meteors, &c. have been introduced to denote glory, grandeur, power, &c. Lions, leopards, tigers, serpents, flags, &c. have been employed to signify courage, strength, prudence, swiftness, &c.

The application to certain exercises, such as war, hunting, music, &c. has furnished lances, swords, pikes, arms, fiddles, &c. Architecture, columns, cheverons, &c.; and the other arts several things that relate to them.

Human bodies, or distinct parts of them, also clothes and ornaments, have, for some particular intention, found place in armory; trees, plants, fruits, and flowers, have likewise been admitted to denote the rarities, advantages, and singularities, of different countries.

The relation of some creatures, figures, &c. to particular names, has been likewise a very fruitful source of variety in arms. Thus the family of Coningsby bears three conies; of Arundel, six swallows; of Urson, a bear; of Lucie, three pikes, in Latin *tres lucios pices*; of Starkey, a stork; of Castleman, a castle triple-towered; of Shuttleworth, three weaver's shuttles, &c.

Besides these natural and artificial figures, there are chimerical or imaginary ones used in heraldry, the result of fancy and caprice; such as centaurs, hydras, phenixes, griffons, dragons, &c. Which great variety of figures shews the impossibility of comprehending all common charges in a work of this nature; therefore such only shall be treated of as are most frequently borne in coats-of-arms.

ART. I. OF NATURAL FIGURES borne in coats-of-arms.

AMONG the multitude of natural things which are used in coats-of-arms, those most usually borne are, for the sake of brevity as well as perspicuity, distributed into the following classes, viz.

Celestial figures; as the sun, moon, stars, &c. and their parts.

Effigies of men, women, &c. and their parts.

Beasts; as lions, flags, foxes, boars, &c. and their parts.

Birds; as eagles, swans, storks, pelicans, &c. and their parts.

Fishes; as dolphins, whales, sturgeons, trouts, &c. and their parts.

Reptiles

Reptiles and insects; as tortoises, serpents, grasshoppers, &c. and their parts.

Vegetables; as trees, plants, flowers, herbs, &c. and their parts.

Stones; as diamonds, rubies, pebbles, rocks, &c.

These charges have, as well as ordinaries, divers attributes or epithets, which express their qualities, positions, and dispositions. Thus the sun is said to be in his *glory, eclipsed, &c.* The moon in her *complement, increfcent, &c.* Animals are said to be *rampant, passant, &c.* Birds have also their denominations, such as *close, displayed, &c.* Fishes are described to be *hauriant, natant, &c.*

I. Examples of Celestial Figures.

1. "Azure, a Sun in his Glory;" borne by the name of *St. Clere*; and is found in the 1st and 4th quarters of the coat-of-arms of the most noble William-Henry Ker, marquis of Lothian, &c. It is needless to express the colour of the sun, nothing being capable to denote it but gold.

2. "Azure, one Ray of the Sun, bendways Gules, between fix Beams of that Luminary Argent;" borne by the name of *Aldam*. There is no mention made of their issuing out of the dexter-corner of the escutcheon; for this is implied in the term *bendways*, for the reason mentioned before.

3. "Argent, five Rays of the Sun issuing out of the sinister-corner Gules;" borne by the name of *Mudshideler*, a family of distinction in Franconia.

4. "Or, a Sun eclipsed." This bearing is seldom to be met with, except in emblematic or hieroglyphic figures; and might be expressed *Sable*, because that hue is accidental and not natural.

5. "Gules, the Moon in her complement Or, illustrated with all her light proper." This is sufficient without naming the colour, which is *Argent*.

6. "Azure, a Moon decrefcent proper;" borne by the name of *Delaluna*.

7. "Gules, a Moon increfcent Or;" borne by the name of *Defcui*.

8. "Argent, a Moon in her *detriment*, *Sable*." This word is used in heraldry to denote her being eclipsed.

9. "Azure, a Crescent Argent;" borne by the name of *Lucy*. This bearing is also used as a difference, it being assigned to the second son, as before-mentioned.

10. "Gules, three Crescents Argent;" borne by the right hon. David Oliphant, lord Oliphant. Amongst the ancestors of this noble family was David de Oliphant, one of those barons who, in 1142, accompanied king David I. into England with an army, to assist his niece Matilda against king Stephen; but, after raising the siege of Winchester, the said king David was so closely pursued, that, had it not been for the singular conduct of this brave person, the king would have been taken prisoner.

11. "Azure, a Crescent between three Mulletts Argent;" borne by the right hon. John Arbuthnot, viscount and baron Arbuthnot. In the year 1105, the first of this family marrying a daughter of the family of Oliphant, sheriff of the county of Kincardin, with her he had the lands of Arbuthnot in that county, from whence he took his surname. Robert Arbuth-

not was the first of this family who, for his loyalty to king Charles I. was, Nov. 16. 1641, dignified with the title of *baron and viscount Arbuthnot*.

12. "Gules, a Star issuing from between the Horns of a Crescent Argent."

13. "Azure, a Star of 16 points Argent;" borne by the name of *Huifon*.

14. "Argent, three Mulletts pierced *Sable*;" borne by the name of *Wollaffen*.

15. "Azure, six Mulletts 3, 2, 1, Or;" borne by the name of *Welfsh*.

16. "Ermine, a Mullet of six points Gules, pierced;" borne by the name of *Hussenhul*.—When a mullet has more than five points, their number must, in blazoning, be always named.

17. "Argent, a Rain-bow with a Cloud at each end proper." This is part of the crest to the earl of Hopeton's coat-of-arms, which is inserted in fig. ix. n° 13. The whole of it is a globe split on the top, and above it is the rain-bow, &c.

18. "Party per Fels crenelle Gules and Azure, three Suns proper;" borne by the name of *Pierfon*.

19. "Gules, a Mullet between three Crescents Argent;" borne by the name of *Oliver*.

20. "Gules, a Chief Argent, on the lower part thereof a Cloud, the Sun's resplendent rays issuing throughout proper;" borne by the name of *Leefer*.

II. Examples of Effigies of Men, &c. and their parts.

1. "Azure, the Virgin Mary crowned, with her Babe in her right arm, and a Sceptre in her left, all Or;" borne by the coat-of-arms of the bishopric of Salisbury.—This bishop's see was at first fixed at Sherborn in Dorsetshire; and contained all that district which is now divided into the dioceses of Salisbury, Bristol, Wells, and Exeter. In the year 905, the dioceses of Wells, Crediton, and St Germans (now Exeter), were taken from it. And it was, moreover, parcelled out into the two bishoprics of Sherborn and Wilton. The present diocese of Salisbury, or Sarum, contains all Wiltshire, except two parishes; and all Berkshire, excepting one parish, and part of another. There are in it three archdeacons, namely, of Salisbury, Wilts, and Berks; and the number of parish-churches and chapels, in the whole, is about 550. It has several peculiars of its own in Dorsetshire; though in Bristol diocese.

2. "Azure, a Presbyter, sitting on a Tomb-stone, with a Crown on his Head and Glory Or, his right hand extended, and holding in his left an open Book Argent, with a Sword cross his mouth Gules." The coat-of-arms of the bishopric of Chichester. The see of Chichester was anciently in the isle of Selsey, but removed to Chichester by Stigand. This diocese contains the whole county of Sussex (except 22 peculiars belonging to the archbishopric of Canterbury), wherein there are 250 parishes, and two archdeacons, those of Chichester and Lewis. Some reckon the number of churches and chapels to be 302.

3. "Azure, a Bishop habited in his pontificals, sitting on a chair of state, and leaning on the sinister side thereof, holding in his left hand a crozier, his right being extended towards the dexter chief of the escutcheon, all Or; and resting his feet on a cushion, Gules, tasselled of the second." The coat-of-arms of the bishopric

shopric of Clogher, in Ireland.

4. "Azure, a Bishop habited in his pontificals, holding before him, in a Pale, a Crucifix proper." The coat-of-arms of the bishopric of Waterford, in Ireland.

5. "Or, a Man's Leg couped at the midft of the thigh Azure;" borne by the name of *Haddon*.

6. "Azure, three sinister Hands couped at the wrist, and erected Argent;" borne by the ancient family of Malmaims.

7. "Argent, three sinister Hands couped at the wrist, and erected Gules;" borne by the name of *Maynard*. By these two last examples it appears, that different coats-of-arms may be easily made from the same figure or figures, by varying the colours only, without the addition of any other charge, counter-changings, partings, &c.

8. "Argent, a Man's Leg erased at the midft of the thigh Sable;" borne by the name of *Prime*.

9. "Gules, three Legs armed proper, conjoined in the Fess-point at the upper part of the thighs, flexed in triangle, garnished and spurred Or." This is the coat-of-arms of the Isle of Man; and is quartered by the most noble John Murray, duke of Athole, titular lord or king of that isle.

10. "Gules, three dexter Arms vambraced fessways in Pale proper;" borne by the name of *Armstrong*. This coat is very well adapted to the bearer's name, and serves to denote a man of excellent conduct and valour.

11. "Or, three Legs couped above the knee Sable;" borne by the name of *Hoffy*.

12. "Vert, three dexter Arms conjoined at the shoulders in the Fess-point, and flexed in triangle Or, with fists clenched Argent;" borne by the name of *Tremain*.

13. "Argent, a Man's Heart Gules, within two equilateral triangles interlaced Sable;" borne by the name of *Villager*, a family of distinction in Provence.

14. "Azure, a sinister Arm, issuing out of the dexter-chief, and extended towards the sinister-base Argent."

15. "Argent, a dexter Hand couped at the wrist and erected, within a Bordure engrailed Sable;" borne by the name of *Manley*.

16. "Argent, a Man's Heart Gules, ensigned with a Crown Or, and on a Chief Azure, three Mullets of the first." The paternal coat of the name of *Douglas*, and quartered in the arms of the dukes of Hamilton and Queensbury; as also in those of the earls of Morton and March, and the Lord Mordington.

17. "Gules, a Saracen's Head affrontée erased at the neck Argent, environed about the temples with a wreath of the second and Sable;" borne by the name of *Mergill*.

18. "Argent, three Blackamoors Heads couped proper, banding about the head Argent and Gules;" borne by the name of *Tanner*.

19. "Gules, three Befeants each charged with a man's face affrontée proper;" borne by the name of *Gamin*.

20. "Or, a Blackamoor's Head couped proper, banding about the Head Argent;" borne by the name of *Ufloc*.

Observe, that when half of the face, or little more, of human figures, is seen in a field, it is then said to be *in profile*; and when the head of a man, woman, or other animal, is represented with a full face, then it is termed *affrontée*.

III. Examples of the different Positions of Lions, &c. in coats-of-arms.

1. "Or, a Lion rampant Gules;" quartered by the right hon. Hugh Percy-Smithton, earl of Northumberland, &c. This noble earl is descended from the family of the Smithsons of Newsham in Yorkshire, which appears to have been possessed of lands in that county in the reign of king Richard II. His lordship, married July 18. 1740, the lady Elizabeth Seymour, only daughter of Algernon Seymour, late duke of Somerset, and earl of Northumberland, on whose death he was created earl of the same county, Feb. 7. 1749-50, and duke of the same county Oct. 22. 1766.

2. "Azure, a Lion rampant-guardant Or;" borne by the name of *Fitz-Hammond*.

3. "Gules, a Lion rampant-guardant Or;" quartered by the right hon. Charles Cadogan, lord Cadogan, &c. This noble lord is descended from Kehdlin, prince of Powis in Wales, from whom descended William Cadwyan or Cadogan of Llanbeder, in the county of Pembroke, another of the ancestors of this present lord, who was created a peer of Great Britain on June 21. 1716.

4. "Ermine, a Lion salient Gules;" borne by the name of *Worley*.

5. "Azure, a Lion statant-guardant Or;" borne by the name of *Bromfield*.

6. "Or, a Lion passant Gules;" borne by the name of *Games*.

7. "Argent, a Lion passant-guardant Gules, crowned Or;" quartered by the right hon. James Ogilvy, earl of Findlater, &c.

8. Gules, a Lion sejant Argent."

9. "Or, a Lion rampant double-headed Azure;" borne by the name of *Mason*.

10. "Sable, two Lions rampant-combatant Or, armed and langued Gules;" borne by the name of *Carter*.

11. "Azure, two Lions rampant-adoffee Or." This coat-of-arms is said to have been borne by Achilles at the siege of Troy.

12. "Sable, two Lioncels counter-passant Argent, the uppermost towards the sinister side of the escutcheon, both collared Gules;" borne by the name of *Glegg*.—It is the natural disposition of the lion not to bear a rival in the field: therefore two lions cannot be borne in one coat-of-arms, but must be supposed to be lion's whelps, called *lioncels*; except when they are parted by an ordinary, as in fig. viii. n° 17. or so disposed as that they seem to be distinctly separated from each other, as in fig. xv. n° 20. In the two foregoing examples they are called *lions*, because in the 10th they seem to be striving for the sovereignty of the field, which they would not do unless they were of full growth: and, in the 11th, they are supposed to represent two valiant men, whose dispute being accommodated by the prince, are leaving the field, their pride not suffering them to go both one way.

13. "Argent, a Demi-lion rampant Sable;" borne by the name of *Mervin*.

Of

Lions, &c.

Different
Animals.

14. "Gules, a lion couchant between six Crofs-croffets, three in Chief, and as many in Base, Argent;" for the name of *Tynte*; and is the first and fourth quarter of the arms of Sir Charles-Kerns Tynte, bart. elected knight of the shire for the county of Somerset to the four last and present parliaments, colonel of the second battalion of the Somerset militia, and LL.D.

15. "Azure, a Lion dormant Or."

16. "Or, out of the midst of a Fefs Sable, a Lion rampant-naissant Gules;" borne by the name of *Emme*. This form of blazon is peculiar to all living things that shall be found issuing out of the midst of some ordinary or other charge.

17. "Azure, three Lionsels rampant Or;" borne by the right hon. Richard Fienes, viscount and baron Saye and Sele. This noble lord is descended from John, baron Fienes, hereditary constable of Dover-castle, and lord Warden of the Cinque-ports, in the 12th century.

18. "Gules, a tricorporated Lion issuing from three parts of the Escutcheon, all meeting under one Head in the Fefs-point Or, langued and armed Azure;" borne by the name of *Crouchback*. This coat appertained to Edmund Crouchback, earl of Lancaster, in the reign of his brother king Edward I.

19. "Gules, a Bessant between three Demi-lions rampant Argent;" borne by the right hon. Charles Bennet, earl of Tankerville, &c. This noble earl is descended from the family of the Bennets in Berkshire, who flourished in the reign of king Edward III. Charles, lord Ossulton, grandfather of the present earl, was created earl of Tankerville, on October 19. 1714, by George I.

20. "Party per Pale Azure and Gules, three Lions rampant Argent;" borne by the right hon. Henry Herbert earl of Pembroke, &c. This noble family is descended from Henry Fitz-Roy, natural son to Henry I. Sir William Herbert, one of the ancestors of the present earl, was master of the horse to king Henry VIII. lord president of the marches of Wales, and knight of the garter. He was also, by that king, advanced to the dignity of baron Herbert of Caerdiff, October 10. 1551, and the very next day created earl of Pembroke.—Observe, that if a lion, or any other beast, is represented with its limbs and body separated, so that they remain upon the field at a small distance from their natural places, it is then termed *Dehaché* or *couped in all its parts*, of which very remarkable bearing, there is an instance in armory, which is, "Or, a Lion rampant Gules, deliaché, or couped in all its parts, within a double Tressure flowery and counter-flowery of the second;" borne by the name of *Maitland*.

IV. *Examples of other Quadrupeds, and their Parts, borne in Coats of Arms.*

1. "Sable, a Camel statant Argent;" borne by the name of *Camel*.

2. "Gules, an Elephant statant Argent, tusked Or;"

3. "Argent, a Boar statant Gules, armed Or;" borne by the name of *Trewarthen*.

4. "Sable, a Bull passant Or;" borne by the name of *Fitz-Geffrey*.

5. "Sable, three Nags Heads erased Argent;"

borne by the right hon. and the reverend Charles-Talbot Blayney, baron Blayney of Monaghan, in Ireland. This noble family is descended in a direct line from Cadwallader, a younger son of the prince of Wales; and the first peer was Sir Edward Bleyney, knight, who was created a baron by king James I. July 29, 1621.

6. "Argent, three Boars Heads erased and erect Sable, langued Gules;" for the name of *Booth*; and borne by Sir George Booth, bart. the present rector of Ashton-under-Line, in the county of Lancaster.—Various are the traditions touching the original stem of this ancient family, which, like most others of long standing, is so ingulfed in the obscurity of all-devouring time, that no other light than conjecture is now to be had thereof. The most probable is, that their beginning was at a certain place called the *Booths*, in the county of Lancaster, where being seated, they were thence surname, as the manner of those ages was to style men from the places where they lived.

7. "Azure, three Boars Heads erased Or;" quartered by his grace Alexander Gordon duke of Gordon, &c. Of this great and noble family, which took their surname from the barony of Gordon in the county of Berwick, there have been, besides those in North-Britain, several of great distinction in Muscovy; and in the time of king Malcolm IV. 1160, this family was very numerous, and flourished in the county aforesaid.

8. "Argent, three Bulls Heads erased, Sable, armed Or;" borne by the right hon. Clotworthy Skeffington, earl of Massarene, &c. of Ireland. This ancient and noble family derives its name from the village of Skeffington, in the county of Liecester, of which place Simon Skeffington was Lord in the reign of Edward I. and from him descended Sir William Skeffington, knt. made so by king Henry VII.

9. "Argent, two Foxes counter-saliant, the dexter surmounted of the sinister Gules;" for the name of *Kadrod-Hard*, an ancient British family, from which is descended Sir Watkyn-Williams Wynne, bart. who bears this quartered, second and third, in his coat-of-arms.

10. "Argent, three Bulls passant Sable, armed and unguled Or;" for Ashley, and quartered by the right hon. Anthony-Ashley Cooper, earl of Shaftesbury, &c. This noble earl is descended from Richard Cooper, who flourished in the reign of king Henry VIII. and purchased the manor of Paulet in the county of Somerset; of which the family are still proprietors. But his ancestor, who makes the greatest figure in history, is Sir Anthony-Ashley Cooper, who was created baron Ashley of Winbourn, April 20, 1661, and afterwards earl of Shaftesbury, April 23, 1672.

11. "Ermine, three Cats passant in Pale Argent;" for the name of *Adams*; and borne by Sir Thomas Adams, bart. a captain of his majesty's navy, who commanded several different ships in the last war with bravery and conduct.

12. "Gules, two Greyhounds rampant Or, respecting each other;" borne by the name of *Dogget*.

13. "Or, an Als's Head erased Sable;" borne by the name of *Hackwell*.

14. "Gules, three Lions gambes erased Argent;" for the name of *Newdigate*, and borne by Sir Roger New-

Fig. xvi:

Birds,
Fishes, &c.

Newdigate, bart. LL.D. and representative in the present and three last parliaments for the university of Oxford.

15. "Argent, three lions tails crested and erased Gules;" borne by the name of *Cork*.

16. "Azure, a Buck's Head cabossed Argent;" borne by the right hon. William Legge, earl of Dartmouth, &c. This noble earl is descended from Signior de Lega, an Italian nobleman, who flourished in Italy in the year 1297. What time the family came into England is uncertain; but it appears they were settled at Legge-place, near Tunbridge in Kent, for many generations; and Thomas, one of their ancestors, was twice lord-mayor of London, viz. in 1346 and 1353.

17. "Argent, two Squirrels sejant adorsed Gules," for the name of *Samwell*; and borne by Sir Thomas Samwell, bart. of Upton, in Northamptonshire, who is lineally descended from the ancient family of the Samwells in Cornwall.

18. "Gules, a Goat passant Argent;" borne by the name of *Baker*.

19. "Sable, a Stag standing at gaze Argent;" borne by the name of *Jones*, of Monmouthshire.

20. "Azure, three Holy-Lambs Or;" borne by the name of *Row*.

V. Examples of Birds, Fishes, Reptiles, &c.

Fig. xvii.

1. "Ermine, an Eagle displayed Sable;" borne by the name of *Beddingfield*.

2. "Gules, a Swan close proper;" borne by the name of *Leigham*.

3. "Argent, a Stork Sable, membred Gules;" borne by the name of *Starkey*.

4. "Gules, a Pelican in her nest with wings elevated, feeding her young ones Or; vulned proper;" borne by the name of *Carne*.

5. "Argent, three Peacocks in their pride proper;" borne by the name of *Pawne*.

6. "Sable, a Goshawk Argent, perching upon a stock in the Base point of the Escutcheon of the second, armed, jessed, and belled Or;" borne by the name of *Weele*.

7. "Or, a Raven proper;" borne by the name of *Corbet*.

8. "Argent, three Cocks Gules, crested and jow-lapped Sable, a Crescent surmounted of a Crescent for difference, borne by the right hon. Charles Cockayne, viscount Cullen, of Donegal in Ireland. Of this ancient family was Andreas Cockayne, of Ashburne in the county of Derby, who lived in the 28th year of Edward I. Charles, son to Sir William Cockayne, lord-mayor of London, 1619, was the first who was advanced to the Peerage, by Charles I. August 11, 1642.

9. "Sable a Dolphin naiant embowed Or;" borne by the name of *Symonds*. This animal is borne by the eldest son of the French king, and next heir to the crown, no other subject in that kingdom being permitted to bear it. In England, where that rule cannot take place, there are several families that have dolphins in their coats-of-arms.

10. "Argent, three Whales Heads erect and erased Sable;" borne by the name of *Whalley*.

11. "Gules, three Escallops Argent;" borne by the right hon. George Keppel, earl of Albemarle, &c. This present earl is descended from Arnold Joost,

van Keppel, a nobleman of the province of Gelderland in Holland, who came over into England with the prince of Orange in 1688, to whom he was then a page of honour, and afterwards master of the robes, and was by him created a peer of England, by the title of earl of Albemarle, in the duchy of Normandy in France, February 10. 1696.

12. "Azure, three Trouts fretted in Triangle Argent;" borne by the name of *Troutbeck*.

13. "Vert, a Grasshopper passant Or."

14. "Azure, three Bees two and one volant in pale Argent;" borne by the name of *Bye*.

15. "Vert, a Tortoise passant Argent;" borne by the name of *Gawdy*.

16. "Gules, an Adder nowed Or;" borne by the name of *Nathiley*. Adders, snakes, and serpents are said to represent many things, which being according to the fancy of the ancients, and a few modern authors who have adopted their opinions, it is needless to enlarge upon. It is certain they often occur in armory; but the noblest is that of the duchy of Milan, viz.

"Argent, a Serpent gliding in Pale Azure, crowned Or, vorant an Infant issuing Gules." The occasion of this bearing was thus: Otho, first viscount of Milan, going to the Holy-land with Godfrey of Bouillon, defeated and slew in a single combat the great giant Volux, a man of an extraordinary stature and strength, who had challenged the bravest of the Christian army. The viscount having killed him, took his armour, and among it his helmet, the crest whereof was a serpent swallowing an infant, worn by him, to strike a terror into those who should be so bold as to engage him.

17. "Ermine, a Rose Gules barbed and seeded proper;" borne by the right hon. Hugh Boscawen viscount Falmouth, &c. This noble lord is descended from Richard Boscawen, of the town of Boscawen, in the county of Cornwall, who flourished in the reign of king Edward VI. Hugh, the late viscount, and the first peer of this ancient family, was created baron of Boscawen-Rose, and viscount Falmouth, on the 13th of June, 1720, 6th of George I.

18. "Azure, three Laurel-leaves slipped Or;" borne by the name of *Leveson*, and quartered by the right hon. Granville-Leveson Gower, earl of Gower, &c.

19. "Azure, three Garbs Or;" borne by the name of *Cuming*. These are sheaves of wheat; but though they were barley, rye, or any other corn whatsoever, it is sufficient, in blazoning, to call them *Garbs*, telling the tincture they are of.

20. "Gules, three Cinquefoils Argent;" borne by the right hon. lord Ford Lambart, baron of Cavan, &c. in Ireland. Of this ancient family, which is of French extraction, was Sir Oliver, who, in the reign of queen Elizabeth, attending the earl of Essex to Spain, was there knighted by him; and afterwards returning with that earl into Ireland, was, for his singular service in the north against O'Neal earl of Tyrone, made camp-master general, and president of Connaught; and February 17. 1617, was created lord Lambart and baron of Cavan, by king James I.

It must be observed that trees and plants are sometimes said to be trunked, eradicated, fructuated, or raguled, according as they are represented in arms.

ART.

Reptiles,
Plants, &c.

ART. 2. Of ARTIFICIAL FIGURES borne in Coats-of-arms.

AFTER the various productions of nature, artificial figures, the objects of arts and mechanics, claim the next rank. They may be distributed into the following classes, viz.

Warlike instruments, as swords, arrows, battering-rams, gauntlets, helmets, spears, pole-axes, &c.

Ornaments used in royal and religious ceremonies, as crowns, coronets, mitres, wreaths, crofters, &c.

Architecture, as towers, castles, arches, columns, plummets, battlements, churches, portcullises, &c.

Navigation, as ships, anchors, rudders, pendants, sails, oars, masts, flags, galleys, lighters, &c.

All these bearings have different epithets, serving either to express their position, disposition, or make, viz. Swords are said to be erect, pommeled, hilted, &c. Arrows, armed, feathered, &c. Towers, covered, embattled, &c.; and so on of all others, as will appear by the following examples.

Fig. xviii.

1. "Sable, three swords, their points meeting in the Base Argent, pommeled and hilted Or, a Crescent in chief of the second for difference;" borne by his grace Charles Powlet, duke of Bolton, &c. This noble duke is descended from Hercules, lord of Tournon in Picardy, who came over to England with Jeffrey Plantagenet earl of Anjou, third son of king Henry II. and among other lands had the lordship of Paulet in Somersetshire conferred on him. William Powlet, the first peer of this illustrious and loyal family, was treasurer of the household to king Henry VIII. and by him created baron St. John of Basing, in the county of Southampton, March 9. 1538.

2. "Argent, three Battering-rams barways in Pale, headed azure and hooped Or, an Annulet for difference;" borne by the right hon. Willoughby Bertie, earl of Abington, &c. The first of the family of Bertie that bore the title of earl of Abington, was James Bertie lord Norris of Rycote, being created earl, November 30. 1682, by Charles II.

3. "Azure, three left-hand Gauntlets with their backs forward Or;" borne by the right hon. Thomas Fane, earl of Westmoreland, &c. This noble earl is descended from the Fanes, an ancient family which resided at Badſal in Kent, from which descended Francis Fane, son and heir of Sir Thomas Fane, knight, by Mary his wife, sole daughter and heiress to Henry Nevil lord Abergavenny, afterwards created baroness Despenſer. The said Francis was a knight of the Bath; and in the reign of king James I. was created baron Burgherſh, and earl of Westmoreland, December 29. 1624.

4. "Azure, three Arrows their points in base Or;" borne by the right hon. Thomas Archer, lord Archer, &c. This noble lord is descended from John de Archer, who came over from Normandy with William the Conqueror; and this family is one of the most ancient in Warwickshire, being settled at Umberſlade, in that county, ever since the reign of Henry II. His lordship is the first peer; and was created lord Archer and baron of Umberſlade by king George II. July 14. 1747.

5. "Gules, two helmets in chief proper, garnished Or, in a Base of a Garb of the third;" borne by

the right hon. George Cholmondeley, earl of Cholmondeley, &c. This noble earl is descended from the ancient family of Egerton in Cheshire, which flourished in the time of the conquest, from whom also the duke of Bridgewater is descended. The first English peer of this branch was Hugh, viscount Cholmondeley of Kells, in Ireland, who, joining with those who opposed the arbitrary measures of king James II. was on the accession of king William and queen Mary, created lord Cholmondeley of Namptwich, in the county of Chester.

6. "Argent, a Ship with its Sails furled up Sable;" quartered by the right hon. James Hamilton, earl of Abercorn, &c. The descent of this noble family is from that of the duke of Hamilton: for James, the fourth lord Hamilton and second earl of Arran, marrying lady Margaret Douglas, daughter of James the third earl of Morton, by her had four sons, James, John, Claud, and David; whereof Claud was progenitor of the lord we are now speaking of; and in consideration of his merit and loyalty to Mary queen of Scots, James VI. created him lord Paisley in 1591, as also earl of Abercorn, baron of Hamilton, &c. July 10. 1606.

7. "Or, an Anchor in pale Gules;" quartered by the most noble George Johnſton, marquis of Annandale, &c. The Johnſtons are an ancient and warlike family, and derive their surname from the barony of Johnſton in Annandale.

8. "Sable, three Spears Heads erect Argent, imbued Gules, on a chief Or, as many Pole-axes Azure;" borne by the right hon. William King, lord King, &c. Peter King, esq; the first lord of this ancient family, was chosen recorder of the city of London, July 27. 1708, and on the 12th of September following had the honour of knighthood conferred on him. He was constituted lord-chief-justice of the common-pleas in the first year of king George I. 1714; on the 5th of April following was sworn of his majesty's most hon. privy council; and on May 19. 1723, was created a peer of this kingdom by the title of lord King, baron of Ockham.

9. "Gules, three Clarions Or;" quartered by the right hon. Robert Carteret, earl of Granville, &c. This ancient and worthy family derives its pedigree from Offerey de Carteret, who attended William the Conqueror in his descent upon England, and contributed to the victory he obtained over king Harold, at Haſtings in Suffex, 1066, he had manors and lands in England conferred on him by that prince, as a reward for his eminent services. George Carteret, grandfather to the present earl, was, in consideration of his own merit and the services of his ancestors, created a peer of Great Britain, October 19th 1681.

10. "Argent, a Maunch Sable;" borne by the right hon. Francis Haſtings, earl of Huntingdon, &c. This noble earl is descended from Hugh de Haſtings, a younger son of the ancient and noble family of the Haſtings, earl of Pembroke, of which family was William de Haſtings, steward of the household to king Henry I.—William, the first lord Haſtings, was created a baron on July 6, 1461, by king Edward IV.

11. "Azure, a circular Wreath Argent and Sable, with four Hawk's Bells joined thereto in quadrature Or;"

Or;" borne by the right hon. Robert Jocelyn, viscount Jocelyn, &c. This noble family is of great antiquity; for, after the Romans had been masters of Britain 500 years, wearied with the wars, they took their final farewell of it, and carried away with them a great many of their brave old British soldiers, who had served them in their wars both at home and abroad, to whom they gave Amorica in France, for their former services, which country was from them afterwards called *Little Britain*. It is supposed that there were some of this family amongst them; and that they gave the name of *Jocelyn* to a town in this country, which still preserves that name: and it is thought probable that they returned with William the Conqueror; for we find, in 1066, mention made of Sir Gilbert Jocelyn. This present nobleman, the first lord of the family, was created baron Newport, of Newport in Ireland, on November 29, 1743, and viscount in November 1751.

12. "Gules, three Powers Argent;" quartered by the right hon. William Fowler, viscount Ashbrook, &c. William Fowler, esq; father to this present lord, was advanced to the peerage by king George II. and created baron of Castle-Durrow, in the county of Kilkenny, October 27, 1733, and his son was created viscount Ashbrook, of Ashbrook in Ireland, on Sept. 30, 1751, now extinct.

13. "Gules, two keys in Saltier Argent, in Chief a Royal Crown proper;" the arms of the archbishopric of York. This archbishopric comprehends only the bishoprics of Carlisle, Chester, and Durham. And the diocese contains about three parts in four of Yorkshire, all Nottinghamshire, and Hexham peculiar jurisdiction; divided into 903 parishes and chapels; and into four archdeaconries, of York, East-Riding, Cleveland, and Nottingham.

14. "Gules, two Swords in Saltier Argent, pomeled and hilted Or;" the arms of the bishopric of London. This diocese contains London, the counties of Middlesex and Essex, and part of Hertfordshire, in which there are about 665 churches and chapels. In it are also five archdeaconries, viz. those of London, Middlesex, Essex, Colchester, and St Albans.

15. "Sable, a Key in Bend, surmounted by a Crozier in Bend sinister, both Or;" the arms of the bishopric of St Asaph. This diocese contains no one whole county; but part of Denbigh, Flint, Montgomery, and Merioneth shires, and some towns in Shropshire, wherein are to the number of 121 parishes; but there are in all 131 churches and chapels, most of which are in the immediate patronage of the bishops. It hath but one archdeaconry, called of *St Asaph*, which is united to the bishopric, for the better support of it.

16. "Gules, two Keys adosce in Bend, the uppermost Argent, the other Or, a Sword interposed between them in Bend sinister of the second, pomeled and hilted of the third;" the arms of the bishopric of Winchester. This diocese contains the whole county of Southampton, with the Isle of Wight, and the isles of Jersey, Guernsey, Sark, and Alderney. It also contains one parish in Wiltshire, and all Surry, except eleven peculiars belonging to Canterbury. The number of churches and chapels in it are 415;

and it has two archdeacons, viz. of Winchester and Surry.

17. "Gules, three Mitres with their pendants Or;" the arms of the bishopric of Chester. The bishopric of Chester was anciently part of the diocese of Litchfield; one of whose bishops, removing his see hither in the year 1075, occasioned his successors being frequently called *bishops of Chester*. But it was not erected into a distinct bishopric till the year 1541, by king Henry VIII. It contains the entire counties of Chester and Lancashire; part of Westmoreland, Cumberland, and Yorkshire; two chapels in Denbighshire, and five churches and chapels in the county of Flint: in all, 506 churches and chapels. It is divided into two archdeaconries, viz. Chester and Richmond.

18. "Sable, three Ducal Coronets paleways Or;" the arms of the bishopric of Bristol. The bishopric of Bristol was founded by king Henry VIII. and taken out of the dioceses of Salisbury, Wells, and Worcester. It contains the city of Bristol, and the county of Dorset; in which there are 276 churches and chapels; and one archdeaconry, viz. that of Dorset.

19. "Gules, a Sword erect in pale Argent, pomeled and hilted Or, surmounted by two Keys in Saltier of the last;" the arms of the bishopric of Exeter. When Christianity was first planted in these parts, Cornwall and Devonshire were placed under the jurisdiction of the bishop of Dorchester; but, that episcopal seat being removed to Winchester in the year 660, these western parts were made subject to that new see. When the monastery of Sherborn was turned into a cathedral about the year 705, these counties were included in that diocese, which continued about 200 years; and then Plegmund, archbishop of Canterbury, at the command of king Edward the Elder, erected three new bishoprics; one at Wells, for Somersetshire; another at Bodmin, for Cornwall; and the last at Tawton-Bishops, for Devon, which was after removed to Crediton, and at length settled at Exeter. That diocese contains the entire counties of Devon and Cornwall; in which there are 725 churches and chapels, and four archdeaconries, viz. those of Exeter, Barnstable, Totness, and Cornwall.

20. "Gules, three Ducal Coronets, Or;" the arms of the bishopric of Ely. The bishopric of Ely was taken from that of Lincoln by king Henry I. anno 1109. It contains all Cambridgeshire, and the isle of Ely, excepting Ilesham, which belongs to the see of Rochester, and 15 other parishes that are in the diocese of Norwich: but it has one parish, viz. Emeth, in Norfolk. The whole number of the churches and chapels within the diocese of Ely are 164. It hath only one archdeacon, viz. that of Ely.

ART. III. Of CHIMERICAL FIGURES.

THE last and the oddest kind of bearings in coats-of-arms, is comprehended under the name of *chimerical figures*; that is to say, such as have no real existence, but are mere fabulous and fantastical inventions. These charges, griffons, martlets, and unicorns excepted, are so uncommon in British coats, that in order to make up the same number of examples hitherto contained in each collection, several foreign bearings are introduced here;

HERALDRY

Pl. 17.
Birds &c.

Pl. 18.
ARTIFICIAL FIGURES.

here; which, however, as they are conformable to the laws of heraldry, will also contribute both to entertain and instruct the reader. Those most in use are the following, viz.

Angels, Cherubim, Tritons, Centaurs, Martlets, Griffons, Unicorns, Dragons, Mermaids, Satyrs, Wiverns, Harpies, Cockatrices, Phoenixes.

These, like the foregoing charges, are subject to various positions and dispositions, which, from the principles already laid down, will be plainly understood. See the examples, fig. xix.

Nº 1. is "Gules, an Angel standing affrontée, with his hands conjoined and elevated upon his breast, habited in a long Robe close girt Argent, his Wings displayed Or;" borne by the name of *Brangor de Cerevisia*, a foreign prelate, who assisted at the council of Constance 1412. This example is quoted by Guillim, Sect. III. Chap. i.

2. "Sable, a Cheveron between three Cherubim Or;" borne by the name of *Chaloner*, of Yorkshire and Cheshire.

3. "Azure, a Fess indented between three Cherubim Argent." These arms were granted to John Ayde, esq; of Doddington in Kent, by Sir William Segar, garter.

4. "Gules, a Cherub having three pair of Wings, the uppermost and lowermost counter-crossed Saltierways, and the middlemost displayed Argent;" borne by the name of *Buocafoco*, a foreign prelate. This example is copied from Menestrier's *Méthode du Blason*, p. 120, Nº viii.

5. "Azure, a Griffon segreant Or, armed and langued Gules, between three Crescents Argent;" quartered by the right hon. John Bligh, lord Clifton, &c. The great grandfather of this noble lord, who lived in London, going over to Ireland in the time of Oliver Cromwell, as an agent to the adventurers there, acquired a good estate, and laid the foundation for the grandeur of this family.

6. "Gules, three Martlets Or;" borne by the name of *Macgill*. Guillim observes, that this bird, which is represented without feet, is given for a difference to younger brothers, to put them in mind, that, in order to raise themselves, they are to trust to their wings of virtue and merit, and not to their legs, having but little land to set their feet on.

7. "Azure, three Mulletts Argent within a double Tressure counter-flowery Or, in the centre a Martlet of the last;" borne by the right hon. Patrick Murray, lord Elibank. Sir Gideon Murray, knighted by king James VI. by whom he was made treasurer-depute, was third son of Sir Andrew Murray of Blackbarony. His son Patrick, in respect of his loyalty to Charles I. was, on May 16. 1628, made a baronet, and, in 1643, created lord Elibank.

8. "Sable, a Cockatrice displayed Argent, crested, membred, and jowllowed Gules."

9. "Argent, a Mermaid Gules, crined Or, holding in her right hand a Comb, and in her left a Mirror, both proper;" borne by the name of *Eliis*.

10. "Argent, a Wivern, his Wings elevated, and his Tail nowed below him Gules;" borne by the name of *Drakes*.

11. "Or, a Dragon passant Vert."

12. "Gules, a Centaur or Sagittary in full speed Vol. V.

regardant proper." This was the coat-of-arms of Stephen, surnamed of *Blois*, son to Adela daughter of William the Conqueror, and of Stephen earl of Blois; and on this descent grounding his pretension to the crown of England, he was proclaimed king in 1135, and reigned to the 25th of October 1154.

13. "Argent, an Unicorn sejant Sable, unguled and horned Or;" borne by the name of *Harling*.

14. "Argent, a Dragon's Head erased Vert, holding in his Mouth a sinister Hand couped at the Wrist Gules;" borne by the name of *Williams*.

15. "Gules, three Unicorns Heads couped Or;" borne by the name of *Paris*.

16. "Argent, a Wivern volant Bendways Sable;" borne by the name of *Raynon*.

17. "Azure, a Lion sejant guardant winged Or, his Head encircled with a Glory, holding in his forepaws an open Book, wherein is written, *Pax tibi, Marce, Evangelista meus*; over the dexter side of the Book a Sword erect, all proper." These are the arms of the republic of Venice.

18. "Azure, a Bull salient and winged Or;" borne by the name of *Cadenet*, a family of distinction in Provence.

19. "Argent, a Wyvern with a human Face affrontée hooded, and winged Vert;" borne by the name of *Bafraghi*, an ancient and noble family of Luques.

20. "Azure, a Harpy displayed, armed, crined, and crowned Or." These are the arms of the city of Noremberg in Germany.

To the forementioned figures may be added the montegre, an imaginary creature, supposed to have the body of a tyger with a Satyr's head and horns; also those which have a real existence, but are said to be endowed with extravagant and imaginary qualities, viz. the salamander, beaver, camelion, &c.

C H A P. IV.

Of the EXTERNAL ORNAMENTS of ESCUTCHEONS.

THE ornaments that accompany or surround escutcheons were introduced to denote the birth, dignity, or office, of the persons to whom the coat-of-arms appertaineth; which is practised both among the laity and clergy. Those most in use are of ten sorts, viz. Crowns, Coronets, Mitres, Helmets, Mantling, Chapeaux, Wreaths, Crests, Scrolls, Supporters.

SECT. I. Of Crowns.

THE first crowns were only diadems, bands, or fillets; afterwards they were composed of branches of divers trees, and then flowers were added to them.

Among the Greeks, the crowns given to those who carried the prize at the Isthmian games, were of pine; at the Olympick, of laurel; and at the Nemean, of smalage.

The Romans had various crowns to reward martial exploits and extraordinary services done to the republic: for which see the detached article Crown in this Dictionary, and Plate LXXXII.

Examples of some of these crowns are frequently
20 P met

Crowns.

met with in modern achievements, viz. 1. The *mural* crown in that of lord Montfort, which was conferred on Sir John Bromley, one of his lordship's ancestors, as an augmentation to his arms, for his great courage at the battle of Le Crobey. Part of the crest of lord Archer is also a mural crown. And there are no less than ten English baronets, whose arms are ornamented with the same crown. 2. The *naval* or *rostral* crown, is still used with coats-of-arms, as may be seen in those of Sir William Burnaby, bart. now admiral of the red squadron, and of John Clerke, esq; as part of their crests. 3. Of the *castræse* or vallary crown, we have instances in the coat-of-arms of Sir Reginald Graham, and of Isaac Akerman, esq. 4. The crest of Grice Blakeney, esq; is encompassed with a *cirole* crown. 5. The *radiated* crown, according to J. Yorke, was placed over the arms of the kings of England, till the time of Edward III. It is still used, as a crest, on the arms of some private families; those, for example, borne by the name of *Whitfield*, are ornamented with it. The celestial crown is formed like the radiated, with the addition of a star on each ray; and is only used upon tomb-stones, monuments, and the like.—Others of the ancient crowns are still borne, as crests, by the right hon. Jeffrey Amherst, baron Amherst of Holmesdale, in Kent; Sir James Gray, bart.; Thomas Sheriff, esq; and others.

But modern crowns are only used as an ornament, which emperors, kings, and independent princes set on their heads, in great solemnities, both to denote their sovereign authority, and to render themselves more awful to their subjects. These are the most in use in heraldry, and are as follows:

The imperial crown, (n^o 1.) is made of a circle of gold, adorned with precious stones and pearls, heightened with fleurs-de-lis, bordered and feeded with pearls, raised in the form of a cap voided at the top, like a crescent. From the middle of this cap rises an arched fillet enriched with pearls, and surmounted of a mound, whereon is a cross of pearls.

The crown of the kings of Great Britain (2.), is a circle of gold, bordered with ermine, enriched with pearls and precious stones, and heightened up with four crosses pattee and four large fleurs-de-lis alternately; from these rise four arched diadems adorned with pearls, which close under a mound, surmounted of a cross like those at bottom. Mr Sandford, in his *Genealogical History*, p. 381. remarks, that Edward IV. is the first king of England that in his seal, or on his coin, is crowned with an arched diadem.

The crown of the kings in France (3.) is a circle enamelled, adorned with precious stones, and heightened up with eight arched diadems, rising from as many fleurs-de-lis, that conjoin at the top under a double fleur-de-lis, all of gold.

The crowns of Spain, Portugal, and Poland, are all three of the same form, and are, amongst others, thus described by colonel Parsons, in his *Genealogical Tables of Europe*, viz. A ducal coronet, heightened up with eight arched diadems that support a mound, ensigned with a plain cross. Those of Denmark and Sweden are both of the same form; and consist of eight arched diadems, rising from a marquise's coronet, which that conjoin at the top under a mound ensigned with a

cross-bottony.

The crowns of most other kings are circles of gold, adorned with precious stones, and heightened up with large trefails, and closed by four, six, or eight diadems, supporting a mound, surmounted of a cross.

The Great Turk (4.), bears over his arms a turband, enriched with pearls and diamonds, under two coronets, the first of which is made of pyramidal points heightened up with large pearls, and the uppermost is surmounted with crescents.

The Pope, or bishop of Rome, appropriates to himself a Tiara (n^o 5.), or long cap of golden cloth, from which hang two pendants embroidered and fringed at the ends, *semée* of crosses of gold. This cap is inclosed by three marquise's coronets; and has on its top a mound of gold, whereon is a cross of the same, which cross is sometimes represented by engravers and painters pommetted, recroffed, flowery, or plain.—It is a difficult matter to ascertain the time when these haughty prelates assumed the three forementioned coronets. A patched up succession of the holy pontiffs, engraved and published a few years ago by order of Clement XIII. the late Pope, for the edification of his good subjects in Great Britain and Ireland, represents Marcellus, who was chosen bishop of Rome anno 310, and all his successors, adorned with such a cap: but it appears, from very good authority, that Boniface VIII. who was elected into the see of Rome anno 1295, first compassed his cap with a coronet; Benedict XII. in 1335, added a second to it; and John XXIII. in 1411, a third; with a view to indicate by them, that the Pope is the sovereign priest, the supreme judge, and the sole legislator amongst Christians.

SECT. II. Of Coronets.

THE Coronet of the prince of Wales, or eldest son of the king of Great Britain, (n^o 7.) was anciently a circle of gold set round with four crosses-pattee, and as many fleurs-de-lis alternately; but since the restoration, it has been closed with one arch only, adorned with pearls, and surmounted of a mound and cross, and bordered with ermine like the king's.

Besides the aforesaid coronet, his royal highness the prince of Wales has another distinguishing mark of honour, peculiar to himself, called by the vulgar the *prince's arms*, viz. A plume of three ostrich-feathers, with an ancient coronet of a prince of Wales. Under it, in a scroll, is this motto, *Ich Dien*, which in the German or old Saxon language signifies "I serve;" (see n^o 6.) This device was at first taken by Edward prince of Wales, commonly called the *black prince*, after the famous battle of Cressy, in 1346, where having with his own hand killed John king of Bohemia, he took from his head such a plume, and put it on his own.

The coronet of the present dukes of Gloucester and Cumberland, and of all the immediate sons and brothers of the kings of Great Britain, is a circle of gold, bordered with ermine, heightened up with four fleurs-de-lis, and as many crosses-pattee alternate, (see n^o 8).—The particular and distinguishing form of such coronets as are appropriated to princes of the blood-royal, is described and settled in a grant of Charles II. the 13th of his reign.

The coronet of the princesses of Great Britain is a circle

Coronets.

Mitres, &c.

circle of gold, bordered with ermine, and heightened up with crosses-patee, fleurs-de-lis and strawberry leaves alternate (n^o 9.); whereas a prince's coronet has only fleurs-de-lis and crosses.

A duke's coronet is a circle of gold, bordered with ermine, enriched with precious stones and pearls, and set round with eight large strawberry or parsley leaves; (n^o 10).

A marquis's coronet is a circle of gold, bordered with ermine, set round with four strawberry leaves, and as many pearls on pyramidal points of equal height, alternate; (n^o 11).

An earl's coronet is a circle of gold, bordered with ermine, heightened up with eight pyramidal points or rays, on the tops of which are as many large pearls, and are placed alternately with as many strawberry-leaves, but the pearls much higher than the leaves; (n^o 12).

A viscount's coronet differs from the preceding ones as being only a circle of gold bordered with ermine, with large pearls set close together on the rim, without any limited number, which is his prerogative above the baron, who is limited (see n^o 13).

A baron's coronet, (n^o 14), which was granted by king Charles II. is formed with six pearls set at equal distance on a gold circle, bordered with ermine, four of which only are seen on engravings, paintings, &c. to shew he is inferior to the viscount.

The eldest sons of peers, above the degree of a baron, bear their father's arms and supporters with a label, and use the coronet appertaining to their father's second title; and all the younger sons bear their arms with proper differences, but use no coronets.

As the crown of the king of Great Britain is not quite like that of other potentates, so do most of the coronets of foreign noblemen differ a little from those of the British nobility: as for example, the coronet of a French earl is a circle of gold with 18 pearls set on the brim of it; a French viscount's coronet is a circle of gold only enamelled, charged with four large pearls; and a French baron's coronet is a circle of gold enamelled and bound about with a double bracelet of pearls: and these coronets are only used on French noblemen's coats-of-arms, and not worn on their heads, as the British noblemen and their ladies do at the king's coronation.

SECT. III. Of Mitres.

THE archbishops and bishops of England and Ireland place a mitre over their coats-of-arms. It is a round cap pointed and cleft at the top, from which hang two pendants fringed at both ends; with this difference, that the bishop's mitre is only surmounted with a fillet of gold, set with precious stones, (see fig. 23. n^o 6.) whereas the archbishop's issues out of a ducal coronet, (see fig. 20. n^o 15).

This ornament, with other masquerade garments, is still worn by all the archbishops and bishops of the church of Rome, whenever they officiate with solemnity; but it is never used in England, otherwise than on coats of arms, as before mentioned.

SECT. IV. Of Helmets.

THE Helmet was formerly worn as a defensive wea-

pon, to cover the bearer's head; and is now placed over a coat-of-arms as its chief ornament, and the true mark of gentility. There are several sorts, distinguished, 1st, by the matter they are made of; 2^{dly}, by their form; and 3^{dly}, by their position.

1st, As to the matter they are, or rather were, made of: The helmets of sovereigns were of burnished gold damasked; those of princes and lords, of silver figured with gold; those of knights, of steel adorned with silver; and those of private gentlemen, of polished steel.

2^{dly}, As to their form: Those of the king and the royal family, and noblemen of Great Britain, are open-faced and grated, and the number of bars serves to distinguish the bearers quality; that is, the helmet appropriated to the dukes and marquises is different from the king's, by having a bar exactly in the middle, and two on each side, making but five bars in all, (see fig. xxi. n^o 1.) whereas the king's helmet has six bars, viz. three on each side, (ibid. n^o 7.) The other grated helmet with four bars is common to all degrees of peerage under a marquis. The open-faced helmet without bars denotes baronets and knights. The close helmet is for all esquires and gentlemen.

3^{dly}, Their position is also looked upon as a mark of distinction. The grated helmet in front belongs to sovereign princes. The grated helmet in profile is common to all degrees of peerage. The helmet standing direct without bars, and the beaver a little open, denotes baronets and knights. Lastly, the side-standing helmet, with the beaver close, is the way of wearing it amongst esquires and gentlemen. See n^o 1, 2, 3, 4, and 7, inserted in fig. xxi. *Ornaments*.

SECT. V. Of Mantlings.

MANTLINGS are pieces of cloth jagged or cut into flowers and leaves, which now-a-days serve as an ornament for escutcheons. They were the ancient covering of helmets, to preserve them, or the bearer, from the injuries of the weather, as also to prevent the ill consequences of their too much dazzling the eye in action. But Guillim very judiciously observes, that their shape must have undergone a great alteration since they have been out of use, and therefore might more properly be termed *flourishings* than *mantlings*. See the examples annexed to the helmets represented in fig. xxi.

The French heralds assure us, that these mantlings were originally no other than short coverings which commanders wore over their helmets, and that, going into battles with them, they often, on their coming away, brought them back in a ragged manner, occasioned by the many cuts they had received on their heads: and therefore the more hacked they were, the more honourable they were accounted; as our colours in time of war are the more esteemed, for having been shot through in many places.

Sometimes skins of beasts, as lions, bears, &c. were thus borne, to make the bearer look more terrible; and that gave occasion to the doubling of mantlings with furs.

SECT. VI. Of Chapeaux.

A CHAPEAU is an ancient hat, or rather cap, of dignity

Wreaths,
Crests, &c.

nity worn by dukes, generally scarlet-coloured velvet on the outside lined and turned up with fur; of late frequently to be met with above an helmet, instead of a wreath, under gentlemen and noblemen's crests. Heretofore they were seldom to be found, as of right appertaining to private families; but by the grants of Robert Cooke, Clarencieux, and other succeeding heralds, these, together with ducal coronets, are now frequently to be met with in families, who yet claim not above the degree of gentlemen. See the representation of the chapeau, n^o 5. fig. xxi.

SECT. VII. Of Wreaths.

THE Wreath is a kind of roll made of two skins of silk of different colours twisted together, which ancient knights wore as a head-dress when equipped for tournaments. The colours of the silk are always taken from the principal metal and colour contained in the coat-of-arms of the bearer. They are still accounted as one of the lesser ornaments of escutcheons, and are placed between the helmet and the crest; (see fig. xxi. n^o 6). In the time of Henry I. and long after, no man, who was under the degree of a knight, had his crest set on a wreath; but this like other prerogatives, has been infringed so far, that every body now-a-days wears a wreath.

SECT. VIII. Of Crests.

THE Crest is the highest part of the ornaments of a coat-of-arms. It is called *crest*, from the Latin word *crisla*, which signifies comb or tuft, such as many birds have upon their heads, as the peacock, pheasant, &c. in allusion to the place on which it is fixed.

Crests were formerly great marks of honour, because they were only worn by heroes of great valour, or by such as were advanced to some superior military command, in order that they might be the better distinguished in an engagement, and thereby rally their men if dispersed; but they are at present considered as a mere ornament. The crest is frequently a part either of the supporters, or of the charge borne in the escutcheon. Thus the crest of the royal achievement of Great Britain is a "Lion guardant crown'd," as may be seen in fig. xxi. n^o 7. The crest of France is "a double Flower-de-luce." Out of the many crests borrowed from supporters, are the following, viz. The duke of Montagu's, "A Griffon's head coup'd Or, back'd and wing'd Sable;" the marquis of Rockingham's, "A Griffon's head Argent, gorg'd with a ducal coronet;" the earl of Westmoreland's, "a Bull's head Argent, py'd Sable, armed Or;" and lord Archer's, which is, "Out of a mural crown Or, a Wyvern's head Argent." There are several instances of crests that are relative to alliances, employments, or names; and which on that account have been changed.

SECT. IX. Of the Scroll.

THE Scroll is the ornament placed above the crest, containing a motto, or short sentence, alluding thereto, or to the bearings; or to the bearer's name, as in the two following instances. The motto of the noble earl of Cholmondeley is, *Cassii tutissima virtus*; i. e. "Virtue is the safest helmet;" on account of helmets in the coat-of-arms. The motto of the right hon. lord Portefcuc is, *Fortē scutum salus ducum*; i. e. "A strong shield is the safety of the commanders;"

alluding to the name of that ancient family. Sometimes it has a reference to neither, but expresses something divine or heroic; as that of the earl of Scarborough, which is, *Murus arcus confectio sana*; i. e. "A good confectio is a wall of brass." Others are enigmatical; as that of the royal achievement, which is *Dieu et mon droit*, i. e. "God and my right;" introduced by Edward III. in 1340, when he assumed the arms and title of king of France, and began to prosecute his claim, which occasioned long and bloody wars, fatal, by turns, to both kingdoms: or that of the prince of Wales, which is *Ich Dien*, "I serve," the origin of which has been already mentioned. Mottos, though hereditary in the families that first took them up, have been changed on some particular occasions, and others appropriated in their stead, instances of which are sometimes met with in the history of families.

SECT. X. Of Supporters.

SUPPORTERS are figures standing on the scroll, and placed at the side of the escutcheon; they are so called, because they seem to support or hold up the shield. The rise of supporters is, by F. Menellier, traced up to ancient tournaments, wherein the knights caused their shields to be carried by servants or pages under the disguise of lions, bears, griffons, blackamoors, &c. who also held and guarded the escutcheons, which the knights were obliged to expose to public view for some time before the lists were opened. Sir George Mackenzie, who dissents from this opinion, says, in his *Treatise on the Science of heraldry*, chap. xxxi. p. 93. "That the first origin and use of them was from the custom which ever was, and is, of leading such as are invested with any great honour to the prince who confers it: thus, when any man is created a duke, marquis, or knight of the garter, or any other order, he is supported by, and led to the prince betwixt two of the quality, and so receives from him the symbols of that honour; and in remembrance of that solemnity, his arms are thereafter supported by any two creatures he chooseth." Supporters have formerly been taken from such animals or birds as are borne in the shields, and sometimes they have been chosen as bearing some allusion to the names of those whose arms they are made to support. The supporters of the arms of Great Britain, since king James the first's accession to the throne, are a *Lion rampant guardant crowned Or*, on the dexter side, and an *Unicorn Argent, crowned, armed, unguled, maned and gorged with an antique Crown, to which a chain is affixed, all Or*, on the sinister; as it appears by fig. xxi. n^o 7.

This last figure represents the coat-of-arms of the king of Great Britain, or the royal achievement, as it has been marshalled since the accession of king George I. in 1714, and is blazoned as follows, viz.

ARMS. *Quarterly, in the first grand quarter Gules, three Lions rampant guardant in pale Or*, the imperial ensigns of England; *in pale with Or, a Lion rampant, within a double tressure flory and counter-flory Gules*, the royal arms of Scotland. *The second is Azure, three Fleurs-de-lis Or*, the arms of France. *The third is Azure, a Harp Or, stringed Argent*, the ensign of Ireland. *The fourth grand quarter*

Of
Supporters.

quarter is Gules, two Lions passant guardant in pale Or, for Brunswick; impaled with Or *sensé* of Hearts proper, a Lion rampant Azure, for Lunenburg; with grafted in base Gules, a Horse current Argent, for ancient Saxony; and in a shield surtout Gules, the Crown of Charlemagne Or, as arch-treasurer of the empire; the whole within a Garter, inscribed with this motto, *HONI SOIT QUI MAL Y PENSE*, as sovereign of that noble order, given by the founder king Edward III.

CREST. On a Helmet full-faced, grated and surmounted of a Crown, a Lion guardant crowned Or; the mantlings of the last, and lining Ermine.

SUPPORTERS. On the Dexter-side, a Lion rampant guardant Or, crowned as the Crest. On the Sinister-side an Unicorn Argent, crowned, armed, maned, and unguled Or, gorged with an antique Crown; a Chain affixed thereto, reflecting over the back, and passing over the hind legs of the last, both standing on a Scroll inscribed with this motto, *DIEU ET MON DROIT*, from which issue the two Royal Badges of his Majesty's chief Dominions, viz. on the Dexter-side a Rose party per Pale Argent and Gules, stalked and leaved proper, for England; and on the Sinister-side a Thistle proper, for Scotland; being so adorned by king James I. upon his succeeding to the crown of England. As king of Scotland, he bore two unicorns, as above, for his supporters; but upon the union of that kingdom with England, 1603, he introduced one of the above supporters on the sinister-side of the royal achievement, and which continues to this day.

It is to be observed, that bearing coats-of-arms supported, is, according to the heraldical rules of England, the prerogative, 1st, Of those called *nobles majores*, viz. dukes, marquises, earls, viscounts, and barons; 2^d, Of all knights of the garter, though they should be under the degree of barons; 3^d, Of knights of the Bath, who both receive on their creation a grant of supporters. And, lastly, of such knights as the king chooses to bestow this honour upon; as in the instance of Sir Andrew Fountain, who was knighted by Philip earl of Pembroke, when lord-lieutenant of Ireland, Fountain being then his secretary; and on his return to England, king William granted him supporters to his arms, viz. two Griffons Gules and Or. In Scotland, all the chiefs of clans, or names have the privilege of claiming supporters; also the baronets. But by act of parliament, 10th September, 1672, none are allowed to use either arms or supporters, under a penalty and confiscation of all moveables whereon arms are put, without the lord Lyon's authority.

C H A P. V.

Of the Rules or Laws of HERALDRY.

THE several escutcheons, tinctures, charges, and ornaments of coats-of-arms, and their various properties, being now explained; it may not be improper to subjoin such rules for blazoning the same, as the ancient usage and laws of heraldry have established amongst us.

I. The first and most general rule is, to express one's felt in proper terms, so as not to omit any thing that ought to be specified, and at the same time to be clear and concise without tautology; as in Ex. xiv.

p. 3588. and also in Ex. ix. p. 3595. wherein these expressions, *of the Field, or of the Field*, prevent the repetition of the forementioned tincture.

II. One must begin with the tincture of the field, and then proceed to the principal charges which possess the most honourable place in the shield, such as Fels, Cheveron, &c. always naming that charge first which lies next and immediately upon the field; as in Ex. xv. p. 3593.

III. After naming the tincture of the field, the honourable ordinaries, or other principal figures, you must specify their attributes, and afterwards their metal or colour, as in Ex. xvi. p. 3601.

IV. When an honourable ordinary, or some one figure, is placed upon another, whether it be a Fels, Cheveron, Crofs, &c. it is always to be named after the ordinary or figure over which it is placed, with one of these expressions, *surtout, or over-all*, as in Ex. xx. p. 3592.

V. In the blazoning of such ordinaries as are plain, the bare mention of them is sufficient; but if an ordinary should be made of any of the crooked lines mentioned above, its form must be specified; that is, whether it be Engrailed, Wavy, &c. as in Ex. i. ii. iii. &c. p. 3588.

VI. When a principal figure possesses the centre of the field, its position is not to be expressed; or (which amounts to the same thing) when a bearing is named, without specifying the point where it is placed, then it is understood to possess the middle of the shield; as in Ex. xv. p. 3602.

VII. The number of the points of mullets or stars must be specified when more than five; and also if a mullet or any other charge be pierced, it must be mentioned as such, to distinguish it from what is plain; as in Ex. xiii. and xiv. p. 3599.

VIII. When a ray of the sun, or other single figure, is borne in any other part of the escutcheon than the centre, the point it issues from must be named; as in Ex. iii. p. 3599. col. 1.

IX. The natural colour of trees, plants, fruits, birds, &c. is no otherwise to be expressed in blazoning but by the word *proper*, as in Exam. ii. vii. p. 3602.: but if discoloured, that is, if they differ from their natural colour, it must be particularized; as in Ex. i. ii. &c. p. 3600.

X. When three figures are in a field, and their position is not mentioned in the blazoning, they are always understood to be placed two above, and one below; as fig. xxii. n^o 3.

XI. When there are many figures of the same species borne in a coat-of-arms, their number must be observed as they stand, and distinctly expressed; as in Ex. i. p. 3603.

But for the better understanding of this last rule, we have inserted examples of the different dispositions of figures, wherein they are properly represented; viz.

Two may be ranged in Pale, in Fels, &c. See fig. xxii. n^o 1 and 2.

Three, may be 2 and 1, as also in bend, &c. See n^o 3 and 4.

Four, are placed 2 and 2, or cantoned, as in n^o 5.

Five, 1, 3, 1, in Crofs; or 2, 1, 2, in Saltier. See n^o 6 and 7.

Six,

Marshalling

Six, 3, 2, 1, in Pile; or 2, 2, 2, Paleways. See n^o 8 and 9.

Eight, in Orle, or on a Bordure. See n^o 10.

Nines, 3, 3, 3, Barways; or 3, 3, 2, 1, in Pile. See n^o 11 and 12.

Tens, 4, 3, 2, 1, in Pile; or else 4, 2, 4, Barways. See n^o 13 and 14.

Twelves, are placed 4, 4, 4, Barways. See n^o 15.

There are other positions called *irregular*; as for example, when three figures which are naturally placed 2 and 1, are disposed 1 and 2, &c. It must also be observed, that when the field is strewn with the same figures, this is expressed by the word *semée*: but, according to a French armorist's opinion, if the figures strewn on the field are whole ones, it must be denoted by the words *sans nombre*; whereas, if part of them is cut off at the extremities of the escutcheon, the word *semée* or *semi* is then to be used.

C H A P. VI.

Of MARSHALLING Coats-of-arms.

By *marshalling* coats-of-arms, is to be understood the art of disposing divers of them in one escutcheon, and of distributing their contingent ornaments in proper places.

Various causes may occasion arms to be thus conjoined, which J. Guillim comprises under two heads, viz. *manifest* and *obscure*.

What this learned and judicious herald means by *manifest causes* in the marshalling of coats-of-arms, are such as betoken marriages, or a sovereign's gift, granted either through the special favour of the prince, or for some eminent services. Concerning marriages, it is to be observed,

I. When the coats-of-arms of a married couple, descended of distinct families, are to be put together in one escutcheon, the field of their respective arms is conjoined Paleways, and blazoned *parted per Pale*, *Baron and Femme, two coats; first, &c.* In which case the baron's arms are always to be placed on the dexter-side, and the femme's arms on the sinister-side, as in n^o 1 and 2, and fig. xxiii. *Of arms marshallled* which are,

1. The coat-of-arms of the rev. Edward Barnard, D. D. chaplain in ordinary to his majesty, provost of Eton-college, canon of Windsor, &c. impaled with that of S. Haggatt, his late spouse.

2. The coat-of-arms of the rev. Thomas Dampier, D. D. chaplain in ordinary to his majesty, prebendary of Durham, canon of Windsor, &c. impaled with that of F. Walker, his spouse.

If a widower marry again, his late and present wife's arms are, according to G. Leigh, "to be both placed on the sinister-side, in the escutcheon with his own, and parted per Pale. The first wife's coat shall stand on the Chief, and the second on the Base; or he may set them both in Pale with his own, the first wife's coat next to himself, and his second outermost. If he should marry a third wife, then the two first matches shall stand on the Chief, and the third shall have the whole Base. And if he take a fourth wife, the must participate one-half of the Base with the third wife, and so will they they seem to be so many coats quartered." But it must be observed, that these forms of impaling are meant

of hereditary coats, whereby the husband stands in expectation of having the hereditary possessions of his wife united to his patrimony.

II. In the arms of femmes joined to the paternal coat of the baron, the proper differences by which they were borne by the fathers of such women must be inserted.

III. If a coat-of-arms that has a Bordure be impaled with another, as by marriage, then the Bordure must be wholly omitted in the side of the arms next the centre.

IV. The person that marries an heiress, instead of impaling his arms with those of his wife, is to bear them in an escutcheon placed in the centre of his shield, after the same manner as the baronet's badge is marshallled in n^o 3. and which, on account of its shewing forth his pretension to her estate, is called an *escutcheon of pretence*, and is blazoned *sur-tout*, i. e. *over-all*, as the inescutcheon borne in the fourth quarter of the royal achievement. But the children are to bear the hereditary coat-of-arms of their father and mother *quarterly*, which denotes a fixed inheritance, and so transmit them to posterity. The first and fourth quarters generally contain the father's arms, and the second and third the mother's; except the heirs should derive not only their estate, but also their title and dignity, from their mother.

V. If a maiden or dowager lady of quality marry a commoner, or a nobleman inferior to her rank, their coats-of-arms may be set aside of one another in two separate escutcheons, upon one mantle or drapery, and the lady's arms ornamented according to her title; see n^o 4 and 5, which represent the coats-of-arms of Gen. C. Montagu, and lady Elizabeth Villiers viscountess Grandison.

VI. Archbishops and bishops impale their arms differently from the fore-mentioned coats, in giving the place of honour, that is, the dexter-side, to the arms of their dignity, as it is expressed in n^o 6, which represents the coat-of-arms of Dr Philip Yonge, lord bishop of Norwich. It may be observed of the above prelates, that they thus bear their arms parted per Pale, to denote their being joined to their cathedral church in a sort of spiritual marriage.

With respect to such armorial ensigns as the sovereign thinks fit to augment a coat-of-arms with, they may be marshallled various ways, as may be seen by the arms of his grace the duke of Rutland, inserted in fig. xiii. n^o 19. and the example contained in fig. xii. n^o 11.

To those augmentations may be added, 1st, The baronet's mark of distinction, or the arms of the province of Ulster in Ireland, granted and made hereditary in the male line by king James I. who erected this dignity on the 22d of May, 1611, in the 9th year of his reign, in order to propagate a plantation in the fore-mentioned province. This mark is *Argent, a sinister Hand couped at the Wrist, and erected Gules*; which may be borne either in a canton, or in an escutcheon, as will best suit the figures of the arms. See fig. xxi. n^o 3, which represents the coat-of-arms of Sir William Lorrayne, of Kirk-harle, Northumberland, and are thus blazoned: *Quarterly, Sable and Argent, a plain Cross counter-quartered of the Field.*

(A. Hall & Co.)

The Crest, — *A Laurel-tree couped, two branches sprouting out proper, and fixed to the lower part thereof with a Belt Gules, edged and buckled Or.* This, according to tradition in the family, was granted for some worthy action in the field.

2dly. The ancient and respectable badge of the most noble order of the Garter, instituted by king Edward III. 1349, in the 27th year of his reign; and which, ever since its institution, has been looked upon as a great honour bestowed on the noblest persons of this nation and other countries. This honourable augmentation is made to furround, as with a garter, the arms of such knights, and is inscribed with this motto, *Honi soit qui mal y pense*: See n° 7. which represents the coat-of-arms of his grace the duke of Montagu, earl of Cardigan, baron Brudenel of Stanton-Wivil, constable and lieutenant of Windforcastle, knight of the most noble order of the Garter, and baronet, president of St Luke's Hospital, and F. R. S.

This nobleman, whose arms were *Argent, a Chevron Gules between three Morions proper*, has, since the decease of John duke of Montagu, taken the name and arms of *Montagu*, on account of his being married to lady Mary Montagu, youngest daughter and one of the co-heiresses of his grace.

So far the causes for marshalling divers arms in one field, &c. are manifest. As to such as are called *obscure*, that is, when coats-of-arms are marshalled in such a manner, that no probable reason can be given why they are so conjoined, they must be left to heralds to explain, as being the properest persons to unfold these and other mysteries of this science.

C H A P. VII.

Of FUNERAL ESCUTCHEONS.

AFTER having treated of the essential parts of the coats-of-arms, of the various charges and ornaments usually borne therewith, of their attributes and dispositions, and of the rules for blazoning and marshalling them, we shall next describe the several funeral escutcheons, usually called *hatchments*; whereby may be known, after any person's decease, what rank either he or she held when living; and if it be a gentleman's hatchment, whether he was a bachelor, married man, or widower, with the like distinctions for gentlemen.

The hatchment, N° 1. represents such as are affixed to the fronts of houses, when any of the nobility and gentry dies; the arms therein being those of a private gentleman and his wife parted per pale; the dexter-side, which is *Gules*, three Bars *Or*, for the husband; having the ground without the escutcheon black, denotes the man to be dead; and the ground on the sinister-side being white, signifies that the wife is living, which is also demonstrated by the small hatchment, n° 2. which is here depicted without mantling, helmet, and crest, for perspicuity's sake only.

When a married gentlewoman dies first, the hatchment is distinguished by a contrary colour from the former; that is, the arms on the sinister-side have the ground without the escutcheon black; whereas those

on the dexter-side, for her surviving husband, are upon a white ground: the hatchment of a gentlewoman is, moreover, differentiated by a cherub over the arms instead of a crest. See n° 3.

When a bachelor dies, his arms may be depicted single or quartered, with a crest over them, but never impaled as the two first are, and all the ground without the escutcheon is also black. See n° 4.

When a maid dies, her arms, which are placed in a lozenge, may be single or quartered, as those of a bachelor; but, instead of a crest, have a cherub over them, and all the ground without the escutcheon is also black. See n° 5.

When a widower dies, his arms are represented impaled with those of his deceased wife, having a helmet, mantling, and crest over them, and all the ground without the escutcheon black. See n° 6.

When a widow dies, her arms are also represented impaled with those of her deceased husband, but inclosed in a lozenge, and instead of a crest, a cherub is placed over them; all the ground without the escutcheon is also black. See n° 7.

If a widower or bachelor should happen to be the last of his family, the hatchment is depicted as in n° 6.; and that of a maid or widow, whose family is extinct by her death, is depicted as in n° 7. with this difference only, that a death-head is generally annexed to each hatchment, to denote, that death has conquered all.

By the forementioned rules, which are sometimes neglected through the ignorance of illiterate people, may be known, upon the sight of any hatchment, what branch of the family is dead; and by the helmet or coronet, what title and degree the deceased person was of.

The same rules are observed with respect to the escutcheons placed on the hearse and horses used in pompous funerals, except that they are not surmounted with any crest, as in the foregoing examples of hatchments, but are always plain. It is necessary, however, to ensign those of peers with coronets, and that of a maiden lady with a knot of ribbands.

In *Scotland*, a funeral escutcheon not only shews forth the arms and condition of the defunct, but is also a proof of the gentility of his descent; and such persons for whom this species of escutcheon can be made out, are legally entitled to the character of gentlemen of blood, which is the highest species of gentility. The English hatchment above described exhibits no more than a right to a coat-of-arms which may be acquired by purchase, and is only the first step towards establishing gentility in a family.

The funeral escutcheon as exhibited in *Scotland*, *France*, and *Germany*, is in form of a lozenge, above six feet square, of black cloth; in the centre of which is painted, in proper colours, the complete achievement of the defunct, with all its exterior ornaments and additional marks or badges of honour; and round the sides are placed the sixteen arms of the families from which he derives his descent, as far back as the grandfather's grandfather, as the proofs of his gentility: they exhibit the armorial bearings of his father and mother, his two grandmothers, his four great-grandmothers, and his eight great-grandmothers; if all these families have acquired a legal right

to bear arms, then the gentility of the person whose proof it is must be accounted complete, but not otherwise. On the four corners are placed mort-heads, and the initials of his name and titles or designation; and the black interstices are fencible or powdered with tears, as in the figure, n^o 8. which is the escutcheon of the right hon. James 5th earl of Balcarras, chief of the ancient surname of *Lindsay*.

On the morning of the interment, one of these is placed on the front of the house where the deceased lies; and another on the church in which he is to be buried, which after the burial is fixed above the grave. The pall, too, is generally adorned with these proofs of gentility, and the horses of the hearse with the defunct's arms.

C H A P. VIII.

OF PRECEDENCY.

THE order of precedency, which is observed in general, is thus, That persons of every degree of honour or dignity take place according to the seniority of their creation, and not of years, unless they are descended from the blood-royal; in which case, they have place of all others of the same degree.

The younger sons of the preceding rank take place from the eldest son of the next mediate, viz. the younger sons of dukes from the eldest sons of earls; the younger sons of earls from the eldest sons of barons. All the chain of precedency is founded upon this gradation, and thus settled by act of parliament, 31 Henry VIII. cap. 10. anno 1539.

But there have been since some alterations made in this act by several decrees and establishments in the succeeding reigns, whereby all the sons of viscounts and barons are allowed to precede baronets. And the eldest sons and daughters of baronets have place given them before the eldest sons and daughters of any knights, of what degree or order soever, though superior to that of a baronet; these being but temporary dignities, whereas that of baronets is hereditary: and the younger sons of baronets are to have place next after the eldest sons of knights.

Observe also, that as there are some great officers of state, who take place, although they are not noblemen, above the nobility of higher degree; so there are some persons, who, for their dignities in the church, degrees in the universities, and inns of court, officers in the state, or army, although they are neither knights, nor gentlemen born, yet take place amongst them. Thus, all colonels and field officers who are honourable, as also the master of the ordnance, quarter-master general, doctors of divinity, law, physic, and music; deans, chancellors, prebendaries, heads of colleges in universities, and sergeants at law, are, by courtesy, allowed place before ordinary esquires. And all bachelors of divinity, law, physic, and music; masters of arts, barristers in the inns of courts; lieutenant-colonels, majors, captains, and other commissioned military officers; and divers patent officers in the king's household, may equal, if not precede, any gentleman that has none of these qualifications.

In towns corporate, the inhabitants of cities are preferred to those of boroughs; and those who have borne magistracy, to all others. And herein a younger

alderman takes not precedency from his senior by being knighted, or as being the elder knight, as was the case of Alderman Craven, who, though no knight, had place as senior alderman, before all the rest who were knights, at the coronation of king James. This is to be understood as to public meetings relating to the town; for it is doubted whether it will hold good in any neutral place. It has been also determined in the earl marshal's court of honour, that all who have been lord mayors of London, shall every where take place of all knights-bachelors, because they have been the king's lieutenants.

It is also quoted by Sir George Mackenzie, in his observations on precedency, that in the case of Sir John Crook, serjeant at law, it was adjudged by the judges in court, that such serjeants as were his seniors, though not knighted, should have preference notwithstanding his knighthood.—The precedency among men is as follows:

The KING, and Prince of WALES.

PRINCES OF THE BLOOD, viz. Sons, Grandsons, Brothers, Uncles, &c. of the king.

The following precede all Dukes by authority of the aforementioned Act of Parliament.

Archbishop of Canterbury.

Lord Chancellor, or Lord-Keeper.

Archbishop of York.

Lord Treasurer of England.

Lord President of the Privy-council.

Lord Privy-Seal.

These also precede all of their own Degree.

Lord Great-Chamberlain.

Lord High-Constable.

Lord Earl-Marshal.

Lord High-Admiral.

Lord Steward of the Household.

Lord Chamberlain of the Household.

Secretaries of State.

Then, according to their respective Creations,

Dukes.

Marquises.

Dukes eldest sons.

Earls.

Marquises eldest sons.

Dukes younger sons.

Viscounts.

Earls eldest sons.

Marquises younger sons.

Bishops.

Barons.

Speaker of the House of Commons.

Viscounts eldest sons.

Earls younger sons.

Barons eldest sons.

Knights of the Garter.

Privy-counsellors, who are styled Right Honourable.

Chancellor and Under-treasurer of the Exchequer.

Chancellor of the dutchy of Lancaster.

Lord Chief-justice of the King's bench.

Master of the Rolls.

Lord Chief-justice of the Common-pleas.

Lord Chief-baron of the Exchequer.

Justices and Barons in the Courts of Law.

Viscounts younger sons.

Barons younger sons.

FUNERAL ATTACHEMENTS. 2

A Bell Sculp.

Baronets of England.
Baronets of Scotland.
Baronets of Ireland.
Knights of the Bath.
Field and Flag-officers.
Knights-bachelors.
Masters in Chancery.
Doctors, Deans, &c.
Serjeants at law.

Baronets eldest sons.
Knights of the Garter's eldest sons.
Knights of the Bath's eldest sons.
Knights-Bachelors' eldest sons.
Baronets younger sons.
Esquires by creation.
Esquires by office.
Gentlemen.
Citizens.
Burgesses, &c.

The esquires attending on knights of the Bath take place also from those gentlemen who are reputed esquires only during the time they are in office, and no longer; such as high sheriffs, justices of the peace, &c.

The precedence among men being known, that which is due to women, according to their several degrees, will be easily demonstrated: but it is to be observed, that women, before marriage, have precedence by their father; with this difference between them and the male children, that the same precedence is due to all the daughters that belongs to the eldest; which is not so among the sons; and the reason of this disparity seems to be, that daughters all succeed equally, whereas the eldest son excludes all the rest.

By marriage, a woman participates of her husband's dignities; but none of the wife's dignities can come by marriage to her husband, but are to descend to her next heir.

If a woman have precedence by creation, or birth, she retains the same though she marry a commoner: but if a woman nobly born marry any peer, she shall take place according to the degree of her husband only, though she be a duke's daughter.

A woman, privileged by marriage with one of noble degree, shall retain the privilege due to her by her husband, though he should be degraded by forfeiture, &c.; for crimes are personal.—Sir G. Mackenzie, *Of Precedency*, chap. ix.

The wife of the eldest son of any degree takes place of the daughters of the same degree, who always have place immediately after the wives of such eldest sons, and both of them take place of the younger sons of the preceding degree. Thus, the lady of the eldest son of an earl takes place of an earl's daughter, and both of them precede the wife of the younger son of a marquis; also the wife of any degree precedes the wife of the eldest son of the preceding degree. Thus, the wife

of a marquis precedes the wife of the eldest son of a duke.

This holds not only in comparing degrees, but also families of the same degree amongst themselves; for instance, the daughter of a senior earl yields place to the wife of a junior earl's eldest son: Though, if such daughter be an heiress, she will then be allowed place before the wives of the eldest sons of all younger earls. (W. Segar, *Of Honourable Places*, chap. xxii.) The precedence among women is as follows:

The QUEEN, and Princesses of WALES.
PRINCESSES, and DUCHESSES of the Blood.
DUCHESSES.

Wives of the eldest } of Dukes of the Blood.
sons; Daughters, }

MARCHIONESSES.

Wives of the eldest } of Dukes.
sons; Daughters, }

COUNTESSES.

Wives of the eldest } of Marquises.
sons; Daughters, }

Wives of the younger sons of Dukes.

VISCOUNTESSSES.

Wives of the eldest } of Earls.
sons; Daughters, }

Wives of the younger sons of Marquises.

BARONESSSES.

Wives of the eldest } of Viscounts.
sons; Daughters, }

Wives of the younger sons of Earls.

Wives of the eldest } of Barons.
sons; Daughters, }

Wives of the younger sons of Viscounts.

Wives of the younger sons of Barons.

WIVES OF BARONETS.

WIVES OF KNIGHTS of the Garter.

WIVES OF KNIGHTS of the Bath.

WIVES OF KNIGHTS Bachelors.

Wives of the eldest } of Baronets.
sons; Daughters, }

Wives of the eldest } of Knights of the Garter.
sons; Daughters, }

Wives of the eldest } of Knights of the Bath.
sons; Daughters, }

Wives of the eldest } of Knights-Bachelors.
sons; Daughters, }

Wives of the younger sons of Baronets.

WIVES OF ESQUIRES, by creation.

WIVES OF ESQUIRES, by office.

WIVES OF GENTLEMEN.

Daughters of Esquires.

Daughters of Gentlemen.

Wives of Citizens.

Wives of Burgesses, &c.

The Wives of Privy-counsellors, Judges, &c. are to take the same place as their husbands do. See the former list.

H E R

HERB, in botany; a name by which Linnæus denominates that portion of every vegetable which arises from the root, and is terminated by the fructification. It comprehends, 1. The trunk, stalk, or stem. 2. The leaves. 3. Those minute external parts called by

Vol. V.

H E R

the same author the *fulcrum*, or supports of plants. 4. The buds, or, as he also terms them, the *winter-quarters* of the future vegetable.

HERBACEOUS Plants, are those which have succulent stems or stalks that die down to the ground every year.

20 Q

OF

Herbage

Herbert

Of herbaceous plants, those are annual which perish stem and root and all every year; biennial, which subsist by the roots two years; perennal which are perpetuated by their roots for a series of years, a new stem being produced every spring.

HERBAGE, in law, signifies the pasture provided by nature for the food of cattle; also the liberty to feed cattle in the forest, or in another person's ground.

HERBAL, signifies a book that treats of the classes, genera, species, and virtues of plants.

HERBAL is sometimes also used for what is more usually called *hortus siccus*. See *HORTUS*.

HERBELOT (Bartholomew d'), a French writer, eminent for his oriental learning, was born at Paris in 1625. He travelled several times into Italy, where he obtained the esteem of some of the most learned men of the age. Ferdinand II. grand duke of Tuscany, gave him many marks of his favour: a library being exposed to sale at Florence, the duke desired him to examine the manuscripts in the oriental languages, to select the best of them, and to mark the price; which being done, that generous prince purchased them, and made him a present of them. M. Colbert being at length informed of Herbelot's merit, recalled him to Paris, and obtained a pension for him of one thousand five hundred livres: he afterwards became secretary and interpreter of the oriental languages, and royal professor of the Syriac tongue. He died at Paris in 1695. His principal work is intitled *Bibliothèque Orientale*, which he first wrote in Arabic, and afterwards translated into French. It is greatly esteemed. M. Herbelot's modesty was equal to his erudition; and his uncommon abilities were accompanied with the utmost probity, piety, and charity, which he practised through the whole course of his life.

HERBERT (Mary), countess of Pembroke, was sister of the famous Sir Philip Sidney, and wife of Henry earl of Pembroke. She was not only a lover of the muses, but a great encourager of polite literature; a character not very common among ladies. Her brother dedicated his incomparable romance *Arcadia* to her, from which circumstance it hath been called *The countess of Pembroke's Arcadia*. She translated a dramatic piece from the French, intitled *Antoni*, a tragedy; though it is said she was assisted by her lord's chaplain, Dr Babington, afterwards bishop of Exeter. She also turned the psalms of David into English metre; but it is doubtful whether these works were ever printed. She died in 1621; and an exalted character of her is to be found in Francis Osborne's memoirs of king James I.

HERBERT (Edward), lord Herbert of Cherbury in Shropshire, an eminent English writer, was born in 1581, and educated at Oxford; after which he travelled, and at his return was made knight of the Bath. James I. sent him ambassador to Lewis XIII. in behalf of the Protestants who were besieged in several cities of France; and continued in this station till he was recalled, on account of a dispute between him and the constable de Luines. In 1625 he was advanced to the dignity of a baron in the kingdom of Ireland, by the title of lord Herbert of Castle Island; and in 1631 to that of lord Herbert of Cherbury in Shropshire. After the breaking out of the civil wars, he adhered to the parliament; and, in 1644, obtained

a pension, on account of his having been plundered by the king's forces. He wrote a history of the life and reign of Henry VIII. which was greatly admired; a treatise de veritate; and several other works. He died at London in 1648.

"Lord Herbert," says Mr Granger, "stands in the first rank of the public ministers, historians, and philosophers, of his age. It is hard to say whether his person, his understanding, or his courage, was the most extraordinary; as the fair, the learned, and the brave, held him in equal admiration. But the same man was wise and capricious; redressed wrongs, and quarrelled for punctilios; hated bigotry in religion, and was himself a bigot to philosophy. He exposed himself to such dangers, as other men of courage would have carefully declined; and called in question the fundamentals of a religion which none had the hardihood to dispute besides himself."

HERBERT (George), an English poet and divine, was brother to the preceding. He was born in 1593, and educated at Cambridge. In 1619 he was chosen public orator of that university, and afterwards obtained a sinecure from the king. In 1626 he was collated to the prebend of Layton Ecclesia, in the diocese of Lincoln; and in 1630 was inducted into the rectory of Bamerton, near Sarum. The great lord Bacon had such an opinion of his judgment, that he would not suffer his works to be printed before they had passed his examination. He wrote a volume of devout poems called *The Temple*, and another intitled *The priest of the temple*. This pious divine died about the year 1635.

HERBERT (Sir Thomas), an eminent gentleman of the Pembroke family, was born at York, where his father was an alderman. William earl of Pembroke sent him to travel at his expence in 1626, and he spent four years in visiting Asia and Africa: his expectations of preferment ending with the death of the earl, he went abroad again, and travelled over several parts of Europe. In 1634, he published, in folio, *A relation of some years travel into Africa and the Great Asia, especially the territories of the Persian monarchy, and some parts of the oriental Indies, and isles adjacent*. On the breaking out of the civil war, he adhered to the parliament; and at Oldenby, on the removal of the king's servants, by desire of the commissioners from the parliament, he and James Harrington were retained as grooms of his bed-chamber, and attended him even to the block. At the restoration he was created a baronet by Charles II. for his faithful services to his father during his two last years. In 1678 he wrote *Threndia Carolina*, containing an account of the two last years of the life of Charles I. and he assisted Sir William Dogdale in compiling the third volume of his *Monasticon Anglicanum*. He died at York in 1682, leaving several MSS to the public library at Oxford, and others to that of the cathedral at York.

HERBIVOROUS ANIMALS, those which feed only on vegetables.

HERCULANEUM, a city of Naples, swallowed up by an earthquake in the reign of the emperor Titus, at the same time that there was an eruption of Mount Vesuvius: or rather it was overwhelmed with the ashes, sulphur, and other matter thrown out of that mountain, to the depth of eighty feet, and in some places of more than

Herbert

Herculanum.

than a hundred ; as appears from the whole earth thereabouts being made up of the matter which has been disgorged from the mountain, and all the houses which have appeared hitherto stand perfectly upright, which could not be the case if this disaster had happened from an earthquake. According to Strabo, one side of this ancient city was washed by the sea, and lay exposed to the south-west wind, which rendered it a very salutary and agreeable place to dwell in. There have been several attempts to open a passage to it : and about a hundred years since, a private gentleman found means to get out as much treasure, of one sort or other, as he sold for eighteen thousand pounds ; but one of his companions betraying him to the government, his effects were seized, and he was forced to fly into Germany. In 1738, this place was again examined, by order of the government : and some years ago they sunk a new passage into the higher part of the city, and when they were got to the level of the town, came to a broad and open square, partly natural, and partly made by the workmen ; and round this they have broken in to several fine apartments, and in one place into a whole street. In this square they found various antiquities, which shew the magnificence of the ancients. One room was lined with most beautiful purple and white marble, in regular pannels, each of which was edged with a black and gold-coloured marble, and surrounded with another of blue, green, white, and purple. The finest rooms were all covered with paintings, which are still extremely beautiful. In the niches there were statues, exquisitely carved ; particularly a Juno of a bluish white marble, the folding of whose robes, at a small distance, would be taken for real linen. The expression of the face is much beyond any thing of the kind that has been lately seen. Among the paintings there is a Prometheus chained to a rock, and a large bird feeding upon his liver ; and the whole is executed with so much beauty and majesty, that it exceeds all description. The figure is eight feet in length, and the muscles are expressed with surprizing art. The plumage of the bird seems to be loose and trembling, as in expectation of a feast ; and the fierceness of its eye is very remarkable. This indeed is a horrible portrait ; but that of Semele melting into transport at the sight of Jupiter, is all softness. There are a multitude of other figures, many of which are not understood. However, there is a representation of the public show of beasts, where some of the animals are painted in a surprizing manner ; as for instance, a dying tyger, the noblest performance of the kind ever executed. There is likewise the death of Achilles, in which the passions are well expressed, and a concealed joy in the face of Polixena that nothing can come up to. There have been likewise found a great many of the utensils and instruments formerly used among the Romans ; and many manuscripts, which are greatly decayed, and much art and care has been used to render them legible.—These manuscripts were thought to be the most valuable of all the curiosities which had been discovered ; and it was hoped that by their means some defects in ancient history might have been supplied ; but nothing of that kind hath been yet accomplished.

HERCULES, in fabulous history, a most renowned Grecian hero, said to have been born at Thebes

about the year 1280 B. C. He is reported to have been the son of Jupiter by Alcmena (wife to Amphitryon king of Argos), whom Jupiter enjoyed in the shape of her husband while he was absent ; and in order to add the greater strength to the child, made that amorous night as long as three. Amphitryon having soon after accidentally killed his uncle and father-in-law Electryon, was obliged to fly to Thebes, where Hercules was born. The jealousy of Juno, on account of her husband's amour with Alcmena, prompted her to destroy the infant. For this purpose she sent two serpents to kill him in the cradle, but young Hercules strangled them both. As he grew up, he discovered such extraordinary strength and fierceness, that he was sent to be brought up among some shepherds, where he killed a lion before he was eighteen years of age.

Euristheus, the son of Amphitryon, having succeeded his father, soon became jealous of Hercules ; and fearing lest he might by him be deprived of his crown, left no means untried to get rid of him. Of this Hercules was not insensible, because he was perpetually engaging him on some desperate expedition ; and therefore went to consult the oracle. But being answered that it was the pleasure of the gods that he should serve Euristheus 12 years, he fell into a deep melancholy, which at last ended in a furious madness ; during which, among other desperate actions, he put away his wife Megara, and murdered all the children he had by her. As an expiation of this crime, the king imposed upon him twelve labours surpassing the power of all other mortals to accomplish, which nevertheless our hero performed with great ease.

The first labour imposed upon him was the killing of a lion in Nemea, a wood of Achaia ; whose hide was proof against any weapon, so that he was forced to seize him by the throat and strangle him ; in memory of which he afterwards wore his skin about his shoulders.

In the second, he killed the Hydra ; a monster with two heads, one of which was no sooner cut off, than two sprung up in its room.

In the third, he brought the Erymanthian boar alive upon his shoulders ; at the sight of which the king is said to have been so frightened, that he ran and hid himself in a brazen hoghead. It was likewise in this expedition that he overcame the famous Centaurs.

In his fourth, he caught a hart with golden horns, and of prodigious swiftness.

In his fifth labour, he was commanded to cleanse Augeas's stable in one day, which he did by turning the river Alpheus into it. See AUGEAS.

In the sixth he chased away the mischievous birds of the lake Stymphe, who are feigned to have lived upon human flesh, and to have been at length destroyed by Hercules's arrows, or, according to others, to have been only scared away from thence.

His seventh was to fetch a famous bull from the isle of Crete, with which Pasiphaë the wife of Minos is said to have fallen in love. In this expedition, having helped Jupiter to overcome the Titanic giants, he reconciled Prometheus to him, and loosed him from mount Caucasus.

The eighth was to fetch the mares of Diomedes out of Thrace, which were tied with iron-chains to brass

Hercules.

zen mangers, and were fed with the flesh of the strangers that passed by that way. Hercules first threw their inhuman master to be devoured by them; and then brought the mares to Eurytheus, who dedicated them to Juno. Their breed is said to have continued till Alexander's time.

In the ninth he fetched away the girdle of the queen of the Amazons: and,

In the tenth, the oxen of Geryon out of Iberia, or Spain; in the furthest parts of which he erected his two pillars, as the utmost limits of the then known world. These ten labours he achieved, as the fable says, in about eight years. In this expedition he is likewise affirmed to have killed Antæus, a famous giant of a monstrous size, who, when weary with wrestling or labour, was immediately refreshed by touching the earth. Pliny makes him the founder of Tangier. Hercules overcame him in wrestling, and slew him; and after him the tyrant Busris in his way through Egypt. This bloody man used to sacrifice all his guests and strangers upon his altars; and designing to have done the same by Hercules, was slain by him, together with all his attendants.

His two last tasks were fetching Cerberus out of hell, and carrying away the Hesperian golden apples kept by a dragon; which last is interpreted to have been some fine herd of cattle kept by a strong man, and brought out of Africa to the king.

Many other exploits are said to have been performed by Hercules; the last of which was against Eurytus king Oechalia, who refused to give him Iôle his daughter, whom he had won by shooting against him and his sons. Upon this he slew him and his sons, and carried off his daughter with him. Coming soon after to the Cænean promontory in Eubœa, to offer some sacrifice there, he sent his servant Lychas to Trachin, to his wife Dejanira, for the shirt and coat in which he used to perform that ceremony.

This prince had some time before been attempted by the centaur Nessus, as he was ferrying her over the river Euenus; and Hercules beholding it from the shore, had given him a mortal wound with an arrow. The monster finding himself dying, advised her to mix some oil with the blood which flowed from his wound, and to anoint her husband's shirt with it, pretending that it would infallibly secure him from loving any other woman; and she, too well apprised of his inconfancy, had actually prepared the poisoned ointment accordingly.

Lychas coming to her for the garments, unfortunately acquainted her with his having brought away Iôle; upon which she, in a fit of jealousy, anointed his shirt with the fatal mixture. This had no sooner touched his body, than he felt the poison diffuse itself through all his veins; the violent pain of which caused him to disband his army, and to return to Trachin. His torment still increasing, he sent to consult the oracle for a cure; and was answered that he should cause himself to be conveyed to mount Oeta, and there rear up a great pile of wood, and leave the rest to Jupiter.

By the time he had obeyed the oracle, his pains being become intolerable, he dressed himself in his martial habit, flung himself upon the pile, and de-

red the by-standers to set fire to it; others say that he left the charge of it to his son Philoctetes, who having performed his father's command, had his bow and arrows given him as a reward for his obedience. At the same time Jupiter, to be as good as his word, sent a flash of lightning, which consumed both the pile and the hero; inasmuch that Iolæus, coming to take up his bones, found nothing but ashes; from which they concluded that he was passed from earth to heaven, and joined to the gods.

