ENCYCLOPÆDIA BRITANNICA;

OR, A

DICTIONARY

OF

ARTS, SCIENCES, &c.

On a PLAN entirely NEW:

BY WHICH,

THE DIFFERENT SCIENCES AND ARTS

Are digested into the FORM of Distinct

TREATISES OR SYSTEMS,

COMPREHENDING

The HISTORY, THEORY, and PRACTICE, of each,
according to the Latest Discoveries and Improvements;

AND FULL EXPLANATIONS ARE GIVEN OF THE

VARIOUS DETACHED PARTS OF KNOWLEDGE,

WHETHER RELATING TO

NATURAL and ARTIFICIAL Objects, or to Matters ECCLESIASTICAL,
CIVIL, MILITARY, COMMERCIAL, *&c.*

TOGETHER WITH

A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, *&c.*
throughout the WORLD;

A General HISTORY, *Ancient* and *Modern*, of the different Empires, Kingdoms, and States;

AND

An Account of the LIVES of the most Eminent Persons in every Nation,
from the earliest ages down to the present times.

THE WHOLE COMPILED FROM
THE WRITINGS OF THE BEST AUTHORS, IN SEVERAL LANGUAGES; THE MOST APPROVED DICTIONARIES,
AS WELL OF GENERAL SCIENCE AS OF PARTICULAR BRANCHES; THE TRANSACTIONS, JOURNALS, AND MEMOIRS, OF LEARNED
SOCIETIES, BOTH AT HOME AND ABROAD; THE MS. LECTURES OF EMINENT PROFESSORS ON DIFFERENT SCIENCES;
AND A VARIETY OF ORIGINAL MATERIALS, FURNISHED BY AN EXTENSIVE CORRESPONDENCE.

The SECOND EDITION; greatly Improved and Enlarged.

ILLUSTRATED WITH ABOVE TWO HUNDRED COPPERPLATES.

VOL. VII.

INDOCTI DISCANT, ET AMENT MEMINISSE PERITI.

EDINBURGH:

Printed for J. BALFOUR and Co. W. GORDON, J. BELL, J. DICKSON, C. ELLIOT, W. CREECH,
J. McCLIESH, A. BELL, J. HUTTON, and C. MACFARQUHAR.

MDCCLXXXI.

A NEW
Dictionary of Arts, Sciences, &c.

MEDICINES, whatever fubftances ferve to reftore health.—Medicines are either *fimple* or *compound;* the former being prepared by nature alone; and the latter owing to the induftry of man, by varioufly mixing the fimple together. See PHARMACY.

MEDICINES are likewife diftinguifhed, from the manner of ufing them, into *external* and *internal;* and with regard to their effects, they are faid to be *emetic*, *cathartic*, *aftringent*, &c. See MATERIA MEDICA.

Pocket MEDICINES, in furgery, thofe which a furgeon ought always to carry about with him, in a box, or convenient cafe.

Thofe, according to Heifter, are the common digeftive ointment, and the brown or Egyptian ointment, for cleanfing and digefting foul ulcers; and fome vulnerary balfams, as the *linimentum Arcæi*, or the balfam of Peru, Gilead, or Copivi, or the Samaritan balfam: to thefe muft alfo be added a plafter or two; as the *diachylon* or *ftypticum Crollii*, fince one or other of thefe is almoft conftantly wanted. Neither fhould there be wanting a piece of blue vitriol for the taking down luxuriant flefh, and to ftop hæmorrhages: but if vitriol is wanting, burnt alum, red precipitate, the infernal ftone, or any other corrofive medicine, will fupply its place in corrofive intentions; and the laft will alfo ferve to open abfceffes, to make iffues, and perform many other operations of that kind.

With thefe there fhould always be kept in readinefs alfo a quantity of fcraped lint, that the furgeon may be able to give immediate affiftance to wounded perfons; fince, if he is unprepared for this, they may eafily be taken off by an hæmorrhage; a circumftance which ought alfo to prevail with him to be always provided with fuitable bandages.

MEDIETAS LINGUÆ, in law, fignifies a jury, or inqueft impanelled, of which the one half are natives of this land, and the other foreigners. This jury is never ufed except where one of the parties in a plea is a ftranger, and the other a denizen. In petit-treafon, murder, and felony, foreigners are allowed this privilege; but not in high-treafon, becaufe an alien in that cafe fhall be tried according to the rules of the common law, and not by a *medietas linguæ*. A grand jury ought not in any cafe to be of a *medietas linguæ;* and the perfon that would have the advantage of a trial in this way, is to pray the fame, otherwife it will not be permitted on a challenge of the jurors.

MEDIMNUS, in Grecian antiquity, a meafure of capacity. See MEASURE.

MEDINA-TALNARI, a famous town of Arabia Petræa, between Arabia Deferta and Arabia the Happy; celebrated for being the burial-place of Mahomet. It is feated in a plain abounding with palm-trees, in E. Long. 39. 53. N. Lat. 25. See *(Hiftory of)* ARABIA.

MEDINA-*Celi*, an ancient town of Spain, in Old Caftile, and capital of a confiderable duchy of the fame name; feated near the river Xalon, in W. Long. 2. 9. N. Lat. 41. 15.

MEDINA-*de-las-Torres*, a very ancient town of Spain, in Eftremadura, with an old caftle, and the title of a duchy. It is feated on the confines of Andalufia, at the foot of a mountain near Bajadoz.

MEDINA-*del-Campo*, a large, rich, and ancient town of Spain, in the kingdom of Leon. The great fquare is very fine, and adorned with a fuperb fountain. It is a trading place, enjoys great privileges, and is feated in a country abounding with corn and wine. W. Long. 4. 20. N. Lat. 41. 22.

MEDINA-*del-rio-Secco*, an ancient and rich town of Spain, in the kingdom of Leon, with the title of a duchy; feated on a plain, where there are fine paftures. E. Long. 4. 33. N. Lat. 42. 8.

MEDINA (Sir John), an eminent painter, was the fon of Medina de l'Afturias, a Spanifh captain, who had fettled at Bruffels; where the fon was born, and inftructed in painting by Du Chatel. He married young; and in 1686 came into England, where he drew portraits for feveral years. The earl of Leven encouraged him to go to Scotland, and procured him a fubfcription of 500l. worth of bufinefs. He painted moft of the Scotch nobility; and at Wentworth-caftle is a large piece, containing the firft duke of Argyle and his fons, the two late dukes John and Archibald, in Roman habits; the ftyle Italian, and fuperior to moft modern performers. The portraits of the profeffors in the furgeons-hall at Edinburgh were painted by him, and are commended; and in that hall are two fmall hiftory-pieces by him. He was knighted by the duke of Queenfberry, lord high-commiffioner; and was the laft knight made in Scotland before the Union. He was not, however, rich; for he had 20 children. He died in Scotland; and was buried in the church-yard of the Gray-friars at Edinburgh in 1711, aged 52. He was capable both of hiſtory and landſcape. The prints in the octavo edition of Milton were deſigned by him.

MEDIOLANUM, an ancient city, the capital of the Inſubres, built by the Gauls on their ſettlement in that part of Italy. A *municipium*, and a place of great ſtrength. The ſeat of the liberal arts; whence it had the name of *Novæ Athenæ*. Now *Milan*, capital of the Milaneſe, ſituate on the rivers Olana and Lombro, E. Long. 9. 30. N. Lat. 45. 25.

Mediolanum *Aulercorum* (anc. geogr.), a town of Gallia Celtica, which afterwards took the name of the *Eburovicum Civitas* (Antonine); corrupted to *Civitas Ebroicorum*, and this laſt to *Ebroica;* whence the modern appellation *Evreux*, a city of Normandy. E. Long. 1. 12. N. Lat. 49. 21.

Mediolanum *Gugernorum* (anc. geogr.), a town of Gallia Belgica, now the village *Moyland*, not far from Cologne.

Mediolanum *Ordovicum* (anc. geogr.), a town of Britain, now *Llan Vethlin*, a market-town in Montgomeryſhire in Wales.

Mediolanum *Santonum* (anc. geogr.), which afterwards taking the name of the people, was called *Santonica Urbs;* alſo *Santones* and *Santoni:* A town of Aquitain. Now *Saintes*, capital of Saintonge in Guienne, on the river Charente. W. Long. 36. 0. N. Lat. 45. 50.

MEDITERRANEAN sea, extends from the Straits of Gibraltar to the coaſt of Syria and Paleſtine, being above 2000 miles in length, but of very unequal breadth: the weſt part of it ſeparating Europe from Africa; and the Levant, or eaſt part of it, dividing Aſia from Africa, Spain, France, Italy, Turky in Europe, and Natolia, or the Leſſer Aſia, bounding it on the north; and the empire of Morocco, Algiers, Tunis, Tripoli, Barca, and Egypt, bounding it on the ſouth. The Strait of Gibraltar being about 15 or 16 miles broad, a ſtrong current ſets through it out of the Atlantic Ocean into the Mediterranean conſtantly, which requires a good gale of wind to ſtem it.

MEDITULLIUM, is uſed by anatomiſts for that ſpungy ſubſtance between the two plates of the *cranium*, and in the interſtices of all laminated bones. See Diploe.

MEDIUM, in logic, the mean or middle term of a ſyllogiſm, being an argument, reaſon, or conſideration, for which we affirm or deny any thing; or, it is the cauſe why the greater extreme is affirmed or denied of the leſs in the concluſion.

Medium, in arithmetic, or *arithmetical medium* or *mean*, called in the ſchools *medium rei;* that which is equally diſtant from each extreme, or which exceeds the leſſer extreme as much as it is exceeded by the greater, in reſpect of quantity, not of proportion; thus 9 is a medium betwixt 6 and 12.

Geometrical Medium, called in the ſchools *medium perſonæ*, is that where the ſame ratio is preſerved between the firſt and ſecond as between the ſecond and third terms; or that which exceeds in the ſame ratio or quota of itſelf, as it is exceeded: thus 6 is a geometrical medium between 4 and 9.

Medium, in philoſophy, that ſpace or region through which a body in motion paſſes to any point: thus æther is ſuppoſed to be the medium through which the heavenly bodies move; air, the medium wherein bodies move near our earth; water, the medium wherein fiſhes live and move; and glaſs is alſo a medium of light, as it affords it a free paſſage. That denſity or conſiſtency in the parts of the medium, whereby the motion of bodies in it is retarded, is called the *reſiſtance of the medium;* which, together with the force of gravity, is the cauſe of the ceſſation of the motion of projectiles.

Subtile or *Ætherial* Medium. See Ether, Electricity, Fire, &c.

Medium, in optics, any ſubſtance through which light is tranſmitted.

MEDLAR, in botany. See Mespilus.

MEDULLA, Medulla *Oblongata*, Medulla *Spinalis*. } See Anat. n° 5. 396—399.

MEDUSA, one of the three Gorgons, daughter of Ceto and a ſea-god named *Phorcus*. Neptune being in love with her, forced her in the temple of Minerva; upon which that goddeſs changed her hair (which was extremely fair) into ſerpents, the ſight of which turned the beholders into ſtones: but Perſeus, armed with Mercury's ax, with which he killed Argus, cut off Meduſa's head, from whoſe blood ſprang Pegaſus and Chryſaor. Minerva is repreſented bearing the picture of Meduſa's head on her ſhield, to terrify her enemies.

Medusa, in zoology, a genus of inſects belonging to the order of molluſca. The body is gelatinous, roundiſh, and depreſſed; and the mouth is in the centre of the under part of the body. There are twelve ſpecies, all natives of the ſea. The moſt remarkable is the ſimplex, or armleſs, with a plain circumference; four apertures beneath; no tenacula. Theſe animals inhabit all our ſeas; are gregarious; often ſeen floating with the tide in vaſt numbers; feed on inſects, ſmall fiſh, &c. which they catch with their claſpers or arms. Many ſpecies, on being handled, affect with a nettle-like burning, and excite a redneſs. The ancients, and ſome of the moderns, add that they have an aphrodiſiac property, and in ſeveral languages they are called by an obſcene name. They were known to the Greeks and Romans by the names of Πνευμα Θαλασσιος, and *pulmo marinus*, or ſea-lungs. They attributed medicinal virtues to them. Dioſcorides informs us, that, if rubbed freſh on the diſeaſed part, they cured the gout in the feet, and kibed heels. Ælian ſays, that they were depilatory; and, if macerated in vinegar, would take away the beard. Their phoſphoric quality is well known; nor was it overlooked by the ancients. Pliny obſerves, that if rubbed with a ſtick it will appear to burn, and the wood to ſhine all over. The ſame naturaliſt obſerves, that when they ſink to the bottom of the ſea, they portend a continuance of bad weather.

MEGALE polis, (anc. geog.), dividedly (Ptolemy, Pauſanias); or conjunctly *Megalopolis*, (Strabo): A town of Arcadia, built under the auſpices of Epaminondas, after the battle of Leuctra; many inconſiderable towns being joined together in one great city, the

the better to withstand the Spartans. It was the greatest city of Arcadia, according to Strabo.

MEGAMETER. See MICROMETER.

MEGARA (anc. geog.), a noble city, and the capital of the territory of Megaris, which for many years carried on war with the Corinthians and Athenians. It had for some time a school of philosophers, called the *Megarici*, successors of Euclid the Socratic, a native of Megara. Their dialect was the Doric; changed from the Attic, which it formely had been, because of Peleponnesian colonists who settled there.

MEGARA (anc. geog.) formely called *Hybla*, a town towards the east coast of Sicily; extinct in Strabo's time, though the name Hybla remained on account of the excellence of its honey. It was a colony of Megareans from Greece. *Risus Megarius* denotes a hoarse-laugh.

MEGARIS (anc. geog.), the country of the Megareans, which Pliny makes a part of Attica; and Strabo says, some were of this opinion; but he himself makes it a distinct part; in which Scylax, Ptolemy, and the histories that relate the wars of the Athenians and Megareans, agree. It had Attica to the east, Bæotia to the north and west, and the Isthmus of Corinth to the south.

MEGARIS, a small island in the Tuscan sea, joined to Naples by a bridge. Now called *Castello dell' ovo*.

MEGIDDO, (Judges v. 19.) A town of Galilee, recited (Joshua xvii. 11.) among the cities of Manasseh, in the tribe of Issachar or Asser, on the west side of Jordan. Famous for the fate of Ahaziah and Josiah, who perished there: near it was an open plain, fit for drawing up an army in battle-array. It was situate to the north, contrary to its position in the common maps. The Canaanites being tributary to the Israelities, dwelt in it, Joshua xvii. It was rebuilt by Solomon, 1 Kings ix.

MEIBOMIUS, the name of several learned Germans.—*John Henry Meibomius* was professor of physic at Helmstadt, where he was born, and at Lubec; he wrote the *Life of Mæcenas*, published at Leyden in 4to. 1653, with several other learned works.—*Henry*, his son, was born at Lubec in 1638; became professor of physic at Helmstadt; and, besides works in his own profession, published *Scriptores rerum Germanicorum*, 3 vol. folio, 1688; a very useful collection, first begun by his father.—*Marcus Meibomius*, of the same family, published a collection of seven Greek authors who had written upon ancient music, with a Latin version by himself; dedicated to queen Christina of Sweden, who invited him to her court. But she engaging him one day to sing an air of ancient music, while somebody was ordered to dance to it, the immoderate mirth which this occasioned in the spectators so disgusted him, that he immediately left the court of Sweden. His edition of the Greek mythologists, and notes upon Diogenes Laertius in Menage's edition, shews him to have been a man of learning; but he suffered no little raillery for his attempt to correct the Hebrew text of the Bible, by a kind of metre he fancies he had found out in those ancient writings.

MEISSEN, a considerable town of Germany, in the electorate of Saxony, and in the margravate of Misnia, with a castle. It formerly belonged to the bishop, but is now secularized, and the inhabitants are Lutherans. In this place is a famous manufactory of porcelain, E. Long. 13. 33. N. Lat. 51. 15.

MELA (Pomponius), an ancient Latin writer, was born in the province of Bætica in Spain, and flourished in the reign of the emperor Claudius. His three books of Cosmography, or *De situ orbis*, are written in a concise, perspicuous, and elegant manner; and have been thought worthy of the attention and labours of the ablest critics. Isaac Vossius gave an edition of them in 1658, 4to. with very large and copious notes. To this edition is added *Julii Honorii oratoris excerptum cosmographiæ*, first published from the manuscript, and *Æthici cosmographia*. Gronovius afterwards published another edition with illustrations by medals. In his last edition are added five books *De geographia*, written by some later author; by Jornandes, as Fabricius conjectures.

MELÆNA, or BLACK FLUX, in medicine. See MEDICINE, n°495.

MELAMPYRUM, COW-WHEAT; a genus of the angiospermia order, belonging to the didynamia class of plants. There are four species, all of them natives of Britain, and growing spontaneously among cornfields. They are excellent food for cattle; and Linnæus tells us, that where they abound the yellowest and best butter is made. Their seeds, when mixed with bread, give it a dusky colour; and, according to some authors, produce a vertigo, and other disorders of the head; but this is denied by Mr Withering, though he allows that they give it a bitter taste.

MELANCHOLY, a kind of delirium attended with gloomy thoughts, heaviness and sorrow. See MEDICINE, n° 185, 428, 429.

MELANCTHON (Philip), born at Bretten in the Palatinate in 1495, was one of the wisest and most able men of his age among the Reformers, though of a mild temper, disposed to accommodate rather than inflame disputes. In his youth he made an admirable progress in learning, and was made Greek professor at Wirtemberg in 1509. Here his lectures upon Homer, and the Greek text of St Paul's epistle to Titus, drew to him a great number of auditors, and entirely effaced the contempt to which his low stature and mean appearance had exposed him. Melanchthon reduced the sciences to systems; and acquired such reputation, that he had sometimes 2500 auditors. He soon entered into an intimate friendship with Luther, who taught divinity in the same university; and in 1519 they went together to Leipsic, to dispute with Eccius. The following years he was continually engaged in various employments; he composed several books; he taught divinity; took several journeys, in order to found colleges and visit churches; and in 1530 drew up a confession of faith, which goes by the name of the *Confession of Augsburg*, because it was presented to the emperor at the diet held in that city. All Europe was convinced, that he was not, like Luther, backward to accommodate the differences between the various sects of Christians. He hated religious disputes, and was drawn into them only through the necessity of the part he was called to act in the world; and therefore would have sacrificed many things, to have produced an union among the Protestants. For this reason, Francis I. the French king, wrote

wrote to defire him to come and confer with the doctors of the Sorbonne, in order to agree with them about putting an end to all controverfies; but though Luther endeavoured to perfuade the elector of Saxony to confent to that journey, and though Melancthon himfelf defired it, that prince, whether he diftrufted Melancthon's moderation, or was afraid of quarrelling with the emperor Charles V. would never grant his permiffion. The king of England alfo in vain defired to fee him. Melancthon, in 1529, affifted at the conferences of Spires. In 1541, he was at the famous conferences at Ratifbon. In 1543, he went to meet the archbifhop of Cologn to affift him in introducing the reformation into his diocefe; but that project came to nothing: and in 1548, he affifted at feven conferences on the fubject of the interim of Charles V. and wrote a cenfure on that interim, and all the writings prefented at thefe conferences. He was extremely affected at the diffenfions raifed by Flaccus Illyricus. His laft conference with thofe of the Roman communion was at Worms, in 1557. He died at Wittemburg in 1560, and was interred near Luther. Some days before he died, he wrote upon a piece of paper the reafons which made him look upon death as a happinefs; and the chief of them was, that it "delivered him from theological perfecutions." Nature had given Melancthon a peaceable temper, which was but ill fuited to the time he was to live in. His moderation ferved only to be his crofs. He was like a lamb in the midft of wolves. No body liked his mildnefs; it looked as if he was lukewarm; and even Luther himfelf was fometimes angry at it.

Melancthon was a man in whom many good as well as great qualities were wonderfully united. He had great parts, great learning, great fweetnefs of temper, moderation, contentednefs, and the like, which would have made him very happy in any other times but thofe in which he lived. He never affected dignities, or honours, or riches, but was rather negligent of all thefe things; too much fo in the opinion of fome, confidering he had a family; and his fon-in-law Sabinus, who was of a more ambitious make, was actually at variance with him upon this very article. Learning was infinitely obliged to him on many accounts; on none more than this,, that, as already obferved, he reduced almoft all the fciences which had been taught before in a vague irregular manner, into fyftems. Confidering the diftractions of his life, and the infinity of difputes and tumults in which he was engaged, it is aftonifhing how he could find leifure to write fo many books. Their number is prodigious, infomuch that it was thought neceffary to publifh a chronological catalogue of them in the year 1582. His works indeed are not correct, and he himfelf owned it: but as he found them ufeful, he chofe rather to print a great number, than to finifh only a few; "which however," as Bayle fays, "was poftponing his own glory to the advantage of others." His conftitution was very weak, and required great tendernefs and management; which made Luther, as hot and zealous as he was, blame him for labouring too earneftly in the vineyard.

MELANTERIA, in natural hiftory, a very beautiful foffil, of a denfe, compact, and regular texture, and of an extremely bright pale yellow, refembling nothing fo much as the pureft gold. It is remarkably heavy; and is fometimes found in little irregular maffes of the bignefs of a pigeon's egg, which are broken with a flight blow: but it is ufually met with in the form of a fine gold-coloured efflorefcence on vitriolic and pyritical bodies; or in loofe, fhattery, and friable maffes of a more dufky yellow; in which latter ftate it fo much refembles a native fulphur, that it is frequently miftaken for one: however, it is not inflammable; but calcines in the fire to a greyifh powder, which by burning longer changes to a deep and fine purple.

The Greeks ufed it externally, as a gentle efcharotic and a ftyptic: they made it an ingredient in their ointments for old ulcers, and ufed to fprinkle the powder of it on frefh wounds in order to ftop the hæmorrhage.

MELASTOMA, the American gooseberry-tree; a genus of the monogynia order, belonging to the decandria clafs of plants. There are a great many fpecies, all of them natives of the warm parts of America, and very beautiful on account of the variegation of their leaves. Moft of the leaves are of two different colours on their furfaces; the under fide being either white gold-colour or ruffet, and their upper parts of different fhades of green; fo that they make a fine appearance in the hot-houfe all the year round. There are but few of thefe plants in the European gardens; which may perhaps have been occafioned by the difficulty of bringing over growing plants from the Weft Indies; and the feeds being fmall when taken out from the pulp of their fruits, rarely fucceed. The beft way is to have the entire fruits put up in dry fand as foon as they are ripe, and forwarded by the quickeft contrivance to England. They fhould be immediately taken out when they arrive, and the feeds fown in pots of light earth, and plunged into a moderate hot-bed of tanner's bark. When the plants come up, and are fit to be removed, they muft each be planted in a fmall pot, and plunged into the tan-bed; and afterwards treated as other exotic plants.

MELCHITES, in church-hiftory, the name given to the Syriac, Egyptian, and other Chriftians of the Levant. The Melchites, excepting fome few points of little or no importance, which relate only to ceremonies and ecclefiaftical difcipline, are in every refpect profeffed Greeks: but they are governed by a particular patriarch, who refides at Damas, and affumes the title of *patriarch of Antioch*. They celebrate mafs in the Arabian language. The religious among the Melchites follow the rule of St Bafil, the common rule of all the Greek monks. They have four fine convents diftant about a day's journey from Damas, and never go out of the cloifter.

MELCHISEDECH, or Melchisedek, (the order of); an order of priefthood, according to the fcriptures of the Old and New Teftament.

The firft mention of Melchifedech is in Genefis xiv. 16, 17, 18. where it is related, that, when Abraham had refcued his brother Lot and all his goods out of the hands of the five kings, he was met, upon his return, by Melchifedech, king of Salem, who "brought forth bread and wine; and he was the prieft of the Moft High God." It is added, that he bleffed Abrabraham; who acknowledged his priesthood, by giving him tythes of all he had taken from the enemy.

The next mention of Melchisedech is by the Royal Psalmist, who, speaking prophetically of the Messiah, says, "Thou art a priest for ever after the order of Melchisedech."

Lastly, St Paul applies the story of Melchisedech to our Saviour, citing the very words of the Psalmist. And, in another place, he gives this account of Melchisedech: "This Melchisedech, king of Salem, priest of the Most High God, who met Abraham returning from the slaughter of the kings, and blessed him; to whom Abraham gave a tenth part of all; first being by interpretation king of righteousness, and after that also king of Salem, which is, king of peace; without father, without mother, without descent; having neither beginning of days, nor end of life; but made like unto the Son of God, abideth a priest continually."

From these passages it appears, that Melchisedech, whoever he was, was a type of Jesus Christ, and his priesthood an image of our Saviour's.

Innumerable difficulties have been started upon the subject of Melchisedech. The first relates to his country, or the place where he reigned. Most authors take Salem to be the same as Jerusalem: but St Jerom places it near Scythopolis, where they still pretended to shew the ruins of Melchisedech's palace. He thinks it was at this place that Jacob arrived, after his passage over Jordan, when he returned from Mesopotamia.

The next difficulty relates to his person. It is generally agreed by learned men, that, when the apostle says he was *without father* and *without mother*, no more is meant than that he is introduced into the history of Abraham without acquainting us who he was or whence he came, when he lived or when he died. Nevertheless, some have taken St Paul's words literally, and contended, that he was not of human, but divine nature. Origen and Didymus took him to be an angel; and the author of the *Questions on the Old and New Testament* pretended he was the Holy Ghost, who appeared to Abraham in a human form.

About the beginning of the third century, arose the heresy of the Melchisedechians, who affirmed, that Melchisedech was not a man, but a heavenly power, superior to Jesus Christ: For Melchisedech, they said, was the intercessor and mediator of the angels; but Jesus Christ was so only for men, and his priesthood only a copy of that of Melchisedech. This heresy was revived in Egypt by one Hierax, who pretended that Melchisedech was the Holy Ghost.

The Arabic catena upon the ninth chapter of Genesis makes Melchisedech to be descended from Shem by his father, and from Japhet by his mother. Heraclas, or Heraclim, his father, was, they say, son or grandson of Phaleg, and son of Heber; and his mother, named *Salathiel*, was daughter of Gomer, son of Japheth. Cedrenus, and others, derive Melchisedech from an Egyptian stock. They say his father was called *Sidon* or *Sida*, and was the founder of the city of Sidon the capital of Phœnicia. Suidas says, he was of the cursed race of Canaan; for which reason the scripture does not mention his genealogy.

The Jews and Samaritans believed Melchisedech to be the same with the patriarch Shem; which opinion has been followed by a great number of modern writers. M. Jurieu has undertaken to prove, that he is the same as Cham or Ham. It would be endless to recount all the opinions upon this matter; we shall therefore only add, that Peter Cunæus, and Peter du Moulin, have asserted, that Melchisedech, who appeared to Abraham, was the Son of God; and that the patriarch worshipped him, and acknowledged him for the Messiah.

MELCOMB-REGIS, a town of Dorsetshire, in England, situated in W. Long. 2. 32. N. Lat. 50. 40. The streets are broad and paved; and there is an excellent harbour, by which they carry on a pretty good foreign trade.

MELEAGER, in fabulous history, the son of Æneas king of Caledonia, and Althæa the daughter of Thestius, was no sooner born than the Parcæ put a firebrand in the fire, saying, "This child shall live as long as this firebrand shall last." The three Parcæ being gone, Althæa took the brand out of the fire, and preserved it with great care. Meleager at length discovered great courage in killing the famous Caledonian boar which laid waste the country, and presented the head to Atalanta who had given the monster the first blow: but Plexippus and Toxeus, the brothers of Althæa, resolving to have the head, Meleager killed them in the quarrel, and married Atalanta, by whom he had Parthenope; but Althæa, in revenge for the death of her two brothers, threw the fatal brand on the fire, which occasioned Meleager's death.

MELEAGER, a Greek poet, the son of Eucrates, was born at Seleucia in Syria, and flourished under the reign of Seleucus VI. the last king of Syria. He was educated at Tyre; and died in the island of Coos, anciently called *Merope*. He there composed the Greek epigrams called by us the *Anthologia*. The disposition of the epigrams in this collection was often changed afterwards, and many additions have been made to them. The monk Planudes put them into the order they are in at present in the year 1380.

MELEAGRIS, in ornithology, the TURKY, a genus of birds belonging to the order of gallinæ. The head is covered with spongy caruncles; and there is likewise a membranaceous longitudinal caruncle on the throat. There are three species, *viz.* 1. The gallopavo, or North American turky of Ray, has a caruncle both on the head and throat; and the breast of the male is bearded. He lives upon grain and insects: when the cock struts, he blows up his breast, spreads and erects his feathers, relaxes the caruncle on the forehead, and the naked parts of the face and neck become intensely red.—Barbot informs us, that very few turkies are to be met with in Guinea, and those only in the hands of the chiefs of the European forts; the Negroes declining to breed any on account of their tenderness, which sufficiently proves them not to be natives of that climate. He also remarks, that neither the common poultry nor ducks are natural to Guinea, any more than the turkey. Neither is that bird a native of Asia: the first that were seen in Persia were brought from Venice by some Armenian merchants. They are bred in Ceylon, but not found wild. In fact, the turky, properly so called, was unknown to the ancient naturalists, and even to the old world, before

before the diſcovery of America. It was a bird peculiar to the new continent, and is now the commoneſt wild-fowl in the northern parts of that country. It was firſt ſeen in France, in the reign of Francis I.; and in England, in that of Henry VIII. By the date of the reign of theſe monarchs, the firſt turkies muſt have been brought from Mexico, the conqueſt of which was completed A. D. 1521. Ælian mentions a bird found in India, which ſome writers have ſuſpected to be the turky; but Mr Pennant concludes, with Geſner, that it was either the peacock, or ſome bird of that genus. On conſulting ſome gentlemen who had reſided long in the Indies, Mr Pennant is of opinion, that though the turky is bred there, it is only conſidered as a domeſtic bird, and not a native of the country.

2. The criſtata, or Braſilican pheaſant of Ray, has an erect creſt of feathers on the head, and violet-coloured temples; it has a caruncle on the throat, but none on the head.

Plate CLXXVI. 3. The ſatyra, or horned pheaſant of Edwards, has two blue horns behind its eyes, and a red body ſpotted with black and white. It is a native of Bengal.

MELES, in zoology. See Ursus.

Meles, (anc. geog.), a fine river running by the walls of Smyrna in Ionia, with a cave at its head, where Homer is ſaid to have written his poems. And from it Homer takes his original name *Melaſigenes*, given him by his mother Crithies, as being born on its banks. (Herodotus).

MELIA, Azaderach, or the *Bead-tree;* a genus of the monogynia order, belonging to the decandria claſs of plants. There are three ſpecies, all of them exotic trees of the Indies, riſing near 20 feet high; adorned with large pinnated or winged leaves, and cluſters of pentapetalous flowers. They are all propagated by ſeeds ſown on hot-beds.

MELIANTHUS, Honey-flower; a genus of the angioſpermia order, belonging to the didynamia claſs of plants. There are two ſpecies. 1. The major hath a thick, ligneous, ſpreading root; many upright, ligneous, durable ſtalks, riſing ſix or eight feet high; garniſhed with large pinnated leaves, of four or five pair of ſerrated lobes terminated by an odd one; and, from the ſides and tops of the ſtalks, long ſpikes of chocolate-coloured flowers. 2. The minor, hath a root like the former; upright, ligneous, ſoft, durable ſtalks, riſing four or five feet high; garniſhed with ſmaller pinnated leaves; and from the ſides and ends of the branches, long, looſe, pendulous bunches of flowers tinged with green, ſaffron colour, and red. Both the ſpecies flower about June; but rarely produce ſeeds in this country. They are very ornamental, both in foliage and flower, and merit admittance in every collection. They are eaſily propagated by ſuckers and cuttings. They thrive beſt in a dry ſoil, and in a ſheltered warm expoſure.

MELIBOEA, (anc. geog.), an iſland of Syria, at the mouth of the Orontes; which, before it falls into the ſea, forms a ſpreading lake round it. This iſland was famous for its purple dye. Thought to be a colony of Theſſalians; and hence Lucretius's epithet *Theſſalicus*.

MELICA, Ropegrass; a genus of the digynia order, belonging to the triandria claſs of plants. There are three ſpecies; of which the moſt remarkable is the nutans. It is a native of ſeveral parts of Britain and the adjacent iſlands; and the inhabitants of ſome of the weſtern iſlands make ropes of it for fiſhing-nets, as it will bear the water for long time without rotting.

MELICERES, in ſurgery, a kind of encyſted tumours, ſo called when their contents are of the conſiſtence of honey.

MELILLA, an ancient town of Africa in the kingdom of Fez, and in the province of Garet. It was taken by the Spaniards in 1469, but returned back to the Moors. W. Long. 2. 9. N. Lat. 35. 20.

MELILOT. See Trifolium.

MELINDA, a kingdom on the eaſt coaſt of Africa, ſituated, according to ſome, between the third and fourth degree of South Latitude; though there is great diſagreement among geographers as to its extent. It is allowed by all, however, that the coaſts are very dangerous; being full of rocks and ſhelves, and the ſea at ſome ſeaſons very liable to tempeſts. The kingdom of Melinda is for the moſt part rich and fertile; producing almoſt all the neceſſaries of life except wheat and rice, both which are brought thither from Cambaya and other parts; and thoſe who cannot purchaſe them make uſe of potatoes in their ſtead, which are here fine, large, and in great plenty. They likewiſe abound with great variety of fruit-trees, roots, plants, and other eſculents, and with melons of exquiſite taſte. They have alſo great plenty of veniſon, game, oxen, ſheep, hens, geeſe, and other poultry, &c. and one breed of ſheep whoſe tails weigh between 30 and 40 pounds. The capital city is alſo called *Melinda*.

MELINUM, in natural hiſtory, the name of an earth, famous in the earlieſt ages of painting, being the only white of the great painters of antiquity; and, according to Pliny's account, one of the three colours with which alone they performed all their works. It is a fine, white, marly earth, of a very compact texture, yet remarkably light; a ſort of texture which muſt render any earth fit for the painter's uſe, that is of a proper colour. It is frequently found forming a ſtratum in the earth, lying immediately under the vegetable mould. It is of a very ſmooth but not gloſſy ſurface; is very ſoft to the touch; adheres firmly to the tongue; is eaſily broken between the fingers; and ſtains the ſkin in handling. It melts readily in the mouth, and is perfectly fine; leaving not the leaſt grittineſs between the teeth: thrown into water, it makes a loud bubbling and hiſſing noiſe, and moulders away into a fine powder. It does not ferment with acids; and ſuffers no change in the fire. Theſe are the characters by which the melinum of the ancients is diſtinguiſhed from all other white earths. It is ſtill found in the ſame place from which the painters of old had it, *viz.* the iſle of Milo or Melos, from whence it had its name; and is common in moſt of the adjacent iſlands. It has of late been tried here as a paint; but is found not to make ſuch a bright paint as the other ſubſtances now employed. It is not, however, liable, like them, to turn yellow: hence it would ſeem to be worth the conſideration of perſons in the colour-trade; eſpecially as it might be had, in any quantities, for the carriage.

MELISSA, Baum; a genus of the gymnoſpermia order, belonging to the didynamia claſs of plants. There

There are several species; but the most remarkable are the following. 1. The officinalis, or common baum, hath fibrous perennial roots; many upright, square, branchy, annual stalks, rising two or three feet high: garnished with oblong, indented, opposite leaves by pairs, two or three inches long, and half as broad; and, from the upper axillas, verticillate clusters of small white flowers, upon single footstalks. There is also a kind with variegated leaves. 2. The grandiflora, or Hetrurian calamint, hath fibrous perennial roots, and annual stalks, rising about a foot high; garnished with oblong, oval, indented, hairy opposite leaves; and from the upper axillas verticillate clusters of large purple flowers, on forked footstalks. 3. The calamintha, or common calamint of the shops, hath fibrous perennial roots; upright, square, branchy hairy stalks, rising a foot high; roundish, indented, opposite leaves; and verticillate clusters of small bluish flowers, on forked footstalks as long as the flowers. All these species are easily propagated by offsets.

Medicinal Uses. The first species, when in perfection, has a pleasant smell, somewhat of the lemon kind; and a weak, roughish, aromatic taste. The young shoots have the strongest flavour; the flowers, and the herb itself when old, or produced in very rich moist soils, or rainy seasons, is much weaker both in smell and taste. Baum is appropriated, by the writers on the materia medica, to the head, stomach, and uterus; and in all disorders of these parts, is said to do extraordinary service. So high an opinion have some chemists entertained of this plant, that they have expected to find in it a medicine which should prolong life beyond the usual period. The present practice, however, holds it in no great esteem; and ranks it (where it certainly deserves to be) among the weaker corroborants. Infusions of the leaves in water smell agreeably of the herb, but have not much taste, though on being inspissated they leave a considerable quantity of a bitterish austere extract. Infusions of baum do not, like other aromatics, offend the head, as is complained off from sage, &c. Cold infusions in water, or spirit, are far better than the cohobated distilled water, and are the best preparations from the plant. On distilling the fresh herb with water, it impregnates the first running pretty strongly with its grateful flavour. When large quantities are subjected to the operation at once, there separates and rises to the surface of the aqueous fluid a small portion of essential oil, which some call *ol. Syriæ*, and others *ol. Germanis*. It is of a yellowish colour, and a very fragrant smell.

MELISSUS of SAMOS, a Greek philosopher, was the son of Rhagines and the disciple of Parmenides; and lived about 520 B. C. The Ephesians gave him the post of admiral, and invested him with extraordinary power. He pretended that the universe is infinite, immoveable, alone, and without a vacuum.

MELITE, (anc. geog.), an island referred to Africa by Scylax and Ptolemy; but nearer Sicily, and allotted to it by the Romans: commended for its commodious harbours; for a city well built, with artificers of every kind, especially weavers of fine linen; all owing to the Phœnicians, the first colonists. Now *Malta*; remarkable for St Paul's shipwreck.

MELITE, *Melita*, or *Melitina Insula;* an island on the coast of Illyricum in the Adriatic. The *Catuli Melitæi*, (Pliny), were famous. Now *Melede*, the name of the island Samos.

MELITE, (anc. geog.), a town of Ionia, struck out of the number of Ionian towns on account of the arrogance of the people, and Smyrna admitted in lieu of it. The situation not said.

MELITENSIS TERRA, the *Earth of Malta:* an earth, of which there are two very different kinds; the one of the genus of boles, the other of the marles. The latter is that known by medicinal authors under this name, the former is the Malta earth now in use; but both being brought from the same place, are confusedly called by the same name. The Maltese marle, which is the *terra Melitensis* of medicinal authors, is a loose, crumbly, and very light earth, of an unequal and irregular texture; and, when exposed to the weather, soon falls into fine soft powder: but, when preserved and dried, it becomes a loose, light mass, of a dirty white colour, with a greyish cast: it is rough to the touch, adheres firmly to the tongue, is very easily crumbled to powder between the fingers, and stains the hands. Thrown into the water, it swells, and afterwards moulders away into a fine powder. It ferments very violently with acid menstruums. Both kinds are found in great abundance in the island of Malta, and the latter has been much esteemed as a remedy against the bites of venomous animals. The other has supplied its place in the German shops; and is used there as a cordial, sudorific, and astringent.

MELITO (canonized), bishop of Sardis in Lydia, in the second century; is remarkable for the apology he presented to the emperor Aurelius, in favour of the Christians; on which Eusebius and the other ancient ecclesiastical writers bestow great praises: but that apology and all Melito's other works, are lost.

MELITUS, Greek orator and poet, the accuser of Socrates. The Athenians, after the death of Socrates, discovering the iniquity of the sentence they had passed against that great philosopher, put Melitus to death 400 B. C.

MELLER, a lake of Sweden, 80 miles long, and 30 broad; on which stands the city of Stockholm.

MELLI, with the country of the Mundingoes, in Africa. The country formerly called *Melli*, now chiefly inhabited by the Mundingoes, who still retain pretty much of the character ascribed to the people of Melli, lies to the south of the river Gambia; on the west it borders on the kingdom of Kabo; on the south it has *Melli*, properly so called, and the mountains that part it from Guinea; and on the east it extends to the kingdom of Gago. A great part of this country we are little acquainted with; as is the case with regard to most of the inland territories of Africa, but towards the sea-coast this country is a little better known.

The first place of note we meet with is Kachao, a Portuguese colony, situated on the river of St Domingo, which falls into the sea about 26 leagues below this town.—About 26 leagues above Kachao, on the same side of the river, is another trading town called *Farini*, where, in the months of October and November, one may trade for about half the quantity of wax and ivory which is traded for at Kachao. Here are also some slaves to be bought.—Bot is a village near the mouth of the river Gesves, where most of the traders buy rice; which is in great plenty there, and very good

good.—Gesves is a village on a river of the same name, on which the Portuguese have a factory. At Gesves one may trade yearly for 250 slaves, 80 or 100 quintals of wax, and as many of ivory. Near the mouth of the river of Gesves is a village called *Kurbali*, where there is a considerable trade for salt: here are also some slaves and ivory. Rio Grande, or the Great River, runs about 10 or 12 leagues to the south of the river of Gesves. About 80 leagues from the mouth of it is a nation of Negroes, who are good traders in ivory, rice, millet, and some slaves. They are called *Analons*. Over-against the mouth of Rio Grande, is a cluster of islands called *Bissago Isles;* the most considerable of which is Cassagut, being about six leagues long and two broad; its soil is very good, and produces millet, rice, and all kinds of pulse, besides orange and palm-trees, and many others. This island, with those of Carache, Canabac, and La Gallina, are the only ones where the Europeans may trade with some security. They trade, however, sometimes at the other islands, but they must be extremely cautious; and yet, after all their precautions, they will be robbed and murdered if they venture to go ashore. The river Nunho runs 16 leagues to the south of Rio Grande; it is very considerable, and comes from a vast distance in land. One may buy here 300 quintals of ivory and 100 slaves a-year. Rice grows here admirably well, and is very cheap. There are every-where sugar-canes which grow naturally; and plants of indigo, which might turn to good account. The trade is carried on here from March till August. In the river of Sierra Leone, the late Royal African company of England had, in the year 1728, two islands; the one, called *Tasso*, a large flat island, near three leagues in circumference, in which the company's slaves had a good plantation: the rest of the island is covered with wood, among which are silk cotton-trees of an unaccountable size. The other island is *Bense*, whereon stood a regular fort. It was formerly the residence of one of the English chiefs.

MELOCHIA, Jews mallow; a genus of the pentandria order, belonging to the monodelphia class of plants. There are several species; but the only remarkable one is the olitorius, or common Jews-mallow, which is a native of the warm parts of Asia and America. It is an annual plant, which rises about two feet high, dividing into several branches, garnished with leaves of different sizes and forms: some are spear-shaped, others are oval, and some almost heart-shaped: they are of a deep green, and slightly indented on their edges, having near their base two bristly reflexed segments. They have very long slender footstalks, especially those which grow on the lower part of the branches. The flowers sit close on the opposite side of the branches to the leaves, coming out singly; they are composed of five small yellow petals, and a great number of stamina surrounding the oblong germen, which is situated in the centre of the flower and afterwards turns to a rough swelling capsule two inches long, ending in a point, and having four cells filled with angular greenish seeds. This species is cultivated about the city of Aleppo in Syria, and in the East Indies, as a pot-herb; the Jews boiling the leaves, and eating them with their meat. It is supposed by Rauwolf to be the *olus Judaicum* of Avicenna, and the *corchorum* of Pliny.

MELODUNUM, (anc. geog.), Cæsar; a town of the Senones in Gallia Celtica above Lutetia; now *Melun*, in the isle of France on the Seine.

MELODY, in music, a succession of sounds ranged in such a manner, according to the laws of rhythmus and modulation, that it may form a sentiment agreeable to the ear. Vocal melody is called *singing;* and that which is performed upon instruments may be termed *symphonic melody*.

The idea of rhythmus necessarily enters into that of melody. An air is not an air but in proportion as the laws of measure and quantity are observed. The same succession of sounds is susceptible of as many different characters, as many different kinds of melody, as the various ways by which its emphatic notes, and the quantities of those which intervene, may be diversified; and the change in duration of the notes alone, may disguise that very succession in such a manner that it cannot be known. Thus, melody in itself is nothing; it is the rhythmus or measure which determines it, and there can be no air without time. If then we abstract measure from both, we cannot compare melody with harmony; for to the former it is essential, but not at all to the latter.

Melody, according to the manner in which it is considered, has a relation to two different principles. When regarded only as agreeable to the proportions of sound and the rules of modulation, it has its principle in harmony; since it is a harmonical analysis, which exhibites the different gradations of the scale, the chords peculiar to each mode, and the laws of modulation, which are the sole elements that compose an air. According to this principle, the whole power of melody is limited to that of pleasing the ear by agreeable sounds, as the eye may be pleased with an agreeable assemblage of suitable colours. But when considered as an imitative art, by which we may affect the mind with various images, excite different emotions in the heart, inflame or soothe the passions; by which, in a word, we produce different effects upon our moral faculties, which are not to be effectuated by the influence of external sense alone, we must explore another principle for melody: for in our whole internal frame there appears to be no power upon which either harmony alone, or its necessary results, can seize, to affect us in such a manner.

What then is the second principle? It is as much founded on nature as the first; but, in order to discover its foundation in nature, it will require a more accurate though simpler observation, and a more exquisite degree of sensibility in the observer. This principle is the same which varies the tone of the voice, when we speak, according as we are interested in what we say, and according to the different emotions which we feel in expressing it. It is the accent of languages which determines the melody of every nation; it is the accent which determines us to employ the emphasis of speaking while we sing, and to speak with more or less energy according as the language which we use is more or less accented. That language whose accents are the most sensible, ought to produce a more passionate and more lively melody; that which has little accentuation, or none at all, can only produce a cold and languid melody, without character

Melody. racter and without expreſſion. Theſe are the true principles: in proportion as we depart from them, when we ſpeak of the power of muſic upon the humanheart, we ſhall become unintelligible to ourſelves and others; our words will be without meaning.

If muſic does not impreſs the ſoul with images but by melody, if from thence it obtains its whole power, it muſt follow, that all muſical ſounds which are not pleaſing by themſelves alone, however agreeable to harmony they may be, is not an imitative muſic; and, being incapable, even with its moſt beautiful chords, either to preſent the images of things, or to excite the finer feelings, very ſoon cloys the ear, and leaves always the heart in cold indifference. It follows likewiſe, that notwithſtanding the parts which harmony has introduced, and which the preſent taſte of muſic ſo wantonly abuſes, wherever two different melodies are heard at the ſame time, they counteract each other, and deſtroy the effects of both, however beautiful each may be when performed alone: from whence it may be judged with what degree of taſte the French compoſers have introduced in their operas the miſerable practice of accompanying one air with another, as well in ſinging, which is the native expreſſion of pathos and ſentiment, as in inſtrumental performances; which is the ſame thing as if whimſical orators ſhould take it in their heads to recite two orations at the ſame time, that the elegance of each might derive more force from the other.

So much for Rouſſeau. The tranſlator, however, has reaſon to fear, that the cauſes by which national melody is diverſified and characteriſed, are more profound and permanent than the mere accentuation of language. This indeed may have great influence in determining the nature of the rhythmus, and the place of emphatic notes; but very little in regulating the nature of the emphaſis and expreſſion themſelves. If Rouſſeau's principle be true in its full extent, he muſt of neceſſity acknowledge, that an air which was never ſet or intended for words, however melodious, cannot be imitative: he muſt likewiſe confeſs, that what is imitative in one nation cannot be ſuch in another: nor can it be denied upon his hypotheſis, that the recitative, which is formed upon the mode of ſpeaking, is the moſt forcible of all melodies; which is abſurd. His other obſervations are at once judicious and profound. Though it is impoſſible to exhibit the beauty and variety of harmony by playing the ſame melody at the ſame time upon different keys, admitting thoſe keys to form among themſelves a perfect chord, which will of conſequence preſerve all the ſubſequent notes in the ſame intervals; yet this perfect harmony would by no means be uniformly pleaſing to the ear. We muſt therefore of neceſſity introduce leſs perfect chords to vary and increaſe the pleaſure, and theſe chords in any complex ſyſtem of muſic muſt of neceſſity produce diſſonances. It then becomes the buſineſs of the compoſer to be careful that theſe diſcords may ariſe as naturally from, and return as naturally to, perfect harmony as poſſible. All theſe cauſes muſt inevitably vary the melody of the different parts; but ſtill amidſt all theſe difficulties, the artiſt ought to be zealous in preſerving the melody of each as homogeneous with the others as poſſible, that the reſult of the whole may be in ſome meaſure uniform. Otherwiſe, by counteracting each other, the parts will reciprocally deſtroy the effects one of another.

Meloe. MELOE, in zoology, a genus of inſects of the order of coleoptera. The antennæ are jointed, the laſt joint being oval; the breaſt is roundiſh; the elytra are ſoft and flexible; and the head is inflected and gibbous. There are 16 ſpecies, principally diſtinguiſhed by their colour. The moſt remarkable is the veſicatorius, or cantharis of the ſhops; which, when bruiſed, is univerſally uſed as a bliſtering plaſter. Theſe inſects are of a ſhinning green colour, intermingled with more or leſs of a blue and a gold yellow. They are found adhering to different kinds of trees and herbs, in Spain, Italy, and France: the largeſt and moſt eſteemed come from Italy.

Cantharides are extremely acrimonious: applied to the ſkin, they firſt inflame, and afterwards excoriate the part, raiſing a more perfect bliſter than any of the vegetable acrids, and occaſioning a more plentiful diſcharge of ſerum. All the bliſtering compoſitions have cantharides for their baſis. The external application of cantharides is often followed by a ſtrangury, accompanied with thirſt and feveriſh heat: this inconvenience may be remedied by ſoft unctuous or mucilaginous liquors liberally drank.

Cantharides taken internally often occaſion a diſcharge of blood by urine, with exquiſite pain: if the doſe is conſiderable, they ſeem to inflame and exulcerate the whole inteſtinal canal; the ſtools become mucous and purulent; the breath fetid and cadaverous; intenſe pains are felt in the lower belly; the patient faints, grows giddy, raving mad, and dies. All theſe terrible conſequences have ſometimes happened from a few grains. Herman relates, that he has known a quarter of a grain inflame the kidneys, and occaſion bloody urine with violent pain. There are nevertheleſs caſes in which this ſtimulating fly, given in larger doſes, proves not only ſafe, but of ſingular efficacy for the cure of diſeaſes that yield little to medicines of a milder claſs. In cold phlegmatic ſluggiſh habits, where the viſcera are overloaded, and the kidneys and ureters obſtructed with thick viſcid mucous matter, cantharides have excellent effects: here the abounding mucus defends the ſolids from the acrimony of the fly, till it is itſelf expelled; when the medicine ought to be diſcontinued. Groenvelt employed cantharides with great ſucceſs in dropſies, obſtinate ſuppreſſions of urine, and ulcerations of the bladder; giving very conſiderable doſes made into boluſes with camphor; and interpoſing large draughts of emulſions, milk, or other emollient liquids: by this means, the exceſſive irritation, which they would otherwiſe have occaſioned, was in great meaſure prevented. The camphor did not perhaps contribute ſo much to this effect as is generally imagined: ſince it has no ſenſible quality that promiſes any conſiderable abatement of the acrimony of cantharides: nitre would anſwer all that the camphor is ſuppoſed to perform; this, with milk, or emollient mucilaginous liquors, drank in large quantity, are the beſt correctors. Cantharides, in very ſmall doſes, may be given with ſafety alſo in other caſes. Dr Mead obſerves, that the obſtinate gleetings which frequently remain after the cure of venereal maladies, and which rarely yield to balſamic medicines, are effectually remedied by cantharides; and that no one remedy is more efficacious in leprous diforders; in which laft, proper purgatives are to be occafionally taken during the ufe of the cantharides. The beft and fafeft preparation of cantharides for thefe purpofes, is a fpirituous tincture; and indeed in all cafes, the tincture is far preferable, for internal ufe, to the fly in fubftance.

The virtues of cantharides are extracted by rectified fpirit of wine, proof fpirit, and water; but do not arife in diftillation. The watery and fpirituous extracts blifter as freely as the fly in fubftance; whilft the fly remaining after the feveral menftrua have performed their office, is to the tafte infipid, and does not in the leaft blifter or inflame the fkin.

MELON, in botany. See CUCUMIS.

MELOTHRIA, in botany; a genus of the monogynia order, belonging to the triandria clafs of plants. There is only one fpecies, viz. the pendula, a native of Carolina, Virginia, and alfo many of the American iflands. The plants ftrike out roots at every joint, which faften themfelves into the ground, by which means their ftalks extend to a great diftance each way. The flowers are very fmall, in fhape like thofe of the melon, of a pale fulphur colour. The fruit in the Weft Indies grows to the fize of a pea, is of an oval figure, and changes to black when ripe: thefe are by the inhabitants fometimes pickled when they are green. In Britain the fruit are much fmaller, and are fo hidden by the leaves that it is difficult to find them. The plants are too tender to be reared in this country without artificial heat.

MELPOMENE, in fabulous hiftory, one of the nine mufes, and the inventrefs of tragedy. She is commonly reprefented with a ferious countenance, and in a theatrical drefs, holding crowns and fceptres in one hand, and a dagger in the other.

MELREY, or MELROSE, a town of Scotland, in the county of Merfe, and on the confines of Tweedale, feated on the fouth-fide of the river Tweed; with an ancient abbey now in ruins. W. Long. 2. 32. N. Lat. 55. 32.

This abbey was founded by king David I. in 1136. He peopled it with Ciftertians, brought from Rivale abbey in Yorfhire, and dedicated it to the virgin Mary. At the reformation James Douglas was appointed commendator, who took down much of the building, in order to furnifh materials for a large houfe to himfelf, which ftill remains, and is dated 1590. Nothing is left of the abbey, excepting a part of the cloifter walls, elegantly carved; but the ruins of the church are of moft uncommon beauty. Part is at prefent ufed for divine fervice, the reft uncovered; but every part does great honour to the architect.—Alexander II. was buried beneath the great altar, and it is alfo the place of interment of the Douglafes and other potent families.—Its fituation is extremely pleafant.

MELT OF FISHES. In the melt of a living cod there are fuch numbers of thofe animalcules faid to be found in the femen of all male animals, that in a drop of its juice, no larger than a grain of fand, there are contained more than 10,000 of them; and, confidering how many fuch quantities there are in the whole melt of one fuch fifh, it is not incredible, that there are more animals in one melt of it, than there are living men at one time upon the face of the earth. However ftrange and romantic fuch a conjecture muft appear, a ferious confideration and calculation will make it appear very plain. An hundred fuch grains of fand as thofe juft mentioned will make about an inch in length; therefore in a cubic inch there will be a million of fuch fands; and if there be 10,00 animals in each of thofe quantities, there muft be in the whole 150,000 millions; which is a number vaftly exceeding that of mankind, even fuppofing the whole earth as populous as Holland.

MELTING CONE, in effaying, an hollow cone of brafs or caft iron, into which melted metalline fubftances are thrown, in order to free them from their fcoriæ. When a fmall quantity of matter is melted, it will be fufficient to rub the infide of the cone with greafe; but when the quantity is very large, efpecially if it contains any thing fulphureous, this caution of tallowing the moulds is not fufficient. In this cafe the effayer has recourfe to a lute reduced to thin pap with water, which effectually prevents any injury to the cone.

MELVIL (Sir James), defcended from an honourable Scots family, being the third fon of the laird of Kaeth, was born about the middle of the 16th century. He went to France, very young, in the capacity of page to qneen Mary, then married to the dauphin; and on the death of her hufband, followed her to Scoland, where he was made gentleman of her chamber, and admitted a privy-counfellor. She employed him in her moft important concerns, till her unhappy confinement in Lochleven, all which he difcharged with the utmoft fidelity; and, from his own accounts, there is reafon to conclude, that, had fhe taken his advice, fhe might have avoided many of her misfortunes. When fhe was prifoner in England, fhe recommended him ftrongly to her fon James; with whom he continued in favour and employment until the death of queen Elizabeth: James would then have taken him to England; but Melvil, now grown old, was defirous of retiring from bufinefs, and in his retirement he drew up the memorirs of his paft life for the ufe of his fon. Thefe memoirs were accidentally found in Edinburgh caftle, in the year 1660, though nobody knew how they came to be depofited there; and were publifhed in folio in 1683.

MEMBER, in architecture, denotes any part of a building; as a frize, cornice, or the like. This word is alfo fometimes ufed for the moulding.

MEMBER *of Parliament*. See PARLIAMENT.

MEMBRANE, in anatomy, a pliable texture of fibres interwoven together in the fame plane.

MEMNON, in fabulous hiftory, was the fon of Tithonus and Aurora. Having led his troops to the affiftance of Priam, in order to raife the fiege of Troy, he was killed by Achilles; when his body being placed on a funeral pile, was, at Aurora's defire, transformed into a bird.

MEMNON *of Rhodes*, one of the generals of Darius king of Perfia, advifed that prince to lay wafte the country, in order to deprive Alexander the Great's army of fupport, and afterwards to attack Macedon;

but

but this counsel was disapproved by Darius's other generals. Memnon behaved at the passage of the Granicus like an experienced general. He afterwards defended the city of Miletum with great courage; seized the islands of Chio and Lesbos; spread terror throughout all Greece; and would have put a stop to the conquests of Alexander, if he had not been prevented by death. Barsina, Memnon's widow, was taken prisoner with Darius's wife, and Alexander had a son by her named *Hercules*.

MEMOIRS, in matters of literature, a species of history, written by persons who had some share in the transactions they relate; answering to what the Romans called *Commentarii*.—The journals of the proceedings of a literary society, or a collection of matters transacted therein, are likewise called *Memoirs*.

MEMORY, a faculty of the human mind, whereby it retains and recalls the ideas it has once perceived. See METAPHYSICS, n° 42.

Memory depends very much upon the temper and constitution of the body. In some, it is not so susceptive of impressions; in others, it is not sufficiently retentive: and as the seat of the memory is in the brain, whatever is hurtful to this latter, must prejudice the former. Too much sleep clouds the brain, and too little over-heats it; therefore either of these extremes must of course hurt the memory. All intemperance likewise, and excess of passion, have the same ill effect.

When we would commit any thing to memory, our first concern should be to understand it thoroughly. For we can never retain those things long, of which we have but an imperfect knowledge. Likewise order and method in the discourse itself is a great help to the memory. Where things have a mutual dependance upon each other, and go on in a series, the thoughts pass more readily from one to another, than where they lie confused and without any connection. The mind should also be free at such times, and have nothing else to take off its attention. Nothing is a greater hindrance to the memory than a crowd of ideas, and those of different kinds, flowing in upon the mind at the same time. They justle out one another, so that but few of them settle; and if they do, it is in such a confused and disorderly manner, that when they come to be surveyed by reflection, little can be made of them.

To write down any thing is likewise a great advantage towards remembering it. For the very action of writing helps very much to imprint it upon the mind, by engaging it to a closer attention, and causing it to dwell longer upon every part than otherwise it would do only in reading. And therefore the Jewish doctors tell us, it was for this reason that the kings of Israel were enjoined always to write out a copy of the law with their own hand. And the fairer a thing is written, it is with greater ease committed to memory. This may possibly at first seem to have little in it; but if we consult experience, we shall generally find, that those things make the deepest impression upon the mind, which affect the senses in the most lively and agreeable manner. As we receive most of our ideas through them, the stronger impulse is made upon the organ, the greater attention it excites in the mind; and what we most attend to, we retain longest.

A little experience and observation will help a person to discover the strength of his memory. And care should be taken not to over-burden it. A long discourse therefore should be committed to memory by parts, so much at once as the memory can well receive and retain. These parts should not be too many, for fear of confusion. And as it is most likely we may be at a loss in passing from one part to another, it will not be amiss in a more particular manner to impress upon the the mind the beginnings of them. One letter often helps us to recover a word; that word a sentence; and the first sentence a whole argument. Some have therefore advised, for the assistance of weaker memories, to write each part of the discourse in a separate paragraph, and the first word in larger characters, which may strike the fancy like a picture when we come to those places. For every one is sensible of the powerful effect of imagery to excite and recall our ideas: and therefore it has been thought a further advantage, if the first letter of each word, written in larger characters, could be joined together in one artificial word; for then the remembrance of that word would give us the first letter of each of those initial words, which letters would help us to recollect the whole words, which was the thing designed by writing them in different characters. We find this method of bringing several ideas together into one artificial word of use in other cases. So the figures of syllogisms being distinguished by technical words, are better known, and more easily remembered; as every one perceives, who is conversant in logic.

As the mind is not at all times equally disposed for the exercise of this faculty, such seasons should be made choice of as are most proper for it. The mind is seldom fit for attention presently after meals; and to call off the spirits at such times from their proper employment in digestion, is apt to cloud the brain, and prejudice the health. Both the mind and body should be easy and undisturbed when we engage in this exercise, and therefore retirement is most fit for it: and the evening, just before we go to rest, is generally recommended as a very convenient season, both for the stillness of the night, and because the impressions will then have a longer time to settle before they come to be disturbed by the accession of others proceeding from external objects; and to call over in the morning what has been committed to the memory over-night, must, for the same reason, be very serviceable. For, to review those ideas while they continue fresh upon the mind, and unmixed with any others, must necessarily imprint them more deeply.

Some ancient writers speak of an artificial memory, and lay down rules for attaining it. Simonides the poet is said first to have discovered this, or at least to have given the occasion for it. The story they tell of him is this: Being once at a feast, he recited a poem which he had made in honour of the person who gave the entertainment. But having (as is usual in poetry) made a large digression in praise of Castor and Pollux; when he had repeated the whole poem, his patron would give him but half the sum he had promised, telling him he must get the other part from

those

those deities who had an equal ſhare in the honour of his performance. Immediately after, Simonides was told that two young men were without, and muſt needs ſpeak with him. He had ſcarce got out of the houſe, when the room where the company was fell down, killed all the perſons in it, and ſo maſhed their bodies, that, when the rubbiſh was thrown off, they could not be known one from another: upon which Simonides recollecting the place where every one had ſat, by that means diſtinguiſhed them. Hence it came to be obſerved, that to fix a number of places in the mind in a certain order, was a help to the memory: As we find by experience, that, upon returning to places once familiar to us, we not only remember them, but likewiſe many things we both ſaid and did in them. This action therefore of Simonides was afterwards improved into an art, and the nature of it is this: They bid you form in your mind the idea of ſome large place or building, which you may divide into a great number of diſtinct parts, ranged and diſpoſed in a certain order. Theſe you are frequently to revolve in your thoughts, till you are able to run them over one after another without heſitation, beginning at any part. Then you are to impreſs upon your mind as many images of living creatures, or any other ſenſible objects which are moſt likely to affect you, and be ſooneſt revived in your memory. Theſe, like characters in ſhort-hand, or hieroglyphics, muſt ſtand to denote an equal number of other words, which cannot ſo eaſily be remembered. When therefore you have a number of things to commit to memory in a certain order, all that you have to do is, to place theſe images regularly in the ſeveral parts of your building. And thus they tell you, that, by going over ſeveral parts of the building, the images placed in them will be revived in the mind; which of courſe will give you the things or words themſelves in the order you deſire to remember them. The advantages of the images ſeems to be this; that, as they are more like to affect the imagination than the words for which they ſtand, they will for that reaſon be more eaſily remembered. Thus, for inſtance, if the image of a *lion* be made to ſignify *ſtrength*, and this word *ſtrength* be one of thoſe I am to remember, and is placed in the porch; when in going over the ſeveral parts of the building I come to the porch, I ſhall ſooner be reminded of that image than of the word *ſtrength*. Some ancient as well as modern writers relate wonderful effects of this artifice. But they all agree it much more aſſiſts us to remember any number of ſeparate and unconnected words, than a continued diſcourſe; unleſs ſo far as the remembrance of one word may enable us to recollect more. And in this reſpect it does not much differ from ſome of thoſe methods above-mentioned as helps to the memory. Quintilian therefore, though he does not wholly paſs it over, yet ſeems to lay no great ſtreſs upon it.

And, doubtleſs, the moſt effectual way to gain a good memory is, its conſtant and moderate exerciſe.—In a word, the memory, like other habits, is ſtrengthened and improved by daily uſe and practice. Wherefore thoſe who have moſt occaſion for it, as orators, ſhould not ſuffer it to lie idle, but conſtantly employ it in treaſuring up and frequently reviewing ſuch things as may be of moſt importance to them.—For by this means it will be more at their command, and they may put greater confidence in it upon any emergent occaſion.

Another method of aſſiſting the memory, is by forming certain words, the letters of which ſhall ſignify the date or æra to be remembered. In order to this, the following ſeries of vowels, diphthongs, and conſonants, together with their correſponding numbers, muſt be exactly learned; ſo as to be able at pleaſure to form a technical word that ſhall ſtand for any number, or to reſolve ſuch a word already formed.

a	*e*	*i*	*n*	*u*	*a*	*oi*	*ei*	*ou*	*y*
1	2	3	4	5	6	7	8	9	o
b	*d*	*t*	*f*	*l*	*s*	*p*	*k*	*n*	*z*

The firſt five vowels, in order, naturally repreſent 1, 2, 3, 4, 5; the diphthong *au*=6, as being compoſed of *a* and *u*, or 1+5=6; and for the like reaſon, *oi*=7, and *ou*=9. The diphthong *ei* will eaſily be remembered for 8, as being the initials of the word. In like manner, where the initial conſonants could conveniently be retained, they are made uſe of to ſignify the number, as *t* for 3, *f* for 4, *s* for 6, and *n* for 9. The reſt were aſſigned without any particular reaſon, unleſs that poſſibly *p* may be more eaſily remembered for 7 or *ſeptem*, *k* for 8 or οκτω, *d* for 2 or *duo*; *b* for 1, as being the firſt conſonant; and *l* for 5, being the Roman letter for 50, than any others that could have been put in their places.

It is to be farther obſerved, that *z* and *y* being made uſe of to repreſent the cypher, where many cyphers meet together, as 1000, 1000000, &c. inſtead of a repetition of *a z y z y z y*, &c. let *g* ſtand for 100, *th* for a thouſand, and *m* for a million. Thus *ag* will be 100, *ig* 300, *oug* 900, &c. *ath* 1000, *am* 1000000, *loum* 59000000, &c.

Fractions may be ſet down in the following manner: let *r* ſignify the line ſeparating the numerator and denominator, the firſt coming *before*, the other *after* it; as *iro* $\frac{3}{4}$, *urp* $\frac{5}{7}$, *pourag* $\frac{79}{100}$, &c. When the numerator is 1 or unit, it need not be expreſſed, but begin the fraction with *r*; as *re* $\frac{1}{2}$, *ri* $\frac{1}{3}$, *ro* $\frac{1}{4}$, &c. So in decimals, *rag* $\frac{1}{100}$, *rath* $\frac{1}{1000}$.

This is the principal part of the method which conſiſts in expreſſing numbers by artificial words. The application to hiſtory and chronology is alſo performed by artificial words. The art herein conſiſts in making ſuch a change in the ending of the name of a place, perſon, planet, coin, &c. without altering the beginning of it, as ſhall readily ſuggeſt the thing ſought, at the ſame time that the beginning of the word, being preſerved, ſhall be a leading or prompting ſyllable to the ending of it ſo changed. Thus, in order to remember the years in which Cyrus, Alexander, and Julius Ceſar, founded their reſpective monarchies, the following words may be formed; for Cyrus, Cyr*uts;* for Alexander, Alex*ita;* for Julius Ceſar, Juli*os*. *Uts* ſignifies, according to the powers aſſigned to the letters before-mentioned, 536; *ita* is 331, and *os* is 46. Hence it will be eaſy to remember, that the empire of Cyrus was founded 536 years before Chriſt, that of Alexander 331, and that of Julius Ceſar 46. This account is taken from a treatiſe, entitled *A New Method of Artificial Memory;* where the reader will find ſeveral

ral examples in chronology, geography, &c. of ſuch artificial words diſpoſed in verſes, which muſt be allowed to contribute much to the aſſiſtance of the memory, ſince being once learned they are ſeldom or never forgot. However, the author adviſes his reader to form the words and verſes himſelf, in the manner deſcribed above, as he will probably remember theſe better than thoſe formed by another.

We ſhall here give his table of the kings of England ſince the conqueſt; where 1000 being added to the italics in each word, expreſſes the year when they began their reigns. Thus,

Will-con*ſau*, Ruf*koi*, Hen*rag*.
Steph*bil* & Henſec*huf*, Rich*bein*, J*ann*, Heth*das* & Ed*doid*
Edſe*typ*, Edtar*tep*, Riſe*tois*, Heſo*toun*, Heſi*fadque*.
Henſi*fed*, Edquar*fauz*, Eſi R*okt*, Henſep*feil*, Heno*clyn*.
Edſex*los*, Mary*lut*, Els*luk*, Jam*ſyd*, Caroprim*ſel*.
Carſec*ſok*, Jam*ſeif*, Wil*ſeik*, An*pyd*, Geo*bo-doi*.

MEMPHIS, an ancient city, and the royal reſidence of the kings in the Higher Egypt; diſtant from the Delta to the ſouth 15 miles, according to Pliny. Situate on the weſt ſide of the Nile, over-againſt Babylon. Famous for its pyramids, the burial-places of the kings. In Strabo's time it was flouriſhing and populous, and ſecond to Alexandria. Called alſo *Moph* and *Noph*, in ſcripture.

MENAGE (Giles), in Latin *Ægidius*, a celebrated French writer, born at Angers in 1613. He finiſhed his ſtudies in that city, was made advocate, and pleaded for ſome time at Angers, Paris, and Poictiers; but, becoming at length diſguſted with the bar, turned eccleſiaſtic, and gave himſelf up entirely to the ſtudy of polite literature. He at length entered into the family of the cardinal de Retz; but diſagreeing with ſome perſons belonging to his eminence, went to live in the cloyſter of Notre Dame, where he held an aſſembly of learned men every Wedneſday. He read a great deal; had a prodigious memory; and was inceſſantly quoting in his converſation, verſes in Greek, Latin, Italian, French, &c. on which account he was often turned into ridicule by the wits, eſpecially towards the end of his days. His great memory he retained even in his old age; and what is very rare, it returned to him after ſome interruption. The reputation of his works procured him a place in the academy *della Cruſca* at Florence. He might have been a member of the French academy at its firſt inſtitution, if it had not been for his *Requeſte des Dictionnaires*: but when that was forgot, he was propoſed in 1684 to fill up a vacant place in that academy, and was excluded only by the ſuperior intereſt of his competitor Mr Bergent; for there was not one member of all thoſe who gave their votes againſt him, but owned that he deſerved the place. He would not ſuffer his friends to propoſe him again. He died at Paris in 1692, aged 79. He wrote a great number of books in proſe and verſe; the principal of which are, 1. Miſcellaneous works. 2. The Origin of the French Language. 3. The Origin of the Italian Tongue; the beſt edition of which is that of Geneva, in 1685, folio. 4. An edition of Malherbe's Poems, with Notes. 5. An edition of Diogenes Laertius, with Obſervations. 6. Remarks on the French Tongue. 7. Greek, Latin, Italian, and French poems.

MENANDER, an ancient Greek poet, was born at Athens in the ſame year with Epicurus, which was the third of the 109th olympiad. His happineſs in introducing the new comedy, and refining an art which had been ſo groſs and licentious in former times, quickly ſpread his name over the world. Pliny informs us, that the kings of Egypt and Macedon gave a noble teſtimony of his merit, by ſending ambaſſadors to invite him to their courts, and even fleets to bring him over; but that Menander was ſo much of a philoſopher, as to prefer the free enjoyment of his ſtudies to the promiſed favours of the great. Of his works, which amounted to above 100 comedies, we have had a double loſs, the originals being not only vaniſhed, but the greateſt part of them, when copied by Terence, having unfortunately periſhed by ſhipwreck before they ſaw Rome. Yet the four plays which Terence borrowed from him before that accident happened, are ſtill preſerved in the Roman habit; and it is chiefly from Terence that moſt people form their judgment of Menander, the fragments that remain of him not being ſufficient to enable them to do it. The ancients have ſaid high things of Menander; and we find the old maſters of rhetoric recommending his works, as the true patterns of every beauty and every grace of public ſpeaking. Quintilian declares, that a careful imitation of Menander only, will ſatisfy all the rules he has laid down in his Inſtitutions. It is in Menander that he would have his orator ſearch for a copiouſneſs of invention, for a happy elegance of expreſſion, and eſpecially for that univerſal genius which is able to accommodate itſelf to perſons, things, and affections.

But Julius Ceſar has left the loftieſt as well as the juſteſt praiſe of Menander's works, when he calls Terence only a *Half-Menander*. For while the virtues of the Latin poet are ſo deſervedly admired, it is impoſſible we ſhould raiſe a higher notion of excellency, than to conceive the great original ſtill ſhining with half its luſtre unreflected, and preſerving an equal part of its graces, above the power of the beſt copier in the world.

Menander died in the 3d year of the 122d olympiad, as we are taught by the ſame old inſcription from which we learn the time of his birth. His tomb, in Pauſanias's age, was to be ſeen at Athens, in the way from the Piræus to the city, cloſe by the honorary monument of Euripides. Quintilian, in his judgment of Afranius the Roman comedian, who imitated him, cenſures Menander's morals as much as he commends his writings; and his character, according to Suidas, is, that he was a very "mad fellow after women." Phædrus has given him the gait and dreſs of a moſt affected fop:

"Unguento delibutus, veſtitu adfluens,
"Veniebat greſſu delicatulo & languido."
Lib. v. fab. 2.

MENASSEH (Ben Iſrael), a celebrated rabbi, born in Portugal about the year 1604, was the ſon of Joſeph Ben Iſrael, and followed his father into Holland, where he was educated by rabbi Iſaac Uziel, under whom, he in a ſhort time made ſuch progreſs in the Hebrew tongue, that at 18 years of age he ſucceeded him in the ſynagogue of Amſterdam, in which poſt he continued ſeveral years, and married Rachel of the family of the Abarbanels, whom the Jews imagine to be deſcended from king David. He afterwards went

went to his brother Ephraim, a rich merchant, who had ſettled at Baſil; by whoſe advice he entered into trade. Some time after, the hopes of a more agreeable ſettlement induced him to come into England, under the protectorſhip of Cromwell; who gave him a very favourable reception, and one day entertained him at his table with ſeveral other learned divines. However, he ſoon after paſſed into Zealand; and died at Middleburg about the year 1657. The Jews at Amſterdam obtained his body, and interred it at their expence. He was of the ſect of the Phariſees; had a lively wit, a ſolid judgment, great learning, and all the virtues that can adorn private life. He wrote many works in Hebrew, Latin, Spaniſh, and Engliſh. The principal of thoſe publiſhed in Latin, are, 1. His *Conciliator;* a learned and curious work, in which he reconciles thoſe paſſages of Scripture which ſeem to contradict each other. 2. *De reſurrectione mortuorum.* 3. *De termino vitæ.* 4. *Diſſertatio de fragilitate humana, ex lapſu Adami, deque Divino in bono opere auxilio.* 5. *Spes Iſrael.* Dr Thomas Pococke has written his life in Engliſh.

MENCKE (Lewis Otto), in Latin *Menckenius*, a learned profeſſor of morality at Leipſic, was born at Oldenburg in Weſtphalia in 1644. He ſtudied in ſeveral univerſities of Germany; and became an able philoſopher, civilian, and divine. He was made profeſſor of morality at Leipſic in 1668; and enjoyed that poſt to his death. He was five times rector of the univerſity of that city, and ſeven times dean of the faculty of philoſophy. He publiſhed ſeveral works; but his moſt conſiderable, and what alone is ſufficient to perpetuate his memory, is the *Acta Eruditorum* of Leipſic, of which he was the firſt author, and in which he was engaged till his death. The firſt volume was publiſhed at Leipſic, in 4to, in 1682.

Mencke (John Burchard), ſon to the preceding. After his ſtudies he travelled into England and Holland; and upon his return was appointed profeſſor of hiſtory at Leipſic in 1699. He gained great reputation by his lectures as well as his writings.. He died in 1732, aged 58. He wrote many pieces. His *De Charlataneriâ eruditorum declamationes duæ*, is an excellent ſatire, deſigned to expoſe the artifices uſed by falſe ſcholars to raiſe themſelves a name. As he named and pointed at certain perſons, it exaſperated them, and they procured his book to be ſeized; but it ſpread, and editions of it were multiplied. He likewiſe publiſhed *Methode pour étudier l'Hiſtoire, avec un catalogue des principaux hiſtoriens*, &c. He made a great many additions to Mr Lenglet's book, eſpecially with regard to the German hiſtorians.

MENDICANTS, or begging friars, ſeveral orders of religious in Popiſh countries, who having no ſettled revenues, are ſupported by the charitable contributions they receive from others.

This ſort of friars began in the 13th century. The Waldenſes, who made profeſſion of renouncing their eſtates, and leading a life of poverty, gave occaſion to this inſtitution. Two of that ſect, Bernard and Durand of Oſca, ſet up a congregation in the province of Tarragon, and called it *The Poor Catholics.* The ſame year, Dominick de Guzman, with nine more of his companions, founded the order of Preaching Friars, called from their founder *Dominicans.* The other three Mendicant orders are, the *Franciſcans*, *Auguſtins*, and *Carmelites.*

"A great many have embraced this ſevere order, (ſays Puffendorf), out of an opinion of a particular holineſs and merit which they believed did belong to it, or rather an eccleſiaſtic ambition; the pride of mankind being ſo great and natural to ſome, that they did not think the commands of God ſufficient, but would receive heaven rather as a deſert than a gift, and were ambitious of having a preference before others even in another life."

Buchannan tells us, the Mendicants in Scotland, under an appearance of beggary, lived a very luxurious life; whence one wittily called them, not *Mendicant*, but *Manducant*, friars.

MENDOZA (Juan Gonzales de), an Auguſtan friar, of the province of Caſtile, was made ambaſſador from the king of Spain to the emperor of China. In 1593, he was made biſhop of Liperi in Italy. In 1607 he was made biſhop of Chiapa in New Spain, and the next year was removed to the ſee of Papaian in the Weſt Indies. He wrote a hiſtory of China in Spaniſh, which has been tranſlated into ſeveral languages.

MENECRATES, a phyſician of Syracuſe, who flouriſhed about 360 B. C. is famous for his ſkill in his profeſſion, but much more for his vanity. He would always be followed by ſome of the patients whom he had cured, one dreſſed like Apollo, another like Eſculapius, a third like Hercules, &c. As for himſelf, he would be called *Jupiter.* He wrote a letter to Philip the father of Alexander the Great, with this ſuperſcription, "Menecrates Jupiter to king Philip, Health:" When that prince ridiculed him by replying, "Philip to Menecrates, Health and Good Senſe." Menecrates compoſed a book of *Remedies*, which is loſt.

MENEDEMUS, a Greek philoſopher, born at Erythreum, was the ſon of Caliſthenes, and one of Phedo's followers. He was in greaſt eſteem, and enjoyed ſeveral important poſts in his own country. He ſeveral times defended Erythreum with great bravery, and died of grief when Antigonus became maſter of it. A perſon one day ſaying to him, "It is a great happineſs to have what we deſire," he replied, "It is a much greater to deſire nothing but what we have." He flouriſhed about 300 B. C.

MENELAUS, the ſon of Atreus, and the brother of Agamemnon, reigned at Sparta, when Paris deprived him of his wife Helen. This rape occaſioned the famous war of Troy. See Helen.

Menelaus, a mathematician in the reign of the emperor Trajan, wrote three books on the *Sphere*, which have been publiſhed by father Merſenne.

MENES, born at This, a town of Thebais in Upper Egypt, was the founder of the Egyptian empire. He had three ſons, viz. Athotis, who ruled after him at This and Thebes; Curudes, who, in Lower Egypt, founded the kingdom of Heliopoli, which afterward was the kingdom of Dioſpoli; and Necherophes, who reigned at Memphis. It is thought this Menes reigned 117 years after the birth of Phaleg, ſon of Heber, which was the very year of the diſperſion of the people throughout the whole earth. In building Memphis, he ſtopped the Nile near it, by the invention of a

MENEcauſeway 100 furlongs broad, and cauſed it to run thro' the mountains.

MENESTRIER (John Baptiſt le), a native of Dijon, and one of the moſt learned and curious French antiquaries of his time, wrote, 1. A treatiſe on the medals, money, and ancient monuments of the Roman empreſſes, in folio. 2. The moſt famous medals of the ancient Roman emperors and empreſſes, in quarto. He died in 1634, aged 70.

MENGRELIA, a province of Turky in Aſia. See MINGRELIA.

MENIALS, domeſtic or houſehold ſervants, who live under their lord or maſter's roof.

MENINGES, or MENYNGES, in anatomy, a name given to the dura and pia mater of the brain. See ANATOMY, n° 394.

MENINX, an iſland in the Mediterranean, to the weſt of the Syrtis Minor. Suppoſed by Strabo and Polybius to be Homer's country of the Lotophagi; and hence Ptolemy and Eratoſthenes denominate the iſland *Lotophagitis*, with a cognominal town *Meninx*. The country of Vibius Gallus the emperor, and of Voluſianus. Now called *Gerbi* and *Zarbi*.

MENISPERMUM, MOONSEED; a genus of the decandria order, belonging to the diœcia claſs of plants. There are three ſpecies, all of them climbing plants, riſing 14 feet high, and natives of warm climates; but noway remarkable for beauty. The ſeeds of a kind which grows in the Levant, being formed into a paſte, are regarded by the inhabitants as ſpecific againſt lice and cutaneous eruptions. The ſame paſte is likewiſe uſed for the purpoſe of intoxicating fiſhes.

MENOCHIUS, vulgarly MENOCHIA, (James), a famous lawyer, meanly born at Pavia, but who became ſo ſkilful in the law, that he was called the *Baldus* and *Bartholus* of his age; all the princes of Italy ſoliciting him to their univerſities. He read at Padua 23 years together; and for love of his country removed to Pavia, and ſucceeded Nicholas Gratiani. He hath got an immortal fame by his works, *De recuperanda poſſeſſione; De adipiſcenda poſſeſſione; De præſumtionibus; De arbitrariis Judicum queſtionibus & cauſis conciliorum*, tom. 13. &c. He died in 1607, aged 75.

MENNITH, or MINNITH, Judges xi. 33. a town near Heſhbon, (Jerome), in Arabia Petræa; in a diſtrict named *Ecoſipolis*, or *twenty-towns*, (Cellarius). There is alſo a Minnith mentioned Ezekiel xxvii. as being in a good wheat country: but whether the ſame with the foregoing is uncertain; though ſome think, that the firſt Minnith lay in the country of Ammon, (Wells).

MENNONITES, a ſect of baptiſts in Holland, ſo called from Mennon Simonis of Friezeland, who lived in the 16th century. This ſect believe, that the New Teſtament is the only rule of faith; that the terms *Perſon* and *Trinity* are not to be uſed in ſpeaking of the Father, Son, and Holy Ghoſt; that the firſt man was not created perfect; that it is unlawful to ſwear or to wage war upon any occaſion; that infants are not the proper ſubjects of baptiſm; and that miniſters of the goſpel ought to receive no ſalary. They all unite in pleading for toleration in religion, and debar none from their aſſemblies who led pious lives, and own the ſcriptures for the word of God. The Mennonites meet privately; and every one in the aſſembly has the liberty to ſpeak, to expound the ſcriptures, to pray and ſing. They aſſemble twice every year, from all parts of Holland, at Rynſbourg, a village about two leagues from Leyden; at which time they receive the communion, ſitting at a table, where the firſt diſtributes to the reſt; and all ſects are admitted, even the Roman Catholics, if they pleaſe to come.

MENOLOGY, the Greek calendar, in which the lives of the ſaints in ſhort, or barely their names, are cited; anſwering nearly to the MARTYROLOGY of the Latin church.

MENSA, in law-books, a term that includes in it all patrimony, and neceſſaries for livelihood.

MENSALS, MENSALIA, in church-hiſtory, ſuch livings as were formerly united to the tables of religious houſes, and hence called *menſal benefices*. See the article BENEFICE.

MENSES, FLUORS, *Courſes*, *Catamenia*, in medicine, the monthly evacuations from the uterus of women not with child and not giving ſuck.

With regard to the cauſes of this evacuation, the beſt phyſiologiſts are entirely at a loſs.. It was long diſputed whether the menſtrual blood flowed from the uterus or vagina, but ſome obſervations of retroverted uteri have determined in favour of the former opinion. —For the diſorders which follow a ſuppreſſion, or too great a flow of the menſes, ſee MEDICINE, n° 488, 259—264. and p. 4871.

MENSTRUUM, in chemiſtry, any body which in a fluid or ſubtiliſed ſtate is capable of interpoſing its ſmall parts betwixt the ſmall parts of other bodies, ſo as to divide them ſubtilly, and form a new uniform compound of the two.

MENSURATION, in general, denotes the act or art of meaſuring lines, ſuperficies, or ſolids. See GEOMETRY.

MENTHA, MINT; a genus of the gymnoſpermia order, belonging to the didynamia claſs of plants. There are many ſpecies; but not more than three are cultivated for uſe, namely, the viridis or common ſpearmint, the piperita or peppermint, and the pulegium or pennyroyal. All theſe are ſo well known as to need no deſcription; and all of them are very eaſily propagated by cuttings, parting the roots, or by offsets.

Uſes. For culinary purpoſes, the ſpearmint is preferable to the other two; but for medicine, the peppermint and pennyroyal have in ſome places almoſt entirely ſuperſeded it. A conſerve of the leaves is very grateful, and the diſtilled waters both ſimple and ſpirituous are univerſally thought pleaſant. The leaves are uſed in ſpring ſallads; and the juice of them boiled up with ſugar is formed into tablets. It has been imagined that cataplaſms and fomentations of mint, would diſſolve coagulations of milk in the breaſts; but Dr Lewis ſays, that the curd of milk, digeſted in a ſtrong infuſion of mint, could not be perceived to be any otherwiſe affected than by common water: however, milk in which mint-leaves were ſet to macerate, did not coagulate near no ſoon as an equal quantity of the ſame milk kept by itſelf. Dr Lewis ſays, that dry mint digeſted in rectified ſpirits of wine, gives out a tincture, which appears by day-light of a fine dark green,

green, but by candle-light of a bright red colour. The fact is, that a small quantity of this tincture is green either by day-light or by candle-light, but a large quantity of it seems impervious to common day-light; however, when held betwixt the eye and a candle, or betwixt the eye and the sun, it appears red.

The virtues of mint are those of a warm stomach and carminative: in loss of appetite, nausea, and continual reaching to vomit, there are few simples of equal efficacy. In colicky pains, the gripes to which children are subject, lienteries, and other immoderate fluxes, this plant frequently does good service. It likewise proves beneficial in many hysteric cases, and affords an useful cordial in languors and other weaknesses consequent upon delivery. The best preparation in these cases is a strong infusion of the dried herb in water, (which is much superior to the green), or rather a tincture or extract prepared with rectified spirit. These possess the whole virtues of the mint; the essential oil and distilled water contain only the aromatic part; the expressed juice only the astringency and bitterishness, together with the mucilaginous substance common to all vegetables. The peppermint is much more pungent than the others.

Pennyroyal has the same general characters with the mint, but is more acrid and less agreeable when taken into the stomach. It has long been held in great esteem, and not undeservedly, as an aperient and deobstruent, particularly in hysteric complaints and suppressions of the menses. For these purposes the distilled water is generally made use of, or, what is of equal efficacy, an infusion of the leaves. It is observable, that both water and rectified spirit extract the virtues of this herb by infusion, and likewise elevate the greatest part of them by distillation. The expressed juice with a little sugar, is not a bad medicine in the chincough.

MENTZ, an archbishopric and electorate in Germany. It lies on the banks of the river Mayne, between the electorate of Triers on the west, the Palatinate on the south, Franconia on the east, and the Wetteraw on the north. It is about 60 miles in length from north-east to south-west, and about 50 in breadth. A considerable part of the elector's revenue arises from the toll on the Rhine and the Mayne, and from the tax on the excellent wines produced in this country. The chief towns of any trade are, 1. Mentz, on the Rhine, near its confluence with the Mayne. This city claims a right to the invention of the art of printing, (see *History* of PRINTING.) Here is a very beautiful quay along the river, defended by several works well fortified with cannon. That part of the city which extends towards the river is most populous. The best vineyards for Rhenish wine being in this neighbourhood, Mentz has a flourishing trade in that commodity more particularly; and its commerce is the brisker, by reason that all the merchandize which passes up and down the Rhine stops in its harbour to change bottoms. In this neighbourhood is Hockhem, so celebrated for good wines, that the best Rhenish is from thence called *old hock*. 2. Bingen is a pleasant small town, which stands in the district called *Rhingaw*, which is so populous, that it looks like one entire town, intermixed with gardens and vinegards. The rising grounds about it produce wines that are esteemed preferable to those of Baccharac, so much in vogue heretofore. 3. Elfeld, five miles west from Mentz, is a strong fortified town, on the north side of the Rhine, and the chief of the Rhingaw.—Here is Roderheim, a place noted for the growth of the best wines in these parts. 4. Weisbaden lies between six and seven leagues from Frankfort, and about five or six miles north of Mentz: it is the metropolis of a country belonging to the branch of Nassau-Saarbrack, and is famous for its mineral waters.

MENYANTHES, MARSH-TREFOIL, or *Buckbean;* a genus of the monogynia order, belonging to the pentandria class of plants. This plant grows wild in moist marshy places in many parts of Britain. It has three oval leaves standing together upon one pedicle, which issues from the root; their taste is very bitter, and somewhat nauseous. According to Mr Lightfoot, the flowers of this plant are so extremely beautiful, that nothing but their native soil could exclude it from a place in every garden. They grow in an elegant spike; are white, dashed with pink, and fringed internally with hairs. The highlanders esteem an infusion or tea of the leaves as good to strengthen the stomach. According to Mr Withering, an infusion of the leaves is prescribed in rheumatisms and dropsies; a dram of them in powder purges and vomits, and is sometimes given to destroy worms. In a scarcity of hops, the plant is used in the north of Europe to bitter the ale. The powdered roots are sometimes used in Lapland instead of bread, but they are unpalatable. Some people say, that sheep will eat it, and that it cures them of the rot; but from the Upsal Experiments it appears, that though goats eat it, sheep sometimes will not. Cows, horses, and swine, refuse it.—As to its medical virtues, Dr Lewis informs us, that it is an efficacious aperient and deobstruent; promotes the fluid secretions; and, if liberally taken, gently loosens the belly. It has of late gained great reputation in scorbutic and scrophulous disorders; and its good effects in those cases have been warranted by experience. Inveterate cutaneous diseases have been removed by an infusion of the leaves, drank to the quantity of a pint a-day, at proper intervals, and continued for some weeks. Boerhaave relates, that he was relieved of the gout by drinking the juice mixed with whey.

MENZINI (Benedict), a celebrated Italian poet, born at Florence, was professor of eloquence at the college Della Sapienza at Rome, where he died in 1704. He wrote, 1. The art of poetry. 2. Satires, elegies, hymns, and the Lamentations of Jeremiah. 3. *Academia Tusculana*, a work in verse and prose, which passes for his masterpiece.

MEOTIS, or PALUS MEOTIS, a sea of Turky, which divides Europe from Asia; extending from Crim Tartary to the mouth of the river Don or Tanais.

MEPHITIC, a name expressing any kind of noxious vapour; but generally applied to that species of vapour called *fixed air*. See AIR, FIXED *Air*, GAS, &c.

MERCATOR (Gerard), one of the most celebrated geographers of his time, was born at Ruremonde in 1512. He applied himself with such industry duftry to geography and mathematics, that he is faid to have frequently forgot to eat and drink. The emperor Charles V. had a particular efteem for him, and the duke of Juliers made him his cofmographer. He compofed a chronology, fome geographical tables, an Atlas, &c. engraving and colouring the maps himfelf. He died in 1594. His method of laying down charts is ftill ufed, and bears the name of *Mercator's charts*.

MERCATOR (Nicholas), an eminent mathematician in the 17th century, was born at Holftein in Denmark; and came to England about the time of the reftoration, where he lived many years. He was fellow of the Royal Society; and endeavoured to reduce aftrology to rational principles, as appeared from a MS. of his in the poffeffion of William Jones, Efq; He publifhed feveral works, particularly *Cofmographia*. He gave the quadrature of the hyperbole by an infinite feries; which was the firft appearance in the learned world of a feries of this fort drawn from the particular nature of the curve, and that in a manner very new and abftracted.

MERCATOR'S *Sailing*, that performed by Mercator's chart. See NAVIGATION.

MERCHANT, a perfon who buys and fells commodities in grofs, or deals in exchanges; or that traffics in the way of commerce, either by importation or exportation. Formerly every one who was a buyer or feller in the retail way was called a *merchant*, as they ftill are both in France and Holland; but here fhopkeepers, or thofe who attend fairs or markets, have loft that appellation.

Previous to a perfon's engaging in a general trade, and becoming an univerfal dealer, he ought to treafure up fuch a fund of ufeful knowledge, as will enable him to carry it on with eafe to himfelf, and without rifking fuch loffes as great ill-concerted undertakings would naturally expofe him to. A merchant fhould therefore be acquainted with the following parts of commercial learning. 1. He fhould write properly and correctly. 2. Underftand all the rules of arithmetic that have any relation to commerce. 3. Know how to keep books of double and fingle entry, as journals, a leger, &c. 4. Be expert in the forms of invoices, accounts of fales, policies of infurance, charter-parties, bills of lading, and bills of exchange. 5. Know the agreement between the money, weights and meafures of all parts. 6. If he deals in filk, woollen, linnen, or hair manufactures, he ought to know the places where the different forts of merchandizes are manufactured, in what manner they are made, what are the materials of which they are compofed, and from whence they come, the preparations of thefe materials before working up, and the places to which they are fent after their fabrication. 7. He ought to know the lengths and breadths which filk, woollen, or hair-ftuffs, linen, cottons, fuftians, &c. ought to have according to the feveral ftatutes and regulations of the places where they are manufactured, with their different prices, according to the times and feafons; and if he can add to his knowledge the different dyes and ingredients which form the various colours, it will not be ufelefs. 8. If he confines his trade to that of oils, wines, &c. he ought to inform himfelf particularly of the appearances of the fucceeding crops, in order to regulate his

difpofing of what he has on hand; and to learn as exactly as he can, what they have produced when got in, for his direction in making the neceffary purchafes and engagements. 9. He ought to be acquainted with the forts of merchandize found more in one country than another, thofe which are fcarce, their different fpecies and qualities, and the propereft method for bringing them to a good market either by land or fea. 10. To know which are the merchandizes permitted or prohibited, as well on entering as going out of the kingdoms or ftates where they are made. 11. To be acquainted with the price of exchange, according to the courfe of different places, and what is the caufe of its rife and fall. 12. To know the cuftoms due on importation or exportation of merchandizes, according to the ufage, the tarifs, and regulations, of the places to which he trades. 13. To know the beft manner of folding up, embaling, or tunning, the merchandizes for their prefervation. 14. To underftand the price and condition of freighting and infuring fhips and merchandize. 15. To be acquainted with the goodnefs and value of all neceffaries for the conftruction and repairs of fhipping, the different manner of their building; what the wood, the mafts, cordage, cannons, fails, and all requifites, may coft. 16. To know the wages commonly given to the captains, officers, and failors, and the manner of engaging with them. 17. He ought to underftand the foreign languages, or at leaft as many of them as he can attain to; thefe may be reduced to four, viz. the Spanifh, which is ufed not only in Spain, but on the coaft of Africa, from the Canaries to the Cape of Good Hope: the Italian, which is underftood on all the coafts of the Mediterranean, and in many parts of the Levant: the German, which is underftood in almoft all the northern countries; and the French, which is now become almoft univerfally current. 18. He ought to be acquainted with the confular jurifdiction, with the laws, cuftoms, and ufages of the different countries he does or may trade to; and in general all the ordinances and regulations both at home and abroad that have any relation to commerce. 19. Though it is not neceffary for a merchant to be very learned, it is proper that he fhould know fomething of hiftory, particularly that of his own country; geography; hydrography, or the fcience of navigation; and that he be acquainted with the difcoveries of the countries in which trade is eftablifhed, in what manner it is fettled, of the companies formed to fupport thofe eftablifhments, and of the colonies they have fent out.

All thefe branches of knowledge are of great fervice to a merchant who carries on an extenfive commerce; but if his trade and his views are more limited, his learning and knowledge may be fo too: but a material requifite for forming a merchant is, his having on all occafions a ftrict regard to truth, and his avoiding fraud and deceit as corroding cankers that muft inevitably deftroy his reputation and fortune.

Trade is a thing of fo univerfal a nature, that it is impoffible for the laws of Britain, or of any other nation, to determine all the affairs relating to it: therefore all nations, as well as Great Britain, fhew a particular regard to the *law-merchant*, which is a law made by the merchants among themfelves: however, merchants and other ftrangers are fubject to the laws of of the country in which they refide. Foreign merchants are to fell their merchandize at the port where they land, in grofs, and not by retail; and they are allowed to be paid in gold or filver bullion, in foreign coin or jewels, which may be exported. If a difference arifes between the king and any foreign ftate, the merchants of that ftate are allowed fix months time to fell their effects and leave the kingdom; during which time they are to remain free and unmolefted in their perfons and goods. See the articles COMMERCE, and *Mercantile* LAW.

MERCHET (MERCHETUM), a fine or compofition paid by inferior tenants to the lord, for liberty to difpofe of their daughters in marriage. No baron, or military tenant, could marry his fole daughter and heir, without fuch leave purchafed from the king, *pro maritanda filia*. And many of our fervile tenants could neither fend their fons to fchool, nor give their daughters in marriage, without exprefs leave from the fuperior lord. See Kennet's Gloffary *in Maritagium*. See alfo MARCHET.

MERCIA, the name of one of the feven kingdoms founded in England by the Saxons. Though the lateft formed, it was the largeft of them all, and grew by degrees to be by far the moft powerful. On the north it was bounded by the Humber and the Merfey, which feparated it from the kingdom of Northumberland; on the eaft by the fea, and the territories of the Eaft-Angles and Saxons; on the fouth by the river Thames; and on the weft by the rivers Severn and Dee. It comprehended well nigh 17 of our modern counties, being equal in fize to the province of Languedoc in France; very little, if at all, lefs than the kingdom of Arragon in Spain; and fuperior in fize to that of Bohemia in Germany.

Penda is regarded as its firft monarch; and the kingdom is thought to derive its name from the Saxon word *merc*, which fignifies a *march*, *bound*, or *limit*, becaufe the other kingdoms bordered upon it on every fide; and not from the river Merfey, as fome would perfuade us. Penda affumed the regal title A. D. 626, and was of the age of 50 at the time of his acceffion; after which he reigned near 30 years. He was of a moft furious and turbulent temper, breaking at different times with almoft all his neighbours, calling in the Britons to his affiftance, and fhedding more Saxon blood than had been hitherto fpilled in all their inteftine quarrels. He killed two kings of Northumberland, three of the Eaft-Angles, and compelled Kenwall king of the Weft-Saxons to quit his dominions. He was at length flain, with moft of the princes of his family, and a multitude of his fubjects, in a battle fought not far from the Leeds, by Ofwy king of Northumberland. This battle, which the Saxon chronicle tells us was fought at Winwidfield, A. D. 655, made a great change in the Saxon affairs, which the unbridled fury of Penda had thrown into great confufion. He had the year before killed Anna king of the Eaft-Angles in battle, whofe brother Ethelred notwithftanding took part with Penda. On the other hand, Peada the eldeft fon of Penda, to whom his father had given the ancient kingdom of the Mid-Angles, had two years before married the natural daughter of king Ofwy, and had been baptized at his court. At that time it fhould feem that Ofwy and Penda were upon good terms; but after the latter had conquered the Eaft-Angles, he refolved to turn his arms againft the kingdom of Northumberland. Ofwy by no means had provoked this rupture; on the contrary, Bede tells us that he offered large fums of money, and jewels of great value, to purchafe peace: thefe offers being rejected, he was reduced to the neceffity of deciding the quarrel by the fword. The river near which the battle was fought overflowing, there were more drowned than killed. Amongft thefe, as the Saxon chronicle fays, there were 30 princes of the royal line, fome of whom bore the title of *kings;* and alfo Ethelred king of the Eaft-Angles, who fought on the fide of Penda againft his family and country.

His fon Peada, who married the daughter of that conqueror, became a Chriftian, and was not long after murdered as is faid by the malice of his mother. His brother Wolfher becoming king of Mercia, embraced in procefs of time the faith of the Gofpel, and proved a very victorious and potent monarch; and is, with no fewer than feven of his immediate fucceffors, commonly ftyled *king of the Anglo-Saxons*, though none of them are owned in that quality by the Saxon chronicle. But though poffibly none of them might enjoy this honour, they were undoubtedly very puiffant princes, maintaining great wars, and obtaining many advantages over the fovereigns of other Saxon ftates, and efpecially the Eaft-Angles, whom they reduced. The extent of the Mercian territories was fo ample as to admit, and fo fituated as to require, the conftituting fubordinate rulers in feveral provinces; to whom, efpecially if they were of the royal line, they gave the title of *kings;* which occafions fome confufion in their hiftory. Befides the eftablifhing epifcopal fees and convents, the Saxon monarchs took other methods for improving and adorning their dominions; and as Mercia was the largeft, fo thefe methods were moft confpicuous therein. Coventry, as being fituated in the centre, was ufually, but not always, the royal refidence. Penda, who was almoft continually in a ftate of war, lived as his military operations directed, in fome great town on the frontiers. Wolfher built a caftle or fortified palace for his own refidence, which bore his name. —Offa kept his court at Sutton Walls near Hereford.

In each of the provinces there refided a chief magiftrate; and if he was of the royal blood, had ufually the title of *king*. Peada, at the time he married Ofwy's daughter, had the title of *king of Leicefter*.—Ethelred made his brother Merowald king of Hereford; who, dying without iffue, bequeathed it to his younger brother Mercelm. The like honours were fometimes conferred upon the princeffes; and hence, in Mercia efpecially, we occafionally read of *vice-queens*. By thefe means the laws were better executed, the obedience of the fubjects more effectually fecured, and the fplendor of thefe refidences conftantly kept up and augmented.

At length, the crown devolving fometimes on minors, and fometimes on weak princes, inteftine factions alfo prevailing, the force of this hitherto mighty kingdom began fenfibly to decline. This falling out in the days of Egbert, the moft prudent as well as the moft potent monarch of the Weft-Saxons, he took advantage of thefe circumftances; and having en-

encouraged the Eaſt-Angles to make an attempt for the recovery of their independence, he, in a conjuncture every way favourable to his deſign, broke with the Mercians, and after a ſhort war obliged them to ſubmit. But this was not an abſolute conqueſt, the kings of Mercia being allowed by him and his ſucceſſors to retain their titles and dominions, till the the invaſion of the Danes put an end to their rule, when this kingdom had ſubſiſted above 250 years; and when the Danes were afterwards expelled by the Weſt-Saxons, it ſunk into a province, or rather was divided into many.

MERCURIAL, ſomething conſiſting of, or relating to, mercury.

MERCURIALIS (Jerom), an eminent Italian phyſician, born at Forli in 1530, where he firſt practiſed; but afterwards was profeſſor of medicine ſucceſſively at Padua, Bologna, and Piſa. His writings in phyſic are very numerous; beſides giving an edition of Hippocrates in Greek and Latin, with notes, which, however, did not anſwer the expectations of the learned. He died in 1606; and in 1644 ſome ſelect pieces of his were publiſhed at Venice in one volume folio.

MERCURIALIS, Mercury; a genus of the enneandria order, belonging to the diœcia claſs of plants. There are three ſpecies. 1. The annua, or French mercury, with ſpiked flowers, male and female. This is an annual plant, with a branching ſtalk about a foot high, garniſhed with ſpear-ſhaped leaves of a pale or yellowiſh green colour. The male plants have ſpikes of herbaceous flowers, growing on the top of the ſtalks: theſe fall off ſoon; but the female plants, which have teſticulated flowers proceeding from the ſide of the ſtalks, are ſucceeded by ſeeds, which, if permitted to ſcatter, will produce plenty of plants of both ſexes. 2. The perennis, mountain or dog's mercury, with ſpiked and teſticulated flowers, grows under hedges and in woods, in many parts of Britain. This hath a perennial root, which creeps in the ground; the ſtalks are ſingle, and without branches, riſing ten or twelve inches high, garniſhed with rough leaves, placed by pairs at each joint, of a dark green colour, indented on their edges: theſe have their male flowers growing in ſpikes, upon different plants from thoſe which produce ſeeds. 3. The tomentoſa, or ſhrubby hairy mercury, is a native of the ſouth of France, Spain, and Italy. It hath a ſhrubby branching ſtalk, growing a foot and an half high, garniſhed with oval leaves placed by pairs, and covered with a white down on both ſides. The male flowers grow in ſhort ſpikes from the ſide of the ſtalks upon different plants from the firſt. All the ſpecies are eaſily propagated by ſeeds, and are apt to become troubleſome weeds where they have once got a footing.

Properties. The perennis, according to Mr Lightfoot, is of a ſoporific deleterious nature, noxious both to man and beaſt. There are inſtances of thoſe who have eaten it by miſtake inſtead of chenopodium, bonus Henricus, or Engliſh mercury, and have thereby ſlept their laſt. In the iſle of Skye, it is called *lusglen-bracadale;* and an infuſion of it is ſometimes taken to bring on a ſalivation; but our author knows not how the experiment anſwers. Tournefort informs us, that the French make a ſyrup of the juice of the annua, two ounces of which is given as a purge; and that they uſe it in peſſaries and clyſters, mixing one quantity of honey, to one and a half of the juice. Mr Withering differs greatly from Lightfoot concerning the qualities of the perennis. "This plant, (ſays he), dreſſed like ſpinach, is very good eating early in the ſpring, and is frequently gathered for that purpoſe; but it is ſaid to be hurtful to ſheep. Mr Ray relates the caſe of a man, his wife, and three children, who experienced highly deleterious effects from eating it fried with bacon; but this was probably when the ſpring was more advanced, and the plant become acrimonious. Steeped in water, it affords a fine deep blue colour. Sheep and goats eat it; cows and horſes refuſe it.

MERCURY, in natural hiſtory. See Chemistry, n° 153, 205, 250, 214. See alſo Metallurgy, and Quicksilver.

The uſe of mercury in medicine ſeems to have been little known before the 15th century. The ancients looked upon it as a corroſive poiſon, though of itſelf perfectly void of acrimony, taſte, and ſmell; there are examples of its having been lodged for years in cavities both of bones and fleſhy parts, without its having injured or affected them. Taken into the body in its crude ſtate, and undivided, it paſſes through the inteſtines unchanged, and has not been found to produce any conſiderable effect. It has indeed been recommended in aſthmas and diſorders of the lungs; but the virtues attributed to it in theſe caſes have not been warranted by experience.

Notwithſtanding the mildneſs and inactivity of crude quickſilver undivided; when reſolved by fire into the form of fume, or otherwiſe divided into very minute particles, and prevented from re-uniting by the interpoſition of proper ſubſtances, or combined with mineral acids, it has very powerful effects; affording the moſt violent poiſons, and the moſt excellent remedies, that we are acquainted with.

The mercurial preparations, either given internally or introduced into the habit by external application, ſeem to liquify all the juices of the body, even thoſe in the minuteſt and moſt remote veſſels; and may be ſo managed as to promote excretion through all the emunctories. Hence their common uſe in inveterate chronic diſorders proceeding from a thickneſs and ſluggiſhneſs of the humours, and obſtinate obſtructions of the excretory glands; in ſcrophulous and cutaneous diſeaſes; and in the venereal lues. If their power is not reſtrained by proper additions to certain emunctories, they tend chiefly to affect the mouth; and, after having fuſed the juices in the remoter parts, occaſion a plentiful evacuation of them from the ſalival glands.

The ſalutary effects of mercurials do not depend on the quantity of ſenſible evacuation. This medicine may be gradually introduced into the habit, ſo as, without occaſioning any remarkable diſcharge, to be productive of very happy effects. To anſwer this purpoſe, it ſhould be given in very ſmall doſes, in conjunction with ſuch ſubſtances as determine its action to the kidneys or the pores of the ſkin. By this method inveterate cutaneous and venereal diſtempers have been cured, without any other ſenſible excretion than a gentle increaſe of perſpiration or urine. Where there are ulcers in any part, they diſcharge for ſome time a very fetid matter, the quantity of which becomes gradually leſs, lefs, and at length the ulcer kindly heals. If the mercury fhould at any time, from cold or the like, affect the mouth, it may be reftrained by omitting a dofe, and, by warmth or fuitable medicines, promoting the perfpiration.

Mercury, in the heathen mythology. See Hermes.

Moft of the actions and inventions of the Egyptian Mercury have likewife been afcribed to the Grecian, who was faid to be the fon of Jupiter and Maia, the daughter of Atlas. No one of all the heathen divinities had fo many functions allotted to him as this god: he had conftant employment both day and night, having been the common minifter and meffenger of the whole Pantheon; particularly of his father Jupiter, whom he ferved with indefatigable labour, and fometimes indeed in a capacity of no very honourable kind. Lucian is very pleafant upon the multitude of his avocations; and, according to the confeffion of the emperor Julian, Mercury was no hero, but rather one who infpired mankind with wit, learning, and the ornamental arts of life, than with courage. The pious emperor, however, omits fome of his attributes; for this god was not only the patron of trade, but alfo of theft and fraud.

Amphion is faid, by Paufanias, to have been the firft that erected an altar to this god; who, in return, invefted him with fuch extraordinary powers of mufic (and mafonry), as to enable him to fortify the city of Thebes in Bœotia, by the mere found of his lyre.

Horace gives us the beft part of his character.

Thou god of wit, from Atlas fprung,
Who by perfuafive power of tongue,
And graceful exercife, refin'd
The favage race of human kind,
Hail! winged meffenger of Jove,
And all th' immortal pow'rs above.
Sweet parent of the bending lyre,
Thy praife fhall all its founds infpire.
Artful and cunning to conceal
Whate'er in fportive theft you fteal,
When from the god who gilds the pole,
E'en yet a boy, his herds you ftole;
With angry voice the threat'ning pow'r
Bad thee thy fraudful prey reftore;
But of his quiver too beguil'd,
Pleas'd with the theft, Apollo fmil'd.
You were the wealthy Priam's guide,
When fafe from Agamemnon's pride,
Through hoftile camps, which round him fpread
Their watchful fires, his way he fped.
Unfpotted fpirits you confign
To blifsful feats and joys divine;
And, pow'rful, with thy golden wand,
The light, unbodied crowd command:
Thus grateful does thy office prove
To gods below, and gods above. *Francis.*

This ode contains the fubftance of a very long hymn to Mercury, attributed to Homer. Almoft all the ancient poets relate the manner in which the Grecian Mercury difcovered the lyre; and tell us that it was an inftrument with feven ftrings; a circumftance which makes it effentially different from that faid to have been invented by the Egyptian Mercury, which had but three. However, there have been many claimants befides Mercury to the feven-ftringed lyre. See Lyre.

His moft magnificent temple was on mount Cylene, in Arcadia. He is defcribed by the poets as a fair beardlefs youth, with flaxen hair, lively blue eyes, and a fmiling countenance. He has wings fixed to his cap and fandals, and holds the caduceus (or ftaff furrounded with ferpents with two wings on the top) in his hand; and is frequently reprefented with a purfe, to fhow that he was the god of gain. The animals facred to him, were the dog, the goat, and the cock. In all the facrifices offered to him, the tongues of the victims were burnt; and thofe who efcaped imminent danger, facrificed to him a calf with milk and honey.

Mercury, ☿ in aftronomy. See Astronomy, n° 4, 20, 44, 108, 112.

Mercury, in heraldry, a term ufed in blazoning by planets, for the purple colour ufed in the arms of fovereign princes.

MERCY-seat, in Jewifh antiquity. See Propitiatory.

MERGANSER. See Mergus.

MERGUS, in ornithology, a genus of birds of the order of anferes; diftinguifhed by having the beak of a cylindrical figure, and hooked at the extremities, and its denticulations of a fubulated form. There are fix fpecies.

1. The cucullatus, or crefted diver of Catefby, has a globular creft, white on each fide; and the body is brown above, and white below. It is a native of America. See Plate CLXXVI. fig. 4.

2. The merganfer, or goofander, is a native of Europe. Thefe birds frequent our rivers and other frefh waters, efpecially in hard winters; they are great divers, and live on fifh. They are never feen in the fouthern parts of Great Britain during fummer; when they retire far north to breed; for in that feafon they have been fhot in the Hebrides. They are uncommonly rank, and fcarce eatable. The male weighs four pounds: its length is two feet four inches; the breadth three feet two. The bill is three inches long, narrow, and finely toothed or ferrated; the colour of that and of the irides is red. The *dun diver*, or female, is lefs than the male: the head and upper part of the neck is ferruginous; the throat white: the feathers on the hind part are long, and form a pendent creft: the back, the coverts of the wings, and the tail, are of a deep afh-colour: the greater quill-feathers are black, the leffer white; the breaft and middle of the belly are white, tinged with yellow.

3. The ferrator, or redbreafted merganfer, weighs about two pounds: the length is one foot nine inches, the breadth two feet feven; the bill is three inches long; the lower mandible red; the upper dufky; the irides a purplifh red: head and throat a fine changeable black and green: on the former a long pendent creft of the fame colour; the tail fhort and brown; the legs orange-coloured. The head and upper part of the female are of a deep rufh-colour, and the tail afh-coloured. Thefe birds breed in the northern parts of Great Britain.

4. The cafter has a crefted afh-coloured head, a white throat, and a black bill and legs. It inhabits the fouth of Europe.

5. The albellus, or fmew, weighs about 34 ounces: the length 18 inches, the breadth 26; the bill is near two inches long, and of a lead colour; the head is adorned with a long creft, white above, and black beneath: the head, neck, and whole under part of the body, are of a pure white; the tail is of a deep afh-colour, the legs a bluifh grey. The female, or *lough-diver*,

diver, is lefs then the male: the back, the fcapulars, and the tail are dufky; as, alfo the tail: the belly white.

6. The minutus, or redheaded fmew, weighs about 15 ounces; the length one foot four inches, the breadth one foot eleven: the bill is of a lead colour; the head flightly crefted, and of a ruft colour: the hind part of the neck is of a deep grey, the forepart clouded with a lighter colour of the fame kind: the back and tail are of a dufky afh-colour, the legs of a pale afh-colour.—It is a native of Europe.

MERIDIAN, in geography, a great circle fuppofed to be drawn through any part on the furface of the earth, and the two poles; and to which the fun is always perpendicular at noon.—In aftronomy, the circle is fuppofed to be in the heavens, and exactly perpendicular to the terreftrial one.

MERIONETHSIRE, a county of North-Wales, on the fouth has the county of Cardigan, on the north thofe of Carnarvon and Denbigh, on the eaft thofe of Montgomery and Denbigh, and on the weft the Irifh fea. Its length is about 35 miles, its breadth 25, and its circumference 108; containing between 4 and 50,000 acres, 637 parifhes, 3 towns, 26 rivers, and about 17000 inhabitants. The air of this county, which is more encumbered with mountains than any other in Wales, is exceeding fharp and bleak; and would be very unwholefome, if the vapours from the Irifh fea were not in a great meafure difperfed by the high winds to which this county is fubject. The foil is very rocky and barren; except in the valleys, which yield good corn, and pafture for cattle and fheep. As the country is fo mountainous, the inhabitants apply themfelves chiefly to grazing, keeping vaft flocks of fheep, deer, and goats, in the mountains, and living much upon butter, cheefe, fowl, and fifh, efpecially herrings. They have but little corn, and their black cattle are generally fold to the Englifh. The chief rivers of the county are the Dyffi or Tovy, the Avon, the Drwrydh, and the Dee, which laft runs through the lake called *Lhyn Tigid* or *Pimble Meer*, without mixing its waters with thofe of the lake, as is fuppofed: for the falmon, with which the river abounds, are never taken out of the main ftream; and the givineads, a fifh peculiar to the lake, are never found in it. This lake is very large; and winds, it is pretended, will make it overflow, but land-floods never. The fifh in the lakes, and the herbs on the rocks and mountains here, like thofe in Caernarvonfhire and other hilly parts of Wales, are faid to be much the fame as thofe of the Alps. This county lies in the diocefe of Bangor: it fends no member to parliament, except a knight of the fhire; for it has no towns of any note.—Dr Campbell is of opinion that this county is capable of much improvement, if the inhabitants underftood their own intereft and were induftrious.

MERIT, fignifies defert. This term is more particularly applied to fignify the moral goodnefs of the actions of men, and the rewards to which thofe actions intitle them.

MERLIN (Ambrofe), a famous Englifh poet, and reputed prophet, flourifhed at the end of the 5th century. Many furprifing and ridiculous thing are related of him. Several Englifh authors have reprefented him as the fon of an incubus, and as tranfporting from Ireland to England the great ftones which form Stonehenge on Salifbury plain. Extravagant prophecies and other works are alfo attributed to him, on which fome authors have written commentaries.

MERLIN, in ornithology. See FALCO.

MERLON, in fortification, is that part of a parapet which is terminated by two embrafures of a battery.

MERMAID, or MERMAN, a fea-creature frequently talked of, fuppofed half human and half a fifh.

However naturalifts may doubt of the reality of *mermen* or *mermaids*, we have teftimony enough to eftablifh it; though, how far thefe teftimonies may be authentic, we cannot take upon us to fay. In the year 1187, as Laray informs us, fuch a monfter was fifhed up in the county of Suffolk, and kept by the governor for fix months. It bore fo near a conformity with man, that nothing feemed wanting to it but fpeech. One day it took the opportunity of making its efcape; and, plunging into the fea, was never more heard of. *Hift. de Angleterre*, P. I. p. 403.

In the year 1430, after a huge tempeft, which broke down the dikes in Holland, and made way for the fea into the meadows, &c. fome girls of the town of Edam in Weft-Freezeland, going in a boat to milk their cows, perceived a mermaid embaraffed in the mud, with a very little water. They took it into their boat, and brought it with them to Edam, dreffed it in womens apparel, and taught it to fpin. It fed like one of them, but could never be brought to offer at fpeech. Some time afterwards it was brought to Haerlem, where it lived for fome years, though ftill fhowing an inclination to the water. Parival relates that they had given it fome notion of a Deity, and that it made its reverences very devoutly whenever it paffed by a crucifix. *Delices de Hollande*.

In the year 1560, near the ifland of Manar, on the weftern coaft of the ifland of Ceylon, fome fifhermen brought up, at one draught of a net, feven mer men and maids; of which, feveral Jefuits, and among the reft F. Hen. Henriques, and Dimas Bofquez phyficians to the viceroy of Goa, were witneffes. The phyfician, who examined them with a great deal of care, and made diffection thereof, afferts, that all the parts both internal and external were found perfectly conformable to thofe of men. See the *Hift. de la compagnie de Jefus*, P. II. T. IV. n° 276. where the relation is given at length.

We have another account of a merman, near the great rock called *Diamond*, on the coaft of Martinico. The perfons who faw it, gave in a precife defcription of it before a notary. They affirmed that they faw it wipe its hand over its face, and even heard it blow its nofe.

Another creature of the fame fpecies was caught in the Baltic in the year 1531, and fent as a prefent to Sigifmond king of Poland, with whom it lived three days, and was feen by all the court. Another very young one was taken near Rocca de Sintra, as related by Damian Goes.

The king of Portugal and the grand mafter of the order of St James, are faid to have had a fuit at law to determine which party thefe monfters belong to.

In Pontopidan's Natural Hiftory of Norway, alfo, we we have accounts of mermaids; but not more remarkable or any way better attested than the above.

MERNS, or Kincardinshire, a county of Scotland, stretching 27 miles in length, and 20 in breadth, is bounded on the east by the German ocean, on the south by the river of North Esk, on the west by Angus, and on the north by the river Dee and Aberdeenshire. The country is pretty plain and level, fruitful in corn and pasturage, producing an infinite number of fir-trees, besides a great number of agreeable plantations; and along the sea-coasts there are many convenient creeks and harbours.—The people are Lowlanders, civil, hospitable, and industrious.—The name *Merns* is by some derived from that of a valiant nobleman, who, subduing the country, received it in reward from Kenneth II. Cambden supposes it to retain part of the ancient name of *Vernicones*. The other name is derived from *Kincardin*, its ancient capital, now an inconsiderable village. The stocking-trade employs the natives from the banks of the Dee to Stone-hive; from thence to the Northesk they are wholly employed in weaving.

MEROE, (anc. geog.), an island of Ethiopia beyond Egypt, in the Nile; with a cognominal town, the metropolis of the Ethiopians. Here the shadow is said to decrease twice a-year, viz. when the sun is in the 18th degree of Taurus and in the 14th of Leo, (Pliny). Josephus says, that its ancient name was *Saba*; but changed to *Meroe* by Cambyses, either after his sister or after his consort, who died there, (Strabo). All the ancients represent *Meroe* as an island, but in modern times it is a peninsula; to which greater credit is to be given, as more accurate than the ancient accounts.

MEROPS, in ornithology, a genus belonging to the order of picæ. The bill is crooked, flat, and carinated; the tongue is jagged at the point; and the feet are of the walking kind. There are six species, viz. 1. The apiaster, or bee-eater, has an iron-coloured back; the belly and tail are of a bluish green; and the throat is yellow. It inhabits the south of Europe. 2. The viridis, or Indian bee-eater, is green, with a black belt on the breast; and the throat and tail are black. 3. The congener is yellowish, with a green rump. It inhabits the south of Europe. 4. The superciliosus is green, with a white line both above and below the eyes, and a yellow throat. It is found in Madagascar. 5. The cinereus is variegated with red and yellow, with the two longest quill-feathers of the tail red. It is a native of America. 6. The caser is grey, with a very long tail. It is a native of Ethiopia.

MERSE, a county of Scotland, called also *Berwickshire*. This last name it derives from the town of Berwick, which was the head of the shire before it fell into the hands of the English, and obtained the appellation of *Mers* or *March*, because it was one of the borders towards England. It is washed on the south and east by the river Tweed and the German Ocean, bounded on the west by Tweedale, and on the north by Lothian. It extends 24 miles from east to west, and the breadth amounts to 16. The face of the country is rough and irregular, exhibiting hills, moors, and mosses, with intermediate valleys, which are pleasant and fruitful. It is watered by many streams; and particularly by the famous Tweed, which, rising from the same hills that gave birth to the Clyde and Annan, runs with a rapid course thro' Tweedale Forest and Teviotdale, and after a course of 50 miles disembogues itself into the German Ocean. Notwithstanding the length of its course, it is not navigable above Berwick, where there is a noble bridge over it, consisting of 15 arches: there was another at Melross, where nothing but the piers now remain. A third, of five arches, is maintained at Peebles; and a fourth has some time ago been built at Kelso. The shire of Berwick is generally distinguished into the three divisions of Mers, Lammermuir, and Lauderdale. The Mers is low, pleasant, and tolerably fruitful in corn. Lammermuir is a hilly country, abounding with game, and yielding good pasture for sheep and black cattle. Lauderdale is a tract of land lying on each side of the river Lauder, agreeably varied with hill, dale, and forest, producing good store of corn and pasturage, and giving the title of earl to the family of Maitland: but the most fruitful and populous parts of Berwickshire, are those that lie along the Tweed, and on both sides of the lesser rivers White Water, Black Water, and Eye. The seats of noblemen and gentlemen abound in this county. Berwick was the chief town until it fell into the hands of the English, and was annexed to their monarchy in the reign of King Edward IV. At present the principal town is Duns.

MERSENNE (Marin), in Latin *Mersennus*, a learned French author, born at Oysé, in the province of Maine, anno 588. He studied at La Flêche at the same time with Des Cartes; with whom he contracted a strict friendship, which lasted till death. He afterwards went to Paris, and studied at the Sorbonne, and in 1611 entered himself among the Minims. He became well skilled in Hebrew, philosophy, and Mathematics. He was of a tranquil, sincere, and engaging temper; and was universally esteemed by persons illustrious for their birth, their dignity, and their learning. He taught philosophy and divinity in the convent of Nevers, and at length became superior of that convent; but being willing to apply himself to study with more freedom, he resigned all the posts he enjoyed in his order, and travelled into Germany, Italy, and the Netherlands. He wrote a great number of excellent works; the principal of which are, 1. *Quæstiones celeberrimæ in Genesim.* 2. *Harmonicorum libri.* 3. *De sonorum naturâ, causis, & effectibus.* 4. *Cogitata physico-mathematica.* 5. *La verité des Sciences.* 6. *Les questions innouies.* He died at Paris in 1648. He had the reputation of being one of the best men of his age. No person was more curious in penetrating into the secrets of nature, and carrying all the arts and sciences to their utmost perfection. He was in a manner the centre of all the men of learning, by the mutual correspondence which he managed between them. He omitted no means to engage them to publish their works; and the world is obliged to him for several excellent discoveries, which, had it not been for him, would perhaps have been lost.

MERULA (George), an Italian of extraordinary parts and learning, born at Alexandria in the duchy of Milan about the year 1420. He taught youth at Venice and Milan for 40 years, and laboured abundantly ly in restoring and correcting ancient authors. He wrote, and addressed to Lewis Sforza, *Antiquitates Vicecomitum;* or "The actions of the Dukes of Milan," in 10 books; with some other things in the same way. His death, in 1494, is said not to have grieved any body; as he lived in a state of war with, and abused, almost all his cotemporary scholars.

MERULA (Paul), born at Dort in Holland, a famous lawyer, historian, and linguist, was professor of history in the university of Leyden after Lipsius. He wrote, 1. Commentaries on Ennius. 2. The life of Erasmus and Junius. 3. A cosmography. 4. A treatise of law; and died in 1607.

MERUS, (anc. geog.), a mountain of the Hither India, hanging over the city Nyssa, built by Bacchus, and situated between the rivers Cophen and Indus. The name, denoting the *thigh*, gave rise to the fable of Bacchus being inserted into Jupiter's thigh, and being born twice; because in this mountain he and his army are said to have been preserved, when disease and pestilence raged in the plains below.

MERA-DE-ASTA, formerly a large town of Andalusia, seated on the river Guadaleta, between Arcos and Xeres de la Frontera; but now only a large heap of ruins. Here the Arabs conquered Roderick the last king of the Goths, and by that victory became masters of Spain in 713.

MESCHED, a considerable town of Persia, and in the province of Khorassan; fortified with several towers, and famous for the magnificent sepulchre of Iman Risa, of the family of Ali, to whom the Persians pay great devotion. It is seated on a mountain near this town, in which are fine turquoise-stones; in E. Long. 59. 25. N. Lat. 37. 0.

MESEMBRYANTHEMUM, FIG-MARIGOLD; a genus of the pentagynia order, belonging to the pentandria class of plants. There are between 40 and 50 species; all African plants, from the Cape of Good Hope; near 40 of which are retained in our gardens for variety. Of these only one is annual, and the most remarkable of them all. It is called the *crystallium, diamond ficoides*, or *ice-plant*. It rises with a short, thick, succulent stalk, dividing low into many trailing, very spreading, succulent branches, bespangled all over with icy pimples; very pellucid and glittering; oval, undulate, alternate, papulose or pimply, glittering leaves; and from the sides of the branches, numerous, almost close fitting, white flowers, tinged with red or crimson; succeeded by plenty of seed in autumn. This singular and curious plant, being closely covered with large pellucid pimples, full of moisture shining brilliantly like diamonds, is in great esteem. It is a very tender plant while young; and is raised annually from seed by means of hot-beds. In June it will endure the open air till October, when it perishes; but if placed in a hot-house in autumn, it will often live all winter. It is commonly planted in pots for the conveniency of removing from place to place; but if planted in the full ground, it grows considerably stronger, even to luxuriance: however, when confined in pots, it flowers more abundantly.

The other species are mostly durable in stem and foliage. Some are shrubby; others pendulous, with loose straggling stems, and branches inclining to the ground; while others have no stalks at all: their leaves are universally very thick, succulent, fleshy; and of many various shapes, situations, and directions; while some are curiously punctured, or dotted with transparent points, and some have pellucid pimples, as already mentioned: they afford a very agreeable variety, at all times in the year, and merit a place in every collection. They are green-house plants, and are propagated by cuttings of their stalks and branches.

MESENTERY, in anatomy. See there, n° 355.

MESENTERITIS, or *Inflammation of the* MESENTERY. See MEDICINE, n° 296.

MESOCOLON, in anatomy. See there, n° 355, c.

MESOLOGARITHMS, according to Kepler, are the logarithms of the co-sines and co-tangents; the former of which were called by Lord Napier *anti-logarithms*, and the latter *differentials*.

MESOPOTAMIA, the ancient name of the province of DIARBECK, in Turkey in Asia. It is situated between the rivers Euphrates and Tigris; having Assyria on the east, Armenia on the north, Syria on the west, and Arabia Deserta with Babylonia on the south. In Scripture it is called *Padan Aram*.

MESOPTERYGIUS, in ichthyology, a term applied to such fishes as have only one back-fin; and that situated in the middle of the back.

MESPILUS, the MEDLAR; a genus of the pentagynia order, belonging to the icosandria class of plants. There are seven species, *viz.*

1. The Germanica, German mespilus, or common medlar, rises with a deformed tree-stem, branching irregularly 15 or 20 feet high; spear-shaped leaves, downy underneath; and large close-fitting, white flowers, singly from the sides of the branches; succeeded by large roundish brown fruit, the size of middling apples, which ripen in October, but are not eatable till beginning to decay. The varieties are, common great German medlar—smaller Nottingham medlar—pear-shaped Italian medlar. This species and varieties are all cultivated in the English gardens for the fruit: but the German or Dutch medlar, and the Nottingham kind, are the most common; and the latter of which two, though a smaller fruit, is rather preferable for richness and poignancy of flavour. These kinds of fruit are never eatable until they begin to rot; for when firm and sound, they are of a singularly austere disagreeable taste; yet having lain some time after being gathered, till they begin to assume a state of decay and become soft, they acquire a delicious flavour, extremely agreeable to many, though to others altogether unpalatable.

All the sorts ripen in the latter end of October, or beginning of November; when being gathered, some should be laid in moist bran, in several layers, to forward their decay; others on straw in the fruitery: those in the bran will begin to be ready for use in about a fortnight, and those laid on straw will come gradually forward in succession.

2. The arbutifolia, arbutus-leaved mespilus, hath a shrubby stem, branching erectly five or six feet high; lanceolate, crenated, alternate leaves, downy underneath; and from the sides and ends of the branches, small white flowers in clusters; succeeded by small, roundish, purple fruit, like haws.

3. The amelanchier, or shrubby medlar, with black fruit, rises with several shrubby, slender, hairy stems, branching

branching moderately about four feet high, having purplifh branches; oval, ferrated leaves, downy underneath; and fmall white flowers, in clufters at the ends of the branches; fucceeded by fmall black fruit.

4. The chamæ-mefpilus, or dwarf medlar, commonly called *baftard quince*, hath a fhrubby, flender, fmooth ftem, branching weakly four or five feet high, having purplifh branches; oval, ferrated, fmooth leaves, on long foot-ftalks; and from the axillas, purple flowers, collected into round heads, with narrow, purplifh, deciduous bracteæ; fucceeded by fmall red fruit.

5. The cotoneafter, commonly called *dwarf quince*, rifes with a fhrubby, fmooth ftem, branching four or five feet high, the branches flender and reddifh; oval entire leaves on fhort foot-ftalks; and from the axillas, fmall clofe-fitting purple flowers, two or three together; fucceeded by fmall, roundifh, bright-red fruit.

6. The Canadenfis, Canada fnowy mefpilus, hath a fhrubby, fmooth ftem, branching four or five feet high, with fmooth, purplifh branches; oval-oblong, ferrated, fmooth leaves, on long footftalks; and all the branches terminated by clufters of fnowy-white flowers; fucceeded by fmall, purplifh fruit, like haws.

3. The pyracantha, or ever-green thorn, rifes with a fhrubby, fpinous ftem, branching diffufely 12 or 14 feet high, the branches flender and flexible, with a dark-greenifh bark, armed with long fharp fpines; fpear-fhaped-oval, crenated, ever-green leaves; and all the fhoots terminated by numerous clufters of whitifh flowers; fucceeded by large bunches of beautiful red berries, remaining all winter, and exhibiting a very ornamental appearance.

All thefe feven fpecies of mefpilus are of the tree and fhrub kind; the firft fix forts are deciduous, the feventh an ever-green: the leaves are univerfally fimple; thofe of the mefpilus Germanica very large, the others moftly of moderate fize, and which in moft of the forts grow upon fhort foot-ftalks. They all flower abundantly every fummer, the flowers univerfally hermaphrodite, and confifting each of five large roundifh petals, 20 ftamina, and five ftyles. They are all very hardy, and fucceed in any common foil and fituation, and their propagation and culture is very eafy.

The firft fort and varieties are cultivated as fruit-trees, principally as ftandards, fometimes alfo as efpaliers for variety. The other fpecies are very proper furniture for any ornamental plantation, where they will make an agreeable variety with their different foliage; and their flowers make a fine appearance, as alfo their fruit in autumn and winter, which, if not devoured by birds, remain long on the branches, and afford a fine variety in thofe feafons. The pyracantha, being rather of flexible growth, is moft commonly trained againft walls or the fronts of houfes, both for the fupport of its flexible branches, and that it may exhibit its berries more ornamentally.

When it is defigned to have any of the common medlars as fruit-trees, they may be trained either as dwarfs, for dwarf ftandards, or for efpaliers, or trained as half or full ftandards; and managed in either of thofe modes of training nearly as other fruit-trees, particularly the apple and pear; and are raifed either by feed, by grafting, or by budding, but either of the two latter methods are the moft certain for continuing the forts without variation: obferving, after fhortening their firft fhoots from the graft or bud, where it fhall feem neceffary to force out a proper fupply of wood to form a head, to train the branches afterwards principally at full length, and let the ftandards branch out in their own way.

MESS, in a military fenfe, implies a number of foldiers, who, by laying away a certain proportion of their pay towards provifions, mefs together: fix or eight is generally the number of each mefs. Experience proves, that nothing contributes more to the health of a foldier, than a regular and well-chofen diet, and his being obliged every day to boil the pot: it corrects drunkennefs, and in a great meafure prevents gaming, and thereby defertion.

MESSANA, (anc. geog.), the firft town of Sicily on croffing over from Italy, fituate on the ftrait now called the *Faro*, (Italicus). Anciently called *Zancle*, according to Diodorus Siculus, from king Zanclus; or, according to others, from the Sicilian term *Zanclon*, denoting a fickle, alluding to the curvity of the coaft: a name appropriated by the poets; and hence *Zanclæi*, the people, (Herodotus, Paufanias). The other name *Meffana* is from the *Meffenii* of Peloponnefus, (Strabo). Thucydides afcribes its origin to Anaxilas the Meffenian, tyrant of Rhegium, who received all comers, calling the town after the name of his country. The Greeks always call it *Meffene;* the Romans *Meffana* conftantly, to diftinguifh it from *Meffene* of Peloponnefus. Now MESSINA.

MESSENA, or MESSENE, an inland town, and the capital of Meffenia, a country of Peloponnefus; erroneoufly placed by Ptolemy on the coaft. It was built by Epaminondas, who recalled all the Meffenian exiles, and gave the town the name of *Meffene*. A place vying in point of ftrength and fituation with Corinth, according to Strabo; and therefore Demetrius Pharius advifed Philip, father of Perfeus, that if he wanted to have Peloponnefus in his power, he fhould make himfelf mafter of thefe two towns, as thus he would have the ox by both horns.

MESSENIA, a country in the fouth of Peloponnefus, moftly maritime, fituate between Elea to the weft, and Laconica to the eaft. Anciently a part of Laconica under Menelaus, and called *Meffene* by Homer; interpreted by the fcholiaft, *Meffenæa Regia*. *Meffenii*, the people, reduced to a ftate of flavery and fubjection by the Spartans; *Meffenius*, the epithet.

This country is famous in hiftory, on account of the refiftance made by the Meffenians againft the Spartans, and the exploits of their hero Ariftomenes. The firft hoftilities commenced about the year 652 B. C. on what occafion is uncertain. Though the Meffenians were inferior in the knowledge of the art of war to the Spartans; yet, by keeping for fome time on the defenfive, they improved fo much, that in three years time they found themfelves in a capacity of giving battle to their enemies in the open field; nor did they appear to be in any degree inferior either in courage or conduct: the war was therefore protracted, with various fuccefs, on both fides. At laft, both confulted the oracle at Delphi; and received for anfwer, "that whoever fhould firft dedicate 100 tripods in the temple of Jupiter at Ithome, a ftrong-hold of the Meffenians, fhould be mafters of

Meſſenia. the country." The inhabitants of Meſſenia, on hearing this, having no money to make the tripods of braſs, fell to cutting them out in wood; but before this could be accompliſhed, a Spartan having got into the city by ſtratagem, dedicated 100 little tripods of clay: which threw the Meſſenians into ſuch deſpair, that they at laſt ſubmitted to the Spartans.

The new ſubjects of Sparta were treated with the utmoſt barbarity by theſe cruel tyrants; ſo that in 685 B. C. a new war commenced under Ariſtomenes, a man of unconquerable valour, and enthuſiaſtically fond of liberty. He perceived that the Argives and Arcadians, who were called the *allies* of the Lacedæmonians, adhered to them only through fear of their power; but that in reality they hated them, and wiſhed to revenge the injuries they had done them. To theſe Ariſtomenes applied; and receiving an anſwer conformable to his wiſhes, he engaged his countrymen unanimouſly to take up arms. About a year after the revolt began, and before either party had received any auxiliaries, the Spartans and Meſſenians met at a village called *Deræ*, where an obſtinate engagement enſued. Ariſtomenes was conceived to have performed more than mortal atchievements: in gratitude therefore, reſpect being alſo had to his royal deſcent, his countrymen unanimouſly ſaluted him *king;* which title he modeſtly waved, alleging, that he took up arms to ſet them free, and not to make himſelf great: he conſented, however, to accept the title of *general*, with a power of doing whatſoever he thought requiſite for the ſervice of the public. Knowing well the ſuperſtition of the age in which he lived, he reſolved to intimidate the Spartans, by ſhowing them what he was ſure they would take for an ill omen. Diſguiſing himſelf therefore, he went privately to the city, where, in the night, he hung up a ſhield on the wall of the temple of Minerva, with this inſcription: *Ariſtomenes dedicates this, out of the ſpoils of the Spartans, to the goddeſs.* It was eaſily perceived that this war would be both long and bloody; the Lacedæmonians therefore ſent deputies to Delphi, to inquire of the oracle concerning its event: the anſwer they received was, *That it behoved the Spartans to ſeek a leader from Athens.* The Athenians, naturally envious of the Spartans, granted their requeſt indeed, but in ſuch a manner as manifeſted their ſpite; for they ſent them for a general Tyrtæus, a ſchoolmaſter and poet, lame of one foot, and who was ſuſpected to be a little out of his wits. But here their ſkill failed them; for this captain, notwithſtanding his deſpicable appearance, proved of great conſequence to Sparta, teaching them how to uſe good, and how to bear up under evil fortune.

In the mean time, Ariſtomenes had drawn together a mighty army, the Eleans, Argives, Sicyonians, and Arcadians, having ſent troops to his aſſiſtance; the Spartans in this, as in the former war, having no ally but Corinth. The Spartan kings, according to the cuſtom of their city, no ſooner took the field, than, notwithſtanding their inferiority in number, they offered the enemy battle, which Ariſtomenes readily accepted.—It was long, obſtinate, and bloody; but in the end the Meſſenians were victorious, and the Lacedæmonians put to flight, with a great ſlaughter. It is ſcarce to be conceived how much the Spartans were ſtruck with this defeat: they grew weary of the war, diſſatisfied with their kings, diffident of their own power, and, in a word, ſunk into a ſtate of general uneaſineſs and want of ſpirit. It was now that the Athenian general convinced them, that he was capable of fulfilling all the promiſes of the oracle; he encouraged them by his poems, directed them by his counſels, and recruited their broken armies with choſen men from among the Helotes. Ariſtomenes, on the other hand, acted with no leſs prudence and vigour. He thought it not enough to reſtore the reputation of the Meſſenians, if he did not alſo reſtore their wealth and power: he therefore taught them to act offenſively againſt their enemies; and, entering the territories of Sparta, he took and plundered Pharæ, a conſiderable borough in Laconia, putting all ſuch as made any reſiſtance to the ſword, carrying off at the ſame time an immenſe booty. This, however, was an injury which the Spartans could not brook with patience; they therefore ſent immediately a body of forces to overtake the Meſſenians, which accordingly they did: but Ariſtomenes routed theſe purſuers, and continued to make a mighty ſlaughter of them, till ſuch time as he was diſabled by having a ſpear thruſt in his ſide, which occaſioned his being carried out of the battle. His cure, which took up ſome time, being finiſhed, he reſolved to carry the war even to the gates of Sparta; and to that purpoſe raiſed a very great army: but, whether he found his deſign impracticable, or was really diverted by ſome dream, he gave out, that Caſtor and Pollux, with their ſiſter Helena, had appeared to him, and commanded him to deſiſt. A ſhort time after this retreat, going with a ſmall party to make an incurſion, and attempting to take priſoners ſome women who were celebrating religious rites near Egila, a village in Laconia, thoſe zealous matrons fell upon him and his ſoldiers with ſuch fury, that they put them to flight, and took him priſoner: however, he ſoon afterwards made his eſcape, and rejoined his forces. In the third year of the war, the Spartans, with a great force, entered Meſſenia, whither Ariſtocrates king of Arcadia was come, with a great body of troops, to the aſſiſtance of his allies: Ariſtomenes therefore made no difficulty of fighting when the Spartans approached; but they entering privately into a negociation with Ariſtocrates, engaged him with bribes and promiſes to betray his confederates. When the battle began, the deceitful Arcadian repreſented to the forces under his command, the mighty danger they were in, and the great difficulty there would be of retreating into their own country, in caſe the battle ſhould be loſt: he then pretended, that the ſacrifices were ominous; and, having terrified his Arcadians into the diſpoſition of mind fitteſt to ſerve his purpoſe, he not only drew them off from both wings, but, in his flight, forced through the Meſſenian ranks, and put them too in confuſion. Ariſtomenes and his troops, however, drew themſelves into cloſe order, that they might defend themſelves the beſt they could: and indeed they had need of all their valour and ſkill; for the Lacedæmonians, who expected this event, immediately attacked and ſurrounded them on all ſides. Fortune was, on this occaſion, too powerful either for the courage or the conduct of the Meſſenians; ſo that, notwithſtand-

Meſſenia. ing their utmoſt efforts, moſt of their army were cut to pieces, and, amongſt them, the chief of their nobility. Ariſtomenes, with the poor remains of his ſhattered forres, retired as well as he could; and, perceiving that it was now impoſſible to maintain the war againſt the Lacedæmonians upon equal terms, he exhorted his countrymen to fortify mount Era, and to make the beſt diſpoſitions poſſible for a long defence. He likewiſe placed garriſons in Pylus and Methone on the ſea-coaſts; and to theſe three places he gathered all the inhabitants, leaving the reſt of Meſſenia to the mercy of the Spartans. They, on the other hand, looked on the war as now in a manner finiſhed; for which reaſon they divided the lands among their citizens, and cauſed them to be carefully cultivated, while they beſieged Era. But Ariſtomenes quickly convinced them that the war was far from being over: he choſe out of all the Meſſenians 300 men, with whom he ravaged all the adjacent country; carried off a prodigious booty; and, when Meſſenia could no longer ſupply the wants of his garriſon, penetrated into Laconia, and bore away corn, wine, cattle, and whatever elſe was neceſſary to the ſubſiſtence of his countrymen ſhut up in Era: ſo that at laſt the Spartans were conſtrained to iſſue a proclamation, forbidding the cultivation, not only of the Meſſenian territory in their hands, but alſo of Laconia in its vicinity; whereby they diſtreſſed themſelves more than their enemies, inducing at laſt a famine in Sparta itſelf, which brought with it its uſual attendant, ſedition. Here again all things had gone wrong, if the wiſdom of the poet Tyrtæus had not ſupported the Spartan courage; nor was it without much difficulty that he influenced them to continue the blockade of Era, and to maintain a flying camp for the ſecurity of the country.

Ariſtomenes, in ſpite of all theſe precautions, committed terrible depredations with his ſmall corps of 300 men. Amongſt other places which he plundered, the city of Amyclæ was one; from whence he carried not only a great quantity of riches, but alſo many carriages laden with proviſions. The kings of Sparta lying with their troops in its neighbourhood, as ſoon as they heard of this expedition, marched after Ariſtomenes with the utmoſt diligence; and, as the Meſſenians were incumbered with their booty, came up with them before he could reach Era. In this ſituation of things, Ariſtomenes, prompted rather by deſpair than prudence, diſpoſed his troops in order of battle; and, notwithſtanding they were ſo few, made a long and vigorous reſiſtance againſt the whole Lacedæmonian army. At length, however, numbers prevailed: the greateſt part of the Meſſenians were ſlain on the ſpot; and Ariſtomenes, with about 50 of his men who ſurvived the ſlaughter, were taken priſoners; that chief having received ſo many wounds, that he was ſenſeleſs when they carried him away. The Lacedæmonians expreſſed the loudeſt joy at the ſight of this illuſtrious captive; who, for ſo many years, by his ſingle abilities, had enabled his exhauſted country to defend itſelf againſt the whole force of Sparta. When he was recovered of his wounds, they decreed him and all his fellow-priſoners to be thrown together into a deep cavern, which was the common puniſhment of the loweſt kind of offenders. This judgment was executed with the utmoſt ſeverity, excepting that Ariſtomenes had leave to put on his armour. Three days he continued in this diſmal place, lying upon, and covered over with, dead bodies. The third day, he was almoſt famiſhed through want of food, and almoſt poiſoned with the ſtench of corrupted carcaſes, when he heard a fox gnawing a body near him. Upon this he uncovered his face, and perceiving the fox juſt by him, he with one hand ſeized one of its hind-legs, and with the other defended his face, by catching hold of its jaw when it attempted to bite him. Following as well as he could his ſtraggling guide, the fox at laſt thruſt his head into a little hole; and Ariſtomenes then letting go his leg, he ſoon forced his way through, and opened a paſſage to the welcome rays of light, from which the noble Meſſenian had been ſo long debarred. Feeble as he was, Ariſtomenes wrought himſelf an outlet with his nails; and travelling by night with all the expedition he could, at length arrived ſafe at Era, to the great joy and amazement of his countrymen. When this news was firſt blazed abroad, the Spartans would have had it paſs for a fiction; but Ariſtomenes ſoon put the truth of it out of doubt, by falling on the poſts of the Corinthians, who, as allies of the Spartans, had a conſiderable body of troops before Era. Moſt of their officers, with a multitude of private men, he ſlew; pillaged their camp; and, in ſhort, did ſo much miſchief, that the Spartans, under the pretence of an approaching feſtival, agreed to a ceſſation of arms for 40 days, that they might have time to bury their dead. On this occaſion, Ariſtomenes for the ſecond time celebrated the *hecatomphonia*, or the ſacrifice appointed for thoſe who had killed 100 of the enemy with their own hands. He had performed the ſame before and after his ſecond battle; and he lived to do it a third time: which muſt appear wonderful to the reader, when he is informed, that, notwithſtanding this truce, certain Cretan archers in the ſervice of the Spartans, ſeized Ariſtomenes as he was walking without the walls, and carried him away a priſoner. There were nine of them in all; two of them immediately flew with the news to Sparta, and ſeven remained to guard their prize, whom they bound, and conducted to a lone cottage inhabited only by a widow and her daughter. It ſo fell out, that the young woman dreamt the night before, that ſhe ſaw a lion without claws, bound, and dragged along by wolves; and that ſhe having looſed his bonds, and given him claws, he immediately tore the wolves to pieces. As ſoon as Ariſtomenes came into the cottage, and her mother, who knew him, had told her who he was, ſhe inſtantly concluded that her dream was fulfilled; and therefore plied the Cretans with drink, and, when they were aſleep, took a poniard from one of them, cut the thongs with which Ariſtomenes was bound, and then put it into his hands. He preſently verified her viſion, by putting all his guards to death; and then carried her and her mother to Era, where, as a reward for her ſervice, he married the young woman to his ſon Gorgus, then about 18 years of age.

When Era had held out near eleven years, it fell into the hands of Sparta by an accident: the ſervant of one Empiramus, a Spartan commander, driving his maſter's cattle to drink at the river Neda, met frequently with the wife of a Meſſenian, whom he engaged

Meſſenia. engaged in an amour. This woman gave him notice, that her huſband's houſe was without the wall; ſo that he could come to it without danger, when the good man was abroad; and ſhe likewiſe gave him intelligence when her huſband was upon duty in the garriſon. The Spartan failed not to come at the time appointed; but they had not been long in bed before the huſhand returned, which put the houſe into great confuſion: the woman, however, ſecured her gallant; and then let in her huſband, whom ſhe received, in appearance, with great joy, inquiring again and again by what exceſs of good fortune ſhe was bleſſed with his return. The innocent Meſſenian told her, that Ariſtomenes being detained in his bed by a wound, the ſoldiers, knowing that he could not walk the rounds, had a grant to retire to their houſes, to avoid the inclemency of the ſeaſon. The Spartan no ſooner heard this, than he crept ſoftly out of doors, and haſtened away to carry the news to his maſter. It ſo happened, that the kings were at this time abſent from the camp, and Empiranus had the chief command of the army. As ſoon as he received this information, he ordered his army to begin its march, though it rained exceſſively, and there was no moon-light. The fellow guided them to the ford, and managed matters ſo well that they ſeized all the Meſſenian poſts: yet, after all, they were afraid to engage; darkneſs, an high wind, heavy rain, together with the dread of Ariſtomenes, keeping them quiet in the places they had ſeized. As ſoon as it was light, the attack began; and Era had been quickly taken, if only the men had defended it; but the women fought with ſuch fury, and, by their mingling in the fray, brought ſuch an acceſſion of numbers, as made the event doubtful. Three days and two nights this deſperate engagement laſted: at laſt, all hopes of preſerving the city being loſt, Ariſtomenes drew off his wearied troops. Early the fourth morning, he diſpoſed the women and children in the centre, the Meſſenian youth in the front and rear, the leſs able men in the main body: himſelf commanded the van; the rear-guard was brought up by Gorgus and Manticlus, the former the ſon of Ariſtomenes, the latter of Theocles, a Meſſenian of great merit, who fell with much glory in this attack, fighting valiantly in the cauſe of his country. When all things were ready, Ariſtomenes cauſed the laſt barrier to be thrown open; and, brandiſhing his ſpear, marched directly towards the Spartan troops, in order to force a paſſage. Empiramus, perceiving his intent, ordered his men to open to the right and left, and fairly gave them a paſſage; ſo that Ariſtomenes marched off in triumph, as it were, to Arcadia.

The Arcadians, when they heard that Era was taken, were very deſirous of ſuccouring their old confederates in this deep diſtreſs: they therefore intreated their king Ariſtocrates to lead them into Meſſenia. But he, corrupted by the Lacedæmonians, perſuaded them that it was too late; that the Meſſenians were all cut off; and that ſuch a ſtep would only expoſe them to the fury of the conquerors. When the thing appeared to be otherwiſe, and it was known that Ariſtomenes was on the frontiers of Arcadia, they went in crowds to carry him proviſions, and to teſtify their readineſs to afford him and thoſe under his command all the aſſiſtance in their power. Ariſtomenes deſired to be heard before a general aſſembly; which being accordingly convoked, he there opened one of the boldeſt and beſt-laid ſchemes recorded in hiſtory: he ſaid, that he had yet 500 undaunted ſoldiers, who, at his command, would undertake any thing; that it was very probable moſt of the Spartans were employed in pillaging Era, and that therefore he determined to march and ſurpriſe Sparta; which appeared ſo ſenſible, that all the aſſembly loudly commended his great capacity and unſhaken courage. Ariſtocrates, however, took care to betray him; having, by various pretences, retarded the execution of the project. The Arcadians, who began to ſuſpect him, waited for and ſurpriſed the meſſengers as they came back. They took the letters from him, and read them openly in the aſſembly. The purport of them was, that they acknowleged his great kindneſs both now and in the battle; and promiſed, that the Lacedæmonians would be grateful. As ſoon as the letters were read, the Arcadians fell to ſtoning their king, frequently calling upon the Meſſenians to aſſiſt them; which, however, they did not, waiting for Ariſtomenes's orders; who, far from triumphing in this ſpectacle, ſtood ſtill, with his eyes fixed on the ground, which he wet with his tears, his ſoul pierced with ſorrow to ſee a crowned head ſo ſhamefully and ſo deſervedly put to death. The Arcadians afterwards erected a monument over him, with an inſcription to perpetuate his infamy. As for the Meſſenians under the command of Gorgus and Manticlus, they paſſed over into Sicily; where they founded the city of Meſſene, one of the moſt famous in the iſland. Ariſtomenes remained, however, in Greece; where he married all his daughters, except the youngeſt, to perſons of great rank. A prince of Rhodes, inquiring of the oracle at Delphi whom he ſhould eſpouſe, that his ſubjects might be happy under his poſterity, was directed to marry the daughter of the moſt worthy of the Greeks; which anſwer was immediately underſtood to point at the virgin daughter of Ariſtomenes. Her therefore he demanded, and received; Ariſtomenes accompanying him back to his dominions, where he formed a ſcheme of uniting the Lydians and Medes againſt the Spartans, reſolving, with this view, to go into Media, and to the court of Sardis: but while he meditated theſe great things, death ſurpriſed him, and thereby freed Lacedæmon from the moſt formidable enemy ſhe ever had.

Meſſenia, Meſſengers. MESSENGERS, are certain officers chiefly employed under the direction of the ſecretaries of ſtate, and always in readineſs to be ſent with all kinds of diſpatches foreign and domeſtic. They alſo, by virtue of the ſecretaries warrants, take up perſons for high treaſon, or other offences againſt the ſtate. The priſoners they apprehend are uſually kept at their own houſes, for each of which they are allowed 6s. 8d. per day, by the government: and when they are ſent abroad, they have a ſtated allowance for their journey, viz. 30l. for going to Paris, Edinburgh, or Dublin; 25 l. for going to Holland, and to other places in the ſame proportion; part of which money is advanced, for the expence of their journey. Their ſtanding ſalary is 45 l. *per annum*; and their poſts, if purchaſed, are eſteemed worth 300l. The meſſengers wait 20 at a time, monthly, and are diſtributed as follows, viz. four at court, five at one ſecretary's office, five at another, two at the third for North Britain, three at the council-office, and one at the lord chamberlain's of the houſehold.

Messengers, in Scotland. See Law, n° clviii. 16.

Messengers *of the Exchequer*, are four officers who attend the exchequer, in the nature of purſuivants, and carry the lord treaſurer's letters, precepts, &c.

Messenger *of the Preſs*, a perſon who, by order of the court, ſearches printing-houſes, bookſellers ſhops, &c. in order to diſcover the printers or publiſhers of ſeditious books, pamphlets, &c.

MESSIAH, a word ſignifying one *anointed*, or inſtalled into an office by unction. It was uſual among the Jews to anoint kings, high-prieſts, and ſometimes prophets, at the deſignation or inſtallment of them, to ſignify emblematically the mental qualifications neceſſary for diſcharging theſe offices. Saul, David, Solomon, and Joaſh, kings of Judah, received the royal unction. Aaron and his ſons received the ſacerdotal, and Eliſha the diſciple of Elijah received the prophetic, unction.—The name Messiah, *Anointed*, or *Chriſt* (Χριστος), was given to the kings and high-prieſts of the Jews. The patriarchs and prophets are alſo called by the name of *Meſſiahs* or the *Lord's anointed*. See 1 Sam. xii. 3, 5. 1 Chron. xvi. 22. Pſ. cv. 15.

But this name Messiah was principally and by way of eminence given by the Jews to their expected great Deliverer, whoſe coming they ſtill vainly wait; and is a name the Chriſtians apply to Jesus *Chriſt*, in whom the prophecies relating to the Meſſiah were accompliſhed. The ſum of theſe prophecies is, That there ſhould be a glorious perſon, named *Meſſiah*, deſcended from Abraham, Iſaac, and Jacob, who ſhould be born at Bethlehem, of a virgin of the family of David, then in its decline, before the Jews ceaſed to be a people, while the ſecond temple was ſtanding, and about 500 years after Ezra's time; who, though appearing in mean circumſtances, ſhould be introduced by a remarkable forerunner, whoſe buſineſs it ſhould be to awaken the attention and expectation of the people. That this illuſtrious perſon called *Meſſiah*, ſhould himſelf be eminent for the piety, wiſdom, and benevolence of his character, and the miraculous works he ſhould perform: yet that, notwithſtanding all this, he ſhould be rejected and put to death by the Jews; but ſhould afterwards be raiſed from the dead, and exalted to a glorious throne, on which he ſhould through all generations continue to rule, at the ſame time making interceſſion for ſinners. That great calamities ſhould for the preſent be brought on the Jews for rejecting him: whereas the kingdom of God ſhould by his means be erected among the Gentiles, and diſperſe itſelf even unto the ends of the earth; wherever it came, deſtroying idolatry, and eſtabliſhing true religion and righteouſneſs. In a word, That this glorious Perſon ſhould be regarded by all who believed in him, as a divine teacher, an atoning ſacrifice, and a royal governor: by means of whom God would make a covenant with his people, very different from that made with Iſrael of old; in conſequence of which they ſhould be reſtored to, and eſtabliſhed in, the divine favour, and fixed in a ſtate of perpetual happineſs. See Jesus *Chriſt*, and Christianity.

MESSUAGE, Messuagium, in law, a dwelling-houſe, with ſome land adjoining aſſigned for its uſe. By the name of *meſſuage* may a garden, ſhop, mill, cottage, chamber, cellar, or the like, paſs.—In Scotland, *meſſuage* denotes what is called in England the *manor-houſe;* viz. the principal dwelling-houſe within any barony.

METACARPUS, in anatomy. See there, n° 54.

METALEPSIS. See Oratory, n° 59.

METALLIZATION, the natural proceſs by which metals are formed in the bowels of the earth. See Metallurgy, ſect. i.

METALS. See Metallurgy; and Chemistry, n° 43, 140, 192, 236, 278, 332, 348.

Metal, in heraldry. There are two metals uſed in heraldry, by way of colours, viz. gold and ſilver, in blazon called *or* and *argent*.

In the common painting of arms theſe metals are repreſented by white and yellow, which are the natural colours of thoſe metals. In engraving, gold is expreſſed by dotting the coat, &c. all over; and ſilver, by leaving it quite blank.

It is a general rule in heraldry, never to place metal upon metal, nor colour upon colour: ſo that if the field be of one of the metals, the bearing muſt be of ſome colour; and if the field be of any colour, the bearing muſt be of one of the metals.

METALLURGY.

METALLURGY, according to Boerhaave, comprehends the whole art of working metals, from the glebe or ore, to the utenſil; in which ſenſe, eſſaying, ſmelting, refining, parting, ſmithery, gilding, &c. are only branches of metallurgy. But, in the preſent work, Gilding, Parting, Purifying, Refining, Smithery, &c. are treated under their proper names. With others, therefore, we have choſen to reſtrain *Metallurgy* to thoſe operations required to ſeparate metals from their ores for the uſes of life. Theſe operations are of two kinds: the ſmaller, or Eſſaying; and the larger, or Smelting. But a particular deſcription of the ores themſelves ſeemed likewiſe neceſſary to be given; and to this place, too, we have referred a general account of metals, metallization, mines, and ores, as a proper introduction to the ſubject. Hence the following diviſion into three parts. The *firſt* treating, 1. Of metals and metallization. 2. Of mines and ores in general. 3. Of the pyrites. 4. Of the eſſaying of ores in general. The *ſecond*, Of the particular ores, and the methods of eſſaying them. The *third*, Of ſmelting of ores, or the methods of extracting metals from large quantities of ores for the purpoſes of commerce or manufacture.

PART I.

Sect. I. *Of Metals and Metallization*.

UNDER the general name *metal*, we comprehend here not only the metals properly ſo called, but alſo the *ſemimetals*, or all matters which have the eſſential metallic properties, which we ſhall here recount. Thus the word *metal* and *metallic ſubſtance* will be ſynonimous in this article.

Metallic ſubſtances form a claſs of bodies, not very numerous, of very great importance in chemiſtry, medicine, arts, and the ordinary affairs of life. Theſe ſubſtances have very peculiar properties, by which they differ from all other bodies.

The natural bodies from which metals differ the leaſt are, earthy and pyritous matters, on account of their ſolidity and denſity. Metals and ſtones are, nevertheleſs, very different; the heavieſt ſtones which are unmetallic being much lighter than the lighteſt metals. A cubic foot of marble weighs 252 pounds; and an equal bulk of tin, the lighteſt of metals, weighs 516 pounds. The difference is much greater when the weight of ſuch a ſtone is compared with that of gold, a cubic foot of which is 1326 pounds.

Opacity is another quality which metals poſſeſs eminently, the opacity of metals being much greater than that of any unmetallic ſubſtance.

This great opacity of metals is a conſequence of their denſity; and theſe two properties produce a third, peculiar alſo to metals, namely, a capacity of reflecting much more light than any other body: hence metals whoſe ſurfaces are poliſhed, form mirrors repreſenting the images of bodies more clearly than any other matter. Thus looking-glaſſes produce their reflexion merely by the ſilvering, which is a covering of metal upon their ſurfaces. To this reflective property metals owe their peculiar luſtre, called the *metallic luſtre*.

Although the ſeveral metallic ſubſtances differ conſiderably in hardneſs and fuſibility, we may ſay in general, that they are leſs hard and leſs fuſible than pure earths.

Metals cannot unite with any earthy ſubſtance, not even with their own earths, when theſe are deprived of their metallic ſtate: hence, when they are melted, they naturally run into globes, as much as the abſolute gravity of their maſs, and their preſſure upon the containing veſſels, will allow. Accordingly, the ſurface of a metal in fuſion is always convex. A metal in that ſtate always endeavours to acquire a ſpherical form, which it does more perfectly as the maſs is leſs. This effect is very ſenſible in quickſilver, which is nothing but a metal habitually fluid or fuſed. A maſs of ſeveral pounds of mercury, contained in a ſhallow widemouthed veſſel, is ſo ſpread out, that its upper ſurface is almoſt flat, and the convexity is not very ſenſible but at its circumference: on the contrary, if we put very ſmall maſſes of mercury into the ſame veſſel, as, for inſtance, maſſes weighing a grain each, they become ſo round as to ſeem perfect globes. This effect is partly occaſioned by the inaptitude of metals to unite with the veſſels containing them when in fuſion, by which quality the whole affinity which ſubſiſts betwixt the integrant parts of theſe metals is capable of acting; and partly alſo by this affinity, which diſpoſes the integrant parts to come as near to each other as they can, and conſequently to form a ſphere.

This property is not peculiar to melted metals, but to all fluids, when contiguous to bodies ſolid or fluid, with which they have no tendency to unite. Thus, for inſtance, maſſes of water upon oily bodies, or oily maſſes upon bodies moiſtened with water, aſſume always a form ſo much nearer to the ſpherical as they are ſmaller. Even a large drop of oil poured upon a watery liquor, ſo that it ſhall be ſurrounded with this liquor, becomes a perfect ſphere.

All metals are in general ſoluble by all acids; but often theſe ſolutions require particular treatment and circumſtances, which are mentioned under Chemistry, ſect. iv. With acids, they form a kind of neutral ſalts, which have all more or leſs cauſticity. The affinity of metals is leſs than of abſorbent earths and alkaline ſalts to acids; and therefore any metal may be ſeparated from any acid by theſe earthy and ſaline alkalis.

Alkaline ſalts are capable of acting upon all metallic ſubſtances, and of keeping them diſſolved by proper management.

Metals may in general be united with ſulphur and liver of ſulphur. With ſulphur, they form compounds reſembling the peculiar ſubſtance of ores, which are generally nothing elſe than natural combinations of ſulphur and metal. Metals have leſs affinity with ſulphur than with acids; hence ſulphur may be ſeparated from them by acids. Some exceptions from theſe general rules, concerning the affinity of metals to ſulphur and liver of ſulphur, and concerning their ſeparation from ſulphur by acids, may be ſeen under the articles of the ſeveral metals. But theſe exceptions do probably take place, only becauſe we have not yet found the method of ſurmounting ſome obſtacles which occur in the ordinary methods of treating certain metals.

All metals may in general be united with each other, with which they form different allays which have peculiar properties; but this rule alſo is not without ſome exceptions.

Metals have ſtrong affinity with the inflammable principle, and are capable of receiving it ſuperabundantly.

Laſtly, oily ſubſtances ſeem to be capable of acting upon all metals. Some metals are eaſily and copiouſly diſſolved by oils; and perhaps they might all be found to be entirely ſoluble in oils, if the methods known in chemiſtry were tried for the accompliſhment of theſe ſolutions.

The properties abovementioned agree in general to all metallic ſubſtances: but, beſides the properties peculiar to each metal, ſome properties are common to a certain number of them; and hence they have been divided into ſeveral claſſes.

Thoſe metallic matters which, when ſtruck by a hammer, or ſtrongly compreſſed, are extended, lengthened,

ened, and flattened, without being broken, (which property is called *ductility* or *malleability*), and which alſo remain fixed in the moſt violent and long continued fire, without diminution of weight, or other ſenſible alteration, are called *perfect metals*. Theſe perfect metals are three; *gold*, *ſilver*, *platina*.

The metallic matters which are ductile and fixed in the fire, to a certain degree, but which are deſtroyed by the continued action of fire, that is, changed into an earth deprived of all the characteriſtic properties of metals, are called *imperfect metals*. Of this kind are four; *copper*, *iron*, *tin*, *lead*.

The metallic ſubſtances which, as well as the imperfect metals, loſe their metallic properties by expoſure to fire, but which alſo have no ductility nor fixity, are diſtinguiſhed from the others by the name of *ſemi-metals*. Of this claſs are five; *regulus of antimony*, *biſmuth*, *zinc*, *regulus of cobalt*, and *regulus of arſenic*.

Laſtly, *mercury*, which has all the general properties of metals, makes a claſs ſeparate from the others; becauſe in purity and gravity it is ſimilar to the perfect metals, and in volatility to the ſemi-metals. Its fuſibility alſo ſo far ſurpaſſes that of any other metallic matter, that it is ſufficient to diſtinguiſh it from all, and to give it a diſtinct claſs. We have enumerated, therefore, in all, 13 metallic ſubſtances; two of which only were unknown to the ancients, namely, platina and regulus of cobalt. We have reaſon to wonder that theſe two metallic bodies, and particularly platina, which is a perfect metal, ſhould have remained unknown till lately.

This may give us cauſe to hope, that if natural hiſtory and chemiſtry be carefully cultivated, as they have been ſince the renovation of the ſciences, we may ſtill make eſſential diſcoveries in this way. Mr Cronſtedt has given, in the Swediſh Memoirs, a deſcription of a metallic matter, which, as he ſays, appears to be a new ſemimetal diſtinct from the others. In that caſe, this would be the fourteenth metallic matter known, and the third lately diſcovered: but as, ſince the Memoir of Mr Cronſtedt, this new ſemimetal has not been examined by chemiſts, it is yet but little known; and therefore further experiments ſeem requiſite to decide whether it ought to be admitted as a new ſemimetal (A).

As chemiſts can only know compound bodies by being capable of ſeparating the principles of ſuch bodies, and even of re-uniting their principles ſo as to reproduce ſuch compounds as they were originally; and as hitherto they have not been able to accompliſh any ſuch decompoſition upon the perfect metals; hence, if all the other metallic ſubſtances were equally unalterable, we ſhould be very far from having certain notions concerning metals in general: but if we except gold, ſilver, and platina, all the other metallic matters are ſuſceptible of decompoſition and of recompoſition, at leaſt to a certain degree; and the experiments of this kind made by chemiſts, and chiefly by the modern chemiſts, have thrown much light on this important ſubject.

We may obſerve, that even if we had not been able to decompoſe any metallic ſubſtance, we might ſtill, by reflecting on the eſſential properties of metals, diſcover ſufficiently well the nature of their principles.

The ſolidity, the conſiſtence, and eſpecially the gravity, which they poſſeſs in a degree ſo ſuperior to all other bodies, would not have allowed us to doubt that the earthy element, of which theſe are the characteriſtical properties, enters largely into their compoſition, and makes their baſis.

The facility with which they combine with almoſt all inflammable matters, and with all thoſe which have great affinity with phlogiſton, ſuch as acids; joined to their incapacity of being allayed with meagre matters that are purely earthy or purely watery, which have no diſpoſition to unite with phlogiſton; would alſo have furniſhed very ſtrong motives to believe, that the inflammable principle enters largely into the compoſition of metals.

We muſt acknowledge, however, that theſe conſiderations would only have furniſhed concerning the exiſtence of the inflammable principle in metals, but a ſimple probability, very far from the complete proof we now have: but the combuſtibility of all metals capable of decompoſition by this method, and of the ſubſequent reduction, with all their properties, by the rejunction of the inflammable principle, furniſhes the cleareſt and the moſt ſatisfactory demonſtration that we have in chemiſtry. We ſhall now mention what is known upon this ſubject, and the conſequences neceſſarily reſulting.

The deſtructible metals preſent exactly the ſame phenomena as all other bodies containing the inflammable principle do, in the ſtate of combuſtion. When expoſed to fire, without acceſs of air, that is, in cloſe veſſels, they become red-hot, melt, or ſublime, according to their nature: but they receive no alteration in their compoſition from fire applied in this manner, and they are afterwards found to be exactly in the ſame ſtate as before. In this reſpect, they reſemble perfectly all bodies which contain no other inflammable matter than pure phlogiſton.

But when imperfect metals are expoſed to fire, with acceſs of air, as, for inſtance, under a muffle in a furnace which is made very hot, then they burn more or leſs ſenſibly, as their inflammable principle is more or leſs abundant, or more or leſs combined. Some of them, as iron and zinc, burn with a very lively and brilliant flame; but this flame is of the ſame nature as that of charcoal, of ſulphur, of all bodies, the combuſtible principle of which is pure phlogiſton, and is not in an oily ſtate, that is, furniſhes no ſoot capable of blackening.

Alſo the imperfect metals detonate with nitre, when all the circumſtances which that detonation requires are united *. Their phlogiſton is conſumed by this method much more quickly and completely than by ordinary calcination or combuſtion. Their flame is alſo much more lively and brilliant; and ſome of them, as iron and zinc, are uſed in compoſitions for fireworks, from their very vivid and beautiful flame.

* See *Detonation*.

Nitre is alkaliſed by theſe metallic detonations exactly in the ſame manner as in its detonation by coals.

Laſtly,

(A) See Nickel. Mr Juſti pretends that he has diſcovered a new metallic ſubſtance contained in yellow mica. This, he ſays, was of a blackiſh grey colour; but when mixed with gold heightened the luſtre, without deſtroying the malleability of that metal, though itſelf is brittle.

Of Metallization.

Laftly, imperfect metals being treated with acids which have an affinity with phlogifton, that is, with the vitriolic and nitrous acids, are deprived alfo by thefe acids of a more or lefs confiderable part of their inflammable principle: they give a fulphureous quality to vitriolic acid, and are even capable of furnifhing fulphur with that acid.

Although the experiments now mentioned were the only proofs of the exiftence of an inflammable principle in metallic fubftances, thefe would be fufficient to eftablifh it inconteftably. But we fhall fee, when we continue to examine the phenomena attending the decompofition of metals, that thofe are not the only proofs.

If the inflammable matter which fhews itfelf fo evidently in the burning of metals, is really one of their conftituent parts, their effential properties muft be altered in proportion to the quantity of it taken from them: and this evidently happens upon trial; for the refiduum of metallic matters, after calcination, departs from the metallic character, and approaches to the nature of mere earth. The opacity, brilliancy, ductility, gravity, fufibility, volatility, in a word, all the properties by which metallic fubftances differ from fimple earths, diminifh or entirely difappear, by taking from them their inflammable principle; fo that when their calcination has been carried as far as is poffible, they refemble mere earths, and have no longer any thing in common with metals. Thefe earths can no longer be combined with acids or with metals, but are capable of uniting with pure earths. They are then called *calxes* or *metallic earths*. See CHEMISTRY, n° 44, 45.

We muft obferve concerning the decompofition of metals, 1. That when only a fmall quantity of inflammable principle is taken from metals, a fmall quantity only of calx is formed, and the remaining part continues in the metallic ftate: hence, as the portion of calcined metal can no longer remain united with the undeftroyed metal, it feparates in form of fcales from the furface of the metal when the calcination has been performed without fufion, as generally happens to iron and to copper; or thefe fcales float upon the furface of the melted matter when the calcination is performed during fufion, becaufe the calx is fpecifically lighter than the metal; as happens to the very fufible metals, as tin, lead, and moft of the femimetals.

2. The imperfect metals are not all equally eafily and completely calcinable. In general, as much of their phlogifton may be eafily taken from them, as is fufficient to deprive them of their metallic properties; but the remaining portion of their phlogifton cannot be fo eafily driven from them. Some of them, as copper, refift the firft calcination more than the reft; and others, as lead and bifmuth, may be very eafily calcined, but only to a certain degree, and retain always obftinately the laft portions of their inflammable principle; laftly, others, as tin and regulus of antimony, may not only be eafily and quickly calcined, but alfo much more completely. All the other metals partake more or lefs of thefe properties relating to their calcination. In general, if we except the labours of alchemifts, which are not much to be depended upon, we have not yet made all the proper efforts to arrive at a perfect calcination of the feveral metallic fubftances; which, however, is abfolutely neceffary, before we can arrive at a complete knowledge of the nature of their earths, as we fhall afterwards fee.

When metallic earths have loft but little of their phlogifton, and are expofed to ftrong fire, they melt, and are reduced to compact maffes, ftill heavy and opake, although much lefs fo than the metals, and always brittle and abfolutely unmalleable. If the calcination has been more perfect, the metallic earths are ftill fufible by fire, but lefs eafily, and convertible into brittle and tranfparent maffes poffeffed of all the properties of glafs, and are accordingly called *metallic glaffes*. Thefe glaffes do not poffefs any of the properties of their metals, excepting that they are fpecifically heavier than other glaffes, that they are capable of being attacked by acids, and that the glaffes of the femimetals are fomewhat lefs fixed than unmetallic glaffes. Laftly, when the calcinaton of metals has been carried to its greateft height, their earths are abfolutely fixed, and unfufible in the fire of our furnaces, and poffefs no longer the folubility in acids by which metals are characterifed.

Thefe are the principal changes which metals fuffer by lofing their phlogifton. They are thus changed into fubftances which have no properties but thofe of earth. This is a certain proof that the inflammable principle is one of their conftituent parts. But we have alfo other proofs of this important truth. The reduction of metallic calxes into metal, by the addition of phlogifton alone, completes the proof; and the whole forms one of the cleareft and moft fatisfactory demonftrations in all the fciences. This reduction is effected in the following manner.

If the earth of a metal be mixed with any inflammable matter, which either is or can be changed into the ftate of coal, together with fome falt capable of facilitating fufion, but which, from its quantity or quality, is incapable of receiving the inflammable principle; and if the whole be put into a crucible, and the fufion promoted by a fire gradually raifed; then an effervefcence will happen, accompanied with a hiffing noife, which continues a certain time, during which the fire is not to be increafed; afterwards, when the whole has been well fufed, and the crucible taken from the fire and cooled, we fhall find at the bottom, upon breaking it, the metal, the earth of which was employed for the operation, poffeffed of all the properties which it had before calcination and reduction. See REDUCTION.

We cannot doubt that this wonderful transformation of an earthy fubftance into a metal, is folely caufed by the phlogifton paffing from the inflammable matter to the metallic earth: for, firft, in whatever manner and with whatever fubftance metallic earths be treated, they cannot be ever reduced into metals without a concurrence of fome fubftance containing phlogifton. 2dly, The nature of the fubftance which is to furnifh phlogifton is quite indifferent, becaufe this principle is the fame in all bodies containing it. 3dly, If, after the operation, the fubftance furnifhing the phlogifton be examined, we fhall find that it has loft as much of that principle as the metallic earth has received.

The facts related concerning the decompofition and the recompofition of metals prove inconteftably, that they are all compofed of earth and phlogifton. But we do not yet certainly know whether thefe two be the only principles of metals. We might affirm this, if we could produce metals by combining phlogifton with fome matter which is certainly known to be fimple earth.

earth. But this hitherto has not been accomplished; for if we try to treat any earth, which has never been metallic, with inflammable matters, we shall perceive that the simple earths are not combinable with phlogiston so as to form metals. We shall even perceive that the metallic earths resist this combination, and are incapable of reduction into metal, when they have been so much calcined as very nearly to approximate the nature of simple earths.

These considerations, added to this, that we cannot easily conceive how, from only two certain principles, so many very different compounds as the several metallic substances are, should result, are capable of inducing a belief that some other principle is added to these two already mentioned in the composition of metals.

Many great chemists, and particularly Becher and Stahl, seem to be convinced of this opinion; and chiefly from the experiments concerning the mercurification of metals, they believe that this third principle exists copiously in mercury; that it is of a mercurial nature; that it also exists in marine acid, to which it gives its specific character; that by extracting this mercurial principle from marine acid, or any other body containing it copiously, and by combining it with simple earths, these may acquire a metallic character, and be rendered capable of receiving phlogiston, and of being completely metallised.

These chemists admit also, and with probability, a different proportion of metallic principles in the several metals; and believe, that particularly the principle which they call *mercurial earth*, exists more copiously and sensibly in certain metals than in others. The most mercurial metals, according to them, are mercury, silver, lead, and arsenic. Most chemists distinguish from the other metals, silver, mercury, and lead; which they call *white metals*, *lunar metals*, or *mercurial metals*.

All these considerations being united, and others too many to be mentioned, give some probability to the existence of the mercurial principle in metals. We must however acknowledge, that the existence of this principle is only merely probable; and, as Stahl observes, is not nearly so well demonstrated as that of the inflammable principle: we may even add, that we have strong motives to doubt of its existence.

To produce metals artificially has justly been reckoned one of the most difficult problems in chemistry. The reflections we shall add upon this subject will be sufficient demonstration to every sensible person, that great knowledge is requisite in that science, to attempt with any hopes of success the production even of the most imperfect semimetal. Even if we were certain that it depends only on the intimate combination of the inflammable principle with a matter simply earthy, we should labour by chance, and without any reasonable expectation of success, if we were to attempt that combination without having more knowledge than we now possess, concerning the true nature of the earthy principle which enters into the composition of metals; for we must acknowledge that chemistry has made but little progress in this matter.

Metallic substances, although they resemble each other by the general properties mentioned in the beginning of this article, differ nevertheless from each other very evidently by the properties peculiar to each. Do these differences proceed from the different proportion, and from the more or less intimate connection of the inflammable principle with the earthy principle; supposing that this latter should be essentially the same in all metals? or ought they to be attributed to the difference of earths, which in that case would be distinct and peculiar to each metal? or, lastly, do metals differ from each other, both by the nature of their earths, and by the proportion and intimacy of connection of their principles? All these things are entirely unknown; and we may easily perceive, that till they are known, we cannot discover what method to pursue in our attempts to accomplish the combinations we are now treating of.

The most essential point then is, to arrive at a knowledge of the true nature of the earths which are in metals; and the only method of arriving at this knowledge is, to reduce them to their greatest simplicity by a perfect calcination. But this cannot be accomplished but by long and difficult operations. We have seen above, that all metals are not calcinable with equal ease; that the perfect metals have not been hitherto calcined truly by any process; and that in general, the last portions of phlogiston adhere very strongly to calcinable metals.

Some metals, however, as tin and regulus of antimony, may be easily calcined so as to be rendered irreducible. By carrying the calcination still further by the methods known in chemistry, we might obtain their earths so pure, that all their essential properties may be discovered, by which they might be easily compared together. This comparison would decide whether their nature be essentially different or not.

If they were found to be composed of earths essentially the same, we might next proceed to compare metallic with unmetallic earths. If the former were found similar to some of the latter kind, we should be then assured that the earth of metals is not peculiar to them, and that ordinary unmetallic earths are susceptible of metallisation.

The greater the number of metals operated upon, the more general and certain the consequences resulting from these would be: so that, for instance, if the operation were extended to all calcinable metals; and if the result of each of these operations were, that the calxes, when perfectly dephlogisticated, do not differ from each other, and are similar to earths already known; we might conclude from analogy, and we should be almost certain, that the earths of the perfect metals are also of the same nature.

They who know the extent and difficulties of chemical operations, will easily perceive that this would be one of the most considerable. Nevertheless, after having determined this essential point, we should only have done half our work. For a knowledge of the nature of the earth of metals, and where it is to be found, would not be sufficient; we must further endeavour to find a method of combining with this earth a sufficient quantity of phlogiston, and in a manner sufficiently intimate, that a metal might be formed by such a combination. But this second difficulty is perhaps greater than the former.

We must observe here, that some famous chemical processes have been considered by many as metallisations, but which are really not so. Such is Becher's famous experiment of the *minera arenaria perpetua*, by

Of Metallization. by which that chemist proposed to the States General to extract gold from any kind of sand. Such also is the process of Becher and of Geoffroy, to obtain iron from all clays by treating them with linseed oil in close vessels. In these, and many other such processes, we do only obtain metal that was already formed. Every earth and sand, as the intelligent and judicious Cramer observes, contain some particles of gold. Clays do not commonly contain iron ready formed; but all of them contain a ferruginous earth, naturally disposed to metallisation. See CLAY. Accordingly we must conclude, that, by Mr Geoffroy's experiment, iron is only reduced or revived, but is not produced.

The great difficulties which occur in attempting to give a metallic quality to simple earths have induced a belief, that the nature of metals ready formed might be more easily changed, and the less perfect brought to a more perfect state. To effect this, which is one of the principal objects of alchemy, and is called *transmutation*, numberless trials have been made. As we have not any certain knowledge of what occasions the specific differences of metallic substances, we cannot decide whether transmutation be possible or not. In fact, if each metallic substance have its peculiar earth, essentially different from the earths of the others, and consequently if the differences of metals proceed from the differences of their earths; then, as we cannot change the essential properties of any simple substance, transmutation of metals must be impossible. But if the earths and other principles of metals be essentially the same, if they be combined in different proportions only, and more or less strictly united, and if this be the only cause of the specific difference of metals, we then see no impossibility in their transmutation.

Whatever be the cause of the differences of metals, their transmutation seems to be no less difficult than the production of a new metallic substance; and perhaps it is even more difficult. Alchemists believe that transmutation is possible, and they even affirm that they have effected it. They begin by supposing that all metals are composed of the same principles; and that the imperfect metals do not differ from gold and silver, but because their principles are not so well combined, or because they contain heterogeneous matters. We have then only these two faults to remedy, which, as they say, may be done by a proper coction, and by separating the pure from the impure. As we have but very vague and superficial notions concerning the causes of the differences of metals, we confess that we cannot make any reasonable conjecture upon this matter; and we shall only advise those who would proceed upon good principles, to determine previously, if metals have each a peculiar earth, or only one common to them all. In the second place, if it should be demonstrated that the earthy principle is the same in all metals, and if that be demonstrated as clearly as the identity of the inflammable principle in metals is proved; they must then determine whether these two be the only principles in metals, whether the mercurial principle exists, and whether it be essential to all metals or to some only, and what is the proportion of these two or three principles in the several metallic substances. When we shall clearly understand these principal objects, we may then be able to determine concerning the possibility of transmutation; and if the possibility should be affirmed, we shall then begin to discover the road which we ought to pursue.

We have no reason to believe that any other principle enters into the composition of metals than those above-mentioned: no vestige is perceptible of either air or water. Some chemists have nevertheless advanced that they contain a saline principle. If that were true, they would also contain a watery principle. But all the experiments adduced to prove this opinion are either false, or only show the presence of some saline particles extraneous to the metals, or contained unknown to the chemists in the substances employed in the experiments. For metals perfectly pure, subjected to all trials with substances which do not contain and which cannot produce any thing saline, do not discover any saline property. We must however except arsenic, and even its regulus, these being singular substances, in which the saline are as sensible as the metallic properties.

Arsenic seems to be one of those intermediate substances which nature has placed in almost all its productions betwixt two different kinds, and which partake of the properties of each kind. Arsenic thus placed betwixt metallic and saline substances has properties common to both these kinds of substances, without being either entirely a metal or salt. See ARSENIC.

As water seems to act to a certain degree upon iron, even without the concurrence of air, as the operation of *martial ethiops* shews, we might thence suspect something saline in that metal. Nevertheless, what happens in that operation has not been so well explained, that any certain consequences can be deduced. 1. The water employed ought to be perfectly pure; that is, distilled rain-water. 2. The iron employed ought also to be perfectly pure, and such is very difficultly to be procured. 3. The operation ought to be performed in a bottle accurately closed, that we may be assured that the air contributes nothing to the action upon the iron. 4. After the water has remained a long time, suppose a year, upon the iron, the water ought to be carefully filtrated and examined, to ascertain whether it really has dissolved any part of the metal.

In the mean time, we may conclude that metals do not seem to contain any saline principle. And when we consider well their general properties, they seem to be nothing else than earths combined more or less intimately with a large quantity of phlogiston. Although we can demonstrate that their inflammable principle is not in an oily state, and that it is pure phlogiston, they have nevertheless an oily appearance, in this circumstance, that they adhere no more than oils to earthy and aqueous substances, and that they always assume a globular figure when supported by these substances entirely free from phlogiston.

This resemblance is so sensible, that chemists, before they knew the nature of phlogiston, believed that metals contained an oily and fat matter; and even now many persons, who talk of chemistry without understanding it, speak of the *oil* or *fat* of *metals*; expressions, which do not sound well to genuine chemists. The cause of this quality of metals is the quantity of phlogiston which they contain. Sulphur, phosphorus, oils, and even fats, have this appearance merely

merely from the inflammable principle which enters into their compofition: for this property is communicated by that principle to every compound which contains a certain quantity of it. See PHLOGISTON.

When the phlogifton combines copioufly and intimately with earthy matters fo as to form metals, it probably fo difpofes them, that the primitive integrant parts of the new compound, that is, of the metal, approximate and touch each other much more than the integrant parts of fimple earths can. This is proved by the great denfity or fpecific gravity, and other general properties, of metals.

In fact, as we cannot conceive that a body fhould be tranfparent, unlefs it have pores and interftices through which rays of light can pafs; therefore the more denfe a body is, that is, the fewer fuch interftices it has, the lefs tranfparent it will be; fo that the denfeft bodies ought to be the moft opake, as in metals. The difpofition of the pores of bodies contributes alfo much to their greater or lefs tranfparency; and bodies, the pores of which are continued and ftraight, are more tranfparent than thofe whofe pores are interrupted, tranfverfe, or oblique; fo that a body may be much more tranfparent than another which is lefs denfe, as we fee that glafs is more tranfparent than charcoal. But when other circumftances are equal, the denfeft bodies are the moft opake. Therefore the opacity of bodies is proportionable to their denfity, and to the deviation of their pores from right and parallel lines.

From the great opacity of metals, they probably poffefs both thefe qualities in an eminent degree. We have feen, at the beginning of this article, that the luftre of metals, and their property of reflecting light much better than any other fubftance, are neceffary confequences of their opacity. This is alfo felf-evident, becaufe the fewer rays any body can tranfmit, the more it muft reflect.

Laftly, the ductility of metals proceeds alfo from their denfity, and from the difpofition of their pores. Phlogifton alfo appears to communicate ductility to moft of the bodies containing it; as we fee in fulphur, and in unctuous bodies, as refins, wax, &c. all which are more or lefs ductile, at leaft when heated to a certain degree. Laftly, the foftnefs, fufibility, and volatility, of which all metals partake more or lefs, and which many of them poffefs in a fuperior degree, being properties entirely contrary to thofe of the earthy principle, probably proceed from the inflammable principle. In general, if we reflect on the effential properties of the earthy and inflammable principles, we fhall eafily perceive that thefe properties, being combined and modified by each other, ought to produce the properties of metals.

The order in which metals compared with each other poffefs moft eminently their principal properties, is the fame as that in which they are here enumerated, according to Mr Macquer, beginning always with that metal in which the property is moft confiderable.

1. *Specific gravity* or *denfity*. Gold, platina, mercury, lead, filver, copper, iron, and tin.

2. *Opacity*. We cannot well compare metals with each other in this refpect, becaufe it is fo confiderable in all, that it feems complete. If, however, they differ in this refpect, the fame order will ferve for opacity as for denfity.

3. *Metallic luftre* or *brilliancy*. The fame obfervation which was made concerning the laft-mentioned property is applicable to this alfo. We muft however obferve, that as by polifh bodies are rendered brighter, and that as whitenefs contributes much to the reflexion of light, the whiteft and hardeft metals therefore reflect beft. Hence, according to Mr Macquer, platina ought to be placed firft; and then iron, or rather fteel, filver, gold, copper, tin, lead.

Hardnefs of metals may contribute much to the duration of their polifh; but certainly foft metals, if their texture be equally compact, are no lefs capable of receiving a polifh than hard metals. Some hard metallic allays have been found to be lefs liable to tarnifh than fofter compounds, and have for this reafon alfo been chiefly ufed for fpeculums. The property of reflecting light feems chiefly to depend on the clofenefs of the particles, or on the denfity, on the fmoothnefs of the furface, and on the colour being moft fimilar to the colour of the light to be reflected. The white metals, filver, mercury, tin, reflect light more abundantly than others. Gold, being the denfeft metal, and perhaps becaufe the colour of folar light has a flightly-yellowifh tinge, does alfo reflect light very copioufly. Hence fpeculums made of leaf-gold have been found to be very effectual. Iron or fteel reflects much lefs light than any of the above-mentioned metals, altho' Mr Macquer has confidered it as capable of a greater reflective power. Platina is generally in fo fmall grains, that its reflective power cannot eafily be determined. The precife degrees of that power which ought to be affigned to each of the above-mentioned metals, cannot without accurate experiments be afcertained. Perhaps, however, their reflective powers will be found to be more nearly in the following order, than in that abovementioned from Mr Macquer. Silver, quickfilver, tin, gold, copper, iron, lead.

4. *Ductility*. Gold, filver, copper, iron, tin, lead. The ductility of mercury and that of platina are not yet determined.

5. *Hardnefs*. Iron, platina, copper, filver, gold, tin, and lead.

6. *Tenacity*. By tenacity we underftand the force with which the integrant parts of metals refift their feparation. This force appears to be in a compound ratio of their ductility and hardnefs. The comparative tenacity of metals is meafured by the weight which wires of the fame diameter, made of the feveral metals, can fuftain without breaking. Gold is the moft tenacious, then iron, copper, filver, tin, lead. The tenacity of mercury is unknown: that of platina is not yet determined, but is probably confiderable.

7. *Fufibility*. Mercury, tin, lead, filver, gold, copper, iron, and laftly platina, which cannot be fufed by the greateft fire of our furnaces, but only by the folar focus, as Meffrs Macquer and Beaumé have determined.

SECT. II. *Of Mines and Ores in general.*

THE fubftances found naturally combined with metals, in the earth, are, particularly, fulphur and arfenic, fometimes feparately, but generally conjointly. Me-

Of Ores. Metals combined with these substances are called *metals mineralised by sulphur*, or *by arsenic*, or *by sulphur and arsenic;* and these matters are called *mineralising* substances.

Besides the sulphur and arsenic with which metals are strictly combined in the mineral state, they are also pretty intimately combined with earthy substances, of different natures, and more or less divided.

These different matters united together form masses which are compact, heavy, brittle, and frequently possessed of much metallic lustre. These substances are properly called *ores*, or the matter of mines.

These ores are found in earths and stones of different kinds, as sands, flints, crystals, slates, indurated clays, according to the ground in which they are contained. But two kinds of stones in particular seem to accompany ores; and have therefore been considered by several mineralogists as matrixes, in which metals are formed. One of these stones is a kind of crystal, generally white, milky, and semi-opake, striking fire with steel, and of the class of vitrifiable earths. It is called QUARTZ.

The other stone is less hard, which does not strike fire with steel, and is sometimes milky like quartz; sometimes transparent and diversely coloured, consisting of rhomboidal crystals, which are composed of plates and faces. This stone becomes more soft and friable by being exposed to fire. It is called *spar*. Spar is more like to gypseous stones than to any other, but it differs from gypseous stones in possessing a much greater density. Some spars are so heavy, that they exceed in this respect all other stones. See SPAR.

These earthy and stony substances form the *matrix of the ore*.

Ores are natural compounds, containing metals allayed with different substances.

Excepting gold, and a very small quantity of each of the other metals found in some places so pure as to possess all their characteristic properties, nature exhibits to us metals and semimetals differently allayed not only with each other, but also with several heterogeneous substances, which so alter and disguise their qualities, that in this state they cannot serve for any of the purposes for which they are proper when they are sufficiently pure.

Ores consist, 1. Of metallic substances *calcined;* or, 2. Of these substances combined with other matters, with which they are said to be *mineralised*.

Calcined metallic substances, or *calciform ores*, are metallic substances deprived of phlogiston, and in the state of a calx or metallic earth. Such are all *ferruginous ochres*, which are calxes of iron.

Mineralised ores, are, 1. *Simple*, containing only one metallic substance: or, 2. *Compound*, containing two or more metallic substances.

Of the simple, and also of the compound ores, four kinds may be distinguished.

1. Ores consisting of metallic substances mineralised by *sulphur*. Such is the lead-ore called *galena*, composed of lead and sulphur.

2. Ores consisting of metallic substances mineralised by *arsenic*. Such is the *white pyritis*, containing iron and arsenic.

3. Ores consisting of metallic substances mineralised by *sulphur and by arsenic*. Such is the *red silver-ore*, containing silver, arsenic, and sulphur. Of Mines.

4. Ores consisting of metallic substances mineralised by *saline matters*. Such are the *native vitriols*. Such also is probably the *corneous silver-ore*, which, according to Mr Cronstedt's opinion, is a luna cornea, or silver combined with marine acid. Of this kind of ores, or native metallic salts, is perhaps the *sedative salt of borax*, which from Mr Cadet's experiments, published in the Memoirs of the Royal Academy for the year 1766, is conjectured to be copper combined with marine acid, and which has been said to be found native. To this class also may be referred the *silver mineralised by an alkaline substance*, which Mr Von Justi pretends to have discovered.

Henckel, and after him Cramer, and the author of the Dictionary of Chemistry, pretend, that in mineralised ores, besides the above-mentioned metallic and mineralising substances, are also contained a metallic and an unmetallic earth. But Wallerius affirms, that the existence of such earths cannot be shewn, and that sulphur is incapable of dissolving unmetallic earths, and even the calxes of all metallic substances, excepting those of lead, bismuth, and nickel.

Having thus defined and distinguished the several general classes of ores, we proceed to shew how they are lodged, and where they are found.

Metals and *metalliferous ores are found* in various places.

I. They are found *under water;* in beds of rivers, lakes, and seas, and chiefly at the flexures of these: such are the auriferous and ferruginous sands, grains of native gold, ochres, and fragments of ores washed from mines.

II. They are found *dissolved in water:* such are the vitriolic waters containing iron, copper, or zinc.

III. They are found *upon the surface of the earth*. Such are many ochres; metalliferous stones, sands, and clays; and lumps of ores. Mr Gmelin says, that in the northern parts of Asia ores are almost always found upon or near the surface of the ground.

IV. They are found *under the surface of the earth*. When the quantity of these collected in one place is considerable, it is called a *mine*.

Subterranean metals and ores are differently disposed in different places.

1. Some are *infixed in stones and earths*, formed *nodules* or *spots* diversely coloured.

2. Some are equably and *uniformly diffused through the substance of earths and stones*, to which they give colour, density, and other properties. Such are the greatest part of those earths, stones, sands, clays, crystals, flints, gems, and fluors, which are coloured.

3. Some form *strata* in mountains. Such are the slates containing pyrites, copper-ore, lead-ore, silver-ore, or blend. These lie in the same direction as the strata of stones betwixt which they are placed; but they differ from the ordinary strata in this circumstance, that the thickness of different parts of the same metalliferous stratum is often very various; whereas the thickness of the stony strata is known to be generally very uniform.

4. *Fragments of ores* are frequently found accumulated in certain subterranean cavities, in fissures of mountains, or interposed betwixt the strata of the earth.

Of Mines. earth. These are loose, unconnected, frequently involved in clay, and not accreted to the contiguous rocks or strata immediately, nor by intervention of spar or of quartz, as the ores found in veins are. Tin and iron mines are frequently of the kind here described.

5. Large entire masses of ores are sometimes found in the stony strata of mountains. These are improperly called *cumulated veins*, because their length, relatively to their breadth and depth, is not considerable.

6. Some instances are mentioned of *entire mountains* consisting of ore. Such is the mountain Taberg in Smoland; and such are the mountains of Kerunavara and Luosavara in Lapland, the former of which is 1400 perches long and 100 perches broad. These mountains consist of iron-ore.

9. Lastly, and chiefly, metals and ores are found in oblong tracts, forming masses called *veins*, which lie in the stony strata composing mountains.

The direction of veins greatly varies; some being straight, and others curved. Their position also respecting the horizon is very various; some being perpendicular, some horizontal, and the rest being of the intermediate degrees of declivity.

The dimensions, the quality, and the quantity of contents, and many other circumstances of veins, are also very various. Miners distinguish the several kinds of veins by names expressive of their differences. Thus veins are said to be *deep; perpendicular; horizontal*, or *hanging*, or *dilated; rich; poor; morning, noon, evening*, and *night* veins, by which their direction towards that point of the compass where the sun is at any of these divisions of the natural day, is signified.

The stratum of earth or stone lying above a vein is called its *roof:* and the stratum under the vein is called its *floor*.

Some parts of veins are considerably thicker than others. Small veins frequently branch out from large veins, and sometimes these branches return into the trunk from which they issued. These veins from which many smaller veins depart, have been observed to be generally rich.

Veins are terminated variously: 1. By a gradual diminution, as if they had been compressed, while yet soft, by superincumbent weight; or by splitting and dividing into several smaller veins. Or, 2. They are terminated abruptly, together with their proper strata in which they lie. This abrupt termination of veins and strata is occasioned by their being crossed by new strata running transversely to the direction of the former; or by perpendicular fissures through the strata; which fissures are frequently filled with alluvial matters, or with water, or are empty. These perpendicular fissures seem to have been occasioned by some rupture or derangement of the stratum through which the vein passes, by which one part of it has been raised or depressed, or removed aside from the other, probably by earthquakes. Where the veins are terminated abruptly, it does not cease, but is only broken and disjoined; and is often recovered by searching in the analogous parts of the opposite side of the deranged stratum. A principal part of the art of miners consists in discovering the modes of these derangements from external marks, that they may know where to search for the disjoined vein.

Of Mines. The *contents of veins* are metals and metalliferous minerals; as, the several kinds of ores, pyrites, blends, guhrs, vitriols; the several kinds of fluors, spars, quartz, horn-blend, in which the ores are generally embedded, or inveloped, and to which therefore the name *matrix of the ore* is applied; stalactites; crystallizations of these metalliferous and stony substances encrusting the small cavities of the circumjacent rock; and lastly, water, which flows or drops through crevices in that rock.

In a vein, ores are found sometimes attached to the rock or stratum through which the vein runs, but more frequently to a matrix which adheres to the rock; and sometimes both these kinds of adhesion occur in the same vein at different places. Frequently betwixt the matrix and the rock is interposed a thin crust of stone or of earth, called by authors the *fimbria of the ore*.

The *matrix* or the stone in which the ore lies inveloped is of various kinds in different veins. And some kinds of stone seem better adapted than others to give reception to any ore, or to the ores of particular metals. Thus quartz, spar, fluors, and hornblend, give reception to all ores and metals; but slates, chiefly to copper and silver, and never to tin; calcareous and sparry matrixes, to lead, silver, and tin; and mica to iron.

Veins lie in strata of different kinds of stone; but more frequently in some kinds of stone than in others. Thus of the simple or uncompounded stones which compose strata, the following are metalliferous: *Calcareous stones; slaty sand-stone* (cos fissilis arenosus Wallerii); *feltspar* (spatum pyrimachum sive scintillans); *quartz;* sometimes *jasper;* frequently *slates;* and chiefly *micaceous* or *talky* stones; and *hornblend*, (lapis corneus Wallerii; bolus indurata particulis squamosis Cronstedt). No veins have been found in gypseous or in siliceous strata, although *chertz* and *flints* frequently contain metallic particles, and some instances have been observed of ores of silver and of tin in *alabaster*. Of compound stones, those are said to be chiefly metalliferous which consist of particles of hornblend. Veins have also been found in the *red granite;* but seldom, if ever, in any other *granite*, or in *porphyry*. In general, veins are more frequently found in soft, fissile, and friable strata, than in those which are compact and hard.

A vein sometimes passes from one stratum into the inferior contiguous stratum. Sometimes even the veins of one stratum do so correspond with those of an inferior stratum, the contiguity of which with the former is interrupted by a mass of different matter thro' which the veins do not pass, that they seem originally to have been continued from one stratum to the other. Thus in the mines of Derbyshire, where the veins lie in strata of limestone, the contiguity of which strata with each other is interrupted in some places by a blue marle or clay, and in other places by a compound stone called *toadstone;* the veins of one stratum frequently correspond with the veins of the inferior stratum of limestone, but are never continued through the interposed clay or toadstone. But we must observe, that these interposed masses, the blue marle, clay, and toadstone, have not the uniform thickness ob-

observable in regular strata, but are (especially the toadstone) in some places a few feet in depth, and in others some hundreds of yards. The above disposition seems to indicate, that these several strata of limestone have been originally contiguous; that the veins now disjoined have been once continued; that these strata of limestone have been afterwards separated by some violent cause, probably by the same earthquakes which have in a singular manner shattered the strata of this mountainous country; that the interstices thus formed between the separated strata have been filled with such matters as the waters could insinuate, probably with the mixed comminuted ruins of shattered strata; or with the lava of neighbouring volcanoes, of which many vestiges remain.

To the above historical sketch of mines, we shall add some conjectural remarks concerning their *formation.*

Those ores which are found under water (I.); upon the surface of the earth (III.); in fissures of mountains and subterraneous cavities, accumulated, but not accreted to the contiguous rocks, (IV. 4.); seem from their loose, unconnected, broken appearances, to have been conveyed by alluvion.

All martial ochres have probably been separated from vitriolic ferruginous waters (II.) either spontaneously or by calcareous earth; and these waters seem to have acquired their metallic contents by dissolving the vitriol which is produced by the spontaneous decomposition of martial pyrites. The ochres of copper, zinc, and perhaps of several other metals, have probably been precipitated from vitriolic waters by some substance, as calcareous earth, more disposed to combine with acids; and these vitriolic waters have probably been rendered metalliferous, by dissolving the vitriols produced by a combustion of cupreous pyrites and of the ore of zinc called *blend;* for these minerals are not, as martial pyrites is, susceptible of decomposition spontaneously, that is, by air and moisture.

The metalliferous nodules and spots (IV. 1.) seem to have been infixed in stones while these were yet soft. Perhaps the metalliferous and lapideous particles were at once dissolved and suspended in the same aqueous menstruum, and during their concretion crystallized distinctly, as different salts do when dissolved in the same fluid.

The earths and stones uniformly coloured by metals (IV. 2.) were also probably in a soft state while they received these tinges. The opake-coloured stones seem to have received their colour from metallic calxes mixed and diffused through the soft lapideous substance; and the transparent-coloured stones have probably received their colours from vitriolic salts, or from metallic particles dissolved in the same water which softened or liquefied the stony substance; which metallic salts and particles were so much diffused, that they could not be distinctly crystallized. That all stones have been once liquid and dissolved in water, appears probable not only from their regular crystallized forms, but also the solubility of some stones, as of gypseous and calcareous earths, in water; and from the water which we know is contained in the hardest marbles, as well as in alabasters; to which water these stones owe the crystallization of their particles.

The veins called *cumulated* (IV. 5.), and the entire metalliferous mountains (IV. 6.), are believed by Wallerius to be analogous to the nodules (IV. 1.) These metalliferous substances seem to have been originally formed or concreted in the places where they are found.

The metalliferous strata (IV. 3.) have probably been insinuated between the lapideous strata, after the separation of these from each other by some violent cause; in the same manner in which we supposed that the clay and toadstone have been insinuated betwixt the several strata of lime-stone in Derbyshire. The matters thus insinuated may have been either fluid, which would afterwards crystallize and form entire regular masses; or they may have been the ruins of shattered strata and veins brought by waters, and there deposited; in which case they will appear broken and irregular. The metalliferous strata, although frequently confounded with the horizontal or dilated veins, may be distinguished, according to Wallerius, from these by the following properties: 1. They are generally thinner and much broader than the veins called *dilated.* 2. They are seldom found at a greater depth than 100 perches, and generally in the neighbourhood of veins from which they probably have received their contents. 3. From their want of the thin encrustations called *fimbriæ;* which, we observed, are frequently interposed betwixt the rock and the ore or its matrix; and from their want of the other properties of veins.

But in *veins* properly so called, the strongest marks exist of ores having been there concreted, and not carried thither and deposited in their present state. Their regular, unbroken appearance; their accretion to the contiguous rock, either immediately, or by intervention of a matrix; the regular appearance of this matrix inveloping the ore; the frequent crystallization of the ore, and of the other contents of the vein, indicate that ores, as well as the other solid contents, have been there concreted from a fluid to a solid state.

Most authors believe that veins, and the perpendicular clefts in the stony strata of mountains, called *fissures*, have been produced by the same cause; or rather, they consider veins only as fissures filled with metalliferous matters. They further believe, that fissures have been occasioned by the exsiccation of strata, while these were passing from a fluid to a solid state. Wallerius thinks, that fissures have been formed from exsiccation; but that veins were channels made through the strata, while yet soft and fluid, by water, or by the more fluid parts of the strata penetrating and forcing a passage through the more solid parts. He thinks, that these fluid parts conveyed thither their metalliferous and stony contents, which were there coagulated or concreted. He supports his opinion by observing, that all the veins of the same stratum generally run parallel to each other; that they frequently bend in their course; that the same vein is sometimes contracted, and sometimes dilated; that veins are frequently terminated by being split, or divided into inferior veins; that veins are frequently wider at bottom than at top, whereas fissures are always widest at top, and are very narrow below; all which appearances, he thinks, could not have been produced by exsiccation. From these reasons, Formation of Mines.

fons, fiffures appear to have had a different, and, from the disjunction and rupture of veins croffed by fiffures, they feem to have had a later origin than veins. Whether fiffures could have been produced by the very gradual exficcation of thefe large maffes of ftrongly coherent matter; or whether they have been produced by the fame violent caufes, namely, *earthquakes*, by which the ftrata in which fiffures are generally found have been broken and deranged, and by which metalliferous mountains themfelves have been formed, or their ftrata raifed above their original level, as fome authors have with great probability conjectured, we do not pretend to determine.

Veins are feldom, if ever, found but in mountains. The reafon of which may not improbably be, that in metalliferous mountains we have accefs to the more ancient ftrata of the earth, which in plains are covered with fo many depofited, alluvial, and other later ftrata, that we can feldom, if ever, reach the former. That thefe mountains confift of ftrata which have been originally lower than the upper ftrata of adjacent plains, appears from an obfervation which has been made, that the ftrata of mountainous countries dip with more or lefs declivity as they approach the plains, till they gradually fink under the feveral ftrata of thofe plains, and are at laft immerfed beyond the reach of miners. This leading fact in the natural hiftory of the earth has been obferved by a fagacious philofopher, Mr Mitchell, in his *Conjectures concerning Earthquakes*, Phil. Tranf. 1760.

That the inferior ftrata of the earth contain large quantities of pyritous, fulphureous, and metalliferous matters, appears, 1. From the fubterranean fires in thofe inferior ftrata, which produce volcanoes, and probably earthquakes, as Mr Mitchell ingenioufly conjectures. 2. From the obfervation, that all kinds of mountains are not equally metalliferous; but that veins efpecially are only found in thofe mountains which, being compofed of very ancient ftrata, are called *primæval*, which form the chains and extenfive ridges on the furface of the earth, which direct the courfe of the waters, and which confift of certain ftrata, the thicknefs of each of which, its generic qualities, and its pofition relatively to the other ftrata, are, in different parts of the chain of mountains where that ftratum is found, nearly uniform and alike, notwithftanding that the numbers and the inclinations of the ftrata compofing contiguous mountains, or even different parts of the fame mountain, are often very various; and therefore that veins are feldom, if ever, found in the mountains called by authors *diluvial* and *temporary*, which are fingle, or detached, which confift not of ftrata uniformly difpofed, but of alluvial maffes, in which fragments of ores may be fometimes, but veins never, found. Neverthelefs, fingle and feemingly detached mountains, in fmall iflands, have fometimes been found to be metalliferous. But we muft obferve, that thefe mountains confift of uniform ftrata; that iflands themfelves, efpecially fmall iflands, may be confidered as eminent parts of fub-marine ranges of mountains, and that the mountains of fuch iflands may be confidered as apices or tops only of inferior mountains.

Thofe mountains are faid to be moft metalliferous which have a gentle afcent, a moderate height, and a broad bafis, the ftrata of which are nearly horizontal, and not much broken and disjoined. In thefe mountains at leaft the veins are lefs interrupted, more extended, and confequently more valuable to miners, than the veins in lofty, craggy, irregular, and fhattered mountains.

Authors difpute concerning the time in which ores have been formed; fome referring it to the creation of the world, or to the firft fubfequent ages; and others believing that they have been gradually from all times, and are now daily, formed. From the accretion of ores and of their matrices to their proper rocks, and from the infertion of metalliferous nodules and ftriæ in the hardeft ftones, we are inclined to believe that the matter of thefe veins and nodules are nearly coeval with the rocks and ftones in which they are inveloped. Neverthelefs, we cannot doubt that fmall quantities at leaft of ores are ftill daily formed in veins, fiffures, and other fubterranean cavities. Several well-attefted inftances confirming this opinion are adduced by authors: Cronftedt mentions an incruftation of filver-ore that was found adhering to a thin coat of lamp-black or of foot, with which the fmoke of a torch had foiled a rock in a mine at Koningfberg in Norway; and that this incruftation of filver-ore had been formed by a metalliferous water paffing over the rock. Lehman affirms, that he poffeffes fome filver-ore attached to the ftep of a ladder found in a mine in Hartz, which had been abandoned 200 years ago; and that feveral fteps of ladders fimilarly incrufted had been found. Many other inftances are mentioned by authors, of galena, pyrites, filver-ores, and other metalliferous fubftances, having been found adhering to wood, to foffil-coal, to ftalactitical incruftations, to oyfter-fhells, and other recent fubftances. From thefe, and from fimilar inftances, it is probable, that not only ochres and fragments of ores may, with other alluvial matters, be now daily depofited, but alfo that fmall quantities of mineralized ores are recently formed; although many hiftories mentioned by Becher, Barba, Henckel, and other authors, of the entire renovation of exhaufted veins, and efpecially thofe of the growth and vegetation of metals and of ores, appear to be at leaft doubtful.

Various opinions have been publifhed concerning the formation of mineralized ores. According to fome, thefe ores were formed by congelation of the fluid maffes found in mines, called *Guhrs*. Other authors believe, that ores have been formed by the condenfation of certain mineral, metallic, fulphureous, and arfenical vapours, with which they fuppofe that mines abound. Some have even affirmed, that they have feen this vapour condenfe, and become in a few days changed into gold, filver, and other metallic matters. It has been above obferved, that from feveral appearances which occur in veins, there is great reafon to believe, that ores have not been carried thither and depofited in their prefent ftate, but have been there *concreted* and *cryftallized*; that is, changed from a fluid to a folid ftate. But the fluidity of the metalliferous matters at the time of their entrance into veins, may have been occafioned either by their having been *diffolved in water*, if they were capable of fuch folution, or by their having been raifed in form of *vapour* by fubterranean fires. For the difpofition to cryftallize is is acquired by every homogeneous fubftance that is fluid, whether it has received its fluidity by being melted by fire, or by being diffolved in a liquid menftruum, or by being reduced to the ftate of vapour. Thus cryftals of fulphur have been obferved to be daily formed by the fulphureous vapours which exhale in the neighbourhood of volcanoes. The volatility of the two mineralifing fubftances fulphur and arfenic, and the power which volatile bodies poffefs of elevating a certain portion of any fixed matter which happens to be united with them, render it probable, that the greateft part at leaft of mineralifed ores have been formed of vapours exhaled from fubterranean fires, through the cracks in the intervening ftrata occafioned by thofe earthquakes which have, in a fingular manner, broke and deranged the ftrata of metalliferous countries, and which, as has been above remarked, have been probably occafioned by, at leaft have certainly been always accompanied with, fubterranean fires.