HERCULES, in astronomy. See there, n° 206.

HERCULES'S Pillars, in antiquity, a name given to mount Calpe in Spain, near Gibraltar; and mount Avila on the African side.

HERCYNIA SILVA, (anc. geog.) the largest of forests. Its breadth was a journey of nine days to the best traveller. Taking its rise at the limits of the Helvetii, Nemetes, and Raurici, it run along the Danube to the borders of the Daci and Anantes, a length of 60 days journey, according to Cæsar, who appears to have been well acquainted with its true breadth, seeing it occupied all Lower Germany. It may therefore be considered as covering the whole of Germany; and most of the other forests may be considered as parts of it, though distinguished by particular names: consequently the Hartz, in the duchy of Brunswick, which gave name to the whole, may be considered as one of its parts. The name Hartz denotes "resinous," or "pine-trees." By the Greeks it is called *Orcynius*, as a name common to all the forests in Germany; in the same manner as *Hercynius* was the name given by the Romans; and both from the German Hartz.

HERD, among hunters, an assemblage of black or fallow beasts, in contradistinction to flock. See Flock.—In the hunting language there are various terms used for companies of the divers kinds of game. We say a *herd* of harts or bucks, a *bevy* of roes, a *route* of wolves, a *richess* of martens, &c.

HEREDITAMENTS, whatever moveable things a person may have to himself and his heirs by way of inheritance; and which, if not otherwise bequeathed, descend to him who is next heir, and not to the executor as chattels do.

HEREDITARY, an appellation given to whatever belongs to a family by right of succession from heir to heir.

HEREDITARY is also figuratively applied to good or ill qualities supposed to be transmitted from father to son: thus we say virtue and piety are hereditary qualities in such a family; and that in Italy the hatred of families is hereditary. And indeed the gout, king's evil, madness, &c. may really be hereditary diseases.

HEREDITARY Right. The grand fundamental maxim upon which the *ius coronæ*, or right of succession to the throne of these kingdoms, depends, Sir William Blackstone takes to be this: "That the crown is, by common law and constitutional custom, hereditary; and this in a manner peculiar to itself: but that the right of inheritance may from time to time be changed or limited by act of parliament; under which limitations the crown still continues hereditary."

1. The crown is in general hereditary, or descendible to the next heir, on the death or demise of the last proprietor. All regal governments must be either hereditary

Hercules
Hereditary.

Hereditary. reditory or elective : and as there is no instance where-
in the crown of England has ever been asserted to be
elective, except by the regicides at the infamous and
unparalleled trial of king Charles I. it must of conse-
quence be hereditary. Yet in thus asserting an
hereditary right, a *jure divino* title to the throne
is by no means intended. Such a title may
be allowed to have subsisted under the theocratic
establishments of the children of Israel in Palestine :
but it never yet subsisted in any other country ; save
only so far as kingdoms, like other human fabrics, are
subject to the general and ordinary dispensations of
Providence. Nor indeed have a *jure divino* and an he-
reditary right any necessary connexion with each o-
ther ; as some have very weakly imagined. The titles
of David and Jeshu were equally *jure divino* as
those of either Solomon or Ahab ; and yet David
slew the sons of his predecessor, and Jeshu his pre-
decessor himself. And when our kings have the same
warrant as they had, whether it be to sit upon the
throne of their fathers, or to destroy the house of the
preceding sovereign, they will then, and not before,
possess the crown of England by a right like theirs,
immediately derived from heaven. The hereditary
right, which the laws of England acknowledge, owes
its origin to the founders of our constitution, and to
them only. It has no relation to, nor depends upon,
the civil laws of the Jews, the Greeks, the Romans,
or any other nation upon earth ; the municipal laws
of one society having no connexion with, or influence
upon, the fundamental polity of another. The found-
ers of our English monarchy might perhaps, if they
had thought proper, have made it an elective mo-
narchy ; but they rather chose, and upon good rea-
son, to establish originally a succession by inheritance.
This has been acquiesced in by general consent, and
ripened by degrees into common law ; the very same
title that every private man has to his own estate.
Lands are not naturally defensible, any more than
thrones : but the law has thought proper, for the be-
nefit and peace of the public, to establish hereditary
succession in the one as well as the other.

It must be owned, an elective monarchy seems to be
the most obvious, and best suited of any to the rational
principles of government, and the freedom of human
nature ; and accordingly we find from history, that, in
the infancy and first rudiments of almost every state,
the leader, chief magistrate, or prince, hath usually been
elective. And, if the individuals who compose that
state could always continue true to first principles, un-
influenced by passion or prejudice, unassailed by cor-
ruption, and unawed by violence, elective succession
were as much to be desired in a kingdom, as in other
inferior communities. The best, the wisest, and the
bravest man would then be sure of receiving that crown,
which his endowments have merited ; and the sense of
an unbiassed majority would be dutifully acquiesced in
by the few who were of different opinions. But history
and observation will inform us, that elections of every
kind (in the present state of human nature) are too fre-
quently brought about by influence, partiality, and ar-
tifice : and, even where the case is otherwise, these
practices will be often suspected, and as constantly charged
upon the successful, by a splenetic disappointed
minority. This is an evil to which all societies are

liable ; as well those of a private and domestic kind, as **Hereditary.**
the great community of the public, which regulates and
includes the rest. But in the former there is this ad-
vantage, That such suspicions, if false, proceed no far-
ther than jealousies and murmurs, which time will ef-
fectually suppress ; and, if true, the injustice may be
remedied by legal means, by an appeal to those tribu-
nals to which every member of society has (by be-
coming such) virtually engaged to submit. Whereas, in
the great and independent society, which every nation
composes, there is no superior to resort to but the law
of nature ; no method to redress the infringements of
that law, but the actual exertion of private force. As
therefore between two nations, complaining of mutual
injuries, the quarrel can only be decided by the law of
arms ; so in one and the same nation, when the funda-
mental principles of their common union are supposed
to be invaded, and more especially when the appoint-
ment of their chief magistrate is alleged to be unduly
made, the only tribunal to which the complainants can
appeal is that of the God of battles, the only process
by which the appeal can be carried on is that of a ci-
vil and intestine war. An hereditary succession to the
crown is therefore now established, in this and most o-
ther countries, in order to prevent that periodical blood-
shed and misery, which the history of ancient imperial
Rome, and the more modern experience of Poland and
Germany, may shew us are the consequences of elective
kingdoms.

2. But, secondly, as to the particular mode of in-
heritance, It in general corresponds with the feudal
path of descents, chalked out by the common law in
the succession to landed estates ; yet with one or two
material exceptions. Like them, the crown will de-
scend lineally to the issue of the reigning monarch ;
as it did from king John to Richard II. through a re-
gular pedigree of six lineal generations : As in them
the preference of males to females, and the right of
primogeniture among the males, are strictly adhered
to. Thus Edward V. succeeded to the crown, in pre-
ference to Richard his younger brother, and Elizabeth
his elder sister. Like them, on failure of the male
line, it descends to the issue female ; according to the
ancient British custom remarked by Tacitus, *Solent
feminarum ductu bellare, et sexum in imperiis non dis-
cernere*. Thus Mary I. succeeded to Edward VI. ;
and the line of Margaret queen of Scots, the daughter
of Henry VII. succeeded, on failure of the line of Hen-
ry VIII. his son. But among the females, the crown
descends by right of primogeniture to the eldest daugh-
ter only and her issue ; and not, as in common inheri-
tances, to all the daughters at once ; the evident ne-
cessity of a sole succession to the throne having occa-
sioned the royal law of descents to depart from the
common law in this respect : and therefore queen Ma-
ry, on the death of her brother, succeeded to the
crown alone, and not in partnership with her sister E-
lizabeth. Again, the doctrine of representation pre-
vails in the descent of the crown, as it does in other
inheritances ; whereby the lineal descendants of any
person deceased stand in the same place as their ances-
tor, if living, would have done. Thus Richard II.
succeeded his grandfather Edward III. in right of his
father the black prince ; to the exclusion of all his
uncles, his grandfather's younger children. Lastly,
on

on failure of lineal descendants, the crown goes to the next collateral relations of the late king; provided they are lineally descended from the blood-royal, that is, from that royal stock which originally acquired the crown. Thus Henry I. succeeded to William II. John to Richard I. and James I. to Elizabeth; being all derived from the Conqueror, who was then the only legal stock. But herein there is no objection (as in the case of common descents) to the succession of a brother, an uncle, or other collateral relation, of the *half-blood*; that is, where the relationship proceeds not from the same *couple* of ancestors, (which constitutes a kinsman of the *whole blood*), but from a *single* ancestor only; as when two persons are derived from the same father, and not from the same mother, or *vice versa*: provided only, that the one ancestor, from whom both are descended, be that from whose veins the blood-royal is communicated to each. Thus Mary I. inherited to Edward VI. and Elizabeth inherited to Mary; all born of the same father, king Henry VIII. but all by different mothers. See the articles CONSANGUINITY, DESCENT, and SUCCESSION.

3. The doctrine of hereditary right does by no means imply an *indefeasible* right to the throne. No man will assert this, who has considered our laws, constitution, and history, without prejudice, and with any degree of attention. It is unquestionably in the breast of the supreme legislative authority of this kingdom, the king and both houses of parliament, to defeat this hereditary right; and, by particular entails, limitations, and provisions, to exclude the immediate heir, and vest the inheritance in any one else. This is strictly consonant to our laws and constitution; as may be gathered from the expression so frequently used in our statute-book, of "the king's majesty, his heirs, and successors." In which we may observe, that as the word *heirs* necessarily implies an inheritance or hereditary right generally subsisting in the royal person; so the word *successors*, distinctly taken, must imply that this inheritance may sometimes be broken through; or, that there may be a successor, without being the heir of the king. And this is so extremely reasonable, that without such a power, lodged somewhere, our polity would be very defective. For, let us barely suppose so melancholy a case, as that the heir-apparent should be a lunatic, an idiot, or otherwise incapable of reigning; how miserable would the condition of the nation be, if he were also incapable of being set aside! — It is therefore necessary that this power should be lodged somewhere; and yet the inheritance and regal dignity would be very precarious indeed, if this power were *expressly* and *avowedly* lodged in the hands of the subject only, to be exerted whenever prejudice, caprice, or discontent, should happen to take the lead. Consequently it can nowhere be so properly lodged, as in the two houses of parliament, by and with the consent of the reigning king; who, it is not to be supposed, will agree to any thing improperly prejudicial to the rights of his own descendants. And therefore in the king, lords, and commons, in parliament assembled, our laws have expressly lodged it.

4. But, fourthly, However the crown may be limited or transferred, it still retains its defendable quality, and becomes hereditary in the wearer of it. And hence in our law the king is said never to die in his

political capacity; though, in common with other men, he is subject to mortality in his natural: because immediately upon the natural death of Henry, William, or Edward, the king survives in his successor. For the right of the crown vests, *eo instanti*, upon his heir; either the *heres natus*, if the course of descent remains unimpeached, or the *heres factus*, if the inheritance be under any particular settlement. So that there can be no *interregnum*; but, as Sir Matthew Hale observes, the right of sovereignty is fully invested in the successor by the very descent of the crown. And therefore, however acquired, it becomes in him absolutely hereditary, unless by the rules of the limitation it is otherwise ordered and determined: In the same manner as landed estates, to continue our former comparison, are by the law hereditary, or defendable to the heirs of the owner; but still there exists a power, by which the property of those lands may be transferred to another person. If this transfer be made simply and absolutely, the lands will be hereditary in the new owner, and descend to his heir at law: but if the transfer be clogged with any limitations, conditions, or entails, the lands must descend in that channel, so limited and prescribed, and no other. See SUCCESSION.

HEREDITAS JACENS, in Scots law. An estate is said to be in *hereditate jacente*, after the proprietor's death till the heir's entry.

HEREFORD, which in Saxon signifies the *ford of the army*, the capital of Herefordshire in England, situated in W. Lon. 2. 35. N. Lat. 52. 6. It is supposed to have risen out of the ruins of Kenchester, in its neighbourhood, which Camden believes to have been the *Ariconium* of Antoninus. It is very pleasantly situated among meadows and corn-fields, and is almost encompassed with rivers. It seems to have owed its rise, or at least its increase, to the building and dedicating a church there to Ethelbert king of the East-Angles, who was murdered in the neighbourhood and afterwards taken into the catalogue of martyrs; soon after it became a bishop's see, and in consequence of that a considerable place. In 1055 it was sacked, the cathedral destroyed, and its bishop Leofgar carried away captive by Gryffin prince of South-Wales, and Algar, an Englishman, who had rebelled against Edward the Confessor. Harold fortified it with a broad and high rampart; and it appears by Doomsday-book, that there were no more than 300 men within and without the wall. A very large and strong castle was built by the Normans along the Wye, and the city walled round. The present stately cathedral was founded in the reign of Henry I. by bishop Reinelm, but enlarged and beautified by his successors. It suffered much in the barons wars; and was often taken and retaken in the war between king Charles I. and the parliament. This city is pretty large, and had once six churches; but two were destroyed in the civil wars. It is not very populous nor well built, many of the houses being old. Its manufactures are gloves and other leathern goods; and its corporation consists of a mayor, six aldermen, a high-steward, deputy steward, and town-clerk, who have a sword-bearer, and four sergeants at mace. Each of the companies enjoys distinct laws and privileges by their charter, and each has its hall. The city gave
long

long the title of *earl* to the noble family of the Bohuns; then of *duke* to Henry of Lancaster, afterwards Henry IV. king of England; after him, of *earl* to Stafford, earl of Buckingham; then of *viscount* D'Evereux, earl of Essex, which a collateral branch of this family still enjoys, and is thereby the premier viscount of England.

HEREFORDSHIRE, a county of England, nearly of a circular form, bounded on the east by Worcester and Gloucester, on the south by Monmouthshire, on the west by Radnorshire and Brecknockshire, and on the north by Shropshire. Its length from north to south is 35 miles, its breadth from east to west 30; and its circumference 108. It contains 660,000 acres, 11 hundreds, one city, eight market-towns, 176 parishes, and 95,000 inhabitants. The members it sends to parliament are eight, namely, two for the county, two for Hereford city, two for Lempster, and two for Woolby.

The air of this county is allowed to be as pleasant, sweet, and wholesome, as that of any other in England, there being nothing either in the soil or situation to render it otherwise. The soil throughout is excellent, and inferior to none, either for grain, fruit, or pasture, supplying the inhabitants plentifully with all the necessities of life: but that by which it is distinguished from most others, is its fruit, especially apples, of which it produces such quantities, that the cyder made of them is not only sufficient for their own consumption, though it is their ordinary drink, but also in a great measure for that of London and other parts. That in particular which is made from the apple called *redstreak*, is much admired, and has a body almost equal to that of white-wine. The county is well supplied with wood and water; for, besides lesser streams, there are the rivers Frome, Loden, Lug, Wye, Wadel, Atrow, Dare, and Monow; the last of which is large, and all of them are well stored with fish, particularly the Wye, which breeds salmon. It lies in the diocese of Hereford, and Oxford circuit.

HERENHAUSEN, a palace of Germany near Hanover, belonging to the king of Great Britain. Here are lodgings for all the court; and a garden of vast extent, in which are fine waterworks, a labyrinth, and many other curiosities worthy the observation of a traveller.

HERENTHALS, a town of Brabant in the Austrian Netherlands, in the quarter of Antwerp; seated on the river Nethe, in E. Long. 4. 51. N. Lat. 51. 9.

HERESY, in law, an offence against Christianity, consisting in a denial of some of its essential doctrines, publicly and obstinately avowed; being defined, "*sententia rerum divinarum humano sensu exogitata; palam docta et pertinaciter defensa.*" And here it must also be acknowledged that particular modes of belief or unbelief, not tending to overturn Christianity itself, or to sap the foundations of morality, are by no means the object of coercion by the civil magistrate. What doctrines shall therefore be adjudged heresy, was left by our old constitution to the determination of the ecclesiastical judge; who had herein a most arbitrary latitude allowed him. For the general definition of an heretic given by Lyndewode, extends to the smallest deviations from the doctrines of holy church: "*hereticus est qui dubitat de fide catholica, et qui negligit*

servare ea, quæ Romana ecclesia statuit, seu servare decreverat." Or, as the statute 2 Hen. IV. c. 15. expresses it in English, "teachers of erroneous opinions, contrary to the faith and blessed determinations of the holy church." Very contrary this to the usage of the first general councils, which defined all heretical doctrines with the utmost precision and exactness. And what ought to have alleviated the punishment, the uncertainty of the crime, seems to have enhanced it in those days of blind zeal and pious cruelty. It is true, that the sanctimonious hypocrisy of the canonists went at first no farther than enjoining penance, excommunication, and ecclesiastical deprivation, for heresy; tho' afterwards they proceeded boldly to imprisonment by the ordinary, and confiscation of goods in *pious* use. But in the mean time they had prevailed upon the weakness of bigotted princes to make the civil power subservient to their purposes, by making heresy not only a temporal, but even a capital, offence: the Romish ecclesiastics determining, without appeal, whatever they pleased to be heresy, and shifting off to the secular arm the odium and drudgery of executions; with which they themselves were too tender and delicate to intermeddle. Nay, they pretended to intercede and pray, on behalf of the convicted heretic, *ut citra mortis periculum sententia circa eum moderetur*: well knowing that at the same time they were delivering the unhappy victim to certain death. Hence the capital punishments inflicted on the ancient Donatists and Manichæans by the emperors Theodosius and Justinian: hence also the constitution of the emperor Frederic mentioned by Lyndewode, adjudging all persons without distinction to be burnt with fire who were convicted of heresy by the ecclesiastical judge. The same emperor, in another constitution, ordained, that if any temporal lord, when admonished by the church, should neglect to clear his territories of heretics within a year, it should be lawful for good catholics to seize and occupy the lands, and utterly to exterminate the heretical possessors. And upon this foundation was built that arbitrary power, so long claimed and so fatally exerted by the Pope, of disposing even of the kingdoms of refractory princes to more dutiful sons of the church. The immediate event of this constitution was something singular, and may serve to illustrate at once the gratitude of the holy see, and the just punishment of the royal bigot; for, upon the authority of this very constitution, the pope afterwards expelled this very emperor Frederic from his kingdom of Sicily, and gave it to Charles of Anjou.

Christianity being thus deformed by the dæmon of persecution upon the continent, we cannot expect that our own island should be entirely free from the same scourge. And therefore we find among our ancient precedents a writ *de heretico comburendo*, which is thought by some to be as ancient as the common law itself. However, it appears from thence, that the conviction of heresy by the common law was not in any petty ecclesiastical court, but before the archbishop himself in a provincial synod; and that the delinquent was delivered over to the king to do as he should please with him: so that the crown had a controul over the spiritual power, and might pardon the convict by issuing no process against him: the writ *de heretico comburendo* being not a writ of course, but issuing only by the

Hereby.

the special direction of the king in council.

But in the reign of Henry IV. when the eyes of the Christian world began to open, and the seeds of the Protestant religion (though under the opprobrious name of *lollardy*) took root in this kingdom; the clergy, taking advantage from the king's dubious title to demand an increase of their own power, obtained an act of parliament, which sharpened the edge of persecution to its utmost keenness. For, by that statute, the diocesan alone, without the intervention of a synod, might convict of heretical tenets; and unless the convict alured his opinions, or if after abjuration he relapsed, the sheriff was bound *ex officio*, if required by the bishop, to commit the unhappy victim to the flames, without waiting for the consent of the crown. By the statute 2 Hen. V. c. 7. *lollardy* was also made a temporal offence, and indictable in the king's courts; which did not thereby gain an exclusive, but only a concurrent jurisdiction with the bishop's consistory.

Afterwards, when the final reformation of religion began to advance, the power of the ecclesiastical was somewhat moderated: for though what heresy *is*, was not then precisely defined, yet we are told in some points what it *is not*: the statute 25 Hen. VIII. c. 14. declaring, that offences against the see of Rome are not heresy; and the ordinary being thereby restrained from proceeding in any case upon mere suspicion; that is, unless the party be accused by two credible witnesses, or an indictment of heresy be first previously found in the king's courts of common law. And yet the spirit of persecution was not then abated, but only diverted into a lay channel. For in six years afterwards, by statute 31 Hen. VIII. c. 14. the bloody law of the six articles was made, which established the six most contested points of popery, transubstantiation, communion in one kind, the celibacy of the clergy, monastic vows, the sacrifice of the mass, and auricular confession; which points were "determined and resolved by the most godly study, pain, and travail of his majesty: for which his most humble and obedient subjects, the lords *spiritual* and temporal and the commons, in parliament assembled, did not only render and give unto his highness their most high and hearty thanks;" but did also enact and declare all opposers of the first to be heretics, and to be burnt with fire; and of the five last to be felons, and to suffer death. The same statute established a new and mixed jurisdiction of clergy and laity for the trial and conviction of heretics; the reigning prince being then equally intent on destroying the supremacy of the bishops of Rome, and establishing all other their corruptions of the Christian religion.

Without perplexing this detail with the various repeals and revivals of these sanguinary laws in the two succeeding reigns, let us proceed to the reign of queen Elizabeth; when the reformation was finally established with temper and decency, unsullied with party-rancour, or personal caprice and resentment. By statute 1 Eliz. c. 1. all former statutes relating to heresy are repealed, which leaves the jurisdiction of heresy as it stood at common law; *viz.* as to the infliction of common censures, in the ecclesiastical courts; and, in case of burning the heretic, in the provincial synod only. Sir Matthew Hale is indeed of a different opinion, and holds that such power resided in the diocesan also; tho' he agrees, that in either case the writ *de heretico com-*

burendo was not demandable of common right, but grantable or otherwise merely at the king's discretion. But the principal point now gained was, that by this statute a boundary is for the first time set to what shall be accounted heresy; nothing for the future being to be so determined, but only such tenets, which have been heretofore so declared, 1. By the words of the canonical scriptures; 2. By the first four general councils, or such others as have only used the words of the holy Scriptures; or, 3. Which shall hereafter be so declared by the parliament, with the assent of the clergy in convocation. Thus was heresy reduced to a greater certainty than before; though it might not have been the worse to have defined it in terms still more precise and particular: as a man continued still liable to be burnt, for what perhaps he did not understand to be heresy, till the ecclesiastical judge so interpreted the words of the canonical scriptures.

For the writ *de heretico comburendo* remained still in force; and we have instances of its being put in execution upon two Anabaptists in the seventeenth of Elizabeth, and two Arians in the ninth of James I. But it was totally abolished, and hereby again subjected only to ecclesiastical correction, *pro salute animæ*, by virtue of the statute 29 Car. II. c. 9: for, in one and the same reign, our lands were delivered from the slavery of military tenures; our bodies from arbitrary imprisonment by the *habeas corpus* act; and our minds from the tyranny of superstitious bigotry, by demolishing this last badge of persecution in the English law.

Every thing is now as it should be, with respect to the spiritual cognizance, and spiritual punishment, of heresy: unless perhaps that the crime ought to be more strictly defined, and no prosecution permitted, even in the ecclesiastical courts, till the tenets in question are by proper authority previously declared to be heretical. Under these restrictions, it seems necessary for the support of the national religion, that the officers of the church should have power to censure heretics; yet not to harass them with temporal penalties, much less to exterminate or destroy them. The legislature hath indeed thought it proper, that the civil magistrate should again interpose, with regard to one species of heresy, very prevalent in modern times; for by statute 9 & 10 W. III. c. 32. if any person educated in the Christian religion, or professing the same, shall by writing, printing, teaching, or advised speaking, deny any one of the persons in the holy Trinity to be God, or maintain that there are more Gods than one, he shall undergo the same penalties and incapacities which were just now mentioned to be inflicted on apostacy by the same statute.

HERETABLE RIGHTS, in Scots law, all rights affecting lands, houses, &c. or any immoveable subject.

HERETAGE, in Scots law, lands, houses, or any immoveable subject, in contradistinction to moveables or moveable subjects. It also sometimes signifies such immoveable property as a person succeeds to as heir to another, in contradistinction to that which he himself purchases or acquires in any other manner, called *conquest*.

HERETIC, a general name for all such persons under any religion, but especially the Christian, as profess or teach religious opinions contrary to the established

Herforden
||
Hermannia

blished faith, or to what is made the standard of orthodoxy. See HERESY.

HERFORDEN, or HERWARDEN, a free and imperial town of Germany, in the circle of Westphalia, and capital of the county of Ravensberg. Here is a famous nunnery belonging to the Protestants of the confession of Augsburg, whose abbess is a princess of the empire, and has a voice and place in the diet. It is seated on the river Aa. E. Long. 8. 47. N. Lat. 52. 12.

HERGUNDT, a town of Upper Hungary, remarkable for its rich mines of vitriol. Those who work in the mines have built a subterraneous town, which has a great number of inhabitants. E. Long. 18. 15. N. Lat. 48. 30.

HERISSON, in fortification, a beam armed with a great number of iron spikes with their points outwards, and supported by a pivot on which it turns. These serve as a barrier to block up any passage, and are frequently placed before the gates, and more especially the wicket-doors, of a town or fortress, to secure those passages which mult of necessity be often opened and shut.

HERMÆA, in antiquity, ancient Greek festivals in honour of the god Hermes or Mercury. One of these was celebrated by the Phenææ in Arcadia; a second by the Cyllenians in Elis; and a third by the Tanagræans, where Mercury was represented with a ram upon his shoulder, because he was said to have walked thro' the city in that posture in time of a plague, and to have cured the sick; in memory of which, it was customary at this festival for one of the most beautiful youths in the city to walk round the walls with a ram upon his shoulder.—A fourth festival of the same name was observed in Crete, when it was usual for the servants to sit down at the table while their masters waited; a custom which was also observed at the Roman Saturnalia.

HERMAN (Paul), a famous botanist in the 17th century, was born at Hall in Saxony. He practised physic in the Isle of Ceylon, and was afterwards made professor of botany at Leyden, where he died in 1695. He wrote a catalogue of the plants in the public garden at Leyden, and a work intitled *Flora Lugduno-Batava flores*.

HERMANN (James), a learned mathematician of the academy at Berlin, and a member of the academy of sciences at Paris, was born at Basil in 1678. He was a great traveller, and for six years was professor of mathematics at Padua. He afterwards went to Muscovy, being invited thither by the Czar in 1724. At his return to his native country, he was made professor of morality and natural law at Basil; and died there in 1733. He wrote several mathematical works.

HERMANNIA, in botany; a genus of the pentandria order, belonging to the monodelphia class of plants.

Species. 1. The lavenderifolia, hath a shrubby stalk and slender branches, very bushy, about a foot and an half high, small, spear-shaped, obtuse and hairy leaves, with clusters of small yellow flowers along the sides of the branches, continuing from June to Autumn. 2. The altheifolia hath a shrubby stalk, and soft woolly branches, growing two feet high, with numerous yellow flowers in loose spikes growing at the end of the branches, and making their appearance in July. 3. The

grossularifolia hath a shrubby stalk and spreading branches, growing three or four feet high, with bright yellow flowers coming out in great numbers at the ends of all the shoots and branches in April or May. 4. The alnifolia hath a shrubby stalk and branches growing irregularly four or five feet high, with pale yellow flowers in short spikes from the sides and ends of the branches, appearing in April or May. 3. The hyssopifolia hath a shrubby upright stalk, branching out laterally six or seven feet high, with pale yellow flowers in clusters from the sides of the branches, appearing in May and June.

Culture. All these plants are natives of Africa, and therefore must be kept in a green-house during the winter in this country. They are propagated by cuttings of their young shoots, which may be planted in pots of rich earth any time from April to July.

HERMANSTADT, a handsome, populous, and strong town of Hungary, capital of Transilvania, with a bishop's see. It is the residence of the governor of the province; and is seated on the river Ceben, in E. Long. 23. 40. N. Lat. 46. 25.

HERMANT (Godfrey), a learned doctor of the Sorbonne, born at Beauvais in 1917. He wrote many excellent works; the principal of which are, 1. The lives of St Athanasius, St Basil, St Gregory Nazianzen, St Chrysostom, and St Ambrose. 2. Four pieces in defence of the rights of the university of Paris against the Jesuits. 3. A French translation of St Chrysostom's treatise of Providence, and St Basil's Ascetics. 4. Extracts from the councils; published after his death, under the title of *Clavis discipline ecclesiastica*. He died suddenly at Paris in 1690.

HERMAPHRODITE, is generally understood to signify a human creature possessed of both sexes, or who has the parts of generation both of male and female. The term however is applied also to other animals, and even to plants.—The word is formed of the Greek ἑρμαφροδιτος, a compound of ἑρμης, Mercury, and ἀφροδιτη, Venus; q. d. a mixture of Mercury and Venus, i. e. of male and female. For it is to be observed, *Hermaphroditus* was originally a proper name, applied by the heathen mythologists to a fabulous deity, whom some represent as a son of *Hermes*, Mercury, and *Aphrodite*, Venus; and who, being desperately in love with the nymph *Salmacis*, obtained of the gods to have his body and hers united into one. Others say, that the god *Hermaphroditus* was conceived as a composition of Mercury and Venus, to exhibit the union between eloquence, or rather commerce, whereof Mercury was god, with pleasure, whereof Venus was the proper deity. Lastly, others think this junction intended to shew that Venus, (pleasure,) was of both sexes; as, in effect, the poet Calvus call Venus a god.

Pollentemque Deum Venerem.

As also Virgil, *Æneid*. lib. ii.

Dif. ed. ac ducente Deo flammam inter et hostes

Exspedior

M. Spon observes, *Hesychius* calls Venus *Aphroditos*; and *Theophrastus* affirms, that *Aphroditos*, or Venus, is *Hermaphroditus*; and that in the island of Cyprus she has a statue, which represents her with a beard like a man.—The Greeks also call *hermaphroditos* ἀνδρῶν, androgyni, q. d. men-women. See the article ANDROGYNES.

Herman-
stadt
||
Hermaphrodite.

The best treatise that hath appeared on this subject is that of Mr Hunter, in the 69th volume of the Philosophical Transactions. He divides hermaphrodites into *natural*, and *unnatural* or monstrous. The first belongs to the more simple orders of animals, of which there are a much greater number than of the more perfect. The *unnatural* takes place in every tribe of animals having distinct sexes, but is more common in some than in others. The human species, our author imagines, has the fewest; never having seen them in that species, nor in dogs; but in the horse, sheep, and black cattle, they are very frequent.

From Mr Hunter's account, however, it doth not appear that such a creature as a perfect hermaphrodite has ever existed. All the hermaphrodites which he had the opportunity of seeing had the appearance of females, and were generally saved as such. In the horse they are very frequent; and in the most perfect of this kind he ever saw, the testicles had come down out of the abdomen into the place where the udder should have been, and appeared like an udder, not so pendulous as the scrotum in the male of such animals. There were also two nipples, of which horses have no perfect form; being blended in them with the sheath or prepuce, of which there was none here. The external female parts were exactly similar to those of a perfect female; but instead of a common-sized clitoris, there was one about five or six inches long; which, when erect, stood almost directly backwards.

A foal as very similar to the above was killed, and the following appearances were observed on dissection. The testicles were not come down as in the former, possibly because the creature was too young. It had also two nipples; but there was no penis passing round the pubes to the belly, as in the perfect male ass. The external female parts were similar to those of the she-ass. Within the entrance of the vagina was placed the clitoris; but much longer than that of a true female, being about five inches long. The vagina was open a little further than the opening of the urethra into it, and then became obliterated; from thence, up to the fundus of the uterus, there was no canal. At the fundus of the common uterus it was hollow, or had a cavity in it, and then divided into two, viz. a right and a left, called the *horns* of the uterus, which were also pervious. Beyond the termination of the two horns were placed the ovaria, as in the true female; but the Fallopian tubes could not be found.—From the broad ligaments, to the edges of which the horns of the uterus and ovaria were attached, there passed towards each groin a part similar to the round ligaments in the female, which were continued into the rings of the abdominal muscles; but with this difference, that there were continued with them a process or theca of the peritonæum, similar to the tunica vaginalis communis in the male ass; and in these theca were found the testicles, but no vasa deferentia could be observed passing from them.

In most species of animals, the production of hermaphrodites appears to be the effect of chance; but in the black cattle it seems to be an established principle of their propagation. It is a well-known fact, and, as far as hath yet been discovered, appears to be universal, that when a cow brings forth two

calves, one of them a bull, and the other a cow to appearance, the cow is unfit for propagation, but the bull-calf becomes a very proper bull. They are known not to breed; they do not even shew the least inclination for the bull, nor does the bull ever take the least notice of them. Among the country people in England, this kind of calf is called a *free martin*; and this singularity is just as well known among the farmers as either cow or bull. When they are preferred, it is for the purposes of an ox or spayed heifer; viz. to yoke with the oxen, or fatten for the table. They are much larger than either the bull or the cow, and the horns grow longer and bigger, being very similar to those of an ox. The bellow of a free-martin is also similar to that of an ox, and the meat is similar to that of the ox or spayed heifer, viz. much finer in the fibre than either the bull or cow; and they are more susceptible of growing fat with good food. By some they are supposed to exceed the ox and heifer in delicacy of taste, and bear a higher price at market; this, however, does not always hold, and Mr Hunter gives an instance of the contrary. The Romans, who called the bull *taurus*, spoke also of *tauræ* in the feminine gender different from cows. Stephens observes, that it was thought they meant by this word *barren cows*, who obtained the name because they did not conceive any more than bulls. He also quotes a passage from Columella, lib. vi. cap. 22. "And, like the *tauræ*, which occupy the place of fertile cows, should be rejected or sent away." He likewise quotes Varro, *De re rustica*, lib. ii. cap. 5. "The cow which is barren is called *taura*." From which we may reasonably conjecture, that the Romans had not the idea of the circumstances of their production.

Of these creatures Mr Hunter dissected three, and the following appearances were observed in the most perfect of them.—The external parts were rather smaller than in the cow. The vagina passed on as in the cow to the opening of the urethra, and then it began to contract into a small canal, which passed on to the division of the uterus into the two horns; each horn passing along the edge of the broad ligament laterally towards the ovaria. At the termination of these horns were placed both the ovaria and testicles, both of which were nearly about the size of a small nutmeg. No Fallopian tubes could be found. To the testicles were vasa deferentia, but imperfect. The left one did not come near the testicle; the right only came close to it, but did not terminate in the body called *epididymis*. They were both pervious, and opened into the vagina near the opening of the urethra.—On the posterior surface of the bladder, or between the uterus and bladder, were the two bags called the *vesiculae seminales* in the male, but much smaller than what they are in the bull: the ducts opened along with the vasa deferentia.

Concerning hermaphrodites of the human species, much has been wrote, and many laws enacted about them in different nations; but the existence of them is still disputed. Dr Parsons has given us a treatise on the subject, in which he endeavours to explode the notion as a vulgar error. According to him, all the hermaphrodites that have appeared, were only women whose clitoris from some cause or other was overgrown;

Hermaphrodite
||
Hermes.

and, in particular, that this was the case with an Angola woman shewn at London as an hermaphrodite some time ago.

Among the reptile tribe, indeed, such as worms, snails, leeches, &c. hermaphrodites are very frequent.

HERMAPHRODITE Flowers, in botany. These are so called by the sexualists on account of their containing both the antheræ and stigma, the pretended organs of generation, within the same calix and petals. Of this kind are the flowers of all the classes in Linnæus's sexual method, except the classes *monœcia* and *diœcia*; in the former of which, male and female flowers are produced on the same root; in the latter, in distinct plants from the same fecd. — In the class *polygamia*, there are always hermaphrodite flowers mixed with male or female, or both, either on the same or distinct roots. In the plantain-tree the flowers are all hermaphrodite; in some, however, the antheræ or male organ, in others the stigma or female organ, proves abortive. The flowers in the former case are styled *female hermaphrodites*; in the latter, *male hermaphrodites*. — Hermaphrodites are thus as frequent in the vegetable kingdom as they are rare and scarce in the animal one.

HERMAS, an ecclesiastical author of the first century; and, according to Origen, Eusebius, and Jerome, the same whom St Paul salutes in the end of his epistle to the Romans. He wrote a book in Greek some time before Domitian's persecution, which happened in the year 95. This work is entitled *The Pastor*, from his representing an angel speaking to him in it under the form of a shepherd. The Greek text is lost, but a very ancient Latin version of it is still extant. Some of the fathers have considered this book as canonical. The best edition of it is that of 1698, where it is to be found among the other apostolical fathers, illustrated with the notes and corrections of Cotelærius and Le Clerc. With them it was translated into English by Archbishop Wake, the best edition of which is that of 1710.

HERMES, *Thoth*, or *Mercury*, one of the secondary gods of Egypt, who received divine honours on account of his useful and extraordinary talents.

There is no personage in all antiquity more renowned than the Egyptian Hermes, who was furnished *Trismegistus*, or *Thrice-illustrious*. He was the soul of Osiris's counsel and government; and is called by Sir Isaac Newton, his *secretary*. "Osiris," says he, "using the advice of his secretary Thoth, distributes Egypt into 36 nomes; and in every nome erects a temple, and appoints the several gods, festivals, and religions of the several nomes. The temples were the sepulchres of his great men, where they were to be buried and worshipped after death, each in his own temple, with ceremonies and festivals appointed by him; while he and his queen, by the names of *Osiris* and *Isis*, were to be worshipped in all Egypt: these were the temples seen and described by Lucian, who was himself an Egyptian, 1100 years after, and to be of one and the same age: this was the original of the several nomes of Egypt, and of the several gods and several religions of those nomes." And Diodorus Siculus tells us, that Mercury was honoured by Osiris, and afterwards worshipped by the Egyptians,

as a person endowed with extraordinary talents for every thing that was conducive to the good of society. He was the first who out of the coarse and rude dialects of his time formed a regular language, and gave appellatives to the most useful things: he likewise invented the first characters or letters, and even regulated the harmony of words and phrases: he instituted several rites and ceremonies relative to the worship of the gods, and communicated to mankind the first principles of astronomy. He afterwards suggested to them as amusements, wrestling and dancing; and invented the lyre, to which he gave three strings in allusion to the seasons of the year: for these three strings producing three different sounds, the grave, the mean, and the acute, the grave answered to winter, the mean to spring, and the acute to summer.

Among the various opinions of the several ancient writers who have mentioned this circumstance, and confined the invention to the Egyptian Mercury, that of Apollodorus is the most intelligible and probable. "The Nile, (says this writer), after having overflowed the whole country of Egypt, when it returned within its natural bounds, left on the shore a great number of dead animals of various kinds; and among the rest a tortoise, the flesh of which being dried and waisted by the sun, nothing was left within the shell but nerves and cartilages; and these being braced and contracted by desiccation, were rendered sonorous. Mercury, in walking along the banks of the Nile, happening to strike his foot against the shell of this tortoise, was so pleased with the sound it produced, that it suggested to him the first idea of a lyre, which he afterwards constructed in the form of a tortoise, and strung it with the dried sinews of dead animals." See *LYRE*.

It is generally imagined that there were two *Thoths* or *Mercuries* in Egypt, who lived at very remote periods, but both persons of great abilities. The Egyptians themselves distinguish two *Thoths* or *Hermes*; and yet the histories of the first and second are as much confounded together, as those of *Osiris* and *Sesostris*. *Div. Leg.* book iv. sect. 5.

The Greek Christians had so high an opinion of the antiquity of the first Egyptian Hermes, who lived at Sais, that they supposed him and the antediluvian patriarch Enoch to have been the same person, and give to both the same inventions. We are told likewise, that Manetho extracted his history and dynasties of the Egyptians from certain pillars in Egypt, on which inscriptions had been made by *Thoth* or the first *Mercury*, in the sacred letters before the flood! *Vid. Dodwell Dissert. de Sathon. Fabric. Bib. Gr. Stillingfleet. Orig. Sac. et alios.*

No less than 42 different works are attributed to the Egyptian Hermes by ancient writers; of these the learned and exact Fabricius has collected all the titles. It was usual for the Egyptians, who had the highest veneration for this personage, after his apotheosis, to have his works, which they regarded as their bible, carried about in processions with great pomp and ceremony; and the first that appeared in these solemnities was the chanter, who had two of them in his hands, while others bore symbols of the musical art. It was the business of the chanters to be particularly versed in the two first books of Mercury; one

Hermes.

Chronology,
p. 22.

Hermetical
||
Hermit.

of which contained the hymns to the gods; and the other, maxims of government: 36 of these books comprehended a complete system of Egyptian philosophy; the rest were chiefly upon the subjects of medicine and anatomy.

These books upon theology and medicine are ascribed by Marsham to the second Mercury, the son of Vulcan, who, according to Eusebius, lived a little after Moses; and this author, upon the authority of Manetho, cited by Syncellus, regarded the second Mercury as the Hermes furnished *Trismegistus*. Enough has been said, however, to prove, that the Egyptian Mercuries, both as to the time when they flourished, and their attributes, were widely different from the Grecian Mercury, the son of Jupiter and Maia. See MERCURY.

HERMETICAL PHILOSOPHY, that which undertakes to solve the various phenomena of nature, from the chemical principles salt, sulphur, and mercury.

HERMETICAL Seal, among chemists, a method of stopping glass-vessels used in chemical operations, so closely, that the most subtil spirit cannot escape thro' them.

It is commonly done by heating the neck of the vessel in a flame till ready to melt, and then twisting it closely together with a pair of pincers. Or vessels may be hermetically sealed by stopping them with a glass plug, or by putting one ovum philosophorum over another.

HERMIONE (anc. geog.), a considerable city of Argolis. It was in ruins, except a few temples, in the time of Pausanias; who says that the new city was at the distance of four stadia from the promontory on which the temple of Neptune stood. It gave name to the Sinus Hermionicus, a part of the Sinus Argolicus.

HERMIT, or EREMIT, *Eremita*, a devout person retired into solitude, to be more at leisure for prayer and contemplation, and to disencumber himself of the affairs of this world.—The word is formed from the Greek *ἐρημικός*, *desart*, or *wilderness*; and, according to the etymology, should rather be wrote *Eremit*.

Paul furnished the *hermit* is usually reckoned the first hermit; though St Jerome at the beginning of the life of that saint says, it is not known who was the first.—Some go back to John the Baptist, others to Elias: others make St Anthony the founder of the eremitical life; but others think that he only rekindled and heightened the fervour thereof, and hold that the disciples of that saint owned St Paul of Thebes for the first that practised it. The persecutions of Decius and Valerian are supposed to have been the occasion.—A hermit is not reputed a religious, unless he have made the vows.

HERMIT (Gaytier Peter the), a French officer of Amiens in Picardy, who quitted the military profession, and commenced hermit and pilgrim. Unfortunately, he travelled to the Holy Land about the year 1093; and making a melancholy recital of the deplorable situation of a few Christians in that country to Pope Urban II. and at the same time enthusiastically lamenting that Infidels should be in possession of the famous city where the Author of Christianity first promulgated his sacred doctrines, Urban gave him a fatal commis-

sion to excite all Christian princes to a general war against the Turks and Saracens the possessors of the Holy Land. See CRUSADES.

HERMOGENES, the first and most celebrated architect of antiquity, was, according to Vitruvius, born at Alabanda, a city in Caria. He built a temple of Diana at Magnesia; another of Bacchus at Tros; and was the inventor of several parts of architecture. He composed a book on the subject, which is lost.

HERMOGENES *Tarsensis*, a rhetorician and orator, and who was in every respect a prodigy. At 17 years of age he published his system of rhetoric, and at 20 his philosophic ideas: but at 25 he forgot every thing he had known. It is said, that his body being opened after his death, his heart was found of an extraordinary size, and all over hairy. He died about 168 B. C.

HERMON, or AERMON (anc. geog.); a mountain of the Amorites, called *Sanior* by the Phenicians, and *Sanir* or *Senir* by the Amorites on the east of Jordan. It is also called *Sion*, (Moses); but must not be confounded with the Sion of Jerusalem. By the Sidonians it was called *Scirion*; in the vulgate, it is called *Sarion*. Joshua informs us, that it was the dominion of Og king of Bashan; which must be understood of its south side. It is never particularly mentioned by profane writers; being comprised under the appellation *Libanus*, or *Antilibanus*, with which mountain it is joined to the east. It is also called *Hermontin* plurally, Psalm xlii. 6. because it was extensive, and contained several mountains.

HERMUS, (anc. geog.), a river of Ionia; which rising near Dorylæum, a town of Phrygia, in a mountain sacred to Dindymene or Cybele, touched Myſia, and ran through the Regio Combusta, then through the plains of Smyrna down to the sea, carrying along with it the Pactolus, Hyllus, and other less noble rivers. Its waters were said to roll down gold, by Virgil and other poets.

HERNANDRIA, JACK-IN-A-BOX TREE; a genus of the triandria order, belonging to the monœcia class of plants.

Species. 1. The sonora, or common jack-in-a-box, is a native of the West Indies. It grows 20 or 30 feet high; and is garnished with broad peltated leaves, and monœcious flowers, succeeded by a large swollen hollow fruit formed of the calix; having a hole or open at the end, and a hard nut within. The wind blowing into the cavity of this fruit makes a very whistling and rattling noise, whence comes the name. 2. The ovigera grows many feet high, garnished with large oval leaves not peltated; and monœcious flowers, succeeded by a swollen fruit open at the end, and a nut within.

Culture. Both these plants being tender exotics, must be planted in pots of rich earth, and always kept in a hot-house; in which, notwithstanding all the care that can be taken, they seldom flower, and never grow beyond the height of common shrubs, tho' in the places where they are natives they arrive at the height of trees. They are propagated by seeds procured from the West Indies.

HERNIA, in medicine. See (the *Index* subjoined to) MEDICINE, and SURGERY.

Her-
mo-
genes
||
Hernandria.

Herniaria
Herodians.

HERNIARIA, RUPTURE-WORT; a genus of the digynia order, belonging to the pentandria class of plants.

Species. There are four species, of which the only remarkable one is the glabra, or smooth rupture-wort, a native of many parts of England. It is a low trailing plant, with leaves like the smaller chickweed; the flowers come out in clusters from the side of the stalks at the joints, and are of a yellowish green colour.

Uses, &c. This plant is a little falsh and astringent. The juice takes away specks in the eye. Cows, sheep, and horses, eat the plant; goats and swine refuse it.

HERO, in Pagan mythology, a great and illustrious person, of a mortal nature, though supposed by the populace to partake of immortality, and after his death to be placed among the number of the gods. The word is formed of the Latin *heros*, and that of the Greek *ἥρως*, *seni-deus*, "demi-god."

HERO, in fabulous history, a famous priestess of Venus, lived at Abydos, in a tower situated on the banks of the Hellespont. She being beloved by Leander, who lived at Sestos on the other side of the strait, he every night swam over to visit her, being directed by a light fixed on the tower. But the light being put out in a stormy night, the youth missed his way, and was drowned; on which Hero threw herself into the sea, and perished.

HERO, the name of two celebrated Greek mathematicians; the one called the *old*, and the other the *young*, *Hero*. The younger was a disciple of Ctesibius. They are known by two works translated into Latin by Barochius: *Spiralium liber*, by Hero senior; and *Tractat. artis et machin. militar.* by Hero junior. They flourished about 130 and 100 B. C.

HEROD, falsely styled the *Great*, king and excrable tyrant of Judaea; who, on the strength of a misinterpreted prophecy, caused all the male children of Bethlehem and its neighbourhood, to be massacred by his soldiers at the time of the birth of Christ, in the vain hope of destroying the Saviour of mankind. He died, eaten with worms, two or three years after the birth of our Saviour, at the age of 71, after a reign of 40 years. He had ordered that all the persons of quality, whom he kept in prison, should be massacred the moment the breath was out of his body, in order that every considerable family in the kingdom might shed tears at his death; but that inhuman order was not executed.

HERODIAN, an eminent Greek historian, who spent the greatest part of his life at Rome, flourished in the third century, in the reigns of Severus, Caracalla, Heliogabalus, Alexander, and Maximin. His history begins from the death of Marcus Aurelius the philosopher; and ends with the death of Balbinus and Maximin, and the beginning of the reign of Gordian. It is wrote in very elegant Greek; and there is an excellent translation of it into Latin, by Angelus Politianus. Herodian has been published by Henry Stephens in 4to, in 1581; by Boecler, at Strasburg, in 1662, 8vo; and by Hudson, at Oxford, in 1699, 8vo.

HERODIANS, a sect among the Jews at the time of our Saviour; mentioned Math. xxii. 16. Mark iii. 6.

The critics and commentators are very much divided

with regard to the Herodians. St Jerom, in his Dialogue against the Luciferians, takes the name to have been given to such as owned Herod for the Messiah; and Tertullian and Epiphanius are of the same opinion. But the same Jerom, in his Comment on St Matthew, treats this opinion as ridiculous; and maintains, that the Pharisees gave this appellation by way of ridicule to Herod's soldiers who paid tribute to the Romans; agreeable to which the Syrian interpreters render the word by the *domestics of Herod*, i. e. "his courtiers." M. Simon, in his notes on the 22d chapter of Matthew, advances a more probable opinion. The name *Herodian* he imagines to have been given to such as adhered to Herod's party and interest; and were for preserving the government in his family, about which were great divisions among the Jews.—F. Hardouin will have the Herodians and Sadducees to have been the same.

HERODOTUS, an ancient Greek historian of Halicarnassus in Caria, son of Lyxus and Dryo, was born in the first year of the 74th Olympiad, that is, about 484 B. C. The city of Halicarnassus being at that time under the tyranny of Lygdamis grandson of Artemisia queen of Caria, Herodotus quitted his country and retired to Samos; from whence he travelled over Egypt, Greece, Italy, &c. and in his travels acquired the knowledge of the history and origin of many nations. He then began to digest the materials he had collected into order, and composed that history which has preserved his name among men ever since. He wrote it in the Isle of Samos, according to the general opinion.—Lucian informs us, that when Herodotus left Caria to go into Greece, he began to consider with himself,

What he should do to be for ever known
And make the age to come his own,

in the most expeditious way, and with as little trouble as possible. His history, he presumed, would easily procure him fame, and raise his name among the Grecians in whose favour it was written; but then he foresaw that it would be very tedious to go through the several cities of Greece, and recite it to each respective city; to the Athenians, Corinthians, Argives, Lacedaemonians, &c. He thought it most proper therefore to take the opportunity of their assembling all together; and accordingly recited his work at the Olympic games, which rendered him more famous than even those who had obtained the prizes. None were ignorant of his name, nor was there a single person in Greece who had not seen him at the Olympic games, or heard those speak of him who had seen him there.

His work is divided into nine books; which, according to the computation of Dionysius Halicarnassensis, contain the most remarkable occurrences within a period of 240 years; from the reign of Cyrus the first king of Persia, to that of Xerxes when the historian was living. These nine books are called after the names of the nine muses, each book being distinguished by the name of a muse; and this has given birth to two disquisitions among the learned: 1. Whether they were so called by Herodotus himself; and, 2. For what reason they were so called. As to the first, it is generally agreed that Herodotus did not impose these names himself; but it is not agreed why they were imposed:

Heroic,
Heron.

imposed by others. Lucian tells us, that these names were given them by the Grecians at the Olympic games, when they were first recited, as the best compliment that could be paid the man who had taken pains to do them so much honour. Others have thought that the names of the *muses* have been fixed upon them by way of reproach; and were designed to intimate, that Herodotus, instead of true history, had written a great deal of fable. But, be this as it will, it is certain, that, with regard to the truth of his history, he is accused by several authors; and, on the other hand, he has not wanted persons to defend him. Aldus Manutius, Joachim Camerarius, and Henry Stephens, have written apologies for him; and, among other things, have very justly observed, that he seldom relates any thing of doubtful credit without producing the authority on which his narration is founded; and, if he has no certain authority to fix it upon, uses always the terms *ut ferunt, ut ego audio, &c.*

There is ascribed also to Herodotus, but falsely, a *Life of Homer*, which is usually printed at the end of his work.—He wrote in the Ionic dialect, and his style and manner have ever been admired by all people of taste. There have been several editions of the works of this historian; two by Henry Stephens, one in 1570, and the other in 1592; one by Gale at London in 1679; and one by Gronovius at Leyden in 1715, which is the last and best, though not the best printed.

HEROIC POEM, that which describes some extraordinary enterprise; being the same with *EPIC* poem.

HEROIC Verse, that wherein heroic poems are usually composed, or it is that proper for such poems. In the Greek and Latin, hexameter verses are usually denominated heroic verses, as being those only used by *mer*, Virgil, &c. See **POETRY**, n^o 116—124.

HERON, in ornithology. See **ARDEA**.

This bird is a very great devourer of fish, and will do more mischief to a pond than even an otter. Some say that an heron will destroy more fish in a week than an otter will in three months; but that seems carrying the matter too far. People who have kept herons, have had the curiosity to number out the fish they fed them with into a tub of water; and counting them again afterwards, it has been found, that a heron will eat 50 moderate sized dace and roaches in a day. It has been found, that in carp-ponds visited by this bird, one heron will eat up 1000 fere carp in a year, and will hunt them so close that very few can escape. The readiest method of destroying this mischievous bird is by fishing for him in the manner of pike, with a baited hook. When the haunt of the heron is found out, three or four small roach or dace are to be procured, and each of them is to be baited on a wire with a strong hook at the end; entering the wire just under the gills, and letting it run just under the skin to the tail: the fish will live in this condition five or six days, which is a very essential thing; for if it is dead, the heron will not touch it. A strong line, about two yards long, is then to be prepared of silk and wire twisted together; tie this to the wire that holds the hook; and to the other end there is to be tied a stone of about a pound weight. Let three or four of these baits be sunk in different shallow parts of the pond, and in a night or two the heron will not fail of being taken by one or other of them.—When hawking was in use,

the heron afforded a great deal of sport to people who loved that diversion. There is but very little art in this flight of the hawk; but as both birds are large and courageous, the flight is finer than in the flight of smaller birds that make no resistance.

HERPES, in medicine, a bilious pustule, which breaking out in different manners upon the skin, accordingly receives different denominations. See (the *Index* subjoined to) **MEDICINE**.

HERRERA TORDESILLAS (Anthony), a Spanish historian, was secretary to Vespasian Gonzaga viceroy of Naples, and afterwards historiographer of the Indies, under king Philip II. who allowed him a considerable pension. He wrote a general history of the Indies, in Spanish, from 1492 to 1554; and of the world (not so much esteemed), from 1554 to 1598. He died in 1625, aged about 66.

HERRERA (Ferdinand de), an eminent Spanish poet, of the 16th century, was born at Seville, and principally succeeded in the lyric kind. Besides his poems, he wrote notes on Garcilasso de la Vega, and an account of the war of Cyprus and the battle of Lepanto, &c.

HERRING, in ichthyology. See **CLUPEA**.

HERRING (Thomas), archbishop of Canterbury, was the son of the rev. Mr John Herring, rector of Walsoken in Norfolk, where he was born in 1693. He was educated at Jesus-college, Cambridge; was afterwards chosen fellow of Corpus Christi college, and continued a tutor there upwards of seven years. Having entered into priest's orders in 1719, he was successively minister of Great Shelford, Stow cum Qui, and Trinity, in Cambridge; chaplain to Dr Fleetwood, bishop of Ely; rector of Rettingdon in Essex, and of Barly in Hertfordshire; preacher to the Society of Lincoln's Inn, chaplain in ordinary to his late majesty, rector of Blechingly in Surry, and dean of Rochester. In 1737 he was consecrated bishop of Bangor, and in 1743 translated to the archiepiscopal see of York. When the late rebellion broke out in Scotland, and the king's troops were defeated by the Highlanders at Prestonpans, he distinguished himself by removing the general panic, and awakening the nation from its lethargy. He convened the nobility, gentry, and clergy of his diocese; and addressed them in a noble speech, which had such an effect upon his auditory, that a subscription ensued, to the amount of forty thousand pounds; and the example was followed by the nation in general. On the death of Dr Potter in 1747, he was translated to the see of Canterbury; but in 1753, was seized with a violent fever, which brought him to the brink of the grave; and after languishing about four years, he died on the 13th of March 1757. He expended upwards of six thousand pounds in repairing and adorning the palaces of Croydon and Lambeth. This worthy prelate, in a most eminent degree, possessed the virtues of public life; his mind was filled with unaffected piety and benevolence, he was an excellent preacher, and a true friend to religious and civil liberty. After his death was published a volume of his sermons on public occasions.

HERSE, in fortification, a lattice, or portcullis, in form of an harrow, beset with iron-spikes. The word *herse* is French, and literally signifies "harrow;" being

Herpes
Heric.

Hefe
Hesbon.

being formed of the Latin *herpes* (or *irpex*), which denotes the same.

It is usually hung by a rope fastened to a moulinet; to be cut, in case of surprize, or when the first gate is broken with a petard, that the herfe may fall, and stop up the passage of the gate or other entrance of a fortrefs.

The herfe is otherwise called a *sarrafin*, or *catacraft*; and when it consists of straight stakes, without any cross-pieces, it is called *orgues*.

HERSE, is also a harrow, which the besieged, for want of chevaux de frise, lay in the way, or in breaches, with the points up, to incommode the march as well of the horse as of the infantry.

HERSILLON, in the military art, a fort of plank, or beam, ten or twelve feet long, whose two sides are drove full of spikes or nails, to incommode the march of the infantry or cavalry. The word is a diminutive of *herfe*; the hersillon doing the office of a little herfe. See HERSE.

HERTZBERG, a considerable town of Germany, in the electorate of Saxony, and on the confines of Lusatia. E. Lon. 13. 37. N. Lat. 51. 42.

HERVEY (James), a late divine of exemplary piety, was born in 1714, and succeeded his father in the livings of Weston Favell and Collingtree in Northamptonshire. These being within five miles of each other, he attended alternately with his curate; till being confined by his ill health, he resided constantly at Weston; where he diligently pursued the labours of the ministry and his study, under the disadvantage of a weak constitution. He was remarkably charitable; and desired to die just even with the world, and to be, as he termed it, his own executor. This excellent divine died on Christmas-day 1758, leaving the little he possessed to buy warm clothing for the poor in that severe season.—No work is more generally or deservedly known than his *Meditations and Contemplations*: containing, Meditations among the tombs, reflections on a flower-garden, a descent on creation, contemplations on the night and starry heavens, and a winter-piece. The sublime sentiments in these pieces have the peculiar advantage of being conveyed in a flowing elegant language, and they have accordingly gone through many editions. He published besides, *Remarks on Lord Bolingbroke's letters on history*; *Theron and Aspasio*, or a series of dialogues and letters on the most important subjects; some sermons, and other tracts.

HERVEY Island, one of the south-sea islands, discovered by captain Cook September 23d 1773, who gave it that name in honour of the earl of Bristol. It is a low island, situated in W. Lon. 158. 54. S. Lat. 19. 8.

HESBON, ESEBON, or *Hesbon*, (anc. geog.), the royal city of the Amorites, in the tribe of Reuben, according to Moses: Though in Joshua xxi. 39. where it is reckoned among the Levitical cities, it is put in the tribe of Gad; which argues its situation to be on the confines of both. It is thus determined by Jerome, who says, that in his time it was called *Ejbus*. A considerable city, in the mountains of Arabia, which lie over against Jericho, distant 20 miles from the Jordan; not indeed in the same latitude with Jericho, but somewhat more to the north, because situated on the

borders of the Gadites; and called a city of Arabia, because the Arabs were at that time possessed of the Lower Petraea.

HESIOD, a very ancient Greek poet; but whether cotemporary with Homer, or a little older or younger than him, is not yet agreed among the learned; nor is there light enough in antiquity to settle the matter exactly. His father, as he tells us in his *Opera et dies*, was an inhabitant of Cuma, one of the Eolian isles, now called *Taio Novas*; and removed from thence to Ascra, a little village of Boeotia, at the foot of mount Helicon, where Hesiod was probably born, and called, as he often is, *Ascreus*, from it. Of what quality his father was, is nowhere said; but that he was driven by his misfortunes from Cumæ to Ascra, Hesiod himself informs us. His father seems to have prospered better at Ascra than he did in his own country; yet Hesiod could arrive at no higher fortune than keeping sheep on the top of mount Helicon. Here the muses met with him, and entered him into their service:

Erewhile as they the shepherd-swain behold,
Feeding beneath the sacred mount his fold,
With love of charming song his breast they fir'd,
There me the heav'nly muses first inspir'd;
There, when the maids of Jove the silence broke.
To Hesiod thus, the shepherd-swain, they spoke, &c.

To this account, which is to be found in the beginning of his *Generatio Deorum*, Ovid alludes in these two lines:

Nec mihi sunt iuste Clío, Clisq; sorores.
Servant pœdæ vallibus Ascræ tuis.
Nor Clío nor her sisters have I seen,
As Hesiod saw them in th' Ascræan green.

On the death of the father, an estate was left, which ought to have been equally divided between the two brothers Hesiod and Peres; but Peres defrauded him in the division, by corrupting the judges. Hesiod was so far from resenting this injustice, that he expresses a concern for those mistaken mortals who place their happiness in riches only, even at the expence of their virtue. He lets us know, that he was not only above want, but capable of assisting his brother in time of need; which he often did, though he had been so ill used by him. The last circumstance he mentions relating to himself is his conquest in a poetical contention. Archidamus, king of Eubœa, had instituted funeral games in honour of his own memory, which his sons afterwards took care to have performed. Here Hesiod was a competitor for the prize in poetry; and won a tripod, which he consecrated to the muses.

Hesiod having entered himself in the service of the muses, left off the pastoral life, and applied himself to the study of arts and learning. When he was grown old, for it is agreed by all that he lived to a very great age, he removed to Locria, a town about the same distance from mount Parnassus as Ascra was from Helicon. His death was tragical. The man with whom he lived at Locris, a Milesian born, ravished a maid in the same house; and though Hesiod was entirely ignorant of the fact, yet being maliciously accused to her brothers as an accomplice, he was injuriously slain with the ravisher, and thrown into the sea.

The *Theogony*, and *Works and Days*, are the only undoubted.

Hesper
Hesperis.

undoubted pieces of this poet now extant : though it is supposed that these poems have not defended perfect and finished to the present time. A good edition of Hesiod's works was published by Mr Le Clerc at Amsterdam in 1701.

HESPER, an appellation given to the planet Venus when she sets after the sun. See HESPERUS.

HESPERIA, an ancient name of Italy ; so called by the Greeks from its western situation. *Hesperia* was also an appellation of Spain ; but with the epithet *ultima* (Horace), to distinguish it from Italy, which is called *Hesperia magna* (Virgil), from its extent of empire.

HESPERI CORNU, called the *Great Bay* by the author of Hanno's Periplus : but most interpreters, following Mela, understand a promontory ; some Cape Verd, others *Palmar Cape* : Vossius takes it to be the former, since Hanno did not proceed so far as the latter cape.

HESPERIDEÆ (from the *Hesperides*, whose orchards are said to have produced golden apples), *golden or precious fruit* : The name of the 19th order in Linnaeus's fragments of a natural method. See BOTANY, p. 1308.

HESPERIDES, in the ancient mythology, were the daughters of Hesper, or Hesperus, brother of Atlas. The Hesperides were three in number, *Ægle*, *Arethusa*, and *Hesperia*.—Hesiod, in his Theogony, makes them the daughters of Nox, night ; and seats them in the same place with the Gorgons, viz. at the extremities of the west, near mount Atlas : it is on that account he makes them the daughters of Night, by reason the sun sets there.

The Hesperides are represented by the ancients, as having the keeping of certain golden apples, on t'other side the ocean. The poets give them a dragon to watch the garden where the fruit grows : this dragon Hercules slew, and carried off the apples.

Pliny and Solinus will have the dragon to be no other than an arm of the sea, wherewith the garden was encompassed, and which defended the entrance thereof. And Varro supposes that the golden apples were nothing but sheep. Others, with more probability, say they were oranges.

HESPERIDUM INSULÆ, (anc. geog.), islands near the Hesperii Cornu ; but the accounts of them are so much involved in fable, that nothing certain can be affirmed of them.

HESPERIS, ROCKET, *Dame's violet*, or *queen's gilliflowers* ; a genus of the siliquosa order, belonging to the tetradynamia class of plants.

Species 1. The matronalis, or common sweet scented garden-rocket hath fibrous roots, crowned with a tuft of long, spear-shaped, rough leaves ; upright, single, hairy stalks two feet high ; garnished with oval, lanceolate, slightly indented, close-fitting leaves ; and the stalk and branches terminated by large and long spikes of sweet-scented flowers of different colours and properties in the varieties, of which there are a great number. All the varieties of this species are so remarkable for imparting a fragrant odour, that the ladies were fond of having them in their apartments. Hence they derived the name of *dame's violet* ; and, bearing some resemblance to a stock-gilliflower, were sometimes also called *queen's gilliflowers* ; but are now

most commonly called *rocket*. 2. The inedora, or scentless rocket, hath a fibrous root ; upright, round, firm stalks, two feet high, garnished with spear-shaped, acute-pointed, sharply indented, close-fitting leaves ; and all the branches terminated by large spikes of scentless flowers, with obtuse petals, of different colours and properties in the varieties. This species makes a fine appearance, but hath no scent. 3. The tristis, or dull-flowered night-smelling rocket, hath fibrous roots ; upright, branching, spreading, bristly stalks, two feet high ; spear-shaped pointed leaves ; and spikes of pale purple flowers, of great fragrance in the evening.

Culture. All the species are hardy, especially the first and second, which prosper in any of the open borders, and any common garden-soil ; but the third, being rather impatient of a severe frost, and of much moisture in winter, should have a dry warm situation, and a few may be placed in pots to be sheltered in case of inclement weather. They may be propagated either by seeds, by offsets, or by cuttings of the stalks.

HESPERUS, in fabulous history, son of Cephalus by Aurora, as fair as Venus, was changed into a star, called *Lucifer* in the morning, and *Hesperus* in the evening. See HESPER.

HESSE, a country of Germany, in the circle of the Upper Rhine ; bounded on the south by the bishopric of Fulda ; on the east, by the principality of Hersfeld, Thuringia, and Eichsfeld, as also by that of Calenberg ; on the north, by the bishopric of Paderborn, and Waldeck, the duchy of Westphalia, and the county of Witgenstein ; and on the west, by Nassau-Dillenburg, the county of Solms, and Upper-Isenburg. In the above limits, the county of Katzenelnbogen and some other territories are not included. The whole country, in its utmost length, is near 100 miles, and in some places near as much in breadth. The air is cold, but wholesome ; and the soil fruitful in corn, wine, wood, and pasture. The country abounds also in cattle, fish, and game ; salt-springs, baths, and mineral waters. The hills, which are many, yield silver, copper, lead, iron, alum, vitriol, pit-coal, sulphur, boles, a porcelain earth, marble, and alabaster. In the Eder, gold is sometimes found ; and at Frankenberg a gold mine was formerly wrought. Besides many lesser streams, Hesse is watered by the following rivers, viz. the Lahn, the Fulda, the Eder or Schwalm, the Werra or Weser, and Diemel. The Rhine also and the Mayne pass through the country of Katzenelnbogen. This country, like most others in Germany, has its states, consisting of the *prelates*, as they are called, the nobility, and the towns. The diets are divided into general and particular, and the latter into the greater and smaller committees. The house of Hesse is divided into two principal branches, viz. Cassel and Darmstadt, of which Philippsdale, Rhinfels, and Homburg, are collateral branches ; the two first of Hesse-Cassel, and the last of Hesse-Darmstadt. Their rights and privileges are very considerable. In particular, they have several votes at the diets of the empire ; and caufes, not exceeding 1000 florins, are determined by the courts of the country, without appeal. The princes of Hesse-Cassel are not of age till they are 25, but those of Hesse-Darmstadt are so at 18. The right of primogeniture hath been established in both

Hesperis.
Hesse.

Hesse
|
Heterogeneous.Heteroscii,
Hevelius.

both houses. The revenues of Darmstadt are said to amount to near 100,000*l.* a year, and those of Hesse-Cassel to near 200,000*l.* The small county of Schaumburg alone yields a revenue of 10,000*l.* and that of Katzenellenbogen, with the forests of Richardswalde, it is said, was farmed near 200 years ago at 12,000*l.* The prince of Hesse-Cassel has 40 or 50,000 men in his dominions fit to bear arms; and the troops that he hires out have often brought him in large sums, especially from Great Britain. The branches of Cassel, Homburg, and Philippsdale, are Calvinists; that of Darmstadt, Lutherans; and that of Rhinfeldts, Roman-catholics. The present prince of Hesse-Cassel, indeed, in the year 1749, embraced the Roman-catholic religion; but in 1754 drew up, and confirmed by oath, an instrument, of which all the Protestant princes are guaranties, declaring, that the established religion of his dominions should continue in every respect as before, and that his children should be brought up and instructed therein. Here, as in the other Protestant Lutheran countries of Germany, are consistories, superintendents, and inspectors of the church. In the whole landgraviate are three universities, besides Latin schools and gymnasia, for the education of youth. The manufactures of Hesse are linen cloth, hats, stockings, gloves, paper, goldsmiths wares, and at Cassel a beautiful porcelain is made. They have also the finest wool in Germany; but are reproached with want of industry, in exporting instead of manufacturing it themselves.—This is supposed to have been the country of the ancient Catti, mentioned by Tacitus, &c. who, in after-ages, were called *Chatti*, *Chassi*, *Hassi*, and *Hessi*. The two chief branches of Cassel and Darmstadt have many rights and privileges in common, which we have not room to specify. Both of them have a seat and vote in the college of princes at the diet of the empire, and those of this circle. Each of these princes, besides their guards and militia, maintains a considerable body both of horse and foot.

HESYCHIUS, the most celebrated of all the ancient Greek grammarians whose works are now extant, was a Christian; and, according to some, the same with Hefychius patriarch of Jerusalem, who died in 609. He wrote a Greek lexicon; which, in the opinion of Casaubon, is the most learned and useful work of that kind produced by the ancients. Schrevelius published a good edition of it in 1668, in 4to, with notes; but the best is that of John Alberti, printed at Leyden in 1746, in two vols folio.

HETEROCLITE, among grammarians, one of the three variations in irregular nouns, and defined by Mr Ruddiman, a noun that varies in its declension; as *hoc vas, vasis; hac vasa, vasorum*.

HETERODOX, in polemical theology, any thing contrary to the faith and doctrines of a church.

HETEROGENEITY, in physiology, that quality or property of bodies which denominates a thing heterogeneous.

HETEROGENEOUS, or **HETEROGENEAL**, something that consists of parts of dissimilar kinds, in opposition to *homogeneous*.

HETEROGENEOUS Light, is, by Sir Isaac Newton, said to be that which consists of rays of different degrees of refrangibility: thus the common light of the sun or clouds is heterogeneous, being a mixture of all

sorts of rays.

HETEROGENEOUS Nouns, one of the three variations in irregular nouns; or such as are of one gender in the singular number, and of another in the plural.—Heterogeneous, under which are comprehended mixed nouns, are six-fold. 1. Those which are of the masculine gender in the singular number, and neuter in the plural; as *hic tartarus, hec tartara*. 2. Those which are masculine in the singular number, but masculine and neuter in the plural; as *hic locus, hi loci, & hec loca*. 3. Such as are feminine in the singular number, but neuter in the plural; as *hec carbasis, & hec carbasa*. 4. Such nouns as are neuter in the singular number, but masculine in the plural; as *hec calum, hi cali*. 5. Such as are neuter in the singular, but neuter and masculine in the plural; as *hec rastrum, hi rastri, & hec rastra*; and, 6. Such as are neuter in the singular, but feminine in the plural number; as *hec epulum, he epule*.

HETEROSCII, in geography, a term of relation, denoting such inhabitants of the earth as have their shadows falling but one way, as those who live between the tropics and polar circles; whose shadows at noon in north latitude are always to the northward, and in south latitude to the southward.

HEVELIUS, or **HEVELKE**, (John), an eminent astronomer, was born at Dantzig in 1611. He studied in Germany, England, and France, and every where obtained the esteem of the learned. He was the first that discovered a kind of libration in the moon, and made several important observations on the other planets. He also discovered several fixed stars, which he named the *firmament of Sobieski*, in honour of John III. king of Poland. His wife was also well skilled in astronomy, and made a part of the observations published by her husband. In 1673, he published, A description of the instruments with which he made his observations, under the title of *Machina Cælestis*: and in 1679, he published the second part of this work; but in September the same year, while he was at a seat in the country, he had the misfortune to have his house at Dantzig burnt down. By this calamity he is said to have sustained a loss of several thousand pounds; having not only his observatory and all his valuable instruments and apparatus destroyed; but also a great number of copies of his *Machina Cælestis*; which accident has made this second part very scarce, and consequently very dear. In the year 1690 were published, “*Firmamentum Sobiescianum*,” and “*Prodromus astronomice & novæ tabulæ solares, una cum catalogo fixarum*,” in which he lays down the necessary preliminaries for taking an exact catalogue of the stars. But both these works are posthumous; for Hevelius died in 1687, on his birth-day, aged 76. He was a man greatly esteemed by his countrymen, not only on account of his great reputation and skill in astronomy, but as a very excellent and worthy magistrate. He was made a burgo-master of Dantzig; which office he is said to have executed with the utmost integrity and applause. He was also very highly esteemed by foreigners; and not only by those skilled in astronomy and the sciences, but by foreign princes and potentates: as appears abundantly from a collection of their letters which were printed at Dantzig in the year 1683.

Heurnius
Hexham.

HEURNIUS, or **VAN HEURN**, (John), a learned physician, was born at Utrecht, in 1543; and studied at Louvain, Paris, Padua, and Pavia. At his return to his native country he became magistrate of Amsterdam; after which he was professor of physic at Leyden, and rector of the university of that city, where he died in 1601. He wrote, among other works, several treatises on the diseases of different parts of the body, and several commentaries on the works of Hippocrates.—*Otho Heurnius*, his son, was also professor of physic at Leyden, and wrote some books.

HEUSDEN, a strong town of the United Provinces in Holland, seated on the river Maese among marshes, with a handsome castle, in E. Long. 5. 3. N. Lat. 51. 47.

HEWSON (William), a very ingenious anatomist, was born in 1739. He became assistant to Dr Hunter, and was afterwards in partnership with him; but, on their disagreement, read anatomical lectures at his own house (in which he was seconded by Mr Falconer). He wrote *Inquiries into the properties of the blood, and the lymphatic system*, 2 vols; and disputed with Dr Monro the discovery of the lymphatic system of vessels in oviparous animals. He died in 1774.

HEXACHORD, in ancient music, a concord called by the moderns a *sixth*.

HEXAGON, in geometry, a figure of six sides and angles; and if these sides and angles are equal, it is called a *regular hexagon*.

HEXAEDRON, in geometry, one of the five platonic bodies, or regular solids, being the same with a cube.

HEXAMETER, in ancient poetry, a kind of verse consisting of six feet; the first four of which may be indifferently either spondees or dactyls; the fifth is generally a dactyl, and the sixth always a spondee. Such is the following verse of Horace:

1 2 3 4 5 6
Aut prodeſſe volunt. aut deleſtare poeta.

HEXANDRIA, in botany, (from *ἕξ*, “six;” and *ἄντρον*, “a man;”) the name of the sixth class in Linnæus’s sexual method, consisting of plants with hermaphrodite flowers, which are furnished with six stamina or male organs, that are of an equal length. See *BOTANY*, p. 1292.

HEXASTYLE, in architecture, a building with six columns in front.

HEXHAM, a town of Northumberland. It is commonly reckoned to be the *Alexodunum* of the Romans, where the first cohort of the Spaniards were in garrison. It was made a bishop’s see by Etheldreda, wife of king of Egfred, in the year 675. Its first bishop, St Wilfred, built here a most magnificent cathedral and monastery, and it was possessed by seven bishops successively; but being very much infested by the Danes, the see was removed to York. The town is at present well built, and its market is pretty good for corn. There was a remarkable and bloody battle fought near this town, between the houses of Lancaster and York, wherein the former were defeated, chiefly by the extraordinary bravery and conduct of John Nevil, lord Montacute, who was for that reason created earl of Northumberland. W. Long. 1. 37. N. Lat. 55. 5.

HEYDON, a little, pleasant, well-built town of

Yorkshire, in that part called *Holderneſſe*, seated on a river that falls into the Humber. It has now but one church, tho’ there are the remains of two more; and had formerly a considerable trade, which is now lost, on account of its being far near Hull. The houses being rebuilt, adds to the beauty of the place. It is a corporation; and is governed by a mayor, a recorder, nine aldermen, and two bailiffs, who have the power of choosing sheriffs, and are justices of the peace. It sends two members to parliament. W. Long. 0. 55. N. Lat. 53. 46.

HEYDON (John), who sometimes assumed the name of *Eugenius Theodidactus*, was a great pretender to skill in the Rosicrucian philosophy and the celestial signs, in the reign of king Charles I.; and wrote a considerable number of chemical and astrological works, with very singular titles. This ridiculous author was much referred to by the duke of Buckingham, who was infatuated with judicial astrology. He employed him to calculate the king’s and his own nativity, and was assured that his stars had promised him great things. The duke also employed Heydon in some treasonable and seditious practices, for which he was sent to the tower. He lost much of his former reputation by telling Richard Cromwell and Thurloe, who went to him disguised like cavaliers, That Oliver would infallibly be hanged by a certain time; which he out-lived several years.

HEYLIN (Dr Peter), an eminent English writer, was born at Burford, in Oxfordshire, in 1600. He studied at Hart-hall, Oxford; where he took his degrees in arts and divinity, and became an able geographer and historian. He was appointed one of the chaplains in ordinary to king Charles I. was presented to the rectory of Hemingford in Huntingdonshire, made a prebendary of Westminster, and obtained several other livings: but of these he was deprived by the parliament, who also sequestered his estate; by which means he and his family were reduced to great necessity. However, upon the restoration, he was restored to his spiritualities; but never rose higher than to be subdean of Westminster. He died in 1662; and was interred in St Peter’s church in Westminster, where he had a neat monument erected to his memory. His writings are very numerous: the principal of which are, 1. *Microcosmus*, or a description of the great world. 2. *Cosmographia*. 3. The history of St George. 4. *Ecclesia vindicata*, or the church of England justified. 5. Historical and miscellaneous tracts, &c.

HEYWOOD (John), one of our most ancient dramatic poets, was born at North-Mims, near St Alban’s in Hertfordshire, and educated at Oxford. From thence he retired to the place of his nativity; where he had the good fortune to become acquainted with Sir Thomas More, who, it seems, had a seat in that neighbourhood. This patron of genius introduced our comic poet to the princeſs Mary, and afterwards to her father Henry, who, we are told, was much delighted with his wit, and skill in music, and by whom he was frequently rewarded. When his former patroness, queen Mary, came to the crown, Heywood became a favourite at court, and continued often to entertain her majesty, exercising his fancy before her, even to the time that she lay languishing on her death-bed.

Heydon
Heywood.

Heywood,
Hiatus.

bed. On the accession of Elizabeth, being a zealous Papist, he thought fit to decamp, with other favourites of her deceased majesty. He settled at Mechlin in Flanders, where he died in the year 1565.—John Heywood was a man of no great learning, nor were his poetical talents by any means extraordinary; but he possessed talents of more importance in the times in which he lived, namely, the talents of a jester. He wrote several plays; 500 epigrams; *A dialogue in verse concerning English proverbs*; and *The spider and fly, a parable*, a thick 4to. Before the title of this last work is a whole-length wooden print of the author; who is also represented at the head of every chapter in the book, of which there are 77.—He left two sons, who both became Jesuits and eminent men: viz. Ellis Heywood, who continued some time at Florence under the patronage of cardinal Pole, and became so good a master of the Italian tongue, as to write a treatise in that language, entitled *Il Moro*; he died at Louvain about the year 1572. His other son was Jasper Heywood, who was obliged to resign a fellowship at Oxford on account of his immorality: he translated three tragedies of Seneca, and wrote various poems and devices; some of which were printed in a volume, intitled, *The paradise of dainty devices*, 4to. 1573. He died at Naples in 1597.

HEYWOOD (Eliza), one of the most voluminous novel writers this island ever produced; of whom we know no more than that her father was a tradesman, and that she was born about the year 1696. In the early part of her life, her pen, whether to gratify her own disposition or the prevailing taste, dealt chiefly in licentious tales, and memoirs of personal scandal: the celebrated Atalantis of Mrs Manley served her for a model; and *The court of Carimania*, *The new Utopia*, with some other pieces of a like nature, were the copies her genius produced. She also attempted dramatic writing and performance, but did not succeed in either. Whatever it was that provoked the resentment of Pope, he gave full scope to it by distinguishing her as one of the prizes to be gained in the games introduced in honour of Dullness, in his Dunciad. Nevertheless, it seems undeniable, that there is much spirit, and much ingenuity, in her manner of treating subjects, which the friends of virtue may perhaps wish she had never meddled with at all. But, whatever offence she may have given to delicacy or morality in her early works, she appears to have been soon convinced of, and endeavoured to atone for in the latter part of her life; as no author then appeared a greater advocate for virtue. Among her riper productions may be specified, *The female Spectator*, 4 vols; *The history of Miss Betty Thoughtless*, 4 vols; *Jenny and Jenny Jessamy*, 3 vols; *The invisible spy*, 4 vols; with a pamphlet, intitled, *A present for a servant-maid*. She died in 1759.

HIATUS, properly signifies an opening, chasm, or gap; but it is particularly applied to those verses where one word ends with a vowel, and the following word begins with one, and thereby occasions the mouth to be more open, and the sound to be very harsh.

The term *hiatus* is also used in speaking of manuscripts, to denote their defects, of the parts that have been lost or effaced.

HIBISCUS, SYRIAN MALLOW; a genus of the po-

lyandria order, belonging to the monodelphia class of Hibiscus.

Species. Of this genus there are 25 species; the most remarkable are, 1. The Syriacus, commonly called *althæa frutex*, is a native of Syria. It rises with shrubby stalks to the height of eight or ten feet, sending out many woody branches covered with a smooth grey bark, garnished with oval spear-shaped leaves, whose upper parts are frequently divided into three lobes. The flowers come out from the wings of the stalk at every joint of the same year's shoot. They are large, and shaped like those of the mallow, having five large roundish petals which join at their base, spreading open at the top, in shape of an open bell. These appear in August; and if the season is not too warm, there will be a succession of flowers till September. The flowers are succeeded by short capsules, with five cells, filled with kidney-shaped seeds; but unless the season proves warm, they will not ripen in this country. Of this species there are four or five varieties, differing in the colour of their flowers: the most common hath pale purple flowers with dark bottoms; another hath bright purple flowers with black bottoms; a third hath white flowers with purple bottoms; and a fourth, variegated flowers with dark bottoms. There are also two with variegated leaves, which are by some much esteemed. All these varieties are very ornamental in a garden. 2. The Chinenfis is a native of the East Indies, whence it has got the name of *China rose*; but the seeds having been carried by the French to their West India settlements, it hath thence obtained the name of *Martinico rose*. Of this there are the double and single flowering kinds; the seeds of the first frequently produce plants that have only single flowers, but the latter seldom vary to the double kind. The plant has a soft spongy stem, which by age becomes ligneous and pithy. It rises to the height of 12 or 14 feet, sending out branches towards the top, which are hairy, garnished with heart-shaped leaves, cut into five acute angles on their borders, and slightly sawed on their edges; of a lucid green on their upper side, but pale below. The flowers are produced from the wings of the leaves; the single are composed of five petals which spread open, and are at first white, but afterwards change to a bluish rose colour, and as they decay turn purple. In the West Indies, all these alterations happen on the same day, and the flowers themselves are of no longer duration; but in Britain the changes are not so sudden. The flowers are surrounded by short, thick, blunt, capsules, which are very hairy; having five cells, which contain many small kidney-shaped seeds, having a fine plume of fibrous down adhering to them. 3. The almofcus, or musk, is a native of the West Indies, where the French cultivate great quantities of it. The plant rises with an herbaceous stalk three or four feet high, sending out two or three side-branches, garnished with large leaves cut into six or seven acute angles, sawed on their edges, having long footstalks, and placed alternately. The stalks and leaves of this sort are very hairy. The flowers come out from the wings of the leaves upon pretty long footstalks which stand erect. They are large, of a sulphur colour, with purple bottoms; and are succeeded by pyramidal five-cornered capsules, which open in five cells, filled with large kidney-shaped seeds of a

very musky odour. 4. The tiliaceus, or mahoe-tree, is a native of both the Indies. It rises with a woody, pithy stem, to the height of ten feet, dividing into several branches towards the top, which are covered with a woolly down, garnished with heart-shaped leaves ending in acute points. They are of a lucid green on their upper side, and hoary on the under side, full of large veins, and are placed alternately. The flowers are produced in loose spikes at the end of the branches, and are of a whitish-yellow colour. They are succeeded by short acuminate capsules, opening in five cells, filled with kidney-shaped seeds. 5. The javanica grows naturally on the coast of Malabar. It rises with a woody stalk 12 or 14 feet high, dividing into many small branches towards the top, garnished with oval sawed leaves ending in acute points, of a lucid green above, but pale on their under side, placed without order. The flowers come out from the sides of the branches at the wings of the leaves on pretty long foot-stalks. They are composed of many oblong roundish petals of a red colour, which expand like the rose; the flowers being as large when fully blown as the common red rose, and as double. 6. The gossypifolius, with a cotton leaf, is a native of the West Indies, and rises with an herbaceous stem three feet high, sending out several lateral branches, which are garnished with smooth leaves divided into five lobes. The flowers come out at the side of the branches. They are of a dirty white, with dark purple bottoms, and are succeeded by obtuse seed-vessels divided into five cells, which are filled with kidney-shaped seeds. 7. The trionum, Venice mallow, or flower of an hour, is a native of some parts of Italy, and has long been cultivated in the gardens of this country. It rises with a branching stalk a foot and an half high, having many short spines, which are soft, and do not appear unless closely viewed: the leaves are divided into three lobes, which are deeply jagged almost to the midrib. The flowers come out at the joints of the stalks, upon pretty long foot-stalks. They have a double empalement; the outer being composed of ten long narrow leaves, which join at their base: the inner is of one thin leaf swollen like a bladder, cut into five acute segments at the top, having many longitudinal purple ribs, and is hairy. Both these are permanent, and inclose the capsule after the flower is past. The flower is composed of five obtuse petals, which spread open at the top; the lower part forming an open bell-shaped flower. These have dark purple bottoms, but are of a pale sulphur-colour above. In hot weather the flowers continue but a few hours open; however, there is a succession of flowers that open daily for a considerable time. 8. The ficifolia, or ketmia of the Brasils, with a fig-leaf, is common in the West Indies. It rises with a soft herbaceous stalk from three to five feet high, dividing upward into many branches garnished with hand-shaped leaves, divided into five lobes. The flowers are produced from the wings of the stalks; they are of a pale sulphur-colour with dark purple bottoms, but are of a very short duration; opening in the morning with the rising sun, and fading long before noon in hot weather. They are succeeded by capsules of very different forms, in the different varieties. In some, the capsules are not thicker than a man's finger, and five or six inches long; in others, they are very thick, and not more than two

or three inches long; in some plants they grow erect, in others they are inclined, &c.

Culture. The first fort may be propagated either by seeds or cuttings. The seeds may be sown in pots filled with light earth about the latter end of March, and the young plants transplanted about the same time next year. They will succeed in the full ground; but must be covered in winter whilst young, otherwise they are apt to be destroyed. The second fort is propagated by seeds, which must be sown in a hot-bed. The young plants are to be transplanted into small separate pots, and treated like other tender vegetables, only allowing them a good share of air. The third fort is annual in this country, though biennial in those places where it is native. It is propagated by seeds, and must be treated in the manner directed for Amaranth. The fourth, fifth, sixth, and eighth forts require the same treatment with the third. The seventh is propagated by seeds, which should be sown where the plants are designed to remain, for they do not bear transplanting well. They require no other culture than to be kept free from weeds, and thinned where they are too close; and if the seeds are permitted to scatter, the plants will come up fully as well as if they had been sown.

Uses. The third fort is cultivated in the West Indies by the French, for the sake of its seeds. These are annually sent to France in great quantities, and form a considerable branch of trade, but the purposes which they answer are not certainly known. The flowers of the fifth kind are used by the Indian women of Malabar for colouring their hair and eyebrows of a black that will not wash off. The Europeans there use it for blacking their shoes, and thence have named it the *shoe-flower*. The green pods of the sixth fort have the taste of sorrel, and are used by the West Indians for giving an acid taste to their viands. The eighth fort is also cultivated by the West Indians for the sake of its pods. These they gather green to put into their soups; and having a soft viscous juice, they add a thickness to the soup which renders it very palatable.

HICETAS of Syracuse, an ancient philosopher and astronomer, who taught that the sun and stars were motionless, and that the earth moved round them. This is mentioned by Cicero, and probably gave the first hint of the true system to Copernicus. He flourished 344 B. C.

HICKES (George), an English divine of extraordinary parts and learning, born in 1642. In 1681 he was made king's chaplain, and two years after dean of Worcester. The death of Charles II. stopped his farther preferment; for, though his church principles were very high, he manifested too much zeal against Popery to be any favourite with James II. On the revolution, he with many others was deprived for refusing to take the oaths to king William and queen Mary; and soon after, archbishop Sancroft and his colleagues considering how to maintain episcopal succession among those who adhered to them, Dr Hickes carried over a list of the deprived clergy to king James; and with his sanction a private consecration was performed, at which it is said lord Clarendon was present. Among others, Dr Hickes was consecrated suffragan bishop of Thetford, and died in 1715.—He wrote, 1. *Institutiones Grammaticae Anglo-Saxonicae, et Maso-Gothicae.*

Hickup
||
Hicetacium.

thiæ. 2. *Antiqua literatura septentrionalis*. 3. Two treatises, one of the Christian priesthood, the other of the dignity of the episcopal order. 4. Jovian, or an answer to Julian the apostate. 5. Sermons; with many temporary controversial pieces on politics and religion.

HICKUP, or **HICCOUGH**, a spasmodic affection of the stomach, œsophagus, and muscles subservient to deglutition, arising sometimes from some particular injury done to the stomach, œsophagus, diaphragm, &c. and sometimes from a general affection of the nervous system. See (the *Index* subjoined to) **MEDICINE**.

HIDAGE (*Hidagium*), was an extraordinary tax payable to the kings of England for every hyde of land. This taxation was levied not only in money, but in provision, armour, &c.; and when the Danes landed in Sandwich in 994, king Ethelred taxed all his lands by hides; so that every 310 hides found one ship furnished, and every eight hides furnished one jack and one fiddle, to arm for the defence of the kingdom, &c.—Sometimes the word *hidage* was used for the being quit of that tax: which was also called *hidesgild*; and interpreted, from the Saxon, a “price, or ransom paid to save one’s skin or hide from beating.”

HIDE, the skin of beasts; but the word is particularly applied to those of large cattle, as bullocks, cows, horses, &c.

Hides are either raw or green, just as taken off the carcase, salted, or seasoned with salt, alum, and salt-petre, to prevent their spoiling; or curried and tanned. See **TANNING**.

HIDE of Land, was such a quantity of land as might be ploughed with one plough within the compass of a year, or as much as would maintain a family; some call it 60, some 80, and others 100 acres.

HIDE-Bound. See **FARRIERY**, §. xix.

HIERACIUM, **HAWKWEED**; a genus of the order of polygamia æqualis, belonging to the syngenesia class of plants.

Species. 1. The aurantiacum, commonly called *grim the collier*, hath many oblong oval entire leaves, crowning the root; an upright, single, hairy, and almost leafless stalk, a foot high, terminated by reddish orange-coloured flowers in a corymbus. These flowers have dark oval ash-coloured calyces; whence the name of *grim the collier*. 2. The pilosella or moufe-ear, hath blossoms red on the outside, and pale yellow within; the cups set thick with black hairs. The flowers open at eight in the morning, and close about two in the afternoon. 3. The umbellatum grows to the height of three feet, with an erect and firm stalk, terminated with an umbel of yellow flowers.

Culture. The first is the only species cultivated in gardens. It is propagated by seeds, or parting the roots. The feed may be sown in autumn or spring. In June, when the plants are grown two or three inches high, they may be picked out and planted in beds, where they must remain till the next autumn, and then transplanted where they are to remain.

Properties. The second species is common in dry pastures in England; it has a milky juice, but is less bitter and astringent than is usual with plants of that class. It is reckoned hurtful to sheep. An insect of the cochineal genus, (*Coccus Polonicus*) is often found at the roots, (*Ad. Upfal. 1752*). Goats eat it; sheep are not fond of it; horses and swine refuse it.—

The third species is a native of Scotland, and grows in rough stony places, but is not very common. The flowers are sometimes used for dying yarn of a fine yellow colour.

HIERACITES, in church-history, Christian heretics in the third century: so called from their leader Hierax, a philosopher of Egypt; who taught that Melchisedek was the Holy Ghost, denied the resurrection, and condemned marriage.

HIERANOSIS, or **MORBUS SACER**. See (the *Index* subjoined to) **MEDICINE**.

HIERA PICRA. See **PHARMACY**, n° 826.

HIERARCHY, among divines, denotes the subordination of angels.

Some of the rabbins reckon four, others ten, orders or ranks of angels; and give them different names according to their different degrees of power and knowledge.

HIERARCHY, likewise denotes the subordination of the clergy, ecclesiastical polity, or the constitution and government of the Christian church considered as a society.

HIERES, the name of some small islands lying near the coast of Provence in France, opposite to the towns of Hieres and Toulon, where the English fleet lay many months in 1744, and blocked up the French and Spanish fleets in the harbour of Toulon.

HIERES, a town of Provence in France, seated on the Mediterranean sea. It is a pretty little town, and was formerly a colony of the Maritians; and pilgrims used to embark here for the holy land.

But its harbour being now choaked up, it is considerable only for its salt-works. E. Long. 6. 13. N. Lat. 43. 7.

HIERO I. and **II.** kings of Syracuse. See **SYRACUSE**.

HIEROCLES, a cruel persecutor of the Christians, and a violent promoter of the persecution under Dioclesian, flourished in 302. He wrote some books against the Christian religion; in which he pretends some inconsistencies in the Holy Scriptures, and compares the miracles of Apollonius Tyaneus to those of our Saviour. He was refuted by Lactantius and Eusebius. The remains of his works were collected into one volume octavo, by bishop Pearson; and published in 1654, with a learned dissertation prefixed to the work.

HIEROCLES, a Platonic philosopher of the fifth century, taught at Alexandria, and was admired for his eloquence. He wrote seven books upon Providence and Fate; and dedicated them to the philosopher Olympiodorus, who by his embassies did the Romans great services under the emperors Honorius and Theodosius the younger. But these books are lost, and we only know them by the extracts in Photius. He wrote also a Commentary upon the golden verses of Pythagoras; which is still extant, and has been several times published with those verses.

HIEROGLYPHICS, in antiquity, mystical characters, or symbols, in use among the Egyptians, and that as well in their writings as inscriptions; being the figures of various animals, the parts of human bodies, and mechanical instruments.

The word is composed of the Greek ἱερός, *sacer*, “holy,” and γλυφειν, *sculpsere*, “to engrave;” it being the custom to have the walls, doors, &c. of their temples, obelisks, &c. engraven with such figures.

After

Hieracites
||
Hieroglyphics.

After Hermes, and the Egyptian priests who succeeded, had, by long study and speculation, formed a system of theology, and natural philosophy, in which God, the supreme cause of all, was the universal soul diffused through the whole creation, they endeavoured to express the divine attributes and operations of the Deity, in the works of nature, by the properties and powers of living animals, and other natural productions, as the proper symbols of such amazing causes.

In order to choose the most proper symbols, and, at the same time, the most expressive of the divine attributes, and of the effects of Divine Providence in every part of the universe, they studied with great application and care, not only the peculiar properties of those animals, birds, and fishes, herbs and plants, which Egypt produced; but also the geometrical properties of lines and figures; and by a regular connection of these in various orders, attitudes, and compositions, they formed the whole system of their theology and philosophy, which was hidden under hieroglyphic figures and characters, known only to themselves, and to those who were initiated into their mysteries.

In this system their principal hero-gods, Osiris and Isis, theologically represented the Supreme Being, and universal nature; and physically signified the two great celestial luminaries, the sun and moon, by whose influence all nature was actuated. In like manner, the inferior heroes represented the subordinate gods, who were the ministers of the supreme spirit; and physically they denoted the inferior mundane elements and powers. Their symbols represented, and comprehended under them, the natural productions of the Deity; and the various beneficial effects of Divine Providence, in the works of creation: and also the order and harmony, the powers and mutual influence of the several parts of the universal system.

This is the sum and substance of the Egyptian learning, so famed in ancient times throughout the world. And in this general system, the particular history of their hero-gods was contained, and applied to physical causes, and theological science. The hieroglyphic system was composed with great art and sagacity; and was so universally esteemed and admired, that the most learned philosophers of other nations came into Egypt on purpose to be instructed in it, and to learn the philosophy and theology conveyed by these apostolic symbols.

In this hieroglyphic system the hero-gods not only represented, and were symbols of, the supreme God, and subordinate deities; but they had each their animal symbol, to represent their peculiar powers, energy, and administration: and their figures were compounded of one part or other of their symbols, to express more sensibly the natural effects of divine energy attributed to them.

Thus Osiris, when he represented the power and all-seeing providence of the Supreme Being, had a human body with a hawk's head, and a sceptre in his hand, and decorated with the other regalia or ensigns of royalty. Under the same form also he represented the sun, the great celestial luminary; and, as it were, the soul of the world: his symbol now was a bull, and the scarabæus or beetle, which expressed the sun's

motion, by rolling balls of dung, containing its seed, backwards, or from east to west, his face being towards the east. The symbolic bull was likewise of a particular form and make, to denote the various influences of the sun.

Osiris was also delineated sometimes with a bull's, and sometimes with a lion's head, to represent the heat, vigour, and influence of the sun, especially in the inundation of the Nile, when the sun was in the celestial sign Leo; and likewise to express the solar influence in all the productions of nature. And it is also observable, that the bull and lion were parts of the Jewish cherub's symbol; and as the one was the head of the wild, and the other of the tame beasts, they represented, in conjunction, the animal-creation; while the other two parts, namely, the eagle and human figure, represented the aerial, rational creation.

Isis was formed with many beasts, to represent the earth, the universal mother; and with a cornucopia in her hand, denoting the nutritive and productive powers of nature: her symbol was a cow, part black and part white, to represent the enlightened and dark parts of the moon.

Pan had the horns and feet, and sometimes also the head, of a goat, which was his symbol, to shew the generative power of nature, over which he presided. At the same time, he symbolically represented universal nature, the cause of all things.

Hermes had a dog's head, which was his symbol, to denote his sagacity in the invention of arts and sciences; especially in his watchful diligence in the culture of religious rites and sacred knowledge: at the same time he symbolically represented the Divine Providence, and was worshipped as the chief counsellor of Saturn and Osiris; he who communicated the will of the gods to men, and by whom their souls were conducted into the other world. He was likewise represented by the ibis, and with the head of this bird, which was at the same time his symbol, to signify his conveying literature to the Egyptians; which they believed was done under the form of this bird, and confined to their nation only, as the ibis was known to live no where but in Egypt.

Ammon represented the deity called *Amun*, and his symbol was a ram. He was also delineated with a ram's head and horns, to denote the creative power of God, and his beneficial and diffusive influence through the works of nature, making every thing fruitful, to produce and multiply its kind; and cherishing and preserving them by the warmth of the sun, and an internal vital heat and vigour.

The universal soul itself was beautifully represented by a winged globe, with a serpent emerging from it. The globe denoted the infinite divine essence, whose centre, to use the expression in the Hermetic writings, was every where, and circumference no where. The wings of the hawk represented the divine all-comprehensive intellect: and the serpent denoted the vivifying power of God, by which life and existence are given to all things.

Typhon represented the most powerful dæmon, or evil genius; who was continually at war with Osiris and Isis, the most benevolent geniuses of Egypt. His symbol was an hippopotamus, or river-horse, a very treacherous and cruel animal.

Hieroglyphics.

Orus was a principal deity of the Egyptians; and, according to his hieroglyphic forms and habits, signified sometimes the sun, and sometimes the harmony of the whole mundane system. At the same time, being the offspring of Osiris and Isis, he was always represented young. He also represented the order and fitness of the several parts of the external sensible world, formed by the wisdom of Divine Providence, expressed by Isis; and by the intellect, power, and goodness of the supreme God, represented by Osiris. Hence, and also because Osiris and Isis represented physically the sun and moon, who, by their diffusive light, heat, and influence, preserve the visible system, Orus was called their offspring.

To express the hieroglyphic mean of Orus, as representing the world, he was represented with a staff, upon the top of which was the head of the upupa, to signify, by the variegated feathers of that bird, the beautiful variety of the creation. In one of his hands he held a lituus, to denote the harmony of the system; and a gnomon in the other, to shew the perfect proportions of its parts. Behind him was a triangle inscribed in a circle, to signify that the world was made by the unerring wisdom of God. He had also sometimes a cornucopia in his hand, to denote the fertility and productions of the earth.

Harpocrates was described holding one of his fingers on his lips, to denote the mysterious and ineffable nature of God; and that the knowledge of him was to be searched after, with profound and silent meditation, and, at the same time, that they are not to be uttered or divulged.

Upon the whole, almost all the Egyptian deities and symbols centered in two, namely, Osiris and Isis; who represented, under various hieroglyphic forms, both the celestial and terrestrial system, together with all the divine attributes, operations, and energy, which created, animated, and preserved them.

The Egyptians likewise concealed their moral philosophy under hieroglyphic symbols; but these were not the subjects of the hieroglyphics delineated on obelisks. And as hieroglyphic and symbolical figures were very ancient in Egypt, and first invented, at least formed into a system, there; so they were thence carried into other countries, and imitated in all religious mysteries as well as in political and moral science.

The preceding symbolical figures making the substance of hieroglyphics, and all belonging to Osiris, his family, and contemporaries, they were probably formed into a system soon after the death of those herods, by some who had been instructed, in the art of hieroglyphics, by Hermes the inventor of them. The first he formed himself; and the others were probably added by his learned successors, who had been instructed by him in all his mysterious learning.

This hieroglyphic system was, in its beginning, more simple, and less compounded, than afterwards; for it had been improving for several ages before it appeared on the obelisks of the temples. And hence we may infer the time of the first Egyptian hieroglyphic symbols; for, in all probability, they were not older than the time of the famous Hermes, who flourished in the reign, and some time after the death, of Osiris.

The hieroglyphic symbols were, in early times, car-

ried into Greece; and gave the first occasion to the fables of the poets, with regard to the metamorphoses of the gods, which they improved from inventions of their own; and from the knowledge of them, the Greeks ascribed peculiar arts and inventions to their gods, whose names they first received from Egypt.

But besides the hieroglyphics in common use among the people, the Egyptian priests had certain mystical characters, in which they wrapped up and concealed their doctrines from the vulgar. It is said that these something resembled the Chinese characters, and that they were also the invention of Hermes. Sir John Marsham conjectures, that the use of these hieroglyphical figures of animals introduced the strange worship paid them by that nation: for as these figures were made choice of according to the respective qualities of each animal, to express the qualities and dignity of the persons represented by them, who were generally their gods, princes, and great men, and being placed in their temples as the images of their deities, hence they came to pay a superstitious veneration to the animals themselves.

HIEROGRAMMATISTS, i. e. *holy registers*, were an order of priests among the ancient Egyptians, who presided over learning and religion. They had the care of the hieroglyphics, and were the expositors of religions doctrines and opinions. They were looked upon as a kind of prophets; and it is pretended that one of them predicted to an Egyptian king, that an Israelite (meaning Moses), eminent for his qualifications and achievements, would lessen and depress the Egyptian monarchy.

HIEROMANCY, in antiquity, that part of divination which predicted future events from observing the various things offered in sacrifice. See **DIVINATION** and **SACRIFICE**.

HIEROMNEMON, the name of an officer in the Greek church, whose principal function it was to stand behind the patriarch at the sacraments and other ceremonies of the church, and to shew him the prayers, psalms, &c. in the order in which they were to be heard.

HIERONYMUS. See **JEROME**.

HIEROPHANTES, in Grecian antiquity, the name by which the Athenians called those priests and priestesses who were appointed by the state to have the supervisal of things sacred, and to take care of the sacrifices.

HIEROPHYLAX, an officer in the Greek church, who was guardian or keeper of the holy utensils, vestments, &c. answering to our *sacrista* or vestry-keeper.

HIGH, a term of relation, importing one thing's being superior or above another: thus we say, a *high* mountain, the *high* court of parliament, *high* relieve, &c.

HIGH, in music, is sometimes used in the same sense with *loud*, and sometimes in the same sense with *acute*.

HIGH Dutch, is the German tongue in its greatest purity, &c. as spoken in Misnia, &c.

HIGH Operation, in chirurgery, is a method of extracting the stone; thus called, because the stone is taken out at the upper part of the bladder. See **SURGERY**.

||
High.

High
in
Highland-
ders.

HIGH Way, a free passage for the king's subjects; on which account it is called the *king's high-way*, though the freehold of the soil belong to the owner of the land. Those ways that lead from one town to another, and such as are drift or cart ways, and are for all travellers in great roads, or that communicate with them, are high-ways only; and as to their reparation, are under the care of surveyors.

HIGHAM FERRERS, an ancient borough of Northamptonshire in England, which has its name from the family of the Ferrers, to whom it formerly belonged, and who had a castle in its neighbourhood. It sends one member to parliament. E. Lon. 1. 40. N. Lat. 52. 20.

HIGHGATE, a village five miles north of London. It has its name from its high situation, and from a gate set up there about 400 years ago, to receive toll for the bishop of London, when the old miry road from Gray's-inn lane to Barnet was turned through the bishop's park. There was a hermitage where the chapel now stands; and one of the hermits caused a causeway to be made between Highgate and Islington, with gravel dug out of the top of the hill, where there is now a pond. Near the chapel, in 1562, lord chief baron Cholmondeley built and endowed a free school, which was enlarged, in 1570, by Edwin Sandys, bishop of London.—This village is a noted and airy retirement for the gentry and wealthy citizens; and is a place of good accommodation, besides its affording a delightful and pleasant prospect over the city and adjacent country.

HIGHLANDERS, the inhabitants of the mountainous parts of Scotland, to the north and north-west, including those of the Hebrides or Western Isles.—They are a branch of the ancient Celts; and undoubtedly the descendants of the first inhabitants of Britain, as appears from the many monuments of their language still retained in the most ancient names of places in all parts of the island. The Highlanders, or, as they are often termed by ancient authors, the *Caledonians*, were always a brave, warlike, and hardy race of people; and, in the remotest times, seem to have possessed a degree of refinement in sentiment and manners, then unknown to the other nations that surrounded them. This appears not only from their own traditions and poems, but also from the testimony of many ancient authors. This civilization was probably owing in a great measure to the order of the Bards, or Druids, and some other institutions peculiar to this people.

The ancient Highlanders lived in the hunting state till some time after the æra of Fingal, who was one of their kings, towards the close of the third century. For some ages after that, they turned their chief attention to the pastoral life, which afforded a less precarious subsistence. Till of late, agriculture in most parts of the Highlands, made but little progress.

The Highlanders always enjoyed a king and government of their own, till Kenneth MacAlpin, (anno 845,) after having subdued the Pictish kingdom, transferred thither the seat of royalty. This event proved very unfavourable to the virtues of the Highlanders, which, from this period, began to decline. The country, no longer awed by the presence of the sovereign, fell into anarchy and confusion. The chief-

tains began to extend their authority, to form factions, and to foment divisions and feuds between contending clans. The laws were either too feeble to bind them, or too remote to take notice of them. Hence sprung all those evils which long disgraced the country, and disturbed the peace of its inhabitants. Robbery or plunder, providing it was committed on any one of an adverse clan or tribe, was countenanced and authorized; and their reprisals on one another were perpetual. Thus quarrels were handed down from one generation to another, and the whole clan were bound in honour to espouse the cause of every individual that belonged to it. By this means the genius of the people was greatly altered; and the Highlanders of a few ages back were almost as remarkable for their irregular and disorderly way of life, as their predecessors were for their civilization and virtue. It is from not attending to this distinction between the ancient Highlanders and their posterity in later times, that many have doubted the existence of those exalted virtues ascribed by their poets to the more ancient inhabitants of the country. But now that the power of the chieftains is again abolished, law established, and property secured, the genius of the people (where it is not hindered by some other extraneous cause) begins again to shew itself in its genuine colours; and many of their ancient virtues begin to shine with conspicuous lustre. Justice, generosity, honesty, friendship, peace and love, are perhaps nowhere more cultivated than among this people. But one of the strongest features which marked the character of the Highlanders in every age, was their hospitality and benevolence to strangers. At night the traveller was always sure to find a hearty welcome in whatever house he should go to; and the host thought himself happier in giving the entertainment, than the guest in receiving it. Even with regard to their enemies, the laws of hospitality were observed with the most sacred regard. They who fought against each other in the day, could in the night feast, and even sleep together, in the same house. From the same principle, they were, in most other cases, so faithful to their trust, that they rarely betrayed any confidence reposed in them. A promise they thought as binding as an oath, and held it equally inviolable and sacred.

The Caledonians in all ages have been much addicted to poetry and music. The poems of Ossian, so universally repeated, and so highly esteemed by every Highlander, are a strong proof of the early proficiency of this people in the poetical art. Even to this day, notwithstanding the many disadvantages they labour under, the most illiterate of either sex discover frequently a genius for poetry, which often breaks forth in the most natural and simple strains, when love, grief, joy, or any other subject of song, demands it. Wherever their circumstances are so easy as to allow them any respite from toil, or any cheerfulness of spirits, a good portion of their time, especially of the winter-nights, is still devoted to the song and tale. This last species of composition is chiefly of the novel-kind, and is handed down by tradition like their poems. It was the work of the bards; and proved, while they existed, no contemptible entertainment. But since the extinction of that order, both the Galic poems and tales

Highland-
ders.

Highlander tales are, in a great measure, either lost or adulterated. —The genius and character of the Galic poetry is well known. It is tender, simple, beautiful, and sublime.

Among the ancient Highlanders, the harp was the chief instrument of music. It suited the mildness of their manners, and was well adapted to the peace and quiet which they enjoyed under their own kings. In a later period, however, when the constant quarrels of their chiefs, and the endless feuds of contending clans, turned all their thoughts to war, it was forced to give place to the bag-pipe, an instrument altogether of the martial kind, and therefore well suited to the state of the country at that time. But ever since the cause which had brought this instrument in vogue has ceased to operate, the attention to it has been on the decline; so that the harp, with very little encouragement, might again resume the feat from which it was once expelled.

—The most, and especially the oldest of the Highland music, having been composed to the harp, is of a soft, tender, and elegiac cast, as best suited the genius of that instrument. These pieces are generally expressive of the passions of love and grief. Other pieces, which were composed in their state of war, and adapted to a different instrument, are altogether bold and martial. And many are of a sprightly and cheerful cast, the offspring of mirth, and the sport of fancy in the season of festivity. Many of these last are of the chorus kind; and are sung in almost all the exercises in which a number of people are engaged, such as rowing, reaping, fulling, &c. The time of these pieces is adapted to the exercises to which they are respectively sung. They greatly forward the work, and alleviate the labour. The particular musick which is generally used by the Highlanders in their dances is well known by the name of *Strathspey reels*.

The language of the Highlanders is still the Galic; which, with many of their customs and manners, has been secured to them by their mountains and fastnesses, amidst the many revolutions which the rest of the island has undergone in so long a course of ages. The Galic seems to be the oldest and purest dialect which remains of the Celtic, as appears from its approaching the nearest to the names of places, &c. which that language left in most countries where it prevailed, and from its most obvious affinity to those tongues, ancient or modern, which have been in any measure derived from the old Celtic. The Galic has all the marks of an original and primitive language. Most of the words are expressive of some property or quality of the objects which they denote. This, together with the variety of its sounds (many of which, especially of those that express the soft and mournful passions, are peculiar to itself), renders it highly adapted for poetry. It is generally allowed to have been the language of court, in Scotland, till the reign of Malcom Canmore. The Galic epithet of *Can-mor*, or "large head," by which this king is distinguished, seems to intimate so much. In some particular parliaments at least, it was spoken much later, as in that held by Robert the Bruce at Ardchattan. That it has been formerly a good deal cultivated, appears from the style and complexity of its poems and tales, and from several ancient MSS. that have come down to the present times. To strangers the Galic has a forbidding aspect, on ac-

VOL. V.

count of the number of its quiescent consonants (which are retained to mark the derivation of words and their variation in case and tense), but its sound is abundantly musical and harmonious; and its genius strong and masculine. Its alphabet consists of 18 letters, of which one is an aspirate, 12 are consonants, and five are vowels.

The Highlanders are beginning of late to apply to learning, agriculture, and especially to commerce, for which their country, every where indented with arms of the sea, is peculiarly favourable. Cattle is the chief staple of the country; but it produces more grain than would supply its inhabitants, if so much of it were not consumed in whisky. The natives are beginning to avail themselves of their mines, woods, wool, and fisheries; and by a vigorous application, with the due encouragement of government, may become a prosperous and useful people.

The Highlanders are of a quick and penetrating genius, strongly tinged with a curiosity or thirst of knowledge, which disposes them to learn anything very readily. They are active and industrious, where oppression does not discourage them by secluding even the hope of thriving. They are remarkably bold and adventurous, which qualifies them for being excellent seamen and soldiers. They are generally of a middle size, rather above it than otherwise; their eyes are bright and lively, their features distinctly marked, and their persons tight and well made. Their countenance is open and ingenuous, and their temper frank and communicative.

HIGHNESS, a quality, or title of honour given to princes.—The kings of England and Spain had formerly no other title but that of *highness*; the first till the time of James I. and the second till that of Charles V. The petty princes of Italy began first to be complimented with the title of *highness* in the year 1630.—The duke of Orleans assumed the title of *royal highness* in the year 1631, to distinguish himself from the other princes of France.

The duke of Savoy, late king of Sardinia, bore the title of *royal highness*, on account of his pretensions to the kingdom of Cyprus.—It is said that duke only took the title of *royal highness*, to put himself above the duke of Florence, who was called *great duke*; but the great duke afterwards assumed the title of *royal highness*, to put himself on a level with the duke of Savoy.

The prince of Comde first took the title of *most serene highness*, leaving that of simple *highness* to the natural princes.

HILARIA, an ancient Roman festival, observed on the eighth of the kalends of April, or the 25th day of March, in honour of the goddess Cybele. It was so called from the various expressions of joy and mirth on this occasion.

HILARIUS, an ancient father of the Christian church, who flourished in the 4th century. He was born, as St Jerome informs us, at Poitiers, of a good family; who gave him a liberal education in the Pagan religion, and which he did not forsake till he was arrived at maturity. He was advanced to the bishopric of Poitiers in the year 355, according to Baronius; and became a most zealous champion for the orthodox faith, particularly against the Arians, who were

Hilarodi

Hill.

were at that time gaining ground in France. He assembled several councils there, in which the determinations of the synods of Rimini and Seleucia were condemned. He wrote a treatise concerning synods; and a famous work in 12 books on the Trinity, which is much admired by the orthodox believers. He died in the latter end of the year 367. His works have been many times published; but the last and best edition of them was given by the Benedictines at Paris in 1693.

HILARODI, in the ancient music and poetry, a sort of poets among the Greeks, who went about singing little gay poems or songs, somewhat graver than the Ionic pieces, accompanied with some instrument. From the streets they were at length introduced into tragedy, as the magodi were into comedy. They appeared dressed in white, and were crowned with gold. At first they wore shoes; but afterwards they assumed the crepida, being only a sole tied over with a strap.

HILARY-TERM. See **TERM.**

HILDESHEIM, a small district of Germany, in the circle of Lower Saxony. It lies between the duchies of Lunenburg and Brunswick; and may be about 25 miles from east to west, and 36 from north to south. It is watered by the rivers Leine and Innerfity. The soil is fertile; and its principal places are Peine, Sarstedt, Broggen, and Alveld. Hildesheim, from whence it takes its name, is governed as an imperial city. Its bishop is now elector of Cologne.

HILDESHEIM, a strong city of Germany, in Lower Saxony, with a Roman-catholic bishop's see, whose bishop is sovereign. It is a free imperial city, tho' in some things dependent on the bishop. It is a large town, well built and fortified. It is divided into the Old Town and the New, which have each their separate council. It is seated on the river Innerfity, in E. Long. 10. 0. N. Lat. 52. 17.

HILL, a term denoting any considerable eminence on the earth's surface. It is sometimes synonymous with the word *mountain*; though generally it denotes only the lesser eminences, the word *mountain* being particularly applied to the very largest. See **Mountain**.

HILL (Aaron), a poet of considerable eminence, the son of a gentleman of Malmesbury-abbey in Wiltshire, was born in 1685. His father's imprudence having cut off his paternal inheritance, he left Westminster school at 14 years of age; and embarked for Constantinople, to visit lord Paget the English ambassador there, who was his distant relation. Lord Paget received him with surprise and pleasure, provided him a tutor, and sent him to travel: by which opportunity he saw Egypt, Palestine, and a great part of the east; and returning home with his noble patron, visited most of the courts of Europe. About the year 1709, he published his first poem intitled *Camillus*, in honour of the earl of Peterborough who had been general in Spain; and being the same year made master of Drury-lane theatre, he wrote his first tragedy, *Elfrid*, or *the fair Inconstant*. In 1710, he became master of the opera-house in the Hay-market; when he wrote an opera called *Rinaldo*, which met with great success, being the first that Mr Handel set to music after he came to England. Unfortunately for Mr Hill, he was a pro-

jector as well as poet, and in 1715 obtained a patent for extracting oil from beech-nuts; which undertaking, whether good or bad, miscarried after engaging three years of his attention. He was also concerned in the first attempt to settle the colony of Georgia; from which he never reaped any advantage; and in 1728 he made a journey into the Highlands of Scotland, on a scheme of applying the woods there to ship-building; in which also he lost his labour.

Mr Hill seems to have lived in perfect harmony with all the writers of his time, except Mr Pope, with whom he had a short paper-war, occasioned by that gentleman's introducing him in the *Dunciad*, as one of the competitors for the prize offered by the goddess of Dullness, in the following lines.

"Then Hill essay'd; scarce vanish'd out of sight,
"He buoy'd up an infant, and returns to light;
"He bears no token of the fibler's dreams,
"And mounts far off among the Swans of Thames."

This, though far the gentlest piece of satire in the whole poem, and conveying at the same time an oblique compliment, roused Mr Hill to take some notice of it; which he did by a poem written during his perigrination in the north, intitled, "The progress of wit, a caveat for the use of an eminent writer;" which he begins with the following eight lines, in which Mr Pope's too well known disposition is elegantly, yet very severely, characterized:

"Tuneful *Alexis* on the Thames' fair side,
"The Ladies play-thing and the Muses' pride;
"With merit popular, with wit polite,
"Easy tho' vain, and elegant tho' light;
"Desiring and deferring others praise;
"Poorly accepts a Fame he ne'er repays;
"Unborn to cherish, *sneakingly* approves;
"And wants the soul to spread the worth he loves."

The *sneakingly* approves, in the last couplet, Mr Pope was much affected by; and indeed, thro' their whole controversy afterwards, in which it was generally thought that Mr Hill had much the advantage, Mr Pope seems rather to express his repentance by denying the offence, than to vindicate himself supposing it to have been given.

Besides the above poems, Mr Hill, among many others, wrote one, called *The northern star*, upon the actions of Czar Peter the Great; for which he was several years afterwards complimented with a gold medal from the empress Catharine, according to the Czar's desire before his death. He likewise altered some of Shakespeare's plays, and translated some of Voltaire's. His last production was *Merope*; which was brought upon the stage in Drury-lane by Mr Garrick. He died on the eighth of February 1749, as it is said, in the very minute of the earthquake; and after his decease four volumes of his works in prose and verse were published in octavo, and his dramatic works in two volumes.

HILL (Sir John), a voluminous writer, was originally bred an apothecary; but his marrying early, and without a fortune, made him very soon look round for other resources than his profession. Having, therefore, in his apprenticeship, attended the botanical lectures of the company, and being possessed of quick natural parts, he soon made himself acquainted with the theoretical as well as practical parts of botany; from

Hillel
Hippocrates

from whence being recommended to the late duke of Richmond and lord Petre, he was by them employed in the inspection and arrangement of their botanic gardens. Affixed by the liberality of these noblemen, he executed a scheme of travelling over the kingdom, to collect the most rare and uncommon plants; which he afterward published by subscription; but after great researches and uncommon industry, this undertaking turned out by no means adequate to his expectation. The stage next presented itself, as a foil in which genius might stand a chance of flourishing; but after two or three unsuccessful attempts, it was found he had no pretensions either to the sock or bulkin; which once more reduced him to his botanical pursuits, and his business as an apothecary. At length, about the year 1746, he translated from the Greek a small tract, written by Theophrastus, *On gems*, which he published by subscription; and which, being well executed, procured him friends, reputation, and money. Encouraged by this, he engaged in works of greater extent and importance. The first he undertook was *A general natural history*, in 3 vols. folio. He next engaged, in conjunction with George Lewis Scott, esq; in furnishing a *Supplement to Chambers's Dictionary*. He at the same time started the British Magazine; and while he was engaged in a great number of these and other works, some of which seemed to claim the continued attention of a whole life, he carried on a daily essay, under the title of *Inspector*. Amidst this hurry of business, Mr Hill was so laborious and ready in all his undertakings, and was withal so exact an oeconomist of his time, that he scarcely ever missed a public amusement for many years: where, while he relaxed from the feverish pursuits of study, he gleaned up articles of information for his periodical works. It would not be easy to trace Mr Hill, now Dr Hill, (for he procured a diploma from the college of St Andrews,) through all his various pursuits in life. A quarrel he had with the Royal Society, for being refused as a member, which provoked him to ridicule that learned body, in *A review of the works of the Royal Society of London*, 4to, 1751; together with his over-writing himself upon all subjects without reserve; made him sink in the estimation of the public nearly in the same pace as he had ascended. He found as usual, however, resources in his own invention. He applied himself to the preparation of certain simple medicines: such as the essence of water-dock, tincture of valerian, balsam of honey, &c. The well-known simplicity of these medicines, made the public judge favourably of their effects, inasmuch that they had a rapid sale, and once more enabled the doctor to figure in that style of life ever so congenial to his inclination. Soon after the publication of the first of these medicines, he obtained the patronage of the earl of Bute, through whose interest he acquired the management of the royal gardens at Kew, with an handsome salary: and to wind up the whole of an extraordinary life, having, a little before his death, seized an opportunity to introduce himself to the knowledge of the king of Sweden, that monarch invested him with one of the orders of his court, which title he had not the happiness of enjoying above two years. He died toward the close of the year 1775.

HILLEL, senior, of Babylon, president of the

fanhedrim of Jerusalem. He formed a celebrated school there, in which he maintained the oral traditions of the Jews against Shamai, his colleague, whose disciples adhered only to the written law; and this controversy gave rise to the sects of Pharisees and Scribes. He was likewise one of the compilers of the Talmud. He also laboured much at giving a correct edition of the sacred text; and there is attributed to him an ancient manuscript bible, which bears his name. He flourished about 30 years B. C. and died in a very advanced age.

HILLEL, the nasi, or prince, another learned Jew, the grandson of Judas Hakkadosh, or the Saint, the author of the Mishna, lived in the fourth century. He composed a cycle; and was one of the principal doctors of the Gamara. The greatest number of the Jewish writers attribute to him the correct edition of the Hebrew text which bears the name of *Hillel*, which we have already mentioned in the preceding article. There have been several other Jewish writers of the same name.

HILUM, among botanists, denotes the eye of a bean.

HIN, a Hebrew measure of capacity for things liquid, containing the sixth part of an ephah, or one gallon two pints English measure.

HIND, a female stag in the third year of its age. See CERVUS.

HINDON, a small town of Wiltshire in England, which sends two members to parliament. It is situated in E. Long. 2. 14. N. Lat. 51. 12.

HINE, or HIND, a husbandman's servant. Thus the person who oversees the rest, is called the master's hine.

HIPPARCHUS, a great astronomer, born at Nice in Bithynia, flourished between the 154th and 163d Olympiads. His commentary upon Aratus's phenomena is still extant. Rohault was very much mistaken when he asserted, that this astronomer was not acquainted with the particular motion of the fixed stars from west to east, by which their longitude changes. By foretelling eclipses, he taught mankind not to be frightened at them, and that even the gods were bound by laws. Pliny, who tells this, admires him for making a review of all the stars; by which his descendants would be enabled to discover whether they are born and die, whether they change their place, and whether they increase and decrease.

HIPPOBOSCA, or HORSE-FLY, in zoology, a genus of insects, belonging to the order of diptera. The beak consists of two valves, is cylindrical, obtuse, and hanging; and the feet have several claws. There are four species, distinguished by their wings, &c. The equina is very troublesome to horses.

HIPPOCAMPUS, in ichthyology. See SYNGNATHUS.

HIPPOCENTAUR, in antiquity, a fabulous animal, half man and half horse.

What gave rise to the fable of Hippocentaurs was this. The Thessalians are said to have been the first inventors of the art of breaking horses; and being first seen on horseback, they seemed to make but one body with the horses; whence the fable took its rise.

HIPPOCRATES, the greatest physician of antiquity,

Hippocrates quity, was born in the island of Cos in the 80th Olympiad, and flourished at the time of the Peloponnesian war. He was the first that we know of who laid down precepts concerning physic; and, if we may believe the author of his life, who goes under the name of *Soranus*, drew his original from Hercules and *Asclepius*. He was first a pupil of his own father *Heralclides*, then of *Herodicus*, then of *Gorgias* of *Leontium* the orator, and, according to some, of *Democritus* of *Abdera*. After being instructed in physic, and in the liberal arts, and losing his parents, he left his own country, and practised physic all over Greece; where he was so much admired for his skill, that he was publicly sent for with *Euryphon*, a man superior to him in years, to *Perdiccas* king of *Macedonia*, who was then thought to be consumptive. But *Hippocrates*, as soon as he arrived, pronounced the disease to be entirely mental, as in truth it was. For upon the death of his father *Alexander*, *Perdiccas* fell in love with *Phyllas*, his father's mistress: and this *Hippocrates* discerning by the great change her presence always wrought upon him, a cure was soon effected.

Being intreated by the people of *Abdera* to come and cure *Democritus* of a supposed madness, he went; but, upon his arrival, instead of finding *Democritus* mad, he found all his fellow-citizens fo, and *Democritus* the only wise man among them. He heard many lectures, and learned much philosophy from him; which has made *Cornelius Celsus* and some others imagine, that *Hippocrates* was the disciple of *Democritus*, though it is probable they never saw each other till this interview which was occasioned by the *Abderites*. *Hippocrates* had also public invitations to other countries. Thus, when a plague invaded the *Illyrians* and *Pæonians*, the kings of those countries begged him to come to their relief: he did not go; but learning from the messengers the course of the winds there, he concluded that the distemper would come to *Athens*; and, foretelling what would happen, applied himself to take care of the city and the students. He was indeed such a lover of Greece, that when his fame had reached as far as *Persia*, and upon that account *Artaxerxes* had intreated him by his governor of the *Hellestont*, with a promise of great rewards, to come to him, he refused to go. He also delivered his own country from a war with the *Athenians*, that was just ready to break out, by prevailing with the *Thessalians* to come to their assistance, for which he received very great honours from the *Coans*. The *Athenians* also conferred great honours upon him; they admitted him next to *Hercules* in the *Eleusian* ceremonies; gave him the freedom of the city; and voted a public maintenance for him and his family in the *prytæneum* or council-house at *Athens*, where none were maintained at the public charge but such as had done signal service to the state. He died among the *Larissæans*, some say in his 90th year, some in his 87th, others in his 104th, and some in his 109th. The best edition of his works is, that of *Fœsius*, in Greek and Latin. *Hippocrates* wrote in the *Ionian* dialect. His aphorisms, prognostics, and all that he has written on the symptoms of diseases, justly pass for master-pieces. See *History of Medicine*.

HIPPOCREPIS, COMMON HORSE-SHOE VETCH; a genus of the *decandria* order, belonging to the *diadel-*

phia class of plants. There are three species, two natives of the warm parts of Europe, and one of Britain. They are all low herbaceous trailing plants, with yellow flowers. They are propagated by seeds; but having, no great beauty are seldom kept in gardens.

HIPPODROME, in antiquity, the course where horse-races were performed.

HIPPOGLOSSUS, in ichthyology; a species of *PLEURONECTES*.

HIPPOMANE, the *MANCHINEEL-TREE*; a genus of the *adelphia* order, belonging to the *monœcia* class of plants.

Species. 1. The *manicella*, with oval sawed leaves, is a native of all the West India islands. It hath a smooth brownish bark; the trunk divides upward into many branches, garnished with oblong leaves about three inches long. The flowers come out in short spikes at the end of the branches, but make no great appearance, and are succeeded by fruit of the same shape and size with a golden pippin. The tree grows to the size of a large oak. 2. The *biglandulosa*, with oblong bay leaves, is a native of South America; and grows to as large a size as the first, from which it differs mostly in the shape of its leaves. 3. The *spinosa*, with holly leaves, is a native of *Campeachy*, and seldom rises above 20 feet high; the leaves greatly resemble those of the common holly, and are set with sharp prickles at the end of each indenture. They are of a lucid green, and continue all the year.

Culture. These plants being natives of very warm climates, cannot be preserved in this country without a stove; nor can they by any means be made to rise above five or six feet high even with that assistance. They are propagated by seeds; but must have very little moisture, or they will certainly be killed by it.

Properties. These trees have a very poisonous quality, abounding with an acrid milky juice of a highly caustic nature. Strangers are often tempted to eat the fruit of the first species; the consequences of which are, an inflammation of the mouth and throat, pains in the stomach, &c. which are very dangerous unless remedies are speedily applied. The wood is much esteemed for making cabinets, book-cases, &c. being very durable, taking a fine polish, and not being liable to become worm-eaten: but as the trees abound with a milky caustic juice already mentioned, fires are made round their trunks, to burn out this juice; otherwise those who fell the trees would be in danger of losing their sight by the juice flying in their eyes. This juice raises blisters on the skin wherever it falls, turns linen black, and makes it fall out in holes. It is also dangerous to work the wood after it is sawn out; for if any of the saw-dust happens to get into the eyes of the workmen, it causes inflammations and the loss of sight for some time; to prevent which, they generally cover their faces with fine lawn during the time of working the wood.

HIPPOMANES, a sort of poison famous among the ancients as an ingredient in amorous philters or love-charms. The word is Greek, *ἵππος*, composed of *ἵππος*, "a horse," and *μανία*, "fury, or madness."

Authors are not agreed about the nature of the *Hippomanes*. *Pliny* describes it as a blackish caruncle found

Hippodrome
||
Hippomanes.

found on the head of a new-born colt; which the dam bites off and eats as soon as she is delivered. He adds, that if she is prevented herein by any one's cutting it off before, she will not take to nor bring up the young. Virgil, and after him Servius and Columella, describe it as a poisonous matter trickling from the pudendum of a mare when proud, or longing for the horse. At the end of Mr Bayle's Dictionary is a very learned dissertation on the *hippomanes*, and all its virtues both real and pretended.

HIPPOPHAE, SEA-BUCKTHORN; a genus of the tetrandria order, belonging to the diœcia class of plants.

Species. 1. The *rhannoides* hath a shrubby stem, branching irregularly eight or ten feet high, having a dark brown bark. It is armed with a few thorns; hath spear-shaped, narrow, sessile leaves, of a dark green above, and hoary underneath. 2. The *canadensis* hath a shrubby brown stem, branching eight or ten feet high, with oval leaves, and male and female flowers on different plants.

Culture, &c. Both these species are very hardy, and may be propagated in abundance by suckers from the roots, by layers, and by cuttings of their young shoots. They are retained in gardens, on account of their two-coloured leaves in summer; and in winter, on account of the appearance of the young shoots, which are covered with turgid, irregular, scaly buds. Goats, sheep, and horses, eat the first species; cows refuse it.

HIPPOTAMUS, the RIVER-HORSE; a genus of quadrupeds, belonging to the order of belluæ; the characters of which are these: it has six fore-teeth in the upper jaw, disposed in pairs at a distance from each other; and four prominent fore-teeth in the under jaw, the intermediate ones being longest: the dog-teeth are solitary and obliquely truncated; and the feet are hoofed on the edges.

There is but one species of hippopotamus, viz. the amphibius, or river-horse. The history of this quadruped, though next to the elephant in magnitude, is far from being sufficiently delineated. The best description hitherto given of him is that of Frederic Zerenghi, an Italian surgeon, published in the year 1603. Zerenghi killed two of them (a male and a female) on the banks of the Nile, preserved their skins, and brought them to Rome. Every skin took 400 pounds of salt in curing. He says, the skin of the hippopotamus is about an inch thick, extremely hard, impenetrable by a common mallet-ball; and there are only a few short white hairs scattered very thin over it. The teeth are not protruded out of the mouth, as is commonly believed; for, when the mouth is shut, although the teeth be extremely large, they are entirely covered by the lips. The dimensions of the female, of which Zerenghi gives a figure, are as follow: from the point of the muzzle to the origin of the tail, between 11 and 12 feet; the circumference of the body, about 10 feet; the height of the body, 4½ feet; the circumference of the leg, near the shoulder, 2 feet 9 inches, lower down 1 foot 9½ inches; the height of the legs about 1½ feet; the length of the feet from the extremity of the claws, 4½ inches: the claws are nearly of an equal length and breadth, and are somewhat more than two inches; each toe is furnished with a claw, and each foot has four toes. The tail is a-

bout one foot long, more than a foot in circumference near the origin, and about 3 inches near the point. The tail is not round, but flatfish. The head, from the extremity of the lips to the neck, is about 2 feet 4 inches, and the circumference 5 feet 8 inches. The ears are about 3 inches long, and nearly as broad; they are a little pointed, and covered in the interior side with short white hair. The mouth, when open, is about 1½ foot wide, and furnished with 44 teeth of different figures. Their teeth are of such a hard substance, that they give fire with steel. These dimensions are taken from a female hippopotamus; but the male is generally about one third larger.

With such powerful arms, and such a prodigious strength of body, the hippopotamus might render himself formidable to every other animal. But he is naturally of a mild disposition; and besides, his body is so heavy, and his motions so slow, that he cannot overtake any other quadruped. He swims swifter than he runs, and preys upon fishes. He dives in the water, and can stay very long under. He has no membrane betwixt his toes, as the callos or the otter; and he only swims easily in consequence of the great bulk of his belly, which makes him nearly of an equal specific gravity with the water. Moreover, he often keeps himself at the bottom, and walks upon the channel with the same freedom as upon dry land. Besides preying upon fishes, crocodiles, &c. he frequently goes out of the water, and feeds upon sugar-canes, rushes, millet, rice, roots, &c. These he devours in large quantities, and often does great damage in the cultivated field. But as he is more timid on land than in the water, he is easily driven away. His legs are so short, that he cannot escape by flight when at a distance from the river. He generally flies when approached by people in boats; but, if they wound him, he returns with fury, attacks the boats with his teeth, and frequently overlets them.

This animal seems to be confined principally to the rivers of Africa. The male and female generally go together, and the female is said to produce but one at a time.

Concerning this creature Mr Hasselquist relates the following particulars, which he says he had from a credible person who lived 12 years in Egypt.

"1. The hide of a full-grown hippopotamus is a load for a camel.

"2. The river-horse is an inveterate enemy to the crocodile, and kills it whenever he meets it. This, with some other reasons, contributes much to the extirpation of the crocodile; which, otherwise, considering the many eggs they would lay, would utterly destroy Egypt.

"3. "The river-horse never appears below the cataracts in Egypt; wherefore the inhabitants of Upper Egypt only can give an account of it; and as very few Europeans, none at least who understand natural history, have travelled into those parts of Egypt, we know little of the history of this animal; such as have travelled in India, have had better opportunities of informing themselves in this matter. The Egyptians very seldom bring the hide of it to Cairo; and it is impossible to bring thither the living animal. A hide has been sent to France, which, I am informed, is preserved in the royal menagerie.

Hippopotamus
||
Hirch-horn

4. "The river-horse does much damage to the Egyptians in those places he frequents. He goes on shore, and in a short space of time destroys an entire field of corn or clover, not leaving the least verdure as he passes: for he is voracious, and requires much to fill his great belly. They have a curious manner of freeing themselves, in some measure, from this destructive animal. They remark the places he frequents most, and there lay a large quantity of pease: when the beast comes on shore, hungry and voracious, he falls to eating what is nearest him; and filling his belly with the pease, they occasion an insupportable thirst: he then returns immediately into the river, and drinks upon these dry peas large draughts of water, which suddenly causes his death; for the pease soon begin to swell with the water, and not long after the Egyptians find him dead on the shore, blown up, as if killed with the strongest poison.

5. "The oftener the river-horse goes on shore, the better hopes have the Egyptians of a sufficient swelling or increase of the Nile.

6. "The Egyptians say, they can almost distinguish the food of this animal in his excrement."

Mr Pennant in his *Synopsis*, p. 80. treats the enmity of the hippopotamus and crocodile as a vulgar error; an eye-witness, he tells us, declaring he had seen them swimming together without any disagreement. "They are (says he) capable of being tamed. Belon says, he has seen one so gentle as to be let loose out of a stable, and fed by its keeper, without attempting to injure any one. They are generally taken in pitfalls, and the poor people eat the flesh. In some parts, the natives place boards full of sharp irons in the corn-grounds; which these beasts strike into their feet, and so become an easy prey. Sometimes they are struck in the water with harpoons fastened to cords, and 10 or 12 canoes are employed in the chase. The teeth are most remarkably hard, even harder than ivory, and much less subject to turn yellow. Des Marchais says, that the dentists prefer them for the making of false teeth. The skin when dried is used to make bucklers, and is of impenetrable hardness. It is the *behemoth* of Job, and was known to the Romans. An ancient writer asserts, that these animals were found in the Indus; which is not confirmed by any modern traveller."

HIPPURIS, MARE'S-TAIL; a genus of the monandria order, belonging to the monogynia class of plants. There is only one species, a native of Britain, and which grows in ditches and stagnant waters. The flower of this plant is found at the base of each leaf, and is as simple as can be conceived; there being neither empalement nor blossom; and only one chive, one pointal, and one seed. It is a very weak astringent. Goats eat it; cows, sheep, horses, and swine, refuse it.

HIRAM, a king of Tyre, cotemporary with Solomon, whom he supplied with cedar, gold, silver, and other materials for building the temple. He died 1000 years B. C.

HIRAM of Tyre, an artist who assisted in the construction of Solomon's temple, and other public buildings at Jerusalem, flourished 1015. B. C.

HYRCANIA, (anc. geog.) See **HYRCANIA**.

HIRCH-HORN, a town of Germany, in the circle

of the lower Rhine, with a strong castle. It is seated on the side of a hill on the river Neckar, and belongs to the elector Palatine. E. Long. 9. o. N. Lat. 49. 28.

HIRE (Philip de la), an eminent French mathematician and astronomer, born at Paris in 1640. His father, who was painter in ordinary to the king, designed him for the same profession: but he devoted himself to mathematical studies, and was nominated together with M. Picard to make the necessary observations for a new map of France by the directions of M. Colbert. In 1683, he was employed in continuing the famous meridian line begun by M. Picard; and was next engaged in constructing those grand aqueducts which were projected by Lewis XIV. He died in 1718, after having wrote a great number of works, besides several occasional papers dispersed in journals, and in memoirs of the Academy of Sciences.

HIRING, in law. See **BORROWING** and **Hiring**.

HIRSBERG, a town of Silesia, in the territory of Jauer, famous for its mineral baths. It is seated on the river Bosar, in E. Long. 17. 50. N. Lat. 50. 50.

HIRSCHFELD, a town of Germany in the circle of the upper Rhine, and capital of a principality of the same name, depending on a famous abbey which was secularized in favour of the house of Cassel. It is seated on the river Fulda, in E. Long. 9. 52. N. Lat. 51. 46.

HIRUDO, the **LEECH**; a genus of insects belonging to the order of vermes intestinalia. The body moves either forward or backward. There are nine species, principally distinguished by their colour. The most remarkable are the following.

1. The medicinal, or common leech, hath an oblong brown body, marked with six yellow spots, and is an inhabitant of ponds, ditches, and other stagnant waters. This animal is well known for the purpose of bleeding, children especially. This practice is as old as the days of Pliny, who gives the creature the name of *hirudo sanguisuga*. In his time, leeches were used instead of cupping-glasses for persons of plethoric habits, and those who were troubled with the gout in the feet. He asserts, that if they left their head in the wound, as was sometimes the case, the wound was incurable; and he informs us, that Messalinus, a person of consular dignity, lost his life by such an accident. Some imagine, that leeches have a poisonous quality, because the wound they make is not always easily healed; but this depends on the habit of the body, and will also happen when the lancet is used. To make leeches fasten soon, keep them hungry, and rub the part to which they are to be applied with warm milk or blood. If they stick longer than is thought convenient, they must not be pulled off; but if their heads are touched with common salt, they soon fall off of themselves. If they are thought not to have drawn a sufficient quantity of blood, apply cloths wrung out of warm water upon the orifice; or, if convenient, put the part into warm water; and thus the bleeding may be prolonged. They are to be kept in bottles not quite filled with water, which ought to be renewed every three or four days at farthest. A little sugar may be added to the water in which they are kept. For the cases in which the application of leeches is advisable, see (the *Index* subjoined to) **MEDICINE**.

Hire
||
Hirudo.

Hirudo,
Hirundo.

Hirundo.

2. The sanguifuga, or horse-leech, hath a depressed body; in the bottom of the mouth are certain great sharp tubercles or whitish caruncles. The slenderest part is about the mouth, and the thickest about the tail. The tail itself is very slender; the belly of a yellowish green; the back dusky. This species is also a blood-sucker, though not used in medicine. The instruments with which both species perforate the skin, are found, on a nice dissection, to be a number of very fine teeth disposed in a regular order on three ribs, or jaws, placed between the aperture of the lips and the bottom of the mouth; each of them along a strong muscle of its own length. Hence the wound made by leeches consists of three cuts proceeding like radii from a centre, and making equal angles with each other. This structure of the wound is most distinctly seen when the swelling has gone down, and the skin is clean, which is usually on the fourth day.—Leeches are able to live in oil; and when taken out of this liquid and put into water again, they throw off a tender skin or film, of the regular shape of the whole body. Their being able to live in this fluid shews, that they respire by the mouth: which is also further proved, by gently warming the water in which they are kept; for then the animals being uneasy, breathe hard, and very visibly. These animals may in some shape answer the purposes of barometers; for when preferred in glasses, they predict bad weather by their great restlessness and change of place.

3. The geometra, or geometrical leech, is a native of the same places with the two former. It hath a filiform body, greenish, spotted with white; both ends dilatable, and equally tenacious. It moves as if measuring the spaces it passes over like a compass, whence its name. It is found on trout and other fish after the spawning season.

4. The muricata, or tuberculated leech, hath a taper body, rounded at the greater extremity, and furnished with two small horns; strongly annulated and tuberculated upon the rings; the tail dilated. It inhabits the sea, adheres strongly to fish, and leaves a black mark on the spot.

5. The myxine, or hag, is about eight inches long, with a slender body, carinated beneath, and an adipose or rayless fin round the tail, and under the belly. It inhabits the ocean; enters the mouths of fish, when on the hooks of lines that remain a whole tide under water; and devours the whole, except the skin and bones. The Scarborough fishermen often take it in the *robbed fish*, on drawing up their lines. Linnaeus attributes to it the property of turning water into glue.

HIRUNDO, in ornithology, a genus of birds of the order of passeres. There are twelve species, chiefly distinguished by their colour. The most remarkable are,

1. The domestica, or chimney-swallow, appears in Great Britain near 20 days before the martin, or any other of the swallow tribe. They leave us the latter end of September; and for a few days previous to their departure, they assemble in vast flocks on house-tops, churches, and even trees, from whence they take their flight. It is now known that swallows take their winter-quarters in Senegal, and possibly they may be found along the whole Morocco shore. We

are indebted to M. Adanson for this discovery, who first observed them in the month of October, after their migration out of Europe, on the shores of that kingdom: but whether it was this species alone, or all the European kinds, he is silent.

The name of *chimney-swallow* may almost be confined to Great Britain; for in several other countries they choose different places for their nests. In Sweden, they prefer barns; so are styled there *ladu-swallow*, or the *barn-swallow*: and in the hotter climates, they make their nests in porches, gate-ways, galleries, and open halls.

The house-swallow is distinguished from all others by the superior forkiness of its tail, and by the red spot on the forehead and under the chin. The crown of the head, the whole upper-part of the body, and the coverts of the wings, are black, glossed with a rich purplish blue, most resplendent in the male: the breast and belly white, that of the male tinged with red: the tail is black; the two middle feathers are plain, the others marked transversely near their ends with a white spot. The exterior feathers of the tail are much longer in the male than in the female.

Its food is the same with the others of its kind, viz. insects. For the taking of these, in their swiftest flight, nature hath admirably contrived their several parts: their mouths are very wide to take in flies, &c. in their quickest motion; their wings are long, and adapted for distant and continual flight; and their tails are forked, to enable them to turn the readier in pursuit of their prey. This species, in our country, builds in chimneys; and makes its nest of clay mixed with straw, leaving the top quite open. It lines the bottom with feathers and grasses: and usually lays from four to six eggs, white speckled with red; but, by taking away one of the eggs daily, it will successively lay as far as 19, as Dr Lister has experienced. It breeds earlier than any other species. The first brood are observed to quit the nest the last week in June, or the first in July; the last brood towards the middle or end of August. The nest being fixed five or six feet deep within the chimney, it is with difficulty that the young can emerge. They even sometimes fall into the rooms below: but as soon as they succeed, they perch for a few days on the chimney-top, and are there fed by their parents. Their next essay is to reach some leafless bough, where they sit in rows, and receive their food. Soon after they take to the wing, but still want skill to take their own prey. They hover near the place where their parents are in chase of flies, attend their motions, meet them, and receive from their mouths the offered sustenance.—It has a sweet note, which it emits in August and September, perching on house-tops.

2. The urbana, or martin, is inferior in size to the former, and its tail much less forked. The head and upper-part of the body, except the rump, is black glossed with blue: the breast, belly, and rump, are white: the feet are covered with a short white down. This is the second of the swallow-kind that appears in our country. It builds under the eaves of houses, with the same materials, and in the same form, as the house-swallow; only its nest is covered above, having only a small hole for admittance. It will also build against the sides of high cliffs over the sea. For the time.

time that the young keep the nest, the old one feeds them, adhering by the claws to the outside; but as soon as they quit it, the feeds them flying, by a motion quick and almost imperceptible to those who are not used to observe it.

It is a later breed than the preceding by some days, but both will lay twice in the season; and the latter brood of this species have been observed to come forth so late as the 18th of September; yet that year (1766) they entirely quitted our sight by the 5th of October: not but that they sometimes continue here much later; the martins and red-wing thrushes having been seen flying in view on the 7th of November. Nestlings have been remarked in Hampshire as late as the 21st of October, 1772.

3. The riparia, or sand-martin, is the least of the genus that frequents Great Britain. The head and whole upper-part of the body are mouse-coloured; the throat white, encircled with a mouse-coloured ring; the belly white; the feet smooth and black.—It builds in holes in sand-pits, and in the banks of rivers, penetrating some feet deep into the bank, boring through the soil in a wonderful manner with its feet, claws, and bill. It makes its nest of hay, straw, &c. and lines it with feathers: it lays five or six white eggs. It is the earliest of the swallow-tribe in bringing out its young.

4. The apus, or swift, is the largest of our swallows; but the weight is most disproportionately small to its extent of wing of any bird: the former being scarce one ounce, the latter 18 inches. The length near eight. The feet of this bird are so small, that the action of walking and rising from the ground is extremely difficult; so that nature hath made it full amends, by furnishing it with ample means for an easy and continual flight. It is more on the wing than any other swallows; its flight is more rapid, and that attended with a shrill scream. It rests by clinging against some wall, or other apt body; from whence Klein styles this species *hirundo muraria*. It breeds under the eaves of houses, in steeples, and other lofty buildings; makes its nest of grasses and feathers; and lays only two eggs, of a white colour. It is entirely of a glossy dark footy colour, only the chin is marked with a white spot: but by being so constantly exposed to all weathers, the gloss of the plumage is lost before it retires. A pair of these birds were found adhering by their claws, and in a torpid state, in Feb. 1766, under the roof of Longnor-chapel, Shropshire: on being brought to a fire, they revived, and moved about the room. The feet are of a particular structure, all the toes standing forward; the least consists of only one bone; the others of an equal number, viz. two each; in which they differ from those of all other birds.

This appears in our country about 14 days later than the sand-martin; but differs greatly in the time of its departure, retiring invariably about the 10th of August, being the first of the genus that leaves us.

The fabulous history of the *manucodiata*, or *bird of paradise*, is, in the history of this species, in great measure verified. It was believed to have no feet; to live upon the celestial dew; to float perpetually on the atmosphere; and to perform all its functions in that element.

The swift actually performs what has been in these enlightened times disproved of the former, except the small time it takes in sleeping, and what it devotes to incubation; every other action is done on wing. The materials of its nest it collects either as they are carried about by the winds, or picks them up from the surface in its sweeping flight. Its food is undeniably the insects that fill the air. Its drink is taken in transient sips from the water's surface. Even its amorous rites are performed on high. Few persons who have attended to them in a fine summer's morning, but must have seen them make their aerial courtes at a great height, encircling a certain space with an easy steady motion. On a sudden they fall into each others embraces, then drop precipitate with a loud shriek for numbers of yards. This is the critical conjuncture; and to be no more wondered at, than that insects (a familiar instance) should discharge the same duty in the same element.

These birds and swallows are inveterate enemies to hawks. The moment one appears, they attack him immediately: the swifts soon desert; but the swallows pursue and persecute those rapacious birds, till they have entirely driven them away.

Swifts delight in sultry thundery weather, and seem thence to receive fresh spirits. They fly at those times in small parties with particular violence; and as they pass near steeples, towers, or any edifices where their mates perform the office of incubation, emit a loud scream, a sort of serenade, as Mr White supposes, to their respective females.

Concerning the disappearance of swallows in the winter, Mr Pennant hath given the following dissertation.

"There are three opinions among naturalists concerning the manner the swallow-tribes dispose of themselves after their disappearance from the countries in which they make their summer residence. Herodotus mentions one species that resides in Egypt the whole year: Prosper Alpinus asserts the same; and Mr Loten, late governor of Ceylon, assured us, that those of Java never remove. These excepted, every other known kind observe a periodical migration, or retreat. The swallows of the cold Norway, and of North America, of the distant Kamtschatka, of the temperate parts of Europe, of Aleppo, and of the hot Jamaica, all agree in this one point.

"In cold countries, a defect of insect-food on the approach of winter, is a sufficient reason for these birds to quit them: but since the same cause probably does not subsist in the warm climates, recourse should be had to some other reason for their vanishing.

"Of the three opinions, the first has the utmost appearance of probability; which is, that they remove nearer the sun, where they can find a continuance of their natural diet, and a temperature of air suiting their constitutions. That this is the case with some species of European swallows, has been proved beyond contradiction (as above cited) by M. Adanson. We often observe them collected in flocks innumerable on churches, on rocks, and on trees, previous to their departure: hence and Mr Collinson proves their return here in perhaps equal numbers, by two curious relations of undoubted credit; the one communicated to him by Mr Wright, master of a ship; the other by the

Hirundo.

the late Sir Charles Wager; who both described (to the same purpose) what happened to each in their voyages. "Returning home, (says Sir Charles), in the spring of the year, as I came into founding in our channel, a great flock of swallows came and settled on all my rigging; every rope was covered; they hung on one another like a swarm of bees; the decks and carving were filled with them. They seemed almost famished and spent, and were only feathers and bones; but, being recruited with a night's rest, took their flight in the morning." This vast fatigue proves that their journey must have been very great, considering the amazing swiftness of these birds: in all probability they had crossed the Atlantic ocean, and were returning from the shores of Senegal, or other parts of Africa; so that this account from that most able and honest seaman, confirms the later information of M. Adanson.

"Mr White, on Michaelmas day 1768, had the good fortune to have ocular proof of what may reasonably be supposed an actual migration of swallows. Travelling the morning very early between his house and the coast, at the beginning of his journey he was environed with a thick fog; but on a large wild heath the mist began to break, and discovered to him numberless swallows, clustered on the standing bushes, as if they had roosted there: as soon as the sun burst out, they were instantly on wing, and with an easy and placid flight proceeded towards the sea. After this he saw no more flocks, only now and then a straggler.

In Kalm's voyage to America, is a remarkable instance of the distant flight of swallows; for one lighted on the ship he was in, September 2d, when he had passed over only two thirds of the Atlantic ocean. His passage was uncommonly quick, being performed from Deal to Philadelphia in less than six weeks; and when this accident happened, he was fourteen days sail from Cape Hinlopen.

"This rendezvous of swallows about the same time of year is very common on the willows, in the little isles in the Thames. They seem to assemble for the same purpose as those in Hampshire, notwithstanding no one yet has been eye-witness of their departure. On the 26th of September 1775, two gentlemen who happened to lie at Maidenhead Bridge, furnished at least a proof of the multitudes there assembled: they went by torch-light to an adjacent isle, and in less than half an hour brought ashore fifty dozen; for they had nothing more to do than to draw the willow-twigs through their hands, the birds never stirring till they were taken.

"The northern naturalists will perhaps say, that this assembly met for the purpose of plunging into their subaqueous winter-quarters: but were that the case, they would never escape discovery in a river perpetually fished as the Thames, as some of them must inevitably be brought up in the nets that harrahs that water.

"The second notion has great antiquity on its side. Aristotle and Pliny give it as their belief, that swallows do not remove very far from their summer habitation, but winter in the hollows of rocks, and during that time lose their feathers. The former part of their opinion has been adopted by several ingenious men; and of late, several proofs have been brought of some

Hirundo.

species, at least, having been discovered in a torpid state. Mr Collinson favoured us with the evidence of three gentlemen, eye-witnesses to numbers of sand martins being drawn out of a cliff on the Rhine, in the month of March 1762. And the honourable Daines Barrington communicated to us the following fact, on the authority of the late lord Belhaven, That numbers of swallows have been found in old dry walls, and in sand-hills near his Lordship's seat in East Lothian; not once only, but from year to year; and that when they were exposed to the warmth of a fire, they revived. We have also heard of the same annual discoveries near Morpeth, in Northumberland, but cannot speak of them with the same assurance as the two former: neither in the two last instances are we certain of the particular species.

"Other witnesses crowd on us to prove the residence of those birds in a torpid state during the severe season.

"First, In the chalky cliffs of Sussex; as was seen on the fall of great fragment some years ago.

"Secondly, In a decayed hollow tree that was cut down, near Dolgell, in Merionethshire.

"Thirdly, In a cliff near Whitby, Yorkshire; where, on digging out a fox, whole bushels of swallows were found in a torpid condition. And,

"Lastly, the reverend Mr Conway, of Sychton, Flintshire, was so obliging as to communicate the following fact: A few years ago, on looking down an old lead-mine in that county, he observed numbers of swallows clinging to the timbers of the shaft, seemingly asleep; and on flinging some gravel on them, they just moved, but never attempted to fly or change their place: this was between All Saints and Christmas.

"These are doubtless the lurking places of the later hatches, or of those young birds, who are incapable of distant migrations. There they continue insensible and rigid; but like flies may sometimes be reanimated by an unseasonable hot day in the midst of winter: for very near Christmas a few appeared on the moulding of a window of Merton college, Oxford, in a remarkably warm nook, which prematurely set their blood in motion, having the same effect as laying them before the fire at the same time of year. Others have been known to make this premature appearance; but as soon as the cold natural to the season returns, they withdraw again to their former retreats.

"I shall conclude with one argument drawn from the very late hatches of two species.

"On the 23d of October 1767, a martin was seen in Southwark, flying in and out of his nest: and on the 29th of the same month, four or five swallows were observed hovering round and settling on the county hospital at Oxford. As these birds must have been of a late hatch, it is highly improbable that at so late a season of the year, they would attempt, from one of our midland counties, a voyage almost as far as the equator to Senegal or Goree: we are therefore confirmed in our notion, that there is only a partial migration of these birds; and that the feeble late hatches conceal themselves in this country.

"The above are circumstances we cannot but assent to, though seemingly contradictory to the common course of nature in regard to other birds. We

must, therefore, divide our belief relating to these two so different opinions; and conclude, that one part of the swallow-tribe migrate, and that others have their winter-quarters near home. If it should be demanded, why swallows alone are found in a torpid state, and not the other many species of soft-billed birds, which likewise disappear about the same time? the following reason may be assigned:

“No birds are so much on the wing as swallows, none fly with such swiftness and rapidity, none are obliged to such sudden and various evolutions in their flight, none are at such pains to take their prey, and, we may add, none exert their voice more incessantly: all these occasion a vast expence of strength and of spirits, and may give such a texture to the blood as other animals cannot experience; and so dispose, or we may say necessitate, this tribe of birds, or part of them at least, to a repose more lasting than that of any others.

“The third notion is, even at first sight, too amazing and unnatural to merit mention, if it was not that some of the learned have been credulous enough to deliver for fact, what has the strongest appearance of impossibility; we mean the relation of swallows passing the winter immersed under ice, at the bottom of lakes, or lodged beneath the water of the sea at the foot of rocks. The first who broached this opinion, was Olaus Magnus, archbishop of Upsal, who very gravely informs us, that these birds are often found in clustered masses at the bottom of the northern lakes, mouth to mouth, wing to wing, foot to foot; and that they creep down the reeds in autumn, to their subaqueous retreats: That when old fishermen discover such a mass, they throw it into the water again; but when young inexperienced ones take it, they will, by thawing the birds at a fire, bring them indeed to the use of their wings, which will continue but a very short time, being owing to a premature and forced revival.

“That the good archbishop did not want credulity in other instances, appears from this, that after having stocked the bottoms of the lakes with birds, he stores the clouds with mice, which sometimes fall in plentiful showers on Norway and the neighbouring countries.

“Some of our own countrymen have given credit to the submersion of swallows; and Klein patronises the doctrine strongly, giving the following history of their manner of retreating, which he received from some countrymen and others. They asserted, that sometimes the swallows assembled in numbers on a reed, till it broke and sunk with them to the bottom; and their immersion was preceded by a dirge of a quarter of an hour's length: That others would unite in laying hold of a straw with their bills, and so plunge down in society. Others again would form a large mass, by clinging together with their feet, and so commit themselves to the deep.

“Such are the relations given by those that are fond of this opinion; and though delivered without exaggeration, must provoke a smile. They assign not the smallest reason to account for these birds being able to endure so long a submersion without being suffocated, or without decaying, in an element so unnatural to so delicate a bird; when we know that the

otter, the corvorant, and the grebes, soon perish, if caught under ice, or entangled in nets: and it is well known, that those animals will continue much longer under water than any others to whom nature hath denied that particular structure of heart necessary for a long residence beneath that element. Though entirely satisfied in our own mind of the impossibility of these relations; yet, desirous of strengthening our opinion with some better authority, we applied to that able anatomist, Mr John Hunter; who was so obliging as to inform us, that he had dissected many swallows, but found nothing in them different from other birds as to the organs of respiration: That all those animals which he had dissected of the class that sleep during winter, such as lizards, frogs, &c. had a very different conformation as to those organs: That all these animals, he believes, do breathe in their torpid state; and, as far as his experience reaches, he knows they do: and that therefore he esteems it a very wild opinion, that terrestrial animals can remain any long time under water without drowning.”

To this reasoning of Mr Pennant's, however, the following answer hath appeared in Kalm's travels in North America.—“It has been a subject of contest among naturalists, to determine the winter-retreat of swallows. Some think they go to warmer climates when they disappear in the northern countries: others say, they creep into hollow trees, and holes in clefts of rocks, and lie there all the winter in a torpid state; and others affirm, that they make their retreat into water, and revive again in spring. The two first opinions have been proved, and it seems have found credit; the last has been treated as ridiculous, and almost as an old woman's tale. Natural history, as all other histories, depends not always upon the intrinsic degree of probability, but upon facts founded on the testimony of people of noted veracity.—Swallows are seldom seen sinking down into the water; swallows have not such organs as frogs or lizards, which are torpid during winter; *ergo*, swallows live not, and cannot live, under water.—This way of arguing, I believe, would carry us, in a great many cases, too far; for, though it is not clear to every one, it may however be true; and lizards and frogs are animals of a class widely different from that of birds, and must therefore of course have a different structure; hence it is they are classed separately. The bear and the marmot are in winter in a torpid state, and have however not such organs as lizards and frogs; and nobody doubts of their being, during some time, in the most rigid climates, in a torpid state: for the Alpine nations hunt the marmots frequently, by digging their holes up; and find them so torpid, that they cut their throats, without their reviving or giving the least sign of life during the operation; but when the torpid marmot is brought into a warm room, and placed before the fire, it revives from its lethargy. The question must therefore be decided by facts; nor are these wanting here. Dr Wallerius, the celebrated Swedish chemist, informs us, That he has seen, more than once, swallows assembling on a reed, till they were all immersed and went to the bottom; this being preceded by a dirge of a quarter of an hour's length. He attests likewise, that he had seen a swallow caught during winter out of a lake with a net, drawn, as is com-

Hirundo,

common in northern countries, under the ice; this bird was brought into a warm room, revived, fluttered about, and soon after died.

"Mr Klein applied to many fermiers generaux of the king of Prussia's domains, who had great lakes in their districts, the fishery in them being a part of the revenue. In winter the fishery thereon is the most considerable under the ice, with nets spreading more than 200 or 300 fathoms, and they are often wound by screws and engines on account of their weight. All the people questioned made affidavits upon oath before the magistrates. First, The mother of the countess Lehnendorf said, that she had seen a bundle of swallows brought from the Frith-Haff, (a lake communicating with the Baltic at Pillaw), which, when brought into a moderately warm room, revived and fluttered about. Secondly, Count Schilleben gave an instrument on stamped paper, importing, that by fishing on the lake belonging to his estate of Gerdauen in winter, he saw several swallows caught in the net, one of which he took up with his hand, brought it into a warm room, where it lay about an hour, when it began to stir, and half an hour after it flew about the room. Thirdly, Fermier-general (Amtman) Witkouski made affidavit, that, in the year 1740, three swallows were brought up with the net in the great pond at Didlacken; in the year 1741, he got two swallows from another part of the pond, and took them home (they being all caught in his presence;) after an hour's space they revived all in a warm room, fluttered about, and died in three hours after. Fourthly, Amtman Bönke says, that having had the estate Kleskow in farm, he had seen nine swallows brought up in the net from under the ice, all which he took into a warm room, where he distinctly observed how they gradually revived; but a few hours after they all died. Another time his people got likewise some swallows in a net, but he ordered them to be again thrown into the water. Fifthly, Andrew Rutta, a master fisherman at Oletsko, made affidavit, in 1747, that 22 years ago, two swallows were taken up by him in a net, under the ice, and, being brought into a warm room, they flew about.—Sixthly, Jacob Kosulso, a master fisherman at Stradauen, made affidavit, that, in 1736, he brought up in winter, in a net, from under the ice of the lake at Ralki, a seemingly dead swallow, which revived in half an hour's time in warm room, and he saw, in a quarter of an hour after, the bird grow weaker, and soon after dying. Seventhly, I can reckon myself among the eye-witnesses of this paradoxon of natural history. In the year 1735, being a little boy, I saw several swallows brought in winter by fishermen, from the river Vitula, to my father's house; where two of them were brought into a warm room, revived, and flew about. I saw them several times settling on the warm stove (which the northern nations have in their rooms); and I recollect well, that the same forenoon they died, and I had them, when dead, in my hand. In the year 1754, after the death of my uncle Godefroy Wolf, captain in the Polish regiment of foot-guards; being myself one of his heirs, I administered for my co-heirs, several estates called the *Starosty of Dischau*, in Polish Prussia, which my late uncle farmed under the king. In January, the lake of Lyb-

shaw, belonging to these estates, being covered with ice, I ordered the fishermen to fish therein, and in my presence several swallows were taken, which the fishermen to fish therein, and in my presence several swallows threw in again; but one I took up to myself, brought it home, which was five miles from thence, and it revived, but died about an hour after its reviving.

"These are facts, attested by people of the highest quality, by some in public offices, and by others who, tho' of a low rank, however made these affidavits upon oath. It is impossible to suppose indifferently, that they were prompted, by views of interest, to assert as a fact, a thing which had no truth in it. It is therefore highly probable, or rather incontestably true, that swallows retire in the northern countries during winter, into the water, and stay there in a torpid state, till the return of warmth revives them again in spring. The question therefore, I believe, ought for the future to be thus stated: The swallows in Spain, Italy, France, and perhaps some from England, remove to warmer climates; some English ones, and some in Germany and other mild countries, retire into clefts and holes in rocks, and remain there in a torpid state. In the colder northern countries the swallows immerse in the sea, in lakes, and rivers; and remain in a torpid state, under ice, during winter. There are still some objections to this latter assertion, which we must remove. It is said, Why do not rapacious fish, and aquatic quadrupeds and birds, devour these swallows? The answer is obvious. Swallows choose only such places in the water for their winter-retreat, as are near reeds and rushes; so that sinking down there between them and their roots, they are by them secured against the rapaciousness of their enemies. But others object, Why are not these birds caught in such waters as are continually harried by nets? I believe the same answer which has been made to the first objection will serve for this likewise. Fishermen take care to keep off with their nets from places filled with reeds and rushes, for fear of entangling and tearing their net; and thus the situation of swallows under water, is the reason that they are seldom disturbed in their silent winter-retreats. What confirms this opinion still more is, that swallows were never caught in Prussia, according to the above-mentioned affidavits, but with those parts of the net which passed near to the reeds and rushes; and sometimes the swallows were yet fastened with their feet to a reed, when they were drawn up by the net. As to the argument taken from their being so long under water without corruption, I believe, there is a real difference between animals suffocated in water and animals being torpid therein. We have examples of things being a long time under water; to which we may add the intense cold of these northern regions, which preserves them. Who would have thought it, that snails and polypes may be dissected, and could reproduce the parts severed from their body, if it was not a fact? Natural history ought to be studied as a collection of facts, not as the history of our guesses or opinions. Nature varies in an infinite manner; and Providence has diversified the instinct of animals and their economy, and adapted it to the various seasons and climates."

HISPANIOLA, called also *St Domingo*, the

20 U 2 largest.

Hirundo,
hispaniola.

Hispaniola. largest of the Antilles or Caribbee islands, extending about 420 miles from east to west, and 120 in breadth from north to south; lying between $17^{\circ} 37'$ and 20° of N. Lat. and between $67^{\circ} 35'$ and $74^{\circ} 15'$ W. Long. The climate here hot, but not reckoned unwholesome; and some of the inhabitants are said to arrive at the age of 120. It is sometimes refreshed by breezes and rains; and its salubrity is likewise in a great measure owing to the beautiful variety of hills and valleys, woods and rivers, which every where present themselves. It is indeed reckoned by far the finest and most pleasant island of the Antilles, as being the best accommodated to all the purposes of life when duly cultivated.

This island, famous for being the earliest settlement of the Spaniards in the new world, was at first in high estimation for the quantity of gold it supplied: this wealth diminished with the inhabitants of the country, whom they obliged to dig it out of the bowels of the earth; and the source of it was entirely dried up, when they were exterminated, which was quickly done, by a series of the most shocking barbarities that ever disgraced the history of any nation. Benzoni relates, that of two millions of inhabitants, contained in the island when discovered by Columbus in 1492, scarce 153 were alive in 1545. A vehement desire of opening again this source of wealth inspired the thought of getting slaves from Africa; but, besides that these were found unfit for the labours they were destined to, the multitude of mines, which then began to be wrought on the continent, made those of Hispaniola no longer of any importance. An idea now suggested itself, that their negroes, which were healthy, strong, and patient, might be usefully employed in husbandry; and they adopted, through necessity, a wise resolution, which, had they known their own interest, they would have embraced by choice.

The produce of their industry was at first extremely small, because the labourers were few. Charles V. who, like most sovereigns, preferred his favourites to every thing, had granted an exclusive right of the slave-trade to a Flemish nobleman, who made over his privilege to the Genoese. Those avaricious republicans conducted this infamous commerce as all monopolies are conducted; they resolved to sell dear, and they sold but few. When time and competition had fixed the natural and necessary price of slaves, the number of them increased. It may easily be imagined, that the Spaniards, who had been accustomed to treat the Indians as beasts, did not entertain a higher opinion of these negro Africans, whom they substituted in their place. Degraded still further in their eyes by the price they had paid for them, even religion could not restrain them from aggravating the weight of their servitude. It became intolerable, and these wretched slaves made an effort to recover the unalienable rights of mankind. Their attempt proved unsuccessful; but they reaped this benefit from their despair, that they were afterwards treated with less inhumanity.

This moderation (if tyranny cramped by the apprehension of revolt can deserve that name) was attended with good consequences. Cultivation was pursued with some degree of success. Soon after the middle of the 16th century, the mother-country drew

annually from this colony ten million weight of sugar, *Hispaniola.* a large quantity of wood for dyeing, tobacco, cocoa, cassia, ginger, cotton, and peltry in abundance. One might imagine, that such favourable beginnings would give both the desire and the means of carrying them further; but a train of events, more fatal each than the other, ruined these hopes.

The first misfortune arose from the depopulation of the island. The Spanish conquests on the continent should naturally have contributed to promote the success of an island, which nature seemed to have formed to be the centre of that vast dominion arising around it, to be the staple of the different colonies. But it fell out quite otherwise: on a view of the immense fortunes raising in Mexico, and other parts, the richest inhabitants of Hispaniola began to despise their settlements, and quitted the true source of riches, which is on the surface of the earth, to go and ransack the bowels of it for veins of gold, which are quickly exhausted. The government endeavoured in vain to put a stop to this emigration; the laws were always either artfully eluded, or openly violated.

The weakness, which was a necessary consequence of such a conduct, leaving the coasts without defence, encouraged the enemies of Spain to ravage them. Even the capital of this island was taken and pillaged by that celebrated English sailor, Sir Francis Drake. The cruizers of less consequence contented themselves with intercepting vessels in their passage through those latitudes, the best known at that time of any in the new world. To complete these misfortunes, the Castilians themselves commenced pirates. They attacked no ships but those of their own nation; which were more rich, worse provided, and worse defended, than any others. The custom they had of fitting out ships clandestinely, in order to procure slaves, prevented them from being known; and the assistance they purchased from the ships of war, commissioned to protect the trade, insured to them impunity.

The foreign trade of the colony was its only resource in this distress; and that was illicit: but as it continued to be carried on, notwithstanding the vigilance of the governors, or, perhaps, by their connivance, the policy of an exasperated and short-sighted court exerted itself in demolishing most of the sea-ports, and driving the miserable inhabitants into the inland country. This act of violence threw them into a state of dejection; which the incursons and settlement of the French on the island afterwards carried to the utmost pitch. The latter, after having made some unsuccessful attempts to settle on the island, had part of it yielded to them in 1697, and now enjoy by far the best share.

Spain, totally taken up with that vast empire which she had formed on the continent, used no pains to dissipate this lethargy. She even refused to listen to the solicitations of her Flemish subjects, who earnestly pressed that they might have permission to clear those fertile lands. Rather than run the risk of seeing them carry on a contraband trade on the coasts, she chose to bury in oblivion a settlement which had been of consequence, and was likely to become so again.

This colony, which had no longer any intercourse with the mother-country but by a single ship, of no great burthen, that arrived from thence every third year, consisted

confisted, in 1717, of 18410 inhabitants, including Spaniards, Mestees, Negroes, or Mulattoes. The complexion and character of these people differed according to the different proportions of American, European, and African blood they had received from that natural and transient union which restores all races and conditions to the same level. These demi-savages, plunged in the extreme of sloth, lived upon fruits and roots, dwelt in cottages without furniture, and most of them without clothes. The few among them, in whom indolence had not totally suppressed the sense of decency, and taste for the conveniences of life, purchased clothes

of their neighbours the French, in return for their cattle, and the money sent to them for the maintenance of two hundred soldiers, the priests, and the government. It does not appear that the company, formed at Barcelona in 1757, with exclusive privileges for the re-establishment of St Domingo, hath as yet made any considerable progress. They send out only two small vessels annually, which are freighted back with six thousand hides, and some other commodities of little value. See ST DOMINGO.

HISTORIOGRAPHER, a professed historian, or writer of history.

H I S T O R Y.

HISTORY, in general, signifies an account of some remarkable facts which have happened in the world, arranged in the true order in which they actually took place, together with the causes to which they were owing, and the different effects they have produced, as far as can be discovered.—The word is Greek, *ἱστορία*; and literally denotes a search of curious things, or a desire of knowing, or even a rehearsal of things we have seen; being formed from the verb *ἵστωρ*, which properly signifies to know a thing by having seen it. But the idea is now much more extensive, and is applied to the knowledge of things taken from the report of others. The origin is from the verb *ἵστωρ*, “I know;” and hence it is, that among the ancients several of their great men were called *polyhistores*, i. e. persons of various and general knowledge.

Sometimes, however, the word history is used to signify a description of things, as well as an account of facts. Thus Theophrastus calls his work, in which he has treated of the nature and properties of plants, an *history of plants*; and we have a treatise of Aristotle, intitled an *history of animals*; and to this day the descriptions of plants, animals, and minerals, are called by the general name of *natural history*.

But what chiefly merits the name of history, and what is here considered as such, is an account of the principal transactions of mankind since the beginning of the world; and which naturally divides itself into two parts, namely, *civil* and *ecclesiastical*. The first contains the history of mankind in their various relations to one another, and their behaviour, for their own emolument, or that of others, in common life; the second considers them as acting, or pretending to act, in obedience to what they believe to be the will of the Supreme Being.—Civil history, therefore, includes an account of all the different states that have existed in the world, and likewise of those men who in different ages of the world have most eminently distinguished themselves either for their good or evil actions. This last part of civil history is usually termed BIOGRAPHY.

History is now considered as a very considerable branch of polite literature: few accomplishments are more valued than an accurate knowledge of the histories of different nations; and scarce any literary production is more regarded than a well-written history of any nation.

With regard to the study of history, we must consider, that all the revolutions which have happened in

the world, have been owing to two causes. 1. The connections between the different states existing together in the world at the same time, or their different situations with regard to one another; and, 2. The different characters of the people who in all ages constituted these states, their different geniuses and dispositions, &c. by which they were either prompted to undertake such and such actions of themselves, or were easily induced to it by others. The person who would study history, therefore, ought in the first place to make himself acquainted with the state of the world in general in all different ages; what nations inhabited the different parts of it; what their extent of territory was; at what particular time they arose, and when they declined. He is then to inform himself of the various events which have happened to each particular nation; and, in so doing, he will discover many of the causes of those revolutions, which before he only knew as facts. Thus, for instance, a person may know the Roman history from the time of Romulus, without knowing in the least why the city of Rome happened to be built at that time. This cannot be understood without a particular knowledge of the former state of Italy, and even of Greece and Asia; seeing the origin of the Romans is commonly traced as high as Æneas, one of the heroes of Troy. But when all this is done, which indeed requires no small labour, the historian hath yet to study the genius and dispositions of the different nations, the characters of those who were the principal directors of their actions, whether kings, ministers, generals, or priests; and when this is accomplished, he will discover the causes of those transactions in the different nations which have given rise to the great revolutions above mentioned: after which, he may assume the character of one who is perfectly versed in history.

The first outline of history, as it may be called, is most easily obtained by the inspection of an historical chart; and that subjoined to the present treatise, will answer the purpose as well as any. Along with this it will be proper to peruse a short abridgment of general history, from the creation of the world to the present time; but in this way there have been but very few attempts attended with any tolerable success. The following is collected from respectable authorities, and may serve to help the ideas of the reader on this subject.

SECT. I. *Civil History.*3
Civil
history how
divided.

HISTORY, tho' seemingly incapable of any natural division, will yet be found, on a nearer inspection, to resolve itself into the following periods, at each of which a great revolution took place, either with regard to the whole world, or a very considerable part of it. 1. The creation of man. 2. The flood. 3. The beginning of profane history, *i. e.* when all the fabulous relations of heroes, demi-gods, &c. were expelled from historical narrations, and men began to relate facts with some regard to truth and credibility. 4. The conquest of Babylon by Cyrus, and the destruction of the Babylonian empire. 5. The reign of Alexander the Great, and the overthrow of the Persian empire. 6. The destruction of Carthage by the Romans, when the latter had no longer any rival capable of opposing their designs. 7. The reign of the emperor Trajan, when the Roman empire was brought to its utmost extent. 8. The division of the empire under Constantine. 9. The destruction of the Western empire by the Herali, and the settlement of the different European nations. 10. The rise of Mahomet, and the conquests of the Saracens and Turks. 11. The crusades, and all the space intervening between that time and the present.

4
Mosaic ac-
count of the
creation
the only
probable
one.

Concerning the number of years which have elapsed since the creation of the world, there have been many disputes. The compilers of the Universal History determine it to have taken place in the year 4305 B. C. so that, according to them, the world is now in the 6085th year of its age. Others think it was created only 4000 years B. C. so that it hath not yet attained its 6000th year. Be this as it will, however, the whole account of the creation rests on the truth of the Mosaic history; and which we must of necessity accept, because we can find no other which does not either abound with the grossest absurdities, or lead us into absolute darkness. The Chinese and Egyptian pretensions to antiquity are so absurd and ridiculous, that the bare reading must be a sufficient confutation of them to every reasonable person. See the articles CHINA and EGYPT. Some historians and philosophers are inclined to discredit the Mosaic accounts, from the appearances of volcanoes, and other natural phenomena: but their objections are by no means sufficient to invalidate the authority of the sacred writings; not to mention that every one of their own systems is liable to insuperable objections. See the article EARTH. It is therefore reasonable for every person to accept of the Mosaic account of the creation as truth: but an historian is under an absolute necessity of doing it, because, without it, he is quite destitute of any standard or scale by which he might reduce the chronology of different nations to any agreement; and, in short, without receiving this account as true, it would be in a manner impossible at this day to write a general history of the world.

5
History
from the
creation to
the flood.

1. The transactions during the first period, viz. from the creation to the flood, are very much unknown, nothing indeed being recorded of them but what is to be found in the first six chapters of Genesis. In general, we know, that men were not at that time in a savage state; they had made some progress in the arts, had invented music, and found out the method of working

metals. They seem also to have lived in one vast community, without any of these divisions into different nations which have since taken place, and which evidently proceeded from the confusion of languages. The most material part of their history, however, is, that having once begun to transgress the divine commands, they proceeded to greater and greater lengths of wickedness, till at last the Deity thought proper to send a flood on the earth, which destroyed the whole human race except eight persons, viz. Noah and his family. This terrible catastrophe happened, according to the Hebrew copy of the Bible, 1656 years after the creation; according to the Samaritan copy, 1307. For the different conjectures concerning the natural causes of the flood, see the article DELUGE.

2. For the history of the second period we must again have recourse to the Scriptures, almost as much as for that of the first. We now find the human race reduced to eight persons possessed of nothing but what they had saved in the ark, and the whole world to be stored with animals from those which had been preserved along with these eight persons. In what country their original settlement was, no mention is made. The ark is supposed to have rested on Mount Ararat in Armenia*; but it is impossible to know whether Noah and his sons made any stay in the neighbourhood of this mountain or not. Certain it is, that, some time after, the whole or the greatest part of the human race were assembled in Babylonia, where they engaged in building a tower. This gave offence to the Deity; so that he punished them by confounding their language; whence the division of mankind into different nations.

6
From the
flood to the
beginning of
profane
history.• See
Ararat.

According to a common opinion, Noah when dying left the whole world to his sons, giving Asia to Shem, Africa to Ham, and Europe to Japhet. But this hath not the least foundation in Scripture. By the most probable accounts, Gomer the son of Japhet was the father of the Gomerians or Celtes; that is, all the barbarous nations who inhabited the northern parts of Europe under the various names of *Gauls, Cimbrians, Goths*, &c. and who also migrated into Spain, where they were called *Celtiberians*. From Magog, Meshech, and Tubal, three of Gomer's brethren, proceeded the Scythians, Sarmatians, Tartars, and Moguls. The three other sons of Japhet, Madai, Javan, and Tiras, are said to have been the fathers of the Medes, the Ionians, Greeks, and Thracians.

7
Nations de-
scended
from Ja-
phet.

The children of Shem were Elam, Ashur, Arphaxad, Lud, and Aram. The first settled in Persia, where he was the father of that mighty nation: The descendants of Ashur peopled Assyria, (now *Curdeslan*): Arphaxad settled in Chaldaea. Lud is supposed by Josephus to have taken up his residence in Lydia; though this is much controverted. Aram, with more certainty, is thought to have settled in Mesopotamia and Syria.

8
From Shem

The children of Ham were Cush, Mizraim, Phut, Canaan. The first is thought to have remained in Babylonia, and to have been king of the south-eastern parts of it afterwards called *Khuzestan*. His descendants are supposed to have removed into the eastern parts of Arabia; from whence they by degrees migrated into the corresponding part of Africa. The second peopled Egypt, Ethiopia, Cyrenaica, Libya, and

9
From Ham.

Civil
History.

and the rest of the northern parts of the same continent. The place where Phut settled is not known: but Canaan is universally allowed to have settled in Phœnicia; and to have founded those nations who inhabited Judea, and were afterwards exterminated by the Jews.

Almost all the countries of the world, at least of the eastern continent, being thus furnished with inhabitants, it is probable that for many years there would be few or no quarrels between the different nations. The paucity of their numbers, their distance from one another, and their diversity of language, would contribute to keep them from having much communication with each other. Hence, according to the different circumstances in which the different tribes were placed, some would be more civilized, and others more barbarous. In this interval, also, the different nations probably acquired different characters, which afterwards they obstinately retained, and manifested on all occasions; hence the propensity of some nations to monarchy, as the Asiatics, and the enthusiastic desire of the Greeks for liberty and republicanism, &c.

10
Foundation of the kingdoms of Babylonia, Assyria, &c.

The beginning of monarchical government was very early; Nimrod, the son of Cush, having found means to make himself king of Babylonia. In a short time Ashur emigrated from the new kingdom; built Nineveh, afterwards capital of the Assyrian empire; and two other cities called *Rezen* and *Rehoboth*, concerning the situation of which we are now much in the dark. Whether Ashur at this time set up as a king for himself, or whether he held these cities as vassal to Nimrod, is now unknown. It is probable, however, that about the same time various kingdoms were founded in different parts of the world; and which were great or small, according to different circumstances. Thus the scripture mentions the kings of Egypt, Gerar, Sodom, Gomorrah, &c. in the time of Abraham; and we may reasonably suppose, that these kings reigned over nations which had existed for some considerable time before.

11
Migration of the Israelites from Egypt

The first considerable revolution we read of is the migration of the Israelites out of Egypt, and their establishment in the land of Canaan. For the history of these transactions we must refer to the Old Testament, where the reader will see that it was attended with the most terrible catastrophe to the Egyptians, and with the utter extermination of some nations, the descendants of Ham, who inhabited Judea. Whether the overthrow of Pharaoh in the Red Sea could affect the Egyptian nation in such a manner as to deprive them of the greatest part of their former learning, and to keep them for some ages after in a barbarous state, is not easily determined; but unless this was the case, it seems exceedingly difficult to account for the total silence of their records concerning such a remarkable event, and indeed for the general confusion and uncertainty in which the early history of Egypt is involved. The settlement of the Jews in the promised land of Canaan is supposed to have happened about 1491 B. C.

12
History of the Greeks.

For near 200 years after this period, we find no accounts of any other nations than those mentioned in scripture. About 1280 B. C. the Greeks began to make other nations feel the effects of that enterprising and martial spirit for which they were so remarkable, and which they had undoubtedly exercised upon one

another long before. Their first enterprise was an invasion of Colchis (now *Mingrelia*), for the sake of the golden fleece. Whatever was the nature of this expedition, it is probable they succeeded in it; and it is likewise probable, that it was this specimen of the riches of Asia which inclined them so much to Asiatic expeditions ever after. All this time we are totally in the dark about the state of Asia and Africa, except in so far as can be conjectured from Scripture. The ancient empires of Babylon, Assyria, and Persia, probably still continued in the former continent, and Egypt and Ethiopia seem to have been considerable kingdoms in the latter.

About 1184 years B. C. the Greeks again distinguished themselves by their expedition against Troy, a city of Phrygia Minor; which they plundered and burnt, massacring the inhabitants with the most unrelenting cruelty. *Æneas*, a Trojan prince, escaped with some followers into Italy, where he became the remote founder of the Roman empire. At this time Greece was divided into a number of small principalities, most of which seem to have been in subjection to Agamemnon king of Mycenæ. In the reign of Atreus, the father of this Agamemnon, the Heraclidae, or descendants of Hercules, who had been formerly banished by Euristheus, were again obliged to leave this country. Under their champion Hyllus, they claimed the kingdom of Mycenæ as their right, pretending that it belonged to their great ancestor Hercules, who was unjustly deprived of it by Euristheus *. The controversy was decided by single combat; but Hyllus being killed, they departed as had been before agreed, under a promise of not making any attempt to return for 50 years. About the time of the Trojan war also, we find the Lydians, Mysians, and some other nations of Asia Minor, first mentioned in history. The names of the Greek states mentioned during this uncertain period are, 1. Sicyon. 2. Leleg. 3. Messina. 4. Athens. 5. Crete. 6. Argos. 7. Sparta. 8. Pelasgia. 9. Theffaly. 10. Attica. 11. Phocis. 12. Locris. 13. Ozela. 14. Corinth. 15. Eleusina. 16. Elis. 17. Pilus. 18. Arcadia. 19. Egina. 20. Ithaca. 21. Cephalone. 22. Phthia. 23. Phocidia. 24. Ephyra. 25. Eolia. 26. Thebes. 27. Calista. 28. Etolia. 29. Doloppa. 30. Oechalia. 31. Mycenæ. 32. Eubœa. 33. Mynia. 34. Doris. 35. Phera. 36. Iola. 37. Trachina. 38. Thraprocia. 39. Myrmidonia. 40. Salamine. 41. Scyros. 42. Hypæria or Melite. 43. The Vulcanian isles. 44. Megara. 45. Epirus. 46. Achaia. 47. The isles of the Egean Sea. Concerning many of these, we know nothing besides their names; the most remarkable particulars concerning the rest may be found under their respective articles.

* See
Hercules.

About 1048 B. C. the kingdom of Judea under king David approached its utmost extent of power. In its most flourishing condition, however, it never was remarkable for the largeness of its territory. In this respect it scarce exceeded the kingdom of Scotland; though, according to the accounts given in Scripture, the magnificence of Solomon was superior to that of the most potent monarchs on earth. This extraordinary wealth was owing partly to the spoils amassed by king David in his conquests over his various enemies, and partly to the commerce with the East Indies which

13
Of the
Jews.

which Solomon had established. Of this commerce he owed his share to the friendship of Hiram king of Tyre, a city of Phœnicia, whose inhabitants were now the most famed for commerce and skill in maritime affairs of any in the whole world.

After the death of Solomon, which happened about 975 B. C. the Jewish empire began to decline, and soon after many powerful states arose in different parts of the world. The disposition of mankind in general seems now to have taken a new turn, not easily accounted for. In former times, whatever wars might have taken place between neighbouring nations, we have no account of any extensive empire in the whole world, or that any prince undertook to reduce far distant nations to his subjection. The empire of Egypt indeed is said to have been extended immensely to the east, even before the days of Sesostris. Of this country, however, our accounts are so imperfect, that scarce any thing can be concluded from them. But now, as it were all at once, we find almost every nation aiming at universal monarchy, and refusing to set any bounds whatever to its ambition. The first shock given to the Jewish grandeur was the division of the kingdom into two through the imprudence of Rehoboam: This rendered it more easily a prey to Shishak king of Egypt; who five years after came and pillaged Jerusalem, and all the fortified cities of the kingdom of Judah. The commerce to the East Indies was now discontinued, and consequently the sources of wealth in a great measure stopped; and this, added to the perpetual wars between the kings of Israel and Judah, contributed to that remarkable and speedy decline which is now so easily to be observed in the Jewish affairs.

Whether this king Shishak was the Sesostris of profane writers or not, his expedition against Jerusalem as recorded in Scripture seems very much to resemble the desultory conquests ascribed to Sesostris. His infantry is said to have been innumerable, composed of different African nations; and his cavalry 60,000, with 1200 chariots; which agrees pretty well with the mighty armament ascribed to Sesostris, and of which an account is given under the article EGYPT, n° 2. There indeed his cavalry are said to have been only 24,000; but the number of his chariots are increased to 27,000; which last may not unreasonably be reckoned an exaggeration, and these supernumerary chariots may have been only cavalry: but, unless we allow Sesostris to be the same with Shishak, it seems impossible to fix on any other king of Egypt that can be supposed to have undertaken this expedition in the days of Solomon.

Though the Jews obtained a temporary deliverance from Shishak, they were quickly after attacked by new enemies. In 941 B. C. one Zerah, an Ethiopian, invaded Judæa with an army of a million of infantry and 300 chariots; but was defeated with great slaughter by Asa king of Judah, who engaged him with an army of 80,000 men. About this time also we find the Syrians grown a considerable people, and bitter enemies both to the kings of Israel and Judah; aiming in fact at the conquest of both nations. Their kingdom commenced in the days of David, under Hadadzer, whose capital was Zobah, and who probably was at last obliged to become David's tributary, after

having been defeated by him in several engagements. Before the death of David, however, one Rezon, who it seems had rebelled against Hadadzer, having found means to make himself master of Damascus, erected there a new kingdom, which soon became very powerful. The Syrian princes being thus in the neighbourhood of the two rival states of Israel and Judah (whose capitals were Samaria and Jerusalem), found it an easy matter to weaken them both, by pretending to assist the one against the other; but a detail of the transactions between the Jews and Syrians is only to be found in the Old Testament, to which we refer. In 740 B. C. however, the Syrian empire was totally destroyed by Tiglath Pileser king of Assyria; as was also the kingdom of Samaria by Shalmaneser his successor, in 721. The people were either massacred, or carried into captivity into Media, Persia, and the countries about the Caspian sea.