Sect. III. *Of the Pyrites.*

Pyrite is a mineral refembling the true ores of metals, in the fubftances of which it is compofed, in its colour or luftre, in its great weight, and, laftly, in the parts of the earth in which it is found, fince it almoft always accompanies ores. It is, like ores, compofed of metallic fubftances, mineralized by fulphur or by arfenic, or by both thefe matters, and of an unmetallic earth intimately united with its other principles.

Notwithftanding the conformity of pyrites with ores properly fo called, fome chemifts and metallurgifts diftinguifh the former from the latter minerals; becaufe the proportion and connection of the materials compofing the pyrites differ much from thofe of ores. Thus, although fometimes pyrites contains more metal than fome ores, yet generally it contains lefs metal, and a larger quantity of mineralizing fubftances, fulphur and arfenic, and particularly of unmetallic earth. The connection of thefe matters is alfo much ftronger in pyrites than in ores, and they are accordingly much harder; fo that almoft every pyrites can ftrike fparks from fteel.

From the above property of ftriking fparks from fteel they have been called *pyrites;* which is a Greek word fignifying *fire-ftone*. Pyrites was formerly ufed for firearms, as we now ufe flints; hence it was called *carabine-ftone*. It is ftill named by fome *marcafite*. Perhaps no other kind of natural body has received fo many names. Perfons curious to known the other names lefs ufed than thofe we have mentioned, may find them in *Henckel's Pyritologia*. We think, with that celebrated chemift, that the fubject has been perplexed by this multiplicity of names; for before his great and excellent work, the notions concerning pyrites were very confufed and inaccurate.

Pyrite differs alfo from ores by its forms and pofitions in the earth. Although pyritous metals generally precede, accompany, and follow veins of ores; they do not, properly fpeaking, themfelves form the oblong and continued maffes called *veins*, as ores do; but they form maffes fometimes greater and fometimes fmaller, but always diftinct from each other. Large quantities of them are often found unaccompanied by ores. They are formed in clays, chalk, marles, marbles, plafters, alabafters, flates, fpars, quartz, granites, cryftals, in a word, in all earths and ftones. Many of them are alfo found in pit-coals and other bituminous matters.

Pyrites is alfo diftinguifhable from ores by its luftre and figure; which is almoft always regular and uniform, externally or internally, or both. Some ores indeed, like thofe of lead, many ores of filver, and fome others, have regular forms, and are in fome manner cryftallized; but this regularity of form is not fo univerfal and fo confpicuous in ores as in pyrites. The luftre of pyrites feems to be caufed by its hardnefs, and the regularity of its form by the quantity of mineralizing fubftances which it contains.

By all thefe marks we may eafily, and without analyfis, diftinguifh pyrites from true ores. When we fee a mineral that is heavy, poffeffed of metallic luftre, and of any regular form, the mafs of which appears evidently to be entire, that is, not to have been a fragment of another mafs, and which is fo hard as to be capable of ftriking fparks from fteel, we may be affured that fuch a mineral is a pyrites, and not an ore.

The clafs of pyrites is very numerous, various, and extenfive. They differ one from another in the nature and proportions of their component parts, in their forms, and in their colours. The forms of thefe minerals are exceedingly various. No folid, regular or irregular, can eafily be conceived, that is not perfectly imitated by fome kind of pyrites. They are fpherical, oval, cylindrical, pyramidal, prifmatical, cubic; they are folids with 5, 6, 7, 8, 9, 10, &c. fides. The furface of fome is angular, and confifts of many bafes of fmall pyramids; while their fubftance is compofed of thefe pyramids, the points of which all unite in the centre of the mafs.

Pyritous minerals differ alfo in their component fubftances. Some of them are called *fulphureous*, *martial*, *cupreous*, *arfenical*, as one or other of thefe fubftances predominate. We muft obferve with Henckel, whofe authority is very great in this fubject, that in general all pyrites are martial; as ferruginous earth is the effential and fundamental part of every pyrites. This earth is united with an unmetallic earth, with fulphur or arfenic, or with both thefe matters; in which cafe, the fulphur always predominates over the arfenic, as Henckel obferves. He confiders thefe as the only effential principles of pyrites; and believes that all the other matters, metallic or unmetallic, which are found in it, are only accidental; amongft which he even includes copper, although fo much of it exifts in fome kinds of pyrites, that thefe are treated as ores of copper, and fometimes contain even 50lb. of copper each quintal. Many other metals, even gold and filver, are fometimes combined in pyrites; but thefe are lefs frequent, and the precious metals always in very fmall quantities; they are therefore juftly to be confidered as accidental to pyrites. The different fubftances compofing pyrites fenfibly affect its colours. Henckel diftinguifhes them in general into three colours, white, yellowifh or a pale yellow, and yellow. He informs us, that thefe three colours are often fo blended one with another, that they cannot be eafily diftinguifhed unlefs when compared together.

The white pyrites contain moft arfenic, and are fimilar to cobalt and other minerals abounding in arfenic. The Germans call them *mifpickel* or *mifpilt*. Iron and

and arſenic form the greateſt part of this pyrites. As arſenic has the property of whitening copper; ſome pyritous minerals almoſt white, like that of Chemnitz in Miſnia, are found to contain 40 pounds of copper per quintal, and which are ſo much whitened by the arſenic, that they are very like white pyrites. But Henckel obſerves, that theſe pyritous matters are very rare, and are never ſo white as the true white pyrites, which is only ferruginous and arſenical.

Yellowiſh pyrites is chiefly compoſed of ſulphur and iron. Very little copper and arſenic are mixed with any pyrites of this colour, and moſt of them contain none of theſe two metallic ſubſtances. This is the moſt common kind of pyrites: it is to be found almoſt every where. Its forms are chiefly round, ſpherical, oval, flattened, cylindrical; and it is compoſed internally of needles or radii, which unite in the centre, or in the axis of the ſolid.

Yellow pyrites receives its colour from the copper and ſulphur which enter into its compoſition. Its colour, however, is inclined to a green; but is ſufficiently yellow to diſtinguiſh it from the other two kinds of pyrites, particularly when they are compared together. To make this compariſon well, the pyrites muſt be broken, and the internal ſurfaces muſt be placed near each other. The reaſon of this precaution is, that the colour of minerals is altered by expoſure to the air.

Perſons accuſtomed to theſe minerals can eaſily diſtinguiſh them. The chief difficulty is, to diſtinguiſh white pyrites from cobalt and other minerals; which alſo contain ſome copper and much arſenic.

Hence then we ſee, that arſenic is the cauſe of whiteneſs in pyrites, and is contained in every pyrites of that colour; that copper is the principal cauſe of the yellow colour of pyrites; and that every pyrites which is evidently yellow contains copper; that ſulphur and iron produce a pale-yellow colour, which is alſo produced by copper and arſenic; hence ſome difficulty may ariſe in diſtinguiſhing pyrites by its colours. We may alſo obſerve, that ſulphur and arſenic, without any other ſubſtance, form a yellow compound, as we ſee from the example of orpiment or yellow arſenic. Thus, although the colours of the pyrites enable us to diſtinguiſh its different kinds, and to know their nature at firſt ſight, particularly when we have been accuſtomed to obſerve them; yet we cannot be entirely certain concerning the true nature of theſe minerals, and even of all minerals in general; that is, to know preciſely the kinds and proportions of their component ſubſtances, but by chemical analyſis and decompoſition.

Beſides the above-mentioned matters which compoſe pyrites, it alſo contains a conſiderable quantity of unmetallic earth; that is, an earth which cannot by any proceſs be reduced to metal. Henckel, Cramer, and all thoſe who have examined this matter, mention this earth, and prove its exiſtence.

We ought to obſerve, that this earth is combined with the other principles of the pyrites, and not merely interpoſed betwixt its parts. It muſt therefore be diſtinguiſhed from other earthy and ſtony matters mixed accidentally with pyrites, and which do not make a part of the pyrites, ſince they may be ſeparated by mechanical means, and without decompoſing that mineral: but the earth of which we now treat is intimately united with the other conſtituent parts of the pyrites, is even a conſtituent part of pyrites, and eſſential to the exiſtence of this mineral, and cannot be ſeparated but by a total decompoſition of it.

According to Henckel, this unmetallic earth abounds much in the white pyrites, ſince he found from the analyſes which he made, that the iron, which is the only metal exiſting in theſe pyrites, is only about $\frac{1}{15}$th part of the fixed ſubſtance that remains after the arſenic has been expelled by torrefaction or ſublimation.

A much larger quantity of iron is in the pale-yellow pyrites, according to Henckel. The proportion of iron is generally about twelve pounds to a quintal of pyrites, and ſometimes 50 or 60 pounds: this is therefore called *martial pyrites*. It contains about $\frac{1}{4}$ of its weight of ſulphur, and the reſt is unmetallic earth.

The quantity of unmetallic earth contained in the yellow or cupreous pyrites, which are alſo martial, ſince, as we have obſerved, iron is an eſſential part of every pyrites, has not yet been determined. They probably contain ſome of that earth, tho' perhaps leſs of it than the others.

The nature of this unmetallic earth of pyrites has not been well examined. Henckel thinks that it is an earth diſpoſed already by nature to metallization, but not ſufficiently elaborated to be conſidered as a metallic earth. This opinion is not improbable; but as alum may be obtained from many pyrites, may we not ſuſpect that this unmetallic earth is of the nature of the baſis of alum or argillaceous earth? Perhaps alſo this earth is different in different kinds of pyrites. The ſubject deſerves to be well examined.

Although pyrites is not ſo valuable as true ores, becauſe in general it contains leſs metal, and but exceedingly little of the precious metals; and becauſe its metallic contents are ſo difficult to be extracted, that, excepting cupreous pyrites, which is called *pyritous copper ore*, it is not worked for the ſake of the contained metal; yet it is applied to other purpoſes, and furniſhes us with many uſeful ſubſtances; for from it we obtain all our green and blue vitriols, much ſulphur, arſenic, and orpiment. *See the principal proceſſes by which theſe ſubſtances are extracted from pyrites, under the* ſection SMELTING *of* ORES.

As all pyrites contain iron, and moſt of them contain alſo ſulphur; as the pyrite moſt frequently found contains only theſe two ſubſtances with the unmetallic earth; and as iron and ſulphur have a ſingular action upon each other when they are well mixed together and moiſtened; hence many kinds of pyrites, particularly thoſe which contain only the principles now mentioned, ſuſtain a ſingular alteration, and even a total decompoſition, when expoſed during a certain time to the combined action of air and water. The moiſture gradually penetrates them, divides and attenuates their parts; the acid of the ſulphur particularly attacks the martial earth, and alſo the unmetallic earth, its inflammable principle is ſeparated from it, and is diſſipated. While theſe alterations happen, the pyrites changes its nature. The acid of the ſulphur which is decompoſed, forms with the fixed principles of the pyrites, vitriolic, aluminous, and ſelenitic ſalts; ſo that a pyrites, which was once a ſhining, compact, very hard mineral, becomes in a certain time a greyiſh, ſaline,

 line, powdery mafs, the tafte of which is faline, auftere, and ftyptic.

Laftly, if this mafs be lixiviated with water, cryftals of vitriol, and fometimes of alum, according to the nature of the pyrites employed, may be obtained by evaporation and cryftallization.

This alteration and fpontaneous decompofition of pyrites, is called *efflorefcence* and *vitriolization;* becaufe the pyrites become covered with a faline powder, and becaufe vitriol is always formed. This vitriolization is more or lefs quickly accomplifhed in pyrites according to its nature. It is a kind of fermentation excited by moifture amongft the conftituent parts of thefe minerals; and it is fo violent in thofe which are moft difpofed to it, that is, in the pale-yellow pyrites, which contain chiefly fulphur and iron, that when the quantity of thefe is confiderable, not only a fulphureous vapour and heat may be perceived, but alfo the whole kindles and burns intenfely. The fame phenomena are obfervable, and the fame refults are formed, by mixing well together, and moiftening a large quantity of filings of iron and powdered fulphur; which experiment Lemeri has made, to explain the caufes of fubterranean fires and volcanos.

We cannot doubt that, as the earth contains very large maffes of pyrites of this kind, they muft undergo the fame changes when air and moifture penetrate the cavities containing them; and the beft natural philofophers agree, that very probably this furprifing decompofition of pyrites is the caufe of fubterranean fires, of volcanos, and of mineral waters, vitriolic, aluminous, fulphureous, hot and cold.

No other pyrites is fubject to this fpontaneous decompofition when expofed to humid air, but that which is both martial and fulphureous; that is, the pale-yellow pyrites. The arfenical pyrites, or that which contains little or no fulphur, is not changed by expofure to air. This latter kind is harder, heavier, and more compact, than the former. The pyrites which is angular and regularly fhaped, is chiefly of this kind. Mr Wallerius, in his Mineralogy, propofes to diftinguifh this kind of pyrites by the name of *marcafite.* When cut, it may be polifhed fo well as to give a luftre almoft equal to that of diamonds, but without refracting or decompofing the light; for it is perfectly opake. It has been employed fome years paft in the manufacture of toys, as of buckles, necklaces, &c. and is called in commerce *marcafite.*

We cannot, however, concur with Mr Macquer, (from whom the above is taken), in thinking that there is fufficient reafon for confidering the minerals called *pyrites*, as a diftinct clafs of fubftances from ores. They have indeed no mark by which they can certainly and conftantly be diftinguifhed from thefe. The hardnefs or property of ftriking ignited fparks from fteel is not common to all the fubftances generally called *pyrites;* for we find fome of thefe enumerated by mineralogifts which have not that property. Wallerius even mentions a pyrites which contains no iron, altho' that metal is thought by Henckel to be effential to pyrites. The diftinction of pyrites from ores has been chiefly introduced by miners; becaufe the greateft part of the former minerals contain fo little metal, and fo much of the mineralizing fubftances, fulphur, or arfenic, that they are feldom fmelted. Neverthelefs, fome kinds of pyrites are found which contain fo much copper, that they are fmelted with great profit. Accordingly, fome later mineralogifts confider the cupreous yellow pyrites as an ore of copper, the pale-yellow martial pyrites as an ore of iron; and the white arfenical pyrites as an ore of arfenic. See ORES *of* COPPER, IRON, and of ARSENIC, *infra*.

SECT. IV. *Effaying of Ores in general.*

ESSAYS are chemical operations made in fmall, to determine the quantity of metal or other matter which is contained in minerals; or to difcover the value or purity of any mafs of gold or filver. The former kind is the fubject of the prefent fection; the latter is treated under the word ESSAYS, in the order of the alphabet.

Before effays of ores can be well made, a preliminary knowledge of the nature of the feveral metallic minerals ought to be attained. Each metal has its proper and improper ores, which have peculiar characters and appearances: hence perfons accuftomed to fee them, know pretty nearly, by the appearance, weight, and other obvious qualities, what metal is contained in a mineral. A good effayer ought to be very intelligent in this matter, that he may at once know what the proper operations are which are requifite to the effay of any given mineral.

As metals are very unequally diftributed in their ores, we fhould be apt to make falfe and deceitful effays, if we did not ufe all poffible precautions that the proportionable quantity of metal produced by an effay fhall be nearly the medium contained in the whole ore. This is effected by taking pieces of the mineral from the feveral veins of the mine if there be feveral, or from different places of the fame vein. All thefe minerals are to be fhook together with their matrixes. The whole is to be well mixed together, and a convenient quantity of this mixture is to be taken for the effay. This is called the *lotting* of the ore.

As effays, particularly the firft, are generally made in fmall, effayers have very fmall weights correfponding to the weights ufed in the great; that is, to the quintal or hundred pounds weight, to pounds, ounces, drams, &c. The effay quintal and its fubdivifions, vary according to the difference of weights in different countries; and this occafions fome confufion, when thefe weights are to be adjufted to each other. Tables of thefe weights are found in treatifes of effaying; and particularly in that written by Schlutter, and tranflated and rendered more complete by Hellot, which contains all the details neceffary for the fubject.

The cuftom is to take, for the effay quintal, a real weight of a gros, or dram, which in France is equal to 72 grains; but as the whole dram reprefents 100 pounds, each grain reprefents a pound and a fraction of a pound; and hence fome difficulty and confufion arife in making the fubdivifions. A better method is that of Mr Hellot, which is to make the fictitious or effay quintal equal to 100 real grains, and then each grain reprefents a real pound. This effay quintal is fufficiently exact for ores of lead, tin, copper, iron, antimony, bifmuth, and mercury. But for ores of filver and gold, another reprefentation is convenient: for thefe metals, as Mr Hellot fays, are generally in fo fmall quantity, that the button or fmall piece of metal ob-

Essaying of Ores.

obtained in the essay could not be accurately weighed if 100 real grains were made to represent a quintal; and the difficulty of separating the gold from so small a quantity would be still greater. These motives have induced Mr Hellot to use for these ores a fictitious quintal 16 times bigger; that is, equal to 1600 real grains, which represent 1600 ounces; that is, 100lb. or quintal. The ounce being represented by a grain, its several subdivisions must be represented by fractions of a grain. Thus 12 grains of the fictitious quintal correspond with $\frac{5}{48}$ of a real grain (B); and this latter quantity may be accurately weighed in essay-balances, which when well made are sensible to a much less weight. See *(Essay)* Balance.

When a quintal of an ore to be essayed has been weighed, and lotted, as we described above, it is to be roasted in a test under a muffle. It is to be washed, if necessary; and, in short, the same operations are to be made in small which are usually done in great. Additions also are to be made, and in proper proportions, according to the peculiar nature of the ore. The fluxes generally mixed with the ore in essays are three, four, or five parts of black flux; one, two, or three parts of calcined borax; and one half of that quantity of decrepitated common salt. The more refractory the ore is, the more necessary is the addition of these fluxes: then the whole mixture is to be fused either in a forge, or in a melting or essay furnace.

To make essays well, all possible attention and accuracy are to be employed. This object cannot be too much attended to; for the least inaccuracy in weighing, or loss of the smallest quantity of matter, might cause errors, so much greater, as the disproportion betwixt the weights employed and those represented is greater. The most minute accuracy therefore is necessary in these operations. For instance, the essay-balances ought to be small, and exceedingly just. The ore ought not to be weighed till it has been reduced to gross powder fit for roasting; because some of it is always lost in this pulverization. When the ore is roasted, it ought to be covered with an inverted test; because most ores are apt to crackle and disperse when first heated. To make the fusion good and complete, the precise degree of fire which is requisite ought to be employed; and when it is finished, the crucible ought to be struck two or three times with some instrument, to facilitate the disengagement of the parts of the regulus from the scoria, and to occasion their descent and union into one button of metal. The crucible ought not to be broken, nor its contents examined, till it is perfectly cold.

Upon breaking the crucible, we may know that the fusion has been good, if the scoria be neat, compact, and equal; if it has not overflowed or penetrated the crucible; if it contain no metallic grains; and if its surface be smooth, and hollowed in the middle. The regulus or button ought to be well collected, without holes or bubbles, and to have a neat convex surface; it is then to be separated from the scoria, well scraped and cleaned; and, lastly, is to be weighed. If the operation has been well made, its weight shews the quantity of metal which every real quintal of ore will yield in the great. If the perfect success of this essay be in any respect doubtful, it ought to be repeated; but the best method at all times is, to make several essays of the same ore. Some small differences are always found, however well the essays may have been made. By taking the medium of the results of the several operations, we may approach as nearly as possible the true product of the ore.

Lastly, as mines are not worked, nor founderies established (which cannot be done without considerable expence), till the ore has been essayed, ten or twelve real pounds of the ore ought to be previously essayed; and essayers ought to be furnished with necessary furnaces and instruments for these larger essays.

In Part II. to the several articles of the ores of metals, we shall add the most approved methods of essaying these ores. We shall here only further observe in general, that the methods commonly practised for essaying ores of imperfect metals, and semimetals especially, are insufficient to procure the whole quantity of metal contained in ores, or even so much as is obtained in the smelting of large quantities of ores; and that therefore the result of essays is not be considered as the precise quantity contained in an ore, but generally only as an inaccurate approximation to that quantity. M. Gellert ascribes one cause of the want of success of these operations to the alkaline salts employed as fluxes to the ores, by which most metallic calxes are partially soluble, but more especially so when any of the sulphur of the ore remains; which, by uniting with these salts, forms a hepar of sulphur which is the most powerful of all solvents. He proposes therefore to omit the black flux, and other alkaline salts, and to add nothing to the ore but powder of charcoal, and some fusible glass. This method, he says, he learned from Mr Cramer, and has himself used with much success in the essays of iron and copper: but finding that other imperfect metallic substances could not sustain the heat necessary to effect the fusion and vitrification of the unmetallic parts of the ore without being partly dissipated, he found it necessary to add in the essays of these latter metallic matters some borax, by which the fusion might be completed with less heat. As we consider this as a considerable improvement in the art of essaying ores, we shall, to the articles of the several ores, add not only the processes commonly prescribed, but all those of Mr Gellert, according to the method here mentioned.

PART

(B) The pounds, of which 100 is here supposed to make a quintal, are called *Paris pounds*, one of which contains 1269 Troy grains.

PART II.

Containing a ſummary deſcription of the principal Ores of each Metal, and the methods of Eſſaying them.

Sect. I. *Ores of Gold.*

§ 1. PRoperly ſpeaking, no ores of gold exiſt: for as this metal cannot be allayed with arſenic, nor with ſulphur, it is never found directly mineraliſed by theſe ſubſtances, as the other metals are. In the ſecond place, if it be mineraliſed indirectly by the union it contracts with other metals naturally combined with ſulphur and arſenic, ſo ſmall a quantity of it only is found in theſe ores, that they ſcarcely even deſerve the name of *improper ores of gold*.

Hence gold is found either in its natural ſtate, of a certain degree of purity, poſſeſſed of all its properties; or engaged with ſome other metals in certain minerals.

The gold which is found alone is called *native* or *virgin gold*. This is generally incruſted, and fixed in different kinds of ſtones, principally in flints and quartz. Mr Cramer ſays, that the yellow brilliant ſpots of the blue ſtone, called *lapis lazuli*, are native gold; but theſe are very ſmall.

Gold is alſo found in fat and muddy earths; and Mr Cramer affirms, that ſcarcely any ſand can be found which does not contain gold; but he acknowledges, at the ſame time, that the quantity is too ſmall to compenſate for the expence of obtaining it.

Laſtly, the largeſt quantity of native gold is to be found in the ſands of ſome rivers. It is chiefly collected in hollows at the bottom of theſe rivers, and at their ſeveral bendings. The gold is collected in theſe places by a natural operation, ſimilar to that of waſhing of ores.

A conſiderable quantity of gold is in the ſand of ſeveral rivers in France: ſo that perſons who collect it find enough to compenſate their trouble. Mr Reaumur, in a memoir that he gave in the year 1718 concerning the rivers of France which contain gold, enumerates ten of them; namely, the Rhine, the Rhone, the Doux, the Ceze, and the Gardon; the Arriege; the Garonne; two ſtreams which flow into the Arriege, called *Ferriet* and *Benagues;* laſtly, the Salat, the ſource of which is in the Pyrenean mountains.

The Ceze is the river which furniſhes the largeſt quantity of gold at certain times. Mr Reaumur obſerves, that its particles are larger than thoſe of the Rhine and of the Rhone; and ſays, that in ſome days a peaſant will find gold to the value of a piſtole, and in others will ſcarcely find any.

The native gold found in rivers or elſewhere is never perfectly pure, or of twenty-four karats. It always contains a certain quantity of allay, which is generally ſilver. The gold of the French rivers, according to Mr Reaumur's trials, was found to be from eighteen to twenty-two karats, that of the Ceze being the loweſt, and that of the Arriege being the pureſt.

Although gold, however, as above obſerved from Macquer, cannot be directly diſſolved by ſulphur, yet it probably may be mineraliſed by the intervention of other metallic matters. Thus, although no proper ore of gold exiſts, yet it is found in ſeveral mineral ſubſtances, in which it is always accompanied, as Cramer affirms, with a much larger quantity of ſilver; to which latter metal that author attributes its mineraliſed ſtate. The minerals containing gold are blend, cupreous and arſenical pyrites, ore of antimony, cinnabar, white ore of arſenic, vitreous and other ſilver ores, and the lead-ore called *galena*.

Gold is more frequently imbedded in quartz than in any other matrix, but it is alſo found in limeſtone and in hornblend. Gold mines are in general very precarious, as they do not form regular veins, nor is the gold uniformly diſtributed through a matrix.

Becher and Cramer think, that no ſand is entirely free from gold. The yellow, red, black, and violet-coloured ferruginous ſands, are ſaid to contain moſt gold. Mr Hellot relates, that in a eleven eſſays of one kind of ſand, from a quintal, or 921,600 grains, were obtained each time from 848 to 844 grains of noble metal, excluſive of the gold which remained in the ſcoria; and that of the metal thus obtained two thirds were gold, and the remaining third was ſilver. He ſays, that parcels of ſand taken up at very ſmall diſtances from each other contained very unequal proportions of gold.

The gold found in ſands is generally leſs pure than that which is imbedded in a ſolid matrix. Reaumur ſays, that a piece of gold, weighting 448 ounces, was ſhewn to the Royal Academy at Paris, which was found upon eſſay to have different fineneſs in different parts of the maſs.

§ 2. *Ores and earths containing gold may be eſſayed* by the methods directed for the extraction of gold from large quantities of theſe auriferous matters, (ſee Part III.): or they may in general be eſſayed by being fuſed in a cupel or teſt, placed under the muffle of an eſſay-furnace, or in a crucible placed in an air-furnace, with eight or ten times their quantity of lead if they be eaſily fuſible, and with a larger quantity of lead if they be difficultly fuſible; and by ſcorifying the earthy matters, while the lead becomes impregnated with the noble metals. Theſe operations are entirely ſimilar to thoſe employed for the ſeparation of ſilver from its ores by precipitation with lead; *a detail of which ſee ſubjoined under the ſection* Ores *of* Silver, [*Proceſſes* I. III. IV. V. VI.]. Theſe metals are afterwards to be ſeparated from the lead by cupellation, in the manner directed in the article Essay (*of the value of ſilver and of gold*). The gold is then to be ſeparated from the ſilver by the proceſſes deſcribed in the article Parting.

The quantity of lead to be added to the ore in this eſſay muſt be ſuch as renders the ſcoria very thin, that the whole gold may be imbibed by the lead. Some iron ores containing gold cannot be reduced into

Platina and Silver.

into a ſcoria ſufficiently thin with ſixteen times their quantity of lead unleſs the heat be at the ſame time conſiderably increaſed. When the ore is exceedingly refractory, the ſcoriſication ought to be promoted by adding to it four times its quantity of tartar, twice its quantity of nitre, and four times its quantity of litharge. This mixture is to be put in a good eſſay-crucible, and covered with the ſea-ſalt. The crucible is to be ſet in a forge-hearth, and expoſed gradually to heat, till the ſcoria has acquired ſufficient fluidity, and the lead has imbibed the noble metal.

See the methods which have been uſed for eſſaying auriferous ſands, under Part III.

Sect. II. *Ores of Platina.*

Platina is very rare, and has been but lately diſcovered. As, like gold, it cannot be allayed with ſulphur or with arſenic, probably no *ore*, properly ſo called, exiſts of this metal. Accordingly in the only mines of platina which we know, namely, the gold mines of Santafe near Carthagena, the platina is found native like the gold, and in its metallic ſtate.

Sect. III. *Ores of Silver.*

§ 1. Next to gold, ſilver is the metal moſt frequently found in its metallic ſtate, that is, not mineraliſed by ſulphur or by arſenic. This ſilver, called alſo *native* or *virgin*, generally affects ſome regular form, and conſiſts of filaments or vegetations of various figures. It is found in form of plates, of fibres, or of grains, or cryſtallized. It lies generally in quartz, flint, ſpar, ſlate, cobalt, and in ſilver-ores. It is ſometimes enveloped in a thin ſtony cruſt. It is generally allayed with ſome gold: but ſilver, like all the other metals, is much more frequently found mineraliſed by ſulphur and by arſenic.

Three principal proper ores of ſilver are known, which are very rich, but very rare. Theſe are;

1. The *vitreous ſilver ore.* This ore has no determinate figure, and has nearly the colour, ſoftneſs, and fuſibility of lead. It is very heavy, and contains three quarters of its weight of pure ſilver. In this ore the ſilver is minerallized by ſulphur alone. Some expert artiſts imitate it very well by combining ſulphur with ſilver by fuſion in a crucible.

This ore, according to Cronſtedt, is either in form of plates or of fibres, or is cryſtallized, or has no determinate figure. It may be imitated by adding about five parts of ſulphur to one part of melted ſilver; in which operation moſt of the ſulphur is conſumed: or it may be imitated by expoſing a plate of ſilver red-hot to the fumes of burning ſulphur.

2. The *horny* or *corneous ſilver ore.* This ore is ſo called from its colour and ſemitranſparency, by which it reſembles horn or colophony. This ore, being ſuddenly heated, crackles, as almoſt all ores do, and melts with a gentle heat. Two-thirds of it are ſilver, which is mineraliſed by ſulphur and arſenic. This ore is very rare. Wallerius ſays, after Woodward, that it is found at Johaun-Georgen-Stadt in Saxony.

Corneous ore has various colours; white, pearly, brown, yellow, greeniſh, or reddiſh. It is foliated and ſemitranſparent. It is ſomewhat ductile, and fuſible with the flame of a candle. When heated, it emits, as Wallerius ſays, a ſulphureous and blue flame, and, according to Cramer, alſo a very ſmall quantity of an arſenical fume. Wallerius ſays, that it contains two-thirds of ſilver, with a conſiderable quantity of ſulphur, and a ſmall quantity of arſenic. Lehman thinks that it is ſilver united with a little arſenic. But Mr Cronſtedt ſays, that it is a luna cornea, or ſilver combined with marine acid; and that it is incapable of being decompoſed but by ſubſtances which can unite with that acid. This latter opinion ſeems to be the moſt probable; as the ore, according to its deſcription, is ſimilar to luna cornea, and as it cannot be imitated by any mixture of ſulphur and of arſenic with ſilver. The blue flame, and the ſmell ſlightly arſenical, which are emitted from heated corneous ore, are alſo obſervable from every combination of marine acid with a ſubſtance containing phlogiſton.

Ores of Silver.

3. *Red ſilver ore*, called alſo *roſiclare.* Its colour is more or leſs red; it is ſometimes cryſtallized, very heavy, and is fuſible like the above-mentioned ores. In this ore the ſilver is mineraliſed by arſenic and by ſulphur, but chiefly by the former. It alſo contains a little iron, and furniſhes two-thirds of its weight of ſilver. Its red colour may proceed either from the iron it contains; or from the mixture of arſenic and ſulphur; or, laſtly, from the particular manner in which the arſenic is united with the ſilver, an example of which we have in the red precipitate of ſilver made by the neutral arſenical ſalt.

Red ſilver ore is either plated or ſolid, or cryſtallized, and frequently ſemitranſparent. Its colour is various, from a dark grey to a deep red, according to the proportions of the two mineraliſing ſubſtances. It crackles and breaks in the fire, exhales an arſenical fume, and is readily fuſed. It is found generally in quartz, ſpar, cryſtal, hornblend.

Beſides the three ſilver ores above deſcribed, the following ores contain ſilver mixed with other metals.

1. *Grey ſilver ore.* This contains copper and ſilver mineraliſed by arſenic and ſulphur, and generally more of the former than of the latter metal; but as it is valued chiefly for the ſilver, it has been generally enumerated amongſt ſilver ores.

2. *White ſilver ore* is an arſenical pyrites containing ſilver.

3. *Black ſilver ore* contains ſulphur, arſenic, copper, iron, ſometimes lead, and about a fourth part of ſilver, according to Wallerius.

4. *Plumoſe ſilver ore* is white or black, ſtriated like plum-alum, or like ore of antimony. It is ſilver mineraliſed by ſulphur, arſenic, and antimony.

5. *Pech-blend.* In this blend ſilver, gold, and zinc, are mineraliſed by ſulphur, probably by intervention of iron, by which the gold and zinc are rendered capable of uniting with the ſulphur.

6. Silver is frequently found in *galena;* and ſometimes in *martial pyrites;* in the *red ore of arſenic;* in various *ores of copper, lead, tin, iron,* and eſpecially *cobalt;* in *blends;* in *yellow* or *red earths;* in *black* and *blue baſaltes;* and alſo in *ſtrata of ſtones* which do not appear externally to contain any mineral ſubſtance.

7. *Liquid ſilver ore*, or *guhr of ſilver*, is a grey or whitiſh liquid maſs, which contains, as Wallerius ſays, either native ſilver, or ſome fluid ſubſtance capable of producing it. Mr Cronſtedt mentions, in the Swediſh

Effaying of Ores of Silver.

difh Memoirs, a water flowing through a mine in Norway containing filver. Another inftance is alfo mentioned of a filver guhr, in the *Act. Erud. Upfal.* 1720.

8. Mr Von Jufti pretends, that he has found filver mineralifed by an *alkaline fubftance;* but he has not fpoken fufficiently diftinctly concerning it, to know whether he means a faline or earthy alkaline matter. Henckel alfo pretends, that by treating calcareous earth or certain clays with pyrites, filver may be obtained.

§ 2. *Ores of filver may be effayed* by the fame methods which are employed for the extraction of that metal from large quantites of ores; which methods are different, and fuited to the different qualities of the different ores. See Part III. Or, in general, ores and earths containing filver may be effayed by the following proceffes, which are copied from Dr Mortimer's Englifh edition of *Cramer's Art of Effaying Metals, Part II. Procefs* 1.

PROCESS I.

To precipitate Silver by means of Lead from fufible Ores.

" Pound the ore in a very clean iron mortar into fine powder: of this weigh one docimaftical centner or quintal, and eight of the like centners of granulated lead.

" Then have at hand the docimaftical teft, which muft not as yet have ferved to any operation: pour into it about half of the granulated lead, and fpread it with your finger thro' the cavity of it.

" Put upon this lead the pounded ore; and then cover it quite with the remainder of the granulated lead.

" Put the teft thus loaded under the muffle of an effay-furnace, and in the hinder part of it: then make your fire, and encreafe it gradually. If you look thro' the holes of either of the fliders, you will foon fee that the pounded ore will be raifed out of the melted lead, and fwim upon it. A little after, it will grow clammy, melt, and be thrown towards the border of the teft: then the furface of the lead will appear in the middle of the teft like a bright difc, and you will fee it fmoak and boil: fo foon as you fee this, it will be proper to diminifh the fire a fmall matter for a quarter of an hour; fo that the boiling of the lead may almoft ceafe. Then again, increafe the fire to fuch a degree, that all may turn into a thin fluid, and the lead may be feen, as before, fmoking and boiling with great violence. The furface of it will then diminifh by degrees, and be covered over with a mafs of fcorias. Finally, have at hand an iron hook ready heated, wherewith the whole mafs muft be ftirred, efpecially towards the border; that in cafe any fmall parcels of the ore not yet diffolved fhould be adherent there, they may be brought down, taking great care not to ftir any the leaft thing out of the teft.

" Now, if what is adherent to the hook during the ftirring, when you raife it above the teft, melts quickly again, and the extremity of the hook grown cold is covered with a thin, fmooth, fhining cruft; it is a fign that the fcorification is perfect; and it will be the more fo as the faid cruft adherent to the hook fhall be coloured equally on every fide: but in cafe, while the fcorias are ftirred, you perceive any confiderable clamminefs in them, and when they adhere in good quantity to the hook, though red-hot, and are inequally tinged, and feem dufty or rough with grains interfperfed here and there; it is a fign that the ore is not entirely turned into fcorias. In this cafe, you muft with a hammer ftrike off what is adherent to the hook, pulverize it, and with a laddle put it again into the teft, without any lofs or mixture of any foreign body, and continue the fire in the fame degree till the fcoria has acquired its perfection and the abovementioned qualities. This once obtained, take the teft with a pair of tongs out of the fire, and pour the lead, together with the fcoria fwimming upon it, into a cone made hot and rubbed with tallow. Thus will the firft operation of the procefs be performed, which does not commonly indeed laft above three quarters of an hour.

" With a hammer ftrike the fcorias off from the regulus grown cold, and again examine whether they have the characteriftics of a perfect fcorification; if they have, you may thence conclude, that the filver has been precipitated out of the ore turned to fcorias, and received by the lead.

" When the fcorification lafts longer than we mentioned, the lead at laft turns to fcorias or litharge, and the filver remains at the bottom of the veffel: but the fire muft be moderately fupplied, and the veffels be extremely good, to produce this effect; for they feldom refift to the ftrength of the fcorias long enough; fo that the whole fcorification may be brought to an end; which has afterwards this inconveniency, that the filver is diffipated by grains in the fmall hollows of the corroded ore, and can hardly be well collected again, when the ore has but little filver in it. Nay, there is ftill more time to be confumed to obtain the perfect deftruction of the lead, by means of the combined actions of the fire and air, becaufe the fcorias fwimming at the top retard it confiderably.

" In this procefs, the fulphur and the arfenic of the filver-ore, when the ore is broken fmall, and extended widely in a fmall quantity, are in part eafily diffipated by the fire, and in part abforbed by the lead; the lighter part of which, fwimming upon the heavier, becomes very clammy by means of the fulphur which is in the ore; but when this is diffipated by the violence of fire, it turns into glafs or fcorias: but when arfenic is predominant in the ore, the plumbeous part turns immediately into a very penetrating and very fufible glafs, having a diffolving efficacy, unlefs the arfenic lies hidden in a white pyrite or cobalt. For this reafon, the fixed part of the ore, which is no filver, is diffolved by that glafs, melts, and affumes the form of fcorias. The unmetallic earths and the pure copper or lead ores thereto adherent are of this kind. The filver then remains immutable; and being freed of thefe heterogeneous bodies, which are partly diffipated and partly melted, it is precipitated and received by the remaining regulus of lead. Therefore this procefs is completed by three diftinct operations; viz. 1. By roafting. 2. By fcorification. 3. By the melting precipitation of the filver, which is the refult of the two former operations.

" The

Essaying of Ores of Silver.

" The ore must be pulverised very fine, in order to increase the surface, that the dissipation of the volatiles and the dissolution by litharge may be sooner effected. This pulverising must then be done before the ore is weighed, because there is always some part of the ore adherent to the mortar or iron plate on which it is made fine; which part being lost, the operation is not exact. Erker was in the right when he prescribed eight centners of lead for the subduing of fusible ores. Nevertheless, it must be owned, that this quantity is superfluous in some cases. However, as the fluxibility of the silver-ore depends from the absence of stones, pyrites, &c. it is easy to see, that there are an infinite number of degrees of fluxibility which it would be needless to determine exactly, and most commonly very difficult to determine by the bare sight. Besides, a little more lead does not render the process imperfect; on the contrary, if you use too small a quantity of lead, the scorification is never completely made. Nay, there are a great many ores, containing sulphur and arsenic in plenty, that destroy a considerable quantity of lead: such are the red silver-ore, and that wherein there is a great deal of the steel-grained lead-ore. If the fire must be sometimes diminished in the middle of the process, it is in order to hinder the too much attenuated litharge, which is continually generated out of the lead, from penetrating the pores of the test, and from corroding it; which is easily done when the fire is over-strong; for then the surface of the vessel which is contiguous to the lead contracts cavities, or, being totally consumed by small holes, lets the regulus flow out of it. The vessels that are most subject to this inconvenience are those in the materials of which lime, plaster, and chalk are mixed. Nay, these bodies, which are of their nature refractory, being eroded during their scorification, at the same time communicate a great clamminess to the scoria; so that a great quantity of the mass remains adherent to the test in the form of protuberances, when you pour it out; whereby a great many grains of the regulus are detained."

PROCESS II.

The regulus obtained by the process I. contains all the silver of the ore, and the unscorified part of the lead. The silver may be afterwards separated from the lead, and obtained pure by *cupellation;* which process is described under the article Essay *(of the value of Silver.)*

PROCESS III.

If the silver-ore cannot be washed clean, or if it be rendered refractory by a mixture of unmetallic earths and stones, the scorification of these earthy matters frequently cannot be completed by the process I. Cramer therefore directs, that such ores shall be treated in the following manner.

" Bruise the ore into an impalpable powder, by grinding in a mortar; to a docimastical centner of it, add a like quantity of glass of lead finely pulverised; for the more exactly these two are mixed together, the more easily the scorification afterwards succeeds. Put this mixture, together with 12 centners of lead, into the test, according to process I. then put the test under the muffle.

" Make first under it a strong fire, till the lead boils very well; when you see it so, diminish the violence of the heat, as was directed in the first process; but keep it thus diminished a little longer: then, finally, again increase the fire to such a degree, till you perceive the signs of a perfect scorification and fusion. *See the whole process I.* Now this process lasts a little longer than the foregoing, and requires a greater fire towards the end.

" It sometimes happens that a very refractory ore cannot be dissolved by litharge; and that a mass, which has the clamminess of pitch, swims upon the regulus and upon the scorias themselves which are already subdued in part: when you see this, shut the vents of the furnace to diminish the fire; then gently touch this refractory body with a small iron cold hook, to which it will immediately stick; take it off softly, not to lose any thing; pound it into a fine powder, adding a little glass of lead, and put it again into the test; then continue the scorification till it is brought to its perfection. But you must always examine the scoria of your refractory ore, to see whether there may not be some grains of regulus dispersed in it: for sometimes the scorias that grow clammy retain something of the metal; which if you suspect, pound the scorias into a fine dust, and thus the grains of metal will appear if there are any left, because they can never be pounded fine. The silver is separated from this regulus by cupelling, as in Process II.

" All earths and stones are refractory in the fire: for, although some of them melt naturally in the fire, as those that are vitrifiable do; nevertheless, all the others, a very few excepted, melt much more difficultly than metals, and never become so thin in the fusion as is required for the sufficient precipitation of a precious metal. But litharge itself does not conveniently dissolve these refractory matters by the help of fire alone, unless you add some mechanical mixture to them; for the very moment the said litharge penetrates through the interstices of the refractory ore, and begins to dissolve it, a tenacious mass is produced, which hardly admits any farther dilution by the litharge. You may see it plain, if you make coloured glasses with metallic calxes; if you pour carelessly upon them a calx that gives a colour, you will never obtain that they may be equally dyed on every side, even although you should torture them for whole days together in a great fire. Nay, glass already made can never be diluted by only pouring salts and litharge upon it. Wherefore, you must use the artifice of glass-makers, who, in the making of the most perfect glasses, take great care, before they put the species of their ingredients into the fire, to have a mechanical mixture precede, or at least accede during the fusion itself, which is done here by pounding glass of lead mixed with the ore: but if you think that your glass of lead is not sufficiently fusible, you may add to it litharge melted first, and then pounded into a fine powder.

" As this scorification requires a longer and a greater fire than the foregoing, and as a greater quantity of litharge is moreover requisite to subdue the refractory scoria; it is easy to see why a much greater quantity of lead must be used here than in Process I.; and, although less lead is often sufficient, it it is neverthelefs proper always to ufe the greateft quantity that can be neceffary; left, for inftance, it fhould be neceffary to try fo many times the lead alone, to make it evident how much filver the lead when alone leaves in the coppel. Nor need you fear left any thing of the filver be taken away by the lead, provided the coppels be good, and the coppelling duly put in execution: for you can hardly collect a ponderable quantity of filver out of the collected fume of the lead, which rifes during the coppelling, as well as out of the litharge that is withdrawn into the coppel."

PROCESS IV.

If the ore be rendered refractory by pyrites, Cramer directs that the filver fhould be precipitated by lead in the following manner. *(Art of Affaying*, Part II. proc. 4.)

"Break your ore into a rough powder, and put a centner of it into the teft: put upon this another teft in the manner of a tile; put it under the muffle hardly red-hot: increafe the fire by degrees. There will always be a crackling: which being ended, take away the upper-teft; for when the veffels have been red-hot about one minute, the ore ceafes to fplit. Leave the ore under the muffle till the arfenic and the fulphur are for the moft part evaporated; which you will know from the ceffation of the vifible fmoke, of the fmell of garlic, or the acid; then take away the teft, and leave it in a place not too cold, that it may cool of itfelf.

"Pour out, without any diffipation, the roafted ore, and with a knife take away what is adherent to the veffel; pound it to a moft fubtile powder, and grind it together with an equal weight of glafs of lead; and, finally, fcorify the whole collected ore in the fame teft wherein the tefting was made, unlefs it has contracted chinks, as was defcribed in Procefs III.

"*Remarks.* Yellow pyrites-ores contain a very great quantity of fulphur, even greater than is neceffary to faturate the metal that lies hidden in them. For which reafon this fuperfluous fulphur diffipates in a middling fire; but if it had been mixed with lead, it would have rendered it refractory, nor could it afterwards be diffipated from it without a confiderable deftruction of the lead. The white arfenical pyrites turn alfo a great quantity of lead into glafs, on account of the abundance of the arfenic they contain. For which reafon thefe ores muft be previoufly roafted, that the fulphur and arfenic may be diffipated. Nor need you fear left any part of the filver be carried away with the arfenic; for when arfenic is feparated from any fixed body, by a certain degree of fire, it carries nothing of that body away with it."

PROCESS V.

SILVER may be precipitated from its ore by cupellation only, in the following Procefs, given by Cramer, [*Art of Affaying, Part* II. *Proc.* 9.]

"Pound one centner of ore; roaft it in the manner directed in the laft procefs; beat it to a moft fubtle powder; and if it melts with difficulty on the fire, grind it together with one centner of litharge, which is not neceffary when the ore melts eafily: then divide the mixture or the powder of the ore alone into five or fix parts, and wrap up every one of them feverally in fuch bits of paper as can contain no more than this fmall portion.

"Put a very large coppel under the muffle; roaft it well firft, and then put into it fixteen centners of lead: when the lead begins to fmoke and boil, put upon it one of the faid portions with the fmall paper it was wrapt up in, and diminifh the fire immediately, in the fame manner as if you would make a fcorification in a teft, but in a leffer time. The fmall paper, which turns prefently to afhes, goes off of itfelf, and does not fenfibly increafe the mafs of the fcorias. The ore proceeding therefrom is caft on the border, and turns to fcorias very foon. Increafe the fire again immediately, and, at the fame time, put another portion of the ore into the coppel, as was juft now faid. The fame effects will be produced. Go on in the fame manner, till all the portions are thrown in and confumed in the lead. Finally, deftroy the remaining lead with a ftronger fire.

"The filver that was in the ore and in the lead will remain in the coppel. If you deduct from it the bead proceeding from the lead, you will have the weight of the filver contained in the ore. If the ore employed was eafy to be melted, all the fcoria vanifhes; but if it was refractory or not fufible, all the fcoria does not always go away, but there remains fomething of it now and then in the form of duft. A great many ores and metals may be tried in this way, except only fuch as fplit and corrode the coppels. There are likewife fome of them which muft be previoufly prepared in the fame manner as is required to render them fit for going through a fcorification. *See the foregoing Proceffes.*

"*Remarks.* The ore thrown at feveral times upon lead boiling in a coppel may be diffolved without the foregoing fcorification: but this is very far from having an equal fuccefs with all kinds of ores; for there are ores and metals which refift very much to their diffolution by litharge; and which being on this account thrown on the border, are not fufficiently diffolved; becaufe the litharge fteals away foon into the coppel. Neverthelefs, there are fome others which vanifh entirely by this method, except the filver and gold that was contained in them.

"A previous roafting is neceffary, firft, for the reafons mentioned, and then becaufe the ore thrown upon boiling lead fhould not crackle and leap out; for, having once paffed the fire, it bears the moft fudden heat."

PROCESS VI.

Silver may be precipitated out of the fame bodies as were mentioned in the foregoing proceffes by fcorification in a crucible. [*Cramer*, *Proc.* 15.]

"The body out of which you intend to precipitate filver muft be previoufly prepared for a fcorification by pounding and roafting, as mentioned in the former proceffes. Then, in the fame manner, and with the fame quantity of lead, put it into a crucible ftrictly examined, that it be entire, folid, not fpeckled with black fpots, like the fcoria of iron, efpecially at its inferior parts, and capable of containing three times as

Essaying of Ores of Silver.

as much. Add besides glass gall and common salt, both very dry, and enough, that when the whole is melted, the salts may swim at top at the height of about half an inch.

"Put the crucible thus loaded into a wind-furnace; shut it close with a tile; put coals round it, but not higher than the upper border of the crucible. Then light them with burning coals, and increase the fire till the whole melts very thin, which will be done by a middling fire, maintained always equal, and never greater: leave it thus for about one quarter of an hour, that the scorification may be perfectly made. Take off the tile and stir the mass with an iron wire, and a little after pour it out into the mould. When the regulus is cleaned from scorias, try it in a test by coppelling it.

"*Remarks.* The scorification of any ore whatever, or of any body fetched out of ores, may indeed be made by this apparatus, as well as in a test under a muffle: but it serves chiefly to the end that a greater quantity of metal may be melted from it with profit. For you may put many common pounds of it at one single time into the crucible; but then you need not observe the proportion of lead prescribed in the foregoing process; nay, a quantity of lead two or three times less is sufficient, according to the different qualities of the object. But the mass will certainly be spilt, unless you choose a very good crucible; for there is no vessel charged with litharge, that can bear a strong fire having a draught of wind, without giving way through it to the litharge.

"You add glass-gall and common salt, that they may forward the scorification, by swimming at top; for the refractory scoria rejected by the litharge, and adhering between this and the salts that swim at top, is soon brought to a flux, and the precipitation of the silver is thereby accelerated. They also hinder in a manner a small burning coal fallen into the crucible, from setting the litharge a boiling, which troubles the operation; for the litharge or glass of lead, especially that which is made without any addition, so soon as the phlogiston gets into it, raises into a foamy mass, consisting of a multitude of small bubbles very difficult to be confined, unless the phlogiston be entirely consumed, and the litharge reduced to lead, which sometimes raises above the border of the vessel."

Copper Ores.

Native metallic silver may be separated from the stones and earths with which it is intermixed, by *amalgamation with mercury*, which operation is to be performed in the same manner as for the separation of native gold; a detail of which see in Part III. sect. iii.

The *corneous ore*, if it really be, as Cronstedt says, a luna cornea, ought to be treated in some of the methods directed for the reduction of luna cornea. See Chemistry, n° 366, 367.

Sect. IV. *Ores of Copper.*

§ 1. Copper is found under ground in three different forms. 1. Native or virgin copper diversely ramified, which is much more rare than native silver. This native copper is not so ductile as copper purified by fusions from the ore (A). 2. Copper is found in form of calx, of verdigrease, of precipitates. Such are the minerals called *silky copper ores*, and several white and green earths. These matters are only copper almost pure and but little mineralised, but which has been corroded, dissolved, precipitated, calcined by saline matters, by the action of the air, of water, and of earths (B). 3. Copper is frequently in a truly mineral state, that is, combined with sulphur, and with arsenic, with other metallic matters mixed with earths, and enveloped in different matrixes. These are the true copper ores. They have no regular forms except they partake of the nature of pyrites. Their colours are very different, which depend chiefly on the proportion of the mineral substances composing them. Lastly, in almost all of them we may perceive green or blue colours, which always indicate an erosion or calcination of the copper. Most copper ores contain also some iron or ferruginous earth, to which the ochrey colour is to be attributed, which might make us believe them to be ores of iron. Ores which contain much iron are the most difficultly fusible.

Copper ores have almost all a yellow, golden, and shining colour, by which they are easily distinguished. Some of them are coloured with irises, and frequently have spots of verdegrise, by which also they are distinguishable from other ores.

Many copper ores are also rich in silver. Such is that called the *white copper ore*, the colour of which is rather occasioned by arsenic than by silver, altho' it contains so much silver as to be enumerated by several mine-

(A) *Native Copper* is solid; or consisting of friable masses, formed by precipitation of cupreous vitriolic waters, called *cement* or *ziment copper*; or forming crystallized cubes, or grains, leaves, branches, or filaments.

(B) *Calciform ores* are either pure calxes of copper, or are mixed with heterogeneous matters. 1. The *pure* are, loose friable ochre, called *cæruleum montanum*, mountain-blue, and *viride montanum*, mountain-green; and the *red indurated calx*, called improperly *glass copper ore*. 2. *Mixed* calciform ores are those in which the calx of copper is mixed; with *calcareous earth*, forming a mountain blue; with *iron*, forming a black calx; with *gypsum*, an indurated green ore, called *malachites*; and with *quartz*, a red ore.

(C) Copper is *mineralised*, 1. By *sulphur*, forming the *grey copper ore*, improperly called *vitreous* (minera cupri vitrea Wallerii). 2. By *sulphurated iron*, forming the *hepatic copper ore* (minera cupri hepatica Wallerii) of a brown yellow colour. It is a kind of cupreous pyrites, and is called by Cronstedt *minera cupri pyritacea*. Sometimes it is of a blackish grey colour, and is then called *pyrites cupri griseus* (minera cupri grisea Wallerii); sometimes of a reddish yellow, and tarnished with blue irises on its surface, when it is called *minera cupri lazurea*; when of a yellowish green colour, it is the *pyrites cupri flavo-viridescens* (cuprum sulphure & ferro mineralisatum Wallerii); and when of a pale yellow colour, it is the *pyrites cupri palidè flavus*. Most of the above pyritaceous ores contain also some arsenic, but their sulphur is predominant. 3. *Copper mineralised by sulphur, iron, and arsenic. White copper ore* (Minera cupri alba Wall.) This ore contains also some silver. 4. *Copper dissolved by vitriolic acid. Native blue vitriol.* 5. *Copper united with bitumens. Copper-coal ore.* This is a pit-coal, from the ashes of which copper is obtainable. 6. Copper is also found in the mineral called *kupfer nickel.*

mineralogiſts amongſt ſilver ores.

Laſtly, the pyrites of a golden yellow colour which contains copper and ſulphur, and the white pyrites which contains copper and arſenic, are conſidered as copper ores by ſeveral chemiſts and naturaliſts. Henckel and Cramer remark, that no proper ore of copper is known which does not contain a conſiderable quantity of arſenic.

§. 2. *Ores of copper* may be *eſſayed* in methods ſimilar to thoſe employed for ſmelting of large quantities of ores, (Part III.) or they may in general be eſſayed by the following proceſſes.

PROCESS I.

To reduce and precipitate copper from a pure and fuſible ore in a cloſe veſſel.

" Mix one, or, if you have ſmall weights, two docimaſtical centners of ore beat extremely fine, with ſix centners of the black flux; and having put them into a crucible or pot, cover them one inch high with common ſalt, and preſs them down with your finger: but let the capacity of the veſſel be ſuch, that it may be only half full; ſhut the veſſel cloſe, put it into the furnace; heap coals upon it, ſo that it may be covered over with them a few inches high; govern the fire in ſuch a manner, that it may firſt grow ſlightly red-hot. Soon after you will hear your common ſalt crackle; and then there will be a gentle hiſſing noiſe. So long as this laſts, keep the ſame degree of fire till it is quite over. Then increaſe ſuddenly the fire, either with the funnel and cover put upon the furnace, or with a pair of bellows applied to the hole of the bottom part, that the veſſel may grow very red-hot. Thus you will reduce and precipitate your copper in about a quarter of an hour: then take out the veſſel, and ſtrike with a few blows the pavement upon which you put it, that all the ſmall grains of copper may be collected in one maſs.

" Break the veſſel, when grown cold, in two, from top to bottom, as nearly as you can: if the whole proceſs has been well performed, you will find a ſolid, perfectly yellow and malleable regulus adhering to the bottom of the veſſel, with ſcorias remaining at top of a brown colour, ſolid, hard, and ſhining, from which the regulus muſt be ſeparated with ſeveral gentle blows of a hammer; this done, weigh it, after having wiped off all the filthineſs.

A ſoft, duſty, and very black, ſcoria, is a ſign of a fire not ſufficiently ſtrong. Small neat grains of copper reduced but not precipitated, and adhering ſtill to ſcorias, eſpecially not very far from the bottom, and an unequal and ramificated regulus, are ſigns of the ſame thing. A ſolid, hard, ſhining, red-coloured ſcoria, eſpecially about the regulus, or even the regulus itſelf when covered with a like ſmall cruſt, are ſigns of an exceſs in the degree and duration of the fire.

" *Remarks.* All the ores which are eaſily melted in the fire are not the objects of this proceſs; for they muſt alſo be very pure. Such are the vitreous copper ores." (Mr Cramer means, it is preſumed, the red calciform ore called improperly *glaſs ore*, and not the *minera cupri vitrea* of Wallerius, which being compoſed of copper mineraliſed by ſulphur, could not be treated properly by this proceſs, in which no previous roaſting is required. The ſulphur of this ore would with the alkali of the black flux form a hepar, from which the metal would not precipitate.) " But eſpecially the green and azure-coloured ores, and the *cæruleum* and *viride montanum*, which are not very different from them. But if there is a great quantity of arſenic, ſulphur, or of the ore of another metal and ſemimetal joined to the ore of copper, then you will never obtain a malleable regulus of pure copper, tho' ores are not always rendered refractory by the preſence of theſe."

PROCESS II.

To reduce and precipitate copper out of ores rendered refractory by earth and ſtones that cannot be waſhed off.

" Beat your ore into a moſt ſubtil powder, of which weigh one or two centners, and mix as much ſandiver to them. This done, add four times as much of the black flux with reſpect to the ore; for by this means, the ſterile terreſtrial parts are better diſpoſed to a ſcorification, and the reducing and precipitating flux may act more freely upon the metallic particles freed from all their incumbrances.

" As for the reſt, make the apparatus as in laſt proceſs: but you muſt make the fire a little ſtronger for about half an hour together. When the veſſel is grown cold and broken, examine the ſcorias, whether they are as they ought to be. The regulus will be as fine and ductile as the foregoing.

" *Remarks.* As theſe copper ores hardly conceal any ſulphur and arſenic in them, the roaſting would be of no effect, and much copper would be loſt. For no metallic calx, except thoſe of gold and ſilver, improperly ſo called, can be roaſted, without you find a part of the metal loſt after the reduction.

PROCESS III.

To precipitate copper out of an ore (D) *that contains iron.*

" Do all according to laſt proceſs. But you will find, after the veſſel is broken, a regulus upon no account ſo fine, but leſs ductile, wherein the genuine colour of the copper does not perfectly appear, and which muſt be further purified.

" *Remarks.* The fire uſed in this operation is not ſo ſtrong that the iron ſhould turn to a regulus. But as copper is the menſtruum of iron, which is of itſelf very refractory in the fire; for this reaſon, while the ore and the flux are moſt intimately mixed and confounded by trituration, the greateſt part of the iron being diſſolved by the copper, turns into a regulus along with it."

PROCESS IV.

The roaſting of a pyritoſe, ſulphureous, arſenical, ſemimetallic, copper ore.

" Break two docimaſtical centners of the ore to a coarſe powder, put them into a teſt covered with a tile,

(D) Mr Cramer ſtill means the calciform ores only, and not the mineraliſed ores of copper.

tile, and place them under the muffle of a docimaftical furnace. But the fire muft be fo gentle, that the muffle may be but faintly red-hot. When the ore has decrepitated, open the teft, and continue the fire for a few minutes; then increafe it by degrees, that you may fee the ore perpetually fmoking a little: in the mean time, it is alfo proper now and then to ftir it up with an iron hook. The fhining particles will affume a dark red or blackifh colour. This done, take out the teft, that it may grow cold. If the fmall grains are not melted, nor ftrongly adherent to each other, hitherto all will be well; but if they run again into one fingle cake, the procefs muft be made again with another portion of the ore, in a more gentle fire.

" When the ore is grown cold, beat it to a powder fomewhat finer, and roaft it by the fame method as before; then take it out, and if the powder is not melted yet, beat it again to a moft fubtil powder; in this you are to take care that nothing be loft.

" Roaft the powder in a fire fomewhat ftronger, but for a few minutes only. If you do not then find the ore any way inclined to melt, add a little tallow, and burn it away under the muffle, and do the fame another time again, till, the fire being very bright, you no longer perceive any fulphureous, arfenical, unpleafant fmell, or any fmoke; and there remains nothing but a thin, foft powder, of a dark red, or blackifh colour.

" *Remarks.* Every pyrites contains iron, with an unmetallic earth: to which fulphur, or arfenic, and moft commonly both, always join. Befides, there is copper in many pyrites; but fometimes more, and fometimes lefs: fome of them are altogether deftitute of copper; therefore, fo much as pyrites differ with regard to the proportion of their conftituent particles, fo much do they differ as to their difpofition in the fire. For inftance, the more copper there is in pyrites, the more it inclines to colliquation. The more fulphur and arfenic it has in it, the more quickly the melting of it will be procured, and the reverfe: the more iron and unmetallic earth it contains, the more it proves refractory in the fire. Now if fuch pyrites melt in the roafting, as happens to fome of them if they grow but red-hot, the fulphur and arfenic that lies hidden therein are fo ftrictly united with the fixed part, that you would in vain attempt to diffipate them. Nay, in this cafe, when it is reduced again into a powder, it requires a much greater time and accuracy in the regimen of the fire to perform the operation. For this reafon, it is much better to repeat it with new pyrites. But you can roaft no more than the double quantity at once of the ore you have a mind to employ in the foregoing experiment; to the end that, the precipitation by fufion not fucceeding, there may remain ftill another portion entire; left you fhould be obliged to repeat a tedious roafting. If you fee the figns of a ferreous refractory pyrites, the operation muft be performed with a greater fire, and much more quickly. However, take care not to do it with too violent a fire: for a great deal of copper is confumed not only by the arfenic, but alfo by the fulphur; and this happens even in veffels fhut very clofe, when the fulphur is expelled by a fire not quite fo ftrong; which a reiterated and milder fublimation of the fulphur in a veffel both very clean and well clofed will clearly fhew.

" When the greateft part of the fulphur and the arfenic is diffipated by fuch caufes as promote colliquation, you may make a ftronger fire: but then it is proper to add a little of fome fat body; for this diffolves mineral fulphur: it changes the mixture of it in fome part, which, for inftance, confifts in a certain proportion of acid and phlogifton; and at the fame time hinders the metallic earth from being reduced into copper, by being burnt to an excefs. From thefe effects, the reafon is plain, why affayers produce lefs metals in the trying of veins of copper, lead, and tin, than fkilful fmelters do in large operations. For the former perform the roafting under a muffle, with a clear fire, and without any oily reducing menftruum; whereas the latter perform it in the middle of charcoal or of wood, which perpetually emit a reductive phlogifton.

" The darker and blacker the powder of the roafted ore appears, the more copper you may expect from it. But the redder it looks, the lefs copper and the more iron it affords; for roafted copper diffolved by fulphur or the acid of it is very black, and iron, on the contrary, very red.

PROCESS V.

The precipitation of copper out of roafted ore of the laft procefs.

" Divide the roafted ore into two parts: each of them fhall go for a centner: add to it the fame weight of fandiver, and four times as much of the black flux, and mix them well together. As for the reft, do all according to the procefs I.: the precipitated regulus will be half malleable, fometimes quite brittle, now and then pretty much like pure copper in its colour, but fometimes whitifh, and even blackifh. Whence it is moft commonly called *black copper*, tho' it is not always of fo dark a dye.

" It is eafy to conceive, that there is as great a difference between the feveral kinds of that metal called *black copper*, as there is between the pyritofe and other copper ores accidentally mixed with other metallic and femi-metallic bodies. For all the metals, the ores of which are intermixed with the copper ores, being reduced, are precipitated together with the copper, which is brought about by means of the black flux. Wherefore iron, lead, tin, the reguline part of antimony, bifmuth, moft commonly are mixed with black copper in a multitude of different proportions. Nay, it is felf-evident, that gold and filver, which are diffolvable by all thefe matters, are collected in fuch a regulus when they have been firft hidden in the ore. Befides, fulphur and arfenic are not always altogether abfent. For they can hardly be expelled fo perfectly by the many preceding roaftings, but there remain fome veftiges of them, which are not diffipated by a fudden melting, efpecially in a clofe veffel, wherein the flux fwimming at top hinders the action of the air. Nay, arfenic is rather fixed by the black flux, and affumes a reguline femi-metallic form, while it is at the fame time preferved from diffipating by the copper.

PRO-

Essaying of Ores of Copper.

PROCESS VI.

To reduce black copper into pure copper by scorification.

" Separate a specimen of your black copper, of the weight of two small docimastical centners at least; and do it in the same manner, and with the same precautions, as if you would detect a quantity of silver in black copper.

" Then with lute and coal-dust, make a bed in the cavity of a test moistened: when this bed is dry, put it under the muffle of the docimastical furnace, in the open orifice of which there must be bright burning coals, wherewith the test must likewise be surrounded on all parts. When the whole is perfectly red-hot, put your copper into the fire, alone, if it contains lead; but if it is altogether destitute of it, add a small quantity of glass of lead, and with a pair of hand-bellows increase the fire, that the whole may melt with all speed: this done, let the fire be made a little violent, and such as will suffice to keep the metallic mass well melted; and not much greater. The melted mass will boil, and scorias will be produced, that will gather at the circumference. All the heterogeneous matters being at last partly dissipated, and partly turned to scorias, the surface of the pure melted copper will appear. So soon as you see it, take the pot out of the fire, and extinguish it in water: then examine it in a balance, and if lead has been at first mixed with your black-copper, add to the regulus remaining of the pure copper, one 15th part of its weight which the copper has lost by means of the lead, then break it with a vice; and thus you will be able to judge by its colour and malleability, and by the surface of it after it is broken, whether the purifying of it has been well performed or no. But whatever caution you may use in the performing of this process, the product will nevertheless be always less in proportion than what you can get by a greater operation, provided the copper be well purified in the small trial.

" *Remarks.* This is the last purifying of copper, whereby the separation of the heterogeneous bodies begun in the foregoing process is completed as perfectly as it possibly can be. For, except gold and silver, all the other metals and semimetals are partly dissipated and partly burnt, together with the sulphur and arsenic. For in the fusion they either turn of themselves to scoria or fumes, or this is performed by means of iron, which chiefly absorbs semimetals, sulphur and arsenic, and the destruction of it is at the same time accelerated by them. Thus the copper is precipitated out of them pure; for it is self-evident, that the unmetallic earth is expelled, the copper being reduced from a vitrescent terrestrial to a metallic state, and the arsenic being dissipated by means of which the said earth has been joined to the coarser reguluses of the first fusion. But there is at the same time a good quantity of the copper that gets into the scorias: however, a great part of it may be reduced out of them by repeating the fusion.

" The fire in this process must be applied with all imaginable speed, to make it soon run: for if you neglect this, much of your copper is burnt; because copper that is only red-hot, cleaves much sooner, and in much greater quantity, into half-scorified scales, than it is diminished in the same time when melted. However, too impetuous a fire, and one much greater than is necessary for the fusion of it, destroys a much greater quantity of it than a fire sufficient only to put it in fusion would do. For this reason, when the purifying is finished, the body melted must be extinguished in water together with the vessel, lest, being already grown hard, it should still remain hot for a while; which must be done very carefully to prevent dangerous explosions.

" The scoria of the above process frequently contains copper. To extract which, let two or three docimastical centners of the scoria, if it be charged with sulphur, be beat to a subtil powder, and mix it, either alone, or, if its refractory nature requires it, with some very fusible common pounded glass without a reducing saline flux, and melt it in a close vessel, and in a fire having a draught of air; by which you will obtain a regulus.

" But when the scoria has little or no sulphur at all in it, take one centner of it, and with the black flux manage it as you do the fusible copper ore, (process I.) by which you will have a pure regulus."

PROCESS VII.

The following process is translated from Mr Gellert's *Elements of Essaying*, and describes a new method of essaying ores, concerning which, see the section *Of Essaying in general*, p. 4922, col. 2.

To essay copper ores.

Roast a quintal of ore [in the manner described in process IV.]; add to it an equal quantity of borax, half a quintal of fusible glass, and a quarter of a quintal of pitch: put the mixture in a crucible, the inner surface of which has been previously rubbed with a fluid paste of charcoal-dust and water: cover the whole with pounded glass mixed with a little borax, or with decrepitated sea-salt: put a lid on the crucible, which you will place in an air-furnace, or in a blast-furnace: when the fire shall have extended to the bottom of the coals, let it be excited briskly during half an hour, that the crucible may be of a brisk red colour: then withdraw the crucible, and when it is cold break it: observe if the scoria be well made: separate the regulus, which ought to be semi-ductile; and weigh it. This regulus is black copper; which must be purified, as in process VI.

If the ore be very poor, and inveloped in much earthy and stony matters; to a quintal of it, a quintal and a half of borax, a quarter of a quintal of pitch, and ten pounds of calx of lead or minium, must be added. The calx of lead will be revived, and will unite with the scattered particles of the copper, and together with these will fall to the bottom of the crucible, forming a compound regulus. When the ores of copper are very rich, half a quintal of borax and a quarter of a quintal of glass will be sufficient for the reduction. If the ore is charged with much antimony, a half or three quarters of a quintal of clean iron-filings may be added; otherwise the large quantity of antimony might destroy the copper, especially if the ore contained no lead. If iron be contained in copper ore, as in pyrites, some pounds of antimony, or of its regulus, may be

Effaying of Ores of Copper.

be added in the effay; as thefe fubftances more readily unite with iron than with copper, and therefore difengage the latter metal from the former.

PROCESS VII.

To effay Ores of Copper by humid Solution.

Some pyrites and ores contain fo fmall a quantity of copper, that it cannot be feparated by the above proceffes, but is deftroyed by the repeated roaftings and fufions. Thefe, and indeed any copper-ores, may be effayed by humid folution, or by menftruums.

1. By roafting a fulphureous ore, the fulphur is burnt or decompofed, its phlogifton with part of the acid evaporating, while the remaining part of the acid combines with the metals, efpecially with the copper and iron contained in the ore. Accordingly, from an ore thus roafted, a vitriolic folution may be obtained by lixiviation with warm water, efpecially if the ore has been expofed, during a few days after it has been roafted, to a moift air; as the water thus gradually applied unites better with the combination of the metallic calxes with the concentrated vitriolic acid of the fulphur: but all the copper is not thus reduced by one operation to a vitriol. More fulphur muft therefore be combined with the refiduous ore by fufion, and muft be again burnt off, that the remaining part of the copper may be attacked by fome of the acid of the fulphur. By repeating this operation, almoft all the copper and iron will be reduced to a vitriolic lixivium, from which the copper may be feparated and precipitated by adding clean pieces of iron.

2. Copper-ores may be more eafily effayed by humid folution in the following manner:

Roaft the mineralized ores in the manner directed in Procefs IV. and pulverife them. If the ores be calciform, they do not require a previous roafting. Put this powder into a matrafs capable of containing ten times the quantity of the ore; pour upon the ore fome water: fet the matrafs in a fand-bath, that the water may boil: pour off the lixivium: add to the refiduous ore more water, with fome vitriolic or marine acid: digeft as before in the fand-bath, and add this lixivium to the former: repeat this operation, till you find that the acid liquor diffolves no more metal.

By adding clean plates of iron you may precipitate the copper, which ought then to be collected, fufed with a little borax and charcoal duft, and weighed.

We may remark, that although copper is not foluble by a dilute vitriolic acid, yet the calx of it obtained by roafting the ore, and alfo the calciform ores, are readily foluble in that acid.

3. Stahl advifes to effay copper-ores by boiling them, after they have been roafted and powdered, in water, together with tartar and common falt, or with alum and common falt: but we have not found this method fo effectual as the preceding.

PROCESS VIII.

Dr Fordyce's method of effaying copper ores, by means of Aqua Regia. [Phil. Tranf. for 1781, vol. lxxx. art. 3.]

This method confifts only in pouring a quantity of an aqua regia compofed of equal parts of the nitrous and muriatic acids upon a fmall quantity of the ore in powder, till a frefh affufion of the menftruum fhews no green or blue tinge; by which means all the metalline part of the ore will be diffolved. It is then to be precipitated by means of a folution of fixed alkali, or volatile alkali cautioufly managed will anfwer the fame purpofe. The metal then appears in form of a green precipitate called *green verditer;* but is mixed with what calcareous earth might have been contained in the ore; which the acids would diffolve, and the fixed alkali, if that kind was ufed, would precipitate. The cauftic volatile alkali would not throw down this earth, and is therefore to be preferred to any other; but care muft be taken to hit the point of faturation very exactly with it, as it violently diffolves the metal if added in too great quantity. Dr Fordyce orders this green calx to be diffolved in vitriolic acid, and then, by adding a piece of clean iron to the folution, all the copper contained in the ore will be obtained in its metallic form.

This method can be fubject to no fallacy, unlefs the ore contains aluminous matter, in which cafe fome of the earth of alum will be mixed with the metal, as that earth will be precipitated by fixed alkali, by cauftic volatile alkali, and by iron. This, however, may very effectually be prevented by diffolving the green calx firft in volatile alkali, and then in vitriolic acid. It is even probable, that by reducing the ore to a very fine powder, and treating it with cauftic alkali, all the metal might be feparated from the ore, without the trouble of ufing aqua regia. For the principles on which this method is conducted, fee the article Chemistry *paffim*.

Sect. V. *Ores of Lead.*

Lead is feldom found native (e) and malleable. Neither, fays Mr Macquer (f), is it found in form of calx or precipitate, as copper is, becaufe it is much lefs liable to lofe its phlogifton by the action of air and water: therefore almoft all lead is found naturally mineralized.

Lead is generally mineralized by fulphur (g). Its ores have a dark white, but a fhining metallic colour. Thefe

(e) Cronftedt doubts whether any native lead has been found. Linnæus fays, he has feen what externally appeared to be fuch.

(f) But he is miftaken. As lead unites ftrongly with vitriolic acid, we might expect to meet ochres of this metal as well as of copper. Accordingly, we find fome calciform ores of lead. 1. A pure calx of lead, in form of a friable ochre, *ceruffa nativa*, found on the furface of galena; or it is indurated with a radiated or fibrous texture, of a white or yellowifh green colour, and refembling fpar; it is called *fpatum plumbi*, *fparry lead-ore*, and *lead-fpar*. 2. A calx of lead is found mixed with calx of arfenic, forming the ore called *arfenicated lead-fpar*. Sometimes alfo that calx is mixed with calcareous earth.

(g) Lead is mineralifed, 1. With fulphur; fuch are the feveral kinds of fteel-grained and teffelated galenas, which alfo contain generally fome filver. 2. With fulphurated iron and filver. It is fine-grained or teffelated, and is diftin-

Ores of Lead

These ores, although they form irregular masses, are internally regularly disposed, and seem to be composed of cubes of different sizes applied to each other, but not adherent. These ores are generally distinguished by the name of *Galena*. They commonly contain about three quarters of lead and a quarter of sulphur. They are accordingly heavy and fusible, although much less so than pure lead.

Most lead-ores contain silver; none but those of Willach in Carinthia are known to be quite free from it: some of them contain so much of it, that they are considered as improper ores of silver. The smaller the cubes of galena are, the larger quantity of silver has been remarked to be generally contained.

§ 2. *Lead ores may be essayed*, 1. By means of the black flux, in the manner directed by Mr Cramer, as follows:

"Let one or more quintals of this ore be grossly powdered, and roasted in a test till no more sulphureous vapours be exhaled, and then reduced to a finer powder; it is then to be accurately mixed with twice its weight of black flux, a fourth part of its weight of clean filings of iron and of borax. The mixture is to be put into a good crucible, or rather into a test; it is then to be covered with a thickness of two or three fingers of decrepitated sea-salt; the crucible is to be closed, and placed in a melting furnace, which is to be filled with unlighted charcoal, so that the top of the crucible shall be covered with it. Lighted coals are then to be thrown upon the unkindled charcoal, and the whole is left to kindle slowly, till the crucible be red-hot; soon after which a hissing noise proceeds from the crucible, which is occasioned by the reduction of the lead: the same degree of fire is to be maintained while this noise continues, and is afterwards to be suddenly increased, so as to make a perfect fusion; in which state it is to be continued during a quarter of an hour; after which it is to be extinguished; and the operation is then finished."—The filings of iron are added to the mixture, to absorb the sulphur, a certain quantity of which generally remains united with the lead-ore, notwithstanding the roasting. We need not fear lest this metal should unite with the lead and alter its purity; because, although the sulphur should not hinder it, these two metals cannot be united. The refractory quality of the iron does not impede the fusion; for the union it forms with the sulphur renders it so fusible, that it becomes itself a kind of flux.—This addition of iron in the essay of lead-ores would be useless, if the ores were sufficiently roasted, so that no sulphur should remain.

Or, 2. By the following process of Mr Gellert.

"Mix a quintal of roasted-lead ore with a quintal of calcined borax, half a quintal of glass finely pulverised, a quarter of a quintal of pitch, and as much of clean iron-filings: put this mixture into a crucible wetted with charcoal-dust and water: place the crucible before the nozzle of the bellows of a forge, and when it is red raise the fire during 15 or 20 minutes; then withdraw the crucible, and break it when cold."

Some very fusible ores, such as the galena of Derbyshire, may be essayed, as large quantities of it are smelted, without previous roasting, and without addition, merely by fusion during a certain time. For this purpose nothing more is requisite than to keep the ore melted in a crucible with a moderate heat, till all the sulphur is destroyed, and the metal be collected. To prevent the destruction of any part of the metal after it is separated from the sulphur, some charcoal dust may be thrown over the ore, when put into the crucible; but if the galena be mixed with pyrites, especially arsenical pyrites, it requires much roasting and saline fluxes.

Ores of Tin

Sect. VI. *Tin Ores.*

§ 1. Tin is very seldom found pure, but almost always mineralized, and chiefly by arsenic.

The richest ore of tin is of an irregular form, of a black or tarnished colour, and almost the heaviest of all ores. The cause of this extraordinary weight is, that it contains much more arsenic than sulphur, whereas most ores contain more sulphur than arsenic.

The most common tin ore is of the colour of rust, which proceeds from a quantity of iron, or of iron-ore mixed with it. The tin-ores of Saxony and Bohemia appear to be all of this kind.

One kind of tin-ore is semi-transparent and like spar. Lastly, several kinds of garnets are enumerated by mineralogists among tin-ores, because they actually contain tin.

The county of Cornwall, in England, is very rich in tin-ores; and the tin contained in them is very pure. From tin-mines in the East Indies tin is brought, called *Malacca tin*. No mines of tin have been dicovered in France; only in Bretagne garnets are found which contain some tin.

Native tin is said to have been found in Saxony and Malacca. Its ores are all of the calciform kind, excepting black-lead, which appears to be tin mineralized by sulphur and iron.

The calciform ores of tin are, 1. Tin-stone, which is of a blackish-brown colour, and of no determinate figure; and tin-grains, or crystals of tin, which resemble garnets, and are of a spherical or polygonal figure, which they have probably acquired by the attrition of their angles. The tin-stone seems to consist of attrited tin-grains. This ore is calx of tin united with calx of arsenic, and frequently with calx of iron. 2. Garnets are said to contain calx of tin united with calx of iron. 3. Manganese is said also to contain tin.

§ 2. *Ores of tin may be essayed* in the same manner, according to Cramer, as he directed for the essay of lead-ores, *supra*. He further makes upon this essay the following remarks.

1. Tin-ore, on account of its greater gravity, admits better of being separated, by elutriation or washing, from earths, stones, and lighter ores. 2. A most exact separation of earths and stones ought to be made, because the scorification of these by fluxes requires such a heat as would destroy the reduced tin. 3. The iron ought to be separated by a magnet. 4. By a previous roasting, the arsenic is dissipated, which would otherwise carry off a great deal of tin along with it in a melting

distinguished from the former by yielding a black slag when scorified, whereas the former yields a yellow slag. 3. With sulphurated antimony and silver. *Plumbum stibiatum Linnæi*. Its colour is similar to that of galena, and its texture is striated. 4. With sulphur and arsenic. This cure is soft, almost malleable, like lead. From this ore lead may be melted by the flame of a candle.

Ores of Iron

ing heat, would change another part of it into afhes, and would vitiate the remaining tin. 5. The effay of tin is very precarious and uncertain; becaufe tin once reduced is eafily deftructible by the fire, and by the faline fluxes requifite for the reduction.

Mr Gellert directs, that ores of tin fhould be effayed in the following manner:

"Mix a quintal of tin-ore, wafhed, pulverized, and twice roafted, with half a quintal of calcined borax, and half a quintal of pulverized pitch: thefe are to be put into a crucible moiftened with charcoal-duft and water, and the crucible placed in an air-furnace: after the pitch is burnt, give a violent fire during a quarter of an hour; and then withdraw your crucible. If the ore be not very well wafhed from the earthy matters, as it ought to be, a larger quantity of borax is requifite, with fome powdered glafs, by which the too quick fufion of the borax is retarded, and the precipitation of the earthy matters is prevented. If the ore contains iron, to the above mixture may be added fome alkaline falt.

Sect. VII. *Ores of Iron.*

§. 1. Iron is feldom found in its metallic ftate, and free from admixture; though Cramer gives an account of an ore which needs only to be put into a forge, and heated to a welding heat. Several fands and earths alfo have the appearance of iron, and are even attractable by a magnet. The ore mentioned by Cramer is found vitrified; with moderate blows the fcorias are thrown out, and a mafs of iron obtained, which, by being put into the forge again, gives tough iron without any other procefs. But in general this metal is found in the ftate of a calx; or, though it is combined with a great quantity of the principle of inflammability, it has feldom enough of the metallic form; and it is very often intermixed with a certain proportion of fulphur. The minerals wrought for iron are three, viz. iron-ore, iron-ftone, and bog-ore.

The iron ore is found in veins as the ores of other metals are, and the appearance is very various; fometimes it has a rufty iron colour refembling that of iron; fometimes it has a reddifh caft; often it is formed into a fort of cryftallizations which are protuberant knobs on the outfide; and thefe confift of fibres tending to a common centre; and it is of a dark colour like coagulated blood. It is called *hæmatites*, or *blood-ftone;* and confifts of a calx of iron with a fmall quantity of vitriolic acid.

Iron-ftone in this country is clay found in ftrata with coal; but which contains a large quantity of iron, fo as to make the working profitable. Sometimes it has little appearance of iron; but, when burnt with a certain degree of heat, it becomes of a deep red.

The bog-ore is an ochre of iron, and is found generally in low fituations, and in fprings containing a fmall quantity of iron, which flowing over thefe grounds depofits it in the form of ochre; and after a number of ages it proves a rich mine of iron, and it is extracted from a calx of this kind in many parts of the world. There is alfo a particular kind of fpar found in different countries of a pale blue colour, fo that from its firft appearance we would expect copper; but it contains a fmall quantity of iron, and is a combination of the metal with inflammable matter, as in Pruffian blue.

Effaying of Ores of Iron.

The loadftone is a noted iron ore. It is always found in veins, and it is alleged that it is only poffeffed of its magnetic qualities when near the furface. In appearance, it does not differ from many of the ores of iron, and treated as an ore, it affords a confiderable quantity of metal.

Neither is iron generally mineralized fo diftinctly as other metals are, unlefs in pyrites and ores of other metals.

Moft of the minerals called *iron ores* have an earthy, rufty, yellowifh, or brownifh appearance, which proceeds from the facility with which the true iron ores are decompofed.

Iron is the moft common and moft abundant of all metals. In Europe, at leaft, we cannot find an earth, a fand, a chalk, a clay, a vitrifiable or calcinable ftone, or even the afhes of any fubftance, which do not contain an earth convertible into iron. All earths and ftones which are naturally yellow or red, and all thofe which acquire thefe colours by calcination, receive them from the ferruginous earth mixed with them. The yellow and red ochres confift almoft folely of this earth: the black and heavy fands are generally very ferruginous.

The iron ore moft commonly found is a ftone of the colour of ruft, of an intermediate weight betwixt thofe of ores in general and of unmetallic ftones. This ore has no determinate form, and eafily furnifhes an iron of good quality.

Blood-ftone or hematites, fanguine or red chalk, and emery, are iron ores; fome of which, for inftance blood-ftone, are almoft all iron. Moft of thefe fubftances require but a flight calcination to be rendered very attractable by a magnet, and foluble in aqua fortis; but the iron obtained from them is of a bad quality, and they are therefore neglected. Iron from the hematites is very brittle; that obtained from ochres is red-fhort. All thefe iron ores are fo refractory, that they can fcarcely be fufed.

Iron ores are very various in their form; or rather they have no determinate form. Sometimes they are earths, fometimes ftones, fometimes grains. Accordingly, thofe naturalifts who attend only to the external form of things in claffing and fubdividing minerals, have been obliged to multiply the names of iron ores: hence they are called *iron ores in form of peafe, of beans, of coriander feeds, of pepper-corns, of cinnamon*, &c. which Mr Cramer treats as ridiculous trifles,

§. 2. *Ores of iron may be effayed* by the following procefs.

PROCESS I.

[Cramer's *Art of Affaying*, Proc. 54.]

To reduce a precipitate iron out of its ore in a clofe veffel.

"Roast for a few minutes in a teft under a muffle, and with a pretty ftrong fire, two centners of the fmall weight of your iron ore grofsly pulverifed; that the volatiles may be diffipated in part, and the ore itfelf be foftened in cafe it fhould be too hard. When it is

Essaying of Ores of Iron.

is grown cold, beat it extremely fine, and roaſt it a ſecond time, as you do the copper-ore, but in a much ſtronger fire, till it no longer emits any ſmell; then let it grow cold again. Compoſe a flux of three parts of the white flux, with one part of fuſible pulveriſed glaſs, or of the like ſterile unſulphureous ſcorias, and add ſandiver and coal-duſt, of each one half-part; add of this flux three times the quantity of your roaſted ore, and mix the whole very well together; then chooſe a very good crucible, well rubbed with lute within, to ſtop the pores that may be here and there unſeen; put into it the ore mixed with the flux; cover it over with common ſalt; and ſhut it cloſe with a tile, and with lute applied to the points.

" Put the wind-furnace upon its bottom-part, having a bed made of coal-duſt. Introduce beſides into the furnace a ſmall grate ſupported on its iron bars, and a ſtone upon it, whereon the crucible may ſtand as on a ſupport: ſurround the whole with hard coals, not very large, and light them at top. When the veſſel begins to grow red, which is indicated by the common ſalt's ceaſing to crackle, ſtop with groſs lute the holes of the bottom-part, except that in which the nozzle of the bellows is received: blow the fire, and excite it with great force, adding now and then freſh fuel, that the veſſel may never be naked at top: having thus continued your fire in its full ſtrength for three quarters of an hour, or for a whole hour, take next the veſſel out of it, and ſtrike ſeveral times the pavement upon which it is ſet, that the ſmall grains of iron which happen to be diſperſed may be collected into a regulus, which you will find after having broken the veſſel.

" When the regulus is weighed, try its malleability: then make it red-hot; and when ſo, ſtrike it with a hammer: if it bears the ſtrokes of a hammer, both when red-hot and when cold, and extends a little, you may pronounce your iron very good; but if, when either hot or cold, it proves brittle, you may judge it to be not quite pure, but ſtill in a ſemi-mineral condition.

" *Remarks.* The arſenic, but eſpecially the ſulphur, muſt be diſſipated by roaſting: for the former renders the iron brittle; and the latter not only does the ſame, but, being managed in a cloſe veſſel, with a ſaline alkaline flux, turns to liver of ſulphur; to the action of which iron yielding in every reſpect, it can upon no account be precipitated; and if not the whole, a great part of it, at leaſt, is retained by the ſulphureous ſcoria; ſo that in this caſe you commonly in vain look for a regulus.

" The iron obtained from this firſt precipitation has hardly ever the requiſite ductility, but is rather brittle: the reaſon of which is, that the ſulphur and arſenic remain in it; for notwithſtanding that the greateſt part of theſe is diſſipated by roaſting, yet ſome part adheres ſo ſtrictly, that it can never be ſeparated but with abſorbent, terreſtrial, alkaline ingredients, that change the nature of the ſulphur. For which reaſon, in larger operations, they add quicklime, or marble ſtones that turn into quicklime; which, while they abſorb the ſaid minerals, are, by it, and by help of the deſtroyed part of the iron, brought to a fuſion, and turn to a vitrified ſcoria; although, at other times, they reſiſt ſo much by their own nature a vitrification. Another cauſe of the brittleneſs of iron is the unmetallic earth, when it is not yet ſeparated from it; for the iron ore contains a great quantity of it, and in the melting remains joined with the reguline part: whence the iron is rendered very coarſe and brittle. Some iron ores are altogether untractable: nevertheleſs, the reguluſes produced out of them, when broken, have ſometimes a neat ſemi-metallic look; which proceeds undoubtedly from a mixture of a ſmall quantity of ſome other metal or ſemi-metal."

PROCESS II.

[The following Proceſs for eſſaying iron ores, and ferruginous ſtones and earths, is extracted from Mr Gellert's *Elements of Eſſaying.*]

" Roast two quintals of iron ore, or of ferruginous earth: divide the roaſted matter into two equal parts; to each of which add half a quintal of pulveriſed glaſs, if the ſubſtance be fuſible and contain much metal; but if otherwiſe, add alſo half a quintal of calcined borax. If the roaſting has entirely diſengaged the ſulphur and arſenic, an eighth part, or even half a quintal, of quicklime may be added. With the above matters, mix twelve pounds of charcoal-powder.

" Take a crucible, and cover the bottom and ſides of its inner ſurface with a paſte made of three parts of charcoal-duſt and one part of clay beat together. In the hollow left in this paſte put the above mixture; preſs it lightly down; cover it with pulveriſed glaſs; and put on the lid of the crucible.

" Place two ſuch crucibles at the diſtance of about four fingers from the air-pipe, in ſuch a manner that the air ſhall paſs betwixt them at about the third part of the height from the bottom: fill the ſpace betwixt the two crucibles with coals of a moderate ſize: throw lighted coals upon them, that the fire may deſcend and make them red-hot from top to bottom: at firſt let the bellows blow ſoftly, and afterwards ſtrongly during an hour, or an hour and a quarter: then take away the crucible, and break it when cold. A regulus will be found in the bottom, and ſometimes ſome ſmall grains of iron in the ſcoria, which muſt be ſeparated and weighed along with the regulus: then try the regulus, whether it can be extended under the hammer, when hot and when cold.

" *Remarks.* To diſengage a metal from the earthy matters mixed with it by fire, we muſt change theſe matters into ſcoria or glaſs. This change may be effected by adding ſome ſubſtance capable of diſſolving theſe matters; that is, of converting them into a ſcoria or glaſs, from which the metallic matters may, by their weight, ſeparate and form a regulus at bottom. Fixed alkali, which is an ingredient of the black and of the white flux, is a powerful ſolvent of earths and ſtones: but the alkali does alſo diſſolve iron, eſpecially when this is in a calcined or earthy ſtate; and this ſolution is ſo much more complete, as the fire is longer applied. Hence, in ordinary eſſays, where an alkaline ſalt is uſed, little or no regulus of iron is obtained. Now, glaſs acts upon and diſſolves earths and ſtones; but not, or very little, iron: conſequently glaſs is the beſt flux for ſuch eſſays, and experience confirms this aſſertion. If the ore contains but little iron, we may alſo

Ores of Mercury.

also add to the glass some borax; but borax cannot be employed singly, because it very soon fuses, and separates from the ore before the metal is revived. Quicklime is added, not only to absorb the sulphur and arsenic remaining in the ore, but also because it dissolves and vitrifies the stony and earthy matters of iron ores, which are generally argillaceous. For which reason, in the large operations for smelting iron ore, quicklime, and even in certain cases gypsum, are commonly added to facilitate the fusion.

The reduction of iron-ore, and even the fusion of iron, requires a violent and long-continued heat: therefore, in this operation, we must not employ an inflammable substance, as pitch, that is soon consumed, but charcoal pulverised, which in close vessels is not sensibly wasted. Too much charcoal must not be added, else it will prevent the action of the glass upon the earthy matter of the ore, and consequently the separation of the metallic part. Experiments have taught me, that one part of charcoal-dust to eight parts of oar was the best proportion.

When iron is surrounded by charcoal, it is not decomposed or destroyed: hence the iron of the ore, which sinks into the hollow made of paste of charcoal-dust and clay, remains there unhurt. The clay is added in this paste to render it more compact, and to keep the fluid iron collected together.

The air is directed betwixt the crucibles; because if it was thrown directly upon them, they would scarcely be able to resist the heat. The space betwixt the air-pipe and the crucibles ought to be constantly filled with charcoal, to prevent the cold air from touching the crucibles. Ductile and malleable iron is seldom obtained in this first operation. The sulphur and arsenic, and frequently also an earthy matter adhering to the iron, prevent these qualities.

Sect. VIII. *Ores of Mercury.*

§ 1. Mercury is sometimes found pure, fluid, and in its proper metallic state, only mixed with earths and stones. Such are the ores of mercury found near Montpelier, in Tuscany, and in other places.

But the largest quantity of the mercury found in the earth is mineralised by sulphur, and consequently is in the form of cinnabar.

Mercury is never mineralised by arsenic. The richest mine of mercury is that of Almaden, in Spain.

Linnæus and Cronstedt mention a singular ore, in which the mercury is *mineralised by sulphur and by copper*. It is said to be of a blackish-grey colour, of a glassy texture, and brittle. When the mercury and sulphur are expelled by fire, the copper is discovered by giving an opake red colour to glass of borax, which, by continuance and increase of heat, becomes green and transparent.

§ 2. Cramer directs, that *ores of mercury should be essayed* by the following Processes.

PROCESS I.

To separate Mercury out of an unsulphureous Ore by Distillation.

" Take a lump of the pulverised ore, one common pound, which must stand for one centner: put it into a glass retort perfectly clean, well loricated, or coated up to half the length of its neck: this must be very long, and turned backwards with such a declivity, that a glass recipient may be perpendicularly applied to it: but you must choose a retort small enough, that the belly of it may be filled hardly two-thirds with the ore: this retort must be placed so, that nothing of the fluid adherent to the neck of it may fall into the cavity of the belly, but that the whole may run forward into the recipient. Finally, have a small recipient full of cold water: let it be perpendicularly situated, and receive the neck of the retort in such manner that the extremity of it be hardly one half-inch immersed into the water.

Essaying of Ores of Mercury.

" Let the retort be surrounded with hot burning coals placed at some distance in form of a circle, lest the vessel should burst by too sudden a heat: then by degrees bring the burning coals nearer and nearer, and at last surround the whole retort with them and with fresh charcoal, that it may grow slightly red-hot: this fire having been continued for an hour, let the retort cool of itself: then strike the neck of it gently, that the large drops which are always adherent to it may fall into the recipient: let the recipient be taken away, and the water separated from the mercury by filtration, and let the mercury be weighed. This operation may be more conveniently performed in a sand-bath; in which case the pot containing the sand must be middling red-hot, and the retort be able to touch the bottom of it immediately; nor is it then necessary that the retort be loricated."

PROCESS II.

To revive Mercury from a sulphureous Cinnabar-ore.

" Beat your ore extremely fine, and mix it exactly with an equal portion of iron-filings, not rusty; proceed to distill it with the same apparatus as in the former process, but urge it with the strongest fire that can be made.

" Cinnabar may be separated from stones by sublimation thus: Beat it to a fine powder, and put it into a small narrow glass or earthen cucurbit, the belly of which it must not fill more than one-third part: stop the orifice at top; this must be very narrow, to hinder the free action of the air. Put this small cucurbit in an earthen pot above two inches wide in diameter, and gather sand around this pot about as high as the pulverised ore rises in the cucurbit. Then put it upon burning coals in such manner that the bottom of the pot may be middling red-hot. Thus will your cinnabar ascend and form a solid ponderous ring, which must be got out by breaking the vessel."

Sect. IX. *Ore of the Regulus of Antimony.*

Native regulus of antimony was first observed by Mr Swab, in Sweden, in the mine of Salberg, and described by him in the memoirs of the Swedish Academy in 1749. Mr Wallerius mentions it in his Mineralogy.

Regulus of antimony is generally united with sulphur, with which it forms antimony, which ought to be considered as a true ore of the regulus of antimony.

Another ore of regulus of antimony is also known, of

Ores of Antimony. of a red colour, in which the regulus is mineralised both by arsenic and by sulphur. This ore resembles some iron ores, and some kinds of blend. It is distinguished by its great fusibility, which is such, that it may be easily melted by the flame of a candle.

The *native regulus* of antimony, by Von Sweb, is said by that author to have differed from the regulus of antimony obtained from ores, in these two properties, that it was capable of being easily amalgamated with mercury, and that its calx shot into crystals during the cooling.

Besides the ores of regulus of antimony enumerated above, this semimetal is also found in ores of other metallic substances, as in the *plumose silver-ore*, and in the *stibiated lead-ore*.

§ 2. The *ores of antimony may be essayed* by the following processes described by Mr Cramer.

PROCESS I.

To obtain antimony from its ore.

"Choose a melting crucible, or an earthen pot not glazed, that may contain some common pounds of the ore of antimony, broken into small bits. Bore at the bottom of the crucible some small holes, two lines in diameter. Let the bottom of the vessel be received by the orifice of a smaller one, upon which it must be put; and when the ore is put into it, let it be covered with a tile, and all the joints be stopped with lute.

"Put these vessels upon the pavement of a heath, and put stones all around them at the distance of six inches. Fill this intermediate space with ashes, so high that the inferior pot be covered to the upper brim. Then put fresh and burning coals upon it, and with a pair of hand-bellows excite the fire, till the upper vessels grow red-hot: take off the fire a quarter of an hour after; and when the vessels are grown cold, open them. You will find that the melted antimony has run through the holes made at the bottom of the upper vessel into the inferior one, where it is collected."

PROCESS II.

To roast crude antimony, or its ore, with or without addition.

"Choose an earthen, flat, low dish, not glazed; and if it cannot bear being made middling red-hot, cover it over with a coat of lute without. Spread it thinly over with crude antimony, or with its ore, beaten to a pretty coarse powder, not exceeding a few ounces at once. Put the dish upon a fire-pan, having a few burning coals in it: increase the fire till it begins to smoke a little. Meanwhile you must incessantly move the powder with a piece of new tobacco-pipe; for this causes the sulphur to evaporate the sooner. If you increase the fire a little too soon, the powder immediately gathers into large clots, or even begins to melt. When this happens, take it immediately off the fire before it melts entirely. Then pulverise it again, and finally make a gentle fire under it. Your black shining powder will assume an ash-colour almost like that of earth, and become more refractory in the fire; wherefore you may then increase the fire till your powder grows middling red-hot, and let it last till it ceases to smoke. If you add to your crude antimony pulverised, half or an equal quantity of charcoal-dust, and perform the rest as above, the roasting will be done more conveniently: for it does not gather so easily into clots, and melts with much greater difficulty. When part of the sulphur is evaporated, add some fat to it at several times. Thus you will sooner finish the operation, and the remaining calx will not be burnt to excess. However, if it be thus exposed to too violent and long-lasting a fire, a great quantity of it evaporates; nor does it cease entirely to smoke in a great fire. And it will be enough, if, growing middling red-hot, it does no longer emit the unpleasant smell of the acid of sulphur."

PROCESS III.

To reduce a calx of antimony into a semi-metallic regulus.

"Mix some calx of antimony with a quarter part of the black flux, and put it into the crucible. Cover the vessel with a tile; make the fire as quickly as the vessel can bear it, but not greater than is necessary to melt the flux. When the whole has been well in fusion for half a quarter of an hour (which may be tried with a tobacco-pipe, taking off the tile) pour it into the melting cone, which must be warm and done over with tallow. Then immediately strike the cone several times. You will find, when the cone is inverted, a regulus, above which is a saline scoria."

The methods of *calcining antimony by means of nitre*, are described under Chemistry, n° 489—459; and those of obtaining a *regulus of antimony* without a previous calcination or roasting, by throwing a mixture of powdered antimony, tartar, and nitre, into a red-hot crucible, and by fusing this mixture, and of obtaining a *martial regulus of antimony*, are described at the article Regulus.

Sect. X. *Ores of Bismuth.*

Ores of Bismuth. § 1. Bismuth is found *native*, resembling the regulus of bismuth.

An *ochre* of bismuth, of a whitish yellow colour, is mentioned by Cronstedt; and is different from the ore improperly called *flowers of bismuth*, which is a calx of cobalt.

Bismuth is mineralised, 1. By *sulphur*. This ore has the appearance of galena. 2. With *sulphurated iron*. Bismuth is found also in cobalts, and in some ores of silver.

§ 2. *Ores of Bismuth* may be *essayed* by the following process.

PROCESS I.

To melt bismuth from its ore.

"Bismuth ore may be melted with the same apparatus as was directed for the fusion of crude antimony out of its ore. Or you may beat your ore to a very fine powder, with the black flux, sandiver, and common salt, in a close vessel, like the ore of lead, or of tin, and melt it in a middling fire, having a draught of air. But as this semi-metal is destructible and volatile, you must as quick as possible apply to it that degree of fire which the flux requires to be melted; and

Ores of Cobalt.

and fo foon as it is well melted, the veffel muft be taken out of the fire; and when it is grown quite cold and broken, you will find your regulus."

Mr Gellert directs that ores of bifmuth fhould be effayed by fufing a quintal of pulverifed ore with half a quintal of calcined borax and half a quintal of pulverifed glafs, in order to vitrify the adherent earths and ftones which invelop the bifmuth. But probably the heat requifite for this vitrification would volatilife part of the bifmuth.

If the ore be of the kinds above defcribed, mineralifed by fulphur, or by fulphur and iron, a previous roafting would be expedient, which may be performed in the fame manner as is directed for the roafting of antimony.

Sect. XI. *Ores of the Regulus of Cobalt.*

Cobalt is a grey-coloured mineral, with more or lefs of a metallic appearance. Its grain is clofe; it is compact and heavy, and frequently covered with an efflorefcence of peach-coloured flowers. Of this feveral kinds are known*. All the true cobalts contain the femi-metal called *regulus* of cobalt, the calx of which becomes blue by vitrification. This regulus is mineralifed in cobalt by fulphur, and efpecially by a large quantity of arfenic. Some cobalts alfo contain bifmuth and filver.

* See *Cobalt.*

Authors have given the name of *cobalt* to many minerals, although they do not contain the femi-metal above-mentioned, but only becaufe they externally refemble the ore of the regulus of cobalt. But thefe minerals can only be confidered as falfe cobalts. They are diftinguifhable from true cobalt by trying whether they can yield the blue glafs called *fmalt*, and the fympathetic ink. The red efflorefcence is alfo a mark by which true cobalt is diftinguifhable from the falfe: but this efflorefcence only happens when the ore has been expofed to a moift air.

The principal mines of cobalt are in Saxony, where they are dug for the fake of obtaining zaffre, azure-blue or fmalt, and arfenic. Very fine cobalt is alfo found in the Pyrenean mountains. It has been likewife found in Cornwall and Scotland. And that it is in the eaftern parts of Afia, appears from the blue colouring on old oriental porcelain: but probably the mines difcovered in thefe countries are nearly exhaufted, as confiderable quantities of zaffre and fmalt are exported from Europe to China.

Cobalt is heavier than moft other ores, from the large quantity of arfenic it contains; and in this refpect it refembles the ore of tin.

Befides the grey or afh-coloured cobalt above defcribed, which is the moft frequent, other cobalts are found of various colours and textures, mixed with various fubftances. Wallerius enumerates fix fpecies of cobalts. 1. The *afh-coloured ore*, which is regulus of cobalt mineralifed by arfenic, confifting of fhining leaden-coloured grains. Some ores of this kind are compact refembling fteel, and others are of a loofe texture and friable. 3. The *fpecular ore* is black, fhining like a mirror, and laminated. This fpecies is very rare; and is fuppofed by Wallerius to be a foliated fpar, or felenites mixed with cobalt. 3. The *vitreous*, or *flag-like ore*, is of a bluifh, fhining colour, compact, or fpongy. 4. *Cryftallized ore*, is a grey, deep-coloured cobalt, confifting of clufters of cubical, pyramidal, prifmatic cryftals. 5. *Flowers of cobalt*, red, yellow, or violet. Thefe flowers feem to be formed from fome of the above-defcribed compact ores, decompofed by expofure to moift air. This decompofition is fimilar to that which happens to ferruginous and cupreous pyrites. 6. The *earthy cobalt* is of a greenifh white, or of a yellow colour, and of a foft and friable texture. This fpecies feems to be an ochre of cobalt; and is formed perhaps from the flowers of cobalt further decompofed, in the fame manner as a martial ochre is formed from the faline efflorefcence of decompofing pyrites, when this efflorefcence is further decompofed by expofure to moift air; by which the vitriolic acid contained in it is expelled, and the efflorefcence is changed from a faline ftate to that of an ochre or calx.

Ores of Zinc.

Befides thefe proper ores, cobalt is alfo found in a blue clay along with native filver, in ores of bifmuth, and in the mineral called *kupfernickel*. See Nickel.

The *effay* of cobalt is defcribed at the article Regulus *of Cobalt.*

Sect. XII. *Ores of Zinc.*

§ 1. The proper ore of zinc is a fubftance which has rather an earthy or ftony than metallic appearance, and is called *calamy*, *calamine*, or *lapis calaminaris*. This ftone, although metallic, is but moderately heavy, and has not the brilliancy of moft other ores. Its colour is yellow, and like that of ruft. It is alfo lefs denfe than other metallic minerals. It feems to be an ore naturally decompofed. The calamine is not worked directly to obtain zinc from it, becaufe this would only fucceed in clofe veffels, and confequently with fmall quantities, according to Mr Margraaf's procefs. But it is fuccefsfully employed for the converfion of copper into brafs by cementation, by which the exiftence of zinc in that ftone is fufficiently proved.

Mr Wallerius enumerates alfo amongft the ores of zinc a very compounded mineral, confifting of zinc, fulphur, iron, and arfenic. This mineral, called *blend*, refembles externally the ore of lead, and hence has been called *falfe galena*. Thefe blends have different forms and colours; but are chiefly red, like the red ore of antimony.

Zinc is obtained from certain minerals in the Eaft Indies, of which we know little.

Calciform ores of zinc, according to Cronftedt, are pure or mixed. The pure are indurated, and fometimes cryftallifed, refembling lead-fpar. The mixed ore contains alfo fome calx of iron. This is *calamine*. It is whitifh, yellowifh, reddifh, or brown.

Zinc is *mineralifed*, 1. By *fulphurated iron. Ore of zinc.* Wallerius fays, lead is fometimes contained in this ore. It is white, blue, or brown. 2. By *fulphur, arfenic, and iron. Blend*, or *pfeudo-galena*, or *falfe-galena*, or *black-jack*. Thefe are of various colours, white, yellowifh, brown, reddifh, greenifh, black. They confift of fcales, or are teffelated. Mr Cronftedt thinks, that in blends the zinc is mineralifed in the ftate of a calx, and in the ore of zinc in its metallic ftate.

§ 2. Although the minerals above enumerated have been known, from their property of converting copper into brafs, to be ores of zinc, yet the method of effaying

faying them fo as to obtain the contained zinc was not known, or at leaft not publifhed, before Mr Margraaf's Memoir of the Berlin Academy for the year 1746, upon that fubject. That very able chemift has fhewn, that zinc may be obtained from its ores, from the flowers, or from any other calx of zinc, by treating thefe with charcoal-duft, in clofe veffels, to prevent the combuftion of the zinc, which happens immediately upon its reduction when expofed to air. For this purpofe, he put a quantity of finely powdered calamine, or roafted blend, or other calx of zinc, well mixed with an eighth part of charcoal-duft, into a ftrong, luted earthen retort, to which he fitted a receiver. Having placed his retort in a furnace and raifed the fire, he applied a violent heat during two hours. When the veffels were cold and broken, he found the zinc in its metallic form adhering to the neck of the retort.

The chief difficulty in this operation is to get an earthen retort fufficiently compact to retain the vapour of the zinc, (for it eafily pervades the Heffian crucibles, Stourbridge melting-pots, and fimilar veffels, as may be feen from the quantity of flowers which appear upon their outer furface, when zinc or its calxes and any inflammable matter have been expofed to heat within thefe veffels) and at the fame time fufficiently ftrong to refift the violent fire which Mr Margraaf requires.

A pretty exact effay of an ore of zinc may be made in the following manner.

Mix a quantity of pulverifed roafted ore or calx of zinc with an eighth part of charcoal-duft. Put this mixture into a crucible capable of containing thrice the quantity. Diffufe equally amongft this mixture a quantity of fmall grains or thin plates of copper equal to that of the calamine or ore employed, and upon the whole lay another equal quantity of grains or plates of copper; and laftly, cover this latter portion of copper with charcoal-duft. Lute a lid upon the crucible; and apply a red heat during an hour or two. The copper or part of it will unite with the vapour of the zinc, and be thereby converted into brafs. By comparing the weight of all the metal after the operation, with the weight of the copper employed; the weight acquired, and confequently the quantity of zinc united with the copper, will be known. The copper which has not been converted into brafs, or more copper with frefh charcoal-duft, may be again added in the fame manner to the remaining ore, and the operation repeated with a heat fomewhat more intenfe, that any zinc remaining in the ore may be thus extracted. A curious circumftance is, that a much greater heat is required to obtain zinc from its ore, by diftillation, than in the operation now defcribed of making brafs; in which the feparation of the zinc from its ore feems to be facilitated by its difpofition to unite with copper.

Sect. XIII. *Ores of Arfenic.*

§ 1. The minerals which contain the largeft quantity of arfenic are cobalts and white pyrites; although it is alfo contained in other ores, it being one of the mineralifing fubftances. But as cobalt muft be roafted to obtain the fulphur it contains, the arfenic alfo which rifes during this torrefaction is collected, as we fhall fee in Part III. (Smelting of Ores,) and the particular articles of each of the metallic fubftances mentioned in this article.

I. Regulus of arfenic is found native. It is of a leaden colour; it burns with a fmall flame; and is diffipated, leaving generally a very fmall quantity of calx of bifmuth, or of calx of cobalt, and a very little filver. When it is of a folid and teftaceous texture, it has been improperly called *teftaceous cobalt*, in German *fcherbencobalt*. II. Calx of arfenic is found in form of powder; native flowers of arfenic, or of indurated femitranfparent cryftals; native cryftalline arfenic. III. Calx of arfenic is mixed, 1. With fulphur: when yellow, it is called *orpiment;* when red, it is called *native realgar:* the difference of colour depends on the proportion of the two component parts. 2. With calx of tin; tin-grains. 3. With fulphur and filver, in the red filver ore. 4. With calx of lead, in the lead-fpar. 5. With calx of cobalt, in the efflorefcence of cobalt. IV. Arfenic is mineralifed, 1. With fulphurated iron; arfenical pyrites. 2. With iron only; white pyrites, or mifspickle. 3. With cobalt, in almoft all cobalt-ores. 4. With filver. 5. With copper. 6. With antimony.

§ 2. Arfenic may be feparated from its ore or earthy matter with which it happens to be mixed, by fublimation, according to the following procefs by Mr Cramer.

"Do every thing as was faid about mercury, or fulphur; but let the veffel which is put into the fire with the ore in it be of earth or ftone, and the recipient be of glafs, and of a middling capacity. Nor is it neceffary that this fhould be filled with water, fo it be but well luted. The fire muft likewife be ftronger, and continued longer than for the extracting of fulphur. Neverthelefs every kind of arfenic cannot be extracted in a confined fire: for it adheres to the matrix more ftrongly than fulphur and mercury. You will find in the part of the veffel which is more remote from the fire, pulverulent and fubtle flowers of arfenic; but there will adhere to the pofterior of the neck of the retort fmall folid maffes, fhining like fmall cryftals, tranfparent, fometimes gathered into a folid fublimate, and perfectly white, if the ore of the arfenic was perfectly pure; which, neverthelefs, happens very feldom. The flowers are moft commonly thin, and of a grey colour: which proceeds from the phlogifton mixed with the mafs. They are often of a citron or of a golden colour, which is a fign that there is in the mixture fome mineral fulphur; and if the fublimate be red or yellow, it is a fign of much fulphur.

"As all the arfenic contained in the ore is not expelled in clofe veffels, you muft weigh the refiduum; then roaft it in a crucible till it fmokes no longer, or rather in an earthen flat veffel not glazed, and in a ftrong fire to be ftirred now and then with a poker, and then weigh it when grown cold: you will be able thus to know how much arfenic remained in the clofe veffel, unlefs the ore contain bifmuth."

If the arfenic be fulphurated, it may be purified by triturating it with mercury or with fixed alkali, and by fubliming the arfenic from the remaining fulphurated mercury or alkali. The method of obtaining a regulus of arfenic is defcribed at the article Regulus *of Arfenic*.

PART

PART III.

SMELTING of ORES.

Sulphur-works.

HAving fhown the nature of the principal metallic minerals, and the fubftances of which they are compofed; and alfo explained the proceffes by which an exact analyfis of thefe compound minerals may be made, and the nature and quantity of the contained metals may be known; in order to complete what relates to this important fubject, we fhall defcribe in this Part the principal operations by which metals, &c. are obtained "in the great," as it is called, or for commercial purpofes. What we fhall fay upon this fubject will chiefly be extracted from a *Treatife on the Smelting of Ores, by Schlutter*, tranflated from the German into French by M. Hellot; becaufe this, of all the modern works upon that fubject, appears to be the moft exact. We fhall firft defcribe the operations upon pyritous matters for the extraction of fulphur, &c. and afterwards the operations by which metallic fubftances are extracted from *ores* properly fo called.

Sect. I. *Extraction of Sulphur from Pyrites and other Minerals.*

In order to obtain fulphur from pyrites, this mineral ought to be expofed to a heat fufficient to fublime the fulphur, or to make it diftill in veffels, which muft be clofe, to prevent its burning.

Sulphur is extracted from pyrites at a work at Schwartzemberg, in Saxony, in the high country of the mines; and in Bohemia, at a place called *Alten-Sattel*.

The furnaces employed for this operation are oblong, like vaulted galleries; and in the vaulted roofs are made feveral openings. Thefe are called *furnaces for extracting fulphur*.

In thefe furnaces are placed earthen-ware tubes, filled with pyrites broken into pieces of the fize of fmall nuts. Each of thefe tubes contains about 50 pounds of pyrites. They are placed in the furnace almoft horizontally, and have fcarcely more than an inch of defcent. The ends, which come out of the furnace five or fix inches, become gradually narrower. Within each tube is fixed a piece of baked earth, in form of a ftar, at the place where it begins to become narrower, in order to prevent the pyrites from falling out, or choaking the mouth of the tube. To each tube is fitted a receiver, covered with a leaden plate, pierced with a fmall hole to give air to the fulphur. The other end of the tube is exactly clofed. A moderate fire is made with wood, and in eight hours the fulphur of the pyrites is found to have paffed into the receivers.

The refiduum of the pyrites, after the diftillation, is drawn out at the large end, and frefh pyrites is put in its place. From this refiduum, which is called *burnings of fulphur*, vitriol is extracted.

The 11 tubes, into which were put, at three feveral diftillations, in all nine quintals or 900 pounds of pyrites, yield from 100 to 150 pounds of crude fulphur, which is fo impure as to require to be purified by a fecond diftillation.

This purification of crude fulphur is alfo done in a furnace in form of a gallery, in which five iron cucurbits are arranged on each fide. Thefe cucurbits are placed in a floping direction, and contain about eight quintals and a half of crude fulphur. To them are luted earthen tubes, fo difpofed as to anfwer the purpofe of capitals. The nofe of each of thefe tubes is inferted into an earthen pot called the *fore-runner*. This pot has three openings; namely, that which receives the nofe of the tube; a fecond fmaller hole, which is left open to give air; and a third in its lower-part, which is ftopped with a wooden peg.

Sulphur-works.

When the preparations are made, a fire is lighted about feven o'clock in the evening, and is a little abated as foon as the fulphur begins to diftil. At three o'clock in the morning, the wooden pegs which ftop the lower holes of the fore-runners are for the firft time drawn out, and the fulphur flows out of each of them into an earthen pot with two handles, placed below for its reception. In this diftillation the fire muft be moderated and prudently conducted; otherwife lefs fulphur would be obtained, and it alfo would be of a grey colour, and not of the fine yellow which it ought to have when pure. The ordinary lofs in the purification of eight quintals of crude fulphur is, at moft, one quintal.

When all the fulphur has flowed out, and has cooled a little in the earthen pots, it is caft into moulds made of beech-tree, which have been previoufly dipt in water and fet to drain. As foon as the fulphur is cooled in the moulds, they are opened, and the cylinders of fulphur are taken out and put up in cafks. Thefe are called *roll-brimftone*.

As fulphur is not only in pyrites, but alfo in moft metallic minerals, it is evident that it might be obtained by works in the great from the different ores which contain much of it, and from which it muft be feparated previoufly to their fufion: but as fulphur is of little value, the trouble of collecting it from ores is feldom taken. Smelters are generally fatisfied with freeing their ores from it, by expofing them to a fire fufficient to expel it. This operation is called *torrefaction*, or *roafting of ores*.

There are, however, ores which contain fo much fulphur, that part of it is actually collected in the ordinary operation of roafting, without much trouble for that purpofe. Such is the ore of Ramelfberg in the country of Hartz.

This ore, which is of lead, containing filver, is partly very pure, and partly mixed with cupreous pyrites and filver; hence it is neceffary to roaft it.

The roafting is performed by laying alternate ftrata of ore and wood upon each other in an open field, taking care to diminifh the fize of the ftrata as they rife higher; fo that the whole mafs fhall be a quadrangular pyramid truncated above, whofe bafe is about 31 feet fquare. Below, fome paffages are left open, to give free entrance to the air; and the fides and

Sulphur-works.

and top of the pyramid are covered over with ſmall ore, to concentrate the heat and make it laſt longer. In the centre of this pyramid there is a channel which deſcends vertically from the top to the baſe. When all is properly arranged, ladlefuls of red-hot ſcoria from the ſmelting-furnace are thrown down the channel, by which means the ſhrubs and wood placed below for that purpoſe are kindled, and the fire is from them communicated to all the wood of the pile, which continues burning till the third day. At that time the ſulphur of the mineral becomes capable of burning ſpontaneouſly, and of continuing the fire after the wood is conſumed.

When this roaſting has been continued 15 days, the mineral becomes greaſy; that is, it is covered over with a kind of varniſh: 20 or 25 holes or hollows are then made in the upper-part of the pile in which the ſulphur is collected. From theſe cavities the ſulphur is taken out thrice every day, and thrown into water. This ſulphur is not pure, but crude; and is therefore ſent to the manufacturers of ſulphur, to be purified in the manner above-related.

As this ore of Ramelſberg is very ſulphureous, the firſt roaſting, which we are now deſcribing, laſts three months; and during this time, if much rain has not fallen, or if the operation has not failed by the pile falling down or cracking, by which the air has ſo much free acceſs, that the ſulphur is burnt and conſumed, from 10 to 20 quintals of crude ſulphur are by this method collected.

The ſulphur of this ore, like that of moſt others, was formerly neglected, till, in the year 1570, a perſon employed in the mines called *Chriſtopher Sauder*, diſcovered the method of collecting it, nearly as it is done at preſent.

Metallic minerals are not the only ſubſtances from which ſulphur is extracted. This matter is diffuſed in the earth in ſuch quantities, that the metals cannot abſorb it all. Some ſulphur is found quite pure, and in different forms, principally in the neighbourhood of volcanos, in caverns, and in mineral waters. Such are the opaque kind called *virgin ſulphur;* the tranſparent kind called *ſulphur of Quito;* and the native flowers of ſulphur, as thoſe of the waters of Aix-la-Chapelle. It is alſo found mixed with different earths. Here we may obſerve, that all thoſe kinds of ſulphur which are not mineralized by metallic ſubſtances, are found near volcanoes, or hot mineral waters, and conſequently in places where nature ſeems to have formed great ſubterranean laboratories, in which ſulphureous minerals may be analyſed and decompoſed, and the ſulphur ſeparated, in the manner in which it is done in ſmall in our works and laboratories. However that be, certainly one of the beſt and moſt famous ſulphur-mines in the world is that called *Solfatara.* The Abbé Nollet has publiſhed, in the Memoirs of the Academy, ſome intereſting obſervations upon this ſubject, which we ſhall here abridge.

Near Puzzoli, in Italy, is that great and famous mine of ſulphur and alum called at preſent *Solfatara.* It is a ſmall oval plain, the greateſt diameter of which is about 400 yards, raiſed about 300 yards above the level of the ſea. It is ſurrounded by high hills and great rocks, which fall to pieces, and whoſe fragments form very ſteep banks. Almoſt all the ground is bare and white, like marle; and is every-where ſenſibly warmer than the atmoſphere in the greateſt heat of ſummer, ſo that the feet of perſons walking there are burnt through their ſhoes. It is impoſſible not to obſerve the ſulphur there; for every-where may be perceived by the ſmell a ſulphureous vapour, which riſes to a conſiderable height, and gives reaſon to believe that there is a ſubterraneous fire below, from which that vapour proceeds.

Near the middle of this field there is a kind of baſon three or four feet lower than the reſt of the plain, in which a ſound may be perceived when a perſon walks on it, as if there were under his feet ſome great cavity, the roof of which was very thin. After that, the lake Agnano is perceived, whoſe waters ſeem to boil. Theſe waters are indeed hot, but not ſo hot as boiling water. This kind of ebullition proceeds from vapours which riſe from the bottom of the lake, which being ſet in motion by the action of ſubterranean fires, have force enough to raiſe all that maſs of water. Near this lake there are pits, not very deep, from which ſulphureous vapours are exhaled. Perſons who have the itch, come to theſe pits, and receive the vapours in order to be cured. Finally, there are ſome deeper excavations, whence a ſoft ſtone is procured which yields ſulphur. From theſe cavities vapours exhale, and iſſue out with noiſe, and which are nothing elſe than ſulphur ſubliming through the crevices. This ſulphur adheres to the ſides of the rocks, where it forms enormous maſſes: in calm weather, the vapours may be evidently ſeen to riſe 25 or 30 feet from the ſurface of the earth.

Theſe vapours, attaching themſelves to the ſides of rocks, form enormous groups of ſulphur, which ſometimes fall down by their own weight, and render theſe places of dangerous acceſs.

In entering the Solfatara, there are warehouſes and buildings erected for the refining of ſulphur.

Under a great ſhed, or hangar, ſupported by a wall behind, and open on the other three ſides, the ſulphur is procured by diſtillation from the ſoft ſtones we mentioned above. Theſe ſtones are dug from under ground; and thoſe which lie on the ſurface of the earth are neglected. Theſe laſt are, however, covered with a ſulphur ready formed, and of a yellow colour: but the workmen ſay they have loſt their ſtrength, and that the ſulphur obtained from them is not of ſo good a quality as the ſulphur obtained from the ſtones which are dug out of the ground.

Theſe laſt mentioned are broken into lumps, and put into pots of earthen ware, containing each about 20 pints Paris meaſure. The mouths of theſe pots are as wide as their bottoms; but their bellies, or middle parts, are wider. They are covered with a lid of the ſame earth, well luted, and are arranged in two parallel lines along two brick walls, which form the two ſides of a furnace. The pots are placed within theſe walls; ſo that the centre of each pot is in the centre of the thickneſs of the wall, and that one end of the pots overhangs the wall within, while the other end overhangs the wall without. In each furnace ten of theſe pots are placed; that is, five in each of the two walls which form the two ſides of the furnace. Betwixt

Smelting of Ores in general.

twixt these walls there is a space of 15 or 18 inches; which space is covered by a vault resting on the two walls. The whole forms a furnace seven feet long, two feet and a half high, open at one end, and shut at the other, excepting a small chimney through which the smoke passes.

Each of these pots has a mouth in its upper part without the furnace, in order to admit a tube of 18 lines in diameter and a foot in length, which communicates with another pot of the same size placed without the building, and pierced with a round hole in its base of 15 or 18 lines diameter. Lastly, to each of these last-mentioned pots there is a wooden tub placed below, in a bench made for that purpose.

Four or five of these furnaces are built under one hangar, or shed. Fires are kindled in each of them at the same time; and they are thrown down after each distillation, either that the pots may be renewed, or that the residuums may be more easily taken out.

The fire being kindled in the furnace, heats the first pots containing the sulphureous stones. The sulphur rises in fumes into the upper part of the pot, whence it passes through the pipe of communication into the external vessel. There the vapours are condensed, become liquid, and flow through the hole below into the tub, from which the sulphur is easily turned out, because the form of the vessel is that of a truncated cone whose narrower end is placed below, and because the hoops of the tub are so fastened that they may be occasionally loosened. The mass of sulphur is then carried to the buildings mentioned before, where it is remelted for its purification, and cast into rolls, such as we receive it.

Extraction of ALUM *from pyritous substances and from aluminous earths.* See CHEMISTRY, n° 129.

SECT. II. *Smelting of Ores in general.*

§ 1. As ores consist of metallic matters combined with sulphur and arsenic, and are besides intermixed with earthy and stony substances of all kinds, the intention of all the operations upon these compound bodies is to separate these different substances from each other. This is effected by several operations founded on the known properties of those substances. We now proceed to give a general idea of these several operations.

First of all, the ore is to be separated from the earths and stones accidentally adherent to it; and when these foreign substances are in large masses, and are not very intimately mixed in small particles with the ore, this separation may be accomplished by mechanical means. This ought always to be the first operation, unless the adherent substance be capable of serving as a flux to the ore. If the unmetallic earths be intimately mixed with the ore, this must necessarily be broken and divided into small particles. This operation is performed by a machine which moves pestles, called *bocards* or *stampers*. After this operation, when the parts of the mineral are specifically heavier than those of the unmetallic earth or stone, these latter may be separated from the ore by washing in canals through which water flows. With regard to this washing of ores, it is necessary to observe, that it cannot succeed but when the ore is sensibly heavier than the foreign matters. But the contrary happens frequently, as well because quartz and spar are naturally very ponderous, as because the metallic matter is proportionably so much lighter as it is combined with more sulphur.

When an ore happens to be of this kind, it is necessary to begin by roasting it, in order to deprive it of the greatest part of its sulphur.

It happens frequently that the pyritous matters accompanying the ore are so hard that they can scarcely be pounded. In this case it is necessary to roast it entirely, or partly, and to throw it red-hot into cold water; by which the stones are split, and rendered much more capable of being pulverized.

Thus it happens very frequently, that roasting is the first operation to which an ore is exposed.

When the substance of the ore is very fusible, this first operation may be dispensed with, and the matter may be immediately fused without any previous roasting, or at least with a very slight one. For, to effect this fusion, it is necessary that it retain a great quantity of its sulphur, which, with the other fluxes added, serves to destroy or convert into scoria a considerable part of the stony matter of the mineral, and to reduce the rest into a brittle substance, which is called the *matt of lead*, or of *copper*, or other metal contained in the ore. This matt is therefore an intermediate matter betwixt the mineral and the metal; for the metal is there concentrated, and mixed with less useless matter than it was in the ore. But as this matt is always sulphureous, the metal which it contains cannot have its metallic properties. Therefore it must be roasted several times to evaporate the sulphur, before it is remelted, when the pure metal is required. This fusion of an ore not roasted, or but slightly roasted, is called *crude fusion*.

We may here observe upon the subject of washing and roasting of ores, that as arsenic is heavier than sulphur, and has nearly the weight of metals, the ores in which it prevails are generally very heavy, and consequently are susceptible of being washed, which is a great advantage. But on the other side, as arsenic is capable of volatilising, scorifying, and destroying many metals, these ores have disadvantages in the roasting and fusion, in both which considerable loss is caused by the arsenic. Some ores contain, besides arsenic, other volatile semi-metals, such as antimony and zinc. These are almost untractable, and are therefore neglected. They are called *mineræ rapaces*, "rapacious ores."

When the metal has been freed as much as is possible from foreign matters by these preliminary operations, it is to be completely purified by fusions more or less frequently repeated; in which proper additions are made, either to absorb the rest of the sulphur and arsenic, or to complete the vitrification or scorification of the unmetallic stones and earth.

Lastly, as ores frequently contain several different metals, these are to be separated from each other by processes suited to the properties of these metals, of which we shall speak more particularly as we proceed in our examination of the ores of each metal.

§ 2. To facilitate the extraction of metallic substances from the ores and minerals containing them, some operations previous to the fusion or smelting of these

Roasting of Ores.

these ores and minerals are generally neceſſary. Theſe operations conſiſt of, 1. The *ſeparation* of the ores and metallic matters from the adhering unmetallic earths and ſtones, by hammers and other mechanical inſtruments, and by waſhing with water. 2. Their *diviſion* or reduction into ſmaller parts by contuſion and trituration, that by another waſhing with water they may be more perfectly cleanſed from extraneous matters, and rendered fitter for the ſubſequent operations, calcination or roaſting, and fuſion. 3. *Roaſting* or *calcination;* the uſes of which operation are, to expel the volatile, uſeleſs, or noxious ſubſtances, as water, vitriolic acid, ſulphur, and arſenic; to render the ore more friable, and fitter for the ſubſequent contuſion and fuſion; and, laſtly, to calcine and deſtroy the viler metals, for inſtance the iron of copper-ores, by means of the fire, and of the ſulphur and arſenic. Stones, as quartz and flints, containing metallic veins or particles, are frequently made red-hot, and then extinguiſhed in cold water, that they may be rendered ſufficiently friable and pulverable, to allow the ſeparation of the metallic particles.

Roaſting is unneceſſary for native metals; for ſome of the richer gold and ſilver ores; for ſome lead-ores, the ſulphur of which may be ſeparated during the fuſion; and for many calciform ores, as theſe do not generally contain any ſulphur and arſenic.

In the roaſting of ores, the following attentions muſt be given, 1. To reduce the mineral previouſly into ſmall lumps, that the ſurface may be increaſed; but they muſt not be ſo ſmall, nor placed ſo compactly, as to prevent the paſſage of the air and flame. 2. The larger pieces muſt be placed at the bottom of the pile, where the greateſt heat is. 3. The heat muſt be gradually applied, that the ſulphur may not be melted, which would greatly retard its expulſion; and that the ſpars, fluors, and ſtones, intermixed with the ore, may not crack, fly, and be diſperſed. 4. The ores not thoroughly roaſted by one operation muſt be expoſed to a ſecond. 5. The fire may be increaſed towards the end, that the noxious matters more ſtrongly adhering may be expelled. 6. Fuel which yields much flame, as wood and foſſil coals free from ſulphur, is ſaid to be preferable to charcoal or coaks. Sometimes cold water is thrown on the calcined ore at the end of the operation, while the ore is yet hot, to render it more friable.

No general rule can be given concerning the duration or degree of the fire, theſe being very various according to the difference of the ores. A roaſting during a few hours or days is ſufficient for many ores; while ſome, ſuch as the ore of Rammelſberg, require that it ſhould be continued during ſeveral months.

Schlutter enumerates five methods of roaſting ores. 1. By conſtructing a pile of ores and fuel placed in alternate ſtrata, in the open air, without any furnace. 2. By confining ſuch a pile within walls, but without a roof. 3. By placing the pile under a roof, without lateral walls. 4. By placing the pile in a furnace conſiſting of walls and a roof. 5. By roaſting the ore in a reverberatory furnace, in which it muſt be continually ſtirred with an iron rod.

Several kinds of fuſions of ores may be diſtinguiſhed. 1. When a ſulphureous ore is mixed with much earthy matter, from which it cannot be eaſily ſeparated by mechanical operations, it is frequently melted, in order to diſengage it from theſe earthy matters, and to concentrate its metallic contents. By this fuſion, ſome of the ſulphur is diſſipated, and the ore is reduced to a ſtate intermediate betwixt that of ore and of metal. It is then called a *matt (lapis ſulphureo-metallicus);* and is to be afterwards treated like a pure ore by the ſecond kind of fuſion, which is properly the ſmelting, or extraction of the metal by fuſion. 2. By this fuſion or ſmelting, the metal is extracted from the ore previouſly prepared by the above operations, if theſe be neceſſary. The ores of ſome very fuſible metals, as of biſmuth, may be ſmelted by applying a heat ſufficient only to melt the metals, which are thereby ſeparated from the adhering extraneous matters. This ſeparation of metals by fuſion, without the vitrification of extraneous matters, may be called *eliquation.* Generally, a complete fuſion of the ore and vitrification of the earthy matters are neceſſary for the perfect ſeparation of the contained metals. By this method, metals are obtained from their ores, ſometimes pure, and ſometimes mixed with other metallic ſubſtances, from which they muſt be afterwards ſeparated; as we ſhall ſee, when we treat of the extraction of particular metals. To procure this ſeparation of metals from ores, theſe muſt be ſo thinly liquefied, that the ſmall metallic particles may diſengage themſelves from the ſcoria; but it muſt not be ſo thin as to allow the metal to precipitate before it be perfectly diſengaged from any adhering extraneous matter, or to pervade and deſtroy the containing veſſels and furnace. Some ores are ſufficiently fuſible; but others require certain additions called *fluxes,* to promote their fuſion and the vitrification of their unmetallic parts; and alſo to render the ſcoria ſufficiently thin to allow the ſeparation of the metallic particles.

Fuſion of Ores.

Different fluxes are ſuitable to different ores, according to the quality of the ore, and of the matrix, or ſtone adherent to it.

The matrixes of two different ores of the ſame metal frequently ſerve as fluxes to each other; as, for inſtance, an argillaceous matrix with one that is calcareous; theſe two earths being diſpoſed to vitrification when mixed, though each of them is ſingly unfuſible. For this reaſon, two or more different ores to be ſmelted are frequently mixed together.

The ores alſo of different metals require different fluxes. Thus calcareous earth is found to be beſt ſuited to iron-ores, and ſpars and ſcoria to fuſible ores of copper.

The fluxes moſt frequently employed in the ſmelting of ores are, calcareous earth, fluors or vitreous ſpars, quartz and ſand, fuſible ſtones, as ſlates, baſaltes, the ſeveral kinds of ſcoria, and pyrites.

Calcareous earth is uſed to facilitate the fuſion of ores of iron, and of ſome of the poorer ores of copper, and, in general, of ores mixed with argillaceous earths, or with feltſpar. This earth has been ſometimes added with a view of ſeparating the ſulphur, to which it very readily unites: but by this union the ſulphur is detained, and a hepar is formed, which readily diſſolves iron and other metals, and ſo firmly adheres to them, that they cannot be ſeparated without more difficulty than they could from the original ore. This addition is therefore not to be made till the ſulphur be previ-

Of Fluors. oufly well expelled.

Fluors or *fufible fpars* facilitate the fufion of moft metallic minerals, and alfo of calcareous and argillaceous earths, of fteatites, afbeftus, and fome other unfufible ftones, but not of filiceous earths without a mixture of calcareous earth.

Quartz is fometimes added in the fufion of ferruginous copper ores, the ufe of which is faid chiefly to be, to enable the ore to receive a greater heat, and to give a more perfect vitrification to the ferruginous fcoria.

The *fufible ftones*, as *flates*, *bafaltes*, are fo tenacious and thick when fufed, that they cannot be confidered properly as fluxes, but as matters added to leffen the too great liquidity of fome very fufible minerals.

The *fcoria* obtained in the fufion of an ore is frequently ufeful to facilitate the fufion of an ore of the fame metal, and fometimes even of ores of other metals.

Sulphurated pyrites greatly promote the fufibility of the fcoria of metals, from the fulphur it contains. It is chiefly added to difficultly-fufible copper-ores, to form the fulphureous compounds called *matts*, that the ores thus brought into fufion may be feparated from the adhering earthy matters, and that the ferruginous matter contained in them may be deftroyed, during the fubfequent calcination and fufion, by means of the fulphur.

As in the ores called *calciform*, the metallic matter exifts in a calcined ftate; and as calcination reduces the metals of mineralized ores (excepting the perfect metals) to that ftate alfo; therefore all calciform and calcined ores require the addition of fome inflammable fubftance, to reduce them to a metallic ftate. In great works, the charcoal or other fuel ufed to maintain the fire produces alfo this effect.

Metals are fometimes added in the fufion of ores of other more valuable metals, to abforb from thefe fulphur or arfenic. Thus iron is added to fulphurated, cupreous, and filver ores. Metals are alfo added in the fufion of ores of other more valuable metals, to unite with and collect the fmall particles of thefe difperfed through much earthy matter, and thus to affift their precipitation. With thefe intentions, lead is frequently added to ores and minerals containing gold, filver, or copper.

Ores of metals are alfo fometimes added to affift the precipitation of more valuable metals. Thus antimony is frequently added to affift the precipitation of gold intermixed with other metallic matters. Thus far of fmelting of ores in general.

Sect. III. *Operations on Ores of Native Gold and Silver, by Wafhing and by Mercury.*

Earths and fand are at firft feparated by wafhing with water; by which operation the greateft part of what is not gold, being lighter, is carried off. After this a fecond wafhing is made with mercury, which having the property of uniting with gold, feizes this metal, amalgamates with it, and feparates it exactly from the earthy matters, with all which it can form no union.

The mercury thus charged with gold is preffed through fhamoy leather, and the gold is retained united with a part of the mercury, from which it may be eafily difengaged by expofure to a proper degree of heat, which diffipates and evaporates the mercury, while the gold, being fixed, remains.

Wafhing of Ores of Gold.

This is the foundation of all the operations by which gold is obtained from the rich mines of Peru belonging to the Spaniards. Thefe operations confift in wafhings, triturations, and amalgams in the great by help of machines.

The ores of native filver are much rarer and lefs abundant than thofe of gold. But if any of this kind were found fufficiently rich, they might be treated with mercury exactly in the fame manner as the ores of native gold.

Gold is frequently contained in the ores of other metals, either in a native or mineralifed ftate, and in fands, efpecially thofe which are black and ferruginous. See Part II. fect. of *Ores of Gold*.

If *gold be contained in ores of other metals*, thefe metals together with the gold may be firft extracted by the ordinary proceffes for fmelting thefe ores; and the gold may be then feparated from the metallic mafs thus obtained, by mixing and fufing this mafs with a quantity of lead, and by the procefs of cupellation defcribed in the articles Essay *of the value of filver*, and Refining. Generally, the operations for obtaining gold from ores of imperfect metals are precifely the fame as thofe for obtaining filver, to which therefore we refer. Moft frequently a quantity of filver alfo is contained in thefe ores; and in this cafe the perfect metal obtained by cupellation is an allay of gold and filver, which muft be afterwards feparated by the proceffes called *parting*. See Parting.

Many trials have been made to procure the fmall quantity of gold contained in the *ferruginous fands*, at a moderate expence (fee Part II. fect. of *Ores of Gold*); but as no work of this kind is now eftablifhed, we may prefume they have not been fuccefsful. The beft effays of this kind have been made, according to Schlutter, in the following manner.

The fand is to be made red-hot, and extinguifhed in cold water four times, by which its colour is changed from the original yellow, red, or black, to a reddifh-brown. It is obferved to emit, during the firft and fecond calcinations, an arfenical fmell; and this fmell may be produced again in the following calcinations by adding fome inflammable matter. Let an ounce of the calcined fand be mixed with two ounces of granulated lead, and one ounce of black flux, and put into a Heffian crucible, with half an ounce of decrepitated fea-falt upon the furface of the mixture. The crucible is to be placed in a good blaft-furnace, and a ftrong fire is to be excited. The matter contained in the crucible is to be frequently ftirred with an iron-rod, and the heat is to be continued till the fcoria is thin and perfectly fufed. When the crucible is broken, a regulus of lead will be found, containing the gold and filver of the fand. By this method Mr Leberecht obtained, in eleven effays, from 840 to 844 grains of perfect metal from a quintal of fand. Of the perfect metal obtained, from a fourth to a third part was gold. Some parcels of fand have yielded more than 1000 grains, and fome not more than 350 grains, per quintal. Inftead of the granulated lead, and the black flux, which is too expenfive for great operations, fome have added, to an ounce of the fand, two ounces of litharge and

Smelting of Ores of Silver.

and a little powder of charcoal, by which they have obtained the fame quantity of perfect metal. The fcoria in thefe effays has been always found to contain fome perfect metal.

The Hungarian copper ores, from which gold and filver are profitably extracted, contain a lefs quantity of thefe perfect metals than many ferruginous fands. But they may be formed into a matt, by fufion with pyrites, of which treatment the fands are incapable. From this matt, the gold and filver, along with the copper of the ore, may be precipitated, and feparated from the fulphur of the pyrites, by addition of iron, which being more difpofed than the other metals to unite with fulphur, difengages thefe metals, and allows them to precipitate.

SECT. IV. *Smelting of Ores of Silver.*

§ 1. As filver, even in its proper ores, is always allayed with fome other metals from which it is intended to be feparated after that the filver-ore has been well roafted, it muft be mixed with a greater or lefs quantity of lead previous to its fufion.

Lead has the fame effect in fufion of gold and filver as mercury has upon thefe metals by its natural fluidity; that is to fay, it unites with them, and feparates them from unmetallic matters, which, being lighter, rife always to the furface. But lead has the further advantage of procuring, by its own vitrification, that of all metallic fubftances, excepting gold and filver. Hence it follows, that when gold and filver are obtained by means of mercury, they ftill remain allayed with other metallic fubftances; whereas when they are obtained by fufion and fcorification with lead, they are then pure, and not allayed with any metals but with each other.

In proportion as the lead, which has been united to the gold and filver of the ore, is fcorified by the action of the fire, and promotes the fcorification of the other metallic matters, it feparates the perfect metals, and carries with it all the others to the furface. There it meets the unmetallic fubftances, which it likewife vitrifies, and which it changes into a perfect fcoria, fluid, and fuch as a fcoria ought to be to admit all the perfect metal contained in it to precipitate.

When all heterogeneous matters have been thus difengaged by fcorification with lead, the perfect metals, to which fome lead ftill remains united, are to be further purified by the ordinary operation of the cupel.

The common rule for the fufion and fcorification of filver-ore with lead, is to add to the ore a quantity of lead fo much greater as there is more matter to be fcorified, and as thefe matters are more refractory and of more difficult fufion. Silver ores, or thofe treated as fuch, are often rendered refractory by ferruginous earths, pyritous matters, or cobalts, containing always a confiderable quantity of an earth which is unmetallic, very fubtile, and very refractory, and which renders a confiderable augmentation of the quantity of lead neceffary.

The quantity of lead which is commonly added to fufible filver ores, that do not contain lead, is eight times the quantity of the ore. But when the ore is refractory, it is neceffary to add twelve times the quantity of lead, and even more; alfo glafs of lead, and fluxes, fuch as the white and black fluxes; to which however borax and powder of charcoal are preferable, on account of the liver of fulphur formed by thefe alkaline fluxes.

It is neceffary to obferve, that faline fluxes are only ufed in fmall operations, on account of their dearnefs. To thefe are fubftituted, in the great operations, of which we now treat, fandiver, fufible fcoria, and other matters of little value.

The greateft part of filver now employed in commerce is not obtained from the proper ores of filver, which are very fcarce; but from lead, and even copper ores, which are more or lefs rich in filver. To give an idea of the manner of treating thefe kinds of ores, from which filver is extracted in the great works, we fhall briefly defcribe here, after Schlutter, the fmelting of the ore of Rammelfberg, which contains, as we have already faid, feveral different kinds of metals, but particularly lead and filver.

When this mineral has been difengaged from its fulphur as much as poffible by three very long roaftings, it is melted in the Lower Hartz in Saxony, in a particular kind of furnace, called a *furnace for fmelting upon a hollow or caffe.* The mafonry of this furnace is compofed of large thick flates, capable of fuftaining great heat, and cemented together by clay. The interior part of the furnace is three feet and a half long, and two feet broad at the back part, and one foot only in the front. Its height is nine feet eight inches. It has a foundation of mafonry in the ground; and in this foundation channels are made for the evaporation of the moifture. Thefe channels are covered over with ftones called *covering ftones.* The hollow or caffe, which is made above thefe, is formed of bricks, upon which are placed, firft, a bed of clay; then a bed of fmall ore and fifted vitriols; and, laftly, a bed of charcoal-powder beat down, called *light brafque.* The anterior wall of the furnace is thinner than the others, and is called the *chemife.* The back wall, which is pierced to give paffage to the pipes of two large wooden bellows, is called the *middle wall.* When the furnace is thus prepared, charcoal is thrown into the hollow, or caffe; which being kindled, the fire is to be continued during three hours, before the matters to be fufed are added. Then thefe matters are thrown in, which are not the pure ore, but a mixture of feveral fubftances, all of which are fomewhat profitable. The quantity of thefe matters is fufficient for one day's work; that is, for a fufion of eighteen hours; and it confifts of, 1. Twelve fchorbens or meafures of well roafted Rammelfberg ore; (the fchorben is a meafure whofe contents are two feet five inches long, one foot feven inches broad, and a little more than a foot deep: it is equal to 32 quintals of that country, Cologn weight, at 123 pounds each quintal.) 2. Six meafures of fcoria produced by the fmelting of the ore of Upper Hartz, which is refractory, and what workmen call *cold.* 3. Two meafures of knobben, which is an impure fcoria containing fome lead and filver, which has been formerly thrown away as ufelefs, and is now collected by women and children. Befides thefe, other matters are added, containing lead and filver, as the tefts employed in refining, the drofs of lead, impure litharge, and

Smelting of Ores of Silver.

and any rubbifh containing metal, which was left in the furnace after the foregoing fufion. All thefe matters being mixed together, are thrown into the furnace: and to each meafure of this mixture a meafure of charcoal is added. The fufion is then begun by help of bellows; and as it proceeds, the lead falls through the light brafque, or charcoal-bed, into the hollow, or caffe, where it is preferved from burning under the powder of charcoal. The fcoria, on the other hand, being lighter and lefs fluid, is fkimmed off from time to time by means of ladles, that it may not prevent the reft of the lead from falling down into the hollow. Thus, while the fufion lafts, frefh matters and frefh charcoal are alternately added, till the whole quantity intended for one fufion, or, as they call it, one *day*, be thrown in.

There are feveral effential things to be remarked in this operation, which is very well contrived. Firft, The mixture of matters from which a little lead and filver is procured, which would otherwife be loft; and which have alfo this advantage, that they retard the fufion of the Ramelfberg ore, which, however well roafted it has been, retains always enough of the fulphur and iron of the pyrites mixed with it, to render it too fufible or too fluid, fo that without the addition of thofe matters nothing would be obtained but a matt. It is even neceffary, notwithftanding thefe additions, not to haften the fufion too much, but to give time for the ore to mix with other matters, elfe it would melt and flow of itfelf before the reft. Secondly, The fufion of the ore through charcoal, which is practifed in moft fmelting-houfes, and for almoft all ores, is an excellent method, the principal advantage of which is the faving of fuel. The action of the burning charcoal directed immediately upon the mineral, at the fame time that it melts it more readily and efficacioufly, alfo fupplies it with the phlogifton neceffary to bring it to a perfect ftate.

From the Ramelfberg ore after its firft roafting, a *white vitriol* is obtained and prepared at Goflar *, whofe bafis was *zinc:* which proves that this ore contains alfo a certain quantity of this femi-metal. As this ore is fmelted in a country where the art is well underftood of extracting every thing which a mineral contains, fo in this fufion *zinc* and *cadmia* are obtained in the following manner: When the furnace is prepared for the fufion, it is neceffary to clofe it up in the fore-part, before the fufion is begun.

* See *Chemiftry*, nº 157.

" Firft of all, a gritt-ftone is to be placed, fupported at the height of three inches. This ftone is as long as the furnace is broad, and the height of it is level with the hole where the bellows-pipe enters. It is faftened on each fide of the furnace, externally and internally, with clay. Upon this ftone a kind of receptacle, or, as it is called, the *feat of the zinc*, is made in the following manner: A flat flaty ftone is chofen, as long as the furnace is broad, and eight inches in breadth. This is placed on the grittftone above-mentioned, in fuch a manner that it inclines confiderably towards the front of the furnace, and that its bottom touches clofely the gritt-ftone. It is faftened with clay, which is alfo laid upon the feat of the zinc. Upon this feat, which is to receive the zinc, two round pieces of charcoal are placed, and alfo a ftone called the *zinc ftone*, which is about a foot and a half in length, and clofes one part of the front of the furnace. This ftone alfo is faftened on each of its fides with clay. Clay is likewife put under the ftone betwixt the two pieces of charcoal, which hinder it from touching the feat of the zinc. The under-part of this ftone is but flightly luted, that the workmen may make an opening for the zinc to flow out. Thus is made the feat or receptacle of the zinc to detain this metallic fubftance, which would otherwife fall into the hotteft part of the fire, called by the workmen the *melting-place*, and would be there burnt: whereas it is collected upon this receptacle during the fufion, where it is fheltered from the action of the bellows, and confequently from too great heat.

" When all the matter to be fufed in one day is put into the furnace, the blaft of air is continued till that matter has funk down. When it is half-way down the furnace, they draw out the fcoria, that more of the ore and other matters may be expofed to the greateft heat. As foon as the fcoria is cooled and fixed a little, two fhovel-fulls of fmall wet fcoria or fand is thrown clofe to the furnace, and beat down with the fhovel; then the workmen open the feat or receptacle of zinc, and ftrike upon the zinc-ftone to make the femi-metal flow out. As foon as the pureft part of it has flowed out, it is fprinkled with water and carried away. Then the workmen feparate entirely the zinc-ftone from the wall of the furnace, and they continue to give it little ftrokes, that the fmall particles of zinc difperfed among the charcoal may fall down. This being done, the ftone is removed; and the zinc is feparated from the charcoal by an iron inftrument, is cleaned, and remelted along with the zinc that flowed out at firft, and is caft into round cakes. The reafon why the zinc is withdrawn before the bellows ceafe to blow, is, that if it was left till the charcoal on the feat or receptacle was confumed, it would be moftly burnt, and little would be obtained. Thus after the zinc is withdrawn, the fufion is finifhed by blowing the bellows till the end."

Thus the zinc is feparated from the ore of Ramelfberg, and is not confounded in the hollow or caffe with the lead and filver, becaufe, being a volatile femi-metal, it cannot fupport the activity of the fire without rifing into vapours, which are condenfed in the place leaft hot, that is to fay, upon the ftones exprefsly prepared for that purpofe; and which, being much thinner than the other walls of the furnace, are continually cooled by the external air.

It is alfo in this furnace, and after the fufion of the Ramelfberg ore, that the *cadmia of zinc*, or the *cadmia of furnaces*, is obtained. This ore is compofed of fulphureous and ferruginous pyrites, of true lead-ore containing filver, and a very hard and compact matter of a dark brownifh-grey colour, which is probably a *lapis calaminaris*, or an ore of zinc. Thefe feveral matters of the Ramelfberg ore are not feparated from each other, either for the roafting or for the fufion. Thus there is zinc in all the parts of the roafted ore; and much more of it would be obtained, if it was not fo eafily inflammable. All the zinc which is obtained is preferved from burning by falling, while

Smelting of Ores of Silver.

while in fusion, behind the chemise or fore-part of the furnace, which is, as has been said, a kind of schistus or slate, called by the workmen *steel-stone*. But the part of this semi-metal which falls in the middle of the furnace, near the middle-wall, or towards the sides, being exposed to the greatest heat of the fire, is there burnt; and its smoke or flowers attaching itself on all sides to the walls of the furnace, undergo there a semi-fusion, which renders this matter so hard and so thick, that it must be taken away after every fourth fusion, or, at most, after every sixth fusion. That which is found attached to the highest part of the furnace is the best and purest. The rest is altered by a mixture of a portion of lead which it has carried up with it; and which, from its great weight and fixity, has hindered the zinc from rising so high as it would have done alone. Therefore, with this kind of impure cadmia, ductile brass cannot be made.

Almost all the zinc we have, as well as the cadmia of the furnaces, is obtained from the Ramelsberg ore, by the process described, and consequently is not the produce of a pure ore of zinc, or *lapis calaminaris*, which is never fused for that purpose. Before Mr Margraaf, although it was well known that this ore contained zinc, and that it was employed for the making of brass, a convenient process for extracting zinc from it was not known; because, when treated by fusion with fluxes, like other ores, it does not yield any zinc; which proceeds partly from the refractory quality of the earth contained in the calamine, that cannot be fused without a very violent fire; and also from the volatility and combustibility of the zinc, which for this reason cannot be collected at the bottom of a crucible, as a regulus under a scoria, like most metals.

M. Margraaf has remedied these inconveniences by distilling *lapis calaminaris*, mixed with charcoal, in a retort, to which is joined a receiver containing some water, and consequently in close vessels, where the zinc, by the help of a very strong fire indeed, is sublimed in its metallic form without burning. He also by the same method reduced into zinc the *flowers of zinc*, or *pompholix*, *cadmia of the furnaces*, *tutty*, which is also a kind of cadmia; in a word, all matters capable of producing zinc by combination with phlogiston.—But it is evident that such operations as these are rather fit to supply proofs for chemical theory, than to be put in practice for works in great. M. Margraaf has observed, that the zinc which he obtained by this process was less brittle than what is obtained from the fusion of ores; which may proceed from its greater purity, or from its better combination with phlogiston.

Zinc is obtained, not only in the method used at Goslar above-described; but is also extracted in great works, from *lapis calaminaris* and calcined blend, by a distillation similar to that by which M. Margraaf has essayed ores of zinc. The first work of that kind was erected in Sweden by Mr Von Swab, in the year 1738. The ore employed was a kind of blend; this ore, when calcined, powdered, and mixed with charcoal, was put into iron or stone retorts, and the zinc was obtained by distillation. In Bristol a work is established in which zinc is obtained by distillation *by descent*.

Fining of Silver.

After this digression which we have now made concerning the operation in the great by which zinc and cadmia are obtained, and which we could not insert elsewhere, because of the necessary relation it has with the smelting of the Rammelsberg ore, we proceed to the other operations of the same ore; that is to say, to the *finery*, by which the silver is separated from the lead, which are mixed together, forming what is called the *work*.

This operation differs from the *fining of essay*, or *in small*, principally in this circumstance, that in the latter method of fining all the litharge is absorbed into the cupel, whereas in the former method the greatest part of this litharge is withdrawn.

The fining in great of the work of Ramelsburg is performed in a furnace called a *reverberatory furnace*. This furnace is so constructed that the flame of wood burning in a cavity called the *fire-place*, is determined by a current of air (which is introduced through the ash-hole, and which goes out at an opening on one side of that part of the furnace where the work is, that is, where the lead and silver are) to circulate above, and to give the convenient degree of heat, when the fire is properly managed. In this furnace a great cupel, called a *test*, is disposed. This test is made of the ashes of beech-wood, well lixiviated in the usual manner. In some founderies different matters are added, as sand, spar, calcined gypsum, quicklime, clay. When the test is well prepared and dried, all the work is put at once upon the cold test, to the quantity of 64 quintals for one operation. Then the fire is lighted in the fire-place with faggots; but the fusion is not urged too fast, 1. That the test may have time to dry; 2. Because the work of the Ramelsberg ore is allayed by the mixture of several metallic matters, which it is proper to separate from it, otherwise they would spoil the litharge and the lead procured from it. These metallic matters are, copper, iron, zinc, and matt. As these heterogeneous substances are hard and refractory, they do not melt so soon as the work, that is, as the lead and silver; and when the work is melted, they swim upon its surface like a skin, which is to be taken off. These impurities are called the *scum*, or the *first-waste*. What remains forms a second scum, which appears when the work is at its greatest degree of heat, but before the litharge begins to form itself. It is a scoria which is to be carefully taken off. It is called the *second waste*.

When the operation is at this point, it is continued by the help of bellows, the wind of which is directed, not upon the wood or fuel, but upon the very surface of the metal, by means of iron-plates put for that purpose before the blast-hole, which are called *papillons*. This blast does not so much increase the intensity of the fire, as it facilitates the combustion of the lead, and throws the litharge that is not imbibed by the test towards a channel, called the *litharge way*, through which it flows. The litharge becomes fixed out of the furnace: the matter which is found in the middle of the largest pieces, and which amounts to about a half or a third of the whole, is friable, and falls into powder like sand. This is put into barrels containing each five quintals of it; and is called *saleable litharge*, because it is sold in that state. The other part which remains solid is called *cold litharge*, and is again melted and

Various processes for extracting Silver.

and reduced into lead. The fusion is called *cold fusion*, and the lead obtained from it *cold lead*, which is good and saleable when the work has been well cleared from the heterogeneous matters mentioned above. The tests and cupels impregnated with litharge are added in the fusion of the ore, as we have already related.

When two thirds, or nearly that quantity, of the lead are converted into litharge, no more of it is formed. The silver then appears covered with a white skin, which the finers call *lightening*, and the metal *lightened* or *fined silver*.

The silver obtained by this process of fining is not yet altogether pure. It still contains some lead, frequently to the quantity of four drams in each marc, or eight ounces. It is delivered to the workmen, who complete its purification by the ordinary method. This last operation is the refining, and the workmen employed to do it are called *refiners*. A fining of 64 quintals of work, yields from 8 to 10 mercs of fined silver, and from 35 to 40 quintals of litharge; that is, from 12 to 18 of saleable litharge, from 22 to 23 of cold litharge, from 20 to 22 quintals of impregnated test, and from 6 to 7 quintals of lead-dross. The operation lasts from 16 to 18 hours.

§ 2. Ores containing silver may be divided into four kinds, 1. Pure, or those which are not much compounded with other metals. 2. Galenical, in which the silver is mixed with much galena, or ore of lead mineralised by sulphur. 3. Pyritous, in which the silver is mixed with the martial pyrites. 4. Cupreous; in which the silver is contained in copper ores. To extract the silver from these several kinds of ores, different operations are necessary.

Native silver is separated from its adhering earths and stones by amalgamation with mercury, in the manner directed for the separation of gold; or by fusion with lead, from which it may be afterwards separated by cupellation.

Pure ores seldom require a previous calcination; but, when bruised and cleansed from extraneous matters, may be fused directly, and incorporated with a quantity of lead; unless they contain a large proportion of sulphur and arsenic, in which case a calcination may be useful. The lead employed must be in a calcined or vitrified state, which, being mixed with the ore, and gradually reduced by the phlogiston of the charcoal added to it, may be more effectually united with the silver of the ore, than if lead itself had been added, which would too quickly precipitate to the bottom of the containing vessel or furnace. The silver is to be afterwards separated from the lead by cupellation.

Galenical ores, especially those in which pyrites is intermixed, require a calcination, which ought to be performed in an oven, or reverberatory furnace. They are then to be fused together with some inflammable matter, as charcoal, by which the lead is revived, and, together with the silver, is precipitated.

Pyritous ores must be first melted, so as to form a matt. If the sulphur is not sufficient for this kind of fusion, more sulphurated pyrites may be added. This matt contains, besides silver and sulphur, also various metals, as lead, iron, and sometimes cobalt. The matt must be exposed to repeated calcinations till the sulphur is dissipated. By these calcinations most of the iron is destroyed. The calcined matt is to be fused with litharge, and the silver incorporated with the revived lead; from which, and from the other imperfect metals with which it may be mixed, it must afterwards be separated by cupellation.

The silver contained in cupreous ores may be obtained, either, 1. By separating it from the copper itself, after this has been extracted along with the silver, in the usual manner, from the ore; or, 2. By precipitating it immediately, from the other matters of the ore.

1. It may be separated from the copper by two methods. One of these is by adding lead, and scorifying the imperfect metals. By this method much of the copper would be destroyed, and it is therefore not to be used unless the quantity of silver relatively to the copper be considerable. Another method by which silver may be separated from copper is, by eliquation; that is, by mixing the mass of copper and silver with a quantity of lead, and applying such a heat as shall be just sufficient to make the lead eliquate from the copper, together with the silver, which being more strongly disposed to unite with the lead than with the copper, is thus incorporated with the former metal, and separated from the latter.

2. Silver may also be extracted from these cupreous ores by precipitation. For this purpose, let the ore, previously bruised and cleansed, be formed into a matt, that the earthy matters may be well separated. Let the matt be then fused with a strong heat; and when the scoria has been removed, and the heat is diminished, add to it some clean galena, litharge, and granulated lead. When the fire has been raised, and the additions well incorporated with the matt, let some cast or filed iron be thrown into the liquid mass, which, being more disposed than lead is to unite with sulphur, will separate and precipitate the latter metal, and along with it the silver or gold contained in the matt. This method was introduced by Scheffer, and is practised at Adelfors in Smoland. In this work the proportion of the several materials is, four quintals of matt, two quintals of black copper containing some lead with the perfect metal, one quintal of galena, one quintal of litharge, a fifth part of a quintal of granulated lead, and an equal quantity of cast iron.

The silver in this, and in all other instances where it is united with lead, is to be afterwards separated from the lead by cupellation; which process is described at the articles Essay *of the Value of Silver*, and Refining.

Sect. V. *Smelting of Ores of Copper.*

§ 1. The smelting in great of copper ores, and even of several ores of silver and lead, excepting that of Ramelsberg, is performed in furnaces not essentially different from that already described; but in this respect only, that the scoria and metal are not drawn out of the furnace, but flow spontaneously, as soon as they are melted, into receiving basons, where the metal is freed from the scoria. These furnaces are generally called *pierced furnaces*.

Instead of a light brasque, or bed of charcoal-powder, under which the metal lies hid, the bottom of these furnaces is covered with a bason composed of heavy

heavy brasque, which is a mixture of charcoal-powder and clay. In the front of the furnace, and at the bottom of the chemise, there is a hole, called the *eye*, through which the melted matter flows, and runs along a trench or furrow, called the *trace*, into one or more receiving basons, made of earth, scoria, sand, &c. There the metal is separated from the scoria, by making it flow from these basons into another lateral one. These furnaces are also called *crooked furnaces*.

Different names are given to them according to some difference in their construction. For instance, those which have two eyes, and two traces, through which the melted matter flows alternately into two basons, are called *spectacle-furnaces*. Their greater or less height gives occasion also to the distinction of *high furnaces*, and *middle furnaces*.

The high furnaces are of modern invention. They were first introduced at Mansfeldt in the year 1727; and they are now used in almost all countries where ores are smelted, as in Saxony, Bohemia, Hungary, &c. Their chief advantage consists in simplifying and diminishing the labour. This advantage is effected by the great height of the furnace, which allows the ore to remain there a long time before it falls down into the hottest part of the fire and is melted. Consequently, it suffers successively different degrees of heat; and, before it is melted, it undergoes a roasting which costs nothing: therefore the high furnaces are chiefly employed for crude fusions; and particularly for the slate-copper ore. These furnaces are above 18 feet high. A too great height is attended with an inconvenience, besides the trouble of supplying it with ore and fuel, which is, that the charcoal is mostly consumed before it gets down where the greatest heat is required, and is then rendered incapable of maintaining a fire sufficiently intense.

All the furnaces which we have mentioned are supplied with large bellows, moved by the arbor of a wheel, which is turned round by a current of water.

The only kind of furnace for smelting ores where bellows are not employed, is what is called a *reverberatory furnace*. The Germans call it a *wind-furnace*. It is also distinguished by the name of *English furnace*, because the invention of it is attributed to an English physician of the name of *Wright*, who was well versed in chemistry; and because the use of it was first introduced in England about the end of the last century, where it is much employed, as well as in several other countries, as at Konigsberg, in Norway.

The length of these furnaces is about 18 feet, comprehending the masonry: their breadth is 12 feet, and their height nine feet and a half. The hearth is raised three feet above the level of the foundery: on one side is the fire-place, under which is an ash-hole hollowed in the earth; on the other side is a bason made, which is kept covered with fire when there is occasion: on the anterior side of this furnace there is a chimney, which receives the flame after it has passed over the mineral that is laid upon the hearth. This hearth, which is in the interior part of the furnace, is made of a clay capable of sustaining the fire. The advantage of this furnace is, that bellows are not necessary; and consequently it may be constructed where there is no current of water, and wherever the mine happens to be. This furnace has a hole in its front, through which the scoria is drawn out; and a bason, as we have said, on one side, made with sand, in which are oblong traces for the reception of the matt, and of the black copper, when they flow out of the furnace.

Copper is generally mineralised, not only by sulphur and arsenic, but also by semimetals and pyritous matters, and is frequently mixed with other metals. As this metal has great affinity with sulphur and arsenic, it is almost impossible to disengage it from them entirely by roasting: hence, in the smelting in great, nothing is obtained by the first operation but a copper matt, which contains all the principles of the ore, excepting the earthy and stony parts, particularly when the ore is smelted crude and unroasted. Afterwards this matt must be again roasted and fused. The produce of this second fusion begins still more to resemble copper, but is not malleable. It continues mixed with almost all the minerals, particularly with the metals. As it is frequently of a black colour, it is always called *black copper*, when it is unmalleable, whatever its colour happens really to be.

As, of all the imperfect metals, copper is most difficultly burnt and scorified, it is again remelted several times, in order to burn and scorify the metallic substances mixed with it; and this is done till the copper is perfectly pure, which is then called *red* or *refined copper*, and these last fusions are called the *fining* and *refining* of it: red copper contains no metals but gold and silver, if any of these happened to be in the ore.

In order to avoid all these fusions, it has been proposed to treat in the humid way certain copper ores, particularly those which are very pyritous. This method consists in making blue vitriol from the ore, by roasting and lixiviating it, and in precipitating pure copper from this lixivium, which is called *cement-water*, by means of iron: but it is not much practised, because it has been observed, that all the copper contained in the ore was not procured by this means.

As expence is not much regarded in small essays and experiments, these fusions are much abridged and facilitated by adding at first saline and glassy fluxes; and then by refining the black copper with lead in the cupel, as gold and silver are done. In this method of refining, it is to be most carefully observed, that the metal be fused as quickly as possible, and exposed to no more heat than is necessary, lest it be calcined.

When the black copper contains some iron, but not a great deal, the lead presently separates the iron from it, and makes it rise to the surface of the copper: but if the iron be in too large a proportion, it prevents the lead from uniting with the copper. These two phenomena depend on the same cause, which is, that lead and iron cannot unite.

Frequently copper ores contain also a quantity of silver sufficient to make its extraction by particular processes profitable. It was long before any process could be thought of for this purpose which was not too expensive and troublesome: but at length it is accomplished by the excellent operation called *eliquation*.

The

Smelting of Ores of Copper.

The copper from which filver has been feparated by eliquation muft be refined after this operation, as it is generally black copper from which filver is extracted: but even if it had not been black copper which was employed for this operation, it would require to be refined on account of a little lead it always retains. It is therefore carried to the refiners furnace, when this operation is performed by help of bellows, the blaft of which is thrown upon the furface of the melted metal. As in this refining of copper the precife time when it becomes pure cannot be known, becaufe fcoria is always formed on its furface, it is neceffary to ufe an effay-iron, the polifhed end of which being dipt in melted copper, fhews that this metal is pure when the copper adhering to the iron falls off as foon as it is dipt in cold water.

When this mark of the purity of the copper has been obferved, its furface ought to be well cleaned; and as foon as it begins to fix, it muft be fprinkled with a broom or befom dipped in cold water. The furface of the copper which is then fixing, being fuddenly cooled by the water, detaches itfelf from the reft of the metal, is taken hold off by tongs, and is thrown red-hot into cold water. By again fprinkling water on the mafs of copper, it is all of it reduced into plates which are called *rofettes*, and thefe plates are what is called *rofette-copper*.

§ 2. The copper of pyritous cupreous ores cannot be obtained without feveral operations, which vary according to the nature of the ores. Thefe operations are chiefly roaftings and fufions. By the firft fufion a matt is produced, which is afterwards to be roafted; and thus the fufions and roaftings are to be alternately applied, till by the laft fufion copper is obtained. Thefe methods of treating pyritous copper ores depend on the two following facts: 1. Sulphur is more difpofed to unite with iron than with copper. 2. The iron of thefe ores is deftructible by the burning fulphur during the roafting or the fufion of the ores, while the copper is not injured. This fact appears from experiments mentioned by Scheffer and by Wallerius, and from the daily practice of fmelting cupreous ores.

From thefe facts we learn, 1. That fulphur may be employed to feparate and deftroy iron mixed with copper. 2. That iron may be employed to feparate the fulphur from copper, as is fometimes done in the effay of fulphurated copper-ores. 3. That by adjufting the proportion of the iron and fulphur to each other in the fmelting of copper-ores, thefe two fubftances may be made to deftroy each other, and to procure a feparation of the copper: and this adjuftment may be effected, by adding fulphur or fulphureous pyrites to the copper-ore, when the quantity of fulphur contained in this ore relatively to the iron is too fmall; or by adding iron when the fulphur predominates; or by roafting, by which the fuperfluous fulphur may be expelled, and no more left than is fufficient for the deftruction of the iron contained in the ore. We fhall apply thefe principles to the following cafes.

1. When the quantity of fulphur and of iron in a copper-ore is fmall, and efpecially when the iron does not too much abound, a previous roafting will at once calcine the iron, and expel moft of the fulphur; fo that by one fufion the calcined iron may be fcorified, and black copper may be obtained. If the fulphur has not been fufficiently expelled, a fecond roafting and fufion are requifite; for the whole quantity of fulphur ought not to be expelled during the firft roafting: but as much ought to be left as is fufficient for the fcorification of the calcined iron; otherwife this might, during the fufion, be again revived and united with the copper.

2. If, in a copper-ore, the quantity of iron be too great, relatively to the fulphur, fome fulphurated pyrites, efpecially that kind which contains copper, ought to be added, that a matt may be obtained, and that the iron may be calcined and fcorified.

3. When the quantity of fulphur and iron is very great, that is, when the ore is very pyritous and poor, it ought to be firft formed into a matt; by which it is feparated from the adherent earths and ftones, and the bulk is diminifhed: then by repeated and alternate roaftings and fufions, the copper may be obtained.

4. When the quantity of fulphur in an ore is greater than is fufficient for the forming a matt, the fuperfluous quantity ought to be previoufly expelled by roafting.

The copper thus at firft obtained is never pure, but is generally mixed with fulphur or with iron. It is called *black copper*. This may be refined in furnaces, or on hearths.

In the former method, to the copper when melted a fmall quantity of lead is added, which unites with the fulphur, and is fcorified together with the iron, and floats upon the furface of the melted copper. This purification of copper by means of lead is fimilar to the refining of filver by cupellation; and is founded on the property of lead, by which it is more difpofed to unite with fulphur than copper is; and on a property of copper, by which it is lefs liable than any other imperfect metal to be fcorified by lead. But as copper is alfo capable of being fcorified by lead, this operation muft be no longer continued, and no more lead muft be employed, than is fufficient for the feparation of the fulphur, and for the fcorification of the iron.

The copper might alfo be purified from any remaining fulphur by adding a fufficient quantity of iron to engage the fulpur. Thus Mr Scheffer found, that by adding to fulphurated copper from $\frac{1}{25}$th to $\frac{1}{16}$th of old caft iron, he rendered the copper pure and ductile. See his Differtation on the Parting of Metals amongft the *Swedifh Memoirs* for the year 1752. In this purification, the quantity of iron added ought not to be too little, elfe all the fulphur will not be feparated; and it ought not to be too great, elfe the fuperfluous quantity will unite with and injure the purity of the copper. The fufion and fcorification, with addition of lead, feems to be the beft method for the laft purification of copper.

Sect. VI. *Smelting*, &c. *of Ores of Iron.*

Notwithstanding the great importance of this fubject, and the labours of Reaumur, Swedenborgius, and of fome other authors, we have ftill a very imperfect knowledge of the caufes of the differences of the feveral kinds of ores, of the methods of fmelting beft adapted to thefe differences, of the caufes of the good and bad qualities of different kinds of iron, and of the means of fo meliorating this metal that we may obtain tough and ductile iron from any of its ores.

Sweden-

Manufacturing of Iron.

Swedenborgius has very induftriouſly and exactly deſcribed the different proceffes now uſed in moſt parts of Europe for the ſmelting of ores of iron, for the forging of that metal, and for the converſion of it into ſteel: but we do not find that he or any other author have, by experiments and diſcoveries, contributed much to the illuſtration or to the improvement of this part of metallurgy, unleſs, perhaps, we except thoſe of Mr Reaumur, concerning the ſoftening of caſt iron by cementation with earthy ſubſtances.

The ores of iron are known to vary much in their appearance, in their contents, in their degrees of fuſibility, in the methods neceſſary for the extraction of their contained metal, and in the qualities of the metal when extracted.

Moſt ores require to be roaſted previouſly to their fuſion; ſome more ſlightly, and others with a more violent and longer-continued fire. Thoſe which contain much ſulphur, arſenic, or vitriolic acid, require a long-continued and repeated roaſting, that the volatile matters may be expelled. Of this kind is the black-iron ore, from which the Swediſh iron is ſaid to be obtained.

Some ores require a very ſlight roaſting only, that they may be dried and rendered friable. Such are the ores called *bog ores*, and others, which being in a calcined ſtate, and containing little ſulphureous matter, would, by a further calcination, be rendered leſs capable of being reduced to a metallic ſtate.

The roaſting of ores of iron is performed by kindling piles, conſiſting of ſtrata of fuel and of ore placed alternately upon one another, or in furnaces ſimilar to thoſe commonly employed for the calcination of limeſtone.

Some authors adviſe the addition of a calcareous earth to ſulphureous ores during the roaſting, that the ſulphur may be abſorbed by this earth when converted into quicklime. But we may obſerve, that the quicklime cannot abſorb the ſulphur or ſulphureous acid, till theſe be firſt extricated from the ore, and does therefore only prevent the diſſipation of theſe volatile matters; and, ſecondly, that the ſulphur thus united with the quicklime forms a hepar of ſulphur, which will unite with and diſſolve the ore during its fuſion, and prevent the precipitation of the metal.

The next operation is the *fuſion* or *ſmelting* of the ore. This is generally performed in furnaces or towers, from 20 to 30 feet high, in the bottom of which is a baſon for the reception of the fluid metal. When the furnace is ſufficiently heated, which muſt be done at firſt very gradually, to prevent the cracking of the walls; a quantity of the ore is to be thrown in, from time to time, at the top of the furnace, along with a certain quantity of fuel and of lime-ſtone, or whatever other flux is employed. While the fuel below is conſumed by the fire excited by the wind of the bellows, the ore, together with its proportionable quantity of fuel and of flux, ſink gradually down, till they are expoſed to the greateſt heat in the furnace. There the ore and the flux are fuſed, the metallic particles are revived by the fuel, are precipitated by means of their weight through the ſcoria formed of the lighter earthy parts of the flux and of the ore, and unite in the baſon at the bottom of the furnace, forming a maſs of fluid metal covered by a glaſſy ſcoria. When a ſufficient quantity of this fluid metal is collected, which is generally twice or thrice in 24 hours, an aperture is made, through which the metal flows into a channel or groove made in a bed of ſand; and from thence into ſmaller lateral or connected channels, or other moulds. There it is cooled, becomes ſolid, and retains the forms of the channels or moulds into which it flows. The piece of iron formed in the large channel is called a *ſow*, and thoſe formed in the ſmaller channels are called *pigs*. Sometimes the fluid iron is taken out of the furnace by means of ladles, and poured into moulds ready prepared, of ſand or of clay, and is thus formed into the various utenſils and inſtruments for which caſt iron is a proper material.

The *ſcoria* muſt be, from time to time, allowed to flow out, when a conſiderable quantity of it is formed, through an aperture made in the front of the furnace for that purpoſe. A ſufficient quantity of it muſt, however, be always left to cover the ſurface of the melted iron, elſe the ore which would fall upon it, before the ſeparation of its metallic from its unmetallic parts, would leſſen the fluidity and injure the purity of the melted metal. This ſcoria ought to have a certain degree of fluidity; for if it be too thick, the revived metallic particles will not be able to overcome its tenacity, and collect together into drops, nor be precipitated. Accordingly, a ſcoria not ſufficiently fluid, is always found to contain much metal. If the ſcoria be too thin, the metallic particles of the ore will be precipitated before they are ſufficiently metallized, and ſeparated from the earthy and unmetallic parts. A due degree of fluidity is given to the ſcoria by applying a proper heat, and by adding fluxes ſuited to the ore.

Some ores are fuſible without addition, and others cannot be ſmelted without the addition of ſubſtances capable of facilitating their fuſion.

The *fuſible ores* are thoſe which contain ſulphur, arſenic, or are mixed with ſome fuſible earth.

The *ores difficultly fuſible* are thoſe which contain no mixture of other ſubſtance. Such are moſt of the ores which contain iron in a ſtate nearly metallic. As iron itſelf, when purified from all heterogeneous matters, is ſcarcely fuſible without addition, ſo the metal contained in theſe purer kinds of ores cannot be eaſily extracted without the addition of ſome fuſible ſubſtance. 2. Thoſe which are mixed with ſome very refractory ſubſtance. Some of theſe refractory ores contain arſenic; but as this ſubſtance facilitates the fuſion of iron, we may preſume that their refractory quality depends upon a mixture of ſome unmetallic earth or other unfuſible ſubſtance. The earth which is mixed with the common calciform ores is in conſiderable quantity; and is ſometimes calcareous, ſometimes ſiliceous, and ſometimes argillaceous.

Perhaps the fuſibility of different ores depends greatly on the degree of calcination to which the metal contained in them has been reduced; ſince we have reaſon to believe, that, by a very perfect calcination, ſome metals at leaſt may be reduced to the ſtate of an earth almoſt unfuſible, and incapable of metallization; and ſince we know, that in every calcination and ſubſequent reduction of a given quantity of any imperfect

Manufacturing of Iron.

imperfect metal, a fenfible part of that quantity is always loft or deftroyed, however carefully thefe operations may have been performed. That fome of thefe ores are already too much calcined, appears from the inftance above-mentioned of the *bog ores*, which are injured by roafting; and even the great height of the common fmelting furnaces, although advantageous to many ores that require much roafting, is faid to be injurious to thofe which are already too much calcined, by expofing them to a further calcination, during their very gradual defcent, before they arrive at the hotteft part of the furnace, where they are fufed.

But as too violent calcination renders fome ores difficultly fufible, fo too flight calcination of other ores injures the purity of the metal, by leaving much of the fulphureous or other volatile matter, which ought to have been expelled.

Various *fubftances are added to affift the fufion of ores difficultly fufible.* Thefe are, 1. *Ores* of a fufible quality, or which, being mixed with others of a different quality, become fufible: accordingly, in the great works for fmelting ores of iron, two or more different kinds of ore are commonly mixed, to facilitate the fufion, and alfo to meliorate the quality of the iron. Thus an ore yielding an iron which is brittle when hot, which quality is called *red-fhort*, and another ore which produces iron brittle when cold, or *cold-fhort*, are often mixed together; not, as fometimes fuppofed, that thefe qualities are mutually deftructive of each other, but that each of them is diminifhed in the mixed mafs of iron, as much as this mafs is larger than the part of the mafs originally poffeffed of that quality. Thus, if from two fuch ores the mafs of iron obtained confifts of equal parts of cold-fhort and of red-fhort iron, it will have both thefe qualities, but will be only half as *cold-fhort* as iron obtained folely from one of the ores, and half as *red-fhort* as iron obtained only from the other ore. 2. *Earths* and *ftones* are alfo generally added to facilitate the fufion of iron ores. Thefe are fuch as are fufible, or become fufible when mixed with the ore, or with the earth adhering to it. Authors direct that, if this earth be of an argillaceous nature, limeftone or fome calcareous earth fhould be added; and that, if the adherent earth be calcareous, an argillaceous or filiceous earth fhould be added; becaufe thefe two earths, though fingly unfufible, yet, when mixed, mutually promote the fufion of each other: but as limeftone is almoft always added in the fmelting of iron ores, and as in fome of thefe, at leaft, no argillaceous earth appears to be contained, we are inclined to believe, that it generally facilitates the fufion, not merely by uniting with thofe earths, but by uniting with that part of the ore which is moft perfectly calcined, and leaft difpofed to metallization; fince we know, that by mixing a calciform or roafted ore of iron with calcareous earth, without any inflammable matter, thefe two fubftances may be totally vitrified. See *Experiments made upon quicklime and upon iron, by Mr Brandt, in the Swedifh Memoirs for the years* 1749 *and* 1751. Calcareous earth does indeed fo powerfully facilitate the fufion of iron ores, that it deferves to be confidered whether workmen do not generally ufe too great a quantity of it, in order to haften the operation. For when the fcoria is rendered too thin, much earthy or unmetallized matter is precipitated, and the caft iron produced is of too vitreous a quality, and not fufficiently approximated to its true metallic ftate.

Some authors pretend, that a principal ufe of the addition of limeftone in the fmelting of iron ores is to abforb the fulphur, or vitriolic acid, of thefe ores: but, as we have already obferved, a hepar of fulphur is formed by that mixture of calcareous earth and fulphur, which is capable of diffolving iron in a metallic ftate; and thus the quantity of metal obtained from an ore not fufficiently divefted of its fulphur, or vitriolic acid, (which, by uniting with the fuel, is formed into a fulphur during the fmelting,) muft be confiderably diminifhed, though rendered purer, by addition of calcareous earth: hence the utility appears of previoufly expelling the fulphur and vitriolic acid from the ore by a fufficient roafting. 3. The *fcoria* of former fmeltings is frequently added to affift the fufion of the ore; and, when the fcoria contains much iron, as fometimes happens in ill-conducted operations, it alfo increafes the quantity of metal obtained.

The quantity of thefe fufible matters to be added varies according to the nature of the ore; but ought in general to be fuch, that the fcoria fhall have its requifite degree of thinnefs, as is mentioned above.

The *fuel* ufed in moft parts of Europe for the fmelting of ores of iron is charcoal. Lately, in feveral works in England and Scotland, iron ore has been fmelted by means of pit-coal, previoufly reduced to cinders or *coaks*, by a kind of calcination fimilar to the operation for converting wood into charcoal, by which the aqueous and fulphureous parts of the coal are expelled, while only the more fixed bituminous parts are left behind. In France, pit-coal not calcined has been tried for this purpofe, but unfuccefsfully. The ufe of *peat* has alfo been introduced in fome parts of England.

The quality of the iron depends confiderably upon the quality and alfo upon the quantity of the fuel employed. Charcoal is fitter than coaks for producing an iron capable of being rendered malleable by forging.

The quantity of fuel, or the intenfity of the heat, muft be fuited to the greater or lefs fufibility of the ore. Sulphureous, and other ores eafily fufible, require lefs fuel than ores difficultly fufible. In general, if the *quantity of fuel be too fmall*, and the heat not fufficiently intenfe, all the iron will not be reduced, and much of it will remain in the fcoria, which will not be fufficiently thin. This defect of fuel may be known by the blacknefs and compactnefs of the fcoria; by the qualities of the iron obtained, which in this cafe is hard, white, light, intermixed with fcoria, fmooth in its texture, without fcales or grains, rough and convex in its furface, and liable to great lofs of weight by being forged; and, laftly, it may be known by obferving the colour and appearance of the drops of metal falling down from the fmelted ore, and of the fcoria upon the furface of the fluid metal, both which are darker-coloured than when more fuel is ufed. When the *quantity of fuel is fufficiently large*, and the heat is intenfe enough, the iron is darker-coloured,

Manufacturing of Iron.

coloured, denfer, more tenacious, contains lefs fcoria, and is therefore lefs fufible, and lofes lefs of its weight by being forged. Its furface is alfo fmoother and fomewhat concave; and its texture is generally granulated. The fcoria, in this cafe, is of a lighter colour, and lefs denfe. The drops falling down from the fmelted ore and the liquid fcoria in the furnace appear hotter and of a brighter colour. When the quantity of fuel is too great, and the heat too intenfe, the iron will appear to have a ftill darker colour, and more confpicuous grains or plates, and the fcoria will be lighter, whiter, and more fpungy. The drops falling from the fmelted ore, and the fluid fcoria, will appear to a perfon looking into the furnace through the blaft-hole to be very white and fhining hot. The quantity of charcoal neceffary to produce five hundred weight of iron, when the ore is rich, the furnace well contrived, and the operation fkilfully conducted, is computed to be about 40 cubic feet; but is much more in contrary circumftances.

The *time, during which the fluid metal ought to be kept in fufion* before it is allowed to flow out of the furnace, muft be alfo attended to. How long that time is, and whether it ought not to vary according to the qualities of ores and other circumftances, we cannot determine. In fome works the metal is allowed to flow out of the furnace every fix or eight, and in others only every 10 or 12, hours. Some workmen imagine, that a confiderable time is neceffary for the concoction of the metal. This is certain, that the iron undergoes fome change by being kept in a fluid ftate; and that if its fufion be prolonged much beyond the ufual time, it is rendered lefs fluid, and alfo its cohefion, when it becomes cold, is thereby greatly diminifhed. The marquis de Courtivron fays, that the cohefion may be reftored to iron in this ftate, by adding to it fome vitrefcible earth, which he confiders as one of the conftituent parts of iron, and which he thinks is deftroyed by the fufion too long continued. That the fufibility of caft iron does depend on an admixture of fome vitrefcible earth, appears probable from the great quantity of fcoria forced out of iron during its converfion into malleable or forged iron, and from the lofs of fufibility which it fuffers nearly in proportion to its lofs of fcoria. The quantity of iron daily obtained from fuch a furnace as is above defcribed, is from two to five tons in 24 hours, according to the richnefs and fufibility of the ore, to the conftruction of the furnace, to the adjuftment of the due quantity of flux and of fuel, and to the fkill employed in conducting the operation.

The *quality of the iron* is judged by obferving the appearances during its flowing from the furnace, and when it is fixed and cold. If the fluid iron, while it flows, emits many and large fparkles; if many brown fpots appear on it while it is yet red-hot; if, when it is fixed and cold, its corners and edges are thick and rough, and its furface is fpotted; it is known to have a red-fhort quality. If, in flowing, the iron feems covered with a thin glaffy cruft, and if, when cold, its texture be whitifh, it is believed to be cold-fhort. Mr Reaumur fays, that dark-coloured caft iron is more impure than that which is white. The marquis de Courtivron is of a contrary opinion. But no certain rules for judging of the quality of iron before it be forged can be given. From brittle caft iron, fometimes ductile forged iron is produced. Caft iron with brilliant plates and points, when forged, becomes fometimes red-fhort and fometimes cold-fhort. Large fhining plates, large cavities called *eyes*, want of fufficient denfity, are almoft certain marks of bad iron; but whether it will be cold or red-fhort cannot be affirmed till it be forged. Whitenefs of colour, brittlenefs, clofenefs of texture, and hardnefs, are given to almoft any caft iron by fudden cooling; and we may obferve, that in general the whither the metal is, the harder it is alfo, whether thefe properties proceed from the quality of the iron, or from fudden cooling; and that, therefore, the darker-coloured iron is fitter for being caft into moulds, becaufe it is capable in fome meafure of being filed and polifhed, efpecially after it has been expofed during feveral hours to a red-heat in a reverberatory furnace, and very gradually cooled. This operation, called by workmen *annealing*, changes the texture of the metal, renders it fofter, and more capable of being filed than before, and alfo confiderably lefs brittle.

Mr Reaumur found, that by cementing caft iron with abforbent earths in a red-heat, the metal may be rendered fofter, tougher, and confequently a fit material for many utenfils formerly made of forged iron. Whether cementation with abforbent earths gives to caft iron a greater degree of thefe properties than the annealing commonly practifed, has not been yet determined.

In Navarre, and in fome of the fouthern parts of France, iron-ore is fmelted in furnaces much fmaller, and of a very different conftruction form thofe above defcribed. A furnace of this kind confifts of a wide-mouthed copper-caldron, the inner furface of which is lined with mafonry a foot thick. The mouth of the caldron is nearly of an oval or elliptic form. The fpace or cavity contained by the mafonry is the furnace in which the ore is fmelted. The depth of this cavity is equal to two feet and a half: the larger diameter of the oval mouth of the cavity is about eight feet, and its fmaller diameter is about fix feet: the fpace of the furnace is gradually contracted towards the bottom, the greateft diameter of which does not exceed fix feet: eighteen inches above the bottom is a cylindrical channel in one of the longer fides of the caldron and mafonry, through which the nozzle of the bellows paffes. This channel, and alfo the bellows-pipe, are fo inclined, that the wind is directed towards the loweft point of the oppofite fide of the furnace. Another cylindrical channel is in one of the fhorter fides of the furnace, at the height of a few inches from the bottom, which is generally kept clofed, and is opened occafionally to give paffage to the fcoria; and above this is a third channel in the fame fide of the furnace, through which an iron inftrument is occafionally introduced to ftir the fluid metal, and to affift, as is faid, the feparation of the fcoria from it. The greateft height of this channel is at its external aperture on the outfide of the furnace, and its fmaller height is at its internal aperture; fo that the inftrument may be directed towards the bottom of the furnace; but the fecond channel below it has a contrary inclination, that, when an opening is made, the fcoria may flow out of the furnace into a bafon

Manufacturing of Iron.

bason placed for its reception. When the furnace is heated sufficiently, the workmen begin to throw into it alternate changes of charcoal, and of ore previously roasted. They take care to throw the charcoal chiefly on that side at which the wind enters, and the ore at the opposite side. At the end of about four hours a mass of iron is collected at the bottom of the furnace, which is generally about 600 weight; the bellows are then stopt: and when the mass of iron is become solid, the workmen raise it from the bottom of the furnace, and place it, while yet soft, under a large hammer, where it is forged. The iron produced in these furnaces is of the best quality; the quantity is also very considerable, in proportion to the quantity of ore, and to the quantity of fuel employed. In these furnaces no limestone or other substance is used to facilitate the fusion of the ore. We should receive much instruction concerning the smelting of iron-ore, if we knew upon what part of the process, or circumstance, the excellence of the iron obtained in these furnaces depends; whether on the quality of the ore; on the disuse of any kind of flux, by which the proportion of vitreous or earthy matter, intermixed with the metallic particles, is diminished; on the forging while the iron is yet soft and hot, as the Marquis de Courtivron thinks; or on some other cause, not observed.

The iron thus produced by smelting ores is very far from being a pure metal; and though its fusibility renders it very useful for the formation of cannon, pots, and a great variety of utensils, yet it wants the strength, toughness, and malleability, which it is capable of receiving by further operations.

Cast-iron seems to contain a large quantity of vitreous or earthy matter mixed with the pure iron; which matter is probably the chief cause of its fusibility, brittleness, hardness, and other properties by which it differs from forged iron. The sulphur, arsenic, and other impurities of the ore, which are sometimes contained in cast-iron, are probably only accidental, and may be the causes of the red-short quality, and of other properties of certain kinds of iron: but the earthy matter above-mentioned seems principally to distinguish cast-iron from forged or malleable iron; for, first, by depriving the former of this earthy matter, it is rendered malleable, as in the common process hereafter to be discribed; and, secondly, by fusing malleable iron with earthy and vitrescible matters, it loses its malleability, and is restored to the state and properties of cast-iron.

The earthy vitreous matter contained in cast-iron consists probably of some of the ferruginous earth or calx of the ore not sufficiently metallised, and also of some unmetallic earth. Perhaps it is only a part of the scoria which adheres to, and is precipitated with, the metallic particles, from which it is more and more separated, as the heat applied is more intense, and as the fusion is longer continued.

To separate these impurities from cast-iron, and to unite the metallic parts more closely and compactly, and thus to give it the ductility and tenacity which render this metal more useful than any other, are the effects produced by the following operations.

The first of these operations is a fusion of the iron, by which much of its impurities is separated in form of scoria; and by the second operation, a further and more complete separation of these impurities, and also a closer compaction of the metallic particles, are effected by the application of mechanical force or pressure, by means of large hammers.

Some differences in the construction of the forge or furnace, in which the *fusion* or *refining of cast-iron* is performed, in the method of conducting the operation, and in other circumstances, are observed to occur in different places. We shall describe from Swedenborgius the *German method*.

The fusion of the cast-iron, which is to be rendered malleable, is performed upon the hearth of a forge similar to that used by blacksmiths: at one side of this hearth is formed a cavity or fire-place, which is intended to contain the fuel and the iron to be melted: this fire-place is 20 inches long, 18 inches broad, and 12 or 14 inches deep: it is bounded on three sides by three plates of cast-iron placed upright; and on the fourth side, which is the front, or that part nearest to which the workmen stand, by a large forge-hammer, through the eye of which the scoria is at certain times allowed to flow. The floor also of the fire-place is another cast-iron plate. The thickness of these plates is from two to four inches. One of the upright side-plates rests against a wall, in an aperture through which a copper tube, called the *tuyere*, is luted with clay. This tube is a kind of case or covering for the pipe of a pair of bellows placed behind the wall, and its direction is therefore parallel to that of the bellows-pipe; but it advances about half a foot further than this pipe into the fire-place; and thus gives greater force to the air, which it keeps concentrated, or prevents the divergency of the air, till it is required to act. The tube rests upon the edge of the side-plate which leans against the wall, nearer to the back-part than to the front of the fire-place, and in such an oblique direction, that the wind shall be impelled towards the furthest part of the floor of the fire-place, or where this floor is intersected by the opposite side-plate. The obliquity of the tuyere ought to vary according to the quality of the iron: and therefore, in every operation, it may be shifted till its proper position is found. The more nearly its direction approaches to a horizontal plane, the more intense is the heat; but a larger quantity of fuel is consumed than is even proportional to the increase of heat, because the flame is not then so well confined. When the iron is easily fusible, great heat is not required: the tuyere may then decline considerably from the horizontal plane, and thus fuel may be saved. This tuyere, tho' made of copper, a metal more easily fusible than iron, is preserved from fusion by the constant passage of cold air through it. It must be carefully kept open, and cleansed from the scoria, which would be apt to block up its cavity, by which not only the heat would be too much diminished for the success of the operation, but the tube itself would be melted.

To prepare for the fusion, a quantity of scoria of a former operation is thrown into the fire-place, till one-third part of this be full; and the remaining two-thirds of the fire-place are to be filled with smaller scoria, coal-dust, and sparks ejected from hot iron. These matters, being fusible, form a bath for the reception of the iron when melted. Upon this bed of scoria, the mass of cast-iron to be melted is placed; so-

Manufacturing of Iron.

fo that one end of it fhall be within the fire-place, oppofite to the tuyere, and at the diftance of about four or five inches from its aperture; and the other end fhall ftand without the fire-place, to be pufhed in, as the former is melted. The upper fide of the mafs of iron ought to be in the fame horizontal plane as the upper part of the orifice of the tuyere, that the wind may, by means of the obliquity of its courfe, ftrike upon and pafs along the under-fide of the mafs: but if the iron be difficultly fufible, the tuyere is to be difpofed more horizontally, fo that the wind fhall ftrike directly upon the mafs of iron; and that one part of the blaft fhall graze along the upper furface, and the other part along the under furface of the iron. The mafs of iron weighs generally from 200 to 400 pounds. Sometimes two or three fmaller maffes are put one above another, fo as not to touch. When thefe are of different qualities, the cold-fhort piece is placed undermoft, that being more unfufible than the red-fhort. The iron being placed, charcoal-powder is thrown on both fides, and coals are accumulated above, fo as to cover entirely the iron.

The coals are then to be kindled, and the bellows are made to blow, at firft flowly, and afterwards with more and more force. The iron is gradually liquefied, and flows down in drops through the melted fcoria to the bottom of the fire-place; during which the workmen frequently turn the iron, fo that the end oppofed to the blaft of wind may be equally expofed to heat, and uniformly fufed. While the coals are confumed, more are thrown on, fo that the whole may be kept quite covered. During the operation, a workman frequently founds the bottom and corners of the fire-place by means of a bar or poker, raifes up any mafs of metal which he finds adhering to thefe, and expofes them to the greateft heat, that they may be more perfectly fufed.

When all the iron is fufed, no more coals are to be added; but the melted mafs is to remain half uncovered for fome time; during which the iron boils and bubbles, and its furface fwells and rifes higher and higher. When the iron has rifen as high as the upper edge of the fire-place, the coals upon its furface muft be removed; and by thus expofing it to cold air, its ebullition and fwelling fubfide. In this ftate, or coction, the iron is kept during half an hour or more, by adding occafionally pieces of good coal, which maintain a fufficient heat, without covering entirely the furface of the mafs. During this coction, the workmen allow the orifice of the tuyere to be half ftopped up by the fcoria, that the air may not blow upon the iron with all its force, by which it would be too much cooled. Accordingly, when they think that the coction has continued fufficiently long, they clear the paffage of the tuyere, and the mafs is foon cooled by the cold air. At the fame time alfo, they open a paffage in the eye of the hammer placed in the front of the fire-place, through which fome of the fcoria is allowed to flow out. When the iron has become folid, the bellows are ftopt, the coals are removed, and the mafs is left during an hour; and then the workmen raife it from the fire-place, turn it upfide down, and proceed to the fecond coction or fufion of the iron.

From this fecond operation, the mafs is to be fo placed, that one part of it fhall reft upon the tuyere, and the other upon the fcoria remaining in the fire-place. This fcoria is to be difpofed in an oblique direction parallel to the tuyere, by which means the wind of the bellows is obliged to pafs along the under fide of the mafs of iron. About the fides of the mafs, charcoal-powder and burnt afhes are thrown; but towards the tuyere, dry and entire pieces of coals are placed, to maintain the fire. When thefe are kindled, more coals are added, and the fire is gradually excited. The workman attends to the direction of the flame, that it pafs equally along the under furface of the iron, quite to the further extremity, and that it do not efcape at the fides, nor be reverberated back towards the tuyere, by which this copper tube might be melted. During this fufion, pieces of iron are apt to be feparated from the mafs, and to fall down unfufed to the bottom and corners of the fire-place. Thefe are carefully to be fearched for, and expofed to the greateft heat till they are melted. When the whofe mafs is thus brought into perfect fufion, the coals are removed; and the wind blowing on its furface, whirls and diffipates the fmall remaining pieces of fcoria, and fparks thrown out from the fluid iron. This jet of fire continues about feven or eight minutes, and the whole operation about two hours. In this fecond fufion the fcoria is to be thrice removed, by opening a paffage through the eye of the hammer. The firft time of removing the fcoria is about 20 minutes from the kindling of the fire, the fecond time is about 40 minutes after the firft, and the third time is near the end of the operation.

The mafs is then removed from the hearth, and put upon the ground of the forge, where it is cleanfed from fcoria, and beat into a more uniform fhape. It is then placed on an anvil, where, by being forged, it receives a form nearly cubical. This mafs is to be divided into five, fix, or more pieces, by means of a wedge; and thefe are to be heated and forged till they are reduced to the form of the bars commonly fold.

In fome forges, the iron is fufed only once, and in others it fuffers three fufions, by which it is faid to be rendered rery pure. Where only one fufion is practifed, it is called the *French method*. In this, no greater quantity of iron is fufed at once than is fufficient to make one bar. The fire-place is of confiderable lefs dimenfions, and efpecially is lefs deep, than in the German method above defcribed. The fire is alfo more intenfe, and the proportion of fuel confumed to the iron is greater. The iron, when melted, is not kept in a ftate of ebullition as is above defcribed; but this ebullition is prevented by ftirring the fluid mafs with an iron bar, till it is coagulated, and becomes folid.

By thefe operations, fufion and forging, the iron lofes about $\frac{3}{11}$ parts of its former weight, fometimes more and fometimes lefs, according to the quality of the caft-iron employed; it is purified from the vitreous and earthy parts which were intermixed with it, its metallic particles are more clofely compacted, its texture is changed, and it is rendered more denfe, foft, and malleable, tough, and difficultly fufible.

The degrees, however, of thefe qualities vary much in different kinds of iron. Thus fome iron is tough and malleable, both when it is hot and when it is cold. This

This is the beſt and moſt uſeful iron. It may be known generally by the equable ſurface of the forged bar, which is free from tranſverſe fiſſures or cracks in the edges, and by a clear, white, ſmall-grained, or rather fibrous texture. Another kind is tough when it is heated, but brittle when it is cold. This is called *cold ſhort* iron; and is generally known by a texture conſiſting of large, ſhining plates, without any fibres. It is leſs liable to ruſt than other iron. A third kind of iron, called *red-ſhort*, is brittle when hot, and malleable when cold. On the ſurface and edges of the bars of this kind of iron, tranſverſe cracks or fiſſures may be ſeen; and its internal colour is dull and dark. It is very liable to ruſt. Laſtly, ſome iron is brittle both when hot and when cold.

Moſt authors agree, that the red-ſhort quality of iron proceeds from ſome ſulphur or vitriolic acid being contained in it, becauſe ſulphur is known to produce this effect when added to iron, and becauſe the iron obtained from pyritous and other ſulphurated ores has generally this quality.

The cauſe of the cold-ſhort quality of iron is not ſo well aſcertained. Some imagine, that it proceeds from a mixture of arſenic or of antimony. But this opinion ſeems to be improbable, when we conſider that theſe metallic ſubſtances may in a great meaſure be diſſipated by roaſting, whereas the ores which yield a cold-ſhort iron are injured by much roaſting; that no arſenic or antimony are obſervable in moſt, if in any, of theſe ores; and laſtly, that theſe ſemi-metals would render the iron brittle both when hot and when cold. Cramer and other authors impute this vicious quality to a mixture of an unmetallic earth or vitreous matter; and affirm, that it may be deſtroyed by cementation with phlogiſton, and by forging. And laſtly, others aſcribe the cold-ſhort quality of iron to a defect of phlogiſton, or, as Swedenborgius ſays, of ſulphur. To aſcertain the cauſes of the bad qualities of iron, and to diſcover practical remedies, are ſtill deſiderata in metallurgy.

In one bar frequently two or more different kinds of iron may be obſerved, which run all along its whole length; and ſcarcely a bar is ever found of entirely pure and homogeneous iron. This difference probably proceeds from the practice we have mentioned of mixing different kinds of ores together, in the ſmelting; and alſo from the practice of mixing two or more pigs of caſt iron of different qualities in the finery of theſe; by which means, the red-ſhort and cold-ſhort qualities of the different kinds are not, as we have already remarked, mutually counteracted or deſtroyed by each other, but each of theſe qualities is diminiſhed in the mixed maſs of iron, as much as this maſs is larger than the part of the maſs originally poſſeſſed of that quality: that is, if equal parts of red-ſhort and of cold-ſhort iron be mixed together, the mixed maſs will be only half as red-ſhort as the former part, and half as cold-ſhort as the latter. For theſe different kinds of iron ſeem as if they were only capable of being interwoven and diffuſed thro' each other, but not of being intimately united or combined.

The quality of forged iron may be known by the texture which appears on breaking a bar. The beſt and toughеſt iron is that which has the moſt fibrous texture, and is of a clear greyiſh colour. This fibrous appearance is given by the reſiſtance which the particles of the iron make to their rupture. The next beſt iron is that whoſe texture conſiſts of clear, whitiſh, ſmall grains, intermixed with fibres. Theſe two kinds are malleable, both when hot and when cold, and have great tenacity. *Cold-ſhort iron* is known by a texture conſiſting of large, ſhining plates, without fibres: and *red ſhort iron* is diſtinguiſhed by its dark dull colour, and by the tranſverſe cracks and fiſſures on the ſurface and edges of the bars. The quality of iron may be much improved by violent compreſſion, as by forging and rolling; eſpecially when it is not long expoſed to too violent heat, which is known to injure, and at length to deſtroy its metallic properties.

For the converſion of iron into *ſteel*, ſee the article Steel.

Sect. VII. *Of the Smelting of Tin Ores.*

The tin-ores commonly ſmelted are thoſe which conſiſt of calx of tin combined with calx of arſenic and ſometimes with calx of iron. Theſe are either pure, as the tin-grains, or intermixed with ſpars, ſtones, pyrites, ores of copper, iron, or of other metals.

The impure ores muſt be cleanſed as much as is poſſible from all heterogeneous matters. This cleanſing is more neceſſary in ores of tin than of any other metal; becauſe in the ſmelting of tin-ores a leſs intenſe heat muſt be given than is ſufficient for the ſcorification of earthy matters, leſt the tin be calcined. Tin-ores previouſly bruiſed may be cleanſed by waſhing, for which operation their great weight and hardneſs render them well adapted. If they be intermixed with very hard ſtones or ferruginous ores, a ſlight roaſting will render theſe impure matters more friable, and conſequently fitter to be ſeparated from the tin-ores. Sometimes theſe operations, the roaſting, contuſion, and lotion, muſt be repeated. By roaſting, the ferruginous particles are ſo far revived, that they may be ſeparated by magnets.

The ore, thus cleanſed from adhering heterogeneous matters, is to be roaſted in an oven or reverberatory furnace with a fire rather intenſe than long continued, during which it muſt be frequently ſtirred to prevent its fuſion. By this operation, the arſenic is expelled, and in ſome works is collected in chambers built purpoſely above the calcining furnace.

Laſtly, the ore cleanſed and roaſted is to be fuſed, and reduced to a metallic ſtate. In this fuſion, attention muſt be given to the following particulars. 1. No more heat is to be applied than is ſufficient for the reduction of the ore; becauſe this metal is fuſible with very little heat, and is very eaſily calcinable. 2. To prevent this calcination of the reduced metal, a larger quantity of charcoal is uſed in this than in moſt other fuſions. 3. The ſcoria muſt be frequently removed, leſt ſome of the tin ſhould be involved in it, and the melted metal muſt be covered with charcoal powder to prevent the calcination of its ſurface. 4. No flux or other ſubſtance, excepting the ſcoria of former ſmeltings which contains ſome tin, are to be added, to facilitate the fuſion.

Sect. VIII. *Smelting of Ores of Lead.*

Ores of lead are either pure, that is, containing no

Smelting of Tin ores.

no mixture of other metal; or they are mixed with silver, copper, or pyrites. The methods of treating ores of lead containing silver and copper, are described in the sections of *Smelting of Ores of Silver* and *of Copper;* and in the former of these an instance is given of the method of smelting the ore of Rammelsberg, which contains all these three metals.

Pure ores of lead, and those which contain so small a quantity only of silver as not to compensate for the expence of extracting the nobler metal, may be smelted in furnaces, and by operations similar to those used at Rammelsberg, or in the following methods. 1. From the lead-ore of Willach in Carinthia, a great part of the lead is obtained by a kind of eliquation, during the roasting of the ore. For this purpose, the ore is thrown upon several strata or layers of wood, placed in a calcining or reverberatory furnace. By kindling this wood, a great part of the lead flows out of the ore, through the layers of fuel, into a bason placed for its reception. The ore which is thus roasted is beat into smaller pieces, and exposed to a second operation similar to the former, by which more metal is eliquated; and the remaining ore is afterwards ground, washed, and smelted, in the ordinary method.

The lead of Willach is the purest of any known. Schlutter ascribes its great purity to the method used in extracting it, by which the most fusible, and consequently the purest part of the contained lead is separated from any less fusible metal which happens to be mixed with it, and which remains in the roasted ore. This method requires a very large quantity of wood.

2. In England, lead ores are smelted either upon a hearth, or in a reverberatory furnace called *a cupel.*

In the first of these methods, charcoal is employed as fuel, and the fire is excited by bellows. Small quantities of fuel and of ore are thrown alternately and frequently upon the hearth. The fusion is very quickly effected; and the lead flows from the hearth as fast as it is separated from the ore.

3. In the second method practised in England, pitcoal is used as fuel. The ore is melted by means of the flame passing over its surface; its sulphur is burnt and dissipated, while the metal is separated from the scoria, and collected at the bottom of the furnace. When the ore is well cleansed and pure, no addition is requisite; but when it is mixed with calcareous or earthy matrix, a kind of fluor or fusible spar found in the mines is generally added to render the scoria more fluid, and thereby to assist the precipitation of the metal. When the fusion has been continued about eight hours, a passage in the side of the furnace is opened, through which the liquid lead flows into an iron cistern. But immediately before the lead is allowed to flow out of the furnace, the workmen throw upon the liquid mass a quantity of slacked quicklime, which renders the scoria so thick and tenacious, that it may be drawn out of the furnace by rakes. Schlutter mentions this addition of quicklime in the smelting of lead ores in England, but thinks that it is intended to facilitate the fusion of the ores; whereas it really has a contrary effect, and is never added till near the end of the operation, when the scoria is to be raked from the surface of the metal.

Smelting of ores of Semimetals.

Sect. IX. *Of the Smelting of Ores of Semimetals.*

Antimony is obtained by a kind of eliquation from the minerals containing it, as is described in the article Antimony; and the regulus of antimony is procured from antimony, by the processes described in the same article, and in the article Regulus *of* Antimony.

Arsenic, saffre, and *bismuth,* are obtained generally from one ore, namely, that called *cobalt.* The arsenic of the ore is separated by roasting, and adheres to the internal surface of a chimney, which is extended horizontally about 200 or 300 feet in length, and in the sides of which are several doors, by means of which the arsenic, when the operation is finished, may be swept out and collected. These chimneys are generally bent in a zig-zag direction, that they may better retard and stop the arsenical flowers. These flowers are of various colours, white, grey, red, yellow, according to the quantity of sulphur or other impurity, with which they happen to be mixed. They are afterwards purified by repeated sublimations; while some alkaline or other substances are added to detain the sulphur, and to assist the purification.

In the same roasting of the ore by which the arsenic is expelled, the bismuth, or at least the greatest part of this semi-metal which is contained in the ore, being very fusible, and having no disposition to unite with the regulus of cobalt, which remains in the ore, is separated by eliquation.

The remaining part of the roasted ore consists chiefly of calx of regulus of cobalt, which not being volatile, as the arsenic is, nor so easily fusible as bismuth is, has been neither volatilized nor melted. It contains also some bismuth, and a small quantity of arsenic, together with any silver or other fixed metal which happened to be contained in the ore. This roasted ore being reduced to a fine powder, and mixed with three or four times its weight of fine sand, is the powder called *saffre* or *zaffre.* Or the roasted ore is sometimes fused See *Zaffre.* with about thrice its quantity of pure sand and as much pure pot-ash, by which a blue glass, called *smalt,* See *Smalt.* is produced; and a metallic mass, called *speiss,* is collected at the bottom of the vessel in which the matters are fused. The metallic mass or speiss is composed of very different substances, according to the contents of the ore and the methods of treating it. The matters which it contains at different times are, nickel, regulus of cobalt, bismuth, arsenic, sulphur, copper, and silver.

Bismuth is seldom procured from any other ores but that of cobalt. It might, however, be extracted from its proper ores, if a sufficient quantity of these were found, by the same method by which it is obtained from cobalt, namely, by eliquation.

Mercury, when native, and inveloped in much earthy or other matter, from which it cannot be separated merely by washing, is distilled either by ascent or by descent. When it is mineralised by sulphur, that is, when it is contained in cinnabar, some intermediate substance, as quicklime, or iron, must be added in the distillation, to disengage it from the sulphur.

The rich ore of Almaden in Spain is a cinnabar, with which a calcareous stone happens to be so blend-

ed

ed, that no addition is required to disengage the mercury from the sulphur. The distillation is there performed in a furnace consisting of two cavities, one of which is placed above another. The lower cavity is the fire-place, and contains the fuel, resting upon a grate, through the bars of which the air enters, maintains the fire, and passes into a chimney, placed at one side of the fire-place immediately above the door thro' which fuel is to be introduced. The roof of this fire-place, which is vaulted and pierced with several holes, is also the floor of the upper cavity. Into this upper cavity, the mineral from which mercury is to be distilled is introduced, through a door in one of the sides of the furnace. In the opposite wall of this cavity are eight openings, all at the same height. To each of these openings is adapted a file of aludels connected and luted together, extending 60 feet in length. These aludels, which are earthen vessels open at each end, and wider in the middle than at either extremity, are supported upon an inclined terras; and the aludel of each file, that is most distant from the furnace, terminates in a chamber built of bricks, which has two doors, and two chimneys.

When the upper cavity is filled sufficiently with the mineral, a fire is made below, which is continued during 12 or 14 hours. The heat is communicated thro' the holes of the vaulted roof of the fire-place to the mineral in the upper cavity, by which means the mercury is volatilised, and its vapour passes into the aludels, where much of it is condensed, and the rest is discharged into the brick-chamber, in which it circulates till it also is condensed. If any air or smoke passes through the aludels along with the vapour of the mercury, they escape thro' the two chimneys of the chamber. Three days after the operation, when the apparatus is sufficiently cooled, the aludels are unluted, the doors of the chamber are opened, and the mercury is collected.

METAMORPHOSIS, in general, denotes the changing of something into a different form; in which sense it includes the transformation of insects, as well as the mythological changes related by the ancient poets.