While the nations of the east were thus destroying each other, the foundations of very formidable empires were laid in the west, which in process of time were to swallow up almost all the eastern ones. In Africa, Carthage was founded by a Tyrian colony, about 869 B. C. according to those who ascribe the highest antiquity to that city; but, according to others, it was founded only in 769 or 770 B. C. In Europe a very considerable revolution took place about 900 B. C. The Heraclidae, whom we have formerly seen expelled from Greece by Atreus the father of Agamemnon, after several unsuccessful attempts, at last conquered the whole Peloponnesus. From this time the Grecian states became more civilized, and their history becomes less obscure. The institution, or rather the revival and continuance, of the Olympic games, in 776 B. C. also greatly facilitated the writing not only of their history, but that of other nations; for as each Olympiad consisted of four years, the chronology of every important event became indubitably fixed by referring it to such and such an Olympiad. In 748 B. C. or the last year of the seventh Olympiad, the foundations of the city of Rome were laid by Romulus; and, 43 years after, the Spartan state was new modelled, and received from Lycurgus those laws, by observing of which it afterwards arrived at such a pitch of splendor.

3. With the beginning of the 28th Olympiad, or 568 B. C. commences the third general period above mentioned, when profane history becomes somewhat more clear, and the relations concerning the different nations may be depended upon with some degree of certainty. The general state of the world was at that time as follows.—The northern parts of Europe were either thinly inhabited, or filled with unknown and barbarous nations, the ancestors of those who afterwards destroyed the Roman empire. France and Spain were inhabited by the Gomerians or Celtes. Italy was divided into a number of petty states arising partly from Gauls, and partly from Grecian colonies; among which the Romans had already become formidable. They were governed by their king Servius Tullius; had increased their city by the demolition of Alba Longa, and the removal of its inhabitants to Rome; and had enlarged their dominions by several cities taken from their neighbours. Greece was also divided into a number of small states, among

general pe-
riod.

12
Of the Sy-
rians.

which the Athenians and Spartans, being the most remarkable, were rivals to each other. The former had, about 599 B. C. received an excellent legislation from Solon, and were enriching themselves by navigation and commerce: the latter were become formidable by the martial institutions of Lycurgus; and, having conquered Messina, and added its territory to their own, were justly esteemed the most powerful people in Greece. The other states of most consideration were Corinth, Thebes, Argos, and Arcadia.—In Asia great revolutions had taken place. The ancient kingdom of Assyria was destroyed by the Medes and Babylonians, its capital city Nineveh utterly ruined, and the greatest part of its inhabitants carried to Babylon. Nay, the very materials of which it was built were carried off, to adorn and give strength to that stately metropolis, which was then undoubtedly the first city in the world. Nebuchadnezzar, a wife and valiant prince, now sat on the throne of Babylon. By him the kingdom of Judæa was totally overthrown in 587 B. C. Three years before this, he had taken and razed the city of Tyre, and overrun all the kingdom of Egypt. He is even said by Josephus to have conquered Spain, and reigned there nine years, after which he abandoned it to the Carthaginians; but this seems by no means probable. The extent of the Babylonian empire is not certainly known: but, from what is recorded of it, we may conclude, that it was not at all inferior even in this respect to any that ever existed; as the Scripture tells us it was superior in wealth to any of the succeeding ones. We know that it comprehended Phœnicia, Palestine, Syria, Babylonia, Media, and Persia, and not improbably India also; and from a consideration of this vast extent of territory, and the riches with which every one of these countries abounded, we may form some idea of the wealth and power of this monarch. When we consider also, that the whole strength of this mighty empire was employed in beautifying the metropolis, we cannot look upon the wonders of that city as related by Herodotus to be at all incredible. See BABYLON; and ARCHITECTURE, n° 13. As to what passed in the republic of Carthage about this time, we are quite in the dark; there being a chasm in its history for no less than 300 years.

17
Fourth period. History of the Babylonian empire.

4. The fourth general period of history, namely, from the end of the fabulous times to the conquest of Babylon by Cyrus, is very short, including no more than 31 years. This sudden revolution was occasioned by the misconduct of Evil-merodach Nebuchadnezzar's son, even in his father's life-time. For having, in a great hunting match on occasion of his marriage, entered the country of the Medes, and some of his troops coming up at the same time to relieve the garisons in those places, he joined them to those already with him, and without the least provocation began to plunder and lay waste the neighbouring country. This produced an immediate revolt, which quickly extended over all Media and Persia. The Medes, headed by Astyages and his son Cyaxares, drove back Evil-merodach and his party with great slaughter; nor doth it appear that they were afterwards reduced even by Nebuchadnezzar himself. The new empire continued daily to gather strength, and at last Cyrus, Astyages's

Vol. V.

grandson, a prince of great prudence and valour, being made generalissimo of the Median and Persian forces, took Babylon itself, in the year 538 B. C. as related under the article BABYLON.

During this period the Romans increased in power under the wife administration of their king Servius Tullius, who, though a pacific prince, rendered his people more formidable by a peace of 20 years than his predecessors had done by all their victories. The Greeks, even at this early period, began to interfere with the Persians, on account of the Ionians or Grecian colonies in Asia Minor. These had been subdued by Cræsus king of Lydia about the year 562, the time of Nebuchadnezzar's death. Whether the Lydians had been subdued by the Babylonish monarch or not, is not now to be ascertained; though it is very probable that they were either in subjection to him, or greatly awed by his power, as before his death nothing considerable was undertaken by them. It is indeed probable, that during the infancy of Nebuchadnezzar, spoken of by Daniel, the affairs of his kingdom would fall into confusion; and many of those princes whom he formerly retained in subjection would set up for themselves. Certain it is, however, that if the Babylonians did not regard Cræsus as their subject, they looked upon him to be a very faithful ally; inasmuch that they celebrated an annual feast in commemoration of a victory obtained by him over the Scythians. After the death of Nebuchadnezzar, Cræsus subdued many nations in Asia Minor, and among the rest the Ionians, as already related. They were, however, greatly attached to his government; for though they paid him tribute, and were obliged to furnish him with some forces in time of war, they were yet free from all kind of oppression. When Cyrus therefore was proceeding in his conquests of different parts of the Babylonish empire, before he proceeded to attack the capital, the Ionians refused to submit to him, though he offered them very advantageous terms. But soon after, Cræsus himself being defeated and taken prisoner, the Ionians sent ambassadors to Cyrus, offering to submit on the terms which had formerly been proposed. These terms were now refused; and the Ionians, being determined to resist, applied to the Spartans for aid. Though the Spartans at that time could not be prevailed upon to give their countrymen any assistance, they sent ambassadors to Cyrus with a threatening message; to which he returned a contemptuous answer, and then forced the Ionians to submit at discretion, five years before the taking of Babylon. Thus commenced the hatred between the Greeks and Persians; and thus we see, that in the two first great monarchies the seeds of their destruction were sown even before the monarchies themselves were established. For while Nebuchadnezzar was raising the Babylonish empire to its utmost height, his son was destroying what his father built up; and at the very time when Cyrus was establishing the Persian monarchy, by his ill-timed severity to the Greeks he made that warlike people his enemies, whom his successors were by no means able to resist, and who would probably have overcome Cyrus himself, had they united in order to a tack him. The transactions of Africa during this period are almost entirely unknown; though we cannot

not doubt that the Carthaginians enriched themselves by means of their commerce, which enabled them afterwards to attain such a considerable share of power.

5. Cyrus having now become master of all the east, the Asiatic affairs continued for some time in a state of tranquillity. The Jews obtained leave to return to their own country, rebuild their temple, and again establish their worship, of all which an account is given in the sacred writings, though undoubtedly they must have been in a state of dependance on the Persians from that time forward. Cambyles the successor of Cyrus added Egypt to his empire, which had either not submitted to Cyrus, or revolted soon after his death. He intended also to have subdued the Carthaginians; but as the Phœnicians refused to supply him with ships to fight against their own countrymen, he was obliged to lay this design aside.

In 517 B. C. the Babylonians finding themselves grievously oppressed by their Persian masters, resolved to shake off the yoke, and set up for themselves. For this purpose, they took care to store their city with all manner of provisions; and when Darius Hytaspes, then king of Persia, advanced against them, they took the most barbarous method that can be imagined of preventing an unnecessary consumption of those provisions, which they had so carefully amassed. Having collected all the women, old men, and children, into one place, they strangled them without distinction, whether wives, fathers, mothers, brothers, or sisters; every one being allowed to save only the wife he liked best, and a maid servant to do the work of the house. This cruel policy did not avail them: their city was taken by treachery (for it was impossible to take it by force); after which the king caused the walls of it to be beat down from 200 to 50 cubits height, that their strength might no longer give encouragement to the inhabitants to revolt. Darius then turned his arms against the Scythians; but finding that expedition turn out both tedious and unprofitable, he directed his course eastward, and reduced all the country as far as the river Indus. In the mean time, the Ionians revolted; and being assisted by the Greeks, a war commenced between the two nations, which was not thoroughly extinguished but by the destruction of the Persian empire in 330 B. C. The Ionians, however, were for this time obliged to submit, after a war of six years; and were treated with great severity by the Persians. The conquest of Greece itself was then projected: but the expeditions for that purpose ended most unfortunately for the Persians, and encouraged the Greeks to make reprisals on them, in which they succeeded according to their utmost wishes; and had it only been possible for them to have agreed among themselves, the downfall of the Persian empire would have happened much sooner than it did. See ATHENS, SPARTA, MACEDON, and PERSIA.

In 459 B. C. the Egyptians made an attempt to recover their liberty, but were reduced after a war of six years. In 413 B. C. they revolted a second time: and being assisted by the Sidonians, drew upon the latter that terrible destruction foretold by the prophets; while they themselves were so thoroughly humbled, that they never after made any attempt to recover their liberty.

The year 403 B. C. proved remarkable for the revolt of Cyrus against his brother Artaxerxes Mnemon; in which, through his own rashness, he miscarried, and lost his life at the battle of Cunaxa in the province of Babylon. Ten thousand Greek mercenaries, who served in his army, made their way back into Greece, though surrounded on all sides by the enemy, and in the heart of a hostile country. In this retreat they were commanded by Xenophon, who has received the highest praises on account of his conduct and military skill in bringing it to a happy conclusion. Two years after, the invasions of Agaglaus king of Sparta threatened the Persian empire with total destruction; from which however it was relieved by his being recalled in order to defend his own country against the other Grecian states; and after this the Persian affairs continued in a more prosperous way till the time of Alexander.

During all this time, the volatile and giddy temper of the Greeks, together with their enthusiastic desire of romantic exploits, were preparing fetters for themselves, which indeed seemed to be absolutely necessary to prevent them from destroying one another. A zeal for liberty was what they all pretended; but on every occasion it appeared that this love of liberty was only a desire of dominion. No state in Greece could bear to see another equal to itself; and hence their perpetual contests for pre-eminence, which could not but weaken the whole body, and render them an easy prey to an ambitious and politic prince, who was capable of taking advantage of those divisions. Being all equally impatient of restraint they never could bear to submit to any regular government; and hence their determinations were nothing but the decisions of a mere mob, of which they had afterwards almost constantly reason to repent. Hence also their base treatment of those eminent men whom they ought most to have honoured, as Miltiades, Aristides, Themistocles, Alcibiades, Socrates, Phocion, &c. The various transactions between the Grecian states, though they make a very considerable figure in particular history, make none at all in a general sketch of the history of the world. We shall therefore only observe, that in 404 B. C. the Athenian power was in a manner totally broken by the taking of their city by the Spartans. In 370, that of the Spartans received a severe check from the Thebans at the battle of Leuctra; and, eight years after, was still further reduced by the battle of Mantinea. Epaminondas, the great enemy of the Spartans, was killed; but this only proved a more speedy means of subjugating all the states to a foreign, and at that time despicable, power. The Macedonians, a barbarous nation, lying to the north of the states of Greece, were, two years after the death of Epaminondas reduced to the lowest ebb by the Illyrians, another nation of barbarians in the neighbourhood. The king of Macedon being killed in an engagement, Philip, his brother, departed from Thebes, where he had studied the art of war under Epaminondas, in order to take possession of his kingdom. Being a man of great prudence and policy, he quickly settled his own affairs; vanquished the Illyrians; and, being no stranger to the weakened situation of Greece, began almost immediately to meditate the conquest of it. The particulars of this enterprize are related under the article MACEDON: here it is sufficient

retreat.

21
History of
the Greeks.

ficient to take notice, that by first attacking those he was sure he could overcome, by corrupting those whom he thought it dangerous to attack, by sometimes pretending to assist one state and sometimes another, and by imposing upon all as best served his turn, he at last put it out of the power of the Greeks to make any resistance, at least such as could keep him from gaining his end. In 338 B. C. he procured himself to be elected general of the Amphictyons, or council of the Grecian states, under pretence of settling some troubles at that time in Greece; but having once obtained liberty to enter that country with an army, he quickly convinced the States that they must all submit to his will. He was opposed by the Athenians and Thebans; but the intestine wars of Greece had cut off all her great men, and no general was now to be found capable of opposing Philip with success.

The king of Macedon, being now master of all Greece, projected the conquest of Asia. To this he was encouraged by the ill success which had attended the Persians in their expeditions against Greece, the success of the Greeks in their invasions, and the retreat of the ten thousand under Xenophon. All these events shewed the weakness of the Persians, their vast inferiority to the Greeks in military skill, and how easily their empire might be overthrown by a proper union among the states.

22
Conquest of
Persia by
Alexander.

Philip was preparing to enter upon his grand design, when he was murdered by some assassins. His son Alexander was possessed of every quality necessary for the execution of so great a plan; and his impetuosity of temper made him execute it with a rapidity unheard of either before or since. It must be confessed, indeed, that the Persian empire was now ripe for destruction, and could not in all probability have withstood an enemy much less powerful than Alexander. The Asiatics have in all ages been much inferior to the European nations in valour and military skill. They were now sunk in luxury and effeminacy; and what was worse, they seem at this period to have been seized with that insatiation and distraction of counsels which scarce ever fails to be a forerunner of the destruction of any nation. The Persian ministers persuaded their sovereign to reject the prudent advice that was given him, of distressing Alexander by laying waste the country, and thus forcing him to return for want of provisions. Nay, they even prevented him from engaging the enemy in the most proper manner, by dividing his forces; and persuaded him to put Charidemus the Athenian to death, who had promised, with 100,000 men, of whom one third were mercenaries, to drive the Greeks out of Asia. In short, Alexander met with only two checks in his Persian expedition. The one was from the city of Tyre, which for seven months resisted his utmost efforts; the other was from Memnon the Rhodian, who had undertaken to invade Macedonia. The first of these obstacles Alexander at last got over, and treated the governor and inhabitants with the utmost cruelty. The other was scarce felt; for Memnon died after reducing some of the Grecian islands, and Darius had no other general capable of conducting the undertaking. The power of the Persian empire was totally broke by the victory gained over Darius at Arbela in 331 B. C. and next year a total end was put to

it by the murder of the king by Bessus one of his subjects.

The ambition of Alexander was not to be satisfied with the possession of the kingdom of Persia, or indeed of any other on earth. Nothing less than the total subjection of the world itself seemed sufficient to him; and therefore he was now prompted to invade every country of which he could only learn the name, whether it had belonged to the Persians or not. In consequence of this disposition, he invaded and reduced Hyrcania, Bactria, Sogdiana, and all that vast tract of country now called *Bukharia*. At last, having entered India, he reduced all the nations to the river Hyphasis, one of the branches of the Indus. But when he would have proceeded farther, and extended his conquests quite to the eastern extremities of Asia, his troops positively refused to follow him farther, and he was constrained to return. In 323, this mighty conqueror died of a fever; without having time to settle the affairs of his vast extended empire, or even to name his successor.

While the Grecian empire thus suddenly sprung up in the east, the rival states of Rome and Carthage were making considerable advances in the west. The Romans were establishing their empire on the most solid foundations; to which their particular situation naturally contributed. Being originally little better than a parcel of lawless banditti, they were despised and hated by the neighbouring states. This soon produced wars; in which, at first from accidental circumstances, and afterwards from their superior valour and conduct, the Romans proved almost constantly victorious. The jealousies which prevailed among the Italian states, and their ignorance of their true interest, prevented them from combining against that aspiring nation, and crushing it in its infancy, which they might easily have done; while in the mean time the Romans, being kept in a state of continual warfare, became at last such expert soldiers, that no other state on earth could resist them. During the time of their kings they had made a very considerable figure among the Italian nations; but after their expulsion, and the commencement of the republic, their conquests became much more rapid and extensive. In 501 B. C. they subdued the Sabines; eight years after, the Latins; and in 399 the city of Veii, the strongest in Italy excepting Rome itself, was taken after a siege of ten years. But in the midst of their successes a sudden irruption of the Gauls had almost put an end to their power and nation at once. The city was burnt to the ground in 383 B. C. and the capitol on the point of being surprized, when the Gauls, who were climbing up the walls in the night, were accidentally discovered and repulsed*. In a short time Rome was rebuilt with much greater splendour than before, but now a general revolt and combination of the nations formerly subdued took place. The Romans, however, still got the better of their enemies; but, even at the time of the celebrated Camillus's death, which happened about 352 B. C. their territories scarce extended six or seven leagues from the capital. The republic from the beginning was agitated by those dissensions which at last proved its ruin. The people had been divided by Romulus into two classes, namely *Patricians* and *Plébeians*, answer-

23
His conquest of other nations.

History of the Romans.

* See Rome.

Civil
History.

ing to our nobility and commonalty. Between these two bodies were perpetual jealousies and contentions; which retarded the progress of the Roman conquests, and revived the hopes of the nations they had conquered. The tribunes of the people were perpetually opposing the consuls and military tribunes. The senate had often recourse to a dictator endowed with absolute power; and then the valour and experience of the Roman troops made them victorious: but the return of domestic seditions gave the subjugated nations an opportunity of shaking off the yoke. Thus had the Romans continued for near 400 years, running the same round of wars with the same enemies, and reaping very little advantage from their conquests, till at last matters were compounded by choosing one of the consuls from among the plebeians; and from this time chiefly we may date the prosperity of Rome, so that by the time that Alexander the Great died they were held in considerable estimation among foreign nations.

25
Of the Car-
thaginians,
and of Si-
cily.

The Carthaginians in the mean time continued to enrich themselves by commerce; but, being less conversant in military affairs, were by no means equal to the Romans in power, though they excelled them in wealth. A new state, however, makes its appearance during this period; which may be said to have taught the Carthaginians the art of war, and by bringing them into the neighbourhood of the Romans proved the first source of contention between these two powerful nations. This was the island of Sicily. At what time people were first settled on it, is not now to be ascertained. The first inhabitants we read of were called *Sicani*, *Siculi*, *Lasfrignes*, &c. but of these we know little or nothing. In the second year of the seventeenth Olympiad, or 710 B. C. some Greek colonies are said to have arrived on the island, and in a short time founded several cities, of which Syracuse was the chief. The Syracusans at last subdued the original inhabitants; though it doth not appear that the latter were ever well affected to their government, and therefore were on all occasions ready to revolt. The first considerable prince, or (as he is called by the Greeks) *tyrant* of Syracuse, was Gelon, who obtained the sovereignty about the year 483 B. C. At what time the Carthaginians first carried their arms into Sicily, is not certainly known; only we are assured, that they possessed some part of the island as early as 505 B. C. For in the time of the first consuls, the Romans and Carthaginians entered into a treaty chiefly in regard to matters of navigation and commerce; by which it was stipulated, that the Romans who should touch at Sardinia, or that part of Sicily which belonged to Carthage, should be received there in the same manner as the Carthaginians themselves. Whence it appears, that the dominion of Carthage already extended over Sardinia and part of Sicily: but in 28 years after, they had been totally driven out by Gelon; which probably was the first exploit performed by him. This appears from his speech to the Athenian and Spartan ambassadors who desired his assistance against the forces of Xerxes king of Persia. The Carthaginians made many attempts to regain their possessions in this island, which occasioned long and bloody wars between them and the Greeks, as related under the articles *CARTHAGE* and *SICILY*. This island also proved

the scene of much slaughter and bloodshed in the wars of the Greeks with one another. Before the year 323 B. C. however, the Carthaginians had made themselves masters of a very considerable part of the island, from whence all the power of the Greeks could not dislodge them. It is proper also to observe, that after the destruction of Tyre by Alexander the Great, almost all the commerce in the western part of the world fell to the share of the Carthaginians. Whether they had at this time made any settlements in Spain, is not known. It is certain, that they traded to that country for the sake of the silver, in which it was very rich; as they probably also did to Britain, for the tin with which it abounded.

6. The beginning of the sixth period presents us with a state of the world entirely different from the foregoing. We now behold all the eastern part of the world, from the confines of Italy to the river Indus, and beyond it, newly united into one vast empire, and at the same time ready to fall to pieces for want of a proper head; the western world filled with fierce and savage nations, whom the rival republics of Carthage and Rome were preparing to enslave as fast as they could. The first remarkable events took place in the Macedonian empire.—Alexander, as already observed, had not distinctly named any successor; but he had left behind him a victorious, and, we may say, invincible army, commanded by most expert officers, all of them ambitious of supreme authority. It is not to be supposed that peace could long be preserved in such a situation. For a number of years, indeed, nothing was to be seen or heard of but the most horrid slaughters, and wickedness of every kind; until at last the mother, wives, children, brothers, and even sisters, of Alexander were cut off; not one of the family of that great conqueror being left alive. When matters were a little settled, four new empires, each of them of no small extent, had arisen out of the empire of Alexander. Cassander, the son of Antipater, had Macedonia, and all Greece; Antigonus, Asia-Minor; Seleucus had Babylon, and the eastern provinces; and Ptolemy Lagus, Egypt, and the western ones. One of these empires, however, quickly fell; Antigonus being defeated and killed by Seleucus and Lyfimachus at the battle of Ipsus, in 301 B. C. The greatest part of his dominions then fell to Seleucus: but several provinces took the opportunity of these confusions to shake off the Macedonian yoke altogether; and thus were formed the kingdoms of Pontus, Bithynia, Pergamus, Armenia, and Cappadocia. The two most powerful and permanent empires, however, were those of Syria founded by Seleucus, and Egypt by Ptolemy Lagus. The kings of Macedon, though they did not preserve the same authority over the Grecian states that Alexander, Antipater, and Cassander, had done, yet effectually prevented them from those outrages upon one another, for which they had formerly been so remarkable. Indeed, it is somewhat difficult to determine, whether their condition was better or worse than before they were conquered by Philip; since, though they were now prevented from destroying one another, they were most grievously oppressed by the Macedonian tyrants.

While the eastern parts of the world were thus deluged with blood, and the successors of Alexander were

nians.

were pulling to pieces the empire which he had established; the Romans and Carthaginians proceeded in their attempts to enslave the nations of the west. The Romans, ever engaged in war, conquered one city and state after another, till, about the year 253 B.C. they had made themselves masters of almost the whole of Italy. During all this time they had met only with a single check in their conquests; and that was the invasion of Pyrrhus, king of Epirus. That ambitious and sly prince had projected the conquest of Italy, which he fancied would be an easy matter. Accordingly, in 271 B.C. he entered that country, and maintained a war with the Romans for six years; till at last, being utterly defeated by Curius Dentatus, he was obliged to return.

The Romans had no sooner made themselves masters of Italy, than they wanted only a pretence to carry their arms out of it; and this pretence was soon found out. Being invited into Sicily to assist the Mamertines against Hiero king of Syracuse and the Carthaginians, they immediately commenced a war with the latter, which continued with the utmost fury for 23 years. The war ended greatly to the disadvantage of the Carthaginians, chiefly owing to the bad conduct of their generals; none of whom, Hamilcar Barca alone excepted, seem to have been possessed of any degree of military skill; and the state had suffered too many misfortunes before he entered upon the command, for him or any other to retrieve it at that time. The consequence of this war was the entire loss of Sicily to the Carthaginians; and soon after, the Romans seized on the island of Sardinia.

Hamilcar perceiving that there was now no alternative, but that in a short time either Carthage must conquer Rome, or Rome would conquer Carthage, bethought himself of a method by which his country might become equal to that haughty republic. This was by reducing all Spain, in which the Carthaginians had already considerable possessions, and from the mines of which they drew great advantages. He had, therefore, no sooner finished the war with the mercenaries, which succeeded that with the Romans, than he set about the conquest of Spain. This, however, he did not live to accomplish, though he made great progress in it. His son Asdrubal continued the war with success; till at last, the Romans, jealous of his progress, persuaded him to enter into a treaty with them, by which he engaged himself to make the river Iberus the boundary of his conquests. This treaty probably was never ratified by the senate of Carthage; nor, though it had, would it have been regarded by Hannibal, who succeeded Asdrubal in the command, and had sworn perpetual enmity with the Romans. The transactions of the second Punic war are perhaps the most remarkable which the history of the world can afford. Certain it is, that nothing can shew more clearly the slight foundations upon which the greatest empires are built. We now see the Romans, the nation most remarkable for their military skill in the whole world, and who, for more than 500 years, had been constantly victorious, unable to resist the efforts of one single man. At the same time we see this man, though evidently the first general in the world, lost solely for want of a slight support. In former times,

the republic of Carthage supplied her generals in Sicily with hundreds of thousands, though their enterprises were almost constantly unsuccessful; but now Hannibal, the conqueror of Italy, was obliged to abandon his design, merely for want of 20 or 30,000 men. That degeneracy and infatuation, which never fails to overwhelm a falling nation, or rather which is the cause of its fall, had now infected the counsels of Carthage, and the supplies were denied. Neither was Carthage the only infatuated nation at this time. Hannibal, whose prudence never forsook him either in prosperity or adversity, in the height of his good fortune had concluded an alliance with Philip king of Macedon. Had that prince sent an army to the assistance of the Carthaginians in Italy immediately after the battle of Cannæ, there can be no doubt but the Romans would have been forced to accept of that peace which they so haughtily refused; and indeed, this offer of peace in the midst of so much success, is an instance of moderation which perhaps does more honour to the Carthaginian general, than all the military exploits he performed. Philip, however, could not be rouled from his inactivity, nor see that his own ruin was connected with that of Carthage. The Romans had now made themselves masters of Sicily: after which they recalled Marcellus, with his victorious army, to be employed against Hannibal; and the consequence at last was, that the Carthaginian armies, unsupported in Italy, could not conquer it, but were recalled into Africa, which the Romans had invaded. The southern nations seem to have been as blind to their own interest as the northern ones. They ought to have seen, that it was necessary for them to preserve Carthage from being destroyed; but, instead of this, Masinissa king of Numidia allied with the Romans, and by his means Hannibal was overcome at the battle of Zama, * which finished the second Punic war, in 188 B.C.

The event of the second Punic war determined the fate of almost all the other nations in the world. All this time, indeed, the empires of Egypt, Syria, and Greece, had been promoting their own ruin by mutual wars and intestine divisions. The Syrian empire was now governed by Antiochus the Great, who seems to have had little right to such a title. His empire, though diminished by the defection of the Parthians, was still very powerful; and to him Hannibal applied, after he was obliged to leave his country, as related under CARTHAGE, n^o 152. Antiochus, however, had not sufficient judgment to see the necessity of following that great man's advice; nor would the Carthaginians be prevailed upon to contribute their assistance against the nation which was soon to destroy them without any provocation. The pretence for war on the part of the Romans was, that Antiochus would not declare his Greek subjects in Asia to be free and independent states; a requisition which neither the Romans nor any other nation had a right to make. The event of all was, that Antiochus was every-where defeated, and forced to conclude a peace upon very disadvantageous terms.

In Europe, matters went on in the same way; the states of Greece, weary of the tyranny of the Macedonians, entered into a resolution of recovering their liberties.

liberties. For this purpose was framed the Achæan League †; but, as they could not agree among themselves, they at last came to the imprudent determination of calling in the Romans, to defend them against Philip king of Macedon. This produced a war, in which the Romans were victorious. The Macedonians, however, were still formidable; and, as the intention of the Romans to enslave the whole world could no longer be doubted, Perseus, the successor of Philip, renewed the war. Through his own cowardice he lost a decisive engagement, and with it his kingdom, which submitted to the Romans in 167 B. C.

Macedon being thus conquered, the next step was utterly to exterminate the Carthaginians; whose republic, notwithstanding the many disasters that had befallen it, was still formidable. It is true, the Carthaginians were giving no offence; nay, they even made the most abject submissions to the republic of Rome: but all was not sufficient. War was declared a third time against that unfortunate state; there was now no Hannibal to command their armies, and the city was utterly destroyed 146 B. C. The same year the Romans put an end to the liberties they had pretended to grant the cities of Greece, by the entire destruction of CORINTH. See that article.

After the death of Antiochus the Great, the affairs of Syria and Egypt went on from bad to worse. The degenerate princes which filled the thrones of those empires, regarding only their own pleasures, either spent their time in oppressing their subjects, or in attempting to deprive each other of their dominions, by which means they became a more easy prey to the Romans. So far indeed were they from taking any means to secure themselves against the overgrown power of that republic, that the kings both of Syria and Egypt sometimes applied to the Romans as protectors. Their downfall, however, did not happen within the period of which we now treat.—The only other transaction which makes any considerable figure in the Syrian empire, is the oppression of the Jews by Antiochus Epiphanes. After their return from the Babylonish captivity, they continued in subjection to the Persians till the time of Alexander. From that time they were subject to the kings of Egypt or Syria, as the fortune of either happened to prevail. Egypt being reduced to a low ebb by Antiochus Epiphanes, the Jews fell under his dominion, and being severely treated by him, imprudently shewed some signs of joy on a report of his death. This brought him against them with a powerful army; and in 170 B. C. he took Jerusalem by storm, committing the most horrid cruelties on the inhabitants, in so much that they were obliged to hide themselves in caverns and in holes of rocks to avoid his fury. Their religion was totally abolished, their temple profaned, and an image of Jupiter Olympius set up on the altar of burnt-offerings; which profanation is thought to be the *abomination of desolation* mentioned by the prophet Daniel. This revolution, however, was of no long continuance. In 167 B. C. Mattathias restored the true worship in most of the cities of Judea; and, in 165, the temple was purified, and the worship there restored by Judas Maccabæus. This was followed by a long series of wars between the Syrians and Jews, in which the latter were almost always victori-

ous; and before these wars were finished, the destruction of Carthage happened, which puts an end to the sixth general period formerly mentioned.

7. The beginning of the seventh period presents us with a view of the ruins of the Greek empire in the declining states of Syria and Egypt; both of them much circumscribed in bounds. The empire of Syria at first comprehended all Asia to the river Indus, and beyond it; but in 312 B. C. most of the Indian provinces were by Seleucus ceded to one *Sandrocottus*, or *Andrococtus*, a native, who in return gave him 500 elephants. Of the empire of Sandrocottus we know nothing farther than that he subdued all the countries between the Indus and the Ganges; so that from this time we may reckon the greatest part of India independent on the Syro-Macedonian princes. In 250 B. C. however, the empire sustained a much greater loss by the revolt of the Parthians and Bactrians from Antiochus Theus. The former could not be subdued; and as they held in subjection to them the vast tract which now goes under the name of *Persia*, we must look upon their defection as an irreparable loss. Whether any part of their country was afterwards recovered by the kings of Egypt or Syria, is not very certain; nor is it of much consequence, since we are assured that in the beginning of the seventh period, i. e. 146 B. C. the Greek empires of Syria and Egypt were reduced by the loss of India, Persia, Armenia, Pontus, Bithynia, Cappadocia, Pergamus, &c. The general state of the world in 146 B. C. therefore was as follows. In Asia were the empires of India, Parthia, and Syria, with the lesser states of Armenia, Pontus, &c. above-mentioned; to which we must add that of Arabia, which, during the sixth period, had grown into some consequence, and had maintained its independency from the days of Ishmael the son of Abraham. In Africa were the kingdoms of Egypt and Ethiopia; the Carthaginian territories, now subject to the Romans; and the kingdoms of Numidia, Mauritania, and Getulia, ready to be swallowed up by the same ambitious and insatiable power, now that Carthage was destroyed, which served as a barrier against it. To the fourth lay some unknown and barbarous nations, secure by reason of their situation and insignificance, rather than their strength, or distance from Rome. In Europe we find none to oppose the progress of the Roman arms, except the Gauls, Germans, and some Spanish nations. These were brave indeed; but, through want of military skill, incapable of contending with such masters in the art of war as the Romans then were.

The Spaniards had indeed been subdued by Scipio Africanus in the time of the second Punic war: but, in 155 B. C. they revolted; and, under the conduct of one Viriathus, formerly a robber, held out for a long time against all the armies the Romans could send into Spain. Him the Consul Cæpio caused to be murdered about 138 B. C. because he found it impossible to reduce him by force. The city of Numantia defied the whole Roman power for six years longer; till at last, by dint of treachery, numbers, and perseverance, it was not taken, but the inhabitants, reduced to extremity by famine, set fire to their houses, and perished in the flames, or killed one another, so that not one remained to grace the triumph of the

mans.

the conqueror; and this for the present quieted the rest of the Spaniards.—About the same time Attalus, king of Pergamus, left by will the Roman people heirs to all his goods; upon which they immediately seized on his kingdom as part of those goods, and reduced it to a Roman province, under the name of *Asia Proper*. Thus they continued to enlarge their dominions on every side, without the least regard to justice, to the means they employed, or to the miseries they brought upon the conquered people. In 122 B. C. the Balearic islands, now called *Majorca*, *Minorca*, and *Ivica*, were subdued, and the inhabitants exterminated; and, soon after, several of the nations beyond the Alps were obliged to submit.

In Africa the crimes of Jugurtha soon gave this ambitious republic an opportunity of conquering the kingdoms of Numidia and Mauritania; and indeed this is almost the only war in which we find the Romans engaged, where their pretensions had the least colour of justice; though in no case whatever could a nation shew more degeneracy than the Romans did on this occasion. The particulars of this war are related under the articles NUMIDIA and ROMÉ. The event of it was the total reduction of the former about the year 105 B. C. but Mauritania and Getulia preserved their liberty for some time longer.

In the east, the empire of Syria continued daily to decline; by which means the Jews not only had an opportunity of recovering their liberty, but even of becoming as powerful, or at least of extending their dominions as far, as in the days of David and Solomon. This declining empire was still farther reduced by the civil dissensions between the two brothers Antiochus Grypus and Antiochus Cyzicenus; during which the cities of Tyre, Sidon, Ptolemais, and Gaza, declared themselves independent, and in other cities tyrants started up who refused allegiance to any foreign power. This happened about 100 B. C.; and 17 years after, the whole was reduced by Tigranes, king of Armenia. On his defeat by the Romans, the latter reduced Syria to a province of their empire. The kingdom of Armenia itself, with those of Pontus, Cappadocia, and Bithynia, soon shared the same fate; Pontus, the most powerful of them all, being subdued about 64 B. C.—The kingdom of Judea also was reduced under the same power much about this time. This state owed the loss of its liberty to the same cause that had ruined several others, namely, calling in the Romans as arbitrators between two contending parties. The two sons of Alexander Jannæus (Hyrcaus and Aristobulus) contended for the kingdom. Aristobulus, being defeated by the party of Hyrcanus, applied to the Romans. Pompey the Great, who acted as ultimate judge in this affair, decided it against Aristobulus, but at the same time deprived Hyrcanus of all power as a king; not allowing him even to assume the regal title, or to extend his territory beyond the ancient borders of Judea. To such a length did Pompey carry this last article, that he obliged him to give up all those cities in Cœlosyria and Phœnicia which had been gained by his predecessors, and added them to the newly acquired Roman province of Syria.

Thus the Romans became masters of all the eastern parts of the world, from the Mediterranean sea to the

borders of Parthia. In the west, however, the Gauls were still at liberty, and the Spanish nations bore the Roman yoke with great impatience. The Gauls infested the territories of the republic by their frequent incursions, which were sometimes very terrible; and though several attempts had been made to subdue them, they always proved insufficient till the time of Julius Cæsar. By him they were totally reduced, from the river Rhine to the Pyrenæan mountains, and many of their nations almost exterminated. He carried his arms also into Germany and the southern parts of Britain; but in neither of these parts did he make any permanent conquests. The civil wars between him and Pompey gave him an opportunity of seizing on the kingdom of Mauritania and those parts of Numidia which had been allowed to retain their liberty. The kingdom of Egypt alone remained, and to this nothing belonged except the country properly so called. Cyrenaica was bequeathed by will to the Romans about 58 B. C.; and about the same time the island of Cyprus was seized by them without any pretence, except a desire of possessing the treasures of the king.—The kingdom of Egypt continued for some time longer at liberty; which in some measure must be ascribed to the internal dissensions of the republic, but more especially to the amours of Pompey, Julius Cæsar, and Marc Antony, with the famous Cleopatra queen of Egypt. The battle of Actium, however, determined the fate of Antony, Cleopatra, and Egypt itself; which last was reduced to a Roman province, about 9 B. C.

While the Romans thus employed all means to reduce the world to their obedience, they were making one another feel the same miseries at home, which they inflicted upon other nations abroad. The first civil dissensions took their rise at the siege of Numantia in Spain. We have already observed, that this small city resisted the whole power of the Romans for six years. Once they gave them a most terrible and shameful defeat, wherein 30,000 Romans fled before 4000 Numantines. Twenty thousand were killed in the battle, and the remaining ten thousand so shut up, that there was no possibility of escaping. In this extremity they were obliged to negotiate with the enemy, and a peace was concluded upon the following terms: 1. That the Numantines should suffer the Romans to retire unmolested; and, 2. That Numantia should maintain its independence, and be reckoned among the Roman allies.—The Roman senate, with an injustice and ingratitude hardly to be matched, broke this treaty, and in return ordered the commander of their army to be delivered up to the Numantines: but they refused to accept of him, unless his army was delivered along with him; upon which the war was renewed, and ended as already related. The fate of Numantia, however, was soon revenged. Tiberius Sempronius Gracchus, brother-in-law to Scipio Africanus the second, had been a chief promoter of the peace with the Numantines already mentioned, and of consequence had been in danger of being delivered up to them along with the commander in chief. This disgrace he never forgot; and, in order to revenge himself, undertook the cause of the Plebeians against the Patricians, by whom the former were greatly oppressed. He began with reviving an old law, which had enacted

34
Origin and
progress of
the civil
wars in
Rome.

enacted that no Roman citizen should possess more than 500 acres of land. The surplus he designed to distribute among those who had no lands, and to reimburse the rich out of the public treasury. This law met with great opposition, bred many tumults, and at last ended in the death of Gracchus and the persecution of his friends, several hundreds of whom were put to cruel deaths without any form of law.

The disturbances did not cease with the death of Gracchus. New contests ensued on account of the Sempronian law, and the giving to the Italian allies the privilege of Roman citizens. This last not only produced great commotions in the city, but occasioned a general revolt of the states of Italy against the republic of Rome. This rebellion was not quelled without the utmost difficulty: and in the mean time, the city was deluged with blood by the contending factions of Sylla and Marius; the former of whom sided with the patricians, and the latter with the plebeians. These disturbances ended in the perpetual dictatorship of Sylla, about 80 B. C.

From this time we may date the loss of the Roman liberty; for though Sylla resigned his dictatorship two years after, the succeeding contests between Cæsar and Pompey proved equally fatal to the republic. These contests were decided by the battle of Pharsalia, by which Cæsar became in effect master of the empire in 43 B. C. Without loss of time, he then crossed over into Africa; totally defeated the republican army in that continent; and, by reducing the country of Mauritania to a Roman province, completed the Roman conquests in these parts. His victory over the sons of Pompey at Munda 40 B. C. secured him from any further apprehensions of a rival. Being therefore sole master of the Roman empire, and having all the power of it at his command, he projected the greatest schemes; tending, according to some, not less to the happiness than to the glory of his country: when he was assassinated in the senate-house, in the 56th year of his age, and 39 B. C.

Without investigating the political justice of this action, or the motives of the perpetrators; it is impossible not to regret the death of this great man, when we contemplate his virtues, and the designs which he is said to have formed: (See *ROME*.) Nor is it possible to justify, from ingratitude at least, even the most virtuous of the conspirators, when we consider the obligations under which they lay to him. And as to the measure itself, even in the view of expediency, it seems to be generally condemned. In fact, from the transactions which had long preceded, as well as those which immediately followed, the murder of Cæsar, it is evident, that Rome was incapable of preserving its liberty any longer, and that the people had become unfit for being free. The efforts of Brutus and Cassius were therefore unsuccessful, and ended in their own destruction and that of great numbers of their followers in the battles of Philippi. The defeat of the republicans was followed by numberless disturbances, murders, proscriptions, &c. till at last Octavianus, having cut off all who had the courage to oppose him, and finally got the better of his rivals by the victory at Actium, put an end to the republic in the year 27 B. C.

The destruction of the Roman commonwealth pro-

ved advantages to the few nations of the world who still retained their liberty. That outrageous desire of conquest, which had so long marked the Roman character, now in a great measure ceased; because there was now another way of satisfying the desires of ambitious men, namely, by courting the favour of the emperor. After the final reduction of the Spaniards, therefore, and the conquest of the countries of Media, Pannonia, and some others adjacent to the Roman territories, and which in a manner seemed naturally to belong to them, the empire enjoyed for some time a profound peace.

The only remarkable transactions which took place during the remainder of the period of which we treat were the conquest of Britain by Claudius and Agricola, and the destruction of Jerusalem by Vespasian and Titus. The war with the Jews began A. D. 67; and was occasioned by their obstinately claiming the city of Cæsarea, which the Romans had added to the province of Syria. It ended in 73, with the most terrible destruction of their city and nation; since which time they have never been able to assemble as a distinct people. The southern parts of Britain were totally subdued by Agricola about ten years after.

In the 98th year of the Christian æra, Trajan was created emperor of Rome; and being a man of great valour and experience in war, carried the Roman conquests to their utmost extent. Having conquered the Dacians, a German nation beyond the Danube, and who had of late been very troublesome, he turned his arms eastward; reduced all Mesopotamia, Chaldæa, Assyria; and having taken Ctesiphon, the capital of the Parthian empire, appointed them a king, which he thought would be a proper method of keeping that warlike people in subjection. After this, he proposed to return to Italy, but died by the way; and with his reign the seventh general period above-mentioned is concluded.

8. The beginning of the eighth period presents us with a view of one vast empire, in which almost all the nations of the world were swallowed up. This empire comprehended the best part of Britain, all Spain, France, the Netherlands, Italy, part of Germany, Egypt, Barbary, Bulgaria, Turkey in Europe, Turkey in Asia, and Persia. The state of India at this time is unknown. The Chinese lived in a remote part of the world, unheard of and unmolested by the western nations who struggled for the empire of the world. The northern parts of Europe and Asia were filled with barbarous nations, already formidable to the Romans, and who were soon to become more so. The vast empire of the Romans, however, had no sooner attained its utmost degree of power, than, like others before it, it began to decline. The provinces of Babylonia, Mesopotamia, and Assyria, almost instantly revolted, and were abandoned by Adrian the successor of Trajan in the empire. The Parthians having recovered their liberty, continued to be very formidable enemies, and the barbarians of the northern parts of Europe continued to increase in strength; while the Romans, weakened by intestine divisions, became daily less able to resist them. At different times, however, some warlike emperors arose, who put a stop to the incursions of these barbarians; and about the year 215, the Parthian empire was totally overthrown by the Persians,

fians, who had long been subject to them. This revolution proved of little advantage to the Romans. The Persians were enemies still more troublesome than the Parthians had been; and though often defeated, they still continued to infect the empire on the east, as the barbarous nations of Europe did on the north. In 260, the defeat and captivity of the emperor Valerian by the Persians, with the disturbances which followed, threatened the empire with utter destruction. Thirty tyrants seized the government at once, and the barbarians pouring in on all sides in prodigious numbers ravaged almost all the provinces of the empire. By the vigorous conduct of Claudius, Aurelian, Tacitus, Probus, and Carus, the empire was restored to its former lustre; but as the barbarians were only repulsed, and never thoroughly subdued, this proved only a temporary relief. What was worse, the Roman soldiers, grown impatient of restraint, commonly murdered those emperors who attempted to revive among them the ancient military discipline which alone could ensure the victory over their enemies. Under Dioclesian, the disorders were so great, that though the government was held by two persons, they found themselves unable to bear the weight of it, and therefore took other two partners in the empire. Thus was the Roman empire divided into four parts; which by all historians is said to have been productive of the greatest mischiefs. As each of the four sovereigns would have many officers both civil and military, and the same number of forces that had been maintained by the state when governed only by one emperor, the people were not able to pay the sums necessary for supporting them. Hence the taxes and imposts were increased beyond measure, the inhabitants in several provinces reduced to beggary, the land left untilled for want of hands, &c. An end was put to these evils when the empire was again united under Constantine the Great; but in 330 a mortal blow was given to it by removing the imperial seat to Byzantium, now Constantinople, and making it equal to Rome. The introduction and establishment of Christianity, already corrupted with the grossest superstitions, proved also a most grievous detriment to the empire. Instead of that ferocious and obstinate valour in which the Romans had so long been accustomed to put their trust, they now imagined themselves secured by signs of the cross, and other external symbols of the Christian religion. These they used as a kind of magical incantations, which undoubtedly proved at all times ineffectual, and hence also in some measure proceeded the great revolution which took place in the next period.

9. The ninth general period shews us the decline and miserable end of the western part of the Roman empire. We see that mighty empire, which formerly occupied almost the whole world, now weakened by division, and surrounded by enemies. On the east, the Persians; on the north, the Scythians, Sarmatians, Goths, and a multitude of other barbarous nations, watched all occasions to break into it; and miscarried in their attempts, rather through their own barbarity, than the strength of their enemies. The devastations committed by those barbarians when they made their incursions are incredible, and the relation shocking to human nature. Some authors seem much inclined to favour them; and even insinuate, that barbarity and

Vol. V.

ignorant ferocity were their chief, if not their only faults: but from their history it plainly appears, that not only barbarity and the most shocking cruelty, but the highest degrees of avarice, perfidy, and disregard to the most solemn promises, were to be numbered among their vices. It was ever a sufficient reason for them to make an attack, that they thought their enemies could not resist them. Their only reason for making peace, or for keeping it, was because their enemies were too strong; and their only reason for committing the most horrid massacres, rapes, and all manner of crimes, was, because they had gained a victory. The Romans, degenerate as they were, are yet to be esteemed much better than these savages; and therefore we find not a single province of the empire that would submit to the barbarians, while the Romans could possibly defend them.

Some of the Roman emperors indeed withstood this inundation of savages; but as the latter grew daily more numerous, and the Romans continued to weaken themselves by their intestine divisions, they were at last obliged to take large bodies of barbarians into their pay, and teach them their military discipline, in order to drive away their countrymen, or others who invaded the empire. This at last proved its total destruction; for, in 476, the barbarians who served in the Roman armies, and were dignified with the title of *allies*, demanded the third part of the lands of Italy as a reward for their services: but meeting with a refusal, they revolted, and made themselves masters of the whole country, and of Rome itself, which from that time ceased to be the head of an empire of any consequence.

This period exhibits a most unfavourable view of the western parts of the world: The Romans, from the height of grandeur, sunk to the lowest slavery, nay, in all probability, almost exterminated; the provinces they formerly governed, inhabited by human beings scarce a degree above the brutes; every art and science lost; and the savage conquerors even in danger of starving for want of a sufficient knowledge of agriculture, having now no means of supplying themselves by plunder and robbery as before. Britain had long been abandoned to the mercy of the Scots and Picts; and in 450 the inhabitants had called in the Saxons to their assistance, whom they soon found worse enemies than those against whom they had implored their aid. Spain was held by the Goths and Suevians; Africa (that is, Barbary and Bildulgerid,) by the Vandals; the Burgundians, Goths, Franks, and Alans, had erected several small states in Gaul; and Italy was subjected to the Heruli under Odoacer, who had taken upon him the title of *king of Italy*. In the east, indeed, matters were an aspect somewhat more agreeable. The Roman empire continued to live in that of Constantinople, which was still very extensive. It comprehended all Asia-Minor and Syria, as far as Persia; in Africa, the kingdom of Egypt; and Greece in Europe. The Persians were powerful, and rivalled the emperors of Constantinople; and beyond them lay the Indians, Chinese, and other nations, who, unheard-of by the inhabitants of the more western parts, enjoyed peace and liberty.

The Constantinopolitan empire continued to decline

riod. De-
struction
of the
western
empire.

Civil
History.

by reason of its continual wars with the Persians, Bulgarians, and other barbarous nations; to which also superstition and relaxation of military discipline largely contributed. The Persian empire also declined, from the same causes, together with the intestine broils from which it was seldom free more than that of Constantinople. The history of the eastern part of the world during this period, therefore, consists only of the wars between these two great empires, of which an account is given under the articles CONSTANTINOPLE and PERSIA; and which were productive of no other consequence than that of weakening them both, and making them a more easy prey to those enemies who were now as it were in embryo, but shortly about to erect an empire almost as extensive as that of the Greeks or Romans.

39
History of
Italy.

Among the western nations, the revolutions, as might naturally be expected from the character of the people, succeeded one another with rapidity. The Heruli under Odoacer were driven out by the Goths under Theodoric. The Goths were expelled by the Romans; and, while the two parties were contending, both were attacked by the Franks, who carried off an immense booty. The Romans were in their turn expelled by the Goths: the Franks again invaded Italy, and made themselves masters of the province of Venetia; but at last the superior fortune of the emperor of Constantinople prevailed, and the Goths were finally subdued in 553. Narles, the conqueror of the Goths, governed Italy as a province of the eastern empire till the year 568, when Longinus his successor made considerable alterations. The Italian provinces had, ever since the time of Constantine the Great, been governed by *consulares*, *correctores*, and *prefides*; no alteration having been made either by the Roman emperors or the Gothic kings. But Longinus, being invested with absolute power by Justinian, suppressed those magistrates; and, instead of them, placed in each city of note a governor, whom he distinguished with the title of *duke*. The city of Rome was not more honoured than any other; for Longinus, having abolished the very name of *senate* and *consuls*, appointed a *duke* of Rome as well as of other cities. To himself he assumed the title of *exarch*; and, residing at Ravenna, his government was styled the *exarchate of Ravenna*. But while he was establishing this new empire, the greatest part of Italy was conquered by the Lombards.

40
Of France.

In France a considerable revolution also took place. In 487, Clovis, the founder of the present French monarchy, possessed himself of all the countries lying between the Rhine and the Loire. By force or treachery, he conquered all the petty kingdoms which had been erected in that country; his dominions had been divided, re-united, and divided again; and were on the point of being united a second time, when the great impostor Mahomet began to make a figure in the world.

41
Of Spain.

In Spain, the Visigoths erected a kingdom, ten years before the conquest of Rome by the Heruli. This kingdom they had extended eastward, about the same time that Clovis was extending his conquests to the west; so that the two kingdoms met at the river Loire. The consequence of this approach of such barbarous conquerors towards each other, was an

immediate war. Clovis proved victorious, and subdued great part of the country of the Visigoths, which put a final stop to their conquests on that side.

Another kingdom had been founded in the western parts of Spain by the Suevi, a considerable time before the Romans were finally expelled from that country. In 409 this kingdom was entirely subverted by Theodoric king of the Goths; and the Suevi were so pent up in a small district of Lusitania and Galicia, that it seemed impossible for them to recover themselves. During the abovementioned period, however, while the attention of the Goths was turned another way, they had found means again to erect themselves into an independent state, and to become masters of considerably extended territories. But this success proved of short duration. In 584 the Goths attacked them; totally destroyed their empire a second time; and thus became masters of all Spain, except some small part which still owed subjection to the emperors of Constantinople. Of this part, however, the Goths became masters also in the year 623; which concludes the 9th general period.

Africa, properly so called, had changed its masters ⁴²Of Africa, three times during this period. The Vandals had expelled the Romans, and erected an independent kingdom, which was at last overturned by the emperors of Constantinople; and from them the greatest part of it was taken by the Goths in 620.

10. At the commencement of the tenth general period, ⁴³Tenth general period. Conquests of the Saracens. (which begins with the flight of Mahomet in the year 622, from whence his followers date their æra, called the *Hegira*), we see every thing prepared for the great revolution which was now to take place: the Roman empire in the west annihilated; the Persian empire and that of Constantinople weakened by their mutual wars and intestine divisions; the Indians and other eastern nations unaccustomed to war, and ready to fall a prey to the first invader; the southern parts of Europe in a distracted and barbarous state; while the inhabitants of Arabia, from their earliest origin, accustomed to war and plunder, and now united by the most violent superstition and enthusiastic desire of conquest, were like a flood pent up, and ready to overwhelm the rest of the world.—The northern nations of Europe and Asia, however formidable in after-times, were at present unknown, and peaceable, at least with respect to their southern neighbours; so that there was in no quarter of the globe any power capable of opposing the conquests of the Arabs. With amazing celerity, therefore, they over-ran all Syria, Palestine, Persia, Bakharia, and India, extending their conquests farther to the eastward than ever Alexander had done. On the west side their empire extended over Egypt, Barbary, and Spain, together with the islands of Sicily, Sardinia, Majorca, Minorca, &c. and many of the Archipelago islands: nor were the coasts of Italy itself free from their incursions; nay, they are even said to have reached the distant and barren country of Iceland. At last this great empire, as well as others, began to decline. Its ruin was very sudden, and owing to its internal divisions. Mahomet had not taken care to establish the apostleship in his family, or to give any particular directions about a successor. The consequence of this was, that the caliph, or succession

to the apostleship, was seized by many usurpers in different parts of the empire; while the true caliphs, who resided at Bagdad, gradually lost all power, and were regarded only as a kind of high-priests. Of these divisions the Turks took advantage to establish their authority in many provinces of the Mohammedan empire: but as they embraced the same religion with the Arabs, and were filled with the same enthusiastic desire of conquest, it is of little consequence to distinguish between them; as indeed it signified little to the world in general whether the Turks or Saracens were the conquerors, since both were cruel, barbarous, ignorant, and superstitious.

44
Of the
Pope's tem-
poral
power.

While the barbarians of the east were thus grasping at the empire of the whole world, great disturbances happened among the no less barbarous nations of the west. Superstition seems to have been the ruling motive in both cases. The Saracens and Turks conquered for the glory of God, or of his apostle Mahomet and his successors; the western nations professed an equal regard for the divine glory, but which was only to be perceived in the respect they paid to the Pope and clergy. Ever since the establishment of Christianity by Constantine, the bishops of Rome had been gradually extending their power, and attempting not only to render themselves independent, but even to assume an authority over the emperors themselves. The destruction of the empire was so far from weakening their power, that it afforded them opportunities of greatly extending it, and becoming judges of the sovereigns of Italy themselves, whose barbarity and ignorance prompted them to submit to their decisions. All this time, however, they themselves had been in subjection to the emperors of Constantinople; but on the decline of that empire, they found means to get themselves exempted from this subjection. The principal authority in the city of Rome was then engrossed by the bishop; though of right it belonged to the duke appointed by the exarch of Ravenna. But tho' they had now little to fear from the eastern emperors, they were in great danger from the ambition of the Lombards, who aimed at the conquest of all Italy. This aspiring people the bishops of Rome determined to check; and therefore, in 726, when Luitprand king of the Lombards had taken Ravenna and expelled the exarch, the pope undertook to restore him. For this purpose he applied to the Venetians, who are now first mentioned in history as a state of any consequence; and by their means the exarch was restored. Some time before, a quarrel had happened between the pope (Gregory II.) and Leo emperor of the east, about the worship of images. Leo, who it seems, in the midst of so much barbarism, had still preserved some share of common sense and reason, reprobated the worship of images in the strongest terms, and commanded them to be destroyed throughout his dominions. The pope, whose cause was favoured by the most absurd superstitions, and by these only, refused to obey the emperor's commands. The exarch of Ravenna, as a subject of the emperor, was ordered to force the pope to a compliance, and even to seize or assassinate him in case of a refusal. This excited the pious zeal of Luitprand to assist the pope, whom he had formerly designed to subdue: the exarch was first excommunicated, and then torn in pieces by the enra-

ged multitude: the duke of Naples shared the same fate; and a vast number of the *Iconoclasts*, or Image-breakers, as they were called, were slaughtered without mercy: and to complete all, the subjects of the exarchate, at the instigation of the pope, renounced their allegiance to the emperor.

Leo was no sooner informed of this revolt, than he ordered a powerful army to be raised, in order to reduce the rebels, and take vengeance on the pope. Alarmed at these warlike preparations, Gregory looked round for some power on which he might depend for protection. The Lombards were possessed of sufficient force, but they were too near and too dangerous neighbours to be trusted; the Venetians, though zealous Catholics, were as yet unable to withstand the force of the empire; Spain was over-run by the Saracens: the French seemed, therefore, the only people to whom it was advisable to apply for aid; as they were able to oppose the emperor, and were likewise enemies to his edict. Charles Martel, who at that time governed France as mayor of the palace, was therefore applied to; but before a treaty could be concluded, all the parties concerned were removed by death. Constantine Copronymus, who succeeded Leo at Constantinople, not only persisted in the opposition to image-worship, begun by his predecessor, but prohibited also the invocation of saints. Zachary, who succeeded Gregory III. in the pontificate, proved as zealous an adversary as his predecessors. Pepin, who succeeded Charles Martel in the sovereignty of France, proved as powerful a friend to the pope as his father had been. The people of Rome had nothing to fear from Constantinople; and therefore drove out all the emperor's officers. The Lombards, awed by the power of France, for some time allowed the pope to govern in peace the dominions of the Exarchate; but in 752, Astolphus, king of Lombardy, not only reduced the greatest part of the pope's territories, but threatened the city of Rome itself. Upon this an application was made to Pepin, who obliged Astolphus to restore the places he had taken, and gave them to the pope, or, as he said, to St Peter. The Greek emperor, to whom they of right belonged, remonstrated to no purpose. The pope from that time became possessed of considerable territories in Italy; which, from the manner of their donation, go under the name of *St Peter's Patrimony*. It was not however before the year 774 that the pope was fully secured in these new dominions. This was accomplished when the kingdom of the Lombards was totally destroyed by Charlemagne, who was thereupon crowned king of Italy. Soon after this monarch made himself master of all the Low Countries, Germany, and part of Hungary; and in the year 800, was solemnly crowned emperor of the west by the pope.

Thus was the world once more shared among three great empires. The empire of the Arabs or Saracens extended from the river Ganges to Spain, comprehending almost all of Asia and Africa which has ever been known to Europeans, the kingdoms of China and Japan excepted. The eastern Roman empire was reduced to Greece, Asia Minor, and the provinces adjoining to Italy. The empire of the west under Charlemagne, comprehended France, Germany, and the greatest part of Italy. The Saxons, however, as yet

45
General
state of the
world.

possessed Britain unmolested by external enemies, thro' the seven kingdoms erected by them were engaged in perpetual contests. The Venetians also enjoyed a nominal liberty; though it is probable, that their situation would render them very much dependent on the great powers which surrounded them. Of all nations on earth, the Scots and Picts, and the remote ones of China and Japan seem to have enjoyed, from their situation, the greatest share of liberty; unless, perhaps, we except the Scandinavians, who, under the names of *Danes* and *Normans*, were soon to infect their southern neighbours. But of all the European potentates, the popes certainly exercised the greatest authority; since even Charlemagne himself submitted to accept the crown from their hands, and his successors made them the arbiters of their differences.

Matters, however, did not long continue in this state. The empire of Charlemagne, was, on the death of his son Lewis, divided among his three children. Endless disputes and wars ensued among them, till at last the sovereign power was seized by Hugh Capet in 987. The Saxon heptarchy was dissolved in 827, and the whole kingdom of England reduced under one head. The Danes and Normans began to make depredations, and infect the neighbouring states. The former conquered the English Saxons, and seized the government, but were in their turn expelled by the Normans in 1066. In Germany and Italy the greatest disturbances arose from the contests between the popes and the emperors. To all this, if we add the internal contests which happened through the ambition of the powerful barons of every kingdom, we can scarce form an idea of times more calamitous than those of which we now treat. All Europe, nay, all the world, was one great field of battle; for the empire of the Mahometans was not in a more settled state than that of the Europeans. Caliphs, sultans, emirs, &c. waged continual war with each other in every quarter; new sovereignties every day sprung up, and were as quickly destroyed. In short, thro' the ignorance and barbarity with which the whole world was overspread, it seemed in a manner impossible that the human race could long continue to exist; when happily the crusades, by directing the attention of the Europeans to one particular object, made them in some measure suspend their slaughters of one another.

11. The crusades originated from the superstition of the two grand parties into which the world was at that time divided, namely, the Christians and Mahometans. Both looked upon the small territory of Palestine, which they called the *Holy Land*, to be an invaluable acquisition, for which no sum of money could be an equivalent; and both took the most unjustifiable methods to accomplish their desires. The superstition of Omar the second caliph had prompted him to invade this country, part of the territories of the Greek emperor, who was doing him no hurt; and now when it had been so long under the subjection of the Mahometans, a similar superstition prompted the pope to send an army for the recovery of it. The crusaders accordingly poured forth in multitudes, like those with which the kings of Persia formerly invaded Greece; and their fate was pretty similar. Their impetuous valour at first, indeed, carried every thing before them: they recovered all Palestine, Phœnicia, and part of Syria, from the in-

fidels; but their want of conduct soon lost what their valour had obtained, and very few of that vast multitude which had left Europe ever returned to their native countries. A second, a third, and several other crusades, were preached, and were attended with a like success in both respects; vast numbers took the cross, and repaired to the Holy Land, which they polluted by the most abominable massacres and treacheries, and from which very few of them returned. In the third crusade Richard I. of England was embarked, who seems to have been the best general that ever went into the east; but even his valour and skill were not sufficient to repair the faults of his companions, and he was obliged to return even after he had entirely defeated his antagonists, and was within sight of Jerusalem.

But while the Christians and Mahometans were thus ⁴⁷superstitiously contending for a small territory in the western parts of Asia, the nations in the more easterly ⁴⁸parts were threatened with total extermination. Jenghiz Khan, the greatest, as well as the most bloody, conqueror that ever existed, now makes his appearance. The rapidity of his conquests seemed to emulate those of Alexander the Great; and the cruelties he committed were altogether unparalleled. It is worth observing, that Jenghiz Khan and all his followers were neither Christians nor Mahometans, but strict deists. For a long time even the sovereign had not heard of a temple or any particular place on earth appropriated by the Deity to himself, and treated the notion with ridicule when it was first mentioned to him.

The Moguls, over whom Jenghiz Khan assumed the sovereignty, were a people of East Tartary, divided into a great number of petty governments as they are at this day, but who owed a subjection to one sovereign whom they called *Vang-khan*, or the Great Khan. Temujin, afterwards *Jenghiz-Khan*, was one of these petty princes, but unjustly deprived of the greatest part of his inheritance at the age of 13, which he could not recover till he arrived at that of 40. This corresponds with the year 1201, when he totally reduced the rebels, and as a specimen of his lenity caused 70 of their chiefs to be thrown into as many caldrons of boiling water. In 1202, he defeated and killed Vang-khan himself (known to the Europeans by the name of *Prestor John of Asia*); and possessing himself of his vast dominions, became from thenceforward altogether irresistible. In 1206, having still continued to enlarge his dominions, he was declared khan of the Moguls and Tartars; and took upon him the title of *Jenghiz Khan*, or *The most Great Khan of khans*. This was followed by the reduction of the kingdom of Hya in China, Tangut, Kitay, Turkestan, Karazm (the kingdom of GAZNA founded by Mahmud Gazi), Great Bukharia, Persia, and part of India; and all these vast regions were reduced in 26 years. The devastations and slaughters with which they were accompanied are unparalleled, no fewer than 14,470,000 persons being computed to have been massacred by Jenghiz Khan during the last 22 years of his reign. In the beginning of 1227 he died, thereby freeing the world from a most bloody tyrant. His successors completed the conquest of China and Korea; but were foiled in their attempts on Cochinchina, Tong-king, and Japan. On the western side the

Tartar

Tartar dominions were not much enlarged till the time of Hulaku, who conquered Media, Babylonia, Mesopotamia, Assyria, Syria, Georgia, Armenia, and almost all Asia Minor; putting an end to the empire of the Saracens by the taking of Bagdad in 1258.

The empire of Jenghiz Khan had the fate of all others. Being far too extensive to be governed by one head, it split into a multitude of small kingdoms, as it had been before his time. All these princes, however, owned allegiance to the family of Jenghiz Khan till the time of Timur Bek, or Tamerlane. The Turks, in the mean time, urged forward by the inundation of Tartars who poured in from the east, were forced upon the remains of the Greek empire; and at the time of Tamerlane above-mentioned, they had almost confined this once mighty empire within the walls of Constantinople.

In the year 1335 the family of Jenghiz Khan becoming extinct in Persia, a long civil war ensued, during which Timur Bek, one of the petty princes among which the Tartar dominions were divided, found means to aggrandize himself in a manner similar to what Jenghiz Khan had done about 150 years before. Jenghiz Khan, indeed, was the model whom he proposed to imitate; but it must be allowed that Timur was more merciful than Jenghiz Khan, if indeed the word can be applied to such inhuman tyrants. The plan on which Jenghiz Khan conducted his expeditions was that of total extermination. For some time he utterly extirpated the inhabitants of those places which he conquered, designing to people them anew with his Moguls; and in consequence of this resolution, he would employ his army in beholding 100,000 prisoners at once. Timur's cruelty, on the other hand, seldom went farther than the pounding of 3 or 4000 people in large mortars, or building them among bricks and mortar into a wall. We must observe, however, that Timur was not a Deist, but a Mahometan, and conquered expressly for the purpose of spreading the Mahometan religion; for the Moguls had now adopted all the superstitions and absurdities of Mahomet. Thus was all the eastern quarter of the world threatened anew with the most dreadful devastations, while the western nations were exhausting themselves in fruitless attempts to regain the Holy Land. The Turks were the only people who seem at this period to have been gathering strength, and by their perpetual encroachments threatened to swallow up the western nations, as the Tartars had done the eastern ones.

In 1362, Timur invaded Bukharia, which he reduced in five years. He proceeded in his conquests, though not with the same celerity as Jengiz Khan, till the year 1387, when he had subdued all Persia, Armenia, Georgia, Karazm, and great part of Tartary. After this he proceeded westward, subduing all the countries to the Euphrates: made himself master of Bagdad; and even entered Russia, where he pillaged the city of Moscow. From thence he turned his arms to the east, and totally subdued India. In 1393, he invaded and reduced Syria; and having turned his arms against the Turks, forced their sultan Bajazet to raise the siege of Constantinople. This brought on an engagement, in which Bajazet was entirely defeated and taken prisoner; which broke the power of the Turks

to such a degree, that they were not for some time able to recover themselves. At last this great conqueror died in the year 1405, while on his way to conquer China, as Jenghiz Khan had done before him.

The death of Timur was followed almost immediately by the dissolution of his empire. Most of the nations he had conquered, recovered their liberty. The Turks had now no further obstacle to their conquest of Constantinople. The western nations having exhausted themselves in the *holy wars*, as they were called, had lost that insatiable thirst after conquest which for so long time possessed the minds of men. They had already made considerable advances in civilization, and began to study the arts of peace. Gunpowder was invented, and its application to the purposes of war already known; and, though no invention threatened to be more destructive, perhaps none was ever more beneficial to the human race. By the use of fire-arms, nations are put more on a level with each other than formerly they were; war is reduced to a regular system, which may be studied with as much success as any other science. Conquests are not now to be made with the same ease as formerly; and hence the last ages of the world have been much more quiet and peaceable than the former ones. In 1453, the conquest of Constantinople by the Turks fixed that wandering people to one place; and though now they possess very large regions both in Europe, Asia, and Africa, an effectual stop hath long been put to their further progress.

About this time also, learning began to revive in Europe, where it had been long lost; and the invention of PRINTING, which happened about the same time, rendered it in a manner impossible for barbarism ever to take place in such a degree as formerly. All nations of the world, indeed, seem now at once to have laid aside much of their former ferocity; and, though wars have by no means been uncommon, they have not been carried on with such circumstances of fury and savage cruelty as before. Instead of attempting to enrich themselves by plunder, and the spoils of their neighbours, mankind in general have applied themselves to commerce, the only true and durable source of riches. This soon produced improvements in navigation; and these improvements led to the discovery of many regions formerly unknown. At the same time, the European powers being at last thoroughly sensible, that extensive conquests could never be permanent, applied themselves more to provide for the security of those dominions which they already possessed, than to attempt the conquest of one another: and this produced the policy to which so much attention was lately paid, namely, the *preserving of the balance of Europe*; that is, preventing any one of the nations from acquiring sufficient strength to overpower another.

In the end of the 15th century, the vast continent of America was discovered; and, almost at the same time, the passage to the East-Indies by the Cape of Good-Hope. The discovery of these rich countries gave a new turn to the ambition of the Europeans. To enrich themselves, either by the gold and silver produced in these countries, or by traffic with the natives, now became the object. The Portuguese had

49
State of the
world since
that time.

the advantage of being the first discoverers of the eastern, and the Spaniards of the western countries. The former did not neglect so favourable an opportunity of enriching themselves by commerce. Many settlements were formed by them in the East-India islands, and on the continent; but their avarice and perfidious behaviour towards the natives, proved at last the cause of their total expulsion. The Spaniards enriched themselves by the vast quantities of the precious metals imported from America, which were not obtained but by the most horrid massacres committed on the natives, and of which an account is given under the different names of the American countries. These possessions of the Spaniards and Portuguese soon excited other European nations to make attempts to share with them in their treasures, by planting colonies in different parts of America, and making settlements in the East-Indies: and thus has the rage of war in some measure been transferred from Europe to these distant regions; and after various contests, the British at last obtained a great superiority both in America and the East-Indies.

In Europe the only considerable revolutions which happened during this period, were, The total expulsion of the Moors or Saracens from Spain, by the taking of Grenada in 1491; the union of the kingdoms of Arragon and Castile, by the marriage of Ferdinand and Isabella; and the revolt of the states of Holland from the Spaniards. After much contention and bloodshed, these last obtained their liberty, and were declared a free people in 1609; since which time they have continued an independent and very considerable nation of Europe.

The European nations at the beginning of the 17th century were, Sweden, Muscovy, Denmark, Poland, Britain, Germany, Holland, France, Spain, Portugal, Italy, and Turkey in Europe. Of these the Russians, though the most barbarous, were by far the most considerable, both in regard to numbers and the extent of their empire; but their situation made them little feared by the others, who lay at a distance from them. The kingdom of Poland, which was first set up in the year 1000, proved a barrier betwixt Russia and Germany; and at the same time the policy abovementioned of keeping up the balance of power in Europe, rendered it probable that no one European nation, whatever wars it might be engaged in, would have been totally destroyed, or ceased to exist as a distinct kingdom. The late dismemberment of Poland, however, or its partition between the three powers Russia, Hungary, and Prussia, seems to be a step very unfavourable to the liberties of Europe in general. The revolt of the British colonies in America, must be a considerable diminution of the strength of Great Britain: the advantage taken by France and Spain of an event so favourable to their ambition, the duplicity and evasions of her allies, and the unconcerned or unfriendly aspect of the other powers, seem to indicate a total disregard of that equilibrium formerly so much and so wisely attended to.

In Asia nothing of importance hath happened since the taking of Constantinople by the Turks. That continent is now divided among the following nations. The most northerly part, called *Siberia*, extending to the very extremity of the continent, is under the

power of Russia. To the southward, from Asia Minor to China and Korea, are the Tartars, formidable indeed from their numbers, but, by reason of their barbarity and want of union, incapable of attempting any thing. The Turks possess the Western part of the continent called *Asia Minor*, to the river Euphrates. The Arabs are again confined within their own peninsula; which they possess, as they have ever done, without owning subjection to any foreign power. To the east of Turkey in Asia lies Persia, now more confined in its limits than before; and to the eastward of Persia lies India, or the kingdom of the Mogul, comprehending all the country from the Indus to the Ganges, and beyond that river. Still farther to the east lie the kingdoms of Siam, Pegu, Thibet, and Cochin-China, little known to the Europeans. The vast empire of China occupies the most easterly part of the continent, while that of Japan comprehends the islands which go by that name, and which are supposed to lie at no great distance from the western coasts of America.

In Africa the Turks possess Egypt, which they conquered in 1517, and have a nominal jurisdiction over the states of Barbary. The interior parts are filled with barbarous and unknown nations, as they have always been. On the western coasts are many settlements of the European nations, particularly the British and Portuguese, and the southern extremity is possessed by the Dutch. The eastern coasts are almost totally unknown. The Asiatic and African islands are either possessed by the Europeans, or inhabited by savage nations.

SECT. II. Ecclesiastical History.

THE history of religion, among all the different ^{so} ^{Revolutions} nations that have existed in the world, is a subject no less important and interesting than that of civil history. It is, however, less fertile of great events, ^{happen,} affords an account of fewer revolutions, and is much more uniform, than civil history. The reason of this is plain. Religion is conversant about things which cannot be seen; and which of consequence cannot suddenly and strongly affect the senses of mankind, as natural things are apt to do. The expectation of worldly riches can easily induce one nation to attack another; but it is not easy to find any thing which will induce a nation to change its religion. The invisible nature of spiritual things, the prejudice of habit and of early education, all stand in the way of changes of this kind. Hence the revolutions in religion have been but few, and the duration of almost any religion, of longer standing than the most celebrated empires; the changes which have happened, in general have acquired a long time to bring them about, and history scarce affords an instance of the religion of any nation being essentially and suddenly changed for another.

With regard to the origin of religion, we must have recourse to the Scriptures; and are as necessarily constrained to adopt the account there given, as we are to adopt that of the creation given in the same book; namely, because no other hath made its appearance which seems in any degree rational, or consistent with itself.—In what manner the true religion given

given to Adam was falsified or corrupted by his descendants before the flood, doth not clearly appear from Scripture. Idolatry is not mentioned: nevertheless we are assured that the inhabitants of the world were then exceedingly wicked; and as their wickedness did not consist in worshipping false gods, it may be concluded that they worshipped none at all; i. e. that the crime of the antediluvians was delirium or atheism.

51
Origin of idolatry.

After the flood, idolatry quickly made its appearance; but what gave rise to it, is not certainly known. This superstition indeed seems to be natural to man, especially when placed in such a situation that he hath little opportunity of instruction, or of improving his rational faculties. This seems also probable from a caution given to the Jews, lest, when they looked up to the sun, moon, and stars, and the rest of the host of heaven, they should be driven to worship them. The origin of idolatry among the Syrians and Arabians, and also in Greece, is therefore accounted for with great probability in the following manner by the author of *The Ruins of Balbec*. "In those uncomfortable deserts, where the day presents nothing to the view but the uniform, tedious, and melancholy prospect of barren sands, the night discloses a most delightful and magnificent spectacle, and appears arrayed with charms of the most attractive kind. For the most part unclouded and serene, it exhibits to the wondering eye the host of heaven in all their variety and glory. In the view of this stupendous scene, the transition from admiration to idolatry was too easy to uninstructed minds; and a people whose climate offered no beauties to contemplate but those of the firmament, would naturally look thither for the objects of their worship. The form of idolatry in Greece was different from that of the Syrians, which perhaps may be attributed to that smiling and variegated scene of mountains, valleys, rivers, woods, groves, and fountains, which the transported imagination, in the midst of its pleasing astonishment, supposed to be the seats of invisible deities."

A difficulty, however, arises on this supposition; for if idolatry is naturally produced in the mind of uninstructed and savage man, from a view of the creation, why hath not idolatry of some kind or other taken place among all the different nations of the world. This certainly hath not been the case; of which the most striking examples are the Persians of old, and the Moguls in more modern times. Both these nations were strict Deists: so that we must allow some other causes to concur in producing idolatry besides those already mentioned; and of these causes an imperfect and obscure notion of the true religion seems to be the most probable.

Though idolatry, therefore, was formerly very prevalent, it neither extended over the whole earth, nor were the superstitions of the idolaters all of one kind. Every nation had its respective gods, over which one more excellent than the rest was said to preside; yet in such a manner, that this supreme deity himself was controuled by the rigid empire of the fates, or by what philosophers called *eternal necessity*. The gods of the east were different from those of the Gauls, the Germans, and the other northern nations. The Grecian divinities differed widely from those of the Egyptians, who deified plants, animals, and a great

variety of the productions both of nature and art. Each people also had their own particular manner of worshipping and appeasing their respective deities, entirely different from the sacred rites of other countries. All this variety of religions, however, produced neither wars nor dissensions among the different nations; each nation suffered its neighbours to follow their own method of worship, without discovering any displeasure on that account. There is nothing surprising in this mutual toleration, when we consider, that they all looked upon the world as one great empire, divided into various provinces, over each of which a certain order of divinities presided; for which reason they imagined that none could behold with contempt the gods of other nations, or force strangers to pay homage to theirs.—The Romans exercised this toleration in the most ample manner; for though they would not allow any change to be made in the religions that were publicly professed in the empire, nor any new form of worship to be openly introduced, yet they granted to their citizens a full liberty of observing in private the sacred rites of other nations, and of honouring foreign deities as they thought proper.

The heathen deities were honoured with rites and sacrifices of various kinds, according to their respective natures and offices. Their rites were absurd and ridiculous; while the priests, appointed to preside over this strange worship, abused their authority, by deceiving and imposing upon the people in the grossest manner.

From the time of the flood to the coming of Christ, idolatry prevailed among almost all the nations of the world, the Jews alone excepted; and even of these they were on all occasions ready to run into it, as is evident from their history in the Old Testament. At the time of Christ's appearance, the religion of the Romans, as well as their empire, extended over a great part of the world. Some people there were among the heathens who perceived the absurdities of that system; but being destitute of means, as well as of abilities, to effect a reformation, matters went on in their old way. Though there were at that time various sects of philosophers, yet all of them proceeded upon false principles, and consequently could be of no service to the advancement or reformation of religion. Nay, some, among whom were the Epicureans and Academics, declared openly against every kind of religion whatever.

Two religions at this time flourished in Palestine, viz. The Jewish and Samaritan; between whose respective followers reigned the most violent hatred and contempt. The difference between them seems to have been chiefly about the place of worship; which the Jews would have to be in Jerusalem, and the Samaritans on Mount Gerizim. But though the Jews were certainly right as to this point, they had greatly corrupted their religion in other respects. They expected a Saviour indeed, but they mistook his character; imagining that he was to be a powerful and warlike prince, who should set them free from the Roman yoke, which they bore with the utmost impatience. They also imagined that the whole of religion consisted in observing the rites of Moses, and some others which they had added to them, without the least regard to what is commonly called *morality or virtue*;

52
State of religion at the appearance of Christ.

52
General account of the Heathen superstitions.

Ecclesi-
astical
History.

as is evident from the many charges our Saviour brings against the Pharisees, who had the greatest reputation for sanctity among the whole nation. To these corrupt and vicious principles they added several absurd and superstitious notions concerning the divine nature, invincible powers, magic, &c. which they had partly imbibed during the Babylonian captivity, and partly derived from their neighbours in Arabia, Syria, and Egypt. The principal sects among them were the *ESSENES* or *ELLENIANS*, *PHARISEES*, and *SAD- DUCCEES*. The Samaritans, according to the most general opinion had corrupted their religion still more than the Jews.

When the true religion was preached by the Saviour of mankind, it is not to be wondered at if he became on that account obnoxious to a people so deeply sunk in corruption and ignorance as the Jews then were. It is not here requisite to enter into the particulars of the doctrine advanced by him, or of the opposition he met with from the Jews; as a full account of these things, and likewise of the preaching of the gospel by the Apostles, may be found in the New Testament.—The rapid progress of the Christian religion, under these faithful and inspired ministers, soon alarmed the Jews, and raised various persecutions against its followers. The Jews, indeed, seem at first to have been every where the chief promoters of persecution; for we find that they officiously went from place to place, where-ever they heard of the increase of the gospel, and by their calumnies and false suggestions endeavoured to excite the people against the Apostles. The Heathens, however, though at first they shewed no very violent spirit of persecution against the Christians, soon came to hate them as much as the Jews themselves. Tacitus acquaints us with the causes of this hatred, when speaking of the first general persecution under Nero. That inhuman emperor having, as was supposed, set fire to the city of Rome, to avoid the imputation of this wickedness, transferred it on the Christians. Our author informs us that they were already abhorred on account of their many and enormous crimes. “The author of this name (*Christians*),” says he, “was *CHRIST*, who, in the reign of Tiberius, was executed under Pontius Pilate, procurator of Judæa. The pestilent superstition was for a while suppressed: but it revived again, and spread, not only over Judæa, where this evil was first broached; but reached Rome, whither from every quarter of the earth is constantly flowing whatever is hideous and abominable amongst men, and is there readily embraced and practised. First, therefore, were apprehended such as openly avowed themselves to be of that sect; then by them were discovered an immense multitude; and all were convicted, not of the crime of burning Rome, but of hatred and enmity to mankind. Their death and tortures were aggravated by cruel derision and sport; for they were either covered with the skins of wild beasts and torn in pieces by devouring dogs, or fastened to crosses, or wrapped up in combustible garments, that, when the day-light failed, they might, like torches, serve to dispel the darkness of the night. Hence, towards the miserable sufferers, however guilty and deserving the most exemplary punishment, compassion arose; seeing they were doomed to perish, not

with a view to the public good, but to gratify the cruelty of one man.”

That this account of Tacitus is downright misrepresentation and calumny, must be evident to every one who reads it. It is impossible that any person can be convicted of hatred and enmity to mankind, without specifying a number of facts by which this hatred shewed itself. The burning of Rome would indeed have been a very plain indication of enmity to mankind; but of this Tacitus himself clears them, and mentions no other crime of which they were guilty. It is probable, therefore, that the only reason of this charge against the Christians, was their absolute refusal to have any share in the Roman worship, or to countenance the absurd superstitions of Paganism in any degree.

The persecution under Nero was succeeded by another under Domitian, during which the Apostle John was banished to Patmos, where he saw the visions, and wrote the book called his *Revelation*, which completes the canon of Scripture. This persecution commenced in the 95th year of the Christian æra; and John is supposed to have wrote his Revelation the year after, or in the following one.

During the first century, the Christian religion spread over a great number of different countries; but as we have now no authentic records concerning the travels of the apostles, or the success which attended them in their ministry, it was impossible to determine how far the gospel was carried during this period. We are, however, assured, that even during this early period many corruptions were creeping in, the progress of which was with difficulty prevented even by the apostles themselves. Some corrupted their profession by a mixture of Judaism, others by mixing it with the oriental philosophy; while others were already attempting to deprive their brethren of liberty, setting themselves up as eminent pastors, in opposition even to the apostles, as we learn from the epistles of St Paul, and the third epistle of St John. Hence arose the sects of the Gnostics, Cerinthians, Nicolaitans, Nazarenes, Ebionites, &c. with which the church was troubled during this century.

Concerning the ceremonies and method of worship used by the Christians of the first century, it is impossible to say any thing with certainty. Neither is the church order, government, and discipline, during this period, ascertained with any degree of exactness. Each of those parties, therefore, which exist at this day, contends with the greatest earnestness for that particular mode of worship which they themselves have adopted, and some of the most bigotted would willingly monopolise the word *church* in such a manner as to exclude from all hope of salvation every one who is not attacked to their particular party. It doth not however appear that, excepting baptism, the Lord's supper, and anointing the sick with oil, any external ceremonies or symbols were properly of divine appointment. According to Dr Mosheim, “there are several circumstances which incline us to think, that the friends and apostles of our blessed Lord either tolerated through necessity, or appointed for wise reasons, many other external rites in various places. At the same time, we are not to imagine, that they ever conferred upon any person a perpetual, indelible, pontifical authority,

thority, or that they enjoined the same rites in all churches. We learn on the contrary, from authentic records, that the Christian worship was, from the beginning, celebrated in a different manner in different places; and that, no doubt, by the orders, or at least with the approbation, of the apostles and their disciples. In those early times, it was both wise and necessary to shew, in the establishment of outward forms of worship, some indulgence to the ancient opinions, manners, and laws, of the respective nations to whom the gospel was preached.

55
History of the second century.

The second century commences with the third year of the emperor Trajan. The Christians were still persecuted; but as the Roman emperors were for the most part of this century princes of a mild and moderate turn, they persecuted less violently than formerly. Marcus Aurelius, notwithstanding the clemency and philosophy for which he is so much celebrated, treated the Christians worse than Trajan, Adrian, or even Severus himself did, who was noted for his cruelty. This respite from rigorous persecution proved a very favourable circumstance for the spreading of the Christian religion; yet it is by no means easy to point out the particular countries through which it was diffused. We are, however, assured, that, in the second century, Christ was worshipped as God almost through the whole east; as also among the Germans, Spaniards, Celts, and many other nations: but which of them received the gospel in the first century, and which in the second, is a question unanswerable at this distance of time. The writers of this century attribute the rapid progress of Christianity chiefly to the extraordinary gifts that were imparted to the first Christians, and the miracles which were wrought at their command; without supposing that any part of the success ought to be ascribed to the intervention of human means, or secondary causes. Many of the moderns, however, are so far from being of this opinion, that they are willing either to deny the authenticity of all miracles said to have been wrought since the days of the apostles, or to ascribe them to the power of the devil. To enter into the particulars of this controversy is foreign to our present purpose; for which reason we must refer to the writers of polemic divinity, who have largely treated of this and other points of a similar nature.

56
Ceremonies multiplied.

The corruptions which had been introduced in the first century, and which were almost coeval with Christianity itself, continued to gain ground in the second. Ceremonies, in themselves futile and useless, but which must be considered as highly pernicious when joined to a religion incapable of any other ornament than the upright and virtuous conduct of its professors, were multiplied for no other purpose than to please the ignorant multitude. The immediate consequence of this was, that the attention of Christians was drawn aside from the important duties of morality; and they were led to imagine, that a careful observance of the ceremonies might make amends for the neglect of moral duties. This was the most pernicious opinion that could possibly be entertained; and was indeed the very foundation of that enormous system of ecclesiastical power which afterwards took place, and held the whole world in slavery and barbarism for many ages.

57
Myteries introduced.

Another mischief was the introduction of *myteries*, VOL. V.

as they were called, into the Christian religion; that is, insinuating, that some parts of the worship in common use had a hidden efficacy and power, far superior to the plain and obvious meaning assigned to them by the vulgar: and by paying peculiar respect to these *myteries*, the pretended teachers of the religion of Jesus accommodated their doctrines to the taste of their heathen neighbours, whose religion consisted in a heap of *myteries*, of which nobody knew the meaning.

By these, and other means of a similar kind, the Christian pastors greatly abridged the liberty of their flock. Being masters of the ceremonies and *myteries* of the Christian religion, they had it in their power to make their followers worship and believe whatever they thought proper, and this they did not fail to make use of for their own advantage. They persuaded the people, that the ministers of the Christian church succeeded to the character, rights, and privileges, of the Jewish priesthood; and accordingly, the bishops considered themselves as invested with a rank and character similar to those of the high-priest among the Jews, while the presbyters represented the priests, and the deacons the Levites. This notion, which was first introduced in the reign of Adrian, proved a source of very considerable honour and profit to the clergy.

58
The teachers assume a power over the people.

The form of ecclesiastical government was in this century rendered permanent and uniform. One inspector or bishop presided over each Christian assembly, to which office he was elected by the voices of the whole people. To assist him in his office, he formed a council of presbyters, which was not confined to any stated number. To the bishops and presbyters the ministers or deacons were subject; and the latter were divided into a variety of classes, as the different exigencies of the church required. During a great part of this century, the churches were independent of each other; nor were they joined together by association, confederacy, or any other bonds but those of charity. Each assembly was a little state governed by its own laws; which were either enacted, or at least approved of, by the society. But, in process of time, all the Christian churches of a province were formed into one large ecclesiastical body, which, like confederate states, assembled at certain times, in order to deliberate about the common interests of the whole. This institution had its origin among the Greeks; but in a short time it became universal, and similar assemblies were formed in all places where the gospel had been planted. These assemblies, which consisted of the deputies or commissioners from several churches, were called *synods* by the Greeks, and *councils* by the Latins; and the laws enacted in these general meetings were called *canons*, i. e. *rules*.

These councils, of which we find not the smallest trace before the middle of this century, changed the whole face of the church, and gave it a new form; for by them the ancient privileges of the people were considerably diminished, and the power and authority of the bishops greatly augmented. The humility indeed, and prudence, of these pious prelates hindered them from assuming all at once the power with which they were afterwards invested. At their first appearance in these general councils, they acknowledged that they were no more than the delegates of their respective churches,

59
Form of church government.

60
Changes produced by the institution of councils.

churches, and that they acted in the name and by the appointment of their people. But they soon changed this humble tone; imperceptibly extended the limits of their authority; turned their influence into dominion, their counsels into laws; and at length openly asserted, that Christ had empowered them to prescribe to his people *authoritative rules of faith and manners*. Another effect of these councils was the gradual abolition of that perfect equality which reigned among all bishops in the primitive times. For the order and decency of these assemblies required, that some one of the provincial bishops met in council should be invested with a superior degree of power and authority; and hence the rights of Metropolitans derive their origin. In the mean time, the bounds of the church were enlarged; the custom of holding councils was followed wherever the sound of the gospel had reached; and the universal church had now the appearance of one vast republic formed by a combination of a great number of little states. This occasioned the creation of a new order of ecclesiastics, who were appointed in different parts of the world as heads of the church, and whose office it was to preserve the confidence and union of that immense body, whose members were so widely dispersed throughout the nations. Such was the nature and office of the *Patriarchs*; among whom, at length, ambition, being arrived at its most insolent period, formed a new dignity, investing the bishop of Rome with the title and authority of the *prince of the patriarchs*.

62.
Account of
the Ascetic-
tics.

During the second century, all the sects continued which had sprung up in the first, with the addition of several others, the most remarkable of which were the *Ascetics*. These owed their rise to an error propagated by some doctores of the church, who asserted that Christ had established a *double rule of sanctity and virtue* for two different orders of Christians. Of these rules, one was ordinary, the other extraordinary; the one of a lower dignity, the other more sublime: the first for persons in the active scenes of life; the other for those who, in a sacred retreat, aspired after the glory of a celestial state. In consequence of this system, they divided into two parts all those moral doctrines and instructions, which they had received either by writing or tradition. One of these divisions they called *precepts*, and the other *counsels*. They gave the name of *precepts* to those laws that were universally obligatory upon all orders of men; and that of *counsels* to those which related to Christians of a more sublime rank, who proposed to themselves great and glorious ends, and breathed after an intimate communion with the Supreme Being.—Thus were produced all at once a new set of men, who made pretensions, to uncommon sanctity and virtue, and declared their resolution of obeying all the *precepts and counsels* of Christ, in order to their enjoyment of communion with God here; and also that, after the dissolution of their mortal bodies, they might ascend to him with the greater facility, and find nothing to retard their approach to the centre of happiness and perfection. They looked upon themselves as prohibited from the use of things which it was lawful for other Christians to enjoy, such as wine, flesh, matrimony, and commerce. They thought it their indispensable duty to extenuate their body by watchings, abstinence, labour,

and hunger. They looked for felicity in solitary retreats, and desert places; where, by severe and assiduous efforts of sublime meditation, they raised the soul above all external objects, and all sensual pleasures. They were distinguished from other Christians, not only by their title of *Ascetics*, *Ἐσκητικοί*, *Εσκητικοί*, and philosophers, but also by their garb. In this century, indeed, those who embraced such an austere kind of life, submitted themselves to all these mortifications in private, without breaking asunder their social bands, or withdrawing themselves from mankind; but in process of time they retired into deserts, and, after the example of the *Essenes* and *Therapeutæ*, they formed themselves into certain companies.

This austere sect arose from an opinion which has been more or less prevalent in all ages and in all countries, namely, That religion consists more in prayers, meditations, and a kind of secret intercourse with God, than in fulfilling the social duties of life in acts of benevolence and humanity to mankind. Nothing can be more evident than that the Scripture reckons the fulfilling of these infinitely superior to the observance of all the ceremonies that can be imagined; yet it somehow or other happens, that almost every body is more inclined to observe the ceremonial part of devotion, than the moral; and hence, according to the different humours or constitutions of different persons, there have been numberless forms of Christianity, and the most virulent contentions among those who professed themselves followers of the Prince of Peace. It is obvious, that if the moral conduct of Christians was to be made the standard of faith, instead of speculative opinions, all these divisions must cease in a moment; but while Christianity, or any part of it, is made to consist in speculation, or the observance of ceremonies, it is impossible there can be any end of sects or heresies. No opinion whatever is so absurd, but some people have pretended to argue in its defence; and no ceremony so insignificant, but it hath been explained and sanctified by hot-headed enthusiasts: and hence ceremonies, sects, and absurdities, have been multiplied without number, to the prejudice of society and of the Christian religion.—This short relation of the rise of the Ascetic sect will also serve to account for the rise of any other; so that we apprehend it is needless to enter into particulars concerning the rest, as they all took their origin from the same general principle variously modified, according to the different dispositions of mankind.

The Ascetic sect began first in Egypt, from whence it passed into Syria and the neighbouring countries. At length it reached the European nations: and hence that train of austere and superstitious vows and rites which totally obscured, or rather annihilated, Christianity; the celibacy of the clergy, and many other absurdities of the like kind.—The errors of the Ascetics, however, did not stop here. In compliance with the doctrines of some Pagan philosophers, they affirmed that it was not only lawful, but even praiseworthy to deceive, and to use the expedient of a lie, in order to advance the cause of piety and truth; and hence the *pious frauds* for which the church of Rome hath been so notorious, and with which she hath been so often and justly reproached.

As Christians thus deviated more and more from the

Ecclesiastical History.

63
Contests concerning festivals.

the true practice of their religion, they became more zealous in the external profession of it. Anniversary festivals were celebrated in commemoration of the death and resurrection of Christ, and of the effusion of the Holy Ghost on the apostles. Concerning the days on which these festivals were to be kept, there arose violent contests. The Asiatic churches in general differed in this point from those of Europe ; and towards the conclusion of the century, Victor, bishop of Rome, took it in his head to force the eastern churches to follow the rules laid down by the western ones. This they absolutely refused to comply with : upon which Victor cut them off from communion with the church of Rome ; though, by means of the intercession of some prudent people, the difference was made up for the present.

64
Third century.

During most of the third century, the Christians were allowed to enjoy their religion, such as it was, without molestation. The emperors Maximinus and Decius, indeed, made them feel all the rigours of a severe persecution ; but their reigns were short, and from the death of Decius to the time of Dioclesian the church enjoyed tranquillity. Thus vast multitudes were converted ; but at the same time, the doctrine grew daily more corrupt, and the lives of professed Christians more wicked and scandalous. New ceremonies were invented in great numbers, and an unaccountable passion now prevailed for the oriental superstitions concerning demons ; whence proceeded the whole train of exorcisms, spells, and fears for the apparition of evil spirits, which to this day are nowhere eradicated. Hence also the custom of avoiding all connections with those who were not baptized, or who lay under the penalty of excommunication, as persons supposed to be under the dominion of some evil spirit. And hence the rigour and severity of that discipline and penance imposed upon those who had incurred, by their immoralities, the censures of the church.—Several alterations were now made in the manner of celebrating the Lord's supper. The prayers used on this occasion were lengthened, and the solemnity and pomp with which it was attended were considerably increased. Gold and silver vessels were used in the celebration ; it was thought essential to salvation, and for that reason administered even to infants.—Baptism was celebrated twice a-year to such as, after a long course of trial and preparation, offered themselves candidates. The remission of sins was thought to be its immediate consequence ; while the bishop, by prayer and imposition of hands, was supposed to confer those sanctifying gifts of the Holy Ghost, that are necessary to a life of righteousness and virtue. An evil demon was supposed naturally to reside in every person, who was the author and source of all the corrupt dispositions and unrighteous actions of that person. The driving out of this demon was therefore an essential requisite for baptism ; and, in consequence of this opinion, the baptized persons returned home clothed in white garments, and adorned with crowns, as sacred emblems, the former of their inward purity and innocence, and the latter of their victory over sin and the world.—Fasting began now to be held in more esteem than formerly. A high degree of sanctity was attributed to this practice ; it was even looked upon as indispensably necessary, from a notion that the demons directed

their force chiefly against those who pampered themselves with delicious fare, and were less troublesome to the lean and hungry who lived under the severities of a rigorous abstinence.—The sign of the cross also was supposed to administer a victorious power over all sorts of trials and calamities ; and was more especially considered as the surest defence against the snares and stratagems of malignant spirits ; for which reason, no Christian undertook any thing of moment, without arming himself, as he imagined, with the power of this triumphant sign.—The heresies which troubled the church during this century, were the Gnostics, (whose doctrines were new-modelled and improved by Manes, from whom they were afterwards chiefly called *Manicheans*) ; the HIERACITES, NOETIANS, SABELLIANS, and NOVATIANS ; for a particular account of which, see those articles.

65
Fourth century.

The fourth century is remarkable for the establishment of Christianity by law in the Roman empire ; which, however, did not take place till the year 324. In the beginning of the century, the empire was governed by four chiefs, viz. Dioclesian, Maximian, Constantius Chlorus, and Galerius, under whom the church enjoyed a perfect toleration. Dioclesian, tho' much addicted to superstition, had no ill-will against the Christians ; and Constantius Chlorus, having abandoned polytheism, treated them with condescension and benevolence. This alarmed the Pagan priests, whose interests were so closely connected with the continuance of the ancient superstitions ; and who apprehended, not without reason, that the Christian religion would at length prevail throughout the empire. To prevent the downfall of the Pagan superstition, therefore, they applied to Dioclesian and Galerius Cæsar ; by whom a most bloody persecution was commenced in the year 303, and continued till 311. An asylum, however, was opened for the Christians in the year 304. Galerius having dethroned Dioclesian and Maximian, declared himself emperor in the east ; leaving all the western provinces, to which great numbers of Christians resorted to avoid the cruelty of the former, to Constantius Chlorus. At length Galerius, being overtaken with an incurable and dreadful disease, published an edict ordering the persecution to cease, and restoring freedom to the Christians, whom he had most inhumanly oppressed for eight years. Galerius died the same year : and in a short time after, when Constantine the Great ascended the throne, the Christians were freed from any farther uneasiness, by his abrogating all the penal laws against them ; and afterwards issuing edicts, by which no other religion than the Christian was tolerated throughout the empire.

66
Christianity established by Constantine.

This event however, so favourable to the outward peace of the church, was far from promoting its internal increase of harmony, or the reformation of its leaders. The clergy, who had all this time been augmenting their power at the expence of the liberty of the people, now set no bounds to their ambition. The bishop of Rome was the first in rank, and distinguished by a sort of pre-eminence above the rest of the prelates. He surpassed all his brethren in the magnificence and splendor of the church over which he presided ; in the riches of his revenues and possessions ; in the number and variety of his ministers ; in his credit with the people, and in his sumptuous

67
Increase of internal corruptions.

and splendid manner of living. Hence it happened that when a new pontiff was to be chosen by the presbyters and people, the city of Rome was generally agitated with dissensions, tumults, and cabals, which often produced fatal consequences. The intrigues and disturbances which prevailed in that city in the year 366, when, upon the death of Liberius, another pontiff was to be chosen in his place, are a sufficient proof of what we have advanced. Upon this occasion, one faction elected Damasus to that high dignity; while the opposite party chose Ursicinus, a deacon of the vacant church, to succeed Liberius. This double election gave rise to a dangerous schism, and to a sort of civil war within the city of Rome; which was carried on with the utmost barbarity and fury, and produced the most cruel massacres and desolations. The inhuman contest ended in the victory of Damasus; but whether his cause was more just than that of Ursicinus, is not so easily determined.

Notwithstanding the pomp and splendor which surrounded the Roman see, it is certain that the bishops of Rome had not yet acquired that pre-eminence of power and jurisdiction which they afterwards enjoyed. In the ecclesiastical commonwealth, indeed, they were the most eminent order of citizens; but still they were citizens as well as their brethren, and subject, like them, to the laws and edicts of the emperors. All religious causes of extraordinary importance were examined and determined, either by judges appointed by the emperors, or in councils assembled for that purpose; while those of inferior moment were decided in each district by its respective bishop. The ecclesiastical laws were enacted either by the emperor or councils. None of the bishops acknowledged that they derived their authority from the permission and appointment of the bishop of Rome, or that they were created bishops by the favour of the *apostolic see*. On the contrary, they all maintained that they were the ambassadors and ministers of Jesus Christ, and that their authority was derived from above. It must, however, be observed, that even in this century, several of those steps were laid, by which the bishops of Rome mounted afterwards to the summit of ecclesiastical power and despotism. This happened partly by the imprudence of the emperors, partly by the dexterity of the Roman prelates themselves, and partly by the inconsiderate zeal and precipitate judgment of certain bishops.—The imprudence of the emperor, and precipitation of the bishops, were remarkably discovered in the following event, which favoured extremely the ambition of the Roman pontiff. About the year 372, Valentinian enacted a law, empowering the bishop of Rome to examine and judge other bishops, that religious disputes might not be decided by any profane or secular judges. The bishops, assembled in council at Rome in 378, not considering the fatal consequences that must arise from this imprudent law both to themselves and to the church, declared their approbation in the strongest terms, and recommended the execution of it in their address to the emperor Gratian. Some think, indeed, that this law empowered the Roman bishop to judge only the bishops within the limits of his jurisdiction; others, that his power was given only for a certain time, and for a particular purpose. This last notion seems the most probable;

but still this privilege must have been an excellent instrument in the hands of sacerdotal ambition.

By the removal of the seat of empire to Constantinople, the emperor raised up, in the bishop of this new metropolis, a formidable opponent to the bishop of Rome, and a bulwark which threatened a vigorous opposition to his growing authority. For as the emperor, in order to render Constantinople a second Rome, enriched it with all the rights and privileges, honours and ornaments, of the ancient capital of the world; so its bishop, measuring his own dignity and rank by the magnificence of the new city, and its eminence as the residence of the emperor, assumed an equal degree of dignity with the bishop of Rome, and claimed a superiority over the rest of the episcopal order. Nor did the emperors disapprove of these high pretensions, since they considered their own dignity as connected in a certain measure with that of the bishop of their imperial city. Accordingly, in a council held at Constantinople, in the year 381, by the authority of Theodosius the Great, the bishop of that city was, during the absence of the bishop of Alexandria, and against the consent of the Roman prelate, placed by the third canon of that council in the first rank after the bishop of Rome, and consequently above those of Alexandria and Antioch. Nestarius was the first bishop who enjoyed these new honours accumulated upon the see of Constantinople. His successor, the celebrated John Chrysostom, extended still farther the privileges of that see, and submitted to its jurisdiction all Thrace, Asia, and Pontus; nor were the succeeding bishops of that imperial city destitute of a fervent zeal to augment their privileges, and extend their dominion. By this unexpected promotion, the most disagreeable effects were produced. The bishops of Alexandria were not only filled with the most inveterate hatred against those of Constantinople, but a contention was excited between the bishops of Rome and Constantinople; which, after being carried on for many ages, concluded at last in the separation of the Greek and Latin churches.

Constantine the Great, in order to prevent civil commotions, and to fix his authority on a stable and solid foundation, made several changes not only in the laws of the empire, but also in the form of the Roman government. And as there were many important reasons which induced him to suit the administration of the church to these changes in the civil constitution, this necessarily introduced among the bishops new degrees of eminence and rank. The four bishops, of Rome, Constantinople, Antioch, and Alexandria, were distinguished by a certain degree of pre-eminence over the rest. These four prelates answered to the four praetorian prefects created by Constantine; and it is possible, that even in this century they were distinguished by the Jewish title of *patriarchs*. After these followed the *exarchs*, who had the inspection over several provinces, and answered to the appointment of certain civil officers who bore the same title. In a lower class were the *metropolitans*, who had only the government of one province; under whom were the *archbishops*, whose inspection was confined to certain districts. In this gradation the bishops brought up the rear; but the sphere of their authority was not in all places equally extensive; being in some considerably ample, and in others con-

69

stantine.

finend

lined within narrow limits. To these various ecclesiastical orders we might add that of the *chorepiscopi*, or superintendants of the country-churches; but this last order was in most places suppressed by the bishops, with a design to extend their own authority, and enlarge the sphere of their power and jurisdiction. The administration of the church itself was divided by Constantine into an *external* and *internal* inspection. The latter, which was committed to bishops and councils, related to religious controversies, the forms of divine worship, the offices of priests, the vices of the ecclesiastical orders, &c. The external administration of the church the emperor assumed to himself. This comprehended all those things which related to the outward state and discipline of the church; it likewise extended to all contests that should arise between the ministers of the church, superior as well as inferior, concerning their possessions, their reputation, their rights and privileges, their offences against the laws, &c. but no controversies that related to matters purely spiritual were cognisable by this external inspection. In consequence of this artful division of the ecclesiastical government, Constantine and his successors called councils, presided in them, appointed the judges of religious controversies, terminated the differences which arose between the bishops and the people, fixed the limits of the ecclesiastical provinces, took cognizance of the civil causes that subsisted between the ministers of the church, and punished the crimes committed against the laws by the ordinary judges appointed for that purpose; giving over all causes purely ecclesiastical to the bishops and councils. But this famous division of the administration of the church was never explained with sufficient accuracy; so that, both in the fourth and fifth centuries, there are frequent instances of the emperors determining matters purely ecclesiastical, and likewise of bishops and councils determining matters which related merely to the external form and government of the church.

After the time of Constantine many additions were made by the emperors and others to the wealth and honours of the clergy; and these additions were followed by a proportionable increase of their vices and luxury, particularly among those who lived in great and opulent cities. The bishops, on the one hand, contended with each other in the most scandalous manner concerning the extent of their respective jurisdictions; while, on the other, they trampled on the rights of the people, violated the privileges of the inferior ministers, and imitated in their conduct and in their manner of living the arrogance, voluptuousness, and luxury of magistrates and princes. This pernicious example was soon followed by the several ecclesiastical orders. The presbyters, in many places, assumed an equality with the bishops in point of rank and authority. Many complaints are also made by the authors of this century about the vanity and effeminacy of the deacons. Those more particularly of the presbyters and deacons who filled the first stations of these orders, carried their pretensions to an extravagant length, and were offended at the notion of being placed on an equality with their colleagues. For this reason they not only assumed the titles of *arch-presbyters*; and *arch-deacons*, but also claimed a degree of authority and power much superior to that which was vested in the other members

of their respective orders.

In the fifth century, the bishops of Constantinople having already reduced under their jurisdiction all the Asiatic provinces, began to grasp at still further accessions of power. By the 28th canon of the council held at Chalcedon in 451, it was resolved, that the same rights and honours which had been conferred on the bishop of Rome were due to the bishop of Constantinople, on account of the equal dignity and lustre of the two cities in which these prelates exercised their authority. The same council confirmed also, by a solemn act, the bishop of Constantinople in the spiritual government of those provinces over which he had usurped the jurisdiction. Leo the Great, bishop of Rome, opposed with vehemence the passing of these laws; and his opposition was seconded by that of several other prelates. But their efforts were vain, as the emperors threw in their weight into the balance, and thus supported the decisions of the Grecian bishops. In consequence, then, of the decisions of this famous council, the bishop of Constantinople began to contend obstinately for the supremacy with the Roman pontiff, and to crush the bishops of Antioch and Alexandria. About the same time, Juvenal, bishop of Jerusalem, attempted to withdraw himself and his church from the jurisdiction of the bishop of Cæsarea, and aspired after a place among the first prelates of the Christian world. The high degree of veneration and esteem in which the church of Jerusalem was held among all other Christian societies (on account of its rank among the apostolical churches, and its title to the appellation of *mother-church*, as having succeeded the first Christian assembly formed by the Apostles), was extremely favourable to the ambition of Juvenal, and rendered his project much more practicable than it would otherwise have been. Encouraged by this, and likewise by the protection of Theodosius the younger, this aspiring prelate not only assumed the dignity of patriarch of all Palestine, a rank which rendered him independent of all spiritual authority; but also invaded the rights of the bishop of Antioch, and usurped his jurisdiction over the provinces of Phœnicia and Arabia. Hence arose a warm contest between Juvenal and Maximus bishop of Antioch; which the council of Chalcedon decided, by restoring to the latter the provinces of Phœnicia and Arabia, and confirming the former in the spiritual possession of all Palestine and in the high rank which he had assumed in the church.

In 588, John, bishop of Constantinople, furnished the *Foster*, either by his own authority or that of the emperor Mauritius, summoned a council at Constantinople to inquire into an accusation brought against Gregory, bishop of Antioch; and upon this occasion assumed the title of *oecumenical* or *universal bishop*. This title had been formerly enjoyed by the bishops of Constantinople without any offence; but now, Gregory the Great, at that time bishop of Rome, suspecting that John was aiming at the supremacy over all the churches, opposed his claim with the greatest vigour. For this purpose he applied by letters to the emperor, and others, whom he thought capable of assisting him in his opposition: but all his efforts were without effect; and the bishops of Constantinople were allowed to enjoy the disputed title, though not in the sense which had alarmed the Roman pontiff.

Gregory.

71
Contests between the bishops of Rome and Constantinople.

70
Scandalous lives of the clergy.

Gregory, however, adhered tenaciously to his purpose, raised new tumults and dissensions among the clergy, and aimed at nothing less than an unlimited supremacy over the Christian church. This ambitious design succeeded in the West; while, in the Eastern provinces, his arrogant pretensions were scarcely respected by any but those who were at enmity with the bishop of Constantinople. How much the people were at this time deluded by the Roman pontiffs, appears from the expression of Ennodius, one of the flatterers of Symmachus, (who was a prelate of but ambiguous fame) that the Roman pontiff was constituted *judge in the place of God*, which he filled as the viceregent of the most high. On the other hand it is certain, from a variety of the most authentic records, that both the emperors and the nations in general, were far from being disposed to bear with patience the yoke of servitude which the see of Rome was arrogantly imposing on the whole church.

72
Origin of the supremacy of the pope.

In the beginning of the seventh century, according to the most learned historians, Boniface III. engaged Phocas, emperor of Constantinople, to take from the bishop of that metropolis, the title of *apostolical or universal bishop*, and to confer it upon the Roman pontiff; and thus was first introduced the supremacy of the pope. The Roman pontiffs used all methods to maintain and enlarge this authority and pre-eminence which they had acquired from one of the most odious tyrants that ever disgraced the annals of history.

In the eighth century, the power of the bishop of Rome, and of the clergy in general, increased prodigiously. The chief cause of this, besides the superstition of the people, was the method at that time used by the European princes to secure themselves on their thrones. All these princes being then employed either in usurpation or in self-defence, and the whole continent being in the most unsettled and barbarous condition, they endeavoured to attach warmly to their interests those whom they considered as their friends and clients. For this purpose they distributed among them extensive territories, cities, and fortresses, with the various rights and privileges belonging to them; reserving only to themselves the supreme dominion, and the military service of these powerful vassals. For this reason it was by the European princes reckoned a high instance of political prudence to distribute among the bishops and other Christian doctors the same sort of donations which had formerly been given to their generals and clients. By means of the clergy, they hoped to check the seditious and turbulent spirits of their vassals, and to maintain them in their obedience by the influence and authority of their bishops, whose commands were highly respected, and whose spiritual thunderbolts, rendered formidable by ignorance, struck terror into the boldest and most resolute hearts.

This prodigious accession to the opulence and authority of the clergy in the west, began at their head, viz. the Roman pontiff; from whence it spread gradually among the inferior sacerdotal orders. The barbarous nations who had received the gospel, looked upon the bishop of Rome as the successor of their chief druid or high priest: and as this tremendous druid had enjoyed, under the darkness of Paganism, a kind of boundless authority; so these barbarous nations thought proper to confer upon the chief bi-

shop, the same authority which had belonged to the chief druid. The Pope received these august privileges with great pleasure; and left, upon any change of affairs, attempts should be made to deprive him of them, he strengthened his title to these extraordinary honours by a variety of passages drawn from ancient history, and, what is still more astonishing, by arguments of a religious nature. This swelled the Roman druid to an enormous size; and gave to the see of Rome that high pre-eminence and despotic authority in civil and political matters, that were unknown to former ages. Hence, among other unhappy circumstances, arose that monstrous and pernicious opinion, that such persons as were excluded from the communion of the church by the pontiff himself, or any of the bishops, forfeited thereby, not only their civil rights and advantages as citizens, but even the common claims and privileges of humanity. This horrid opinion, which was a fatal source of wars, massacres, and rebellions, without number, and which contributed more than any thing else to confirm and augment the papal authority, was borrowed by the clergy from the Pagan superstitions.—Though excommunication, from the time of Constantine the Great, was in every part of the Christian world attended with many disagreeable effects; yet its highest terrors were confined to Europe, where its aspect was truly formidable and hideous. It acquired also, in the eighth century, new accessions of terror; so that from that period the excommunication practised in Europe differed entirely from that which was in use in other parts of Christendom. Excommunicated persons were indeed considered in all places as objects of hatred both to God and man: but they were not, on that account, robbed of the privileges of citizens, nor of the rights of humanity; much less were those kings and princes, whom an insolent bishop had thought proper to exclude from the communion of the church, supposed to forfeit on that account their crowns or their territories. But from this century it was quite otherwise in Europe. Excommunication received that infernal power which dissolved all connections; so that those whom the bishops, or their chief, excluded from church communion, were degraded to a level with the beasts. The origin of this unnatural and horrid power was as follows. On the conversion of the barbarous nations to Christianity, these ignorant proselytes confounded the excommunication in use among Christians with that which had been practised in the times of Paganism, and which was attended with all the dreadful effects above-mentioned. The Roman pontiffs, on the other hand, were too artful not to encourage this error; and therefore employed all sorts of means to gain credit to an opinion so well calculated to gratify their ambition, and to aggrandize in general the episcopal order.

The annals of the French nation furnish us with the following instance of the enormous power which was at this time vested in the Roman pontiff. Pepin, who was mayor of the palace to Childeric III. king of France, and who in the exercise of that high office was possessed in reality of the royal power and authority, aspired to the titles and honours of majesty also, and formed a scheme of dethroning his sovereign. For this purpose he assembled the states in 751; and though

73
He becomes a temporal prince.

Ecclesi-
astical
History.

though they were devoted to the interests of this ambitious usurper, they gave it as their opinion that the bishop Rome was previously to be consulted whether the execution of such a scheme was lawful or not. In consequence of this, ambassadors were sent by Pepin to Zachary, the reigning pontiff, with the following question, "Whether the divine law did not permit a valiant and warlike people to dethrone a pusillanimous and indolent prince who was incapable of discharging any of the functions of royalty; and to substitute in his place one more worthy to rule, and who had already rendered most important services to the state?" The situation of Zachary, who stood much in need of the succours of Pepin against the Greeks and Lombards, rendered his answer such as the usurper desired: and when this favourable decision of the Roman oracle was published in France, the unhappy Childeric was stripped of his royalty without the least opposition; and Pepin, without the smallest resistance, stepped into the throne of his master and his sovereign. This decision was solemnly confirmed by Stephen II, the successor of Zachary; who undertook a journey into France in the year 754, in order to solicit assistance against the Lombards. The pontiff at the same time dissolved the obligation of the oath of fidelity and allegiance which Pepin had sworn to Childeric and violated by his usurpation in the year 751; and to render his title to the crown as sacred as possible, Stephen anointed and crowned him, with his wife and two sons, for the second time. This complaisance of the Pope was rewarded with the exarchate of Ravenna and all its dependencies, as we have already related. See CIVIL HISTORY, n^o 44; and *History of ITALY*.

In the succeeding centuries, the Roman pontiffs continued to increase their power by every kind of artifice and fraud which can dishonour the heart of man; and, by continually taking advantages of the civil dissensions which prevailed throughout Italy, France, and Germany, their influence in civil affairs arose to an enormous height. The increase of their authority in religious matters was not less rapid. The wisest and most impartial among the Roman Catholic writers acknowledge, that, from the time of Lewis the Meek, the ancient rules of ecclesiastical government were gradually changed in Europe by the counsels and instigation of the church of Rome, and new laws substituted in their place. The European princes suffered themselves to be divested of the supreme authority in religious matters which they had derived from Chaulmagne; the power of the bishops was greatly diminished, and even the authority of both provincial and general councils began to decline. The popes, elated with their overgrown prosperity, and become arrogant beyond measure by the daily accessions that were made to their authority, were eagerly bent upon establishing the maxim, That the bishop of Rome was constituted and appointed by Jesus Christ, supreme legislator and judge of the church universal; and that therefore the bishops derived all their authority from him. This opinion, which they inculcated with the utmost zeal and ardour, was opposed in vain by such as were acquainted with the ancient ecclesiastical constitutions, and the government of the church in the earlier ages. In order to gain credit to this new ecclesiastical code, and to support the preten-

sions of the popes to supremacy, it was necessary to produce the authority of ancient deeds, in order to stop the mouths of such as were disposed to set bounds to their usurpations. The bishops of Rome were aware of this; and as those means were looked upon as the most lawful that tended best to the accomplishment of their purposes, they employed some of their most ingenious and zealous partisans in forging conventions, acts of councils, epistles, and such-like records, by which it might appear, that, in the first ages of the church, the Roman pontiffs were clothed with the same spiritual majesty and supreme authority which they now assumed. There were not, however, wanting among the bishops some men of prudence and sagacity, who saw through these impious frauds, and perceived the chains that were forging both for them and the church. The French bishops distinguished themselves eminently in this respect: but their opposition was soon quashed; and as all Europe was sunk in the grossest ignorance and darkness, none remained who were capable of detecting these odious impollutes, or disposed to support the expiring liberty of the church.

This may serve as a general specimen of the characters and behaviour of the pretended viceregents of Jesus Christ, to the 16th century. In the 11th century indeed, their power seems to have risen to its utmost height. They now received the pompous titles of *Masters of the world*, and *Popes*, i. e. *Universal Fathers*. They presided every where in the councils by their legates, assumed the authority of supreme arbiters in all controversies that arose concerning religion or church-discipline, and maintained the pretended rights of the church against the encroachments and usurpations of kings and princes. Their authority, however, was confined within certain limits: for, on the one hand, it was restrained by sovereign princes, that it might not arrogantly aim at civil dominion; and on the other, it was opposed by the bishops themselves, that it might not arise to a spiritual despotism, and utterly destroy the privileges and liberty of synods and councils. From the time of Leo IX. the popes employed every method which the most artful ambition could suggest to remove those limits, and to render their dominion both despotic and universal. They not only aspired to the character of supreme legislators in the church, to an unlimited jurisdiction over all synods and councils whether general or provincial, to the sole distribution of all ecclesiastical honours and benefices; as divinely authorized and appointed for that purpose; but they carried their insolent pretensions so far, as to give themselves out for lords of the universe, arbiters of the fate of kingdoms and empires, and supreme rulers over the kings and princes of the earth. Hence we find instances of their giving away kingdoms, and loosing subjects from their allegiance to their sovereigns, among which the history of John king of England is very remarkable. At last, they plainly assumed the whole earth as their property, as well where Christianity was preached as where it was not; and therefore, on the discovery of America and the East Indies, the pope, by virtue of this spiritual property, granted to the Portuguese a right to all the countries lying eastward, and to the Spaniards all those lying to the westward of Cape Non in Africa, which they were able to conquer by force of arms; and that nothing might be wanting

to complete their character, they pretended to be lords of the future world also, and to have a power of restraining even the Divine Justice itself, and remitting that punishment which the Deity hath denounced against the workers of iniquity.

76
Christianity
greatly cor-
rupted.

Invocations
of saints,
relics, pur-
gatory, &c.
introduced.

All this time, the powers of superstition reigned triumphant over those remains of Christianity which had escaped the corruptions of the first four centuries. In the fifth century began the invocation of the happy souls of departed saints. Their assistance was in-creased by many fervent prayers, while none stood up to oppose this preposterous kind of worship. The images of those who during their lives had acquired the reputation of uncommon sanctity, were now honoured with a particular worship in several places; and many imagined that this drew into the images the propitious presence of the saints or celestial beings which they were supposed to represent. A singular and irresistible efficacy was attributed to the bones of martyrs, and to the figure of the cross, in defeating all the attempts of Satan, removing all sorts of calamities, and in healing not only the diseases of the body, but also those of the mind. The famous Pagan doctrine concerning the *purgation of departed souls*, by means of a certain kind of fire, *i. e.* purgatory, was also confirmed and explained more fully than it had formerly been; and every one knows of how much consequence this absurd doctrine hath been to the wealth and power of the Ro-mish clergy.

77
Introduc-
tion of the
mass.

In the sixth century, Gregory the Great advanced an opinion, That all the *words* of the sacred writings were *images* of invisible and spiritual things; for which reason he loaded the churches with a multitude of ceremonies the most insignificant and futile that can be imagined; and hence arose a new and most difficult science, namely, the explication of these ceremonies, and the investigation of the causes and circumstances whence they derived their origin. A new method was contrived of administering the Lord's supper, with a magnificent assemblage of pompous ceremonies. This was called the *canon of the mass*. Baptism, except in cases of necessity, was administered only on the great festivals. An incredible number of temples were erected in honour of the saints. The places set apart for public worship were also very numerous; but now they were considered as the means of purchasing the protection and favour of the saints; and the ignorant and barbarous multitude were persuaded, that these departed spirits defended and guarded against evils and calamities of every kind, the provinces, lands, cities, and villages in which they were honoured with temples. The number of these temples was almost equalled by that of the festivals, which seem to have been invented in order to bring the Christian religion as near the model of Paganism as possible.

78
Supersti-
tion still
increases.

In the seventh century, religion seemed to be alto-gether buried under a heap of superstitious ceremonies; the worship of the true God and Saviour of the world was exchanged for the worship of bones, bits of wood (said to be of the cross), and the images of saints. The eternal state of misery threatened in Scripture to the wicked was exchanged for the temporary punish-ment of purgatory; and the expressions of faith in Christ by an upright and virtuous conduct, for the aug-mentation of the riches of the clergy by donations to

the church, and the observance of a heap of idle cere-monies. New festivals were still added; one in par-ticular was instituted in honour of the *true cross* on which our Saviour suffered; and churches were declared to be sanctuaries to all such as fled to them, whatever their crimes might have been.

Superstition, it would seem, had now attained its highest pitch; nor is it easy to conceive a degree of ig-norance and degeneracy beyond what we have already mentioned. If any thing can possibly be imagined more contrary to true religion, it is an opinion which prevailed in the eighth century, namely, That Chris-tians might appease an offended Deity by voluntary acts of mortification, or by gifts and oblations lavished on the church, and that people ought to place their confidence in the works and merits of the saints. The piety in this and some succeeding ages consisted in building and embellishing churches and chapels; in en-dowing monasteries and basilics; hunting after the re-lics of saints and martyrs, and treating them with an absurd and excessive veneration; in procuring the in-tercession of the saints by rich oblations, or super-stitious rites; in worshipping images; in pilgrimages to those places where they were esteemed holy, particu-larly to Palestine, &c. The genuine religion of Jes-us was now utterly unknown, both to clergy and people, if we except a few of its general doctrines con-tained in the creed. In this century also, the super-stitious custom of *solitary masses* had its origin. These were celebrated by the priest alone in behalf of souls detained in purgatory, as well as upon some other oc-casions. They were prohibited by the laws of the church, but proved a source of immense wealth to the clergy. Under Charlemagne they were condemned by a synod assembled at Mentz, as criminal effects of avarice and sloth. A new superstition, however, still sprung up in the tenth century. It was imagined, from Rev. xx. 1. that Antichrist was to make his appear-ance on the earth, that soon after the world itself would be destroyed. An universal panic ensued; vast num-bers of people, abandoning all their connections in so-ciety, and giving over to the churches and monasteries all their worldly effects, repaired to Palestine, where they imagined that Christ would descend from heaven to judge the world. Others devoted themselves by a solemn and voluntary oath to the service of the churches, convents, and priories, whose slaves they became, in the most rigorous sense of that word, performing daily their heavy tasks; and all this from a notion that the supreme Judge would diminish the severity of their sentence, and look upon them with a more favourable and propitious eye, on account of their having made themselves the slaves of his ministers. When an eclipse of the sun or moon happened to be visible, the cities were deserted, and their miserable inhabitants fled for refuge to hollow caverns, and hid themselves among the craggy rocks, and under the bending summits of steep mountains. The opulent attempted to bribe the saints and the Deity himself by rich donations conferred upon the sacerdotal tribe, who were looked upon as the immediate vicegerents of heaven. In many places, temples, palaces, and noble edifices both pub-lic and private, were suffered to decay, nay, were delib-erately pulled down, from a notion that they were no longer of any use, as the final dissolution of all things

Ecclesi-
astical

History

Ecclesiastical History.

Ecclesiastical History.

was at hand. In a word, no language is sufficient to express the confusion and despair that tormented the minds of miserable mortals upon this occasion. The general delusion was indeed opposed and combated by the discerning few, who endeavoured to dispel these terrors, and to efface the notion from which they arose in the minds of the people. But their attempts were ineffectual; nor could the dreadful apprehensions of the superstitious multitude be removed before the end of the century, and this terror became one of the accidental causes of the *CRUSADES*.

That nothing might now be wanting to complete that Antichristian system of religion which had over-spread all Europe, it was in the 11th century determined that divine worship should be celebrated in the Latin tongue, though now unknown throughout the whole continent. During the whole of this century also, Christians were employed in the rebuilding and ornamenting their churches, which they had destroyed through the superstitious fear already taken notice of.

In much the same way with what is above related, or worse if possible, matters went on till the time of the reformation. The clergy were immer-sed in crimes of the deepest dye; and the laity, imagining themselves able to purchase pardon of their sins for money, followed the examples of their pastors without remorse. The absurd principle formerly mentioned, namely, that religion consists in acts of austerity, and an unknown mental correspondence with God, produced the most extravagant and ridiculous behaviour in the devotees and reputed saints. They not only lived among the wild beasts, but also after the manner of these savage animals: they ran naked through the lonely deserts with a furious aspect, and all the agitations of madness and frenzy; they prolonged their wretched life by grass and wild herbs, avoided the sight and conversation of men, remained motionless in certain places for several years exposed to the rigour and inclemency of the seasons, and towards the conclusion of their lives shut themselves up in narrow and miserable huts; and all this was considered as true piety, the only acceptable method of worshipping the Deity and attaining a share in his favour.—But of all the instances of superstitious frenzy which disgraced the times we now speak of, none was held in higher veneration, or excited more the wonder of the multitude, than that of a certain order of men who were called *Stilitæ* by the Greeks, and *Sancti Colum-nares*, or Pillar-Saints, by the Latins. These were persons of a most singular and extravagant turn of mind, who stood motionless on the tops of pillars expressly raised for this exercise of their patience, and remained there for several years amidst the admiration and applause of the stupid populace. The inventor of this strange discipline was one *Simon* a Syrian, who began his follies by changing the agreeable employment of a shepherd for the austerities of a monkish life. He began his devotions on the top of a pillar six cubits high; but as he increased in sanctity, he also increased the height of his pillar, till, towards the conclusion of his life, he had got up on the top of a pillar 40 cubits in height. Many of the inhabitants of Syria and Palestine, seduced by a false ambition and an utter ignorance of true religion, followed the example of this fanatic,

Vol. V.

though not with the same degree of austerity. This superstitious practice began in the fifth century, and continued in the east for 600 years. The Latins, however, had too much wisdom and prudence to imitate the Syrians and Orientals in this whimsical superstition; and when a certain fanatic, or impostor, named *Wulfilaicus*, erected one of these pillars in the country of Treves, and proposed to live on it after the manner of *Simeon*, the neighbouring bishops ordered it to be pulled down.

The practices of austere worship and discipline in other respects, however, gained ground throughout all parts of Christendom. Monks of various kinds were to be found in every country in prodigious numbers. But though their discipline was at first exceedingly severe, it became gradually relaxed, and the monks gave into all the prevailing vices of the times. Other orders succeeded, who pretended to still greater degrees of sanctity, and to reform the abuses of the preceding ones; but these in their turn became corrupted, and fell into the same vices they had blamed in others. The most violent animosities, disputes, and hatred, also reigned among the different orders of monks; and, indeed, between the clergy of all ranks and degrees, whether we consider them as classed in different bodies, or as individuals of the same body. To enter into a detail of their wranglings and disputes, the methods which each of them took to aggrandise themselves at the expense of their neighbours, and to keep the rest of mankind in subjection, would require many volumes. We shall only observe, therefore, that even the external profession of the austere and absurd piety which took place in the fourth and fifth centuries, continued gradually to decline. Some there were, indeed, who boldly opposed the torrent of superstition and wickedness, which threatened to overflow the whole world: but their opposition proved fruitless, and all of these towards the era of the reformation had been either silenced or destroyed: so that, at that time, the pope and clergy reigned over mankind without controul, had made themselves masters of almost all the wealth in every country of Europe, and may truly be said to have been the only *sovereigns*; the rest of the human race, even kings and princes, being only their vassals and slaves.

While the Popish superstition reigned thus violent-ly in the west, the absurd doctrines of Mahomet over-spread all the east. The rise of this impostor is related under the article ARABIA. His successors conquered in order to establish the religion of their apostle; and thus the very name of Christianity was extinguished in many places where it had formerly flourished. The conquests of the Tartars having intermingled them with the Mahometans, they greedily embraced the superstitions of that religion, which thus almost entirely overspread the whole continents of Asia and Africa; and, by the conquest of Constantinople by the Turks in 1453, was likewise established throughout a considerable part of Europe.

About the beginning of the 16th century, the Roman pontiffs lived in the utmost tranquillity; nor had they, according to the appearance of things at that time, any reason to fear an opposition to their authority in any respect, since the commotions which had

81
State of religion in the beginning of the 16th century and since that time.

been raised by the Waldenses, Albigenses, &c. were now entirely suppressed. We must not, however, conclude, from this apparent tranquillity and security of the pontiffs and their adherents, that their measures were universally applauded. Not only private persons, but also the most powerful princes and sovereign states, exclaimed loudly against the tyranny of the popes, and the unbridled licentiousness of the clergy of all denominations. They demanded, therefore, a reformation of the church in its head and members, and a general council to accomplish that necessary purpose. But these complaints and demands were not carried to such a length as to produce any good effect; since they came from persons who never entertained the least doubt about the supreme authority of the pope in religious matters, and who of consequence, instead of attempting themselves to bring about that reformation which was so ardently desired, remained entirely inactive, or looked for redress to the court of Rome, or to a general council. But while the so much desired reformation seemed to be at such a great distance, it suddenly arose from a quarter whence it was not at all expected. A single person, Martin Luther, a monk of the order of St Augustine, ventured to oppose himself to the whole torrent of papal power and despotism. This bold attempt was first made public on the 30th of September 1517; and notwithstanding all the efforts of the Pope and his adherents, the doctrines of Luther continued daily to gain ground. Others, encouraged by his success, lent their assistance in the work of Reformation; which at last produced new churches, founded upon principles quite different from that of Rome, and which still continue. But for a particular account of the transactions of the first Reformers, the opposition they met with, and the final settlement of the reformed churches in different nations in Europe, see the articles LUTHER and REFORMATION.

The state of religion in other parts of the world seems as yet to be but little altered. Asia and Africa are sunk in the grossest superstitions either of the Mahomedan or Pagan kinds. The southern continent of America belonging to the Spaniards, continues immersed in the most absurd superstitions of Popery. The northern continent, being mostly peopled with colonies from Great Britain, professes the reformed religion. At the same time it must be owned, that some kind of reformation hath taken place even in Popery and Mahomedanism themselves. The Popes have no longer that authority over states and princes, even those most bigotted to Popery, which they formerly had. Neither are the lives either of the clergy or laity so corrupt as they were before. The increase of learning in all parts of the world hath contributed to cause men open their eyes to the light of reason, and this hath been attended with a proportional decrease of superstition. Even in Mahomedan countries, that furious enthusiasm which formerly emboldened the inhabitants to face the greatest dangers, hath now almost vanished; so that the credit of Mahomet himself seems to have sunk much in the estimation of his followers. This is to be understood even of the most ignorant and bigotted multitude; and the sensible part of the Turks are said to incline much towards Deism. With regard to those nations which still pro-

fect Paganism, the intercourse of Europeans with them is so small, that it is impossible to say any thing concerning them. As none of them are in a state of civilization, however, it may be conjectured, that their religion is of the same unpolished cast with their manners, and that it consists of a heap of barbarous superstitions which have been handed down among them from time immemorial, and which they continue to observe without knowing why or wherefore.

SECT. III. *Of the Composition of History.*

CICERO has given us the whole art of composing history, in a very short and comprehensive manner. We shall first transcribe what he says, and then consider the several parts of it in their proper order. "No one is ignorant (says he), that the first law in writing history is, Not to dare to say any thing that is false; and the next, Not to be afraid to speak the truth: that on the one hand there be no suspicion of affection, nor of prejudice on the other. These foundations are what all are acquainted with. But the superstructure consists partly in things, and partly in the style or language. The former require an order of times, and descriptions of places. And because in great and memorable events, we are desirous to know first their causes, then the actions themselves, and lastly their consequences; the historian should take notice of the springs or motives, that occasioned them; and, in mentioning the facts themselves, should not only relate what was done or said, but likewise in what manner; and, in treating upon their consequences, shew if they were the effects of chance, wisdom, or imprudence. Nor should he only recite the actions of great and eminent persons, but likewise describe their characters. The style ought to be fluent, smooth, and even, free from that harshness and poignancy which is usual at the bar." Thus far Cicero. An history written in this manner, and furnished with all these properties, must needs be very entertaining, as well as instructive. And perhaps few have come nearer this plan than Tacitus; though his subject is attended with this unhappy circumstance, or at least unpleasant one, that it affords us examples rather of what we ought to avoid, than what to imitate. But it is the business of the historian, as well as of the philosopher, to represent both virtues and vices in their proper colours; the latter doing it by precepts, and the former by examples. Their manner is different; but the end and design of both is, or should be, the same: And therefore history has not improperly been said by some to be moral philosophy, exemplified in the lives and actions of mankind.

We shall reduce these several things mentioned by Cicero to three heads, Matter, Order, and Style; and treat upon each of them separately. But as Truth is the basis and foundation of all history, it will be necessary to consider that in the first place.

ART. I. *Of Truth in History.*

TRUTH is, as it were, the very life and soul of history, by which it is distinguished from fable or romance. An historian therefore ought not only to be a man of probity, but void of all passion or bias. He must have the steadiness of a philosopher, joined with the vivacity of a poet or orator. Without the former,

he will be insensibly swayed by some passion, to give a false colouring to the actions or characters he describes, as favour or dislike to parties or persons affects his mind. Whereas he ought to be of no party, nor to have either friend or foe while writing; but to preserve himself in a state of the greatest indifference to all, that he may judge of things as they really are in their own nature, and not as connected with this or that person or party. And with this firm and sedate temper, a lively imagination is requisite; without which his descriptions will be flat and cold, nor will he be able to convey to his readers a just and adequate idea of great and generous actions. Nor is the assistance of a good judgment less necessary than any of the former qualities, to direct him what is proper to be said and what to be omitted, and to treat every thing in a manner suitable to its importance. And since these are the qualifications necessary for an historian, it may perhaps seem the less strange, that we have so few good histories.

But historical truth consists of two parts; one is, Not not to say any thing we know to be false: 'Tho' it is not sufficient to excuse an historian in relating a falsehood, that he did not know it was so when he wrote it; unless he first used all the means in his power to inform himself of the truth. For then undoubtedly, an invincible error is as pardonable in history as in morality. But the generality of writers in this kind content themselves with taking their accounts from hearsays, or transcribing them from others; without duly weighing the evidence on which they are founded, or giving themselves the trouble of a strict inquiry. Few will use the diligence necessary to inform themselves of the certainty of what they undertake to relate. And as the want of this greatly abates the pleasure of reading such writers, while persons read with diffidence; so nothing more recommends an historian, than such industry. Thus we are informed of Thucydides, that when he wrote his history of the Peloponnesian war, he did not satisfy himself with the best accounts, he could get from his countrymen the Athenians, fearing they might be partial in their own cause; but spared no expence to inform himself how the same facts were related by their enemies the Lacedæmonians; that, by comparing the relations of both parties, he might better judge of the truth. And Polybius took greater pains than he, in order to write his history of the Roman affairs; for he travelled into Africa, Spain, Gaul, and other parts of the world, that by viewing the several scenes of action, and informing himself from the inhabitants, he might come at a greater certainty of the facts, and represent them in a juster light. But as an historian ought not to assert what he knows to be false; so he should likewise be cautious in relating things which are doubtful, and acquaint his readers with the evidence he goes upon in such facts, from whence they may be able to judge how far it is proper to credit them. So Herodotus tells us what things he saw himself in his travels, and what he heard from the information of the Egyptian priests and others with whom he conversed. And Curtius, in the life of Alexander, speaking of the affairs of India, ingenuously confesses, that he wrote more than he fully believed. "For (says he) I neither dare to affirm positively, what I doubt of; nor can I

think it proper to omit what I have been told." By such a conduct the author secures his credit, whether the things prove really true or false; and gives room for further inquiry, without imposing on his readers.

The other branch of historical truth is, Not to omit any thing that is true, and necessary to set the matter treated of in a clear and full light. In the actions of past ages, or distant countries, wherein the writer has no personal concern, he can have no great inducement to break in upon this rule. But where interest or party is engaged, it requires no small candour, as well as firmness of mind, constantly to adhere to it. Affection to some, aversion to others, fear of disobliging friends or those in power, will often interpose, and try his integrity. Besides, an omission is less obvious to censure, than a false assertion: for the one may be easily ascribed to ignorance or forgetfulness; whereas the other will, if discovered, be commonly looked upon as design. He therefore, who in such circumstances, from a generous love to truth, is superior to all motives to betray or flatter it, justly deserves the character of a brave, as well as honest man. What Polybius says upon this head is very well worth remarking: "A good man ought to love his friends and his country, and to have a like disposition with them, both towards their friends and enemies. But when he takes upon him the character of an historian; they must all be forgot. He must often speak well of his enemies, and commend them when their actions deserve it; and sometimes blame, and even upbraid his greatest friends, when their conduct makes it necessary. Nor must he forbear sometimes to reprove, and at other times to commend, the same persons; since all are liable to mistake in their management, and there are scarce any persons who are always in the wrong. Therefore, in history, all personal considerations should be laid aside, and regard had only to their actions."

What a different view of mankind and their actions should we have, were these rules observed by all historians? Integrity is undoubtedly the principal qualification of an historian; when we can depend upon this, other imperfections are more easily passed over. Suetonius is said to have written the lives of the first twelve Roman emperors with the same freedom wherewith they themselves lived. What better character can be given of a writer? The same ingenuous temper appears in the two Grecian historians above mentioned, Thucydides and Polybius: The former of whom, though banished by his countrymen the Athenians, yet expresses no marks of resentment in his history, either against them in general, or even against the chief authors of it, when he has occasion to mention them; and the latter does not forbear censuring, what he thought blameable in his nearest relations and friends. But it is often no easy matter to know, whether an historian speaks truth or not, and keeps up to the several characters here mentioned; tho' it seems reasonable, upon the common principles of justice due to all mankind, to credit him where no marks of partiality or prejudice appear in his writings. Sometimes, indeed, a judgment may in a good measure be formed of the veracity of an author, from his manner of expressing himself. A certain candour and frankness, that is always uniform and consistent with

itself runs through their writings, who have nothing in view but truth, which may be justly esteemed as a very good evidence of their sincerity. Whereas those, who have partial designs to answer, are commonly more clofe and covert; and if at other times they assume an air of openness and freedom, yet this is not constant and even, but soon followed again with the appearance of some bias and reserve: for it is very difficult to act a part long together, without lying open to a discovery. And therefore though craft and design is exceeding various, and, Proteus like, assumes very different shapes; there are certain characters, by which it may often be perceived and detected. Thus, where things are uncertain by reason of their being reported various ways, it is partiality in an historian to give into the most unfavourable account, where others are as well known and equally credible. Again, it is a proof of the same bad temper, when the facts themselves are certain and evident, but the design and motives of those concerned in them are unknown and obscure, to assign some ill principle, such as avarice, ambition, malice, interest, or any other vicious habit, as the cause of them. This conduct is not only unjust to the persons, whose actions they relate; but hurtful to mankind in general, by endeavouring to destroy the principal motive to virtue, which springs from example. Others, who affect to be more covert, content themselves with suspicions and fly insinuations; and then endeavour to come off, by intimating their unwillingness to believe them, tho' they would have their readers do so. And to mention no more, there are others, who, when they have loaded persons with unjust calumnies and reflections, will allow them some slight commendations, to make what they have said before look more credible, and themselves less partial. But the honest and faithful historian contemns all such low and mean arts; he considers things as they are in themselves, and relates them as he finds them, without prejudice or affection.

ART. II. THE SUBJECT OR ARGUMENT of History.

83
Subject of history.

THE *subject* in general is facts, together with such things as are either connected with them, or may at least be requisite to set them in a just and proper light. But although the principal design of history be to acquaint us with facts, yet all facts do not merit the regard of an historian; but such only as may be thought of use and service for the conduct of human life. Nor is it allowable for him, like the poet, to form the plan and scheme of his work as he pleases. His business is to report things as he finds them, without any colouring or disguise to make them more pleasing and palatable to his reader, which would be to convert his history into a novel. Indeed, some histories afford more pleasure and entertainment than others, from the nature of the things of which they consist; and it may be esteemed the happiness of an historian to meet with such a subject, but it is not his fault if it be otherwise. Thus Herodotus begins his history with shewing, that the barbarians gave the first occasion to the wars between them and the Greeks, and ends it with an account of the punishment which, after some ages, they suffered from the Greeks on that account. Such a relation must not only be very agreeable to his countrymen the Grecians, for whose sakes it was written; but likewise

very instructive, by informing them of the justice of Providence in punishing public injuries in this world, wherein societies, as such, are only capable of punishment. And therefore those examples might be of use to caution them against the like practices. On the contrary, Thucydides begins his history with the unhappy state of his countrymen the Athenians; and in the course of it plainly intimates, that they were the cause of the calamitous war between them and the Lacedemonians. Whereas, had he been more inclined to please and gratify his countrymen, than to write the truth, he might have set things in such a light as to have made their enemies appear the aggressors. But he scorned to court applause at the expense of truth and justice, and has set a noble example of integrity to all future historians. But as all actions do not merit a place in history, it requires no small judgment in an historian to select such only as are proper. Cicero observes very justly, that history "is conversant in great and memorable actions." For this reason, an historian should always keep posterity in view, and relate nothing which may not, upon some account or other, be worth the notice of after-ages. To descend to trivial and minute matters, such as frequently occur in the common affairs of life, is below the dignity of history. Such writers ought rather to be deemed journalists than historians; who have no view or expectation that their works should survive them. But the skilful historian is fired with a more noble ambition. His design is to acquaint succeeding ages with what remarkable occurrences happened in the world before them; to do justice to the memory of great and virtuous men; and at the same time to perpetuate his own. Pliny the younger has some fine reflections upon this head, in a letter to a friend. "You advise me (says he) to write an history; and not you only, for many others have done the same, and I am myself inclined to it. Not that I believe myself qualified for it, which would be rash to think, till I have tried; but because I esteem it a generous action not to suffer those to be forgotten, whose memory ought to be eternized; and to perpetuate the names of others, together with one's own. For there is nothing I am so desirous or ambitious of, as to be remembered hereafter; which is a thing worthy of a man, especially of one who, conscious of no guilt, has nothing to fear from posterity. Therefore I am thinking day and night by what means, as Virgil says,

—My name

To raise aloft;

That would suffice me; for it is above my wish to add with him,

and wing my flight to fame.

But oh!

However, this is enough, and what history alone seems to promise." This was Pliny's opinion, with regard to the use and advantage of history; the subjects of which are generally matters of weight and importance. And therefore, when a prudent historian thinks it convenient to take notice of things in themselves less considerable, he either does it with brevity, or for some apparent reason, or accounts for it by some just apology. So Dion Cassius, when he has mentioned some things of lesser moment in the life of Commodus (as indeed that emperor's life was chiefly filled up with cruelty

Lik. v. ep. 8.

crudely and folly), makes this excuse for himself: "I would not have it thought that I descend below the gravity of history in writing these things. For, as they were the actions of an emperor, and I was present and saw them all, and both heard and conversed with him, I did not think it proper to omit them." He seems to think those actions, when performed by an emperor, might be worth recording, which, if done by a person of inferior rank, would scarce have deserved notice. Nor does he appear to have judged amiss, if we consider what an influence the conduct and behaviour of princes, even in the common circumstances of life, have upon all beneath them; which may sometimes render them not unworthy the regard of an historian, as examples either for imitation, or caution.

But, although facts in general are the proper subject of history, yet they may be differently considered with regard to the extent of them, as they relate either to particular persons, or communities of men. And from this consideration, history has been distinguished into three sorts, viz. *biography*, *particular*, and *general history*. The lives of single persons is called *biography*. By *particular history* is meant that of particular states, whether for a shorter or longer space of time. And *general history* contains an account of several states existing together in the same period of time.

1. The subjects of *biography* are the lives either of public or private persons; for many useful observations in the conduct of human life may be made from just accounts of those who have been eminent and beneficial to the world in either station. Nay, the lives of virtuous persons are not without their use, as warnings to others, by observing the fatal consequences which sooner or later generally follow such practices. But, for those who exposed their lives, or otherwise employed their time and labour for the service of their fellow-creatures, it seems but a just debt that their memories should be perpetuated after them, and posterity acquainted with their benefactors. The expectation of this was no small incentive to virtue in the Pagan world. And perhaps every one, upon due reflection, will be convinced how natural this passion is to mankind in general. And it was for this reason, probably, that Virgil places not only his heroes, but also the inventors of useful arts and sciences, and other persons of distinguished merit, in the Elysian fields, where he thus describes them:

Here patriots live, who, for their country's good,
In fighting fields were prodigal of blood:
Priests of unblemish'd lives here make abode,
And poets worthy their inspiring god;
And teaching wits of more mechanic parts,
Who grac'd their age with new-invented arts;
Those who to worth their bounty did extend,
And those who knew that bounty to commend:
The heads of these with holy fillets bound,
And all their temples were with garlands crown'd.

ÆNEID, l. vi. v. 66.

In the lives of public persons, their public characters are principally, but not solely, to be regarded. The world is inquisitive to know the conduct of princes and other great men, as well in private as public. And both, as has been said, may be of service, considering the influence of their examples. But to be

over-inquisitive in searching into the weaknesses and infirmities of the greatest or best of men, is, to say no more of it, but a needless curiosity. In the writers of this kind, Plutarch is justly allowed to excel.

But it has been a matter of dispute among the learned, whether any one ought to write his own history. It may be pleaded in favour of this, that no one can be so much master of the subject as the person himself: and besides, there are many instances, both ancient and modern, to justify such a conduct. But on the other hand it must be owned, that there are many inconveniences which attend it, some of which are mentioned by Cicero. "If (says he) there is any thing commendable, persons are obliged to speak of themselves with greater modesty, and to omit what is blameable in others. Besides, what is said is not so soon credited, and has less authority; and after all, many will not stick to censure it." And Pliny says very well to the same purpose, "Those who proclaim their own virtues, are thought not so much to proclaim them because they did them, as to have done them that they might proclaim them. So that which would have appeared great if told by another, is lost when related by the party himself. For when men cannot deny the fact, they reflect upon the vanity of its author. Wherefore, if you do things not worth mentioning, the actions themselves are blamed; and if the things you do are commendable, you are blamed for mentioning them." These reflections will be generally allowed to be very just; and yet considering how natural it is for men to love themselves, and to be inclined in their own favour, it seems to be a very difficult task for any one to write an impartial history of his own actions. There is scarce any treatise of this kind that is more celebrated than Cæsar's Commentaries. And yet Suetonius tells us, that "Agnius Pollio (who lived at that time,) thought they were neither written with due care nor integrity: that Cæsar was often too credulous in his accounts of what was done by other persons; and misrepresented his own actions, either designedly, or through forgetfulness: and therefore he supposes he would have revised and corrected them." However, at some times it may doubtless be justifiable for a person to be his own historian. Plutarch mentions two cases wherein it is allowable for a man to commend himself, and be the publisher of his own merits. These are, when the doing of it may be of considerable advantage, either to himself or others. It is indeed less invidious for other persons to undertake the province. And especially for a person to talk or write of his own virtues, at a time when vice and a general corruption of manners prevails, let what he says be ever so true, it will be apt at least to be taken as a reflection upon others. "Anciently (says Tacitus), many wrote their own lives, rather as a testimony of their conduct, than from pride." Upon which he makes this judicious remark: "That the more virtue abounds, the sooner the reports of it are credited." But the ancient writers had a way of taking off the reader's attention from themselves, in recording their own actions, and so rendering what they said less invidious: and that was, by speaking of themselves in the third person, and not in the first. Thus Cæsar never says,

Ad Fem.
lib. v.
cp. 12.

Lib. viii.
cp. 1.

"I did," or "I said, this or that;" but always, "Cæsar did, or said, so and so." Why the moderns have not more chosen to follow them in this, we know not, since it seems less exceptionable.

2. In a continued history of *particular* states, some account may be given of their original, and founders; the nature of their soil, and situation; what advantages they have for their support or improvement, either within themselves, by foreign traffic, or conquests; with the form of their government. Then notice should be taken of the methods by which they increased in wealth or power, till they gradually advanced to their highest pitch of grandeur; whether by their virtue, the goodness of their constitution, trade, industry, wars, or whatever cause. After this the reasons of their declension should be shewn, what were the vices that principally occasioned it, (for that is generally the case), whether avarice, ambition, luxury, discord, cruelty, or several of these in conjunction. And lastly, where that has been their unhappy fate, how they received their final ruin and subversion. Most of these things Livy had in view, when he wrote his history of the Roman state, as he acquaints his readers in the preface. "The accounts (says he) of what happened either before, or while the city was building, consisting rather of poetical fables than any certain records of facts, I shall neither assert nor confute them. Let antiquity be allowed to make the origin of their cities more venerable, by uniting things human and divine. But if any nation may be suffered to fetch their origin from the gods, such is the military glory of the Romans, that when they represent Mars as the father of their founder, other nations may as easily acquiesce in this, as they do in their government. But I lay no great stress upon these things, and others of the like nature, whatever may be thought of them. What I am desirous every one should carefully attend to, are our lives and manners; by what men, and what arts, civil and military, the empire was both acquired and enlarged: then let him observe, how our manners gradually declined under our discipline; afterwards grew worse and worse; and at length so far degenerated, that at present we can neither bear with our vices, nor suffer them to be remedied. This is the chief benefit and advantage to be reaped from history, to fetch instructions from eminent examples of both kinds; in order to imitate the one, which will be of use both to yourself and your country, and avoid the other, which are equally base in their life and event." Thus far Livy. And how well he has executed this design, must be acknowledged by all who will be at the pains to peruse his work.

3. But as a particular history consists in a number of facts relating to the same state, suitably connected and laid together in a proper series; so a *general* history is made up of several particular histories, whose separate transactions within the same period of time, or part of it, should be so distinctly related as to cause no confusion. Such was the history of Diodorus Siculus, which contained an account of most of the eminent states and kingdoms in the world, though far the greatest part of it is now unhappily lost. Of the same nature is the history of Herodotus, though not so extensive; to whom we are especially indebted for the

Perian affairs. And to this kind may likewise be referred Justin's history, though it be only the epitome of a larger work, written by another hand. The rules proper for conducting such histories are much the same as those above mentioned concerning particular histories; excepting what relates to the *order*, of which we shall have occasion to speak hereafter.

But the histories, both of particular states and those which are more general, frequently contain only the affairs of some short period of time. Thus the history of the Peloponnesian war, written by Thucydides, comprises only what was done in the first twenty years of that war, which lasted seven years longer than his account reaches; though indeed the reason of that might be, because Thucydides died before the war was finished, otherwise he would very probably have continued his history to the conclusion of it. But the history of the war between the Romans and king Jugurtha in Africa, given us by Sallust, as also Cæsar's histories of the Gallic and civil wars, are all confined within a much less number of years than that of Thucydides. Nay, sometimes one single transaction is thought sufficient to furnish out an history. Such was the conspiracy of Catiline to subvert the Roman state, written likewise by Sallust. As to more general histories, Xenophon's history of Greece may be esteemed as such, which in order of time succeeds that of Thucydides, and contains the affairs of forty-eight years. And Polybius called his a *general history*; which, though it principally contained the Roman affairs, yet took in the most remarkable transactions of several other states, for the space of fifty-three years: though it has met with the same hard fate as that of Diodorus Siculus, so that only the first five books out of forty, of which it consisted at first, now remain entire. And to mention no more, the celebrated history of Thuanus is another instance of this sort, in which the principal transactions of Europe for about sixty years, chiefly in the sixteenth century, are described with that judgment and fidelity, and in a manner so accurate and beautiful, that he has been thought scarcely inferior to any of the ancient historians. Now, in such histories as these, to go farther back than is requisite to set the subject in a just light, seems as improper as it is unnecessary.

The general subject or argument of history, in its several branches, may be reduced to these four heads; *narration, reflections, speeches, and digressions.*

I. By *narration* is meant a description of facts or of actions, with such things as are necessarily connected with them, namely, persons, time, place, design, and event.

As to *actions* themselves, it is the business of the historian to acquaint his readers with the manner in which they were performed; what measures were concerted on all sides, and how they were conducted, whether with vigilance, courage, prudence, and caution, or the contrary, according to the nature of the action; as likewise, if any unforeseen accidents fell out, by which the designed measures were either promoted or broken. All actions may be referred to two sorts, military and civil. And as war arises from injustice, and injuries received, on one side or the other, it is fit the reader should be informed who were the

the aggressors. For though war is never to be dis-
sisted, yet it is sometimes necessary. In the description
of battles, regard should be had equally to both parties,
the number of forces, conduct of the generals, in
what manner they engaged, what turns and changes
happened in the engagement, either from accidents,
courage, or stratagem, and how it issued. The like
circumstances should all be observed in sieges and other
actions. But the most agreeable scene of history arises
from a state of peace. Here the writer acquaints
us with the constitution of states, the nature of their
laws, the manners and customs of the inhabitants, the
advantages of concord and unanimity, with the dis-
advantages of contention and discord; the invention
of arts and sciences, in what manner they were im-
proved and cultivated, and by whom; with many
other things, both pleasant and profitable in the con-
duct of life.

As to *persons*, the characters of all those should be
described who act any considerable part in an history.
This excites the curiosity of the reader, and makes
him more attentive to what is said of them; as every
one is more inquisitive to hear what relates to others,
in proportion to his knowledge of them. And it will
likewise be of use to observe, how their actions agree
with their characters, and what were the effects of
their different qualifications and abilities.

The circumstances of *time* and *place* are carefully to
be regarded by an historian, without which his ac-
counts of facts will be frequently very lame and im-
perfect. And therefore chronology and geography
seem not improperly to have been called the *two eyes*
of history. Besides, they very much assist the memory.
For it is much easier to remember any thing said to
be done at such a time, and in such a place, than if
only related in general. Nay, the remembrance of
these often recalls those things to mind, which other-
wise had been obliterated. By time is meant not
only the year of any particular æra or period; but
likewise the season, as summer or winter; and the
age of particular persons. For it is oftentimes from
hence that we are principally enabled to make a just
estimate of facts. Thus Cicero commends Pompey for
undertaking and finishing the Piratic war at a season of
the year when other generals would not have thought
it safe to venture out at sea. This double danger, as
well from the weather as the enemy, considering the
necessity of the case, heightens the glory of the ac-
tion; since to have done the same thing in summer,
would not have been an equal proof of the courage
and intrepidity of the general. And there is nothing
more surprising in the conquests of Alexander, than
that he should subdue so large a part of the world by
that time he was little more than thirty years old; an
age at which few other generals have been much dis-
tinguished. Had we not known this, a considerable
part of his character had been lost.

The like advantages arise from the other circum-
stances of place. And therefore, in marches, battles,
and other military actions, the historian should take
notice of the nature of the country, the passes, rivers,
distances of places, situation of the armies, and strength
of the towns, either by nature or art; from which
the reader may the better form a judgment of the dif-
ficulties and greatness of any enterprise. Cæsar is ge-

nerally very particular in these things, and seems to
have thought it highly requisite in order to give his
readers a just idea of his actions. The descriptions of
countries, cities, and rivers, are likewise both useful
and pleasant; and help us to judge of the probability
of what is related concerning the temper and genius
of the inhabitants, their arts, traffic, wealth, power,
or whatever else is remarkable among them.

But an accurate historian goes yet further, and con-
siders the *causes* of actions, and what were the *designs*
and views of those persons who were principally con-
cerned in them. Some, as Polybius has well observed,
are apt to confound the beginnings of actions with
their springs and causes, which ought to be carefully
separated. For the causes are often very remote, and
to be looked for at a considerable distance from the ac-
tions themselves. Thus, as he tells us, some have re-
presented Hannibal's besieging Saguntum in Spain,
and passing the Ebro, contrary to a former agreement
between the Romans and Carthaginians, as causes of
the second Punic war. But these were only the begin-
nings of it. The true causes were the jealousies and
fears of the Carthaginians from the growing power of
the Romans; and Hannibal's inveterate hatred to them,
with which he had been impregnated from his infancy.
For his father, whom he succeeded in the command of
the Carthaginian army, had obliged him, when but nine
years old, to take a most solemn oath upon an altar never
to be reconciled to the Romans: and therefore he was
no sooner at the head of the army, than he took the
first opportunity to break with them. Again, the true
springs and causes of action are to be distinguished
from such as are only feigned and pretended. For gene-
rally the worse designs men have in view, the more soli-
citous they are to cover them with specious pretences.
It is the historian's business, therefore, to lay open,
and expose to view, these arts of politicians. So, as
the same judicious historian remarks, we are not to
imagine Alexander's carrying over his army into Asia
to have been the cause of the war between him and the
Persians. That had its being long before. The Gre-
cians had formerly two armies in Asia, one under Xe-
nophon, and the other commanded by Agésilas. Now
the Asiatics did not venture to oppose or molest either
of these armies in their march. This made king Phi-
lip, Alexander's father, who was an ambitious prince,
and aspired after universal monarchy, think it might
be a practicable thing to make a conquest of Asia. Ac-
cordingly, he kept it in his view, and made prepara-
tions for it; but did not live to execute it. That was
left for his son. But as king Philip could not have
done this, without first bringing the other states of
Greece into it, his pretence to them was only to avenge
the injuries they had all suffered from the Persians;
though the real design was an universal government,
both over them and the Persians, as appeared after-
wards by the event. But in order to our being well
assured of a person's real designs, and to make the ac-
counts of them more credible, it is proper we should
be acquainted with his disposition, manners, way of
life, virtues, or vices; that by comparing his actions
with these, we may see how far they agree and suit
each other. For this reason Sallust is so particular in
his description of Catiline, and Livy of Hannibal; by
which it appears credible, that the one was capable of
entering.

entering into such a conspiracy against his country, and the other of performing such great things as are related concerning him. But if the causes of actions lie in the dark and unknown, a prudent historian will not trouble himself, or his readers, with vain and trifling conjectures, unless something very probable offers itself.

Lastly, an historian should relate the *issue* and *event* of the actions he describes. This is undoubtedly the most useful part of history; since the greatest advantage arising from it is to teach us experience, from what has happened in the world before us. When we learn from the examples of others the happy effects of wisdom, prudence, integrity, and other virtues, it naturally excites us to an imitation of them, and to pursue the same measures in our own conduct. And, on the contrary, by perceiving the unhappy consequences which have followed from violence, deceit, rashness, or the like vices, we are deterred from such practices. But since the wisest and most prudent measures do not always meet with the desired success, and many cross accidents may happen to frustrate the best concerted designs; when we meet with instances of this nature, it prepares us for the like events, and keeps us from too great a confidence in our own schemes. However, as this is not commonly the case, but in the ordinary course of human affairs like causes usually produce like effects; the numerous examples of the happy consequences of virtue and wisdom, recorded in history, are sufficient to determine us in the choice of our measures, and to encourage us to hope for an answerable success, though we cannot be certain we shall in no instance meet with a disappointment. And therefore Polybius very justly observes, that "he who takes from history the causes, manner, and end of actions, and omits to take notice whether the event was answerable to the means made use of, leaves nothing in it but a bare amusement, without any benefit or instruction." These then are the several things necessary to be attended to in historical narrations, but the proper disposition of them must be left to the skill and prudence of the writer.

II. *Reflections* made by the writer. Some have condemned these, as having a tendency to bias the reader; who should be left to draw such conclusions from the accounts of facts, as he sees proper. But since all readers are not capable of doing this for themselves, what disadvantage is it for the author to suggest to them such observations as may assist them to make the best use of what they read? And if the philosopher is allowed to draw such inferences from his precepts, as he thinks just and proper; why has not the historian an equal right to make reflections upon the facts he relates? The reader is equally at liberty to judge for himself in both cases, without danger of being prejudiced. And therefore we find, that the best historians have allowed themselves this liberty. It would be easy to prove this by a large number of instances, but one or two may here suffice. When Salust has given a very distinct account of the designs of Catiline, and of the whole scheme of the conspiracy, he concludes it with this reflection: "All that time the empire of the Romans seems to me to have been in a very unhappy state. For when they had extended their conquests through the

whole world from east to west, and enjoyed both peace and plenty, which mankind esteem their greatest happiness; some persons were obstinately bent upon their own ruin, and that of their country. For notwithstanding two decrees were published by the senate, not one out of so great a multitude was prevailed with, by the rewards that were offered, either to discover the conspiracy, or to leave the army of Catiline. So desperate a disease, and as it were infection, had seized the minds of most people!" And it is a very handsome observation that Livy makes upon the ill conduct of Hannibal in quartering his army in Capua after the battle of Cannæ; by which means they lost their martial vigour through luxury and ease. "Those (says he), who are skilled in military affairs reckon this a greater fault in the general, than his not marching his army immediately to Rome after his victory at Cannæ; for such a delay might have seemed only to defer the victory, but this ill step deprived him of the power to gain it." The modesty of the historian in this passage is worth remarking, in that he does not represent this as his own private opinion, and by that means undertake to censure the conduct of so great a general as Hannibal was; but as the sense of those who were skilled in such affairs. However, an historian should be brief in his remarks; and consider, that altho' he does not exceed his province, by applauding virtue, expressing a just indignation against vice, and interposing his judgment upon the nature and consequences of the facts he relates; yet there ought to be a difference between his reflections, and the encomiums or declamations of an orator.

III. *Speeches* inserted by historians. These are of two sorts, oblique and direct. The former are such, as the historian recites in his own person, and not in that of the speaker. Of this kind is that of Hannibal in Justin; by which he endeavours to persuade king Antiochus to carry the seat of the war against the Romans into Italy. It runs thus: "Having desired liberty to speak, (he said,) none of the present counsels and designs pleased him; nor did he approve of Greece for the seat of the war, which might be managed in Italy to greater advantage: because it was impossible to conquer the Romans but by their own arms, or to subdue Italy but by its own forces; since both the nature of those men, and of that war, was different from all others. In other wars, it was of great importance to gain an advantage of place or time, to ravage the countries and plunder the towns; but tho' you gain some advantage over the Romans, or defeat them, you must still fight with them when beaten. Wherefore, should any one engage with them in Italy, it was possible for him to conquer them by their own power, strength, and arms, as he himself had done. But should he attempt it out of Italy, the source of their power, he would be as much deceived, as if he endeavoured to alter the course of a river, not at the fountain-head, but where its streams were largest and deepest. This was his judgment in private, and what he had offered as his advice, and now repeated in the presence of his friends; that all might know, in what manner a war ought to be carried on against the Romans, who were invincible abroad, but might be conquered at home. For they might sooner be driven out of their city than their empire, and from Italy than their

Composi-
tion of
History.

c. 5.

their provinces; having been taken by the Gauls, and almost subdued by himself. That he was never defeated, till he withdrew out of their country; but upon his return to Carthage, the fortune of the war was changed with the place." He seems to intimate by this speech, that the Romans were like some fierce and impetuous animals, which are no otherwise to be subdued than by wounding them in some vital part. In speeches related after this manner, we are not necessarily to suppose the historian gives us the very words in which they were at first delivered, but only the sense. But, in direct speeches, the person himself is introduced as addressing his audience; and therefore, the words, as well as the sense, are to be suited to his character. Such is the speech of Eumenes, one of Alexander's captains and successors, made to his soldiers when they had traitorously bound him in chains, in order to deliver him up to his enemy Antigonus, as we have it in the same writer. "You see, soldiers, (says he), the habit and ornaments of your general, which have not been put upon me by mine enemies; that would afford me some comfort: it is by you, that of a conqueror I am become conquered, and of a general a captive; though you have sworn to be faithful to me four times within the space of a year. But I omit that, since reflections do not become persons in calamity. One thing I intreat, that, if Antigonus must have my life, you would let me die among you. For it no way concerns him, how, or where I suffer, and I shall escape an ignominious death. If you grant me this, I free you from your oath, with which you have been so often engaged to me. Or, if shame restrains you from offering violence to me at my request, give me a sword, and suffer your general to do that for you without the obligation of an oath, which you have sworn to do for your general."

Lib. xiv.
c. 4.

But this likewise is a matter in which critics have been divided in their sentiments; whether any, or what kind, of speeches ought to be allowed in history. Some have thought all speeches should be excluded. And the reason given for that opinion is this; that it breaks the thread of the discourse, and interrupts the reader, when he is desirous to come to the end of an action, and know how it issued. This is true indeed, when speeches are either very long, or too frequent; but otherwise they are not only entertaining, but likewise instructive. For it is of service to know the springs and reasons of actions; and these are frequently opened and explained in the speeches of those by whom they were performed. Others therefore have not been against all speeches in general, but only direct ones. And this was the opinion of Probus Pompeius, as Justin informs us; though he did not think fit to follow him in that opinion, when he abridged him, as we have seen already by the speech of king Eumenes. The reason offered against direct speeches is, because they are not true, and truth is the foundation of all history, from which it never ought to depart. Such speeches, therefore, are said to weaken the credit of the writer; since he, who will tell us, that another person spoke such things, which he does not know that he ever did speak, and in such language as he could not use, may take the same liberty in representing his actions. Thus, for example, when Livy gives us the speeches of Romulus, the Sabine women, Brutus, and others, in the

VOL. V.

first ages of the Roman state, both the things themselves are imaginary, and the language wholly disagreeable to the times in which those persons lived. Accordingly we find, that when several historians relate some particular speech of the same person, they widely differ both in the subject-matter and expressions. So the speech of Veturia, by which the dissuaded her son Coriolanus from besieging Rome when he came against it with an army of Volscians to avenge the injuries he had received, is very differently related by Livy, Dionysius of Halicarnassus, and Plutarch. Such fictitious speeches therefore are judged more fit for poets, who are allowed a greater liberty to indulge their fancy than historians. And if any direct speeches are to be inserted, they should be such only as were really spoken by the persons to whom they are ascribed, where any such have been preserved. These have been the sentiments of some critics, both ancient and modern. However, there is scarce an ancient historian now extant, either Greek or Latin, who has not some speeches, more or less, in his works; and those not only oblique, but also direct. They seem to have thought it a necessary ornament to their writings; and even where the true speeches might be come at, have chosen rather to give them in their own words, in order, probably, to preserve an equality in the style. Since therefore the best and most faithful historians have generally taken this liberty, we are to distinguish between their accounts of facts, and their speeches. In the former, where nothing appears to the contrary, we are to suppose they adhere to truth, according to the best information they could get; but in the latter, that their view is only to acquaint us with the causes and springs of actions, which they chose to do in the form of speeches, as a method most ornamental to the work, and entertaining to the reader: Though the best historians are cautious of inserting speeches, but where they are very proper, and upon some solemn and weighty occasions. Thucydides is said to have been the first who brought complete and finished speeches into history, those of Herodotus being but short and imperfect. And tho' Dionysius of Halicarnassus, in his censure upon Thucydides, seems then to have disliked that part of his conduct; yet he afterwards thought fit to imitate it in his *Antiquities of Rome*, where we find many, not only oblique, but also direct, speeches.

What has been said of speeches, may likewise be understood of letters, which we sometimes meet with in histories; as that of Alexander to Darius in Q. Curtius, those of Tiberius and Drusus in Tacitus, and many others. Some letters are wholly fictitious; and in others perhaps the historian represents the substance of what was really said, but gives it his own dress. Thus we find, that short letter of Lentulus to Catiline, at the time of his conspiracy, differently related by Cicero and Sallust. The reason of which seems to be this: That as Cicero recited it publicly to the people of Rome, in his third oration against Catiline, it is reasonable to imagine, he did it in the very words of the letter, which he had by him; whereas Sallust, as an historian, might think it sufficient to give the sense of it in his own words.

IV. *Digressions.* These, if rightly managed, afford the reader both delight and profit. Like speeches, they should neither be too long nor frequent; lest they in-

History.

terrupt the course of the history, and divert the reader from the main design of the work. But now and then to introduce a beautiful description, or some remarkable incident, which may give light to the subject, is so far from an interruption, that it is rather a relief to the reader, and excites him to go on with greater pleasure and attention. See further on this head, ORATORY, n° 37.

ART. III. OF ORDER.

88
Of order.

SINCE most histories consist of an introduction and the body of the work, in each of which some order is requisite, we shall speak to them separately.

1. The design of the introduction is the same here as in orations. For the historian proposes three things by his introduction, which may be called its parts; to give his reader some general view of the subject, to engage his attention, and to possess him with a candid opinion of himself and his performance. Some have thought this last unnecessary for an historian. But if we consider how differently mankind are apt to judge of the same persons and actions, it seems as requisite for an historian to be well esteemed as an orator. And therefore we find some of the best historians have not omitted this part. Livy's introduction has been very much applauded by the learned, as a master-piece in its kind. It begins with an account of his design. "Whether (says he) it may answer any valuable end for me to write the history of the Roman affairs from the beginning of the city, I neither am certain, nor, if I was, should I venture to declare it." Soon after he endeavours to prepare the reader's attention, by representing the grandeur and usefulness of the subject in the following words: "Either I am prejudiced in favour of my subject, or there never was any state greater, more virtuous, and fruitful of good examples, or in which avarice and luxury had a later admittance, or poverty and thriftiness were either more highly or longer esteemed, they always coveting less, the less they enjoyed." And then he presently proceeds to ingratiate himself with his readers, and gain their favourable opinion: "Although my name is obscure in so great a number of writers, yet it is a comfort, that they cloud it by their fame and character. But I shall gain this advantage by my labour, that I shall be diverted for a time from the prospect of those evils which the age has seen for so many years; while my mind is wholly intent upon former times, free from all that care which gives the writer an uneasiness, though it cannot bias him against the truth." In this passage we see he endeavours to gain the good esteem of his readers from two very powerful motives, modesty, and a strict regard to truth. It may scarce seem necessary to observe, that those introductions are esteemed the best which are most natural; that is, such as are taken from the subject-matter of the history itself, and closely connected with it. Such are those of Herodotus, Thucydides, Livy, Tacitus, and others. And therefore Sallust is greatly blamed by Quintilian on the account of his introductions, which are so general, that they might suit other histories as well as those to which they are prefixed. Introductions should likewise be proportioned to the length of the work. We meet with some few histories, in which the writers immediately enter upon their subject, without any intro-

Composi-
tion of
History.

duction; as Xenophon in his Expedition of the younger Cyrus, and Cæsar in his Commentaries of the Gallic and Civil Wars. But the latter does not profess to write a just history; and therefore left himself more at liberty, as well in this respect as in some others.

2. But order is principally to be regarded in the body of the work. And this may be managed two ways; either by attending to the time in a chronological series, or the different nature and circumstances of the things contained in the history. However, as these two methods do not equally suit all subjects, we shall a little consider to what kind of histories each of them seems more properly adapted. All history then, as we have observed already, may be reduced to three sorts; *biography, the history of particular states, and the general history of several states* existing at the same time.

In biography, or the lives of particular persons, most writers follow the order of time; though some reduce them to certain general heads, as their virtues and vices, or their public and private character. Plutarch and Cornelius Nepos have taken the former method, and Suetonius the latter.

As to the history of particular states, the order of time is generally best, as being most natural and easy. And therefore it has usually been observed by the best historians, as Thucydides, Livy, and others. Tacitus, indeed, wrote two distinct works; one of which he called *Annals*, and the other *Histories*. And, as in both he has kept to the order of time, critics have been at a loss to assign any other reason for these different titles, unless that in the former work he confines himself more closely to the facts themselves, and does not treat so largely upon the causes, manner, or event of them, as he has done in the latter. And even in the circumstances of facts, there is a certain order proper to be observed, for rendering the account more plain and intelligible. Thus, for instance, in the description of a battle or siege, the time should first be known, then the chief person or persons who conducted it, then the number of forces and other requisites, afterwards the nature of the place, then the action itself, and lastly the event. But sometimes it is necessary to add the time in which several of the other circumstances happened, especially in actions of any considerable length. Where the order of these circumstances is confused, it perplexes the account, and renders it both less entertaining to the reader, and more difficult to remember.

In a general history, the order of time cannot always be preserved; though, where the actions of different communities have respect to one as the principal, they should all, as far as possible, be referred to the transactions of that state. But even here the several affairs of those different states ought to be related separately, which will necessarily occasion the anticipating some things, and postponing others, so that they cannot all stand in the order of time in which they were performed. However, Velleius Paterculus says very justly with regard to this subject, That "every entire action, placed together in one view, is much better apprehended than if divided by different times." In this case, therefore, for better preserving the chronology, it is usual with historians, when they have finished any particular narrative, in passing to the
next,

Composition of History.

Composition of History.

Gell. Lib. xi. c. 8.

next, to express the time by some short and plain transition; and sometimes to apologize for themselves, by assigning the reasons of their conduct. So Polybius, whose history is of this kind, says concerning himself: "As in writing the actions of each year, in the order of time, I endeavour to represent the affairs of the same nation together in one summary view, it is plain that inconvenience must of course attend this way of writing." Curtius professes only to write the actions of Alexander king of Macedon; but his history contains in it the principal affairs of the greatest states in the world during that period. Now although, in the course of those transactions, the war between Archelaus governor of Macedonia, and Agis king of Sparta, happened before the battle of Alexander at Arbela; yet the historian not only relates that battle first, but carries on the account of Alexander's affairs in Asia to the death of Darius without interruption; for which he gives this reason: "If I should relate the affairs of Alexander, which happened in the mean time, either in Greece, or Illyrium and Thrace, each in their proper order and time, I must interrupt the affairs of Asia; which it is much better to represent together in one continued series as they fell out, to the flight and death of Darius." Such anachronisms, therefore, are nothing more than what necessarily arise sometimes from the nature of the subject: As every thing, the more complex it is, and contains under it a greater number of parts, is more difficult to be digested in a regular order. But in an history composed of several states, whose affairs are independent of one another, the actions of each nation must necessarily be separated, in order to represent them in a just view, and prevent confusion. This is the method which Herodotus has taken, as likewise Diodorus Siculus and Justin. Now both the pleasure and benefit which such histories afford, arise from observing the conduct of each state separately in the course of their affairs, and then comparing one with the other. And as the order of time must frequently be interrupted, it is not unusual to continue the chronology at proper distances in relating the affairs of each nation; which preserves an unity in the whole, and connects it in one consistent body.

The division of histories into books was designed only for the better distinction of the subject and ease of the reader. And the dividing these books again into chapters, is rather a practice of later editors, (founded, as they have thought, on the same reasons), than countenanced by the example of ancient writers.

ART. IV. OF STYLE.

AN historical style is said to be of a middle nature, between that of a poet and an orator, differing from both not only in the ornamental parts, but likewise in the common idioms and forms of expression.

Cicero observes, that "nothing is more agreeable in history than brevity of expression, joined with purity and perspicuity." Purity indeed is not peculiar to history, but yet it is absolutely necessary. For no one will ever think him fit to write an history who is not master of the language in which he writes. And therefore, when Albinus had written an history of the Roman affairs in Greek, and apologized for any slips or improprieties that might be found in the language

upon the account of his being a Roman, Cato called him a trifler, for choosing to do that which, after he had done it, he was obliged to ask pardon for doing. Nor is perspicuity less requisite in an historical style. The nature of the subject plainly directs to this. For as history consists principally in narration, clearness and perspicuity is nowhere more necessary than in a relation of facts. But these two properties are to be accompanied with brevity, since nothing is more disagreeable than a long and tedious narrative. And in this respect an historical style differs both from that of poetry and oratory. For the poet frequently heightens and enlarges his descriptions of facts, by dwelling upon every circumstance, placing it in different views, and embellishing it with the finest ornaments of wit and language, to render his images more agreeable. And the orator often does the like, with a design to strike the passions. But such colouring is not the business of an historian, who aims at nothing more than a just and faithful representation of what he relates, in a way best suited to its nature, and in such language as is most proper to set it in a plain and easy light.

Again, Cicero, treating of an historical style, says: "It ought to be fluent, smooth, and even, free from that harshness and poignancy which is usual at the bar." The properties here mentioned distinguish this style from that of judicial discourses, in which the orator often finds it necessary to vary his manner of speaking, in order to answer different views, either of pursuing an argument, pressing an adversary, addressing a judge, or recommending the merits of his cause. This occasions an inequality in his style, while he speaks sometimes directly, at other times by way of question, and intermixes short and concise expressions with round and flowing periods. But the historian has no necessity for such variations in his style. It is his province to espouse no party, to have neither friend nor foe, but to appear wholly disinterested and indifferent to all; and therefore his language should be smooth and equal in his relations of persons and their actions.

But further: Dionysius makes "decency a principal virtue in an historian;" which he explains by saying, that "he ought to preserve the characters of the persons, and dignity of the actions of which he treats." And to do this it seems necessary that an historical style should be animated with a good degree of life and vigour; without which neither the characters of eminent persons, nor their remarkable actions, which make up the main business of history, can be duly represented. For even things in themselves great and excellent, if related in a cold and lifeless manner, often do not affect us in a degree suitable to their dignity and importance. And this seems particularly necessary in speeches, in order to represent what every one says, according to his different country, age, temper, and station of life, in the same manner we may suppose he either really did, or would have spoken himself on that occasion. Besides, there are some scenes of action which require very pathetic and moving language, to represent them agreeably to their nature. And, in descriptions, the most beautiful tropes and lively figures are often necessary to set the ideas of things in a proper light. From whence it appears,

Lib. v. init.

Epist. ad Cn. Pompeium.

Composi-
tion of
History.

that painting and imagery make up no small part of the historian's province, though his colours are not so strong and glittering as those either of the poet or orator. He ought, therefore, to be well acquainted with the manners of men and the nature of the passions, since he is often obliged to describe both; in the former of which Herodotus excels, and Thucydides in the latter, as Dionysius has observed.

Now from these several properties laid down by ancient writers, as requisite for an historical style, it seems upon the whole to agree best with the middle character. And this will further appear, by what they say relating to the ornamental parts of style; namely, composition and dignity. As to the former of these, which respects the structure of sentences, and the several parts of them, Demetrius remarks, that, "An historical period ought neither to rise very high, nor sink very low, but to preserve a medium." This simplicity, (he says,) "becomes the gravity and credit of history; and distinguishes it from oratory on the one hand, and dialogue on the other." His meaning is, that historical periods should neither be so full and sonorous, as is frequent in oratory; nor yet so short and flat, as in dialogue: the former of which, as he says, require a strong voice to pronounce them; and the latter have scarce the appearance of periods. So that, according to this judicious writer, the periods best suited for history are those which, being of a moderate length, will admit of a just rise and cadency, and may be pronounced with ease. And Dionysius tells us, that "History should flow smooth and even, every where consistent with itself, without roughness or chafms in the sound." This relates to the harmony of periods, which arises from such a position of the words as renders the sound pleasant and agreeable, and, as he thinks, ought to be attended to in history. And as to dignity, which respects the use of tropes and figures, the same author says, that "History should be embellished with such figures, as are neither vehement, nor carry in them the appearance of art." This is agreeable to what Cicero observes, in comparing Xenophon and Calisthenes, two Greek historians. "Xenophon the Socratic, (says he,) was the

first philosopher, and after him Calisthenes the scholar of Aristotle, who wrote an history; the latter almost like a rhetorician; but the style of the former is more moderate, and has not the force of an orator, less vehement perhaps, but in my opinion more sweet and pleasant." The difference between these two writers, with regard to their style, consisted chiefly in the choice of their figures, which in Xenophon were more gentle and moderate, and therefore in the judgment of Cicero more agreeable to history. Now these several properties relating to the ornaments of language, as well as those before mentioned, which by ancient writers have been thought requisite for history, are all suited to the middle style, as we have elsewhere shewn at large. See ORATORY, n^o 99—21.

But notwithstanding this general account of the several properties which constitute an historical style, it admits of considerable varieties from the different nature and dignity of the subject. The lives of particular persons do not require that strength and majesty of expression, nor all those ornaments of language, as an history of the Roman empire. And accordingly we find the style of Nepos and Suetonius very different from that of Livy. The former is smooth and easy, scarce rising above the low character; but the latter often approaches near to the sublime. And other historians again have kept a medium between these. Upon the whole, therefore, we may conclude, that the middle style is the proper character for history, tho' historians may sometimes sink into the low character, and at other times rise to the grandeur and magnificence of the sublime, from the different nature of their subject, or some particular parts of it. For that is to be esteemed the proper character of any writing, which in the general best suits it. And this distinction may help us in some measure to reconcile the sentiments of writers upon this head who seem to attribute different characters to an historical style, or at least to judge where the truth lies; since a variety of style is not only requisite in different subjects, but likewise in different parts of the same work.

for a great pile of dry bones in the town, 28 feet long, six broad, and eight high. E. Long. 1. 7. N. Lat. 51. 6.

HIVE, in country affairs, a convenient receptacle for bees. See APIS.

HIVING of Bees. See APIS.

HOACHE, in natural history, a kind of earth approaching to the nature of chalk, but harder, and feeling like soap; whence some think that it is either the same with the soap-rock of Cornwall, or very like it. The Chinese dissolve it in water, till the liquor is of the consistence of cream, and then varnish their China-ware with it.

HOADLEY (Benjamin), successively bishop of Bangor, Hereford, Salisbury, and Winchester, was born in 1676. His first preferment in the church was the rectory of St Peter le Poor, and the leasehold of St Mildred's in the Poultry. In the year 1706, he published some *Remarks* on the late bishop Atterbury's sermon

Histrio
||
Hithe.

Hoadley.

sermon at the funeral of Mr Bennet, in which Dr Atterbury had, in the opinion of Mr Hoadley, laid down some dangerous propositions. Two years after, Mr Hoadley again entered the lists against this formidable antagonist; and in his *exceptions* against a sermon published by Dr Atterbury, intitled "The Power of Charity to cover Sin," he attacked the doctor with his usual strength of reasoning, and dispassionate inquiry.—In 1709, another dispute arose between these two learned combatants, concerning the doctrine of non-resistance, occasioned by a performance of Mr Hoadley's, intitled "The Measures of Obedience;" some positions in which, Dr Atterbury endeavoured to confute in his elegant Latin sermon, preached that year before the London clergy. In this debate Mr Hoadley signalized himself in so eminent a degree, that the honourable house of commons gave him a particular mark of their regard, by representing, in an address to the queen, the signal services he had done to the cause of civil and religious liberty.—The principles, however, which he espoused being repugnant to the general temper of those times, drew on him the virulence of a party; yet it was at this period (1710, when, as he himself expressed it, *stary seemed to be let loose upon him*), that the late Mrs Howland presented him to the rectory of Streatham in Surry, unasked, unapplied to, and without his either having seen her or been seen by her. Soon after the accession of king George I. Mr Hoadley was consecrated to the see of Bangor; and 1717 having broached some opinions concerning the nature of Christ's kingdom, &c. he again became the object of popular clamour. At this juncture he was distinguished by another particular mark of the royal regard, by means of which the convocation was successively prorogued, and it was not permitted to sit, nor do any business, till that resentment was entirely subsided. In 1721, he was translated to Hereford; and from thence, in 1723, to Salisbury. In 1734, he was translated to Winchester (on the demise of Dr Willis), and published his *Plain Account of the Sacrament*: a performance which served as a butt for his adversaries to shoot at, yet impartially owns it to be clear, rational, and manly, wrote with great candour and judgment, and suited to the capacity of every serious and considerate inquirer after truth.—His later days were embittered by a most vile instance of fraud and ingratitude. The bishop took a French priest, who pretended to abjure his religion, under his protection, with no other recommendation than that of his necessities; in return for which act of humanity, the priest found an opportunity of getting the bishop's name wrote by his own hand, and causing a note of some thousand pounds to be placed before it, offered it in payment. But the bishop denying it to be his, it was brought before a court of justice, and was there found to be a gross imposition. The ungrateful villain had now recourse to a pamphlet, in which he charged the bishop with being a drunkard, and alleged that he had the note of him when he was in liquor. To this calumny the bishop made a full and nervous answer; in which he exposed the man's falsehood, and solemnly averred that he was never drunk in his whole life. The world with becoming ardour embraced his defence, and he had the happiness to find himself perfectly acquitted even of any

suspicion of such a charge. As a writer, he possessed uncommon abilities. His sermons (published in 1754 and 1755) are esteemed inferior to few writings in the English language, for plainness and perspicuity, energy, and strength of reasoning, and a free and masterly manner. In private life, he was naturally facetious, easy, and complying, fond of company, yet would frequently leave it for the purposes of study or devotion. He was every where happy; and particularly in his own family, where he took all opportunities of instructing by his influence and example. He died in 1761, aged 83. Besides the works already mentioned, he wrote, 1. *Terms of Acceptance*, 8vo. 2. *Reasonableness of Conformity*. 3. *On the Sacrament*.—His tracts and pamphlets are extremely numerous; and the reader may see a complete catalogue of them in his life inserted in the supplement to the *Biographia Britannica*.

HOADLEY (Benjamin), M. D. son of the former, was born in 1706, and studied at Bennet college Cambridge, under the tuition of Dr Herring afterwards archbishop of Canterbury. He took his degree in physic; and particularly applying himself to mathematical and philosophical studies, was, when very young, admitted a member of the royal society. He was made regifter of Hereford, while his father filled that see, and was early appointed physician to his majesty's household, but died at his house in Chelsea in 1757. He wrote, 1. *Three Letters on the organs of respiration*, 4to. 2. *The Suspicious Husband*, a comedy. 3. *Observations on a series of electrical experiments*; and, 4. *Oratio anniverfaria, in Theatro Col. Med. Londin. ex Harveii instituto habita die*, Oârob. 1742.

HOAR-HOUND, in botany. See *MARUBIUM*.

HOARSENESS, in medicine, a diminution of the voice, commonly attended with a preternatural asperity and roughness thereof. The parts affected are the *aspera arteria* and larynx. For its causes and cure, see (the *Index* subjoined to) *MEDICINE*.

HOBBS (Thomas), a famous writer, born at Malmfury in 1588, was the son of a clergyman. He completed his studies at Oxford, and was afterwards governor to the eldest son of William Cavendish earl of Devonshire. He travelled through France and Italy with that young nobleman, and at length applied himself entirely to the study of polite literature. He translated *Thucydides* into English; and published his translation in 1628, in order to shew his countrymen, from the Athenian history, the disorders and confusions of a democratical government. In 1626, his patron the earl of Devonshire died; and in 1628, his son died also: which loss affected Mr Hobbes to such a degree, that he very willingly accepted an offer made him of going abroad a second time with the son of Sir Gervase Clifton; whom he accordingly accompanied into France, and staid there some time. But, while he continued there, he was solicited to return to England, and to resume his concern for the hopes of that family to whom he had attached himself so early, and to which he owed so many and so great obligations.

In 1631, the countess dowager of Devonshire desired to put the young earl under his care, who was then about the age of 13. This was very suitable to Mr

Hoadley

Hobbes.

Hobbes. Mr Hobbes's inclinations, who discharged that trust with great fidelity and diligence. In 1634, he republished his translation of Thucydides, and prefixed to it a dedication to that young nobleman, in which he gives a large character of his father, and represents in the strongest terms the obligations he was under to that illustrious family. The same year he accompanied his noble pupil to Paris, where he applied his vacant hours to the study of natural philosophy, and more especially to the perfect understanding of mechanism, and the causes of animal motion. He had frequent conversations upon these subjects with father Marin Merfenne; a man deservedly famous, and who kept up a correspondence with almost all the learned in Europe. From Paris he attended his pupil into Italy, where at Pisa he became known to that great astronomer Galileo Galilei, who communicated to him his notions very freely; and after having seen all that was remarkable in that country, he returned with the earl of Devonshire into England; afterwards, foreseeing the civil wars, he went to seek a retreat at Paris, where, by the good offices of his friend father Merfenne, he became known to the famous Renatus des Cartes, and afterwards held a correspondence with him upon several mathematical subjects, as appears from the letters of Mr Hobbes published in the works of Des Cartes. But when this philosopher printed afterwards his Meditations, wherein he attempted to establish points of the highest consequence from innate ideas, Mr Hobbes took the liberty of dissenting from him; as did also the French king's mathematical professor, the illustrious Peter Gassendi, with whom Mr Hobbes contracted a very close friendship, which was not interrupted till the death of the former. In 1642, Mr Hobbes printed a few copies of his famous book *De Cive*, which, in proportion as it became known, raised him many adversaries, who charged him with infilling principles which had a dangerous tendency.