Mythological metamorphoses were held to be of two kinds, apparent and real: thus, that of Jupiter into a bull, was only apparent; whereas that of Lycaon into a wolf, was supposed to be real.

Most of the ancient metamorphoses include some allegorical meaning, relating either to physics or morality: some authors are even of opinion that a great part of the ancient philosophy is couched under them; and Lord Bacon and Dr Hook have attempted to unriddle several of them.

METAPHOR, in rhetoric. See ORATORY, n° 50.

METAPHOR *and Allegory*, in poetry.—A metaphor differs from a simile, in form only, not in substance: in a simile the two subjects are kept distinct in the expression, as well as in the thought; in a metaphor, the two subjects are kept distinct in the thought only, not in the expression. A hero resembles a lion, and upon that resemblance many similies have been raised by Homer and other poets. But instead of resembling a lion, let us take the aid of the imagination, and feign or figure the hero to be a lion: by that variation the simile is converted into a metaphor; which is carried on by describing all the qualities of a lion that resemble those of the hero. The fundamental pleasure here, that of resemblance, belongs to the thought. An additional pleasure arises from the expression: the poet, by figuring his hero to be a lion, goes on to describe the lion in appearance, but in reality the hero; and his description is peculiarly beautiful, by expressing the virtues and qualities of the hero in new terms, which, properly speaking, belong not to him, but to the lion. This will better be understood by examples. A family connected with a common parent, resembles a tree, the trunk and branches of which are connected with a common root: but let us suppose, that a family is figured, not barely to be like a tree, but to be a tree; and then the simile will be converted into a metaphor, in the following manner.

Edward's sev'n sons, whereof thyself art one,
Were sev'n fair branches, springing from one root;
Some of these branches by the dest'nies cut:
But Thomas, my dear lord, my life, my Glo'ster,
One flourishing branch of his most royal root,
Is hack'd down, and his summer-leaves all faded,
By Envy's hand and Murder's bloody axe.

Richard II. *act* i. *sc.* 3.

Figuring human life to be a voyage at sea:

There is a tide in the affairs of men,
Which, taken at the flood, leads one to Fortune:
Omitted, all the voyage of their life
Is bound in shallows and in miseries.
On such a full sea are we now afloat;
And we must take the current when it serves,
Or lose our ventures. *Julius Cæsar, act* iv. *sc.* 5.

Figuring glory and honour to be a garland of flowers:

Hotspur. ————————Wou'd to heav'n,
Thy name in arms were now as great as mine!
Pr. Henry. I'll make it greater, ere I part from thee;
And all the budding honours on thy crest
I'll crop, to make a garland for my head.

First part of Henry IV. *act* v. *sc.* 9.

Figuring a man who hath acquired great reputation and honour to be a tree full of fruit:

————————Oh, boys, this story
The world may read in me: my body's mark'd
With Roman swords; and my report was once
First with the best of note. Cymbeline lov'd me;
And when a soldier was the theme, my name
Was not far off: then was I as a tree,
Whose boughs did bend with fruit. But in one night,
A storm or robbery, call it what you will,
Shook down my mellow hangings, nay my leaves;
And left me bare to weather.

Cymbeline, act iii. *sc.* 3.

"Blest be thy soul, thou king of shells, said Swaran of the dark-brown shield. In peace, thou art the gale of spring; in war, the mountain-storm. Take now my hand in friendship, thou noble king of Morven."

Fingal.

"Thou

"Thou dwelleſt in the ſoul of Malvina, ſon of mighty Oſſian. My ſighs ariſe with the beam of the eaſt: my tears deſcend with the drops of night. I was a lovely tree in thy preſence, Oſcar, with all my branches round me: but thy death came like a blaſt from the deſart, and laid my green head low; the ſpring returned with its ſhowers, but no leaf of mine aroſe."

Fingal.

An *allegory* differs from a metaphor; and what lord Kaim's calls a *figure of ſpeech* differs from both. A metaphor is defined above to be an act of the imagination, figuring one thing to be another. An allegory requires no ſuch operation, nor is one thing figured to be another: it conſiſts in chooſing a ſubject having properties or circumſtances reſembling thoſe of the principal ſubject; and the former is deſcribed in ſuch a manner as to repreſent the latter: the ſubject thus repreſented is kept out of view: we are left to diſcover it by reflection; and we are pleaſed with the diſcovery, becauſe it is our own work. (See the word Allegory.) Quintilian gives the following inſtance of an allegory,

O navis, referent in mare te novi
Fluctus. O quid agis? fortiter occupa portum.
Horat. lib. i. *ode* 14.

and explains it elegantly in the following words: "Totuſque ille Horatii locus, quo navim pro republica, fluctuum tempeſtates pro bellis civilibus, portum pro pace atque concordia, dicit."

In a *figure of ſpeech*, there is no fiction of the imagination employed, as in a metaphor; nor a repreſentative ſubject introduced, as in an allegory. This figure, as its name implies, regards the expreſſion only, not the thought; and it may be defined, the uſing a word in a ſenſe different from what is proper to it. Thus youth, or the beginning of life, is expreſſed figuratively by *morning of life:* morning is the beginning of the day; and in that view it is employed to ſignify the beginning of any other ſeries, life eſpecially, the progreſs of which is reckoned by days. See Figure *of Speech.*

Metaphor and *allegory* are ſo much connected, that it ſeemed proper to handle them together: the rules, particularly for diſtinguiſhing the good from the bad, are common to both. We ſhall therefore proceed to theſe rules, after adding ſome examples to illuſtrate the nature of an *allegory*, which, with a view to this article, was but ſlightly illuſtrated under its proper name.

Horace, ſpeaking of his love to Pyrrha, which was now extinguiſhed, expreſſeth himſelf thus:

———————Me tabulâ facer
Votivâ paries indicat uvida
Suſpendiſſe potenti
Veſtimenta maris Deo. *Carm. lib.* i. *ode* 5.

Again:

Phœbus volentem prælia me loqui,
Victas et urbes, increpuit lyrâ:
Ne parva Tyrrhenum per æquor
Vela darem. *Carm. lib.* v. *ode* 15.

Queen. Great Lords, wiſe men ne'er ſit and wail their loſs,
But cheerly ſeek how to redreſs their harms.
What though the maſt be now blown overboard,
The cable broke, the holding-anchor loſt,
And half our ſailors ſwallowed in the flood?
Yet lives our pilot ſtill. Is't meet that he
Should leave the helm, and, like a fearful lad,
With tearful eyes add water to the ſea,
And give more ſtrength to that which hath too much;
While in his moan the ſhip ſplits on the rock,
Which induſtry and courage might have ſav'd?
Ah, what a ſhame! ah, what a fault were this!
Third part Henry VI. *act* v. *ſc.* 5.

Oroonoko. Ha! thou haſt rous'd
The lion in his den; he ſtalks abroad,
And the wide foreſt trembles at his roar.
I find the danger now. *Oroonoko, act* iii. *ſc.* 2.

"My well-beloved hath a vineyard in a very fruitful hill. He fenced it, gathered out the ſtones thereof, planted it with the choiceſt vine, built a tower in the midſt of it, and alſo made a wine-preſs therein; he looked that it ſhould bring forth grapes, and it brought forth wild grapes. And now, O inhabitants of Jeruſalem, and men of Judah, judge, I pray you, betwixt me and my vineyard. What could have been done more to my vineyard, that I have not done? Wherefore, when I looked that it ſhould bring forth grapes, brought it forth wild grapes? And now go to, I will tell you what I will do to my vineyard: I will take away the hedge thereof, and it ſhall be eaten up; and break down the wall thereof, and it ſhall be trodden down. And I will lay it waſte: it ſhall not be pruned, nor digged, but there ſhall come up briars and thorns: I will alſo command the clouds that they rain no rain upon it. For the vineyard of the Lord of hoſts is the houſe of Iſrael, and the men of Judah his pleaſant plant." *Iſaiah*, v. 1.

The rules that govern metaphors and allegories are of two kinds. The conſtruction of theſe figures comes under the firſt kind: the propriety or impropriety of introduction comes under the other.—To begin with rules of the firſt kind; ſome of which coincide with thoſe already given for ſimilies; ſome are peculiar to metaphors and allegories:

In the firſt place, it has been obſerved, that a ſimile cannot be agreeable where the reſemblance is either too ſtrong or too faint. This holds equally in metaphor and allegory; and the reaſon is the ſame in all. In the following inſtances, the reſemblance is too faint to be agreeable.

Malcolm.————But there's no bottom, none,
In my voluptuouſneſs: your wives, your daughters,
Your matrons, and your maids, could not fill up
The ciſtern of my luſt. *Macbeth, act* iv. *ſc.* iv.

The beſt way to judge of this metaphor, is to convert it into a ſimile; which would be bad, becauſe there is ſcarce any reſemblance between luſt and a ciſtern, or betwixt enormous luſt and a large ciſtern.

Again:

He cannot buckle his diſtemper'd cauſe
Within the belt of rule. *Macbeth, Act* v. *ſc.* 2.

There is no reſemblance between a diſtempered cauſe and any body that can be confined within a belt.

Again:

Steep me in poverty to the very lips.
Othello, Act iv. *ſc.* 9.

Poverty here muſt be conceived a fluid, which it reſembles not in any manner.

Metaphor. Speaking to Bolingbroke banish'd for six years:

The sullen passage of thy weary steps
Esteem a foil, wherein thou art to set
The precious jewel of thy home-return.
Richard II. *act* ii. *sc.* 6.

Again:
Here is a letter, lady,
And every word in it a gaping wound
Issuing life-blood.
Merchant of Venice, *Act* iii. *sc.* 3.

Tantæ *molis* erat Romanam condere gentem.
Æneid. i. 37.

The following metaphor is strained beyond all endurance: Timur-bec, known to us by the name of *Tamerlane the Great*, writes to Bajazet emperor of the Ottomans in the following terms:

"Where is the monarch who dares resist us? where is the potentate who doth not glory in being numbered among our attendants? As for thee, descended from a Turcoman sailor, since the vessel of thy unbounded ambition hath been wreck'd in the gulf of thy self-love, it would be proper, that thou shouldst take in the sails of thy temerity, and cast the anchor of repentance in the port of sincerity and justice, which is the port of safety; lest the tempest of our vengeance make thee perish in the sea of the punishment thou deservest."

Such strained figures, as observed above, are not unfrequent in the first dawn of refinement: the mind in a new enjoyment knows no bounds, and is generally carried to excess, till taste and experience discover the proper limits.

Secondly, Whatever resemblance subjects may have, it is wrong to put one for another, where they bear no mutual proportion. Upon comparing a very high to a very low subject, the simile takes on an air of burlesque: and the same will be the effect, where the one is imagined to be the other, as in a metaphor; or made to represent the other, as in an allegory.

Thirdly, These figures, a metaphor especially, ought not to be crowded with many minute circumstances; for in that case it is scarcely possible to avoid obscurity. A metaphor above all ought to be short: it is difficult, for any time, to support a lively image of a thing being what we know it is not; and for that reason, a metaphor drawn out to any length, instead of illustrating or enlivening the principal subject, becomes disagreeable by overstraining the mind. Here Cowley is extrememely licentious: take the following instance.

Great and wise conqu'ror, who, where-e'er
Thou com'st, dost fortify, and settle there!
Who canst defend as well as get;
And never hadst one quarter beat up yet;
Now thou art in, thou ne'er will part
With one inch of my vanquish'd heart;
For since thou tookst it by assault from me,
'Tis garrison'd so strong with thoughts of thee
It fears no beauteous enemy.

For the same reason, however agreeable long allegories may at first be by their novelty, they never afford any lasting pleasure: witness the *Fairy Queen*, which with great power of expression, variety of images, and melody of versification, is scarce ever read a second time.

In the fourth place, the comparison carried on in a simile, being in a metaphor sunk by imagining the principal subject to be that very thing which it only resembles; an opportunity is furnished to describe it in terms taken strictly or literally with respect to its imagined nature. This suggests another rule, That in constructing a metaphor, the writer ought to make use of such words only as are applicable literally to the imagined nature of his subject: figurative words ought carefully to be avoided; for such complicated figures, instead of setting the principal subject in a strong light, involve it in a cloud; and it is well if the reader, without rejecting by the lump, endeavour patiently to gather the plain meaning, regardless of the figures:

A stubborn and unconquerable flame
Creeps in his veins, and drinks the streams of life.
Lady Jane Gray, *act* i. *sc.* 1.

Copied from Ovid,

Sorbent avidæ præcordia flammæ.
Metarmorph. lib. ix. 172.

Let us analyse this expression. That a fever may be imagined a flame, we admit; though more than one step is necessary to come at the resemblance: a fever, by heating the body, resembles fire; and it is no stretch to imagine a fever to be a fire: again, by a figure of speech, flame may be put for fire, because they are commonly conjoined; and therefore a fever may be termed a *flame*. But now, admitting a fever to be a flame, its effects ought to be explained in words that agree literally to a flame. This rule is not observed here; for a flame drinks figuratively only, not properly.

King Henry to his son prince Henry:

Thou hid'st a thousand daggers in thy thoughts,
Which thou hast whetted on thy stony heart
To stab at half an hour of my frail life.
Second part Henry IV. *act* iv. *sc.* 11.

Such faulty metaphors are pleasantly ridiculed in the *Rehearsal:*

"*Physician.* Sir, to conclude, the place you fill has more than amply exacted the talents of a wary pilot; and all these threatening storms, which, like impregnate clouds, hover o'er our heads, will, when they once are grasp'd but by the eye of reason, melt into fruitful showers of blessings on the people.

"*Bayes.* Pray mark that allegory. Is not that good?

"*Johnson.* Yes, that grasping of a storm with the eye is admirable." *Act* ii. *sc.* 1.

Fifthly, The jumbling different metaphors in the same sentence, beginning with one metaphor and ending with another, commonly called a *mixt metaphor*, ought never to be indulged.

K. Henry.———Will you again unknit
This churlish knot of all-abhorred war,
And move in that obedient orb again,
Where you did give a fair and natural light?
First part Henry VI. *act* v. *sc.* 1.

Whether 'tis nobler in the mind, to suffer
The stings and arrows of outrageous fortune;
Or to take arms against a sea of troubles,
And by opposing end them.
Hamlet, *act* iii. *sc.* 2.

In the sixth place, It is unpleasant to join different metaphors in the same period, even where they are preserved preferved diftinct: for when the fubject is imagined to be firft one thing and then another in the fame period without interval, the mind is diftracted by the rapid tranfition; and when the imagination is put on fuch hard duty, its images are too faint to produce any good effect:

At regina gravi jamdudum faucia cura,
Vulnus alit venis, et cæco carpitur igni.
Æneid. iv. 1.

————Eft mollis flamma medullas
Interea, et tacitum vivit fub pectore vulnus.
Æneid. iv. 66.

Motum ex Metello confule civicum,
Bellique caufas, et vitia, et modos,
Ludumque fortunæ, gravefque
Principum amicitias, et arma
Nondum expiatis uncta cruoribus,
Periculofæ plenum opus aleæ,
Tractas, et incedis per ignes
Subpofitos cineri dolofo.
Horat. Carm. lib. ii. *ode* 1.

In the laft place, It is ftill worfe to jumble together metaphorical and natural expreffion, fo as that the period muft be underftood in part metaphorically in part literally; for the imagination cannot follow with fufficient eafe changes fo fudden and unprepared: a metaphor begun and not carried on, hath no beauty; and inftead of light, there is nothing but obfcurity and confufion. Inftances of fuch incorrect compofition are without number: we fhall, for a fpecimen, felect a few from different authors.

Speaking of Britain.

This precious ftone fet in the fea,
Which ferves it in the office of a wall,
Or as a moat defenfive to a houfe
Againft the envy of lefs happier lands.
Richard II. *act* ii. *fc.* 1.

In the firft line Britain is figured to be a precious ftone: in the following lines, Britain, divefted of her metaphorical drefs, is prefented to the reader in her natural appearance.

Thefe growing feathers pluck'd from Cæfar's wing,
Will make him fly an ordinary pitch,
Who elfe would foar above the view of men,
And keep us all in fervile fearfulnefs.
Julius Cæfar, act i. *fc.* 1.

Rebus anguftis animofus atque
Fortis adpare: fapienter idem
Contrahes vento nimium fecundo
Turgida vela. *Hor.*

The following is a miferable jumble of expreffions, arifing from an unfteady view of the fubject, between its figurative and natural appearance:

But now from gath'ring clouds deftruction pours,
Which ruins with mad rage our halcyon hours:
Mifts from black jealoufies the tempeft form,
Whilft late divifions reinforce the ftorm.
Difpenfary, canto iii.

To thee the world its prefent homage pays,
The harveft early, but mature the praife.
Pope's imitation of Horace, B. ii.

Oui, fa pudeur ne'ft que franche grimace,
Qu'une ombre de vertu qui garde mal la place,
Et qui s'evanouit, comme l'on peut favoir,
Aux rayons du foleil qu'une bourfe fait voir.
Moliere, L'Etourdi, act iii. *fc.* 2.

Et fon feu, depourvû de fenfe et de lecture,
S'éteint à chaque pas, faut de nourriture.
Boileau, L'art poetique, chant. iii. l. 319.

Dryden, in his dedication of the tranflation of *Juvenal*, fays, "When thus, as I may fay, before the ufe of the loadftone, or knowledge of the compafs, I was failing in a vaft ocean, without other help than the pole-ftar of the ancients, and the rules of the French ftage among the moderns, &c."

"There is a time when factions, by the vehemence of their own fermentation, ftun and difable one another."
Bolingbroke.

This fault of jumbling the figure and plain expreffion into one confufed mafs, is not lefs common in allegory than in metaphor. Take the following examples.

————Heu! quoties fidem,
Mutatofque Deos flebit, et afpera
Nigris æquora ventis
Emirabitur infolens,
Qui nunc te fruitur credulus aureâ:
Qui femper vacuam, femper amabilem
Sperat, nefcius auræ
Fallacis. *Horat. Carm. lib.* i. *ode* 5.

Pour moi fur cette mer, qu'ici bas nous courons,
Je fonge à me pourvoir d'efquif et d'avirons,
A regler mes defirs, à prévenir l'orage,
Et fauver, s'il fe peut, ma Raifon du naufrage.
Boileau, epitre 5.

Lord Halifax, fpeaking of the ancient fabulifts: "They (fays he) wrote in figns, and fpoke in parables: all their fables carry a double meaning: the ftory is one, and entire; the characters the fame throughout; not broken or changed, and always conformable to the nature of the creature they introduce. They never tell you, that the dog which fnapped at a fhadow, loft his troop of horfe; that would be unintelligible. This is his (Dryden's) new way of telling a ftory, and confounding the moral and the fable together." After inftancing from the hind and panther, he goes on thus: "What relation has the hind to our Saviour? or what notion have we of a panther's Bible? If you fay he means the church, how does the church feed on lawns, or range in the foreft? Let it be always a church, or always a cloven-footed beaft; for we cannot bear his fhifting the fcene every line."

A few words more upon allegory. Nothing gives greater pleafure than this figure, when the reprefentative fubject bears a ftrong analogy, in all its circumftances, to that which is reprefented: but the choice is feldom fo lucky; the analogy being generally fo faint and obfcure, as to puzzle and not pleafe. An allegory is ftill more difficult in painting than in poetry: the former can fhow no refemblance but what appears to the eye; the latter hath many other refources for fhowing the refemblance. And therefore, with refpect to what the Abbé du Bos terms *mixt allegorical compofitions*, thefe may do in poetry; becaufe, in writing, the allegory can eafily be diftinguifhed from the hiftorical part: no perfon, for example, miftakes Virgil's Fame for

for a real being. But ſuch a mixture in a picture is intolerable; becauſe in a picture the objects muſt appear all of the ſame kind, wholly real or wholly emblematical. For this reaſon, the hiſtory of Mary de Medicis, in the palace of Luxembourg, painted by Rubens, is unpleaſant by a perpetual jumble of real and allegorical perſonages, which produce a diſcordance of parts, and an obſcurity upon the whole: witneſs, in particular, the tablature repreſenting the arrival of Mary de Medicis at Marſeilles; where, together with the real perſonages, the Nereids and Tritons appear ſounding their ſhells: ſuch a mixture of fiction and reality in the ſame group, is ſtrangely abſurd. The picture of Alexander and Roxana, deſcribed by Lucian, is gay and fanciful; but it ſuffers by the allegorical figures. It is not in the wit of man to invent an allegorical repreſentation deviating farther from any ſhadow of reſemblance, than one exhibited by Lewis XIV. anno 1664; in which an enormous chariot, intended to repreſent that of the ſun, is dragged along, ſurrounded with men and women, repreſenting the four ages of the world, the celeſtial ſigns, the ſeaſons, the hours, &c.; a monſtrous compoſition, and yet ſcarce more abſurd than Guido's tablature of Aurora.

In an allegory, as well as in a metaphor, terms ought to be choſen that properly and literally are applicable to the repreſentative ſubject: nor ought any circumſtance to be added that is not proper to the repreſentative ſubject, however juſtly it may be applicable properly or figuratively to the pricipal. The following allegory is therefore faulty.

Ferus et Cupido,
Semper ardentes acuens ſagittas
Cote *cruentâ*. *Horat. lib.* ii. *ode* 8.

For though blood may ſuggeſt the cruelty of love, it is an improper or immaterial circumſtance in the repreſentative ſubject: water, not blood, is proper for a whetſtone.

We proceed to the next head, which is, to examine in what circumſtrnces theſe figures are proper, in what improper. This inquiry is not altogether ſuperſeded by what is ſaid upon the ſame ſubject in the article Comparison; becauſe, upon trial, it will be foud, that a ſhort metaphor or allegory may be proper, where a ſimile, drawn out to a greater length and in its nature more ſolemn, would ſcarce be reliſhed.

And, in the firſt place, a metaphor, like a ſimile, is excluded from common converſation, and from the deſcription of ordinary incidents.

Second, in expreſſing any ſevere paſſion that totally occupies the mind, metaphor is unnatural.

The following example, of deep deſpair, beſide the highly figurative ſtyle, hath more the air of raving than of ſenſe:

Caliſta. Is it the voice of thunder, or my father?
Madneſs! Confuſion! let the ſtorm come on,
Let the tumultuous roar drive all upon me,
Daſh my devoted bark; ye ſurges, break it;
'Tis for my ruin that the tempeſt riſes.
When I am loſt, ſunk to the bottom low,
Peace ſhall return, and all be calm again.

Fair Penitent, act 4.

The following metaphor is ſweet and lively; but it ſuits not the fiery temper of Chamont, inflamed with paſſion: parables are not the language of wrath venting itſelf without reſtraint:

Chamont. You took her up a little tender flower,
Juſt ſprouted on a bank, which the next froſt
Had nipp'd; and with a careful loving hand,
Tranſplanted her into your own fair garden,
Where the ſun always ſhines: there long ſhe flouriſh'd,
Grew ſweet to ſenſe, and lovely to the eye;
Till at the laſt a cruel ſpoiler came,
Cropt this fair roſe, and rifled all its ſweetneſs,
Than caſt it like a loathſome weed away.

Orphan, act 4.

The following ſpeech, full of imagery, is not natural in grief and dejection of mind.

Gonſalez. O my ſon! from the blind dotage
Of a father's fondneſs theſe ills aroſe.
For thee I've been ambitious, baſe and bloody:
For thee I've plung'd into this ſea of ſin;
Stemming the tide with only one weak hand,
While t'other bore the crown, (to wreathe thy brow),
Whoſe weight has ſunk me ere I reach'd the ſhore.

Mourning Bride, act 5. *ſc* 6.

There is an enchanting picture of deep diſtreſs in Macbeth, where Macduff is repreſented lamenting his wife and children, inhumanly murdered by the tyrant. Stung to the heart with the news, he queſtions the meſſenger over and over: not that he doubted the fact, but that his heart revolted againſt ſo cruel a misfortune. After ſtruggling ſome time with his grief, he turns from his wife and children to their ſavage butcher; and then gives vent to his reſentment, but ſtill with manlineſs and dignity:

O, I could play the woman with mine eyes,
And braggart with my tongue. But, gentle Heav'n!
Cut ſhort all intermiſſion; front to front
Bring thou this fiend of Scotland and myſelf;
Within my ſword's length ſet him.——If he 'ſcape,
Then Heav'n forgive him too.

Metaphorical expreſſion, indeed, may ſometimes be uſed with grace where a regular ſimile would be intolerable: but there are ſituations ſo ſevere and diſpiriting, as not to admit even the ſlighteſt metaphor. It requires great delicacy of taſte to determine with firmneſs, whether the preſent caſe be of that nature: perhaps it is; yet who could wiſh a ſingle word of this admirable ſcene altered?

But metaphorical language is proper when a man ſtruggles to bear with dignity or decency a misfortune however great; the ſtruggle agitates and animates the mind:

Wolſey. Farewell, a long farewell, to all my greatneſs!
This is the ſtate of man; to-day he puts forth
The tender leaves of hope; to-morrow bloſſoms,
And bears his bluſhing honours thick upon him;
The third day comes a froſt, a killing froſt,
And when he thinks, good eaſy man, full ſurely
His greatneſs is a ripening, nips his root,
And then he falls as I do.

Henry VIII. *act* 3. *ſc*. 6.

METAPHRAST, a tranſlator, or perſon who renders an author into another form or another language, word for word.

METAPHYSICS.

METAPHYSICS is that part of philoſophy which conſiders the nature and properties of thinking beings.

Ariſtotle, after treating on phyſics, begins his next book, (in which he pretends to elevate the mind above corporeal objects, to fix it on the contemplation of God, of angels, and of things ſpiritual, and to enable it to judge of the principles of ſciences by abſtraction,) with the Greek words μετα τα φυσικα, *poſt phyſicam*, i. e. *after phyſics*. His diſciples, and ſucceeding philoſophers, have formed, of theſe two, one word, METAPHYSICS, by which they mean that ſcience of which we have juſt now given the definition.

Metaphyſics is divided, according to the objects that it conſiders, into ſix principal parts, which are called, 1. *Ontology*. 2. *Coſmology*. 3. *Anthrophology*. 4. *Pſychology*. 5. *Pneumatology*: and, 6. *Theodicy*, or *metaphyſical theology*.

1. The doctrine that is named *ontology*, is that part of metaphyſics which inveſtigates, and explains, the nature and general eſſence of all beings, as well as the qualities and attributes that eſſentially appertain to them, and which we ought to aſſign them by abſtraction, as conſidering them *à priori*. Hence it appears, that this doctrine ſhould proceed in its operations from the moſt ſimple ideas; ſuch as do not admit of any other qualities of which they may be compounded. Theſe ſimple ideas are, for example, thoſe of being, of eſſence, of ſubſtance, of mode, of exiſtence as well with regard to time as place, of a neceſſary cauſe, of unity, the idea of negation, the difference between a being that is ſimple or compound, neceſſary or accidental, finite or infinite; the idea of eſſential and abſtract properties, as of the greatneſs, perfection, and goodneſs of beings; and ſo of the reſt. The buſineſs therefore of ontology, is to make us acquainted with every kind of being in its eſſence and abſtract qualities, and ſuch as are diſtinct from all other beings. This knowledge being once eſtabliſhed on ſimple principles, juſt conſequences may from thence be drawn, and thoſe things proved after which metaphyſics inquires, and which is its buſineſs to prove.

It is eaſy to conceive, that even a clear knowledge of beings, and their eſſential properties, would be ſtill defective and uſeleſs to man, if he did not know how to determine and fix his ideas by proper denominations, and conſequently to communicate his perceptions to thoſe whom he would inſtruct, or againſt whom he is obliged to diſpute, as they would not have the ſame perceptions that he has. It is, by the way, perhaps, one of the greateſt advantages that we have over other animals, to be able ſo to determine our ideas by ſigns or denominations, either of writing or ſpeech, as to refer each particular perception to its general idea, and each general perception to its particular idea. To render therefore our ideas intelligible to others, we muſt have determinate words or denominations for each being, and the qualities of each being; and ontology teaches us thoſe terms which are ſo neceſſary to fix our ideas, and to give them the requiſite perſpicuity and preciſion, that we may not diſpute about words when we endeavour to extend the ſphere of our knowledge, or when we debate concerning the eſſence of an object, or endeavour to make it more evident. It is for this reaſon that ontology was formerly regarded as a barren ſcience, that conſiſted of technical terms only; as a mere terminology: whereas the beſt modern philoſophers make it a more ſubſtantial ſcience, by annexing determinate ideas to thoſe words, and the examination of thoſe objects themſelves that theſe terms imply. But the misfortune is, to ſpeak the truth, that in this ontologic determination there is ſtill much uncertainty and ſophiſtry. For, in the firſt place, we yet know of no metaphyſics where all the definitions are juſt; and in the ſecond place, the words that are employed in theſe definitions have always ſomething equivocal in their meaning, and have conſequently themſelves need of definitions; and in this manner we may recede to infinity, unleſs we recur to the firſt impreſſions that the ſimple words have made in our minds, and the primitive ideas which they there excite. The words *man*, *love*, *coach*, &c. ſay more, and make a ſtronger impreſſion, than all the definitions we can give of them; by ontologic explications they are almoſt always covered with a dark cloud.

2. Metaphyſics, after having, in as ſolid a manner as poſſible, explained and eſtabliſhed the principles above-mentioned, continues its inquiries to the ſecond part, that is called *Coſmology*, and examines into the eſſence of the world, and all that it contains; its eternal laws; of the nature of matter; of motion; of the nature of tangible bodies, of their attributes and eſſential qualities, and of all that can be known by abſtraction, and ſometimes alſo by adding the lights that man acquires concerning them by the experience of his ſenſes. It is alſo in coſmology that we examine the Leibnitzian ſyſtem; that is, whether God in creating the world muſt neceſſarily have created the beſt world; and if this world be ſo in effect. And in this manner they purſue the argument from conſequence to conſequence to its laſt reſort. All philoſophers, however, do not go equally deep. Each mind has its doſe of penetration. Due care ſhould be likewiſe taken, that ſubtilty, in this chain of reaſoning, carried beyond the general bounds of the human mind, do not prejudice either the perſpicuity or the truth of ideas: ſeeing that error here too nearly approaches the truth; and that every idea, which cannot be rendered intelligible, is in effect equal to a falſe idea.

3. *Anthrophology*, or the knowledge of man, forms the third branch of metaphyſics. It is ſubdivided into two parts. The firſt, which conſiſts in the knowledge of the exterior parts of the human frame, does not belong to this ſcience: anatomy and phyſiology teach that. The buſineſs here is only a metaphyſical examination of man, his exiſtence, his eſſence, his eſſential qualities and neceſſary attributes, all conſidered *à priori*: and this examen leads at the ſame time to

4. *Pyſychology*, which conſiſts in the knowledge of the ſoul in general, and of the ſoul of man in particu-

lar; concerning which the moſt profound, the moſt ſubtle and abſtract reſearches have been made, that the human reaſon is capable of producing; and concerning the ſubſtance of which, in ſpite of all theſe efforts, it is yet extremely difficult to aſſert any thing that is rational, and ſtill leſs any thing that is poſitive and well ſupported.

5. The fifth part of metaphyſics is called *pneumatology*. It is not a very long time ſince this term has been invented, and that metaphyſicians have made of it a diſtinct doctrine. By this they mean the knowledge of all ſpirits, angels, &c. It is eaſy to conceive that infinite art is neceſſary to give an account of what we do not abſolutely know any thing, and of which, by the nature of the ſubject itſelf, we never can know any thing. But the metaphyſician preſently offers to ſhow us, "what is the idea of a ſpirit; the effective exiſtence of a ſpirit; what are its general qualities and properties; that there are rational ſpirits, and that theſe rational ſpirits have qualities that are founded in the moral qualities of God:" for this is, in ſo many words, what is taught us by pneumatology.

6. *Metaphyſical Theology*, which M. Leibnitz and ſome others call *Theodicy*, is the ſixth and laſt doctrine of metaphyſics. It teaches us the knowledge of the exiſtence of God; to make the moſt rational ſuppoſitions concerning his divine eſſence, and to form a juſt idea of his qualities and perfections, and to demonſtrate them by abſtract reaſoning *à priori*. Theodicy differs from natural theology, in as much as this laſt borrows, in fact, from theodicy proofs and demonſtrations to confirm the exiſtence of a Supreme Being; but after having ſolidly eſtabliſhed that great truth, by extending its conſequences, natural theology teaches us what are the relations and connexions that ſubſiſt between that Supreme Being and man, and what are the moral duties that reſult from that connexion. As pneumatology is a ſcience highly inſidious and chimerical, ſo is metaphyſical theology ſuſceptible of ſound argument and demonſtration; to the great comfort of mankind, the whole of whoſe happineſs is founded on the certainty of this ſcience. If the effects and operations of ſpirits in the univerſe were as evident as the effects and operations of the Deity, and their neceſſary exiſtence as capable of being proved *à priori*, pneumatology would be a doctrine of equal certainty with theodicy: but as neither one nor the other can be proved with regard to ſpirits in general, whilſt God manifeſts himſelf in every part of nature, we have only to deſcend from the moſt ſimple and abſtract ideas, to thoſe that are the moſt compound; and from thence to reaſcend, by a chain of reaſonings, from the creature up to the Author of the creature and of all nature: we ſhall find, that the reſult of all theſe operations of the mind will conſtantly be, The neceſſity of the exiſtence of a God; and we may at all times determine, tho' very imperfectly, from the weakneſs of our diſcernment, what that Supreme Being muſt be, by poſitively determining what he cannot be. Every thing that can concur to furniſh new proofs on this ſubject, or to elucidate and eſtabliſh thoſe which are already known, is therefore of ineſtimable value to mankind: and though this were the only object of metaphyſics, it would highly merit the attention of thoſe of the moſt refined and moſt exalted genius.

After giving this general view of the ſubject, we ſhall proceed to give the ſubſtance of what Mr Locke has delivered upon it.

Sect. I. *Of Ideas in general, and their Original.*

7. By the term *idea*, as defined by Mr Locke, is meant whatever is the object of the underſtanding when a man thinks, or whatever it is which the mind can be employed about in thinking.

8. In order to trace the manner by which we acquire theſe ideas, let us ſuppoſe the mind to be, as we ſay, *white paper*, void of all characters, without any *ideas*: how comes it to be furniſhed? whence has it all the materials of reaſon and knowledge? From *experience* and *obſervation*. This, when employed about external ſenſible objects, we may call *ſenſation*: by this we have the ideas of *bitter*, *ſweet*, *yellow*, *hard*, &c. which are commonly called *ſenſible qualities*, becauſe conveyed into the mind by the ſenſes. The ſame experience, when employed about the internal operations of the mind, perceived and reflected on by us, we may call *reflection*: hence we have the *ideas* of *perception*, *thinking*, *doubting*, *willing*, *reaſoning*, &c.

9. Theſe two, viz. *external material things* as the objects of ſenſation, and *the operations of our own minds* as the objects of reflection, are the only *originals* from whence all our *ideas* take their beginnings: the underſtanding ſeems not to have the leaſt glimmering of *ideas* which it doth not receive from one of theſe two *ſources*. Theſe, when we have taken a full ſurvey of them, and their ſeveral *modes* and compoſitions, we ſhall find to contain our whole ſtock of *ideas*: and that we have nothing in our minds which did not come in one of theſe two ways.

10. It is evident, that children come by degrees to be furniſhed with *ideas* from the objects they are converſant with: they are ſo ſurrounded with bodies that perpetually and diverſely affect them, that ſome ideas will (whether they will or no) be imprinted on their minds. *Light* and *colours*, *ſounds* and *tangible* qualities, do continually ſolicit their proper ſenſes, and force an entrance into the mind. It is late, commonly, before *children* come to have *ideas* of the operations of their minds; and ſome men have not any very clear or perfect *ideas* of the greateſt part of them all their lives: becauſe, tho' they paſs there continually, yet, like floating viſions, they make not deep impreſſions enough to leave in the mind clear and laſting *ideas*, till the underſtanding turns inward upon itſelf, and reflects on its own operation, and makes them the objects of its own contemplation.

11. When a man *firſt perceives*, then he may be ſaid *to have ideas*; having ideas, and perception, ſignifying the ſame thing.

Sect. II. *Of Simple Ideas.*

Of ideas, ſome are *ſimple*, others *complex*. A *ſimple idea* is one uniform appearance or conception in the mind, which is not diſtinguiſhable into different *ideas*. Such are the *ideas* of *ſenſible qualities*, which though they are in the things themſelves ſo united and blended, that there is no ſeparation, no diſtance between them, yet the *ideas* they produce in the mind enter by the ſenſes ſimple and unmixed. Thus, tho' the

Different ſorts of Ideas.

the hand feels *ſoftneſs* and *warmth* in the ſame piece of *wax*, yet the *ſimple ideas* thus united in the ſame ſubject are as perfectly *diſtinct* as thoſe that come in by different ſenſes.

12. Theſe *ſimple ideas* are ſuggeſted no other way than from the two ways above-mentioned, viz. *ſenſation* and *reflection*.

13. The mind being once ſtored with the *ſimple ideas*, has the power to repeat, compare, and unite them to an infinite variety; and ſo can make, at pleaſure, new *complex ideas*. But the moſt enlarged underſtanding cannot frame one new *ſimple idea;* nor by any force deſtroy them that are there.

14. Ideas, with reference to the different ways wherein they approach the mind, are of *four ſorts*.

Firſt, There are ſome which come into our minds by *one ſenſe* only.

Secondly, There are others conveyed into the mind by *more ſenſes than one*.

Thirdly, Others that are had from *reflection* only.

Fourthly, There are ſome ſuggeſted to the mind by all the ways of *ſenſation* and *reflection*.

Sect. III. *Of Ideas of one Senſe.*

15. Some ideas enter into the mind only by one ſenſe peculiarly adapted to receive them. Thus colours, ſounds, ſmells, &c. come in only by the eyes, ears, and noſe. And if theſe organs are any of them ſo diſordered as not to perform their functions, they have no other way to bring themſelves in view, and be perceived by the underſtanding.

16. We ſhall here mention one, which we receive by our touch, becauſe it is one of the chief ingredients in many of our complex ideas; and that is, the idea of *ſolidity:* it ariſes from the reſiſtance one body makes to the entrance of another body into the place it poſſeſſes, till it has left it. There is no idea which we more conſtantly receive from ſenſation than this. In whatever poſture we are, we feel ſomewhat that ſupports us, and hinders us from ſinking downwards: and the bodies we daily handle, make us perrceive, that while they remain between them, they do, by an unſurmountable force, hinder the approach of the parts of our hands that preſs them. This ſeems to be the moſt eſſential property of body, and that whereby we conceive it to fill ſpace: the idea of which is, that where we imagine any ſpace taken up by a ſolid ſubſtance, we conceive it ſo to poſſeſs it, that it excludes all other ſolid ſubſtances. This reſiſtance is ſo great, that no force can ſurmount it. All the bodies in the world preſſing a *drop of water* on all ſides, will never be able to overcome the reſiſtance it makes to their approaching one another, till it be removed out of their way.

17. The idea of *ſolidity* is diſtinguiſhed from that of *pure ſpace*, in as much as this *latter* is neither capable of reſiſtance nor motion: it is diſtinguiſhed from *hardneſs*, in as much as hardneſs is a firm coheſion of the ſolid parts of matter making up maſſes of a ſenſible bulk, ſo that the whole doth not eaſily change its figure. Indeed, *hard* and *ſoft*, as commonly apprehended by us, are but *relative* to the conſtitutions of our bodies: that being called *hard* which will put us to pain ſooner than change its figure by the preſſure of any part of our bodies; and that *ſoft*, which changes the ſituation of its parts upon an eaſy and unpainful touch.

Senſation and Reflection.

18. This difficulty of changing ſituation among the parts, gives no more ſolidity to the hardeſt body than to the ſofteſt; nor is an adamant one jot more ſolid than water. He that ſhall fill a yielding ſoft body well with air or water, will quickly find its reſiſtance. By this we may diſtinguiſh the idea of the extenſion of body, from the idea of the extenſion of ſpace: That of body, is the coheſion or continuity of ſolid, ſeparable, and moveable parts; that of ſpace, the continuity of unſolid, inſeparable, and immoveable parts. Upon the ſolidity of bodies depend their mutual impulſe, reſiſtance, and protruſion.

Sect. IV. *Of Simple Ideas of different Senſes.*

19. Some ideas we get into the mind by *more than one ſenſe;* as *ſpace*, *extenſion*, *figure*, *reſt*, and *motion*. Theſe are perceivable by the eyes and touch.

Sect. V. *Of Simple Ideas of Reflection.*

20. Some ideas are had from reflection only. Such are the ideas we have of the operations of our minds: of which the two principal are, *perception*, or *thinking;* and *volition*, or *willing*. The powers of producing theſe operations are called *faculties;* which are, the *underſtanding*, and *will*. The ſeveral *modes* of thinking, &c. belong to this head.

Sect. VI. *Of Simple Ideas of Senſation and Reflection.*

21. There are ſome ſimple ideas conveyed into the mind by all the ways of *ſenſation* and *reflection;* ſuch are *pleaſure*, *pain*, *power*, *exiſtence*, *unity*, *ſucceſſion*. Pleaſure or delight, pain or uneaſineſs, accompany almoſt every impreſſion on our ſenſes, and every action or thought of the *mind*.

22. The Author of our beings having given a power to our minds, in ſeveral inſtances, to chooſe amongſt its ideas which it will think on; to excite us to theſe actions of *thinking* and *motion*, he has joined to ſeveral thoughts and ſenſations a perception of delight; without this we ſhould have no reaſon to prefer one thought or action to another.

23. *Pain* has the ſame efficacy to ſet us on work that pleaſure has; ſince we are as ready to avoid that, as to purſue this. This is worth our conſideration, that *pain is often produced by the ſame objects and ideas that produce pleaſure* in us. This their near conjunction gives us new occaſion of admiring the wiſdom and goodneſs of our *Maker;* who, deſigning the preſervation of our being, has annexed pain to the application of many things to our bodies, to warn us of the harm they will do us, and as advices to withdraw us from them. But he not deſigning our preſervation barely, but the preſervation of every part and organ in its perfection, hath in many caſes annexed pain to thoſe very ideas which delight us. Thus heat, that is very agreeable to us in one degree, by a little greater increaſe of it proves no ordinary torment: Which is wiſely ordered by *nature*, that when any object does by the vehemence of its operation diſorder the inſtruments of ſenſation, whoſe ſtructures cannot but be very delicate, we might by the pain be warned to withdraw before the organ be quite put out of order. That this is the *end of pain*, appears from this conſi-

Simple Ideas. deration; that though great light is insufferable to the eyes, yet the highest degree of *darkness* does not at all disease them, because *that* causes no disorderly motion in that curious organ the eye. But excess of *cold*, as well as *heat*, pains us; because it is equally destructive to the temper which is necessary to the preservation of life.

24. *Existence* and *unity* are two other ideas suggested by every object without, and every idea within. When ideas are in our minds, we consider them as being actually there, as well as we consider things to be actually without us; which is, that they *exist*, or have existence: And whatever we consider as *one thing*, whether a *real being*, or *idea*, suggests the idea of *unity*.

25. *Power* is another idea derived from these sources: For finding in ourselves that we can *think*, and *move* several parts of our bodies at pleasure, and observing the *effects* that natural bodies produce in one another; by both these ways we get the idea of *power*.

26. *Succession* is another idea suggested by our senses, and by reflection on what passes in our minds: For if we look into ourselves, we shall find our *ideas* always, whilst we are awake, or have any thought, passing in train, one going and another coming, without intermission.

Sect. VII. *Some farther Considerations concerning Simple Ideas.*

27. Whatsoever is able, by affecting our senses, to cause any perception in the mind, doth hereby produce in the understanding a *simple idea;* which, whatsoever be the cause of it, is looked upon as a *real positive idea* in the understanding. Thus the ideas of *heat* and *cold*, *light* and *darkness*, *motion* and *rest*, &c. are equally positive in the mind, though some of their causes may be mere *privations*.

28. That a *privative* cause may produce a *positive* idea, appears from shadows; which, though nothing but the absence of light, are discernible, and cause clear and positive ideas. We have indeed some *negative* names which stand not directly for positive ideas, but of their absence; such as *insipid*, *silence*, which denote positive ideas, viz. *taste* and *sound*, with a signification of their absence.

29. It will be useful to distinguish *ideas* as they are *perceptions* in our minds, from what *they are in the bodies* that cause such perceptions in us; for we are not to think the former exact images and resemblances of something inherent in the subject, most of those of *sensation* being, in the mind, no more the likeness of something existing without us, than the names that stand for them are the likeness of our ideas, which yet, upon hearing, they excite in us.

30. Whatsoever the *mind perceives in itself*, or is the immediate object of perception, thought, or understanding, is an idea: And the power to produce any idea in our mind, is the *quality of the subject* wherein that power exists. Thus a *snow-ball* having the power to produce in us the ideas of *white*, *cold*, and *round;* those *powers*, as they are in the snow-ball, are called *qualities;* and as they are *sensations* or *perceptions* in our understandings, they are called *ideas*. These *qualities* are of *two sorts:*

31. First, *Original*, or primary; such are *solidity*, *extension*, *motion*, or *rest*, *number*, and *figure*. These are inseparable from body, and such as it constantly keeps in all its changes and alterations. Perception.

32. Secondly, *Secondary qualities;* such as *colours*, *smells*, *tastes*, *sounds*, &c. which, whatever reality we by mistake may attribute to them, are in truth nothing in the objects themselves, but *powers* to produce various sensations in us; and depend on the qualities beforementioned.

33. The *ideas* of *primary* qualities of bodies, are resemblances of them; and their patterns really exist in bodies themselves: But the ideas produced in us by secondary qualities have no resemblance of them at all; and what is *sweet*, *blue*, or *warm*, in the idea, is but the certain bulk, figure, and motion of the sensible parts in the bodies themselves, which we call so.

34. Thus we see, that fire at one distance produces in us the sensation of *warmth*, which at a nearer approach causes the sensation of *pain*. Now what reason have we to say, that the idea of *warmth* is actually in the fire, but that of *pain* not in the fire, which the same fire produces in us the same way? The bulk, number, figure, and motion of the parts of fire, are really in it, whether we perceive them or not; and therefore may be called *real* qualities, because they really exist in that body: But *light* and *heat* are no no more really in it, than sickness or pain: Take away the sensation of them; let not the eyes see light or colours, nor the ear hear sounds; let the palate not taste, or the nose smell; and all *colours*, *tastes*, *odours*, and *sounds*, as they are such particular ideas, vanish and cease, and are reduced to their causes, that is, bulk, motion, figure, &c. of parts.

35. These *secondary* qualities are of two sorts. First, *Immediately perceivable:* which by immediately operating on our bodies, produce several different ideas in us. Secondly, *Mediately perceivable;* which, by operating on other bodies, change their primary qualities, so as to render them capable of producing ideas in us different from what they did before. These last are powers in bodies, which proceed from the particular constitution of those primary and original qualities, to make such a change in the *bulk*, *figure*, *texture*, &c. of another body, as to make it operate on our senses different from what it did before; as in fire, to make lead fluid. These two last being nothing but powers relating to other bodies, and resulting from the different modifications of the original qualities, are yet otherwise thought of; the former being esteemed *real qualities*, but the latter barely *powers*.

Sect. VIII. *Of Perception.*

36. Perception is the first idea we receive from reflection. It is by some called *thinking* in general: Though *thinking*, in the propriety of the *English* tongue, signifies that sort of operation of the mind about its ideas, wherein the mind is active; where it considers any thing with some degree of voluntary attention: For in bare *perception* the mind is, for the most part, only *passive;* and what it perceives, it cannot avoid perceiving. What this is, we cannot otherwise know, than by reflecting on what passes in our minds when we see, feel, hear, &c.

37. Im-

Retention.

37. Impreffions made on the outward parts, if they are not taken notice of within, caufe no *perception;* as we fee in thofe whofe minds are intently bufied in the contemplation of certain objects.

38. We may obferve, that the ideas we receive from fenfation, are often in grown people altered by the judgment, without our taking notice of it. Thus a globe of any uniform colour, as of gold or jet, being fet before our eyes, the *idea* thereby imprinted is of a flat circle varioufly fhadowed: But being accuftomed to perceive what kind of appearance convex bodies are wont to make in us, the judgment alters the appearance into their caufes; and, from that variety of fhadow or colour, frames to itfelf the perception of a convex figure of one uniform colour. This in many cafes, by a fetled habit, is performed fo readily, that we take that for the perception of our fenfation, which is but an idea formed by the judgment; fo that one ferves only to excite the other, and is fcarce taken notice of itfelf: As a man who reads or hears with attention, takes little notice of the characters or founds, but of the ideas that are excited in him by them.

39. Perception is alfo the firft ftep and degree towards knowledge, and the inlet of all the materials of it; fo that the fewer fenfes any man has, and the duller the impreffions that are made by them are, the more remote he is from that knowledge which is to be found in other men.

Sect. IX. *Of Retention.*

40. The next faculty of the mind whereby it makes a further progrefs towards knowledge, is called *retention;* which is the keeping of thofe ideas it has received. Which is done two ways:

41. *Firft*, By keeping the idea which is brought into the mind for fome time actually in view; which is called *contemplation.*

24. *Secondly*, By reviving thofe ideas in our minds which have difappeared, and have been, as it were, laid out of fight: And this is *memory;* which is, as it were, the ftore-houfe of our ideas; for the narrow mind of man not being capable of having many ideas under view at once, it was neceffary to have a repofitory to lay up thofe ideas, which at another time it may have ufe of. But our ideas being nothing but actual perceptions in the mind, which ceafe to be any thing when there is no perception of them, this laying up of our *ideas* in the repofitory of the memory fignifies no more but this, that the mind has a power, in many cafes, to revive perceptions it has once had, with this additional perception annexed to them, that it has had them before. And it is by the affiftance of this faculty, that we are faid to have all thofe ideas in our underftandings which we can bring in fight, and make the objects of our thoughts, without the help of thofe fenfible qualities which firft imprinted them there.

43. Thofe ideas that are often refrefhed by a frequent return of the objects or actions that produce them, fix themfelves beft in the memory, and remain longeft there: Such are the *original qualities of bodies.* viz. Solidity, extenfion, figure, motion, *&c.* Thefe and the like are feldom quite loft while the mind retains any *ideas* at all.

Sect. X. *Of Difcerning, and other Operations of the Mind.*

Complex Ideas.

44. Another faculty of the mind, is that of *difcerning between its ideas.* On this depends the evidence and certainty of feveral general propofitions. In being able nicely to diftinguifh one thing from another, where there is the leaft difference, confifts, in a great meafure, that *exactnefs of judgment* and *clearnefs of reafon* which is to be obferved in one man above another.

45. To the well diftinguifhing our *ideas*, it chiefly contributes that they be clear and determinate; and when they are fo, it will not breed any confufion or miftake about them, though the fenfes fhould convey them from the fame object differently on different occafions.

46. The comparing of our *ideas* one with another in refpect of *extent*, *degree*, *time*, *place*, or any other circumftances, is another operation of the mind about its *ideas*, which is the ground of *relations.* Brutes feem not to have this faculty in any great degree. They have probably feveral *ideas* diftinct enough; but cannot compare them farther than fome fenfible circumftances annexed to the objects themfelves.

47. *Compofition* is another operation of the mind, whereby it combines feveral of its fimple *ideas* into *complex* ones: Under which operation we may reckon that of *enlarging;* wherein we put feveral *ideas* together of the fame kind, as feveral units to make a *dozen.*

48. *Abftraction* is another operation of the mind, whereby the mind forms general *ideas* from fuch as it received from particular objects; which it does by confidering them, as they are in the mind fuch appearances feparate from the circumftances of real exiftence, as *time*, *place*, &c. Thefe become general *reprefentatives* of all the fame kind, and their names applicable to whatever exifts comformable to fuch abftract *ideas.* Thus the colour received from *chalk*, *fnow*, and *milk*, is made a reprefentative of all of that kind; and has a name given it (*whitenefs*), which fignifies the fame quality, wherever to be found or imagined. And thus *univerfals*, both *ideas* and *terms*, are made.

Sect. XI. *Of Complex Ideas.*

49. In the reception of fimple ideas the mind is only *paffive*, having no power to frame any one to itfelf, nor having any idea which does not wholly confift of them. But about thefe fimple ideas it exerts feveral acts of its own, whereby out of them, as the materials and foundations of the reft, the others are framed. The acts of the mind, wherein it exerts its power over its fimple ideas, are chiefly thefe three. *Firft*, It combines feveral fimple ideas into one compound one; and thus all *complex ideas* are made. *Secondly*, It brings two ideas, whether *fimple* or *complex*, together, and fets them by one another, fo as to take a view of them at once, without uniting them into one; by which way it gets all its ideas of relations. *Thirdly*, It feparates them from all other ideas that accompany them in their real exiftence: And thus all its *general ideas* are made. As *fimple ideas* are obferved to exift in feveral combinations united together, fo the mind may confider them as united, not only as they are

really

Of Space. really united in external objects, but as itself has joined them. *Ideas* thus made up of several ones put together, are called *complex;* as *man, army, beauty, gratitude*, &c. By this faculty of repeating and joining together its *ideas*, the mind has great power in varying and multiplying the objects of its thoughts. But it is still confined to those simple *ideas* which it received from the two sources of *sensation* and *reflection*. It can have no other *ideas* of sensible qualities than what come from without by the senses, nor any other *ideas* of the operations of a thinking substance than what it finds in itself; but having once got these simple *ideas*, it can by its own power put them together, and make new *complex ones*, which it never received so united.

50. *Complex ideas*, however compounded and decompounded, though their number be infinite, and their variety endless, may all be reduced under these three heads: 1st, *Modes;* 2dly, *Substances;* 3dly, *Relations*.

51. First, *Modes* are such complex *ideas* as contain not the supposition of subsisting by themselves; but are considered as dependences on, and affections of, substances; as *triangle, gratitude, murder*, &c. These modes are of two sorts: First, *Simple;* which are combinations of the same simple *idea;* as a *dozen, score*, &c. which are but the *ideas* of so many distinct units put together. Secondly, *Mixed;* which are compounded of simple *ideas* of several kinds; as *beauty*, which consists in a certain composition of colour and figure, causing delight in the beholder; *theft*, which is the concealed change of the possession of any thing, without the consent of the proprietor. *These* visibly contain a combination of *ideas* of several kinds.

52. Secondly, *Substances*. The *ideas* of substances are only such combinations of simple *ideas*, as are taken to represent distinct particular things subsisting by themselves, in which the confused *idea* of substance is always the chief. Thus a combination of the *ideas* of a certain figure, with the powers of motion, thought, and reasoning, joined to substance, make the ordinary *idea* of man.

53. These again are either of *single substances*, as *man, stone;* or of *collective*, or several put together, as *army, heap*. *Ideas* of several substances thus put together, are as much each of them one single *idea*, as that of a *man* or an *unit*.

54. Thirdly, *Relations;* which consist in the consideration and comparing of one *idea* with another. Of these several kinds we shall treat in their order.

Sect. XII. *Of Simple Modes: And, first, of the simple modes of Space.*

55. Concerning *simple modes* we may observe, that the modifications of any *simple ideas* are as perfectly different and distinct ideas in the mind, as those of the greatest distance or contrariety: Thus *two* is as distinct from *three*, as *blueness* from *heat*.

56. *Space* is a simple idea which we get both by our sight and touch. When we consider it barely in length between two bodies, it is called *distance:* when in length, breadth, and thickness, it may be called *capacity*. When considered between the extremities of matter, which fills the capacity of space with something solid, tangible, and moveable, it is called *extension*. And thus *extension* will be an *idea* belonging to body; *space* may be conceived without it. Duration.

57. Each different *distance* is a different modification of space; and each *idea* of any different space is a *simple mode* of this *idea*. Such are an *inch, foot, yard*, &c. When these *ideas* are made familiar to mens thoughts, they can in their minds repeat them as often as they will, without joining to them the *idea* of body, and frame to themselves the *ideas* of feet, yards, or fathoms, beyond the utmost bounds of all bodies; and by adding these still one to another, enlarge their *idea* of space as much as they please. From this power of repeating any *idea* of distance, without being ever able to come to an end, we come by the *idea* of immensity.

58. Another modification of *space* is taken from the *relation* of the parts of the termination of extension or circumscribed space amongst themselves; and this is what we call *figure*. This the *touch* discovers in sensible bodies, whose extremities come within our reach; and the *eye* takes both from bodies and colours, whose boundaries are within its view; where observing how the extremities terminate either in straight lines, which meet at discernible angles, or in crooked lines, wherein no angles can be perceived; by considering these as they relate to one another in all parts of the extremities of any body or space, it has that idea we call *figure:* which affords to the mind infinite variety.

59. Another *mode* belonging to this head, is that of *place*. Our idea of *place* is nothing but the relative position of any thing with reference to its distance from some fixed and certain points. Whence we say, that a thing has or has not changed *place*, when its distance either is or is not altered with respect to those bodies with which we have occasion to compare it. That this is so, we may easily gather from hence, that we can have no idea of the place of the *universe*, though we can of all its parts. To say that the world is *somewhere*, means no more than that it does *exist*. The word *place* is sometimes taken to signify that *space* which any body takes up; and so the universe may be conceived in a place.

Sect. XIII. *Of Duration, and its Simple Modes.*

60. There is another sort of *distance*, the *idea* of which we get from the fleeting and perpetually perishing parts of succession, which we call *duration*. The simple modes of it are any different lengths of it whereof we have distinct *ideas;* as *hours, days, years*, &c. *time* and *eternity*.

61. The *idea* of *succession* is got by reflecting on that train of *ideas* which constantly follow one another in our minds as long as we are awake. The distance between any parts of this *succession*, is what we call *duration;* and the continuation of the existence of ourselves, or any thing else, *commensurate* to the succession of any *ideas* in our minds, is what we call our *own duration*, or *that* of another thing co-existing with our thinking. That this is so, appears from hence, that we have no perception of succession or duration, when that succession of our *ideas* ceases, as in *sleep:* the moment that we sleep, and awake, how distant soever, seems to be joined and connected. And possibly it would be so to a waking man, could he fix upon one *idea* without variation and the succession of others. And we see that

they whofe thoughts are very intent upon one thing, let flip out of their account a good part of that *duration*, and think that time fhorter than it is. But if a man, during his fleep, *dream*, and a variety of *ideas* make themfelves perceptible in his mind one after another, he hath then, during fuch dreaming, a fenfe of *duration*, and of the length of it.

A man having once got this *idea* of duration, can apply it to things which exift while he does not think: and thus we meafure the time of our fleep, as well as that wherein we are awake.

Duration, as marked by certain periods and meafures, is what we moft properly call *time;* which we meafure by the diurnal and annual *revolutions* of the fun, as being conftant, regular, and univerfally obfervable by all mankind, and fuppofed equal to one another.

The mind having once got fuch a meafure of *time*, as the annual revolution of the fun, can eafily apply it to duration wherein that meafure itfelf did not exift; and the *idea* of *duration* equal to an *annual revolution of the fun*, is as eafily applicable in our thoughts to duration where no fun nor motion was, as the *idea* of a *foot* or *yard* to diftances beyond the confines of the world.

By the fame means, and from the fame original that we come to have the *idea* of time, we have alfo that *idea* which we call *eternity:* for having got the ideas of certain lengths of duration, we can in our thoughts add them to one another as oft as we pleafe, without ever coming to an end.

And thus it is plain, that from the two fountains of all knowledge before mentioned, *viz. fenfation* and *reflection*, we get the ideas of duration, and the feveral meafures of it.

Sect. XIV. *Of Number.*

62. The complex *ideas* of *number* are formed by adding feveral *units* together. The *fimple modes* of it are each feveral combinations, as *two*, *three*, &c. Thefe are of all others moft diftinct, the neareft being as clearly different from each other as the moft remote: *two* being as diftinct from *one*, as two hundred. But it is hard to form diftinct *ideas* of every the leaft excefs in extenfion. Hence demonftrations in numbers are more general in their ufe, and more determinate in their application, than thofe of extenfion.

63. *Simple modes* of numbers being in our minds but fo many combinations of units, which have no variety but *more* or *lefs; names* for each diftinct combination feem more neceffary than in any other fort of *ideas:* For without a *name*, or *mark*, to diftinguifh that precife collection, it will hardly be kept from being a heap of confufion. Hence fome *Americans* have no diftinct *idea* of any number beyond twenty; fo that when they are difcourfed with of greater numbers, they fhew the hairs of their head. So that to reckon right, two things are required.

64. *Firft*, That the mind diftinguifh carefully two *ideas* which are different one from another only by the addition or fubtraction of one unit.

65. *Secondly*, That it retain in memory the names or marks of the feveral combinations, from an unit to that number; and that in exact order, as they follow one another. In either of which if it fails, the whole bufinefs of *numbering* will be difturbed; and there will remain only the confufed *idea* of *multitude;* but the *ideas* neceffary to diftinct numeration will not be attained to.

Sect. XV. *Of Infinity.*

66. The *idea* fignified by the name *infinity*, is beft examined, by confidering to *what* infinity is by the mind attributed, and then *how* it frames it. *Finite* and *infinite*, then, are looked upon as the modes of quantity; and attributed primarily to things that have parts, and are capable of increafe or diminution by the *addition* or *fubtraction* of any the leaft part. Such are the *ideas* of *fpace*, *duration*, and *number*.

67. When we apply this *idea* to the *Supreme Being*, we do it primarily, in refpect of his duration and ubiquity; more figuratively, when to his *wifdom*, *power*, *goodnefs*, and other attributes, which are properly *inexhauftible* and *incomprehenfible:* for when we call them infinite, we have no other *idea* of this infinity, but what carries with it fome reflection on the *number* or the *extent* of the *acts* or *objects* of God's power and wifdom, which can never be fuppofed fo great, or fo many, that thefe attributes will not always furmount and exceed, though we multiply them in our thoughts with the infinity of *endlefs number*.

68. The next thing to be confidered, is, *How we come* by the *idea* of infinity. Every one that has any *idea* of any ftated lengths of fpace, as a *foot*, *yard*, &c. finds that he can repeat that *idea*, and join it to *another*, to a *third*, and fo on without ever coming to an end of his additions. From this power of enlarging his *idea* of fpace, he takes the *idea* of infinite fpace, or *immenfity*. By the fame power of repeating the *idea* of any length of duration we have in our minds, with all the endlefs addition of number, we come by the *idea* of *eternity*.

69. If our *idea* of *infinity* be got by repeating without end our own *ideas;* why do we not attribute it to other *ideas*, as well as thofe of *fpace* and *duration;* fince they may be as eafily and as often repeated in our minds as the other? yet nobody ever thinks of infinite *fweetnefs* or *whitenefs*, though he can repeat the *idea* of fweet or white as frequently as thofe of *yard* or *day*. But thofe *ideas* that have parts, and are capable of increafe by the addition of any parts, afford us, by their repetition, an *idea* of infinity; becaufe with the endlefs repetition there is continued an enlargement, of which there is no end. But it is not fo in other *ideas:* for if to the perfect *idea* I have of white, I add another of equal whitenefs, it enlarges not my *idea* at all. Thofe *ideas* that confift not of parts, cannot be augmented to what proportion men pleafe, or be ftretched beyond what they have received by their fenfes: but *fpace*, *duration*, and *number*, being capable of increafe by repetition, leave in the mind an *idea* of an endlefs room for more; and fo thofe *ideas* alone lead the mind towards the thought of infinity.

Sect. XVI. *Of the Modes of Thinking.*

70. When the mind turns its view inwards upon itfelf, *thinking* is the firft *idea* that occurs: wherein it obferves a great variety of modifications; and thereof frames to itfelf diftinct *ideas*. Thus the perception annexed to any impreffion on the body made by an ex-

ternal

Pleasure and Pain.

ternal object, is called *sensation*. When an *idea* recurs without the presence of the object, it is called *remembrance:* when sought after by the mind, and brought again in view, it is *recollection:* when held there long under attentive consideration, it is *contemplation*. When *ideas* float in the mind without regard or reflection, it is called in French *revérie;* our language has scarce a name for it: When the ideas are taken notice of, and as it were registered in the memory, it is *attention:* When the mind fixes its view on any one *idea*, and considers it on all sides, it is *intention* and *study*. *Sleep*, without dreaming, is rest from all these: And *dreaming* is the perception of *ideas* in the mind, not suggested by any external objects, or known occasions; nor under any choice or conduct of the understanding.

Sect. XVII. *Of the Modes of Pleasure and Pain.*

71. Pleasure and *pain* are simple *ideas*, which we receive both from sensation and reflection. There are thoughts of the mind, as well as sensations, accompanied with pleasure or pain. Their causes are termed *good* or *evil*. *Pleasure* and *pain*, and their causes *good* and *evil*, are the hinges upon which our passions turn; by reflecting on the various modifications or tempers of mind, and the internal sensations which pleasure and pain, good and evil, produce in us, we may thence form to ourselves the *ideas* of our passions. Thus by reflecting upon the thought we have of the delight which any thing is apt to produce in us, we have an *idea* we call *love:* and on the contrary, the thought of the pain which any thing present or absent produces in us, is what we call *hatred*. *Desire* is that uneasiness which a man finds in himself upon the absence of any thing the present enjoyment of which carries the *idea* of delight with it. *Joy* is a delight of the mind arising from the present or assured approaching possession of a good. *Sorrow* is an uneasiness of the mind, upon the thought of a good lost, or the sense of a present evil. *Hope* is a pleasure in the mind, upon the thought of a probable future enjoyment of a thing which is apt to delight. *Fear* is an uneasiness of the mind, upon the thought of a future evil likely to befal us. *Anger* is a discomposure of the mind, upon the receipt of injury, with a present purpose of revenge. *Despair* is the thought of unattainableness of any good. *Envy* is an uneasiness of the mind, caused by the consideration of a good we desire, obtained by one we think should not have had it before us.

72. It is to be considered, that, in reference to the passions, the removal or lessening of a pain is considered and operates as a pleasure; and the loss or diminishing of a pleasure, as a pain: And farther, that the passions in most persons operate on the body, and cause various changes in it; but these being not always sensible, do not make a necessary part of the *idea* of each passion.

Sect. XVIII. *Of Power.*

73. The mind being every day informed by the senses of the alteration of those simple *ideas* it observes in things without, reflecting also on what passes within itself, and observing a constant change of its *ideas*, sometimes by the impressions of outward objects upon the senses, and sometimes by the determination of its own choice; and concluding, from what it has so constantly observed to have been, that the like changes will for the future be made in the same things, by the same agents, and by the like ways, considers in one thing the possibility of having any of its simple *ideas* changed, and in another the possibility of making that change, and so comes by that *idea* which we call *power*. Thus we say *fire* has a power to *melt gold*, and make it fluid; and *gold* has a power to be *melted*.

Of Power.

74. Power thus considered, is twofold, viz. as able to make, or able to receive any change: the one may be called *active*, the other *passive power*. Of *passive power* all sensible things abundantly furnish us with *ideas*, whose sensible qualities and beings we find to be in a continual flux. Nor have we of *active power* fewer instances; since whatever change is observed, the mind must collect a power somewhere able to make that change. But yet, if we will consider it attentively, bodies by our senses do not afford us so clear and distinct an *idea* of *active* power as we have from reflection on the operation of our minds. For all power relating to action, and there being but two sorts of *action*, viz. *thinking* and *motion*, let us consider whence we have the clearest *ideas* of the powers which produce these actions.

75. Of *thinking* body affords us no *idea* at all: it is only from reflection that we have that; neither have we from body any *idea* of the beginning of motion. A body at rest, affords us no *idea* of any *active* power to move; and when it is set in motion itself, that motion is rather a passion than action in it. The *idea* of the beginning of motion, we have only by reflection on what passes in ourselves; where we find by experience, that barely by willing it, we can move the parts of our bodies which were before at rest.

We find in ourselves a power to begin or forbear, continue or end, several actions of our minds, and motions of our bodies, barely by a thought, or preference of the mind. This power which the mind has thus to order the consideration of any *idea*, or the forbearing to consider it; or to prefer the motion of any part of the body to its rest, and *vice versa*, in any particular instance, is that we call the *will;* the actual exercise of that power is that which we call *volition* or *willing*. The forbearance or performance of that action, consequent to such order or command of the mind, is called *voluntary;* and whatsoever action is performed without such a thought of the mind, is called *involuntary*.

77. The power of perception is that we call the *understanding*. *Perception*, which we make the act of the understanding, is of three sorts: *1st*, The perception of *ideas* in our minds. *2dly*, The perception of the signification of signs. *3dly*, The perception of the agreement or disagreement of any distinct *ideas*. These powers of the mind, viz. of perceiving and preferring, are usually called by another name; and the ordinary way of speaking is, that the understanding and will are two *faculties* of the mind.

78. From the consideration of the extent of the power of the mind over the actions of the man, which every one finds in himself, arise the *ideas* of *liberty* and *necessity:* so far as a man has a power to think or not to think, to move or not to move, according to the preference or direction of his own mind, so far is a man free.

Of Power.

free. Wherever any performance or forbearance are not equally in a man's power; wherever doing, or not doing, will not equally follow upon the preference of his mind; there he is not *free*, though perhaps the action may be *voluntary*. So that the *idea* of *liberty* is the *idea* of a power in any agent to do or forbear any action, according to the determination or thought of the mind whereby either of them is preferred to the other. Where either of them is not in the power of the agent to be produced by him according to his volition, there he is not at liberty; that agent is under *neceffity*. So that *liberty* cannot be where there is no *thought*, no *volition*, no *will;* but there may be thought, there may be will, there may be volition, where there is no *liberty*. Thus a *tennis-ball*, whether in motion by the ftroke of a racket, or lying ftill at reft, is not by any one taken to be a free agent. So a man ftriking himfelf or his friend by a convulfive motion of his arm, which it is not in his power by volition or the direction of his mind to ftop or forbear; nobody thinks he has in this *liberty;* every one pities him, as acting by *neceffity* and *conftraint*. Again, fuppofe a man be carried while faft afleep into a room where is a perfon he longs to fee, and be there locked faft in beyond his power to get out; he awakes, and is glad to fee himfelf in fo defirable company: which he ftays willingly in, that is, prefers his ftaying to going away. Is not this ftay voluntary? no body will doubt it; and yet being locked faft in, he is not at liberty to ftay, he has not freedom to be gone. So that *liberty* is not an *idea* belonging to volition or preferring, but to the perfon having the power of doing, or forbearing to do, according as the mind fhall choofe or direct.

79. As it is in the motions of the body, fo it is in the thoughts of our minds: where any one is fuch, that we have power to take it up, or lay it by, according to the preference of the mind, there we are at liberty. A waking man is not at liberty to think, or not to think, no more than he is at liberty whether his body fhall touch any other or no: but whether he will remove his contemplation from one *idea* to another, is many times in his choice. And then he is, in refpect of his *ideas*, as much at liberty, as he is in refpect of bodies he refts on. He can at pleafure remove himfelf from one to another: but yet fome *ideas* to the mind, like fome motions to the body, are fuch, as in certain circumftances it cannot avoid, nor obtain their abfence by the utmoft effort it can ufe. Thus a man on the rack is not at liberty to lay by the *idea* of *pain*, and entertain other contemplations.

80. Wherever thought is wholly wanting, or the power to act or forbear according to the direction of thought, there neceffity takes place. This, in an agent capable of volition, when the beginning or continuation of any action is contrary to the preference of his mind, is called *compulfion*; when the hindering or ftopping any action is contrary to his volition, it is called *reftraint:* agents that have no thought, no volition at all, are in every thing neceffary agents.

Sect. XIX. *Of Mixed Modes.*

81. Mixed *modes* are combinations of *fimple ideas* of different kinds. The mind being once furnifhed with fimple *ideas*, can put them together in feveral compofitions, without examining whether they exift fo together in nature. And hence it is that thefe ideas are called *notions*, as if they had their original and conftant exiftence more in the thoughts of men than in the reality of things: and to form fuch ideas, it fufficed that the mind put the parts of them together, and that they were confiftent in the underftanding, without confidering whether they had any real being. There are three ways whereby we get thefe complex ideas of *mixed modes*.

Mixed Modes.

1ft, By *experience*, and obfervation of things themfelves: Thus by feeing two men wreftle, we get the *idea* of wreftling.

2dly, By *invention*, or voluntary putting together of feveral fimple *ideas* in our own minds: So he that firft invented *printing*, had an *idea* of it firft in his mind before it ever exifted.

3dly, By *explaining* the names of actions we never faw, or nations we cannot fee; and by enumerating all thofe *ideas* which go to the making them up. Thus the mixed mode, which the word *lie* ftands for, is made up of thefe fimple *ideas:* 1ft, *Articulate founds*. 2dly, *Certain* ideas *in the mind of the fpeaker*. 3dly, *Thofe words, the figns of thefe ideas*. 4thly, *Thofe figns put together*, by affirmation or negation, otherwife than the *ideas* they ftand for are in the mind of the fpeaker. Since languages are made, *complex ideas* are ufually got by the explication of thofe terms that ftand for them: for fince they confift of fimple *ideas* combined, they may, by words ftanding for thofe fimple *ideas*, be reprefented to the mind of one who underftands thofe words, though that combination of fimple *ideas* was never offered to his mind by the real exiftence of things.

82. Mixed modes have their *unity* from an act of the mind, combining thofe feveral fimple *ideas* together, and confidering them as one complex one: the mark of this union is one *name* given to that combination. Men feldom reckon any number of *ideas* to make one complex one: but fuch collections as there be names for. Thus the *killing of an old man*, is as fit to be united into one *complex idea* as that of *a father;* yet there being no name for it, it is not taken for a particular complex *idea*, nor a diftinct fpecies of action from that of killing any other man.

83. Thofe collections of *ideas* have names generally affixed which are of frequent ufe in converfation: in which cafes, men endeavour to communicate their thoughts to one another with all poffible difpatch. Thofe others, which they have feldom occafion to mention, they tie not together nor give them names.

84. This gives the reafon why there are words in every language which cannot be rendered by any one fingle word of another. For the fafhions and cuftoms of one nation make feveral combinations of *ideas* familiar in one which another had never any occafion to make. Such were *οςρακισμος* among the the Greeks, *profcriptio* among the Romans. This alfo occafions the *conftant change* of languages; becaufe the change of cuftom and opinions brings with it new combinations of *ideas*, which, to avoid long defcriptions, have new names annexed to them, and fo they become *new fpecies* of *mixed* modes.

85. Of all our fimple *ideas*, thofe that have had moft *mixed modes* made out of them, are, *thinking* and *motion*, which comprehend in them all action; and

Subſtance. *power*, from whence theſe actions are conceived to flow. For actions being the great buſineſs of mankind, it is no wonder if the ſeveral modes of thinking and motion ſhould be taken notice of, the *ideas* of them obſerved and laid up in memory, and have names aſſigned them. For without ſuch *complex ideas* with names to them, men could not eaſily hold any communication about them. Of this kind are the modes of actions diſtinguiſhed by their *cauſes*, *means*, *objects*, *ends*, *inſtruments*, *time*, *place*, and other circumſtances: as alſo of the powers fitted for thoſe actions. Thus *boldneſs* is the power to do or ſpeak what we intend, without fear or diſorder: which power of doing any thing, when it has been acquired by the frequent doing the ſame thing, is that *idea* we call *habit*; when forward, and ready upon every occaſion, to break into action, we call it *diſpoſition*: thus *teſtineſs* is a diſpoſition or aptneſs to be angry.

86. *Power* being the ſource of all action, the ſubſtances wherein theſe powers are, when they exert this power, are called *cauſes*; and the ſubſtances thereupon produced, or the ſimple *ideas* introduced into any ſubject, *effects*. The efficacy whereby the new ſubſtance or *idea* is produced, is called, in the ſubject exerting that power, *action*; in the ſubject, wherein any ſimple *idea* is changed or produced, *paſſion*: Which efficacy, in *intellectual agents*, we can conceive to be nothing elſe but modes of thinking and willing; in *corporeal agents*, nothing elſe but modifications of motion.

Sect. XX. *Of our Complex Ideas of Subſtances.*

87. The mind obſerving ſeveral ſimple *ideas* to go conſtantly together, which being preſumed to belong to one thing, are called, ſo united in one ſubject, by one name, which we are apt afterward to talk of and conſider as one ſimple *idea*, which indeed is a complication of many *ideas* together. We imagine not theſe ſimple *ideas* to ſubſiſt by themſelves: but ſuppoſe ſome *ſubſtratum* wherein they ſubſiſt, which we call *ſubſtance*. The *idea* of pure ſubſtance is nothing but the ſuppoſed (but unknown) ſupport of thoſe qualities which are capable of producing ſimple *ideas* in us.

88. The *ideas* of *particular circumſtances* are compoſed out of this obſcure and general *idea* of ſubſtance, together with ſuch combinations of ſimple *ideas* as are obſerved to exiſt together, and ſuppoſed to flow from the internal conſtitution and unknown eſſence of that ſubſtance. Thus we come by the *ideas* of *man*, *horſe*, *gold*, &c. Thus the ſenſible qualities of *iron*, or a *diamond*, make the complex *ideas* of thoſe ſubſtances which a ſmith or a jeweller commonly knows better than a philoſopher.

89. The ſame happens concerning the operations of the mind, viz. *thinking*, *reaſoning*, &c. which we concluding not to ſubſiſt by themſelves, nor apprehending how they can belong to body, or be produced by it, we think them the action of ſome other ſubſtance, which we call *ſpirit*: of whoſe ſubſtance or nature we have as clear a notion as of that of body; the one being but the ſuppoſed *ſubſtratum* of the ſimple *ideas* we have from without, as the other of thoſe operations which we experiment in ourſelves within: So that the *idea* of *corporeal ſubſtance* in matter, is as remote from our conceptions as that of *ſpiritual ſubſtance*. Relation.

90. Hence we may conclude, that he has the perfecteſt *idea* of any particular ſubſtance who has collected moſt of thoſe ſimple *ideas* which do exiſt in it; among which we are to reckon its *active powers* and *paſſive capacities*, though not ſtrictly *ſimple ideas*.

91. *Secondary qualities*, for the moſt part, ſerve to diſtinguiſh ſubſtance. For our ſenſes fail us in the diſcovery of the *bulk*, *figure*, *texture*, &c. of the minute parts of the bodies, on which their real conſtitutions and differences depend; and ſecondary are nothing but powers, with relation to our ſenſe. The *ideas* that make our complex ones of corporeal ſubſtances are of three ſorts: Firſt, The *ideas* of primary qualities of things, which are diſcovered by our ſenſes; ſuch are *bulk*, *figure*, *motion*, &c. Secondly, The ſenſible ſecondary qualities; which are nothing but powers to produce ſeveral *ideas* in us by our ſenſes. Thirdly, The aptneſs we conſider in any ſubſtance to cauſe or receive ſuch alterations of primary qualities, as that the ſubſtance ſo altered ſhould produce in us different *ideas* from what it did before; and they are called *active* and *paſſive powers*. All which, as we have any notice or notion of them, terminate in *ſimple ideas*.

92. Had we ſenſes acute enough to diſcern the minute particles of bodies, it is not to be doubted but they would produce quite different *ideas* in us; as we find in viewing things with *microſcopes*. Such bodies as to our naked eyes are coloured and opaque, will through *microſcopes* appear pellucid. *Blood* to the naked eye appears all red; but by a good *microſcope* we ſee only ſome red globules ſwimming in a tranſparent liquor.

93. Beſides theſe complex *ideas* we have of material ſubſtances; by the ſimple *ideas* taken from the operations of our own minds, which we experiment in ourſelves, as *thinking*, *underſtanding*, *willing*, *knowing*, &c. co-exiſting in the ſame ſubſtance, we are able to frame the complex *idea* of a *ſpirit*. And this *idea* of an *immaterial ſubſtance*, is as clear as that we have of a *material*. By joining theſe with ſubſtance, of which we have no diſtinct *idea*, we have the *idea* of a *ſpirit*: And by putting together the ideas of coherent ſolid parts, and power of being moved, joined with ſubſtance, of which likewiſe we have no poſitive *idea*, we have the *idea* of *matter*. The one is as clear and diſtinct as the other. The ſubſtance of *ſpirit* is unknown to us; and ſo is the ſubſtance of *body* equally unknown to us. Two primary qualities or properties of body, viz. *ſolid coherent parts*, and *impulſe*, we have diſtinct clear *ideas* of: So likewiſe have we of two primary qualities or properties of ſpirit, viz. *thinking*, and a *power of action*. We have alſo clear and diſtinct *ideas* of ſeveral qualities inherent in bodies, which are but the various modifications of the extenſion of cohering ſolid parts and their motion. We have likewiſe the *ideas* of the ſeveral modes of thinking, viz. Believing, doubting, hoping, fearing, &c. as alſo of willing and moving the body conſequent to it.

Sect. XXI. *Of Relation.*

94. There is another ſet of *ideas* which the mind gets

Of Cause and Effect. gets from the *comparing of one thing with another*. When the mind so considers one thing, that it does as it were bring it to and set it by another, and carry its view from one to the other, this is *relation* or *respect*; and the denominations given to things intimating that respect, are what we call *relatives*, and the things so brought together *related*. Thus when I call CAJUS, *husband*, or *whiter*, I intimate some other person, or thing, in both cases, with which I compare him. Any of our *ideas* may be the foundation of relation.

95. Where languages have failed to give correlative names, there the relation is not so easily taken notice of: As in *concubine*, which is a relative name as well as *wife*.

96. The *ideas* of relation may be the same in those men who have far different *ideas* of the things that are related. Thus those who have different *ideas* of *man*, may agree in that of *father*.

97. There is no *idea* of any kind which is not capable of an almost infinite number of considerations, in reference to other things; and therefore this makes no small part of mens words and thoughts. Thus one single man may at once sustain the relations of *father*, *brother*, *son*, *husband*, *friend*, *subject*, *general*, *European*, *Englishman*, *islander*, *master*, *servant*, *bigger*, *less*, &c. to an almost infinite number; he being capable of as many relations as there may be occasions of comparing him to other things in any manner of agreement, disagreement, or respect whatsoever.

SECT. XXII. *Of Cause and Effect, and other Relations.*

98. THE *ideas* of *cause* and *effect* we get from our observation of the *vicissitude of things*, while we perceive some qualities or substances begin to exist, and that they receive their existence from the due application and operation of other things: That which *produces*, is the *cause*; that which is *produced*, the *effect*. Thus *fluidity* in wax is the effect of a certain degree of heat, which we observe to be constantly produced by the application of such heat.

99. We distinguish the originals of things into two sorts.

100. First, When the thing is wholly made new, so that no part thereof did ever exist before, as when a new particle of matter doth begin to exist which had before no being, it is called *creation*.

101. Secondly, When a thing is made up of particles which did all of them before exist, but the thing so constituted of pre-existing particles, which all together make up such a collection of simple *ideas*, had not any existence before; as this *man*, this *egg*, this *rose*, &c.: this, when referred to a substance produced in the ordinary course of nature by an internal principle, but set on work by some external agent, and working by insensible ways which we perceive not, is called *generation*: When the cause is extrinsical, and the effect produced by a sensible separation, or juxtaposition of discernible parts, we call it *making*: and such are all artificial things. When any simple *idea* is produced, which was not in that subject before, we call it *alteration*.

102. The denomination of things taken from *time* are for the most part only relations. Thus when it is said that queen *Elizabeth* lived sixty-nine, and reigned forty-five years, no more is meant, than that the duration of her existence was equal to sixty-nine, and of her government to forty-five annual revolutions of the sun.

Identity and Diversity.

103. *Young* and *old*, and other words of time, that are thought to stand for positive ideas, are indeed relative; and intimate a relation to a certain length of duration, whereof we have the idea in our minds. Thus we call a man *young* or *old*, that has lived little or much of that time that men usually attain to. This is evident from our application of these names to other things; for a man is called *young* at twenty, but a horse *old*, &c. The sun and stars we call not *old* at all, because we know not what period God has set to that sort of beings.

104. There are other ideas that are truly *relative*, which we signify by names that are thought *positive* and *absolute*; such as *great* and *little*, *strong* and *weak*. The things thus denominated, are referred to some standards, with which we compare them. Thus we call an apple *great*, that is bigger than the ordinary sort of those we have been used to; and a man *weak*, that has not so much strength or power to move as men usually have.

SECT. XXIII. *Of Identity and Diversity.*

105. ANOTHER occasion the mind takes of comparing is, the very *being of things*. When considering a thing as existing at any certain time or place, and comparing it with itself as existing at any other time, &c. it forms the ideas of *identity* and *diversity*. When we see any thing in any certain time and place, we are sure it is that very thing, and can be no other, how like soever it may be in all other respects.

106. We conceiving it to be impossible that two things of the same kind should exist together in the same place, we conclude, that whatever exists any where at the same time, excludes all of the same kind, and is there itself alone. When therefore we demand whether any thing be the *same*, or no, it refers always to something that existed such a time, in such a place, which it was certain at that instant was the same with itself, and no other.

107. We have ideas of three sorts of substances: 1. Of *God*. 2. *Finite intelligences*. 3. *Bodies*.

First, God being eternal, unalterable, and every-where, concerning his *identity* there can be no doubt.

Secondly, Finite spirits having had their determinate time and place of beginning to exist, the relation to that time and place will always determine to each its *identity* as long as it exists.

Thirdly, The same will hold of every particle of matter to which no addition or subtraction is made. These three exclude not one another out of the same place, yet each exclude those of the same kind out of the same place.

108. The identity and diversity of *modes* and *relations* are determined after the same manner that substances are; only the actions of finite beings, as *motion* and *thought*, consisting in succession, they cannot exist in different times and places as permanent beings: for no motion or thought, considered as at different times,

Identity and Diversity. times, can be the ſame, each part thereof having a different beginning of exiſtence.

109. From whence it is plain, that exiſtence itſelf is the *principium individuationis*, which determinates a being to a particular time and place incommunicable to two beings of the ſame kind. Thus, ſuppoſe an *atom* exiſting in a determined time and place; it is evident that, conſidered in any inſtant, it is the ſame with itſelf, and will be ſo as long as its exiſtence continues. The ſame may be ſaid of two, or more, or any number of particles, whilſt they continue together. The maſs will be the ſame, however jumbled: but if one atom be taken away, it is not the ſame maſs.

110. In *vegetables*, the identity depends not on the ſame maſs, and is not applied to the ſame thing. The reaſon of this is, the difference between an animate body and maſs of matter; *this* being only the coheſion of particles any-how united: *the other*, ſuch a diſpoſition, an organization of parts, as is fit to receive and diſtribute nouriſhment, ſo as to continue and frame the wood, bark, leaves, &c. (of an *oak*, for inſtance) in which conſiſts the vegetable life. That therefore which has ſuch an organization of parts partaking of one common life, continues to be the ſame *plant*, though that life be communicated to new particles of matter, vitally united to the living plant. The caſe is not ſo much different in *brutes*, but that any one may hence ſee what makes an *animal*, and continues it the *ſame*.

111. The identity of the *ſame man* likewiſe conſiſts in a participation of the ſame continued life in ſucceeding particles of matter vitally united to the ſame organized body.

112. To underſtand *identity* aright, we muſt conſider what *idea* the word it is applied to ſtands for; it being one thing to be the *ſame ſubſtance*, another the *ſame man*, and a third the *ſame perſon*.

113. An *animal* is a living organized body; and the ſame animal is the ſame continued life communicated to different particles of matter, as they happen ſucceſſively to be united to that organized living body; and our notion of *man* is but of a particular ſort of animal.

114. *Perſon* ſtands for an intelligent being, that reaſons and reflects, and can conſider itſelf the ſame thing in different times and places; which it doth by that *conſciouſneſs* that is inſeparable from thinking. By this every one is to himſelf what he calls *ſelf*, without conſidering whether that *ſelf* be continued in the ſame or divers ſubſtances. In this conſiſts *perſonal identity*, or the ſameneſs of a rational being; and ſo far as this conſciouſneſs extends backward to any paſt action or thought, ſo far reaches the identity of that perſon. It is the ſame *ſelf* now it was then: and it is by the ſame *ſelf*, with this preſent one that now reflects on it, that that action was done.

115. *Self* is that conſcious thinking thing, whatever ſubſtance it matters not, which is conſcious of pleaſure or pain, capable of happineſs or miſery; and ſo is concerned for itſelf as far as that conſciouſneſs extends. That with which the conſciouſneſs of this preſent thinking thing can join itſelf, makes the ſame perſon, and is one ſelf with it; and ſo attributes to itſelf and owns all the actions of that thing as its own, as far as that conſciouſneſs reaches.

Various Relations. 116. This *perſonal identity* is the object of reward and puniſhment, being that by which every one is concerned for himſelf. If the *conſciouſneſs* went along with the little finger, when that was cut off, it would be the ſame ſelf that was juſt before concerned for the whole body.

117. If the ſame *Socrates*, waking and ſleeping, did not partake of the ſame conſciouſneſs, they would not be the ſame *perſon*. *Socrates* waking, could not be in juſtice accountable for what *Socrates* ſleeping did, no more than one *twin* for what his brother *twin* did becauſe their outſides were ſo like that they could not be diſtinguiſhed.

118. But ſuppoſe I wholly loſe the memory of ſome parts of life, beyond a poſſibility of retrieving them, ſo that I ſhall never be conſcious of them again: am I not the *ſame perſon* that did thoſe actions, though I have now forgot them? I anſwer, that we muſt here take notice what the word *I* is applied to, which in this caſe is the man only: and the ſame man being preſumed to be the ſame perſon, *I* is eaſily here ſuppoſed to ſtand alſo for the ſame perſon. But if it be poſſible for the ſame man to have diſtinct incommunicable conſciouſneſs at different times, it is paſt doubt the ſame man would, at different times, make different perſons. Which we ſee is the ſenſe of mankind in the ſolemneſt declaration of their opinions, human laws not puniſhing the mad man for the ſober man's actions, nor the ſober man for what the mad man did; thereby making them two perſons. Thus we ſay in *Engliſh*, ſuch a one *is not himſelf*, or is *beſides himſelf*; in which phraſe, it is inſinuated, that *ſelf* is changed, and the *ſelf-ſame perſon* is no longer in that man.

119. But is not a man drunk or ſober the ſame perſon? Why elſe is he puniſhed for the ſame fact he commits when drunk, tho' he be never afterwards conſcious of it? Juſt as much the ſame perſon as a man that walks and does other things in his ſleep is the ſame perſon, and is anſwerable for any miſchief he ſhall do in it. Human laws puniſh both with a juſtice ſuitable to their way of knowledge: becauſe in theſe caſes they cannot diſtinguiſh certainly what is real and what is counterfeit. And ſo the ignorance in drunkenneſs or ſleep, is not admitted as a plea: for tho' puniſhment be annexed to perſonality, and perſonality to conſciouſneſs; and the drunkard, perhaps, is not conſcious of what he did; yet human judicatures juſtly puniſh him, becauſe the fact is proved againſt him, but want of conſciouſneſs cannot be proved for him.

120. To conclude: whatever ſubſtance begins to exiſt, it muſt during its exiſtence be the ſame. Whatever compoſitions of ſubſtances begin to exiſt, during the union of thoſe ſubſtances, the concrete muſt be the ſame. Whatſoever mode begins to exiſt, during its exiſtence it is the ſame. And ſo if the compoſition be of diſtinct ſubſtances, and different modes, the ſame rule holds.

Sect. XXIV. *Of other Relations.*

121. All ſimple *ideas*, wherein are parts or degrees, afford an occaſion of comparing the ſubjects wherein they are to one another, in reſpect of thoſe ſimple *ideas*: As *whiter*, *ſweeter*, *more*, *leſs*, &c.

These

Various Relations. Thefe depending on the equality and excefs of the fame fimple *ideas*, in feveral fubjects, may be called *proportional relations*.

122. Another occafion of comparing things is taken from the circumftances of their origin; as *father*, *fon*, *brother*, &c. Thefe may be called *natural relations*.

123. Sometimes the foundation of confidering things, is fome act whereby any one comes by a moral right, power, or obligation to do fomething: Such are *general*, *captain*, *burgher*. Thefe are *inftituted* and *voluntary relations*; and may be diftinguifhed from the *natural*, in that they are alterable and feparable from the perfons to whom they fometimes belonged, tho' neither of the fubftances fo related be deftroyed. But natural relations are not alterable, but are as lafting as their fubjects.

124. Another relation is the conformity or difagreement of mens voluntary actions to a rule to which they are referred, and by which they are judged of: thefe may be called *moral relations*. It is this conformity or difagreement of our actions to fome law (whereby good or evil is drawn on us from the will and power of the law-maker, and is what we call *reward* or *punifhment*) that renders our actions morally good or evil.

125. Of thefe moral *rules* or *laws* there feem to be three forts, with their different enforcements: firft, The *divine law*; fecondly, *Civil law*; thirdly, *The law of opinion* or *reputation*. By their relation to the firft, our actions are either *fins* or *duties*; to the fecond, *criminal* or *innocent*; to the third, *virtues* or *vices*.

126. *Firft*, The *divine law* is that law which God has fet to the actions of men, whether promulgated to them by the light of nature or the voice of revelation.

127. That God has given a law to mankind, feems undeniable, fince he has, firft, A right to do it; we are his creatures. Secondly, Goodnefs and wifdom, to direct our actions to what is beft. Thirdly, Power to enforce it by reward and punifhment, of infinite weight and duration. This is the only true touchftone of moral rectitude, and by which men judge of the moft confiderable moral good or evil of their actions; that is, whether, as duties or fins, they are like to procure to them happinefs or mifery from the hands of the Almighty.

128. *Secondly*, The *civil law* is the rule fet by the commonwealth to the actions of thofe that belong to it. This law nobody overlooks; the rewards and punifhments being ready at hand to enforce it, extending to the protecting or taking away of the life, liberty, and eftate, of thofe who obferve or difobey it.

129. *Thirdly*, The law of *opinion* or *reputation*. *Virtue* and *vice* are names fuppofed every where to ftand for actions in their own nature right and wrong. As far as they are really fo applied, they fo far are coincident with the divine law. But it is vifible that thefe names, in the particular inftances of their application, through the feveral nations and focieties of men, are conftantly attributed only to fuch actions as in each country and fociety are in reputation or difcredit. So that the meafure of what is every where called and efteemed virtue and vice, is the approbation or diflike, praife or blame, which by a tacit confent eftablifhes itfelf in the focieties and tribes of men in the world; whereby feveral actions come to find credit or difgrace amongft them, according to the judgment, maxims, or fafhions of the place.

Various Relations.

130. That this is fo, appears hence: That tho' that paffes for virtue in one place which is elfewhere accounted vice, yet every where *virtue* and *praife*, *vice* and *blame*, go together. *Virtue* is every where that which is thought praife-worthy; and nothing elfe but that which has the allowance of public efteem, is called *virtue*. Thefe have fo clofe an alliance, that they are often called by the fame name.

131. It is true, virtue and vice do, in a great meafure, every where correfpond with the unchangeable rule of right and wrong, which the laws of God have eftablifhed; becaufe the obfervation of thefe laws vifibly fecures and advances the general good of mankind, and the neglect of them breeds mifchief and confufion: and therefore men, without renouncing all fenfe and reafon, and their own intereft, could not generally miftake in placing their commendation and blame on that fide that deferved it not.

132. They who think commendation and difgrace not fufficient motives to engage men to accommodate themfelves to the opinions and rules of thofe with whom they converfe, feem little fkilled in the hiftory of mankind; the greateft part whereof govern themfelves by this *law of fafhion*.

133. The penalties that attend the breach of God's laws are feldom ferioufly reflected on; and thofe that do reflect on them entertain thoughts of future reconciliation; and for the punifhment due from the laws of the commonwealth, men flatter themfelves with the hopes of impunity: but no man efcapes cenfure and diflike, who offends againft fafhion; nor is there one of ten thoufand ftiff and infenfible enough to bear up under the conftant diflike and condemnation of his own club.

134. *Morality* then is nothing but a relation to thefe laws or rules: and thefe rules being nothing elfe but a collection of feveral fimple *ideas*, the conformity thereto is but fo ordering the action that the fimple *ideas* belonging to it may correfpond to thofe which the law requires. By which we fee, how moral beings and notions are founded on and terminated in the fimple *ideas* of fenfation and reflection. For example; let us confider the complex *idea* fignified by the word *murder*. Firft, from reflection, we have the *ideas* of *willing*, *confidering*, *purpofing*, *malice*, &c. alfo of *life*, *perception*, and *felf-motion*. Secondly, from fenfation, we have the *ideas* of *man*, and of fome action whereby we put an end to that perception and motion in the man: all which fimple *ideas* are comprehended in the word *murder*.

135. This collection of fimple *ideas* being found to agree or difagree with the efteem of the country I have been bred in, and to be held worthy of praife or blame, I call the action *virtuous* or *vicious*. If I have the will of a fupreme invifible Law-maker for my rule; then as I fuppofe the action commanded or forbidden by *God*, I call it *good* or *evil*, *fin* or *duty*: if I compare it with the civil law of my country, I call it *lawful* or *unlawful*, a crime or no crime.

136. Moral actions may be confidered two ways; Firft,

Real and Fantaftical Ideas.

First, As they are in themfelves a collection of fimple *ideas*; in which fenfe they are pofitive abfolute *ideas*.

Secondly, As *good*, or *bad*, or *indifferent*: in this refpect they are *relative*, it being their conformity or difagreement with fome rule that makes them fo. We ought carefully to diftinguifh between the pofitive *idea* of the action, and the reference it has to a rule; both which are commonly comprehended under one name, which often occafions confufion, and mifleads the judgment.

137. Thus the taking from another what is his, without his confent, is properly called *ftealing*: but that name being commonly underftood to fignify alfo the moral pravity of the action, men are apt to condemn whatever they hear called *ftealing* as an ill action difagreeing with the rule of right. And yet the private taking away his fword from a madman, to prevent his doing mifchief, though it be properly denominated *ftealing*, as the name of fuch a mixed mode; yet, when compared to the law of God, it is no fin or tranfgreffion, tho' the name *ftealing* ordinarily carries fuch an intimation with it.

Sect. XXV. *Of Real and Fantaftical Ideas.*

138. Our *ideas*, in reference to things from whence they are taken, or which they may be fuppofed to reprefent, come under a *threefold* diftinction; and are, firft, either *real* or *fantaftical*; fecondly, *adequate* or *inadequate*; thirdly, *true* or *falfe*.

139. *Real ideas*, are fuch as have a foundation in nature, fuch as have a conformity with the real being and exiftence of things, or with their archetypes.

140. *Fantaftical* are fuch as have no foundation in nature, nor any conformity with that reality of being to which they are referred as to their *archetypes*. By examining the feveral forts of *ideas* we fhall find, that, firft, our *fimple ideas* are all real; not that they are images or reprefentations of what does exift, but as they are the certain effects of powers in things without us, ordained by our Maker to produce in us fuch fenfations: they are real *ideas* in us, whereby we diftinguifh the qualities that are really in things themfelves.

141. Their reality lies in the fteady correfpondence they have with the diftinct conftitutions of real beings. But whether they anfwer to thofe conftitutions as to *caufes* or *patterns*, it matters not; it fuffices that they are conftantly produced by them.

142. *Complex ideas*, being arbitrary combinations of *fimple ideas* put together, and united under one general name, in forming of which the mind ufes its liberty, we muft inquire which of thefe are real, and which imaginary combinations.

143. Firft, Mixed modes and relations having no other reality than what they have in the minds of men, nothing elfe is required to make them real, but a poffibility of exifting conformable to them. Thefe *ideas* being themfelves *archetypes*, cannot differ from their *archetypes*, and fo cannot be chimerical; unlefs any one will jumble together in them inconfiftent *ideas*. Thofe indeed that have names affigned them in any language, muft have a conformity to the ordinary fignification of the name that is given them, that they may not be thought fantaftical.

144. Secondly, Our complex *ideas* of fubftances being made, in reference to things exifting without us, whofe reprefentations they are thought, are no farther real than as they are fuch combinations of *fimple ideas* as are really united, and co-exift in things without us: thofe are fantaftical which are made up of feveral *ideas* that never were found united, as *Centaur*, &c.

Of Ideas adequate or inadequate.

Sect. XXVI. *Of Ideas Adequate or Inadequate.*

145. Real *ideas* are either *adequate* or *inadequate*. Firft, *adequate*; which perfectly reprefents thofe archetypes which the mind fuppofes them taken from, and which it makes them to ftand for. Secondly, *Inadequate*; which are fuch as do but partially or incompletely reprefent thofe archetypes to which they are referred. Whence it appears,

146. Firft, That all our *fimple ideas* are *adequate*; for they being but the effects of certain powers in things fitted and ordained by God to produce fuch fenfations in us, they cannot but be correfpondent and adequate to fuch powers, and we are fure they agree to the reality of things.

147. Secondly, Our *complex ideas of modes* being voluntary collections of *fimple ideas*, which the mind puts together without reference to any real archetypes, cannot but be *adequate ideas*. They are referred to no other pattern, nor made by any original, but the good-liking and will of him that makes the combination. If indeed one would conform his *ideas* to thofe which are formed by another perfon, they may be wrong or *inadequate*, becaufe they agree not to that which the mind defigns to be their archetype and pattern; in which refpect only any *ideas* of modes can be wrong, imperfect, or inadequate.

148. Thirdly, Our *ideas of fubftances* have in the mind a double reference: Firft, They are fometimes referred to a fuppofed real effence, of each fpecies of things; fecondly, They are defigned for reprefentations in the mind, of things that do exift, by *ideas* difcoverable in them: in both which refpects they are *inadequate*.

149. Firft, If the names of fubftances ftand for things, as fuppofed to have certain real effences, whereby they are of this or that fpecies, of which real effences men are wholly ignorant; it follows, that the *ideas* they have in their minds, being referred to real effences as *archetypes* which are unknown, they muft be fo far from being adequate, that they cannot be fuppofed to be any reprefentation of them at all. Our complex *ideas* of fubftances are nothing but certain collections of fimple *ideas* that have been obferved or fuppofed conftantly to exift together. But fuch a complex *idea* cannot be the real effence of any fubftance: for then the properties we difcover in it would be deducible from it, and their neceffary connection with it be known; as all the properties of a *triangle* depend on and are deducible from the complex *idea* of *three lines including a fpace*: but it is certain, that in our complex *ideas* of fubftances are not contained fuch *ideas* on which all other qualities that are to be found in them depend.

150. Secondly, Thofe that take their *ideas* of fubftances from their fenfible qualities, cannot form adequate *ideas* of them: becaufe their qualities and powers

True and False Ideas. powers are so various, that no man's complex *idea* can contain them all. Most of our simple *ideas*, whereof our complex ones of substances do consist, are powers, which being relations to other substances, we cannot be sure we know all the powers, till we have tried what changes they are fitted to give and receive from other substances in their several ways of application; which being not possible to be tried upon one body, much less upon all, it is impossible we should have adequate *ideas* of any substance made of a collection of all its properties.

Sect. XXVII. *Of True and False Ideas.*

151. Truth and *falsehood*, in propriety of speech, belong only to propositions; and when *ideas* are termed *true* or *false*, there is some secret or tacit proposition which is the foundation of that denomination. Our *ideas* being nothing but *appearances* or *perceptions* in the mind, can, in strictness of speech, no more be said to be true or false than single names of things can be said to be true or false. The *idea* of *Centaur* has no more falsehood in it when it appears in our minds, than the name *Centaur* when it is pronounced or writ on paper. For truth or falsehood lying always in some affirmation or negation, our *ideas* are not capable, any of them, of being false, till the mind passes some judgement on them, that is, affirms or denies something of them. In a *metaphysical* sense they may be said to be true, that is, to be really such as they exist; tho' in things called *true*, even in that sense, there is perhaps a secret reference to our *ideas*, looked upon as the standards of that truth; which amounts to a *mental proposition.*

152. When the mind refers any of its *ideas* to any thing extraneous to it, they are then capable of being true or false: because in such a reference, the mind makes a tacit supposition of their conformity to that thing; which supposition, as it is true or false, so the *ideas* themselves come to be denominated. This happens in these cases:

1st, When the mind supposes its *idea* conformable to that in other mens minds called by the same name, such as that of *justice*, *virtue*, &c.

2dly, When the mind supposes any *idea* conformable to some real existence. Thus, that of *Man* is true, that of *Centaur* false; the one having a conformity to what has really existed, the other not.

3dly, When the mind refers any of its *ideas* to that real constitution and essence of any thing whereon all its properties depend: and thus the greatest part, if not all our *ideas of substances* are false.

153. As to the first, when we judge of our *ideas* by their conformity to those of other men, they may be any of them false: but simple *ideas* are least liable to be so mistaken. We seldom mistake green for blue, or bitter for sweet; much less do we confound the names belonging to different senses, and call a *colour* by the name of a *taste*. Complex *ideas* are much more liable to falsehood in this particular; and those of mixed modes more than substances: because, in substances, their sensible qualities serve, for the most part, to distinguish them clearly; but in mixed modes we are more uncertain, and we may call that *justice* which ought to be called by another name. The reason of this is, that the abstract *ideas* of mixed modes being mens voluntary combination of such a precise collection of simple *ideas*, we have nothing else to refer our *ideas* of mixed modes or standards to, but the *ideas* of those who are thought to use names in their proper significations; and so as our *ideas* conform or differ from them, they pass for true or false. True and False Ideas.

154. As to the *second*, When we refer our *ideas* to the real existence of things, none can be termed *false* but our complex *ideas* of substances: for our simple *ideas* being nothing but perceptions in us answerable to certain powers in external objects, their truth consists in nothing but such appearances as are produced in us suitable to those powers: neither do they become liable to the imputation of falsehood, whether we judge these *ideas* to be in the things themselves, or no: for God having set them as marks of distinguishing things, that we may be able to discern one thing from another, and thereby choose them as we have occasion, it alters not the nature of our simple *ideas*, whether we think the *idea* of *blue* (for instance) to be in the violet itself, or in the mind only: and it is equally from that appearance to be denominated *blue*, whether it be that real colour, or only a peculiar texture in it, that causes in us that *idea;* since the name *blue* notes properly nothing but that mark of distinction that is in a violet, discernible only by our eyes, whatever it consists in.

155. Neither would our simple *ideas* be *false*, if by the different structure of our organs it were so ordered that the same object should produce in several mens minds different *ideas:* for this could never be known, since objects would operate constantly after the same manner. It is most probable, nevertheless, that the *ideas* produced by the same objects in different mens minds are very near and undiscernibly like. Names of simple *ideas* may be misapplied; as a man, ignorant in the *English* tongue, may call *purple*, *scarlet:* but this makes no falsehood in the *idea*.

156. Complex *ideas* of modes cannot be false, in reference to the essence of any thing really existing; because they have no reference to any pattern existing, or made by nature.

157. Our complex *ideas* of substances, being all referred to patterns in things themselves, may be false. They are so, *1st*, When looked upon as representations of the unknown essences of things: *2dly*, When they put together simple *ideas* which in the real existence of things have no union; as in *Centaur*. *3dly*, When from any collection of simple *ideas*, that do not always exist together, there is separated, by a direct negation, any one simple *idea* which is constantly joined with them. Thus, if from extension, solidity, fixedness, malleableness, fusibility, &c. we remove the colour observed in *gold:* if this *idea* be only left out of the complex one of *gold*, it is to be looked on as an inadequate and imperfect, rather than a false one; since though it contains not all the simple *ideas* that are united in nature, yet it puts none together but what do really exist together.

158. Upon the whole, our *ideas*, as they are considered by the mind, either in reference to the proper signification of their names, or in reference to the reality of things, may more properly be called *right* or *wrong ideas*, according as they agree or disagree to those patterns to which they are referred. The *ideas* that are in mens minds, simply considered, cannot be wrong

Association of Ideas.

wrong, unless *complex ideas*, wherein inconsistent parts are jumbled together. All other *ideas* are in themselves right, and the knowledge about them right and true knowledge. But when we come to refer them to any patterns, or archetypes, then they are capable of being wrong, as far as they disagree with such archetypes.

Sect. XXVIII. *Of the Association of Ideas.*

159. Some of our *ideas* have a natural correspondence and connection one with another: it is the office and excellency of our reason to trace these, and hold them together in that union and correspondence which is founded in their peculiar beings. Besides this, there is another connection of *ideas* wholly owing to chance or custom: *ideas* that in themselves are not at all of kin, come to be so united in some mens minds, that it is very hard to separate them; they always keep company, and the one no sooner comes into the understanding, but its associate appears with it; and if they are more than two, the whole gang always inseparably shew themselves together. This strong combination of *ideas*, not allied by nature, the mind makes in itself either voluntarily or by chance: and hence it comes in different men to be very different, according to their different *inclinations*, *educations*, *interests*, &c. Custom settles habits of thinking in the understanding, as well as of determining in the will, and of motions in the body; all which seem to be but trains of motion in the animal-spirits, which, once set a-going, continue on in the same steps they have been used to; which by often treading are worn into a smooth path, and the motion in it becomes easy, and, as it were, natural. As far as we can comprehend thinking, thus *ideas* seem to be produced in our minds; or if they are not, this may serve to explain their following one another in an habitual train, when once they are put into that tract, as well as it does to explain such motions of the body.

160. This connection in our minds of *ideas*, in themselves loose and independent one of another, is of so great force to set us awry in our actions, as well moral as natural, passions, reasonings, and notions themselves, that perhaps there is not any one thing that deserves more to be looked after. Thus the *ideas* of *goblins* and *sprights* have really no more to do with darkness than light; yet let but a foolish maid inculcate these often on the mind of a child, and raise them there together, possibly he shall never be able to separate them again so long as he lives, but darkness shall ever afterwards bring with it those frightful *ideas*. A man has suffered pain or sickness in any place; he saw his friend die in such a room; though these have in nature nothing to do one with another, yet when the *idea* of the *place* occurs to his mind, it brings that of the pain and displeasure with it; he confounds him in his mind, and can as little bear the one as the other.

161. *Intellectual habits* and defects this way contracted, are not less frequent and powerful, though less observed. Let the *ideas* of *being* and *matter* be strongly joined either by education or much thought, whilst these are still combined in the mind, what notions, what reasonings will there be about separate spirits? Let custom from the very childhood have joined figure and shape to the *idea* of God, and what absurdities will that mind be liable to about the Deity? Let the *idea* of *infallibility* be joined to any person, and these two constantly together possess the mind; and then one body in two places at once shall be swallowed for a certain truth, whenever that imagined infallible person dictates, and demands assent without inquiry.

Knowledge in general.

162. Some such wrong combinations of *ideas* will be found to establish the irreconcileable opposition between different sects of philosophy and religion: for we cannot imagine every one of their followers to impose wilfully on himself, and knowingly refuse truth offered by plain reason. Interest, though it does a great deal in the case, yet cannot be thought to work whole societies of men to so universal a perverseness, as that every one of them should knowingly maintain falsehood; some at least must be allowed to do what all pretend to, i. e. to pursue truth sincerely. That therefore which captivates their reasons, and leads men of sincerity blindfold from common sense, will, when examined, be found to be what we are speaking of: some independent *ideas* are by education, custom, and the constant din of their party, so coupled in their minds, that they always appear there together; and they can no more separate them in their thoughts, than if they were but one *idea*; and they operate as if they were so. This gives sense to jargon, demonstration to absurdities, and consistency to nonsense, and is the foundation of the greatest errors in the world. The confusion of two different *ideas*, which a customary connection of them in their minds hath to them in effect made but one, cannot but fill mens heads with false views, and their reasonings with false consequences.

Sect. XXIX. *Of Knowledge in general.*

163. Since the mind, in all its thoughts and reasonings, has no other immediate object but its own *ideas*, which alone it does or can contemplate, it is evident that our knowledge is only conversant about them. *Knowledge* then seems to be nothing but the perception of the connection and agreement, or disagreement and repugnancy of any of our *ideas:* where this perception is, there is *knowledge;* and where it is not, there, though we fancy, guess, or believe, yet we always come short of *knowledge.* When we know that *white* is not *black*, what do we but perceive that these two *ideas* do not agree? Or that the three angles of a *triangle*, are equal to two right ones; what do we more but perceive that equality to two right ones does necessarily agree to and is inseparable from the three angles of a triangle? But to understand a little more distinctly wherein this agreement or disagreement consists, we may reduce it all to these *four sorts:* 1st, *Identity* or *diversity;* 2dly, *Relation;* 3dly, *Co-existence;* 4thly, *Real existence.*

164. I. *Identity* or *diversity.* It is the first act of the mind *to perceive its* ideas; and, so far as it perceives them, to know each what it is, and thereby to perceive their difference, that is, the one not to be the other: by this the mind clearly perceives each *idea* to agree with itself, and to be what it is; and all distinct *ideas* to disagree. This it does without any pains or deduction, by its natural power of perception and distinction. This is what men of art have reduced to those general rules, viz. *What is, is;* and, *It is impossible for the same thing to be and not to be.* But no

maxim

Knowledge. *maxim* can make a man know it clearer, that *round* is not *ſquare*, than the bare perception of thoſe two *ideas*, which the mind at firſt ſight perceives to diſagree.

165. II. The next ſort of agreement or diſagreement the mind perceives in any of its *ideas* may be called *relative*, and is nothing but the perception of the relation between any two *ideas* of what kind ſoever; that is, their agreement or diſagreement one with another in ſeveral ways the mind takes of comparing them.

166. III. The third ſort of agreement or diſagreement to be found in our ideas, is, *coexiſtence* or *non-exiſtence* in the ſame ſubject; and this belongs particularly to ſubſtances. Thus when we pronounce concerning *gold*, that it is fixed; it amounts to no more but this, that fixedneſs, or a power to remain in the fire unconſumed, is an *idea* that always accompanies that particular ſort of *yellowneſs*, *weight*, *fuſibility*, &c. which make our complex *idea* ſignified by the word *gold*.

167. IV. The fourth ſort is that of actual and *real exiſtence* agreeing to any *idea*. Within theſe four ſorts of agreement or diſagreement, is contained all the knowledge we have, or are capable of. For all that we know or can affirm concerning any *idea*, is, That it is, or is not, the ſame with ſome other; as, that *blue is not yellow*: That it does, or does not, coexiſt with another in the ſame ſubject; as, that *iron is ſuſceptible of magnetical impreſſions*: That it has that or this relation to ſome other *ideas*; as, that *two triangles, upon equal baſes upon two parallels, are equal*: or, That it has a real exiſtence without the mind; as, *that God is*.

168. There are ſeveral ways wherein the mind is poſſeſſed of truth, each of which is called *knowledge*. *Firſt*, There is *actual knowledge*, when the mind has a preſent view of the agreement or diſagreement of any of its *ideas*, or of the relation they have one with another. *Secondly*, A man is ſaid to know any propoſition, when having once evidently perceived the agreement or diſagreement of the *ideas* whereof it conſiſts, and ſo lodged it in his memory, that whenever it comes to be reflected on again, the mind aſſents to it without doubt or heſitation, and is certain of the truth of it. And this may be called *habitual knowledge*. And thus a man may be ſaid to know all thoſe truths which are lodged in his memory by a foregoing, clear, and full perception.

169. Of *habitual knowledge* there are two ſorts: the one is of ſuch truths laid up in the memory, as whenever they occur to the mind, it actually perceives the relation that is between thoſe *ideas*. And this is in all thoſe truths, where the *ideas* themſelves, by an immediate view, diſcover their agreement or diſagreement one with another. The other is of ſuch truths, whereof the mind having been convinced, it retains the memory of the conviction, without the proofs. Thus a man that remembers certainly, that he once perceived the demonſtration, that the three angles of a triangle are equal to two right ones, knows it to be true, when that demonſtration is gone out of his mind, and poſſibly cannot be recollected: but he knows it in a different way from what he did before, namely, not by the intervention of thoſe intermediate *ideas*, whereby the agreement or diſagreement of thoſe in the propoſition was at firſt perceived, but by remembering, i. e. knowing that he was once certain of the truth of this propoſition, that the three angles of a triangle are equal to two right ones. The immutability of the ſame relations between the ſame immutable things, is now the *idea* that ſhews him, that if the three angles of a triangle were once equal to two right ones, they will always be ſo. And hence he comes to be certain, that what was once true, is always true; what *ideas* once agreed, will always agree; and conſequently, what he once knew to be true, he will always know to be true, as long as he can remember that he once knew it.

Degrees of Knowledge.

Sect. XXX. *Of the Degrees of our Knowledge.*

170. All our knowledge conſiſting in the view the mind has of its own *ideas*, which is the utmoſt light and greateſt certainty we are capable of, *the different clearneſs of our knowledge* ſeems to lie in the different way of perception the mind has of the agreement or diſagreement of any of its *ideas*.

171. When the mind perceives this agreement or diſagreement of two *ideas immediately* by themſelves, without the intervention of any other, we may call it *intuitive knowledge*; in which caſes the mind perceives truth, as the eye does light, only by being directed towards it. Thus the mind perceives, that *white is not black*; that *three are more than two*, and *equal to one and two*. This part of knowledge is irreſiſtible, and, like the bright ſunſhine, forces itſelf immediately to be perceived as ſoon as ever the mind turns its view that way. It is on this *intuition* that depends all the certainty and evidence of our other knowledge; which certainty every one finds to be ſo great, that he cannot imagine, and therefore not require a greater.

172. The next degree of knowledge is, where the mind perceives not this agreement or diſagreement immediately, or by the *juxta-poſition*, as it were, of the *ideas*, becauſe thoſe *ideas* concerning whoſe agreement or diſagreement the inquiry is made, cannot by the mind be ſo put together as to ſhew it. In this caſe the mind is fond to diſcover the agreement or diſagreement which it ſearches, by the intervention of other *ideas*: And this is that which we call *reaſoning*. And thus, if we would know the agreement or diſagreement in bigneſs between the three angles of a triangle and two right angles, we cannot by an immediate view and comparing them do it; becauſe the three angles of a triangle cannot be brought at once, and be compared with any other one or two angles. And ſo of this the mind has no immediate or intuitive knowledge. But we muſt find out ſome other angles to which the three angles of a triangle have equality; and finding thoſe equal to two right ones, we come to know the equality of theſe three angles to two right ones. Theſe intervening *ideas* which ſerve to ſhew the agreement of any two others, are called *proofs*; and where the agreement or diſagreement is by this means plainly and clearly perceived, it is called *demonſtration*. A quickneſs in the mind to find thoſe proofs, and to apply them right, is that which is called *ſagacity*.

173. This knowledge, though it be certain, is not ſo clear and evident as *intuitive* knowledge. It requires pains and attention, and ſteady application of mind, to diſcover the agreement or diſagreement of the *ideas* it conſiders; and there muſt be a progreſſion by ſteps and degrees before the mind can in this way

Degrees of Knowledge.

arrive at certainty. Before demonstration there was a doubt, which, in *intuitive knowledge*, cannot happen to the mind that has its faculty of perception left to a degree capable of distinct *ideas*, no more than it can be a doubt to the eye (that can distinctly see *white* and *black*) whether this ink and paper be all of a colour.

174. Now, in every step that reason makes in *demonstrative knowledge*, there is an *intuitive knowledge* of that agreement or disagreement it seeks with the next immediate *idea*; which it uses as a proof: for if it were not so, that yet would need a proof; since without the perception of such agreement or disagreement, there is no knowledge produced. By which it is evident, that every step in reasoning that produces knowledge has *intuitive certainty*; but when the mind perceives, there is no more required but to remember it, to make the agreement or disagreement of the *ideas* concerning which we inquire visible and certain. This *intuitive perception* of the agreement or disagreement of the intermediate *ideas* in each step and progression of the demonstration, must also be exactly carried in the mind; and a man must be sure that no part is left out; which because in long deductions the memory cannot easily retain, this knowledge becomes more imperfect than *intuitive*, and men often embrace falsehoods for demonstrations.

175. It has been generally taken for granted, that mathematics alone are capable of demonstrative certainty. But to have such an agreement or disagreement as may be *intuitively* perceived, being not the privilege of the ideas of *number*, *extension*, and *figure* alone, it may possibly be the want of due method and application in us, and not of sufficient evidence in things, that demonstration has been thought to have so little to do in other parts of knowledge: For in whatever ideas the mind can perceive the agreement or disagreement immediately, there it is capable of *intuitive knowledge*: And where it can perceive the agreement or disagreement of any two *ideas* by an *intuitive perception* of the agreement or disagreement they have with any intermediate *ideas*, there the mind is capable of demonstration which is not limited to the ideas of figure, number, extension, or their modes. The reason why it has been generally supposed to belong to them only, is because in comparing their equality or excess the *modes of numbers* have every the least difference very clear and perceivable: And in *extension*, though every the least excess is not so perceptible, yet the mind has found out ways to discover the just equality of two angles, extensions, or figures; and both, that is, numbers and figures, can be set down by visible and lasting marks.

176. But in other simple *ideas*, whose modes and differences are made and counted by degrees, and not quantity, we have not so nice and accurate a distinction of their differences as to perceive or find ways to measure their just equality or the least differences: for those other simple ideas being appearances or sensations produced in us by the *size*, *figure*, *motion*, &c. of minute corpuscles singly insensible, their different degrees also depend on the variation of some or all of those causes; which since it cannot be observed by us in particles of matter, whereof each is too subtile to be perceived, it is impossible for us to have any exact measures of the different degrees of these simple *ideas*. Thus, for instance, not knowing what number of particles, nor what motion of them, is fit to produce any precise degree of *whiteness*, we cannot demonstrate the certain equality of any two degrees of *whiteness*, because we have no certain standard to measure them by, nor means to distinguish every the least difference; the only help we have being from our senses, which in this point fail us.

Extent of Knowledge.

177. But where the difference is so great as to produce in the mind *ideas* clearly distinct, there *ideas* of *colours*, as we see in different kinds, (*blue* and *red*, for instance), are as capable of demonstration as ideas of number and extension. What is here said of colours holds true in all secondary qualities. These two then, *intuition* and *demonstration*, are the degrees of our *knowledge*; whatever comes short of one of these is but *faith* or *opinion*, not *knowledge*, at least in all *general truths*. There is indeed another perception of the mind employed about the *particular existence of finite beings* without us; which going beyond probability, but not reaching to either of the foregoing degrees of certainty, passes under the name of *knowledge*.

178. Nothing can be more certain than that the *idea* we receive from an external object is in our minds: This is *intuitive knowledge*; but whether we can thence certainly infer the existence of any thing without us corresponding to that idea, is that whereof some men think there may be a question made, because men may have such an idea in their minds when no such things exist, no such object affects their senses. But it is evident that we are invincibly conscious to ourselves of a different perception, when we look upon the sun in the day, and think on it by night; when we actually taste wormwood or smell a rose, or only think on that savour or odour. So that we may add to the two former sorts of knowledge this also of the existence of particular external objects, by that perception and consciousness we have of the actual entrance of ideas from them, and allow these three degrees of knowledge, viz. *intuitive*, *demonstrative*, and *sensitive*.

179. But since our knowledge is founded on and employed about our ideas only, will it follow thence that it must be conformable to our ideas; and that where our ideas are clear and distinct, obscure and confused, there our knowledge will be so too? *No*. For our knowledge consisting in the perception of the agreement or disagreement of any two ideas, its clearness or obscurity consists in the clearness or obscurity of that perception, and not in the clearness or obscurity of the ideas themselves. A man (for instance) that has a clear idea of the angles of a triangle, and of equality to two right ones, may yet have but an obscure perception of their agreement; and so have but a very obscure knowledge of it. But obscure and confused ideas can never produce any clear or distinct knowledge; because, as far as any ideas are obscure or confused, so far the mind can never perceive clearly whether they agree or disagree.

Sect. XXXI. *Of the Extent of Human Knowledge.*

180. From what has been said concerning knowledge, it follows, First, That we can have no knowledge

Extent of Knowledge

ledge farther than we have *ideas*.

Secondly, That we have no knowledge farther than we can have perception of that agreement or disagreement of our *ideas*, either by *intuition*, *demonstration*, or *sensation*.

Thirdly, We cannot have an *intuitive* knowledge that shall extend itself to all our *ideas*, and all that we would know about them, because we cannot examine and perceive all the relations they have one to another by juxta-position, or an immediate comparison one with another. Thus we cannot *intuitively* perceive the equality of two extensions, the difference of whose figures makes their parts incapable of an exact immediate application.

Fourthly, Our *rational* knowledge cannot reach to the whole extent of our *ideas*; because between two different *ideas* we would examine, we cannot always find such *proofs* as we can connect one to another, with an *intuitive knowledge* in all the parts of the deduction.

Fifthly, *Sensitive* knowledge reaching no farther than the existence of things actually present to our senses, is yet much narrower than either of the former.

Sixthly, From all which it is evident, that the *extent of our knowledge* comes not only short of the reality of *things*, but even of the extent of our own *ideas*. We have the *ideas* of a *square*, a *circle*, and *equality*; and yet perhaps shall never be able to find a *circle equal to a square*.

181. The affirmations or negations we make concerning the ideas we have, being reduced to the four sorts above-mentioned, viz. *identity*, *coexistence*, *relation*, and *real existence*, we shall examine how far our knowledge extends in each of these.

182. First, As to *identity* and *diversity*, our *intuitive knowledge* is as far extended as our *ideas* themselves; and there can be no *idea* in the mind which it does not presently, by an *intuitive knowledge*, perceive to be what it is, and to be different from any other.

183. Secondly, As to the agreement or disagreement of our *ideas* in *coexistence*: in this our knowledge is very short; tho' in this consists the greatest and most material part of our knowledge, concerning *substances*. For our *ideas* of *substances* being nothing but certain *collections of simple* ideas, *coexisting in one subject*, (our *idea* of *flame*, for instance, is a body *hot*, *luminous*, and *moving upward*; when we would know any thing farther concerning this, or any other sort of substance, what do we do but inquire what other qualities or powers these substances have, or have not? Which is nothing else but to know what other simple *ideas* do or do not *coexist* with those that make up that complex *idea*. The reason of this is, because the simple *ideas* which make up our complex *ideas* of substances, have no visible necessary connection or inconsistence with other simple *ideas* whose coexistence with them we would inform ourselves about. These *ideas* being likewise, for the most part, *secondary qualities*, which depend upon the *primary* qualities of their minute or insensible parts, or on something yet more remote from our comprehension, it is impossible we should know which have a necessary union or inconsistency one with another, since we know not the root from whence they spring, or the size, figure, and texture of parts on which they depend, and from which they result.

184. Besides this, there is no *discoverable connection* between any *secondary* quality, and those *primary* qualities that it depends on. We are so far from knowing what figure, size, or motion produces (for instance), a *yellow colour*, or *sweet taste*, or a *sharp sound*, that we can by no means conceive how any *size*, *figure*, or *motion*, can possibly produce in us the *idea* of any *colour*, *taste*, or *sound*, whatsoever; and there is no conceivable connection between the one and the other.

185. Our knowledge therefore of coexistence reaches little farther than *experience*. Some few, indeed, of the *primary* qualities have a necessary dependence and visible connection one with another; as *figure* necessarily supposes *extension*, *receiving or communicating motion by impulse* supposes *solidity*. But qualities coexistent in any subject, without this dependence and connection, cannot certainly be known to coexist any farther than experience by our senses informs us. Thus, though upon trial we find *gold* yellow, weighty, malleable, fusible, and fixed, yet because none of these have any evident dependence or necessary connection with the other, we cannot certainly know that where any *four* of these are, the *fifth* will be there also, how highly probable soever it may be: but the highest degree of *probability* amounts not to *certainty*; without which there can be no true knowledge: for this coexistence can be no further known, than it is perceived; and it cannot be perceived, but either, in *particular* subjects, by the observation of our senses, or, in *general*, by the necessary connection of the *ideas* themselves.

186. As to *incompatibility*, or *repugnancy to coexistence*, we may know, that any subject can have of each sort of *primary* qualities but one particular at once, one extension, one figure; and so of sensible *ideas*, peculiar to each sense: for whatever of each kind is present in any subject, excludes all others of that sort; for instance, one subject cannot have *two smells* or *two colours* at the same time.

187. As to *powers of substances*, which make a great part of our inquiries about them, and are no inconsiderable branch of our knowledge; our knowledge as to these reaches little farther than *experience*, because they consist in a texture and motion of parts which we cannot by any means come to discover. *Experience* is that which in this part we must depend on; and it were to be wished that it were more improved.

188. As to the third sort, the *agreement or disagreement of our ideas in any other relation*, this is the largest field of knowledge, and it is hard to determine how far it may extend. This part depending on our sagacity in finding intermediate *ideas* that may shew the habitudes and relations of *ideas*, it is an hard matter to tell when we are at the end of such discoveries. They that are ignorant of *algebra*, cannot imagine the wonders in this kind that are to be done by it; and what further improvements and helps advantageous to other parts of knowledge the sagacious mind of man may yet find out, it is not easy to determine. The *ideas* of *quantity* are not those alone that are capable of demonstration and knowledge; other, and perhaps more useful parts of contemplation, would un-

Extent of Knowledge. doubtedly afford us certainty, if vices, paffions, and domineering intereft, did not oppofe or menace endeavours of this kind.

189. The *idea* of a *Supreme Being*, infinite in power, goodnefs, and wifdom, whofe workmanfhip we are, and on whom we depend; and *ideas* of *ourfelves*, as underftanding rational creatures; would, if duly confidered, afford fuch foundation of our *duty*, and *rules of action*, as might place *morality* among the fciences capable of demonftration. The relations of other modes may certainly be perceived, as well as thofe of number and extenfion. *Where there is no property, there is no injuftice*, is a propofition as certain as any demonftration in Euclid: for the *idea* of *property* being a right to any thing; and the *idea* of *injuftice* being the invafion or violation of that right; it is evident, that thefe *ideas* being thus eftablifhed, and thefe names annexed to them, we can as certainly know this propofition to be true, as that a *triangle has three angles equal to two right ones*. Again, *No government allows abfolute liberty*. The *idea* of *government* being the eftablifhment of fociety upon certain rules or laws which require conformity to them, and the *idea* of *abfolute liberty* being for any one to do whatever he pleafes, we are as capable of being certain of the truth of this propofition as of any in *mathematics*.

190. What has given the advantage to the *ideas* of *quality*, and made them thought more capable of certainty and demonftration, is,

191. Firft, That they can be reprefented by fenfible marks, which have a nearer correfpondence with them than any words or founds. *Diagrams* drawn on paper are copies of the *ideas*, and not liable to the uncertainty that words carry in their fignification: but we have no fenfible marks that refemble our *moral ideas*, and nothing but words to exprefs them by; which though when written they remain the fame, yet the *ideas* they ftand for may change in the fame man; and it is very feldom that they are not different in different perfons.

192. Secondly, *Moral ideas* are commonly more complex than figures. Whence thefe two inconveniences follow: 1. That their names are of more uncertain fignification; the precife collection of fimple *ideas* they ftand for not being fo eafily agreed on, and fo the fign that is ufed for them, in communication always, and in thinking often, does not fteadily carry with it the fame *idea*. 2. The mind cannot eafily retain thofe precife combinations fo exactly and perfectly as is neceffary, in the examination of the habitudes and correfpondencies, agreements or difagreements, of feveral of them one with another, efpecially where it is to be judged of by long deductions, and the intervention of feveral other complex *ideas* to fhew the agreement or difagreement of two remote ones.

193. Now one part of thefe difadvantages in *moral ideas*, which has made them to be thought not capable of demonftration, may in a good meafure be remedied by *definitions*, fetting down that collection of fimple *ideas* which every term fhall ftand for, and then ufing the terms fteadily and conftantly for that precife collection.

194. As to the fourth fort of knowledge, viz. of *the real actual exiftence of things*, we have an *intuitive* knowledge of our *own exiftence*; a *demonftrative* knowledge of *the exiftence of God*; and a *fenfitive* knowledge of the *objects that prefent themfelves to our fenfe*.

Caufes of Ignorance. 195. From what has been faid, we may difcover the *caufes of our ignorance*, which are chiefly thefe three: Firft, Want of *ideas*: Secondly, Want of a difcoverable connection between the *ideas* we have: Thirdly, Want of tracing and examining our *ideas*.

196. Firft, There are fome things we are ignorant of for *want of ideas*. All the fimple *ideas* we have are confined to the obfervations of our fenfes, and the operations of our own minds that we are confcious of in ourfelves. What other *ideas* it is poffible other creatures may have by the affiftance of other fenfes and faculties more or perfecter than we have, or different from ours, it is not for us to determine; but to fay or think there are no fuch, becaufe we conceive nothing of them, is no better an argument, than if a blind man fhould be pofitive in it, that there was no fuch thing as fight and colours, becaufe he had no manner of *idea* of any fuch thing. What faculties therefore other fpecies of creatures have to penetrate into the nature and inmoft conftitutions of things, we know not. This we know, and certainly find, that we want other views of them, befides thofe we have, to make difcoveries of them more perfect. The *intellectual* and *fenfible* world are in this perfectly alike, that the parts which we fee of either of them hold no proportion with that we fee not, and whatfoever we can reach with our eyes or our thoughts of either of them is but a point almoft nothing in comparifon of the reft.

197. Another great caufe of ignorance, is the *want of ideas that we are capable of*. This keeps us in ignorance of things we conceive capable of being known. Bulk, figure, and motion, we have *ideas* of; yet not knowing what is the particular bulk, motion, and figure, of the greateft part of the bodies of the univerfe, we are ignorant of the feveral powers, efficacies, and ways of operation, whereby the effects we daily fee are produced. Thefe are hid from us, in fome things, by being *too remote*; in others, by being *too minute*.

198. When we confider the vaft diftance of the known and vifible parts of the world, and the reafons we have to think that what lies within our ken is but a fmall part of the immenfe univerfe, we fhall then difcover an huge abyfs of ignorance. What are the particular fabrics of the great maffes of matter which make up the whole ftupendous frame of corporeal beings; how far they are extended; what is their motion, and how continued; and what influence they have upon one another; are contemplations, that at firft glimpfe our thoughts lofe themfelves in. If we confine our thoughts to this little fyftem of our fun, and the groffer maffes of matter that vifibly move about it; what feveral forts of vegetables, animals, and intellectual corporeal beings, infinitely different from thofe of our little fpot of earth, may probably be in other *planets*, to the knowledge of which, even of their outward figures and parts, we can no way attain whilft we are confined to this earth, there being no natural means, either by fenfation or reflection, to convey their certain *ideas* into our minds?

199. There are other bodies in the univerfe, no lefs con-

Causes of Ignorance. concealed from us by their *minuteness*. These insensible corpuscles being the active parts of matter, and the great instruments of nature on which depend all their *secondary* qualities and operations, our want of precise distinct *ideas* of their *primary* qualities keeps us in incurable ignorance of what we desire to know about them. Did we know the mechanical affections of *rhubarb* and *opium*, we might as easily account for their operations of *purging* or *causing sleep*, as a watchmaker can for the motions of his watch. The dissolving of silver in *aqua fortis*, or gold in *aqua regia*, and not *vice versa*, would be then, perhaps, no more difficult to know, than it is to a smith to understand why the turning of one key will open a lock, and not the turning of another. But whilst we are destitute of senses acute enough to discover the minute particles of bodies, and to give us *ideas* of their mechanical affections, we must be content to be ignorant of their properties and operations: nor can we be assured about them any farther than some few trials we make are able to reach; but whether they will succeed again another time, we cannot be certain. This hinders our certain knowledge of universal truths concerning natural bodies; and our reason carries us herein very little beyond particular matters of fact. And therefore, how far soever human industry may advance useful and *experimental philosophy* in physical things, yet *scientifical* will still be out of our reach; because we want perfect and adequate *ideas* of those very bodies which are nearest to us, and most under our command.

200. This, at first sight, shews us how disproportionate our knowledge is to the whole extent, even of *material* beings; to which if we add the consideration of that infinite number of *spirits* that may be, and probably are, which are yet more remote from our knowledge, whereof we have no cognizance; we shall find this cause of ignorance conceal from us, in an impenetrable obscurity, almost the whole *intellectual* world, a greater, certainly, and a more beautiful world than the *material*: for bating some very few *ideas* of spirit we get from our own mind by reflection, and from thence the best we can collect of the *Father of all spirits*, the Author of them and us and all things, we have no certain information so much as of the existence of other spirits but by revelation; much less have we distinct *ideas* of their different natures, states, powers, and several constitutions, wherein they agree or differ one from another, and from us; and therefore in what concerns their different species and properties, we are under an absolute ignorance.

201. The *second* cause of ignorance, is the *want of discoverable connection* between those *ideas* we have: where we want that, we are utterly incapable of *universal* and *certain* knowledge: and are, in the former case, left only to *observation* and *experiment*. Thus the mechanical affections of bodies having no affinity at all with the *ideas* they produce in us, we can have no distinct knowledge of such operations beyond our experience; and can reason no otherwise about them, than as the effects or appointment of an infinitely *wise agent*, which perfectly surpass our comprehensions.

202. The operation of our minds upon our bodies is as inconceivable. How any *thought* should produce a motion in *body*, is as remote from the nature of our *ideas*, as how any *body* should produce any *thought* in the *mind*. That it is so, if experience did not convince us, the consideration of the things themselves would never be able in the least to discover to us.

Reality of Knowledge.

203. In some of our *ideas* there are certain relations, habitudes, and connections, so visibly included in the nature of the *ideas* of themselves, that we cannot conceive them separable from them by any power whatsoever: in these only we are capable of certain and universal knowledge. Thus the *idea* of a *right-lined triangle*, necessarily carries with it an *equality of its angles to two right ones*. But the coherence and continuity of the parts of matter, the production of sensation in us of *colours* and *sounds*, &c. by impulse and motion, being such wherein we can discover no natural connection with any *ideas* we have, we cannot but ascribe them to the arbitrary will and good pleasure of the wise Architect.

204. The things that we observe constantly to proceed regularly, we may conclude to act by a law set them; but yet by a law that we know not; whereby, tho' causes work steadily, and effects constantly flow from them, yet their connections and dependencies being not discoverable in our *ideas*, we can have but an experimental knowledge of them.

205. The *third* cause of ignorance, is our *want of tracing those ideas we have* or may have, and finding out those intermediate *ideas* which may shew us what habitude of agreement or disagreement they may have one with another: and thus many are ignorant of *mathematical* truths, for want of application in inquiring, examining, and by due ways comparing those *ideas*.

206. Hitherto we have examined the *extent* of our knowledge in respect of the several sorts of beings that are: there is another *extent* of it, in respect of *universality*, which will also deserve to be considered; and in this regard our knowledge follows the nature of our *ideas*. If the *ideas* are *abstract*, whose agreement or disagreement we perceive, our knowledge is *universal*. For what is known of such general *ideas*, will be true of every particular thing in which that *essence*, that is, *abstract idea*, is to be found: and what is once known of such *ideas*, will be perpetually and for ever true. So that, as to all general knowledge, we must search and find it only in our own minds: and it is only the examining of our own *ideas* that furnishes us with that. Truths belonging to essences of things, (that is, to *abstract ideas*), are *eternal*, and are to be found out by the contemplation only of those essences, as the existence of things is to be known only from experience.

Sect. XXXII. *Of the Reality of our Knowledge.*

207. The reader by this time may be ready to object, If it be true, that all knowledge lies only in the perception of the agreement or disagreement of our own *ideas*, the visions of an *enthusiast*, and the reasonings of a *sober* man, will be equally certain: it is no matter how things are, so a man observe but the agreement of his own imaginations, and talk conformably; it is all truth, all certainty.

208. To this it is answered, That if our knowledge of our *ideas* should terminate in them, and reach no farther,

Reality of Knowledge. farther, when there is something farther intended, our most serious thoughts would be of little more use than the *reveries* of a crazy brain. But it is evident, that this way of *certainty*, by the knowledge of our own *ideas*, goes a little farther than bare imagination; and that all the certainty of general truths a man has, lies in nothing else but this knowledge of our *ideas*.

209. It is evident, that the mind knows not things immediately, but by the intervention of the *ideas* it has of them. Our knowledge therefore is *real*, only so far as there is a conformity between our *ideas* and the reality of things. But how shall we know when our *ideas* agree with things themselves? There are *two sorts* of *ideas*, that we may be assured agree with things: these are,

210. First, *Simple* ideas; which since the mind can by no means make to itself, must be the effect of things operating upon the mind in a natural way, and producing therein those perceptions, which, by the will of our Maker, they are ordained and adapted to. Hence it follows, that *simple ideas* are not fictions of our fancies, but the natural and regular productions of things without us, really operating upon us; which carry with them all the conformity our state requires, which is to represent things under those appearances they are fitted to produce in us. Thus the *idea* of *whiteness*, as it is in the mind, exactly answers that power which is in any body to produce it there. And this conformity between our *simple ideas*, and the existence of things, is sufficient for real knowledge.

211. Secondly, All our *complex ideas*, except those of substances, being *archetypes* of the mind's own making, and not referred to the existence of things as to their originals, cannot want any conformity necessary to real knowledge: for that which is not designed to represent any thing but itself, can never be capable of a wrong representation. Here the *ideas* themselves are considered as *archetypes*, and things no otherwise regarded than as they are conformable to them. Thus the mathematician considers the truth and properties belonging to a *rectangle* or *circle* only as they are *ideas* in his own mind, which possibly he never found existing mathematically, that is, precisely true: yet his knowledge is not only certain, but *real*; because real things are no farther concerned, nor intended to be meant by any such propositions, than as things really agree to those *archetypes* in his mind. It is true of the *idea* of a *triangle*, *that its three angles are equal to two right ones*: it is true also of a *triangle*, wherever it *exists*: what is true of those *figures* that have barely an *ideal* existence in his mind, will hold true of them also when they come to have a *real* existence in matter.

212. Hence it follows, that *moral* knowledge is as capable of *real certainty* as *mathematics*: For *certainty* being nothing but the perception of the agreement or disagreement of our *ideas*, and demonstration nothing but the perception of such agreement by the intervention of other *ideas*; our *moral ideas*, as well as *mathematical*, being *archetypes* themselves, and so adequate or complete *ideas*, all the agreement or disagreement we shall find in them will produce *real* knowledge, as well as in *mathematical figures*. That which is requisite to make our knowledge *certain*, is the clearness of our *ideas*; and that which is required to make it *real*, is, that they answer their *archetypes*. Of truth.

213. Thirdly, But the complex *ideas*, which we refer to *archetypes* without us, may differ from them, and so our knowledge about them may come short of being real; and such are our *ideas* of *substances*. These must be taken from something that does or has existed, and not be made up *ideas* arbitrarily put together without any real pattern. Herein, therefore, is founded the reality of our knowledge concerning *substances*, that all our complex *ideas* of them must be such, and such only, as are made up of such simple ones as have been discovered to coexist in nature. And our *ideas* being thus true, though not perhaps very exact copies, are the subjects of the *real* knowledge of them. Whatever *ideas* we have, the agreement we find they have with others will be knowledge. If those *ideas* be abstract, it will be *general* knowledge. But to make it *real* concerning *substances*, the *ideas* must be taken from the real existence of things. Wherever, therefore, we perceive the agreement or disagreement of our *ideas*, there is *certain knowledge*: and wherever we are sure those *ideas* agree with the reality of things, there is *certain real knowledge*.

Sect. XXXIII. *Of Truth in general.*

214. Truth, in the proper import of the word, signifies the joining or separating of signs, as the things signified by them do agree or disagree one with another. The joining or separating of signs, is what we call *propositions*; so that *truth* properly belongs only to *propositions*: whereof there are two sorts, *mental* and *verbal*; as there are *two* sorts of signs commonly made use of, *ideas* and *words*.

215. It is difficult to treat of *mental* propositions without *verbal*; because, in speaking of *mental*, we must make use of *words*, and then they become *verbal*. Again, men commonly in their thoughts and reasonings use *words* instead of *ideas*; especially if the subject of their meditation contains in it *complex ideas*. If we have occasion to form *mental* propositions about *white*, *black*, *circle*, &c. we can, and often do, frame in our minds the *ideas* themselves, without reflecting on the *names*: but when we would consider, or make propositions about the more *complex ideas*, as of a *man*, *vitriol*, *fortitude*, *glory*, &c. we usually put the *name* for the *idea*; because the *idea* these *names* stand for being for the most part confused, imperfect, and undetermined, we reflect on the *names* themselves, as being more clear, certain, and distinct, and readier to occur to our thoughts, than pure *ideas*; and so we make use of these *words* instead of the *ideas* themselves, even when we would meditate and reason within ourselves, and make tacit *mental propositions*.

216. We must then observe two sorts of *propositions* that we are capable of making: First, *Mental propositions*, wherein the *ideas* in our understandings are put together or separated by the mind perceiving or judging of their agreement or disagreement. Secondly, *Verbal propositions*; which are words put together or separated in affirmative or negative sentences: so that *proposition* consists in joining or separating signs; and *truth* consists in putting together or separating these signs, according as the things they stand for agree or disagree.

217.

Knowledge of Exiftence.

217. Truth, as well as knowledge, may well come under the diftinction of *verbal* and *real;* that being only *verbal truth,* wherein terms are joined according to the agreement or difagreement of the *ideas* they ftand for, without regarding whether our *ideas* are fuch as really have or are capable of having an exiftence in nature. But then it is they contain *real truth,* when thefe figns are joined as our *ideas* agree: and when our ideas are fuch as, we know, are capable of having an exiftence in nature; which in fubftances we cannot know, but by knowing that fuch have exifted. *Truth* is the marking down in words the agreement or difagreement of *ideas* as it is; *falfehood* is the marking down in words the agreement or difagreement of *ideas* otherwife than it is: and fo far as thefe *ideas,* thus marked by founds, agree to their *archetypes,* fo far only is the *truth real.* The knowledge of this *truth* confifts in knowing what *ideas* the words ftand for, and the perception of the agreement or difagreement of thofe *ideas* according as it is marked by thofe words.

218. Befides *truth* taken in the ftrict fenfe before mentioned, there are other forts of *truths:* As, firft, *Moral truth;* which is fpeaking of things according to the perfuafion of our own minds. Secondly, *Metaphyfical truth;* which is nothing but the real exiftence of things conformable to the *ideas* to which we have annexed their names.

219. Thefe confiderations of *truth* either having been before taken notice of, or not being much to our prefent purpofe, it may fuffice here only to have mentioned them.

Sect. XXXIV. *Of our Knowledge of Exiftence.*

220. Hitherto we have only confidered the *effences* of things; which being only *abftract ideas,* and thereby removed in our thoughts from particular exiftence, give us no knowledge of *exiftence* at all. We proceed now to inquire concerning our *knowledge of the exiftence* of things, and how we come by it.

221. We have the knowledge of our *own exiftence* by *intuition;* of *the exiftence of God,* by *demonftration;* and of *other things,* by *fenfation.* As for our *own exiftence,* we perceive it fo plainly, that it neither needs, nor is capable of any proof. *I think, I reafon, I feel pleafure and pain:* can any of thefe be more evident to me than my *own exiftence?* If I doubt of all other things, that very *doubt* makes me perceive my *own exiftence,* and will not fuffer me to doubt of that. If I know I doubt, I have as certain a perception of the *thing* doubting, as of that *thought* which I call *doubt.* Experience then convinces us, that we have an *intuitive knowledge of our own exiftence,* and an internal infallible perception that we *are.* In every act of fenfation, reafoning, or thinking, we are confcious to ourfelves of our own being; and in this matter come not fhort of the higheft degree of certainty.

Sect. XXXV. *Of our Knowledge of the Exiftence of a God.*

222. Though *God* has given us no *innate ideas* of himfelf, yet having furnifhed us with thofe faculties our minds are endowed with, he hath not *left himfelf without a witnefs,* fince we have fenfe, perception, and reafon, and cannot want a clear proof of him as long as we carry ourfelves about us. Nor can we juftly complain of our ignorance in this great point, fince he has fo plentifully provided us with means to difcover and know him, fo far as is neceffary to the end of our being, and the great concernment of our happinefs. But though this be the moft obvious truth that reafon difcovers, yet it requires thought and attention; and the mind muft apply itfelf to a regular deduction of it, from fome part of our *intuitive* knowledge; or elfe we fhall be as ignorant of this, as of other propofitions which are in themfelves capable of clear demonftration. To fhew, therefore, that we are capable of knowing, that is, *being certain,* that *there is a God,* and how we may come by this certainty, we need go no farther than ourfelves, and that undoubted knowledge we have of our own *exiftence.* It is beyond queftion, that *man has a clear perception of his own being:* He knows certainly that he exifts, and that he is fomething. In the next place, man knows by an *intuitive* certainty, that *bare nothing can no more produce any real being, than it can be equal to two right angles.* If therefore we know there is fome real being, it is an evident demonftration, that *from eternity there has been fomething;* fince what was not from eternity had a beginning, and what had a beginning muft be produced by fomething elfe. Next, it is evident, that *what has its being from another, muft alfo have all that which is in and belongs to its being from another too:* All the powers it has, muft be owing to, and received from, the fame fource. This eternal fource then of all being muft be alfo the fource and original of all power; and fo this *eternal being* muft be alfo the *moft powerful.*

Exiftence of a God.

223. Again, man finds in himfelf *perception* and *knowledge:* We are certain, then, that there is not only fome being, but fome knowing intelligent being in the world. There was a time, then, when there was no knowing being, or elfe there has been a knowing being from eternity. If it be faid, there was a time when that eternal being had no knowledge; the reply is, that then it is impoffible there fhould have ever been any knowledge; it being as impoffible that things wholly void of knowledge, and operating blindly and without any perception, fhould produce a knowing being, as it is that a triangle fhould make itfelf three angles bigger than two right ones.

224 This from the confideration of ourfelves, and what we infallibly find in our own conftitutions, our reafon leads us to the knowledge of this certain and evident truth, that *there is an eternal, moft powerful and knowing being;* and from this *idea* duly confidered, will eafily be deduced all thofe other *attributes* we ought to afcribe to this *eternal being.*

225. From what has been faid, it is plain, we have a more certain knowledge of the exiftence of a *God* than of any thing our fenfes have not immediately difcovered to us; nay, that we more certainly know that there is a *God,* than that there is any thing elfe without us.

226. It being then unavoidable for all rational creatures to conclude, that *fomething has exifted from eternity;* let us next fee what *kind of thing* that muft be. There are but two forts of beings in the world, that man knows or conceives. Firft, Such as are purely material, without fenfe or preception, as the clippings of our beards, and parings of our nails.

Secondly,

Existence of a God.

Secondly, Sensible perceiving beings; such as we find ourselves to be. These two sorts we shall hereafter call *cogitative* and *incogitative* beings; which to our present purpose are better than *material* and *immaterial*.

228. If then there must be something *eternal*, it is very obvious to reason, that it must necessarily be a *cogitative* being; because it is as impossible to conceive that ever bare *incogitative* matter should produce a *thinking* intelligent being, as that nothing should of itself produce matter. Let us suppose any parcel of matter *eternal*, we shall find it in itself unable to produce any thing. Let us suppose its parts firmly at rest together: If there were no other being in the world, must it not eternally remain so, a dead unactive lump? Is it possible to conceive it can add motion to itself, or produce any? *Matter* then by its own strength cannot produce in itself so much as *motion*. The motion it has must also be from eternity, or else added to matter by some other being more powerful than matter. But let us suppose motion eternal too; yet matter, *incogitative* matter and motion, could never produce *thought*. *Knowledge* will still be as far beyond the *power* of *motion* and *matter* to produce, as matter is beyond the power of nothing to produce. Divide *matter* into as minute parts as you will, vary the figure and motion of it as much as you please, it will operate no otherwise upon other bodies of proportionable bulk than it did before this division. The minutest particles of matter knock, impel, and resist one another, just as the greater do; and that is all they can do. So that if we will suppose *nothing eternal*, *matter can never begin to be:* If we suppose *bare matter* without motion *eternal*, *motion can never begin to be:* If we suppose only matter and motion *eternal*, *thought can never begin to be:* For it is impossible to conceive that matter, either with or without motion, could have originally, in and from itself, sense, perception, and knowledge; as is evident from hence, that then sense, perception, and knowledge, must be a property eternally inseparable from matter and every particle of it. Since, therefore, whatsoever is the first eternal being, must necessarily be *cogitative;* and whatsoever is first of all things, must necessarily contain in it, and actually have, at least all the perfections that can ever after exist; it necessarily follows, that the *first eternal being cannot be matter*.

229. If therefore it be evident that something necessarily must exist from eternity, it is also evident that that *something must necessarily be a cogitative being:* For it is as impossible that *incogitative matter* should produce a *cogitative being*, as that nothing, or the negation of all being, should produce a positive being or matter.

230. This discovery of the necessary existence of an Eternal Mind, does sufficiently lead us into the knowledge of God. For it will hence follow, that all other knowing beings that have a beginning must depend on him, and have no other ways of knowledge or extent of power than what he gives them; and therefore if he made those, he made also the less excellent pieces of this universe, all *inanimate bodies*, whereby his *omniscience*, *power*, and *providence*, will be established; and from thence all his other attributes necessarily follow.

Sect. XXXVI. *Of our Knowledge of the Existence of other Things.*

Knowledge of other Existences.

231. The knowledge of our own being we have by *intuition:* The existence of a God, *reason* clearly makes known to us. The *knowledge of the existence* of any other thing, we can have only by *sensation:* For there being no necessary connection *of real existence* with any idea a man hath in his memory; nor of any other existence, but that of God, with the existence of any particular man; no particular man can know the existence of any other being, but only when, by actually operating upon him, it makes itself be perceived by by him. The having the idea of any thing in our mind, no more proves the existence of that thing, than the picture of a man evidences his being in the world, or the visions of a dream make thereby a true history. It is therefore the actual receiving of ideas from without, that gives us notice of the existence of other things, and makes us know that something doth exist at that time without us, which causes that idea in us, though perhaps we neither know nor consider how it does it; for it takes not from the *certainty* of our senses, and the ideas we receive by them, that we know not the manner wherein they are produced. This notice we have by our senses of the existing of things without us, though it be not altogether so certain as *intuition* and *demonstration*, deserves the name of *knowledge*, if we persuade ourselves that our faculties act and inform us right concerning the existence of those objects that affect them. But besides the assurance we have from our senses themselves, that they do not err in the information they give us of the existence of things without us, we have other concurrent reasons: As, 1. It is plain those perceptions are produced in us by exterior causes affecting our senses, because those that want the *organs* of any *sense* never can have the *ideas* belonging to that sense prodouced in their minds. This is too evident to be doubted; and therefore we cannot but be assured, that they come in by the organs of that sense, and no other way.

Secondly, Because we find sometimes that we cannot avoid the having those *ideas* produced in our minds. When my eyes are shut, I can with pleasure recall to my mind the *ideas* of *light* or the *sun*, which former sensations had lodged in my memory: But if I turn my eyes towards the *sun*, I cannot avoid the *ideas* which the *light* or the *sun* then produces in me. Which shews a manifest difference between those *ideas* laid up in the memory, and such as force themselves upon us and we cannot avoid having. And therefore it must needs be some *exterior* cause, whose efficacy I cannot resist, that produces those *ideas* in my mind whether I will or no.

233. Besides, there is nobody who doth not perceive the difference in himself, between actually looking upon the *sun*, and contemplating the *idea* he has of it in his memory; and therefore he hath certain knowledge, that they are not both memory or fancy, but that actual seeing has a cause without.

234. Thirdly, add to this, that many *ideas* are produced in us with pain, which we afterwards remember without the least offence. Thus the pain of *heat* or *cold*, when the *idea* of it is received in our minds, gives us

Existence. us no disturbance, which, when felt, was very troublesome; and we remember the pain of *hunger*, *thirst*, *head-ach*, &c. without any pain at all, which would either never disturb us, or else constantly do it as often as we thought of it, were there nothing more but *ideas* floating in our minds, and appearances entertaining our fancies, without the real existence of things affecting us from abroad.

235. *Fourthly*, Our *senses* in many cases bear witness to the truth of each other's report concerning the existence of sensible things without us: he that doubts when he sees a *fire*, whether it be *real*, may, if he please, feel it too; and by the exquisite pain he will be convinced, that it is not a bare *idea* or *phantom*.

236. If, after all this, any one will be so *sceptical* as to distrust his senses, and to question the existence of all things, or our knowledge of any thing, let him consider that the certainty of things existing *in rerum natura*, when we have the testimony of our senses for it, is not only as great as our frame can attain to, but as our condition needs. For our *faculties* being not suited to the full extent of being, nor a clear comprehensive knowledge of all things, but to the preservation of us in whom they are, and accommodated to the use of life; they serve our purpose well enough, if they will but give us certain notice of those things that are convenient or inconvenient to us. For he that sees a *candle* burning, and has experimented the force of the flame by putting his finger in it, will little doubt that this is something existing without him which does him harm and puts him to pain: which is assurance enough; when no man requires greater certainty to govern his actions by, than what is as certain as his actions themselves. So that this evidence is as great as we can desire, being as certain to us as our pleasure or pain, that is, *happiness* or *misery;* beyond which we have no concernment either of knowing or being.

237. In fine, when our *senses* do actually convey into our understandings any *idea*, we are assured that there is something at that time *really existing* without us. But this knowledge extends only as far as the present testimony of our senses, employed about particular objects that do then affect them, and no farther. My seeing a *man* a minute since, is no certain argument of his present existence.

238. As when our *senses* are actually employed about any object, we know that it does exist; so by our memory we may be assured, that heretofore things that affected our *senses have existed:* And thus we have the knowledge of the past existence of several things, whereof our senses having informed us, our memories still retain the *ideas;* and of this we are past all doubt, so long as we remember well.

239. As to the *existence* of *spirits*, our having *ideas* of them does not make us know that any such things do exist without us, or that there are any *finite spirits*, or any other *spiritual beings* but the *eternal God*. We have ground from *revelation*, and several other reasons, to believe with assurance, that there are such creatures: But our senses not being able to discover them, we want the means of knowing their particular existence; for we can no more know that there are *finite spirits* really existing, by the *ideas* we have of such beings, than by the *ideas* any one has of *fairies*, or *centaurs*, he can come to know, that things answering those *ideas* do really exist. Judgment.

240. Hence we may gather, that there are *two sorts* of propositions: *One* concerning the existence of any thing answerable to such an *idea*, as that of an *elephant*, *phœnix*, *motion*, or *angel*, *viz.* whether such a thing does any where exist: And this knowledge is only of *particulars*, and not to be had of any thing without us, but only of *God*, any other way than by our *senses*.

241. *Another sort* of proposition is, wherein is expressed the agreement or disagreement of our *abstract ideas*, and their dependence one on another. And these may be *universal* and certain: so having the *idea* of *God* and my *self*, of *fear* and *obedience*, I cannot but be sure that *God is to be feared and obeyed by me:* and this proposition will be certain concerning *man* in general, if I have made an *abstract idea* of such a *species*, whereof I am one particular. But such a proposition, how certain soever, proves not to me the existence of men in the world; but will be true of all such creatures, whenever they do exist: which *certainty* of such general propositions depends on the agreement or disagreement discoverable in those *abstract ideas*. In the former case, our knowledge is the consequence of the *existence of things* producing *ideas* in our minds by our senses: in the latter, the consequences of the *ideas* that *are in our minds*, and producing these general propositions, many whereof are called *eternæ veritates:* and all of them indeed are so; not from being written all or any of them in the minds of all men, or that they were any of them propositions in any one's mind, till he, having got the *abstract ideas*, joined or separated them by affirmation or negation; but wheresoever we can suppose such a creature as *man* is, endowed with such faculties, and thereby furnished with such *ideas* as we have, we must conclude he must needs, when he applies his thoughts to the consideration of his *ideas*, know the truth of certain propositions that will arise from the agreement or disagreement he will perceive in his own *ideas*. Such propositions being once made about *abstract ideas*, so as to be true, they will, whenever they can be supposed to be made again, at any time past, or to come, by a mind having those *ideas*, always be true: for names being supposed to stand perpetually for the same *ideas*, and the same *ideas* having immutably the same habitudes one to another, propositions concerning any *abstract ideas* that are once true must needs be *eternal verities*.

Sect. XXXVII. *Of Judgment.*

242. The *understanding faculties* being given to man, not barely for speculation, but also for the conduct of his life, a man would be at a great loss, if he had nothing to direct him but what has the certainty of true knowledge. He that will not *eat* till he has demonstration that it will nourish him, nor *stir* till he is infallibly assured of success in his business, will have little else to do but *sit still, and perish*.

243. Therefore as *God* hath set some things in broad *day-light;* as he has given us some certain knowledge, though limited to a few things in comparison,

Probability. (probably as a taste of what *intellectual* creatures are capable of, to excite in us a desire and endeavour after a better state;) so, in the greatest part of our concernment, he has afforded us only the *twilight* of *probability*, suitable to that state of *mediocrity* and *probationership* he has been pleased to place us in here.

244. The faculty which *God* has given *man* to enlighten him, next to certain knowledge, is *judgment*; whereby the mind takes its *ideas* to agree or disagree, without perceiving a demonstrative evidence in the proofs. The mind exercises this judgment sometimes out of *necessity*, where demonstrative proofs and certain knowledge are not to be had; and sometimes out of *laziness*, unskilfulness, or haste, even where they are to be had.

245. This faculty of the mind, when it is exercised immediately about things, is called *judgment*: when about truths delivered in words, is most commonly called *assent* or *dissent*. Thus the mind has *two faculties* conversant about truth and falsehood: First, *Knowledge*; whereby it certainly perceives, and is undoubtedly satisfied of the agreement or disagreement of any ideas. Secondly, *Judgment*; which is the putting *ideas* together, or separating them from one another in the mind, when their certain agreement or disagreement is not *perceived*, but presumed to be so. And if it so unites or separates them as in reality things are, it is *right judgment*.

Sect. XXXVIII. *Of Probability.*

246. Probability is nothing but the appearance of the agreement or disagreement of two *ideas*, by the intervention of proofs, whose connection is not constant and immutable, or is not perceived to be so; but is or appears for the most part to be so; and is enough to induce the mind to judge the proposition to be *true* or *false*, rather than the contrary.

247. Of *probability* there are degrees, from the neighbourhood of *certainty* and *demonstration*, quite down to *improbability* and *unlikeliness*, even to the confines of *impossibility*: And also degrees of *assent*, from *certain knowledge*, and what is next it, *full assurance* and *confidence*, quite down to *conjecture*, *doubt*, *distrust*, and *disbelief*.

248. That proposition then is *probable*, for which there are arguments or proofs to make it pass or be received for *true*: The entertainment the mind gives to this sort of propositions, is called *belief*, *assent*, or *opinion*. *Probability* then being to supply the defect of our knowledge, is always conversant about propositions whereof we have no *certainty*, but only some *inducements* to receive them for true. The *grounds* of it are, in short, *these two* following.

First, The *conformity* of any thing with our own knowledge, experience, or observation.

Secondly, The *testimony* of others, vouching their observation and experience. In the *testimony* of others is to be considered, *First*, The number; *Secondly*, The integrity; *Thirdly*, The skill of the witnesses; *Fourthly*, The design of the author, if it be a testimony cited out of a book; *Fifthly*, The consistency of the parts and circumstances of the relation; *Sixthly*, Contrary testimonies.

249. The mind, before it rationally *assents* or *dissents* to any probable proposition, ought to examine all the grounds of *probability*, and see how they make, more or less, for or against it; and upon a due balancing of the whole, reject or receive it, with a more or less firm *assent*, according to the preponderancy of the greater *grounds* of *probability* on one side or the other.

Sect. XXXIX. *Of the Degrees of Assent.*

Degrees of Assent.

250. The *grounds of probability*, laid down in the foregoing section, as they are the foundations on which our *assent* is built, so are they also the measure whereby its several *degrees* are (or ought to be) regulated. Only we are to take notice, that no grounds of probability operate any farther on the mind, which searches after truth, and endeavours to judge right, than they appear, at least, in the first judgment or search that the mind makes. It is indeed in many cases impossible, and in most very hard, even for those who have admirable memories, to retain all the proofs which, upon a due examination, made them embrace that side of the question. If suffices that they have once, with care and fairness, sifted the matter as far as they could; and having once found on which side the *probability* appeared to them, they lay up the conclusion in their memories, as a *truth* they have discovered; and for the future remain satisfied with the testimony of their memories, that this is the opinion, that, by the proofs they have once seen of it, deserves such a *degree* of their *assent* as they afford it.

251. It is unavoidable then that the memory be relied on in this case, and that men be persuaded of several *opinions*, whereof the proofs are not actually in their thoughts, nay, which perhaps they are not able actually to recall: without this the greatest part of men must be either *sceptics*, or change every moment, when any one offers them arguments which, for want of memory, they are not presently able to answer.

252. It must be owned, that mens sticking to past judgments, is often the cause of great *obstinacy* in error and mistake. But the fault is not that they rely on their memories for what they have before well judged, but because they judged before they had well examined. Who almost is there that hath the leisure, patience, and means, to collect together all the proofs concerning most of the opinions he has, so as safely to conclude, that he has a clear and full view, and that there is no more to be alleged for his better information? And yet we are forced to determine ourselves on one side or other: the conduct of our lives, and the management of our great concerns, will not bear delay: For those depend, for the most part, on the determination of our judgment in points wherein we are not capable of certain knowledge, and in where it is necessary for us to embrace one side or the other.

253. The propositions we receive upon inducements of *probability are of two sorts*: *First*, Concerning some particular existence, or matter of *fact*, which falling under our observation, is capable of *human testimony*: *Secondly*, Concerning things which, being beyond the discovery of our *senses*, are not capable of human testimony.

Concerning the first of these, *viz. Particular matter of fact.*

254. *First*, Where any particular thing consonant to the constant observation of ourselves, and others, in the like case, comes attested with the concurrent reports

Degrees of Assent.

ports of all that mention it, we receive it as easily, and build as firmly upon it, as if it were certain knowledge. Thus, if all *Englishmen*, who have occasion to mention it, should report, that it *froze* in England last winter, or the like, a man would as little doubt of it, as that *seven and four are eleven*.

255. The *first* and *highest* degree of *probability* then is, when the general consent of all men, in all ages, as far as can be known, concurs with a man's own constant experience in the like cases, to confirm the truth of any particular matter of fact, attested by fair witnesses. Such are the stated *constitutions* and *properties* of bodies, and the regular proceedings of *causes* and *effects* in the ordinary course of *nature*. This we call an *argument* from the nature of things themselves: For what we and others always observe to be after the same manner, we conclude with reason to be the effects of steady and regular *causes*, though they come not within the reach of our knowledge; as that fire warmed a man, or made *lead fluid;* that *iron* sunk in water, or swam in quicksilver. A relation affirming any such thing to have been, or a predication that it will happen again in the same manner, is received without doubt or hesitation; and our *belief* thus grounded, rises to *assurance*.

256. *Secondly*, The next degree of *probability*, is when by my own experience, and the agreement of all others that mention it, a *thing* is found to be for the most part so; and that the particular instance of it is attested by many and undoubted *witnesses*. Thus *history* giving us such an account of men in all ages, and my own experience confirming it, that most men prefer their own private advantage to the public; if all historians that write of *Tiberius*, say that he did so, it is extremely probable: And in this case, our *assent* rises to a degree which we may call *confidence*.

257. *Thirdly*, In matters happening indifferently, as that a *bird* should fly this or that way; when any particular matter of fact comes attested by the concurrent testimony of unsuspected *witnesses*, there our *assent* is also unavoidable. Thus, that there is in *Italy* such a city as *Rome;* that about one thousand and eight hundred years ago there lived such a man in it as *Julius Cæsar*, &c. a man can as little doubt of this, and the like, as he does of the being and actions of his own acquaintance, whereof he himself is a witness.

258. *Probability*, on these grounds, carries so much evidence with it, that it leaves us as little liberty to believe or disbelieve, as demonstration does, whether we will know or be ignorant. But the difficulty is, when testimonies contradict common experience, and the reports of witnesses clash with the ordinary course of nature, or with one another; here diligence, attention, and exactness, is required to form a *right judgment*, and to proportion the *assent* to the evidence and *probability* of the thing, which rises and falls according as the two foundations of credibility favour or contradict it. These are liable to such variety of contrary observations, circumstances, reports, tempers, designs, oversight, &c. of reporters, that it is impossible to reduce to precise rules the various degrees wherein men give their *assent*. This in general may be said, that as the *proofs*, upon due examination, shall to any one appear in a greater or less degree to preponderate on either side, so they are fitted to produce in the mind such different entertainments, as are called *belief*, *conjecture*, *guess*, *doubt*, *wavering*, *distrust*, *disbelief*, &c.

Degrees of Assent.

259. It is a *rule* generally approved, that any testimony, the farther off it is removed from the original truth, the less force it has: and in *traditional* truths, each remove weakens the force of the *proof*. There is a *rule* quite contrary to this, advanced by some men, who look on *opinions* to gain force by growing *older*. Upon this ground, propositions evidently false or doubtful in their first beginning, come by an inverted *rule* of *probability* to pass for *authentic* truths; and those which deserved little credit from the mouths of their first relators, are thought to grow *venerable* by age, and are urged as undeniable.

260. But certain it is, that no *probability can rise above its first original*. What has no other evidence than the single testimony of *one witness*, must stand or fall by his *only* testimony, though afterwards cited by hundreds of others; and is so far from receiving any strength thereby, that it becomes the weaker; because passion, interest, inadvertency, mistake of his meaning, and a thousand odd reasons, which capricious mens minds are acted by, may make one man quote another's words or meaning wrong. This is certain, that what in one age was affirmed upon slight grounds, can never after come to be more valid in future ages by being often repeated.

261. *The second sort of probability*, is concerning things not falling under the reach of our senses, and therefore not capable of testimony: and such are,

262. (1.) The existence, nature, and operations of *finite immaterial* beings without us, as *spirits*, *angels*, &c. or the existence of *material* beings, such as, for their smallness or remoteness, our *senses* cannot take notice of; as whether there be any *plants*, *animals*, &c. in the *planets*, and other mansions of the vast universe.

263. (2.) Concerning the manner of operation in most parts of the works of *nature;* wherein though we see the sensible *effects*, yet their causes are unknown, and we perceive not the ways and manner how they are produced. We see *animals* are generated, nourished, and move; the *loadstone* draws *iron*, &c. But the causes that operate, and the manner they are produced, we can only guess, and probably conjecture. In these matters *analogy* is the only help we have; and it is from that alone we draw all our grounds of *probability*. Thus observing, that the bare rubbing of two bodies violently upon one another, produces *heat*, and very often *fire*, we have reason to think, that what we call *heat* and *fire* consists in a certain violent agitation of the imperceptible minute parts of the burning matter.

This sort of *probability*, which is the best conduct of rational experiments, and the rise of *hypotheses*, has also its use and influence. And a wary reasoning from *analogy* leads us often into the discovery of *truths* and useful *deductions*, which would otherwise lie concealed.

264. Though the common experience, and the ordinary course of things, have a mighty influence on the minds of men, to make them give or refuse credit to any thing proposed to their belief; yet there is one case wherein the strangeness of the fact lessens not the *assent* to a fair testimony given of it. For where such supernatural *events* are suitable to ends aimed at by

Reafon. Him who has the power to change the courfe of nature, there, under fuch circumftances, they may be the fitter to procure belief, by how much the more they are beyond or contrary to ordinary obfervation. This is the proper cafe of *miracles;* which, well attefted, do not only find credit themfelves, but give it alfo to other *truths.*

265. There are propofitions that challenge the higheft degree of our *affent* upon bare teftimony, whether the thing propofed agree or difagree with common experience and the ordinary courfe of things or no: the reafon whereof is, becaufe the teftimony is of fuch *an one* as cannot deceive nor be deceived; and that is *God* himfelf. This carries with it certainty beyond doubt, evidence beyond exception. This is called by a peculiar name, *revelation*, and our *affent* to it, *faith*, which has as much certainty in it as our knowledge itfelf; and we may as well doubt of our own *being*, as we can whether any *revelation* from *God* be *true*. So that *faith* is a fettled and fure principle of *affent* and *affurance*, and leaves no manner of room for doubt or hefitation; only we muft be fure, that it be a divine *revelation*, and that we underftand it right, elfe we fhall expofe ourfelves to all the extravagancy of *enthufiafm*, and all the error of wrong principles, if we have *faith* and *affurance* in what is not *divine revelation.*

Sect. XL. *Of Reafon.*

266. The word *reafon*, in *Englifh*, has different fignifications. Sometimes it is taken for *true* and *clear principles;* fometimes for *clear* and *fair deductions* from thofe principles; fometimes for the *caufe*, and particularly for the *final caufe:* but the confideration we fhall have of it here, is as it ftands for a *faculty* whereby *man* is fuppofed to be diftinguifhed from *beafts*, and wherein it is evident he much furpaffes them.

267. Reafon is neceffary, both for the enlargement of our knowledge and regulating our affent; for it hath to do both in knowledge and opinion, and is neceffary and affifting to all our other intellectual faculties; and indeed contains *two* of them, *viz.* firft, *Sagacity*, whereby it finds intermediate *ideas;* fecondly, *Illation*, whereby it fo orders and difpofes of them, as to difcover what connection there is in each link of the chain, whereby the extremes are held together, and thereby, as it were, to draw into view the truth fought for; which is that we call *illation*, or *inference*, and confifts in nothing but the perception of the connection there is between the *ideas* in each ftep of the deduction; whereby the mind comes to fee either the certain agreement or difagreement of any two *ideas*, as in *demonftration*, in which it arrives at knowledge; or their probable connection, on which it gives or withholds its *affent*, as in *opinion.*

268. *Senfe* and *intuition* reach but a little way: the greateft part of our knowledge depends upon deductions and intermediate *ideas*. In thofe cafes where we muft take propofitions for true, without being certain of their being fo, we have need to find out, examine, and compare the grounds of their probability: in both cafes, the faculty which finds out the means, and rightly applies them to difcover certainty in the one, and probability in the other, is that which we call *reafon:* fo that in reafon we may confider thefe *four* degrees; *Firft*, The difcovering and finding out of proofs. *Secondly*, The regular and methodical difpofition of them, and laying them in fuch order as their connection may be plainly perceived. *Thirdly*, The perceiving their connection. *Fourthly*, The making a right conclufion. Reafon.

269. There is one thing more which deferves to be confidered concerning *reafon;* and that is, whether *fyllogifm*, as is generally thought, be the proper inftrument of it, and the ufefulleft way of exercifing this faculty. The caufes to doubt of it, are thefe:

270. *Firft*, Becaufe *fyllogifm* ferves our *reafon* but in one only of the forementioned parts of it; and that is, to fhew the connection of the proofs of any one inftance, and no more: but in this it is of no great ufe, fince the mind can perceive fuch connection, where it really is, as eafily, nay perhaps better, without it. We may obferve, that there are many men that reafon exceeding clear and rightly, who know not how to make a *fyllogifm;* and fcarce any one make *fyllogifms* in reafoning within himfelf. Indeed, fometimes they may ferve to difcover a fallacy, hid in a *rhetorical* flourifh; or, by ftripping an abfurdity of the cover of wit and good language, fhew it in its naked deformity: but the weaknefs or fallacy of fuch a loofe difcourfe it fhews, by the artificial form it is put into, only to thofe who have thoroughly ftudied *mode* and *figure*, and have fo examined the many ways that three propofitions may be put together, as to know which of them does certainly conclude right, and which not, and upon what grounds it is that they do fo: but they who have not fo far looked into thofe forms, are not fure, by virtue of *fyllogifm*, that the conclufion certainly follows from the premiffes; the mind is not taught to reafon by thefe *rules;* it has a native faculty to perceive the coherence or incoherence of its *ideas*, and can range them right without any fuch perplexing *repetitions.*

271. And to fhew the weaknefs of an argument, there needs no more but to ftrip it of the fuperfluous *ideas*, which, blended and confounded with thofe on which the inference depends, feem to fhew a connection where there is none, or at leaft do hinder the difcovery of the want of it; and then to lay the naked *ideas*, on which the force of the argumentation depends, in their due order; in which pofition the mind, taking a view of them, fees what connection they have, and fo is able to judge of the inference without any need of fyllogifm at all.

272. *Secondly*, Becaufe fyllogifms are not lefs liable to fallacies than the plainer ways of argumentation. And for this we appeal to common obfervation, which has always found thefe artificial methods of reafoning more adapted to catch and entangle the mind, than to inftruct and inform the underftanding. And if it be certain that fallacy can be couched in fyllogifms, as it cannot be denied, it muft be fomething elfe, and not fyllogifm, that muft difcover them: but if men fkilled in and ufed to fyllogifms, find them affifting to their reafon in the difcovery of truth, we think they ought to make ufe of them. All that we aim at is, that they fhould not afcribe more to thefe forms than belongs to them; and think that men have no ufe, or not fo full a ufe, of their reafoning faculty without them.

273. But however it be in knowledge, it is of far lefs, or no ufe at all in *probabilities:* for the *affent* there being to be determined by the preponderancy, after a due weighing of all the proofs on both fides, nothing

is

Reason. is so unfit to assist the mind in that as *syllogism;* which running away with one assumed *probability*, pursues that till it has led the mind quite out of sight of the thing under consideration.

274. But let it help us (as perhaps may be said) *in convincing men of their errors or mistakes:* yet still it fails our reason in that part, which if not its highest perfection, is yet certainly its hardest task, and that which we most need its help in; and that is, the *finding out of proofs and making new discoveries*. This way of reasoning discovers no new proofs, but is the art of marshalling and ranging the old ones we have already. A man knows first, and then he is able to prove *syllogistically;* so that *syllogism* comes after knowledge; and then a man has little or no need of it. But it is chiefly by the finding out those *ideas* that shew the connection of distant ones, that our stock of knowledge is increased, and that useful arts and sciences are advanced.

275. *Reason*, though of a very large extent, fails us in several instances; as, *first*, Where our ideas fail. *Secondly*, It is often at a loss, because of the obscurity, confusion, or imperfection of the *ideas* it is employed about. Thus having no perfect *idea* of the least extension of *matter*, or of *infinity*, we are at a loss about the divisibility of *matter*. *Thirdly*, Our *reason* is often at a stand, because it perceives not those *ideas* which would serve to shew the certain or probable agreement or disagreement of any two other *ideas*. *Fourthly*, Our *reason* is often engaged in absurdities and difficulties, by proceeding upon false principles, which being followed lead men into contradictions to themselves, and inconsistency in their own thoughts. *Fifthly*, Dubious words, and uncertain signs, often puzzle mens *reason*, and bring them to a nonplus.

276. Though the deducing one proposition from another be a great part of reason, and that which it is usually employed about; yet the principal act of ratiocination, is the finding the agreement or disagreement of two *ideas* one with another, by the intervention of a third; as a man, by a yard, finds two houses to be of the same length, which could not be brought together to measure their equality by *juxta-position:* words have their consequences as the signs of such *ideas:* and things agree or disagree, as really they are; but we observe it only by our *ideas*.

In reasoning, men ordinarily use *four* sorts of *arguments*.

277. The *first* is to allege the opinions of men, whose parts, learning, eminency, power, or some other cause, has gained a name, and settled their reputation in the common esteem with some kind of authority: this may be called *argumentum ad verecundiam*.

278. *Secondly*, Another way is, to require the adversary to admit what they allege as a proof, or to assign a better: this is called *argumentum ad ignorantiam*. Reason.

279. A *third* way, is to press a man with consequences drawn from his own principles or concessions: this is known under the name of *argumentum ad hominem*.

280. *Fourthly*, The using of proofs drawn from any of the foundations of knowledge or probability: this is called *argumentum ad judicium*. This alone, of all the four, brings true instruction with it, and advances us in our way to knowledge: for, first, It argues not another man's opinion to be right, because I, out of respect, or any other consideration but that of conviction, will not contradict him. Secondly, It proves not another man to be in the right way, nor that I ought to take the same with him, because I know not a better. Thirdly, Nor does it follow, that another man is in the right way, because he has shewn me that I am in the wrong: this may dispose me, perhaps, for the reception of truth, but helps me not to it; that must come from *proofs and arguments*, and light arising from the nature of things themselves; not from my shamefacedness, ignorance, or error.

281. By what has been said of *reason*, we may be able to make some guess at the distinction of things into those that are according to, above, and contrary to, *reason*. *According to reason*, are such propositions whose truth we can discover by examining and tracing those *ideas* we have from *sensation* and *reflection*, and by natural deduction find to be true or probable. *Above reason*, are such propositions, whose *truth* or *probability* we cannot by *reason* derive from those principles. *Contrary to reason*, are such propositions as are inconsistent with, or irreconcileable to, our clear and distinct *ideas*. Thus the *existence of one God*, is according to *reason;* the *existence of more than one God*, contrary to *reason;* the *resurrection of the body* after death, above *reason*. *Above reason*, may be also taken in a double sense, viz. *above probability*, or, *above certainty:* in that large sense also, *contrary to reason* is sometimes taken.

282. There is another use of the word *reason*, wherein it is opposed to *faith;* which, though authorised by common use, yet is in itself a very improper way of speaking: for *faith* is nothing but a firm *assent* of the mind; which, if it be regulated as is our duty, cannot be afforded to any thing but upon good *reason*, and so cannot be opposite to it: he that believes without having any reason for believing, may be in love with his own fancies; but neither seeks *truth* as he ought, nor pays the obedience due to his Maker, who would have him use those discerning faculties he has given him, to keep him out of mistake and error.

METAPLASMUS, in grammar, a transmutation or change made in a word, by adding, retrenching, or altering a syllable or letter thereof.

METAPONTUM, or METAPONTIUM, (anc. geog.), a town of Lucania, on the Sinus Tarentinus, to the west of Tarentum; built by the Pylians, who returned from Troy, (Mela). Where Pythagoras is said to have taught in the time of Servius Tullius, (Livy). *Metapontini*, the people; who pretended to shew, in a temple of Minerva, the tools with which Epeus built the wooden horse, (Justin). Now a tower, called *Torre di Mare*, in the Basilicata of Naples, (Baudrand).

METASTASIS, in medicine, a transposition, or settlement of some humour or disease on some other part; and sometimes it signifies such an alteration of a disease

disease as is succeeded by a solution.

METATARSUS, in anatomy. See there, n° 69.

METATHESIS, in grammar, a species of the metaplasmus; being a figure whereby the letters or syllables of a word are transposed, or shifted out of their usual situations, as *pistris* for *pristis*, *Lybia* for *Libya*, &c.

This word is, by physicians, used with respect to morbific causes; which, when they cannot be evacuated, are removed to places where they are less injurious.

METEMPSYCHOSIS, the doctrine of transmigration, which supposes, that human souls, upon their leaving the body, become the souls of such kind of brutes as they most resemble in their manners.

This was the doctrine of Pythagoras and his followers, who held, that the souls of vicious men were imprisoned in the bodies of miserable beasts, there to do penance for several ages, at the expiration whereof they returned again to animate men; but if they had lived virtuously, some happier brute, or even a human creature, was to be their lot. What led Pythagoras into this opinion was the persuasion he had that the soul was not of a perishable nature; whence he concluded, that it must move into some other body upon its abandoning this. Lucan thinks this doctrine was contrived to mitigate the apprehension of death, by persuading men that they only changed their lodgings, and ceased to live only to begin a new life. Reuchlin denies this doctrine, and maintains, that the metempsychosis of Pythagoras implied nothing more than a similitude of manners and desires formerly existing in some person deceased, and now reviving in another alive. Pythagoras is said to have borrowed the notion of a metempsychosis from the Egyptians; others say from the ancient brachmans. It is still retained among the ancient Banians, and other idolaters of India and China, and makes the principal foundation of their religion. Many of the modern Jews are said to espouse this doctrine; and, to support their opinion, quote these words of Job, "Lo all these things worketh God oftentimes with man (in Hebrew, *and thrice*) to bring back his soul from the pit to be enlightened with the light of the living." It is certain, that at the time of Jesus Christ this opinion was very common among the Jews: this appears in the gospel, when they say, that some thought Jesus Christ to be John the Baptist, others Elias, others Jeremiah, &c.

METEMPTOSIS, a term in chronology, expressing the solar equation, necessary to prevent the new moon from happening a day too late; by which it is opposed to proemptosis, which signifies the lunar equation necessary to prevent the new moon from happening a day too soon. The new moon's running a little backward, that is, coming a day too soon, at the end of three hundred twelve years and a half; by the proemptosis a day is added every three hundred years, and another every two thousand four hundred years. On the other hand, by the metemptosis, a bissextile is suppressed every one hundred and thirty-four years; that is, three times in four hundred years. These alterations are never made but at the end of each century; that period being very remarkable, and rendering the practice of the kalendar easy.

There are three rules for making this addition or suppression of the bissextile day, and by consequence for changing the index of the epacts. 1. When there is a metemptosis, the next following, or lower index, must be taken. 2. When there is a proemptosis without a metemptosis, the next preceding or superior index is to be taken. 3. When there are both a metemptosis and proemptosis, or when there is neither the one nor the other, the same index is preserved.

METEOR, (by the Greeks called μετεωρα, q. d. *sublima*, or "high raised;" by the Latins *impressiones*, as making signs or impressions in the air), commonly denotes any bodies in the air that are of a flux or transitory nature. Hence it is extended to the phenomena of hail, rain, snow, thunder, &c.; but is most commonly confined to those unusual and fiery appearances named *falling-stars*, *ignes fatui*, *auroræ boreales*, &c. whether they appear at a great distance from the earth or not. —Till the discovery of electricity these meteors could not be accounted for: but they are now resolved, by the almost universal consent of philosophers, into the action of that fluid; which, tho' unheeded, hath shewed itself in all ages.

A luminous appearance, which must have been of an electric nature, is mentioned by Plutarch in his life of Lysander; who considers it as a meteor. Pliny, in his second book of Natural History, calls those appearances *stars*; and tells us, that they settled not only upon the masts, and other parts of ships, but also upon mens heads. "Stars, says he, make their appearance, both on land and sea. I have seen a light in that form on the spears of soldiers keeping watch by night upon the ramparts. They are seen also on the sail-yards, and other parts of the ships, making an audible sound, and frequently changing their places. Two of these lights forebode good weather and a prosperous voyage; and drive away the single one, which wears a threatening aspect. This the sailors call *Helen*; but the two they call *Castor* and *Pollux*, and invoke them as gods. These lights do sometimes, about the evening, rest on mens heads, and are a great and good omen." Seneca, in his natural questions, chap. 1. takes notice of the same phenomenon. "A star (says he) settled on the lance of Gylippus, as he was sailing to Syracuse: and spears seemed to be on fire in the Roman camp." In Cæsar we find the same appearances attending a violent storm. "About that time, (says the author,) there was a very extraordinary appearance in the army of Cæsar. In the month of February, about the second watch of the night, there suddenly arose a thick cloud, followed by a shower of stones; and the same night, the points of the spears belonging to the fifth legion seemed to be on fire." Livy also mentions two similar facts. "The spears of some soldiers in Sicily, and a walking stick which a horseman in Sardinia was holding in his hand, seemed to be on fire. The shores were also luminous with frequent fires."

These appearances are called, both by the French and Spaniards inhabiting the coasts of the Mediterranean, *St Helme's* or *St Telme's fires*; by the Italians, the *fires of St Peter and St Nicholas*; and are frequently taken notice of by the writers of voyages. If some late accounts from France are to be depended upon, this phenomenon has been observed at Plauzet for time immemorial; and Mr Binon, the curate of the place, says, fays, that for 27 years, during which he refided there, in great ftorms accompanied with black clouds, and frequent lightning, the three-pointed extremities of the crofs of the fteeple of that place appeared furrounded with a body of flame; and that when this phenomenon has been feen, the ftorm was no longer to be dreaded, and calm weather returned foon after.

Modern hiftory furnifhes a great many examples of a fimilar kind; but the moft remarkable of thefe terreftrial meteors, if they may be fo called, is the *ignis fatuus*, or, in common Englifh, *Will with a wifp*, to which the credulous vulgar afcribe very extraordinary and efpecially mifchievous powers. This phenomenon is chiefly vifible in damp places, and is alfo faid to be very often feen in burying grounds, and near dunghills. Travellers fay, that it is very frequent near Bologna in Italy, and in feveral parts of Spain and Ethiopia. The form and fize of it are very various, and often variable.

It was the opinion of many philofophers, and efpecially Willoughby and Ray, that the ignis fatuus is made by fhining infects; but this opinion was never well fupported. Sir Ifaac Newton calls it *a vapour fhining without heat*, and fuppofes that there is the fame difference between this vapour and flame, that there is between wood fhining without heat, and burning coals of fire. That this opinion is juft, and, moreover, that the light of this vapour fhining without heat is of the fame nature with light from putrefcent fubftances, may, according to Dr Prieftley, be concluded from the following circumftances relating to them, as defcribed by Dr Derham, and G. B. Beccari.

The former of thefe gentlemen, having obferved an ignis fatuus in fome boggy ground, between two rocky hills, in a dark and calm night, got by degrees within two or three yards of it, and thereby had an opportunity of viewing it to the greateft advantage. It kept fkipping about a dead thiftle, till a flight motion of the air, occafioned, as he fuppofed, by his near approach to it, made it jump to another place; and as he advanced, it kept flying before him. He was fo near to it, that, had it been the fhining of glow-worms, he was fatisfied that he could not but have diftinguifhed the feparate lights of which it muft have confifted; whereas it was one uniform body of light. He therefore thought that it muft be an ignited vapour. Similar in fome refpects to this light, was one that furrounded the body and the bed of a woman at Milan, which fled from the hand that approached it, but was at length difperfed by the agitation of the air.

Mr Beccari made it his bufinefs to inquire concerning this phenomenon of all his acquaintance, who had had opportunities of obferving it, either on the mountains, or on the plain. He found that two which appeared on the plains, one to the north, and the other to the eaft of Bologna, were to be feen almoft every dark night, efpecially the latter; and the light they gave was equal to that of an ordinary faggot. That to the eaft of Bologna once appeared to a gentleman of his acquaintance, as he was travelling, and kept him company above a mile, conftantly moving before him, and cafting a ftronger light upon the road than the torch which was carried along with him. All thefe luminous appearances, he fays, gave light enough to make all the neighbouring objects vifible, and they were always obferved to be in motion, but this motion was various and uncertain. Sometimes they would rife up, and at other times fink; but they commonly kept hovering about fix feet from the ground. They would alfo difappear of a fudden, and inftantly appear again in fome other place. They differed both in fize and figure, fometimes fpreading pretty wide, and then again contracting themfelves; fometimes breaking into two, and then joining again; fometimes floating like waves, and dropping, as it were, fparks of fire. He was affured that there was not a dark night all the year round in which they did not appear, and that they were obferved more frequently when the ground was covered with fnow, than in the hotteft fummer; nor did rain or fnow in the leaft hinder their appearance; but, on the contrary, they were obferved more frequently, and caft a ftronger light in rainy and wet weather; nor were they much affected by the wind.

The grounds to the eaft of Bologna, where the largeft of thefe appearances was feen, is, he fays, a hard chalky and clayey foil, which will retain the water a long time, and afterwards, in hot weather, would break into large cracks; but on the mountains, where the *ignes fatui* were fmaller, the foil was of a loofe fandy texture, which would not keep the water very long. According to the beft information he could procure, thefe lights very much frequent brooks and rivers, being often obferved on the banks of them; perhaps, he fays, becaufe the current of air carries them thither more readily than to any other place.

This gentleman concludes his account of thefe appearances with the following curious narrative. An intelligent gentleman travelling in March, between eight and nine in the evening, in a mountainous road, about ten miles fouth of Bologna, perceived a light, which fhone very ftrongly upon fome ftones which lay on the banks of the river Rioverde. It feemed to be about two feet above the ftones, and not far from the water. In fize and figure it had the appearance of a parallelopiped, fomewhat more than a foot in length, and half a foot high, the longeft fide being parallel to the horizon. Its light was fo ftrong, that he could plainly diftinguifh by it part of a neighbouring hedge, and the water of the river; only in the eaft corner of it the light was rather faint, and the fquare figure lefs perfect, as if it was cut off or darkened by the fegment of a circle.

His curiofity tempting him to examine this appearance a little nearer, he advanced gently towards the place; but was furprifed to find that it changed gradually from a bright red, firft to a yellowifh, and then to a pale colour, in proportion as he drew nearer; and when he came to the place itfelf it quite vanifhed. Upon this he ftepped back, and not only faw it again, but found that the farther he went from it, the ftronger and brighter it grew. When he examined the place of this luminous appearance, he could not perceive the leaft fmell, or any other mark of fire.

This extraordinary account was confirmed to M. Beccari by another gentleman, who frequently travelled the fame road, and who affured him that he had feen the very fame light five or fix different times, in fpring and autumn, and that he had always obferved

it

it to be of the very fame fhape, and in the fame place; and he once took particular notice of its coming out of a neighbouring place, and fettling itfelf in the figure above defcribed.

M. Beccari owns himfelf to be greatly at a lofs to account not only for this very remarkable appearance, but alfo for the *ignes fatui* in general. He only fays, that all perfons who ever faw any of thefe appearances, agree, that they caft a light quite different from that of fhining flies.

Dr Shaw defcribes an ignis fatuus, which he faw in the Holy Land, the circumftances of which are very remarkable. As he and his company were travelling by night, through the valleys of mount Ephraim, they were attended, more than an hour, by an ignis fatuus, which was fometimes globular, or in the form of the flame of a candle; and which would, immediately afterwards, fpread itfelf fo much as to involve the whole company in a pale inoffenfive light, and then contract itfelf again, and fuddenly difappear. But in lefs than a minute it would become vifible as before; or, running along from one place to another, with a fwift progreffive motion, would expand itfelf, at certain intervals, over more than two or three acres of the adjacent mountains. The atmofphere, from the beginning of the evening, had been remarkably thick and hazy, and the dew, as they felt it upon their bridles, was unufually clammy and unctuous. In the fame kind of weather, he fays, he has obferved thofe luminous appearances, which, at fea, fkip about the mafts and yards of fhips, and which the failors call *corpufanfe*, which is a corruption of the Spanifh *cuerpo fanto*.

Of the *celeftial* meteors, the moft common are thofe called *falling-ftars*, which are fo well known, that it is needlefs to defcribe them. They do not very often appear of a larger fize than the brighteft fixed ftars, tho' fometimes they equal Jupiter, or even Venus in apparent bulk, and are then exceedingly bright. They fometimes rife high in the air; for Mr Brydone takes notice of his having feen them as high to appearance above the top of Mount Ætna, as they ufually appear when viewed from the ordinary ground. Sometimes, however, they are much lower. Signior Beccari mentions one which feemed to direct its courfe towards the place where he fat, growing continually larger and larger as it advanced, till at laft it difappeared at no great diftance, and left the faces, hands, and clothes, of thofe who faw it, and all the neighbouring objects, fuddenly illuminated with a diffufed and lambent light attended with no noife at all. While they were ftarting up, ftanding and looking at one another, furprifed at the appearance, a fervant came running to them out of a neighbouring garden, and afked them if they had feen nothing; for that he had feen a light fhine fuddenly in the garden, and efpecially upon the ftreams which he was throwing to water it.

The other kinds of celeftial meteors are, aurora borealis, lightning of various forms, and large fire-balls. All thefe too fometimes appear very high, and fometimes very low; the fire-balls efpecially, will fometimes ftrike the ground, and explode with great violence, producing many mifchievous effects. See Atmosphere, Aurora Borealis, Cloud, Lightning, &c.

The general principles on which the phenomena of meteors depend, have already been fo fully explained under the article Electricity, &c. that very little remains to be added in this place. The inoffenfive lights, fuch as appear on the points of metallic bodies, the ignis fatuus, &c. are occafioned by a current of electric matter fetting into or out of any particular body; for wherever that fluid is much agitated, there a light will be vifible. If at the fame time there is a confiderable difference between the electricity of the atmofphere and the furface of the ground, the electric ftream will be quietly imbibed, and no dangerous confequences will enfue to thofe who approach it; but if the electricity of the atmofphere and the ground happens to be much the fame, the fluid will then be much compreffed, will burn, explode, and produce all the mifchief of the forked or crooked lightning, or of that kind which appears in the form of balls, and which is fully explained under the article Lightning.

METHOD, the arrangement of our ideas in fuch a regular order, that their mutual connection and dependence may be readily comprehended. See Logic, n° 114.—118.

METHODISTS, a name at firft given to a fociety of religious young men at Oxford, and now applied to all thofe who adhere to the doctrine of the church of England as taught by Whitefield, Wefley, &c. They are faid to be, in general, plain well-meaning people, who do not diffent from the eftablifhed church, but profefs to live with great purity according to her articles. At their firft appearance their teachers were charged, in the heat of their zeal, with feveral irregularities, and many expreffions in their preaching which were not altogether unexceptionable: but as the civil government, with a moderation and wifdom peculiar to the prefent time, thought fit to overlook their behaviour, they have fince honeftly acknowledged wherein they were miftaken; and, in confequence of the perfect liberty of confcience they enjoy, have fubfided into a more regular and peaceable conduct, agreeable to the genuine fpirit of Chriftianity.

Methodists, *Methodici*, is alfo an appellation given to a fect of ancient phyficians, who reduced the whole healing art to a few common principles or appearances.

METHODIUS, a father of the church, bifhop of Olympus or Patara in Lycia, and afterward of Tyre in Paleftine, fuffered martyrdom at Chalcis in Greece toward the end of Dioclefian's perfecution in the year 302. He compofed many works in a clear and elaborate ftile, which were extant in Jerome's time. Father Combefis collected feveral confiderable fragments of this writer, cited by Epiphanius, Photius, and others; and printed them with notes of his own, together with the works of Amphilochius, and Andreas Cretenfis, in folio, Paris 1644.

METIUS (James), of Alcmaer, in Holland, the inventor of telefcopes with glaffes, one of which he prefented to the States General in 1609. Tubes extended, by uniting them, to a great length, were known to the ancients; but Metius was the firft who added glaffes, and he was indebted to chance for the difcovery: he had frequently obferved fome fchoolboys playing upon the ice, who made ufe of their copypy books rolled up in the ſhape of tubes, to look at each other, to which they ſometimes added pieces of ice at each end, to view diſtant objects: this led him to the invention of optic glaſſes.

METO, a famous mathematician of Athens, 432 B. C. publiſhed his *Anneadecatoride*, that is, his Cycle of Nineteen years, by which he endeavoured to adjuſt the courſe of the ſun to that of the moon, and to make the ſolar and lunar years begin at the ſame point of time. See Cycle *of the Moon*.

METONYMY, in rhetoric, is a trope in which one name is put for another, on account of the near relation there is between them. See Oratory, n° 51.

METOPE, in architecture, is the interval, or ſquare ſpace between the triglyphs of the Doric freeze, which among the ancients uſed to be painted or adorned with carved work, repreſenting the heads of oxen, or utenſils uſed in ſacrifices.

METOPOSCOPY, the pretended art of knowing a perſon's diſpoſitions and manners, by viewing the traces and lines in the face. Ciro Spontoni, who has wrote expreſsly on metopoſcopy, ſays, that ſeven lines are examined in the forehead, and that each line is conſidered as having its particular planet: the firſt is the line of Saturn, the ſecond of Jupiter, the third of Mars, &c. Metopoſcopy is only a branch of phyſiognomy, which founds its conjectures on all the parts of the body.

METRE, μετρια, in poetry, a ſyſtem of feet of a juſt length.

The different metres in poetry, are the different manners of ordering and combining the quantities, or the long and ſhort ſyllables: thus hexameter, pentameter, iambic, ſapphic verſes, &c. conſiſt of different metres, or meaſures. See Hexameter.

In Engliſh verſes, the metres are extremely various and arbitrary, every poet being at liberty to introduce any new form that he pleaſes. The moſt uſual are the heroic, generally conſiſting of five long and five ſhort ſyllables, and verſes of four feet, and of three feet, and a cæſura, or ſingle ſyllable.

The ancients, by variouſly combining and tranſpoſing their quantities, made a vaſt variety of different meaſures, by forming ſpondees, &c. of different feet. See Poetry, n° 124, &c.

METRODORUS, a Greek phyſician, born at Chios, was the diſciple of Democritus the philoſopher, and the maſter of Hippocrates the phyſician and Anaxarchus the philoſopher. He maintained, that the univerſe is infinite and eternal: but his works are loſt. He lived about 444 B. C.

METROPOLIS, the capital or principal city of a country or province.

The term *metropolis* is alſo applied to archiepiſcopal churches, and ſometimes to the principal or mother-church of a city. The Roman empire having been divided into 13 dioceſes and 120 provinces, each dioceſe and each province had its metropolis, or capital city, where the proconſul had his reſidence. To this civil diviſion, the eccleſiaſtical was afterwards adapted, and the biſhop of the capital city had the direction of affairs, and the preheminence over all the biſhops of the province. His reſidence in the metropolis gave him the title of *metropolitan*. This erection of metropolitans is referred to the end of the third century, and was confirmed by the council of Nice. A metropolitan has the privilege of ordaining his ſuffragans; and appeals from ſentences paſſed by the ſuffragans are preferred to the metropolitan.

METZ, an ancient, large, and ſtrong town of France, and capital of the territory of Meſſin, with a citadel, a parliament, and a biſhop's ſee, whoſe biſhop aſſumes the title of a *prince of the empire*. The cathedral church is one of the fineſt in Europe, and the ſquare called *Coſlin*, and the houſe of the governor, are worth ſeeing. The Jews live in a part of the town by themſelves, where they have a ſynagogue. The ſweetmeats they make here are in high eſteem. It is ſeated at the confluence of the rivers Moſelle and Seille. E. Long. 6. 16. N. Lat. 49. 7.

MEURSIUS (John), a learned and laborious writer, born at Loſdun, near the Hague, in 1579. He early diſcovered a fondneſs for polite literature and the ſciences; and went to ſtudy the law at Orleans with the ſon of Barneveldt, whom he accompanied in his travels. In 1610 he was made profeſſor of hiſtory at Leyden, and afterwards Greek profeſſor. His reputation daily increaſing, Chriſtian IV. king of Denmark made him profeſſor of hiſtory and politics, in the univerſity of Sora. Meurſius filled that chair with univerſal applauſe; and died in 1641, aged 62. He wrote many learned works, ſeveral of which relate to the ancient ſtate of Greece; as, 1. *De populis Atticæ*. 2. *Atticarum lectionum libri* vi. 3. *Archontes Athenienſes*. 4. *Fortuna Attica*. 5. *De Athenarum origine*. 6. *De feſtis Græcorum*, &c. John Meurſius, his ſon, was alſo the author of ſeveral works. It ſeems almoſt needleſs to obſerve, that the ſcandalous obſcene Latin work, intitled *Meurſius*, is not either of our author or his ſon; but, as is ſaid, the notable production of one John Weſtranus, a lawyer at the Hague.

MEW, Sea-mew, or *Sea-mall*. See Anas.

Winter-Mew, or *Coddy-moddy*, in ornithology. See Larus.

MEWING, the falling off or change of hair, feathers, ſkin, horns, or other parts of animals, which happens in ſome annually, in others only at certain ſtages of their lives: but the generality of beaſts mew in the ſpring. An old hart caſts his horns ſooner than a young one, which is commonly in the months of February and March, after which they begin to button in March or April: and as the ſun grows ſtrong, and the ſeaſon of the year puts forth the fruits of the earth, ſo their heads grow, and are ſummed full by the middle of June. It is to be obſerved, that if a hart be gelt before he has a head, he will never have any; and if he be gelt after he has a head, he will never caſt his horns; again, if he be gelt when he has a velvet-head, it will always be ſo, without fraying, or burniſhing.

MEXICO, otherwiſe called *New-Spain*; a large country of America, bounded on the north by New-Mexico, on the eaſt by the gulf of Mexico and the North Sea, and on the ſouth and weſt by South America and the South Sea; extending upwards of 2000 miles in length, and from 60 to 600 in breadth.

1 Conqueſt of Mexico undertaken by Cortes.

This country was firſt diſcovered, though imperfectly, by a Spaniard named *Nunez de Balboa*; but, in 1518, the conqueſt of it was undertaken by a celebrated adventurer named *Ferdinando Cortes*. It was not, how-

Mexico. however, without great difficulty that he got his expedition ſet on foot; being perſecuted by the Spaniſh governors in the Weſt Indies, ſo that he was at laſt obliged to throw off his allegiance to them, and proceed without any commiſſion. However, on the 10th of February 1519, he ſet ſail from the Havannah in Cuba; and ſoon landed on the iſland of Cozumel, on the coaſt of Yucatan, diſcovered the preceding year. Here he joined one of his officers named *Pedro d' Alvaredo*, who had arrived ſome days before, and collected ſome booty and taken a few priſoners. But the general ſeverely cenſured his conduct; and the priſoners were diſmiſſed, after they had been informed by an Indian interpreter named *Melchior*, that ſuch injuries were entirely diſagreeable to the intentions and wiſhes of Cortes. Here he muſtered his army, and found that it amounted to 508 ſoldiers, 16 horſemen, and 109 mechanics, pilots, and mariners. Having encouraged his men by a proper ſpeech, and releaſed, by means of ſome Indian ambaſſadors, a Spaniard named *Jerom de Aguilar*, who had been detained a priſoner for eight years, he proceeded to the river Tabaſco, where he hoped to be received in a friendly manner, as one Grijalva had been a ſhort time before; but, from ſome unknown cauſe, he was violently attacked by them: however, the ſuperiority of the Spaniſh arms ſoon decided the victory, and the inhabitants were obliged to own the king of Caſtile as their ſovereign.

2 Receives an embaſſy from the emperor of Mexico.

The Spaniards then continued their courſe weſtward, to the harbour of St Juan de Ullua; where they were met by two Mexican canoes, who carried two ambaſſadors from the emperor of that country, and ſhewed the greateſt ſigns of peace and amity. Their language was unknown to Aguilar; but one of the female ſlaves above-mentioned underſtood it, and tranſlated it into the Yucatan tongue; after which Aguilar interpreted the meaning in Spaniſh. This ſlave was afterwards named *Donna Marina*, and proved very uſeful in their conferences with the natives.

3 State of the empire at that time.

At this time the Mexican empire, according to Dr Robertſon, was arrived at a pitch of grandeur to which no ſociety had ever attained in ſo ſhort a period. Though it had ſubſiſted only for 130 years, its dominion extended from the north to ſouth ſea; over territories ſtretching about 500 leagues from eaſt to weſt, and more than 200 from north to ſouth; comprehending provinces not inferior in fertility, population, and opulence, to any in the torrid zone. The reigning emperor was called Montezuma, or *Motezuma*, whoſe authority was very deſpotic, and his temper haughty and cruel. Though by nature he poſſeſſed a good deal of courage and reſolution; yet from the firſt moment that the Spaniards appeared on his coaſt, he diſcovered ſymptoms of timidity and embarraſſment, and all his ſubjects were embarraſſed as well as himſelf. The general diſmay which took place on this occaſion was partly owing to the ſtrange figure the Spaniards made, and the prodigious power of their arms; but partly alſo to the following circumſtance. An opinion prevailed almoſt univerſally among the Americans, if we may believe the earlieſt and moſt authentic hiſtorians, that ſome dreadful calamity impended over their heads, from a race of formidable invaders who ſhould come from regions towards the riſing ſun, to over-run and deſolate their country. Whether this diſquieting apprehenſion flowed from the memory of ſome natural calamity which had afflicted that part of the globe, and impreſſed the minds of the inhabitants with ſuperſtitious fears and forebodings; or whether it was an imagination accidentally ſuggeſted by the aſtoniſhment which the firſt ſight of a race of new men occaſioned, it is impoſſible to determine. But as the Mexicans were more prone to ſuperſtition than any people in the new world, they were more deeply affected with the appearance of the Spaniards, whom they inſtantly ſuppoſed to be the inſtruments deſtined to bring about that fatal revolution which they dreaded: and this produced the embaſſy above-mentioned.

By means of his two interpreters, Donna Marina, and Aguilar, Cortes learned that the chiefs of the Mexican embaſſy were deputies from Pilpatoe and Teutile; the one governor of a province under the emperor, and the other the commander of all his forces in that province: the purport of their embaſſy was, to inquire what his intentions were in viſiting their coaſts, and to offer him what aſſiſtance he might need in order to continue his voyage. Cortes, in his turn, alſo profeſſed the greateſt friendſhip; and informed the ambaſſadors, that he came to propoſe matters of the utmoſt conſequence to the welfare of the prince and his kingdom; which he would more fully unfold in perſon to the governor and the general. Next morning, without waiting for any anſwer, he landed his troops, his horſes, and his artillery; began to erect huts for his men, and to fortify his camp. The natives, inſtead of oppoſing the entrance of theſe fatal gueſts into their country, aſſiſted them in all their operations, with an alacrity which they had ere long reaſon to repent.

4 Cortes lands and fortifies his camp.

The next day the ambaſſadors had a formal audience; at which Cortes acquainted them, that he came from Don Carlos of Auſtria, king of Caſtile, the greateſt monarch of the eaſt, and was intruſted with propoſitions of ſuch moment, that he would impart them to none but the emperor himſelf, and therefore required to be conducted immediately to the capital. This demand immediately produced the greateſt uneaſineſs; and the ambaſſadors did all in their power to diſſuade Cortes from his deſign, endeavouring to conciliate his good-will by the preſents ſent him by Montezuma. Theſe they introduced with great parade, and conſiſted of fine cotton-cloth, of plumes of various colours, and of ornaments of gold and ſilver to a conſiderable value, the workmanſhip of which appeared to be as curious as the materials were rich. But theſe preſents ſerved only to excite the avidity of the Spaniards, and to increaſe their deſire for becoming maſters of a country which abounded with ſo many precious commodities. Cortes indeed could ſcarcely reſtrain himſelf ſo far as to hear the arguments made uſe of by the ambaſſadors to diſſuade him from going to the capital; and, in a haughty, determined tone, inſiſted on his former demand of being admitted to a perſonal interview with their ſovereign.

5 The Indians endeavour to diſſuade him from going to the capital, but in vain.

During this converſation, ſome painters in the retinue of the Mexican chiefs had been diligently employed in delineating, upon white cotton cloths, figures of the ſhips, horſes, artillery, ſoldiers, and whatever elſe attracted their eyes as ſingular. When Cortes obſerved this, and was informed that theſe pictures were to be ſent to Montezuma, he reſolved to render the repreſentation ſtill more ſtriking and intereſting. The trumpets, by his orders, ſounded an alarm; the troops

Mexico. troops formed in order of battle, and ſhewed their agility and ſtrength in the beſt manner they could; while the artillery was pointed againſt the neighbouring trees, among which it made dreadful havock. The Indians for ſome time looked on with ſilent aſtoniſhment; but at the exploſion of the cannon, ſome fled, others fell to the ground, and all were ſo confounded, that Cortes found it difficult to quiet and compoſe their minds.

6 Montezuma made acquainted with his deſign.

When the painters had exerted their utmoſt efforts in repreſenting all theſe wonderful things, meſſengers were immediately diſpatched to Montezuma with the pictures, and a full account of every thing that had paſſed ſince the arrival of the Spaniards, together with ſome European curioſities to Montezuma; which, though of no great value, Cortes believed would be acceptable on account of their novelty. The Mexican monarchs, in order to obtain the earlieſt information of every occurrence in all parts of their empire, had couriers poſted at proper ſtations along the principal roads; and as theſe were trained to agility by a regular education, they conveyed intelligence with ſurpriſing rapidity. Though the city in which Montezuma reſided was above 180 miles from St Juan de Ullua, Cortes's preſents were carried thither, and an anſwer returned to his demands, in a few days.

7 Sends an unfavourable anſwer, but accompanied with rich preſents.

As the anſwer was unfavourable, Montezuma had endeavoured to mollify the Spaniſh general by the richneſs of his preſents. Theſe conſiſted of the manufactures of the country; cotton-ſtuffs ſo fine, and of ſuch delicate texture, as to reſemble ſilk; pictures of animals, trees, and other natural objects, formed with feathers of different colours, diſpoſed and mingled with ſuch ſkill and elegance as to rival the works of the pencil in truth and beauty of imitation. But what chiefly attracted their attention, were two large plates of a circular form; one of maſſive gold repreſenting the ſun, the other of ſilver repreſenting the moon. Theſe were accompanied with bracelets, collars, rings, and other trinkets of gold; and that nothing might be wanting which could give the Spaniards a complete idea of what the country afforded, ſome boxes filled with pearls, precious ſtones, and grains of gold unwrought, as they had been found in the mines or rivers, were ſent along with the reſt. Cortes received all with an appearance of the moſt profound reſpect for Montezuma; but when the Mexicans, preſuming upon this, informed him, that their maſter, though he deſired him to accept of what he had ſent as a token of his regard for the prince whom he repreſented, would not give his conſent that foreign troops ſhould approach nearer to his capital, or even allow them to continue longer in his dominions.