Among many illustrious persons who, upon shipwreck of the royal cause, retired to France for safety, was Sir Charles Cavendish, brother to the duke of Newcastle: and this gentleman, being skilled in every branch of the mathematics, proved a constant friend and patron to Mr Hobbes; who, by embarking in 1645 in a controversy about squaring the circle, was grown so famous for it, that in 1647 he was recommended to instruct Charles prince of Wales, afterwards king Char. II. in that kind of learning. His care in the discharge of this office gained him the esteem of that prince in a very high degree: and though he afterwards withdrew his public favour to Mr Hobbes on account of his writings, yet he always retained a sense of the services he had done him; shewed him various marks of his favour after he was restored to his dominions; and, as some say, had his picture hanging in his closet. This year also was printed in Holland, by the care of M. Sorbier, a second and more complete edition of his book *De Cive*; to which are prefixed two Latin letters to the editor, the one by Mr Gassendi, the other by father Merfenne, in commendation of it: and in 1650 was published at London a small treatise of Mr Hobbes's, intitled, "Human Nature;" and another, "*De corpore politico*, or of the elements of the law."

All this time Mr Hobbes had been digesting with great care and pains his religious, political, and moral

principles, into a complete system, which he called the *Leviathan*, and which was printed in English at London in 1650 and 1651. After the publication of his *Leviathan* he returned to England, and passed the summer commonly at his patron the earl of Devonshire's seat in Derbyshire, and some of his winters in town, where he had for his intimate friends some of the greatest men of the age.

In 1660, upon the restoration, he quitted the country, and came up to London, where he obtained from the king assurance of protection, and had an annual pension of L. 100 settled upon him out of the privy purse. Yet this did not render him entirely safe: for, in 1666, his *Leviathan* and his treatise *De Cive* were censured by parliament, which alarmed him very much; as did also the bringing in of a bill into the house of commons to punish atheism and profaneness. When this storm was a little blown over, he began to think of procuring a beautiful edition of his pieces, that were in Latin; but finding this impracticable in England, he caused it to be undertaken abroad, where they were published in quarto in 1668, from the press of John Bleau. In 1669, he was visited by Cosmo de Medicis, then prince, afterwards duke of Tuscany, who gave him ample marks of his esteem and respect; and having received his picture, and a complete collection of his writings, caused them to be deposited, the former among his curiosities, the latter in his noble library at Florence. The like visits he received from foreign ambassadors and other strangers of distinction; who were curious to see a person whose singular opinions and numerous writings had made so much noise all over Europe. In 1672, he wrote his own life in Latin verse, when, as he observes, he had completed his 84th year: and, in 1674, he published in English verse four books of Homer's *Odyssey*, which was so well received, that it encouraged him to undertake the whole *Iliad* and *Odyssey*, which he likewise performed and published in 1675. About this time, he took his leave of London, and went to spend the remainder of his days in Derbyshire; where, however, he did not remain inactive, notwithstanding his advanced age; but published from time to time several pieces, to be found in the collection of his work. He died in 1679, aged 92.

As to his character and manners, they are thus described by Dr White Kennet, in his *Memoirs of the Cavendish family*. "The earl of Devonshire (says he) for his whole life entertained Mr Hobbes in his family, as his old tutor, rather than as his friend or confidant. He let him live under his roof in ease and plenty, and in his own way, without making use of him in any public, or so much as domestic affairs. He would often express an abhorrence of some of his principles in policy and religion; and both he and his lady would frequently put off the mention of his name, and say, 'He was a humourist, and nobody could account for him.' There is a tradition in the family, of the manners and customs of Mr Hobbes, somewhat observable. His professed rule of health was to dedicate the morning to his exercise, and the afternoon to his studies. And therefore, at his first rising, he walked out, and climbed any hill within his reach; or if the weather was not dry, he fatigued himself within doors by some exercise or other, to be in a sweat: recommending

mending that practice upon this opinion, that an old man had more moisture than heat, and therefore by such motion heat was to be acquired and moisture expelled. After this, he took a comfortable breakfast; and then went round the lodgings to wait upon the earl, the countess, and the children, and any considerable strangers, paying some short addresses to all of them. He kept these rounds till about 12 o'clock, when he had a little dinner provided for him, which he eat always by himself without ceremony. Soon after dinner he retired to his study, and had his candle with 10 or 12 pipes of tobacco laid by him; then shutting his door, he fell to smoking, thinking, and writing, for several hours. He retained a friend or two at court, and especially the lord Arlington, to protect him if occasion should require. He used to say, that it was lawful to make use of ill instruments to do ourselves good: 'If I were calf (says he) into a deep pit, and the devil should put down his cloven foot, I would take hold of it to be drawn out by it.' After the restoration, he watched all opportunities to ingratiate himself with the king and his prime ministers; and looked upon his pension to be more valuable, as an earnest of favour and protection, than upon any other account. His future course of life was to be free from danger. He could not endure to be left in an empty house. Whenever the earl removed, he would go along with him, even to his last stage, from Chatsworth to Hardwick. When he was in a very weak condition, he dared not be left behind, but made his way upon a feather-bed in a coach, though he furvied the journey but a few days. He could not bear any discourse of death, and seemed to cast off all thoughts of it: he delighted to reckon upon longer life. The winter before he died, he made a warm coat, which he said must last him three years, and then he would have such another. In his last sickness his frequent questions were, Whether his disease was curable? and when intimations were given, that he might have ease, but no remedy, he used this expression, 'I shall be glad to find a hole to creep out of the world at;' which are reported to have been his last sensible words; and his lying some days following in a silent stupefaction, did seem owing to his mind more than to his body."

The reverend Mr Granger observes, that Hobbes's style is incomparably better than that of any other writer in the reign of Charles I. and was for its uncommon strength and purity scarcely equalled in the succeeding reign. "He has in translation (says he) done Thucydides as much justice as he has done injury to Homer; but he looked upon himself as born for much greater things than treading in the steps of his predecessors. He was for striking out new paths in science, government, and religion; and for removing the land-marks of former ages. His ethics have a strong tendency to corrupt our morals, and his politics to destroy that liberty which is the birthright of every human creature. He is commonly represented as a sceptic in religion, and a dogmatist in philosophy; but he was a dogmatist in both. The main principles of his Leviathan are as little founded in moral or evangelical truths, as the rules he has laid down for squaring the circle are in mathematical demonstration. His book on human nature is esteemed the best of his works."

HOBBY, the name of a hawk called by some authors *subbuteo*. See FALCO.

It is a hawk of the lure, and not of the fist; and is very like the faker, only much less. It makes excellent sport with net and spaniels; for when the birds see the hobby, they dare not commit themselves to the wing, but lie close to the ground, and so are taken in nets.

HODY (Humphy), a learned English divine, was born in 1659. At 21 years of age, he published his celebrated *Dissertation against Aristoteli's history of the 70 interpreters*; which was received with great applause by all the learned, Isaac Vossius excepted, who could not bear to have his opinions opposed by such a youth. Twenty years after, he treated the subject more fully in his *De Bibliorum textibus originalibus, versionibus Græcis & Latina vulgata, libri IV.* In 1689, he wrote the *Prologomena* to John Melala's Chronicle, printed at Oxford; and the year after was made chaplain to Dr Stillingfleet, bishop of Worcester. The deprivation of the nonjuring bishops engaged him in a controversy with Mr Dodwell; which recommended him to archbishop Tillotson, to whom, and his successor Dr Tenison, he was domestic chaplain. In 1698, he was made regius professor of the Greek tongue at Oxford, and archdeacon of Oxford in 1704. On occasion of the controversy about the convocation, he in 1701 published *A history of English councils and convocations, and of the clergy's sitting in parliament, &c.* He died in 1706, leaving in MS. *An account of those learned Grecians who retired to Italy on the taking of Constantinople, &c.* which was published in 1742 by Dr Jebb.

HOE, in country affairs, a tool made like a cooper's adze, to cut up weeds in gardens, &c. This tool is commonly called the *hand hoe*.

HOEING, according to Tull, is the breaking and dividing the soil by tillage, whilst the corn and other plants are growing thereon.—It differs from common tillage (which is always performed before the corn or plants are sown or planted), in the time of performing it, and it is much more beneficial to the crops than any other tillage. See AGRICULTURE, n° 171—175.

HOEMATOPUS, in ornithology, a genus of birds, of the order of grallæ. It has a long compressed bill, with the end cuneated; the nostrils are linear, and the feet have only three toes. There is but one species, the ostralegus, sea-pie, or oyster-catcher. They are very common on most of our coasts, feeding on marine insects, oysters, limpets, &c. Their bills, which are compressed sideways, and end obtusely, are very fit instruments to insinuate between the limpet and the rock to which these shells adhere; which they do with great dexterity, to get at the fish. On the coast of France, where the tides recede so far as to leave the beds of oysters bare, these birds feed on them, forcing the shells open with their bills. They keep in summer-time in pairs, laying their eggs on the bare ground: they lay four of a whitish-brown hue, thinly spotted and striped with black; and when any one approaches their young, they make a loud and shrill noise. In winter, they assemble in vast flocks, and are very wild. The head, neck, scapulars, and coverts of the wings, of this bird are of a fine black;

Hoffman

Hogarth.

in some the neck is marked with white; the wings dusky, with a broad transverse band of white; the bill three inches long, and of a rich orange colour.

HOFFMAN, the name of several eminent physicians; of whom Maurice Hoffman, and John Maurice Hoffman his son, practised at Altorf. Maurice died in 1698, leaving behind him many works; and was succeeded by his son John Maurice, who wrote as well as his father, and died in 1727, highly esteemed by the faculty.—Frederic Hoffman, probably of the same family, was born at Magdeburg in 1660. The principal known circumstances of his life are, his journey into Holland and England, where he became intimately acquainted with Paul Herman, and Robert Boyle; never taking any fees, being supported by his annual stipend; his curing the emperor Charles VI. and Frederic I. king of Prussia of inveterate diseases; to which may be added, his accurate knowledge of the nature and virtues of mineral waters. He survived his 80th year; and his works, which are in great esteem, were printed in six volumes folio at Geneva, in 1740.

HOG, in zoology. See *Sus*.

Hog's *Dung* is, by Mortimer, reckoned one of the richest manures we are acquainted with, and the next in value to sheep's dung, and is found to be equal in virtue to twice the quantity of any other dung except this. The ancients seem to have been displeased with it, on account of its breeding weeds; but this is only accusing it of being too rich, for any dung will do this when laid too thick. It is an excellent manure for pasture-grounds, and excels all other kinds of dung for trees. The farmers who use this kind of dung for their lands, generally take care to save it, by well-paving the flies; and increase the quantity by throwing in bean-stalks, stubble, and many other things of a like nature: and, by good management of this kind, many farmers have procured 50 or 60 loads of excellent manure a-year out of a small flye. The very best way of using this dung is, by mixing it with horse-dung; and for this reason, it is best to have the flye near the stable, that the two cleanings may be mixed in one heap, and used together.

They have in many parts of Staffordshire a poor, light, shallow land, on which they sow a kind of white pea: the land is neither able to bear this nor any thing else to advantage for their reaping; but, when the peas are ripe, they turn in as many hogs as the quantity of peas will fatten, suffering them to live at large, and to remain there day and night: in consequence of this, the land will produce good crops of hay for several years afterwards; or, if too poor for that, it will at worst raise grass enough to make it good pasture-ground.

HOGARTH (William), an excellent moral painter, was born in London, in the parish of St Bartholomew. His father, being poor, put him apprentice to an engraver of pewter-pots, and in this humble situation he passed through his time, without seeming to have any higher views. His apprenticeship was however no sooner expired, than he pursued every method of improving himself in the art of drawing, of which his former master had given him but a rude idea. This ambition was productive of distress; and while

Hogarth.

he spent his time in preparing for his future excellence, he felt all the contempt that indigence could produce. Being one day arrested by his landlady for the trifling sum of 20 shillings, and being bailed by one of his friends; in order to be revenged on her, he drew her picture in caricatura, and in that single figure gave marks of the dawn of a superior genius. The first piece in which he distinguished himself as a painter, was in the figures of the Wandsworth assembly; which are drawn from the life, without any circumstances of his burlesque manner. His next piece was his Pool of Bethesda, which he presented to St Bartholomew's hospital. His being afterwards employed to draw designs for a new edition of Hudibras, proved the first opportunity of signaling himself in that style. The Harlot's Progress was the first of his burlesque pictures, or rather life-pictures; for it is unjust to give them the character either of burlesque or grotesque pieces, since both the one and the other convey to us a departure from nature, to which Hogarth almost always strictly adhered. The ingenious Abbé du Bos has often complained, that no history-painter of his time went through a series of actions, and thus, like an historian, painted the successive fortunes of an hero from the cradle to the grave. What du Bos wished to see done, Hogarth performed. In the above piece, he launches out his young adventurer a simple girl upon the town, and conducts her through all the vicissitudes of wretchedness, to a premature death. This was painting to the reason and to the heart; none had ever before made the art subservient to the purposes of morality and instruction: a book like this is fitted to every soil and every observer, and he that runs may read. The Rake's Progress succeeded the former; which, though not equal to it, came short only of that single excellence, in which no other could come near him in that way. It consists of eight prints; and, like the former, it exhibits a complete history adapted to answer the most moral purposes: as is also his marriage A-la-mode, in six prints; and The Effects of Idleness and Industry, exemplified in the conduct of two fellow-apprentices, in 12 prints, &c.—Mr Hogarth travelled with several of his companions to Paris; but had no sooner landed at Calais, than, attempting to draw the gate of that city, he was taken into custody, on suspicion of his being a spy. He was soon let at liberty: but the resentment he felt on this occasion, induced him to design the satirical print called *the Gate of Calais*; and he never after drew a Frenchman but in caricatura. The last remarkable circumstance of his life was his contest with Mr Churchill. It is said that both met at Westminster-hall; Hogarth to take by his eye a ridiculous likeness of the poet, and Churchill to furnish a description of the painter. But Hogarth's print of the poet was not much esteemed, and the poet's letter to him was but little admired. Some pretend, indeed, to say that it broke the painter's heart; but this we can from good authority say is not true. Indeed the report falls of itself; for we may as well say, that Hogarth's pencil was as efficacious as the poet's pen, since neither long survived the contest.

The following character of this artist is given by Mr Gilpin in his *Essay on Prints*. "The works of this

this

Hogarth. this matter abound in true humour; and satire, which is generally well-directed: they are admirable moral lessons, and a fund of entertainment suited to every taste; a circumstance, which shews them to be just copies of nature. We may consider them too as valuable repositories of the manners, customs, and dresses of the present age. What a fund of entertainment would a collection of this kind afford, drawn from every period of the history of Britain?—How far the works of Hogarth will bear a *critical examination*, may be the subject of a little more inquiry.

“In *design*, Hogarth was seldom at a loss. His invention was fertile; and his judgment accurate. An improper incident is rarely introduced; a proper one rarely omitted. No one could tell a story better; or make it, in all its circumstances, more intelligible. His genius, however, it must be owned, was suited only to *low* or *familiar* subjects. It never soared above *common* life: to subjects naturally sublime, or which, from antiquity or other accidents, borrowed dignity, he could not rise.

“In *composition* we see little in him to admire. In many of his prints the deficiency is so great, as plainly to imply a want of all principle; which makes us ready to believe, that when we do meet with a beautiful group, it is the effect of chance. In one of his minor works, the *Idle Prentice*, we seldom see a crowd more beautifully managed than in the last print. If the sheriff's officers had not been placed in a line, and had been brought a little lower in the picture, so as to have formed a pyramid with the cart, the composition had been unexceptionable; and yet the first print of this work is such a striking instance of disagreeable composition, that it is amazing how an artist who had any idea of beautiful forms, could suffer so unmasterly a performance to leave his hands.

“Of the *distribution of light* Hogarth had as little knowledge as of *composition*. In some of his pieces we see a good effect; as in the *Execution* just mentioned: in which, if the figures at the right and left corners had been *kept down* a little, the light would have been beautifully distributed on the fore-ground, and a fine secondary light spread over part of the crowd. But at the same time there is so obvious a deficiency in point of effect, in most of his prints, that it is very evident he had no principles.

“Neither was Hogarth a master in *drawing*. Of the muscles and anatomy of the head and hands he had perfect knowledge; but his trunks are often badly moulded, and his limbs ill set on: yet his figures, upon the whole, are inspired with so much life and meaning, that the eye is kept in good-humour, in spite of its inclination to find fault.

“The author of the *Analysis of beauty*, it might be supposed, would have given us more instances of *grace* than we find in the works of Hogarth; which shews strongly, that theory and practice are not always united. Many opportunities his subjects naturally afford of introducing graceful attitudes; and yet we have very few examples of them. With instances of picturesque grace his works abound.

“Of his *expression*, in which the force of his genius lay, we cannot speak in terms too high. In every mode of it he was truly excellent. The passions he thoroughly understood; and all the effects which they

produce in every part of the human frame: he had the happy art also of conveying his ideas with the same precision with which he conceived them.—He was excellent too in expressing any humorous oddity which we often see stamped upon the human face. All his heads are cast in the very mould of nature. Hence that endless variety, which is displayed through his works; and hence it is, that the difference arises between his heads, and the affected caricatures of those masters who have sometimes amused themselves with patching together an assemblage of features from their own ideas. Such are Spaniolet's; which, though admirably executed, appear plainly to have no archetypes in nature. Hogarth's, on the other hand, are collections of natural curiosities. The *Oxford-heads*, the *Physician's-arms*, and some of his other pieces, are expressly of this humorous kind. They are truly comic, though ill-natured effusions of mirth: more entertaining than Spaniolet's, as they are pure nature; but less innocent, as they contain ill-directed ridicule.—But the species of expression in which this master perhaps most excels, is that happy art of catching those peculiarities of art and gesture which the ridiculous part of every profession contract, and which for that reason become characteristic of the whole. His counsellors, his undertakers, his lawyers, his usurers, are all conspicuous at sight. In a word, almost every profession may see in his works, that particular species of affectation which they should most endeavour to avoid.

“The *execution* of this master is well suited to his subjects, and manner of treating them. He etches with great spirit, and never gives one unnecessary stroke.”

HOGSHEAD, in commerce, a measure of capacity containing 63 gallons.

HOGUE, a town and cape on the north-west point of Normandy in France; near which admiral Rook burnt the French admiral's ship called the *Rising Sun*, with 12 more large men of war, the day after the victory obtained by admiral Russell near Cherbourg, in May 1692. W. Long. 2. 0. N. Lat. 49. 50.

HOKE-TIDE, a solemn festival celebrated for many ages in England, in memory of the great slaughter of the Danes in the time of king Ethelred, they having been in that reign almost all destroyed in one day in the different parts of the kingdom, and that principally by the women. This is still kept up in some counties, and the women bear the principal sway in it, stopping all passengers with ropes and chains, and exacting some small matter to make merry with.

HOLBEIN (Hans), a celebrated painter, born at Basil in Switzerland in 1498, learned the rudiments of his art from his father, who was a painter; but soon shewed his superior genius. In the town-house of Basil he painted our Saviour's Passion; and in the fish-market of the same city, Death's dance, and a dance of peasants, which were extremely admired; and Erasmus was so pleased with them, that he desired him to draw his picture, and was ever after his friend. He staid some years longer at Basil, till his necessities, occasioned by his own extravagance and an increasing family, made him comply with Erasmus's persuasions to go to England. In his journey he staid some days at Strasburg, where it is said he applied to

Hogarth
Holbein.

Holbein.

a very great painter for work, who took him in, and ordered him to give a specimen of his skill. On which Holbein finished a piece with great care, and painted a fly on the most eminent part of it; after which he privately withdrew in the absence of his master, and pursued his journey, without saying any thing to any body. When the painter returned home, he was astonished at the beauty and elegance of the drawing; and especially at the fly, which he at first took for a real one, and endeavoured to remove it with his hand. He now sent all over the city for his journeyman; but after many inquiries, discovered that he had been thus deceived by the famous Holbein.

Holbein having in a manner begged his way to England, presented a letter of recommendation from Erasmus to Sir Thomas More, and also shewed him Erasmus's picture. Sir Thomas, who was then lord-chancellor, received him with all the joy imaginable, and kept him in his house between two and three years, in which time he drew Sir Thomas's picture, and those of many of his relations and friends. Holbein one day happening to mention a nobleman who had some years before invited him to England, Sir Thomas was very solicitous to know who it was. Holbein said that he had forgot his title, but remembered his face so well, that he believed he could draw his likeness; which he did so perfectly, that the nobleman it is said was immediately known by it. The chancellor having now adorned his apartments with the productions of this great painter, resolved to introduce him to Henry VIII. For this purpose, he invited that prince to an entertainment; having, before he came, hung up all Holbein's pieces in the great hall, in the best order, and placed in the best light. The king, on his first entrance into this room, was so charmed with the sight, that he asked whether such an artist was now alive, and to be had for money? Upon this, Sir Thomas presented Holbein to his majesty; who immediately took him into his service, and brought him into great esteem with the nobility and gentry; by which means he drew a vast number of portraits.

But while he was here, there happened an affair which might have proved fatal to him, had he not been protected by the king. On the report of this painter's character, a lord of the first quality came to see him, when he was drawing a figure after the life. Holbein sent to desire his lordship to defer the honour of his visit to another day; which the nobleman taking for an affront, broke open the door, and very rudely went up stairs. Holbein hearing a noise, came out of his chamber, and meeting the lord at his door, fell into a violent passion, and pushed him backwards from the top of the stairs to the bottom. However, immediately reflecting on what he had done, he escaped from the tumult he had raised, and made the best of his way to the king. The nobleman, much hurt, though not so much as he pretended, was there soon after him; and upon opening his grievance, the king ordered Holbein to ask his pardon. But this only irritated the nobleman the more, who would not be satisfied with less than his life; upon which the king sternly replied, "My lord, you have not now to do with Holbein, but with me; whatever punishment you may contrive by way of revenge against him, shall certainly be inflicted on yourself. Remember,

"pray, my lord, that I can, whenever I please, make "seven lords of seven ploughmen, but I cannot make "one Holbein of even seven lords." Holbein died of the plague at his lodgings at Whitehall, in 1554. "It is amazing (says De Piles), that a man born in "Switzerland, and who had never been in Italy, "should have so good a *gusto*, and so fine a genius for "painting." He painted alike in every manner; in fresco, in water-colours, in oil, and in miniature. His genius was sufficiently shewn in the historical style, by two celebrated compositions which he painted in the hall of the Stillyard company. He was also eminent for a rich vein of invention, which he shewed in a multitude of designs which he drew for engravers, statuaries, jewellers, &c. and he had this singularity, that he painted with his left-hand.

HOLCUS, INDIAN MILLET or CORN; a genus of the monœcia order, belonging to the polygamia class of plants.

Species. Of this genus there are ten species, two of which are natives of Britain. The most remarkable of these is the lanatus, or creeping soft-grass of Hudson; for the description and properties of which, see AGRICULTURE, n° 57. The most remarkable of the foreign species is the forghum, or Guinea-corn. The stalks are large, compact, and full eight feet high. In Senegal the fields are entirely covered with it. The negroes, who call it *guarnot*, cover the ears when ripe with its own leaves to shelter it from the sparrows, which are very mischievous in that country. The grain made into bread, or otherwise used, is esteemed very wholesome. With this the slaves in the West Indies are generally fed, each being allowed from a pint to a quart every day. The juice of the stalks is so agreeably luscious, that, if prepared as the sugar-canes, they would afford an excellent sugar. The negroes on the coast of Guinea make of two kinds of millet a thick-grained pap called *couscous*, which is their common food.

HOLD, the whole interior cavity or belly of a ship, or all that part of her inside which is comprehended between the floor and the lower-deck throughout her whole length.—This capacious apartment usually contains the ballast, provisions, and stores of a ship of war, and the principal part of the cargo in a merchantman. The disposition of these articles with regard to each other, naturally falls under consideration in the article STOWAGE; it suffices in this place to say, that the places where the ballast, water, provisions, and liquors are stowed, are known by the general name of the *hold*. The several store-rooms are separated from each other by *bulk-heads*, and are denominated according to the articles which they contain, the *fail room*, the *bread-room*, the *fish-room*, the *spirit-room*, &c.

HOLDERNESS, a peninsula in the east-riding of Yorkshire, having the German sea on the east, and the Humber on the south. It has the title of an earldom.

HOLERACEÆ (from *holus*, "pot-herbs"). The name of the 12th order in Linneus's fragments of a natural method, consisting of plants which are used for the table, and enter into the economy of domestic affairs. See BOTANY, p. 1307.

HOLIBUT, in ichthyology. See PLEURONECTES.
HOLIDAY (Dr Barten), a learned divine and poet,

Holcus

Holiday.

Holiness

Holland.

Holland.

poet, was the son of a taylor in Oxford, and born there about the year 1593. He studied at Christ-church college, and in 1615 took orders. He was before admired for his skill in poetry and oratory; and now distinguishing himself by his eloquence and popularity as a preacher, he had two benefices conferred on him in the diocese of Oxford. In 1618, he went as chaplain to Sir Francis Stewart, when he accompanied count Gondomare to Spain. Afterwards he became chaplain to the king, and before the year 1626 was promoted to the archdeaconry of Oxford. In 1642 he was made doctor of divinity at Oxford; near which place he sheltered himself during the time of the rebellion; but after the restoration returned to his archdeaconry, where he died in 1661. His works are, 1. Twenty sermons, published at different times. 2. *Philosophie politico-barbara specimen*, quarto. 3. Survey of the world, a poem in ten books, octavo. 4. A translation of the satires of Juvenal and Persius. 5. Technogamia, or the marriage of the arts, a comedy.

HOLINESS, or SANCTITY; the quality which constitutes or denominates a person or thing *holy*; i. e. pure, or exempt from sin. The word is also used in respect of persons and things that are sacred, i. e. set apart to the service of God, and the uses of religion.

HOLINESS, is also a title or quality attributed to the pope; as that of *majesty* is to kings. Even kings, when writing to the pope, address him under the venerable appellation of *Your Holiness*, or *Holy Father*; in Latin, *Sanctissime* or *Beatissime Pater*. Anciently the same title was given to all bishops. The Greek emperors also were addressed under the title of *Holiness*, in regard of their being anointed with holy oil at their coronation. De Cange adds, that some of the kings of England have had the same attribute; and that the orientals have frequently refused it to the pope.

HOLINSHED (Raphael), an English historian famous for the *Chronicles* under his name, was descended from a family that lived at Bosely in Cheshire; but neither the time of his birth, nor scarcely any circumstances of his life are known. However, he appears to have been a man of considerable learning, and to have had a genius particularly adapted for history. His *Chronicles of England, Scotland, and Ireland*, were first published at London in 1570, in 2 vols folio; and then in 1587, in 3 vols. In this second edition several sheets in the 2d and 3d vols were caltreated for containing some passages disagreeable to queen Elizabeth and her ministers; but the caltreatments have since been printed apart. Holinshed was not the sole compiler of this work, being assisted in it by several other hands. The time of his death is unknown; but from his will, which is prefixed to Hearne's edition of *Cambden's Annals*, it appears to have happened between 1578 and 1582.

HOLLAND (Philemond), M. D. commonly called the *Translator general of his age*, was educated in the university of Cambridge. He was for many years a schoolmaster at Coventry, where he also practised physic. He translated Livy, Pliny's Natural History, Plutarch's Morals, Suetonius, Ammianus Marcellinus, Xenophon's Cyropædia, and Cambden's Britannia, into English; and the geographical part of Speed's Theatre of Great Britain, into Latin. The Britannia, to which he made many useful additions, was the

most valuable of his works. It is surprising, that a man of two professions could find time to translate so much; but it appears from the date of the Cyropædia, that he continued to translate till he was 80 years of age. He died in 1636, aged 85. He made the following epigram upon writing a large folio with a single pen:

With one sole pen I wrote this book,
Made of a grey goose quill;
A pen it was when it I took,
And a pen I leave it still.

HOLLAND, the largest of the seven United Provinces, divided into South and North Holland, the latter of which is also called *West Friesland*, is bounded on the west by the German ocean, or north sea; to the east by the Zuyder-see, the province of Utrecht, and part of Gelderland; to the south by Dutch Brabant and Zealand; and to the north by the Zuyder-see. Its greatest extent from north to south, including the island of Texel, is about 90 English miles; but from east to west its extent varies from 40 to 25. To defend it against the sea, dykes have been erected at an immense expence, and innumerable canals cut to drain it, as being naturally very low and marshy. Some parts of the province are very fruitful in corn; but the greater part consists of rich pastures, wherein are kept large herds of kine, which supply them with incredible quantities of butter and cheese. Of the latter, that of Edam, in North Holland, is highly esteemed. The many rivers and canals that intersect the province are of great advantage to its commerce, but contribute to render the air foggy and unwholesome. There is a communication by water betwixt almost every town and village. Towards the middle also of the province are great numbers of turf pits. It is so populous, that the number of the inhabitants is computed at 1,200,000. In point of cleanliness, no country surpasses, and few come up to it, especially in North Holland, and that even in the villages. From the counts of Holland this province devolved, in 1436, to the dukes of Burgundy, and from them to the house of Austria, along with the other provinces. The States of Holland and West Friesland are composed of the nobility and deputies of the towns: of the latter there are 18 that send deputies to the assembly of the states, which is held at the Hague. The grand pensionary is a person of great dignity and weight in this assembly, and his office requires extraordinary abilities. There are also two councils composed of deputies, one for South, and another for North Holland, who have the cognizance of the revenue and military affairs. The whole province sends one deputy from among the noblesse to the states-general, who takes precedence of all others, together with three or four more. There are two supreme courts of judicature for Holland and Zealand; viz. the great council of Holland and Zealand, and the hof or court of Holland. To these appeals lie from the towns; but the causes of noblemen come before them in the first instance. With respect to the ecclesiastical government, there is a synod held annually both in South and North Holland, of which the former contains eleven classes, and the latter six; and the ministers of both together amount to 331. In the whole province are 37 towns, 8 boroughs, and 400 villages.

HOLLAND, one of the divisions of Lincolnshire in

Holland.

England. It so much resembles the province of that name upon the continent, in most respects, being low and marshy, with the sea on one side, and canals running through it, that it must either have had its name from thence, or on the same account. On the east it has what the ancient geographers call *Æstuarium Mediaris*, now the Waddes, which are overflowed at high water, and part of Cambridgeshire on the south. The lower part of it is full of bogs and marshes, and has huge banks to defend it against the sea and land floods. The whole division seems to have been gained from the sea. The ground is so soft, that horses are worked unshod; and it produces plenty of grass, but little corn. Though there are no stones to be found in or upon the ground, yet the churches are all of stone. They have no fresh water but from the clouds, which is preserved in pits: but if these are deep, it soon turns brackish; and if they are shallow, they soon become dry.

New HOLLAND, the largest island in the world, reaching from 10 to 44 deg. S. lat. and between 110 and 154 of E. long. east from London. It received its name from having been chiefly explored by Dutch navigators. The land first discovered in those parts was called *Eendracht* (Concord) Land, from the name of the ship on board which the discovery was made, in 1616; 24 deg. and 25 deg. south. In 1618, another part of this coast, nearly in 15 deg. south, was discovered by Zeachen, who gave it the name of *Arnhems* and *Diemen*; though a different part from what afterwards received the name of Diemen's Land from Tasman, which is the southern extremity, in latitude 43 deg. In 1619, Jan Van Edels gave his name to a southern part of New-Holland. Another part, situated between 30 and 33 deg. received the name of *Leuven*. Peter Van Nuytz gave his name, in 1627, to a coast which communicates to Leuven's Land towards the westward; and a part of the western coast, near the tropic of Capricorn, bore the name of *De Wits*. In 1628, Peter Carpenter, a Dutchman, discovered the great gulph of Carpentaria, between 10 and 20 deg. south. In 1687, Dampier, an Englishman, sailed from Timor, and coasted the western parts of New-Holland. In 1699, he left England, with a design to explore this country, as the Dutch suppressed whatever discoveries had been made by them. He sailed along the western coast of it, from 28 to 15 deg. He saw the land of *Eendracht* and of *De Wit*. He then returned to Timor: from whence he went out again, examined the isles of Papua, coasted New-Guinea, discovered the passage that bears his name; called a great island which forms this passage, or strait, on the east side, *New-Britain*; and sailed back to Timor along New-Guinea. This is the same Dampier who, between 1683 and 1691, sailed round the world by changing his ships. This immense island, which many late writers have styled a continent from its extent, which is more than equal to the habitable parts of the continent of Europe, has been explored on the eastern coast with great perseverance and peril by captain Cook, in the Endeavour bark, 1770, to which he gave the name of *New South Wales*. Captain Furneaux, in the Adventure, attempted to discover the connection which Van Diemen's land bears to New-Holland; but the tempestuous weather which he had to contend with baffled

Holland.

all his attempts, and he was forced (not possessing the same ardour as his leader) to leave that point in the same indeterminate state as Tasman had before transmitted it. As this coast was explored to a very great extent, without much time being spent on any part of the country, or any friendly intercourse being established with the inhabitants, we shall follow the ship in its progress along the eastern coast, after describing the country and its inhabitants as fully as the lights which are thrown upon them will enable us.

This country is not mountainous; but chiefly consists of valleys and plains, rather barren than fruitful. The face of the country is much the best to the southward, the trees being taller, and the herbage richer; but no underwood was seen any where. The whole eastern coast is well watered by brooks and springs, but there are no great rivers. There are but two sorts of timber-trees, the gum-tree, and a kind of pine. Here is the palm-tree of three sorts. Though this country affords very few esculent plants, yet it abounds with such as gratify the curiosity of the naturalist. Here is an animal resembling a polecat, which the natives call *quill*; the back is brown, spotted with white, and the belly unmixt white. Here are many kinds of bats; also gulls, flags, so-called geese or gannets of two sorts, boobies, noddies, curlews, ducks, pelicans of an enormous size, among the water-fowl; crows, parrots, paroquets, cockatoos, and other birds of the same kind, of exquisite beauty, pigeons, doves, quails, butards, herons, cranes, hawks, and eagles, among the land-birds. Here are serpents, some of which are venomous, others harmless; scorpions, centipedes, and lizards. The most remarkable insect found in this country is the ant, of which there are several sorts. One is green, and builds its nest upon trees: These wonderful insects form their nests by bending down several leaves, each of which is as broad as a man's hands, and gluing the points of them together, so as to form a purse. The viscus used for this purpose is an animal-juice which nature has enabled them to elaborate. Thousands of these busy insects were seen uniting all their strength to hold the leaves in this position, while other busy multitudes were employed within, in applying the gluten that was to prevent their returning back. "To satisfy ourselves, (says captain Cook), that the leaves were bent and held down by the effort of these diminutive artificers, we disturbed them in their work; and as soon as they were driven from their station, the leaves on which they were employed sprung up with a force much greater than we could have thought them able to conquer by any combination of their strength. But tho' we gratified our curiosity at their expence, the injury did not go unrevenged; for thousands immediately threw themselves upon us, and gave us intolerable pain with their stings, especially those which took possession of our necks and our hair, from whence they were not easily driven. The sting was scarcely less painful than that of a bee; but except it was repeated, the pain did not last more than a minute." Another kind burrows in the root of a plant which grows on the bark of trees, in the manner of mistletoe. This root is commonly as big as a large turnip; when cut, it appears intersected by innumerable winding passages,

Holland.

ges, all filled with these animals; but notwithstanding, the vegetation of the plant suffers no injury. The insects are very small, not more than half as big as the common red ant in England. Their stings give no pain; but, by running about on the hands, and such parts of the body where they light, produce a titillation more intolerable than pain, if not excruciating. There is still another fort, possessing no power of tormenting; they resemble the white ants of the East-Indies. These construct nests on the branches of trees, three or four times as big as a man's head: the materials of these houses seem to be formed of small parts of vegetables kneaded together with a glutinous matter, with which nature has probably furnished them. Upon breaking the outside crust of this dwelling, innumerable cells, swarming with inhabitants, appear in a great variety of winding directions, all communicating with each other, and with several apertures that lead to other nests upon the same tree. They have also another house built upon the ground, generally at the root of a tree: it is formed like an irregularly sided cone; and sometimes is more than six feet high, and nearly as much in diameter. The outside of these is of well-tempered clay, about two inches thick; and within are the cells, which have no opening outward. Between these two dwellings, one of which is their summer and the other their winter residence, there is a communication by a large avenue, or covered way, leading to the ground, and by a subterranean passage. The structures on the ground are proof against any wet that can fall, which those on the trees are not, from the nature and thinness of their crust or wall.—The fish here are of kinds unknown to Europe, except the mullet, and some of the shell-fish. Upon the shoals and reef are great quantities of the finest green turtle in the world, and oysters of various kinds, particularly the rock-oyster and the pearl-oyster. In the rivers and salt creeks are alligators.

This extensive country appears to be very thinly inhabited: the natives never appeared in larger companies than thirty together. The inland parts are most probably quite uninhabited, as no part of the coast which was visited had any appearance of cultivation, and the miserable natives drew their subsistence from the sea. The only tribe with which any intercourse was established, consisted of twenty-one persons; twelve men, seven women, a boy and a girl. The women were never seen but at a distance; for when the men crossed the river to the ship, they left them behind. The men are of a middle size, and in general well made, clean-limbed, and remarkably vigorous, active, and nimble: their countenances were not altogether without expression, and their voices are remarkably soft and effeminate. They encrust their bodies with dirt, which makes them appear as black as negroes; their hair, which naturally grows long and black, they crop short; their beards grow bushy and thick, but they keep them short by fingering them. Neither sex have any sense of indecency in discovering their whole body. Here they perforate the cartilage that divides the nostrils from each other, through which they thrust a bone, which is as thick as a man's finger, and between five and six inches long; it reaches quite across the face, and so effectually stops

Holland.

up both the nostrils, that they are forced to keep their mouths wide open for breath, and snuffle so when they attempt to speak, that they are scarcely intelligible even to each other. Besides this nose-jewel, they have necklaces made of shells, very neatly cut and strung together; bracelets of small cord, wound two or three times round the upper part of their arm, and a string of plaited human hair, about as thick as a thread of yarn, tied round the waist. Besides these, some of them had gorgets of shells hanging round the neck, so as to reach cross the breast. They paint their bodies both white and red, and draw a circle of white round each eye. They have holes in their ears, but were not seen to wear any thing in them. They were so attached to their own ornaments, that they preferred them to any beads and ribbons that were offered them, though more showy, and regularly made. They received the things that were given them, but were insensible to all the signs which were made them that something was expected in return. Many of the trinkets that had been given them were afterwards found thrown negligently away in the woods, like the playthings of children, which please only while they are new. The bodies of many were marked with large scars, which appeared to be the remains of wounds that they had inflicted on themselves with some blunt instrument, and which they signified by signs to have been memorials of grief for the dead. There was no appearance of a town or village in the whole country. Their houses are formed without art or industry; some of them were just high enough for a man to stand upright in, but not large enough for him to extend his whole length in any direction: they are built with pliable rods, about as thick as a man's finger, in the form of an oven, by sticking the two ends into the ground, and covering them with palm-leaves and broad pieces of bark: the door is nothing but a large hole at one end. Under these houses or sheds they sleep, coiled up with their heels to their heads; in which position one shed will hold three or four persons: towards the northward, as the climate becomes hotter, these sheds were constructed much lighter: one side was entirely open, and none of them were more than four feet deep. These hovels were set up occasionally by a wandering herd, in any place that would furnish them for a time with subsistence, and left behind them when they removed to another spot. When they mean to continue only a night or two at one place, they sleep without any shelter except the bushes and grass, the latter of which is near two feet high. They have a vessel to hold the water they fetch from springs, made of bark, only by tying up the two ends with a withy, which not being cut off, serves for a handle. They have a small bag, about the size of a moderate cabbage-net, which the men carry upon their back by a string which passes over their heads. It generally contains a lump or two of paint and resin, some fish-hooks and lines, a shell or two, out of which their hooks are made, a few points of darts, and their usual ornaments; which is an inventory of the whole worldly treasure of the richest man among them. Their fish-hooks are very neatly made, and some of them are extremely small. For striking turtle, they have a peg of wood, which is about a foot long, and very well bearded;

Holland.

bearded; this fits into a socket at the end of a staff of light wood, about as thick as a man's wrist, and about seven or eight feet long. To the staff is tied one end of a loose line, about three or four fathoms long, the other end of which is fastened to the peg. To strike the turtle, the peg is fixed into the socket; and when it has entered his body, and is retained there by the barb, the staff flies off, and serves for a float to trace their victim in the water. It assists also to tire him, till they can overtake him with their canoes, and haul him ashore. One of these pegs was found buried in the body of a turtle, which had healed up over it. Their lines are made of the fibres of a vegetable, and are from the thickness of a half-inch rope to the fineness of a hair. They are unacquainted with the use of nets in fishing; and can only catch fish by striking them, or with a hook and line, or groping for them in the hollows of the rocks and shoals, which are dry at half-ebb. They bake their provisions by the help of hot stones, like the inhabitants of the South-sea islands. They produce fire with great facility, and spread it in a wonderful manner. To produce it, they take two pieces of dry, soft wood; one is a stick about eight or nine inches long, the other piece is flat. The stick they shape into an obtuse point at one end; and pressing it upon the other, turn it nimbly, by holding it between both their hands, as we do a chocolate-mill; often shifting their hands up, and then moving them down upon it, to increase the pressure as much as possible. By this method they get fire in less than two minutes, and from the smallest spark they increase it with great speed and dexterity. "We have often seen (says captain Cook) one of them run along the shore, to all appearance with nothing in his hand, who stooping down for a moment, at the distance of every fifty or an hundred yards, left fire behind him, as we could see, first by the smoke, and then by the flame along the drift of wood and other litter which was scattered along the place. We had the curiosity to examine one of these planters of fire when he set off, and we saw him wrap up a small spark in dry grass, which, when he had run a little way, having been fanned by the air that his motion produced, began to blaze; he then laid it down in a place convenient for his purpose, inclosing a spark of it in another quantity of grass, and so continued his course." Their weapons are spears or lances; some have four prongs pointed with bone, and barbed. To the northward, the lance has but one point; the shaft is made of cane, very straight and light, and from eight to fourteen feet long, consisting of several joints, where the pieces are let into each other and bound together. The points of these darts are either of hard heavy wood, or bones of fish: those points that are of wood, are also sometimes armed with sharp pieces of broken shells, which were stuck in, and at the junctures covered with resin. The lances which are thus barbed, are indeed dreadful weapons, as they cannot be drawn out of a wound without tearing away the flesh, or leaving the sharp ragged splinters of the bone or shell which forms the barb behind them in the wound. The canoes to the northward are not made of bark, but of the trunk of a tree, hollowed probably by fire: none of these boats will carry more than four people. The only tools seen

among them were, an adze wretchedly made of stone, some small pieces of the same substance in form of a wedge, a wooden mallet, and some shells and fragments of coral. It is difficult to account for the small number of the human species which are found dispersed over this country; whether they are thinned by civil broils, excited by the horrid appetite for devouring each other that prevails in New Zealand, or that their population is prevented by any other causes, cannot be ascertained. Their total ignorance of every method to procure the comforts of life, both from the cultivation of the ground, and furnishing materials for clothing and fishing, place them among the lowest of the human species.

HOLLAND in commerce, a fine and close kind of linen, so called from its being first manufactured in Holland.

HOLLAR (Wenceslaus), a celebrated engraver, born at Prague, in 1607. He employed himself chiefly in copying portraits; and his delicate little views of many of the cities in Germany, got him such reputation, that the earl of Arundel our ambassador at the Imperial court brought him over to England. Here he executed several plates from the fine Arundelian collection of paintings, engraved many landscapes and views about London, and of London itself, as well before as after the great fire: but it being his fate to work chiefly for printfellers and booksellers, in a state of subordination, more for the profit of his employers than for himself; so he could not even in his old age keep clear of the encumbrances of debt. About the year 1672, he travelled northward, and took views of towns, castles, churches and tombs, that would prove almost endless to enumerate. Few artists have been able to imitate his works, and the lovers of art are always zealous to collect them. It is melancholy to add, that on the verge of his 70th year, he was attached with an execution at his lodgings in Gardener's lane, Westminster; when he desired only the liberty of dying in his bed, and that he might not be removed to any other prison than the grave: a favour which it is uncertain whether he obtained or not. He died, however, in 1677.—The merits of this artist are thus characterized in the *Essay on Prints*: "Hollar gives us views of particular places, which he copies with great truth, unornamented, as he found them. If we are satisfied with exact representations, we have them no where better than in Hollar's works: but if we expect pictures, we must seek them elsewhere. Hollar was an antiquarian, and a draughtsman; but seems to have been little acquainted with the principles of painting. Stiffness is his characteristic, and a painful exactness void of taste. His larger views are mere plans. In some of his smaller, at the expence of infinite pains, something of an effect is sometimes produced. But in general, we consider him as a repository of curiosities, a record of antiquated dresses, abolished ceremonies, and edifices now in ruins."

HOLLES (Thomas Pelham), duke of Newcastle, was born in 1693, and succeeded his father as baron Pelham of Loughton: by the last will of his uncle John Holles duke of Newcastle, who died in 1711, he was adopted heir to his great estate, and empowered to bear the arms and name of *Holler*, together with the title of *duke of Newcastle upon Tyne*. His power and interest

Hollar

Holloa
Hollstein.

interest were now very great, and he exerted both in supporting George I. against the Tory party that opposed him. The whole weight of authority had for some time been in the hands of the Tories at the accession of this king, while the Whigs remained without credit or influence; but this state of affairs was now reversed; and the duke of Newcastle, among the rest, was distinguished by the royal favour. He was created duke of Newcastle-under-Lyne, with remainder to the female issue of his brother the honourable Henry Pelham; was made lord chamberlain of the king's household, and a knight of the garter; and was one of the peers commissioned to sign the quadruple alliance in 1718. In 1724, he resigned the place of lord chamberlain, and was appointed secretary of state. It would be tedious to trace him farther through his places and honours: it need therefore only be added, that after his long services to the crown, he gave way to lord Bute, who succeeded him in 1762 as first lord of the treasury. Quitting now the fatigues of business, he lived in retirement to his death in 1768, leaving the character of a most disinterested patriot; having greatly impoverished his private estate during his public services, and retiring without accepting any pension.

HOLLOA, in the sea-language, an exclamation of answer, to any person who calls to another to ask some question, or to give a particular order. Thus, if the master intends to give any order to the people in the main-top, he previously calls, *Main-top, boy!* to which they answer, *Holloa!* to shew that they hear him, and are ready. It is also the first answer in hailing a ship at a distance. See **HAILING**.

HOLLY, in botany. See **ILEX**.

Sea-HOLLY. See **ERYNGIUM**.

HOLM (Sax. *hulmus*, *insula amnica*), an isle or fenny ground, according to Bede; or a river island. And where any place is called by that name, and this syllable is joined with any other in the names of places, it signifies a place surrounded with water; as the *Flatholmes* and *Stepholmes* in the Severn near Bristol; but if the situation of the place is not near the water, it may then signify a hilly place; *holm*, in Saxon, signifying also a hill or cliff.

HOLocaust, a burnt-offering, or sacrifice, wholly consumed by fire: of this kind was the daily sacrifice in the Jewish church. This was done by way of acknowledgment, that the person offering and all that belonged to him were the effects of the divine bounty.

HOLOGRAPH, among civilians, a will wholly written by the hand of the testator.

HOLSTEIN, a duchy of Germany, bounded by the German ocean on the west; the Baltic, or the gulph of Lubeck, on the east; the duchy of Mecklenburg, on the south-east; that of Bremen, with the river Elbe, on the south-west; and Laueburg, with the territory of Hamburg, on the south. Its greatest length is about 80 miles, and its breadth 60. The diocese of Eutin, and the county of Ranzau, though they make a part of the duchy of Holstein, yet being lands belonging to the empire and circle, shall be described separately.

A great part of this country consists of rich marsh-land, which being much exposed to inundations both

Holstein.

from the sea and rivers, dykes have been raised at a great expence, to guard and defend them. The pastures in the marshes are so rich, that cattle are bred in vast numbers and fattened in them, and great quantities of excellent butter and cheese made of their milk. They are also very fruitful in wheat, barley, pease, beans, and rape-seed. In the more barren, sandy, and heathy parts of the country, large flocks of sheep are bred and fed: nor are orchards wanting, or woods, especially of oak and beech; nor turk, poultry, game, and wild-fowl. Here is a variety both of sea and river fish; and the beef, veal, mutton, and lamb, are very fat and palatable. Holstein is also noted for beautiful horses. The gentry usually farm the cows upon their estates to a Hollander, as he is called, who for every cow pays from six to ten rix-dollars; the owner providing pasture for them in summer, and straw and hay in winter. It is no uncommon thing here, to drain the ponds and lakes once in three or four years, and sell the carp, lampreys, pikes, and perch, found in them; then sow them for several years after with oats, or use them for pasture; and after that, lay them under water again, and breed fish in them. There are hardly any hills in the country; but several rivers, of which the principal are the Eyder, the Stor, and the Trave. The duchy contains about 30 towns great and small: most part of the peasants are under villenage, being obliged to work daily for their lords, and not even at liberty to quit their estates. The nobility and the proprietors of manors are possessed of the civil and criminal jurisdiction, with other privileges and exemptions. Formerly there were diets, but now they seem to be entirely laid aside: meetings, however, of the nobility are still held at Kiel. The predominant religion here is Lutheranism, with superintendencies as in other Lutheran countries. In several places the Jews are allowed the exercise of their religion. At Gluckstadt, and Altena, are both Calvinist and Popish churches; and at Kiel, a Greek Russian chapel. Besides the Latin schools in the towns, at Altena is a gymnasium, and at Kiel an university. Notwithstanding this country's advantageous situation for commerce there are few manufactures and little trade in it. Hamburg and Lubeck supply the inhabitants with what they want from abroad; from whence and Altena, they export some grain, malt, groats, starch, buck-wheat, pease, beans, rappedseed, butter, cheese, sheep, swine, horned cattle, horses, and fish. The manufactures of the duchy are chiefly carried on at Altena, Kiel, and Gluckstadt. The duchy of Holstein, consists of the ancient provinces of Holstein, Stormar, Ditmarsh, and Wagria. It belongs partly to the king of Denmark, and partly to the dukes of Holstein Gottorf and Ploen. Anciently the counts of Holstein were vassals of the dukes of Saxony; but afterwards they received the investiture of their territories from the emperor, or the bishops of Lubeck in the emperor's name, though now the investiture is given by the emperor in person. The king of Denmark appoints a regency over his part of Holstein and the duchy of Sleswick, which has its office at Gluckstadt. The seat of the great duke's privy council, and regency-court, together with the chief consistory, which is united to it, is at Kiel: there are

many.

Holstein
Holt.

many inferior courts and consistories, from which an appeal lies to the higher. In the duchy of Holstein, the government of the convents and nobility is alternately in the king and duke, for a year, from Michaelmas to Michaelmas. The person in whom the government is lodged, administers it by his regency. In some cases an appeal lies from this court to the Aulic council or chamber at Wetzlar: the convents, the nobility, and the proprietors of manors in the country, have a civil and criminal jurisdiction over their estates. The revenues of the sovereigns arise principally from their demesnes and regalia; besides which, there is a land and several other taxes and imposts. The duke's income, setting aside his ducal patrimony, has been estimated at 70,000 or 80,000 pounds. The king usually keeps here some regiments of foot and one of horse. With respect to the duke's military force, it amounts to about 800 men. The king, on account of his share in this country, styles himself *duke of Holstein, Stormar, and Ditmarsch*. The dukes, both of the royal and princely house, style themselves *heirs of Norway, dukes of Slefwick, Holstein, Stormar, and Ditmarsch*, and counts of *Oldenburg and Delmenhorst*. On account of Holstein, both the king of Denmark and the grand duke have a seat and voice in the college of the princes of the empire, and in that of the circle. Together with Mecklenburg they also nominate an assessor for this circle in the Aulic chamber. The matricular assessment of the whole duchy is 40 horse and 80 foot, or 800 florins; to the chamber of Wetzlar both princes pay 189 rix-dollars, 31 kruitzeners. In 1735, duke Charles Frederic, of Holstein Gottorf, founded an order of knighthood here, viz. that of St Anne, the ensign of which is a red cross, enamelled, and worn pendant at a red ribbon edged with yellow.—The principal places of that part of the duchy belonging to the king of Denmark and the duke of Ploen are Gluckstadt, Itzhoë, Rendsburg, and Ploen; and that part belonging to the great duke are Kiel, Oldenburgh, Preetz, and Altena.

HOLSTENIUS (Lucas), an ingenious and learned German, born at Hamburg in 1596, was bred a Lutheran; but being converted to popery by father Sirmond the Jesuit, he went to Rome, and attached himself to cardinal Francis Barberini, who took him under his protection. He was honoured by three popes; Urban VIII. gave him a canonry of St Peter's; Innocent X. made him librarian of the Vatican; and Alexander VII. sent him in 1655 to queen Christina of Sweden, whose formal profession of the Catholic faith he received at Inspruck. He spent his life in study, and was very learned both in sacred and profane antiquity. He died in 1661; and though he was not the author of any great works, his notes and dissertations on the works of others have been highly esteemed for the judgment and precision with which they are drawn up.

HOLT (Sir John), knight, eldest son of Sir Thomas Holt, serjeant at law, was born in 1642. He entered himself of Gray's Inn in 1658; and applied to the common law with so much industry, that he soon became a very eminent barrister. In the reign of James II. he was made recorder of London, which office he discharged with much applause for about a year and a half; but lost his place for refusing to expound

the law suitably to the king's designs. On the arrival of the prince of Orange, he was chosen a member of the convention parliament, which afforded him a good opportunity of displaying his abilities; so that as soon as the government was settled, he was made lord chief justice of the court of king's bench, and a privy councillor. He continued chief justice for 22 years, with great repute for steadiness, integrity, and thorough knowledge in his profession. Upon great occasions he asserted the law with intrepidity, though he thereby ventured to incur by turns the indignation of both the houses of parliament. He died in 1709, and published some reports.

HOLT (Sax.) "a wood;" wherefore the names of towns beginning or ending with *holt*, as *buck-holt*, &c. denote that formerly there was great plenty of wood in those places.

HOLY-GHOST, one of the persons of the holy Trinity. See GOD and TRINITY.

Order of the HOLY-GHOST, the principal military order in France, instituted by Henry III. in 1569. It consists of 100 knights, who are to make proof of their nobility for three descents. The king is the grand-master, or sovereign; and as such, takes an oath, on his coronation-day, to maintain the dignity of the order.

The knights wear a golden-cross, hung about their necks by a blue silk ribbon, or collar. But before they receive the order of the Holy-ghost, that of St Michael is conferred as a necessary degree; and for this reason their arms are surrounded with a double collar.

HOLYHEAD, a town and cape of the isle of Anglesea in Wales, and in the Irish channel, where people usually embark for Dublin, there being three packet-boats that sail for that city every Monday, Wednesday, and Friday, wind and weather permitting. It has a very convenient harbour for the northern trade, when taken short by contrary winds. If this was properly repaired, and warehouses built, it would be very convenient for the Irish, to import such of their goods as pay English duty, it being but a few hours sail from Dublin. Besides, the Dublin merchants might come over with the packets, to see their goods loaded. The commodities are, butter, cheese, bacon, wild-fowl, lobsters, crabs, oysters, razor-fish, shrimps, herrings, cod-fish, whiting, whiting-pollacks, cole-fish, sea-teaches, turbot, soles, flounders, rays, and plenty of other fish. On the rocks the herb grows of which they make kelp, a fixed salt used in making glass, and in alum works. In the neighbourhood there is a large vein of white fullers earth, and another of yellow which might be useful to fullers. On the isle of Skerries, nine miles to the north, is a light-house, which may be seen 24 miles off. Large flocks of puffins are often seen here; they all come in one night, and depart in the same manner. W. Long. 4. 40. N. Lat. 53. 20.

Holy-Island, a small island lying on the coast of England, six miles south of Berwick, in Northumberland. It is not above two miles and a quarter in length, nor much above a mile in breadth. The soil is rocky and full of stones, for which reason it is thinly peopled: it has but one town, with a church, and a castle, under which there is a commodious harbour, defended by a block-house.

Holy
Ghost
Holy-
Island.

Holywell
Homberg.

HOLYWELL, a town of North Wales, in the county of Flint. It is a place of great note, for the well of St Winnifrid, who is reputed a virgin martyr; and it is much frequented by people that come to bathe in it, as well as by popish pilgrims out of devotion. The spring gushes forth with such impetuosity, that at a small distance it turns several mills. Over the spring is a chapel built upon pillars, and on the windows are painted the history of St Winnifrid's life. There is a moat about the well, which some foolishly imagine to be St Winnifrid's hair. W. Long. 3. 15. N. Lat. 54. 23.

HOLYOAK (Francis), author of the Latin dictionary, became rector of South-ham in Warwickshire in 1604; and being greatly esteemed, was chosen member of the convocation in the first year of Charles I.'s reign. He suffered much for the king; and died in 1653, aged 87. His son Thomas made enlargements to the said Dictionary.

HOLYWOOD (John), or HALIFAX, of *Sacro-bosco*, was, according to Leland, Bale, and Pitts, born at Halifax in Yorkshire; according to Stainhurst, at Holywood near Dublin; and, according to Dempster and Mackenzie, in Nithsdale in Scotland. The last-mentioned author informs us, that, having finished his studies, he entered into orders, and was made a canon regular of the order of St Augustin in the famous monastery of Holywood in Nithsdale. The English biographers, on the contrary, tell us, that he was educated at Oxford. They all agree, however, in asserting that he spent most of his life at Paris; where, says Mackenzie, he was admitted a member of the university on the fifth of June in the year 1221, under the syndics of the Scotch nation; and soon after, elected professor of mathematics, which he taught for many years with applause. We are told by the same author, that he died in 1256, as appears from the inscription on his monument in the cloisters of the convent of St Maturine at Paris. Holywood was certainly the first mathematician of his time. He was cotemporary with Roger Bacon, but probably older by about 20 years. He wrote, 1. *De sphaera mundi*; often reprinted, and illustrated by various commentators. 2. *De anni ratione, seu de computo ecclesiastico*. 3. *De algorismo*, printed with *Comm. Petri Circilli Hisp.* Paris 1498.

HOMAGE, in law, is the submission, loyalty, and service, which a tenant promised to his lord, when he was first admitted to the land which he held of the lord in fee: also that owing to a king, or to any superior.

HOMBERG (William), a celebrated physician, chemist, and philosopher, was the son of a Saxon gentleman, and born in Batavia, in the East Indies, in 1652. His father afterwards settling at Amsterdam, William there prosecuted his studies; and from thence removed to Jena, and afterwards to Leipzig, where he studied the law. In 1642, he was made advocate at Magdeburg, and there applied himself to the study of experimental philosophy. Some time after, he travelled into Italy; and applied himself to the study of medicine, anatomy, and botany, at Padua. He afterwards studied at Bologna; and at Rome learned optics, painting, sculpture, and music. He at length travelled into France, England, and Holland; obtained the degree of doctor of physic at Wittemberg; travelled into Germany and the North; visited the mines of Saxony, Bohemia, Hungary, and Sweden; and re-

Vol. V.

turned to France, where he acquired the esleem of the learned. He was on the point of returning into Germany, when M. Colbert being informed of his merit, made him such advantageous offers, as induced him to fix his residence at Paris. M. Homberg, who was already well known for his phosphorus, for a pneumatic machine of his own invention more perfect than that of Guericke, for his microscopes, for his discoveries in chemistry, and for the great number and variety of his curious observations, was received into the academy of sciences in 1691, and had the laboratory of that academy, of which he was one of its principal ornaments. The duke of Orleans, afterwards regent of the kingdom, at length made him his chemist, settled upon him a pension, gave him the most superb laboratory that was ever in the possession of a chemist, and in 1704 made him his first physician. He had abjured the Protestant religion in 1682, and died in 1715. There are a great number of learned and curious pieces of his writing, in the memoirs of the academy of sciences, and in several journals. He had begun to give the elements of chemistry in the memoirs of the academy, and the rest were found among his papers fit for printing.

HOMBERG, a town of Germany, in the circle of the Upper Rhine, and landgrate of Hesse, seated ten miles north of Frankfurt, and gives title to one of the branches of the house of Hesse, who is its sovereign. E. Long. 8. 24. N. Lat. 50. 20.

HOMBERG, a town of Germany, in the palatinate of the Rhine, and duchy of Deuxponts. E. Long. 7. 6. N. Lat. 49. 20.

HOMER, the prince of the Greek poets, flourishing, according to Dr Blair, about 900 B. C. according to Dr Pristley 850, according to the Arundelian marbles 300, after the taking of Troy; and agreeable to them all, above 400 years before Plato and Aristotle. Seven cities disputed the glory of having given him birth, viz. Smyrna, Rhodes, Colophon, Salamis, Chios, Argos, and Athens; which has been expressed by the following distich:

Smyrna, Rhodes, Colophon, Salamis, Chios, Argos, Athenae;
Orbis de patria certat, Homerus, tua.

We have nothing that is very certain in relation to the particulars of his life. The most regular account is that which goes under the name of Herodotus, and is usually printed with his history: and though it is generally supposed to be a spurious piece, yet as it is ancient, was made use of by Strabo, and exhibits that idea which the later Greeks, and the Romans in the age of Augustus, entertained of Homer, we must content ourselves with giving an abstract of it.

A man of Magnesia, whose name was *Menaliippus*, went to settle at Cumæ, where he married the daughter of a citizen called *Homyrer*, and had by her a daughter called *Critheis*. The father and mother dying, the young woman was left under the tuition of Cleonax her father's friend, and suffering herself to be deluded was got with child. The guardian, though his care had not prevented the misfortune, was however willing to conceal it; and therefore sent Critheis to Smyrna, which was then building, 18 years after the founding of Cumæ; and about 168 after the taking of Troy. Critheis being near her time, went one day to a festival, which the town of Smyrna was celebra-

Homer.

ting on the banks of the river Meles; where her pains coming upon her, she was delivered of Homer, whom she called *Melēsignes*, because he was born on the banks of that river. Having nothing to maintain her, she was forced to spin; and a man of Smyrna called *Phemius*, who taught literature and music, having often seen Critheis, who lodged near him, and being pleased with her housewifery, took her into his house to spin the wool he received from his scholars for their schooling. Here she behaved herself so modestly and discreetly, that Phemius married her; and adopted her son, in whom he discovered a wonderful genius, and the best natural disposition in the world. After the death of Phemius and Critheis, Homer succeeded to his father-in-law's fortune and school; and was admired, not only by the inhabitants of Smyrna, but by strangers, who resorted from all parts to that place of trade. A shipmaster called *Mentes*, who was a man of learning and a lover of poetry, was so taken with Homer, that he persuaded him to leave his school, and to travel with him. Homer, who had then begun his poem of the *Iliad*, and thought it of great consequence to see the places he should have occasion to treat of, embraced the opportunity. He embarked with Mentes, and during their several voyages never failed carefully to note down all that he thought worth observing. He travelled into Egypt; from whence he brought into Greece the names of their gods, the chief ceremonies of their worship, and a more improved knowledge in the arts than what prevailed in his own country. He visited Africa and Spain; in his return from whence he touched at Ithaca, where he was much troubled with a rheum falling upon his eyes. Mentes being in haste to take a turn to Leucadia his native country, left Homer well recommended to Mentor, one of the chief men of the island of Ithaca, who took all possible care of him. There Homer was informed of many things relating to Ulysses, which he afterwards made use of in composing his *Odyssey*. Mentes returning to Ithaca, found Homer cured. They embarked together; and after much time spent in visiting the coasts of Peloponnesus and the islands, they arrived at Colophon, where Homer was again troubled with the distemper upon his eyes, which proved so violent, that he is said to have lost his sight. This misfortune made him resolve to return to Smyrna, where he finished his *Iliad*. Some time after, the ill posture of his affairs obliged him to go to Cumæ, where he hoped to have found some relief. Here his poems were highly applauded: but when he proposed to immortalize their town, if they would allow him a salary, he was answered, that "there would be no end of maintaining all the *ὄψωνοι*, or blind men;" and hence got the name of *Homer*. He afterwards wandered through several places, and stopped at Chios, where he married, and composed his *Odyssey*. Some time after, having added many verses to his poems in praise of the cities of Greece, especially of Athens and Argos, he went to Samos, where he spent the winter, singing at the houses of the great men, with a train of boys after him. From Samos he went to Io, one of the Sporades, with a design to continue his voyage to Athens; but landing by the way at Chios, he fell sick, died, and was buried on the sea-shore.

The only incontestable works which Homer has left

behind him are the *Iliad* and *Odyssey*. The *Batrachomyomachia*, or battle of the frogs and mice, has been disputed. The hymns have been disputed also, and attributed by the scholiasts to Cynæthos the rhapsodist: but neither Thucydides, Lucian, nor Paulanias, have scrupled to cite them as genuine. Many other pieces are ascribed to him: epigrams, the *Eartiges*, the *Cecropes*, the destruction of *Oechalia*, of which only the names are remaining.

Nothing was ever comparable to the clearness and majesty of Homer's style; to the sublimity of his thoughts; to the strength and sweetness of his verses. All his images are striking; his descriptions just and exact; the passions so well expressed, and nature so finely painted, that he gives to every thing motion, life, and action. But he more particularly excels in invention, and in the different characters of his heroes, which are so varied, that they affect us in an inexpressible manner. In a word, the more he is read by a person of good taste, the more he is admired. Nor are his works to be esteemed merely as entertaining poems, or as the monuments of a sublime and varied genius. He was in general so accurate with respect to costume, that he seldom mentioned persons or things that we may not conclude to have been known during the times of which he writes; and it was Mr Pope's opinion, that his account of people, princes, and countries, was purely historical, founded on the real transactions of those times, and by far the most valuable piece of history and geography left us concerning the state of Greece in that early period. His geographical divisions of that country were thought so exact, that we are told of many controversies concerning the boundaries of Grecian cities which have been decided upon the authority of his poems.

Alcibiades gave a rhetorician a box on the ear for not having Homer's writings in his school. Alexander was ravished with them, and commonly placed them under his pillow with his sword: he inclosed the *Iliad* in the precious casket that belonged to Darius; "in order, (said he to his courtiers), that the most perfect production of the human mind might be inclosed in the most valuable casket in the world." And one day seeing the tomb of Achilles in Sigæa, "Fortunate hero! (cried he), thou hast had a Homer to sing thy victories!" Lycurgus, Solon, and the kings and princes of Greece, set such a value on Homer's works, that they took the utmost pains in procuring correct editions of them, the most esteemed of which is that of Aristarchus. Didymus was the first who wrote notes on Homer; and Eustathius, archbishop of Thessalonica, in the 12th century, is the most celebrated of his commentators. Mr Pope has given an elegant translation of the *Iliad*, adorned with the harmony of poetic numbers; and Mad. Dacier has translated both the *Iliad* and *Odyssey* in prose. But those who desire to know the several editions of Homer, and the writers who have employed themselves on the works of that great poet, may consult Fabricius, in the first volume of his *Bibliotheca Græca*.

HOMICIDE, signifies in general, the taking away of any person's life. It is of three kinds; *justifiable*, *excusable*, and *felonious*. The first has no share of guilt at all; the second very little; but the third is the highest crime against the law of nature, that man is

Homer.
Homicide.

Homicide. capable of committing.

I. Justifiable homicide is of divers kinds.

1. Such as is owing to some unavoidable necessity, without any will, intention, or desire, and without any inadvertence or negligence, in the party killing, and therefore without any shadow of blame; as, for instance, by virtue of such an office as obliges one, in the execution of public justice, to put a malefactor to death, who hath forfeited his life by the laws and verdict of his country. This is an act of necessity, and even of civil duty; and therefore not only justifiable, but commendable, where the law requires it. But the law must require it, otherwise it is not justifiable: therefore wantonly to kill the greatest of malefactors, a felon or a traitor, attainted or outlawed, deliberately, uncompelled, and extrajudicially, is murder. And farther, if judgment of death be given by a judge not authorized by lawful commission, and execution is done accordingly, the judge is guilty of murder. Also such judgment, when legal, must be executed by the proper officer, or his appointed deputy; for no one else is required by law to do it, which requisition it is that justifies the homicide. If another person doth it of his own head, it is held to be murder: even though it be the judge himself. It must farther be executed, *servato juris ordine*; it must pursue the sentence of the court. If an officer beheads one who is adjudged to be hanged, or vice versa, it is murder: for he is merely ministerial, and therefore only justified when he acts under the authority and compulsion of the law. But, if a sheriff changes one kind of punishment for another, he then acts by his own authority, which extends not to the commission of homicide: and besides, this licence might occasion a very gross abuse of his power. The king indeed may remit part of a sentence, as in the case of treason, all but the beheading: but this is no change, no introduction of a new punishment; and in the case of felony, where the judgment is to be hanged, the king (it hath been said) cannot legally order even a peer to be beheaded.

Again: In some cases homicide is justifiable, rather by the permission, than by the absolute command, of the law: either for the advancement of public justice, which without such indemnification would never be carried on with proper vigour; or, in such instances where it is committed for the prevention of some atrocious crime, which cannot otherwise be avoided.

2. Homicides, committed for the advancement of public justice, are, 1. Where an officer, in the execution of his office, either in a civil or criminal case, kills a person that assaults and resists him. 2. If an officer, or any private person, attempts to take a man charged with felony, and is resisted; and, in the endeavour to take him, kills him. 3. In case of a riot, or rebellious assembly, the officers endeavouring to disperse the mob are justifiable in killing them, both at common law, and by the riot act, 1 Geo. I. c. 5. 4. Where the prisoners in a gaol, or going to gaol, assault the gaoler or officer, and he in his defence kills any of them, it is justifiable, for the sake of preventing an escape. 5. If trespassers in forests, parks, chafes, or warrens, will not surrender themselves to the keepers, they may be slain; by virtue of the statute 21 Edward I. ft. 2. *de malefactoribus in parci*, and 3 & 4 W. & M. c. 10. But, in all these cases, there

must be an apparent necessity on the officer's side; viz. that the party could not be arrested or apprehended, the riot could not be suppressed, the prisoners could not be kept in hold, the deer-stealers could not but escape, unless such homicide were committed: otherwise, without such absolute necessity, it is not justifiable. 6. If the champions in a trial by battle killed either of them the other, such homicide was justifiable, and was imputed to the just judgment of God, who was thereby presumed to have decided in favour of the truth.

3. In the next place, such homicide as is committed for the prevention of any forcible and atrocious crime, is justifiable by the law of nature; and also by the law of England, as it stood so early as the time of Bracton, and as it is since declared by stat. 24 H. VIII. c. 5. If any person attempts a robbery or murder of another, or attempts to break open a house in the night-time, (which extends also to an attempt to burn it,) and shall be killed in such attempt, the slayer shall be acquitted and discharged. This reaches not to any crime unaccompanied with force, as picking of pockets; or to the breaking open of any house in the day-time, unless it carries with it an attempt of robbery also. So the Jewish law, which punished no theft with death, makes homicide only justifiable in case of nocturnal house-breaking: "if a thief be found breaking up, and he be smitten that he die, no blood shall be shed for him: but if the sun be risen upon him, there shall blood be shed for him; for he should have made full restitution." At Athens, if any theft was committed by night, it was lawful to kill the criminal, if taken in the fact: and, by the Roman law of the twelve tables, a thief might be slain by night with impunity; or even by day, if he armed himself with any dangerous weapon: which amounts very nearly to the same as is permitted by our own constitutions.

The Roman law also justifies homicide, when committed in defence of the chastity either of one's self or relations: and so also, according to Selden, stood the law in the Jewish republic. The English law likewise justifies a woman killing one who attempts to ravish her: and so too the husband or father may justify killing a man, who attempts a rape upon his wife or daughter; but not if he takes them in adultery by consent; for the one is forcible and felonious, but not the other. And there is no doubt but the forcibly attempting a crime, of a still more detestable nature, may be equally resisted by the death of the unnatural aggressor. For the one uniform principle that runs through our own, and all other laws, seems to be this: That where a crime, in itself capital, is endeavoured to be committed by force, it is lawful to repel that force by the death of the party attempting. But we must not carry this doctrine to the same visionary length that Mr Locke does; who holds, "that all manner of force without right upon a man's person, puts him in a state of war with the aggressor; and, of consequence, that, being in such a state of war, he may lawfully kill him that puts him under this unnatural restraint." However just this conclusion may be in a state of uncivilized nature, yet the law of England, like that of every other well-regulated community, is too tender of the public peace, too careful of

Homicide⁶Exodus
xxii. 2.

the lives of the subjects, to adopt so contentious a system; nor will suffer with impunity any crime to be prevented by death, unless the same, if committed, would also be punished by death.

In these instances of justifiable homicide, it may be observed, that the slayer is in no kind of fault whatsoever, not even in the minutest degree; and is therefore to be totally acquitted and discharged, with commendation rather than blame. But that is not quite the case in excusable homicide, the very name whereof imports some fault, some error, or omission; so trivial, however, that the law excuses it from the guilt of felony, though in strictness it judges it deserving of some little degree of punishment.

II. Excusable homicide is of two sorts; either *per infortunium*, by misadventure; or *se defendendo*, upon a principle of self-preservation. We will first see wherein these two species of homicide are distinct, and then wherein they agree.

1. Homicide *per infortunium*, or misadventure, is where a man, doing a lawful act, without any intention of hurt, unfortunately kills another: as where a man is at work with a hatchet, and the head thereof flies off and kills a slander-by; or, where a person, qualified to keep a gun, is shooting at a mark, and undesignedly kills a man: for the act is lawful, and the effect is merely accidental. So where a parent is moderately correcting his child, a master his apprentice or scholar, or an officer punishing a criminal, and happens to occasion his death, it is only misadventure; for the act of correction was lawful: but if he exceeds the bounds of moderation, either in the manner, the instrument, or the quantity of punishment, and death ensues, it is manslaughter at least, and in some cases (according to the circumstances) murder; for the act of immoderate correction is unlawful. Thus by an edict of the emperor Constantine, when the rigour of the Roman law with regard to slaves began to relax and soften, a master was allowed to chastise his slave with rods and imprisonment, and, if death accidentally ensued, he was guilty of no crime: but if he struck him with a club or a stone, and thereby occasioned his death; or if in any other yet grosser manner "*innoderate suo jure utatur, tunc reus homicidii fit.*"

But, to proceed. A tilt or tournament, the martial diversion of our ancestors, was however an unlawful act; and so are boxing and sword-playing, the succeeding amusement of their posterity: and therefore, if a knight in the former case, or a gladiator in the latter, be killed, such killing is felony of manslaughter. But if the king command or permit such diversion, it is said to be only misadventure; for then the act is lawful: In like manner as, by the laws both of Athens and Rome, he who killed another in the *pancratium*, or public games, authorised or permitted by the state, was not held to be guilty of homicide. Likewise to whip another's horse, whereby he runs over a child and kills him, is held to be accidental in the rider, for he has done nothing unlawful; but manslaughter in the person who whipped him, for the act was a trespass, and at best a piece of idleness, of inevitably dangerous consequence. And in general, if death ensues in consequence of an idle, dangerous, and unlawful sport, as shooting or casting stones in a town, or the barbarous diversion of cock-throwing; in

these and similar cases, the slayer is guilty of manslaughter, and not misadventure only; for these are unlawful acts.

2. Homicide in *self-defence*, or *se defendendo*, upon a sudden affray, is also excusable rather than justifiable, by the English law. This species of self-defence must be distinguished from that just now mentioned, as calculated to hinder the perpetration of a capital crime; which is not only a matter of excuse, but of justification. But the self-defence which we are now speaking of, is that whereby a man may protect himself from an assault, or the like, in the course of a sudden brawl or quarrel, by killing him who assaults him. And this is what the law expresses by the word *chance-medley*, or (as some rather choose to write it) *chaud-medley*; the former of which in its etymology signifies a casual affray, the latter an affray in the heat of blood or passion: both of them of pretty much the same import; but the former is in common speech too often erroneously applied to any manner of homicide by misadventure; whereas it appears by the statute 24 H. VIII. c. 5. and our ancient books, that it is properly applied to such killing as happens in self-defence upon a sudden encounter. The right of natural defence does not imply a right of attacking: for, instead of attacking one another for injuries past or impending, men need only have recourse to the proper tribunals of justice. They cannot therefore legally exercise this right of preventive defence, but in sudden and violent cases; when certain and immediate suffering would be the consequence of waiting for the assistance of the law. Wherefore, to excuse homicide by the plea of self-defence, it must appear that the slayer had no other possible means of escaping from his assailant.

In some cases this species of homicide (upon *chance-medley* in self-defence) differs but little from manslaughter, which also happens frequently upon *chance-medley* in the proper legal sense of the word. But the true criterion between them seems to be this; when both parties are actually combating at the time when the mortal stroke is given, the slayer is then guilty of manslaughter; but if the slayer hath not begun to fight, or (having begun) endeavours to decline any farther struggle, and afterwards, being closely pressed by his antagonist, kills him to avoid his own destruction, this is homicide excusable by self-defence. For which reason the law requires, that the person, who kills another in his own defence, should have retreated as far as he conveniently or safely can, to avoid the violence of the assault, before he turns upon his assailant; and that not seditiously, or in order to watch his opportunity, but from a real tenderness of shedding his brother's blood. And though it may be cowardice, in time of war between two independent nations, to flee from an enemy; yet between two fellow-subjects, the law countenances no such point of honour: because the king and his courts are the *vindices injuriarum*, and will give to the party wronged all the satisfaction he deserves. In this the civil law also agrees with ours, or perhaps goes rather farther; "*qui cum aliter tueri se non possunt, damni culpam dederint, innoxii sunt.*" The party assaulted must therefore flee as far as he conveniently can, either by reason of some wall, ditch, or other impediment; or as far as the fierceness of the assault will permit him: for it may be so fierce as not

to allow him to yield a step, without manifest danger of his life, or enormous bodily harm; and then in his defence he may kill his assailant instantly. And this is the doctrine of universal justice, as well as of the municipal law.

And, as the manner of the defence, so is also the time to be considered: for if the person assaulted does not fall upon the aggressor till the affray is over, or when he is running away, this is revenge and not defence. Neither, under the colour of self-defence, will the law permit a man to screen himself from the guilt of deliberate murder: for if two persons, A and B, agree to fight a duel, and A gives the first onset, and B retreats as far as he safely can, and then kills A, this is murder; because of the previous malice and concerted design. But if A upon a sudden quarrel assaults B first, and upon B's returning the assault, A really and *bona fide* flees; and, being driven to the wall, turns again upon B and kills him; this may be *se defendendo*, according to some of our writers: tho' others have thought this opinion too favourable; inasmuch as the necessity, to which he is at last reduced, originally arose from his own fault. Under this excuse of self-defence, the principal civil and natural relations are comprehended: therefore, master and servant, parent and child, husband and wife, killing an assailant in the necessary defence of each other respectively, are excused; the act of the relation assisting being construed the same as the act of the party himself.

There is one species of homicide *se defendendo*, where the party slain is equally innocent as he who occasions his death: and yet this homicide is also excusable from the great universal principle of self-preservation, which prompts every man to save his own life preferable to that of another, where one of them must inevitably perish. As, among others, in that case mentioned by lord Bacon, where two persons, being shipwrecked, and getting on the same plank, but finding it not able to save them both, one of them thrusts the other from it, whereby he is drowned. He who thus preserves his own life at the expence of another man's, is excusable through unavoidable necessity, and the principle of self-defence; since their both remaining on the same weak plank is a mutual, though innocent, attempt upon, and an endangering of, each other's life.

Let us next take a view of those circumstances wherein those two species of homicide, by misadventure and self-defence, agree; and those are in their blame and punishment. For the law sets so high a value upon the life of a man, that it always intends some misbehaviour in the person who takes it away, unless by the command or express permission of the law. In the case of misadventure, it presumes negligence, or at least a want of sufficient caution in him who was so unfortunate as to commit it; who therefore is not altogether faultless. And as to the necessity which excuses a man who kills another *se defendendo*, lord Bacon entitles it *necessitas culpabilis*, and thereby distinguishes it from the former necessity of killing a thief or a malefactor. For the law intends that the quarrel or assault arose from some unknown wrong, or some provocation, either in word or deed: and since in quarrels both parties may be, and usually are, in some fault; and it scarce can be tried who was originally in

the wrong; the law will not hold the survivor entirely guiltless. But it is clear, in the other case, that where I kill a thief who breaks into my house, the original default can never be upon my side. The law besides may have a farther view, to make the crime of homicide more odious, and to caution men how they venture to kill another upon their own private judgment; by ordaining, that he who slays his neighbour, without an express warrant from the law so to do, shall in no case be absolutely free from guilt.

Nor is the law of England singular in this respect. Even the slaughter of enemies required a solemn purgation among the Jews; which implies, that the death of a man, however it happens, will leave some stain behind it. And the Mosaiical law appointed certain cities of refuge for him "who killed his neighbour unawares; as if a man goeth into the wood with his neighbour to hew wood, and his hand fetcheth a stroke with the ax to cut down a tree, and the head slippeth from the helve, and lighteth upon his neighbour that he die, he shall flee unto one of those cities and live." But it seems he was not held wholly blameless, any more than in the English law; since the avenger of blood might slay him before he reached his asylum, or if he afterwards stirred out of it till the death of the high priest. In the imperial law likewise casual homicide was excused, by the indulgence of the emperor signed with his own sign manual, "*adnotatione principis*;" otherwise, the death of a man, however committed, was in some degree punishable. Among the Greeks, homicide by misfortune was expiated by voluntary banishment for a year. In Saxony, a fine is paid to the kindred of the slain; which also, among the western Goths, was little inferior to that of voluntary homicide: and in France, no person is ever absolved in cases of this nature, without a largess to the poor, and the charge of certain masses for the soul of the party killed.

The penalty inflicted by our laws is said by Sir Edward Coke to have been anciently no less than death; which, however, is with reason denied by latter and more accurate writers. It seems rather to have consisted in a forfeiture, some say of all the goods and chattels, others of only a part of them, by way of fine or *amercement*: which was probably disposed of, as in France, *in pios usus*, according to the humane superstition of the times, for the benefit of his soul who was thus suddenly sent to his account with all his imperfections on his head. But that reason having long ceased, and the penalty (especially if a total forfeiture) growing more severe than was intended, in proportion as personal property has become more considerable, the delinquent has now, and has had as early as our records will reach, a pardon and writ of restitution of his goods as a matter of course and right, only paying for suing out the same. And, indeed, to prevent this expence, in cases where the death has notoriously happened by misadventure or in self-defence, the judges will usually permit (if not direct) a general verdict of acquittal.

III. Felonious homicide is an act of a very different nature from the former, being the killing of a human creature, of any age or sex, without justification or excuse. This may be done either by killing one's self, or another man: for the consideration of which, see the

Homily
Homan.

articles SELF-MURDER, MURDER, and MANSLAUGHTER.

HOMILY, in ecclesiastical writers, a sermon, or discourse, upon some point of religion, delivered in a plain manner, so as to be easily understood by the common people.—The word is Greek, *ομιλία*; formed of *ομιλεω*, *catus*, "assembling, or council."

At the time of the reformation, there were several of these homilies made and printed, and ordered to be read in such churches as were not provided with a sufficiently learned minister, in order to prevent unsound doctrine being taught in remote country places.

In the primitive church, homily rather meant a conference or conversation by way of question and answer, which made part of the office of a bishop, till the 5th century, when the learned priests were allowed to preach, catechise, &c. in the same manner as the bishops used to do.

There are still extant several fine homilies, composed by the ancient fathers, particularly St Chrysostom and St Gregory.

DE HOMINE *Replegiando*. See *Falsè-IMPRISONMENT*.

The writ *de homine replegiando* lies to replevy a man out of prison, or out of the custody of any private person (in the same manner that chattels taken in any distress may be replevied), upon giving security to the sheriff, that the man shall be forthcoming to answer any charge against him. And if the person be conveyed out of the sheriff's jurisdiction, the sheriff may return that he is *eigoined, elongatus*; upon which a process issues (called *capias in withernam*), to imprison the defendant himself, without bail or mainprize, till he produces the party. But this writ is guarded with so many exceptions, that it is not an effectual remedy in numerous instances, especially where the crown is concerned. See *HABEAS CORPUS*.

HOMMOC, a name given by mariners to a hillock, or small eminence of land, resembling the figure of a cone, and appearing on the sea coast of any country.

HOMO, **MAN**, is ranked by Linnæus under the order of primates; and characterised by having four parallel foreteeth both in the upper and lower jaw, and two mammae on the breast. The species, according to this author, are two, viz. the *homo sapiens*, and the *homo troglodytes*.

He subdivides the *homo sapiens* into five varieties, viz. the American, the European, the Asiatic, the African, and what he calls the *manfrous*. See *MAN*.

The *troglodytes*, or orang outang, is a native of Ethiopia, Java, and Amboina. His body is white; he walks erect; and is about one half the ordinary human size. He generally lives about 25 years. He conceals himself in caves during the day, and searches for his prey in the night. He is said to be exceedingly sagacious, but is not endowed with the faculty of speech. See *TROGLODYTES*, *ORANG OUTANG*, and *SIMIA*.

HOMOLOGOUS, in geometry, an appellation given to the corresponding sides and angles of similar figures, as being proportional to each other.

HONAN, a province of China, bounded on the north by that of Pecheli and Chanfi, on the west by Chanfi, on the south by Houquang, and on the east

by Chantong. It is watered by the river Holiango; and besides the forts, castles, and garrisoned towns, it contains eight cities of the first rank, and 102 of the second and third. The air of this province is very temperate and healthful, abounding with wheat, rice, pastures, cattle, oranges of several sorts, pomegranates, and all sorts of European fruits. Towards the west it is mountainous and woody, and towards the east it is all cultivated like a garden. It is well watered with fountains, brooks, and rivers, which render it very pleasant.

HONDERKOOTER (Melchior), a famous Dutch painter born at Utrecht, excelled in painting animals, and especially birds. His pictures sell at a high price, and are much sought after. He died at Utrecht in 1695, aged 59.

HONDURAS, a province of North America in New Spain, lying on the North Sea, being about 370 miles in length, and 200 in breadth; it was discovered by Christopher Columbus in the year 1502. The English have been possessed of the logwood country on the bay of Honduras a great while, and cut large quantities every year. The Mosquito native Americans live in the eastern parts; and being independent of the Spaniards, have entered into treaties with the English, and serve them in several capacities. This province is watered by several rivers, which enrich the country by their inundations; and it is very fertile in Indian corn. It is said there are some mines of gold and silver in this province. Valadolid is the capital town.

HONE, a fine kind of white stone, used for setting razors, pen-knives, and the like.

HONEY, a sweet vegetable juice, collected by the bees from the flowers of various plants, and deposited in the cells of the comb; from which it is extracted either by spontaneous percolation through a sieve in a warm place, the comb being separated and laid thereon, or by expression. That which runs spontaneously is purer than that which is expressed, a quantity of the wax and other matters being forced out along with it by the pressure. The best sort of honey is of a thick consistence, a whitish colour inclining to yellow, an agreeable smell, and pleasant taste; both the colour and flavour are said to differ in some degree, according to the plants which the bees collect it from. It is supposed that honey is merely the juice of the flower perspiring, and becoming inspissated thereon; and that the bee takes it up with its proboscis, and carries it to be deposited in its waxen cells, with which the young bees are to be fed in summer, and the old ones in winter: but it is certain, that honey can be procured by no other method of collecting this juice than by the bees. The honey wrought by the young bees, and that which is permitted to run from the comb without heat or pressure, is white and pure, and called *virgin's honey*. The honey of old bees, and that which is forced from the comb by heat or pressure, is yellow, from the wax. Honey produced where the air is clear and hot, is better than that where the air is variable and cold.—The honey of Narbonne in France, where rosemary abounds, is said to have a very manifest flavour of that plant, and to be imitable by adding to other honey an infusion of rosemary flowers.—Honey, considered as a medicine, is a very useful detergent and aperient, powerfully dissolving

Honder-
kooter
Honey.

vificid

Honey-dew.

vifcid juices, and promoting the expectoration of tough phlegm: in fome particular confutations it has an inconvenience of griping, or of proving purgative; this is faid to be in fome meafure prevented by previously boiling the honey.

HONEY-Dew, a fweet faccharine fubftance founded on the leaves of certain trees, of which bees are very fond, by the husbandmen fuppofed to fall from the heavens like common dew. This opinion hath been refuted, and the true origin of this and other faccharine dews fhewn by the Abbe Boiffier de Sauvages, in a memoir read before the Society of Sciences at Montpellier, "Chance (fays the Abbe) afforded me an opportunity of feeling this juice in its primitive form on the leaves of the holm-oak: thefe leaves were covered with thoufands of fmall round globules, or drops, which, without touching one another, feemed to point out the pore from whence each of them had proceeded. My tafte informed me that they were as fweet as honey: the honey-dew on a neighbouring bramble did not refemble the former, the drops having run together; owing either to the moiſture of the air which had diluted them, or to the heat which had expanded them. The dew became more viſcous, and lay in large drops, covering the leaves; in this form it is uſually ſeen.

"The oak had at this time two forts of leaves; the old, which were ſtrong and firm; and the new, which were tender, and newly come forth. The honey-dew was found only on the old leaves; tho' theſe were covered by the new ones, and by that means ſheltered from any moiſture that could fall from above. I obſerved the fame on the old leaves of the bramble, while the new leaves were quite free from it. Another proof that this dew proceeds from the leaves is, that other neighbouring trees not furniſhed with a juice of this kind, had no moiſture on them; and particularly the mulberry, which is a very particular circumſtance, for this juice is a deadly poiſon to ſilk-worms. If this juice fell in the form of a dew, miſt, or fog, it would wet all the leaves without diſtinction, and every part of the leaves, under as well as upper. Heat may have ſome ſhare in its production: for though the common heat promotes only the tranſpiration of the more volatile and fluid juices, a ſultry heat, eſpecially if reflected by clouds, may ſo far dilate the veſſel, as to produce a more viſcous juice, ſuch as the honey-dew.

"The ſecond kind of honey-dew, which is the chief reſource of bees after the ſpring-flowers and dew by tranſpiration on leaves are paſt, owes its origin to a ſmall infect called a *vine-fretter*; the excrement ejected with ſome force by this infect makes a part of the moſt delicate honey known in nature. See **APHIS**.

"Theſe vine-fretters reſt during ſeveral months on the barks of particular trees, and extract their food by piercing that bark, without hurting or deforming the tree. Theſe infects alſo cauſe the leaves of ſome trees to curl up, and produce galls upon others. They ſettle on branches that are a year old. The juice, at firſt perhaps hard and crabbed, becomes, in the bowels of this infect, equal in ſweetneſs to the honey obtained from the flowers and leaves of vegetables; excepting that the flowers may communicate ſome of their eſſential oil to the honey, and this may give it a peculiar flavour, as happened to myſelf by planting a

hedge of roſemary near my bees at Sauvages: the honey has taſted of it ever ſince, that ſhrub continuing long in flower.

"I have obſerved two ſpecies of vine-fretters, which live unſheltered on the bark of young branches; a larger and a leſſer.

"The leſſer ſpecies is of the colour of the bark upon which it feeds, generally green. It is chiefly diſtinguiſhed by two horns, or ſtrait, immovable, fleſhy ſubſtances, which riſe perpendicularly from the lower ſides of the belly, one on each ſide. This is the ſpecies which live on the young branches of bramble and elder.

"The larger ſpecies is double the ſize of the other; is of a blackiſh colour; and inſtead of the horns which diſtinguiſh the other, have in the ſame part of the ſkin a ſmall button, black and ſhining like jet.

"The buzzing of bees in a tuft of holm-oak, made me ſuſpect that ſomething very intereſting brought fo many of them thither. I knew that it was not the ſeaſon for expecting honey-dew, nor was it the place where it is uſually found; and was ſurprized to find the tuft of leaves and branches covered with drops which the bees collected with a humming noiſe. The form of the drops drew my attention, and led me to the following diſcovery. Inſtead of being round like drops which had fallen, each formed a ſmall longiſh oval. I ſoon perceived from whence they proceeded. The leaves covered with theſe drops of honey were ſituated beneath a ſwarm of the larger black vine-fretters; and on obſerving theſe infects, I perceived them from time to time raiſe their bellies, at the extremity of which there then appeared a ſmall drop of an amber colour, which they inſtantly ejected from them to the diſtance of ſome inches. I found by taſting ſome of theſe drops which I had caught on my hand, that it had the ſame flavour with what had before fallen on the leaves. I afterwards ſaw the ſmaller ſpecies of vine-fretters eject their drops in the ſame manner.

"This ejection is ſo far from being a matter of indifference to theſe infects themſelves, that it ſeems to have been wiſely inſtituted to procure cleanlineſs in each individual, as well as to preſerve the whole ſwarm from deſtruction; for preſſing as they do one upon another, they would otherwiſe ſoon be glued together, and rendered incapable of ſtirring.

"The drops thus ſpurred out fall upon the ground, if not intercepted by leaves or branches; and the ſpots they make on ſtones remain ſome time, unleſs waſhed off by rain. This is the only honey-dew that falls; and this never falls from a greater height than a branch where theſe infects can cluſter.

"It is now eaſy to account for a phenomenon which formerly puzzled me greatly. Walking under a lime-tree in the king's garden at Paris, I felt my hand wetted with little drops, which I at firſt took for ſmall rain. The tree indeed ſhould have ſheltered me from the rain, but I eſcaped it by going from under the tree. A ſeat placed near the tree ſhone with theſe drops. And being then unacquainted with any thing of this kind, except the honey-dew found on the leaves of ſome particular trees, I was at a loſs to conceive how ſo glutinous a ſubſtance could fall from the

leaves

Honey-dew.

Honey-
dew
Honour.

leaves in such small drops: for I knew that rain could not overcome its natural attraction to the leaves till it became pretty large drops; but I have since found, that the lime-tree is very subject to these vine-fretters.

"Bees are not the only insects that feast upon this honey; ants are equally fond of it. Led into this opinion by what naturalists have said, I at first believed that the horns in the lesser species of these vine-fretters had in their extremity a liquor which the ants went in search of: but I soon discovered that what drew the ants after them came from elsewhere, both in the larger and lesser species, and that no liquor is discharged by the horns.

"There are two species of ants which search for these insects. The large black ants follow those which live on the oaks and chestnut; the lesser ants attend those on the elder. But as the ants are not, like the bees, provided with the means of sucking up fluids; they place themselves near the vine-fretters, in order to seize the drop the moment they see it appear upon the anus; and, as the drop remains some time on the small vine fitters before they can cast it off, the ants have leisure to catch it, and thereby prevent the bees from having any share: but the vine-fretters of the oak and chestnut being stronger, and perhaps more plentifully supplied with juice, dart the drop instantly, so that the larger ants get very little of it.

"The vine-fretters finding the greatest plenty of juice in trees about the middle of summer, afford also at that time the greatest quantity of honey; and this lessens as the season advances, so that in the autumn the bees prefer it to the flowers then in season.

"Though these insects pierce the tree to the sap in a thousand places, yet the trees do not seem to suffer at all from them, nor do the leaves lose the least of their verdure. The husbandman therefore acts injudiciously when he destroys them."

HONEY-GUIDE, a curious species of cuckoo. See **CUCULUS**.

HONEY-SUCKLE. See **LONICERA**.

HONFLEUR, a considerable sea-port town of France, in Upper Normandy, with a good harbour, and trade in bone-lace. It is seated on the river Seine, in E. Long. o. 8. N. Lat. 17. 49.

HONITON, a town of Devonshire in England, seated near the river Otter, over which there is a bridge on the road from London to Exeter. A dreadful fire happened here in July 1747, which consumed three parts of the town, and the damage was computed at 43,000*l*. It sends two members to parliament; but being no corporation, a portrieve is the returning officer. It has one church, which is half a mile from the town, and a chapel within it; with about 400 houses, which are chiefly in one broad-paved street. Here is a large manufactory of bone-lace. W. Long. 3. 11. N. Lat. 50. 43.

HONOUR, a testimony of esteem or submission, expressed by words, actions, and an exterior behaviour, by which we make known the veneration and respect we entertain for any one on account of his dignity or merit. The word *honour* is also used in general for the esteem due to virtue, glory, and reputa-

tion. It is also used for *virtue* and *probity* themselves, and for an exactness in performing whatever we have promised; and in this last sense we use the term, *a man of honour*. But *honour* is more particularly applied to two different kinds of virtue; bravery in men, and chastity in women.—Virtue and Honour were deified among the ancient Greeks and Romans, and had a joint temple consecrated to them at Rome: but afterwards each of them had separate temples, which were so placed, that no one could enter the temple of Honour, without passing through that of Virtue; by which the Romans were continually put in mind, that virtue is the only direct path to true glory. Plutarch tells us, that the Romans, contrary to their usual custom, sacrificed to Honour uncovered; perhaps to denote, that wherever honour is, it wants no covering, but shews itself openly to the world.

HONOUR, or Rank.—The degrees of honour which are observed in Britain, may be comprehended under these two heads, viz. *nobiles majores*, and *nobiles minores*. Those included under the first rank are, archbishops, dukes, marquises, earls, viscounts, bishops, and barons; which are all distinguished by the respective ornaments of their escutcheons: and those of the last are baronets, knights, esquires, and gentlemen. There are some authors who will have baronets to be the last under the first rank; and their reason is, because their honour is hereditary, and by patent, as that of the nobility. See **COMMONALTY** and **NOBILITY**.

HONOURS of War, in a siege, is, when a governor, having made a long and vigorous defence, is at last obliged to surrender the place to the enemy, for want of men and provisions, and makes it one of his principal articles to march out with the *honours of war*; that is, with shouldered arms, drums beating, colours flying, and all their baggage, &c.

Military HONOURS. All armies salute crowned heads in the most respectful manner, drums beating a march, colours and standards dropping, and officers saluting. Their guards pay no compliment, except to the princes of the blood; and even that by courtesy, in the absence of the crowned head.

To the commander in chief the whole line turns out without arms, and the camp-guards beat a march, and salute.

To generals of horse and foot, they beat a march, and salute.

Lieutenant-generals of ditto, three ruffs, and salute.

Major-generals of ditto, two ruffs, and salute.

Brigadiers of ditto, rested arms, one ruff, and salute.

Colonels of ditto, rested arms, and no beating. Centinels rest their arms to all field-officers, and shoulder to every officer.

All governors, that are not general-officers, shall, in all places where they are governors, have one ruff, with rested arms; but for those who have no commission as governors, no drum shall beat.

Lieutenant-governors shall have the main-guard turned out to them with shouldered arms.

Prussian Honours of War, chiefly imitated by most powers in Europe, are,

To the king, all guards beat the march, and all officers salute.

Field-

Honour,
Honours.

Honour.

Field-marshal received with the march, and saluted in the king's absence.

General of horse or foot, four ruffs; but if he commands in chief, a march and salute.

Mil. Dis.

Lieutenant-generals of horse or foot, commanding or not, guards beat three ruffs.

Major-generals of horse or foot, two ruffs.

Officers, when their guards are under arms, and a general makes a signal, must reit to him, but not beat; when not got under arms, and a signal made, only stand by their arms.

Village-guards go under arms only to the king, field-marshal, general of horse and foot, and to the general of the day.

Generals guards go under arms only to the king, field-marshal, and the general over whom they mount.

Commanding officers of regiments and battalions, their own quarter and rear guards to turn out; but not to other field-officers, unless they are of the day.

Generals in foreign service, the same.

HONOURS paid by Centinels. Field-marshal; two centinels with ordered firelocks, at their tent or quarters.

Generals of horse or foot; two centinels, one with his firelock shouldered, the other ordered.

Lieutenant-generals; one, with firelock ordered.

Major-generals; one, with firelock shouldered.

The first battalion of guards go under arms to the king only; not to stand by, nor draw up in the rear of their arms to any other; nor to give centinels to foreigners. Second and third battalions draw up behind their arms to the princes, and to field-marshal; but when on grenadier-guards or out-posts, they turn out, as other guards do, to the officers of the day. They give one centinel with shouldered arms to the princes of the blood, and to field-marshal when they lie alone in garrison.

Court of Honour. See Court of CHIVALRY.

Fountain of Honour. The king is so styled, as being the source of honours, dignities, &c. See PREROGATIVE.

It is impossible that government can be maintained without a due subordination of rank; that the people may know and distinguish such as are set over them, in order to yield them their due respect and obedience; and also that the officers themselves, being encouraged by emulation and the hopes of superiority, may the better discharge their functions: and the law supposes, that no one can be so good a judge of their several merits and services, as the king himself who employs them. It has therefore intrusted him with the sole power of conferring dignities and honours, in confidence that he will bestow them upon none but such as deserve them. And therefore all degrees of nobility, of knighthood, and other titles, are received by immediate grant from the crown: either expressed in writing, by writs or letters patent, as in the creations of peers and baronets; or by corporeal investiture, as in the creation of a simple knight.

From the same principle also arises the prerogative of erecting and disposing of offices: for honours and offices are in their nature convertible and synonymous. All offices under the crown carry in the eye of the law an honour along with them; because they imply

Vol. V.

a superiority of parts and abilities, being supposed to be always filled with those that are most able to execute them. And, on the other hand, all honours in their original had duties or offices annexed to them: an earl, *comes*, was the conservator or governor of a county; and a knight, *miles*, was bound to attend the king in his wars. For the same reason therefore that honours are in the disposal of the king, offices ought to be so likewise; and as the king may create new titles, so may he create new offices: but with this restriction, that he cannot create new offices with new fees annexed to them, nor annex new fees to old offices; for this would be a tax upon the subject, which cannot be imposed but by act of parliament. Wherefore, in 13 Hen. IV. a new office being created by the king's letters patent for measuring cloths, with a new fee for the same, the letters patent were, on account of the new fee, revoked and declared void in parliament.

Upon the same, or a like reason, the king has also the prerogative of conferring privileges upon private persons. Such as granting place or precedence to any of his subjects, as shall seem good to his royal wisdom: or such as converting aliens, or persons born out of the king's dominions, into denizens; whereby some very considerable privileges of natural-born subjects are conferred upon them. Such also is the prerogative of erecting corporations; whereby a number of private persons are united and knit together, and enjoy many liberties, powers, and immunities in their politic capacity, which they were utterly incapable of in their natural.

Maid of Honour, are six young ladies in the household of the queen and princess-royal; the salary of those of a queen are 300l. per ann. each, and those of a princess dowager of Wales, 200l.

Honour-Point, in heraldry, is that next above the centre of the escutcheon, dividing the upper part into two equal portions.

HONOURABLE, a title conferred on the younger sons of earls, the sons of viscounts and barons; as also on such persons as have the king's commission, and upon those who enjoy places of trust and honour.

HONOURARY, something done or conferred upon any one, to do him honour. See the article Honour.

Honourary is sometimes understood of a person who bears or possesses some post or title, only for the name's sake, without doing any thing of the functions belonging to it, or receiving any advantage from it: thus we say, honourary counsellors, honourary fellows, &c.

Honourary is also used for a lawyer's fee, or a salary given to public professors in any art or science.

HOOD (Robin), a famous outlaw and deer-stealer, who chiefly harboured in Sherwood forest in Nottinghamshire. He was a man of family, which by his pedigree appears to have had some title to the earldom of Huntingdon; and played his pranks about the latter end of the 12th century. He was famous for archery, and for his treatment of all travellers who came in his way; levying contributions on the rich, and relieving the poor. Falling sick at last, and requiring to be bled, he is said to have been betrayed and bled to death. He died in 1247; and was buried

21 E

ried

Honour

Hood.

Hood

Hooke.

ried at Kirklees in Yorkshire, then a Benedictine monastery, where his gravestone is still shewn.

HOON-Island, one of the *MARQUESAS Islands* in the South Sea. It was discovered in April 1774 by captain Cook, who gave it that name from the person who first saw the land. It is the most northerly of the cluster, and lies in S. Lat. 9. 26. W. Long. 139. 13.

HOOF, the horny substance that covers the feet of divers animals, as oxen, horses, &c.

HOOR-bound, in Fariery. See there, § xlii.

HOOF (Peter Cornelius Van), an eminent historian and poet, born at Amsterdam in 1581. He was lord of Muyden, judge of Goyland, and knight of the order of St Michael. He died at the Hague in 1647. He wrote, 1. An excellent history of the Netherlands, from the abdication of Charles V. to the year 1588. 2. Several Comedies, and other works. By these he acquired such reputation, that the Flemings considered him as the Homer and Tacitus of the Netherlands.

HOOGUESTRATEN, a town of the Netherlands in Dutch Brabant, and capital of a county of the same name. E. Long. 4. 41. N. Lat. 51. 25.

HOOSKE (Robert), a very eminent English mathematician and philosopher, was the son of Mr John Hooke minister of Freshwater in the Isle of Wight, where he was born in 1635. He very early discovered a genius for mechanics, by making curious toys with great art and dexterity. He was educated under Dr Busby in Westminster school; where he not only acquired a competent share of Greek and Latin, together with an insight into Hebrew and some other Oriental languages, but also made himself master of a good part of Euclid's elements. About the year 1653 he went to Christ-church in Oxford, and in 1655 was introduced to the Philosophical Society there; where, discovering his mechanic genius, he was first employed to assist Dr Willis in his operations in chemistry, and afterwards recommended to the honourable Robert Boyle, Esq; whom he served several years in the same capacity. He was also instructed in astronomy about this time by Dr Seth Ward, Savilian professor of that science; and from henceforward distinguished himself by many noble inventions and improvements of the mechanic kind. He invented several astronomical instruments, for making observations both at sea and land; and was particularly serviceable to Mr Boyle in completing the invention of the air-pump. Sir John Cutler having founded a mechanic school in 1664, he settled an annual stipend on Mr Hooke for life, intrusting the president, council, and fellows, of the Royal Society to direct him with respect to the number and subject of his lectures; and on the 11th of January 1664-5, he was elected by that society, curator of experiments for life, with an additional salary. In 1666 he produced to the Royal Society a model for rebuilding the city of London destroyed by fire, with which the society was well pleased; and the lord mayor and aldermen preferred it to that of the city surveyor, though it happened not to be carried into execution. It is said, by one part of this model of Mr Hooke's, it was designed to have all the chief streets, as from Leaden-hall to Newgate, and the like, to lie in exact straight lines, and all the

Hooke.

other cross-streets turning out of them at right angles, with all the churches, public buildings, markets, &c. in proper and convenient places. The rebuilding of the city according to the act of parliament requiring an able person to set out the ground to the proprietors, Mr Hooke was appointed one of the surveyors; in which employment he got most of part of his estate, as appeared pretty evident from a large iron chest of money found after his death, locked down with a key in it, and a date of the time, which shewed it to have been so shut up above 30 years.—Mr Oldenburg, secretary to the Royal Society, dying in 1677, Mr Hooke was appointed to supply his place, and began to take minutes at the meeting in October, but did not publish the Transactions. In the beginning of the year 1687, his brother's daughter, Mrs Grace Hooke, who had lived with him several years, died; and he was so affected with grief at her death, that he hardly ever recovered it, but was observed from that time to become less active, more melancholy, and, if that could be, more cynical than ever. At the same time, a chancery suit in which he was concerned with Sir John Cutler, on account of his salary for reading the Cutlerian lectures, made him very uneasy, and increased his disorder. In 1691, he was employed in forming the plan of the hospital near Hoxton, founded by Robert Aik alderman of London, who appointed archbishop Tillotson one of his executors; and in December the same year, Hooke was created doctor of Physic, by a warrant from that prelate. In July 1696, the chancery suit with Sir John Cutler was determined in his favour, to his inexplicable satisfaction. His joy on that occasion was found in his diary thus expressed; *DOMINUS EST: that is, Deo, Optimo, Maximo, sit honor, laus, gloria, in secula seculorum, Amen.* "I was born on this day of July 1635, and God has given me a new birth: may I never forget his mercies to me! while he gives me breath may I praise him!"—In the same year 1696, an order was granted to him for repeating most of his experiments at the expence of the Royal Society, upon a promise of his finishing the accounts, observations, and deductions from them, and of perfecting the description of all the instruments contrived by him; but his increasing illness, and general decay, rendered him unable to perform it. He continued some years in this wretched condition; and thus languishing till he was quite emaciated, he died March 3d, 1702, at his lodgings in Gresham college, and was buried in St Helen's church, Bishopgate street; his corpse being attended by all the members of the Royal Society then in London.

As to the character of Mr Hooke, it is not in all respects one of the most amiable. He made but a despicable figure as to his person, being short of stature, very crooked, pale, lean, and of a meagre aspect, with dark brown hair, very long, and hanging over his face uncut and lank. Suitable to his person, his temper was penurious, melancholy, mistrustful; and, though possessed of great philosophical knowledge, he had so much ambition, that he would be thought the only man who could invent or discover; and thus frequently laid claim to the inventions and discoveries of others, while he boasted of many of his own which he never communicated. In the religious part of his character

Hooker.

character he was so far exemplary, that he always expressed a great veneration for the Deity; and seldom received any remarkable benefit in life, or made any considerable discovery in nature, or invented any useful contrivance, or found out any difficult problem, without setting down his acknowledgment to God, as many places in his diary plainly shew. He frequently studied the sacred writings in the original; for he was acquainted with the ancient languages, as well as with all parts of the mathematics.—He wrote, 1. *Lectioes Cutlerianæ*. 2. *Micrographia*, or Descriptions of minute bodies made by magnifying glasses. 3. A description of helioscopes. 4. A description of some mechanical improvements of lamps and water-works, quarto. 5. Philosophical collections. After his death were published, 6. Poetical works collected from his papers by Richard Waller secretary to the Royal Society.

HOOKER (John), *alias* VOWELL, was born in Exeter, about the year 1524, the second son of Robert Hooker, who in 1529 was mayor of that city. He was instructed in grammar learning by Dr Moreman, vicar of Menhinit in Cornwall, and thence removed to Oxford; but to what college is uncertain. Having left the university, he travelled to Germany, and resided some time at Cologne, where he kept exercises in law, and probably graduated. Thence he went to Strasburg, where he studied divinity under the famous Peter Martyr. He now returned to England, and soon after visited France, intending to proceed to Spain and Italy; but was prevented by a declaration of war. Returning therefore again to England, he fixed his residence in his native city, where, having married, he was in 1554 elected chamberlain, being the first person who held that office, and in 1571 represented his fellow-citizens in parliament. He died in the year 1601, and was buried in the cathedral church at Exeter. He wrote, among other works, 1. Order and usage of keeping of parliaments in Ireland. 2. The events of comets or blazing stars, made upon the sight of the comet Pagonia, which appeared in November and December 1577. 3. An addition to the chronicles of Ireland from 1546 to 1568; in the second volume of Holinshed's chronicle. 4. A description of the city of Exeter, and of the sondrie assaults given to the same; in Holinshed's chron. vol. iii. 5. A book of ensignes. 6. Translation of the history of the conquest of Ireland from the Latin of Giraldus Cambrensis; in Holinshed's chron. vol. ii. 7. *Synopsis chorographica*, or an historical record of the province of Devon; never printed.

HOOKER (Richard), a learned divine, was born at Heavy-tree, near Exeter, in the year 1553. Some of his ancestors were mayors of that city, and he was nephew to John HOOKER the historian. By this uncle he was first supported at the university of Oxford, with the addition of a small pension from Dr Jewel, bishop of Salisbury, who in 1561 got him admitted one of the clerks of Corpus Christi college. In 1573 he was elected scholar. In 1577 he took the degree of master of arts, and was admitted fellow the same year. In July 1579, he was appointed deputy professor of the Hebrew language. In October, in the same year, he was for some trivial misdemeanour expelled the college, but was immediately restored.

Hooker
Hooper.

In 1581 he took orders; and, being appointed to preach at St Paul's cross, he came to London, where he was unfortunately drawn into a marriage with Joan Churchman, the termagant daughter of his hostess. Having thus lost his fellowship, he continued in the utmost distress till the year 1584, when he was presented by John Cheney, Esq. to the rectory of Drayton-Baucham in Buckinghamshire. In this retirement he was visited by Mr Edwin Sandys, and Mr George Crammer, his former pupils. They found him, with a Horace in his hand, tending some sheep in the common field, his servant having been ordered home by his sweet Xantippe. They attended him to his house; but were soon deprived of his company by an order, from his wife Joan, for him to come and rock the cradle. Mr Sandys's representation to his father, of his tutor's situation, procured him the mastership of the Temple. In this situation he met with considerable molestation from one Travers, lecturer of the Temple, and a bigoted Puritan, who in the afternoon endeavoured to confute the doctrine delivered in the morning. From this disagreeable situation he solicited archbishop Whitgift to remove him to some country retirement, where he might prosecute his studies in tranquillity. Accordingly, in 1591, he obtained the rectory of Boscomb in Wiltshire, together with a prebend in the church of Salisbury, of which he was also made sub-dean. In 1594 he was presented to the rectory of Bishopbourne in Kent, where he died in the year 1600. He was buried in his own parish-church, where a monument was erected to his memory by William Cooper, Esq. He was a meek, pious, and learned divine. He wrote, 1. Ecclesiastical politie, in eight books. fol. 2. A discourse of justification, &c. with two other sermons, Oxf. 1612, 4to. Also several other sermons printed with the Ecclesiastical Politie.

HOOKER, in naval architecture, a vessel much used by the Dutch, built like a pink, but rigged and masted like a hoy.

Hookers will lie nearer a wind than vessels with cross-fails can do. They are from 50 to 200 tons burthen, and with a few hands will sail to the East Indies.

HOOP, a piece of pliant wood, or iron, bent into a circular form, commonly used for securing calks, &c. *Driving a Hoop*, a boyish exercise, of good effect in rendering the limbs pliable, and for strengthening the nerves.

HOOPER (John), bishop of Worcester, and a martyr in the Protestant cause, was born in Somersetshire, and educated at Oxford, probably in Merton-college. In 1518 he took the degree of bachelor of arts, and afterwards became a Cistercian monk; but at length, disliking his fraternity, he returned to Oxford, and there became infected with Lutheranism. In 1539 he was made chaplain and house-steward to Sir John Arundel, who afterwards suffered with the protector in the reign of Edward VI. But *that very catholic knight*, as Wood calls him, discovering his chaplain to be a heretic, Hooper was obliged to leave the kingdom. After continuing some time in France, he returned to England, and lived with a gentleman called *Seintlow*; but, being again discovered, he escaped in the habit of a sailor to Ireland; thence

Hooper embarked for the continent, and fixed his abode in Switzerland.

When king Edward came to the crown, Mr Hooper returned once more to his native country. In 1550, by his old patron Sir John Arundel's interest with the earl of Warwick, he was consecrated bishop of Gloucester; and in 1552 was nominated to the see of Worcester, which he held in commendam with the former. But queen Mary had scarce ascended the throne, before his lordship was imprisoned, tried, and, not choosing to recant, condemned to the flames. He suffered this terrible death at Gloucester, on the 9th of February 1554, being then near 60 years of age. He was an avowed enemy to the church of Rome, and not perfectly reconciled to what he thought remnants of Popery in the church of England. In the former reign he had been one of Bonner's accusers, which sufficiently accounts for his being one of queen Mary's first sacrifices to the *holy see*. He was a person of good parts and learning, as may be found in Fox's *Book of Martyrs*.

HOOPER (George), a very learned writer, bishop of Bath and Wells, was well skilled in mathematics, and in the eastern learning and languages. He sat in those fees above 24 years, often refused a seat in the privy council, and could not be prevailed upon to accept of the bishopric of London on the death of bishop Compton. He wrote, 1. The church of England free from the imputation of Popery. 2. A discourse concerning Lent. 3. New danger of Presbytery. 4. An inquiry into the state of the ancient measures. 5. *De Valentinianorum heresi conjectura*. 6. Several sermons; and other works.

HOOPING-COUGH. See (the Index subjoined to) MEDICINE.

HOOPOE. See UPUPA.

HOORNBECK (John), professor of divinity in the universities of Leyden and Utrecht, was born at Haerlem in 1617. He understood the Latin, Hebrew, Chaldaic, Syriac, Rabbinical, Dutch, German, English, French, and Italian languages; and published many works, among which are, 1. A refutation of Socinianism, in 3 vols 4to. 2. A treatise for the conviction of the Jews. 3. Of the conversion of the Heathens. 4. Theological institutions, &c. which are written in Latin. Mr Bayle represents him as a complete model of a good pastor and divinity professor.

HOP, in botany. See HUMULUS.

New land is found to succeed better with hops than old; and on this principle they are very cautious in their plantations in Kent, and look forward for the after-produce. When they make a new hop-ground, they plant it with apple-trees at a large distance asunder, and with cherry-trees between: by this means, when the hops have grown ten years, which they judge as much as they will do well, they place their account in the cherry-trees, which bear large crops: these they gather for about 30 years, and then they cut them up, and depend upon their apple-trees only; which they find very large and strong by that time.

The dry stalks of hops should be burnt on the ground in winter, covering them with a little fresh earth as they burn. This makes together an excellent compost, to make the hills of. The land must be dug or plow-

ed well, and laid very even; and then the places for the hills marked out by a line, and a stick put in every place where one is to be. A thousand hills may be made in an acre of ground, and six or seven plants set on every hill. From six to nine feet should be allowed between every hill, and the grounds in the hills should be better and richer than the common earth. Some plant hops in March and April, but the most experienced people prefer the month of October, because they will then strike firm roots, and be strong and vigorous against spring. The largest plants are to be chosen; and it is best to procure them from some rich ground, where the hills have been laid high; they should be about eight or ten inches long, and have three or four joints or buds a-piece; the holes for planting them are to be dug eight or ten inches deep, and about a foot over; and in each of these holes four plants are to be set, one in each corner: they may be covered an inch deep over the top, if planted in October; but in spring, when they have shot from the joints, then they must not be buried: after this, the ground must be carefully kept clear of weeds.

Dressing of Hops. This is preparing the ground in winter and spring for the making a good summer-crop. In doing this, the hills upon which the plants stand must be all pulled down, and undermined on every side, till the spade comes near the principal root; then shake off or remove with the hand the loose mould from the upper or loose roots, that you may see where the new roots grow out of the old sets. The old sets are to be carefully preserved, but the other roots may be cut away. Whatever time the hills are pulled down, the roots must not be cut till March. When the young hops are dressed for the first time, all the roots are to be cut away that grew the year before, and the sets are to be cut off within one inch of the same; and every year after, they must be cut as close as may be to the old roots; but to a weak hop, some of the shoots are to be left at the dressing. Those roots of the plant which grow downwards, are never to be injured, but only those which run horizontally are to be cut. The old roots and the young ones may be easily distinguished, in that the old ones are always red, and the young white. If there are by accident any wild hops got among the rest, the places where they grow are to be marked with sticks, or otherwise, at the time of their being gathered; and after this, at the time of dressing the ground, that whole hill is to be destroyed, and a new one made with new plants in the room of it. When the roots are cut and dressed, the rich compost is to be put to them; and the hills must not be made too high at first, lest they hinder the young shoots.

Gathering and drying of Hops. Hops blow in the latter end of July; in the beginning of August they bell; and they are sometimes ripe at the beginning of September, sometimes later. When they begin to change colour, are easily pulled to pieces, and their seeds look brown within them, they are ripe; and they are then to be gathered as quick as possible, for the least blast of wind will hurt them at this time.

The manner of gathering hops, is to take down four hills standing together in the midst of the garden, and to cut the roots even with the ground, then lay the ground level; and when it is swept clean, it makes

Hop.

a floor, on which the hops may be laid and picked. The hop-plants are first unwound from the poles, and then the people sit round and pick off the hops into baskets.

Care should be taken to dry the hops as fast as they are picked, for in lying undried they are apt to heat and change colour very quickly. If the quantity picked be so large, that the kiln in which they are to be dried is over-stocked, they must be spread thin upon a floor, and they will keep two or three days in that manner without any harm. Indeed, where the quantity is but small, there is no need to have recourse to the kiln at all; for they will dry much better than any other way, by being laid thin upon a floor, and often turned. The drying of hops is the most material part of their manufacture: for if they be ill dried, they lose all their agreeable flavour; and great caution should be used, that they be all equally dried.

Bagging of Hops, a term used by the farmers, who cultivate hops, for the last thing they have to do with them in order to bring them to market; that is, the putting them up in large bags of coarse cloth, for carriage. When the hops have been picked and dried in the ool, or tin-floor, they are so brittle that they would break to pieces and be spoiled if they were immediately to be put up; they are therefore to lie together three weeks, or thereabouts, that they may become tough: if they are covered from the air by blankets in the heap, they may be bagged much sooner than if left open.

The manner of bagging them is this. A hole is made in an upper-floor, so large that a man may easily go up and down it; then a bag is fitted to the mouth of the bag, and so firmly sewed on, that it cannot be torn off; the bag is then let down through the hole, and the hoop remaining above, stops it from being pulled quite through, being larger than the hole: a few hops are to be first thrown into the bag, and a person below is to take up a parcel of these in each corner of the bag, tying it with a packthread; this makes a sort of tassels, by which the bags are afterwards the easier managed and turned about. When this is done, one man must go down into the bag, and, while another calls in the hops, he must tread them down equally every way with his feet; when the bag is in this manner filled, it is to be ripped from the hoop, and sewed up, leaving two tassels at the corners, as at the bottom. A bag of hops thus prepared, may be kept for several years in a dry place.

Uses, &c. The tops of this plant, being of a cooling quality, are eaten, when boiled, as an emollient. A decoction of hop-flowers is also accounted an antidote against poison; cures the itch, as well as the syph thereof; and is esteemed excellent in choleric and pestilential fevers. The heads and tendrils are good in the scurvy and most cutaneous diseases. Juleps and apozems are also prepared with hops for hypochondriacal and hysterical affections, and to promote the menses: but the chief use of this plant consists in preserving beer and other malt-liquors (in which the flower of this plant is a principal ingredient) from turning sour, and rendering it wholesome and grateful to the taste, &c.

Hops were introduced about 250 years ago, from Flanders, and from that time have been assiduously

cultivated in this kingdom. The duties arising from them are reckoned about 55,000*l. per annum*, for which reason all public brewers are enjoined under a severe penalty to use no other bitter than hops.

The benefits derived from hops are subject to great uncertainty, no plant being more exposed to accidents; and, independent of this, too great fertility is to the industrious owner sometimes as fatal as too slender a crop. But those who have money, and of course are able to wait for a market, avail themselves of both. The great hop-planter, if a man of skill and substance, seldom fails of making, or rather earning a large estate. He is continually attentive to his grounds; and by that attention provides for the accurate culture of them, at a small, or at least a moderate expence. In a common year, his profits are considerable. In a year of plenty, he lays by a flock; and when, in the course of four or five years, crops in general fail, his stock fetches a large price, and he has a sure sale. It hath been computed by those who are esteemed the best judges, that in an acre of hops, producing to the value of 30*l.* one moiety goes clear into the pocket of the proprietor, and that the other moiety of it goes in discharge of the rent, tythe, and all other expences, except the duty by excise, which is, however, drawn back on exportation. The duties on hops imported are so high as to prevent their coming in, except in a time of extreme scarcity, when the brewery might be otherwise injured; and in many other respects provisions have been made by law to render the proprietors of so precarious a commodity as safe as possible.—The destroying hops while growing, hath been made felony without benefit of clergy.

HOPKINS (Ezekiel), bishop of Derry in Ireland, was the son of an obscure clergyman in Devonshire; and was for some time a chorister of Magdalen college, Oxford, and usher of the adjoining school. He was afterwards a Presbyterian minister, and was extolled as an excellent preacher. John, lord Roberts, happening to hear him preach, was so pleased with his person, his discourse, and his manner, that he retained him as his chaplain, when he was sent in quality of lord lieutenant into Ireland, and preferred him to the deanery of Raphoe; and, on his being recalled, so strongly recommended him to his successor, that he was soon preferred to the bishopric at Raphoe, whence he was translated to Derry. During the war under the earl of Tyrconnel, at the revolution, he withdrew into England; and was chosen minister of St Mary, Aldermanbury, in London, where he died in 1690. His sermons, his exposition of the ten commandments, and that of the Lord's prayer, are much esteemed. His works were printed together in 1710, folio. He was the father of Mr Charles Hopkins, several of whose poetical pieces are in Dryden's *Miscellanies*.

HOR, a mountain, or mountainous tract of Arabia Petræa, situated in that circuit which the Israelites took to the south and south-east of Edom in their way to the borders of Moab: on this mountain Aaron died. The inhabitants were called *Horites*. This tract was also called *Seir*, either from a native Horite, or from Esau, by way of anticipation from his hairy habit of body: whose posterity drove out the Horites.

HORAPOLLO, or HORUS APOLLO, a grammarian of Panopolis in Egypt, according to Suidas,

Hop
Horapollo.

Horatii
Hord.

who first taught at Alexandria, and then at Constantinople under the reign of Theodosius. There are extant under his name, two books on the hieroglyphics of the Egyptians; which Aldus first published in Greek in 1505, in folio; and they have often been published since, with a Latin version and notes. It is not certain, however, that the grammarian of Alexandria was the author of these books; they being rather thought to belong to another Horapollo of more ancient date: on which head, see *Fabricius's Bibliotheca Græca*.

HORATII, three Roman brothers, who, under the reign of Tullus Hostilius, fought against the three Curiatii, who belonged to the Albanian army. Two of the Horatii were first killed; but the third, by his address, successively slew the three Curiatii, and by this victory rendered the city of Alba subject to the Romans. See *Rome*.

HORATIUS, surnamed *Cocles* from his losing an eye in combat, was nephew to the consul Horatius Pulvillus, and descended from one of the three brothers who fought against the Curiatii. Porfenna, laying siege to Rome, drove the Romans from Janiculum; and pursued them to the wooden bridge over the Tiber, which joined the city to Janiculum. Largius, Herminius, and Horatius Cocles, sustained the shock of the enemy on the bridge, and prevented their entering the city with the Romans; but Largius and Herminius having passed the bridge, Horatius Cocles was left alone, and repulsed the enemy till the bridge was broken under him: he then threw himself armed into the Tyber, swam across the river, and entered Rome in triumph.

HORATIUS (Quintus Flaccus), the most excellent of the Latin Poets of the lyric and satyrical kind, and the most judicious critic in the reign of Augustus, was the grandson of a freedman, and was born at Venusium, 64 B. C. He had the best masters in Rome, after which he completed his education at Athens. Having taken up arms, he embraced the party of Brutus and Cassius, but left his shield at the battle of Philippi. Some time after, he gave himself up entirely to the study of polite literature and poetry. His talents soon made him known to Augustus and Mæcenas, who had a particular esteem for him, and loaded him with favours. Horace also contracted a strict friendship with Agrippa, Pollio, Virgil, and all the other great men of his time. He lived without ambition, and led a tranquil and agreeable life with his friends; but was subject to a fluxion in his eyes. He died at the age of 57. There are still extant his Odes, Epistles, Satires, and Art of Poetry; of which there have been a great number of editions. The best are those of the Louvre, in 1642, folio; of Paris, 1691, quarto; of Cambridge, 1699; and that with Bentley's emendations, printed at Cambridge in 1711.

HORD, in geography, is used for a company of wandering people, which have no settled habitation, but stroll about, dwelling in waggons, or under tents, to be ready to shift as soon as the herbage, fruit, and the present province, is eaten bare: such are several tribes of the Tartars, particularly those who inhabit beyond the Wolga, in the kingdom of Astracan and Bulgaria.

A hord consists of 50 or 60 tents, ranged in a circle,

and leaving an open place in the middle. The inhabitants in each hord usually form a military company or troop, the eldest whereof is commonly the captain, and depends on the general or prince of the whole nation.

HORDEUM, *BARLEY*, in botany, a genus of the triandria digynia class. The involucre consists of six leaves, and contains three flowers. There are eight species; only one of which, viz. the murinum, or wall-barley-grass, is a native of Britain. The native place of the vulgar, or common barley cultivated in our fields, is not known. For the culture, &c. of common barley, see *AGRICULTURE*, n° 118,—122.

HORDICALIA, or *HORDICOMIA*, in antiquity, a religious feast held among the Romans, wherein they sacrificed cattle big with young. This feast fell on April 15. on which day they sacrificed 30 cows with calf to the goddess Tellus or the Earth; part of them were sacrificed in the temple of Jupiter. The calves taken out of their bellies were burnt to ashes at first by the pontifices, afterwards by the eldest of the vestal virgins.

HOREB, or *OREB*, a mountain of Arabia Petrea, contiguous to and on the south side of mount Sinai; the scene of many miraculous appearances.

HOREHOUND, *BALLOTA*, or *Stachys*, in botany. See *MARRUBIUM*.

HORIZON, or *HORISON*, in geography and astronomy, a great circle of the sphere, dividing the world into two parts or hemispheres; the one upper and visible, the other lower and hid. The word is pure Greek, *ὁρίζων*, which literally signifies "bounding or terminating the sight;" being formed of *ὅρις*, *terminus*, *definitio*, "I bound, I limit;" whence it is also called *finitor*, "finisher."

The horizon is either *rational* or *sensible*.

Rational, *true*, or *astronomical* **HORIZON**, which is also called simply and absolutely the *horizon*, is a great circle, whose plane passes thro' the centre of the earth, and whose poles are the zenith and nadir. It divides the sphere into two equal parts, or hemispheres.

Sensible, *visible*, or *apparent* **HORIZON**, is a lesser circle of the sphere, which divides the visible part of the sphere from the invisible. Its poles, too, are the zenith and nadir: and consequently the *sensible horizon* is parallel to the *rational*; and it is cut at right angles, and into two equal parts, by the verticals.—The *sensible horizon* is divided into *eastern* and *western*. The *eastern* or *ortive horizon*, is that part of the horizon wherein the heavenly bodies rise. The *western* or *occidental horizon*, is that wherein the stars set. The altitude or elevation of any point of the sphere, is an arch of a vertical circle intercepted between it and the sensible horizon.

By *sensible horizon* is also frequently meant a circle, which determines the segment of the surface of the earth, over which the eye can reach; called also the *physical horizon*. In this sense we say, a spacious horizon, a narrow scanty horizon.

HORIZONTAL, something that relates to the horizon, is taken in the horizon, or on a level with the horizon.—We say, a horizontal plane, horizontal line, &c.

HORIZONTAL Dial, is that drawn on a parallel to the horizon; having its gnomon, or style, elevated ac-

Hordeu
Horizon

according to the altitude of the pole of the place it is designed for. Horizontal dials are, of all others, the most simple and easy. The manner of describing them, see under the article *DIAL*.

HORIZONTAL Line, in perspective, is a right line drawn through the principal point, parallel to the horizon: or, it is the intersection of the horizontal and perspective planes. See *PERSPECTIVE*.

HORIZONTAL Plane, is that which is parallel to the horizon of the place, or nothing inclined thereto.

The business of levelling, is to find whether two points be in the horizontal plane; or how much the deviation is. See *LEVELLING*.

HORIZONTAL Plane, in perspective, is a plane parallel to the horizon, passing through the eye, and cutting the perspective plane at right angles.

HORIZONTAL Projection. See *GEOGRAPHY*, n° 16, 19.

HORIZONTAL Range, or *Level Range*, of a piece of ordnance, is the line it describes, when directed parallel to the horizon or horizontal line. See *GUNNERY*, *passim*.

HORIZONTAL Moon. See *ASTRONOMY*, n° 172.

HORMINUM, CLARY; a genus of the gymnospermia order, belonging to the didynamia class of plants. There are several species; the most remarkable of which is the verbenacum, or common wild clary. It grows naturally on sandy and gravelly ground in many parts of Britain. It has sometimes been called *oculus Christi*, from the supposed virtues of its seeds in clearing the sight, which it does by its viscous covering; for when any thing happens to fall into the eye, if one of the seeds is put in at one corner, and the eyelid kept close over it, moving the seed gently along the eye, whatever happens to be there will stick to it, and so be brought out. The virtues of this are supposed to be the same as those of the garden clary, but not quite so powerful.

HORN, in physiology, a hard substance growing on the heads of divers animals, particularly the cloven-footed quadrupeds; and serving them both as weapons of offence and defence.

The horn of animals is of the same nature as their gelatinous matter; and is only that matter charged with a less quantity of water, and a larger quantity of earth, and sufficiently condensed to have a firm and solid consistence. By digesting horn with water in Papin's digester, it may be entirely converted into jelly.

Horn is a perfectly animalised matter, and furnishes in distillation the same principles as all animal-matters; that is, at first a pure phlegm, with a degree of heat not exceeding that of boiling water; then a volatile alkaline spirit, which becomes more and more penetrating and strong; a fetid, light, and thin oil; a concrete volatile salt, which forms ramifications upon the sides of the receiver; much air; fetid oil, which becomes more and more black and thick; and lastly, it leaves in the retort a considerable quantity of almost incombustible coal, from which, after its incineration, scarcely any fixed alkali can be obtained.

Animal oil, and particularly that which is drawn first in the distillation of horn, is susceptible of acquiring great thinness and volatility by repeated distillations, and is then called the *oil of dippe*.

The horns of flags, and of other animals of that

kind, are the most proper to furnish the animal oil to be rectified in the manner of dippe; because they yield the largest quantity. These horns also differ from the horns of other animals in this, that they contain a larger quantity of the same kind of earth which is in bones; hence they seem to possess an intermediate nature betwixt horns and bones.

Hart's-HORN. See *HART'S-HORN*.

Hart's-HORN calcined to Whiteness. The phlogiston of the coal of hart's-horn, although very difficultly combustible, may nevertheless be burnt with more ease than the coal of other horns, and with nearly the same facility as bones may. This coal, by being calcined with a long-continued and strong fire, is changed into a very white earth called *hart's-horn calcined to whiteness*. This earth is employed in medicine as an absorbent. It is given in dysenteries and labour-pains which are supposed to be caused by acrid and ill-digested matters. Hart's-horn calcined to whiteness and levigated, is the basis of Sydenham's white decoction, which is commonly prescribed in these diseases.

Hart's-HORN prepared philosophically. This name is given to hart's-horn deprived by water of almost all its gelatinous part, so that it becomes brittle; and when its outer part is taken off, it is thus rendered very white, and is applicable to the same uses as that which is calcined by fire.

Dyeing of HORN—Black is performed by steeping brags in aqua-fortis till it be returned green: with this the horn is to be washed once or twice, and then put into a warmed decoction of logwood and water. Green is begun by boiling it, &c. in alum-water; then with verdigrise, ammoniac, and white-wine vinegar; keeping it hot therein till sufficiently green. Red is begun by boiling it in alum-water, and finished by decoction in a liquor compounded of quick-lime steeped in rain-water, strained, and to every pint an ounce of Brazil-wood added. In this decoction the bone, &c. is to be boiled till sufficiently red.

Dr Lewis informs us that horns receive a deep black stain from solution of silver. It ought to be diluted to such a degree as not sensibly to corrode the subject; and applied two or three times, if necessary, at considerable intervals, the matter being exposed as much as possible to the sun, to hasten the appearance and deepening of the colour.

Dyeing or staining HORN to imitate Tortoise-shell.—The horn to be dyed must be first pressed into proper plates, scales, or other flat form; and the following mixture prepared. Take of quick-lime two parts, and of litharge one part; temper them together to the consistence of a soft paste with soap-ley. Put this paste over all the parts of the horn, except such as are proper to be left transparent, in order to give it a nearer resemblance of the tortoise-shell. The horn must remain in this manner covered with the paste till it be thoroughly dry; when, the paste being brushed off, the horn will be found partly opaque and partly transparent, in the manner of tortoise-shell; and when put over a foil, of the kind of latten called *assidue*, will be scarcely distinguishable from it. It requires some degree of fancy and judgment to dispose of the paste in such a manner as to form a variety of transparent parts, of different magnitudes and figures, to look like the effect of nature: and it will be an improvement to add semi-

Horn
Hornbeck.

semi-transparent parts; which may be done by mixing whitening with some of the paste to weaken its operation in particular places; by which spots of a reddish brown will be produced, which if properly interperfed, efpecially on the edges of the dark parts, will greatly increafe both the beauty of the work, and its fimilitude with the real tortoise-shell.

HORN is alfo a fort of mufical instrument of the wind kind; chiefly ufed in hunting, to animate and bring together the dogs and the hunters. The term anciently was, *wind a horn*; all horns being in thofe times compaffed: but fince ftraight horns are come in fashion, they fay *blow a horn*, and fometimes *found a horn*.—There are various leffons on a horn; as the recheat, double recheat, royal recheat, running or farewell recheat, &c. See RECHEAT.

Cape-Horn. See *Terra del Fuego*.

HORN-Beam, in botany. See CARPINUS.

HORN-Blend, is a black or green indurated bole or clay, confifting of fealy particles, which are diftinguifhable from thofe of mica, by being lefs fhining, thicker, and reftangular. It is generally found amongft iron ores, and fometimes intermixed with mica, forming a compact ftone.

Human Horns. In Dr Charles Leigh's natural hiftory of Lancashire, Cheshire, and the Peak in Derbyshire, is the print of a woman with two horns on her head. When fhe was 28 years of age an excrescence grew upon her head like a wen, which continued 30 years, and then grew into two horns. After four years fhe caft them, and in their place grew two others. After four years fhe caft thefe alfo; and the horns which were on her head in 1668 (the time when the account was written) were then loofe. Her picture and one of her horns are in Ashmole's mufeum. In the univerfity library at Edinburgh is preferved a horn which was cut from the head of Elizabeth Love, in the 50th year of her age. It grew three inches above the ear, and was growing feven years.

HORN-Fish, Gar-fish, or Sea-Needle. See Esox.

HORN-Work, in fortification, an outwork compofed of two demi-baftions joined by a curtain. See FORTIFICATION.

HORNBY, a town of Lancashire in England, feated on a branch of the river Lune, and beautified with a handfome parochial chapel. The ruins of a decayed caftle are ftill to be feen here. W. Long. 2. 20. N. Lat. 54. 6.

HORN-CASTLE, a town of Lincolnshire in England. It had a caftle, as the name imports; from the architecture of which, and the Roman coins that are fometimes dug up here, it is thought to have been a camp or ftation of the Romans. The town is well built, and is almoft furrounded with water. W. Long. o. 2. N. Lat. 51. 20.

HORNDON, a town in Effex, in England. It ftands near a rivulet, that at a fmall diftance from hence falls into the Thames, which is there called the *Hope*. E. Long. o. 30. N. Lat. 51. 20.

HORNECK (Dr Anthony), a learned and pious divine, was born at Baccharach, in the Lower Palatinate, in 1641. He ftudied divinity under Dr Spanheim at Heidelberg; and afterwards coming to England, completed his ftudies at Oxford, and became vicar of Allhallows in that city. In 1665, he removed

into the family of the duke of Albemarle; and was tutor to his grace's fon, then lord Torrington. The duke prefented him to the rectory of Doulton in Devonfhire, and procured for him a prebend in Exeter. He was afterwards chofen preacher of the Savoy. In 1693, he was collated to a prebend in Weftminfter, and the fame year admitted to a prebend in the cathedral of Wells. He publifhed, 1. The great law of confideration. 2. The happy afcetic. 3. Delight and judgment. 4. The fire of the altar. 5. The exercife of prayer. 6. The crucified Jesus. 7. Several fermons, and other works. He died in 1696, and was interred in Weftminfter abbey, where a monument is erected to his memory.

HORNERS, thofe people whofe bufinefs it is to prepare various utensils of the horns of cattle. The horners were a very ancient and confiderable fraternity in the city of London fome hundred years ago. In the reign of Edward II. they complained to parliament, that by foreigners buying up the horns in England, they were in danger of being ruined, and this bufinefs loft to the nation. For this reafon was made the ftatute 6 Edw. IV. by which the fale of horns to foreigners, (except fuch as the faid horners refufed), was prohibited; and the wardens had power granted them to fearch all the markets in London and 24 miles round, and to infpect Sturbridge and Ely fairs, to prevent fuch practices, and to purchafe horns at ftated prices. But on plausible pretences this law was repealed in the reign of James I. and thereupon the old evil revived. The horners again applied to parliament, and king Edward's ftatute was renewed (excepting as to the infpection of the fairs,) and ftill remains in force. The importation of unwrought horns into this country is alfo prohibited. In 1750, there were exported to Holland 514,500 lantern-leaves, befides powder-ftalks. There was formerly a duty of 20 fhillings a thoufand, under which in 1682 were exported 76,650; but in the reign of George I. this duty was taken off, and thefe and all other manufactures made of horns may be exported free. The prefent company of horners were incorporated January 12th 1638; and confift of a mafter, two wardens, and nine affiftants, without livery or hall. They have a warehouse in Spitalfields, to which the horns are fent as brought from town and country markets, and thence regularly divided, the widows and orphans of deceased members having equal fhares.

HORNET, in zoology, a very bold and venomous infect of the flying kind. It greatly refembles the wafp; only it is twice as large, and the head is of a longer and flenderer fhape, and the eyes formed fomething in the figure of a half moon. They build under ground, and in winter hide themfelves in hollow trees. They feed on fleft, and when very hungry will feize upon a fmall bird. Mouffet relates, that they have been feen fingly to purfue and kill a fparrow, and afterwards feed on its fleft.—Mr Evelyn informs us, that they are very pernicious to trees, and will peel them round to the very timber, as if they had been unbarked by cattle. They are deftroyed by ftopping up their entrances with tar or goofe-dung, or conveying the fumes of brimftone into their cells.

HORNET-FLY, in natural hiftory, a very large two-winged fly, which has the fhape and colours of the horn-

Horn
Horn

horn-

Horned

Horse.

hornet, and is at first light scarce to be distinguished from it. The principal colour of the body of this fly is yellow; but it has two long and large black lines placed transversely upon it, and has a black corcelet and a yellow head. These lay, at a proper season, a large number of oblong white eggs, which hatch into large and long worms, whose chief food is the worms and nymphs of the humble bees. The worm of this fly is continually found in the nests of these bees, where it never meddles with the wax or honey, but preys only upon the young offspring of the creature.

HORNING, in Scots law, a writing issuing from the signet, in his majesty's name, at the instance of a creditor against his debtor, commanding him to pay or perform within a certain time.

HORNSEY, a town in Yorkshire, in England. It is almost surrounded by a small arm of the sea; and the church having a high steeple, is a noted sea-mark. Not many years ago there was a street here called *Hornsey beach*, which was washed away by the sea, except a house or two. E. Long. o. 6. N. Lat. 54. o.

HOROLOGIUm, a general name for instruments to measure the hours, as a watch, clock, dial, &c. See **DIAL** and **WATCH**.

HOROSCOPE, in astrology, is the degree of the ascendant, or the star that rises above the horizon at a certain moment, which is observed in order to predict some future event, as the success of a design, the fortune of a person who was at that instant born, &c.

HOROSCOPY. See **DIVINATION**, n° 2.

HORROX (Jeremiah), an eminent English astronomer in the 17th century, was born at Texteth near Liverpool in Lancashire in 1619. He died, to the great loss of that science and of the world, in the 23d year of his age, after he had just finished his *Venus in sole visa*; which, with some other works, were published by Dr Wallis, in quarto.

HORROR, strictly signifies such an excess of fear as makes a person tremble.—In medicine, it denotes a shivering and shaking of the whole body, coming by fits. It is common at the beginning of all fevers, but is particularly remarkable in those of the intermittent kind. See (*Index* subjoined to) **MEDICINE**.

HORSE, in zoology. See the article **EQUUS**.

Hunting-Horse, a name given to a horse qualified to carry a person in the chase. The shape of the horse designed for this service should be strong, and well knit together, as the jockeys express it. Irregular or unequal shapes in these creatures are always a token of weakness. The inequalities in shape, which shew a horse improper for the chase, are the having a large head and a small neck, a large leg and a small foot, &c. The head of a hunting horse indeed should always be large, but the neck should also be thick and strong to support it. The head should be lean, the nostrils wide, and the wind-pipe straight. In order to his behaving well in the field, he ought to have great care and indulgence in the stable; to have as much rest and quiet as may be; to be kept well supplied with good meat, clean litter, and fresh water by him; he should be often dressed, and suffered to sleep as much as he pleases. He should be fed in such a manner as that his dung may be rather soft than hard, and it must be of a bright and clean colour. All this

may be easily managed by the continual observance and change of his food as occasion requires. After his usual coverings, he should have exercise, and masses of sweet malt; and bread and beans, or wheat and beans mixed together, are to be his best food, and beans and oats his worst.

There is a general practice among groomers, of giving their hunting horses wheat-straw, as soon as they take them up from the grass. They say they do this to take up their bellies; but there seems to be much reason for disapproving such a practice. The change is very violent, and the nature of the straw so heating and drying, that there seems great reason to fear, that the stringent nature of it would be prejudicial more than at first is perceived. It is always found, that the dung is hard after this food, and is voided with pain and difficulty, which is in general very wrong for this kind of horses. It is better, therefore, to avoid this straw-feeding; and to depend upon moderate airing, warm clothing, good old hay, and old corn, than to have recourse to any thing of this kind.

It is a rule with all staunch sportsmen, that no horse should be used in hunting till he is five years old. Some will hunt them at four: but the horse at this time is not come up to his true strength and courage; and will not only fail at any tough trials, but will be subject to strains and accidents of that kind, much more than if he was kept for another year, when his strength would be more confirmed.

Management of a Horse upon and after a Journey. See that his shoes be not too strait, or press his feet, but be exactly shaped; and let him be shod some days before you begin a journey, that they may be settled to his feet.

Observe that he is furnished with a bitt proper for him, and by no means too heavy, which may incline him to carry low, or to rest upon the hand when he grows weary, which horsemen call *making use of his fifth leg*. *Sportsm.* *Diff.*

The mouth of the bitt should rest upon his bars about half a finger's-breadth from his tusks, so as not to make him fumble his lips; the curb should rest in the hollow of his beard a little above the chin; and if it gall him, you must defend the place with a piece of buff, or other soft leather.

Take notice that the saddle do not rest upon his withers, reins, or back-bone, and that one part of it do not press his back more than another.

Some riders gill a horse's sides below the saddle with their stirrup-leathers, especially if he be lean; to hinder it, you should fix a leather-strap between the points of the fore and hind-bows of the saddle, and make the stirrup-leather pass over them.

Begin your journey with short marches, especially if your horse has not been exercised for a long time: suffer him to stale as often as you find him inclined; and not only so, but invite him to it: but do not excite your mares to stale, because their vigour will be thereby diminished.

It is advisable to ride very softly, for a quarter or half an hour before you arrive at the inn, that the horse not being too warm, nor out of breath, when put into the stable, you may unbridle him: but if your business obliges you to put on sharply, you must

Horse.

then (the weather being warm) let him be walked in a man's hand, that he may cool by degrees; otherwise, if it be very cold, let him be covered with cloths, and walked up and down in some place free from wind; but in case you have not the convenience of a sheltered walk, stable him forthwith, and let his whole body be rubbed and dried with straw.

Although some people will have their horses legs rubbed down with straw as soon as they are brought into the stable, thinking to supple them by that means; yet it is one of the greatest errors that can be committed, and produces no other effects than to draw down into the legs those humours that are always stirred up by the fatigue of the journey: not that the rubbing of horses legs is to be disallowed; on the contrary, we highly approve of it, only would not have it done at their first arrival, but when they are perfectly cooled.

Being come to your inn, as soon as your horse is partly dried, and ceases to beat in the flanks, let him be unbridled, his bitt washed, cleaned, and wiped, and let him eat his hay at pleasure.

If your horse be very dry, and you have not given him water on the road, give him oats washed in good mild ale.

The dust and sand will sometimes so dry the tongues and mouths of horses, that they lose their appetites: in such case, give them bran well moistened with water to cool and refresh their mouths; or wash their mouths and tongues with a wet sponge, to oblige them to eat.

The foregoing directions are to be observed after moderate riding; but if you have rid excessively hard, unfaddle your horse, and scrape off the sweat with a sweating-knife, or scraper, holding it with both hands, and going always with the hair; then rub his head and ears with a large hair-cloth, wipe him also between the fore-legs and hind-legs; in the mean while, his body should be rubbed all over with straw, especially under his belly and beneath the saddle, till he is thoroughly dry.

That done, set on the saddle again, cover him; and if you have a warm place, let him be gently led up and down in it, for a quarter of an hour; but if not, let him dry where he stands.

Or you may unfaddle him immediately; scrape off the sweat; let the ostler take a little vinegar in his mouth, and squirt it into the horse's; then rub his head, between the fore and hind-legs, and his whole body, till he is pretty dry: let him not drink till thoroughly cool and has eaten a few oats; for many, by drinking too soon, have been spoiled. Set the saddle in the sun or by a fire, in order to dry the pannels.

When horses are arrived in an inn, a man should, before they are unbridled, lift up their feet, to see whether they want any of their shoes; or if those they have do not rest upon their sides; afterwards he should pick and clear them of the earth and gravel, which may be got twixt their shoes and soles.

If you water them abroad, upon their return from the river, cause their feet to be flopped with cow-dung, which will ease the pain therein; and if it be in the evening, let the dung continue in their feet all night, to keep them soft and in good condition: but

if your horse have brittle feet, it will be requisite to anoint the fore-feet, at the on-setting of the hoofs, with butter, oil, or hog's-grease, before you water him in the morning, and in dry weather they should be also greased at noon.

Many horses, as soon as unbridled, instead of eating, lay themselves down to rest, by reason of the great pain they have in their feet, so that a man is apt to think them sick: but if he looks to their eyes, he will see they are lively and good; and if he offers them meat as they are lying, they will eat it very willingly; yet if he handles their feet, he will find them extremely hot, which discovers their suffering in that part. You must therefore see if their shoes do not rest upon their soles, which is somewhat difficult to be certainly known, without unhoofing them; but if you take off their shoes, then look to the inside of them, and you may perceive that those parts which rest upon the soles are more smooth and shining than the others: in this case you are to pare their feet in those parts, and fix on their shoes again, anointing the hoofs, and stopping the soles, with scalding hot black pitch or tar.

After a long day's journey, at night feel your horse's back, if he be pinched, galled, or swelled, (if you do not immediately discover it, perhaps you may after supper), there is nothing better than to rub it with good brandy and the white of an egg. If the galls are between the legs, use the same remedy; but if the ostler rubs him well between the legs, he will seldom be galled in that part.

In order to preserve horses after travel, take these few useful instructions. When you are arrived from a journey, immediately draw the two heel-nails of the fore-feet; and, if it be a large shoe, then four: two or three days after, you may blood him in the neck, and feed him for ten or twelve days only with wet bran, without giving him any oats; but keep him well littered.

The reason why you are to draw the heel-nails, is because the heels are apt to swell, and if they are not thus eased, the shoes would press and straiten them too much: it is also advisable to stop them with cow-dung for a while; but do not take the shoes off, nor pare the feet, because the humours are drawn down by that means.

The following bath will be very serviceable for preserving your horse's legs. Take the dung of a cow or ox, and make it thin with vinegar, so as to be of the consistence of thick broth; and having added a handful of small salt, rub his fore-legs from the knees, and the hind-legs from the gambrels, chafing them well with and against the hair, that the remedy may sink in and stick to those parts, that they may be all covered over with it. Thus leave the horse till morning, not wetting his legs, but giving him his water that evening in a pail: next morning lead him to the river, or wash his legs in well-water, which is very good, and will keep them from swelling.

Those persons, who, to recover their horses feet, make a hole in them, which they fill with moistened cow-dung, and keep it in their fore-feet during the space of a month, do very ill; because, though the continual moisture that issues from the dung occasions the growing of the hoof, yet it dries and shrinks

Horse.

shrinks it so excessively when out of that place, that it splits and breaks like glass, and the foot immediately straitens. For it is certain, that cow-dung (contrary to the opinion of many people) spoils a horse's hoof: it does indeed moisten the sole; but it dries up the hoof, which is of a different nature from it. In order, therefore, to recover a horse's feet, instead of cow-dung, fill a hole with blue wet clay, and make him keep his fore-feet in it for a month.

Mild horses that are fatigued, or over-rid, and made lean by long journeys, have their flanks altered without being purly, especially vigorous horses that have worked too violently.

There is no better method to recover them, than to give each of them in the morning half a pound of honey very well mingled with scalded bran; and when they readily eat the half pound, give them the next time a whole one, and afterwards two pounds, every day continuing this course till your horses are empty, and purge kindly with it; but as soon as you perceive that their purging ceases, forbear to give them any more honey.

You may administer powder of liquorice in the scalded bran for a considerable time; and to cool their blood, it will not be improper to let them have three or four glisters.

In case the horse be very lean, it is expedient to give him some wet bran, over and above his proportion of oats; and grass is also extraordinary beneficial; if he be not purly.

If it be a mare, put her to a horse; and if she never had a foal before, it will enlarge her belly.

Sometimes excessive feeding may do horses more harm than good, by rendering them subject to the farcy. You should therefore be cautious in giving them too great a quantity at a time, and take a little blood from them now and then.

When a horse begins to drink it heartily, it is a certain sign that he will recover in a short time. As to the method of giving him water during a journey, observe the following rules:

All the while you are upon a journey, let your horse drink of the first good water you come to, after seven o'clock in the morning if it be in summer-time, and after nine or ten in winter.

That is accounted good water, which is neither too quick and piercing, nor too muddy and stinking.

This is to be done, unless you would have him gallop a long time after drinking; for if so, you must forbear.

Though it is the custom of England to run and gallop horses after drinking, which we call *watering-courses*, to bring them (as they say) into wind; yet, says M. de Solleysfel, it is the most pernicious practice that can be imagined for horses, by which many are rendered purly.

While a horse is drinking, draw up his head five or six times, making him move a little between every draught; and notwithstanding he be warm, and sweat very much, yet if he is not quite out of breath, and you have still four or five miles to ride, he will be better after drinking a little, than if he had drank none at all: it is true, indeed, that if the horse is very warm, you should, at coming out of the water, redouble your pace, to make him go at a gentle trot, to warm

the water in his belly.

You ought to let him drink after this manner during the whole time of your journey: because, if when you happen to bait he be hot or sweaty, you must not let him drink for a long time, as it would endanger his life; and when his bridle is taken off, his excessive thirst will hinder him from eating, so that he will not offer to touch his meat for an hour or two, which perhaps your occasions will not allow you for a baiting time, and not to have any food will render him unfit for travel.

If you meet with any ford before you come to your inn, ride the horse through it two or three times, but not up to his belly: this will not only cleanse his legs; but the coldness of the water will bind up the humours, and prevent them from descending.

If your horse has been very warm, and you have not had the convenience of watering him upon the road, he will, when unbridled, eat but very little; therefore he should have his oats given him washed in ale or beer, or only some of them, if you intend to feed him again after he has drank.

Some are of opinion, that horses are often spoiled by giving them oats before their water; because they say, the water makes the oats pass too soon, and out of the stomach undigested. But M. de Solleysfel affirms, that though it be the common custom not to do it till after, yet it is proper to feed with oats both before and after, especially if the horse be warm, and has been hard rid; for they will be a great deal the better for it, and in no danger of becoming sick.

Animated HORSE-Hairs, a term used to express a sort of long and slender water-worm of a blackish colour, and so much resembling a horse-hair that it is generally, by the vulgar, supposed to be the hair fallen from a horse's mane into the water as he drinks, and there animated by some strange power. Dr Lister has at large confuted this opinion in the *Philosophical Transactions*. See the article *SETACEOUS Worms*.

Breeding of HORSES. When the stallion is chosen, and all the mares intended for him are collected together, there must be another stone-horse, to discover which of the mares are in heat; and, at the same time, contribute to inflame them. All the mares are to be brought successively to this stone-horse; which should also be enflamed, and suffered frequently to neigh. As he is for leaping every one, such as are not in heat keep him off, whilst those which are so suffer him to approach them. But instead of being allowed to satisfy his impulse, he must be led away, and the real stallion substituted in his stead. This trial is necessary for ascertaining the true time of the mare's heat, especially of those which have not yet had a colt; for with regard to such as have recently foaled, the heat usually begins nine days after their delivery; and on that very day they may be led to the stallion to be covered; and nine days after, by the experiment above-mentioned, it may be known whether they are still in heat. If they are, they must be covered a second time; and

Buffon's
Nat. Hist.

thus successively every ninth day while their heat continues: for when they are impregnated, their heat abates, and in a few days ceases entirely.

But that every thing may be done easily and conveniently, and at the same time with success and advantage, great attention, expence and precaution are requisite. The stud must be fixed in a good soil, and in a suitable place, proportioned to the number of mares and stallions intended to be used. This spot must be divided into several parts, inclosed with rails or ditches well fenced; in the part where the pasture is the richest, the mares in fold, and those with colts by their sides, are to be kept. Those which are not impregnated, or have not yet been covered, are to be separated, and kept with the fillies in another close, where the pasture is less rich, that they may not grow too fat, which would obstruct the progress of generation. Lastly, the young stone colts, or geldings, are to be kept in the driest part of the fields, and where the ground is most unequal; that by running over the uneven surface, they may acquire a freedom in the motion of their legs and shoulders. This close, where the stone colts are kept, must be very carefully separated from the others, lest the young horses break their bounds, and enervate themselves with the mares. If the tract be so large as to allow of dividing each of these closes into two parts, for putting oxen and horses into them alternately, the pasture will last much longer than if continually eaten by horses; the ox improving the fertility, whereas the horse lessens it. In each of these closes should be a pond; standing water being better than running, which often gripes them: and if there are any trees in the ground, they should be left standing, their shade being very agreeable to the horses in great heats; but all stems or stumps should be grubbed up, and all holes levelled, to prevent accidents. In these pastures your horses should feed during the summer; but in the winter the mares should be kept in the stable and fed with hay. The colts also must be housed, and never suffered to feed abroad in winter, except in very fine weather. Stallions that stand in the stable should be fed more with straw than hay; and moderately exercised till covering time, which generally lasts from the beginning of April to the end of June. But during this season they should have no other exercise, and be plentifully fed, but with the same food as usual. Before the stallion is brought to the mare, he should be dressed, as that will greatly increase his ardour. The mare must also be curried, and have no shoes on her hind feet, some of them being ticklish, and will kick the stallion. A person holds the mare by the halter, and two others lead the stallion by long reins; when he is in a proper situation, another assistant carefully directs the yard, pulling aside the mare's tail, as a single hair might hurt him dangerously. It sometimes happens that the stallion does not complete the work of generation, coming from the mare without making any injection: it should therefore be attentively observed, whether, in the last moments of the copulation, the dock of the stallion's tail has a vibrating motion; for such a motion always accompanies the emission of the seminal lymph. If he has performed the act, he must on no consideration be suffered to repeat it; but be led away directly to the stable, and there kept two days. For, however able a

good stallion may be of covering every day during the three months, it is much better to let him be led to a mare only every other day: his produce will be greater, and he himself less exhausted. During the first seven days, let four different mares be successively brought to him; and the ninth day let the first be again brought, and so successively while they continue in heat: but as soon as the heat of any one is over, a fresh mare is to be put in her place, and covered in her turn every nine days; and as several retain even at the first, second, or third time, it is computed that a stallion, by such management, may, during the three months, cover 15 or 18 mares, and beget 10 or 12 colts. These animals have a very large quantity of the seminal lymph; so that a considerable portion of it is shed during the emission. In the mares likewise is an emission, or rather distillation of the seminal lymph, during the whole time they are horning; ejecting a viscid whitish lymph, called the *heats*, which cease on conception. This liquor the Greeks called *hippomanes*; and pretended that philtres might be made of it, one remarkable effect of which was, to render a horse frantic with lust. This *hippomanes* is very different from that found in the secundines of the foal, which Mr Daubenton first discovered, and has so accurately described its nature, origin, and situation. The ejection of this liquor is the most certain sign of the mare's heat; but it is also known by the inflation of the lower part of the vulva, by her frequent neighings, and attempts to get to the horses. After being covered, nothing more is requisite than to lead her away to the field. The first foal of a mare is never so strongly formed as the succeeding; so that care should be taken to procure for her, the first time, a larger stallion, that the defect of the growth may be compensated by the largeness of the size. Particular regard should also be had to the difference or congruity of the fashion of the stallion and the mare, in order to correct the faults of the one by the perfections of the other: especially never to make any disproportionate copulations, as of a small horse with a large mare, or a large horse with a small mare; as the produce of such copulation would be small, or badly proportioned. It is by gradations that we must endeavour to arrive at natural beauty: for instance, to give to a mare a little too clumsy, a well-made horse and finely shaped; to a small mare, a horse a little higher; to a mare which is faulty in her forehead, a horse with an elegant head and noble chest, &c.

It has been observed, that horses fed in dry and light grounds, produce temperate, swift, and vigorous foals, with muscular legs and a hard hoof; while the same bred in marshes and moist pastures have produced foals with a large heavy head, a thick carcass, clumsy legs, bad hoofs, and broad feet. These differences proceed from the air and food, which is easily understood; but what is more difficult to be accounted for, and still more essential than what we have hitherto observed, is, to be continually crossing the breed to prevent a degeneracy.

In coupling of horses, the colour and size should be suited to each other, the shape contrasted, and the breed crossed by an opposition of climates: but horses and mares foaled in the same stud should never be joined. These are essential articles; but there are others which should

should by no means be neglected: as that no short-docked mares be suffered in a stud, because from their being unable to keep off the flies, they are much more tormented by them than others which have a long sweeping tail; and their continual agitations from the stings of these insects, occasions a diminution in the quantity of their milk, and has a great influence on the constitution and size of the colt, which will be vigorous in proportion as its dam is a good nurse. Care must also be taken, that the stud mares be such as have been always brought up in pastures, and never over-worked. Mares which have always been brought up in the stable on dry food, and afterwards turned to grass, do not breed at first: some time is required for accustoming them to this new aliment.

Though the usual season for the heat of mares be from the beginning of April to the end of June, yet it is not uncommon to find some among a large number, that are in heat before that time: but it is advisable to let this heat pass over without giving them to the stallion, because they would foal in winter; and the colts, besides the inclemency of the season, would have bad milk for their nourishment. Again, if the mares are not in heat till after the end of June, they should not be covered that season; because the colts being foaled in summer, have not time for acquiring strength sufficient to repel the injuries of the following winter.

Many, instead of bringing the stallion to the mare, turn him loose into the close, where all the mares are brought together; and there leave him to choose such as will stand to him. This is a very advantageous method for the mares: they will always take horse more certainly than in the other; but the stallion, in six weeks, will do himself more damage than in several years by moderate exercise, conducted in the manner we have already mentioned.

When the mares are pregnant, and their belly begins to swell, they must be separated from those that are not, lest they hurt them. They usually go 11 months and some days; and foal standing, whereas most other quadrupeds lie down. Those that cannot foal without great difficulty, must be assisted; the foal must be placed

in a proper situation; and sometimes, if dead, drawn out with cords. The head of the colt usually presents itself first, as in all other animals: at its coming out of the matrix, it breaks the secundines or integuments that inclose it, which is accompanied with a great flux of the lymph contained in them; and at the same time one or more solid lumps are discharged, formed by the sediment of the inspissated liquor of the allantoides. This lump, which the ancients called the *hippomenes of the colt*, is so far from being, as they imagined, a mass of flesh adhering to the head of the colt, that it is separated from it by a membrane called *amnios*. As soon as the colt is fallen, the mare licks it, but without touching the hippomenes; which points out another error of the ancients, who affirmed that she instantly devours it.

The general custom is, to have a mare covered nine days after her foaling, that no time may be lost; but it is certain, that the mare having, by this means, both her present and future foal to nourish, her ability is divided, and she cannot supply both so largely as she might one only. It would therefore be better, in order to have excellent horses, to let the mares be covered only every other year; they would last the longer, and bring foals more certainly: for, in common studs, it is so far from being true that all mares which have been covered bring colts every year, that it is considered as a fortunate circumstance if half or at most two thirds of them foal.

Mares, when pregnant, will admit of copulation; but it is never attended with any superfecundation. They usually breed till they are 14 or 15 years of age; and the most vigorous till they are above 18. Stallions, when well managed, will engender till the age of 20, and even beyond; but it must be observed, that such horses as are soonest made stallions, are also the soonest incapable of generation: thus the large horses, which acquire strength sooner than the slender, and are therefore often used as stallions as soon as they are four years old, are incapable of generation before they are sixteen.

Rearing of HORSES. See COLT.

H O R S E M A N S H I P;

Or, The Art of Riding, and of Training and Managing HORSES.

SECT. I. *The method of preparing horses to be mounted.*

THOUGH all horses are generally bought at an age when they have already been backed, they should be begun and prepared for the rider with the same care, gentleness and caution, as if they had never been handled or backed, in order to prevent accidents, which might else arise from skittishness or other causes: and as it is proper that they should be taught the figure of the ground they are to go upon when they are at first mounted, they should be previously trotted in a *longe* on circles, without any one upon them.

The manner of doing this is as follows: Put an easy *snaffle* round the horse's nose, and make him go forwards upon you, standing quiet and holding the

longe; and let another man, if you find it necessary, follow him with a whip. All this must be done very gently, and but a little at a time: for more horses are spoiled by overmuch work, than by any other treatment whatever; and that by very contrary effects; for sometimes it drives them into vice, madness, and despair, and often stupifies and totally dispirits them.

The first obedience required in a horse is going forwards: till he perform this duty freely, never even think of making him rein back, which would inevitably make him restive: as soon as he goes forwards readily, stop and caress him. You must remember in this, and likewise in every other exercise, to use him to go equally well to the right and left; and when he obeys, caress him and dismiss him immediately. If a horse, that is very young, takes fright and stands still, lead.

Earl of Pembroke's Directions.

Breaking of
horses.

lead on another horse before him, which probably will induce him instantly to follow. Put a snaffle in his mouth; and when he goes freely, saddle him, girthing him at first very loose. Let the cord, which you hold, be long and loose; but not so much so as to endanger the horse's entangling his legs in it. It must be observed, that small circles, in the beginning, would constrain the horse too much, and put him upon descending himself. No bend must be required at first: never suffer him to gallop false; but whenever he attempts it, stop him without delay, and then set him off afresh. If he gallops of his own accord, and true, permit him to continue it; but if he does it not voluntarily, do not demand it of him at first. Should he fly and jump, shake the cord gently upon his nose without jerking it, and he will fall into his trot again. If he stands still, plunges or rears, let the man who holds the whip make a noise with it; but never touch him, till it be absolutely necessary to make him go on. When you change hands, stop and caress him, and entice him by fair means to come up to you: for by presenting yourself, as some do, on a sudden before horses, and frightening them to the other side, you run a great risk of giving them a thynels. If he keeps his head too low, shake the *caveçon* to make him raise it: and in whatever the horse does, whether he walks, trots, or gallops, let it be a constant rule, that the motion be determined and really such as is intended, without the least shuffling, pacing, or any other irregular gait.

SECT. II. *The method of placing the rider and rendering him firm on horseback, with some occasional instructions for riders and the horses.*

It is necessary that the greatest attention, and the same gentleness that is used in teaching the horses, be observed likewise in teaching the rider, especially at the beginning. Every method and art must be practised to create and preserve, both in man and horse, all possible feeling and sensibility; contrary to the usage of most riding-masters, who seem industriously to labour at abolishing these principles both in one and the other. As so many essential points depend upon the manner in which a man is at first placed on horseback, it ought to be considered and attended to with the strictest care and exactness.

The absurdity of putting a man, who perhaps has never before been upon a horse, on a rough trotting horse, on which he is obliged to stick with all the force of his arms and legs, is too obvious to need mentioning. This rough work, all at once, is plainly as detrimental at first, as it is excellent afterwards in proper time. No man can be either well or firmly seated on horseback, unless he be master of the balance of his body, quite unconstrained, with a full possession of himself, and at his ease: none of which requisites can he enjoy, if his attention be otherwise engaged; as it must wholly be in a raw, un-supplied, and un-prepared lad, who is put at once upon a rough horse: in such a distressful state, he is forced to keep himself on at any rate, by holding to the bridle (at the expense of the sensibility both of his own hand and the horse's mouth), and by clinging with his legs, in danger of his life, and to the certain depravation of a right feeling in the horse.

The first time a man is put on horseback, it ought to be upon a very gentle one. He never should be made to trot, till he is quite easy in the walk; nor gallop, till he is able to trot properly. The same must be observed in regard to horses: they should never be made to trot till they are obedient, and their months are well formed on a walk; nor be made to gallop, till the same be effected on a trot. When he is arrived at such a degree of firmness in his seat, the more he trots, and the more he rides rough horses, the better. This is not only the best method, but also the easiest and the shortest: by it a man is soon made sufficiently an horseman for a soldier; but by the other detestable methods that are commonly used, a man, instead of improving, contracts all sorts of bad habits, and rides worse and worse every day; the horse too becomes, daily more and more unfit for use. In proceeding according to the manner proposed, a man is rendered firm and easy upon the horse, both his own and the horse's sensibility is preserved, and each in a situation fit to receive and practise all lessons effectually.

Among the various methods that are used of placing people on horseback, few are directed by reason. Before you let the man mount, teach him to know, and always to examine, if the curb be well placed, (that is, when the horse has a bit in his mouth, which at first he should not; but only a snaffle, till the rider is firm in his seat, and the horse also somewhat taught); likewise to know if the nose-band be properly tight; the throat-band loose; and the mouth-piece neither too high nor too low in the horse's mouth, but rightly put so as not to wrinkle the skin nor to hang lax; the girths drawn moderately, but not too tight; and the crupper and the breast-plate properly adjusted. A very good and careful man may venture on a bit at first, and succeed with it full as well as by beginning with a snaffle alone: on colts, indeed, it is better, in all schools whatsoever, to avoid any pressure on the bars just at first, which a curb, though ever so delicately used, must in some degree occasion. When the bridle, &c. have been well looked to, let the man approach the horse gently near the shoulder; then taking the reins and an handful of the mane in his left hand, let him put his foot softly in the left stirrup, by pulling it towards him, let him touch the horse with his toe; then raising himself up, let him rest a moment on it with his body upright, but not stiff; and after that, passing his right leg clear over the saddle without rubbing against anything, let him seat himself gently down. He must be cautious not to take the reins too short, for fear of making the horse rear, run, or fall back, or throw up his head; but let him hold them of an equal length, neither tight nor slack, and with the little finger betwixt them. It is fit that horses should be accustomed to stand still to be mounted, and not to stir till the rider pleases. All soldiers should be instructed to mount and dismount equally well on both sides, which may be of great use in times of hurry and confusion. Then place the man in his saddle, with his body rather back, and his head held up with ease, without stiffness; seated neither forwards, nor very backwards; with the breast pushed out a little, and the lower part of the body likewise a little forwards; the thighs and legs turned in without constraint, and

of placing
the rider.

and the feet in a straight line, neither turned in nor out. By this position, the natural weight of the thighs has a proper and sufficient pressure of itself, and the legs are in readiness to act when called upon: they must hang down easy and naturally; and be so placed, as not to be wriggling about, touching and tickling the horse's sides, but always near them in case they should be wanted, as well as the heels.

The body must be carefully kept easy and firm, and without any rocking when in motion; which is a bad habit very easily contracted, especially in galloping. The left elbow must be gently leant against the body, a little forwards: unless it be so rested, the hand cannot be steady, but will always be checking, and consequently have pernicious effects on the horse's mouth. And the hand ought to be of equal height with the elbow; if it were lower, it would constrain and confine the motion of the horse's shoulders: but, as the mouths of horses are different, the place of the hand also must occasionally differ: a leaning, low, heavy fore-hand requires a high hand; and a horse that pokes out his nose, a low one. The right-hand arm must be placed in symmetry with the left; only let the right hand be a little forwarder or backwarder, higher or lower, as occasions may require, in order that both hands may be free: both arms must be a little bent at the elbow, to prevent stiffness.

A soldier's right hand should be kept unemployed in riding; it carries the sword, which is a sufficient business for it.

There remains one farther observation, that ought not to be omitted, about the hand, that it must be kept clear of the body; i. e. about two inches and a half forwards from it, with the nails turned opposite to the belly, and the wrist a little rounded with ease; a position not less graceful than ready for slackening, tightening, and moving the reins from one side to the other, as may be found necessary.

When the men are well placed, the more rough trotting they have without stirrups, the better; but with a strict care always, that their position be preserved very exactly. In all cases, great care must be taken to hinder their clinging with their legs: in short, no sticking by hands or legs is ever to be allowed of at any time. If the motion of the horse be too rough, slacken it, till the rider grows by degrees more firm: and when he is quite firm and easy on his horse in every kind of motion, stirrups may be given him; but he must never leave off trotting often without any.

The stirrups must be neither short nor long; but of such a length, that when the rider, being well placed, puts his feet into them, (about one third of the length of each foot from the point of it,) the points may be between two and three inches higher than the heels. The rider must not bear upon his stirrups, but only let the natural weight of his legs rest on them: For if he bear upon them, he would be raised above and out of his saddle; which should never be, except in charging sword in hand, with the body inclined forwards at the very instant of attacking. Spurs may be given, as soon as the rider is grown familiar with stirrups; or even long before, if his legs are well placed.

A hand should always be firm, but delicate: a horse's mouth should never be surprised by any sudden

transition of it, either from slack to tight, or from tight to slack. Every thing in horsemanship must be effected by degrees, but at the same time with spirit and resolution. That hand which, by giving and taking properly, gains its point with the least force, is the best; and the horse's mouth, under this same hand's directions, will also consequently be the best, supposing equal advantages in both from nature. This principle of gentleness should be observed upon all occasions in every branch of horsemanship. Sometimes the right hand may be necessary, upon some troublesome horses, to assist the left: but the seldom is this done, the better; especially in a soldier, who has a sword to carry, and to make use of.

The snaffle must on all occasions be uppermost; that is to say, the reins of it must be above those of the bridle, whether the snaffle or the bit be used separately, or whether they be both used together. When the rider knows enough, and the horse is sufficiently prepared and settled to begin any work towards suppling, one rein must be shortened according to the side worked to; but it must never be so much shortened, as to make the whole strength rest on that rein alone: for, not to mention that the work would be false and bad, one side of the horse's mouth would by that means be always deadened; whereas, on the contrary, it should always be kept fresh by its own play, and by the help of the opposite rein's acting delicately in a somewhat smaller degree of tension; the joint effect of which produces in a horse's mouth the proper, gentle, and easy degree of *appui* or bearing.

A coward and a madman make alike bad riders, and are both alike discovered and confounded by the superior sense of the creature they are mounted upon, who is equally spoiled by both, though in very different ways. The coward, by suffering the animal to have his own way, not only confirms him in his bad habits, but creates new ones in him: and the madman, by false and violent motions and corrections, drives the horse, through despair, into every bad and vicious trick that rage can suggest.

It is very requisite in horsemanship, that the hand and legs should act in correspondence with each other in every thing; the latter always subservient and assistant to the former. Upon circles, in walking, trotting, or galloping, the outward leg is the only one to be used, and that only for a moment at a time, in order to set off the horse true, or put him right if he be false; and as soon as that is done, it must be taken away again immediately: but if the horse be lazy, or otherwise retains himself, both legs must be used, and pressed to his sides at the same time together. The less the legs are used in general, the better. Very delicate good riders, with horses they have dressed themselves, will scarcely ever want their help. By the term *outward* is understood the side which is more remote from the centre; and by *inward* is meant the side next to the centre. In reining back, the rider should be careful not to use his legs, unless the horse backeth on his shoulders; in which case they must be both applied gently at the same time, and correspond with the hand. If the horse refuse to back at all, the rider's legs must be gently approached, till the horse lifts up a leg, as if to go forwards; at which time, when that leg is in the

concerning
both man
and horse.

Instructions concerning both man and horse.

the air, the rein of the same side with that leg which is lifted up, will easily bring that same leg backwards, and accordingly oblige the horse to back; but if the horse offers to rear, the legs must be instantly removed away. The inward rein must be tighter on circles, so that the horse may bend and look inwards; and the outward one crossed over a little towards it; and both held in the left hand.

Let the man and horse begin on very slow motions, that they may have time to understand and reflect on what is taught them; and in proportion as the effects of the reins are better comprehended, and the manner of working becomes more familiar, the quickness of motion must be increased. Every rider must learn to feel, without the help of the eye, when a horse goes false, and remedy the fault accordingly: this is an intelligence, which nothing but practice, application, and attention, can give, in the beginning on slow motions. A horse may not only gallop false, but also trot and walk false. If a horse gallops false, that is to say, if going to the right he leads with the left leg, or if going to the left he leads with the right; or in case he is disunited, *i. e.* if he leads with the opposite leg behind to that which he leads with before; stop him immediately, and put him off again properly. The method of effecting this, is by approaching your outward leg, and putting your hand outwards; still keeping the inward rein the shorter, and the horse's head inwards, if possible: and if he should still resist, then bend and pull his head outwards also; but replace it again, bent properly inwards, the moment he goes off true. A horse is said to be disunited to the right, when going to the right, and consequently leading with the right leg before, he leads with the left behind; and is said to be disunited to the left, when going to the left, and consequently leading with the left leg before, he leads with the right behind. A horse may at the same time be both false and disunited; in correcting both which faults, the same method must be used. He is both false and disunited to the right, when in going to the right he leads with the left leg before, and the right behind; notwithstanding that hinder leg be with propriety more forward under his belly than the left, because the horse is working to the right: And he is false and disunited to the left, when in going to the left he leads with the right leg before, and the left behind; notwithstanding, as above, that hinder leg be with propriety more forward under his belly than the right, because the horse is working to the left.

In teaching men a right seat on horseback, the greatest attention must be given to prevent stiffness, and sticking by force in any manner upon any occasion: Stiffness disgraces every right work; and sticking serves only to throw a man (when displaced) a great distance from his horse by the spring he must go off with: whereas, by a proper equilibrating position of the body, and by the natural weight only of the thighs, he cannot but be firm and secure in his seat.

As the men become more firm, and the horses more supple, it is proper to make the circles less; but not too much so, for fear of throwing the horses forwards upon their shoulders.

Some horses, when first the bit is put into their mouths, if great care be not taken, will put their heads

very low. With such horses, raise your right hand with the *bridoon* in it, and play at the same time with the bit in the left hand, giving and taking.

On circles, the rider must lean his body inwards; unless great attention be given to make him do it, he will be perpetually losing his seat outwards. It is scarce possible for him to be displaced, if he leans his body properly inwards.

SECT. III. *The method of suppling horses with men upon them, by the ÉPAULE en dedans, &c. with and without a longe, on circles and on straight lines.*

When a horse is well prepared and settled in all his motions, and the rider firm, it will be proper then to proceed on towards a farther suppling and teaching of both.

In setting out upon this new work, begin by bringing the horse's head a little more inwards than before, pulling the inward rein gently to you by degrees. When this is done, try to gain a little on the shoulders, by keeping the inward rein the shorter, as before, and the outward one crossed over towards the inward one. The intention of these operations is this: The inward rein serves to bring in the head, and procures the bend; whilst the outward one, that is a little crossed, tends to make that bend perpendicular, and as it should be, that is to say, to reduce the nose and the forehead to be in a perpendicular line with each other: it also serves, if put forwards, as well as also crossed, to put the horse forwards, if found necessary; which is often requisite, many horses being apt in this and other works rather to lose their ground backwards than otherwise, when they should rather advance: if the nose were drawn in towards the breast beyond the perpendicular, it would confine the motion of the shoulders, and have other bad effects. All other bends, besides what are above specified, are false. The outward rein, being crossed, not in a forward sense, but rather a little backwards, serves also to prevent the outward shoulder from getting too forwards, and makes it approach the inward one; which facilitates the inward leg's crossing over the outward one, which is the motion that so admirably supple the shoulders. Care must be taken, that the inward leg pass over the outward one, without touching it; this inward leg's crossing over must be helped also by the inward rein, which you must cross towards and over the outward rein every time the outward leg comes to the ground, in order to lift and help the inward leg over it: at any other time, but just when the outward leg comes to the ground, it would be wrong to cross the inward rein, or to attempt to lift up the inward leg by it; nay, it would be demanding an absolute impossibility, and lugging about the reins and horse to no purpose: because in this case, a very great part of the horse's weight resting then upon that leg, would render such an attempt not only fruitless, but also prejudicial to the sensibility of the mouth, and probably oblige him to defend himself; and moreover, it would put the horse under a necessity of straddling before, and also of leading with the wrong leg, without being productive of any suppling motion whatsoever.

When the horse is thus far familiarly accustomed to what you have required of him, then proceed to effect by

Of suppling horse.

Directions
for men
and horses.

by degrees the same crossing in his hinder legs. By bringing in the fore-legs more, you will of course engage the hinder ones in the same work: if they resist, the rider must bring both reins more inwards; and, if necessary, put back also, and approach his inward leg to the horse; and if the horse throws out his croup too far, the rider must bring both reins outwards, and, if absolutely necessary, he must also make use of his outward leg, in order to replace the horse properly: observing that the croup should always be considerably behind the shoulders, which in all actions must go first; and, the moment that the horse obeys, the rider must put his hand and leg again in their usual position.

Nothing is more ungraceful in itself, more detrimental to a man's seat, or more destructive of the sensibility of a horse's feet, than a continual wriggling unsettledness in a horseman's legs, which prevents the horse from ever going a moment together true, steady, or determined.

A horse should never be turned, without first moving a step forwards: and when it is doing, the rider must not lift his elbow, and displace himself; a motion only of the hand from the one side to the other being sufficient for that purpose. It must also be a constant rule, never to suffer a horse to be stopped, mounted or dismounted, but when he is well placed. The slower the motions are when a man or horse is taught any thing, the better.

At first, the figures worked upon must be great, and afterwards made less by degrees, according to the improvement which the man and horse make; and the cadenced pace also, which they work in, must be accordingly augmented. The changes from one side to the other, must be in a bold determined trot, and at first quite straight forwards, without demanding any side-motion on two paces, which is very necessary to require afterwards when the horse is sufficiently suppled. By two paces is meant, when the fore-parts and hinder-parts do not follow but describes two different lines.

In the beginning, a *lunge* is useful on circles, and also on straight lines, to help both the rider and the horse; but afterwards, when they are grown more intelligent, they should go alone. At the end of the lesson, rein back; then put the horse, by a little at a time, forwards, by approaching both legs gently to his sides, and playing with the bridle: if he hears, push him out immediately into a full trot. Shaking the *cavesson* on the horse's nose, and also putting one's self before him and rather near to him, will generally make him back, though he otherwise refuse to do it: and moreover a slight use and approaching of the rider's legs, will sometimes be necessary in backing, in order to prevent the horse from doing it too much upon his shoulders; but the pressure of the legs ought to be very small, and taken quite away the moment that he puts himself enough upon his haunches. If the horse does not back upon a straight line properly, the rider must not be permitted to have recourse immediately to his legs, and so distort himself by it; but first try, if crossing over his hand and reins to which ever side may be necessary, will not be alone sufficient; which most frequently it will; if not, then employ the leg.

After a horse is well prepared and settled, and goes freely on in all his several paces, he ought to be in all

his works kept, to a proper degree, upon his haunches, with his hinder legs well placed under him; whereby he will be always pleasant to himself and his rider, will be light in hand, and ready to execute whatever may be demanded of him, with facility, vigour, and quickness.

The common method that is used, of forcing a horse sidewise, is a most glaring absurdity, and very hurtful to the animal in its consequences; for instead of suppling him, it obliges him to stiffen and defend himself, and often makes a creature, that is naturally benevolent, restless, frightened, and vicious.

For horses, who have very long and high fore-hands, and who poke out their noses, a running snaffle is of excellent use; but for such as bore and keep their heads low, a common one is preferable; though any horse's head indeed may be kept up also with a running one, by the rider's keeping his hands very high and forwards: but whenever either is used alone without a bridle upon horses that carry their heads low and that bore, it must be sawed about from one side to the other.

This lesson of the *epaule en dedans*, should be taught to such people as are likely to become useful in helping to teach men and to break horses; and the more of such that can be found, the better: none others should ever be suffered upon any occasion to let their horses look any way besides the way they are going. But all horses whatever, as likewise all men, who are designed for the teaching others, must go thoroughly and perfectly through this excellent lesson, under the directions of intelligent instructors, and often practise it too afterwards; and, when that is done, proceed to and be finished by the lessons of head and tail to the wall.

SECT. IV. Of the head to the wall, and of the croup to the wall.

This lesson should be practised immediately after that of the *epaule en dedans*, in order to place the horse properly the way he goes, &c. The difference between the head to the wall, and the croup to the wall, consists in this: in the former, the fore-parts are more remote from the centre, and go over more ground; in the latter, the hinder-parts are more remote from the centre, and consequently go over more ground: in both, as likewise in all other lessons, the shoulders must go first. In riding-houses, the head to the wall is the easier lesson of the two at first, the line to be worked upon being marked by the wall, not far from his head.

The motion of the legs to the right, is the same as that of the *epaule en dedans* to the left, and so *vice versa*; but the head is always bent and turned differently: in the *epaule en dedans*, the horse looks the contrary way to that which he goes; in this, he looks the way he is going.

In the beginning, very little bend must be required; too much at once would astonish the horse, and make him defend himself: it is to be augmented by degrees. If the horse absolutely refuses to obey, it is a sign that either he or his rider has not been sufficiently prepared by previous lessons. It may happen, that weakness or a hurt in some part of the body, or sometimes temper, though seldom, may be the cause of the horse's defending himself: it is the rider's business to find out

Of head to the wall, &c.

Head to the
wall, &c.

from whence the obstacle arises; and if he finds it to be from the first mentioned cause, the previous lessons must be resumed again for some time; if from the second, proper remedies must be applied; and if from the last cause, when all fair means that can be tried have failed, proper corrections with coolness and judgment must be used.

In practising this lesson to the right, bend the horse to the right with the right rein; helping the left leg over the right (at the time when the right leg is just come to the ground), with the left rein crossed towards the right, and keeping the right shoulder back with the right rein towards your body, in order to facilitate the left leg's crossing over the right; and so likewise *vice versa* to the left, each rein helping the other by their properly mixed effects. In working to the right, the rider's left leg helps the hinder-parts on to the right, and his right leg stops them if they get too forwards; and so *vice versa* to the left: but neither ought to be used, till the hand being employed in a proper manner has failed, or finds that a greater force is necessary to bring about what is required than it can effect alone: for the legs should not only be corresponding with, but also subservient to the hand; and all unnecessary aids, as well as all force, ought always to be avoided as much as possible.

In the execution of all lessons, the equilibrium of the rider's body is of great use to the horse; it ought always to go with and accompany every motion of the animal; when to the right, to the right; and when to the left, to the left.

Upon all horses, in every lesson and action, it must be observed, that there is no horse but has his own peculiar appui or degree of bearing, and also a sensibility of mouth, as likewise a rate of his own, which it is absolutely necessary for the rider to discover and make himself acquainted with. A bad rider always takes off at least the delicacy of both, if not absolutely destroys it. The horse will inform his rider when he has got his proper bearing in the mouth, by playing pleasantly and steadily with his bit, and by the spray about his chaps. A delicate and good hand will not only always preserve a light appui, or bearing, in its sensibility; but also of a heavy one, whether naturally so or acquired, make a light one. The lighter this appui can be made, the better; provided that the rider's hand corresponds with it; if it does not, the more the horse is properly prepared, so much the worse. Instances of this inconvenience of the best of appuis, when the rider is not equally taught with the horse, may be seen every day in some gentlemen, who try to get their horses *bitted* as they call it, without being suitably prepared themselves for riding them: the consequence of which is, that they ride in danger of breaking their necks; till at length, after much hauling about, and by the joint insensibility and ignorance of themselves and their grooms, the poor animals gradually become mere senseless unfeeling pofts; and thereby grow, what they call, *settled*. When the proper appui is found, and made of course as light as possible, it must not be kept duly fixed without any variation, but be played with; otherwise one equally continued tension of reins would render both the rider's hand and the horse's mouth very dull. The slightest and frequent giving and taking, is therefore necessary

to keep both perfect.

Whatever pace or degree of quickness you work in, (be it ever so fast, or ever so slow,) it must be cadenced; time is as necessary for a horseman as for a musician.

This lesson of the head and of the tail to the wall, must be taught every soldier: scarce any manœuvre can be well performed without it. In closing and opening of files, it is almost every moment wanted.

SECT. V. *The method of making horses stand fire, noises, alarms, fights, &c.*

In order to make horses stand fire, the sound of drums, and all sorts of different noises, you must use them to it by degrees in the stable at feeding-time; and instead of being frightened at it, they will soon come to like it as a signal for eating.

With regard to such horses as are afraid of burning objects, begin by keeping them still at a certain distance from some lighted straw: caress the horse; and in proportion as his fright diminishes, approach gradually the burning straw very gently, and increase the size of it. By this means he will very quickly be brought to be so familiar with it, as to walk undaunted even through it.

As to horses that are apt to lie down in the water, if animating them, and attacking them vigorously, should fail of the desired effect, then break a straw-bottle full of water upon their heads, and let the water run into their ears, which is a thing they apprehend very much.

All troop-horses must be taught to stand quiet and still when they are shot off from, to stop the moment you present, and not to move after firing till they are required to do it; this lesson ought especially to be observed in light troops: in short, the horses must be taught to be so cool and undisturbed, as to suffer the rider to act upon him with the same freedom as if he was on foot. Patience, coolness, and temper, are the only means requisite for accomplishing this end. Begin by walking the horse gently, then stop and keep him from stirring for some time, so as to accustom him by degrees not to have the least idea of moving without orders: if he does, then back him; and when you stop him, and he is quite still, leave the reins quite loose.

To use a horse to fire-arms, first put a pistol or a carbine in the manger with his feed; then use him to the sound of the lock and the pan; after which, when you are upon him, shew the piece to him, presenting it forwards, sometimes on one side, sometimes on the other: when he is thus far reconciled, proceed to flash in the pan; after which, put a small charge into the piece, and so continue augmenting it by degrees to the quantity which is commonly used: if he seems uneasy, walk him forward a few steps slowly; and then stop, back, and caress him. Horses are often also disquieted and unsteady at the clasp, and drawing, and returning of swords; all which they must be familiarized to by little and little, by frequency and gentleness.