8 Cortes ſtill inſiſts on his demand.

Cortes declared, in a manner more reſolute and peremptory than formerly, that he muſt inſiſt on his firſt demand; as he could not, without diſhonour, return to his own ſovereign until he was admitted into the preſence of the prince whom he was appointed to viſit in his name. The Mexicans were aſtoniſhed at the ſight of a man who dared to oppoſe the will of their emperor; but not being willing to come to an open rupture with ſuch formidable enemies, with much ado they prevailed upon Cortes to promiſe that he would not move from his preſent camp until the return of a meſſenger whom they ſent to Montezuma for further inſtructions.

The puſillanimity of the Indian monarch afforded time to the Spaniards to take meaſures which would have been out of their power had they been vigorouſly attacked on their firſt refuſal to obey his orders. Cortes uſed every method of ſecuring the affections of the ſoldiers; which indeed was very neceſſary, as many of them began to exclaim againſt the raſhneſs of his attempt in leading them againſt the whole force of the Mexican empire.

9 Montezuma peremptorily commands him to leave his dominions.

In a ſhort time Teutile arrived with another preſent from Montezuma, and together with it delivered the ultimate orders of that monarch to depart inſtantly out of his dominions; and when Cortes, inſtead of complying with his demands, renewed his requeſt of audience, the Mexican immediately left the camp with ſtrong marks of ſurpriſe and reſentment. Next morning, none of the natives appeared; all friendly correſpondence ſeemed to be at an end, and hoſtilities were expected to commence every moment. A ſudden conſternation enſued among the Spaniards, and a party was formed againſt him by the adherents of Velaſques; who took advantage of the occaſion, and deputed one of their number, a principal officer, to remonſtrate, as if in name of the whole army, againſt his raſhneſs, and to urge the neceſſity of his returning to Cuba. Cortes received the meſſage without any appearance of emotion; and as he well knew the temper and wiſhes of his ſoldiery, and foreſaw how they would receive a propoſition ſo fatal to all the ſplendid hopes and ſchemes which they had been forming with ſuch complacency, he pretended to comply with the requeſt now made him, and iſſued orders that the army ſhould be in readineſs next day to embark for Cuba. Upon hearing this, the troops, as Cortes had expected, were quite outrageous: they poſitively refuſed to comply with theſe orders, and threatened immediately to chooſe another general if Cortes continued to inſiſt on their departure.

Our adventurer was highly pleaſed with the diſpoſition which now appeared among his troops: nevertheleſs, diſſembling his ſentiments, he declared, that his orders for embarking had proceeded from a perſuaſion that it was agreeable to his fellow-ſoldiers, to whoſe opinion he had ſacrificed his own; but now he acknowledged his error, and was ready to reſume his original plan of operation. This ſpeech was highly applauded; and Cortes, without allowing his men time to cool, ſet about carrying his deſigns into execution.

10 Villa Rica founded.

In order to give a beginning to a colony, he aſſembled the principal perſons in his army, and by their ſuffrages elected a council and magiſtrates, in whom the government was to be veſted. The perſons choſen were moſt firmly attached to Cortes; and the new ſettlement had the name of *Villa Rica de la vera Cruz*; that is, the rich town of the true croſs.

11 The government of the new colony veſted in Cortes.

Before this court of his own making, Cortes did not heſitate at reſigning all his authority, and was immediately re-elected chief-juſtice of the colony, and captain-general of its army, with an ample commiſſion, in the king's name, to continue in force till the royal pleaſure ſhould be farther known. The ſoldiers eagerly ratified their choice by loud acclamations; and Cortes, now conſidering himſelf as no longer accountable to any ſubject, began to aſſume a much greater degree of dignity, and to exerciſe more extenſive powers, than he had done before. Some of the ſoldiers began to exclaim againſt the proceedings of the council as illegal; but the ringleaders were inſtantly

Mexico. ftantly fent on board the fleet loaded with irons. By this timely feverity the reft were overawed; and Cortes, knowing of how great importance unanimity was to his future fuccefs, foon found means to reconcile thofe who were moft difaffected; to which purpofe a liberal diftribution of the Mexican gold, both among friends and foes, contributed not a little.

11
Makes an alliance with the Cacique of Zempoalla.

Cortes, having thus ftrengthened himfelf as well as he could, refolved to advance into the country; and to this he was encouraged by the behaviour of the cacique or petty prince of Zempoalla, a confiderable town at no great diftance. This prince, though fubject to Montezuma, was exceedingly impatient of the yoke; and fo filled with dread and hatred of the emperor, that nothing could be more acceptable to him than an appearance of being delivered from that fubjection; and a deliverance of this kind he now hoped from the Spaniards. For this reafon he fent ambaffadors to Cortes, with offers of friendfhip, which were gladly accepted by him; and in confequence of the alliance, he very foon vifited Zempoalla. Here he was received in the moft friendly manner imaginable, and had a refpect paid towards him almoft equivalent to adoration. The cacique informed him of many particulars relating to the character of Montezuma.— He told him, that he was a tyrant, haughty, cruel, and fufpicious; who treated his own fubjects with arrogance, ruined the conquered provinces by his extortions, and often tore their fons and daughters from them by violence; the former to be offered as victims to his gods, the latter to be referved as concubines for himfelf and favourites. Cortes, in reply, artfully infinuated, that one great object of the Spaniards in vifiting a country fo remote from their own was, to redrefs grievances, and to relieve the oppreffed; and having encouraged him to hope for this interpofition in due time, continued his march to Quiabiflan, the territory of another cacique, and where, by the friendly aid of the Indians, a Spanifh colony was foon formed.

12
Character of Montezuma given by the cacique.

During the refidence of Cortes in thefe parts, he fo far wrought on the minds of the caciques of Zempoalla and Quiabiflan, that they ventured to infult the Mexican power, at the very name of which they had been formerly accuftomed to tremble. Some of Montezuma's officers having appeared to levy the ufual tribute, and to demand a certain number of human victims, as an expiation of their guilt in prefuming to hold intercourfe with thofe ftrangers whom the emperor had commanded to leave his dominions; inftead of obeying his orders, they made them prifoners, treated them with great indignity, and, as their fuperftition was no lefs barbarous than Montezuma's, they threatened to facrifice them to their gods. From this laft danger, however, they were delivered by the interpofition of Cortes, who manifefted the utmoft horror at the mention of fuch a deed. This act of rebellion firmly attached the two caciques to the intereft of Cortes; and without hefitation they acknowledged themfelves vaffals of the king of Spain. Their example was followed by the Totonaques, a fierce people who inhabited the mountainous parts of the country. They willingly fubjected themfelves to the crown of Caftile; and offered to accompany Cortes with all their forces in his march towards Mexico.

13
The caciques of Zempoalla, Quiabiflan, and fome others, fubmit.

Though Cortes had now taken fuch meafures as in a manner enfured his fuccefs; yet, as he had thrown off all dependence on the governor of Cuba, who was his lawful fuperior, and apprehended his intereft at court, he thought proper, before he fet out on his intended expedition, to take the moft effectual meafures againft the impending danger. With this view, he perfuaded the magiftrates of his colony to addrefs a letter to the king, containing a pompous account of their own fervices, of the country they had difcovered, &c. and of the motives which had induced them to throw off their allegiance to the governor of Cuba, and to fettle a colony dependent on the crown alone, in which the fupreme power civil as well as military had been vefted in Cortes; humbly requefting their fovereign to ratify what had been done by his royal authority. Cortes himfelf wrote in a fimilar ftrain; but as he knew that the Spanifh court, accuftomed to the repeated exaggerations of American adventurers, would give little credit to the fplendid accounts of New-Spain, if they were not accompanied with fuch a fpecimen of what it contained as would excite an high idea of its opulence, he folicited his foldiers to relinquifh what they might claim as their part of the treafures which had hitherto been collected, in order that the whole might be fent to the king. Portocarrero and Montejo, the chief magiftrates of the colony, were appointed to carry this prefent to Caftile, with exprefs orders not to touch at Cuba in their paffage thither. But while a veffel was preparing for their departure, an unexpected event produced a general alarm. Some foldiers and failors, fecretly difaffected to Cortes, formed a defign of feizing one of the brigantines, and making their efcape to Cuba, in order to give fuch intelligence to the governor, as might enable him to intercept the veffel which was to carry the treafure and difpatches to Spain. This confpiracy was conducted with profound fecrefy; but at the moment when every thing was ready for execution, the fecret was difcovered by one of the affociates. The latent fpirit of difaffection which Cortes was now too well convinced had not been extinguifhed amongft his troops, gave him very great uneafinefs. The only method which he could think of to prevent fuch confpiracies for the future was, to deftroy his fleet; and thus deprive his foldiers of every refource except that of conqueft: and with this propofal he perfuaded his men to comply. With univerfal confent therefore the fhips were drawn afhore, and, after being ftripped of their fails, rigging, iron-work, and whatever elfe might be of ufe, they were broke in pieces.

14
The magiftrates of Villa Rica fend a letter to the king of Spain in favour of Cortes.

15
Cortes burns his fleet.

Cortes having thus rendered it neceffary for his troops to follow wherever he chofe to lead, began his march from Zempoalla with 500 infantry, 15 horfe, and fix field-pieces. The reft of his troops, confifting chiefly of fuch as from age or infirmity were lefs fit for active fervice, he left as a garrifon in Villa Rica, under the command of Efcalante, an officer of merit, and warmly attached to his intereft. The cacique of Zempoalla fupplied him with provifions; and with 200 of thofe Indians called *Tamames*, whofe office, in a country where tame animals were unknown, was to carry

 carry burdens, and perform all manner of servile labour. He offered likewise a considerable body of troops; but Cortes was satisfied with 400; taking care, however, to choose persons of such note, that they might serve as hostages for the fidelity of their master.

Nothing memorable happened till the Spaniards arrived on the confines of the republic of Tlascala. The inhabitants of that province were warlike, fierce, and revengeful, and had made considerable progress in agriculture and some other arts. They were implacable enemies to Montezuma; and therefore Cortes hoped that it would be an easy matter for him to procure their friendship. With this view, four Zempoallans of high rank were sent ambassadors to Tlascala, dressed with all the badges of that office usual among the Indians. The senate were divided in their opinions with regard to the proposals of Cortes: but at last, Magiscatzin, one of the oldest senators, and a person of great authority, mentioned the tradition of their ancestors, and the revelations of their priests; that a race of invincible men, of divine origin, who had power over the elements, should come from the east to subdue their country. He compared the resemblance which the strangers bore to the persons figured in the tradition of Mexico, their dominion over the elements of fire, air, and water; he reminded the senate of their prodigies, omens, and signals, which had lately terrified the Mexicans, and indicated some very important event; and then declared his opinion, that it would be rashness to oppose a force apparently assisted by heaven, and men who had already proved, to the sad experience of those who opposed them, that they were invincible. This orator was opposed by Xicotencal, who endeavoured to prove that the Spaniards were at best but powerful magicians; that they had rendered themselves obnoxious to the gods by pulling down their images and altars, (which indeed Cortes had very imprudently done at Zempoalla); and of consequence, that they might easily be overcome, as the gods would not fail to resent such an outrage. He therefore voted for war, and advised the crushing of these invaders at one blow.

16 Sends ambassadors to the republic of Tlascala.

17 The Tlascalans resolve on war.

The advice of Xicotencal prevailed; and in consequence of it, the ambassadors were detained; which giving Cortes the alarm, he drew nearer the city of Tlascala. In this transaction we may easily see how little the Tlascalans, notwithstanding all their ferocity, were skilled in military affairs. They suffered Cortes, with his army drawn up in good order, to pass a strong wall between two mountains, which might have been very advantageously defended against him. He had not advanced far beyond this pass, however, before a party of Tlascalans with plumes were discovered, which denoted that an army was in the field. These he drove before him by a detachment of six horse, obliged them to join another party, and then reinforcing the advanced detachment, charged the enemy with such vigour that they began to retire. Five thousand Tlascalans, whom Xicotencal had placed in ambush, then rushed out of their hiding places, just as the infantry came up to assist their slender body of cavalry. The enemy attacked with the utmost fury; but were so much disconcerted by the first discharge of the fire-arms, that they retreated in confusion, furnishing the Spaniards with an opportunity of pursuing them with great slaughter. Cortes, however, supposing that this could not be their whole force, advanced with the utmost caution, in order of battle, to an eminence, from whence he had a view of the main body of the Tlascalan army commanded by Xicotencal, consisting of no fewer than 40,000 men. By these the small army of Cortes was entirely surrounded; which Xicotencal no sooner perceived, than he contracted the circle with incredible diligence, while the Spaniards were almost overwhelmed with showers of arrows, darts, and stones. It is impossible but in this case many of the Spaniards must have perished, had it not been for the insufficiency of the Indian weapons. Their arrows and spears were headed only with flint, or the bones of fishes; their stakes hardened in the fire, and wooden swords, though destructive weapons among naked Indians, were easily turned aside by the Spanish bucklers, and could hardly penetrate the quilted jackets which the soldiers wore. These circumstances gave the Spaniards a prodigious advantage over them; and therefore, the Tlascalans notwithstanding their valour and superiority in number, could accomplish no more in the present instance, than to kill one horse, and slightly wound nine soldiers.

The Tlascalans being taught by this, and some subsequent encounters, how much they were inferior to the Spaniards, began to conceive them to be really what Magiscatzin had said; a superior order of beings, against whom human power could not prevail. In this extremity they had recourse to their priests, requiring them to reveal the causes of such extraordinary events, and to declare what means they should take to repel such formidable invaders. The priests, after many sacrifices and incantations, delivered their response, That these strangers were the offspring of the sun, procreated by his animating energy in the regions of the east: that, by day, while cherished with the influence of his parental beams, they were invincible; but by night, when his reviving heat was withdrawn, their vigour declined and faded like herbs in the field, and they dwindled down into mortal men. In consequence of this, the Tlascalans acted in contradiction to one of their most established maxims in war, and ventured to attack the enemy in the night-time, hoping to destroy them when enfeebled and surprised. But the Spanish centinels having observed some extraordinary movements among the Tlascalans, gave the alarm. Immediately the troops were under arms, and sallying out, defeated their antagonists with great slaughter, without allowing them to approach the camp. By this disaster the Tlascalans were heartily disposed to peace; but they were at a loss to form an adequate idea of the enemies they had to deal with. They could not ascertain the nature of these surprising beings, or whether they were really of a benevolent or malignant disposition. There were circumstances in their behaviour which seemed to favour each opinion. On the one hand, as the Spaniards constantly dismissed the prisoners whom they took, not only without injury, but often with presents of European toys, and renewed their offers of peace after every victory; this lenity amazed people accustomed to the exterminating system of war known in America, and who sacrificed and devoured without mercy all the captives taken in battle; and

18 But are defeated and sue for peace.

Mexico. and difpofed them to entertain fentiments favourable to their humanity. But, on the other hand, as Cortes had feized 50 of their countrymen who brought provifions to their camp, and cut off their heads; this bloody fpectacle, added to the terror occafioned by the fire-arms and horfes, filled them with dreadful ideas of their ferocity. Accordingly they addreffed them in the following manner: "If, (faid they), you are divinities of a cruel and favage nature, we prefent to you five flaves, that you may drink their blood and eat their flefh. If you are mild deities, accept an offering of incenfe and variegated plumes. If you are men, here is meat, bread, and fruit, to nourifh you."

19 Which is granted. After this addrefs, the peace was foon concluded, to the great fatisfaction of both parties. The Tlafcalans yielded themfelves as vaffals to the crown of Caftile, and engaged to affift Cortes in all his operations; while he took the republic under his protection, and promifed to defend their perfons and poffeffions from injury and violence.

20 Great diftreffes of the Spaniards. This reconciliation took place at a very feafonable juncture for the Spaniards. They were not only worn out with inceffant toil, but fo deftitute of neceffaries, that they had no other falve to drefs their wounds but what was compofed of the fat of Indians whom they had flain. Their diftreffes, in fhort, were arifen to fuch an height that they had begun to murmur, and even to defpair, infomuch that Cortes had much difficulty in reftraining them within any kind of bounds: but the fubmiffion of the Tlafcalans, and their own triumphant entry into the city, where they were received with the reverence due to a fuperior order of beings, banifhed at once all memory of paft fufferings, difpelled every anxious thought, and fully convinced them that they could not be refifted by any power in America.

Cortes left no method untried to gain the favour and confidence of the Tlafcalans; which, however, he had almoft entirely loft, by his untimely zeal in deftroying their idols as he had done thofe of Zempoalla. But he was deterred from this rafh action by his chaplain, father Bartholomew de Olmedo; and left the Tlafcalans in the undifturbed exercife of their fuperftition, requiring only that they fhould defift from their horrid practice of offering human victims.

21 Cortes continues his march for Mexico. As foon as his troops were fit for fervice, he refolved to continue his march towards Mexico, notwithftanding the remonftrances of the Tlafcalans, who looked upon his deftruction as unavoidable if he put himfelf into the power of fuch a faithlefs prince as Montezuma. But the emperor, probably intimidated with the fame of his exploits, had refolved to admit his vifit; and informed Cortes that he had given orders for his friendly reception at Cholula, the next place of any confequence on the road to Mexico.

22 Treachery of Montezuma and the Cholulans. In this, however, he was by no means fincere. Cholula was looked upon by all the inhabitants of the empire as a very holy place; the fanctuary and chief feat of their gods, to which pilgrims reforted from every province, and a greater number of human victims were offered in its principal temple than even in that of Mexico. Montezuma therefore invited the Spaniards thither, either from fome fuperftitious hope that the gods would not fuffer this facred manfion to be defiled; or from a belief, that he himfelf might there find an opportunity of cutting them off with more certainty of fuccefs, when under the immediate protection of his gods. Cortes, however, was received with much feeming cordiality; but 6000 Tlafcalan troops who accompanied him were obliged to remain without the town, as the Cholulans refufed to admit their ancient enemies within their precincts. Yet two of thefe, by difguifing themfelves, got into the city, and acquainted Cortes that they obferved the women and children belonging to the principal citizens retiring every night in a great hurry, and that fix children had been facrificed in the great temple; a fign that fome warlike enterprife was at hand. At the fame time Donna Marina, the interpreter, received information from an Indian woman of diftinction, whofe confidence fhe had gained, that the deftruction of the Spaniards was concerted; that a body of Mexican troops lay concealed near the town; that fome of the ftreets were barricaded, in others deep pits or trenches were dug, and flightly covered over, as traps into which the horfe might fall; that ftones and miffive weapons were collected on the tops of the temples, with which to overwhelm the infantry; that the fatal hour was already at hand, and their ruin unavoidable.

23 Severe punifhment of the Cholulans. Cortes, alarmed at this news, fecretly arrefted three of the chief priefts, from whom he extorted a confeffion that confirmed the intelligence he had already received. As not a moment was to be loft, he inftantly refolved to prevent his enemies, and to inflict on them fuch dreadful vengeance as might ftrike Montezuma and his fubjects with terror. For this purpofe the Spaniards and Zempoallans were drawn up in a large court, which had been allotted for their quarters, near the centre of the town; the Tlafcalans had orders to advance; the magiftrates and chief citizens were fent for under various pretexts, and feized. On a fignal given, the troops rufhed out, and fell upon the multitude, deftitute of leaders, and fo much aftonifhed, that the weapons dropped from their hands, and they ftood motionlefs, and incapable of defence. While the Spaniards attacked them in front, the Tlafcalans did the fame in the rear; the ftreets were filled with flaughter; the temples, which afforded a retreat to the priefts and fome leading men, were fet on fire, and they perifhed in the flames. This fcene of horror continued two days; during which the wretched inhabitants fuffered all that the deftructive rage of the Spaniards, or the implacable revenge of their Indian allies, could inflict. At length the carnage ceafed, after the flaughter of 6000 Cholulans, without the lofs of a fingle Spaniard. Cortes then releafed the magiftrates; and reproaching them bitterly for their intended treachery, declared, that as juftice was now appeafed, he forgave the offence; but required them to recall the inhabitants who had fled, and re-eftablifh order in the town. Such was the afcendant that the Spaniards had now obtained over this fuperftitious race, that this order was inftantly complied with; and the city was in a few days again filled with people, who paid the moft refpectful fervice to thofe men whofe hands were ftained with the blood of their relations and fellow-citizens.

24 Difaffection of Montezuma's fubjects. From Cholula, Cortes advanced directly towards Mexico; and throughout the whole of his journey was entertained with accounts of the oppreffions and cruelty of Montezuma. This gave him the greateft hope of accomplifhing his defign; as he now perceived that the

the empire was entirely divided, and no fort of unanimity prevailed among them. No enemy appeared to check his progrefs. Montezuma was quite irrefolute; and Cortes was almoft at the gates of the capital, before the emperor had determined whether to receive him as a friend, or oppofe him as an enemy. But as no fign of open hoftility appeared, the Spaniards, without regarding the fluctuations of Montezuma's fentiments, continued their march to Mexico, with great circumfpection and the ftricteft difcipline, though without feeming to fufpect the prince whom they were about to vifit.

25
Meeting of Cortes and Montezuma.

When they drew near the city, about 1000 perfons, who appeared to be of diftinction, came forth to meet them, adorned with plumes, and clad in mantles of fine cotton. Each of thefe, in his order, paffed by Cortes, and faluted him according to the mode deemed moft refpectful and fubmiffive in their country. They announced the approach of Montezuma himfelf, and foon after his harbingers came in fight. There appeared firft 200 perfons in an uniform drefs, with large plumes of feathers, alike in fafhion, marching two and two, in deep filence, barefooted, with their eyes fixed on the ground. Thefe were followed by a company of higher rank, in their moft fhowy apparel; in the midft of whom was Montezuma, in a chair or litter richly ornamented with gold, and feathers of various colours. Four of his principal favourites carried him on their fhoulders, others fupported a canopy of curious workmanfhip over his head. Before him marched three officers with rods of gold in their hands, which they lifted up on high at certain intervals; and at that fignal all the people bowed their heads, and hid their faces, as unworthy to look on fo great a monarch. When he drew near, Cortes difmounted, advancing towards him with officious hafte, and in a refpectful pofture. At the fame time Montezuma alighted from his chair, and leaning on the arms of two of his near relations, approached with a flow and ftately pace, his attendants covering the ftreet with cotton cloths, that he might not touch the ground. Cortes accofted him with profound reverence, after the European fafhion. He returned the falutation, according to the mode of his country, by touching the earth with his hand, and then kiffing it. This ceremony, the cuftomary expreffion of reverence from inferiors towards thofe who are above them in rank, appeared fuch amazing condefcenfion in a proud monarch, who fcarcely deigned to confider the reft of mankind as of the fame fpecies with himfelf, that all his fubjects firmly believed thofe perfons, before whom he humbled himfelf in this manner, to be fomething more than human. Accordingly, as they marched through the crowd, the Spaniards frequently, and with much fatisfaction, heard themfelves denominated *teules*, or *divinities*. Nothing material paffed in this firft interview. Montezuma conducted Cortes to the quarters which he had prepared for his reception; and immediately took leave of him, with a politenefs not unworthy of a court more refined. "You are now, (fays he), with your brothers, in your own houfe; refrefh yourfelves after your fatigue, and be happy until I return." The place allotted to the Spaniards for their lodging was a houfe built by the father of Montezuma. It was furrounded by a ftone-wall, with towers at proper diftances, which ferved for defence as well as for ornament; and its apartments and courts were fo large as to accommodate both the Spaniards and their Indian allies. The firft care of Cortes was to take precautions for his fecurity, by planting the artillery fo as to command the different avenues which led to it, by appointing a large divifion of his troops to be always on guard, and by pofting centinels at proper ftations, with injunctions to obferve the fame vigilant difcipline as if they were within fight of an enemy's camp.

In the evening Montezuma returned to vifit his guefts with the fame pomp as in their firft interview; and brought prefents of fuch value, not only to Cortes and to his officers, but even to the private men, as proved the liberality of the monarch to be fuitable to the opulence of his kingdom. A long conference enfued, in which Cortes learned what was the opinion of Montezuma with refpect to the Spaniards. It was an eftablifhed tradition, he told him, among the Mexicans, that their anceftors came originally from a remote region, and conquered the provinces now fubject to his dominion; that after they were fettled there, the great captain who conducted this colony returned to his own country, promifing, that at fome future period his defcendants fhould vifit them, affume the government, and reform their conftitutions and laws; that, from what he had heard and feen of Cortes and his followers, he was convinced that they were the very perfons whofe appearance and prophecies taught them to expect; that accordingly he had received them, not as ftrangers, but as relations of the fame blood and parentage, and defired that they might confider themfelves as mafters in his dominions; for both himfelf and his fubjects fhould be ready to comply with their will, and even to prevent their wifhes. Cortes made a reply in his ufual ftyle with refpect to the dignity and power of his fovereign, and his intention in fending him into that country; artfully endeavouring fo to frame his difcourfe, that it might coincide as much as poffible with the idea which Montezuma had formed concerning the origin of the Spaniards. Next morning, Cortes and fome of his principal attendants were admitted to a public audience of the emperor. The three fubfequent days were employed in viewing the city; the appearance of which, fo far fuperior in the order of its buildings and the number of its inhabitants to any place the Spaniards had beheld in America, and yet fo little refembling the ftructure of an European city, filled them with furprife and admiration.

26
Defcription of the city of Mexico.

Mexico, *Tenuchtitlan*, as it was anciently called by the natives, is fituated in a large plain, environed by mountains of fuch height, that though within the torrid zone, the temperature of its climate is mild and healthful. All the moifture which defcends from the high grounds is collected in feveral lakes, the two largeft of which, of about 90 miles in circuit, communicate with each other. The waters of the one are frefh, thofe of the others brackifh. On the banks of the latter, and on fome fmall iflands adjoining to them, the capital of Montezuma's empire was built. The accefs to the city was by artificial caufeways or ftreets, formed of ftones and earth, about 30 feet in breadth. As the waters of the lake, during the rainy feafon, overflowed the flat country, thefe caufeways were of con-

confiderable length. That of Tacuba on the weft a mile and a half; that of Tezeuco on the north-weft three miles; that of Cuoyacan towards the fouth fix miles. On the eaft there was no caufeway, and the city could be approached only by canoes. In each of thefe caufeways were openings, at proper intervals, through which the waters flowed; and over thefe beams of timber were laid, which being covered with earth, the caufeway or ftreet had every where an uniform appearance. As the approaches to the city were fingular, its conftruction was remarkable. Not only the temple of their gods, but the houfes belonging to the monarch and to perfons of diftinction, were of fuch dimenfions, that, in comparifon with any other buildings which had been difcovered in America, they might be termed *magnificent*. The habitations of the common people were mean, refembling the huts of other Indians. But they were all placed in a regular manner, on the banks of the canals which paffed thro' the city, in fome of its diftricts, or on the fides of the ftreets which interfected it in other quarters. In feveral places were large openings or fquares, one of which, allotted for the great market, is faid to have been fo fpacious, that 40,000 or 50,000 perfons carried on traffic there. In this city, the pride of the New World, and the nobleft monument of the induftry and art of man, while unacquainted with the ufe of iron, and deftitute of aid from any domeftic animal, the Spaniards, who are moft moderate in their computations, reckon that there were at leaft 60,000 inhabitants.

27
Uneafinefs of the Spaniards.

But how much foever the novelty of thofe objects might amufe or aftonifh the Spaniards, they felt the utmoft folicitude with refpect to their own fituation. From a concurrence of circumftances, no lefs unexpected than favourable to their progrefs, they had been allowed to penetrate into the heart of a powerful kingdom, and were now lodged in its capital, without having once met with open oppofition from its monarch. The Tlafcalans, however, had earneftly diffuaded them from placing fuch confidence in Montezuma as to enter a city of fuch a peculiar fituation as Mexico, where that prince would have them at mercy, fhut up as it were in a fnare, from which it was impoffible to efcape. They affured him that the Mexican priefts had, in the name of the gods, counfelled their fovereign to admit the ftrangers into the capital, that he might cut them off there at one blow with perfect fecurity. The Spaniards now perceived, too plainly, that the apprehenfions of their allies were not deftitute of foundation; that, by breaking the bridges placed at certain intervals on the caufeways, or by deftroying part of the caufeways themfelves, their retreat would be rendered impracticable; and they muft remain cooped up in the centre of a hoftile city, furrounded by multitudes fufficient to overwhelm them, and without a poffibility of receiving aid from their allies. Montezuma had, indeed, received them with diftinguifhed refpect. But ought they to reckon upon this as real, or to confider it as feigned? Even if it were fincere, could they promife on its continuance? Their fafety depended upon the will of a monarch in whofe attachment they had no reafon to confide; and an order flowing from his caprice, or a word uttered by him in paffion, might decide irrevocably concerning their fate.

28
Some hoftilities between the Spaniards and Mexicans.

Thefe reflections, fo obvious as to occur to the meaneft foldier, did not efcape the vigilant fagacity of their general. Before he fet out from Cholula, Cortes had received advice from Villa Rica, that Qualpopoca, one of the Mexican generals on the frontiers, having affembled an army in order to attack fome of the people whom the Spaniards had encouraged to throw off the Mexican yoke, Efcalante had marched out with part of the garrifon to fupport his allies; that an engagement had enfued, in which, though the Spaniards were victorious, Efcalante, with feven of his men, had been mortally wounded, his horfe killed, and one Spaniard had been furrounded by the enemy and taken alive; that the head of this unfortunate captive, after being carried in triumph to different cities, in order to convince the people that their invaders were not immortal, had been fent to Mexico. Cortes, though alarmed with this intelligence, as an indication of Montezuma's hoftile intentions, had continued his march. But as foon as he entered Mexico, he became fenfible, that, from an excefs of confidence in the fuperior valour and difcipline of his troops, as well as from the difadvantage of having nothing to guide him in an unknown country but the defective intelligence which he received from people with whom his mode of communication was very imperfect, he had pufhed forward into a fituation, where it was difficult to continue, and from which it was dangerous to retire. Difgrace, and perhaps ruin, was the certain confequence of attempting the latter. The fuccefs of his enterprife depended upon fupporting the high opinion which the people of New Spain had formed with refpect to the irrefiftible power of his arms. Upon the firft fymptom of timidity on his part, their veneration would ceafe, and Montezuma, whom fear alone reftrained at prefent, would let loofe upon him the whole force of his empire. At the fame time, he knew that the countenance of his own fovereign was to be obtained only by a feries of victories; and that nothing but the merit of extraordinary fuccefs could fcreen his conduct from the cenfure of irregularity. From all thefe confiderations, it was neceffary to maintain his ftation, and to extricate himfelf out of the difficulties in which one bold ftep had involved him, by venturing upon another ftill bolder. The fituation was trying, but his mind was equal to it; and after revolving the matter with deep attention, he fixed upon a plan no lefs extraordinary than daring. He determined to feize Montezuma in his palace, and carry him a prifoner to the Spanifh quarters. From the fuperftitious veneration of the Mexicans for the perfon of their monarch, as well as their implicit fubmiffion to his will, he hoped, by having Montezuma in his power, to acquire the fupreme direction of their affairs; or at leaft, with fuch a facred pledge in his hands, he made no doubt of being fecure from any effort of their violence.

29
Cortes refolves to feize Montezuma in his palace.

This he immediately propofed to his officers. The timid ftartled at a meafure fo audacious, and raifed objections. The more intelligent and refolute, confcious that it was the only refource in which there appeared any profpect of fafety, warmly approved of it, and brought over their companions fo cordially to the fame opinion, that it was agreed inftantly to make the attempt. At his ufual hour of vifiting Montezuma, Cortes went to the palace, accompanied by Alvarado, Saudoval, Mexico. Sandoval, Lugo, Velafquez de Leon, and Davila, five of his principal officers, and as many trufty foldiers. Thirty chofen men followed, not in regular order, but fauntering at fome diftance, as if they had no object but curiofity; fmall parties were pofted at proper intervals, in all the ftreets leading from the Spanifh quarters to the court; and the remainder of his troops, with the Tlafcalan allies, were under arms, ready to fally out on the firft alarm. Cortes and his attendants were admitted without fufpicion; the Mexicans retiring, as ufual, out of refpect. He addreffed the monarch in a tone very different from that which he had employed in former conferences; reproaching him bitterly as the author of the violent affault made upon the Spaniards by one of his officers, and demanded public reparation for the lofs which he had fuftained by the death of fome of his companions, as well as for the infult offered to the great prince whofe fervants they were. Montezuma, confounded at this unexpected accufation, and changing colour either from the confcioufnefs of guilt, or from feeling the indignity with which he was treated, afferted his own innocence with great earneftnefs; and, as a proof of it, gave orders inftantly to bring Qualpopoca and his accomplices prifoners to Mexico. Cortes replied, with feeming complaifance, that a declaration fo refpectable left no doubt remaining in his own mind; but that fomething more was requifite to fatisfy his followers, who would never be convinced that Montezuma did not harbour hoftile intentions againft them, unlefs, as an evidence of his confidence and attachment, he removed from his own palace and took up his refidence in the Spanifh quarters, where he fhould be ferved and honoured as became a great monarch. The firft mention of fo ftrange a propofal bereaved Montezuma of fpeech, and almoft of motion. At length he haughtily anfwered, "That perfons of his rank were not accuftomed voluntarily to give up themfelves as prifoners; and were he mean enough to do fo, his fubjects would not permit fuch an affront to be offered to their fovereign." Cortes, unwilling to employ force, endeavoured alternately to foothe and intimidate him. The altercation became warm; and having continued above three hours, Velafquez de Leon, an impetuous and gallant young man, exclaimed with impatience, "Why wafte more time in vain? Let us either feize him inftantly, or ftab him to the heart." The threatening voice and fierce geftures with which thefe words were uttered, ftruck Montezuma. The Spaniards, he was fenfible, had now proceeded fo far, as left him no hope that they would recede. His own danger was imminent, the neceffity unavoidable. He faw both; and abandoning himfelf to his fate, complied with their requeft.

30 The emperor carried to the Spanifh quarters.

His officers were called. He communicated to them his refolution. Though aftonifhed and afflicted, they prefumed not to queftion the will of their mafter, but carried him in filent pomp, all bathed in tears, to the Spanifh quarters. When it was known that the ftrangers were conveying away the emperor, the people broke out into the wildeft tranfports of grief and rage, threatening the Spaniards with immediate deftruction, as the punifhment juftly due to their impious audacity. But as foon as Montezuma appeared with a feeming gaiety of countenance, and waved his hand, the tumult was hufhed; and upon his declaring it to be of his own choice that he went to refide for fome time among his new friends, the multitude, taught to revere every intimation of their fovereign's pleafure, quietly difperfed. Mexico.

The Spaniards at firft pretended to treat Montezuma with great refpect; but foon took care to let him know that he was entirely in their power. Cortes wifhed that the fhedding the blood of a Spaniard fhould appear the moft heinous crime that could be committed; and therefore not only took a moft exemplary vengeance on thofe who had been concerned in the affair of Villa Rica, but even put the emperor himfelf in chains till the execution of the Mexican general was over. By thefe, and other infults, he at laft gained entirely the afcendant over this unhappy monarch; and he took care to improve his opportunity to the utmoft. He fent his emiffaries into different parts of the kingdom, accompanied with Mexicans of diftinction, who might ferve both to guide and to protect them. They vifited moft of the provinces, viewed their foil and productions, furveyed with particular care the diftricts which yielded gold or filver, pitched upon feveral places as proper for future colonies, and endeavoured to prepare the minds of the people for fubmitting to the Spanifh yoke: and while they were thus employed, Cortes, in the name and by the authority of Montezuma, degraded fome of the principal officers in the empire, whofe abilities or independent fpirit excited his jealoufy; and fubftituted in their place perfons who he imagined would be more obfequious. One thing, however, was ftill wanting to complete his fecurity. He wifhed to have fuch a command of the lake as might enfure a retreat, if, either from levity or difguft, the Mexicans fhould take arms againft him, and break down the bridges or caufeways, in order to inclofe him in the city. In order to obtain this without giving difguft to the emperor or his court, Cortes artfully inflamed the curiofity of the Indians with accounts of the Spanifh fhipping, and thofe floating palaces that moved with fuch velocity on the water, without the affiftance of oars; and when he found that the monarch himfelf was extremely defirous of feeing fuch a novelty, he gave him to underftand, that nothing was wanting to his gratification befides a few neceffaries from Vera Cruz, for that he had workmen in his army capable of building fuch veffels. The bait took with Montezuma; and he gave immediate orders that all his people fhould affift Cortes in whatever he fhould direct concerning the fhipping. By this means, in a few days, two brigantines were got ready, full-rigged and equipped; and Montezuma was invited on board, to make the firft trial of their failing, of which he could form no idea. Accordingly he embarked for this purpofe, and gave orders for a great hunting upon the water, in order that all his people might be diverted with the novelty prefented by the Spaniards. On the day appointed, the royal equipage was ready early in the morning; and the lake was covered with a multitude of boats and canoes loaded with people. The Mexicans had augmented the number of their rowers on board the royal barges, with an intention to difgrace the Spanifh veffels, which they regarded as clumfy, unweildy, and heavy. But they were foon undeceived; a frefh gale ftarted up, the brigantines hoifted fail, to the utter aftonifhment of all the fpectators, and foon left all the canoes behind; while the monarch

31 Cortes rules the empire.

32 By a pretence, he obtains leave to build two brigantines on the lake.

Mexico. monarch exulted in the victory of the Spaniards, without once confidering that now he had effectually rivetted his own chains.

33 Montezuma owns himfelf a vaffal to the king of Spain.

Cortes having obtained this important point, refolved to put the condefcenfion of the emperor to a trial ftill more fevere. He urged Montezuma to acknowledge himfelf a vaffal to the crown of Caftile; to hold his crown of him as fuperior, and to fubject his dominions to the payment of an annual tribute. With this requifition, humiliating as it was, Montezuma complied. He called together the chief men of his empire, and, in a folemn harangue, reminded them of the traditions and prophecies which led them to expect the arrival of a people fprung from the fame ftock with themfelves, in order to take poffeffion of the fupreme power; he declared his belief that the Spaniards were this promifed race; and that therefore he recognized the right of their monarch to govern the Mexican empire, would lay his crown at his feet, and obey him as a tributary. While uttering thefe words, Montezuma difcovered how deeply he was affected in making fuch a facrifice. Tears and groans frequently interrupted his difcourfe. The firft mention of fuch a refolution ftruck the affembly dumb with aftonifhment. This was followed by a fullen murmur of forrow mingled with indignation; which indicated fome violent eruption of rage to be near at hand. This Cortes forefaw, and feafonably interpofed to prevent it, by declaring that his mafter had no intention to deprive Montezuma of the royal dignity, or to make any innovation upon the conftitution and laws of the Mexican empire. This affurance, added to their dread of the Spanifh arms, and the authority of their monarch's example, extorted the confent of the affembly; and the act of fubmiffion and homage was executed with all the formalities which the Spaniards pleafed to prefcribe.

Montezuma, at the requeft of Cortes, accompanied this profeffion of fealty and homage with a magnificent prefent to his new fovereign; and, after his example, his fubjects brought in very liberal contributions.

34 The Spaniards divide their treafure.

The Spaniards then collected all the treafure which had been either voluntarily beftowed upon them at different times by Montezuma, or had been extorted from his people under various pretences; and having melted the gold and filver, the value of thefe, without including jewels and ornaments of various kinds, which were preferved on account of their curious workmanfhip, amounted to 600,000 pefos. The foldiers were impatient to have it divided; and Cortes complied with their defire. A fifth of the whole was fet apart as the tax due to the king. Another fifth was allowed to Cortes, as commander. The fums advanced by the governor of Cuba, who had originally fitted out the expedition, were then deducted. The remainder was then divided among the army, including the garrifon of Vera Cruz, in proportion to their different ranks; and after fo many deductions, the fhare of a private man did not exceed 100 pefos. This fum fell fo far below their fanguine expectations, that it required all the addrefs, and no fmall exertions of the liberality of Cortes to prevent an open mutiny. However, he at laft reftored tranquillity; but had no fooner efcaped this danger, than he involved himfelf, by his imprudent zeal for religion, in one much worfe. Montezuma, though often importuned, had obftinately refufed to change his religion, or abolifh the fuperftitious rites which had been for fuch a long time practifed throughout his dominions.

35 Cortes attempts to deftroy the Mexican idols.

This at laft tranfported the Spaniard with fuch rage, that, in a fally of zeal, he led out his foldiers in order to throw down the idols in the great temple by force. But the priefts taking arms in defence of their altars, and the people crowding with great ardour to fupport them, Cortes's prudence over-ruled his zeal; and induced him to defift from his rafh attempt, after diflodging the idols from one of the fhrines, and placing in their ftead an image of the Virgin Mary.

36 Which produces a general difaffection.

From this moment the Mexicans began to meditate the expulfion or the deftruction of the Spaniards. The priefts and leading men held frequent meetings with Montezuma for this purpofe. But as any violent attempt might have proved fatal to the captive monarch, it was thought proper firft to try more gentle means. Having called Cortes into his prefence, he obferved, that now, as all the purpofes of his embaffy were fully accomplifhed, the gods had declared their will, and the people fignified their defire, that he and his followers fhould inftantly depart out of the empire.

37 The Spaniards are commanded to depart.

With this he required them to comply, or unavoidable deftruction would fall fuddenly on their heads. This unexpected requifition, as well as the manner in which it was delivered, alarmed Cortes. However, he fuppofed that more might be gained by a feigned compliance than by open refiftance; and therefore replied with great compofure, that he had already begun to prepare for his return; but as he had deftroyed the veffels in which he arrived, fome time was requifite for building other fhips. This appeared reafonable; and a number of Mexicans were fent to Vera Cruz to cut down timber, and fome Spanifh carpenters were appointed to fuperintend the work.

38 An armament fent from Cuba againft Cortes.

Cortes flattered himfelf that, during this interval, he might either find means to avert the threatened danger, or receive fuch reinforcements as would enable him to defend himfelf. Nine months had now elapfed fince Portocarrero and Montejo had failed with his difpatches to Spain; and he daily expected a return with a confirmation of his authority from the king, without which all that he had done ferved only to mark him out as an object of punifhment. While he remained in great anxiety on this account, news were brought that fome fhips had appeared on the coaft. Thefe were imagined by Cortes to be a reinforcement fent him from Spain: but his joy was of fhort continuance, for a courier very foon arrived from Vera Cruz, with certain information that the armament was fitted out by Velafquez, the governor of Cuba; and inftead of bringing fuccours, threatened them with immediate deftruction.

Velafquez had been excited to this hoftile meafure chiefly through the indifcretion, or rather treachery, of the meffengers of Cortes; who, contrary to his exprefs injunctions, had landed on the ifland of Cuba, and given intelligence of all that had paffed; and Velafquez, tranfported with rage at hearing of the proceedings of Cortes, had now fent againft him this armament; confifting of 18 fhips, which carried 80 horfemen, 800 infantry, of which 80 were mufketeers, and 120 crofs-bowmen, commanded by a brave officer named *Pamphilo de Narvaez*; whofe inftructions were, to feize Cortes and his principal officers, to fend them prifoners priſoners to him, and then to complete the diſcovery and conqueſt of the country in his name. This proved a moſt afflicting piece of news to Cortes. However, thinking it imprudent to attempt any thing againſt his countrymen at firſt by force, he ſent his chaplain, Olmedo, with propoſals of accommodation. Narvaez rejected his propoſals with ſcorn; but his followers were leſs violent in their reſentments. Olmedo delivered many letters to them, either from Cortes himſelf, or from his officers, their ancient friends and companions. Theſe Cortes had artfully accompanied with preſents of rings, chains of gold, and other trinkets of value; which inſpired thoſe needy adventurers with high ideas of the wealth he had acquired, and with envy of the good fortune of thoſe who were engaged in his ſervice. Some, from hopes of becoming ſharers in theſe rich ſpoils, declared for an immediate accommodation; while others were for the ſame pacific meaſure, through fear of ſubverting the Spaniſh power entirely in a country where it was ſo imperfectly eſtabliſhed. Narvaez diſregarded both; and, by a proclamation, denounced Cortes and his adherents rebels, and enemies to their country.

39
Which is defeated by that general.

Cortes having now no reſource but in war, left 150 men under the command of Pedro de Alvarado, an officer of great bravery, and much reſpected by the Mexicans, to guard the capital, and the captive emperor; while he himſelf marched with the remainder to meet his formidable opponent, who had taken poſſeſſion of Zempoalla. Even after being reinforced by Sandoval his governor of Vera Cruz, the force of Cortes did not exceed 250 men. He hoped for ſucceſs chiefly from the rapidity of his motions and the poſſibility of ſurpriſing his enemies; and as he chiefly dreaded their cavalry, he armed his ſoldiers with long ſpears; accuſtoming them to that deep and compact arrangement which the uſe of this formidable weapon enabled them to aſſume. As he advanced, however, he repeated his propoſals of accommodation; but theſe being conſtantly rejected, and a price ſet upon his head, he at laſt attacked Narvaez in the night-time, entirely defeated and took him priſoner, obliging all his troops to own allegiance to himſelf.

Nothing could be more ſeaſonable than this victory, by which Cortes found his army very conſiderably increaſed; for moſt of the ſoldiers of Narvaez choſe rather to follow Cortes than to return to Cuba, whither the conqueror had offered to ſend them if they

40
Dangerous ſituation of the Spaniards left at Mexico.

choſe. His affairs at Mexico, in the mean time, were in the utmoſt danger of being totally ruined; and had this deciſive victory been delayed but a few days longer, he muſt have come too late to ſave his companions. A ſhort time after the defeat of Narvaez, a courier arrived from Mexico with the diſagreeable intelligence that the Mexicans had taken arms; and having ſeized and deſtroyed the two brigantines which he had built in order to ſecure the command of the lake, had attacked the Spaniards in their quarters, killed ſome, and wounded many more, burnt their magazine of proviſions, and, in ſhort, carried on hoſtilities with ſuch fury, that though Alvarado and his men defended themſelves with undaunted reſolution, they muſt either be cut off by famine, or ſink under the multitude of their enemies. This revolt was excited by motives which rendered it ſtill more alarming. On the departure of Cortes for Zempoalla, the Mexicans flattered themſelves, that the long-expected opportunity of reſtoring their ſovereign to liberty, and driving out the Spaniards, was arrived; and conſultations were accordingly held for bringing about both theſe events. The Spaniards in Mexico, conſcious of their own weakneſs, ſuſpected and dreaded theſe machinations; but Alvarado, who had neither the prudence nor the addreſs of Cortes, took the worſt method imaginable to overcome them. Inſtead of attempting to ſooth or cajole the Mexicans, he waited the return of one of their ſolemn feſtivals, when the principal perſons in the empire were dancing, according to cuſtom, in the court of the great temple; he ſeized all the avenues which led to it; and, allured partly by the rich ornaments which they wore in honour of their gods, and partly by the facility of cutting off at once the authors of that conſpiracy which he dreaded, he fell upon them, unarmed and unſuſpicious of danger, and maſſacred a great number; none eſcaping, but ſuch as made their way over the battlements of the temple. An action ſo cruel and treacherous filled not only the city, but the whole empire, with indignation and rage; and the Mexicans immediately proceeded in the manner above-mentioned.

41
Cortes allowed to return to Mexico.

Cortes advanced with the utmoſt celerity to the relief of his diſtreſſed companions; but as he paſſed along, had the mortification to find that the Spaniards were generally held in abhorrence. The principal inhabitants had deſerted the towns through which he paſſed; no perſon of note appeared to meet him with the uſual reſpect, nor were proviſions brought to his camp as uſual. Notwithſtanding theſe ſigns of averſion and horror, however, the Mexicans were ſo ignorant of the militray art, that they again permitted him to enter the capital without oppoſition; though it was in their power to have eaſily prevented him, by breaking down the bridges and cauſeways which led to it.

Cortes was received by his companions with the utmoſt joy; and this extraordinary ſucceſs ſo far intoxicated the general himſelf, that he not only neglected to viſit Montezuma, but expreſſed himſelf very contemptuouſly concerning him. Theſe expreſſions

42
But is furiouſly attacked by the natives.

being reported among the Mexicans, they all at once flew to arms, and made ſuch a violent and ſudden attack, that all the valour and ſkill of Cortes were ſcarce ſufficient to repell them. This produced great uneaſineſs among the ſoldiers of Narvaez, who had imagined there was nothing to do but to gather the ſpoils of a conquered country. Diſcontent and murmurings, however, were now of no avail; they were incloſed in an hoſtile city, and, without ſome extraordinary exertions, were inevitably undone. Cortes therefore made a deſperate ſally; but, after exerting his utmoſt efforts for a whole day, was obliged to retire with the loſs of 12 killed, and upwards of 60 wounded. Another ſally was attempted with the like bad ſucceſs, and in it Cortes himſelf was wounded in the hand.

The Spaniſh general was now thoroughly convinced of his error; and therefore betook himſelf to the only reſource which was left; namely, to try what effect the interpoſition of Montezuma would have to ſooth or overawe his ſubjects. When the Mexicans approached the next morning to renew the aſſault, that

Mexico. that unfortunate prince, at the mercy of the Spaniards, and reduced to the fad neceffity of becoming the inftrument of his own difgrace, and of the flavery of his people, advanced to the battlements in his royal robes, and with all the pomp in which he ufed to appear on folemn occafions. At the fight of their fovereign, whom they had been long accuftomed to reverence almoft as a god, the Mexicans inftantly forebore their hoftilities, and many proftrated themfelves on the ground: but when he addreffed them in favour of the Spaniards, and made ufe of all the arguments he could think of to mitigate their rage, they teftified their refentment with loud murmurings; and at length broke forth with

43 Montezuma killed.

fuch fury, that before the foldiers, appointed to guard Montezuma, had time to cover him with their fhields, he was wounded with two arrows, and a blow on his temple with a ftone ftruck him to the ground. On feeing him fall, the Mexicans inftantly fled with the utmoft precipitation: but the unhappy monarch, now convinced that he was become an object of contempt even to his own fubjects, obftinately refufed all nourifhment; and thus in a fhort time ended his days.

44 A terrible engagement between the Spaniards and Mexicans.

On the death of Montezuma, Cortes having loft all hope of bringing the Mexicans to any terms of peace, prepared for retreat. But his antagonifts, having taken poffeffion of a high tower in the great temple, which overlooked the Spanifh quarters, and placing there a garrifon of their principal warriors, the Spaniards were fo much expofed to their miffile weapons, that none could ftir without danger of being killed or wounded. From this poft, therefore, it was neceffary to diflodge them at any rate; and Juan de Efcobar, with a large detachment of chofen foldiers, was ordered to make the attack. But Efcobar, though a valiant officer, and though he exerted his utmoft efforts, was thrice repulfed. Cortes, however, fenfible, that not only his reputation, but the fafety of his army, depended on the fuccefs of this affault, caufed a buckler to be tied to his arm, as he could not manage it with his wounded hand, and rufhed with his drawn fword among the thickeft of the combatants. Encouraged by the prefence of their general, the Spaniards returned to the charge with fuch vigour, that they gradually forced their way up the fteps, and drove the Mexicans to the platform at the top of the tower. There a dreadful carnage began; when two young Mexicans of high rank, obferving Cortes, as he animated his foldiers, refolved to facrifice their own lives in order to cut off the author of fo many calamities which defolated their country. They approached him in a fuppliant pofture, as if they intended to lay down their arms, and feizing him in a moment, hurried him towards the battlements, over which they threw themfelves headlong, in hopes of dragging him along with them. But Cortes, by his ftrength and agility, difengaged himfelf from their grafp; fo that the two Mexicans perifhed alone.

As foon as the Spaniards became mafters of the tower, they fet fire to it, and without further moleftation continued the preparations for their retreat. This became the more neceffary, as their emenies, aftonifhed at this laft effort of their valour, had now entirely changed their fyftem of hoftility; and, inftead of inceffant attacks, endeavoured, by barricading the ftreets, and breaking down the caufeways, to cut off the communication of the Spaniards with the continent, and thus to ftarve an enemy whom they could not fubdue. The firft point to be determined was whether they fhould march out openly in the face of day, when they could difcern every danger, or whether they fhould endeavour to retire fecretly in the night. The latter was preferred, partly from hopes that the fuperftition of the Mexicans would prevent them from attacking them in the night, and partly from their own fuperftition in giving credit to the predictions of a private foldier, who pretended to aftrology, and affured them of fuccefs if they retreated in this manner. Towards midnight, therefore, they began their march, in three divifions. Sandoval led the van; Pedro Alvarado and Veles Guez de Lean had the conduct of the rear; and Cortes commanded in the centre, where he placed the prifoners, among whom were a fon and two daughters of Montezuma, together with feveral Mexicans of diftinction; the artillery, baggage, and a portable bridge of timber intended to be laid over the breaches in the caufeway. They marched in profound filence along the caufeway which led to Tacuba, becaufe it was fhorter than any of the reft, and, lying moft remote from the road towards Tlafcala and the fea-coaft, had been left moft entire by the Mexicans.

They reached the firft breach in the caufeway without moleftation, hoping that their retreat was undifcovered. But the Mexicans had not only watched all their motions, but made preparations for a moft formidable attack. While the Spaniards were intent upon placing their bridges in the breach, and occupied in conducting their horfes and artillery along it, they were fuddenly alarmed with the found of warlike inftruments, and found themfelves affaulted on all fides by an innumerable multitude of enemies. Unfortunately the wooden bridge was wedged fo faft in the mud by the weight of the artillery, that it was impoffible to remove it. Difmayed at this accident, the Spaniards advanced with precipitation to the fecond breach. The Mexicans hemmed them in on every fide; and though they defended themfelves with their ufual courage, yet, crowded as they were in a narrow caufeway, their difcipline and military fkill were of little avail; nor did the obfcurity of the night allow them to derive much advantage from their fire-arms or the fuperiority of their other weapons. At laft the Spaniards, overborne with the numbers of their enemies, began to give way, and in a moment the confufion was univerfal. Cortes, with about 100 foot-foldiers, and a few horfe, forced his way over the two remaining breaches in the caufeway, the bodies of the dead ferving to fill up the chafms, and reached the main land. Having formed them as foon as they arrived, he returned with fuch as were yet capable of fervice, to affift his friends in their retreat. He met with part of his foldiers who had forced their way through the enemy, but found many more overwhelmed by the multitude of their aggreffors, or perifhing in the lake; and heard the grievous lamentations of others whom the Mexicans were carrying off in triumph, to be facrificed to the god of war.

45 Cortes retreats with great lofs.

In this fatal retreat more than one half of Cortes's army perifhed, together with many officers of diftinction. All the artillery, ammunition, and baggage were

Mexico were loſt; the greater part of the horſes and above 2000 Tlaſcalans were killed, and only a very ſmall part of their treaſure ſaved. The firſt care of the Spaniſh general was to find ſome ſhelter for his wearied troops; for, as the Mexicans infeſted them on every ſide, and the people of Tacuba began to take arms, he could not continue in his preſent ſtation. At laſt he diſcovered a temple ſeated on an eminence, in which he found not only the ſhelter he wanted, but ſome proviſions; and though the enemy did not intermit their attacks throughout the day, they were without much difficulty prevented from making any impreſſion. For ſix days after, they continued their march through a barren, ill-cultivated, and thinly-peopled country, where they were often obliged to feed on berries, roots, and the ſtalks of green maize; at the ſame time they were haraſſed without intermiſſion by large parties of Mexicans, who attacked them on all ſides. On the ſixth day they reached Otumba, not far from the road between Mexico and Tlaſcala. Early next morning they began to advance towards it, flying parties of the enemy ſtill hanging on their rear; and amidſt the inſults with which they accompanied their hoſtilities, Donna Marina remarked, that they often exclaimed with exultation, "Go on, robbers; go to the place where you ſhall quickly meet the vengeance due to your crimes." The meaning of this threat the Spaniards did not comprehend, until they reached the ſummit of an eminence before them. There a ſpacious valley opened to their view, covered with a vaſt army as far as the eye could reach. The Mexicans, while with one body of their troops they haraſſed the Spaniards in their retreat, had aſſembled their principal force on the other ſide of the lake; and marching

46 The battle of Otumba.

along the road which led directly to Tlaſcala, poſted it in the plain of Otumba, through which they knew Cortes muſt paſs. At the ſight of this incredible multitude, which they could ſurvey at once from the riſing ground, the Spaniards were aſtoniſhed, and even the boldeſt began to deſpair. But Cortes, without allowing their fears time to operate, after warning them briefly that no alternative remained but to conquer or die, led them inſtantly to the charge. The Mexicans waited their approach with unuſual fortitude: yet, ſuch was the ſuperiority of the Spaniſh diſcipline and arms, that the impreſſion of this ſmall body was irreſiſtible; and which ever way its force was directed, it penetrated and diſperſed the moſt numerous battalions. But while theſe gave way in one quarter, new combatants advanced from another; and the Spaniards, though ſucceſsful in every attack, were ready to ſink under theſe repeated efforts, without ſeeing any end to their toil, or any hope of victory. At that time Cortes obſerved the great ſtandard of the empire, which was carried before the Mexican general, advancing; and fortunately recollecting to have heard, that on the fate of it depended the event of every battle, he aſſembled a few of his braveſt officers, whoſe horſes were ſtill capable of ſervice, and, placing himſelf at their head, puſhed towards the ſtandard with ſuch impetuoſity that he bore down every thing before him. A choſen body of nobles, who guarded the ſtandard, made ſome reſiſtance, but were ſoon broken. Cortes, with a ſtroke of his lance, wounded the Mexican general, and threw him to the ground. One of his followers alighting, put an end to his life, and laid hold of the imperial ſtandard. The moment that their leader fell, and the ſtandard, towards which all directed their eyes, diſappeared, an univerſal panic ſtruck the Mexicans; and, as if the bond which held them together had been diſſolved, every enſign was lowered, each ſoldier threw away his weapons, and fled with precipitation to the mountains. The Spaniards, unable to purſue them far, returned to collect the ſpoils of the field; and theſe were ſo valuable as to be ſome compenſation for the wealth which they had loſt in Mexico; for in the enemy's army were moſt of their principal warriors dreſſed out in their richeſt ornaments, as if they had been marching to aſſured victory.

47 Mexicans defeated.

The day after this important action, (being July 8th 1520), the Spaniards entered the Tlaſcalan territories, where they were received with the moſt cordial friendſhip. Cortes endeavoured to avail himſelf of this diſpoſition as much as poſſible; for which purpoſe he diſtributed among them the rich ſpoils taken at Otumba with ſuch a liberal hand, that he made himſelf ſure of obtaining from the republic whatever he ſhould deſire. He drew a ſmall ſupply of ammunition, and two or three field-pieces from his ſtores at Vera Cruz. He diſpatched an officer of confidence with four ſhips of Narvaez's fleet to Hiſpaniola and Jamaica, to engage adventurers, and to purchaſe horſes, gunpowder, and other military ſtores. And, as he knew that it would be in vain to attempt the reduction of Mexico, unleſs he could ſecure the command of the lake, he gave orders to prepare, in the mountains of Tlaſcala, materials for building 12 brigantines, ſo that they might be carried thither in pieces, ready to be put together, and launched when he ſtood in need of their ſervice. But, in the mean time, his ſoldiers, alarmed at the thoughts of being expoſed to ſuch calamities a ſecond time, preſented a remonſtrance to their general, in which they repreſented the imprudence of attacking a powerful empire with his ſhattered forces, and formally required him to return back to Cuba. All the eloquence of Cortes could now only prevail with them to delay their departure for ſome time, when he promiſed to diſmiſs ſuch as ſhould deſire it. However, this was only a pretence; for Cortes, in fact, had the conqueſt of Mexico as much at heart as ever. Without giving his ſoldiers an opportunity of caballing, therefore, he daily employed them againſt the people of the neighbouring provinces, who had cut off ſome detachments of Spaniards during his misfortunes at Mexico; and by which, as he was conſtantly attended with ſucceſs, his men ſoon reſumed their wonted ſenſe of ſuperiority.

48 Cortes receives an unexpected reinforcement.

But all the efforts of Cortes could have been of little avail, had he not unexpectedly obtained a reinforcement of Spaniſh ſoldiers. The governor of Cuba, to whom the ſucceſs of Narvaez appeared an event of infallible certainty, having ſent two ſmall ſhips after him with new inſtructions, and a ſupply of men and military ſtores, the officer whom Cortes had appointed to command on the coaſt, artfully decoyed them into the harbour of Vera Cruz, ſeized the veſſels, and eaſily perſuaded the ſoldiers to follow the ſtandard of a more able leader than him whom they were deſtined to join. Soon after, three ſhips of more conſiderable force came into the harbour ſeparately. Theſe belonged to an

Mexico.

an armament fitted out by Francifco de Garay, governor of Jamaica, who had long aimed at dividing with Cortes the glory and gain of annexing the empire of Mexico to the crown of Caftile. They had, however, unadvifedly made their attempt on the northern provinces, where the country was poor, and the inhabitants fierce and warlike; fo that, after a fucceffion of difafters, they were now obliged to venture into Vera Cruz, and caft themfelves upon the mercy of their countrymen; and here they alfo were foon perfuaded to throw off their allegiance to their mafter, and to enlift with Cortes. About the fame time a fhip arrived from Spain, freighted by fome private adventurers, with military ftores; and the cargo was eagerly purchafed by Cortes, while the crew, following the example of the reft, joined him at Tlafcala.

From thefe various quarters, the army of Cortes was augmented with 180 men, and 20 horfes; by which means he was enabled to difmifs fuch of the foldiers of Narvaez as were moft troublefome and difcontented; after the departure of whom, he ftill muftered 550 infantry, of whom 80 were armed with mufkets or crofs-bows, 40 horfemen, and nine pieces of artillery. At the head of thefe, with 10,000 Tlafcalans and other friendly Indians, he began his march towards Mexico, on the 28th of December, fix months after his fatal retreat from that city.

49 *He fets out again for Mexico.*

The Mexicans, in the mean time, had made the beft preparations they could for oppofing fuch a formidable enemy. On the death of Montezuma, his brother Quetlavaca was raifed to the throne; and he had an immediate opportunity of fhewing that he was worthy of their choice, by conducting in perfon thofe fierce attacks which obliged the Spaniards to retire from his capital. His prudence in guarding againft the return of the invaders was equal to the fpirit he had fhewn in driving them out. He repaired what the Spaniards had ruined in the city, ftrengthened it with fuch fortifications as his people could erect; and befides filling his magazines with the ufual weapons of war, gave directions to make long fpears, headed with the fwords and daggers which they had taken from the Spaniards, in order to annoy the cavalry. But in the midft of thefe preparations he was taken off by the fmall-pox; and Guatimozin, his nephew and fon-in-law, raifed to the throne.

50 Preparations of the Mexicans for their defence.

As foon as Cortes entered the enemy's territories, he difcovered various preparations to obftruct his progrefs. But his troops forced their way with little difficulty; and took poffeffion of Tezeuco, the fecond city of the empire, fituated on the banks of the lake, about 20 miles from Mexico. Here he determined to eftablifh his head-quarters, as the moft proper ftation for lanching his brigantines, as well as for making his approaches to the capital. In order to render his refidence there more fecure, he depofed the cazique or chief, who was at the head of that community, under pretence of fome defect in his title, and fubftituted in his place a perfon whom a faction of the nobles pointed out as the right heir of that dignity. Attached to him by this benefit, the new cazique and his adherents ferved the Spaniards with inviolable fidelity.

As the conftruction of the brigantines advanced flowly under the unfkilful hands of foldiers and Indians, whom Cortes was obliged to employ in affifting three or four carpenters who happened fortunately to be in his fervice, and as he had not yet received the reinforcement which he expected from Hifpaniola, he was not in a condition to turn his arms directly againft the capital. To have attacked a city fo populous, fo well prepared for defence, and in a fituation of fuch peculiar ftrength, muft have expofed his troops to inevitable deftruction. Three months elapfed before the materials for conftructing the brigantines were finifhed, and before he heard any thing with refpect to the fuccefs of his negotiation in Hifpaniola. This, however, was not a feafon of inaction to Cortes. He attacked fucceffively feveral of the towns fituated around the lake; and though all the Mexican power was exerted to obftruct his operations, he either compelled them to fubmit to the Spanifh crown, or reduced them to ruins. Other towns he endeavoured to conciliate by more gentle means; and though he could not hold any intercourfe with the inhabitants but by the intervention of interpreters, yet, under all the difadvantage of that tedious and imperfect mode of communication, he had acquired fuch thorough knowledge of the ftate of the country, as well as of the difpofitions of the people, that he conducted his negotiations and intrigues with aftonifhing dexterity and fuccefs. Moft of the cities adjacent to Mexico were originally the capitals of fmall independent ftates; and fome of them having been but lately annexed to the Mexican empire, ftill retained the remembrance of their ancient liberty, and bore with impatience the rigorous yoke of their new mafters. Cortes having early obferved fymptoms of their difaffection, availed himfelf of this knowledge to gain their confidence and friendfhip. By offering with confidence to deliver them from the odious dominion of the Mexicans, and by liberal promifes of more indulgent treatment if they would unite with him againft their oppreffors, he prevailed on the people of feveral confiderable diftricts, not only to acknowledge the king of Caftile as their fovereign, but to fupply the Spanifh camp with provifions, and to ftrengthen his army with auxiliary troops. Guatimozin, on the firft appearance of defection among his fubjects, exerted himfelf with vigour to prevent or to punifh their revolt; but, in fpite of his efforts, the fpirit continued to fpread. The Spaniards gradually acquired new allies; and with deep concern he beheld Cortes arming againft his empire thofe very hands which ought to have been active in his defence, and ready to advance againft the capital at the head of a numerous body of his own fubjects.

51 Cortes makes great progrefs.

While, by thofe various methods, Cortes was gradually circumfcribing the Mexican power within fuch narrow limits that his profpect of overturning it feemed neither to be uncertain nor remote, all his fchemes were well nigh defeated by a confpiracy againft his own perfon, and which was difcovered only a fhort time before it was to have been executed. Though many were concerned, Cortes did not think proper to punifh any more than the principal ringleader, whom he caufed immediately to be hanged; and then, without allowing them leifure to ruminate on what had happened, and as the moft effectual means of preventing the return of a mutinous fpirit, he determined to call forth his troops immediately to action. Fortunately, a proper occafion for this occurred, without his feeming

to

to court it. He received intelligence, that the materials for building the brigantines were at length completely finiſhed, and waited only for a body of Spaniards to conduct them to Tezeuco. The command of this convoy, conſiſting of 200 foot-ſoldiers, 15 horſemen, and 2 field-pieces, he gave to Sandoval, who, by the vigilance, activity, and courage, which he manifeſted on every occaſion, was growing daily in his confidence, and in the eſtimation of his fellow-ſoldiers. The ſervice was no leſs ſingular than important; the beams, the planks, the maſts, the cordage, the ſails, the iron-work, and all the infinite variety of articles requiſite for the conſtruction of 13 brigantines, were to be carried 60 miles over land, thro' a mountainous country, by people who were unacquainted with the miniſtry of domeſtic animals, or the aid of machines to facilitate any work of labour. The Tlaſcalans furniſhed 8000 *Tamenes*, an inferior order of men deſtined for ſervile taſks, to carry the materials on their ſhoulders, and appointed 15,000 warriors to accompany and defend them. Sandoval made the diſpoſition for their progreſs with great propriety, placing the Tamenes in the centre, one body of warriors in the front, another in the rear, with conſiderable parties to cover the flanks. To each of theſe he joined ſome Spaniards, not only to aſſiſt them in danger, but to accuſtom them to regularity and ſubordination. Parties of Mexicans frequently appeared hovering around them on the high grounds: but perceiving no proſpect of ſucceſs in attacking an enemy continually on his guard, and prepared to receive them, they did not venture to moleſt him; and Sandoval had the glory of conducting ſafely to Tezeuco, a convoy on which all the future operations of his countrymen depended.

52 he Spa- ards re- ive ano- er rein- rce- ent.

This was followed by another event of no leſs moment. Four ſhips arrived at Vera Cruz from Hiſpaniola, with 200 ſoldiers, 80 horſes, two battering cannon, and a conſiderable ſupply of ammuniton and arms. Elevated with obſerving that all his preparatory ſchemes, either for recruiting his own army, or impairing the force of the enemy, had now produced their full effect, Cortes, impatient to begin the ſiege in form, haſtened the launching of the brigantines. To facilitate this, he had employed a vaſt number of Indians, for two months, in deepening the ſmall rivulet which runs by Tezeuco into the lake, and in forming it into a canal near two miles in length: and though the Mexicans, aware of his intentions, as well as of the danger which threatened them, endeavoured frequently to interrupt the labourers, or to burn the brigantines, the work was at laſt completed. On the 28th of April, all the Spaniſh troops, together with auxiliary Indians, were drawn up on the banks of the canal; and with extraordinary military pomp, heightened and rendered more ſolemn by the celebration of the moſt ſacred rites of religion, the brigantines were launched. As they fell down the canal in order, Father Olmedo bleſſed them, and gave each its name. Every eye followed them with wonder and hope, until they entered the lake, when they hoiſted their ſails, and bore away before the wind. A general ſhout of joy was raiſed; all admiring that bold inventive genius, which, by means ſo extraordinary, that their ſucceſs almoſt exceeded belief, had acquired the command of a fleet, without the aid of which Mexico would have continued to ſet the Spaniſh power and arms at defiance.

53 The city beſieged.

Cortes determined to attack the city from three different quarters; from Tezeuco on the eaſt ſide of the lake, from Tacuba on the weſt, and from Cuyocan towards the ſouth. Thoſe towns were ſituated on the principal cauſeways which led to the capital, and intended for their defence. He appointed Sandoval to command in the firſt, Pedro de Alvarado in the ſecond, and Chriſtoval de Olid in the third; allotting to each a numerous body of Indian auxiliaries, together with an equal diviſion of Spaniards, who, by the junction of the troops from Hiſpaniola, amounted now to 86 horſemen, and 818 foot-ſoldiers; of whom 118 were armed with muſkets or croſs-bows. Their train of artillery conſiſted of three battering cannon, and 15 field-pieces. He reſerved for himſelf, as the ſtation of greateſt importance and danger, the conduct of the brigantines, each armed with one of his ſmall cannon, and manned with 25 Spaniards.

As Alvarado and Olid proceeded towards the poſts aſſigned them, they broke down the aqueducts which the ingenuity of the Mexicans had erected for conveying water into the capital, and, by the diſtreſs to which this reduced the inhabitants, gave a beginning to the calamities which they were deſtined to ſuffer. Alvarado and Olid found the towns, of which they were ordered to take poſſeſſion, deſerted by their inhabitants, who had fled for ſafety to the capital, where Guatimozin had collected the chief force of his empire, as there alone he could hope to make a ſucceſsful ſtand againſt the formidable enemies who were approaching to aſſault him.

54 The Spaniards defeat the Mexicans, and become maſters of the lake.

The firſt effort of the Mexicans was to deſtroy the fleet of brigantines, the fatal effects of whoſe operations they foreſaw and dreaded. Though the brigantines, after all the labour and merit of Cortes in forming them, were of inconſiderable bulk, rudely conſtructed, and manned chiefly with landmen, hardly poſſeſſed of ſkill enough to conduct them, they muſt have been objects of terror to a people unacquainted with any navigation but that of their lake, and poſſeſſed of no veſſel larger than a canoe. Neceſſity, however, urged Guatimozin to hazard the attack; and hoping to ſupply by numbers what he wanted in force, he aſſembled ſuch a multitude of canoes as covered the face of the lake. They rowed on boldly to the charge, while the brigantines, retarded by a dead calm, could ſcarcely advance to meet them. But as the enemy drew near, a breeze ſuddenly ſprung up; in a moment the ſails were ſpread, and the brigantines with irreſiſtible impetuoſity broke their feeble opponents, overſet many canoes, and diſſipated the whole armament with ſuch ſlaughter, as convinced the Mexicans, that the progreſs of the Europeans in knowledge and arts rendered their ſuperiority greater on this new element than they had hitherto found it by land.

From that time Cortes remained maſter of the lake; and the brigantines not only preſerved a communication between the Spaniards in their different ſtations, though at conſiderable diſtance from each other; but were employed to cover the cauſeways on each ſide, and keep off the canoes, when they attempted to annoy the troops as they advanced towards the city. He formed

Mexico.

formed the brigantines in three divisions, allotting one to each station, with orders to second the operations of the officer who commanded there. From all the three stations he pushed on the attack against the city with equal vigour; but in a manner so very different from that whereby sieges are conducted in regular war, as might appear no less improper than singular to persons unacquainted with his situation. Each morning his troops assaulted the barricades which the enemy had erected on the causeways, forced their way over the trenches which they had dug, and thro' the canals where the bridges were broken down, and endeavoured to penetrate into the heart of the city, in hopes of obtaining some decisive advantage, which might force the enemy to surrender, and terminate the war at once; but when the obstinate valour of the Mexicans rendered the efforts of the day ineffectual, the Spaniards retired in the evening to their former quarters. Thus their toil and danger were, in some measure, continually renewed; the Mexicans repairing in the night what the Spaniards had destroyed through the day, and recovering the posts from which they had driven them. But necessity prescribed this slow and untoward mode of operation. The number of his troops was so small, that Cortes durst not, with a handful of men, attempt to make a lodgment in a city where he might be surrounded and annoyed by such a multitude of enemies. The remembrance of what he had already suffered by the ill-judged confidence with which he had ventured into such a dangerous situation, was still fresh in his mind. The Spaniards, exhausted with fatigue, were unable to guard the various posts which they daily gained; and though their camp was filled with Indian auxiliaries, they durst not devolve this charge upon them, because they were so little accustomed to discipline, that no confidence could be placed in their vigilance. Besides this, Cortes was extremely solicitous to preserve the city as much as possible from being destroyed, both as he destined it to be the capital of his conquests, and wished that it might remain as a monument of his glory. From all these considerations, he adhered obstinately, for a month after the siege was opened, to the system which he had adopted. The Mexicans, in their own defence, displayed valour which was hardly inferior to that with which the Spaniards attacked them. On land, on water, by night and by day, one furious conflict succeeded to another. Several Spaniards were killed, more wounded, and all were ready to sink under the toils of unintermitting service, which were rendered more intolerable by the injuries of the season, the periodical rains being now set in with their usual violence.

Astonished and disconcerted with the length and difficulties of the siege, Cortes determined to make one great effort to get possession of the city before he relinquished the plan which he had hitherto followed, and had recourse to any other mode of attack. With this view, he sent instructions to Alvarado and Sandoval to advance with their divisions to a general assault, and took the command in person of that posted on the causeway of Cuyocan. Animated by his presence, and the expectation of some decisive event, the Spaniards pushed forward with irresistible impetuosity. They broke through one barricade after another, forced their way over the ditches and canals, and having entered the city, gained ground incessantly, in spite of the multitude and ferocity of their opponents. Cortes, though delighted with the rapidity of his progress, did not forget that he might still find it necessary to retreat; and in order to secure it, appointed Julian de Alderete, a captain of chief note in the troops which he had received from Hispaniola, to fill up the canals and gaps in the causeway as the main body advanced. That officer deeming it inglorious to be thus employed, while his companions were in the heat of action and the career of victory, neglected the important charge committed to him, and hurried on inconsiderately to mingle with the combatants. The Mexicans, whose military attention and skill were daily improving, no sooner observed this, than they carried an account of it to their monarch.

Guatimozin instantly discerned the consequences of the error which the Spaniards had committed, and, with admirable presence of mind, prepared to take advantage of it. He commanded the troops posted in the front to slacken their efforts, in order to allure the Spaniards to push forward, while he dispatched a large body of chosen warriors through different streets, some by land, and others by water, towards the great breach in the causeway, which had been left open. On a signal which he gave, the priests in the great temple struck the great drum consecrated to the god of war. No sooner did the Mexicans hear its doleful solemn sound, calculated to inspire them with contempt of death and with enthusiastic ardour, than they rushed upon the enemy with frantic rage. The Spaniards, unable to resist men urged on no less by religious fury than hope of success, began to retire, at first leisurely, and with a good countenance; but as the enemy pressed on, and their own impatience to escape increased, the terror and confusion became so general, that when they arrived at the gap in the causeway, Spaniards and Tlascalans, horsemen and infantry, plunged in promiscuously, while the Mexicans rushed upon them fiercely from every side, their light canoes carrying them through shoals which the brigantines could not approach. In vain did Cortes attempt to stop and rally his flying troops; fear rendered them regardless of his intreaties or commands. 55 Cortes repulsed in an attack. Finding all his endeavours to renew the combat fruitless, his next care was to save some of those who had thrown themselves into the water; but while thus employed, with more attention to their situation than to his own, six Mexican captains suddenly laid hold of him, and were hurrying him off in triumph; and tho' two of his officers rescued him at the expence of their own lives, he received several dangerous wounds before he could break loose. Above 60 Spaniards perished in the rout; and what rendered the disaster more afflicting, 40 of these fell alive into the hands of an enemy never known to shew mercy to a captive.

The approach of night, though it delivered the dejected Spaniards from the attacks of the enemy, ushered in, what was hardly less grievous, the noise of their barbarous triumph, and of the horrid festival with which they celebrated their victory. Every quarter of the city was illuminated; the great temple shone with such peculiar splendour, that the Spaniards could plainly

Mexico.

plainly ſee the people in motion, and the prieſts buſy in haſtening the preparations for the death of the priſoners. Through the gloom they fancied that they diſcerned their companions by the whiteneſs of their ſkins, as they were ſtripped naked and compelled to dance before the image of the god to whom they were to be offered. They heard the ſhrieks of thoſe who were ſacrificed, and thought they could diſtinguiſh each unhappy victim by the well-known ſound of his voice. Imagination added to what they really ſaw or heard, and augmented its horror. The moſt unfeeling melted into tears of compaſſion, and the ſtouteſt heart trembled at the dreadful ſpectacle which they beheld.

Cortes, who, beſides all that he felt in common with his ſoldiers, was oppreſſed with the additional load of anxious reflections natural to a general on ſuch an unexpected calamity, could not like them relieve his mind by giving vent to its anguiſh. He was obliged to aſſume an air of tranquillity in order to revive the ſpirits and hopes of his followers. The juncture, indeed, required an extraordinary exertion of fortitude. The Mexicans, elated with their victory, ſallied out next morning to attack him in his quarters. But they did not rely on the efforts of their own arms alone. They ſent the heads of the Spaniards whom they had ſacrificed to the leading men in the adjacent provinces, and aſſured them that the god of war, appeaſed by the blood of their invaders, which had been ſhed ſo plentifully on his altars, had declared with an audible voice, that in eight days time thoſe hated enemies ſhould be finally deſtroyed, and peace and proſperity re-eſtabliſhed in the empire.

56 The Mexicans renew the attack with great fury.

A prediction, uttered with ſuch confidence, and in terms ſo void of ambiguity, gained univerſal credit among a people prone to ſuperſtition. The zeal of the provinces which had already declared againſt the Spaniards augmented, and ſeveral which had hitherto remained inactive took arms with enthuſiaſtic ardour to execute the decrees of the gods. The Indian auxiliaries who had joined Cortes, accuſtomed to venerate the ſame deities with the Mexicans, and to receive the reſponſes of their prieſts with the ſame implicit faith, abandoned the Spaniards as a race of men devoted to certain deſtruction. Even the fidelity of the Tlaſcalans was ſhaken, and the Spaniſh troops were left almoſt alone in their ſtations. Cortes finding that he attempted in vain to diſpel the ſuperſtitious fears of his confederates by argument, took advantage from the imprudence of thoſe who had framed the prophecy in fixing its accompliſhment ſo near at hand, to give them a ſtriking demonſtration of his falſity. He ſuſpended all military operations during the period marked out by the oracle. Under cover of the brigantines, which kept the army at a diſtance, his troops lay in ſafety, and the fatal term expired without any diſaſter.

His allies, aſhamed of their own credulity, returned to their ſtation. Other tribes, judging that the gods, who had now deceived the Mexicans, had decreed finally to withdraw their protection from them, joined his ſtandard; and ſuch was the levity of a ſimple people, moved by every ſlight impreſſion, that, in a ſhort time after ſuch a general defection of his confederates, Cortes ſaw himſelf, if we may believe his own account, at the head of 150,000 Indians. Even with ſuch a numerous army, he found it neceſſary to adopt a new and more wary ſyſtem of operation. Inſtead of renewing his attempts to become maſter of the city at once, by ſuch bold but dangerous efforts of valour as he had already tried, he made his advances gradually, and with every poſſible precaution againſt expoſing his men to any calamity ſimilar to that which they ſtill bewailed. As the Spaniards puſhed forward, the Indians regularly repaired the cauſeways behind them. As ſoon as they got poſſeſſion of any part of the town, the houſes were inſtantly levelled with the ground. Day by day, the Mexicans, forced to retire as their enemies gained ground, were hemmed in within more narrow limits. Guatimozin, though unable to ſtop the career of the enemy, continued to defend his capital with obſtinate reſolution, and diſputed every inch of ground. But the Spaniards, having not only varied their mode of attack, but, by orders of Cortes, having changed the weapons with which they fought, were again armed with the long Chinantlan ſpears, which they had employed with ſuch ſucceſs againſt Narvaez; and, by the firm array in which this enabled them to range themſelves, they repelled, with little danger, the looſe aſſault of the Mexicans: incredible numbers of them fell in the conflicts, which they renewed every day. While war waſted without, famine began to conſume them within the city. The Spaniſh brigantines, having the entire command of the lake, rendered it impoſſible to receive any ſupply of proviſions by water. The vaſt number of his Indian auxiliaries enabled Cortes to ſhut up the avenues to the city by land. The ſtores which Guatimozin had laid up were exhauſted by the multitudes which crowded into the capital, to defend their ſovereign and the temples of their gods. Not only the people, but perſons of the higheſt rank, felt the utmoſt diſtreſſes of want. What they ſuffered brought on infectious and mortal diſtempers, the laſt calamity that viſits beſieged cities, and which filled up the meaſure of their woes.

57 [C]ortes ad[o]pts a more [ca]utious [m]ethod of [pr]oceeding.

But, under the preſſure of ſo many and ſuch various evils, the ſpirit of Guatimozin remained firm and unſubdued. He rejected with ſcorn every overture of peace from Cortes; and, diſdaining the idea of ſubmitting to the oppreſſors of his country, determined not to ſurvive its ruin. The Spaniards continued their progreſs. At length all the three diviſions penetrated into the great ſquare in the centre of the city, and made a ſecure lodgment there. Three-fourths of the city were now reduced, and laid in ruins. The remaining quarter was ſo cloſely preſſed, that it could not long withſtand aſſailants who attacked it from their new ſtation with ſuperior advantage, and more aſſured expectation of ſucceſs. The Mexican nobles, ſolicitous to ſave the life of a monarch whom they revered, prevailed on Guatimozin to retire from a place where reſiſtance was now vain, that he might rouſe the more diſtant provinces of the empire to arms, and maintain there a more ſucceſsful ſtruggle with the public enemy. In order to facilitate the execution of this meaſure, they endeavoured to amuſe Cortes with overtures of ſubmiſſion, that, while his attention was employed in adjuſting the articles of pacification, Guatimozin might eſcape unperceived. But they made this attempt upon a leader of greater ſagacity and diſcernment than to be deceived by their arts. Cortes ſuſpecting

58 Guatimozin refuſes to ſubmit on any terms.

 ting their intention, and aware of what moment it was to defeat it, appointed Sandoval, the officer on whose vigilance he could most perfectly rely, to take the command of the brigantines, with strict injunctions to watch every motion of the enemy. Sandoval, attentive to the charge, observing some large canoes crowded with people rowing along the lake with extraordinary rapidity, instantly gave the signal to chace. Gracia Holguin, who commanded the fleetest brigantine, soon overtook them, and was preparing to fire on the foremost canoe, which seemed to carry some person whom all the rest followed and obeyed. At once the rowers dropt their oars, and all on board, throwing down their arms, conjured him with cries

59 He is taken prisoner.

and tears to forbear, as the emperor was there. Holguin eagerly seized his prize; and Guatimozin, with a dignified composure, gave himself up into his hands, requesting only that no insult might be offered to the empress or his children. When conducted to Cortes, he appeared neither with the sullen fierceness of a barbarian, nor with the dejection of a supplicant. "I have done," said he, addressing himself to the Spanish general, "what became a monarch. I have defended my people to the last extremity. Nothing now remains but to die. Take this dagger," laying his hand on one which Cortes wore, "plant it in my breast, and put an end to a life which can no longer be of use."

60 Mexico submits.

As soon as the fate of their sovereign was known, the resistance of the Mexicans ceased; and Cortes took possession of that small part of the capital which yet remained undestroyed. Thus terminated the siege of Mexico, the most memorable event in the conquest of America. It continued 75 days, hardly one of which passed without some extraordinary effort of one party in the attack, or of the other in the defence of a city, on the fate of which both knew that the fortune of the empire depended. As the struggle here was more obstinate, it was likewise more equal, than any between the inhabitants of the Old and New Worlds. The great abilities of Guatimozin, the number of his troops, the peculiar situation of his capital, so far counterbalanced the superiority of the Spaniards in arms and discipline, that they must have relinquished the enterprise, if they had trusted for success to themselves alone. But Mexico was overturned by the jealousy of neighbours who dreaded its power, and by the revolt of subjects impatient to shake off its yoke. By their effectual aid, Cortes was enabled to accomplish what, without such support, he would hardly have ventured to attempt. How much soever this account of the reduction of Mexico may detract, on the one hand, from the marvellous relations of some Spanish writers, by ascribing that to simple and obvious causes which they attribute to the romantic valour of their countrymen, it adds, on the other, to the merit and abilities of Cortes, who, under every disadvantage, acquired such an ascendant over unknown nations, as to render them instruments towards carrying his scheme into execution.

The exultation of the Spaniards, on accomplishing this arduous enterprise, was at first excessive. But this was quickly damped by the cruel disappointment of those sanguine hopes which had animated them amidst so many hardships and dangers. Instead of the inexhaustible wealth which they expected from becoming masters of Montezuma's treasures, and the ornaments of so many temples, their rapaciousness could collect only an inconsiderable booty amidst ruins and desolation (A). Guatimozin, aware of his impending fate, had ordered what remained of the riches amassed by his ancestors to be thrown into the lake. The Indian auxiliaries, while the Spaniards were engaged in conflict with the enemy, had carried off the most valuable part of the spoil. The sum to be divided among the conquerors was so small, that many of them disdained to accept of the pittance which fell to their share, and all murmured and exclaimed; some against Cortes and his confidents, whom they suspected of having secretly appropriated to their own use a large portion of the riches which should have been brought into the common stock; others against Guatimozin, whom they accused of obstinacy, in refusing to discover the place where he had hidden his treasure.

Arguments, intreaties, and promises, were employed in order to soothe them; but with so little effect, that Cortes, from solicitude to check this growing spirit of discontent, gave way to a deed which stained the glory of all his great actions. Without regarding the former dignity of Guatimozin, or feeling any reverence for those virtues which he had displayed, he subjected the unhappy monarch, together with his chief favourite, to torture, in order to force from them a discovery of the royal treasures, which it was supposed they had concealed. Guatimozin bore whatever the refined cruelty of his tormentors could inflict, with the invincible fortitude of an American warrior. His fellow-sufferer, overcome by the violence of the anguish, turned a dejected eye towards his master, which seemed to implore his permission to reveal all that he knew. But the high-spirited prince, darting on him a look of authority mingled with scorn, checked his weakness, by asking, "Am I now reposing on a bed of flowers?" Overawed by the reproach, he persevered in his dutiful silence, and expired. Cortes, ashamed of a scene so horrid, rescued the royal victim from the hands of his torturers, and prolonged a life reserved for new indignities and sufferings.

61 Guatimozin tortured.

62 The Spaniards become masters of the whole Mexican empire.

The fate of the capital, as both parties had foreseen, decided that of the empire. The provinces submitted one after another to the conquerors. Small detachments of Spaniards marching through them without interruption, penetrated, in different quarters, to the great Southern Ocean, which, according to the ideas of Columbus, they imagined would open a short as well as easy passage to the East Indies, and secure to the crown of Castile all the envied wealth of those fertile regions; and the active mind of Cortes began already to form schemes for attempting this important discovery. In his after schemes, however, he was disappointed; but Mexico hath ever since remained in the hands of the Spaniards.

63 Climate, soil, &c. of Mexico.

Mexico is almost entirely situated within the torrid zone. The air is excessively warm, moist, and unwholesome, on the coasts of the North Sea. These de-

(A) The gold and silver, according to Cortes, amounted only to 120,000 pesos, Relat. 280, A. a sum far inferior to that which the Spaniards had formerly divided in Mexico.

Mexico. defects of the climate are infinitely lefs felt on the coafts of the South Sea, and hardly at all in the inland country, which is interfected by a chain of mountains, that are fuppofed to be a continuation of the Cordeleras.

The quality of the foil has the fame variations. The eaftern part is low, marfhy, overflowed in the rainy feafons, covered with impenetrable forefts, and totally uncultivated. The foil on the weftern fide is higher, of a better quality, on which there are many fields, and feveral houfes are built upon it. In the low lands there are diftricts on which nature has been very liberal; but, like every country fituated under the tropics, they abound more in fruits than in corn.

The population of this vaft empire is not lefs various than its foil. Its moft diftinguifhed inhabitants are the Spaniards fent hither by the court, to fill the pofts of government. They are obliged, like thofe in the mother-country who afpire to any ecclefiaftical, civil, or military employments, to prove that there have been neither heretics, Jews, Mohammedans, nor any perfons in their family who have been called before the inquifition for four generations. Merchants who are defirous of going to Mexico, as well as to other parts of America, without becoming colonifts, are compelled to obferve the fame forms. They are alfo obliged to fwear that they have 300 palms of merchandife, their own property, in the fleet in which they embark, and that they will not carry their wives with them. On thefe abfurd conditions they become the principal agents of the European commerce with the Indies. Though their charter is only to continue three years, and a little longer for countries more remote, it is of great importance. To them alone belongs the right of felling, as commiffioners, the major part of the cargo. If thefe laws were obferved, the merchants ftationed in the new world would be confined to difpofe of what they have received on their own account.

The predilection which adminiftration has for Spaniards born in Europe, has reduced the Spanifh Creoles to acquiefce in fubordinate ftations. The defcendents of the companions of Cortes, and of thofe who came after them, being conftantly excluded from all places of honour or of truft that were any way confiderable, have feen the gradual decay of the power that fupported their fathers. The habit of being obliged to bear that unjuft contempt with which they have been treated, has at laft made them become really contemptible. They have totally loft, in the vices which originate from indolence, from the heat of the climate, and from a fuperfluous enjoyment of all things, that firmnefs and that fort of pride which have ever characterized their nation. A barbarous luxury, fhameful pleafures, and romantic intrigues, have enervated all the vigour of their minds, and fuperftition hath completed the ruin of their virtues. Blindly devoted to priefts too ignorant to enlighten them by their inftructions, too depraved to edify them by their example, and too mercenary to attend to both thefe duties of their function, they have no attachment to any part of their religion but that which enfeebles the mind, and have neglected what might have contributed to rectify their morals.

The Meftees, who conftitute the third order of citizens, are held in ftill greater contempt. It is well known that the court of Madrid, in order to replenifh a part of that dreadful vacancy which the avarice and cruelty of the conquerors had occafioned, and to regain the confidence of thofe who had efcaped their fury, encouraged as much as poffible the marriage of Spaniards with Indian women. Thefe alliances, which became pretty common throughout all America, were particularly frequent in Mexico, where the women had more underftanding and were more agreeable than in other places. The Creoles transferred to this mixed progeny the contemptuous flight they received from the Europeans. Their condition, equivocal at firft, in procefs of time at laft was fixed between the whites and the blacks.

Thefe blacks are not very numerous in Mexico. As the natives are more intelligent, more robuft, and more induftrious, than thofe of the other colonies, they have hardly introduced any Africans except fuch as were required either to indulge the caprice, or perform the domeftic fervice, of rich people. Thefe flaves, who are much beloved by their mafters, on whom they abfolutely depend, who purchafed them at an extravagant price, and who make them the minifters of their pleafures, take advantage of the high favour they enjoy, to oppress the Mexicans. They affume over thefe men, who are called *free*, an afcendant which keeps up an implacable hatred between the two nations. The law has ftudied to encourage this averfion, by taking effectual meafures to prevent all connection between them. Negroes are prohibited from having any amorous correfpondence with the Indians; the men, on pain of being mutilated, the women of being feverely punifhed. On all thefe accounts, the Africans, who in other fettlements are enemies to Europeans, are in the Spanifh Indies their warm friends.

Authority has no need of this fupport, at leaft in Mexico, where population is no longer what it was formerly. The firft hiftorians, and thofe who copied them, have recorded, that the Spaniards found there 10,000,000 of fouls. This is fuppofed to have been the exaggerated account of conquerors, to exalt the magnificence of their triumph: and it was adopted, without examination, with fo much the more readinefs, as it rendered them the more odious. We need only trace with attention the progrefs of thofe ruffians who at firft defolated thefe fine countries, in order to be convinced that they had not fucceeded in multiplying men at Mexico and the adjacent parts, but by depopulating the centre of the empire; and that the provinces which are remote from the capital, differed in nothing from the other deferts of South and North-America. It is making a great conceffion, to allow that the population of Mexico has only been exaggerated one-half: for it does not now much exceed 2,000,000.

64 Mexicans cruelly treated by the Spaniards.

It is generally believed, that the firft conquerors maffacred the Indians out of wantonnefs, and that even the priefts incited them to thefe acts of ferocity. Undoubtedly thefe inhuman foldiers frequently fhed blood without even an apparent motive; and certainly their fanatic miffionaries did not oppofe thefe barbarities as they ought to have done. This was not,

however,

Mexico. degree. The Spaniards are encouraged to profecute the labours which thefe cultures require, from the happy circumftance of their having difcovered iron mines, which were entirely unknown to the Mexicans, as well as fome mines of a kind of copper that is hard enough to ferve for implements of hufbandry. All thefe articles, however, for want of men and induftry, are merely confumed within the country.— There is only the vanilla, indigo, and cochineal, which make part of the trade of Mexico with other nations.

New-MEXICO, fo called becaufe of its being difcovered later than Old-Mexico, a country of America, is bounded on the north by high mountains, beyond which is a country altogether unknown; by Louifiana on the eaft; by New-Spain on the fouth; and on the weft by the gulph of California, and the Rio Colorado; extending, it is faid, above 100 miles from eaft to weft, and about 900 from fouth to north; but the twentieth part of the country within thefe limits is neither cultivated nor inhabited either by Spaniards or Indians. As it lies in the midft of the temperate zone, the climate, in general, is very pleafant; the fummers, though very warm, are neither fultry nor unwholefome; and the winters, though pretty fharp, are far from being infupportable, and, for the moft part, clear and healthy.

The greateft encomiums are lavifhed on the fertility of the foil, the richnefs of the mines, and the variety of valuable commodities produced in this country. It is faid to be beautifully diverfified with fields, meadows, rifing grounds, and rivers; abounding with fruit and timber-trees, turquoifes, emeralds, and other precious ftones, mines of gold and filver, a great variety of wild and tame cattle, fifh, and fowls. Upon the whole, we may fafely affirm, that New-Mexico is among the pleafanteft, richeft, and moft plentiful countries in America, or any other part of the world. There are few great or navigable rivers in it: the moft confiderable are, the Rio Solado and Rio del Norte, which, with feveral fmaller ftreams, fall into the gulph of Mexico. On the coaft of the gulph are divers bays, ports, and creeks, which might be eafily converted into excellent harbours if the Spaniards were poffeffed of any portion of that commercial fpirit which animates the other maritime nations of Europe.

The Spanifh writers tell us, that New-Mexico is inhabited by a great variety of Indian nations or tribes, totally unconnected with each other: but the principal are the Apaches, a brave, warlike, refolute people; fond of liberty, and the inveterate enemies of tyranny and oppreffion. About the clofe of the laft century, thinking themfelves aggrieved by the Spanifh government, they made a general infurrection, and did a great deal of mifchief; but were at laft obliged to fubmit, and have fince been curbed by ftronger garrifons. Moft of the natives are now Chriftians. When the Spaniards firft entered this country, they found the natives well clothed, their lands cultivated, their villages neat, and their houfes built with ftone. Their flocks alfo were numerous, and they lived more comfortably than moft of the other favages of America. As to religion, they were idolaters, and worfhipped the fun and moon; but whether they offered human facrifices, we are not fufficiently informed.

As to the number of the provinces of this country, we can advance nothing certain; fome writers making them only five, others 15, 18, 20, and 25; but adding no defcription, either of them or the towns contained in them, excepting the capital, Santa Fé, which we are told, ftands near the fource of the Rio del Norte, in 36° of north latitude, and about 130 leagues from the gulph: that it is a well-built handfome, rich town; and the feat of a bifhop, fuffragan of Mexico, as well as of the governor of the province, who is fubordinate to the viceroy of Mexico, or New-Spain.

Mezeray. MEZERAY (Francis Eudes de), an eminent French hiftorian, the fon of Ifaac Eudes a furgeon, was born at Rye, in Lower Normandy, in 1610; and took the furname of *Mezeray*, from a hamlet near Rye. Having performed his ftudies at Caen, he difcovered a ftrong inclination to poetry; but going to Paris, he, by the advice of one of his friends, applied himfelf to the ftudy of politics and hiftory, and procured the place of commiffary at war, which he held for two campaigns. He then fhut himfelf up in the college of St Barbe, in the midft of books and manufcripts; and, in 1643, publifhed the firft volume of the Hiftory of France, in folio; and fome years after, the other two volumes. Mezeray in that work furpaffed all who had written the hiftory of France before him, and was rewarded by the king with a penfion of 4000 livres. In 1668, he publifhed an Abridgment of his Hiftory of France, in three volumes 4to. which was well received by the public: but as he inferted in that work the origin of moft of the taxes, with very free reflections, Mr Colbert complained of it, when Mezeray promifed to correct what he had done in a fecond edition; but thofe corrections being only palliations, the minifter caufed half of his penfion to be fuppreffed. Mezeray complained of this in very fevere terms; when he obtained no other anfwer than the fuppreffion of the other half. Vexed at this treatment, he refolved to write on fubjects that could not expofe him to fuch difappointments; and compofed his treatife on the origin of the French, which did him much honour. He was elected perpetual fecretary to the French academy; and died in 1683. He is faid to have been a man extremely negligent in his perfon; and fo carelefs in his drefs, that he might have paffed for a beggar, rather than for what he was. He was actually feized one morning by the *archers des pauvres*, or parifh-officers; which miftake was fo far from provoking him, that he was highly diverted with it, and told them, that "he was not able to walk on foot, but that as foon as a new wheel was put to his chariot, he would attend them wherever they thought proper." He ufed to ftudy and write by candle-light, even at noon-day in fummer; and, as if there had been no fun in the world, always waited upon his company to the door with a candle in his hand. With regard to religion, he affected Pyrrhonifm; which however was not, it feems, fo much in his heart as in his mouth. This appeared from his laft ficknefs: for having fent for thofe friends who had been the moft ufual witneffes of his licentious talk about religion, he made a fort of recantation, which he concluded with defiring them "to forget what he might formerly have faid upon the fubject of religion, and to remember, that Mezeray dying was

a

a better believer than Mezeray in health." Befides his hiftory, he alfo wrote, 1. A continuation of the hiftory of the Turks. 2. A French tranflation of John de Sarifbury's Latin treatife on the vanities of the court. 3. There are attributed to him feveral fatires againft the government; and in particular, thofe that bear the name of *Sandricourt*.

MEZIERS, a ftrong town of France, in Champagne, with a citadel. It was befieged with a powerful army by Charles V. who was obliged to raife the fiege in 1521. It is feated on the river Meafe, partly upon a hill, and partly in a valley, in E. Long. 3. 48. N. Lat. 49. 46.

MEZIRIAC (Claude Gafpar Backet Sieur de), one of the moft ingenious men of the 17th century, was born at Breffe, of an ancient and noble family. He was a good poet in French, Italian, and Latin; an excellent grammarian, a great Greek fcholar, and an admirable critic. He was well verfed in the controverfies, both in philofophy and religion; and was deeply fkilled in algebra and geometry, of which laft he gave proof by publifhing the fix books of Diophantes, enriched with a very able Commentary and Notes. In his youth he fpent a confiderable time at Paris and at Rome: at which laft place he wrote a fmall collection of Italian poems, in competition with Vaugelas, who was there at the fame time; among which there are imitations of the moft beautiful fimilies contained in the eight firft books of the Æneid. He alfo tranflated Ovid's Epiftles; a great part of which he illuftrated with very curious Commentaries of his own. While he was at Paris, they talked of making him preceptor of Lewis XIII.: upon which he left the court in great hafte, and afterwards declared that he had never felt fo much pain upon any occafion of his life; for he feemed to have already upon his fhoulders the important weight of the whole kingdom. He undertook the tranflation of all Plutarch's works, with notes; which he had brought nearly to a conclufion, when he died at Bourg, in Breffe, anno 1638, at 45 years of age. He left behind him feveral finifhed works, that were not printed.

MEZZOTINTO, a particular manner of reprefenting figures on copper, fo as to form prints in imitation of painting in Indian ink.

The manner of making mezzotintos is very different from all other kinds of engraving and etching; fince, inftead of forming the figures with lines and fcratches made with the point of a graver, or by means of aquafortis, they are wholly formed by fcraping and burnifhing. Mezzotintos are made in the following manner: Take a well-polifhed copperplate, and beginning at the corner, rake or furrow the furface all over with a knife or inftrument made for the purpofe, firft one way, and then the other, till the whole is of a regular roughnefs, without the leaft fmooth part to be feen; in which ftate, if a paper was to be worked off from it at the copper-plate prefs, it would be all over black. When this is done, the plate is rubbed over with charcoal, black chalk, or black lead, and then the defign is drawn with white chalk; after which the out-lines are traced out, and the plate finifhed by fcraping off the roughnefs, fo as to leave the figure on the plate. The outlines and deepeft fhades are not fcraped at all; the next fhades are fcraped but little, the next more; and fo on, till the fhades gradually falling off, leave the paper white, in which places the plate is neatly burnifhed.

By an artful difpofition of the fhades and different parts of a figure on different plates, mezzotintos have been printed in colours, fo as nearly to refemble very beautiful paintings.

MIASMA, among phyficians, a particular kind of effluvia, by which certain fevers, particularly intermittents, are produced. See MEDICINE, n° 139.

MICA, GLIMMER, in natural hiftory, a genus of talcs. See TALC.

MICAH, or *The Book of* MICAH, a canonical book of the Old Teftament, written by the prophet Micah, who is the feventh of the twelve leffer prophets. He is cited by Jeremiah, and prophefied in the days of Jotham, Ahaz, and Hezekiah. He cenfures the reigning vices of Jerufalem and Samaria, and denounces the judgments of God againft both kingdoms. He likewife foretells the confufion of the enemies of the Jews, the coming of the Meffiah, and the glorious fuccefs of his church.

MICHAEL (Angelo Buonaruoti). See ANGELO.

MICHAEL (Angelo da Caravaggia). See ANGELO, and CARAVAGGIO.

Mount MICHAEL, one of the moft celebrated ftate-prifons of France, lies about 20 miles from Granville. It is a rock fituated in the middle of the bay of Avranches; and is only acceffible at low water. Nature has completely fortified one fide, by its craggy and almoft perpendicular defcent, which renders it impracticable to mount it by any addrefs or courage, however confummate. The other parts are furrounded by walls fenced with femilunar towers after the Gothic manner; but fufficiently ftrong, together with the advantages of its fituation, to render it impregnable to any attack. At the foot of the mountain begins a ftreet or town, which winds round its bafe to a confiderable height. Above are chambers where ftate-prifoners are kept, and where there are other buildings intended for refidence. On the fummit is erected the abbey itfelf, occupying a prodigious fpace of ground, and of a ftrength and folidity equal to its enormous fize; fince it has for many centuries withftood all the injuries of the weather, to which it is fo much expofed. In an apartment, called the *Sale de Chavalerie*, the knights of St Michael ufed to meet in folemn convocation on important occafions. They were the defenders and guardians of this mountain and abbey, as thofe of the temple, and of St John of Jerufalem, were of the holy fepulchre. The hall in which they met is very fpacious, but rude and barbarous. At one end is a painting of the archangel, the patron of their order; and in this hall Lewis XI. firft inftituted and invefted with the infignia of knighthood the chevaliers of the crofs of St Michael. There is a miferable dark apartment, or rather dungeon, in which many eminent perfons were formerly confined. In the middle of it is a cage, compofed of prodigious bars of wood; and the wicket which gives entrance into it is 10 or 12 inches in thicknefs. The infide of it comprifes about 12 or 14 feet fquare, and it is nearly 20 in height. Towards the latter end of the laft century, a certain newf-writer in Holland, who had prefumed to print fome very fevere and farcaftic reflections on Madame de

Michael.

Maintenon, was confined in this place. Some months after his publication, he was induced, by a perſon ſent expreſsly for that purpoſe, to make a tour into French Flanders. The moment he had quitted the Dutch territories, he was put under arreſt; and immediately, by his majeſty's expreſs command, conducted to Mount Michael, where he was ſhut up in this cage. Here he lived upwards of 23 years; and here he at length expired. During the long nights of winter, no candle or fire was allowed him. He was not permitted to have any book. He ſaw no human face, except the goaler; who came once every day to preſent him, through a hole in the wicket, with his little portion of bread and wine. No inſtrument was given him with which he could deſtroy himſelf: but he found means at length to draw out a nail from the wood, with which he engraved, or cut on the bars of his cage, certain fleurs de lis and armorial bearings, which formed his only employment and recreation. They are very curiouſly performed, conſidering the rudeneſs of his tool.

The ſubterraneous chambers in this mountain are ſaid to be ſo numerous, that the jailors themſelves do not know them. There are certain dungeons called *oubliettes*, into which they were accuſtomed anciently to let down malefactors guilty of very heinous crimes: they provided them with a loaf of bread and a bottle of wine, and then they were totally forgotten, and left to periſh by hunger in the dark vaults of the rock. This puniſhment, however, has not been inflicted by any king in the laſt or preſent century.

Here alſo is a remarkable chamber, in one corner of which is a kind of window; between this and the wall of the building is a very deep ſpace, of near 100 feet perpendicular, at the bottom of which is another window opening to the ſea. It is called the *Hole of Montgomeri;* and the hiſtory of it is as follows: In the year 1559, Henry II. king of France was unfortunately killed at a tournament by the count de Montgomeri ‡. He was a Huguenot; and having eſcaped the maſſacre of Paris, made head againſt the royal forces in Normandy, ſupported by queen Elizabeth with arms and money. Being driven from his fortreſſes in theſe parts, he retired to a rock called the *Tombelaine.* This is another ſimilar to Mount Michael; only three quarters of a league from it, and of nearly equal dimenſions. At that time there was a caſtle upon it, which hath ſince been demoliſhed, and of which ſcarce any veſtiges now remain. From this fortreſs, acceſſible only at low-water, he continually made excurſions, and annoyed the enemy, who never dared to attack him. He coined money, laid all the adjacent country under contribution, and rendered himſelf univerſally dreaded. Deſirous, however, to ſurpriſe Mount Michael, he found means to engage one of the monks reſident in the abbey; who promiſed to give him the ſignal for his enterpriſe by diſplaying a handkerchief. The monk having made the ſignal, betrayed him, and armed all his aſſociates, who waited Montgomeri's arrival. The chieftain came, attended by 50 choſen ſoldiers, all deſperate, and capable of any attempt. They croſſed the ſand; and having placed their ſcaling-ladders, mounted one by one. As they came to the top, they were diſpatched, each in turn, without noiſe. Montgomeri, who followed laſt, diſcovered the perfidy, and eſcaped with only two of his men, with whom he regained the Tombelaine. They preſerve with great care the ladders and grappling irons uſed on this occaſion. The count was at laſt beſieged and taken priſoner, by the mareſhal de Matignon, in 1574, at Domfront in Normandy; and Catharine de Medicis, who hated him for having been, though innocently, the cauſe of her huſband's death, cauſed him to be immediately executed.

‡ See *France*, nº 80.

The church of Mount Michael is a great curioſity. It ſtands on nine pillars of moſt enormous dimenſions, built on the ſolid rock. Each of them appear to be about 25 feet in circumference: beſides theſe, there are two others much inferior in ſize, on which the centre of the church reſts, and over which is the tower. The following is the legendary account of the origin of this church: In the reign of Childebert II. there was a biſhop of Avranches named *St Aubert.* To this holy man the archangel Michael was pleaſed to appear one night, and ordered him to go to this rock to build a church. St Aubert treated this as a dream; upon which the angel appeared a ſecond time; and being ſtill diſobeyed, he returned a third time; when, by way of imprinting his command upon the ſaint's memory, he made a hole in his ſkull, by touching it with his thumb. The ſkull is ſtill preſerved in the treaſury of the church. It is incloſed in a little ſhrine of gold, and a cryſtal, which opens over the orifice, admits the gratification of curioſity by the minuteſt examination of it. The hole is of a ſize and ſhape proportionable to the thumb ſaid to have produced it; but it is impoſſible to determine whether it has been really made by a knife, or any other way. It is not to be ſuppoſed that the ſaint would forget ſuch a ſenſible mark of the angel's diſpleaſure; he therefore immediately repaired to the rock, and conſtructed a ſmall church, as he had been commanded. Here, however, true hiſtory ſupplies the place of fable; and informs us, that it was in 966 when Richard the ſecond duke of Normandy began to build the abbey. It was completed about the year 1070, under William the Conqueror, though many other additions were made by ſucceeding abbots.

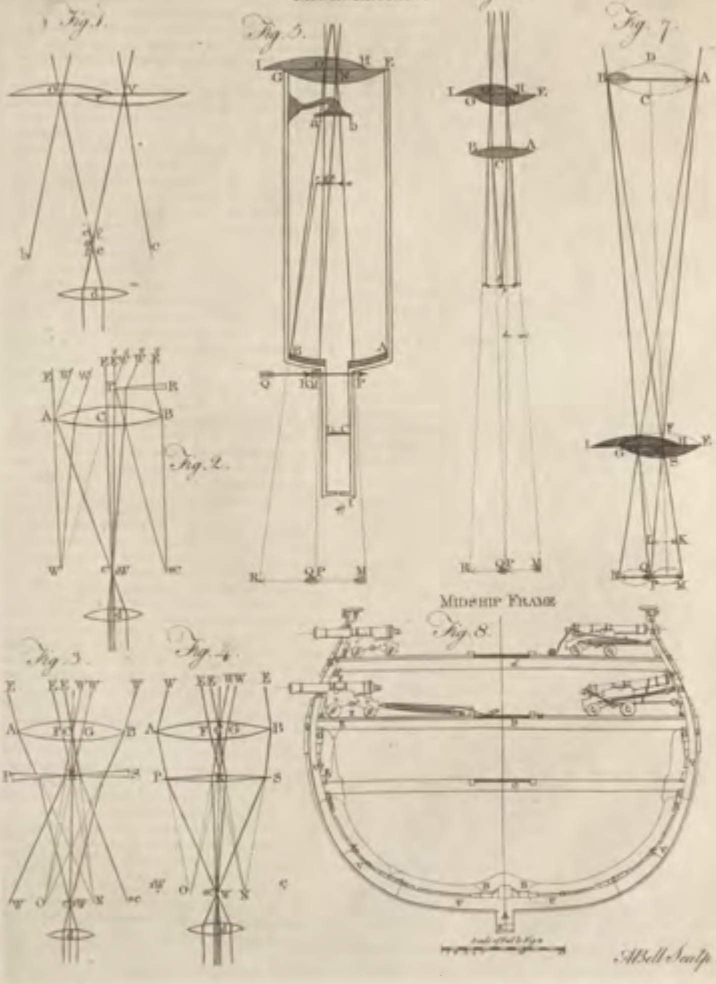
In the treaſury of the church are innumerable other relics; among which ſome few have a real and intrinſic value. There is a fine head of Charles VI. of France, cut in a cryſtal, and the repreſentation of a cockle-ſhell in gold, weighing many pounds, given by Richard II. duke of Normandy when he founded the abbey. There is an arm ſaid to belong to *St Richard* king of England; but who this ſaint was, muſt be very difficult to determine.

MICHAELMAS, or *Feaſt of St* MICHAEL *and all Angels*, a feſtival of the Chriſtian church, obſerved on the 29th of September.

The Scripture account of Michael is, That he was an archangel, who preſided over the Jewiſh nation, as other angels did over the Gentile world, as is evident of the kingdoms of Perſia and Greece; that he had an army of angels under his command; that he fought with the Dragon, or Satan and his angels; and that, contending with the devil, he diſputed about the body of Moſes.

As to the combat between Michael and the Dragon, ſome authors underſtand it literally, and think it means the expulſion of certain rebellious angels, with their

MICROMETERS. Plate CLXXV



their head or leader, from the prefence of God. Others take it in a figurative fenfe; and refer it, either to the conteft that happened at Rome between St Peter and Simon Magus, in which the apoftle prevailed over the magician; or to thofe violent perfecutions, under which the church laboured for 300 years, and which happily ceafed when the powers of the world became Chriftian.

The conteft about the body of Mofes is likewife taken both literally and figuratively. Thofe who underftand it literally, are of opinion, that Michael, by the order of God, hid the body of Mofes after his death, and that the devil endeavoured to difcover it, as a fit means to entice the people to idolatry by a fuperftitious worfhip of his relics. But this difpute is figuratively underftood to be a controverfy about rebuilding the temple, and reftoring the fervice of God among the Jews at Jerufalem, the Jewifh church being fitly enough ftyled the *body of Mofes*. It is thought by fome, that this ftory of the conteft between Michael and the devil was taken by St Jude out of an apocryphal book, called the *Affumption of Mofes*.

MICROCOSM, a Greek term fignifying the *little world;* ufed by fome for man, as being fuppofed an epitome of the univerfe or great world.

MICROGRAPHY, the defcription of objects too minute to be viewed without the affiftance of a microfcope. See MICROSCOPIC *Objects*.

MICROMETER, an inftrument, by the help of which the apparent magnitudes of objects viewed thro' telefcopes or microfcopes are meafured with great exactnefs.

The firft micrometers were only mechanical contrivances for meafuring the image of an object in the focus of the object-glafs. Before thefe contrivances were thought of, aftronomers were accuftomed to meafure the field of view in each of their telefcopes, by obferving how much of the moon they could fee through it, the femidiameter being reckoned at 15 or 16 minutes; and other diftances were eftimated by the eye, comparing them with the field of view. Mr Gafcoigne, an Englifh gentleman, however, fell upon a much more exact method, and had a treatife on Optics prepared for the prefs; but he was killed during the civil wars, in the fervice of Charles I. and his manufcript was never found. His inftrument, however, fell into the hands of Mr R. Townly, who fays, that by the help of it he could mark above 40,000 divifions in a foot.

Mr Gafcoigne's inftrument being fhewn to Dr Hooke, he gave a drawing and defcription of it, and propofed feveral improvements in it, which may be feen in *Phil. Tranf.* abr. Vol. I. p. 217. Mr Gafcoigne divided the image of an object, in the focus of the object-glafs, by the approach of two pieces of metal, ground to a very fine edge, in the place of which Dr Hooke would fubftitute two fine hairs ftretched parallel to one another. Two other methods of Dr Hooke's, different from this, are are defcribed in his Pofthumous Works, p. 497, 498. An account of feveral curious obfervations that Mr Gafcoigne made by the help of his micrometer, particularly in the menfuration of the diameters of the moon and other planets, may be feen in the Phil. Tranf. Vol. XLVIII. p. 190.

Mr Huygens, as appears by his Syftem of Saturn, publifhed in 1659, ufed to meafure the apparent diameters of the planets, or any fmall angles, by firft meafuring the quantity of the field of view in his telefcope; which, he fays, is beft done by obferving the time which a ftar takes up in paffing over it, and then preparing two or three long and flender brafs plates, of various breadths, the fides of which were very ftraight, and converging to a fmall angle. In making ufe of thefe pieces of brafs, he made them flide in two flits, that were made in the fides of the tube, oppofite to the place of the image, and obferved in what place it juft covered the diameter of any planet, or any fmall diftance that he wanted to meafure. It was obferved, however, by Sir Ifaac Newton, that the diameters of planets, meafured in this manner, will be larger than they fhould be, as all lucid objects appear to be, when they are viewed upon dark ones.

In the Ephemerides of the Marquis of Malvafia, publifhed in 1662, it appears that he had a method of meafuring fmall diftances between fixed ftars, and the diameters of the planets, and alfo of taking accurate draughts of the fpots of the moon; and this was by a net of filver wire, fixed in the common focus of the object and eye-glafs. He alfo contrived to make one of two ftars to pafs along the threads of this net, by turning it, or the telefcope, as much as was neceffary for that purpofe; and he counted, by a pendulum-clock, beating feconds, the time that elapfed in its paffage from one wire to another, which gave him the number of the minutes and feconds of a degree contained between the intervals of the wires of his net, with refpect to the focal length of his telefcope.

In 1666, Meffrs Auzout and Picard publifhed a defcription of a micrometer, which was nearly the fame with that of the Marquis of Malvafia, excepting the method of dividing it, which they performed with more exactnefs by a fcrew. In fome cafes they ufed threads of filk, as being finer than filver wires. Dechales alfo recommends a micrometer confifting of fine wires, or filken threads, the diftances of which were exactly known, difpofed in the form of a net, as peculiarly convenient for taking a map of the moon.

M. de la Hire fays, that there is no method more fimple or commodious for obferving the digits of an eclipfe than a net in the focus of the telefcope. Thefe, he fays, were generally made of filken threads; and that for this particular purpofe fix concentric circles had alfo been made ufe of, drawn upon oiled paper; but he advifes to draw the circles on very thin pieces of glafs with the point of a diamond. He alfo gives feveral particular directions to affift perfons in the ufe of them. In another memoir he fhews a method of making ufe of the fame net for all eclipfes, by ufing a telefcope with two object-glaffes, and placing them at different diftances from one another.

M. Caffini invented a very ingenious method of afcertaining the right afcenfions and declinations of ftars, by fixing four crofs hairs in the focus of the telefcope, and turning it about its axis, fo as to make them move in a line parallel to one of them. The difficulty there was in accomplifhing this was entirely removed by a mechanical contrivance of Dr Bradley.

M. Lewenhoek's method of eftimating the fize of fmall objects was by comparing them with grains of fand, of which 100 placed in a line took up an inch. Thefe grains he laid on the fame plate with his objects, Micrometer

jects, and viewed them at the same time. Dr Jurin's method was similar to this of M. Lewenhoek; for he found the diameter of a piece of fine silver-wire, by wrapping it as close as he could about a pin, and observing how many rings made an inch. For he used this wire in the same manner as Lewenhoek used his sand.

Mr Martin, in his Optics, recommends such a micrometer to a microscope as had been applied to telescopes; for he advises to draw a number of parallel lines on a piece of glass, with the fine point of a diamond, at the distance of $\frac{1}{40}$ of an inch from one another, and to place it in the focus of the eye-glass. By this method Dr Smith contrived to take the exact draught of objects viewed by a double microscope. For he advises to get a lattice, made with small silver wires or small squares, drawn upon a plain glass by the strokes of a diamond, and to put it into the place of the image formed by the object-glass. Then by transferring the parts of the object, seen in the squares of the glass or lattice, upon similar correspondimg squares, drawn on paper, the picture may be exactly taken. Mr Martin also introduced into compound miscroscopes another micrometer, consisting of a screw.

Dr Hooke used to look upon the magnified object with one eye, while, at the same time, he viewed other objects placed at the same distance with the other eye. In this manner he was able, by the help of a ruler, divided into inches and small parts, and laid on the pedestal of the microscope, to cast, as it were, the magnified appearance of the object upon the ruler, and thereby exactly to measure the diameter which it appeared to have through the glass; which being compared with the diameter as it appeared to the naked eye, easily shewed the degree in which it was magnified. This, says Mr Baker, is a ready and good method for many objects; and he declares, from his own experience, that a little practice will render it exceedingly easy and pleasant.

We are obliged to Dr Hooke for an excellent method of viewing the sun without injuring our eyes. For this purpose he contrived that the rays should be reflected from one plane to another, till it was so much weakened that the eye might receive it with great safety and pleasure. This method is much preferable to that of looking at the sun through a smoky or coloured glass, which gives it a red and disagreeable hue. His discourse on this subject was read before the Royal Society June 28 1675.

These micrometers, however, have several considerable defects. In particular, it is not easy to measure with them objects that are in motion, or those which are too large to come within the field of view; so that the diameters of the sun and moon cannot well be measured with them to any great degree of exactness. Another method was found of measuring the apparent magnitude of the object, free from the inconveniencies above mentioned, by means of a telescope furnished with two object-glasses. This ingenious method was hit upon about the same time both by Mr Servington Sauvery and the celebrated M. Bouguer.

In this instrument, both object-glasses are of equal focal distance, and placed one of them by the side of the other; so that the same eye-glass may serve for them both. By this means two distinct images of an object are formed in the focus of the eye-glass; and since the distance of these images depends upon the distance at which the two object-glasses are placed from one another, it may be measured with great accuracy. Nor is it necessary that the whole disc of the sun or moon come within the field of view; since, if the images of a small part of the disc be formed by each object-glass, the whole diameter may easily be computed, by their position with respect to one another. For if the object be large, the images will approach towards, or perhaps even ly over one another. And the object-glasses being moveable, the two images may always be brought exactly to touch one another, and the diameter may be computed from the known distance of the centres of the two glasses.

Another advantage attending this instrument is, that by having a common micrometer in the focus of the eye-glass, when the two images of the sun or moon are made in part to cover one another, that part which is common to both the images may be measured with great exactness, as being viewed upon a ground that is only one half less luminous than itself; whereas, in general, the heavenly bodies are viewed upon a dark ground, and on that account are imagined to be larger than they really are. By a small addition to this instrument, provided it be of a moderate length, M. Bouguer thought it very possible to measure angles of three or four degrees; which is of particular consequence in taking the distance of stars from the moon.

Mr Sauvery's paper containing a very particular description of his construction of this instrument was read at the Royal Society October 27. 1743, and M. Bouguer's account of his instrument which he called an *heliometer* is contained in the Memoirs of the Royal Academy of Sciences for the year 1748, p. 15.

A very great improvement was made in this kind of micrometer by Mr Dollond; for, instead of two complete object-glasses, he used only one, cut into two equal parts, one of them sliding by the other. Each half of this object-glass will give a separate and distinct image; and as the distance at which their centres are placed from one another may be exactly ascertained, the same uses may be made of them as of two entire object-glasses, and the application of them is much more commodious.

But the ground or reason of this new micrometer, as applied to the refractory or reflecting telescope, may be illustrated by figures, as follows:

Plate CLXXV. fig. 7.

Let ABCD represent any very distant object, as the sun, &c. and AB its diameter; also let EFGS represent the object-glass consisting of two segments EFG and ESG divided through the centre N in the right line EG. The angle under which it appears at the end of the telescope will be ANB equal to the angle KNL, under which the image KL is contained. Now, suppose the moveable segment EFG were by a mechanical contrivance drawn off to the position HI, the distance of their centres would be NO; and the two lines AN and BO passing through the centres N, O, of the segments, if produced, meet at the focus in L; and since BL and BK do also pass through the centres N and O, and the object being at an indefinitely great distance, the line OL will be parallel to

Micrometer to NK, and consequently the angle NLO is equal to the angle KNL or ANB; that is to say, *the angle under which the object appears from the end of the telescope (or to the naked eye), is equal to the angle under which the distance between the two centres of the segments appear from the solar focus of the telescope.*

And this will be the case in every distance of an object: for supposing the object AB were at some near distance from the telescope, and subtended the same angle ANB, the only consequence would be, that its image would be formed at a greater distance from the glass, suppose at MP: it would still be contained under the same angle MNP, equal to NLO, as before, upon the supposition that the segment HI and BO produced meets AP in the point P; that is to say, suppose that the segment HI is in such position that the moveable image QR formed by it, exactly coincides with the fixed image MP, formed by the segment ESG.

Concerning this vitreous micrometer we may farther observe, that its great excellency consists in this, that it depends solely in measuring the distance of the centres of the two segments, not only when applied alone at the end of a telescope, but even in conjunction with the object-glass of any common telescope; Fig. 6. for, let EG and HI represent the two segments, as before, of a glass whose focal distance is very long, suppose, for instance, 50 feet; then, at a small distance from it, let AB represent the object-glass of a common long telescope, whose focal distance of parallel rays is C *d*, or its focus of very distant objects *d c*. Then this glass, combined with the foregoing segments, will have its focus shortened, and the common focus of both will be in point *q*. Then because the triangles RCQ and PNM are similar to the triangles *r* O *q* and *p* N *m* respectively; therefore the images RQ and PM will be similar, and alike posited to the two small images *r q* and *p m*; and therefore when these two images are in contact in the focus of the semi-lenses, they will likewise be in contact in the shortened compound focus. And as the centres N and O of the two semi-lenses GE and IH are separated farther from, or brought nearer to, each other, the images in either focus will be moved in similar manner; and when the centres N and O coincide, the images in each focus respectively will also coincide, or become one entire image; the difference in every case being only as to large and small, greater or lesser distance. Consequently, in the micrometer by which those two semi-lenses are moved by each other, the same turns of the screw which measures the angle OPN, and which brings the images into an exact contact in the single focus at Q, will be necessary for the same purpose in the compound focus also; so that by this means we have an opportunity of measuring the said angle OPQ, without being obliged to have so great and so unmanageable a length of the telescope.

However, the larger the focal distance of the lens AB is, the more distinct the contact of the images will appear; and because this is the point on which the whole perfection of this micrometer depends, it will be likewise necessary to have it so contrived, when applied to a telescope, that the centres NO may be equally distant from the axis of the telescope or centre of the aperture on either side; because, in this case, the point of contact in the two images will be just in the centre of the focus, and therefore the most distinct that it possibly can be.

But the application of this micrometer to refracting telescopes will be less convenient than when it is applied to a reflecting telescope; for if it be placed on the open end of the reflecting telescope, then will the rays that tend to form the larger images RQ and PM be incident upon the larger speculum Fig. 5. AB, and from thence reflected to a compound focus, where the similar images *r q* and *p m* will be formed as before; the rays proceeding from these two images to the smaller speculum *a b*, will be reflected back through the hole of the larger, to form the images QR and PM, which likewise will still be in contact in the focus of the eye-glass DC, where it will be distinctly perceived by the eye at I. This contact will likewise be shewn in the focus of the eye-glass, if the centres O and N are properly disposed, as before-mentioned.

From what has been said, the general rationale of this micrometer will evidently appear; but one thing must not pass unregarded in an affair of such moment and consequence as the measuring these small angles in the science of astronomy. It has been customary to suppose, that the focus of a lens, or the local distance of rays parallel to its axis, is equal to the radius in a double and equally convex lens. But this is too great an error not to be noticed here; for in different sorts of glass there is found a different refractive power, and the focus of parallel rays is at a different distance in each; but this distance in no sort of glass is equal to the radius, but falls short of it more or less. Now the foregoing demonstration regards the radius, and not the focal distance of parallel rays.

With regard to the planets, as Jupiter is the largest of all, and subtends an angle to the eye of 3′ 12″, the diameter of his image in the focus of a 50 foot glass will be about half an inch; and that will be the utmost distance to which the centres of the segments will be required to be separated for measuring the apparent diameters of the planets.

But for a heliometer, the diameter of the sun, being near 10 times as great as that of Jupiter, will require the centres of the segments in a glass of 40 or 50 feet focus to be removed from each other at least to the distance of four or five inches; and to take in the whole system of Jupiter's moons, the distance of the centres will be required much larger; and therefore, for such purposes, the segments of glasses of a less focal length must be used.

But, valuable as the object-glass micrometer undoubtedly is, some difficulties have been found in the use of it, owing to the alterations in the focus of the eye, which are apt to cause it to give different measures of the same angle at different times. For instance, in measuring the sun's diameter, the axes of the pencils of rays, which come through the two segments of the object-glass from contrary limbs of the sun, crossing one another at the focus of the telescope under an angle equal to that of the sun's diameter, the union of the limbs of the two images of the sun cannot appear perfect unless the eye be disposed to see

Micrometer fee objects diftinctly which are placed at the point of interfection. But if the eye be difpofed to fee objects diftinctly, which are placed nearer the object-glafs than the interfection is, the two limbs will appear feparated by the interval of the axes of the pencils in that place; and if the eye be difpofed to fee objects diftinctly, which are placed farther from the object-glafs than the interfection is, the two limbs will appear to encroach upon each other by the diftance of the axes of the pencils, after their croffing, taken at that place.

Fig. 1. To explain this, let OV reprefent the centres of the two femicircular glaffes of the object-glafs micrometer, feparated to the diftance OV from each other, fubtending the angle O*a*V, equal to the fun's diameter, at the point *a*, which is the common focus of the two pencils of rays having O*a* and V*a* for their axes, namely, thofe proceeding from contrary fides of the fun, and paffing through the contrary femi-circles; and let *d* be the eye-glafs. It is evident, that if *d* be properly placed to give diftinct vifion of objects placed at the point *a*, the rays O*a*, V*a*, as well as all the other rays belonging to thofe pencils, will be collected into one point upon the retina of the eye; and confequently, the two oppofite limbs of the two images of the fun will feem to coincide, and the two images of the fun to touch one another externally. But if the ftate of the eye fhould alter, the place of the eye-glafs remaining the fame, the eye will be no longer difpofed to fee the image formed at the point *a* diftinctly, but to fee an object placed at *ef*, nearer to or farther from the object-glafs diftinctly; and therefore an image will be formed on the retina exactly fimilar to the fomewhat confufed image formed by the rays on a plane perpendicular to their courfe at *ef*. Confequently, as the two cones of folar rays, *b*O *a*, *c*V*a*, formed by the two femi-circles, are feparated or encroach upon one another at this point of the axis by the diftance *ef*, the two images of the fun will not feem to touch one another externally, but to feparate or to encroach upon one another by the interval *ef*. The error hereby introduced into the meafure of the fun's diameter will be the angle *erf*, fubtended by *ef* at *r* the middle point between O and V, which is to *caf* or O*a*V, the fun's apparent diameter, as e e to e *r*, or even to *ar*, on account of the fmallnefs of *a* e with refpect to *ar*.

Thefe confiderations concerning the caufe of a principal error that has been found in the object-glafs micrometer led to an inquiry, whether fome method might not be found of producing two diftinct reprefentations of the fun, or any other object, which fhould have the axes of the pencils of rays, by which they are formed, diverging from one and the fame point, or nearly fo: and it occurred to Mr Mafkelyne, that this might be done by the refraction of a prifm placed to receive part of the rays proceeding from the object, either before or after their refraction through the object-glafs of a telefcope. If the prifm be placed without the object-glafs, the rays that are refracted thro' it will make an angle with the rays that pafs befide it equal to the refraction of the prifm; and this angle will not be altered by the refraction of the object-glafs afterwards. Confequently, two images of an object will be reprefented, and the prifm fo applied will enable us to meafure the apparent diameter of any object, or any other angular diftance which is equal to the refraction of the prifm. But if the prifm be placed within the object-glafs, that is to fay, between the object-glafs and eye-glafs, the angle meafured by the inftrument will vary according to the diftance of the prifm from the focus of the object-glafs, bearing the fame ratio to the refraction of the prifm, as the diftance of the prifm from the focus bears to the focal length of the object-glafs.

Let ACB (fig. 2.) reprefent the object-glafs and *d* the eye-glafs of a telefcope, and PR a prifm placed to intercept part of the rays coming from an object, fuppofe the fun, before they fall on the object-glafs. The rays EE proceeding from the eaftern limb of the fun, and refracted through the object-glafs ACB without paffing through the prifm, will form the correfponding point of the fun's image at e; and the rays WW proceeding in like manner from the weftern limb of the fun will be refracted to form the correfponding point of the fun's image at W. But the rays 2E, 2E, 2W, 2W, proceeding in like manner from the eaftern and weftern limbs of the fun, and falling on the prifm PR, and thence refracted to the object-glafs ACB, will, after refraction through it, form the correfpondent points of the fun's image at 2e, 2W. Let the refraction of the prifm be equal to the fun's apparent diameter: in this cafe, at whatever diftance the prifm be placed beyond the object-glafs, the two images of the fun We, 2W 2e, will touch one another externally at the point e2W; for the rays 2W, 2W, proceeding from the weftern of the fun being inclined to the rays EE proceeding from the eaftern limb in the angle of the fun's apparent diameter, will, after fuffering a refraction in paffing through the prifm equal to the fun's apparent diameter, emerge from the prifm and fall upon the object-glafs parallel to the rays EE, and confequently will have their focus 2W coincident with the focus e of the rays EE; and therefore the two images of the fun We, 2W 2e, will touch one another externally at the point e 2W, and the inftrument will meafure the angle EC2W, and that only.

But if the prifm be placed within the telefcope, the angle meafured by the inftrument will be to the refraction of the prifm as the diftance of the prifm from the focus of the object-glafs is to the focal diftance of the object-glafs: or if two prifms be ufed to form the two images, with their refracting angles placed contrary ways, as reprefented in fig. 3. and 4. the angle meafured will be to the fum of the refractions of the prifm, as the diftance of the prifms from the focus of the object-glafs is to the focal diftance of the object-glafs. For let ACB (fig. 3.) reprefent the object-glafs, and *d* the eye-glafs of a telefcope, and PR, RS, two prifms interpofed between them, with their refracting angles turned contrary ways, and the common fections of their refracting planes touching one another at R. The rays proceeding from an object, fuppofe the fun, will be difpofed, by the refraction of the object-glafs, to form an image of the fun at the focus; but part of them falling on one prifm, and part on the other, will be thereby refracted contrary ways, fo as to form two equal images We, 2W 2e, which, if the refractions of the prifms be of proper quantities, will touch one another externally at the point e 2W.

Let

Micrometer

Let ECN be the axis of the pencil of rays EE proceeding from the fun's eaftern limb; and WCO the axis of the pencil of rays WW proceeding from the fun's weftern limb; and the point N the place where the image of the fun's eaftern limb would be formed, and the point O where that of the weftern limb would be formed, were not the rays diverted from their courfe by the refractions of the prifms. But by this means part of the rays EE, which were proceeding to N, falling on the prifm PR, will be refracted to form an image of the fun's eaftern limb at *e*, while others of the rays EE, which fall on the prifm RS, will be refracted to form an image of the fun's eaftern limb at 2*e*. In like manner, part of the rays WW, which were proceeding to form an image of the fun's weftern limb at O, falling on the prifm RS, will be refracted to form an image of the fun's weftern limb at 2W coincident with e, the point of the image correfpondent to the fun's eaftern limb; while others of the rays WW, which fall on the prifm PR, will be refracted to form the image of the fun's weftern limb at W. The two images We, 2W 2e, are fuppofed to touch one another externally at the point e2W. The ray EFR, which belongs to the axis ECN, and is refracted by the prifm PR to e, undergoes the refraction NRe, which (becaufe fmall angles are proportional to their fines, and the fine of NR*e* is equal to the fine of its fupplement NRC), is to NCR as NC or C*e* is to NR or R*e*. In like manner, the ray WGR, which belongs to the axis WCO, and is refracted by the prifm RS to 2W or e, undergoes the refraction ORe, which is to OCe as OC or Ce is to RO or Re; therefore, by compofition, ORN the fum of the refractions OR*e*, NR*e*, is to OCN the fum of the angles OC*e*, NC*e*, or the fun's apparent diameter, as C*e* to R*e*; that is, as the focal diftance of the object-glafs to the diftance of the prifms from the focus of the object-glafs.

Or let the prifms PR, RS, be placed with their refracting angles P, S, turned from one another as in fig. 4.: the refraction of the prifm PR will transfer the image of the fun from ON to We, and the refraction of the prifm RS will transfer the image ON to 2W 2e, the two images 2W 2e, We, touching one another externally at the point 2We. Let ECN, WCO, be the axes of the pencils of rays proceeding from the two extreme limbs of the fun, and N, O, the points where the images of the fun's eaftern and weftern limbs would be formed by the object-glafs, were it not for the refraction of the prifms; the ray EFR, which belongs to the axis ECN, and is refracted by the prifm RS, to 2e, undergoes the refraction NR2e; and the ray WGR, which belongs to the axis WCO, and is refracted by the prifm PR to W, undergoes the refraction ORW. Now NC2e, part of the angle meafured, is to NR2e, the refraction of the prifm RS, as RW to CW; and OCW, the other part of the angle meafured, is to ORW, the refraction of the prifm PR, in the fame ratio of RW to CW: therefore OCN, the whole angle meafured, is to ORN, the fum of the refractions of the two prifms, as RW to CW; that is, as the diftance of the prifms from the focus of the object-glafs to the focal diftance of the object-glafs.

When the prifms are placed in the manner reprefented in fig. 3. the point e of the image We is illuminated only by the rays which fall on the object-glafs between A and F, and the point 2W only by the rays which fall on the object-glafs between B and G. Now the angles CRF, CRG, equal to the refractions of the prifms, being conftant, the fpaces FC, CG, will increafe in proportion as the diftances RF, RG, increafe, and the fpaces AF, GB, diminifh as much; and therefore the images at the point of mutual contact e2W will be each illuminated by half the rays which fall on the object-glafs when the prifms are placed clofe to the object-glafs, but will be enlightened lefs and lefs the nearer the prifms are brought to the focus of the object-glafs.

But when the prifms are placed in the manner fhewn in fig. 4. the images at the point of contact, as the prifms are removed from the object-glafs towards the eye-glafs, will be enlightened with more than half the rays that fall on the object-glafs, and will be moft enlightened when the prifms are brought to the focus itfelf; for the point 2e of the image 2W 2e will be enlightened by all the rays EE that fall on the object-glafs between B and B, and the point W of the image W e will be enlightened by all the rays WW which fall on the object-glafs between A and G. But the difference of the illuminations is not very confiderable in achromatic telefcopes, on account of the great aperture of the object-glafs; as the greateft fpace FG is to the focal diftance of the object-glafs as the fum of the fines of the refractions of the prifms is to the radius.

There is a third way, and perhaps the beft, of placing the prifm, fo as to touch one another along their fides which are at right angles to the common fections of their refracting planes. In this difpofition of the prifms the images will be equally enlightened, namely, each with half the rays which fall on the object-glafs, wherever the prifms be placed between the object-glafs and eye-glafs.

From what has been fhewn it appears, that this inftrument, which may be properly called the *prifmatic micrometer*, will meafure any angle that does not exceed the fum of the refractions of the prifms, excepting only very fmall angles, which cannot be taken with it on account of the vanifhing of the pencils of rays at the juncture of the two prifms near the focus of the object-glafs; that it will afford a very large fcale, namely, the whole focal length of the object-glafs, for the greateft angle meafured by it; and that it will never be out of adjuftment; as the point of the fcale where the meafurement begins (or the point of O) anfwers to the focus of the object-glafs, which is a point for celeftial objects, and a point very eafily found for terreftial objects. All that will be neceffary to be done, in order to find the value of the fcale of this micrometer, will be to meafure accurately the diftance of the prifms from the focus when the inftrument is fet to meafure the apparent diameter of any object fubtending a known angle at the centre of the object-glafs, which may be eafily found by experiment, as by meafuring a bafe and the diameter of the object obferved placed at the end of it, in the manner practifed with other micrometers: for the angle fubtended by this object will be to the angle fubtended by a celeftial object, or very remote land-object, when the diftance of the prifms from the principal

cipal focus is the fame as it was found from the actual focus in the terreftrial experiment, as the principal focal diftance of the object-glafs is to the actual focal diftance in the faid experiment.

It will probably be the beft way in practice, inftead of one prifm to ufe two prifms, refracting contrary ways, and fo divide the refraction between them (as reprefented in fig. 3. and 4.). Achromatic prifms, each compofed of two prifms of flint and crown-glafs, placed with their refracting angles contrary ways, will unoubtedly be neceffary for meafuring angles with great precifion by this inftrument: and we can only add with pleafure, that it is found by experiment made with this inftrument, as it was executed by Mr Dollond with achromatic prifms, ground with great care for this trial fometime ago, that the images, after refraction through the prifms, appear very diftinct; and that obfervations of the apparent diameters of objects may be taken in the manner here propofed with eafe and precifion.

Two or more fets of prifms may be adapted to the fame telefcope, to be ufed each in their turn, for the more commodious meafurement of different angles. Thus it may be very convenient to ufe one fet of prifms for meafuring angles not exceeding 36′, and confequently fit for meafuring the diameters of the fun and moon, and the lucid parts and diftances of the cufps in their eclipfes; and another fet of prifms to meafure angles not much exceeding one minute, and confequently fit for meafuring the diameters of all the other planets. This latter fet of prifms will be the more convenient for meafuring fmall angles, on account of a fmall imperfection attending the ufe of this micrometer, as before mentioned; namely, that angles cannot be meafured with it when the prifms approach very near the focus of the object-glafs, the pencils of rays being there loft at the point where the prifms touch one another.

Upon the principles that have been here explained, a prifm placed within the telefcope of an aftronomical inftrument, adjufted by a plumb-line or level, to receive all the rays that pafs through the object-glafs, may conveniently ferve the purpofe of a micrometer, and fuperfede the ufe both of the vernier fcale and the external micrometer; and the inftrument may then be always fet to fome even divifion before the obfervation. Thus the ufe of a telefcopic level may be extended to meafure with great accuracy the horizontal refractions, the depreffion of the horizon of the fea, and fmall altitudes and depreffions of land-objects. Time and experience will doubtlefs fuggeft many other ufeful applications of this inftrument.

But the greateft improvement which the micrometer hath yet received is from Dr Mafkelyne, who hath invented a catoptric one. This, befides the advantage it derives from the principle of reflection, of not being difturbed by the heterogeneity of light, avoids every defect of other micrometers, and can have no aberration, nor any defect which arifes from the imperfection of materials, or of execution, as the extreme fimplicity of its conftruction requires no additional mirrors or glaffes to thofe required for the telefcope: and the feparation of the image being effected by the inclination of the two fpecula, and not depending on the focus of any lens or mirror, any alteration, in the eye of an obferver, cannot affect the angle meafured.

It has, peculiar to itfelf, the advantages of an adjuftment to make the images coincide in a direction perpendicular to that of their motion; and alfo of meafuring the diameter of a planet on both fides the zero, which will appear no inconfiderable advantage to obfervers who know how much eafier it is to afcertain the contact of the external edges of two images than their perfect coincidence. A fhort explanation of the annexed drawings will make the conftruction and the properties of this micrometer obvious.

"I divided (fays Mr Mafkelyne) the fmall fpeculum of a reflecting telefcope, of Caffegrain's conftruction, into two equal parts, by a plane acrofs its centre; and by inclining the halves of the fpeculum to each other on an axis at right angles to the plane that feparated them, I obtained two diftinct images. The fatisfaction I received on the firft trial was checked by the apparent impoffibility of reducing this principle to practice. The angular feparation of the two images in this cafe being half the angular inclination of the two fpecula, it required an index of an unmanageable length to allow the quantity of one fecond of a degree to become vifible. Some time afterwards, on revifing the principle, I confidered, that if both the halves of the mirror turned on their centre of curvature, there could be no alteration in their relative inclination to each other from their motion on this centre; and that any extent of fcale might be obtained, by fixing the centre of motion at a proportional diftance from the common centre of curvature. This will be better underftood from the annexed figure.

"R (fig. 1.) reprefents the fmall fpeculum divided into two equal parts; one of which is fixed on the end of the arm B; the other end of the arm is fixed on a fteel axis X, which croffes the end of the telefcope C. The other half of the mirror R is fixed on the arm D, which arm at the other end terminates in a focket *y*, that turns on the axis, X; both arms are prevented bending by the braces *a a*. G reprefents a double fcrew, having one part *e* cut into double the number of threads in an inch to that of the part *g*: the part *e* having 100 threads in one inch, and the part *g* 50 only. The fcrew *e* works in a nut F in the fide of the telefcope, while the part *g* turns in a nut H, which is attached to the arm B; the ends of the arms B and D, to which the mirrors are fixed, are feparated from each other by the point of the double fcrew preffing againft the ftud *h*, fixed to the arm D, and turning in the nut H on the arm B. The two arms B and D are preffed againft the direction of the double fcrew *e g* by a fpiral fpring within the part *n*, by which means all fhake or play in the nut H, on which the meafure depends, is entirely prevented. Plate CLXXVII.

"From the difference of the threads on the fcrew at *e* and *g*, it is evident, that the progreffive motion of the fcrew through the nut will be half the diftance of the feparation of the two halves of the mirror; and confequently the half mirrors will be moved equally in contrary directions from the axis of the telefcope C.

"The wheel V fixed on the end of the double fcrew has its circumference divided into 100 equal parts, and numbered at every fifth divifion with 5, 10, &c. to 100, and the index I fhews the motion of the fcrew with

Fig. 1.

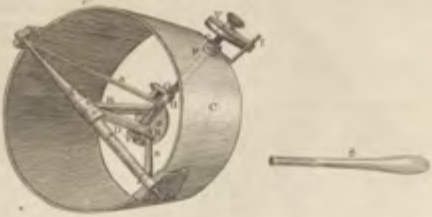

Fig. 2.

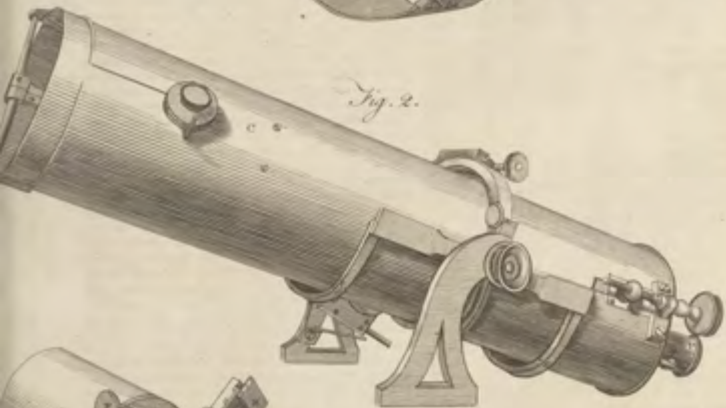

Fig. 3.

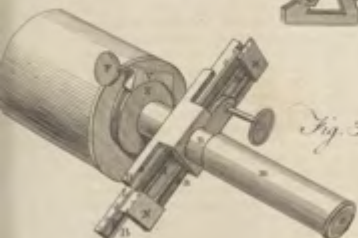

Fig. 4.

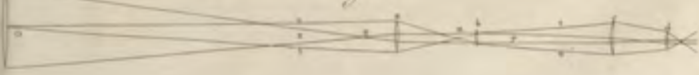

A. Bell Sculp.

Micrometer with the wheel round its axis, while the number of revolutions of the ſcrew is ſhewn by the diviſions on the ſame index. The ſteel ſcrew at R may be turned by the key S, and ſerves to incline the ſmall mirror at right angles to the direction of its motion. By turning the finger-head T (fig. 2.) the eye-tube P is brought nearer or farther from the ſmall mirror, to adjuſt the teleſcope to diſtinct viſion; and the teleſcope itſelf hath a motion round its axis for the conveniency of meaſuring the diameter of a planet in any direction. The inclination of the diameter meaſured with the horizon is ſhewn in degrees and minutes by a level and vernier on a graduated circle, at the breech of the teleſcope.

" The method of adjuſting and uſing the catoptric micrometer is too obvious to require any explanation: it is only neceſſary to obſerve, that, beſides the table for reducing the revolutions and parts of the ſcrew to minutes, ſeconds, &c. it may require a table for correcting a very ſmall error which ariſes from the excentric motion of the half-mirrors. By this motion their centres of curvature will (when the angle to be meaſured is large) approach a little towards the large mirror: the equation for this purpoſe in ſmall angles is inſenſible; but when angles to be meaſured exceed ten minutes, it ſhould not be neglected. Or, the angle meaſured may be corrected by diminiſhing it in the proportion the verſed ſine of the angle meaſured, ſuppoſing the excentricity radius, bears to the focal length of the ſmall mirror.

" The teleſcope to which the catoptric micrometer is applied is of the Caſſegrain conſtruction. The great ſpeculum is about 22 inches focus, and bears an aperture of $5\frac{1}{10}$ inches, which is conſiderably larger than thoſe of the ſame focal length are generally made: indeed, the apparent utility of this micrometer makes me wiſh to ſee the reflecting teleſcope meet with further improvements. I believe it would more tend to the advancement of the art of working mirrors, if writers on this ſubject, inſtead of giving us their methods of working imaginary parabolas, would demonſtrate the properties of curves for mirrors, which, placed in a teleſcope, will ſhew images of objects perfectly free from aberration; or, what will yet be more uſeful in practice, of what forms ſpecula might be made, that the aberration cauſed by one mirror may be corrected by that of the other. If mathematicians aſſume *data* which really exiſt, they muſt ſee, that when the two ſpecula of a reflecting teleſcope are parabolas, they cauſe a very conſiderable aberration, which is negative, that is to ſay, the focus of the extreme ray is longer than thoſe of the middle ones. If the large ſpeculum is a parabola, the ſmall one ought to be an ellipſe; but when the ſmall ſpeculum is ſpherical, which is generaly the caſe in practice, if concave, the figure of the large ſpeculum ought to be an hyperbola; if convex, the large ſpeculum ought to be an ellipſe, to free the teleſcope from aberration.

" This will be eaſier underſtood by attending to the poſitions of the firſt and ſecond images; when a curve is of ſuch form that lines drawn from each image, and meeting in any part of the curve, make equal angles with the tangent to the curve at that point, it is evident, that ſuch curve will be free from aberration.

" This is the property of a circle when the radiant Micrometer and image are in the ſame place; but, when they recede from each other, of an ellipſe, of ſuch form that the radiant and image are in the two *foci*, till, one diſtance becoming infinite the ellipſe changes into a parabola, and to an hyperbola when the focus is negative; that is to ſay, when reflected rays diverge, and the focus is on the oppoſite ſide of the mirror.

" Theſe principles made me prefer Caſſegrain's conſtruction of the reflecting teleſcope to either the Gregorian or Newtonian. In the former, errors cauſed by one ſpeculum are diminiſhed by thoſe in the other.

" From a property of the reflecting teleſcope (which has not been attended to) that the apertures of the two ſpecula are to each other very nearly in the proportion of their focal lengths, it follows, that their aberrations will be to each other in the ſame proportion; and theſe aberrations are in the ſame direction, if the two ſpecula are both concave; or in contrary directions, if one ſpeculum is concave, and the other convex.

" In the Gregorian conſtruction, both ſpecula being concave, the aberration at the ſecond image will be the ſum of the aberrations of the two mirrors; but in the Caſſegrain conſtruction, one mirror being concave, and the other convex, the aberration at the ſecond image will be the difference between their aberrations. By aſſuming ſuch proportions for the *foci* of the ſpecula as are generally uſed in the reflecting teleſcope, which is about as 1 to 4, the aberration in the Caſſegrain conſtruction will be to that in the Gregorian as 3 to 5.

" I have mentioned theſe circumſtances in hopes of recommending the demonſtration of curves ſuited to the purpoſes of optics to the attention of mathematicians, which would be of great uſe to artiſts.

" I ſhall conclude with the deſcription of a new micrometer ſuited to the principle of refraction; being ſenſible that both principles have their peculiar advantages. Though the former part of this paper proves my partiality to the principle of reflection applied to micrometers, yet the favourable opinion I have of the refracting teleſcope made me attentively conſider ſome means of applying a micrometer to it, which might obviate the errors complained of in the former part of this paper.

" The application of any lens or medium between the object-glaſs and its focus muſt inevitably deſtroy the diſtinctneſs of the image; I therefore have employed for the micrometer-glaſs, one of the eye-glaſſes requiſite in the common conſtruction of the teleſcope; but if it ſhould be found neceſſary to apply an additional eye-glaſs for the conveniency of enlarging the ſcale, I am able thereby to correct both the colours and ſpherical aberration of the firſt eye-glaſs.

" This micrometer is applied to the erect eye-tube of a refracting teleſcope, and is placed in the conjugate focus of the firſt eye-glaſs: hence ariſes its great ſuperiority to the object-glaſs micrometer. It has been before obſerved, that if a micrometer is applied at the object-glaſs, the imperfections of its glaſs are magnified by the whole power of the teleſcope; but in this poſition, the image being conſiderably magnified before it comes to the micrometer, any imperfection in its glaſs will be magnified only by the remaining eye-glaſſes, glaffes, which in any telefcope feldom exceeds five or fix times.

"By this pofition the fize of the micrometer glafs will not be the $\frac{1}{100}$ part of the area which would be required if it was placed in the object-glafs; and, notwithftanding this great difproportion of fize, which is of great moment to the practical optician, the fame extent of fcale is preferved, and the images are uniformly bright in every part of the field of the telefcope.

"Fig. 4. reprefents the glaffes of a refracting telefcope; *x y* the principal pencil of rays from the object-glafs O; *t t* and *u u*, the axis of two oblique pencils; *a*, the firft eye-glafs; *m*, its conjugate focus, or the place of the micrometer; *b* the fecond eye-glafs; *c* the third; and *d* the fourth, or that which is neareft the eye. Let *p* be the diameter of the object-glafs, *e* the diameter of a pencil at *m*, and *f* the diameter of the pencil at the eye; it is evident, that the axis of the pencils from every part of the image will crofs each other at the point *m*; and *e*, the width of the micrometer-glafs, is to *p* the diameter of the object-glafs as *m a* is to *g o*, which is the proportion of the magnifying power at the point *m*; and the error caufed by an imperfection in the micrometer-glafs placed at *m* will be to the error, had the micrometer been at O, as *m* is to *p*.

"Fig. 3. reprefents the micrometer; A, a convex or concave lens divided into two equal parts by a plane acrofs its centre; one of thefe femi-lenfes is fixed in a frame B, and the other in the frame E; which two frames flide on a plate H, and are preffed againft it by thin plates *a a*: the frames B and E are moved in contrary directions by turning the button D; L is a fcale of equal parts on the frame B; it is numbered from each end towards the middle with 10, 20, &c. There are two verniers on the frame E, one at M and the other at N, for the conveniency of meafuring the diameter of a planet, &c. on both fides the zero. The firft divifion on both thefe verniers coincides at the fame time with the two zeros on the fcale L; and, if the frame is moved towards the right, the relative motion of the two frames is fhewn on the fcale L by the vernier M; but if the frame B be moved towards the left, the relative motion is fhewn by the vernier N.

"This micrometer has a motion round the axis of vifion, for the conveniency of meafuring the diameter of a planet, &c. in any direction, by turning an endlefs fcrew F, and the inclination of the diameter meafured with the horizon is fhewn on the circle *g* by a vernier on the plate V. The telefcope may be adjufted to diftinct vifion by means of an adjufting fcrew, which moves the whole eye-tube with the micrometer nearer or farther from the object-glafs, as telefcopes are generally made; or the fame effect may be produced in a better manner, without moving the micrometer, by fliding the part of the eye-tube *m* on the part *n*, by help of a fcrew or pinion. The micrometer is made to take off occafionally from the eye-tube, that the telefcope may be ufed without it."

MICROPUS, BASTARD CUDWEED; a genus of the polygamia fegregata order, belonging to the fyngenefia clafs of plants. There are two fpecies, the fupinus and erectus; but only the former is ever cultivated in gardens. It is an annual plant growing naturally in Portugal, in places near the fea. The root fends out feveral trailing ftalks, about fix or eight inches long, which are garnifhed with fmall, oval, filvery leaves, whofe bafes embrace the ftalks. The flowers comes out in clufters from the wings of the ftalks, and are very fmall, and of a white colour. It flowers in June and July; and is frequently preferved in gardens on account of the beauty of its filvery leaves. It is eafily propagated by feed fown in autumn, and requires no other culture but to be kept free from weeds.

MICROSCOPE, an optical inftrument, confifting of lenfes, or mirrors, by means of which fmall objects appear larger than they do the naked eye. Single microfcopes confift of lenfes or mirrors; or if more lenfes or mirrors be made ufe of, they only ferve to throw light upon the object, and not contribute to enlarge the image of it. Double microfcopes are thofe in which the image of an object is compofed by means of more lenfes or mirrors than one. For the principles on which the conftruction of microfcopes depend, and the beft methods of making them, fee (the *Index* fubjoined to) OPTICS.

MICROSCOPIC OBJECTS. All things too minute to be viewed diftinctly by the naked eye, are proper objects for the microfcope. Whatever object offers itfelf as the fubject of our examination, the fize, contexture, and nature of it are firft to be confidered, in order to apply to it fuch glaffes and in fuch a manner as may fhew it beft. The firft ftep fhould always be to view the whole of it together, with fuch a magnifier as can take it all in at once; and after this the feveral parts of it may the more fitly be examined, whether remaining on the object or feparated from it. The fmaller the parts are, the more powerful ought the magnifiers to be which are employed: the tranfparency or opacity of the object muft alfo be confidered, and the glaffes employed accordingly fuited thereto; for a tranfparent object will bear a much greater magnifier than one which is opake, fince the nearnefs that a glafs muft be placed at, unavoidably darkens an object if in its own nature opake, and renders it very difficult to be feen, unlefs by the help of the apparatus contrived for that purpofe, which has a filver fpeculum. Moft objects, however, become tranfparent by being divided into extremely thin parts.

The nature of the object alfo, whether it be alive or dead, a folid or a fluid, an animal, a vegetable, or a mineral fubftance, muft likewife be confidered, and all the circumftances of it attended to, that we may apply it in the moft advantageous manner. If it be a living object, care muft be taken not to fqueeze or injure it, that we may fee it in its natural ftate and full perfection. If it be a fluid, and that too thick, it muft be diluted with water; and if too thin, we fhould let fome of its watery parts evaporate. Some fubftances are fitteft for obfervation when dry, others when moiftened; fome when frefh, and others after they have been kept fome time.

Light is the next thing to be taken care of, for on this the truth of all our obfervations depends; and a very little obfervation will fhew how very different objects appear in one degree of it to what they do in another;

other; fo that every new object fhould be viewed in all degrees of light, from the greateft glare of brightnefs to perfect obfcurity; and that in all pofitions to each degree, till we hit upon the certain form and figure of it. In many objects it is very difficult to diftinguifh between a prominency and a depreffion, a black fhadow and a black ftain; and in colour, bebetween a bright reflection and whitenefs. The eye of a fly in one kind of light appears like a lattice drilled full of holes, in the fun-fhine like a folid fubftance covered with golden nails; in one pofition like a furface covered with pyramids, in another with cones, and in others with ftill different fhapes.

The degree of light muft always be fuited to the object. If that be dark, it muft be feen in a full and ftrong light; but if tranfparent, the light fhould be proportionably weak; for which reafon there is a contrivance both in the fingle and double microfcope to cut off abundance of the rays, when fuch tranfparent objects are to be examined by the largeft magnifiers. The light of a candle for many objects, and efpecially for fuch as are very bright and tranfparent, and very minute, is preferable to day-light: for others, a ferene day-light is beft: but fun-fhine is the worft light of all; for it is reflected from objects with fo much glare, and exhibits fuch gaudy colours, that nothing can be determined from it with any certainty. This, however, is not to be extended to the folar or *camera obfcura Microfcope;* for in that nothing but fun-fhine can do, and the brighter that is, the better; but in that way we do not fee the object itfelf on which the fun-fhine is caft, but only the image or fhadow of it exhibited on a fcreen; and therefore no confufion can arife from the glaring reflection of the fun's rays from the object to the eye, which is the cafe in other microfcopes. But then in that folar way we muft reft contented with viewing the true form and fhape of an object, without expecting to find its natural colour; fince no fhadow can poffibly wear the colour of the body it reprefents.

Moft objects require alfo fome management in order to bring them properly before the glaffes. If they are flat and tranfparent, and fuch as will not be injured by preffure, the beft way is to inclofe them in fliders between two Mufcovy talcs or ifinglaffes. This way the feathers of butterflies, the fcales of fifhes, and the farinæ of flowers, may be very conveniently preferved, as alfo the parts of infects, the whole bodies of minute ones, and a great number of other things. Thefe are to be kept in fliders, each containing three, four, or more holes: and thefe muft not be filled promifcuoufly; but all the things preferved in one flider fhould be fuch as require one and the fame magnifying power to view them, that there may not be a neceffity of changing the glaffes for every object; and the fliders fhould be marked with the number of the magnifier it is proper to be viewed with. In placing the objects in the fliders, it is always proper to have a fmall magnifier, of about an inch focus, in your hand, to examine and adjuft them by, before they are fixed down with the rings.

Small living objects, fuch as lice, fleas, bugs, mites, minute fpiders, &c. may be placed between thefe talcs without injuring them, if care be taken to lay on the brafs rings without preffing them down, and they will remain alive many weeks in this manner; but if they are too large to be treated thus, they fhould be either preferved between two concave glaffes, or elfe viewed immediately, by holding them in the pliers, or fticking them on the point at the other end of that inftrument.

If fluids come under examination, to difcover the animalcules in them, a fmall drop is to be taken with a hair-pencil, or on the nib of a clean pen, and placed on a plate of glafs; and if they are too numerous to be thus feen diftinctly, fome water, warmed by holding it in the mouth, muft be added to the drop, and they will then feparate and be feen diftinctly. This is particularly neceffary in viewing the animalcules in the *femen mafculinum* of all creatures; which, though extremely minute, are always fo numerous, that without this caution their true form can feldom be feen. But if we are to fee the falts in a fluid, the contrary method muft be obferved, and the plate of glafs muft be held gently over the fire, till part of the liquor is evaporated.

The diffection of minute animals, as lice, fleas, &c. requires patience and care: but it may be done very accurately by means of a needle and a fine lancet, placing the creature in a drop of water; for then the parts will readily unfold themfelves, and the ftomach, guts, &c. be very diftinctly feen.

Thefe feem the beft ways of preferving tranfparent objects; but the opake ones, fuch as feeds, woods, &c. require a very different treatment, and are beft preferved and viewed in the following manner.

Cut cards into fmall flips about half an inch long and a tenth of an inch broad; wet thefe half-way of their length in gum-water, and with that faften on feveral parcels of the object; and as the fpots of cards are of different colours, fuch fhould be chofen for every object as are the moft different from its own colours. Thefe are very convenient for viewing by the microfcope made for opake objects with the filvered fpeculum; but they are proper for any microfcope that can view opake bodies.

A fmall box fhould be contrived for thefe flips, with little fhallow holes for the reception of each: and this is conveniently done, by cutting pieces of pafte-board, fuch as the covers of books are made of, to the fize of the box, fo that they will juft go into it; and then cutting holes through them with a fmall chiffel, of the fhape of the flips of card: thefe pafte-boards having then a paper pafted over their bottom, are cells very proper for the reception of thefe flips, which may be taken out by means of a pair of plyers, and will be always ready for ufe.

Great caution is to be ufed in forming a judgment on what is feen by the microfcope, if the objects are extended, or contracted, by force or drinefs. Nothing can be determined about them, without making the proper allowances; and different lights and pofitions will often fhew the fame object as very different from itfelf. There is no advantage in any greater magnifier than fuch as is capable of fhewing the object in view diftinctly; and the lefs the glafs magnifies, the more pleafantly the object is always feen.

The colours of objects are very little to be depended on, as feen by the microfcope; for their feveral component particles being by this means removed to great diftances from one another, may give reflections very

very different from what they would, if feen by the naked eye.

The motions of living creatures alfo, or of the fluids contained in their bodies, are by no means to be haftily judged of, from what we fee by the microfcope, without due confideration; for as the moving body, and the fpace wherein it moves, are magnified, the motion muft be fo too; and therefore that rapidity with which the blood feems to pafs through the veffels of fmall animals muft be judged of accordingly: fuppofe, for inftance, that a horfe and a moufe move their limbs exactly at the fame time, if the horfe runs a mile while the moufe runs 50 yards; though the number of fteps are the fame in both, the motion of the horfe muft notwithftanding be allowed the fwifteft; and the motion of a mite, as viewed by the naked eye, or through the microfcope, is perhaps not lefs different.

MIDAS, in fabulous hiftory, a famous king of Phrygia, who having received Bacchus with great magnificence, that god, out of gratitude, offered to grant him whatever he fhould afk. Midas defired that every thing he touched fhould be changed into gold. Bacchus confented; and Midas, with extreme pleafure, every where found the effects of his touch. But he had foon reafon to repent of his folly: for wanting to eat and drink, the aliments no fooner entered his mouth, than they were changed into gold; which obliged him to have recourfe to Bacchus again, to befeech him to reftore him to his former ftate; on which the god ordered him to bathe in the river Pactolus, which from thence forward had golden fands. Some time after, being chofen judge between Pan and Apollo, he gave another inftance of his folly and bad tafte, in preferring Pan's mufic to Apollo's; on which the latter being enraged, gave him a pair of affes ears. See the article APOLLO.

MIDAS, *Ear-fhell*, the fmooth ovate-oblong buccinum, with an oblong and very narrow mouth. It confifts of fix volutions, but the lower one alone makes up almoft the whole fhell.

MID-HEAVEN, the point of the ecliptic that culminates, or in which it cuts the meridian.

MIDDLEBURG, one of the friendly iflands in the fouth-fea. This ifland was firft difcovered by Tafman, a Dutch navigator, in January 1742-3; and is called by the natives *Ea-Oo-whe*: it is about fixteen miles from north to fouth, and in the wideft part about eight miles from eaft to weft. The fkirts are chiefly laid out in plantations, the fouth-weft and north-weft fides efpecially. The interior parts are but little cultivated, though very capable of it: but this neglect adds greatly to the beauty of the ifland; for here are agreeably difperfed groves of cocoa-nuts and other trees, lawns covered with thick grafs, here and there plantations and paths leading to every part of the ifland, in fuch beautiful diforder, as greatly to enliven the profpect. The hills are low; the air is delightful; but unfortunately water is denied to this charming fpot. Yams, with other roots, bananas, and bread-fruit, are the principal articles of food; but the latter appeared to be fcarce. Here is the peppertree, or *ava-ava*, with which they make an intoxicating liquor, in the fame difgufting manner as is practifed in the Society Iflands. Here are feveral odoriferous trees and fhrubs, particularly a fpecies of the lemon tribe; and the botanical gentlemen met with various new fpecies of plants. Here alfo are a few hogs and fowls.

There are no towns or villages; moft of the houfes are built in plantations, which are laid out in different parts, with no other order than what convenience requires. They are neatly conftructed, but are lefs roomy and convenient than thofe in the Society Ifles. The floors are a little raifed, and covered with thick ftrong mats. The fame fort of matting ferves to inclofe them on the windward fide, the others being open. They have little areas before moft of them, which are planted round with trees or ornamental fhrubs, whofe fragrance perfumes the air. Their houfehold furniture confifts of a few wooden platters, cocoa-nut fhells, and pillows made of wood, and fhaped like four-footed ftools or forms: their common clothing, with the addition of a mat, ferves them for bedding.

The natives are of a clear mahogany or chefnut brown, with black hair, in fhort frizzled curls, which feems to be burnt at the tips; their beards are cut or fhaven. The general ftature of the men is equal to our middle fize, from five feet three to five ten inches; the proportions of the body are very fine, and the *contours* of the limbs extremely elegant, though fomething more mufcular than at O-Taheitee, which may be owing to a greater and more conftant exertion of ftrength in their agriculture and domeftic œconomy. Their features are extremely mild and pleafing; and differ from the O-Taheitian faces in being more oblong than round, the nofe fharper, and the lips rather thinner. The women are, in general, a few inches fhorter than the men, but not fo fmall as the lower clafs of women at the Society Iflands. The practice of puncturing the fkin, and blacking it, which is called *tattowing*, is in full force among the men here, for their belly and loins are very ftrongly marked in configurations more compounded than thofe at O-Taheitee. The tendereft parts of the body were not free from thefe punctures; the application of which, befides being very painful, muft be extremely dangerous on glandulous extremities.

The men in general go almoft naked, having only a fmall piece of cloth round the loins, but fome wrap it in great abundance round them from their waift: this cloth is manufactured much like that at O-Taheitee, but overfpread with a ftrong glue, which makes it ftiff, and fit to refift the wet. The women are likewife covered from the waift downwards: they often have loofe necklaces, confifting of feveral ftrings of fmall fhells, feeds, teeth of fifhes; and in the middle of all, the round *operculum*, or cover of a fhell as large as a crown-piece. The men frequently wear a ftring round their necks, from which a mother-of-pearl fhell hangs down on the breaft; both the ears of the women were perforated with two holes, and a cylinder cut out of tortoife-fhell or bone was ftruck through both the holes. The moft remarkable circumftance obferved of this people was, that moft of them wanted the little finger on one, and fometimes on both hands: the difference of fex or age did not exempt them from this amputation; for even among the few children that were feen running about naked, the greater part had already fuffered fuch lofs. This circumftance was obferved by Tafman. Another fingularity which was obferved to be very general among thefe

Middleburg these people was, a round ſpot on each cheek-bone, which appeared to have been burnt or bliſtered. On ſome it ſeemed to have been recently made, on others it was covered with ſcurf, and many had only a ſlight mark of its former exiſtence: how, or for what purpoſe it was made, could not be learnt. The women here, in general, were reſerved; and turned, with diſguſt, from the immodeſt behaviour of ungovernable ſeamen: there were not, however, wanting ſome who appeared to be of eaſy virtue, and invited their lovers with laſcivious geſtures. The language ſpoken here is ſoft, and not unpleaſing; and whatever they ſaid was ſpoken in a kind of ſinging tone. O-Mai and Mahine, who were both paſſengers on board the ſhip, at firſt declared that the language was totally new, and unintelligible to them; however, the affinity of ſeveral words being pointed out, they ſoon caught the particular modification of this dialect, and converſed much better with the natives than any on board the ſhips could have done, after a long intercourſe. They have the neateſt ornaments imaginable, conſiſting of a number of little flat ſticks, about five inches long, of a yellow wood like box, firmly and elegantly connected together at the bottom by a tiſſue of the fibres of cocoa-nut, ſome of which were of their natural colour, and others dyed black; the ſame fibres were likewiſe uſed in the making of baſkets, the taſte of which was highly elegant, and varied into different forms and patterns. Their clubs are of a great variety of ſhapes, and many of them ſo ponderous as ſcarce to be managed with one hand. The moſt common form was quadrangular, ſo as to make a rhomboid at the broad end, and gradually tapering into a round handle at the other. Far the greater part were curved all over in many chequered patterns, which ſeemed to have required a long ſpace of time, and incredible patience, to work up; as a ſharp ſtone, or a piece of coral, are the only tools made uſe of: the whole ſurface of the plain clubs was as highly poliſhed as if an European workman had made them with the beſt inſtruments. Beſides clubs, they have ſpears of the ſame wood, which were ſometimes plain ſharp-pointed ſticks, and ſometimes barbed with a ſting-ray's tail. They have likewiſe bows and arrows of a peculiar conſtruction: the bow, which is ſix feet long, is about the thickneſs of a little finger, and when ſlack forms a ſlight curve; its convex part is channelled with a ſingle deep groove, in which the bow-ſtring is lodged. The arrow is made of reed, near ſix feet long, and pointed with hard wood: when the bow is to be bent, inſtead of drawing it ſo as to increaſe the natural curvature, they draw it the contrary way, make it perfectly ſtraight, and then form the curve on the other ſide. Moſt of their canoes have outriggers, made of poles, and their workmanſhip is very admirable: two of theſe canoes are joined together with a ſurpriſing exactneſs, and the whole ſurface receives a very curious poliſh. Their paddles have ſhort broad blades, ſomething like thoſe at O-Taheitee, but more neatly wrought, and of better wood.

They keep their dead above ground, after the manner of the Society Iſlands; as a corpſe was ſeen depoſited on a low hut.

Here were ſeen ſeveral men and women afflicted with leprous diſeaſes, in ſome of whom the diſorder had riſen to a high degree of virulence; one man in particular had his back and ſhoulders covered with a large cancerous ulcer, which was perfectly livid within, and of a bright yellow all round the edges. A woman was likewiſe unfortunate enough to have her face deſtroyed by it in the moſt ſhocking manner; there was only a hole left in the place of her noſe; her cheek was ſwelled up, and continually oozing out a purulent matter; and her eyes ſeemed ready to fall out of her head, being bloody and ſore: though theſe were ſome of the moſt miſerable objects that could poſſibly be ſeen, yet they ſeemed to be quite unconcerned about their misfortunes, and traded as briſkly as any of the reſt.

Middleſex, Middleton.

MIDDLESEX, a county of England in which ſtands the city of London. This county, which derives its name from its ſituation amidſt the three kingdoms of the Eaſt, Weſt, and South Saxons, is bounded on the weſt by Buckinghamſhire, from which it is ſeparated by the little river Coln and the ſhireditch; on the north by Hertfordſhire; on the eaſt by the river Lea, which parts it from Eſſex; and on the ſouth by the Thames, which divides it from Surry. It is but of ſmall extent, in length not exceeding 21 miles, in breadth 15, and in circumference eighty; but, by reaſon of the cities of London and Weſtminſter, and the numerous large villages in their nighbourhood, it is by far the moſt populous and wealthy in England. The whole of it lies in the dioceſe of London; and is divided into ſix hundreds, two liberties, and ſeventy-three pariſhes, which, beſides London and Weſtminſter, contains five market-towns. There are ſeveral royal parks in it, and a great many chapels of eaſe. The ſheriffs are not appointed by the king, but choſen by the liverymen of London.

As the ſoil is gravelly, and exceedingly well cultivated, in conſequence of the great number of inhabitants, the air is very pure and wholeſome. The great quantities of rich manure produced by ſuch multitudes of people and cattle has ſo improved and enriched the lands, that they are extremely fruitful in vegetables of all kinds. In the neighbourhood of London there is little or no corn, the land being employed either for feeding cows, raiſing hay, or as garden grounds.

MIDDLETON (Dr Conyers), a very celebrated Engliſh divine, the ſon of a clergyman in Yorkſhire, was born at Richmond in 1683. He diſtinguiſhed himſelf, while fellow of Trinity-college Cambridge, by his controverſy with Dr Bentley his maſter, relating to ſome mercenary conduct of the latter in that ſtation. He afterwards had a controverſy with the whole body of phyſicians, on the dignity of the medical profeſſion; concerning which he publiſhed, *De medicorum apud veteres Romanos degentium conditione diſſertatio; qua, contra viros celeberrimos Jacobum Sponium et Richardum Meadium, ſervilem atque ignobilem eam fuiſſe, oſtenditur:* and in the courſe of this diſpute much reſentment and many pamphlets appeared. Hitherto he had ſtood well with his clerical brethren; but he drew the reſentment of the church on him in 1729, by writing "A letter from Rome, ſhewing an exact conformity between popery and paganiſm," &c.; as this letter, though politely written, yet attacked popiſh miracles with a gaiety that appeared dangerous to the cauſe of miracles in general. Nor were his Objections to Dr Waterland's manner of vindicating Scripture againſt Tindal's "Chriſtianity as old as the Creation," looked on in a more favourable point of view. In 1741, came out his great work, "The hiſtory of the life of M. Tullius Cicero," 2 vols 4to; which is indeed a fine performance, and will probably be read as long as taſte and polite literature ſubſiſt among us: the author has nevertheleſs fallen into the common error of biographers, who often give panegyrics inſtead of hiſtory. In 1748, he publiſhed, "A free inquiry into the miraculous powers which are ſuppoſed to have ſubſiſted in the Chriſtian church from the earlieſt ages, through ſeveral ſucceſſive centuries." He was now attacked from all quarters; but before he took any notice of his antagoniſts, he ſupplied them with another ſubject in "An examination of the lord biſhop of London's diſcourſes concerning the uſe and extent of prophecy," &c. Thus Dr Middleton continued to diſplay talents and learning, which were highly eſteemed by men of a free turn of mind, but by no means in a method calculated to invite promotion in the clerical line. He was, in 1723, choſen principal librarian of the public library at Cambridge; and if he roſe not to dignities in the church, he was in eaſy circumſtances, which permitted him to aſſert a dignity of mind often forgot in the career of preferment. He died in 1750, at Hilderſham in Cambridgeſhire, an eſtate of his own purchaſing; and in 1752, all his works, except the life of Cicero, were collected in 4 vols, 4to.

MIDIAN, or *Madian*, (anc. geog.) a town on the ſouth ſide of Arabia Petræa; ſo called from one of the ſons of Abraham by Keturah. Another Midian, near the Arnon and Æoplis, in ruins in Jerome's time; with the daughters of theſe Midianites the Iſraelites committed fornication, and were guilty of idolatry. A branch of the Midianites dwelt on the Arabian gulph, and were called *Kenites;* ſome of whom turned proſelytes, and dwelt with the Iſraelites in the land of Canaan.

MID-LOTHIAN. See Lothian.

MIDSHIP-frame, a name given to that timber, or combination of pieces formed into one timber, which determines the extreme breadth of the ſhip, as well as the figure and dimenſion of all the inferior timbers.

In the article Ship-*Building*, the reader will find a full explanation of what is meant by a frame of timbers. He will alſo perceive the outlines of all the principal frames, with their gradual dimenſions, from the midſhip-frame delineated in the plane of projection annexed to that article. As the parts of which the ſeveral frames are compoſed have the ſame relation to each other throughout the veſſel; and as all the correſponding pieces, without and within thoſe frames, are alſo nearly alike, and fixed in the ſame manner; it will be here ſufficient for our purpoſe to repreſent the principal, or midſhip-frame, together with its correſponding parts, which are as follow:

Plate CLXXV. fig. 8. A, the keel, with *a* the falſe keel beneath it.

B, the chocks fixed upon the kelſon, to retain the oppoſite pieces of the *riders* firmly together.

C, one of the beams of the orlop.

D, one of the lower-deck beams; with *d* the beams of the upper deck.

E, the hanging-knees, by which the beams are attached to the timbers.

F, the ſtandards, which are fixed above the decks to which they belong.

G, the clamps, which ſuſtain the extremities of the beams.

H, the gun-ports of the lower-deck; with *h* the ports of the upper-deck.

I, K, L, different pieces of *thick-ſtuff*, placed oppoſite to the ſeveral ſcarfs, or joinings, in the frame of timbers.

M, the planks of the deck.

N, the water-ways.

O, the planks of the ceiling, between the ſeveral ranges of thick-ſtuff.

P, the ſpirketing.

Q, the main-wale, to fortify the ſhip's ſide oppoſite to the lower deck.

R, the channel-wale, oppoſite to the upper-deck.

S, the waiſt-rail.

T, the ſtring, with the moulding under the gunwale.

U, the floor-timbers, which are laid acroſs the keel, and bolted to it.

V, the ſeveral futtocks; and W the top-timbers, which are all united into one frame.

X, the kelſon.

MIDSHIPMAN, a ſort of naval cadet, appointed by the captain of a ſhip of war, to ſecond the orders of the ſuperior officers, and aſſiſt in the neceſſary buſineſs of the veſſel, either aboard or aſhore.

The number of midſhipmen, like that of ſeveral other officers, is always in proportion to the ſize of the ſhip to which they belong. Thus a firſt-rate man of war has 24, and the inferior rates a ſuitable number in proportion. No perſon can be appointed lieutenant without having previouſly ſerved two years in the royal navy in this capacity, or in that of *mate*, beſides having been at leaſt four years in actual ſervice at ſea, either in merchant-ſhips, or in the royal navy.

Midſhipman is accordingly the ſtation in which a young volunteer is trained in the ſeveral exerciſes neceſſary to attain a ſufficient knowledge of the machinery, movements, and military operations of a ſhip, to qualify him for a ſea-officer.

On his firſt entrance in a ſhip of war, every midſhipman has ſeveral diſadvantageous circumſtances to encounter. Theſe are partly occaſioned by the nature of the ſea-ſervice; and partly by the miſtaken prejudices of people in general reſpecting naval diſcipline, and the genius of ſailors and their officers. No character, in their opinion, is more excellent than that of the common ſailor, whom they generally ſuppoſe to be treated with great ſeverity by his officers, drawing a compariſon between them not very advantageous to the latter. The midſhipman uſually comes aboard tinctured with theſe prejudices, eſpecially if his education has been amongſt the higher rank of people; and if the officers happen to anſwer his opinion, he conceives an early diſguſt to the ſervice, from a very partial and incompetent view of its operations. Blinded by theſe prepoſſeſſions, he is thrown off his guard, and very ſoon ſurpriſed to find, amongſt thoſe honeſt ſailors, Midſhipman. ſailors, a crew of abandoned miſcreants, ripe for any miſchief or villainy. Perhaps, after a little obſervation, many of them will appear to him equally deſtitute of gratitude, ſhame, or juſtice, and only deterred from the commiſſion of any crimes by the terror of ſevere puniſhment. He will diſcover, that the pernicious example of a few of the vileſt in a ſhip of war are too often apt to poiſon the principles of the greateſt number, eſpecially if the reins of diſcipline are too much relaxed, ſo as to foſter that idleneſs and diſſipation, which engender ſloth, diſeaſes, and an utter profligacy of manners. If the midſhipman, on many occaſions, is obliged to mix with theſe, particularly in the exerciſes of extending or reducing the ſails in the tops, he ought reſolutely to guard againſt this contagion, with which the morals of his inferiors may be infected. He ſhould, however, avail himſelf of their knowledge, and acquire their expertneſs in managing and fixing the ſails and rigging, and never ſuffer himſelf to be excelled by an inferior. He will probably find a virtue in almoſt every private ſailor, which is entirely unknown to many of his officers: that virtue is emulation, which is not indeed mentioned amongſt their qualities by the gentlemen of *terra firma*, by whom their characters are often copiouſly deſcribed with very little judgment. There is hardly a common tar who is not envious of ſuperior ſkill in his fellows, and jealous on all occaſions to be outdone in what he conſiders as a branch of his duty: Nor is he more afraid of the dreadful conſequences of whiſtling in a ſtorm, than of being ſtigmatized with the opprobrious epithet of *lubber*. Fortified againſt this ſcandal, by a thorough knowledge of his buſineſs, the ſailor will ſometimes ſneer in private at the execution of orders which to him appear aukward, improper, or unlike a ſeaman. Nay, he will perhaps be malicious enough to ſuppreſs his own judgment, and, by a punctual obedience to command, execute whatever is to be performed in a manner which he knows to be improper, in order to expoſe the perſon commanding to diſgrace and ridicule. Little ſkilled in the method of the ſchools, he conſiders the officer who cons his leſſon by rote as very ill qualified for his ſtation, becauſe particular ſituations might render it neceſſary for the ſaid officer to aſſiſt at putting his own orders in practice. An ignorance in this practical knowledge will therefore neceſſarily be thought an unpardonable deficiency by thoſe who are to follow his directions. Hence the midſhipman who aſſociates with theſe ſailors in the tops, till he has acquired a competent ſkill in the ſervice of extending or reducing the ſails, &c. will be often entertained with a number of ſcurrilous jeſts, at the expence of his ſuperiors. Hence alſo he will learn, that a timely application to thoſe exerciſes can only prevent him from appearing in the ſame deſpicable point of view, which muſt certainly be a cruel mortification to a man of the ſmalleſt ſenſibility.

If the midſhipman is not employed in theſe ſervices, which are undoubtedly neceſſary to give him a clearer idea of the different parts of his occupation, a variety of other objects preſent themſelves to his attention. Without preſuming to dictate the ſtudies which are moſt eſſential to his improvement, we could wiſh to recommend ſuch as are moſt ſuitable to the bent of his inclination. Aſtronomy, geometry, and mechanics, which are in the firſt rank of ſcience, are the materials which form the ſkilful pilot, and the ſuperior mariner. The theory of navigation is entirely derived from the two former, and all the machinery and movements of a ſhip are founded upon the latter. The action of the wind upon the ſails, and the reſiſtance of the water at the ſtem, naturally dictate an inquiry into the property of ſolids and fluſds: and the ſtate of the ſhip, floating on the water, ſeems to direct his application to the ſtudy of hydroſtatics and the effects of gravity. A proficiency in theſe branches of ſcience will equally enlarge his views, with regard to the operations of naval war, as directed by the efforts of powder and the knowledge of projectiles. The moſt effectual method to excite his application to thoſe ſtudies is, perhaps, by looking round the navy, to obſerve the characters of individuals. By this inquiry he will probably diſcover, that the officer, who is eminently ſkilled in the ſciences, will command univerſal reſpect and approbation; and that whoever is ſatisfied with the deſpicable ambition of ſhining the hero of an aſſembly, will be the object of univerſal contempt. The attention of the former will be engaged in thoſe ſtudies which are highly uſeful to himſelf in particular, and to the ſervice in general. The employment of the latter is to acquire thoſe ſuperficial accompliſhments that unbend the mind from every uſeful ſcience, emaſculate the judgment, and render the hero infinitely more dextrous at falling into his ſtation in the dance than in the line of battle.

Unleſs the midſhipman has an unconquerable averſion to the acquiſition of thoſe qualifications, which are ſo eſſential to his improvement, he will very rarely want opportunities of making a progreſs therein. Every ſtep he advances in thoſe meritorious employments will facilitate his acceſſion to the next in order. If the dunces, who are his officers or meſs-mates, are rattling the dice, roaring bad verſes, hiſſing on the flute, or ſcraping diſcord from the fiddle, his attention to more noble ſtudies will ſweeten the hours of relaxation. He ſhould recollect that no example from fools ought to influence his conduct, or ſeduce him from that laudable ambition which his honour and advantage are equally concerned to purſue.

MIDWIFERY,

THE art of aſſiſting women in the birth of children. It is ſuppoſed to comprehend alſo the management of women both before and after delivery, as well as the treatment of the child in its moſt early ſtate.

History. The art of midwifery is certainly almoſt coeval with mankind. The firſt midwiſe of whom mention is made under that name, aſſiſted at the ſecond labour of Rachel, the wife of Jacob. Another midwife is ſpoken of in Geneſis, at the lying-in of Thamar, who was deli-

delivered of twins. But the most honourable mention of midwives is that in Exodus, when Pharaoh king of Egypt, who had a mind to destroy the Hebrews, commanded two midwives to kill all the male children of the Hebrew women; which command they disobeyed, and thereby obtained a recompence from God.

From all the passages in Scripture where midwives are mentioned, it is plain, that women were the only practitioners of this art among the Hebrews. Among the Greeks also women assisted at labours. Phanarete the mother of Socrates was a midwife. Plato speaks at large of midwives, explains their functions, regulates their duty, and remarks that they had at Athens the right of proposing or making marriages. Hippocrates makes mention of midwives, as well as Aristotle, Galen, and Aëtius. This last even frequently quotes a woman called *Aspasia*, who was probably a midwife. They were called among the Greeks Μαιαι, or Ιατρομαιαι; that is to say, *mamma*, or *grand-mamma*.

We are still better acquainted with the customs of the Romans, and know that they employed women only. This may be deduced from the comedies of Plautus and Terence alone. We there see that they are women only who are called to assist persons in labour. Besides, Pliny, in his Natural History, frequently speaks of midwives and their duties; and names two, *Sotira* and *Salpe*, who had apparently the greatest reputation. Women were also employed after the fall of the empire; and it is certain, that, till lately, all civilized nations have employed women only as midwives. This appears even from their names in many different languages, which are all feminine. There were, however, especially in great cities, surgeons who applied themselves to the art of midwifery, and made it their peculiar study. They were sent for in difficult cases, where the midwives found their incapacity; and then the surgeon endeavoured to deliver the woman by having recourse to instruments useful in those cases, as by crotchets, crows-bills, &c.; but as these cases happened but seldom, women remained in possession of this business. It is certain, according to Astruc, that Maria Theresia wife of Lewis XIV. employed women only in her labours; and the example of the queen determined the conduct of the princesses and court-ladies, and likewise of the other ladies of the city. The same author tells us, that he has been assured, that the epoch of the employment of men-midwives goes no farther back than the first lying-in of Madam de la Valiere in 1663. As she desired it might be kept a profound secret, she sent for Julian Clement a surgeon of reputation. He was conducted with the greatest secrecy into an house where the lady was, with her face covered with a hood; and where it is said the king was concealed in the curtains of the bed. The same surgeon was employed in the subsequent labours of the same lady; and as he was very successful with her, men-midwives afterwards came into repute, and the princesses made use of surgeons on similar occasions; and as soon as this became fashionable, the name of *acoucheur* was invented to signify this class of surgeons. Foreign countries soon adopted the custom, and likewise the name of *acoucheurs*, though they had no such term in their own language; but in Britain they have more generally been called *men-midwives*.

In opposition to this account, which is taken from Astruc, that author tells us, that he is aware of an objection from Hyginus, who asserts, that the ancients had no midwives; which made the women, through modesty, rather choose to run the risk of death than to make use of men on this occasion. For the Athenians, he adds, had forbid women and slaves to study physic, that is to say, the art of midwifery. A young woman, named *Agnodice*, desirous of learning this art, cut off her hair, dressed herself in the habit of a man, and became a scholar to one Hierophilus. She afterwards followed this business. The women at first refused assistance from her, thinking she was a man; but accepted thereof when she had convinced them that she was a woman.

To this account our author replies, that the authority of Hyginus is by no means to be depended upon. His book is full of solecisms and barbarisms; and therefore cannot be attributed to any writer who lived before the fall of the empire; but must have been the work of an author who lived when the Latin tongue was corrupted; that is, about the seventh or eighth century. The contradictions met with in this book also give room to suspect that it is not the work of one hand, but of several. The authority of such a work, therefore, is by no means sufficient to destroy the testimonies of those writers who affirm, that among the Greeks the care of lying-in women was committed entirely to others of their own sex.

The art of midwifery seems not to have been so soon improved as that of physic. Hippocrates, though an excellent physician, seems to have been a very bad midwife. He was acquainted with no other kind of natural labour than that in which the head presents; and condemns footling labour as fatal both to mother and child: he would have the children in such cases turned, so that the head may present: but, says he, if the arm, or leg, or both, of a living child present, they must, as soon as discovered, be returned into the womb, and the child brought into the passage with its head downwards. For this purpose he advises to roll the woman on the bed to shake her, and make her jump: he proposes the same expedients to procure the child's delivery; and if they do not succeed, he advises to extract it with crotchets, and, whatever happens, to dismember it.

From the time of Hippocrates to that of Celsus, who lived in the reign of the emperor Tiberius, we have no accounts of any improvements in midwifery; but this author gives two very useful directions. 1. In dilating the womb: "We must (says he) introduce the fore-finger, well moistened with hog's lard, into the mouth of the womb, when it begins to open, and in like manner afterwards a second, and so on until all the fingers are introduced, which are then to be used by separating them, as a kind of dilater, to distend the orifice, and facilitate the introduction of the hand which is to act in the womb. 2. Children may be delivered by the feet easily and safely, without crotchets, by taking hold of their legs. For this purpose we must take care to turn children, which are otherwise placed in the womb, with their head or feet downwards."

wards." It is true, Celfus fpeaks of a dead child only; but it was eafy to conclude from thence, that the fame practice might be ufed with fuccefs to deliver a living child. Neverthelefs, this was not done; and, notwithftanding the authority of Celfus, the former prejudice continued for a long time. Tho' Pliny, who lived under the emperors Vefpafian and Titus, was not a phyfician himfelf, yet by condemning footling labour he attefts the opinion of the phyficians of his time. He afferts, as a known fact, that footling labour was a preternatural kind of labour: he adds, that children which came into the world in this manner were called *Agrippa*, that is to fay, born with a great deal of difficulty.

But however common this opinion was, it was never univerfally received; and feveral phyficians of character rofe up, who, without fuffering themfelves to be dazzled with the common prejudice, or feduced by the authority of Hippocrates or Galen, recommended and approved of footling delivery. The queftion then was a long time undecided; and even in 1657, Riverius, a phyfician of reputation, condemned footling labour. Mauriceau alfo remarks, in the firft edition of his book, on the diforders of pregnant women, printed in 1664, that many authors were ftill of opinion, that when the child prefented with its feet, it fhould be turned to make it come with its head foremoft; but after having obferved that it is difficult, if not impoffible, to execute this, he concludes, "it is much better to extract the child by its feet when they prefent, than to run the hazard of doing worfe by turning it." All practitioners, however, are now of the fame opinion; and the knowledge of midwifery has been fo much increafed within this century, that it feems to have nearly attained its ultimate perfection, and its operations reduced almoft to a geometrical certainty: And this, fays Aftruc, is not furprifing; for, after all, the art of midwifery is reduced to the following mechanical problem, "An extenfible cavity of a certain capacity being given, to pafs a flexible body of a given length and thicknefs through an opening dilatable to a certain degree." This might be refolved geometrically, if the different degrees of elafticity of the womb, and ftrength and weaknefs of the child, the greater or leffer difpofition of the blood to inflammation, and the greater or leffer degree of irritability of the nerves, did not occafion that uncertainty which phyfical facts conftantly produce in all phyfico-mathematical queftions.

Chap. I. *Of Pregnancy.*

At the time of conception, and for fome time after, the parts which form the fmall fœtus are fo blended together, that one cannot be diftinguifhed from another. The whole mafs is then called an *ovum.* This ovum confifts of four membranes; the placenta, or after-birth; the funis umbilicalis or navel ftring, leading to the child; and the furrounding watery fluid in which it floats. Before the child acquires a diftinct and regular form, it is called *embryo,* and afterwards retains the name of *fœtus* till its birth. For the increafe and nutrition of the fœtus, fee the article Generation.

During the progrefs of impregnation the uterus fuffers confiderable changes; but, though it enlarges as the ovum increafes, yet, in regard to its contents, it is never full; for, in early geftation, thefe are confined to the fundus only: and though the capacity of the uterus increafes, yet it is not mechanically ftretched, for the thicknefs of its fides do not diminifh; there is a proportional increafe of the quantity of fluids, and therefore pretty much the fame thicknefs remains as before impregnation.

The gravid uterus is of different fizes in different women; and muft vary according to the bulk of the fœtus and involucra. The fituation will alfo vary according to the increafe of its contents and the pofition of the body. For the firft two or three months, the cavity of the fundus is triangular as before impregnation; but as the uterus ftretches, it gradually acquires a more rounded form. In general, the uterus never rifes directly upwards, but inclines a little obliquely, moft commonly to the right fide; its pofition is never, however, fo oblique, as to prove the fole caufe either of preventing or retarding delivery: its increafe of bulk does not feem to arife merely from diftention, but to depend on the fame caufe as the extenfion of the fkin in a growing child. This is proved from fome late inftances of extra-uterine fœtufes, where the uterus, though there were no contents, was nearly of the fame fize, from the additional quantity of nourifhment tranfmitted, as if the ovum had been contained within its cavity.

The internal furface, which is generally pretty fmooth, except where the placenta adheres, is lined with a tender efflorefcence of the uterus, which, after delivery, appears as if torn, and is thrown off with the cleanfings. This is the *membrana decidua* of Dr Hunter.

Though the uterus, from the moment of conception, is gradually diftended, by which confiderable changes are occafioned, it is very difficult to judge of pregnancy from appearances in the early months. For the firft three months the os tincæ feels fmooth and even, and its orifice as fmall as in the virgin ftate. When any difference can be perceived, about the fourth or fifth month from the defcent of the fundus through the pelvis, the tubercle or projecting part of the os tincæ will feem larger, longer, and more expanded; but, after this period, it fhortens, particularly at its fore-parts and fides, and its orifice or labia begin to feparate, fo as to have its conical appearance deftroyed. The cervix, which in the early months is nearly fhut, now begins to ftretch and to be diftended to the os tincæ; but during the whole term of utero-geftation, the mouth of the uterus is ftrongly cemented with a ropy mucus, which lines it and the cervix, and begins to be difcharged on the approach of labour. In the laft week, when the cervix uteri is completely diftended, the uterine orifice begins to form an elliptical tube, inftead of a fiffure, or to affume the appearance of a ring on a large globe; and often at this time, efpecially in pendulous bellies, difappears entirely, fo as to be out of the reach of the finger in touching. Hence the os uteri is not in the direction of the axis of the womb, as has generally been fuppofed.

About the fourth, or between the fourth and fifth month, the fundus uteri begins to rife above the pubes or brim of the pelvis, and its cervix to be diftended nearly

Spurious gravidity.

nearly one third. In the fifth month the belly swells, like a ball, with the skin tense, the fundus about half way between the pubes and navel, and the neck one half distended. After the sixth month the greatest part of the cervix uteri dilates, so as to make almost one cavity with the fundus. In the seventh month the fundus advances as far as the umbilicus. In the eighth it reaches mid-way between the navel and scrobiculus cordis; and in the ninth to the scrobiculus itself, the neck then being entirely distended, which, with the os tincæ, become the weakest parts of the uterus. Thus at full time the uterus occupies all the umbilical and hypogastric regions; its shape is almost pyriform, that is, more rounded above than below, and having a stricture on that part which is surrounded by the brim of the pelvis.

The appendages of the uterus suffer very little change during pregnancy, except the ligamenta lata, which diminish in breadth as the uterus enlarges, and at full time are almost entirely obliterated.

The most remarkable change happens in the ovarium. A cicatrice of a roundish figure and yellowish colour appears in this body, called by anatomists the *corpus luteum.* It is always to be found in one of the ovaria, and in cases of twins a corpus luteum often appears in both ovaria. It was formerly considered as the calyx ovi; but modern physiologists think it a gland, from whence the seminal fluid is ejected. In early gestation it is most conspicuous, when a cavity is observable, which afterwards collapses; no vessels appear at the centre of this cavity which has the appearance of cicatrix, but all around that centre the substance is vascular.

During the progress of distention, the substance of the uterus becomes much looser, of a softer texture, and more vascular than before conception; its veins particularly, in their diameters, being enlarged in such a manner as to get the name of *sinuses;* they observe a more direct course than the arteries, which run in a serpentine manner, anastomosing with one another and through its whole substance, especially where the placenta adheres, where this vascular appearance is most conspicuous.

The arteries pass from the uterus through the decidua, and open into the substance of the placenta in a slanting direction. The veins also open into the placenta, and by injecting these veins from the uterus with wax, the whole spungy or cellular part of the placenta will be filled.

The muscular structure of the gravid uterus is extremely difficult to be shewn: in the wombs of women who die in labour, or soon after delivery, fibres running in various directions are observable more or less circular, that seem to arise from three distinct origins; viz. from the place where the placenta adheres, and from the aperture or orifice of each of the tubes; but it is almost impossible to demonstrate regular plans of fibres, continued any length without interruption.

Chap. II. *Spurious Gravidity.*

The various diseases incident to the uterine system, and other morbid affections of the abdominal viscera, will frequently excite the symptoms and assume the appearance of utero-gestation. Complaints arising from a simple obstruction, are sometimes mistaken for those of breeding; when a tumour about the region of the uterus is also formed, and gradually becomes more and more bulky, the symptoms it occasions are so strongly marked, and the resemblance to pregnancy so very striking, that the ignorant patient is often deceived, and even the experienced physician imposed on.

Scirrhous, polypous, or sarcomatous tumours in or about the uterus or pelvis; dropsy or ventosity of the uterus or tubes; steatoma or dropsy of the ovaria, and ventral conception, are the common causes of such fallacious appearances. In many of these cases the menses disappear; nausea, retchings, and other symptoms of breeding, ensue; flatus in the bowels will be mistaken for the motion of the child; and in the advanced stages of the disease, from the pressure of the swelling on the adjacent parts. Tumefaction and hardness of the mammæ supervene, and sometimes a viscid or serous fluid distills from the nipple; circumstances that strongly confirm the woman in her opinion, till time, or the dreadful consequences that often ensue, at last convince her of her fatal mistake.

False Conception.—Mola. Other kinds of spurious gravidity, less hazardous in their nature than any of the preceding, may under this head also be classed; diseases commonly known by the names of *false conception* and *mola:* The former of these is nothing more than the dissolution of the fœtus in the early months; the placenta is afterwards retained in the uterus, and from the addition of coagula, or in consequence of disease, is excluded in an indurated or enlarged state; when it remained for months or longer, and came off in the form of a fleshy or schirrous-like mass, without having any cavity in the centre, it was formerly distinguished by the name of *mola.*

Mere coagula of blood, retained in the uterus after delivery, or after immoderate floodings at any period of life, and squeezed, by the pressure of the uterus, into a fibrous or compact form, constitute another species of mola, that more frequently occurs than any of the former. These, though they may assume the appearances of gravidity, are generally however expelled spontaneously, and are seldom followed with dangerous consequences.

Superfœtation.

Chap. III. *Superfœtation.*

Soon after impregnation takes place, the cervix uteri becomes entirely shut up by means of a thick viscid gluten: the internal cavity is also lined by the external membrane of the ovum, which attaches itself to the whole internal surface of the fundus uteri· the fallopian tubes also become flaccid; and are, as gravidity advances, supposed to be removed at such a distance, that they cannot reach the ovaria to receive or convey another ovum into the uterus. For these, and other reasons, the doctrine of *superfœtation* is now pretty generally exploded.—A doctrine that seems to have arisen from the case of a double or triple conception, where, some time after their formation in utero, one fœtus has been expelled, and another has remained; or after the extinction of life at an early period, one or more may be still retained, and thrown

Monsters. thrown off in a small and putrid state, after the birth of a full-grown child.

The uterus of brutes is divided into different cells; and their ova do not attach themselves to the uterus so early as in the human subject, but are supposed to receive their nourishment for some time by absorption. Hence the os uteri does not close immediately after conception; for a bitch will admit a variety of dogs while she is in season, and will bring forth puppies of these different species: thus it is common for a grey-hound to have, in the same litter, one of the grey-hound kind, a pointer, and a third, or more, different from both; another circumstance that has given rise to *super-fœtation* in the human subject, which can *only* happen when there is a double set of parts, instances of which are very rare.

Chap. IV. *Extra-uterine Fœtuses, or ventral Conception.*

The impregnated ovum, or rudiments of the fœtus, is not always received from the ovarium by the tuba Fallopiana, to be thence conveyed into the cavity of the uterus; for there are instances where the fœtus sometimes remains in the ovarium, and sometimes even in the tube; or where it drops out of the ovarium, misses the tubes, and falls into the cavity of the abdomen, takes root in the neighbouring parts, and is thereby nourished: But as these fœtuses cannot there receive so much nourishment as in the succulent uterus, they are less, and generally come to their full growth before the common term.

Of these some burst in the abdomen; and others form abscesses, and are thereby discharged; others dry, and appear bony, and remain so during life, or are discharged as above, or by stool, &c.

Chap. V. *Monsters.*

When two or more ova contained in the uterus attach themselves so near one another as to adhere in whole or in part, so as to form only one body with membranes and water in common, this body will form a confused irregular mass called *monstrous;* and thus a monster may be either defective in its organic parts, or be supplied with a supernumerary set of parts derived from another ovum. This seems a rational conjecture; but, while every thing relative to generation is a mystery, how can we account for the extraordinary phænomena? Some authors enumerate a third species of monster, the product of a mixed breed, exemplified, for instance, in the mule, produced by the mixed generation of an ass and a mare. In this animal there are organical parts different from what preexisted in the parents; there is a defect of some parts, a luxuriant growth of others; and the defect in the parts of generation, which renders the animal unfit for propagation, constitutes a very curious and particular species.

Chap. VI. *Diseases of Pregnancy.*

After conception, a remarkable change is soon produced in the genital system. This is the source from whence arise different symptoms, that are however liable to considerable variation, not only in the constitution of different women, but in the same woman in different pregnancies, and at different periods of the same pregnancy.

Diseases. *Pregnancy,*—though a natural alteration of the animal-œconomy, which every female seems originally formed to undergo, and hence not to be considered as a state of disease, occasions, however, sooner or later, in many women, various complaints, which evidently depend on it as a cause.

Diseases incident to the pregnant state may be considered, either, 1. As arising from sympathy in the early months; or, 2. As depending on the stretching and pressure of the uterus towards the more advanced stages.

I. Though the former of these complaints are generally to be accounted for from other causes than that of plethora; yet, in many constitutions, a certain plethoric disposition in the early months of pregnancy seems to prevail in the vascular system: And therefore, though many inconveniencies may ensue from a too frequent, a too copious, or an indiscriminate use of venesection; yet, if prudently and judiciously employed, abortion by this means will not be endangered, as some late authors have alleged; but, on the contrary, on many occasions, a seasonable bleeding will be attended with the most beneficial and salutary effects.

In young women, suddenly affected with severe sickness and loathing, febrile commotion, head-ach, vertigo, and other symptoms of breeding, more especially in full sanguineous habits, besides a spare light diet and suitable exercise, recourse must be had to proper evacuations, the chief of which is venesection: this may be safely performed at any term of gravidation, and occasionally repeated according to the urgency of the symptoms: small breedings, at proper intervals, are preferable to copious evacuations, which in early pregnancy ought always to be carefully guarded against.

When the stomach is loaded with putrid bile or acrid saburra, the offensive matter should be discharged by gentle vomits of ipecacuan, or of infusions of chamomile flowers. The violent efforts to retch and vomit, and the commotions thence excited, which often occasion the expulsion of the fœtus, will by this means frequently be removed, in most cases greatly diminished. During the term of breeding, the state of the belly must be also attended to: When laxative medicines become necessary, those of the mildest and gentlest kind should be administered.

In women liable to nervous complaints, where the stomach is weak, and the sickness violent and continued, the patient should be put on a course of light, aromatic, and strengthening bitters; such as infusions of bark, columbo, &c. and her diet, air, exercise, company, and amusement, should be regulated: In order to settle the stomach, and lessen the sensibility of the system, opiates will often happily succeed, when every other remedy fails.

Heart-burn and *diarrhœa,*—common symptoms of breeding, or of pregnancy, must be treated pretty much as at other times: Both complaints chiefly depend on the state of the stomach.

Tumefaction, tension, and *pains* in the *mammæ.*—If tight lacing here be only avoided, and the breasts have room to enlarge and swell, no inconvenience ever follows:

Diseases of Pregnancy.

follows: These effects arise from a natural cause, and seldom require medical treatment. If very troublesome and uneasy, bathing with oil, or anointing with pomatum, and covering with soft flannel or fur, will in most cases prove the cure.

The *menstrual evacuation*—is in some women regular for the first, second, or third period after conception. This seldom happens but in women of sanguinary plethoric habits, such as have been accustomed to large copious evacuations at other times, when the discharge is to be considered as beneficial.

Deliquia, *nervous*, or *hysteric fits*.—When these are occasioned by falls, frights, and passions of the mind, they frequently end in the loss of the child: But when they happen about the term of quickening, they seem to arise from the escape of the uterus from its confinement within the capacity of the pelvis; in which case they are commonly slight, of short duration, and never threaten any dangerous consequence.

II. The second class of complaints, viz. those that are incident to the advanced stages of uterogestation, and that depend on the change of situation of the gravid uterus, its enlargement and pressure on the neighbouring parts, are more painful in their symptoms, and more dangerous in their consequences, than those enumerated in the preceding class. The premature exclusion of the fœtus is generally the worst inconvenience resulting from the *one;* the death of the mother, along with the loss of the child, is too frequently an attendant of the *other*.

Difficulty or *suppression* of *urine*—is sometimes occasioned by the pressure of the uterus on the neck of the bladder, before the fundus uteri escapes from its confinement within the brim of the pelvis. This complaint, if early attended to, will seldom prove troublesome or hazardous; but cannot be entirely removed till the uterus rises above the brim of the pelvis, and by its enlargement becomes supported by resting on the expanded bones of the ossa ilia. But if neglected in the beginning,

A retroversion of the uterus—is generally the consequence, a case that demands particular attention. Here the fundus uteri, instead of being loose, falls back in a reclined state within the hollow of the os sacrum: thus a tumor is formed in the vulva, whereof the os tincæ makes the superior part; the body of the uterus, by this means, becomes strongly wedged between the rectum and bladder; and, from the enlargement of the uterus itself, and accumulating load of fæces and urine, the reduction will prove in many instances utterly impracticable. A total suppression of urine, or a rupture of the coats of the bladder, fever, inflammation, or gangrene of the uterus, often ensue; and these are succeeded by delirium, convulsions, death.

The indications of cure, in this dangerous disease, are sufficiently obvious: For, in the first place, every obstacle that prevents the reduction should be removed: thus the contents of the rectum and bladder must, if possible, be evacuated; emollient fomentations and cataplasms must be applied, if indicated by inflammation or tumefaction of the parts. Secondly, The reduction of the prolapsed uterus must be attempted, by placing the patient upon her knees, with her head low and properly supported. While this is attempted within the vagina, a finger or two should also be passed within the rectum, by which the operation in some cases may be facilitated: but, at other times, no power whatever will be sufficient for this purpose. Lastly, If the reduction be accomplished, the fever, inflammatory symptoms, and other consequences of the disease, must be subdued; and a recurrence prevented by an open belly, rest, and recumbent posture, and promoting a free discharge of urine: means that ought to be persisted in till the uterus rises within the abdomen, when the patient will be secured from future danger.

Costiveness in pregnancy—is inconvenient. It may proceed from the same cause with the preceding complaint; it may depend of the stomach; the febrile heat, that in many women prevails, will also prove an occasional cause. It may be obviated or prevented by a proper regulation of the regimen, and by such gentle laxative medicines as are best suited to the state of the woman; the chief of which are ripe fruit, magnesia, lenitive electuary, cream of tartar, sulphureous and aloetic medicines, oleum ricini, emollient glysters.

The piles—frequently arise in consequence of costiveness, or from pressure of the gravid uterus on the hæmorrhoidal veins. These are also to be removed or palliated by the same means employed on other occasions; regard being had to this distinction, which may be applied universally to the gravid state, that all violent remedies are to be avoided: a light diet should be enjoined; the belly should be kept moderately open; and topical liniments or cataplasms should be applied, such as Bals. sulphur. Bals. traumaticum, Liniment. ex ol. palmæ, Ung. sambucin. cum laud. liquid. Poultices of bread and milk with opium, &c. according to the various circumstances of the case.

Oedematous swellings of the legs and *labia*,—are occasioned by the languid state of the circulation, by the interruption of the refluent blood from the pressure of the distended uterus on the vena cava, &c. These, though very troublesome and inconvenient, are seldom however of dangerous consequence, except where the habit is otherwise diseased; and seldom require puncture, as the swelling generally subsides very quickly after delivery. They can only, therefore, at this time, admit of palliation; for which purpose, along with a proper diet and moderate exercise, a frequent recumbent posture, open belly, and dry frictions applied to the legs evening and morning, will prove the most effectual means.

Varicous swellings in the legs and thighs—from the interruption of the venal blood in these parts, occasioned by the pressure of the gravid uterus, are to be treated in the same manner with the preceding complaint.

Pains in the back, loins, cholic-pains, cramp,—occasioned by the stretching of the uterus and appendages, and from the pressure of the uterus on the neighbouring parts, symptoms that are most troublesome in a first pregnancy, are to be palliated by venesection, an open belly, and light spare diet. If the patient be of a full habit, and pre-disposed to inflammatory complaints, where the pressure is very great in the advanced months, or in twins, &c. if proper

Diseases of Pregnancy.

proper remedies are neglected, inflammation of the uterus and adjacent viscera, or dreadful epileptic fits, may quickly ensue; the event whereof is generally fatal. Crampish spasms in the belly and legs require the same palliative treatment; to which may be added friction, and the application of æther, ol. volatil. bals. anodyn. or the like, to the parts affected.

Cough, dyspnœa, vomitings, difficulty or incontinency of urine, occasioned by the pressure of the bulky uterus on the stomach, liver, diaphragm, &c.—Complaints that can only be alleviated by frequent small bleedings, a light spare diet, and open belly. The patient should be placed in an easy posture, something between sitting and lying; and when the uterus rises high, a moderate degree of pressure from the superior part downwards, may in in some cases prove useful. But this must be used with great caution; for dreadful are the effects of violent pressure, or tight lacing, during pregnancy. It frequently kills both mother and child, and ought to be guarded from the earliest months.

Epileptic fits,—are a very dreadful and alarming appearance. They generally depend on the same cause with the above complaints: they may also arise from irritation, excited by the motion and stirring of the fœtus; and from various other causes. Such as have had convulsions when young, are most liable to have them during pregnancy: they happen most frequently in first pregnancies, or where the fœtus is very large, or in twins, triplets, &c. In such cases, the distention of the uterine fibres is so great, that actual laceration is sometimes the consequence.