It is very expedient for all cavalry in general, but particularly for light cavalry, that their horses should be very ready and expert in leaping over ditches, hedges, gates, &c. The leaps, of whatever fort they are, which

To make
horses stand
fire, &c.

the

Of reining
back, &c.

the horses are brought to in the beginning, ought to be very small ones; the riders must keep their bodies back, raise their hands a little in order to help the fore-parts of the horse up, and be very attentive to their equilibre. It is best to begin at a low bar covered with furze, which pricking the horse's legs, if he does not raise himself sufficiently, prevents his contracting a sluggish and dangerous habit of touching, as he goes over, which any thing yielding and not pricking would give him a custom of doing. Let the ditches you first bring horses to be narrow; and in this, as in every thing else, let the increase be made by degrees. Accustom them to come up to every thing which they are to leap over, and to stand coolly at it for some time; and then to raise themselves gently up in order to form to themselves an idea of the distance. When they leap well standing, then use them to walk gently up to the leap, and to go over it without first halting at it; and after that practice is familiar to them, repeat the like in a gentle trot, and so by degrees faster and faster, till at length it is as familiar to them to leap flying on a full gallop as any other way: all which is to be acquired with great facility by calm and soft means, without any hurry.

As horses are naturally apt to be frightened at the sight and smell of dead horses, it is advisable to habituate them to walk over and leap over carcases of dead horses: and as they are particularly terrified at this sight, the greater gentleness ought consequently to be used.

Horses should also be accustomed to swim, which often may be necessary upon service; and if the men and horses both are not used to it, both may be frequently liable to perish in the water. A very small portion of strength is sufficient to guide a horse, anywhere indeed, but particularly in the water, where they must be permitted to have their heads, and be no-ways constrained in any shape.

The unreasonable rage in Britain of cutting off all extremities from horses, is in all cases a very pernicious custom. It is particularly so in regard to a troop-horse's tail. It is almost incredible, how much they suffer at the picket for want of it: constantly fretting, and sweating, kicking about and laming one another, tormented, and stung off their meat, miserable, and helpless; whilst other horses, with their tails on, brush off all flies, are cool and at their ease, and mend daily; whilst the docked ones grow every hour more and more out of condition.

SECT. VI. *The method of reining back,—and of moving forwards immediately after:—of piafing,—of pillars, &c.*

NEVER finish your work by reining back with horses that have any disposition towards retaining themselves; but always move them forwards, and a little upon the haunches also, after it, before you dismount, (unless they retain themselves very much indeed, in which case nothing at all must be demanded from the haunches). This lesson of reining back, and piafing, is excellent to conclude with, and puts an horse well and properly on the haunches: It may be done, according as horses are more or less suppled, either going forwards, backing, or in the same place: if it is done well advancing, or at most on the same spot, it

Of curing
restiveness,
&c

is full sufficient for a soldier's horse: For to piafe in backing, is rather too much to be expected in the hurry which cannot but attend such numbers both of men and horses as must be taught together in regiments. This lesson must never be attempted at all, till horses are very well suppled, and somewhat accustomed to be put together; otherwise it will have very bad consequences, and create restiveness. If they refuse to back, and stand motionless, the rider's legs must be approached with the greatest gentleness to the horse's sides; at the same time that the hand is acting on the reins to solicit the horse's backing. This seldom fails of procuring the desired effect, by raising one of the horse's fore-legs, which being in the air, has no weight upon it, and is consequently very easily brought backwards by a small degree of tension in the reins. When this lesson is well performed, it is very noble and useful, and has a pleasing air; it is an excellent one to begin teaching scholars with.

The lesson is particularly serviceable in the pillars, for placing scholars well at first. Very few regimental riding-houses have pillars, and it is fortunate they have not: for though, when properly made use of with skill, they are one of the greatest and best discoveries in horfmanfhip; they must be allowed to be very dangerous and pernicious, when they are not under the direction of a very knowing person.

SECT. VII. *The method of curing restivenesses, vices, defences, starting, &c.*

WHENEVER a horse makes resistance, one ought, before remedy or correction is thought of, to examine very minutely all the tackle about him, if any thing hurts or tickles him, whether he has any natural or accidental weakness, or in short any the least impediment in any part. For want of this precaution, many fatal disasters happen: the poor dumb animal is frequently accused falsely of being selfish and vitious; is used ill without reason; and, being forced into despair, is in a manner obliged to act accordingly, be his temper and inclination ever so well disposed. It is very seldom the case, that a horse is really and by nature vitious; but if such be found, he will despise all caresses, and then chastisements become necessary.

Correction, according as you use it, throws a horse into more or less violent action, which, if he be weak, he cannot support: but a vitious strong horse is to be considered in a very different light, being able both to undergo and consequently to profit by all lessons; and is far preferable to the best-natured weak one upon earth. Patience and attention are never failing means to reclaim such a horse: in whatsoever manner he defends himself, bring him back frequently with gentleness (not however without having given him proper chastisement if necessary) to the lesson which he seems most averse to. Horses are by degrees made obedient, through the hope of recompense and the fear of punishment: how to mix these two motives judiciously together, is a very difficult matter; it requires much thought and practice; and not only a good head, but a good heart likewise. The coolest and best-natured rider will always succeed best. By a dexterous use of the incitements above mentioned, you will gradually bring the horse to temper and obedience; mere force, and want of skill and coolness,

Of tearing,
flirting,
&c.

would only tend to confirm him in bad tricks. If he be impatient or choleric, never strike him, unless he absolutely refuse to go forwards; which you must resolutely oblige him to do, and which will be of itself a correction, by preventing his having time to meditate and put in execution any defence by retaining himself. Resistance in horses, you must consider, is sometimes a mark of strength and vigour, and proceeds from spirits, as well as sometimes from vice and weakness. Weakness frequently drives horses into viciousness, when any thing wherein strength is necessary is demanded from them; nay, it inevitably must: great care therefore should always be taken to distinguish from which of these two causes any remedy or punishment is thought of. It may sometimes be a bad sign when horses do not at all defend themselves, and proceed from a sluggish disposition, a want of spirit and of a proper sensibility. Whenever one is so fortunate as to meet with a horse of just the right spirit, activity, delicacy of feeling, with strength and good-nature, he cannot be cherished too much; for such a one is a rare and inestimable jewel, and, if properly treated, will in a manner do every thing of himself. Horses are oftener spoiled by having too much done to them, and by attempts to dress them in too great an hurry, than by any other treatment.

If after a horse has been well fuppled, and there are no impediments, either natural or accidental, if he still persists to defend himself, chastisements then become necessary: but whenever this is the case, they must not be frequent, but always firm, though always as little violent as possible; for they are both dangerous and very prejudicial when frequently or slightly played with, and still more so when used too violently.

It is impossible, in general, to be too circumspect in lessons of all kinds, in aids, chastisements, or caresses. Some have quicker parts, and more cunning, than others. Many will imperceptibly gain a little every day on their rider. Various, in short, are their dispositions and capacities. It is the rider's business to find out their different qualities, and to make them sensible how much he loves them, and desires to be loved by them; but at the same time that he does not fear them, and will be master.

Plunging is a very common defence among restive and vicious horses: if they do it in the same place, or backing, they must, by the rider's legs and spurs firmly applied, be obliged to go forwards, and their heads kept up high. But if they do it flying forwards, keep them back, and ride them gently and very slow for a good while together. Of all bad tempers and qualities in horses, those which are occasioned by harsh treatment and ignorant riders are the worst.

Rearing is a bad vice, and, in weak horses especially, a very dangerous one. Whilst the horse is up, the rider must yield his hand; and when the horse is descending, he must vigorously determine him forwards: if this be done at any other time but whilst the horse is coming down, it may add a spring to his rearing, and make him fall backwards. With a good hand on them, horses seldom persist in this vice; for they are themselves naturally much afraid of falling backwards. If this method fails, you must make the horse kick up behind, by getting somebody on foot

to strike him behind with a whip; or, if that will not effect it, by pricking him with a goad.

Starting often proceeds from a defect in the sight; which therefore must be carefully looked into. Whatever the horse is afraid of, bring him up to it gently; if you carels him every step he advances, he will go quite up to it by degrees, and soon grow familiar with all sorts of objects. Nothing but great gentleness can correct this fault; for if you inflict punishment, the apprehension of chastisement becomes prevalent, and causes more starting than the fear of the object. If you let him go by the object, without bringing him up to it, you increase the fault, and confirm him in his fear: the consequence of which is, he takes his rider perhaps a quite contrary way from what he was going, becomes his master, and puts himself and the person upon him every moment in great danger.

With such horses as are to a very great degree fearful of any objects, make a quiet horse, by going before them, gradually entice them to approach nearer and nearer to the thing they are afraid of. If the horse, thus alarmed, be undisciplined and headstrong, he will probably run away with his rider; and if so, his head must be kept up high, and the snaffle sawed backwards and forwards from right to left, taking up and yielding the reins of it, as also the reins of the bit: but this latter must not be sawed backwards and forwards like the snaffle, but only taken up and yielded properly. No man ever yet did, or ever will, stop a horse, or gain any one point over him, by main force, or by pulling a dead weight against him.

SECT. VIII. Rules for Bad Horsemen.

In the first place, every horse should be accustom'd to stand still when he is mounted. One would imagine this might be readily granted; yet we see how much the contrary is practised. When a gentleman mounts at a livery-stable, the groom takes the horse by the bit, which he bends tight round his under-jaw: the horse striving to go on, is forced back; advancing again, he frets, as he is again stopped short, and hurt by the manner of holding him. The rider, in the mean time, mounting without the bridle, or at least holding it but slightly, is helped to it by the groom, who being thoroughly employed by the horse's flustering, has at the same time both bridle and stirrup to give. This confusion would be prevented, if every horse was taught to stand still when he is mounted.

Forbid your groom therefore, when he rides your horse to water, to throw himself over him from a horse-block, and kick him with his leg, even before he is fairly upon him. This wrong manner of mounting, is what chiefly teaches your horse the vicious habit against which we are here warning. On the other hand, a constant practice of mounting in the proper manner, is all that is necessary to prevent a horse's going on till the rider is quite adjusted in the saddle.

The next thing necessary therefore is, that the rider should mount properly. The common method is to stand near the croup, or hinder part of the horse, with the bridle held very long in the right hand. By this manner of holding the bridle before you mount, you are liable to be kicked; and when you are mounted, your horse may go on some time, or play what gambols

horfemen.

holds the reins, before the rein is short enough in your hand to prevent him. It is common likewise, for an awkward rider, as soon as his foot is in the stirrup, to throw himself with all his force, to gain his seat; which he cannot do, till he hath first overbalanced himself on one side or the other: he will then wriggle into it by degrees. The way to mount with ease and safety is, to stand rather before than behind the stirrup. In this posture take the bridle short, and the mane together in your left hand, helping yourself to the stirrup with your right, so that your toe may not touch the horse in mounting. When your left foot is in the stirrup, move on your right, till you face the side of the horse, looking across over the saddle. Then with your right hand grasp the hinder part of the saddles; and with that and your left, which holds the mane and bridle, lift yourself upright on your left foot. Remain thus a mere instant on your stirrup, only so as to divide the action into two motions. While you are in this posture, you have a sure hold with both hands, and are at liberty, either to get safely down, or to throw your leg over and gain your seat. By this deliberate motion, likewise, you avoid, what every good horfeman would endeavour to avoid, putting your horse into a flutter.

When you dismount, hold the bridle and mane together in your left hand, as when you mounted; put your right hand on the pommel of the saddle, to raise yourself; throw your leg back over the horse, grasp the hinder part of the saddle with your right hand, remain a moment on your stirrup, and in every respect dismount as you mounted; only what was your first motion when you mounted, becomes the last in dismounting. Remember not to bend your right knee in dismounting, lest your spur should rub against the horse.

It may be next recommended to hold your bridle at a convenient length. Sit square, and let not the purchase of the bridle pull forward your shoulder; but keep your body *even*, as it would be if each hand held a rein. Hold your reins with the whole grasp of your hand, dividing them with your little finger. Let your hand be perpendicular; your thumb will then be uppermost, and placed on the bridle. Bend your wrist a little outward; and when you pull the bridle, raise your hand toward your breast, and the lower part of the palm rather more than the upper. Let the bridle be at such a length in your hand, as, if the horse should stumble, you may be able to raise his head, and support it by the strength of your arms, and the weight of your body thrown backward. If you hold the rein too long, you are subject to fall backward, as your horse rises.

If, knowing your horse perfectly well, you think a tight rein unnecessary, advance your arm a little (but not your shoulder) towards the horse's head, and keep your usual length of rein. By this means, you have a check upon your horse, while you indulge him.

If you ride with a curb, make it a rule to hook on the chain yourself; the most quiet horse may bring his rider into danger, should the curb hurt him. If, in fixing the curb, you turn the chain to the right, the links will unfold themselves, and then oppose a farther turning. Put on the chain loose enough to hang down on the horse's under lip, so that it may not

rise and press his jaw, till the reins of the bridle are moderately pulled.

If your horse has been used to stand still when he is mounted, there will be no occasion for a groom to hold him; but if he does, suffer him not to touch the reins, but that part of the bridle which comes down the cheek of the horse. He cannot then interfere with the management of the reins, which belongs to the rider only; and holding a horse by the curb (which is ever painful to him) is evidently improper when he is to stand still.

Another thing to be remembered is, not to ride with your arms and elbows as high as your shoulders; nor let them shake up and down with the motion of the horse. The posture is unbecoming, and the weight of the arms (and of the body too if the rider does not sit still) acts in continual jerks on the jaw of the horse, which must give him pain, and make him unquiet, if he has a tender mouth, or any spirit.

Bad riders wonder why horses are gentle as soon as they are mounted by skilful ones, tho' their skill seems unemployed: the reason is, the horse goes at his ease, yet finds all his motions watched; which he has sagacity enough to discover. Such a rider hides his whip, if he finds his horse is afraid of it; and keeps his legs from his sides, if he finds he dreads the spur.

Avoid the ungraceful custom of letting your legs shake against the sides of the horse; and as you are not to keep your arms and elbows high, and in motion; so you are not to rivet them to your sides, but let them fall easy. One may, at a distance, distinguish a genteel horfeman from an awkward one: the first sits still, and appears of a piece with his horse; the latter seems flying off at all points.

It is often said with emphasis, that such a one has no seat on horseback; and it means, not only that he does not ride well, but that he does not sit on the right part of the horse. To have a *good seat*, is to sit on that part of the horse, which, as he springs, is the centre of motion; and from which, of course, any weight would be with most difficulty shaken. As in the rising and falling of a board placed in *equilibrium*, the centre will be always most at rest; the true seat will be found in that part of your saddle, into which your body would naturally slide, if you rode without stirrups; and is only to be preserved by a proper poise of the body, though the generality of riders imagine it is to be done by the grasp of the thighs and knees. The rider should consider himself as united to his horse in this point; and when shaken from it, endeavour to restore the balance.

Perhaps the mention of the two extremes of a bad seat may help to describe the true one. The one is, when the rider sits very far back on the saddle, so that his weight presses the loins of the horse; the other, when his body hangs forward over the pommel of the saddle. The first may be seen practised by grooms, when they ride with their stirrups affectedly short; the latter, by fearful horfemen on the least flutter of the horse. Every *good rider* has, even on the hunting saddle, as determined a place for his thighs, as can be determined for him by the bias of a demi-peak. Indeed there is no difference between the seat of either: only, as in the first you ride with shorter stirrups, your body will be consequently more behind your knees.

Plain rules
for bad
horsemen.

To have a good seat yourself, your saddle must fit well. To fix a precise rule might be difficult: it may be a *direction*, to have your saddle press as nearly as possible on that part which we have described as the point of union between the man and horse; however, so as not to obstruct the motion of the horse's shoulders. Place yourself in the middle or lowest part of it: sit erect; but with as little constraint as in your ordinary sitting. The ease of action marks the gentleman: you may repose yourself, but not lounge. The set and studied erectness acquired in the riding-house, by those whose department is not easy, appears ungenteel and unnatural.

If your horse stops short, or endeavours by rising and kicking to unseat you, bend not your body forward, as many do in those circumstances: that motion throws the breech backward, and you off your fork or twist, and out of your seat; whereas, the advancing the lower part of your body, and bending back the upper part and shoulders, is the method both to keep your seat, and to recover it when lost. The bending your body back, and that in a great degree, is the greatest security in *flying* leaps; it is a security too, when your horse leaps *standing*. The horse's rising does not try the rider's seat; the laxity of his hind legs is what ought chiefly to be guarded against, and is best done by the body's being greatly inclined back. Stiffen not your legs or thighs; and let your body be pliable in the loins, like the coachman's on his box. This loose manner of sitting will elude every rough motion of the horse; whereas the fixture of the knees, so commonly laid a stress on, will in great shocks conduce to the violence of the fall.

Was the cricket-player, when the ball is struck with the greatest velocity, to hold his hand firm and fixed when he receives it, the hand would be bruised, or perhaps the bones fractured by the resistance. To obviate this accident, he therefore gradually yields his hand to the motion of the ball for a certain distance; and thus by a due mixture of opposition and obedience, catches it without sustaining the least injury. The case is exactly the same in riding: the skilful horseman will recover his poise, by giving some way to the motion; and the ignorant horseman will be flung out of his seat, by endeavouring to be fixed.

Stretch not out your legs before you; this will push you against the back of the saddle: neither gather up your knees, like a man riding on a pack; this throws your thighs upwards: each practice unseats you. Keep your legs straight down; and sit not on the most fleshy part of the thighs, but turn them inwards, so as to bring in your knees and toes: and it is more safe to ride with the ball of the foot pressing on the stirrup, than with the stirrup as far back as the heel; for the pressure of the heel being in that case behind the stirrup, keeps the thighs down.

When you find your thighs thrown upwards, widen your knees to get them and the upper part of your fork lower down on the horse. Grasp the saddle with the hollow or inner part of your thighs, but not more than just to assist the balance of your body: this will also enable you to keep your spurs from the horse's sides, and to bring your toes in, without that affected and useless manner of bringing them in practised by many. Sink your heels straight down; for while your

heels and thighs keep down, you cannot fall: this (aided with the bend of the back) gives the security of a seat, to those who bear themselves up in their stirrups in a swift gallop, or in the alternate rising and falling in a full trot.

Let your seat determine the length of your stirrups, rather than the stirrups your seat. If more precision is requisite, let your stirrups (in the hunting saddle) be of such a length, as that, when you stand in them, there may be the breadth of four fingers between your seat and the saddle.

It would greatly assist a learner, if he would practice riding in a large circle, as directed sect. ii. without stirrups; keeping his face looking on the outward part of the circle so as not to have a full view of the horse's head, but just of that ear which is on the outward part of the circle; and his shoulder, which is towards the centre of the circle, very forward. By this means you learn to balance your body, and keep a true seat, independent of your stirrups: you may probably likewise escape a fall, should you at any time lose them by being accidentally shaken from your seat.

As the seat in some measure depends on the saddle, it may not be amiss to observe, that because a saddle with a high pommel is thought dangerous, the other extreme prevails, and the pommel is scarce allowed to be higher than the middle of the saddle. The saddle should lie as near the back-bone as can be, without hurting the horse; for the nearer you sit to his back, the better seat you have. If it does so, it is plain the pommel must rise enough to secure the withers from pressure: therefore, a horse whose withers are higher than common, requires a higher pommel. If, to avoid this, you make the saddle of a more straight line, the inconvenience (spoken of follows); you sit too much above the horse's back, nor can the saddle form a proper seat. There should be no ridge from the button at the side of the pommel, to the back part of the saddle. That line also should be a little concave, for your thighs to lie at ease. In short, a saddle ought to be, as nearly as possible, as if cut out of the horse.

When you want your horse to move forward, raise his head a little, and touch him gently with your whip; or else, press the calves of your legs against his sides. If he does not move fast enough, press them with more force, and so till the spur just touches him. By this practice, he will (if he has any spirit) move upon the last pressure of the leg. Never spur him by a kick; but if it be necessary to spur him briskly, keep your heels close to his sides, and slacken their force as he becomes obedient.

When your horse attempts to be vicious, take each rein separate, one in each hand, and advancing your arms forward, hold him very short. In this case, it is common for the rider to pull him hard, with his arms low. But the horse by this means having his head low too, has it more in his power to throw out his heels: whereas, if his head be raised very high, and his nose thrown out a little, which is consequent, he can neither rise before nor behind; because he can give himself neither of those motions, without having his head at liberty. A plank placed in *equilibrio*, cannot rise at one end unless it sinks at the other.

If your horse is headstrong, pull not with one con-

Plain r.
for bad
horsemen.

tinued pull, but stop, and back him often, just shaking the reins, and making little repeated pulls till he obeys. Horses are so accustomed to bear on the bit when they go forward, that they are discouraged if the rider will not let them do so.

If a horse is loose-necked, he will throw up his head at a continued pull; in which situation, the rider, seeing the front of his face, can have no power over him. When your horse does thus, drop your hand and give the bridle play, and he will of course drop his head again into its proper place: while it is coming down, make a second gentle pull, and you will find his mouth. With a little practice, this is done almost instantaneously; and this method will stop, in the distance of a few yards, a horse, which will run away with those who pull at him with all their might. Almost every one must have observed, that when a horse feels himself pulled with the bridle, even when he is going gently, he often mistakes what was designed to stop him, as a direction to bear on the bit and to go faster.

Keep your horse's head high, that he may raise his neck and crest; play a little with the rein, and move the bit in his mouth, that he may not press on it in one constant and continued manner: be not afraid of raising his head too high; he will naturally be too ready to bring it down, and tire your arms with its weight, on the least abatement of his mettle. When you feel him heavy, stop him, and make him go back a few paces: thus you break by degrees his propensity to press on his bridle.

You ought not to be pleased (though many are) with a round neck, and a head drawn in towards his breast: let your horse carry his head bridling in, provided he carries it high, and his neck arching upwards; but if his neck bends downwards, his figure is bad, his fight is too near his toes, he leans on the bridle, and you have no command over him. If he goes prestling but lightly on the bridle, he is the more sure-footed, and goes pleasanter; as your writ only may guide him. If he hangs down his head, and makes you support the weight of that and his neck with your arms bearing on his fore-legs, (which is called *being on his shoulders*), he will strike his toes against the ground, and stumble.

If your horse is heavy upon the bit, tie him every day, for an hour or two, with his tail to the manger, and his head as high as you can make him lift it, by a rein on each post of the stall, tied to each ring of the snaffle bit.

Horse-breakers and grooms have a great propensity to bring a horse's head down, and seem to have no feat without a strong hold by the bridle. They know indeed, that the head should yield to the reins, and the neck form an arch; but do not take the proper pains to make it an arch upward. A temporary effect of attempting to raise a horse's head, may perhaps be making him push out his nose. They will here tell you, that his head is too high already; whereas it is not the distance from his nose, but from the top of his head, to the ground, which determines the head to be high or low. Besides, although the fault is said to be in the manner of carrying the head, it should rather be said to be in that of the neck; for if the neck was raised, the head would be more in the position of one

set on a well formed neck.

The design therefore of lifting up the head, is to raise the neck, and thereby bring in the head; for even while the bridle makes the same line from the rider's hand to the bit, the horse's nose may be either drawn in, or thrust out, according as his neck is raised or depressed. Instead of what has been here recommended, we usually see colts broke with their heads caved down very low, their necks stiff, and not in the least suppled. When the breaking-tackle is left off, and they are mounted for the road, having more food and rest, they frequently plunge, and a second breaking becomes necessary. Then, as few gentlemen can manage their own horses, they are put into the hands of grooms, from whom they learn a variety of bad habits.

If, on the other hand, your horse carries his head (or rather his nose) too high, he generally makes some amends by moving his shoulders lightly, and going safely. Attend to the cause of this fault. Some horses have their necks set so low on their shoulders, that they bend first down, then upwards, like a flag's. Some have the upper line of their necks, from their ears to their withers, too short. A head of this sort cannot possibly bend inwards and form an arch, because the vertebrae (or neck bones) are too short to admit of flexure; for in long and short necked horses the number of the vertebrae is the same. In some, the jaw is so thick, that it meets the neck, and the head by this means has not room to bend. On the other hand, some have the under line from the jaw to the breast, so short, that the neck cannot rise.

In all these cases you may gain a little by a nice hand with an easy bit; but no curb, martingale, or other forcible method, will teach a horse to carry his head or neck in a posture which nature has made uneasy to him. By trying to pull in his nose farther than he can bear, you will add a bad habit to nature. You could not indeed contrive a more effectual method to make him continually toss his nose up, and throw his foam over you.

The rule already given to ride a loose-necked horse, will be a proper one for all light-mouthed horses: one caution being added, which is, always to search whether his saddle or girths may not in some way pinch him; and whether the bit may not hurt his lip by being too high in his mouth: because, whenever he frets from either of these causes, his head will not be steady.

It is a common custom to be always pulling at the bridle, as if to set off to advantage either the spirit of the horse, or the skill of the rider. Our horses therefore are taught to hold their heads low, and pull so, as to bear up the rider from the saddle, standing in his stirrups, even in the gentlest gallop: how very improper is this, we are experimentally convinced, when we happen to meet with a horse which gallops otherwise. We immediately say, *he canters excellently*, and find the ease and pleasure of his motion. When horses are designed for the race, and swiftness is the only thing considered, the method may be a good one.

It is not to be wondered that *dealers* are always pulling at their horses; that they have the spur constantly in their sides, and are at the same time continually checking the rein: by this means they make them bound, and champ the bit, while their rage has the

Plain rules
for bad
horsemen.

the appearance of spirit. These people ride with their arms spread, and very low on the shoulders of their horses: this method makes them stretch their necks, and gives a better appearance to their fore-hands; it conceals also a thick jaw, which, if the head was up, would prevent its yielding to the bit; it hides likewise the ewe-neck, which would otherwise shew itself. Indeed, if you have a horse unsteady to the bit, formed with a natural heavy head, or one which carries his nose obstinately in the air, you must find his mouth where you can, and make the best of him.

Many horses are taught to start by whipping them for starting. How is it possible they can know it is designed as a punishment? In the riding-house, you teach your horse to rise up before, and to spring and lash out his hinder legs, by whipping him when tied between two pillars, with his head a little at liberty. If he understood this to be a punishment for doing so, he would not by that method learn to do it. He seems to be in the same manner taught to spring and fly when he is frightened. Most horses would go quietly past an object they were beginning to fly from, if their riders, instead of gathering up their bridles, and shewing themselves so ready, should throw the reins loose upon their necks.

When a horse starts at any thing on one side, most riders turn him out of the road, to make him go up to what he starts at: if he does not get the better of his fear, or readily comply, he generally goes past the object, making with his hinder parts, or croup, a great circle out of the road; whereas, he should learn to keep straight on, without minding objects on either side.

If he starts at any thing on the left, hold his head high, and keep it straight in the road, pulling it from looking at the thing he starts at, and keeping your right leg hard pressed against his side, towards his flank: he will then go straight along the road. By this method, and by turning his head a little more, he may be forced with his croup close up to what frightened him; for as his head is pulled one way, his croup necessarily turns the other. Always avoid a quarrel with your horse, if you can: if he is apt to start, you will find occasions enough to exercise his obedience, when what he starts at lies directly in his way, and you *must* make him pass; if he is not subject to start, you should not contend with him about a trifle.

It must be observed, however, that this rule in going past an object may perhaps be a little irregular in a managed horse, which will always obey the leg: but even such a horse, if he is really afraid, and not restive, it may not be amiss to make look another way; unless the object be something you would particularly accustom him to the sight of.

The case will also be different with a horse whose fear is owing to his being not used to objects; but such a one is not to be rode by any horseman to whom these rules are directed: the starting here meant arises merely from the horse's being pamper'd, and springing through liveliness.

The notion of the necessity of making a horse go immediately up to every thing he is afraid of, and not suffering him to become master of his rider, seems to be in general carried too far. It is an approved and good method to conquer a horse's fear of the sound of

a drum, by beating one near to him at the time of feeding him: this not only familiarizes the noise to him, but makes it pleasant, as a fore-runner of his meat*; whereas, if he was whipped up to it, he might perhaps start at it as long as he lived. Might not this be applied to his starting at other things, and shew that it would be better to suffer him (provided he does not turn back) to go a little from, and avoid an object he has a dislike to, and to accustom him to it by degrees, convincing him, as it were, that it will not hurt him; than to punish him, quarrel with him, and perhaps submit to his will at last, while you insist on his overcoming his fear in an instant? If he sees a like object again, it is probable he will recollect his dread, and arm himself to be disobedient.

We are apt to suppose, that a horse fears nothing so much as his rider: but may he not, in many circumstances, be afraid of instant destruction? of being crushed? of being drowned? of falling down a precipice? Is it a wonder that a horse should be afraid of a loaded waggon? may not the hanging load seem to threaten the falling on him? There cannot be a rule more general, than, in such a case, to shew him there is room for him to pass. This is done by turning his head a very little from the carriage, and pressing your leg, which is farthest from it, against his side.

A horse is not to stop without a sign from his rider. —Is it not then probable, that when he is driven up to a carriage he starts at, he conceives himself obliged either to attack or run against it? Can he understand the rider's spurring him with his face directed to it, as a sign for him to pass it? That a horse is easily alarmed for his face and eyes, (he will even catch back his head from a hand going to caress him); that he will not go with any force, face to face, even to another horse, (if in his power to stop); and that he sees perfectly sideways,—may be useful hints for the treatment of horses, with regard to starting.

Though you ought not to whip a horse for starting, there can be no good effect from clapping his neck with your hand to encourage him. If one took any notice of his starting, it should be rather with some tone of voice which he usually understood as an expression of dislike to what he is doing; for there is *opposition* mixed with his starting, and a horse will ever repeat what he finds has foiled his rider.

Notwithstanding the direction above given, of not pressing a horse up to a carriage he starts at; yet if one which you apprehend will frighten him meets you at a narrow part of the road, when you have once let him know he is to pass it, be sure you remain determined, and press him on. Do this more especially when part of the carriage has already passed you: for if, when he is frightened, he is accustomed to go back, and turn round, he will certainly do it if he finds, by your hand slackening, and legs not pressing, that you are irresolute; and this at the most dangerous point of time, when the wheels of the carriage take him as he turns. Remember not to touch the curb-rein at this time; it will certainly check him. It is not known to every one, that the person who would lead a horse by the bridle, should not turn his face to him when he refuses to follow him: if, besides this, he raises his arms, shews his whip, or pulls the bridle with jerks, he frightens the horse, instead of persuading

Plain rules riding him to follow; which a little patience may bring about.

for bad horfemen.

Ride with a snaffle; and use your curb, if you have one, only occasionally. Choose your snaffle full and thick in the mouth, especially at the ends to which the reins are fastened. Most of them are made too small and long; they cut the horse's mouth, and bend back over the bars of his jaw, working like pincers.

The management of the curb is too nice a matter to enter on here, farther than to prescribe great caution in the use of it: a turn of the wrist, rather than the weight of your arm, should be applied to it. The elasticity of a rod, when it hath hooked a fish, may give you some idea of the proper play of a horse's head on his bridle; his spirit and his pliancy are both marked by it.

A horse should never be put to do any thing in a curb, which he is not ready at: you may force him, or pull his head any way, with a snaffle; but a curb acts only in a straight line. It is true, that a horse will be turned out of one track into another by a curb, but it is because he knows it as a *signal*. When he is put to draw a chair, and does not understand the necessity he is then under of taking a larger sweep when he turns, you frequently see him *refuse*, as it is then called: but put him on a snaffle, or buckle the rein to that part of the bit which does not curb him; and the horse submits to be pulled about, till he understands what is desired of him. These directions suppose your horse to have spirit, and a good mouth: if he has not, you must take him as he is, and ride him with such a bit as you find most easy to yourself.

When you ride a journey, be not so attentive to your horse's nice carriage of himself, as to your encouragement of him, and keeping him in good-humour. Raise his head; but if he flags, you may indulge him with bearing a little more upon the bit than you would suffer in an airing. If a horse is lame, tender-footed, or tired, he naturally hangs upon his bridle. On a journey, therefore, his mouth will depend greatly on his strength and the goodness of his feet. Be then very careful about his feet, and let not a farrier spoil them. You will be enabled to keep them from danger, by the directions given under the article *SHOEING*.

Very few, although practised in riding, know they have any power over a horse, but by the bridle; or any use for the spur, except to make him go forward. A little experience will teach them a farther use. If the left spur touches him (and he is at the same time prevented from going forward), he has a sign, which he will soon understand, to move sideways to the right. In the same manner to the left, if the right spur is clofed to him: he afterwards, through fear of the spur, obeys a touch of the leg; in the same manner as a horse moves his croup from one side of the stall to the other, when any one strikes him with his hand. In short, his croup is guided by the leg, as his head is by the bridle. He will never disobey the leg, unless he becomes reltive. By this means you will have a far greater power over him: he will move sideways, if you close one leg to him; and straight forward, if both: even when he stands still, your legs hold near

Vol. V.

him will keep him on the watch; and with the slightest, unseen motion of the bridle upwards, he will raise his head, and shew his forehead to advantage.

On this use of the legs of the rider, and guidance of the croup of the horse, are founded all the *airs* (as the riding-masters express themselves) which are taught in the manage; the passage, or side-motion of troopers to close or open their files, and indeed all their evolutions. But the convenience of some degree of this discipline for common use, is the reason of mentioning it here. It is useful if a horse is apt to stumble or start. If to the first, by pressing your legs to his flank, and keeping up his head, he is made to go light on his fore-legs, which is aiding and supporting him; and the same if he does actually stumble, by helping him at the very instant to exert himself, while as yet any part of him remains not irrecoverably impressed with the precipitate motion. Hence this use of the hand and legs of the rider is called *giving aids* to a horse; for, as to holding up the weight of a heavy unactive horse, by mere pulling, it is as impossible as to recover him when falling down a precipice.

A horse is supported and helped by the hands and legs of his rider, in every action they require of him; hence he is said to perform his *airs*: by the *aids* from his rider.

The same manner is useful if a horse starts. For if when he is beginning to fly to one side, your leg on the side he is flying to, he stops his spring immediately. He goes past what he started at, keeping straight on, or as you choose to direct him; and he will not fly back from any thing, if you press him with both legs. You keep his haunches under him, going down a hill; help him on the side of a bank; more easily avoid the wheel of a carriage; and approach more gracefully and nearer to the side of a coach, or horseman. When a pampered horse curvets irregularly, and twists his body to and fro, turn his head either to the right or left, or both alternately, (but without letting him move out of the track), and press your leg to the opposite side: your horse cannot then spring on his hind-legs to one side, because your leg prevents him; nor to the other, because his head looks that way, and a horse does not start and spring to the side on which he looks. Here it may not be amiss to observe the impropriety of the habit which many riders have, of letting their legs shake against the sides of the horse: if a horse is taught, they are then continually pressing him to violent action; and if he is not, they render him insensible and incapable of being taught. The fretting of a hot horse will hence be excessive, as it can no otherwise be moderated, than by the utmost skillness of the seat, hands, and legs of the rider.

Colts at first are taught to *bear* a bit, and by degrees to *pull* at it. If they did not press it, they could not be guided by it. By degrees they find their necks stronger than the arms of a man; and that they are capable of making great opposition, and often of foiling their riders. Then is the time to make them supple and pliant in every part. The part which of all others requires most this pliancy, is the neck. Hence the metaphor of *stiff-necked* for *disobedient*. A

21 H

horfe

Plain rules for bad horfemen.

horse cannot move his head, but with the muscles of his neck: this may be called his *helm*; it guides his course, changes and directs his motion.

The use of this pliancy in the different parts and limbs of a horse has been already shewn in a former section. The present section being directed to the *unexperienced* horseman, it may suffice to add, that

his idea of suppleness need only be, that of an ability and readiness in a horse to move every limb, on a sign given him by the hands or legs of his rider; as also, to bend his body, and move in a short compass, quick and collected within himself, so as instantly to be able to perform any other motion.

H O R

Horsham
|| Hortus.

HORSHAM, a town of Suffex in England, seated near St Leonard's forest, sending two members to parliament. W. Long. o. 22. N. Lat. 51. 10.

HORSTIUS (James), professor of medicine in the university of Helmstadt, in the 16th century. He joined devotion with the knowledge and practice of physic. He carefully prayed to God to bless his prescriptions, and published a form of prayer upon this subject. He also wrote, 1. A treatise on the qualities of a good physician. 2. Another on the qualities of a good apothecary. 3. A treatise of the plague, in German. 4. A commentary in *libros Hippocratis de corde*, and other works.

HORSTIUS (Gregory), nephew of the former, called the *Æsculapius of Germany*, published several books, which are esteemed.

HORTAGILERS, in the grand signior's court, upholsters, or tapestry-hangers. The grand signior has constantly 400 in his retinue when he is in the camp: these go always a day's journey before him, to fix upon a proper place for his tent, which they prepare first; and afterwards those of the officers, according to their rank.

HORTENSIVS (Quintus), a celebrated Roman orator, the cotemporary of Cicero, pleaded with universal applause at 19 years of age, and continued the same profession during 48 years. But being at last eclipsed by Cicero, he quitted the bar, and embraced a military life; became a military tribune, prætor, and afterwards consul, about 70 B. C. Cicero speaks of him in such a manner as makes us regret the loss of his orations. Hortensius had a wonderful memory, and delivered his orations without writing down a single word, or forgetting one particular that had been advanced by his adversaries. He died very rich, a little before the civil war, which he had endeavoured by all possible means to prevent.

HORTUS SICCUS, A DRY GARDEN; an appellation given to a collection of specimens of plants, carefully dried and preserved.

Take a specimen of a plant in flower, and with it one of its bottom-leaves, if it have any; bruise the stalk, if too rigid; slit it, if too thick; spread out the leaves and flowers on paper; cover the whole with more paper, and lay a weight over all. At the end of 18 hours take out the plants, now perfectly flatted; lay them on a bed of dry common sand; sift over them more dry sand, to the depth of two inches, and thus let them lie about three weeks: the less succulent dry much sooner, but they take no harm afterwards. If the floor of a garret be covered in spring with sand two inches deep, leaving space for walking to the several parts, it will receive the collection of a whole summer, the covering of sand being sifted over every parcel as laid in. They need no farther care, from the time of laying them, till they are taken up to be

H O R

stuck on paper. The cement used is a solution of gum-arabic in water.

Plants may be dried very well without sand, by only putting them frequently into fresh quires of paper, or a few by only pressing them between the leaves of a book; but the sand-method preserves the colour best, and is done with least trouble.

HOSANNA, a Hebrew word, signifying *save now*, or *save, we beseech thee*; from the frequent use of which, during the feast of tabernacles, the whole solemnity got the appellation of *Hosanna Rabbi*.

HOSE, from the Saxon *Hofa*, a flocking. See STOCKING.

HOSEA, a canonical book of the Old Testament, so called from the prophet of that name, its author, who was the son of Beri, and the first of the lesser prophets. He lived in the kingdom of Samaria, and delivered his prophecies under the reign of Jeroboam II. and his successors, kings of Israel; and under the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. His principal design is to publish the gross idolatries of the people of Israel and Judah, to denounce the divine vengeance against them, and to foretell the captivity in Assyria.

In the beginning of Hosea's prophecy, we read that the Lord directed him to take unto him a wife of whoredoms, and children of whoredoms; that is, to marry a woman of a bad life. This was designed as a figurative description of the idolatry and infidelity of Samaria and the ten tribes, formerly the Lord's spouse, but afterwards become adulterous and corrupt. Many interpreters, shocked at the irregularity of this marriage of the prophet, fancy that it only passed in vision; whilst others think, that the marriage was real, though figurative of the things it described, and which were afterwards to be performed.

HOSPINIAN (Rodolphus), one of the greatest writers that Switzerland has given birth to. He was born in 1547, at Aorf near Zurich; obtained the freedom of Zurich; and was made provisor of the abbey school. Notwithstanding this employment, he undertook a noble work of vast extent, which was a *History of the Errors of Popery*. Though he could not complete this work according to his plan, he published some considerable parts of it: what he published on the Eucharist, and another work called *Concordia Discors*, exceedingly exasperated the Lutherans. He did not reply to them; but turning his arms against the Jesuits, published *Historia Jesuitica*, &c. These writings gained him preferment; he being appointed archdeacon of Caroline church, and then minister of the abbey-church. He died in 1626; and there was an edition of his works published at Geneva 1681, in seven volumes in folio.

HOSPITAL

Hofan
|| Hofpint

Hospital.

HOSPITAL (Michael de l'), chancellor of France in the 16th century, was one of the greatest men of his age, and had raised himself by degrees. He agreed to an edict much feverer against the Protestants than he could have wished, to prevent the introduction of the inquisition. It was that of Romorantin. The speeches he made, in order to inspire a spirit of toleration, made him much suspected by the Roman Catholics, and extremely odious to the court of Rome. The maxims of state, upon which he regulated himself, were of great advantage to France, since he formed some disciples who opposed, in proper time, the pernicious attempts of the leaguers, and rendered them abortive.—His pacific views being disliked by Catharine de Medicis, who had contributed to his advancement, he excluded him from the council of war, and occasioned his disgrace. He retired, however, of his own accord, in 1568; and spent the rest of his life at his country-seat at Vignai, where he died in 1573, aged 68. His poems are esteemed. He also published some excellent speeches and memoirs.

HOSPITAL, popularly **SPITAL**, a place or building erected, out of charity, for the reception and support of the poor, aged, infirm, sick, and otherwise helpless. The word is formed of the Latin *hospes*, "host, stranger." See **HOST**.

In the ages of the church, the bishop had the immediate charge of all the poor, both found and diseased, as also of widows, orphans, strangers, &c.—When the churches came to have fixed revenues allotted them, it was decreed, that at least one fourth part thereof should go to the relief of the poor; and to provide for them the more commodiously, divers houses of charity were built, which are since denominated *hospitals*. They were governed wholly by the priests and deacons, under the inspection of the bishop. In course of time, separate revenues were assigned for the hospitals; and particular persons, out of motives of piety and charity, gave lands and money for erecting of hospitals. When the church-discipline began to relax, the priests, who till then had been the administrators of hospitals, converted them into a sort of benefices, which they held at pleasure, without giving account thereof to any body; reserving the greatest part of the income to their own use; so that the intentions of the founders were frustrated.—To remove this abuse, the council of Vienne expressly prohibited the giving any hospital to secular priests in the way of a benefice; and directed the administration thereof to be given to sufficient and responsible laymen, who should take an oath, like that of tutors, for the faithful discharge thereof, and be accountable to the ordinaries.—This decree was executed and confirmed by the council of Trent.

In Britain, hospitals are buildings properly endowed, or otherwise supported by charitable contributions, for the reception and support of the poor, aged, infirm, sick, or helpless.

A charitable foundation laid thus for the sustenance and relief of the poor, is to continue for ever. Any person seized of an estate in fee, may, by deed inrolled in chancery, erect and found an hospital, and nominate such heads and governors therein as he shall think fit; and this charitable foundation shall be incorporated, and subject to the inspection and guid-

ance of the heads and visitors nominated by the founder. Likewise such corporations shall have, take, and purchase lands, so as not to exceed 200 l. a-year, provided the same be not held of the king; and to make leases, reserving the accustomed yearly rent *.

HOSPITAL-FEVER, a name given to the malignant catarrhal fever, as being frequent in hospitals. See (the *Index* subjoined to) **MEDICINE**.

HOSCHIUS (Sidonius), a jesuit, who was born at Marke, in the diocese of Xpres, in 1596, and died at Tongres in 1653. He wrote some elegies and other poems in Latin, with great purity and elegance.

HOSPITALITY, the practice of entertaining strangers.—Dr Robertson speaking of the middle ages, says, "Among people whose manners are simple, and who are seldom visited by strangers, hospitality is a virtue of the first rank. This duty of hospitality was so necessary in that state of society which took place during the middle ages, that it was not considered as one of those virtues which men may practise or not, according to the temper of their minds and the generosity of their hearts. Hospitality was enforced by statutes, and those who neglected the duty were liable to punishment. The laws of the Slavi ordained that the moveables of an inhospitable person should be confiscated, and his house burnt. They were even so solicitous for the entertainment of strangers, that they permitted the landlord to steal for the support of his guest."

HOSPITALLERS, an order of religious knights, now known by the title of *knight of Malta*. See **MALTA**.

HOSPITIUM, a term used in old writers either for an inn or a monastery, built for the reception of strangers and travellers. See **INN** and **MONASTERY**.

HOSPODAR, a title borne by the princes of Walachia and Moldavia, who receive the investiture of their principalities from the grand signior. He gives them a vest and standard; they are under his protection, and obliged to serve him, and he even sometimes depose them; but in other respects they are absolute sovereigns within their own dominions.

HOST, **HOSSES**, a term of mutual relation, applied both to a person who lodges and entertains another, and to the person thus lodged, &c.—The word is formed of the Latin *hospes*, which some will have thus called, *quasi hospitium* or *ostium petens*; for *ostium* was anciently wrote with an aspirate.—Thus the innkeeper says, he has a good *host*, in speaking of the traveller who lodges with him; and the traveller, again, says, he has a kind *host*, in speaking of his landlord.

It must be observed then, that it was the custom among the ancients, when any stranger asked for lodging, for the master of the house, and the stranger, each of them to set a foot on their own side of the threshold, and swear they would neither of them do any harm to the other.—It was this ceremony that raised so much horror against those who violated the law or right of hospitality on either side; inasmuch as they were looked on as perjured.

Instead of *hospes*, the ancient Latins called it *hospis*; as Cicero himself informs us: though in course of time, *hospis* came to signify an enemy; so much was the notion of hospitality altered.

Hospital
||
Host.* See Cor-
poration.

Hot
||
Hot-beds.

Host, in the church of Rome, a name given to the elements used in the eucharist, or rather to the consecrated wafer; which they pretend to offer up every day, a new host or sacrifice for the sins of mankind.—They pay adoration to the host, upon a false presumption that the elements are no longer bread and wine, but transubstantiated into the real body and blood of Christ. See TRANSUBSTANTIATION.

HOSTAGE, a person given up to an enemy as a security for the performance of the articles of a treaty.

Hot-Beds, in gardening, beds made with fresh horse-dung, or tanner's bark, and covered with glasses to defend them from cold winds.

By the skilful management of hot-beds, we may imitate the temperature of warmer climates; by which means, the seeds of plants brought from any of the countries within the torrid zone, may be made to flourish even under the poles.

The hot-beds commonly used in kitchen-gardens, are made with new horse-dung mixed with the litter of a stable, and a few sea-coal-ashes, which last are of service in continuing the heat of the dung. This should remain six or seven days in a heap; and being then turned over, and the parts mixed well together, it should be again cast into a heap; where it may continue five or six days longer, by which time it will have acquired a due heat. These hot-beds are made in the following manner: In some sheltered part of the garden, dig out a trench of a length and width proportionable to the frames you intend it for; and if the ground be dry, about a foot or a foot and a half deep; but if it be wet, not above six inches: then wheel the dung into the opening, observing to stir every part of it with a fork, and to lay it exactly even and smooth on every part of the bed, laying the bottom part of heap, which is commonly free from litter, upon the surface of the bed: and if it be designed for a bed to plant out cucumbers to remain for good, you must make a hole in the middle of the place designed for each light about ten inches over, and six deep, which should be filled with good fresh earth, thrusting in a stick to shew the places where the holes are; then cover the bed all over with the earth that was taken out of the trench, about four inches thick, and put on the frame, letting it remain till the earth be warm, which commonly happens in three or four days after the bed is made, and then the plants may be placed in it. But if your hot-bed be designed for other plants, there need be no holes made in the dung; but after having smoothed the surface with a spade, you should cover the dung about three or four inches thick with good earth, putting on the frames and glasses as before. In making these beds, care must be taken to settle the dung close with a fork; and if it be pretty full of long litter, it should be trod down equally on every part. During the first week or ten days after the bed is made, you should cover the glasses but slightly in the night, and in the day-time carefully raise them, to let out the steam: but as the heat abates, the covering should be increased; and as the bed grows cold, new hot dung should be added round the sides of it.

The hot-bed made with tanner's bark, is, however, much preferable to that described above, especially

for all tender exotic plants and fruits, which require an even degree of warmth to be continued for several months, which cannot be effected with horse-dung. The manner of making them is as follows: Dig a trench about three feet deep, if the ground be dry; but if wet, it must not be above a foot deep at most, and must be raised two feet above the ground. The length must be proportioned to the frames intended to cover it; but it should never be less than ten or twelve feet, and the width not less than six. The trench should be bricked up round the sides to the above-mentioned height of three feet, and filled in the spring with fresh tanner's bark that has been lately drawn out of their vats, and has lain in a round heap, for the moisture to drain out of it, only three or four days: as it is put in, gently beat it down equally with a dung-fork; but it must not be trodden, which would prevent its heating, by settling it too close: then put on the frame, covering it with glasses; and in about ten days or a fortnight, it will begin to heat; at which time plunge your pots of plants or feed into it, observing not to tread down the bark in doing it. These beds will continue three or four months in a good temper of heat; and if you stir up the bark pretty deep, and mix a load or two of fresh bark with the old when you find the warmth decline, you will preserve its heat two or three months longer. Many lay some hot horse-dung in the bottom of the trench under the bark; but this ought never to be practised unless the bed is wanted sooner than the bark would heat of itself, and even then there ought only to be a small quantity of dung at the bottom.

The frames which cover these beds, should be proportioned to the several plants they are designed to contain. If they are to cover the ananas or pine-apple, the back part should be three feet high, and the lower part fifteen inches: if the bed be intended for taller plants, the frame must be made of a depth proportionable to them: but if it be for sowing of seeds, the frame need not be above fourteen inches high at the back, and seven in the front; by which means, the heat will be much greater.

HOTEL, a French term, anciently signifying a house, or dwelling place.—It is now more commonly used for the palaces, or houses of the king, princes, and great lords. In this sense they say, the *hotel de Conde*, *hotel de Conti*, *hotel du Louvre*, &c.

The *grand prévost de l'hotel*, is the first judge of the officers of the king's household. His jurisdiction is much like that of lord steward of the household of the king of England.

The *hotel de ville* is what we call a *town-house*, or *town-hall*.

HOTEL, is likewise used for a large inn, also for a large lodging-house ready furnished.

HOTMAN (Francis), one of the most learned civilians in the 16th century. He professed law at Bourges: but, on account of religion, retired to Geneva, read lectures on civil law there, and published books with such strength against the persecutors, that great promises were made to him to engage him not to write any more in that manner; but he did not regard their offers. He died at Basil in 1590. His *Franco-Gallia* is well known, having been done in English by lord Moleworth. Some persons think he

||
Hotman

Hottentots. was the author of *Vindicie contra Tyrannos*. All his works were printed at Geneva in 1599, in 3 vols folio.

HOTTENTOTS, a people in the southern part of Africa, whose country surrounds the empire of Monomotapa, in form of a horse-shoe, extending, according to Magin, from the Negroeth of Cabo as far as the Cape of Good Hope; and from thence northward to the river Magnica, or Rio de St Spiriti, including Mattatan a distinct kingdom. According to Sanutus, this coast, beginning at the Mountains of the Moon under the tropic of Capricorn in $23^{\circ}\frac{1}{2}$ S. Lat. extends north beyond the Cape to the coast of Zanguebar; having the Indian sea on the east, the Ethiopic on the west, the southern ocean on the south; and on the north the kingdoms of Mattatan, Monomotapa, and the coast of Zanguebar, or rather the Mountains of the Moon, which divide it from the rest of the continent.

The Europeans first became acquainted with this country in the year 1493, when Bartholomew Diaz, a Portuguese admiral, discovered the most southerly point of Africa now called the *Cape of Good Hope*, but by him *Cabo dos todos tormentos*, or Cape of all Plagues, on account of the storms he met with in the neighbourhood; but John, then king of Portugal, having from the account of Diaz concluded that a passage to the East Indies was now discovered, changed the name to that of the *Cape of Good Hope*, which it still retains. In 1497, it was circumnavigated by Vasco de Gama, who made a voyage to India that way; however, it remained useless to Europeans till the year 1650, when Van Riebeck a Dutch surgeon first law the advantages that would accrue to the East India company in Holland, from a settlement at such a convenient distance both from home and from India. The colony which he planted has ever since continued in the hands of the Dutch, has greatly increased in value, and is visited by all the European ships trading to the East Indies.

The country now possessed by the Dutch is of pretty considerable extent, and comprehends that part of the African coast on the west called *Terra de Natal*. It is naturally barren and mountainous; but the industry of the Dutch hath overcome all natural difficulties, and it now produces not only a sufficiency of all the necessaries of life for the inhabitants, but also for the refreshment of all the Europeans who pass and repass that way.

The coast abounds in capes, bays, and roads. Thirty leagues to the east of the Cape of Good Hope, in S. Lat. $34^{\circ} 21'$, is another Cape which runs out beyond 35° , called by the Portuguese, who first doubled it, *Cabo dos Agulhas*, or the *Cape of Needles*, on account of some strange variations in the magnetic needle observed as they came near it. Near this Cape is a flat shore, with plenty of fish: it begins in the west near a fresh-water river, and extending 15 leagues in the main sea, ends in the east near *Fish-bay*. Cabo Falso, so called by the Portuguese, who returning from India mistook it for the Cape of Good Hope, lies to the eastward between these two capes, about eight or nine leagues beyond that of Good Hope. Along the coasts, on both sides of the Cape of Good Hope, are many fine bays, where ships may ride in the greatest

safety. Twenty-seven leagues to the northwest is Sal-donha bay, so named from a Portuguese captain shipwrecked on the coast. The largest and most commodious is *Table or Vafel Bay*, on the south, and near the mountain of that name, six leagues in circumference, with four-fathom water close to the beach, and sheltered from all but northwest winds, which blow straight up. Opposite to this bay is *Roku Eilan*, or the Island of Rabbits, in $34^{\circ} 30'$ S. Lat. 67 leagues east from the Cape of Good Hope. Peter Both, in 1661, discovered a bay, which he named *Ulegst*, sheltered only from north winds, in which is a small island, and on the west a rivulet of fresh water extremely convenient for European mariners. Twenty-five or thirty leagues farther east, Both discovered Marshall Bay, afterwards named by the Portuguese *Seno Formoso*. Next to this is *Seno de Lago*, from its resemblance to a lake. There are several roads in this bay, and an island called *Ilha dos Cuos*. Cabo de St. Francisco, and Cabo das Serras are marked upon charts between these two bays. Near the latter of these capes is Cabo de Are-cito, and the island Contento; and something more north-east is St Christopher's river, called *San Chri-stovano* by the Portuguese, and by the Hottentots *Nagod*. The country beyond this river, was called by the Portuguese, who discovered it on the day of our Lord's nativity, *Terra de Natal*. Between the Cape of Good Hope and Cabo das Agulhas are the Sweet, Salt, and Jagulina rivers, which run into the sea, and Sweet-water river flows from the Table-mountain.

The most remarkable mountains in this country are Table-hill, Lion-hill, Wind-hill, and the Tiger-hills. The three first lie near Table-bay, and surround Table-valley, where the Cape-town stands. The first is the highest, and extends to the south and a little west, from the centre of the valley. Kolben determined its height to be 1857 feet. Mr Forster, who lately visited this part of the world, informs us, that "the extremity of Africa towards the south is a mass of high mountains, of which the outermost are craggy, black, and barren, consisting of a coarse granite, which contains no heterogeneous parts, such as petrified shells, &c. nor any volcanic productions. The ground gradually rises on all sides towards the three mountains which lie round the bottom of the bay, keeping low and level only near the sea-side, and growing somewhat marshy in the isthmus between False and Table Bays, where a salt rivulet falls into the latter. The marshy part has some verdure, but intermixed with a great deal of sand. The higher grounds, which, from the sea-side, have a parched and dreary appearance, are, however, covered with an immense variety of plants, among which are a prodigious number of shrubs, but scarce one or two species that deserve the name of trees. There are also a few small plantations wherever a little run of water moistens the ground. The ascent of Table-mountain is very steep and difficult, on account of the number of loose stones which roll away under the feet of the traveller. About the middle of the mountain is a bold, grand chasm, whose walls are perpendicular and often impending rocks, piled up in strata. Small rills of water ooze out of crevices, or fall from precipices in drops, giving life to hundreds of plants and low shrubs,

Hottentots.

Hottentots. shrubs in the chasm. The summit of the mountain is nearly level, very barren, and bare of soil; several cavities, however, are filled with rain water, or contain a small quantity of vegetable earth, from whence a few odoriferous plants draw their nourishment. Some antelopes, howling baboons, solitary vultures, and toads, are sometimes to be met with on the mountain. The view from thence is very extensive and picturesque. The bay seems a small pond or basin, and the ships in it dwindled to little boats; the town under our feet, and the regular compartments of its gardens, look like the work of children."

Most accounts of this country that have been published mention a surprising phenomenon which is annually to be seen on the top of Table-hill from September to March; namely, a white cloud hovering on its top, and is reckoned the cause of those terrible south-east winds with which the Cape is infested. This cloud, called by sailors *The Devil's table-cloth*, is said by some to appear at first no bigger than a barley-corn; then increases to the size of a walnut, and soon after covers the whole top of the mount. But, according to Mr Kolben, it is never less, even on its first appearance, than the size of a large ox; often bigger. It hangs in several fleeces over the Table-hill, and the Wind or Devil's-hill; which fleeces, at last uniting, form a large cloud that covers the summits of these two hills. After this has rested for some time without change or motion, the wind bursts out suddenly from it with the utmost fury. The skirts of the cloud are white, but seem much more compact than the matter of common clouds; the upper parts are of a leaden colour. No rain falls from it, but sometimes it discovers a great deal of humidity; at which times it is of a darker colour, and the wind issuing from it is broken, raging by fits of short continuance. In its usual state, the wind keeps up its first fury unabated for one, two, three, or eight days; and sometimes for a whole month together. The cloud seems all the while undiminished, though little fleeces are from time to time detached from it, and hurried down the sides of the hills, vanishing when they reach the bottom, so that during the storm the cloud seems to be supplied with new matter. When the cloud begins to brighten up, these supplies fail, and the wind proportionably abates. At length, the cloud growing transparent, the wind ceases. During the continuance of these south-east winds, the Table-valley is torn by furious whirlwinds. If they blow warm, they are generally of short duration; and in this case, the cloud soon disappears. This wind rarely blows till after sunset, and never longer than till towards midnight, though the cloud remains, but then it is thin and clear: but when the wind blows cold, it is a sure sign that it will last for some time, an hour at noon and midnight excepted; when it seems to lie still to recover itself, and then lets loose its fury anew.

The Europeans at the Cape consider the year as divided into two seasons, which they term *monsoons*. The wet monsoon or winter, and the dry one or summer. The first begins with our spring in March; the latter with September, when our summer ends. In the summer monsoon reign the south-east winds already mentioned; which, though they clear and render the air more healthy, yet make it difficult for ships outward

bound to enter Table-bay. In the bad season, the Cape is much subject to fogs; and the north-west winds and rain make the inhabitants stay much at home. But there are frequent intermissions and many clear days till June and July; when it rains almost continually, and from thence till summer. The weather in winter is cold, raw, and unpleasant; but never more rigorous than autumn in Germany. Water never freezes to above the thickness of half a crown; and as soon as the sun appears, the ice is dissolved. The Cape is rarely visited by thunder and lightning, excepting a little near the turn of the seasons, which never does any hurt. During the continuance of the south-east winds which rage in summer, the sky is free of all clouds except that on the Table and Wind Hills already mentioned; but during the north-west winds, the air is thick, and loaded with heavy clouds big with rain. If the south-east winds should cease for any length of time, the air becomes sickly by reason of the sea-weeds driving ashore and rotting; hence the Europeans are at such times affected with head-achs and other disorders: but, on the other hand, the violence of those winds subjects them to inflammations of their eyes, &c.

The natives of this country are called *Hottentots*, in their own language; a word of which it is vain to inquire the meaning, since the language of this country can scarce be learned by any other nation. The *Hottentot* language is indeed said to be a composition of the most strange and disagreeable sounds, deemed by many the disgrace of speech, without human sound or articulation, resembling rather the noise of irritated turkeys, the chattering of magpies, hooting of owls, and depending on extraordinary vibrations, inflexions, and clappings of the tongue against the palate.—If this account is true, however, it is obvious, that all the relations we have concerning the religion, &c. of the *Hottentots* derived from themselves, must fall to the ground, as nobody can pretend to understand a language in itself unintelligible. The manners and customs of those people, however, are easily observable, whether they themselves give the relation or not; and if their language is conformable to them, it is no doubt of a nature sufficiently wonderful.

The *Hottentots*, according to the most authentic accounts, are, of all human creatures, the most filthy. Human urine, the excrements of beasts, entrails, and garbage, foot, grease, &c. are their sole delight, and even used as symbols of honour and dignity. As soon as a child is born, they rub it all over with fresh cow-dung; which when dried they rub off, and then wash it with the juice of the *Hottentot* fig. When this juice has dried up, they rub the child over with sheep's grease, or melted butter; and when it has well soaked, they sprinkle on the powder of Buchu (the herb *SPICEA*), which now sticks all over like a crust. When her time has expired, the mother in like manner purifies herself first with cow-dung, and then with grease and buchu; after which she is restored to the embraces of her husband, who must previously undergo a purification of the same kind. They are of an olive colour when born: but the parents take care to make their children as black as possible by a daily unction with a mixture of grease and foot; a ceremony which is continued during the rest of their lives, and

Hottentots. and which makes them appear much blacker than they really are. As soon as the child is born, the women break down the bridge of the nose with their thumbs, looking upon a high nose as a great deformity; and hence it hath been pretty generally believed among Europeans, that the *Hottentots* are born with flat noses.

Every male, when arrived at the age of eight or ten years, according to *Hottentot* law, ought to be deprived of the left testicle; but in cases where the parents are poor, this ceremony is deferred till they are able to answer the expence. The origin of a custom so very extraordinary would no doubt afford entertainment to the curious; but nothing satisfactory hath been said upon the subject. Most authors are of opinion, that this is done to make them run the swifter; and many of the natives themselves assign the same reason: but Kolben was informed by some of the most intelligent *Hottentots*, that it has been a law among them from time immemorial, "that no man should be allowed to have carnal knowledge of a woman, till deprived of his left testicle." Should any marry without this necessary mutilation, both parties would lie at the mercy of the rulers, and the woman perhaps be torn in pieces by her own sex; among whom it is a prevailing opinion, that a man with two testicles constantly begets twins. This extraordinary ceremony is performed in the following manner. The patient being daubed over with the fat of a sheep newly killed, lies on his back on the ground at full length, with his hands and feet tied. His friends lie upon him, in order to keep him from moving. The operator then, with a common table or case knife, laying hold of the left testicle, makes an orifice in the scrotum about an inch and an half long. Thro' this orifice he squeezes out the testicle in a moment, ties up the vessels, thrusts in a little ball of the size of the testicle, composed of sheep's fat and several herbs pulverised. He then stitches up the wound with a thread made of a sheep's sinew, and a needle in the form of an awl. The bands of the patient being then unloosed, the operator anoints him again with the warm fat of the sheep, turning him sometimes on his back and sometimes on his belly, while the poor boy is sweating and almost convulsed with pain. After this, he pisses all over him, rubbing the precious liquor into his skin as well as he can; and the ceremony being thus ended, the patient crawls to a little hut raised for the purpose, and in two or three days becomes as well as ever.

The next essential ceremony is the receiving the youth into the society of men. This is performed when they have arrived at the age of 18. Before this time they are confined to the tuition of their mothers, whom they constantly follow, and dare not, before the performance of the ceremony, converse even with their own fathers. The appointed time being arrived, the inhabitants are assembled, and the men seated in a circle, and the candidate ordered to sit down without upon his hams or heels, but in such a manner as not to touch the ground by at least three inches. The oldest man then rises, and, having obtained consent for the youth's admission, steps up to him and acquaints him, that he must thenceforward forsake his mother, and the company of the women, with every childish

amusement, and learn to behave as a man, both in his words and actions. The candidate then, being previously debauched with grease and foot, squats down to receive the smoking inundation of urine, which the orator discharges all over him with great formality. The old men then congratulate him on the honour done him, and add the following benedictions, "Good luck attend thee;—Live to be old;—Increase and multiply;—May thy beard grow soon."

This ceremony is usually followed by the young man's marriage. All overtures of the matrimonial kind among the *Hottentots*, are made by the father or nearest relation of the man, to the father or nearest relation of the woman. The father and his son wait on the woman's friends; and the lover is first employed in preparing and presenting the company with tobacco. They all smoke, and nothing is said about the matter till their heads become giddy with the fume: then the father opens the business to the woman's father, and demands her for his son. The other leaves the room to consult with his wife; but quickly returns with a positive answer; which is seldom in the negative, unless in case of a prior engagement. If the young woman does not like the match which her parents have agreed to, she has only one chance to avoid it; namely, to lie down with her lover on the ground, and play with him all night at pinching, tickling, and whipping. If she conquers, she fairly gets rid of him; but if he subdues her, which is generally the case, she must marry him. After this the young fellow goes to the habitation of the bride, attended by all his relations and friends, male and female, driving before them one or more oxen, according to their wealth. They are received with great joy; and the oxen being killed, they besmear themselves plentifully with the fat, powdering themselves thick all over with buchu, and the women paint their cheeks, forehead, and chin, with red chalk. This being done, they perform the wedding ceremony in the following manner. The men squat themselves in a circle, in the centre of which the bridegroom is seated in the same posture. At some little distance the women do the same round the bride. Then the priest, or master of religious ceremonies, enters the mens circle, and coming up to the bridegroom pisses a little on him, who with his long nails (for the *Hottentots* never pare their nails) makes furrows in the grease and buchu with which he is covered, that the urine may penetrate the better. He then does the same kindness to the bride; returning from the one to the other, till his whole stock is exhausted, pronouncing all the time short blessings to the following purpose: "May you live happily together; may you have a son before the year's end; may he be a good huntsman and a warrior."

The *Hottentots* have an honourable order among them, consisting of such as have singly encountered and slain a lion, tyger, leopard, elephant, rhinoceros, or elk. The hero, after his return from the exploit to the village, retires to his own hut, where he has not sat long, till an old man, deputed by the inhabitants of the *kraal* or village, comes to invite him to receive the honours due to his merit. The champion rises and follows his conductor to the middle of the village, where all the men are assembled and waiting his arrival. He there squats down on a mat prepared for him; while
all

Hottentots.

Hottentots. all the old men squat in a circle round him. The old deputy then marches up to him, and pisses upon him from head to foot, pronouncing certain words. If the deputy is the hero's friend, he lays him under a deluge of water; for the more plentifully he is besprinkled, the greater is the honour; and the urine is rubbed in by the hero himself with the greatest eagerness. The deputy then lights a pipe of tobacco, which he circulates through the company till nothing but ashes remain in the pipe. These the deputy shakes on the new knight, who is congratulated on the high honour he has received and the service he has done his country. After this he takes three days rest, during which his wife is forbidden to come near him. On the third day he kills a sheep, receives his wife again, and rejoices with his friends and neighbours; wearing ever after the bladder of the beast he has killed, fastened to his hair, as a mark of honour. The Hottentots express greater joy at the destruction of a tyger than of any other wild beast.

The dress of the Hottentots is perfectly agreeable to the nastiness of those customs already described. The skin of a wild beast, or sheep, prepared with cowdung and grease, hangs like a mantle over the shoulders, high or low, open or closed, according to the season of the year, or the customs of the tribe. The men, who have no covering but a composition of fat, foot, and dirt, in the most raging heats, wear cat or lamb-skin caps in cold and wet seasons. The face and forehead of the neck are always bare; and, the pudenda excepted, which are covered with a kind of apron, they go naked from the hips downwards. Leather stockings, and sandals cut out of the raw hides of oxen or elephants, are used occasionally in driving their herds to pasture, or in passing sands or rocks. A greasy pouch hangs about their necks, with a knife, pipe, tobacco, and a small piece of wood called *sassa*, burnt at both ends, as an amulet against witchcraft. Three ivory rings adorn the left arm; to which, on journeys, is fastened a bag with provisions. The *kirri* and *rackhum* sticks (which they use in hunting) are in the right hand; and another is carried in the left, with the bushy tail of a wild cat, fox, or other animal, fastened to it for a handkerchief. The honquers or captains, who were formerly distinguished only by fair skins of tigers or wild-cats, now appear at the head of the army, in councils, and on every solemn occasion, with brass crowns, and brass-headed canes. These ornaments were presented by the Dutch to the chiefs and captains of the nations in alliance with them; and are now annexed to defend with, and are esteemed an unalienable property and distinctive badge of their dignity.

Most writers have affirmed that the Hottentot women wear the guts of sheep and other animals by way of ornament about their legs; but this is a mistake. The girls from their infancy to about 12 years old, wear bulrushes tied in rings about their legs from the knee down to the ankle. When they pass that age, they change the matter of these rings, from bulrushes to slips of sheep and calf-skin, of the thickness of the little finger. They singe off the hair, and then turn inwards the side on which it grew. Some grown women have above 100 of these rings on the leg, so nicely wound about and fitted, that they look like one continued swathe, and by long wearing assume the hard-

ness of wood. These rings are kept from falling down by large wrappers of leather or rushes about the ankles; and serve both as an ornamental distinction to the sex, and for preserving the legs from being scratched or torn in the fields. Like other savages, the Hottentots are very fond of brass buttons, bits of looking-glasses, &c. and some wear on their foreheads a small plate of polished iron in the shape of an half-moon.

The diet of the Hottentots is the flesh and entrails of their cattle, and certain wild beasts, with roots and fruits of different kinds. But, excepting at their public feasts, they rarely kill any cattle for their own eating, unless in cases of great necessity. Yet if any of their cows or sheep die naturally, they make no scruple to eat them, and esteem them as wholesome food. If the men are not contented with the roots, fruits, or milk, which the women take care to provide, they go out a-hunting, or, if near the sea, a-fishing. They always hunt in large companies. The entrails of cattle, or of such wild beasts as they kill for food, are looked upon as most exquisite eating, after they have been boiled in beasts blood mingled with milk. Sometimes they broil them; but in general they eat them half raw. In either case, they devour their victuals in a very furious and ravenous manner, without any regard to decency. They have no set meals; but eat as their appetite or humour directs, either by night or day. In fair weather, they eat in the open air; in wind or rain, in their huts. They have traditional laws as to abstaining from certain meats. Swines flesh, and fish without scales, are prohibited to both sexes: hares and rabbits are forbidden to the men, but not to the women: the pure blood of beasts, and the flesh of the mole, are forbidden to the women, but not to the men.

The nastiness of the Hottentots makes them swarm with lice, some of which are exceedingly big. These last they eat, throwing away the unsizeable ones; and if they are asked how they can devour such detestable vermin, they plead the law of retaliation, and urge that it is no shame to eat those who would eat them. The Europeans at the Cape have a sort of field-shoes, cut out of the raw hide of an ox or stag, with the hairy side outwards. These, when thrown away, the Hottentots gather and lay up against a rainy day, when their provisions fall short, and eat them heartily; first singeing off the hair, then soaking them in water, and lastly broiling them on the fire.

These are the customs which chiefly distinguish the Hottentots from all other people on earth; but besides these, they have others in common with the generality of barbarous nations. If a woman is delivered of female twins, they generally destroy the worst-favoured; or if the children are male and female, the latter perishes, by being exposed on the bough of a tree, or buried alive with the consent of the whole village. Some of these deserted infants have been found by the Europeans, and educated by them; yet it is said, that, when arrived at the years of maturity, they always renounced the European manners, apparel, and religion, to conform to those of their own people. After a youth is discharged from the tuition of his mother in the manner already mentioned, he may insult, and even beat her, whenever he pleases; for which he receives applause instead of reproof. Nay, it is usual for them to go and abuse their mothers immediately.

Hotentots. mediately after their being admitted into the order of men, to shew their contempt for the conversation of females. If the eldest son, or, in default of sons, the next male relation, determines to get rid of his father, mother, or other relation, who are considered as superannuated, and incapable of any useful domestic performance, the village is convoked, and informed of the condition and request of the heir. Consent is never refused; and a day is immediately appointed for the removal of the superannuated man or woman. There is now no distinction of persons; the wealthiest man, or the captain of the village, must submit as well as the meanest, and is compelled to surrender his whole estate to the claimant. The whole village accompany him to a lonely hut, where he is left with a small quantity of provisions set within his reach, where he soon perishes, or is devoured by wild beasts. Adultery among the Hotentots is always punished with death; but they allow divorce, if the husband can shew sufficient cause for it; and of the sufficiency of which the rest of the village are the judges. In this case, the men may marry again, but the woman is not allowed to do so while her husband lives. If a widow marries, she cuts off a joint of her finger, beginning with the little one, for every husband after the first.

In other respects, the Hotentots are the most lazy people in the world: they esteem thinking a labour, and avoid both as capital plagues; passing three parts in four of their lives in the most shameful stupidity and idleness. Occasionally, however, they are surprisingly active. In swiftness, they are said to surpass the fleetest horse; and are famed for their dexterity in discharging their arrows, javelins, &c. Though unacquainted with agriculture and the qualities of tobacco before the arrival of the Europeans, they excel, and are consulted by most of those resident in their country, concerning the management of lands and the choice of tobacco. Their mutual affection, liberality, and benevolence, extend to each other in the most friendly manner; and, naturally compassionating distresses, they are extremely hospitable to strangers of every nation. They are of good sense and integrity in the execution of justice, and in chastity excel almost all other nations in the world.

Besides the methods of fighting with bows and arrows, darts, &c. common to all barbarous nations, the Hotentots have a kind of oxen trained to war. These they call *Bakkeleyers*, or fighting oxen; and the skill of the Hotentot generals is chiefly displayed by choosing the most proper time and place for driving in the beasts among the enemy. These animals stamp, kick, and gore, with incredible fury; and, if well followed by the men, speedily rout the enemy. A battle decides the war; for an Hotentot army once routed never rallies again. The conquerors triumph and pursue the enemy with astonishing shouts and exclamations. All prisoners are killed; and both armies bury their dead, which are never insulted or plundered. Deserters and spies are immediately put to death.

The Hotentots are very shy of entering upon any discourse concerning their religion; whence it hath been doubted whether they have any at all. Kolben, however, assures us, that they believe in a God, the author of all things. This supreme power they call

the *God of gods*; and say, "he is a good man, who does nobody any hurt, and from whom none need be apprehensive of any, and that he lives far beyond the moon." But it does not appear, that they have any intimation of worship directly regarding this supreme deity. They excuse themselves when pressed on this head, by a tradition, that their first parents so grievously offended this great God, that he cursed them and their posterity with hardness of heart; so that they know little about him, and have less inclination to serve him. They adore the moon, by assembling at night in the fields, killing cattle, and offering milk and flesh. This they do constantly at the full and change. They welcome her; and then invoke her for favourable weather, to grant them fodder for their cattle, &c. They also regard as a good deity an insect of the beetle kind, peculiar to these countries. It is about the size of a child's little finger, the back green, the belly speckled red and white, with two wings and two horns. Wherever they meet this animal, they pay it the highest honour and veneration. If it visits a village, they assemble about it in troops as if a divinity had appeared among them; they kill a sheep or two as a thank-offering, and esteem it as an omen of the greatest happiness and prosperity. They believe its appearance expiates all their guilt. If the insect lights upon a Hotentot, the person is looked upon as a saint, and ever after treated with uncommon respect. The village kills the fattest ox for a thank-offering; and the caul powdered with buchu, and twisted like a rope, is put collar-wise about the saint's neck, and there must remain till it rots off. A sort of veneration is also paid to deceased saints or heroes. They believe in an evil deity, whom they represent as a little, malicious, ill-natured being, a great enemy to Hotentots, and the author of all the mischiefs which befall them in this world, beyond which he hath no power. They therefore worship and offer sacrifices to him, in order to soften and bring him into better temper. Some of them even pretend, that they have seen him in the shape of a deformed, hairy, frightful monster, dressed in white, with a head and feet like those of a horse. All sudden pain, crotch accidents, and sickness, are by the Hotentots ascribed to witchcraft; so that charms and amulets are in high esteem among them. They seem to have no notion of a future state, either good or bad, after death, much less of a resurrection; yet that they believe the immortality of the soul, seems evident from the following particulars. 1. They offer prayers and praises to the good Hotentots deceased. 2. They are apprehensive of the return of departed spirits to molest them; for which reason they remove their village on the death of any of its inhabitants. 3. They believe it is in the power of wizards and witches to lay these spirits. But they seem to think these departed souls remain in or about those places where the body was inhabited by them; for of a heaven or hell, rewards or punishments, they have not the least notion.

This appears to be the whole that can be collected concerning the Hotentot religion, and to which they are invincibly attached. If you attempt to reason with them, they hear you sullenly, or quit you abruptly. They avoid, if possible, any religious subject. Some of them have pretended a belief of Christianity;

Hotentots. nity: but when the motive was removed, they always returned to their former idolatry; and, in spite of all the endeavours of the Dutch missionaries at the Cape, they have never been able to make a single convert.

Of the cape-town and country adjacent peopled by the Dutch, Mr Foster gives the following account: "The town is neat and well built; looks white at a distance, and seems to rise out of a desert surrounded by broken masses of black and dreary mountains. The storehouses of the Dutch East-India company are all situated near the water, and the private buildings lie beyond them in a gentle ascent. The fort which commands the road, is on the east side of the town, but seems not to be of great strength; besides which, there are several batteries on both sides. The streets in the town are broad, and regular; all the principal ones are planted with oaks; and some have in their middle a canal of running water, which, on account of its small quantity, they are obliged to husband by sluices, so that parts of it are sometimes entirely drained, and occasion no very pleasant smell. The national character of the Dutch strongly manifests itself in this particular; their settlements being always supplied with canals, though reason and common sense evidently prove their noxious influence on the health of the inhabitants, especially at Batavia.

"The houses are built of brick, and many of them are white-washed on the outside. The rooms are in general lofty and spacious, and very airy, which the hot climate requires. There is but one church in the whole town; and that is extremely plain, and seems to be rather too small for the congregation. That spirit of toleration, which has been so beneficial to the Dutch government at home, is not to be met with in their colonies. It is but very lately that they have suffered even the Lutherans to build churches at Batavia, and at this place; and at the present time, a clergyman of that persuasion is not tolerated at the Cape, but the inhabitants are obliged to content themselves with the chaplains of Danish and Swedish East-India-men, who give them a sermon, and administer the sacrament once or twice a-year, and are very handsomely rewarded. The government and the inhabitants do not give themselves the trouble to attend to a circumstance of so little consequence in their eyes as the religion of their slaves, who in general seem to have none at all. A few of them follow the Mahomedan rite; and weekly meet in a private house belonging to a free Mahomedan, in order to read or rather chaunt several prayers and chapters of the Khoran. As they have no priest among them, they cannot partake of any other acts of worship (A).

"The slaves belonging to the company, who amount to several hundreds, are lodged and boarded in a spacious house erected for that purpose, where they are likewise kept at work. Another great building serves as an hospital for the sailors belonging to the Dutch East-India ships, which touch here, and commonly have prodigious numbers of sick on board, on their

voyage from Europe towards India. The vast number of men, sometimes six, seven, or eight hundred, which these ships carry out to supply the military in India, the small room to which they are confined, and the short allowance of water and salt provision they receive, on a long voyage through the torrid zone, generally make considerable havoc among them: it is therefore no uncommon circumstance at the Cape, that a ship on her passage thither from Europe, loses eighty or a hundred men, and sends between two and three hundred others dangerously ill to the hospital. A fact no less deplorable than certain, is, that the small expence and facility with which the *ziel-verkooopers* actually carry on their infamous trade of supplying the India company with recruits, makes them less attentive to the preservation of health among these poor people. Nothing is more common, in this and other Dutch colonies, than to meet with soldiers in the company's service, who, upon inquiry, acknowledge they have been kidnapped in Holland. There is an apothecary's shop belonging to the hospital, where the most necessary remedies are prepared, but no expensive drugs are to be found in it; and the method of administering to all the patients indiscriminately out of two or three huge bottles, full of different preparations, suffices to convince us, that the fresh air of the land, and the fresh provisions here, contribute much more to the recovery of the sick, than the skill of their physicians. Patients who are able to walk, are ordered to go up and down the streets every fair morning; and all kinds of greens, pot-herbs, fallads, and antiscorbutics, are raised for their use, in an adjacent garden belonging to the company. Travellers have sometimes praised and sometimes depreciated this garden, according to the different points of view in which it has been considered. It is true, a few regular walks of indifferent oaks, encompassed with elm and myrtle hedges, are not objects engaging enough to those who are used to admire the perfection of gardening in England, or who contemplate in Holland and France cypresses, box, and yew-trees cut out into vases, statues, and pyramids, or *charmilles* turned into pieces of architecture! But considering that the trees were planted in the beginning of this century, more for use than ornament; that they shelter the kitchen-herbs for the hospital, against the destructive violence of storms; and that they form the only shady and airy walks, comfortable to voyagers and sick persons in this hot climate: I cannot wonder that some should extol as "a delightful spot*," what others contemptuously call "a friar's garden†."

"The governor depends immediately upon the East-India company, and has the rank of an *edele heer*, the title given to the members of the supreme council of Batavia. He presides here over a council, consisting of a second or deputy-governor, the fiscal, the major (who commands the fort), the secretary, the treasurer, the comptroller of provisions, the comptroller of liquors, and the book-keeper; each of which has a branch of the company's commerce assigned to his

(A) We would not be understood to throw an odium on the Dutch in particular, when it is well known that the negroes, who wear the chains of the English and French, are equally neglected: it was only intended to awaken a fellow-feeling towards an unhappy race of MEN, among the colonists of all nations; and to remind them, whilst they enjoy, or *strive* to enjoy, the inestimable blessing of LIBERTY, to exert themselves in acts of humanity and kindness towards those from whom they withhold it, perhaps, without remorse.

* Byron.
† Hougoulinville.

Hottentots. his care. This council has the whole management of the civil and military departments; but the deputy-governor prebides over another, named the *court of justice*, which tries all offences and crimes, and consists of some of the members of the former; but no two relations can sit and vote in the same council, to prevent the influence of parties.

"The income of the governor is very considerable; for, besides a fixed appointment, and the use of houses, gardens, proper furniture, and every thing that belongs to his table, he receives about 10 dollars for every leagre of wine which the company buy of the farmer, in order to be exported to Batavia. The company allows the sum of 40 dollars for each leagre, of which the farmer receives but 24: what remains is shared between the governor, and second or deputy; the former taking two-thirds, which sometimes are said to amount to 4000 dollars per annum. The deputy-governor has the direction of the company's whole commerce here, and signs all orders to the different departments under him, as well as the governor to others. He and the fiscal have the rank of *upper koopman*. The fiscal is at the head of the police, and sees the penal laws put in execution: his income consists of fines, and of the duties laid on certain articles of commerce; but if he be strict in exacting them, he is universally detested. The found policy of the Dutch has likewise found it necessary to place the fiscal as a check, to overawe the other officers of the company, that they may not counteract the interests of their masters, or infringe the laws of the mother-country. He is, to that end, commonly well versed in juridical affairs, and depends solely upon the mother-country. The major (at present Mr Von Prehn, who received us with great politeness) has the rank of *koopman* or merchant: this circumstance surprises a stranger, who, in all other European states, is used to see military honours confer distinction and precedence; and appears still more singular to one who knows the contrast in this particular between Holland and Russia, where the idea of military rank is annexed to every place, even that of a professor at the university. The number of regular soldiers at this colony amounts to about 700; of which 400 form the garrison of the fort, near the Cape-town. The inhabitants capable of bearing arms form a militia of 4000 men; of whom a considerable part may be assembled in a few hours, by means of signals made from alarm-places in different parts of the country. We may from hence make some estimate of the number of white people in this colony, which is at present so extensive, that the distant settlements are above a month's journey from the Cape; but these remote parts lie sometimes more than a day's journey from each other, are surrounded by various nations of Hottentots, and too frequently feel the want of protection from their own government at that distance. The slaves in this colony are at least in the proportion of five or more to one white person. The principal inhabitants at the Cape have sometimes from 20 to 30 slaves, which are in general treated with great lenity, and sometimes become great favourites with their masters, who give them very good cloathing, but oblige them to wear neither shoes nor stockings,

reserving these articles to themselves. The slaves are chiefly brought from Madagascar, and a little vessel annually goes from the Cape thither on that trade; there are, however, besides them, a number of Malays and Bengalese, and some negroes. The colonists themselves are for the greatest part Germans, with some families of Dutch, and some of French Protestants. The character of the inhabitants of the town is mixed. They are industrious, but fond of good living, hospitable, and social; though accustomed to hire their apartments to strangers, for the time they touch at this settlement, and used to be complimented with rich presents of stuffs, &c. by the officers of merchant ships. They have no great opportunities of acquiring knowledge, there being no public schools of note at the Cape; their young men are therefore commonly sent to Holland for improvement, and their female education is too much neglected. A kind of dislike to reading, and the want of public amusements, make their conversation uninteresting, and too frequently turn it upon scandal, which is commonly carried to a degree of intemperacy peculiar to little towns. The French, English, Portuguese, and Malay languages, are very commonly spoken, and many of the ladies have acquired them. This circumstance, together with the accomplishments of singing, dancing, and playing a tune on the lute, frequently united in an agreeable person, make amends for the want of refined manners and delicacy of sentiment. There are, however, among the principal inhabitants, persons of both sexes, whose whole deportment, extensive reading, and well-cultivated understanding would be admired and distinguished even in Europe. Their circumstances are in general easy, and often very affluent, on account of the cheap rate at which the necessaries of life are to be procured: but they seldom amass such prodigious riches here as at Batavia; and I was told the greatest private fortune at the Cape did not exceed 100,000 dollars, or about 22,500 l. sterling.

"The farmers in the country are very plain hospitable people; but those who dwell in the remotest settlements seldom come to town, and are said to be very ignorant; this may easily be conceived, because they have no better company than Hottentots, their dwellings being often several days journey asunder, which must in a great measure preclude all intercourse. The vine is cultivated in plantations within the compass of a few days journey from the town; which were established by the first colonists, and of which the ground was given in perpetual property to them and their heirs. The company at present never part with the property of the ground, but let the surface to the farmer for an annual rent, which, though extremely moderate, being only 25 dollars for 60 acres*, yet does not give sufficient encouragement to plant vineyards. The distant settlements, therefore, chiefly raise corn and rear cattle; nay, many of the settlers entirely follow the latter branch of rustic employment, and some have very numerous flocks. We were told there were two farmers who had each 15,000 sheep, and oxen in proportion; and several who possessed 6000 or 8000 sheep, of which they drive great droves to town every year: but lions and buffaloes, and the fatigues

* Each acre of 666 square Rhynland rods, the rood of 12 feet. The proportion of the Rhynland foot to the English, is about 116 to 120.

Hottentots.

tigue of the journey, destroy numbers of their cattle before they can bring them so far. They commonly take their families with them in large waggons covered with linen or leather, spread over hoops, and drawn by 8, 10, and sometimes 12 pair of oxen. They bring butter, mutton-tallow, the flesh and skins of sea-cows (hippopotamus), together with lion and rhinoceros' skins, to sell. They have several slaves, and commonly engage in their service several Hottentots of the poorer sort, and (as we were told) of the tribe called *Boschemans*, or *Bushman*, who have no cattle of their own, but commonly subsist by hunting, or by committing depredations on their neighbours. The opulent farmers set up a young beginner by intrusting to his care a flock of 400 or 500 sheep, which he leads to a distant spot, where he finds plenty of good grass and water; the one-half of all the lambs which are yeaned fall to his share, by which means he soon becomes as rich as his benefactor.

"Though the Dutch company seem evidently to discourage all new settlers, by granting no lands in private property; yet the products of the country have of late years sufficed not only to supply the islands of France and Bourbon with corn, but likewise to furnish the mother-country with several ship-loads. These exports would certainly be made at an easier rate than at present, if the settlements did not extend so far into the country, from whence the products must be brought to the Table-bay by land-carriage, on roads which are almost impassable. The intermediate spaces of uncultivated land between the different settlements are very extensive, and contain many spots fit for agriculture; but one of the chief reasons why the colonists are so much divided and scattered throughout the country, is to be met with in another regulation of the company, which forbids every new settler to establish himself within a mile of another. It is evident, that if this settlement were in the hands of the commonwealth, it would have attained to a great population, and a degree of opulence and splendor, of which it has not the least hopes at present: but a private company of East-India merchants find their account much better in keeping all the landed property to themselves, and tying down the colonist, lest he should become too great and powerful.

"The wines made at the Cape are of the greatest variety possible. The best, which is made at M. Vander Spy's plantation of Constantia, is spoken of in Europe, more by report than from real knowledge; 30 leagues (a) at the utmost are annually raised of this kind, and each league sells for about 50*l*. on the spot. The vines from which it is made were originally brought from Shiraz in Persia. Several other sorts grow in the neighbourhood of that plantation, which produce a sweet rich wine, that generally passes for genuine Constantia in Europe. French plants of burgundy, muscade, and frontignan, have likewise been tried, and have succeeded extremely well, sometimes producing wines superior to those of the original soil. An excellent dry wine, which has a slight agreeable tartness, is commonly drank in the principal families, and is made of Madeira vines transplanted to the Cape. Several low sorts, not entirely disagreeable, are raised

in great plenty, and sold at a very cheap rate; so that the sailors of the East-India ships commonly indulge themselves very plentifully in them whenever they come ashore.

"The products of the country supply with provisions the ships of all nations which touch at the Cape. Corn, flour, biscuit, salted beef, brandy, and wine, are to be had in abundance, and at moderate prices; and their fresh greens, fine fruits (c), good mutton and beef, are excellent restoratives to seamen who have made a long voyage."

HOTTINGER (John Henry), born at Zurich in Switzerland in 1620, professed the Oriental languages at Leyden, and was esteemed by all his learned colleagues. He was drowned, with part of his family, in the river Lemit, in the year 1667. He wrote a prodigious number of works; the principal of which are, 1. *Exercitationes Anti-Morinianæ de Pentateucho Samaritano*, quarto, in which he defends the Hebrew text against father Morin. 2. *Historia Orientalis*, quarto. 3. *Bibliothecarius quadripartitus*. 4. *The-saurus Philologicus Sacre Scripture*, quarto. 5. *Historia Ecclesiastica*. 6. *Promptuarium, sive Bibliotheca Orientalis*, 4to. 7. *Dissertationes miscellaneæ*, &c.

HOTTONIA, WATER-VIOLET; a genus of the monogynia order, belonging to the pentandria class of plants.—There is but one species, viz. the palustris, with a naked stalk. It grows naturally in the standing waters in many parts of England. The leaves, which are for the most part immersed in water, are finely winged and flat like most of the sea-plants; and at the bottom have long fibrous roots, which strike into the mud: the flower-stalks rise or five six inches above the water, and toward the top have two or three whorls of purple flowers, terminated by a small cluster of the same. These flowers have the appearance of those of the stock-gillflower, so make a pretty appearance on the surface of the water.—It may be propagated in deep standing waters, by procuring its seeds when they are ripe, from the places of their natural growth; which should be immediately dropped into the water in those places where they are designed to grow, and the spring following they will appear; and if they are not disturbed, they will soon propagate themselves in great plenty.—Cows eat this plant; swine refuse it.

HOVEDEN (Roger de), born of an illustrious family, became chaplain to king Henry II. and left behind him two books of *English Annals*, carried on from the year 732, where Bede ended, to the 4th of king John, 1201. Sir H. Savile and Mr. Selden reckon him among the most considerable historians who flourished in the 11th and 12th centuries.

HOULIERES (Antoinette de), a French lady, whose poetry is highly esteemed in France. Her works and those of her daughter have been collected and printed together in two volumes. Most of the Idyls, particularly those on sheep and birds, surpass every thing of the kind in the French language: the thoughts and expressions are noble; and the style pure, flowing, and chaste. Mademoiselle des Houlières carried the poetic prize in the French academy against Fontenelle. Both of these ladies were members

bers of the academy of Ricovatri; the mother was also a member of the academy of Arles.—Those who desire to be more particularly acquainted with the history of Madam des Houlieres may consult her life prefixed to her works in the Paris edition of 1747, 2 vols 12mo.

HOULSWORTHY, a large town of Devonshire, seated between four branches of the river Tamer, having a good market for corn and provisions. W. Long. 4. 42. N. Lat. 50. 50.

HOUND. See **CANIS**, **BLOOD-HOUND**, and **GRE-HOUND**.

HOURLY, in chronology, an aliquot part of a natural day, usually a 24th, but sometimes a 12th. The origin of the word *hora*, or *ura*, comes, according to some authors, from a surname of the sun, the father of hours, whom the Egyptians call *Horus*. Others derive it from the Greek *ὥριον*, to terminate, distinguish, &c. Others from the word *ουρα*, urine; holding, that Trismegistus was the first that settled the division of hours, which he did from observation of an animal consecrated to Serapis, named *cynocephalus*, which makes water 12 times a-day, and as often in the night, at equal intervals.

An hour, with us, is a measure or quantity of time, equal to a 24th part of the natural day, or nycthemeron; or the duration of the 24th part of the earth's diurnal rotation. Fifteen degrees of the equator answer to an hour; though not precisely, but near enough for common use. It is divided into 60 minutes; the minute into 60 seconds, &c.

The division of the day into hours is very ancient: as is shewn by Kircher, *Oedip. Egypt.* Tom. II. P. II. class. VII. c. 8.: though the passages he quotes from Scripture do not prove it.—The most ancient hour is that of the 12th part of the day. Herodotus, lib. ii. observes, that the Greeks learnt from the Egyptians, among other things, the method of dividing the day into twelve parts.—The astronomers of Cathaya, &c. bishop Beveridge observes, still retain this division. They call the hour, *chag*; and to each *chag* give a peculiar name, taken from some animal: The first is called *zeth*, "mouse;" the second, *chiu*, "bullock;" the third, *zem*, "leopard;" the fourth, *mau*, "hare;" the fifth, *chiu*, "crocodile, &c."

The division of the day into 24 hours, was not known to the Romans before the first Punic war.—Till that time they only regulated their days by the rising and setting of the sun. They divided the 12 hours of their day into four, viz. *prime*, which commenced at six o'clock; *third*, at nine; *sixth*, at twelve, and *nones*, at three. They also divided the night into four watches, each containing three hours.

HOURS, **Horæ**, in the ancient mythology, were certain goddesses, the daughters of Jupiter and Themis; at first only three in number, Eunomia, Dice, and Irene; to which were afterwards added two more, Carpo and Thallo.—Homer makes them the door-keepers of heaven. Ovid allots them the employment of harnessing the horses of the sun:

Jungere equos Titan velocibus imperat Horis.

HOURS, **Horæ**, in the Romish church, are certain prayers performed at stated times of the day; as matins, vespers, lauds, &c.—The lesser hours, are *prime*,

tierce, *sixth*, and *nones*. They are called *hours*, or *canonical hours*, as being to be rehearsed at certain hours prescribed by the canons of that church, in commemoration of the mysteries accomplished at those hours. These hours were anciently also called *cours*, *curfus*; F. Mabillon has a dissertation on them, entitled, *De Curfu Gallicano*.

The first constitution enjoining the observation of the canonical *hours*, is of the ninth century, being found in a capitular of Heito bishop of Basil directed to his curates, importing that the priests shall never be absent at the canonical hours either by day or night.

HOUSE, a habitation, or place built with conveniences for dwelling in. See **ARCHITECTURE**.

HOUSE is also used for one of the estates of the kingdom assembled in parliament. Thus we say, the house of lords, the house of commons, &c. See **PEERS**, **COMMONS**, &c.