At whatever period of pregnancy they seize, the utmost danger may be dreaded. This, however, will be in proportion to the severity, duration, and recurrence of the paroxysm, to the term of gravidation, to the constitution of the patient, and her condition during the remission. The danger is greater towards the latter end of pregnancy than in the earlier months or in time of labour.

Such as arise from inanition, from excessive and profuse hæmorrhages, from violent blows, falls, &c. or from a ruptured uterus, are for the most part fatal.

Hysteric or nervous spasms must be carefully distinguished from true epileptic fits. The former are milder than the latter; they are not attended with foamings; they do not affect the posture; the pulse is smaller, feebler, and more frequent; the woman is pretty hearty after they are over; they are followed with no bad consequences, and yield to the common treatment. Women of strong, robust, vigorous constitutions, are more generally the subjects of the *one;* the delicate, the nervous, and the irritable, of the *other*.

Epileptic fits generally come on very rapidly; if any previous symptoms occur, the fit is commonly announced by an intense pain in the scrobiculum cordis, or violent head-ach.

In the pregnant state, these fits are for the most part symptomatic, and will therefore only admit of a palliative cure. They may be distinguished into three classes; those of the early months, those of the latter, and those that come on with labour-pains.

With regard to the cure, the term of pregnancy, as well as the constitution of the patient, and particular cause of the disease, must carefully be considered.

1. Convulsions at an early period of pregnancy chiefly happen to young women of a plethoric sanguine habit; and can therefore only be removed or palliated by a free and bold use of the lancet, by an open belly, cool regimen, and spare diet. After plentiful evacuations, if the stomach be loaded with acrid saburra or putrid bile, a gentle puke may be of use: but such remedies, on those occasions, must be employed with great caution. Instead of a plethoric, if the patient is of a nervous habit, a very necessary and important distinction, the intentions of cure will essentially vary. For here opiates in large doses and frequently repeated, emollient glysters, stupes applied to the legs, the femicupium, and every other means to soothe the nerves and remove spasmodic stricture, will prove the most effectual remedies. If insensible or comatous, opium, musk, and other antispasmodics, should be exhibited by way of glyster, and the patient ought to be roused by epispastic and stimulating cataplasms applied to the legs and hams. Convulsions succeeding profuse evacuations, are generally mortal. The vis vitæ, in such circumstances, must be supported, by replenishing the vessels with the utmost speed: this is to be done by pouring in nourishing fluids as fast as possible by the mouth, and by glyster; warm applications should also be made to the stomach and feet, and nervous cordials given internally along with opium.

The treatment of epileptic fits, depending on other causes than those now mentioned, must be regulated by a proper attention to the particular symptoms with which they are attended.

2. In the advanced months, such complaints are more to be dreaded than in early gestation, as they generally proceed from the irritation occasioned by the distention of the uterine fibres, or by the pressure of the uterus on the contiguous viscera: hence the natural functions of these parts will be interrupted, the circulation of their fluids will be impeded, and the blood, being thus prevented from descending to the inferior parts, will be derived in greater proportion to the brain, and overcharge that organ.

The cure must, in this case, chiefly rest on copious and repeated bleedings, an open belly, and spare diet.

3. Lastly, when fits come on with labour-pains, a speedy delivery, if it can be done with safety, either by turning the child, or by extracting with the forceps when the head is within reach, will prove the most effectual cure

When the bladder is distended, the contents must be evacuated: if a stone sticks in the urethra, it must be pushed back or extracted. If the fits are the effects of a ruptured uterus, immediate death is generally the consequence.

With regard to the treatment of such complaints, no other change is generally requisite, than what arises from the symptoms peculiar to this situation. In general, till after delivery, they will only admit of palliation.

Chap. VII. *Floodings*.

These, tho' confined to no particular term, may hap-

Diseases.

pen at every period of gravidation. The one is a frequent consequence of the other; the event of both is often hazardous, as the earlier miscarriages are generally preceded by an effusion of blood from the uterus, which, in the advanced stages of pregnancy, besides the loss of the child, always endangers the life of the mother.

The *menorrhagia gravidarum*—may be defined, an effusion of blood from the uterus, confined to no regular or stated periods, in quantity and duration various, and liable to recur on the slightest occasions.

The immediate cause is, a separation of some portion of the placenta or chorion from the internal surface of the uterus. Whatever occasions this separation may be considered as the remote cause, which, though various, may be reduced to

I. Those that affect the general system: as,

1. External accidents changing the state of the circulation.
2. Changes in the circulation from internal causes.
3. Debility.
4. Plethora.

II. Those that affect the uterus and placenta: as,

1. Direct affections.
2. Stimuli communicated from an affection of other parts.

With regard to the cure.—Though a flooding in some constitutions may happen, even in early gestation, and may remit and recur from time to time, and the woman go on to the end of her reckoning; and tho' it seldom or never happens, that this complaint proves mortal to the mother in the first five months of pregnancy; yet every appearance of this kind, even the slightest, is to be dreaded; as in the early months it will often throw off the fœtus, and, in the latter, always threatens the utmost danger both to mother and child. Floodings of gravid women we cannot propose radically to cure; they will only admit of palliation. With this view, the indications are,

I. To lessen the force and velocity of the blood in general.

II. To promote the constriction of the patulous mouths of the bleeding vessels, or the formation of coagula in their orifices.

1. To answer the first indication, rest and a recumbent posture, cool air, tranquillity of mind, a light diet, venesection, and opiates, are the chief means.

2. To restrain the violence of the hæmorrhage, internal astringent medicines are recommended; but this is to be accomplished chiefly by means of cold styptic applications to the parts and their neighbourhood. But, as these floodings often arise from so various and opposite causes, it is difficult to lay down particular indications, or to point out a method of cure suited to every case that may occur. The intention of cure can only be regulated by a careful and judicious consideration of the cause, and of those particular circumstances with which the case may be attended. In early pregnancy, it may be restrained by keeping the patient quiet and cool, by giving internally cooling things and opiates; but, in the advanced stages, the deluge is sometimes so profuse as to kill very suddenly. Under such circumstances, when the woman is near her time, emptying the uterus by delivery, if practicable, is the only safe expedient both for preserving the life of the mother and of the child.

Abortion.

If the hæmorrhage can be restrained, a recurrence must be guarded against, by avoiding or counteracting the occasional or remote causes.

Chap. VIII. *Abortion, or Miscarriage,*

May be defined, the premature expulsion of the embryo or fœtus. Some, however, make the following distinction: When a woman miscarries in early gestation, this they consider as an abortion; but if in the latter months, that they term a *premature birth*. The symptoms that threaten abortion are:

Flooding.

Pain in the back and belly.

Bearing down pains with regular intermissions.

The evacuation of the waters.

The death of the child, which discovers itself by the following symptoms; though in general these are so doubtful and fallacious, that none of them afford an infallible sign:

1. The subsiding of the abdominal tumour.
2. Cessation of motion in the fœtus.
3. The sensation of a heavy weight falling from side to side, as the woman turns herself in bed.
4. Sickness, faintings, rigors, cold sweats.
5. The breasts turning flaccid.
6. Coldness of the abdomen, and putrid discharge from the vagina.

Abortions are seldom dangerous in the first five months; but a frequent habit of miscarriage debilitates the system, shatters the constitution, and lays the foundation of chronic diseases of the most obstinate and dangerous nature.

In the advanced months, the prognosis will be more or less favourable, according to the patient's former state of health, the occasional cause, and symptoms with which it is attended. The proximate cause of abortion is the same with that of true labour, *viz.* a contracting effort of the uterus and abdominal muscles, assisted by the other expulsive powers. The remote causes cannot be explained with precision; as many circumstances, with regard to the nature of impregnation, and connection of the fœtus with the placenta and uterus, are subjects still involved in darkness. They may in general, however, be reduced,

I. To whatever interrupts the regular circulation between the uterus and placenta.

II. To every cause that excites the spasmodic contraction of the uterus, or other assisting powers.

III. To whatever occasions the extinction of life in the fœtus.

Amongst the first are:

1. Diseases of the uterus.
2. Imperviousness or spasmodic constriction of the extremities of the uterine blood-vessels.
3. Partial or total separation of the placenta or chorion from the uterus.
4. Determination to other parts.

To the second general head belong all causes that produce a strong contraction of the elastic fibres of the uterus, or of the parts that can press upon it, or that occasion a rupture of the membranes: such as,

1. Violent agitation of mind or body.
2. A disease of the membranes.
3. Too large a quantity of liquor amnii.

4. The

Abortion.

4. The crofs pofition of the fœtus.

5. Its motion and kicking.

The laft head includes the numerous caufes of the death of the child, which, befides thofe referred to in the preceding claffes, may be occafioned by,

1. Difeafes peculiar to itfelf.
2. Difeafes communicated by the parents.
3. External accidents happening to the mother: or,
4. Accidents incident to the fœtus in utero.
5. Difeafes of placenta or funis.
6. Knots and circumvolutions of the chord.
7. Too weak an adhefion of placenta or chorion to the uterus: and,
8. Every force that tends to weaken or deftroy this attachment.

With regard to the treatment. This muft be varied according to the particular circumftances of the cafe: nor is it poffible to point out particular indications, or propofe any regular plan to be purfued for this purpofe. Abortion is often preceded by no apparent fymptom, till the rupture of the membranes, and evacuation of the waters, announce the approaching expulfion of the fœtus. Either to remove threatening fymptoms, or to prevent mifcarriage when there is reafon to apprehend it, often baffles our utmoft fkill; becaufe it generally happens, that there is a ceffation of growth in the ovum; or, in other words, an extinction of life in the fœtus, fome time previous to any appearance of abortion. For inftance, in early geftation, a woman commonly mifcarries about the 11th or 12th week; but the age of the fœtus at this time is generally no more than eight weeks. At other times, when by accident the fœtus perifhes, perhaps about the fifth or fixth month, it will ftill be retained in utero, and the expulfion will not happen till near the completion of full time.

As women who have once aborted are fo liable to a recurrence from a like caufe, at the fame particular period, fuch an accident, in future pregnancies, fhould therefore be guarded againft with the utmoft caution. On the firft appearance of threatening fymptoms, the patient fhould be confined to a horizontal pofture; her diet fhould be light and cooling; her mind fhould be kept as tranquil as poffible; a little blood from the arm may be taken occafionally; and opiates adminiftered according to circumftances; but excepting fo far as depends on thefe, and fuch like precautions, for the moft part, in the way of medicine, very little can be done.

Manual affiftance is feldom or never neceffary during the firft five months of pregnancy: the exclufion of fœtus and placenta fhould very generally be trufted to nature.

The medical treatment of abortion muft therefore be confidered with a view only to the prophylactic cure: and this again will chiefly confift in a proper

Chap. IX. *Regimen during Pregnancy.*

Women, when pregnant, fhould live a regular temperate life; moderation in eating and drinking fhould now be very carefully obferved, and every thing that has any tendency to difagree with the ftomach fhould be avoided; otherwife the manner of life fhould be much as ufual. If complaints do occur, thefe fhould be treated as at other times; only guarding againft fuch things as, by violent operation, may endanger mifcarriage. If the woman has formerly been fubject to this accident, the caufe fhould be carefully confidered, and fuitable remedies applied; if plethoric, for inftance, fhe fhould be blooded, live fparingly, and keep quiet, till fhe gets beyond the dangerous period. If fhe be weak, delicate, and nervous, bark, light aromatic bitters, mineral waters, and the cold bath (if able to bear it), will prove the beft prophylactic remedies. The cold bath has, in many cafes, cured the moft obftinate fluor albus, and fometimes even fterility itfelf; and, in relaxed habits difpofed to mifcarriage, when every other means has failed, the cold bath has done confiderable fervice: the practice may fafely be continued for fome months after conception, when it has been early begun, or when the patient has been accuftomed to it. Such a fhock will, however, act very differently on different fyftems: hence, it is an expedient by no means to be indifcriminately ufed in the pregnant ftate.

Regimen.

Abortions that happen in early geftation, and that come on fuddenly without any prefaging fign, if ever they are to be prevented, it can only be done by avoiding all occafional caufes, by counteracting morbific difpofition, and by confinement to a horizontal pofture, for fome time before, and till the critical period be over.

When a venereal taint in the parents is fufpected to be the caufe either of abortion or the death of the fœtus, the like accident can only be prevented by putting both parties on a mercurial courfe.

Pregnant women require a free pure air; their amufement fhould often be varied; their company fhould be agreeable and cheerful; their exercife fhould be moderate, and fuited to their inclination, conftitution, and the feafon; they fhould avoid crowds, confinement, travelling over rough roads in a carriage, or being expofed to fea-voyages. Riding a-horfeback fhould alfo be practifed with great caution, that difagreeable objects may be fhunned, and fhocks of every kind prevented. For this reafon, when riding is judged proper, the woman fhould be a courageous rider; fhe fhould never ride without fomebody being in company; the horfe fhould be tame and well trained; the road fhould be fmooth as well as private; and the exercife fhould be gentle and eafy, and never carried the length of fatigue. Women fhould, with the utmoft care, guard againft confining the breafts or belly; early recourfe fhould be had to jumps, and they fhould keep themfelves as loofe and eafy as poffible through the whole term of utero-geftation. An open belly is neceffary and important in the pregnant ftate; it keeps the ftomach in good condition, prevents cholics and other complaints that may terminate in mifcarriage. When the abdomen is pendulous towards the latter months, a gentle fupport by proper bandage will prove ufeful; and the woman, when fatigued, fhould occafionally, through the day, indulge in reft on a bed or couch.

LABOURS.

Labours are divided into three claffes: *natural*, *laborious*, and *preternatural*.

In whatever manner the head of the child prefents, where the delivery at full time is performed by nature, the labour is with great propriety called *natural*; when the

Natural Labour. the birth is protracted beyond the usual time, or cannot be accomplished without extraordinary assistance, it is deemed *laborious;* and *preternatural*, when any other part but the head presents.

Chap. X. *Natural Labour.*

By whatever power the uterus is enlarged, when any further increase is prevented, a stimulus to contraction must ensue; by this means an uneasy sensation is excited, which must, in the woman, produce an effort to procure relief: and thus arise the true labour-pains, which at first are slight and of short duration, a considerable remission intervening: the periods of recurrence soon become more frequent; the pains acquire an increased force, producing more and more change on the os uteri; which, yielding to the impelling cause, gradually opens and expands; till at length it becomes completely dilated, the membranes protruded and ruptured, and the child, by the expulsive force of the uterus, assisted by that of the diaphragm and abdominal muscles, is thus pushed along and delivered.

The symptoms of approaching labour are, The subsiding of the abdominal tumour: hence a discharge of mucus from the vagina, sometimes tinged with blood; incontinency, or suppression of urine; tenesmus; pains of the belly, loins, and about the region of the pubes; restlesness, hot and cold fits, &c.

Spurious pains are to be carefully distinguished from those of genuine labour. The former arise from the stretching of the uterus and its pressure on the neighbouring parts, or from costiveness; and are to be distinguished from the latter by the following symptoms: They are most troublesome towards the evening, increase in the night, and abate through the day; they are more trifling and irregular than true uterine pains; the uterine orifice is not affected; and there is no increased flow of mucus from the parts.

True pains begin about the region of the kidneys, strike forward towards the pubes, and down the thighs: they return at regular periods: there is a copious discharge of mucus from the vagina; the os uteri gradually opens, and can be felt to dilate in time of a pain; while the membranous bag, in a tense state, forcibly pushes against the finger.

The event of labours is so precarious, that no certain judgment can be formed from almost any symptoms, till the labour itself be considerably advanced. A prognosis in general is chiefly to be formed from the age, state of health, and temperament of the patient; from the force, duration, and recurrence of the pains; and from their effect on the uterine orifice; from the time of the rupture of the membranes; from the general make and form of the woman, but, in particular, of that of the pelvis; from the bulk and position of the child, &c.

With regard to the method of delivery, and position of the woman, this has been different at different ages, and in different countries: the chief thing, however, is to guard against cold and fatigue, observing that the woman be placed in the most favourable posture for supporting the back, for the action of the abdominal muscles, &c. and most convenient for the necessary assistants: till the labour is considerably advanced, she may be indulged in whatever posture is most agreeable; after which the bed or couch is the most proper.

Natural Labour. With regard to assistance in natural parturition, the accoucheur for the most part has little to do, till the membranes are ruptured, and the head in perinæo. In time of labour, the woman should be kept very cool, and every means of being overheated should be avoided. She should be put to bed in proper time, placed on her side or back, with her head and shoulders a little raised, a cloth tied to the bed-post, or held by an assistant, to support her hands in time of pain, and her feet resting against a foot-board; her knees should be drawn up towards the belly, and a folded pillow put between them. All efforts to press or strain, except what nature excites, are improper, hurtful, and should be avoided: the membranes, if possible, ought not to be ruptured till they almost protrude at the os externum: the perinæum must be lubricated when formed into a tumour, and carefully supported while overstretched; for this purpose, a cloth smoothly folded should be applied over the part, to enable the accoucheur to have a firmer hold. This is an important part of his office; and must be attended to with the strictest care. From the time this protrusion begins to form till the head of the child be completely delivered, the perinæum must be carefully preserved by the palm of the hand firmly applied against it, which should be carried backwards in a direction towards the anus, and kept so during every pain. Thus the miserable consequences will be prevented to which the neglect of this pressure exposes: for by this support the overstretching of the perinæum will be greatly lessened, the parts will dilate gently and gradually, the vertex will easily slip from under the pubes, and the fore-head will rise from under the perinæum in a safe, slow, and gentle manner. The perinæum must now be released, by cautiously sliding it over the face and chin of the child; and this ought to be made further sure of, by passing a finger under it round and round. After the head has thus mechanically advanced through the pelvis and vagina, a pain or two must be waited for, when in like manner the body will follow; nothing more being necessary than to support the child while it is gradually pushed forwards by the expulsive force of the natural pains.

When the child has cried, and the change in the circulation freely taken place, the funis umbilicalis must be tied and divided, the infant must be wrapped in a warm receiver, and given to the nurse to be washed and dressed.

The parts of the woman must now be gently wiped, a warm soft cloth must be applied, and a proper time waited for the separation of the placenta.

This is also the work of nature, and seldom requires more force to bring it along than if it lay entirely loose within the cavity of the uterus. Thus, in pulling, no greater force should be employed than is just sufficient to put the funis on the stretch: for if it is already separated, no violence is necessary to extract it; and if the adhesion is very firm, all violent efforts are improper, and often followed with most dangerous consequences. Its advancing is known by the contraction of the uterus, and shifting of the abdominal tumour, and by the lengthening of the cord. By the spontaneous contraction of the uterus, this separation is effected; the expulsion will be slower or more expeditious, Natural Labour.

ditious, according to the ſtate and condition of the woman, according to the number of children ſhe has born, and according to the duration or violence of the labour; it is eaſier and ſooner ſeparated in a firſt birth, when the woman is in good health, and when the labour has been properly managed. In moſt caſes, this ſeparation is accompliſhed within half an hour after the delivery of the child. It adheres moſt firmly after premature births, when the woman has been ſickly during pregnancy, where the labour has been tedious and difficult, or when haſty attempts have been made to extract it. A finger, or finger and thumb, guided by the funis, and introduced within the vagina, to bring down the edge, will remove any difficulty occaſioned by the centre or bulky part paſſing the uterine or vaginal orifice.

When it becomes neceſſary to employ force in extracting the placenta, which is never requiſite but in caſes of flooding, when the woman has been in bad health during pregnancy, when ſhe has ſuffered much in time of labour, or when the ſtring has been torn from it, (though the firſt of theſe caſes is perhaps the only one wherein the practice is abſolutely proper), the method of doing it is as follows: In ordinary caſes, the woman ſhould be laid on her back or ſide; but when the belly is pendulous, or when the placenta is attached to the fundus uteri, ſhe muſt be placed on her knees, which is the moſt convenient poſture.

The acoucheur, though with a certain degree of courage, yet with the utmoſt poſſible tenderneſs, muſt then paſs his hand well lubricated through the vagina into the uterus, and feel for the convex body of the after-birth; if the chord be entire, this will direct him; if not, he muſt feel for the looſe membranes at the edge of the cake; and muſt not be deceived by coagula of blood that lie in the way: if the uterus be conſtricted in the middle like a ſand-glaſs, a circumſtance that ſometimes, though rarely, occurs, this muſt be overcome by a gradual dilatation with one finger after another, till the whole hand in a conical manner can ſafely be paſſed. He muſt not content himſelf with feeling a part; he ſhould be able to move his fingers round the whole body of the cake; the adheſion muſt be ſeparated very gradually, in a direction from the ſides round and round. The placenta is diſtinguiſhed from the uterus, as well by its ſoftneſs as by its convex puckered feel. This convexity increaſes in the ſame proportion as the uterus contracts: hence the middle part or centre of the placenta is firſt detached; and if the edges are carefully ſeparated, by gently paſſing the fingers behind, the whole body becomes looſe and diſengaged, which muſt now be brought along with great caution, that no part be left behind, and that no injury be done to the woman in making the extraction.

Though bad conſequences ſometimes follow from the retention of the placenta, yet it is much to be queſtioned, if theſe are not leſs to be dreaded than the dangerous floodings, convulſions, deliquia, inflammation of the uterus, fever, &c. that may be induced from the prepoſterous practice of paſſing the hand to make the extraction: and would it not in general be better to confine the practice of introducing the hand, to caſes of uterine hæmorrhages only? Where the adheſion is ſo firm as to require force, or where its place of attachment is out of the reach of the finger, by which, for the moſt part, the edge may be brought down, is it not by far the ſafeſt and the moſt rational practice univerſally to truſt to nature? Should the mouth or body of the uterus become conſtricted before the ſeparation is effected, no matter; little is to be dreaded: it will afterwards kindly dilate; and the ſeparation and expulſion will ſpontaneouſly be accompliſhed with as much ſafety as in other animals, where no force is ever uſed. Let every candid practitioner acknowledge, that for one inſtance where the retention of the placenta has been attended with dangerous conſequences, a precipitate or forcible extraction has proved fatal to hundreds.

After the delivery of child and placenta, the woman muſt reſt a few minutes; her ſtrength and ſpirits may be recruited by ſome light nouriſhing cordial; the wet cloths, &c. muſt then be removed; the bed muſt be properly ſhifted and adjuſted; and a gentle compreſſion muſt be made on the abdomen.

During lying-in, the woman ſhould avoid company and noiſe; her dreſs and bed-linens ſhould be often changed; ſhe ſhould avoid every means of being overheated; and with regard to her diet, it ſhould, for the firſt week at leaſt, be very light and of eaſy digeſtion.

Difficult Labour.

Chap. XI. *Laborious or difficult labour.*

When the birth is protracted beyond the ordinary time, or when the child's head, though naturally preſenting, cannot be brought forwards without aſſiſtance, the labour is accounted difficult or laborious.

Though the cauſes of laborious births are various and complicated, they may in general be conſidered as depending,

I. On the mother.
II. On the child.
III. On the ſecundines.

I. The birth may be protracted, or the labour-pains interrupted, by,

(1.) Debility in the mother, ariſing,
- *a* From diſeaſe, *viz.*
  1. Flooding.
  2. Epileptic fits.
  3. Crampiſh ſpaſms.
  4. Lowneſs and faintiſhneſs.
  5. Inflammatory diatheſis.
  6. Colic.
  7. Nauſeating ſickneſs and vomiting.
  8. Hectic or conſumptive habit.
- *b* From paſſions of the mind.
- *c* From miſmanagement in time of labour.

(2.) Local complaints in the parts, or their neighbourhood, *viz.*
- *a* In the bones, occaſioning narrowneſs and diſtortion.
- *b* In the ſoft parts, *viz.*
  1. Dryneſs and conſtriction of the vagina.
  2. Thickneſs and rigidity of the os tincæ.
  3. Scirrhous or polypous tumours about theſe parts.
  4. Accumulated fæces in the inteſtines.
  5. Stone in the urethra.
  6. Prolapſus of the uterus, vagina, and rectum.

7. Ob-

Natural Labour.

7. Obliquity of the uterus.

II. Difficulties also arise on the part of the child, *viz.*

1. From the bulk and ossification of the head.
2. The situation in which the head presents.
3. Large broad shoulders, or their transverse descent through the pelvis.

III. The secundines, *viz.*

1. The rigidity of the membranes, and the contrary.
2. Too great a quantity of water.
3. The funis umbilicalis too long, or too short.
4. The prolapsus of the funis before the child's head: and,
5. The attachment of the placenta towards the cervix or os uteri.

The treatment of laborious births requires a very nice and careful attention to the condition of the patient and other circumstances, from whence only we can judge when assistance becomes requisite, and how it may be applied to the best advantage. That pain and misery is the unavoidable and inseparable attendant of child-bearing, though dealt out in different proportions to different subjects, the testimony of all nations, and all ages, as well as daily experience, bear witness: nor is the easiest labour altogether exempted from pain, even under the most favourable circumstances. The delivery, however, promises to be safe and easy, when the woman is of proper age, in good health, the child presenting right, and the pelvis well proportioned: but the force of the natural pains may be interrupted, and of consequence labour be retarded, from,

I. Debility in the mother, arising from

a Disease. This may appear under various forms; as,

1st, A flooding. Which is very alarming, even along with labour-pains: though less so in this case than when at a distance from full time; because as the labour-pains increase, the hæmorrhage very generally abates; or if not, breaking the membranes when the aperture of the os uteri is sufficient to admit the hand, seldom fails to produce that effect. The woman in this case must be kept cool. Opiates must be administered; she must be comforted with the best assurances of a happy delivery; and the natural pains must be waited for.

But if the hæmorrhage proceeds from a separation of the placenta, attached towards the cervix or orificium uteri; in this unhappy case, the whole body of the cake may be completely separated before the aperture of the uterus be sufficient for allowing the head to pass; and the deluge may be so sudden and impetuous, that the woman will sink immediately under it. Breaking the membranes, and making the delivery, either by turning the child, or extracting with the forceps or crotchet, according to circumstances, with as much expedition as is consistent with the mother's safety, is the only expedient by which the threatening catastrophe may be prevented.

2dly, Epileptic fits may in like manner retard labour, and endanger the life of the mother. If the child is not thrown off by a few fits, which is often the case, the delivery should be effected as soon as possible.

3dly, Crampish spasms in the thighs, legs, rarely in the belly, are very troublesome. They depend on the pressure of the head on the nerves as it passes through the pelvis, and can only be removed by delivery, which, as these pains are seldom, if ever, attended with danger, is not to be forced on this account. Breaking the membranes will sometimes remove them.

4thly, Lowness and faintishness often occur, and frequently prove the cause of protracted labour.

No general rules with regard to the management of slow labour can be recommended. The mode of treatment, where so many circumstances may occur, must be suited to the condition of the patient, as every particular case will in some measure require a different management. Much depends on the prudence and judgment of the attentive practitioner. For instance, when the woman is nervous, low-spirited, or weakly, from whatever cause, in general her strength must be supported: she must not be put on labour too early: she must avoid heat, fatigue, and every means of exhausting her strength or spirits. When she is restless, or the pains trifling and unprofitable, opiates are particularly indicated; they remove spurious or grinding pains, recruit the spirits, procure rest, and amuse time. Little else for the most part is to be done. If the uterus once begins to dilate, though the dilatation goes on slowly, it is by much the best and safest practice to do nothing but regulate the management as above. The pains at last will become strong and forcing; and the delivery, even where the patient has been very weakly, will often have a safe and happy termination. In these tedious labours, if the strength of the woman be properly supported, every thing almost is to be expected from nature. Forcible means should be the last resource.

5thly, Inflammatory diathesis, in young subjects of strong rigid fibres and plethoric habits, must be obviated by venesection, an open belly, and cooling regimen.

6thly, Colic.—Many women have severe attacks of this disease immediately before the labour-pains come on; the reason of which is sufficiently obvious: the belly, which formerly rose so high, that the fundus of the womb pressed against the pit of the stomach, afterwards subsiding, by the child's sinking to the lower part of the womb, and the oval of the head being applied to the oval of the basin, the contents of the intestines will be forced lower and lower, and the strait gut will be distended. Hence colic-pains, irritation, and uneasiness, a frequent desire to go to stool, or frequent loose stools, generally ensue. The best palliative remedy is to inject emollient glysters repeatedly till the bowels be entirely emptied. Although some degree of purging should attend the tenesmus, it will be necessary to wash the strait gut, by the use of one or more glysters. The irritating cause being in this way removed, an opiate, if no inflammatory heat or fever prevents, may be afterwards given with advantage.

7thly, Nauseating sickness, with vomiting.—When these symptoms occur, warm water or chamomile-tea must be drunk freely. Sickness and vomiting happen in some degree in the easiest labours. Sometimes they proceed from a disordered state of the stomach; but in general are to be accounted for from the well-known

Difficult Labour.

known ſympathy of the womb with the ſtomach; and accompany the ſtretching of the os uteri only.

8thly, Hectic or conſumptive habit.—It is a melancholy thing to attend a labouring woman in this ſtate. The pains are weak and trifling; ſhe cannot force much down; and ſhe is feeble, and liable to faint when the pain goes off. But however apparently exhauſted, the progreſs of labour goes on, in moſt caſes, much better than could be well expected. The orifice of the womb gives little reſiſtance to the force of the pains, weak and trifling as they are; the parts are ſoft and lax, and ſoon ſtretch in ſuch a manner, that, if there be no fault in the pelvis, the child readily obtains a paſſage.

Here little is to be done, but ſupplying the patient, from time to time, with light nouriſhment; with cordials that do not heat; and keeping up a free circulation of cool air all around her: for this purpoſe the curtains ſhould be quite drawn aſide, doors and windows widely opened; and ſhe ſhould be placed in a poſition with her head and breaſt well raiſed, that an eaſy reſpiration may be promoted. Hectic women under proper management rarely ſink immediately after delivery; they generally ſurvive a week, or longer, tho' they ſeldom outlive the month.

b. Paſſions of the mind. Any piece of news in which the patient, her family or relations, are intereſted, ſhould be carefully concealed, as well as every thing that tends in general to affect the paſſions; as labour may not only be interrupted from this cauſe, but the moſt dangerous ſymptoms, as floodings, convulſions, deliquia, and fatal ſyncope, may be induced.

c. From miſmanagement in time of labour often ariſes debility; ſo that the patient's ſtrength is exhauſted, the pains at length entirely ceaſe, and the head of the child remains locked in the pelvis, merely from want of force of pain to puſh it forwards. In all caſes where the labour has the appearance of being tedious, the woman's patience muſt, as much as poſſible, be ſupported. During the grinding pains, ſhe muſt be kept cool and quiet; opiates may be exhibited to paſs the time, till the forcing throes enſue, when ſhe will acquire reſolution, the parts will dilate kindly, and the labour end happily; whereas, if ſhe conſiders herſelf in labour from the earlieſt appearance of grinding pains, ſhe is frightened at the length of time, and her patience runs out. Slow lingering labours happen chiefly to elderly women having a rigidity in the parts, to nervous ſubjects, and to ſuch as have been weakly during pregnancy. It is of great conſequence, and the advice cannot be too much inculcated, to avoid exhauſting the woman's ſtrength too much at firſt.

2. *Local complaints in the parts, or their neighbourhood.*

a. Narrowneſs or diſtortion of the bones of the pelvis. Where there is any material defect in this cavity, a ſuperficial knowledge of the form and ſtructure of the parts will enable us to judge. If, from the figure of the woman's body, there is reaſon to ſuſpect a faulty pelvis; if the ſpine is twiſted, the legs crooked, the breaſt-bone raiſed, or the cheſt narrow; whether the pelvis be affected or not, ſhe will require a particular management; for the conſtitution of ſuch women is weak and feeble, and they cannot be much confined to bed on account of their breathing. We can never be abſolutely certain of a diſtortion of the pelvis, (except when the diſtortion is confined to the inferior aperture), till the uterine orifice is conſiderably dilated. After this time, if the pains are ſtrong and forcible, and the head of the child makes no advance, a narrow pelvis or large head is to be ſuſpected. The pelvis may be faulty at the brim, bottom, or in the cavity or capacity. The firſt of theſe, which moſt frequently occurs, is the moſt difficult to be diſcovered. The ſecond can be readily perceived by the touch: for we can feel the defects in the ſhape of the os ſacrum and coccyx, in the poſition of the iſchia, and in the bending of the pubes; and where the diſtortion is ſo general, that the whole cavity of the pelvis is affected, the ſhape of the woman's body, the ſlow progreſs of the labour, and the ſtate of the parts to the touch, will afford ſufficient information.

In the firſt caſe, we can only know the diſtortion by the ſymptoms; for we ſhould not attempt to introduce the hand till the mouth of the womb be dilated: it is afterwards unneceſſary; for we know that the pelvis is too ſmall, or the head too large, by its not advancing in proportion to the pains, and by feeling a ſharp ridge like a ſow's back on the top of the child's head, which is occaſioned by the bones riſing over each other in conſequence of the preſſure.

How long nature, in ſuch circumſtances, can ſupport the conflict, it is difficult to ſay. It is ſufficient to obſerve, that when things are properly prepared for the advance of the child, when the firſt ſtage of the labour is accompliſhed, but its progreſs is then ſuſpended, it is of little conſequence to the midwife whether the obſtacle is to be referred to the child, or to the mother; and a man-midwife ought to be immediately called in.

If the patient's ſtrength declines; if the head, from being locked in the bones of the pelvis, begins to ſwell, and the parts of the woman to be affected with tumefaction and inflammation; nature, in this caſe, ſeems inſufficient, and it will be dangerous longer to delay the proper means of making the delivery; as mother, or child, or both, may fall a victim to our neglect. We muſt not, however, allow ourſelves to be impoſed on, either by the impatience of the diſtreſſed mother, or by the clamours of the officious impertinents about her. In affording that aſſiſtance we are able to give, we are only to be directed by the ſymptoms of the caſe: we muſt remember that the gentleſt aſſiſtance our hands or inſtruments in laborious births can afford, is always attended with hazard and riſk; that if inſtruments be applied too early, nature will be thus interrupted in her work, and the moſt fatal conſequences may enſue; and that if aſſiſtance be delayed too long, the mother may die undelivered: we ought, however, to be informed, that the former practice of having too early recourſe to forcible means, where, in time, nature unaſſiſted might do her buſineſs, has proved by far more fatal than the latter. We ought therefore carefully to conſider the general hiſtory of the patient, and particular circumſtances of the caſe, that we may hit the proper time of making the delivery; which, in theſe laborious labours, is exceedingly difficult to determine; yet is a matter of the utmoſt importance, as there is always one, often two or more lives at ſtake, and the accoucheur is accountable for the conſequences of his

miſ-

Difficult Labour.

misconduct or neglect.

b. The fault may be in the soft parts: as,

1. Dryness and constriction of the vagina. Here all stretching and scooping is to be avoided. The natural moisture is to be supplied by lubricating with pomatum or butter, or by throwing up injections of warm oil; the parts are likewise to be relaxed by the application of warm stupes, or by warm steams directed to them.

2. Thickness and rigidity of the os tincæ. This happens chiefly in women well advanced in life, where the parts open more slowly, and the labour generally proves more tedious. Here also little is to be done but waiting on with patience, comforting the woman as well as possible, and giving an opiate from time to time. The parts may be relaxed with butter or pomatum, by throwing into the vagina injections of warm oil, or by the application of warm stupes to the os externum. Every forcible attempt to open or stretch the uterus, as some authors presume to advise, is apt to induce inflammation and its consequences, and to interrupt the natural pains: it is therefore universally the safest practice to trust in every case to these; tho' tedious, or even violent, the labour for the most part will end more happily, and the woman recover better, than if force had been employed.

3. Polypous tumours, &c.—There is seldom occasion, in case of cicatrices in the vagina, to dilate with the scalpel, to remove polypous tumors by excision, or to cut upon and extract a stone from the urethra in time of labour. But, if circumstances are urgent, such expedients are safe and practicable, and warranted by many precedents.

4. Accumulated fæces in the intestines, ought always to be removed by repeated emollient glysters, on the first appearance of approaching labour.

5. A stone in the urethra, if it cannot be pushed back, must be cut upon and extracted, as already advised.

6. Prolapsus of the uterus may happen even at full time, in a pelvis too wide in all its dimensions; for which, however, nothing can be done, but to support the uterus in time of a pain, that the stretching of the parts may be gradual. Prolapsi of the vagina and rectum must be reduced at the remission of the pain, and a return by gentle pressure must be prevented.

7. Obliquity of the uterus, though a favourite theory of some authors, never happens in such a degree as to influence delivery, except in the case of a pendulous abdomen, or where it depends on the make or distortion of the pelvis. The first of these, tho' it may, by throwing the child's head over the pubes, occasion perhaps some little delay, will seldom prove any material obstacle to the progress of the labour.

II. The protraction of labour may depend on the child, and may arise from,

1st, The bulk or ossification of the head.

There may be either a natural disproportion between the head and body, or the swelling may be occasioned by a putrid emphysema in consequence of the child's death, or the enlargement may proceed from a hydrocephalus. The first of these cases can only be discovered by the slow progress of the labour, when the pains are strong and frequent, the soft parts sufficiently dilated, the woman in good health, and no other apparent cause to account for the remora. The second is discovered from the history of the case, from the common symptoms of a dead child, viz. the puffy emphysematous feel of the presenting part of the head, and from the separation of the cuticle when touched. Lastly, the hydrocephalus is discovered by the head falling down in the pelvis in a large bulky form, by the bones of the head being separated at considerable distances, and by a fluctuation evident to the touch. On the whole, however, it may here be observed, that the most probable or suspicious symptoms of the child's death are often deceitful.

From whatever cause the head is enlarged, if the difficulty arises from this cause, and the force of the pains prove insufficient to push the head forwards, recourse must be had to instruments; and, if the bulk of the head is too large to pass the diameter of the pelvis, the cranium must be opened to diminish its size, and the brain evacuated previous to the extraction.

2dly, The position of the head, which may be squeezed into the pelvis in such a manner as not to admit of that compression necessary for its passing. Such a cause of difficulty, however, more seldom occurs than many authors have imagined. The rash and preposterous application of instruments has, in such cases, proved the bane of thousands. Here though the labour will prove more painful and more tedious, yet nature in general, unassisted, will accomplish her own work with more safety to mother and child, than by the intrusion of officious hands. Turning here is always difficult, often dangerous. The same observation will hold of instruments, which should never be employed but when alarming symptoms occur: the assertion perhaps is not more bold than true, that, in general, the most disadvantageous position in which the head can offer is not sufficient, without some other cause concurring, either to prevent delivery, or to endanger the life of mother or child so much as would be done by the movement of the gentlest hands. Yet, in some cases, where the woman is weak and exhausted, and the pains trifling; if the head of the child be large, the bones firm, and the sutures closely connected; or if there by any degree of narrowness in the pelvis, a difficult labour is to be expected; and the life of both mother and child will depend on a well-timed and skilful application of the surgeon's hands.

The unfavourable position of the head may be referred to two kinds, which include a considerable variety. 1. When the fontanella, or open of the head, presents instead of the vertex. 2. Face-cases.

If no other obstacle appears but the presenting of the fontanella, the labour will, by proper management, generally end well; and much injury may be done by the intrusion of officious hands.

Face-cases are the most difficult and laborious of all kinds of births; and our success in these will chiefly depend upon a prudent management, by carefully supporting the strength of the woman. The varieties of face-cases are known by the direction of the chin; for the face may present, 1. With the chin to the pubes. 2. To the sacrum. 3. To either side. The rule in all these cases is to allow the labour to go on till the face be protruded as far down as possible. It is often as difficult and hazardous to push back the child, and to bring down the crown or vertex, as to turn the child,

Difficult Labour.

child, and deliver it by the feet. Sometimes a ſkilful artiſt may ſucceed in his attempt to alter the poſition, when he has the management of the delivery from the beginning; or, in thoſe caſes where the face is conſiderably advanced in the pelvis, may be able to give aſſiſtance by paſſing a finger or two in the child's mouth, and pulling down the jaw; which leſſens the bulk of the head; or, by preſſing on the chin, to bring it under the arch of the pubes; when the crown getting into the hollow of the os ſacrum, the head will afterwards paſs eaſily.

3dly, The breadth of the ſhoulders, or their tranſverſe deſcent through the pelvis, rarely proves the cauſe of protracted labour. The head is always pretty far advanced before any obſtruction can ariſe from this cauſe; and if the head has already paſſed, in a pain or two the ſhoulders will follow. The ſame reaſoning will alſo apply with regard to the aperture of the uterus itſelf: if the head paſſes freely, in like manner will the ſhoulders; the os uteri rarely, if ever, is capable of contracting upon the neck of the child, and thus preventing the advance of the ſhoulders; and, ſhould this prove the caſe, what can we do but wait with patience? After the delivery of the head, if the woman falls into deliquia, or if, after ſeveral pains, the ſhoulders do not follow, and the child's life be in danger from delay, we ſhould naturally be induced to help it forward in the gentleſt manner we are able, by paſſing a finger on each ſide as far as the axilla, and thus gradually pulling along.

III. Laſtly, From the ſecundines, difficulty and danger ſometimes ariſe.

1ſt, The rigidity of the membranes, and the contrary. From the firſt of theſe cauſes, the birth is ſometimes rendered tedious; but as the ſame effect is much oftener produced by the oppoſite cauſe, and the conſequences of the latter are more troubleſome and dangerous than the former, we ſhould always be exceedingly cautious of having recourſe to the common expedient of breaking the membranes, which ought never to be done, till we be certain the difficulty depends upon this cauſe; and, even then, the head of the child ſhould be well advanced, and the membranes protruded almoſt as far as the os externum. Many inconveniencies ariſe from a premature evacuation of the waters; for thus the parts become dry and rigid, a conſtriction of the os uteri for a time enſues, the pains often either remit or become leſs ſtrong and forcing, though not leſs painful and fatiguing; the dilatation goes on ſo ſlow, and the labour becomes ſo ſevere, that the woman's ſtrength and ſpirits, by the unprofitable labour, are quite overcome and exhauſted; ſo that the head remains confined in the paſſage, merely from want of force of pain to puſh it forwards. The woman in the beginning of labour ſhould therefore be treated with the utmoſt delicacy and gentleneſs. The work of nature is too often ſpoiled by officious hands. She ſhould be ſeldom touched while the membranes are whole, leſt they ſhould be ruptured; and, even when touching is neceſſary, this ſhould only be done when the pains begin to remit, and the tenſe membranous bag to relax.

2dly, Too great a quantity of water may prevent the uterus from contracting, and thus weaken the force of the pains. Though this may, however, occaſion a delay, it will never be attended with more dangerous conſequences; and the ſame advice already given will hold equally good in this caſe, that the membranes ſhould never be broken till the ſoft parts be completely dilated; and we are aſſured that the difficulty or delay proceeds only from this cauſe.

3dly, The funis umbilicalis too long. The funis may be faulty from its too great length, or the contrary: thus the extraordinary length, by forming circumvolutions round the child's neck or body, ſometimes proves the cauſe of protracting the labour. But as this can only happen when the chord is of an uncommon length, there is generally enough left to admit of the exit of the child with ſafety; and it is time enough, in general, after the child is born, to ſlip the nooſe over the ſhoulders or head: there is ſeldom occaſion to divide the chord in the birth, a practice that may be attended with trouble and hazard.

The practice of introducing a finger in ano, to preſs back the coccyx, or to prevent the head, when it advances, from being retracted by circumvolutions of the chord, is now entirely laid aſide; an expedient that can anſwer no end, but that of fretting and bruiſing the parts of the mother, and injuring thoſe of the child.

Funis too ſhort. The funis is ſometimes thick and knotty, or preternaturally thickened by diſeaſe. In this caſe, part of the placenta may be ſeparated as the child advances through the pelvis, and thus a flooding will enſue; or the funis may be actually ruptured and occaſion the death of the child, if the birth does not quickly follow. Such caſes, however, rarely happen.

An inconvenience, at leaſt fully as bad as the former, may ariſe from the too great length of the funis, though it may depend on other circumſtances: *viz.*

4thly, The prolapſus of the funis before the head. In this caſe, the funis, if poſſible, ſhould be puſhed up above the preſenting part; for, if the labour pains are ſlow, and the chord becomes cold, or the pulſation in it begins to grow languid, the circulation will thus be interrupted, and the life of the child deſtroyed. If the head is far advanced in the pelvis, and the child's life in danger, the delivery may be performed with the forceps. But to puſh up the head, and turn the child with a view to preſerve its life, as many authors recommend, is a practice by no means adviſeable: we ſhould ſeldom, in this poſition, be enabled to ſave the child; and turning under ſuch circumſtances can never be done, but at the immediate hazard of loſing the mother.

5thly, Placenta attached towards the cervix or os uteri. This caſe is truly melancholy; for, if the delivery is not ſpeedily accompliſhed, the effuſion from the uterine veſſels will be ſo copious and profuſe, that the unfortunate woman muſt, in a very ſhort time, periſh. On this occaſion the delivery muſt be conducted in the beſt manner the judgment and ſkill of the operator can direct, and with as much expedition as the ſafety of the mother will admit.

Thus, in moſt laborious caſes, provided the woman's ſtrength be ſupported, the management properly regulated, the natural moiſture of the parts when deficient ſupplied, manual aſſiſtance very ſeldom becomes

Difficult Labour.

comes requiſite: but as caſes do occur, wherein nature, with all advantages, will fail, and the common methods of relief prove unſucceſsful, recourſe muſt be had to more powerful means, while the woman is able to ſuport the conflict. In all ſuch caſes, the condition of the patient, the ſtructure and ſtate of the parts, and poſition of the preſenting part of the child, muſt very carefully be conſidered.

Method of Delivery by Inſtruments.

When the powers of nature are inſufficient to expel the child, extraordinary aſſiſtance muſt be had recourſe to. In laborious births, this is chiefly of two kinds.

I. The head is either extracted as it preſents: or,

II. Its diameter is diminiſhed previous to the extraction.

The head may be detained from advancing thro' the pelvis by all the cauſes formerly enumerated. Theſe are chiefly included in four general ones,

1. Weakneſs in the mother.
2. Narrowneſs of the pelvis.
3. The bulk of the head of the child: or,
4. Its diſadvantageous poſition.

Whatever is the cauſe, when the natural pains begin to remit, and the parts of the woman begin to ſwell; when her ſtrength declines, her pulſe grows feeble, and there is no proſpect of advantage to be gained by delay; meaſures muſt be taken for aſſiſting the delivery, otherwiſe both mother and child may periſh from neglect.

As inſtruments are never to be employed but in the moſt urgent and neceſſitous caſes, and expreſly with a view to preſerve the life of mother or child, or both; thoſe of a ſafe and harmleſs kind ſhould always be made trial of, in preference to thoſe of a deſtructive nature.

Uſe of the Forceps.

The forceps, is an inſtrument intended to lay hold of the head of the child in laborious births, and to extract it as it preſents. This inſtrument, as now improved, in the hands of a prudent and cautious operator, may be employed without doing the leaſt injury either to mother or child.

In every obſtetrical caſe, wherein manual aſſiſtance becomes neceſſary, the contents of rectum and bladder ſhould, if poſſible, be previouſly emptied.

The membranes alſo ſhould be broken, the ſoft parts completely dilated, and the head of the child as far as poſſible advanced, previous to the uſe of any inſtrument.

The form and ſtructure of the parts of the woman, the ſituation and progreſs of the preſenting part of the child, muſt at this time be carefully conſidered. The concavity of the ſacrum, for inſtance, will determine the progreſs of the labour. The touch of the vertex, fontanella, lambdoidal, or ſagittal ſuture, the fore or back part of the ear, or ſome part of the face, will aſcertain the true preſentation of the child.

The lower the head is advanced in the pelvis, our ſucceſs with the forceps is the more to be depended on. For when it has proceeded as far as the inferior aperture, by means of this inſtrument, it may be readily relieved: but when the head of the child is confined at the brim, both the application of inſtruments, and the extraction by rhis means, are exceedingly difficult and dangerous.

Difficult Labour.

The head may be ſo firmly wedged in the pelvis, that the forceps can neither be introduced nor fixed without bruiſing or tearing the parts of the woman: wherever, therefore, inſurmountable difficulties occur, either in applying or extracting with the forceps, the life of the mother muſt not be endangered by fruitleſs efforts; the head of the child muſt immediately be opened, and the delivery accompliſhed without further delay.

In laborious births, the proper forceps caſes may be reduced to two, which include, however, a conſiderable variety. Theſe are,

I. The ſmooth part of the cranium,

II. The face, preſenting.

The head may preſent,

1ſt, Naturally, when low advanced in the pelvis, with the vertex to the pubes, and the forehead or face in the hollow of the ſacrum. Or,

2dly, When higher in the pelvis, the vertex may preſent with the face laterally, the ears to the pubes and ſacrum. Or,

3dly, The fontanel may preſent with the face to the pubes, and vertex to the ſacrum; or with the vertex to the pubes, and face to the ſacrum.

1. When the head preſents naturally. The woman in this caſe muſt be placed on her back a-croſs the bed, properly ſupported; the accoucheur, ſeated before or in a kneeling poſture, after gradually lubricating the perinæum and vagina, muſt proceed gently to ſtretch the parts, by paſſing the hand in a conical manner through the os externum vaginæ, puſhing it forwards by the ſide of the child's head, till it advances as far as an ear, if poſſible; along this hand he is to guide a blade of the forceps, which with the other hand he introduces in the direction of the line of the pelvis, holding the handle backwards towards the perinæum, and keeping the clam cloſely applied to the child's head. This muſt be inſinuated very gradually by a kind of wriggling motion, puſhing it on till the blade is applied along the ſide of the head over the ear: he muſt then gently withdraw the firſt hand from the pelvis, with which he muſt ſecure the handle of the blade of the forceps already introduced, till the other blade be paſſed along the other hand, in the ſame ſlow cautious manner: the handles muſt then be brought oppoſite to each other, carefully locked, and, leſt they ſlip in extracting, properly ſecured by tying a fillet or garter round them; but this muſt be looſed during the remiſſion of pulling, to prevent the brain from being injured by the preſſure. The extraction muſt be made by very ſlow and gentle degrees, and with one hand only, while the other is employed to guard the perinæum: the motion in pulling, ſhould be from blade to blade; the accoucheur muſt reſt from time to time, and, if the pains are not gone, ſhould always in his efforts only co-operate with thoſe of nature. The child and mother will ſuffer leſs by going on in this gradual manner than by precipitating the birth, which can never be done but at the riſk of deſtroying both. If, in making the extraction, the forceps ſlip, they muſt be cautiouſly withdrawn blade by blade, and again introduced in the ſame manner.

manner. When the tumour of the perinæum forms, and the vertex begins to protrude at the os externum, the accoucheur muſt riſe from his ſeat, raiſe the handle gently upwards, and, by a half-round turn, bring the hind-head from under the ſymphyſis or arch of the pubes; remembering carefully to guard the perinæum from laceration and its conſequences, to which it is now ſo greatly expoſed.

In attempting the introduction of either blade, if it meets with any interruption, it muſt be as often withdrawn, and puſhed up again in a proper direction, till every difficulty be ſurmounted; and if, from the ſmallneſs or conſtriction of the parts, the introduction of the ſecond blade ſhall ſeem impracticable, the former one muſt be withdrawn, and the latter muſt be firſt introduced.

2. The vertex may preſent with the face laterally in the pelvis. It is always difficult to apply the forceps till the bulky part of the head has paſſed the brim; and here it is not only difficult to the operator, but extremely hazardous to the patient, to introduce this inſtrument till the ear of the child has got under the pubes. When the ears thus preſent to pubes and ſacrum, the woman ſhould be placed on her ſide or knees; the moſt difficult blade of the forceps ſhould be firſt applied, which is the one under the pubes; when both are paſſed, and properly ſecured, the patient ſhould again be turned to her back, before the operator attempts to extract, and the head in this caſe (as the quarter-turn can ſeldom be made with ſafety) ſhould be delivered in the manner wherein it preſents; becauſe, when confined any time in the paſſage, its figure is altered by the overlapping of the bones, in ſuch a manner that it paſſes along, in general, with far leſs difficulty than to attempt to puſh up and make the mechanical turns; a work often altogether impracticable, by which contuſion or laceration of the parts of the woman, and the moſt fatal conſequences, may be occaſioned. The handles of the forceps muſt here particularly be well preſſed backwards towards the perinæum, that the clams may humour the curvature and intruſion of the ſacrum, and accommodate themſelves to the form of the child's head.

This is a caſe wherein the forceps often fail; if ſo, they will ſometimes ſucceed by varying the mode of application, and fixing them over the forehead and occiput; if this method fails alſo, the ſize of the head muſt be diminiſhed, and the extraction made with the blunt hook or crotchet.

3. The fontanella may preſent with the face to the pubes. This is the moſt common of the fontanel caſes; though ſometimes the face is lateral in the pelvis, ſometimes diagonal, and ſometimes it is turned to the ſacrum. The true poſition is aſcertained by the direction of the fontanel, and that of the ear. Here, as in other laborious births, nature ſhould be intruſted as long as we dare. The head does not always deſcend mechanically through the capacity of the pelvis, as ſome practitioners have ſuppoſed; nor will the deviation from its ordinary mode of deſcent always of itſelf influence the delivery, at leaſt very rarely in ſuch a manner as to require extraordinary aſſiſtance. In whatever manner the head preſents, when it is ſituated high in the pelvis, the delivery cannot be effected without difficulty and hazard: in ſuch circumſtances, the application of the forceps will frequently baffle the utmoſt efforts of the accoucheur, and the conſequences of ſuch attempts may prove fatal to mother and child.

When extreme weakneſs in the mother, floodings, convulſions, or other urgent ſymptoms, render it neceſſary to force the delivery, whether the face be to pubes or ſacrum, the forceps may be applied along the ears, in the ſame manner as directed in a natural labour; and the head, for the reaſons already given, ſhould be brought along in the manner it preſents; the extraction ſhould be made with great deliberation, that the parts of the woman may have time to ſtretch; the perinæum muſt be carefully ſupported; the forceps muſt be gently releaſed, when the head is delivered; and the reſt of the delivery conducted as in a natural labour.

In this caſe, when ſituated high in the pelvis, the fontanel preſenting, and the face either to pubes or ſacrum, the long axis of the head interſects the ſhort diameter of the pelvis, and very often, though the forceps be applied, and a firm hold of the head be obtained, it is not poſſible to bring it along with all the force we dare exert. If this method therefore fails, the common forceps ſhould be cautiouſly withdrawn, and the long ones applied, if poſſible, over the fore-head and occiput, when, the ſize of the head, by the compreſſion it ſuffers in paſſing along, being perhaps ſomewhat diminiſhed, the extraction will be ſucceſsfully performed. This method alſo failing, previous to the operation of embryotomy, Dr Leak's forceps, with the third blade, may be had recourſe to. But of this little can be ſaid with confidence, till the inſtrument has been more generally employed. From the difficulty of ſucceeding in the application of the common forceps, it may, *à priori*, be concluded, that the introduction of a third blade, even in the hands of an expert practitioner, however ingenious the invention, is an expedient not eaſily to be put in practice. Neither is Roonhuyſe's lever, or a blade of the forceps paſſed up between the pubes and fore-head or hind-head of the child, in order to procure the delivery of the head, to be recommended in ſuch caſes: however ſome have boaſted of its ſucceſs, it is an inſtrument that may do much miſchief; and few practitioners can uſe it with ſafety.

II. *Face preſenting*.—Of laborious births, face-caſes, as we have already obſerved, are the moſt difficult and the moſt dangerous. From its length, roughneſs, and inequality, the face muſt occaſion greater pain; and from the ſolidity of the bones, it muſt yield to the propelling force with much more difficulty, than the ſmooth moveable body of the cranium. Face-caſes are the moſt troubleſome that occur in the practice of midwifery, and in which the moſt expert practitioners may be foiled in their attempts; and theſe attempts, if too early exerted, will be followed in many inſtances with fatal conſequences. Whatever way the face preſents, it ſhould be allowed to advance as low as poſſible in the pelvis; by which means, the acceſs will be more eaſy, and the poſition, for the application of inſtruments, more favourable. In this aukward ſituation, much miſchief may be done by raſhneſs; whereas, if time be allowed, and the

Difficult Labour.

the patient be properly ſupported, the delivery will generally end well.

The face may preſent with,

1. The chin to the pubes.
2. to the ſacrum.
3. laterally.

From the difficulty of applying inſtruments in theſe caſes, ſome authors recommend, as an univerſal practice, to turn the child, and deliver by the feet. But this in general is a dangerous practice, and ſeldom or never adviſeable, except when the membranes remain entire, till the os uteri is completely dilated, and the head continues looſe above the brim of the pelvis: and even then the propriety of the practice is doubtful; becauſe, if the head is ſmall, or the pelvis be well proportioned, the face will deſcend without much difficulty; and if otherwiſe, beſides the riſk in attempting to turn, the child may be loſt from the preſſure of the chord, or the difficulty of extracting the head after the delivery of the body.

When aſſiſtance becomes neceſſary, the beſt practice in face-caſes is the following: Having placed the patient in a convenient poſture, let the accoucheur in the gentleſt manner paſs his hand within the pelvis; and, during the remiſſion of pain only, endeavour to raiſe the head of the child, ſo that he may puſh up the ſhoulders entirely above the brim of the pelvis, and thus change the poſition of the face: by this means, if ſucceſsful, he will be able to reduce the firſt of theſe caſes, ſo as to make the fontanel preſent with the face to the pubes; he will reduce the ſecond ſo as to bring down the vertex, with the face to the ſacrum; and the third, he will reduce to a vertex caſe, with the face lateral. The delivery may be afterwards truſted to nature; which failing, there is eaſier acceſs for the application of inſtruments to make the extraction, as already directed. The ſucceſs, however, of the accoucheur, in altering the poſition of the head, by puſhing it up, will entirely depend on the time he is called; for, ſhould the head be firmly wedged in the pelvis, no force he dares employ will be ſufficient to alter the poſture.

If therefore every attempt to reduce the face, and make the vertex or fontanel preſent, ſhall prove unſucceſsful, and ſymptoms are urgent, the forceps muſt be applied over the ears of the child, and the extraction performed in the beſt manner the operator is able. And, failing theſe, immediate recourſe muſt be had to the crotchet.

1. In the firſt caſe, previous to the introduction of the forceps, the chin, if poſſible, ſhould be advanced below the pubes.

2. In the ſecond, the chin ſhould be advanced to the inferior part of the ſacrum. And,

3. In the third, the chin ſhould be as low as the under-part of the tuber iſchii: and although in general the head is to be extracted as it preſents, if the operator meets with conſiderable reſiſtance, it muſt be gently puſhed up and turned with the chin, either laterally, below the pubes, or into the hollow of the ſacrum, according to the particular circumſtances of the caſe, and in a direction beſt accommodated to the form and diameter of the pelvis.

Uſe of the Sciſſars, Crotchet, and Blunt Hook.

When the head of the child, from its ſize, unfavourable poſition, or from a fault in the pelvis, cannot be protruded by the force of natural pains, nor extracted by the forceps, recourſe muſt be had to more violent means, and the life of the child muſt be deſtroyed in order to preſerve that of the mother. This operation was by the ancients called *embryotomy*.

When the head, from its extraordinary bulk, is detained at the brim of the pelvis; on evacuating the contents, the bones of the cranium immediately collapſe, and the head is afterwards propelled by the force of the labour-pains; failing which only, the extraction muſt be made with the blunt-hook or crotchet.

The unfavourable poſition of the head is of itſelf a cauſe inſufficient to juſtify the uſe of deſtructive inſtruments, which ought never to be employed but in extreme caſes, after every milder method has failed. From the difficult acceſs to the cranium in order to make a perforation and evacuate the brain, a face-caſe makes a very troubleſome and dangerous crotchet one. Very luckily, in narrow pelviſes, the face rarely preſents, and very ſeldom advances far in that direction; at other times, the poſition may be ſo altered, that the crown, the back of the ear, or ſome other part of the cranium, can be reached; otherwiſe the crotchet muſt be fixed in the mouth, orbit of the eye, &c. and the head brought along in that direction, till the ſciſſars can be employed to open the ſkull.

But the grand cauſe of difficult labour is, the narrowneſs or diſtortion of the pelvis. For when, at the brim, inſtead of four inches and a quarter from pubes to ſacrum, it meaſures no more than one and a half, one and three-fourths, two, or two inches and one-fourth, the uſe of inſtruments becomes abſolutely requiſite, and very frequently in thoſe of two inches and one-half, and three inches; or when the diameters through the capacity, or at the inferior aperture, are retrenched in the ſame proportion, difficulties will in like manner ariſe, and the delivery, except the labour be premature, or the child of a ſmall ſize, cannot be accompliſhed without the aſſiſtance of deſtructive inſtruments.

We judge of the form and ſize of the pelvis by the external make and form of the woman; by the progreſs of the labour; by the touch. When the fault is at the inferior aperture, the touch is pretty deciſive; *e. g.* if a bump is felt in the os ſacrum inſtead of a concavity; if the coccyx is angulated; if the ſymphyſis pubis projects inwards in form of an acute angle; if the tuberoſities of the iſchia approach too near each other; or the one tuber be higher than the other; ſuch appearances are infallible marks of a diſtorted pelvis. But when the narrowneſs is confined to the brim, this is only to be diſcovered by the introduction of the hand within the pelvis: the projection of the lumbar vertebræ over the ſacrum, is a ſpecies of narrow pelvis, that moſt frequently occurs in practice. In this caſe, the child's head, by the preſſure it ſuſtains between pubes and ſacrum, is moulded into a conical or ſugar-loaf form, the parietal bones are ſqueezed together, over-lapping one another, and will be felt to the touch when the labour is advanced, like an acute ridge, ſomething in the form of a ſow's back.

In-

Difficult Labour.

Inſtead of the complicated inſtrumental apparatus invented by the ancients, ſuch as ſcrews, hooks, &c. for fixing in, laying hold of, and extracting the head, as it preſented, an operation in many caſes difficult and dangerous, when the head was bulky or the pelvis narrow, as the woman frequently loſt her life in the attempt; the practice of diminiſhing the ſize of the head, by opening the cranium and evacuating the brain, previous to the extraction, is a modern improvement, and an important one: the inſtruments for this purpoſe conſiſt ſimply of a pair of long ſciſſars, a ſharp curved crotchet, and a blunt hook: theſe are preferable to every other, whether of ancient or modern conſtruction.

When the accoucheur is under the diſagreeable neceſſity of deſtroying the child to preſerve the mother, ſhe muſt be laid in the ſame poſition as already adviſed for the application of the forceps; and the ſame rules, recommended for the one operation, will in general apply to the other.

Thus, in the narroweſt pelvis that occurs, previous to opening the cranium, the ſoft parts ſhould be completely dilated, and the head of the child ſhould be fixed ſteadily in the pelvis and advanced as far as poſſible; for while the head is high and looſe above the brim, the application of inſtruments is very difficult as well as hazardous.

The long ſciſſars muſt be cautiouſly introduced into the vagina, directed by the hand of the accoucheur; the points muſt be carefully guarded, till they preſs againſt the cranium of the child, which they muſt be made to perforate with a boring kind of motion, till they are puſhed on as far as the reſts; they muſt then be opened fully, carefully re-ſhut, half turned, and again widely opened, ſo as to make a crucial hole in the ſkull. They muſt afterwards be puſhed beyond the reſts, opened diagonally again and again, in ſuch a manner as to tear and break to pieces the bones of the cranium; they muſt then be ſhut with great care, and withdrawn along the hand, in the ſame cautious manner as they were introduced, leſt they ſhould bruiſe or tear the uterus, vagina, or any other part of the woman. After a free opening in the cranium has thus been made, the brain muſt be ſcooped out with the fingers or blunt-hook, and the looſe ſharp pieces of bone muſt be carefully ſeparated and removed, that no part of the woman be tore while the head is extracting. The teguments of the ſcalp ſhould now be brought over the ragged bones of the cranium, and the woman ſhould be allowed to reſt an hour or two, according to her ſtrength and other circumſtances: the bones of the cranium will now collapſe; and if the woman has as much ſtrength remaining, or the pelvis be not much diſtorted, the head being thus diminiſhed, will be protruded by the force of natural pains; otherwiſe it muſt be extracted, either by means of two fingers introduced within the cavity of the cranium, by the blunt-hook introduced in the ſame manner, guarding the point on the oppoſite ſide while making the extraction; or, failing theſe, by the crotchet, which, though dangerous in the hands of an ignorant raſh operator, may be employed by the prudent practitioner with as much ſafety as the blunteſt inſtrument.

The method of introduction is the ſame with a blade of the forceps. The chief thing to be attended to is, to guard the point till it be applied againſt the head, and firmly fixed in its hold, which ſhould always be ſomewhere on the outſide of the cranium; provided a firm hold is obtained, no matter where, behind the ears, about the os petroſum, orbits of the eyes, maxilla inferior, &c. according to the preſentation of the head. The woman being properly ſecured, and the handle of the inſtrument covered with a cloth, the operator muſt then pull, at firſt gently, afterwards more forcibly, reſting from time to time, and endeavouring to make the extraction in the beſt manner the circumſtances of the caſe will admit of. If the pelvis be much diſtorted, ſo that, by means of the utmoſt ſtrength the accoucheur can exert, little purchaſe is made, he may apply to the oppoſite ſide a blade of the forceps, which are now ſo conſtructed as to lock with the crotchet; let him then bring the handles together, ſecure properly, and thus endeavour to make the extraction. Should this expedient alſo fail, the blade of the forceps muſt be withdrawn, the other blade of the crotchet muſt be applied, the handles brought together and ſecured, and the extraction made, moving from blade to blade.

Should the head preſent in ſuch a manner, that, in attempting to extract it, the crotchet divides the vertebræ of the neck, and the head is thus ſevered from the body, an accident that can only happen in the hands of an ignorant blundering practitioner; the head muſt be puſhed up above the brim of the pelvis, the crotchet or blunt hook muſt be fixed under the axilla, the arms muſt be brought down, and the body extracted, by fixing the crotchet below the ſcapula on the ſternum, or among the ribs; the head muſt afterwards be extracted in the manner already adviſed: or ſhould the head in extracting be pulled from the body, as may happen when the child has been long dead, or when it is putrid, the delivery of the body muſt be effected by means of the crotchet as now directed; a method preferable to that of turning, as ſome adviſe.

If the head, inſtead of yielding to the force of pulling, be at laſt cut and broken in pieces, the operator muſt endeavour to bring down an arm of the child, to fix the crotchet about the jaw or neck, pull at both holds, and thus attempt to make the extraction; this alſo failing, he muſt bring down the other arm, fix the crotchet in the thorax, and, in a word, muſt tear the child in pieces, that the delivery may be accompliſhed by any means.

In face-caſes, where it is impracticable to alter the poſition, and when the pelvis is much diſtorted, the double crotchet is ſometimes requiſite; the handles muſt be well ſecured, kept well backwards towards the perinæum, and the motion always from blade to blade. It very ſeldom, however, happens, that there is occaſion for the double crotchet: by this means the head is flattened in pulling; whereas if one blade only can be employed, the head is lengthened, and, in pulling, can better accommodate itſelf to the ſhape of the pelvis as it paſſes along.

Chap. XII. *Preternatural Labour.*

In whatever manner the child preſents when the body is delivered before the head, the birth is accounted preternatural.

Preternatural labours may be referred to one of the four following claſſes.

I. When

I. When one or both feet, knees, or the breech, present.

II. When the child lies acrofs in a rounded or oval form, with the arm, fhoulder, fide, back, or belly, prefenting.

III. When one or both of the upper extremities prefent, the child lying in the form of a fheath, the feet towards the fundus uteri, the waters evacuated, and the uterus ftrongly contracted round the body of the child.

IV. Laftly, Premature or flooding cafes, or others in which it may be neceffary to force the delivery, either previous to the rupture of the membranes, or quickly after it.

The caufes of crofs labours moft commonly affigned by authors, are, The obliquity of the uterus; circumvolutions of the funis umbilicalis round the child's body; the fhortnefs of the funis, or attachment of the placenta towards the fundus uteri; fhocks affecting the mother when pregnant, &c. The pofition of the fœtus may alfo be influenced by its own motion and ftirrings, by the particular form and bulk of its body, by the manner of ftretching of the uterus, by the quantity of liquor amnii, and by many other circumftances.

The fymptoms that indicate an unfavourable pofition of the child, before it can be difcovered by the touch, are very uncertain and fallacious: a crofs birth may, however, be fufpected,

1ft, If the pains be more flack and trifling than ordinary.

2dly, If the membranes be protruded in a long form like a gut, or the finger of a glove.

3dly, If no part of the child can be difcovered when the uterine orifice is confiderably opened.

4thly, If the prefenting part through the membranes be fmaller, feels lighter, and gives lefs refiftance than the bulky ponderous head.

5thly, Laftly, after the rupture of the membranes, if the meconium of the child be paffed along with the waters, it is a fign that the breech prefents, or that the child is dead.

Preternatural labours are difficult or hazardous, according to,

1. The form of the pelvis, and general health and conftitution of the woman.

2. The bulk of the child, and its manner of prefenting.

3. The time the waters have been evacuated, and the uterus contracted round the body of the child.

4. When complicated with plurality of children; the prolapfus of the funis umbilicalis; the limbs of the child intangled with the chord; profufe and violent floodings from the attachment of the placenta towards the cervix uteri, &c.

Turning is often laborious, and always dangerous in proportion to the force ufed in fearching for and bringing down the feet; though, in general, the difficulty and hazard are not fo great, as in many cafes ftrictly called *laborious*, when the head prefents; the treatment of preternatural labours being better known, and for the moft part eafier put in practice.

Each clafs of the general divifion of crofs labours includes a variety of different cafes. By confidering a few of every clafs, a general idea of the whole will be formed.

CLASS I.

Case 1. The fimpleft and eafieft cafe is the Agrippan pofture, when the child prefents with the feet.

The foot is to be diftinguifhed from the hand, firft, by the weight and refiftance it gives to the touch; fecondly, by the fhortnefs of the toes; thirdly, by the projecting heel.

When the feet prefent in the paffage, the labour fhould be allowed to go on as if natural. If the child be of an ordinary fize, the woman in health, the parts well proportioned, in the way of affiftance nothing further feems neceffary but the application of a warm cloth round the body of the child, which muft be properly fupported till it advances as far as the pains are able to force it. If the fize be ordinary, or rather fmall, it will fometimes make the mechanical turns, and be entirely pufhed along by the force of the natural pains; but it generally ftops at the fhoulders, after the breech protrudes without the os externum, where the refiftance is fo great, that the accoucheur's affiftance becomes requifite.

In this cafe, the patient muft be placed on her back, properly fupported; the hand of the accoucheur muft be cautioufly introduced; the parts of the woman muft be gently ftretched; the feet of the child muft be laid hold of, and brought as low in the vagina as poffible; a foft warm cloth muft be wrapped round them, and the extraction muft be performed in a flow, cautious manner, making large motions in a circular or lateral direction, refting from time to time, if the pains are gone; and if not, always waiting for the natural efforts. When advanced as far as the breech, the body, if not already in a proper direction, muft be pufhed up, and gently turned with the face towards the mother's back; and to make fure that the face turns with the body, or to prevent the chin, vertex, or fhoulders from catching on the pubes, or angle of the facrum, an extraordinary quarter-turn more muft be made: this muft be reverfed previous to the extraction; and the difficulty arifing from the obftruction of the fhoulders muft be removed in the following manner. While the breaft and legs of the child are fupported over the palm and forearm of the one hand of the accoucheur, which he draws towards one fide, he muft introduce two fingers of the other hand at the oppofite fide into the vagina, over the back-part of the fhoulder, as far as the elbow, ande ndeavour in the moft gentle manner to bring down the arm, always remembering, in his movements, to humour the natural motions of the joint: he muft then fhift hands, when the other arm is to be relieved in the fame manner: both arms being brought down, the woman muft now reft a little, when a pain or two generally follows, and the head is alfo forced along. But fhould the woman be much exhaufted, and if the head does not quickly advance, the child may be loft from delay. The extraction of the head in preternatural labours, is often the moft difficult and the moft dangerous part of the delivery; the caufe of refiftance, when it does not advance, is chiefly owing to its confinement between the angle of the facrum and pubes, when the bulky part of the head is detained at the brim; whether the refiftance be here or towards the inferior aperture of the pelvis, if the head does not advance in a pain or two, the extraction muft be made in this manner:

ner: While the right hand of the accoucheur supports the body of the child below, with two fingers pressing on either shoulder, the left hand and fingers must in the same manner be placed over the back of the neck, and pulling gently in the direction from pubes to sacrum, he must thus endeavour to bring it along: but, should the pelvis be narrow, or the child's head of a large size, or the face be laterally or anteriorly placed in the pelvis, or, what rarely happens, the os uteri contracted round the neck of the child; in either of these cases, the accoucheur will sometimes meet with the utmost difficulty. When the above method therefore fails, he must introduce two fingers of the right-hand into the child's mouth, while those of the left-hand are expanded over the shoulders, as already directed; and in this way he must endeavour to relieve it, pulling from pubes to sacrum, alternately raising and depressing the head till it advances low down, so that the face descends from the hollow of the sacrum, when the accoucheur must rise from his seat, and bring the hind-head from under the pubes with a half-round turn, imitating that of a natural labour.

If the position be unfavourable, the face, if possible, should be turned to the sacrum, by pushing up the head, or by pushing back the chin: If the contraction of the uterus is the cause of resistance, which rarely occurs, it must be gently stretched with the fingers. Or if the difficulty arises from circumvolutions of the chord round the legs, thighs, body, or neck of the child, these must be disengaged in the easiest manner possible; it is rarely necessary to divide the funis on this account.

Should every method fail in bringing down the head, the delivery must be effected by means of the forceps cautiously passed over the ears, with the handles under the child's body, in a direction downwards towards the perinæum. If the pelvis be very narrow, or the head of a large size, it must be opened by pushing the sciffars through the occipital bone, so that the contents of the cranium may be evacuated, and the extraction made by means of the forceps, blunt-hook, or crotchet. But if the head, by the efforts to extract it, be actually severed from the body, and left behind in the uterus, an accident which sometimes occurs, it must be delivered by inclosing it in the forceps, while secured from rolling by pressing externally on the abdomen. If the forceps cannot be applied, the cranium must be opened, the texture of the brain destroyed, and the extraction performed by the fingers of the accoucheur, by the blunt-hook, or by the crotchet. If the under-jaw remains, the head may be effectually secured till locked in the forceps, or till its bulk be diminished, by introducing a finger into the mouth, thrusting it through the jaw under the chin, drawing it down, and passing a ligature through the perforation.

In cases where the child has been long dead, should the belly or thorax be distended with air or water, and prove the cause of obstruction, the contents must be evacuated by opening with the sciffars, or tearing with the crotchet; and in general, where difficulties occur, the delivery must be accomplished in that manner the circumstances of the case will best admit of.

Case 2. When instead of two, one foot only falls into the vagina, the other is sometimes detained by catching on the pubes, and, if easily come at, should be brought down, always remembering to humour the natural motion of the joint; but, should the leg be folded up along the child's body, the attempt is sometimes both difficult and dangerous, and ought not to be persisted in, as the breech will either be forced down by the assistance of natural pains, or by gently pulling by one leg only.

Case 3. When one or both knees present, the delivery must be conducted in the same manner with that of the feet.

Case 4. When the feet offer along with the breech, this last must be pushed up, while the former are secured and brought down, till it be reduced to a footling case, and otherwise managed as above.

Case 5. The breech may present with the fore-parts to the mother,

1st, Anteriorly.
2dly, Laterally. Or,
3dly, Posteriorly.

Sometimes the breech may be discovered, previous to the rupture of the membranes; but afterwards with more certainty, by the meconium of the child passed with the waters, and by the touch.

In whatever manner the breech presents, the delivery should be submitted to nature, till the child be advanced as far as the thorax, when the feet are to be brought down and laid hold of, the child, if necessary, pushed up, the mechanical turns effected, and the delivery otherwise conducted as in a footling case. There is much less hazard in general, agreeable to an old observation of Mauriceau, in allowing the child to advance double, than in precipitating the extraction by pushing up to bring down the feet before the parts have been sufficiently dilated; a practice difficult and troublesome to the operator; painful, and sometimes dangerous, to the mother; and by which the child is exposed to the risk of strangulation, from the retention of the head after the delivery of the body. If the child be small, though doubled, it will easily pass in that direction; if large, though the labour be painful, the natural throes are less violent and less dangerous than the preposterous help of the accoucheur: If the child thus advances naturally, it will be less exposed to suffer; if it does not advance, the parts of the mother will be prepared for the accoucheur to pass his hand into the pelvis, to raise up the breech, to bring down one or both feet, and deliver as above.

Weakness in the mother, floodings and convulsions, a very large child, or narrow pelvis, the prolapsus of the funis, or its compression between the thighs of the child, or between the child and pelvis, by which its life is endangered, if the chord cannot be reduced above the presenting part, are the only exceptions to the general rule of treating the breech as a natural labour.

The practice of helping forward the breech, by passing the blunt-hook under the ham, is now entirely laid aside: this can never be done with safety, till the breech be so low advanced, that the hand of the accoucheur can be used, which may be employed with more advantage as well as safety.

CLASS II.

In the former claſs of preternatural labours, it is adviſeable to truſt to nature in many caſes, as the birth will often be accompliſhed without manual aſſiſtance: but when the child lies a-croſs, no force of pain can make it advance in that poſition; and, without proper aſſiſtance, both the mother and child would periſh.

If the accoucheur has the management of the labour from the beginning, the child may be turned, in the worſt poſition, without difficulty; but when the waters have been for ſome time evacuated, and the uterus ſtrongly contracted, turning is laborious to the operator, painful and dangerous to the mother. In ſuch caſes, the ancients endeavoured to make the head preſent; but, from its bulk, they often failed, and the attempt was often attended with fatal conſequences. The method of delivering by the feet is the moſt important modern improvement in the practice of midwifery; an improvement to which many thouſands owe their lives.

When the child lies in a tranſverſe poſition, the accoucheur muſt inſinuate his hand through the vagina into the uterus in the gentleſt manner, ſearch for the feet, bring them down with the utmoſt caution, and finiſh the delivery as in footling-caſes. To effect this, the following rules ſhould be obſerved.

1. The patient muſt be placed in a convenient poſture, that the operator may be able to employ either hand, as the various circumſtances of the caſe may require.

2. Though the beſt poſture, in general, is laying the woman on her back, it will be ſometimes neceſſary to turn her to her ſide; and, in theſe caſes, where the abdomen is pendulous, where it is difficult to reach the feet, or where they lie towards the fundus uteri, the woman ſhould be placed on her knees and elbows.

3. An exact knowledge of the true poſition of the child, and of the ſtructure and ſtate of the parts, ſhould be acquired, before attempting to make the delivery.

4. The orifice of the uterus ſhould be enlarged, ſo as freely to admit the hand; and the ſtrong pains ſhould be abated, before any attempt be made to deliver.

5. Should the waters be drained off, the parts dry and rigid, and the uterus contracted round the child, warm oil muſt be injected into the uterus, otherwiſe its rupture may be endangered.

6. In paſſing the hand into the uterus, this muſt be done in the gentleſt manner; the parts muſt be well lubricated with butter or pomatum; the line of the pelvis muſt be attended to; the efforts of the operator muſt be ſlow and gradual; and thus the utmoſt rigidity in the ſoft parts will, in time, be overcome.

7. The hand muſt be introduced only during the remiſſion of pain; when pain comes, the accoucheur muſt always reſt; otherwiſe he may puſh his hand, or the fœtus, through the body of the uterus.

8. In puſhing up, to come at the feet, this muſt never be done with the points of the fingers, nor with the hand clenched, but with the palm of the hand, or the broad expanded fingers, and always during the remiſſion of pain, and the latter ſhould alſo be obſerved in bringing down the legs; but, in making the extraction of the body, the efforts of the operator ſhould always co-operate with thoſe of nature.

9. The hand ſhould, if poſſible, be introduced along the anterior parts of the child; and both feet, if eaſily come at, ſhould be laid hold of.

10. In turning, the accoucheur ſhould never conſider the child as dead, nor allow himſelf to be deceived by ſymptoms doubtful and fallacious; the child is ſometimes born alive when he would leaſt of all expect it; therefore, in puſhing up, bringing down the legs, or extracting the body, it ſhould be handled with the greateſt delicacy.

11. When the hand is within the pelvis, it ſhould not always be moved in the line of the umbilicus, but rather towards one ſide of the ſpine, by which more room is gained, and the prominent angle of the ſacrum avoided.

12. The hand ſhould be paſſed as far as the middle of the child's body, before attempting to ſearch for the feet; or before attempting to break the membranes, ſhould theſe remain entire, till the aperture of the uterus will admit of the hand.

13. If the hand cannot paſs the preſenting part of the child to come at the feet, inſtead of violently puſhing back, the part ſhould be as it were lifted up in the pelvis, and moved towards a ſide; by which means difficulties may be ſurmounted, and great danger often prevented.

By attending carefully to the above rules, laceration of the uterus, floodings, convulſions, inflammations, and their conſequences, may be prevented; accidents that frequently happen in the hands of ignorant raſh operators.

Caſe 1.—*The arm preſenting.* The right is to be diſtinguiſhed from the left by laying hold of the child's hand, in the ſame manner as in ſhaking hands; and thus the general poſition of the child may be judged of.

When the accoucheur is called in early, the reduction is generally practicable: but if the arm protrudes through the vagina, and the ſhoulder be locked in the pelvis, it is needleſs, by fruitleſs efforts, for the accoucheur to fatigue himſelf, and diſtreſs his patient, to attain a point by which he will gain no very material advantage; as the hand can be paſſed into the uterus by the ſide of the child's arm, which will, of courſe, return into the uterus when the feet are brought down into the vagina.

In order to make the delivery, the hand of the accoucheur, well lubricated, muſt be conducted into the uterus by the ſide of the child's arm, along the thorax, at the oppoſite ſide of the pelvis where the head lies; if any difficulty occurs in coming at the feet, this hand muſt be withdrawn, and the other introduced in its ſtead; and if ſtill the hand cannot eaſily paſs beyond the child's head or ſhoulder, the preſenting part muſt be raiſed up, or gently puſhed to a ſide, that one or both feet may be laid hold of, which muſt be brought as low as poſſible, puſhing up the head and ſhoulders, and pulling down the feet alternately, till they advance into the vagina, or ſo low that a nooſe or fillet can be applied; and thus by pulling with

with the one hand by means of the noofe, and pufhing with the other, the feet can be brought down and the delivery finifhed, however difficult.

The method of forming the noofe is by paffing the two ends of a tape or garter through the middle when doubled; or fhould the garter be thick, by making an eye on one extremity, and paffing the other end through it: this, mounted on the points of the fingers and thumb of the accoucheur's hand, muft be conveyed into the uterus, paffed over one or both feet and ankles, and fecured by pulling at the other extremity.

Cafe 2.—*The fide.* This is difcovered by feeling the ribs.

Cafe 3.—*The back.* This is difcovered by feeling the fpine.

Cafe 4.—*The belly.* This is known by the funis.

Thefe cafes occur rarely, as the uterus muft with difficulty admit of fuch pofitions. When any of thefe parts do prefent, the child feldom paffes any part of the brim of the pelvis, and is, in general, more eafily turned than in feveral poftures in which it may offer. The belly, from the difficulty with which the legs can be bended backwards, except the child be flaccid, putrid, or before the time, will very feldom directly prefent; if fo, it will be early and readily difcovered by the prolapfus of the funis, and there will be no great difficulty to come at the feet, and deliver. The rule in all thefe cafes is, to pafs the hand into the womb in the gentleft manner poffible, and to fearch for the feet and bring them down.

CLASS III.

When the child lies longitudinally in the uterus, with the arm or fhoulder prefenting, and the head more or lefs over the pubes, or laterally in the pelvis, the feet towards the fundus uteri, the waters evacuated, and uterus contracted round the child's body; thefe are the moft difficult and laborious of all the cafes of preternatural labours. Here the protruding arm ought, if poffible, to be reduced, and the head brought into the pelvis; for unlefs the child be very fmall, it is impoffible for the head and arm to pafs along together.

In order to effect the reduction of the arm, different inftruments have been invented; but the hand of the accoucheur is preferable to every thing of this kind, whether of ancient or modern invention. This, conducted by the arm that protrudes, muft be infinuated through the vagina into the uterus, as far as the fhoulder of the child, which, if the accoucheur can raife up, he will generally fucceed in reducing the arm. Should this method fail, he muft attempt to pufh up the fore-arm at the elbow; but, in bending it, muft be very cautious, to avoid overftraining or diflocating the joint. In whatever manner the reduction is accomplifhed, if any method proves fuccefsful, the arm muft be retained till the head, by the force of natural pain, enters the pelvis, and prevents its return; otherwife the arm will defcend, as often as it is reduced.

But if the attempts for reduction prove impracticable, the woman muft be placed on her knees and elbows, and the accoucheur, with great deliberation, muft endeavour gently to flide up his hand between the uterus and child as far in the uterus as poffible, to lift up the head and fhoulders, and fearch for and bring down one or both feet, in the beft manner the various circumftances of the cafe will admit of. As foon as they can be laid hold of, they muft be gradually brought down into the vagina, fo low that the noofe can be applied over them, which muft be fixed and pulled with the one hand, while the head and upper parts of the body are raifed and gently pufhed up with the other.

Should the arm have been long protruded without the os externum, much fwelled, and cold; the waters drained off; the uterus ftrongly contracted; and the pofition of the child fuch as to render it impracticable, either to reduce the protruded limb, or to fearch for and bring down the feet; the head, if eafily come at, muft be opened and extracted with the blunt-hook or crotchet; or a crotchet muft be fixed amongft the ribs, and the breech or feet thus pulled down.

Should the pelvis be very narrow, and unfurmountable difficulties occur, the arm muft be twifted off at the elbow, though this expedient is rarely neceffary; and the delivery muft in general be accomplifhed as the prudence and judgment of the operator can beft direct; always remembering, when one life muft fall a facrifice, that the tree muft be preferved at the expence of the fruit.

In this, as in other cafes, the fwelling and coldnefs of the arm, and even want of pulfation in the artery, are not infallible figns of the child's death; and fhould this even be fo, it makes little difference in the mode of delivery, unlefs that it will lead us to pay all our attention to the mother: For a living child gives no more affiftance in the birth than a dead one, whatever authors have faid to the contrary.

When both arms prefent, the delivery muft be conducted in the fame manner as when one only prefents. The former cafe is lefs difficult than the latter, as the head feldom advances far when both arms fall into the paffage, fo that they can either be reduced, or there is eafy accefs to come at the feet to bring them down and deliver.

CLASS IV.

When the membranes remain entire, till the foft parts are fo much dilated, that the hand will readily find admittance; or when the hand can be paffed within the cavity of the uterus, immediately after the rupture of the membranes, fo that part of the water may be retained; the delivery may be accomplifhed, in the moft troublefome preternatural cafes, with the greateft fafety and expedition. But when the waters have been long evacuated, and the uterus clofely contracted round the body of the child, the cafe will prove laborious to the operator, painful and dangerous to the mother and child.

When there is reafon to fufpect that the child lies acrofs, which can often be afcertained, either by feeling the prefenting part through the membranes, or by fome of the figns of preternatural labours already mentioned; the woman fhould be managed in fuch a manner, that the membranes may be preferved entire as long as poffible; for this purpofe fhe fhould keep quiet in bed, and her pofture fhould be fuch as is leaft favourable for ftraining, or exerting force during the pain:

Preternatural Labour.

pain: ſhe ſhould be touched as ſeldom as poſſible, till the os internum be ſufficiently dilated. The accoucheur ſhould then introduce his hand in a conical form, well lubricated, into the vagina, and through the aperture of the internal orifice, inſinuating it between the uterus and the membranes, till it advances almoſt as high as the fundus uteri, when he muſt break the membranes, by pinching ſome part of them between a finger and thumb, or by forcibly puſhing a finger thro' them; he muſt then ſearch for, and endeavour to lay hold of, one or both feet, and deliver.

Should the membranes be ruptured in the attempt, he muſt be ready to run up his hand as quickly as can be done with ſafety, when, part of the waters by his arm being retained, the operation of turning will be facilitated. Should the placenta adhere on that ſide of the uterus where the hand is paſſed, it muſt again be withdrawn, and the other hand be introduced in the oppoſite ſide.

Floodings. It has been already obſerved, that a flooding ſeldom proves fatal to the mother before the ſeventh month of pregnancy; after which period, from its duration or exceſs, the life of both the mother and child may ſuffer. Should therefore a flooding attack a woman in the two laſt months of pregnancy, from whatever cauſe it may ariſe, and whether attended with labour-pains or not, if the hæmorrhage be ſo conſiderable that ſhe is ready to ſink under it, and that cold applications and other means of checking the evacuation ſhall fail, the woman muſt be placed in a proper poſture, her friends prudently appriſed of her danger, and the delivery muſt be immediately performed, by ſtretching the vagina and os uteri, till the hand of the operator can eaſily gain admittance to break the membranes, catch hold of the feet, and extract the child.

If it can poſſibly be prevented, the membranes in flooding caſes ſhould never be broken till the aperture of the uterine orifice will freely admit the hand to paſs, that, after the evacuation of the waters, the accoucheur may have it in his power either to make the delivery or not, according as the effuſion continues or abates.

Soon after attempting to ſtretch the parts, ſhould the labour-pains come on, the waters begin to be collected, and the uterine hæmorrhage diminiſh, the accoucheur muſt then withdraw his hand, and manage the delivery according to circumſtances. And if, for inſtance, the child preſents naturally, the delivery muſt be truſted to nature; otherwiſe, if the flooding continues, or the child preſents acroſs, the accoucheur muſt perſiſt in his work, going on ſlowly, and with the utmoſt delicacy, till he be able to reach the feet, to bring them down, and deliver; always remembering, during this proceſs, that the ſtrength of the woman, by proper nouriſhment, be ſupported.

But ſhould the placenta adhere to the cervix, or upon the os uteri, the greateſt danger is to be dreaded; for thus the flooding will commence from the moment the os uteri begins to ſtretch, and will increaſe ſo rapidly, that the woman, if not ſpeedily delivered, muſt inevitably ſink under it. The whole body of the placenta, in ſuch caſes, is ſometimes ſeparated when the labour has made but little progreſs; ſo that the woman will often periſh, whether delivery be attempted or not. As this, however, is the only expedient by which her life, and that of the child, can be ſaved; in every caſe where the placenta preſents, which the accoucheur will readily diſcover by the touch of the ſoft pappy ſubſtance of that body, he muſt immediately place the woman in a proper poſture, inſinuate his hand gently by the ſide of the protruding placenta, break the membranes, ſearch for the feet of the child, and bring them down, ſo that the delivery may be finiſhed with all poſſible expedition; for, in this unhappy caſe, a few minutes delay may prove fatal.

Preternatural Labour.

The after-birth ought never to be extracted before the child, if it can poſſibly be avoided.

After delivery, time ſhould be given for the uterus to contract, that nature may thus throw off the placenta, which never ought to be hurried away, unleſs the continuance or a recurrence of the hæmorrhage render it neceſſary.

Prolapſus of the funis. Difficulties ariſing from the funis falling down into the vagina, and preſenting along with ſome part of the child, may, in this claſs of the diviſion of preternatural labours, be included.

A preſſure on the chord, in ſuch a degree as to interrupt the circulation, muſt infallibly deſtroy the life of the child: hence a coldneſs and want of pulſation in the chord is the trueſt criterion of the death of the child; and hence, in every caſe where the chord is prolapſed before any bulky part of the child, if the delivery be not accompliſhed with expedition, the child will periſh. This is only to be prevented by replacing the chord, and retaining it above the preſenting part, till this laſt, by the force of labour-pains, be ſo far advanced as to prevent the return of the former; or the child muſt be turned and brought by the feet, provided this can be done with ſafety to the mother. But it is often difficult to ſucceed in the attempt of the one or other; and, if the woman has ſtrong pains, ſuch attempts are not to be hazarded, as the conſequences may prove fatal.

When the accoucheur is thus ſituated between two puzzling difficulties, the preference muſt always be given to the mother. If the child be ſmall, and the pelvis well formed, which may be known by the hiſtory of former deliveries, and if the labour goes on quickly, the child will generally be born alive; but if, on the contrary, the child be above the ordinary ſize, and the pelvis rather narrow, turning will prove a dangerous operation to the mother, and there is little proſpect of ſaving the infant by this means.

Beſides our former diviſion of labours, *plurality of children*, *monſters*, *extra-uterine fœtuſes*, and the *Cæſarean operation*, are parts of the ſubject that yet remain to be conſidered.

Chap. XIII. *Plurality of Children.*

The caſe of twins often occurs: of triplets ſeldom: of quadruplets rarely: nor is there perhaps a ſingle inſtance, where five or more diſtinct fœtuſes have been found contained in the human uterus, though many ſuch fabulous hiſtories have been recorded by credulous authors.

The ſigns of two or more children, ſuch as the ſudden or extraordinary increaſe of the uterine tumour, motion felt in different parts of the abdomen, &c. are very

Plurality of Children.

very doubtful and fallacious: this can only be afcertained after the delivery of one child; and even then a recurrence or continuance of labour-pains is not a certain and infallible criterion; neither is the abfence of pains a fure indication of the contrary; as many cafes have occurred, where feveral days have intervened between the birth of a firft and fecond child. The chief fymptoms to be depended on are, 1ft, The child being of a fmall fize, and the quantity of liquor amnii fo inconfiderable as not to account for the bulk of the woman in time of pregnancy. 2dly, The bleeding of the funis umbilicalis next the mother. 3dly, The remora of the placenta. 4thly, The uterine tumour not fenfibly diminifhed, which, very foon after delivery, in ordinary births, will be found gradually fhifting lower and lower, and will feel at laft as if a hard circumfcribed tumour like a ball between the umbilicus and pubes. Hence the utility of the general practice of applying the hand externally on the abdomen, in every cafe after delivery; by which an accurate knowledge will be formed of the nature and manner of the uterine contraction. When, from any of thefe circumftances, there is reafon to fufpect another child, the moft certain and infallible method of difcovering it is, the paffing of a finger, or the introduction of the hand, into the uterus, where another fet of membranes will be perceived, and probably fome part of the child prefenting through them.

The pofition of twins or triplets is commonly that which is moft commodious, and which will occupy the leaft room in utero: their fituation is often diagonal; tho' they may prefent in every poffible pofture. Thus, therefore, the general rules recommended for the delivery of one child, are equally applicable in the cafe of twins, triplets, &c.

It has been the general practice with many, after the birth of one child, to pafs the hand immediately into the uterus, to break the membranes, catch hold of the feet of the child, and thus deliver. But this is certainly bad practice, whatever authors have faid to the contrary. If the woman is healthy, and the child prefents favourably, that is, with the head, breech, or feet, natural pains ought to be waited for, when the child will be expelled by the force of thefe only; failing which, manual affiftance, as in other cafes, muft be had recourfe to.

It very rarely happens, when the firft birth is preternatural, that the fecond membranes are ruptured in making the extraction. Should this prove the cafe, the limbs of the children may be confounded, fo that a leg and an arm, or three legs, or arms of different children, may prefent; which, however, will make little difference in the mode of delivery: the accoucheur will endeavour to lay hold of the foot or feet moft readily within his reach, and will be cautious in bringing them down, to make fure they belong to the fame body.

If the child prefents crofs; if floodings, convulfions, or other dangerous fymptoms, fhall take place; if the woman has fuffered much in the firft labour; and if, after feveral hours, a recurrence of labour-pains does not enfue; the hand muft then be introduced into the uterus, the membranes muft be broken, and the child muft be extracted by the feet: or, if the head remains locked in the pelvis, and, from want of ftrength in the woman, cannot be expelled, the treatment is the fame as in other laborious births.

In twin-cafes it may be recommended as a general rule, to avoid precipitating the delivery of the fecond child till the woman fhall have refted a proper time, and till, by the contraction of the fundus uteri, the fecond fet of membranes occupy the place of the firft, and be protruded as far as the os externum, when, and not before, the delivery may fafely be affifted, fhould circumftances occur to render fuch affiftance neceffary: whereas, by breaking the membranes and evacuating the waters when the child lies high in the uterus, a flooding may be brought on, or a fpafmodic conftriction of the uterus round the body of the child may be occafioned, which may render the delivery both difficult and dangerous.

The placentæ of twins, triplets, &c. generally adhere, though fometimes they are diftinct, and may be thrown off at different times after the birth of the different children; fo that the practitioner fhould be on his guard, and never fhould leave his patient till he makes fure there be no more children. When a fecond child is difcovered, no attempts ought to be made to extract the placenta till after the birth of the remaining child or children; as the woman would be fubject to flooding, which might prove of fatal confequence before the uterus could be emptied of its contents.

In cafe of plurality of children, a fecond ligature fhould be applied on the funis, on that end next the mother, immediately after the birth of every child; and a gentle compreffion fhould be made on the abdomen of the woman after the firft delivery, which muft be gradually tightened after every fucceeding one, to prevent the confequences of a fudden removal of uterine preffure, which is to be dreaded where the diftention has been confiderable.

The placenta, in fuch cafes, muft be managed in much the fame manner as ufual. In twins, &c. it generally feparates with great facility, provided time has been given for the uterus to contract. Both chords fhould be gently pulled; and when it advances towards the uterine orifice, where, being large and bulky, it commonly meets with confiderable refiftance, it requires the ietroduction of a finger or two into the vagina for bringing down the edge, after which the body readily follows.

Chap. XIV. *Monfters.*

Monfters.

These are of various fizes and forms, and, unlefs very fmall, the pofture favourable, and the woman well made, will prove the caufe of a difficult and troublefome delivery. Sometimes a child is monftrous from a preternatural conformation of parts, fuch as a monftrous head, thorax, abdomen, &c. At other times, there is a double fet of parts, as two heads, two bodies with one head, four arms, legs, &c. But fuch appearances very feldom occur in practice; and, when they do, the delivery muft be regulated entirely according to the circumftances of the cafe. A large head, thorax, or belly, muft be opened. If two bodies united together are too bulky to pafs entire, they muft be feparated; the fame of fupernumerary limbs. If the pofture be unfavourable, it muft be reduced when practicable; otherwife the extraction muft

Cæsarean Operation.

muſt be made with the crotchet, in the beſt manner the circumſtances of the caſe will admit of; always, in caſes of danger or difficulty, giving the preference to the ſafety of the mother, without regarding that of the child.

Chap. XV. *Cæſarean Operation.*

When the delivery could not be accompliſhed by other means, or when a woman died ſuddenly with a living child in her belly, an operation to preſerve the life of mother and child in the former caſe, and to ſave the child in the latter, has been recommended, and ſuccesſfully performed, by different authors, and in different ages.

This operation is of ancient date; it is the *ſectio Cæſarea* or *partus Cæſareus* of the Latins, and the *hyſterotomia* of the Greeks. Whether it was ever ſuccesſfully performed on the living ſubject amongſt the ancients, ſeems uncertain; but that it has been ſuccesſfully practiſed by the moderns on various occaſions, and in ſeveral different countries of Europe, there are ſo many authentic hiſtories on record, that the fact will ſcarce admit of doubt: but as this, like many other ſalutary inſtitutions, has been much abuſed, and in many caſes improperly and injudiciouſly employed, (for ſome of thoſe women who ſurvived the operation, were afterwards ſafely delivered of living children), the circumſtances which render this operation neceſſary, demand a very particular inquiry, viz.

1. A narrowneſs, or bad conformation of the bones of the pelvis.
2. Imperforated vagina, or contractions in the vagina, cicatrices, tumors, or calloſities in the os uteri, &c.
3. The eſcape of the child through the uterus when torn.
4. Ventral conceptions.
5. Herniæ of the uterus.
6. The poſition or bulk of the child.

It will be neceſſary carefully to examine theſe different cauſes, in order to ſhew, that they are by no means, in every caſe, ſufficiently powerful motives for having recourſe to it.

I. Bad conformation of the bones of the pelvis. When the hand of the operator cannot be introduced within the pelvis; or, in other words, when its largeſt diameter does not exceed one inch, or one inch and a half, this conformation is perhaps the only one which renders the Cæſarean operation abſolutely neceſſary: happily, however, ſuch a ſtructure very ſeldom occurs in practice; and when it does, the accoucheur will readily diſcover it, by attending to the following circumſtances, and to the common marks of a narrow pelvis. Wherever the capacity of the pelvis is ſo ſtrait as not to admit any part of the child's head to enter, nor two fingers of the accoucheur's hand to conduct proper inſtruments to tear, break down, and extract the child piece-meal; in this caſe, recourſe muſt be had to the Cæſarean ſection: an expedient, though dreadful and hazardous, that will give the woman and child the only chance of life; and which, if timely and prudently conducted, notwithſtanding of the many inſtances wherein it has failed, may be performed with ſome probability of ſucceſs.

It is true, the ſucceſs of the operation in the city of Edinburgh, where it has been done five times, has proved diſcouraging, as none of the women had the good fortune to ſurvive it many days. This, however, is not the fault of the operation; but is to be imputed to the low, weak ſtate of the patients at the time, who had previouſly been ſeveral days in labour, and their ſtrength greatly exauſted, before the operator was called. Delivery by every other means was utterly impracticable; the operation, tho' the event was doubtful, alone gave a chance of life; and three of the children by this means were extracted alive.

Mr Hamilton ſurgeon and profeſſor of midwifery in Edinburgh, having been an eye-witneſs of the operation the laſt time it was performed here, gives the following account of the caſe which fell under his obſervation.

Eliſabeth Clerk, aged 30, had been married for ſeveral years, became pregnant, and miſcarried in the third month; the expulſion of the abortion occaſioned ſo ſevere a ſtreſs, as actually to lacerate the perinæum. Some time after her recovery, ſhe was irregular, afterwards had one ſhew of the menſes, again conceived, and the child, as ſhe imagined, arrived at full time. She was attacked on Monday the 3d of January 1774, about midnight, with labour-pains, which went on ſlowly, gradually increaſing till Saturday the 15th, when ſhe was brought from the country to the Royal Infirmary here. Upon examination, the pelvis ſeemed conſiderably diſtorted; but the body was otherwiſe well ſhaped, though of ſmall ſize; the os externum vaginæ was entirely ſhut up, nor could any veſtige of vagina be obſerved, nor any appearance of labia pudendorum: inſtead of this, there was a ſmall aperture at the ſuperior part of the vulva, immediately under the mons veneris, probably about the middle anterior part of the ſymphyſis pubis. This aperture (which had a ſmall proceſs on the ſuperior part, ſomewhat reſembling the clitoris) was no larger than juſt to allow the introduction of a finger; the meatus urinarius lay concealed within it: a conſulation of ſurgeons was called, and the Cæſarian ſection was determined on. Having had no ſtool, nor voided any urine for two days, an injection was attempted to be thrown up; but it did not paſs, nor was it poſſible to puſh the female catheter into the bladder. Mr William Chalmer was the operator in this caſe. At ſix in the evening, he made an inciſion on the left ſide of the abdomen in the ordinary way, through the integuments, till the peritonæum was expoſed; two ſmall arteries ſprung, which were ſoon ſtopped by a ſlight compreſſion: the wound was then continued through the peritonæum into the cavity of the abdomen, when the bladder appeared, ſlightly inflamed, much diſtended, reaching with its fundus near as far as the ſcrobiculus cordis: another unſucceſsful attempt was made to paſs the female catheter; at length a male catheter was procured, which was, after ſome difficulty, introduced into the bladder, and the urine evacuated to the quantity of above four pounds, high-ſmelled and fetid. This occaſioned a neceſſary interruption for a few minutes, between making the opening into the abdomen and uterus; the bladder collapſing, the uterus, which before lay concealed, now came in view, through which an inciſion was made, and a ſtout male child was extracted alive; and immediately afterwards the ſecundines. The uterus contracted rapidly. After cleanſing the wound, the lips were brought together by the quill-ſuture, and dreſſed

Cæsarean Operation.

dressed superficially. The patient supported the operation with surprising courage and resolution; nor was there more than five or six ounces of blood lost on the occasion.

Being laid in bed, she complained of sickness, and had a slight fit of vomiting; but, by means of an anodyne, these symptoms soon abated: she was affected with universal coldness over her body, which also abated on the application of warm irons to the feet: she then became easy, and slept for four or five hours. Next morning, the 16th, about two o'clock, she complained of considerable pain in the opposite side, for which she was blooded; and an injection was given, but without effect; for the pain increased, stretching from the right side to the scrobiculus cordis; nor did fomentations seem to relieve her; her pulse became frequent, she was hot, and complained of dronght. At 7 A. M. the injection was repeated, bnt with no better success; and eight ounces more of blood were taken from the arm; a third injection still failed to evacuate any fæces; the drought increased; and the pulse rose to 128 strokes in a minute. At 11 A. M. the pulse became fuller; and the respiration mnch oppressed. No stool nor urine passed since the operation. At 12 she was blooded again, when the siziness appeared less than formerly. She now took a solution of *sal Glauber, manna and cr. tart.* at short intervals; she vomited a little after the last dose, had a soft stool, and voided a small quantity of urine. At 3 P. M. her pulse was 136, and she had another stool, when thin fæces were evacuated; she was then ordered two spoonfuls of a cordial anodyne mixture every second hour: the vomiting now abated; the pulse became smaller and more frequent; she passed urine freely; but the pain and oppressed breathing increased. At seven P. M. her pulse rose to 142, and became weak and fluttering; she called for bread, and swallowed a little with some difficulty; her drought was intense; the dyspnœa still increased. She was now much oppressed, and began to toss; the pulse sunk and became imperceptible; she complained of faintishness, but on belching wind her breathing was relieved, and the pulse returned, growing fuller and stronger: the pain of the side still increasing, 12 ounces of blood, very sizy, were taken away; and two glysters of warm water with oil were injected without effect: at 8 P. M. the pulse became less frequent and smaller; she complained much of the pain towards the scrobiculus cordis; her breathing was much oppressed; her belly was tense, and swelled as big as before the operation; her pulse was now small and feeble; she looked ghastly; and expired a little after eight, 26 hours after the operation.

It is to be regretted that the relations would not permit the body to be opened.

Since the first certain accounts of the operation successfully practised by a sow-gelder on his own wife, in the beginning of the 16th century, there are on record above 70 well-attested histories, wherein it has been successfully performed: for, of all the cases related by authors, it has not proved fatal to the patient above once in ten or nine instances; which evidently shews the propriety of the practice, and probability of success, both in regard to the mother's own recovery, and for certainly preserving the life of the child. But it should never be attempted, excepting in those cases only where it is absolutely impossible to deliver the woman by any other means whatever; for there are pelvises to be met with, where, without having recourse to this operation, both mother and child must inevitably perish: such have occurred to many practitioners, who, from want of resolution, or from ill-founded prejudice, have allowed their patients to perish from neglect, contrary to a well known maxim in physic, That in a desperate case, it is better to employ a doubtful, and even desperate remedy, than to abandon the patient to certain and utter ruin. Such, for instance, is a case related by Saviard, of a girl aged 27, whose stature was only three feet, who came to lie in at Paris, in the *Hotel Dieu;* every method but the operation was in vain attempted; both mother and child died. Mauriceau also relates the history of a woman who was left to die, where the aperture of the pelvis was so small as not to admit the hand of the accoucheur. And, not to multiply instances, Mr De la Roche gives a case where the woman had been seven days in labour; the child was saved by the operation; but the woman died the fifth day after, probably from its being too long delayed: the distance, in this subject, from the lower vertebra lumborum and os pubis, was no more than two fingers breadth. The operation, when the necessity is evident, ought therefore to be early performed, that the patient, who from her make and constitution is generally delicate and puny may have every chance of recovery in her favour, without being exhausted by the fruitless efforts of a tedious and painful labour, as too often has been the case. On these occasions, the prudent acconcheur should call in the advice of his elder brethren of the profession, and, by his cautious and prudent conduct, avoid every cause of censure or reproach.

Exostoses from the bones of the pelvis is a species of deformity very rarely met with in practice, and which seldom or never takes place to such a degree as to render this operation necessary.

II. Constriction, callosity, tumours, &c. about the vagina or os tincæ. The vagina and os tincæ are often affected with constrictions from cicatrices, with callosities and tumours; but it is seldom, if ever, necessary to perform the Cæsarean section on this account. Tumours in the vagina many generally be removed with safety, even after the commencement of labour, and delivery happily succeed; or it may be sometimes practicable for the accoucheur to pass his hand by the side of the tumour, to turn the child, and deliver. With regard to constrictions in the vagina, and callosities in the os uteri, there are many instances where, at the commencement of labour, it was impossible to introduce a finger into the vagina; yet the parts have dilated as labour increased, and the delivery terminated happily. At other times, the dilatation has begun during pregnancy, and been completed before delivery. There is a history, for instance, in the *Mem. de l'Acad. des Scienc.* 1712, of a woman whose vagina was no larger than to admit a common writing quill; she had been married at 16, and conceived 11 years after: towards the fifth month of her pregnancy, the vagina began to dilate, and continued to do so till full time, when she was safely delivered. Guilemeau dilated, and La Mott extirpated callosities in the vagina and os tincæ, when the children were successfully expelled:

Cæſarean Operation.

expelled by the force of natural labour.

Harvey relates a caſe where the whole vagina was grown together with cicatrices; nature, after a tedious labour, made the dilatation, and a large child was born.

La Mott mentions his having delivered three women, who had not the ſmalleſt veſtige of an orifice through the vagina to the uterus. Dr Simpſon cut through a calloſity of an os uteri which was half an inch thick, &c.

Upon the whole, tumours in the vagina, or about the orificium uteri, may be ſafely extirpated without danger of hæmorrhagy or other fatal ſymptoms, and the delivery will happily ſucceed: and if the vagina be impervious, the os externum ſhut up, or the labia grown together, the parts ſhould be opened with the ſcalpel, rather than riſk an operation, at beſt in the iſſue doubtful and precarious; an operation never allowable in ſuch caſes, and therefore univerſally improper in diſeaſes or malconformation of the ſoft parts of generation. If the os externum be entirely cloſed, if the cavity of the vagina be entirely filled up, or the paſſage conſiderably obſtructed by tumours, calloſity, or conſtriction from cicatrice, and there is no reaſon to ſuſpect a fault in the pelvis, of which a judgment may be formed by the common marks of deformity, under ſize, or a ricketty habit; it is by much the beſt practice to open a paſſage through the vagina, and deliver the woman in the ordinary way. If there be no defect in the pelvis, the head of the child, or any other bulky part that preſents, will advance in this direction, till it meets with a reſiſtance in the ſoft parts: thus the teguments will at length be protruded before the child's head, in form of a tumour, when a ſimple inciſion downwards to the perinæum, in the direction of the anus, will remove the cauſe of difficulty, by relieving the head; the child will afterwards ſafely paſs, and the wound will heal without any bad conſequence.

The ſtate of the pelvis, and progreſs of the labour in theſe caſes, may often be learned by the touch of the finger in ano.

III. Lacerated uterus is another cauſe for which this operation has been recommended. The uterus may be ruptured from violence in making the delivery; or ſuch an accident may happen naturally, either from the croſs preſentation of the child in time of pregnancy, or in time of labour, when the pelvis is narrow: theſe caſes are generally fatal; and it is very ſeldom, if ever, that the life of the mother can be ſaved by the Cæſarian ſection, after the fœtus eſcapes through the torn uterus into the cavity of the abdomen; becauſe it often happens, that inflammation and ſphacelus has affected the parts of the uterus that ſuſtained the preſſure previous to the rupture; or, if otherwiſe, convulſions or other fatal ſymptoms ſoon enſue, from the quantity of blood, waters, &c. poured into the cavity of the abdomen.

When the child cannot be extracted by the natural paſſages, tremours, ſingultus, cold ſweats, ſyncope, and the death of the mother, for the moſt part, ſo quickly follow, that it will at leaſt ſeem doubtful, to a prudent humane practitioner, how far it would be adviſeable, after ſo dreadful an accident, the woman apparently in the agonies of death, raſhly to perform another dangerous operation, even with a view to preſerve the child, till he had waited till the mother recruits or expires.

Cæſarean Operation.

If part of the child be contained within the uterus, and the feet can be reached, the practice is to deliver by the orifice of the womb: but when the whole fœtus has eſcaped entirely without the uterus, the Cæſarean operation is recommended as the only means of preſerving both mother and child.

If the operation on this occaſion be ever allowable, it may be aſked,

1. At what time muſt it be performed?

2. Would it not have the appearance of inhumanity to have recourſe to this expedient immediately after the uterus burſts, when the woman is ſeemingly ready to expire, although it be the only time when there is a chance of ſaving the child?

3. In moſt caſes where this accident happens, ſhould the Cæſarean ſection be made, is it not highly improbable that the mother will ſurvive ſo terrible a laceration?

4. For if it be done with a view to ſave the mother, in what manner is the extravaſated blood, &c. to be evacuated from the cavity of the abdomen?

What ſeems to make caſes of this kind unfavourable, when the accident happens in time of labour, is,

1mo, That here, the parts before rupture, in moſt caſes, are in a gangrenous ſtate.

2do, As the rupture is commonly towards the cervix, there is generally a much greater hæmorrhagy by reaſon of the ſlow contraction of the uterus at this place.

3tio, The uncertainty, whether, or how long, the patient will ſurvive it, ſeems alſo a conſiderable obſtacle to the operation under ſuch diſagreeable circumſtances, *Ne occidiſſe videatur, quem ſors interemit.*

IV. Ventral conceptions is a fourth indication for this operation. Theſe are either in the ovaria, tubes, or cavity of the abdomen, and ſeldom arrive at great ſize; or are retained, very often a long time, without occaſioning much complaint. The iſſue of theſe conceptions has alſo been no leſs various than extraordinary; for after being retained for a great many years in an indolent ſtate, at length abſceſſes or ulcerations have formed, and they have been diſcharged through all the different parts of the abdomen.

Moſt women feel pain and violent motion at the time of ordinary delivery in theſe caſes of ventral conception; if therefore the operation be ever neceſſary, now is the proper time to perform it. But in general, as the ſeparation of extra-uterine fœtuſes from their involucra, may occaſion immediate death in many caſes, from the vaſt hæmorrhagy that might enſue from the non-contractile power of the parts to which they adhere; unleſs they point outwardly, or excite the moſt violent ſymptoms, they ought univerſally to be left to nature.

V. Herniæ of the uterus are ſeldom or never ſufficient to induce us to perform the Cæſarian ſection, as the uterus is very rarely influenced in ſuch a manner, that the orifice cannot be reached, and the delivery ſucceſsfully made. Many inſtances are to be found among ſurgical authors, where deliveries, under ſuch circumſtances, have been happily performed, without having recourſe to ſo hazardous an expedient. Thus Mauriceau mentions a caſe, where the uterus, in a ventral hernia, was puſhed along with the inteſtines above the

Cæsarean Operation.

belly, and contained in a tumour of a prodigious fize; the woman, however, was delivered at the end of her time, in the ordinary way. La Mott relates the hiftory of a woman in a preternatural labour, whofe uterus and child hung down pendulous to the middle of her thigh, but whom, notwithftanding, he fafely delivered: and Ruyfch gives a cafe where the midwife reduced the hernia before delivery; although it was prolapfed as far as the knee, the delivery was fafely performed, and the woman had a good recovery.

Laftly, The pofition or bulk of the child.

Since the practice of turning the child and delivering by the feet, and the late improvement of obftetrical inftruments, this operation is never to be performed on account of pofition, monftrofity, or any other obftacle on the part of the child.

Upon the whole, when the pelvis is faulty to fuch a degree, that no inftrument can be conducted to tear and extract the child, this perhaps is the only cafe wherein this operation fhould be performed on the living fubject. Incifions through the teguments of the abdomen to extract extra-uterine fœtufes, or bones of fœtufes, do not properly fall under the name of *Cæfarean fection*, as that name implies incifion of the uterus alfo.

When a woman advanced in pregnancy dies fuddenly, either by accident or by natural difeafe, the Cæfarean fection is recommended as an expedient to preferve the life of the child. This is a very proper meafure, provided the death of the mother be afcertained; but fometimes it is a very nice and difficult point to diftinguifh between a deliquium and death; and therefore the accoucheur, on fuch an occafion, muft act with the utmoft circumfpection. If the operation be delayed but a very fhort while after the mother expires, it will probably be in vain to make the attempt; for, whatever fabulous ftories may be related to the contrary, there are few authentic cafes of the fœtus of any animal furviving the mother, perhaps an hour; and therefore every thing fhould be in readinefs to extract the child with all poffible expedition, after the event of the mother's death. But, in fuch cafes, the agonies of death often perform the part of labour, and the child is fometimes thrown off *in articulo mortis*; or the os uteri is fo much dilated, that there is eafy accefs to pafs the hand, turn the child, and deliver. Thus one fhould be very cautious in having recourfe to this operation, even in the above circumftances; which fhould never be done,

1. Till the death of the mother be afcertained beyond doubt;

2. Till the ftate of the os uteri be examined;

3. Till the confent of the relations be obtained; And,

Laftly, It need not be undertaken, except where the mother dies fuddenly, between the 7th and 9th month.

It is unneceffary where the difeafe has been lingering; in fuch cafes the child commonly dies before the mother.

When it is doubtful whether the child be alive or not, it may be determined by applying the hand on the abdomen of the mother about the time of, and for a little while after, her death, when the life of the child will be difcovered by its motions and ftruggling.

Thus having pointed out the different caufes that determine this operation, it may be obferved, that it is a frightful and hazardous one; and although performed fuccefsfully in a number of cafes, yet, in many others, it has failed, and the woman has died either immediately or foon after. It fhould never, therefore, be undertaken but on extraordinary and defperate occafions; and then it is not only adviseable, but incumbent on every practitioner to whom fuch cafes occur.

To conclude, it may not be improper to give a few directions with regard to the method of performing the operation on the living fubject.

Having emptied the bladder, and evacuated the contents of the inteftines with repeated emollient glyfters; the patient being encouraged, with proper cordials, and every other requifite in readinefs, fhe muft be placed on a table or bed, with her left fide gently raifed with pillows or bolfters, and properly fecured by affiftants. An incifion muft be made with a common convex fcalpel, beginning rather below the navel at the middle fpace between it and the fpine of the os ilium, carrying it obliquely forwards towards this bone, fo that the wound in length may exceed fix inches. This external wound is to be carried through the common teguments of the abdomen till the peritonæum is expofed, when the operator fhould reft a little, till the hæmorrhage be entirely abated. He muft then, with great caution, make a fmall opening through this membrane, introduce his finger, and upon this a fcalpel (which is preferable to fciffars), and with great expedition make a complete dilatation; he muft now wipe away the blood with a fpunge, prefs the omentum or inteftines gently to a fide, if in the way, and endeavour to difcover to what part of the uterus the placenta adheres, that it may be avoided in making the incifion. This may eafily be known by a thicknefs and folidity in the part, which diftinguifh it from the reft of the uterus; it is ftill more eafily difcovered when the membranes are entire. The blood-veffels are lefs in number, and fmalleft in the middle and interior part of the uterus, which therefore, if the placenta does not interfere, is the proper place for making the incifion, which muft be performed with the utmoft attention left the child fhould be wounded: if the membranes are entire, more freedom may be ufed, and *vice verfa*. The direction and length of the wound of the uterus muft be the fame with the external one. The child muft now be quickly extracted, and the placenta carefully feparated: thefe muft be given to an affiftant, who will divide the chord, and take care of the child, as the operator's attention muft be wholly beftowed on the mother. The coagulated blood, &c. being removed by a fpunge wrung out of warm water, (left the uterus or inteftines be protruded, which are very troublefome to reduce), the lips of the external wound muft be quickly brought together, and retained by an affiftant till fecured by a few ftitches; generally three will be fufficient; as many needles fhould be ready threeded with pretty large broad ligatures; the middle ftitch ought to be made firft; the needle fhould be introduced at a proper diftance, i. e. about an inch and one-fourth from the fide of the wound, carrying it

Cæfarean Operation.

it firft from without inwards, and then from within outwards, fecuring with a double flip a knot, to be ready to untie, left violent tenfion or inflammation fhould enfue; under the knot a foft comprefs of lint, fharpee, or rolled plafter, fhould be applied, and the whole dreffings muft be fecured by a proper comprefs and bandage. The patient muft be afterwards treated in the fame manner as after lithotomy, or any other capital operation.

Quæritur, To what caufe is the unfuccefsful event of this operation to be imputed? When the operation proves fatal, to what immediate caufe are we to afcribe the death of the patient? Is it nervous, or uterine irritation, from cutting, that kills? Is it internal hæmorrhage, or the extravafation of fluids into the cavity of the abdomen? Or are not the fatal confequences rather to be imputed to the accefs of the air on the irritable vifcera? This can only therefore be prevented by expofing thefe parts for as fhort a fpace of time as poffible. Dr Monro, the prefent anatomical profeffor at Edinburgh, in making experiments on young fmall animals, fuch as bitches, cats, frogs, &c. by opening the cavity of the abdomen, and tying the biliary ducts, remarks, that though a large opening into the abdomen be made by incifion, if the wound be quickly clofed and ftitched, the animal will recover, and no bad confequences follow; but if expofed a few minutes to the air, dreadful pain foon comes on, which the creature expreffes by the fevereft agonies; convulfions at laft enfue, and death within four or fix hours after the operation. On opening the abdomen after death, the whole vifcera are found to be in an inflamed ftate, and univerfally adhering to one another. He has often repeated the experiment, and the fame appearances as often take place.

May not the analogy here juftly apply to the human fubject? And, in performing the Cæfarean operation, fhould we not be very careful that the vifcera be expofed as little as poffible, and that the wound be covered with the utmoft poffible expedition?

The ill fuccefs which generally attends the Cæfarean operation fome years ago, induced fome French practitioners to try a new method of extracting the child when, through the narrownefs of the pelvis, or any other caufe, it is impoffible to deliver the woman either naturally or by means of inftruments. This was by cutting the fymphyfis of the os pubis; by which operation it was thought that the bones would feparate to a fufficient degree to make room for the paffage of the child. This operation is found not to be fo fatal in itfelf as the Cæfarean fection; but unhappily it doth not promife with any certainty to afford the neceffary relief to the woman. Dr Vaughan remarks, 1. That it is extremely difficult to execute it with a thick knife, however fharp in the edge. The ligamentous and griftly fubftance between the bones is fo incompreffible that it will hardly make room for the thicker part of the knife to follow its edge; but a thin knife goes through it with great eafe.

2. Whoever has had a little practice, will find, that it may be executed without any danger of wounding the bladder or urethra; becaufe, in cutting cautioufly with a thin knife, from above downwards and inwards, the inftant that the whole is cut through, there is both a particular found, which informs us that the bufinefs is done, and the two bones fly afunder to a fenfible diftance.

3. When the fymphyfis is completely divided, the offa pubis feparate fo little a way, that fome force is neceffary to produce an interval of half an inch; and upon increafing the force till the fpace of interval comes to two inches and an half, there is a continued crafh, from the tearing of the ligamentous fibres at the pofterior joints, viz at the fides of the facrum. This, though requiring great force, is eafily affected, by bringing the thighs to right angles with the trunk of the body, and preffing the knees gradually outwards and backwards. In that way, a fmall force has a great effect, becaufe it has the advantage of a long lever, and is affifted by almoft the whole weight of the lower extremities.

4. When fuch a violent feparation of the offa pubis has been produced, the facrum and offa innominata remain in contact only at their pofterior parts; the ligaments that connect them at the fore-part being all, more or lefs, torn afunder.

5. The mifchief that may enfue upon cutting one joint of the pelvis, and tearing the other two afunder, can be afcertained by experience only. It is propofed, that the incifion at the pubes fhall not penetrate into the cavity of the abdomen. If, by accident, that fhould happen, the operation would of courfe be very dangerous. Lacerations of tendons, ligaments, and flefhy parts, when not complicated with an external wound, generally heal up in a kindly manner, as we fee in cafes of the ruptured tendo achillis, diflocations, and fractures.

But, on the other hand, at the time of parturition, the body is remarkably difpofed to an inflammatory fever, which is alway very dangerous when it rifes to any height; and therefore, whatever expofes the body to confiderable inflammation at that time, we may prefume, muft be attended with fome danger. And it muft likewife be remembered, that women who are exceedingly crooked, are commonly fo weak that they eafily fink under any great difeafe.

At the fame time our author allows, that the Cæfarean fection, though it may fave the child, yet will almoft always be fatal to the mother. The cutting of the fymphyfis, on the other hand, hath no probability of faving the child, and the effect on the mother muft be doubtful. He indeed gives no inftance of the bad fuccefs of the cutting the fymphyfis, though he gives an additional one of the fatality of the Cæfarean operation. As a decifive proof of the inefficacy of the cutting the fymphyfis to fave the child, he gives the figures of the diftorted pelvis of two women; by which it appears, that the utmoft dilatation ufed by this means could have amounted to no more than to enlarge the paffage to a circle of two inches and a quarter, which is not at all fufficient to afford an exit to a living child. In all cafes therefore, when the mother cannot be delivered without deftroying the child, he gives the preference to the crotchet; after the ufe of which, he fays, if the operation is flowly performed, by allowing intervals of eafe, as in the natural labour, women recover almoft as foon as in other cafes. Yet, notwithftanding all that can be argued againft this operation, it is plain, that as it gives

Management after Delivery.

gives a probable chance of saving the mother's life, though at the expence of the child, it ought always to be preferred to the Cæsarean section, which saves the child, but destroys the mother. Nevertheless, it would be shocking to think of performing even this operation where there was a possibility of accomplishing the delivery by any other means.

Chap. XVI. *Of the Management of Women after delivery.*

The woman being delivered of the child and placenta, let a soft linen-cloth, warmed, be applied to the external parts; and if she complains much of a smarting soreness, some pomatum may be spread upon it. The linen that was laid below her, to spunge up the discharges, must be removed, and replaced with others that are clean, dry, and warm. Let her lie on her back, with her legs extended close to each other; or upon her side, if she thinks she can lie easier in that position, until she recovers from the fatigue: if she is spent and exhausted, let her take a little warm wine or caudle, or, according to the common custom, some nutmeg and sugar grated together in a spoon: the principal design of administering this powder, which among the good women is seldom neglected, is to supply the want of some cordial draught, when the patient is too weak to be raised, or supposed to be in danger of retchings from her stomach's being overloaded. When she hath in some measure recovered her strength and spirits, let the cloths be removed from the parts, and others applied in their room; and, if there is a large discharge from the uterus, let the wet linen below her be also shifted, that she may not run the risk of catching cold.

When the patient is either weak or faintish, she ought not to be taken out of bed, or even raised up to have her head and body shifted, until she is a little recruited; otherwise she will be in danger of repeated faintings, attended with convulsions, which sometimes end in death. To prevent these bad consequences, her skirt and petticoats ought to be loosened and pulled down over the legs, and replaced by another well warmed, with a broad head-band to be slipt in below, and brought up over her thighs and hips: a warm double cloth must be laid on the belly, which is to be surrounded by the head-band of the skirt pinned moderately tight over the cloth, in order to compress the viscera and the relaxed parietes of the abdomen, more or less, as the woman can easily bear it; by which means the uterus is kept firm in the lower part of the abdomen, and prevented from rolling from side to side when the patient is turned: but the principal end of this compression is to hinder too great a quantity of blood from rushing into the relaxed vessels of the abdominal contents, especially when the uterus is emptied all of a sudden by a quick delivery. The pressure being thus suddenly removed, the head is all at once robbed of its proportion of blood, and the immediate revulsion precipitates the patient into dangerous lypothymia.

For this reason the belly ought to be firmly compressed by the hands of an assistant, until the bandage is applied; or, in lieu of it, a long towel, sheet, or roller, to make a suitable compression: but for this purpose different methods are used in different countries, or according to the different circumstances of the patients. The head-cloaths and shift ought also to be changed, because with sweating in time of labour they are rendered wet and disagreeable. Several other applications are necessary, when the external or internal parts are rent or inflamed, misfortunes that sometimes happen in laborious and preternatural cases.—We shall conclude this chapter with giving some necessary directions with regard to air, diet, &c.

Although we cannot remove the patient immediately after delivery into another climate, we can qualify the air so as to keep it in a moderate and salutary temper, by rendering it warm or cold, moist or dry, according to the circumstances of the occasion. With regard to diet, women, in time of labour, and even till the ninth day after delivery, ought to eat little solid food, and none at all during the first five or seven: let them drink plentifully of warm diluting fluids, such as barley-water, gruel, chicken-water, and teas; caudles are also commonly used, composed of water-gruel boiled up with mace and cinnamon, to which, when strained, is added a third or fourth part of white wine, or less, if the patient drinks plentifully, sweetened with sugar to their taste: this composition is termed *white caudle;* whereas, if ale is used instead of wine, it goes under the name of *brown caudle.* In some countries, eggs are added to both kinds; but, in that case, the woman is not permitted to eat meat or broths till after the fifth or seventh day: in this country, however, as eggs are no part of the ingredients, the patient is indulged with weak broth sooner, and sometimes allowed to eat a little boiled chicken. But all these different preparations are to be prescribed weaker or stronger, with regard to the spices, wine, or ale, according to the different constitutions and situations of different patients: for example, if she is low and weak, in consequence of an extraordinary discharge of any kind, either before or after delivery, or if the weather is cold, the caudles and broths may be made the stronger; but if she is of a full habit of body, and has the least tendency to a fever, or if the season is excessively hot, these drinks ought to be of a very weak consistence, or the patient restricted to gruel, tea, barley and chicken water, and these varied according to the emergency of the case.

Her food must be light and easy of digestion, such as panada, biscuit, and sago; about the fifth or seventh day she may eat a little boiled chicken, or the lightest kind of young meat; but these last may be given sooner or later, according to the circumstances of the case and the appetite of the patient. In the regimen as to the eating and drinking, we should rather err on the abstemious side than indulge the woman with meat and strong fermented liquors, even if these last should be most agreeable to her palate: for we find by experience, that they are apt to increase or bring on fevers, and that the most nourishing and salutary diet is that which we have above prescribed. Every thing that is difficult of digestion, or quickens the circulating fluids, must of necessity promote a fever; by which the necessary discharges are obstructed, and the patient's life endangered.

Management after Delivery.

As to the article of fleeping and watching, the patient muft be kept as free from noife as poffible, by covering the floors and ftairs with carpets and cloths, oiling the hinges of the doors, filencing the bells, tying up the knockers, and in noify ftreets ftrowing the pavement with ftraw; if, notwithftanding thefe precautions, fhe is difturbed, her ears muft be ftuffed with cotton, and opiates adminiftered to procure fleep; becaufe watching makes her reftlefs, prevents perfpiration, and promotes a fever.

Motion and reft are another part of the nonnaturals to which we ought to pay particular regard. By toffing about, getting out of bed, or fitting up too long, the perfpiration is difcouraged and interrupted; and in this laft attitude the uterus, not yet fully contracted, hangs down, ftretching the ligaments, occafioning pain, cold fhiverings, and a fever: for the prevention of thefe bad fymptoms, the patient muft be kept quiet in bed till after the fourth or fifth day, and then be gently lifted up in the bed-cloaths, in a lying pofture, until the bed can be adjufted, into which fhe muft be immediately reconveyed, there to continue, for the moft part, till the ninth day, after which period women are not fo fubject to fevers as immediately after delivery. Some there are who, from the nature of their conftitutions, or other accidents, recover more flowly; and fuch are to be treated with the fame caution after as before the ninth day, as the cafe feems to indicate: others get up, walk about, and recover, in a much fhorter time; but thefe may fome time or other pay dearly for their foolhardinefs, by encouraging dangerous fevers: fo that we ought rather to err on the fafe fide than run any rifk whatfoever.

What next comes under confideration is the circumftance of retention and excretion. We have formerly obferved, that, in time of labour, before the head of the child is locked into the pelvis, if the woman has not had an eafy paffage in her belly that fame day, the rectum and colon ought to be emptied by a glyfter, which will affift the labour, prevent the difagreeable excretion of the fœces before the child's head, and enable the patient to remain two or three days after, without the neceffity of going to ftool. However, fhould this precaution be neglected, and the patient very coftive after delivery, we muft beware of throwing up ftimulating glyfters, or adminiftering ftrong cathartics, left they fhould bring on too many loofe ftools, which, if they cannot be ftopt, fometimes produce fatal confequences, by obftructing the perfpiration and lochia, and exhaufting the woman, fo as that fhe will die all of a fudden; a cataftrophe which hath frequently happened from this practice. Wherefore, if it be neceffary to empty the inteftines, we ought to prefcribe nothing but emollient glyfters, or fome very gentle opener, fuch as manna, or *elect. lenitivum.* But no excretion is of more confequence to the patient's recovery than a free perfpiration; which is fo abfolutely neceffary, that unlefs fhe has a moifture continually on the furface of her body, for fome days after the birth, fhe feldom recovers to advantage: her health, therefore, in a great meafure, depends upon her enjoying undifturbed repofe, and a conftant breathing fweat, which prevents a fever, by carrying off the tenfion, and affifts the equal difcharge of the lochia: and when thefe are obftructed, and a fever enfues with pain and reftleffnefs, nothing relieves the patient fo effectually as reft and profufe fweating, procured by opiates and fudorifics at the beginning of the complaints; yet thefe laft muft be more cautioufly prefcribed in exceffive hot than in cool weather.

The laft of the nonnaturals to be confidered are the paffions of the mind, which alfo require particular attention. The patient's imagination muft not be difturbed by the news of any extraordinary accident which may have happened to her family or friends: for fuch information hath been known to carry off the labour-pains entirely, after they were begun, and the woman has funk under her dejection of fpirits: and, even after delivery, thefe unfeafonable communications have produced fuch anxiety as obftructed all the neceffary excretions, and brought on a violent fever and convulfions, that ended in death.

Chap. XVII. *Of violent Floodings.*

Floodings.

All women, when the placenta feparates, and after it is delivered, lofe more or lefs red blood, from the quantity of half a pound to that of one pound, or even two; but fhould it exceed this proportion, and continue to flow without diminution, the patient is in great danger of her life: this hazardous hæmorrhage is known by the violence of the difcharge, wetting frefh cloaths as faft as they can be applied; from the pulfe becoming low and weak, and the countenance turning pale; then the extremities grow cold, fhe finks into faintings, and, if the difcharge is not fpeedily ftopped or diminifhed, is feized with convulfions, which often terminate in death.

This dangerous efflux is occafioned by every thing that hinders the emptied uterus from contracting, fuch as great weaknefs and laffitude, in confequence of repeated floodings before delivery; the fudden evacuation of the uterus; fometimes, though feldom, it proceeds from part of the placenta's being left in the womb; it may happen when there is another child, or more, ftill undelivered; when the womb is kept diftended with a large quantity of coagulated blood; or when it is inverted by pulling too forcibly at the placenta.

In this cafe, as there is no time to be loft, and internal medicines cannot act fo fuddenly as to anfwer the purpofe, we muft have immediate recourfe to external application. If the diforder be owing to weaknefs, by which the uterus is difabled from contracting itfelf, fo that the mouths of the veffels are left open; or, though contracted a little, yet not enough to reftrain the hæmorrhage of the thin blood; or if, in feparating the placenta, the accoucheur has fcratched or tore the inner furface or membrane of the womb; in thefe cafes, fuch things muft be ufed as will affift the contractile power of the uterus, and hinder the blood from flowing fo faft into it and the neighbouring veffels; for this purpofe, cloths dipped in any cold aftringent fluid, fuch as oxycrate, or red tart wine, may be applied to the back and belly. Some prefcribe venefection in the arm, to the amount of five or fix ounces, with a view of making revulfion: if the pulfe is ftrong, this may be proper; otherwife, it will do more harm than good. Others order ligatures, for compreffing the returning veins at the hams, arms, and

After-pains and neck, to retain as much blood as poffible in the extremities and head. Befides thefe applications, the vagina may be filled with tow or linen-rags, dipped in the abovementioned liquids, in which a little alum, or fachar-faturni hath been diffolved: nay, fome practitioners inject proof-fpirits warmed, or, foaking them up in a rag or fpunge, introduce and fqueeze them into the uterus, in order to conftringe the veffels.

If the flooding proceeds from another child, the retention of the placenta, or coagulated blood, thefe ought immediately to be extracted; and if there is an inverfion of the uterus, it muft be fpeedily reduced. Should the hæmorrhage, by thefe methods, abate a little, but ftill continue to flow, though not in fuch a quantity as to bring on fudden death, fome red wine and jelly ought to be prefcribed for the patient, who fhould take it frequently, and a little at a time; but above all things chicken or mutton broths, adminiftered in the fame manner, for fear of overloading the weakened ftomach, and occafioning retchings: thefe repeated in fmall quantities, will gradually fill the exhaufted veffels, and keep up the circulation. If the pulfe continues ftrong, it will be proper to order repeated draughts of barley-water, acidulated with elixir vitriol: but if the circulation be weak and languid, extract of the bark, diffolved in *aq. cinnamomi tenuis*, and given in fmall draughts, or exhibited in any other form, will be ferviceable; at the fame time, lulling the patient to reft with opiates. Thefe, indeed, when the firft violence of the flood is abated, if properly and cautioufly ufed, are generally more effectual than any other medicine.

Chap. XVIII. *Of the After-pains.*

After-pains commonly happen when the fibrous part of the blood is retained in the uterus or vagina, and formed into large clots, which are detained by the fudden contraction of the os internum and externum, after the placenta is delivered: or, if thefe fhould be extracted, others will fometimes be formed, tho' not fo large as the firft, becaufe the cavity of the womb is continually diminifhing after the birth. The uterus, in contracting, preffes down thefe coagulums to the os internum; which being again gradually ftretched, produces a degree of labour-pains, owing to the irritation of its nerves; in confequence of this uneafinefs, the woman fqueezes the womb as in real labour; the force being increafed, the clots are pufhed along, and when they are delivered fhe grows eafy. The larger the quantity is of the coagulated blood, the feverer are the pains, and the longer they continue.

Women in the firft child feldom have after-pains; becaufe, after delivery, the womb is fuppofed to contract; and pufh off the clots with greater force in the firft than in the following labours: after-pains may alfo proceed from obftructions in the veffels, and irritations at the os internum. In order to prevent or remove thefe pains, as foon as the placenta is feparated and delivered, the hand being introduced into the uterus, may clear it of all the coagula. When the womb is felt through the parietes of the abdomen larger than ufual, it may be taken for granted that there is either another child, or a large quantity of this clotted blood; and, which foever it may be, there is a neceffity for its being extracted. If the placenta comes away of itfelf, and the after-pains are violent, they may be alleviated and carried off by an opiate: for, by fleeping and fweating plentifully, the irritation is removed, the evacuations are increafed, the os uteri is infenfibly relaxed, and the coagula flide eafily along. When the difcharge of the lochia is fmall, the after-pains, if moderate, ought not to be reftrained; becaufe the fqueezing which they occafion promotes the other evacuation, which is neceffary for the recovery of the patient. After-pains may alfo proceed from an obftruction in fome of the veffels, occafioning a fmall inflammation of the os internum and ligaments; and the fqueezing thereby occafioned may not only help to propel the obftructing fluid, but alfo (if not too violent) contribute to the natural difcharges.

Chap. XIX. *Of the Lochia.*

Lochia. We have already obferved, that the delivery of the child and placenta is followed by an efflux of more or lefs blood, difcharged from the uterus, which, by the immediate evacuation of the large veffels, is allowed to contract itfelf the more freely, without the danger of an inflammation, which would probably happen in the contraction, if the great veffels were not emptied at the fame time: but as the fluids in the fmaller veffels cannot be fo foon evacuated, or returned into the vena cava, it is neceffary that, after the great difcharge is abated, a flow and gradual evacuation fhould continue, until the womb fhall be contracted to near the fame fize which it had before pregnancy; and to this it attains about the 18th or 20th day after delivery, though the period is different in different women.

When the large veffels are emptied immediately after delivery, the difcharge frequently ceafes for feveral hours, until the fluids in the fmaller veffels are propelled into the larger, and then begins to flow again, of a paler colour.

The red colour of the lochia commonly continues till the fifth day, though it is always turning more and more ferous from the beginning: but, about the fifth day, it flows off a clear, or fometimes (though feldom) of a greenifh tint; for, the mouths of the veffels growing gradually narrower by the contraction of the uterus, at laft allow the ferous part only to pafs: as for the greenifh hue, it is fuppofed to proceed from a diffolution of the cellular or cribriform membrane or mucus, that furrounded the furface of the placenta and chorion; part of which, being left in the uterus, becomes livid, decays, and, diffolving, mixes with and tinctures the difcharge as it paffes along.

Though the lochia, as we have already obferved, commonly continue till the 18th or 20th day, they are every day diminifhing in quantity, and fooneft ceafe in thofe women who fuckle their children, or have had an extraordinary difcharge at firft; but the colour, quantity, and duration, differ in different women: in fome patients, the red colour difappears on the firft or fecond day; and in others, though rarely, it continues more or lefs to the end of the month: the evacuation in fome is very fmall, in others exceffive: in one woman it ceafes very foon, in another flows during

Milk fever. during the whole month: yet all of thefe patients fhall do well.

Some allege, that this difcharge from the uterus is the fame with that from a wound of a large furface; but it is more reafonable to fuppofe, that the change of colour and diminution of quantity proceed from the flow contraction of the veffels; becaufe, previous to pus, there muft have been lacerations and impofthumes, and, in women who have fuddenly died after delivery, no wound or excoriation hath appeared upon the inner furface of the womb, which is fometimes found altogether fmooth, and at other times rough and unequal, on that part to which the placenta adhered. The fpace that is occupied before the delivery, from being fix inches in diameter, or 18 inches in circumference, will, foon after the birth, be contracted to one third or fourth of thefe dimenfions.

Chap. XX. *Of the Milk-fever.*

About the fourth day, the breafts generally begin to grow turgid and painful. We have formerly obferved, that, during the time of uterine geftation, the breafts in moft women gradually increafe till the delivery, growing fofter as they are enlarged by the veffels being more and more filled with fluids; and by this gradual diftenfion they are prepared for fecreting the milk from the blood after delivery. During the two or three firft days after parturition, efpecially when the woman has undergone a large difcharge, the breafts have been fometimes obferved to fubfide and grow flaccid; and about the 3d or 4th day, when the lochia begin to decreafe, the breafts fwell again to their former fize, and ftretch more and more, until the milk, being fecreted, is either fucked by the child, or frequently of itfelf runs out at the nipples.

Moft of the complaints incident to women after delivery, proceed either from the obftruction of the lochia in the uterus, or of the milk in the breafts, occafioned by any thing that will produce a fever; fuch as catching cold, long and fevere labour, eating food that is hard of digeftion, and drinking fluids that quicken the circulation of the blood in the large veffels; by which means the fmaller, with all the fecretory and excretory ducts, are obftructed.

The difcharge of the lochia being fo different in women of different conftitutions, and befides in fome meafure depending upon the method of management, and the way of life peculiar to the patient, we are not to judge of her fituation from the colour, quantity, and duration of them, but from the other fymptoms that attend the difcharge; and if the woman feems hearty, and in a fair way of recovery, nothing ought to be done with a view to augment or diminifh the evacuation. If the difcharge be greater than fhe can bear, it will be attended with all the fymptoms of inanition; but as the lochia feldom flow fo violently as to deftroy the patient of a fudden, fhe may be fupported by a proper nourifhing diet, affifted with cordial and reftorative medicines. Let her, for example, ufe broths, jellies, and affes milk; if the pulfe is languid and funk, fhe may take repeated dofes of the *confect. cardiac.* with mixtures compofed of the cordial waters and volatile fpirits: fubaftringents and opiates frequently adminiftered, with the *cort. Peruvian.* in different forms, and auftere wines, are of great fervice. On the other hand, when the difcharge is too fmall, or hath ceafed altogether, the fymptoms are more dangerous, and require the contrary method of cure: for now the bufinefs is to remove a too great plenitude of the veffels in and about the uterus, occafioning tenfion, pain, and labour, in the circulating fluids; from whence proceed great heat in the part, reftlefsnefs, fever, a full, hard, quick pulfe, pains in the head and back, naufea, and difficulty in breathing. Thefe complaints, if not at firft prevented, or removed by reft and plentiful fweating, muft be treated with venefection and the antiphlogiftic method.

When the obftruction is recent, let the patient lie quiet, and encourage a plentiful diaphorefis, by drinking frequently of warm, weak, diluting fluids, fuch as water-gruel, barley-water, tea, or weak chicken-broth.

Should thefe methods be ufed without fuccefs, and the patient, far from being relieved by reft, plentiful fweating, or a fufficient difcharge of the obftructed lochia, labour under an hot, dry fkin, anxiety, and a quick, hard, and full pulfe, the warm diaphoretics muft be laid afide; becaufe, if they fail of having the defired effect, they muft neceffarily increafe the fever and obftruction, and recourfe be had to bleeding at the arm or ankle to more or lefs quantity, according to the degree of fever and obftruction; and this evacuation muft be repeated as there is occafion. When the obftruction is not total, it is fuppofed more proper to bleed at the ankle than at the arm; and at this laft, when the difcharge is altogether ftopped, her ordinary drink ought to be impregnated with nitre.

If fhe is coftive, emollient and gently opening glyfters may be occafionally injected; and her breafts muft be fomented and fucked, either by the mouth or pipe-glaffes. If by thefe means the fever is abated, and the neceffary difcharges return, the patient commonly recovers; but if the complaints continue, the antiphlogiftic method muft ftill be purfued. If, notwithftanding thefe efforts, the fever is not diminifhed or removed by a plentiful difcharge of the lochia from the uterus, the milk from the breafts, or by a critical evacuation by fweat, urine, or ftool, and the woman is every now and then attacked with cold fhiverings; an abfcefs or abfceffes will probably be formed in the uterus or neighbouring parts, or in the breafts; and fometimes the matter will be tranflated to other fituations, and the feat of it foretold from the part's being affected with violent pains: thefe abfceffes are more or lefs dangerous, according to the place in which they happen, the largenefs of the fuppuration, and the good or bad conftitution of the patient.

If, when the pains in the epigaftric region is violent, and the fever increafed to a very high degree, the patient fhould all of a fudden enjoy a ceffation from pain, without any previous difcharge or critical eruption, the phyfician may pronounce that a mortification is begun; efpecially if, at the fame time, the pulfe becomes low, quick, wavering, and intermitting: if the woman's countenance, from being florid, turns dufky and pale, while fhe herfelf, and all the attendants, conceive her much mended; in that cafe, fhe will grow delirious, Milk-fever. rious, and die in a very ſhort time.

What we have ſaid on this ſubject regards that fever which proceeds from the obſtructed lochia, and in which the breaſts may likewiſe be affected: but the milk-fever is that in which the breaſts are originally concerned, and which may happen tho' the lochia continue to flow in ſufficient quantity; nevertheleſs, they mutually promote each other, and both are to be treated in the manner already explained; namely, by opiates, diluents, and diaphoretics, in the beginning; and, theſe preſcriptions failing, the obſtructions muſt be reſolved by the antiphlogiſtic method deſcribed above. The milk-fever alone, when the uterus is not concerned, is not ſo dangerous, and much more eaſily relieved. Women of an healthy conſtitution, who ſuckle their own children, have good nipples, and whoſe milk comes freely, are ſeldom or never ſubject to this diſorder, which is more incident to thoſe who do not give ſuck, and neglect to prevent the ſecretion in time; or, when the milk is ſecreted, take no meaſures for emptying their breaſts. This fever likewiſe happens to women who try too ſoon to ſuckle, and continue their efforts too long at one time; by which means the nipples, and conſequently the breaſts, are often inflamed, ſwelled, and obſtructed.

In order to prevent a too great turgency in the veſſels of the breaſts, and the ſecretion of milk, in thoſe women who do not chooſe to ſuckle, it will be proper to make external application of thoſe things which, by their preſſure and repercuſſive force, will hinder the blood from flowing in too great quantity to this part, which is now more yielding than at any other time: for this purpoſe, let the breaſts be covered with *emp. de minia*, *diapalma*, or *emp. ſimp.* ſpread upon linen, or cloths dipped in camphorated ſpirits, be frequently applied to theſe parts and the arm-pits; while the patient's diet and drink is of the lighteſt kind, and given in ſmall quantities. Notwithſtanding theſe precautions, a turgency commonly begins about the third day; but by reſt, moderate ſweating, and the uſe of theſe applications, the tenſion and pain will ſubſide about the fifth or ſixth day, eſpecially if the milk runs out at the nipples: but if the woman catches cold, or is of a full habit of body, and not very abſtemious, the tenſion and pain increaſing, will bring on a cold ſhivering ſucceeded by a fever; which may obſtruct the other excretions, as well as thoſe of the breaſt.

In this caſe, the ſudorifics above recommended muſt be preſcribed; and if a plentiful ſweat enſues, the patient will be relieved; at the ſame time the milk muſt be extracted from her breaſts, by ſucking with the mouth or glaſſes: ſhould theſe methods fail, and the fever increaſe, ſhe ought to be blooded in the arm; and inſtead of the external applications hitherto uſed, emollient liniments and cataplaſms muſt be ſubſtituted, in order to ſoften and relax. If, in ſpite of theſe endeavours, the fever proceeds for ſome days, the patient is frequently relieved by critical ſweats, a large diſcharge from the uterus, miliary eruptions, or looſe ſtools mixed with milk, which is curdled in the inteſtines; but ſhould none of theſe evacuations happen, and the inflammation continue with increaſing violence, there is danger of an impoſthume, which is to be brought to maturity, and managed like other inflammatory tumours; and no aſtringents ought to be applied, leſt they ſhould produce ſchirrhous ſwellings in the glands. Evacuations.

As the criſis of this fever, as well as of that laſt deſcribed, often conſiſts in miliary eruptions over the whole ſurface of the body, but particularly on the neck and breaſt, by which the fever is carried off, nothing ought to be given which will either greatly increaſe or diminiſh the circulating force, but ſuch only as will keep out the eruptions. But if, notwithſtanding theſe eruptions, the fever, inſtead of abating, is augmented, it will be neceſſary to diminiſh its force, and prevent its increaſe, by thoſe evacuations we have mentioned above. On the contrary, ſhould the pulſe ſink, the eruptions begin to retreat inwardly, and the morbific matter be in danger of falling upon the viſcera, we muſt endeavour to keep them out by opiates and ſudorific medicines; and here bliſters may be applied with ſucceſs.

Chap. XXI. *Of the Evacuations neceſſary at the end of the Month after Delivery.*

Those who have had a ſufficient diſcharge of the lochia, plenty of milk, and ſuckle their own children, commonly recover with eaſe, and, as the ſuperfluous fluids of the body are drained off at the nipples, ſeldom require evacuations at the end of the month; but if there are any complaints from fullneſs, ſuch as pains and ſtitches, after the 20th day, ſome blood ought to be taken from the arm, and the belly gently opened by frequent glyſters, or repeated doſes of laxative medicines.

If the patient has tolerably recovered, the milk having been at firſt ſucked or diſcharged from the nipples, and afterwards diſcuſſed, no evacuations are neceſſary before the third or fourth week; and ſometimes not till after the firſt flowing of the menſes, which commonly happens about the fifth week; if they do not appear within that time, gentle evacuations muſt be preſcribed, to carry off the plethora, and bring down the catamenia.

EXPLANATION of the PLATES.

Fig. 1. gives a front-view of the uterus *in ſitu* ſuſpended in the vagina; the anterior parts of oſſa iſchium, with the oſſa pubis; pudenda, perinæum, and anus, being removed in order to ſhew the internal parts. Plate CLXXVIII.

A, the laſt vertebra of the loins.

BB, the oſſa ilium.

CC, the acetabula.

DD, the inferior and poſterior parts of the oſſa iſchium.

E, the part covering the extremity of the coccyx.

F, the inferior part of the rectum.

GG, the vagina cut open longitudinally, and ſtretched on each ſide of the collum uteri, to ſhew in what manner the uterus is ſuſpended in the ſame.

HH, part of the veſica urinaria ſtretched on each ſide of the vagina, and inferior part of the fundus uteri.

I, the collum uteri.

K, the fundus uteri.

LL, the tubi Fallopiani and fimbriæ.

MM, the ovaria.

NN, the

Explanat. of Plates.

NN, the ligamenta lata and rotunda.

OO, the ſuperior part of the rectum.

Fig. 2. gives a front-view of the uterus in the beginning of the firſt month of pregnancy; the anterior part being removed that the embryo might appear through the amnios, the chorion being diſſected off.

A, the fundus uteri.

B, the collum uteri, with a view of the rugous canal that leads to the cavity of the fundus.

C, the os uteri.

Fig. 3. In the ſame view and ſection of the parts as in fig. 1. ſhews the uterus as it appears in the ſecond or third month of pregnancy.

F, the anus.

G, the vagina, with its plicæ.

HH, the poſterior and inferior part of the urinary bladder extended on each ſide; the anterior and ſuperior part being removed.

II, the mouth and neck of the womb, as raiſed up when examining the ſame by the touch, with one of the fingers in the vagina.

KK, the uterus as ſtretched in the ſecond or third month, containing the embryo, with the placenta adhering to the fundus.

Fig. 4. In the ſame view and ſection of the parts with the former figures, repreſents the uterus in the eighth or ninth month of pregnancy.

A, the uterus as ſtretched to near its full extent, with the waters, and containing the fœtus entangled in the funis, the head preſenting at the upper part of the pelvis.

BB, the ſuperior part of the oſſa ilium.

CC, the acetabula.

DD, the remaining poſterior parts of the oſſa iſchium.

E, the coccyx.

F, the inferior part of the rectum.

GGG, the vagina ſtretched on each ſide.

H, the os uteri, the neck being ſtretched to its full extent or entirely obliterated.

II, part of the veſica urinaria.

KK, the placenta, at the ſuperior and poſterior part of the uterus.

LL, the membranes.

M, the funis umbilicalis.

Fig. 5. gives a front view of twins *in utero* in the beginning of labour.

A, the uterus as ſtretched, with the membranes and waters.

BB, the ſuperior parts of the oſſa ilium.

CC, the acetabula.

DD, the oſſa iſchium.

E, the coccyx.

F, the lower part of the rectum.

GG, the vagina.

H, the os internum ſtretched open about a fingerbreadth, with the membranes and waters in time of labour-pains.

II, The inferior part of the uterus, ſtretched with the waters which are below the head of the child that preſents.

KK, the two placentas adhering to the poſterior part of the uterus, the two fœtuſes lying before them, one with its head in a proper poſition at the inferior part of the uterus, and the other ſituated preternaturally with the head to the fundus: the bodies of each are here entangled in their proper funis, which frequently happens in the natural as well as preternatural poſitions.

Explanat. of Plates.

LLL, the membranes belonging to each placenta.

Fig. 6. ſhews, in a lateral view and longitudinal diviſion of the parts, the gravid uterus when labour is ſomewhat advanced.

A, the loweſt vertebra of the back; the diſtance from which to the laſt-mentioned vertebra is here ſhewn by dotted lines.

CC, the uſual thickneſs and figure of the uterus when extended by the waters at the latter end of pregnancy.

D, the ſame contracted and grown thicker after the waters are evacuated.

EE, the figure of the uterus when pendulous.

FF, the figure of the uterus when ſtretched higher than uſual, which generally occaſions vomitings and difficulty of breathing.

G, the os pubis of the left ſide.

HH, the os internum.

I, the vagina.

K, the left nympha.

L, the labium pudendi of the ſame ſide.

M, The remaining portion of the bladder.

N, the anus.

OP, the left hip and thigh.

Fig. 7. ſhews the forehead of the fœtus turned backwards to the os ſacrum, and the occiput below the pubes, by which means the narrow part of the head is to the narrow part of the pelvis, that is, between the inferior parts of the oſſa iſchium.

A, the uterus contracted cloſely to the fœtus after the waters are evacuated.

BCD, the vertebræ of the loins, os ſacrum, and coccyx.

E, the anus.

F, the left hip.

G, the perinæum.

H, the os externum beginning to dilate.

I, the os pubis of the left ſide.

K, the remaining portion of the bladder.

L, the poſterior part of the os uteri.

Plate CLXXIX.

Fig. 1. is principally intended to ſhew in what manner the perinæum and external parts are ſtretched by the head of the fœtus, in a firſt pregnancy, towards the end of the labour.

A, the abdomen.

B, the labia pudendi.

C, the clitoris and its preputium.

D, the hairy ſcalp of the fœtus, ſwelled at the vertex, in a laborious caſe, and protruded to the os externum.

E, F, the perinæum and anus puſhed out by the head of the fœtus in form of a large tumour.

GG, the parts that cover the tuberoſities of the oſſa iſchium.

H, the part that covers the os coccygis.

Fig. 2. ſhews in what manner the head of the fœtus is helped along with the forceps, as artificial hands, when it is neceſſary for the ſafety of either mother or child.

AABC, the vertebræ of the loins, os ſacrum, and coccyx.

D, the

Explanat. of Plates.

D, the os pubis of the left ſide.
E, the remaining part of the bladder.
FF, the inteſtinum rectum.
GGG, the uterus.
H, the mons veneris.
I, the clitoris, with the left nymph.
X, the corpus cavernoſum clitoridis.
V, the meatus urinarius.
K, the left labium pudendi.
L, the anus.
N, the perinæum.
QP, the left hip and thigh.
R, the ſkin and muſcular parts of the loins.

Fig. 3. ſhews the head of the fœtus, by ſtrong labour-pains, ſqueezed into a longiſh form, with a tumour on the vertex, from a long compreſſion of the head in the pelvis.

K, the tumour on the vertex.
L, the forceps.
M, the veſica urinaria much diſtended with a large quantity of urine from the long preſſure of the head againſt the urethra.
N, the under part of the uterus.
OO, the os uteri.

Fig. 4. ſhews, in the lateral view, the face of the child preſenting and forced down into the lower part of the pelvis, the chin being below the pubes, and the vertex in the concavity of the os ſacrum: the water being likewiſe all diſcharged, the uterus appears cloſely joined to the body of the child.

Fig. 5. ſhews, in a lateral view, the head of the child in the ſame poſition as in the former figure.

AB, the vertebræ of the loins, os ſacrum, and coccyx.
C, the os pubis of the left ſide.
D, the inferior part of the rectum.
E, the perinæum.
F, the left labium pudendi.
GGG, the uterus.

Fig. 6. gives a lateral internal view of a diſtorted pelvis, divided longitudinally, with the head of a fœtus of the ſeventh month paſſing the ſame.

ABC, the os ſacrum and coccyx.
D, the os pubis of the left ſide.
E, the tuberoſity of the os iſchium of the ſame ſide.

Fig. 7. gives a ſide-view of a diſtorted pelvis, divided longitudinally, with the head of a full grown fœtus ſqueezed into the brim, the parietal bones decuſſating each other, and compreſſed into a conical form.

ABC, the os ſacrum and coccyx.
D, the os pubis of the left ſide.
E, the tuberoſity of the os iſchium.
F, the proceſſus acutus.
G, the foramen magnum.

Plate CLXXX.

Fig. 1. ſhews, in a front view of the pelvis, the breech of the fœtus preſenting, and dilating the os internum, the membranes being too ſoon broke.

Fig. 2. is the reverſe of fig. 1. the fore-parts of the child being to the fore-part of the uterus.

Fig. 3. repreſents, in a front-view of the pelvis, the fœtus compreſſed, by the contraction of the uterus, into a round form, the fore-parts of the former being towards the inferior part of the latter, and one foot and hand fallen down into the vagina. In this figure, the anterior part of the pelvis is removed, by a longitudinal ſection through the middle of the foramen magnum.

AA, the ſuperior parts of the oſſa ilium.
BB, the uterus.
C, the mouth of the womb ſtretched and appearing in
OOOO, the vagina.
D, the inferior and poſterior part of the os externum.
EEEE, the remaining parts of the oſſa pubis and iſchium.
FFFF, the membrana adipoſa.

Fig. 4. repreſents, in the ſame view with fig. 3. the fœtus in the contrary poſition; the breech and fore-parts being towards the fundus uteri, the left arm in the vagina, and the fore-arm without the os externum, the ſhoulder being likewiſe forced into the os uteri.

Fig. 5. repreſents, in a lateral view of the pelvis, the method of extracting, by means of a curved crotchet, the head of the fœtus, when left in the uterus, after the body is delivered and ſeparated from it; either by its being too large, or the pelvis too narrow.

ABC, the os ſacrum and coccyx.
D, the os pubis of the left ſide.
EE, the uterus.
F, the locking part of the crotchet.
g,h,i, the point of the crotchet on the inſide of the cranium.

Fig. 6. repreſents the forceps and blunt-hook.

A, the ſtreight forceps, in the exact proportion as to the width between the blades, and length from the points to the locking-part; the firſt being two and the ſecond ſix inches, which, with three inches and a half, (the length of the handles), make in all eleven inches and a half.

B repreſents the poſterior part of a ſingle blade in order to ſhew the width and length of the open part of the ſame, and the form and dimenſions of the whole.

C, the blunt hook, which is uſed for three purpoſes: 1. To aſſiſt the extraction of the head, after the cranium is opened with the ſciſſars, by introducing the ſmall end along the ear on the outſide of the head to above the under-jaw, where the point is to be fixed; the other extremity of the hook being held with one hand, whilſt two fingers of the other are to be introduced into the foreſaid opening, by which holds the head is to be gradually extracted. 2. The ſmall end is uſeful in abortions, in any of the firſt four or five months, to hook down the fecundines, when lying looſe in the uterus, when they cannot be extracted by the fingers or labour-pains, and when the patient is much weakened by floodings. 3. The large hook at the other end is uſeful to aſſiſt the extraction of the body, when the breech preſents; but ſhould be uſed with great caution, to avoid the diſlocation or fracture of the thigh.

Fig. 7. A repreſents the whale-bone fillet, which may be ſometimes uſeful in laborious caſes, when the operator is not provided with the forceps, in ſudden and unexpected exigencies.

BB, two views of a peſſary for the prolapſus uteri. After the uterus is reduced, the large end of the peſſary is to be introduced into the vagina, and the os uteri retained in the concave part, where there are three holes

Explanat. of Plates.

holes to prevent the ftagnation of any moifture. The fmall end without the os externum has two tapes drawn through the two holes, which are tied to four other tapes, that hang down from a belt that furrounds the woman's body, and by this means keep up the peffary. This peffary may be taken out by the patient when fhe goes to bed, and introduced again the morning; but as this fometimes rubs the os externum, fo as to make its ufe uneafy, the round kind, marked C, are of more general ufe. They are made of wood, ivory, or cork, (the laft covered with cloth and dipped in wax:) the peffary is to be lubricated with pomatum, the edge forced through the paffage into the vagina, and a finger introduced in the hole in the middle lays it acrofs within the os externum. They ought to be larger or fmaller, according to the widenefs or narrownefs of the paffage, to prevent their being forced out by any extraordinary ftraining.

DD gives two views of a female catheter, to fhew its degree of curvature and different parts.

Fig. 8. *a*, reprefents a pair of curved crotchets locked together in the fame manner as the forceps. The dotted lines along the infide of one of the blades reprefent a fheath contrived to guard the point till it is introduced high enough: the ligature at the handles marked with two dotted lines is then to be untied, the fheath withdrawn, and the point being uncovered is fixed as in fig. 5.

b, gives a view of the back-part of one of the crotchets, which is 12 inches long.

c, a front view of the point, to fhow its proportional length and breadth.

d, the fciffars for perforating the cranium in very narrow and diftorted pelvifes. They ought to be made very ftrong, and at leaft nine inches in length, with ftops or refts in the middle of the blades, by which a large dilatation is more eafily made.

Migdol ‖ Migration.

MIGDOL, or MAGDOL, (anc. geog.), a place in the Lower Egypt, on this fide Pihahiroth, or between it and the Red-Sea, towards its extremity. The term denotes a tower or fortrefs. It is probably the *Magdolus* of Herodotus; feeing the Septuagint render it by the fame name.

MIGNARD (Nicholas), a very ingenious French painter, born at Troyes in 1628; but, fettling at Avignon, is generally diftinguifhed from his brother Peter by the appellation of *Mignard of Avignon*. He was afterwards employed at court and at Paris, where he became rector of the royal academy of painting. There are a great number of his hiftorical pieces and portraits in the palace of the Tuilleries. He died in 1690.

MIGNARD (Peter), the brother of Nicholas, was born at Troyes in 1610; and acquired fo much of the tafte of the Italian fchool as to be known by the name of the *Roman*. He was generally allowed to have a fuperior genius to his brother Nicholas; and had the honour of painting the popes Alexander VII. and Urban VIII. befides many of the nobility at Rome, and divers of the Italian princes: his patron, Lewis, fat ten times to him for his portrait, and refpected his talents fo much as to ennoble him, make him his principal painter after the death of Le Brun, and appoint him director of the manufactories. He died in 1695; and many of his pieces are to be feen at St Cloud.

MIGNON (Abraham), a celebrated painter, born at Francfort, acquired a great reputation by his fkill in reprefenting flowers, fruits, infects, flies, birds, and fifhes. His colouring is admirable; and the dew fpread on the flowers is fo well imitated in his pictures, that one is tempted to take hold of them.

MIGRATION, the paffage or removal of a thing out of one place into another.

MIGRATION *of Birds*.—It has been generally believed that many different kinds of birds annually pafs from one country to another, and fpend the fummer or the winter where it is moft agreeable to them; and that even the birds of our own ifland will feek the moft diftant fouthern regions of Africa, when directed by a peculiar inftinct to leave their own country. It hath long been an opinion pretty generally received, that fwallows refide during the winter-feafon in the warm fouthern regions; and Mr Adanfon particularly relates his having feen them at Senegal when they were obliged to leave this country. But befides the fwallow, Mr Pennant enumerates many other birds which migrate from Britain at different times of the year, and are then to be found in other countries; after which they again leave thefe countries, and return to Britain. The reafon of thefe migrations he fuppofes to be a defect of food at certain feafons of the year, or the want of a fecure afylum from the perfecution of man during the time of courtfhip, incubation, and nutrition.—The following is his lift of the migrating fpecies.

Migration.

1. *Crows*. Of this genus, the hooded crow migrates regularly with the woodcock. It inhabits North Britain the whole year: a few are faid annually to breed on Dartmoor, in Devonfhire. It breeds alfo in Sweden and Auftria: in fome of the Swedifh provinces it only fhifts its quarters, in others it refides throughout the year. Our author is at a lofs for the fummer retreat of thofe which vifit us in fuch numbers in winter, and quit our country in the fpring; and for the reafon why a bird, whofe food is fuch that it may be found at all feafons in this country, fhould leave us.

2. *Cuckoo*. Difappears early in autumn; the retreat of this and the following bird is quite unknown to us.

3. *Wryneck*. Is a bird that leaves us in the winter. If its diet be ants alone, as feveral affert, the caufe of its migration is very evident. This bird difappears before winter, and revifits us in the fpring a little earlier than the cuckoo.

4. *Hoopoe*. Comes to England but by accident: Mr Pennant once indeed heard of a pair that attempted to make their neft in a meadow at Selborne, Hampfhire, but were frighted away by the curiofity of people. It breeds in Germany.

5. *Grous*. The whole tribe, except the quail, lives here all the year round: that bird either leaves us, or elfe retires towards the fea-coafts.

6. *Pigeons*. Some few of the ring-doves breed here; but the multitude that appears in the winter, is fo difproportioned to what continue here the whole year, as to make it certain that the greateft part quit the

the country in the fpring. It is moft probable they go to Sweden to breed, and return from thence in autumn; as Mr Ekmark informs us they entirely quit that country before winter. Multitudes of the common wild pigeons alfo make the northern retreat, and vifit us in winter; not but numbers breed in the high cliffs in all parts of this ifland. The turtle alfo probably leaves us in the winter, at leaft changes its place, removing to the fouthern counties.

7. *Stare*. Breeds here. Poffibly feveral remove to other countries for that purpofe, fince the produce of thofe that continue here feems unequal to the clouds of them that appear in winter. It is not unlikely that many migrate into Sweden, where Mr Berger obferves they return in fpring.

8. *Thrufhes*. The fieldfare and the redwing breed and pafs their fummers in Norway and other cold countries; their food is berries, which abounding in our kingdoms, tempts them here in the winter. Thefe two and the Royfton crow are the only land-birds that regularly and conftantly migrate into England, and do not breed here. The hawfinch and crofsbill come here at fuch uncertain times as not to deferve the name of *birds of paffage*.

9. *Chatterer*. The chatterer appears annually about Edinburgh in flocks during winter; and feeds on the berries of the mountain-afh. In South Britain it is an accidental vifitant.

10. *Grofbeaks*. The grofbeak and crofsbill come here but feldom; they breed in Auftria. The pine grofbeak probably breeds in the forefts of the Highlands of Scotland.

11. *Buntings*. All the genus inhabits England throughout the year; except the greater brambling, which is forced here from the north in very fevere feafons.

12. *Finches*. All continue in fome parts of thefe kingdoms, except the fifkin, which is an irregular vifitant, faid to come from Ruffia. The linnets fhift their quarters, breeding in one part of this ifland, and remove with their young to others. All finches feed on the feeds of plants.

13. *Larks, fly-catchers, wagtails, and warblers*. All of thefe feed on infects and worms; yet only part of them quit thefe kingdoms; though the reafon of migration is the fame to all. The nightingale, black-cap, fly-catcher, willow-wren, wheat-ear, and white-throat, leave us before winter, while the fmall and delicate golden-crefted wren braves our fevereft frofts. The migrants of this genus continue longeft in Great Britain in the fouthern counties, the winter in thofe parts being later than in thofe of the north; Mr Stillingfleet having obferved feveral wheat-ears in the ifle of Purbeck on the 18th of November. As thefe birds are incapable of very diftant flights, Spain, or the fouth of France, is probaby their winter-afylum.

14. *Swallows and goat-fucker*. Every fpecies difappears at the approach of winter.

WATER-FOWL.

Of the vaft variety of water-fowl that frequent Great Britain, it is amazing to reflect how few are known to breed here: the caufe that principally urges them to leave this country, feems to be not merely the want of food, but the defire of a fecure retreat. Our country is too populous for birds fo fhy and timid as the bulk of thefe are: when great part of our ifland was a mere wafte, a tract of woods and fen; doubtlefs many fpecies of birds (which at this time migrate) remained in fecurity throughout the year. Egrets, a fpecies of heron, now fcarce known in this ifland, were in former times in prodigious plenty; and the crane, that has totally forfaken this country, bred familiarly in our marfhes: their place of incubation, as well as of all other cloven-footed water-fowl (the heron excepted) being on the ground, and expofed to every one: as rural œconomy increafed in this country, thefe animals were more and more difturbed; at length, by a feries of alarms, they were neceffitated to feek, during the fummer, fome lonely fafe habitation.

On the contrary, thofe that build or lay in the almoft inacceffible rocks that impend over the Britifh feas, breed there ftill in vaft numbers, having little to fear from the approach of mankind: the only difturbance they meet with in general being from the defperate attempts of fome few to get their eggs.

CLOVEN-FOOTED WATER-FOWL.

15. *Herons*. The white heron is an uncommon bird, and vifits us at uncertain feafons; the common kind and the bittern never leave us.

16. *Curlews*. The curlew breeds fometimes on our mountains; but, confidering the vaft flights that appear in winter, it is probable that the greater part retire to other countries: the whimbrel breeds on the Grampian hills, in the neighbourhood of Invercauld.

17. *Snipes*. The woodcock breeds in the moift woods of Sweden, and other cold countries. Some fnipes breed here, but the greateft part retire elfewhere; as do every other fpecies of this genus.

18. *Sandpipers*. The lapwing continues here the whole year; the ruff breeds here, but retires in winter; the redfhank and fandpiper breed in this country, and refide here. All the others abfent themfelves during fummer.

19. *Plovers and oyfter-catcher*. The long-legged plover and fanderling vifit us only in winter; the dottrel appears in fpring and in autumn; yet, what is very fingular, we do not find it breeds in South Britain. The oyfter-catcher lives with us the whole year. The Norfolk plover and fea-lark breed in England. The green plover breeds on the mountains of the north of England, and on the Grampian hills.

We muft here remark, that every fpecies of the genera of curlews, woodcocks, fandpipers, and plovers, that forfake us in the fpring, retire to Sweden, Poland, Pruffia, Norway, and Lapland, to breed: as foon as the young can fly, they return to us again, becaufe the frofts which fet in early in thofe countries totally deprive them of the means of fubfifting; as the drynefs and hardnefs of the ground, in general, during our fummer, prevent them from penetrating the earth with their bills, in fearch of worms, which are the natural food of thefe birds. Mr Ekmark fpeaks thus of the retreat of the whole tribe of cloven-footed water fowl out of his country (Sweden) at the approach of winter; and Mr Klein gives much the fame account of thofe of Poland and Pruffia.

20. *Rails and gallinules*. Every fpecies of thefe two genera continue with us the whole year; the land-rail excepted, which is not feen here in winter. It likewife continues in Ireland only during the fummer-months, when

when they are very numerous, as Mr Smith tells us in the *Hiftory of Waterford*, p. 336. Great numbers appear in Anglefea the latter end of May; it is fuppofed that they pafs over from Ireland, the paffage between the two iflands being but fmall. As we have inftances of thefe birds lighting on fhips in the channel and the Bay of Bifcay, we may conjecture their winter-quarters to be in Spain.

FINNED-FOOTED WATER-BIRDS.

21. *Phalaropes*. Vifit us but feldom; their breeding place is Lapland, and other arctic regions.

22. *Grebes*. The great-crefted grebe, the black and white grebe, and little grebe, breed with us, and never migrate; the others vifit us accidentally, and breed in Lapland.

WEB-FOOTED BIRDS.

23. *Avofet*. Breed near Fofsdike in Lincolnfhire; but quit their quarters in winter. They are then fhot in different parts of the kingdom, which they vifit, not regularly, but accidentally.

24. *Auks and guillemots*. The great auk or pinguin fometimes breeds in St Kilda. The auk, the guillemot, and puffin, inhabit moft of the maritime cliffs of Great Britain, in amazing numbers, during fummer. The black guillemot breeds in the Bafs Ifle, and in St Kilda, and fometimes in Llandidno rocks. We are at a lofs for the breeding place of the other fpecies; neither can we be very certain of the winter refidence of any of them, excepting of the leffer guillemot and black-billed auk, which, during winter, vifit in vaft flocks the Frith of Forth.

25. *Divers*. Thefe chiefly breed in the lakes of Sweden and Lapland, and fome in countries near the pole; but fome of the red-throated divers, the northern and the imber, may breed in the north of Scotland and its ifles.

26. *Terns*. Every fpecies breeds here; but leaves us in the winter.

27. *Petrels*. The fulmar breeds in the Ifle of St Kilda, and continues there the whole year, except September and part of October: the fhearwater vifits the Ifle of Man in April; breeds there; and, leaving it in Auguft or the beginning of September, difperfes over all parts of the Atlantic ocean. The ftormfinch is feen at all diftances from land on the fame vaft watery tract; nor is ever found near the fhore except by fome very rare accident, unlefs in the breeding feafon. Mr Pennant found it on fome little rocky ifles, off the north of Skie. It alfo breeds in St Kilda. He alfo fufpects that it neftles on the Blafquet Ifles off Kerry, and that it is the gourder of Mr Smith.

28. *Merganfers*. This whole genus is mentioned among the birds that fill the Lapland lakes during fummer. Mr Pennant has feen the young of the red-breafted in the north of Scotland: a few of thefe, and perhaps of the goofanders, may breed there.

29. *Ducks*. Of the numerous fpecies that form this genus, we know of few that breed here. The fwan and goofe, the fhield-duck, the eider-duck, a few fhovelers, garganies, and teals, and a very fmall portion of the wild ducks.

The reft contribute to form that amazing multitude of water-fowl that annually repair from moft parts of Europe to the woods and lakes of Lapland and other arctic regions, there to perform the functions of incubation and nutrition in full fecurity. They and their young quit their retreat in September, and difperfe themfelves over Europe. With us they make their appearance the beginning of October; circulate firft round our fhores; and, when compelled by fevere froft, betake themfelves to our lakes and rivers. Of the web-footed fowl there are fome of hardier conftitutions than others: thefe endure the ordinary winters of the more northern countries; but when the cold reigns there with more than common rigour, repair for fhelter to thefe kingdoms: this regulates the appearance of fome of the diver kind, as alfo of the wild fwans, the fwallow-tailed fhield-duck, and the different forts of goofeanders which then vifit our coafts. Barentz found the barnacles with their nefts in great numbers in Nova Zembla. *Collect. Voy. Dutch Eaft-India Company*, 8vo. 1703. p. 19. Clufius, in his *Exot.* 368. alfo obferves, that the Dutch difcovered them on the rocks of that country and in Waygate Straits. They, as well as the other fpecies of wild-geefe, go very far north to breed, as appears from the hiftories of Greenland and Spitzbergen, by Egede and Crantz. Thefe birds feem to make Iceland a refting place, as Horrebow obferves: few continue there to breed, but only vifit that ifland in the fpring, and after a fhort ftay retire ftill further north.

30. *Corvorants*. The corvorant and fhag breed on moft of our high rocks: the gannet in fome of the Scotch ifles, and on the coaft of Kerry: the two firft continue on our fhores the whole year. The gannet difperfes itfelf all round the feas of Great Britain, in purfuit of the herring and pilchard, and even as far as the Tagus to prey on the fardina.

But of the numerous fpecies of fowl here enumerated, it may be obferved how very few entruft themfelves to us in the breeding feafon, and what a diftant flight they make to perform the firft great dictate of nature.

There feems to be fcarcely any but what we have traced to Lapland, a country of lakes, rivers, fwamps, and alps, covered with thick and gloomy forefts, that afford fhelter during fummer to thefe fowls, which in winter difperfe over the greateft part of Europe. In thofe arctic regions, by reafon of the thicknefs of the woods, the ground remains moift and penetrable to the woodcocks, and other flender-billed fowl: and for the web-footed birds, the waters afford larvæ innumerable of the tormenting knat. The days there are long; and the beautiful meteorous nights indulge them with every opportunity of collecting fo minute a food: whilft mankind is very fparingly fcattered over that vaft northern wafte.

Why then fhould Linnæus, the great explorer of thefe rude defarts, be amazed at the myriads of water-fowl that migrated with him out of Lapland? which exceeded in multitude the army of Xerxes; covering, for eight whole days and nights, the furface of the river Calix. His partial obfervation as a botanift, would confine their food to the vegetable kingdom, almoft denied to the Lapland waters; inattentive to a more plenteous table of infect-food, which the all-bountiful Creator had fpread for them in the wildernefs. It may be remarked, that the lakes of mountainous rocky countries in general are deftitute of plants: few or none are feen on thofe of Switzerland; and Linnæus

makes

makes the fame obfervation in refpect to thofe of Lapland; having, during his whole tour, difcovered only a fingle fpecimen of a *lemna trifulca*, or "ivy-leaved duck's meat," *Flora Lap.* n° 470.; a few of the *fcirpus lacuftris*, or "bullrufh," n° 18.; the *alopecurus geniculatus*, or "flote foxtail grafs," n° 38.; and the *ranunculus aquatilis*, n° 234.; which are all he enumerates in his *Prolegomena* to that excellent performance.

Under the article Hirundo, we have given the principal arguments for and againft the migration of fwallows. Here we fhall give a fhort abftract of the arguments ufed by the Hon. Daines Barrington againft the migration of birds in general, from a paper publifhed by him in the 62d volume of the Philofophical Tranfactions. This gentleman denies, that any well-attefted inftances can be produced of this fuppofed migration, which, if there were any fuch periodical flight, could not poffibly have efcaped the frequent obfervation of feamen. It has indeed been afferted that birds of paffage become invifible in their flight, becaufe they rife too high into the air to be perceived, and becaufe they choofe the night for their paffage. The author, however, expreffes his doubts "whether any bird was ever feen to rife to a greater height than perhaps twice that of St Paul's crofs;" and he further endeavours to fhew, that the extent of fome of thefe fuppofed migrations (from the northern parts of Europe, for inftance, to the line) is too great to be accounted for, by having recourfe to the argument founded on a nocturnal paffage.

The author next recites, in a chronological order, all the inftances that he has been able to collect, of birds having been actually feen by mariners when they were croffing a large extent of fea; and he endeavours to fhew that no ftrefs can be laid on the few cafual obfervations of this kind that have been produced in fupport of the doctrine of a regular and periodical migration.

Mr Barrington afterwards proceeds to invalidate M. Adanfon's celebrated obfervation with refpect to the migration of the fwallow in particular, and which has been confidered by many as perfectly decifive of the prefent queftion. He endeavours to fhew that the four fwallows which that naturalift caught, on their fettling upon his fhip, on the 6th of October at about the diftance of 50 leagues from the coaft of Senegal, and which he fuppofes to have been then proceeding from Europe to pafs the winter in Africa, could not be true European fwallows; or, if they were, could not have been on their return from Europe to Africa. His objections are founded principally on fome proofs which he produces of M. Adanfon's want of accuracy on this fubject, which has led him, in the prefent inftance, to miftake two African fpecies of the fwallow-tribe, defcribed and engraved by Briffon, for European fwallows, to which they bear a general refemblance: or granting even that they were European fwallows, he contends, that they were flitting from the Cape de Verd Iflands to the coaft of Africa; "to which fhort flight, however, they were unequal, and accordingly fell into the failor's hands."

After many obfervations and reflections on the fubject, the author endeavours to fupport the opinion that fwallows, and perhaps fome other fuppofed birds of paffage, remain with us during the winter in a torpid ftate; obferving that, notwithftanding the great care which they take to conceal themfelves, it is certain that they have been frequently found, during the period of their fuppofed abfence, lying hid in caverns, or hollow trees, and even under water. Befides other inftances, well known to thofe who have attended to this fubject, the author gives us the teftimony of Mr Stephens A. S. S. who affured him that he had himfelf picked up a clufter of three or four fwallows (or martins) out of a pond of his father's at Shrivenham in Berkfhire, in the month of February; that they were caked together in the mud; and that, on carrying them into the kitchen, they foon flew about the room, in the prefence of his father, mother, and others. The fame fact was afterwards confirmed to the author by Dr Pye, who was then Mr Stephens's fchool-fellow at Shrivenham, and by another gentleman who now lives in that village.

It may naturally be afked, why fwallows, in particular, are not frequently thus found in their torpid ftate. In anfwer to this queftion the author obferves, that the fame inftinct which prompts the bird thus to conceal itfelf, inftructs it to choofe fuch a place of fecurity, that common accidents will not difcover it;—that ponds are feldom cleaned in the winter, as it is fuch cold work for the labourers;—that facts of this fort are little attended to; and that the common labourers who have the beft chance of finding torpid birds, make no mention of the difcovery to others, as they confider it as a thing of courfe, and confequently not interefting to any one. He adds, that fwallows may be conftantly taken in the month of October, and even fo late as November, during the dark night, while they fit on the willows in the Thames; and that one may almoft inftantaneoufly fill a large fack with them, becaufe at this time they will not ftir from the twigs when you lay your hands upon them. This, fays the author, looks very much like their beginning to be torpid, before they hide themfelves under the water.

To this argument, however, the monthly reviewers oppofe the following, which appears to them decifive in favour of migration. The fwallow, it is fuppofed, like other birds, moults once a-year at leaft: but during the whole time this bird is feen with us, it appears in full feather. The procefs of moulting, therefore, muft be performed fomewhere: but as it is abfurd to fuppofe that this great change can be effected in thefe birds while they are lying afleep, or torpid in caverns and hollow-trees, or immerfed in clufters in the mud at the bottom of ponds or rivers, they muft moult in fome diftant country, to which they retire when they difappear in thefe parts.

Migration *of Fifhes*. See Clupea.

St MIGUEL, one of the Azore iflands, fituated in W. Long. 22. 45, N. Lat. 38. 10. This ifland appears to be entirely volcanic. The beft account we have of it hath been publifhed in the 68th volume of the Philofophical Tranfactions by Mr Francis Maffon. Acording to him, the productions differ greatly from thofe of Madeira, infomuch that none of the trees of the latter are found here, except the faya: it has a nearer affinity to Europe than Africa. The mountains are covered with the erica vulgaris, and an elegant

 elegant ever-green ſhrub very like a phillyrea, which gives them a moſt beautiful appearance.

It is one of the principal and moſt fertile of the Azorian iſlands, lying nearly eaſt and weſt; its length is about 18 or 20 leagues; its breadth unequal, not exceeding five leagues, and in ſome places not more than two. It contains about 80000 inhabitants.

Its capital, the city of Ponta del Guda, which contains about 12000 inhabitants, is ſituated on the ſouth ſide of the iſland, on a fine fertile, plain country, pretty regularly built; the ſtreets ſtraight, and of a good breadth. It is ſupplied with good water, which is brought about the diſtance of three leagues from the neighbouring mountains. The churches and other religious edifices are elegant and well built for ſuch an iſland. There is a large convent of Franciſcan friars and one of the order of St Auguſtin, four convents for profeſſed nuns, and three Recolhimentos for young women and widows who are not profeſſed. The veſſels anchor in an open road; but it is not dangerous, as no wind can prevent their going to ſea in caſe of ſtormy weather.

The country round the city is plain for ſeveral miles, well cultivated, and laid out with good taſte into ſpacious fields, which are ſown with wheat, barley, Indian corn, pulſe, &c. and commonly produce annually two crops; for as ſoon as one is taken off, another is immediately ſown in its place. The ſoil is remarkably gentle and eaſy to work, being for the moſt part compoſed of pulverized pumice-ſtone. There are in the plains a number of pleaſant country-ſeats, with orchards of orange trees, which are eſteemed the beſt in Europe.

The ſecond town is Ribeira Grande, ſituated on the north ſide of the iſland, containing about as many inhabitants as the city; a large convent of Franciſcan friars, and one of nuns. It gives title to a count, called the *Conde Ribeira Grande*, who firſt inſtituted linen and woollen manufactories in the iſland.

The third town is Villa Franca, on the ſouth ſide of the iſland, about ſix leagues eaſt of Ponta del Guda. It has a convent of Franciſcan friars, and one of nuns, which contains about 300. Here, about half a mile from the ſhore, lies a ſmall iſland (Ilhao), which is hollow in the middle, and contains a fine baſon with only one entrance into it, fit to hold fifty ſail of veſſels ſecure from all weather; at preſent it wants cleaning out, as the winter's rain waſhes down great quantities of earth into it, which has greatly diminiſhed its depth. But veſſels frequently anchor between this iſland and the main.

Beſide theſe towns are ſeveral ſmaller, viz. Alagoa, Agoa de Pao, Brelanha, Fanaes de Ajuda, and a number of hamlets, called *lugars*, or *places*.

About four leagues north-eaſt from Villa Franca, lies a place called the *Furnas*, being a round deep valley in the middle of the eaſt part of the iſland, ſurrounded with high mountains, which, though ſteep, may be eaſily aſcended on horſeback by two roads. The valley is about five or ſix leagues in circuit. The face of the mountains, which are very ſteep, is entirely covered with beautiful ever-greens, viz. myrtles, laurels, a large ſpecies of bilberry called *uva de ſerra*, &c. and numberleſs rivulets of the pureſt water run down their ſides. The valley below is well cultivated, producing wheat, Indian corn, flax, &c. The fields are planted round with a beautiful ſort of poplars, which grow into pyramidal forms, and by their careleſs, irregular diſpoſition, together with the multitude of rivulets, which run in all directions through the valley, a number of boiling fountains throwing up clouds of ſteam, a fine lake in the ſouth-weſt part about two leagues round, compoſe a proſpect the fineſt that can be imagined. In the bottom of the valley the roads are ſmooth and eaſy, there being no rocks but a fine pulverized pumice-ſtone that the earth is compoſed of.

There are a number of hot fountains in different parts of the valley, and alſo on the ſides of the mountains: but the moſt remarkable is that called the *chaldeira*, ſituated on the eaſtern part of the valley, on a ſmall eminence by the ſide of a river, on which is a baſon about 30 feet diameter, where the water continually boils with prodigious fury. A few yards diſtant from it is a cavern in the ſide of the bank, in which the water boils in a dreadful manner, throwing out a thick, muddy, unctuous water ſeveral yards from its mouth with a hideous noiſe. In the middle of the river are ſeveral places where the water boils up ſo hot, that a perſon cannot dip his finger into it without being ſcalded; alſo along its banks are ſeveral apertures, out of which the ſteam riſes to a conſiderable height, ſo hot that there is no approaching it with one's hand: in other places, a perſon would think that 100 ſmiths bellows were blowing all together, and ſulphureous ſteams iſſuing out in thouſands of places; ſo that native ſulphur is found in every chink, and the ground covered with it like hoar-froſt; even the buſhes that happen to lie near theſe places are covered with pure brimſtone, condenſing from the ſteam that iſſues out of the ground, which in many places is covered over with a ſubſtance like burnt alum. In theſe ſmall caverns, where the ſteam iſſues out, the people often boil their yams.

Near theſe boiling fountains are ſeveral mineral ſprings; two in particular, whoſe waters have a very ſtrong mineral quality, of an acid taſte, and bitter to the tongue.

About half a mile to the weſtward, and cloſe by the river ſide, are ſeveral hot ſprings, which are uſed by ſick people with great ſucceſs. Alſo, on the ſide of a hill weſt of St Ann's church, are many others, with three bathing-houſes, which are moſt commonly uſed. Theſe waters are very warm, altho' not boiling hot; but at the ſame place iſſue ſeveral ſtreams of cold mineral water, by which they are tempered, according to every one's liking.

About a mile ſouth of this place, and over a low ridge of hills, lies a fine lake about two leagues in circumference, and very deep, the water thick, and of a greeniſh colour. At the north end is a plain piece of ground, where the ſulphureous ſteams iſſue out in many places, attended with a ſupriſing blowing noiſe. Our author could obſerve ſtrong ſprings in the lake, but could not determine whether they were hot or cold: this lake ſeems to have no viſible evacuation. The other ſprings immediately form a conſiderable river, called *Ribeira Quente*, which runs a courſe about two or three leagues, thro' a deep rent in the mountains, on each ſide of which are ſeveral places where the ſmoke iſſues

 iſſues out. It diſcharges itſelf into the ſea on the ſouth ſide, near which are ſome places where the water boils up at ſome diſtance in the ſea.

This wonderful place had been taken little notice of until very lately: ſo little curioſity had the gentlemen of the iſland, that ſcarcely any of them had ſeen it, until of late ſome perſons, afflicted with very virulent diſorders, were perſuaded to try its waters, and found immediate relief from them. Since that time it has become more and more frequented; ſeveral perſons who had loſt the uſe of their limbs by the dead palſy have been cured; and alſo others who were troubled with eruptions on their bodies.

A clergyman, who was greatly afflicted with the gout, tried the ſaid waters, and was in a ſhort time perfectly cured, and has had no return of it ſince. When Mr Maſſon was there, ſeveral old gentlemen, who were quite worn out with the ſaid diſorder, were uſing the waters, and had received incredible benefit from them; in particular, an old gentleman, about 60 years of age, who had been tormented with that diſorder more than 20 years, and often confined to his bed for ſix months together: he had uſed theſe waters about three weeks, had quite recovered the uſe of his limbs, and walked about in the greateſt ſpirits imaginable. A friar alſo who had been troubled with the ſaid diſorder about 12 years, and reduced to a cripple, by uſing them a ſhort time was quite well, and went a-hunting every day,

There are ſeveral other hot ſprings in the iſland, particularly at Ribeira Grande; but they do not poſſeſs the ſame virtues, at leaſt not in ſo great a degree.

The eaſt and weſt part of the iſland riſes into high mountains; but the middle is low, interſperſed with round conic hills, all of which have very recent marks of fire; all the parts below the ſurface conſiſting of melted lava lying very hollow.

Moſt of the mountains to the weſtward have their tops hollowed out like a punch-bowl, and contain water. Near the weſt end is an immenſe deep valley, like the Furnas called the *Sete Cidades*. This valley is ſurrounded with very abrupt mountains, about ſeven or eight leagues round; in the bottom is a deep lake of water, about three leagues in circuit, furniſhed with great number of water-fowls. This water has no mineral quality; neither are there any hot ſprings in the valley. All theſe mountains are compoſed of a white crumbly pumice-ſtone, which is ſo looſe, that, if a perſon thruſt a ſtick into the banks, whole waggon-loads of it will tumble down. The inhabitants of the iſland relate a ſtory, that he who firſt diſcovered it obſerved an extraordinary high peak near the weſt end; but the ſecond time he viſited it, no ſuch peak was to be ſeen, which he ſuppoſed muſt have certainly ſunk;—but, however improbable this ſtory may be, at ſome period or another it muſt have certainly been the caſe.

MILAN, or the duchy of the Milaneſe, a country of Italy, bounded on the weſt by Savoy, Piedmont, and Montferrat; by Switzerland on the north; by the territories of Venice, the duchies of Mantna, Parma, and Placentia, on the eaſt; and by the territories of Genoa on the ſouth. Anciently this duchy, containing the north part of the Old Liguria, was called *Injubria*, from its inhabitants the *Inſubres;* who were conquered by the Romans, as theſe were by the Goths; who in their turn were ſubdued by the Lombards. Didier, the laſt king of the Lombards, was taken priſoner by Charlemagne, who put an end to the Longobardic empire, and appointed governors of Milan. Theſe governors, being at a diſtance from their maſters, ſoon began to aſſume an independency, which brought a dreadful calamity on the country; for, in 1152, the capital itſelf was levelled with the ground by the emperor Frederic Barbaroſſa, who committed great devaſtations otherwiſe throughout the duchy. Under this emperor lived one Galvian, a nobleman who was deſcended from Otho a Milaneſe. Galvian, along with William prince of Montferrat, ſerved in the cruſade, when Godfrey of Boulogne took Jeruſalem: he killed in ſingle combat the Saracen general, whom he ſtripped of his helmet, which was adorned with the image of a ſerpent ſwallowing a youth; and this ever afterwards was the badge of that family. His grandſon Galvian, having oppoſed the emperor, was taken priſoner, and carried in irons into Germany, from whence he made his eſcape, and returning to Milan, died in the ſervice of his country. From him deſcended another Otho, at the time that Otho IV. was emperor of Germany, and who ſoon diſtinguiſhed himſelf by the accompliſhments both of his mind and body. When he grew up, he was received into the family of cardinal Octavian Ubaldini at Rome. This prelate, who was himſelf aſpiring at the popedom, was in a ſhort time greatly taken with the addreſs and accompliſhments of young Otho, and predicted his future greatneſs. In the mean time, one Torreſs, or Torriano, a Milaneſe nobleman of unbounded ambition, was attempting to make himſelf maſter of Milan. The popular faction had ſome time before been caballing againſt the nobility; and at laſt, Torriano, putting himſelf at their head, expelled the biſhop, and put to death or baniſhed all the nobility: by which means the popular government was fully eſtabliſhed; and Torriano, under this pretence, ruled every thing as he pleaſed. He was, however, ſoon oppoſed by one Franciſco Sepri, who formed a great party, pretending to deliver the city from Torriano's haughtineſs and cruelty. But while the two parties were collecting their forces againſt each other, cardinal Ubaldini was projecting the deſtruction of both, by means of his favourite Otho. This prelate had for ſome time borne an implacable hatred to Torriano, becauſe he had been by him prevented from carrying out of the treaſury of St Ambroſe's church at Milan, a carbuncle or jewel of great value, which he pretended to reſerve for adorning the papal tiara; for which reaſon he now determined to oppoſe his ambition.

Ubaldini began with naming Otho archbiſhop of Milan; which, as the pope's legate, he had a right to do. This nomination was confirmed by Pope Urban IV.; and the party of the nobility having now got a head from the pope himſelf, began to gather ſtrength. Otho in the mean time employed himſelf in collecting troops; and had no ſooner procured a ſhew of an army, than he advanced towards Lago Maggione, and took poſſeſſion of Arona, a ſtrong poſt near that lake: but Torriano, marching immediately

againſt

againſt him with all his troops, obliged him to abandon the place, and leave his party to make the beſt terms they could with the conqueror. This was followed by the deſtruction of the caſtles of Arona, Anghiari, and Brebia: ſoon after which Torriano died; and was ſucceeded by his brother Philip, who had ſufficient intereſt to get himſelf elected podeſta, or prætor of Milan, for ten years. During his lifetime, however, the party of the nobility increaſed conſiderably under Otho, notwithſtanding the check they had received. Philip died in 1265, having loſt ground conſiderably in the affections of the people, though he obtained a great reputation for his courage and conduct. His ſucceſſor Napi rendered himſelf terrible to the nobility, whom he proſcribed, and put to death as often as he could get them into his power. He proceeded ſuch lengths, and acted with ſuch fury againſt that unfortunate party, that pope Clement IV. who had ſucceeded Urban, at laſt interdicted Milan, and excommunicated Napi and all his party. By this Napi began to loſe his popularity, and the public diſaffection towards him was much heightened by the natural cruelty of his temper. But in the mean time, the party of the nobility was in the utmoſt diſtreſs. Otho himſelf and his friends, having ſpent all their ſubſtance, wandered about from place to place; the pope not being in a capacity of giving them any aſſiſtance. Otho, however, was not diſcouraged by his bad ſucceſs, but found means ſtill to keep up the ſpirits of his party, who now choſe for their general Squarcini Burri, a man of great eminence and courage, whoſe daughter was married to Matthew Viſconti, afterwards called *Matthew the Great.* At the ſame time they renewed their confederacy with the marquis of Montferrat, who was ſon-in-law to the king of Spain. The marquis agreed to this confederacy chiefly with a view to become maſter of the Milaneſe.

The nobility now again began to make head; and having collected an army, which was joined by 600 Spaniſh cavalry and a body of foot, gained ſome advantages. But in the mean time Napi, having gathered together a ſuperior army, ſuddenly attacked Otho and Burri, and defeated them. After this diſaſter Otho applied to the pope; from whom, however, he did not obtain the aſſiſtance he deſired; and in the mean time Napi invited the emperor Rodolph into Italy, with the promiſe of being crowned at Milan. This invitation was accepted of with great readineſs by Rodolph; who conſtituted Napi his governor and vicar-general in Lombardy, ſending to him at the ſame time a fine body of German horſe, the command of which was given to Caſſoni, Napi's nephew. On this Otho again applied to the pope, (Gregory X.): but he was ſo far from granting him any aſſiſtance, that he is ſaid to have entered into a ſcheme of aſſaſſinating him privately; but Otho eſcaped the danger, and in 1276 began to recover his affairs. The reaſon of pope Gregory's enmity to him was, that he and his party were thought to be Gibelines, and were oppoſed by great numbers of the nobility themſelves; but after that pope's death, the Milaneſe exiles being united under one head, ſoon became formidable. They now choſe for their general Godfrey count of Languſio, a noble Pavian, and an inveterate enemy of the Torriano family. This nobleman being rich and powerful, enliſted many German and other mercenaries, at whoſe head he marched towards the Lago Maggiore. All the towns in that country opened their gates to him through the intereſt of the Viſconti family, who reſided in theſe parts. But this ſucceſs ſoon met with a ſevere check in an unfortunate engagement, wherein Godfrey was defeated and taken priſoner; after which he and 34 nobles had their heads ſtruck off, and ſent from the field of battle piled up in a common waggon.

This defeat greatly affected Otho; but having in a ſhort time recovered himſelf, he again attacked his enemies, and defeated them; but, ſuffering his troops to grow remiſs after their victory, the fugitives rallied, and entirely defeated him. The next year, however, Otho had better ſucceſs, and totally defeated and took priſoner Napi himſelf. After this victory Caſſoni was obliged to abandon Milan to his competitor, who kept poſſeſſion of it till his death, which happened in 1295, in the 87th year of his age.

Otho was ſucceeded by Matthew Viſconti abovementioned; and Milan continued in ſubjection to that family without any very memorable occurrence, till the year 1378, when, by the death of Galeazzo II. his brother Barnabo became ſovereign of Milan. He was of a brave and active diſpoſition; but exceſſively profuſe in his expences, as his brother Galeazzo had alſo been; and, to procure money to ſupply his extravagancies, was obliged to oppreſs his ſubjects. Galeazzo had engaged in an enterpriſe againſt Bologna, and the ſiege of it was continued by Barnabo. It laſted for nine years, and during this time is ſaid to have coſt 300 millions of gold, a prodigious ſum in thoſe days, near 40 millions ſterling; the loweſt gold coin being in value ſomewhat more than half-a-crown Engliſh. Both the brothers were exceſſively fond of building. Barnabo erected a bridge over the Adda, conſiſting of three ſtories, the loweſt for chariots and heavy carriages, the middle for horſes; and the uppermoſt for foot-paſſengers. He built alſo another bridge which was carried over houſes without touching them. To accompliſh theſe, and many other expenſive ſchemes, he became one of the greateſt tyrants imaginable, and every day produced freſh inſtances of his rapacity and cruelty. He inſtituted a chamber of inquiry, for puniſhing all thoſe who had for five years before been guilty of killing boars, or even of eating them at the table of another. They who could not redeem themſelves by money were hanged, and above 100 wretches periſhed in that manner. Thoſe who had any thing to loſe were ſtripped of all their ſubſtance, and obliged to labour at the fortifications and other public works. He obliged his ſubjects to maintain a great many hunting-dogs, and each diſtrict was taxed a certain number. The overſeers of his dogs were at the ſame time the inſtruments of his rapacity. When the dogs were poor and ſlender, the owners were always fined; but when the dogs were fat, the owners were alſo fined, for ſuffering them to live without exerciſe.

The extravagant behaviour of Barnabo ſoon rendered public affairs ready for a revolution, which was at laſt accompliſhed by his nephew John Galeazzo. He affected a ſolitary life, void of ambition, and even incling to devotion; but at the ſame time took care to have his uncle's court filled with ſpies, who gave him

Milan. him information of all that paffed. He reduced his table and manner of living, pretending that he took thefe fteps as preparatives to a retirement from the world, which was foon to take place, after he had paid a religious vow. In fhort, he acted his part fo well, that even Barnabo, though abundantly cautious, had no fufpicion of his having any defigns againft him; and fo entirely did he conceal his ambition, that he feveral times made application to his uncle for his intereft to procure him a quiet retreat as foon as his religious vows were performed. One of thefe was to pay a vifit to the church of the bleffed Virgin upon mount Varezzio. This was to be done with fo much fecrecy that all kinds of eye-witneffes were to be excluded; and it was with difficulty that Barnabo himfelf and two of his fons were allowed to accompany our devotee. But, in the mean time, the hypocritical Galeazzo had foldiers advancing from all quarters, fo that Barnabo and his fons were immediately feized, and the houfes of thofe who had fided with them given up to be plundered. The booty in plate, money, and all kinds of rich furniture, was immenfe. The minifters of the late government were dragged from their hiding-places, and put to death; and at laft the citadel itfelf fell into the hands of Galeazzo, who found in it an immenfe fum of money. Barnabo was carried prifoner to Tritici, a caftle of his own building, where he had the happinefs to find one perfon ftill faithful to him. This was his miftrefs, named *Doninia Porra;* who, when he was abandoned by all the world, fhut herfelf up a voluntary prifoner in his chamber, and remained with him as long as he lived, which was only feven months after his degradation.

John Galeazzo was the firft who took upon him the title of the *duke of Milan*, and was a prince of great policy and no lefs ambition. He made war with the Florentines, became mafter of Pifa and Bologna, and entirely defeated the emperor in 1401, fo that he entertained hopes of becoming mafter of all Lombardy, and cutting off all poffibility of invading it either from France or Germany; but his defigns were fruftrated by death, which happened in 1402, in the 55th year of his age. After his deceafe the Milanefe government fell into the moft violent diftractions, fo that it could not be fupported, even in time of peace, without an army of 20,000 foot and as many horfe. In the year 1421, however, Philip duke of Milan became mafter of Genoa; but though he gained great advantages in all parts of Italy, the different ftates ftill found means to counterbalance his fucceffes, and prevent him from enflaving them: fo that Milan never became the capital of any extenfive empire; and in 1437 Genoa revolted, and was never afterwards reduced.

Philip died in 1448, and by his death the male line of the Vifconti family was at an end. The next lawful heir was Valentina his fifter, who had married the duke of Orleans fon to Charles V. of France. By the contract of that marriage, the lawful progeny of it was to fucceed to the duchy of Milan in failure of the heirs-male of the Vifconti family; but this fucceffion was difputed by Sforza, who had married Philip's natural daughter. It is certain, however, that the rightful fucceffion was vefted in the houfe of Orleans and the kings of France; and therefore though the Sforza family got poffeffion of the duchy for the prefent, Lewis XII. afterwards put in his claim, as being grandfon to John Galeazzo. For fome time he was fuccefsful; but the French behaved in fuch an infolent manner, that they were driven out of the Milanefe by the Swifs and Maximilian Sforza. The Swifs and Milanefe were in their turn expelled by Francis I. who obliged the Sforza family to relinquifh the government for a penfion of 30,000 ducats a-year. Francis Sforza, the fon of Maximilian, however, being affifted by the emperor and the pope, regained the poffeffion of the Milanefe about the year 1521; and, eight years after, the French king, by the treaty of Cambray, gave up his claim on the duchy.

But, in fact, the emperors of Germany feem to have had the faireft title to the Milanefe in right of their being for a long time fovereigns of Italy. On the death of Francis Sforza, therefore, in the year 1536, the emperor Charles V. declared the Milanefe to be an imperial fief, and granted the inveftiture of it to his fon Philip II. king of Spain. In his family it continued till the year 1706, when the French and Spaniards were driven out by the imperialifts, and the emperor again took poffeffion of it as a fief. It was confirmed to his houfe by the treaty of Baden in 1714, by the quadruple alliance in 1718, and by the treaty of Aix la Chapelle in 1748.

The duchy of Milan is one of the fineft provinces in Italy. It is bounded on the fouth by the Appenine mountains, and the territory of Genoa; on the north by Switzerland; on the eaft by the Venetian territories, and the duchies of Mantua, Parma, and Placentia; and on the weft by Savoy, Piedmont, and Montferrat; extending from north to fouth about 100 miles, and from eaft to weft about 108. It is well watered by the Teffino, the Sefia, the Adda, the Po, the Oglio, the Lombro, Serio, &c. and alfo by feveral canals and lakes. Of the latter the Lago Maggiore is between 30 and 40 miles in length, and in fome places fix or feven miles broad. In it lie the *Boromean iflands*, as they are called, viz. Ifola Bella and Ifola Madre, the beauty of which almoft exceeds imagination: art and nature feem to have vied with one another in embellifhing them. In each of them is a palace with delicious gardens, belonging to the Boromean family. The water of the lake is clear and of a greenifh colour, and abounds with fifh. The hills with which it is furrounded prefent a moft charming landfcape, being planted with vines and chefnut-trees, interfperfed with fummer-houfes. There is a canal running from it towards Switzerland, with which the city of Milan has a communication. It was anciently called *Lacus Verbanus*. The Lago de Como, which was called by the Latin poets *Lacus Larius*, but had its modern name from the city, near which it lies, extends itfelf about 30 miles northward from Como, but its greateft breadth is not above five miles. From the Lago Maggiore iffues the Teffino; and from that of Como the Adda. Of the other lakes, that of Lugano and Guarda are the chief: that of Guarda was anciently called *Benacus*.

The trade and manufactures of this duchy confift principally in filks, ftuffs, ftockings, gloves, and handkerchiefs, linen and woollen cloth, hardware, curious works

works of cryftal, agate, hyacinths, and other gems; but their exports are ufually far fhort of their imports.

As to the revenue of the duchy, it muft without doubt be very confiderable. It is faid to have amounted to 2,000,000 of dollars while the duchy was in the hands of the Spaniards.

In the year 1767, the Auftrian government of Milan publifhed a law, by which all the rights which the pope or the bifhops had till then exercifed over ecclefiaftics, either with regard to their effects or perfons, is transferred to a council eftablifhed for that purpofe at Milan. By the fame edict, all ecclefiaftics were obliged to fell the eftates which they had become poffeffed of fince the year 1722; and no fubject, whether ecclefiaftic or fecular, was to go to Rome to folicit any favour, except letters of indulgence, without the confent of the faid council.

Milan, the capital of the duchy of that name, in Latin *Mediolanum*, is a very large city, and has a wall and rampart round it, with a citadel; yet is thought to be incapable of making any great refiftance. The gardens within the city take up a great deal of ground. In the citadel is a foundery for cannon, and an arfenal furnifhed with arms for 12,000 men. The governor of it is quite independent of the governor-general of the Milanefe, who refides in the city, in a large, but old and ill-contrived palace. The yearly income of the governor of Milan is faid to be 200,000 guilders. The council belonging to the city is compofed of a prefident and 60 doctors of law, who are all nobles, and independent of the governor-general. Milan hath experienced a great variety of fortune, having been fubject fometimes to the French, fometimes to the Spaniards, and fometimes to the Germans. A great number of perfons of rank and fortune live in it, efpecially during the winter. The ladies in France are not allowed more liberty than thofe of this city: even the aufterities of the monaftic life are fo far mitigated here, that gentlemen have not only the liberty of talking with the nuns, and of rallying and laughing at the grate, but alfo of joining with them in concerts of mufic, and of fpending whole afternoons in their company. The place where the *beau monde* take the air, either in their coaches or on foot, is the rampart betwixt the Porta Orientale, and the Porta Tofa, where it is ftraight and broad, and extremely pleafant, being planted with white mulberry-trees, and commanding a profpect on one fide of the open country, and on the other of the gardens and vineyards between the ramparts and the city. Milan, which is faid to have been built by the Gauls about 200 years after the foundation of Rome, contains a great number of ftately edifices, as churches, convents, palaces, and hofpitals. The cathedral is a vaft pile, all of marble; and though fomething has been doing for near 400 years towards the outward or inward ornament thereof, it is not yet finifhed. Of the great number of ftatues about it, that of St Bartholomew, juft flead alive, with his fkin hanging over his fhoulders, and of Adam and Eve, over the main portal, are the fineft. The pillars fupporting the roof of the church are all of marble, and the windows finely painted. This church contains a treafure of great value, particularly a fhrine of rock-cryftal, in which the body of St Charles Boromæo is depofited. The other churches moft worthy a ftranger's notice are thofe of St Alexander, St Jerom, St Giovanni di Cafarotti della Paffione, that of the Jefuits, and of St Ambrofe, in which lie the bodies of the faint, and of the kings Pepin and Bernard. In the Ambrofian college, founded by Frederic Boromæo, 16 profeffors teach gratis. In the fame college is alfo an academy of painting, with a mufæum, and a library, containing a vaft number of printed books and manufcripts; among the laft of which is a tranflation of Jofephus's Hiftory of the Jews, done by Rufinus about 1200 years ago, and written on the bark of a tree; St Ambrofe's works on vellum, finely illuminated; the orations of Gregory Nazianzen, and the works of Virgil, in folio, with Petrarch's notes. In the mufæum are Leonardi da Vinci's mathematical and mechanical drawings, in 12 large volumes. The feminary for fciences, the college of the nobles, the Helvetian college, and the mathematical academy, are noble foundations, and ftately buildings. Of the hofpitals, the moft remarkable are the Lazaretto, and that called the *great hofpital;* the latter of which receives fick perfons, foundlings, and lunatics, and has fix fmaller hofpitals depending on it, with a revenue of 100,000 rixdollars. The number of the inhabitants of this city is faid to be about 250,000. It has been 40 times befieged, taken 20 times, and four times almoft entirely demolifhed; yet it hath always recovered itfelf. It is faid that gunpowder is fold here only by one perfon, and in one place. The court of inquifition is held in the Dominican convent, near the church of Madonna della Gratia. The houfes of entertainment, and the ordinaries here, are reprefented as very indifferent. Mr Keyfler fays, it is not unufual for young travellers, when they go to any of the taverns in Milan, to be afked, "whether they choofe a *letto fornito*, or female bed-fellow," who continues mafked till fhe enters the bed-chamber. Deformed dwarfs, and people with wens, fome of them of a prodigious fize, are very common in the ftreets of Milan. The wens are faid to be hereditary. The common method of burying here is, to throw the corpfes into vaults, without coffins, to the amount of two or three hundred, which cannot fail to fill the air in thefe places with noxious effluvia. Mr Keyfler tells us, that when he was at Milan, goods of any kind might have been brought into the city without fearch or inquiry, provided a fmall gratuity was given to the officer. Milan is far fhort of Turin both in beauty and conveniency, many of the ftreets being crooked and narrow, and paper-windows much more frequent than in that city; even in grand palaces, the windows are often compofed promifcuoufly of glafs and paper. It is not uncommon here for beggars, when they afk alms, to hold out to you a difh, in which is a human fkull. Two large canals extend from hence, the one to the Teffino, and the other to the Adda; the Teffino having a communication with the Lago Maggiore, and, by a canal, with the Sefia; and the Adda iffuing from the Lago di Como, and having a communication by canals with the Lambro and Serio. In a void fpace in one of the ftreets of Milan, where ftood the houfe of a barber who had confpired with the commiffary of health to poifon his fellow-citizens, is erected a pillar called *Colonna Infame*, with an infcription to perpetuate the memory of of the execrable defign. The environs of this city are very pleafant, being adorned with beautiful feats, gardens, orchards, &c. About two Italian miles from it, at the feat of the Simonetti family, is a building, that would have been a mafter-piece of its kind had the architect defigned it for an artificial echo. It will return or repeat the report of a piftol above 60 times; and any fingle mufical inftrument, well touched, will have the fame effect as a great number of inftruments, and produce a moft furprifing and delightful concert. E. Long. 15. 35. N. Lat. 38. 32.

MILBORN-PORT, a town of Somerfetfhire in England, feated on a branch of the river Parret, and fends two members to parliament. W. Long. 2. 28. N. Lat. 51. 5.

MILDEW is faid to be a kind of thick, clammy, fweet juice, exhaled from, or falling down upon, the leaves and bloffoms of plants. By its thicknefs and clamminefs it prevents perfpiration, and hinders the growth of the plant. It fometimes refts on the leaves of trees, in form of a fatty juice, and fometimes on the ears of corn. It is naturally very tough and vifcous, and becomes ftill more fo by the fun's heat exhaling its more fluid parts; by which means the young ears of corn are fo daubed over, that they can never arrive at their full growth. Bearded wheat is lefs fubject to the mildew than the common fort; and it is obferved, that newly-dunged lands are more liable to mildew than others. The beft remedy is a fmart fhower of rain, and immediately afterwards a brifk wind. If the mildew is feen before the fun has much power, it has been recommended to fend two men into the field with a long cord, each holding one end, and drawing this along the field through the ears, the dew will be diflodged from them, before the heat of the fun is able to dry it to that vifcous ftate in which it does the mifchief. Some alfo fay, that lands which have for many years been fubject to mildews, have been cured of it by fowing foot along with the corn, or immediately after it.

Mr J. S. Segar, the author of a treatife upon this fubject, obferves, that the mildew is of fuch a fharp corrofive nature, that it raifes blifters on the feet of the fhepherds who go barefoot, and even confumes the hoofs of the cattle. He fufpects that it poffeffes fome arfenical qualities, though he does not pretend to affirm this pofitively. Its pernicious influence, according to him, is rendered ftill more powerful by a variety of circumftances; fuch as fending the cattle into the fields too early in the fpring; their drinking water mixed with ice, or but lately thawed; their being kept in ftables that are too clofe and filthy, and which are not fufficiently aired. The fame author confiders the mildew as a principal caufe of epidemical diftempers among the cattle. The mildew producing thefe difeafes, he fays, is that which dries and burns the grafs and leaves. It falls ufually in the morning, particularly after a thunder-ftorm. Its poifonous quality (which does not continue above 24 hours) never operates but when it has been fwallowed immediately after its falling. The diforder attacks the ftomach, is accompanied with pimples on the tongue, lofs of appetite, a deficcation of the aliments in the ftomach, a cough, and difficulty of refpiration. As a prefervative, the author prefcribes purging in fpring and in winter. The medicine he advifes is compofed of 30 grains of fulphur of antimony, and 60 grains of refin of jalap. He is againft vomiting, and every thing that is of a heating nature.

MILE, a meafure of length or diftance, containing eight furlongs. The Englifh ftatute-mile is 80 chains, or 1760 yards; that is, 5280 feet.

We fhall here give a table of the miles in ufe among the principal nations of Europe, in geometrical paces, 60,000 of which make a degree of the equator.

	Geometrical paces.
Mile of Ruffia	750
of Italy	1000
of England	1200
of Scotland and Ireland	1500
Old league of France	1500
The fmall league, *ibid.*	2000
The mean league, *ibid.*	2500
The great league, *ibid.*	3000
Mile of Poland	3000
of Spain	3428
of Germany	4000
of Sweden	5000
of Denmark	5000
of Hungary	6000

MILETUS (anc. geogr.), a town of Crete mentioned by Homer; but where fituate does not appear. It is faid to be the mother-town of Miletus in Caria, whither a colony was led by Sarpedon, Minos's brother, (Ephorus, quoted by Strabo). *Milefii*, the people, (Ovid).

MILETUS (anc. geogr.), the capital of Ionia, formerly a leading and principal town in the arts of war and peace, (Mela); of great antiquity, (Nonnus); built by Miletus the companion of Bacchus, (Apollodorus); famous above all for its colonies, (Herodotus, Strabo). The only town that made head againft Alexander, and with much difficulty taken, (Arrian). The country of Thales, one of the feven wife men, and the firft who applied himfelf to the ftudy of nature. It was alfo the country of Anaximander, the fcholar and fucceffor of Thales, the inventor of fun-dials and the gnomon, and the firft that publifhed a geographical map; of Anaximenes, fcholar and fucceffor to the foregoing; and of other great men. It was famous for its excellent wool, according to Virgil. *Milefii*, the people; who, from being powerful, becoming afterwards opulent and abandoned to pleafures, loft both their riches and their power.

MILFOIL, or YARROW. See ACHILLEA.

MILFORD-HAVEN, one of the fineft harbours in Europe, and indifputably the beft in Britain, is fituated in Pembrokefhire in South-Wales, and lies on the north fide of the Briftol Channel. It is very large, fafe, and deep; there is no danger of going in or out with the tide, or almoft with any wind. If a fhip comes in without a cable or anchor, fhe may run afhore on the ooze, and there lie fafe till fhe is refitted; and in an hour's time fhe may get out of the harbour into the open fea. It lies extremely convenient for fhips bound from the Englifh or Briftol Channels to Ireland, or farther weft, and from thence to the Channels. It is faid, that 1000 fail of any fize may ride secure in this haven. Yet Dr Campbell informs us, that, in some places, even this singular and wonderful haven is not safe. As, for instance, in Nangle-road, in Milford-haven, at about half-flood, all Nangle-flutch is covered; about the middle of which flutch or ooze there lie a parcel of straggling stones called the *Oyster-rocks;* most of them loose, and about four feet high, which renders the place very dangerous for ships which are obliged to run in there when it blows too hard in the road; and the more so, because they do not appear at low-water neap-tides, being quarter-tide stones. These, and some others on Nangle-point, may be removed at the expence of 100l.; but though the improvement and fortification of Milford-haven have been much talked of, and even a large sum granted by parliament for that purpose, very little hath been done, and it still continues in a great measure neglected. The pier, which lies now in ruins, would be very useful if repaired. In the time of queen Elizabeth, before the Spanish invasion, there were two forts begun at the entrance of Milford, one on each side, as may be seen in Speed's maps, called *Nangle* and *Dale Block-houses;* but they were never finished. The situation of these block-houses was very ill chosen, since a vessel being obliged to bring-to before she has well entered the mouth of the haven, may either drive ashore on the rocks, or miss the harbour. A small fort might be built on the Stack, and another on Sandy-haven Point, which would command the entrance of Milford-haven, and not be liable to the former objection, or in any way prejudice the shipping. Pennamouth is the opening of that branch of the haven upon which the town of Pembroke lies, where the custom-house of Milford is kept. The entrance, or breadth from rock to rock, is but 200 yards at high-water, and 112 at low-water, and from 9 to 12 feet deep. The navigation up this river to Pembroke-town is much impeded by the rubbish of the limestone-quarries being thrown into the river; which ought to be prevented, or the place will in time be stopped up. Within Pennamouth a dock might be made, which would contain all the shipping in England, and which would be the greatest thing of the kind in the whole world. Milford-haven contains five large bays, 13 good roads, and 16 safe creeks.

MILIARY, in general, something resembling millet-seed.

MILIARY *Fever*. See MEDICINE, n° 336.

MILITANT, or CHURCH-MILITANT, denotes the body of Christians while here on earth.

MILITARY, something belonging to the soldiery or militia.

MILITARY-*Discipline*, the training of soldiers, and the due enforcement of the laws and regulations instituted by authority for their conduct.

Next to the forming of troops, military discipline is the first object that presents itself to our notice: it is the soul of all armies; and unless it be established amongst them with great prudence, and supported with unshaken resolution, they are no better than so many contemptible heaps of rabble, which are more dangerous to the very state that maintains them, than even its declared enemies.

MILITARY *Execution*, the ravaging or destroying of a country or town that refuses to pay the contribution inflicted upon them.

MILITARY-*Exercise*. See EXERCISE and WORDS *of Command*.

MILITARY-*State*, in British polity, one of the three divisions of the laity. See LAITY.

This state includes the whole of the soldiery; or such persons as are peculiarly appointed among the rest of the people, for the safeguard and defence of the realm.

In a land of liberty, it is extremely dangerous to make a distinct order of the profession of arms. In absolute monarchies, this is necessary for the safety of the prince; and arises from the main principle of their constitution, which is that of governing by fear: but, in free states, the profession of a soldier, taken singly and merely as a profession, is justly an object of jealousy. In these no man should take up arms but with a view to defend his country and its laws: he puts not off the citizen when he enters the camp; but it is because he is a citizen, and would wish to continue so, that he makes himself for a while a soldier. The laws, therefore, and constitution of these kingdoms, know no such state as that of a perpetual standing soldier, bred up to no other profession than that of war: and it was not till the reign of Henry VII. that the kings of England had so much as a guard about their persons.

In the time of the Anglo-Saxons, as appears from Edward the confessor's laws, the military force of England was in the hands of the dukes or heretochs, who were constituted through every province and county in the kingdom; being taken out of the principal nobility, and such as were most remarkable for being *sapientes, fideles, et animosi.* Their duty was to lead and regulate the English armies, with a very unlimited power; *prout eis visum fuerit, ad honorem coronæ et utilitatem regni.* And because of this great power they were elected by the people in their full assembly, or folkmote, in the same manner as sheriffs were elected: following still that old fundamental maxim of the Saxon constitution, that where any officer was entrusted with such power, as, if abused, might tend to the oppression of the people, that power was delegated to him by the vote of the people themselves. So too, among the ancient Germans, the ancestors of our Saxon forefathers, they had their dukes, as well as kings, with an independent power over the military, as the kings had over the civil state. The dukes were elective, the kings hereditary: for so only can be consistently understood that passage of Tacitus, *Reges ex nobilitate, duces ex virtute sumunt.* In constituting their kings, the family or blood-royal was regarded; in choosing their dukes or leaders, warlike merit: just as Cæsar relates of their ancestors in his time, that whenever they went to war, by way either of attack or defence, they elected leaders to command them. This large share of power, thus conferred by the people, though intended to preserve the liberty of the subject, was perhaps unreasonably detrimental to the prerogative of the crown: and accordingly we find a very ill use made of it by Edric duke of Mercia, in the reign of king Edmond Ironside; who, by his office of duke or heretoch, was entitled to a large command in the king's army, and by his repeated treacheries

Military. cheries at laſt transferred the crown to Canute the Dane.

It ſeems univerſally agreed by all hiſtorians, that king Alfred firſt ſettled a national militia in this kingdom, and by his prudent diſcipline made all the ſubjects of his dominion ſoldiers: but we are unfortunately left in the dark as to the particulars of this his ſo celebrated regulation; though, from what was laſt obſerved, the dukes ſeem to have been left in poſſeſſion of too large and independent a power: which enabled duke Harold on the death of Edward the confeſſor, though a ſtranger to the royal blood, to mount for a ſhort ſpace the throne of this kingdom, in prejudice of Edgar Atheling the rightful heir.

Upon the Norman conqueſt, the feodal law was introduced here in all its rigour, the whole of which is built on a military plan. In conſequence thereof, all the lands in the kingdom were divided into what were called knights fees, in number above 60,000; and for every knight's fee a knight or ſoldier, *miles*, was bound to attend the king in his wars, for 40 days in a year; in which ſpace of time, before war was reduced to a ſcience, the campaign was generally finiſhed, and a kingdom either conquered or victorious. By this means the king had, without any expence, an army of 60,000 men always ready at his command. And accordingly we find one, among the laws of William the conqueror, which in the king's name commands and firmly enjoins the perſonal attendance of all knights and others; *quod habeant et teneant ſe ſemper in armis et equis, ut decet et oportet: et quod ſemper ſint prompti et parati ad ſervitium ſuum integrum nobis explendum et peragendum, cum opus adfuerit, ſecundum quod debent de feodis et tenementis ſuis de jure nobis facere.* This perſonal ſervice in proceſs of time degenerated into pecuniary commutations or aids; and at laſt the military part of the feodal ſyſtem was aboliſhed at the Reſtoration, by ſtatute 12 Car. II. c. 24. See Feodal *Syſtem*.

In the mean time we are not to imagine that the kingdom was left wholly without defence in caſe of domeſtic inſurrections, or the proſpect of foreign invaſions. Beſides thoſe who by their military tenures were bound to perform 40 days ſervice in the field, firſt the aſſiſe of arms, enacted 27 Hen. II. and afterwards the ſtatute of Wincheſter, under Edward I. obliged every man, according to his eſtate and degree, to provide a determinate quantity of ſuch arms as were then in uſe, in order to keep the peace; and conſtables were appointed in all hundreds by the latter ſtatute, to ſee that ſuch arms were provided. Theſe weapons were changed, by the ſtatute 4 & 5 Ph. & M. c. 2. into others of more modern ſervice; but both this and the former proviſions were repealed in the reign of James I. While theſe continued in force, it was uſual from time to time for our princes to iſſue commiſſions of array, and ſend into every county officers in whom they could confide, to muſter and array (or ſet in military order) the inhabitants of every diſtrict; and the form of the commiſſion of array was ſettled in parliament in the 5 Hen. IV. But at the ſame time it was provided, that no man ſhould be compelled to go out of the kingdom at any rate, nor out of his ſhire, but in caſes of urgent neceſſity; nor ſhould provide ſoldiers unleſs by conſent of parliament. About the reign of king Henry VIII. and his children, lord-lieutenants began to be introduced, as ſtanding repreſentatives of the crown, to keep the counties in military order; for we find them mentioned as known officers in the ſtatute 4 & 5 Ph. & M. c. 3. tho' they had not been then long in uſe; for Cambden ſpeaks of them in the time of queen Elizabeth as extraordinary magiſtrates, conſtituted only in times of difficulty and danger. Military.

In this ſtate things continued till the repeal of the ſtatutes of armour in the reign of king James I.; after which, when king Charles I. had, during his northern expeditions, iſſued commiſſions of lieutenancy, and exerted ſome military powers which, having been long exerciſed, were thought to belong to the crown, it became a queſtion in the long-parliament, how far the power of the militia did inherently reſide in the king; being now unſupported by any ſtatute, and founded only upon immemorial uſage. This queſtion, long agitated with great heat and reſentment on both ſides, became at length the immediate cauſe of the fatal rupture between the king and his parliament: the two houſes not only denying this prerogative of the crown, the legality of which claim perhaps might be ſomewhat doubtful; but alſo ſeizing into their hands the entire power of the militia, the illegality of which ſtep could never be any doubt at all.

Soon after the reſtoration of king Char. II. when the military tenures were aboliſhed, it was thought proper to aſcertain the power of the militia, to recognize the ſole right of the crown to govern and command them, and to put the whole into a more regular method of military ſubordination: and the order in which the militia now ſtands by law, is principally built upon the ſtatutes which were then enacted. It is true, the two laſt of them are apparently repealed; but many of their proviſions are re-enacted, with the addition of ſome new regulations, by the preſent militia-laws: the general ſcheme of which is to diſcipline a certain number of the inhabitants of every county, choſen by lot for three years, and officered by the lord-lieutenant, the deputy-lieutenants, and other principal landholders, under a commiſſion from the crown. They are not compellable to march out of their counties, unleſs in caſe of invaſion or actual rebellion, nor in any caſe compellable to march out of the kingdom. They are to be exerciſed at ſtated times: and their diſcipline in general is liberal and eaſy; but, when drawn out into actual ſervice, they are ſubject to the rigours of martial law, as neceſſary to keep them in order. This is the conſtitutional ſecurity which our laws have provided for the public peace, and for protecting the realm againſt foreign or domeſtic violence; and which the ſtatutes declare is eſſentially neceſſary to the ſafety and proſperity of the kingdom.

When the nation was engaged in war, more veteran troops and more regular diſcipline were eſteemed to be neceſſary, than could be expected from a mere militia; and therefore at ſuch times more rigorous methods were put in uſe for the raiſing of armies and the due regulation and diſcipline of the ſoldiery: which are to be looked upon only as temporary excreſcences bred out of the diſtemper of the ſtate, and not as any part of the permanent and perpetual laws of the kingdom. For martial law, which is built upon no ſettled principles, but is entirely arbitrary in its deciſions, is, Military. as Sir Matthew Hale obferves, in truth and reality no law, but fomething indulged rather than allowed as a law. The neceffity of order and difcipline in an army is the only thing which can give it countenance; and therefore it ought not to be permitted in time of peace, when the king's courts are open for all perfons to receive juftice according to the laws of the land. Wherefore, Thomas earl of Lancafter being conducted at Pontefract, 15 Edw. II. by martial law, his attainder was reverfed 1 Edw. III. becaufe it was done in time of peace. And it is laid down, that if a lieutenant, or other, that hath commiffion of martial authority, doth in time of peace hang or otherwife execute any man by colour of martial law, this is murder; for it is againft *magna carta*. And the petition of right enacts, that no foldier fhall be quartered on the fubject without his own confent; and that no commiffion fhall iffue to proceed within this land according to martial law. And whereas, after the Reftoration, king Ch. II. kept up about 5000 regular troops, by his own authority, for guards and garrifons; which king James II. by degrees increafed to no lefs than 30,000, all paid from his own civil lift; it was made one of the articles of the bill of rights, that the raifing or keeping a ftanding army within the kingdom in time of peace, unlefs it be with confent of parliament, is againft law.

But as the fafhion of keeping ftanding armies (which was firft introduced by Charles VII. in France, 1445) has of late years univerfally prevailed over Europe, (tho' fome of its potentates, being unable themfelves to maintain them, are obliged to have recourfe to richer powers, and receive fubfidiary penfions for that purpofe), it has alfo for many years paft been annually judged neceffary by our legiflature, for the fafety of the kingdom, the defence of the poffeffions of the crown of Great Britain, and the prefervation of the balance of power in Europe, to maintain even in time of peace a ftanding body of troops, under the command of the crown; who are however *ipfo facto* difbanded at the expiration of every year, unlefs continued by parliament. And it was enacted by ftatute 10 W. III. c. 1. that not more than 12,000 regular forces fhould be kept on foot in Ireland, tho' paid at the charge of that kingdom: which permiffion is extended by ftat. 8. Geo. III. c. 13. to 16,235 men in time of peace.

To prevent the executive power from being able to oppress, fays baron Montefquieu, it is requifite that the armies with which it is entrufted fhould confift of the people, and have the fame fpirit with the people; as was the cafe at Rome, till Marius new-modelled the legions by enlifting the rabble of Italy, and laid the foundation of all the military tyranny that enfued. Nothing then, according to thefe principles, ought to be more guarded againft in a free ftate, than making the military power, when fuch a one is neceffary to be kept on foot, a body too diftinct from the people. Like ours, therefore, it fhould wholly be compofed of natural fubjects; it ought only to be enlifted for a fhort and limited time; the foldiers alfo fhould live intermixed with the people; no feparate camp, no barracks, no inland fortreffes fhould be allowed. And perhaps it might be ftill better, if, by difmiffing a ftated number, and enlifting others at every renewal of their term, a circulation could be kept up between the army and the people, and the citizen and the foldier be more intimately connected together. Military.

To keep this body of troops in order, an annual act of parliament likewife paffes, "to punifh mutiny and defertion, and for the better payment of the army and their quarters." This regulates the manner in which they are to be difperfed among the feveral inn-keepers and victuallers throughout the kingdom; and eftablifhes a law-martial for their government. By this, among other things, it is enacted, that if any officer or foldier fhall excite, or join any mutiny, or, knowing of it, fhall not give notice to the commanding officer, or fhall defert, or lift in any other regiment, or fleep upon his poft, or leave it before he is relieved, or hold correfpondence with a rebel or enemy, or ftrike or ufe violence to his fuperior officer, or fhall difobey his lawful commands; fuch offender fhall fuffer fuch punifhment as a court-martial fhall inflict, tho' it extend to death itfelf.

However expedient the moft ftrict regulations may be in time of actual war, yet, in times of profound peace, a little relaxation of military rigour would not, one fhould hope, be productive of much inconvenience. And, upon this principle, tho' by our ftanding laws (ftill remaining in force, tho' not attended to) defertion in time of war is made felony without benefit of clergy, and the offence is triable by a jury and before the judges of the common law; yet, by our militia-laws beforementioned, a much lighter punifhment is inflicted for defertion in time of peace. So, by the Roman law alfo, defertion in time of war was punifhed with death, but more mildly in time of tranquillity. But our mutiny-act makes no fuch diftinction: for any of the faults abovementioned are, equally at all times, punifhable with death itfelf, if a court-martial fhall think proper. This difcretionary power of the court-martial is indeed to be guided by the directions of the crown; which, with regard to military offences, has almoft an abfolute legiflative power. "His Majefty (fays the act) may form articles of war, and conftitute courts-martial, with power to try any crime by fuch articles, and inflict fuch penalties as the articles direct." A vaft and moft important truft! an unlimited power to create crimes, and annex to them any punifhments not extending to life or limb! Thefe are indeed forbidden to be inflicted, except for crimes declared to be fo punifhable by this act; which crimes we have juft enumerated, and among which, we may obferve, that any difobedience to lawful commands is one. Perhaps in fome future revifion of this act, which is in many refpects haftily penned, it may be thought worthy the wifdom of parliament to afcertain the limits of military fubjection, and to enact exprefs articles of war for the government of the army, as is done for the government of the navy: efpecially as, by our prefent conftitution, the nobility and gentry of the kingdom, who ferve their country as militia officers, are annually fubjected to the fame arbitrary rule during their time of exercife.

One of the greateft advantages of our law is, that not only the crimes themfelves which it punifhes, but alfo the penalties which it inflicts, are afcertained and no-

notorious: nothing is left to arbitrary discretion: the king by his judges dispenses what the law has previously ordained; but is not himself the legislator. How much therefore is it to be regretted, that a set of men, whose bravery has so often preserved the liberties of their country, should be reduced to a state of servitude in the midst of a nation of freemen! for Sir Edward Coke will inform us, that it is one of the genuine marks of servitude, to have the law, which is our rule of action, either concealed or precarious: *Misera est servitus, ubi jus est vagum aut incognitum.* Nor is this state of servitude quite consistent with the maxims of sound policy observed by other free nations. For the greater the general liberty is which any state enjoys, the more cautious has it usually been in introducing slavery in any particular order or profession. These men, as baron Montesquieu observes, seeing the liberty which others possess, and which they themselves are excluded from, are apt (like eunuchs in the eastern seraglios) to live in a state of perpetual envy and hatred towards the rest of the community, and indulge a malignant pleasure in contributing to destroy those privileges to which they can never be admitted. Hence have many free states, by departing from this rule, been endangered by the revolt of their slaves: while, in absolute and despotic governments, where no real liberty exists, and consequently no invidious comparisons can be formed, such incidents are extremely rare. Two precautions are therefore advised to be observed in all prudent and free governments: 1. To prevent the introduction of slavery at all: or, 2. If it be already introduced, not to entrust those slaves with arms; who will then find themselves an overmatch for the freemen. Much less ought the soldiery to be an exception to the people in general, and the only state of servitude in the nation.

Blackst. Comment.

But as soldiers, by this annual act, are thus put in a worse condition than any other subjects; so, by the humanity of our standing laws, they are in some cases put in a much better. By statute 43 Eliz. c. 3. a weekly allowance is to be raised in every county for the relief of soldiers that are sick, hurt, and maimed: not forgetting the royal hospital at Chelsea for such as are worn out in their duty. Officers and soldiers, that have been in the king's service, are by several statutes, enacted at the close of several wars, at liberty to use any trade or occupation they are fit for, in any town in the kingdom (except the two universities), notwithstanding any statute, custom, or charter to the contrary. And soldiers in actual military service may make nuncupative wills, and dispose of their goods, wages, and other personal chattels, without these forms, solemnities, and expences, which the law requires in other cases. Our law does not indeed extend this privilege so far as the civil law, which carried it to an extreme that borders upon the ridiculous: for if a soldier, in the article of death, wrote any thing in bloody letters on his shield, or in the dust of the field with his sword, it was a very good military testament.

MILITARY *Court.* See CHIVALRY (*Court of*).

MILITARY *Tenures.* See TENURE, FEODAL SYSTEM, and KNIGHT.

MILITIA, in general, denotes the body of soldiers, or those who make profession of arms.

In a more restrained sense, militia denotes the trained bands of a town or country, who arm themselves, upon a short warning, for their own defence. So that, in this sense, militia is opposed to regular or stated troops. See MILITARY *State*, and FEODAL *System.*

MILIUM, MILLET; a genus of the digynia order, belonging to the triandria class of plants. There are five species, of which the most remarkable is the panicum or common millet. This is a native of India, but is now commonly cultivated in many parts of Europe as an esculent grain. It rises, with a reed-like stalk, three or four feet high, and channelled: at every joint there is one reed-like leaf, which is joined on the top of the sheath, and embraces and covers that joint of the stalk below the leaf: this sheath is closely covered with soft hairs, but the leaf which is expanded has none. The top of the stalk is terminated by a large loose panicle, which hangs on one side, having a chaffy flower, which is succeeded by a small round seed. There are two varieties; one with white, and the other with black seeds; but they do not differ in any other particular. This plant is greatly cultivated in the oriental countries, and from whence we are annually furnished with it. It is seldom cultivated in Britain but in small gardens, for feeding of poultry, where the seeds generally ripen very well. It is used as an ingredient in puddings, and is by some people greatly esteemed. The seeds must be sown in the beginning of April, upon a warm dry soil, but not too thick, because the plants divide into several branches, and should have much room. When they come up they should be cleaned from weeds; after which they will in a short time get the better of them, and prevent the future growth. In August the seeds will ripen, when the plant most be cut down, and the seeds beaten out as is practised for other grain; but if it is not protected from birds, they will devour it as soon as it begins to ripen.

MILK, a well-known fluid, prepared by nature in the breasts of women, and the udders of other animals, for the nourishment of their young.—According to Dr Cullen, milk is a connecting and intermediate substance between animals and vegetables. It seems immediately to be secreted from the chyle, both being a white liquor of the same consistence: it is most copiously secreted after meals, and of an acescent nature. In most animals who lives on vegetables, the milk is acescent; and it is uncertain, though at the same time no observation proves the contrary, whether it is not so likewise in carnivorous animals. But, whatever be in this, it is certain, that the milk of all animals who live on vegetables is acescent. Milk being derived from the chyle, we thence conclude its vegetable nature; for in those who live on both promiscuously, more milk is got, and more quickly, from the vegetable than the animal food. Milk, however, is not purely vegetable; though we have a vegetable liquor that resembles its taste, consistence, colour, acescency, and the separability of the oily part, viz. an emulsion of the nuces oleosæ and farinaceous substances. But these want the coagulable part of milk, which seems to be of animal-nature, approaching to that of the coagulable lymph of the blood. Milk, then, seems to be of an intermediate nature, between chyle taken

up

Milk.

up from the inteſtines and the fully elaborated animal-fluid.

Its contents are of three kinds: firſt, an oily part, which, whatever may be ſaid concerning the origin of other oils in the body, is certainly immediately derived from the oil of the vegetables taken in, as with theſe it agrees very exactly in its nature, and would entirely if we could ſeparate it fully from the coagulable part. Another mark of their agreemen is the ſeparability, which proves that the mixture has been lately attempted, but not fully performed. 2dly, Beſides this oily, there is a proper coagulable part: And, 3dly, Much water accompanies both, in which there is diſſolved a ſaline ſaccharine ſubſtance. Theſe three can be got ſeparate in cheeſe, butter, and whey; but never perfectly ſo, a part of each being always blended with every other part.

Nothing is more common, from what has been ſaid of its immediate nature, than to ſuppoſe that it requires no aſſimilation; and hence has been deduced the reaſon of its exhibition in the moſt weakly ſtate of the human body. But wherever we can examine milk, we always find that it coagulates, ſuffers a decompoſition, and becomes aceſcent. Again, infants, who feed entirely on milk, are always troubled with eructations, which every body obſerves are not of the ſame quality with the food taken; and therefore it appears, that, like all other food, milk turns naturally aceſcent in the ſtomach, and only enters the chyle and blood in conſequence of a new recompoſition. It approaches then to the nature of vegetable aliment, but is not capable of its noxious vinous fermentation, and therefore has an advantage over it; neither from this quality, like animal-food, is it heating in the ſtomach, and productive of fever; though at the ſame time, from its quantity of coagulable matter, it is more nouriſhing than vegetables.

Milk is the food moſt univerſally ſuited to all ages and ſtates of the body; but it ſeems chiefly deſigned by nature as the food of infants. When animals are in the fœtus-ſtate, their ſolids are a perfect jelly, incapable of an aſſimilatory power. In ſuch ſtate nature has perfectly aſſimilated food, as the albumen ovi in the oviparous, and in the viviparous animals certainly ſomewhat of the ſame kind, as it was neceſſary the veſſels ſhould be filled with ſuch a fluid as would make way for an after-aſſimilation. When the infant has attained a conſiderable degree of firmneſs, as when it is ſeparated from the mother, yet ſuch a degree of weakneſs ſtill remains as makes ſomewhat of the ſame indication neceſſary, it behoves the infant to have an alkaleſcent food ready prepared, and at the ſame time its noxious tendency to be avoided. Milk then is given, which is alkaleſcent, and, at the ſame time, has a ſufficient quantity of acidity to correct that alkaleſcency. As the body advances in growth, and the alkaleſcent tendency is greater, the animal, to obviate that tendency, is led to take vegetable food, as more ſuited to its ſtrength of aſſimilation.

Dr Cullen obſerves, that milk is almoſt ſuited to all temperaments; and it is even ſo to ſtomachs diſpoſed to aceſcency, more than thoſe ſubſtances which have undergone the vinous fermentation; nay, it even cures the heart-burn, checks vinous fermentation, and precipitates the lees, when, by renewal of fermentation, the wine happens to be fouled. It therefore very properly accompanies a great deal of vegetable aliment; although ſometimes its aceſcency is troubleſome, either from a large proportion taken in, or from the degree of it; for, according to certain unaccountable circumſtances, different acids are formed in the ſtomach in different ſtates of the body; in a healthy body, *e. g.* a mild one; in the hypochondriac diſeaſe, one ſometimes as corroſive as the foſſil acid. When the acidity of milk is carried to a great degree, it may prove remarkably refrigerant, and occaſion cold crudities, and the recurrence of intermittent fevers. To take the common notion of its paſſing unchanged into the blood, it can ſuffer no ſolution. But if we admit its coagulum in the ſtomach, then it may be reckoned among ſoluble or inſoluble foods, according as that coagulum is more or leſs tenacious. Formerly rennet, which is employed to coagulate milk, was thought an acid; but, from late obſervations, it appears, that, if it be an acid, it is very different from other acids, and that its coagulum is ſtronger than that produced by acids. It has been imagined, that a rennet is to be found in the ſtomachs of all animals, which cauſes coagulation of milk; but, to Dr Cullen, the coagulation of milk ſeems to be owing to a weak acid in the ſtomach, the relicts of our vegetable food, inducing, in healthy perſons, a weak and ſoluble coagulum; but in different ſtomachs this may be very different, in theſe becoming heavy and leſs ſoluble food, and ſometimes even evacuated in a coagulated undiſſolved ſtate both by ſtomach and ſtool.

As milk is aceſcent, it may be rendered ſometimes purgative by mixing with the bile; and ſome examples of this have been remarked. More commonly, however, it is reckoned among thoſe foods which occaſion coſtiveneſs.

Hoffman, in his experiments on milk, found that all kinds of it contained much water; and when this was diſſipated, found the reſiduum very different in their ſolubility. But we muſt not thence conclude, that the ſame inſolubility takes place in the ſtomach; for extracts made from vegetables with water are often very inſoluble ſubſtances, and hardly diffuſible through water itſelf: therefore, in Hoffman's extracts, if we may ſo call them, of milk, ſomewhat of the ſame kind might have appeared; and theſe ſubſtances, which in their natural ſtate were not ſo, might appear very inſoluble. However, we may allow that milk is always ſomehow inſoluble in the inteſtines, as it is of a drying nature, and, as cheeſe, &c. is very coſtive. And this effect ſhows that milk is always coagulated in the ſtomach; for if it remained fluid, no fæces would be produced, whereas ſometimes very hard ones are obſerved. In the blood-veſſels, from its animal-nature, it may be conſidered as nutritious; but when we conſider its vegetable contents, and aceſcency in the primæ viæ, we find, that, like animal-food, it does not excite that degree of fever in the time of digeſtion, and that from its aceſcency it will reſiſt putrefaction. Hence its uſe in hectic fevers, which, whatever be their cauſe, appear only to be exacerbations of natural feveriſh paroxyſms, which occur twice every day, commonly after meals, and at night. To obviate theſe, therefore, we give ſuch an aliment as produces the leaſt exacerbation of theſe fevers; and of this nature is milk,

on

Milk.

on account of its acefcent vegetable nature.

There appears alfo fomewhat peculiar to milk, which requires only a fmall exertion of the animal-powers in order to its affimilation; and befides, in hectic complaints there is wanted an oily, bland food, approaching to the animal nature: fo that on all thefe accounts, milk is a diet peculiarly adapted to them, and, in general, to moft convalefcents, and to thofe of inflammatory temperaments.—So far of milk in general.—We fhall now fpeak of the particular kinds which are in common ufe.

The milk of women, mares, and affes, agree very much in their qualities, being very dilute, having little folid contents, and, when evaporated to drynefs, having thefe very foluble, containing much faccharine matter, of a very ready acefcency, and, when coagulated, their coagulum being tender and eafily broke down. From this view they have lefs oil, and feem to have lefs coagulable matter, than the reft.

The milk of cows, fheep, and goats, agree, in oppofite qualities to the three juft mentioned; but here there is fomewhat more of gradation. Cows milk comes neareft to the former milk: goats milk is lefs fluid, lefs fweet, lefs flatulent, has the largeft proportion of infoluble part after coagulation, and indeed the largeft proportion of coagulable part; its oily and coagulable parts are not fpontaneoufly feparable, never throwing out a cream, or allowing butter to be readily extracted from it. Hence the virtues of thefe milks are obvious, being more nourifhing, though, at the fame time, lefs eafily foluble in weak ftomachs, than the three firft, lefs acefcent than thefe, and fo more rarely laxative, and peculiarly fitted for the diet of convalefcents without fever. The three firft, again, are lefs nourifhing, more foluble, more laxative, as more acefcent, and adapted to the convalefcents with fever.

Thefe qualities, in particular milks, are confiderably diverfified by different circumftances. Firft, Different animals, living on the fame diet, give a confiderably different milk; for there feems to be fomething in the conftitution, abftracting from the aliment, which conftitutes a confiderable diverfity of milk, not only in the fame fpecies of animals, but alfo in the fame animal, at different ages, and at different diftances after delivery: this applies to the choice of nurfes. Secondly, Milk follows the nature of the aliment more than any other juice in the human body, being more or lefs fluid and dilute, more or lefs folid and nourifhing, in proportion as thefe qualities are more or lefs in the aliment. The nature of the aliment differs according to its time of growth, *e.g.* old grafs being always found more nourifhing than young. Aliment, too, is always varied according to the feafon, as that is warm or dry, moift or cloudy.

The milk of each particular kind of animal is fitter for particular purpofes, when fed on proper food. Thus the cow delights in the fucculent herbage of the vale: if the fheep be fed there he certainly rots, but on the higher and more dry fide of the mountain he feeds pleafantly and healthy; while the goat never ftops near the bottom, but afcends to the craggy fummit: and certainly the milks of thefe animals are always beft on their proper foil, and that of goats is beft on a mountainous country. From a differtation of Linnæus, we have many obfervations concerning the diverfity of plants on which each animal choofes to feed. All the Swedifh plants which could be collected together, were prefented alternately to domeftic animals, and then it appeared that the goat lived on the greateft variety, and even on many which were poifonous to the reft; that the cow chofe the firft fucculent fhoots of the plant, and neglected the fructification; which laft was preferred by the goat. Hence may be deduced rules concerning the pafturage of different animals; *e.g.* Farmers find, that, in a pafture which was only fit to feed a certain number of fheep, an equal number of goats may be introduced, while the fheep are no lefs nourifhed than before.

It is not eafy to affign the difference between milk frefh-drawn and that detained in the open air for fome time; but certainly there is fome material one, otherwife nature univerfally would not have directed infants to fucking; and indeed it feems, better than the other, fitted for digeftion and nourifhment. Phyficians have fuppofed that this depended on the evaporation of fome *fpt. rector.* but our author cannot conceive any fuch, except common water here; and befides, thefe volatile parts can hardly be nutritious. A more plaufible account feems deducible from mixture: milk, new drawn, has been but lately mixed, and is expofed to fpontaneous feparation, a circumftance hurtful to digeftion; none of the parts being, by themfelves, fo eafily affimilated as when they are all taken together. Hence, then, milk new-drawn is more intimately blended, and therefore then is moft proper to the weakly and infants.

Another difference in the ufe of milk expofed for fome time to the air, is taking it boiled or unboiled. Phyficians have generally recommended the former; but the reafon is not eafily affigned. Perhaps it is this: Milk kept for fome time expofed to the air has gone fo far to a fpontaneous feparation; whereas the heat thoroughly blends the whole, and hence its refolution is not fo eafy in the ftomach; and thus boiled milk is more coftive than raw, and gives more fæces. Again, when milk is boiled, a confiderable quantity of air is detached, as appears from the froth on the furface; and air is the chief inftrument of fermentation in bodies; fo that, after this procefs, it is not liable to acefcency: for thefe reafons it is proper for the robuft and vigorous.

Another difference of milk is, according as it is fluid or coagulated. The coagulated is of two kinds, as induced by rennet, or the natural acefcency of the milk. The former preparation makes the firmer and lefs eafily foluble coagulum; though, when taken with the whey unfeparated, it is lefs difficult of folution, tho' more fo than any other coagulum in the fame cafe. Many nations ufe the latter form, which is eafier foluble, but very much acefcent, and therefore, in point of folution, fhould be confined to the vigorous, in point of acefcency, to thofe who live on alkalefcent food; and in the laft cafe the Laplanders ufe it as their chief acefcent condiment. From the fame confiderations it is more cooling, and in its other effects like all other acefcent vegetables.

Milk.

Milk by evaporation yields a ſweet ſaline matter, of which Dr Lewis gives the following proportions:

Twelve ounces of	Left of dry matter	From which water extracted a ſweet ſaline ſubſtance amounting to
Cows milk	13 drams.	$1\frac{1}{2}$ drams.
Goats milk	$12\frac{1}{2}$	$1\frac{1}{2}$
Human milk	8	6
Aſſes milk	8	6

The ſaline ſubſtance extracted from aſſes milk was white, and ſweet as ſugar; thoſe of the others brown, or yellow, and conſiderably leſs ſweet; that from cows milk had the leaſt ſweetneſs of any.

On diſtilling 12 quarts of milk *in balneo mariæ*, at leaſt nine quarts of pure phlegm were obtained: the liquor which afterwards aroſe was acidulous, and by degrees grew ſenſibly more and more acid as the diſtillation was continued. After this came over a little ſpirit, and at laſt an empyreumatic oil. The remaining ſolid matter adhered to the bottom of the retort, in the form of elegant ſhining black flowers, which being calcined and elixated yielded a portion of fixed alkaline ſalt.

Milk, ſet in a warm place, throws up to the ſurface an unctuous cream, from which, by agitation, the butter is eaſily ſeparated. The addition of alkaline ſalts prevents this ſeparation, not (as ſome have ſuppoſed) by abſorbing an acid from the milk, but by virtue of their property of intimately uniting oily bodies with watery liquors. Sugar, another grand intermedium betwixt oils and water, has this effect in a greater degree, though that concrete is by no means alkaline, or an abſorbent of acids.

The ſweet ſaccharine part of the milk remains diſſolved in the whey after the ſeparation of the curd or cheeſy matter, and may be collected from it in a white cryſtalline form, by boiling the whey till all remains of the curdled ſubſtance have fallen to the bottom; then filtering, evaporating it to a due conſiſtence, ſetting it to ſhoot, and purifying the cryſtals by ſolution in water and a ſecond cryſtallization. Much has been ſaid of the medicinal virtues of this ſugar of milk, but it does not ſeem to have any conſiderable ones: It is from cows milk that it has been generally prepared; and the cryſtals obtained from this kind of milk have but little ſweetneſs.

When milk is ſuffered to coagulate ſpontaneouſly, the whey proves acid, and on ſtanding grows more and more ſo till the putrefactive ſtate commences. Sour whey is uſed as an acid, preferably to the directly vegetable or the mineral acids, in ſome of the chemical arts; as for diſſolving iron in order to the ſtaining of linen and leather. This acid was commonly made uſe of in the bleaching of linen, for diſſolving and extracting the earthy particles left in the cloth by the alkaline ſalts and lime employed for cleanſing and whitening it. Butter-milk is preferred to plain ſour-milk or ſour-whey: This laſt is ſuppoſed to give the cloth a yellow colour. Dr Home, in his ingenious treatiſe on this ſubject, recommends water acidulated with ſpirit of vitriol, (in the proportion of about half an ounce, or at moſt three quarters of an ounce, to a gallon), as preferable in many reſpects to the acid of milk, or of the more directly vegetable ſubſtances. He obſerves, that the latter are often difficultly procurable, abound with oleaginous particles, and haſten to corruption; whilſt the vitriolic acid is cheap, and pure, and indiſpoſed to putrefy: That milk takes five days to perform its office, whilſt the vitriolic acid does it in as many hours, perhaps in as many minutes: That this acid contributes alſo to whiten the cloth, and does not make it weaker though the cloth be kept in it for months. He finds, that acids as well as alkalies, extract an oily matter from the cloth, and loſe their acidity and alkalicity. Since this treatiſe appeared, the uſe of ſour-milk is very generally ſuperſeded by oil of vitriol.

It is obſervable, that aſſes milk is greatly diſpoſed, on ſtanding for a little time, to become thick and ropy. In the Breſlau collection for the year 1720, there is a remarkable account of milk (which probably was that of the aſs) grown ſo thick and tenacious as to be drawn out into long ſtrings, which, when dried, were quite brittle.

New cows milk, ſuffered to ſtand for ſome days on the leaves of butterwort or ſun-dew, becomes uniformly thick, ſlippery, and coherent, and of an agreeable ſweet taſte, without any ſeparation of its parts. Freſh milk, added to this, is thickened in the ſame manner, and this ſucceſſively. In ſome parts of Sweden, as we are informed in the Swediſh Memoirs, milk is thus prepared for food.

New milk has a degree of glutinous quality, ſo as be uſed for joining broken ſtone-ware. There is a far greater tenacity in cheeſe properly prepared.

Milk, when examined by a microſcope, appears compoſed of numerous globules ſwimming in a tranſparent fluid. It boils in nearly the ſame degree of heat with common water; ſome ſorts rather ſooner, and ſome a little later: after boiling, it is leſs diſpoſed to grow ſour than in its natural ſtate. It is coagulated by acids both mineral and vegetable, and by alkalies both fixed and volatile. The coagulum made by acids falls to the bottom of the ſerum; that made by alkalies ſwims on the ſurface, commonly forming (eſpecially with volatile alkalies) a thick coriaceous ſkin. The ſerum, with alkalies, proves green or ſanious; with acids, it differs little in appearance from the whey that ſeparates ſpontaneouſly. The coagulum formed by acids is diſſolved by alkalies, and that formed by alkalies is re-diſſolved by acids; but the milk does not in either caſe reſume its original properties. It is coagulated by moſt of the middle ſalts, whoſe baſis is an earth or a metallic body; as ſolution of alum, fixed ſal ammoniac, ſugar of lead, green and blue vitriol: but not by the chalybeate or purging mineral waters, nor by the bitter ſalt extracted from the purging waters. Among the neutral ſalts that have been tried, there is not one that produces any coagulation. They all dilute the milk, and make it leſs diſpoſed to coagulate with acids or alkalies: Nitre ſeems to have this effect in a greater degree than the other neutral ſalts. It is inſtantly coagulated by highly-rectified ſpirit of wine, but ſcarcely by a phlegmatic ſpirit. It does not mingle with expreſſed oils. All the coagula are diſſolved by gall.

Milk *of Lime. Milk of Sulphur.* The name of *milk* is given to ſubſtances very different from *milk* properly ſo

Milk, Mill.

fo called, and which refemble milk only in colour. Such is water in which quicklime has been flaked, which acquires a whitenefs from the fmall particles of the lime being fufpended in it, and has hence been called the *milk of lime*. Such alfo is the folution of liver of fulphur, when an acid is mixed with it, by which white particles of fulphur are made to float in the liquor.

Milk *of Vegetables*. For the fame reafon that milk of animals may be confidered as a true animal-emulfion, the emulfive liquors of vegetables may be called *vegetable milks*. Accordingly emulfions made with almonds are commonly called *milk of almonds*. But befides this vegetable milk, which is in fome meafure artificial, many plants and trees contain naturally a large quantity of emulfive or milky juices. Such are lettuce, fpurge, fig-tree, and the tree which furnifhes the elaftic American refin. The milky juices obtained from all thefe vegetables derive their whitenefs from an oily matter, mixed and undiffolved in a watery or mucilaginous liquor. Moft refinous gums were originally fuch milky juices, which afterwards become folid by the evaporation of their moft fluid and volatile parts.

Thefe natural milky juices have not been examined by any chemift. Such an examination would, however, procure much effential knowledge concerning vegetable œconomy. We fhould probably find examples of all kinds of oils reduced into milky juices; and this knowledge cannot fail of throwing much light on the nature of refins and gum-refins.

Milk-*Fever*. See Midwifery, Chap. XX.

MILL, a machine for grinding corn, &c. of which there are various kinds, according to the different methods of applying the moving power; as water-mills, wind-mills, mills worked by horfes, &c. See Mechanics.

The firft obvious method of reducing corn into flour for bread would be, by the fimple expedient of pounding. And that was for ages the only one which was practifed by the various defcendants of Adam, and actually continued in ufe among the Romans below the reign of Vefpafian. But the procefs was very early improved by the application of a grinding power, and the introduction of mill-ftones. This, like moft of the common refinements in domeftic life, was probably the invention of the antediluvian world, and certainly practifed in fome of the earlieft ages after it. And, like moft of them, it was equally known in the eaft and weft. Hence the Gauls and Britons appear familiarly acquainted with the ufe of hand-mills before the time of their fubmiffion to the Romans; the Britons particularly diftinguifhing them, as the Highlanders and we diftinguifh them at prefent, by the fimple appellation of *querns*, *carnes*, or *ftones*. And to thefe the Romans added the very ufeful invention of water-mills. For this difcovery the world is pretty certainly indebted to the genius of Italy; and the machine was not uncommon in the country at the conqueft of Lancafhire. This, therefore, the Romans would neceffarily introduce with their many other refinements among us. And that they actually did, the Britifh appellation of a *water-mill* fully fuggefts of itfelf; the *melin* of the Welfh and Cornifh, the *mull*, *meill*, and *melin* of the Armoricans, and the Irifh *muilean* and *muilind*, being all evidently derived from the Roman *mola* and *molendinum*. The fubject Britons univerfally adopted the Roman name, but applied it, as we their fucceffors do, only to the Roman *mill*; and one of thefe was probably erected at every ftationary city in the kingdom. One plainly was at Manchefter, ferving equally the purpofes of the town, and the accommodation of the garrifon. And one alone would be fufficient, as the ufe of hand-mills remained very common in both, many having been found about the fite of the ftation particularly; and the general practice having defcended among us nearly to the prefent period. Such it would be peculiarly neceffary to have in the camp, that the garrifon might be provided againft a fiege. And the water-mill at Manchefter was fixed immediately below the Caftle-field and the town, and on the channel of the Medlock. There, a little above the ancient ford, the fluice of it was accidentally difcovered about 30 years ago. On the margin of Dyer's-croft, and oppofite to fome new conftructions, the current of the river, accidentally fwelled with the rains, and, obftructed by a dam, broke down the northern bank, fwept away a large oak upon the edge of it, and difclofed a long tunnel in the rock below. This has been fince laid open in part with a fpade. It appeared entirely uncovered at the top, was about a yard in width, and another in depth, but gradually narrowed to the bottom. The fides fhewed every-where the marks of the tool on the rock, and the courfe of it was parallel with the channel. It was bared by the flood about 25 yards only in length, but was evidently continued for feveral further; having originally begun, as the nature of the ground evinces, juft above the large curve in the channel of the Medlock.

Whitaker's Hift. of Manchefter.

For the firft five or fix centuries of the Roman ftate, there were no public bread-bakers in the city of Rome. They were firft introduced into it from the eaft, at the conclufion of the war with Perfeus, and about the year 167 before Chrift. And, towards the clofe of the firft century, the Roman families were fupplied by them every morning with frefh loaves for breakfaft. But the fame cuftom, which prevailed originally among the Romans and many other nations, has continued nearly to the prefent time among the Mancunians. The providing of bread for every family was left entirely to the attention of the women in it. And it was baked upon ftones, which the Welfh denominate *greidiols* and we *gredles*. It appears, however, from the kiln-burnt pottery which has been difcovered in the Britifh fepulchres, and from the Britifh appellation of an *odyn* or *oven* remaining among us at prefent, that furnaces for baking were generally known among the original Britons. An odyn would, therefore, be erected at the manfion of each Britifh baron, for the ufe of himfelf and his retainers. And, when he and they removed into the vicinity of a Roman ftation, the oven would be rebuilt with the manfion, and the public bakehoufes of our towns commence at the firft foundation of them. One bakehoufe would be conftructed, as we have previoufly fhewn one mill to have been fet up, for the public fervice of all the Mancunian families. One oven and one mill appear to have been equally eftablifhed in the town. And the inhabitants of it appear immemorially accuftomed to bake at the one and grind at the other. Both, therefore, were in all probability

bability conſtructed at the firſt introduction of water-mills and ovens into the country. The great ſimilarity of the appointments refers the conſideration directly to one and the ſame origin for them. And the general nature of all ſuch inſtitutions points immediately to the firſt and actual introduction of both. And, as the ſame eſtabliſhments prevailed equally in other parts of the north, and pretty certainly obtained over all the extent of Roman Britain, the ſame erections were as certainly made at every ſtationary town in the kingdom.

MILL (John), a very learned divine, was born at Shap in Weſtmoreland, about the year 1645; and became a ſervitor of Queen's college Oxford. On his entering into orders he became an eminent preacher, and was made prebendary of Exeter. In 1681, he was created doctor of divinity; about the ſame time he was made chaplain in ordinary to king Charles II. and in 1685 he was elected principal of St Edmund's hall in Oxford. His edition of the Greek Teſtament, which will ever render his name memorable, was publiſhed about a fortnight before his death, which happened in June 1707. Dr Mill was employed 30 years in preparing this edition.

MILLENARIANS, or Chiliasts, a name given to thoſe, in the primitive ages, who believed that the ſaints will reign on earth with Chriſt 1000 years.

The Millenarians held, that after the coming of Antichriſt, and the deſtruction of all nations which ſhall follow, there ſhall be a firſt reſurrection of the juſt alone: that all who ſhall be found upon earth, both good and bad, ſhall continue alive; the good, to obey the juſt who are riſen, as their princes; the bad, to be conquered by the juſt, and to be ſubject to them: that Jeſus Chriſt will then deſcend from heaven in his glory: that the city of Jeruſalem will be rebuilt, enlarged, embelliſhed, and its gates ſtand open night and day. They applied to this new Jeruſalem what is ſaid in the Apocalypſe, chap. xxi. and to the temple all that is written in Ezekiel xxxvi. Here, they pretended, Jeſus Chriſt will fix the ſeat of his empire, and reign 1000 years with the ſaints, patriarchs, and prophets, who will enjoy perfect and uninterrupted felicity.

This reign of our Saviour on earth is uſually ſtyled the *millennium*, or reign of 1000 years.

MILLEPES, or wood-louse, in zoology; a ſpecies of Oniscus. Theſe inſects are found in cellars, under ſtones, and in cold moiſt places; in the warmer countries they are rarely met with. Millepedes have a faint diſagreeable ſmell, and a ſomewhat pungent, ſweetiſh, nauſeous taſte. They have been highly celebrated in ſuppreſſions of urine, in all kinds of obſtructions of the bowels, in the jaundice, weakneſs of ſight, and a variety of other diſorders. Whether they have any juſt title to theſe virtues is greatly to be doubted: thus much is certain, that their real effects come far ſhort of the character uſually given them.

MILLET, in botany. See Milium.

MILLING of Cloth. See Fulling.

MILLION, in arithmetic, the ſum of ten hundred thouſand, or a thouſand times a thouſand. See Arithmetic.

MILLO, a part of mount Zion at its extremity; and therefore called *Millo*, of the city of David, (2 Chron. xxxii.) taken in with the wall that encompaſſed mount Zion. Uncertain whether *Beth-Millo*, (Judges ix. 20.) denotes a place; if it did, it lay near Sechem.

MILO, an iſland in the Archipelago, about 50 miles in circumference, with a harbour, which is one of the largeſt and beſt of the Mediterranean, and which ſerves for a retreat for all the ſhips that go to or return from the Mediterranean. The inhabitants are all Greeks, except the cadi, or judge, who is a Turk. Salt is ſo cheap, that they ſell 67 pounds for ſevenpence. There are two biſhops, the one of the Greek, and the other of the Latin church; and there are 13 monaſteries in this iſland. In the ſpring the whole iſland is like a carpet thick ſet with anemonies of all ſorts and colours. There are public baths at the foot of a ſmall hill going from the town to the harbour; they are in a cavern, with a very narrow entrance of 50 paces long. When a perſon is got in, the ſweat guſhes out in large drops; and this ſweating is eſteemed good for the palſy, rheumatiſm, and other diſeaſes. Below theſe baths, near the ſhore, there are many little ſprings, ſo hot as to ſcald one's fingers. Four miles from the town, in a very ſteep place by the ſea, is a grotto, 15 paces deep, which is all cruſted over with plume-alum, in ſome places as white as ſnow, and reddiſh in others. Some paces from this cavern, on the ſea-ſhore, is another grotto, whoſe bottom is filled with ſulphur, which burns continually. Thoſe who are troubled with the itch go and ſweat here, and are generally cured. Near the chapel of St Surriacus is a ſpot of ground continually burning; and the fields about it are always ſmoking, and yet they are all covered with marigolds. Though the air of Milo is very unwholeſome, yet the inhabitants lead a merry life, and regale themſelves very cheap; but the women are not very famous for chaſtity. They have partridges, turtle-doves, quails, wheat-ears, wood-pigeons, and ducks, in great plenty; as alſo good figs, melons, excellent grapes, and very delicate fiſh. The principal town is of the ſame name as the iſland, and contains near 5000 inhabitants. It is prettily built, but abominably naſty; the houſes are two ſtories high, with flat roofs, and are built with a ſort of pumice-ſtone, which is hard, blackiſh, and yet very light. This iſland is 60 miles north of Candia, and the town is ſituated in E. Long. 25. 15. N. Lat. 36. 27.

MILT, in anatomy, a popular name for the ſpleen.

Milt, or *Melt*, in natural hiſtory, the ſoft roe in fiſhes; thus called by reaſon it yields, by expreſſion, a whitiſh juice reſembling milk. See Roe.

The milt is properly the ſeed or ſpermatic part of the male fiſh. The milt of a carp is reckoned a choice bit. It conſiſts of two long whitiſh irregular bodies, each included in a very thin fine membrane. M. Petit conſiders them as the teſticles of the fiſh wherein the ſeed is preſerved; the lower part, next the anus, he takes for the *veſiculæ ſeminales*.

MILTIADES, a celebrated Athenian captain, who, with 12,000 men, routed above 300,000 Perſians at Marathon, and, purſuing them, took many iſlands in the Archipelago: but returning to Athens without taking Paros, his fellow-citizens, forgetting the important ſervices he had rendered them, ſentenced him to pay a large fine. Being unable to advance the money, he was thrown into priſon, where he languiſhed out the remainder of his days.

MILTON (John), the moſt illuſtrious of the Engliſh poets, was deſcended of a genteel family, ſeated at a place of their own name, viz. *Milton*, in Oxfordſhire. He was born December 9. 1608, and received his firſt rudiments of education under the care of his parents, aſſiſted by a private tutor. He afterwards paſſed ſome time at St Paul's ſchool, London; in which city his father had ſettled, being engaged in the buſineſs of a ſcrivener. At the age of 17, he was ſent to Chriſt's college, Cambridge; where he made a great progreſs in all parts of academical learning; but his chief delight was in poetry. In 1698, he proceeded bachelor of arts, having performed his exerciſe for it with great applauſe. His father deſigned him for the church; but the young gentleman's attachment to the muſes was ſo ſtrong, that it became impoſſible to engage him in any other purſuits. In 1632, he took the degree of maſter of arts; and having now ſpent as much time in the univerſity as became a perſon who determined not to engage in any of the three profeſſions, he left the college, greatly regretted by his acquaintance, but highly diſpleaſed with the uſual method of training up youth there for the ſtudy of divinity; and being much out of humour with the public adminiſtration of eccleſiaſtical affairs, he grew diſſatisfied with the eſtabliſhed form of church-government, and diſliked the whole plan of education practiſed in the univerſity. His parents, who now dwelt at Horton, near Colnbrook, in Buckinghamſhire, received him with unabated affection, notwithſtanding he had thwarted their views of providing for him in the church, and they amply indulged him in his love of retirement; wherein he enriched his mind with the choiceſt ſtores of Grecian and Roman literature: and his poems of *Comus*, *L'Allegro*, *Il Penſeroſo*, and *Lycidas*, all wrote at this time, would have been ſufficient, had he never produced any thing more conſiderable, to have tranſmitted his fame to lateſt poſterity. However, he was not ſo abſorbed in his ſtudies as not to make frequent excurſions to London; neither did ſo much excellence paſs unnoticed among his neighbours in the country, with the moſt diſtinguiſhed of whom he ſometimes choſe to relax his mind, and improve his acquaintance with the world as well as with books.

After five years ſpent in this manner, he obtained his father's permiſſion to travel for farther improvement.—At Paris he became acquainted with the celebrated Hugo Grotius; and from thence travelling into Italy, he was every where careſſed by perſons of the moſt eminent quality and learning.

Upon his return home, he ſet up a genteel academy in Alderſgate-ſtreet.—In 1641, he began to draw his pen in defence of the Preſbyterian party; and the next year he married the daughter of Richard Powell, Eſq; of Foreſt-Hill in Oxfordſhire. This lady, however, whether from a difference on account of party, her father being a zealous royaliſt, or ſome other cauſe, ſoon thought proper to return to her relations; which ſo incenſed her huſband, that he reſolved never to take her again, and wrote and publiſhed ſeveral tracts in defence of the doctrine and diſcipline of divorce. He even made his addreſſes to another lady; but this incident proved the means of a reconciliation with Mrs Milton.

In 1644, he wrote his Tract upon Education; and the reſtraint on the liberty of the preſs being continued by act of parliament, he wrote boldly and nobly againſt that reſtraint.

In 1645, he publiſhed his juvenile poems; and about two years after, on the death of his father, he took a ſmaller houſe in High Holborn, the back of which opened into Lincoln's-Inn Fields.—Here he quietly proſecuted his ſtudies, till the fatal cataſtrophe and death of Charles I.; on which occaſion he publiſhed his Tenure of Kings and Magiſtrates, in juſtification of the fact. He was now taken into the ſervice of the commonwealth, and made Latin ſecretary to the council of ſtate, who reſolved neither to write to others abroad, nor to receive any anſwers, except in the Latin tongue, which was common to them all. The famous Εικων Βασιλικη coming out about the ſame time, our author, by command, wrote and publiſhed his *Iconoclaſtes* the ſame year. It was alſo by order of his maſters, backed by the reward of 1000l. that, in 1651, he publiſhed his celebrated piece, entitled *Pro Populo Anglicano Defenſio*, "A Defence of the People of England, in anſwer to Salmaſius's Defence of the King;" which performance ſpread his fame over all Europe.—He now dwelt in a pleaſant houſe, with a garden, in Petty France, Weſtminſter, opening into St James's Park. In 1652, he buried his wife, who died not long after the delivery of her fourth child; and about the ſame time he alſo loſt his eye-ſight, by a *gutta ſerena*, which had been growing upon him many years.

Cromwell took the reins of government into his own hands in the year 1653; but Milton ſtill held his office. His leiſure-hours he employed in proſecuting his ſtudies, wherein he was ſo far from being diſcouraged by the loſs of his ſight, that he even conceived hopes this misfortune would add new vigour to his genius; which, in fact, ſeems to have been the caſe.—Thus animated, he again ventured upon matrimony: his ſecond lady was the daughter of Captain Woodcock of Hackney: ſhe died in childbed about a year after.

On the depoſition of the protector, Richard Cromwell, and on the return of the long parliament, Milton being ſtill continued ſecretary, he appeared again in print; pleading for a farther reformation of the laws relating to religion; and, during the anarchy that enſued, he drew up ſeveral ſchemes for re-eſtabliſhing the commonwealth, exerting all his faculties to prevent the return of Charles II. England's deſtiny, however, and Charles's good fortune, prevailing, our author choſe to conſult his ſafety, and retired to a friend's houſe in Bartholomew-Cloſe. A particular proſecution was intended againſt him; but the juſt eſteem to which his admirable genius and extraordinary accompliſhments entitled him, had raiſed him ſo many friends, even among thoſe of the oppoſite party, that he was included in the general amneſty.

This ſtorm over, he married a third wife Elizabeth, daughter of Mr Minſhall a Cheſhire gentleman; and not long after he took a houſe in the Artillery Walk, leading to Bunhill-Fields.—This was his laſt ſtage: here he ſat down for a longer continuance than he had been able to do any where; and though he had loſt his fortune, (for every thing belonging to him went to wreck

wreck at the Restoration), he did not lose his taste for literature, but continued his studies with almost as much ardour as ever; and applied himself particularly to the finishing his grand work, the *Paradise Lost;* one of the noblest poems that ever was produced by human genius.—It was published in 1667, and his *Paradise Regained* came out in 1670.—This latter work fell short of the excellence of the former production; although, were it not for the transcendent merit of the Paradise Lost, the second composition would doubtless have stood foremost in the rank of English epic poems.—After this he published many pieces in prose; for which we refer our readers to the edition of his Historical, Poetical, and Miscellaneous Works, printed by Millar, in 2 vols 4to. in 1753.

In 1674, this great man paid the last debt to nature, at his house in Bunhill-Fields, in the 66th year of his age; and was interred on the 12th of November, in the chancel of St Giles's, Cripplegate.—A decent monument was erected to his memory, in 1737, in Westminster Abbey, by Mr Benson, one of the auditors of the imprest.—As to his person, it was remarkably handsome; but his constitution was tender, and by no means equal to his incessant application to his studies.—Though greatly reduced in his circumstances, yet he died worth 1500l. in money, beside his household goods.—He had no son; but left behind him three daughters, whom he had by his first wife.

MILVIUS, Molvius, or *Mulvius Pons*, a bridge on the Tiber, built by Æmilius Scaurus the censor, in the time of Sylla, at two miles distance from the city, on the Via Flaminia, and repaired by Augustus. From this bridge the ambassadors of the Allobroges were brought back to Rome, by Cicero's management, and made a discovery of Catiline's conspiracy (Sallust.) Near it Maxentius was defeated by Constantine, (Eutropius.) Now called *Ponte Molle.*

Milvius, in ornithology, a species of Falco.

MIME, in the ancient comedy, a person who acted any character by mere gestures, and hence denominated *pantomime.* See Pantomime.

MIMESIS, in rhetoric, the imitating the voice and gestures of another person.

MIMNERMUS, an ancient poet and musician, flourished about the beginning of the 6th century B. C. He was of Smyrna, and cotemporary with Solon. Athenæus gives him the invention of pentameter verse. His elegies, of which only a few fragments are preserved, were so much admired in antiquity, that Horace preferred them to those of Callimachus. He composed a poem of this kind, as we learn from Pausanias, upon the battle fought between the people of Smyrna, and the Lydians, under Gyges. He likewise was author of a poem in elegiac verse, quoted by Strabo, which he intitled *Nanno*, and in which we may suppose he chiefly celebrated a young and beautiful girl of that name, who, according to Athenæus, was a player on the flute, with whom he was enamoured in his old age. With respect to love-matters, according to Propertius, his verses were more valuable than all the writings of Homer.

Plus in amore valet Mimnermi versus Homero.
Lib. i. Eleg. 9. v. 11.

And Horace bears testimony to his abilities, in describing that seducing passion:

Si Mimnermus uti censet, sine amore jocisque
Nil est jucundum, vivas in amore jocisque.
Epist. VI. Lib. i. v. 65.

If, as wise Mimnermus said,
Life unblest with love and joy,
Ranks us with the senseless dead,
Let these gifts each hour employ.

Alluding to some much admired lines of this Greek poet, which have been preserved by Stobæus.

Τις δε βιος, τι δε τερπνον ατερ χρυσης 'Αφροδιτης, &c.

What is life and all its pride,
If love and pleasure be denied?
Snatch, snatch me hence, ye fates, whene'er
The am'rous bliss I cease to share.
Oh let us crop each fragrant flow'r,
While youth and vigour give us pow'r;
For frozen age will soon destroy
The force to give or take a joy;
And then, a prey to pain and care,
Detested by the young and fair,
The sun's blest beams will hateful grow,
And only shine on scenes of wo!

MIMOSA, the sensitive plant; a genus of the monœcia order, belonging to the polygamia class of plants.

This genus comprises shrubby and herbaceous plants, but mostly of the shrub kind, some trailing, others erect, all natives of the Indies, &c. retained here in stoves as great curiosities, particularly for the very singular sensibility of the leaves of some sorts, which on being touched, suddenly recede, contract, and fall down in a very wonderful manner: all of them garnished with pinnated leaves, and monopetalous, funnel-shaped, five-parted, polygamous flowers at the axillas and ends of the branches in clusters and spikes.

The name *mimosa* of this genus, signifies mimic, originating from the sensibility of the leaves, which, by their motion, mimic or imitate, as it were, the motions of animals.

To this genus Linnæus joins many of the *acacias*, and it comprises upwards of 40 different species; tho' not more than a quarter of them are common in the English gardens, or possess any particular merit either for curiosity or ornament, and none for use. Of the sorts cultivated here in our stoves, &c. some are of the shrub and tree kind, and two or three are herbaceous perennials and annuals; are mostly of the sensitive kinds, except the acacia sorts, which are motionless, as expressed under their proper heads, i. e. sensitive and humble kinds, and senseless kinds. The former of which are exceedingly curious plants in the very singular circumstance of their leaves receding rapidly from the touch: the leaves are winged, each composed of numerous small lobes, all of which on being touched, hastily run up close together; and in some sorts the footstalks and all are affected, so as instantly to fall downward, as if fastened by hinges.

Shrubby, Sensitive, and Humble Kinds.

They have all winged leaves, each wing consisting of many small pinnæ; some only contract the lobes of the leaves and pinnæ at the touch; others not only contract every part of their leaves, but their footstalks also suddenly drop downward; and for distinction sake, the former are called *sensitive mimosas*, and the latter *humble sensitives;* but the leaves of both sorts soon recover their usual position. The most remarkable species are,

1. Sen-

Mimosa.

1. Senfitiva, or common fenfitive humble plant. Rifes with an underfhrubby prickly ftem, branching fix or eight feet high, armed with crooked fpines; conjugated, pinnated leaves, with bijugated partial lobes, or wings, having the inner ones the leaft, each leaf on a long footftalk; and at the fides and ends of the branches many purple flowers in roundifh heads; fucceeded by broad, flat, jointed pods, in radiated clufters.

This is fomewhat of the humble fenfitive kind; the leaves, footftalks and all, recede from the touch, though not with fuch facility as in fome of the following forts.

2. The pudica, or bafhful humble plant. Rifes with an underfhrubby, declinated, prickly ftem, branching two or three feet around, armed with hairy fpines; pinnated, digitated leaves, each leaf being of five or more long folioles, attached by their bafe to a long footftalk, and fpread out above like the fingers of a hand; and at the fides and ends of the branches roundifh heads of greenifh white flowers, fucceeded by fmall, jointed, prickly pods.

This is truly of the humble fenfitive kind; for by the leaft touch the leaves inftantly recede, contract clofe, and, together with the footftalk, quickly decline downward, as if afhamed at the approach of the hand.

3. The pernambucana, or pernambuca flothful mimofa. Hath underfhrubby, procumbent, unarmed ftems, branching two or three feet around; bipinnated leaves, of three or four pair of fhort, winged foliola; and at the axillas drooping fpikes of pentandrous flowers, the lower ones caftrated.

This fort recedes very flowly from the touch, only contracting its pinnæ a little when fmartly touched; hence the name *flothful mimofa*.

4. The afperata, or rough fenfitive mimofa, hath a fhrubby, upright, prickly, hairy, rough ftem, branching four or five feet high, armed with fhort, broad, whitifh fpines; bipinnated, prickly leaves, of five or fix pair of foliola, or wings, arranged oppofite, having two thorns between each pair; and at the upper axillas globular heads of purple flowers, fucceeded by fhort, flat, jointed pods, in clufters, fpreading each way like a radius.

This is only moderately fenfitive in its foliola, but not in the footftalks.

5. The punctata, or punctated fenfitive mimofa, rifes with a fhrubby, upright, taper, punctated, or fpotted, unarmed ftem, branching erectly five or fix feet high; bipinnated leaves, of four or five pair of long, winged folioles, having each about 20 pair of pinnæ; and at the axillas and termination of the branches oblong fpikes of yellowifh decandrous flowers, the inferior ones caftrated; fucceeded above by oblong feed-pods. This fort, though naturally fhrubby and perennial in its native foil, yet in this country it fometimes decays in winter. It is only fenfitive in the foliola, but quick in the motion.

Herbaceous Senfitive and Humble Kinds.

Of thefe forts two are perennial of the trailing kind; and one is annual, of fomewhat erect growth; have all winged leaves, with the wings formed of many fmall pinnæ.

6. The viva,—perennial, or lively fenfitive mimofa, hath herbaceous, trailing, unarmed, repent ftems, very branchy, fpreading widely around, rooting at the joints as they advance; conjugated pinnated leaves, with quadrijugated, roundifh, partial lobes, or wings; and at the axillas globular beads of yellowifh flowers; fucceeded by fhort, flat, jointed pods.

Mimofa.

This fpecies is only fenfitive in the foliola; but is the moft lively of that kind, it being fo fufceptible that all the folliola recede rapidly from the leaft touch, whereby it has the diftinctive appellation of *vivacious*, or *lively mimofa*.

7. The quadrivalvis;—perennial, or quadrivalve humble mimofa, hath herbaceous flender, quadrangular, prickly ftems, branching and fpreading all around, armed with recurved fpines; bipinnated leaves of two or three pair of winged lobes, having each many pinnæ; and at the axillas globular heads of purple flowers, fucceeded by quadrivalvular pods.

This is of the humble fenfitive kind, both leaves and footftalks recede from the touch.

8. The plena,—annual, or double-flowered fenfitive annual mimofa, rifes with an herbaceous, erect, round, unarmed ftem, clofely branching and fpreading every way, three or four feet high; bipinnated leaves of four or five pair of winged lobes, of many pairs of pinnæ; and at the axillas and termination of the branches fpikes of yellow pentandrous flowers, the lower ones double; fucceeded by fhort broad pods.

This annual is only fenfitive in the folliola, but extremely fenfible of the touch or air.

Shrubby Infenfible Kinds.

Thefe are of the acacia kind, formerly a diftinct genus, but now all fpecies of Mimofa; but their leaves are deftitute of motion or fenfibility at the touch: there are about three noted fpecies in the Englifh gardens, all for the ftove.

9. The cornigera, or horned Mexican mimofa, commonly called *great horned acacia*, hath a fhrubby, upright, deformed ftem, branching irregularly, armed with very large, horned-like white fpines, by pairs, connated at the bafe; bipinnated leaves thinly placed; and flowers growing in fpikes.

This fpecies is efteemed a curiofity for the oddity of its large fpines, refembling the horns of animals, and which are often varioufly wreathed, twifted, and contorted.

10. The farnefiana, or farnefian fragrant acacia, hath a fhrubby ftem, branching many feet high, armed with diftinct fpines; bipinnated leaves, having eight pair of partial lobes, or wings; and globular, clofe-fitting fpikes of yellow fweet-fcented flowers.

11. The nilotica, or nilotic true Egyptian acacia, hath an upright tree-ftem, branching many feet high, armed with fpreading fpines; bipinnated leaves; and globular fpikes of flowers, having footftalks. From the exfudation of the leaves of this fort is procured the drugs called *fuccus acaciæ* and *gum-arabic*.

Propagation, &c. Thefe 11 fpecies of mimofa are the moft noted forts in the Englifh gardens; all the fhrubby kinds are durable in root, ftem, and branches; thofe of the perennial herbaceous kinds are alfo often abiding; but the annual fort always perifh, root and branch, at the approach of winter. They are all natives of the Indies; and in this country require the continual fhelter of a hot-houfe, or of a hot-bed of fimilar

lar temperature under frames and glaſſes; though they can hardly be ſupported alive in winter unleſs placed in a ſtove; ſo all the ſorts muſt conſtantly be kept in pots, and placed principally in that department, eſpecially during the winter; nor will they ſucceed well in the open air in ſummer, except about a month during the greateſt heat; but the ſenſitive and humble kinds, if expoſed to the open air, even in the hotteſt days, will be deprived of their ſenſibility during the time they remain ſo expoſed, therefore ſhould always be kept under glaſſes, in a ſtove if poſſible; or in default of ſuch a convenience, the plants might be raiſed from ſeed in ſpring in any common hot-bed under frames, &c. as directed for tender annuals, and continued conſtantly under the glaſſes, and thereby will afford pleaſure all ſummer by the oddity of their ſenſitive foliage; however, to have them to remain in perfection the year round, ſome muſt be continued always in a ſtove, as before obſerved; for the warmer they are kept, the ſtronger will be their ſenſible quality: but for a particular account of this quality, ſee the article SENSITIVE *Plant*.

The propagation of all the ſorts, both ſenſitives and acacias, is by ſeed in ſpring in a hot-bed, or in the bark-bed in the ſtove; and ſome of the ſenſitive kinds alſo by layers and cuttings.

MINA, in Grecian antiquity, a money of account, equal to 100 drachms.

MIND, a thinking intelligent being, otherwiſe called *ſpirit*, in oppoſition to matter, or body.

MINDANOA, a large iſland of Aſia in the Eaſt Indies, and one of the Philippines; 180 miles in length, and 120 in breadth. It is a very mountainous country, full of hills and valleys, and the mould is generally deep, black, and fruitful. The ſides of the hills and valleys are ſtony, and yet there are tall trees of kinds not known in Europe: ſome of the mountains yield very good gold, and the valleys are watered with variety of rivulets. The palm-trees † produce the ſago, which the poor people eat, inſtead of bread, three or four months in the year. They have here all ſorts of fruits proper to the climate, beſides plenty of rice: ſome affirm that there are nutmegs and cloves, but none of the trees that bear them appear near the coaſt. They have horſes, beeves, buffaloes, goats, deer, monkeys, lizards, and ſnakes; but they have neither lions nor tygers. Their hogs are very ugly creatures, having all great knobs growing over their eyes; however, their fleſh is ſweet. Their fowls are ducks, hens, pigeons, parrots, paroquets, turtle-doves, and bats as large as kites, beſides many ſmall birds. The air is temperate, they having breezes by day, and cooling land-winds at night. The winds are eaſterly one part of the year, and weſterly the other: while the former blow, it is fair weather; but while the latter, it is rainy, ſtormy, and tempeſtuous. The inhabitants are of a mean low ſtature, with ſmall limbs and little heads. Their faces are oval, with flat foreheads, black ſmall eyes, ſhort low noſes, and pretty large mouths. Their hair is black and ſtrait, and their complexion tawney, but more inclining to yellow than that of other Indians. The women are very deſirous of the company of ſtrangers, eſpecially white men. The chief trades are goldſmiths, blackſmiths, and carpenters; and they can build pretty good veſſels for the ſea. Their diſtempers are as in other places, except the leproſy, which is very common here. The ſultan has a queen, beſides 20 other women, and all the men have ſeveral wives; for their religion is Mahometaniſm. Their houſes are built on poſts, from 14 to 20 feet high; and they have ladders to go up out of the ſtreets. They have but one floor, which is divided into ſeveral rooms; and the roofs are covered with palmeto leaves. Thoſe that have been far up in the country ſay, that the people are all blacks, and go quite naked. The principal town, of the ſame name, is pretty large, and is ſeated on the eaſtern coaſt.

† See *Palma*.

MINDELHEIM, a town of Germany, in the circle of Suabia, and in Algow, with a caſtle. It is capital of a ſmall territory between the rivers Iller and Lech, ſubject to the houſe of Bavaria. It was taken by the Imperialiſts after the battle of Hochſtet, who erected it into a principality in favour of the duke of Marlborough; but it returned back to the houſe of Bavaria by the treaty of Raſtat. It is 33 miles ſouth-eaſt of Ulm. E. Long. 10. 40. N. Lat. 48. 5.

MINDELHEIM, a diſtrict of Germany, in Suabia, lying between the biſhopric of Augſburgh and the abbacy of Kempten, which is 20 miles in length and 16 in breadth.

MINDEN, a conſiderable town of Germany, in the circle of Weſtphalia, and capital of a territory of the ſame name; ſeated on the river Weſer, which renders it a trading-place. It belongs to the king of Pruſſia, who has ſecularized the biſhopric. It is 27 miles eaſt-by-ſouth of Oſnaburg, and 37 weſt of Hanover. E. Long. 9. 5. N. Lat. 52. 22.

MINDEN (the principality of), in Germany, lies in the circle of Weſtphalia, to the north of the county of Ravenſberg, and along each ſide of the river Weſer. It is about 22 miles ſquare, and Minden and Peterſhagen are the principal places. It was formerly a biſhopric, but is now ſecularized; and was ceded to the elector of Brandenburg by the treaty of Weſtphalia.

MINDORA, an iſland of Aſia, in the Eaſt Indies, and one of the Philippines, 50 miles in circumference, and ſeparated from Luconia by a narrow channel. It is full of mountains, which abound in palm-trees and all ſorts of fruits. The inhabitants are idolaters, and pay tribute to the Spaniards, to whom this iſland belongs.

MINE, in natural hiſtory, a place under ground, where metals, minerals, or even precious ſtones, are dug up.

As, therefore, the matter dug out of mines is various, the mines themſelves acquire various denominations, as *gold mines*, *ſilver mines*, *copper mines*, *iron mines*, *diamond mines*, *ſalt mines*, *mines of antimony*, *of alum*, &c.

Mines, then, in general, are veins or cavities within the earth, whoſe ſides receding from, or approaching nearer to each other, make them of unequal breadths in different places, ſometimes forming larger ſpaces, which are called *holes*: they are filled with ſubſtances, which, whether metallic or of any other nature, are called the *loads*; when the ſubſtances forming theſe loads are reducible to metal, the loads are by the miners ſaid to be alive, otherwiſe they are called *dead loads*. In Cornwall and Devon, the loads always hold

Mine. hold their courfe from eaftward to weftward; though in other parts of England they frequently run from north to fouth. The miners report, that the fides of the load never bear in a perpendicular, but conftantly under-lay either to the north or to the fouth. The load is frequently intercepted by the croffing of a vein of earth or ftone, or fome different metallic fubftance; in which cafe it generally happens that one part of the load is moved a confiderable diftance to the one fide. This tranfient load is by the miners called *flooking;* and the part of the lead which is to be moved is faid to be heaved.

According to Dr Nicols's obfervations upon mines, they feem to be, or to have been, the channels thro' which the waters pafs within the earth, and, like rivers, have their fmall branches opening into them in all directions. Moft mines have ftreams of water running through them: and when they are found dry, it feems to be owing to the waters having changed their courfe, as being obliged to it, either becaufe the load has ftopped up the ancient paffages, or that fome new and more eafy ones are made.

Mines, fays Dr Shaw, are liable to many contingencies; being fometimes poor, fometimes foon exhauftible, fometimes fubject to be drowned, efpecially when deep, and fometimes hard to trace. Yet there are many inftances of mines proving highly advantageous for hundreds of years: the mines of Potofi are to this day worked with nearly the fame fuccefs as at firft; the gold mines of Cremnitz have been worked almoft thefe 1000 years; and our Cornifh tin mines are extremely ancient. The neat profit of the filver alone, dug in the Mifnian filver-mines in Saxony, is ftill, in the fpace of eight years, computed at a thoufand fix hundred and forty-four millions, befides feventy-three tons of gold. Many mines have been difcovered by accident: a torrent firft laid open a rich vein of the filver-mine at Friburg in Germany; fometimes a violent wind, by blowing up trees, or overturning the parts of rocks, has difcovered a mine; the fame has happened by violent fhowers, earthquakes, thunder, the firing of woods, or even the ftroke of a ploughfhare or horfe's hoof.

But the art of mining does not wait for thefe favourable accidents, but directly goes upon the fearch and difcovery of fuch mineral veins, ores, or fands, as may be worth the working for metal. The principal inveftigation and difcovery of mines depend upon a particular fagacity, or acquired habit of judging from particular figns, that metallic matters are contained in certain parts of the earth, not far below its furface. The principal figns of a latent metallic vein feem reducible to general heads; fuch as, 1. The difcovery of certain mineral waters. 2. The difcolouration of the trees or grafs of a place. 3. The finding of pieces of ore on the furface of the ground. 4. The rife of warm exhalations. 5. The finding of metallic fands, and the like. All which are fo many encouragements for making a ftricter fearch near the places where any thing of this kind appears; whence rules of practice might be formed for reducing this art to a greater certainty. But when no evident marks of a mine appears, the fkilful mineralift ufually bores into the earth, in fuch places as, from fome analogy of knowledge, gained by experience, or by obferving the fituation, courfe, or nature of other mines, he judges may contain metal. As to the power of the divining wand in difcovering mines, it feems to be a mere chimera. See *Divining*-WAND. Mine.

After the mine is found, the next thing to be confidered, is whether it may be dug to advantage. In order to determine this, we are duly to weigh the nature of the place, and its fituation, as to wood, water, carriage, healthinefs, and the like; and compare the refult with the richnefs of the ore, the charge of digging, ftamping, wafhing, and fmelting.

Particularly the form and fituation of the fpot fhould be well confidered. A mine muft either happen, 1. In a mountain. 2. In a hill. 3. In a valley. Or, 4. In a flat. But mountains and hills are dug with much greater eafe and convenience, chiefly becaufe the drains and burrows, that is, the adits or avenues, may be here readily cut, both to drain the water and to form gang-ways for bringing out the lead, &c. In all the four cafes, we are to look out for the veins which the rains, or other accidental thing, may have laid bare; and if fuch a vein be found, it may often be proper to open the mine at that place, efpecially if the vein prove tolerably large and rich: otherwife the moft commodious place for fituation is to be chofe for the purpofe, *viz.* neither on a flat, nor on the tops of mountains, but on the fides. The beft fituation for a mine, is a mountainous, woody, wholefome fpot; of a fafe eafy afcent, and bordering on a navigable river. The places abounding with mines are generally healthy, as ftanding high, and every where expofed to the air; yet fome places, where mines are found, prove poifonous, and can upon no account be dug, tho' ever fo rich: the way of examining a fufpected place of this kind, is to make experiments upon brutes, by expofing them to the effluvia or exhalations, to find the effects.

Devonfhire and Cornwall, where there are a great many mines of copper and tin, is a very mountainous country, which gives an opportunity in many places to make adits, or fubterraneous drains, to fome valley at a diftance, by which to carry off the water from the mine, which otherwife would drown them out from getting the ore. Thefe adits are fometimes carried a mile or two, and dug at a vaft expence, as from 2000 l. to 4000 l. efpecially where the ground is rocky; and yet they find this cheaper than to draw up the water out of the mine quite to the top, when the water runs in plenty, and the mine is deep. Sometimes, indeed, they cannot find a level near enough to which an adit may be carried from the very bottom of the mine; yet they find it worth while to make an adit at half the height to which the water is to be raifed, thereby faving half the expence.

The late Mr Coftar, confidering that fometimes from fmall ftreams, and fometimes from little fprings or collections of rain-water, one might have a good deal of water above ground, though not a fufficient quantity to turn an overfhot-wheel, thought, that if a fufficient fall might be had, this collection of water might be made ufeful in raifing the water in a mine to the adit, where it may be carried off.

But now the moft general method of draining mines is by the fire or fteam engine. See STEAM-*Engine*.

MINE, in the military art, denotes a ſubterraneous canal or paſſage, dug under the wall or rampart of a fortification, intended to be blown up by gunpowder.

The alley or paſſage of a mine is commonly about four feet ſquare; at the end of this is the chamber of the mine, which is a cavity about five feet in width and in length, and about ſix feet in height; and here the gun-powder is ſtowed. The fauciſſe of the mine is the train, for which there is always a little aperture left. There are various kinds of mines, which acquire various names, as *royal mines*, *ſerpentine mines*, *forked mines*, according as their paſſages are ſtraight, oblique, winding, &c.

MINERAL, in natural hiſtory, is uſed in general for all foſſile bodies, whether ſimple or compound, dug out of a mine; from whence it takes its denomination.

MINERAL *Waters*. All waters naturally impregnated with any heterogeneous matter which they have diſſolved within the earth may be called *mineral waters*, in the moſt general and extenſive meaning of that name; in which are therefore comprehended almoſt all thoſe that flow within or upon the ſurface of the earth, for almoſt all theſe contain ſome earth or ſelenites. But waters containing only earth or ſelenites are not generally called *mineral*, but *hard* or *crude waters*.

Hard waters, which are ſimply ſelenitic, when tried by the chemical proofs, ſhew no marks of an acid or of an alkali, nor of any volatile, ſulphureous, or metallic matters. Waters which contain a diſengaged calcareous earth, change the colour of ſyrup of violets to a green; and thoſe that contain ſelenites, being mixed with a ſolution of mercury in nitrous acid, form a turbith mineral; and when a fixed alkali is added, they are rendered turbid, and a white ſediment is precipitated. Theſe waters alſo do not diſſolve ſoap well. From theſe we may know, that any water which produces theſe effects is a hard, earthy, or ſelenitic water. The waters impregnated with gas are alſo hard.

Although the waters of the ſea and ſaline ſprings be not generally enumerated amongſt mineral waters, they might nevertheleſs be juſtly conſidered as ſuch: for beſides earthy and ſelenitic matters, they alſo contain a large quantity of mineral ſalts. We ſhall therefore conſider them as ſuch in this article.

Mineral waters, properly ſo called, are thoſe in which gas, or ſulphureous, ſaline, or metallic ſubſtances, are diſcovered by chemical trials. As many of theſe waters are employed ſucceſsfully in medicine, they are alſo called *medicinal waters*.

Mineral waters receive their peculiar principles by paſſing through earths containing ſalts, or pyritous ſubſtances that are in a ſtate of decompoſition. Some of theſe waters are valuable from the quantity of uſeful ſalts which they contain, particularly of common ſalt, great quantities of which are obtained from theſe waters; and others are chiefly valued for their medicinal qualities. The former kind of mineral waters is an object of manufacture, and from them is chiefly extracted that ſalt only which is moſt valuable in commerce. See SALT.

Many of theſe waters have been accurately analyſed by able chemiſts and phyſicians. But notwithſtanding theſe attempts, we are far from having all the certainty and knowledge that might be deſired on this important ſubject; for this kind of analyſis is perhaps the moſt difficult of any in chemiſtry.—Almoſt all mineral waters contain ſeveral different ſubſtances, which being united with water may form with each other numberleſs compounds. Frequently ſome of the principles of mineral waters are in ſo ſmall quantity, that they can ſcarcely be perceived; altho' they may have ſome influence on the virtues of the water, and alſo on the other principles contained in the water. The chemical operations uſed in the analyſis of mineral waters, may ſometimes occaſion eſſential changes in the ſubſtances that are to be diſcovered. And alſo, theſe waters are capable of ſuffering very conſiderable changes by motion, by reſt, and by expoſure to air.

Probably alſo the variations of the atmoſphere, ſubterranean changes, ſome ſecret junction of a new ſpring of mineral or of pure water, laſtly the exhauſtion of the minerals whence waters receive their peculiar principles, are cauſes which may occaſionally change the quality of mineral waters.

We need not therefore wonder that the reſults of analyſes of the ſame mineral waters made by different chemiſts, whoſe ſkill and accuracy are not queſtioned, ſhould be very different.

The conſequences of what we have ſaid on this ſubject are, That the examination of mineral waters is a very difficult taſk; that it ought not to be attempted but by profound and experienced chemiſts; that it requires frequent repetitions, and at different times; and laſtly, that no fixed general rules can be given concerning theſe analyſes.

As this matter cannot be thoroughly explained without entering into details connected with all the parts of chemiſtry, we ſhall here mention only the principal reſults, and the moſt eſſential rules, that have been indicated by the attempts hitherto made on this ſubject.

We may admit the diviſion or arrangement of mineral waters into certain claſſes, propoſed by ſome of the beſt chemiſts and naturaliſts.

Some of theſe waters are called *cold*, becauſe they are not naturally hotter than the atmoſphere. Some of them are even colder, eſpecially in ſummer.

Thoſe are called *hot mineral waters*, which in all ſeaſons are hotter than the air. Theſe are of various degrees of heat, and ſome of them are almoſt as hot as boiling water. In ſome mineral waters certain volatile, ſpirituous, and elaſtic principles may be perceived, by a very ſenſible piquant taſte: this principle is called the *gas* or the *ſpirit of waters*.

The waters which contain this principle are generally lighter than pure water. They ſparkle and emit bubbles, at their ſpring, but eſpecially when they are ſhook, and poured from one veſſel into another. They ſometimes break the bottles containing them, when theſe are well corked, as fermenting wines ſometimes do. When mixed with ordinary wine, they give to it the piquancy and ſparkling quality of Champaigne wine.

This volatile principle, and all the properties of the water dependent upon it, are loſt merely by expoſure to air, or by agitation. The waters containing this principle are diſtinguiſhed by the name of *ſpirituous mineral waters*, or *acidulous waters*.

Other divifions of mineral waters may be made relatively to fome of their predominant principles. Hence fome waters are called *acidulous*, *alkaline*, *martial*, *neutral*, &c.

When a mineral water is to be examined, we may obferve the following rules:

Experiments ought to be made near the fpring, if poffible.

The fituation of the fpring, the nature of the foil, and the neighbouring rifing grounds, ought to be examined.

Its fenfible qualities, as its fmell, tafte, colour, are to be obferved.

Its fpecific gravity and heat are to be afcertained by the hydroftatical balance and the thermometer.

From the properties above-mentioned of fpirituous mineral waters, we may difcover whether it be one of this clafs. For greater certainty we may make the following trial. Let the neck of a wet bladder be tied to the neck of a bottle containing fome of this water. By fhaking the water, any gas that it may contain will be difengaged, and will fwell the bladder. If the neck of the bladder be then tied with a ftring above the bottle, and be cut below this ftring, fo as to feparate the bladder from the bottle, the quantity and nature of the contained gas may be further examined.

Laftly, we muft obferve the changes that are fpontaneoufly produced upon the water in clofe and in open veffels, and with different degrees of heat. If by thefe means any matter be cryftallized or depofited, it muft be fet apart for further examination.

Thefe preliminary experiments and obfervations will almoft certainly indicate, more or lefs fenfibly, fomething concerning the nature of the water, and will point out the method to be followed in our further inquiry.

We muft then proceed to the decompofition of the water, either without addition, and merely by evaporation and diftillation, or with the addition of other fubftances, by means of which the matters contained in the water may be precipitated and difcovered. It is not material which of thefe two methods be firft practifed, but it is quite neceffary that the one fhould fucceed the other. If we begin by evaporating and diftilling, thefe operations muft be fometimes interrupted, that the feveral principles which rife at different times of the diftillation may be obtained and examined feparately, and alfo to allow the feveral falts that may be contained to cryftallize by the evaporation and by cold.

The fubftances generally found in mineral waters, are almoft always combinations of vitriolic acid, and thofe of marine acid, together with the feveral matters that thefe acids are capable of diffolving.

The following combinations of vitriolic acid are found in mineral waters.

1. *Volatile fulphureous acid.* This is feldom found, both becaufe it eafily lofes its phlogifton, and becaufe it muft almoft always meet with fome fubftance that it is capable of diffolving.

2. *Sulphur.* This is found fometimes fingly, but generally in form of a liver of fulphur. In thefe waters, fulphur is formed into a hepar by means of calcareous earth or of mineral alkali.

3. *Vitriolic falts with earthy bafes.* Thefe falts are frequently *felenitic*, that is, their acid is combined with a calcareous earth; or they are of the nature of Epfom falt, the bafis of which is magnefia. Sometimes, but not fo frequently, they are *aluminous*, when their acid happens to be united with an argillaceous earth.

4. *Vitriols. Martial vitriol* is frequently contained in mineral waters; *vitriol of copper* is fometimes, but feldom, and *vitriol of zinc* is ftill more rarely found in thefe waters. The vitriols of other metallic fubftances are fcarcely ever, but in very fingular cafes, found in water.

5. Laftly, *vitriolic falts with bafis of fixed alkali.* This is always *Glauber's falt.* Neither *vitriolated tartar* nor *vitriolic ammoniacal falt* are ever found, unlefs by fome fingular accident, in mineral waters.

The combinations of marine acid that are contained in mineral waters are *common falt*, and *marine falt with earthy bafis.* For no combinations of this acid with phlogifton are known, and it is very feldom found united with any metallic fubftance.

Compounds formed of the nitrous acid with an earthy bafis are very common in waters in this country, infomuch that fome have thought that nitre might be extracted from them advantageoufly in the way of trade. See CHEMISTRY, n° 178. In France, however, the cafe feems to be otherwife; for Mr Macquer determines, in his Chemical Dictionary, that the nitrous acid is not (nay that it *cannot*) be found in waters except by accident.

Thefe are the principal fubftances that form almoft all thefe waters. We fhall now fhew the proofs by means of which they may be difcovered in water, without decompofing the water by evaporation or by diftillation.

If any portion of difengaged acid or alkali be contained in water, it may be known by the tafte, by changing the colour of violets or of turnfol, and by adding the precife quantity of acid or of alkali that is neceffary for the faturation of the contained difengaged faline matter.

Sulphur, and liver of fulphur, may be difcovered in waters by their fingular fmell, and by the black colour which thefe fubftances give to white metals or to their precipitates, but efpecially to filver.

Vitriolic falts with earthy bafis may be difcovered in water by two proofs: 1. By adding fome fixed alkali, which decompofes all thefe falts, and precipitates their earthy bafis; and, 2. By adding a folution of mercury in nitrous acid, which alfo decompofes thefe falts, and forms a *turbith mineral* with their acid. But for this purpofe the folution of mercury ought to have a fuperabundant quantity of acid: for this folution, when perfectly faturated, forms a precipitate with any kind of water, as M. Rouelle has very juftly remarked; and indeed, all metallic folutions in any acids are ftrictly capable of decompofition by water alone, and fo much more eafily as the acid is more perfectly faturated with the metal.

Martial vitriol or iron combined with any acid, or even with gas, fhews itfelf in waters by blackening an infufion of galls, or by forming a Pruffian blue with the phlogifticated alkaline lixivium.

The vitriol of copper, or copper diffolved by any acid, may be difcovered by adding fome of the volatile ſpirit of ſal ammoniac, which produces a fine blue colour; or by the addition of clean iron, upon the ſurface of which the copper is precipitated in its natural or metallic ſtate.

Glauber's ſalt is diſcovered by adding a ſolution of mercury in nitrous acid, and forming with it a turbith mineral; or by cryſtallization.

Common ſalt contained in waters forms with a ſolution of ſilver in nitrous acid a white precipitate, or luna cornea. It may alſo be known by its cryſtallization. Marine ſalt with earthy baſis produces the ſame effect upon ſolution of ſilver. It alſo forms a precipitate when fixed alkali is added. The acrimony, bitterneſs, and deliqueſcency of this ſalt, ſerve to diſtinguiſh it.

The proofs related for the examination of mineral waters, are only thoſe which are moſt eſſential. Many others may be made to confirm the former proofs: but the details of theſe are too extenſive to be inſerted here. We ſhall add only two of theſe, becauſe they are very general, and may be very uſeful.

The firſt is the production of artificial ſulphur, or of the volatile ſulphureous acid; by which means the vitriolic acid may be diſcovered in any combination whatever. For this purpoſe, the matter to be examined muſt be mixed with any inflammable ſubſtance, and expoſed to a red heat. If this matter contained but a particle of vitriolic acid, it would be rendered ſenſible by the ſulphur, or by the volatile ſulphureous acid thence produced.

The ſecond general proof for mineral waters which we ſhall mention here, ſerves to diſcover any metallic ſubſtance whatever, diſſolved in water by any acid. This proof conſiſts in adding ſome of the liquor ſaturated by the colouring matter of Pruſſian blue, deſcribed under the article Chemistry, n° 391. This liquor produces no effects upon any neutral ſalts with earthy or alkaline baſes, but decompoſes all metallic ſalts: ſo that if no precipitate be formed upon adding ſome of this liquor, we may be certain that the water does not contain any metallic ſalt; and on the contrary, if a precipitate be formed, we may certainly infer that the water does contain ſome metallic ſalt.

Two kinds only of gas, or the ſpirituous volatile part of ſome waters, are hitherto known; of which one is the volatile ſulphureous acid, and the other is fixed air, See Air, Fixed *Air*, and Gas, *paſſim*. Air united ſuperabundantly with ſpirituous waters is the chief cauſe of their lightneſs, piquancy, and ſparkling.

When the nature and quantities of the principles contained in a mineral water are aſcertained by ſuitable experiments, we may imitate artificially this water, by adding to pure water the ſame proportions of the ſame ſubſtances, as Mr Venel has done in examining ſeveral waters, eſpecially that of Selters.

We may eaſily perceive the neceſſity of uſing no veſſels in theſe experiments, but ſuch as are perfectly clean and rinſed with diſtilled water; of weighing the products of the experiments very exactly; of making the experiments upon as large quantities of water as is poſſible, eſpecially the evaporations, cryſtallizations, and diſtillations; and of repeating all experiments ſeveral times. We may further obſerve, that the mixtures from which any precipitates might be expected ought to be kept two or three days, becauſe many of theſe precipitates require that time, or more, to appear, or to be entirely depoſited.

MINERALOGY,

1 IS that ſcience which teaches us the properties of mineral bodies, and by which we learn how to characteriſe, diſtinguiſh, and claſs them into a proper order.

2 Mineralogy ſeems to have been in a manner coeval with the world. Precious ſtones of various kinds appear to have been well known among the Jews and Egyptians in the time of Moſes; and even the moſt rude and barbarous nations appear to have had ſome knowledge of the ores of different metals. As the ſcience is nearly allied to chemiſtry, it is probable that the improvements both in chemiſtry and mineralogy have nearly kept pace with each other; and indeed it is but of late, ſince the principles of chemiſtry were well underſtood, that mineralogy hath been advanced to any degree of perfection. The beſt way of ſtudying mineralogy, therefore, is by applying chemiſtry to it; and not contenting ourſelves merely with inſpecting the outſides of bodies, but decompounding them according to the rules of chemiſtry. This method hath been brought to the greateſt perfection by Mr Pott of Berlin, and after him by Mr Cronſtedt of Sweden. To obtain this end, chemical experiments in the large way are without doubt neceſſary; but as a great deal of the mineral kingdom has already been examined in this manner, we do not need to repeat all thoſe experiments in their whole extent, unleſs ſome new and particular phenomena ſhould diſcover themſelves in thoſe things we are examining; elſe the tedioufneſs of thoſe proceſſes might diſcourage ſome from going farther, and take up much of the time of others that might be better employed. An eaſier way may therefore be adopted, which even for the moſt part is ſufficient, and which though made in miniature, yet is as ſcientifical as the common manner of proceeding in the laboratories, ſince it imitates that, and is founded upon the ſame principles. This conſiſts in making the experiments upon a piece of charcoal with the concentrated flame of a candle blown through a blow-pipe. The heat occaſioned by this is very intenſe; and the mineral bodies may here be burnt, calcined, melted, and ſcorified, &c. as well as in any great works.

A pocket-laboratory containing all things neceſſary for trying mineralogical experiments is repreſented, Plate CLXXXI. fig. 1. with the caſe, exactly of the form, bigneſs, and proportions as that made uſe of by Mr Cronſtedt: what alterations there may be wanted are eaſily found out by practice. 3

c, h. Are the two parts of which the Blow-*Pipe* conſiſts, and which are already deſcribed under that article.

a. A wax-candle, deſtined to be made uſe of, particularly in travelling, when no other candle is to be had.

b. A

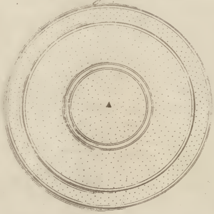

Fig. 3.

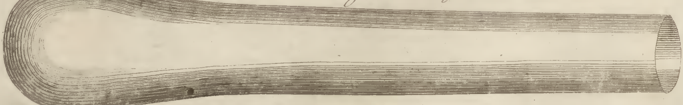
Fig. 4.

Fig. 5. Trough.

Fig. 4. Matrass.



A Bell Sculp.t

b. A pair of nippers, to handle ſo much the eaſier theſe things which are to be tried, becauſe they are generally ſmall particles: this ſerves alſo to touch and turn the ſubjects during the experiments, when they are hot and could not be well handled with the fingers.

d, e, f. Are three phials, to put the required fluxes in, viz. borax, the mineral alcali *ſal ſodæ*), and ſal fuſibile microcoſmicum.

g. A hammer, to break any part of a ſtone, when it is to be tried: this ſerves alſo to pound things with.

i. A magnifying-glaſs, neceſſary when the objects are too ſmall to be ſeen by the naked eye.

k. A ſteel to ſtrike fire, by which the hardneſs or ſoftneſs of the bodies is tried.

l. A loadſtone, to diſcover the preſence of iron.

m. A file, wherewith to diſtinguiſh natural gems, quartz-cryſtals, and artificial or coloured glaſſes, from one another.

n. A thin ſquare plate made of untempered ſteel, filed flat on one ſide to pound things upon, and poliſhed on the other ſide to hammer metals upon.

Above this ſteel plate *n*, and within the circle drawn round about it, is the place for a candleſtick. This candleſtick is ſhewn in plan, fig. 2. and in profile, fig. 3. It conſiſts of a round braſs plate; the point *a*, and the ring *b* round it, is inſtead of the ſocket in another candleſtick, which would here take up too much room.

Fig. 4. is a thin iron ring, a ſixth part of an inch high; within this ring the pounding and grinding of the things upon the ſteel plate, fig. 1. *n*, is performed, that they may not be loſt. In packing up, this ring is to be put looſe upon the candleſtick; and, as it is lower than the point of this, it does not take up much room in the caſe.

The whole caſe thus made, with all the inſtruments in it, is no more than one and an eighth part of an inch high, and conſequently not more troubleſome to be carried in the pocket than a ſmall book.

The pocket-laboratory here deſcribed, and the box for the acids, to be afterwards mentioned have been improved after the manner of Mr Cronſtedt, by a gentleman particularly acquainted with Mr Engeſtrom, from whom he learned this method of making mineralogical experiments. The bulk of the firſt has been reduced nine and a half cubic inches; its length being diminiſhed one ſixteenth of an inch, the breadth five and the depth two; notwithſtanding which, there is alſo added a piece of charcoal for trying the experiments, a flint, a piece of agaric tinder, and ſome matches for lighting the candle. The three phials *n m v* for the ſalts, are of different colours, to prevent any miſtake. The candleſtick has different concentric grooves for keeping the reſults of the trials ſeparate. The blow-pipe *e h* has a ſilver mouth-piece, and ſcrews in the middle of the ball, in order to clean out the moiſture with the greater eaſe; and the ſmall wire (Plate CLV. fig. 2. n° 1.) is more conveniently detached than fixed round it. The other box for the acids is reduced to leſs than a fourth of its original bulk, being exactly of the ſame ſize with the above. It contains two ſmall matraſſes (fig. 4.) for making ſolutions; a trough (fig. 5.) for waſhing the ore after its being pounded; and the three ſmall bottles with double ſtoppers, for the nitrous, muriatic, and vitriolic acids, have their reſpective initials cut on each.

Both theſe pocket-laboratories, made in the neateſt manner by an ingenious artiſt, may be had ready furniſhed with the pureſt acids, &c. at the General Office of Buſineſs, Arts, and Trade, N° 98. Wood-ſtreet, Cheapſide.

Whenever any thing is to be tried, one muſt not begin immediately with the blow-pipe; ſome preliminary experiments ought to go before, by which thoſe in the fire may afterwards be directed. For inſtance, a ſtone is not always homogeneous, or of the ſame kind throughout, although it may appear to the eye to be ſo: the magnifying-glaſs is therefore neceſſary, to diſcover the heterogeneous particles, if there be any; and theſe ought to be ſeparated, and every thing tried by itſelf, that the effects of two different things, tried together, may not be attributed to one alone. This might happen with ſome of the finer micæ, which are now and then found mixed with ſmall particles of quartz, ſcarcely to be perceived by the eye. The trapp (in German *ſchwartzſtein*) is alſo ſometimes mixed with very fine particles of feltſpat (*ſpatum ſcintillans*), or of calcareous ſpar, &c. After this experiment follows that to try the hardneſs of the ſtone in queſtion with the ſteel. The flint and garnet kinds are commonly known to ſtrike fire with the ſteel; but there are alſo other ſtones, though very ſeldom, found ſo hard as to ſtrike fire: a kind of trapp is found of that hardneſs in which no particles of feltſpat are to be ſeen. Coloured glaſſes reſemble true gems; but as they are very ſoft in compariſon to theſe, they are eaſily diſcovered by means of the file: the common quartz-cryſtals are harder than coloured glaſſes, but ſofter than the gems. The loadſtone diſcovers the preſence of iron, when it is not mixed in too ſmall a quantity in the ſtone, and often before the ſtone is roaſted. Some kinds of hæmatites, and particularly the cœruleſcens, is very like ſome other iron ores; but diſtinguiſhes itſelf from theſe by a red colour when pounded, and others giving a blackiſh powder, and ſo forth. 4

To manage the blow-pipe with eaſe requires ſome practice. A beginner blows generally too ſtrongly, which forces him to take breath very often, and then he draws the flame at the ſame time along into the blow-pipe: this is troubleſome for himſelf, and the experiment cools always a little at the ſame time. But the more experienced can breathe in through the noſe, and yet at the ſame time blow through the pipe, whereby a conſtant flame from the candle is kept up. The whole art conſiſts in conſtantly taking in air through the noſe, and with the tongue moderating its blowing out; ſo that the tongue performs nearly the office of a ſucker in a pump; or rather, the action of the noſe, lungs, and mouth, reſembles here the action of bellows with double partitions. In this manner there is no need of blowing violently, but only with a moderate and equal force; and thus the breath can never fail the operator. The only inconveniency attending it is, that the lips grow weak or tired, after having continued to blow for a while in one ſtrain; but they ſoon recover their former ſtrength by ceaſing to blow for ſome minutes. 5

Method of making Experiments.

The candle used for this purpose ought to be snuffed often, but so that the top of the wick may retain some fat in it, because the flame is not hot enough
6 when the wick is almost burnt to ashes; so that only the top must be snuffed off, because a low wick gives too small a flame. The blue flame is the hottest; this ought therefore to be forced out when a great heat is required, and only the point of the flame must be directed upon the subject which is to be essayed.

7 The piece of charcoal made use of in these experiments must not be of a disposition to crack. If this should happen, it must gradually be heated until it does not crack any more, before any essay is made upon it. If this be not observed, but the essay made immediately with a strong flame, small pieces of it will split off in the face and eyes of the essayer, and often throw along with them the matter that was to be essayed. Charcoal which is too much burnt consumes too quickly during the experiment, leaving small holes in it, wherein the matter to be tried may be lost: and charcoal that is burnt too little catches flame from the candle, burning by itself like a piece of wood, which likewise hinders the process.

8 Of those things that are to be essayed, only a small piece must be broke off for that purpose, not bigger than that the flame of the candle may be able to act upon it at once, if required; which is sometimes necessary; for instance, when the matter requires to be made red-hot throughout. A piece of about an eighth part of an inch square is reckoned of a moderate size, and fittest for experiments; seldom more, but rather less. This proportion is only mentioned as a direction in regard to the quantity, the figure being of no consequence at all, a piece broke off from a stone seldom or never happening to be square. But here it is to be observed, that the piece ought to be broke as thin as possible, at least the edges: the advantage thereof is easily seen, the fire having then more influence upon the subject, and the experiment being quicker made. This is particularly necessary to be observed when such stones are to be essayed, which, although in some respects fusible by themselves, yet resist considerably the action of the fire; because they may by these means be brought into fusion, at least at their edges, which else would have been very difficult if the piece had been thick.

9 Some of the mineral bodies are very difficult to keep steady upon the charcoal during the experiment, before they are made red-hot; because, as soon as the flame begins to act upon them, they split asunder with violence, and disperse. Such often are those which are of a soft consistence, or a particular figure, and which preserve the same figure in however minute particles they are broke; for instance, the calcareous spar, the sparry gypsum, sparry fluor, white sparry lead-ore, the potters ore, *(galena tessellata)*, the tessellated mock-lead or blende, &c. even all the common fluors which have no determinate figure, and most of the *mineræ metallorum calciformes crystallisatæ* or *spatosæ*: all these are not so compact as common hard stones; and therefore, when the flame is immediately pushed at them, the heat forces itself quickly through and into their clefts or pores, and causes this violent expansion and dispersion. Many of the clays are likewise apt to crack in the fire, which may be for the most part ascribed to the humidity, of which they always retain a portion. Besides those enumerated, there may be found now and then other mineral bodies of the same quality.

The only way of preventing this inconveniency, is to heat the body as slowly as possible. It is best first of all to heat that place of the charcoal where the piece is intended to be put on, and afterwards lay it thereon; a little crackling will then ensue, but commonly of no great consequence. After that, the flame is to be blown very slowly towards it, in the beginning not directly upon, but somewhat above it, and so approaching nearer and nearer with the flame until it becomes red-hot. This will do for the most part; but there are nevertheless some substances which, notwithstanding all these precautions, it is almost impossible to keep on the charcoal. Thus the fluors are generally the most difficult; and as one of their principal characters is discovered by their effects in the fire *per se*, they ought necessarily to be tried that way. To this purpose it is best to make a little hole in the charcoal to put the fluor in, and then to put another piece of charcoal as a covering upon this, leaving only a small opening for the flame to come in at, and to look at the proof. As this stone will nevertheless mostly split and fly about, a larger piece thereof than is before-mentioned must be taken, in order to have at least something of it left.

But if the experiment is to be made upon a stone whose effects one does not want to see in the fire *per se*, but rather with fluxes, then a piece of it ought to be forced down into melted borax, when always some part of it will remain in the borax, notwithstanding the greatest part may sometimes fly away by cracking. 10

As the stones undergo great alterations when exposed to the fire by themselves, whereby some of their characteristics, and often the most principal, are discovered, they ought first to be tried that way; observing what has been said before concerning the quantity of the matter, direction of the fire, &c. The following effects are generally the results of this experiment, *viz.* 11

1. Calcareous earth or stone, when it is pure, does never melt by itself, but becomes white and friable, so as to break freely between the fingers; and, if suffered to cool, and then mixed with water, it becomes hot, just as common quick-lime. As in these experiments only very small pieces are used, this last effect is best discovered by putting the proof on the outside of the hand, with a drop of water to it, when instantly a very quick heat is felt on the skin. When the calcareous substance is mixed with the vitriolic acid, as in the gypsum; or with clay, as in the marle; it commonly melts by itself; yet more or less difficultly in proportion to the differences of the mixtures: the gypsum produces generally a white, and the marle a grey glass or slag. When there is any iron in it, as in white iron ore, it becames dark, and sometimes quite black, &c. 12

2. The siliceæ never melt alone, but become generally more brittle after being burnt: such of them as are coloured become colourless, and the sooner when it does not arise from any contained metal; for instance, the topazes, amethists, &c. some of the precious stones, however, excepted. And such as are mixed with a quantity of iron grow dark in the fire, as some of the jaspers, &c. 13

3. The

Method of making Experiments.

3. The garnet-kind melt always into a dark ſlag; and ſometimes ſo eaſily, that it may be brought into a round globule upon the charcoal.

14 4. The argillaceæ, when pure, never melt, but be-
15 come white and hard: the ſame effects follow when they are mixed with phlogiſton: for inſtance, the ſoap-rock is eaſily cut with the knife; but, being burnt, it cuts glaſs, and would ſtrike fire with the ſteel, if as large a piece as is neceſſary for that purpoſe could be tried in this way. The ſoap-rocks are ſometimes found of a dark brown and nearly black colour, but become white in the fire, as a piece of China ware: however, care muſt be taken not to puſh the flame from the top of the wick, there being for the moſt part a ſooty ſmoke, which commonly will darken all that it touches; and if this is not obſerved, a miſtake in the experiment might eaſily happen: but if it is mixed with iron, as it is ſometimes found, it does not ſo eaſily part with its dark colour. The argillaceæ, when mixed with lime, melt by themſelves, as above-mentioned. When mixed with iron, as in the boles, they grow dark or black; and if the iron is not in too great a quantity, they melt alone into a dark ſlag: the ſame happens when they are mixed with iron and a little of the vitriolic acid, as in the common clay, &c.

16 5. The micaceæ and aſbeſtinæ become ſomewhat hard and brittle in the fire, and are more or leſs refractory, though they give ſome marks of fuſibility.

17 6. The fluors diſcover one of their chief characteriſtics by giving a light, like phoſphorus, in the dark, when they are ſlowly heated; but loſe this property, as well as their colour, as ſoon as they are made red-hot: they commonly melt in the fire into a white opaque ſlag, though ſome of them not very eaſily.

18 7. Some ſorts of the zeolites, a ſtone lately diſcovered, melt eaſily and foam in the fire, ſometimes nearly as much as borax, and become a frothy ſlag, &c.

19 8. A great many of thoſe mineral bodies which are impregnated with iron, as the boles, and ſome of the white iron ores, &c. as well as ſome of the other iron ores, *viz.* the bloodſtone, are not attracted by the loadſtone before they have been thoroughly roaſted, &c.

20 After the mineral bodies have been tried in the fire by themſelves, they ought to be melted with fluxes, to find out if they can be diſſolved or not, and ſome other phenomena attending this operation. To this purpoſe three different kinds of ſalts are uſed as fluxes, viz. *ſal ſodæ*, *borax*, and *ſal fuſibile microcoſmicum.*

21 The ſal ſodæ is not much uſed in theſe ſmall experiments, its effects upon the charcoal rendering it for the moſt part improper; becauſe, as ſoon as the flame begins to act upon it, it melts inſtantly, and is almoſt wholly attracted by the charcoal. When this ſalt is employed to make any experiment, but a very little quantity thereof is wanted at once, *viz.* about the cubical contents of an eighth part of an inch, more or leſs: this is laid upon the charcoal, and the flame blown on it with the blow-pipe; but as this ſalt commonly is in form of a powder, it is neceſſary to go on very ſoftly, that the force of the flame may not diſperſe the minute particles of the ſalt. As ſoon as it begins to melt, it runs along on the charcoal almoſt as melted tallow; and when cold, it is a glaſſy matter of an opaque dull colour ſpread on the coal. The moment it is melted, the matter which is to be tried ought to be put into it, becauſe otherwiſe the greateſt part of the ſalt will be ſoaked into the charcoal, and too little of it left for the intended purpoſe: the flame ought then to be directed on the matter itſelf, and if the ſalt ſpreads too much about, leaving the proof almoſt alone, it may be brought to it again by blowing the flame on its extremities, and directing it towards the ſubject of the experiment. In the eſſays made with this ſalt, it is true, we may find if the mineral bodies which are melted with it have been diſſoved by it or not; but we cannot tell with any certainty whether this is done haſtily and with force, or gently and ſlowly; whether only a leſs or a greater part of the matter has been diſſolved; nor can it be well diſtinguiſhed if the matter has imparted any weak tincture to the ſlag; becauſe this ſalt always bubbles upon the charcoal during the experiment, nor is it clear when cool; ſo that ſcarce any colour, except it be a very deep one, can be diſcovered, although it may ſometimes be coloured by the matter that has been tried.

The two other ſalts, *viz.* the *borax*, and the *ſal fu-* 22
ſibile microcoſmicum, are very well adapted to theſe experiments, becauſe they may by the flame be brought to a clear uncoloured and tranſparent glaſs; and as they have no attraction to the charcoal, they keep themſelves always upon it in a round globular form. The *ſal fuſibile microcoſmicum* is very ſcarce, and not to be met with in the ſhops; it is made of urine. For its preparation, ſee Chemistry, n° 308.

The quantity of theſe two ſalts required for an ex- 23
periment is almoſt the ſame as the ſal ſodæ; but as theſe ſalts are cryſtalliſed, and conſequently include a great deal of water, particularly the borax, their bulk is conſiderably reduced when melted, and therefore little more may be taken than the before-mentioned quantity.

The borax and microcoſmic ſalt, when expoſed to the 24
flame of the blow-pipe, bubble very much and foam before they melt to a clear glaſs; but more ſo the borax, which for the moſt part depends on the water they contain: and as this would hinder the eſſayer to make due obſervations on the phenomena of the experiment, the ſalt which is to be uſed muſt firſt be brought to clear glaſs before it can ſerve as a flux; it muſt therefore be kept in the fire until it is become ſo tranſparent that the cracks in the charcoal may be ſeen thro' it. This done, whatſoever is to be tried, is put to it, and the fire continued.

Here it is to be obſerved, that for the eſſays made 25
with any of theſe two fluxes on mineral bodies, no larger pieces of theſe muſt be taken than that all together they may keep a globular form upon the charcoal; becauſe then it may be better diſtinguiſhed in what manner the flux acts upon the matter during the experiment: if this is not obſerved, the flux, communicating itſelf with every point of the ſurface of the mineral body, ſpreads all over it, and keeps the form of this laſt, which commonly is flat, and by that means hinders the operator to obſerve all the phenomena which may happen. Beſides, the flux being in too ſmall a quantity, in proportion to the body to be tried, is too weak to act with all its force upon it. The beſt proportion, therefore, is about a third part of the mineral body to the flux. And, as the quantity of the flux (21, 23) makes a globe of a due ſize, in regard to the greateſt

Method of making Experiments.

greateſt heat that it is poſſible to procure in theſe experiments, the ſize of the mineral body (8) required when it is to be tried in the fire by itſelf, is too large on this occaſion, the third part of it being here almoſt ſufficient.

26 The ſal ſodæ, as has been ſaid before, is not of much uſe in theſe experiments; nor has it any particular qualities in preference to the two laſt-mentioned ſalts, except that it diſſolves the zeolites eaſier than the borax and the *ſal fuſibile microcoſmicum.*

This laſt-mentioned ſalt ſhews almoſt the ſame effects in the fire as the borax; and differs from this in very few circumſtances, of which one of the principal is, that, when melted with manganeſe, it becomes of a crimſon hue, inſtead of a jacinth colour, which borax takes.

This ſalt is, however, for its ſcarcity, ſtill very little in uſe, borax alone being that which is commonly uſed. Whenever a mineral body is melted with any of theſe two laſt mentioned ſalts, in the above-deſcribed manner, it is eaſily ſeen whether it is quickly diſſolved; becauſe in that caſe an effervescence ariſes, which laſts till the whole is diſſolved; or whether this is ſlowly done, in which caſe few and ſmall bubbles only riſe from the matter: likewiſe, if it cannot be diſſolved at all; becauſe then it is obſerved only to turn round in the flux without the leaſt bubble, and the edges look as ſharp as they were before.

27 In order further to illuſtrate what has been ſaid about theſe experiments, we ſhall mention ſome inſtances concerning the effects of borax upon the mineral bodies, *viz.*

28 1. The calcareous ſubſtances, and all thoſe ſtones which contain any thing of lime in their compoſition, diſſolve readily, and with effervescence, in the borax: this effervescence is the more violent, the greater the portion of lime contained in the ſtone. This, however, is not the only reaſon in the gypſum, becauſe both the conſtituents of this do readily mix with the borax, and therefore a greater effervescence ariſes in melting gypſum with the borax than lime alone.

29 2. The ſiliceæ do not diſſolve, unleſs ſome few, which contain a quantity of iron.

30 3. The argillaceæ, when pure, are not acted upon by the borax; but when they are mixed with ſome heterogeneous bodies, they are diſſolved, though very ſlowly; ſuch is, for inſtance, the ſtone marrow, the common clay, &c.

31 4. The granateæ, zeolites, and trapp, diſſolve but ſlowly.

32 5. The fluores, aſbeſtinæ, and micaceæ, diſſolve for the moſt part very eaſily; and ſo forth.

33 Some of theſe bodies melt to a colourleſs tranſparent glaſs with the borax; for inſtance, the calcareous ſubſtances when pure, the fluors, ſome of the zeolites, &c. Others tinge the borax with a green tranſparent colour; *viz.* the granateæ, trapp, ſome of the argillaceæ, ſome of the micaceæ and aſbeſtinæ: this green has its origin, partly from a ſmall portion of iron which the granateæ particularly contain, and partly from phlogiſton.

34 The borax cannot diſſolve but a certain quantity of a mineral body proportional to its own. Of the calcareous kind it diſſolves a vaſt quantity; but turns at laſt, when too much has been added, from a clear, tranſparent, to a white opaque ſlag. When the quantity of the calcareous matter exceeds but little in proportion, the glaſs looks very clear as long as it remains hot; but as ſoon as it begins to cool, a white half opaque cloud is ſeen to ariſe from the bottom, which ſpreads over the third, half, or more of the glaſs globe, in proportion to the quantity of calcareous matter; but the glaſs or ſlag is nevertheleſs ſhining, and of a glaſſy texture when broke: if more of this matter be added, the cloud riſes quicker and more opaque, and ſo by degrees till the ſlag becomes quite milk-white: it is then no more of a ſhining, but rather dry appearance, on the ſurface; is very brittle, and of a grained texture when broke.

Method of making Experiments.

All that has been ſaid hitherto of experiments upon mineral bodies, is only concerning the ſtones and earths. We now proceed to the metals and ores, in order to deſcribe the manner of examining theſe bodies, and particularly the management of the blowpipe in theſe experiments. An exact knowledge and nice proceeding are ſo much the more neceſſary here, as the metals are often ſo much digniſed in their ores as to be very difficultly known by their external appearance, and liable ſometimes to be miſtaken one for the other: ſome of the cobalt ores, for inſtance, reſemble much a pyrites arſenicalis; there are alſo ſome iron and lead ores which are nearly like one another, &c. 35

As the ores generally conſiſt of metals mineraliſed with ſulphur or arſenic, or ſometimes both together; they ought firſt to be expoſed to the fire by themſelves in order not only to determine with which of them they are mineraliſed, but alſo to ſet them free from theſe volatile mineraliſing bodies: And this alſo ſerves inſtead of calcination, by which they are prepared for further eſſays. 36

Here it muſt be obſerved, that, whenever any metal or fuſible ore is to be tried, a little concavity muſt be made in that place of the charcoal where the matter is to be put; becauſe, as ſoon as it is melted, it forms itſelf into a globular figure, and might then roll from the charcoal, if its ſurface was plain; but when borax is put to it, this inconveniency is not ſo much to be feared. 37

Whenever an ore is to be tried, a ſmall bit is broke off for that purpoſe, of ſuch a ſize as has been directed; this bit is laid upon the charcoal, and the flame blown on it ſlowly: Then the ſulphur or arſenic begins to part from it in form of ſmoke; theſe are eaſily diſtinguiſhed from one another by their ſmell, that of ſulphur being ſufficiently known, and the arſenic ſmelling like garlic. The flame ought to be blown very ſoftly, as long as any ſmoke is ſeen to ariſe from the ore; but after that the heat muſt be augmented by degrees, in order to make the calcination as perfect as poſſible. If the heat is applied very ſtrong from the beginning upon an ore that contains much of the ſulphur or arſenic, this ore will preſently melt, and yet loſe very little of its mineraliſing bodies, and by that means render the calcination very imperfect. It is, however, impoſſible to calcine the ores in this manner to the utmoſt perfection, which is eaſily ſeen in the following inſtance, viz. in melting down a calcined potter's ore with borax, it will be found to bubble upon the coal, which depends on the ſulphur 38 fulphur which is ftill left, the vitriolic acid of this uniting with the borax, and caufing this motion. However, lead, in its metallic form, melted in this manner, bubbles alone upon the charcoal, if any fulphur remains in it. But as the lead, as well as fome of the other metals, may raife bubbles upon the charcoal, although they are quite free from the fulphur, only by the flame's being forced too violently on it, thefe phænomena ought not to be confounded with each other.

39 The ores being thus calcined, the metals contained in them may be difcovered, either by being melted alone, or with fluxes: when they fhew themfelves either in their pure metallic ftate, or by tinging the flag with colours peculiar to each of them. In thefe experiments, it is not to be expected that the quantity of metal contained in the ore fhould be exactly determined; this muft be done in larger laboratories. This cannot, however, be looked upon as any defect, fince it is fufficient for a mineralogift only to find out what fort of metal is contained in the ore. There is another circumftance which is a more real defect in our little laboratory, which is, that fome ores are not at all able to be tried in it by fo fmall an apparatus: for inftance, the gold ore called *pyrites aureus*, which confifts of gold, iron, and fulphur. The greateft quantity of gold which this ore contains is about one ounce, or one ounce and an half, out of 100 pounds of the ore, the reft being iron and fulphur; and as only a very fmall bit is allowed for thefe experiments, the gold contained therein can hardly be difcerned by the eye, even if it could be extracted; but it goes along with the iron in the flag, this laft metal being in fo large a quantity in proportion to the other, and both of them being capable of mixture with each other.

All the kinds of blende, black-jack, which are mineralifed zinc ores, containing zinc, fulphur, and iron, cannot be tried this way, becaufe they cannot be perfectly calcined; and befides, the zinc flies off, when the iron fcorifies: neither can all thofe blendes which contain filver or gold mineralifed with them, be tried in this manner, which is particularly owing to the imperfect calcination: nor are the quickfilver ores fit for thefe experiments; the volatility of this femi-metal making it impoffible to bring it out of the poorer fort of ores; and the rich ores which fweat out the quickfilver, when kept clofe in the hand, not wanting any of thefe effays, &c. Thofe ores ought to be effayed in larger quantities, and by methods which cannot be applied upon a piece of charcoal.

40 Some of the rich filver ores are eafily tried: for inftance, *minera argenti vitrea*, commonly called *filver-glafs*, which confifts only of filver and fulphur. When this ore is expofed to the flame, it melts inftantly, and the fulphur goes away in fume, leaving the filver pure upon the charcoal, in a globular form. If this filver fhould happen to be of a dirty appearance, which often is the cafe, then it muft be melted anew with a very little borax; and after it has been kept in fufion for a minute or two, fo as to be perfectly melted and red-hot, the proof is fuffered to cool: it may then be taken off the coal, and being laid upon the fteel-plate, the filver is feparated from the flag by one or two ftrokes of the hammer. Here the ufe of the iron ring is manifeft; for this ought firft to be placed upon the plate, to hinder the proof from flying off by the violence of the ftroke, which otherwife would happen. The filver is then found inclofed in the flag of a globular form, and quite fhining, as if it were polifhed. When a large quantity of filver is contained in a lead ore, viz. in a potter's ore, it can likewife be difcovered through the ufe of the blow-pipe.

Of the pure tin ores, the tin may be melted out in its metallic ftate. Some of thefe ores melt very eafily, and yield their metal in quantity, if only expofed to the fire by themfelves: but others are more refractory, and as thefe melt very flowly, the tin, which fweats out in form of very fmall globules, is inftantly burnt to afhes, before thefe globules have time to unite in order to compofe a larger globe which might be feen by the eye, and is not fo foon deftroyed by the fire; it is therefore neceffary to add a little borax to thefe from the beginning, and then to blow the flame violently at the proof. The borax does here preferve the metal from being too foon calcined; and even contributes to the readier collecting of the fmall metallic particles, which foon are feen to form themfelves into a globule of metallic tin at the bottom of the whole mafs, neareft to the charcoal. As foon as fo much of metallic tin is produced as is fufficient to convince the operator of its prefence, the fire ought to ceafe, although not the whole of the ore be yet melted; becaufe feldom, or rather never, the whole of this kind of ore can be reduced into metal by means of thefe experiments, a great deal thereof always being calcined: and if the fire is continued too long, perhaps even the metal, already reduced, may likewife be burnt to afhes; for the tin is very foon calcined by the fire. 41

Moft part of the lead ores may be brought to a metallic lead upon the charcoal. The *mineræ plumbi calciformes*, which are pure, are eafily melted into lead: but fuch of them as are mixed with an *ochra ferri*, or any kind of earth, as clay, lime, &c. yield very little of lead, and even nothing at all, if the heterogenea are combined therewith in any large quantity: this happens even with the *minera plumbi calciformis arfenica mixta*. Thefe, therefore, are not to be tried but in larger laboratories. However, every mineral body fufpected to contain any metallic fubftance, may be tried by the blow-pipe, fo as to give fufficient proofs whether it contains or not, by its effects being different from thofe of the ftone or earths, &c. 42

The *mineræ plumbi mineralifatæ* leave the lead in a metallic form, if too large a quantity of iron be not mixed with it. For example, when a teffellated or fteel-grained lead-ore is expofed to the flame, its fulphur, and even the arfenic, if there be any, begins to fume, and the ore itfelf immediately to melt into a globular form; the reft of the fulphur continues then to fly off, if the flame is blown flowly upon the mafs; inftead of that, very little of the fulphur will go off, if the flame is forced violently on it: in this cafe, it rather happens that the lead itfelf crackles and diffipates, throwing about very minute metallic particles. 43

The

Of Experiments. The fulphur being driven out as much as poffible, which is known by finding no fulphureous vapour in fmelling at the proof, the whole is fuffered to cool, and then a globule of metallic lead will be left upon the coal. If any iron is contained in the lead ore, the lead which is melted out of it is not of a metallic fhining, but rather of a black and uneven furface: a little borax muft in this cafe be melted with it, and as foon as no bubble is feen to rife any longer from the metal into the borax, the fire muft be difcontinued: when the mafs is grown cold, the iron will be found fcorified with the borax, and the lead left pure and of a fhining colour.

44 The borax does not fcorify the lead in thefe fmall experiments, when it is pure: if the flame is forced with violence on it, a bubbling will enfue, refembling that which is obferved when borax diffolves a body melted with it; but when the fire ceafes, the flag will be perfectly clear and tranfparent, and a quantity of very minute lead particles will be feen fpread about in the borax, which have been torn off from the mafs during the bubbling.

45 If fuch a lead ore is rich in filver, this laft metal may likewife be difcovered by this experiment; becaufe, as the lead is volatile, it may be forced off, and the filver remain. To effect this, the lead, which is melted out of the ore, muft be kept in conftant fufion with a flow heat, that it may be confumed. This end will be fooner obtained, and the lead part quicker, if, during the fufion, the wind through the blow-pipe be directed immediately, though not forcibly, upon the melted mafs itfelf, until it begins to cool, then the fire muft be directed on it again. The lead, which is already in a volatilifing ftate, will by this artifice be driven out in form of a fubtile fmoke; and by thus continuing by turns to melt the mafs, and then to blow off the lead, as has been faid, until no fmoke is any longer perceived, the filver will at laft be obtained pure. The fame obfervation holds good here alfo which was made about the gold, that, as none but very little bits of the ores can be employed in thefe experiments, it will be difficult to extract the filver out of a pure ore; for fome part of it will fly off with the lead, and what might be left is too little to be difcerned by the eye. The filver which by this means is obtained is eafily diftinguifhed from lead by the following external marks, viz. that it muft be red-hot before it can be melted: it cools fooner than lead: it has a filver colour; that is to fay, brighter and whiter than lead: and is harder to beat with the hammer.

46 The *mineræ cupri calciformes*, (at leaft fome of them) when mixed with too much ftone or earth, are eafily reduced to copper with any flux: if the copper is found not to have its natural bright colour, it muft be melted with a little borax, which purifies it. Some of thefe ores do not at all difcover their metal, if not immediately melted with borax; the heterogenea contained in them hindering the fufion, before thefe are fcorified by the flux.

47 The grey copper ores, which only confift of copper and fulphur, are tried almoft in the fame manner as the preceding. Being expofed to the flame by themfelves, they will be found inftantly to melt, and part of their fulphur to go off. The copper may afterwards be obtained in two ways: the one, by keeping the proof in fufion for about a minute, and then fuffering it to cool; when it will be found to have a dark and uneven appearance externally, but which, after being broke, difcovers the metallic copper of a globular form in its centre, furrrounded with a regule, which ftill contains fome fulphur and a portion of the metal: the other, by being melted with borax, which laft way fometimes makes the metal appear fooner.

The *mineræ cupri pyritaceæ*, containing copper, fulphur, and iron, may be tried with the blow-pipe, if they are not too poor: in thefe experiments the ore ought to be calcined, and after that the iron fcorified. For this purpofe a bit of the ore muft be expofed to a flow flame, that as much of the fulphur as poffible may part from it before it is melted; becaufe the ore commonly melts very foon, and then the fulphur is more difficult to drive off. After being melted, it muft be kept in fufion with a ftrong fire, for about a minute, that a great part of the iron may be calcined: and, after that, fome borax muft be added, which fcorifies the iron, and turns with it to a black flag. If the ore is very rich, a metallic copper will be had in the flag, after the fcorification: if the ore is of a moderate riehnefs, the copper will ftill retain a little fulphur, and fometimes iron: the product will therefore be brittle, and muft with great caution be feparated from the flag, that it may not break into pieces; and if this product is afterwards treated in the fame manner as before faid, in fpeaking of the grey copper ores, the metal will foon be produced. But, if the ore is poor, the product after the firft fcorification muft be brought into fufion, and afterwards melted with fome frefh borax, in order to calcine and fcorify the remaining portion of iron; after which it may be treated as mentioned n° 47. The copper will, in this laft cafe, be found in a very fmall globule. 48

The copper is not very eafily fcorified with this apparatus, when it is melted together with borax; unlefs it has firft been expofed to the fire by itfelf for a while, in order to be calcined. When only a little of this metal is diffolved, it inftantly tinges the flag of a reddifh-brown colour, and moftly opaque; but as foon as this flag is kept in fufion for a little while, it becomes quite green and tranfparent: and thus the prefence of the copper may be difcovered by the colour, when it is concealed in heterogeneous bodies, fo as not to be difcovered by any other experiment. 49

If metallic copper is melted with borax by a flow fire, and only for a very little time, the glafs, or flag, becomes of a fine tranfparent blue or violet colour, inclining more or lefs to the green: but this colour is not properly owing to the copper, but it may rather be to its phlogifton; becaufe the fame colour is to be had in the fame manner from iron: and thefe glaffes which are coloured with either of thefe two metals, foon lofe their colour if expofed to a ftrong fire, in which they are made quite clear and colourlefs. Befides, if this glafs, tinged blue with the copper, is again melted with more of this metal, it becomes of a good green colour, which for a long time keeps unchanged in the fire. 50

The iron ores, when pure, can never be melted by themfelves, through the means of the blow-pipe alone; 51 nor

nor do they yield their metal, when melted with fluxes, becaufe they require too ftrong a heat to be brought into fufion; and, as both the ore and the metal itfelf very foon lofe their phlogifton in the fire, and cannot be fupplied with a fufficient quantity from the charcoal, fo likewife they are very foon calcined in the fire. This eafy calcination is alfo the reafon why the fluxes, for inftance borax, readily fcorify this ore, and even the metal itfelf. The iron lofes its phlogifton in the fire fooner than the copper, it is therefore eafier fcorified; and this is the principle on which the experiment mentioned n° 48. is founded.

52 The iron is, however, difcovered without much difficulty, although it be mixed but in a very fmall quantity with heterogeneous bodies. The ore, or thofe bodies which contain any large quantity of the metal, are all attracted by the loadftone, fome without any previous calcination, and others not till after having being roafted. When a clay is mixed with a little iron, it commonly melts by itfelf in the fire; but, if this metal is contained in a limeftone, it does not promote the fufion, but gives the ftone a dark, and fometimes a deep black colour, which always is the character of iron. A *minera ferri calciformis pura cryftallifata*, is commonly of a red colour: this being expofed to the flame, becomes quite black; and is then readily attracted by the loadftone, which it was not before. Befides thefe figns, the iron difcovers itfelf, by tinging the flag of a green tranfparent colour, inclining to brown, when only a little of the metal is fcorified; but as foon as any large quantity thereof is diffolved in the flag, this becomes firft a blackifh brown, and afterwards quite black and opaque.

53 Bifmuth is known by its communicating a yellowifh-brown colour to borax; and arfenic by its volatility, and garlick fmell. Antimony, both in form of regulus and ore, is wholly volatile in the fire, when it is not mixed with any other metal (except arfenic), and is known by its particular fmell; eafier to be diftinguifhed, when once known, than defcribed. When the ore of antimony is melted upon the charcoal, it bubbles conftantly during its volatilifing.

54 Zinc ores are not eafily tried upon the coal (n° 39.) But the regulus of zinc, expofed to the fire upon the charcoal, burns with a beautiful blue flame, and forms itfelf almoft inftantly into white flowers, which are the common flowers of zinc.

55 Cobalt is particularly remarkable for giving to the glafs a blue colour, which is the zaffre or fmalt. To produce this, a piece of cobalt ore muft be calcined in the fire (36, 37.) and afterwards melted with borax. As foon as the glafs, during the fufion, from being clear, feems to grow opaque it is a fign that it is already tinged a little; the fire is then to be difcontinued, and the operator muft take hold, with the nippers, of a little of the glafs whilft yet hot, and draw it out flowly in the beginning, but afterwards very quick, before it cools, whereby a thread of the coloured glafs is procured, more or lefs thick, on which the colour may eafier be feen againft the day or candle light than if it were left in a globular form. The thread melts eafily if only put in the flame of the candle, without the help of the blow-pipe.

If this glafs is melted again with more of the cobalt, and kept in fufion for a while, the colour becomes very deep; and thus the colour may be altered, according to pleafure.

When the cobalt ore is pure, or at leaft contains but little iron, a cobalt regulus is almoft inftantly produced in the borax, during the fufion: but when it is mixed with a quantity of iron, this laft metal ought firft to be feparated, which is eafily performed, fince it fcorifies fooner than the cobalt; therefore, as long as the flag retains any brown or black colour (55.) it muft be feparated, and melted again with frefh borax, until it fhew the colour. 56

Nickel is very feldom to be had, as its ores are feldom free from mixtures of other metals. It is very difficultly tried with the blow-pipe. However, when this femi-metal is mixed with iron and cobalt, it is eafily freed from thefe heterogeneous metals, and reduced to a pure nickel regulus, by means of fcorification with borax, in the fame manner as is mentioned (46.), becaufe both the iron and cobalt fooner fcorify than the nickel. The regulus of nickel itfelf is of a green colour, when calcined: it requires a pretty ftrong fire before its melts, and tinges the borax with a jacinth colour. Manganefe gives the fame colour to borax; but its other qualities are quite different, fo as not to be confounded with the nickel. 57

Thus we have briefly defcribed the ufe of the blow-pipe, and the method of employing it in the ftudy of mineralogy. Any gentleman who is a lover of this fcience, will, by attending to the rules here laid down, be able in an eafy manner to amufe himfelf in difcovering the properties of thofe works of nature which the mineral kingdom furnifhes us with. The hufbandman may by its help find out what forts of ftones earths, ores, &c. there are on his eftate, and to what œconomical ufes they may be employed. The fcientific mineralift may, by examining into the properties and effects of the mineral bodies, difcover the natural relation thefe bodies ftand in to each other, and thereby furnifh himfelf with materials for eftablifhing a mineral fyftem, founded on fuch principles as nature herfelf has laid down in them; and this in his own ftudy, without being forced to have recourfe to large laboratories, crucibles, furnaces, &c. which is attended with a great deal of trouble, and is the reafon why fo few can have an opportunity of gratifying their defire of knowledge in this part of natural hiftory. It is to be hoped, that the more general its ufe becomes, the more and fooner will its imperfections be removed, and fuch additions made as may be found neceffary and convenient. We fhall now add fome hints towards thefe improvements, leaving to the judicious practitioner the manner of completing them. 58

A greater number of fluxes might perhaps be found out, whofe effects on mineral bodies might be different from thefe already in ufe, whereby more diftinct characters of thofe mineral bodies might be difcovered, which now either fhew ambiguous ones, or which are almoft impoffible to be exactly tried by the blow-pipe. Inftead of the fal fodæ, fome other falts might be found out, more fit for thefe experiments. But it is very neceffary not to make ufe of any other fluxes than fuch as have no attraction to the charcoal: if they at the fame time are clear and tranfparent when melted, as the borax and *fal fufibile microcofmicum*, it is ftill bet- 59

Of Experiments.

ter: however, the tranſparency or opacity are of no great conſequence, if a ſubſtance is eſſayed only in order to diſcover its fuſibility, without any attention to its colour: in which caſe, ſome metallic ſlag perhaps might be uſeful.

60 When ſuch ores are to be reduced whoſe metals are very apt to calcine, ſuch as tin, zinc, &c. it might perhaps be of ſervice to add ſome phlogiſton, ſince the charcoal cannot afford enough of it in the open fire of theſe eſſays: ſuch a phlogiſton might be the hard reſin, or ſome ſuch body. The manner of melting the volatile metals out of their ores *per deſcenſum* might alſo perhaps be imitated: for inſtance, a hole might be made in the charcoal, wide above, and very narrow at the bottom; a little piece of ore being then laid at the upper end of the hole, and covered with ſome very ſmall pieces of the charcoal, the flame muſt be directed on the top: the metal might, perhaps, by this method gather in the hole below, removed from the violence of the fire, particularly if the ore is very fuſible, &c.

61 The uſe of the pocket laboratory, as here deſcribed, is chiefly calculated for a travelling mineraliſt. But a perſon who is always reſiding at one and the ſame place, may by ſome ſmall alteration make it more commodious to himſelf, and avoid the trouble of blowing with the mouth. For this purpoſe he may have the blow-pipe go through a hole in a table, and fixed underneath to a ſmall pair of bellows with double bottoms, ſuch as ſome of the glaſs-blowers uſe, and then nothing more is required than to move the bellows with the feet during the experiment; but in this caſe a lamp may be uſed inſtead of a candle. This method would be attended with a ſtill greater advantage, if there were many ſuch parts as fig. 2. n° 2. (Plate LV. Vol. II.) the openings of which were of different dimenſions: theſe parts might by means of a ſcrew be faſtened to the main body of the blow-pipe, and taken away at pleaſure. The benefit of having theſe nozzles of different capacities at their ends, would be that of exciting a ſtronger or weaker heat as occaſion might reqnire. It would only be neceſſary to obſerve, that in proportion as the opening of the pipe (nozzle) is enlarged, the quantity of the flame muſt be augmented by a thicker wick in the lamp, and the force of blowing increaſed by means of weights laid on the bellows. A much more intenſe heat would thus be procured by a pipe of a conſiderable opening at the end, by which the experiments might undoubtedly be carried farther than with the common blow-pipe.

62 A traveller, who has ſeldom an opportunity of carrying many things along with him, may very well be contented with this pocket laboratory, and its apparatus, which is ſufficient for moſt part of ſuch experiments as can be made on a journey. There are, however, other things very uſeful to have at hand on a journey, which ought to make a ſecond part of the pocket-laboratory, if the manner of travelling does not oppoſe it: this conſiſts of a little box including the different acids, and one or two matraſſes, in order to try the mineral bodies in liquid menſtrua, if required.

63 Theſe acids are, the acid of nitre, of vitriol, and of common ſalt. Moſt of the ſtones and earths are attacked, at leaſt in ſome degree, by the acids; but the calcareous are the eaſieſt of all to be diſſolved by them, which is accounted for by their calcareous properties. The acid of nitre is that which is moſt uſed in theſe experiments; it diſſolves the limeſtone, when pure, perfectly, with a violent efferveſcence, and the ſolution becomes clear: when the limeſtone enters into ſome other body, it is nevertheleſs diſcovered by this acid, through a greater or leſſer efferveſcence in proportion to the quantity of the calcareous particles, unleſs theſe are ſo few as to be almoſt concealed from the acid by the heterogeneous ones. In this manner, a calcareous body, which ſometimes nearly reſembles a ſiliceous or argillaceous one, may be known from theſe latter, without the help of the blow-pipe, only by pouring one or two drops of this acid upon the ſubject, which is very convenient when there is no opportunity nor time for uſing this inſtrument.

The gypſa, which conſiſt of lime and the vitriolic acid, are not in the leaſt attacked by the acid of nitre, if they contain a ſufficient quantity of their own acid, becauſe the vitriolic acid has a ſtronger attraction to the lime than the acid of nitre: but if the calcareous ſubſtance is not perfectly ſaturated with the acid of vitriol, then an efferveſcence ariſes with the acid of nitre, more or leſs in proportion to the want of the vitriolic acid. Theſe circumſtances are often very eſſential in diſtinguiſhing the calcarei and gypſa from one another. 64

The acid of nitre is likewiſe neceſſary in trying the zeolites, of which ſome ſpecies have the ſingular effect to diſſolve with efferveſcence in the abovementioned acid; and within a quarter of an hour, or even ſometimes not until ſeveral hours after, to change the whole ſolution into a clear jelly, of ſo firm a conſiſtence, that the glaſs, wherein it is contained, may be reverſed, without its falling out. 65

If any mineral body is tried in this menſtruum, and only a ſmall quantity is ſuſpected to be diſſolved, tho' it was impoſſible to diſtinguiſh it with the eye during the ſolution, it can eaſily be diſcovered by adding to it *ad ſaturitatem* a clear ſolution of an alkali, when the diſſolved part will be precipitated, and fall to the bottom. For this purpoſe the ſal ſodæ may be very uſeful. 66

The acid of nitre will ſuffice for making experiments upon ſtones and earths; but if the experiments are to be extended to the metals, the other two acids are alſo neceſſary. As the acids are very corroſive, they muſt not be kept in the ordinary pocket-laboratory, already deſcribed, for fear of ſpoiling the other apparatus, if the ſtoppers ſhould happen not to fit exactly to the necks of the bottles, and ſome of the acid ſhould be ſpilt. 67

For theſe acids a ſeparate box muſt be made, which is eight inches and three quarters long, four inches broad, and five inches high (A). In this box are three long and narrow bottles, containing the acids, placed upright at one end of it, two glaſs matraſſes laid horizontally in the upper part, and a little drawer underneath, made on purpoſe to fill the empty room below the matraſſes, and to give the box a regular form; and as charcoal is not every where to be met with in travelling, a piece ought always to be kept in this drawer for the uſe of the blow-pipe. 68

In

(A) But theſe dimenſions, originally directed, have been ſince reduced, as mentioned under n° 3. par. *penult*.

69 In order to keep the acids more close in the bottles, since the glass-stopper is not always sufficient, there is a glass-cover besides, made so as to screw round the neck of the bottle; and if this is nicely made, nothing can come through, though the box be inclined, or even reversed, which sometimes may happen. The form of the glass matrasses is seen fig. 4. They ought to be very thin at the bottom, that they may not crack by being suddenly put over the fire or taken off it. In these matrasses solutions may very easily be made over the flame of a candle: every mineral body capable of being affected by the acids in this degree of heat, may here be dissolved, and particularly the metals.

Plate CLXXXI.

70 Another instrument is likewise necessary to a complete pocket-laboratory, *viz.* a washing-trough; in which the mineral bodies, and particularly the ores, may be separated from each other, and from the adherent rock, by means of water.

This trough is very common in the laboratories, and is used of different sizes; but here only one is required of a moderate size, such as twelve inches and a half long, three inches broad at the one end, and one inch and a half at the other end (B), sloping down from the sides and the broad end to the bottom, where it is three quarters of an inch deep: we have given a figure of it in fig. 5. It is commonly made of wood, which ought to be chosen smooth, hard, and compact, wherein are no pores in which the minute grains of the pounded matter may conceal themselves.

It is to be observed, that if any matter is to be washed which is suspected to contain some native metal, as silver or gold; a trough should be procured for this purpose, of a very shallow slope, because the minute particles of the native metal have then more power to assemble together at the broad end, separate from the other matter.

The magnagement of this trough, or the manner of washing, consists chiefly in this: that when the matter is mixed with about three or four times its quantity of water in the trough, this is kept very loose between two fingers of the left hand, and some light strokes given on its broad end with the right, that it may move backwards and forwards, by which means the heaviest particles assemble at the broad and upper end, from which the lighter ones are to be separated by inclining the trough and pouring a little water on them. By repeating this process, all such particles as are of the same gravity may be collected together, separate from those of a different gravity, provided they all were before equally pounded; though such as are of a clayish nature, are often very difficult to separate from the rest, which, however, is of no great consequence to a skilful and experienced washer. The washing process is very necessary, as there are often rich ores, and even native metals, found concealed in earths and sand in so minute particles, as not to be discovered by any other means.

ARRANGEMENT *of Mineral Bodies.*

71 THE bodies belonging to the mineral kingdom are divided into four different classes, viz.

1. *Earths*, or those substances which are not ductile, are mostly indissoluble in water or oil, and preserve their constitution in a strong heat (C).
2. *Salts*: these dissolve in water, and give it a taste; and when the quantity of water required to keep them in dissolution is evaporated, they concrete again into solid and angular bodies.
3. *Inflammables*, which can be dissolved in oils, but not in water, and are inflammable.
4. *Metals*, the heaviest of all bodies; some of which are malleable, and some can be decompounded.

Here, however, it must be observed, that these classes are blended one with another; and therefore some exceptions must be allowed in every one of them: for instance, in the first class, the calcareous earth is in some measure dissoluble in water, and pipe-clay with some others diminish somewhat in their bulk when kept for a long time in a calcining heat. In the third class, the calx of arsenic has nearly the same properties as salts; and there is no possible definition of salt, that can exclude the arsenic, though at the same time it is impossible to arrange it elsewhere than among the semi-metals. In the fourth class it is to be observed, that the metals and semi-metals, perfect or imperfect, have not the same qualities common to them all; because some of them may be calcined, or deprived of their phlogiston, in the same degree of fire in which others are not in the least changed, unless particular artifices or processes are made use of: some of them also may be made malleable, while others are by no means to be rendered so. That the convex surface metals take after being melted, is a quality not particularly belonging to them, because every thing that is perfectly fluid in the fire, and has no attraction to the vessel in which it is kept, or to any added matter, takes the same figure; as we find borax, *sal fusibile microcosmicum*, and others do, when melted upon a piece of charcoal: therefore, with regard to all that has been said, it is hardly worth while to invent such definitions as shall include several species at once; we ought rather to be content with perfectly knowing them separately.

The FIRST CLASS.

EARTHS, are those mineral bodies, not ductile, for the most part not dissoluble in water or oils, and that preserve their constitution in a strong heat. 72

These earths are here arranged according to their constituent parts, so far as hitherto discovered, and are divided into nine orders.

The FIRST ORDER.

The *Calcareous* kinds. These, when pure, and free from heterogeneous matters, have the following qualities common to them all: 73

1. That they become friable when burnt in the fire, and afterwards fall into a white powder.
2. That their falling into powder is promoted, if, after being burnt, they are thrown into water, whereby a strong heat arises, and a partial solution.
3. They cannot be melted by themselves into glass in the strongest fire.
4. When burnt, they augment the causticity of the lixivium of potashes.

5. They

(B) Reduced dimensions are mentioned under n° 3. par *ult*.

(C) By *earths*, the author (Mr Cronstedt) does not mean (strictly speaking) only earths, but includes all the kinds of stones or fossils not inflammable, saline, or metallic.

5. They are diffolved in acids with effervefcence, in the following manner:
   a. The acid of vitriol partly unites with them, and forms a precipitate, which is a gypfeous earth; and partly fhoots into felenitical cryftals with that which is kept diffolved, after a due evaporation.
   b. With the acid of common falt they make a fal ammoniacum fixum, which alfo partly precipitates itfelf.
   c. The acid of nitre diffolves them perfectly, and does not part with them again, unlefs fome alkaline falt is added.
6. They melt eafily with borax into a glafs, which fuffers impreffions in a degree of heat below ignition.
7. They likewife fufe into a glafs with *fal fufibile microcofmicum* with an effervefcence (D)
8. They melt the readieft of all kinds of ftones, with the calces, into a corrofive glafs or flag.
9. They have alfo fome power of reducing certain metallic earths or calces; for inftance, thofe of lead and of bifmuth, and likewife, tho' in a lefs degree, thofe of copper and of iron: thus,
10. Do they, in this laft-mentioned article (9.), as well as in other circumftances, refemble a fixed alkaline falt; from whence alfo this whole kind is very often, and properly, called *alkaline earths*.

The calcareous earth is found,

74 I. Pure,

1. In form of powder. *Agaricus mineralis*, or *lac lunæ*.
   a. White, is found in moors, and at the bottom of lakes.
   b. Red.
   c. Yellow.—This kind of earth feems to be an impalpable powder of mouldered limeftones abraded and collected by the waters, and is therefore common in the neighbourhoods where limeftones are found: and tho' the ftone be at fome diftance, which is fometimes the cafe, ftill nothing contradictory appears in this opinion of the origin of this fpecies; fince in that cafe it has only been carried farther by the greater rapidity of a ftronger current of water. When this earth is found in the clefts of rocks, it receives more pompous names; fuch as *gur*, *lac lunæ*, &c. It burns readily into lime, if it is previoufly ftamped, that it may better cohere: it is then, or in its native ftate, ufed for white-wafhing, but eafily rubs off by the leaft touch. At certain places in the province of Smoland in Sweden, there is found in the moors a white earth, which, by its external appearance, refembles the fpecies here defcribed; but it does not fhow any marks of effervefcence with acids, nor does it burn into lime. It were to be wifhed, that thofe who have an opportunity of getting any quantity of this latter earth, would undertake to examine it better.

75 2. Friable and compact. Chalk, *creta*.
   a. White, *creta alba*, is found in England, France, and in the province of Skone in Sweden, in which laft place it is only found adherent to flint. In the two firft kingdoms there are large ftrata of this fubftance, in which flint is imbedded. This feems to indicate, that the loofe flints, or thofe difperfed on the furface of the earth, have been by fome caufes carried from their native beds; but, as yet, no one can prove, that chalk and flint are of the fame conftituent parts.—Chalk is, however a vague name, alfo applied to other earths; whence we hear of chalks of various colours; but there are none which are known to be of a calcareous nature, except this kind here defcribed, and of which there are no other varieties, otherwife than in regard to the loofenefs of the texture, or the finenefs of the particles.

3. Indurated, or hard; *Terra calcarea indurata*. Limeftone; *Lapis calcareus*. 76
   A. Solid, of no vifible particles, or not granulated.
   This kind varies in regard to hardnefs and colour; for inftance,
   a. White.
   b. Whitifh yellow.
   c. Flefh-coloured, found in loofe maffes.
   d. Reddifh brown.
   e. Grey.
   f. Variegated with many colours, and particularly called *marble*.
   g. Black.

   B. Grained or granulated limeftone; *Lapis calcareus particulis granulatis*. 77
   1. Coarfe-grained and of a loofe texture, called *falt-flag* in Swedifh, from its refemblance to lumps of falt.
      a. Reddifh yellow. *b.* White.
      The grained flux fpar is alfo fometimes called *falt-flag*.
   2. Fine-grained.
      a. White. *b.* Semi-tranfparent, from Solfatara in Italy, in which native brimftone is found.
   3. Very fine grained.
      a. White and green.
      b. White and black.—This fpecies has often as beautiful colours as thofe commonly called *marbles*; but the texture and coherency of its particles will not admit of a good polifh.

   C. Scaly limeftone; *Lapis calcareus particulis fquamofis five fpatofis*. 78
   1. With coarfe or large fcales.
      a. White.
      Some kinds of this lofe in a calcining heat 40 *per cent.* of their weight; and, expofed to the air, get a brownifh efflorefcence, a fign that they contain fome iron, and are a medium between a limeftone and the white iron ore called *ftahlfteine*; nor do they excite any effervefcence with acids in their crude ftate.
      b. Reddifh yellow.
   2. With fmall fcales.
      a. White.
   3. Fine glittering or fparkling.
      a. White.

(D) This effervefcence is alfo made with the borax, as well as with this *fal fufibile microcofmicum*; and it is alfo to be obferved, that the glaffes made with thefe falts are quite colourlefs and tranfparent.

a. White.
b. Of many colours. This variety conftitutes a great number of the foreign marbles.

This fpecies of limeftone takes a good polifh, and is therefore ufed as marble whenever it is found of a fine colour. It is befides to be remarked, that the grained and fcaly limeftones are found either in veins, or form whole mountains, that fhew no ftrata, nor figns of petrifactions.

79 *D*. Lime or calcareous fpars.
(1.) Of a rhomboidal figure.
a. Tranfparent or diaphanous.
1. Refracting fpar; *Spatum iflandicum*.

This reprefents the objects feen through it double.

2. Common fpar, which fhews the object fingle.
1. White, or colourlefs.
2. Yellowifh and phofphorefcent.

b. Opaque; *Spatum rhomboidale opacum*.
1. White, is found in many places, moftly in clefts, and among cryftallifations.
2. Black.
3. Brownifh yellow.

(2.) Foliated or plated fpar.

This has no rhomboidal figure, but breaks into thin plates, fo placed as to be not unlike fheets of thin paper, laid over each other.

a. Opaque white.

80 *E*. Cryftallifed calcareous fpars. *Spar Drufen* (E).

It is compofed of the laft-mentioned fpar that has formed itfelf exteriorly into feveral planes or fides, wherefrom many different figures arife, the varieties of which have not yet been fully obferved, nor can they be exactly defcribed. The following are therefore mentioned, only as inftances of the moft regular and common kinds, viz.

(1.) Tranfparent; *Spatum drufcum diaphanum*.
a. Hexagonal truncated, *Cryftalli fpatofi hexagonii truncati*.
b. Pyramidal.
1. Dog's teeth; *Pyramidales diftincti*. Found at Salberg, and in the iron mines at Dannemera in the province of Upland.
2. Balls of cryftallifed fpar, *Pyramidales concreti*.

Thefe are balls which have drufen, pyramidal, octaedral, fpars accreted in their hollows or centres: they are found at Rettwin in the province of Dalarne, and other places (F).

F. Stalactitical fpar; *Stalactites calcareus*. Stalactites, Stone-icicle, or Drop-ftone. 81

This is formed from water faturated with lime, which, while running or dropping, depofits by degrees the calcareous earth which it has carried along with it from clefts of rocks, or from out of the earth. It is therefore commonly of a fcaly, though fometimes of a folid and fparry texture. Its external figure depends on the place where it is formed, or the quantity of the matter contained in the water, and other like circumftances.

(1.) Scaled ftalactites of very fine particles.
a. Of a globular form.
1. White, the pea-ftone.
2. Grey, *pifolithus*, *oolithus*. Alfo the hammites, from its refemblance to the roes or fpawn of fifh. It has been exhibited by authors as petrified roes. The Ketton free-ftone, of Rutlandfhire, is a remarkable ftone of this fort.

b. Hollow, in the form of a cone.
1. White, is found every-where in vaults made with mortar, and through which water has had an opportunity to penetrate; and alfo in grottos dug in rocks of limeftone.

c. Of an indeterminate figure. *Sinter*.
d. Of coherent hollow cones.

Of this kind is a ftalactitical cruft, which has formed a ftratum, or rather filled a fiffure between the ftrata of the earth, at Helfingborg in the province of Skone; it is of a very fingular figure, refembling conical caps of paper placed and fixed one in the other, diminifhing by degrees both in height and the other dimenfions.

2. Solid

(E) The tranflator of Mr Cronftedt's treatife has adopted this German term *drufen* into the Englifh language, for a clufter of regular-figured bodies, as a groupe conveys the idea of a clufter only, whether regular or of indeterminate figures.

(F) The name *fpar* is very well known, and only ufed to determine a certain figure, viz. when a ftone breaks into a rhomboidal, cubical, or a plated form, with fmooth and polifhed furfaces, it is called *fpar*: and as it is thus applied to ftones of different kinds, without any regard to their principles, one ought neceffarily to add fome term to exprefs the conftituent parts at the fame time that the figure is mentioned; for inftance, calcareous fpar, gypfeous fpar, flux fpar, fhorl or cockle fpar, &c. This term, however, is applied only to earths, and fuch ores as are of the fame figure as the lead fpar, &c.

All cryftallifed fpars, when broken, fhow the fparry figure in their particles, and the cryftallifation is to be afcribed to the empty fpace left by the contraction of the fparry principle: fuch holes filled with drufen of fpars, are in Swedifh called *drake*, or *drufe-hol*.

The figure of the cryftals varies more in this genus than in any other, for which no reafon can be affigned; it ought not to be afcribed to falts, as long as the prefence of any fuch cannot be proved: but there are ftrong indications to fufpect, that other fubftances may likewife have received the fame property to affume an angular furface on certain occafions. See Mr Cronftedt's Introductory Speech at the Royal Academy of Sciences at Stockholm.

Befides, the confideration of thofe figures is a thing of more curiofity than of real ufe, becaufe no miner has yet been able to make any conclufion relative to the quantity or quality of the ores, from the difference of the figures of fpars found along with them; and the grotto-makers never take any notice of the angles or fides, but think it fufficient for their purpofe if they make a fine or glittering appearance at a diftance.

It would, neverthelefs, be well if any one would take upon himfelf the trouble to obferve whether each fpecies of fpar has not a certain determinate number of figures or fides, within which it is confined, in its accretions. This it has hitherto been impoffible to do, becaufe all fpecies of fpars have been confounded together, without regard to their different principles.

Calcareous Earths.

(2.) Solid ftalactites of a fparry texture.

a. Hollow, and in form of a cone.

1. White, and femitranfparent.

In making lime-water, one may obferve how the lime gathers firft like a pellicle on the furface of the water, and afterwards, when this breaks, falls down to the bottom in form of a fcaly fediment, which is called *cremor calcis:* after that a new pellicle is formed, which likewife falls down; and in this manner it continues for a long while, although the lime-water had before been paffed through a filtre. This we may alfo imagine to be the way in which the works of nature are performed: whence the ftalactites commonly is of a fcaly texture, or at leaft difcovers fome tendency towards it. But a ftalactites of a fparry texture, fuch as above-mentioned from Rouen, may be fuppofed to be owing to a more copious principle concurring at once: and in the fame manner the fparry limeftone and its cryftallifations feem likewife to have been produced; fince they, as far as we know, are only found in clefts, which, when they have been filled up with a ftony matter, the Swedifh miners call *klyfter*, and *gangar*, or *veins*. In regard to this, the ftalactites, the fparry limeftone, and alfo its cryftallifations, might all be ranked under the fame title in a fyftematical defcription, as very little different from one another, if it were not neceffary, in defcribing mines and other works, to give them their feparate names; becaufe it is certain, that a piece which is broken from large fpar-cryftals, or from fparry ftalactites, may in a cabinet pafs extremely well for a common fparry limeftone, without leaving any fufpicion of its former figure before it was broke.

82 II. Satiated or united with the acid of vitriol. Gypfum, Plafter-ftone, or Parget.

This is,

1. Loofer and more friable than a pure calcareous earth.
2. Either crude or burnt, it does not excite any effervefcence with acids; or, at moft, it effervefces but in a very flight degree, and then only in proportion as it wants fome of the vitriolic acid to complete the faturation.
3. It readily falls into a powder in the fire.
4. If burnt, without being red-hot, its powder readily concretes with water into a mafs, which foon hardens; and then,
5. No heat is perceived in the operation.
6. It is nearly as difficult to be melted by itfelf as the limeftone, and fhews moftly the fame effects with other bodies as the lime-ftone: the acid of vitriol feems, however, to promote its vitrification.
7. When melted in the fire with borax, it puffs and bubbles very much, and for a long while, during the fufion, owing to the nature of both the falts.
8. When a fmall quantity of any gypfum is melted together with borax, the glafs becomes colourlefs and tranfparent; but fome forts of alabafter and fparry gypfa, when melted in fome quantity with borax, yield a fine yellow tranfparent colour, refembling that of the beft topazes. This phænomenon might probably happen with every one of the gypfeous kind. But it is to be obferved, that if too much of fuch gypfum is ufed in proportion to the borax, the glafs becomes opaque, juft as it happens with the pure limeftone.
9. Burnt with a phlogifton, it fmells of fulphur, and may as well by that means, as by both the alkaline falts, be decompounded; but for this purpofe there ought to be five or fix times as much weight of falt as of gypfum.
10. Being thus decompounded, the calx or earth which is left fhows commonly fome marks of iron.

The gypfeous earth is found, 83

(1.) Loofe and friable; *Terra gypfea pulverulenta.* Gypfeous earth, properly fo called; *Guhr.*

a. White.

(2.) Indurated,

A. Solid, or of no vifible particles, Alabafter. 84

This ftone is very eafy to faw and cut, and takes a dull polifh. It is not always found fatiated with the acid of vitriol.

a, White, alabafter.

1. Clear and tranfparent.
2. Opaque.

b. Yellow.

1. Tranfparent, from the Eaftern countries.
2. Opaque.

B. Gypfum of a fcaled or granulated ftructure. This is the common plafter-ftone. 85

1. With coarfe fcales.

a. White.

2. With fmall fcales. *a.* Yellowifh. *b.* Greyifh.

C. Fibrous gypfum, or plafter-ftone, improperly (though commonly) called *Englifh talc* by our druggifts. 86

1. With the fibres coarfe.

a. White, from Livonia.

2. With fine fibres.

a. White.

D. Spar-like gypfum. Selenites. This by fome is alfo called *glacies mariæ;* and is confounded with the clear and tranfparent mica. 87

1. Pure felenites.

A. Tranfparent.

a. Colourlefs.

b. Yellowifh.

2. Spar-like gypfum; *Marmor metallicum.*

This ftone, on account of its heavinefs, which comes near to that of tin or iron, is fufpected to contain fomething metallic; but, as far as is hitherto known, no one has yet been able to extract any metal from it, except fome traces of iron, which is no more than what all other gypfa contain.

A. Semitranfparent; *fpatum Bononienfe*, the Bononian ftone, or phofphorus. Its fpecific gravity is 4,5000 : 1000.

B. Opaque.

a. White.

3. Liverftone, fo called by the Swedes and Germans.

E. Chry-

Calcareous Earths.

88 *E.* Cryſtalliſed gypſum. Gypſeous druſen; *druſeæ gypſeæ.*

(1.) Druſen of cryſtals of pure ſparry gypſum.

A. Wedge-formed, are compoſed of a pure ſpar-like gypſum.

1. Clear and colourleſs. 2. Whitiſh yellow.

B. Capillary. *a.* Opaque, whitiſh yellow.

C. Of ponderous ſpar-like gypſum; *Marmor metallicum druſicum.*

1. Jagged or like cocks combs, *criſtati.* Theſe reſemble cocks combs, and are found in clefts or fiſſures accreted on the ſurfaces of balls of the ſame ſubſtance. 2. White. 3. Reddiſh.

89 *F.* Stalactitical gypſum. *Gips ſinter.*

This perhaps may be found of as many different figures as the calcareous ſtalactites, or ſinters.

Mr Cronſtedt has only ſeen the following, *viz.*

1. Of no viſible particles; in French, *grignard.*

A. Of an irregular figure.

a. Yellow.

b. White.

This is uſed in ſeveral works as alabaſter, eſpecially when it is found in large pieces; and then it commonly varies in colour between white and yellow, as alſo in tranſparency and opacity.

2. Of a ſpar-like texture.

A. In form of a cone.

a. White and yellow.

B. Of an irregular figure.

a. White.

Gypſeous foſſils abound in England. Plaſter-ſtone, granulated and ſolid, ſome ſo very fine as to be alabaſter, that is, take a ſurface and politure, are plenty in Derbyſhire and Nottinghamſhire, where are large pits of it, and alſo in moſt of the cliffs of the Severn, eſpecially at the Old Paſſage in Somerſetſhire. A very fine ſemipellucid ſolid alabaſter is found in Derbyſhire. Fibrous talcs, very fine, are found in the ſame pits of plaſter-ſtone above-mentioned, and many other places. Selenites of many kinds abound in England in clays, inſomuch that it is needleſs to enumerate the places. Very fine gypſeous druſen are found in Sheppy-iſle; and ſome, perfectly pellucid as cryſtal, and large, have been dug from the ſalt-rocks at Nantwich in Cheſhire. The *ſelenites rhomboidalis,* a rare foſſil in other countries, is frequently found in England; but Shotover-hill, in Oxfordſhire, is famous for it. The iſle of Sheppy affords a kind peculiar to that ſmall ſpot of ground, and not found any where elſe in the world, fibrous, and always accreting in radiations like a ſtar on the ſeptaria, thence called *ſtella ſeptarii.*

90 III. Calcareous earth ſatiated with the acid of common ſalt. *Sal ammoniacum fixum naturale.*

This is found,

1. In ſea-water.

2. In ſalt-pits.

It is formed in great quantities at the bottoms of the ſalt-pans of the ſalt-works. It attracts the moiſture of the air.

IV. Calcareous earth united with the inflammable ſubſtance.

These have a very offenſive ſmell, at leaſt when they are rubbed, and receive their colour from the phlogiſton, being dark or black in proportion as it predominates. 91

(1.) Calcareous earth mixed with phlogiſton alone; *Lapis ſuillus,* fetid ſtone and ſpar, or ſwine-ſtone and ſpar. Perhaps the ſmell of this ſtone may not be ſo diſagreeable to every one: it goes ſoon off in the fire. Its varieties, in regard to the texture, are as follow: 92

A. Solid, or of no viſible or diſtinct particles.

a. Black.

B. Grained.

a. Blackiſh brown.

C. Scaly, *particulis micaceis.*

1. With coarſe ſcales.

a. Black.

2. With fine glittering or ſparkling ſcales.

a. Brown.

D. Sparry.

a. Black.

b. Light brown.

c. Whitiſh yellow.

E. Cryſtalliſed.

1. In a globular form.

(2.) Calcareous earth united with phlogiſton and the vitriolic acid. *Leberſtein* of the Germans and Swedes. *Lapis hepaticus.* 93

This ſtone ſometimes readily, at other times only when rubbed, ſmells like the *hepar ſulphuris,* or gun-powder. It excites no efferveſcence with acids, and is a medium between the gypſum and the fœtid ſtones (93), to which it has, however, generally been referred, although no lime can be made from it; whereas they are the fitteſt of all the different limeſtones to be burnt into lime. It is found,

A. Scaly. 94

1. With coarſe ſcales.

a. Whitiſh yellow.

2. With fine glittering or ſparkling ſcales.

a. Black.

The method that nature takes in combining thoſe matters which compoſe the liver-ſtone, may perhaps be the ſame as when a limeſtone is laid in a heap of mundic while it is roaſting; becauſe there the ſulphur unites itſelf with the limeſtone, whereby the limeſtone acquires that ſmell common to liver of ſulphur, inſtead of which the vitriolic acid alone enters into the formation of gypſum. How the ſulphur combines itſelf may likewiſe be obſerved in the ſlate-balls or kernels from Andrarum alum-mines, where it ſometimes combines itſelf with a martial earth, with which this ſlate abounds, and forms therewith pyrites within the very ſlate-balls. The fetid or ſwine ſtones, and the liver-ſtone, are, in regard to the ſtructure of their parts, ſubject to the ſame varieties as the other ſpecies of limeſtone: and it is to be obſerved, that a volatile alkali is commonly ſuppoſed to have entered into the compoſition of the fetid ſtones, though it has never yet been diſcovered by any experiment.

V. Calcareous earths blended with an argillaceous earth. Marle, *Marga*.

95 1. When crude, it makes an effervefcence with acids; but,

2. Not after having been burnt; by which operation it is obferved to harden, in proportion as the clay exceeds the calcareous fubftance.

3. It eafily melts by itfelf into a glafs, and even when it is mixed with the moft refractory clay.

4. It is of great ufe in promoting the growth of vegetables, fince the clay tempers the drying quality of the calcareous earth.

5. When burnt in a calcining heat, it readily attracts water: and, expofed to the air, in time it falls into a powder.

The varieties of this kind worthy to be taken notice of, depend on the different quantities of each of their component parts, and on the quality of the clay. We fhall fpecify the following examples.

96 *A*. Loofe and compact, *Marga friabilis*. This diffolves in water like common clay.

a. Rdedifh brown.

b. Pale red. This, when burnt, is of a yellowifh colour, and ufed for making earthen-ware in fome places.

97 *B*. Semi-indurated, *Marga indurata aëre fatefcens*.

It is nearly as hard as ftone when firft dug up, but moulders in the open air. It is moftly flatty, and is not uncommon in the flate-rocks of Sweden, where it lies between the thick beds of flatty limeftone, and is alfo found by itfelf forming very thick ftrata. It does not diffolve in water, till by a confiderable length of time it has mouldered to a powder.

a. Grey.

b. Red.

98 *C*. Indurated or ftone marle.

A. In loofe pieces, *Marga indurata amorpha;* by the Germans called *duckftein*, or *tophftein*.

a. White.

b. Grey.

It is formed from a fediment which the water carries along with it.

B. In continued ftrata. Hard flatty marle.

99 VI. Calcareous earth united with a metallic calx.

Here, as well as in the others, fuch a mixture or combination is to be underftood, as cannot be difcovered by the eye alone, without the help of fome other means.

The fubjects belonging to this divifion lofe the property of raifing an effervefcence with acids, when they are rich in metal, or contain any vitriolic acid. However, there have been found fome that contained 20 or 30 *per cent.* of metal, and yet have fhewn their calcareous nature by the nitrous acid.

There are no more than three metals hitherto known to be united in this manner with the calcareous earth, *viz.*

100 (1.) Calcareous earth united with iron. White fparlike iron ore, *Minera ferri alba.* The *ftahlftein* or *weifes eifenerz* of the Germans.

1. This ore, however, is not always white, but commonly gives a white powder when rubbed.

2. It becomes black in the open air, as likewife in a calcining heat.

3. In this laft circumftance it lofes 30 or 40 *per cent.* of its weight, which by diftillation has been found owing to the water that evaporates; and it is poffible that fome fmall quantity of vitriolic acid may, at the fame time, evaporate with the water.

4. It is of all the iron ores the moft eafy to melt, and is very corrofive when melted.

This kind is found,

A. Loofe; the mouldered part of the indurated fort.

a. Black, like foot.

b. Dark brown, fomewhat refembling umbre.

B. Indurated.

1. Solid, of no diftinct particles.

a. Red. Looks like red ochre, or the red hæmatites, but diffolves in the acid of nitre with a great effervefcence.

2. Scaly, *particulis micaceis*.

a. White. *b*. Blackifh grey.

3. Spar-like.

a. Light brown.

4. Drufen.

a. Blackifh brown. *b*. White.

1. Porous. This is often called *eifenblute*, or *flos ferri*.

2. Cellular.

(2.) Calcareous earth united with copper. 101

A. Loofe and friable. Mountain blue. Germanicè, *Bergblau*.

This diffolves in aquafortis with effervefcence.

B. Indurated.

1. Pure calcareous earth mixed with calx of copper. Armenian ftone, *lapis Armenus*. 102
Such, according to the defcription of authors, ought the nature of the ftone called *lapis Armenus* to be, though the druggifts fubftitute in its ftead a pale blue lapis lazuli, free from marcafite.

2. Gypfeous earth united with calx of copper. 103
Is of a green colour; and might perhaps be called *turquoife ore*, or *malachites;* though we do not know if all forts of turquoife ore are of this nature.

a. Semi-tranfparent, is found at Ardal in Norway. By chemiftry we know, that alkaline falts produce a blue colour with copper, which is changed into green as foon as any acid is added; and from thence the reafon is obvious why a green colour may be found among calcareous copper ores, *viz.* when the vitriolic acid is in the neighbourhood of it.

(3.) Calcareous earth united with the calx of lead. 104
This is a lead ochre, or a fpar-like lead ore, which, in its formation, has been mixed with a calcareous earth, and for that reafon effervefces with acids.

A. Loofe and friable.

a. White, from Krifterfberget at Nya Kopparberget in Weftmanland.

B. Indurated.

1. Scaly.

a. Yellowiſh.

Both theſe varieties contain a conſiderable quantity of lead, viz. 40 *per cent.* more or leſs; and the calcareous earth is as equally and intimately mixed with it, as in the white iron ore. Thus may theſe be diſtinguiſhed from other lead-ochres and ſpar-like lead ores, which are much richer in lead, and never effervesce with acids. Theſe laſt mentioned alſo ſeem to be produced by nature, nearly as the ſpar-like lead ores, and as the *flores ſaturni* are formed in calcining a regule of lead.

The Second Order.

105 The *Siliceous* kind.

This ſiliceous earth is, of all others, the moſt difficult to deſcribe and to diſtinguiſh perfectly: however, it may be known by the following characters, which are common to all bodies belonging to this order.

1. In its indurated ſtate it is hard, if not in regard to the whole, yet at leaſt in regard to each particle of it, in a degree ſufficient to ſtrike fire with ſteel, and to ſcratch it, when rubbed againſt it, though the ſteel be ever ſo well tempered.
2. When pure, and free from heterogeneous particles, it does not melt by itſelf, neither in a reverberatory, nor in a blaſt furnace.
3. After being burnt, it does not fall to a powder, neither in the open air, nor in water, as the calcareous order does, but becomes only a little looſer and more cracked by the fire, unleſs it has been very ſlowly and by degrees heated.
4. It excites no efferveſcence with acids.
5. In the fire it melts eaſieſt of all to a glaſs with the fixed alkaline ſalt; and hence it has got the name of *vitreſcent*, though this name is, properly ſpeaking, leſs applicable to this order than to a great many other earths.

The mineral bodies that are comprehended in this order, are, indeed, ſomewhat different from one another. This difference, however, on firſt ſight may be diſcerned: but, in regard to their effects in the fire, and other chemical experiments, it cannot be eſteemed of any great conſequence, at leaſt while we are no farther advanced in the art of decompounding theſe hard bodies, and as long as no one has thought it worth the trouble and expence to uſe thoſe means which are already diſcovered for this purpoſe; namely, the burning-glaſs or concave mirror; and to continue ſuch experiments which Mr Pott has ingeniouſly begun as a baſis for his *Lithogeognoſia*. For want of this, there is no other way left, than to conſider theſe bodies as ſimple ſubſtances, (how much ſoever compounded they may be), in the following manner.

106 I. Diamond. *Adamas gemma*.

Which,

1. Of all ſtones, is the hardeſt.
2. Is commonly clear, or tranſparent; which quality, however, may, perhaps, only belong to its cryſtals, but not to the rock itſelf from which they have their origin.
2. Its ſpecific gravity is neareſt 3,500. When brought to Europe in its rough ſtate, it is in form either of round pebbles with ſhining ſurfaces, or of cryſtals of an octoëdral form.

a. Colourleſs, or diaphanous, or the diamond properly ſo called.

But it alſo retains this name when it is tinged ſomewhat red or yellow. Being rubbed, it diſcovers ſome electrical qualities, and attracts the maſtic.

b. Red; Ruby. *Adamas ruber; Rubinus*.— 107

Which, by lapidaries and jewellers, is, in regard to the colour, divided into,

1. The ruby of a deep red colour inclining a little to purple.
2. Spinell, of a dark colour.
3. The balaſs, pale red, inclining to violet. This is ſuppoſed to be the mother of the rubies.
4. The rubicell, reddiſh yellow.

However, all authors do not agree in the characters of theſe ſtones.

II. Sapphire. *Sapphyrus gemma*. 108

It is tranſparent, of a blue colour; and is ſaid to be in hardneſs next to the ruby, or diamond.

Sapphires are ſaid to be found in Alſatia, at St Amarin: but accounts of this kind are in general not to be depended upon, as the fluors are frequently met with in collections and the druggiſts ſhops under the name of *ſaphires*, when they are of a deep blue colour; not to mention that the quartz is always termed a precious ſtone, whenever it is found clear and of a fine colour. The ſapphire is ſaid to loſe its blue colour in the fire. Thoſe which are but a little tinged are called *white ſapphires*. The ſapphire is ſeldom found of a very deep blue colour, and free from parallel flaws which run through it.

III. Topaz. *Topazius gemma*. 109

This is a precious ſtone which, when rough and perfect, is ſold in a cryſtalliſed form. At Schneckenſtein in Saxony, theſe cryſtals are found of a priſmatical octoëdral form, with no points, but flat, and with ſome facets at the top; however, without doubt the oriental topazes have another figure.

Experiments by fire have been made on the Schneckenſtein topazes by Mr Pott, as may be ſeen in his Lithogeognoſia.

To this kind may be referred,

a. The pale yellow topaz; which is nearly uncoloured, and is found at Schneckenſtein.

b. The yellow topaz, from Schneckenſtein.

c. Deep yellow, or gold-coloured topaz, or oriental topaz.

d. Orange-coloured topaz.

e. The yellowiſh green topaz, or *chryſolite*.

It is of a graſs-green colour, and may perhaps belong to ſome other ſpecies, which might be diſcovered, if it could be obtained rough, or in its matrix, and large enough or in ſuch quantity as is neceſſary for experiments to be made.

f. The yellowiſh green and cloudy topaz, the *chryſopraſe*.

This is perhaps the ſubſtance which ſerves as a matrix to the chryſolite: for thoſe which have been ſeen of this kind are like the clear-veined, called

called in Swedifh *milk-cryftal*, and *quartz*, which is of the firft degree of cryftallifation.

g. Bluifh green topaz, or the beryl.

This varies in its colours; and is called, when,

1. Of a fea-green colour, the *aqua-marine*;
2. When more green, the *beryl*.

They are found in the ftream-works in Saxony and Bohemia, in form of pebbles, or round pieces.

110 IV. Emerald. *Smaragdus gemma*.

Its chief colour is green, and is tranfparent. It is the fofteft of precious ftones, and when heated it is phofphorefcent like the fluors. What in fome cabinets is given out for its matrix, and faid to come from Egypt, is nothing elfe than a deep green cockle-fpar; of which colour we likewife find cockle, or fhirl, in the ifland of Uto near Stockholm, and at Norbery in the province of Weftmanland in Sweden.

Mr Maillet informs us, that in former times the beft emeralds were found in Egypt.

111 To the precious ftones belong alfo the jacinths, or hyacinths; which are cryftals harder than quartz cryftals, tranfparent, of a fine reddifh-yellow colour when in their full luftre, and formed in prifms pointed at both ends: thefe points are always regular, in regard to the number of the facets, being four on each point; but the facets feldom tally: the fides alfo which form the main body, or column, are very uncertain in regard both to their number and fhape; for they are found of four, five, fix, feven, and fometimes of eight, fides: further, the column or prifm is in fome alfo fo compreffed, as almoft to refemble the face of a fpherical facetted garnet. Thefe cryftals lofe their colour, become white, and do not melt in the fire; by which qualities chiefly they may be diftinguifhed from garnets, which are likewife fometimes found of a colour not inferior to the true jacinths. The author had not, at the time when he wrote this effay, feen the true jacinths; but fays that the reddifh yellow garnets from Greenland are fold by the jewellers for jacinths; fo are likewife the Eaft Indian garnets of the fame colour; and, what is ftill more, there are fome jewellers that do not know the true diftinctions between a jacinth and a garnet at all, but buy and fell the garnets for jacinths, when they are of a fine reddifh yellow colour; this muft in particular be owing to the fcarcity of the true jacinth.

Mr Cronftedt fays he lately got fome jacinths of a quadrangular figure, which did not melt in the fire, but only became colourlefs.

112 V. Quartz. *Quartzum*.

This ftone is very common in Europe, and eafier to be known than defcribed. It is diftinguifhed from the other kinds of the filiceous order, by the following qualities.

1. That it is moft generally cracked throughout, even in the rock itfelf; whereby,
2. As well as by its nature, it breaks irregularly, and into fharp fragments.
3. That it cannot eafily be made red-hot, without cracking ftill more.
4. It never decays in the air.
5. Melted with pot-afhes, it gives a more folid and fixed glafs than any other of the filiceous order.
6. When there has been no interruption in its natural accretion, its fubftance always cryftallifes into hexagonal prifms pointed at one or both ends.
7. It occurs in clefts, fiffures, and fmall veins in rocks. It very feldom forms large veins, and ftill feldomer whole mountains, without being mixed with heterogeneous fubftances.

The quartz is found,

(1.) Pure.

A. Solid, of no vifible particles with a gloffy furface. Fat quartz.

a. Uncoloured and clear, *diaphanum*. This has no cryftallifed form, but is neverthelefs as clear as quartz cryftals of the beft water.
b. White, the common fat quartz.
c. Blue.
d. Violet.

B. Grained.

a. White.
b. Pale green.

C. Sparry quartz.

This is the fcarceft; and ought not to be confounded with the white felt-fpat, being of a fmoother appearance, and breaking into larger and more irregular planes.

a. Whitifh yellow. *b*. White.

D. Cryftallifed quartz. Rock cryftal. Quartz cryftal.

Its figure is already defcribed; and, in regard to the colours, the following varieties occur.

1. Opaque, or femi-tranfparent.
   a. White, or of a milk colour.
   b. Red, or of a carnelian colour.
   c. Black.
2. Clear.
   a. Blackifh brown, fmoky topaz, or *raunch topas* of the Germans.
   b. Yellow; found in Bohemia, and fold inftead of topazes.
   c. Violet; the amethyft.
   d. Uncoloured; rock-cryftal, properly fo called. When thefe coloured cryftals are not clear, they are called *fluſs*; for inftance, *topaz-fluſs*, *amethyft-flus*, &c.

(2.) Impure quartz.

A. Mixed with iron, in form of a black calx. This is of a gloffy texture, and contains a great quantity of iron.

B. Mixed with copper in form of a red calx.

a. Red.

VI. The flint. *Silex pyromachus*, *Lapis corneus*, or *hornftein* of the Germans. 113

This is equally common with the quartz, and it is full as difficult to defcribe it; efpecially as it forms a kind of intermediate fubftance between quartz and jafper, both which it fo nearly refembles, that it is not eafy to point out fuch characters as fhall readily diftinguifh it from them. The beft way, perhaps, will be to fpeak of its properties

Siliceous Earths.

perties comparatively; and then we may say, that,

1. It is more uniformly solid, and not so much cracked in the mass as the quartz; and,
2. It is more pellucid than the jasper.
3. It bears being exposed to the air, without decaying, better than the jasper, but not so well as the quartz.
4. It is better for making of glass than the jasper, but is not quite so good as quartz for that purpose.
5. Whenever there has been an opportunity in this matter of its shooting into crystals, quartz crystals are always found in it; just as if the quartz had made one of its constituent parts, and had on certain circumstances been squeezed out of it; this is to be seen in every hollow flint, and its clefts, which are always filled up with quartz.
6. It often shows most evident marks of having been originally in a soft and slimy state.

The several varieties of this species have obtained distinct names, more with respect to their colours than from any real difference in their substance; but these are still necessary to be retained, as the only names used by jewellers and others, who know how to value them accordingly.

114 (1.) The opal. *Opalus pæderota.*

It is the most beautiful of all the flint kind, owing to the changeable appearance of its colours by reflection and refraction, and must therefore be described under both these circumstances.

a. The opal of Nonnius, the sangenon of the Indians.

This appears olive-coloured by reflection, and seems then to be opaque; but when held against the light, is found transparent, and of a fine ruby red.

That opal is supposed to have been of this kind, which Pliny mentions in his Natural History, chap. 307. sect. 21. and which he says was in the senator Nonius's possession, who rather suffered banishment than part with it to Antony.

This stone was at that time valued in Rome at 20,000 sesterces. But the stone here particularly described, was found in the ruins of Alexandria; it is about the size of a hazle-nut, and was bought for a trifle of a French druggist, named *Roboly*, and presented to the French general consul Lironcourt, who afterwards offered it to sale in several places for the sum of 40,000 rixdollars. See Hasselquist's Travel's to the East, under the article of OPAL.

This very stone was in the year 1763 in the possession of his excellency the duke de Nivernois, then ambassador to the British court.

There is, however, another of the same kind in Sweden, which by reflection appears rather brown; but by refraction is red, with violet veins.

b. The white opal. Its ground is white, of a glass-like complexion, from whence are thrown out green, yellow, and bluish rays; but it is of a reddish or rather flame colour, when held against the light.

1. Of many colours. The oriental opal.
2. Of a milky colour.
3. Bluish, and semi-transparent. This is not so much valued as those which are more opaque, because it is easier to be imitated by art.

(2.) The cat's eye. *Pseudopalus.* 115

This stone is opaque, and reflects green and yellowish rays from its surface, and is found in Siberia.

(3.) The onyx. *Onyx camehuja.* Memphites. 116

This stone is the hardest of the flinty tribe; and consists of differently coloured veins, which run parallel to one another, sometimes in straight, sometimes in curved lines. It is found of two sorts.

a. Nail-coloured onyx, having pale flesh-coloured and white lines. From the river Tomm in Siberia.

b. With black and white lines. The oriental onyx.

The old Romans were accustomed to cut figures in relief on the straight-lined onyxes, which they called *camehuja;* these are still counterfeited, and called *camayeu.* Those which consist of concentric circles were called *memphites;* and we have now of this kind cut to be set in rings, under the name of *occhi di gatti,* which, however, ought not to be confounded with the pseudopal, or cat's eye.

(4.) The chalcedony, or white agate. 117

Is a flint of a white colour, like milk diluted with water, more or less opaque: it has veins, circles, and round spots. It is said to be softer than the onyx, but much harder than those agates which are sometimes found of the same colour.

a. The white opaque chalcedony, or *cacholong,* from the Buckharish Calmucks. This was first made known by one Renez, a Swedish officer, who for several years had been in that country. The inhabitants find this flint on the banks of their rivers, and work idols and domestic vessels out of it.

b. Of white and semi-transparent strata; from Ceylon.

c. Bluish grey; from Ceylon and Siberia.

(5.) The carnelian. *Carniolus.* 118

Is of a brownish red colour, and often entirely brown. Its name is originally derived from its resemblance to flesh, or to water mixed with blood.

a. Red.

b. Yellowish brown, looks like yellow amber, from the river Tomm in Siberia. It is said not to be so hard as the chalcedony.

(6.) The sardonyx. 119

Is a mixture of the chalcedony and carnelian, sometimes stratum-wise, and sometimes confusedly blended and mixed together.

a. Striped with white and red strata: this serves as well cut in cameo as the onyx.

b. White, with red dendritical figures. This very much resembles that agate which is called the *mocha stone,* but with this difference, that the figures are of a red colour in this, instead of black, as in that agate.

Between the onyx, carnelian, chalcedony, sardonyx, and agate, there seems to be no real difference,

difference, except fome inexplicable degrees of hardnefs.

120 (7.) The agate; *Achates*.

This name is given to flints that are variegated with different colours, promifcuoufly blended together; and they are efteemed in proportion to their mixture of colours, their beauty, and elegance. Hence alfo they have obtained variety of names, moftly Greek, as if the bufinefs of the lapidary in cutting of them, and admiring their feveral beauties and figures, had been derived from that nation alone.

a. Brown opaque agate, with black veins, and dendritical figures; the Egyptian pebble.

b. Of a chalcedony colour, *achates chalcedonifans*.

c. Semi-tranfparent, with lines of a blackifh brown colour, and dendritical figures; the mocha ftone. This is much efteemed, and makes a valuable part of fome collections, where it has a place chiefly for the fake of its figures, refembling vegetables, animals, &c. which however are often improved by art.

d. Semi-tranfparent, with red dots; *Gemma divi Stephani*. When the points are very minute, fo as to give the ftone a red appearance, it is by fome called *Sardea*.

e. Semi-tranfparent, with clouds of an orange colour.

f. Deep red or violet, and femi-tranfparent.

g. Of many colours, or variegated.

h. Black.

121 VII. Jafper. *Jafpis*.

All the opaque flints are called by this name, whofe texture refembles dry clay, and which have no other known quality, whereby they may be diftinguifhed from other flints, except that they may be more eafily melted in the fire; and this quality perhaps may proceed from fome heterogeneous mixture, probably of iron.

(1.) Pure jafper; which by no means yet known can be decompounded.

a. Green with red fpecks or dots; the *heliotrope*, or blood-ftone. *b*. Green. *c*. Red. *d*. Yellow. *e*. Red with yellow fpots and veins. *f*. Black.

(2.) Jafper containing iron; *Jafpis martialis*, *Sinople*.

A. Coarfe-grained.

a. Red and reddifh brown; *finople*.

B. Steel-grained, or fine-grained.

a. Reddifh brown: looks like the red ochre or chalk ufed for drawing; and has partition veins, which are unctuous to the touch, like a fine clay, and other like kinds.

C. Of a folid and fhining texture, like a flag.

a. Liver-coloured; and, *b*. Deep red. *c*. Yellow. This laft mentioned, when calcined, is attracted by the loadftone; and being effayed, yields 12 to 15 *per cent*. of iron.

122 VIII. Rhombic quartz; *Spatum fcintillans*, *Feltfpatum*.

This has its name from its figure, but feems to be of the fame fubftance as the jafper. We have not, however, ranked them together, for want of true marks to diftinguifh the different forts of the flinty tribe from one another.

This kind is found,

1. Sparry.

a. White.

b. Reddifh brown.

c. Pale yellow.

d. Greenifh.

This laft mentioned refembles very much the fchorl or cockle-fpar; but is neither fo eafy to melt in the fire, nor of fo exact a figure.

2. Chryftallifed.

a. In feparate or diftinct rhomboidal cryftals.

The Third Order.

The *Garnet* kind. *Terræ granateæ*. 123

The matter compofing the fubftance of garnet, and fchorl or cockle, except that fmall portion which is metallic, does in its indurated ftate refemble the filiceous tribe, fo far as relates to external appearance and hardnefs; and therefore we would willingly have followed the opinion commonly received, of confidering thefe two fubftances as arifing from one another, if we had not been perfuaded to the contrary by the following qualities of the garnet.

1. It is more fufible, in proportion as it contains lefs metallic matter, and is more tranfparent or glaffy in its texture; which is quite contrary to the filiceous kind.
2. This is the reafon, perhaps, why the garnet, mixed with the falt of kelp, may on a piece of charcoal be converted to a glafs by the blowpipe, which cannot be done with the flints: and,
3. Why the moft tranfparent garnet may, without any addition, be brought to a black opaque flag by the fame means.
4. It is never, fo far as is hitherto known, found pure, or without fome mixture of metal; and efpecially iron, which may be extracted by the common methods.
5. The garnet matter, during the cryftallifation, has either been formed in fmall detached quantities, or elfe has had the power of fhooting into cryftals, though clofely confined in different fubftances: fince garnets are generally found difperfed in other folid ftones, and oftentimes in the harder ones, fuch as quartz and chert.

I. Garnet; *Granatus*. Which is a heavy and hard kind of ftone, cryftallifing in form of polygonal balls, and is moftly of a red, or reddifh brown colour. 124

A. garnet mixed with iron; *Granatus martialis*.

1. Coarfe-grained garnet-ftones, without any particular figure; in Swedifh called *Granatberg*; in German, *Granatftein*. *a*. Reddifh-brown garnet. *b*. Whitifh-yellow. *c*. Pale yellow.

2. Cryftallifed garnet.

a. Black. *b*. Red: femi-tranfparent, and cracked; tranfparent. *c*. Reddifh yellow tranfparent; the jacinth, or hyacinth. *d*. Reddifh brown. *e*. Green. *f*. Yellowifh green.

B. Garnet mixed with iron and tin.

1. Coarfe grained, without any particular figure.

a. Blackifh-brown.

2. Chryftal-

2. Cryſtalliſed.
  a. Blackiſh-brown.
  b. Light-green or white.

The *bergs-radets*, or mine-maſters, Mr Brandt and Mr Rinman, have publiſhed ſome experiments on this kind of garnet, in the Memoirs of the Royal Academy of Sciences at Stockholm.

C. Garnet mixed with iron and lead.
  1. Cryſtalliſed.
    a. A reddiſh-brown, diſcovered and accurately examined by the bergs-radet Mr Von Swab (G).

125 II. Cockle, or ſhirl. *Baſaltes; Corneus cryſtalliſatus Wallerii; Stannum cryſtallis columnaribus nigris Linnæi.*—Is a heavy and hard kind of ſtone, which ſhoots into cryſtals of a priſmatical figure, and whoſe chief colours are black or green. Its ſpecific gravity is the ſame as the garnets, viz. between 3000 and 3400, though always proportionable to their different ſolidity.

126 *A.* Cockle, or ſhirl, mixed with iron.
  1. Coarſe, without any determined figure.
    a. Green, found in moſt of the Swediſh iron mines.

127 2. Sparry.
    a. Deep green, (the mother of the emeralds), from Egypt.
    b. Pale green.
    c. White.

This occurs very frequently in the ſcaly limeſtones; and its colour changes from deep green to white, in proportion as it contains more or leſs of iron.

128 3. Fibrous, ſtriated cockle, or ſhirl: it looks like fibres or threads made of glaſs.
  A. Of parallel fibres.
    a. Black.
    b. Green.
    c. White.
  B. Of concentrated fibres. The ſtarred cockle, or ſhirl, from its fibres being laid ſtellarwiſe.
    a. Blackiſh green, from Salberg, in Weſtmanland; where, being found together with a ſteel-grained lead ore, the whole is called *grau-ris-malm*, or pine-ore, from its reſemblance to the branches of that tree. This kind of cockle is alſo found at Uto in Malaren.
    b. Light green.
    c. White.

129 4. Cryſtalliſed cockle, or ſhirl.
    a. Black.

To this ſpecies of cockle, or ſhirl, belong moſt of thoſe ſubſtances called *imperfect aſbeſti;* and as the cockle perfectly reſembles a ſlag from an iron furnace, both in regard to its metallic contents and its glaſſy texture, it is no wonder that it is not ſoft enough to be taken for an aſbeſtus. It has, however, only for the ſake of its ſtructure, been ranked among the aſbeſti. The ſtriated cockle, or ſhirl, compared to the aſbeſti, is of a ſhining and angular ſurface (though this ſometimes requires the aid of the magnifying-glaſs to be diſcovered), always ſomewhat tranſparent, and is pretty eaſily brought to a glaſs with the blow-pipe, without being conſumed as the pure aſbeſti ſeem to be.

    b. Deep green, from Salberg in Weſtmanland.
    c. Light green, from Enighets-grufvan at Norberg in Weſtmanland.
    d. Reddiſh brown; from Sorwik at Grengie in Weſtmanland, and Glanſhammar in the province of Nerike.

The tauffstein, from Baſil, is of this colour, and conſiſts of two hexagonal cryſtals of cockle grown together in form of a croſs: this the Roman Catholics wear as an amulet, and is called in Latin *lapis crucifer*, or the croſs-ſtone.

It is not impoſſible that there may be ſome kinds of cockles, or ſhirls, which, beſides iron, alſo contain tin or lead, as the garnets: it has been ſaid, that lead has been melted out of a cockle, from Rodbeck's Eng at Umea in Lapland; and it ſeems likewiſe very probable that the cockles which are found in the Engliſh tin-mines may contain ſome tin. There are ſome cryſtals of cockle found which are fuſible to a greater degree than any ſort of ſtone whatſoever: theſe are always of a glaſſy texture, and ſemi-tranſparent.

The figure of the cockle cryſtals is uncertain, but always priſmatical: the cockle from Yxſio at Nya Kopparberg, is quadrangular: the French kind has nine ſides, or planes; and the tauffstein is hexagonal.

The name *cockle* for theſe ſubſtances is an old Corniſh mineral name; but is alſo given ſometimes to other very different matters.

We have not in England any great quantity of ſpecies of cockles; the chief are found in the tin mines of Cornwall, and ſome fine cryſtalliſed kinds have been brought from Scotland.

The Engliſh mineral name of *call*, has been uſed by ſome authors as ſynonymous with *cockles*, and they are confounded together at the mines; but the call, definitely ſpeaking, is the ſubſtance called *wolffram* by the Germans, &c.

Garnets, though ſmall, are often found in micaceous ſtones in England; but extreme good garnets are found in great plenty alſo in like ſtones in Scotland. 130

The Fourth Order.

The *Argillaceous* kind.

The principal character whereby thoſe may be diſtinguiſh from other earths is, that they harden in the fire, and are compounded of very minute particles, by which they acquire a dead or dull appearance when broken.

I. Porcelain

(G) When any of the garnet kind is to be tried for its containing metal, the iron ought to be melted out of it by the common proceſs; and if the garnet, at the ſame time, contains both tin and lead, theſe two metals are likewiſe included in the iron: however, they may be extracted out of the iron, by expoſing it to a heat augmented by degrees; becauſe then the tin and lead ſweat out in form of drops, almoſt pure, though always ſomewhat mixed with iron.

Argillaceous Earths.

I. Porcelain clay; *Terra porcellanea*, vulgò *Argilla apyra*.

131 This is very refractory in the fire, and cannot in any common ftrong fire be brought into fufion any farther than to acquire a tenacious foftnefs, without lofing its form: it becomes then of a dim fhining appearance and folid texture, when it is broke; ftrikes fire with fteel; and has confequently the beft qualities required as a fubftance whereof veffels capable of refifting a melting and boiling heat, and of holding falts and acids, can be made. It is found,

132 (1.) Pure, *Pura*.

A Diffufible in water.

1. Coherent and dry.

a White. Mr Cronftedt affirms that he has feen a root of a tree changed into this clay.

2. Friable and dry.

a. White.

Thefe may be called *pure*, fince, after being burnt, they are quite white, though they have been expofed to a quick melting heat; and it may be queried, if all fuch clays muft not be fomewhat harfh, or at leaft not unctuous to the touch.

133 (2.) Mixed with phlogifton, and a very fmall quantity of infeparable heterogeneous fubftances. Of thefe are,

A. Diffufible in water.

a. White and fat pipe-clay.

b. Of a pearl colour.

c. Bluifh grey.

d. Grey.

e. Black.

f. Violet.

Thefe contain a phlogifton which is difcovered by expofing them to quick and ftrong fire, in which they become quite black interiorly, affuming the appearance of the common flints, not only in regard to colour, but alfo in regard to hardnefs: but if heated by degrees, they are firft white, and afterwards of a pearl colour. The fatter they feem to be, which may be judged both by their feeling fmooth and unctuous, and by their fhining when fcraped with the nail, they contain a larger quantity of the inflammable principle. It is difficult to determine, whether this ftrongly inherent phlogifton be the caufe of the above-mentioned pearl colour, or prevents them from being burnt white in a ftrong fire: yet no heterogeneous fubftance can be extracted from them, except fand, which may be feparated from fome by means of water, but which fand does not form any of the conftituent parts of the clays. If they be boiled in aqua regis in order to extract any iron, they are found to lofe their vifcofity.

134 *B*. Indurated.

Is commonly unctuous to the touch, and more or lefs difficult to be cut or turned in proportion to its different degrees of hardnefs; is not diffufible in water; grows hard, and is very refractory in the fire; pounded and mixed with water, it will not eafily cohere in a pafte: however, if it is managed with care, it may be baked in the fire to a mafs, which, being broke, fhews a dull and porous texture. It takes for the moft part, and without much labour, a fine polifh. It is found,

A. Compact and foft; *Smectis*, Briançon or French chalk. 135

a. White.

b. Yellow.

c. Red and white, and which looks like Caftile foap.

B. Solid and compact fteatites, and alfo foap-rock. 136

a. White or light green. *b*. Deep green

c. Yellow.

It is a very difficult matter to fpecify all the varieties of the foap-ftones in regard to their hardnefs or foftnefs, fince they cannot be compared with any ftandard meafure. Thofe from Rifver, Sikfioberg, and China, are a great deal harder and more folid than the Englifh kind from the Land's End, which breaks between the fingers; but are foft in comparifon to that from Salberg, which is there called *ferpentine*, although both thefe varieties may indifcriminately be made ufe of for cutting and turning. The foft ones, however, are not fo apt to crack, when they are worked, as the harder. But none of thefe varieties is found in the rock, without being interfperfed with the unctuous clefts. When they are too many, too clofe to one another, and make the ftone unfit for ufe, they are in this cafe called by the Swedifh miners, *Skiolige;* and of this kind is a great quantity found at Salberg and Swartwik. Moft part of the foap-rock which is found in Sweden, is likewife mixed with glimmer or mica; and then it is called *telgften*, that is, *ollaris*.

C. Solid, and of vifible particles; ferpentine ftone. 137

1. Of fibrous and coherent particles. This is compofed, as it were, of fibres; and might therefore be confounded with the afbeftus, if its fibres did not cohere fo clofely with one another as not to be feen when the ftone is cut and polifhed. The fibres themfelves are large, and feem as if they were twifted.

a. Deep green. This is fold for the *lapis nephriticus*, and is dug at fome unknown place in Germany.

b. Light green from Skienfhyttan, in Weftmanland; in Sweden it is ufed by the plate-fmiths inftead of the French chalk.

2. Fine-grained ferpentine ftone: the Zoeblitz ferpentine. 138

a. Black. *b*. Deep green. *c*. Light green, *d*. Red. *e*. Bluifh grey. *f*. White. Thefe colours are all mixed together in the ferpentine ftone from Zoeblitz, but the green is the moft predominant colour.

(3.) Mixed with iron. This is, 148

A. Diffufible in water.

a. Red. Some of the bricks which are imported

ported from certain places in Germany, seem to be made of this kind.

B. Indurated.

1. Martial soap-earth; *Creta Brianzonica martialis*.
   a. Red, and mixed with some calcareous matter.
2. Martial soap-rock; *Steatites martialis*.
   a. Black. *b*. Red.

140 II. Stone-marrow; *Lithomarga*. *Keffekil* of the Tartars.

1. When dry, it is as fat and slippery as soap: but,
2. Is not wholly diffusible in water, in which it only falls to pieces, either in larger bits, or resembles a curd like mass.
3. In the fire it easily melts to a white or reddish frothy slag, consequently is of a larger volume than the clay was before being fused.
4. It breaks into irregular scaly pieces.

A. Of coarse particles: Coarse stone-marrow.

a. Grey, from Osmundsberget, in the parish of Rettwik, in Dalarne; and is there called *walklera*, that is, fuller's earth. It is mentioned in an account of Osmundsberget, published in the Transactions of the Academy of Sciences at Stockholm, in the year 1739, by the berg's-radet, or mine-master, Mr Tilas.

b. Whitish yellow, from the Crim Tartary, where it is called *keffekil*, and is said to be used for washing instead of soap.

B. Of very fine particles; fine stone-marrow.

a. Yellowish-brown; *Terra Lemnia*.—Is of a shining texture, falls to pieces in the water with a crackling noise; it is more indurated than the preceding, but has otherwise the same qualities.

141 III. Bole.

Is a fine and dense clay of various colours, containing a great quantity of iron, which makes it impossible to know the natural and specifical qualities of the bole itself, by any easy method hitherto in use. It is not easily softened in water, contrary to what the porcelain and the common clays are, (I. & V.); but either falls to pieces in form of small grains, or repels the water, and cannot be made ductile. In the fire it grows black, and is then attracted by the loadstone.

142 *A*. Loose and friable boles, or those which fall to a powder in water.

a. Flesh-coloured bole.

b. Red.
1. Fine; *Bolus Armenus*.
2. Coarse; *Bolus communis officinalis*.
3. Hard; *Terra rubrica*.

c. Green; *Terre verte*.
1. Fine.
2. Coarse.

d. Bluish-grey, is ductile as long as it is in the rock, but even then repels the water; it contains 40 per cent. of iron; which metal being melted out of it in a close vessel, the iron crystallises on its surface.

e. Grey.
1. Crystallised in a spherical polygonal figure.
2. Of an undeterminate figure.

At the time when the *terræ sigillatæ*, or sealed earths, were in general use, the druggists endeavoured to have them of all colours, and for that reason they took all sorts of clays, and sealed them: not only the natural ones, but likewise such as had been coloured by art, or had been mixed with *magnesia alba officinalis*, or other things, were afterwards vended for true boles; and for this reason the species of boles is still thought to comprehend so many varieties. Thus the Cologne clay is by the druggists ranked among the white sealed earths, and is called a *white bole:* and this same clay is by the Swedish potters called *Englesk jord*, or English earth; and by the tobacco-pipe makers *pip-lera*, or pipe-clay, &c.: which shews how great a confusion there must ensue, if the knowledge of these bodies was not founded upon a surer ground than the colour, figure, and names invented by common mechanics. Since the most part of these *terræ sigillatæ*, or sealed earths, are found to contain iron, we may conclude that the bole must be a martial clay; and, as such, it seems to be more fit for medical uses than other clays, if any dead earth must be used internally, when there is such an abundance of finer substances.

B. Indurated bole. 143

A. Of no visible particles.

This occurs very often in form of slate, or layers, in the earth; and then is made use of as an iron ore. However, it has usually been considered more in regard to its texture than to its constituent parts; and has been called *slate*, in common with several other earths which are found to have the same texture.

a. Reddish-brown; in most collieries, between the seams of coal.

b. Grey; from Coalbrookdale in Shropshire, and most collieries of England.

B. Of scaly particles.—The hornblende of the Swedes. 144

Is distinguished from the martial glimmer, or mica, by the scales being less shining, thicker, and rectangular.

a. Black.—This, when rubbed fine, gives a green powder.

b. Greenish.

Both these, particularly the black, are found every-where in Sweden among the iron-ores, and in the Grunsten. The hornblende grows hard in the fire, which is the reason why it is ranked here among the clays, though in all its other qualities it much resembles the cockle or shirl.

IV. Tripoli. *Terra Tripolitana*.

Is known by its quality of rubbing hard bodies, and making their surfaces to shine; 145 the particles of the tripoli being so fine as to leave even no scratches on the surface. This effect

effect, which is called *polifhing*, may likewife be effected by other fine clays when they have been burnt a little. The tripoli grows fomewhat harder in the fire, and is very refractory: it is with difficulty diffolved by borax, and ftill with greater difficulty by the microcofmic falt. It becomes white when it is heated: when crude, it imbibes water, but is not diffufible in it: it taftes like common chalk, and is rough or fandy between the teeth, although no fand can by any means be feparated from it. It has no quality common with any other kind of earth, by which it might be confidered as a variety of any other. That which is here defcribed is of a yellow colour, and is fold by druggifts. This kind of tripoli has been lately difcovered in Scotland. But the *rotten-ftone*, fo called, is another fort found in England, viz. in Derbyfhire. It is in common ufe in England among workmen for all forts of finer grinding and polifhing, and is alfo fometimes ufed by lapidaries for cutting of ftones, &c.

146 V. Common clay, or brick clay. *Argilla communis; vulgaris plaftica.*

This kind may be diftinguifhed from the other clays, by the following qualities.

1. In the fire it acquires a red colour, more or lefs deep.
2. It melts pretty eafily into a greenifh glafs.
3. It contains a fmall quantity of iron and of the vitriolic acid, by which the preceding effects are produced.

It is found,

A. Diffufible in water.

1. Pure.
   - *a.* Red clay.
   - *b.* Flefh-coloured, or pale-red.
   - *c.* Grey.
   - *d.* Blue.
   - *e.* White, is found in the woody parts of Sodermanland, Dalarne, and of other provinces. It is often found in a flaty form, with fine fand between its ftrata. It is not eafy to be baked in the fire: when it it burnt, it is of a pale-red colour, and is more fufible than the preceding ones.
   - *f.* Fermenting clay. *Argilla intumefcens.* This is very like the preceding, as to the external appearance and other qualities; but when they are both found in the fame place, which is not uncommon in feveral of our mine countries, they feem to be different in regard to the fermenting quality of this variety. This fermentation cannot be the effect of the fand mixed with it, becaufe fand is found in them both: and befides, this kind ferments in the fame manner when it is mixed with gravel or ftones; and then it ferments later in the fpring than the other, fince by the ftones, perhaps, the froft is longer retained in it.

2. Mixed with lime. See MARLE, n° 95.

B. Indurated.

1. Pure. 147
   - *a.* Grey flaty.
   - *b.* Red flaty, from Kinnekulle, in the province of Weftergottland.
2. Mixed with phlogifton, and a great deal of the vitriolic acid. See ALUM *Ores*, n° 173.
3. Mixed with lime; (n° 98).

The FIFTH ORDER.

THE *Micaceous* kinds. The glimmer, daze, or glift. 148

Thefe are known by the following characters.

1. Their texture and compofition confift of thin flexible particles, divifible into plates or leaves, having a fhining furface.
2. Thefe leaves, or fcales, expofed to the fire, lofe their flexibility, and become brittle, and then feparate into thinner leaves: but in a quick and ftrong fire, they curl or crumple, which is a mark of fufion; though it is very difficult to reduce them into a pure glafs by themfelves, or without addition.
3. They melt pretty eafily with borax, the microcofmic falt, and the alkaline falt; and may, by means of the blow-pipe, be brought to a clear glafs with the two former falts. The martial mica is, however, more fufible than the uncoloured ones.

There is not yet difcovered any loofe earth of this kind, but it is always found indurated.

A. Colourlefs or pure mica; daze, glimmer, or glift. 149

1. Of large parallel plates; Mufcovy glafs. Is tranfparent as glafs; found in Siberia, and Elfdalen in the province of Wermeland in Sweden. 2. Of fmall plates; from Silfverberget, at Runneby, in the province of Blekinge, in Sweden. 3. Of particles like chaff; chaffy mica. 4. of twifted plates; crumpled mica.

B. Coloured and martial glimmer.

1. Of large parallel plates; *Martialis.* 150
   - *a.* Brown femi-tranfparent.
2. Of fine and minute fcales.
   - *a.* Brown.
   - *b.* Deep green.
   - *c.* Light green; *Talcum officinale.*
   - *d.* Black, found in granites.
3. Twifted or crumpled glimmer.
   - *a.* Light green, in the olaris.
4. Chaffy glimmer.
   - *a.* Black, is found in the ftone called *hornberg*, which occurs in moft of the Swedifh copper-mines.
5. Cryftallifed glimmer; *Mica drufica.*
   1. Of concentrated and erect fcales.
   2. Of hexagonal horizontal plates.

The SIXTH ORDER.

The fluors, *Fluores minerales.* Suec. *Fluff-arter.* Germ. *Fluff-arten.* 151

Thefe are commonly called *fluxing*, *vitrefcent*, or *glafs fpars*, becaufe moft part of them have a fparry from form and appearance: they are, however, often met with in an indeterminate figure.

These are only known in an indurated state; and distinguish themselves from the other earths by the following characters.

1. They are scarce harder than a calcareous spar, and consequently do not strike fire with steel.
2. They do not ferment with acids, neither before nor after calcination, notwithstanding a phlogiston or an alkali had been added in the calcination.
3. They do not melt by themselves, but only split to pieces when exposed to a strong fire. But,
4. In mixtures with all other earths, they are very fusible, and especially when they are blended with the calcareous earth, with which they melt to a corroding glass, which dissolves the strongest crucibles, unless some quartz or apyrus clay is added thereto.
5. When heated slowly, and by degrees, they give a phosphorescent light; but as soon as they are made red-hot, they lose this quality. The coloured ones, and especially the green, give the strongest light, but none of them any longer than whilst they are well warm.
6. They melt and dissolve very easily by the addition of borax, and next to that by the microcosmic salt, without ebullition.

152 *A.* Indurated fluor.

(1.) Solid, of an indeterminate figure. Is of a dull texture, semi-transparent, and full of cracks in the rock.

a. White.

(2.) Sparry fluor has nearly the figure of spar, though, on close observation, it is found not to be so regular, nothing but the glossy surface of this stone giving it the resemblance of spar.

a. White. *b.* Blue. *c.* Violet. *d.* Deep green. *e.* Pale green. *f.* Yellow, from Gislof in Skone.

153 (3.) Crystallised fluor, when in single crystals; but fluor druse, when many crystals are heaped together.

1. Of an irregular figure.
   a. White. *b.* Blue. *c.* Red.
2. Of a cubical figure.
   a. Yellow. *b.* Violet.
3. Of a polygonal spherical figure.
   a. White. *b.* Blue.
4. Of an octoëdral figure.
   a. Clear and colourless.

The Seventh Order.

154 The *Asbestus* kind; *Asbestinæ.*

These are only yet discovered in an indurated state: their characters are as follow,

1. When pure they are very refractory in the fire. 2. In large pieces they are flexible. 3. They have dull or uneven surfaces. 4. In the fire they become more brittle. 5. They do not strike fire with the steel. 6. They are not attacked by acids. 7. They are easily brought into fusion by borax.

In this order are included both those varieties which by fossilogists have been mentioned under the names *amianti* and *asbesti*, and have often been confounded together.

I. Asbestus which is compounded of soft and thin membranes; *Amiantus Wallerii.* 155

A. Of parallel membranes; *Corium,* sive *caro montana,* mountain-leather.

1. Pure.
   a. White.
2. Martial.
   a. Yellowish brown, from Storrginningen, at Dannemora, in the province of Upland. This melts pretty easily in the fire to a black slag, or glass.

B. Of twisted soft membranes, mountain-cork. 156

1. Pure.
   a. White.
2. Martial.
   a. Yellowish brown. This has the same quality in the fire as the martial mountain-leather.

II. Of fine and flexible fibres; *Asbestus,* or earth-flax; *Asbestus Wallerii.* 157

A. With parallel fibres; *Byssus.*

1. Pure and soft.
   a. Light green.
   b. White.
2. A little martial, and more brittle.
   a. Greenish; from Bastnas Grufva, at Ryddarhyttan in Westmanland in Sweden. There it forms the greatest part of the vein out of which the copper ore is dug; a great part of it is consequently melted together with the ore, and is then brought to a pure semi-transparent martial slag or glass.

B. Of broken and recombined fibres. 158

1. Martial.
   a. Light green.

The Eighth Order.

Zeolites.

This is described in its indurated state, in the Transactions of the Academy of Sciences at Stockholm for the year 1756; and there methodised as a stone *sui generis,* in regard to the following qualities: 159

1. It is a little harder than the fluors, and the calcareous kind: it receives however scratches from the steel, but does not strike fire with it.
2. It melts easily by itself in the fire, with a like ebullition as borax does, into a white frothy slag, which not without great difficulty can be brought to a solidity and transparency.
3. It is easier dissolved in the fire by the mineral alkali *(sal sodæ),* than by the borax and microcosmic salt.
4. It does not ferment with this last salt, as the lime does; nor with the borax, as those of the gypseous kind.
5. It dissolves very slowly, and without any effervescence, in acids, as in oil of vitriol and spirit of nitre. If concentrated oil of vitriol is poured on pounded zeolites, a heat arises, and the

powder unites into a mafs (1).

6. In the very moment of fufion it gives a phofphorus or light.

160 The zeolites is found in an indurated ftate.

(1.) Solid, or of no vifible particles.

A. Pure; *Zeolites durus.*

a. White, from Iceland.

B. Mixed with filver and iron.

a. Blue; *Lapus lazuli*, from the Buckarian Calmucks. This, by experiments made with it, has difcovered the following properties:

1. It retains for a long time its blue in a calcining heat, but is at laft changed into a brown colour.

2. It melts eafily in the fire to a white frothy flag; which, when expofed to the flame of a blow-pipe, is greatly puffed up, but in a covered veffel, and with a ftronger heat, becomes clear and folid, with blue clouds in it.

3. It does not ferment with acids: but,

4. Boiled in oil of vitriol, it diffolves flowly, and lofes its blue colour.

When a fixed alkali is added to this folution, a white earth is precipitated, which being fcorified with borax, yields a filver regulus, that varies in bignefs according to the various famples of the ftone.

5. By fcorification with lead, there has been extracted two ounces of filver out of 100 pounds weight of the ftone.

6. The prefence of filver is not difcovered with the fame certainty by the fpirit of nitre as by oil of vitriol.

7. When the fpirit of fal ammoniac is added to any folution, made either of crude or of a perfectly calcined lapis lazuli, there is no blue colour produced; which proves that this colour is not owing to copper, as fome have pretended: and this is farther confirmed by the fixity of the blue colour in the fire (1, 2.), and by the colour of the flag or glafs (2).

8. It is a little harder than the other kinds of zeolites; but does not, however, in hardnefs approach to the quartz, or to other ftones of the filiceous kind in general; becaufe the pureft and fineft blue lapis lazuli may be rubbed with the fteel to a white powder, although it takes a polifh like marble.

9. The lapis lazuli, when perfectly calcined, is a little attracted by the loadftone; and fcorified with lead, the flag becomes of a greenifh colour, not fuch a colour as copper gives, but fuch as is always produced by iron mixed with a calcareous fubftance.

161 (2.) Sparry zeolites.

This refembles a calcareous fpar; though it is of a more irregular figure, and is more brittle.

a. Light red, or orange-coloured; from Nya Krongrufvan, one of the gold-mines at Adelfors, in the province of Smoland.

(3.) Cryftallifed zeolites is more common than the two preceding kinds; and is found, 162

A. In groups of cryftals in form of balls, and with concentrical points.

a. Yellow.

b. White.

B. Prifmatical and truncated cryftals.

a. White.

C. Capillary cryftals are partly united in groups, and partly feparate. In this latter accretion they refemble the capillary or feather filver ore; and is perhaps fometimes called *flos ferri*, at places where the nature of that kind of ftone is not yet fully known.

Thefe cryftals are found,

a. White.

The Ninth Order.

The *Manganefe* kind; *Magnefiæ.*

The ftones belonging to this order are in Swedifh called *brunften*, in Latin *fydereæ*, or *magnefiæ nigræ*; in order to diftinguifh them from the *magnefia alba officinalis*, and in French *mangonefe*, &c. They are by fome lithographifts entirely omitted, and by others ranked among the iron ores. 163

1. The manganefes confift of a fubftance which gives a colour both to flags and to the folutions of falts, or, which is the fame thing, both to dry and to liquid menftrua, *viz.*

a. Borax, which has diffolved manganefe in the fire, becomes tranfparent, of a reddifh brown or jacinth colour. *b.* The microcofmic falt becomes tranfparent with it, of a crimfon colour, and moulders in the air. *c.* With the fixed alkali, in compofitions of glafs, it becomes violet; but if a great quantity of manganefe is added, the glafs is in thick lumps, and looks black. *d.* Scorified with lead, the glafs gets a reddifh brown colour. *e.* The lixivium of a deflagrated manganefe is of a deep red colour.

2. It deflagrates with nitre, which is a proof that it contains fome phlogifton.

3. When reckoned to be light, it weighs as much as an iron ore of the fame texture.

4. Being melted together with glafs-compofitions, it ferments during the folution; but it ferments in a ftill greater degree when it is melted with the microcofmic falt.

5. It does not excite any effervefcence with the fpirit of nitre: aqua regia, however, extracts the colour out of the black, and diffolves likewife a great deal of it, which, by means of an alkali, is precipitated to a white powder.

6. Such colours as are communicated to glaffes by manganefe, are eafily deftroyed by the calx of arfenic or tin: they alfo vanifh of themfelves in the fire.

7. It is commonly of a loofe texture, fo as to colour the fingers like foot, although it is of a metallic appearance when broke.

Manganefe

(1) Other varieties of the zeolites have been difcovered, particularly at Adelfors's gold-mines in Smoland in Sweden; of which fome forts do not melt by themfelves in the fire, but diffolve readily in the acid of nitre, and are turned by it into a firm jelly.

Manganese EARTHS. Manganese is found,

A. Loose and friable,

164 *a.* Black, seems to be decayed particles of the indurated kind.

165 *B.* Indurated.

1. Pure, in form of balls, whose texture consists of concentric fibres.

a. White, *Magnesia alba strictè sic dicta*, is very scarce. Mr Cronstedt saw a specimen of this kind in a collection from an unknown place in Norway; and by examining a piece of it, he found that it differed from the common manganese, by giving to the borax a deep red colour in the fire: this sort acquires a reddish brown colour when it is calcined.

b. Red manganese is said to be found in Piedmont. This Mr Cronstedt has never seen; but has been told that this variety is free from iron, and gives to glass rather a red than a violet colour.

166 2. Mixed with a small quantity of iron.

a. Black manganese, with a metallic brightness. This is the most common kind, and is employed at the glass-houses and by the potters. It is found,

1. Solid, of a flaggy texture; *Magnesia textura vitrea.*
2. Steel-grained.
3. Radiated.
4. Crystallised.

a. In form of coherent hemispheres.

167 3. Blended with a small quantity of iron and tin; *Spuma lupi*, or *Wolfram.*

Wolfram is a name which is also sometimes given to mock lead, and sometimes to cockle or shirl, as also to other minerals; however, it is chiefly given to this species of manganese, when it occurs in the tin mines.

1. With coarse fibres.

a. Of an iron colour. This gives to the glass compositions, and also to borax and the microcosmic salt, an opaque whitish yellow colour, which at last vanishes.

SECOND CLASS.

168 The SALTS. By this name those mineral bodies are called which can be dissolved in water, and give it a taste; and which have the power, at least when they are mixed with one another, to form new bodies of a solid and angular shape, when the water in which they are dissolved is diminished to a less quantity than is required to keep them in solution; which quality is called *crystallisation.*

No other salts ought to be considered and ranked in a mineral system but those which are found natural in the earth; and for this reason a great number of salts will be in vain looked for here, viz. all such as are either natural or prepared by art in the other two kingdoms of nature, and from substances belonging to them. Amongst these is nitre itself and its acid, and the vegetable acid, since these are never had from true mineral bodies; nor is it demonstrated that they have their origin from the true mineral vitriolic and muriatic acids. There have, indeed, been many attempts made to reduce most of them to a vitriolic acid, which by many is called the *universal acid:* but experiments will not agree with it; at least nobody has yet been able, by uniting a phlogiston with any other acid than the true vitriolic, to produce a substance in every particular resembling the true brimstone, or sulphur.

Acid SALTS.

In regard to the known principal circumstances or qualities of the mineral salts, they are divided into

1. Acid salts, or mineral acids.
2. Alkaline salts, or mineral alkalis.

The FIRST ORDER.

Acid salts; the characters of which are, that they 169

1. Have a sour taste.
2. Are corrosive; that is to say, have a power of dissolving a great number of bodies.
3. They have a strong attraction to the alkaline salts and earths, whence they always unite with them with an effervescence, and sometimes with a strong heat: by this mixture bodies are produced, which are employed in common life under the names of *vitriols, neutral salts, gypsum,* &c.
4. They change most of the expressed blue juices of vegetables into red.
5. They separate the alkali from the fat, when they have been united in soap; which effect is called *curdling* or *coagulation.*
6. They are volatile and subtile, so as never to be observable by the naked eye, unless they are mixed with heterogeneous bodies; and therefore the figure of the pure mineral acids cannot be defined but by guess.

A. The vitriolic acid; *Acidum vitrioli, aluminis, et sulphuris.* 170

I. The pure vitriolic acid is, in abstract, considered as possible to occur in nature: its qualities, when mixed with water, in which it is caught by distillation, are as follows:

1. When mixed with the least possible quantity of water, it is of an unctuous appearance, and is for that reason improperly called *oil of vitriol.*
2. It has in that state a considerable heaviness, viz. in comparison to water, as 1700 to 1000.
3. It dissolves silver, tin, the regulus of antimony, and quicksilver; but,
4. When mixed with more water, it dissolves zinc, iron, and copper.
5. It dissolves likewise the calcareous earth, and precipitates with it in form of a gypsum, of which a part shoots into gypseous drusen, *selenites et crystalli gypsei.*
6. It unites with the earth of quartz, when it has been previously dissolved in the *liquor silicum;* and with a pure argillaceous earth, dissolving it without any fermentation: with both these earths it makes alum.
7. It has a stronger attraction to the inflammable substance than to the alkaline salt, and forms with it a body which properly may be called the *mineral sulphur.*
8. When it is perfectly united with phlogistic substances belonging to the vegetable kingdom,

dom, and the water has been completely feparated, this mixture catches flame in the open air, and is confumed; as may be feen by the powder called *pyrophorus*.

9. It attracts water ftrongly, and the aqueous vapours out of the air; and if a great quantity of water is added to it at once, a ftrong heat arifes.
10. It unites readily and eafily with the alkalis, whereby, according to their nature, different compounds are produced, which have obtained the names of *tartarus vitriolatus*, *fal mirabile*, and *fal ammoniacum fixum*.

171 II. The vitriolic acid mixed or faturated.

A. With metals; *Vitriola*, vitriols.

a. Simple vitriols.

1. Martial vitriol; green vitriol, or copperas.

This is the common green vitriol, which naturally is found diffolved in water, and is produced in abundance by decayed or calcined marcafites.

2. Copper vitriol; blue vitriol. This is of a deep blue colour, and is found in all ziment waters, as they are called; for inftance, at Neufohl in Hungary, in St Johan's mine at Fahlune in the province of Dalarne, at Nya Kopparberget in Weftmanland, and the copper-mines at Wicklow in Ireland, &c. It is, however, feldom perfectly free from an admixture of iron and zinc.
3. Zinc vitriol, is white and clear as alum, and is found at the Ramelfberg in the Hartz, as alfo in the rubbifh at Stollgrufvan in Weftmanland in Sweden, where the mock lead has decayed either fpontaneoufly, or after having been burnt.

172 *b*. Compound vitriols.

1. Vitriol of iron and copper, is of a bluifh green colour.
2. Vitriol of iron, zinc, and copper. This verges more to the blue than to the green colour. It is made at Fahlune in Dalarne, from the water which is pumped out of the copper mines: in this water large cryftals of vitriol are often ready formed. If this vitriol is dipped in water, and afterwards rubbed on clean iron, the copper does not precipitate from it.
3. Vitriol of zinc and iron. This is the green vitriol from Goflar in the Hartz.
4. Vitriol of zinc and copper. This is the blue vitriol from Goflar.
5. Vitriol of nickel and iron, is of a deep green colour, and is contained in the ochre or decayed parts of the nickell, at the cobalt-mines at Los, in the province of Helfingland.

Moft part of the vitriols owe their formation to art: becaufe when fuch ores as contain fulphur are dug out of the mines by means of fire, the phlogifton of the fulphur is by the heat expelled, leaving the acid behind; which, being let loofe or freed, is thereby enabled to attract and unite with watery vapours, diffolving at the fame time the metals; and it is thus the vitriols are formed. Every fort of ore does not commonly decay or weather in a natural manner, without being promoted by art; and this decaying or weathering is moftly performed in the open air: for which reafon no very great quantity of vitriol can be expected in that way; for when any ore thus weathers or decays, the diffolved particles are by degrees carried off by the rain, and are at laft found in a diffolved ftate in certain fprings or mineral waters. All fuch ores may therefore be called *true vitriol ores*, as contain iron, copper, zinc, and nickel mineralifed with fulphur. The acid in the vitriols, however, is not dulcified by the metals, as it is by the alkali in the true neutral falts.

B. The acid of vitriol mixed or faturated with earths. 173

1. With a calcareous earth. Gyfpum.
2. With an argillaceous earth. The alum kind.

a. With a fmall quantity of clay. Native or plumofe alum.

Is found on decayed alum ores in very fmall quantities.

The gypfa and afbefti, but more efpecially the latter, have been ufed through ignorance in moft countries for plumofe native alum, on account of the fimilarity of ftructure.

b. With a greater quantity of pure clay. White alum ore.

1. Indurated pale red alum ore. Is employed at Lumini, not far from Civita Vecchia in Italy, to make the pale red alum called *roche-alum*. This is, of all alum ores, the moft free from iron; and the reddifh earth which can be precipitated from it does not fhow the leaft marks of any metallic fubftance.

c. With a very large quantity of martial clay, which likewife contains an inflammable fubftance. Common alum ore.

Is commonly indurated and flaty, and is therefore generally called *alum flate*.

It is found,

1. Of parallel plates, with a dull furface; from Andrarum in the province of Skone, Hunneberg and Billingen in the province of Weftergottland, Rodoen in the province of Jemtland, and the ifland of Oeland, &c.
2. Undulated and wedge-like, with a fhining furface. This at firft fight refembles pit-coal: it is found in great abundance in the parifh of Nas in Jemtland.

C. Vitriolic acid united with phlogifton. The fulphur kind. 174

D. Vi-

D. Vitriolic acid saturated with alkaline salt.

a. With the alkali of the common salt or sea-salt.

175 This is a neutral salt, prepared by natute as well as by art, containing more or less of iron, or of a calcareous earth, from which arises also some difference in its effects when internally used. It shoots easily into prismatical crystals, which become larger in proportion to the quantity of water evaporated before the crystallisation. When laid on a piece of burning charcoal, or else burnt with a phlogiston, the vitriolic acid discovers itself by the smell like to the *hepar sulphuris*.

It is found in a dissolved state in springs and wells, and in a dry form on walls, in such places where aphronitrum has effloresced through them, and the vitriolic acid has happened to be present; for instance, where marcasites are roasted in the open air. This salt is often confounded with the aphronitrum, or a pure mineral alkali; and a learned dispute once arose, which of these salts ought with the greatest propriety to be called *natron*, *Baurach veterum*, *sal mirabile*, or *Epsom salt*; whereas it might easily have been decided by chemical experiments, if their qualities had been regarded in preference to their figures or their native places.

This may be called *English* or *Epsom salt*, when it has naturally as equal a copious portion of the calcareous earth as of the artificial one; but in regard to its effects, for which it has been most valued by Glauber, Mr Cronstedt has ranked all the less considerable varieties of this neutral salt, when natural, under the name of *sal mirabile*.

176 *B.* Acid of common or sea-salt. This acid, considered in that state in which it can be had, viz. in mixture with water, has the following qualities:

1. It does not alter the fluidity of water, nor considerably augment its heaviness, as the vitriolic acid does.
2. It is somewhat less corrosive and sour than the said vitriolic acid.
3. It strongly attracts the alkaline salts; but, however, is forced to quit them to the vitriolic acid, when that is added.
4. It dissolves the calcareous earth, and makes with it a substance called *sal ammoniacum fixum*.
5. When exposed to the fire, combined with a phlogiston, it burns with a yellowish green flame.
6. When highly concentrated and pure, as when it is distilled from common salt mixed with pipe-clay, it dissolves tin and lead: but less pure, it dissolves copper, iron, zinc, and the regulus of antimony: the copper is, however, more easily dissolved when it is in form of a calx, as the calces of quicksilver and cobalt likewise are.
7. It unites with silver dissolved in aquafortis, and with lead dissolved in aqua-regia, falling with them to the bottom in form of a white spongy mass. This precipitation, exposed to the fire, still retains the acid, and melts with it into a glassy substance, which does not dissolve in water.
8. It is apt to attract the humidity of the air, and to promote the decaying of those dry substances with which it has been united.
9. Mixed with the spirit of nitre, it makes the solution called *aqua-regia*, which is the true liquid menstruum for gold.

This acid seems also, on certain occasions, to have got loose from those substances with which it had been originally united in the earth: the *sal ammoniacum naturale* at Solfatara in Italy, and the horn silver ore, appear to be proofs of this, as they seem to be the products of time.

I. Mixed or satiated acid of sea-salt.

A. With earths. 177

1. With a calcareous earth; *sal ammoniacum fixum*.

This somewhat decays, or attracts the humidity of the air: it is found in abundance in the sea-water. See the calcareous kind, (91, &c.)

B. With alkaline salts. 178

(1.) With the fixed mineral alkali, or sea alkali; common salt, or sea-salt.

This shoots into cubical crystals during the evaporation; it crackles in the fire, and attracts the humidity of the air.

α. Rock salt, fossil salt.

Occurs in form of solid strata in the earth.

1. With scaly and irregular particles.
   - *a.* Grey, and
   - *b.* White. These are the most common, but the following are scarcer:
   - *c.* Red,
   - *d.* Blue, and
   - *e.* Yellow, from Cracow in Poland, England, Salzberg, and Tirol.
2. Crystallised rock-salt.
   - *a.* Transparent, from Cracow in Poland, &c.

β. Sea-salt.

Is produced from sea-water, or from the water of salt lakes, by evaporation in the sun, or by boiling.

The seas contain this salt, though more or less in different parts. In Siberia and Tartary, there are lakes that contain great quantities of salt.

γ. Spring-salt.

(2.) Saturated with a volatile alkali. Native sal. ammoniac.

This is of a yellowish colour, and is sublimed from the flaming vents or crevices at the Solfatara near Naples.

C. United with phlogiston; amber, *succinum*. 179

D. United with metals. 180

1. With silver; *Minera argenti cornea*, horn silver ore. The *hornertz* of the Germans.

The Second Order.

Alkaline mineral salts.

These are known by their action on the above-mentioned acids when they are joined together, whereby 181

Alkaline SALTS.

whereby a fermentation ariſes, and a precipitation enſues of ſuch bodies as either of them had before kept in diſſolution, uniting at the ſame time together; by which new compoſitions are made, that are called *neutral ſalts*, or *ſalia neutra*.

Theſe alkaline ſalts are,

182 I. Fixed in the fire.

A. Alkali of the ſea, or of common ſalt.

(1.) Pure.

This has nearly the ſame qualities with the lixivious ſalt which is prepared from the aſhes of burnt vegetables; it is the ſame with the *ſal ſodæ*, or kelp, becauſe the kelp is nothing elſe than the aſhes remaining after the burning of certain herbs that abound with common ſalt; but which common ſalt, during the burning of thoſe vegetables, has quitted its acid.

This,

1. Ferments with acids, and unites with them.
2. Turns the ſyrup of violets to a green colour.
3. Precipitates ſublimate mercury in an orange-coloured powder.
4. Unites with fat ſubſtances to make ſoap.
5. Diſſolves the ſiliceous earth in the fire, and makes glaſs with it, &c. It diſtinguiſhes itſelf from the ſalt of the pot-aſhes, by the following properties: that,
6. It ſhoots eaſily into priſmatical cryſtals; which
7. Fall to powder in the air, in conſequence of their eaſily loſing their humidity.
8. Mixed with the vitriolic acid, it makes the *ſal mirabile*.
9. It melts eaſier; and perhaps it is alſo more conveniently applied in the preparation of ſeveral medicines.
10. It is ſomewhat volatile in the fire.

183 (2.) Mixed with a ſmall quantity of the calcareous earth.

This is ſo ſtrongly united with the calcareous earth, that the latter enters with it into the very cryſtals of the ſalt: though, by repeated ſolutions, the earth is by degrees ſeparated from it, and falls to the bottom after every ſolution. It grows in form of white froſt on walls, and under vaults, and in places where it cannot be waſhed away by the rain. When it contains any conſiderable quantity of the calcareous earth, its cryſtals become rhomboidal, a figure which the calcareous earth often aſſumes in ſhooting into cryſtals; but when it is purer, the cryſtals ſhoot into a priſmatical figure. This is a circumſtance which neceſſarily muſt confuſe thoſe who know the ſalts only by their figure, and ſhews at the ſame time how little certainty ſuch external marks afford in a true diſtinction of things. This ſalt is therefore very often confounded with the *ſal mirabile*.

184 (3.) Saturated with mineral acids. Neutral ſalts.

a. With the acid of ſea-ſalt; common ſalt, ſea-ſalt.

b. With the vitriolic acid; *ſal mirabile*.

B. Borax. 185

Many experiments have been made with this ſalt, in order to diſcover its origin and conſtituent parts, the moſt remarkable of which are mentioned under the article CHEMISTRY n° 170, and its following qualities are to be obſerved.

1. It ſwells and froths in the fire, as long as any humidity remains in it; but melts afterwards very eaſily to a tranſparent glaſs, which, as it has no attraction to the phlogiſton, keeps itſelf in the form of a pearl on the charcoal when melted with the blow-pipe.
2. It changes the ſyrup of violets into green; and precipitates the ſolution of alum, and that of metals made with acids.
3. It unites with mineral acids to a neutral ſalt, which ſhoots into very fine and ſubtile hair-like cryſtals, and is called *ſal ſedativum*. In a certain compoſition it is volatile; and mixed with *litmus*, or *ſuccus heliotropii*, and the ſyrup of violets, it diſcovers marks both of an alkali and an acid.
4. When it has been united with the vitriolic acid and a phlogiſton, no *hepar ſulphuris* is produced.
5. After being refined, it ſhoots into irregular figures: but the cryſtals, which form themſelves after the firſt operation, and are called *tincal*, conſiſt of octagonal priſms, flat at the extremities, and with their angles cut off or truncated.

II. Volatile. This perfectly reſembles that ſalt 186
which is extracted from animals and vegetables, under the name of *alkali volatile*, or *ſal urinoſum*, and is commonly conſidered as not belonging to the mineral kingdom; but ſince it is diſcovered not only in moſt part of the clays, but likewiſe in the ſublimations at Solfatara near Naples, it cannot poſſibly be quite excluded from the mineral kingdom.

Its principal qualities are, That,

a. In the fire it riſes in a dry form, and volatiliſes in the air in form of corroſive vapours, which are offenſive to the eyes and noſe.

b. It precipitates the ſolution of the mercurial ſublimate into a white powder.

c. It alſo precipitates gold out of *aqua regia*, and detonates with it.

d. It has a reaction in regard to the acids, tho' not ſo ſtrongly as other alkalies.

e. It tinges the ſolution of copper blue, and diſſolves this metal afreſh, if a great quantity is added.

f. It deflagrates with nitre, which proves that it contains a phlogiſton.

It is never found pure; but,

A. Mixed, 187

1. With ſalts.

a. With the acid of common ſalt. Native ſal ammoniac.

2. With earths.

a. Clay.

Inflammables. *Ambergrife, Amber.*

a. Clay. The greateft part of the clays contain a volatile alkali, which difcovers itfelf in the diftillation of the fpirit of fea-falt, &c.

THIRD CLASS.

188 Mineral Inflammable Substances.

To this clafs belong all thofe fubterraneous bodies that are diffoluble in oils, but not in water, which they repel; catch flame in the fire; and are electrical.

It is difficult to determine what conftitutes the difference between the purer forts of this clafs, fince they all muft be tried by fire, in which they all yield the fame product; but thofe which in the fire fhew their differences by containing different fubftances, are here confidered as being mixed with heterogeneous bodies: that fmall quantity of earthy fubftance, which all phlogifta leave behind in the fire, is, however, not attended to.

189 I. Ambergrife, is commonly reckoned to belong to the mineral kingdom, although it is faid to have doubtful marks of its origin.

a. It has an agreeable fmell, chiefly when burnt.

b. It is confumed in an open fire.

c. It foftens in a gentle degree of heat, fo as to ftick to the teeth like pitch.

d. It is of a black or grey colour, and of a dull and fine-grained texture. The grey is reckoned the beft, and is fold very dear.

190 II. Amber. *Ambra flava; fuccinum; electrum.* There are often found fifh, infects, and vegetables included in it, which teftify its once having been liquid. It is more tranfparent than moft part of the other bitumens, and is doubtlefs that fubftance which firft gave rife to electrical experiments.

Its varieties are reckoned from the colour and tranfparency: it is found,

A. Opake.

a. Brown. *b.* White. *c.* Blackifh.

B. Tranfparent.

a. Colourlefs.

b. Yellow. The greateft quantity of European amber is found in Pruffia; but it is, befides, collected on the fea-coaft of the province of Skone, and at Biorko, in the Lake Malaren, in the province of Upland; as alfo in France and in Siberia. It is chiefly employed in medicines, and for making varnifhes.

191 III. Rock-oil; *Petroleum.* It is an inflammable mineral, of a light-brown colour, which cannot be decompounded, but is often rendered impure by heterogeneous admixtures. In length of time, it hardens in the open air, like a vegetable refin; and then becomes of a black colour, whether it is pure, or mixed with other bodies. It is likewife found in the earth.

A. Liquid.

1. Naphtha. This is faid to be of a very fragrant fmell, tranfparent, extremely inflammable, and attracts gold. It is gathered from the furface of the water in fome wells in Perfia.

Inflammables. *Rock-oil. Sulphur.*

2. Rock-oil; *Petroleum*, properly fo called. This fmells like the oil of amber, though more agreeable, and is likewife very ready to take fire. It is collected in the fame manner as the naphtha, from fome wells in Italy, 192
and in a deferted mine at Ofmundfberget in the province of Dalarne in Sweden: at this laft-mentioned place it is found in fmall hollows in the limeftone, as refin is in the wood of the pines.

B. Thick and pitchy rock-oil, or Barbadoes tar; 193
Petroleum tenax, maltha. Refembles foft pitch.

C. Hardened rock-oil; *Petroleum induratum.* 194
Foffil pitch; *Pix montana.*

1. Pure; *Afphaltum.* This leaves no afh or earthy fubftance when it is is burnt. From this or the preceding fubftance, it is probable the afphaltum was prepared that the Egyptians ufed in embalming their dead bodies, and which is now called *mummia.*

2. Impure; *Pix montana impura.* This contains a great quantity of earthy matter, which is left in the retort after diftillation, or upon the piece of charcoal if burnt in an open fire; it coheres like a flag, and is of the colour of black lead: but in a calcining heat this earth quickly volatilifes; fo that the nature of it is not yet known. The fubftance which rifes, and then falls into the receiver during the diftillation of this foffil pitch, is entirely the fame as the common natural liquid rock-oil.

IV. Mineral phlogifton, or bitumen, united with the vitriolic acid. Sulphur, or brimftone. This 195
is very common in the earth, and difcovers itfelf in many and various forms. It is found,

A. Native fulphur. In this the two conftituent parts are mixed in due proportion in regard to each other, according to the rules of that attraction which is between them; it is eafily known,

1. By its inflammability, and by its flame.
2. By its fmell when burnt; and,
3. By its producing a liver of fulphur, when mixed with a fixed alkali, like that made from artificial fulphur.

It is found,

a. Pellucid, of a deep yellow colour.

b. Opake, white, and greyifh. It is often found on limeftone, which the vitriolic acid has left untouched, having a ftronger attraction to the phlogifton, and therefore wholly uniting with that.

B. Sulphur that has diffolved or is faturated with 196
metals.

1. With iron. Pyrites, or copperas-ftone; *Pyrites.* This is the fubftance from which moft fulphur is prepared, and is therefore ranked here with all its varieties. It is hard, and of a metallic fhining colour.

A. Pale yellow pyrites; *Pyrites fubflavus.* Marcafite. This is very common, and contains a proportionable quantity of fulphur with refpect to the iron; when once thoroughly inflamed, it burns by itfelf.

a. Of a compact texture; *Polita piedra del ynca, Hifpanorum.*
b. Steel-grained.
c. Coarfe-grained.
d. Cryftallifed. It fhoots moftly into cubical and octoëdral figures, tho' it alfo cryftallifes into innumerable other forms.

197 B. Liver-coloured marcafite. Its colour cannot be defcribed, being betwixt that of the preceding marcafite, and the azure copper ore. The iron prevails in this kind; it is therefore lefs fit to have fulphur extracted from it, and alfo for the fmelting of copper ores. It is found,
a. Of a compact texture.
b. Steel-grained.
c. Coarfe-grained.

198 2. Iron and tin. Black-lead, or wadd; *Molybdæna.* If by fuch a mixture as this the iron and tin be not rendered too volatile, it muft be fuppofed that the great lofs the black lead fuftains in the calcining heat is occafioned from the fulphur, and that the fulphur confequently makes out the greateft part of the black lead. It is found,
a. Lamellar and fhining, of the fame colour as the potters lead ore.
b. Of a fteel-grained and dull texture. It is naturally black, but when rubbed it gives a dark lead colour.
c. Of a fine fcaly and coarfe-grained texture; coarfe black lead. It has at the fame time a fcaly and a granulated appearance. From Gran in the province of Upland, and from Tavaftehuflan in Finland. Profeffor Pott has examined the black lead in covered veffels, and Mr Quift in an open fire; from which difference in the method of treating it, different notions have arifen: becaufe the black lead is nearly unalterable when expofed to the fire in covered veffels, or when immediately put into a ftrong charcoal fire, but it is almoft wholly volatile in a calcining heat. This is the cafe with feveral others of the mineral phlogiftons; and from this we may in general learn, how neceffary it is to examine the mineral bodies by many and different methods, and to endeavour to multiply the experiments more than what has been hitherto done.

199 3. Sulphur with iron and copper; yellow or marcafitical copper ore.
4. Sulphur with iron and lead; potters lead-ore.
5. Sulphur with iron and zinc; mock lead, black jack, or blende.
6. Sulphur with iron and arfenic; arfenical pyrites.
7. Sulphur with iron and cobalt.
8. Sulphur with iron and bifmuth.
9. Sulphur with iron and nickel.
10. Sulphur with iron and gold; pyritical gold ore.
11. Sulphur with filver; glafs filver ore.
12. Sulphur with copper; grey or vitreous copper ore.
13. Sulphur with lead; potters lead ore.
14. Sulphur with bifmuth.
15. Sulphur with quickfilver; cinnabar.
16. Sulphur with arfenic, orpiment, *realgar.*

V. Mineral phlogifton united with earths. 200
A. With a calcareous earth.
1. With pure calcareous earth; the fetid or fwine fpar.
2. With the calcareous earth and vitriolic acid; the *leberftein* or *liverftone* of the Swedes.
B. With an argillaceous earth.
1. With a fmall quantity of argillaceous earth and vitriolic acid: Coal; *Lithantrax.* It is of a black colour, and of a fhining texture; it burns, and is moftly confumed, in the fire; but leaves, however, a fmall quantity of afhes. *a.* Solid coal. *b.* Slatty coal.
2. With a greater quantity of argillaceous earth and vitriolic acid; the *kolm* of the Swedes. This is of the fame appearance with the former, though of a more dull texture; it burns with a flame, and yet is not confumed, but leaves behind a flag of the fame bulk or volume as the coal was.
3. With abundance of argillaceous earth; ftone coal. It burns with a flame by itfelf, otherwife it looks like other flates.

VI. Mineral phlogifton mixed with metallic earths. 201
This is not found in any great quantity: in regard to its external appearance, it refembles pit-coal; and the fat fubftance contained in it, at times, partly burns to coal, and partly volatilifes in a calcining heat.
The only known varieties of this kind are,
A. Minera cupri phlogiftica.
When it has been inflamed, it retains the fire, and at laft burns to afhes, out of which pure copper can be fmelted.
B. Minera ferri phlogiftica.
This is not very different in its appearance from the pit-coal or foffil pitch, but it is fomewhat harder to the touch. There are two varieties of this fpecies:
1. Fixt in the fire; *Minera ferri phlogiftica fixa.*
Expofed to a calcining heat, it burns with a very languid though quick flame; it preferves its bulk, and lofes only a little of its weight. It yields above 30 per cent. of iron.
a. Solid, refembles black fealing-wax.—— It is found in the liver-coloured marcafite in Wafkberget, at Norrberke in Weftmanland.
b. Cracked, and friable.
2. Volatile in the fire.
This is unalterable in an open fire, either of charcoal, or even upon a piece of charcoal before the flame of the blow-pipe; but under a muffle the greateft part of it volatilifes, fo that only a fmall quantity of calx of iron remains. It is found,
a. Solid.
b. Cracked.
This laft kind leaves more afhes: thefe afhes,

aſhes, when farther expoſed to the fire, become firſt yellowiſh-green, and afterwards reddiſh-brown, when, beſides iron, they then alſo diſcover ſome marks of copper; it has, however, not been poſſible to extract any metallic ſubſtance from them, the effects of the loadſtone, and the colour communicated to the glaſs of borax, having only given occaſion to this ſuſpicion.

FOURTH CLASS.

Metals.

202 Are thoſe mineral bodies which, with reſpect to their volume, are the heavieſt of all hitherto-known bodies; they are not only malleable, but they may alſo be decompounded, and in a melting heat be brought again to their former ſtate, by the addition of the phlogiſton they had loſt in their decompoſition.

Thoſe metals which in a calcining heat loſe their phlogiſton, and conſequently with that the former coherency of their particles, are called *imperfect;* as tin, lead, copper, and iron, and all the ſemi-metals (of which more hereafter): notwithſtanding which, they may be malleable. But thoſe which cannot be deſtroyed in the fire alone are called *perfect;* as gold, ſilver, and platina del pinto. Nevertheleſs, the metals have commonly been conſidered more with regard to their malleability than to their fixity in the fire; and are therefore divided into,

A. Malleable, which are called *metals;* and,

B. Brittle, which are called *ſemi-metals.*

The zinc is, however, as a medium between theſe two diviſions, juſt as the quickſilver is between the perfect and imperfect metals; becauſe the quickſilver may indeed be ſo far deſtroyed in the fire, that its particles are ſeparated during their volatiliſation; but every one of them, even the minuteſt, retains, however, the phlogiſton united with it.

The First Order. *True Metals.*

203 I. Gold; *Aurum, ſol chymicorum.*

This is by mankind eſteemed as the principal and firſt among the metals; and that partly for its ſcarcity, but chiefly for the following qualities:

1. It is of a yellow ſhining colour.
2. It is the heavieſt of all known bodies, its ſpecific gravity to water being as 19,640 to 1000.
3. It is the moſt tough and ductile of all metals; becauſe one grain of it may be ſtretched out ſo as to cover a ſilverwire of the length of 98 yards, by which means $\frac{1}{705600}$ grain becomes viſible to the naked eye.
4. Its ſoftneſs comes neareſt to that of lead, and conſequently it is but very little elaſtic.
5. It is fixed and unalterable in air, water, and fire, becauſe it does not eaſily quit its phlogiſton; its liquid menſtruum being only made by art.

   It has, however, according to Homberg's experiments, when expoſed to Tſchirnhauſen's burning-glaſs, been found partly to volatiliſe in form of ſmoke, and partly to ſcorify: but this wants to be farther examined. It is alſo ſaid, that gold, in certain circumſtances, and by means of certain artifices in electrical experiments, may be forced into glaſs; and that on this occaſion it becomes white, leaving a black duſt behind it; which, if ſo, confirms certain other chemical experiments, viz. That gold can, together with its colour, loſe ſomething of its phlogiſton, and yet retain its heavineſs, ductility, &c.
6. When melted, it reflects a bluiſh-green colour from its ſurface.
7. It diſſolves in aqua regia, which is compoſed of the acids of ſea-ſalt and nitre; but not in either alone, nor in any other ſolution of ſalt or acid whatſoever.
8. When mixed with a volatile alkali and a little of the acid of nitre, by means of precipitation out of aqua regia, it burns off quickly, in the leaſt degree of heat, with a ſtrong fulmination.
9. It is diſſolved, *in forma ſicca*, by the liver of ſulphur, and alſo ſomewhat by the glaſs of biſmuth.
10. It is not carried away by the antimony during the volatiliſation of that ſemi-metal, and is therefore conveniently ſeparated from other metals by the help of crude antimony; in which proceſs the other metals are partly made volatile, and fly off with the antimony, and partly unite with the ſulphur, to which the gold has no attraction, unleſs by means of ſome uniting body, or by a long digeſtion.
11. The phoſphorus is ſaid to have ingreſs into gold.
12. If mixed with a leſs portion of ſilver, platina, copper, iron, and zinc, it preſerves tolerably well its ductility. But,
13. When mixed with tin, it becomes very brittle; and it attracts likewiſe the ſmoke of that metal ſo as to be ſpoiled, if melted in an hearth where tin has been lately melted: And this is perhaps the reaſon why gold becomes brittle, and of a paler colour, when melted in a new black lead crucible.
14. It requires a ſtrong heat before it melts, nearly as much, or a little more than copper.
15. It mixes or amalgamates readily with quickſilver.

A. Native gold is in its metallic form commonly pure: and in this ſtate moſt part of this metal uſed in the world is found. With reſpect to 204
either the figure or the quantity in which it is found in one place, it is by miners divided into,

1. Thin ſuperficial plated or leaved gold; which conſiſts of very thin plates or leaves, like paper.
2. Solid or maſſive, is found in form of thick pieces.
3. Cryſtalliſed, conſiſts of an angular or cryſtalline figure.
4. Waſh gold, or gold duſt, is waſhed out of ſands, wherein it lies in form of looſe grains

and lumps. The gold is in general more frequently imbedded and mixed with quartz than with any other kind of ftone; and the quartz in which the gold is found in the Hungarian gold mines is of a peculiar appearance. All other forts of ftones, however, are not to be excluded, fince gold is likewife found in fome of them; for inftance, in limeftone, in Adolph Fredrik's Grufva at Adelfors in the province of Smoland in Sweden; in Hornblende, in Baftnas Grufva at Riddarfhyttan in the province of Weftmanland; not to mention feveral other gold mines.

205 *B.* Mineralifed gold. This is an ore in which the gold is fo far mineralifed, or fo entangled in other bodies, as not to be diffolved by the aqua regia:

1. Mineralifed with fulphur.
   - *a.* Mineralifed by means of iron. Marcafitical gold ore; *Pyrites aureus.* It is found at Adelfors, in the province of Smoland; and contains an ounce of gold, or lefs, in 100 pounds.
   - *b.* Mineralifed by means of quickfilver. It is found in Hungary.
   - *c.* Mineralifed by means of zinc and iron; *Aurum fulphure mineralifatum mediante zinco & ferro, aut argento.* The Schemnitz blende. At Schemnitz in Hungary are found zinc ores, which contain a great deal of filver, and this filver is very rich in gold. Since gold and fulphur have no immifcible power or attraction to one another, many have infifted that gold never could be found in marcafite, or thofe ores which contain fulphur: but fince we know by experience that gold can be melted out of the above-mentioned ores, although they have been previoufly digefted in aqua-regia; and that gold likewife mixes and diffolves into a regulus; there is the greateft reafon to believe that a third fubftance, which here is a metal, muft neceffarily have by its admixture enabled the fulphur to unite with a certain quantity of gold. Scheffer has given upon this fubject fome very curious and ufeful obfervations, in his Hiftory of the Refining of Metals, inferted in the Tranfactions of the Academy of Sciences at Stockholm.

It is, however, by no means hereby intended to confirm the credulous in their opinion, that the marcafites in general contain more gold than what true metallurgifts have afferted; becaufe fraud might then perhaps become too common. It is only meant to indicate, that, as no gold is to be expected from marcafites, where no native gold is found in the neighbourhood, in the fame manner no marcafites ought to be defpifed which are found in tracks where gold ores are dug: but at the fame time care muft be taken not to be deluded by the mention of volatile gold, as it is a notion really contradictory and fufpicious; and then there can be no fear of being mifled.

II. Silver; *Argentum, luna.* Which is, 206

- *a.* Of a white fhining colour.
- *b.* Its fpecific gravity to water is 11,091 to 1000.
- *c.* It is very tough or ductile, fo that a grain of it may be ftretched out to three yards in length, and two inches in breadth.
- *d.* It is unalterable in air, water, and fire.
- *e.* It diffolves in the acid of nitre, and alfo by boiling in the acid of vitriol.
- *f.* If precipitated out of the acid of nitre with the common falt, or with its acid, it unites fo ftrongly with this laft acid, that it does not part from it, even in the fire itfelf, but melts with it into a mafs like glafs, which is called *luna cornea.*
- *g.* It does not unite with the femi-metal nickel, during the fufion.
- *h.* It amalgamates eafily with quickfilver.
- *i.* It is in the dry way diffolved by the nitre of fulphur.
- *k.* It has a ftrong attraction to fulphur, fo as readily to take a reddifh yellow or black colour, when it is expofed to fulphureous vapours.
- *l.* It has no attraction to arfenic; whence, when the red arfenical filver ore, or *rothgulden ertz* of the Germans, is put into the fire, the arfenic flies off, and leaves the fulphur (which in this compound was the *medium uniens*) behind, united with the filver in form of the glafs filver ore, or glafs ertz.
- *m.* It is not diffolved by the glafs of lead, and confequently it remains on the cupel.
- *n.* It is exhaled or carried off by volatile metals and acids, as by the vapours of antimony, zinc, and the acid of common falt.
- *o.* It melts eafier than copper.

Silver is found,

A. Native or pure. 207

Native filver moft generally is nearly of fixteen carats ftandard.

1. Thin fuperficial plated or leaved filver.
2. It is alfo found in form,
   - *a.* Of fnaggs, and coarfe fibres.
   - *b.* Of fine fibres. Capillary filver.
   - *c.* Arborefcent. From Potofi in America, and Kongfberg in Norway.
   - *d.* Cryftalline, or figured. This is very fcarce to be met with: it has diftinct figures, with fhining furfaces; it is, however, fometimes found at Kongfberg.

The filver from America is faid to be found for the moft part native; fo it is likewife at Kongfberg in Norway; but it is not commonly fo in the other European mines. In Sweden, it is found native in a very fmall quantity, in the mines of Salberg in Weftmanland, of Lofafen in Dalarne, of Hevaffwik and Sladkierr in the province of Dal, of Sunnerfkog in the province of Smoland, and in the ifland Utoen in the Lake Malaren. It was once found in pretty large lumps in a vein

vein of clay in one of the iron mines at Normark, in the province of Wermeland. It was there mixed with nickel, which was partly decayed or withered; and under this circumstance it formed the compound ore called the *stercus anserinum*, or *goose-dung ore*. At this place the argillaceous vein crosses the veins of the iron ore, and will perhaps be found to have more of these riches, even in several other places, if well searched, as is done in other countries, oftentimes not on such evident marks or signs.

208 *B.* Dissolved and mineralised.

(1.) With sulphur alone. Glass silver ore,

This is ductile, and of the same colour as lead; but, however, becomes blacker in the air. It has, therefore, very undeservedly got the name of *glass-ore;* for that name rather belongs to the *minera argenti cornea*, or horn silver ore, if indeed any silver ore can be considered as glassy.

It is found in the same manner as native gold; *viz.*

1. In crusts, plates, or leaves.
2. Grown into
   a. Snaggs, and
   b. Chrystalline figures.

It is generally either of a lamellar or a grained texture, and is found at Kongsberg and in the Saxon mines.

The glass silver ore is the richest of all silver ores; since the sulphur, which is united with the silver in this ore, makes out but a very small quantity of its weight.

209 (2.) With sulphur and arsenic. The red or ruby-like silver ore. The *rothgulden* of the Germans.

The colour of this ore varies as the proportion of each of these ingredients varies in the mixture; viz. from dark grey to deep red: but when it is rubbed or pounded, it always gives a red colour. When put in the fire, it crackles and breaks; and when the crackling ceases, it melts easily, the arsenic at the same time exhaling in smoke.

a. Grey arsenical silver ore: which is either,
   1. Plated, crusted, or leaved; and,
   2. Solid.
b. The red arsenical silver ore:
   1. Plated, crusted, or leaved;
   2. Solid or scaly; and,
   3. Crystallised.

In this last form it shows the most beautiful red colour, and is often semi-transparent. It contains about 60 *per cent.* in silver; and is found in the greatest quantity at Andreasberg in the Hartz.

210 (3.) With sulphurated arsenic and copper. The *weissgulden* of the Germans.

This, in its solid form, is of a light grey colour, and of a dull and steel-grained texture. The more copper it contains, the darker is the colour. It often holds seven pounds of silver *per cent.* It is,

a. Friable, withered, or decayed, of a black or footy colour; and is therefore by the Germans called *silber-schwartz*, or *Russig-tes-ertz.*
b. Solid, of a light grey colour, and is that sort properly called *weissgulden.*

It is found at St Mary of the Mines in Alsatia, the Saxon mines, and at St Andreasberg in the Hartz.

(4.) With sulphurated arsenic and iron. The *weisertz*, or white silver ore, of the Germans. 211

This is an arsenical pyrites, which contains siver; it occurs in the Saxon mines, and so exactly resembles the common arsenical pyrites as not to be distinguished from it by sight alone, or without other means. The silver it contains may perhaps consist of very subtile capillary silver mixed in it.

(5.) With sulphurated antimony. 212

a. Of a dark-grey and somewhat brownish colour. The *lebererz*, from Braunsdorff in Saxony.
b. Of a blackish blue colour.
   1. In form of capillary crystals. *Federertz*, or plumose silver ore.

It is found in Saxony, and contains only two or four ounces of silver *per cent.* 213

(6.) With sulphurated copper and antimony. The Dal *falertz.*

This resembles, both in colour and texture, the dark-coloured weissgulden, or falertz. When rubbed, it gives a red powder.

a. Solid.
b. Crystallised, is found in the parish of Aminskog in the province of Dal; and at that place has been for several years melted by a method invented for the different mixture of the ores; which process must be very troublesome to those who are not perfectly well versed in metallurgy.

It contains 13 ounces of silver, and 24 *per cent.* of copper.

(7.) With sulphurated zinc. The *pechblende* of the Germans. 214

This is a zinc ore, mock lead, or blende, which contains silver, and is found among rich silver and gold ores; for instance, in the Hungarian and Saxon mines.

a. Of a metallic changeable colour.
   1. Solid, and with fine scales.
   2. In form of balls. The *kugel-ertz*, or ball ore.

It is found at Schemnitz, and contains also gold. Its yield of silver is 24 ounces *per cent.* and 30 *per cent.* of zinc.

b. Black mock lead, or blende, found in Saxony. This is also found,
   1. Solid, and with fine scales;
   2. And in form of balls.

(8.) With sulphurated lead; potters ore. *Galena, bleyglanz.* 215

(9.) With

(9.) With ſulphurated lead and antimony, called *ſtriperz.*

216 (10.) With ſulphurated iron. *Silberhaltiger kies;* marcaſite holding ſilver.

At Kongſberg in Norway, it is ſaid, a liver-coloured marcaſite is often found, particularly at the mine called *Fraulein Chriſtiana*, &c. This marcaſite contains of ſilver from three ounces to three and an half *per cent.*

217 (11.) With the acid of common ſalt. *Minera argenti cornea. Hornertz*, or horn-ſilver ore.

This is the ſcarceſt ſilver ore; it is of a white or pearl colour, changeable or varying on the ſurface, ſemi-tranſparent, and ſomewhat ductile both when crude and when melted. It cannot be decompoſed without ſome admixture of ſuch ſubſtances as attract the acid of the ſea-ſalt. It is found in very thin wrought leaves or cruſts, at Johan Georgenſtadt, in Saxony.

218 III. Platina del Pinto; *Juan blanca.*

This metal is a recent diſcovery of our times; and is deſcribed with great accuracy by Scheffer, in the Acts of the Royal Academy of Sciences at Stockholm for the year 1752; as alſo by Dr Lewis, in the Philoſophical Tranſactions for the year 1754, vol. xlviii. And though theſe two gentlemen agree in the principal circumſtances relating to this metal, yet it is very plain by their deſcriptions, that neither of them knew any thing of the other's experiments. By theſe deſcriptions we are convinced of the reſemblance this metal bears to gold; and therefore we muſt allow it to be called *white gold*, though, both theoretically and practically, it may be diſtinguiſhed from gold by the following qualities.

1. It is of a white colour.
2. It is ſo refractory in the fire, that there is no degree of heat yet found by which it can be brought into fuſion by itſelf, the burning-glaſs excepted, which has not yet been tried. But, when mixed with other metals and ſemi-metals, it melts very eaſily, and eſpecially with arſenic, both in its metallic form and in form of a calx or glaſs.
3. It does not amalgamate with quickſilver by itſelf, but only by means of the acid of common ſalt after a long trituration. This metal is therefore really ſeparated from gold by amalgamation, at thoſe places where it is found; and without this quality it would be very difficult to ſeparate it.
4. It is harder and leſs coherent than gold.
5. It is heavier than gold; and therefore the heavieſt of all bodies hitherto diſcovered: for though the ſpecific gravity of platina, in the hydroſtatical experiments made by Dr Lewis, is found to be to water only as 17,000 to 1000; yet, when melted with other certain metals, its ſpecific gravity has, by an exact calculation, been found to be conſiderably augmented, even ſo much as to 22,000.
6. Diſſolved in aqua regia, and precipitated with tin, or with a ſolution of that metal, it yields no *purpura mineralis.*

Except theſe, this metal has the ſame qualities as gold: but it cannot, on account of its refractorineſs in the fire, be worked off pure on the cupel, nor can it be worked with antimony; becauſe, before it is rendered perfectly pure, it cools, grows hard, and retains always ſome part of the added metals. It is brought to us only in its native ſtate, in ſmall, irregular, rugged grains; and it is yet uncertain whether it is found naturally mineraliſed. The platina is brought to Europe from the Rio del Pinto, in the Spaniſh Weſt Indies.

IV. Tin; *Stannum, Jupiter.* 219

This is diſtinguiſhed from the other metals by the following characters and qualities.

a. A white colour, which verges more to the blue than that of ſilver.

b. It is the moſt fuſible of all metals; and,

c. The leaſt ductile; that is, it cannot be extended or hammered out ſo much as the others.

d. In breaking or bending it makes a crackling noiſe.

e. It has a ſmell particular to itſelf, and which cannot be deſcribed.

f. In the fire it is eaſily calcined to white aſhes, which are 25 *per cent.* heavier than the metal itſelf. During this operation, the phlogiſton is ſeen to burn off in form of ſmall ſparkles among the aſhes, or calx.

g. This calx is very refractory; but may, however, with a very ſtrong degree of heat be brought to a glaſs of the hard reſin. But this calx is eaſily mixed in glaſs compoſitions, and makes with them the white enamel.

h. It unites with all metals and ſemi-metals; but renders moſt of them very brittle, except lead, biſmuth, and zinc.

i. It amalgamates eaſily with quickſilver.

k. It diſſolves in aqua-regia, the ſpirit of ſea-ſalt, and the vitriolic acid; but it is only corroded into a white powder by the ſpirit of nitre.

The vegetable acid, ſoaps, and pure alkaline ſalts, alſo corrode this metal by degrees.

l. Its ſpecific gravity to water is as 7400 to 1000, or as 7321 to 1000.

m. Diſſolved in aqua-regia, which for this purpoſe ought to conſiſt of equal parts of the ſpirit of nitre and ſea-ſalt, it heightens the colour of the cochineal, and makes it deeper; for otherwiſe that dye would be violet.

Tin is not found naturally in the earth in any other ſtate than, 220

(1.) In form of a calx.

A. Indurated, or vitrified.

1. Mixed with a little of the calx of arſenic.

A. Solid tin ore, without any determinate figure; tin-ſtone.

It reſembles a garnet of a blackiſh-brown colour, but is a great deal heavier; and has been conſidered, at the Engliſh tin-mines, as a ſtone containing no metal, until ſome years ago it began to be ſmelted to great advantage.

B. Cryſtalliſed; tin-grains.

Is like the garnets, of a ſpherical polygonal

polygonal figure, but looks more unctuous on the surface.

1. In larger grains; and,
2. In smaller grains.

2. Mixed with the calx of iron.
3. Mixed with the manganese.
4. Mineralised with sulphur and iron; black lead.

221 V. Lead; *Plumbum*, *Saturnus*. It is,

a. Of a blueish-white colour when fresh broke, but soon dulls or sullies in the air.

b. Is very heavy; viz. to water as 11,325 to 1000.

c. Is softest next to gold; but has no great tenacity, and is not in the least sonorous.

d. It is easily calcined; and, by a certain art in managing the degrees of the fire, its calx becomes white, yellow, and red.

e. This calx melts easier than any other metallic calx to a glass, which becomes of a yellow colour, and semi-transparent. This glass brings other bodies, and the imperfect metals, into fusion with it.

f. It dissolves, 1st, In the spirit of nitre; 2dly, In a diluted oil of vitriol, by way of digestion; 3dly, In the vegetable acid; 4thly, In alkaline solutions; and 5thly, In expressed oils, both in the form of metal and of calx.

g It gives a sweet taste to all solutions.

h. It amalgamates with quicksilver.

i. With the spirit of sea-salt it has the same effect as silver, whereby is produced a *saturnus corneus*.

k. It does not unite with iron, when it is alone added to it in the fire.

l. It works on the cupel, which signifies that its glass enters into certain porous bodies, destitute of phlogiston and alkaline salts.

m. It melts in the fire before it is made red-hot, almost as easily as the tin.

n. Its calx or glass may be reduced to its metallic state by pot-ashes.

222 Lead is found,

A. In form of a calx.

(1.) Pure.

A. Friable; lead ochre; native ceruss. This is found at Kristiersberget in Westmanland in Sweden, on the surface of the potter's ore.

B. Indurated; lead spar, or spatose lead ore.

1. Radiated, or fibrous.
   a. White.
2. Crystallised into a prismatical figure.
   a. White.
   b. Yellowish green.

223 (2.) Mixed.

A. With the calx of arsenic; arsenic lead-spar.

1. Indurated.

a. White. Mr Cronstedt has tried such an ore from an unknown place in Germany, and found that no metallic lead could be melted from it by means of the blow-pipe, as can be done out of other lead spars; but it must be performed in a crucible, and then that part of the arsenic which did not fly off in smoke during the experiment was likewise reduced, and found in form of grains dispersed, and forced into the lead. Another ore of this kind, which likewise was not easily reduced by means of the blow-pipe, did always, after being melted, and during the cooling, hastily shoot into polygonal, but mostly hexagonal, crystals, with shining surfaces. Can this crystallisation be owing to salts, which are said not to act in this manner but when they are dissolved in water?

B. With a calcareous earth.

The above-mentioned lead ores are very rich in lead, and easy to be tried; because most of them, being slowly heated, may be reduced to lead by means of the blow-pipe on a piece of charcoal. The calx of the lead in these ores has, perhaps, first been dissolved by sulphur and arsenic; and has afterwards, when these two have weathered away or decayed, and parted from it, assumed this form, in the same manner as we see it really happens, during the calcination, with rich lead ores, or such regules as contain lead. The same, very likely, is the case with other metals; for which reason their ores, when they occur in form of a calx, often contain a little sulphur, and more especially arsenic.

B. Mineralised.

1. With sulphur alone: the *bley-schweiff*, or *bley-glanz*, of the Germans. 224

a. Steel-grained lead-ore; from the mines at Hellefors, in the province of Westmanland.

b. Radiated, or antimoniated lead-ore.

c. Tessellated, or potter's lead-ore.

At Villach in Austria there is said to be found a potter's lead-ore, which contains not the least portion of silver.

2. With sulphurated silver. *Galena*; also called 225 *bleyglanz*, by the Germans.

a. Steel-grained.

b. With small scales; is found at Selberg, and is there particularly called *blyschweif*.

c. Fine-grained.

d. Of a fine cubical texture; and,

e. Of coarse cubes. These two varieties are found in all the Swedish silver-mines.

f. Crystallised.

The steel-grained and scaly ores are of a dim and dull appearance when they are broke, and their particles have no determined angular figure: they are therefore in Swedish commonly called *blyschweif*; in opposition to the cubical ores, which are called *blyglanz*. The most part of the ores called *blyglanz* contain silver, even to 24 ounces *per cent*. of which we have instances in the mines of Salberg, where it has been observed, that the coarse cubical lead ores are generally the richest in silver, contrary to what

what is commonly taught in books; the reafon of which may perhaps be, that, in making the effays on thefe two ores, the coarfe cubical can be chofen purer or freer from the rock than the fine cubical ores.

226 3. With fulphurated iron and filver. This is found, *a.* Fine-grained. *b.* Fine cubical. *c.* Coarfe cubical. When this ore is fcorified, it yields a black flag; whereas the preceding lead-ores yield a yellow one, becaufe they do not contain any iron.

227 4. With fulphurated antimony and filver; antimoniated or radiated lead-ore. This has the colour of a blyglanz, but is of a radiated texture.

It is found,

a. Of fine rays and fibres; and,

b. Of coarfe rays or fibres. The lead in this ore prevents any ufe being made of the antimony to advantage; and the antimony likewife in a great meafure hinders the extracting of the filver.

228 VI. Copper; *Cuprum, Venus, Æs.*

This metal is,

a. Of a red colour.

b. The fpecific gravity of the Japan copper is 9000, and of the Swedifh 8784 or 8843 to 1000.

c. It is pretty foft and tough.

d. The calx of copper being diffolved by acids becomes green, and by alkalies blue.

e. It is eafily calcined in the fire into a blackifh blue fubftance, which, when rubbed to a fine powder, is red; when melted together with glafs, it tinges it firft reddifh brown, and afterwards of a tranfparent green or fea-green colour.

f. It diffolves in all the acids; viz. the acids of vitriol, fea-falt, nitre, and the vegetable; and likewife in all alkaline folutions. That it becomes rufty, and tarnifhes in the air (a confequence of a former folution), depends very much on fome vitriolic acid which is left in the copper in the refining of it. This metal is eafier diffolved when in form of a calx than in a metallic ftate, efpecially by the acids of vitriol and fea-falt, and the vegetable acid.

g. Vitriol of copper is of a deep blue colour; but the vegetable acid produces with the copper a green falt, which is verdigrife.

h. It can be precipitated out of the folutions in a metallic ftate; and this is the origin of the precipitated copper of the mines, called *Ziment copper.*

i. It is not eafily amalgamated with quickfilver; but requires for this purpofe a very ftrong trituration, or the admixture of the acid of nitre.

k. It becomes yellow when mixed with zinc, which has a ftrong attraction to it, and makes brafs, pinchbeck, &c.

l. It is eafily diffolved by lead glafs, which laft is coloured green by it.

m. When this metal is expofed to the fire, it gives a green colour to the flame in the moment it begins to melt, and continues to do fo afterwards, without lofing any thing confiderable of its weight.

n. It requires a ftrong degree of heat before it melts, yet is it a leffer degree than for iron.

Copper is found in the earth, 229

A. Native, or in a metallic ftate; virgin or native copper.

1. Solid, is found in the iron mine of Hefslekulla in the province of Nerike, and at Sunnerfkog in the province of Smoland; alfo in the Ruffian Carelia, and in other foreign places.

2. Friable, in form of fmall, and fomewhat coherent grains. Precipitated or ziment copper. It is found at Riddarfhyttan in Weftmanland, at Fahlun in Dalarne, and in Hungary.

It has been obferved, that both copper and filver glafs ore, being precipitated from water, become friable and granulated, but that they in time grow folid and ductile: whence the difpute about the diftinction between native and precipitated copper may ceafe; the rather as native copper will fcarcely be found in other places, and in any other kinds of ftones, than thofe thro' which the ziment or vitriolic waters have circulated; although the fiffures through which it has run may afterwards be filled with a ftony fubftance.

B. In form of a calx. 230

(1.) Pure.

A. Loofe or friable; *Ochra veneris.*

1. Blue; *Cœruleum montanum.* Is very feldom found perfectly free from a calcareous fubftance.

2. Green; *Viride montanum.* Both thefe colours depend on menftrua, which often are edulcorated or wafhed awuy.

3. Red. This is an efflorefcence of the glafs copper ore. It is found in the province of Dal, and at Oftanberg in the province of Dalarne.

B. Indurated. Glafs copper ore. 231

a. Red. This is fometimes as red as fealing wax, and fometimes of a more liver-brown colour. It is found in Sandbacken, at Norberg in Weftmanland, at Ordal in Norway, in Siberia, and in Suabia in Germany.

This ore is always found along with native copper, and feems to have loft its phlogifton by way of efflorefcence, and to be changed into this form. It is likewife found along with the fulphurated copper; and is commonly, though very improperly, called *glafs copper ore.*

(2.) Mixed. 232

A. Loofe or friable; *Ochra veneris friabilis impura.*

1. Mixed with a calcareous fubftance; *Cœruleum montanum.* In this ftate copper blue is moftly found. It ferments during the folution in aquafortis.

2. Mixed with iron. Black. It is the decom-

decomposition of the Fahlun copper ore.

B. Indurated.

1. Mixed with gypsum, or plaster. Green. Is found at Ordal in Norway, and there called *malachites*.

2. Mixed with quartz. Red. From Sunnerskog in the province of Smoland.

3. Mixed with lime. Blue. This is the *lapis armenus*, according to the accounts given of it by authors.

C. Dissolved and mineralised; *Cuprum mineralisatum*.

233 (1.) With sulphur alone. Grey copper ore. Is improperly also called *glass copper ore*.

a. Solid, without any certain texture. This is very soft, so that it can be cut with a knife, almost as easily as black lead.

b. Fine-cubical; *Minera cupri sulphurata tessilis constans minoribus*. Both these varieties are found at Sunnerskog in Smoland; where the last is sometimes found decomposed or weathered, and changed into a deep mountain blue.

234 (2.) With sulphurated iron. *Minera cupri pyritacea*; yellow copper ore. Marcasitical copper ore; *Pyrites cupri*. This is various both in regard to colour, and in regard to the different proportion of each of the contained metals; for instance,

a. Blackish grey, inclining a little to yellow; *Pyrites cupri griseus*. When decayed or weathered, it is of a black colour; is the richest of all the varieties of this kind of copper ore, yielding between 50 and 60 *per cent.* and is found in Spain and Germany.

b. Reddish yellow, or liver brown, with a blue coat on the surface; *Minera cupri lazurea*. This ore yields between 40 and 50 *per cent.* of copper, and is commonly said to be blue, though it is as red, when fresh broke, as a red copper regulus.

c. Yellowish green; *Pyrites cupri flavo viridescens*. This is the most common in the north part of Europe; and is, in regard to its texture, found,

1. Solid, and of a shining texture, from Ostanberg in the province of Dalarne.

2. Steel-grained, of a dim texture, from the same place, and Falun in Dalarne.

3. Coarse-grained, is of an uneven and shining texture. It occurs in most of the Swedish and Norwegian copper mines.

4. Crystallised marcasitical copper ore.

a. Of long octoëdrical crystals. This is found at Hevasswik in the province of Dal, and in Lovisagrufva in Westmanland; notwithstanding its existence is denied by Henckel and his followers.

d. Pale-yellow. This cannot be described but as a marcasite, though an experienced eye will easily discover some difference between them. It yields 22 *per cent.* of copper.

e. Liver-coloured. This is found at Falun, in Darlarne in Sweden, where it contains copper; though at most other places where it occurs, it does not contain any copper, but is only a martial marcasite.

(3.) With sulphurated arsenic and iron. White copper ore. It is said to be found in the Hartz in Germany, and to resemble an arsenical pyrites; but most of the pyritical copper ores, as well as the marcasites, contain a little arsenic, though it is in too small a quantity to be observable. 235

(4.) Dissolved by the vitriolic acid; *Vitriolum veneris*. 236

(5.) With phlogiston. Copper coal-ore.

VII. Iron; *Ferrum, Mars*. It is, 237

a. Of a blackish blue shining colour.

b. It becomes ductile by repeated heating between coals, and hammering.

c. It is attracted by the loadstone, which is an iron ore; and the metal itself may also be rendered magnetical.

d. Its specific gravity to water is as 7,645, or 8000 : : 1000.

e. It calcines easily to a black scaly calx, which, when pounded, is of a deep red colour.

f. When this calx is melted in great quantity with glass compositions, it gives a blackish brown colour to the glass; but in a small quantity a greenish colour, which at last vanishes, if forced by a strong degree of heat.

g. It is dissolved by all salts, by water, and likewise by their vapours. The calx of iron is dissolved by the spirit of sea-salt, and by aqua regia.

h. The calx of the dissolved metal becomes yellow, or yellowish brown; and in a certain degree of heat, it turns red.

i. The same calx, when precipitated from acids by means of the fixed alkali, is of a greenish colour; but it becomes blue, when precipitated by means of an alkali united with phlogiston; in which last circumstance the phlogiston unites with the iron: these two precipitates lose their colour in the fire, and turn brown.

k. The vitriol of iron is brown.

l. It is the most common metal in nature, and at the same time the most useful in common life; notwithstanding which, its qualities are perhaps very little known.

Iron is found, 238

A. In form of calx.

[1.] Pure.

A. Loose and friable. Martial ochre; *Minera ochracea*.

1. Powdery; *Ochra ferri*. This is commonly yellow or red, and is iron which has been dissolved by the vitriolic acid.

2. Concreted. Bog-ore.

a. In form of round porous balls.

b. More solid balls.

c. In small flat pieces, like cakes, or pieces of money.

d. In fmall grains.
e. In lumps of an indeterminate figure. All thefe are of a blackifh brown, or a light brown colour.

239 B. Indurated. The bloodftone; *Hæmatites.*
(1.) Of an iron colour; *Hæmatites cœrulefcens.* This is of a blueifh grey colour; it is not attracted by the loadftone, yields a red powder when rubbed, and is hard.
a. Solid, and of a dim appearance when broken.
b. Cubical, and of a fhining appearance when broken.
c. Fibrous, is the moft common *torrften* of Sweden.
d. Scaly; the *eifenman* of the Germans.
1. Black; from Gellebeck, in Norway.
2. Blueifh grey; from Reka Klitt. When this is found along with marcafite, as at Sandfwar in Norway, it is not only attracted by the loadftone, but is of itfelf really a loadftone.
e. Cryftallifed.
1. In octoëdrical cryftals.
2. In polyëdrical cryftals.
3. In a cellular form. Thefe varieties are the moft common in Sweden, and are very feldom blended with marcafite, or any other heterogeneous fubftance, except their different beds. It is remarkable, that, when thefe ores are found along with marcafite, thofe particles which have lain neareft to the marcafite are attracted by the loadftone, although they yield a red, or reddifh brown powder, like thofe which are not attracted by the loadftone: it is likewife worth obfervation, that they generally contain a little fulphur, if they are imbedded in a lime-ftone rock, which, however, very feldom happens in Sweden; but there is one fuch inftance at Billfia in Soderberke, in the province of Dalarne.

240 (2.) Blackifh brown bloodftone; *Hæmatites nigrefcens.* Kidney ore. This yields a red or brown powder when it is rubbed; it is very hard, and is attracted by the loadftone.
a. Solid, with a glaffy texture.
b. Radiated.
c. Cryftallifed.
1. In form of cones, from Siberia.
2. In form of concentric balls, with a facetted furface. Thefe are very common in Germany, but very fcarce in Sweden.

241 (3.) Red bloodftone; *Hæmatites ruber.* Red kidney ore.
a. Solid, and dim in its texture.
b. Scaly. The *eifenman* of the Germans. This is commonly found along with the iron-coloured iron glimmer, and fmears the hands.
c. Cryftallifed, in concentric balls, with a flat or facetted furface.
(4.) Yellow bloodftone; *Hæmatites flavus.*
a. Solid. 242
b. Fibrous, from Lamerhof in Bohemia. The varieties of the colours in the bloodftone are the fame with thofe produced in the calces of iron, made by dry or liquid menftrua, and afterwards expofed to different degrees of heat.

[2.] Iron in form of calx, mixed with heterogeneous fubftances. 243
A. With a calcareous earth. White fpathofe iron ore. The *ftablftein* of the Germans.
B. With a filiceous earth. The martial jafper of Sinople.
C. With a garnet earth. Garnet and cockle or fhirl.
D. With an argillaceous earth. The bole.
E. With a micaceous earth. Mica.
F. With manganefe.
G. With an alkali and phlogifton. Blue martial earth. Native Pruffian-like blue. 244
1. Loofe or powdery: found among the turf in the levels of the province of Skone; alfo in Sax Weiffenfels, and at Norvlanden in Norway, &c.
H. With an unknown earth, which hardens in water. Tarras; *Cementum.* 245
1. Loofe or granulated; *Terra Puzzolana:* from Naples and Civita Vecchia in Italy. This is of a reddifh brown colour, is rich in iron, and is pretty fufible.
2. Indurated; *Cementum induratum.* This is of a whitifh yellow colour, contains likewife a great deal of iron, and has the fame quality with the former, to harden foon in water, when mixed with mortar. This quality cannot be owing to the iron alone, but rather to fome particular modification of it occafioned by fome accidental caufes, becaufe thefe varieties rarely happen at any other places except where volcanos have been, or are yet in the neighbourhood. 246
I. Calx of iron, united with another unknown earth. The *tungften* of the Swedes. This is alfo, though improperly, called *white tin-grains.* This refembles the garnet-ftone, and the tin-grains; is nearly as heavy as pure tin; very refractory in the fire, and exceffively difficult to reduce to metal. Iron has, however, been melted out of it to more than 30 *per cent.* It is very difficultly diffolved by borax and alkaline falts, but melts very eafily with the microcofmic falt; giving a black flag: and for this reafon, this laft mentioned falt muft be 247

be employed in the experiments on this ſtone. It is found,

1. Solid and fine-grained.
   a. Reddiſh or fleſh-coloured.
   b. Yellow.
2. Spathoſe, and with an unctuous ſurface.
   a. White.
   b. Pearl-coloured. This kind of ſtone is very ſeldom met with, but in ſuch places where black-lead is common in the neighbourhood; and the hiſtory of the black lead, inſerted in the Memoirs of the Swediſh Academy of Sciences, gives reaſon to believe, that this may contain ſome tin; which merits further examination. Mr Cronſtedt has in the ſaid Memoirs communicated his experiments upon this kind of ſtone from Riddarſhyttan, and Biſpberget in Weſtmanland; as has alſo Mr Rinman, on a great number of other martial earths. See the Memoirs for the years 1751 and 1754.

248 *B.* Diſſolved or mineraliſed iron.

[1.] With ſulphur alone.

A. Perfectly ſaturated with ſulphur; *Ferrum ſulphure ſaturatum.* Marcaſite.

B. With very little ſulphur. Black iron ore. Iron ſtone.

This is either attracted by the loadſtone, or is a loadſtone itſelf attracting iron; it reſembles iron, and yields a black powder when rubbed.

(1.) Magnetic iron ore. The loadſtone, *Magnes.*
   a. Steel-grained, of a dim texture, from Hogberget in the pariſh of Gagnœf in Dalarne: it is found at that place almoſt to the day, and is of as great ſtrength as any natural loadſtones were ever commonly found.
   b. Fine grained, from Saxony.
   c. Coarſe-grained, from Spetalſgrufvan at Norberg, and Kierrgrufvan, both in the province of Weſtmanland. This loſes very ſoon its magnetical virtue.
   d. With coarſe ſcales, found at Sandſwœr in Norway. This yields a red powder when rubbed.

249 (2.) Refractory iron ore. This in its crude ſtate is attracted by the loadſtone.
   a. Giving a black powder when rubbed; *Tritura atra.* Of this kind are,
      1. Steel-grained.
      2. Fine-grained.
      3. Coarſe-grained. This kind is found in great quantities in all the Swediſh iron mines; and of this moſt part of the fuſible ores conſiſt, becauſe it is commonly found in ſuch kinds of rocks as are very fuſible: and it is as ſeldom met with in quartz as the hæmatites is met with in limeſtone.
   b. Rubbing into a red powder. Theſe are real hæmatites, that are ſo far modified by ſulphur or lime as to be attracted by the loadſtone.
      1. Steel-grained.
      2. Fine-grained. Emery. This is imported from the Levant: it is mixed with mica, is ſtrongly attracted by the loadſtone, and ſmells of ſulphur when put to the fire.
      3. Of large ſhining cubes.
      4. Coarſe, ſcaly. The *eiſenglimmer* or *eiſenman*, from Gellebeck in Norway.

      Theſe are very ſcarce in Sweden, moſt part of the Swediſh bloodſtones being pure, as has already been ſaid, and form that very profitable ore in Swediſh called *torrſten.*

[2.] With arſenic; *Ferrum arſenico mineraliſatum.* Called *miſpickel* by the Germans, and *plate mundic* in Cornwall. 250

[3.] With ſulphurated arſenic. Arſenical pyrites.

[4.] With vitriolic acid. Martial vitriol.

[5.] With phlogiſton. Martial coal ore.

[6.] With other ſulphurated and arſenicated metals. See theſe in their reſpective arrangements.

SECOND ORDER. *Semi-metals.*

There are but ſeven ſemi-metals yet diſcovered, viz.

I. Quickſilver, mercury; *Argentum vivum, mercurius, hydrargyrum.* 251

This diſtinguiſhes itſelf from all metals, by the following qualities:

a. Its colour is white and ſhining, a little darker than that of ſilver.

b. It is fluid in the cold, and diviſible by the leaſt force; but as it only ſticks to a few bodies, to which it has an attraction, it is ſaid that it does not wet.

c. It is volatile in the fire.

d. Its weight is next to that of the gold, viz. to water, as 13,593 : : 1000.

e. It attracts the other ſemi-metals and metals, and unites with them all, except cobalt and nickel, with which it cannot by any means yet known be made to mix. This union is called an *amalgamation.* This amalgamation, or mixtion of metallic bodies, according to the readineſs with which they unite or mix, is in the following progreſſion, viz. gold, ſilver, lead, tin, zinc, biſmuth, copper, iron, and the regulus of antimony: but the three latter, however, do not very readily amalgamate. The iron requires a ſolution of the vitriol of iron, as a medium to promote the union.

f. It diſſolves in the ſpirit of nitre, out of which it is precipitated by a volatile alkali, and the common ſalt, in form of a white powder; but if a fixed alkali is ufed, into a yellow powder or calx.

g. It diffolves in the oil of vitriol by a ftrong boiling.

h. It is not affected by the acid of common falt, unlefs it be previoufly diffolved by other acids; in which cafe only they unite with one another, and may be fublimed together, which fublimation is a ftrong poifon.

i. It unites with fulphur by grinding; and then produces a black powder called *æthiops mineralis*, which fublimes into a red ftriated body called *factitious cinnabar*.

k. The fulphur is again feparated from the quickfilver, by adding iron or lime, to which the fulphur attaches itfelf, leaving the quickfilver to be diftilled over in a metallic form; but if a fixed alkali is added to it, fome part of the quickfilver will remain in the refiduum, and in that cafe makes a liver of fulphur.

252 Quickfilver is found,

A. Native, or in a metallic ftate. This is found in the quickfilver mines at Idria in Friuli, or the Lower Auftria, in clay, or in a black flaty lapis ollaris, out of which it runs, either fpontaneoufly or by being warmed even in the hands. It has feveral times been found at Herr Sten's Bottn, in the mines of Salberg in Weftmanland, and fometimes alfo amalgamated with native filver.

253 *B.* Mineralifed,

(1.) With fulphur. Cinnabar; *Cinnabaris nativa.* This is of a red colour, and its fpecific gravity to water is as 7500 to 1000.

a. Loofe or friable cinnabar; looks like red ochre.

b. Indurated. Solid cinnabar. Is of a deep red colour; and, with refpect to its texture, is either,

1. Steel-grained:
2. Radiated:
3. Compofed of fmall cubes, or fcaly:
4. Chryftallifed,

a. In a cubical form; it is tranfparent, and deep red as a ruby.

254 (2.) With fulphur and copper; *Mercurius cupro fulphurato mineralifatus.* This is blackifh grey, of a glaffy texture, and brittle; crackles and fplits exceffively in the fire; and when the quickfilver and fulphur are evaporated, the copper is difcovered by its common opaque red colour in the glafs of borax, which, when farther forced in the fire, or diluted, becomes green and tranfparent.

255 II. Bifmuth; tin-glafs. *Vifmutum, bifmutum, marcafita officinalis.* It is,

a. Of a whitifh yellow colour.

b. Of a laminated texture, foft under the hammer, and neverthelefs very brittle.

c. Its fpecific gravity to water is, as 9,700 : : 1000.

d. It is very fufible; calcines and fcorifies like lead, if not rather eafier; and therefore it works on the coppel. It is pretty volatile in the fire.

e. Its glafs or flag becomes yellowifh brown, and has the quality of retaining fome part of the gold, if that metal has been melted, calcined, and vitrified with it.

f. It may be mixed with the other metals, except cobalt and zinc, making them white and brittle.

g. It diffolves in aquafortis, without imparting to it any colour; but to the aqua-regia it gives a red colour, and may be precipitated out of both thefe folutions with pure water, into a white powder, which is called *Spanifh white.* It is alfo precipitated by the acid of fea-falt; which laft unites with it, and makes the *vifmutum corneum.*

h. It amalgamates eafily with quickfilver. Other metals are fo far attenuated by the bifmuth, when mixed with it, as to be ftrained or forced along with the quickfilver through fkins or leather.

Bifmuth is found in the earth. 256

A. Native. This refembles a regulus of bifmuth, but confifts of fmaller fcales or plates.

1. Superficial, or in crufts.
2. Solid, and compofed of fmall cubes. This is found in and with the cobalt ore, at Schneeberg in Saxony, and other foreign places: likewife along with the copper ore, at Nyberget, in the parifh of Stora Skedwi, in the province of Dalarne.

B. In form of calx. 257

1. Powdery or friable; *Ochra vifmuti.* This is of a whitifh yellow colour; it is found in form of an efflorefcence, to the day, at Los in the province of Helfingland.

It has been cuftomary to give the name of *flowers of bifmuth* to the pale red calx of cobalt, but it is wrong; becaufe neither the calx of bifmuth, nor its folutions, become red, this being a quality belonging to the cobalt.

C. Mineralifed bifmuth. This is, with refpect to colour and appearance, like the coarfe teffelated potter's lead ore; but it confifts of very thin fquare plates or flakes, from which it receives a radiated appearance when broken croffwife. 258

1. With fulphur.

a. With large plates or flakes, from Baftnas at Riddarfhyttan, Bafringe and Stripas in Weftmanland.

b. With fine or fmall fcales, from Jacobsgrufvan at Riddarfhyttan, and the mines at Los in the parifh of Farila in Helfingland.

2. With fulphurated iron.

a. Of coarfe, wedge-like fcales, from Kongruben, at Gellebeck in Norway.

This mineralifed bifmuth ore yields a fine radiated regulus; for which reafon it has been ranked among the antimonial ores, by thofe who have not taken proper care to melt a pure regulus or deftitute of fulphur from it; while others, who make no difference between regules and pure metals, have ftill more pofitively afferted it to be only an antimonial ore.

III. Zinc; fpeltre. *Zincum.* 259

a. Its colour comes neareft to that of lead, but it does not fo eafily tarnifh.

b. It fhows a texture, when it is broken, as if it were compounded of flat pyramids.

c. Its

Semi-Metals. Zinc.

c. Its specific gravity to water is, as 6,900 or 7000 to 1000.

d. It melts in the fire before it has acquired a glowing heat; but when it has gained that degree of heat, it burns with a flame of a changeable colour, between blue and yellow; and if in an open fire, the calx rises in form of soft white flowers; but if in a covered vessel, with the addition of some inflammable, it is distilled in a metallic form; in which operation, however, part of it is sometimes found vitrified.

e. It unites with all the metals, except bismuth, and makes them volatile. It is, however, not easy to unite it with iron without the addition of sulphur. It has the strongest attraction to gold and copper, and this last metal acquires a yellow colour by it; which has occasioned many experiments to be made to produce new metallic compositions.

f. It is dissolved by all the acids: of these the vitriolic acid has the strongest attraction to it; yet it does not dissolve it, if it is not previously diluted with much water. The abundance of phlogiston in this semi-metal is perhaps the reason of its strong attraction to the vitriolic acid.

g. Quicksilver amalgamates easier with zinc than with copper, by which means it is separated from compositions made with copper.

h. It seems to become electrical by friction, and then its smaller particles are attracted by the loadstone; which effects are not yet perfectly investigated; but they may excite philosophers to make farther experiments, in order to discover whether the electrical power shews itself in the metals by being attracted by the loadstone, or whether the magnetic power can be exerted on other metals than iron.

260 Zinc is found,

A. In form of calx.

(1.) Pure.

a. Indurated.

1. Solid.

2. Crystallised.

This is of a whitish grey colour, and its external appearance is like that of a lead spar; it cannot be described, but is easily known by an experienced eye. It looks very like an artificial glass of zinc; and is found among other calamines at Namur, and in England.

(2.) Mixed.

A. With a martial ochre; *Ochra sive calx zinci martialis.*

1. Half indurated. Calamine; *Lapis calaminaris.*

a. Whitish yellow,

b. Reddish brown.

This seems to be a mouldered or weathered blende.

B. With a martial clay or bole.

C. With a lead ochre and iron.

261 *B.* Mineralised zinc.

(1.) With sulphurated iron. Blende, mock-lead, black-jack, mock-ore; *pseudogalena* and *blende* of the Germans.

A. Mineralised zinc in a metallic form. Zinc ore.

This is of a metallic blueish grey colour, neither perfectly clear as a potter's ore, nor so dark as the Swedish iron ores.

1. Of a fine cubical or scaly texture.

2. Steel-grained.

B. In form of calx. Blende. Mock-lead; *Sterile nigrum. Pseudogalena.* This is found, 262

1. With course scales,

a. Yellow; semi-transparent.

b. Greenish.

c. Black; *pechbende* or *pitch blende* of the Germans.

d. Blackish brown.

2. With fine scales,

a. White.

b. Whitish yellow.

c. Reddish brown.

3. Fine and sparkling; at Goslar called *braun bleyertz.*

a. Dark brown.

The zinc, in these last kinds of blendes, is as it were in form of a calx or glass, so that they are often transparent: on the contrary, in the zinc ore, (n° 261.) it seems rather to be in a metallic form, or, like most other metals, mineralised with sulphur. The sulphur, nevertheless, exists in the different kinds of blende, equally as in the zinc ore; and this remarkable difference in their appearance must be accounted for from another principle than the quantity of the zinc which they contain; because the yellow and white blendes are often found richer than the zinc ores; but the zinc ores are, however, more easy to melt, and consequently more profitable. Perhaps it is because the blende does not contain a sufficient quantity of the phlogiston of the sulphur, to prevent the calcination of the zinc.

It is no matter whether a calcined blende is called *calamine* or not, provided it has such properties that it may be employed to the same purposes, and with the same advantage, as that calamine which nature has freed from its sulphur by its weathering or decaying. This may be done with some kinds of blende; and Mr Von Swab has given evident and excellent proofs of it in Sweden; insomuch that it would demonstrate a want of experience to insist that sulphur cannot be expelled by calcination, without destroying the zinc itself, and that flowers of zinc may be produced from zinc ores in a calcining heat, without addition of any phlogiston.

Mr

Mr Jufti however avers, that he has found an ore of this quality, which in his Mineralogy he calls *Zinkfpat:* but there is great reafon to doubt if it really contains any zinc, until it is proved whether the author added any phlogifton during the calcination, or reduced the zinc out of it; becaufe, although the flowers of zink may not always be perfectly well calcined, yet there is no inftance of a natural zinc ore being difcovered, which by itfelf yields thofe flowers during the calcination: and it requires, befides, a ftrong heat to produce thefe flowers from a perfect calx or glafs of this femi-metal, either natural or artificial, though mixed with a phlogifton; for it could not have been a native zinc, fince it refembled a fpar, and fuch a one very likely is not to be found in nature.

263 IV. Antimony; *Antimonium Stibium.* This femi-metal is,

a. Of a white colour almoft like filver.

b. Brittle; and in regard to its texture, it confifts of fhining planes, of greater length than breadth.

c. In the fire it is volatile, and volatilifes part of the other metals along with it, except gold and platina. It may, however, in a moderate fire, be calcined into a light grey calx, which is pretty refractory in the fire, but melts at laft to a glafs of a reddifh brown colour.

d. It diffolves in fpirit of fea-falt and aqua regia, but is only corroded by the fpirit of nitre into a white calx; it is precipitated out of the aqua regia by water.

e. It has an emetic quality when its calx, glafs, or metal, is diffolved in an acid, except when in the fpirit of nitre, which has not this effect.

f. It amalgamates with quickfilver, if the regulus, when fufed, is put to it; but the quickfilver ought for this purpofe to be covered with warm water: it amalgamates with it likewife, if the regulus of antimony be previoufly melted with an addition of lime.

264 Antimony is found in the earth.

A. Native.

This is of a filver colour, and its texture is compofed of pretty large fhining planes.

This kind was found in Carls Ort, in the mine of Salberg, about the end of the laft century; and fpecimens thereof have been preferved in collections under the name of an arfenical pyrites, until the mine-mafter Mr Von Swab difcovered its real nature, in a treatife he communicated to the Royal Academy of Sciences at Stockholm in the year 1748. Among other remarkable obfervations in this treatife, it is faid, firft, That this native antimony eafily amalgamated with quickfilver; doubtlefs, becaufe it was imbedded in a limeftone; fince, according to Mr Pott's experiments, an artificial regulus of antimony may, by means of lime, be difpofed to an amalgamation: Secondly, That when brought in form of a calx, it fhot into cryftals during the cooling.

B. Mineralifed antimony. 265

(1.) With fulphur.

This is commonly of a radiated texture, compofed of long wedge-like flakes or plates; it is nearly of a lead colour, and rough to the touch.

a. Of coarfe fibres.

b. Of fmall fibres.

c. Steel-grained, from Saxony and Hungary.

d. Cryftallifed, from Hungary.

1. Of a prifmatical, or of a pointed pyramidal figure, in which laft circumftance the points are concentrical.

Mr Cronftedt mentions a fpecimen of this, in which the cryftals were covered with very minute cryftals of quartz, except at the extremities, where there was always a little hole: this fpecimen was given for a *flos ferri* fpar.

(2.) With fulphur and arfenic. Red antimony ore; *Antimonium folare.* 266

This is of a red colour, and has the fame texture with the preceding, though its fibres are not fo coarfe.

a. With fmall fibres.

b. With abrupt broken fibres, from Braunfdorff in Saxony, and from Hungary.

All antimonial ores are fomewhat arfenical, but this is more fo than the preceding kinds.

(3.) With fulphurated filver. Plumofe filver-ore.

(4.) With fulphurated filver, copper, and arfenic.

(5.) With fulphurated lead.

V. Arfenic. This is, 267

a. In its metallic form, nearly of the fame colour as lead, but brittle, and changes fooner its fhining colour in the air, firft to yellow, and afterwards to black.

b. It appears laminated in its fractures, or where broken.

c. Is very volatile in the fire, burns with a fmall flame, and gives a very difagreeable fmell like garlic.

d. It is, by reafon of its volatility, very difficult to be reduced, unlefs it is mixed with other metals: However, a regulus may be got from the white arfenic, if it is quickly melted with equal parts of pot-afhes and foap; but this regulus contains generally fome cobalt, moft of the white arfenic being produced from the cobalt ores during their calcination. The white arfenic, mixed with a phlogifton, fublimes likewife into octoëdral cryftals of a metallic appearance, whofe fpecific gravity is 8,308.

e. The calx of arfenic, which always, on account of of its volatility, muſt be got as a ſublimation, is white, and eaſily melts to a glaſs, whoſe ſpecific gravity is 5,000. When ſulphur is blended in this calx, it becomes of a yellow, orange, or red colour; and according to the degrees of colour is called *orpiment* or yellow arſenic; *ſandarach*, *realgar*, or red arſenic; and alſo *rubinus arſenici*.

f. This calx and glaſs are diſſoluble in water, and in all liquids; though not in all with the ſame facility. In this circumſtance arſenic reſembles the ſalts; for which reaſon it alſo might be ranked in that claſs.

g. The regulus of arſenic diſſolves in ſpirit of nitre; but as it is very difficult to have it perfectly free from other metals, it is yet very little examined in various menſtrua.

h. It is poiſonous, eſpecially in form of a pure calx or glaſs: But probably it is leſs dangerous when mixed with ſulphur, ſince it is proved by experience, that the men at mineral works are not ſo much affected by the ſmoke of this mixture as by the ſmoke of lead; and that ſome certain nations make uſe of the red arſenic in ſmall doſes as a medicine.

i. It unites with all metals, and is likewiſe much uſed by nature itſelf to diſſolve, or, as we term it, to *mineraliſe*, the metals, to which its volatility and diſſolubility in water muſt greatly contribute. It is likewiſe moſt generally mixed with ſulphur.

k. It abſorbs or expels the phlogiſton, which has coloured glaſſes, if mixed with them in the fire.

Arſenic is found,

268 [1.] Native; called *Scherbencobolt* and *Fliegenſtein* by the Germans.

It is of a lead colour when freſh broken, and may be cut with a knife, like black lead, but ſoon blackens in the air. It burns with a ſmall flame, and goes off in ſmoke.

A. Solid and teſtaceous.

This is found in the mines of Saxony, the Hartz, and Hungary.

B. Scaly, at Kongſberg in Norway.

C. Friable and porous; *Fliegenſtein*.

(1.) With ſhining fiſſures.

This is by ſome called *Spigel cobolt, (minera cobalti ſpecularis)*, according to their notions of the affinity of theſe metals to one another. However, there always remains after the volatiliſation of the ſcherbencobolt, ſome calx, either of cobalt or biſmuth, and ſome ſilver, though in too ſmall a quantity to deſerve any notice.

(2.) In form of a calx.

A. Pure, or free from heterogeneous ſubſtances.

1. Looſe or powdery.
2. Indurated, or hardened. This is found in form of white ſemi-tranſparent cryſtals.

B. Mixed with ſulphur.

1. Hardened.

a. Yellow. Orpiment; *Auripigmentum*.

b. Red. Native realgar, or ſandarach.

The orpiment may perhaps be found naturally in looſe ſcaly powder, as it is ſometimes met with in the ſhops: however, the hardened ſort is ſeldom found but in collections.

C. Mixed with the calx of tin, in the tin-grains.

D. With ſulphur and ſilver, in the rothgulden, or red ſilver ore.

E. With calx of lead, in the lead-ſpar.

F. With calx of cobalt, in the efflore ſcence of cobalt.

[2.] Mineraliſed.

A. With ſulphur and iron. Arſenical pyrites or marcaſite. Theſe kinds in Cornwall are called *ſilvery* or *white mundics*, and *plate mundics*. 269

This alone produces red arſenic, when calcined, and is found in great quantities in the mines of Loras in the province of Dalarne: It is if a deeper colour than the following.

B. With iron only. This differs with regard to its particles, being,

1. Steel-grained;
2. Coarſe-grained, from Weſterſilſverberget;
3. Cryſtalliſed.

a. In an octoëdral figure. This is the moſt common kind.

b. Priſmatical. The ſulphureous marcaſite is added to this kind, when red arſenic is to be made; but in Sweden it is ſcarcer than the ſulphureous arſenical pyrites.

C. With cobalt, almoſt in all cobalt ores.

D. With ſilver.

E. With copper.

F. With antimony.

VI. Cobalt.

This ſemi-metal is, 270

a. Of a whitiſh grey colour, nearly as fine-tempered ſteel.

b. Is hard and brittle, and of a fine-grained texture; hence it is of a duſky, or not ſhining appearance.

c. Its ſpecific gravity to water is 6000 to 1000.

d. It is fixt in the fire, and becomes black by calcination; it then gives to glaſſes a blue colour, inclining a little to violet, which colour, of all others, is the moſt fixed in fire.

e. The concentrated oil of vitriol, aquafortis, and aqua-regia, diſſolve it; and the ſolutions become red. The cobalt calx is likewiſe diſſolved by the ſame menſtrua, and alſo by the volatile alkali and the ſpirit of ſea-ſalt.

f. When united with the calx of arſenic in a flow (not a briſk) calcining heat, it aſſumes a red colour: the ſame colour is naturally produced by way of efflore ſcence, and is then called the *bloom*, or *flowers of cobalt*. When cobalt and arſenic are melted together in an open fire, they produce a blue flame.

g. It does not amalgamate with quickſilver by any means hitherto known.

h. Nor does it mix with biſmuth, when melted with it, without addition of ſome medium to promote their union.

The cobalt is moſt commonly found in the earth mixed with iron.

A. In form of a calx.

(1.) With iron without arsenic.

a. Loose or friable. Cobalt ochre. It is black, and like the artificial zaffre.

271 *b.* Indurated; the *schlacken* or slag cobalt. This is likewise of a black colour, but of a glassy texture; and seems to have lost that substance which mineralised it, by being decayed or weathered. It is often confounded with the scherbencobolt, for it is seldom quite free from arsenic; and there may perhaps exist a progressive series from the schlacken kind to the scherbencobolt kind.

272 (2.) With the calx of arsenic. Cobalt-blut; *Ochra cobalti rubra;* bloom, flowers, or efflorescence, of cobalt.

a. Loose or friable. This is often found of a red colour like other earths, spread very thin on the cobalt ores, and is, when of a pale colour, erroneously called *flowers of bismuth.*

b. Indurated. Hardened flowers of cobalt. This is commonly crystallised in form of deep red semi-transparent rays or radiations.

A white cobalt-earth, or ochre, is said to have been found. It has been seen and examined by a celebrated mineralist, who has found it in every respect, except the colour, to resemble the cobalt flowers; and it is very possible that those cobalt flowers might in length of time have lost their red colour, and become white.

273 *B.* Mineralised.

(1.) With arsenic and iron in a metallic form. This is of a dim colour when broken, and not unlike steel. It is found,

a. Steel-grained.

b. Fine-grained,

c. Coarse-grained.

d. Crystallised.

1. In a dendritical or arborescent form.
2. Polyëdral, with shining surfaces; the *glanzkobolt* of the Germans.
3. In radiated nodules.

274 (2.) With sulphurated iron. This is of a lighter colour than the preceding, nearly like to tin or silver. It is found,

A. Crystallised.

1. In a polygonal form.

a. Of a slaggy texture.

b. Coarse-grained. This kind discovers not the least mark of arsenic. The coarse-grained becomes slimy in the fire, and sticks to the stirring hook during the calcination, in the same manner as many regules do; and is a kind of regule prepared by nature.

That sort of a slaggy texture is very martial, and is described by the mine-master Mr Brandt, in the Acts of the Swedish Academy of Sciences for the year 1746. Both these give a beautiful colour.

275 (3.) With sulphur, arsenic, and iron. This resembles the arsenicated cobalt ore, being only rather of a whiter or lighter colour. It is found,

a. Coarse-grained.

b. Crystallised,

1. In a polygonal figure, with shining surfaces, or *glanzkobolt*. It is partly of a white or light colour, and partly of a somewhat reddish yellow.

(4.) With sulphurated and arsenicated nickel and iron; see n° 279. 276

VII. Nickel; *Niccolum.* This is the latest discovered semi-metal. It was first described by its discoverer Mr Cronstedt, in the Acts of the Royal Academy of Sciences at Stockholm for the years 1751 and 1754, where it is said to have the following qualities: That, 277

1. It is of a white colour, which, however, inclines somewhat to red.
2. Of a solid texture, and shining in its fractures.
3. Its specific gravity to water is as 8,500 to 1000.
4. It is pretty fixt in the fire; but, together with the sulphur and arsenic, with which its ore abounds, it is so far volatile as to rise in form of hairs and branches, if in the calcination it is left without being stirred.
5. It calcines to a green calx.
6. This calx is not very fusible, but, however, tinges glass of a transparent reddish-brown or jacinth colour.
7. It dissolves in aquafortis, aqua regia, and the spirit of sea-salt, but more difficultly in the vitriolic acid, tinging all these solutions of a deep green colour. Its vitriol is of the same colour; but the colcothar of this vitriol, as well as the precipitates from the solutions, become by calcination of a light green colour.
8. These precipitates are dissolved by the spirit of sal ammoniac, and the solution has a blue colour; but being evaporated, and the sediment reduced, there is no copper, but a nickel regulus is produced.
9. It has a strong attraction to sulphur; so that when its calx is mixed with it, and put on a scorifying test under the muffel, it forms with the sulphur a regule: this regule resembles the yellow steel-grained copper-ores, and is hard and shining on its convex surface.
10. It unites with all the metals, except quicksilver and silver. When the nickel regulus is melted with the latter, it only adheres close to it, both the metals lying near one another on the same plane; but they are easily separated with a hammer. Cobalt has the strongest attraction to nickel, after that to iron, and then to arsenic. The two former cannot be separated from one another but by their scorification; which is easily done, since
11. This semi-metal retains its phlogiston a long time in the fire, and its calx is reduced by the help of a very small portion of inflammable matter: it requires, however, a red heat before it can be brought into fusion, and melts a little sooner, or almost as soon as copper or gold, consequently sooner than iron.

The

The nickel is found.

A. In form of a calx. Nickel ochre.

278 1. Mixed with the calx of iron. This is green, and is found in form of flowers on Kupfernickel.

279 *B.* Mineralifed nickel.

1. With fulphurated and arfenicated iron and cobalt. *Kupfernickel.* This is of a reddifh yellow colour; and is found,

a. Of a flaggy texture, in Saxony.

b. Fine-grained; and

c. Scaly, in Loos cobalt-mines in the province of Helfingeland, at which place it is of a lighter colour than the foreign ones. Thefe two are often from their colour confounded with the liver-coloured marcafite.

280 2. With the acid of vitriol. This is of a beautiful green colour, and may be extracted out of the nickel ochre, or efflorefcence of the Kupfernickel.

Of Saxa and Petrifactions.

281 Though the *Saxa*, and foffils commonly called *petrifactions*, cannot be ranked in a mineral fyftem, as confifting of principles already taken notice of; yet as thefe bodies, efpecially the latter, occupy fo confiderable a place in moft mineral collections, and the former muft neceffarily be taken notice of by the miners in the obfervations they make in the fubterranean geography, it appeared proper to fubjoin them in fuch an order as may anfwer the purpofe for which they are regarded by miners and mineralogifts.

FIRST ORDER.

Saxa. *Petræ.*

282 Thefe may be divided into two kinds.

1. Compound faxa, are ftones whofe particles, confifting of different fubftances, are fo exactly fitted and joined together, that no empty fpace, or even cement, can be perceived between them; which feems to indicate, that fome, if not all, of thefe fubftances have been foft at the inftant of their union.

2. Conglutinated ftones, are ftones whofe particles have been united by fome cementitious fubftance, which, however, is feldom perceivable, and which often has not been fufficient to fill every fpace between the particles: in this cafe the particles feem to have been hard, worn off, and in loofe, fingle, unfigured pieces, before they were united.

283 I. Compound faxa.

A. Ophites. Scaly limeftone with kernels or bits of ferpentine ftone in it.

1. *Kolmord's marble.* It is white and green.

2. *Serpentino antico*, is white, with round pieces of black fteatites in it. This muft not be confounded with the *ferpentino verde antico.*

3. The *Haraldfio marble.* White, with quadrangular pieces of a black fteatites.

4. The *marmor pozzevera di Genoua.* Dark green marble, with white veins. This kind receives its fine polifh and appearance from the ferpentine ftone.

284 *B. Stellften* or *geftellftein; Saxum compofitum particulis quartzofis & micaceis.*

1. Of diftinct particles. In fome of thefe the quartzofe particles predominate, and in others the micaceous: in the laft cafe it is commonly flaty, and eafy to fplit.

2. Of particles which are wrapt up in one another.

a. Whitifh grey.

b. Greenifh.

c. Reddifh. Both thefe kinds of ftellften are, for their refiftance to the fire, employed in building furnaces; but the latter is the beft, becaufe it feems at the fame time to contain a little of a refractory clayifh fubftance: it, however, cracks very foon, if the flat fide of the ftratum, inftead of the extremity, is turned towards the fire. It is alfo of great ufe in mills. It is lucky for œconomical purpofes, that the plates of thefe ftones are fo thick, although thereby they are not fo eafily fplit.

C. Norrka. Murkften of the Swedes. *Saxum compofitum micâ, quartzo, et granato.* 285

1. With diftinct garnets or fhirl.

a. Light grey.

b. Dark grey.

c. Dark grey, with prifmatical, radiated, or fibrous cockle or fhirl.

2. With kernels of garnet-ftone.

a. Of pale red garnet-ftone. The firft of this kind, whofe flaty ftrata makes it commonly eafy to be fplit, is employed for mill-ftones, which without difficulty diftinguifh themfelves for that purpofe, if fand is firft ground with them, becaufe the fand wears away the micaceous particles on the furfaces, and leaves the garnets prominent, which renders the ftone fitter for grinding the corn.

D. The whetftone, *Cos. Saxum compofitum micâ, quartzo, et forfan argillâ martiali in nonnullis fpeciebus.* 286

1. Of coarfe particles.

a. White.

b. Light grey.

2. Of fine particles.

a. Liver-brown colour.

b. Blackifh grey.

c. Light grey.

d. Black. The table-flate, or that kind ufed for large tables and for fchool-flates.

The naked eye, and the magnifying glafs, much better difcovers the micaceous particles in this kind to be as it were twifted in one another; fome clay feems likewife to enter into the compofition: however, it cannot yet be certainly afferted that it is real mica which has that appearance in this kind.

3. Of very minute and clofely combined particles. The Turkey ftone. This is of an olive colour, and feems to be the fineft mixture of the firft fpecies of this genus. It is found in loofe ftones at Biorkfkoginas in the parifh of Hellefors in Weftmanland, though

not perfectly free from cross veins of quartz, which always are in the surface of the rock, and spoil the whetstones. It is also said to be found in Tellemarken in Norway. The best of this sort come from the Levant, and are pretty dear. The whetstone kinds, when they split easily, and in thin plates, are very fit to cover houses with, tho' most of them are not used for that purpose.

E. The *telgsten* of the Swedes. *Lapis ollaris. Saxum compositum steatite et micâ.*

a. Light grey.

b. Whitish yellow.

c. Dark grey.

d. Dark green. This is employed with great advantage to build fire-places and furnaces, &c. and when it is slaty, the extremities of the strata must be turned towards the fire.

287 *F.* Porphyry; *Porphyrites.* Italorum *porfido. Saxum compositum jaspide et feltspato, interdum micâ et basalte.*

a. Its colour is green, with light green feltspat, *Serpentino verde antico.* It is said to have been brought from Egypt to Rome, from which latter place the specimens of it now come.

b. Deep red, with white feltspat.

c. Black, with white and red feltspat.

d. Reddish brown, with light-red and white feltspat.

e. Dark grey, with white grains of feltspat also. Many varieties of this kind in regard to colour are found in form of nodules or loose stones in Sweden; but we have only mentioned the hardest and finest of those which are found in the rocks; because, besides these, there are coarse porphyries found, which scarce admit of any polish. The dark red porphyry has been most employed for ornaments in building: yet it is not the only one known by the name of *porfido*, the Italians applying the same name also to the black kind.

288 *G.* The *trapp* of the Swedes. *Saxum compositum jaspide martiali molli, seu argillâ martiali induratâ, et - - - -*

This kind of stone sometimes constitutes or forms whole mountains; as, for example, the mountain called *Hunneberg* in the province of Westergottland, and at Drammen in Norway; but it is oftener found in form of veins in mountains of another kind, running commonly in a serpentine manner, contrary or across to the direction of the rock itself. It is not homogeneous, as may be plainly seen at those places where it is not pressed close together; but where it is pressed close, it seems to be perfectly free from heterogeneous substances. When this kind is very coarse, it is interspersed with feltspat; but it is not known if the finer sorts likewise contain any of it. Besides this, there are also some fibrous particles in it, and something that resembles a calcareous spar: this, however, does not ferment with acids, but melts as easy as the stone itself, which becomes a black solid glass in the fire. By calcination it becomes red, and yields in essays 12 or more *per cent.* of iron. No other sort of ore is to be found in it, unless now and then somewhat merely superficial lies in its fissures; for this stone is commonly, even to a great depth in the rock, cracked in acute angles, or in form of large rhomboidal dice. It is employed at the glass-houses, and added to the composition of which bottles are made. By the Germans it is called *schwach* or *schwartsstein;* at the Swedish glass-works, *trappskiol*, *tegelskiol*, or *swartskiol;* and at Jarlsberg in Norway, *blabest.* In the air it decays a little, leaving a powder of a brown colour; it cracks commonly in the fire, and becomes reddish brown if made red-hot. It is found,

1. Of coarse chaffy particles.
   a. Dark grey.
   b. Black.
2. Coarse-grained.
   a. Dark grey.
   b. Reddish.
   c. Deep brown.
3. Of fine imperceptible particles.
   a. Black. The touchstone; *Lapis lydius.*
   b. Blueish.
   c. Grey.
   d. Reddish.

The black variety (3. *a.*) is sometimes found so compact and hard, as to take a polish like the black agate: it melts, however, in the fire to a black glass; and is, when calcined, attracted by the loadstone.

H. *Amygdaloides.* *Saxum basi jaspideâ martiali, cum fragmentis spati calcarei et serpentini, figurâ ellipticâ.* The carpolithi or fruit-stone rocks of the Germans. It is a martial jasper, in which elliptical kernels of calcareous spar and serpentine stone are included. 289

a. Red, with kernels of white limestone, and of a green steatites. This is of a particular appearance, and when calcined is attracted by the loadstone; it decays pretty much in the air, and has some affinity with the trapp, and also with the porphyry. There are sometimes found pieces of native copper in this stone.

I. The *gronsten* of the Swedes. *Saxum compositum micâ et hornblende.* Its basis is hornblende, interspersed with mica. It is of a dark green colour, and is dug in several places in Smoland, where it is employed in the iron furnaces as a flux to the bog ore. 290

K. The granites. *Saxum compositum feltspata, micâ et quartzo, quibus accidentaliter interdum hornblende, steatites, granatus et basaltes immixti sunt.* Its principal constituent parts are feltspat, or rhombic quartz, mica, and quartz. It is found, 291

(1.) Loose or friable. This is used at the Swedish brass-works to cast the brass in, and comes from France.

(2.) Hard and compact.

a. Red.

a. Red.
1. Fine-grained.
2. Coarfe-grained.

b. Grey, with many and various colours. The granites are feldom flaty or laminated, when their texture is clofe, and the harder particles, as the felt-fpat or rhombic quartz, the quartz, and the fhirl, predominate in it. They admit of a good polifh; for which reafon the Egyptians in former times, and the Italians now, work them into large pieces of ornamental architecture; for which purpofe they are extremely fit, as they do not decay in the air.

292 II. Conglutinated faxa.

A. Of larger or broken pieces of ftones of the fame kinds conglutinated together. *Breccia.*

1. Of limeftone cemented by lime.

a. The calcareous breccia; *Breccia calcarea:* the *marmi brecciati* of the Italians.

When thefe kinds have fine colours, they are polifhed and employed for ornaments in architecture, and other œconomical ufes: they come from Italy.

b. The *lumachella* of the Italians, or fhell-marbles. Thefe are a compound of fhells and corals, which are petrified or changed into lime, and conglutinated with a calcareous fubftance. When they have many colours, they are called *marbles*, and employed for the fame purpofes as the preceding.

293 2. Of kernels of jafper cemented by a jafpery fubftance. *Breccia jafpidea. Diafpro brecciato* of the Italians. Of this kind fpecimens from Italy are feen in collections. A coarfe jafper breccia is faid to be found not far from Frejus in Provence in France.

294 3. Of filiceous pebbles, cemented by a jafpery fubftance, or fomething like it. The plumpudding ftone of the Englifh. *Breccia filicea.* Its bafis, which at the fame time is the cement, is yellow, wherein are contained fingle flinty or agaty pebbles, of a grey colour or variegated. This is of a very elegant appearance when cut and polifhed; it is found in England.

295 4. Of quartzofe kernels combined with an unknown cement. *Breccia quartzofa.*

296 5. Of kernels of feveral different kinds of ftones. *Breccia faxofa.*

a. Of kernels of porphyry, cemented by a porphyry or coarfe jafpery fubftance; *Breccia porphyrea.*

b. Of kernels of feveral faxa; *Breccia indeterminata.* Is found in loofe ftones in Dalarne, and are originally broken from the Fiell tracts in Serna, which confift of nothing elfe but conglutinated ftones.

c. Of conglutinated kernels of fandftone; *Breccia arenacea.* This kind confifts of fandftone kernels, which have been combined a fecond time together.

The above-mentioned brecciæ of themfelves muft demand the diftinctions here made between, but which perhaps may feem to be carried too far, fince their particles are fo big and plain as to be eafily known from one another. Thefe ftones are a proof both of the fubverfions which the mountains in many centuries have undergone, and of fome of hidden means which nature makes ufe of in thus cementing different kinds of ftones together. Any certain bignefs for the kernels or lumps in fuch compounds, before they deferve the name of *breccia*, cannot be determined, becaufe that depends on a comparifon which every one is at liberty to imagine. At one place in the mountain called *Hykieberget*, the kernels of porphyry have a diameter of fix feet, while in other places they are no bigger than walnuts. At Maffewala, the kernels have a progreffive fize down to that of a fine fandftone. Moft of this kind of ftone is fit for ornaments, though the workmanfhip is very difficult and coftly.

B. Conglutinated ftones of granules or fands of different kinds. Sandftone; *Lapis arenaceus.* 297

In this divifion are reckoned thofe which confift of fuch minute particles, that all of them cannot eafily be difcovered by the naked eye. The greateft part, however, confift of quartz and mica; which fubftances are the moft fit to be granulated, without being brought to a powder.

1. Cemented by clay.

a. With an apyrous or refractory clay; is of a loofe texture, but hardens, and is very refractory in the fire.

b. With common clay; from Burfwick in the ifland of Gottland.

2. With lime; refembles mortar made with coarfe fand.

a. Confifting of tranfparent and greenifh grains of quartz and white limeftone.

b. Of no vifible particles. This is of a loofe texture, and hardens in the air.

3. With an unknown cement.

a. Loofe.
b. Harder.
c. Compact.
d. Very hard.

4. Cemented by the ruft or ochre of iron. Is found in form of loofe ftones at feveral places, and ought perhaps to be reckoned among the *mineræ arenaceæ* or fand-ores; at leaft when the martial ochre makes any confiderable portion of the whole.

C. Stones and ores cemented together; *Mineræ arenaceæ.* 298

1. Of larger fragments.

a. Mountain green, or *viride montanum cupni*, and pebbles cemented together, from Siberia.

b. Potters lead-ore, with limeftone.

c. Yellow or marcafitical copper ore, with fmall pebbles.

2. Of fmaller pieces. 299

Earthy changes, &c.

a. Potters lead-ore with a quartzoſe ſand.
b. Mountain green with ſand from Siberia.
c. Cobalt ore with ſand.
d. Martial ochre with ſand.

300 SECOND ORDER.

MINERAL CHANGES, or the PETRIFACTIONS.

Mineralia-Larvata, vulgò *Petrifacta*,

ARE mineral bodies in the form of animals or vegetables, and for this reaſon no others belong to this order than ſuch as have been really changed from the ſubjects of the other two kingdoms of nature. There is more difficulty to determine the firſt point, viz. from when theſe bodies are to be ſtyled petrifactions, than from when they ceaſe to be ſuch.

301 I. Earthy changes; *Terræ larvatæ. Terrificata.*
A. Extraneous bodies changed into a lime ſubſtance, or calcareous changes; *Larvæ calcareæ.*
(1.) Looſe or friable. Chalky changes; *Cretæ larvatæ.*
a. In form of vegetables.
b. In form of animals.
1. Calcined or mouldered ſhells; *Humus conchaceus.*
(2.) Indurated; *Petrifacta calcarea.*
a. Changed and filled with ſolid lime-ſtone.
1. In form of animals.
2. In form of vegetables.
b. Changed into a calcareous ſpar; *Petrifacta calcarea ſpatoſa.*
1. In form of animals.
2. In form of vegetables.

302 *B* Extraneous bodies changed into a flinty ſubſtance. Siliceous changes; *Larvæ ſiliceæ.* Theſe are, like the flint,
(1.) Indurated.
a. Changed into flints.
1. Carnelians in form of ſhells, from the river Tomm in Siberia.
2. Agat in form of wood. Such a piece is ſaid to be in the collection of Count Teſſin.
3. Coralloids of white flint, *(Millepora).*
4. Wood of yellow flint.

303 *C* Extraneous bodies changed into clay. Argillaceous changes; *Larvæ argillaceæ.*
A. Looſe and friable.
1. Of porcelane clay.
a. In form of vegetables.
A piece of white porcelane clay from Japan, with all the marks of the root of a tree, has been obſerved in a certain collection.
B. Indurated.
1. In an unknown clay.
a. In form of vegetables. *Oſteocolla.* It is ſaid to be changed roots of the poplar tree, and not to conſiſt of any calcareous ſubſtance.
A ſort of foſſil ivory is ſaid to be found, which has the properties of a clay; but it is doubtful if it is rightly examined.

304 II. Saline extraneous bodies, or ſuch as are penetrated by mineral ſalts. *Corpora peregrina inſalita. Larvæ inſalitæ.*

Metallic changes, &c.

A. With the vitriol of iron.
1. Animals.
a. Human bodies have been twice found in the mine at Falun in Dalarne; the laſt was kept a good many years in a glaſs-caſe, but began at laſt to moulder and fall to pieces.
2. Vegetables.
a. Turf, and
b. Roots of trees.
Theſe are found in water ſtrongly impregnated with vitriol. They do not burn with a flame, but only like a coal in a ſtrong fire; neither do they decay in the air.

III. Extraneous bodies penetrated by mineral inflammable ſubſtances, or mineral phlogiſton. 305
A. Penetrated by the ſubſtance of pit-coals.
1. Vegetables, which commonly have been woods, or appertaining to them.
a. Fully ſaturated. *Gagas.* Jet.
The jet is of a ſolid ſhining texture.
b. Not perfectly ſaturated; *Mumia vegetabilis.* Is looſe; reſembles umbre, and may be uſed as ſuch.

B. Penetrated by rock-oil or aſphaltum. 306
1. Vegetables.
a. Turf.
The Egyptian mummies cannot have any place here, ſince art alone is the occaſion that thoſe human bodies have in length of time been penetrated by the aſphaltum, in the ſame manner as has happened naturally to the wood in pit-coal ſtrata.

C. Penetrated by ſulphur which has diſſolved iron, or by marcaſite and pyrites; *Pyrite impregnata. Petrifacta pyritacea.* 307
1. Human.
a. Bivalves,
b. Univalves,
c. Inſects.

IV. Metals in form of extraneous bodies; *Larvæ metalliferæ.* 308
A. Silver; *Larvæ argentiferæ.*
(1.) Native.
a. On the ſurfaces of ſhells.
(2.) Mineraliſed with copper and ſulphur.
a. Fahlertz, or grey ſilver ore in form of ears of corn, &c. and ſuppoſed to be vegetables, are found in argillaceous ſlate at Frankenberg and Tahlitteren in Heſſe.
B. Copper; *Larvæ cupriferæ.*
(1.) Copper in form of calx.
a. In form of animals, or of parts belonging to them. 309
1. Ivory, and other bones of the elephant. The Turcois or Turkey ſtone. It is of a blueiſh green colour, and much valued in the eaſt.
At Simore in Languedoc bones of animals are dug, which during the calcination aſſume a blue colour; but it is not

Changes from Decomposition.

not probable that the blue colour is owing to copper.

(2.) Mineralised copper, which impregnates extraneous bodies; *Cuprum mineralisatum corpora peregrina ingressum.*

310 A. With sulphur and iron. The yellow or marcasitical copper-ore that impregnates,

1. Animals.

a. Shells.

b. In form of fish.

B. With sulphur and silver. Grey silver-ore or fahlerts, like ears of corn, from the slate-quarries in Hesse.

311 *C.* Changes into iron; *Larvæ ferriferæ.*

(1.) Iron in form of calx, which has assumed the place or the shape of extraneous bodies; *Ferrum calciforme corpora peregrina ingressum.*

a. Loose; *Larvæ ochraceæ.*

1. Of vegetables.

Roots of trees, from the lake Langelma in Finland. See the acts of the Swedish Academy of Sciences for the year 1742.

b. Indurated; *Larvæ hæmatiticæ.*

1. Of vegetables.

312 (2.) Iron mineralised, assuming the shape of extraneous bodies.

a. Mineralised with sulphur. Marcasite. *Larvæ pyritaceæ.*

313 V. Extraneous bodies decomposing, or in a way of destruction; *Corpora peregrina in gradibus destructionis considerata.* Mould; *Humus.* Turf; *Turba.*

A. From animals. Animal-mould; *Humus animalis.*

1. Shells. *Humus conchaceus.*

2. Mould of other animals; *Humus diversorum animalium.*

B. Vegetable mould; *Humus vegetabilis.*

1. Turf; *Turba.*

a. Solid, and hardening in the air; *Turba solida aëre indurescens.*—Is the best of this kind to be used for fuel, and comes nearest to the pit-coals. It often contains a little of the vitriolic acid.

b. Lamellated turba; *Turba foliata.* This is in the first degree of destruction.

2. Mould of lakes; *Humus lacustris.* This is a black mould which is edulcorated by water.

3. Black mould; *Humus ater.*

This is universally known, and covers the surface of that loose earth in which vegetables thrive best.

314 THIRD ORDER. Natural Slags. *Scoriæ Vulcanorum.*

Slags are found in great abundance in many places in the world, not only where volcanoes yet exist, but likewise where no subterraneous fire is now known: Yet, in Mr Cronstedt's opinion, they cannot be produced but by means of fire. These are not properly to be called *natural*, since they have marks of violence, and of the last change that mineral bodies can suffer without the destruction of the world; nor are they *artificial*, according to the universally-received meaning of this word. When we, perhaps, in future times, by new-discovered means, may be able to find out of what sort of earth stones are compounded, we shall still be forced to stop at the surface of them, and be contented with knowing that they contain a little iron.

Slags.

A. Iceland agate; *Achates islandicus niger.* 315

It is black, solid, and of a glassy texture; but in thin pieces it is greenish and semi-transparent like glass-bottles, which contain much iron. The most remarkable is, that such large solid masses are found of it, that there is no possibility of producing the like in any glass-house.

It is found in Iceland, and in the island of Ascension: The jewellers employ it as an agate, though it is too soft to resist wear.

B. Rhenish millstone; *Lapis molaris Rhenanus.* 316

Is blackish-grey, porous, and perfectly resembles a sort of slag produced by mount Vesuvius.

C. Pumice-stone; *Pumex.* 317

Is very porous and blistered, in consequence of which it is specifically very light. It resembles that frothy slag which is produced in our iron furnaces.

1. White.

2. Black.

The colour of the first is perhaps faded or bleached, because the second kind comes in that state from the laboratory itself, viz. the volcanoes.

D. Pearl slag; *Scoriæ constantes globulis vitreis conglomeratis.* 318

Is compounded of white and greenish glass particles, which seem to have been conglutinated while yet soft, or in fusion. Found on the isle of Ascension.

E. Slag-sand or ashes; *Scoriæ pulverulentæ cineres vulcanorum.* 319

This is thrown out from volcanoes in form of larger or smaller grains. It may perhaps be the principle of the Terra Puzzolana, because such an earth is said at this time to cover the ruins of Herculaneum near Naples, which history informs us was destroyed by a volcano during an earthquake.

MINERVA, or Pallas, in Pagan worship, the goddess of sciences and of wisdom, sprung completely armed from Jupiter's brain; and on the day of her nativity it rained gold at Rhodes. She disputed with Neptune the honour of giving a name to the city of Athens; when they agreed that whosoever of them should produce what was most useful to mankind, should have that advantage. Neptune, with a stroke of his trident, formed a horse; and Minerva caused an olive to spring from the ground, which was judged to be most useful, from its being the symbol of peace. Minerva changed Arachne into a spider, for pretending to excel her in making tapeftry. She fought the giants; favoured Cadmus, Ulyffes, and other heroes; and refufed to marry Vulcan, choofing rather to live in a ftate of celibacy. She alfo deprived Tirefias of fight, turned Medufa's locks into fnakes, and performed feveral other exploits.

Minerva is ufually reprefented by the poets, painters, and fculptors, completely armed, with a compofed but agreeable countenance, bearing a golden breaft-plate, a fpear in her right-hand, and her ægis or fhield in the left, on which is reprefented Medufa's head encircled with fnakes, and her helmet was ufually entwined with olives.

Minerva had feveral temples both in Greece and Italy. The ufual victim offered her was a white heifer, never yoked. The animals facred to her were the cock, the owl, and the bafilifk.

Minervæ *Caftrum*, *Arx Minervæ*, *Minervium*, or *Templum Minervæ*, (anc. geogr.), a citadel, temple, and town on the Ionian fea, beyond Hydrus; feen a great way out at fea. Now *Caftro*, a town of Otranto in Naples. E. Long. 19. 25. N. Lat. 46. 8.

Minervæ *Promontorium* (anc. geogr.), the feat of the Sirens, a promontory in the Sinus Paeftanus, the fouth boundary of Campania on the Tufcan coaft; fo called from a temple of Minerva on it: fituate to the fouth of Surrentum, and therefore called *Surrentinum*. Now *Capo della Minerva*, on the weft coaft of Naples, over-againft the ifland Capri.

Minervalia, in Roman antiquity, feftivals celebrated in honour of Minerva, in the month of March; at which time the fcholars had a vacation, and ufually made a prefent to their mafters, called from this feftival *minerval*.

MINGRELIA, anciently Colchis, a part of Weftern Georgia, in Afia; bounded on the eaft by Iberia, or *Georgia* properly fo called; on the weft, by the Euxine Sea; on the fouth, by Armenia, and part of Pontus; and on the north, by Mount Caucafus.

Colchis, or Mingrelia, is watered by a great many rivers; as the Corax, the Hippus, the Cyaneus, the Chariftus, the Phafis, where the Argonauts landed, the Abfarus, the Ciffa, and the Ophis, all emptying themfelves into the Euxine Sea. The Phafis does not fpring from the mountains in Armenia, near the fources of the Euphrates, the Araxes, and the Tigris, as Strabo, Pliny, Ptolemy, Dionyfius, and after them Arrian, Reland, Calmet, and Sanfon, have falfely afferted; but rifes on Mount Caucafus; and flows not from fouth to north, but from north to fouth, as appears from the map of Colchis or Mingrelia in Thevenot's collection, and the account which Sir John Chardin gives of that country. This river forms in its courfe a fmall ifland, called alfo *Phafis;* whence the pheafants, if Ifidorus is to be credited, were firft brought to Europe, and thence called by the Greeks *Phafiani*. The other rivers of Colchis are not confiderable.

The whole kingdom of Colchis was in ancient times very pleafant and fruitful, as it is ftill where duly cultivated; abounded in all the neceffaries of life; and was enriched with many mines of gold, which gave occafion to the fable of the Golden Fleece and the Argonautic expedition fo much celebrated by the ancients.

The lateft account we have of this country is from Sir John Chardin, who tells us, that its length is above 100 miles, and its breadth 60; being not near fo extenfive as the ancient Colchis, which reached from the frontiers of Iberia or Georgia Proper, weftward to the Palus Mæotis: that it is beautifully diverfified with hills, mountains, valleys, woods, and plains, but badly cultivated: that there are all the kinds of fruits which are found in England, growing wild, but taftelefs and infipid for want of culture: that, if the natives underftood the art of making wines, thofe of this country would be the fineft in the world: that there are many rivers which have their fource in Mount Caucafus, particularly the Phafis, now called the *Rione:* that the country abounds in beeves, hogs, wild boars, ftags, and other venifon; and in partridges, pheafants, and quails: that falcons, eagles, pelicans, lions, leopards, tigers, wolves, and jackals, breed on Mount Caucafus, and fometimes greatly annoy the country: that the people are generally handfome, the men ftrong and well made, and the women very beautiful; but both fexes very vicious and debauched: that they marry their nieces, aunts, or other relations, indifferently; and take two or three wives if they pleafe, and as many concubines as they will: that they not only make a common practice of felling their children, but even murder them, or bury them alive, when they find it difficult to bring them up: that the common people ufe a fort of pafte, made of a plant called *gom*, inftead of bread; but that that of the better fort confifts of wheat, barley, or rice: that the gentry have an abfolute power over their vaffals, which extends to life, liberty, and eftate: that their arms are the bow and arrow, the lance, the fabre or broad-fword, and the buckler: that they are very nafty; and eat fitting crofs-legged upon a carpet, like the Perfians; but the poorer fort upon a mat or bench, in the fame pofture: that the country is very thin of inhabitants, no lefs than 12,000 being fuppofed to be fold yearly to the Turks and Perfians: that the principal commodities exported from it are, honey, wax, hides, caftor, martin-fkins, flax-feed, thread, filk, and linen-cloth; but that there are no gold or filver mines now, and very little money: that the revenue of the prince or viceroy, amounts to about 20,000 crowns *per annum:* that the inhabitants call themfelves *Chriftians;* but that both they and their priefts are altogether illiterate, and ignorant of the doctrines and precepts of Chriftianity: that there bifhops are rich, have a great number of vaffals, and are cloathed in fcarlet and velvet: and that their fervice is according to the rites of the Greek church, with a mixture of Judaifm and Paganifm.

The cities of moft note in this country in ancient times were Pityus; Diofcurias, or Diofcorias, which was fo called from Caftor and Pollux, two of the Argonauts, by whom it is fuppofed to have been founded, and who in Greek are ftyled *Diofcuroi*, at prefent known by the name of *Savatapoli;* Aea on the Phafis, fuppofed to be the fame as Hupolis; *Phafis*, fo called from the river on which it ftood; Cyta, at the mouth of the river Cyaneus, the birth-place of the famous Medea, called from thence, by the poets, *Cytæis;* Saraceæ, Zadris, Surium, Madia, and Zoliffa. As for modern cities, it does not appear that there are any here

Minho. here confiderable enough to merit a defcription; or, if there are, they feem to be little, if at all, known to Europeans.

MINHO, a great river in Spain, which taking its rife in Galicia, divides that province from Portugal, and falls into the Atlantic at Caminha. Miniature.

MINIATURE, in a general fenfe, fignifies reprefentation in a fmall compafs, or lefs than the reality.

MINIATURE-PAINTING;

A DELICATE kind of painting, diftinguifhed from every other fpecies of that art by the following particulars. 1. It is more delicate. 2. It requires a nearer view. 3. It is not eafily done but in little. 4. It is wrought only upon vellum, paper, or ivory; and the colours are diluted only with gum-water.

SECT. I. *Of Drawing and Defigning.*

To fucceed in this art, a man fhould be perfectly fkilled in the art of defigning or drawing: but as moft people who affect the one, know little or nothing of the other, and would have the pleafure of painting, without giving themfelves the trouble of learning to defign, (which is indeed an art that is not acquired without a great deal of time, and continual application), inventions have been found out to fupply the place of it; by means of which a man defigns or draws, without knowing how to defign.

The firft is chalking: that is, if you have a mind to do a print or defign in miniature, the back-fide of it, or another paper, muft be blackened with fmall-coal, and then rubbed very hard with the finger wrapped in a linen cloth: afterwards the cloth muft be lightly drawn over the fide fo blackened that no black grains may remain upon it to foil the vellum you would paint upon; and the print or draught muft be faftened upon the vellum with four pins, to keep it from fhifting. And if it be another paper that is blackened, it muft be put between the velom and the print, or draught, with the blackened fide upon the vellum. Then, with a blunted pin or needle, you muft pafs over the principal lines or ftrokes of the print, or draught, the contours, the plaits of the drapery, and over every thing elfe that muft be diftinguifhed; preffing fo hard, that the ftrokes may be fairly marked upon the velom underneath.

Copying by fquares is another convenient method for fuch as are but little fkilled in the art of defigning, and would copy pictures, or other things, that cannot be chalked. The method is this: The piece muft be divided into many equal parts by little fquares, marked out with charcoal, if the piece be clear and whitifh, and the black can be fairly feen upon it; or with white chalk, if it be too brown and dufky. After which, as many fquares of equal dimenfions muft be made on white paper, upon which the piece muft be defigned; becaufe, if this be done immediately upon velom, (as one is apt to mifcarry in the firft attempt), the vellum may be foiled with falfe touches. But when it is neatly done upon paper, it muft be chalked upon the vellum in the manner before defcribed. When the original and the paper are thus ordered, obferve what is in each fquare of the piece to be defigned; as a head, an arm, a hand, and fo forth; and place it in the correfponding part of the paper. And thus finding where to place all the parts of the piece, you have nothing to do but to form them well, and to join them together. By this method you may reduce or enlarge a piece to what compafs you pleafe, making the fquares of your paper greater or leffer than thofe of the original; but they muft always be of an equal number.

To copy a picture, or other thing, in the fame fize and proportion, another method is, to make ufe of varnifhed paper, or of the fkin of a hog's bladder, very tranfparent, fuch as is to be had at the gold-beaters. Talc or ifinglafs will likewife do as well. Lay any one of thofe things upon your piece; through it you will fee all the ftrokes and touches; which are to be drawn upon it with a crayon or pencil. Then take it off; and faftening it under paper or velom, fet up both againft the light in the manner of a window; and with a crayon, or a filver needle, mark out upon the paper or vellum you have put uppermoft, all the lines and touches you fhall fee drawn upon the varnifhed paper, bladder, talc, or ifinglafs, you have made ufe of, and which will plainly appear through this window.

After this manner, making ufe of the window, or of glafs expofed to the light, you may copy all forts of prints, defigns, and other pieces, on paper or velom; laying and faftening them under the paper or velom upon which you would draw them. And it is a very good and a very eafy contrivance for doing pieces of the fame fize and proportion.

If you have a mind to make pieces look another way, there is nothing to be done but to turn them; laying the printed or drawn fide upon the glafs, and faftening the paper or velom upon the back of it; remembering to let your lights fall on the left fide.

A good method likewife to take a true copy of a picture in oil, is to give a touch of the pencil upon all the principal ftrokes, with lake tempered with oil; and to clap upon the whole a paper of the fame fize: then paffing the hand over it, the touches of the lake will ftick and leave the defign of your piece expreffed upon the paper, which may be chalked like other things. But you muft remember to take off with the crumb of bread what remains of the lake upon the picture before it be dry.

You muft likewife make ufe of pounce, made of powdered charcoal put in a linen-rag; with which the piece you would copy muft be rubbed, after you have pricked all the principal ftrokes or touches, and faftened white paper or vellum underneath.

But a furer and eafier help than all thefe for one who knows nothing of defigning, is a mathematical compafs; it is generally made of ten pieces of wood, in form of rulers, half a quarter of an inch thick, half an inch broad, and a foot long, or more, according as you have a mind to draw pieces of a greater or leffer fize. To facilitate the conftruction of this inftrument, a figure is given, with an explanation of the manner in which it is to be ufed. See Plate CLXXXIII. fig. 4.

The little board A is to be of fir, and covered with linen, Of Colours.

linen, or any other cloth; becaufe the piece you copy, and the vellum or paper you copy upon, muft be fixed upon it. Upon this board muft the compafs alfo be fixed with a pin, by the end of the firft foot B, deep enough to keep it clofe, but not fo deep as to hinder it from turning eafily. When you have a mind to reduce things, place your original on the fide of the foot C, and the vellum or paper you would draw upon on the fide of the foot B; removing the vellum or drawing it nearer, according as you intend to reduce or enlarge.

In order to enlarge a piece, you have nothing to do but to change the places of your original and your copy; placing the laft towards C, and the other on the fide of B.

And in both one and the other method, a crayon or leaden needle muft be put in the foot under which the vellum lies; and a pin, a little blunted, in that over the original, with which all the traces are to be followed; conducting the pin with one hand, and with the other preffing gently upon the crayon or needle that marks the vellum. When the crayon or needle bears fufficiently upon the vellum, you have no occafion to touch it

By this inftrument you may alfo drawn in equal dimenfions: but in order to this, the compafs muft be fixed in another manner upon the board; for if it is to be faftened upon it by the middle at D, and your original and your copy muft be fixed on each fide of this middle foot, at the equal diftances, or from corner to corner; that is, from C to E, when the pieces are large. One may likewife draw feveral copies at once of equal and different dimenfions.

When your piece is marked out upon the vellum, you muft pafs with a pencil of very clear carmine over all the traces, to the end they may not be effaced as you work: then clean your vellum with the crumb of bread, that no black may remain upon it.

Your vellum muft be pafted upon a little plate of brafs or wood, of the fize you would make your piece, to keep it firm and tight: but this pafting muft be on the edges of your vellum only, and behind the plate; for which purpofe your vellum muft exceed your plate above an inch on every fide: for the part you paint upon muft never be pafted; becaufe it would not only give it an ill look, but you could not take it off if you would. Cut off the little fhags and locks of the velom; and wetting the fair fide with a linen-cloth, dipped in water, clap the other upon the plate with a clean paper between them: fo much as hangs over muft be pafted upon the back of the plate, drawing it equally on all fides, and hard enough to ftretch it well.

Sect. II. *Of Materials.*

The chief colours made ufe of for painting in miniature, are

- Carmine.
- Venice and Florence lake.
- Rofe pink.
- Vermilion.
- Red-lead.
- Brown red.
- Red orpiment.
- Ultramarine.
- Verditer.
- Indigo.
- Gall-ftone.
- Yellow-ochre.
- Dutch pink.
- Gamboge.
- Naples yellow.
- Pale mafticot.
- Deep yellow mafticot.
- Ivory-black.
- Lamp-black.
- True Indian ink.
- Biftre, or wood-foot.
- Raw umber.
- Burnt umber.
- Sap-green.
- Verdigrife.
- Flake-white.
- Crayons of all colours.
- Gold and filver fhells.
- Leaf-gold and leaf-filver.

The feven tranfparent colours, which are ufed where writing is feen through the colour.

Liquid:
- Lake.
- Blue.
- Yellow.
- Grafs-green.
- Dark-green.
- Purple-colour.
- Brown.

Moft of thefe colours neceffary for miniature-painting may eafily be prepared by attending to the directions given under the article Colour-*Making*.

As colours taken from earth and other heavy matter are always too coarfe, be they never fo well ground, efpecially for delicate work, becaufe of a certain fand remaining in them; the fineft parts may be drawn out by diluting them with the finger in a cup of water. When they are well fteeped, let them fettle a while: then pour out the cleareft, which will be at top, into another veffel. This will be the fineft, and muft be let dry; and when it is ufed, muft be diluted with gum-water.

If you mix a little of the gall of an ox, a carp, or an eel, particularly of the laft, in green, black, grey, yellow, and brown, colours, it will not only take away their greafy nature, but alfo give them a luftre and brightnefs they have not of themfelves. The gall of eels muft be taken out when they are fkinned, and hung upon a nail to dry; and when you would ufe it, it muft be diluted with brandy; add a little of it mixed with the colour you have diluted already. This likewife makes the colour ftick better to the velom, which it hardly does when it is greafy: moreover, this gall hinders it from fcaling,

Some colours are made clearer by fire, as yellow ochre, brown red, ultramarine, and umber: all others are darkened by it. But if you heat the faid colours with a fharp fire, they change; for the brown red becomes yellow; yellow ochre becomes red; umber reddens alfo. Cerufs by fire takes the colour of citron, and is often called *mafticot*. Obferve, that yellow ochre heated, becomes more tender than it was, and fofter than brown red. Likewife brown red heated becomes fofter than fine yellow ochre. Both are very proper. The fineft and trueft ultramarine, heated upon a red-hot

Colours, &c.

hot iron, becomes more glittering; but it waftes, and is coarfer and harder to work with in miniature.

All thefe colours are diluted in little cups of ivory, made on purpofe, or in fea fhells, with water in which gum-arabic and fugar-candy are put. For inftance, in a glafs of water put a piece of gum as big as a walnut, and half that quantity of fugar-candy. This laft hinders the colours from fcaling when they are laid on, which they generally do when they want it, or the vellum is greafy.

This gum-water muft be kept in a neat bottle corked; and you never muft take any out of it with a pencil that has colour upon it, but with a quill or fome fuch thing.

Some of this water is put in the fhell with the colour you would temper, and diluted with the finger till it be very fine. If it be too hard, you muft let it foften in the fhell with the faid water before you dilute it. Afterwards let it dry: and do thus with every colour, except lily-green, fap-green, and gamboge, which muft be tempered with fair water only. But ultramarine, lake, and biftre, are to be more gummed than other colours.

If you make ufe of fea-fhells, you muft let them fteep two or three days beforehand in water: then cleanfe them in boiling-hot water, mixed with vinegar, in order to carry off a certain falt, which otherwife fticks to them, and fpoils the colours that are put to them.

To know whether colours are fufficiently gummed, you have nothing to do but to give a ftroke of the pencil upon your hand when they are diluted, which dries immediately: if they chap and fcale, there is too much gum; if they rub out by paffing the finger over them, there is too little. It may be feen likewife when the colours are laid on the vellum, by paffing the finger over them. If they ftick to it like a powder, it is a fign there is not gum enough, and more muft be put to the water with which you temper them: but take care you do not put too much; for that makes the colour extremely hard and dry. It may be known likewife by their glueinefs and brightnefs: fo the more they are gummed, the darker they paint; and when you have a mind to give a greater ftrength to a colour than it has of itfelf, you have nothing to do but to give it a great deal of gum.

Provide yourfelf with an ivory pallet, very fmooth, as big as your hand; on one fide of which the colours for the carnation, or naked parts of a picture, are to ranged in the following manner. In the middle put a great deal of white, pretty largely fpread; becaufe it is the colour moft made ufe of: and upon the edge, from the left to the right, place the following colours at a little diftance from the white.

Mafticot.
Dutch pink.
Orpiment.
Yellow-ochre.
Green; compofed of verditer, Dutch pink, and white, in equal quantities.
Blue; made of ultramarine, Indigo, and white, to a great degree of palenefs.
Vermilion.
Carmine.
Biftre, and
Black.

On the other fide of the pallet, fpread fome white in the fame manner as for the carnation. And when you have a mind to paint draperies, or other things, place near the white the colour you would make them of, in order to work as fhall be fhewn hereafter.

The ufe of good pencils is a great matter. In order to make a good choice, wet them a little; and if the hairs keep clofe together as you turn them upon the finger, and make but one point, they are good: but if they clofe not together, but make feveral points, and fome are longer than others, they are good for nothing. When they are too fharp-pointed, with only four or five hairs longer than the reft, yet clofing all together, they are, notwithftanding, good; but they muft be blunted with a pair of fciffars, taking care at the fame time you do not clip away too much. It is proper to have two or three forts of them; the largeft for laying the grounds and dead-colouring, and the fmalleft for finifhing.

To bring the hairs of your pencil to join clofe together and make a good point, you muft often put the pencil juft between your lips when you are at work; moiftening and preffing it clofe with the tongue, even when there is colour upon it; for if there be too much, fome of it is taken off by this means, and enough left for giving fine and equal touches. You need not apprehend this will do you any harm. None of the colours for miniature, except orpiment, when they are prepared, have either ill tafte or ill quality. This expedient muft efpecially be ufed for dotting, and for finifhing, particularly the naked parts of a picture, that the touches may be neat and fair, and not too much charged with colour. As for draperies and other things, as well in dead-colouring as in finifhing, it is fufficient, in order to make the hairs of your pencil join well, and to unload it when it has too much colour, to draw it upon the edge of the fhell, or upon the paper you muft put upon your work to reft your hand on, giving fome ftrokes upon it before you work upon your piece.

To work well in miniature, you muft do it in a room that has but one window, and fix yourfelf very near it, with a table and defk almoft as high as the window; placing yourfelf in fuch a manner, that the light may always come in on the left fide, and never forward or on the right.

When you would lay a colour on all parts equally ftrong, as for a ground, you muft make your mixtures in fhells, and put in enough for the thing you defign to paint; for if there be not enough, it is a great chance but the colour you mix afterwards is too dark or too light.

Sect. III. *Of Working.*

After having fpoke of vellum, pencils, and colours, let us now fhew how they are to be employed. In the firft place, then, when you would paint a piece, be it carnation, drapery, or any thing elfe, you muft begin by dead-colouring; that is to fay, by laying your colours on with liberal ftrokes of the pencil, in the fmootheft manner you can, as the painters do in oil; not giving it all the force it is to have for a finifhing: that

Of Working.

that is, make the lights a little brighter, and the ſhades leſs dark, than they ought to be; becauſe in dotting upon them, as you muſt do after dead-colouring, the colour is always fortified, and would at laſt be too dark.

There are ſeveral ways of dotting; and every painter has his own. Some make their dots perfectly round. Others make them a little longiſh. Others hatch by little ſtrokes that croſs each other every way, till the work appears as if it had been wrought with dots. This laſt method is the beſt, the boldeſt, and the ſooneſt done. Wherefore ſuch as would paint in miniature ought to uſe it, and to inure themſelves from the firſt to dot in the plump and the ſoft way; that is to ſay, where the dots are loſt, in a manner, in the ground upon which you work, and only ſo much appears as is ſufficient to make the work ſeem dotted. The hard and the dry way is quite the reverſe, and always to be avoided. This is done by dotting with a colour much darker than your ground, and when the pencil is not moiſtened enough with the colour, which makes the work ſeem rough and uneven.

Study likewiſe carefully to loſe and drown your colours one in another, ſo that it may not appear where they disjoin; and to this end, ſoften or allay your touches with colours that partake of both, in ſuch ſort that it may not appear to be your touches which cut and disjoin them. By the word *cut*, we are to underſtand what manifeſtly ſeparates and divides, and does not run in and blend itſelf with the neighbouring colours; which is rarely practiſed but upon the borders of drapery.

When your pieces are finiſhed, to heighten them a little, gives them a fine air; that is to ſay, give, upon the extremity of the lights, ſmall touches with a colour yet lighter, which muſt be loſt and drowned with the reſt.

When the colours are dry upon your pallet or in your ſhells, in order to uſe them, they muſt be diluted with water. And when you perceive they want gum, which is ſeen when they eaſily rub off the hand or the vellum if you give a touch with them upon either, they muſt be tempered with gum-water inſtead of pure water, till they are in condition.

There are ſeveral ſorts of grounds for pictures and and portraitures. Some are wholly dark, compoſed of biſtre, umber, and Cologn earth, with a little black and white; others more yellow, in which is mixed a great deal of ochre; others greyer, which partake of indigo. In order to paint a ground, make a waſh of the colour or mixture you would have it, or according to that of the picture or portraiture you would copy; that is to ſay, a very light lay, in which there is hardly any thing but water, in order to ſoak the vellum. Then paſs another lay over that, ſomewhat thicker, and ſtrike it on very ſmoothly with large ſtrokes as quick as you can, not touching twice in the ſame place before it be dry; becauſe the ſecond ſtroke carries off what has been laid on at the firſt, eſpecially when you lean a little too hard upon the pencil.

Other dark grounds are likewiſe made of a colour a little greeniſh: and thoſe are moſt in uſe, and the propereſt to lay under all ſorts of figures and portraitures; becauſe they make the carnation, or naked parts of a picture, appear very fine; are laid on very eaſily, and there is no occaſion to dot them, as one is often obliged to do the others, which are rarely made ſmooth, and even at the firſt; whereas in theſe one ſeldom fails of ſucceſs at the firſt bout. To make them, you muſt mix black, Dutch pink, and white, all together; more or leſs of each colour, according as you would have them darker or lighter. You are to make one lay very light, and then a thicker, as of the firſt grounds. You may alſo make them of other colours, if you pleaſe; but theſe are the moſt common.

When you paint a holy perſon upon one of theſe grounds, and would paint a ſmall glory round the head of your figure, you muſt not lay the colour too thick in that part, or you may even lay none at all, eſpecially where this glory is to be very bright: but lay for the firſt time with white and a little ochre mixed together, of a ſufficient thickneſs; and in proportion as you go from the place of the head, put a little more ochre; and to make it loſe itſelf, and die away with the colour of the ground, hatch with a free ſtroke of the pencil, following the round of the glory, ſometimes with the colour of which it is made, and ſometimes with that of the ground, mixing a little white or ochre with the laſt when it paints too dark to work with: and do this till one be inſenſibly loſt in another, and nothing can be ſeen to disjoin them.

To fill an entire ground with a glory, the brighteſt part is laid on with a little ochre and white, adding more of the firſt in proportion as you come nearer the edges of the picture: and when the ochre is not ſtrong enough (for you muſt always paint darker and darker), add gall-ſtone, afterwards a little carmine, and laſtly biſtre. This firſt laying, or dead-colouring, is to be made as ſoft as poſſible; that is to ſay, let theſe ſhadowings loſe themſelves in one another without gap or interſection. Then the way is to dot upon them with the ſame colours, in order to drown the whole together; which is pretty tedious, and a little difficult, eſpecially when there are clouds of glory on the ground. Their lights muſt be fortified in proportion as you remove from the figure, and finiſhed as the reſt, by dotting and rounding the clouds; the bright and obſcure parts of which muſt run inſenſibly into one another.

For a day-ſky, take ultramarine and a good deal of white, and mix them together. With this make a lay, as ſmooth as you can, with a large pencil and liberal ſtrokes, as for grounds; applying it paler and paler as you deſcend towards the horizon; which muſt be done with vermilion or red lead, and with white of the ſame ſtrength with that where the ſky ends, or ſomething leſs; making this blue loſe itſelf in the red, which you bring down to the ſkirts of the earth, or tops of houſes; mixing towards the end gall-ſtone and a good deal of white, in ſuch a manner that the mixture be ſtill paler than the former, without any viſible interſection or parting between all theſe colours of the ſky.

When there are clouds in the ſky, you may ſpare the places where they are to be; that is to ſay, you need not lay on any blue there, but form them, if they are reddiſh, with vermilion, gall-ſtone, and white, with a little Indigo; and if they are more upon the black, put in a good deal of the laſt; painting the lights of one and the other with maſticot, vermilion, and white, more or leſs of any of theſe colours, according to

Of Draperies.

to the ftrength you would give them, or according to that of the original you copy; rounding the whole as you dot; for it is a difficult matter to lay them very fmooth at the firft painting: and if the fky is not even enough, you muft dot it alfo.

It is at your pleafure to exempt the places of the clouds, for you may lay them upon the ground of the fky; heightening the bright parts by putting a good deal of white, and fortifying the fhadows by ufing lefs. This is the fhorteft way.

A night or ftormy fky is done with indigo, black, and white, mixed together; which is laid as for a day-fky. To this mixture muft be added ochre, vermilion, or brown-red, for the clouds; the lights of which are to be of mafticot, or red-lead, and a little white; now redder, now yellower, at difcretion. And when it is a tempeftuous fky, and lightning appears in fome places, be it blue or red, it is to be done as in a day-fky, drowning and lofing the whole together at the firft forming or dead-colouring, and at the finifhing.

Sect. IV. *Of Draperies.*

To paint a blue drapery, put ultramine near the white upon your pallet; and mix a part of the one with the other, till it makes a fine pale, and has a body. With this mixture you muft form the brighteft parts; and then adding more ultramarine, form fuch as are darker; and go on after this manner till you come to the deepeft plaits and the thickeft fhades, where you muft lay pure ultramine: and all this muft be done as for a firft-forming or dead-colouring; that is to fay, laying the colour on with free ftrokes of the pencil, yet as fmooth as you can; lofing the lights of the fhadows with a colour neither fo pale as the lights, nor fo dark as the fhades. Then dot with the fame colour as in the firft-forming, but a fmall matter deeper; that the dots may be fairly feen. All the parts muft be drowned one in another, and the plaits appear without interfection. When the ultramarine is not dark enough to make the deeper fhadows, how well foever it be gummed, mix a little Indigo with it to finifh them. And when the extremities of the lights are not bright enough, heighten them with white and a very little ultramarine.

A drapery of carmine is done in the fame manner as the blue; except that in the darkeft places there is to be a lay of pure vermilion, before you dead-colour with carmine, which muft be applied at top; and in the ftrongeft fhades, it muft be gummed very much. To deepen it the more, mix a little biftre with it.

There is likewife made another red drapery, which is firft drawn with vermilion, mixing white with it to dead-colour the bright places; laying it pure and unmixed for thofe that are darker, and adding carmine for the grand fhades. It is finifhed afterwards, like other draperies, with the fame colours. And when the carmine with the vermilion do not darken enough, work with the firft alone, but only in the deepeft of the fhades.

A drapery of lake is made in the fame manner with that of carmine; mixing a good deal of white with it for the bright places, and very little for thofe that are dark. It is finifhed likewife with dotting; but you have nothing to do with vermilion in it.

Violet-draperies are likewife done after this manner; after making a mixture of carmine and ultramarine, putting always white for the bright parts. If you would have your violet be columbine or dove-colour, there muft be more carmine than ultramarine: but if you would have it bluer and deeper, put more ultramarine than carmine.

A drapery is made of a flefh-colour, beginning with a lay made of white, vermilion, and very pale lake; and making the fhades with the fame colours, ufing lefs white in them. This drapery muft be very pale and tender, becaufe the ftuff of this colour is thin and light; and even the fhades of it ought not to be deep.

To make a yellow drapery, put a lay of mafticot over all; then one of gamboge upon that, excepting the brighteft places, where the mafticot muft be left entire; the dead-colour with ochre, mixed with a little gamboge and mafticot, putting more or lefs of the laft according to the ftrength of the fhades. And when thefe colours do not darken enough, add gall-ftone. And gall-ftone pure and unmixed is ufed for the thickeft fhades; mixing a little biftre with it, if there be occafion to make them ftill darker. You finifh by dotting with the fame colours you dead-coloured with, and lofing the lights and the fhades in one another.

If you put Naples-yellow, or Dutch-pink, in lieu of mafticot and gamboge, you will make another fort of yellow.

The green drapery is made by a general lay of verditer; with which, if you find it too blue, mix mafticot for the lights, and gamboge for the fhades. Afterwards add to this mixture lily-green or fap-green, to fhadow with; and as the fhades are thicker, put more of thefe laft greens, and even work with them pure and unmixed where they are to be extremely dark. You finifh with the fame colours, a little darker.

By putting more yellow, or more blue, in thefe colours, you may make different forts of greens as you pleafe.

To make a black drapery, you dead-colour with black and white, and finifh with the fame colour, putting more black, as the fhades are thicker; and for the darkeft, mix indigo with it, efpecially when you would have the drapery appear like velvet. You may always give fome touches with a brighter colour, to heighten the lights of any drapery whatfoever.

A white woolen drapery is made by a lay of white, in which there muft be a very fmall matter of ochre, orpiment, or gall-ftone, that it may look a little yellowifh. Then dead-colour, and finifh the fhades with blue, a little black, white, and biftre; putting a great deal of the laft in the darkeft.

The light-grey is begun with black and white, and finifhed with the fame colour deeper.

For a brown drapery, make a lay of biftre, white and a little brown-red; and fhadow with this mixture, made a little darker.

There are other draperies, called *variable*, becaufe the lights are of a different colour from the fhades. Thefe are moftly ufed for the veftments of angels, for young and gay people, for fcarfs and other airy attire, admitting of a great many folds, and flowing at the

Of Draperies.

pleasure of the wind. The most common are the violets: of which they make two sorts; one, where the lights are blue; and the other, where they are yellow.

For the first, put a lay of ultramarine and very pale white upon the lights; and shadow with carmine, ultramarine, and white, as for a drapery wholly violet; so that only the grand lights appear blue. Yet they must be dotted with violet, in which there is a great deal of white, and lost insensibly in the shades.

The other is done by putting upon the lights only, instead of blue, a lay of masticot; working the rest as in the drapery all violet, excepting that it must be dotted, and the light parts blended with the shadowy, that is, the yellow with the violet, with a little gamboge.

The carmine-red is done like the last; that is, let the lights be done with masticot, and the shades with carmine; and to lose the one in the other, make use of gamboge.

The lake-red is done like that of carmine.

The green is done as the lake; always mixing verditer with lily or sap-green, to make the shades; which are not very dark.

Several other sorts of draperies may be made at discretion, always taking care to preserve the union of the colours, not only in one sort of cloth or so, but also in a group of several figures; avoiding, as much as the subject will allow, the putting of blue near the colour of fire, of green against black; and so of other colours which cut and disjoin, and whose union is not kind enough.

Several other draperies are made of foul colours, as brown-red, bistre, indigo, &c. and all in the same manner. Likewise of other colours, simple and compound; the agreement between which is always to be minded, that the mixture may produce nothing harsh and disagreable to the eye. No certain rule can be laid down for this. The force and effect of your colours are only to be known from use and experience, and you most work according to that knowledge.

Linen-cloths are done thus: After drawing the plaits or folds, as is done in a drapery, put a lay of white over all; then dead-colour, and finish the shades with a mixture of ultramarine, black, and white, using more or less of the last, according to their strength or tenderness; and in the greatest deepenings put bistre, mixed with a little white; giving only some touches of this mixture, and even of pure bistre, upon the extremities of the greatest shadows, where the folds must be drawn, and lost with the rest.

They may be done in another manner, by making a general lay of this mixture of ultramarine, black and very pale white; and dead-colour (as has been said before) with the same colour, but a little deeper. And when the shades are dotted and finished, heighten the lights with pure white, and lose them with the deepenings of the linen. But of whateve sort you make them, when they are finished, you must give a yellowish teint of orpiment and white to certain places; laying it lightly on, and as it were in water; so that what is underneath may, notwithstanding, plainly appear, as well the shadows as the dotting.

Yellow linen-cloth is done by putting a lay of white, mixed with a little ochre. Then form and finish the shades with bistre, mixed with white and ochre; and in the thickest shades use pure bistre: and before you finish, give some teints here and there of ochre and white, and others of white and ultramarine, as well upon the shades as the lights; but let them be very bright; and drown the whole together in dotting, and it will look finely. As you finish, heighten the extremities of the lights with masticot and white. You may add to this sort of linen, as well as to the white, certain bars from space to space, as in Turkey-mantuas; that is, small stripes blue and red with ultramarine and carmine; one of red between two of blue, very bright and clear upon the lights, and deeper upon the shades. Virgins are pretty often dressed with veils of this sort (by Popish painters), and scarfs of this kind are put about necks that are bare; because they become the teint mighty well.

If you would have both these sorts of linen transparent, and the stuff or other thing that is beneath appear through them, make the first lay for them very light and clear, and mix in the colour to shadow with, a little of that which is underneath, especially towards the end of the shades; and only do the extremities of the lights, for the yellow, with masticot and white; and for the white, with pure white.

They may be done in another manner, especially when you would have them altogether as clear as muslin, lawn, or gauze. To this end form and finish what is to be beneath, as if nothing was to be put over it. Then mark out the light and clear folds with white or masticot; and a shadowy with bistre and white, or with black, blue, and white, according to the colour you would make them of; making the rest somewhat fainter: yet this is not necessary but for the parts that are not to be so clear.

Crape is done the same way; excepting that the folds of the shades and the lights, and the borders too, are to be marked out with little filaments of black upon what is underneath; which is likewise to be finished beforehand.

When you would make a stuff like a watered tabby, make the waves upon it with a colour a little lighter, or a little darker, in the lights and the shades.

There is a manner of touching draperies which distinguishes the silken from the woolen. The last are more terrestrial and sensible; the others more light and fading. But it must be observed, that this is an effect which depends partly upon the stuff and partly upon the colour; and for the employing these in a manner suitable to the subjects and the deepenings of painting, we shall here touch upon their different qualities.

We have no colour which partakes more of light, nor which comes nearer the air, than white; which shews it to be fickle and fleeting. It may, nevertheless, be held and brought to by some neighbouring colour, more heavy and sensible, or by mixing them together.

Blue is a most fleeting colour: and so we see, that the sky and the remotest views of a picture are of this colour; but it will become lighter and fickler, in proportion as it is mixed with white.

Pure black is the heaviest and most terrestrial of all co-

Of Draperies.

colours; and the more of it you mix with others, the nearer you bring them to the eye.

Neverthelefs, the different difpofitions of black and white make alfo their effects different: for white often makes black difappear, and black brings white more into view; as in the reflection of globes, or other figures to be made round, where there are always parts that fly as it were from the eye, and deceive it by the craft of art: and under the white are here comprehended all the light colours; as under the black, all the heavy colours.

Ultramarine is, then, foft and light.

Ochre is not fo much fo.

Mafticot is very light; and fo is verditer.

Vermilion and carmine come near this quality.

Orpiment and gamboge not fo near.

Lake holds a certain mean, rather foft than rough.

Dutch pink is an indifferent colour, eafily taking the quality of others. So it is made terreftrial by mixing it with colours that are fo; and, on the contrary, the moft light and fleeting by joining it with white or blue.

Brown-red, umber, dark greens, and biftre, are the heavieft and moft terreftrial, next to black.

Skilful painters, who underftand perfpective, and the harmony of colours, always obferve to place the dark and fenfible colours on the fore-parts of their pictures; and the moft light and fleeting they ufe for the diftances and remote views. And as for the union of colours, the different mixtures that may be made of them will learn you the friendfhip or antipathy they have to one another. And upon this you muft take your meafures for placing them with fuch agreement as fhall pleafe the eye.

For the doing of lace, French-points, or other things of that nature, put over all a lay of blue, black, and white, as for linen: then heighten the flower-work with pure white: afterwards make the fhades above with the firft colour, and finifh them with the fame. When they are upon the carnation or naked parts of a picture, or upon any thing elfe that you would fhow through another, finifh what is beneath, as if nothing was to be put over it: and at top, make the points or lace with pure white, fhadowing and finifhing them with the other mixture.

If you would paint a fur, you muft begin with a kind of drapery, done, if it be dark, with biftre and white, making the fhadowings of the fame colour, with lefs white. If the fur be white, do it with blue, white, and a little biftre. And when this beginning, or firft-forming, is done, inftead of dotting, draw fmall ftrokes, turning, now in one manner, now in another, according to the courfe and flatting of the hair. Heighten the lights of dark furs with ochre and white, and of the other with white and a little blue.

For doing a building, if it be of ftone, take indigo, biftre, and white, with which make the beginning or firft form of it; and for fhadowing it, put lefs of this laft; and more biftre than indigo, according to the colour of the ftone you would paint. To thefe you may likewife add a little ochre, both for the forming and the finifhing. But to make it finer, you muft give, here and there, efpecially for old fabrics, blue and yellow teints, fome with ochre, others with ultramarine, mixing always white with them, whether before the firft-forming, provided they appear through the draught, or whether upon it, lofing or drowning them with the reft when you finifh.

When the building is of wood, as there are many forts, it is done at difcretion; but the moft ordinary way is to begin or firft-form with ochre, biftre, and white, and finifh without white, or with very little; and if the fhades are deep, with pure biftre. In the other they add fometimes vermilion, fometimes green or black; in a word, juft according to the colour they would give it; and they finifh with dotting, as in draperies and every thing elfe.

Of Carnations.

SECT. V. *Of Carnations, or the naked parts of Painting.*

THERE are in carnation fo many different colourings, that it would be a difficult thing to give general rules upon fo variable a fubject. Nor are they minded, when one has got, by cuftom and practice, fome habit of working eafily: and fuch as are arrived to this degree, employ themfelves in copying their originals, or elfe they work upon their ideas, without knowing how: infomuch, that the moft fkilful, who do it with lefs reflection and pains than others, would likewife be more put to it to give an account of their maxims and knowledge in the matter of painting, if they were to be afked what colours they made ufe of for fuch and fuch a colouring, a teint here, and another there.

Neverthelefs, as beginners want fome inftruction at the firft, we will fhow in general, after what manner feveral carnations are to be done.

In the firft place, after having drawn your figure with carmine, and ordered your piece, apply, for women and children, and generally for all tender colourings, a lay of white, mixed with a very little of the blue made for faces, of which we have told the compofition; but let it hardly be feen.

And for men, inftead of blue, they put in this firft lay a little vermilion; and when they are old, a little ochre is mixed with it.

Afterwards follow all the traces with vermilion, carmine, and white, mixed together; and begin all the fhades with this mixture, adding white in proportion as they are weaker; and putting but little in the darkeft, and none, in a manner, in certain places where ftrong touches are to be given: for inftance, in the corner of the eye; under the nofe; at the ears; under the chin; in the feparations of the fingers; in all joints; at the corners of the nails; and generally in every part where you would mark out feparations in fhades that are obfcure. Neither need you fear to give to thofe places all the force and ftrength they ought to have as foon as you begin or firft-form them, becaufe in working at top with green, the red you have put there is always weakened.

After having begun, or firft-formed, or dead-coloured, with red, make blue teints with ultramarine and a great deal of white, upon the parts which fly from the eye; that is to fay, upon the temples; under and in the corners of the eyes; on both fides the mouth, above and below; a little upon the middle of the forehead; between the nofe and the eyes; on the fide of the cheeks; on the neck and other places where

Of Carnations.

where the fleſh aſſumes a bluiſh caſt. Yellowiſh teints are likewiſe made with ochre or orpiment, and a little vermilion mixed with white, under the eye-brows, on the ſides of the noſe towards the bottom, a little underneath the cheeks, and upon the other parts which riſe and come nearer the eye. It is eſpecially from theſe teints that the natural complexion is to be obſerved, in order to catch it; for painting being an imitation of nature, the perfection of the art conſiſts in the juſtneſs and ſimplicity of the repreſentation, eſpecially in face-painting.

When, therefore, you have done your firſt lay, your dead colouring, and your teints, you muſt work upon the ſhades, dotting with green for the carnations or naked parts; mixing, according to the rule we have given for the teints, a little blue for the parts which fly from the eye; and, on the other hand, making it a little yellower for thoſe that are more ſenſible; that is to ſay, which riſe, and come nearer the eye: and at the end of the ſhades, on the ſide of the light, you muſt blend and loſe your colour inſenſibly in the ground of the carnation with blue, and then with red, according to the places where you paint. If this mixture of green does not work dark enough at firſt, paſs over the ſhades ſeveral times, now with red, and now with green; always dotting: and this do till they are as they ſhould be.

And if you cannot with theſe colours give the ſhades all the force they ought to have, finiſh, in the darkeſt, with biſtre mixed with orpiment, ochre, or vermilion, and ſometimes with pure biſtre, according to the colouring you would make, but lightly, laying on your colour very clear.

You muſt dot upon the clear and bright places with a little vermilion or carmine, mixed with much white, and a very ſmall matter of ochre, in order to loſe them with the ſhadowy, and to make the teints die away inſenſibly into one another; taking care, as you dot, or hatch, to make your ſtrokes follow the turnings and windings of the fleſhy parts. For though the rule be to croſs always, this dotting or hatching ought to appear a little more here, becauſe it rounds the parts. And as this mixture might make a colouring too red, if it was always to be uſed, they work likewiſe in every part, to blend the teints and the ſhades, with blue and a little green, and much white, ſo mixed as to be very pale; excepting, nevertheleſs, that this colour muſt not be put upon the cheeks, nor upon the extremities of the clear parts, no more than the other mixture upon theſe laſt, which muſt be left with all their light; as certain places of the chin, of the noſe, and of the forehead, and upon the cheeks; which, and the cheeks, ought nevertheleſs to be redder than the reſt, as well as the feet, the hollows of the hands, and the fingers of both.

Obſerve, that theſe two laſt mixtures ought to be ſo pale, that the work ſhall hardly be viſible; for they ſerve only to ſoften it; to unite the teints with one another, and the ſhades with the lights, and to drown the traces. Care muſt likewiſe be taken that you work not too much with the red mixture upon the blue teints, nor with the blue upon the others; but change the colour from time to time, when you perceive it works too blue or too red, till the work be finiſhed.

The white of the eyes muſt be ſhadowed with this ſame blue, and a little fleſh-colour; and the corners, on the ſide of the noſe, with vermilion and white; giving them a little touch of carmine. The whole is ſoftened with this mixture of vermilion, carmine, white, and a very ſmall matter of ochre.

The apples or balls of the eyes are done with the mixture of ultramarine and white; the laſt prevailing a little; adding a little biſtre, if they are yellowiſh; or a little black, if they are grey. Make the little black circle in the middle, called the *cryſtal of the eye;* and ſhadow the balls with indigo, biſtre, or black, according to the colour they are of; giving to each a ſmall touch of pure vermilion round the cryſtal; which muſt be loſt with the reſt at the finiſhing. This gives vivacity to the eye.

The round or circumference of the eye is done with biſtre and carmine; that is to ſay, the ſlits or partings, and the eye-lids, when they are large and bold; eſpecially the upper ones; which muſt afterwards be ſoftened with the red or blue mixtures we have mentioned before, to the end they may be loſt in one another, and nothing ſeem interſected. When this is done, give a little touch of pure white upon the cryſtal, on the ſide of the lights. This makes the eye ſhine, and gives life to it.

The mouth is dead-coloured with vermilion, mixed with white; and finiſhed with carmine, which is ſoftened as the reſt. And when the carmine does not work dark enough, mix a little biſtre with it. This is to be underſtood of the corners in the ſeparation in the lips; and particularly, of certain mouths half open.

The hands, and all the other parts of carnation, are done in the ſame manner as the faces; obſerving, that the ends of the fingers be a little redder than the reſt. When your whole work is formed and dotted, mark the ſeparations of all the parts with little touches of carmine and orpiment mixed together, as well in the ſhadowy as the light places; but a little deeper and ſtronger in the firſt; and loſe them in the reſt of the carnation.

The eye-brows and the beard are dead-coloured, as are the ſhades of carnations; and finiſhed with biſtre, ochre, or black, according to the colour they are of, drawing them by little ſtrokes the way they ought to go; that is to ſay, give them all the nature of hair. The lights of them muſt be heightened with ochre and biſtre, a little vermilion, and much white.

For the hair of the head, make a lay of biſtre, ochre, and white, and a little vermilion. When it is very dark-coloured, uſe black inſtead of ochre. Afterwards form the ſhadowy parts with the ſame colours, putting leſs white in them; and finiſh with pure biſtre, or mixed with ochre or black, by ſmall ſtrokes very fine, and cloſe to each other, waving and buckling them according to the curling of the hair. The light parts muſt alſo be heightened by little ſtrokes with ochre or orpiment, white, and a little vermilion. After which, loſe the lights and the ſhades in each other, by working ſometimes with a dark, and ſometimes with a pale colour.

And for the hair about the forehead, thro' which the ſkin is ſeen, it muſt be firſt formed with the colour thereof, and that of the carnation, working and ſhadowing with one and the other, as if you deſigned to

Of Carnations.

to paint none. Then form it, and finiſh with biſtre. The lights are to be heightened as the other. Grey hair is dead-coloured with white, black, and biſtre, and finiſhed with the ſame colour, but deeper; heightening the bright and clear parts of the hair, as well as thoſe of the eye-brows and the beard, with white and very pale blue, after having formed them as the others, with the colour of the fleſh or ſkin; and finiſh with biſtre.

But the moſt important thing is to ſoften one's work; to blend the teints in one another, as well as the beard and the hair about the forehead, with the other hair and the carnation; taking eſpecial care not to work rough and dry; and that the traces, turnings and windings of the carnation, or naked parts, be not interſected. You muſt likewiſe accuſtom yourſelf to put white in your colours only in proportion as you work lighter or darker: for the colour you uſe the ſecond time muſt be always a little ſtronger and deeper than the firſt, unleſs it be for ſoftening.

Different colourings are eaſily made, by putting more or leſs of red, or blue, or yellow, or biſtre, whether for the dead-colouring, or for the finiſhing. That for women ought to be bluiſh; that for children a little red; and both freſh and florid. That for men ought to be yellower; eſpecially when they are old.

To make a colouring of death, there muſt be a firſt lay of white and orpiment, or a very pale ochre: dead-colour with vermilion, and lake, inſtead of carmine, and a good deal of white; and afterwards work over it with a green mixture, in which there is more blue than any other colour, to the end the fleſh may be livid and of a purple colour. The teints are done the ſame way as in another colouring; but there muſt be a great many more blue than yellow ones, eſpecially upon the parts which fly from the ſight, and about the eyes; and the laſt are only to be upon the parts which riſe, and come nearer the eye. They are made to die away in one another, according to the ordinary manner; ſometimes with very pale blue, and ſometimes with ochre and white, and a little vermilion; ſoftening the whole together. The parts and contours muſt be rounded with the ſame colours. The mouth is to be, in a manner, of a quite violet. It is dead-coloured, however, with a little vermilion, ochre, and white; but finiſhed with lake and blue: and to give it the deep ſtrokes, they take biſtre and lake; with which they likewiſe do the ſame to the eyes, the noſe, and the ears. If it is a crucifix, or ſome martyr, upon whom blood is to be ſeen, after the finiſhing the carnation, form it with vermilion, and finiſh it with carmine, making in the drops of blood a little bright reflecting ſpark, to round them. For the crown of thorns, make a lay of ſea-green and maſticot; ſhadow it with biſtre and green; and heighten the clear and light parts with maſticot.

Iron is formed, or firſt laid, with indigo, a little black and white; and finiſhed with pure indigo, heightening it with white.

For painting fire and flames, the lights are done with maſticot and orpiment; and for the ſhades, they mix vermilion and carmine.

A ſmoke is done with black, indigo and white, and ſometimes with biſtre; one may likewiſe add vermilion or ochre, according to the colour it is to be of.

Pearls are painted by putting a lay of white, and a little blue: they are ſhadowed and rounded with the ſame colour, deeper: a ſmall white dot is made almoſt in the middle, on the ſide of the light; and on the other ſide, between the ſhadow and the edge of the pearl, they give a touch with maſticot, to make the reflection; and under the pearls is made a little ſhadow of the colour of the ground they are upon.

Diamonds are done with pure black; then they heighten them with little touches of white on the ſide of the light. It is the ſame thing for any other jewels you have a mind to paint: there is nothing to be done but to change the colour.

For making a figure of gold, put a lay of ſhell-gold, and ſhadow it with gall-ſtone. Silver is done the ſame way; excepting that it muſt be ſhadowed with indigo.

One great means to acquire a perfection in the art, is to copy excellent originals. We enjoy with pleaſure and tranquillity the labour and pains of others. But a man muſt copy a great number before he is able to produce as fine effects; and it is better to be a good copier than a bad author.

Sect. VI. *Of Landſcapes.*

Of Landſcapes.

In the firſt firſt place, after having ordered the œconomy of your landſcape as of your other pieces, you muſt form the neareſt grounds or lands, when they are to appear dark, with ſap or lily-green, biſtre, and a little verditer, to give a body to your colour; then dot with this mixture, but a little darker, adding ſometimes a little black to it.

For ſuch pieces of ground as the light falls upon, and which are therefore clear and bright, make a lay of ochre and white: then ſhadow and finiſh with biſtre. In ſome they mix a little green, particularly for ſhadowing and finiſhing.

There are ſometimes upon the fore-part certain reddiſh lands; which are dead-coloured with brown-red, white, and a little green; and finiſhed with the ſame, putting a little more green in them.

For the making of graſs and leaves upon the foreground, you muſt, when that is finiſhed, form with ſea-green, or verditer, and a little white; and for thoſe that are yellowiſh, mix maſticot. Afterwards ſhadow them with lily-green, or biſtre and gall-ſtone, if you would have them appear withered.

The grounds or lands at a little diſtance, are formed with verditer, and ſhadowed and finiſhed with ſap-green, adding biſtre for ſome of the touches here and there.

Such as are at a greater diſtance, are done with ſea-green and a little blue; and ſhadowed with verditer.

In a word, the farther they go, the more blueiſh they are to be made; and the fartheſt diſtances ought to be of ultramarine and white; mixing in ſome places ſmall touches of vermilion.

Water is painted with indigo and white, and ſhadowed with the ſame colour, but deeper: and to finiſh it, inſtead of dotting, they do nothing but make ſtrokes and traces without croſſing; giving them the ſame turn with the waves, when there are any. Sometimes a little green muſt be mixed in certain places, and

Of Landſcapes.

and the light and clear parts heightened with pure white, particularly where the water foams.

Rocks are dead-coloured like buildings of ſtone; excepting that a little green is mixed for forming and ſhadowing them. Blue and yellow teints are made upon them, and loſt with the reſt in finiſhing. And when there are ſmall branches, with leaves, moſs, or graſs, when all is finiſhed, they are to be raiſed at top with green and maſticot. They may be made yellow, green, and reddiſh, for appearing dry, in the ſame manner as on the ground. Rocks are dotted as the reſt; and the farther they are off, the more greyiſh they are made.

Caſtles, old houſes, and other buildings of ſtone and wood, are done in the manner abovementioned; ſpeaking of thoſe things, when they are upon the firſt lines. But when you would have them appear at a diſtance, you muſt mix brown-red and vermilion, with much white; and ſhadow very tenderly with this mixture; and the farther they are off, the weaker are the ſtrokes to be for the ſeparations. If they are covered with ſlate, it is to be made bluer than the reſt.

Trees are not done till the ſky be finiſhed; one may, nevertheleſs, ſpare the places of them when they contain a good number: and however it be, ſuch as come near the eye, are to be dead-coloured with verditer, mixing ſometimes ochre; and ſhadowed with the ſame colours, adding, lily-green. Afterwards you muſt work leaves upon them by dotting without croſſing: for this muſt be done with ſmall longiſh dots, of a darker colour, and pretty full of it, which muſt be conducted on the ſide the branches go, by little tufts of a little darker colour. Then heighten the lights with verditer or ſea-green, and maſticot, making leaves in the ſame manner: and when there are dry branches or leaves, they are dead-coloured with brown-red or gall-ſtone, with white; and finiſhed with gall-ſtone, without white, or with biſtre.

The trunks of trees are to be dead-coloured with ochre, white, and a little green, for the light and clear parts; and for the dark, they mix black, adding biſtre and green for ſhadowing one and the other. Blue and yellow teints are likewiſe made upon them, and little touches given here and there with white and maſticot; ſuch as you ordinarily ſee upon the bark of trees.

The branches which appear among the leaves are done with ochre, verditer, and white; or with biſtre and white, according to the light they are placed in. They muſt be ſhadowed with biſtre and lily-green.

Trees, which are at a little diſtance, are dead-coloured with verditer and ſea-green; and are ſhadowed and finiſhed with the ſame colours, mixed with lily-green. When there are ſome which appear yellowiſh, lay with ochre and white, and finiſh with gall-ſtone.

For ſuch as are in the diſtances and remote views, you muſt dead-colour with ſea-green; with which, for finiſhing, you muſt mix ultramarine. Heighten the lights of one and the other with maſticot, by ſmall diſjoined leaves.

It is the moſt difficult part of landſcape, in manner of miniature, to leaf a tree well. To learn, and break one's hand to it a little, the way is to copy good ones; for the manner of touching them is ſingular, and cannot be acquired but by working upon trees themſelves; about which you muſt obſerve to make little boughs, which muſt be leafed, eſpecially ſuch as are below and towards the ſky.

And generally, let your landſcapes be coloured in a handſome manner, and full of nature and truth; for it is that which gives them all their beauty.

Of Flowers.

Sect. VII. *Of Flowers.*

It is an agreeable thing to paint flowers, not only on account of the ſplendour of their different colours, but alſo by reaſon of the little time and pains that are beſtowed in trimming them. There is nothing but delight in it; and, in a manner, no application. You maim and bungle a face, if you make one eye higher than another; a ſmall noſe with a large mouth; and ſo of other parts. But the fears of theſe diſproportions conſtrain not the mind at all in flower-painting; for unleſs they be very remarkable, they ſpoil nothing. For this reaſon moſt perſons of quality, who divert themſelves with painting, keep to flowers. Nevertheleſs, you muſt apply yourſelf to copy juſtly: and for this part of miniature, as for the reſt, we refer you to nature, for ſhe is your beſt model. Work, then, after natural flowers; and look for the teints and different colours of them upon your pallet: a little uſe will make you find them eaſily; and to facilitate this to you at the firſt, we ſhall, in the continuance of our deſign, ſhew the manner of painting ſome; for natural flowers are not always to be had; and one is often obliged to work after prints, where nothing is ſeen but graving.

It is a general rule, that flowers are deſigned and laid like other figures; but the manner of forming and finiſhing them is different: for they are firſt formed only by large ſtrokes and traces, which you muſt turn at the firſt the way the ſmall ones are to go, with which you finiſh; this turning aiding much thereto. And for finiſhing them, inſtead of hatching or dotting, you draw ſmall ſtrokes very fine, and very cloſe to one another, without croſſing; repaſſing ſeveral times, till your dark and your clear parts have all the force you would give them.

Of Roses.—After making your firſt ſketch, draw with carmine the red roſe, and apply a very pale lay of carmine and white. Then form the ſhades with the ſame colour, putting leſs white in it: and laſtly, with pure carmine, but very bright and clear at the firſt; fortifying it more and more as you proceed in your work, and according to the darkneſs of the ſhades. This is done by large ſtrokes. Then finiſh; working upon it with the ſame colour by little ſtrokes, which you muſt make go the ſame way with thoſe of the graving, if it be a print you copy; or the way the leaves of the roſe turn, if you copy after a painting, or after nature; loſing the dark in the clear parts, and heightening the greateſt lights, and the brighteſt or moſt lightſome leaves, with white and a little carmine. You muſt always make the hearts of roſes, and the ſide of the ſhadow darker than the reſt; and mix a little indigo for ſhadowing the firſt leaves, particularly when the roſes are blown, to make them ſeem faded. The ſeed is dead-coloured with gamboge; with which a little ſap-green is mixed for ſhadowing. Roſes ſtreaked with ſeveral colours, ought to be paler

Of Flowers.

than others, that the mixture of colours may be better seen; which are done with carmine; a little darker in the shades, and very clear in the lights; always hatching by strokes. For white roses you must put a lay of white, and form and finish them as the red; but with black, white, and a little bistre; and make the seed a little yellower. Yellow roses are done by putting in every part a lay of masticot, and shadowing them with gamboge, gall-stone, and bistre; heightening the clear and light places with masticot and white.

The stiles, the leaves, and the buds of all sorts of roses are formed with verditer, with which is mixed a little masticot and gamboge; and for shadowing them, they add sap-green, putting less of the other colours when the shades are deep. The outside of the leaves ought to be bluer than the inside: wherefore it must be dead-coloured with sea-green, and sap-green mixed with that for shadowing, making the veins or fibres on this side clearer than the ground, and those on the other side darker. The prickles which are upon the stiles and buds of roses, are done with little touches of carmine, which are made to go every way; and for those that are upon the stalks, they are formed with verditer and carmine, and shadowed with carmine and bistre; making the bottom of the stalks more reddish than the top; *i. e.* you must mix with the green, carmine and pure bistre.

Of Tulips.—As there is an infinity of tulips, different from one another, one cannot pretend to mention the colours with which they are all done. We will only touch upon the handsomest, called *streaked:* and these streaks are dead-coloured, with very clear carmine in some places, and with darker in others; finishing with the same colour by little strokes, which must be carried the same way with the streaks. And in others is put first a lay of vermilion. Then they form them by mixing carmine, and finish them with pure carmine. In some they put Florence-lake over the vermilion instead of carmine. Some are done with lake and carmine mixed together, and with lake alone, or with white and lake for the first forming; whether it be rose-pink or Florence-lake. There are some of a purple colour, which are formed with ultramarine, carmine, or lake, sometimes bluer and sometimes redder. The manner of doing both one and the other is the same: there is no difference but in the colours. You must, in certain places, as between the streaks of vermilion, carmine, or lake, sometimes put blue made of ultramarine and white, and sometimes a very bright purple, which is finished by strokes as the rest, and lost with the streaks. There are some likewise that have sallow teints, that are made with lake, bistre, and ochre, according as they are: but this is only in fine and rare tulips, and not in the common ones. For shadowing the bottom of them, they ordinarily take indigo and white for such whose streaks are of carmine. For such as are of lake, they take black and white; with which, in some, bistre is mixed, and in others green. Some are likewise to be shadowed with gamboge and umber, and always by strokes and traces, that turn as the leaves turn. Other tulips are likewise done, called *bordered;* that is to say, the tulip is not streaked but on the edges of the leaves, where there is a border. It is white in the purple; red in the yellow; yellow in the red; and red in the white. The purple is laid with ultramarine, carmine, and white; shadowing and finishing it with this mixture. The border is spared; that is to say, let only a light lay of white be put there, and let it be shadowed with very bright indigo. The yellow is formed with gamboge, and shadowed with the same colour, mixing ochre and umber or bistre with it. The border is laid with vermilion, and finished with a very small matter of carmine. The red is formed with vermilion, and finished with the same colour, mixing carmine or lake with it. The bottom and the border are done with gamboge; and for finishing, they add gall-stone and umber, or bistre. The white is shadowed with black, blue, and white. Indian ink is very proper for this. The shadowings of it are very tender. It produces alone the effect of blue and white, mixed with the other black. The border of this white tulip is done with carmine. In all these sorts of tulips, they leave a nerve or sinew in the middle of the leaves that are brighter than the rest: and the borders are drowned at the bottom by small traces, turning crosswise; for they must not appear cut and separated, as the streaked or party-coloured. They make them likewise of several other colours.—When they happen to be such whose bottoms on the inside are black, as it were, they form and finish them with indigo, as also the seed about the nozzle or stalk. And if the bottom is yellow, it is formed with gamboge, and finished by adding umbre or bistre. The leaves and the stalks of tulips are ordinarily formed with sea-green, and shadowed and finished with lily-green, by large traces all along the leaves. Some may likewise be done with verditer, mixing masticot with it, and shadowed with sap-green, that the green of the shades may be yellower.

The Anemony, or *Wind-flower.*—There are several sorts of them, as well double as single. The last are ordinarily without streaks. Some are made of a purple colour, with purple and white, shadowing them with the same colour; some redder, others bluer; sometimes very pale, and sometimes very dark. Others are formed with lake and white, and finished with the same, putting less white; some without any white at all. Others are formed with vermilion, and shadowed with the same colour, adding carmine. We see likewise white ones, and some of a citron colour. The last are laid with masticot; and one and the other shadowed and finished sometimes with vermilion, and sometimes with very brown lake, especially near the seed, at the bottom; which is often likewise of a blackish colour, that is done with indigo, or black and blue, mixing for some a little bistre; and always working by very fine strokes and traces, and losing the lights in the shades. There are others that are brighter and clearer at the bottom than any where else; and sometimes they are perfectly white there, though the rest of the flower be dark. The seed of all these anemonies is done with indigo and black, with a very little white, and shadowed with indigo; and in some it is raised with masticot. The double anemonies are of several colours. The handsomest have their large leaves streaked. Some are done, that is, the streaked or party-coloured, with vermilion, to which carmine is added for the finishing; shadowing the rest of the leaves with indigo; and for the small leaves

Of Flowers.

leaves within, a lay is put of vermilion and white, and they are ſhadowed with vermilion mixed with carmine, mixing here and there ſome ſtronger touches, eſpecially in the heart of the flower, next the great leaves on the ſide of the ſhadow. They finiſh with carmine, by little ſtrokes and traces, turning the ſame way with the mixed or party-colours, and the leaves. They form and finiſh the ſtreaks or party-colours of ſome others, as well as the ſmall leaves, with pure carmine; leaving, nevertheleſs, in the middle of the laſt, a little circle, in which is laid dark purple, which is loſt with the reſt. And when all is finiſhed, they give ſome touches with this ſame colour round about the ſmall leaves, eſpecially on the ſide of the ſhadow; drowning them with the large ones, the remainder of which is ſhadowed either with indigo or black. In ſome, the ſmall leaves are done with lake or purple, though the party-colours of the large ones be done with carmine. There are others, whoſe mixed colours are done with carmine, in the middle of moſt of the large leaves; putting in ſome places vermilion underneath, and loſing theſe colours with the ſhadows of the bottom; which are done with indigo and white. The ſmall leaves are laid with maſticot, and ſhadowed with very dark carmine on the ſide of the ſhade, and with very clear on the ſide of the light, leaving there in a manner pure maſticot, and giving only ſome little touches with orpiment and carmine, to ſeparate the leaves, which may be ſhadowed ſometimes with a very little pale-green. There are double anemonies painted all red, and all purple. The firſt are formed with vermilion and carmine, in a manner without white, and ſhadowed with pure carmine, well gummed, that they may be very dark. Purple anemonies are laid with purple and white, and finiſhed with white. In a word, there are double anemonies, as there are ſingle ones, of all colours; and they are done in the ſame manner. The green of one and the other is verditer; with which maſticot is mixed for forming. It is ſhadowed and finiſhed with ſap-green. The ſtiles of them are a little reddiſh; wherefore they are ſhadowed with carmine mixed with biſtre, and ſometimes with green, after having laid them with maſticot.

The Carnation and the Pink.—It is with pinks and carnations as with anemonies and tulips; that is, there are ſome mixt-coloured, and others of one ſingle colour. The firſt are ſtreaked and diverſified ſometimes with vermilion and carmine, ſometimes with pure lake, or with white; ſome ſtreaks very dark, and others very pale; ſometimes by little ſtreaks and diverſifications, and ſometimes by large ones. Their bottoms are ordinarily ſhadowed with indigo and white. There are pinks of a very pale fleſh-colour, and ſtreaked and diverſified with another, a little deeper, made with vermilion and lake. Others, which are of lake and white, are ſhadowed and ſtreaked without white. Others all red, which are done with vermilion and carmine, as dark as poſſible. Others all of lake. And laſtly, there are others, wherein nature or fancy is the rule. The green of one and the other is ſea-green, ſhadowed with lily-green or ſap-green.

The Red-lily.—It is laid with red-lead, formed with vermilion, and in the deepeſt of the ſhades with carmine; and finiſhed with the ſame colour by ſtrokes and traces, turning as the leaves turn. The clear and light parts are heightened with red-lead and white. The ſeed is done with vermilion and carmine. The green parts are done with verditer, ſhadowed with lily or ſap-green.

The Day-lily.—There are three ſorts of them:

1. The gridelin, a little red;
2. The gridelin, very pale; and,
3. The white.

For the firſt they put a lay of lake and white, and ſhadow and finiſh with the ſame colour deeper; mixing a little black to deaden it, eſpecially in the darkeſt places.

The ſecond are laid with white, mixed with a very little lake and vermilion, in ſuch a manner that theſe two laſt colours are hardly ſeen. Afterwards they ſhadow with black and a little lake, working redder in the middle of the leaves, next the ſtalks; which ought to be, as alſo the ſeed, of the ſame colour, particularly towards the top; and at the bottom a little greener.

The ſtile of the ſeed is laid with maſticot, and ſhadowed with ſap-green.

The other day-lilies are done by putting a lay of pure white, and ſhadowing and finiſhing with black and white.

The ſtalks of theſe laſt, and the greens of them all, are done with ſea-green, and ſhadowed with ſap-green.

The Hyacinth, or *Purple-flower.*—There are four ſorts of them.

The blue, a little dark;
Others paler;
The gridelin;
And the white.

The firſt are laid with ultramarine and white; and ſhadowed and finiſhed with leſs white. Others are laid and ſhadowed with pale blue. The gridelines are formed with lake and white, and a very ſmall matter of ultramarine; and finiſhed with the ſame colour a little deeper. For the laſt they put a lay of white; then they ſhadow them with black, with a little white; and finiſh them all by ſtrokes and traces, following the turnings and windings of the leaves. The green and the ſtalks of ſuch as are blue, are done with ſea and lily-green very dark: and in the ſtalks of the firſt may be mixed a little carmine, to make them reddiſh. The ſtalks of the two others, as alſo the green, are formed with verditer and maſticot, and ſhadowed with ſap-green.

The Piony.—A lay of Venice-lake and white muſt be put on all parts, pretty ſtrong: then ſhadow with leſs white, and with none at all in the darkeſt places: after which finiſh with the ſame colour by traces, turning them as for the roſe; gumming it very much in the deepeſt of the ſhades; and raiſing the lights and the edges of the moſt lightſome leaves with white and a little lake. Little veins are likewiſe made, which go like the ſtrokes in hatching, but are more viſible. The green of this flower is done with ſea-green, and ſhadowed with ſap-green.

Cowslips.—They are of four or five colours. There are ſome of a very pale purple.

The gridelin. The white and the yellow.

The purple is done with ultramarine, carmine, and white;

Of Flowers.

white; putting lefs white for fhadowing. The gridelin is laid with Venice-lake, and a very fmall matter of ultramarine, with much white; and fhadowed with the fame colour deeper. For the white, a lay of white muft be put; and they muft be fhadowed with black and white; and finifhed, as the others, by traces, or ftrokes. The heart of thefe cowflips is done with mafticot in the fhape of a ftar, which is fhadowed with gamboge, making a little circle in the middle with fap-green. The yellow are laid with mafticot, and fhadowed with gamboge and umber. The ftiles, the leaves, and the buds, are formed with verditer, mixed with a little mafticot, and finifhed with fap-green; making the fibres or veins, which appear upon the leaves, with this fame colour; and heightening the lights of the largeft with mafticot.

The Ranunculus, or *Crow-foot*.—There are feveral forts of them: the fineft are the orange-coloured. For the firft, they put a lay of vermilion, with a very fmall matter of gamboge; and add carmine for fhadowing; finifhing it with this laft colour, and a little gall-ftone. In the others may be put Venice-lake, inftead of carmine, efpecially in the heart of the flower. The orange-coloured are laid with gamboge, and finifhed with gall-ftone, vermilion, and a little carmine; leaving fome little yellow ftreaks. The green of the ftalks is done with verditer and very pale mafticot; mixing lily-green to fhadow them. That of the leaves is a little darker.

The Crocus.—Thefe are of two colours.

Yellow and purple. The yellow are formed with mafticot and gall-ftone, and fhadowed with gamboge and gall-ftone: after which, upon each leaf, on the outfide, are made three ftreaks, feparate from one another, with biftre and pure lake; which are loft, by little traces, in the bottom. The outfide of the leaves is left all yellow.—The purple are laid with carmine, mixed with a little ultramarine, and very pale white. They are formed and finifhed with lefs white; making likewife, in fome, purple ftripes or ftreaks, very dark, as in the yellow; and in others, only fmall veins. The feed of both is yellow; and is done with orpiment and gall-ftone. For the ftiles, they put a lay of white, and fhadow with black, mixed with a little green. The green of this flower is formed with very pale verditer, and fhadowed with fap-green.

The Iris.—The Perfian iris is done by putting, for the infide-leaves, a lay of white, and fhadowing them with indigo and green together, leaving a little white feparation in the middle of each leaf; and for thofe on the outfide, they put in the fame place a lay of mafticot, which is fhadowed with gall-ftone and orpiment; making little dark and longifh dots over all the leaf, at a fmall diftance from one another. And at the end of each are made large ftrains, with biftre and lake in fome, and in others with pure indigo, but very black. The reft, and the outfide of the leaves, are fhadowed with black. The green is formed with fea-green, and very pale mafticot, and fhadowed with fap-green. The Sufian iris is laid with purple and white, putting a little more carmine than ultramarine; and for the fhades, efpecially in the middle leaves, they put lefs white; and, on the contrary, more ultramarine than carmine; making the veins of this very colour, and leaving in the middle of the infide leaves a little yellow finew. There are others which have this very finew in the firft leaves; the end of which only is bluer than the reft. Others are fhadowed and finifhed with the fame purple, redder: They have alfo the middle finew on the outfide-leaves; but white and fhadowed with indigo. There are likewife yellow ones; which are done by putting a lay of mafticot and orpiment; fhadowing them with gall-ftone, and making the veins upon the leaves with biftre. The green of one and the other is done with fea-green, mixing a little mafticot for the ftiles. They are fhadowed with fap-green.

The Jasmin.—It is done with a lay of white, and fhadowed with black and white; and for the outfide of the leaves, they mix a little biftre; making the half of each, on this fide, a little reddifh with carmine.

The Tuberose.—For the doing of this, they make a lay of white, and fhadow with black, with a little biftre in fome places; and for the outfide of the leaves, they mix a little carmine, to give them a reddifh teint, particularly upon the extremities. The feed is done with mafticot, and fhadowed with fap-green. The green of it is laid with verditer, and fhadowed with fap-green.

The Hellebore.—The flower of hellebore is done almoft in the fame manner; that is, let it be laid with white, and fhadowed with black and biftre, making the outfide of the leaves a little reddifh here and there. The feed is laid with dark green, and raifed with mafticot. The green of it is foul and rufty, and is formed with verditer, mafticot, and biftre; and finifhed with fap-green and biftre.

The White lily.—It is laid with white, and fhadowed with black and white. The feed is done with orpiment and gall-ftone. And the green is done as in the tuberofe.

The Snow-drop.—It is formed and finifhed as the white lily. The feed is laid with mafticot, and fhadowed with gall-ftone. And the green is done with fea and fap-green.

The Jonquil.—It is laid with mafticot and gall-ftone, and finifhed with gamboge and gall-ftone. The green is formed with fea-green, and fhadowed with fap-green.

The Daffodil.—All daffodils, the yellow, the double, and the fingle, are done by putting a lay of mafticot: they are formed with gamboge, and finifhed by adding umber and biftre; excepting the bell in the middle, which is done with orpiment and gall-ftone, bordered or edged with vermilion and carmine. The white are laid with white, and fhadowed with black and white; excepting the cup or bell, which is done with mafticot and gamboge. The green is fea-green, fhadowed with fap-green.

The Marigold.—It is done by putting a lay of mafticot, and then one of gamboge; fhadowing it with this very colour, after vermilion is mixed with it: and for finifhing, they add gall-ftone and a little carmine. The green is done with verditer, fhadowed with fap-green.

The Austrian Rose.—For making the Indian rofe, they put a lay of mafticot, and another of gamboge. Then they form it, mixing gall-ftone; and finifh it with the laft colour, adding biftre and a very

Of Flowers.

small matter of carmine in the deepeſt ſhades.

The INDIAN PINK, or *French Marigold.*—It is done by putting a lay of gamboge; ſhadowing it with this colour, after you have mixed a good deal of carmine and gall-ſtone with it; and leaving about the leaves a little yellow border of gamboge, very clear in the lights, and darker in the ſhades. The ſeed is ſhadowed with biſtre. The green as well of the roſe as the pink, is formed with verditer, and finiſhed with ſap-green.

The SUN-FLOWER.—It is formed with maſticot and gamboge, and finiſhed with gall-ſtone and biſtre. The green is laid with verditer and maſticot, and ſhadowed with ſap-green.

The PASSION-FLOWER.—It is done as the roſe, and the green of the leaves likewiſe; but the veins are done with a darker green.

POETICAL PINKS and SWEET-WILLIAMS—They are done by putting a lay of lake and white; ſhadowing them with pure lake, with a little carmine for the laſt; which are afterwards dotted on all parts with little round dots, ſeparate from one another; and the threads in the middle are raiſed with white. The green of them are ſea-green, which is finiſhed with ſap-green.

The SCABIOUS.—There are two ſorts of ſcabious, the red and the purple. The leaves of the firſt are laid with Florence-lake, in which there is a little white; and ſhadowed without white: and for the middle, which is a great boſs or huſk in which the ſeed lies, it is formed and finiſhed with pure lake, with a little ultramarine or indigo to make it darker. Then they make little white longiſh dots over it, at a pretty diſtance from one another, clearer in the light than in the ſhade, making them go every way. The other is done by putting a lay of very pale purple, as well upon the leaves as the boſs in the middle; ſhadowing both with the ſame colour, a little deeper: and inſtead of little white touches from the ſeed, they make them purple; and about each grain they make out a little circle, and this over the whole boſs or huſk in the middle. The green is formed with verditer and maſticot, and ſhadowed with ſap-green.

The SWORD or *Day-lily.*—It is laid with Florence-lake and very pale white; formed and finiſhed with pure lake, very clear and bright in ſome places, and very dark in others; mixing even biſtre in the thickeſt of the ſhades. The green is verditer, ſhadowed with ſap-green.

HEPATICA, or *Liverwort.*—There is red and blue. The laſt is done by putting on all parts a lay of ultramarine, white, and a little carmine or lake; ſhadowing the inſide of the leaves with this mixture, but deeper; excepting thoſe of the firſt rank; for which, and for the outſide of every one of them, they add indigo and white, that the colour may be paler, and not ſo fine. The red is laid with lake-columbine and very pale white; and finiſhed with leſs white. The green is done with verditer, maſticot, and a little biſtre; and ſhadowed with ſap-green, and a little biſtre, eſpecially on the outſide of the leaves.

The POMEGRANATE.—The flower of the pomegranate is laid with red-lead; ſhadowed with vermilion and carmine; and finiſhed with this laſt colour. The green is laid with verditer and maſticot, and ſhadowed with ſap-green.

The Flower of the Indian BEAN.—It is done with a lay of Levant-lake and white; ſhadowing the middle leaves with pure lake; and adding a little ultramarine for the others. The green is verditer, ſhadowed with ſap-green.

The COLUMBINE.—There are columbines of ſeveral colours: the moſt common are the purple, the gridelin, and the red. For the purple, they lay with ultramarine, carmine, and white; and ſhadow with this mixture, deeper. The gridelin are done the ſame way, putting a great deal leſs ultramarine than carmine. The red are done with lake and white, finiſhing with leſs white. There are ſome mixed flowers of this kind, of ſeveral colours; which muſt be formed and finiſhed as the others, but paler, making the mixtures of a little darker colour.

The LARK'S HEEL.—There are of different colours, and of mixed colours: the moſt common are the purple, the gridelin, and the red; which are done as the columbines.

VIOLETS and PANSIES.—Violets and panſies are done the ſame way; excepting that in the laſt the two middle leaves are bluer than the others, that is, the borders or edges; for the inſide of them is yellow; and there little black veins are made, which take their beginning from the heart of the flower, and die away towards the middle.

The MUSCIPULA, or *Catch-fly.*—There are two ſorts of it, the white and the red; the laſt is laid with lake and white, with a little vermilion, and finiſhed with pure lake. As for the knot or nozzle of the leaves, it is formed with white and a very ſmall matter of vermilion, mixing biſtre, or gall-ſtone, to finiſh it. The leaves of the white are laid with white; adding biſtre and maſticot upon the knots, which are ſhadowed with pure biſtre, and the leaves with black and white. The green of all theſe flowers is done with verditer and maſticot, and ſhadowed with ſap-green.

The CROWN IMPERIAL.—There are of two colours, the yellow and the red. The firſt is done by putting a lay of orpiment, and ſhadowing it with gall-ſtone and orpiment, with a little vermilion. The other is laid with orpiment and vermilion, and ſhadowed with gall-ſtone and vermilion; making the beginning of the leaves next the ſtile, with lake and biſtre, very dark; and veins with this mixture, both in one and the other, all along the leaves. The green is done with verditer and maſticot, ſhadowed with ſap-green and gamboge.

The CYCLAMEN, or *Sow-bread.*—The red is laid with carmine, a little ultramarine, and much white; and finiſhed with the ſame colour, deeper; putting, in a manner, only carmine in the middle of the leaves, next the heart, and in the reſt add a little more ultramarine. The other is laid with white, and ſhadowed with black. The ſtalks of one and the other ought to be a little reddiſh; and the green, verditer and ſap-green.

The GILLIFLOWER.—There are ſeveral ſorts of gilliflowers; the white, the yellow, the purple, the red, and the mixed, of various colours. The white are laid with white, and ſhadowed with black, and with a little indigo in the heart of the leaves. The yellow, with maſticot, gamboge, and gall-ſtone. The purple are formed with purple and white; and finiſhed with leſs white;

Of Fruits, &c.

white; making the colour brighter in the heart, and even a little yellowish. The red with lake and white; finishing them with white. The mixed-coloured are laid with white, and the mixtures are sometimes made with purple, in which there is much ultramarine; others again, in which there is more carmine. Sometimes they are of lake, and sometimes of carmine. Some are done with white, and others without white; shadowing the rest of the leaves with indigo. The seed of all is formed with verditer and masticot, and finished with sap-green. The leaves and stiles are laid with the same green, mixing sap-green to finish them.

Fruits, fishes, serpents, and all sorts of reptiles, are to be touched in the same manner as the figures of men are; that is, hatched or dotted.

Birds and all other animals are done like flowers, by strokes, or traces.

Never make use, for any of these things, of white-lead. It is only proper in oil. It blackens like ink, when only tempered with gum; especially if you set your work in a moist place, or where perfumes are. Cerus of Venice is as fine, and of as pure a white. Be not sparing in the use of this, especially in forming or dead-colouring; and let it enter into all your mixtures, in order to give them a certain body, which will render your work glueish, and make it appear soft, plump, and strong.

The taste of painters is, nevertheless, different in this point. Some use a little of it, and others none at all. But the manner of the last is meagre and dry. Others use a great deal; and doubtless it is the best method and most followed among skilful persons: for besides that it is speedy, one may by the use of it copy all sorts of pictures; which would be almost impossible otherwise; notwithstanding the contrary opinion of some, who say, that in miniature we cannot give the force and all the different teints we see in pieces in oil. But this is not true, at least of good painters; and effects prove it pretty plainly: for we see figures, landscapes, pictures, and every thing else in miniature, touched in as grand, as true, and as noble a manner, (though more tender and delicate), as they are in oil.

Properties of Miniature.

However, painting in oil has its advantages; were they only these, that it exhibits more work, and takes up less time. It is better defended likewise against the injuries of time; and the right of birth must be granted it, and the glory of antiquity.

But miniature likewise has its advantages; and without repeating such as have been mentioned already, it is neater and more commodious. You may easily carry all your implements in your pockets, and work when and wherever you please, without such a number of preparations. You may quit and resume it when and as often as you will; which is not done in the other; in which one is rarely to work dry.

To conclude: In the art of painting, excellence does not depend upon the greatness of the subject, but upon the manner in which it is handled. Some catch the airs of a face well; others succeed better in landscapes: some work in little, who cannot do it in large: some are skilled in colours, who know little of design: others, lastly, have only a genius for flowers: and even the Bassans got themselves a fame for animals; which they touched in a very fine manner, and better than any thing else.

Minim ‖ Minium.

MINIM, in music, a note equal to two crotchets, or half a semibreve. See Music.

MINIMS, a religious order in the church of Rome, founded by St Francis de Paula, towards the end of the 15th century. Their habit is a coarse black woollen stuff, with a woollen girdle, of the same colours, tied in five knots. They are not permitted to quit their habit and girdle night nor day. Formerly they went bare-footed, but are now allowed the use of shoes.

MINIMUM, in the higher geometry, the least quantity attainable in a given case.

MINISTER, a person who preaches, performs religious worship in public, administers the sacraments, &c.

Minister *of State*, a person to whom the prince intrusts the administration of government. See Counsel.

Foreign Minister, is a person sent into a foreign country, to manage the affairs of his province, or of the state to which he belongs. Of these there are two kinds: those of the first rank are ambassadors, and envoys extraordinary, who represent the persons of their sovereigns; the ministers of the second rank are the ordinary residents.

MINIUM, or Red-lead. See Chemistry, n° 402.

The general method of preparing that colour is there described; but the following more accurate and particular one hath appeared in the last edition of the Chemical Dictionary. "The furnace in which minium is made is of the reverberatory kind, with two fire-places at the ends; each fire-place being separated from the area, or body of the furnace, by a wall 12 inches high. The fire-places are 15 inches broad, and their length is equal to the breadth of the whole furnace, which is about eight or nine feet. The length of the area from one fire-place to the other is 9 or 10 feet. The quantity of lead used in one operation is about 1500 pounds, of which nine parts are lead obtained from furnaces where the ore is smelted, and one part is lead extracted from the scoria which is formed in smelting the ore. This latter kind is said to be necessary, as the former could not alone be reduced into powder. All the lead is at once put into the area, the bottom of which is level. The calx, as fast as it is formed, is drawn to one side by means of a rake suspended by a chain before the mouth of the furnace. In four or five hours the whole quantity of the lead is calcined, or, if any pieces remain uncalcined, they are separated, and kept for the next operation. The heat employed is that of a cherry-red; and the fire-places and mouth are kept open, that the air may accelerate the calcination. The powder or calx is to be frequently stirred to prevent its concreting; and when this operation has been continued about 24 hours, the matter is taken out of the furnace, and laid on a flat pavement. The cold water is thrown on it, to give it weight, as the workmen say; but rather, as some think, to make it friable. It is then to be ground in a mill, and the

Minium.

finer

finer part is feparated by wafhing, while the coarfer part, referved for fome following operation, is to be placed at the mouth of the furnace in order to retain the melted lead. The fine powder, which is now of a yellow colour, is again put into the fame or a fimilar furnace, and expofed to a very moderote fire from 36 to 48 hours; during which time it is ftirred frequently to prevent its concreting; and the powder gradually acquires its proper red colour. The minium is then to be taken out of the furnace, cooled, and fifted thro' an iron fieve placed in a cafk."

MINOR, in law. See Law, n° clxi.

Minor, in logic, the fecond propofition of a regular fyllogifm. See Logic.

MINORCA, an ifland of the Mediterranean, fituated between 39 and 40 degrees of North Latitude, and near four degrees of Eaft Longitude. It is about 33 miles in length from north-weft to fouth-eaft, in breadth from eight to twelve, but in general about ten miles; fo that in fize it may nearly equal the county of Huntingdon or Bedfordfhire. The form is very irregular; and the coafts are much indented by the fea, which forms a great number of little creeks and inlets, fome of which might be very advantageous.

This ifland is one of thofe called by the ancient Romans *Baleares*, which arofe from the dexterity of the inhabitants in ufing the fling. It fell under the power of the Romans, afterwards of the northern barbarians, who deftroyed that empire. From them it was taken by the Arabs, who were fubdued by the king of Majorca, and he by the king of Spain. The Englifh fubdued it in 1708, and the French in the late war; but it was reftored to Britain by the treaty of Paris in 1763.

The air of this ifland is much more clear and pure than in Britain; being feldom darkened with thick fogs: yet the low valleys are not free from mifts and unwholefome vapours; and in windy weather the fpray of the fea is driven over the whole ifland. Hence it happens that utenfils of brafs or iron are extremely fufceptible of ruft, in fpite of all endeavours to preferve them; and houfehold furniture becomes mouldy. The fummers are dry, clear, calm, and exceffively hot; the autumns moift, warm, and unequal; at one time perfectly ferene, at another cloudy and tempeftuous. During the winter there are fometimes violent ftorms, though neither frequent nor of long continuance; and whenever they ceafe, the weather returns to its ufual ferenity. The fpring is always variable, but refembles the winter more than the fummer. The changes of heat and cold are neither fo great nor fo fudden in this climate as in many others. In the compafs of a year, the thermometer feldom rifes much above the 80th, or falls below the 48th degree. In fummer there is fcarcely ever a difference of four or five degrees between the heat of the air at noon and at night; and in winter the variation is ftill lefs confiderable. But this muft be underftood of a thermometer fhaded from the influence of the folar beams; for if expofed to them it will often rife 12, 14, or 16 degrees higher than what we have mentioned; and in other feafons the difference between the heat of the air in the fun and in the fhade is much greater. Yet, even in the dog-days, the heat of the atmofphere, at leaft in open places, feldom furpaffes that of human blood. The winds are very boifterous about the equinoxes, and fometimes during during the winter. At other times they are generally moderate, and, according to the obfervations of feamen, they rarely blow in the fame direction near the iflands adjacent to the gulph of Lyons as in the open fea. During the fummer there is commonly a perfect calm in the mornings and evenings: but the middle of the day is cooled by refrefhing breezes which come from the eaft, and, following the courfe of the fun, increafe gradually till two or three in the afternoon; after which they infenfibly die away, as night approaches. This renders the heat of the fun lefs dangerous and inconvenient; and if thefe breezes intermit for a day or two, the natives grow languid and inactive from the heat. The northerly winds in general are clear and healthy, difpel the mifts, and make a clear blue fky; whilft thofe which blow from the oppofite quarter, render the air warm, moift, and unhealthy. The north wind is fuperior in power to all the reft; which appears from hence, that the tops of all the trees incline to the fouth, and the branches on the north fide are bare and blafted. The next to it in force is the north-weft. Both are frequent towards the clofe of winter, and in the fpring; and, being dry and cold, they fhrivel up the leaves of the vegetables, deftroy their tender fhoots, and are often exceffively detrimental to the vineyards and rifing corn. The piercing blafts at that feafon from the north-eaft, as they are more moift, and more frequently attended with rain, are lefs prejudicial. The fouth and fouth-eaft winds are by much the moft unhealthy. In whatever feafons they blow, the air is foggy, and affects the breathing; but in the fummer feafon they are fultry and fuffocating. An exceffive dejection of fpirits is then a univerfal complaint; and on expofing the thermometer to the rays of the fun, the mercury has frequently rifen above the 100th degree. The weft wind is ufually drier than the fouth: the eaft is cold and bluftering in the fpring, and fultry in the fummer.

The weather in Minorca is generally fair and dry; but when it rains, the fhowers are heavy, though of fhort continuance, and they fall moft commonly in the night. The fky in fummer is clear, and of a beautiful azure, without clouds or rain; but moderate dews defcend regularly after funfet. In autumn the weather becomes lefs ferene; whirlwinds and thunder become frequent; and in the night-time lightning, and thofe meteors called *falling ftars*, are very common. Water-fpouts alfo are often feen at that feafon, and frequently break upon the fhore. A fudden alteration in the weather takes place about the autumnal equinox; the fkies are darkened with clouds, and the rains fall in fuch quantities, that the torrents thereby occafioned, pouring down from the hills, tear up trees by the root, carry away cattle, break down fences, and do confiderable mifchief to the gardens and vineyards. But thefe anniverfary rains are much more violent than lafting; always falling in fudden and heavy fhowers, with intervals of fair weather. They are accompanied with thunder, lightning, and fqualls of wind, moft commonly from the north. Hail and fnow are often intermixed with the rains which fall in winter and in fpring; but the fnow, for the moft part, diffolves immediately; and ice is here an uncommon appearance.

The whole coaft of Minorca lies low; and there are only a few hills near the centre, of which the moft confiderable, named *Toro* by the inhabitants, may be feen at the diftance of 12 or 14 leagues from the land. The furface of the ifland is rough and unequal; and in many places divided by long narrow vales of a confiderable depth, called *barrancoes* by the natives. They begin towards the middle of the ifland, and after feveral windings terminate at the fea. The fouth-weft fide is more plain and regular towards the north-eaft; where the hills are higher, with low, marfhy valleys betwixt them, the foil lefs fruitful, and the whole tract unhealthy to man and beaft. Near the towns and villages the fields are well cultivated, and inclofed with ftone-walls; but the reft, for the moft part, are rocky, or covered with woods and thickets. There are fome pools of ftanding water, but very few rivulets; which is the greateft defect about the ifland, as the inhabitants have fcarcely any wholefome water excepting what is faved from the clouds.

The foil is light, thin, and very ftony, with a good deal of fea-falt, and, in fome places, of calcareous nitre intermixed. In moft places there is fo little earth, that the ifland appears to be but one large irregular rock covered here and there with mould, and an infinite variety of ftones. Notwithftanding this, however, it is not only extremely proper for vineyards, but produces more wheat and barley than could at firft fight be imagined; and, if the peafants may be credited, it would always yield a quantity of corn and wine fufficient for the natives, did not the violence of the winds, and the exceffive drought of the weather, frequently fpoil their crops. The fields commonly lie fallow for two years, and are fown the third. About the latter end of winter, or the beginning of fpring, they are firft broke up; and next autumn, as foon as the rains fall, they are again ploughed and prepared for receiving the proper feeds. The tillage is very eafily performed; for a plough fo light as to be tranfported from place to place on the ploughman's fhoulder, and to be drawn by an heifer, or an afs fometimes affifted by an hog, is fufficient for opening fo thin a foil. The later the harveft happens, the more plentiful it proves. The barley is ufually cut down about the 20th of May N. S. and the wheat is reaped in June; fo that the whole harveft is commonly got in by midfummer-day. The grain is not threfhed with flails as in this country, but trodden out on a fmooth piece of rock by oxen and affes, according to the cuftom of the eaftern nations.

The natives of Minorca are commonly lean, thin, and well-built, of a middle ftature, and olive complexion; but their character is by no means agreeable. Such is the natural impetuofity of their temper, that the flighteft caufe provokes them to anger; and they feem to be incapable of forgiving or forgetting an injury. Hence quarrels break out daily, even among neighbours and relations; and family-difputes are tranfmitted from father to fon; and thus, though lawyers and pettifoggers are very numerous in this country, there are ftill too few for the clients. Both fexes are, by conftitution, extremely amorous: they are often betrothed to each other while children, and marry at the age of 14. The women have eafy labours, and commonly return in a few days to their ufual domeftic bufinefs; but, left the family fhould become too numerous for their income, it is a practice among the poorer fort to keep their children at the breaft for two or three years, that by this means the mothers may be hindered from breeding.

Bread of the fineft wheat-flour, well fermented and well baked, is more than half the diet of people of all ranks. Rice, pulfe, vermicelli, herbs and roots from the garden, fummer-fruits, pickled olives, and pods of the Guinea pepper, make up almoft all the other half; fo that fcarce a fifth of their whole food is furnifhed from the animal-kingdom, and of this fifh makes by much the moft confiderable portion. On Fridays, and other faft-days, they abftain entirely from flefh; and during Lent they live altogether on vegetables and fifh, excepting Sundays, when they are permitted the ufe of eggs, cheefe, and milk. Moft of their difhes are high-feafoned with pepper, cloves, cinnamon, and other fpices; and garlic, onions, or leeks, are almoft conftant ingredients. They eat a great deal of oil, and that none of the fweeteft or beft flavoured; ufing it not only with fallads, but alfo with boiled and fried fifh, greens, pulfe, &c. inftead of butter. A flice of bread foaked in boiled water, with a little oil and falt, is the common breakfaft of the peafants, well known by the name of *oleagua*. Their ordinary meals are very frugal, and confift of very little variety; but on feftivals and other folemn occafions, their entertainments are to the laft degree profufe and extravagant, infomuch that the bill of fare of a country farmer's wedding-dinner would fcarce be credited.

With regard to other matters, the Minorquins are accufed of prodigious indolence in the way of bufinefs, and neglect of the natural advantages they poffefs. In the bowels of the earth are iron, copper, and lead-ores, of none of which any ufe hath been made except the laft. A lead-mine was worked to advantage fome time ago, and the ore fent into France and Spain for the ufe of the potteries in thofe countries. The proprietor difcontinued his work on fome fmall difcouragement; and indeed it is faid, that thefe people are of all mankind the moft eafily put out of conceit with an undertaking that does not bring them in mountains of prefent gain, or that admits of the flighteft probability of difappointing their moft fanguine expectations: nor will their purfe admit of many difappointments; and thus their poverty co-operating with their natural defpondence and love of eafe, is the principal caufe of their backwardnefs to engage in projects, though ever fo promifing, for the improvement of their private fortune, and the advantage of the commerce of their country. This lead-ore went under the name of *vernis* among the natives, as it was wholly ufed by the potters in varnifhing and glazing their earthen veffels.

There are few exports of any account, and they are obliged to their neighbours for near one-third of their corn, all their oil, and fuch a variety of articles of lefs confideration, that nothing could preferve them from a total bankruptcy, but the Englifh money circulated by the troops, which is exchanged for the daily fupplies of provifions, increafed by the multiplication of vineyards, the breeding of poultry, and the production of vegetables, in a proportion of

at

at leaft five to one fince the ifland has been in our poffeffion. It will not require many words to enumerate their exports: they make a fort of cheefe, little liked by the Englifh, which fells in Italy at a very great price; this, perhaps, to the amount of 800 l. *per annum*. The wool they fend abroad may produce 900 l. more. Some wine is exported; and, if we add to its value that of the home-confumption, which has every merit of an export, being nine parts in ten taken off by the troops for ready money, it may well be eftimated at 16,000 l. a-year. In honey, wax, and falt, their yearly exports may be about 400 l. and this comes pretty near the fum of their exports, which we eftimate together at 18,100 l. Sterling *per annum*.

A vaft balance lies againft them, if we confider the variety and importance of the articles they fetch from other countries, for which they muft pay ready cafh. Here it may be neceffary to withdraw fome things from the heap, fuch as their cattle, fheep, and fowls, on which they get a profit; for the country does not produce them in a fufficient abundance to fupply them, efpecially when we have a fleet of men of war ftationed there.

Their imports are, corn, cattle, fheep, fowls tobacco, oil, rice, fugar, fpices, hard-ware, and tools of all kinds; gold and filver lace; chocolate, or cacoa to make it; tobacco, timber, plank, boards, mill-ftones, tobacco-pipes, playing cards, turnery ware, feeds, foap, faddles; all manner of cabinet-makers work, iron fpikes, nails, fine earthen-ware, glafs, lamps, brafiery, paper, and other ftationary wares; copperas, galls, dye-ftuffs, painters brufhes, and colours; mufical inftruments, mufic, and ftrings; watches, wine, fruit, all manner of fine and printed linens, muflins, cambrics, and laces; bottles, corks, ftarch, indigo, fans, trinkets, toys, ribbands, tape, needles, pins, filk, mohair, lanthorns, cordage, tar, pitch, rofin, drugs, gloves, fire-arms, gunpowder, fhot, and lead; hats, caps, velvet, cotton ftuffs, woollen cloths, ftockings, capes, medals, veftments, luftres, pictures, images, agnus Dei's, books, pardons, bulls, relics, and indulgencies.

The ifland is divided into what they ftyle *terminos*, of which there were anciently five, now reduced to four, and refemble our counties. The termino of Ciudadella, at the north-weftern extremity of the ifland, is fo ftyled from this place, which was once a city, and the capital of Minorca. It makes a venerable and majeftic figure, even in its prefent ftate of decay, having in it a large Gothic cathedral, fome other churches and convents, the governor's palace, and an exchange, which is no contemptible pile. There are in it 600 houfes, which, before the feat of government and the courts of juftice were removed to Mahon, were fully inhabited; and there are ftill more gentlemens families here than in all the reft of the ifland. It hath a port commodious enough for the veffels employed in the trade of this country, which, though in the poffeffion of a maritime power, is lefs than it formerly was. It is ftill, in the ftyle of our officers, *the beft quarters* (and there are none bad), in the country; and if there was a civil government, and the place made a free port, the beft judges are of opinion it would very foon become a flourifhing place again; and the fortifications, if it fhould be found neceffary, might then alfo be eafily reftored and improved.

The termino of Fererias is the next, a narrow flip reaching crofs from fea to fea, and the country little cultivated; it is therefore united to Mercandal. In this laft termino ftands Mont-toro in the very centre of the ifle, and the higheft ground, fome fay the only mountain in it; on the fummit of which there is a convent, where, even in the hotteft months, the monks enjoy a cool air, and at all times a moft delightful profpect. About fix miles north from Mont-toro ftands the caftle that covers Port Fornelles, which is a very fpacious harbour on the eaft fide of the ifland. There are in it fhoals and foul ground, which, to thofe who are unacquainted with them, render it difficult and dangerous; yet the packets bound from Mahon to Marfeilles frequently take fhelter therein; and while the Spaniards were in poffeffion of the ifle, large fhips and men of war frequented it. At a fmall diftance from this lies another harbour called *Adaia*, which runs far into the land; but being reputed unfafe, and being fo near Fornelles, is at prefent ufelefs. The country about it is, however, faid to be the pleafanteft and wholefomeft fpot in the ifland, and almoft the only one plentifully fupplied with excellent fpring-water, fo that the gardens are well laid out, and the richeft and fineft fruits grow here in the higheft perfection. Alaior is the next termino, in which there is nothing remarkable but the capital of the fame name, well fituated on an eminence, in a pleafant and tolerably cultivated country.

The termino of Mahon, at the fouth-eaft end of the ifland, is at prefent the moft confiderable of them all, containing about 60,000 Englifh acres, and nearly one-half of the inhabitants in Minorca. The town of Mahon derives its name from the Carthaginian general Mago, who is univerfally allowed to be its founder. It ftands on an eminence on the weft fide of the harbour, the afcent pretty fteep. There are in it a large church, three convents, the governor's palace, and fome other public edifices. It is large; but the ftreets are winding, narrow, and ill-paved. The fortrefs of St Philip ftands near the entrance of the harbour, which it covers, is very fpacious, of great ftrength, with fubterranean works to protect the garrifon from bombs, large magazines, and whatever elfe is neceffary to render it a complete fortification, and hath a numerous and well-difpofed artillery. Port Mahon is allowed to be the fineft harbour in the Mediterranean, about 90 fathoms wide at its entrance, but within very large and fafe, ftretching a league or more into the land. Beneath the town of Mahon there is a very fine quay, one end of which is referved for the fhips of war, and furnifhed with all the accommodations neceffary for careening and refitting them; the other ferves for merchantmen. On the other fide the harbour is Cape Mola, where it is generally agreed a fortrefs might be conftructed which would be impregnable, as the caftle of St Philip was efteemed before we took it, and beftowed fo much money upon it, that, though fome works were erected at Cape Mola, it was not judged proper to proceed in the fortifications there at a frefh expence; at leaft this is the only reafon that hath been affigned.

MINOS, in fabulous hiftory, king of Crete, was Rhadamanthe ſon of Jupiter and Europa. He is ſaid to have built ſeveral cities in the iſland of Crete; to have given laws to the Cretans; and to have had a ſon, from whom ſprung Minos II. king of Crete, Sarpedon, and Rhadamanthus, who diſtributed juſtice with ſuch ſeverity, that they were, according to the poets, conſtituted judges of hell, where the moſt difficult caſes were referred to Minos, who was diſtinguiſhed from the reſt by his holding a ſceptre of gold.

MINOTAUR, in antiquity, a fabulous monſter much talked of by the poets, feigned to be half man and half bull.

The minotaur was brought forth by Paſiphäe, wife of Minos king of Crete. It was ſhut up in the labyrinth of that iſland, and at laſt killed by Theſeus.

Servius gives the explanation of this fable: he ſays that a ſecretary of king Minos, named *Taurus*, "bull," having an intrigue with the queen (Paſiphäe) in the chamber of Dædalus, ſhe was at length delivered of twins; one of whom reſembled Minos, and the other Taurus. This occaſioned the production to be reputed monſtrous.

MINOW, a very ſmall ſpecies of cyprinus, ſo well known that it needs no deſcription.

MINSTREL, an ancient term for a ſinger and inſtrumental performer.

The word *minſtrel* is derived from the French *meneſtrier*, and was not in uſe here before the Norman conqueſt. It is remarkable, that our old monkiſh hiſtorians do not uſe the worc *citharœdus*, *cantator*, or the like, to expreſs a *minſtrel* in Latin; but either *mimus*, *hiſtrio*, *joculator*, or ſome other word that implies *geſture*. Hence it ſhould ſeem that the minſtrels ſet off their ſinging by mimicry, or action; or, according to Dr Brown's hypotheſis, united the powers of melody, poem, and dance.

The Saxons, as well as the ancient Danes, had been accuſtomed to hold men of this profeſſion in the higheſt reverence. Their ſkill was conſidered as ſomething divine, their perſons were deemed ſacred, their attendance was ſolicited by kings, and they were every-where loaded with honours and rewards. In ſhort, poets and their art were held among them in that rude admiration which is ever ſhewn by an ignorant people to ſuch as excel them in intellectual accompliſhments. When the Saxons were converted to Chriſtianity, in proportion as letters prevailed among them, this rude admiration began to abate, and poetry was no longer a peculiar profeſſion. The poet and the minſtrel became two perſons. Poetry was cultivated by men of letters indiſcriminately, and many of the moſt popular rhymes were compoſed amidſt the leiſure and retirement of monaſteries. But the minſtrels continued a diſtinct order of men, and got their livelihood by ſinging verſes to the harp at the houſes of the great. There they were ſtill hoſpitably and reſpectfully received, and retained many of the honours ſhewn to their predeceſſors the Bards and Scalds. And indeed, though ſome of them only recited the compoſitions of others, many of them ſtill compoſed ſongs themſelves; and all of them could probably invent a few ſtanzas on occaſion. There is no doubt but moſt of the old heroic ballads were produced by this order of men. For although ſome of the larger metrical romances might come from the pen of the monks or others, yet the ſmaller narratives were probably compoſed by the minſtrels who ſung them. From the amazing variations which occur in different copies of theſe old pieces, it is evident they made no ſcruple to alter each other's productions, and the reciter added or omitted whole ſtanzas, according to his own fancy or convenience.

In the early ages, as is hinted above, this profeſſion was held in great reverence among the Saxon tribes, as well as among their Daniſh brethren. This appears from two remarkable facts in hiſtory, which ſhew that the ſame arts of muſic and ſong were equally admired among both nations, and that the privileges and honours conferred upon the profeſſors of them were common to both; as it is well known their cuſtoms, manners, and even language, were not in thoſe times very diſſimilar.

When king Alfred the Great was deſirous to learn the true ſituation of the Daniſh army, which had invaded his realm, he aſſumed the dreſs and character of a minſtrel; and taking his harp, and only one attendant, (for in the earlieſt times it was not unuſual for a minſtrel to have a ſervant to carry his harp), he went with the utmoſt ſecurity into the Daniſh camp. And though he could not but be known to be a Saxon, the character he had aſſumed procured him a hoſpitable reception; he was admitted to entertain the king at table, and ſtaid among them long enough to contrive that aſſault which afterwards deſtroyed them. This was in the year 878.

About 60 years after, a Daniſh king made uſe of the ſame diſguiſe to explore the camp of king Athelſtan. With his harp in his hand, and dreſſed like a minſtrel, Anlaff king of the Danes went among the Saxon tents, and taking his ſtand near the king's pavilion, began to play, and was immediately admitted. There he entertained Athelſtan and his lords with his ſinging and his muſic; and was at length diſmiſſed with an honourable reward, though his ſongs muſt have diſcovered him to have been a Dane. Athelſtan was ſaved from the conſequences of this ſtratagem by a ſoldier, who had obſerved Anlaff bury the money which had been given him, from ſome ſcruple of honour, or motive of ſuperſtition. This occaſioned a diſcovery.

From the uniform procedure of both theſe kings, it is plain that the ſame mode of entertainment prevailed among both people, and that the minſtrel was a privileged character among both. Even as late as the reign of Edward II. the minſtrels were eaſily admitted into the royal preſence, as appears from a paſſage in Stow, which alſo ſhews the ſplendour of their appearance.

"In the year 1316, Edward the ſecond did ſolemnize his feaſt of Pentecoſt at Weſtminſter, in the great hall: where ſitting royally at the table with his peers about him, there entered a woman adorned like a minſtrel, ſitting on a great horſe trapped, as minſtrels then uſed, who rode round about the tables, ſhewing paſtime; and at length came up to the king's table, and laid before him a letter, and forthwith turning her horſe, ſaluted every one, and departed."—The ſubject of this letter was a remonſtrance to the king on the favours heaped by him on his minions, to the neglect of his knights and faithful fervants

The meffenger was fent in a minftrel's habit, as what would gain an eafy admiffion; and was a woman concealed under that habit, probably to difarm the king's refentment: for we do not find that any of the real minftrels were of the female fex; and therefore conclude this was only an artful contrivance peculiar to that occafion.

In the 4th year of Richard II. John of Gaunt erected at Tetbury in Staffordfhire a court of minftrels, with a full power to receive fuit and fervice from the men of this profeffon within five neighbouring counties, to enact laws, and determine their controverfies; and to apprehend and arreft fuch of them as fhould refufe to appear at the faid court, annually held on the 16th of Auguft. For this they had a charter, by which they were empowered to appoint a king of the minftrels, with four officers, to prefide over them. Thefe were every year elected with great ceremony; the whole form of which is defcribed by Dr Plott: in whofe time, however, they feem to have become mere muficians.

Even fo late as the reign of king Henry VIII. the reciters of verfes or moral fpeeches learnt by heart, intruded without ceremony into all companies; not only in taverns, but in the houfes of the nobility themfelves. This we learn from Erafmus, whofe argument led him only to defcribe a fpecies of thefe men who did not fing their compofitions; but the others that did, enjoyed without doubt the fame privileges.

We find that the minftrels continued down to the reign of Elizabeth; in whofe time they had loft much of their dignity, and were finking into contempt and neglect. Yet ftill they fuftained a character far fuperior to any thing we can conceive at prefent of the fingers of old ballads.

When queen Elizabeth was entertained at Killingworth caftle by the earl of Leicefter in 1575, among the many devices and pageants which were exhibited for her entertainment, one of the perfonages introduced was that of an ancient minftrel, whofe appearance and drefs are fo minutely defcribed by a writer there prefent, and gives us fo diftinct an idea of the character, that we fhall quote the paffage at large.

"A perfon very meet feemed he for the purpofe, of a xlv. years old, apparelled partly as he would himfelf. His cap off: his head feemingly rounded tonfterwife: fair-kembed, that, with a fponge daintly dipt in a little capon's greafe, was finely fmoothed, to make it fhine like a mallard's wing. His beard fmugly fhaven: and yet his fhirt after the new trink, with ruffs fair ftarched, fleeked and gliftering like a pair of new fhoes, marfhalled in good order with a fetting ftick, and ftrut, 'that' every ruff ftood up like a wafer. A fide [i. e. long] gown of Kendale green, after the frefhnefs of the year now, gathered at the neck with a narrow gorget, faftened afore with a white clafp and a keeper clofe up to the chin; but eafily, for heat, to undo when he lift. Seemingly begirt in a red caddis girdle: from that a pair of capped Sheffield knives hanging a' two fides. Out of his bofom drawn from a lappet of his napkin edged with a blue lace, and marked with a D for Damian; for he was but a batchelor yet.

"His gown had fide [i. e. long] fleeves down to midleg, flit from the fhoulder to the hand, and lined with white cotton. His doublet-fleeves of black worfted: upon them a pair of points of tawny-chamlet laced along the wrift with blue threaden pointes. A weaft towards the hands of fuftian-a-napes. A pair of red neather ftocks. A pair of pumps on his feet, with a crofs cut at his toes for corns; not new indeed, yet cleanly blackt with foot, and fhining as a fhoing horn.

"About his neck a red ribband fuitable to his girdle. His harp in good grace dependent before him. His wreft tyed to a green lace and hanging by: under the gorget of his gown a fair flaggon chain, (pewter for) filver, as a fquire Minftrel of Middlefex, that travelled the country this fummer feafon, unto fair and worfhipful mens houfes. From his chain hung a fcutcheon, with metal and colour, refplendent upon his breaft, of the ancient arms of Iflington."

—This minftrel is defcribed as belonging to that village. We fuppofe fuch as were retained by noble families, wore their arms hanging down by a filver chain as a kind of badge. From the expreffion of Squire Minftrel above, we may conclude there were other inferior orders, as Yeomen Minftrels, or the like.

This minftrel, the author tells us a little below, "after three lowly courtefies, cleared his voice with a hem . . . and wiped his lips with the hollow of his hand for 'filing his napkin; tempered a ftring or two with his wreft; and, after a little warbling on his harp for a prelude, came forth with a folemn fong, warranted for ftory out of king Arthur's acts, &c."

Towards the end of the 16th century, this clafs of men had loft all credit, and were funk fo low in the public opinion, that in the 39th year of Elizabeth a ftatute was paffed by which "minftrels, wandering abroad" were included among "rogues, vagabonds, and fturdy beggars," and were adjudged to be punifhed as fuch. This act feems to have put an end to the profeffion, for after this time they are no longer mentioned.

MINT, the place in which the king's money is coined. See Coinage.

There were anciently mints in almoft every county in England; but the only mint at prefent in the Britifh dominions is that in the tower of London. The officers of the mint are, 1. The warden of the mint, who is the chief; he overfees the other officers, and receives the bullion. 2. The mafter-worker, who receives the bullion from the warden, caufes it to be melted, delivers it to the moneyers, and, when it is coined, receives it again. 3. The comptroller, who is the overfeer of all the inferior officers, and fees that all the money is made to the juft affize. 4. The affay-mafter, who weighs the gold and filver, and fees that it is according to the ftandard. 5. The auditor, who takes the accounts. 6. The furveyor of the melting; who, after the affay-mafter has made trial of the bullion, fees that it is caft out, and not altered after it is delivered to the melter. 7. The engraver; who engraves the ftamps and dyes for the coinage of the money. 8. The clerk of the irons; who fees that the irons are clean and fit to work with. 9. The melter; who melts the bullion before it be coined. 10. The provoft of the mint; who provides for and overfees all the moneyers. 11. The blanchers, who anneal and cleanse the money. 12. The moneyers; some of whom forge the money, some shear it, some round and mill it, and some stamp and coin it. 13. The porters, who keep the gate of the mint.

Mint-*Marks*. It hath been usual, from old time, to oblige the masters and workers of the mint, in the indentures made with them, "to make a privy mark in all the money that they made, as well of gold as of silver, so that another time they might know, if need were, and witte which moneys of gold and silver among other of the same moneys, were of their own making, and which not." And whereas, after every trial of the pix at Westminster, the masters and workers of the mint, having there proved their moneys to be lawful and good, were immediately entitled to receive their *quietus* under the great seal, and to be discharged from all suits or actions concerning those moneys, it was then usual for the said masters and workers to change the privy mark before used for another, that so the moneys from which they were not yet discharged might be distinguished from those for which they had already received their *quietus;* which new mark they then continued to stamp upon all their moneys, until another trial of the pix gave them also their *quietus* concerning those.

The pix is a strong box with three locks, whose keys are respectively kept by the warden, master, and comptroller of the mint; and in which are deposited, sealed up in several parcels, certain pieces taken at random out of every *journey*, as it is called; that is, out of every 15 pounds weight of gold, or 60 pounds weight of silver, before the same is delivered to the proprietors. And this pix is, from time to time, by the king's command, opened at Westminster, in the presence of the lord-chancellor, the lords of the council, the lords-commissioners of the treasury, the justices of the several benches, and the barons of the exchequer; before whom a trial is made, by a jury of goldsmiths impannelled and sworn for that purpose, of the collective weights of certain parcels of the several pieces of gold and silver taken at random from those contained in the pix; after which those parcels being severally melted, assays are then made of the bullion of gold and silver so produced, by the melting certain small quantities of the same against equal weights taken from the respective trial-pieces of gold and silver that are deposited and kept in the exchequer for that use. This is called the *trial of the pix;* the report made by the jury upon that trial is called the *verdict of the pix* for that time; and the indented trial-pieces just above-mentioned, are certain plates of standard gold and standard silver, made with the greatest care, and delivered in upon oath, from time to time as there is occasion, by a jury of the most able and experienced goldsmiths, summoned by virtue of a warrant from the lords of the treasury to the wardens of the mystery of goldsmiths of the city of London for that purpose; and which plates being so delivered in, are divided each, at this time, into seven parts by indentures, one of which parts is kept in his majesty's court of exchequer at Westminster, another by the said company of goldsmiths, and two more by the officers of his majesty's mint in the tower; the remaining three being for the use of the mint, &c. in Scotland. The pix has sometimes been tried every year, or even oftener, but sometimes not more than once in several years: and from hence is understood how it comes to pass, that, among the pieces that are dated as well as marked, three or more different dates are sometimes found upon pieces impressed with the same mark; and again, that different marks are found upon pieces bearing the same date. These marks are first observable upon the coins of king Edward III.; the words above quoted concerning those marks are from the indentures made with the lord Hastings, master and worker to king Edward IV.; and the marks themselves continued to be stamped very conspicuously upon the moneys, till the coinage by the mill and screw was introduced and settled after the Restoration, in the year 1662: since which time, the moneys being made with far greater regularity and exactness than before, these marks have either been totally laid aside, or such only have been used as are of a more secret nature, and only known to the officers and engravers concerned in the coinage: and indeed the constant practice that has ever since prevailed, of dating all the several pieces, has rendered all such marks of much less consequence than before.

Mint, in botany. See Mentha.

MINUET, a very graceful kind of dance, consisting of a coupee, a high step, and a balance: it begins with a beat, and its motion is triple.

The invention of the minuet seems generally to be ascribed to the French, and particularly to the inhabitants of the province of Poictou. The word is said by Menage and Furetiere to be derived from the French *menue* or *menu*, "small, or little;" and in strictness signifies a small pace. The melody of this dance consists of two strains, which, as being repeated, are called *reprises*, each having eight or more bars, but never an odd number. The measure is three crotchets in a bar, and is thus marked $\frac{3}{4}$, though it is commonly performed in the time $\frac{3}{8}$. Walther speaks of a minuet in Lully's opera of *Roland*, each strain of which contains ten bars, the sectional number being 5; which renders it very difficult to dance.

MINUTE, in geometry, the 60th part of a degree of a circle.

Minute *of Time*, the 60th part of an hour.

Minute, in architecture, usually denotes the 60th, sometimes the 30th, part of a module. See Architecture.

Minute is also used for a short memoir, or sketch of a thing taken in writing.

MINUTIUS felix. See Felix.

MIQUELETS, a name given to the Spaniards who inhabit the Pyrenean mountains on the frontiers of Arragon and Catalonia, and live by robbing.

MIQUELON, a small desert island to the south-west of Cape May in Newfoundland, ceded to the French by the peace of 1763, for drying and curing their fish. W. Long. 54. 30. N. Lat. 47. 22.

MIRABILIS, Marvel of Peru; a genus of the monogynia order, belonging to the pentandria class of plants.

The most remarkable species are,

1. The jalappa, or common marvel of Peru, hath a large, thick, fleshy root; an upright, thick, jointed stalk, dividing and branching numerously, widely,

Mirabilis.

and erectly, a yard or more high; garnifhed with oblong, broad, oppofite leaves; and all the branches and fhoots terminated by numerous flowers in clufters, of different colours in the varieties. Of this there are varieties with white flowers—with yellow flowers—with purple flowers—with red flowers—with white and yellow flowers—white and purple flowers—purple and yellow flowers—red and yellow flowers. Several other varieties often rife from feed; and it is remarkable that although feveral of the above colours and variegations are fometimes common to the fame plant, yet it is rare that a plant of this fpecies produces flowers of one of thofe colours alone; fometimes, however, the fame plant will exhibit only white and purple flowers feparate, and fometimes both colours in the fame flowers, intermixed with the plain ones: the fame is alfo obfervable in the red and yellow; others have plain flowers of feveral different colours, and fometimes variegated flowers alfo on the fame plants. The root of this fpecies was fuppofed to be the true officinal jalap, but which is fince difcovered to be the root of a fpecies of *convolvulus*.

2. The longiflora, or long-flowered mirabilis, hath a large, thick, flefhy root; a thick ftalk, dividing low into many declinated fpreading branches, extending two or three feet every way; large, heart-formed, hairy, vifcous leaves, in oppofite pairs; and all the branches and fhoots terminated by white flowers in clufters, having very long tubes, nodding downward.

3. The dichotoma, dichotomous, or forked mirabilis; hath a thick flefhy root; an upright, thick, fwollen, jointed ftem, branching forkedly two or three feet high; oblong oppofite leaves; and fmallifh red flowers at the axillas, fingly and clofe-fitting.

All thefe plants flower in July, continuing in plentiful fucceffion until October, very confpicuous and elegant. They have the fingularity of being fhut all day, and expanding towards the evening when the fun declines; hence the inhabitants of the Indies, where they grow naturally, called them *four o'clock flowers:* their time of opening here, however, depends on the weather; for if cloudy, or that the fun is not very vehement, they often open great part of the day.

They are naturally perennial in root, which, however, if not preferved here in winter, prove but of one year's duration; but if fheltered from froft and wet during the winter feafon, they will remain alive, and fhoot out ftrongly again in fpring: in this country, however, the plants are commonly confidered as annuals; becaufe they rife from feed in the fpring, and the fame year produce flowers and perfect feed; and if left to nature in the open air, totally perifh in winter, at the firft attack of froft or exceffive wet; but, as aforefaid, if in autumn, when the ftalks begin to affume a ftate of decay, the roots are taken up, and preferved in fand in a dry room all winter, and planted again in fpring, they fhoot out afrefh ftronger than at firft, and fometimes obtain four or five feet ftature, with very fpreading heads; or if plants growing in pots, having the ftems cut down in autumn, and the pots placed in a green-houfe, or garden-frames under glaffes, the roots may alfo be preferved found, and will fhoot out again in fpring as above.

The roots generally become large, tuberous, and flefhy, covered with a dark rind.

All the fpecies are of a tender nature, fcarcely able to endure the open air here fully day and night, until May or June; that is, they being raifed from feed in fpring, chiefly in hot-beds under glaffes, continued and forwarded there until the beginning of June, then fully expofed in the borders or pots, they become large branchy plants in July and Auguft, and continue flowering until October or November, till prevented by the cold.

They are all elegant furniture for the principal compartments of the pleafure-ground, they being both very ornamental in their large branchy growth, clofely garnifhed with leaves; and, by flowering fo numeroufly, feem as if entirely covered with flowers, in conftant plentiful fucceffion from July till the beginning of winter, as aforefaid.

The roots of all thefe plants is a ftrong purgative, and given in a double quantity operate equal to the true jalap.

The propagation of all the fpecies is by feed in the fpring, either in a warm border, or in a hot-bed; but the latter will forward the plants to confiderably the earlieft and greateft degree of perfection.

Miracle.

MIRACLE, is defined by Dr Samuel Clarke, to be a work effected in a manner different from the common and regular method of providence, by the interpofition either of God himfelf, or fome intelligent agent fuperior to man.

It has been much controverted, whether true miracles can be worked by any lefs power than the immediate power of God; and whether to complete the evidence of a miracle, the nature of the doctrine pretended to be proved by it is neceffary to be taken into the confideration. The above learned author undertakes to fet this matter in a clear light, as follows.

In refpect to the power of God, and the nature of the things themfelves, all things that are poffible at all, are equally eafy to be done: it is at leaft as great an act of power to caufe the fun to move at all, as to caufe it at any time to ftand ftill; yet this latter we call a *miracle*, the former not.

What degrees of power God may reafonably be fuppofed to have communicated to created beings or fubordinate intelligences, is impoffible for us to determine: therefore a miracle is not rightly defined to be fuch an effect as could not have been produced by any lefs power than the divine omnipotence. There is no inftance of any miracle in fcripture, which to an ordinary fpectator would neceffarily imply the immediate operation of original, abfolute, and underived power.

All things that are done in the world, are done either immediately by God himfelf, or by created intelligent beings, matter not being at all capable of any laws or powers whatfoever; fo that all thofe things which we fay are the effects of the natural powers of matter and laws of motion, are properly the effects of God acting upon matter continually and every moment, either immediately by himfelf, or mediately by fome created intelligent beings. Confequently it is no more againft the courfe of nature for an angel to keep a man from finking in the water, than for a man to hold a ftone from falling in the air, by overpowering the law of gravitation; and yet the one is a miracle, the other not fo.

The only poffible ways by which a fpectator may certainly

certainly and infallibly diftinguifh whether miracles be the works either immediately of God himfelf, or of fome good angel employed by him; or whether, on the contrary, they are the works of evil fpirits, are thefe: If the doctrine attefted by miracles, be in itfelf impious, or manifeftly tending to promote vice; then, without all queftion, the miracles, how great foever they may appear to us, are neither worked by God himfelf, nor by his commiffion. If the doctrine itfelf be indifferent, and at the fame time there be worked other miracles more and greater than the former, then that doctrine which is attefted by the fuperior power muft neceffarily be believed to be divine: this was the cafe of Mofes and the Egyptian magicians. If, in the laft place, the doctrine attefted by miracles tends to promote the honour of God, and the practice of righteoufnefs among men; and yet neverthelefs be not in itfelf demonftrable, nor could without a revelation be difcovered to be actually true, and there is no pretence of more and greater miracles to contradict it, which is the cafe of the doctrine and miracles of Chrift; then the miracles are unqueftionably divine, and the doctrine muft, without all controverfy, be acknowledged as an immediate and infallible revelation from God.

The Lord Bacon obferves, that a miracle was never wrought by God to convert an atheift, becaufe the light of nature might have led him to confefs a God: but miracles, fays he, are defigned to convert idolaters and the fuperftitious, who have acknowledged a deity, but erred in the manner of adoring him; becaufe no light of nature extends fo far as fully to declare the will and true worfhip of God.

Acofta inquiring into the caufe why miracles are not wrought by the prefent miffionaries for the converfion of heathen nations, as they were by the Chriftians of the primitive ages, gives this as one reafon: That the Chriftians at firft were ignorant men, and the Gentiles learned; but now, on the contrary, all the learning in the world is employed in the defence of the gofpel, and there is nothing but ignorance to oppofe it; and there can be no need of farther miracles in fo good a caufe, when it is in the hands of fuch able advocates againft fuch weak adverfaries. See the article Abridgment.

MIRANDA-de-Ebro, a town of Spain in Old Caftile, with a ftrong caftle; feated in a country that produces excellent wine. The town is divided into two parts by the river, over which there is a handfome bridge. W. Long. 3. 10. N. Lat. 42. 52.

MIRANDE, a town of Gafcony in France, capital of the county of Aftarac; feated on a mountain near the river Baufe. E. Long. 0. 21. N. Lat. 42. 53.

MIRANDO-de-Douro, or *Duero*, a ftrong town of Portugal, and capital of the province of Tra-los-Montes, with a bifhop's fee. It is well fortified, and feated on a rock near the confluence of the rivers Douro and Frefna. W. Long. 5. 40. N. Lat. 41. 30.

MIRANDOLA, a town of Italy, and capital of a duchy of the fame name, fituate between the duchies of Mantua and Modena. It is a pretty large place, well fortified, and has alfo a ftrong citadel and fort. It has been feveral times taken and retaken; the laft time by the king of Sardinia in 1742. E. Long. 11. 5. N. Lat. 44. 52.

MIRANDULA. See Picus.

MIRIAM, fifter of Aaron and Mofes, makes two or three remarkable appearances in fcripture. It was owing to her that her mother was employed by Pharaoh's daughter as nurfe to Mofes. She put herfelf at the head of the women of Ifrael after their paffage through the Red-Sea, in order to fing the fong which the men had fung before. She joined with her brother Aaron in murmuring againft Mofes, and was feverely chaftifed for that action; for fhe became leprous, and continued feparate from the reft without the camp for feven days. She died before her brothers, though in the fame year with them, and was buried at the public expence.

MIRROR, a name for a looking-glafs, or any polifhed body, whofe ufe is to form the images of diftant objects by reflexion of the rays of light. See Reflexion.

Mirrors are either plain, convex, or concave. The firft reflect the rays of light in a direction exactly fimilar to that in which they fall upon them, and therefore reprefent bodies of their natural magnitude. The convex ones make the rays diverge much more than before reflexion, and therefore greatly diminifh the images of thofe objects which they fhew: while the concave ones, by collecting the rays into a focus, not only magnify the objects they fhow, but will burn very fiercely when expofed to the rays of the fun; and hence they are commonly known by the name of *burning mirrors*. See Burning-*Mirrors*.

In ancient times the mirrors were made of fome kind of metal; and from a paffage in the Mofaic writings we learn that the mirrors ufed by the Jewifh women were made of brafs. The Jews certainly had been taught to ufe that kind of mirrors by the Egyptians; from whence it is probable, that brazen mirrors were the firft kind ufed in the world. Any kind of metal indeed, when well polifhed, will reflect very powerfully; but of all others filver reflects the moft, though it hath been in all countries too expenfive a material for common ufe. Gold alfo is very powerful; and metals, or even wood, gilded and polifhed, will act very powerfully as burning mirrors. Even polifhed ivory, or ftraw nicely plaited together, will form mirrors capable of burning, if on a large fcale.

Since the invention of glafs, and the application of quickfilver to it, became generally known, it hath been univerfally employed for thofe plain mirrors ufed as ornaments to houfes; but in making reflecting telefcopes, they have been found much inferior to metallic ones. It doth not appear that the fame fuperiority belongs to the metalline burning mirrors, confidered merely as burning-glaffes; fince the mirror with which Mr Macquer melted platina, though only 22 inches diameter, and which was made of quickfilvered glafs, produced much greater effects than M. Villette's metalline fpeculum, which confiderably exceeded it in fize. It is very probable, however, that this mirror of M. Villette's was by no means fo well polifhed as it ought to have been; as the art of preparing the metal for taking the fineft polifh hath but lately been difcovered and publifhed in the Philofophical Tranfactions by Mr Mudge. See Glass-

Grinding, and the *Mechanical Part* of OPTICS.

MIRE-CROW, SEA-CROW, or *Pewit*. See LARUS.

MISADVENTURE, in common language, signifies any unlucky accident which takes place without being foreseen.

MISADVENTURE, in law, has an especial signification for the killing a man partly by negligence, and partly by chance. See HOMICIDE.

MISCHNAH, or MISNAH, the code or collection of the civil law of the Jews. The Jews pretend, that when God gave the written law to Moses, he gave him also another which was not written; and which was preserved by tradition among the doctors of the synagogue, till Rabbi Judah, surnamed the *Holy*, seeing the danger they were in, through their dispersion, of departing from the traditions of their fathers, judged it proper to reduce them to writing. The misnah is divided in six parts: the first relates to the distinction of seeds in a field, to trees, fruits, tythes, &c.; the second regulates the manner of observing festivals; the third treats of women, and matrimonial cases; the fourth, of losses in trade, &c.; the fifth is on obligations, sacrifices, &c.; and the sixth treats of the several sorts of purification.

MISDEMEANOUR, in law, signifies a crime. Every crime is a misdemeanour; yet the law has made a distinction between crimes of an higher and a lower nature; the latter being denominated *misdemeanours*, the former *felonies*, &c. For the understanding of which distinction, we shall give the following definition from Blackstone's Commentaries, vol. iv. 5.

" A crime, or misdemeanour, is an act *committed* or *omitted*, in violation of a public law, either forbidding or commanding it. This general definition comprehends both *crimes* and *misdemesnours*; which, properly speaking, are mere synonimous terms; tho' in common usage, the word *crime* is made to denote such offences as are of a deeper and more atrocious dye; while smaller faults, and omissions of less consequence, are comprised under the gentler name of *misdemeanours* only.

MISE, in law-books, is used in various senses: thus it sometimes signifies costs or expences, in which sense it is commonly used in entering of judgments in actions personal. It is also used for the issue to be tried on the grand assize; in which case, joining of the mise upon the mere right, is putting in issue between the tenant and demandant, Who has the best or clearest right.

MISE also signifies a tax or tallage, &c. An honorary gift, or customary present from the people of Wales to every new king or prince of Wales, anciently given in cattle, wine, and corn, but now in money, being 5000 l. or more, is denominated a *mise*: so was the usual tribute or fine of 3000 merks paid by the inhabitants of the county palatine of Chester, at the change of every owner of the said earldoms, for enjoying their liberties. And at Chester they have a mise-book, wherein every town and village in the county is rated what to pay towards the mise. The 27 Hen. VIII. c. 26. ordains that lords shall have all such mises and profits of their lands as they had in times past, &c.

MISE, is sometimes also corruptly used for *mease*, in law French *mees*, " a messuage;" as a *mise place*, in some manors, is such a messuage or tenement as answers the lord a heriot at the death of its owner. 2. *Inst.* 528.

MISERICORDIA, in law, is an arbitrary fine imposed on any person for an offence: this is called *misericordia*, because the amercement ought to be but small, and less than that required by magna charta. If a person be outrageously amerced, in a court that is not of record, the writ called *moderata misericordia* lies for moderating the amercement according to the nature of the fault.

MISFORTUNE. An unlucky accident.

MISFORTUNE, or chance, in law, a deficiency of the will; or committing of an unlawful act by misfortune or chance, and not by design. In such case, the will observes a total neutrality, and does not co-operate with the deed; which therefore wants one main ingredient of a crime. See CRIME.

Of this, when it affects the life of another, we have spoken under the article HOMICIDE; and in this place have only occasion to observe, that if any accidental mischief happens to follow from the performance of a lawful act, the party stands excused from all guilt: but if a man be doing any thing unlawful, and a consequence ensues which he did not foresee or intend, as the death of a man or the like, his want of foresight shall be no excuse; for, being guilty of one offence, in doing antecedently what is in itself unlawful, he is criminally guilty of whatever consequence may follow the first misbehaviour.

MISFEASANCE, in law-books, signifies a trespass.

MISLETOE, in botany. See VISCUM.

MISNOMER, in law, a misnaming or mistaking a person's name. The Christian name of a person should always be perfect; but the law is not so strict in regard to surnames, a small mistake in which will be dispensed with to make good a contract, and support the act of the party. See PLEA *to Indictment*.

MISO. See DOLICHOS.

MISPRISIONS, (a term derived from the old French, *mespris*, a neglect or contempt), are, in the acceptation of our law, generally understood to be all such high offences as are under the degree of capital, but nearly bordering thereon: and it is said, that a misprision is contained in every treason and felony whatsoever; and that, if the king so please, the offender may be proceeded against for the misprision only. And upon the same principle, while the jurisdiction of the star-chamber subsisted, it was held that the king might remit a prosecution for treason, and cause the delinquent to be censured in that court, merely for a high misdemeanour: as happened in the case of Roger earl of Rutland, in 43 Eliz. who was concerned in the earl of Essex's rebellion. Misprisions are generally divided into two sorts; negative, which consist in the concealment of something which ought to be revealed; and positive, which consist in the commission of something which ought not to be done.

1. Of the first, or negative kind, is what is called *misprision of treason*; consisting in the bare knowledge and concealment of treason, without any degree of assent thereto: for any assent makes the party a principal

pal traitor; as indeed the concealment, which was construed aiding and abetting, did at the common law; in like manner as the knowledge of a plot against the state, and not revealing it, was a capital crime at Florence, and other states of Italy. But it is now enacted by the statute 1 & 2 Ph. & Mar. c. 10. that a bare concealment of treason shall be only held a misprision. This concealment becomes criminal, if the party apprised of the treason does not, as soon as conveniently may be, reveal it to some judge of assize or justice of the peace. But if there be any probable circumstances of assent, as if one goes to a treasonable meeting, knowing beforehand that a conspiracy is intended against the king; or, being in such company once by accident, and having heard such treasonable conspiracy, meets the same company again, and hears more of it, but conceals it; this is an implied assent in law, and makes the concealer guilty of actual high-treason.

Misprision of felony is also the concealment of a felony which a man knows, but never assented to; for, if he assented, this makes him either principal or accessory. And the punishment of this, in a public officer, by the statute Westm. 1. 3 Edw. I. c. 9. is imprisonment for a year and a day; in a common person, imprisonment for a less discretionary time; and, in both, fine and ransom at the king's pleasure: which pleasure of the king must be observed, once for all, not to signify any extrajudicial will of the sovereign, but such as is declared by his representatives, the judges in his courts of justice; *voluntas regis in curia, non in camera.*

2. Misprisions, which are merely positive, are generally denominated *contempt* or *high misdemeanours;* of which the principal is the *mal-administration* of such high officers as are in public trust and employment. This is usually punished by the method of parliamentary impeachment: wherein such penalties, short of death, are inflicted, as to the wisdom of the house of peers shall seem proper; consisting usually of banishment, imprisonment, fines, or perpetual disability. Hither also may be referred the offence of *embezzling the public money,* called among the Romans *peculatus;* which the Julian law punished with death in a magistrate, and with deportation, or banishment, in a private person. With us it is not a capital crime, but subjects the committer of it to a discretionary fine and imprisonment.—Other misprisions are, in general, such contempts of the executive magistrate as demonstrate themselves by some arrogant and undutiful behaviour towards the king and government; for a detail of which, *vide* Blackstone's Comment. iv. 22.

MISSAL, the Romish mass-book, containing the several masses to be said on particular days. It is derived from the Latin word *missa,* which, in the ancient Christian church, signified every part of divine service.

MISSEL-BIRD, a species of TURDUS.

MISSIONARIES, such ecclesiastics as are sent by any Christian church into Pagan or Infidel countries, to convert the natives, and establish the Christian religion among them.

There are in France, and other Popish countries, several congregations of missionaries, whose principal end is to be employed on missions, and to inspire into the young clerks that spirit of piety and devotion which is necessary for the worthy discharge of their ministry. Such are the congregations of the priests of the mission, the Eudists, the missionaries of Lyons, and some others. The most remarkable of these congregations is that of the priests of the mission, which consists of secular clergy; who nevertheless make four simple vows, of poverty, chastity, obedience, and perseverance. Their habit is distinguished from that of other ecclesiastics only by a linen-collar four fingers broad, and by their wearing a little tuft of beard.

MISSISIPPI, also called the *river of St Louis,* is one of the largest in the world. Its source is unknown: for it has not been navigated higher than 300 miles below the fall or cataract of St Anthony; and there it is 30 fathoms deep, though at the distance of 2400 miles from its mouth. It discharges itself into the sea by three mouths; and, like the Nile, has periodical inundations, by the melting of snow in the north, so that in May it overflows the country on each side, from 60 to 90 miles, and the innundation continues till near the end of July. In the lowest parts of the country there are morasses, lakes, and canals, along the banks, which are generally covered with trees, and in some places the course of the river is confined between high precipices. Its inundations always leave a great quantity of mud upon the land, and sometimes carry down trees to the river's mouth, where they form new islands, and render the entrance difficult.

MISSON (Francis Maximilian), whose pleadings before the parliament of Paris in favour of the reformers bear genuine marks of eloquence and ability, retired into England after the revocation of the edict of Nantz, and became a strenuous assertor of the Protestant religion. In the years 1687 and 1688, he travelled to Italy as governor to an English nobleman: in consequence of which he published at the Hague, "A new voyage to Italy," 3 vols 12mo; which has been translated into English with many additions. He published also the "Sacred Theatre at Cevennes, or an account of Prophecies and Miracles performed in that part of Languedoc," London 1707. "Observations and remarks of a traveller," 12mo, Hague. He died at London in 1721.

MISTAKE, any wrong action committed, not through an evil design, but through an error of judgment.

MISTAKE, in law. See IGNORANCE.

MISUSER, in law, is an abuse of any liberty or benefit; as "He shall make fine for his MISUSER." Old. Nat. Br. 149. By *misuser* a charter of a corporation may be forfeited; so also an office, &c.

MISY, in natural history, a species of the chalcantha, a fossil very common in the Turkish dominions, and sometimes found in the mines of Cremnitz in Hungary. It is a considerably firm substance, of an irrelar texture, not compact; much resembling some of our more gaudy marcasites, but wanting in their hardness and weight. It is of no determinate shape or size; but is often found in small detached masses, which are usually broad, flat, and very rugged at the edges. As to its medical virtues, they are no other than those of the green vitriol.

MITE, a small coin formerly current, and equal to about one-third part of a farthing.

MITE,

MITE, in zoology. See ACARUS.

MITELLA, BASTARD AMERICAN SANICLE; a genus of the digynia order, belonging to the decandria clafs of plants. There are two fpecies, both natives of North America, rifing with annual herbaceous ftalks from five or fix to eight or nine inches in height, and producing fpikes of fmall whitifh flowers, whofe petals are fringed on their edges. They are eafily propagated by parting their roots; and fhould be planted in a fhady fituation, and in a foft loamy foil. The fruit of one of the fpecies is the achiotte, or arnotto.

MITHRIDATE, in pharmacy; an antidote, or compofition, in form of an electuary, fuppofed to ferve either as a remedy or a prefervative againft poifons. See PHARMACY, n° 892.—894. It takes its name from the inventor, Mithridates king of Pontus; who is faid to have fo fortified his body againft poifons with antidotes and prefervatives, that when he had a mind to difpatch himfelf, he could not find any poifon that would take effect. The receipt of it was found in his cabinet, written with his own hand, and was carried to Rome by Pompey. It was tranflated into verfe by Damocrates, a famous phyfician; and was afterwards tranflated by Galen, from whom we have it: though there is room to imagine it has undergone confiderable alterations fince the time of its royal prefcriber.

MITHRIDATES, king of Pontus, a renowned general, and at firft fuccefsful againft the Romans: but being finally conquered by Pompey, and his fon Pharnaces raifed to the throne, who treated him with unnatural barbarity, he took poifon; but this proving ineffectual, owing to a falutary medicine which he had almoft conftantly employed, he was flain at his own requeft by one of his attendants, 63 B. C. aged 72. He was a prince of extraordinary courage, capable of forming and executing the greateft defigns. He had travelled a great deal, was learned, fond of men of letters, and fpoke many languages. He compofed a treatife *De Arcanis Morborum*; which Pompey caufed to be carried to Rome, and which his freedman Læneus tranflated into Latin. It was he who compofed that counter-poifon which from his name is ftill called *mithridate*; but his fanguinary temper darkened the luftre of his moft amiable perfections. See PONTUS.

MITRE, a facerdotal ornament worn on the head by bifhops and certain abbots on folemn occafions; being a fort of cap, pointed and cleft at top. The high-prieft among the Jews wore a mitre or bonnet on his head. The inferior priefts of the fame nation had likewife their mitres; but in what refpect they differed from that of the high prieft, is uncertain. Some contend that the ancient bifhops wore mitres; but this is by no means certain.

MITTAU, the capital of the duchy of Courland. It is ftrongly fortified; but was taken by the Swedes in 1701, and by the Mufcovites in 1706. E. Long. 23. 51. N. Lat. 56. 44.

MITTIMUS, as generally ufed, hath two fignifications. 1. It fignifies a writ for removing or transferring of records from one court to another. 2. It fignifies a precept, or command in writing, under the hand and feal of a juftice of the peace, directed to the gaoler or keeper of fome prifon, for the receiving and fafe keeping of an offender charged with any crime, until he be delivered by due courfe of law.

MITYLENE, (anc. geog.), a celebrated, powerful, and affluent city of Lefbos; nor was it lefs famous for the ftudy of philofophy and eloquence. It fuffered much in the Peloponnefian war from the Athenians; and in the Mithridatic war from the Romans, being taken and deftroyed: but it foon rofe again, having recovered its ancient liberty, by the favour of Pompey, (Velleius, Plutarch). It remained a free city and in power 1500 years. The country of Pittacus, one of the feven wife men of Greece; of Alcæus, and of Sappho. *Mytillenæi*, or *Mytilinenfes*, the people; who at ftated times celebrated poetical contefts, (Plutarch). Cicero calls it a city ennobled by nature and fituation, efpecially by the beauty of its edifices, and by its plains, which are pleafant and fertile. It is fometimes by the poets joined with Rhodes, (Horace, Martial). *Mitylenæus*, the epithet, (Lucan). It now gives name to the whole ifland, and this as early as the days of Euftathius; and is itfelf called *Caftro*.

MIXT, or MIXT BODY, in chemiftry, that which is compounded of different elements or principles.

MIXTURE, a compound, or affemblage of feveral different bodies in the fame mafs. Simple mixture, confifts only in the fimple appofition of parts of different bodies to each other. Thus, when powders of different kinds are rubbed together, the mixture is only fimple, and each of the powders retains its particular characters. In like manner, when oil and water are mixed together, though the parts of both are confounded, fo that the liquor may appear to be homogeneous, we cannot fay that there is any more than a fimple appofition of the parts, as the oil and water may very eafily be again feparated from each other. But the cafe is very different when bodies are *chemically* mixed; for then one or both bodies affume new properties, and can by no means be difcovered in their proper form without a particular chemical procefs adapted to this purpofe. Hence chemical mixture is attended with many phenomena which are never obferved in fimple mixtures; fuch as heat, effervefcence, &c. To chemical mixture belongs the union of acids and alkalies, the amalgamation of metals, folution of gums, &c. and upon it depend many of the principal operations of chemiftry. See that article *paffim*.

MIZEN, in the fea-language, is a particular maft or fail. The mizen-maft ftands in the fternmoft part of the fhip. In fome great fhips there are two of thefe; when that next the main-maft is called the *main-mizen*, and that next the poop the *bonaventure mizen*.

MIZRAIM, or MISRAIM, the dual name of Egypt, ufed in fcripture to denote the Higher and Lower Egypt, which fee. It fometimes occurs fingular, *Mazor*: 2 Kings xix. Ifaiah xix. Micah vii.

MNIUM, MARSHMOSS; a genus of the order of mufci, belonging to the cryptogamia clafs of plants. There are 18 fpecies, of which feven are natives of Britain; but none have any remarkable property except the two following. 1. The fontanum is an elegant mofs, frequent in bogs, and on the borders of old fprings. It is from two to four inches high: the ftalks are fimple at the bafe, and covered with a rufty down; but higher up are red, and divided into feveral

veral round, fingle, taper branches, which proceed nearly from the fame point. The leaves are not more than $\frac{1}{11}$ of an inch long, lanceolate and acute, of a whitifh green colour, and fo thinly fet, that the red ftalk appears between them. This mofs, as it may be feen at a confiderable diftance, is a good mark to lead to the difcovery of clear and cold fprings. Linnæus informs us, that the Laplanders are well acquainted with this fign. Mr Withering informs us, that wherever this mofs grows, a fpring of frefh water may be found without much digging. 2. The hygrometricum grows in woods, heaths, garden-walks, walls, old trees, decayed wood, and where coals or cinders have been laid. It is ftemlefs, hath tips inverfely egg-fhaped, nodding, and bright yellow. If the fruit-ftalk is moiftened at the bafe with a little water or fteam, the head makes three or four revolutions: if the head is moiftened, it turns back again.

MOAB, (anc. geog.), a country of Arabia Petræa; fo called from Moab the fon of Lot, to whofe pofterity this country was allotted by divine appointment, Deut. xi. 9. It was anciently occupied by the Emim, a race of giants extirpated by the Moabites, *ibid.* Moab anciently lay to the fouth of Ammon, before Sihon the Amorite ftripped both nations of a part of their territory, afterwards occupied by the Ifraelites, Numb. xxi.; and then Moab was bounded by the river Arnon to the north, the Lacus Afphaltites to the weft, the brook Zared to the fouth, and the mountains Abarim to the eaft.

MOAT, or Ditch, in fortification, a deep trench dug round the rampart of a fortified place, to prevent furprifes.

The brink of the moat, next the rampart, is called the *fcarpe;* and the oppofite one, the *counterfcarpe.*

A dry moat round a large place, with a ftrong garrifon, is preferable to one full of water; becaufe the paffage may be difputed inch by inch, and the befiegers, when lodged in it, are continually expofed to the bombs, granades, and other fire-works, which are thrown inceffantly from the rampart into their works. In the middle of dry moats, there is fometimes another fmall one, called *cunette;* which is generally dug fo deep, till they find water to fill it.

The deepeft and broadeft moats are accounted the beft; but a deep one is preferable to a broad one: the ordinary breadth is about 20 fathoms, and the depth about 16.

To drain a moat that is full of water, they dig a trench deeper than the level of the water, to let it run off; and then throw hurdles upon the mud and flime, covering them with earth or bundles of rufhes, to make a fure and firm paffage.

MOCHO, Moco, or *Mokha;* by fome fuppofed to be the Mufa or Muza of Ptolemy, is a port and town on the Red-Sea, of confiderable trade; contains about 10,000 inhabitants, Jews, Armenians, and Mohammedans, is furrounded with walls after the ancient manner, and has four gates and four towers, the laft mounted with cannon, but no ditch. It gives name to a kingdom extending along the moft fouthern coaft of Arabia; of which that part which lies next the fea is a dry barren defart, in fome places 10 or 12 leagues over; but bounded by mountains, which being well watered, enjoy an almoft perpetual fpring; and befides coffee, the peculiar produce of this country, yields corn, grapes, myrrh, frankincenfe, caffia, balm, gums of feveral forts, mangos, dates, pomegranates, &c. The weather here is fo hot and fultry in fummer, efpecially when the fouth wind blows, that it would be unfupportable, if it was not mitigated by the cool breezes that generally blow from the mountains on the north, or the Red and Arabic Seas on the weft and eaft. The heat in winter is equal to that of our warmeft fummers; and it is very feldom that either clouds or rain are feen. The city of Mocho is now the emporium for the trade of all India to the Red-Sea. The trade was removed hither from Aden, in confequence of the prophecy of a fheik, much revered by the people, who foretold, that it would foon become a place of extenfive commerce, notwithftanding its difadvantageous fituation. It ftands clofe to the fea, in a large, dry, and fandy plain, that affords no good water within 20 miles of the city; what they drink comes from Mofa, and cofts as dear as fmall-beer in England. The water near the town, as it is thought, produces a worm, which the naturalifts call the *dracunculus*, which is about two feet and a half long, very flender, and breeds in the flefhy parts of the body: in extracting it great care muft be ufed, the confequence being dangerous if any part of it remains in the body. The buildings here are lofty, and tolerably regular, having a pleafant afpect from Mecca. The fteeples of feveral mofques are very high, prefenting themfelves to view at a great diftance. Their markets are well ftored with beef, mutton, lamb, kid, camels, and antelopes flefh, common fowls, Guinea hens, partridges, and pigeons. The fea affords plenty of fifh, but not favoury; which fome think proceeds from the extreme faltnefs of the water, and the nature of their aliment. The markets are alfo ftocked with fruit, fuch as grapes, peaches, apricots, quinces, and nectarines; although neither fhrub nor tree is to be feen near the town, except a few date-trees. Frequently no rain falls here in two or three years, and feldom more than a fhower or two in a year; but in the mountains, at the diftance of about 20 miles from Mokha, the earth is watered with a gentle fhower every morning, which makes the vallies fertile in corn, and the fruits natural to the climate. The Arab inhabitants, though remarkably grave and fuperftitious, are faid to be extremely covetous and hypocritical; robbing, thieving, and committing piracy, without the leaft fcruple or remorfe. The Englifh and Dutch companies have handfome houfes here, and carry on a great trade in coffee, olibanum, myrrh, aloes, liquid ftorax, white and yellow arfenic, gum-arabic, mummy, balm of Gilead, and other drugs. One inconvenience, however, they fuftain from the violence and exactions of the Arabian princes; but the king's cuftoms are eafy, being fixed at *three per cent.* to Europeans. Of the coins at Mocha, the moft current is the camaffie, which rifes and falls in value at the banker's difcretion: they are from 50 to 80 for a current dollar, which is but an imaginary fpecies, being always reckoned one and a half *per cent.* lower than Spanifh dollars. As to their weights, they are almoft infinite,

infinite, according to the nature of the thing to be weighed: they have the banian weight; the magnet; the ambergriſe; the agala; the gold and ſilver weights, &c.

MOCKING-BIRD, in ornithology. See TURDUS.

MOCOCO. See LEMUR.

MODE, in metaphyſics, denotes the manner of a thing's exiſtence. See METAPHYSICS, n° 50. 51. 55.—86.

MODE, in muſic; a regular diſpoſition of the air and accompaniments relative to certain principal ſounds upon which a piece of muſic is formed, and which are called the *eſſential ſounds of the mode.*

There is this difference between the mode and the tone, that the latter only determines the principal ſound, and indicates the place which is moſt proper to be occupied by that ſyſtem which ought to conſtitute the baſs of the air; whereas the former regulates the thirds, and modifies the whole ſcale agreeably to its fundamental ſounds.

Our *modes* are not, like thoſe of the ancients, characterized by any ſentiment which they tend to excite, but reſult from our ſyſtem of harmony alone. The ſounds eſſential to the mode are in number three, and form together one perfect chord. 1. The tonic or key, which is the fundamental note both of the tone and of the mode. (See TONE and TONIC). 2. The dominant, which is a fifth from the tonic. (See DOMINANT). 3. The mediant, which properly conſtitutes the *mode*, and which is a third from the ſame tonic. As this third may be of two kinds, there are of conſequence two different modes. When the mediant forms a greater third with the tonic, the mode is major; when the third is leſſer, it is minor.

The major mode is immediately generated by the reſonance of ſounding bodies, which exhibit the third major of the fundamental ſound: but the minor mode is not the product of nature; it is only found by analogy and inverſion. This is equally true upon the ſyſtem of Sig. Tartini as upon that of M. Rameau.

This laſt author, in his various and ſucceſſive publications, has explained the origin of this minor mode in different ways, of which his interpreter M. D'Alembert was ſatisfied with none. It is for this reaſon that he has founded this origin on a different principle which cannot be better explained than in the words of that eminent geometrician. See MUSIC, Art. 28, 29, 30 and 31.

When the mode is once determined, every note in the ſcale aſſumes a name expreſſive of its relation to the fundamental ſound, and peculiar to the place which it occupies in that particular mode. We ſubjoin the names of all the notes ſignificant of their relative values and places in each particular *mode*, taking the octave of *ut* as an example of the major *mode*, and of *la* as an example of the minor.

Major,	*ut*	*re*	*mi*	*fa*	*ſol*	*la*	*ſi*	*ut*,
Minor,	*la*	*ſi*	*ut*	*re*	*mi*	*fa*	*ſol*	*la*.
	Tonic.	Second note.	Mediant.	Fourth note, or Sub-dominant.	Dominant.	Sixth note, or Sub-dominant.	Seventh note.	Octave.

It is neceſſary to remark, that when the ſeventh note is only a ſemitone diſtant from the higheſt in the octave, that is to ſay, when it forms a third major with the dominant, as *ſi* natural in the major *mode*, or *ſol* ſharp in the minor, that ſeventh ſound is then called a *ſenſible note*, becauſe it diſcovers the tonic and renders the tone apreciable.

Nor does each gradation only aſſume that name which is ſuitable to it; but the nature of each interval is determined according to its relation to the *mode*. The rules eſtabliſhed for this are as follow:

1. The ſecond note muſt form a ſecond major above the tonic, the fourth note and the dominant ſhould form a fourth and fifth exactly true; and this equally in both modes.

2. In the major mode, the mediant or third, the ſixth and the ſeventh from the tonic, ſhould always be major; for by this the mode is characterized. For the ſame reaſon theſe three intervals ought always to be minor in the minor mode: nevertheleſs, as it is neceſſary that the ſenſible note ſhould likewiſe there be perceived, which cannot be effectuated without a falſe relation whilſt the ſixth note ſtill remains minor; this occaſions exceptions, of which in the courſe of the air or harmony care muſt be taken. But it is always neceſſary that the cleff, with its tranſpoſitions, ſhould preſerve all the intervals, as determined with relation to the tonic, according to the ſpecies of the *mode*. For this a general rule will be found at the word *Cleff* in Rouſſeau's Muſical Dictionary.

As all the natural chords in the octave of *ut* give, with relation to that tonic, all the intervals preſcribed for the major *mode*, and as the caſe is the ſame with the octave of *la* for the minor mode, the preceding example, which was only given that we might have an opportunity of naming the notes, may likewiſe ſerve as a formula for the rule of the intervals in each *mode*.

This rule is not, as one might imagine, eſtabliſhed upon principles that are merely arbitrary: it has its ſource in the generation of harmony, at leaſt in a certain degree. If you give a perfect major chord to the tonic, to the dominant, and the ſub-dominant, you will have all the ſounds of the diatonic ſcale for the major *mode:* to obtain that of the minor, leaving ſtill its third major to the dominant, give a third minor to the two other chords. Such is the analogy of the mode.

As this mixture of major and minor chords introduces into the minor mode a falſe relation between the ſixth and the ſenſible note, to avoid this falſe relation, they ſometimes give the third major to the fourth note in aſcent, or the third minor to the dominant in deſcending, chiefly by inverting the chords; but theſe in this caſe are licences.

There are properly no more than two *modes*, as we have ſeen: but as there are twelve different ſounds in the octave which may be made fundamental ſounds, and of conſequence form as many keys or tones; and as each of theſe tones are ſuſceptible of the major or minor mode, muſic may be compoſed in twenty-four modes or manners. Nay, in the manner of writing muſic, there are even thirty-four paſſable modes: but in practice ten are excluded, which when thoroughly examined are nothing elſe but a repetition of the other ten, under relations much more difficult, in which all the

the chords muft change their names, and where it muft coft any one fome trouble to know what he is about. Such is the major mode upon a note raifed above its natural pitch by a femitone, and the minor mode upon a note depreffed by a femitone. Thus, inftead of compofing upon *fol* fharp with a third major, it is much more eligible to operate upon *la* flat, which will give you an opportunity to employ the fame tones; and inftead of compofing upon *re* flat with a third minor, you will find it more convenient to choofe *ut* fharp for the fame reafon; viz. on one hand to avoid a *fa* with a double fharp, which would be equivalent to a *fol* natural; and on the other hand a *fi* with a double flat, which would become a *la* natural.

The compofer does not always continue in the fame *mode*, nor in the fame *key*, in which he has begun an air; but, whether to alter the expreffion or introduce variety, *modes* and *keys* are frequently changed, according to the analogy of harmony; yet always returning to thofe which have been firft heard: this is called *modulation*.

From thence arifes a new divifion of *modes* into fuch as are *principal* and fuch as are *relative*: the principal is that in which the piece begins and ends; the relative modes are fuch as the compofer interweaves with the principal in the flow of the harmony. (See Modulation).

Others have propofed a third fpecies, which they call a *mixed mode*, becaufe it participates the modulation of both the others, or rather becaufe it is compofed of them; a mixture which they did not reckon an inconveniency, but rather an advantage, as it increafes the variety, and gives the compofer a greater latitude both in air and harmony.

This new mode, not being found by the analyfis of the three chords like the two former, is not determined, like them, by harmonics effential to the mode, but by an entire fcale which is peculiar to itfelf, as well in rifing as defcending; fo that in the two modes above-mentioned the fcale is inveftigated by the chords, and in this mixed mode the chords are inveftigated by the fcale. The following notes exhibit the form of this fcale in fucceffion, as well rifing as defcending:

mi fa fol la fi ut re mi.

Of which the effential difference is, as to the *melody*, in the pofition of the two femitones; of which the firft is found between the firft and the fecond note, and the laft between the fifth and fixth: and, with refpect to the *harmony*, the difference confifts in this, that upon its tonic it carries a third minor in the beginning, and major in ending, in the accompaniment of this fcale, as well in rifing as defcending, fuch as it has been given by thofe who propofed it, and executed at a fpiritual concert, May 30. 1751.

They object to its inventor, That his mode has neither chords nor harmony effential to itfelf, nor cadences which are peculiar to it, and which fufficiently diftinguifh it from the major or minor mode. He anfwers to this, That the diftinction of his mode is lefs in harmony than in melody, and lefs even in the mode itfelf than in the modulation; that in its beginning it is diftinguifhed from the major mode by its third minor, and in its end from the minor mode by its plagal cadence. To which his opponents reply, That a modulation which is not exclufive cannot be fufficient to eftablifh a mode; and that his muft inevitably occur in the two other modes, and above all in the minor: and, as to his plagal cadence, that it neceffarily takes place in the minor mode as often as tranfition is made from the chord of the tonic to that of the dominant, as has long been the cafe in practice, even upon final notes, in plagal modes, and in the tone proper to the fourth. From whence it is concluded, that his mixed mode is not fo much a particular fpecies, as a new denomination for the manner of interweaving and combining the major and minor modes, as ancient as harmony, practifed at all periods: and this appears to be fo true, that, even when he begins his fcale, its author will neither venture to give the fifth nor the fixth to his tonic, for fear left by the firft the tonic fhould be determined in the minor mode, or the mediant in the major mode by the fecond. He leaves the harmony equivocal by not filling up his chord.

But whatever objections may be made againft the mixed mode, whofe name is rather rejected than its practice, this will not prevent the author from appearing as a man of genius, and a mufician profoundly learned in the principles of his art, by the manner in which he treats it, and the arguments which he ufes to eftablifh it.

Mode *Major.*
Mode *Minor.* } See Interval.

MODEL, in a general fenfe, an original pattern, propofed for any one to copy or imitate.

This word is particularly ufed, in building, for an artificial pattern made in wood, ftone, plafter, or other matter, with all its parts and proportions, in order for the better conducting and executing fome great work, and to give an idea of the effect it will have in large. In all great buildings, it is much the fureft way to make a model in relievo, and not to truft to a bare defign or draught. There are alfo models for the building of fhips, &c. and for extraordinary ftaircafes, &c.

They alfo ufe models in painting and fculpture; whence, in the academies, they give the term *model* to a naked man or woman, difpofed in feveral poftures, to give an opportunity to the fcholars to defign him in various views and attitudes.

MODENA, a duchy of Italy, bounded on the fouth by Tufcany and the republic of Lucca, on the north by the duchy of Mantua, on the eaft by the Bolognefe and the territories of the church, and on the weft by the duchy of Parma; extending in length from fouth to north about 56 Englifh miles, and in breadth between 24 and 36, and yielding plenty of corn, wine, and fruits, with mineral waters. In fome places alfo petroleum is fkimmed off the furface of the water of deep wells made on purpofe; and in others is found a kind of earth or tophus, which, when pulverifed, is faid to be an excellent remedy againft poifon, fevers, dyfenteries, and hypochondriac diforders. The country of La Salfa affords feveral kinds of petrifactions. The principal rivers are the Croftolo, Secchia, and Panaro. The family of Efté, dukes of Modena, is very ancient. They had their name from Efté, a fmall city in the diftrict of Padua.

In 1753, the prefent duke was appointed imperial vicar-general, field-marfhal, and governor, of the Milanefe during the minority of the archduke Peter Leopold, who was declared governor-general of the Auftrian Lombardy. The duke, though a vaffal of the empire, hath an unlimited power within his own dominions.

MODENA, an ancient city, in Latin *Mutina*, which gives name to a duchy of Italy, and is its capital. It ftands 28 miles eaft of Parma, 44 almoft fouth of Mantua, and 20 weft of Bologna; and is a pretty large and populous, but not a handfome city. It is much celebrated by Roman authors for its grandeur and opulence; but was a great fufferer by the fiege it underwent during the troubles of the triumvirate. It hath long been the ufual refidence of the dukes; and is alfo the fee of a bifhop, who is fuffragan to the archbifhop of Bologna. Mr Keyfler fays, that when Decius Brutus was befieged here by Mark Antony, Hirtius the conful made ufe of carrier-pigeons; and that, even at this day, pigeons are trained up at Modena, to carry letters, and bring back anfwers. This city hath given birth to feveral celebrated perfons, particularly Taffo the poet, Correggio the great painter, Sigonius the civilian and hiftorian, da Vignola the architect, and Montecuculi the imperial general. The tutelary faint of it is named *Geminianus*. The ducal palace is a very noble edifice, in which, among the other fine pictures, the birth of Chrift by Correggio, called *la Notte Felice*, is much celebrated. The only manufacture for which this city is noted, is that of mafks, of which great numbers are exported. The churches of the Jefuits, of the Theatines, and of St Dominic, are well worth viewing. In the college of St Carlo Boromeo between 70 and 80 young noblemen are continually maintained, and inftructed both in the fciences and genteel exercifes. St Beatrix, who was of the family of Efté, is faid to knock always at the gate of the palace three days before any of the family dies. Before moft of the houfes are covered walks, or porticos, as at Bologna. The city is fortified, and on its fouth fide ftands the citadel.

MODERATOR, in the fchools, the perfon who prefides at a difpute, or in a public affembly: thus the prefident of the annual affembly of the church of Scotland is ftyled *moderator*.

MODERN, fomething new, or of our time; in oppofition to what is antique, or *ancient*.

MODERN *Authors*, according to Naude, are all thofe who have wrote fince Boëthius. The modern philofophy commences with Galileo; the modern aftronomy with Copernicus.

MODIFICATION, in philofophy, that which modifies a thing, or gives it this or that manner of being. Quantity and quality are accidents which modify all bodies.

Decree of MODIFICATION, in Scots law, a decree afcertaining the extent of a minifter's ftipend, without proportioning it among the perfons liable in payment.

MODILLIONS, in architecture, ornaments in the corniche of the Ionic, Corinthian, and Compofite columns.

MODIUS, in antiquity, a kind of dry meafure, in ufe among the Romans, for feveral forts of grain.

MODREVIUS (Andreas Frichius), fecretary to Sigifmund Auguftus king of Poland, acquired confiderable reputation by his learning and works. He broke off from the Romifh church, favoured the Lutherans and Anti-trinitarians, and took great pains in order to unite all Chriftian focieties under the fame communion. Grotius has placed him in the clafs of the reconcilers of the different fchemes of religion. His principal work is intitled, *De republica emendanda*.

MODULATION, the art of forming any thing to certain proportion.

MODULATION, in reading, or fpeaking. See READING.

MODULATION, in mufic, derived from the Latin *modulari*. This word in our language is fufceptible of feveral different fignifications. It frequently means no more than an air, or a number of mufical founds properly connected and arranged. Thus it anfwers to what Mr Malcolm underftands by the word *tune*, when he does not exprefsly treat concerning the tuning of inftruments. Thus likewife it expreffes the French word *chant;* for which reafon, in the article MUSIC, we have frequently expreffed the one word by the other. But the precife and technical acceptation to which it ought to be confined, is the art of compofing melody or harmony agreeably to the laws prefcribed by any particular key, that of changing the key, or of regularly and legitimately paffing from one key to another. In what remains to be faid upon the fubject we follow Rouffeau.

Modulation (fays he) is properly the manner of afcertaining and managing the modes; but at this time the word moft frequently fignifies the art of conducting the harmony and the air fucceffively through feveral modes, in a manner agreeable to the ear and conformed to rules.

If the different modes be produced by harmony, from thence likewife muft fpring the laws of modulation. Thefe laws are fimple in conception, but difficult in practice. We proceed therefore to fhew in what they confift.

To modulate properly in the fame tone, it is neceffary, 1. To run through all the founds of it in an agreeable air, frequently repeating the founds which are moft effential to it, and dwelling upon thefe founds with the moft remarkable emphafis; that is to fay, that the chord containing the fenfible notes, and that of the tonic, fhould frequently be heard in it, but under different appearances, and obtained by different procedures to prevent monotony. 2. That repofes or cadences fhould only be eftablifhed upon thefe two chords: the greateft liberty, however, which ought to be taken with the rule is, that a cadence or repofe may be eftablifhed on the chord of the fubdominant. 3. In fhort, that none of the founds of the mode ought ever to be altered; for without quitting it, we cannot introduce a fharp or a flat which does not belong to it, nor abftract any one which in reality does belong to it.

But paffing from one mode to another, we muft confult analogy, we muft confider the relations which a key bears to the other notes in the feries, and to the num-

 number of founds common to both the modes, that from whence we pafs, and that into which we enter.

If we pafs from a mode major, whether we confider the fifth from the key as having the moft fimple relation with it except that of the octave, or whether we confider it as the firft found which enters into the harmonics of the fame key, we fhall always find, that this fifth, which is the dominant of the mode, is the chord upon which we may eftablifh the modulation moft analogous to that of the principal key.

This dominant, which conftituted one of the harmonics of the firft key, makes alfo one of its own peculiar key, of which it is the fundamental found. There is then a connection between thefe two chords. Befides, that fame dominant carrying, as well as the tonic, a perfect chord major upon the principle of refonance, thefe two chords are only different one from the other by the diffonance, which paffing from the key to the dominant is the fixth fuperadded, and when reafcending from the dominant to the key is the feventh. Now thefe two chords, thus diftinguifhed by the diffonance which is fuitable to each, by the founds which compofe them when ranged in order, form precifely the octave, or the diatonic fcale, which we call a *gammut*, which determines the mode.

This fame feries of the key, altered only by a fharp, forms the fcale belonging to the mode of the dominant; which fhows how ftriking the analogy is between thefe two tones, and gives the eafieft opportunity of paffing from one to the other by means of one fingle alteration alone. The mode then of the dominant is the firft which prefents itfelf after that of the key in the order of modulations.

The fame fimplicity of relations which we find between a tonic and its dominant, is likewife found between the fame tonic and its fub-dominant; for that fifth, in afcending, which is formed by the dominant with the tonic, is likewife formed by the fub-dominant in defcending: but that fub-dominant does not form a fifth with the tonic except by inverfion; it is directly a fourth, if we take that tonic below, as it ought to be; and which fixes the degree of their relations: for in this fenfe the fourth, whofe ratio is as 3 to 4, immediately follows the fifth, whofe ratio is as 2 to 3. So that, if that fub-dominant does not enter into the chord of the tonic, in return the tonic enters into its perfect chord. For let *ut mi fol* be the chord of the tonic, that of the fub-dominant fhall be *fa la ut:* thus it is the *ut* which here forms the connection, and the two other founds of this new chord are exactly the two diffonances of the preceding. Befides, we need not alter more founds for this new mode than for that of the dominant; they are both in the one and the other quite the fame chords of the principal mode, except one. Add a flat to the fenfible note *fi* or B, and all the notes in the mode of *ut* or C will ferve for that of *fa* or F. The mode of the fub-dominant then is fcarcely lefs analogous to the principal mode than that of the dominant.

It ought likewife to be remarked, that after having made ufe of the firft modulation in order to pafs from a principal mode *ut* or C, to that of the dominant *fol* or G, we are obliged to make ufe of the fecond to return to the principal mode: for if *fol*, or G, be the dominant in the mode of *ut* or C, *ut* is the fub-dominant in the mode of *fol:* thus one of thefe modulations is no lefs neceffary than the other.

The third found which enters into the chord of the tonic is that of third formed by its mediant; and, after the preceding, it is likewife the moft fimple of relations $\frac{2\,3\,4}{3\,4\,5}$. Here then is a new modulation which prefents itfelf, and which is fo much the more analogous, becaufe two of the founds of the principal tonic enter likewife into the minor chord of its mediant; for the former chord being *ut mi fol*, the latter muft be *mi fol fi*, where it may be perceived that *mi* and *fol* are common. But what renders this modulation a little more remote, is the number of founds which are neceffary to be altered, even for the minor mode, which is moft fuitable to this *mi*. In the article Music (234.) will be found a table for all the modes; and Rouffeau, in his Mufical Dictionary, has given the formula of a fcale both for the major and minor: now, by applying this formula to the minor mode, we find nothing in reality, but the fourth found *fa* heightened by a fharp in defcending; but in rifing, we find two others which are altered, *viz.* the principal tonic *ut*, and its fecond *re*, which here becomes a fenfible note: it is certain that the alteration of fo many founds, and particularly of the tonic, muft remove the mode and weaken the analogy.

If we fhould invert the third as we have inverted the fifth, and take that third below the tonic on the fixth note *la*, which ought here to be called a *fub-mediant*, or the *mediant below*, we fhall form upon this note *la* a modulation more analogous to the principal tone than that of *mi;* for as the perfect chord of this fub-mediant is *la ut mi*, there once more we find, as in that of the mediant, two of the founds which enter into the chord of the tonic, viz. *ut* and *mi:* and moreover, fince the fcale of this new key is compofed, at leaft in defcending, of the fame founds with that of the principal key; and fince it has only two founds altered in afcending, that is to fay, one fewer than the feries of the mediant; it follows that the modulation of this fixth note is preferable to that of the mediant; and by fo much the more, that there the principal tonic forms one of the founds effential to the mode; which is more proper for approximating the idea of the modulation. The *mi* may afterwards follow.

Here then are four founds, *mi fa fol la*, upon each of which we may modulate in paffing from the major mode of *ut*. *Re* and *fi* remain, which are the two harmonics of the dominant. This laft, as being a fenfible note, cannot become a tonic by any proper modulation, at leaft it cannot immediately become one: this would be an abrupt application of ideas too much oppofed to the fame founds, and would likewife be to give it a harmony too remote from the principal found. As to the fecond note *re*, we may likewife, by favour of a confonant procedure in the fundamental bafs, modulate upon it in a third minor; but this muft be only continued for an inftant, that the audience may not have time to forget the modulation of *ut*, which is itfelf altered in that place; otherwife, inftead of returning immediately to *ut*, we muft pafs through intermediate modes, where we muft run great hazard of deviation.

By following the fame analogies, we may modulate in the following order, to make our exit from a minor mode;

mode; firſt upon the mediant, afterwards the dominant, next the ſub-dominant, then the ſub-mediant, or ſixth note. The mode of each of theſe acceſſory keys is determined by its mediant taken from the principal ſound. For inſtance, iſſuing from the major mode of *ut*, to modulate upon its mediant, we render the mode of that mediant minor; becauſe *ſol*, the dominant of the principal ſound, forms a third minor with that mediant, which is *mi*. On the contrary, in our egreſs from the minor mode of *la*, we modulate upon its mediant *ut* in the major mode; becauſe *mi*, the dominant of the tone from whence we iſſue, forms a third major with the key of that into which we enter, &c.

Theſe rules, comprehended in one general formula, import, that the modes of the dominant and of the ſub-dominant are like that of the tonic, and that the mediant and the ſixth note require a mode oppoſed. We muſt, however, remark, that, by the right which we have of paſſing from the major to the minor, and *vice verſa*, upon the ſame key, we may likewiſe change the order of modes from one key to another; but whilſt we thus remove ourſelves from the natural modulation, we muſt preſently think of our return: for it is a general rule, that every piece of muſic ought to terminate in that key with which it began.

In his Muſical Dictionary, plate B, fig. 6. and 7. Rouſſeau has collected in two examples, which are very ſhort, all the modes to which we may immediately paſs; the firſt, in paſſing from the major mode; and the ſecond, from the minor. Each note indicates a particular modulation; and the value of the notes in each example likewiſe ſhows the relative duration ſuitable to each of theſe modes, according to its relation with the principal mode.

Theſe immediate tranſitions from one mode to another, furniſh us with the means of paſſing by the ſame rules to modes ſtill more remote, and from thence to return to the principal mode, of which we never ſhould loſe ſight. But it is not ſufficient to know what courſe we ought to purſue; we muſt likewiſe be acquainted with the method of entering into it. A ſummary therefore of the precepts which are given in this department ſhall immediately follow.

In melody, in order to diſcover and introduce the modulation which we have choſen, nothing is neceſſary but to render perceptible the alterations which it cauſes in the ſounds of that mode from whence we iſſue, to make them proper for the mode into which we enter. Are we now in the major mode of *ut?* there needs no more than to ſound the note *fa* ſharp, that we may diſcover the mode of the dominant; or a *ſi* flat, that we may ſhew the mode of the ſub-dominant. Afterwards you may run over the ſounds eſſential to the mode in which you enter; if it is well choſen, your modulation will always be juſt and regular.

In harmony, the difficulty is a little increaſed: for as it is neceſſary that the change of modes ſhould be made at the ſame time through all the parts, care muſt be taken of the harmony, and of the air, that we may avoid purſuing different modulations at the ſame time. Huygens has happily remarked, that the prohibition of two fifths in immediate ſucceſſion proceeds upon this rule as its principal: in reality, between two parts it is ſcarcely poſſible to form a number of juſt fifths in uninterrupted ſucceſſion without operating in two different modes.

To introduce a mode, a great many pretend that it is ſufficient to form the perfect chord of its principal ſound, and this is indiſpenſable in order to produce the mode. But it is certain, that the mode cannot be exactly determined but by the chord containing the ſenſible note, or the dominant: we muſt then cauſe this chord to be heard when we enter into a new modulation. The moſt eligible rule would be, That in it the ſeventh, or minor diſſonance, ſhould always be prepared, at leaſt the firſt time in which it is heard: but this method is not practicable in every admiſſible modulation; and provided that the fundamental baſs proceeds by conſonant intervals, that the connection of harmony be obſerved, the analogy of the mode purſued, and falſe relations avoided, the modulation will always be approved. Compoſers preſcribe as another rule, That a mode ſhould not be changed except after a perfect cadence: but this interdict is uſeleſs, and no perſon obſerves it.

All the poſſible methods of paſſing from one mode to another, are reducible to five with reſpect to the major mode, and to four with reſpect to the minor; which, in the Muſical Dictionary, plate B, fig. 8. will be found implied in a fundamental baſs intended for each modulation. If there be any other modulation which cannot be reſolved into ſome one of theſe nine, unleſs that modulation be enharmonic, it muſt infallibly be illegitimate. See Enharmonic.

MODULE, in architecture, a certain meaſure, or bigneſs, taken at pleaſure, for regulating the proportions of columns, and the ſymmetry or diſpoſition of the whole building. Architects generally chooſe the ſemidiameter of the bottom of the column for their module, and this they ſubdivide into parts or minutes.

MOEBIUS (Godfrey), profeſſor of phyſic at Iena, was born at Lauch in Thuringia in 1611. He became firſt phyſician to Frederic William elector of Brandenburg, to Auguſtus duke of Saxony, and to William duke of Saxe-Weimar. He wrote ſeveral medicinal works, which are eſteemed; and died at Halle, in Saxony, in 1664.

MOENIUS (Caius), a celebrated Roman conſul, conqueror of the ancient Latins, 338 B. C. He was the firſt who hung up the prows, &c. of the galleys he had taken at the naval engagement of Actium, upon the place where the tribunes harangued the people; from whence it was called the *roſtra*.

MOFFAT, a village of Scotland, in the ſhire of Annandale, 36 miles ſouth-weſt of Edinburgh; famous for its ſulphureous waters; one of the ſprings being uſed for bathing, the other for drinking. Theſe waters are of great ſervice in gripings of the guts, colics, and pains in the ſtomach. Thoſe who are troubled with obſtructions, rheumatic pains, and aches, find great relief both from bathing and drinking. The water is alſo of great uſe in ſcorbutic and ſcrophulous caſes.

MOGULS, or Mungls, a celebrated nation of Aſia, whoſe conqueſts formerly were the moſt rapid and extenſive of any people recorded in hiſtory.

The origin of the Moguls, Tartars, and Turks, is univerſally allowed to be the ſame; and they are conſidered as the offſpring of part of the ancient Scythians.

Moguls.

thians. They themselves deduce their origin from Japhet, or, as they call him, *Japhis*, the son of Noah. His son Turk, they say, was the first king, or khan, of those nations who are now known by the separate names of *Turks*, *Tartars*, and *Moguls*; and the Tartars especially, assert that their proper designation is *Turks*. To this prince is attributed many of those inventions which barbarous nations commonly ascribe to their first sovereigns. He was succeeded by Taunak; in whose reign the whole posterity of Turk were divided into four large tribes, denominated the *orda's* of Erlat, Gialair, Kaugin, Berlas, or Perlas; of which last came the famous Timur Beg, or Tamerlane. From this time to that of Alanza Khan, we meet with nothing remarkable. In his reign the Turks being immersed in all kinds of luxury, universally apostatized into idolatry. Having two sons, Tartar and Mogul, he divided his dominions among them, and thus gave rise to the two empires of the Tartars and Moguls.

1 Moguls descended from Japhet.

The two nations had not long existed before they began to make war upon each other: and after long contention, the event at last was, that Il Khan, emperor of the Moguls, was totally overthrown by Siuntz Khan, emperor of the Tartars; and so great was the defeat, that the Mogul nation seems to have been almost exterminated. Only two of Il Khan's family survived this disaster. These were Kajan his youngest son, and Nagos his nephew, who were both of an age, and had both been married the same year. These two princes, with their wives, had been taken prisoners by Siuntz Khan, but found means to make their escape to their own country. Here they seized upon all the cattle which had not been carried off by the Tartars; which was easily done, as having none to dispute the property with them; then stripping some of the slain, they took their clothes, and retired into the mountains. They passed several mountains without much difficulty; but at last advanced to the foot of one exceedingly high, which had no way over it but a very small path made by certain animals, called in the Tartar language *archara*. This path they found themselves obliged to make use of, tho' it was so strait, that only one could pass at a time, and he was in the most imminent danger of breaking his neck at the least false step. Having ascended the mountain on one side by this path, they descended by the same on the other side; and were agreeably surprised to find themselves in a most delightful track, interspersed with rivulets and charming meadows, abounding with a vast variety of delicious fruits, and inclosed on all sides by inaccessible mountains, in such a manner as to shelter them from all future pursuits of the Tartars. Here they lived some time, and gave this beautiful country the name of *Irgana-kon*, in allusion to its situation; *Irgana* signifying, in the old language of the Moguls, a "valley," and *Kon*, a "steep height."

2 Almost exterminated by the Tartars.

3 They arrive in a delightful valley.

In process of time these two families very much increased. Kajan, whose posterity was the most numerous, called his descendants *Kajath*: but the people springing from Nagos were divided into two tribes; one of which received the appellation of *Nagoster*, and the other that of *Durlagan*.

These two Mogul princes and their descendants lived in this place for more than 400 years; but the latter then finding it too narrow for them, meditated a return to the country from which their forefathers had been driven. For some time, however, they found this impracticable, as the path that conducted their ancestors had been long since destroyed. At last they discovered, that one part of the high mountain abovementioned was not very thick in a certain place; and also, that it consisted entirely of iron ore. To this, having before set fire to a layer of wood, and another of charcoal, laid along the foot of the mountain, they applied 70 large bellows, and at last melted the mountain in such a manner, that an opening was made large enough for a loaded camel to pass; and through this passage they all marched out with great joy.

4 From whence they at last issue, and defeat the Tartars.

The Moguls having thus issued as it were from a new world, overthrew the Tartars in their turn; and continued to be a very considerable nation till the time of their great hero Temujin, afterwards called *Jenghiz Khan*, whom they extol in the most extravagant manner. It is difficult, however, to say, at the time Temujin made his appearance, how far the dominions of the Moguls extended, or in what estimation they were held by their neighbours. It seems to be pretty certain, that great part of the vast region now known by the name of *Tartary*, was then in a state of considerable civilization, and likewise extremely populous, as we find mention made of many cities which the Moguls destroyed; and the incredible multitudes whom they slaughtered, abundantly shew the populousness of the country. On the east, the country of the Moguls and Tartars had the great desart which divides Tartary from China; on the west, it had the empire of Karazm, founded by Mahmud Gazni; and on the south were the countries now known by the name of *Indostan*, *Siam*, *Pegu*, *Tonquin*, and *Cochin-China*. Thus it comprehended the eastern part of modern Tartary, and all Siberia. This whole region was divided among a great number of *Aymacks*, or *tribes*; who had each one or more khans, according as it was more or less numerous, or divided into branches. Among these, that of the *Kara-its* was the most powerful: their prince assumed the title of *Grand Khan*, and among the rest the Moguls were tributary to him; but, according to the Chinese historians, both the one and the other were tributary to the emperor of Kitay or Katay. China was divided into two parts: the nine southern provinces were in the hands of the Chinese emperors of the Song dynasty, who kept their court at Hang-chew, the capital of the province of Chekyang: the five northern provinces, excepting part of Shensi, were possessed by the Kin, a people of Eastern Tartary, from whom are descended the Manchew Tartars, at present masters of China. This vast dominion was named *Kitay*, or *Katay*, and was divided into two parts: that which belonged to China, was properly called *Kitay*; and the part, which belonged to Tartary, was called *Karakitay*; in which some even include the territories of the Moguls, Karaits, and other tribes, which are the subject of the present history. The western part of the empire of Kitay was possessed by a Turkish prince, who had lately founded a new kingdom there, called *Hya*; whose capital city was Hya-chew, now Ninghya in Shensi, from whence the kingdom took its name. To the west of Hya lay Tangut; a country of great extent, and formerly very powerful; but at that time reduced to a low state, and di-

5 State of Asia at the time of Jenghiz Khan.

Mogul. divided among many princes; ſome of whom were ſubject to the emperor of Hya, and others to the emperor of China. All Tartary to the weſtward, as far as the Caſpian ſea, with the greater part of Little Buckharia, which then paſſed under the general name of *Turkeſtan*, was ſubject to Gurkhan, Khurkhan, or Kavar Khan; to whom even the Gazni monarchs are ſaid to have been tributary. This Ghurkhan had been prince of the Weſtern Kitan or Lyau; who, driven out of Kitay by the King, ſettled in Little Buckharia, and the country to the north, where they founded a powerful ſtate about the year 1124.

6 Deſcent and birth of Temujin.

Thus the Moguls, properly ſo called, had but a very ſmall extent of empire which could be called their own, if indeed they had any, when Temujin made his appearance. This hero is ſaid by the Tartars to have been of divine origin, ſince his family could be traced no farther back than ten generations, the mother of whom was got with child by a ſpirit. The names and tranſactions of his predeceſſors are equally uncertain and unimportant: he himſelf, however, was born in the year 1163, and is ſaid to have come into the world with congealed blood in his hands; from whence it was prognoſticated that he would be a great warrior, and obtain the victory over all his enemies.

This prediction, if any ſuch there was, Temujin moſt literally fulfilled. At the time of his father's deceaſe, his ſubjects amounted to between 30,000 and 40,000 families; but of theſe two thirds quickly deſerted, and Temujin was left almoſt without ſubjects. When only 13 years of age, he fought a bloody battle againſt theſe revolters; but either was defeated, or gained an indeciſive victory; ſo that he remained in obſcurity for 27 years longer. His good fortune at laſt he owed to the friendſhip of Vang Khan, who ruled over a great number of Tartar tribes to the north of Kitay, and has been heard of under the name of *Preſter John* among the Europeans. This prince took Temujin under his protection; and a rebellion being afterwards raiſed againſt himſelf, Temujin was made his general, and the khan was kept in poſſeſſion of his throne; ſoon after which, Temujin ſubdued the tribes which had revolted from himſelf, treating them at the ſame time with the utmoſt barbarity.

7 Subdues his revolted ſubjects by means of Vang Khan.

8 Who becomes jealous, and contrives his deſtruction.

This happened in the year 1201; but Vang Khan, inſtead of continuing the friend of Temujin, now became jealous, and reſolved to deſtroy him by treachery. With this view he propoſed a marriage between Temujin's ſon Juji and his own daughter, and another between Temujin's daughter and his own ſon. Temujin was invited to the camp of Vang Khan, in order to celebrate this double marriage; but, receiving intelligence of ſome evil intention againſt him, he excuſed himſelf to Vang Khan's meſſengers, and deſired that the ceremony might be put off to ſome other time.

A few days after the departure of theſe meſſengers, Badu and Kiſhlik, two brothers, who kept the horſes of one of Vang Khan's chief domeſtics, came and informed Temujin, that the grand Khan finding he had miſſed his aim, was reſolved to ſet out inſtantly, and ſurpriſe him next morning, before he could ſuſpect any danger. Temujin, alarmed at this intelligence, quitted his camp in the night-time, and retired with all his people to ſome diſtance. He was ſcarce gone, when Vang Khan's troops arrived, and diſcharged an incredible number of arrows among the empty tents; but finding nobody there, they purſued Temujin in ſuch haſte that they fell into great diſorder. In this condition they were ſuddenly attacked and routed by Temujin, after which an open war with Vang Khan took place.

By this quarrel almoſt all the princes of Tartary were put in motion; ſome ſiding with Tamujin, and others with Vang Khan. But at laſt fortune declared in favour of the former: Vang Khan was overthrown in a battle, where he loſt 40,000 men; and obliged to fly for refuge to a prince named *Tayyan Khan*, who was Temujin's father-in-law, and his own enemy, and by whom he was ungenerouſly put to death. Temujin immediately began to ſeize on his dominions, great part of which voluntarily ſubmitted: but a confederacy was formed againſt him by a number of Vang Khan's tributaries, at the head of whom was Jamuka, a prince who had already diſtinguiſhed himſelf by his enmity to Temujin; and even Tayyan Khan himſelf was drawn into the plot, through jealouſy of his ſon-in-law's good fortune. But Temujin was well prepared; and in the year 1204 attacked Tayyan Khan, entirely routed his army, killed himſelf, and took Jemuka priſoner, whoſe head he cauſed inſtantly to be ſtruck off; after which he marched againſt the other tribes who had conſpired againſt him. Them he quickly reduced; took a city called *Kaſhin*, where he put all to the ſword who had borne arms againſt him; and reduced all the Mogul tribes in 1205.

9 Temujin overcomes all his enemies.

Temujin now, having none to oppoſe him, called a general diet, which he appointed to be held on the firſt day of the ſpring 1206; that is, on the day in which the ſun entered Aries. To this diet were ſummoned all the great lords both Moguls and Tartars; and in the mean time, to eſtabliſh good order in the army, he divided his ſoldiers into bodies of 10,000, 1000, 100, and 10 men, with their reſpective officers, all ſubordinate to the generals, or thoſe who commanded the bodies of 10,000; and theſe were to act under his own ſons. On the day of holding the diet, the princes of the blood and great lords appeared dreſſed in white. Temujin, dreſſed in the ſame manner, with his crown on his head, ſat down on his throne, and was complimented by the whole aſſembly, who wiſhed him the continuance of his health and proſperity. After this they confirmed the Mogul empire to him and his ſucceſſors; adding all thoſe kingdoms which he had ſubdued, the deſcendents of whoſe vanquiſhed khans were deprived of all right or title to them; and after this he was proclaimed emperor with much ceremony. During this inauguration, a pretended prophet declared that he came from God to tell the aſſembly, that from thenceforth Temujin ſhould aſſume the name of *Jenghiz Khan*, or *the Moſt Great Khan of khans*; propheſying alſo, that all his poſterity ſhould be khans from generation to generation. This prophecy, which was no doubt owing to Temujin himſelf, had a ſurpriſing effect on his ſubjects, who from that time concluded, that all the world belonged of right to them, and even thought it a crime againſt heaven for any body to pretend to reſiſt them.

10 Aſſumes the title of Jenghiz Khan.

Jenghiz Khan having now reduced under his ſubjection all the wandering tribes of Moguls and Tartars, began to think of reducing thoſe countries to the ſouth

Mogul.

south and south-west of his own, where the inhabitants were much more civilized than his own subjects; and the countries being full of fortified cities, he must of course expect to meet with more resistance. He began with the emperor of Hya, whose dominions he invaded in 1209, who at last submitted to become his tributary. But in the mean time Jenghiz Khan himself was supposed to be tributary to the emperor of Kitay; who, in 1210, sent him an officer, demanding the customary tribute. This was refused with the utmost indignation, and a war commenced, which ended not but with the dissolution of the empire of Kitay, as mentioned under the article CHINA, n° 17—33.

11 Invades, Hya, China, &c.

In the year 1216 Jenghiz Khan resolved to carry his arms westward, and therefore left his general Muchuli to pursue his conquests in Kitay. In his journey westward he overthrew an army of 300,000 Tartars who had revolted against him; and, in 1218, sent ambassadors desiring an alliance with Mohammed Karazm Shah, emperor of Gazna. His ambassador was haughtily treated: however, the alliance was concluded; but soon after broken, through the treachery, as it is said, of the Karazmian monarch's subjects. This brought on a war attended with the most dreadful devastations, and which ended with the entire destruction of the empire of Karazm or Gazna, as related under the article GAZNA.

After the reduction of Karazm, part of the Moguls broke into Iran or Persia, where also they made large conquests, while others of their armies invaded Georgia and the countries to the west; all this time committing such enormities, that the Chinese historians say, both men and spirits burst with indignation. In 1225, Jenghiz Khan returned to Hya, where he made war on the emperor for having sheltered some of his enemies. The event was, that the emperor was slain, and his kingdom conquered, or rather destroyed; which, however, was the last exploit of this most cruel conqueror, who died in 1227, as he marched to complete the destruction of the Chinese.

12 Vast extent of his empire.

The Mogul empire, at the death of Jenghiz Khan, extended over a prodigious tract of country; being more than 1800 leagues in length from east to west, and upwards of 1000 in breadth from north to south. Its princes, however, were still insatiable, and pushed on their conquests on all sides. Oktay was acknowledged emperor after Jenghiz Khan; and had under his immediate government Moguleftan, (the country of the Moguls properly so called), Kitay, and the countries eastward to the Tartarian sea. Jagatay his brother governed under him a great part of the western conquests. The country of the Kipjacks, and others to the east and north-east, north and north-west, were governed by Batu or Patu the son of Juji, who had been killed in the wars; while Tuli or Toley, another son of Jenghiz Khan, had Khorassan, Persia, and what part of India was conquered. On the east side the Mogul arms were still attended with success; not only the empire of Kitay, but the southern part of CHINA, was conquered, as already related under that article, n° 23—40. On the west side matters continued much in the same way till the year 1254, when Magu, or Menkho, the fourth khan of the Moguls, (the same who was afterwards killed at a siege in China *), raised a great army, which he gave to his brother Hulaku, or Hulagu, to extend his dominions westward. In 1255 he entered Iran; where he suppressed the Ismaelians or Assassins, of whom an account is given under the article ASSASSINS; and two years afterwards he advanced to Bagdad, which he took, and cruelly put the khalif to death, treating the city with no more lenity than the Moguls usually treated those which fell into their hands. Every thing was put to fire and sword; and in the city and its neighbourhood, the number of slain, it is said, amounted to 1,600,000.—The next year he invaded Syria; the city of Damascus was delivered up, and, as it made no resistance, the inhabitants were spared; but Aleppo being taken by storm, a greater slaughter ensued there than had taken place at Bagdad, not even the children in their cradles being spared. Some cities of this country revolted the next year, or the year after; but falling again into the hands of the Moguls, they were plundered, and the inhabitants butchered without mercy, or carried into slavery.

* See *China*, n° 36.

13 Bagdad reduced.

Hulaku died in 1264, and at his death we may fix the greatest extent of the Mogul empire. It now comprehended the whole of the continent of Asia, excepting part of Indostan, Siam, Pegu, Cochinchina, and a few of the countries of Lesser Asia, which had not been attacked by them; and during all these vast conquests no Mogul army had ever been conquered, except one by Jaloloddin, as mentioned under the article GAZNA.—From this period, however, the empire began to decline. The ambition of the khans having prompted them to invade the kingdoms of Japan and Cochinchina, they were miserably disappointed in their attempts, and lost a great number of men.—The same bad success attended them in Indostan; and in a short time this mighty empire broke into several smaller ones. The governors of Persia being of the family of Jenghiz Khan, owned no allegiance to any superior; those of Tartary did the same. The Chinese threw off the yoke: and thus the continent of Asia wore much the same face that it had done before Jenghiz Khan began his conquests.

14 It begins to decline.

The successors of Hulaku reigned in Persia till the year 1335; but that year Abusaid Khan, the eighth from Hulaku, dying, the affairs of that country fell into confusion for want of a prince of the race of Jenghiz Khan to succeed to the throne. The empire therefore was divided among a great number of petty princes, who fought against each other almost without intermission, till, in the year 1369, Timur Bek, or Tamerlane, one of these princes, having conquered a number of others, was crowned at Balkh, with the pompous title of *Saheb Karan*; that is, "the emperor of the age, and conqueror of the world." As he had just before taken that city, and destroyed one of his most formidable rivals who had shut himself up in it, the new emperor began his reign with beheading some of the inhabitants, imprisoning others, burning their houses, and selling the women and children for slaves.—In 1370 he crossed the Sihun, made war on the Getes, and attacked Karazm. Next year he granted a peace to his enemies; but two years after, he again invaded the country of the Gates, and by the year 1379 had fully conquered that country as well as Korazan; and from that time he continued to extend his conquests in much the same manner as Jenghiz

15 Tamerlane crowned emperor of Balkh.

16 Becomes a great conqueror.

Jenghiz Khan had done, though with leſs cruelty. In 1387 he had reduced Armenia, Georgia, and all Perſia; the conqueſt of which laſt was completed by the reduction of Iſpahan, 70,000 of the inhabitants of which were ſlaughtered on account of a ſedition raiſed by ſome raſh or evil-diſpoſed perſons.

After the reduction of Perſia, Timur turned his arms northward, and weſtward, ſubduing all the countries to the Euphrates. He took the city of Bagdad; ſubdued Syria; and having ravaged great part of Ruſſia, returned to Perſia in 1396, where he ſplendidly feaſted

17 Invades and conquers Indoſtan.

his whole army. In 1398 he invaded Indoſtan, croſſed the Indus on the 17th of September, reduced ſeveral fortreſſes, and made a vaſt number of captives. However, as he was afraid that, in caſe of any emergency, theſe priſoners might take part with the enemy, he gave orders to his ſoldiers to put all their Indian ſlaves to death; and, in conſequence of this inhuman order, more than 100,000 of theſe poor wretches were ſlaughtered in leſs than an hour.

In the beginning of the year 1399, Timur was met by the Indian army; whom, after a deſperate battle, he defeated with great ſlaughter, and ſoon after took the city of Dehli, the capital of the country. Here he ſeated himſelf on the throne of the Indian emperors; and here the ſharifs, kadis, and principal inhabitants of the city, came to make their ſubmiſſion, and begged for mercy. The tame elephants and rhinoceroſes likewiſe were brought to kneel before him as they had been accuſtomed to do to the Indian emperors, and made a great cry as if they implored his clemency. Theſe war-elephants, 120 in number, were, at his return, ſent to Samarcand, and to the province where his ſons reſided. After this, at the requeſt of the lords of the court, Timur made a great feaſt; at which he diſtributed preſents to the princes and principal officers.

18 The city of Dehli deſtroyed, and the inhabitants ſlaughtered.

Dehli at this time conſiſted of three cities, called *Seyri*, *Old Dehli*, and *Jehan Penah*. Seyri was ſurrounded with a wall in form of a circle. Old Dehli was the ſame, but much larger, lying ſouth-weſt of the other. Theſe two parts were joined on each ſide by a wall; and the third, lying between them, was called *Jehan Penah*, which was larger than Old Dehli. Penah had ten gates; Seyri had ſeven, three of which looked towards Jehan Penah; this laſt had thirteen gates, ſix to the north-weſt, and ſeven to the ſouth-eaſt. Every thing ſeemed to be in a quiet poſture; when, on the 12th of January 1399, the ſoldiers of Timur being aſſembled at one of the gates of Dehli, inſulted the inhabitants of the ſuburbs. The great emirs were ordered to put a ſtop to theſe diſorders; but their endeavours were not effectual. The ſoltanas having a curioſity to ſee the rarities of Dehli, and particularly a famous palace adorned with 1000 pillars, built by an ancient king of India, went in with all the court; and the gate being on that occaſion left open for every body, above 15,009 ſoldiers got in unperceived. But there was a far greater number of troops in a large place between Dehli, Seyri, and Jehan Penah, who committed great diſorders in the two laſt cities. This made the inhabitants in deſpair fall on them; and many, ſetting fire to their houſes, burnt their wives and children. The ſoldiers ſeeing this confuſion, did nothing but pillage the houſes; while the diſorder was increaſed by the admiſſion of more troops who ſeized the inhabitants of the neighbouring places, who had fled thither for ſhelter. The emirs, to put a ſtop to this miſchief, cauſed the gates to be ſhut: but they were quickly opened by the ſoldiers within, who roſe in arms againſt their officers; ſo that by the morning of the 13th the whole army was entered, and this great city was totally deſtroyed. Some ſoldiers carried out 150 ſlaves, men, women, and children; nay, ſome of their boys had 20 ſlaves a-piece to their ſhare. The other ſpoils, in jewels, plate, and manufactures, were immenſe; for the Indian women and girls were adorned with precious ſtones, and had bracelets and rings on their hands, feet, and even toes, ſo that the ſoldiers were loaded with them. On the 15th, in Old Dehli, the Indians retired into the great moſque to defend themſelves; but being attacked by the Tartars they were all ſlaughtered, and towers erected with their heads. A dreadful carnage now enſued throughout the whole city, and ſeveral days were employed before the inhabitants could be made to quit it entirely; and as they went, the emirs took a number of them for their ſervice. The artiſans were alſo diſtributed among the princes and commanders; all but the maſons, who were reſerved for the emperor, in order to build him a ſpacious ſtone-moſque at Samarcand.

After this terrible devaſtation, Timur marched into the different provinces of Indoſtan, every where defeating the Indians who oppoſed him, and ſlaughtering the Ghebrs, or worſhippers of fire. On the 25th of March he ſet out on his return, and on the 9th of May arrived at Samarcand. In a few months after his arrival, he was obliged to undertake an expedition into Perſia, where affairs were in the utmoſt diſorder on account of the miſconduct of his ſon, whom he had appointed ſovereign of that empire. Here Timur ſoon ſettled matters; after which he again ſet out on an expedition weſtward, reduced many places in Georgia which had not ſubmitted before, and invaded and conquered Syria. At the ſame time he quarrelled with Bajazet the Turkiſh ſultan, then buſied in an enterpriſe againſt Conſtantinople, in which he would probably have ſucceeded had not Timur interpoſed. The cauſe of this quarrel at firſt was, that Bajazet had demanded tribute from a prince who was under Timur's protection, and is ſaid to have returned an inſulting anſwer to the Tartar ambaſſadors who were ſent to him on that account. Timur, however, who was an enthuſiaſt in the cauſe of Mahometaniſm, and conſidered Bajazet as engaged in the cauſe of heaven when beſieging a Chriſtian city, was very unwilling to diſturb him in ſo pious a work; and therefore undertook ſeveral expeditions againſt the princes of Syria and Georgia, in order to give the Turkiſh monarch time to cool and return to reaſon. Among other places, he again inveſted the city of Bagdad, which had caſt off its allegiance to him; and having taken it by ſtorm, made ſuch a dreadful maſſacre of the inhabitants, that 120 towers were erected with the heads of the ſlain. In the mean time Bajazet continued to give freſh provocation, by protecting one Kara Yuſef a robber, who had even inſulted the caravan of Mecca; ſo that Timur at length reſolved to make war upon him. The ſultan, however, foreſeeing the danger of

19 Timur quarrels with Bajazet the Turkiſh ſultan.

of bringing such a formidable enemy against himself, thought proper to ask pardon, by a letter, for what was past, and promise obedience to Timur's will for the future. This embassy was graciously received; and Timur returned for answer, that he would forbear hostilities, provided Bajazet would either put Kara Yusef to death, send him to the Tartar camp, or expel him out of his dominions. Along with the Turkish ambassadors he sent one of his own; telling Bajazet that he would march into the confines of Anatolia, and there wait his final answer.

Though Bajazet had seemed at first willing to come to an agreement with Timur, and to dread his superior power; yet he now behaved in such an unsatisfactory manner, that the Tartar monarch desired him to prepare for war; upon which he raised the siege of

20 Bajazet defeated and taken prisoner.

Constantinople, and having met Timur with an army greatly inferior to the Tartars, was utterly defeated and taken prisoner. According to some accounts, he was treated with great humanity and honour; while others inform us, that he was shut up in an iron cage, against which he dashed out his brains the following year. At any rate, it is certain that he was not restored to liberty, but died in confinement.

This victory was followed by the submission of many places of the Lesser Asia to Timur; the Greek emperor owned himself his tributary, as did also the sultan of Egypt. After this Timur once more returned to Georgia, which he cruelly ravaged; after which he marched to Samarcand, where he arrived in the year 1405. Here, being now an old man, this mighty conqueror began to look forward to that state which at one time or other is the dread of all living creatures; and Timur, in order to quiet the remorses of his own conscience, came to the following curious resolution, which he communicated to his intimate friends; namely, that "as the vast conquests he had made were not obtained without *some violence*, which had occasioned the destruction of a great number of God's creatures, he was resolved, by way of atonement for his past crimes, to perform some good action; namely, to make war on the infidels, and exterminate the idolaters of China." This atonement, however, he did not live to accomplish; for he died the same year of a burning fever, in the 71st year of his age and 36th of his reign.

21 Death of Tamerlane, and dissolution of his empire.

On the death of Timur, his empire fell immediately into great disorder, and the civil wars continued for five or six years; but at last peace was restored, by the settlement of Shah Rukh, Timur's son, on the throne. He did not, however, enjoy the empire in its full extent, or indeed much above one half of it, having only Karazm, Khorassan, Kandahar, Persia, and part of Indostan. Neither was he able, though a brave and warlike prince, to extend his dominions, though he transmitted them to his son Ulug Beg. He proved a wise and learned monarch; and is famous for the astronomical tables which he caused to be composed, and which are well known at this day. He was killed in 1448 by his son Abdollatif, who six months after was put to death by his own soldiers. After the death of Abdollatif, Abdollah, a grandson of Shah Rukh, seized the throne; but, after reigning one year, was expelled by Abusaid Mirza, the grandson of Miran Shah the son of Timur. His reign was one continued scene of wars and tumults; till at last he was defeated and taken prisoner by one Hassan Beg, who put him to death in 1468. From this time we may look upon the empire of Timur as entirely dissolved, though his descendents still reigned in Persia and Indostan. The history of the latter, which is still known by the name of the *Mogul's empire*, we shall now give from the death of Abusaid Mirza to the present time. 22

History of Indostan.

On the death of the abovementioned monarch, his son Babr, or Babor, succeeded him, but was soon driven out by the Usbeck Tartars; after which he resided some time in Gazna, whence he made incursions into Indostan, and at length became master of the whole empire, excepting the kingdoms of Dekan, Guzerat, and Bengal. He died in 1530, and was succeeded by his son Hemayun; who in the beginning of his reign conquered the province of Guzerat, excepting a very few places, and in 1540 made himself master of Bengal also; but soon after he was driven out of his dominions by the Afghans, a people inhabiting the mountainous country between India and Persia. In this distress he fled to the court of Persia; and being assisted by that monarch, recovered his kingdom; but three months afterwards was killed by an accidental fall in the year 1556, the 26th of his reign.

Hemayun was succeeded by his son Akbar, at that time only 13 years of age. He subdued Guzerat, Bengal, and Kabul, (a country lying beyond the limits of India Proper), and conquered several other countries; but proved unsuccessful in his attempts on Dekan. He poisoned himself by mistake in 1605, having swallowed the dose he had caused to be prepared for one of his principal lords; and was succeeded by his son Jehan Ghir. The reign of this prince was full of troubles, owing chiefly to his own misconduct. He invaded Dekan without success, and was four years a prisoner in the hands of one of his generals named *Mohabet Khan*; from whom, however, he at last found means to escape, and enjoyed his empire till the year 1627, when he died, and was succeeded by his son Shah Jehan.

The new emperor proved a very debauched and avaricious prince; which gave occasion to one of his sons named *Aureng-zib*, or *Aureng-zebe*, to dethrone him. This prince attained his end by a train of deep hypocrisy and dissimulation; covering his ambition with a pretence of religion, and under that pretence committing the greatest crimes. He defeated two of his brothers who opposed him, by unforeseen accidents, when he himself seemed to be on the very brink of destruction; and when he attained sufficient power, put them to death, and then lamented their misfortune. One of his brothers who assisted him, he rewarded with perpetual imprisonment, and at last put him to death also. The history of the empire, after he began to reign, is very much unknown, because Aurengzebe would not allow it to be written during his life. Neither do we meet with any thing of importance regarding this empire till the invasion of Thamas Kouli Khan, or Nadir Shah, emperor of Persia, which happened in 1739. 23

The empire invaded by Nadir Shah.

This conqueror did not invade India, as Jenghiz Khan and Tamerlane had done, with a view to plunder; though, after he became master of Dehli, he ſeems not to have been inferior in rapacity to any of his predeceſſors. He was invited, however, by ſome of the great men who were diſaffected to the emperor Naſroddin Mohammed Shah, in order to ſettle the affairs of the empire. Nadir was eaſily induced to accept the invitation, and ſet out from Kandahar with an army of 125,000 men, compoſed of many different nations, and, being all inured to hardſhips, were much more than ſufficient to have conquered the whole force of the effeminate Indians. Accordingly he defeated the forces ſent againſt him; after which he was viſited by the Mogul himſelf. Him he ſeverely reprimanded for his miſconduct. However, he told him, that as he was of the race of Timur, who had not offended the reigning family of Perſia, he would not take the empire from him; only as he had put him to the trouble of coming ſo far to ſettle his affairs, he inſiſted that his expences ſhould be paid. To this ſpeech the Mogul made no anſwer; however, Nadir Shah took care to enforce the latter part of it. Some days after the Mogul's return, the Perſian monarch went to his camp to pay him a viſit, where he ſeized 200 cannon, with ſome treaſure and other effects, ſending them off immediately to Kandahar. He then marched to Dehli, where a dreadful ſlaughter was made, owing to a mob which aroſe about the price of corn. Nadir Shah, endeavouring to quell it, narrowly eſcaped being killed by a muſket-ball ſhot purpoſely at him; which enraged him to ſuch a degree, that he gave orders for an indiſcriminate maſſacre. Theſe orders were obeyed with the utmoſt alacrity by his ſoldiers; and 120,000, ſome ſay 150,000, of the inhabitants periſhed at once. After this all the jewels, gold-plate, &c. which could be found were ſeized, and the Shah demanded a preſent of money amounting to about 25 millions ſterling; which was raiſed with ſuch rigour, that many choſe to put an end to their own lives rather than bear the torments which were inflicted on thoſe who could not pay the ſum at which they were aſſeſſed. At laſt, however, the ſum was made up; and Nadir Shah took leave of the Mogul, with all the marks of friendſhip. He put the crown on his head with his own hands; and after having given him ſome good advice concerning the regulation and government of the empire, ſet out from Dehli on the 6th of May 1739.

24 Inhabitants of Dehli ſlaughtered.

By this invaſion the empire ſuſtained a prodigious loſs. Since the arrival of Shah Nadir in the country, about 200,000 people had been deſtroyed, and the conquerors had carried off treaſure and goods to the amount of 125 millions Sterling. Neverthleſs even this dreadful calamity did not awaken the ſufferers to a ſenſe of their danger, nor was any ſtep taken to put the empire in a proper ſtate of defence; ſo that it ſtill continues a prey to every invader, and equally incapable of ſubduing its enemies, or of defending itſelf.

25 Deſcription of Hindoſtan.

Hindoſtan, or the empire of the Great Mogul, or Mogol, is bounded on the north by Great and Little Tibet; on the eaſt by Tibet, and the Farther Peninſula of the Indies; on the ſouth by the Hither Peninſula, part of the Indian Sea, and Bay of Bengal; and on the weſt by Perſia. It is ſituated between the 84th and 102d degrees of longitude, and between the 21ſt and 36th degrees of latitude; being in length about 1204 miles, and in breadth 960, though in ſome parts not near ſo much.

Towards the north, Hindoſtan is very cold and barren; but towards the ſouth, very hot, and fertile in corn, rice, fruits, and other vegetables. The northern provinces are very mountainous and ſandy; while the ſouthern are for the moſt part level, and well watered with ſeveral rivers.

The moſt remarkable mountains are thoſe which ſurround it on three ſides. Thoſe on the weſt, ſeparating it from Perſia, called, in general, *Soleyman Kûy*, or *the mountains of Soleyman*, are of a vaſt height as well as breadth, and are only paſſable in certain places, through which roads have been made for the ſake of commerce. The chief are thoſe which lead to Kabul, Gazna, and Kandahar. This great chain of mountains is inhabited by different nations, the principal of which are the Afghans, or Patans, and the Baluches, who have extended themſelves on the ſide of India, as well as Perſia. The mountains on the north are called *Nagrakut*, *Hima*, or *Mûs Tâg*, which has an affinity with *Imaüs*, and by other names, which are given alſo in common to the mountains on each ſide, ſeparating Hindoſtan from Tibet. The very proſpect of theſe mountains is frightful, being nothing but hideous precipices, perpetually covered with ſnow, and not to be croſſed without the greateſt danger and difficulty.

The moſt remarkable rivers of Hindoſtan are the Indus and Ganges. The former is called by the orientals *Send*, *Sind*, or *Sindi*. It riſes in the mountains to the north, or north-eaſt, of Hindoſtan; whence, after a long courſe, firſt to the ſouth and then to the ſouth-weſt, it falls into the Perſian ſea, below Lower Bander, by ſeveral mouths. In its courſe it receives ſeveral other large rivers, as the Nilâh, Jamal, Behat, and Lakka.

The Ganges, called in the Indies *Ganga*, riſes in the kingdom of Tibet: entering Hindoſtan, about the 30th degree of latitude, it runs firſt ſouth-eaſtward by the cities of Bekâner, Minapor, Halabas, Benâres, and Patna, to Rajah Mahl, where it divides into two branches. The eaſtern having paſſed by Dâkka, the capital of Bengal, enters the gulph of that name about Chatigan. The weſtern, deſcending by Koſſum-Bazar and Hughley, falls into the gulph below Shandernagor, towards Pipeli.

Many of the Jews and ancient Chriſtians believed this river to be the Piſon, one of the four mentioned in ſcripture as the boundaries of the terreſtrial pararadiſe. The Indians retain the greateſt reverence for its waters, going in crowds from the remoteſt parts of the country to waſh in them, from a perſuaſion that they deface from all the ſpots of ſin. The reaſon of this is, becauſe they imagine this river does not take its ſource from the boſom of the earth, but deſcends from heaven into the Paradiſe of Devendre, and from thence into Hindoſtan. Nothing is more childiſh than the fables of the Bramins on this ſubject, yet the people ſwallow them all. The Mogul and prince of Golconda drink no other water than that of the Ganges: foreigners, on the contrary, pretend that it is very unwholeſome, and that it cannot be ſafely drank till it is firſt boiled. There are a great number of ſuperb pagodas on the banks of the Ganges, which are im-

immenfely rich. At certain feftivals, there has been fometimes a concourfe of 100,000 people who came to bathe in it. But what principally diftinguifhes this river, befides its greatnefs and rapidity, is the gold it brings down in its fands, and throws on its banks; and the precious ftones and pearls it produces, not only in itfelf, but in the Gulph of Bengal, into which it difcharges its waters, and which abound therewith. The Chun, or Jemma, the Guderafu, the Perfilis, Lakia, and feveral other rivers, difcharge themfelves into it during its courfe.

The weather and feafons are, for the general, very regular in this fpacious country; the winds blowing conftantly, for fix months, from the fouth, and fix from the north, with very little variation. The months of April, May, and the beginning of June, till the rains fall, are fo extremely hot, that the reflexion from the ground is apt to blifter one's face; and, but for the breeze, or fmall gale of wind, which blows every day, there would be no living in that country for people bred in northern climates; for, excepting in the rainy feafon, the coldeft day is hotter there at noon than the hotteft day in England. However, very furprifing changes of heat and cold fometimes happen within a few hours; fo that a ftifling hot day is fucceeded by a night cold enough to produce a thin ice on the water, and that night by a noon as fcorching as the preceding. Sometimes, in the dry feafon, before the rains, the winds blow with fuch extreme violence, that they carry vaft quantities of duft and fand into the air, which appear black, like clouds charged with rain; but fall down in dry fhowers, filling the eyes, ears, and noftrils of thofe among whom they defcend, and penetrate every cheft, cabinet, or cupboard, in the houfes or tents, by the key-hole or crevices.

From Surat to Agra, and beyond, it feldom or never rains, excepting in one feafon of the year; that is, from the middle of June to the middle of September. Thefe rains generally begin and end with moft furious ftorms of thunder and lightning. During thefe three months it rains ufually every day, and fometimes for a week together without intermiffion: by this means the land is enriched, like Egypt by the Nile. Although the land looks before like the barren fands of the Arabian defarts; yet, in a few days after thofe fhowers begin to fall, the furface appears covered with verdure. When the rainy feafon is over, the fky becomes perfectly ferene again, and fcarce one cloud appears all the nine months: however, a refrefhing dew falls every night, during that dry interval, which cools the air, and cherifhes the earth.

The produce of Hindoftan is very rich in every kind, whether it be foffil, vegetable, or animal. Befides other precious ftones found in it, there is a diamond-mine at the town of Soumelpûr, in Bengal. Quarries of Theban ftone are fo plentiful in the Mogul's empire, that there are both mofques and pagods built entirely of it. Some travellers tell us, there are mines of lead, iron, and copper, and even filver; but thofe of the laft, if there be any, need not be opened, fince the bullion of all nations is funk in this empire, which will take nothing elfe in exchange for her commodities, and prohibits the exporting it again. They till the ground with oxen and foot-ploughs, fowing in May and the beginning of June, that all may be over before the rains, and reaping in November and December, which with them is the moft temperate months in the year. The land is no where enclofed, excepting a little near towns and villages. The grafs is never mowed to make hay, but cut off the ground, either green or withered, as they have occafion to ufe it. Wheat, rice, barley, and other grain, grow here in plenty, and are very good. The country abounds no lefs in fruits, as pomegranates, citrons, dates, grapes, almonds, and cocoa-nuts; plums, thofe efpecially called *mirabolans;* plantanes, which in fhape refemble a flender cucumber, and in tafte excel a Norwich pear; mangos, an excellent fruit, refembling an apricot, but larger; ananas, or pine-apples; lemons and oranges, but not fo good as in other countries; variety of pears and apples in the northern parts; and the tamarind-tree, the fruit of which is contained in a pod refembling thofe of beans. There are many other kinds of fruit trees peculiar to the country. But the valuable trees are the cotton and mulberry, on account of the wealth they bring the natives from the manufactures of callicoes and filks. They plant abundance of fugar-canes here, as well as tobacco; but the latter is not fo rich and ftrong as that of America, for want of knowing how to cure and order it.

Hindoftan affords alfo plenty of ginger, together with carrots, potatoes, onions, garlic, and other roots known to us, befides fmall roots and herbs for fallads; but their flowers, though beautiful to look at, have no fcent, excepting rofes, and fome few other kinds.

There is a great variety of animals in this country, both wild and tame; of the former are elephants, rhinocerofes, lions, tygers, leopards, wolves, jackals, and the like. The jackalls dig up and eat dead bodies, and make a hideous noife in the night. The rhinoceros is not common in the Mogul's empire; but elephants are very numerous, fome 12, 14, or 15 feet high. There is plenty of venifon, and game of feveral kinds; as red-deer, fallow-deer, elks, antelopes, kids, hares, and fuch like. None of thefe are imparked, but all in common, and may be any body's who will be at the pains to take them. Among the wild animals alfo may be reckoned the mufk-animal, apes, and monkeys.

Hindoftan affords variety of beafts for carriage, as camels, dromedaries, mules, affes, horfes, oxen, and buffaloes. Moft of the horfes are white, and many curioufly dappled, pied, and fpotted all over. The flefh of the oxen is very fweet and tender. Being very tame, many ufe them as they do horfes, to ride on. Inftead of a bit, they put one or two fmall ftrings through the griftle of the noftrils, and faftening the ends to a rope, ufe it inftead of a bridle, which is held up by a bunch of grifly flefh which he has on the forepart of his back. They faddle him as they do a horfe; and, if fpurred a little, he will go as faft. Thefe are generally made ufe of all over the Indies; and with them only are drawn waggons, coaches, and chariots. Some of thefe oxen will travel 15 leagues in a day. They are of two forts; one fix feet high, which are rare; another called *dwarfs*, which are only three. In fome places, where the roads are ftony, they fhoe their oxen, when they are to travel far. The buffalo's fkin makes excellent

Mogul. excellent buff, and the female yields very good milk; but their flesh is neither so palatable nor wholesome as beef. The sheep of Hindostan have large heavy tails, and their flesh is very good, but their wool coarse.

This country is much infested with reptiles and insects; some of a noxious kind, as scorpions, snakes, and rats; but the lizards, which are of a green colour, are not hurtful. Snakes and serpents, we are told, are sometimes employed to dispatch criminals, especially such as have been guilty of some atrocious crime, that kind of death being attended with the most grievous torture. The most troublesome insects in this hot country are flies, musketoes, and chinches, or bugs, the first by day, and the others in the night, when they offend no less by their stench than their bite.

26 Account of the inhabitants.

Hindostan is inhabited by several different kinds of people, as the Hindoos, the Pâtans or Afghans, the Baluchis, the Parsis, and the Moguls or Tartars, besides foreigners, especially Jews and Christians of various sects. The Hindoos are the ancient inhabitants; and though subject to the Moguls, are at least some hundreds to one, compared with all the rest. The Parsis are the descendents of the ancient Persians, who worshipped the fire. These fled from India to avoid the persecution of the Mahometans; and are settled on the western peninsula, chiefly about Surat. The Patans, or Afghans, for they seem to be the same people under different names, are those from whom the Moguls conquered Hindostan. They are still very numerous; chiefly in the mountains and north-west parts, towards Kabul, Gazna, and Kandahar, from whence in all probability they originally came. They are a fierce and warlike people, and have a great aversion to the Moguls for having dispossessed them of their territories. The Baluchis, a barbarous people, and much given to rapine, possess several parts of Hindostan to the west of the Indus, particularly the province of Hajakhan. Both they and the Afghans also possess several parts of Persia. The Moguls, or Jagatays, are the present lords of Hindostan, where they reign over the rest, for the most part, with an absolute sway. Of these several nations, the Hindoos and Parsis are Pagan; but excel all the rest in modest deportment and the practice of virtue. The Patans, Baluchis, and Moguls, are Mahometans; and the first and last pretty strict observers of the laws and the rules of justice, at least among themselves. It is rare to see a crooked or deformed person, an idiot, or natural fool, in Hindostan. As to the complexion of the natives, they are of a deep tawny or olive colour; their hair jet black, but not curled. They like not people who are very white or fair, because that is the colour of lepers, who are common in those parts. Most of the Mahometans, except their priests and ancient men, keep their chins constantly shaven, but let the hair on their upper lip grow very long. They shave their heads all over, leaving only a lock on the crown, by which they expect to be drawn up to heaven by their prophet Mahomet. Instead of hats or bonnets, they wear a kind of turban, consisting of a piece of narrow calico, wound several times about the head. The inhabitants, in general, are very civil and courteous, as well to strangers as one another. They salute by bowing the head or their body, laying the right hand on their breast, and uttering compliments as they pass. The meaner people salute their superiors in a very submissive manner, either by putting the right hand to the ground, and then laying it on their head; or else by falling on their knees, and then bowing their head to the earth. In their more familiar salutations, they take each other by the chin, or beard, and cry *Baba*, "father," or *Bij*, "brother." The dress of the inhabitants of Hindostan is all the same in great and small, rich and poor, differing only in cost; for they never alter their fashions. Their upper-coats, to the waist, fit close to their bodies, whence they hang loose a little below their knees. Under this out-coat, they usually wear another slight one of the same cloth, but shorter, in the nature of a vest. Some of the richer sort, in the cooler parts of the day, slip on loose coats over the other, made of quilted silk, or callico, or else of English scarlet-cloth, for that is the colour they most affect. Under their coats they wear a sort of trowsers, which fall down to their ancles, and ruffle on the small of their legs: for their feet are always bare in their shoes, but as clean as their hands. They have girdles, made of a long piece of cloth, which go twice at least about them, the ends hanging down.

The dress of the Mahometan women differs but little from that of the men; only they bind their hair with long fillets, which hang down behind, and wear on their heads mantles or veils of calico; all round their ears they wear small pendants, made of thin and narrow pieces of gold or silver, brass or iron, according to the quality of the person. The lower part of their left nostril is also pierced for putting in rings of those metals at pleasure; the ends of their gold rings meeting in a pearl, drilled for that purpose. Some of the better sort wear great hollow rings of gold enamelled, silver, or brass, upon their wrists and the small of their legs, two or three on each limb, which makes a tinkling noise when they move.

Although the Mahometans are allowed four wives, very few, and those only of the richer sort, take more than one. They are so jealous, that they will not suffer either father or brother to speak to their wives, unless in their presence. Adultery and fornication are reckoned in the highest degree criminal. Great men have eunuchs to guard their women. Common prostitutes are tolerated here; but they must be licensed, before they are at liberty to open a house.

The women are exceeding happy in this part of the world in having easy labours; for it is common to see them one day riding big with child, and the next day riding again with the infants in their arms. The children of the poorer sort go naked several years, only now and then their mothers cover them with a slight calico mantle.

The Mahometans bury not in their mosques or churches, but in some open place out of town.

Their mourning over the deceased is immoderate, especially at their graves; when they often ask the party, as if living, Why he would die, since he had such loving wives and friends, and other comforts, in this life? The men of the greatest quality often provide fair sepulchres for themselves and friends. There are also many handsome monuments erected in memory of such as they esteem pirs, or saints; which are much resorted to by devout people, having lamps continually burning in them, with votaries, who have salaries to attend

attend them. The Mahometans beftow not fo much coft on any fort of ftructures as on fepulchres.

The common language of the empire, called the *Hindûftân*, has a great affinity with the Perfian and Arabic, but is more fmooth, and very fignificant and concife. Its characters are different from thofe of the above languages, and written from the left hand to the right, like the European. All the learning of the Moguls confifts in reading and writing; however, the people themfelves are men of very ftrong reafon, and will fpeak off-hand on any fubject exceeding well. Their chief ftudy is aftrology, with the belief of which the generality are ftrangly infatuated; the Great Mogul himfelf undertaking nothing of any moment without confulting his aftrologers. For an account of the different religions in this empire, fee the articles MAHOMETANISM and GENTOO; and HINDOO in the APPENDIX.

MOHAIR, in commerce, the hair of a kind of goat frequent about Angria in Turkey; the inhabitants of which city are all employed in the manufacture of camblets made of this hair.

MOHAWK COUNTRY, a part of North America, inhabited by one of the five nations of the Iroquois, fituated between the province of New York and the lake Ontario or Frontignac.

MOHILA, or MOELIA, one of the Comorra iflands in the Indian fea, between the north end of the ifland of Madagafcar and the continent of Africa. The inland parts are mountainous and woody; but the lands adjoining to the fea are watered by feveral fine ftreams which defcend from the mountains; and the grafs is green all the year, fo that it affords a moft delightful habitation. There are plenty of provifions of all kinds; and the Eaft India fhips of different nations fometimes touch here for refrefhment.

MOHILOF, a large and ftrong city of Poland, in the province of Lithuania, and palatinate of Mfciflau. It is well built, populous, and has a confiderable trade. Near this place the Swedes obtained a great victory over the Ruffians in 1707.

MOIDORE, a Portuguefe gold coin, value 1l. 7s. Sterling.

MOIETY, the half of any thing.

MOLA, an ancient town of Italy, in the kingdom of Naples, and in the Terra di Lavoro, where they pretend to fhew the ruins of Cicero's houfe. It is feated on the gulf of Venice, in E. Long. 17. 50. N. Lat. 41. 5.

MOLARES, or DENTES MOLARES, in anatomy, the large teeth, called in Englifh the *grinders*. See ANATOMY, n° 26, l.

MOLDAVIA, a province of Turkey in Europe, bounded on the north-eaft by the river Niefter, which divides it from Poland; on the eaft, by Beffarabia; on the fouth by the Danube, which parts it from Bulgaria; and on the weft, by Walachia and Tranfilvania; it being 240 miles in length, and 150 in breadth. It lies in a good air and fruitful foil, producing corn, wine, rich paftures, a good breed of horfes, oxen, fheep, plenty of game, fifh, fowl, honey, wax, and all European fruits. Its principal rivers are the Danube, Neifter, Pruth, Bardalach, and Ceret. The inhabitants are Chriftians of the Greek church, and Jaffy is the principal town. It has been tributary to the Turks ever fince the year 1574; who appoint a prince who is a native of the country, but have no regard to his being of the principal families. They pay a large yearly tribute; befides which, they are obliged to raife a great body of horfe at their own expence.

MOLE, a river in Surry, which has taken its name from running under ground. It firft difappears at Boxhill, near Darking, in the county of Surry, and emerges again near Leatherhead.

MOLE, in zoology. See TALPA.

Moles in the fields may be deftroyed by taking a head or two of garlic, onion, or leek, and putting it into their holes; on which they will run out as if frighted, and you may kill them with a fpear or dog. Or pounded hellebore, white or black, with wheat-flour, the white of an egg, milk, and fweet-wine, or metheglin, may be made into a pafte, and pellets as big as a fmall nut may be put into their holes: the moles will eat this with pleafure, and will be killed by it. In places where you would not dig nor break much, the fuming their holes with brimftone, garlick, or other unfavoury things, drives them away; and if you put a dead mole into a common haunt, it will make them abfolutely forfake it.

Or take a mole-fpear or ftaff, and where you fee them caft, go lightly; but not on the fide betwixt them and the wind, left they perceive you; and at the firft or fecond putting up of the earth, ftrike them with your mole-ftaff downright, and mark which way the earth falls moft: if fhe cafts towards the left-hand, ftrike fomewhat on the right-hand; and fo on the contrary, to the cafting up of the plain ground, ftrike down, and there let it remain; then take out the tongue in the ftaff, and with the fpattle, or flat edge, dig round about your grain to the end thereof, to fee if you have killed her; and if you have miffed her, leave open the hole, and ftep afide a little, and perhaps fhe will come to ftop the hole again, for they love but very little air; and then ftrike her again; but if you mifs her, pour into the hole two gallons of water, and that will make her to come out for fear of drowning: mind them going out of a morning to feed, or coming home when fed, and you may take a great many.

MOLE, in midwifery, a mafs of flefhy matter, of a fpherical figure, generated in the uterus, and fometimes miftaken for a child. See MIDWIFERY, chap. ii.

MOLE, or *Mark*. See NÆVUS.

MOLE is alfo a maffive work of large ftones laid in the fea by means of coffer-dams; extending before a port, either to defend the harbour from the impetuofity of the waves, or to prevent the paffage of fhips without leave.

MOLE-*Cricket*. See GRYLLOTALPA.

MOLESWORTH (Robert), Vifcount Molefworth, an eminent ftatefman and polite writer, born at Dublin in 1656, where his father was a merchant. He was attainted by king James for his activity on the prince of Orange's invafion; but the latter, when he was fettled on the throne, called up Mr Molefworth into the privy-council, and fent him envoy-extraordinary to the court of Denmark. Here he refided above three years, and then returned upon fome difguft, without an audience of leave. Upon his return, he drew up his Account of Denmark, a work well known, in

which

which he reprefented that government as arbitrary; and hence gave great offence to George prince of Denmark. The Danifh envoy prefented a memorial to king William concerning it; and then furnifhed materials for an anfwer, which was executed by Dr William King. Mr Molefworth was member of the houfes of commons in both kingdoms: king George I. made him a commiffioner of trade and plantations, and advanced him to the peerage of Ireland, by the title of *Baron Philipftown*, and *Vifcount Molefworth of Swords*. He died in 1725. Befide his Account of Denmark, he wrote an addrefs to the houfe of commons, for the encouragement of agriculture; and tranflated Franco Gallia, a Latin treatife of the civilian Hottoman, giving an account of the free ftate of France, and other parts of Europe, before the encroachments made on their liberties.

MOLIERE (John Baptift), a famous French comedian, whofe true name was *Pocquelin*, which for fome reafon or other he funk for that of Moliere. He was the fon of a valet de chambre, and was born at Paris about the year 1620. He went through the ftudy of the claffics under the Jefuits in the college of Clermont, and was defigned for the bar; but at his quitting the law-fchools, he made choice of the actor's profeffion. From the prodigious fondnefs he had for the drama, his whole ftudy and application being directed to the ftage, he continued till his death to exhibit plays, which were greatly applauded. It is faid the firft motive of his going upon the ftage was to enjoy the company of an actrefs, for whom he had contracted a violent fondnefs. His comedies are highly efteemed. And it is no wonder he fo juftly reprefented domeftic feuds, and the torments of jealous hufbands, or of thofe who have reafon to be fo, it being afferted that no man ever experienced all this more than Moliere, who was very unhappy in his wife. His laft comedy was *La Malade imaginaire*, which was brought on the ftage in 1673; and Moliere died on the fourth night of its reprefentation; fome fay in acting the very part of the pretended dead man, which gave fome exercife for the wits of the time; but according to others, he died in his bed that night, from the burfting of a vein in his lungs by coughing. The king, as a laft mark of his favour, prevailed with the archbifhop of Paris to fuffer him to be buried in confecrated ground; though he had irritated the clergy by his *Tartuffe*. The moft efteemed editions of his works are that of Amfterdam, 5 vols 12mo, 1699; and that of Paris, 6 vols 4to, 1734.

MOLINOS (Michael), a Spanifh prieft, who endeavoured to fpread new doctrines in Italy. He was born in the diocefe of Saragoffa in 1627; and entered into prieft's orders, though he never held any ecclefiaftical benefice. He was a man of good fenfe and learning, and his life was exemplary; though, inftead of practifing aufterities, he gave himfelf up to contemplation and myftical devotion. He wrote a book intitled, *Il Guida Spirituale*, containing his peculiar notions, which was greedily read both in Italy and Spain. His followers are called *Quietifts;* becaufe his chief principle was, that men ought to annihilate themfelves in order to be united to God, and afterwards remain in quietnefs of mind, without being troubled for what fhall happen to the body. He was taken up in 1687; and his 68 propofitions were examined by the pope and inquifitors, who decreed that his doctrine was falfe and pernicious, and that his books fhould be burned. He was forced to recant his errors publicly in the Dominicans church, and was condemned to perpetual imprifonment. He was 50 years old when he was taken, and had been fpreading his doctrine 22 years before. He died in prifon in 1692.

MOLOCH, a falfe god of the Ammonites, who dedicated their children to him, by making them "pafs through the fire," as the fcriptures exprefs it. There are various opinions concerning this method of confecration. Some think, the children leaped over a fire facred to Moloch; others, that they paffed between two fires; and others, that they were really burnt in the fire, by way of facrifice to this god. There is foundation for each of thefe opinions. For, firft, it was ufual among the pagans to luftrate or purify with fire; and, in the next place, it is exprefsly faid, that the inhabitants of Sepharvaim burnt their children in the fire to Anamalech and Adrammelech; much fuch deities as Moloch of the Ammonitess

Mofes, in feveral places, forbids the Ifraelites to dedicate their children to this god, as the Ammonites did, and threatens death and utter extirpation to fuch perfons as were guilty of this abominable idolatry. And there is great probability that the Hebrews were much addicted to the worfhip of this deity; fince Amos, and after him St Stephen, reproaches them with having carried along with them into the wildernefs the tabernacle of their god Moloch.

Solomon built a temple to Moloch upon the mount of Olives; and Manaffeh, a long time after, imitated his impiety, by making his fon pafs through the fire in honour of Moloch. It was chiefly in the valley of Tophet and Hinnom, to the eaft of Jerufalem, that the Ifraelites paid their idolatrous worfhip to this falfe god of the Ammonites.

There are various fentiments concerning the relation which Moloch had to the other pagan divinities. Some believe he was the fame with Saturn, to whom it is well known that human facrifices were offered. Others fuppofe him to be Mercury; others, Mars; others, Mithras; and others, Venus. Laftly, others take Moloch to be the fun, or the king of heaven. Moloch was likewife called *Milkom;* as appears from what is faid of Solomon, that he went after Afhtaroth the abomination of the Zidonians, and Milkom the abomination of the Ammonites.

MOLOSSES, in commerce, the thick fluid matter remaining after fugar is made, like fyrup. In Holland moloffes are much ufed in the manufacture of tobacco, and by the poor people for fugar. A brandy is alfo diftilled from them, but it is faid to be unwholefome.

MOLOSSUS, in Greek and Latin poetry, a foot compofed of three long fyllables; as *delectent*.

MOLTEN-GREASE, in farriery. See there § xviii.

MOLUCCA ISLANDS, lie in the Eaft Indian fea under the line; of which there are five principal, namely, Ternate, Tydor, Machian, Motyr, and Bacchian. The largeft of them are hardly 30 miles in circumference. They produce neither corn, rice, nor cattle, except goats: but they have oranges, lemons, and other fruits; and are moft remarkable for fpices, efpecially

cially cloves. They have large ſnakes, which are not venomous, and very dangerous land crocodiles. At preſent they have three kings; and the Dutch, who are very ſtrong there, keep out all other European nations, being jealous of their ſpice-trade. The religion is idolatry; but there are many Mahometans. They were diſcovered by the Portugueſe in 1511, who ſettled upon the coaſt; but the Dutch drove them away, and are now maſters of all theſe iſlands.

MOLWITZ, a town of Sileſia, in the province of Grotſka, remarkable for a battle gained by the Pruſſians over the Auſtrians in 1741. E. Long. 16. 45. N. Lat. 50. 26.

MOLYBDIA, in natural hiſtory, the name of a genus of cryſtals of a cubic form, or compoſed of ſix ſides, at right angles, like a dye.

MOLYNEUX (William), an excellent mathematician and aſtronomer, was born at Dublin in 1656, and admitted into the univerſity of that city; which when he left, he carried with him, a teſtimonial drawn up in an uncommon form, and in the ſtrongeſt terms, ſignifying the high opinion conceived of his genius, the probity of his manners, and the remarkable progreſs he had made in letters. In 1675, he entered in the middle-temple, where he ſpent three years in the ſtudy of the laws of his country: but the bent of his genius lay ſtrongly toward mathematics and philoſophical ſtudies; and even at the univerſity he conceived a diſlike to ſcholaſtic learning, and fell into the methods of Lord Bacon. In 1683, he formed a ſociety in Dublin, for carrying on the ſame deſign with the royal ſociety in London. He ſoon got a few ingenious men to meet at ſtated times under proper regulations. Their number immediately increaſed; Sir William Petty was their firſt preſident, and Mr Molyneux their firſt ſecretary. Their ſociety continued to meet till 1688, when the confuſion of the times diſperſed them. Mr Molyneux's reputation for learning recommended him, in 1684, to the notice and favour of the firſt and great duke of Ormond, then lord-lieutenant of Ireland; and chiefly by his grace's influence he was appointed, that year, with Sir William Robinſon, ſurveyor-general of his majeſty's buildings and works, and chief engineer. In 1686, he was ſent abroad by the government to view the moſt conſiderable fortreſſes in Flanders. He travelled, in company with Lord Mountjoy, through that country, Holland, part of Germany, and France. Upon his return from Paris to London, in April 1680, he publiſhed his *Sciothericum Teleſcopium*, containing a deſcription of the ſtructure and uſe of a teleſcopial dial invented by him. The ſeverities of Tyrconnel's government forced him, with many others, into England, where he ſpent two years with his family. In this retirement he wrote his Dioptrics, dedicated to the royal ſociety. A parliament being called in Ireland under Lord Sidney in 1692, Mr Molyneux ſat in it as one of the repreſentatives of the univerſity of Dublin. Upon the cloſe of the ſeſſion, the univerſity honoured him with the degree of doctor of laws; and by the lord-lieutenant he was appointed one of the commiſſioners for the forfeitures in Ireland, with a ſalary of 500l. *per annum*. The laſt favour he entirely declined, as engaging him in an invidious work. Not long before he died, he publiſhed "The Caſe of Ireland ſtated, in relation to its being bound by Acts of Parliament made in England." Among many perſons with whom he maintained correſpondence and friendſhip, Mr Locke was in a particular manner dear to him, as appears from their letters. In 1698, he made a journey to England on purpoſe to pay a viſit to that great man; and not long after his return to Ireland was ſeized with a fit of the ſtone, and died in 1698.—His ſon, Samuel Molyneux Eſq; was born in 1689, and became ſecretary to George II. while prince of Wales, and one of the lords of the admiralty; in which place he died. He was a gentleman of great learning, eſpecially in mathematical and philoſophical ſubjects.

MOMBAZA, or MONBAZA, a town of Africa, in an iſland of the ſame name, with a caſtle and a fort; ſeated on the eaſtern coaſt, oppoſite to the country of Mombaza in Zanguebar, 70 miles ſouth of Melinda, and ſubject to Portugal. E. Long. 48. 0. N. Lat. 44. 0.

MOMBAZA, a country of Africa, in Zanguebar, ſubject to the Portugueſe, from whence they export ſlaves, gold, ivory, rice, fleſh, and other proviſions, with which they ſupply the ſettlements in Braſil. The king of this country being a Chriſtian, had a quarrel with the Portugueſe governor, took the caſtle by aſſault, turned Mahometan, and murdered all the Chriſtians in 1631; but in 1729 they became maſters of the territory again.

MOMENT, in the doctrine of time, an inſtant, or the moſt minute and indiviſible part of duration.

MOMENTUM, in mechanics, ſignifies the ſame with impetus, or the quantity of motion in a moving body; which is always equal to the quantity of matter multiplied into the velocity; or, which is ſame thing, it may be conſidered as a rectangle under the quantity of matter and velocity.

MOMORDICA, MALE BALSAM APPLE; a genus of the ſyngeneſia order, belonging to the monœcia claſs of plants. The moſt remarkable ſpecies are, 1. The balſamina, or male balſam apple. This is a native of Aſia; and hath a trailing ſtalk like thoſe of the cucumber or melon, with ſmooth leaves, cut into ſeveral ſegments, and ſpread open like a hand. The fruit is oval, ending in acute points, having ſeveral deep angles, with ſharp tubercles placed on their edges. It changes to a red or purpliſh colour when ripe, opening with an elaſticity, and throwing out its ſeeds. 2. The elaterium, wild or ſpurting cucumber, hath a large fleſhy root, ſomewhat like briony, from whence come forth every ſpring ſeveral thick, rough, trailing ſtalks, dividing into many branches, and extending every way two or three feet; theſe are garniſhed with thick, rough, almoſt heart-ſhaped leaves, of a grey colour, ſtanding upon long foot-ſtalks. The flowers come out from the wings of the ſtalks: theſe are male and female, growing at different places on the ſame plant like thoſe of the common cucumber; but they are much leſs, of a pale yellow colour, with a greeniſh bottom; the male flowers ſtand upon thick, ſhort, foot-ſtalks, but the female flowers ſit upon the young fruit; which, after the flower is faded, grows of an oval form, an inch and a half long, ſwelling like a cucumber, of a grey colour like the leaves, and covered over with ſhort prickles. This ſpecies has one of its names from the property of caſting out its ſeeds, together

gether with the viscid juice in which the seeds are lodged, with a violent force, if touched while ripe.

Uses. The first species is famous in Syria for curing wounds: the natives cut open the unripe fruit, and infuse it in sweet oil, which they expose to the sun for some days until it becomes red; and then present it for use. Dropped on cotton, and applied to a fresh wound, the Syrians reckon this oil the best vulnerary next to balsam of Mecca, having found by experience that it often cures large wounds in three days. The leaves and stems of this plant are used for arbours or bowers. The elaterium of the shops is the fruit, or rather the inspissated fæcula, of the juice of the unripe fruit of the wild cucumber. It is usually sent us from Spain and the southern parts of France, where the plant is common. We receive it in small, flat, whitish lumps, or cakes, that are dry, and break easily between the fingers. It is of an acrid, nauseous, bitter taste, and has a strong offensive smell when newly made; but these, as well as its other properties, it loses after being kept for some time. It is a very violent purge and vomit, and is now but seldom used. From the property which the plant has of throwing out its seeds, it has sometimes been called *Noli me tangere.*

MOMUS, in fabulous history, the god of raillery, or the jester of the celestial assembly, and who ridiculed both gods and men. Being chosen by Vulcan, Neptune, and Minerva, to give his judgment concerning their works, he blamed them all: Neptune for not making his bull with horns before his eyes, in order that he might give a surer blow; Minerva for building an house that could not be removed in case of bad neighbours; and Vulcan, for making a man without a window in his breast, that his treacheries might be seen.

MONA, two islands of this name in the sea lying between Britain and Ireland. The one described by Cæsar, as situated in the mid-passage between both islands, and stretching out in length from south to north. Called *Monaæda,* (Ptolemy); *Monapia,* or *Monabia,* (Pliny). Supposed to be the Isle of Man. Another Mona, (Tacitus); an island more to the south, and of greater breadth; situate on the coast of the Ordovices, from whom it is separated by a narrow strait. The ancient seat of the Druids. Now called *Anglesey,* the island of the Angles or English.

MONA, an island of the Baltic-Sea, south-west of the island of Zealand, subject to Denmark. E. Long. 12. 30. N. Lat. 55. 20.

MONADELPHIA, (from μονος "alone," and αδελφια a "brotherhood,") a single brotherhood; the name of the 16th class in Linnæus's sexual system, consisting of plants with hermaphrodite flowers; in which all the stamina, or male organs of generation, are united below into one body or cylinder, through which passes the pointal or female organ. See BOTANY, p. 1296.

MONACO, a small, but handsome and strong town of Italy, in the territory of Genoa, with a castle, citadel, and a good harbour. It is seated on a craggy rock; and has its own prince, under the protection of France. E. Long. 7. 33. N. Lat. 43. 48.

MONAGHAN, a county of Ireland, in the province of Ulster, 32 miles long and 22 broad. It is bounded on the north by Tyrone; on the east by Armagh; on the south by Cavan and Louth; and on the west by Fermanagh. It is full of woods and bogs, and a third part of it is taken up by Lough Earne. It contains 24 parishes, five baronies, one borough, near 10,000 houses, and sends four members to parliament. Some time ago there were discovered on the borders of this county, four teeth of a prodigious magnitude, which the royal society, upon comparing with some teeth which had been found in England, were clearly of opinion could be no other that those of the elephant.

MONANDRIA, (from μονος "alone," and ανηρ a "man or husband;") the name of the first class in Linnæus's sexual system; consisting of plants with hermaphrodite flowers, which have only one stamen or male organ.

MONARCHY, a government in which the supreme power is vested in a single person. See GOVERNMENT.

MONARDA, INDIAN HOREHOUND; a genus of the monogynia order, belonging to the diandria class of plants. The most remarkable species is the zeylanica, a native of the East Indies. It rises with an herbaceous, four-cornered, hoary stalk; and bears leaves that are entire, nearly heart-shaped, woolly, deeply notched on the edges, and having foot-stalks. The flowers, which are purplish and fragrant, surround the stalk in whorls, each whorl containing about 14 flowers; and are succeeded by four small kidney-shaped shining seeds, lodged in the bottom of the permanent flower-cup. The Indians superstitiously believe that a fumigation of this plant is effectual for driving away the devil, and from this imaginary property its name in the Ceylonese language is derived. Grimmius relates, in his *Laboratorium Ceylonicum,* that for taste and smell this species of horehound stands remarkably distinguished. A water and subtile oil are obtained from it, both of which are greatly commended in obstructions of the matrix. A syrup is likewise prepared from this plant, which is useful in the above-mentioned disorders as well as in diseases of the stomach.

MONARDES (Nicholas), an excellent Spanish physician of Seville, who lived in the 16th century; and deservedly acquired great reputation by his practical skill and the books which he wrote. His Spanish works have been translated into Latin by Clusius; into Italian by Annibal Brigantus; and those upon American drugs have appeared in English. He died about the year 1578.

MONASTERY, a convent, or house built for the reception and entertainment of monks, mendicant friars, or nuns, whether it be an abbey, priory, &c.

Monasteries are governed by different rules, according to the different regulations prescribed by their founders. The first regular and perfect monasteries were founded by St Pachomius in Egypt: but St Basil is generally considered as the great father and patriarch of the eastern monks; since, in the fourth century, he prescribed rules for the government of the monasteries, to which the Anachorets and Cœnobites, and the other ancient fathers of the desarts, submitted. In like manner St Benedict was styled the *patriarch of the western monks.* He appeared in Italy towards the latter end of the fifth century, and published his rule, which was universally received throughout the west.

St Auguftine being fent into England by St Gregory the pope, in the year 596, to convert the Englifh, he at the fame time introduced the monaftic ftate into that kingdom; which made fuch progrefs there, that, within the fpace of 200 years, there were 30 kings and queens who preferred the religious habit to their crowns, and founded ftately monafteries, where they ended their days in retirement.

MONASTIC, fomething belonging to monks. See Monk.

MONCAON, or Monzon, a town of Portugal, in the province of Entre-Douro-de-Minho, with a ftrong caftle. The Spaniards have feveral times attempted to take it, but in vain. W. Long. 8. 2. N. Lat. 41. 52.

MONCON, or Monzon, a ftrong town of Spain, in the kingdom of Arragon. It was taken by the French in 1642, but the Spaniards retook it the following year. It is feated at the confluence of the rivers Sofa and Cinca. E. Long. 0. 19. N. Lat. 41. 43.

MONDOVI, a confiderable town of Italy, in Piedmont; with a citadel, univerfity, and bifhop's fee. It is the largeft and moft populous town of Piedmont, and is feated in E. Long. 8. 15. N. Lat. 44. 23.

MONDAY, the fecond day of the week, fo called as being anciently facred to the moon; *q. d.* moon-day.

MONEMUGI, an empire in the fouth of Africa, has Zanguebar on the eaft, Monotapa on the fouth, Motamba and Makoko on the weft, and Abyffinia on the north and partly to the eaft, tho' its boundaries that way cannot be afcertained. It is divided into the kingdoms of Mujaco, Makoko or Anfiko, Gingiro, Cambate, Alaba, and Monemugi Proper. This laft lies in the middle of the torrid zone, and about the equinoctial line fouth of Makoko, weft of Zanguebar, north of Monomotopa, and eaft of Congo and of the northern parts of Monomotopa. To afcertain its extent, is too difficult a tafk, being a country fo little frequented. The country known, abounds with gold, filver, copper mines, and elephants. The natives clothe themfelves in filks and cottons, which they buy of ftrangers, and wear collars of tranfparent amber-beads, brought them from Cambaya: which beads ferve alfo inftead of money; gold and filver being too common, and of little value among them.

Their monarch always endeavours to be at peace with the princes round about him, and to keep an open trade with Quitoa, Melinda, and Mombaza, on the eaft, and with Congo on the weft; from all which places the black merchants refort thither for gold. The Portuguefe merchants report, that on the eaft fide of Monemugi there is a great lake full of fmall iflands, abounding with all forts of fowl and cattle, and inhabited by negroes. They relate alfo, that on the main land eaftward they heard fometimes the ringing of bells, and that one could obferve buildings very much like churches; and that from thefe parts came men of a brown and tawny complexion, who traded with thofe iflanders, and with the people of Monemugi.

This country of Monemugi affords alfo abundance of palm-wine and oil, and fuch great plenty of honey, that above half of it is loft, the blacks not being able to confume it. The air is generally very unwholefome, and exceffively hot, which is the reafon why no Chriftians undertake to travel in this empire. De Lifle gives the divifion of this country as follows: The Maracates, the Mefleguaries, the kingdom of the Buengas, the kingdom of Mafti, and that of Maravi. But we are not acquainted with any particulars relating to thefe nations or kingdoms.

MONEY, a piece of matter, commonly metal, to which public authority has affixed a certain value and weight to ferve as a medium in commerce. See Coin, Commerce, and Medals.

Money is ufually divided into *real* or *effective*, and *imaginary* or *money of account*.

I. Real money includes all coins, or fpecies of gold, filver, copper, and the like; which have courfe in commerce, and do really exift. Such are guineas, piftoles, pieces of eight, ducats, &c.

Real money, civilians obferve, has three effential qualities, viz. matter, form, and weight or value.

For the matter, copper is that thought to have been firft coined; afterwards filver; and laftly gold, as being the moft beautiful, fcarce, cleanly, divifible, and pure of all metals.

The degrees of goodnefs are expreffed in gold by carats; and in filver by penny-weights, &c. For there are feveral reafons for not coining them pure and without alloy, viz. the great lofs and expence in refining them, the neceffity of hardening them to make them more durable, and the fcarcity of gold and filver in moft countries. See Alloy.

Among the ancient Britons, iron rings, or, as fome fay, iron plates, were ufed for money; among the Lacedæmonians, iron bars quenched with vinegar, that they might not ferve for any other ufe. Seneca obferves, that there was anciently ftamped money of leather, *corium forma publica impreffum.* And the fame thing was put in practice by Frederic II. at the fiege of Milan; to fay nothing of an old tradition among ourfelves, that in the confufed times of the barons wars the like was done in England: but the Hollanders, we know, coined great quantities of pafteboard in the year 1574.

As to the form of money, it has been more various than the matter. Under this are comprehended the weight, figure, impreffion, and value.

For the impreffion, the Jews, tho' they detefted images, yet ftamped on the one fide of their fhekel the golden pot which had the manna, and on the other Aaron's rod. The Dardans ftamped two cocks fighting. The Athenians ftamped their coins with an owl, or an ox; whence the proverb on bribed lawyers, *Bos in lingua.* They of Ægina, with a tortoife; whence that other faying, *Virtutem & fapientiam vincunt teftudines.* Among the Romans, the monetarii fometimes impreffed the images of men that had been eminent in their families on the coins: but no living man's head was ever ftamped on a Roman coin till after the fall of the commonwealth. From that time they bore the emperor's head on one fide. From this time the practice of ftamping the prince's image on coins, has obtained among all civilized nations; the Turks and other Mahometans alone excepted, who, in deteftation of images, infcribe only the prince's name, with the year of the tranfmigration of their prophet.

As to the figure, it is either round, as in Britain; mul-

Money.

multangular or irregular, as in Spain; ſquare, as in ſome parts of the Indies; or nearly globular, as in moſt of the reſt.

After the arrival of the Romans in this iſland, the Britons imitated them, coining both gold and ſilver with the images of their kings ſtamped on them. When the Romans had ſubdued the kings of the Britons, they alſo ſuppreſſed their coins, and brought in their own; which were current here from the time of Claudius to that of Valentinian the younger, about the ſpace of 500 years.

Mr Camden obſerves, that the moſt ancient Engliſh coin he had known was that of Ethelbert king of Kent, the firſt Chriſtian king in the iſland; in whoſe time all money-accounts begin to paſs by the names of *pounds*, *ſhillings*, *pence*, and *mancuſes*. Pence ſeems borrowed from the Latin *pecunia*, or rather from *pendo*, on account of its juſt weight, which was about three pence of our money. Theſe were coarſely ſtamped with the king's image on the one ſide, and either the mint-maſter's, or the city's where it was coined, on the other. Five of theſe pence made their ſcilling, probably ſo called from *ſcilingus*, which the Romans uſed for the fourth part of an ounce. Forty of theſe ſcillings made their pound; and 400 of theſe pounds were a legacy, or a portion for a king's daughter, as appears by the laſt will of king Alfred. By theſe names they tranſlated all ſums of money in their old Engliſh teſtament; talents by *pundes;* Judas's thirty pieces of ſilver by *thirtig ſcillinga;* tribute-money, by *penining;* the mite by *feorthling*.

But it muſt be obſerved, they had no other real money, but pence only; the reſt being imaginary moneys, *i. e.* names of numbers or weights. Thirty of theſe pence made a mancus, which ſome take to be the ſame with a mark; manca, as appears by an old MS. was *quinta pars unciæ*. Theſe mancas or mancuſes were reckoned both in gold and ſilver. For in the year 680, we read that Ina king of the Weſt Saxons obliged the Kentiſhmen to buy their peace at the price of 30,000 manca's of gold. In the notes on king Canute's laws, we find this diſtinction, that *mancuſa* was as much as a mark of ſilver; and *manca* a ſquare piece of gold, valued at 30 pence.

The Danes introduced a way of reckoning money by ores, *per oras*, mentioned in Domeſday-book; but whether they were a ſeveral coin, or a certain ſum, does not plainly appear. This, however, may be gathered from the Abbey-book of Burton, that 20 ores were equivalent to two marks. They had alſo a gold coin called *byzantine*, or *bezant*, as being coined at Conſtantinople, then called *Byzantium*. The value of which coin is not only now loſt, but was ſo entirely forgot even in the time of king Edward III. that whereas the biſhop of Norwich was fined a bizantine of gold to be paid the abbot of St Edmund's Bury for infringing his liberties (as it had been enacted by parliament in the time of the conqueror), no man then living could tell how much it was; ſo it was referred to the king to rate how much he ſhould pay. Which is the more unaccountable, becauſe but 100 years before, 200,000 bezants were exacted by the ſoldan for the ranſom of St Lewis of France; which were then valued at 100,000 livres.

Though the coining of money be a ſpecial prerogative of the king, yet the ancient Saxon princes communicated it to their ſubjects; inſomuch that in every good town there was at leaſt one mint; but at London eight, at Canterbury four for the king, two for the archbiſhop, one for the abbot at Wincheſter, ſix at Rocheſter, at Haſtings two, &c.

The Norman kings continued the ſame cuſtom of coining only pence, with the prince's image on one ſide, and on the other the name of the city where it was coined, with a croſs ſo deeply impreſſed, that it might be eaſily parted and broke into two halves, which, ſo broken, they called *half-pence;* or into four parts, which they called *fourthings*, or *farthings*.

In the time of king Rich. I. money coined in the eaſt parts of Germany, came in ſpecial requeſt in England on account of its purity, and was called *eaſterling money*, as all the inhabitants of thoſe parts were called *Eaſterlings*. And ſhortly after, ſome of thoſe people ſkilled in coining were ſent for hither, to bring the coin to perfection; which ſince has been called *ſterling* for *Eaſterling*. See Sterling.

King Edward I. who firſt adjuſted the meaſure of an ell by the length of his arm, herein imitating Charles the Great, was the firſt alſo who eſtabliſhed a certain ſtandard for the coin, which is expreſſed to this effect by Greg. Rockley, mayor of London, and mint-maſter.—"A pound of money containeth twelve ounces: in a pound there ought to be eleven ounces, two eaſterlings, and one farthing; the reſt alloy. The ſaid pound ought to weigh twenty ſhillings and three pence in account and weight. The ounce ought to weigh twenty pence, and a penny twenty-four grains and a half. Note, that eleven ounces two-pence Sterling ought to be of pure ſilver, called *leaf-ſilver;* and the minter muſt add of other weight ſeventeen-pence halfpenny farthing, if the ſilver be ſo pure."

About the year 1320, the ſtates of Europe firſt began to coin gold; and among the reſt, our king Edward III. The firſt pieces he coined were called *florences*, as being coined by Florentines; afterwards he coined nobles; then roſe-nobles, current at 6*s.* and 8*d.*; half-nobles, called *half-pennies*, at 3*s.* and 4*d.* of gold; and quarters at 20*d.* called *farthings of gold*. The ſucceeding kings coined roſe-nobles, and double roſe-nobles, great ſovereigns, and half Henry nobles, angels, and ſhillings.

King James I. coined units, double crowns, Britain crowns: then crowns, half-crowns, &c.

II. *Imaginary* Money, or *Money of Account*, is that which has never exiſted, or at leaſt which does not exiſt in real ſpecies, but is a denomination invented or retained to facilitate the ſtating of accounts, by keeping them ſtill on a fixed footing, not to be changed, like current coins, which the authority of the ſovereign raiſes or lowers according to the exigencies of the ſtate. Of which kind are pounds, livres, marks, mar avedies, &c. See the annexed Table, where the fictitious money is diſtinguiſhed by a dagger (†).

Moneys of Account among the Ancients.—1. The Grecians reckoned their ſums of money by *drachmæ*, *minæ*, and *talenta*. The drachma was equal to $7\frac{3}{4}$ l. Sterling; 100 drachmæ made the mina, equal to 3*l.* 4*s.* 7*d.* Sterling; 60 mina made the talent, equal

to

to 193*l.* 15*s.* Sterling: hence 100 talents amounted to 19,375*l.* Sterling.

The mina and talentum, indeed, were different in different provinces: their proportions in Attic drachms are as follow. The Syrian mina contained 25 Attic drachms; the Ptolemaic $33\frac{1}{3}$; the Antiochic and Eubæan 100; the Babylonic 116; the greater Attic and Tyrian $133\frac{1}{3}$; the Æginean and Rhodian $166\frac{2}{3}$. The Syrian talent contained 15 Attic minæ; the Ptolemaic 20; the Antiochic 60; the Eubæan 60; the Babylonic 70; the greater Attic and Tyrian 80; the Æginean and Rhodian 100.

2. Roman moneys of account were the *feftertius* and *feftertium.* The feftertins was equal to 1*d.* $3\frac{3}{4}$*q.* Sterling. One thoufand of thefe made the feftertinm, equal to 8*l.* 1*s.* 5*d.* 2*q.* Sterling. One thoufand of thefe feftertia made the decies feftertium (the adverb *centies* being always underftood) equal to 8072*l.* 18*s.* 4*d.* Sterling. The decies feftertium they alfo called *decies centena millia nummum.* Centies feftertium, or centies HS, were equal to 80,729*l.* 3*s.* 4*d.* Millies HS to 807,291*l.* 13*s.* 4*d.* Millies centies HS to 888,020*l.* 16*s.* 8*d.*

Theory of Money.

1. *Of Artificial or Material Money.*

I. As far back as our accounts of the tranfactions of mankind reach, we find they had adopted the precious metals, that is, filver and gold, as the common meafure of value, and as the adequate equivalent for every thing alienable.

The metals are admirably adapted for this purpofe: they are perfectly homogeneous: when pure, their maffes, or bulks, are exactly in proportion to their weights: no phyfical difference can be found between two pounds of gold, or filver, let them be the production of the mines of Europe, Afia, Africa, or America: they are perfectly malleable, fufible, and fuffer the moft exact divifion which human art is capable to give them: they are capable of being mixed with one another, as well as with metals of a bafer, that is, of a lefs homogeneous nature, fuch as copper: by this mixture they fpread themfelves uniformly through the whole mafs of the compofed lump, fo that every atom of it becomes proportionally poffeffed of a fhare of this noble mixture; by which means the fubdivifion of the precious metals is rendered very extenfive.

Their phyfical qualities are invariable: they lofe nothing by keeping; they are folid and durable; and tho' their parts are feparated by friction, like every other thing, yet ftill they are of the number of thofe which fuffer leaft by it.

If money, therefore, can be made of any thing, that is, if the proportional value of things vendible can be meafured by any thing material, it may be meafured by the metals.

II. The two metals being pitched upon as the moft proper fubftances for realifing the ideal fcale of money, thofe who undertake the operation of adjufting a ftandard, muft conftantly keep in their eye the nature and qualities of a fcale, as well as the principles upon which it is formed.

The unit of the fcale muft conftantly be the fame, altho' realifed in the metals, or the whole operation fails in the moft effential part. This realifing the unit is like adjufting a pair of compaffes to a geometrical fcale, where the fmalleft deviation from the exact opening once given muft occafion an incorrect meafure. The metals, therefore, are to money what a pair of compaffes is to a geometrical fcale.

This operation of adjufting the metals to the money of account implies an exact and determinate proportion of both metals to the money-unit, realifed in all the fpecies and denominations of coin, adjufted to that ftandard.

The fmalleft particle of either metal added to, or taken away from, any coins, which reprefent certain determinate parts of the fcale, overturns the whole fyftem of material money. And if, notwithftanding fuch variation, thefe coins continue to bear the fame denominations as before, this will as effectually deftroy their ufefulnefs in meafuring the value of things, as it would overturn the ufefulnefs of a pair of compaffes, to fuffer the opening to vary, after it is adjufted to the fcale reprefenting feet, toifes, miles, or leagues, by which the diftances upon the plan are to be meafured.

III. Debafing the ftandard is a good term; becaufe it conveys a clear and diftinct idea. It is diminifhing the weight of the pure metal contained in that denomination by which a nation reckons, and which we have called the *money-unit.* Raifing the ftandard requires no farther definition, being the direct contrary.

IV. Altering the ftandard (that is, raifing or debafing the value of the money-unit) is like altering the national meafures or weights. This is beft difcovered by comparing the thing altered with things of the fame nature which have fuffered no alteration. Thus if the foot of meafure was altered at once over all England, by adding to it, or taking from it, any proportional part of its ftandard length, the alteration would be beft difcovered by comparing the new foot with that of Paris, or of any other country, which had fuffered no alteration. Juft fo, if the pound Sterling, which is the Englifh unit, fhall be found any how changed, and if the variation it has met with be difficult to afcertain becaufe of a complication of circumftances, the beft way to difcover it, will be to compare the former and the prefent value of it with the money of other nations which has fuffered no variation. This the courfe of exchange will perform with the greateft exactnefs.

V. Artifts pretend, that the precious metals, when abfolutely pure from any mixture, are not of fufficient hardnefs to conftitute a folid and lafting coin. They are found alfo in the mines mixed with other metals of a bafer nature, and the bringing them to a ftate of perfect purity occafions an unneceffary expence. To avoid, therefore, the inconvenience of employing them in all their purity, people have adopted the expedient of mixing them with a determinate proportion of other metals, which hurts neither their fufibility, malleability, beauty, or luftre. This metal is called *alloy*; and, being confidered only as a fupport to the principal metal, is accounted of no value in itfelf. So that eleven ounces of gold, when mixed with one ounce of filver, acquires, by that addition, no augmentation of value whatever.

This

This being the cafe, we fhall, as much as poffible, overlook the exiftence of alloy, in fpeaking of money, in order to render language lefs fubject to ambiguity.

2. *Incapacities of the Metals to perform the Office of an invariable Meafure of Value.*

I. Were there but one fpecies of fuch a fubftance as we have reprefented gold and filver to be; were there but one metal poffeffing the qualities of purity, divifibility, and durability; the inconveniencies in the ufe of it for money would be fewer by far than they are found to be as matters ftand.

Such a metal might then, by an unlimited divifion into parts exactly equal, be made to ferve as a tolerably fteady and univerfal meafure. But the rivalfhip between the metals, and the perfect equality which is found between all their phyfical qualities, fo far as regards purity and divifibility, render them fo equally well adapted to ferve as the common meafure of value, that they are univerfally admitted to pafs current as money.

What is the confequence of this? that the one meafures the value of the other, as well as that of every other thing. Now the moment any meafure begins to be meafured by another, whofe proportion to it is not phyfically, perpetually, and invariably the fame, all the ufefulnefs of fuch a meafure is loft. An example will make this plain.

A foot of meafure is a determinate length. An Englifh foot may be compared with the Paris foot, or with that of the Rhine; that is to fay, it may be meafured by them: and the proportion between their lengths may be expreffed in numbers; which proportion will be the fame perpetually. The meafuring the one by the other will occafion no uncertainty; and we may fpeak of length by Paris feet, and be perfectly well underftood by others who are ufed to meafure by the Englifh foot, or by the foot of the Rhine.

But fuppofe that a youth of 12 years old takes it into his head to meafure from time to time, as he advances in age, by the length of his own foot, and that he divides this growing foot into inches and decimals: what can be learned from his account of meafures? As he increafes in years, his foot, inches, and fubdivifions, will be gradually lengthening; and were every man to follow his example, and meafure by his own foot, then the foot of a meafure now eftablifhed would totally ceafe to be of any utility.

This is juft the cafe with the two metals. There is no determinate invariable proportion between their value; and the confequence of this is, that when they are both taken for meafuring the value of other things, the things to be meafured, like lengths to be meafured by the young man's foot, without changing their relative proportion between themfelves, change, however, with refpect to the denominations of both their meafures. An example will make this plain.

Let us fuppofe an ox to be worth 3000 pounds weight of wheat, and the one and the other to be worth an ounce of gold, and an ounce of gold to be worth exactly 15 ounces of filver: if the cafe fhould happen, that the proportional value between gold and filver fhould come to be as 14 is to 1, would not the ox, and confequently the wheat, be eftimated at lefs in filver, and more in gold, than formerly? Farther, would it be in the power of any ftate to prevent this variation in the meafure of the value of oxen and wheat, without putting into the unit of their money lefs filver and more gold than formerly?

If therefore any particular ftate fhould fix the ftandard of the unit of their money to one fpecies of the metals, while in fact both the one and the other are actually employed in meafuring value; does not fuch a ftate refemble the young man who meafures all by his growing foot? For if filver, for example, be retained as the ftandard, while it is gaining upon gold one fifteenth additional value; and if gold continue all the while to determine the value of things as well as filver; it is plain, that, to all intents and purpofes, this filver-meafure is lengthening daily like the young man's foot, fince the fame weight of it muft become every day equivalent to more and more of the fame commodity; notwithftanding that we fuppofe the fame proportion to fubfift, without the leaft variation, between that commodity and every other fpecies of things alienable.

Buying and felling are purely conventional, and no man is obliged to to give his merchandife at what may be fuppofed to be the proportion of its worth. The ufe, therefore, of an univerfal meafure, is to mark, not only the relative value of the things to which it is applied as a meafure, but to difcover in an inftant the proportion between the value of thofe, and of every other commodity valued by a determinate meafure in all the countries of the world.

Were pounds Sterling, livres, florins, piaftres, &c. which are all money of account, invariable in their values, what a facility would it produce in all converfions, what an affiftance to trade! But as they are all limited or fixed to coins, and confequently vary from time to time, this example fhews the utility of the invariable meafure which we have defcribed.

There is another circumftance which incapacitates the metals from performing the office of money; the fubftance of which the coin is made, is a commodity which rifes and finks in its value with refpect to other commodities, according to the wants, competition, and caprices of mankind. The advantage, therefore, found in putting an intrinfic value into that fubftance which performs the function of money of account, is compenfated by the inftability of that intrinfic value; and the advantage obtained by the ftability of paper, or fymbolical money, is compenfated by the defect it commonly has of not being at all times fufceptible of realization into folid property or intrinfic value.

In order, therefore, to render material money more perfect, this quality of metal, that is, of a commodity, fhould be taken from it; and in order to render paper-money more perfect, it ought to be made to circulate upon metallic or land-fecurity.

II. There are feveral fmaller inconveniencies accompanying the ufe of the metals, which we fhall here fhortly enumerate.

1*mo*, No money made of gold or filver can circulate long, without lofing of its weight, altho' it all along preferves the fame denomination. This reprefents the contracting a pair of compaffes which had been rightly adjufted to the fcale.

2*do*, Ano-

2*do*, Another inconvenience proceeds from the fabrication of money. Suppofing the faith of princes who coin money to be inviolable, and the probity as well as capacity of thofe to whom they commit the infpection of the finenefs of the metals to be fufficient, it is hardly poffible for workmen to render every piece exactly of a proper weight, or to preferve the due proportion between pieces of different denominations; that is to fay, to make every ten fixpences exactly of the fame weight with every crown-piece and every five fhillings ftruck in a coinage. In proportion to fuch inaccuracies, the parts of the fcale become unequal.

3*tio*, Another inconvenience, and far from being inconfiderable, flows from the expence requifite for the coining of money. This expence adds to its value as a manufacture, withing adding any thing to its weight.

4*to*, The laft inconvenience is, that by fixing the money of account entirely to the coin, without having any independent common meafure, (to mark and control thefe deviations from mathematical exactnefs, which are either infeparable from the metals themfelves, or from the fabrication of them), the whole meafure of value, and all the relative interefts of debtors and creditors, become at the difpofal not only of workmen in the mint, of Jews who deal in money, of clippers and wafhers of coin; but they are alfo entirely at the mercy of princes, who have the right of coinage, and who have frequently alfo the right of raifing or debafing the ftandard of the coin, according as they find it moft for their prefent and temporary intereft.

3. *Methods which may be propofed for leffening the feveral Inconveniences to which Material Money is liable.*

The inconveniences from the variation in the relative value of the metals to one another, may in fome meafure be obviated by the following expedients.

1*mo*, By confidering one only as the ftandard, and leaving the other to feek its own value like any other commodity.

2*do*, By confidering one only as the ftandard, and fixing the value of the other from time to time by authority, according as the market-price of the metals fhall vary.

3*tio*, By fixing the ftandard of the unit according to the mean proportion of the metals, attaching it to neither; regulating the coin accordingly; and upon every confiderable variation in the proportion between them, either to make a new coinage, or to raife the denomination of one of the fpecies, and lower it in the other, in order to preferve the unit exactly in the mean proportion between the gold and filver.

4*to*, To have two units and two ftandards, one of gold and one of filver, and to allow every body to ftipulate in either.

5*to*, Or laft of all, to oblige all debtors to pay one half in gold, and one half in the filver ftandard.

4. *Variations to which the Value of the Money-unit is expofed from every Diforder in the Coin.*

Let us fuppofe, at prefent, the only diforder to confift in a want of the due proportion between the gold and filver in the coin.

This proportion can only be eftablifhed by the market-price of the metals; becaufe an augmentation and rife in the demand for gold or filver has the effect of augmenting the value of the metal demanded. Let us fuppofe, that to-day one pound of gold may buy fifteen pounds of filver: If to-morrow there be a high demand for filver, a competition among merchants to have filver for gold will enfue; they will contend who fhall get the filver at the rate of 15 pounds for one of gold: this will raife the price of it; and in proportion to their views of profit, fome will accept of lefs than the 15 pounds. This is plainly a rife in the filver, more properly than a fall in the gold; becaufe it is the competition for the filver which has occafioned the variation in the former proportion between the metals.

Let us now fuppofe, that a ftate, having with great exactnefs examined the proportion of the metals in the market, and having determined the precife quantity of each for realifing or reprefenting the money-unit, fhall execute a moft exact coinage of gold and filver coin. As long as that proportion continues unvaried in the market, no inconvenience can refult from that quarter in making ufe of metals for money of account.

But let us fuppofe the proportion to change; that the filver, for example, fhall rife in its value with regard to gold: will it not follow, from that moment, that the unit realized in the filver, will become of more value than the unite realized in the gold coin?

But as the law has ordered them to pafs as equivalents for one another, and as debtors have always the option of paying in what legal coin they think fit, will they not all choofe to pay in gold, and will not then the filver coin be melted down or exported, in order to be fold as bullion, above the value it bears when it circulates in coin? Will not this paying in gold alfo really diminifh the value of the money-unit, fince upon this variation every thing muft fell for more gold than before, as we have already obferved?

Confequently, merchandife, which have not varied in their relative value to any other thing but to gold and filver, muft be meafured by the mean proportion of the metals; and the application of any other meafure to them is altering the ftandard. If they are meafured by the gold, the ftandard is debafed; if by filver, it is raifed.

If, to prevent the inconvenience of melting down the filver, the ftate fhall give up affixing the value of their unit to both fpecies at once, and fhall fix it to one, leaving the other to feek its price as any other commodity; in that cafe, no doubt, the melting down of the coin will be prevented; but will ever this reftore the value of the money-unit to its former ftandard? Would it, for example, in the foregoing fuppofition, raife the debafed value of the money-unit in the gold coin, if that fpecies were declared to be the ftandard? It would indeed render filver coin purely a merchandife, and, by allowing it to feek its value, would certainly prevent it from being melted down as before; becaufe the pieces would rife conventionally in their denomination; or an *agio*, as it is called, would be taken in payments made in filver: but the gold would

would not, on that account, rife in its value, or begin to purchafe any more merchandife than before. Were therefore the ftandard fixed to the gold, would not this be an arbitrary and a violent revolution in the value of the money-unit, and a debafement of the ftandard?

If, on the other hand, the ftate fhould fix the ftandard to the filver, which we fuppofe to have rifen in its value, would that ever fink the advanced value which the filver coin had gained above the worth of the former ftandard unit? and would not this be a violent and an arbitrary revolution in the value of the money-unit, and a raifing of the ftandard?

The only expedient, therefore, is, in fuch a cafe, to fix the numerary unit to neither of the metals, but to contrive a way to make it fluctuate in a mean proportion between them; which is in effect the introduction of a pure ideal money of account.

The regulation of fixing the unit by the mean proportion, ought to take place at the inftant the ftandard unit is affixed with exactnefs both to the gold and filver. If it be introduced long after the market-proportion between the metals has deviated from the proportion eftablifhed in the coin; and if the new regulation is made to have a retrofpect, with regard to the acquitting of permanent contracts entered into while the value of the money-unit had attached itfelf to the loweft currency in confequence of the principle above laid down; then the reftoring the money-unit to that ftandard where it ought to have remained (to wit, to the mean proportion) is an injury to all debtors who have contracted fince the time that the proportion of the metals began to vary.

This is clear from the former reafoning. The moment the market-price of the metals differs from that in the coin, every one who has payments to make, pays in that fpecies which is the higheft rated in the coin; confequently, he who lends, lends in that fpecies. If after the contract, therefore, the unit is carried up to the mean proportion, this muft be a lofs to him who had borrowed.

From this we may perceive, why there is lefs inconvenience from the varying of the proportion of the metals, where the ftandard is fixed to one of them, than when it is fixed to both. In the firft cafe, it is at leaft uncertain whether the ftandard or the merchandife fpecies is to rife; confequently it is uncertain whether the debtors or the creditors are to gain by a variation. If the ftandard fpecies fhould rife, the creditors will gain; if the merchandife fpecies rifes, the debtors will gain; but when the unit is attached to both fpecies, then the creditors never can gain, let the metals vary as they will: if filver rifes, then debtors will pay in gold; if gold rifes, the debtors will pay in filver. But whether the unit be attached to one or to both fpecies, the infallible confequence of a variation is, that one half of the difference is either gained or loft by debtors and creditors. The invariable unit is conftantly the mean proportional between the two meafures.

5. *How the Variations of the intrinfic Value of the Unit of Money muft affect all the domeftic Intereft of a Nation.*

If the changing the content of the bufhel by which grain is meafured, would affect the intereft of thofe who are obliged to pay, or who are entitled to receive, a certain number of bufhels of grain for the rent of lands; in the fame manner muft every variation in the value of the unit of account affect all perfons who, in permanent contracts, are obliged to make payments, or who are entitled to receive fums of money ftipulated in multiples or in fractions of that money-unit.

Every variation, therefore, upon the intrinfic value of the money-unit, has the effect of benefiting the clafs of creditors at the expence of debtors, or *vice verfa*.

This confequence is deduced from an obvious principle. Money is more or lefs valuable in proportion as it can purchafe more or lefs of every kind of merchandife. Now, without entering anew into the caufes of the rife and fall of prices, it is agreed upon all hands, that whether an augmentation of the general mafs of money in circulation has the effect of raifing prices in general, or not, any augmentation of the quantity of the metals appointed to be put into the money-unit, muft at leaft affect the value of that money-unit, and make it purchafe more of any commodity than before: that is to fay, if 113 grains of fine gold, the prefent weight of a pound Sterling in gold, can buy 113 pounds of flour; were the pound Sterling raifed to 114 grains of the fame metal, it would buy 114 pounds of flour; confequently, were the pound Sterling augmented by one grain of gold, every miller who paid a rent of ten pounds a-year, would be obliged to fell 1140 pounds of his flour, in order to procure ten pounds to pay his rent, in place of 1130 pounds of flour, which he fold formerly to procure the fame fum; confequently, by this innovation, the miller muft lofe yearly ten pounds of flour, which his mafter confequently muft gain. From this example, it is plain, that every augmentation of metals put into the pound Sterling, either of filver or gold, muft imply an advantage to the whole clafs of creditors who are paid in pounds Sterling, and confequently muft be a proportional lofs to all debtors who muft pay by the fame denomination.

6. *Of the Diforder in the Britifh Coin, fo far as it occafions the melting down or the exporting of the Specie.*

The defects in the Britifh coin are three.

1mo, The proportion between the gold and filver in it is found to be as 1 to $15\frac{2}{10}$, whereas the market price may be fuppofed to be nearly as 1 to $14\frac{1}{2}$.

2do, Great part of the current money is worn and light.

3tio, From the fecond defect proceeds the third, to wit, that there are feveral currencies in circulation which pafs for the fame value, without being of the fame weight.

4to, From all thefe defects refults the laft and greateft inconvenience, to wit, that fome innovation muft be made, in order to fet matters on a right footing.

The Englifh, befides the unit of their money which they call the pound Sterling, have alfo the unit of their weight for weighing the precious metals.

This is called the *pound troy*, and confifts of 12 ounces, Money. ounces, every ounce of 20 penny-weights, and every penny-weight of 24 grains. The pound troy, therefore, confists of 240 penny-weights, and 5760 grains.

The finenefs of the filver is reckoned by the number of ounces and penny-weights of the pure metals in the pound troy of the compofed mafs; or, in other words, the pound troy, which contains 5760 grains of ftandard filver, contains 5328 grains of fine filver, and 432 grains of copper, called *alloy*.

Thus ftandard filver is 11 ounces 2 penny-weights of fine filver in the pound troy to 18 penny-weights copper, or 111 parts fine filver to 9 parts alloy.

Standard gold is 11 ounces fine to 1 ounce filver or copper employed for alloy, which together make the pound troy; confequently, the pound troy of ftandard gold contains 5280 grains fine, and 480 grains alloy, which alloy is reckoned of no value.

This pound of ftandard filver is ordered, by ftatute of the 43d of Elizabeth, to be coined into 62 fhillings, 20 of which make the pound fterling; confequently the 20 fhillings contain 1718.7 grains of fine filver, and 1858.06 ftandard filver.

The pound troy of ftandard gold, $\frac{11}{12}$ fine, is ordered, by an act of King Charles II. to be cut into $44\frac{1}{2}$ guineas; that is to fay, every guinea contains 129.43 grains of ftandard gold, and 118.644 of fine gold; and the pound Sterling, which is $\frac{20}{21}$ of the guinea, contains 112.994, which we may ftate at 113 grains of fine gold.

The coinage in England is entirely defrayed at the expence of the ftate. The mint price for the metals is the very fame with the price of the coin. Whoever carries to the mint an ounce of ftandard filver, receives for it in filver coin 5*s.* 2*d.* or 62*d.*: whoever carries an ounce of ftandard gold receives in gold coin 3*l.* 17*s.* $10\frac{1}{2}$*d.* the one and the other making exactly an ounce of the fame finenefs with the bullion. Coin, therefore, can have no value in the market above bullion; confequently, no lefs can be incurred by thofe who melt it down.

When the guinea was firft ftruck, the government (not inclining to fix the pound Sterling to the gold coin of the nation) fixed the guinea at 20 fhillings, (which was then below its proportion to the filver), leaving it to feek its own price above that value, according to the courfe of the market.

By this regulation no harm was done to the Englifh filver ftandard; becaufe the guinea, or 118.644 grains fine gold being worth more, at that time, than 20 fhillings, or 1718.7 grains fine filver, no debtor would pay with gold at its ftandard value; and whatever it was received for above that price was purely conventional.

Accordingly guineas fought their own price until the year 1728, that they were fixed a-new, not below their value as at firft, but as what was then reckoned their exact value, according to the proportion of the metals, *viz.* at 21 fhillings; and at this they were ordered to pafs current in all payments.

This operation had the effect of making the gold a ftandard as well as the filver. Debtors then paid indifferently in gold as well as in filver, becaufe both were fuppofed to be of the fame intrinfic as well as current value; in which cafe no inconvenience could follow upon this regulation. But, in time, filver came to be more demanded; the making of plate began to prevail more than formerly, and the exportation of filver to the Eaft Indies increafing yearly, made the demand for it greater, or perhaps brought its quantity to be proportionally lefs than before. This changed the proportion of the metals; and by flow degrees they have come from that of 1 to 15.2 (the proportion they were fuppofed to have when the guineas were fixed and made a lawful money at 21 fhillings) to that of 14.5, the prefent *fuppofed* proportion. Money.

The confequence of this has been, that the fame guinea which was worth 1804.6 grains fine filver, at the time it was fixed at 21 fhillings, is now worth no more than 1719.9 grains of fine filver according to the proportion of $14\frac{1}{2}$ to 1.

Confequently debtors, who have always the option of the legal fpecies in paying their debts, will pay pounds fterling no more in filver but in gold; and as the gold pounds they pay in, are not intrinfically worth the filver pounds they paid in formerly according to the ftatute of Elifabeth, it follows that the pound fterling in filver is really no more the ftandard, fince nobody will pay at that rate, and fince nobody can be compelled to do it.

Befides this want of proportion between the metals, the filver coined before the reign of George I. is now become light by circulation; and the guineas coined by all the princes fince Charles II. pafs by tale, tho' many of them are confiderably diminifhed in their weight.

Let us now examine what profit the want of proportion and the want of weight in the coin can afford to the money-jobbers in melting it down or exporting it.

Did every body confider coin only as the meafure for reckoning value, without attending to its value as a metal, the deviations of gold and filver coin from perfect exactnefs, either as to proportion or weight, would occafion little inconvenience.

Great numbers indeed, in every modern fociety, confider coin in no other light than that of money of account; and have great difficulty to comprehend what difference any one can find between a light fhilling and a heavy one, or what inconvenience there can poffibly refult from a guinea's being fome grains of fine gold too light to be worth 21 fhillings ftandard weight. And did every one think in the fame way, there would be no occafion for coin of the precious metals at all; leather, copper, iron, or paper, would keep the reckoning as well as gold and filver.

But although there be many who look no farther than at the ftamp on the coin, there are others whofe fole bufinefs it is to examine its intrinfic worth as a commodity, and to profit of every irregularity in the weight and proportion of metals.

By the very inftitution of coinage, it is implied, that every piece of the fame metal, and fame denomination with regard to the money-unit, fhall pafs current for the fame value.

It is, therefore, the employment of money-jobbers, to examine, with a fcrupulous exactnefs, the precife weight of every piece of coin which comes into their hands.

The firft object of their attention is, the price of the metals in the market: a jobber finds, at prefent, that with 14.5 pounds of fine filver bullion, he can buy one

one pound of fine gold bullion.

He therefore buys up with gold coin all the new ſilver as faſt as it is coined, of which he can get at the rate of 15.2 pounds for one in gold; theſe 15.2 pounds ſilver coin he melts down into bullion, and converts that back into gold bullion, giving at the rate of only 14.5 pounds for one.

By this operation he remains with the value of $\frac{7}{10}$ of one pound weight of ſilver bullion clear profit upon the $15\frac{1}{5}$ pounds he bought; which $\frac{7}{10}$ is really loſt by the man who inadvertently coined ſilver at the mint, and gave it to the money-jobber for his gold. Thus the ſtate loſes the expence of the coinage, and the public the convenience of change for their guineas.

But here it may be aſked, Why ſhould the money-jobber melt down the ſilver coin? can he not buy gold with it as well without melting it down? He cannot; becauſe when it is in coin, he cannot avail himſelf of its being new and weighty. Coin goes by tale, not by weight; therefore, were he to come to market with his new ſilver coin, gold bullion being ſold at the mint price, we ſhall ſuppoſe, viz. at 3*l.* 17*s.* 10½*d.* Sterling money *per* ounce, he would be obliged to pay the price of what he bought with heavy money, which he can equally do with light.

He therefore melts down the new ſilver coin, and ſells it for bullion, at ſo many pence an ounce; the price of which bullion is, in the Engliſh market, always above the price of ſilver at the mint, for the reaſons now to be given.

When you ſell ſtandard-ſilver bullion at the mint, you are to paid in weighty money; that is, you receive for your bullion the very ſame weight in ſtandard coin; the coinage coſt nothing: but when you ſell bullion in the market, you are paid in worn out ſilver, in gold, in bank-notes, in ſhort, in every ſpecies of lawful current money. Now all theſe payments have ſome defect: the ſilver you are paid with is worn and light; the gold you are paid with is over rated, and perhaps alſo light; and the bank-notes muſt have the ſame value with the ſpecie with which the bank pays them; that is, with light ſilver or over-rated gold.

It is for theſe reaſons, that ſilver bullion, which is bought by the mint at 5*s.* 2*d.* *per* ounce of heavy ſilver money, may be bought at market at 65 pence the ounce in light ſilver, over-rated gold, or bank-notes, which is the ſame thing.

Further, we have ſeen how the impoſition of coinage has the effect of raiſing coin above the value of bullion, by adding a value to it which it had not as a metal.

Juſt ſo, when the unit is once affixed to certain determined quantities of both metals, if one of the metals ſhould afterwards riſe in value in the market, the coin made of that metal muſt loſe a part of its value as coin, although it retains it as a metal. Conſequently, as in the firſt caſe it acquired an additional value by being coined, it muſt now acquire an addititional value by being melted down. From this we may conclude, that when the ſtandard is affixed to both the metals in the coin, and when the proportion of that value is not made to follow the price of the market, that ſpecies which riſes in the market is melted down, and the bullion is ſold for a price as much exceeding the mint price as the metal has riſen in its value.

If, therefore, in England, the price of ſilver bullion is found to be at 65 pence the ounce, while at the mint it is rated at 62; this proves that ſilver has riſen $\frac{3}{65}$ above the proportion obſerved in the coin, and that all coin of ſtandard weight may conſequently be melted down with a profit of $\frac{3}{65}$. But as there are ſeveral other circumſtances to be attended to which regulate and influence the price of bullion, we ſhall here paſs them in review, the better to diſcover the nature of this diſorder in the Engliſh coin, and the advantages which money-jobbers may draw from it.

The price of bullion, like that of every other merchandiſe, is regulated by the value of the money it is paid with.

If bullion, therefore, ſells in England for 65 pence an ounce, paid in ſilver coin, it muſt ſell for 65 ſhillings the pound troy; that is to ſay, the ſhillings it is commonly paid with do not exceed the weight of $\frac{1}{65}$ of a pound troy: for if the 65 ſhillings with which the pound of bullion is paid weighed more than a pound troy, it would be a ſhorter and better way for him who wants bullion to melt down the ſhillings and make uſe of the metal, than to go to market with them in order to get leſs.

We may, therefore, be very certain, that no man will buy ſilver bullion at 65 pence an ounce, with any ſhilling which weighs above $\frac{1}{65}$ of a pound troy,

We have gone upon the ſuppoſitiou that the ordinary price of bullion in the Engliſh market is 65 pence *per* ounce. This has been done upon the authority of ſome late writers on this ſubject: it is now proper to point out the cauſes which may make it deviate from that value.

I. It may vary, and certainly will vary, in the price, according as the currency is better or worſe. When the expences of a war, or a wrong balance of trade, have carried off a great many heavy guineas, it is natural that bullion ſhould riſe; becauſe then it will be paid for more commonly in light gold and ſilver; that is to ſay, with pounds Sterling, below the value of 113 grains fine gold, the worth of the pound Sterling in new guineas.

II. This wrong balance of trade, or a demand for bullion abroad, becoming very great, may occaſion a ſcarcity of the metals in the market, as well as a ſcarcity of the coin; conſequently, an advanced price muſt be given for it in proportion to the greatneſs and height of the demand. In this caſe, both the ſpecie and the bullion muſt be bought with paper. But the riſe in the price of bullion proceeds from the demand for the metals and the competition between merchants to procure them, and not becauſe the paper given as the price is at all of inferior value to the ſpecie. The leaſt diſcredit of this kind would not tend to diminiſh the value of the paper; it would annihilate it at once. Therefore, ſince the metals muſt be had, and that the paper cannot ſupply the want of them when they are to be exported, the price riſes in proportion to the difficulties in finding metals elſewhere than in the Engliſh market.

III. A ſudden call for bullion, for the making of plate. A goldſmith can well afford to give 67 pence for an ounce of ſilver, that is to ſay, he can afford to give one pound of gold for 14 pounds of ſilver, and perhaps for

Money.

for less, notwithstanding that what he gives be more than the ordinary proportion between the metals, because he indemnifies himself amply by the price of his workmanship; just as a tavern-keeper will pay any price for a fine fish, because, like the goldsmith, he buys for other people.

IV. The mint price has as great an effect in bringing down the price of bullion, as exchange has in raising it. In countries where the metals in the coin are justly proportioned, where all the currencies are of legal weight, and where coinage is imposed, the operations of trade make the price of bullion constantly to fluctuate between the value of the coin and the mint-price of the metals.

Now let us suppose that the current price of silver bullion in the market is 65 pence the ounce, paid in lawful money, no matter of what weight or of what metal. Upon this the money-jobber falls to work. All shillings which are above $\frac{1}{65}$ of a pound troy, he throws into his melting pot, and sells them as bullion for 65d. *per* ounce; all those which are below that weight he carries to market, and buys bullion with them at 65d. *per* ounce.

What is the consequence of this?

That those who sell the bullion, finding the shillings which the money-jobber pays with perhaps not above $\frac{1}{66}$ of a pound troy, they on their side raise the price of their bullion to 66 d. the ounce.

This makes new work for the money-jobber; for he must always gain. He now weighs all shillings as they come to hand; and as formerly he threw into his melting-pot those only which were worth more than $\frac{1}{65}$ of a pound troy, he now throws in all that are in value above $\frac{1}{66}$. He then sells the melted shillings at 66 d. the ounce, and buys bullion with the light ones at the same price.

This is the consequence of ever permitting any species of coin to pass by the authority of the stamp, without controlling it at the same time by the weight: and this is the manner in which money-jobbers gain by the currency of light money.

It is no argument against this exposition of the matter to say, that silver bullion is seldom bought with silver coin; because the pence in new guineas are worth no more than the pence of shillings of 65 in the pound troy: that is to say, that 240 pence contained in $\frac{20}{21}$ of a new guinea, and 240 pence contained in 28 shillings of 65 to the pound troy, differ no more in the intrinsic value than 0.83 of a grain of fine silver upon the whole, which is a mere trifle.

Whenever, therefore, shillings come below the weight of $\frac{1}{65}$ of a pound troy, then there is an advantage in changing them for new guineas; and when that is the case, the new guineas will be melted down, and profit will be found in selling them for bullion, upon the principles we have just been explaining.

We have already given a specimen of the domestic operations of the money-jobbers; but these are not the most prejudicial to national concerns. The jobbers may be supposed to be Englishmen; and in that case the profit they make remains at home: but whenever there is a call for bullion to pay the balance of trade, it is evident that this will be paid in silver coin, never in gold, if heavy silver can be got; and this again carries away the silver coin, and renders it at home so rare, that great inconveniencies are found for want of the lesser denominations of it. The loss, however, here is confined to an inconvenience; because the balance of trade being a debt which must be paid, we do not consider the exportation of the silver for that purpose as any consequence of the disorder of the coin. But besides this exportation which is necessary, there are others which are arbitrary, and which are made only with a view to profit of the wrong proportion.

When the money-jobbers find difficulty in carrying on the traffic we have described, in the English market, because of the competition among themselves, they carry the silver coin out of the country, and sell it abroad for gold, upon the same principles that the East India company send silver to China in order to purchase gold.

It may be demanded, What hurt this trade can do to Britain, since those who export silver bring back the same value in gold? Were this trade carried on by natives, there would be no loss; because they would bring home gold for the whole intrinsic value of the silver. But if we suppose foreigners sending over gold to be coined at the English mint, and changing the gold into English silver coin, and then carrying off this coin, it is plain that they must gain the difference, as well as the money-jobbers. But it may be answered, That having given gold for silver at the rate of the mint, they have given value for what they have received. Very right; but so did Sir Hans Sloane, when he paid five guineas for an overgrown tod: he got value for his money; but it was value only to himself. Just so, whenever the English government shall be obliged to restore the proportion of the metals, (as they must do,) this operation will annihilate that imaginary value which they have hitherto set upon gold; which imagination is the only thing which renders the exchange of their silver against the foreign gold equal.

But it is farther objected, that foreigners cannot carry off the heavy silver; because there is none to carry off. Very true; but then they have carried off a great quantity already: or if the English Jews have been too sharp to allow such a profit to fall to strangers, (which may or may not have been the case,) then this disorder is an effectual stop to any more coinage of silver for circulation.

7. *Of the Disorder in the British Coin, so far as it affects the Value of the Pound Sterling Currency.*

From what has been said, it is evident, that there must be found in England two legal pounds Sterling, of different values; the one worth 113 grains of fine gold, the other worth 1718.7 grains of fine silver. We call them different; because these two portions of the precious metals are of different values all over Europe.

But besides these two different pounds Sterling, which the change in the proportion of the metals have created, the other defects of the circulating coin produce similar effects. The guineas coined by all the princes since K. Charles II. have been of the same standard weight and fineness, $44\frac{1}{2}$ in a pound troy of standard gold $\frac{11}{12}$ fine: these have been constantly

wearing

wearing ever fince they have been coined; and in proportion to their wearing they are of lefs value.

If, therefore, the new guineas are below the value of a pound Sterling in filver, ftandard weight, the old muft be of lefs value ftill. Here then is another currency, that is, another pound Sterling; or indeed, more properly fpeaking, there are as many different pounds Sterling as there are guineas of different weights. This is not all; the money-jobbers having carried off all the weighty filver, that which is worn with ufe, and reduced even below the ftandard of gold, forms one currency more, and totally deftroys all determinate proportion between the money-unit and the currencies which are fuppofed to reprefent it.

It may be afked, how, at this rate, any filver has remained in England? It is anfwered, that the few weighty fhillings which ftill remain in circulation, have marvelloufly efcaped the hands of the money-jobbers: and as for the reft, the rubbing and wearing of thefe pieces has done what the ftate might have done; that is to fay, it has reduced them to their due proportion with the lighteft gold.

The diforder, therefore, of the Englifh coin has rendered the ftandard of a pound Sterling quite uncertain. To fay that it is 1718.7 grains of fine filver, is quite ideal. Who are paid in fuch pounds? To fay that it is 113 grains of pure gold, may alfo not be true; becaufe there are many currencies worfe than the new guineas.

What then is the confequence of all this diforder; What effect has it upon the current value of a pound Sterling? And which way can the value of that be determined?

The operations of trade bring value to an equation, notwithftanding the greateft irregularities poffible; and fo in fact a pound Sterling has acquired a determinate value over all the world by the means of foreign exchange. This is a kind of ideal fcale for meafuring the Britifh coin, altho' it has not all the properties of that defcribed above.

Exchange confiders the pound Sterling as a value determined according to the combination of the values of all the different currencies, in proportion as payments are made in the one or the other; and as debtors generally take care to pay in the worft fpecies they can, it confequently follows, that the value of the pound Sterling fhould fall to that of the loweft currency.

Were there a fufficient quantity of worn gold and filver to acquit all bills of exchange, the pound Sterling would come down to the value of them; but if the new gold be alfo neceffary for that purpofe, the value of it muft be proportionally greater.

All thefe combinations are liquidated and compenfated with one another, by the operations of trade and exchange: and the pound Sterling, which is fo different in itfelf, becomes thereby, in the eyes of commerce, a determinate unit; fubject, however, to variations, from which it never can be exempted.

Exchange, therefore, is one of the beft meafures for valuing a pound Sterling, prefent currency. Here occurs a queftion:

Does the great quantity of paper-money in England tend to diminifh the value of the pound Sterling?

We anfwer in the negative. Paper money is juft as good as gold or filver money, and no better. The variation of the ftandard, as we have already faid, muft influence the interefts of debtors and creditors proportionally every where. From this it follows, that all augmentation of the value of the money-unit in the fpecie muft hurt the debtors in the paper money; and all diminutions, on the other hand, muft hurt the creditors in the paper money as well as every where elfe. The payments, therefore, made in paper money, never can contribute to the regulation of the ftandard of the pound Sterling; it is the fpecie received in liquidation of that paper money which alone can contribute to mark the value of the Britifh unit; becaufe it is affixed to nothing elfe.

From this we may draw a principle, "That in countries where the money-unit is entirely affixed to the coin, the actual value of it is not according to the the legal ftandard of that coin, but according to the mean proportion of the actual worth of thofe currencies in which debts are paid.

From this we fee the reafon why the exchange between England and all other trading towns in Europe has long appeared fo unfavourable. People calculate the real par, upon the fuppofition that a pound Sterling is worth 1718.7 grains troy of fine filver, when in fact the currency is not perhaps worth 1638, the value of a new guinea in filver, at the market proportion of 1 to 14.5; that is to fay, the currency is but 95.3. *per cent.* of the filver ftandard of the 43d of Elifabeth. No wonder then if the exchange be thought unfavourable.

From the principle we have juft laid down, we may gather a confirmation of what we advanced concerning the caufe of the advanced price of bullion in the Englifh market.

When people buy bullion with current money at a determinate price, that operation, in conjunction with the courfe of exchange, ought naturally to mark the actual value of the pound Sterling with great exactnefs.

If therefore the price of ftandard bullion in the Englifh market, when no demand is found for the exportation of the metals, that is to fay, when paper is found for paper upon exchange, and when merchants verfed in thefe matters judge exchange (that is, remittances) to be at par, if then filver bullion cannot be brought at a lower price than 65 pence the ounce, it is evident that this bullion might be bought with 65 pence in fhillings, of which 65 might be coined out of the pound troy Englifh ftandard filver; fince 65 per ounce implies 65 fhillings for the 12 ounces or pound troy.
